THE budget debate in the Lok Sabha has followed the beaten track of criticising the Finance Minister for increased taxation (both direct and indirect), his inability to hold the price line, wasteful expenditure in the execution of the various projects, non-remunerative character of the public sector projects, and in particular, the non-socialistic character of the abolition of the expenditure tax. The suspension of the expenditure tax evoked more of emotional outpourings than logical reasoning. The Finance Minister in his reply dealt with all these points in a realistic manner, trying to defend his policy but at the same time not losing sight of the fact that all the criticism was not completely unfounded.

The Communist members in the Lok Sabha attempted to run down the Budget because of the larger proportion of indirect taxes in the total new dose of taxation. Their line of thinking was based on the assumption that all the indirect taxes were borne by the poorer section of society. The plea that taxation proposals were intended to make the rich richer and the poor poorer was a mere slogan, and an attempt to suppress the reality that in a country in which direct taxation had very nearly reached the saturation point, even according to outside observers, indirect taxation was bound to emerge as a progressively increasing source of tax revenue. Another fact which is suppressed by implication is that the incidence of indirect taxation does not shift on those who bear the burden of direct taxation. The Finance Minister quoted income-tax statistics to show how levelling up of incomes had been going on during the last few years. The proportion of income-tax assessees in the lower income brackets was rising while of those in the upper income brackets was falling. No reliable figures, however, are available about the changing pattern of distribution of income below the income-tax limit. Even if money incomes at the lower level had risen, it was not known how far this re-distribution in incomes had been brought about by rising prices which tended to erode the value of incomes in real terms.

Mr. T. T. Krishnamachari's outspoken statement that the abolition of the expenditure tax was tantamount to a negation of socialism was cited by many in the House to prove the non-socialistic character of the Budget. Rightly the Finance Minister pointed out that the yield from the expenditure tax had been so small that its continuance was likely to cause more pressure on the administrative machinery than the actual collections warranted. Nevertheless, it is suspended, not removed from the statute book. The Government need not continue to stick to taxation measures whose ineffectiveness had been proved over time. The point often omitted — and omitted with a deliberate design — in harping upon the virtues of the Kaldorian formula of taxation is that it rests on the key principle that the new direct levies should be accompanied by a reduction in the rate of the income-tax to 45 per cent at the final stage of the consummation of the integrated system of direct taxation. The income-tax has gone on increasing progressively since May 1957.

The criticism against inflation was couched in a language of confusion. The critics, while referring to the rising level of prices, were not commenting on what had transpired in the preceding 12 months. The general index of wholesale prices did indicate a restraint on prices during the past year and whatever increase had emerged in certain sectors had been more than counterbalanced by the steep fall in jute prices. The critics complained more of the oppressive character of prices, which had already risen to heights cutting deep into the real standard of living. It is difficult to dispute that this contention has some validity in the longer context. In a Special Article in *The Eastern Economist* dated April 27, it was shown that the double-edged weapon of rising direct taxes and rising prices had taken away more than 20 per cent of the real purchasing power of the middle classes since 1952-53. The cost of education, transport, housing etc. — items which are not taken care of in the index of wholesale prices — were on the increase making it very difficult for the middle classes to honour their social obligations in maintaining tolerable living standards. Education, in particular, has become very costly and the fixed income middle classes, after having borne the brunt of rising taxation and rising prices, find it difficult to meet their elementary obligations to their families.

Increased taxation is written into India's plans. It seems there is no escape from it and those members of the Lok Sabha who a year ago approved the Third Five-Year Plan knew very well the implications of this development plan in terms of financial resources. It is questionable political wisdom to raise one's voice against increased taxation when it is irretrievably agreed that the Third Plan will be based upon taxation a little below one fourth of the resources estimated conservatively, as now transpires. The same spokesmen who are vociferous in condemning taxation measures were also foremost in their lament over the slow rate of economic growth. We cannot have the best of all the possible worlds. It is highly regrettable that the chosen representatives of the masses should overlook the simple fact that they raise dangerous illusions about prosperity without paying its price in diverse ways. It is sensible to raise a reasonable warning against the Government's inability to hold the price line. But any criticism during the course of the Budget debate must be constructive, if it is to produce healthy changes in the Finance Minister's proposals. To decry taxation but to suggest no alternative to replace it, is to resort to silence which it may not be uncharitable to characterise as sinister.

The Set-Back in Laos

THE set-back to truce in Laos came exactly after one year. On May 3, the first anniversary of the cease-fire, the Pathet Lao forces attacked Muong Sing in the North-West province of the Rightist Government of Prince Boun Oum. This was the first manoeuvre to push the royal army from a position of control of a province adjoining Thailand. Once this key post, holding the line of defence of the provincial capital of Nam Tha, fell under the weight of the attack, the path was cleared to deliver a decisive blow at the capital city itself. On May 6, Nam Tha was captured by Pathet Lao and the fate of the North-West province was practically sealed. The next strategy was to chase the garrison expelled from Nam Tha. The entire force took a flight across the border into Thailand. This surprise action was carried out so swiftly—and it was so facilitated by the total lack of resistance on the part of the royalist forces after the fall of Nam Tha—that the world was presented with a *fait accompli* which threatened to throw peace in this region into jeopardy. The problem it has posed is how to save the good work done a year ago from being wrecked.

How Pathet Lao was able to carry out this campaign with such thoroughness yet remains to be explained. Prince Boun Oum has charged China with aggressive intervention to support Pathet Lao and his version is that some battalions of the Chinese 43rd division were deployed for this purpose and they withdrew immediately the capital city was overrun. Exaggerated or groundless reports are not unusual in Laos. The US Embassy, after a careful scrutiny, announced that the version about China's armed intervention was baseless. It has also dismissed the scare of an immediate threat to the Rightist Government's capital of Vientiane as imaginary. Reports about two-thirds of the territory in the North-West province having been seized by Pathet Lao are hard to accept in view of the inhospitable nature of the terrain. But the fact remains that Prince Boun Oum's Government is ousted from the strategic town of Nam Tha. It makes the position of Thailand vulnerable on this side of her frontier.

Various surmises are made to explain the Pathet Lao action which certainly upsets the balance of power in Laos. In their intransigence to thwart all attempts to form a neutralist coalition government in pursuance of the Geneva resolution, Prince Boun Oum and his Defence Minister, General Phouma, frivolously indulged in acts calculated to provoke Pathet Lao into violating the cease-fire agreement. Apparently, they were angered by the punitive action taken by the American Government in stopping its economic aid of $4 million a month. Three months of financial stringency, since the aid was stopped in February, created a host of internal problems for them. Pathet Lao seems to have made an adventurous bid in this tempting situation and it succeeded in aggrandizing its position.

The real problem now is how to restore the cease-fire to the status before its violation. If fighting flares up, it will not be a civil war confined to Laos. It will be difficult to localise it and the overwhelming apprehensions are that Thailand too may be dragged in. President Kennedy's action in ordering the mobilisation of part of the 7th Fleet from the Philippine base in Subic Bay to a position in Thailand was a precautionary measure to offer protection to the latter in case of a likely emergency. The Geneva resolution provides for a government of national unity in Laos and guarantees respect for its neutrality by the Big Powers. A neutral government is the only acceptable solution for the Laotian tangle. None of the Big Powers would wish to cast it away. There is no peaceful alternative.

Attempts made by Britain, as the Co-Chairman of the Geneva Conference, and by America too, to persuade the other Co-Chairman, Russia, to use its undoubted influence with Pathet Lao to agree to a restoration of the cease-fire line, as drawn in May last year, have proved fruitless. The proper agency to act in this situation is the International Control Commission for Laos. It was with the purpose of entrusting the initiative to the ICC that Britain approached Russia with a proposal for an investigation on the spot in Nam Tha by the ICC, keeping the Big Powers aloof. But Russia's blunt refusal to allow the ICC to enter Nam Tha has created an impasse. In fact, it is one of the tragic occurrences in Laos that the ICC, which is presumed to create a climate for a compromise between the three Princes in this unsettled land, is not enabled to function with the right of free movement in the Pathet Lao territory.

The Russian refusal to allow entry to the ICC into Nam Tha presumably implies no return to the cease-fire demarcation of a year ago, but a recognition of 'actuality'—a Chinese euphemism for consolidation of the gains of aggression. If Russia remains adamant—and there are no present signs to the contrary—the course left open will be for Prince Boun Oum to accept ratification of the altered superior position of Pathet Lao. There can be no neutrality without a tripartite government. Prince Boun Oum will have to withdraw his wooden-headed opposition to giving the key portfolios of Defence and the Interior to prince Souvanna Phouma, the obvious choice for premiership. Whether any fresh hard points will be driven in the bargain needs to be watched.

THE WEEK'S NOTES

Berlin Issue

U.S. - GERMAN DIVERGENCE

THE RELATIONS between West Germany and America have reached a point of extreme strain in so far as the settlement of the Berlin issue, currently under negotiation with Russia, is concerned. These talks are of an exploratory nature and it is the endeavour of America to find out the widest possible ground for agreement on both the sides. The issue of the access routes to Berlin and their control has been a source of explosive crises in Europe from time to time. Apart from the political importance of this question, its emotional significance to the German people can be readily appreciated. But the dual control of Berlin is a hard reality and irrespective of the genuine merits of the West German case, it is in the interest as much of the Western alliance as of the Communist Bloc in Europe that a solution ought to be found. It is from this angle that America is trying to sound the probable basis of a compromise on this question.

The provisional plan is based on this consideration and it contains an important proposal by America about the control of the access routes to Berlin by a 13-nation organisation. Dr. Adenauer has not thought it fit to keep his feelings on the proposals under negotiation under restraint and he has gone to the maximum extent practicable in expressing his opposition to the American proposal of the multi-power control of the routes. The relations between the two Western allies, therefore, have been strained in the extreme on this issue. But President Kennedy is quite firm that unless Dr. Adenauer has a positive alternative to replace his tentative proposal, it would not be prudent to give up the talks. While Dr. Adenauer is insisting that the talks be discontinued, America is of the strong opinion that discontinuance would cause greater harm than good. There has been plain speaking from both the sides, but the expectation is that finally the negotiations will be carried as originally planned.

Truck Transport

GOVERNMENT PARTICIPATION

IF THE report that the Central Ministry of Transport is seriously considering the proposal to start long distance truck services under its auspices to relieve the railways from the unmanageable loads of traffic offering is correct, the Ministry would do well to pause and give the fullest consideration to the implications of this proposal. It is indisputable that the planned expansion of the capacity of the railways in the Third Plan will fall short of the conservatively estimated growth of freight traffic. In this situation there is no alternative but to transfer substantial traffic to truck services. It will be one of the most delicate but fundamental tasks of the Neogy Committee to make positive and elaborate suggestions how co-ordination should be orientated towards a rational fixation of rates charged by truck operators and the allocation of traffic according to the rates paid between the railways and the truck services. Thus what is really needed is a practical policy of co-ordination with a pronounced financial angle. Without that the railways whose precarious finances have been saved this year by an increase in rates and fares, will not be able to maintain their financial stability.

This does not in the least imply that the proposal of the entry of the State in the sphere of truck transport is wisely conceived. The justification for the nationalisation of truck transport, whether partial or substantial or wholesale, must rest on the inefficiency and high cost of the operations under the auspices of the private sector. Facts speak eloquently for the efficiency, cheapness and remarkably high degree of personal service which have been all along displayed by the private truck operators. One of the basic advantages which truck transport enjoys over the railways is loading of the freight at the point of origin — whether the factory or the farm—and door-to-door delivery. Furthermore, the element of personal contact and full consideration to the consumer is an important factor in the rapid development of truck transport in spite of the manifold severe restrictions that continue to be retained on it to curb competition with the railways. The Neogy Committee's report contains copious evidence of truck services having successfully and efficiently undertaken long distance operations on regular long-term contracts with wholesale users of transport. This in itself is proof positive of the capacity of the private operators to relieve the railways of the burdens which they are unable to unertake. In Parliament many voices were raised for new railway lines to be opened in particular regions. Similarly, there are vast areas where it would not be economic or practicable for the Railway Ministry to open up new lines. It is in these regions and on these routes (which are in reality feeder routes) that new licences for private truck services should be issued liberally.

If the Central Transport Ministry has at long last recognised the fact that a crisis has been reached when truck transport should carry freight over long distances, the question must be posed why the available services of the private sector are not being utilised. All hesitation about liberalising inter-State licensing and removing the burdens on truck transport should be now dispelled in the interest of the smooth execution of the five-year plans. It is a mistake to suppose that the public sector has just to start truck services over selected routes and efficiency of operation will automatically follow. In the case of the railways there is a large element of monopoly for the State. But the public sector will hardly be able to run truck services with the efficiency and cheapness that the community requires. It must be recalled that the former Bombay Government experimented with the scheme of partial nationalisation of truck transport on selected but lucurative routes and finally burnt its fingers. The present Maharashtra and Gujarat Governments realise too well that prudence lies in not upsetting the policy of denationalisation which the predecessor Government had to undertake. On what evidence does the Central Transport Ministry believe that it can run the truck services better and cheaper than the private operators?

PSP

THE DARKENING SHADOWS

MR. PATTOM THANU PILLAI'S resignation from the office of Chairman of the Kerala State Unit of the Praja Socialist Party was announced on May 12. On that day the State Party's Executive devoted a good deal of its time to matters arising out of Mr. Thanu Pillai's resignation. The fact that the submission of resignation was announced to the Press is significant in the sense that hopes of persuading Mr. Thanu Pillai to change his mind seem to have been exhausted. The Executive has decided to place the resignation for final consideration and decision before the special delegates' conference of the State Party which is scheduled to be convened at Cannanore on May 19 and 20. The reasons which have impelled Mr. Thanu Pillai to take the extreme course he has chosen are not clear from the available Press report. But a laconic statement extracted from the letter of resignation merely says that Mr. Thanu Pillai considered a change in the occupant of this responsible party office desirable as he had held it for several years. This explanation is not helpful in throwing light on the cleavage of opinion inside the Party—very likely on issues of policy or party reorganisation. Right up to the time of the resignation, there was no indication that Mr. Thanu Pillai considered his leadership of the Party having ceased to be of effective value. Internal developments have obviously necessitated this sudden development.

Particular importance attaches to Mr. Thanu Pillai's resignation inasmuch as he is the Chief Minister in the Coalition Ministry of the Kerala State in partnership with the Congress Party. At the meeting of the Executive the PSP members of the State Legislature were specially invited. Their presence was deemed essential probably to consider the repercussions of the resignation on the Coalition Ministry's composition. It need not be assumed that the special delegates' conference will insist upon Mr. Thanu Pillai to withdraw his resignation. The Party's General Secretary has made a meaningful observation that if the Conference accepted the resignation, the new Chairman would be elected immediately. Do these developments mean that a change in the Chief Ministership of the Coalition Government of Kerala is also impending and, if so, what is the prospect for collaborated and smooth working of the coalition under a new Chief Minister? The whole series of upsets in the Kerala Unit of the PSP is bound to produce effects reaching much beyond it.

The fact that the organisation of the PSP is being disturbed in a State, where that Party is in office, speaks for the darkening shadows of disintegration creeping into the organisation. For some time in the recent past attempts were made for a reunification of the PSP and the Socialist Party, but they proved fruitless. In the last general elections the PSP was routed practically in all the States and in Parliament it has emerged with a greatly reduced strength and with still further qualitative decline due to the defeat of some of its front rankers of undoubted ability. It is high time the PSP took stock of the whole situation. There are few in this country who would now retain their faith in the PSP's ability to raise its stature to occupy the position of the Party in Opposition in Parliament and in some of the States at least. If the PSP will not be able to recover from its present state of chaos, this is the time to consider whether its return to the Congress fold would not be in the best national interest.

The World Abroad

PLANNING IN THE U.K.

By

ODYSSEUS

BECAUSE of its associations with wartime controls over manpower, the arbitrary allocation of resources, and rationing of consumer goods, planning became a "dirty word" in the U.K. But (1) disgruntlement with the U.K. Government's zig-zag policy of expansion and restrictions, (2) the disturbing fact that whereas between 1953-60 U.K. industrial production rose only from 100 to 130, while in all OEEC countries it rose to 155 and in the EEC to 171, and (3) increasing realisation that the need for a surplus to aid the developing countries is not only an act of good will but important for the preservation of the free world, has made the idea of planning respectable. There has been an upsurge in the U.K. of articles and conferences on planning. Today, I shall draw on an article by J.C.R. Dow, "Problems of Economic Planning" in the November, 1961, issue of the Westminster Bank Review (41, Lothbury, London. E.C. 2), a long essay by Professor Thomas Wilson in the New Year 1962 issue of the Conservative review "Crossbow" (60, Berners St., London. W.1) and the discussions at the conference on planning held recently by the Business Economic Group in which I participated at Oxford.

WHAT HAS PLANNING ACHIEVED IN EUROPE?

Full scale planning with set targets for individual industries exists only in France. In Holland, a planning council sets no individual targets but concentrates on broad policies intended to create, largely by fiscal and banking policies, conditions favourable to growth. Now, although between 1955-60, industrial production rose in France from 100 to 168 and in Holland to 157, in negligibly planned Italy, it rose to 182, and in competitive Germany to 180. So, did French production increase because it was planned and German and Italian because it was not planned? No one can say. Least of all M. Pierre Masse, France's Planner in Chief, who with disarming candour said to me last year: "I don't know whether France's post-war annual average growth rate of 7 per cent was due to planning or not. It's difficult to determine what part the Plan plays in actual development. But the results have been so good that one may suppose that the two have some connexion." On the other hand, since German and Italian results have been even better than the French, may one suppose that the absence of planning has some connexion with their success? Incidentally, if France's gross national product rose in real terms by 36 per cent in 1953-60, that of unplanned Britain was 22 per cent, which is by no means so contemptible.

Naturally, as Professor Wilson points out, there are many other factors apart from planning that explain differences in growth rates. The most obvious is difference in the rates at which the labour force has been growing, and in the scope for transferring workers from agriculture to industry. In 1957, 26 per cent of the working French population was on the land, compared with only 4 per cent in the U.K. It is true that France invested 17.6 per cent of her output in 1953-60 and the U.K. 15.4 per cent but the difference is too small to explain their differing rates of growth. Moreover, France was below the average of 18.9 per cent for the OEEC countries, and below Germany with 22.4 per cent. By 1960, the UK had herself reached 18.5 per cent.

The advocates of planning in the UK maintain that the price mechanism is an imperfect instrument for securing production and allocating resources, because it proceeds by trial and error, and this is said to waste resources. But no perfect economic system is capable of being devised (as planners, who are forced to revise their plans upwards or downwards, must admit), so before condemning the price mechanism as a failure it is fair to point out its working is falsified by monopolies and restrictive practices, whether of entrepreneurs or workers, by cosy protective tariffs that promote high costs and waste, by huge government subsidies, e.g. to agriculture and nationalised industries, or by a cumberous, antiquated, steeply progressive tax structure, honeycombed with rules, schedules and exceptions to the sole benefit of non-productive civil servants, tax experts, and lawyers, and which also puts a premium on the use of labour rather than on economising labour by switching to capital intensive equipment.

The OECD's 1962 report on the UK economy (Price 3sh. Indian Agents: the Oxford Book Shop, New Delhi) points out that the UK has suffered from a lack of labour mobility, between skills, trades, and regions, which has, in part, reflected labour's concentration on restrictive practices and disputes between unions, etc. and, in part, the desire of management to hoard labour. The unions have resisted dismissals and employers have sought to retain manpower in slack times in order to avoid worsening labour management relations and to guard against the possibility of labour shortages when the bank rate goes down and the green light of expansion reappears. In the motor industry, for example, output fell by 15 per cent in 1960-61 while employment fell by only 2.5 per cent. Between January and December 1960, the number of workers in manufacturing on short time rose from 40,000 to 140,000, which meant that recruitment from stagnant to expanding industries was gravely impeded.

At the same time the UK unions succeeded throughout the years 1950-60 in raising wages faster than productivity. Output at factor cost at constant prices in manufacturing industry rose only from 88 in 1950 to 123 in 1960, but income from employment rose from 71 to 150. The persistence of "autonomous" wage pressure suggests that efforts to restrict excessive demand, while important, were not themselves enough to avoid inflation.

INFLATION DOES NOT HELP GROWTH

Inflation does not help growth. It causes a scramble for labour and raw materials, creates production bottlenecks, leads to optimistic and wasteful investment, causes employers to bid extravagantly against each other for raw materials and workers, keeps inefficient firms alive by creating a seller's market, raises costs, and so makes exporting more difficult. All this does not add up to an argument for planning but for ceasing to impose conditions which prevent the price mechanism from doing its job of automatic planning by consumers' plebiscite.

The truth is that politicians, Labour and Conservative, fearful of unpopular measures, such as a reform of the tax system which would allow profits to soar and therefore prices to be reduced, fearful of enforcing anti-monopolist legislation against employers and trade unions alike, first allow increasing chaos and then claim that planning is essential to end the disorder which they have created. This is why both Labour and Conservatives are committed to planning.

The Business Economists conference was in favour of planning but was against USSR totalitarian planning which allocates resources and manpower in accordance with the planners' view of what the economy should produce, prohibits strikes, and allows consumers only what bureaucrats think they ought to have. If the state is not to plan personal consumption then the problem is how to reconcile planning with the price mechanism, which allows consumers to express their preferences.

It is here that the British National Economic Development Council may have an important role. If the NEDC, consisting of high level industrialists, trade unionists, and economists, is regarded by all political parties as a non-party national economic laboratory, electors, bewildered by Stop and Go policies, would accept its recommendations with a good grace.

The advantages to the UK of NEDC would be that it would extend to the nation the market surveys now carried out individually by each firm. All firms have to plan ahead and their enquiries could be more fruitful if conducted in consultation with a central body armed with a national battery of statistics and better informed on the overall picture. The OECD secured steady economic progress in Europe by its method of confronting the exponents of different views, which, without compulsion, made it difficult for recalcitrants to hold out against demonstrated logic.

Should the NEDC be equipped with incentives (tax concessions etc.) to further its policies and to penalise those who disagree? The difficulty is that planning by agreement on a national scale is only feasible in oligopolistic industries where firms are few and large. Close co-operation between such firms, fostered by planning, damps competition, leads to compromise solutions, and sets up an industrial "Establishment" of dull, respectable firms in which size would count too much. You risk grandiose protective cartels, which would preserve historical patterns of output with slow progress in some lines and disillusioning over production in others. This would hamper the imaginative and unorthodox, prepared to take risks for the big profits necessary for diversification and progress. Penalties would force the unorthodox to conform to the less imaginative or more cautious views of the majority. Rapid expansion implies disproportionate advances in some firms or industries which stimulate subsequent expansion elsewhere. One can imagine circumstances in which planning was more of a soporific than a stimulus. We do not want industrial self-government run by stuffed shirts—fascism without the thuggery. Such planning might appeal to all that is mediocre in UK industry.

All this suggests that NEDC's role should be long-term planning to promote broad policies intended to release the forces of competition, to promote mobility of capital and labour, and by getting employers and workers on their toes, to create a climate of expectation —a mystique of growth—kept realistic by a freely working price mechanism. Planning is no substitute for good management, lively entrepreneurship, and willing workers. All it can do is to clear the field of obstacles for them and make them feel that, with the ball at their feet, a hard fought competitive game will produce inspiring results.

Your idea of an ideal holiday—All on your own? foot-loose and fancy-free? or a group package tour?—everything laid on...new faces for company? Whichever way you like it. American Express Travel Service will tailor your holiday to your needs. No worry—no feeling of "aloneness" American Express makes you feel at home With American Express Travelers Cheques you will be perfectly safe We'll do the work—you'll have the fun

The European Scene

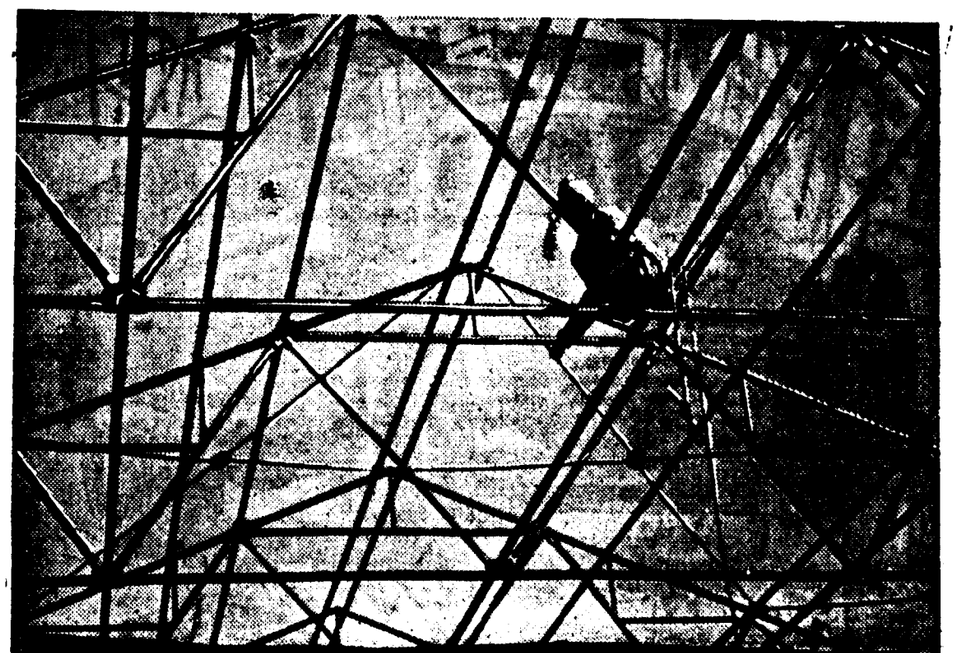
FRENCH BUSINESS CONDITIONS

From Our Special West European Correspondent

PARIS, May 12.

BUSINESS conditions in France will continue to be excellent for the rest of the year, it is agreed by business men and statisticians. The diagnosticians of the ECM Commission have made the following forecasts for the expansion of industrial production in the six countries for 1962: Italy plus 10 per cent, France 6 per cent, Belgo-Luxemburg Union 5 per cent, Holland 4.5 per cent and West Germany 4 per cent. The French Government's experts are slightly more optimistic, foreseeing an increase in industrial output of 7 per cent, in gross national product of 5.5 per cent, in investments of 7 per cent, in domestic consumption by individuals of 5.5 per cent and in exports of 8 per cent. Business men polled by the statistical institute concurred, forecasting an increase in production, a moderate rise in investments and a further extension of foreign demand for French exports. Finally, figures for the first four months of the year confirm these hopes, indicating that industrial production is running about 8.3 per cent ahead of last year at this time, while exports are at record levels. The year 1962, it appears, will be smooth sailing.

The reason is that the main factors influencing activity—consumption, exports and investments—are favourably orienfed. Private consumption is rising because incomes increased sharply last year and are still increasing, though at a slower pace. The rise in money incomes this year will produce an almost equivalent rise in real purchasing power because prices are steadier; barring accidents with the weather or in politics, there is a good chance of holding the price line throughout 1962. The rise in personal incomes, moreover, is more equitably spread as between classes and regions than in recent years. Wages are rising at least as fast as entrepreneurs' profits (the contrary was true in the first years of the monetary reform), the underprivileged groups (the old folk and unskilled labour earning the basic wage) are at last getting their share of prosperity, and the peasants see their income rising in phase with urban revenues.



Since roughly similar developments are occurring in neighbouring European markets, export demand is excellent. Anxiety having been expressed lately about the state of the West German economy (and West Germany is nowadays France's biggest single export client), it is worth noting that nothing has happened to moderate German demand for French goods; quite the contrary. German imports in the first quarter were 16.5 per cent higher than in the same period of 1961, which is good news for French industry. German exports, on the other hand, grew by only 3.2 per cent, indicating an easing of German competition in third markets. Demand from the U.S.A. is also encouraging; the sharp increase in automobile imports into that country this spring is notable. Algeria, which used to be France's main external market, is completely paralysed by anarchy; the consolation for exporters is that sales to the franc zone must now be at the lowest level possible (at a moment when French exports are nonetheless at a peak), and from here on there can only be improvement. The Evian settlement (however little it has "settled") disengages French responsibility on the Barbary Coast, so the Arab countries and certain African states who had boycotted French goods are once again opening their doors.

The third element, investments, is the weakest in that instead of increasing by 12-14 per cent as last year they will rise this year by only 7 per cent. "Only"—but this is still creditable.) Balanced expansion should rely as much on investments as consumption, but on the worst of hypotheses the recent decline in investments could not produce any ill effect before next year; the outlook for 1962 remains good. Consumption will take up the slack, and though this could not continue to be the case for long without damage to economic growth, there are social reasons for thinking that consumers should be allowed for a time to receive the benefits of the big investment effort of the last three years. The reason for the decline in investments is not diminished confidence among producers, but financial difficulty—and this brings us to the problem of the narrowing of profit margins that is to be seen not only in France but in most of Europe.

It is a pretty general phenomenon that freer trade has set a limit on increases in selling prices, because of intensified competition, at a moment when the labour shortage has enabled unions to extract higher wages; governments, too, have taken a more liberal line and have burdened industry with new welfare charges. The upshot is compression of profit margins, which is reducing the ability of enterprises to finance from earnings the creation of new assets. Industrialists, as is natural and proper, have pulled the alarm chain and pointed out that if this goes on expansion will cease. In very general terms they are of course correct, but certain qualifications are needed. Profit margins have indeed been squeezed, but then European firms since the war have been used to wide profit margins on a limited volume of sales. In the new circumstances created by the opening of the Common Market and by the vast expansion of their scale of activity, they can get narrower profit margins on a greater volume of sales, and that volume is constantly increasing. The absolute quantity of profits is often rising, or at least is not falling, so the auto-financing of investments is not crippled. Even where it is being compromised, firms can be reminded that there are other ways to finance expan ion than accumulating reserves out of profits: the increase in dividend payments this spring in the French bourse, heralding an approach to investors for fresh capital, is a sign that this has not been forgotten. The constant inflow of foreign capital to the bourse, notably from the USA, creates very suitable conditions for the raising of fresh money.

Finally, and this point is especially relevant to many French industries of scattered capital structure, the compression of profit margins is precisely one of the mechanisms by which the Common Market will lead to rationalisation of costs, superior organisation and, eventually, fusion between firms that can no longer stand alone. It was never imagined that in the Common Market everyone was going to make more money and that firms adjusted to the limited and protected domestic market were going to get bigger without exception.

PREFABRICATED
TUBULAR ROOFING STRUCTURES

All S & L Prefabricated Tubular Roofing structures are designed to the requirement of I.S. 806 : 1957 code of practice for the use of steel tubes in general building constructions.

Entirely self-supporting S & L structures of the following spans and bay lengths are available ex-stock.

Type	Nom. Single Span	Bay Lengths
SLS/20	20 ft.	10 ft.
SLS/30	30 ft.	10 ft and 13 ft. 4 in.

Producers will seldom make the effort required to modernise and rationalise when every firm can make good profits; that effort is more likely to come when the market is expanding but profit rates are contracting. One is not perversely arguing that falling rates of profit are a good thing, but it is sure that the reorganisation of the European economy which is the objective of economic unification will occur only in a period of narrowing margins. One hears the complaint of smaller profit rates mainly in traditional industries due for a shake-up and in sectors where there are signs of some over-equipment (steel, cars and chemicals, for instance).

If one were to carry this orthodox argument to its customary conclusion, one might say that firms in these three last-named sectors (and one could add textiles and paper, where competition is at present fierce in France, as in West Europe generally) must be let fight it out till only the fittest survive. Few people, in fact, draw that conclusion. Habits of thought acquired in discussions of the French plan incline producers rather to suggest an international co-ordination of expansion plans. Such ideas usually make American industrialists jump; one will recall the acid reply of Detroit to the French suggestion to divide up markets as between makers of big and small cars—yet Detroit has just abandoned its plans to make a really small car that would have competed with the Volkswagen and Dauphine, showing that the force of the French case was recognised. Many people here doubt whether the Atlantic world's programme of development will be successfully fulfilled unless manufacturers of cars, steel and chemicals on both sides of the Atlantic put their heads together to avoid the current race toward suicidal overinvestment. Similar ideas are making their way in the paper industry, where the North Americans and Scandinavians have carried cut-throat warfare into the Common Market; investments are nowhere being coordinated, even in the most general terms, so excess capacity has appeared and the paper industry is in danger of finding again—but this time on a bigger scale —its familiar experience of boom and slump. French producers used to think that the Common Market would be a suitable area in which to co-ordinate long-term investment plans in such industries, but that was when they imagined that the association would practise a fairly protectionist external trade policy. If, on the contrary, it is to follow its current free-trade trend and to reduce tariffs on trans-Atlantic trade, then they favour consultation in the OECD or even in GATT.

These proposals are being discussed in a serene atmosphere, for it is recognised that the dangers they are designed to avoid still lie several years in the future. The spring upturn in the automobile industry (production is up 50 per cent in the UK, 48 per cent in the USA, 30 per cent in Italy, 18 per cent in France but only 2.6 per cent in West Germany) has stilled fears of chronic difficulties for a time. The prospect of eventual over-equipment in this industry remains serious, as in steel and certain chemicals, but it does not affect French views of the outlook for the rest of this year. In general, optimism about 1962 is extraordinary for the reason that, although the economy has, as always, its weak spots, those very spots seem weaker in West Germany. Whether it be the manpower shortage, the rise in prices or the level of investments, West Germany's situation seems similar to, if not less favourable than, France's. French producers are so used to conceiving the Common Market as essentially a trial of strength with West Germany that when their only ills are to be seen in the same form across the Rhine, they are extremely sanguine. What makes this attitude more striking at the present time is that it leaves Britain out of account altogether, although her entry into the Common Market is, supposedly, imminent. On balance, it appears, the introduction of British industry into the Common Market circuit is not thought to be of any immediate relevance to French producers assessing the prospects for the rest of 1962.

Economic Report from the U.S.

UNITED AUTO WORKERS' CONVENTION

By GUY SIMS FITCH

ATLANTIC CITY, (New Jersey), May 8.

PRESIDENT KENNEDY, fresh from explaining his policies to the businessmen of the U.S. Chamber of Commerce, undertook the same task this week in a face-to-face encounter with the ranks of labour. Once again, this time in an address to the United Auto Workers' (U.A.W.) Convention at this seaside resort in New Jersey, he stressed the national interest—the responsibility of both labour and management to the general public. Thus, the President has made it clear that his policies are even-handed in their application, and show no favouritism to any special group. Inherent in this attitude is the belief that "what is good for the United States, for the people as a whole, is going to be good for every American company and for every American union."

What is good for the country, as President Kennedy reminded his U.A.W. audiences, is a basically non-inflationary growth, in which full employment and technological advance go hand in hand, and through which the United States can continue to meet its essential commitments to social and economic progress at home and abroad. This kind of growth, which the President described as "our greatest challenge in the sixties," is being achieved through a rising productivity, or output per man hour, from which all segments of the population benefit—businessmen through higher profits, workers through higher wages, consumers through stable or lower prices, traders through competitive access to the world market places. In the eyes of the Kennedy Administration, therefore, unjustified wage demands that outstrip productivity increases and require higher prices are equally as contrary to the national interest as unjustified profit demands which require higher prices. In addressing his business audience last week, the President laid particular emphasis on the need for price restraint against a background of reasonable and adequate profits. To his labour audience, this week, the President spoke primarily of keeping wage and other employee benefits within the bounds of productivity gains. One important point, however, was the same. Mr. Kennedy reaffirmed his opposition to fixing wages and prices in a peace-time economy. His administration, he noted, can suggest guidelines for the economy, but it cannot set a single pattern for every plant and industry. It can define national goals and point out the national interest, but it possesses and seeks no power of compulsion in the realm of wages and prices.

Thus, it is up to labour and management in each industry to make the necessary and voluntary adjustments to the national interest in their free collective bargaining negotiations. In this they presumably would be using as a guide, but not necessarily as a hard and fast formula, the three per cent a year productivity rise which has been projected by the President's Council of Economic Advisers as the average for industry as a whole. In addressing the U.A.W., Mr. Kennedy was making his plea to a group which has generally supported him in the past and from which he could expect a far more cordial reception, personally and for his views, than was the case with the Chamber of Commerce. Only the day before, despite some earlier indications of dissatisfaction with the President's approach on this issue, the U.A.W. had gone on record as reaffirming its support for "wage increases and improvements in fringe benefits out of the fruits of advancing technology and not through higher prices." This action was duly noted by the President as in keeping with the union's "sense of public responsibility."

This responsibility will be tested—perhaps severely—in the U.A.W. and other unions in the months ahead. The U.A.W. itself, for instance, will be an important participant in forthcoming wage negotiations in the aircraft and missile industry. And coming up soon, probably within a month, are some key labour-management decisions on new contracts for non-operating trainmen in the railroad industry. Just as the President was speaking to all businessmen when he addressed the Chamber of Commerce, he in effect was speaking to all union members in his U.A.W. appearance. And beyond them, his message was directed to all Americans.

Advanced ENGINEERING AND CONSTRUC-

TION FOR THE IRON AND STEEL INDUSTRY

The dictionary defines engineering "as the art and science by which the mechanical properties of matter are made useful to man in structures and machines." In the McKee Organization it is much more than that—it is a constant, unflagging effort toward advanced design, increased plant efficiency, improved construction and greater economy.

The results of that effort are readily apparent in the many contributions to the progress of steel-making made by the McKee Metals Division in more than half a century of specialized, world-wide engineering and construction for the steel industry.

Pioneering by McKee engineers in the fields of plant design, ore beneficiation, automation and production methods have been invaluable to the industry. Recent examples are McKee's work in pelletizing and in the first successful application of gas injection in blast furnaces.

McKee can deliver this kind of advanced engineering and construction to the steel industry in India and back it with an unmatched fund of practical experience and specialized knowledge.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

THE McKEE ORGANIZATION

RECLAMATION OF THE SALT LAKES NEAR CALCUTTA

By K. D. GANGULI, B.E., M.I.E.,

Special Engineer, Salt Lakes & Allied Schemes.

IN common with some cities in many parts of the world, the geographical position of Calcutta is unhappy. With the river Hooghly on the west and the Salt Lake marshes on the east, the city has been growing length-wise north to south, since it was founded about two and three quarters centuries ago. All the town planners agree that this is not the best method of expansion for a city, being similar to a high pressure ribbon development so commonly deprecated. The cost of services such as water-supply, conservancy, etc., is much higher in a city whose length is disproportionate to its width.

The population of the City proper with an area of approximately 32 sq. miles has been continually increasing, and is now over 3 million. This means an average density of more than 140 persons per acre, as against 35 and 40 in New York and London respectively. The growth of population and the consequent high density has made the acquisition of additional space for expansion of the city imperative. The problem created by the pressure of population has been further aggravated by the influx of refugees from East Pakistan. As matters stand, no adjustment by mere planning within the limits of the city proper is possible now. The dispersal of population by the removal of various corporate activities of the city, e.g., certain Government departments, or commercial or industrial concerns to other localities, or the establishment of satellite towns, such as Kalyani, is a fairly long-term process. A more immediate solution is the co-ordinate development of the suburban areas of the city. In these circumstances investigation of the prospects of adding to the city's land resources by reclamation of the low-lying swamps in a manner that would improve not only the sanitary conditions in the environs of Calcutta, but also increase the availability of better dwelling sites for the low and middle income group people, became a necessity.

In this endeavour the experience of the Dutch, with their long history of struggle for dominion over the waters, was of inestimable value. The Government of West Bengal, therefore, in 1953 invited the Netherlands Engineering Consultants to investigate and prepare detailed plans for reclamation of the Northern and Southern Salt Lakes.

The Salt Water Lakes are divided into two parts by the Calcutta Corporation Storm Water Channel. The polygonal area of 18 sq. miles on the north of the Storm Water Channel and bounded by the Kristopur Canal on its north and east, the Storm Water Channel on the south, and the Central Lake Channel and the New Cut Canal on its west, is known as the "Northern Salt Lake". The area of 15 sq. miles south of the Storm Water Channel bounded by the Tolly's Nullah on the south, the Eastern Railway Suburban line to Sonarpur and the Panchannagram embankment on the west, the Calcutta Corporation Storm Water Channel on the north, and the now defunct Bidyadhari river on the east, is known as the "Southern Salt Lake".

The Northern Salt Lake is proposed to be reclaimed in two parts:

(a) In the northernmost end an area of 3.75 sq. miles contiguous to the city of Calcutta is proposed to be used for city extension purposes. This area has a rather low elevation varying from +3.00 to +8.00 above the P.W.D. datum. The quantity required for raising has been estimated at about 726 lakhs cft., the average depth of raising being 6.3 ft. The filling material will be obtained by dredging the bed of the river Hooghly in the Ghusuri sands opposite the Chitpore Lock to give profiles in longitudinal slices more or less parallel to the river axis not exceeding 400 ft. in width in the reach between the Howrah and Vivekananda Bridges. The material dredged will be put in barges and carried to a floating pumping station on the banks of the river Hooghly near Chitpore Lock whence it will be pumped through a pipeline 2.5 miles long to the reclamation site. As the filling and raising of the area progresses, the length of pipes would increase, until ultimately about 5 miles of piping would be laid. Two boosting stations will be installed 'en route' for maintaining necessary pressure for the transmission of soil mixed in water through the pipeline from Chitpore Lock to the reclamation site.

(b) The remaining 14 sq. miles will be reclaimed and made fit for agriculture and horticulture by treating the area as a Polder. "Polder" is an area protected by embankments against inundation from outside, and from which all superfluous water can be drained off into a canal with the aid of pumps.

The City Extension project of the Northern Salt Lake Reclamation Scheme envisages the creation of a new township in 2400 acres of land. It will be provided with modern amenities in the shape of roads, underground sewerage, drainage, electricity, water supply, parks, markets, recreation places, etc. Of the total area, 175 acres is proposed to be set aside for industrial and commercial development. The land proposed to be reserved for hospital, college sites and recreation ground will be 380 acres. Thus the gross area of land left for residential use will be 1845 acres. The net area available for distribution for building purposes exclusive of roads, parks, schools and shopping centres will be 1440 acres, which represents about 60 per cent of the gross area. Approximately 1,50,000 persons will have found residential accommodation in this new township on the basis of 125 persons per acre as against more than 140 per acre in Calcutta.

The selected site lies just east of Maniktola and is bounded on three sides by the New Cut and Kristopur canals. To the east the boundary line will run along the Eastern Drainage Channel which when excavated will separate the City Extension area from the rest of the Northern Salt Lake. The Maniktola area is being developed by the Calcutta Improvement Trust; so the proposed new city extension can be connected with Calcutta by suitable arterial roads.

The storm water from the new township will be drained by the Eastern Drainage Channel which will be connected to a pumping station to be located at Dhapa. The Drainage Channel and the pumping station at Dhapa have been designed for a capacity based on a run-off of 6 inches of rainfall in 24 hours on the analogy of what has been assumed and provided for in the design of the existing Storm Water pumping installation of Calcutta at Palmer's Bridge. The storm

water discharge will be carried from Dhapa to Bantala by the Corporation's remodelled Storm Water Channel, and from there led into the river Kulti.

The dry weather flow is proposed to be led by a Dry Weather Flow sewer system to the pumping station at Dhapa, and finally carried to Bantala through an open channel from Dhapa to Bantala. The effluent after proper treatment will be ultimately discharged into the Kulti.

The total estimated cost of the City Extension Scheme is Rs. 19.20 crores, which includes a provision for the development of the area. The time required for raising the land will be about 6½ years. The development work may take 3 years more to be completed. However, blocks of consolidated land are expected to be available for development purposes even before completion of the reclamation process.

An important feature of the Scheme is the provision of pre-sale of plots. It has been proposed that land would be offered for sale from the first year of commencement of the Scheme. The sale price of land from year to year has been fixed in such a manner as would bring the price within the means of the ordinary man, and would be considerably less than the sale price of land within the nearby Maniktola area where the Calcutta Improvement Trust is now operating.

Part "A" of the work involving the raising of the areas has been allotted to Messrs. Invest Import of Belgrade, Yugoslavia, who have already commenced operations.

Part "B" of the work, which relates to the ancillary work of supply and installation of the Bagjola Sewage Treatment Plant, has been allotted to Messrs. Hindustan Construction Company. The work on this project commenced in November, 1960, and is expected to be completed by December, 1962. The plant is required in connection with the diversion after treatment into the Bagjola main channel of sewage coming from Belgatchia and adjoining areas of Calcutta Corporation now being pumped into the Salt Lakes by the existing Bagjola Pumping Station.

The Polder area is proposed to be utilised for Co-operative farming. A grid of main and secondary channels will carry the surplus water to a pumping station. An irrigation reservoir is proposed to be constructed within the Polder area to give irrigation facilities. The pumping station will discharge the run off from the Polder area into the Irrigation Reservoir. After the irrigation reservoir is filled, the excess water will be discharged by pumps into the Storm Water Channel and thence into the Kulti river. The plan is to grow at least two crops per annum. The estimated cost of the scheme is about Rs. 4 crores.

Thus the reclamation of the Salt Lakes, by utilising the available resources to the best possible advantage, can be truly considered to mark the beginning of a conscious effort to create out of this belt of stagnant watery wastes and moribund streams a flourishing Suburbia. By means of multipurpose plans it is hoped that one day the once malarial marshlands will support a vibrant population on whom the manifold schemes of improvement about to be implemented will shed the light of prosperity and health.

THE BUSINESS WORLD

The Cut in American Aid

THE U.S., Senate Foreign Relations Committee's action in applying a cut of 25 per cent to the economic aid, for which appropriation is asked by the President, has come as a surprise not without an element of some shock. The opposition was led by Senator Symington and he was successful in mustering a majority of 8. It is true that the cut motion was carried by a bare majority of one, the voting being 8 : 7. The significant fact, however, is that the cut has been applied. It now reduces the amount of economic aid to India for the fiscal year commencing July 1 next to a level below the aid granted for the current fiscal year. It was in India's very urgent interest that the next year's appropriation of aid should be maintained at the figure proposed by the President. Its importance lies from two angles. The remaining members of the Aid India Club do not appear to be as enthusiastic as they should be in the matter of enhancing their shares of allocations of aid to India. In view of her balance of payments strains, America expects the other members to contribute an equal amount of aid with her. This would mean that the cut would reduce the quantum of the aid which the European members of the Club would be urged to grant. Already, the commitments made by the Club on aid to India for the first two years of the current Plan are short of our anticipated volume of aid from the Club by $250 million.

The cut voted by the Senate Committee represents one stage in the American constitutional process of voting funds for the Administration. The appropriations will have to be considered by the Foreign Affairs Committee of the House of Representatives and then separately by the Senate and the House. Experience tends to show that the axe applied by the Committee of either House does not represent the effective voice of the House or the Senate, but it amounts to a severe expression of views held by some of the leading members on the committees. An assurance has been conveyed on behalf of the President to the Finance Minister that the President will ensure the restoration of the amount cut. This is heartening news.

The reasons which influenced the extreme attitude taken by Senator Symington and those of his school of thought are likely to cause considerable irritation in this country. Briefly, they relate to India's action in Goa and her 'failure' to settle with Pakistan the dispute over Kashmir. But, in addition, there is a third novel cause. India was charged with failure to reduce her military expenditure. This was presumably on the assumption that India maintains a heavy defence budget as a measure directed against Pakistan. But it totally ignores the fact that the President of Pakistan has time and again held out threats of using against India the latest armament supplied to her by America in pursuance of the SEATO and CENTO obligations. The threats cannot be treated lightly. India is constrained to take appropriate defensive action to arm herself. But more important than that, India's hands have been forced by the belligerent attitude adopted by China in the North. To cut the aid, particularly in the context of the Chinese manoeuvres, is beyond comprehension.

However, one fact ought to bear mention since it has a vital bearing on our policies of armament acquisition. The Government's deal with Russia for the purchase of the MIG-supersonic jet fighters has caused genuine perturbation to President Kennedy. This has created a fresh difficulty in his efforts to ensure that the cut is not finally carried out. Already Ambassador Galbraith has communicated the views of the President to the Prime Minister. But it is a matter for guess what final attitude the Government will take in this deal. There is time before the purchase contract in concluded.

Business Notes

Textiles

POWERLOOM PRODUCTION

IF THERE is an uncertain item in textile statistics, it is undoubtedly that relating to the production of the powerloom sector, and one can well sympathise with the decision of Mr. M. P. Gandhi, Editor and Publisher of "The Indian Cotton Textile Industry (1961) Annual" (just published), therefore, to discontinue the publication of statistics relating to this decentralised sector. "In view of the doubts expressed regarding the veracity of official statistics relating to the production of such powerloom and handloom cloth ," he had stated, "the publication of such statistics has been discontinued." Notwithstanding this, it is needless to say, Mr. Gandhi's Textile Annual is as comprehensive and, therefore, as useful as ever.

In his preface to the publication, Mr. Gandhi has correctly portrayed the present position of the Indian cotton mill industry, and this is quite timely, inasmuch as it helps one to assess the prospects for exports of our textiles. Drawing pointed attention to the steadily rising inflated cost-base of the industry, he asks: "How can yarn and cloth produced on an unduly high cost base compete effectively in world market?" While this is an aspect that should receive the attention of our Union Minister for International Trade, the prominent place occupied by the cotton mill industry in the country's economy, to which the Editor has referred, is an aspect that should make everyone, including the Tariff Commission, realise that the continued progress and prosperity of the industry is a "vital matter of national importance."

Apropos the production of the powerloom sector, the Indian Cotton Mills' Federation (I.C.M.F.) has adroitly clinched the issue by referring to the representations being made by the powerloom sector to the Union Finance Minister in regard to his latest budget proposals, in particular the duties payable by the powerlooms. "It is evident from these representations, says

a Press Note issued by the Federation, that the powerlooms account for a very much higher production than the official figure of estimated annual production of 400 million yards or even the Federation's own estimate of 1,400 million yards. No one is unhappy that the powerlooms are making a steadily increasing contribution to our national output thus, but what everybody would like to see exploded is the much publicised myth of the relatively higher share of the handlooms in the production of the decentralised sector. The fact is that the powerlooms have been thriving at the cost of the handlooms. In other words, most of the benefit intended for the handlooms is being appropriated by the powerlooms. And, yet, it is amusing to find the powerloom interests carrying on an agitation against the recent budget proposals. Even as now proposed by the Union Finance Minister, the highest duty payable by the powerlooms (per loom per shift per month) at Rs. 50 for higher medium cloth and Rs. 151, for superfine cloth compares with as much as Rs. 141 and Rs. 425, respectively, payable by the mills. It is high time that somebody cried a halt to this injured innocence and unintended pampering of powerlooms.

Economy

NCAER'S SURVEY OF PUNJAB

THE TECHNO-ECONOMIC SURVEY OF PUNJAB conducted by the National Council of Applied Economic Research brings to light various facets of Punjab's economy. The survey envisages that by an appropriate investment programme a rapid economic development can be brought about. It is, therefore, recommended that an investment of Rs. 1,114 crores between 1961 and 1971 should be undertaken. While an investment of Rs. 290 crores on agriculture is proposed by the NCAER, Rs. 160 crores has been recommended for industrial development. The approach of the National Council is that a three-pronged attack should be launched with a view to strengthening the infra-structure; strengthening the agricultural base and expansion of the industrial sector to produce intermediate products and durable consumer goods, both for local and external markets. A case has also been made out by the Council for greater financial assistance to the State from the Centre. Of the total investment proposed, it says, the State has the responsibility to bear an outlay of about Rs. 600 crores and will be able to raise an additional Rs. 275 crores. The balance must be met by the Centre.

Although it is true that Punjab has a powerful agricultural sector, but it is conditioned by a low-value-yielding crop pattern. Consequently, though the per acre yield of most of the agricultural commodities is much higher in the Punjab, the value of output per acre is lower than the Indian average. Rice, for example, which is a high value yielding crop accounts for only four per cent of the total area cultivated in Punjab against 22 per cent for the country as a whole. It is therefore suggested by the Council that there should be a stress on high value yielding crops especially commercial crops. Hence sugarcane, cotton and oil seeds have been accorded a greater share than at present. And for industrial development it has been emphasised that there must be expansion of small-scale industries as that would solve unemployment problem to a great extent. Since there is absence of metallic minerals and coal in Punjab, the growth of large industrial plants is obviously limited.

To bring about a balance in the economy, the Council has suggested that there must be an appropriate programme for animal husbandry as well as for the development of forests and fisheries. As there is considerable quantity of cement (2,10,000 tons a year) which the State has to import, the suggestion is that additional capacity of this magnitude should be created. Fertilizers production which should receive due priority in any scheme of agricultural production has of course been given due weightage and it has been recommended that fertilizer production at Nangal be doubled. Power and transport development also receive their due share.

To put it in a nutshell the scheme proposed by the National Council of Applied Economic Research tries to bring about a harmonious balance in every aspect of the economy and if implemented can go a long way in giving a further fillip to this growing State. The Council's estimates are that if the programme recommended by it is implemented fully, the per capita income of Punjab by 1971 would increase by 40 per cent. This by no means would be a mean gain.

Soap Production

EXPANSION IN THE THIRD PLAN

EXPANSION TO the tune of 1,30,000 tons of soap has been envisaged during the Third Five-Year Plan. Production in 1960-61 was 3,70,000 tons and is proposed to be raised to 5 lakh tons in 1965-66. The new expansion that has been envisaged in the Third Plan will be undertaken both in the organised and the unorganized sector. While the organised sector would contribute about 80,000 tons of soap, the unorganised sector would contribute 50,000 tons of soap. The soap manufactured by the unorganised units is believed to be not as high in cleansing properties as those turned out by the organised units. And probably because of that very reason, a low quota has been allotted to the unorganised sector. Estimates are that the output in the unorganised sector is to the tune of 2,30,000 while some figure it at 3,30,000 tons. However, taking the former figure for official purposes of planning, the output of 2,30,000 tons would be equivalent to about 1,60,000 tons of soap of the average strength produced in the organised sector.

Production of soap in the organised and the unorganised sector at present comes to 3,70,000 tons. The soap that is manufactured in the organised sector is of four varieties like that of laundry soap, toilet soap medicated soap and other kinds of soap. During the Second Plan period, the production of these varieties of soaps by the organised factories rose from 90,000 tons in 1955 to 1,40,515 tons in 1960. The lion's share of this production is accounted for by laundry soap. The units manufacturing these kinds of soaps number 91. Nearly one-third of these organised units are in Maharashtra with West Bengal a close second with 21 units. The three States of Rajasthan, Orissa and Assam have no organised soap factories. All the remaining States have a few soap factories each. The total installed capacity of all these factories in the country is 2,55,117 tons.

The principal raw materials that go into the production of soap are vegetable oils and tallow, caustic soda, sodium silicate and perfumery. The requirements of the oils and fats to reach a production target of 5 lakh tons of soap by the end of the Third Five-Year Plan have been placed at about 2,30,000 tons. This oil content is generally secured from coconut oil, palm oil, groundnut oil, hydrogenated vegetable oil and mohwa oil. Since technical considerations demand that there should be a balance between the coconut oil and soft oils on the one hand and hard oils on the other, it is imperative that the balance be struck rightly. As coconut oil is expensive and is in great demand for edible purposes, it is considered that the use of coconut oil should be considerably reduced.

Labour

HOUSING OF INDUSTRIAL WORKERS

PAUCITY OF houses for industrial workers has often been the subject of critical comment. But whether that criticism has been countered or not it is difficult to say, because the situation does not seem to have improved to the extent that it should have been. No doubt houses are being built in the industrial areas but they

Durgapur Thermal Power Station

Prestressed Concrete Plank Roofing was adopted for the Durgapur Thermal Power Station because of its lightness thus reducing the cost of the foundation and superstructure. It also made rapid construction possible.

A conventional cast-in-situ roof was ruled out because of the unusual height between roof and floor.

The roof area covered was 50,000 sq. ft. The job was completed in about twelve months.

An additional feature is thermal insulation with foam concrete blocks.

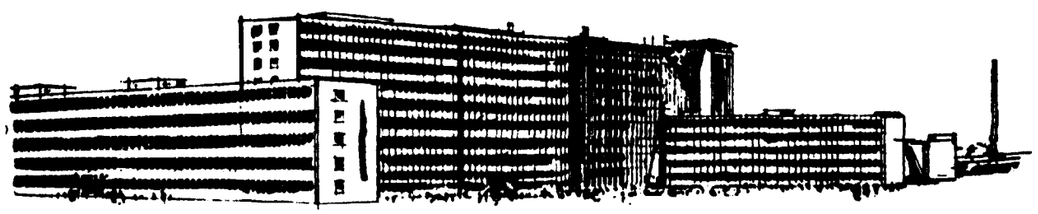
Approaching 600 Crores Rupees

With its 230,000 employees, the Siemens Organization is the largest private business enterprise in West Germany and West Berlin. Founded 115 years ago, it is active in practically all branches of electrical engineering. Its production spectrum extends from microminiature semiconductor devices to giant power stations. Over 10,000 employees are engaged in research & development work alone. Often passed down from generation to generation, the experience and knowhow of a highly qualified staff of engineers and technicians have established for the products of the Siemens Organization a worldwide reputation for superior reliability.

The turnover of the Siemens Organization has risen from 120 Crores Rs. in 1951 to 480 Crores Rs. in 1960 and 580 Crores Rs. in 1961. Exports rose by about 12% above last year's figure to over 120 Crores Rs.



The Siemens Organization has agencies and representatives in 79 countries in all parts of the world. At all branches the services of a staff of technical consultants are always available to customers.

In India, the Siemens Organization is represented by Siemens Engineering & Manufacturing Company of India Ltd.

Summarized Consolidated Balance Sheet of the Siemens Organization as of September 30, 1961 in DM million (DM 1.— = Rs. 1.20)

Assets	30. 9. 61	30. 9. 60
Fixed Assets	874	679
Investments	133	116
Total Fixed Assets and Investments	1,007	795
Inventories (including Communications Equipment Leased to Customers)	1,393	1,052
Accounts Receivable from Customers	807	720
Other Receivables	406	337
Cash and Other Liquid Funds and Marketable Securities	451	504

	4,064	3,408

The Communications Research Laboratory of the Siemens & Halske AG in München has a staff of over 3,000; in Erlangen the Siemens Schuckertwerke AG is at present building a large new research center

Some of the companies belonging to the Siemens Organization are the following:

Siemens & Halske AG
(All branches of communications technology, including data processing and telemetry, electrical signaling)

Siemens-Schuckertwerke AG
(All branches of power engineering)

Siemens-Electrogeräte AG
(Electrical household appliances, radio and tv sets)

Siemens-Reiniger-Werke AG
(Medical electronic equipment)

Deutsche Grammophon GmbH
(Phonographs and records)

Siemens-Planiawerke AG
(Graphite electrodes, carbon products for electrothermal and chemical industries)

Vacuumschmelze AG
(Production and processing of special alloys)

Siemens-Bauunion GmbH
(Civil engineering)

Constructa-Werke GmbH
(Full-automatic washing machines)

are not being built at the pace that could be called really satisfactory. The latest news is that 12 projects for construction of 1224 houses for industrial workers have been sanctioned under the subsidised industrial housing scheme by Andhra Pradesh, Assam, Bihar, Gujarat, Madras, Mysore, Orissa, Uttar Pradesh and West Bengal.

There are various schemes under which these houses are built. Under the subsidised industrial housing scheme, for instance, which was formulated in 1952 for providing housing to industrial workers employed in factories and mines, mainly in the private sector, the Central Government provides to State Governments, State Housing Boards and the Municipal bodies 50 per cent of the cost as loan and 50 per cent as subsidy. Industrial employers and co-operative societies of industrial workers are given financial assistance to the extent of 75 and 90 per cent respectively, the extent of such subsidy in both cases being 25 per cent. To enable industrial workers to provide the remaining 10 per cent of cost, they have been allowed to draw non-refundable loans from their provident fund accounts. By the end of the Second Plan, the construction of about 1,40,000 tenements costing Rs. 45 crores had been approved. About one lakh tenements have been completed and the rest were under different stages of construction.

A fact to note is that the workers cannot pay a high charge for these houses with the result that in some areas the tenements which have been constructed have not been occupied by industrial workers. The question of, therefore, bringing down the rent so that it should be within paying capacity of the workers needs further study Alongwith it there is also the need that arrangements be made to provide free transport for taking workers to their places of work. All said and done, it is apparent that much progress cannot be achieved without the employers generally accepting the housing of a substantial portion of workers as an essential obligation. To the extent the employers are unable to construct directly, it should be for the Government or the Housing Boards to take up construction. These and other suggestions must be considered jointly in consultation with the representatives of employers and workers because in that only lies the solution to the problem.

Sugar

EXPORTS AT A LOSS

THE UNION GOVERNMENT'S decision, as announced by the Deputy Minister of Ministry of Food and Agriculture in the Lok Sabha recently, to release a substantial quantity of sugar shortly is a step towards bringing down its rising market prices. The sugar industry has been caught up in the vicious circle arising out of the production outrunning consumption and the mounting costs leading to flagging exports at a loss of Rs. 8.87 per maund to the U.S.A. and Rs. 15.80 per maund to other markets. The Government sought to regulate the supply of sugar so that the prices might not come down steeply The step was intended to save the grower from being hard-hit by the uneconomic price.

Lately, the problem of disposing of about a crore maunds of sugarcane standing in the Bihar fields has arisen, thus worsening the situation further by way of reducing incentives for growers. A formula is yet to be evolved which would be acceptable to the grower and the millowner alike. The Bihar farmers who had already suffered losses on account of their crops lying in the fields cannot by any reason be asked to suffer more. On the other hand, the millowners have expressed their inability to meet further losses as they are nursing huge sugar stocks. The Bihar Government, in the meantime, is understood to have advised farmers to put less acreage under cane this year. The problem of this industry is such that it hurts both ways. The heart of the problem lies in the rising cost of production and all steps must, therefore, be taken towards reducing it. The closing stocks of sugar with factories being 23.53 lakh tons in April, 1962, it behoves that the consumption of sugar would have to be promoted considerably.

New Issues

ASSOCIATED BEARING

TWO NEW issues are expected in the capital market in the near future.

The much-awaited public issue of Associated Bearing Company Limited is to be floated towards the end of the current month. The authorised capital worth Rs. 4 crores is to be issued in the first instance. The foreign collaborators, SKF Gothenburg and/or Skefee Ball Bearing Co., Ltd. and/or their associates, would be subscribing 60 per cent of the issued capital. The remaining 40 per cent is to be raised in India. Of this, half will be offered to the public for subscription in the form of 80,000 equity shares of Rs. 100 each. The remaining half is envisaged to be subscribed by the shareholders of the Investment Corporation of India, who will be offered shares in the new company on the basis of roughly 10 per cent of their interest in the Investment Corporation, subject to adjustments of fractions and to a ceiling of 100 shares per shareholder.

The company will manufacture ball and taper roller bearings, the latter for the first time in India, besides SKF pendulum weighing arms and dock roller bearing units for drafting system of speed frames, drawing frames and ring spinning frames for the textile industry.

INDEQUIP ENGINEERING

THE SECOND company to approach the public in the near future for subscriptions to its capital is an engineering concern, Indequip Engineering Limited, which has been recently formed to undertake the manufacture of various types of machinery, including continuous bleaching range, humidification plants and spare parts for Butterworth machinery. The company's factory is to be located at Naroda, near Ahmedabad.

The authorised capital of the company is Rs. 100 lakhs, all in equity shares of Rs. 100 each. Capital worth Rs. 35 lakhs is proposed to be issued in the first instance. Of this, the directors and their friends have agreed to take up shares worth Rs. 15 lakhs. The balance of the issue, shares worth Rs. 20 lakhs, will be offered for public subscription.

The total capital outlay on the project is estimated to be about Rs. 53 lakhs. Since the share capital will be making available only Rs. 35 lakhs, the remaining sum of Rs. 18 lakhs is proposed to be secured through a Rs. 10 lakh loan from the Government and bank borrowings to the tune of Rs. 8 lakhs.

An agreement has been entered into by the company with H. W. Butterworth and Sons Company of the U.S.A., for the manufacture of continuous bleaching range and spare parts of Butterworth machinery. Technical collaboration for the manufacture of humidification plants is being arranged with Defensor AG of Switzerland. Manufacture of rotor frames is envisaged to be undertaken in collaboration with Hobourn-Eaton Manufacturing Company of the U.K.

The company has also approached the Government for the grant of a licence for the manufacture of sizing machines (multi-cylinder slashers) to be undertaken in technical collaboration with West Point Foundry and Machine Co. Inc. of the United States.

FROM THE CAPITAL'S CORRIDORS

DEMAND FOR FERRO-ALLOYS

Ferro-Manganese: It has been assumed that the requirement of ferro-manganese for each million ton of steel ingots produced is nearly 10,000 tons. Taking into account the phasing of steel production envisaged for the Third Five-Year Plan, the domestic demand has been estimated to move from 58,000 tons in 1961-62 to 85,000 tons by 1965-66. The table alongside gives the details of estimated requirements of ferro-manganese, as against the steel output. It has been estimated that in addition to 85,000 tons, another quantity of nearly 15,000 tons of ferro-manganese would be necessary for foundries and other miscellaneous consumers. Apart from this domestic demand, ferro-manganese is a crucial item of export and it has been suggested that higher grades of ferro-manganese produced in the country should be reserved for export.

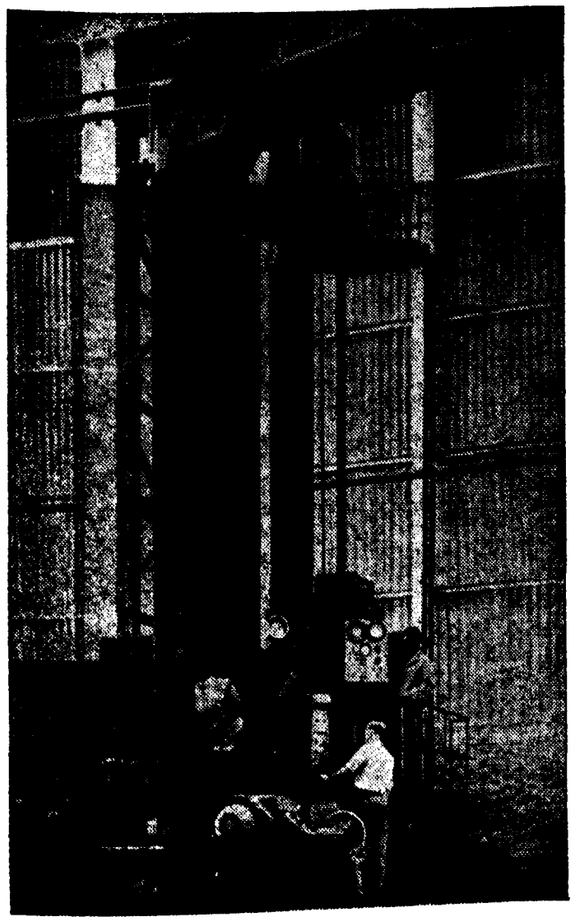
Year	Estimated Production of steel ingots (million tons)	Estimated requirements of ferro-manganese ('000 tons)
1961-62 ..	5.25	58
1962-63 ..	6.25	63
1963-64 ..	7.25	73
1964-65 ..	7.75	78
1965-66 ..	8.50	85

The following three schemes approved in the later years of the Second Plan period were in varying stages of implementation by April 1, 1961 and when completed, the total installed capacity for ferro-manganese industry would reach a figure of 2,62,200 tons:

	Location	Annual Capacity	Remarks
Electro-Metallurgical Works (Expansion).	Dandeli	44,400	Expected to be completed by 1962-63.
Sandur Manganese and Iron Ores (P) Ltd.	Hospet	30,000 to 36,000	Expected to be completed by 1963-64.
B. P. Knemka (P) Ltd. (New Scheme)	Kanhan	24,000	The Plant is expected to be completed during the Third Plan period.
	Total.....	**98,400**	
	or	**104,400**	

In relation to the total requirements for ferro-manganese as estimated, the capacity that would be installed on completion of the schemes outlined above will be adequate for ensuring domestic production of the same order, namely 200,000 tons by 1965-66. This gives no scope for further expansion of capacity under the Third Plan.

During First and Second Plan period, Geological Survey of India carried out detailed mapping of the Chindwara-Balaghat-Bhandara-Nagpur belt of Madhya Pradesh and Maharashtra, Singhbhum-Keonjhar Bonal belt of Bihar and Orissa; Jabua deposits of Madhya Pradesh, Panch Mahal deposits of Gujarat; Banswara-Udaipur deposits of Rajasthan and Visakhapatnam-Srikakulam belt of Andhra Pradesh. The probable reserves of manganese ore excluding the manganiferous rocks of India are estimated at 180 million tons out of which 48 million tons are of high grade with manganese content over 45 per cent. Further exploration has been planned by the Geological Survey of India during the Third Plan in selected areas in Panch Mahals, Gujarat, Madhya Pradesh belt, Koraput-Kalahandi and Sundergarh belt, Orissa, Banswara-Udaipur belt of Rajasthan and Chitaldrug, Tumkum, Bellary and Sandur deposits of Mysore.



For achieving a capacity of 2,62,200 tons by 1965-66 by the electro-thermal process through the implementation of the schemes already licensed, plant and machinery worth about Rs. 2 crores would have to be imported. The overall investment requirements are placed at Rs. 2.5 crores during the Third Plan period. Since all the plants already in operation have been established during 1956-61, no investment on replacements are presumed to be required during the Third Plan period. The maintenance expenditure of foreign exchange for this industry, however, would relate to spares and electrode paste. The requirements of electrode paste are assessed at 0.03 ton of ferro-manganese.

The production of ferro-manganese in closed electric furnace will give rise to the by-product gases rich in carbon monoxide. By developing industrial outlets for this gas, the overall costs of ferro-manganese can be brought down to some extent. It is probable that these gases might be used for thermal beneficiation of the manganese ores in the Third Plan period.

Ferro-Silicon: The requirements of ferro-silicon were estimated at 4,500 tons per annum by the end of the First Plan. Consequent on the expansion of the production of steel ingots to six million tons visualised under the Second Plan and taking into account other demands from the foundry industry and in respect of electrical steel ingots manufactured by the rerollers, it was expected that the demand would go up to about 20,000 tons by 1960-61. To arrange the additional production within the country, the manufacture of ferro-silicon at Bhadravati was to be expanded from the current installed capacity of 5,000 to 20,000 tons by the Mysore Iron and Steel Works. Another scheme was for the manufacture of 5,000 tons of ferro-silicon per year under the composite scheme of Messrs. Serajuddin & Co. envisaging production of ferro-chrome and ferro-silicon in the first stage of implementation and at a suitable location in the Bhadrak district of Orissa. Import licences for the machinery of these two schemes have been issued and the additional capacity is expected to be available in the second year of the Third Plan, if not earlier. An annual installed capacity of 25,000 tons of ferro-silicon would thus be available from the second year of the Third Plan.

The projection of requirements for the Third Plan will have to take due note of the expansion programmes for steel, alloy and tool steels, and stainless steel, electrical grade silicon steel, steel castings and electric furnaces billets based on scrap. The overall demand by 1965-66 for ferro-silicon is not expected to exceed about 40,000 tons. By planning for this capacity the consumption requirements of 1965-66 would be adequately met.

In addition to Mysore Iron and Steel Works and Messrs. Sarajuddin & Co., the schemes of Mr. B. D.

6" spindle ram-type horizontal mill and boring machine

No. 14/36 combination turret lathe installed in the AVB light machine shop

The
REAL POWER
of AVB...

Vast Technical Resources...
Modern Workshops...

Immensely rich in experience and technical knowledge, with modern workshops equipped with some of the world's most up-to-date machine tools... here is the *real power* of AVB. The essential combination to generate *real industrial power.*

This real power and potential of AVB will give added impetus to the continued and large-scale expansion of industry... by providing the finest facilities for the manufacture of high pressure steam-raising plant and pressure vessels and heavy machinery for the cement-making and mining industries.

Among the modern machine tools in the AVB workshops are

1. **6" ram-type horizontal mill and boring machine:** This machine has a vertical movement of 14' 6" and a horizontal movement of 20' and is the largest of its kind in India
2. **Numerous capstan and turret lathes:** Upto 36" diameter swing and central lathes upto 42" diameter.
3. **28/60 vertical model hydrotel milling machine:** With 360° profile milling equipment.

CAL 9 62 SL

Panda for establishing a plant with a capacity of 7,000 tons per annum has been approved by the Government. Foreign exchange towards the machinery requirements of these schemes has been cleared and the additional capacity is expected to be reached in the latter half of the Third Plan period. An annual installed capacity of 32,000 tons of ferro-silicon would thus be available during the Third Plan period. Thus there is scope for setting up an additional capacity of about 8,000 tons per annum for the manufacture of ferro-silicon.

By the end of the Third Five-Year Plan, the output of ferro-silicon would be of the order of 32,000 tons; 20,000 tons from Mysore Iron and Steel Limited, 7,000 tons from B. D. Panda and 5,000 tons from Sirajuddin & Co. The Government has agreed to license the schemes of Tatas and that of Pannalal Patel for 10,000 tons and 7,000 tons of ferro-silicon per annum respectively. It is gathered that a capacity of 5,000 tons may be allocated to Ferro-Alloy Corporation if any other project did not materialise. But the overall capacity is not likely to exceed 50,000 tons per annum.

Ferro-Chrome: At present the production of ferro-chrome in the country is not properly organised because there is no appreciable internal demand. Imports to the extent of nearly 200 tons were executed. Two companies, Ferro-Alloy Corporation, Tumsar (Bombay) and Sirajuddin & Co., Bhadrak (Orissa) were licensed for 6,000 tons and 10,000 tons respectively but no capacity has yet been established. Although requirements of ferro-chrome by 1966 would go up to 9,600 tons per annum, the Third Plan target has been placed at 35,000 tons. It is gathered that if the two producers did not execute their licenced capacity, Tatas and Pannalal Patel might be sanctioned the output capacity.

Ferro-Molybdenum: A Third Plan demand for ferro-molybdenum is placed at 1,000 tons per annum and that for ferro-Vanadium at 750 tons per annum. It is gathered that the only applicant, Pannalal Patel, is likely to be approved for the manufacture.

THE BOARD OF TRADE

The Government of India have decided to constitute a Board of Trade to review all aspects of trade and commerce and to advise and make recommendations to Government from time to time. Particular objectives of the Board include the expansion of production, internal trade and exports, including diversification of exports; rationalisation of imports and forging suitable imports-exports relationships; maintenance and improvement of quality of production, standards, standardisation of inspection for quality and pre-shipment inspection; export incentives; development of fair, ethical and efficient trading practices including maintenance of fair prices; price support, price regulation, organisation of stock piling and buffer stocks, display of price lists and markings including price markings; studies of individual commodities, market research and market surveys; development of State Trading in commodities particularly for external trade; expanding the functions and operations of the State Trading Corporation/ Corporations and other Agencies; promotion and development of Export Houses and Export Agencies; whole-sale and retail marketing; Co-operative marketing and Co-operative Consumer Stores; fair-price shops, etc; exhibitions, trade fairs, emporia, show rooms and trade centres in India and abroad; promotion of salesmanship and marketing techniques and training of personnel for international trade; and facilitating the movement of goods, particularly goods for export by rail, road, air etc.

The Board will consist of not more than 15 members and the composition of the Board will be (1) Minister of International Trade (Chairman). (2) Special Secretary in the Department of International Trade (Vice-Chairman). (3) President of the Federation of Indian Chambers of Commerce and Industry. (4) President of the Associated Chambers of Commerce. (4) Non-official Members not exceeding six nominated by Government representing trade, industry, economists and others. (6) Secretary, Ministry of Finance (Department of Economic Affairs). (7) Additional Secretary, Planning Commission. (8) Two senior officers in the Department of International Trade designated for this purpose as full-time directors dealing with production, incentives, quality control and movement. (Members). (9) A Joint Secretary in the Department of International Trade. (Member-Secretary).

The Board will have power to co-opt members, not exceeding five. Secretaries to Government in other Ministries will be requested to attend meetings of the Board whenever necessary. The Board may also specially invite such other persons as it may consider necessary and in particular from among the following: Presidents/Chairmen of the Indian Cotton Mills Federation; The Indian Jute Mills Association; The All-India Manufacturers Organisation; The State Trading Corporation; The Tea Board; The Forward Markets Commission; The Director-General of Shipping; The Chairman of the Railway Board; and Director of Indian Standards Institution. The Board is to be appointed for a term of two years. The Board will lay down its own rules of procedure. The Board may constitute a Standing Committee and other Committees from its Members, with co-opted members not exceeing one-third of its strength to transact such business as the Board may decide. The Headquarters of the Board will be in Delhi, but the Board may meet at any other place in India. It is expected that the Board will meet once every month.

PARLIAMENTARY SECRETARIES APPOINTED

The Prime Minister has appointed the following Members of Parliament as Parliamentary Secretaries attached to the Ministries shown against each name:

1. Shri Annasaheb Shinde	—	Ministry of Food and Agriculture.
2. Shri D. Ering	—	Ministry of External Affairs.
3. Shri S. C. Jamir	—	Ministry of External Affairs.
4. Shri S. Ahmad Mehdi	—	Ministry of Irrigation & Power.
5. Shri Dodda Thimmaiah	—	Ministry of Mines & Fuel.
6. Shri M. R. Krishna	—	Ministry of Education.
7. Shri Ratan Lal Kishorilal Malviya	—	Ministry of Labour & Employment.

GOA CURRENCY

Escudo currency now legally circulating in Goa, Daman and Diu will cease to be legal tender with effect from May 15, 1962. All monetary transactions in these territories on and after this date will be conducted only in Indian currency. In order to enable such of the members of the public as may still have escudo currency in their possession, to exchange their holdings into Indian currency, conversion facilities will be provided. For a period of one month from May 15, 1962, in the case of the escudo notes asd three months in the case of escudo coins. Mr. T. Sivasankar I.C.S. is likely to be appointed the Governor of Goa.

IRON ORE EXPORT BY S.T.C.

The State Trading Corporation will export 7.5 lakh tons of iron ore to Czechoslovakia and Hungary during 1962. The entire quantity of 6.5 lakh tons will be exported to Messrs. Metalimex of Czechoslovakia during 1962. The ore to be supplied will be homogeneous 65-68 grade of ore. The price accordingly has been proportionately higher as compared with the Japanese prices. The earlier contract with Messrs. Metalimex of Czechoslovakia was nearing completion and a contract in regard to the future supplies had to be negotiated and

finalised. Czechoslovakia is the second largest buyer of Indian iron ore next to Japan.

GERMAN TEAM FOR MANDI

A Five-year agreement was signed between India and West Germany under which the latter will give technical assistance to India for the development of agriculture in Mandi District on the lines of the Indian Government's Intensive Agricultural District Programme. A German Agricultural Assistance Team of 8 Advisers and 7 Technicians will be assigned to Mandi. An agro-technical development centre shall be established in the district with training facilities, demonstration and trial areas and a rural technical training and repair shop. There will be a soil-testing laboratory, a stationary and a mobile plant-protection station and model installations for animal husbandry, dairy, fruit processing and water management. Training of selected Indian specialists in the Federal Republic of Germany is also intended for the purpose of the joint project. "Intensive mixed farming" will be the general line on which development of agriculture shall be followed up by the joint project in Mandi District. German financial contribution for this training and demonstration centre is placed at Rs. 80 lakhs over a period of five years.

FOREIGN COLLABORATIONS

Out of the 402 technical and financial foreign collaboration agreements approved by the Government of India in 1961, majority capital participation has been agreed to in 14 cases. The industries for the manufacture of which majority capital participation has been allowed are gaskets, coal washeries, tyre tube valves, capacitors, industrial refrigeration machinery, ball bearing, paper machinery, contraceptives, automobile electrical equipment, single spindle automatic lathes, calcium Benoyl PAS, Calcium PAS, Sodium PAS, Dithane Fungicides, and Plasticisers, and Automobile wheels.

In addition, the Government of India have received two proposals for majority foreign capital. (1) Proposal from Messrs. Fibre Glass Pilkington Ltd., Bombay for manufacture of Glass Wool, Glass Textiles and Staple Tissues in collaboration with Messrs. Owens-Corning Fiberglass Corporation, Ohio, U.S.A. and Messrs. Fiberglass Ltd., U.K. with a little over 51 per cent foreign capital participation; (2) Proposal from Messrs. Prentice Hall Inc., U.S.A., for establishing an organisation for publishing scientific, technical and other standard books with 51 per cent foreign capital participation. Both the proposals are under consideration.

IN BRIEF....

The Government of India have appointed Messrs. M.N. Dastur and Co., Consulting Engineers, Calcutta, as consultants for the planning and development of the iron and steel industry, including ferro-alloy industry. Under the agreement, to be valid for a period of six years, the consultants will give the Government the benefit of their experience and advice on matters relating to co-ordination of the development of the iron and steel industry, with a view to securing economical installation, costs and high efficiency of production.

•

A high-powered Commission will be appointed by the Union Labour Ministry to go into the question of labour management relation and law and order situation in coal mines if the conditions do not improve in six months from now. This decision was announced by Mr. Gulzari Lal Nanda, Union Minister for Planning, Labour and Employment, at a tripartite meeting on coal mining in New Delhi.

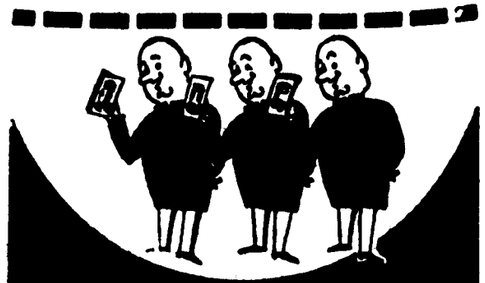
•

The Government of India and three international organisations—UNICEF, WHO and FAO—have entered into an agreement for a 3-year expanded nutrition programme in Uttar Pradesh, which aims at increasing the production of nutritionally valuable foods such as fruit, vegetables, milk, eggs and fish, and includes free feeding programmes for school children and nursing or pregnant mothers. The operation area, in the eastern Uttar Pradesh districts of Basti and Gorakhpur will extend over 800 villages and cover a total population of 600,000.

•

The Government is considering legislative measures to restrict cash-crop cultivation in the country. Mr. S. K. Patil pointed out recently that more and more farmers had been taking to cash crops as these crops yielded better returns. Mr. Patil agreed that any further increase in cash-crop cultivation would be at the expense of food crops and should be checked. The Government of India was therefore considering some kind of legislation to regulate the pattern of agricultural production in the country. For this purpose, the country's requirements in respect of various cash crops and food crops had first to be determined, it was difficult and complex task, and would take some time, he added.

•



Five Units licensed to manufacture thermal reclaimed rubber are:

Name of the Units	Annual licensed capacity
1. Messrs. Rubber Reclaiming Co. of India Ltd., Ballabgarh (Punjab)	1,920 tons
2. Messrs. Indian Rubber Regenerating Co., Bombay	4,800 tons
3. Messrs. Ellargi Products Tiruppur, near Coimbatore, Madras	600 tons
4. Messrs. Chinubhai Manibhai, Ahmedabad	5,400 tons
5. Messrs. Jatia Cotton Mills, Calcutta ..	2,400 tons

None of them have yet gone into production.

•

The project for the manufacture of Phosphorus in the Public Sector has been deferred for the time being due to the non-availability of adequate power to accomodate this project in the Third Five-Year Plan, and because the economic aspects of the project do not appear to be quite attractive for the present.

COMPANY AFFAIRS

PUNJAB NATIONAL BANK

The Punjab National Bank Ltd. has made considerable progress during the year ended 31st December, 1961. Deposits, gross income, net profit and liquidity ratio increased while borrowings declined substantially.

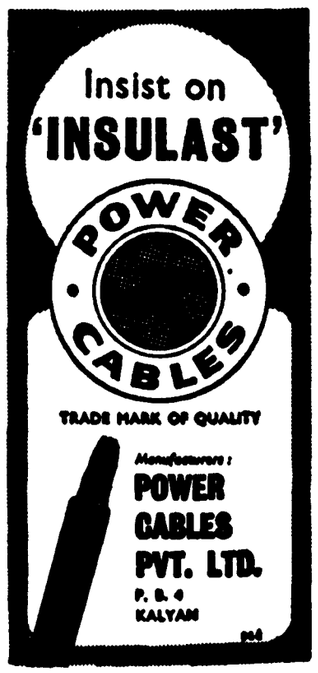
The increase in the balance-sheet totals from Rs. 191.52 crores at the end of 1960 to Rs. 205.12 crores at the end of 1961 reflects an all-round growth of the institution. The gross earnings of the Bank also increased considerably from Rs. 8.71 crores to Rs. 9.16 crores. There was a distinct improvement in profits. Profits after tax increased sharply by 82 per cent from Rs. 65.04 lakhs to Rs. 118.40 lakhs. Out of the profits of Rs. 122.63 lakhs including Rs. 4.23 lakhs brought-forward (after making necessary provision for contingencies and contributing Rs. 12.28 lakhs to Employees' Gratuity Fund Trust) a sum of Rs. 12.50 lakhs has already been utilised for the payment of ad-interim dividend at Re. 1 per share subject to tax, leaving a balance of Rs. 110.13 lakhs for appropriation. Transfer to Reserve Fund has been stepped up substantially from only Rs. 11 lakhs in 1960 to Rs. 45 lakhs in 1961 making a total of Rs. 210.94 lakhs at the end of the year which is more than the paid-up capital in spite of an increase of Rs. 75 lakhs in capital during the year. Provision for bonus to staff has also been increased substantially from Rs. 27 lakhs in 1960 to Rs. 37.50 lakhs in 1961.

In September, 1961 the ordinary issued capital of the Bank was increased from Rs. 1.25 crores to Rs. 2 crores by a further issue of 7,50,000 ordinary shares of Rs. 10 each at a premium of Re. 1 per share. The Directors have recommended a final dividend of Re. 1 per share subject to tax on old shares as well as pro-rata dividend on new shares, making a total of 20 per cent subject to tax on increased capital, same as last year. This will absorb Rs. 16.25 lakhs. A sum of Rs. 1 lakh has been provided for charity, leaving a balance of Rs. 10,38 lakhs to be carried forward to the next year's accounts against Rs. 4.23 lakhs brought forward.

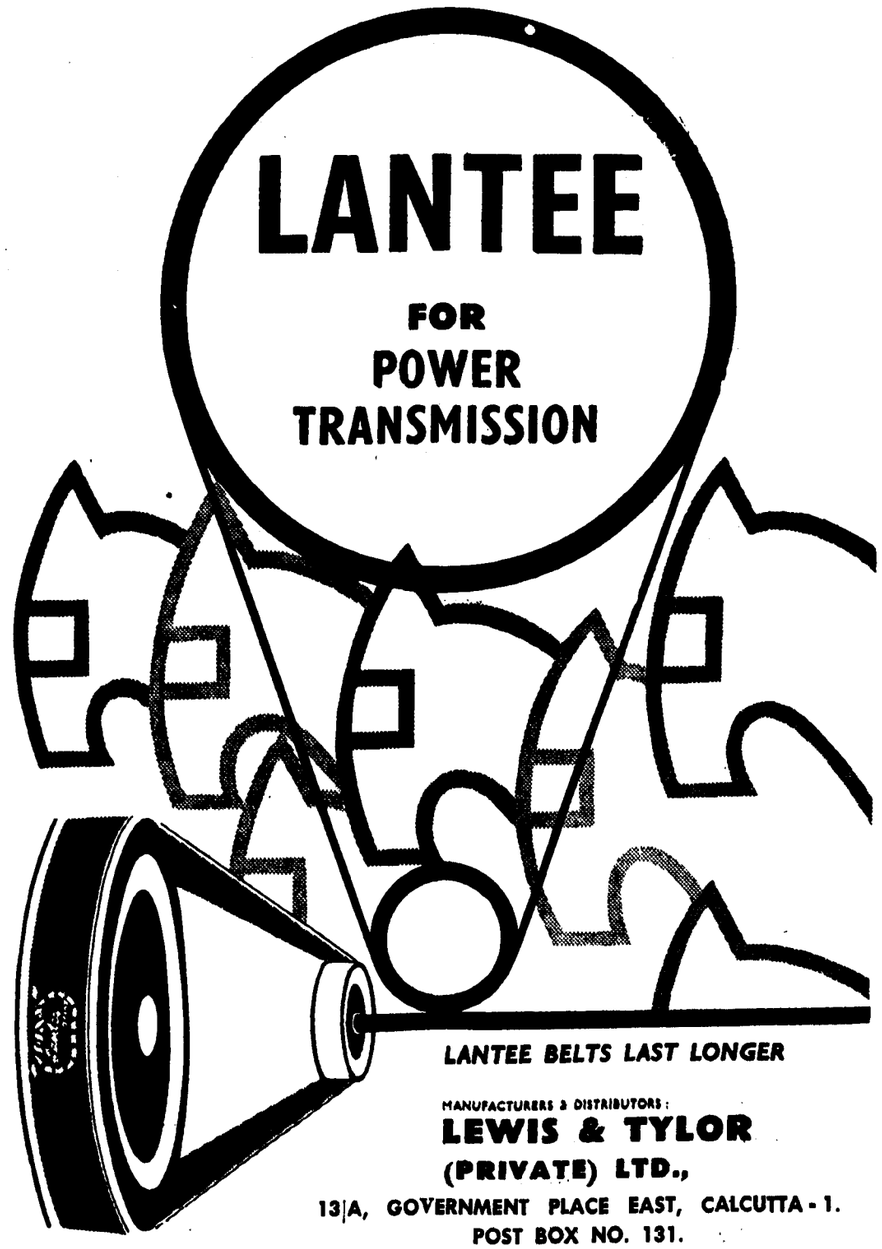
Total deposits of the bank increased considerably by Rs. 11.20 crores and at the end of the year stood at Rs. 150.68 crores. While borrowings were reduced sharply from Rs. 4.74 crores at the end of 1960 to only Rs. 33 lakhs at the end of 1961, cash balances at Rs. 23.69 crores at the end of 1961 were almost double of 1960, improving liquidity position. The Bank has now 429 offices.

BANK OF RAJASTHAN

The Bank of Rajasthan Limited, established in 1943, happens to be the first joint stock bank of Rajasthan and during these years it has developed into a big financial organisation and has as many as 39 branches. The Chairman of the Bank at the annual general meeting recently pointed out that the mobile branch of the Bank started in 1960 was doing well and this is perhaps the first successful experiment of its kind in the country. It may be pointed out that when the bank was established there were only 5 branches of the Indian commercial banks in four cities of the Rajasthan State and now this bank alone had 34 branches within the State by December 31, 1961. In a way the bank has filled an important gap.



The deposits of the bank by the end of the year were around Rs. 6.24 crores which show a rise of nearly 16 per cent over the previous year. Advances were around Rs. 2.6 crores. The ratio of the liquid assets to total liabilities, which is considered the liquidity of the bank, is about 63 per cent which is very high as compared to the Indian scheduled banks ratio of 49 per cent. Net profit of the bank for the year was Rs. 3.59 lakhs. A sum of Rs. 52,336 was transferred to the General Reserve Fund, Rs. 87,000 towards provision for income tax and Rs. 49,345 towards bonus to staff. The Directors have recommended the payment of a dividend at the rate of 10 per cent which will absorb Rs. 92,410.



ASPINWALL & COMPANY

The trading profits of Aspinwall & Company Limited for the year to December 31, 1961, after providing for depreciation and income-tax amounted to Rs. 3.49 lakhs as compared to Rs. 3.21 lakhs during the previous year. After deduction of the preference dividend at the rate of 6.66 per cent and after the transfer to Development Rebate Reserve of a sum of Rs. 7,746, the Directors propose the payment of a dividend at the rate of 9 per cent on ordinary shares of Rs. 10 each. This will absorb Rs. 3.23 lakhs. A sum of Rs. 1.87 lakhs included in the capital reserve in the previous year was transferred to general reserve. There was towards the end of the year a sum of Rs. 2.37 lakhs for dividend equalisation reserve.

STANDARD ENGINEERING

Consent was received recently by New Standard Engineering Company Limited from the Controller of Capital Issues, for issue of 25,000 Equity Shares of Rs. 100 each for cash at a premium of Rs. 20 per share. The consent order also stipulates that the premium shall be collected in full with the first instalment and the shares shall be called up in full within the period of validity of the consent. The Company had applied for issue of rights at part in the proportion of one equity share for two equity shares held in connection with its expansion programme and establishment of a large modern foundry with a capacity of 15,000 tons per annum on its recently acquired site at Goregaon.

OIL'S LIVING ROOM

The hiding places of crude oil are certain types of rock buried deep in the earth. The oil occurs in the tiny spaces between grains of sand in sandstone rocks or little cracks in limestone. Often these spaces account for about one-fifth of the total volume of the solid-looking rock. (You can check this for yourself by filling a glass with dry sand and then seeing how much water can be poured in from another glass before it overflows).

Since the oil is dispersed in these rock-spaces, the "pool" of oil you sometimes hear mentioned is nothing like a lake or river. And however it may have collected in the first place it is not moving at all now

The explorer looks for places where oil might have collected in an underground trap of rocks. Different methods of exploration are used, and all are based on knowledge of the way oil occurred, migrated and accumulated in the earth millions of years ago.

Public Sector Steel

THE debate on the demands of the Ministry of Steel and Heavy Industries for grants was remarkably lively and refreshing for the very obvious reason that the members of the popular House were unsparing in their criticism of the major failures of the public sector of the steel industry. These failures were to be reckoned in terms of physical performance as well as organizational capacity and efficiency. And on both the counts the debits were heavy. But what made the debate particularly refreshing and took away the sting from the criticism was the frankness with which Mr. C. Subramaniam admitted most of the charges against his Ministry and indicated the main directions in which he proposed to infuse vigour and dynamism in the working of the State plants. If the loud thinking, which he has done on their revitalisation during the brief span since he took over this portfolio, is translated into executive action, the steel industry will acquire the tempo of acceleration it has lost. The public sector of the steel industry will now be on trial, not on probation, since the question of an alternative to it does not arise. The pace of growth in this basic industry will be determined primarily by the behaviour of the State-owned sector. It faces a challenge which may produce far-reaching repercussions practically on the entire economy.

What has caused not a little concern is the worsening disequilibrium between the demand for steel, under the continuously rising pressure of the expansion programmes, and the domestic output, which at one time was apprehended to have been planned on an ambitious scale. That this disequilibrium should persist in spite of the heavy investment outlays (inflated by revised estimates of costs) on the three State-owned plants is a sad commentary on the capacity of the State for implementing key plans. It is not a matter of opinion, but of harsh facts on record, that the shortfall in production below the target has occurred on a serious scale. But the real bottleneck threatens to emerge as the expansion programmes of steel-consuming projects get under way during the later part of the Third Plan period. The programmes have been approved on the assumption that the installed capacity of 10 million tons for the steel industry at the end of the current plan will satisfy their requirements and their fate will not hang on the vagaries of foreign exchange for procurement from overseas. That assumption cannot now hold good and the Minister for Steel has made the candid but depressing admission that the economy must wait for another two years before the target could be attained.

This central failure of the public sector of the Steel industry (since all expansion now is a function and responsibility of this sector) provoked a searching post-mortem on the shortcomings in the performance of the State plants. Bhilai, of course, has acquitted itself of its charge and the consensus of technical as well as non-technical opinion is to give it a certificate of reassuring progress according to schedule. Durgapur certainly could have done better, nevertheless, it is now happily free from stagnation and it has stabilised confidence by the gradual rise in its output as well as expansion programme. Rourkela has invited the brunt of the criticism to an extent that Mr. Subramaniam expounded its problems and difficulties as those of a "sick child". In retrospect, it appears ironical that Rourkela, based on German collaboration, which was the first in the public sector and one which broke the stiff barriers against the entry of the State in the steel industry, should have suffered such serious loss of vitality. Lack of an imaginative labour policy, but more specifically a pathetic failure in adopting a human approach in personnel relations, is responsible for the prevailing mood of frustration and indifference on the part of the working force that cannot be missed. On the more important mechanical side, technical defects have assumed large dimensions, in the past year the recurrence of breakdowns has been at the average rate of 2 per month and co-ordination is woefully absent.

Rourkela's weaknesses have forced an initial enquiry into the organizational set-up not so much at the plant level as at the higher level of the Hindustan Steel Corporation. The Germans have tendered their report just recently and the Minister strongly hopes that it will show the way for the eradication of the persistent handicaps and functional disabilities. What precious little has percolated from this report also confirms the state of virtual helplessness which has seized the Hindustan Steel. It has lost the capacity to function for direction from the top in relation to the plants at the base and by reason of its evasive attitude to take responsibility, caused probably by a presumption of close control resting in the hands of the Ministry, it has reduced itself to an intermediate, bureaucratic medium of communication. Its initiative and courage to make decisions are rapidly fading out. To stop this rot, Mr. Subramaniam has promised a radical rehaul in responsibility by means of delegation of authority at the plant level. Rational freedom to take the risks of *bona fide* mistakes and a large share of responsibility for technical talent (which brings youth in the picture) is his prescription for the present malady.

It was inevitable that Bokaro should get its appropriate share of attention. American collaboration has come forward for participation in this enterprise, but twelve valuable months have been lost already. From insistence on private sector set-up to participation in co-operation with the State has been a vital, though time-consuming, change in the American attitude. Where a large stake is involved (not merely in terms of invest-

ment but in terms of operational facilities as disclosed by Rourkela), an independent techno-economic survey of the project by the Americans is in no sense exceptionable. This is conceded by the Government. It is then questionable whether the Minister for Steel observed the limit of diplomatic propriety in making the heroic declaration that we shall have a steel plant at Bokaro with or without American aid, when the prospect of that aid is promising. No aid-giver has claimed indispensability.

Mr. Subramaniam has shown a quick and intelligent grasp of the problems posed for him by the steel challenge and his diagnosis of the present ailment of the public sector of the industry is correct. He has followed it up by a prescription of remedies in very broad terms. They will need more careful study before an elaborate scheme for organisational reform is prepared. But of final importance is the relentless pursuit of the remedies to make internal autonomy for the plants a genuine success.

Resolving the Coal Crisis

MR. K. D. MALAVIYA was expected to announce a crash programme for resolving the current coal crisis in the country, but his speech in the Lok Sabha last week, in reply to the debate on the demands for grants for his Ministry, falls deplorably short of expectation. At best his statement may be considered as somewhat encouraging only as a preliminary expression of his views on the issue; it gives an indication that the coal problem in future will be dealt with in a more realistic manner than hitherto.

The current coal crisis has three aspects, but Mr. Malaviya has preferred to touch upon only two of these, namely, stepping up of output and accelerating the movement from the collieries to the consuming centres. Reference to the third dimension of the problem—reduction in the ash content of coal—figures only nominally and that too in an oblique manner. Presumably, this aspect will receive greater attention as Mr. Malaviya acquaints himself with all the intricacies of the problem.

It is heartening that, unlike his predecessor Sardar Swaran Singh, Mr. Malaviya has recognised the need for allowing an increase in coal prices in the interest of stepping up production, which, according to the contemplated revised target, is required to go up from the current level of about 59 million tons to 104 million tons by the end of 1965-66. The task is herculean indeed and it will be nothing short of a miracle if it could be achieved by just allowing a marginal increase in prices and that too in the case of high quality coals only. Linking of price increase with reduction in the ash content is a rational formula, but the industry has been clamouring for a general raising of coal prices by about Rs. 3.40 per ton. That by no means is a marginal increase over the current prices.

If the industry has to be enthused to put in its best, the increase in prices has to be reasonable and commensurate with the increased cost of raising coal, which has come about in the recent past as a sequel to various factors, not excluding labour charges. An increase to the tune of about Rs. 2.25 per ton would not raise the fuel costs of the industrial consumers to any appreciable extent, especially when they have an assured market at home for their products. For the other consumers also, slightly costlier coal will not be a great burden; they have been paying exorbitant prices for securing adequate quantities to meet their requirements during the past two years in which the coal crisis has been with us.

But more important than the increase in coal prices is meeting the industry's demands for power, explosives, spare parts and other essentials of production. How far the Minister will be able to fulfil his promise to meet these requirements adequately, in view of the precarious foreign exchange position, only time will testify. Expeditious allocations, followed by early disbursements of the World Bank loans to the private sector of the industry assumes great significance. It is to be trusted that the Ministry will bestow urgent thought on it. Incidentally, elimination of uneconomic mines should help in putting the house of the private sector in order. But this should be done, by and large, through amalgamation of the weaker units, as emphasized by Mr. Malaviya in a talk with pressmen at Calcutta, rather than by exposing them to the struggle for existence where their fate is clear. The latter course would make realisation of the target of the Third Plan more difficult. The understanding that is reported to have been reached between the Union Government and the Government of West Bengal in regard to the controversy that has raged in the recent past over the licensing of new mining leases to the National Coal Development Corporation should also augur well for the attainment of the target.

Mr. Malaviya's plans to co-ordinate the movement of coal by rail, road and water transport are attractive in appearance. A programme of moving 3.5 million tons a year by 1965-66 by inland waterways is, however, ambitious. The implications of this decision, especially the cost of moving coal by country boats, also needs a full and objective examination. Implementation of the plans to develop road transport and the capacity of the railways to move coal obviously have to be accelerated, for they are well prepared. To neglect them on the strength of a hypothetical programme of moving coal by inland transport, which must take time to materialise to the extent it is feasible, may create bottlenecks in distribution and shortages at several consuming ends.

The coal movement programme outlined by the Minister can relieve fuel shortages over the long run. He would do well to consider the proposition of importing high quality coal from the rupee payment countries, especially to meet the requirements of the export industries in South and West India. A summary dismissal of this suggestion may prove a costly mistake later. As pointed out earlier in these columns, this injection appears to be necessary and prudent if the health of the economy is to be recouped. A switch-over to furnace oil by the industries in West and South India has been sought to be facilitated by Mr. Morarji Desai, by grant of permission for its greater imports and payment of a subsidy to the railways for moving it from the ports to the consumption centres at cheap rates. Why should there be an aversion to emergency imports of high grade coal from the rupee payment countries, which would serve a similar purpose?

Guest Editorial

Common Market Gets Down to Brass Tacks

By PAUL BAREAU, Editor, "The Statist"

THE real negotiations for the admission of Great Britain to the Common Market have now begun. Until the recent visit of Mr. Edward Heath and Mr. Duncan Sandys to Brussels, generalities had held the stage. Officials had admittedly gone into some detail in studying the economic difficulties that would have to be surmounted if Britain's three reservations — the Commonwealth, British agriculture and the other members of the European Free Trade Association — were to be satisfactorily protected. But the recent meeting was the first one at which the ministers themselves grasped these nettles.

Very little progress appears to have been made. The British delegation made some specific proposals bearing in the main on the reconciliation of the Commonwealth trade links with membership of the European Economic Community. They were not well received, the exercise was sent back to the officials and the ministers will meet again at the end of May.

Ostensibly the economic issues hold the attention and among these the most difficult seems to be the Commonwealth problem. The British delegation has suggested an eight-year period during which the preference now granted to Commonwealth produce in Britain would be gradually eliminated. It has also proposed that this elimination should be made subject to compensating outlets to Commonwealth goods being found in Europe. The British delegation also hinted at international agreements for stabilising certain basic commodity prices as the best way of dealing with the difficult problem of foodstuffs produced in the temperate dominions and likely, therefore, to come into direct competition with the heavily protected agriculture of the Common Market countries.

These proposals fell on somewhat stony ground in Brussels. The opposition to them was a mark of the economic unification of the Common Market. It has now been in effective operation for more than four years and, despite the inevitable teething troubles that are being experienced at this moment, there is no question but that the great venture launched with the Treaty of Rome is one from which there will be no retreat. A very significant proof of the crystallisation of the Common Market is the decision which has just been taken to make another 10 per cent cut in the tariffs on goods moving between Common Market countries. The first tariff cut was made on the 1st January, 1959. With the latest cut these tariffs will have been reduced by 50 per cent in little more than three years — proof, if any were needed, of the irresistible momentum that is now impelling the further unification of the European Economic Community.

Very rapid progress is being made with the proposed admission of Norway and Denmark, the two other EFTA countries which have applied for admission. This is in striking contrast to the resistance whch the British application is meeting. This contrast can be readily explained. Norway and Denmark can be readily swallowed by the E.E.C. without affecting its character. This is not true of Great Britain. The E.E.C. club is European. To use the phrase that Mr. Edward Heath has made familiar, it belongs to the "mainland." The character of the club would be changed if Great Britain with its worldwide interests, its links with the Commonwealth and its alleged special relations with the United States, were to become a member. That is what Dr. Adenauer meant when he said recently, that if the Common Market had too many members it might burst — and added that the one too many would be Britain. That remark may have been officially denied but it rings very true. That is also what General de Gaulle meant when he said in his recent press conference that "everyone knows that Britain, as a great State and as a nation true to herself, will never consent to her dissolution in some Utopian construction."

Germany and France are pursuing delaying tactics in opposition to Britain's entry in the Common Market, while the smaller members of the Community, Belgium and the Netherlands, are doing all they can to get Britain introduced. Here we come up against the main paradox of the Common Market discussions. The political shape which General de Gaulle wishes to give to Western Europe — a group of sovereign countries retaining their identity and not merged in a federation in what he describes as a 'Utopian construction' — is very close to what Britain wants. The federalists on the other hand, those who wish to see a European parliament wielding real legislative powers and a supra-national European Economic Community, are to be found mainly among the Belgians and the Dutch, that is among those who want to see Britain in the Community.

The Belgian Foreign Minister, M. Spaak, has recently resolved this paradox by admitting that his desire for a tight European Federation will not prevail since not only Britain but France are adamantly opposed to it. It is for this reason and because he does not wish a European community to be dominated by its major members, France and Germany, that he wants Britain to be admitted and even if not admitted immediately, to participate in the discussions that will determine the political shape of this Europe of the future. It is, therefore, on the political plane that the real difficulties barring the entry of Britain into the European mainland are to be found.

These divisions within the Six have confused a situation which is already tangled. The reports from Brussels suggest that the French and Belgian foreign ministers are no longer on speaking terms. M. Spaak seems to have given great offence to the French when, at the recent meeting in London of the Western European Union, the one institution in which the six countries of the Common Market are joined by Britain, he said, "We appear to get on much better when we meet as Seven than when we meet as Six." In these circumstances it is very difficult to share the optimism that was expressed by Mr. Edward Heath on the return from the discussions in Brussels. He seemed to imply that sufficient progress had been made in the negotiations for British admission to the Common Market by the end of July, to make it possible to put fairly cut and dried proposals to the Commonwealth ministers who are due to meet to discuss the problem in September. Some near miracles will have to happen over the next two months if that time-table is to be saved and the miracles will have to be all the greater given the fact that they involve matters of major political philosophy. The Common Market negotiations have indeed come down to brass tacks but the shining brass is now found to have a decidedly political gloss.

THE WEEK'S NOTES

U.S. Aid

SLASHING THE CUT

IT WAS a snap vote in the Senate Foreign Relations Committee which was responsible for applying a drastic cut of 25 per cent to the appropriations of aid asked for by President Kennedy for India in the next fiscal year. President Kennedy and the Administration immediately expressed their confidence that the cut would not stay and an assurance to this effect was conveyed to the Government of India. One likelihood hinted at in the post-cut discussion in America was that the cut would be reconsidered and withdrawn in the Senate Committee itself. This has come to pass and the Committee has slashed the original cut, nevertheless maintaining it at 10 per cent and putting a ceiling on the aid for the next fiscal year equivalent to the amount granted for the current year.

The slash which the Committee applied in revision is welcome for the reason that the reduction in the originally proposed aid will not have much serious effect on India's resources position. But there are certain unsavoury aspects of the cut which are attributable to the spirit in which the cut motion was moved by Senator Symington and supported by those of like-thinking. It is not the convention of the two Committees to refer to any specific country in moving cuts in the Foreign Economic Aid Bill. India's defence expenditure which was one of the main reasons behind the original cut has been dropped, but the political reasons stand to explain the retention of the 10 per cent cut. Some may raise the point that Senator Dodd's strongly-worded expressions on the occasion of the second motion were hardly consistent with the spirit of tolerance of difference of opinion among friendly democracies. But the senator's approach is not the approach the President and the Administration.

Hong Kong

THE REFUGEE INVASION

IT IS now more than three weeks that an uninterrupted influx of refugees into Hong Kong began to pour from the neighbouring Kwangtung province of mainland China. It is not as if the border Communist guards could not stop it, if they were under instructions to take that course of action. But the continuous flow over a long period only confirms the absence of any such instructions. The refugees, who poured in from across the barbed wire fencing, are stricken with hunger, leaving no doubt about the great hardships caused by a terrible and widespread famine in Kwangtung. A Chinese official statement says that several hundreds of men and women are engaged in fighting the after-affects of the havoc wrought on numbers of villages by heavy river floods. Privations and a dim prospect of any relief coming in a substantial measure have forced the large-scale exodus. Between May 1 and 17, not less than 25,000 refugees are estimated to have sought shelter in this small colony whose capacity to accommodate at this rate would be easily strained to the breaking point. The colony's regular population has already reached the 3.35 million mark.

A real dilemma was posed before the Colonial Secretary in Hong Kong how to tackle this sudden influx. Wide publicity had to be withheld, on the one hand, lest Peking might take offence, while, on the other, there was a real danger that extending shelter under the pressure of the inflow would result in the admission of politically embarrassing elements. Nevertheless, the point was reached about May 17 to return the escapees and truckloads carrying them back were accepted on the Communist side. But many were refused repatriation. There may be something tricky here. On May 19 the British Charge d'Affaires in Peking called at the Chinese Foreign Ministry and apprised it of the problem posed before the colony by the refugee exodus from Kwangtung. It is amazing that the Foreign Ministry pleaded ignorance of this development extending over a fortnight in full swing. But it promised to look into the matter. Thereafter, however, the Hong Kong police are taking aid from the troops in rounding up the refugees and the artillery is kept ready as a standby as open clashes actually occurred. Above the border hills, helicopters are surveying refugees in their hide-outs in the jungle.

This first large-scale exodus during the Communist regime also speaks for the cracks appearing in the village communes and the fate of the peasants as well as factory workers sent there from overpopulated towns and cities. But the humanitarian aspect of the situation leading to the exodus can never be overlooked. Those suffering the privations of famine certainly deserve prompt relief and there can be no doubt that it will be provided generously by other countries. The main hurdle may arise from the ideological arrogance of the regime.

MIG-21's

ROUGH WEATHER?

A GOOD deal of surprise and anxiety have been caused in this country as well as abroad over the reported proposal and negotiations in pursuance of it, between the Governments of India and Russia, for the purchase by India of MIG-21's and their manufacture under licence here at a subsequent stage. One major point beyond dispute is that the Indian Air Force is grossly deficient in jet fighter aircraft capacity and the acquisition of at least two squadrons of these fighters is urgent for her to redress the imbalance in her defensive strength in the light of the warlike posture that Pakistan (armed with the free supply of F-104's by America) threatens to adopt. India's immediate need for preparation to meet and repel possible aggressive advances by China is too obvious. The question is which supersonic jet fighting aircraft India should acquire and whether the same type of fighters would be freely available for defence against Pakistan and China.

Until Saturday last it was taken for granted that the proposal was under negotiation. But Mr. Krishna Menon's cryptic statement on that day to a Press gathering at Indore provoked a resentful reaction. The Defence Minister pleaded that he came to know about the proposal for purchase from the Press. This denial has come as a surprise and it is being seriously questioned. It would appear that Mr. Menon was endeavouring to evade a positive statement in the public on a delicate issue. Maybe, he took shelter behind the fact that the talks at the present moment are of an exploratory nature and they have not reached the stage of negotiation.

This point of propriety apart, the root of the issue merits a searching re-examination. Mr. Krishna Menon's assertion that as a sovereign power we have the fullest freedom to buy any defence equipment from any source is unexceptionable in abstract theory. But political and military relations are so complex, intricate and sensitive in the international scale that the theoretical right to freedom ought to be tempered by reasonable discretion and a perspective self-enlightened outlook. America and Britain promptly expressed their feelings of deep concern to the Government of India over the projected purchase of the M.I.G's. Our traditional relationship with Britain in the defence organization and acquisition of defence equipment make Britain apprehensive that the supply of her "classified" equipment alongside the MIG's and the Russian technicians who will accompany them creates real risks of leakage of key secrets. America has made a free gift of F-104 supersonic jet fighters to Pakistan as her military ally, which is the undeniable cause that has forced India to take counter defensive measures of acquiring similar fighters. The explanation now seems to be forthcoming that Pakistan's superiority is exaggerated by India and America has supplied not more than one squadron of 12 aircraft to her. Pakistan is likely to feel chagrined at this disclosure. But to jump to the MIG's is highly questionable and its implications must be fully weighed from the long-term perspective. Their use against China is of seriously dubious practicability and their possession for use against Pakistan will disrupt our traditional source of supply. Finally, is it conceived that non-alignment can be stretched to the domain of defence equipment and we can buy from two opposite sources for defence against aggression from two countries in opposite camps? The negotiations (or whatever they may be termed) have been postponed for the present. Postponement gives time for sober second thoughts.

France

A PREMATURE ASSESSMENT

THE UNSUCCESSFUL attempt on the life of President de Gaulle the other day is proof positive, if proof in this matter was required at all, that the Algerian emergency is not yet over and it will not be over in the practical sense until the OAS is completely wiped out. This is by no means an easy task. The organisation has taken widespread roots in Algeria and its sympathizers among the rightist-minded elements in the French population at all levels—whether non-official or official —are by no means few in number. It would appear that a section of the army officials has its own view regarding the propriety and advisability of putting General Salan and his lieutenants on trial. President de Gaulle has been constrained to take firm action in the form of the dismissal of some army generals. This contingency would not have been forced upon him if sympathy for the OAS had dried out.

The cease-fire in Algeria is, of course, fully in operation and the FLN is acting with great restraint and is effectively curbing its followers in preventing them from indulging in retaliation. Nevertheless, reports continue to pour about violence and terror which the OAS continues to inflict upon the Algerian Muslim population. Between now and July 1, when the plebiscite in Algeria is due to be held, there are hardly five weeks left. It would be too much to presume that the OAS terrorism will be stamped out before that day and the plebiscite would be held in peace. It was the Algerian emergency which impelled all the parties in France to install President de Gaulle in power, when such installation quite plainly meant accepting an unbearable burden of office. That emergency continues to exist in a changed and modified form. But the fact remains that the element of emergency is there in the situation, which cannot by any stretch of reasoning be considered as having returned to normalcy.

In these circumstances, the resignations of M. Pflimlin and four of his MRP colleagues in the Cabinet was a most regrettable and misguided decision. It seems that the real cause of the resignation was not so much the difference of the outgoing Ministers with the President on the issue of European unity as the belief that normalcy had returned and therefore a normal Government after elections in the near future was the proper course to choose. The trade unions also have taken the same view and in their revised assessment they have seen no reason to continue the industrial truce. Strikes have also taken place in the wake of this decision of the trade union leadership. This is certainly not the time when elections can be held and normal conditions can be considered as having returned. The day-to-day events in Algeria and their echoes in Paris proclaim a contrary state of affairs. The assessment about the return of normal times is indisputably premature. All elements in France need to strengthen the hands of President de Gaulle at this juncture.

The World Abroad

AFRICA'S DEVELOPMENT HEADACHES

By

ODYSSEUS

THE NEWLY ESTABLISHED Overseas Development Institute (160 Piccadilly, London. W-1.), under the direction of William Clark, is not letting the grass grow under its feet.

Among its many initiatives has been a high level Franco-British conference on planning and development in Africa, recently organised in co-operation with the French Institute of Applied Economics in London. Eight high level reports were presented to the conference: "African Industrialisation and Co-ordination of Investment Programmes," by Professor Francois Perroux, France's most distinguished living economist; "Theoretical and Practical Problems of Planning," by Jean Pierre Berard, of the economic research branch of the French Ministry of Co-operation; "National Accounting in Africa" by Miss Phyllis Deane of Cambridge University; "Afro-European Interdependence in Economic Development" by Professor Maurice Bye of Paris University; "Stabilisation Policies in African Countries" by Professor Alan Peacock and Douglas Dosser of Edinburgh University; "Long-term Forecasting of the Economic Development of African Countries" by Professor Alain Cotta of Caen University; "Criteria For Selecting Investment Projects in Transport Facilities in Africa" by Jacques Raimon of the French Ministry of Co-operation; and last, but far from least, "The Economic Impact of the Monetary and Commercial Institutional Structure of Africa" by Dr. Thomas Balogh of Oxford.

Although these reports were primarily concerned with the problems of Africa, all interested in planning in India would, I think, find it worth their while to apply to the Overseas Development Institute for copies.

AFRICA AND THE COMMON MARKET

It was inevitable that the effects on African countries of association and non-association with the European Economic Community should loom large in the discussions. To illustrate how much a matter of opinion the effects may, however, be, a pamphlet entitled "If Britain Joins — the Economic Effects of the Common Market," recently published (price 6sh.) by the Economist Intelligent Unit (5, Bury St., London. S.W.1.) says that the most likely solution of the relationship of the English-speaking African territories with the EEC will be that, despite the objections of Ghana and Nigeria, they will eventually become associated members of the EEC just like the ex-French colonies in Africa. This would mean joint agreements on the export of coffee, cocoa, oils, fats and fruits, which would discriminate sharply against produce from South America. But at the Overseas Development Institute conference, Dr. Balogh pointed out that, in judging the extent to which association with the EEC might (1) divert production and (2) influence world prices, it should be remembered that Africa, even including the English speaking area, is not as important a market for Germany as Latin America and some of the tropical areas of South-East Africa. Dr. Balogh therefore thought it difficult to assume that trade diversion, serious enough to cause severe losses to these areas, which are important to Germany and to Britain, would be allowed. Germany has already shown her desire to avoid trade diversion by taking advantage of the Rome Treaty's clauses which allow favourable customs quota to non-associated countries. Britain's entry into the EEC might multiply such instances. However (just to muddle the picture), it should not be forgotten that EEC members have, in the unanimity rule, means of preventing developments which they find contrary to their national interests. So what may happen must remain anyone's guess.

Dr. Balogh stressed that, in analysing the problems of associated EEC membership, two facts, which are increasingly important in the recent development of the world economy, are usually neglected.

The first is the speeding up of the technical revolution and its spread to agriculture. The second is the instability of primary product markets, which renders unrealistic simple comparisons of price changes and their effects on production. Simple technical improvements, such as pest and fungus control, and careful weeding and fertilising, can dramatically increase production in the short run. It follows that the variation by a relatively small margin of 8 to 10 per cent in the EEC's tariffs must be measured against the degree of the ability to adopt improved techniques in all areas or only in some areas. If all areas can adapt, the impact of the Common Market would not be offset. Even a small divergence, however, in social adaptability and political leadership would, by achieving great cuts in costs, far outweigh the effects of the Common Market tariff, as conventionally analysed in a static economy.

A prohibition of imports from outside the EEC area could seriously harm the associated territories. Dr. Balogh's view that such drastic action is not likely was supported by the French economists present. The EEC's philosophy is generally against direct controls and favours the much less drastic global controls acting through the price-mechanism. Thus, it is likely that technical progress, in individual areas, will dominate the price and relative export capacity of African countries.

ALL-AFRICAN COLLABORATION ESSENTIAL

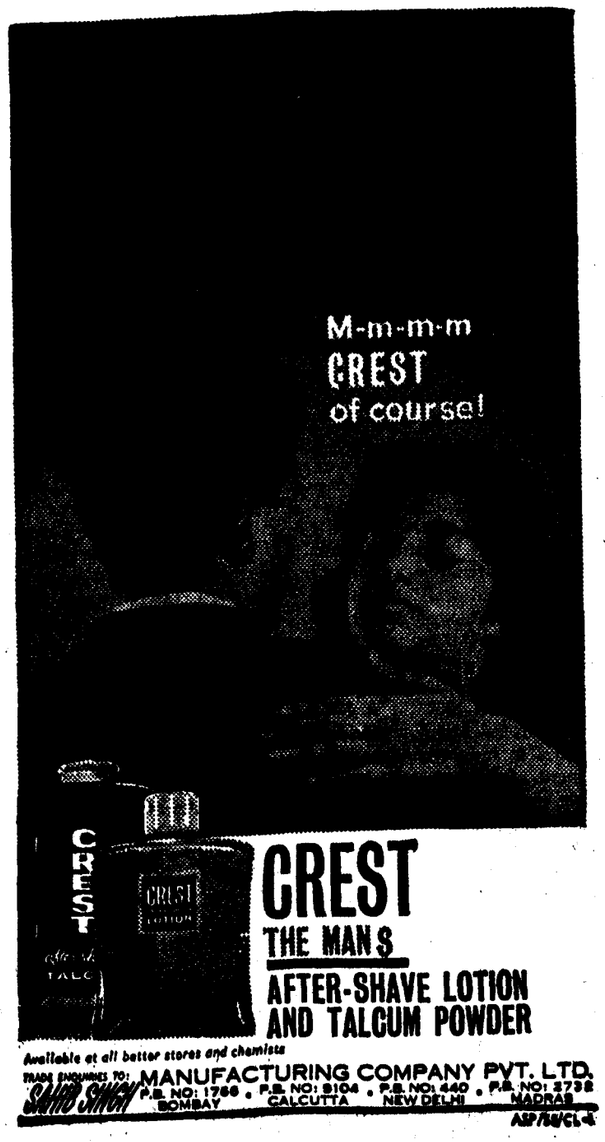
On the other hand, the impact of this revolution in techniques on a relatively static consumer demand might be dramatic. Prices could fall sharply. It follows that collaboration between African countries is essential. These considerations nevertheless do not support measures to restrict production by which dynamic countries are asked to bear the brunt of sacrifice, if their dynamism were to change the supply position so much in their favour as to more than offset the unfavourable impact.

As for the second factor — price instability — Dr. Balogh points out that even after the establishment of marketing boards, which obviously reduce variations, both up and down, in supply, the range of price fluctuations has been much greater than the impact of preferences. He therefore, thinks it difficult to argue that the preferential system would have any serious impact. The overall uncertainties are much more important than the tariff levels.

A big step towards improving Africa's economies might be taken by creating a common market for semi-manufactures, because here the preferences are larger and the instability of markets less. The EEC tariff on cocoa semi-manufactures, for instance, is 22 to 30 per cent compared with 9 per cent on cocoa beans. On vegetable oils, simply processed metals, and cotton goods the tariffs are higher. Thus production of simple manufactures in associated countries might be stimulated.

African countries could, of course, negotiate bilateral agreements with non-EEC countries, which might so increase the non-EEC countries' demand for African products as to more than offset the depressing influence on world of the possible increase in production. If, for example, the USSR or China substantially increased their demand for cocoa, this would far outweigh the impact of the preferential treatment of the associated French area's cocoa production. It is obvious that, in a dynamic world, any increase in total demand for cocoa would also compensate for the effects of the Common Market.

The disadvantages of association with the EEC that follow from not being able to buy in the cheapest market can also be mitigated by bilateral agreements. While these might be held to be contrary to the letter of the Rome Treaty, both Germany and Italy have signed such bilateral agreements without challenge from their partners.



Dr. Balogh concludes that the setting up of the Common Market is not of over-riding importance in assessing the outlook for the export markets of primary products, either favourably for members, or unfavourably for non-members. The real question that, in his view, hesitating applicants for association need to ponder is the net impact of the EEC on their programmes of industrialisation. Africa today is to all intents and purposes not industrialised and it is unlikely that agricultural development alone can help its countries to an appreciably higher standard of living.

Although the French economists present at the Overseas Development Institute's conference assumed that the progressive industrialisation of Africa was a matter of course, Dr. Balogh was sceptical. He thought that the highly industrialised countries would tend to aid agriculture rather than industry in Africa. He readily conceded, however, that it was manifestly uneconomic for single African States to operate capital goods industries, such as steel and heavy mechanical and electrical engineering and chemicals, however, much the long run comparative advantage makes such development possible and necessary for African States grouped in regional associations.

Apart from the lack of technical knowledge and capital, the efforts of Africa's States to raise their living standards are impeded because their markets are insufficient to sustain large-scale industry. The very smallness of the size of each State and its lack of tribal, and geo-economic unity are even more decisive than the usual vicious circle of poverty.

The implication of this fact for their future is momentous. It brings out the overwhelming need for Africans to do all in their power to promote unity among themselves and close collaboration between their States.

We will consider these matters further next week.

The European Scene

LESS WORK, SAME PAY

From Our Special West European Correspondent

PARIS, May 20.

THE demand for a shorter working week is being added to, or in some cases is even replacing, the demand for higher wages in the claim-sheets of many West European trade unions. Following the lead of U.S. unions, some of which have presented truly extravagant propositions for a curtailment of working time, the European workers are informing their employers that they are at least as much interested in more leisure as in more money. On this side of the water, the move began in West Germany about five years ago at a time when the working week was extremely long; since then it has been reduced by about 12 per cent without reduction in wages. This explains, incidentally, why German workers seemed to others less pungacious in pressing for wage increases, and why they were so long content with a lower volume of consumption than in nearby France—they were taking their rewards in more leisure. The labour shortage in the Federal Republic has given them the opportunity to press for both more pay and shorter hours; a current agreement in the metallurgical industry foresees that the working week will be reduced from 44 hours on January 1, 1962 to 40 hours on January 1, 1965.

The British workers have also secured shorter working hours—but not because their unions pressed for it. The slowdown in the British economy wiped out much overtime and bit into the normal working week. What the British unions are asking today is that this involuntary reduction be consecrated in new agreements without loss of wages. The demand for shorter hours has appeared more recently in France, but it is at present intense. The legal work-week is already only 40 hours, but men actually work 46 hours in the private sector and about 45 hours in the civil services, the extra being paid at overtime rates. The unions are asking that the real working week be reduced, without loss of pay: that ultimately men should really work only 40 hours but still be paid for 40 normal hours plus six hours' overtime. The fourth four-year plan had allowed that around 1964-65 there might be a certain reduction in working hours, but the unions want the question taken up immediately.

The reasons for this renewed concern with shorter hours are different from those that lay behind the epic labour battles between the two wars for the 40-hour week and for paid holidays. Those struggles expressed the workers' resentment of conditions of life in urban industry, and were supported by the theory that shorter hours would combat unemployment — if each did less work, there would be more work to go around. This theory was largely mistaken, and if it plays any part in current labour thinking in Britain and the U.S.A., its falsity will soon be demonstrated again. The fact is that to enforce shorter hours in industries that produce capital-goods, at a moment when they are already depressed by poor business conditions, restrains the expansion of the economy and thus tends to perpetuate unemployment. The 40-hour week introduced by Leon Blum in 1936 certainly postponed the recovery of the French economy from the depression, far from providing extra work.

In contrast, the present campaign for shorter hours expresses the workers' confidence in modern capitalism and their enthusiasm for the mass of consumer goods it has made available to them. For example, the real consumption of the average Frenchman has increased by 44 per cent in the past 10 years, and similar increases are known elsewhere. This increase means, materially, a motor car, a television set, a more comfortable flat and often an extraordinary collection of garden furniture and tools, equipment for sport, do-it-yourself hobbies, camping and music. I do not want to exaggerate; few workers have all these things, and the European worker has certainly accumulated less bric-a-brac than the American; but it is sure that the European worker of today owns more material possessions that work, divert, make noise and require upkeep than did the "comfortable" middle-class family of my youth. Obviously, these things all require time for their use, and if you work 46 hours in a factory and spend another 10 travelling to and from the job, there is not a lot of time left, given that one comes home tired, that the days are short half the year and that any work at all on Saturday ruins a week-end planned for a car-trip. The aspiration for shorter working hours, which used to be a negative sign of distaste for the factory, is now-a-days a positive sign of enjoyment of the factory's products. The flood of consumer goods unleashed in an economy where the working week is still as long as ever produces a sense of frustration.

Moreover, no one is more keenly aware than the working man of the spectacular increase in productivity of machinery in recent years. When he tends a machine that does the work of 10 men, he naturally expects to see this progress translated into more leisure for some of those men at least. The argument that the democracies have to keep up the pace of expansion in order to match the progress of the communist economies does not impress him because he knows communist propaganda at first hand: he knows that the competition concerns living conditions, working conditions and leisure as much as output statistics. The communists boast (fallaciously, no doubt) that these things are better in their system; the propaganda they address to workers pays little attention to the production increases noticed by economists. The workers, in Europe at least, are the first to point out the absurdity of the engrossment, both in capitalist and communist countries, with constant increases in production, the "growth-rate fetish".

Coming down from these generalities to particular cases, one finds that the possibility of shorter hours varies widely from country to country, and from industry to industry. For that matter, different classes of workers have varying concern with the question. The employees of the public sector are usually the most interested in abridgement of the working week. They know the big advances that have been made in productivity in such sectors as the railways and postal services, and they are less anxious about more money than workers in the private sector (that is often why they are in the public service); for them, a shorter week is their most urgent demand. In the private sector, women workers (who make up a large part of the labour force in Europe today) are notoriously opposed to strikes for more pay but they are keenly interested in shorter hours, no doubt because they have domestic responsibilities that suffer when they work overtime, no matter how generous the extra pay. Men workers in the private sector are still more concerned with the size of their pay envelope than with more leisure, though their attitude has begun to change. They support the move for a shorter legal work-week mainly in order to boost their overtime pay.

Can the European economies afford to grant this reduction in the work-week? Economists give quite different answers for West Germany and France. The difference between the two cases is that the large increase in the Federal Republic's population has already occurred and from here on demographic growth will be

Your NEW SIGN of Petroleum Energy

ESSO

This is the ESSO sign—world-recognised symbol of outstanding petroleum products, true research! This is your ESSO sign—backed by the world's greatest resources of petroleum knowledge and experience.

ESSO brings better standards of living, serving industry, transportation, agriculture, the home.

Esso research works wonders with oil!

ESSO STANDARD EASTERN, INC. (INCORPORATED IN U.S.A. WITH LIMITED LIABILITY)

Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

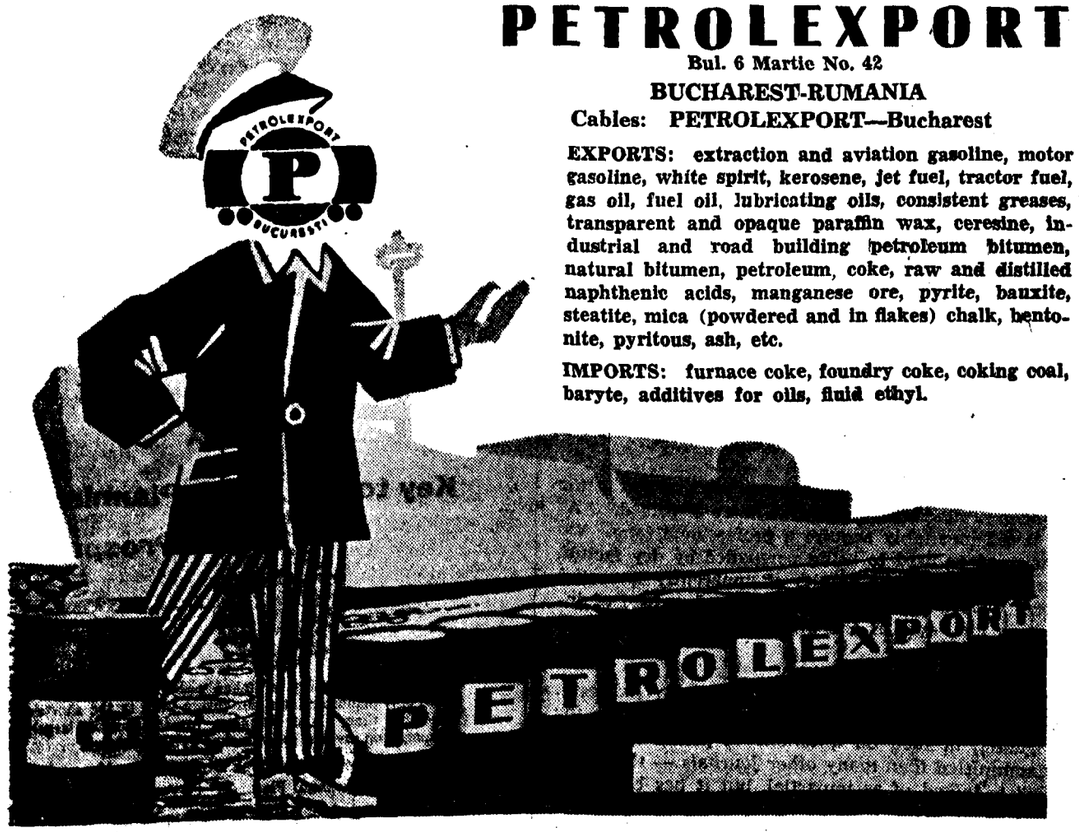
slow, whereas in France the expansion of the labour force, consequent on the post-war baby boom, is yet to occur; it is slated for around 1964-65. In the former case, therefore, it is suggested that reduction in working hours is possible and in fact would be a good thing. Rather than try to overheat the West German economy, which is fully employed, in order to maintain a high growth rate, a shortening of the work-week would be desirable. The inflation of costs that would inevitably result could be met by rationalisation of production, and would be no worse than the inflation of costs that would appear just as surely from the bottlenecks created by forcing the pace.



In France, on the contrary, the main problem is to have ready for 1965 the equipment that will employ the large numbers due to come on to the labour market. Shorter hours today could mean unemployment tomorrow if they restrained the production of capital-goods industries. To reduce the real working week from 46 to 40 hours would call for an extra 1,500,000 hands if the volume of production were to be maintained, and that volume of labour is not yet available. It is concluded that demands for shorter hours will have to be parried, except in certain industries like coal-mining where productivity is rising much faster than production. Shorter hours could be granted in those cases (are already being so, in fact) provided there was no contagion to other industries. If the unions reply that they are willing to go on working 45-46 hours a week, in order to maintain the volume of output, but want overtime paid on a larger proportion of that work-week, they are simply demanding a wage increase — of the order of 12 per cent, which would entail a 6 per cent rise in prices, since labour is half production costs. That takes us back to the familiar question of wage increases, and has nothing really to do with the pressure for less working time that is the new development in Europe. The same unions that claim to be more concerned with pay than leisure, however, are the most ardent supporters of the campaign for longer paid holidays (three weeks annually today, which they want to raise to four), showing that their members, too, want more time off to spend their money.

That is the crux of the matter, in all the West European economies; more time off to spend money, or to use the things that record wages have bought. It has nothing to do with sophistical Marxist theories about reduction in working time being the only way to limit the capitalist's expropriation of surplus-value; nor with the doctrine preached by the IWW in the 1930's, that the wage increases demanded by other unions were made illusory by price-inflation so that the only way to do down the employer was to work less hours. Workers infatuated with the consumer goods produced by industry and admiring of the recent advances in productivity are not trying to do anyone down, and no longer seriously believe in exploitation. Nor, despite some complaints from employers, are they being made lazy by prosperity; the labour of West Germany and France could not by any abuse of language be called indolent today. It may well be that their economics is all wrong, and that their countries could not stand the reduction in the work-week without dangerous inflation but then they are over-estimating, rather than aspersing, the ability of neo-capitalism to generate wealth and provide full employment.

PETROLEXPORT
Bul. 6 Martie No. 42
BUCHAREST-RUMANIA
Cables: PETROLEXPORT—Bucharest

EXPORTS: extraction and aviation gasoline, motor gasoline, white spirit, kerosene, jet fuel, tractor fuel, gas oil, fuel oil, lubricating oils, consistent greases, transparent and opaque paraffin wax, ceresine, industrial and road building petroleum bitumen, natural bitumen, petroleum, coke, raw and distilled naphthenic acids, manganese ore, pyrite, bauxite, steatite, mica (powdered and in flakes) chalk, bentonite, pyritous, ash, etc.

IMPORTS: furnace coke, foundry coke, coking coal, baryte, additives for oils, fluid ethyl.

THE PROFESSION OF INFLUENCE

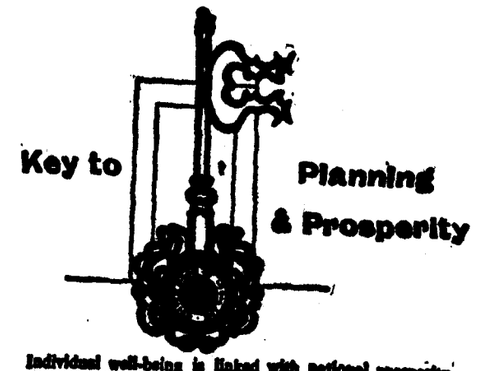
By WILLIAM REES-MOGG

THE PROBLEM of influence in the modern world is one which has seldom been adequately considered, let alone properly analysed, yet it is obviously of first rate importance. It is immediately clear that what might be termed the technology of influence has changed immensely even in the years since the war. The style of business and of public affairs is now much more professional than it was; decisions may not always be better made, but they are certainly made in a more thorough way.

One can ask a number of questions about modern influence. How was the Government persuaded to start independent television? or to apply for entry to Europe? Why does the "Daily Express" have so little influence? or the "Economist" so much? Why did the British Aluminium takeover succeed? or the I.C.I. bid for Courtaulds fail? Does public relations work? Has market research much wider applications than it has yet been given?

These are just a few of the questions which relate to the central issue, of influence, which may itself be defined as the way in which decisions are determined. In considering any of them one is struck by the growing professionalisation of influence. Take for instance the I.C.I.-Courtaulds dispute, which I do not want to write about too much as I wrote a good deal (in the issue of "The Eastern Economist", dated January 19, 1962) about it at the time.

It is, however, clear that in both the Courtaulds and the British Aluminium disputes victory went to the side which gained the greater weight of press support. In both cases, for instance, Lex of the "Financial Times" was arguing in favour of the side that eventually won. In neither case, however, did the eventual winner have predominant support in the City itself. The City establishment tried to defeat Warburgs with almost hysterical fervour, and in the case of I.C.I. the traditional respect of the City for the quick profit and the big battalions had its influence. In fact, it was the professional efficiency of Warburgs handling of the press which won the day for them, and Courtaulds were also immensely skilful in exploiting the advantage of having been raided. They represented themselves, quite properly, as the innocent victim.



This was all, however, also a professional game in which professional judgments were involved. As such it did inevitably acquire a professional tone. We are now-a-days used to being persuaded by dry factual arguments, and by the results of apparently impartial research. Once bias is suspected the advantage of influence is lost, even if the bias is perfectly legitimate and reasonable.

This comes out in the case of the "Daily Express". Lord Beaverbrook has said that he runs his paper for propaganda; in fact, on questions of policy his is no more committed than many other journals — the "Economist" is talked of as impartial, but it has been just as devoted an advocate of British joining the Common Market as the "Express" has ever been of Britain staying out. Yet "Express" propaganda has openly proclaimed its own bias, and has lost credit with the people at whom it is aimed. The art of influence is at least to appear to argue in an impartial manner.

Another fact about modern decisions is that they have become increasingly technical. This is true at all levels, in business and in government. A number of rather contradictory effects flow from this. One is that decisions tend less to be taken on an old boy basis. You cannot usefully negotiate scientific formulae in a bar with an old pal; you have to sit in a committee with your advisers.

At the same time because decisions have become so much more technical fewer and fewer people are qualified to understand them. Thus, while jobbery has undoubtedly been reduced, because it is much less often relevant than it used to be, decision-making has not become more but less democratic. Take, for instance, the economic arguments for or against joining the Common Market. There are certainly not more than 50 men in the U.K. who have mastered them to the point of having a useful opinion to offer. More and more of statecraft goes behind the curtain of privacy, not, as with defence, because the arguments are not public, but because they cannot be presented in anything but an extremely complex form. In discussing such issues appeals to the emotions cannot normally carry much weight.

It is, therefore, tempting for administrators, and particularly for those who are not exposed to the electorate, to treat public opinion as a relatively unimportant variable, which can be worked upon. Up to a point this is true. Market research can eminently offer useful guidance on public attitudes. Public relations can avoid unnecessary frictions. Yet fortunately — as every politician knows — there remains an ultimate if often apparently blind instinct of public feeling. The public knows that it has to rely on expert judgment; it is used to the repetition of half comprehended statistics. Yet fortunately it also knows when it is being taken for a ride.

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1

with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.

offers complete banking service

UNDER SECRETARY TO ... 31 MAY 1962 PUBLIC ...

Designed to suit your special needs!

Designing and engineering are the very core of Voltas organisation and service Voltas have six independent, self-sufficient Engineering divisions—electrical, mechanical, agricultural and construction equipment, textile and paper machinery, machine tools and air conditioning and refrigeration. Activities include the import, distribution, designing, manufacture, erection and servicing of internationally famous machinery and equipment. Manning the various divisions is a powerful force of trained and experienced personnel — expert engineers, designers, technicians, mechanics, servicemen — mobilised to answer your particular needs in the best tradition of Voltas service.

When expert engineering is required

VOLTAS IS THERE

Briefly, Voltas' activities comprise:

Marketing and Distribution of goods:
Representing leading manufacturers, both foreign and Indian, Voltas supply a wide range of goods—Electrical, Mechanical, Air Conditioning and Refrigeration, Textile and Paper Machinery, Agricultural and Construction Equipment, Machine Tools, Pharmaceuticals, Chemicals, Bulk Vitamins, Plastic Raw Materials, Processed Foods.

Manufacture and Development:
Air Conditioners, Water Coolers, Switchgear, Farm Implements, Drilling Machinery... and the list is growing!

Service:
Voltas after-sales service is a by-word in India. Voltas sales are fully backed by its nation-wide service and spare parts organisation.

The Third Five Year Plan
Bird-Heilgers' part in it...

FOURTEEN MILLION NEW JOBS

Employment. A word that translates into a meaningful future for millions of people without jobs. India's Five Year Plans are aimed at the concept of full employment. The intensified drives of the Third Plan are estimated to create 14,000,000 new job opportunities—more jobs for more people than ever before in the economy's history! To achieve the employment target calls for a single-minded national effort. It must be co-ordinated, dedicated, complete...

75,000 jobs—and more in the offing

Bird-Heilgers is convinced that the quickening tempo of industrial activity must be accelerated if unemployment is to be checked and full employment brought about. Wedded to this concept, the group provides well-paid employment for approximately 75,000 people. They are concerned with iron ore and insurance policies, bridges and writing paper, gunny sacks and laboratory tests—a complex of goods and services which involves the group heavily in the industrial insurgence of India.

Towards a self-generating economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...provide employment for many more thousands...join the national drive to economic independence.

Tardy Tempo of Plan Targets

By CROESUS

DEFENDING the higher levels of taxation in his Budget proposals for 1962-63, the Finance Minister made this observation: "The point to remember is that there are only two alternatives to such taxation—inflation or stagnation". As a point to remember, this may be all right; it even sounds well to be worthy of memorising, but what is the reality? Even without the latest additions, we have not only enough taxation, but also inflation and stagnation. It is not merely in raising the taxes, therefore, that a solution to our present economic problem lies, as some seem to imagine, but in an all-out effort, which does nothing to discourage saving, investment and capital formation and does everything to encourage a higher tempo of economic development generally and more production in particular.

These thoughts force themselves on one from the gloomy outlook brought out by a recent study of the performance of certain selected industries during the last eleven years by a contemporary ("Financial Express", Bombay). At a time when there is talk of revising upwards the industrial targets in the Third Five-Year Plan, the conclusions of this study are disturbing in all conscience and should make our planners sit up. It cannot certainly redound to the credit of anyone that, out of as many as 44 industries selected for the study, only eleven industries should be found to be in a position, on the basis of the data available, to achieve the targets. It is a matter for immediate investigation whether the continuation of the present trend, namely, the rising rate of increase in output of capital and producer goods industries and the declining trend of production of consumer goods industries would not add to our problems, especially on the price front. An upsurge of prices at this stage, it is hardly necessary to add, would impose a severe burden on all sections of the community.

Let us take the question of cement, which is an essential commodity, what with all our tall talk of providing shelter to millions of houseless people. By and large, the cement industry has not fared badly. During the First Five-Year Plan period, cement production increased by over 70 per cent and during the Second Plan there was an increase of a little less than 64½ per cent. During the Third Plan the industry is expected to increase its production at least to the same extent as during the Second Plan period—by 64.10 per cent to be precise. During the first year of the Third Plan (or, to be more accurate, during the greater part of the first year of this period covered by the calendar year, 1961) the increase in production was no more than 5.13 per cent! This rate of growth cannot be expected to lead to an increase of over 64 per cent during the remaining years of the Third Plan, unless the rate of growth of output is more than doubled. But, as the study, in question points out, it is the price that will determine the future trend. And, to quote the source, "the restraint under the price policy will be a major handicap".

Now what is the position with regard to prices in the cement industry, which is one of those industries the prices of which came under control as early as in 1942, under the Defence of India Rules. Even after the lapse of these Rules, price control on cement continued to be maintained albeit under a gentleman's agreement —among the producers, supplemented by legislative measures by the States. From July, 1956, however, cement prices came to be regulated by the Cement Control Order issued under the Industries (Development and Regulation) Act, 1951. It is at this point too that the State Trading Corporation (S.T.C.) came into the picture. Since 1953, when the Tariff Commission made its first recommendations on prices of cement, cement prices have been revised thrice, once in 1958, a second time in 1960 following the implementation of the recommendations of the Wage Board for the Cement Industry, and, again, in November, 1961. In the normal course, there should have been a price revision in July last or atleast some interim relief, as pleaded by the industry. This, however, was not to be. Even after the Tariff Commission made its recommendations, there was not only a delay in the announcement of the revised prices but also an advancement of the effective date for the enforcement of the new prices. The Government of India also scaled down even the meagre effective increase in the retention price allowed to the industry, after a detailed and expert scrutiny by the Tariff Commission. Apart from advancing the date of enforcement of the revised prices, as fixed by the Tariff Commission, the Government also made the new prices operative for a full five-year period ending with March 31, 1966, which is yet another deviation from a sound price policy. "In an era of steadily rising costs", as Mr. Dharmsey M. Khatau, Chairman of the Associated Cement Companies Limited, remarked at the last annual general meeting of that company, "a fixed price for a period of nearly five years is bound to affect the industry adversely".

Whether it is as a result of the present unsound price policy or of some other factor or factors, the production of cement in the country has not been rising as planned. As a result, cement shortage is becoming more and more acute, especially for the past three or four months. This has adversely affected the housing programmes of not only private agencies but also of Government Departments and Co-operative Housing Societies. The Controller of Cement in Bombay has openly expressed his inability to satisfy the demand for cement to the full extent, because, he says, he has been receiving only a third of the total requirements of Greater Bombay. Indeed, the position has deteriorated to such an extent that there has been a reversion to the war-time exhortation to the people to restrict the use of cement and adopt alternative building materials. Although commendable efforts are being made, in the meantime, by the Control authorities to effect equitable distribution of cement, there are many instances of unsatisfied demand even from quarters that are supposed to have been accorded top-most priority.

But cement is only one of the many essential industries that are so placed. It is high time, therefore, that the Government of India (or the Planning Commission) took notice of the seriousness of the position,

even as the National Economic Council has done in the U.K., by setting up a series of studies into various sectors of the economy to see whether the rate of growth as envisaged under the Third Five-Year Plan is possible without overstraining the economy, by taking appropriate and timely action. In other words, is there a case for an extended Third Five-Year Plan, as was made out by Messrs. N. Dandeker and Ranvir Khatau some time ago? The difficulties we have begun to encounter with our foreign aid only serve to emphasise it.

Practical Training in Banking in India

By

CROESUS

THE increasing calls that are being made on the commercial banks in this country, consequent on the problems posed by the programmes of planned economic development, evidently explain the steadily rising number of bankers' training institutions. It was not until the other day when I went to the Bankers' Training College, established by the Reserve Bank of India in 1954, for training officers of commercial banks that I learnt there are today not less than ten training institutions for bankers in the country. Apart from the Indian Institute of Bankers (which only holds periodical examinations in banking and allied subjects, but does not offer any practical training) and the Reserve Bank's Bankers' Training College, there are, I gather, institutions run by commercial banks, either solely or jointly with other banks, such as the institutions run by the Punjab National Bank, the Canara Bank, the Central Bank, the Dena Bank, the United Bank of India, the Bank of Baroda, the Indian Overseas Bank, the United Commercial Bank, and the State Bank of India, among others. When there are so many institutions and the trend is to add to them, the question naturally arises as to whether so many institutions are at all necessary and whether, in the interest of all concerned, there should not be a close understanding and co-ordination of efforts on the part of all these institutions. True, the object of training by the different banks is not the same, but, at the higher level, such as the supervisory staff, for whom, in fact, the Bankers' Training College is intended, the nature and course of training cannot differ from institute to institute. It will be interesting to know if any effort has been made, either by the Reserve Bank or by the Banks' Associations, to have a detailed study of the scope and objects of training, as also of the syllabus and curriculum of studies of each of the different institutes, if only with a view to ensuring effective co-ordination. If it has not been done, I think, the time is now ripe for it.

But to revert to the Bankers' Training College, about which it is my purpose to say a few words here, it is interesting to recall the genesis of this institution. Following the introduction of the scheme of inspection of commercial banks by the Reserve Bank of India, several shortcomings, it would appear, came to the notice of the Reserve Bank, and one of these was the absence of adequate trained personnel to man the commercial banks. It was to give an opportunity to those already in service in commercial banks but did not have the benefit of practical training that the idea was conceived of establishing a training college. The B.T. College accordingly seeks, in the main, to impart all-round training in practical banking to the supervisory staff of commercial banks in the country.

Sir Benegal Rama Rao, the then Governor of the Reserve Bank, formally inaugurated the College on September 14, 1954. Thanks to the Colombo Plan, the College was fortunate enough to secure the services and assistance of two trained officers of the Midland Bank to run it for two years. It is these two officers of the Midland Bank — Mr. F. H. Hayne, as Principal, and Mr. T. H. Harvey, as the Chief Instructor — who started the first senior course of eight weeks' duration — the duration was subsequently raised to nine weeks and has since been raised to ten weeks. At present, the College is not only conducting the senior course (for branch managers) but an intermediate course (for branch accountants and other supervisory staff), and also a specialised course on Industrial Finance for officers of financial corporations and banks which are interested in term lending to industries. The last course, namely, that on Industrial Finance, is conducted only once a year. It is gratifying to learn that the College will shortly introduce one more course — a specialised course — on foreign exchange.

Besides the Principal and the Chief Instructor, the teaching staff of the college includes a number of tutors who have not only had years of banking experience but also the benefit of extensive practical training in training establishments of the Midland Bank in London. In addition, some senior officers of the Reserve Bank of India, as also prominent men in the field of banking and finance, are invited periodically to lecture to the trainees. The tutorial system followed offers scope for intensive training and the fact that the College is a residential college, located in excellent surroundings near the sea, enables the trainees to concentrate on their work under ideal conditions. Since the College began, nearly 1,200 trainees have completed one or other of the different courses offered by the institution, and it is interesting to note that these trainees are drawn from all banks, including the State Bank, the I.F.C., the State Finance Corporations, and lately, even the I.C.I.C.I.

Now that nearly eight years have elapsed since the College began, it is time that some evaluation was made (as, in fact, has already been done) of the usefulness of the courses conducted by the College. After considering whether the questionnaire approach or the seminar would yield satisfactory results, a seminar was held last year in which representatives of banks participated. It is stated that the seminar approved the training arrangements and also offered a few suggestions for enlarging the coverage and extending the duration of the courses. It is as a result of this evaluation, incidentally, that the proposed course on Foreign Exchange is to be instituted from September next. Even more important than this evaluation, according to me, is the informal stock-taking, as it were, by the trainees themselves, at the end of their respective courses of training, and the suggestions emanating from them for improvements, if any, in the courses. For, who would be in a better position to do this than those for whom the courses in question are specifically intended?

I cannot conclude this brief note on the working of the Bankers' Training College without a word of praise to those who are in charge of the College and, more particularly — in the prevailing context — to those who insisted on the introduction of a specialised course on Foreign Exchange. To a country which has an export programme of Rs. 3,600 crores during the Third Five-Year Plan and has to import no less in order to fulfil the Plan targets, it is hardly necessary to stress how important a thorough knowledge of foreign exchange is. It is only lately that the leading banks of this country have entered this field earnestly and the need of these banks for people fully conversant in handling foreign exchange business cannot be over-emphasised.

Business Notes

Banking

ACCORD ON DEPOSIT RATES

THE EIGHT-MONTH-OLD controversy between the big and medium banks over the All-India Inter-Bank Agreement has ended. The agreement between the member banks of the Indian Banks Association will be revised with effect from June 1, 1962. The new agreement classifies the banks into four categories in place of the present two. All the scheduled banks with more than Rs. 10 crores of deposits are to be divided into three categories: big, medium and small. The fourth category of the banks will be with deposits below Rs. 10 crores. The new agreement allows the fourth category banks—the banks with deposits below Rs. 10 crores—to quote any rate they like for term deposits. The third category—between Rs. 10 crores and Rs. 25 crores—will be at liberty to quote ¼ per cent more than the standard rates laid down in the agreement for term deposits from time to time. Medium banks other than State subsidiary banks—deposits between Rs. 25 crores and Rs. 50 crores—may, if they want, offer 1/8 per cent more than the standard rates. The large banks with deposits above Rs. 50 crores will have to quote rates not higher than the standard rate of interest. One very important clause of the agreement defines term deposits as time deposits for a fixed period of at least six months. It may be remembered that the definition of the March 1961 agreement included deposits of even very short period.

The new agreement is certainly a step forward in the sense that it has avoided the deposit rate war which could be harmful to the healthy growth of banking industry. The agreement would certainly be of considerable assistance in preventing the vicious competition for charging higher deposits rates; it would also go a long way in uniting the banking institutions. This agreement would also help to stabilise the lending rates which would have continued to increase following the scramble for deposits. By allowing certain amount of premium to the small and medium banks, this agreement brings them at par with the larger banks which usually attract larger proportion of institutional deposits. The smaller banks would also be able to face the competition of larger banks in smaller places where the profit margins are not supposed to be very high. It is hoped the spirit of the agreement would prevail and the individual banks would co-operate with the Association in making this agreement a success.

INCREASE OF P.N.B. DEPOSITS

MR. P. N. GOENKA, Chairman of the Punjab National Bank Limited, indicated at the annual general meeting held recently in New Delhi, that the downward trend in deposits of scheduled banks witnessed in the second half of 1960 came to a stop in 1961. In fact deposits of all scheduled banks excluding the State Bank of India increased by nearly Rs. 135 crores during the year as compared to an increase of only Rs. 72 crores in 1960. Deposits of the Punjab National Bank crossed Rs. 150 crores mark during the year. The chairman was, however, of the opinion that the rate of growth of advances had been much higher than the rate of growth of deposits. This comparative slow growth of deposits, he believed, was partly due to the upward revision in the Inter-Bank Agreement of interest rates on deposits. The advances of the Punjab National Bank increased considerably and as against Rs. 87 crores in 1960 the advances towards the end of 1961 were nearly Rs. 102 crores. He was of the opinion that investments in real property and certain other forms have channalised resources which usually would flow to the banking institutions because the yield in the latter were comparatively unattractive. The Government also was borrowing on a large scale. He also expressed his disappointment over the manner and the method followed by the Government in initiating compulsory deposits insurance which had become a drag on the big banks and in the case of smaller banks it had actually cut into their earnings. It seems that the whole working of deposits insurance needs further examination.

He strongly recommended that the banking institutions should break ground by going to areas not hitherto served by banks and also by taking a more realistic view of financial needs of the different sectors of the economy. This, he added, could be done only if the banks strengthened themselves with a properly trained staff. On practical side, this expansion involved the training of the staff and an intensive study of the local conditions. In this connection the Punjab National Bank has remained in step with the need of the hour. It has its own training college which started functioning in October 1958 and its officials now are better equipped. It is hoped that all other banks pursue this practice.

Textile Industry

COTTON SHORTAGE MIGHT CREATE CRISIS

THE ACUTE cotton shortage presently being experienced in the country is the direct outcome of the sharp fall in the production of cotton in the 1961-62 season. At 43 lakh bales, the cotton output in 1961-62 compares with as much as 54 lakh bales in the previous season. It is not at all surprising, therefore, that the subject should be claiming the attention of every company chairman of late. Mr. Naval H. Tata, Chairman of the Tata Group of Mills, when he addressed the annual general meetings of the Swadeshi and the Ahmedabad Advance Mills, also drew pointed attention to this, last week, in Bombay.

Dwelling at length on the extremely alarming position in regard to our raw cotton supply, Mr. Tata observed that the situation had become further aggravated due to the country's inability to import adequate quantities of cotton to bridge the gap, thanks to the acute shortage of foreign exchange in the country. Even so, he felt, taking into consideration the standing of the cotton textile industry — the largest national industry employing nearly 8,00,000 operatives and having a total turnover of over Rs. 600 crores — the industry should be provided with adequate supplies to keep it going. In fact, he went so far as to describe it as a "compelling necessity in the interests of national economy."

Mr. Tata was afraid that the industry would have to curtail production, unless the supply position improved before the middle of September, 1962. According to him, the present shortage of 7,00,000 cotton bales is estimated to lead to a curtailment of production of some 15 to 20 per cent. Others have placed the figure even higher, that is nearly 30 per cent, which might mean the closure of the mills for a period of about six weeks! Happily for the country, an announcement was made from New Delhi, only last week, about the signing of an agreement between the U.S.A. and India for the supply of 1,80,000 bales of American cotton. Along with the 35,000 bales of cotton out of the recent barter deal, this supply from America would undoubtedly help retrieve, to some extent, the present perilous position. Besides the supply stemming from this agreement, there is also the welcome news of the Indian Government's offer to buy 2,00,000 bales of Sudanese cotton, provided Sudan agrees to buy Indian textile and other goods. A four-man delegation from Sudan has been in India to discuss and negotiate the details. Fortunately for us, Sudan has had a bumper cotton crop this season, and it may be hoped that a mutually satisfactory agreement would be reached soon.

But, while all these may serve to relieve our immediate anxiety, we must not forget that reliance on

imports all the time is hardly a satisfactory solution to the raw material problem of our cotton mill industry. In this context, it may be noted that Mr. Tata opined that even the Third Plan target of 72 lakh bales was beyond the country's capacity to attain. "With all the will in the world," he declared, "this target is unattainable." He was not exaggerating the position in the least, because, if we continue to produce no more than 90 lbs. per acre, as against the per-acre yields of Egypt's 540 lbs., America 450 lbs. and, nearer home, Pakistan's 230 lbs., we can never expect to reach even the modest target of the Third Plan. As he appropriately urged, a permanent solution to this problem could only be found through a substantial increase in our per-acre yield.

Power

FIRST FLOW OF KOYNA POWER FOR BOMBAY

THE COMMISSIONING, last week, by the Chief Minister of Maharashtra, of the first stage of the Koyna Hydro-Electric Project provides a welcome addition of 60,000 KW. of power to the power-starved and heavily industrialised Bombay-Poona region. The first stage of the work, comprising the installation of four generators, which will be commissioned one after the other, every six months, would when completed — i.e. by the end of 1963—account for a total addition of 240,000 KW. of power.

In the context of power shortage in the other regions to be served by Koyna, it is just as well that the civil works for the second stage also have been taken up simultaneously, the idea being that, as the fourth generator of the first stage goes into commission, the first generator in the second stage too should be ready for commissioning. All in all, by the end of the Third Five-Year Plan, a total of 480,000 KW. of power would be released from the Koyna Project. The power so released will be transmitted to six districts in the State and the Bombay-Poona area, for which four transmission lines are being laid — Koyna-Trombay (Bombay), Koyna-Karad, Karad-Sholapur, and Karad-Miraj. It is noteworthy that the Koyna-Trombay transmission line will be linked up with the Tatas-Central Railway grid so as to complete the grid for the entire western Maharashtra.

The Koyna Hydro-Electric Project was first conceived of by the Tatas as far back as the 'twenties. But they were forced to give up their plans owing to vehement opposition by the public at that time. The farmers of the region, whose lands would have been inundated by this project, offered Satyagraha—popularly described as the Mulshi Satyagraha—which lasted for more than a year. Ironically enough, the demand for inclusion of the Koyna Project in the Second Five-Year Plan came from the people of the same region, but after a lapse of more than thirty years. Following four years of intensive propaganda, (which included the threat to name every new born baby as Koyna until the demand was conceded) the scheme was launched in January, 1954.

Some of the highlights of the Koyna Project may be noted here. In the first place, a 207-ft. high dam has been constructed to create an artificial lake of 21 sq. miles 2,000 ft. above sea level. This area having been closely associated with the activities of the Hero of Maharashtra, the lake is appropriately named as "Shivaji Sagar". Secondly, the water stored in the Shivaji Sagar in the east is taken to the power house in the west at Pophali, through a 21-ft. head race tunnel 1900 ft. above sea level. The length of this tunnel is 12,300 ft. A novel feature is that the tunnel and the power house have been built in the heart of the western side of the Sahyadri mountain. It is claimed that this underground power house, a unique feature of which is the generation of extra power from the same quantity of water, will not only bring about an overall economy in the initial costs, but also lead to considerable saving in foreign exchange in the future.

Cables and Wires

PLEA FOR EXEMPTION FROM EXCISE LEVY

THE DELHI PLASTIC CABLE MANUFACTURERS' ASSOCIATION in a memorandum has pleaded that the small scale unit, manufacturing cables and wires be exempted from the present excise duty. The Government of India has levied an excise duty of 15 per cent ad valorem on electric wires and cables upto 10 amperes and 250 volts and 5 per cent above 250 volts and 10 amperes. Since small scale units are manufacturing electric wires mostly below 10 amperes and upto 250 volts this levy has particularly hit them hard.

The thing difficult to understand is that when units in the small sector are earning less profits they should be subjected to higher levy. In a socialist pattern of society, it is desirable that both the sectors must be kept on par and, particularly when the small sector is not very well organized, it is all the more reason that it should be meted a fair treatment. Large-scale units, on the other hand, enjoy numerous advantages in the form of financial resources, in technological and staff matters and are also able to manufacture those varieties of goods which cannot be manufactured by the units in the small sector. So they decidedly are in a position to sell goods at monopoly rates and subsidise the sale of those items which are manufactured in small sector as well.

The principle of levying any tax should normally be based on one's capacity to pay and when the small sector is not in a position to bear such a heavy levy, there is no reason why it should be made the scape goat and subjected to all the inconvenience. Under the circumstances it seems, therefore, essential that the plea made by the General Secretary of the Delhi Plastic Cables Manufacturers' Association be given due consideration. Exemption is certainly not claimed by the small-scale units for increasing their profits. Higher excise levy is not the only factor which is causing a good deal of heart burning in the small sector, but inequitable distribution of raw material too is causing a good deal of concern. It is high time these disparities were removed.

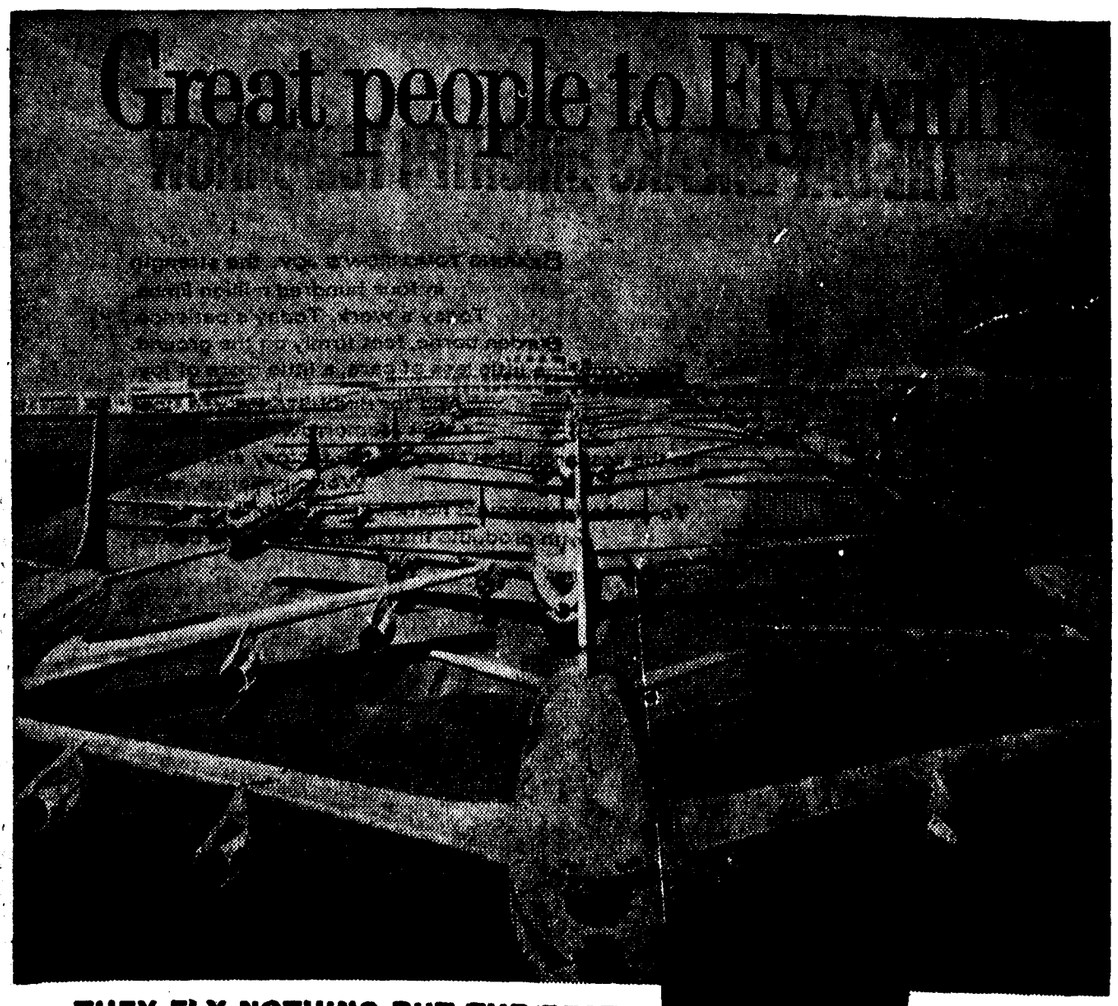
Electricity

PHILIPS INDIA

THE PRODUCTION capacity of Philips India increased considerably during 1961 and consequently their sales increased to Rs. 6.82 crores against Rs. 5.55 crores a year before. A number of factors were responsible for this rise in output. The company's Light factory in Bombay which it acquired in December 1960 started producing lamps of standard quality towards the end of 1961. At company's other factories at Loni and Calcutta production of radio sets and number of components also increased satisfactorily. The Directors have, in their annual report, indicated that the company is now making use of indigenous contents of radio sets to the extent of 70 per cent as against only 48 per cent in 1948. It may be added that the company's factory in Calchtta is also manufacturing fluorescent light fittings.

The gross profits during the year at Rs. 66.2 lakhs were nearly 7 per cent more than the last year's figure of Rs. 62.9 lakhs. The Directors have, however, pointed out that there was a decline in the net profit margin essentially due to rising expenses. The company transferred Rs. 3 lakhs towards depreciation rebate reserve and the Directors have recommended the payment of dividend at the rate of 12 per cent subject to tax which is a clear sign of company's continued prosperity.

The company has been able to conclude arrangements for foreign loans to cover imports of capital equipment needed for implementing the early stages of expansion schemes. The company is also exploring possibilities for exporting the products, though immediately such prospects are limited.



THE DAY BREAKS BRIGHTER TOMORROW

BEARING TOMORROW'S JOY: the strength
in four hundred million limbs.
Today's work. Today's patience.
Burden borne, feet firmly on the ground.
Tomorrow...a little less of care, a little more of joy.

And for HINDUSTAN LEVER, too,
tomorrow begins today.
In the research laboratory, in the factory and office.
Work, patience, care.
To serve tomorrow's homes and the nation's needs,
with products that grow better and better.

TODAY AND TOMORROW...
HINDUSTAN LEVER SERVES THE HOME
WITH SOAPS, FOODS, TOILET PREPARATIONS

—THEY FLY NOTHING BUT THE BEST

You may not recognise all the 'planes in the PIA fleet. Some of them are used for the local air-bus services that make flying in Pakistan almost as cheap and simple as hopping on a bus. They were chosen because they were exactly right for just that kind of job. In the same way, only the great Boeings are sufficiently big, fast and comfortable for PIA's New York run. And PIA extend this thinking far beyond just choosing their 'planes. They maintain and fly them with loving care, and land them strictly on schedule. (PIA hold an unbroken record for punctuality.) This is what makes people say nice things about PIA. It brought the airline 63% more passengers last year, and 41% higher profits than ever before. The figures wouldn't go up if they weren't great people to fly with.

FROM THE CAPITAL'S CORRIDORS

BOKARO STEEL PLANT

ACCORDING to reports from Washington, Mr. N. N. Wanchoo, Secretary, Department of Steel in the Union Ministry of Steel and Heavy Industries, has been able to finalise with the U.S. interests concerned the scope of the tour of a mission from that country which is expected here early next month to make a factual survey of the Bokaro steel project.

The curtain may now be raised from over the controversy that has been going on in respect of the U.S. assistance for setting up this fourth steel plant in the public sector in India. Apart from the availability of iron ore and easy transport, the U.S. steel industry had initially questioned the need for having a 10 million tons steel ingots output target under the Third Plan. Another factor that was responsible for hesitancy on the part of the U.S. interests for extending their assistance for setting up a steel plant in this country was that they wanted to have some latitude in selecting the site for such a plant. This implied that Bokaro's claims had to be judged on its merits. The third reason for the lukewarm response of the U.S. steel interests was that since Bokaro was envisaged to produce the same end-products as are to be manufactured at Rourkela, their contention was that Rourkela ought to be expanded to its full capacity before the setting up of the Bokaro plant is undertaken. An understanding is said to have been reached now on all these points. The U.S. Mission will be empowered only either to accept or reject Bokaro as the site for the fourth steel plant in the public sector; it shall not be allowed to consider any other alternative site.

Meanwhile, the Union Minister for Steel, Mr. C. Subramaniam, has reiterated in the Lok Sabha Government's intention to erect the Bokaro plant with U.S. assistance if possible and without it if necessary. This should imply that even if from U.S.A. aid is not forthcoming, the project shall not be abandoned. "Fortunately, we are not without friends in the world with ability, capacity and willingness to extend help," declared Mr. Subramaniam.

Who these friends are has been a subject of speculation in the lobbies here. Since both the British and the West German steel interests have already committed themselves to expand the Durgapur and the Rourkela plants, they are automatically ruled out. The French, the Belgian and the Japanese interests have ability to manufacture steel plants, but they have shown no inclination to finance the Bokaro project. This leaves only the Russians in the field. The Russians, it is stated, have indicated their willingness to build the Bokaro plant in addition to helping in the expansion of the Bhilai steelworks. The anxiety on the part of the Russians to help India in setting up its fourth steel plant in the public sector appears to be emanating out of their desire to show to the world that their steel technology is not behind any other country. The Bhilai plant does not produce the same high-quality steel products as are manufactured at Rourkela. If the Russians get a chance to erect the Bokaro plant, they will be able to show that they are as efficient in the manufacture of high-quality steel as West Germans or any other industrially advanced nation of the West.

Mr. Subramaniam, however, has amplified his Lok Sabha statement while talking to pressmen in Madras last week-end. There he said that he had no doubt about assistance coming forth from the United States for the Bokaro project and that when he had mentioned taking up of this job without U.S. aid, if necessary, he was only laying emphasis that the Government had set its heart on going in for this project.

STREAMLINING HINDUSTAN STEEL ADMINISTRATION

Mr Subramaniam has also given vent to his determination to streamline the administration of Hindustan Steel Limited. Speaking in the Lok Sabha last week, he said that at present much valuable time was lost in the game of passing on the buck that is going on between the public sector steel plants, Hindustan Steel and the Union Ministry. Mr. Subramaniam's solution to this problem is to entrust responsibility to individuals and sack them if they fail in their performance. The organisation of Hindustan Steel has expanded at a strident pace since it moved out from New Delhi to Ranchi. When it left Delhi, there were only 34 employees on its pay roll. It has now 415. Observers here opine that they would not be surprised if the dead wood in this organisation is done away with in the near future. Arrangements are being made to have a common staff, labour and raw material policy for all the three public sector steel plants.

Mr. Subramaniam agreed with the critics that Rourkela was a sick child. An official committee, he added, had submitted its report on the working of this plant. The defects of this plant (which had as many as 26 breakdowns since it was commissioned), he hoped, would be remedied soon, leading to stepping up of production.

Though he did not hold out any assurance that the Third Plan target of 10 million tons steel ingots output by 1965-66 would be achieved, Mr. Subramaniam promised to do his best to attain it. Work on the expansion programme of the Bhilai steel plant, he said, had reached an advanced stage. Tenders had also been called, he added, for completing the expansion of the Durgapur and the Rourkela plants according to schedule.

The search for finances for setting up the alloy steel plant at Durgapur continues. This project is now estimated to cost Rs. 60 crores, instead of Rs. 38 crores originally estimated.

PLEA FOR ANOTHER STEEL PLANT IN ORISSA

The National Council of Applied Economic Research, in its techno-economic survey of Orissa, has recommended setting up of a second steel plant in this State at Bonaigarh. The report says: "Investment in large-scale industries as envisaged in the report will give a strong push to the economy of Orissa. The spearhead of such a process of industrialization will be the establishment of industries based on locally available minerals. Investment in such industries accounts for 90 per cent (or Rs. 488 crores), out of a total investment of Rs. 538 crores in large-scale industries. The bulk of the investment will be absorbed by a new steel plant at Bonaigarh (Rs. 300 crores), expansion of Rourkela steel plant (Rs. 150 crores) and several other metallurgical and metal-based industries. These developments will step up the industrial output in Orissa by eight-fold. The industrial structure would also undergo a healthy change as the productivity of the structure as a whole will be more than doubled. This will be largely due to the preponderance of high value being added to heavy and metallurgical industries. Locationally, the bulk of industrial activities will be concentrated within the triangular area with Rourkela and Hirakud supplying the base and Cuttack forming the apex. Along with the development of large industries there will be considerable stimulus for the development of several small scale and processing, manufacturing and ancillary industries. It is expected that a number of industrial centres will spring up all over this region.

"The mining output is expected to grow at an annual rate of 37 per cent during the current decade and this

should lead to the establishment of several mineral-based industries within the State as well as large expansion of iron ore exports. But certain essential conditions must be fulfilled; namely, improvement of methods of mining and adoption of mechanized mining techniques, rapid expansion of transport facilities, including the development of Paradip port, training of mining labour and upgrading of skills and large-scale mining by the Orissa Mining Corporation."

ORE EXPORTS FROM GOA

The representatives of Goa mine-owners, who were here last week, were assured that the Government of India would honour all their existing contracts. They would also be free to enter into long-term contracts for the future.

Regarding prices, the policy generally to be followed would be that the Goa Administration would announce the prices for different varieties once every year. The mine-owners would be allowed to enter into contracts for long-term duration but prices might not be fixed for a term longer than three years.

They were further assured that on the basis of a long-term programme they should continue to develop their mines, modernize them and also undertake beneficiation and other diversification programmes. The Government would give all assistance for the modernisation and developmental efforts of the mine-owners.

Enquiries show that the State Trading Corporation will not handle ore exports from Goa. The Goan Administration, it is further learnt, had fixed prices of ore containing 55 per cent iron at Rs. 20.61 per ton for exports to Germany and Italy. The Government of India, it is pointed out, was not agreeable to this price, which was lower to that fixed last year. This might be the reason for mine-owners' visit to Delhi.

Japanese have a slightly different arrangement. They import ore in part payment of equipment supplied to Goanese.

BOARD OF TRADE

The first meeting of the recently constituted Board of Trade, with Mr. Manubhai Shah, Minister for International Trade in the Union Ministry of Commerce and Industry as Chairman, has been fixed for June 9, 1962. The Government has nominated Mr. G. D. Birla, Sir Ramaswamy Mudaliar, Mr. S. L. Kirloskar, Mr. Sachin Chowdhary, Mr. Khandubhai Desai and Raja Surendra Singh of Nalahgarh as the non-official members of this Board. Dr. P. S. Lokanathan and Mr. Padampat Singhania are likely to be co-opted as members.

As a measure of export promotion, the Government has decided to appoint directors to look after the work of productivity, incentives, movement and production in various industries. In order to ensure quick transport of exportable goods, railways have been asked to introduce a system of fixing "for export" labels on such consignments. Some of the leading business and industrial houses like those of Birlas and Tatas have been advised to set up special export organisations. This, it is stressed, will not only help in fostering marketing research and establishment of contacts abroad, but will also enable the Government to give financial assistance for export promotion more freely than at present.

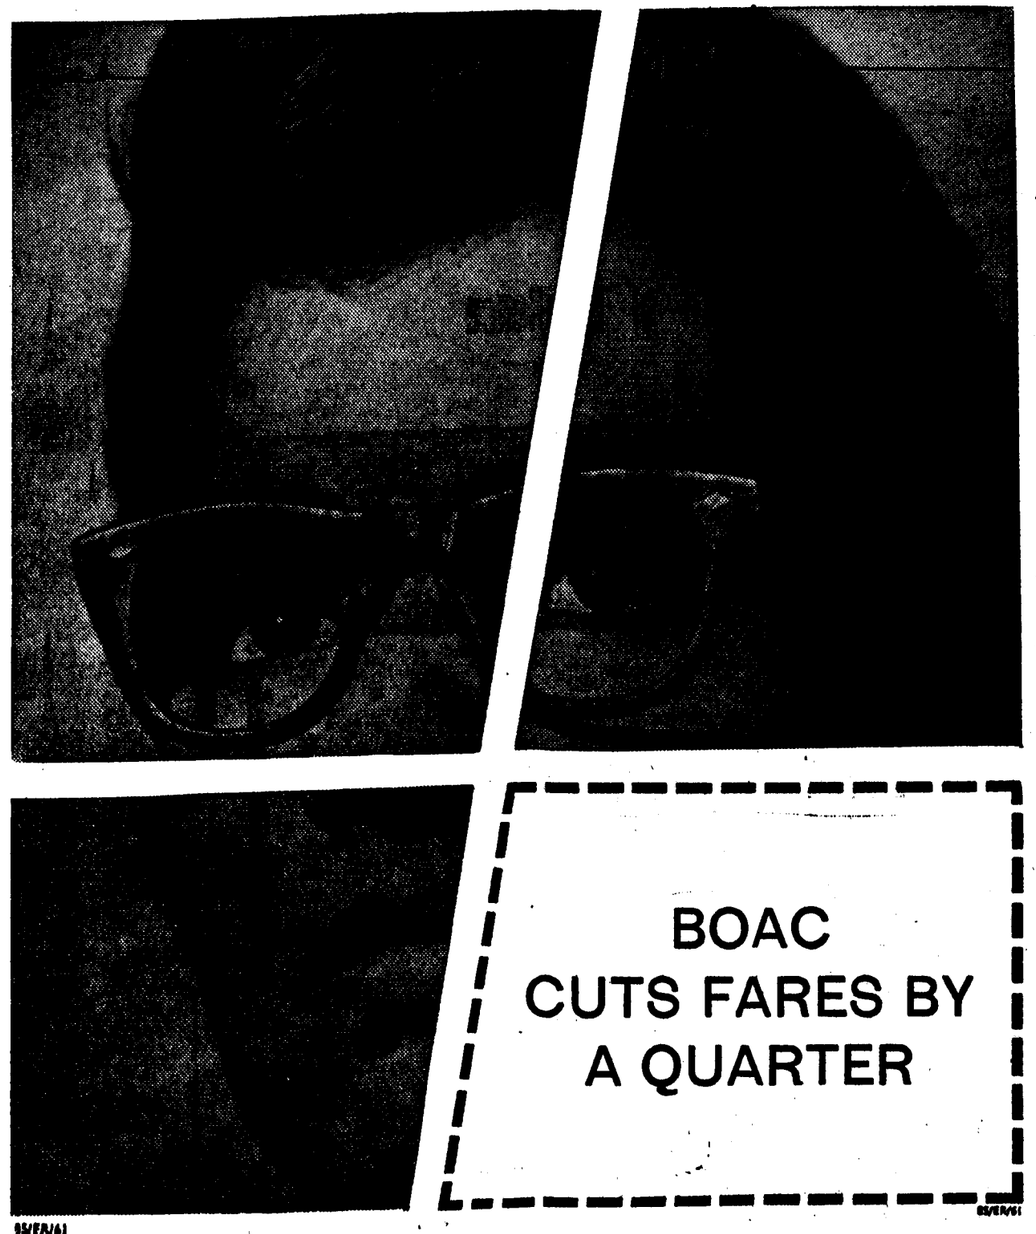
A proposal is also under discussion to levy a special cess on manufactured goods to enable the Government to collect adequate funds to be specifically spent on export promotion work. The Government is as well planning to set up an Institute for Applied Commerce to impart training to its own officers as well as the senior officers of the private sector concerns in order to enable them to undertake the export promotion task in a better way. The State Trading Corporation, which is envisaged to be given heavier responsibilities for stepping up exports, is also being re-organised.

MANUFACTURE OF ALUMINIUM FOILS

The disagreement between the Planning Commission and the Development Wing of the Ministry of Commerce and Industry over allowing of manufacture of aluminium foils has been resolved. The Planning Commission, it is learnt, has cleared the four proposals to manufacture aluminium foils (these proposals had been earlier approved of by the Development Wing) on the condition that these units will not go into production before 1965.

The Third Five-Year Plan does not lay down any target for production of aluminium foils, but the Development Wing had suggested a target of 9,000 tons by 1966 on the basis of the growing demand for these foils. On this basis, it had approved grant of licences to Venesta for raising its aluminium foils-making capacity from 2,000 tons to 3,000 tons per annum (the company had asked for expansion of its capacity to 4,000 tons), to General Industries Society for setting up a plant to produce 1,200 tons of aluminium foils per annum (as against 15,000 tons asked for by the company), to Indian Aluminium Company for producing 2,500 tons foils (as against 3,000 tons capacity applied for) and to the Aluminium Corporation of India for setting up a unit to produce 500 tons foils a year.

The Planning Commission's contention, it is stated, had been that aluminium ingots should not be utilised for the manufacture of foils till the time Indian aluminium industry is in a position to meet fully the internal demand for this metal. At present, aluminium requirements are estimated at about 60,000 metric tonnes, while the indigenous output is likely to go up to only 35,000 metric tonnes by the end of the current year. (In 1959, 1960 and 1961, aluminium production in India amounted to only 17,248 metric tonnes, 18,243 metric tonnes and 18,381 metric tonnes respectively). Demand for the metal is anticipated to increase to 1,15,000 metric tonnes by the end of the current Plan period. By that time, it is hoped, indigenous output will go up to the requisite amount.



ESSO'S OFFER

The Esso Standard Eastern has informed the Union Government that it is prepared to consider abrogation of the Special Refinery Agreement under which its Trombay refinery was set up, and reorganisation of its corporate srtucture in India. The proposal is more or less on the same lines as was made recently by Burmah-Shell. The only difference between the two proposals is that whereas Burmah-Shell intends to set up two companies with Indian public participation in their equity capital to handle its existing oil processing and distribution business, Esso proposes merger of the two activities under the charge of one company to be incorporated, as in Burmah-Shell's case, under the Indian Industries Act.

Mr. J. W. Sinclair, General Manager of Esso Standard Eastern in India, who communicated the offer of the company to the Government last week, has said that the company foresees a period of expansion and development of the Indian oil industry and believes that it is capable of playing an important role in this development, contributing substantially to the expansion of India's economy.

Esso Standard's negotiations with the Government for setting up a lubricating oil plant, in which the Government of India would be an equal partner, are said to be progressing satisfactorily. An agreement in this

SECRETARY TO GOVERNMENT
31 MAY 1962
PUBLIC DEPARTMENT

respect is expected to be reached at none-too-distant a date.

So far as its petro-chemical project is concerned, the company does not appear to be in favour of going into partnership with the Government and is insisting on grant of a licence for a minimum capacity of 2,00,000 tons per annum.

Esso Standard does not appear to be much interested in oil exploration business in this country under the existing policy of the Government.

OIL INDUSTRY'S OUTPUT IN 1961

The total quantity of crude refined in India by the four private sector oil refineries during 1961 was as follows:

(Metric tonnes)

Assam Oil	448,346
Burmah-Shell	2,910,778
Caltex	997,708
Esso Standard (Stanvac)	2,046,317
TOTAL	6,403,149

Refined products output category-wise was as under:

('000 metric tons)

Product	ESSO	Burmah-Shell	Caltex	Assam Oil
Light Distillates	351	436	181	91
Kerosene	256	549	126	86
Diesel	530	744	319	75
Lubricating oils	..	..	..	25
Bitumen	138	290	..	10
Heavy ends	671	764	301	75
Other products	10	15	..	56

MEETING POWER SHORTAGES

The Government of India is making every effort to find foreign exchange for the purchase of six package units of 10,000 kW. each to meet the acute power shortage conditions prevailing in the States like Andhra Pradesh, Mysore and D.V.C. West Bengal-Bihar areas. These package units, which could be commissioned within a period of nine months to a year, would be in addition to those already sanctioned or included in the Third Plan. This was disclosed at the last week's meeting of the Informal Consultative Committee for the Union Ministry of Irrigation and Power by Mr. O. V. Alagesan, Minister of State in the Ministry of Irrigation and Power.

It was also stated at the meeting that used diesel plants could be made available to the States for tiding over their temporary difficulties arising from an acute shortage of power.

The Committee was also informed that a number of power projects would be commissioned in Andhra Pradesh by the end of 1965. These included the Nellore Power Project, expected to be completed by the end of 1963, and the Kothagudam and Ramagundam projects, which would be commissioned by the end of 1965.

Details were also given at the meeting regarding the development of rural electrification for agriculture and village industries in the Third Plan. A total number of 20,000 villages are expected to be electrified by the end of the current Plan, at a cost of approximately Rs. 105 crores.

BASIC RAW MATERIALS FOR ORGANIC CHEMICALS AND PLASTICS

The Distillers Co. Ltd., of Britain, has reached an advanced stage in its negotiations for the formation in India of a new company, Herdillia Chemicals. This project has been approved by the Indian Government and would provide basic raw materials for the country's organic chemicals and plastics industries.

Licences have already been granted to the Distillers Co. for the import into India of a number of raw materials. They are: cumene, 14,500 tons a year; phenol, 10,000 tons; acetone, 6,000 tons; diacetone alcohol, 2,000 tons; phthalic anhydride, 6,000 tons; and phthalate plasticizers, 3,000 tons.

The phenol process has been developed by the Distillers Co. in Britain and independently by the Hercules Powder Company.

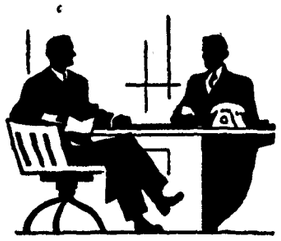
MANUFACTURE OF FERTILIZERS

Khandelwals, it is understood, have returned the industrial licence granted to them to set up a fertilizer manufacturing unit at Itarsi. This unit was envisaged to be based on coal which, it is now considered, would render it uneconomic.

Meanwhile, interest has been shown to set up a fertilizer plant in Goa. Whether the Government should link these two projects and allow a private sector company to establish them or whether it itself should take up the Itarsi project is a proposition that is said to be under consideration here.

SMALL COLLIERIES

Government policy, it is stated, by and large, is not to encourage development of small uneconomic collieries which cannot raise their production to 10,000 tons per month or whose area is less than 100 acres. Under the provisions of the Industries (Development and Regulation) Act, 1951, factories which employ less than 50 workers, working with the aid of power, or less than 100 workers, working without the aid of power, are not required to obtain any licence under the Act. In order, however, to regulate opening/re-opening of coal mines on a scientific basis, the production of a licence under the Act is insisted upon by the Coal Board in the case of coal mines. A proposal to amend the Act, making it applicable to collieries irrespective of the number of workers employed, is at present under the consideration of the Government.



RAW COTTON IMPORTS

Efforts are being made to arrange imports of raw cotton from various countries to meet the shortage of the commodity apprehanded to occur in the near future.

An agreement has been signed between the Government of India and the United States under which India would be importing 1,80,000 bales of long-staple cotton (valued at Rs. 13.4 crores) under the U.S. Public Law 480. This pact forms a supplement to the sixth U.S. P.L. 480 agreement entered into between the two countries on May 1, 1962.

Under the Cotton Textiles Export Incentive Scheme, mills have been allowed to import cotton against exports of their cloth and yarn during the quarter April-June, 1962, and onwards. This has been announced in an Import Trade Control notice issued on May 18. Mills will be eligible for import entitlements for raw cotton worth upto 66-2|3 per cent of the f.o.b. value of cloth and yarn exported by them. They would be allowed to retain for their use all the imported cotton if their exports consist of fine and superfine cloth and yarn of counts 60s and above and if these exports are manufactured out of the foreign cotton imported by them. In othr cases, mills would be allowed to retain 30 per

Beautifully designed
Brilliantly engineered
MODERATELY PRICED

In Orient's modernised factory constant research and planning go on to improve methods and technique of production. These result in improvement of the products on one hand and lowering of costs and prices on the other ... bringing ultimate benefit to the consumer.

No wonder that you get beautifully designed attractively finished Orient fans at such low prices ! Trouble free performance and economy in use account for these fans being the most popular fans in India today.

cent of the imported cotton and the remainder shall have to be made available by them to the Textile Commissioner on terms to be prescribed from time to time. The Textile Commissioner will certify the import entitlements in each quarters. Applications for import licences will thereafter be considered by the Joint Controller of Imports and Exports, Bombay.

Possibilities are also being explored to import some cotton from Sudan in exchange for Indian cloth exports. A trade delegation from there is already here to negotiate sale of Sudanese cotton.

During the forthcoming talks between a trade delegation from Pakistan and the Government of India import of increased quantities of Pakistani cotton will be one of the major items of discussion.

ZETOR TRACTORS

"India is one of the biggest buyers of Czechoslovak tractors and other agricultural machinery", claimed by Mr. V. Kirsbaum, Trade Representative and Commercial Counsellor of Czechoslovakia in India last week. He added that "at present, there are three types of tractors which are being manufactured in Czechoslovakia. First is the ZETOR 3011-Major, 3-Cylinders Diesel 30 HP with the lowest speed of 12 kilometers per hour and the top speed of 24.5 kilometers per hour. The other type which is going to be introduced in the market is ZETOR MINOR of 22 HP capacity, 2-Cylinder Diesel. The third type is ZETOR SUPER 4-Cylinders 50 HP.

"Czechoslovakia is not only a supplier of tractors to India, but in collaboration with Messrs. Tractors and Buldozers in Baroda, a progressive manufacturing of ZETOR SUPER tractors was started. Nearly 50 per cent of indigenous parts are now being used in manufacturing of these tractors in India. The factory is having a planned capacity of 2,000 tractors per year."

IMPORT OF CAPITAL GOODS

According to an Import Trade Control Public Notice, applications for capital goods and heavy electrical plant licences for value in excess of Rs. 5 lakhs for import from countries other than Rupee Area countries and applications of value in excess of Rs. 20 lakhs for import from Rupee Area countries, should henceforth be submitted in the prescribed form to the Development Wing (Mr. M. Veeraraghavan, Deputy Director, Coordination), Udyog Bhavan, New Delhi, and not to the Chief Controller of Imports and Exports, New Delhi. This step has been taken to obviate delays in the disposal of applications.

ICI INTRODUCES TRIPLE BENEFIT RETIREMENT SCHEME

ICI and its two associated companies, Indian Explosives Limited and the Alkali and Chemical Corporation of India Limited, have introduced a Non-contributory Pension Scheme as service conditions for their 5,500 non-management staff, including hourly rated workers. This pension, which is in addition to the existing two retirement benefits of Provident Fund and Gratuity, will be paid every month to an employee during his retired life. The scheme takes effect from January 1, 1961, and applies to all staff who give a minimum of twenty years' satisfactory service.

The scheme will provide a pension which together with the annuity value (at the LIC rates of annuity) of sums received under Provident Fund and Retirement Gratuity will approximate 50 per cent of the last seven years' average earnings consisting of basic pay and dearness allowance. This guarantees minimum pensions of Rs. 45 a month for general staff and Rs. 20 for subordinate staff and hourly rated workers. While there is a guaranteed minimum, no maximum has been stipulated and all members of non-management staff irrespective of grade and pay are covered.

Pension will also be considered even where the employee is prematurely retired for reasons of health or other circumstances provided he has given a minimum of twenty years' service and the premature retirement is within five years of the normal age of retirement.

IN BRIEF....

The Union Government proposes to set up shortly a Joint Committee of Parliament to supervise the working of public sector enterprises, it was announced in the Lok Sabha last week. This would help in improving the work of these undertakings. A Government motion for setting up this Committee would be introduced in the House soon.

*

The U.S. Government has communicated to the Government of India its approval for a loan of Rs. 9.6 crores to finance the foreign exchange cost of the Pamba Kakki Hydro-Electric Project. It is intended by the Government of India to secure a rupee loan of Rs. 15.31 crores from the U.S. Public Law 480 counterpart funds to finance the rupee expenditure on this project. No loan agreement, however, has been signed in this respect.

*

The Government has approved the proposal of the Kulu Valley Development Company to set up a newsprint manufacturing unit in Kangra (Punjab) in collaboration with a Canadian firm.

*

One lakh metric tonnes of sugar have been released for export last week. This is in addition to 50,000 metric tonnes released for this purpose on May 1 and one lakh metric tonnes released in February last.

COMPANY AFFAIRS

ORISSA CEMENT

There was a substantial improvement in the working of Orissa Cement Ltd., during the year 1961. Gross profit at Rs. 1.61 crores was nearly 40 per cent more than last year's figure of Rs. 1.1 crores. After separating Rs. 36.82 lakhs towards depreciation, Rs. 2.91 lakhs towards development rebate, Rs. 44 lakhs towards taxation and Rs. 30 lakhs towards general reserve, the Directors recommended the distribution of dividend at a rate of Rs. 1.50 per ordinary share of Rs. 10 each, which will absorb Rs. 33.75 lakhs. The Directors have reported that production of both Clinker and Cement registered an improvement as against the previous year. Rather strained situation regarding the availability of wagons was responsible for only a negligible improvement in dispatches. Production and dispatch of all types of refractories was, however, considerably higher than the previous year which contributed significantly towards higher profits. The Directors also reported that the ex-work price per ton of cement payable to the company has been increased from Rs. 60.80 to Rs. 69.50. The Government of India has, however, not accepted the recommendations of the Tariff Commission in full nor was the increased price made effective from 1st July, 1961, as recommended by the Commission. It was made effective from 1st November 1961. The Cement Manufacturers' Association has submitted a representation to the Government for reconsideration of the prices fixed by them. A separate representation has also been made by the Company in respect of various increases in costs consequent on governmental action including the 15 per cent duty on electricity levied by the Government of Orissa with effect from 16th October, 1961. Since the several increases have taken place after completion of the Tariff Commission enquiry, their incidence was not included in the cost computations.

TRAVANCORE RUBBER

The working results of the Travancore Rubber and Tea Company Limited recorded a net profit of Rs. 5.09 lakhs after making usual provisions for depreciation, income-tax, etc. This compares favourably with the net profit recorded last year of Rs. 4.75 lakhs. The directors recommended a dividend of 10 per cent which was highest during the last four years. Dividend for 1960, 1959 and 1958 was 9 per cent, 7½ per cent and 5 per cent respectively.

The rubber crop harvested during the year was 6,26,992 kgs. as against an estimate of 5,30,703 kgs., or an increase over estimate of 96,289 kgs. and 76,130 kgs. more than the crop harvested during 1960. 1961 has established a fresh record for rubber crop in spite of the abnormal South-West Monsoon resulting in a heavy toll of tapping days. The main reason for the improved crop return is the intensification of the tapping system, more particularly in those areas scheduled for rehabilitation in the years ahead. It is estimated that a crop of 7,25,000 kgs. rubber will be collected during 1962 at an estimated estate expenditure of 162.47 nP. per kgm.

Tea crop harvested was 5,78,898 kgs. which is 26,647 kgs. below estimate and 10,638 over the crop for the year 1960. This is most satisfactory when taking into account the adverse weather conditions experienced during the year under review. In 1962 it is estimated that the tea crop will be 5,86,000 kgs. to be secured at an estimated estate expenditure of 310.15 nP. per kgm.

NEW ISSUES

The following companies have been granted consent to issue fresh capital. Of these, one is a new company, two are State Corporations and one is a bank. The consent of the Controller in all cases is valid for 12 months.

Mastic Products of India Limited, a new company proposed to be incorporated in Maharashtra, has been granted consent to the issue of capital of Rs. 80 lakhs divided into equity shares of the value of Rs. 65 lakhs and preference shares of the value of Rs. 15 lakhs.

Out of the equity issue of Rs. 65 lakhs the company will issue shares worth Rs. 23.80 lakhs to Ruberoid Company of New York, U.S.A., for consideration other than cash being the value of plant and machinery to be supplied by them. The company has obtained a licence under the Industries (Development and Regulation) Act for the manufacture of various types of tiles for which a factory will be established in the Maharashtra State.

The Industrial Development Corporation of Orissa Limited is to issue capital of Rs. 50 lakhs in equity shares of Rs. 100 each for cash at par to the Orissa Government. The proceeds will be utilised for the establishment of a cement and a cable factory.

Bimetal Bearings Limited, Madras, is raising equity capital of Rs. 40 lakhs (in addition to Rs. 10 lakhs already issued) for cash at par. The proceeds of the issue will be utilised for the manufacture of shell-back bearings, bushings for automobiles etc., in collaboration with Clevite Corporation, Cleveland, Ohio, U.S.A. and Renco Limited, Melbourne, Australia.

The Union Bank of India Limited Bombay, will issue further capital of Rs. 40 lakhs (nominal) divided into 8,00,000 equity shares of Rs. 5 each, fully paid-up, for cash at a premium of Re. 0.50 nP. per share. The proceeds will be utilised for strengthening the bank's capital base. The present paid-up capital is Rs. 60 lakhs.

Industrial Tools Private Limited, Calcutta, is to issue 25,000 equity shares of Rs. 100 each for the manufacture of House Service Meters for which a licence has been obtained by the company under the Industries (Development and Regulation) Act. The company will convert itself into a public limited company and offer shares for public subscription.

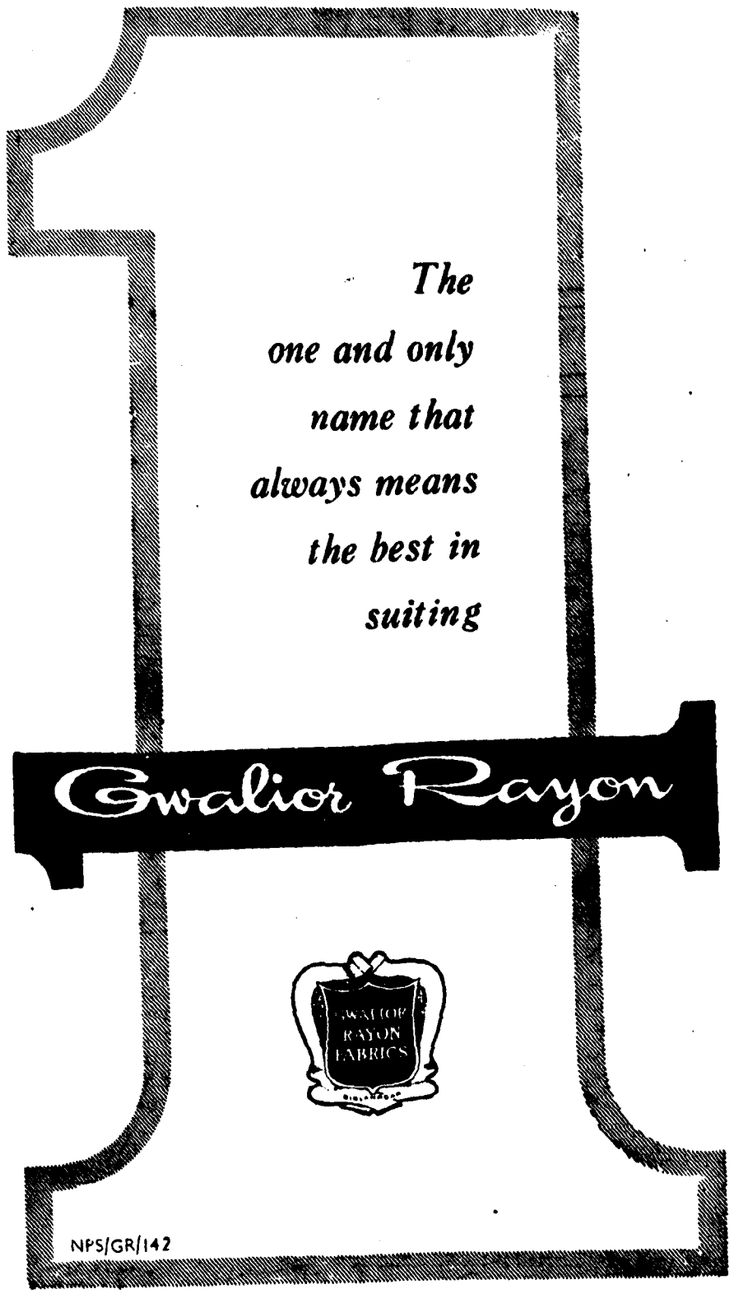
(To be continued)

AVB's newest assignment: to supply high pressure boilers for the Delhi 'C' Power Station of the local Electric Supply undertaking.

These modern steam generating units, designed to deliver 960°F-steam at a pressure of 1300 lb. per sq. in., will drive two turbogenerators with a total capacity of 125,000 kw. There will be provision for increase to 187,500 kw. in the near future. Low grade coal, the primary source of energy for the power plant, will be processed in the latest Babcock Type 'E' Pulverisers and burned under the surveillance of automatic combustion control equipment.



The Delhi installation is the latest in a distinguished series of contracts entrusted to AVB in Maharashtra, Madhya Pradesh, Uttar Pradesh and other parts of India.

In providing much-needed thermal power for Delhi, AVB will make yet another contribution to the development of Indian industry...the all-round progress of the nation.

An outstanding example of international collaboration, AVB brings to India the varied and extensive knowledge of three leaders in industry—India's Associated Cement Companies Ltd., Britain's Vickers Ltd. and Babcock & Wilcox Ltd. These famous enterprises have joined together in establishing at Durgapur a large and modern heavy engineering works to 'tailor-make' cement-making machinery, high pressure boiler plants and heavy equipment for mining and other industries.

Aid Postponement: Implications

FRANKLY, the action of the Aid India Consortium in postponing its decision on the enlarged size of aid to India for the current year has caused keen disappointment in this country. Two months of the financial year have already run out and the few weeks which will elapse before the Consortium is reconvened will keep uncertainty hanging, making it difficult for us to finalise the specific programmes of development for this year and to place orders in time for equipment and materials required for them, since virtually all the loans will be tied to particular projects—even West Germany seems to have made up her mind to depart from her last year's practice to provide enough scope for free use of her credits at our discretion. The absence of untied credits heightens the element of uncertainty in the immediate context inasmuch as we have now no mentionable cushion of foreign reserves to meet the maturing obligations of external payments.

To put this reality in plain words is certainly not to create a scare that the expansion programmes of the second year of our present Plan stand threatened to be paralysed. The members of the Consortium announced in June last year itself their tentative allocations for 1962-63. But the crux of the problem is how completely the gap of $220 million in the combined share of the member-countries other than America will be wiped out. This depends on the increases in the amounts of the credits they finally decide to make in addition to what they declared in June 1961. Until certainty is reached in this matter negotiations for the individual projects to be tied to the credits are difficult to be taken in hand.

The temptation would be strong to attribute the indefinite postponement (when time is of the essence of the situation) to extra-economic, or to put it precisely, to political, reasons. Goa, the Kashmir dispute, India's policy on disarmament and other controversial issues at the UN and finally the MIG-21's may be recalled. It would be idle to pretend that these issues have not produced varying adverse repercussions in the different aid-supplying countries. But differences—sometimes acute—between India and the aid-giving friendly countries have been maintained on several vital questions and their existence is tolerated in a truly democratic spirit. It is regrettable enough that these differences arise intermittently. Whatever the immediate intensity of the reactions to them, the correct perspective is not lost and the fundamental objectives of economic aid for development are not subordinated to political moods.

This is to be seen from the communiques issued by the Consortium. At the end of the previous meeting of the Consortium held on January 29-30 this year, immediately in the wake of the Goa operation, the official communique stressed the central fact that, on an appraisal of India's requirements of assistance for 1962-63, the Consortium recognized the need for additional aid during the year. The drastic cut of 25 per cent applied by the Senate Foreign Relations Committee to the aid recommended for India by President Kennedy is likely to be picked up as an important factor setting the tone for the grant of aid. But this week's communique mentions the intention of the members to increase their contributions. There is another aspect to the cut. The cut in its revised form (at the hands of the Senate Committee itself) places $545 million, the amount of aid supplied in 1961-62, as the ceiling for 1962-63. This is to allow the provisional allocation of $500 million for the fiscal year 1962-63 to be raised by $45 million. But the practical difficulty posed is whether the other member-countries will raise their allocations to fill the gap of $220 million in their contributions to achieve parity with America's offer of $500 million. The ceiling of $545 million enhances the difficulty still further.

This is the issue which calls for patient endeavour if it is to be resolved as much to the best benefit of India as practicable. And in this regard the perseverence of Mr. Eugene Black is a matter of common knowledge. This week's communique contains the significant and encouraging statement that indications were available that the amounts of credit from individual countries would be raised. This, of course, is not the same thing as saying that every single member-country other than America gave such an indication or that the figures of increase hinted at were sufficient to eliminate the gap in a substantial measure, if not entirely. More than one-third of the shortfall in the aggregate contributions of the non-American members is estimated to be the order of these indications.

It includes the maiden credits of new-comers. Austria and the Netherlands participated in the Consortium's deliberations as full members. Belgium and Italy have shown interest in joining when sounded by the IBRD President and Sweden is mentioned as a likely participant. Mr. Eugene Black is using his good offices to persuade the members to be more generous in their co-operation to close the gap. The mention of "several weeks" to enable the members to reach the final decision on their contributions need not be interpreted as an inordinately long postponement. Fixing a definite date for the next decisive meeting of the Consortium would have served little purpose; rather, it may have created avoidable embarrassments in some cases.

The background to America's proposal about the combined contributions of the rest of the member-countries matching to her own need not be repeated here. The proposal-cum-stipulation was made last year, but she demonstrated the flexibility of her attitude by allowing some disequilibrium between the two components of the credits. Her allocation for the first year of the Third Plan was $545 million as against $500 million from the rest. Comparability rather than parity seems to be her condition in this behalf. Optimism will not be wrong if it is assumed that there will be no reverse action on the part of America to readjust her amount of $500 million for 1962-63 to conform to the criterion of matching con-

tributions. What will be the margin of tolerance and how high the rest of the members will increase their amounts need not be speculated. But the time-lag that will be involved may make it necessary for us to seek a loan from the IMF as an interim solution. There will always exist the need to fix priorities for development programmes for concrete implementation to suit the availability of external credits. But there is no warrant for the pessimism that the current year's expansion programmes will be frozen on a substantial scale.

Granaries—Today and Tomorrow

MR. S. K. PATIL indulged in no exaggeration when, in reply to the debate on the demands for grants for his Ministry in the Lok Sabha last week, he observed that "our granaries are full" and that "the food situation today is as it was never before in the history of India". Although this happy position has been largely brought about by heavy imports effected under the U.S. P.L. 480 programme or otherwise, it is also a reflection in some measure of the progress that Indian agriculture has made under the Second Five-Year Plan, especially during the last three years. Foodgrains output has been consistently going up during this period. In 1959-60 it amounted to 74.7 million tons. In 1960-61 it went up by 4.6 million tons to 79.3 million tons. During the current agricultural year, which is coming to a close this month, it is estimated to go up further by about 1.2 million tons to 80.5 million tons. The combined effect of higher indigenous output and massive imports, which since 1959 upto February-end this year have been of the order of 13 million tons, has been that wide fluctuations in food prices have been ironed out and the prices touched in the lean months during all these three years have been substantially lower than those recorded in 1957-58. Today India's food production falls short of domestic requirements by only about 3 million tons.

A part of the increase in grains output in the recent past may have been only of a statistical nature, as has been claimed by not a few statisticians. But that it has been maintained well above 75 million tons during the past three successive years despite the fact that they were not exceptionally favourable, is a pointer to the fact that the massive investment that has gone into our agrarian economy under the first two Plans has started yielding returns. Intermittent reversals coming from the vagaries of weather are not fully amenable to control. Their reduction will take many more years during which irrigation facilities will have to be extended persistently and supplies of other modern aids to farm production augmented. But as conditions obtain today, the country can well look forward to a comfortable food supply during the coming years.

It is sometimes argued that the rate of increase in food output during the past one decade has been such that it makes the Third Plan target of 100 million tons appear unrealistic. During the 'fifties India's food production went up from 54 million tons in 1949-50 to 65.79 million tons in 1955-56 and to 79.27 million tons in 1960-61, showing an increase of about 12 million tons over the five years of the First Plan and of 13.5 million tons over those of the Second Plan. On the basis of this trend, an increase of nearly 15 million tons can be expected over the five years to 1965-66. But the Plan assumes an increase to the tune of 20 million tons. That this is not out of our reach should be evident from the fact that the cumulative effect of the investment that has already gone into the agricultural sector and of the heavy investment that is envisaged upto 1965-66, will be felt only in the next few years.

But there is one danger which has to be warded off. It is that the present comfortable food supply position should not lull us into any false sense of complacency. The Food Minister's much publicised statement quoted at the outset conveys, if unwittingly, such a feeling. If anything is required to achieve the Third Plan food target, it is redoubling of effort. Not only the supplies of various aids to food production, particularly of fertilizers, have to be augmented, commensurate with the demand for them, but there is need to extend the principle of fixing support prices for as many food crops as possible. This has been done so far for wheat only. Rice should be the next beneficiary.

The progress that has been made during the first year of the current Plan in respect of the various developmental programmes of agriculture should temper Mr. Patil's exuberance. It is becoming crystal clear that the ambitious, but imperative, one million ton target for nitrogenous fertilizers is not likely to be achieved if the matters are allowed to drag on at the present pace. Although installed capacity for the manufacture of these fertilizers has been allowed to be stepped up to 1.25 million tons, as many as four important projects have been delayed and they may not go into full production by 1965-66. The Itarsi project appears to have been caught in the doldrums. The Neyveli project is about two years behind schedule. The Gorakhpur project too may not be completed according to plan. The Durgapur project meets the same fate and even technical collaboration has not yet been secured for it. Then there is every possibility of coal shortages hampering the production of fertilizers, as of so many other industrial products. In case the threatened serious shortfall in fertilizers output, which according to a recent appraisal by the Planning Commission may be of the order of 10 per cent below the target, is not compensated by imports, the achievement of the food production target is bound to become difficult. The severe rationing of foreign exchange is a limiting factor for imports of fertilizers too.

There may also be some shortfalls in the attainment of the targets for such development programmes as provision of improved implements (due to a grave set-back to the steel expansion plan), extension of multiple cropping and production of urban compost. If energetic action is not taken to set things right from now on, self-sufficiency in food by the end of the current Plan period may prove to be elusive as hitherto. It is not enough that the granaries should be full today. They must be full tomorrow and thereafter. But fullness is a relative concept. Unless the current intake of 2,100 calories per day is stepped up to 2,300 calories in 1965-66, the Plan will not have fulfilled its basic purpose. In the absence of adequate availability of protective foods, the masses in India will continue to take more grains than the Westerners do. Provision has to be made for it.

Kerala: Industrialisation

THE urge of the Government and the people of Kerala to make firm beginnings in the industrial expansion of the economy of the State is easily understandable. In this State, thickly populated as well as highly advanced in literacy, the compulsion of creating a broader and more diversified base for the expansion of the economy than heretofore is quite obvious. The Kerala Government itself is keenly aware of the injustice that would be done to the people, if it does not give a lead to accelerating the pace of industrialisation, instead of leaving it to the leisurely initiative of the local entrepreneural talent. The problems of Kerala's economy typically represent the problems of an economically backward region and hence there is the need for a determined effort to put an end to stagnation by the effort of the State as well as of the private investor.

It speaks for the earnestness of the Kerala Government that it is approaching this problem on the basis of a technical investigation of the issues involved. The report which the All-India Manufacturers' Organisation recently tendered to the Government at its instance on this subject throws light on the potentialities of exploiting the natural resources of the State. The time available to the AIMO for the laborious investigation that was needed was apparently inadequate, but it has been fortunate in having at its disposal considerable useful material collected on this subject by the National Council of Applied Economic Research in its preliminary survey. It is perhaps arguable that here some duplication of effort has been involved, but it is also true that two technical organisations, looking at the problem from somewhat different angles, would place before the State Government proposals of a varied nature.

An industrially less developed region like Kerala State has certainly a strong claim on the Centre for the allocation of financial and other resources for development on a large scale. Kerala's case in this respect is strengthened by the fact that it accounts for a share of something like 10 per cent in the nation's total earnings of foreign exchange. The margin of error in this estimation apart, the Kerala Government can maintain that its substantial share, relative to its size and population, in the earnings of this scarce resource entitles it to greater indulgence than other economically comparable regions. A grievance against an inadequate share in the allocation of resources for development by the Planning Commission has become a fashionable and stock plea with many States. But the AIMO's report suggests in somewhat emphatic terms that, when a similar grievance is voiced by the Kerala Government, it is based on sound reasoning.

One of the charges made by the State Government relates to the raw deal meted out to the region in the establishment of State-owned heavy industries for which a case could be made out. The argument for the industrialisation of Kerala rests mainly on stepping up its national income and employment and on both these counts the contribution made by heavy industries can hardly be considered to be as substantial as that made by other industries. Nevertheless, where economic factors justify the location of heavy plants in this State, they should be set up, irrespective of the fact that prestige is also a factor that enters into the pressure of demand for heavy plants.

The report contains an elaborate list of industries — large, medium as well as small in the scale of operation—and industries suitable for development under the auspices of the public and private sectors. To mention a few among them, chemicals, ceramics, plantation crops, electrical goods and a number of industries, which lean heavily on a variety of plantation crops, can be given priority with the expectation of reasonable returns within a modest period of gestation. There is also a good case for the expansion of the existing industries. Happily Kerala is situated in a position in which the pace of industrial development will not be retarded for lack of transport and power.

But a word about power is necessary. At the end of the Second Plan the production of power in Kerala was 1.64 lakh kW from where it is to be steeply raised to 5.48 lakh kW at the end of the Third Plan. This is a tall target indeed and if the experience of planning in any State in India is a useful guide, the State Government would do well to take full precautions against a likely shortfall of a serious nature in the Third Plan target. If one major argument for accelerated growth of industry in Kerala is the prospect of the availability of ample power at cheap rates, the programmes of individual industrial projects should be co-ordinated with the progress of the plan for power development. If this precaution is somehow overlooked much of the investment will be immobilised with consequent disappointment and a possible set-back to public confidence.

The Kerala Government has adopted a conscious policy of creating an attractive climate for investment in industry. And to this end a number of aids and incentives have been provided. Local savings are to be channelled into investment in industry by the offer of special facilities to acquire the different categories of resources from land to imported equipment and materials. Inducement is also offered to investors from outside the State to establish industries in Kerala either independently or in collaboration with local investors. The Government is aware that in certain spheres private capital should be enabled to overcome its shyness and here the inducement is held out of the sharing of risk by the State along with the private sector. All in all, a complex of measures are being adopted to attract the flow of investment capital of which there is a traditional dearth in this State. It is not as if Kerala has been free from set-backs to industrial enterprise before and the examples of certain industries being stultified in Kundara and Quilon provide object lessons. The report suggests preventive action to avoid such pitfalls.

Kerala has not ceased to be a problem State politically. Of great importance is the overriding necessity of a stable government without which the appropriate climate for the uninterrupted growth of industry will be hard to ensure. This is a vulnerable point in the political structure of Kerala and the AIMO's report has done well to focus attention on it.

THE WEEK'S NOTES

West Irian

DANGER IN DELAY

AS THE WEST Irian dispute keeps on dragging, its prolongation holds a threat of the element of pugnacity gathering increased momentum. This is confirmed by reports of landings of more Indonesian paratroopers, more important claims of towns or areas falling into their hands, counter-reports of the paratroopers being repelled, arrested or killed, large areas being evacuated under the Dutch authority's instructions for reasons of safety, and so on. Whether the dropping of Indonesian paratroopers in West Irian constitutes the beginning of organized aggression or whether it is part of the liberation movement by volunteers is a subtle point the niceties of whose interpretation can be debated without bringing the solution any the nearer. But it is an exaggeration to maintain that there is a present threat to peace in that region from an aggressive attack. Prof. Jan de Quay's letter to U Thant, drawing his pointed attention to Indonesian attacks on West Irian, has brought a meaningful reply, accompanied by an appeal from the Acting U.N. Secretary-General. He has asked both the sides to refrain from aggressive postures, implying that he is aware that both the parties could be considered as involved in preparations for open violence as a method of solution of the dispute. The Dutch Premier's suggestion for posting U.N. observers in West Irian was also unacceptable to the Secretary-General on the fundamental ground that such a suggestion ought to be endorsed by both the sides and also because the posting of observers may affect his efforts to bring the parties together for settlement by negotiation.

The course of prudence lies in resuming the thread of the talks for settlement. And for this purpose the ground prepared by Mr. Ellsworth Bunker during the negotiations between the parties at Washington provides a practical basis. The essentials of the Bunker Plan are immediate transfer of West Irian's administration to a third non-party official to be nominated by the Secretary-General, replacement of the present Dutch officials by neutral officials, transfer of the administrative control of the island to Indonesia with the retention of the neutral officials in an advisory capacity after a year but not later than two years and guaranteed safeguards by Indonesia thereafter for minority rights and above all for a free plebiscite by the West Irian citizens to decide their final political status. The Dutch Government is now coming round to the acceptance of the Bunker Plan, but its reservation on the transfer of administrative control substantially detracts from the proposed acceptance. Taking the issue to the Security Council will lead to procrastination and further complications. The present stalemate cannot continue for long, since this colonial issue has already consumed over twelve years. Russia's eagerness to strengthen the forces of liberation is a substantative factor which Holland must reckon before she places prestige above any other consideration. Wisdom lies in negotiating on the basis of the Bunker Formula.

Language Issue

VICTORY FOR COMMONSENSE

THE SILVER JUBILEE celebration of the Rashtra Bhasha Prachar Samiti at Wardha early this week provided an appropriate occasion for much fruitful thinking on the positions of Hindi and English in the administrative as well as educational, social and public life of the country. There can be no two opinions that English can never achieve the status of the national language of India and Hindi among all the Indian languages is the only language which is suited to emerge as India's national language. The Constitution speaks of replacing English by Hindi as the nation's official language. But popular opinion goes much forward and advocates the status of the national language for Hindi. But Hindi has to acquire a number of attributes before it can reach this peak.

The major issue in the language controversy relates to the period of transition which would be necessary for a smooth and rational changeover to Hindi. A good case may be spoiled by bad handling and this is precisely what a number of leaders from the Hindi-speaking regions have done to the cause of Hindi by their obsession with its elevation to the popularly agreed status here and now. The manner in which the propaganda for the substitution of Hindi as an official language has been conducted has created genuine and serious apprehensions in the minds of people in many regions, particularly the South and the East, that Hindi is being imposed upon them. There are also other considerations which we can ignore at our cost. In our international contacts and, more important, in our need to make scientific and technological advances, English will continue to retain its great value.

Language can certainly be a potent factor in national integration, but, if handled tactlessly and arbitrarily, it can be a force for disruption. The changeover cannot be hastened without the possible risk of disruption and already some extreme voices are heard in this behalf. In the reorganisation of States the linguistic controversy brought to the surface the ugly features of the language issue. This ought to serve as a timely warning to the enthusiasts of hasty substitution of Hindi. The Government, however, has drawn the right moral from this protracted controversy. It is to be congratulated on its decision to introduce a Bill in the next session of Parliament to maintain the status of the English language as at present. This declaration, solemnly made at this appropriate forum by Mr. Lal Bahadur Shastri, is a victory for commonsense.

In a multi-lingual State like India it is essential that languages other than the national language must be learnt on a wide scale. Real conviction about integration will be strengthened if, for instance, the languages of the South are deliberately propagated in the Hindi-speaking regions. It will also bring the much-needed realisation to the impatient advocates of Hindi about the genuine difficulties of learning extra-regional languages. In his message to the Conference, Mr. Nehru suggested that organisations like the Rashtra Bhasha Prachar Samiti should be set up in North India for the propagation of the knowledge of the South Indian languages. This is a valuable suggestion which needs to be energetically pursued.

Salan

SOFT JUSTICE

THE SENTENCE of imprisonment for life passed on ex-General Salan has come as a staggering surprise. That the arch-organizer of the putsch of April 1961 and the supreme commander of the OAS would not escape death sentence was taken for granted. The charges framed against him were treason and crimes committed under his direction by the OAS. In the earlier trial held in absentia for treason, he was sentenced to death. But it is a fundamental principle of criminal jurisprudence that no accused person should be condemned and punished without an opportunity being given to him to defend himself in a trial according to law. An accused, convicted in absentia, is therefore entitled to a retrial when he is apprehended. Salan's right hand collaborator and second in command of the OAS, ex-General Jouhaud, has been sentenced to death by the military court on the same counts. This makes justice depart from non-discrimination and, ironically enough, if non-discrimination is to be vindicated, a case may be claimed to have been made out for reprieve for Jouhaud.

The majority of the military court awarded the lighter sentence of imprisonment for life for Salan on the ground of mitigating circumstances. What these mitigating circumstances are can be gathered fully from the complete text of the judgment. But a fair idea of their nature may be formed from the tenor of the defence put up on behalf of Salan. It was alleged that General de Gaulle, who rose to power with the help of the army in Algeria on the eve of the Fifth Republic, gave an understanding about retaining a French Algeria. In the course of the trial there was little trace of the atrocities committeed by the OAS. Most of the time of the court was consumed by the evidence adduced on behalf of Salan to prove that he was misled by the alleged understanding. But how an illegal armed organisation operating in secrecy to subvert the authority of the State can maintain this stand and it can be accepted as a mitigating circumstance passes comprehension. Justice must be not only even, but it must also be stern. This judgment has done a great disservice to the nation which has produced the monumental Code Napoleon and established a high reputation for justice without fear or favour. If Salan had been condemned to death and his sentence had been commuted to life imprisonment, depending, of course, on the withdrawal of its blood and terror campaign by the OAS within a reasonable time, justice would have been tempered with grace. The Algerians have been dismayed and shocked. Their patience and restraint have been further overstretched. A presidential decree has now abolished the special military court to try this class of cases, but not before the mischief was done. The OAS feels incited to act with greater vehemence under the cover of the mitigating circumstances.

Student Indiscipline

CALCUTTA COMMOTION

INDISCIPLINE AMONG university students and their indulgence in acts of violence are not new to Calcutta. But the latest case shows that the infection is now spreading to a quarter which ought to be immune from it — the medical institutions. Self-control and devotion to duty are among the minimum qualities that are essential for the profession for which these students are qualifying themselves. Whether their grievance is genuine or frivolous is not an important consideration. The main consideration with the students should be that they must not subvert elementary discipline. In this particular case the students of first and final M.B.B.S. classes insisted upon a postponement of their examinations by a week. This in itself was a strange demand. But if at all the students felt impelled to press it, the proper course was to send a small deputation of their spokesmen to the Vice-Chancellor and pursue their efforts peacefully.

But the students resorted to questionable tactics and it would appear that they were not acting on their own judgment but under extraneous influence. Six hundred students virtually put the Vice-Chancellor and his staff in wrongful confinement in his room and refused to break the siege until their demand was conceded. It was right that the Vice-Chancellor refused to act under duress. A police force was called to handle the situation and a lathi charge as well as use of tear-gas were resorted to. It was unfortunate that matters reached such a pass. But the number of casualties involved gives an idea of the dimensions of the violent behaviour of the students. About 50 students, 24 policemen and the Assistant Commissioner of Police were injured in the clash. The next day about 1,500 students belonging to different medical institutions in Calcutta city boycotted their classes and adopted a resolution demanding the removal of the Vice-Chancellor and the Dean of the Medical Faculty. Meantime, the Vice-Chancellor had no other course but to put off the two examinations scheduled to take place on May 29. Student indiscipline may be a complicated problem involving complex considerations. But this cannot condone the increasing number of light-hearted acts of violence. There are minimum standards which ought to be respected. In the clash between the Calcutta medical students and the police, 127 students were arrested and thereafter released on executing personal bonds of Rs. 500 each during the pendency of the investigation. The circumstances attending this incident warrant that the law should be allowed to take its own course; nevertheless, a lighter punishment by way of disciplinary action may be imposed.

P & T

QUALITY — THE QUESTION MARK

IN HIS reply to the Budget demands for his Ministry, Mr. Jagjivan Ram made some important announcements. He has announced that the allowance of the extra-departmental staff would be increased after some careful examination of the issues involved and that the incentive bonus which has been introduced as an experimental scheme in certain workshops would be extended to benefit members belonging to other sections of P & T. Ostensibly, these announcements aim at providing a greater incentive for work. The extra expenditure which the department will incur will be justified if it is reflected in the quality of the work turned out by the department. On this score, past experience forbids any optimism. Year after year the departmental annual report of P & T parades figures of the growing volume of traffic which is only consistent with the expansion of official and non-official business, but improvement in efficiency is little in evidence.

Mr. Jagjivan Ram has made an important announcement about the simplification of the slabs in the telephone bills as well as in the rates for telephone calls. In substitution of the present 45 slabs, 10 are to be retained. Similarly, a uniform 50 per cent rate for night calls between 7 p.m. and 8 a.m. is to be charged. The Minister claims that this reduced rate will involve some loss of revenue. But this is a debatable point since others claim that actually it would be a case of a lower price stimulating a larger demand and increasing the revenue. At the end of 1960-61 the arrears pending on account of collections of telephone charges rose as high as Rs. 2.15 crores. This may be partly due to the multiplicity of slabs and the complicated system of concessional rates for night calls. The simplified procedure would be tested by the extent to which the arreares are reduced. But the revenue aspect and its collection is not the sole criterian of improvement. Quality of service easily takes priority.

The European Scene

THE DE GAULLE-MACMILLAN MEETING

From Our Special West European Correspondent

PARIS, May 26.

HAVING said here lately that the negotiations for Britain's entry into the Common Market were not, as far as one could see, being complicated yet by political considerations, I am bound to report the first sign that they are. This first sign came not in Brussels, where the affair is moving slowly because of purely economic difficulties, but in Luxembourg, during discussions on Britain's membership of the CECA, or Coal and Steel Pool. Economic difficulties exist in this field too, notably the adjustment of Britain's National Coal Board and her Iron and Steel Board to the market rules of CECA. But they were not the reason for the failure of the Six to agree on how they should negotiate with Britain. It was that the French Industries Minister, having already secured one postponement on a pretext about co-ordinated fuel policy, secured another delay by bringing up some unexpected procedural objections. The Six had to put off writing a reply to Britain's application until June 12, and the French Minister commented, "Between now and then new elements might intervene, thanks to forthcoming international meetings". In plainer language, France was stalling until Messrs. Macmillan and de Gaulle had held the conference scheduled for early June at Champs, near Paris.

Some people have said all along that, ultimately, Britain's entry into the Common Market, CECA and Euratom would depend on the upshot of a top-level political deal between Paris and London, in which the issues at stake would not be economic but power-political and military. One could only say that they might be correct "ultimately", but that meantime there was no evidence of this in Brussels. The proof was that the negotiations were being conducted, from the Continental side, by the ECM Commission, whose competence is only economic; no one of the Six, and certainly not France, had suggested subordinating the economic settlement to concessions by London in the field of international politics. It could still be that Paris, or Bonn and Paris together, had some such eventuality in mind, but they had not revealed their hand; the slowness of the negotiations could easily be explained by the intricacy of the economic issues involved, without invoking sinister ulterior designs. On the contrary, the breakown of the Luxembourg talks this week was openly related to the Macmillan-de Gaulle meeting, which will not be concerned with the economics of coal and steel but with international power strategy.

So it is reasonable to speculate what political and military conditions Paris might impose for Britain's admission to the European Communities. Speculation is easier after President de Gaulle's recent thinking-out-loud Press conference, where he outlined his ideas on European politics so clearly that within a few hours he had lost five of his Cabinet Ministers and had three others, who refused to resign, disowned by their party. Even then, it is necessary to read between the lines, to interpret his silences (for example, he said nothing about Britain although questioned about her entry into the ECM), and to connect up his remarks with what he has been saying and writing on world affairs in the last 30 years. Thus pieced together, the world-power context in which de Gaulle sets the question of Britain's connection with Europe is dominated by the desire to restore Europe's independence of both the super-powers. The Europe in question is not restricted to the present Six of the Common Market, but covers, as well as West Europe, many of the East European nations now under Soviet domination. In this independent Europe, France would have an eminent place but not necessarily a dominant one. It is a false trail to go interpreting all de Gaulle's designs as primarily nationalist, as a means to French hegemony; his thought on the matter is as "European" as that of any of the super-nationalist exponents of European Unity. One stroke in the picture is, if you wish, nationalist but it happens to be approved, openly, by Russia and, less frankly, by many in all Europe and America: namely, that in a free Europe able to stand between the two super-powers Germany must remain divided; division between several nation-states is the normal condition of the Teuton race, its unity being a dangerous exception that has always menaced Russia, France and the rest of Europe.

The alternative to this free and loosely united Europe is a permanent carving up of the continent between zones of Russian and American influence, such as exists at present. As long as Europe is weak and politically fragmented, de Gaulle suspects, both the super-powers will acquiesce in perpetuation of this halving of Europe between themselves. The present line of division between their respective zones leads to friction, so they are ready to make concessions, e.g. over Berlin, which will bring no benefit to the Europeans but will solidify the division. That is, when Washington offers concessions to Moscow, de Gaulle thinks the Americans and Russians are saying to each other, "You keep your half, we'll keep ours; just smoothe out the points of friction". That is why he opposes such concessions; not because he thinks nothing should be conceded to Russia but because an outsider, the USA, should not concede things to Russia without any gain for Europe.

In fact, the independent Europe de Gaulle has in mind would make ample concessions to Russia, beginning with perpetuation of the division of Germany, and the sum total of them would no doubt be much more impressive than anything Washington has ever considered. But then, they would be made by Europe and the countervailing advantages received from Russia would be so many gains for the Europeans, and not concessions in other parts of the world such as the USA might consent to accept. For example, if Europe gave Russia guarantees about the perpetual dismemberment of Germany and the close absorption of West Germany into a union of West European states that Germans could never dominate, then Russia could pay in the shape of a liberation of many East European countries. However, in order to make this grand settlement with Russia, Europe must be independent of US policy and for that must have her own modern armament. Independence of the USA does not mean hostility nor the break-up of the Western alliance; on the contrary, that must be preserved, for Europe's own arms could never (at least in the foreseeable future) hope to intimidate Russia. Behind them must stand, for extreme emergency, American might; but for bargaining with Russia it would suffice for Europe to have enough atomic weapons to dissuade Russian arrogance, and to be able to threaten Russia with an eventual Franco-German atomic force of greater proportions. In the first place, in order to be taken seriously by Russia as a bargaining

partner, Europe must demonstrate her independence; otherwise, Russia will prefer to deal with the USA on European questions.

Who would be acceptable candidates for membership of this independent Europe? The present Six provide the essential core of the union, because they showed that they took it seriously, when others doubted and opposed, by forming the present European Communities. But there is no need to restrict it to them. Any nation can join that is in Europe (as the USA is *not*) and is in it heart and soul, without global interests regarded as being as important as Europe, without special connections with non-European powers. Any such nation would be genuinely interested in European independence and would gain from the realisation of de Gaulle's plan, which is not a peculiarly French conception but a European one; no doubt, it best ensures French national interests but so it does for other European nations, for their situation today is basically identical. That Britain, for example, is bigger, richer and more respected than any single Continental power would be no obstacle to her admission; quite the reverse, for the design is to strengthen Europe and not to allot a privileged role to Paris alone. The question, however, is whether Britain regards herself as part of Europe, so much a part of it as to sacrifice the illusory consolations of the Commonwealth and her special connection with the USA.

Britain would have no place in this European design if the Commonwealth were still considered as valuable as Europe, and if she came in as the special instrument of American influence. So, on the first point, London must pay the price of giving up (gradually if necessary but irrevocably) every vestige of imperial advantage in trade. On this de Gaulle is not original, for the ECM Commission and most of the Six governments and their national industries take just the same stand. And, in truth, the Americans think the same thing. It is on the second point that de Gaulle's position is more original, while being far from simply a private idea. If the Americans persist, as President Kennedy has lately repeated, in giving Britain favoured treatment in atomic co-operation that is denied to the rest of Europe, then Britain of her own initiative must sacrifice this privilege by incorporating her independent nuclear force in a European force. Otherwise, Britain would be an unequal partner, and one whose attachment to the specifically European cause was always subordinate to dependence on the USA—when the whole design is to restore European unity for the sake of a European cause that will never be adequately defended by either of the super-powers, by America no more than by Russia.

Against this background one can appreciate the following imaginary speech written by a Paris paper for President de Gaulle to make to Mr. Macmillan next month: "I am reputed to be an adversary of Britain's entry into the Common Market. In fact, this is what I think: you don't enter economic Europe without entering political Europe, and there is no political Europe without the basis of a joint defence policy. So, if you want to enter Europe, agree to share atomic weapons. Up to now, you have enjoyed special relations with the USA. You cannot claim to join Europe and, at one and the same time, go on considering yourself different from and superior to Europe. No doubt, you benefit from special advantages in atomic matters and the Americans have given you some of their secrets. Very well. Keep those secrets. Yet nothing prevents you putting your strategic aviation at the disposal of the European Community right away. In short, are you ready to do in the atomic field what you have proposed in space research: construction in common of rockets? If so, I am in favour of your entry into Common Market. If not, not". Another well-informed source, giving a very similar presentation of the general's ideas, added, "Britain can take it or leave it; the general is inflexible on the matter." The foregoing sketch of the independent Europe he has in mind is essential to understand his position. Having never been present personally when heads of State meet in private, I do not know if they really talk to each other this way, but this might well be the gist of what is said at Champs next month.

OUR EDITOR ON PL 480

By a Correspondent

WASHINGTON, May 28.

THE noted Indian economist, Mr. Eric da Costa believes the U.S. Public Law 480 programme is rising above politics and has taken on a predominant role in American foreign aid programmes. He cites massiveness, careful planning and partnership in execution as the major characteristics of the P.L. 480 Programme. Mr. da Costa, Editor of "The Eastern Economist" and Managing Director of the Indian Institute of Public Opinion and the Marketing Research Corporation of India in New Delhi, is on a one-month visit to the United States to observe public opinion and market research procedures and to study the use of P.L. 480 funds in South Asian economic development. "I am very happy to be back after ten years and to see the tremendous changes that have taken place in this interval and the new interest in Indian problems," he told a reporter here. From his studies so far, he said, he has received "new insight into the operation of P.L. 480. I am more than ever convinced of its usefulness as an instrument of economic development in countries which are short not only of food and other commodities but also of financial resources in local currencies for their development programmes."

Mr. da Costa, who has already interviewed a number of officials concerned with the P.L. 480 Programme, noted that there is recognition that P.L. 480 "is now rising quite outside American politics and has taken on a predominant role in foreign aid programmes. There would appear to be characteristics of Marshall Aid assistance in these developments." He feels, "massivness, careful planning of projects and, finally, partnership in their execution with both public and private sector agencies are at work on both sides." The Indian economist and editor said he is doing what he believes is the "first connected study of every phase of the P.L. 480 programme, to indicate its current as well as its potential contribution to the economic development of underdeveloped areas. Arising from these studies there are to be broadcasts which will be presented by the Voice of America to explain the purposes of the P.L. 480 programme." Mr da Costa is taping interviews with a number of officials in Washington, and then will visit other parts of the country to interview a wheat farmer, a farm organization official, an agricultural economist and a shipper on the West Coast. He has already interviewed George McGovern, U.S. Food for Peace Director, W. Tyler Wood, Minister in charge of the U.S. Technical Co-operation Mission in New Delhi, and Indian Ambassador, Mr. B. K. Nehru, who, he said, "has been intimately associated with this programme."

Before leaving Washington on Thursday he will talk with former U.S. Ambassador to India Ellsworth Bunker who, he noted, "handled the largest P.L. 480 grant of 17 million metric tons for India in a single deal." He also hopes to schedule an interview with U.S. Agriculture Secretary Orville Freeman. Mr. McGovern, the Indian economist observed, "was particularly affected by the conditions he saw on his recent visit to India." Mr. da Costa said he attaches "particular importance to the new emphasis given by Mr. McGovern to what might be called the humanitarian side of the programme."

In Chicago the Indian editor plans to interview Professor T. W. Schultz of the University of Chicago, whom he describes as "one of the foremost authorities in the world on agricultural economics," on technological advances in U.S. agriculture as an element in the development of P.L. 480 programmes. He also plans to talk with Charles S. Shuman, President of the American Farm Bureau Federation, a farm organization associated with P.L. 480. In Kansas he will interview a wheat farmer and in Portland, Oregon, he will report from the dockside where a ship loaded with wheat is leaving for India. Mr. da Costa will continue his series of 13 planned 15-minute broadcasts with interviews in Rome with B. R. Sen, Director General of the Food and Agriculture Organization (F.A.O.) of the United Nations and Dr. Boerma, head of the World Food Programme which, said Mr. da Costa, "follows the inspiration of the P.L. 480, grants." On his return to India he said he plans to do a series of interviews "so to speak phased from the receiving end." He will talk with the Indian Food and Agriculture Minister, Mr. S. K. Patil, and visit a school where free food and milk are distributed under the auspices of the P.L. 480 programme. The Indian economist added that he hopes to visit Ceylon and possibly Pakistan "to study the effect of P.L. 480 programmes in countries other than India."

Shortly after his arrival in New York on May 12, Mr. da Costa met senior members of the George Gallup American Institute of Public Opinion, in Princeton, New Jersey, "to renew contacts with the Gallop organisation" with which his Institute, the Indian Institute of Public Opinion, is affiliated. "We have worked with the Gallup organization intimately for over ten years and we know how much we owe to it, both in inspiration and in detailed technical guidance," he said. The Indian visitor also attended the "impressive meeting" of the American Association of Public Opinion Research Workers at Lake George, New York. "One of my impressions," he observed, "is that the organization of public opinion research in the United States is, both in numbers and in creative capacity, almost equal to that of the rest of the world together." Mr. da Costa feels there is "much to learn from American Practice," particularly in India where public opinion measurement is fairly recent.

Economic Report from the U.S.

BUSINESSMEN MEET

By GUY SIMS FITCH

WASHINGTON, May 23.

AT the invitation of the President, some 200 leaders of business, labour, government and the academic world gathered here this week to dissect the economy and prescribe remedies for its ailments, real or imagined. Behind the two-day conference lies the typical American penchant for self-examination, the need to isolate and eliminate the flaws and to find the means of achieving what might be called a more perfect society. This is in keeping with democratic man's commitment to responsible action—a commitment which in American society involves private no less than government initiative. In this light, one can understand why Americans are seeking to further improve their economy, which even now is operating at a record rate. Production, employment and incomes are well above previous peaks, and prices are generally stable. Yet to the Kennedy Administration, as to most Americans, good enough is not really good enough. The primary goal of a fully employed and productive economy, living up to its highest potential, is still to be achieved, and achieving it requires new solutions to new problems in a changing world.

Old generalizations offer small comfort in meeting these problems, which involve sophisticated, specific and often technical judgements in such complex and related fields as automation, wage and price policies, labour-management negotiations, and international competition. These, indeed, were the four headings under which the discussions were conducted. There is no single magical nostrum for all these far-ranging areas of economic activity—and none was forthcoming. But, then, no one really expected that this two-day meeting would provide definitive solutions to all problems. Its principal purpose was not to pass resolutions or reach final decisions, but to set in motion a constructive discussion—a great dialogue, or confrontation of views, so to speak—out of which there might emerge new approaches and ideas as bases for enlightened action in the realm of public and private policy. By this test, the conference succeeded very well. It was particularly meaningful in delineating and clarifying the factors involved in policy formulation.

This requires, in turn, more investment in modern equipment and the creation of greater demand for goods and services, while avoiding extremes of recession or inflation. It also requires a proper balance at appropriate times between monetary and fiscal measures to stimulate business investment and consumer demand, on the one hand, and to maintain a reasonable price stability, with wage rises generally geared to productivity increases, on the other. This wage-price approach of the Kennedy Administration is highly esteemed abroad, according to Secretary of the Treasury Douglas Dillon, who has just returned from an international bankers' meeting in Rome. Mr. Dillon also observes that the current record of U.S. price stability with rising living standards is a source of enhanced foreign confidence in the U.S. economy. This kind of price stability also is instrumental in enabling American businessmen to sell more of their products abroad. This export potential is not only an added source of strength to the economy, but can go far toward overcoming once and for all the deficit in the U.S. balance of international payments—a deficit which is the result chiefly of large U.S. outlays abroad for economic aid, defence, tourism, private investment and other purposes in keeping with commitments to international peace and progress.

Special Article

THE GROWTH OF THE CORPORATE SECTOR: 1958-59 TO 1960-61

THE Department of Company Law Administration has released its annual report for the year ending March 31, 1961, on the working and administration of the Companies Act, 1956, highlighting the phenomenal growth which has taken place in recent years with particular reference to the developments in 1960-61. The Report brings into sharp focus the new patterns in regional dispersion which are emerging along with the new shifts in favour of the processing and manufacturing industries as against the earlier trends in favour of commerce and trade as well as mining. The Report also pinpoints the fact that concentration of new companies continues to prevail in the Rs. 1 lakh to Rs. 10 lakhs size.

The growth pattern of the corporate sector is illustrated in Table I below which shows the number of companies at work between 1954-55 and 1960-61 along with the volume of paid-up capital in respect of both the public and the private companies. It will be seen that during the Second Five-Year Plan there was a slow decline in the number of companies at work, while the volume of paid-up capital exhibited a very encouraging growth. In percentage terms, the paid-up capital rose by about 70 per cent from Rs. 1,024.2 crores in 1955-56, the last year of the First Plan, to Rs. 1,724.6 crores in 1960-61, the last year of the Second Plan. The Department has explained that the fall in the number of companies was "the result of continued efforts by the Department to weed out moribund companies from the registers of live companies and does not indicate any decline in the growth of the corporate sector".

TABLE I

COMPANIES AT WORK: 1954-55 — 1960-61

(Paid-up Capital in Crores of Rupees)

Year	Public		Private		Total	
	Number	Paid-up Capital	Number	Paid-up Capital	Number	Paid-up Capital
1954-55 ..	10,056	661.3	19,569	308.3	29,625	969.6
1955-56 ..	9,575	690.4	20,299	333.8	29,874	1,024.2
1956-57 ..	8,810	714.6	20,547	363.0	29,357	1,077.6
1957-58 ..	8,296	773.6	19,984	532.7	28,280	1,306.3
1958-59 ..	7,646	805.0	19,757	710.6	27,403	1,515.6
1959-60 ..	7,306	811.6	19,615	781.5	26,921	1,593.1
1960-61 ..	6,745	876.1	19,363	848.5	26,108	1,724.6

The performance of the corporate sector in 1960-61 was extremely heartening because the new registrations were the highest on record for the last decade. Only in 1951-52, the number of new companies registered was a little higher at 1866 as against the total companies registered at 1,683 in 1960-61. Table II below shows that the rise in the number of new companies in the last three years was rather steep from 1,095 in 1958-59 to 1,683 in 1960-61. In terms of authorised capital, however, the increase was of a nominal nature. The bulk of new registrations took place among the private companies, the ratio in 1960-61 between the two being 90 per cent for private companies and 10 per cent for the public companies.

The Company Law Administration Department has divided the country into four zones and an examination of the growth of new companies zone-wise shows that "a slow but steady" dispersion of new companies has been taking place in areas which have hitherto been held as backward. However, the area of dispersion does not seem to be very wide. Table III overleaf sets out the State-wise distribution of new registrations indicating that out of the total authorised capital of Rs. 287.1 crores, nearly 89 per cent belonged to the four States of Bombay (Maharashtra plus Gujarat), West Bengal, Madras and Delhi. All the other States combined claimed about Rs. 32.6 crores in 305 companies. The State to top the list in regard to the number of

TABLE II

NEW REGISTRATIONS: 1958-59 — 1960-61

(Authorised Capital in Crores of Rupees)

Year	Public		Private		Total	
	Number	Authorised Capital	Number	Authorised Capital	Number	Authorised Capital
1958-59 ..	58	58.7	1,037	225.7	1,095	284.4
1959-60 ..	87	67.1	1,365	93.4	1,452	160.5
1960-61 ..	153	157.5	1,530	129.6	1,683	287.1

new registered companies was West Bengal, followed by Bombay, Madras and Delhi. The lowest in the ladder was Assam with only 5 new companies to its credit. Madras particularly has been gaining more attention in recent years. As against 113 companies in 1958-59 claiming an authorised capital of Rs. 3.5 crores only, it was able to rise in 1960-61 to as many as 343 companies with an authorised capital of Rs. 57.2 crores. The course of growth in Delhi, however, had been rather uneven. While in 1958-59 the number of new companies registered was 130 with an authorised capital of Rs. 50.2 crores, the number of companies in 1960-61 rose to 197, but the total authorised capital declined by 50 per cent to Rs. 25.2 crores. The conclusion is irresistible that the dispersion in new industrial growth is rather slow in relation to the fast expansion which is steadily taking place in the four powerful States of former Bombay, West Bengal, Madras and Delhi. These figures stress the already well known truth that the centres of industrial gravity still exist in these four pivotal States.

The trend towards greater industrialisation was pronounced in 1960-61, when both in terms of number of companies and authorised capital the manufacturing and processing industries of all kinds stood at the head

TABLE III

STATE-WISE DISTRIBUTION OF NEW REGISTRATIONS

(Authorised Capital in Crores of Rupees)

State	1960-61 Number	1960-61 Authorised Capital	1959-60 Number	1959-60 Authorised Capital	1958-59 Number	1958-59 Authorised Capital
Bombay ..	335*	88.0	293	67.5	240	89.2
	72**	24.5

* Maharashtra. ** Gujarat.

of the list vide Table IV below. Commerce (trade and finance) had the next largest number of companies, but with a very much smaller authorised capital of Rs. 21.63 crores. The mining and quarrying companies also indicated a steep fall in terms of the authorised capital, but not in terms of number of new companies.

The size pattern of the new companies has consistently shown a marked preference for broad-based companies, though the bulk of them lie within Rs. 1 lakh to Rs. 10 lakhs range vide Table V on page 1287. The companies with more than Rs. 1 crore authorised capital showed a sharp rise in 1960-61; as against 22 such companies in 1958-59 and 31 in 1959-60, their number nearly trebled in 1960 to 89. Similar was the case with companies with an authorised capital between Rs. 50 lakhs and Rs. 1 crore. Their number also trebled between 1958-59 and 1960-61. Companies with authorised capital between Rs. 25 lakhs and Rs. 50 lakhs have doubled in number during the same period, while those between Rs. 10 lakhs and Rs. 25 lakhs have nearly trebled. As indicated earlier, the largest concentration of new companies continued to be below Rs. 10 lakhs. It is interesting to see that the 89 giants registered in 1960-61 claimed an authorised capital of Rs. 196 crores — more than 68 per cent of the total new capital. Among these giant-sized companies, the contribution of the Government was of Rs. 30 crores for 7 new companies. The balance of Rs. 166 crores belonged to the non-government sector, indicating clearly that the contribution of the government companies was not responsible for inflating the volume of contribution of the giant-sized companies.

TABLE IV

DISTRIBUTION OF NEW COMPANIES: 1958-59 — 1960-61

(According to major Industrial Groups)

(Authorised Capital in Crores of Rupees)

Industrial Group	1960-61 Number	1960-61 Authorised Capital	1959-60 Number	1959-60 Authorised Capital	1958-59 Number	1958-59 Authorised Capital
Agriculture and allied activities	37	3.20	40	2.87	33	0.84
Mining and Quarrying	21	11.22	21	6.10	22	71.59
Processing and Manufacturing (all kinds)	817	227.03	614	119.10	502	167.69
Construction and Utilities	37	7.06	30	2.13	26	1.21
Commerce (Trade and Finance)	424	21.63	367	16.80	302	37.39
Transport, Communication and Storage	277	13.25	283	5.36	104	2.97
Services of all kinds	70	3.66	97	8.18	106	2.67
Total	**1,683**	**287.05**	**1,452**	**160.54**	**1,095**	**284.36**

All in all, the figures demonstrate a healthy trend in the birth of new companies both under the aegis of the government and the non-government sectors, though it is quite reasonably arguable that regional dispersion is not taking place on a scale as would justify optimism at the current pace. The growth rate in new companies, however, speaks eloquently of the judicious manner in which the Companies Act of 1956 has been administered with due care to ensure that new company formation is not retarded by legal obstructions.

TABLE V

SIZE PATTERN OF NEW COMPANIES: 1958-59 — 1960-61

Size Group*	1960-61 Public	1960-61 Private	1960-61 Total	1959-60 Public	1959-60 Private	1959-60 Total	1958-59 Public	1958-59 Private	1958-59 Total
Below Rs. 1 lakh ..	5	365	370	2	344	346	3	249	252

GENERAL MANAGER

THE BUSINESS WORLD

The Wall Street Panic

THE unforgettable memories of 1929 Great Depression were revived in the Wall Street on Monday, May 28, 1962, when prices of almost all the shares lost heavily. The Dow-Jones index at 576.9 indicated a fall of 21.5 per cent over its recent all-time high level at 734.9 on December 13, 1961. As many as 9.35 million shares changed hands on Monday and a still larger number at 14.75 million on Tuesday as against the all-time record of 16.41 million shares on Black Tuesday, October 29, 1929. In this shake-up, the international markets such as London, Paris, Frankfurt and Tokyo could not remain unaffected and a sympathetic downward trend in prices automatically emerged. The Indian markets also exhibited weakness, though not entirely for reasons of the international debacle. Postponement of the Aid-India Club meeting had a more pronounced effect than the Wall Street decline in prices.

What were the basic reasons for the plunge in the Wall Street? Did the malaise start all of a sudden on the fateful Monday? A study of the Dow-Jones index shows that the downward trend in prices had started early in March when the index ruled above 720. It started slipping gradually and had touched 610 before the steep decline occurred on Monday. In other words, the crash was preceded by "general weakness" or a "reappraisal". The firm attitude taken by President Kennedy in disallowing a rise in steel prices was also one of the root causes of the avalanche since the market circles interpreted it as a far-reaching step against inflation and quick capital gains. Communist gains in Laos also contributed towards weakening the sentiment of the market.

What has surprised the analysts is the unprecedented character of the crash at a time when the U.S. economy is in sound health. The President's report had indicated earlier in the year a rise in production, incomes and profits for 1962. A technical correction was certainly expected when the price-earning ratios attained new high levels but the economy and the stock exchanges were not anticipated to move in opposite directions.

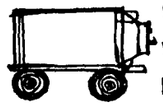
The confidence, however, seems to have returned as fast as it vanished. By Tuesday evening all the losses registered on Monday had been made up. In the long run, it seems, the U.S. economy will not be permitted by the Administration to take a suicidal downward trend purely out of business sentiment. The armoury of the Administration has various weapons which can be pressed into service for reviving confidence in the economy. Perhaps the Administration as well as the Federal Reserve will not have to use their extraordinary powers since the market seems to have rallied already.

Business Notes

Automobiles

BABY CAR PROJECT MUST BE STALLED

IT IS not uncommon these days to hear of some industry or other passing through a bad time, and it is not surprising to hear that the automobile industry too has joined the band wagon. Notwithstanding several handicaps, it is noteworthy that the industry recorded a notable rise in production both in 1959 and 1960. The rate of progress in each of these years over the respective preceding year was of the order of 36 per cent and 43 per cent, but the rate of progress was miserably low at five per cent in 1961, as against the previous year's record. Thus, the overall production of cars, jeeps, and commercial vehicles in 1961 amounted to only 53,661, as against 51,189 in 1960. If this trend were to continue in the coming years, as Mr. Dahyabhai V. Patel, President of the Western India Automobile Association (W.I.A.A.), feared the target of 1,00,000 vehicles (30,000 cars, 60,000 commercial vehicles, and 10,000 jeeps) by the end of the Third Five-Year Plan would not at all be possible of accomplishment.



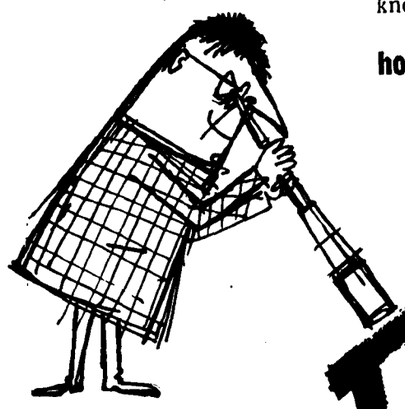
Reviewing some of the problems that the industry has been facing, Mr. Patel observed, in his speech at the W.I.A.A's 42nd annual general meeting, held recently in Bombay, that the high cost of production was perhaps the foremost, and this, he attributed, in the main, to heavy taxation. The "automobile industry is still in an infant stage". Mr. Patel maintained and urged that "until such time as it is able to stand on its own feet and withstand open competition, the Government has a duty to see that its growth is not throttled by excessive taxation". Deprecating the attitude of the Government for not evolving a 'long-range policy to place the industry on a firm foundation, the W.I.A.A. Chief pointed out that, without sufficient incentives in the form of reduction in the tax burden and the grant of adequate foreign exchange to enable the manufacturers to import raw materials and components, the industry could not step up the tempo of production and reach the current Plan target. Mr. Patel suggested, among others, that the baby car programme should be stalled. For, as he said, the industry apprehends that the introduction of the baby car is the easiest way to kill an industry which is being built up only since the past decade.

Yet another problem that the W.I.A.A. Chief dwelt at length was that of oil, which has been one of the very heavily taxed products in the country today. Whereas industrially developed countries like America have shown how successfully they are able to exploit oil by entrusting it to such organisations as have the requisite experience in the line, Mr. Patel remarked, it has become the "subject of experimentation and individual fads and fancies of those in power" in this country. In this connection, he also highlighted the fact that, while, from time to time, the oil companies had

what happened to the rest of the milk?

It just isn't there! About 5 oz. of milk is what *you* get per day—if all the milk India produces is equally shared by her people! That includes milk products, too! And in the next 5 years per capita consumption is expected to go up by just ·2 oz! Not enough? Precisely. More milk has to be produced. Distribution has to be widened. That means more dairies and equipment: milk cans, can-washers, pasteurising plants, storage tanks, bottle-washers and fillers... even foil caps for bottles! And that is the range of Larsen & Toubro products for the dairy industry alone—from a foil cap costing a few naye Paise to complete dairies worth several lakhs of rupees!

When you next open a milk bottle, consider—

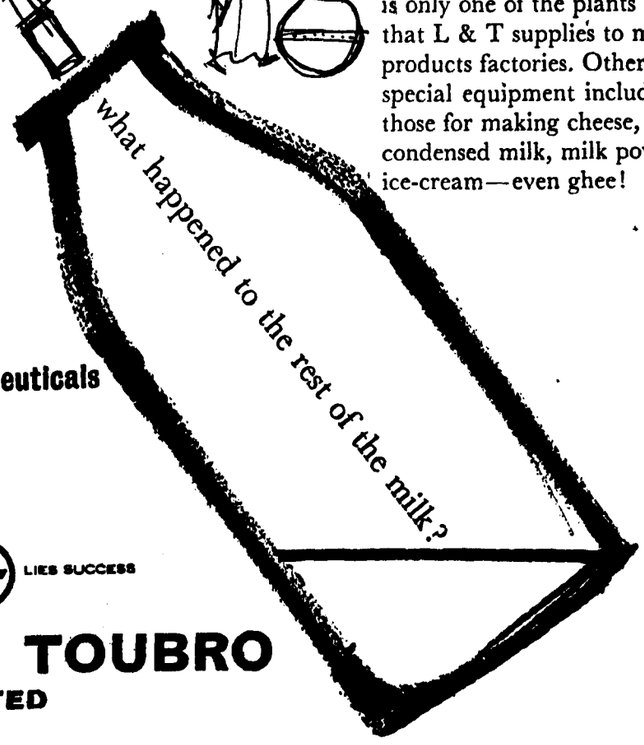


who puts the wheels on milk cans?

We do—but not exactly on cans! Large dairies need large quantities of milk. And it has to be collected in time. A special job for road tankers—virtually tanks on wheels like the ones made by L & T.

here, food preservation is no problem!

...but in the tropics it's a different story. Foodstuffs deteriorate fast. Take milk, for instance. *Tons* of it! That is what a large dairy handles—*every* day! Milk is collected from distant centres, weighed, tested, clarified, pasteurised and chilled. It's then stored in insulated tanks or cold stores that keep the milk cool, safe from bacteria. Next comes filling and capping of lakhs of bottles—bottles that have already been washed, sterilised and dried. A complicated process? Certainly. Something that cannot be done well enough – fast enough—without special plant and the know-how—exactly what L & T provides.



how many hours to churn 11,500 litres of cream?

If by hand—well, it is impossible! But with automatic butter-making plants, in just a day!—and fully packed, too! This is only one of the plants that L & T supplies to milk-products factories. Other special equipment include those for making cheese, condensed milk, milk powder, ice-cream—even ghee!

L & T contributes also to the development of these vital industries:

- oil
- food & agriculture
- steel
- chemicals & pharmaceuticals
- paper
- minerals
- electricity
- transport
- construction

IN SERVICE LIES SUCCESS

LARSEN & TOUBRO
LIMITED

surrendered their duty protection, the resulting advantages had yet to reach the consumer! According to him, it is this lack of relief in prices that has, in turn, led to the lack of enthusiasm among people either in oil discovery or, for that matter, in the construction of refineries in India.

Oils and Seeds

F.M.C. AND OILSEEDS FUTURES

AN APPRECIATIVE reference was made by Mr. Ramdas Kilachand, President of the Bombay Oilseeds and Oils Exchange Ltd. (BO.O.E), to the reorientation of the Forward Markets Commission's (F.M.C.) policy towards the oilseeds and oils trade. He referred, in particular, to the removal of ordinary and special margins and the absence of any ceiling fixation (only a daily fluctuation limit is now imposed on the upward rise in prices above certain levels). This "new deal, he noted, was the outcome of the unanimous decisions adopted at a conference of representatives of recognised associations convened by the F.M.C. Presumably encouraged by this happy consummation, Mr. Ramdas suggested that the F.M.C. should also call meetings, every three months, of the representatives of each trade for mutual exchange of views. He probably felt constrained to make this suggestion in the context of the Government's decision of October last closing the oil and oilseeds markets in the wake of the sharp rise in mustard prices in the North Indian markets at the time.

The B.O.O.E. Chairman was speaking for himself as well as the trade when he recalled how unhappy the whole trade was with the intervention of the market during the currency of a given contract. He accordingly reiterated the feelings of the trade that the Government should decide the terms and conditions of trading before the commencement of any contract and adhere to them for the full currency of that contract. Inasmuch as the repercussions of sudden interventions in the middle of a contract period are known to and borne by only the trade, it is only fair that the representatives of the concerned trade are taken into confidence and consulted before any intervention, if and when such becomes necessary.

While on this subject, Mr. Ramdas made it known that the maximum prices fixed by the Government were very much below the highest prices touched for the contract. In fact, the prices prevailing in the latter half of October, 1961, he maintained, were not only lower than the opening prices in July, 1961, but also much below the prevailing ready prices at the time the maximum prices were fixed. Such a situation could be staved off, the B.O.O.E. Chief pointed out, if only the Government cared to decide the terms and conditions of trading before the commencement of contracts in consultation with the trade, as stated earlier.

Referring to the problem of export promotion, Mr. Ramdas welcomed the formation of the Ministry for International Trade, as also of the Board of Trade, and felt sure that, under the new set-up, export promotion efforts would be pursued in right earnest to achieve tangible results. However, he reminded the meeting that though the country's exports had increased considerably over the last decade, still our performance lagged far behind the target fixed under the Third Plan.. Holding that the traditional exports have an important role to play, he observed that, if proper and timely incentives were given and a long-term policy was formulated for exports of oilseeds, oils and oilcakes, this line would be in a position to contribute much more to the export earnings pool than heretofore. Hence his plea for an Export Promotion Council for Oilseeds, Oils, and Oilcakes. Referring to the current failure in the expansion of exports of groundnut oil, which has for long been a traditional export item, the B.O.O.E. President complained that the main drawback was that the exports of this item had been diverted from normal trade channels with the elimination of established exporters from all export promotion schemes and the importing, into this field also, of the State Trading Corporation. In view of the high competitiveness of Indian groundnut oil in the international market, Mr. Ramdas urged that its export could be best handled only by the established exporters who had the requisite experience.

New Issues

ASIATIC OXYGEN

WITH THE onset of the slack season, there has virtually been a spate of new floatations in the capital market. As many as four companies, namely Associated Bearing, Oriental Cables, Prabhat Udyog and Gammon India, have already approached the public for subscriptions to their capital during the past eight days. Another four, namely Asiatic Oxygen, Indequip Engineering, Hind Rectifiers and Tej Nath Films, are scheduled to enter the market in the next seven days.

Asiatic Oxygen will approach the public for subscriptions to its capital on May 31 with an offer of 6,70,000 equity shares of Rs. 10 each. The list closes on June 9 or earlier at the discretion of the directors, but not before June 4.

The authorised capital of this company is Rs. 2,00,00,000, consisting of 17,50,000 equity shares of Rs. 10 each and 25,000 9.3 per cent (subject to tax) cumulative redeemable preference shares of Rs. 100 each. The already issued, subscribed and paid-up capital is Rs. 70. The present issue comprises 15,99,993 equity shares. Of this, the directors and their associates and friends have agreed to take up 4,13,993 shares. Another 2,66,000 shares are to be given to the shareholders of the Asiatic Oxygen and Acytelene Company Ltd., as fully paid-up in exchange for their ordinary shares in that company which is the promoter of Asiatic Oxygen. One of the foreign collaborators, namely Air Products and Chemicals Incorporated, of the United States, is to be allotted 2,50,000 shares in consideration for the supply of equipment and machinery. The block offered for public subscription is the balance after allowing for the above three allotments out of the present issue.

The company has as its main object the manufacture and sale of industrial and medical gases such as oxygen, dissolved acytelene, carbon, hydrogen, nitrogen, nitrous oxide etc., of electrodes, welding and cutting equipment, welding transformers and generators and other equipment, apparatus and appliances relating to the foregoing or anciliary thereto. For producing gases, it intends to set up factories at a number of places included in which are Bombay, Rourkela, Durgapur, Patna and Gauhati. Initially the aim is to go in for a production of 176.4 million cubic feet of oxygen and 45.6 million cubic feet of dissolved acytelene per annum. The production of gases is expected to commence within a year.

For the manufacture of coated and uncoated electrodes, to the tune of 65 million feet per annum, a factory is to set up at Calcutta.

The factory to manufacture welding and cutting equipment and arch-welding transformers is also to be located at Calcutta. The manufacturing capacity of this factory is to be 90,000 units of regulators, 7,500 units of torches and 150 units of oxy-cutting machines per annum. The capacity of the welding transformers and motor generators manufacturing units will be 2,400 and 240 units a year respectively.

Technical collaboration for this massive programme of manufacture has been secured from four U.S. companies, namely Air Products and Chemicals Inc., KGM Equipment Co., Metal and Thermit Corpn., and Westinghouse Electric International Co. Air Products and Chemicals Inc. will also be participating in the equity capital of Asiatic Oxygen.

The project is estimated to cost Rs. 3.74 crores. This expenditure is to be met out of the share capital of the company to the extent of Rs. 1.6 crores, through loans from the Industrial Finance Corporation of India and other sources to the tune of Rs. 1.64 crores and through other bank borrowings to the remaining extent of Rs. 50 lakhs.

In view of the rapid progress that steel and engineering industries, as also medical facilities, are expected to make during the Third Five-Year Plan and onwards, the company should encounter little difficulty in marketing its products.

HIND RECTIFIERS

HIND RECTIFIERS LIMITED, which recently came into existence as a public limited company on conversion of a private limited company by the same name, floated about four years ago to take over from Messrs. Kaycee Industries Limited its business of manufacturing rectifier apparatus, is offering to the public 1,20,000 equity shares of Rs. 10 each. The list opens on June 7 and will close on June 13 or earlier at the discretion of the directors, but not before June 9.

The company has an authorised capital of Rs. 30 lakhs, all in equity shares of Rs. 10 each, out of which capital worth Rs. 5 lakhs is already subscribed and paid-up. The present issue consists of 2,00,000 shares, out of which 50,000 shares are to be taken up by the existing shareholders and another 30,000 by the foreign collaborators, Messrs. Westinghouse Brake and Signal Company Ltd., London, in lieu of supply of plant and equipment. The public issue represents the balance.

Besides Messrs. Westinghouse Brake and Signal Co., London, with whom there already exists a technical collaboration arrangement dating back to Kaycee Industries' period, the company is arranging for procurement of technical know-how and the patent rights of Messrs. Westinghouse Electric Corporation of U.S.A., for the manufacture of silicon semi-conductors, including transistors, photo-transistors etc.

The proceeds of the issue are to be utilised for making additions to the fixed assets of the company's factory at Bhandup (Bombay) to the extent of Rs. 6 lakhs and for provision of additional working capital to the tune of Rs. 5.5 lakhs, with a view to undertake the manufacture of silicon semi-conductors. The remaining sum is to be utilised for repayment of the borrowings out of which the existing fixed capital expenditure of the factory has been partly financed.

During the past three years of its operation as a private limited concern, the company has declared a dividend of 9 per cent in 1958-59, 18 per cent in 1959-60 and 10 per cent in 1960-61.

The rising tempo of industrial activity in the country is expected to generate a large demand for the company's products. As such it should find it quite easy to market its rectifier apparatus.

TEJ NATH FILMS

TEJ NATH FILMS LIMITED, a company promoted by a film artist, Gopi Krishan, in association with two film producers, one of whom is a film director as well, and some businessmen, is entering the market with an offer of 9,000 equity shares of Rs. 10 each and 5,600 12 per cent cumulative preference shares of Rs. 100 each. The list opens on June 6 and shall close at the discretion of the directors at any time but not before June 9.

The authorised capital of the company is Rs. 10 lakhs, divided into 20,000 equity shares and 8,000 preference shares. Of this, capital worth Rs. 20,000, all in equity shares, has already been subscribed by the directors, promoters, their friends and associates. The present issue consists of 16,000 equity shares and 6,400 preference shares. The public issue represents the balance after provision has been made for 7,000 equity shares and 800 preference shares to be taken up by the existing shareholders.

The company has been floated with the primary purpose of producing educative, cultural, social and recreative films for social reformation of the society. Its Memorandum of Association allows it to carry on the business of motion picture production and, for this purpose, construction and acquisition of studios and other prerequisites of film production and exhibition.

The proceeds of the current issue are proposed to be utilised for financing the company's first production "Adchane" which is expected to cost Rs. 10.50 lakhs. The difference between the cost of the project and the availability of resources by way of share capital and any additional costs are proposed to be secured through loans from banks, financial institutions and film distributors, etc.

To Mr. Gopi Krishan and his associates goes the credit of floating probably the first public limited company to finance film production in this country. The progress of this floatation, as also of the working of this concern, will be watched with interest, for on its success depends the future of this new trend in finding finance for the Indian film industry. It is noteworthy that the promoters have taken a decision that any payment to any director of the company for any services rendered by him during the course of its first production, will be made only after the premiere of the picture.

INDEQUIP ENGINEERING

THE SUBSCRIPTION LIST of Indequip Engineering Limited opens on June 4 and shall close on June 9 or earlier at the discretion of the directors, but not before June 6. Details of this issue were given in these columns last week.

Chemicals

SODA INDUSTRY'S PROGRESS AND PROBLEMS

ALTHOUGH THE caustic soda industry has made quite a substantial progress it has many of the problems which, if not solved in time, might hinder the further growth of the industry. Caustic soda is needed in industries like petroleum refineries, dyestuffs and intermediates, plastic raw materials, drugs and pharmaceuticals and organic chemicals, and therefore, it is all the more essential that this industry be given the required encouragement. Being a basic chemical, caustic soda plays a dual role in the country's industrial development. It not only helps in the growth of other industries, but is itself undergoing a process of development to make the country self-sufficient in caustic soda.

So far as production trend goes, it may be observed that the production of caustic soda has gone up by nearly 11 times during the past decade. In 1958, there were 15 units with an overall established capacity of 68,270 tons, today there are 18 units with an overall established capacity of 1,31,035 tons. Demand is also increasing day by day and keeping this development in view the planners have placed the estimated requirements by the end of the Third Plan at 3,40,000 tons. For producing this quantity the target of installed capacity has been fixed at 4,00,000 tons. But as the industry is beset with certain problems, it seems clear that unless they are dealt with effectively, it may not be able to gain the same tempo that it did during the past decade.

The first and foremost is the problem of selling

prices. While its prices have remained constant over a long period, costs of production have been increasing owing to increases in prices of raw materials like power, fuel, freight and packing charges. The result is that the margin of earnings has been considerably pushed down below the modest 12 per cent return on employed capital allowed by the Tariff Commission. Again the rate of depreciation allowed under the Income Tax Rules is quite inadequate. Under the circumstances, it becomes quite essential that the Government should adopt a more liberal depreciation policy so that this industry may be able to play its full role. A marginal increase in the selling prices may also be allowed as it would help the industry to fully entrench its feet in the ground.

WIMCO'S NEW PROJECT

A PROJECT for the recovery of marine chemicals from the sea in South India is proposed to be started by the Western India Match Company Ltd. In this connection negotiations with the Madras and Central Government are under way. The company expects positive results which will be known quite soon. The project, as far as is known, is for the recovery of common salt which is in great demand from industry and which also has export possibilities. There are also wide possibilities of recovering from sea water potassium chloride which can feed the chloride industry and several chemical concerns. At the moment this chemical is being imported and naturally, therefore, this project when it goes through will result in the saving of considerable foreign exchange. This fact was disclosed by Mr. Chunilal Mehta, Chairman of the company at the annual general meeting held at Bombay recently. This new project that has been conceived by the company will further strengthen its working. The Chairman indicated that the mechanised sector of the match industry was being restrained from increasing its capacity. The new project in a way is also the result of the company's thwarted growth in normal channels.

Cables

A NEW UNIT

A NEW unit was established by Devidayal Rolling and Refineries Private Limited for the manufacture of ¼" non-ferrous wire rod for which the foundation was laid recently by Mr. S. K. Wankhede, Minister for Industries, Government of Maharashtra. It was realized that most of the cable producers required ¼" wide rod which was most convenient and economical raw material for them. In the Bombay region there was no producer to supply ¼" wide rod and consequently the Ministry of Commerce and Industry viewed that some such producer should establish a mill that could produce ¼" rods for the convenience of the cable manufacturers in the Bombay region. The Devidayals offered to provide this facility, in view of the experience that this firm possessed in the rolling of non-ferrous metals. The factory is likely to go into production in a year's time. Apart from ¼" wire rods, it will manufacture copper bus bars, transformer strips, earthing strips and such other products hitherto imported resulting in saving of foreign exchange to the tune of over a crore of rupees. It has been found out that a complete plant for the rolling of ¼" copper wire rods would, if imported, cost anything between Rs. 60 to Rs. 70 lakhs. The Company, however, has plans to complete the plant with the foreign exchange requirements for essential components which would not be more than 25 per cent of the total cost. This project fills an important gap and is likely to be of considerable use to the cable industry in the Bombay region.

Wool

PRODUCTION FORECAST

THE REPORT on the results of the fifteenth annual wool questionnaire prepared by the Commonwealth Economic Committee and the International Wool Textile Organisation shows a variety of trends. While there is a significant increase in production in some countries, there is a discernible decrease to the extent of 7 per cent in a country like Argentina. Falls are expected in the United States also. On the whole there has been forecast an increase of about 1 per cent in 1962 as compared with the previous season. Activity in general in wool textiles industry of the Free World in 1961 was at a higher level than in 1960. Production of wool and hair tops is estimated to have risen a further 3 per cent to the record figure of 1,318 million lbs. The larger increases can be seen in Japan i.e. about 14 per cent. Production of Commonwealth countries fell by 3 per cent to 455 million lbs, Germany, Italy and Belgium showing a substantial decrease.

So far as imports of raw wool in the fourteen major consuming countries of the Free World are involved, it is noticed from the report, that compared to 1960 there was an increase of 8 per cent. Substantial advances were recorded in Japan, the United States, France and West Germany. Exports of wool tops at the figure of 327 million lbs. were 3 per cent above those of the previous year although still slightly below the 1959 record.

Woollen and worsted yarn exports reached a new peak, 5 per cent higher than the previous year and totalled 162 million lbs. for the nine leading exporting countries. Sales of raw wool also showed a noteworthy increase.

EXCISE DUTIES ON MINERAL ACIDS, INDUSTRIAL GASES: AD VALOREM BASIS NOT FAVOURED

The Development Council for Inorganic Chemical Industries at its meeting held here last week, discussed, among other things, the ad valorem basis proposed for the levy of the new excise duties on mineral acids and industrial gases. It came to the conclusion that an ad valorem basis would not be a satisfactory basis for the proposed excise duties for the following reasons:

1. The actual prices realised by the manufacturers for a particular gas or acid would vary considerably from time to time and place to place. The ad valorem basis to be adopted for calculating the excise duty would, therefore, be a perennial source of controversy between basis to be adopted for calculating the excise duty would, create numerous administrative difficulties in the collection of this levy.

2. The production costs, and consequently the selling price for a given acid or gas, would be higher in certain locations than in others owing to higher transport, handling and power costs. To relate the duty payable to the manufacturers' selling price, would thus in effect be to require the consumer, who ultimately pays the excise duty, to pay an excise on the transport, handling and power differentials. This cannot be the intention of the Government.

3. Where sales tax or other similar imposts are leviable on the basis of the selling price, the effect of the ad valorem duty would again be to heap additional burdens on the consumers in the less favourable locations.

4. It is customary to adopt different price levels for bulk sales as against sales in smaller quantities in a production unit. Adoption of excise duty on ad valorem basis would lead to complications arising out of variable prices charged by the same unit. A uniform rate of levy would eliminate such a complication.

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION **COMBINES A LOOM BUILDING EXPERIENCE OF 18 YEARS AT CIMMCO WITH OVER 34 YEARS IN JAPAN.**

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

PLANS TO STEP UP POWER AVAILABILITY

THE Union Ministry of Irrigation and Power, it is learnt, has under consideration a proposal to advance the date of completion of some projects included in the Third Plan with a view to stepping up availability of power by 3 to 4 lakh KW in 1965-66. One such project is the Bhakra right bank power house. These projects were originally scheduled to be completed early during the Fourth Plan period. The decision to advance their date of completion to the last year of the current Plan, however, depends on the availability of foreign exchange required.

Meanwhile, the Central Water and Power Commission has accelerated the implementation of its plans to loan used diesel generating sets to States which may require them to augment power availability in their areas. The Commission is maintaining a list of such sets and any State which requires them can approach it for immediate lending.

The Union Government is also going ahead with its programme to secure foreign exchange for the purchase of six package unit of 10,000 KW each to meet the acute power shortage in States like Andhra Pradesh and Mysore and the DVC-West Bengal-Bihar Area. An approach to the U.S. Export-Import Bank for making available credits for the purchase of these units is likely to be made in the near future.

A REFINERY FOR SOUTH INDIA

The Government of India is planning to establish in South India a refinery to go on stream by March 1966 or early 1967. It has engaged the services of the Italian firm E.N.I. and the Indian Petroleum Institute to prepare a project report with the following terms of reference:

(a) Estimates of the quantity and the pattern of demand for various petroleum products, including lubricating oils and bitumen, by the end of the Third and the Fourth Five-Year Plans in India and in the South Indian States of Kerala, Madras, Mysore and Andhra Pradesh.

(b) How the existing requirements in these States of various petroleum products, including bitumen and lubricating oils, are being met.

(c) In the light of the refinery programme as laid down in the Third Five-Year Plan and as envisaged by the Department of Mines and Fuel for the Third and Fourth Five-Year Plans, particularly the expansion of the existing or the projected units, what would be the economic areas for supplies coming from the refineries lying north of these States by 1966 and 1971.

(d) Quantum and pattern of demand for various petroleum products, including bitumen and lubricating oils, in the South Indian region thus carved out.

(e) Size of the refinery to meet the requirements of this area and any deficit area in the North, by 1966 and 1971, if required.

(f) Probable location or locations, in order of priority, of the refinery from distribution and other angles.

(g) Crude oil or oils to be imported initially. Middle Eastern, Indonesian, North African, Russian (or other rupee payment sources) and other available and suitable crudes are to be considered.

(h) Suggesting of at least two alternate processing schemes — one for fuels and bitumen, if required, and the other for fuels, bitumen and lube oils — based on at least two alternate crudes or combination of crudes. The effect of replacement at a later date of the imported crude by an indigenous crude which may be like Ankleshwar or Nahorkatiya, on yield pattern, process scheme and other relevant aspects is to be examined.

(i) Economics of the refinery based on each of the proposed processing schemes should give:

(i) General description of main and auxiliary processing units and of sites;
(ii) Approximate cost of equipment for above;
(iii) Total approximate capital investment for the erected refinery, broken into foreign exchange and rupees;
(iv) Cost of crude oil;
(v) Requirements of utilities and chemicals and cost thereof;
(vi) Man-power requirements;
(vii) Total approximate operational cost;
(viii) Foreign exchange saving and return on capital;
(ix) Choice of the best processing scheme in consultation with the Department of Mines and Fuel.

EXPORT PROMOTION

The recently-created Department of International Trade in the Union Ministry of Commerce and Industry is getting into strides. As reported last week, the first meeting of the Board of Trade has been called on June 9. The following tentative programme of some of the major steps proposed to be taken to step up exports has been drawn up. It will form a subject for discussion at the Board's forthcoming meeting.

1. According of priority in foreign exchange allotment for industries producing exportable goods;
2. Promoting the establishment of a large number of export houses and international trading firms;
3. Enlargement of the scope of the State Trading Corporation and the various Export Promotion Councils and encouraging of exports through co-operative organisations;
4. Introduction of a programme for reduction in cost structure of major export industries and export commodities;
5. Fostering modernisation of industries by making imported capital goods and equipment available as a compulsory entitlement in every export promotion scheme, e.g., allowing 10 to 20 per cent, depending on the nature of the industry, of the foreign exchange earned to be compulsorily utilised by the exporters and exporter-manufacturers for import of machinery and plant for modernisation.
6. Introduction of various new fiscal measures such as excise bonus related to exports, besides refund of customs and excise duties already granted;
7. Provision of income-tax relief to exporters;
8. Intensification of activities like undertaking of marketing serveys and product displays;
9. Making availability of indigenous and imported raw materials easier to the export industries;
10. Liberalisation and expansion of financial and credit facilities to exporters;
11. Establishment of an effective system of quality control, grading and pre-shipment inspection; and
12. Providing of priority in movement and concessional railways and ocean freight rates of goods for export.

PLASTICS INDUSTRY

A rapid growth of the Indian plastics industry has been envisaged for the Third Plan period because the principal factor which has inhibited its vigorous expansion hitherto, namely absence of domestic primary materials, would be overcome to a great extent.

As regards the processed plastic goods, the basic approach underlining decentralisation and dispersal of processing activities which was recommended under

the Second Plan is to hold good in the following quinquenium also. The potential of the small-scale sector needs to be exploited fully in this field. To implement the policy of decentralisation successfully, it has been recommened that the processing activities of the primary producers should be limited to 25 per cent of the output of the moulding powders.

The creation of additional capacity in the processing sector to match the availability of moulding powders would involve substantial investment in overall terms as well as foreign exchange. In this context, attention has to be given to the indigenous manufacture of dyes, moulds and other equipment as well as to the planning of capacity in relation to its use on double-shift basis.

For meeting the domestic demand and export targets, it is envisaged that the indigenous production will have to be raised to 74,000 tons (165.0 million lbs.) in 1965-66. To achieve this level of production, the capacity target is visualised at 85,000 tons (190 million lbs.) which is distributed between the different plastic materials as under:

(In tons)
(Figures in brackets in million lbs.)

Material	Capacity	Indigenous requirements	Exports
P.F. moulding powder	6,700(15))	8,900(20)	1,340(3)
U.F. moulding powder	4,450(10))		
Cellulose acetate moulding powder (incl. Butyrate, propronate and ethyl cellulose)	6,700(15)	4,450(10)	890(2)
Polystyrene (incl. styrene alloys)	13,400(30))	40,000(90)	8,000(18)
Polyolefines	26,800(60))		
P.V.C.	13,400(30))		
Polyvinyl acetate	4,450(10))		
Cellulose nitrate	890 (2))		
Laminates	1,780 (4))		
Nylon	890 (2))	8,900(20)	890(2)
Acrylics	1,780 (4))		
Polyesters	1,340 (3))		
Polyurethanes	890 (2))		
Others	1,340 (3))		
TOTAL	84,810(190)	62,250(140)	11,120(25)

Although the application of straight polystyrene has its drawbacks, the co-polymers and styrene alloys have found extensive applications in many different fields. In view of the relative cheapness of this material, it is likely to be popular in many applications where other plastics were used previously.

The target capacity under this head includes both high-pressure and low-pressure polyethylene as well as polypropylene. A large increase in the consumption of polyethylene is foreseen because of its likely extensive application as a lining material in packing fertilizers. It has been roughly estimated that in this field alone, the requirements may reach the level of 10 million lbs. annually when all the fertilizers projects proposed under the Third Plan go into production. Another likely field of application of polyethylene is its use as liner for canals to prevent seepage. Furthermore, with larger availability of polyethylene and the lower price as a consequence of the expansion of the industry, much greater use of polyethylene is envisaged as material for packaging as well as for finished goods for exports. With the sugar target at 3.5 million tons, the supply position of alcohol for production of polyethylene may be somewhat easier than what was anticipated earlier, but by and large, future production of polyethylene will have to be based on alternative raw materials like natural gas, coke oven gas and petroleum naphtha and refinery gases.

POLYVINYL CHLORIDE

A large increase in the production of polyvinyl chloride powder has been envisaged because it will consume some quantity of unutilized chlorine produced by the electrolytic caustic soda plants. However, the production of the other major raw material, namely calcium carbide, in India has not yet been stabilised both in regard to its quality and price. Unless good quality carbide is produced economically, the target envisaged here may not be achieved. Opinions have been expressed that production of polyvinyl chloride via ethylene dichloride may be somewhat cheaper. If calcium carbide is not found economic as raw material, other starting materials such as natural gas, refinery gas or naphtha would have to be considered. Export of P.V.C. is also dependent on the cost of production and, therefore, the establishment of units of optimum economic capacity would be essential.

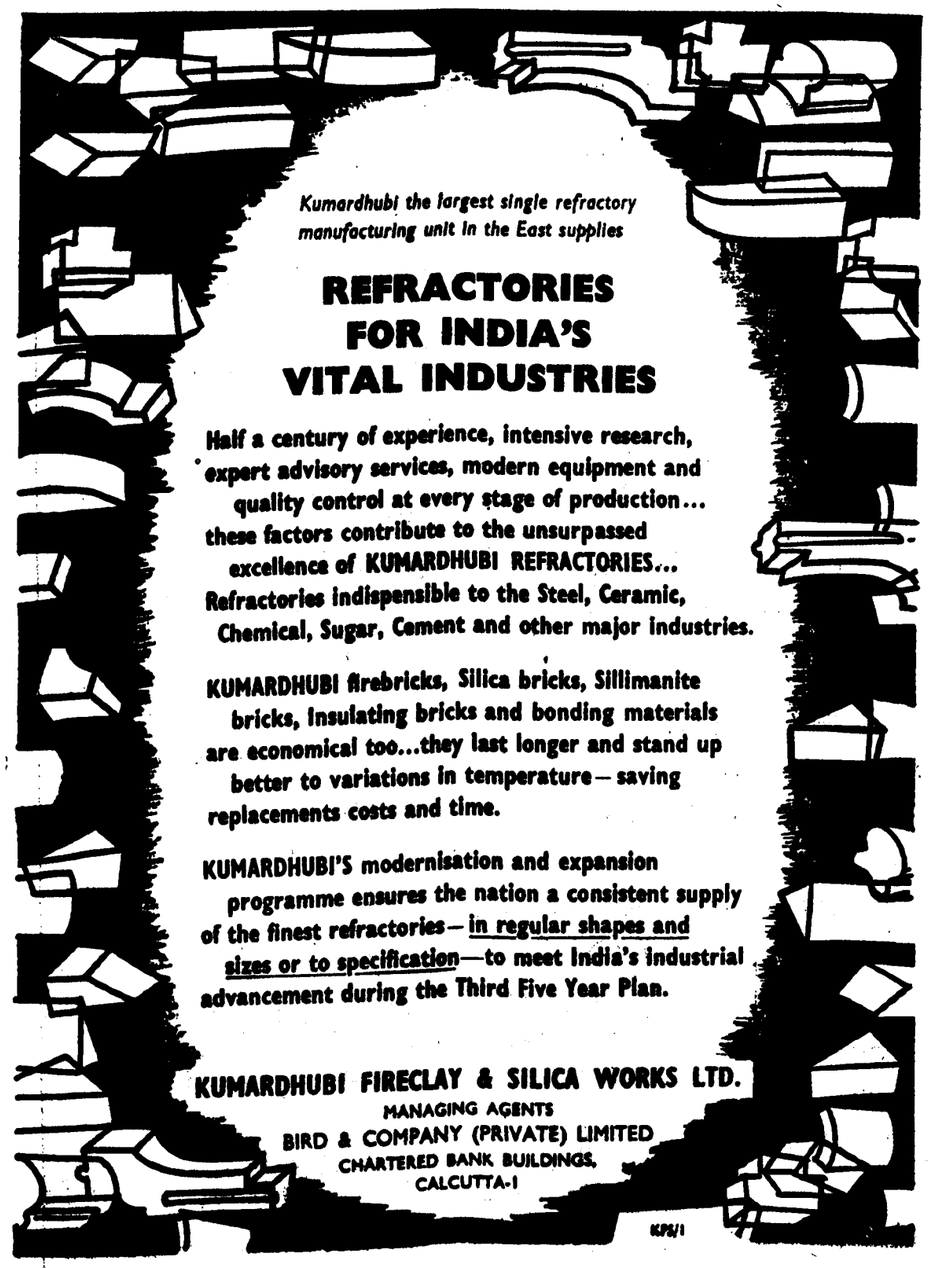
Among the important plastics under this head is cellulose acetate which is popular with the Indian moulder. This is based on indigenous cotton lenters.

The following schemes have been licensed for implementation:

Name of the Firm	Capacity (tons)
P.F. Moulding Powder	
Saurashtra Electrical and Metal Industries Ltd., Bombay	900 (New)
Hyderabad Laminated Products Ltd., Secunderabad	600 (New)
U.F. Moulding Powder	
Saurashtra Electrical and Metal Industries Ltd., Bombay	300 (New)
Polystyrene	
Polychem Ltd., Bombay	1,500(Exp.)*
Hindustan Polymen Ltd., Andhra Pradesh	7,500(New)
Polyethylene	
Alkali and Chemical Corporation of India Ltd., West Bengal	5,000(Exp.)*
Union Carbide India Ltd., Bombay	9,000(Exp.)*
Duncan Bros., Gauhati, Assam	4,000(New)
P.V.C.	
Ahmedabad Manufacturing and Calico Printing Co. Ltd., Bombay	3,600 (Exp.)*
D.C.M. Chemical Works, Kotah, Rajasthan	6,000 (New)
India Cements Ltd., Madras	6,000(New)
Standard Mills Ltd., Bombay	5,000(New)
Dhrangadhra Chemicals, Madras	12,000 (New)

*Expansion.

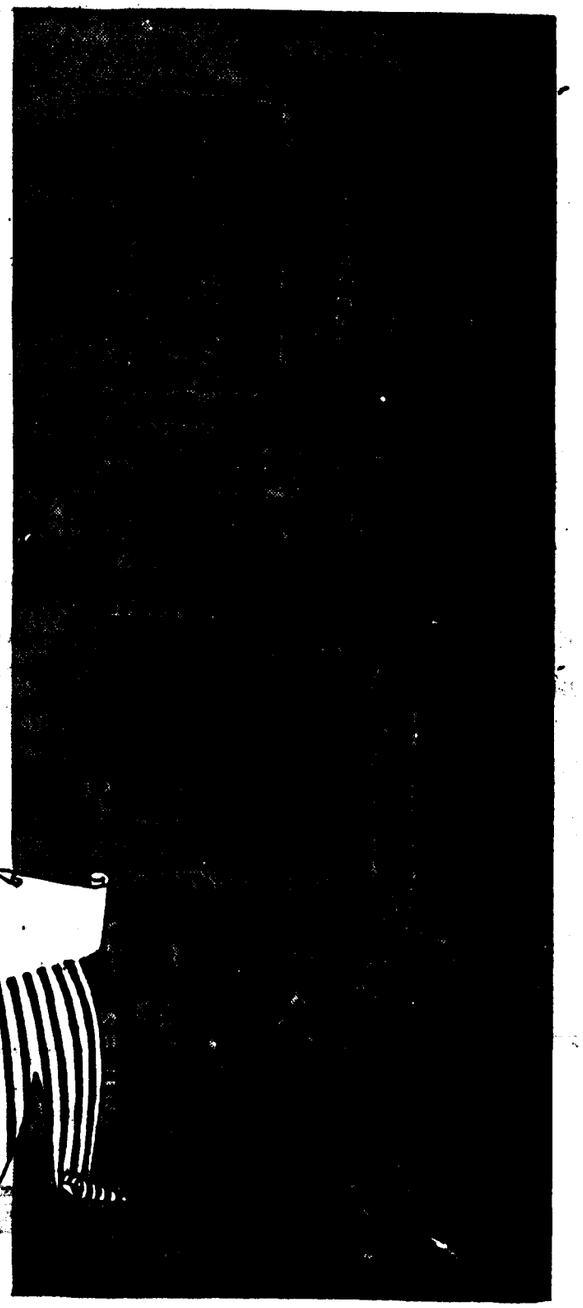
So far only polyethelene has been based wholly on indigenous raw material. It is expected that styrene monomer would also be produced before the middle of the Third Plan. Phenol would be available from the Durgapur coke ovens as well as from the Basic Chemicals and Intermediates Plant of the Central Government and certain other units in the private sector. Urea and formaldehyde would also be available indigenously during the Third Plan.



The following table gives in a summary form the programme of development of the Plastics Moulding Powder Industry during the Third Plan:

(In tons)

	1960-61	1965-66
Annual capacity	15,540	85,000
Production	9,463	74,000



CEMENT MANUFACTURE

The Union Ministry of Heavy Industries has approached the Planning Commission with a view to getting the target of cement production under the Third

IFOC.13

Mr. Al Foil wraps confections to perfection

Whether printed, plain, embossed, coated or laminated, an aluminium foil wrap adds packaging prestige to protection.

FOILS FOR PACKAGING....

India Foils Limited
(Incorporated in Great Britain)
Calcutta Bombay Madras New Delhi.

Plan raised from 15.2 million tons to 18 million tons. In order to achieve this higher target, a request has been made that provisional licensing should be allowed to be done upto 20 million tons.

The cement industry, it is learnt, has assured the Government that it would be able to step up cement production by a million tons within the next 12 months, provided coal and transport are made available to it in adequate quantities. Stepping up of cement output has been necessitated by the growing shortage of this construction material in the country.

Although licences for putting up additional capacity to the tune of 5.8 million tons of cement have already been issued under the programme drawn up for the current Plan period, active steps have been taken so far to instal capacity to the extent of only 3.2 million tons. The need to goad the licencees to take concerted measures to implement the licences granted to them at an early date is thus obvious.

SWITCHING-OVER TO FURNACE OIL BY CEMENT INDUSTRY

In order to fulfil its commitment to the cement manufacturers who had started switching over to furnace oil in place of coal before the Union Finance Minister proposed giving of a general subsidy on rail freight on movement of furnace oil from the ports to the consuming centres, on the understanding that they would be allowed to raise their selling prices to the extent of the additional fuel costs, the Government has decided that these units should be permitted to increase their selling prices with such modifications as would reflect the general concession announced by the Finance Minister. Thus, supposing a unit switching over to furnace oil was originally allowed to enhance the price of its cement by "X" rupees per ton and the concession by general reduction in railway freight on furnace oil works to "Y" rupees per ton. the unit would now be permitted to increase its selling prices by Rs. X-Y per ton.

ROURKELA STEEL PLANT

The Rourkela Steel Plant is faced with some serious problems which are having repercussions on its expansion programme. Reports from Germany go to show that the German financial assistance for the expansion of this plant may not be forthcoming till adequate arrangements are made to reach the one million tons production target of the existing plant. It has also been agreed that a sum of Rs. 10 crores should be the first charge on the new German credit to India for the purpose of rehabilitation of this plant.

Following its teething troubles and the criticism in India of the working of Rourkela, the West German Government had sent out to Rourkela a six-man mission, headed by Mr. Solveen, Secretary in the Federal Ministry for Economic Affairs. The report of the Mission makes an uncomplimentary reading for the Hindustan Steel Limited. The present unsatisfactory state of affairs, it is pointed out, should be attributed to faulty operation of the plant and the unsatisfactory management by Hindustan Steel. It is estimated that about 30 per cent of the Indians trained in Germany were able to get employment in jobs for which they were not trained. Many trainees have also migrated to other firms.

Following this report, it has been suggested that India should have another team of German experts to set up proper operating and administrative procedures.

In building three steel plants, India had followed three separate patterns. One was the Russian pattern — a Government-to-Government package deal. The Bhilai plant has been a success not only because it had the best iron ore and coal, but also because the system of its commissioning and operation has been such as to make Indians believe that they were erecting and operating the plant. The Rourkela steel plant stands on the other extreme. It was designed by the West German Steel Industry, but its erection and commissioning was done by Hindustan Steel through over 40 German suppliers of equipment. In between stands the Durgapur plant, which was set up by a package deal with a British Consortium, Indian Steel Works Construction Company.

The working of the three plants so far has shown that there had been little or no trouble at Bhilai and Durgapur. Rourkela has had the worst luck.

For the expansion programmes, the Government has approved of another package deal with the Soviet Union. Notwithstanding the unhappy lessons of Rourkela, it is not prepared to have another package deal either with the British for the expansion of the Durgapur plant or with the Americans for the building up of the Bokaro steel plant.

COMPANY LAW CLARIFICATIONS

Two important clarifications of the Companies Act have been made in two press notes issued by the Department of Company Law Administration. One of these relates to announcement of capital issues by companies and the other to interpretation of Section 205 and 350 of the Act.

The press note concerning announcements of capital issues by companies states:

"Many companies offering shares or debentures to the public have been publishing in newspapers and other publications announcements of the issue of capital to the public with a note such as 'This is only an announcement and not a prospectus,' etc. However, these announcements are usually found to contain copious extracts from the relevant prospectuses filed by the companies with the Registrar of Companies concerned. Government have been advised that announcements of this nature would be tantamount to publication of prospectuses in an abridged form, and such practice is not in conformity with the provisions of section 56 of the Companies Act, 1956, which provides that every prospectus issued by a company shall state the matters and the reports set out and specified in Schedule II to the Act. Any default in this respect renders the persons concerned liable to the penalties under the law and also to pay compensation to every person who subscribed for any shares or debentures on the faith of the abridged prospectus.

"Company promoters and company managements are, therefore, enjoined to take all possible care to ensure strict compliance with the provisions of law relating to the issue of prospectuses and their failure to do so would not hereafter be condoned by Government.

"If for any reason a company should find it not possible to publish its prospectus in full in newspapers and other publications, it would be well advised to publish only a mere announcement of its intention to issue capital, indicating the names and addresses of the brokers, etc., from whom copies of applications along with copies of the prospectus can be had, without giving extracts from the proposed prospectus. In this connection, Government have devised a proforma for making announcements of the issue of capital by companies which may not consider it possible to publish the full prospectus in newspapers and other publications. A copy of the proforma has been circulated to all the Chambers of Commerce and Stock Exchanges for the information of their constituents and can be had by those interested in the office of the Registrar of Companies in each State. Though the adoption of the said proforma for making the announcement of a new issue in the press is not mandatory, if any company chooses to make the announcement in any other form it would do so at its own risk."

INTERPRETATION OF S. 205 & S. 350 OF COMPANIES ACT

The other press note states: "It has been brought to the notice of the Central Government that some company managements have been declaring and paying dividends without providing for depreciation on their immovable properties in the manner specified in section 205 read with section 350 of the Companies Act, 1956, on the ground that the immovable properties of the company from which a substantial portion of its profits is derived, are held as its capital investment and are not used for the purpose of the business carried on by it and that the Income-tax Law does not make any allowance by way of depreciation of those assets for calculating its total income.

"In this connection, Government would like to draw the attention of all concerned to the fact that the provisions of section 205 of the Companies Act, 1956, under which no dividend shall be declared or paid without providing for depreciation in the manner specified therein, are mandatory in nature and must be strictly complied with by every company before declaring any dividend.

"For the purpose of complying with the aforesaid requirement under the Company Law, it is immaterial as to whether depreciation in respect of any assets is actually admissible under the Income-tax Law. The only provision of the Income-tax Law that is relevant for the above purpose is the provision specifying the rates of percentage as contained in the Indian Income-tax Rules for the purpose of determining the depreciation of various assets referred to therein. Provisions of the Income-tax Law relating to the admissibility of depreciation allowance for the purpose of calculating the total income of the assessee company are not relevant for the purpose of section 205 read with section 350 of the Companies Act."

Defaulting concerns are liable to be punished under the penal provisions of section 629A of the Companies Act.

ACQUISITION OF LIGHT RAILWAYS

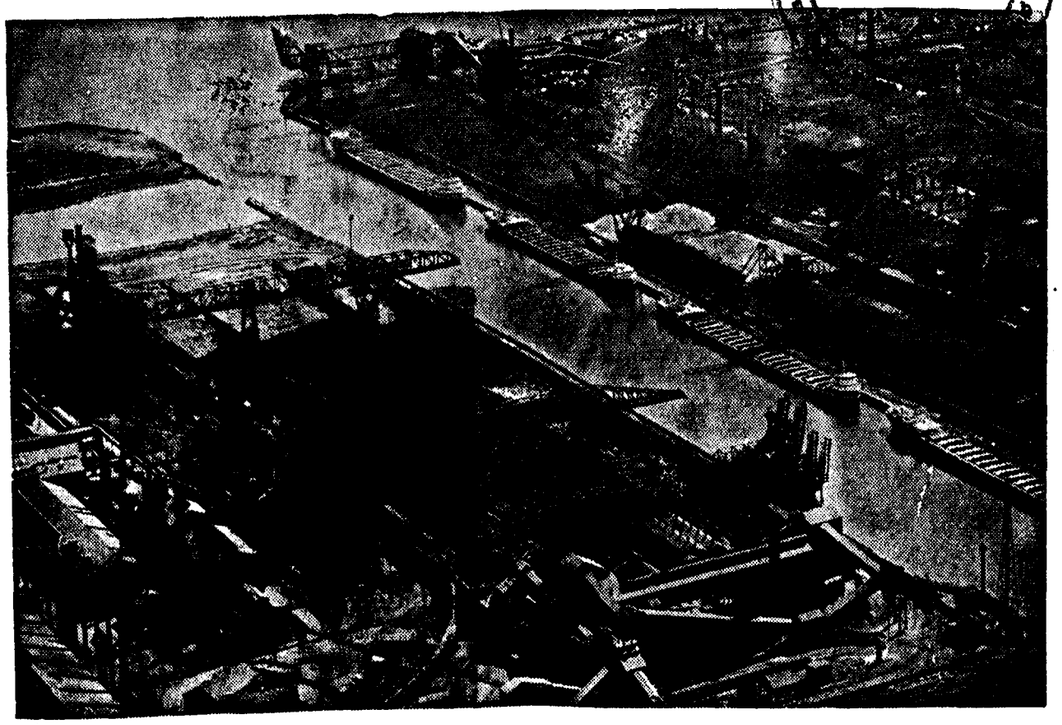
The Central Government, it is explained, has no contractual right to purchase certain light railways. The powers to purchase these lines vest in the local District Boards, in terms of the contracts between them and the light railways. Apart from this, the Government's general policy at present is not to nationalise the light railways so that, in order to create additional rail transport capacity under the Plan, all available resources are utilised on creating new assets rather than on the acquisition of the already existing ones.

In the case of Ahmedpur-Katwa and Burdwan-Katwa Railways, the Government of India, under the terms of the contracts, are paying sums to make up the shortfall in the guaranteed rate of interest of 3½ per cent per annum on their paid-up share capital. In the case of Howrah-Amta and the Howrah-Sheakhala Light Railways, the Central Government is not liable to pay any such subsidy, as the Government is neither under any contractual obligation to pay subsidy nor has it any financial interest in these two railways. The net profits of these two lines, equivalent to 4 per cent on the paid-up capital, has been guaranteed by the District Board of Howrah under terms of agreements with these companies, subject to a maximum of Rs. 28,000 per annum in the case of Howrah-Amta Light Railway and to a maximum of Rs. 950 per annum per mile of the line constructed and opened in the case of Howrah-Sheakhala Light Railway, which comes to a maximum of approximately Rs. 19,000 per annum.

BRITISH AID TO INDIA

Two further loans have been made available by the British Government for the economic development of this country during the Third Plan period. One of these is for £22 million and is to be utilised for the expansion of the Durgapur Steel Works. The other loan is for £10 million. This is to be used to pay for a wide range of British exports to India.

Both the loans are repayable over a period of 25 years, including a grace period of 7 years during which no repayment of the principal may be effected. The rate of interest on these loans will be governed by the usual formula applicable to Commonwealth assistance loans, which is the rate of interest applied by the British Treasury at the time of withdrawal to a loan for a comparative period from the Consolidated Fund of the U.K. plus ¼ per cent towards administrative charges.



These loans are part of the £90 million credit which the British Government has so far undertaken to make available to India during the Third Plan period. Loan agreements for £45 million had been signed previously. The British credit for the Third Five-Year Plan finalised uptil now thus comes to £77 million. Negotiations for the remaining 13 million assistance already promised by the U.K. are still being carried on.

The following table gives the latest position of the assistance made available by Britain for India's economic development since the beginning of the Second Plan:

A.	Grand total of disbursed and committed assistance during the Second and Third Plans to date:	£170.5 million
B.	**SECOND PLAN**	
	Project aid for Durgapur 1958	£ 15 million
	General balance of payments aid 1958	£ 28.5 million
	General balance of payments aid 1959	£ 19 million
	Project aid for Assam pipeline 1959	£ 3 million
	General balance of payments aid 1960	£ 10 million
	General balance of payments aid 1960	£ 5 million
	TOTAL	**£ 80.5 million**
C.	**THIRD PLAN**	
	Commitment to date:	£ 90 million
	LOANS SIGNED	
	Mixed project and development goods loan — May 1961	£ 30 million
	General balance of payments loan — May 1961	£ 10 million
	General balance of payments loan — November 1961	£ 5 million
	General balance of payments loan — May 1962	£ 10 million
	Durgapur Extension Loan — May 1962	£ 22 million
	TOTAL Signed:	**£ 77 million**
	UNDER NEGOTIATION	
	Mixed project and development goods loan	£ 13 million
	TOTAL Promised:	**£ 90 million**

U.S. ASSISTANCE

The Government of India has also recently concluded five agreements with the United States, providing for American grants, totalling Rs. 33.9 crores, for malaria and small-pox eradication, establishment of primary health centres and for financing some elementary and medical education projects. This amount will come out of the money earmarked out of the U.S. P.L. 480 counterpart funds for provision of grants to the Indian Government for various developmental programmes. With the conclusion of these five agreements, the total grants made by the United States to

Advanced ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

The dictionary defines engineering "as the art and science by which the mechanical properties of matter are made useful to man in structures and machines." In the McKee Organization it is much more than that —it is a constant, unflagging effort toward advanced design, increased plant efficiency, improved construction and greater economy.

The results of that effort are readily apparent in the many contributions to the progress of steel-making made by the McKee Metals Division in more than half a century of specialized, world-wide engineering and construction for the steel industry.

Pioneering by McKee engineers in the fields of plant design, ore beneficiation, automation and production methods have been invaluable to the industry. Recent examples are McKee's work in pelletizing and in the first successful application of gas injection in blast furnaces.

McKee can deliver this kind of advanced engineering and construction to the steel industry in India and back it with an unmatched fund of practical experience and specialized knowledge.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

THE McKEE ORGANIZATION
ARTHUR G. McKEE & COMPANY
WESTERN KNAPP ENGINEERING
Represented in India by
DR. B. S. GILANI
29, Jor Bagh, New Delhi 3

UNITED STATES: CLEVELAND • NEW YORK • WASHINGTON • CHICAGO • SAN FRANCISCO • UNION, N. J. HIBBING, MINNESOTA ABROAD: LONDON • TORONTO • MEXICO CITY • SAO PAULO • BUENOS AIRES

the Government of India out of the P.L. 480 funds comes to Rs. 100 crores.

The break-up of the latest grants is as follows: (i) Malaria eradication programme — Rs. 15 crores; (ii) establishent of 1,000 primary health centres in the Community Development Blocks during the first two years of the Third Plan — Rs. 3 crores; (iii) expansion of facilities in medical colleges, medical teacher training institutions and dental colleges during the first two years of the Third Plan — Rs. 2.9 crores; (iv) small-pox eradication programme — Rs. 1 crores; (v) provision of free and compulsory education during the first two years of the Third Plan (the grants to be routed through the Central Ministry of Education) — Rs. 12 crores.

JUTE PRICES AND OUTPUT

The Informal Consultative Committee for the Union Ministry of Food and Agriculture was informed last week by Mr. S. K. Patil, Union Food and Agriculture Minister, that the Government was maintaining "a close and constant watch" on raw jute prices. This, he said, was necessary in view of "this season's good crop and the abnormal price conditions that prevailed in the previous season as a result of the shortage of raw jute".

Mr. Patil stressed the need to safeguard farmer's interests in "this internationally important crop". He recalled that incentives had been given to the producer in the past years to grow more jute. As a result of this intensive drive, the production of jute in India had increased from 16 lakh bales in 1947-48 to 62.69 lakh bales in 1961-62. Care had to be taken to see that the farmer was not penalised for increasing production in the national interest, he observed.

Mr. Patil expressed the hope that raw jute prices would be stabilised at a point somewhat higher than the agreed minimum of Rs. 30 per maund.

Mr. G. R. Kamat, Secretary, Department of Agriculture, disclosed that a study was being made of the cost of jute production as also that of the competitive crop paddy. After the study, he hoped, the Government would be in a position to decide upon further steps necessary to ensure a fair price to jute-growers for their product. Mr. Kamat also revealed that at present there was no proposal under the consideration of the Government to import jute from Pakistan or Thailand; only a small quantity of low-priced cuttings had been obtained from Pakistan.

The jute and mesta crop this year has been the largest since partition, amounting to 79.75 lakh bales — 62.69 lakh bales of jute and 17.06 lakh bales of mesta. But despite this, no overall surplus of this fibre is expected at the end of the current season. This is due to the fact that stocks with all jute mills which are members of the Indian Jute Mills Association, had declined to the "unprecedented low level" of 4.5 lakh bales at the end of the 1961 season. Mills' consumption of jute is going up and during the current season, the raw jute and mesta requirements, both of the mills and the domestic small-scale industries, are expected to go up to about 67 | 68 lakh bales. This will leave a balance of nearly 16 lakh bales which is about the normal carry-over stocks with the trade and the industry.

Efforts are to be made to maintain jute and mesta output at the 1961-62 level (which approximates the target fixed for this crop under the Third Five-Year Plan) in order to avoid any hardship to the jute mill industry which is an important foreign exchange earner for the country.

INCREASE IN COASTAL SHIPPING FREIGHT RATES

Coastal shippers will be allowed to increase their freight rates on all cargoes, except coal, by 15 per cent with effect from June 1, 1962. In the case of coal, the increase in freight rates to be allowed is 10 per cent from Calcutta to Cochin and 15 per cent for destinations beyond Cochin.

These increases in coastal freight rates are subject to revision after a year.

NEW EXPORT PRICES OF GOA IRON ORE

The Goan mine-owners have been permitted to fix the new export prices for iron ore somewhere midway between the 1961 prices and the prices at which fresh contracts were made last month. This follows a representation made by the Goan mining interests to the Union Government a few days ago.

EXPORTS OF SHOES AND HANDICRAFTS TO USSR

The State Trading Corporation has finalised two deals with the Soviet Union, one for the export of 2,30,000 pairs of shoes valued at approximately Rs. 66 lakhs and the other for the supply of handicraft articles worth about Rs. 13 lakhs. The shipment of shoes is to be completed before the end of the current year. The handicraft articles which the Soviet Union has agreed to import include brassware, scarves, zari-bags, knitted-ware etc.

The State Trading Corporation has also secured some orders for export of woollen textiles to the Soviet Union. But these orders are to be examined in consultation with the various manufacturers in India before any final commitment in respect of supply is made.

WORKING OF THE DEVELOPMENT WING

During 1960, 2,241 applications under the Industries (Development and Regulation) Act were received in the Development Wing for scrutiny and comments. Out of these, 1,907 applications were disposed of till the end of March, 1961. Some of these applications included schemes for manufacture of more than one item. The total number of schems for various items processed by the different Directorates of the Development Wing during the year comes to 2,449, as against only 1,987 in 1959.

Of the 2,241 applications, 1,440 were in respect of new units, 852 for substantial expansion and 157 for new articles.

IN BRIEF ....

Just after two years of the earth-breaking ceremony of the aluminium factory of the Hindustan Aluminium Corporation Ltd., at the Rihand Dam site at Renukoot in Uttar Pradesh, the first batch of aluminium was produced on May 23, from imported alumina. The alumina plant of this factory is expected to go into operation within the next two or three months. The company will start marketing its aluminium ingots within the next few days.

*

A team of Indian engineers, led by Dr. A. Nagaraja Rao, Chairman, Heavy Engineering Corporation Ltd., Ranchi, has left for the Soviet Union and Czechoslovakia for discussions with the foreign collaboration for the establishment of the heavy machine-building and coal-mining projects at Ranchi and Durgapur, respectively. The scope of setting up a Central Design Institute for Heavy Machine-Building and Engineering will also figure in these parleys.

*

The construction of the Bhakra Dam is likely to be completed by the end of October this year. Over 99.4 per cent of the concreting work on the dam had been completed by the end of April last. Total expenditure incurred on the dam upto the end of February, 1962, was Rs. 60.48 crores. The power house on the left side of the dam has been completed. The power house on the right side is in the preliminary stages of construction.

COMPANY AFFAIRS

BINANI METAL

The sales proceeds of the Binani Metal Works Ltd. during the year to December 31, 1961 recorded a significant increase. Against Rs. 1.41 crores in 1960, the sales during the year under review were to the extent of Rs. 1.76 crores, showing an increase of more than 20 per cent. Improved production methods adopted by the company resulted in the streamlining of the operations. The profit at Rs. 12.36 lakhs was far too attractive a figure against the profit of Rs. 2.97 lakhs during the previous year. The Directors have provided Rs. 90,000 towards Development Rebate Reserve, Rs. 6 lakhs towards taxation and from the balance a dividend at the rate of Rs. 1 per equity share of Rs. 10 each, subject to tax, has been provided. This will absorb Rs. 4 lakhs. Rs. 1 lakh is separated towards the Reserve Fund.

The company's new scheme sanctioned by the Government for the installation of plant and equipment for the Tool Room Project is proceeding well. The production of simple dies and moulds is also expected to commence shortly. The Government of India has approved a collaboration arrangement of the company for the milling machine production and the grant of foreign exchange for the import of capital goods necessary for the project is being considered by the Government.

BINOD MILLS

The Directors of the Binod Mills Co. Ltd. consider the working of the company for the year 1961 to be quite satisfactory. They, however, point out that with the steady rise in sales the costs too have been increasing. During the year under review the demand for the home market for the company's textiles remained steady during the first half, but a sort of slackness was registered during the second half. The company is, however, making certain changes in its production pattern to be in tune with the consumers' taste. The Directors have added that in the export market the company could not maintain its sales, but to face the situation, certain basic changes are being brought about and considerable amount of capital is being spent. A number of latest types of machines have been installed. The Government has granted permission for installation of 17,506 spindles and 380 looms. The company, under these conditions, will make considerable progress in the years to come.

During the year under review the profit recorded was to the extent of Rs. 50.36 lakhs. After making a provision for taxation and depreciation, the Directors recommended a payment of the dividend at the rate of Rs. 20 per share. This compares favourably against Rs. 12.50 per share of dividend distributed last year.

NEW ISSUES

Recently the following new issues have been sanctioned by the Controller of Capital Issues:

Hindustan Sugar Mills Limited (Bombay) has been granted consent to the issue of Rs. 60 lakhs bonus capital divided into equity shares of Rs. 100 each. This is to be allotted in the ratio of one bonus share for every equity share held.

Dyer Meakin Breweries Limited, Solan (Simla Hills), is to issue bonus shares of the value of Rs. 28,36,160 in the ratio of 1:1 on capitalisation of the company's reserves to a like extent.

Shree Hanuman Sugar Mills Limited, (Calcutta) is issuing 1,00,000 equity shares of Rs. 10 each as fully paid-up bonus shares on capitalisation of its reserves to be issued in the ratio of two bonus shares for every five shares held.

Indian Vegetable Products Limited (Bombay), is to issue bonus shares of the value of Rs. 3,02,500 divided into 3,025 equity shares of Rs. 100 each to be made in the ratio of one bonus share for every seven shares held.

Bharat Fire & General Insurance Company Limited (Delhi), is issuing 15,384 bonus shares of Rs. 10 each, to be issued on capitalisation of the company's reserves to a like extent.

National Steel Works Limited (Bombay), is to issue 4,259 equity shares of Rs. 10 each to be issued as bonus shares on capitalisation of the company's reserves to a like extent.

Multimetals Limited, a new company proposed to be incorporated in Calcutta, has been granted consent to the issue of 7,50,000 shares of Rs. 10 each for cash at par. Out of the capital of 75 lakhs consented, shares of the value of Rs. 25 lakhs may be issued to Revere Copper and Brass Inc. of New York who are the collaborators. The company will establish a plant at Kotah for the manufacture of copper|brass rods, tubes etc., for which a licence has been obtained. The total cost of the scheme is Rs. 150 lakhs.

Brakes India Private Limited (Madras), is raising equity capital of Rs. 1,50,00,000 for cash at par. The proceeds of the issue will be utilised for the manufacture of complete brake equipments for atomotive and non-automotive units in collaboration with M/s. Joseph Lucas (Industries) Limited, U.K. or their subsidiary M/s. Girling Ltd., U.K.

Structural Engineering Works Limited (Bombay), is to issue capital of Rs. 45 lakhs divided into 45,000 equity shares of Rs. 100 each for cash at a premium of Rs. 5 per share, to be made to the existing shareholders in the ratio of one new share for one old share held.

Trichy Steel Rolling Mills Limited (Madural), will issue equity capital of Rs. 40 lakhs for cash at par. The proceeds of the issue will be utilised for the establishment of a re-rolling mill.

Hindustan Gum and Chemicals Limited, a new company, has been granted consent to the issue of capital of Rs. 30 lakhs in 3 lakhs equity shares of Rs. 10 each. The company is establishing a factory in Hissar District for the manufacture of guar gum. Collaboration with a USA firm has been arranged who will invest 50 per cent of the capital the remaining 50 per cent capital will be subscribed privately.

Poysha Industrial Company Limited (Bombay), will issue further capital of Rs. 25 lakhs divided into 2,50,000 equity shares of Rs. 10 each, for cash at par.

Special Steels Limited (Bombay), is to issue capital of Rs. 20 lakhs in equity shares of Rs. 100 each for cash at par. The proceeds of the issue would be utilised for repayment of loans.

National Straw Board Manufacturing Company Private Limited, a company proposed to be registered in the State of U.P. for the manufacture of straw boards and mill boards, has been given consent to issue capital of Rs. 20 lakhs divided into equity shares of Rs. 100 each, for cash at par.

Digvijay Cement Company Limited (Jamnagar), is raising further share capital of Rs. 13.50 lakhs in equity shares of Rs. 100 each at a premium of Rs. 50 per share for cash. The shares will be offered to M/s. Johns Manville International Corporation of USA who will collaborate with the Indian company in the manufacture of asbestos cement.

Debate on Defence

IT is rare for the parliament of any country to debate openly on the floor of the House delicate issues of preparation for security and defence. This is what happened in the Lok Sabha debate on the budget demands of the Defence Ministry. The issue would have been touched in very brief terms in the conventional manner in the ordinary course. Not that the purchase of supersonic jet fighters could have been kept a closely guarded secret. It was bound to come to knowledge sooner rather than later. But it was certainly extraordinary that a compelling necessity should have arisen to discuss the delicate circumstances leading to or attending the deal of purchase, even while the deal is under negotiation.

The defence debate was dominated by the discussion on the pending negotiations for the purchase of MIG-21 supersonic jet fighters from Russia and also very likely their manufacture under licence here in this country. There was a more important aspect to it. America and Britain were concerned about this projected contract and in view of its varied repercussions they could not but take anxious interest in it and watch the developments. If the exchange of ideas had been confined strictly to the diplomatic level and the kind of publicity witnessed in this country as well as abroad had not taken place, much misunderstanding could have been avoided and ways and means devised to iron out, or at least to minimise, the main differences of view-points on the acquisition of the supersonic fighters and related problems, including a possible race in augmenting the defence potential.

Matters had gone beyond this stage here and abroad and the final result was that the House expressly gave its consent to the MIG deal. The Defence Minister's reply, however, clarified the position that no decision had been made on finalising this deal and there was still time before the Cabinet made up its mind. This is a saving grace in a controversial issue which has been confused by publicity of a propagandist nature. Apparently, the fuller implications of this question are being scrutinised and there will be no haste in reaching a conclusion right now. The Defence Minister has deprecated in unmistakable terms the attempt abroad to make political capital out of this question and he has retorted, as is his wont, that where we buy our goods is largely our business. This display of temper (under provocation) may be overlooked. What is significant is that immediately in the same context he gave the meaningful assurance—"That does not mean that we want to irritate anybody".

The circumstances leading to the stage when the Government deemed it urgent to explore the possibility of the purchase of the MIG-21's are important for a correct appreciation of this question and it is this appreciation which can provide ways and means for rapprochement. It was about eighteen months or so ago that Pakistan received the first squadron of the F-104 supersonic jet fighters. India could not envisage with equanimity the prospect of her Air Force losing its defensive potential by having to rest content with subsonic jet fighters.

But the need to acquire matching military aircraft with Pakistan has been overdone. Undoubtedly the more overriding urgency is to arm ourselves for defence against China, whose ultra-aggressive postures in the face of India's determination to avoid an armed conflict are becoming increasingly menacing. Mr. Krishna Menon has added to his plain statement, that our need is to match our arms with offensive arms elsewhere, the rider that perhaps it is necessary to provide a deterrent. The latter reference seems to be intended to imply China.

Mr. Krishna Menon's exposition of the purchase of the supersonic jet fighters clarifies certain relevant issues. Cost, performance, availability of spares are important considerations entering into a contract for the acquisition of these fighters. But time is of the essence of the contract, it is already running out against India and as such the delivery date is a crucial term. Of much greater importance than the fighter aircraft is the question of the type of weapons they can carry and the supply of these weapons. The manufacture of the fighters and weapons in India under licence from the collaborating country is another vital question. And in this behalf the Government's solemn pledge to honour security commitments must be accepted and it has been amply borne out in all the previous deals.

An armament race is not in the interest of the countries of the Indian sub-continent. But it would be suicidal to relax efforts in defensive preparation against the northern aggressor. It should be possible to devise a solution from this angle. A departure from the conventional sources of supply and the deeper as well as long-term consequences of such a departure ought to be weighed carefully. They argue for rapprochement by an earnest effort by both the sides—the supplier and the purchaser.

Business at Brussels

MR. EDWARD HEATH'S statement in the House of Commons on May 31 is an authoritative indication that Britain's negotiations with the European Economc Community have entered the crucial stage, when the terms that should govern her entry are being discussed in a thoroughly business-like manner at Brussels. Before the ministerial session concluded on the previous day, Mr. Heath tendered the British Government's proposals on the selected items of exports from India, Pakistan and Ceylon to the enlarged Community. This grouping follows the prior pattern of putting Canada, Australia and New Zealand in one bracket. The deputies of the Ministers are now seized of the concrete business of examining the issues raised in the export trade of India, Pakistan and Ceylon to suggest solutions to their principals when they start their next session on June 27. The solutions will be debated by the Ministers. Nevertheless, this is a signal to the three Commonwealth members that the day of reckoning will not be far off.

The British proposals will serve as the basis of the deliberations of the deputies, but they cannot be the exclusive basis. Differences of approach between Britain, on the one hand, and the Commonwealth countries concerned, on the other, are no secrets. This is so in the case of Canada, Australia and New Zealand—and certainly with a much more pronounced emphasis than is to be noticed in the divergence between Britain and India.

Britain's approach aims at reducing to the minimum the area of controversy and with this end in view she has based her proposals on the reactions of the Six to the demand for safeguards for the Commonwealth trade with Britain, in so far as they could be gathered from the preliminary general discussions between her and the Six. This way of finding a solution to the problem inevitably falls too short of the expectation of the rest of the Commonwealth countries and cannot win their concurrence. India has presented her memorandum of proposals to the Chairman of the European Economic Commission and this memorandum, along with the British suggestions, is to form the joint basis of the investigation now being conducted by the deputies.

The British proposals divide the items of exports of the three countries into four classes on all of which India does not necessarily enter her dissent. Tea, a top-ranking Indian export, is recommended for duty-free entry in the enlarged community and there are besides other items on which India does not disagree with the British view-point. But controversy rages round cotton textiles and certain propositions about the Community's outer tariffs, which India has advanced in the memorandum, but on which the British proposals are silent. The silence amounts to an unreserved acceptance of the principle of the application of the outer tariffs in full on Britains accession to the Community.

Cotton textiles are a premier export in regard to which India has built up a definite position in the British market as well as in her aggregate structure of exports by reason of the Commonwealth scheme of preferences. The British proposal suggests the levy of 30 per cent of the Community's ad valorem duty of 18 per cent immediately on accession. This would clearly imply that right from 1963 India will be under a compulsion to nullify the competition of Japan, for instance, by cutting her export prices by about 6 per cent, if she is to maintain the flow of her exports to Britain. The next measure of the application of another 30 per cent of the ou er tariff would be due some time towards the middle of 1964 on an examination of the statistical position of India's exports at the end of the first year. The full imposition of 18 per cent tar.ff would be due some time around the beginning of 1970. The British scheme proposes suspension of the levy in case the exports are hit and pushed below a certain base level. But the entire decision on suspension is to be governed by a process of consultation with the European Economic Commission.

India's memorandum is to be viewed in the light of the unsatisfactory nature of relief in import duty and the inadequate transition period of about eight years, coinciding with the full enforcement of the outer tariffs by the individual members of the Community, as suggested by Britain. India's case for duty-free entry of cotton textiles is cogently argued and so are the pleas of nil tariffs on some additional items, or in the alternative, their duty-free access to the British market on the analogy of exports from Morocco and Tunisia to the French market. These pleas could be substantiated on the reasonable ground of warding off a distortion of her export trade and the inevitable serious upsets in her balance of payments.

But if the Community is averse to duty-free access and the Common Market's tariff discipline ought to be enforced, the Indian argument of last resort of the provision of a sufficiently long period of transition for adjustment offers a sensible basis for a compromise. The Community may not take an inflexible and adamant attitude in the matter of safeguards. This is illustrated in the case of Canada, Australia and New Zealand in regard to which its original positon has shifted noticeably from deferred imposition of the outer tariffs on a restricted range of industrial goods to all goods of this type. Likewise, the second stage of the levy of the tariff is fixed at a longer interval of four years in 1967. It is for the Government to press India's indispensable requirements on the Community and to convince a responsive party of the reasonableness of a mutually beneficial compromise. The Indian case ought to be argued by a senior member of the Cabinet, preferably the Finance Minister, following the useful precedent of the other three.

New Hope for Turkey

FOR some weeks Turkey has been in the grip of a political crisis which now seems to be resolving itself, thanks to the firm line taken by President Gursel and Mr. Inonu. The instability dates back to four landmarks, namely, the revolution of 27, 1960, the Yassida trials resulting in the execution of Mr. Menderes and two of his associates, the October elections which gave a sizeable vote—almost equal to that of the Republican Party—to the new Justice Party (a successor under a garb to Mr. Menderes' Democratic Party) and the abortive coup of February 1962. The almost equal strength of the Justice Party and the Republican Party in the National Assembly forced a coalition, but in practice it became impossible for Mr. Inonu to function effectively. Ever since this coalition came into being in October, all activities of an essential, if controversial, nature were suspended. In fact, no legislation of importance was enacted during this period. The friction between the two parties which was simmering beneath the surface for a long time, came to a head because the Justice Party wanted prompt amnesty to be provided to the prisoners sentenced at the Yassida trials.

A week ago it seemed that the ghost of Menderes stalked the land forcefully. The extremists in the Justice Party pressed for leniency towards the convicts at the Yassida trials. Their argument was that the mutineers of the February *coup* had been treated very leniently. Why were the leaders of the defunct Democratic Party who were rotting in jails not treated in the same manner? The demand for a complete amnesty for the prisoners was acceptable neither to Mr. Inonu's Republican Party nor to the military junta. They were afraid that the release of these leaders would take the country back on the road to corruption and inefficiency which prevailed before the revolution of May 27, 1960.

In a dramatic move Mr. Inonu submitted his resignation which was promptly accepted by President Gursel. The search for a new leader began and it was "discovered" by the President that there was no one else except Mr. Inonu who could muster the progressive elements under himself. President Gursel once again invited Mr. Inonu to form a new government and he readily agreed to take up the challenge. The only condition that Mr. Inonu put forward in forming the coalition government was that the participants must accept to put through a programme of legislation in regard to urgent economic and social reforms which could wait no longer. He particularly stressed the point that the question of the political amnesty to the Yassida prisoners should be shelved for the time being so as to divert the attention of the people from this ticklish problem, which had been worrying a sizeable section of the population due to the misleading and short-sighted tactics of the extremist group in the Justice Party.

With the active support of the military leaders, Mr. Inonu has now set about the task of forming a new government through a realignment of the various parties. The new Turkey Party which commanded 65 seats in the National Assembly (13.7 per cent of the votes) and 28 seats in the Senate (13.9 per cent of the total votes) has indicated its willingness to form a coalition with Mr. Inonu's Republican Party. It is expected that certain elements from the Peasant Party and some of the moderates from the Justice Party would also lend their support to Mr. Inonu to from a stable government in the country. This naturally sent a wave of discontent and frustration amongst the extremists in the Justice Party who see a bleak future for themselves. The Yassida prisoners, who were expecting a prompt release as a result of the crisis which their supporters in the Justice Party had succeeded in creating, are now doubtful about the chances of their freedom in the near future.

The only hope for Turkey now lies in charting a new path under the leadership of Mr. Inonu with the active support of President Gursel. It is necessary that the new government should keep religion away from politics. The process of westernising Turkey, which was started by Kamal Ataturk, must not be reversed. Recently some trends have been visible within Turkey indicating a new religious fervour. Even the coalition government which broke up only a week ago was not free from the influence of these trends. The support of the army and of the other political groups to Mr. Inonu now promises a stable future for Turkey.

No Regrets

NO tears will be shed in this country over the lapse of the eight-year old Sino-Indian Agreement on Trade and General Relations between India and the Tibet Region of China. The reluctance of the Government of India to renew this agreement is easily comprehensible. India's trade over this border had been reduced from Rs. 3.6 crores in 1954 to a trifle during the past three years. The agreement, however, had a greater significance for this country than that of a mere arrangement to govern the trade relations between India and Tibet. It was in this pact that the five principles on which India's foreign policy is based, were, for the first time, incorporated in an international treaty.

The lip sympathy that the Peking Government has paid to Panchsheel has undoubtedly created serious doubts in the minds of not a few Indians about the practical propriety of a foreign policy based on this philosophic outlook, insofar as it pertains to relations between two countries, one of which, China in this case, has expansionist designs. This makes nonsense of respect for mutual territorial integrity. An inference that India's foreign policy will undergo a change as a sequal to China's aggression on our northern border is obviously not justified. But the stab that Peking has given in India's back will continue to bedevil relations between the two countries as long as the *statusque ante* on India's northern border is not restored and friendly negotiations are not entered into for making any adjustments in border line.

Apart from these political overtones and the cloak-and-dagger policy followed by China as a reason for non-renewal of this agreement, its extension could have been hardly appropriate in view of the harrassment and hardships to which Indian traders had been persistently subjected to by the Chinese authorities in Tibet since the overthrow of the Dalai Lama's regime in 1959. Indians were made to pay exorbitant prices for exports from Tibet, particularly wool. Discriminatory tariffs were levied on exports from India. Indian goods were purchased at arbitrarily fixed low prices. Not only that. The stocks built up by the Indian traders in Tibetan villages and towns were invariably usurped. Recently, even the Indian currency was declared illegal in this region. The export trade of Tibet was forcibly oriented towards Peking and when this artificial diversion proved unsuccessful and acute hardships were experienced in the inaccessible parts of Southern and Western Tibet, overtures were made to Nepalese traders for procurement of essential supplies.

The difficulty of maintaining the supply-line for the Chinese armed forces stationed in the occupied Indian border areas appears to have been the main impelling force for China for making successive attempts in the last few months for getting this trade agreement extended. The Chinese official press organs were never tired of fabricating, for home consumption, propagandist statements to smear this country in spite of the fact that, on humanitarian grounds, India refrained from preventing Chinese settlers in the country from sending food parcels to their home country. This attitude was adopted in the face of the fact that India is still short of its domestic requirements by as much as three million tons per annum and has to depend on imports from abroad. But Indian Government could scarcely be expected to fall in this trap contrived for the eventual supply of food to Chinese troops in the occupied border.

One of the problems that the Government of India will now face is the rehabilitation of border traders. But that should not be difficult, firstly, because most of them have already taken to other avocations after having been squeezed out of the Tibetan trade by the Chinese, and secondly, because already an impressive programme is under implementation for economic development of these border areas.

THE WEEK'S NOTES

National Integration

TOWARDS POSITIVE ADVANCE

THE LAST session of the National Integration Council can claim credit for having achieved some positive advance in formulating a broad policy on one of the basic questions—language. But there are other facets to this all-embracing problem which underline the fact that the NIC is essentially dealing with an issue which has very powerful undertones of emotion and one which is fundamentally intangible.

Thinking on a concrete and rational policy for language is now crystallising. It would be absurd to rake up the controversy of Hindi versus English when the accepted position is that Hindi must be elevated to the status of the official as well as national language. But various trends have emerged whose cumulative effect is to equate the systematic expulsion of English with the promotion of Hindi. The resolution adopted by the NIC takes care to emphasize that both Hindi and English must be promoted consciously. English is necessary to prevent any likely barrier isolating India from the world currents of progress in knowledge, literature, science and technology. It will continue to be a link of communication between India and the world.

A formula has been devised by the NIC to place Hindi, English and the regional languages in their correct positions. English is to be retained indefinitely as an associate language for all-India purposes. In non-Hindi speaking regions, Hindi and English are to be deliberately cultivated since all-India contacts and a sense of integration through such contacts will require either of the two languages as an appropriate vehicle. But the regional languages are the very breath of the cultural and other life of the local population. The formula provides that regional languages will be entitled to predominance in their particular areas. A strong warning has been uttered against any artificial acceleration in the replacement of English as a medium of instruction by Hindi or the regional languages. It is left to the initiative and discretion of the universities to decide the pace of this replacement. A significant issue in the language problem has been emphasised by the NIC. It has urged that provision should be made for the use of English or Hindi as a medium of instruction in each university or in the colleges affiliated to the university with an option to the examinees to answer the questions in English or Hindi in the non-Hindi speaking areas.

Communalism is indisputably one of the most dangerous forces which can disrupt national unity and sow deeper seeds of disintegration. Its roots are embeded in the historical past, but essentially the question, even for outward treatment, depends upon a variety of intangibles. The NIC has appointed a committee to examine the question of the definition of communalism. Communalism is certainly not confined to religious divisions but transcends into the realm of casteism. To prevent both these forces from poisoning the national life is a long-term function depending upon a basic change in the outlook of the masses upon life and this means the predominance of the economic and other non-religious elements of life. The contribution of the Press to integration can be powerful and substantial. The NIC has urged upon the Government to consider the appointment of a committee to prescribe a Press Code in consultation with the Press. Voluntary observance of the code in the fullness of spirit may be a gradual process, but its effects will be enduring. All in all, the NIC is approaching its task in the right direction in seeking first to define the dimensions of the problem before concrete solutions are evolved.

Kerala

CRACKS IN THE COALITION

EVIDENCE OF the appearance of cracks in the Congress-PSP Coalition Ministry of Kerala has been emerging with the greater vehemence at intervals. There is hardly any room for doubt that at the present time feeling over the partnership is one of intense bitterness. The cracks are apparently widening and both the parties seem to be unmindful of the inevitable effect of the rot that will ensue in the administration in such a situation. Actually, the issue which has given rise to a difference of opinion between the partners is too small to force the extreme course of the dissolution of the coalition. Mr. Pattom Thanu Pillai has categorically refused permission to private agencies to set up lower primary schools in the State to meet the current demand of the increasing numbers of students. Mr. Pillai's contention is that the Government is quite capable of meeting this demand on its own. But it will be recalled that when a similar question of increasing the number of higher primary schools and secondary schools came up for decision earlier, permission was granted to private individuals to set them up. Since this is an issue which will be tested immediately with the commencement of the ensuing academic session, it would appear that Mr. Pillai would spare no resources to prove that he is in the right.

But the real point of difference goes much deeper. The PSP Chief Minister has announced, and stuck to his position, that the decision on the lower primary schools is a cabinet decision, implying that the Congress Ministers, in particular the Deputy Chief Minister, Mr. R. Sankar and the Home Minister, Mr. Chacko, are parties to it. This is flatly contradicted by the latter who maintain that it is the Education Minister's decision and not a cabinet decision. The controversy is only symptomatic of the manner in which Mr. Pillai is said to be riding rough-shod over his Congress Party colleagues. Mr. Sankar and Mr. Chacko urge that the issue should be forced even if it comes to the breaking up of the coalition. This is how differences are being overstretched. At a recent meeting of the Kerala Pradesh Congress Committee, the rift between the ministerialists and non-ministerialists made itself evident. The non-ministerialists took the opposite view on the lower primary school issue. They are emphatically of the opinion that this crack should not be allowed to split the coalition. This, of course, is the view which is held by the High Command, and even on an earlier occasion, Mr. Govindan Nair, President of the KPCC had advised Mr. Sanker to give up his extreme stand. The Kerala Congress Party is obviously a house divided against itself and it is highly doubtful whether the Congress Party would be able to run the Government on its own as Mr. Sankar and Mr. Chacko claim.

Mr. Pillai is exploiting full advantage from the situation and time and again he has given the gratuitous warning that the only party to benefit will be the Communist Party. But he entirely overlooks the fact that the PSP's fate would be far worse than that of the Congress Party. The Kerala electorates's verdict on his party in the parliamentary elections is quite unequivocal. It serves neither party to continue in an atmosphere in which mutual trust and respect are lacking. Both the parties have their internal troubles and they would do a service to themselves as well as to the State if they set their own houses in order and guard themselves against the blunder of letting the Communist Party benefit by their wrangles.

Everest Attempt

A HEROIC FEAT

THE SECOND Indian expedition on Mount Everest performed what is readily recognized by the Indian Mountaineering Foundation as an amazing feat. Major Dias and his party stood the severest tests of mountaineering as well as human endurance in the face of the worst inclemencies of weather in their attempt to reach the world's highest mountain peak. The expertise gained by the first Indian expedition under Brigadier Gian Chand was not only freely used but remarkably improved upon by the successor expedition. The party reached the height of 28,600 feet and was only 400 feet short of Mount Everest, when it had to abandon the effort under the sheer compulsion of extremely bad weather. Its heroic efforts have been reveald fully in the dispatches transmitted to the capital city and they unfold the story of a great romantic adventure. No expedition ever before spent more than a night at the altitude of 28,000 feet. But the claim of Major Dias and his colleagues to having achieved an amazing performance lies precisely in the fact that they spent three successive nights near about this altitude.

Hopes that escape from the adverse weather of the monsoons may be available by reason of the earlier start made by the team were unfortunately belied. The team was behind schedule by two weeks in reaching the South Col from Camp IV at the foot of Lhotse Face. While it was negotiating Lhotse Face, extremely bad weather began to foil its heroic efforts. This turning point decided the final result. For the rest it was to fight a losing battle. But if Major Dias and his men showed unique perseverence in continuing their battle, they gave proof of persisting until the limit of human endurance was reached. Since Tensing Norkay and Hillary hoisted the flag of triumph on the Everest in 1953, Indian mountaineering skill has achieved records worthy of mention—reaching Annapurna III and Nilkanth, not climbed before. The first Indian expedition of 1960 and now this one of 1962 have demonstrated that there is the expertise to achieve the utmost during the brief mountaineering season. There is already a talk of the third expedition being organized and it may be that, with the rich fund of skill and experience so far amassed, it will achieve the elusive success.

East Pakistan

RESTORATION OF CONFIDENCE

THE PRIME MINISTER'S statement in the Lok Sabha on the riots at Dacca and Rajshahi is reassuring. The two important facts which emerge from Mr. Nehru's statement are the admission of the Government of Pakistan to the effect that the riots in the two areas had assumed a grave proportion and the strong-handed action taken by that Government to restore normalcy.

At one time the Government of India entertained grave apprehensions that the exodus of the Hindu minority community from East Pakistan into West Bengal would occur on a substantially large scale and create a serious problem of their rehabilitation. This exodus had another sinister aspect and the possibility of retaliation which is common in such upheavels would have caused disturbance in India. The position as could be gathered from the statistics of transfrontier travel shows that the movements are no more than normal. The contingents of East Pakistan Rifles, posted in the areas of disturbance, acted promptly and effectively in rounding up over 1,900 persons directly involved in the riots or instigating the riots. What is further encouraging is the attitude of the local population of the majority community which prevailed upon their minority brethren not to migrate and gave earnest proof of their persuasion by actively co-operating in the speedy reconstruction of burnt houses and creating a sense of security in the rural areas. Panic does not now prevail in the minority community. It is in the interest of neither India nor Pakistan that communal riots should rear their head and assume dimensions creating the risk of migration and upsets in both the countries. The return to normalcy in East Pakistan does credit to the Government of that country as much as to the two communities.

Laos

INTRANSIGENCE

THE DEADLOCK in Laos over the formulation of a neutralist government in persuance of the Geneva resolution does not appear to approach its end. The Pathet Lao forces celebrated the first anniversary of the cease-fire by breaking it with open armed action and with a sudden sweep they captured the key town of Nam Tha commanding the North-West province of Laos as well as the road to Thailand. Contrary to the fears which were very strongly voiced by the Rightist Government of Boun Oum, they did not march either in the direction of the capital city of Vientiane or the royal city of Luang Prabhang. In fact, the withdrawal of the royalist forces was so complete that Pathet Lao could have captured at least some of the interior territory. But their action in stopping with the important gains they made is now being interpreted as an open military pressure on Prince Boun Oum to agree to the formation of a government of national unity.

It is no secret that the real obstacle to an agreement on the Coalition Government is Prince Boun Oum's Foreign Minister, General Phoumi Nosavan. So confirmed is his intransigence that even at this stage he is clinging to his contention that no Communists would be admitted in the coalition Government. In the prevailing context, Communists in Laos can be no other than Pathet Lao. He is not worried how a neutralist government can really be installed unless Pathet Lao, which has now acquired an accession of strength, is included. Prince Souvanna Phouma seems to be tired of his unending rounds of visits for negotiations to form a neutralist government and he has announced June 15 as a dead-line for the final effort. But General Phoumi Nosavan has retorted by interpreting it as a veiled ultimatum and consistently with his intransigence he has once again declared his opposition to the inclusion of Pathet Lao. The only way out of the stalemate is the removal of Prince Phoumi Nosavan. Of this fact the Kennedy Administration is keenly aware. How the removal comes about will determine the end of the impasse.

ECONOMIC CURES FOR AFRICAN DISUNITY

By

ODYSSEUS

IT IS SOBERING to reflect that, whereas, in 1951, there were only four sovereign independent states in Africa, and the greater part of the continent consisted of provinces whose administration was centralised under four colonial powers, today there are no fewer than 26 sovereign independent States—most with less than two years of existence—and another nine, or so, due to achieve independence within the near future.

Whatever the blessings of nationalism, it does not promote integration and unity. The developing countries are rightly anxious to catch up on European industry. We must hope that they will soon realise the imperative need to catch up on Europe's programme of unification. As Dr. Thomas Balogh, of Oxford, pointed out at the recent Anglo-French conference in London on Planning in Africa, the vicious circle of poverty is less of an impediment to development in Africa than is the smallness of the new States, their internal tribal divisions, and their lack of geo-economic unity.

The implication of these grim facts are momentous for their future. They cannot each singly devote enough resources to research or to specialised education, nor make a real start in establishing industry, because they cannot singly provide secure protected markets in most industries for anything but small and ineffectual units. To set up small units might raise the standard of living by giving employment to men now partly or wholy unproductive but it would, in the long run, seriously limit the maximum possible increase in productivity, and so perpetuate Africa's economic inferiority. Even large-scale units would need protection for an indefinite period until they could reduce costs to competitive levels.

Unless Africans can combine for industrial development, they will either be unable to create industry at all, or they will set up inefficient industries, which will set limits to the increase in their incomes. The fragmentation of the larger trading union, which existed between the French-speaking territories in Western and Equatorial Africa, and the failure of non-French territories to co-operate between themselves and with the French areas, is ominous.

Only if the African States join the European Economic Community not singly but in one large-scale unit (or possibly in three units: West Africa, Central Africa, and Eastern Africa) can the threat of perpetual economic inferiority be overcome. It cannot be too greatly emphasised that Africa's future standard of living depends on establishing co-operation between the numerous new small States. Many African leaders understand this. They have made efforts to promote economic co-operation and even political union, but the multifarious nature of the combinations proposed, is, when internal tribal divisions are added, a grave handicap.

OVER-HASTY INDUSTRIALISATION

Dr. Balogh believes that the very absence of industrial development should facilitate co-operation. It should be easier to build up from scratch than to reconcile the vested interests of existing industries. However, with independence, the growing pressure on African governments by their peoples for better employment and higher incomes must push them to speed up attempts to industrialise. If, at that point, co-ordination of economic planning between African States has not been achieved, the rift between them will become wider and wider and what Dr. Balogh picturesquely calls their "final income horizon" will be increasingly limited. There is this no time to lose.

At the same time, the multifariousness of, and the conflicts between, the inter-African agreements already reached, suggest that one of the reasons for their lack of success may be that they are too ambitious. It might be well, therefore, to seek examples for African development among cases in which the beginnings have been less ambitious, but which have proved themselves flexible. The development of European economic co-operation is an encouraging example, because its success was largely due to its flexibility, which accommodated the varied and often divergent needs of the co-operating countries. This flexibility is being copied in Latin America. Africa is vast: 11,500,000 sq. miles, i.e., thrice the size of Europe, and no less than ten times that of India and Pakistan. That is why economic grouping is imperative.

Regional groups are essential to promote co-ordination in (a) investment and (b) research, and specialised education, through some inter-governmental agency, such as the remarkably successful Organisation for European Economic Co-operation, set up in 1948 to work out the development needs of eighteen diffe-

BANKING ONLY ON SUNDAYS

A 'bank' operating on Sundays only was started in 1799 by the Rev. Joseph Smith of Wendover. The object was to help the poorer sections of his congregation who were often in distress during the winter. The Rev. Smith encouraged them to bring pennies to church on Sundays during the summer, on the understanding that they'd be returned at Christmas increased by one-third "to enable them to purchase a warm garment, half a load of wool or any other domestic comfort they may want at the most inclement season."

Banking has of course become more complex and better organised since the Sunday Bank. But the concepts of social benefit, service and friendliness continue to inspire modern institutions like the Union Bank of India. The Union Bank prides itself on its unique *personalised service*, under which every depositor is treated as a Very Important Person.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information; Safe Deposit Vaults; TELEX contact with countries all over the world.

rent States at a time when there was not only no co-operation, but when Europe was thick with trade barriers and nationalistic restrictions. When the OEEC was set up, European feeling was not yet ready to accept a supra-national body, and Africa would be wise to follow Europe's step-by-step precedent. Since there are no conflicts of interest in Africa between established industries, one hopes that through an equitable distribution of new industry, and infra-structure investment, a balanced development programme could be worked out on the European precedent.

Dr. Balogh warns that even such informal co-operation will create new problems. There is a basic antithesis between (a) stimulating existing centres in which infra-structure investment already exists, and in which, therefore, the background for self-sustaining cumulative progress has been created, and which might be set off in such progress, and (b) a programme aiming at coming to the rescue, for humanitarian reasons, of the worst-off areas. Just as the impact of free trade between unequal countries hits the weaker, so it is in inter-regional trade, or even within the regions of one country. One essential difference is that in inter-regional, or regional, trade, migration can be promoted more easily and co-ordinated with the planning. In Africa, these problems are acute because of (1) the heavy infra-structure investment needed to open up the poorest regions, which are usually farthest away from the more easily accessible coast, and (2) sharp tribal differences.

REGIONAL PROBLEMS

In planning investment it is essential to secure protection for infant industries by regions, because (1) it is possible to set up efficient industry only on a regional basis, and (2) there are cases in which the establishment of large-scale industry in one area of a region might harm other areas, which might wish to protect their infant industries for an intermediate period.

Thus, the establishment of a powerful regional unit in agriculture as well as industry will need a new preferential system. This would not conflict basically with the Rome Treaty, or even with GATT, if interpreted from the viewpoint of development aid and planning. The products of the industries estblished would thus be treated by the rest of the group either as produced domestically or subject to a low preferential duty. So that if the African group envisaged becomes a member of the EEC, there could be three tariff levels to (1) all countries of the African group itself, (2) EEC countries, and (3) the rest of the world.

Progress could be speeded by forming a Payments Union with a strong clearing house at the centre, which would receive a special contribution in convertible currencies from the industrialised members, including the EEC. Most African States will be short of foreign exchange before their development plans get under way. Their accumulation of resources in the past was, after all, only due to their failure to push development. The exhaustion of India's initially large sterling balances is one evidence of her activity in development. A clearing union would allow freer movement of goods between African States and thus reinforce the preferential tariff. That the clearing union would have a convertible reserve would allow a multilateral fostering of African trade, which is precisely what is wanted.

One drawback of a clearing union is that surplus balances in the international payments between members might arise, not through deliberate choice by the relatively richer States providing aid to the poorer in the region, but by haphazard differences in their economic and (especially) monetary policies. This drawback could be mitigated if, in addition, an inter-African Development Bank were formed to channel foreign long-term capital in Africa on the basis of priorities and plans in member countries, which would be mutually consistent, and thus strengthen the economic potential of Africa or a region of it, rather than weaken it through competition and national protectionism, which would reduce the scale of productive units to a level too low to achieve full potential productivity.

To be effective an inter-African Bank would have to have substantial support from the industrialised countries of the West, either by loans to the Bank or guarantees up to certain amounts. In this way, all the members of the United Nations might participate in the working of the Bank: they would be providing capital without the need for insisting on voting power in it. For the donor countries a guarantee of the Bank's obligations would probably be best because it would avoid the need for the hazards of parliamentary action. Such a Bank would give a big push towards African unity. If resources were channelled through one agency, duplication, and waste of resources, would be avoided and it could be made a condition of loans and grants that they would only be given if the participating countries agreed upon joint plans, consistent with what Dr. Balogh calls "coherent and inter-connected national unity," which is essential if Africa is ever to catch up.

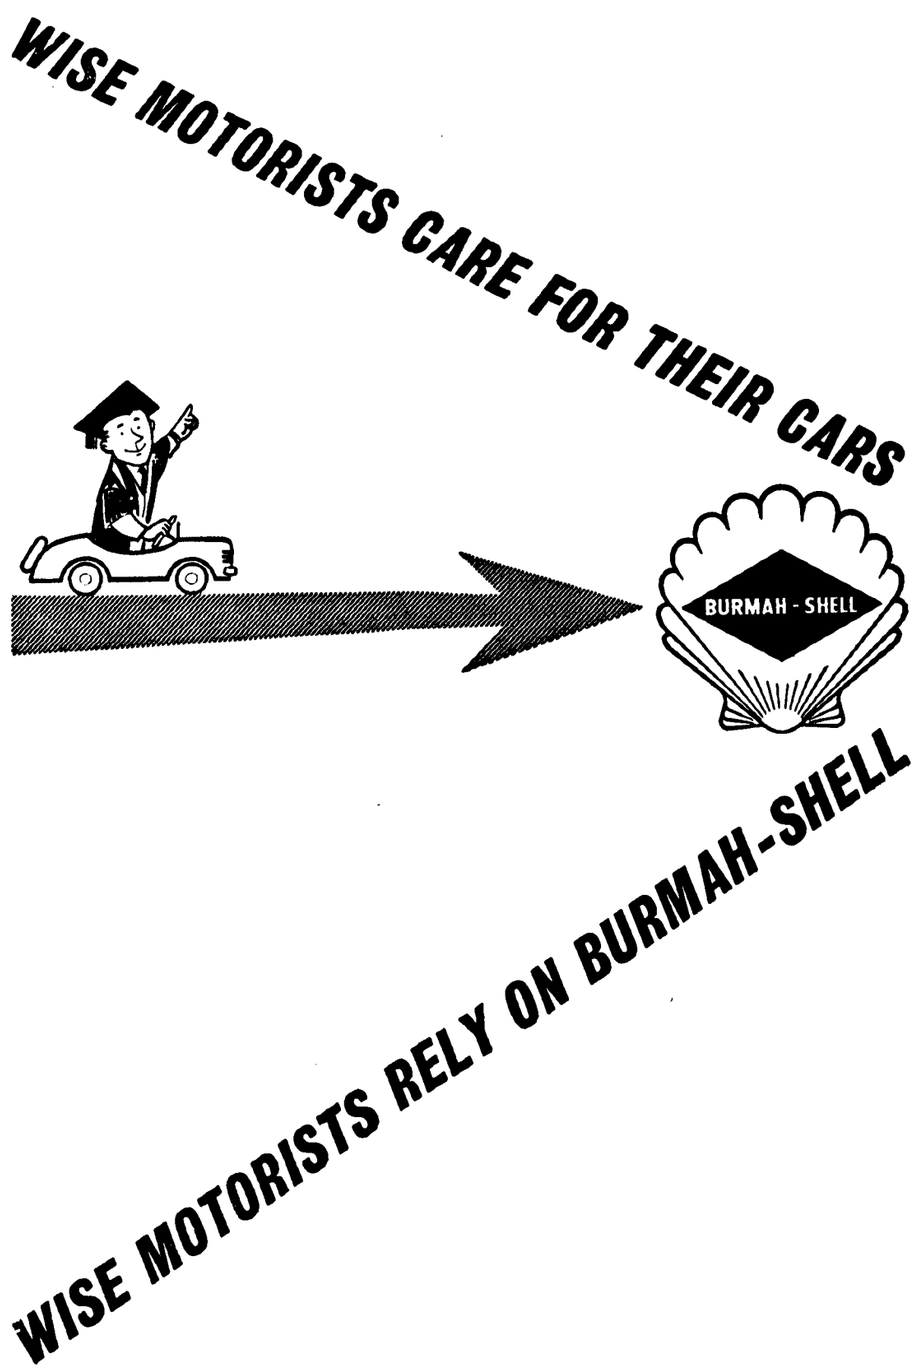
EUROPEAN, NATIONAL AND REGIONAL PLANS

From Our Special West European Correspondent

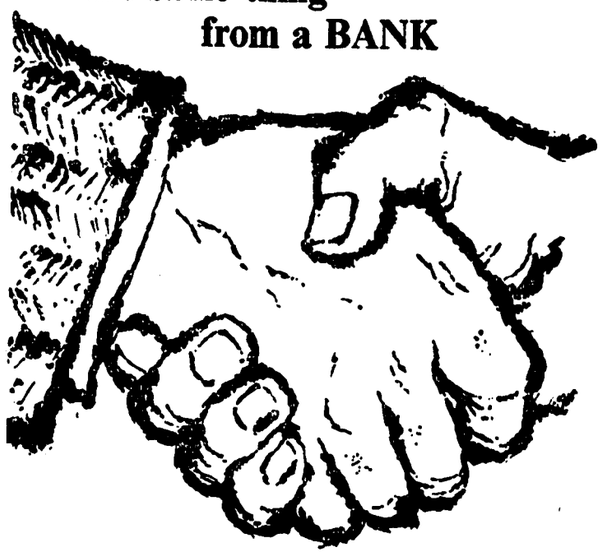
PARIS, June 2.

HOW long will it be, I asked here two months ago, before there exists a European economic plan in the sense that there already exist plans in France and Holland? Rather earlier than most people have thought, replies Le Monde Economique in its latest issue where it reviews the gathering campaign for medium-term forward programming at the West European level. This campaign is not new in France, where it is realised that the opening up of the economy on to the rest of West Europe makes strictly national planning more and more difficult. For example, M. Albin Chalandon, formerly secretary of the Gaullist party and its economic ideas-man, write this week: "Soon to be deprived of such major means of intervention as the fixation of agricultural prices (because of the common farm policy of the Six), our economic policy will depend as much on other nations as on ourselves. Thus, big breaches are constantly being opened in the flank of our national planning, which might endanger all our efforts at co-ordination. There is only one way to fill those breaches: the adoption by other countries of our own methods, and the creation of a European economic policy, if only to co-ordinate investments. This task should not be impossible, for the West is increasingly interested by our planning, and a European political authority is coming inevitably; but it will be a long task, which will not be entirely completed during our Fourth Plan".



However, the case for a European plan has been taken up in the past two weeks outside France — and for reasons other than French convenience, such as M. Chalandon limited himself to. The Confederation of Christian Trade Unions, representing all the Six countries, called for a European planning bureau at its meeting in Rome last week. More important, a few days later, M. Robert Marjolin, Vice-President of the ECM Commission, openly suggested "a charter for common European action, which some call a 'plan', others a 'programme' and others simply long-range provision". I say "openly" because, as a supranational bureaucrat who had to consider West German susceptibilities on the question, M. Marjolin has hitherto bean very cautious; the people in Brussels did not want to seem to be leading West Germany into a course that is not favourably viewed by Dr. Erhard. At most, pressed with questions about co-ordination of budgetary and tax policies by the Strasbourg deputies a few months ago, M. Marjolin replied vaguely that the matter could not be separated from "the formulation of a long-term European economic programme".

Last week in Arcachon he spoke more plainly. Perhaps he had been emboldened by signs that the European plan idea is making headway in West Germany. After all, the Bundestag had just passed a bill prohibiting for one year the construction of office buildings, a measure of control that no planning authority in France or Holland would have dared to decree. And Dr. Erhard had just discovered that, though "what's good for General Motors is good for the USA", on the contrary what was good for Volkswagen was not good for West Germany. In any event, M. Marjolin gave the first official support at the ECM level for a European plan. He based himself on the adoption in January of a common agricultural policy, and had no trouble showing that this amounted to a six-nation agricultural plan which could only work smoothly if it were co-ordinated with a six-nation industrial plan. The farm policy adopted for the next few years supposes that there will be transfers of manpower out of agriculture to other occupations, and if these transfers are to be managed humanely redundant labour must not be merely expelled but attracted to industries and services that are calling for their help when the land no longer requires them. In other words, there must be a guaranteed level of industrial activity that matches as nearly as possible the rising productivity of the farms.



So he suggested "a European plan, as there is now a French plan and as there will be no doubt tomorrow a British, a Belgian and an Italian plan". By a plan he meant "an effort to penetrate the future, and to mould it, to the extent compatible with freedom of enterprise". He did not think that what was necessary was for all other member-nations to adopt French planning techniques for their national economies. This corrects a misleading impression that no doubt arose from my last article on this subject, where I said that it remained to convince West Germany to adopt a plan. Why should the West Germans be convinced when the French themselves, as I have quoted M. Chalandon saying, realise that strictly national programmes are becoming harder to apply inside the Common Market? A West German plan today would make no more sense than a French plan. M. Marjolin declared: "National plans or programmes are more and more difficult to draw up and, once the Common Market is realised, they are in danger of losing much of their significance. The fact is that a plan or programme pre-supposes an economy whose external relations are limited or can be restricted in case of need. Increasingly already, and completely within a few years, each of the six economies of the Common Market will be open on to the rest of Europe". Within a few years, that is to say, the economy whose external relations can be controlled will be the whole Common Market, and it is only on that scale that planning will be possible.

Yet M. Marjolin did not think that French planning methods could be applied wholesale to that larger unit. "An original effort of intellectual creation will be necessary if a charter of common European action is to be drawn up. It would be utopian to try to fix at the European level objectives for every branch of industry. On the other hand, it would not be utopian to seek to determine the maximum feasible expansion rate for production over the next five or ten years, taking into account the necessary reduction in working hours, and taking into account the share of each of the major sectors, industry, agriculture and services, in that general expansion. Nor would it be utopian to try to determine the economic and financial policies that must be followed, in Europe as a whole and in each member-country, in order to attain that maximum expansion". And he concluded, "I do not have in mind an authoritarian plan, defining targets for each firm, but an act of intelligence and will, at the level of the State and of professional organisations, determining the future of Europe and its nations".

The picture then is rather different to what was suggested here in an earlier article. West Germany is not being asked to adopt a national plan, something that inevitably (but improperly) reminds Germans of the

Nazis' authoritarian direction of the economy, and of the ruthless global planning used today (so ineffectively) in East Germany. Nor are the other European countries, from Italy to Britain, being encouraged to go further along the French path, because that runs into difficulties created by European unification. Instead, all of them together are being invited to consider a European plan, to be drawn up by a European planning bureau, using the methods proven in France of commissions for each sector of activity which bring together representatives of the State, of employers and of labour. This West European plan might well remain very general (from the point of view of any single enterprise), though it would go into considerable detail for crucial sectors such as automobiles, steel and chemicals where the volume of investments involved is too huge for mistakes to be made.

You might expect the enthusiasts of planning in this country to be disappointed by the prospect of their national plan being replaced by a much more general, and naturally rather vague, Europe-wide plan. Not at all — provided this more general plan is combined with a multiplicity of regional plans. For that is the other interesting lesson lately drawn from French planning experience. If the nation has been found to be too small a unit in a Continent that is uniting economically, the nation has also been found to be too big a unit, in that its global requirements remain remote from every day life. To make the plan more "popular", to get folk to feel that it involves their destiny and deserves their interest and support, the solution is not to make it more detailed within each branch of activity: to replace targets for consumer-goods production with more precise targets for, say, production of radios, and then to replace those targets with specific assignments for particular firms. That way of breaking down the plan does not bring it nearer the people except in the unwelcome and unwanted sense of proliferating orders from above. On the contrary, the national plan secures more support when it is broken down into, or co-ordinated with, geographical development schemes.

There has therefore been a spate of congresses and studies on the 'regionalisation" of the plan, and also on the regional effects of the Common Market. (It has been pointed out here before that the real disequilibriums caused by European economic integration are not so much between the nation-states West Germany, Italy, France etc., as between economic regions like the Rhine valley, southern Alps or Lowlands which straddle the old national frontiers.) Regional plans, said an orator at the Archachon conference, are "more concrete, more human and more social than a national plan", and it is only at the regional level that one can see disequilibriums caused by industrial progress which might be missed at the national level but which have considerable social consequences.

That is why exponents of democratic planning would cheerfully exchange the national plan that now exists in France and those that are projected in Italy, Britain and Belgium for, on the one hand, a European plan that set a general growth rate for the whole of the enlarged Common Market, co-ordinated budgetary and financial policies, harmonised investments in the major sectors, however loosely, and ensured that the Common Market's economic frontiers were sufficiently definite to permit planning inside the area, and, on the other hand, a series of regional plans that were concerned not only, as at present, with localities like Sardinia, Corsica, Brittany, Flanders etc. but also with vital areas that straddle existing frontiers. This is a "more European" or more unitary notion than the idea of getting each nation to adopt a national plan of its own and then seeking to harmonise them. There will be political opposition to this conception, but it is the view of European planning that is now favoured by producers and economists.

KLM mechanic scrutinizes intake duct of jet engine—one of 166 points KLM inspect in detail every 75 hours.

What you should know about the remarkable reliability of KLM, before your next flight to any of the 104 cities served on KLM's world-wide network

KLM is pre-eminent in jet maintenance. KLM crews were servicing jets years before the first commercial jetliners went into transatlantic service. Read 18 other remarkable facts about KLM and how they earned their enviable reputation for reliability.

1. KLM has had more years of experience than any other airline. Founded in 1919, KLM is literally the World's First Airline.

2. 'Golden Circle Service' is offered on KLM flights from the Far East to Europe via the South Asian routes and over the Pole.

3. The initials KLM stand for Koninklijke Luchtvaart Maatschappij. This is Dutch for Royal Aviation Company. Just KLM will do—it's known all over the world.

Jet maintenance at its best

4. KLM has its own Rs. 28 million jet workshop in Amsterdam.

5. When KLM maintenance crews overhaul a jet engine, they strip it down to two thousand parts.

6. Every KLM DC-8 Jet has weather radar. Your captain can see what the weather is like 150 miles ahead. If it looks turbulent, he finds a calmer route.

7. It takes 12 years for a pilot to become captain of a KLM DC-8 Jet—longer than it takes a doctor to become a surgeon.

Personalised Service

8. KLM economy class passengers enjoy exactly the same friendly personal attention as first class passengers do. The cuisine is simpler, of course, but comes from the same chefs and the same kitchens, and wines and other drinks are available at nominal charge.*

9. Every KLM DC-8 Jet has a luxuriously appointed lounge, simply named the 'Sky Cocktail Bar'. Located in first class. It is a perfect place to meet your fellow travellers over free drinks.*

10. KLM will prepare special baby food on request. Name the brand when you book your ticket. On longer routes American and Dutch baby foods are carried as regular supplies in airplane pantries.

* outside prohibition areas

Special facilities

11. KLM offers special lowfares for registered students between 12—26 years, for travel between their homes and place of study. Discounts to and from Europe are usually 25% of the normal round trip fare. For particulars, ask KLM.

12. KLM has its own resthouses in Karachi, Bangkok and Biak. All have spacious rooms with private baths and showers, and recreational facilities. KLM flies in fresh food and delicacies regularly from Holland and Australia. The service in these resthouses matches the standards of a good European Hotel.

13. If you are flying via Amsterdam and can spare a few hours between flights, KLM can book you on a quick tour of Holland. A Holland Minitour lasts about 3 hours. A multi-lingual hostess takes you for a boat ride through Amsterdam's canals. Or a visit to a diamond cutting plant. Or the flower auction at Aalsmeer, or the Keukenhof Gardens. The cost : Rs. 17 approximately.

14. The tax-free shopping centre at Amsterdam airport is probably the best in Europe. You can buy German cameras, Swiss watches, French perfumes and wines and spirits at low, tax-free prices.

15. You can buy a car at Amsterdam airport—tax-free. You will find at least sixteen makes of car in the showroom. Buy there. Or order in advance. (What you save can pay for your entire European trip.)

Flights from Calcutta, Delhi and Karachi

16. KLM's Westbound DC-8 Jet services leave Calcutta on Tuesdays, Delhi on Saturdays and Karachi on Mondays, Wednesdays, Thursdays, Saturdays and Sundays. All these services provide excellent KLM connections at Amsterdam to USA, UK and many European cities.

17. KLM operates twice-weekly DC-8 Jet Services to Japan on Mondays from Calcutta, on Fridays from Delhi.

18. Your travel agent will help you with all your travel arrangements. He is an expert and his experience will tell you where and how you can make the very most of your time and money. Your travel agent's advice is valuable, he'll tell you about the advantages of flying KLM.

GANDHI AND THOREAU

BY B. K. NEHRU, Ambassador for India in the United States*

ON the 6th of May, 1862, Henry David Thoreau was laid to rest where he had spent the major part of his life, in the wooded hills of his beloved Concord. One hundred years later, we gather in this vast metropolis to do him honour and to inscribe his name in the Hall of Fame. It is a recognition of the essential permanence of Thoreau's teachings; it is equally a recognition that, as a celebrated American newspaper recently wrote, "the ideas of an eccentric Yankee individualist ..... have spun round the world and have provided the oppressed with an honourable philosophy of resistance".

You have done my country signal honour in inviting me as the Ambassador of India to deliver the main address on this historic occasion. This honour I do most deeply appreciate: but, even more, I am grateful to have been given this opportunity to pay homage to the memory of a man who, drawing on the prescription of the dignity of the human soul in the ancient Indian scriptures, postulated in turn the status in political society of what Professor Laski was later to call "that last inwardness of the human mind which resists all authority save its own conviction of rectitude". There are between our two countries many bonds that will endure the test of time. There are the shared beliefs in the ideals so eloquently set forth in your Declaration of Independence. There is the common belief in the rights of man and the dignity of the individual. There is the shared passion for the democratic way of life and for the establishment of a peaceful and just world order. But there is also a deep relationship between the thinking of Concord in the last century and the shape of India today. Thoreau had in his library a number of books on Indian philosophy and the development of his thought was obviously affected by them. That thought, in turn, had the profoundest effect on Mahatma Gandhi, the maker of modern India, and is consequently today one of the elements that make up our national consciousness. Gandhiji himself acknowledged freely and often his draft on Thoreau's individual and social philosophy. He conveyed to President Roosevelt in July 1942 how deeply influenced he had been by Thoreau's writings; in the open letter to the American people of about the same time, he wrote "You have given me a teacher in Thoreau who furnished me through his essay on "The Duty of Civil Disobedience" scientific confirmation of what I was doing ....." It is, therefore, in the fitness of things that I, as the Ambassador of Gandhiji's country, come here to pay tribute to the spirit of Thoreau.

It is one of the great paradoxes — and equally redeeming features — of human history and evolution that as the scale of organised society grows and as the gregariousness and enveloping nature of that society increasingly dominates the inividual, the very same process highlights the extreme individuality of the human conscience. The more grows the conformist nature of society, the more accented is the non-conformity of what the ancient Hindus called the "atman" — the individual soul. It is the spirit of non-conformity that has enriched the dialogue of human progress — no less indeed in the material fields than in the spiritual. The blooming of many flowers in ancient Chinese thought, the periodic enrichment of Hindu philosophy by great men like the Buddha and Shankaracharya, the resurgence of the human spirit heralded by Jesus Christ, the Reformatory movements within the Christian Church in Europe following the Dark Ages, the enlivening of political thought first in Europe, then in this country and later in the erstwhile colonial empires, that led to the overthrow of conformity to an authoritarian or alien rule — all these analysed to their fundamentals are basic proof of the moving force of individual conscience and of the role that it can play in uprooting existing order if such order be unrighteous.

Thoreau and Gandhiji were two great non-conformists. Thoreau lived and worked in a country whose political testament was based on the right of people to resist arbitrarary power. As the Grand Jury in Georgetown, South Carolina, declared in 1776 —

> "When a people .... find that, by the baseness and corruption of their rulers, those laws which were intended as the guardians of their sacred and inalienable rights, are impiously perverted into instruments of oppression; and, in violation of every social compact, and the ties of common justice, every means is adopted by those whom they instituted to govern and protect them, to enslave and destroy them; human nature and the laws of God justify their employing those means for redress which self-preservation dictates"

In a country where the powers of Government were limited, where arbitrary power was checked, where the approval of the ruled through their legislatures was the sanction for the acts of the rulers, and where there was not the frustrating and desolating aspect of despotic power — as in India — to incite and provoke into revolt the inner sense of rectitude of man, it is somewhat surprising that a Thoreau arose here. And yet he did.

Where and how did Thoreau carry the concept of the duty of disobedience further than was accepted till his time? The exercise of the Right of Resistance was, in the words of Samuel West in 1776, the prerogative of "the publick; not few disaffected individuals but the collective body of the State". Secondly, where "the overwhelming majority of a thoroughly abused people" felt it necessary, resistance was justified in the sense of armed rebellion — the "appeal to God by the sword" as the colony of New Hampshire termed it. Thirdly, resistance was measured in terms of failure of the Government to observe legality either in the sense of adherence to established law or in the sense of having the consent of the governed.

If this understanding of the Revolutionary Concept of the Right of Resistance is correct, then Thoreau seems to have carried the idea much further. He measured the sanctity or profaning of secular power not in terms of a legal process or of a parliamentary sanction, but in terms of a more deep-seated ethic namely the conviction of an abiding rectitude. "The only obligation which I have the right to assume is to do at any time what I think right". The right, and indeed the duty, of disobedience to secular power came to be a moral, and not merely a legal, issue. Further this was a right that each and every citizen had: it mattered not if he was one of many protestants or was a lonely person whose conscience did not permit him to conform to the political ethics of his society; he had the right to disobey. It would thus seem that Thoreau was defining — or was it redefining — the context of the individual human sense of values to the outside world.

As Gandhiji pointed out later, such an attitude was something that called for the highest courage, the loftiest conception of freedom. The courage that it calls

* Address at the Hall of Fame for Great Americans at the New York University, New York City, at the ceremony for the unveiling of the bust and tablet for Henry David Thoreau.

for is clearly stated in Gandhiji's simple but awesome statement "The method of passive resistance is the clearest and safest, because, if the cause is not true, it is the resisters, and they alone, who suffer." The conception of freedom that the Thoreauesque attitude entails was perhaps never so clearly stated as by Thoreau himself; from the prison he was able to reflect "if there was a wall of stone between me and my townsmen, there was a still more difficult one to climb or break through before they could get to be as free as I was". Or, as Gandhiji, in somewhat greater detail, put it —

> "An out-and-out civil resister simply ignores the authority of the State. He becomes an outlaw claiming to disregard every unmoral State law .... This he does because, and when, he finds the bodily freedom he seemingly enjoys to be an intolerable burden. He argues to himself that a State allows personal freedom only in so far as the citizen submits to its regulations. Submission to the State law is therefore the price a citizen pays for his personal liberty. Submission, therefore, to a State law wholly or largely unjust is an immoral barter for liberty."

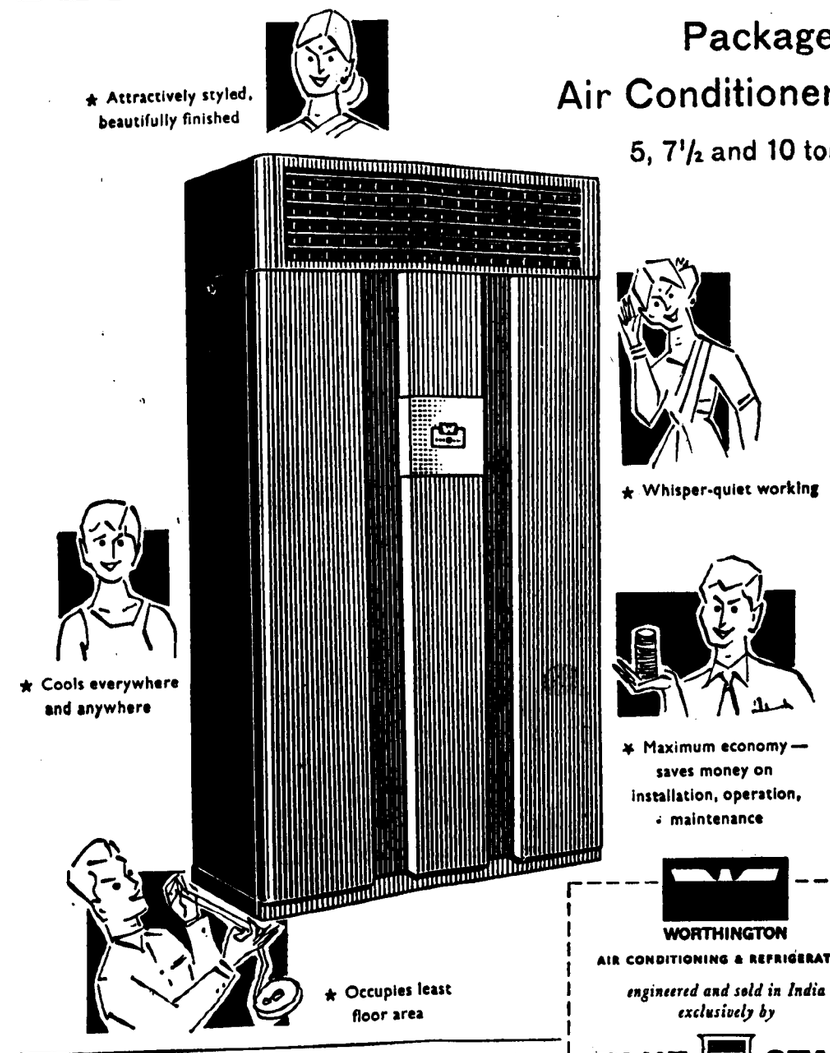
And I have no doubt at all that Thoreau would have agreed with Gandhiji when the latter declared —

> "My work will be finished if I succeed in carrying conviction to the human family that every man or woman, however week in body, is the guardian of his or her self-respect and liberty. This defence avails, though the whole world may be against the individual resister".

These high expectations and ideals of the human consciousness acting as a free and untrammelled entity may conceivably have joined the limbo of history with other idealist aberrations had it not been for the demonstration in action of how Civil Disobedience can be every whit as powerful an instrument as the Armed Resistance. The great national movement in India since it came under the influence of Gandhiji in the second decade of this century was based on the premise that it was the duty of the individual to non-co-operate with evil. Gandhiji was only incidentally a political leader and equally incidentally a nationalist. His passionate concern, like Thoreau's passionate concern, was with the individual and with the obstacles that prevented the individual from living the life of self-respect and liberty which Thoreau's conscience or Gandhiji's inner voice wanted him to live. Tracing the obstacles to a good or righteous life in the India of his time, it became obvious to him that the root of the malady lay in the continued existence of a foreign occupation and an alien rule; and he therefore concluded that the people must bend their every nerve for the removal of what he called the Satanic Government which ruled over them. He declared "it is not so much British guns that are responsible for our subjection as our voluntary co-operation". With an almost frightening strength of individual and national will, Gandhiji saw — in his own words — that "nations like individuals, could only be made through the agony of the Cross and in no other way". The path he indicated was the path of civil disobedience and history records the effect. The magnification of Thoreau's technique a hundred thousand fold — both in time and in numbers — caused ultimately the collapse of the mightiest Empire the world has ever known. Here was a clear demonstration on an immense scale of the practicality of the ideas of Thoreau which his detractors had regarded as so impractical.

It is fitting that we should today once again turn our minds to the simple principles that Thoreau preached, to the value of the simple life that he lived and his burning and passionate concern for the individual. In this modern world, one-third of humanity has chosen forms of political and social organisation which exalt the State so high above the individual as almost to cause one to forget that the latter has any rights or that he is anything but an interchangeable spare part in the vast machinery of production. Even the theory on which these societies are based seems to deny what to Thoreau seemed axiomatic that social and political organisations have validity only in so far as they can lead to the greater growth of the individual.

Another third of humanity alleges great concern with individual freedom, with value of the spirit and with man's relationship to God. The theory of these societies is, however, in great danger of being divorced from their practice. In these societies as a result of a single-minded pursuit of the material goods of life, the individual is in danger of being forced to subordinate himself not necessarily to the State but certainly to organisations that taken collectively are much vaster and more powerful than himself. This subordination detracts from the individual's freedom and impels him with almost irresistable force to drab uniformity and conformity not only in action but perhaps also in thought. There seems to be inherent in the modern mechanism for the creation of wealth a tendency increasingly to subordinate the individual to the process; to assume that the individual is valuable not because God created him in his image but because he is particularly gifted in the performance of the repetitive motions required for the proper functioning of an assembly line. It is to be hoped that in these societies, with the satiety that wealth can produce, there will be an increasing realisation that at some stage there should be liberation, not from the power of the State, but from the power of the machine.



The last third of humanity has not yet made the final choice as to what kind of society it is going to have. This third, the one belonging to the newly independent and economically underdeveloped nations has many obstacles to overcome before its individuals can hope to live the good life. The prime hurdle of an alien rule has largely been removed; the main obstacle now remaining is the removal of that grinding material poverty which degrades the individual to a point where human values have no meaning. The one great objective of these countries is to remove this poverty as rapidly as they can. The experience of those who have been successful in banishing poverty from their own countries, whether they have adopted the communistic or capitalistic method, seems to show that in either event the individual may well go under. He may become an automation to be used either at the bidding of the State or at the bidding of a corporation as a small cog in an enormous machine over the destiny of which, no matter what the theory is, he has no control. In either case his system of values may well be distorted and the desire for material goods may be so developed that it tends to overshadow and to dominate the many other and at least equally valuable aspects of the human personality. The material requirements for a good life, as Thoreau was never tired of pointing out, are in reality very limited. But the experience of existing societies appears to show that once this appetite for material well-being is created, it tends to feed on itself and leads to an elaboration and complexity of material consumption which is not only unnecessary but actually destructive of the fundamental value of humanity.

The wiser among the new societies may therefore legitimately engage themselves in a search to find whether it is possible to get rid on the one hand of the curse of poverty and to avoid on the other the dangers which concentration on the pursuit of wealth creates. The message of Thoreau is, therefore, valuable to them for it serves as a constant reminder that it shall not profit man to possess the world if he loses his own soul; that there is an unrelenting conflict between the Transcendentalist and the Organisation Man and that no matter how impressive the external trappings one covers oneself with, what is invaluable is, in the last resort, the individual.

The Decline in Foreign Exchange Reserves

THE shadows cast by the postponement of the Aid India Club meeting without making a commitment in regard to the needs of foreign exchange of the Indian Union for the current year seem to be lengthening. On June 1, the Reserve Bank's Weekly Bulletin reported that the foreign exchange reserves of the country had dwindled to Rs. 101 crores. This naturally initiated hurried consultations between the Union Ministry of Finance, the Planning Commission and the Reserve Bank of India. If the present trend continues, some of the Plan Projects will of necessity have to be deferred. In any case a three-pronged attack is being launched on this problem. In the first place, all loopholes in regard to the allocation of foreign exchange for tours abroad are being plugged. Secondly, the Department of International Trade is planning an extensive scheme of export promotion incentives. These proposals will be presented to the Board of Trade at its first meeting on June 9. Thirdly, the Federation of Indian Chambers of Commerce has put in a fervent plea for a rational study of India's imports so as to reduce the imports of those items which can be manufactured within the country.

According to the current mood at New Delhi, fresh curbs on travels abroad are likely to emerge very soon. The difficult foreign exchange situation will make frequent visits of businessmen abroad very difficult. Hitherto the businessmen who wanted to go abroad were not compelled to seek the permission of the Reserve Bank of India. As a matter of privilege they were allowed foreign exchange equivalent to Rs. 75 for each trip and the Government never bothered to know how they financed their trips abroad. The suspicion exists that some of these businessmen had underinvoiced their exports and had built up foreign exchange reserves in foreign banks which they utilised during their stay abroad. Moreover, the purchase of foreign exchange abroad at exorbitant cost—sometimes at Rs. 22 per pound as against the normal rate of Rs. 13 per pound—tended to weaken the Indian rupee in the foreign markets. It is believed that the new regulation will make it obligatory for everyone going abroad to seek the permission of the Reserve Bank whether one needed foreign exchange for the purpose or not. It is also a foregone conclusion that in the second half of the current year substantial cuts in imports of industrial raw materials and components will ensue.

The most important element in resolving foreign exchange problem is to expand the volume of India's exports. The scheme that is being currently drawn up by the Department of International Trade in regard to export promotion incentives is welcome. It is reported that the new measures will include "special treatment to export houses with regard to taxes in early years, simplification and liberalisation of other incentives, cheaper export credit, provision of long-term and cheap credit, discounting of export bills by the Reserve Bank" and various other new measures to help the export houses in expanding their exports. The Minister of International Trade, Mr. Manubhai Shah has had recently a series of meetings with the exporters. He has fixed tentative targets for all the major items of exports so as to attain the target of exports at Rs. 700 crores this year. The manner in which Mr. Shah is tackling the problem indicates that he is likely to attain this goal unless the foreign trade trends in the international markets work against the under-developed countries. The possible short-term repercussions of U.K.'s entry into the Common Market and the recent shake-up in the Wall Street are factors which are likely to hurt the trade of the developing countries, including India.

The analysis of India's imports made by the Federation of Indian Chamber of Commerce in New Delhi merits special study because it brings out prominently the need to revise the composition of India's imports so as to stimulate domestic manufacture of items on which valuable foreign exchange is currently being expended. The Federation is of the view that the Indian Union can easily chalk out a programme to manufacture indigenously goods worth at least Rs. 500 crores (i.e. 50 per cent of our total imports).

A large variety of capital goods can certainly be manufactured within the country. For this purpose, the import policy should be biased "in favour of machine tools to make capital goods rather than to import all types of capital goods." Also there does not appear to be any justification for importing industrial combustion diesel engines as the Indian Union has the capacity and technical knowledge to produce them. The other items which can be manufactured in the country are Conveying, Hoisting, Excavating and Road-construction Equipment. This also applies to certain types of chemical elements and compounds, which can be manufactured indigenously. Raw cotton shortage has put a considerable strain in recent years. Till the country becomes self-sufficient in the supply of cotton, the Federation has recommended that the manufacture of synthetic fibres should be undertaken in order to supplement the supplies of raw cotton. Also, the existing refineries have some spare capacity which, if utilised, can assist in saving some foreign exchange. Some economy on the import of consumer goods and unclassified items is also possible.

While all attempts should be made to conserve foreign exchange and to boost India's exports, the suggestions made by the Federation in regard to reducing the bill of imports by stimulating indigenous production of certain items needs special attention. Unless the problem is tackled by making an all out effort, the Third Plan is likely to come in for a cut even before the expiry of the first two years of the Plan.

Role of Forward Markets

By

CROESUS

THANKS to three conferences — including the latest one held on June 2, 1962 — of the presidents of the recognised forward markets, there is today a better — but not, as yet, complete — understanding between the forward markets and the authorities represented by the Forward Markets Commission (F.M.C.). Much water has flowed under the bridge since 1952, when the Forward Contracts (Regulation) Act was first put on the Statute Book. It is difficult to imagine that the same trading interests which were so sharply critical of the legislation at the time could be re-orientate their attitude to such an extent as to compliment the F.M.C. on its policies and decisions even in a guarded way.

This is undoubtedly the result of the delibrations at the periodical conferences (which began in 1959) where both the associations concerned and the F.M.C. were able to discuss and understand each other's point of view on all the problems concerning the futures markets. Only recently, the President of the Bombay Oilseeds and Oils Exchange Ltd., Mr. Ramdas Kilachand, went so far as to describe the F.M.C.'s policy of removing ordinary and special margins and refraining from fixing any ceilings as a 'New Deal'. In their turn, the authorities also have not been slow to appreciate the co-operation extended to the F.M.C. by these associations. Mr. Manubhai Shah, the Union Minister for International Trade for example, complimented these associations in his inaugural address at the Third Conference of the Presidents and the Nominated Directors of Recognised Forward Markets. He stated: "The recognised associations have, on the whole, taken more kindly to the various regulatory steps that have been found necessary from time to time than could have been imagined some years ago .... The large measure of freedom granted to the recognised associations to act under the powers vested in them under the bye-laws has not, on the whole, been seriously abused". Again, according to Mr. Shah, the drastic weapon of closing out contracts was not resorted to any time during last year (1961) nor during the current year, so far, which should be a matter of satisfaction to all concerned.

It would appear, however, that the authorities are still not fully satisfied with the functioning of our forward markets, especially on the organisational side. Both the F.M.C. Chairman and the Union Minister for International Trade accordingly availed themselves of the Conference to stress the desirability, on the part of the associations, to regulate the trading activities of non-member clients, to prevent kerb trading and to do away with the great evil of option trading, which was described by Mr. Doraiswamy as "a malignant growth in the organism of forward trading." The organisational side of these associations, according to Mr. Shah, requires to be toned up. In this connection, he particularly stressed the desirability of the evalution of panel-wise elected boards. It is gratifying to note that the Conference also generally agreed that, except in the case of associations with very small membership, the panel system of representation for different interests on the board and panel-wise elections of the directors to the board would be conducive to more efficient regulation from the overall point of view of the trade and the public interest. It remains to be seen how far and how soon this decision will be implemented by the associations so as to obviate the criticism that "discussions in the board meetings are not only not free from bias, but personal interests dominate the discussions". The uninitiated may not consider any such contingency to be feasible, by reason of the presence of Government directors, but they are probably not aware that the Government directors are there just to guide the others and to see that wrong and indefensible decisions are not taken. Besides, they are only in a minority, being four in a board consisting of 15 to 20 directors. Again, it may be argued that the F.M.C. can always disapprove of a wrong decision, but, as Mr. Shah pointed out, it is far better that the directors should themselves function without any bias rather than attract the intervention of the F.M.C. May be, there have so far not been too frequent occasions for intervention by the F.M.C., but even those intenventions that eventuated could have been avoided, had the boards of the concerned associations taken "more objective and more agreed decisions". In order to facilitate this perhaps, the F.M.C. put forward at the Conference a proposal that the Articles of Association of the recognised associations might contain an enabling provision whereby, in an emergency, the board would be empowered to appoint a non-trading president. The trade, however, stuck to the view that only a member of the trade elected as the President would enjoy the confidence of the trade and also inspire confidence among the traders in an emergency.

One of the very pertinent suggestions of Mr. Shah to the Conference was that the associations should have a first-class full-time secretary and adequate staff to man their offices. Considering the enormous increase in the work of the recognised associations and the need to keep members fully posted with the day-to-day developments, as also all the relevant statistical data, not to speak of such specialised work as the issuing of pamphlets and conducting of market surveys and researches, this advice was most timely and it is to be hoped that the associations, at any rate the bigger recognised ones, would pay due heed to this advice.

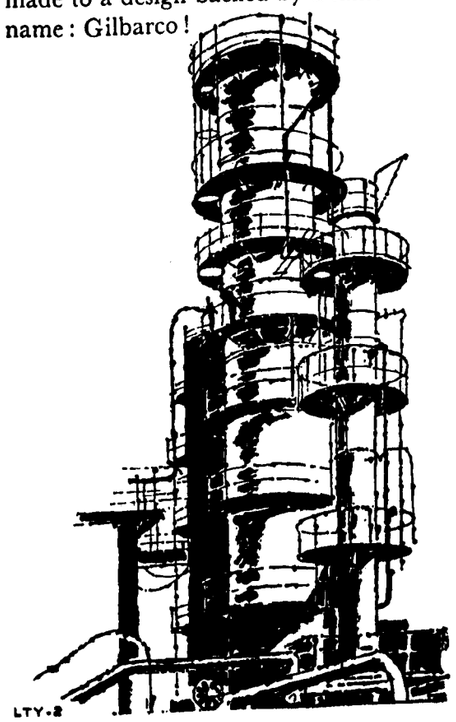
It is significant that the Union Minister dwelt at quite some length on the work of the Commission and explained how it has been reorientated from the earlier phase of regulation, when reliance was mainly on the system of special margins applicable at certain margin lines of price levels, to the present practice of imposition of maximum prices and several other new methods of control, such as imposition of limits on the open position of individual members, restriction on fluctuations in prices either on a daily or a weekly basis and withholding of profits at weekly clearing for temporary periods. Apparently Mr. Shah did this in order to make the significance of the new methods better appreciated. Anyway, from the deliberation that followed at the Conference, it would appear, nearly all the new methods of control introduced by the F.M.C. were welcomed by the trade, on the ground that, while being effective, these were far less restrictive in their scope than the imposition of special margins or maximum prices. This still leaves the question of limiting the business of non-member clients unresolved. Despite the very outspoken and forth-right condemnation of this by the F.M.C. Chairman, who opined that "nothing could be farther from the purpose of establishing recognised forward markets than to afford facilities for the enormous speculative operation of such

how much energy from 750,000 tons of oil?

Enough to keep all the cars in India going for weeks—or to make one of them run non-stop for centuries! Seems a lot of energy? It is. 750,000 tons of oil is the annual capacity of the Noonmati refinery. But it is only a part of India's requirements! One reason why crores are spent to find new wells, set up new refineries, enlarge the distribution network. It is a gigantic enterprise—one in which Larsen & Toubro today plays an important role. Drilling rigs and bits, valves, petrol pumps,and geophysical, process and telemetering instruments—these are some of the items L & T supplies for the growing oil industry. Even the complete mechanical construction and erection, including instrumentation, of the Noonmati refinery was a job done by L & T!

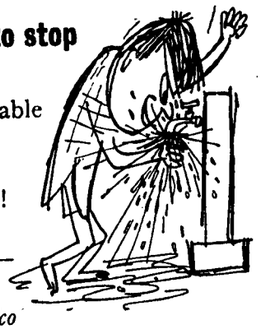
When you next stop at a petrol pump, consider—

how long does it take to drill a hole—minutes? hours? days?

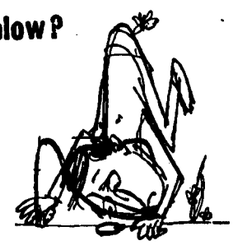


Depends. If it's drilling for oil, it could be anything! Minutes through soft soil, hours through hard rock. And the drill can go several thousand feet into the earth! Not any drill! Only those specially designed for the job—drills and bits like the ones supplied by L & T.

how much petrol to fill the tank?



Say, 40 litres. And, imagine, all over the country thousands of such tanks are being filled. A round-the-clock job for petrol pumps—an important product of LARSEN & TOUBRO, made to a design backed by a famous name: Gilbarco!



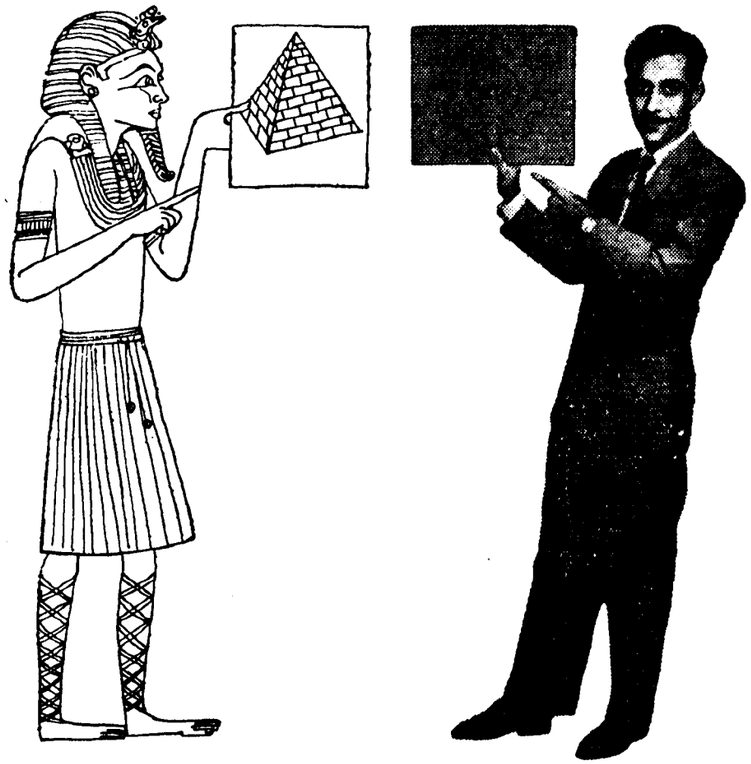
LTY-2

It's no child's play to stop the flow...

Not when it is inflammable petrol! And that too, in an emergency—say, a fire at an oil refinery! When lives are in danger, seconds count—and seconds are what it takes to close an *Audco* valve. One reason why it is an important component at oil wells, refineries and pipelines.

Is there oil down below?

Perhaps. But how does one find out? Experts drill a hole, fill it with charge and explode it. They record the shock-waves—but not with a stethoscope! Highly sensitive geophysical instruments are used to discover oil-bearing strata far, far below the earth's surface—instruments like the ones made by the world-renowned Texas Instrument Corporation.



L & T contributes also to the development of these vital industries:

88Y-97

market adventurers", there were sharp differences of opinion on the subject at the Conference. Whereas the Commission argued that, unless this was solved, the controls on open position of members would not serve their purpose, the spokesmen of the associations did not think so. Evidently they do not seem to appreciate the gravity of the problem: or have they failed to note the determination of the F.M.C. Chairman to root out this evil, as witness these words of his: "The Commission will not sit with folded hands indefinitely watching such anti-social activities?"

It would have been quite a surprise if Mr. Shah had omitted to say something about forward trading in relation to our export drive. Indeed, he spoke of the role of forward trading not only in this context, but even in the wider context of the Third Plan, and referred to the several risks that the country's economy would have to face—risks which would be insured only by the functioning of efficient futures markets. "Backed by a buffer stock system and adequate stock-piling arrangement", he went on to say, "we have also embarked on a big export drive, the success of which will, in turn, depend greatly on steady prices and larger and larger supplies, both for domestic exports industries and exports of surplus agricultural crops." And he expressed the hope that the exporters and shippers would take substantial advantage of the forward markets to increase the turnover of export sales. He considered it a happy coincidence that many commodities in which forward trading is regulated today also figured on the export list and added that it was the responsibility of regulated and disciplined markets "to shoulder and fulfil, in the interests of the nation, larger and larger exports through reasonable internal price levels and adequate and speedily available incentives."

While not necessarily disagreeing with the desederata outlined above, the impression that the participants in the Conference would appear to have carried with them seems to me to be that the F.M.C. is still not averse to wielding the big stick, albeit in extreme cases. I am convinced that the F.M.C. can bag more successes for its scheme of regulation by continuing its policy of "converting by persuasion rather than by pressure," actual or threatened. The F.M.C. must not presume that all the suggestions made by it, however wise or well-conceived, should be straightaway accepted by the recognised associations. It should give the latter time to ponder over and grasp the significance of its suggestions. After all, most of those who are in charge of these associations are quite conscious of the fact that their activities affect the welfare of large sections of the community and that, therefore, they owe certain obligations to society. Has not Mr. Shah himself admitted this in so many words, when he told the Conference that he had been informed by the F.M.C. Chairman that, by and large, the recognised associations were increasingly aware of the responsibility resting on their shoulders in ensuring stability of prices and fair trading opportunities and practices?

Business Notes

Small Savings

NEW PRIZE BONDS

ALTHOUGH INDIA'S experience with the instrument of prize bonds as a means to attract small savings has not been as happy as that of some other countries, notably the United Kingdom, the role prize bonds can play in boosting savings of the lower middle class cannot be over-emphasized. It is encouraging, therefore, that the Union Government has decided to continue issuing of these bonds under a revised scheme.

The not-so-happy experience with the current series of the prize bonds, after the first flush, may be partly due to the inroads that inflation has been making into the incomes of the lower middle classes, affecting their propensity to save, but a major contributory factor has been the lack of lure these bonds developed in about six months after the opening of their sales. The 1960-65 bonds went out of favour with the small saver due to a number of reasons, the most important of which were: (i) that the unsold bonds were also allowed to participate in the prize draws, the prize money accruing to them being kept by the Government; (ii) that with the successive prize draws, the number of such draws went on declining, thus reducing the incentive to buy more bonds; (iii) that the prize money, in the case of especially the lower denomination bonds, was not very attractive, and (iv) that the procedure adopted for payment of the prize money was cumbersome.

The new series that is proposed to be put on the market in about three months under a revised scheme, whose bare outlines were given by the Deputy Finance Minister, Mrs. Tarkeshwari Sinha, at this week's meeting of the National Savings Central Advisory Board and Chairmen of State Boards, seeks to rectify some of these defects. The prize money, for instance, is to be raised by having only annual draws, instead of quarterly draws as in the case with the present series. Besides, only those bonds are to participate in the prize draws which have actually been sold. To make the new prize bonds more attractive, a small premium is to be paid on them so that even those holders who fail to win any prize, have at least the consolation of earning something on their investments. As this premium is to be tax-free and the prize money is to come out of the interest accruing on the money invested in these bonds the premium has to be fixed at a low rate — perhaps, the rate which small savings accounts attract in the big scheduled banks of the country.

The new scheme suffers from one major drawback from which the current one also suffered. It is that instead of making the prize-winners hunt for their numbers in the prize list, arrangements should be made for giving information to them in case luck favours them. This would require registration of the names of all those who purchase bonds. That may not be feasible in the case of the lower denomination bonds because of the huge administrative work involved. But for the hundred-rupee bonds this procedure ought to be adopted. The move to discontinue in the new series issue of five-rupee bonds also does not appear to be a wise one; this would shut out a large number of marginal savers, particularly in the countryside. By and large, the new scheme should find favour with the small investor. It is a distant improvement over the 1960 scheme.

General Insurance

ALL-ROUND GAINS

EVEN AS did the year 1960, the year 1961 also proved to be a year of all-round gains for the general insurance business in India, according to Mr. A. D. Shroff, Chairman of the Indian Reinsurance Corporation Limited (I.R.C.). But for a serious fire in a textile mill in Bombay, the loss in respect of which is estimated at

around Rs. 75 lakhs, he said, the overall fire loss ratio in India for 1961 could be regarded as satisfactory. In view of the uniformly good performance noted in fire business over a period of years, thus, the Tariff Committee had actually decided to reduce the fire tariff rates according to experience on different classes of risks and in such a way as to bring about an average reduction of about 15 per cent, observed the I.R.C Chairman. In the marine section, no major loss, either on the hull or the cargo side, had been experienced. However, while the hull business maintained its usual high level of profits, the profits of cargo business remained marginal, even in the absence of any major loss.

In the miscellaneous section, the favourable result of 1960 was fully maintained in 1961. While motor workmen's compensation, engineering and personal accident business showed satisfactory results, the profit on burglary, cash-in-transit, fidelity, third party, solvency and credit business was extremely good. Aviation business also showed a very high profit, there being hardly any loss of significance during the whole year. However, according to Mr. Shroff, as a result of the introduction of the Boeing jet aircraft with its high insured values and large amount of cover for liabilities, a very large portion of aviation business had to be reinsured abroad.

Reviewing the progress of the I.R.C at the annual general meeting held recently in Bombay, Mr. Shroff said that the Corporation too had registered overall progress in 1961. And this, Mr. Shroff pointed out, was mainly due to the various steps taken by the Corporation since the past few years, namely to improve the reciprocity obtained by the I R.C., as also to develop a portfolio of non-reciprocal business of good quality. As a result of these, he went on to say, a significant increase in the I.R.C.'s premium income had been realised. There was also an improvement in the claims experience, as compared with the experience of previous years.

In 1961, the Corporation wrote a total gross premium from members and others of Rs. 5,05,88,043, as against Rs. 3,79,89,945 in the previous year. Out of the former, Rs. 1,08,73,350 (£815,502) was retroceded in fulfilment of the Corporation's statutory obligations and, after taking into account the premium otherwise retroceded, the total net premium income of the Corporation in the year 1961 at Rs. 2,58,85,719 compared with Rs 1,90,37,522 in 1960. Premium income in all the departments increased substantially during the year, the increase in the fire department being of the order of Rs. 18,10,517 and that in the miscellaneous department Rs. 19,57,496.

In the fire department, however, there was no significant increase in I.R.C 's net Indian premium income in 1961, as compared with 1960. Mr. Shroff explained that this was due to the fact that the I.R.C.'s retrocession of Indian business to companies against their compulsory cession had increased from 45 per cent in 1960 to 50 per cent in 1961.

In the marine department, there was a very substantial increase in I.R.C.'s net premium income, both in India and outside. Thus, cargo premium income in India, the rise in which was relatively steady up to 1959, increased substantially in 1960, and there was an even larger increase during the year 1961; the underwriting result of this business, however, continued to be marginal. Substantial stepping up of the retained premium on Indian hull business enabled the Corporation to take full advantage of the excellent profit yielded by the business during the year under review.

Small-scale Industries

A SIGNIFICANT CONFERENCE

SMALL-SCALE industries have lately begun to attract more and more attention. This is not only the result of the recognition that, in a predominantly agricultural country, such as ours, the process of rapid growth is best attained through the decentralisation of industries, but also of the various concessions that are offered to small-scale industries. Also, partly by reason of the commendable progress already made in the field of basic and large industries and partly because of the difficulty in securing adequate finance, especially the foreign exchange component thereof, entrepreneurs have begun to turn more and more to small-scale industries. Fortunately, in the scheme of planned development, small-scale industries have been accorded a vital place.

The importance given to small-scale industries in the Third Plan will be evident from the fact that, in the western region (Maharashtra, Gujarat and Madhya Pradesh) alone, there will be, at the end of 1965-66, as many as 17,900 units providing full-time employment for four lakhs of people and seasonal employment for 40 lakhs. Impressive as these targets appear, the question is whether and how far they are practicable. It is in this context that the experience of the first two Plans in the matter of promotion and development of small-scale industries would be found to be valuable. In the light of the experience gained during these two Plans periods, it should be possible to devise suitable measures for the effective development of small-scale industries during the Third Plan period. The Indian Merchants' Chamber, Bombay, which has always evinced a keen interest in industries generally and in small-scale industries in particular — it has even set up a Small-scale Industries Wing to assist its members by providing the necessary information — has done well, therefore, in taking the initiative in convening a conference of those engaged in small-scale industries in the western region. This is not to say that small-scale industries in the western region have peculiar problems of their own. For the problems are of an all-India nature and what the forthcoming conference — it is scheduled for June 9, 1962 — will discuss and decide should be of use to small-scale industries all over the country. It is known that there are various difficulties which prevent the steady growth of small-scale industries. There are also certain basic problems which require to be examined in detail. Considering the programme of the Conference, which will be inaugurated by Mr. Nityanand Kanungo, Minister of State for Industries, Union Government, we may expect that all these problems will receive adequate attention. It is noteworthy that, besides the inaugural session, there will also be a number of group meetings to discuss problems pertaining to raw materials, finance, marketing, publicity, and administrative and procedural difficulties. It is understood that nearly 150 organisations and about 675 delegates will participate in the conference. The outcome of the conference will naturally be eagerly awaited by small-scale industry interests in the other States. They will not only do well to follow the proceedings of this conference but also arrange similar regional conference for the industries in their respective areas.

New Issues

ZENITH LAMPS AND ELECTRICALS

THREE MORE companies shall be approaching the public in the near future for subscriptions to their share capital.

Zenith Lamps and Electricals Limited has plans to raise its subscribed and paid-up capital from Rs. 6,00,000 to Rs. 25,00,000, out of an authorised capital of Rs. 1,00,00,000, consisting of 8,00,000 equity shares, of Rs. 10 each, and 2,00,000 9.286 per cent (free of company's tax, but subject to deduction of taxes at source) redeemable cumulative preference shares, also of Rs. 10 each. The new issue will comprise 1,40,000 equity shares and 50,000 preference shares. Of this, the promoters and directors of the company and their friends and associates have agreed to take up 40,000 equity shares. The balance 1,00,000 equity shares and 50,000 preference shares are being thrown open for public subscription on June 14. The list closes on June 21 or earlier at the discretion of the directors, but not before June 18.

The company was formed in May, 1961, for the primary purpose of undertaking manufacture of fluorescent tubes with technical collaboration from Messrs. United Incandascent Lamp and Electrical Company Ltd., Budapest, Hungary (manufacturers of "Tungsram" products). It wil be setting up a factory at Madhavaram, about six miles from Madras Central Station, having a capacity to produce 12 millios fluorescent tubes per annum.

The total cost of the project is estimated at Rs. 75,00,000, which is proposed to be met as follows: share capital—Rs. 25 lakhs; deferred payment facilities from supplies and machinery for the fluorescent tube plant —Rs. 9.5 lakhs; loan from Madras Industrial Investment Corporation—Rs. 14.5 lakhs; arrangements yet to be made for procuring the glass tube drawing plant—Rs. 14 lakhs; borrowings from company's bankers and receipts from other sources—Rs. 12 lakhs.

In view of the progressive industrialisation and electrification of the country, the demand for the company's products is bound to increase. By the end of the current Plan, according to the company's estimates, it is likely to be of the order of six million tubes. In 1960 indigenous production amounted to only 1.46 million tubes. As such, the company is likely to encounter little difficulty in marketing its manufactures.

GALILEO INSTRUMENTS

THE SECOND company which is expected to enter the capital market in the near future is Galileo Instruments, formed recently to undertake the manufacture of gas and electric meters in technical and financial collaboration with the Italian firm Officine Galileo S.P.A., Florence. The authorised capital of the company is Rs. 100 lakhs, of which capital worth Rs. 40 lakhs, all in equity shares of Rs. 100 each, is proposed to be issued in the first instance. The foreign collaborators will be alloted 25 per cent of this or in any other proportion to be fixed by the Government. Of the rest, 51 per cent will be taken up by the promoters and directors of the company and their friends and associates. The residue will be offered to the public for subscription.

The company is setting up its factory at a place near Baroda to manufacture 60,000 gas meters and a similar number of house service meters. The whole of the foreign exchange component of the project is to be financed by the Italian collaborators, who will be providing a loan to the extent of the cost of the plant and machinery and the fee for technical know-how in excess of its participation in the share capital.

Mr. C. C. Desai will be the Chairman of the Board of Directors of the company.

PRESTOLITE OF INDIA

THE THIRD company to approach the public for subscriptions to its share capital shortly is Prestolite of India Limited, which has been floated by Mr. Inder Singh, Managing Director of the Tropical Commercial Company (Private) Ltd., New Delhi, in collaboration with the Electric Autolite Company of the United States.

The authorised capital of this company is Rs. 100 lakhs, divided into 7,50,000 equity shares of Rs. 10 each and 25,000 cumulative redeemable preference shares of Rs. 100 each. Capital to the extent of Rs. 40 lakhs, all in equity shares, is being issued in the first instance. Of this, 44 per cent will be allotted to the foreign collaborators in consideration for the supply of plant and equipment for the project. Of the remaining, part will be subscribed by the promoters and directors of the company and their friends and associates and part will be offered to the public.

The company proposes to manufacture automotive electrical components of the latest design for original equipment as well as for replacement under the trade mark "Prestolite". A partial list of the products to be manufactured here includes ignition coils, voltage regulators, lamps, horns, horn relays, distributors and miscellaneous electrical replacement parts. Most of these items are at present imported.

The factory of the company is to be located at Faridabad, near Delhi. The foreign collaborators will be represented on its Board of Directors.

Rayon

FALL IN WORLD OUTPUT

THE COMMONWEALTH ECONOMIC COMMITTEE has revealed that the world rayon and acetate production during the first three months of the current year declined by nearly 1 per cent from that in the last quarter of 1961. There was, however, a 9 per cent increase as compared to the figures of the first quarter of 1961. World output for 1961 was estimated at nearly 5,960 million lbs. out of which eleven major producers accounted for nearly 4,349 million lbs. or nearly 74 per cent of the total output. As far as staple fibre is concerned, there was a marked decline from 689 million lbs. during the last quarter of 1961 to nearly 662 million lbs. in the first quarter of 1962. The production of filament yarn, however, increased from 482 million lbs. to an estimated 497 million lbs.

Table I below shows the rayon acetate filament yarn output in 9 major producing countries in 1962 as against 1961 (the first quarter). The output was highest in the United States and the increase too was maximum (30 per cent) in that country. Other important producing countries, Japan, the U.K., Italy and Germany recorded minor increases.

TABLE I

PRODUCTION OF RAYON AND ACETATE FILAMENT YARN IN 9 MAJOR PRODUCING COUNTRIES

(Million lbs.)

		1st Quarter	January—December
United States	1961	148.2	641.7
	1962	188.1	
Japan	1961	77.7	311.3
	1962	78.7 b	
United Kingdom (a)	1961	67.5	264.0
	1962	67.7	
Italy	1961	45.2	185.1
	1962	48.0 b	
Germany (Fed. Rep.)	1961	42.7	166.4
	1962	44.1 b	
France	1961	33.5	124.5
	1962	34.8 b	
Netherlands	1961	19.2	75.5
	1962	19.2 b	
Spain	1961	8.6	36.0
	1962	9.4 b	
Belgium	1961	6.9	29.5
	1962	7.4 b	
Total	**1961**	**449.5**	**1,834.0**
	1962	**497.2 b**	

a = including other man-made fibres.
b = partly estimated.

As far as the output of rayon and acetate staple is concerned, Table II below, showing the output for 11 major countries, reveals that Japan is the leading most producer. In that country the output during the first quarter of 1962 declined as against the corresponding quarter of 1961. In the U.S., the second leader in production, the output increased by more than 30 per cent. West Germany, U.K., East Germany, Italy and France all recorded minor increases.

TABLE II
PRODUCTION OF RAYON AND ACETATE STAPLE IN 11 MAJOR PRODUCING COUNTRIES
(Million Lb.)

		1st Quarter	January—December
Japan	1961	161.4	670.5
	1962	153.0 b	
United State (d)	1961	90.0	400.5
	1962	123.0	
Germany (Fed. Rep.)	1961	80.4	342.4
	1962	85.2 b	
United Kingdom (a)	1961	71.6	305.6
	1962	79.0	
East Germany	1961	62.0	250.2
	1962	63.1 b	
Italy	1961	44.4	196.9
	1962	54.1 b	
France	1961	36.0	148.4
	1962	38.7	
Austria	1961	27.5 b	108.5 b
	1962	27.0 b	
Spain	1961	16.1	68.8
	1962	19.1 b	
Belgium	1961	9.9	44.7
	1962	11.9 b	
Netherlnds	1961	8.1	31.8
	1962	8.2 h	
Total	**1961**	**607.4 b**	**2,568.3 b**
	1962	**662.3 b**	

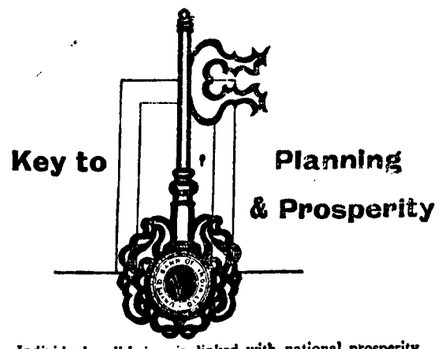
a = Including other man-made fibre.
b = Partly estimated.
c = Excluding Western Zone of Berlin.
d = Excluding acetate staple and tow.

This decline in the first quarter of 1962 as against the first quarter of 1961 cannot be taken as a certain indication that the demand for rayon products has declined in any way. This can as well be a seasonal factor because as compared to the corresponding quarter the production for nearly all the countries was positively higher with only one or two exceptions.

Civil Aviation

STEADY PROGRESS

THAT CIVIL AVIATION has been making a steady progress is evident from the report released to the Press for the second half of 1961. It may be the Air-India International or the Indian Airlines Corporation, one notices that both flew more kilometers and carried more passangers during the period under review. The Indian Airlines Corporation introduced a new service on the route Delhi-Phoolbagh-Lucknow and introduced a scheduled halt at Baroda on its Bombay-Ahmedabad service. To put it in concrete terms, during the second half of 1961, Air-India International on its scheduled services flew 6,595,164 kilometers, carrying 79,279 passengers, 2,587,452 kilograms of cargo and 543,274 kilograms of mail, as against 6,523,105 kilometers flown and 65,101 passengers, 1,766,558 kilograms of cargo and 42,275 kilograms of mail carried during the corresponding period of 1960. The figures in the first half of 1961 were 6,477,608 kilometers flown and 59,747 passengers, 2,132,606 kilograms of cargo and 430,064 kilograms of mail. During the second half of 1961, the Indian Airlines Corporation flew on its schedule services 15,809,284 kilometers, carrying 418,906 passengers, 17,282,823 kilograms of cargo and 3,399,159 kilograms of mail as against 14,977,273 kilometers flown and 372,971 passengers, 18,303,473 kilograms of cargo and 3,057,961 kilograms of mail carried during the corresponding period of 1960. Frequency of services also increased on certain routes and the operations of night airmail service improved considerably. Not only during the day but in the night airmail service also, more kilograms of cargo, mail and passengers were carried during the second half of 1961.



The aerodromes were maintained in a good condition by the Civil Aviation Department and during this period a new runway at Delhi airport for use by heavy inter-continental jet transport aircraft was nearly completed. The construction of a new terminal commenced at Calcutta (Dum Dum) airport and terminal building at Madurai was put into commission. Spade work on these terminals was done during the tenure of Mr. K. M. Raha, the then Director General of Civil Aviation, under whose able guidance the Civil Aviation Department made a considerable headway. The credit goes to the Administration for organising every detail correctly and for putting into execution schemes that the second quarter of the report can now take pride of. Emphasis on modernisation, improvement and reorganisation of the Aeronautical Telecommunication Services were carried through during this period and research and development were given an added fillip. Not only in the domestic field, but in the matter of international relations also, negotiations were carried successfully and a certain number of agreements were put into effect. Notable amongst the agreements may be mentioned the agreement with German airlines Lufthansa and the India-France Air Services Agreement. All said and done, it can be safely remarked that the progress made so far has been quite satisfactory and there is nothing to doubt that it will be impeded in any way as the administration is in sound hands and the officers manning the Department are likely to give new thinking to many of the problems that might arise in the near future.

WORLD BANK TO RAISE LOAN IN NETHERLANDS

A GUILDER BOND issue of the International Bank for Reconstruction and Development will be offered for public subscription in the Netherlands on June 12, 1962, by a syndicate of Dutch banks. The banks will offer f40,000,000 (approximately $11 million) of 4½ per cent 20-year bonds at a price of 99½ to the public. The Netherlands Trading Society (Nederlandsche Handel-Maatschappij, N.V.) heads the underwriting group, as it has done on previous public offerings of the World Bank on the Netherlands market.

The new issue of 4½ per cent Netherlands Guilder Bonds of 1962 will be dated July 15, 1962, and the final maturity will be July 15, 1982. It will be non-callable until July 15, 1973. Beginning on July 15, 1973, the issue will be retired at par in ten equal annual instalments of f4,000,000 each. The bonds will also be subject to redemption in whole or in part at 101½ per cent from July 15, 1973, through July 14, 1977, and thereafter at 101 per cent.

This is the fourth public offering of World Bank bonds in the Netherlands. Two issues of f40,000,000 each were offered in 1954 and 1955, and one issue of f50,000,000 was offered in 1961. Giving effect to the current offering, outstanding guilder bonds of the World Bank will amount to f153 million, equal to about $42 million. Total outstanding funded debt of the Bank on March 31, 1962, was equivalent to $2,527,949,542, of which roughly 55 per cent was held by investors outside the United States. Included in outstanding obligations were $1,902,728,000 of bonds and notes denominated in U.S. dollars and the equivalent of $625,221,542 denominated in other currencies.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

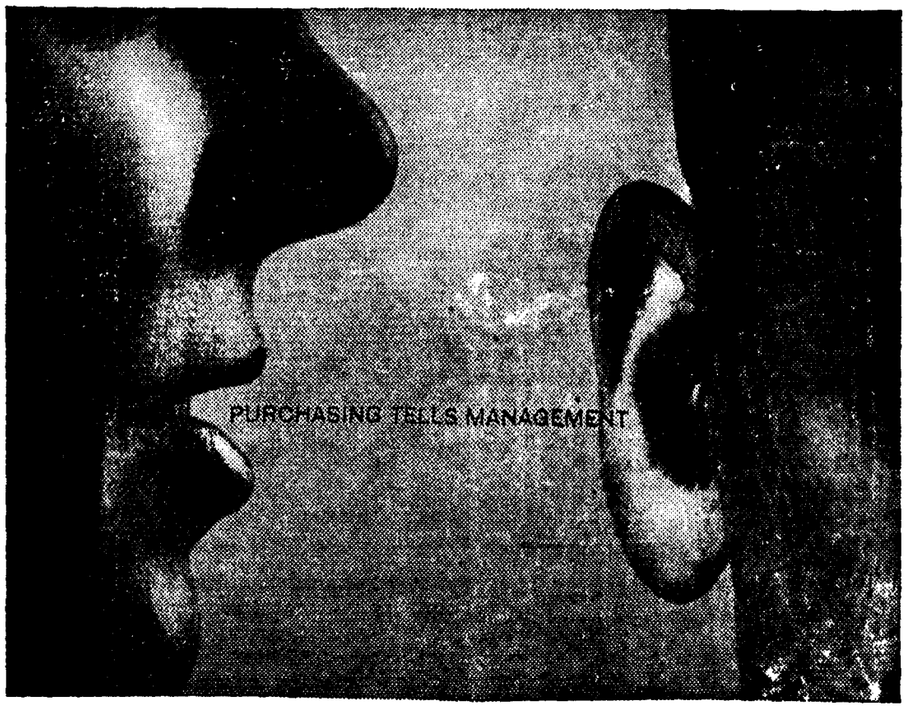
HOW

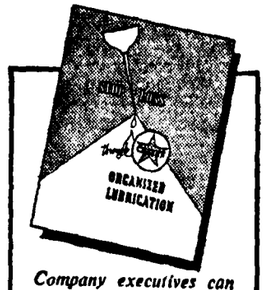
KIND HEARTED



IS YOUR DIET?

Doctors now agree that heart ailments due to hardening of the arteries can be avoided by excluding saturated fats from one's diet. In fact, the use of an unsaturated cooking medium is highly recommended. Nature has provided such a medium in the form of safflower oil (kardi, in Hindi). Known as saffola, it is the ideal cooking medium for everyone and particularly for those over forty. Saffola is nutritious, palatable, easy to digest and so economical. For health's sake get a tin of Saffola from your nearest store.

Saffola



Refined and processed by:
THE BOMBAY OIL INDUSTRIES PRIVATE LTD.

Cocoanut Oil, Til Oil
COCOVITE Refined Cocoanut Oil

The CALTEX "Stop-loss" Programme helps cut plant-wide maintenance costs as much as 15%

"Stop-loss" organises lubrication throughout the plant—from purchasing on through actual application. By specifying multi-purpose lubricants and by eliminating duplication, a "Stop-loss" Programme can reduce the number of lubricants needed by as much as 50%. By streamlining purchasing procedures the programme can cut the number of purchase orders.

Best of all—by assuring proper lubrication to every piece of equipment in the plant, a "Stop-loss" Programme helps extend equipment life. Result—plant-wide maintenance savings upto 15%. *Ask your Caltex Sales Engineer for information.*

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

DEEPENING FOREIGN EXCHANGE CRISIS

THE deepening foreign exchange crisis, as a result of no specific commitments having been made, at their last week's Washington meeting, by the Aid-India Club members in regard to the quantum of assistance to be provided by them during the current year, the debate in Parliament on the demands for grants for the Ministry of Defence and Britain's talks with the E.C.M., resulting in a tentative agreement being reached on the tariff arrangements in respect of some manufactured goods to be imported into Britain after it decides to join the Common Market, have been the highlights on the economic front last week.

The Aid-India Club adjourned without making an announcement in regard to the aid to be made available by it for India's economic development during the current year. That this development could be expected had been indicated in this column earlier. But still there was some hope that some sort of assurance would be forthcoming from the Consortium members, which would help this country to go ahead with its planned programme during the second year of the current Plan.

The adjournment of the Consortium's last meeting without holding out any assurance has been received with deep disappointment in New Delhi. Its next meeting is now anxiously awaited.

Enquiries show that the phenomenal success of the earlier meetings of the Consortium was mainly due to the enthusiasm evinced by the U.S. Administration for India's development plans. For all practical purposes, the U.S.A. had become the "whip" at these meetings and cooling of its ardour lately—may be due to India's action to liberate Goa or owing to the negotiations which the Government of India is carrying on with the Soviet Union for the purchase and manufacture of MIG Supersonic Fighters—has resulted in near-disastrous results at the last week's confabulations. It is understood that the gap of $220 million in the contribution to be made by the members of the Consortium other than the United States and the World Bank or its affiliate, the International Development Corporation, to make this contribution comparable to the indicated U.S. commitment of $500 million, could be bridged only to the extent of about 25 per cent. While the United Kingdom, Canada, France and Japan are said to have expressed their willingness to raise their contributions, even though by a small degree, West Germany is said to have preferred not to make any further commitment beyond the one which it had already indicated.

The Netherlands' and Austria's joining of the Consortium and the likelihood of Italy and Belgium becoming its members in the near future have been significantly taken note of here. Austria, it is learnt, has already indicated the aid which it would be prepared to extend under the aegis of the Consortium. But the quantum of aid to be made available by the Netherlands is yet to be disclosed. Belgium has so far attended the Consortium meetings only as an observer; it is still to become a member. Italy's contribution depends on how far the credit made available by the State-owned oil company of that country, E.N.I., is taken into account while calculating the comparable assistance of the members of the Consortium other than the United States.

Meanwhile, perturbed by the rapidly dwindling foreign exchange reserves of the country, which stood at about Rs. 101 crores on June 1, the Union Ministry of Finance is having feverish consultations with the Planning Commission and the Governor of the Reserve Bank of India, on devising measures to slow down this drain. The Planning Commission has also had talks with the State Chief Ministers who were here this week for the National Integration Council's meeting, on deferring of some Plan projects.

A detailed statement on India's reaction to the Aid-India Club's last week's deliberations and the measures which are proposed to be taken to meet the current foreign exchange crisis is expected to be made by the Finance Minister, Mr. Morarji Desai, towards the end of this week. Some of the measures being talked about are: (i) cutting down of imports, especially of spare parts and components which had been liberalised recently in expectations of some easing of the foreign exchange situation; (ii) firmly curbing of superfluous foreign travel by Indian nationals; (iii) prevention of malpractices by the trade such as under-invoicing of exports; (iv) approaching the United Kingdom and the United States for some temporary credits to avoid a request during the curent year to the IMF for a loan and; (v) holding in abeyance the Plan projects the foreign exchange component of whose costs has not yet been underwritten from any source.

As a temporary expedient, the statutory limit of Rs. 200 crores worth of gold and foreign securities as backing for currency may also be relaxed, freeing some of the foreign exchange from this source for meeting urgent requirements.

The £10 million assistance made available by Britain about a fortnight ago for maintenance imports from that country and the likelihood of some aid being provided by West Germany for similar purposes might give some breathing time for the Government of India. But, in the absence of firm commitments by the Aid-India Club in respect of its assistance for the current year, some drastic measures to check the drain on foreign exchange resources appear to be in the offing.

PURCHASE OF MIG SUPERSONIC FIGHTERS

In the last week's debate on demands for grants for the Defence Ministry, massive support was provided by the Members of Parliament for Mr. Krishna Menon's proposed deal with the Soviet Union for purchase, in the first instance, of MIG Supersonic Fighters and for their manufacture ultimately in this country.

The Indian Press also, by and large, has supported this move. But a final decision on it is yet to be taken, for the proposal has neither so far been considered by the Defence Committee of the Union Cabinet nor by the full Cabinet. Among the points which will have to be deliberated upon by the Union Cabinet before it decides to go in for this deal is the repercussions it will have on the availability of assistance from the Western countries for the implementation of the Third Plan.

BRITAIN'S NEGOTIATIONS FOR ENTRY INTO THE COMMON MARKET

New Delhi has been unhappy over the trend of negotiations between Britain and the Common Market countries in regard to the tariffs to be levied on imports of manufactured goods by Britain from the Commonwealth countries in general and from the under-developed countries like India in particular, after Britain joins the E.C.M. Particular disappointment has been express-

ed at the proposal discussed in respect of tariffs to be levied on textile imports into the Common Market via Britain.

The incongruity of restricting trade between the E.C.M. countries and the under-developed countries like India and the efforts which at least four of the present six members of the Common Market, namely West Germany, France, Italy and Belgium, have been making through provision of financial assistance for the economic uplift of the developing countries is frequently being talked here. If the flow of Indian goods to the E.C.M. countries is sought to be restricted, as is evident from the current negotiations between the United Kingdom and the ECM Secretariat at Brussels, India, it is pointed out, will find it very difficult to meet her obligations to these countries, undertaken by her as a recipient of economic assistance from there and forced on her by the unfavourable balance of trade which she has with them. With this end in view, India's Special Ambassador in Europe for Economic Affairs, Mr. K. B. Lall, has submitted a memorandum to the E.C.M. authorities pleading for concessions for India's exports to the Common Market area.

MANUFACTURE OF STEEL

The Secretary to the Department of Iron and Steel in the Union Ministry of Steel and Heavy Industries, Mr. N. N. Wanchoo, disclosed at a press conference here last week that the expansion programmes of the Rourkela and Durgapur Steel Plants had fallen behind schedule by approximately one year. How far this would affect the steel production programme of the current Plan was being studied by his Department and the Planning Commission, he added.

Mr. Wanchoo stated that the Government assumed that financial and technical assistance for setting up the Bokaro Steel Plant would be forthcoming from the United States. An American Team, he added, was expected here on June 21 to make a survey of this fourth steel plant to be set up in the public sector. The conclusions of this Team are likely to be available in about 7 to 8 months' time.

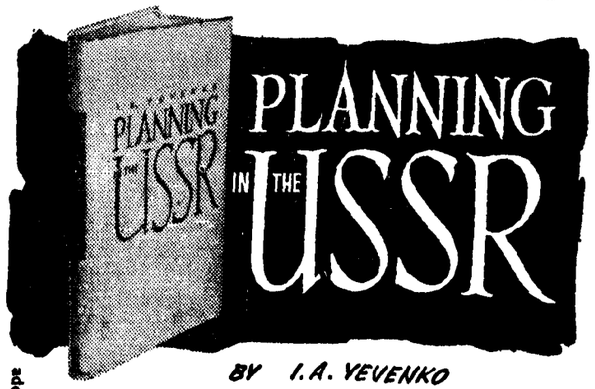
The U.S. Team's survey, Mr. Wanchoo said, would only be confined to the Bokaro project. The economics of the other steel plants or a search for an alternative site for the fourth public sector steel project would be outside the scope of this survey. The U.S. Team, Mr. Wanchoo added, would conduct its survey in close co-operation with the Indian consultants of the Department of Steel, Messrs. Dastoor and Co. The actual decision on financial aid for the project would be taken after the Team has submitted its report. There is, however, no proposal to offer equity participation to the U.S. financiers in this project.

About the Rourkela Plant, Mr. Wanchoo expressed the hope that as a result of the measures agreed upon by his delegation and the West German collaborators, this Plant would start operating to its full capacity in 6 to 12 months. Among the principal measures recommended to be taken are the building up of adequate stocks of spare parts (so as to improve maintenance), effecting of some additions to the workshop equipment and transport facilities and recruitment of 40 to 50 technical personnel from abroad in addition to what the Hindustan Steel has already decided upon.

All this would cost about Rs. 6 crores, of which approximately 75 per cent will be the expenditure on building up of spare parts stocks and for payment of wages to the additional personnel to be employed. This, as such, will not add to the capital cost of the project.

Giving a few details of the Solveen Report on the working of the Rourkela Plant, Mr. Wanchoo said: "The general findings of the experts are to the effect that the maintenance of the plant has been below par and that full production could not be achieved in a number of sections because of either lack of adequately qualified technical personnel or some deterioration in the quality of raw materials used. The deficiencies in the transportation system within the plan have also been stressed. There is also recognition in the report that some part of the equipment supplied by the German firms had not performed fully to expectations."

In regard to the supply of machinery and equipment for the expansion of the Rourkela Plant, Mr. Wanchoo disclosed that Hindustan Steel was thinking in terms of having a consortium of suppliers in place of a large number of individual suppliers as was the case when the existing plant was set up. About the supply of machinery and equipment for the expansion of the Durgapur Plant, he added that continued use of the services of ISCON in some form was not ruled out. In fact, tenderers had been asked to give their quotations individually and through ISCON in order to ascertain the financial implications of working through a consortium.



MANUFACTURE OF SYNTHETIC FIBRES

The impending shortage of raw cotton vis-a-vis the expanding home and export demand for manufactured textiles has, it seems, forced the Government to issue licences to more and more units for the manufacture of various synthetic fibres which could be woven either with raw cotton or wool or separately, to give the appearance of textiles made from cotton, wool or silk. Manjushree Industries Limited, has for instance, been licensed to manufacture rayon pulp from natural gas in Assam. This material can be woven by itself or by mixing it with cotton or rayon to give the look of woollen fabrics. The capacity of this unit would be 54,000 lbs. a year. Foreign collaboration for it is likely to be secured from a Japanese firm. Another concern, Mariwallas, is also being licensed to produce synthetic fibre from castor oil with technical assistance from a French firm. The Imperial Chemical Industries has already been licensed to manufacture Terylene. There are several other schemes too (given below) which have been approved with the same end in view. By 1966, it is estimated that this industry will be producing something like 250 million lbs. of synthetic fibres.

(In '000 lbs.)

Company	Unit to be located at	Capacity licensed
(1) Gwalior Rayons	Mysore	45,000
(2) Greater Mysore Rayons Grade Pulp and Paper Mills, Bangalore	Mysore	30,000

OF GREAT INTEREST TO INDIAN ECONOMISTS AND STUDENTS

This publication is the product of the rich experience of successful planning in the USSR, planning that has ensured the economic and cultural advance at a pace unprecedented in history.

The author deals with the main questions of organisation of planning in the Soviet Union, the tasks and functions of planning agencies, the general principles of drafting plans and the system of their target.

The book also describes the methods of drafting plans and analysing and controlling their fulfilment, using as an illustration chiefly the central section of the national economic plan and industry.

Valuable handbook on the principles of planning !

(9) J.K. Cotton Spg. & Wvg. Mills Co. Ltd., ...	Kanpur	3,000
(10) Purshotam Lal Jhunjhunwala, Bombay	Maharashtra	3,600
(11) National Rayons, Bombay	Mysore	30,000

VISCOSE FILAMENT

The following schemes have been cleared by the Government for the manufacture of Viscose Filament:

Unit	Existing Capacity	Capacity after scheme has been completed (m. lb.)
Indian Rayons Corporation, (Gujarat)	—	8.0
South India Viscose Ltd.(Madras)	—	8.0
Baroda Rayons (Gujarat)	—	6.0
Century Rayons (Maharashtra)	9.6	14.9
J. K. Rayons (Corporation (Kanpur)	4.0	8.0
Travancore Rayons (Kerala)	7.2	11.2

ACETATE FILAMENT

Three schemes, involving a total capacity of 15 million lbs. per annum, have been recently licensed or recommended for grant of licences for the manufacture of acetate filament. They are:

(1) **Sirsilk's** scheme to expand its existing capacity from 4 million lbs. to 8 million lbs. per annum.

(2) **Modi Spinning and Weaving Mills'** plan to set up an acetate rayon plant at Modinagar (U.P.) with a capacity to produce 8 million lbs. of acetate filament.

(3) **Modern Mills'** scheme recommended for the grant of a licence, to spin 3 million lbs. of acetate yarn from indigenous collulose acetate flakes proposed to be manufactured by a sister concern of this company. The plant is proposed to be located at Harihar, in Mysore.

After the implementation of these schemes, the total capacity to produce acetate filament in the country will go up to 19 million lbs.

CUPRAMMONIUM AND SYNTHETICS FROM NYLON SALTS

Licences have also been issued for the manufacture of Cuprammonium for the first time in the country to (i) **Modern Mills Ltd.** for setting up a new unit at Harihar, in Mysore, with an annual capacity of 5 million lbs., and to (ii) **Swadeshi Cotton Mills** for putting up a plant at Bangalore with a capacity of 8 million lbs. per annum. Out of these, the Capital Goods Committee has so far agreed to the release of foreign exchange for the scheme of Modern Mills Ltd. On the implementation of these schemes, the capacity for the manufacture of cuprammonium will be 13 million lbs.

With a view to encourage the manufacture of certain Synthetics from nylon salts, which are to be produced for the first time in the country, a number of schemes have been licensed or recommended for grant of licences. They are:

Unit	Location	Annual Capacity (Million lbs.)
(1) J. K. Investment Trust Ltd.	Rajasthan	0.48
(2) Manubhai Industries Ltd.	Maharastra	5.00
(3) Century Rayons Co,, Ltd.	Maharastra	1.60
(4) Prabhulal Bhikhabhai & Co.	Gujarat	4.00
(5) Arthur Import & Export Co.	Maharastra	2.35

Of these, the scheme of J. K. Investment, Century Rayons and Arthur Import and Export Co. will be based on imported nylon salts, while those of Nanubhai Industries and Prabhulal Bhikhabhai envisage also the production of nylon salt, namely caprolactum, from indigenous raw materials.

STAPLE FIBRE

Two new units with a total annual capacity of 9 million lbs. have been given licences for the manufacture of staple fibre. They are: (i) **South India Viscose** Ltd., to manufacture 8 million lbs. of viscose staple fibre at Mettupalayam in Madras. This scheme is already under implementation.

(ii) **Modern Mills,** to manufacture one million lbs. of acetate staple fibre from cellulose acetate flakes at Harihar, Mysore. The scheme is yet to be cleared by the Capital Goods Committee for import of plant and equipment.

On the completion of these schemes, the total capacity for the manufacture of the staple fibre will increase from 48 million lbs. to 57 million lbs.

RAISING COAL OUTPUT

The Union Government has tentatively accepted the offer of the private sector coal industry to raise another 7 million tons of coal during the Third Plan period, besides the target stipulated for it in the Plan documents. The offer, it is learnt, has been accepted in view of the World Bank loans made available for this purpose.

The Third Plan coal target as it stands today is 97 million tons, representing an increase of 37 million tons over the Second Plan target. Of the additional raisings, the private sector was originally envisaged to produce 17 million tons, while the rest of them were to be in the public sector. As a sequel to the acceptance of the private sector's offer, the Government is considering whether the Third Plan coal target should be increased from 97 million tons to 104 million tons.

The target may even be raised further if the plans of the West Bengal Government to open up new mines in its area materialise. In the past few weeks, Mr. K. D. Malaviya, the Union Minister for Mines and Fuel, has had talks with the West Bengal Chief Minister, Dr. B. C. Roy, on this issue, which emanated out of the recent controversy over licensing of new mines by the West Bengal Government for development by the National Coal Development Corporation. The West Bengal Government is understood to have a programme to raise 14 million tons of coal during the Third Plan period with a view to ensure adequate supplies of this vital fuel to the coal-based industries in this State.

Details of this proposal, understood to have been approved of in principle by the Minister for Mines and

Fuel, are being looked into by the Planning Commission, especially in respect of its financial implications; if the proposal is accepted by the Planning Commission, it would involve additional Central assistance to the State. In respect of setting up an agency to undertake this job, the proposal is to establish a new public sector enterprise in which the West Bengal Government and the National Coal Development Corporation will have interest. Technical collaboration for the job is proposed to be obtained from Poland.

The promised marginal increase in coal prices is expected to be announced by the Mines and Fuel Ministry shortly. The Ministry is also understood to be examining in details the proposal to move coal by inland transport.

ASSISTANCE FOR REMOVAL OF OVERBURDEN: COAL BOARD'S SCHEME

Meanwhile, the Coal Board has worked out principles governing the grant of assistance for removal of overburden for quarrying out coal.

A mine will be entitled to assistance if the coal won by open-cast mining is of grade I or higher quality and the recovery of such coal is not possible with reasonable economy by underground mining.

The ratio of overburden to coal is another factor that is to be taken into account before assistance is granted. It is also necessary that the output of coal from the mine is 5,000 tons or more per month from quarrying operations.

It is further necessary that for ascertaining the cost, the applicant invites open tenders and reports to the Coal Board which alone would determine what cost it should admit for the purpose of assistance.

The margin of profit on coal won by quarrying should be less than Rs. 1.75 nP. per ton and the assistance to be paid by the Board shall be limited to allow the owner etc., of a mine a profit of Rs. 1.75 nP. per ton on such quarried out coal. The margin of Rs. 1.75 nP. should be calculated not on the overall cost of the coal company or producer, but that of a particular area where open-cast mining would be taken up.

Payment shall be made for an area of the quarry for which previous approval of the Board has been obtained and on the quantity of coal actually despatched.

ROAD TRANSPORT

In pursuance of its policy that the nationalised road transport undertakings in the States should be run through Road Transport Corporations, in which the State Governments concerned, the Central Government and, if possible, the private operators, may participate, the Union Government has advised the State Governments to set up Road Transport Corporations for the management of State road transport undertakings. Such Corporations hve already been set up in Andhra Pradesh, Bihar, Gujarat, Maharashtra, Mysore, Punjab and West Bengal. The Government of Madhya Pradesh and the Tripura Administration propose to bring into existence such Corporations in the near future. The Governments of Uttar Pradesh and Rajasthan are also said to be giving due consideration to this proposition. The Madras Government will be considering the question when it takes up large-scale expansion of nationalised road transport services. The Government of Assam and Orissa, however, have stated that they do not propose to set up Road Transport Corporations in their States.

PIPELINES TO GIVE RELIEF TO RAILWAYS

In order to give relief to the railways, the Government of India has under consideration construction of a number of pipelines for the transport of petroleum products, crue oil and gas. Three of these will be products pipelines, two will be crude oil pipelines and another three gas pipelines.

The products pipelines proposed to be constructed are: (i) Calcutta-Barauni-Delhi pipeline, having an initial capacity to transport 1.5 million metric tons of white products per annum; (2) Gauhati-Siliguri pipeline, having an initial capacity to carry about 5,00,000 metric tons of white products a year; and (3) Koyali-Ahmedabad pipeline, having an initial carrying capacity of about 6,00,000 tons of oil products annually.

The two crude oil pipelines proposed to be laid are the Ankleshwar-Koyali pipeline and the Kalol-Koyali pipeline. Each will be designed to initially transport one million metric tons of crude per annum.

The three gas pipelines will be Ankleshwar-Uttran, Cambay-Dhuvaran and Kalol-Ahmedabad pipelines. They will be designed to carry initially about one million cubic metres of gas daily.

The technical, economic and other aspects of these schemes, which have a bearing on rail transport, and also the quantum of relief to be provided to the railways in consequence thereof, are being studied by the Government.

GINGERING UP ADMINISTRATION OF PUBLIC SECTOR ENTERPRISES

The Minister and the Secretary for Heavy Industries, Mr. C. Subramaniam and Mr. T. Swaminathan, last week paid their first visit to Heavy Electricals, Bhopal, to see for themselves the reasons for slow production at this public sector enterprise. As a result of their visit, a number of steps are envisaged to be taken, which should go some way in stepping up production at this unit, as also in the other public sector enterprises. The first step contemplated is to speed up imports of raw materials and spare parts of these units.

In order to deal with the growing indiscipline and inefficiency of labour in public sector enterprises, an incentive scheme is proposed to be introduced in these units linking wages with production. Instructions, it is said, are being issued to deal promptly with labour grievances, real or imaginary. Contractors employing labour are also to be asked to provide houses (with adequate amenities) to their labour force in terms of their contracts.

The Government is also not oblivious of the fact that one of the biggest bottlenecks in the way of industrial expansion in the country is the paucity of trained designers. The training arrangements at engineering colleges are proposed to be overhauled to bring them in line with similar arrangements at such institutes in the West.

In order to resolve the transport problem faced by some of the private sector heavy industrial units, the Union Ministry of Heavy Industries has suggested that big industrial units, such as the cement factories, should own and operate their own road transport.

panies and the Government authorities which are administratively concerned with the working of Government companies in the various States and in the Central Government, there were 154 Government companies at work in the country at the end of the financial year 1961-62. The new class of Government companies, for the first time, came to be statutorily recognised in this country under the Companies Act, 1956. Since the introduction of this distinction in the corporate economy of the country on April 1, 1956, when the present Companies Act came into force, 106 new Government companies were formed upto the end of the financial year 1961-62. Of these, after amalgamations and liquidations etc., 98 new companies were reported to be working at the end of this period. Of the total 154 Government companies at work, 20 companies belonged to the First Plan period, 79 to the Second Plan period and 19 to the first year of the Third Plan.

It is further revealed that in the total, 37 Government companies were exclusively owned and run by the Central Government, whereas 14 companies were jointly owned by the Central Government and other participants with the administrative control thereof or majority shares therein vested in the Central Government. Thus, the total number of Central Government companies at the end of 1961-62 was 51. The remaining 103 were the State Governments' undertakings.

The first five biggest Government companies working at present are the Hindustan Steel Ltd., the Neyveli Lignite Corporation of India Ltd.; the Fertilizer Corporation of India Ltd.; the National Coal Development Corporation Ltd., and Heavy Electricals (India) Ltd. The paid-up capital of each of these companies exceeds Rs. 20 crores.

APPOINTMENT OF DIRECTORS IN LIMITED COMPANIES

The Department of Company Law Administration has called for strict compliance with the provisions of the Companies Act, whereby relatives of directors cannot be appointed to offices or places of profit without a special resolution of the company. Such appointments, a press note issued by the Company Law Administration states, cannot be regularised by subsequent resolutions; the office has to be vacated from the first day of contravention, under Section 314(2), and any monetary benefit received has to be refunded.

In some private limited companies, the press note adds, relatives of directors have been appointed to offices or places of profit carrying a monthly salary of over Rs. 500 without obtaining the previous consent of the company through a special resolution. Instances have also been noticed of directors themselves being paid remuneration in terms of salaries, perquisites etc., over and above the remuneration to which they are ordinarily entitled, viz., sitting fees, without similar prior consent. Some companies have sought to regularise such cases subsequently, by passing special resolutions according retrospective consent. This, it is pointed out, is not in conformity with Section 314 of the Companies Act, which applies equally to public and private limited companies.

INDO-PAKISTAN TRADE

As a result of the trade talks held here between India and Pakistan last week, India will be importing one lakh bales of Pakistani long-staple cotton, valued at Rs. 5 crores during the current year. Supplies to the extent of Rs. 2.1 crores would be under the Rupee Payments Arrangement and the rest against convertible foreign exchange. On a similar basis, Pakistan will be importing coal from India to the tune of 15.6 lakh tons.

India's jute imports from Pakistan are to be cut down from Rs. 1 crore worth of supplies in 1961-62 to Rs. 40 lakhs worth during the current year.

According to a joint communique issued at the end of the talks, it has been agreed that the unutilised amounts of the ceilings of the last two years under the Special Payments Arrangement should be carried over into the third year of the operation of the current Indo-Pakistan Trade Agreement. In addition, the ceilings fixed under this Arrangement for the third year are: Rs. 40 lakhs for import of fruits by each country; Rs. 210 lakhs for import of cotton and Rs. 40 lakhs for import of jute cuttings by India; Rs. 180 lakhs for import of coal by Pakistan; Rs. 70 lakhs for import of iron and steel items, biri leaves, railway material, cement etc., by Pakistan; and Rs. 115 lakhs for import of miscellaneous commodities by each country.

Trade under the Rupee Payments Arrangement between the two countries during the current year (ending March, 1963) is, thus, likely to be of the order of Rs. 4.05 crores, as against Rs. 4.1 crores in 1961-62. The slight reduction in this trade is due to the removal of items like livestock from the agreement. The total trade between the two countries, which has been nearly Rs. 16 crores in 1961-62, is, however, expected to go up slightly this year.

INDO-TIBETAN TRADE

With the non-renewal of the 1954 Sino-Indian Agreement on Trade and General Relations between India and the Tibetan region of China, the Government of India is stated to have decided to close down its three trade agencies situated at Yatung, Gyantse and Gartok in Tibet. The three trade agencies maintained by China at Kalimpong, Calcutta and New Delhi are similarly to close down.

The movement of border traders between Tibet and India and of pilgrims from one country to the other is

The Third Five Year Plan
Bird-Heilgers' part in it...

Rs. 1900 CRORES FOREIGN EXCHANGE BILL FOR THE THIRD PLAN

The foreign exchange bill for the Third Plan is the highest ever—more than Rs. 1900 crores. Clearly, the economy's pressing need is to find means of earning and saving more foreign currency. To bring this about, the Third Plan is implementing a clear-cut policy: stepping-up exports, cutting down imports. To stimulate exports, controls on most products have been relaxed, export duties abolished or reduced, promotion councils set up and trade agreements concluded with 25 countries.

Export—a priority with Bird-Heilgers

Among export commodities, jute is high on the list of the Plan's priorities—and tops the list of Bird-Heilgers exporting activities. Between 1957 and 1961 the group's exports of jute earned well over Rs. 94 crores—a significant addition to India's foreign exchange earnings. During the Third Plan, the group hopes to better this effort by intensifying and widening the scope of its export drive.

Towards a self-generating economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...earn and conserve foreign exchange...join the national drive to economic independence.

likely to be adversely affected as a result of the expiry of this agreement. A detailed announcement regarding certain arrangements which the Government of India intends to make in this respect is expected to be made shortly.

IMPORT OF GAS TURBINE GENERATING UNITS

The following seven applications for the grant of import licences for gas turbine generating units are under examination of the Union Government:

Particulars of the Import Proposal	Name of the State Electricity Board/Government
(1) One 9,000 kw Hydel Set	Assam State Electricity Board (Umiam Project)
(2) Twelve units 150 KVA each	Mysore State Electricity Board.
(3) One 700 KVA set	Punjab State Electricity Board.
(4) Two units 150 KVA each	Jammu and Kashmir Government.
(5) Two units 688 kw. each	
(6) Two unit 360 kw. each	Arsam State Electricity Board.
(7) Six units 250 kw each	Rajasthan State Electricity. Board.

Yen Credit is assued in respect of the 9,000 kw. Hydel set applied for by the Assam, State Electricity Board for the Umiam Project.

TENDERS FOR SINTERING PLANT AT ROURKELA

The following firms have submitted tenders for the sintering plant at Rourkela:

1. Messrs. Simon Carves Limited, London.
2. Messrs. Koppers Export, GMBH, Germany.
3. Messrs. Head Wrightson Iron and Steel Works, England.
4. Messrs. Lurgi-Krupp, West Germany.
5. Messrs. G.H.H., West Germany.
6. Messrs. McDowell Company Inc., U.S.A.
7. Messrs. Gammon India Private Limited India.

The total value of the contract is Rs. 37.67 million, excluding the cost of spares.

TWO MORE MINISTERS AT THE CENTRE

Two more ministers have been appointed at the Centre. One of them, Mr. T. T. Krishnamachari, will be of Cabinet rank, and the other, Mr. Prakash Chandra Sethi, of the status of a Deputy Minister. No portfolio has been assigned to Mr. T. T. Krishnamachari. His main task for the present will be co-ordination of the Union Government economic activities. Mr. Sethi will be attached to the Ministry of Steel and Heavy Industries

IMPORT OF LUXURY TOURIST CARS

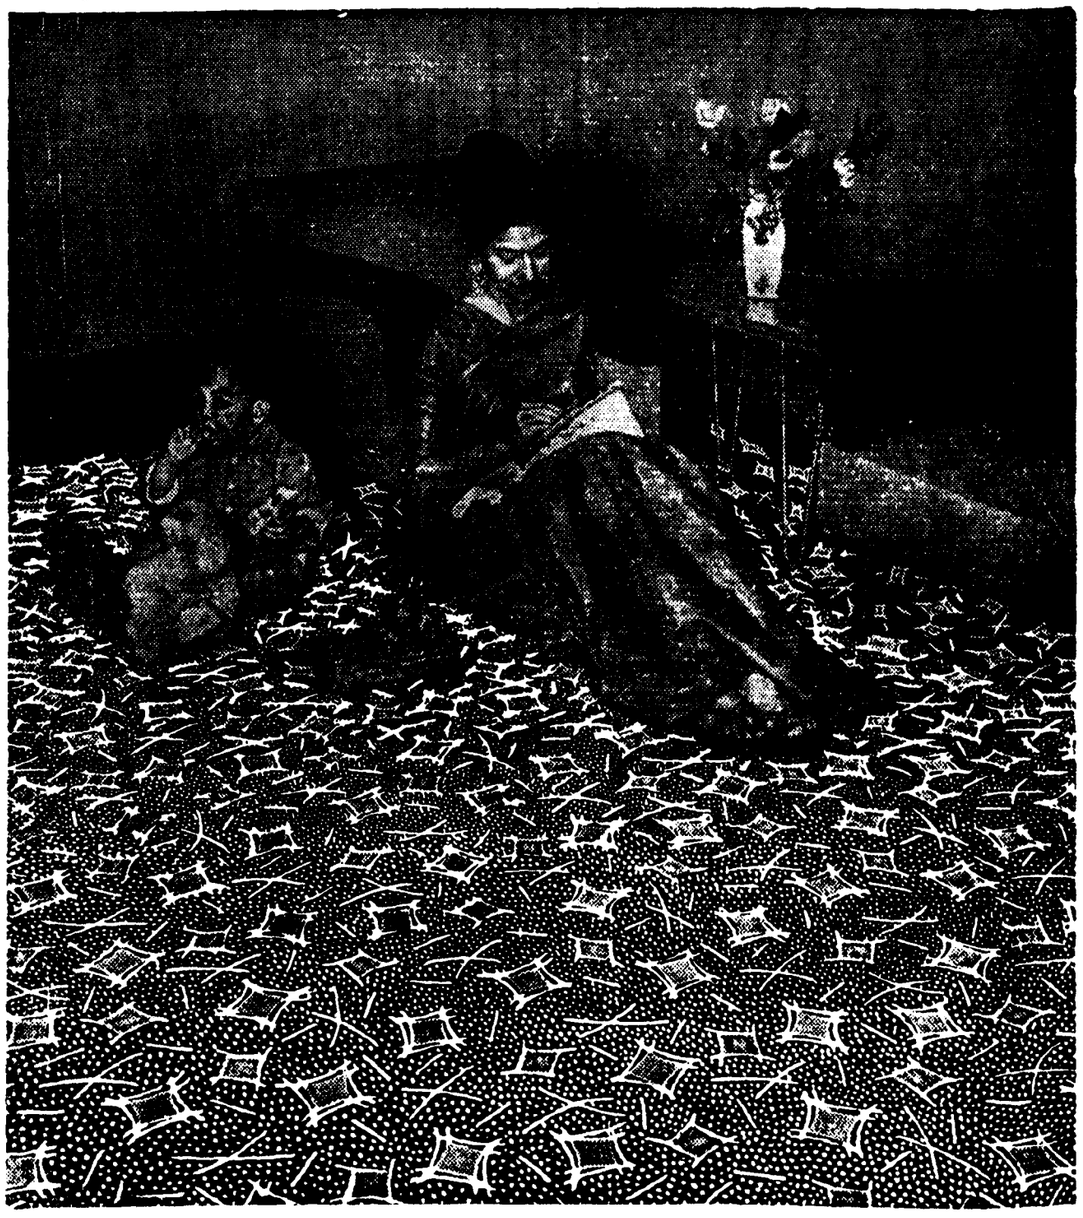
Air India is negotiating a barter agreement with the Chrysler Corporation, a U.S. firm, for the import of luxury tourist cars.

The Corporation will utilise the Trans-Atlantic flights of Air India. In exchange, Air India will receive luxury cars which will be allotted to travel agents and others by the Department of Tourism.

IN BRIEF....

As many as 18,025 box wagons—1,468 for meeting the coal requirements of the steel plants and 16,557 for carrying the coal traffic of other consumers—are required by the end of the Third Plan period. The present production is about 450 wagons per month.

•



The West Coast Road which will pass through the States of Maharashtra, Mysore and Kerala, is likely to be completed by the end of the Third Plan, it is learnt. When developed, it will provide all-weather road communication from Panvel in Maharashtra to Chaeliseri in Kerala. The total length of the road will be 723 miles.

•

One month's general extension has been given for the submission of returns of their incomes by assesses of income-tax.

THE VERSATILE FLOORCOVERING

INDIA LINOLEUMS LTD. 14 Radhabazar Lane, Calcutta-1

COMPANY AFFAIRS

INDO-BURMAH PETROLEUM

The directors of Indo-Burmah Petroleum Company Ltd. in their annual report for the year December 31, 1961 have complained that in spite of increased sales in all branch territories there has been a lower margin of profits and this they thought was likely to continue in the near future. During the year their sale proceeds for instance were to the tune of Rs. 1.89 crores, a figure considerably higher than the last year's Rs. 1.77 crores. The balance in the form of profit before taxation however was Rs. 63.36 lakhs which was considerably below the previous year's figure of over Rs. 1 crore. The directors have recommended the allocation of Rs. 31.32 lakhs towards taxation, one lakh towards provision of terminal gratuities to staff and Rs. 2 lakhs towards general reserves. The directors recommended the payment of Re. 1 per share as interim dividend on ordinary shares which absorbed Rs. 10 lakhs. Now they have recommended the payment of final dividend at the rate of Rs. 1.50 per share subject to tax which will absorb Rs. 15 lakhs. A sum of Rs. 5.0 lakhs is carried forward.

CALTEX

The directors' report of Caltex Oil Refining (India) Ltd. for the year 1961 shows that the company was able to process 7.4 million barrels of crude oil as against 6.5 million barrels a year before which naturally resulted in higher incomes. This Company also seems to have reduced its profit margin. The directors have communicated that during the later half of year 1961 the Government of India placed restrictions on the importation of crude oil which did not allow the Company to operate to their maximum capacity. On account of their restrictions the Company will now have to reduce the amount of crude processed by at least 12 per cent. The directors add, however, that they are trying to persuade the Government to relax this restriction.

The refinery operations for the year under review resulted in a profit of Rs. 1.11 crores. The directors recommended the net profit for the year to be carried forward and, therefore, declared no dividends. This was considered essential because the Company expects to expand its activity and the profit amount has been reinvested.

The directors also mentioned that their application to the Controller of Capital Issues for the assurance of preference share capital in the amount of Rs. 150 lakhs was still pending. They have also applied to the Ministry of Commerce and Industry for licences to manufacture LPG and Naphtha. This is the fifth year of their operation and fourth year of full production and the refinery, it seems, has made considerable progress.

ANDHRA CEMENT

The production during the year 1961 of cement in the Andhra Cement Company Ltd. suffered due to various factors and the main bottleneck being the continuing short supplies of coal. The supplies received by sea-cum-rail route as in the case of the factories in South was not extended to this unit. Arrangements by rail routes were not very certain. The working results were also affected due to rising cost of raw materials and the directors have communicated that in spite of the recommendations of the Tariff Commission to give the revised price with retrospective effect the Government of India did not accept it and the revised price was made applicable from November 1, 1961. The directors hoped that the Government would provide adequate facilities for supply of required quantities of coal for achieving production to full capacity.

The Company's operation during the year resulted in a net profit of Rs. 10.82 lakhs after making provision for taxation and for development rebate reserve. The directors proposed the payment of dividend at the rate of 10 per cent on ordinary shares subject to tax which will absorb Rs. 7.10 lakhs.

HINDUSTAN LEVER

The Hindustan Lever Limited, the directors report, has completed the posting of bonus shares in pursuance of the resolution passed at the Annual General Meeting held recently. The Company decided to issue 12 bonus shares for every 25 ordinary shares held by their shareholders, by the capitalisation of certain reserves. It was proposed that the new ordinary shares be allotted to the holders of existing shares registered in the books of the Company as at the close of business on 10th May, 1962.

The entire lot of about 17,350 certificates was posted to approximately 14,000 shareholders all over the country by May 29, thus completing the operation in five days.

CAPITAL ISSUES

Recently the following new issues have been sanctioned by the Controller of Capital Issues.

Orissa Mining Corporation Ltd., Bhubaneswar, a State-owned enterprise has been granted consent to the issue of 6½ per cent debentures of the value of Rs. 1.00 crore to be issued for cash at par privately. The proceeds will be utilised for exploitation of the mineral resources in the State. The present paid up capital of Rs. 50 lakhs is in equity shares.

Hindustan Photo Films Mfg. Co. Ltd., Madras, wholly owned by the Central Government, engaged in the manufacture of raw films for cinema industry, X-ray and roll films, is to issue further equity capital of Rs. 20 lakhs to be subscribed by the Central Government for cash at par. The Company's paid-up capital is Rs. 60 lakhs.

The Central India Spg. Wvg. & Mfg. Co. Ltd., Bombay, having a paid up capital of Rs. 96,87,500 is issuing further capital of Rs. 46,87,500 divided into 46,875 equity shares of Rs. 100 each as 'right' in the ratio of 1 : 1 to their existing shareholders, for cash at par. The money will be used partly for financing renovation and rehabilitation of the mill and partly for repaying temporary loans.

Tata Robins-Fraser Limited, Bihar, is issuing Rs. 60 lakhs equity capital in shares of Rs. 100 each to be issued for cash at par. Out of this 49 per cent will be subscribed by Hewitt-Robins Inc., U.S.A., and Fraser and Chalmere Engineering Works of the G.E.C. of England, and the remaining 51 per cent will be subscribed by Tata Iron & Steel Co. Ltd., and A.C.C. Ltd.

Sikands Limited, Delhi, a public company to be established for the manufacture of high tensile fasteners for Automobiles, Jeeps, Tractors, etc., has been given consent to issue capital of Rs. 30 lakhs divided into equity shares of Rs. 100 each, for cash at par.

Meeting the Emergency

IT cannot be disputed that the ultra-austerity which was imposed by the Finance Minister last Friday on the rationing of foreign exchange was an unavoidable necessity. A state of emergency has arisen in the nation's economy which has thrown up a big challenge. It can be met by emergency measures alone. This is precisely what Mr. Desai has done in applying the axe ruthlessly to the outlay on imports in the current year — whether the outlay is intended for goods or services. It is in this sense that the curbs on import licences of all discriptions for the needs of the private sector or the public sector as well as the severe restrictions clamped on foreign travel are to be interpreted. They are to be borne as a supreme and overriding national necessity with the implicit faith that they will be retained not a not a day longer than the emergency.

A forewarning of the deterioration in the condition of the foreign reserves was available long before last Friday. Week after week the sterling balances — the mainstay of our total external reserves — disclosed a sharp downward trend. Between the beginning of April this year and the end of May, there was a substantial depletion of something like Rs. 28 crores, pushing the balances to the margin of Rs. 100 crores. Barely Rs. 15 crores can now be drawn upon and a resort to the remedy of reducing the minimum limit of foreign securities, forming a part of the currency reserve, below the statutory normal point of Rs. 85 crores, permissible as an exceptional measure, seems inadvisable at this junction. The elbow-room it may provide may exact a high price in terms of a pressure on the effective cost of imports.

This decline in the balances took place during the busy season. With the onset of the slack season this month, the prospect of replenishing the foreign resrves by means of our own earnings is bleak. The proper instrument to tackle the obligation of external payments maturing in the very near future is to obtain credits from friendly countries. Britain has virtually agreed to supply a loan of $24 million as an advance (to be freely usable) from her aid for the current year. West Germany is likely to extend co-operation on the same terms. The IMF line of credit is thus put off.

What makes the difficulties of foreign exchange assume the dimensions of an emergency for some time is the uncertainty that attaches to the final and revised amounts of credits which the non-American member countries of the Aid-India Consortium may decide to offer. It is a sort of an impasse which has arisen in the Consortium's allocation of assitance for the current financial year. The gap which will need to be filled before the aggregate contributions of the non-American members are raised to a matching level with America's offer of $500 million is as wide as $220 million (Rs. 105 crores) — nearly four-fifth of what they tentatively proposed in June last year. One-third of it can be narrowed down by higher credits from the rest of the members excluding America, according to hints thorwn at the last meeting of the Consortium in May. But the uncertainty about closing the residuary gap of Rs. 75 crores has accentuated the emergency and made it co-existensive with this uncertainty.

It is somewhat ironical that import licensing which was put on a liberalised basis of a yearly period only three months back should now be subjected to austere cuts. The cut in the established importers' licences is to be the heaviest at 50 per cent and so will it be for the licences issued to the consumer co-operatives. But the latter has a minor place in the total scale of the import trade. Actual users' licences are to be axed by 15 per cent. Considering their importance to maintenance imports, this threatens to be a sharp cut. There is the promise that individual classes of cases will be considered on merit. The pruning must be judicious. The review which is to be made at the end of the half year towards the close of September will be conditioned by the extent to which the gap in the Consortium's aid will be wiped out. The cuts are bound to react on production and prices, but their impact can be tempered.

The Reserve Bank has taken the proper course in plugging the loopholes in expenditure on foreign travel — part of which cannot be justified on the ground of essentiality. But great hardship would result from applying the identical yardstick to all seekers of permission to go abroad. Businessmen going overseas to negotiate deals connected with development programmes or promotion of exports ought to be treated with consideration by the Reserve Bank in the process of granting its discretionary clearance.

The Change in Pakistan

FRIDAY, June 8, saw yet another turning point in the constitutional life of Pakistan. On that day martial law was vacated and with it the military regime was terminated. The National Assembly, elected by indirect vote, was inaugurated as a logical sequence to the withdrawal of military rule. Between October 7, 1958, when the army captured power and the constitution was abrogated and June 8, 1962, when the federal legislature was set up under the new constitution (promulgated on March 1 this year) there was a long interval of forty-four months. President Ayub Khan will continue to be in the saddle until August 1965, when the first presidential election under the new constitution will be held. Basic democracy is a creature of his creation and the extended tenure of three years which he now gets will be used assiduously for giving a concrete shape to his philosophy as also for guiding the course of the new democracy in its infancy.

President Ayub Khan never made a secret of his contempt for political parties and of his confirmed disapproval of the parliamentary system of government which is based on the existence of political parties in the legislature. But the presidential system too presumes the existence of political parties and it is here that the Field-Marshal's dilemma arises. The genesis of his dislike for political parties in Pakistan can be readily appreciated and the abhorrence which he feels for self-seeking and opportunistic group alignments masquerading as political alliances can be understood. But no national leader, much less one who pilots the ship of State,

can countenance loss of faith in the destiny of his people and even if the parties in Pakistan behaved in the way they did, hope of their revival in a clean and healthy form cannot be abandoned.

The ban on the political parties in Pakistan continues, but it will need to be lifted sooner or later. President Ayub Khan's inaugural speech at the National Assembly reveals his confusion of mind how and in what form the revival should be allowed. This problem is to be taken up for solution some time and the Bill for this purpose, to be placed before the National Assembly, is likely to undergo substantial modifications which may eventually assign to the parties a diminished stature. In the meantime, the Preisdent and his Ministers intend to keep contacts with individuals and groups (what these groups are is not clear in the context of the ban on the parties) for their reactions to the government's policies and administrative programmes.

A good part of President Ayub Khan's inaugural address was devoted to the problem raised by the propaganda for the restoration of the parliamentary system of government. This was clearly a firm retort and warning to its sponsors in East Pakistan who smell authoritarianism in the presidential system which the constitution has given — a system with vital differences from the American prototype. He was certainly right in issuing the warning against the background of his country's bitter experience before the military regime, when the party system was reduced to a travesty and shifting alliances, eager to grab power, made instability a chronic source of the weakness of the government.

His plain warning was that the members of the National Assembly, who swear allegiance to the constitution, cannot do so with basic mental reservations and they must give the new constitution a fair trial before the question of its reform and amendment could be allowed. A fair trial to the new constitution was necessary to ensure first and last a strong and stable government. But a major difficulty posed here is that strength and stability ought to be derived from the consent of the people. The military regime's tenure of three and a half years — relatively quite long for a government in the history of Pakistan — eventually showed that consent is not necessarily attracted by the display of force made by the Government from the top.

Field-Marshal Ayub Khan has ended the regime of martial law in Pakistan and introduced a new chapter in its constitutional history. He has opted for the presidential system of government. But the reserves of power earmarked for the President are too large and they are set apart at the cost of the powers that belong to the legislature in a democracy. The power of the purse is a major illustration. The National Assembly's control of the budget has been curtailed at key points. Like the legislature, the judiciary has had limitations placed on it. It is not competent to declare certain legislation passed by the National Assembly as *ultra vires*. And the federal legislature in Pakistan is unicameral without the sobering influence of the Upper House. Nor are the fundamental rights made justiciable.

The variations from the prototype affect strategic constitutional checks. The numerous committees of the two Houses of Congress in the United States provide a potential mechanism to keep a jealous watch on the executive, armed as they are with powers to subject to searching examinations persons at different levels, including in particular the Secretaries nominated to his cabinet by the President. And the Committees wield great influence on the Administration and its policies. This scafeguard is absent in Pakistan. Pakistan's departure from the military regime has not amounted to a full-scale departure from authoritarianism.

Labour Policy

THE Labour Minister, Mr. Gulzari Lal Nanda, made a sober and balanced assessment of the labour situation and labour policies while replying to the debate, in the Lok Sabha, on the grants to his Ministry. An encouraging feature of his reply was that he acknowledged all the shortcomings from which the labour policy in the country suffered and assured the House that a sincere effort would be made to rectify them. This is indeed a very welcome assurance, but the political undertones make optimism difficult to entertain.

The problem of increased wages for labour has plagued almost all the industries in the country, the root cause of the unrest being the rising trend in prices over which the employers have no control. While all right-thinking employers would like to give better wages to labour, the hard fact relating to the incapacity of particular industries to pay becomes a stumbling block. Rightly Mr. Nanda stated that one of the limitations in the way of increasing wages was "how far the economy of the country in its present stage of development could bear additional burden". The viewpoint consistently put forward by industry all along is being acknowledged by the Labour Minister at long last. Until the economy continued to expand and inflation was curbed reasonably, better wages and more employment could not be provided.

One of the irresponsible suggestions made from the Opposition Benches was that all the dividends paid by the industries should be frozen and distributed amongst the workers. The Minister for Labour made a very fitting and realistic reply to this point. He said that according to his calculations if all the dividends were taken, reduced to a half and distributed amongst the workers, the increase in the workers' wages would not be more than 7 or 8 per cent. Surely this order of rise in the wages of the workers could be brought about by better techniques of production instead of playing havoc with the corporate sector of industry by searing away capital. All such suggestions emanate from quarters which seem to have shut their eyes to the needs of increased production which alone can sustain wages and employment at a high level.

In the last few years, the Government has been accused of adopting a double standard in evolving a labour policy for the public sector undertakings entirely different from that applicable to the private sector units. Critics in the Lok Sabha even went to the extent of stating that there was no labour policy applicable to the public sector undertakings. Mr. Nanda maintained that there was a labour policy for the public sector undertakings as well and it had been applied "progressively to the public sector units. He was honest enough to acknowledge that there were some deficiencies in the application of this policy. In particular, the code of discipline had not been applied to all the public sector units and he was taking measures to see that it was applied soon.

Only the other day, Mr. C. Subramaniam, Minister for Steel and Heavy Industries, categorically stated on the floor of the House that there was no labour policy for the public sector undertakings and that on his initiative, the Labour Minister had set up a departmental sub-committee for this purpose. This statement ran counter to Mr. Nanda's declaration. In any case, it is apparent from the strikes which ensued in Bhopal at the Heavy Electricals and in Rourkela in the Steel Mill that the public sector units have not come under any definite labour policy and some decisions were taken in these cases under pressure of the exigencies of the situation. Exigency more than policy seems to guide labour relations in State undertakings

Most of the industrial disputes in 1961 arose due to labour's demands for higher wages. While labour must be provided better wages, the claim for higher wages must be correlated with higher productivity, otherwise the cost structure of the economy would become lopsided. Moreover, it will make most of our exports uncompetitive in the international markets. Another consideration which must be borne in mind in regard to some of the weaker industries is that wages must not be enhanced without reference to the "capacity of the industry to pay". Recent experience has shown that in most of the industries real wages have tended to keep ahead of increase in productivity. There are some industries which are under great pressure because of the increased wage bill, while they do not possess the capacity to meet this bill. Any unrealistic approach in wage policy particularly is likely to harm the economy enormously. One reservation, however, ought to be entered. Where the high pressure of the rising cost of living proves intractable, it would be unfair to make higher wages conditional on productivity.

The Labour Ministry has thus failed, according to the confessions of Mr. Nanda, in keeping down the loss to the nation in production due to strikes and lockouts reckoned at 42 lakhs mandays last year; the discriminatory treatment to the public sector employees as against private sector employees; weak-kneed employment policy tending to increaee the army of the unemployed; and making some of the export industries uncompetitive by reason of higher production costs consequent on intermittent increases in wages.

All the assurances held out by him need to be given a practical shape by a concentrated effort so that they are not reduced to pious hopes. While the country has put faith in the word of the Labour Minister, any further failure on his part is likely to deepen the crisis of production which is already gathering momentuous due to failures at numerous other points.

The Augean Stable

THE delay caused in the implementation of the expansion programmes of the three public sector steel plants and the problems faced by the "sick child" at Rourkela have shown up the Achilles' tendon of the public sector in Indian steel. Replying to the debate on the demands for grants for his Ministry a few days ago, the Union Minister for Steel, Mr. C. Subramaniam, candidly admitted that he could not hold out any promise about achieving the Third Plan production target for steel, although he would endeavour his best to attain it. This has necessitated some feverish thinking on the part of the authorities for the reorganisation of Hindustan Steel Limited, which owns the three steel plants at Bhilai, Durgapur and Rourkela. Indications are that some far-reaching changes are likely to be made in the HSL set-up, both in the interest of speeding up production, particularly at Rourkela, and with a view to cutting down production costs at all the three plants.

Most of the troubles of the Rourkela Plant, which is said to be working to not more than 35 to 40 per cent of its installed capacity, and of the other two units at Durgapur, which is yet to be completed, and at Bhilai, which experienced labour unrest sometime ago, have emanated primarily from the over-centralised control which HSL has exercised. Not only unnecessary and inordinate delays are caused in making crucial decisions, which in the interest of successful working of these enterprises should be arrived at expediously, but the present set-up has led to killing initiative at the plant management level. The plant managers invariably feel helpless in taking even emergency decisions, both financial and administrative, for their powers are clipped by the labyrinthine procedures they have to adopt to get the concurrence of HSL, which, in turn, looks to the Ministry at New Delhi for guidance in all important matters. This entails mountains of correspondence, especially when some technical matter is in dispute, between the Ministry and the plant managements, HSL assuming the role of a mere post office.

In the proposed reorganisation, it is sometimes suggested that Hindustan Steel should be wound up, making the three steel plants fully independent in their working. This, it is argued, would not only help in cutting down undesirable delays but will also provide the much-needed scope for the individual plant managements to break the bottlenecks in their working. But the paucity of experienced personnel to man responsible jobs in a majority of the public sector enterprises, not only steel, obviously renders it an impracticable proposition, howsoever attractive in theory it may appear. Similarly, a number of economies resulting from large-scale operations in respect of procurement of raw materials, machinery and equipment for the expansion programmes of these plants, arranging for training facilities for their personnel etc., warrant some sort of a high-powered supervisory and co-ordinating body consisting of experts. But there is apparently a case for devolution of decision-making authority to the plant managements in a number of matters such as procurement of spares, provision of incentives to the staff and so on. The relaxation of the present limits upto which financial transactions can be entered into by the plant managements themselves and of the centralised control on the recruitment policy in respect of personnel, except at the highest rung, is urgently required. This will incidentally help in cutting off the dead wood in HSL where Parkinson's Law is operating with a vengeance.

The controversy whether the public sector enterprises should be fully autonomous bodies or whether there should be some control over them from the Ministries concerned, of course, will take time to settle. But much can be gained in the meantime if attempts are made to shake off the superfluous procedural formalities. The built-in safeguards in the present methods of work may have some virtues of their own, but invariably they have proved highly costly in the changed circumstances of the country when the public sector in the economy has expanded at a fast rate. Mr. Subramaniam has to proceed with determination in cleansing the Augean stable which the public sector in steel is at present, notwithstanding the relatively satisfactory working of the Bhilai project.

THE WEEK'S NOTES

Comecon

NEW AWARENESS

SCRAPPY REPORTS of the two-day meeting of the Comecon highlight the fact that there is now emerging very fast a new awareness among the member countries of the Council for Mutual Economic Co-operation. The absentees from the Comecon were China, who did not send any observers, and Albania. But a new entrant who joined as a full member was Mangolia. Mangolia's admission to the Comecon is obviously a slap in the face to China and an unmistakable indication that she would be given all the sustenance necessary for her economic march by the other members of the Comecon. The organisational machinery of the Comecon is neither strong at the present time nor has it been built up to a level of perfection where it would function as a powerful agency for co-ordination of the economic policies of the member countries. But the European Common Market right on the door-step has apparently thrown up a serious challenge. A new awareness about reorganising the Comecon is in evidence. This certainly engaged attention at the last session.

The communique issued at the end of the session highlights the urgency of strengthening the role of the Comecon and to produce more concrete results than heretofore. In economic co-operation and in the scientific sphere activities are to be intensified, co-ordination is to be strengthened, trade with the capitalist countries is to be expanded and the new links of aid and trade with the underdeveloped countries are to be fortified.

Curiously enough, there is no reference in the communique — even oblique — to the European Common Market. This does not at all mean that the ECM was ignored. On the contrary, all the indications point to a contrary reaction to the rapidly emerging strength of the ECM. What the communique left unsaid was partially said most vociferously on the Moscow Radio. Appeals were specially made in these propaganda broadcasts to the countries of the Middle East and Africa in particular. The Africans were given a new image of the ECM — that of neo-colonialism — and the Arab countries were told that this was a sinister organisation to shut out their export trade. Even in the short period the effects of the ECM would make their noticeable impact on the industrial exports of Czechoslovakia and East Germany which rely to a considerable extent on the West European markets. But more fundamentally, there is an anxious awareness, based on a deep feeling of apprehension, that the European Economic Community is rapidly rising in stature as a potential economic, and, therefore, political, rival and the prospect would be much harder if America at a later stage joins the Community.

Economic Co-ordination

MR. KRISHNAMACHARI'S ROLE

MR. T. T. KRISHNAMACHARI'S re-entry in the Central Cabinet brings to it a positive accession of strength, a new vigour and dynamism which it would always need. He has accepted responsibility of office without portfolio and this is to accept consciously a heavy responsibility whose outline remains undefined for all time. Conferment of the office of Minister Without Portfolio is reserved as a distinction for talent and administrative ability to respond to the multifarious calls arising from recurring problems. Mr. Krishnamachari's task is that of ensuring economic co-ordination between the policies and administrative actions of the various ministries and this means practically all the ministries.

He has been invited to join the key Cabinet sub-committees for economic affairs, foreign affairs and defence. The economic affairs sub-committee in particular stood in need of revitalisation. Mr. Krishnamachari has been also appointed as a member of the Planning Commission, where he may be called upon to deal immediately with intractable problems which throw up a challenge in the spheres of transport, electric power, coal and steel. All this adds up to a heavy responsibility and there is little doubt that he will show that he possesses shoulers broad enough to bear it.

Finance is unquestionably the crowning Ministry among the Ministries dealing with economic affairs. In a real and effective sense it is the fountain from which other Ministries derive sustenance. What will be required in the relations between the Finance Minister and the Minister Without Portfolio is full, frank and frequent consultation inasmuch as on the fruits of this consultation will depend the effectiveness of co-ordination. Since the frontiers of Mr. Krishnamachari's portfolio are undefined, he has rightly given the indication to proceed with care not to let co-ordination lapse into intervention. It will be the overall co-ordinator's major task not only to co-ordinate but to create a sense of urgency for forward-looking policies, when new challenges are being flung by new hurdles in the execution of the Third Plan.

Laos

INTERIM COALITION

THE NEWS of the agreement between the three Princes on the formation of an interim coalition government in Laos will be greeted with a sigh of relief. The balance of representation in the new coalition has been properly maintained bearing in mind the neutralist or extremist leannigs of the three parties. The neutralists get 7 seats in a cabinet with a total strength of 15, the remaining 8 being distributed equally between the rightist and the leftist parties. Prince Souvanna Phouma is the unanimous choice for the office of Premier, while General Phoumi Nosavan (the strong man of Prince Boun Oum, who has stayed aloof from the cabinet) and Prince Souphanouvong are appointed as Vice-Premiers. Since it is extremely unlikely that the rightists and the leftists can make a common cause on any issue, the possibility of out-voting the majority neutralist bloc is ruled out. Prince Souvanna Phouma's non-partisan temparament and high sense of national unity will be valuable in steering a middle course. The allocation of the portfolios shows trust in the neutralist party. Most of the key portfolios and the two controversial portfolios have been assigned either to Prince Souvanna or his deputies. Thus Defence and Interior, on which General Phoumi Nosavan insisted, have been entrusted to the neutralists and in addition this group keeps other important charges like war veterans and social welfare. General Phomi Nosavan is awarded the key portfolio of Finance, while the Pathet Lao pro-Communist Prince Souphanouvong controls the important Ministries of Information and Planning.

There is unanimity among the three groups that the major problems which will demand satisfactory but patient solutions are the merger of the armies of the three parties, the question of the war prisoners and the holding of a general election. There has been no attempt on the part of the three parties to underestimate the intricate nature of the difficulties involved in these three issues. And it is equally clear that unless the interim coalition in operation gives proof of a real and hearty concord, no agreement will be possible on the merger of the armies and the holding of the general elections.

This is the beginning of the realisation of the goal of a government of national unity set for Laos at the Geneva Conference and it is to be trusted that there will be no intervention to disturb the hard won agreement on the coalition. The Laotion people are pacifists by nature and they would lend their support to a government which would keep their country free from the shocks of the cold war.

A.-I.C.C.

LACK OF ENTHUSIASM

LAST WEEK'S session of the AICC gave further proof, if it was needed, that intrinsic enthusiasm in the work of the AICC's sessions appears to be on the wane. In fact, excitement ought to have been displayed at a time when the successor to the out-going Congress President was to be elected. But the difficulties and hesitations in finding out a candidate of the requisite stature, willing to accept the post, convey their own commentary. The pull of effective power vested in ministerial office is too great to induce men of proved service to the Congress organisation to prefer the presidentship to a ministerial office. And Congress Ministries have been substantially inflated to accommodate too many. Mr. Damodaran Sanjivayya who has been elected as the interim Congress President (and will no doubt be elected for a full term in due course of time) represents certain trends, whose significance, however, has been exaggerated. At 43 he is certainly a young incumbent to hold this office, which once carried very high responsibilities based on effective power. He has never been to jail in the freedom struggle which has normally been insisted upon as one of the major tests for positions of distinction or power in the Congress organisation. As the Press report goes he never saw Mahatmaji. It is questionable whether it could be argued from these trends that youth of a new variety now pilots the destinies of the Congress. The truth of the matter is that the centre of gravity in the organisation rests elsewhere. It is elementary knowledge that the High Command is its respository. It is manned by the old generation.

The Congress has taken the unusual step of making a unilateral decision of putting into practice the principle of not importing party politics into the village panchayats. It is going to refrain from the panchayat elections. The realistic course ought to have been to secure the concurrence of the political parties, both at the all-India and regional levels, with this high principle, which seeks to keep village life free from the contamination of interested and narrow politics. The result of the unilateral decision would be to keep the door open for the other parties to capture power in the panchayats and where this is not possible to leave the panchayatiraj a prey to village factionalism in a majority of cases. It is yet premature to leave panchayat elections and administration without organised guidance.

Maharashtra

MEDIUM OF INSTRUCTION

THE MEDIUM of Instruction (Universities) Committee, under the Chairmanship of Mr. Dongerkery, has brought out its report. The major term of reference prescribed for the Committee was to suggest the measures for the progressive replacement of English by the regional and national languages as the media of instruction at the level of the universities and higher technical as well as other institutions. The Committee has taken a very sensible and objective view of the subject.

The Committee has stated quite categorically that the medium of instruction—whether it is Marathi or Hindi as a substitute for English — should not be prescribed by law. Similarly, no time limit should be fixed for the consummation of this process of substitution. It has urged that the question of a change in the medium should be left to the discretion of the individual universities. It would be wrong to charge the Committee with adopting an escapist attitude. Those in authority in the universities can be trusted not to take either extreme or wayward decisions on this subject. Now that the responsibility has been placed squarely on them, all the universities in the State should proceed in this matter on the basis of consultation and, as far as possible, a concerted policy. This should not pose any difficulties. But what is of great importance is that the National Integration Council has made precisely the same recommendation that the decision on the medium of instruction should be left to the universities themselves.

The Committee's suggestion that in the short run of the transition as well as in the long run the teaching of English should be maintained at a high level and it should also be allowed to be used as a medium of answering the question papers alongside Marathi or Hindi need not really create confusion. Students in the universities or the institutions must not be deprived of the main progressive currents of modern knowledge and progress in science and technology flowing abroad. This would mean learning English as an additional subject even after the medium of instruction is changed over to Marthai and Hindi. But it is a price which the students ought to pay in the interest of quality and standards.

The Committee has urged, as a corollary, that the standard of teaching of English at the secondary education level must be improved. Maharashtra (and Gujarat) have suffered too much from a hasty march of governmental policy in removing English from the curriculum as a compulsory subject at the secondary stage — a policy which has now been reversed, but not before it caused great damage to the student community. There is great wisdom in the Committee's recommendation that the pace of change should be conditioned by the progress in the outturn of text books and reference books of the requisite standards. To this end the universities have been exhorted to pool their resources and expedite the production of this type of basic literature in the regional language.

Naga Escape

ADMONITION?

AMONGST THE Nagas who effected their escape into East Pakistan are suspected to be Mr. Phizo's lieutenants who made their way there on reports of his arrival in that country. The veracity of the reports is immaterial. But a serious aspect of this situation is the failure of security measures by the army in keeping vigilance and preventing the escape. It seems that vigilance had been relaxed. The Prime Minister frankly admitted in the Lok Sabha that the escape was due to a certain lack of co-ordination. In so far as co-ordination between the civilian or the police authorities in Assam and the army is concerned, it was not lacking. Mr. Chaliha, Chief Minister of Assam, explained in detail how from day to day the army authorities were kept informed of the moves on the part of the Naga gang to escape across the frontier.

As the Press report would have it, the Defence Ministry instituted an enquiry into this affair and the resulting report, while it emphasises the difficulties of the terrain which place obstacles in the movements of the army, is inclined to put the blame on the army. But the East Command takes a more serious, if self-critical, view of the whole incident and it is is quite emphatic on fixing the responsibility on the army officers concerned. Its major ground is that advance warning was available in good time and the necessary mobilisation could have been arranged to prevent the escape and to apprehend the members of the gang. The officers concerned, as the report states, will be visited with the punishment of admonition which is essential.

The World Abroad

A PROFILE OF LONDON

By

ODYSSEUS

"NO SIR," thundered Samuel Johnson on September 20, 1777, "when a man is tired of London, he is tired of life, for there is in London all that life can afford." If this was true 135 years ago when London's population was about 600,000, it must be truer today when it totals 8,350,000, one-fifth of the population of England and Wales.

The City's services in finance, insurance, commodity, and other, exchanges make it the world's greatest banking and merchant centre, but, as Mr. P. G. Hall brings out in his new book "The Industries of London since 1861" (Hutchinson University Library. 12sh. 6d.), it was already the chief manufacturing centre in the U.K. even in 1861.

Here is the broad picture:

TOTAL EMPLOYED IN THOUSANDS

	England and Wales			Greater London		
	1861	1921	1951	1861	1921	1951
Primary (Agricultural, Fishing, Mining and Quarries)	2,276.9	2,395.9	1,705.2	44.	29.	19.8
Manufacturing	3,149.9	5,979.9	7,532.8	468.8	1,052.6	1,522.5
Service Industry	3,719.9	8,414.1	10,685.	903.	2,089.5	2,741.5
TOTAL Employed	**9,493.**	**17,178.**	**19,940.**	**1,478.8**	**3,216.1**	**4,288.3**

(Totals may not agree because of rounding).

WORKERS IN GREATER LONDON AS PER CENT OF ENGLAND AND WALES

	1861	1921	1951
Primary (Agriculture, Fishing Mining and Quarries)	1.9	1.2	1.2
Manufacturing	14.9	17.6	20.2
Service Industry	24.3	24.8	25.7
TOTAL Employed	15.6	18.7	21.5

London's oldest industries are clothing, furniture, and printing.

The U.K. clothing industry, of which Savile Row is world famous for its individual retailing and Montague Burton typical of the wholesale bespoke system, is the largest in Europe with sales worth £556 million 1959. It employs 512,000 workers, of whom 166,500 or 32.3 per cent, are in London, with big concentrations in Westminster and Stepney.

Furniture employs 161,700 workers of whom 63,400, or 39.2 per cent, are in London, centred on Tottenham Court Road (e.g. Maples Ltd.) and Camden Town.

There are 307,800 workers employed in printing in England and Wales, of whom 135,200, or 43.9 per cent, are in London. From 1476, when William Caxton set up his press, until the mid-19th century, printing largely meant books. Famous names here are Harrison & Sons Ltd. dating from 1738, and Waterlow & Sons Ltd., specialising in commercial work, the first printer to develop mass production. Their factory at Finsbury was already "assuming enormous proportions" in 1850. By 1925 the firm had several large factories for its specialities, including bank notes, cheques, and railway tickets. But from 1890 onwards, the revolution in popular newspaper production began which ended in almost half the nation's printers working for newspapers and, of those, 70 per cent work in the City and Westminster, the greater international news clearing centre in the world. While books and periodicals are edited in London, rising costs have mostly sent them to be printed outside.

Between the wars industry continued to multiply, because London had a high proportion of new and expanding industries and few of the depressed industries which were contracting in the North.

Among the many reasons for growth was its great army of women workers, a result of the absence of a single great female employing manufacture, such as cotton in Lancashire. This army attracted manufactures to the areas of heavy male employment, like the docks. Secondly, the streets of London have seemed paved with gold to a succession of immigrants — the Irish in the 18th century, Russian and Polish jews in the 1880's, West Indians, Pakistanis, Indians, and Cypriots today. Mr. Hall records that all have provided for a time vital services in grades of work which the natives were reluctant to undertake, that all in turn have provoked resentment but that, if precedent is a guide, all are eventually integrated in the social system.

Other reasons for London's growth are (1) proximity to a huge market, which contains large numbers of wealthy consumers, attracts others from the provinces, and tourists from abroad; (2) industrialists find it important to be in the national pooling centre of experience, initiative, and communications; (3) raw materials are easily imported into London's centrally situated docks; and (4) London is the national and world market for many commodities.

Over 1,000 ships enter and leave London's port every week. In 1957, the value of London's exports and imports and those of the U.K. were:

	London	United Kingdom	London's Percentage
Imports	£1,412,893,136	£4,070,810,906	35 %
Exports	£1,109,851,259	£3,324,412,107	33 %
Re-Exports	£ 61,082,632	£ 133,513,779	45 %

Of London's newer industries, the chief as general engineering, electrical engineering, and vehicles.

In 1951, there were 826,300 employed in engineering in England and Wales, of whom 161,000 or 19.5 per cent

"Here are five ways

BOAC Air Cargo can help your business!"

★ *Fast* BOAC jetliners slash transit time by *hours*.

★ *Direct* BOAC city-to-city freighting cuts out time-wasting journeys to and from docks.

★ *Simple* (cheap) packaging is all that's needed with careful BOAC handling.

★ *Safe*, efficient BOAC freighting means lower insurance costs, wider coverage.

★ *Experienced* BOAC staff give all goods *individual* attention all the way.

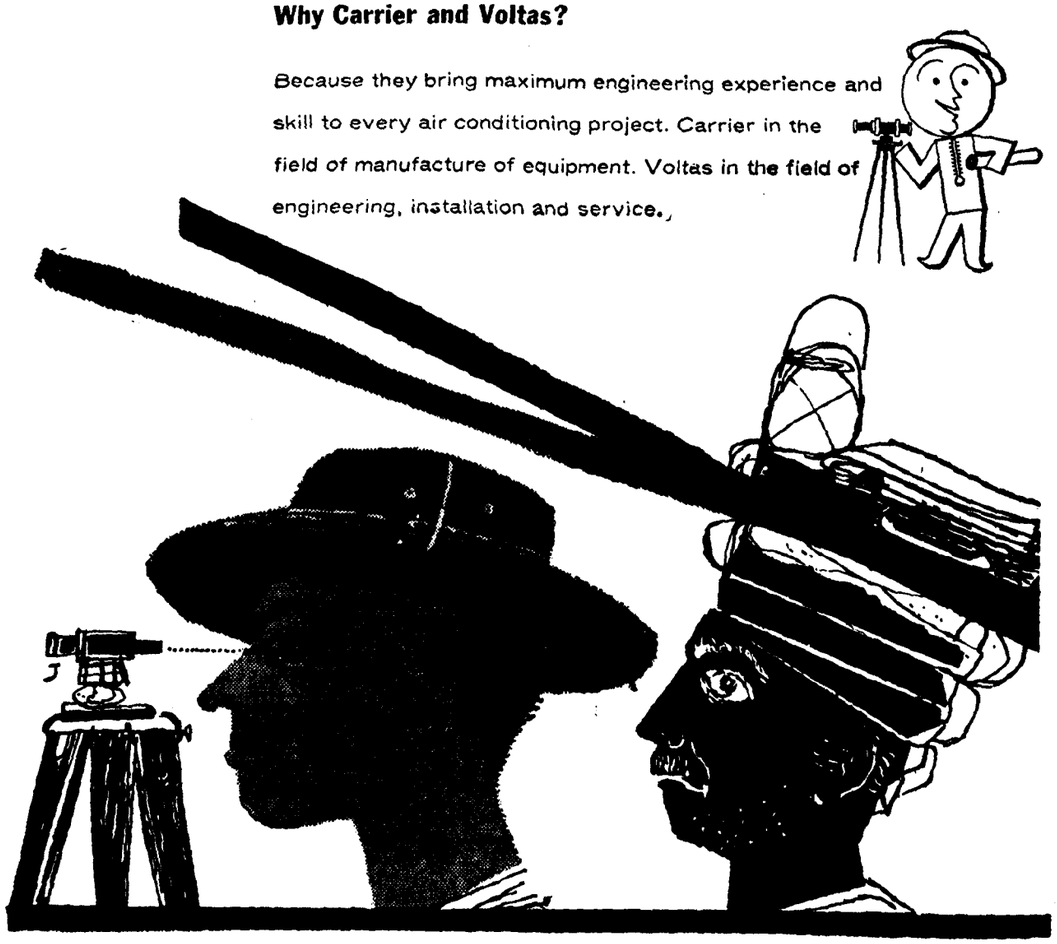
We deliver your goods in hours, instead of days or weeks! And that's only one of the things you gain. Speed alone may not be enough for you—but BOAC Air Cargo gives more and more successful businessmen these extra advantages...advantages that can help and benefit *your* business!

Ask for details now—from your Forwarding Agent or BOAC offices at:

BOMBAY - NEW DELHI - CALCUTTA - MADRAS - COCHIN

B·O·A·C GIVES YOUR CARGO JET-AGE HANDLING

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH AIR-INDIA AND QANTAS



this is the time to think about air conditioning

and this is the time to think about Carrier and Voltas

—now, while the surveyor collects data about a construction site. Too early? Not at all. Before the architect prepares his design he must know what plans the landlord has for his new building. Plans to air condition it, for instance.

Why Carrier and Voltas?

Because they bring maximum engineering experience and skill to every air conditioning project. Carrier in the field of manufacture of equipment. Voltas in the field of engineering, installation and service.

Carrier

the people who know air conditioning and refrigeration best

VOLTAS

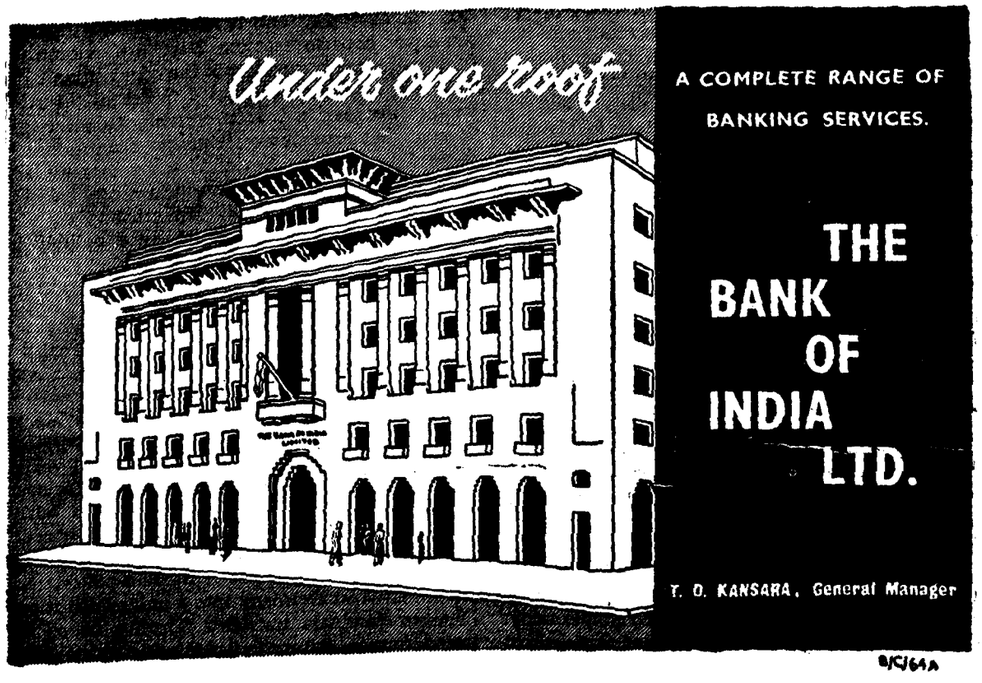
VOLTAS LIMITED,
Head Office: Ballard Estate, Bombay 1

CALCUTTA • MADRAS • NEW DELHI • BANGALORE • COCHIN

AHMEDABAD • LUCKNOW • KANPUR • SECUNDERABAD

were in London. They are spread all over the metropolis and, in general, are in the lighter branches, e.g. lifts (e.g., Otis Elevator Co. Ltd.), refrigerators (Electrolux, Frigidaire, and Kelvinator), brewery equipment (Metal Box Co. Ltd.), motor accessories (Smith's Motor Accessory Division), stoves (Flexaire Ltd.), gas meters (Smith Meters Ltd.), and weighing machines (W. & T. Avery Ltd.) The heavy branches usually concentrate on the canals or riverside, where constructional engineers (John Mowlem & Co. Ltd., John Laing & Son Ltd., Sir William Arrol & Co. Ltd., Dorman Long Bridge & Engineering Ltd., Dawnays Ltd.), cranes, hydraulic apparatus, boilers (Towler & Son Ltd.) and tanks pullulate.

Of the 538,600 workers in England and Wales in electrical engineering, London has 183,000 or 34 per cent, almost half in Greenwich and Woolwich. The industry originated in cable manufacture for electric telegraphs, in use on the railways by 1837 and spanning the oceans by 1858. Henleys Telegraph Works at Woolwich are one among world names here.



The spread of electric power and technological developments led to light electrical products—lamps, flex, stoves, irons, kettles, radio sets and parts, ignition machinery, switch gear, and accumulators, which include such well-known names as Osram GEC Ltd., Philips Electrical Co. Ltd., Pearl Electrical Co., Britannia Electrical Motors, English Electric, and Joseph Lucas Ltd.

In illustration of the importance of the mobility of labour to that economic growth with which we are all so pre-occupied today, note that the expanding electrical industries had the great advantage of being able to draw on a wide range of skills from traditional London industries in decline; meter manufacturers recruited from the Clerkenwell clock industry; electrical wire-makers from wire-makers, and so on. London has 44 per cent of total workers in telegraph and telephone equipment, 49 per cent of those in wireless, and 52 per cent of those in wireless valves and electric lamps, e.g., Pye Ltd., Mullard Ltd., and Electrical and Musical Industries Ltd.

Of the total of 931,300 employed in the manufacture of vehicles, 143,800 or 15.4 per cent are in London. Of these 143,800, Fords employ 17.1 per cent at Dagenham, but Acton, Brentford, Chiswick, Hayes, Southall, Willesden and Hendon, which include such names as Lancia, Rolls Royce, Standard-Triumph, and Vauxhall, account for 25.8 per cent of workers. Mr. Hall recalls that the old (horse drawn) coach builders of Long Acre provided the nucleus of the new industry, as for example Hoopers, now known as Hooper Motor Services, who build coaches for Rolls Royce and Bentley.

Mr. Hall lists over forty activities employing London's 4,288,300 workers. Apart from the major industries already noted, two others which employ over 100,000 each are building and contracting with 283,100 (e.g. George Wimpey), and food and drink with 136,400, whose array includes confectionary, biscuits, and tinned foods (Glaxo Laboratories, Crosse & Blackwell, Heinz, J. Lyons, Birds Eye Foods, and the Distillers Co. Ltd., who have made London gin world famous).

Mr. Hall records that the attraction for industry of the south-east corner of England remains undiminished, but that the Board of Trade succeeded in 1952-58 in slowing the rate of growth of 'manufacturing' in London to 3.4 per cent, which is half of the national rate, although the numbers of 'office' workers are rising. No less than 44.4 million square feet of new (or replacement) office space was approved in central London between 1948-58. The cost of compensation if vacated premises were to be controlled was estimated at £100,000 per acre, and to move work for 380,000 would need 500 to 700 acres at £50 to £70 million. Moreover, although New Town locations offer savings in rent or building price, against this must be set higher wages for key workers, possible lower efficiency of other workers, and the higher costs of slower communications. "To try to divert much of the increase in office employment out of London altogether...would probably be foredoomed to failure," says Mr. Hall, and he concludes that in the absence of adequate studies of the forces which govern industrial location "...our attempts at regulation must continue to resemble the attempt of an intelligent child to operate an atomic power house."

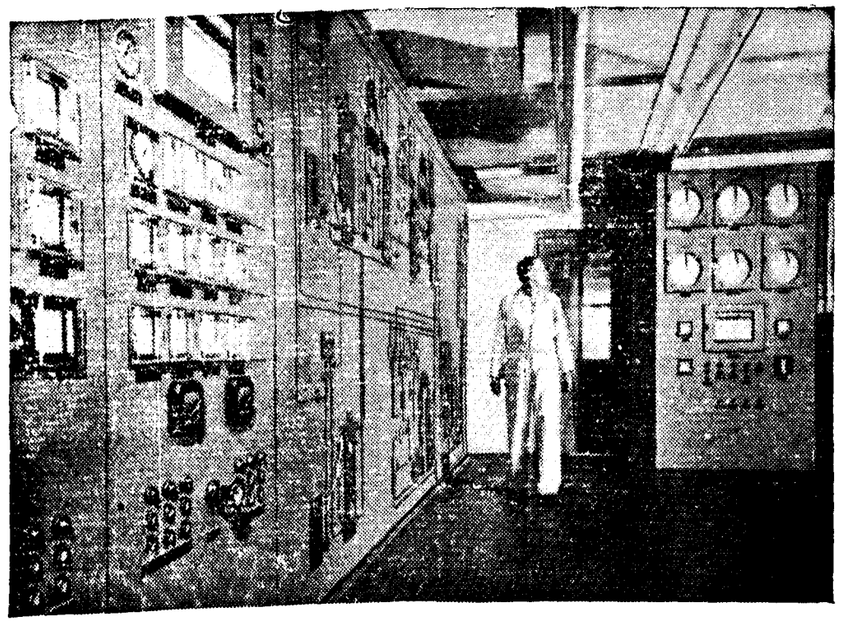
The European Scene

COMECON AND COMMON MARKET

From Our Special West European Correspondent

PARIS, June 10.

COMECON, which began its top-level meeting in Moscow this week, is sometimes loosely described as the Communist replica of the Common Market. Mr. Krushchev was no doubt suggesting a comparison between the two associates when he prefaced the Comecon gathering with his first vehement attacks on the Common Market and hinted that he was going to take the advice of his Comecon partners on his plan for a "world trade conference" that would take up the challenge of the Common Market. Yet Comecon cannot be compared with the Common Market, and much less has it worked out an alternative form of economic co-operation that could be set against that of the West European association. Comecon still bears the mark of its Stalinist origins: it expresses the imperialist relations between Russia and the East European satellites. The satellites hardly do any trade between themselves, but between 60 and 80 per cent of their exports, in each case, go to the Soviet Union. It is thus a set of bilateral relations, and not a multilateral arrangement as we wrongly suggest when we call the Soviet empire a bloc. The frontiers between the satellites are almost as impermeable as the frontier between the Communist world and the West. Their currencies are not convertible as between themselves or even in Moscow. Attempts at co-ordination of planning have been rudimentary, and amount simply to a unilateral allocation of tasks by the dominating power in the Kremlin.



Since Stalin, moreover, this central authority has been much less successful in allocating tasks. It can only make recommendations, which are frequently ignored in the satellite capitals. Thus there is no equivalent in Comecon either of the germs of supranationality that are represented by the ECM Commission or of spontaneous collaboration between all th members of the association. One of the few achievements the organisation has to its credit is the "pipeline of friendship" which is to carry oil from the Volga to East Germany, Czechoslovakia and Hungary; but this has half a dozen equivalents in West Europe. In short, Comecon has failed in its objective of stimulating multilateral trade, and Mr. Krushchev still complains publicly when he visits the satellite capitals that they all look to Moscow for export markets and supplies, instead of co-operating among themselves.

These familiar facts need to be recalled to see that when Mr. Krushchev attacks the Common Market before a visitor from the developing world (M. Modibo Keita's presence in Moscow was the occasion for the latest outburst), he has no alternative form of co-operation to suggest. If the proposed world trade conference were ever to be held (it is an old Russian idea, which Mr. Krushchev has just refurbished), the Communists would have nothing to bring forward as superior to the customs union now being introduced in the West Europe. They would have the opportunity for propaganda attacks, but when asked about how they conceived international economic co-operation between neighbouring countries of similar technological development, they could offer nothing but a system that all Asians and Africans would at once recognise as 19th century imperialism. However, some former colonials think (Mr. Krishna Menon, rightly or wrongly, is taken in Europe to represent this opinion) that it does not matter how Russia imperialises over the East Europeans: as long as she is helpful to overseas developing nations. So the internal affairs of Comecon interest them less than its exteranl aid as compared with that of the Common Market.

On this point, Mr. Krushchev was almost frank with his visitor from Mali. The aid the Soviet bloc offered "is perhaps smaller in volume than that promised by others", he said, but it was still preferable on metaphysical grounds. I say metaphysical, because he explained that even when the Common Market supplied teachers, doctors, roads and ports to independent nations this was still an insidious form of slavery, whereas the much smaller and less effective help of the Soviet bloc was disinterested. This subtle distinction will escape most statesmen in the "third world", so the Russian leader sought to cover up with some frothing attacks on the likes of M. Tshombe. One needs to note that this outburst was made in the presence of the leader of Mali, a State that has chosen to break with France, to practise studied neutralism—but still clings to its status as an associate of the Common Market. In other words, M. Modibo Keita is as sensitive as Mr. Krushchev could wish to the dangers of neo-colonialism and is poles away from the policies of M. Tshombe, but he still sees that the Common Market can provide useful aid whereas Comecon offers much less aid and much more propaganda.

This confession, that Comecon had less to give than the Common Market and could only claim to have more worthy intentions, must have cost the Soviet leader dearly. After all, it was his own idea in 1955 to proclaim that the struggle between capitalism and communism would henceforth take the form of peaceful competition for the allegiance of the third world, a competition which the Soviet bloc was sure to win because of its economic superiority. It was to make this view prevail that he has had to combat the more aggressive elements in his own party and in China. When his doctrine appears to have won out, he has to admit that Comecon can never hope to beat the West in providing material assistance, that it cannot win the competition he invented. For a developing country to accept the story that smaller Russian aid is preferable to more generous Western aid presupposes that that country has already decided to join the Soviet bloc, or at least adopt its view of the world; Mr. Krushchev can only win the allegiance of those already converted to his cause. It is not surprising that M. Keita listed politely to these fulminations against the Common Market's neo-colonialism—and then left for Bonn.

Comecon's failure in the aid sphere, now admitted by Mr. Krushchev, is of course connected with its failure in stimulating the economies of the Soviet bloc. It is the contrast between this poor performance and the progress realised inside the Common Market that really irritates Moscow and explains the onslaught that Mr. Krushchev has initiated after several years of silence about the achievements of the Six. On most other grounds, one would expect him to take a fairly benevolent view of the Common Market. First of all, it assumes the perpetual division of Germany, which is one of the basic objectives of Russian policy. Secondly, it absorbs West Germany into a unit which it can never hope to dominate outright. Thirdly, in so far as it keeps former European colonies in Africa within its

Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

the sinew of industry

STEEL

To the Rourkela works, in the heart of India's Ruhr, Gutehoffnungshutte has supplied the heart of the steel plant—three 1000-ton blast furnaces, a 2400-ton pig casting machine and four scale cars.

Soon, the heart of India's Ruhr will throb with new activity, when plant and epuipment for the iron and steel industry will be manufactured in the vicinity of Rourkela itself. GHH's collaboration with Larsen & Toubro has borne fruit in a new venture, Utkal Machinery Limited, which will go into production early this year, yielding a wide range of Indian manufactures. GHH and L&T will be right at the site with the best tools and tackle to execute new orders for expansion.

Foremost in the field of oxygenated steel production, GHH has delivered the first LD converters, the first rotors ever used in the world, and has to its credit a blast furnace in the Ruhr with the largest capacity in the entire area of the European Coal and Steel Community.

When it comes to steel, GHH steals the show!

sphere of influence, it at least ensures that they do not fall under American influence, and Russia has always shown a preference for this solution (e.g. in Algeria). Lastly, the Six have begun to show a measure of independence of the USA, and this attitude will become more marked as their relative economic power increases, even if General de Gaulle's ideas on European independence are not widely accepted yet.

These four weighty reasons do not add up to a case for Moscow positively to bless the Common Market, but one would have expected a continuation of the policy of the last four years: academic criticism from the Western Communist parties, but no hostile comment from the Kremlin, apart from warnings to the European neutrals not to join the venture. Instead, Mr. Krushchev has suddenly discovered that the Common Market is a "monopolistico-governmental conspiracy of the financial oligarchy of West Europe threatening the vital interests of all nations and the cause of peace throughout the world". He took care to say that "we are not frightened of it" but went on to speak exactly as if he were. It is as though, from seeing the Common Market as an enterprise that crippled Germany and limited US influence, he had passed to seeing it as a new capitalist power much bigger than united Germany and comparable to the USA. You might wonder that he has been so slow in seeing this, and that it needed the recent demonstration of the Common Market's economic vitality to open his eyes. In that case, you could not have been reading official Marxist theory on the Common Market these last four years. Communist economists on both sides of the iron curtain have patiently but implausibly been explaining that the Common Market is the symptom of a deep crisis in Western capitalism. Faced with excess production (excess in relation to the cruelly depressed purchasing power of the labouring masses), Western capitalists have been seeking outlets for their goods and trought to find temporary relief in mutual dumping. That is, German producers, unable to sell their production to their poor workers, have tried to widen their market to all Europe, rather than increase the buying power of their labour at the expense of their own profits. French capitalists have tried the same. The solution, it was unnecessarily explained, was illusory, so ultimately the Common Market was bound to fail. Students will have recognised a singularly inept application of Marx's "over-production" theory of the trade cycle, already used by Lenin to explain imperialism.

This absurdity could be propped up for a certain time by means of references to conflicts between groups of Western capitalists and to signs of excess capacity in some industries. There is no doubt such things exist; they have frequently been referred to here. But they are no explanation of the Common Market; often they are among its effects, rather than its causes, and they can be cured by more generous support for development in Asia and Africa—i.e. by that development aid which, Mr. Krushchev admits, West Europe can afford to provide more lavishly than the Soviet bloc. The theory that the Common Market was a symptom of the breakdown of capitalism, which had the incidental advantages of splitting Germany and embarrassing America, has had to be abandoned in the face of evidence that it represented a revival of capitalism, which is achieving economic progress beyond the means of the Comecon countries. Since its first successes coincide with the failure of Communist agriculture, one understands the bitterness with which Mr. Krushchev discovers its true potentiality.

Economic Report from the U.S.

TAX REDUCTION: A STIMULANT

By GUY SIMS FITCH

WASHINGTON, June 5.

TAX reduction can be the most potent of the government's many tools to stimulate economic activity. U.S. Treasury Secretary, Douglas Dillon, now has let it be known officially that the Administration will propose a comprehensive tax reform, or tax-cutting, programme to the Congress.

Mr. Dillon's tax announcement was not directly related to the publicized stock-market decline, although the recent gyrations in securities prices may have prompted its official utterance at this time. Nor does it seem from any serious misgivings about the current economic situation or outlook.

On the contrary, Mr. Dillon emphasized that when the 1962 results are in, the nation's total output of goods and services—the gross national product—will be close to the optimistic projection of $570,000 million.

The indicated tax move appears rather to stem from other long-standing administration concerns. One relates to a further acceleration of the economy's long growth at its present pace still leaves something to be desired in terms of full utilization of manpower and physical resources.

With some slackness still evident in the economy and prices generally stable, the feeling is that a tax reduction—even if it were to cause or intensify an ostensible budget deficit—would not have important inflationary consequences.

In addition, there appear to be some long-held misgivings about the adequacy of the traditional U.S. budget as a reliable indicator of fiscal trends. First off, there is the belief—apparently winning acceptance among private as well as government experts—that the budget as now constituted has a tendency to approach a balance, or even to generate a surplus, too quickly during periods of business recovery.

This is largely a reflection of several "built-in" economic factors. There are, for instance, the economy's automatic stabilizers, such as social security and unemployment compensation, which help sustain income during periods of business downturn. Then, there are the nation's high and graduated tax rates, which rise with income and hence tend to add markedly to government revenues during business upswings.

As a result, the budget may become something of a deflationary influence and tend to moderate a rise before the goal of a fully employed economy has been achieved.

Complicating the situation is a method of budgeting which many economists consider misleading in its economic impact. The traditional administrative budget, the one the President submits for Congressional approval each year, is largely a programming document. It lumps together both capital and normal operating costs, and expects federal revenues to cover both. Moreover, it excludes such important and vast operations as the government's social security and highway trust funds.

The result, according to federal experts, is that deficits in Government finances may be exaggerated and surpluses underestimated. As Dr. Heller has observed, the United States imposes on itself more rigorous budgeting standards than any other advanced country.

It is interesting to recall, in this connection, that President Kennedy specifically mentioned budget policy when he suggested to the White House Conference on National Economic Issues a few weeks ago that the United States might be able to learn some valuable lessons from the West European experience of recent years. Many West European countries tend to differentiate between current and capital outlays for budget purposes.

In the meantime, the Kennedy Administration has been trying to familiarize economists and the public at large with some new budgeting concepts, notably the national income and product account. This excludes Federal loans scheduled for repayment and threats tax liabilities on an accrual rather than an actually received basis, and hence is considered a reasonably precise measurement of the actual economic impact of Federal finances.

On this basis, preliminary projections for the 1963 fiscal year, beginning this July 1, show a surplus of $4,400 million, compared with a mere $500 million in the administrative budget. And some experts point out that if the 1963 U.S. Budget were figured according to European standards, with capital expenditures carried separately, the projected surplus would be even larger.

What seems to emerge from all this is a more conservative U.S. Budget position than is often realized, one that leaves plenty of room now for a sizeable tax cut, even if that cut were to mean continued administrative budget deficits for a while. Experience indicates, moreover, that these deficits tend to disappear rapidly as economic growth accelerates. This underscores the view that budget surpluses or deficits are neither good nor bad in themselves, but are to be judged primarily by their usefulness in the light of economic circumstances.

Special Article

FOR A PRACTICAL SOLUTION OF DISARMAMENT PROBLEM

By SERGEI S. VESHCHUNOV, Counsellor of the U.S.S.R. Embassy in New Delhi.

BACK in the days of the League of Nations, Geneva gained the unenviable reputation of being a diplomatic talking-shop. The idea of disarmament, constantly fought for by the Soviet Union, was then buried under endless debates. Similar had been the results of the post-war talks on disarmament. And that is why when the conference of the 18-Nation Disarmament Committee was drawing near most people were apt to think that just another of those endless conferences, which discussed the disarmament problem over the past 15-years without any results, was about to begin.

But this attitude changed literally in the course of a single day after the Head of the Soviet Government, N. S. Khrushchov, issued his historic call to the Heads of the Governments represented in the Committee to participate in its proceedings from the very beginning. His call emphasised the tremendous importance the Soviet Government attaches to the work of the Committee and the speediest solution of the disarmament problem.

Then when the Committee met, the Soviet Government submitted at the very first-session a draft treaty on general and complete disarmament under strict international control, in order to give to the work of the Committee a concrete and businesslike character. In fact this draft treaty was the main event in the work of the 18-Nation Committee. For, though new important proposals were expected of the Soviet Government, no one could imagine that it would come out with a document, which so clearly, strictly, in almost a mathematical language presented the whole process of disarmament from the beginning to the end. What is particularly important about the Soviet draft is that it is not some interim or working document, nor a scheme of basic propositions, but the text of a treaty proper which sets forth article by article, paragraph by paragraph the entire process of disarmament in the form of precise legal obligations.

THREE CONCRETE STAGES IN FOUR YEARS

The Soviet draft treaty envisages the destruction and liquidation of the whole war machine in three consecutive stages within the limits of which the disarmament and control measures are distributed in such a way that no State will receive any unilateral military advantages in the process of disarmament. In only four years' time there will remain neither nuclear bombs, nor tanks and artillery, nor navies or military aircraft. The armies themselves will be fully disbanded, and all military institutions—from General Staffs to local military boards—will be abolished.

Already in the first stage mankind will be relieved of the danger of becoming the object of a nuclear attack. Since all means of nuclear weapons delivery i.e. combat rockets, pilotless aircraft, bombers, surface craft and submarines etc. will be destroyed at this very stage, the dreadful A-bombs and H-Bombs will be rendered useless just like bullets without rifles or revolvers. Another important step envisaged in the very first stage of the Soviet draft is the abolition of all military bases on foreign territories and withdrawal of all troops within the boundaries of their national frontiers. Moreover, the strength of the troops of States will be considerably reduced, the armed forces of the USSR and the USA, specifically, not to include more than 1.7 million men each.

The second stage of disarmament, as envisaged by the Soviet draft treaty, will completely remove the threat of a nuclear war. For, at this stage all nuclear weapons and all other weapons of mass destruction will be banned, their stockpiles destroyed and their production discontinued. Further cuts in national armed forces at this stage, down to one million men in the case of the USSR and the USA, will reduce the chances of armed conflicts in general.

Finally war would be banished forever from the life of human society after the completion of the third stage, by the end of the fourth year. For, during this last stage all the remaining armed forces and armaments as well as the entire war machinery of States are to be abolished.

INTERNATIONAL CONTROL

In working out the draft treaty on general and complete disarmament the Soviet Government presumed that the establishment of a strict and reliable international control is an imperative condition of a successful implementation of general and complete disarmament.

To establish control over the fulfilment by the States of their agreement commitments the Soviet Government has proposed that an international disarmament organisation should be set up, including all States which are parties to the agreement. The organisation is to start its work simultaneously with the beginning of disarmament measures. Thus, already the first step towards the abolition of the war machine of States will be put under strict international control.

According as the disarmament process develops, embracing new and new types of armaments and armed forces, the functions and powers of the international control organisation also will develop. In solving this question the Soviet Government proceeds from the principle that control measures should be carried out during the entire course of disarmament and even after its implementation and strictly correspond to the volume and character of disarmament measures. What is noteworthy about the Soviet proposals on the question of international control is that it is the fulfilment of the disarmament measures that is put under control, and not the armed forces and armaments of the States which remain at one or another stage of disarmament. In other words, the Soviet draft treaty envisages control over disarmament, not control over armament.

A COMPARISON

The "Outline of Basic Provisions of a Treaty," submitted before the 18-Nation Committee by the US Government after the expiry of over one full month since the Committee commenced its proceedings, appears to be least concerned about disarmament and actually proceeds no further than control over armament—a special kind of control. In a slightly retouched version of its older plans the USA has offered, in the name of control, a plan of dividing Soviet soil into zones and effecting control (and espionage) by zones, by a selective method, so to say.

The meaning of this kind of "control" becomes very clear when one recalls that the US Deputy Defence Secretary Gilpatrick stated quite openly, soon after the 18-Nation Committee commenced its work, that the most important thing for the Pentagon was to "specify" the system of targets in the territory of the USSR.

The US proposals also embody direct attempts to secure unilateral advantages for the West to the detriment of the Soviet Union's security. The USA, for

Barve's Bold Budget

By

CROESUS

IT is not surprising that the Union Planning Minister, Mr. Gulzarilal Nanda, should have so confidently reassured the Lok Sabha, last Monday, that there was no ground for any sense of diffidence about the States being able to raise Rs. 610 crores through additional taxation during the Third Plan period, notwithstanding the fact that the additional taxation actually imposed by the States in 1961-62, i.e. in the first year of the Third Five-Year Plan, yielded only about Rs. 17 crores (to yield over the entire five-year period a total of about Rs. 100 crores). Evidently he was encouraged by the bold maiden performance of Mr. S. G. Barve, Maharashtra's Finance Minister, when he presented the additional Budget Estimates for 1962-63, on June 7, 1962. The new tax measures outlined by Mr. Barve are expected to yield Rs. 5.71 crores during the current year (or Rs. 8.61 in a full year). In other words, Maharashtra's efforts at raising new taxes in 1962-63 alone would contribute Rs. 31.54 crores to the States' share of additional taxation during the Third Plan period.

This is no doubt a commendable effort in the context of the repeated criticism of the Planners that the States have not been pulling their full weight in raising additional resources. It is, at the same time, on the admission of Mr. Barve himself, "a very considerable tax effort", though he has sought to justify it by saying that "we have undertaken the carrying out of an ambitious Plan and taxation effort of this order is obligatory for discharging our responsibility in that regard". This is honest enough, but to maintain in the same breath, that, while adopting the taxation programme, Government has taken the utmost care to avoid burdening the poorer and more vulnerable sections of the population, is to make a very tall claim, if it is not proper to describe it as hyprocritical. This claim cannot certainly hold water when the Finance Minister has chosen to tax such items as hand-made 'bidis', 'gur' and Mangalore tiles, not to speak of bicycles and vacuum flasks, which even the poorest classes now go in for, not because they regard them as luxury items but because these enable them to economise on their transport and tea bills. Surely, nobody is going to be deceived by the familiar consolation which finance ministers are wont to trot out, namely that, in most cases, the incidence of the tax would be absorbed in the price before it reaches the consumer. What the consumer minds is not the dope that the tax would be absorbed in the price before it reaches him but the rise in the price as such. Whatever assurances the authorities may give, no producer is so philanthropic as to let the additional incidence of tax eat into his profit margin. Nor is the argument that other States have levied a given tax a convincing one. In the final analysis, it is the impact that counts, and Mr. Brave cannot claim, unless he wants to delude himself, that the impact of his new tax measures will not be felt by the common man; however slight the increase he has proposed in the rates of tax applicable to a particular commodity may be, it is bound to be reflected in the sale price to the consumer. It is difficult, again, to agree with the Finance Minister of Maharashtra that the slight increase he has proposed in the rates of tax on raw cotton and cotton yarn is something that enters into production of end-products of high value only. Our cotton textiles, unless they are of superfine or extra superfine variety, cannot be described as such, although their prices have gone up, in all conscience, thanks to successive doses of the Union Excise Duty. Moreover, Mr. Brave should not have overlooked the additional burden of Rs. 12.10 crores (in fact, the yield, it is estimated, would be two to three times higher) imposed by the Union Finance Minister in his latest budget.

It has also been claimed that, in devising the new measures of taxation, an attempt has been made to see that the burdens will fall to the maximum extent where they can be borne. In a sense, this may be said to apply to taxes on such items as aviation motor spirit and petrol, electricity duty on specialised non-industrial utilisation of power for air-conditioners, and refrigerators, etc., but taxes on items like aerated waters, domestic electrical appliances, suitcases, and carriage of goods by road and motor vehicles tax on stage carriages cannot be said to fall in this category. Today, if people use domestic appliances, such as cooking ranges, electric stoves and electric irons, they do so more as an escape from the high cost of coal (not to speak of the dirt and sort that accumulates with the use of coal) and the stiff charges of the 'dhobi', rather than as a fashion. But, in his anxiety to gather as much revenue as possible in his first attempt itself, perhaps, Maharashtra's Finance Minister has not cared to consider all these aspects.

While one has to admire the trouble that Mr. Barve has taken to find some justification or other for every one of his new tax proposals, one feels rather intrigued that he has not bothered to say anything about the impact of all his tax proposals on the future trend of prices. It would have been interesting to know from him the extent to which the levy of additional taxes every year on this scale would impinge on the working class living index. It would not have taken much time for the Bureau of Economics and Statistics of the Government of Maharashtra to work this out. But it should be obvious, even to the uninitiated, that the effect would be much greater than that experienced during the Second Plan period, when wholesale prices increased by 35 per cent.

The people of Maharashtra should be eternally grateful to the predecessors of the present Finance Minister for having built up several specific funds, such

as, for example, the Sugarcane Cess Fund. For, but for the accumulations to the credit of this Fund and the Fund for Development Schemes, they would probably have been in for more taxes. Be that as it may, an interesting point that arises in this connection is whether the Finance Minister is justified in closing the Sugarcane Cess Fund and appropriating the balance in that Fund for general purposes, as he has done, merely on the score that the Sugarcane Cess has been replaced by a purchase tax. If only he cares to call for the speech of the Finance Minister who created this Fund (Mr. V. L. Mehta) he will be able to find out the circumstances in, and the purposes for, which this Fund was started and the specific assurance (that the Fund would be used only for improving cane cultivation in the State) given at the time. Will not the action of Mr. Barve amount to going back on the solemn assurances of the Government ?

The new tax proposals for 1962-63 apart, the budget speech this year is particularly notable for its exhaustiveness and clarity. The decision to provide additional literature, such as the Economic Review and the statements and charts contained in a companion publication, along with the budget literature is to be welcomed. To those who may wish to acquaint themselves with the economic conditions in the State more fully, these should be particularly useful.

And, before I conclude, I must refer to the really encouraging affirmation of Mr. Barve that "Maharashtra's Third Plan for Industry and Mining has been formulated on the basis that it will be the private sector which will play the major role in setting up new industrial and mining enterprises in the State." This, if I may say so, is the only silver lining to the budget cloud in so far as business men are concerned.

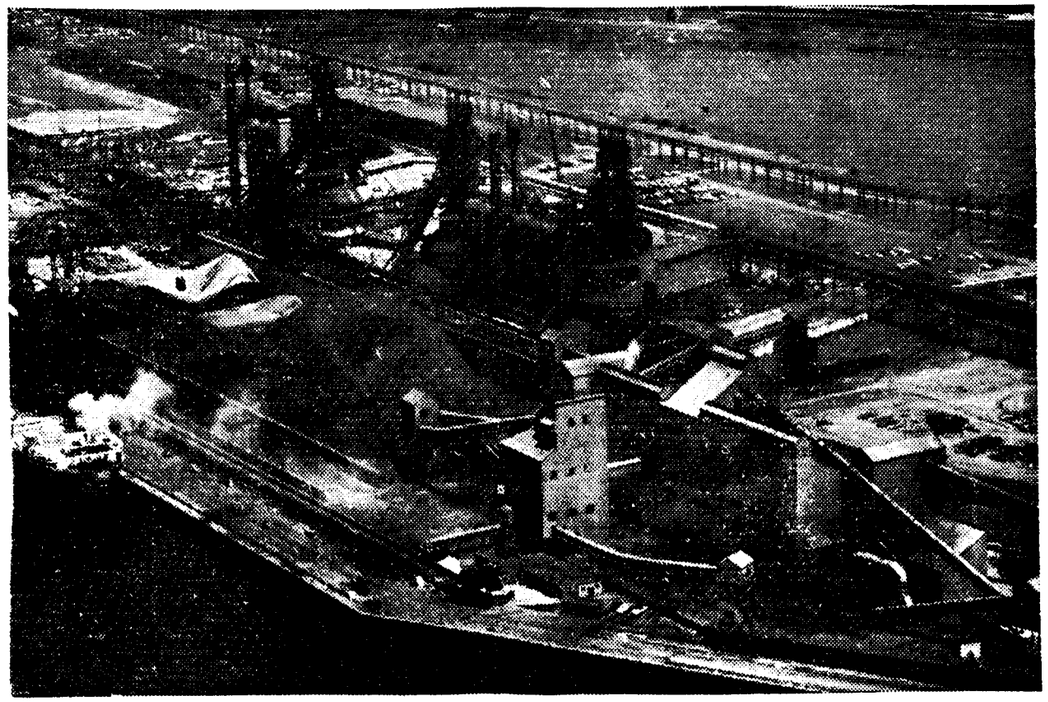
The Cashewnut Industry in Goa

By DR. JOSE C. ALMEIDA

THE cashewnut industry is Goa's second most important industry, the first place having been occupied by the mining industry. There are, in all, ten units currently operating in this region and they are situated in the concelhos of Bicholim, Ponda and Goa. Only four of these units are reasonably big while only one unit is managed by a limited company. Since the financial capacity of most of the units is small and they are governed by private enterprisers of meagre means, they cannot by any reckoning be considered as large-scale units. The main activity of these units consists in roasting the cashewnuts by a manufacturing process spread over various stages. For improved productivity, there needs to be a higher order of functional co-ordination amongst all the stages of production.

These units do not employ any machinery for dehusking the cashewnuts and the job is done by "skilled labour", specially trained for this purpose. The effective capacity of the industry is thus dependent upon the availability of skilled labour. The local supply of cashewnuts at 3000 tons is not sufficient to meet the demand for local consumption as well as for exports. This situation was remedied in the past by purchasing cashewnuts from the foreign markets, mostly from Mozambique. For economic operation of the units, it is necessary that the raw material supply should be in the region of 5000 tons. Thus the two major factors conditioning the growth of this industry in Goa are: the availability of skilled labour and the raw material. There are some other minor factors such as the availability of credit, which also affect the industry directly.

The furnaces employed by the cashewnut industry have not been working at full capacity in recent years. Hitherto not more than 30 per cent of the available capacity has been utilised. The localization of the industries in the mining areas of Bicholim and Ponda places additional strain in the sense that necessary labour cannot be recruited as the mining industries in these centres are in a position to offer higher wages.



In 1960 Goa's exports were as high as 1,300 tons mainly due to the facilities granted to the industry for the import of cashewnuts from Mozambique. On an average the exports of cashewnuts during the last few years were about 1000 tons per year. Assuming the local consumption at about ten per cent of total production, the annual output of the cashewnut industry can be estimated at about 1,100 tons.

A majority of the workers in the cashewnut factories are daily wage earners. Some women workers work in their own homes for the factory. The distribution of the workers in each factory is roughly like this: 6 to 10 workers are employed in the roasting stage, about 600 are employed in the nut cracking stage, about 300 in the husking stage, about 100 in the selection stage, about 6 in the sorting and granding stage about 10 in the packing stage. Normally foremen are paid Rs. 116 per month; wage earners above the age of 18 are paid between Rs. 2.50 and Rs. 1.50 per day. While the duration of work in the factories is normally eight hours, the wage earners are not paid for Sundays and holidays.

Analysing the cost of production in the various stages of the operation and keeping out the cost of raw materials, it is estimated that for preparation, packing, sale and despatch of one ton of cashewnuts to the customs house in New York, it comes to about Rs. 380. The overhead expenses can be considerably reduced if large-scale production process is initiated. Present estimates indicate that the cost of this operation can be reduced to Rs. 330 per ton.

Every year in the month of March the Portuguese Government in Goa used to protect the grower of cashewnuts by fixing its price in conformity with the price ruling in the Indian markets and the other markets abroad. During the last three years, the prices of cashewnuts have gradually taken an upward trend. The prices in the US market have usually fluctuated according to the laws of demand and supply, but an analysis of the prices during the last three years shows that the wholesome nut has kept up its upward trend in prices, specially in the case of grades WF 200, WF 220 and WF 240. The local demand being hardly one-tenth of the total produce, it has very little influence in disturbing prices.

Hitherto the Goan cashewnuts have had to face competition in the US market from the Indian Union which is capable of competing in prices, but not in quality. As stated earlier, the industries in Goa did not enjoy any special credit or subsidy facilities. Only during the last two years, i.e. 1959 and 1960 the "Junta de Comercio Externo" gave loans at the rate of 6 per cent for the import of cashewnuts with husk from Mozambique. The industry, however enjoyed exemption of import duty relating to the import of cashewnut husk from Portuguese overseas territories. Tin sheets

Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

SISTA'S-SB-33

and other equipment required by the industry were also exempted from the payment of import duties.

On all exports, the exporters have hitherto paid one per cent ad valorem as export duty and two per cent ad valorem as "on other dues".

The industry has functioned in a disorganised manner. Given facilities in the form of credits or subsidies, there is no doubt that the units can start operating up to optimum capacity. Unless they are organised on more sound lines, they are likely to stagnate in the face of competition from the units operating in other parts of India. The industry needs to be encouraged not only because of its capacity to earn foreign exchange, but also because of its being able to provide employment to sizeable numbers.

Business Notes

Urban Markets

MARKETING RATING INDICES FOR TOWNS

THE CLARION ADVERTISING SERVICES need to be congratulated for having attempted the computation of market rating indices for class I towns of India. This is the second attempt that an advertising agency has made in this country to rate the towns on the basis of their market potential. In 1960, Messrs. J. Walter Thompson Private Ltd., had prepared a consumer index of markets based upon no less than twelve economic indicators. Th present rating made by the market research department of Clarion Advertising Services is based upon three major factors, namely (a) 1961 population, (b) per capita consumption and (c) growth of population over the decade 1951-61. All these three are the central factors for defining the size of a particular urban market.

The summary of the analysis is given in the table below :

(Total population: 36.02 millions)

Group	Index range	No. of towns	Percentage share of	
			Population	Market
A	50 and above ..	4	30.9	43.3
B	10 to 50 ..	10	21.9	17.4
C	5 to 10 ..	21	18.3	15.5
D	Below 5	73	28.9	23.8
	TOTAL ..	108	100.0	100.0

It would be seen that the study covers about 36 million population in 108 towns. Four of the leading cities, namely, Bombay, Calcutta, Madras and Delhi command about 43.3 per cent of the market with 30.9 per cent of the population.

The rating of these four cities according to the present index is:

Calcutta (Corporation Area) ..	100.00
Greater Bombay	152.97
Delhi	91.73
Madras	53.22

In all of the other three categories, the share of the market is slightly less than the percentage of population. It shows that the per capita consumer expenditure in the four cities is higher than in the remaining 104 towns. Therein lies the reason for the 'more than proportionate size' of the market in the leading four cities. The application of these index numbers cannot, however, be made uniformally to the sales potential of all products without regard to the degree of priority enjoyed by them in the budgets of the urban families. There is a certain compulsion in regard to the expenditure on necessities. A proper way would be to estimate the volume of the discretionary and the non-discretionary components of the consumer expenditure of these towns so as to estimate the probable expenditure on the necessities, the consumr durables and the luxuries. If a manufacturer of fans were to rely upon these index numbers, he will be disappointed because the purchase of fans is a function of the discretionary component of the consumer expenditure and not the total volume of consumer expenditure. This is to highlight the fact that whereas these index numbers can be very rough guides for determining the size of the market, they cannot be used in the case of particular products, for which an elaborate market research survey must be planned. Thus, these index numbers can hardly take the place of scientific market research which must be used for assessing accurate sales potential for particular commodities in the urban centres. While the attempt at constructing these indices is laudable, the manufacturers who are planning gigantic sales programmes are warned not to place too high a faith in these index numbers.

Term Loans

R. B. STUDY GROUP'S REPORT

IN THE WAKE of rapid industrialisation initiated by the Five-Year Plans, the crucial importance of providing term loans to industry and the need for improvising the techniques of appraisal of term loan applications so as to provide such loans have, not unnaturally, come in for comprehensive appraisal. Sometime ago, the Reserve Bank of India set up a Working

Group to study and report on the general principles followed by financial institutions extending such loans.

According to the report since submitted by the said Working Group, while several special financial institutions have been established, in recent years, for the provision of medium and long-term credit for industry, there is still further need for broadening the institutional set up. In this connection, the Working Group has tried to dispel the long-held notion entertained by the banks that term loans are "non-liquid and risky." The Group has categorically stated that "the traditional concepts of liquidity are not applicable to term loans" and, further, that "the liquidity of such loans depends on the 'anticipated income' of the borrowers, as they are intended to be repaid over a period of years out of the enhanced profits arising from the utilisation of the loans." The adoption of formal term lending, at least by the larger banks, the Group has opined, would bring in a certain flexibility in the operations of the Indian banking system. When suggesting such participations, the Group is not oblivious of certain limitations such as the high credit/deposit ratio bringing in pressure on the liquidity ratio of the Indian Banks.

As regards the appraisal aspect, the Group has expressed the view that, while a static analysis of the balance sheet position might suffice for a short-term loan, the appraisal of term loans would require a dynamic approach, inasmuch as these loans call for a projection of future trends of output and sales, as also of estimates of costs, returns and flow of funds. Hence the thesis of the Study Group that "the standards to be adopted and the methods of analysis required for the appraisal of term loans are more appropriate to investment decisions than to short-term lending."

According to the Report, there are four broad aspects of appraisal: technical feasibility, economic feasibility, financial or commercial feasibility, and managerial competition. While the examination of technical feasibility consists of an assessment of the various requirements of the actual production process, the economic feasibility has reference to the earning capacity of the project. The appraisal of managerial competence is felt to be of considerable importance, since, in a dynamic economic environment, the ability of the enterprise to forge ahead of others depends primarily upon the quality of its management. The financial, however, is by far the most important aspect of term loan appraisal, and, as such, a different criterion, as distinguished from that adopted for short-term accommodation, is suggested. According to this new criterion, term lending institutions have to ensure; (i) that the estimated cost of the project has a fair chance of materialising; (ii) that the financial arrangement is comprehensive, without leaving any gaps and ensuring availability of cash as and when needed; (iii) that the estimates of earnings and operating costs are as realistic as circumstances permit; (iv) and that the borrower's repaying ability, as judged from the project operations, is demonstrable with a reasonable margin of safety.

Sheet Glass

NEED TO IMPROVE QUALITY

OF COMPARATIVELY recent growth, the sheet glass industry has recorded notable results not only in the expansion of its capacity and production but also in the range of its products. The industry has now been enjoying protection for the last twelve years, and Mr. K. R. P. Aiyangar, Chairman of the Tariff Commission, has himself expressed satisfaction with the performance of the industry, despite several difficulties in obtaining regular supplies of raw materials. But it is only on the count of high cost of manufacture, and the consequent high prices to the consumer, that this industry, like many an other in the country, has failed to come up to public expectations. There are, of course, some extenuating circumstances, such as the cost of some items that enter into the cost of production over which the industry has no control, but they do not fully explain the prevailing high prices. It is in this context that the question of the obligations of a protected industry came up prominently at a public inquiry into the extension of protection to the sheet glass industry beyond December 31, 1962.

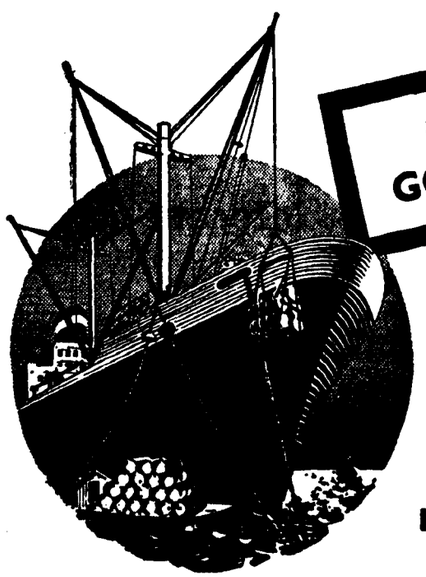
Referring to the expansion of capacity of the industry, Mr. Aiyangar pointed out that the present producers were still the same four units as in 1960; five more units had been licensed, but they have yet to establish production. Thus, the installed capacity of the units in production at present, as given by the producers, stands at 13.101 million square metres, as against 10.573 million square metres in 1960. If the five new units also come into existence as scheduled, Mr. Aiyangar pointed out, the capacity of the sheet glass industry would increase to 17.30 million square metres in 1963 and to 20.48 million square metres in 1964. Meanwhile, there has not been any appreciable rise in production; the total net production which was 8.240 million square metres in 1960, rose only fractionally to 8.282 million square metres in 1961. However, the output of thicker varieties has risen considerably.

As regards domestic demand, the Tariff Commission had estimated it in 1960 at 9.29 million square metres and envisaged an annual increase at the rate of 1.394 million square metres during the three succeeding years. The present estimates of demand for sheet glass, according to the Tariff Commission Chief, range from 10.22 million square metres to 13.93 million square metres for 1962, 11.61 million square metres to 15.98 million square metres for 1963, and 13.47 million square metres to 18.02 million square metres for 1964. However, according to the Development Wing, the demand for sheet glass would be somewhere near 16.257 million square metres by the end of the Third Plan.

In regard to the problem of raw materials — sand, soda ash, limestone, sodium sulphate, dolomite and arsenic — needed by the industry, only soda ash and, to some extent, sodium sulphate continued to be imported. However, the industry's complaint is that the prices of all the basic raw materials, including those of the imported ones, increased railway freight rates, expensive road transport, and non-availability of adequate rail, as well as road transport, had all combined to push up the cost of manufacture sharply. Another complaint of the industry is that there has been no consistency in the quality of basic raw materials, which has not only affected the quality of the glass produced but has created great wastages in production.

On the other hand, the Tariff Commission Chairman highlighted the general complaint received from the consumers and the trade associations that the prices charged by the indigenous industry for sheet glass were greater than those of imported glass, which, in fact, was also considerably better in quality. He accordingly reminded the producers that, "as a protected industry, manufacturers have obligations to spare no pains to improve the quality of their products and simultaneously to reduce their costs by effectig all possible economies in consumption, over-heads, etc. so that they could afford some relief to consumers and also stabilise themselves on a sound footing." Not until this happens, it is needless to stress, can the industry hope for a bright future.

New Issues



ASSAM SILLIMANITE LIMITED

TWO MORE companies are approaching the public in the near future for subscriptions to their share capital.

Assam Sillimanite Limited has plans to raise Rs. 70 lakhs in the form of 7 lakh equity shares of Rs. 10 each. After this issue is subscribed, the whole of the authorised capital of the company, Rs. 100 lakhs, would have been issued and subscribed.

Of the present issue, 2.9 lakh shares are being reserved for allotment to the International Finance Corporation, if it proposes to exercise the option provided to it by the company in consideration for the loans granted by it. Another 60,000 shares are to be reserved for allotment to the West German technical collaborators, Messrs. Vereinigte Grossalmeroder Thonwerke, Grossalmerode. Of the remainder, 60,000 shares have been reserved for allotment to the existing shareholders of the company and another 50,000 for allotment to the Life Insurance Corporation of India. The balance 2.4 lakh shares are to be offered to the public for subscription at par, the full amount being payable alongwith the applications. The list opens on June 18 and shall close on June 25 or earlier at the discretion of the directors, but not before June 20. The new shares will rank as regards dividends and in all other respects pari passu with the already issued shares except that they will not rank for any dividend that may be declared in respect of the financial year ending March 31, 1962.

The proceeds of the issue are to be utilised for extension of the company's refractories manufacturing factory at Ramgarh, in Bihar, which started production in February-March, 1961, with an installed capacity of 3,000 tons of refractory products per annum. The expansion programme is to be completed in two stages. The first stage will raise the installed capacity of the

RED LEAD GOES ABROAD

Red Lead, manufactured by D. Waldie & Co. (Lead Oxides) Ltd. in India, is now being exported to Cambodia and the Far Eastern countries. This makes yet another item for India's export drive to earn valuable foreign exchange.

A proved anticorrosive primer Red Lead has been extensively used by engineers for over 100 years all over the world for protection of metal structures, bridges, ships and buildings from rust and corrosion damage.

CALCUTTA-11

factory by 29,000 tons per annum; it is expected to be completed by the end of the current calendar year. The second stage envisages raising of the installed capacity further by another 17,000 tons per annum. Work on this stage will be taken up after the completion of the first stage.

The total cost of the project, covering both the stages, is estimated at Rs. 139.21 lakhs. The International Finance Corporation has agreed to make available two loans, one for $9,24,000 (approx. Rs. 44 lakhs) and the other for $4,41,000 (approx. Rs. 21 lakhs), for financing the import of machinery and equipment during the first and the second stage, respectively. These loans are to be repaid in easy instalments from 1965 to 1974 and will carry an interest at the rate of 6.25 per cent per annum.

The company's main business till now had been quarrying and shaping of sillimanite from Khasi Jyantiya Hills in Assam. The manufacture of refractories, suitable for use in all types of blast furnaces, on the scale envisaged in the expansion programme of the Ramgarh factory will obviously help it in increasing its profits. The company paid a dividend of 6 per cent per annum, less tax, during the years 1959-60 and 1960-61, out of its profits which, after taxation, amounted to Rs. 1.29 lakhs in 1959-60 and Rs. 1.59 lakhs in 1960-61.

The demand for refractories is estimated to go up to 1.6 million tons per annum by the end of the current Plan. The present production in the country is in the neighbourhood of 0.52 million tons a year, which is far below the country's current requirements. The company, thus, is likely to encounter little difficulty in marketing its products; in fact, it is reported to have already on hand orders which can only be serviced early next year after the first stage of the expansion programme is completed.

SATELLITE ENGINEERING

THE SECOND company that has plans to enter the capital market sometimes next month is an engineering concern, Satellite Engineering Limited, incorporated as a public limited company in the State of Gujarat in April last for the purposes of manufacturing fluorescent starter switches, miniature filament bulbs, automobile pistons and other allied products.

The company's authorised capital is Rs. 30 lakhs, of which Rs. 10 lakhs is subscribed. An offer is being made to the public for subscribing to 50,000 equity shares of Rs. 10 each.

The company has secured technical know-how from Messrs. W. & E. Kupfer Ltd., for the manufacture of starter switches and miniature filament bulbs and from Messrs. Meteor Pistons, S.R.I., Milan, Italy, for the production of pistons. Its factory is located at Kathwada, near Ahmedabad.

The manufacture of fluorescent starter switches has already started (the capacity of this plant is 89,600 dozen starter switches per annum on single shift basis). Miniature filament bulbs will be produced on receipt of raw materials and some additional equipment in another six months time. The piston manufacturing unit is scheduled to go into production in 1964.

General Insurance

UPWARD TREND IN BUSINESS

THE FIGURES given in the Indian Insurance Year Book 1961, published by the Controller of Insurance, Government of India, provide an interesting reading. One gets the idea that general insurance business has gone up by over Rs. 3 crores during the period for which the report speaks for. The net premium income in all classes of general insurance business of Indian insurers, it would be observed, increased to Rs. 18.51 crores in 1960 from Rs. 15.02 crores in 1959. In 1960, Rs. 5.93 crores were earned from fire insurance, Rs. 3.09 crores from marine insurance and Rs. 9.49 crores from miscellaneous insurance business. In the case of non-Indian insurers, the net premium income in India was also higher in 1960 as compared to 1959, in marine and miscellaneous business, but it was slightly down in fire insurance business.

The net premium income outside India of Indian insurers was also higher in 1960 as compared to 1959. It amounted to Rs. 14.43 crores in 1960 of which Rs. 7.33 crores were earned from fire insurance, Rs. 2.72 crores from marine insurance and Rs. 4.68 crores from miscellaneous insurance business. The Index Number of general insurance business recorded on the whole a rise of 11.8 points in 1960 compared to 11.1 points in 1959.

A significant point to note is that the life insurance business has not fared badly after nationalisation. In fact it goes to the credit of the Life Insurance Corporation that after nationalisation it has weathered the storm successfully. It may also be, noted that after nationalisation a higher proportion of new life insurance business was obtained from persons in the higher income groups than in the lower income groups.

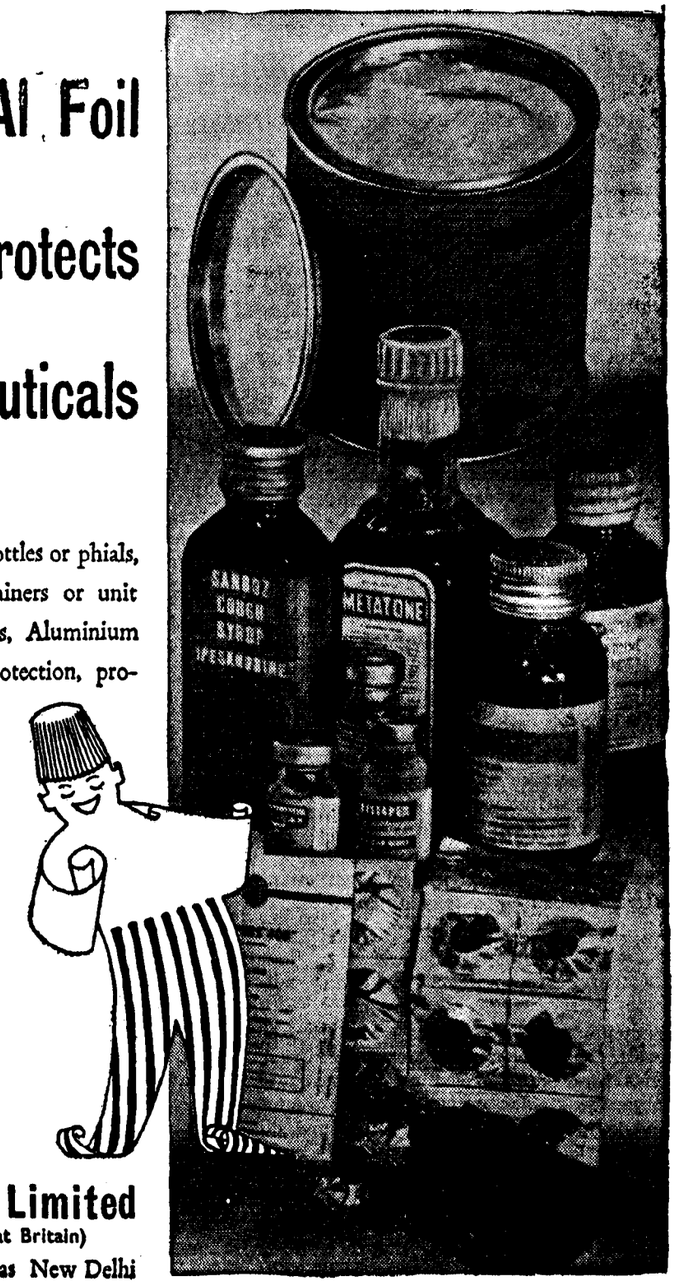
IDA

THE SWEDISH GESTURE

THE CREDIT for making available the first supplementary contribution for strengthening the resources of the International Development Association, an affiliate of the World Bank, goes to Sweden whose Parliament a few days ago voted a grant of $5,826,975 for the purpose. This sum is to be remitted to IDA authorities in freely convertible Swedish kroners, not tied to Swedish exports nor restricted to use in any specific country, and will raise Sweden's total contribution to IDA's funds to nearly $16 million.

As has been repeatedly emphasized by the World Bank President, Mr. Eugene R. Black, who is also the Chief of the International Development Association, IDA's resources need to be strengthened if this international finance institution is to continue to play its useful role in the economic uplift of the under-developed countries. Not only these resources require to be augmented by a general increase in the subscriptions of the member countries, which number 61, but there is obviously a case for making of such special contributions by the highly developed among IDA's members. The lead given by Sweden, it is hoped, will be followed up by the advanced countries of the West, some of which are even otherwise making useful contribution to the economic development of the backward countries through unilateral loans and grants or through consortiums such as the ones formed for helping India and Pakistan.

(Continued from page 1383)



instance, proposes to reduce by 30 per cent in three years the means of delivering nuclear weapons. But at the expense of what types of weapons? Missiles with a range of 5,000 kilometres and more i.e. the intercontinental and global rockets! But such things as American war bases and forces in foreign territories are treated as mere trifles in the US "Outline" and referred to only in the third i.e., the last stage of disarmament, the deadline of which is not indicated at all.

The above comparison brings out clearly the fact that while the Soviet draft proposes disarmament with control, the US "Outline" envisages control without disarmament.

Calcutta Bombay Madras New Delhi

FROM THE CAPITAL'S CORRIDORS

THE FOREIGN EXCHANGE CRISIS: FINANCE MINISTER'S STATEMENT

THE Union Finance Minister, Mr. Morarji Desai's last week's statement in the Lok Sabha, on the foreign exchange situation, has been on the expected lines. Mr. Desai traced the genesis of the current foreign exchange crisis in the country to three factors, namely (1) payment of large sums (in foreign exchange) outside the credits made available by the friendly countries for import of machinery, components and other departmental requirements, as also on account of discharge of debt obligations; (2) deterioration in 'invisible' earnings and accruals of foreign exchange, especially on account of fall in remittances from Indians abroad; and (3) slow mobilisation of the readily usable assistance made available by the friendly countries.

Talking about the present foreign exchange resources of the country the Finance Minister said: "Our sterling balances stand at about Rs. 100 crores at present, against Rs. 128 crores on April 1, 1962. We have, in addition, Rs. 118 crores of reserves in the shape of gold as well as certain working balances maintained by Government which are not a part of the Reserve Bank's balances. Although the Reserve Bank is required to maintain a minimum of Rs. 200 crores in gold and foreign exchange in its Issue Department, this requirement can be relaxed by Government. As member of the International Monetary Fund, we have a second line of reserves to fall back upon, if necessary."

This, alongwith the postponement of the commitments to be made by the Aid-India Club in respect of the assistance to be made available by it for the second year of the Third Plan, the Finance Minister said, made it obligatory on the part of the Government to adopt measures which will lead to slowing down of drain on foreign reserves so that after taking into consideration the aid that is available, there is no net drawal on them over the year as a whole. Mr. Desai proposed the following four measures to deal with the current acute foreign exchange situation.

(1) Redoubling of efforts to increase exports;
(2) Speedier mobilisation and utilisation of assistance already promised by friendly countries;
(3) Cutting down of imports both on Government as well as private account; and
(4) Rectification of the unfavourable trend witnessed in the recent past in invisibles."

Regarding stepping up of exports, the Finance Minister said while the Minister for International Trade would adopt whatever measures were necessary to achieve this objective, it was imperative that greater attention should be paid to crops like cotton and oil seeds etc., which have a major bearing on our export drive.

The unfavourable trend in "invisibles" Mr. Desai proposed to rectify through plugging of all loopholes through which foreign exchange which should normally be earned by the economy was being diverted to illegitimate purposes. One such loophole, he pointed out, was travel abroad by Indians even though no foreign exchange was released to them by the Reserve Bank. To check this, he stated the Reserve Bank had been asked to issue new regulations to close this source of leakage by stopping journeys abroad by Indians who had not been given any foreign exchange by it. Simultaneously, he added, changes were being made in the regulations governing travel for purposes like business and education, with a view to effect sizeable savings. More intensive measures to counter smuggling of all kinds were also under the consideration of the Government, he disclosed.

CUT IN IMPORTS

Soon after Mr. Morarji Desai had made his above-mentioned statement in Parliament, two notifications were issued — one by the Ministry of Commerce and Industry and the other by the Ministry of Finance. The former related to the cuts in imports, while the latter was in respect of foreign travel by Indians.

The Commerce and Industry Ministry notification said:

"Established importers will be granted quota/additional licences and other types of licences equal to 50 per cent of their entitlement calculated in terms of the policy announced in the current Red Book. The minimum value of licences to which the established importers are eligible in terms of the provisions contained in para 31 of Section I of the Red Book or elsewhere, will be reduced by 50 per cent. The value of licences granted on an annual basis or in two half-yearly instalments will be subject to 50 per cent cut.

"Licences already granted to established importers for the current period will be called back for reduction in value. Established importers should immediately return the licences granted for the current period to the concerned licensing authority for amendment in value, without entering into any further commitment for the supply of goods against such licences.

"The cut will not be applicable to licences to be granted to established importers under aid from U.S.A.

"A cut will also be applied in licensing the requirements of actual users from free resources. The extent of cut will be decided in each case on merits, subject to the availability of foreign exchange.

"A 50 per cent cut will be applied in the entitlement of licences to be issued to Consumer Co-operative Societies in terms of the provisions contained in Appendix 41 of the current Red Book.

"The position will be reviewed by the end of September, 1962, and supplementary licences will be issued wherever necessary, subject to availability of foreign exhcange."

RESTRICTIONS ON TRAVEL ABROAD

The Finance Ministry notification said: "With immediate effect, no person in India who wishes to travel abroad, can obtain a ticket from a shipping company or an airline without producing clearance in writing from the Reserve Bank of India. A directive to this effect has been issued by the Reserve Bank to all shipping companies and airlines operating in this country."

TAX CONCESSIONS

While introducing the Finance Bill to give effect to his tax proposals for the year 1962-63, in the Lok Sabha on Tuesday, Mr. Morarji Desai announced the following concessions:

(1) Cloth certified by the All-India Khadi and Village Industries Commission to be genuine khadi will be exempted from the processing duty even where such processing is done by power.

(2) **Cotton Yarn:** All single cotton yarns, whether bleached or grey, as well as unprocessed folded cotton yarns would be totally exempted from duty if issued in hanks up to 40 counts.

(3) **Powerloom Units:** Powerloom units having between 50 and 300 looms will be allowed to pay duty at half the standard rates for the period up to February 28, 1963, and at three-fourth of the standard rates during the year ending February 29, 1964. The relief during this interval is intended to enable the powerlooms to readjust their economy.

(4) **Mercerising:** Rate of excise duty for mercerising and waterproofing (including rubberisation) is to be reduced from 25 nP. to 10 nP. per square metre in respect of fabrics of an average count of below 26s and to 15 nP per square metre for fabrics of higher counts.

(5) **Handloom Fabrics:** Handloom and powerloom fabrics processed by independent operators will be charged four-fifth of the standard rates. This concession will apply to fabrics only when they are processed by units which are not in any way connected with a spinning or a weaving unit.

(6) **Processing Units:** Independent processing units which were in existence on April 24, 1962, but were not required to take out a Central Excise licence because of confining their activities solely to processing handloom or exempted powerloom fabrics would be given the exemption for the first 20,000 square metres of cloth bleached, dyed or printed by them in any month.

(7) **Woollen Fabrics:** Woollen fabrics produced on handlooms or powerlooms, that is, units not having their own spinning plants would be charged only two-third of the standard rates if such fabrics are processed in a unit which was not in any way connected with a spinning or weaving mill.

(8) **Indigenous Newsprint:** Duty on indigenous newsprint will be reduced from 22 nP. to 5 nP. per kilogram. At the same time a countervailing duty would be levied on imported newsprint.

(9) **Penicillin:** Duty on penicillin, streptomycin, quinine, insulin and a few other items commonly used as basic remedies for prolonged treatment of certain endemic diseases like malaria, tuberculosis, leprosy and dysentry is to be reduced to 2½ per cent.

(10) **Fertilizers:** To guard against dimunition in use of fertilizers ammonia and carbon dioxide used for manufacturing fertilizers, a nominal duty of Rs. 25 per metric tonne would be levied, as against the standard rate of Rs. 125 and Rs. 500 respectively.

(11) **Coal Tar:** Coal tar will be totally exempted from excise duty for the present.

(12) **Cables:** Duty on telecommunication cables as well as winding wires which were assessable at 15 per cent ad valorem would be assessed at five per cent ad valorem.

(13) **Acids:** All units producing without the use of power not more than 50 tons per annum of hydrochloric and nitric acids are to be exempted from all duty provided duty-paid sulphuric acid is used in their manufacture.

(14) **Plywood:** Coarse plywood, used mostly in the manufacture of packing cases, is to be exempted when produced in units whose total output in a year did not exceed 4,000 square metres.

(15) **Re-Rollers:** All re-rollers using mainly re-rollable scrap and who do not ordinarily get a quota of billets exceeding 10 tons a year are to be exempted provided duty has been paid for such scraps or billets.

(16) **Capital Assets:** Losses in respect of capital assets which had been or would be assessed up to the assessment year 1961-62 would be enabled to carry forward losses for eight years. Future losses in respect of long-term capital assets would be allowed to be carried for only four years.

As a consequence of these concessions, the additional yield to the Central Exchequer, which was estimated at Rs. 71.7 crores at the time of presenting the tax proposals in April, will be reduced by Rs. 77 lakhs.

BOARD OF TRADE'S FIRST MEETING

The Board of Trade, which met here last week under the Chairmanship of Mr. Manubhai Shah, Minister of International Trade, considered important items on the agenda concerning the development of trade and expansion of exports.

The question of evolving a code for fair trade practices and exhibition of price lists and price markings at the manufacturers', wholesalers' and retailers' level was discussed in detail. The representatives of wholesalers' and retailers' associations from different parts of the country were also present.

The Board generally welcomed the idea that in due course not only a code for fair commercial practices should be evolved and enforced but also an operational programme should be drawn up. In order to make a further study, it was decided to set up a sub-committee under the chairmanship of Mr. Shriyans Prasad Jain, President of the Federation of Indian Chambers of Commerce and Industry, who will be assisted by seven other members drawn from the trade and industry. The committee will draw up a draft code of fair commercial practices and will also prepare preliminary phased programme of implementation. What should be the commodities with which the average consumer would be vitally concerned, which important industrial and trade centres should be selected for the introduction of such a programme and in what manner manufacturers', wholesalers' and retailers' associations could co-operate among themselves in order to implement such a phased programme, will also be studied by the sub-committee in detail. Its conclusions and recommendations would be submitted to the Board within a period of two to three months.

The role of consumer co-operatives, fair-price shops, stamping of prices and exhibition of price lists and price markings will also be studied by this committee.

This approach is designed to initiate a movement wherein, through social discipline and co-operative effort, the manufacturers, wholesalers and retailers can not only establish fair trading practices but also ensure fair prices to the consumer.

EXPORT PLAN

The most important item on the agenda was the export plan for the current financial year. It was agreed that while the long-term programme was important, the most vital thing at the moment was the export performance during the current financial year. The Board agreed that every sector of trade and industry should fully activise itself and co-operate in the national effort to reach the modest export target of Rs. 720 crores set for the current year.

Several members pointed out that the two most important difficulties were transport bottlenecks and delays in granting of incentives and assistance. It was also pointed out that the supply of raw materials in some cases was not timely and adequate. On behalf of the Government, the steps that were proposed to be taken to meet these difficulties were indicated. The various export promotion councils and the Department of International Trade, it was stated, were trying to grant incentives and assistance to different industries as expeditiously as possible. A full-time Director of Incentives had already been appointed for this purpose. Any exporting trader or industry, who experienced any difficulty, could contact the Director of Incentives. A Director of Transport and Freight had also been ap-

pointed to assist the exporters in removing any difficulties in the way of speedy movement of goods meant for export.

ACHIEVING TARGET

However, it was realised that while the simplification and streamlining of procedures would be a continuous process, the trade and industry should make a determined effort to achieve the target fully. The supply of raw materials to the exporting industries would also be taken up on high priority. It should not be difficult for the exporters to obtain from the trade and manufacturers sufficient quantities of goods to achieve the target.

Several long-term measures for promoting export performance were considered. The main participating industries which had a steadily increasing export potential were plantation crops, cotton textiles and jute textile industries. It was, herefore, decided to give greater attention to these three staple exporting industries which contributed more than 50 per cent of the total exports. As far as engineering goods and chemicals and allied products were concerned, there was considerable possibility of their contributing larger volume of exports both on immediate basis as well as on long-term basis. The facilities to be extended to these industries should also be given special priority. The economy of scale and the optimum size of units for maximising productivity in these industries will be specially studied.

The Board agreed that while the long-term measures should continue to receive attention, the immediate task of all concerned was to give all attention to immediate export performance.

INCENTIVES

The Board also discussed the respective roles of the manufacturer-exporters and merchant-exporters. It was recognised that both these categories of exporters had vital roles to play in export promotion. The question of assistance to be given to the exporters would have to be further studied in consultation with each industry and trade concerned, as the nature of assistance would naturally vary according to the different categories of industry and trade.

The Vice-Chairman of the Board made a broad review of the discussion that the Government had with different export promotion councils during the last few months. All the export promotion schemes, he said, had now been put on a permanent basis and necessary and suitable modifications had been either made or were in the process of being made. One of the main items of incentives, he added, was that not only the supply of necessary raw materials and components for export items but also the machinery entitlement had been included in each scheme so as to provide built-in modernisation and raising of levels of productivity in each of the export entitlements.

A comprehensive directory of exports is being compiled in order to serve as guide to our embassies abroad and foreign buyers.

The question of promoting export houses and international trading firms, both by manufacturer and merchant exporters, was emphasised. The Board felt that the creation of a sound and healthy export tradition would get a great fillip by the establishment of well-organised export houses and export agencies.

Regarding the item on export finance and credit, the Board was informed that a study group, headed by the Chairman of the Industrial Finance Corporation, had been constituted. The Board felt that liberalised and widespread credit and guarantee facilities should be provided to the export trade and suitable institutional arrangements should be made to make both short-term and medium-term credits available at favourable rates of interest to the exporters and the exporting industries.

QUALITY CONTROL

The Board approved the establishment of a Quality Control and Inspection Council. The Council, when constituted, would place before the Board the operational programme of the quality control and pre-shipment inspection. It would be for the trade and industrial associations to promote the movement of quality control by establishing control houses and testing laboratories. Simultaneously, encouragement would be given to the specialised firms establishing control houses and test laboratories. Government would also establish control houses and testing laboratories for some of the important items of export trade at various industrial and trade centres. The quality control movement would have to be generated over a period of time so as to cover a large number of products and a large portion of the country in order to create consciousness on adhering to specifications and quality control.

The Board, however, emphasised that pre-shipment inspection should be given immediate priority because this would be the most vital and immediate phase of the quality control and inspection programme.

While the transport difficulties would continue, the Board felt that as the quantities involved in the export progarmme were only a small fraction of the total transport of goods in the country, it should not be difficult for the national transport systems to give overriding priority for movement of goods meant for export.

There was a general discussion on the committee to be appointed for studies of cost reduction programmes. Further consideration of this item, to select export products and manufactured articles for the cost reduction studies, will be continued at the next meeting of the Board to be held in Calcutta on July 6, 1962. Rest of the items on the agenda will also be taken up then.

The Board concluded its deliberations with the emphasis that the most important single task before the country was to create an adequate and vigorous export climate in the country in all sectors of economy. Only through the creation of such a climate, notwithstanding any minor or major difficulties, could the modest export target for the current year be a capable of being fully realised.

EXPORT POTENTIAL

A note circulated to the Board contained some loud thinking on the part of the Department of International Trade on the export potential of some important commodities, as also some of the measures contemplated to step up exports. The following extracts from this note would be read with interest.

"Mineral ores, particularly, iron ore and manganese ore, we have in plenty and their exports would give much higher foreign exchange earnings in the short term."

"The other group of articles which could be exported in large quantities in the short-term are those falling in the agricultural sector. We are priced out for groundnut oil and linseed oil. Their production over the years has increased, but internal prices of groundnut oil are higher by about 40 per cent over international prices. Clear decisions should be taken to earmark about 100,000 tons of these oils together for export; the necessary subsidies could be provided via the State Trading Corporation and its operations. Similarly, at least 500,000 tons of sugar should be earmarked for export."

"Pulses, the exports of which have been restricted,

need to be practically freed for export. Production in the last five years has increased from 5 million tons to 6.4 million tons and if 100,000 to 200,000 tons move in export, no particular harm would be done to the internal economy or the diet of the public. Similarly, oninos, potatoes, chillies, garlic and some other commodities should be made available freely for export, as also good quality rice like Basumati rice."

To step up cotton output, "irrigated area, whether presently available or to be added, needs to be actively diverted to cotton".

"There is possibility of much greater production on the side of marine products as well as meat and meat products. Unfortunately, higher production of fish has gone primarily towards increased supply to the domestic market. This is an excellect field for public sector operation and proposals for establishment of two public sector fisheries and one piggery mainly for exports are being examined. Simultaneously, public sector will have to take a lead in establishing installations at ports for storage of such commodities as oils, alcohol, molasses, etc."

COMPULSORY EXPORTS

"Export obligation on part of each manufacturer will serve to spread sacrifice evenly and would take away the 'pull' of the internal market which today the "manufacturer" has to resist as compared to the "non-exporter manufacturer" who exploits the internal sheltered market and who does not share the sacrifice and harder work involved in exports. Export obligation could be transferable so that when a manufacturer is not able to produce right quality, he can buy from others. In due course he will also produce right quality for export. Compulsory exports may have to be introduced in due course through some legislative measure if necessary."

"It is proposed to establish an Institute for Training in International Trade so that personnel in adequate numbers would be available both in the private sector and the public sector specialised in applied commerce and international trade techniques and to acquire knowledge of more than two to three foreign languages."

"The export finance problems are also being taken up. A proposal to set up an 'Export Credit and Guarantee Corporation' for extending guarantees for margins etc. and for rediscounting facilities through State Bank and other scheduled banks is under consideration. The problem of liberalised and well-spread export financing facilities both short-term and long-term is being considered."

"Central selling agencies are necessary in many fields. Iron ore is being sold only by the State Trading Corporation. Ferro-manganese producers have agreed that State Trading Corporation should also handle ferro-manganese. The manganese producers are also likely to agree to centralised sales agency. The film producers have now agreed, in principle, to the establishment of a central export agency. Shellac is an important export commodity in which India holds a large share of the world market and centrally-controlled selling agency would give much higher return per unit against exports. In order to avoid speculative forces, export of groundnut oil and linseed oil should also be canalised through the State Trading Corporation."

"Buffer stock agencies and State operations in stockpiling would help regulating prices at moderate levels, insuring somewhat steady prices for exports of finished products as well as of the primary products."

"Reorganisation of trade missions abroad and international trade information and exchange services will have to be undertaken."

"It is proposed to establish an Indian Exhibition and Fairs Society to participate in and to encourage fairs and exhibitions more so abroad."

HELPING IRON ORE EXPORTS FROM ORISSA

The Central Government has approved, in principle, a scheme of the Orissa Government to step up production of iron ore in the Sukinda-Daiteri area from 0.5 to 2.0 million tons for export, subject to the following conditions:

(1) The State Government accommodating the scheme within its overall ceiling;

(2) The Railways being able to move the surplus production from this area (surplus to what can be handled through Paradip port) to Calcutta or Vishakhapatnam, as the case may be; and

(3) The availability of foreign exchange required for the implementation of the mining project.

Part of the Sukinda-Daiteri area has already been opened up during the Second Plan for stepping up iron ore exports. The area is close to Calcutta as well as to the proposed new ports at Haldia and Paradip.

The State Government of Mysore has also set up an organisation for exploitation of mineral resources, including iron ore, for export. Any request from other State Governments, for undertaking mineral development projects for exports, will be dealt with on merits, it is stated here.

TRADE WITH TIBET

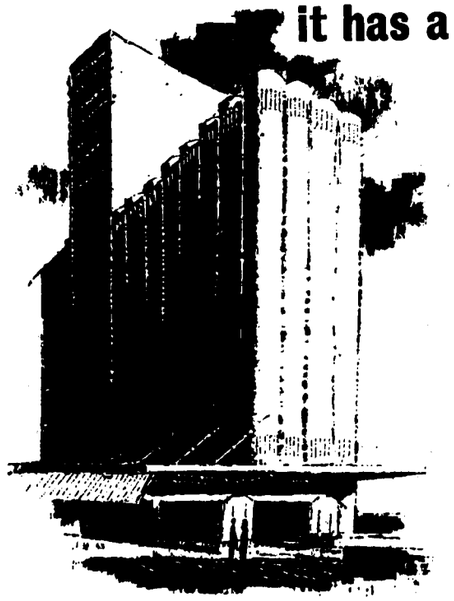
The Government of India has declared Tibet as a foreign territory in exercise of the powers conferred by the Indian Tariff Act, 1934. A notification, issued by the Government, says that customs duty, at the rate prescribed under the Indian Tariff Act or any other law for the time being in force, leviable on any article when imported into or exported from a port in India or the State of Pondicherry, shall be leviable on any such article when imported or exported, as the case may be, by land from or to Tibet.

SODA ASH AND CAUSTIC SODA: REQUIREMENTS AND OUTPUT

The existing requirements of India for soda ash and caustic soda are estimated as under:

1. **Soda Ash**		
i. Light	..	280,000 M. tons per annum.
ii. Heavy	..	50,000 M. tons per annum.
Total	..	330,000 M. tons per annum.
2. **Caustic Soda**	..	225,000 M. tons per annum.

The indigenous production of these two chemicals is as follows:



(M. tons)

		1961	1962 (Estimated)
1. **Soda Ash**			
i. Light	..	176,638	220,000
ii. Heavy	..	—	6,000
Total	..	176,638	226,000
2. **Caustic Soda**	..	119,854	130,000

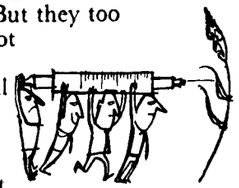
The following further capacities have been licensed for their manufacture during the Third Plan period:

i. Soda Ash	..	310,000 M. tons.
ii. Caustic Soda	..	288,000 M. tons.

A silo—built to accommodate 100,000 tons of foodgrains! If the set-up looks too luxurious, consider *this:* every year in India more than a million tons of foodgrains are destroyed by pests—due to old methods of storage! Colossal wastage? It is. One reason why scientific storage is important—almost next in line to raising food production in India. Today Larsen & Toubro supplies a wide range of plant and equipment in the field of food and agriculture: tractors and implements, earth-moving equipment, fertiliser plants, grain silos and food processing plants.

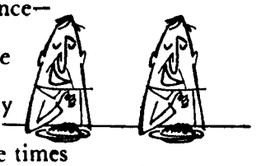
it has a lift. it has a railway siding.

what is it?



stronger than a pair of bullocks!

Certainly! And faster. Not the caterpillar—but the tractor that bears the famous name. It ploughs, for instance, about an acre an hour! (A pair of bullocks takes 16 hours!) Impressive? Then think also of the bigger machines: bull-dozers, scrapers, dumpers, traxcavators... all essential equipment for building irrigation dams and canals, clearing forest lands, harrowing and soil conservation.



plants do have feelings!

So science has proved. But they too occasionally need a "shot in the arm". Fertilisers, in other words. Essential for healthy growth and increased yield. Every year the demand is growing—and with it the need for fertiliser plants and equipment like the Chemiebau superphosphate plants and other process equipment manufactured by L & T.

which one is eating rice?

Hard to tell the difference—and that exactly is the point. Synthetic rice *looks* similar; it tastes equally good. Then why choose it in place of rice? Because it is three times more nutritious. It is comparatively cheap... two aspects that are important to a country with a food problem. And this is where Buhler come in—with their long experience and know-how.

bread does not grow on trees!

Nor do biscuits, for that matter! Bakeries need flour—large quantities of it every day! Now think of the time it takes to produce one ton of flour *by hand.* And think of the modern Buhler mill that grinds 1,000 tons a day—just one of the plants that L&T now progressively manufactures.

L & T contributes also to the development of these vital industries:

- **dairy**
- **oil**
- **steel**
- **chemicals & pharmaceuticals**
- **paper**
- **minerals**
- **electricity**
- **transport**
- **construction**

LARSEN & TOUBRO LIMITED IN SERVICE L&T LIES SUCCESS

NEW SCHEMES FOR MYSORE, MADRAS AND KERALA

The following major new industrial schemes have been included in the Third Five-Year Plan for the States of Mysore, Madras and Kerala. They will be in the public sector under the Central Government.

(Rs. crores)

State and Scheme	Approx. Investment
Mysore	
Watch Factory	2.5
Madras	
i. Raw Film Project (Near Ooty)	8.0
ii. Boiler Plant, Trichi ..	12.0
iii. Surgical Instruments Plant, Guindy	6.2
iv. Neyveli High Temperature Carbonization Plant ..	25.0
Kerala	
i. Second Shipyard, Cochin	20.0
ii. Phyto-Chemical Plant, Narialmanglam	6.2

The following new industries are to be set up in the public sector under the State Governments in these States:

(Rs. lakhs)

State and Scheme	Plan Provision
Mysore	
Sulphuric-acid Plant at Ingaldahl, based on pyrites, to produce 25 tons of acid per day	25
Madras	
i. Multi-purpose Food Plant ..	15
ii. Pilot Iron and Steel Plant, based on Salem Magnetite and Neyveli Lignite	75
iii. Steel Re-rolling Mill with a capacity of 20,000 tons per year ..	100

LD STEEL FROM BHADRAVATI

The Mysore Iron and Steel Works in Bhadravati will be the second, after Rourkela, to manufacture steel in India by the extremely economical LD process. The already existing plants are at present being extended by DEMAG by an LD and elecric steel works, one 800 ton mixer, one three-high blooming mill, one three-high finishing train and the necessary crane and subsidiary equipment. After completion of the extensions, 130,000 tons of crude steel will be produced annually in Bhadravati. During the last few years, LD steel works with converters holding up to 175 tons have been built by DEMAG for a number of steel works at home and abroad.

IN BRIEF....

In order to avoid hardship to Indian citizens resident in Goa, Daman and Diu who had taken out Life Insurance Policies with Portuguese Companies operating in Portuguese-held territories in India before their liberation, the Government of India, in consultation with the Life Insurance Corporation, has decided that all such policies will, in future, be serviced by the Life Insurance Corporation.

*

The final estimate of sesamum for 1961-62 puts the current year's area under this crop at 5,561,000 acres and the production at 366,000 tons. Compared to the partially revised estimates for 1960-61 (5,360,000 acres and 316,000 tons), the estimates for 1961-62 show an increase of 3.8 per cent in area and 15.8 per cent in production. The yield per acre during the current year works out to 147 lbs., as against 132 lbs. last year, showing an increase of 11.4 per cent.

*

The Minister of International Trade, Mr. Manubhai Shah, declared last week that India was not accepting any cut in Indian cloth imports into the United Kingdom. According to Lobby reports, the Government of India is equally opposed to a Government-to-Government agreement on textile imports into the U.K., instead of the Industry-to-Industry agreement as at present.

*

The British Government has reminded the Commonwealth countries in general and India in particular that Ottawa Preferences can be terminated by giving six months' notice by either party.

*

The Indian Investment Centre has received a foreign grant to undertake "feasibility" studies in order to attract American investment and know-how to India. The Ministry of Heavy Industries has suggested that these funds could be used in financing the visit to India of experts to study the feasibility of solid coal pipeline, river transport for coal, coal-mining machinery manufacture and manufacture of machine tools.

*

Poland is sending out to India a team by the middle of this month to discuss the possibility of long-term arrangements for the import of iron ore and other commodities from India. An Indian team is likely to visit Poland by October to negotiate industrial collaboration for the manufacture of coal-mining machinery and machine tools.

*

There is "at present" no proposal for the nationalisation of private coal mines, it was stated by the Union Minister of Mines and Fuel last week.

*

Aluminium Cables and Conductors (Uttar Pradesh) Private Ltd., Calcutta, has entered into a collaboration agreement with Messrs. VEB Kablework Oberspree of Berlin and Messrs. A. C. Limex of the German Democratic Republic for the manufacture of paper insulated power cables.

*

After inviting tenders on a global basis, the Calcutta Port Commissioners have placed an order with Simons Lobnitz Ltd., a Scottish firm, whose quotation was the lowest, for the construction of two diesel-propelled hopper barges of 1,400-ton hopper capacity, costing £712,450, inclusive of the cost of spares and incidental expenses.

*

A five-year grant of $ 3½ lakh from the Ford Foundation has been received by the Institute of Applied Manpower Research, set up (by the Government of India in New Delhi. The grant will be used by the Institute for further research programme, the establishment of a library in the manpower and economic development fields and for the training of Indian nationals abroad.

*

The Government of India has decided to reduce the existing rates of compounded levy on khandsari sugar by one-third for the period from July 1 to October 31, 1962.

*

The target set for production of radio receivers in the Third Plan is nine lakhs per year to be achieved by 1965-66, as against three lakhs a year set in the Second Plan. Of this, the production target for the organised sector is eight lakh receivers and for the small-scale sector one lakh receivers.

COMPANY AFFAIRS

TEXMACO

THE Directors of Textile Machinery Corporation Limited indicate in the annual report that the year 1961 has been one of considerable improvement for the company. Although there were certain handicaps like the labour troubles, which were controlled to a large extent, and a cut in power supply, the working has been by and large quite satisfactory, and has yielded comparatively higher profits. The Directors, however, add that the extent of progress made has not been fully reflected in results of the year because the improvement has been gradual. It would be reflected, they believe, in working results for the current year. Profit for the year at Rs. 76.39 lakhs was considerably higher than the last year's figure of Rs. 58.21 lakhs. After providing for depreciation of Rs. 24.37 lakhs, and for taxation Rs. 19.31 lakhs, the Directors suggested that Rs. 5.80 lakhs be transfered to reserve for development. The Directors further recommend the payment of a dividend subject to deduction of tax on equity shares of Rs. 10 each at the rate of Re. 1 per share. This will absorb Rs. 15 lakhs. The last year's dividend was maintained.

During the year under review the production in all branches of textiles Division has increased. Ring Frames and Carding Engines have shown substantial improvements and Drawing Frames have begun to be assembled. The developments of Simplex Frames is proceeding speedily and the first Frame is expected to be completed sometime in the current year. The working of the Textile Division is steadily improving and the Directors hope for a higher production in the current year. Orders in hand for all types of textile machinery are quite adequate. Apart from the better utilisation of the existing plant and equipment, the company is launching an ambitious programme for the manufacture of textile machinery to meet the growing needs of the country as determined by the Standing Committee that was set up by the Government of India to assess the requirements for the Third and Fourth Five-Year Plans. The Chairman of the company, Mr. K. K. Birla, was the Chairman of this Standing Committee and its recommendations have been accepted by the Government. The expansion programme will require the installation of a lot of new machinery and also the renovation of the existing plant and it is going to be implemented at the rate of the availability of the necessary import licences. The Company recently exhibited a Ring Frame, completely designed and manufactured in the company's works, at the World Fair at Seattle in America and it is a matter of satisfaction that the Ring Frame has been well spoken of.

The Directors report that the company was granted a licence to manufacture Texmaco Ward Capstan Lathes in collaboration with the well-known firm of Messsrs. H.W. Ward & Co. Ltd., London. The production of some lathes has started. These lathes have been delivered to the market and have been well received. Steps are being taken to increase the production according to a phased programme during the current year. The company is also making endeavours to undertake the manufacture of a more complicated variety of lathe known as 7 Combination Turret Lathe. A modern plant is being set up for the manufacture of these machine tools.

STANDARD MOTOR PRODUCTS

The annual report for the year to December 31, 1961, for Standard Motor Products of India Limited reveals that during the year their car Standard Herald was introduced which was well received in the market. They, however, add that the introduction of the 4-door Herald is delayed. Licence application for capital goods was granted in October 1961 and it takes 18 to 24 months to obtain capital goods and tooling. The introduction of the 4-door Saloon may be expected in 1964.

The profit of the company for the year came to Rs. 17.99 lakhs. After setting aside Rs. 8.25 lakhs for taxation and Rs. 2 lakhs for development reserve, there was a surplus of Rs. 7.7 lakhs. A dividend at the rate of 7 per cent on ordinary shares subject to tax was recommended by the Directors which, if approved, would absorb Rs. 3.29 lakhs.

INDIAN STANDARD WAGON

The profit recorded by the Indian Standard Wagon Company Limited for the year to March 31, 1962, after providing for taxation, depreciation, development, etc., came to Rs. 13.15 lakhs. The Directors have recommended the payment of a dividend on ordinary shares of Rs. 25 each at the rate of 28.5 per cent subject to tax.

The Directors consider the profit for the year slightly more favourable than the last year. They add that the additions to reserve this year are of Rs. 7.07 lakhs to General Reserve and Rs. 5.29 lakhs to General Development Reserve. These further reserves are necessary to ensure progress towards the modernisation of the plant.

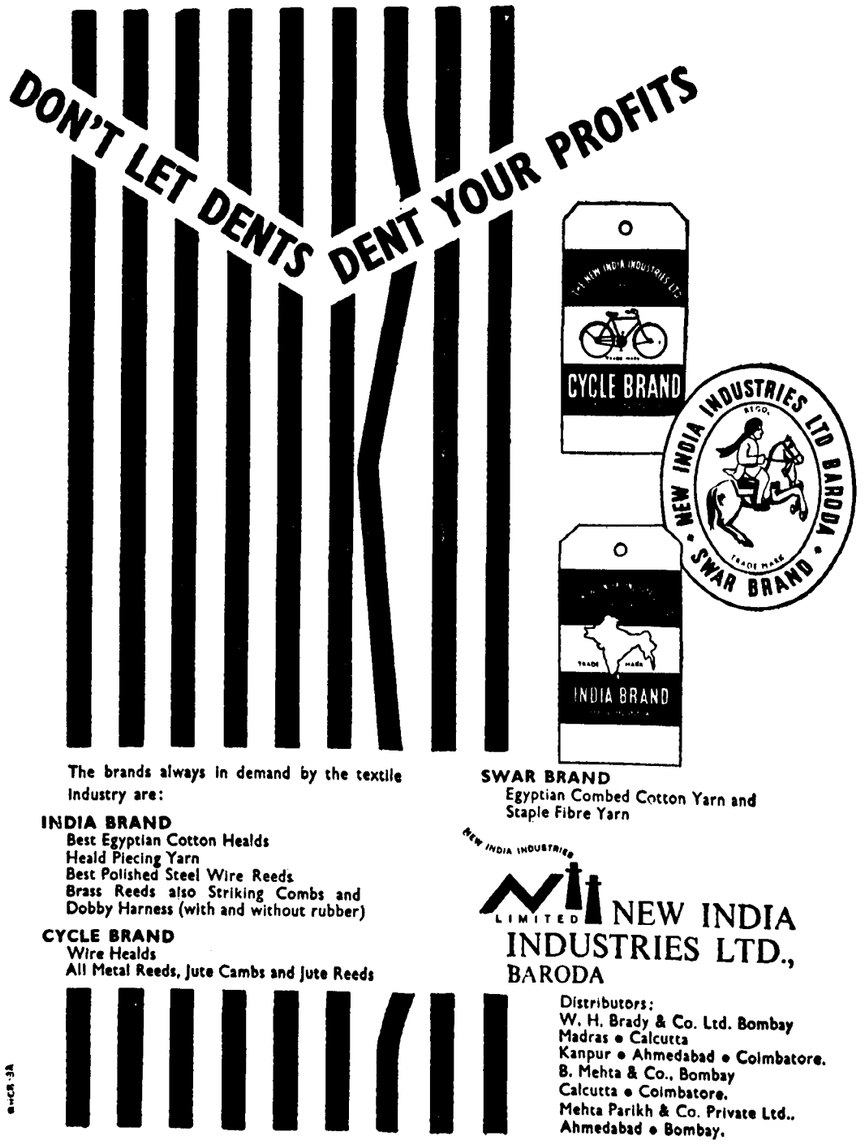
putting India on rails

Featured above is the "EXPRESS", Eastern Railway's first passenger locomotive.

UNTIL the advent of John Gray upon the scene in 1829, the main lines of business of the old-established firm of Burn & Company were house-building and cabinet-making. Gray put the affairs of the young company on a firm foundation and expanded its activities into the new fields of civil and mechanical engineering, iron founding and contracting.

Recognised as India's first railway contractor, Gray laid between the years 1851 and 1859 one hundred miles of permanent way for the East Indian Railway Company stretching over two provinces. Gray's pioneering railway work "reflected great credit on the Firm" and earned the Company good profits which went into the purchase of some land at Howrah on which a foundry and workshops—the nuclei of the present Howrah Ironworks of Burn & Co. Ltd.—were erected.



As a constituent of the Martin Burn Organisation, Burn & Co. Ltd., Howrah, have, among other things, specialised in railway engineering and the large-scale building of rolling stock for the Indian Railways. Since 1904, the Company has produced more than 58,000 four-wheeler units of more than 100 types and over 1,12,000 sets of crossings and switches for India's fast expanding transport system. In addition, from their Structural Shops have come many thousands of tons of fabricated steelwork for the building of railway bridges spanning the great rivers of this sub-continent.

The subscription list will open at the commencement of banking hours on June 18, 1962, and will close at the close of banking hours on June 25, 1962, unless closed earlier at the discretion of the Directors PROVIDED that the subscription list will not in any event be closed earlier than the close of banking hours on June 20, 1362 and that it will be closed at that date if a full subscription has been received by that date. Share certificates will be issued within 4 months from the date of allotment.

The Company commenced business on 25th day of October, 1951, and had been principally engaged in the mining and prospecting of Sillimanite and other refractory materials from the Khasi Hills in Assam. It has recently also undertaken extensive prospecting for refractory clays and minerals.

SCOPE AND PROSPECTS

The main aim of the Refractory Project, which the new issue is to help finance, is the establishment of a plant at Ramgarh, in Bihar, for the manufacture, on a large scale, of a special type of Sillimanite and other refractory bricks and shapes to meet the demand of India's growing needs. The Prospectus contains inter alia details of the land acquired by the Company and details of the pilot plant already in operation.

FOREIGN TECHNICAL COLLABORATION

The Company has entered into a Technical Collaboration agreement with the Vereinigte Grossalmeroder Thonwerke, Grossalmrods, West Germany and full details are given in the Prospectus.

INTERNATIONAL FINANCE CORPORATION (WASHINGTON) PARTICIPATION

The Company has entered into an agreement with the International Finance Corporation, Washington whereby, the International Finance Corporation Washington will lend the total foreign exchange requirements of the project amounting to Rs. 44 lakhs, for the first stage, and Rs. 21 lakhs for the second stage. Full details of the agreement are given in the Prospectus.

The Atomic Energy Establishment Trombay

ZERLINA

LIGHTING BY PHILIPS

A vitally important industrial-research complex, the Atomic Energy Establishment at Trombay is another outstanding example where Philips have solved an entirely new and complicated lighting problem.

From APSARA, the first Indian designed and built Reactor, to ZERLINA, India's third Nuclear Reactor, Philips have been actively associated with the Project Authorities. Their expert advice and pre-planned, scientific lighting techniques have contributed to the success of this gigantic installation.

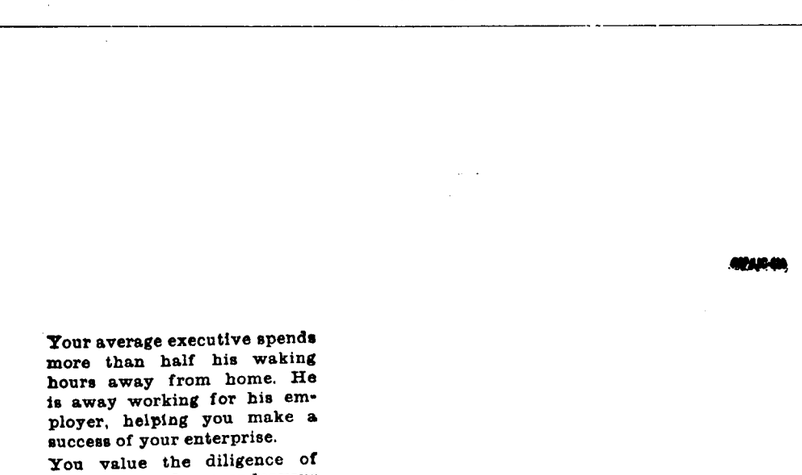
Philips' scientifically designed equipment is the result of experience, research and development aimed to meet the evergrowing demands of better lighting... And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

PHILIPS
quality lighting for ultimate economy

FREE: *For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.*

PHILIPS INDIA LIMITED

Your average executive spends more than half his waking hours away from home. He is away working for his employer, helping you make a success of your enterprise.



You value the diligence of these men and you endeavour to reward them accordingly.

The LIC can show you a new tax-light way to do so. It is through the Group & Superannuation Schemes. These Schemes possess three unique advantages:

1 Your executives can receive a part of their emoluments tax-free to build up retirement benefits and maximum family security
2 This may not involve any extra cost to the employer
3 The employer gets tax-relief on what he pays towards the Scheme

For further information, please contact the nearest LIC Divisional Office and have a word with the Manager. He will be delighted to give you full particlars.

IS HIS DESK HIS HOME?

A Helpful Mission

MR. DUNCAN SANDYS, Britain's Secretary of State for Commonwealth Relations, had a dual mission assigned to him during his visit to India. The nature of both was such as to allow only very limited information to be disclosed to the Press. In fact, he could do no more than touch the fringe of the controversial issue of the purchase of the supersonic jet fighters and he was very cautious in adding nothing to his very brief prepared statement on it. But in respect of the trade negotiations with the EEC at Brussels, he allowed himself a greater liberty, which served to modify the brevity-cum-austerity of the joint statement issued here on Tuesday on the Common Market negotiations. The net assessment unmistakably shows that the visit was helpful in widening the area of agreement on the forthcoming talks at Brussels and in clearing up some of the atmosphere of misapprehension on the delicate question of the supersonic aircraft.

From the full text of the Government of India's memorandum to the EEC and the official summary of the British proposals on safeguards to the export trade interests of India, Pakistan and Ceylon, it is apparent that a wide divergence exists between the two view-points. The differences are conditioned by the background against which the memorandum has been drawn up and the proposals are framed. The inhibiting factor for the latter was the British Government's own assessment of the length to which the EEC might go in agreeing on the form of the safeguards.

India has, of course, taken the view that negotiations between the Six and India, which have developed closer economic ties since India entered the era of planned development, presuppose adjustment in the original position that the Six may have been inclined to take up. She believes that there is scope for accommodating the developing Commonwealth countries, for whom trade with Europe is a vital determinant of their balance of payments and, therefore, of their plans of expansion. Accommodation has already been shown by the Six in the case of Canada, Australia and New Zealand by extending the application of the transitional tariff safeguards to all their industrial exports instead of the selected ones as first contemplated. India's deep concern about the short-term difficulties of the export trade with Britain, in the event of insufficient tariff safeguards and a transition period of inadequate duration, predominantly govern her approach to the negotiations. There is, nevertheless, the belief that in the long run a rapidly growing European market will produce a catalytic effect on her export-import trade.

Mr. Duncan Sandys' talks with Mr. Morarji Desai have been fruitful in an encouraging degree and from the available indications it seems clear that on the British side there is now an increased awareness of India's trade problems in relation to the enlarged Community. These problems must not be considered as concerned purely with exports. The Community's external tariff policy will no doubt produce a profound influence on her exports. But the flow of economic aid from that region makes the equilibrium between imports and exports a matter of primary concern to her. A heavy import surplus with the prospect of a slower expansion of exports (or, perhaps, stagnation or decline in a few commodities after the end of the transition) can ill go together. Furthermore, limiting the transition to the fourth year of the Fourth Five-Year Plan, gives too short a time to India to recondition the pattern of her exports.

Against this background, it is somewhat cheering to hear from Mr. Sandys that the two governments have come to a clearer and more positive understanding on the line to be adopted in the Brussels negotiations. In the last analysis India must argue her own case from her view-point if it is to produce any effect at Brussels. As we go to Press, Mr. Desai has made a statement in the Lower House, highlighting the fact that the EEC would very likely sign a special agreement with India to allow scope for the progressive expansion of her trade with the enlarged Community. The Finance Minister is undertaking a mission to conduct high level talks with the Six. This is heartening news, but optimism will need to be cautious.

Public debate in India and abroad on the MIGs even before any transaction or agreement is completed has had a vitiating effect in making a confused situation worse confounded. The Prime Minister's statement in the Upper House on Wednesday this week (which does not differ from the clarification given by the Defence Minister in his reply to the debate in the Lower House on the budget demands) makes it clear that there is no offer from the Soviet Government. But the intention to explore the possibilities of purchase is there, which makes the distinction between the two technical stages too thin. The risk of the consequences following the deal remains. Mr. Sandys has made the valuable disclosure that Britain has expressed her willingness to make an offer, depending on the preliminaries for the regular negotiations. Initial discussions between the two Governments will be the first preliminary, to be followed by precise proposals in the light of the former. This is the time to weigh meticulously the longer risks implicit in the MIG deal.

Nuclear Disarmament

THE Anti-nuclear Arms Convention, sponsored by the Gandhi Peace Foundation, met under the dark shadow of the deadlock at Geneva over the talks for clamping a ban on nuclear arms tests. It is incomprehensible how the Convention could be taken as having assembled under appropriate auspices, in utter disregard of this irony in the situation. If anything, the element of irony ought to have served as a reminder that the minimum that needed to be achievd in the immediate context was the abolition of nuclear tests. A tone of urgency is now imparted to the ban inasmuch as the tests have already entered the critical phase of experiments at high altitudes.

What was required at the Convention was a sense of realism, not an exercise in gazing at the stars. This is not to imply that the ardent advocates of peace, who participated in the three-day deliberations, were all oblivious of this imperative.

In fact, an outspoken voice was raised to impress upon the Convention that great things were expected of it, not in the nature of a philosophical discourse or a scientific thesis, but in the concrete form of a specific solution to the immediate problem of nuclear tests. The Convention could not suggest any. In the result, an air of unreality pervaded its sessions.

Contrary to the objective of the Convention, from the very start the discussions strayed from the abolition of nuclear arms to general disarmament. General disarmament is no doubt the final condition for the abolition of war, but little attention seemed to have been paid to the fact that in the order of priorities, based on imminent potential danger, nuclear tests, output and stockpiles demand the first offensive. But even if this reversal in priorities is overlooked, it was amazing that the issue of general disarmament was discussed naively in a philosophical spirit.

The proposition was advanced in all earnestness that India should set the tone for disarmament by a bold unilateral action. This was later amended by the addition of such other countries as may be pursuaded to join the unilateralist group. And with what result? How would unilateral disarmament by a non-nuclear power or powers produce a magic effect on the nuclear powers? What sanctions would be forged for the defence of the disarmed nations against aggression even with conventional weapons? A pious hope was expressed that the world would not allow such a nation to be the victim of aggression. If its protection is to be achieved by armed defence at the hands of other powers (and there seems no other way) disarmament defeats its own purpose.

The Convention was right in proceeding on the incontrovertible premise that nuclear arms are not the exclusive concern of the nuclear powers and in their destructive potential they will recognise no nuclear and non-nuclear boundaries. The nuclear war will be a total war without any frontiers of operation. But the remedy suggested at the Convention to bring the nuclear powers round was patently too impracticable to win substantial support. The UN General Assembly, it was stressed, could be prevailed upon to pass a resolution on nuclear disarmament and the recalcitrant powers could be expelled from the organisation. The sponsor was aware that the explusion of the Big Powers would be nothing short of effective dissolution of the United Nations itself. But the logic advanced by him was curious. The UN should rather commit suicide than resign itself to a purposeless and hypocritical existence. But, alas, even after this sacrifice at the high altar of principle, the scourge of nuclear arament would survive.

The nuclear powers hate nuclear armament as intensely as the non-nuclear ones. But having entered the dangerous race of armament of this variety, fear and distrust of each other deter them from retracing the step. It is up to them to realise the futility of the course they are pursuing due to a psychology of helplessness. And here the rest of the world can bring the pressure of mass opinion to bear upon their attitudes. This is a moral mission. In adopting the solution of persuasion at the UN level as well as by signature campaigns, the Convention reiterated a remedy that was already too widely known. But the resolution it adopted for organising a deputation of front rank leaders from different countries to approach the Heads of Government of the four nuclear nations to appeal to them to ban the tests, stop the manufacture of nuclear weapons and destroy their existing stock-piles — all in one bundle—betrays a lack of objectivity.

A Healthy Trend

AN illuminating research piece by the Reserve Bank of India on the ownership of shares of joint stock companies at the end of December, 1959, which incidentally fills an important gap in the available statistics on the working of the corporate sector of the Indian economy, imparts solid content to the belief that economic power in this country is getting more and more diffused. A study of the share registers of 70 companies, 56 of them old and established and 14 newly set up, has revealed that out of a total of 4,92,066 shareholders of these concerns, 98.87 per cent belonged to the group "individuals", 0.91 per cent to the group "joint stock companies", 0.17 per cent to the category "trusts and charitable institutions," 0.04 per cent to the classification "other institutions including LIC" and 0.01 per cent to the miscellanous section. Amongst individuals, 64.2 per cent had invested upto Rs. 1,000 and another 27.9 per cent between Rs. 1,001 and Rs. 5,000. These are obviously drawn from middle income brackets.

The total equity capital of these seventy companies held by individuals (52 per cent), as could be expected, was, of course, proportionately small as compared to that held by institutional investors, but it compared quite favourably with the pattern obtaining in the United States (57 per cent) and the United Kingdom (52 per cent). Another encouraging fact that has emerged from this study is that the number of shareholders belonging to the "individuals" category is steadily going up. In the new companies there were as many as 99.13 per cent individual (including joint holdings) accounts, as against 98.83 per cent such accounts in this trend obviously has gathered further momentum since 1959, as despite growing monetary stringency in the organised banking sector, most of the new issues in the market have been absorbed by investors as soon as the subscription lists have opened. Partly the boom in the Indian capital market can be ascribed to the protected sales field which the Indian industry enjoys by virtue of imports being shut off (this leads to capital appreciation at a very early date), but it can safely be assumed that the middle and the lower middle income groups are no longer shy of investing their savings in profit-yielding ventures as they used to be a couple of decades ago.

This development is healthy indeed and should augur well for capital accumulation which influences the pace of industrialisation. It apparently needs to be nursed and fostered carefully. One important step that ought to be taken with this end in view is making the balance-sheets of companies more intelligible to the lay investor who cannot always be expected to be so well-versed with their intricacies. This perhaps explains the preference of the small investor for shares of ventures which have on their Boards of Directors well-known industrialists or which have been floated in collaboration with foreign firms of repute.

Another important fact that has emerged from this survey is pertinent from the point of view of throwing open the capital of some State enterprises for subscription by the general public. The holdings of individuals, according to this

cement, electricity, shipping and iron and steel, while they are noticeably lower in such industries as tobacco, rubber and sugar. This perhaps indicates the preference of individuals for making their investments in *giant* enterprises of basic importance to economic growth, rather than merely in consumer goods producing industries. Nothing has been heard for quite some time now of the proposal to associate private investment by individuals with State undertakings. A firm decision on this issue is warranted in the light of the Reserve Bank's study.

Guest Editorial

Slump and Counter-offensive

By **PAUL BAREAU, Editor, The Statist**

THE persistence of the decline of prices in Wall Street and the meekness with which other security markets are following the American lead are beginning to cause some worried frowns on high brows in the United States and Europe. Anxious questions are being asked as to how far this deflation of security prices may begin to affect the economy and deepen into a more serious recession.

One can still say of the decline that it is essentially a corrective movement. It has been getting rid of the over-optimistic values to which the prices of equities had been hoisted last year. These prices were based on the assumption not only that inflation would continue but that it would go hand in hand with steadily increasing profits and dividends. That belief has been undermined for some time, particularly in the United States where for the past three or four years it has become evident that though costs might go up, manufacturers were finding it increasingly difficult to pass these higher costs on to the backs of consumers by way of higher prices. The same phenomenon has become apparent in Britain and in most of the older industrial countries.

In fact a highly interesting paradoxical stage has been reached in which cost inflation could become an active deflationary force. If profit margins have to take the impact of higher costs there will be inadequate profits to plough back into new industrial investment. Moreover, if profits fall and dividends have to be cut—and there has been a dismal succession of such company results in Britain recently—the undertakings concerned will find it extremely difficult to raise new capital in the open market. In these circumstances the classic pattern of deflation could be recreated, savings would tend to run ahead of productive investment and this in turn would create the conditions in which the vicious circle of further contraction of production and falling prices would start revolving ever more quickly.

The sudden realisation that this might be the shape of events to come, came in the United States with the vigorous intervention of President Kennedy in the steel prices dispute. This brought to American investors and industrialists alike the revelation that the days of easy profits were finally over. The hint was taken and very soon after came the infamous "black Monday" of May 28th. This was followed by a technical recovery due to bear covering, but since then prices have fallen again and the "low" of May 28th has been penetrated.

Whether this decline in security prices, which has been followed at some distance by the London Stock Exchange and European Bourses, grows into a deeper recession, depends on the counter-offensive launched by the authorities in the United States and elsewhere. In Britain these counter measures have got off the mark with highly commendable speed. There had previously been some cuts in the Bank Rate. Hire purchase restrictions have been eased. The Bank of England, with the consent of the Treasury, has taken an important step to widen the basis of bank credit by repaying to the commercial banks part of the special deposits they had previously been called upon to make with the central bank.

All this is in the best tradition of Keynesian economics. It should have the effect of stimulating the economy at a time when it requires a little judicious application of the accelerator. Fortunately, the strength of sterling, the reinforcement of the gold and convertible currency reserve and the state of the balance of payments, make it not only possible but safe for such reflationary measures to be taken.

In the United States, unfortunately, the doctrines of the late Lord Keynes are not as unanimously accepted as they are in Europe. President Kennedy and his economic advisers believe in them, and the Administration has moved in the right direction by promising substantial cuts in taxation. That proposal has, however, met most violent resistance in Congress and particularly among the ultra-conservative Republicans, to whom any policy consciously aiming at a budget deficit reeks of the devil.

President Kennedy has recently attacked this attitude. He has criticised the myth that Federal budget deficits create inflation and surpluses prevent it. He has pointed to the sizeable budget surpluses after the war which did not prevent inflation and to the persistent deficits of the last few years which have not upset the basic price stability in the United States. He has suggested to Congress that economic policy requires a somewhat more sophisticated approach.

It is evident that a battle royal on economic policy will be waged between the Administration and certain sections of Congress. Although it is highly probable that the Administration will win, a great deal of damage, actual and psychological, may be done while the debate rages.

There have recently been signs that the U.S. dollar may prove one of the casualties of this battle. It is significant that during the crumbling of security prices the one firm section of the market, whether in Wall Street or London, has been that for gold shares. Speculators are again beginning to talk about the possibility of a world-wide adjustment in the price of gold and to argue that such a day will be brought nearer if the stock market slump snowballs into a larger economic recession. The same symptoms are to be found in the market for gold itself where private hoarding demand has recently been swelling significantly and where the price has again risen above the danger point of $35.12. It is far too early to say the slump in the security markets is getting out of bounds and affectng the economy; but the danger signals are unmistakably flying.

THE WEEK'S NOTES

Algeria

OAS — SANITY RESTORED

AS JULY 1, the fateful day for the referendum in Algeria, began to approach, speculation about precipitate developments in Algeria became rife. Not that the result of referendum was held in doubt, but what was doubted was the possibility itself of the holding of the referendum. These apprehensions were accentuated by the sudden shift in the strategy of the OAS from a campaign of murder to the scorched earth policy. Entire institutions were set on fire or razed to the ground in the past few days. This was evidence of the fact that the OAS was fighting the last ditch battle in sheer desperateness. But its effects were horrifying.

The Europeans were quitting Algeria in fright because of the uncertainty about the future. The exodus to metropolitan France began to assume ever-increasing proportions. It is estimated that not long ago the rate of evacuation went up as high as 5,000 per day. This exodus and the firmness displayed by President de Gaulle about sticking to the prescribed date for the referendum at last convinced the OAS of the futility of their policy of destruction. The possibility of starting a fresh prosecution against Salan was another indication that their opposition would be crushed without any hesitation. The Avian agreement, as they now saw, had come to stay. It was in this situation that the secret talks between the OAS and the FLN were carried on in Algeria. They took not less than a fortnight to conclude, but the final outcome has brought spectacular relief.

Dr. Mostefai's broadcast over Algiers Radio gives the authoritative gist of the terms of the agreement between the two parties. The OAS is to be granted full amnesty as soon as practicable after the declaration of independence in Algeria. As Dr. Mostefai announced in his broadcast, the European settlers have been granted the unqualified assurance of equality of status with the Algerian nationals and safeguards for their property and other economic rights. What is important, as Dr. Mostefai's offer over the Algiers Radio made it clear, the past would be buried deep and the slate would be wiped clean to write a new chapter in the history of Algeria. The OAS apparently realised that once the FLN was in the saddle it would get the necessary resources—including especially the military resources—for a counter-offensive and it would only be a matter of days before its activities would be stamped out. Wisdom, therefore, lay in reconciling itself with the inevitability of Algerian independence and accepting the fair terms offered by the FLN. Nevertheless, the OAS had to abandon all hope of securing any modifications in the Avian agreement. The FLN leadership was quite dogmatic that the party would not budge an inch from the Avian agreement, but amnesty could be granted within its terms. While the OAS directive requires abandonment of the scorched earth policy from the night of Sunday, June 17, sporadic attacks by groups of unorganized desperadoes may not be ruled out. But the countrywide terror campaign is now withdrawn.

Kerala Coalition

UNCERTAINTY ENDED

THE ACTION of the Executive of the Kerala Pradesh Congress Committee in issuing a sharp policy directive to all the members of the Party, including particularly those of the Congress Legislature Party, making it quite clear that the coalition must be continued and strengthened will be hailed as a timely display of firmness. It was badly needed at a time when the differences between the coalition partners — the Congress and the PSP — became open subjects of public discussion producing no other effect than that of creating a strong impression that the fate of the Coalition Government was haunted with uncertainty even in the immediate future. No doubt the Executive of the KPCC lent full support to the Congress Ministers in their demand that the lower primary schools in the State should be allowed to run under private auspices. This demand is now conceded by the PSP, although it will be effective next year. But the school controversy was by no stretch of reasoning an issue on which the coalition could be allowed to founder. The Communist Party even out of office has retained its cohesion and strength and it is easily in a position to make capital out of the laxity in administration arising from differences inside the Cabinet. From propaganda for this purpose to organized agitation against the coalition would in no way mean a long step. Furthermore, communalism is again raising its head in Kerala after the severence of the alliance of the Muslim League with the Congress Party. One distressing result of uncertainty about the future of the coalition would have been to let loose the disruptive forces of Communism and communalism in the political life of the State.

More re-assuring proof of the firmness of the executive of the KPCC has come in the form of the explanation it has demanded from Mr. Maleth Gopinath Pillai, Secretary to the Congress Legislature Party, for issuing an inciting statement that on any particular issue, where the KPCC and the Congress Legislature Party held opposite views, the Ministers would be bound by the views of the Legislature Party in disregard of the directives of the KPCC. This is no occasion for making hair-splitting distinctions based on interpretations of constitutional obligations. Mr. Pillai is on unsure ground. He would be technically right if, and only if, the issue was one on which the Party gave a definite pledge to the electorate in its election manifesto and the Pradesh Congress Committee's directive amounted to a violation of the mandate. This question does not arise here at all, so that even a plausible excuse will not be available to the Legislature Party to flout the directive of the KPCC which it has rightly issued with a sense of emergency.

Financial Powers

DEVOLUTION

MR MORARJI DESAI'S announcement, in the course of his reply to the debate on the Finance Bill, regarding the Government's decision on the devolution of financial powers to the spending Ministries should serve to set at rest a long-standing controversy. Decentralisation was already being experimented in three Ministries at the Centre, but the announcement made by the Finance Minister carries the process a stage further and it is certainly a very vital stage. Mr. Desai declared that the Government had from now on decided to invest the Ministries with certain financial powers within defined limits on items which would be previously subjected to a close scrutiny. This planned devolution pre-supposes very careful pre-budgeting on the part of the Ministries concerned and a strict scrutiny by the Finance Ministry. Incidentally, this process should help to make budget estimates more precise and the present lopsided margins in estimation would be eliminated to a great extent.

The orthodox control of the Finance Ministry over expenditure, even after the demands were granted by the legislature, had justification when the Government's functions were quite limited. But after independence, with the assumption of the role of a Welfare State and the adoption of planned development of the economy, the scale on which expenditure is being incurred has increased enormously and the items on which the outlay is distributed have multiplied rapidly—factors which make centralised control by the Finance Ministry exacting in its own case and irritating and dilatory in the case of the other Ministries. It is somewhat strange that this bold reform should have been criticised on the ground that it would lead to laxity in spending and negligence in the standards of economy and efficiency in expenditure. The strict budgeting and scrutiny by the Finance Ministry do not leave much room for the play of these alleged consequences. The Finance Ministry has often been accused of making a fetish of the departmental procedure and causing inordinate delays in the sanctions of funds to the Ministries. The shortfalls in the performance of the Ministries in respect of their annual developmental programmes were very often attributed to the tight control retained by the Finance Ministry. Now that this grievance has been removed the Ministries would be put to the test of speedy and efficient execution of expansion projects. This reform should go a long way to reduce the "lapse ratio" in the grants by reason of non-utilisation before the end of the financial year.

Untouchability

PACE OF REMOVAL

THE MAIN finding recorded by the Commissioner for Scheduled Castes and Scheduled Tribes in the Tenth Report for the year 1960-61 emphasizes the fact that the removal of untouchability is taking place steadily, but at a gradual pace. But the reason for his concern is really not cogent. He is too much pre-occupied with the date-line of 1970 fixed in the Constitution for the withdrawal of the special safeguards provided for the scheduled castes and scheduled tribes. He thinks that the pace must be hastened so that the removal of untouchability will be accomplished before the safeguards are removed. There is nothing sanctimonious about this date-line. Untouchability is essentially a very intricate, deep-rooted, socio-religious phenomenon and if at the end of 1970 the situation justifies the extention of the date-line, there will certainly be no hesitation on the part of any section of Parliament to amend the Constitution to the end. To remove untouchability is the function both of the Government as well as private agencies, but the greater share of responsibility to bring about this result rests on non-official sources. A band of social reformers, inspired with missionary zeal, will do more expeditious and lasting work than any number of legal or financial provisions could do. What is, therefore, required is to pool such resources.

The Commissioner's recommendation for the appointment of an expert committee representing different social sciences and persons well-versed in administration and social work is superfluous. This problem has been thrashed in a number of scholarly treatises and a good deal of thought has gone into this question, nor has there been a dearth of active work for the removal of untouchability. The proposed committee is unlikely to throw any new light to accelerate the pace of removal. The Commissioner has frankly given credit to the Government for showing spectacular results in the field of the education of the scheduled castes during the periods of the first two five-year plans. This is undoubtedly gratifying since education will operate as a powerful force enabling the scheduled castes to assert their inherent position as equal members of the society. But it is disconcerting to find the Commissioner recording the conclusion that the economic condition of the scheduled castes has not shown any marked progress and no special schemes on a sufficient scale have been devised by the State Governments for levelling up their standards of living. This state of affairs is depressing against the background of a multitude of programmes of economic expansion in the smaller towns and the countryside. A deliberate policy ought to be adopted to make investment in programmes of appropriate industries or agricultural occupations to absorb the working force in the scheduled castes. Their economic and educational betterment will strengthen the forces working for the removal of untouchability. What is required in this arduous and time-consuming task is patience and perserverence.

Parliamentary Control

AN UNHELPFUL SEMINAR

IT WOULD appear that the departure which the Feroz Gandhi Smarak Samiti made this time, from the previous year's laudable practice of inviting a distinguished speaker to deliver an address on a constitutional subject of public interest, by holding a seminar instead has not proved to be a happy change. Last Sunday's seminar on the "Smooth and Effective Control of Parliament over the Executive" can hardly be regarded as having made a substantial contribution to the subject. Rather, the seminar took the form of a forum for the ventilation of grievances by the participants and this class included not only the Opposition Parties or Independent M.Ps. but back benchers in the ruling Party. To take some of the major points raised at the seminar. It is difficult to see how the procedure for the preparation and discussion of the budget can be made more elaborate than it is. A fruitful convention is now established whereby, in place of the Finance Minister piloting the entire budget, the Minister concerned with the demands for grants faces the House, offering comprehensive scope for raising criticism and obtaining elaborate clarification. The Public Accounts Committee and the Estimates Committee function with a remarkable degree of independence and they enjoy wide opportunities and powers to collect evidence.

How is the supremacy of Parliament or its control over the Executive to be asserted? Eventually, the solution will depend upon the standard of the practice of democracy in a genuine spirit. Parliamentary democracy, based on the party system of government, does not give an unfettered right to the Executive, drawn from the majority party, to govern at will, the mandate of the electorate notwithstanding. Its essence lies in discussion on the floor of the House and consultation through the various committees. A democratic executive is not expected to conduct itself with a closed mind, but it is placed under an implied obligation to be responsive to the Opposition and to be ready to modify its policies and decisions in response to constructive suggestions advanced by the Opposition. The process of consultation can be fruitful and Parliament's control over the Executive can be made effective in accordance with the quality of the debates and criticism. This presumes specialisation by Members of Parliament in subjects of their choice and observance of a code whereby they should normally limit their participation to such subjects only.

The World Abroad

WHAT IS THE "ESTABLISHMENT"?

By

ODYSSEUS

IT IS FASHIONABLE in Leftist circles in the U.K. today to satirise the "establishment." By this, the Left means anyone who has gone to one of the traditional public schools, on to Oxford or Cambridge, and then achieved a good position in the City, the Civil Service, or the Conservative Party, allegedly through his social connections. The "establishment" is 1962 slang for what used, with equal suspicion, to be called the "ruling classes."

It is not my purpose to try to refute this theory of "insiders" and "outsiders." We may agree that the able working class boy, or the lower middle class outsider, has a more difficult initial struggle to secure recognition for his talents and has to push harder to get his toe in the door.

But what should be sauce for the goose should be sauce for the gander. The Left, which is understandably irritated about the social "establishment," is wholly indifferent to the economic "establishment."

Here are some examples. Admission to the ranks of taxi-drivers in London is limited by strict rules. An enterprising company has found a loophole in these rules and has launched a fleet of cheap mini-minor cabs. That these are well patronised means that they satisfy a previous unsatisfied demand. What is significant is not that the "legitimate" (sic!) taxi-drivers object, but that their "establishment" has succeeded in getting parliamentary support for a bill to close the loophole and enable them to retain their monopoly.

THE COTTON "ESTABLISHMENT"

Soon after World War II depression hit the U.K. cotton industry. The industry's first response was to inaugurate price-fixing and output control. As Professor C. L. Allen of London University says in his first rate new book "The Structure of Industry in Britain" (Longmans. London. 1961. Price 12sh. 6d.), these schemes maintained prices at a higher level than would have obtained under free competition and slowed the rate at which surplus capacity was eliminated. They were condemned by the Restrictive Practices Court at a time when the industry was suffering from the enterprise of Indian and Hong Kong manufacturers who had invaded the U.K. textile market. Prices fell, and the full extent of the surplus capacity of the cotton "establishment" was revealed. It might have been expected that government would leave the industry to contract, especially as it seemed that the process would be rapid and since most of the displaced workers could, in an era of full employment, count on finding jobs in neighbouring industries. But, as Professor Allen observes, apart from the tender regard which both political parties have for Lancashire as the home of many marginal Parliamentary seats, present day Governments cannot, it appears, allow free competition when it threatens a large established industry. If the ordinary "establishment" is a social force, whose moth-eaten survival is to be deplored, the economic "establishment" is a victorious political force very much in being. So the Government provided compensation for scrapping machinery and subsidies for the re-equipment of a contracted cotton industry, which, it was hoped, would be capable of meeting overseas competition. That it would, however, have been more realistic to allow the cotton industry to find its own level through competition now emerges from a report of a House of Commons Estimates Committee, which says that much of the expensive machinery installed in 1959 is threatened with idleness, and much of the £23 million provided in compensation has been spent "to no purpose."

When a contracting economic "establishment" is a nationalised industry, like the railways, it should be possible to rationalise without the delays and individual resistance that accompany reorganisation in an industry composed of many independent firms. In fact, however, not only the trades unions protest but a wide section of the public joins in, urging that even though certain branch lines are insufficiently used to make them pay, they are fulfilling a "social need." A letter to the "Times" says that the Government proposes to deprive "thousands of ordinary people of one of their basic freedoms: the freedom to travel in reasonable comfort and safety at a reasonable cost." To suggest that it would be worth investigating the use of the railway lines as cleared tracks for hovercraft, capable of flying over the routes at high speeds, and able to stop at will, would be to affront the railway "establishment."

Professor Allen describes the tremendous transformation which British industry has undergone between 1900 and 1960. Goods of little importance in 1900, or entirely unknown, now form a huge proportion of U.K. output, and even those produced in large quantities in past decade have changed profoundly in quality. Motors, the present chief form of transport, hardly existed and there were no aeroplanes at all sixty years ago. The private cars and commercial lorries of the 1960's are very different from those of the 1930's and an entirely new product, agricultural tractors, now forms a substantial part of the industry's output. Television, the present chief form of entertainment, was unheard of in 1900, and was still several years in the future when imagined by Bernard Shaw in his play "Back to Methusalah" in 1917.

TRANSFORMATION OF U.K. INDUSTRY

The transformation of British industry is obvious as one looks back over the decades, but at the time when new products first appeared and the changes were in embryo, innovators needed vision and courage to push ahead in the face of disbelief or indifference. Governments, the press, and business leaders, usually concentrate on the problems of established industries, especially of those in difficulties. The industrial "establishment" naturally associates national prosperity with the progress of particular groups of great industries and is slow to be persuaded that the future may lie with obscure industries of trifling size. So a period

• The Third Five Year Plan
Bird-Heilgers' part in it...

MADE IN INDIA

A SIMPLE PHRASE...
...VITALLY IMPORTANT!

"...special emphasis is being placed on... steel and machine-building and the manufacture of producer goods". The Third Plan very rightly stresses the need for rapid industrial development. Every new project for domestic production creates employment, saves foreign exchange, adds to the national striving for economic independence. The expansion of indigenous manufacture is critically important, and Bird-Heilgers is deeply committed to this decisive aspect of the Plan.

Steel for a solid industrial base

Steel is the very life-blood of an economy. Industries, utilities, homes, all depend on steel. Steady steel production depends, in turn, on the uninterrupted supply of minerals to the nation's blast furnaces. Bird-Heilgers supplies these minerals. Between 1957 and 1961, the group's output of minerals—coal, dolomite, iron and manganese ore and limestone—shot up almost 100% to well over 6,000,000 tons. The group will continue to help meet demand...to feed the blast furnaces with the minerals they must have

"Made in India"—by Bird-Heilgers

A vast range of products, hitherto imported, are now manufactured in India by Bird-Heilgers. The group produces jute goods, paper and board, water treatment equipment, air compressors and springs, castings and fabricated steel. The refractory manufacturing plant is the largest single unit in the East. A factory for the production of coal washeries was the first in India.

The group's engineering units are extremely flexible. They contribute, with equal facility, to projects as far removed as blast furnaces and ceramic plants. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. The agency department handles everything from heavy capital equipment to light consumer goods.

Towards a self-generating economy

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group is alive to the problems of a growing economy. It deploys the full potential of a century's resources, technical knowledge and executive skill to broaden its activities...increase domestic production...join in the national drive to economic independence.

PIA FIRST AGAIN-

FILMS WHILE YOU FLY, WHATEVER YOU PAY FOR YOUR TICKET

Now, planes of PIA's intercontinental Boeing fleet are showing the world's best *new* films on their Karachi–New York–Karachi routes. Only PIA offer this new kind of jet-flight relaxation to *all* passengers, first and economy class.

And films don't interfere with PIA's cabin service, still as good as any in the world. Whatever you pay for your ticket, you get jet speed and comfort, record-breaking punctuality—and now the world's best new films to help you relax.

No wonder more and more experienced jet travellers are saying PIA are great people to fly with...

Great people to Fly with PIA PAKISTAN INTERNATIONAL AIRLINES

of transition is likely to be one of foreboding. The decline of established industries can be observed and measured, but contemporaries cannot judge the future of industries in embryo. In 1900, no one could predict that by the late 1950's exports of road vehicles from the U.K. would be five times in value those of cotton textiles, that the net output of the radio and tele-communications industries would be substantially greater than that of shipbuilding, or that of aircraft greater than that of wool textiles.

If the past is a guide to the future, we must suppose that the industries that will surge into the lead in the twenty-first century may as yet be unidentified, if indeed they exist at all. There is no reason to suppose that the changes of the coming fifty years will be less striking than those of the last fifty. Or is there?

Today the economic "establishment" — the public authorities, central and local — decides, directly or indirectly, over half the U.K.'s annual gross investment — in the nationalised industries, in supervising the steel industry, in its role as leading customer for many products, such as aircraft, in financing research and development, in long term policies that affect major private industries, like agriculture, in financing the expansion, re-organisation, re-equipment, or location of industries, and in innumerable other ways.

An economy which is merely rationalising, re-equipping, or expanding existing industries is not dynamic. Growth means innovation — the exploitation of entirely new products or techniques. British industry was not transformed by the leaders of the economic "establishment," but by the enterprise of innumerable small or medium sized entrepreneurs, like Rolls, Morris, Marconi, Ferranti, de Havilland, or Mullard, men whose criterion was a matter of fact: "Does it, or doesn't it pay?" Today, this question is regarded as bad taste and is asked in a shrinking area of the economy. The economic "establishment's" criterion is the "national interest." This is not a matter of fact but of opinion, largely determined by vote catching.

Conclusion? The clock cannot be put back. State intervention is here to stay. But I do urge that, in all countries, we should look upon the economic "establishment" with as keenly satirical an eye as we look upon the social "establishment." I applaud Professor Allen when he says that it is unwise to pursue policies that encourage uniformity. We should abhor "closed shops," keep clear the channels of entry into professions, trades, industries, be suspicious of the pressure of an industry's "establishment" — its representative body — that divides firms into "legitimate" and "illegitimate" members. We should applaud the poacher rather than the game keeper. These are the ways to keep the economic "establishment" on its toes, to keep every kind of initiative alive, to minimise the over-centralisation of decisions, to maintain the competitive pressures which keep established firms and industries from falling back on the government for rescue operations. These should be the aims of "progressive" people as much in the economic as in the social sphere. Full employment, the Welfare state, the Socialist attack on private enterprise, the UK's new anti-monopoly policy, the closer relations between government and industry, all combine to make industrialists conscious of their "social responsibilities". In highly competitive industries the necessary discipline exists. But in nationalised industries or in monopoly markets, the economic "establishment" is likely to get its reactionary way all too easily. What should be the test of the "national interest"? The truth lies in nuances but, broadly speaking social aims are best accomplished by ensuring competition and by doing whatever earns the biggest profits.

The European Scene

ASIAN TEXTILES VERSUS EUROPEAN CHEMICALS

From Our Special West European Correspondent

PARIS, June 16.

THE European natural-textiles industry (cotton, wool, linen, silk and jute) today faces two formidable competitive challenges: synthetic textiles and the exports of Asian countries. However, these two threats are not cumulative, they cannot be added together. On the contrary, the first provides the antidote to the second, to the extent that European spinning and weaving mills make the relatively minor technological adjustments necessary to use their equipment to handle synthetic fibres. Only in the case of Japan are these competitive threats cumulative, for Japan at once benefits from comparatively cheap labour and is a major producer of synthetic fibres: her output of these is second only to the USA's and increased last year by 30 per cent. Japan thus constitutes a case apart, and the European textiles protectionists confuse the issue when they lump Japan in with the "cheap-labour countries of Asia". Their governments in fact treat Japan as a case apart — Tokyo forces them to, because the value of the Japanese market for European capital goods gives her a bargaining counter that has been used adroitly.

For India, however, the situation is very different and some recent studies of trade in textiles between Europe and Asia have been honest enough to say so. Despite the agitation of the textiles protectionist lobby (which is particularly active in Brussels during the negotiations about Britain's entry into the Common Market), it is not Indian agricultural fibres that threaten the European mills. It is rather that chemical fibres threaten the natural products, and the European mills have the opportunity to switch easily from natural to chemical materials, whereas the Indian mills (lacking the support of a major chemicals industry) have not. Thus, exaggerating a little, one could well imagine the situation where all restrictions on import of Indian textiles into Europe were removed without the Indian exporters gaining much nor the European mills losing much — because synthetics would have claimed the greater part of the market, and the European mills would have converted to follow this trend.

In stating their case against unrestricted import of Indian textiles, the Common Market producers continue to speak of the textiles industry as a labour-intensive occupation. The public and politicians, who are always several years behind technological developments, believe that this is true and find the protectionist case reasonable: European wages are higher than Indian, so it appears that open competition would result in loss of employment for large numbers of European workers. There would be much to say about the comparison of European and Indian wages in the textiles industry. The contrast between per capita revenues is stark and familiar but it does not apply in textiles, for European textiles wages are about the lowest in any branch of Western industry while Indian textile wages are nearer the highest in the country. Taking productivity into account, the difference is even less, and by the time Indian textiles are landed in Europe they are not so fabulously cheap, except for types of cloth that are produced in vast quantity and which serve as a raw material for an advanced textile industry such as Europe's. However, the disadvantage of the European mills in the matter of labour costs cannot be denied.

The point is that the textiles industry in Europe is becoming less labour-intensive and is in fact being incorporated into the chemicals industry. The chemicals firms are going into textiles while, what comes to the same thing, the textiles firms are widening the range of their chemicals production. For example, Hoechst and Bayer in West Germany, which issued from the break-up of I. G. Farben, now do one-quarter of their business in textiles. On the other hand, a French firm like Textil, which started out as a specialist in finishing (i.e. the chemicals end of the traditional textiles industry) has broadened its interests until it is now really a chemicals firm. The textiles industry, primarily a mechanical occupation, was always chemical at one end, finishing; now it is chemical at the other end too, raw materials, for these are increasingly man-made fibres. The mechanical division that subsists between two chemical ends is being revolutionised constantly, and under the direction of the chemicals industry. This was inevitable. The chemicals industry is highly concentrated and it found itself getting involved with an ancient craft that had virtually escaped the second industrial revolution and still retained a scattered capital structure. To spin and weave the chemical fibres it received from Hoechst, Rhone-Poulenc or ICI it needed fresh capital and new management, and these came from the bigger industry. The unification of the two industries would not have gone so far but that it was discovered that the best outlets for the man-made fibres was in mixtures with natural fibres: rhovyl and wool, cotton and nylon linen and tergal.

The chemicals industry soon realised that it could not rest content with being the supplier of a new sort of raw material to an ancient industry. The revitalisation of that industry was a prime condition of its own expansion. For example, last year it was found in West Europe that sales of underwear made entirely of synthetics increased by 24 per cent, whereas sales of the same piecegoods made of a mixture of synthetics and natural fibres increased by 66 per cent. The chemicals firms discovered that, like it or not, they were in the textiles trade. They proceeded to modernise it, improve the technical qualification of its labour and expand the size of its installations (this last, because there were economies of scale to be realised in mills using synthetics that did not exist when they used only natural fibres). Even that part of the textiles industry that stuck to agricultural fibres found that it had to resort to the aid of the chemicals firms to give its materials special treatment that enabled them to stand comparison with chemical fabrics; as is known, big advances have been made in the chemical treatment of wool, cotton and linen. The competition of Asian natural textiles hastened this process. As European mills found their export markets threatened, they sought compensation in chemicals sidelines. For example, there are firms that are called jute spinners or weavers and are still listed in the stock markets as textiles firms, but which in reality

MODERN DIVINING ROD

Operated by skilled men, seismic surveys can probe the earth to track underground rock structures that may contain petroleum. Shock waves created by small charges of dynamite travel down, hit the rock formation and bounce back again, to be recorded on the surface by sensitive instruments which produce an X-ray picture, as it were, of the earth's crust. If the picture looks favourable, the next step is to drill a test well.

Geological and geophysical techniques have made oil exploration less of a leap in the dark than it used to be, yet even with scientific aids like the seismic survey it is the drill alone that gives certain knowledge of the presence—or absence—of oil.

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH AIR-INDIA AND QANTAS

are chemicals firms making plastics, to line or supplant jute bags.

The swallowing up of the textiles industry by the chemicals firms is, of course, far from complete but the trend is clear. Already, last year in France two out of every three shirts sold were of nylon, and 30 per cent of all the fibres consumed by the textiles industry were chemical in origin. The tonnage of man-made fibres converted into textiles, five years ago, was 39 per cent of the tonnage of cotton used; last year it was 55 per cent—and much of the cotton used was in combination with synthetics. One refers to tonnages because there is no other convenient measure, but this is quite misleading since chemicals fibres are lighter: weight for weight, the "covering power" of synthetic textiles is three and a half times that of wool and twice that of cotton. The inroads of synthetics are thus much more substantial than the tonnages indicate.

Te European mills have not suffered from this process. Although we speak of the "cotton industry", the "wool industry" and so forth, there are really only spinning, weaving, dyeing and piecegoods industries, which are perfectly capable of changing their raw materials, given technical adjustments. The silk weavers of Lyons, for instance, who date from the Middle Ages, would have disappeared long ago if they had not learned to weave rayon soon after it was invented; they have learned to handle synthetics with no more trouble. In any case, as mentioned, the new fibres are often used in combination with the old, so the conversion is even simpler. Some branches are hit: installations for combing wool obviously have no future when wool sales decline, and spinners are short-circuited when the chemicals firms produce continuous fibres. Yet on the whole the adjustments are not too painful when spread out over several years and when the bigger and richer chemicals industry is there to supply capital and know-how.

The moral of all this is that it is misleading to speak of competition between the European and Indian textile industries. The real competition is between the Western chemicals industry (of which textiles is, increasingly, becoming one division) and Indian mills spinning and weaving natural fibres of which the market is contracting. In this competition, the balance of power is decidedly unequal and the trend, as everywhere that synthetics have challenged natural materials, is toward victory for the challenger. World consumption of all textiles has increased since just before the war from 8 million to 15 million tons, but in that period the percentage of chemical fibres in the total has risen from 11 to 23; output of synthetics alone has been multiplied by 10 in the last decade. (These figures must be read with the above remarks about weight-for-weight covering power in mind.) Moreover, figures referring to the last 10 or 20 years give no idea of the advance of synthetics, for they are just entering on their period of maximum expansion. Italian output of synthetics, for example, rose by 25.6 per cent last year, and so far this year it is running 68 per cent above 1961! The current French plan foresees an annual increase of no less than 16.5 per cent in output of synthetics, against only 4.5 per cent yearly for the textiles industry as a whole (including synthetics)

The impact of this progression on the trade balance of the European countries is considerable. They save imports of natural raw materials and of piecegoods made of natural fibres, while gaining new export markets for chemical fibres that are not manufactured by developing countries that do not have a chemicals industry. Thus, chemical fibres last year contributed Rs. 145 crores to the French trade accounts, counting earnings and savings on both sides of the register. Meantime, countries producing natural fibres see their markets contract or stabilise, while prices fall. Between 1953 and 1959 natural fibre imports by West Europe rose by only 6.4 per cent, which is negligible in view of the rise in population and incomes in that period. Worse, the value of those exports fell by 24 per cent. This greatly assisted the European mills who were transferring from natural to chemical raw materials, but it lopped $642 million off the revenues of the natural fibre exporters.

It has been said so often that one comes to believe it that textiles are the one department where the developing countries can compete on equal terms with the industrialised West. European producers have said that this is so true that they require blanket protection to save them from an invasion of cheap Asian cloth. On the contrary, the trends indicate that textiles are no exception to the general evolution of world trade in favour of the industrialised economies, to the disadvantage of the developing countries.

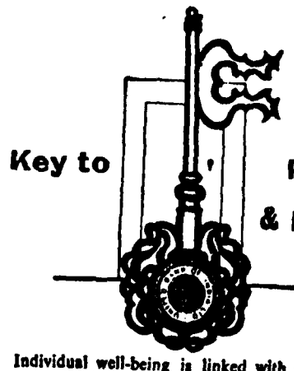
Economic Report from the U.S.

DECLARATION OF ECONOMIC INDEPENDENCE



By GUY SIMS FITCH

WASHINGTON, June 12.

PRESIDENT Kennedy journeyed to New Haven, Connecticut, this week, to old and renowned Yale University, to receive an honorary degree and deliver the commencement address. It was an address rumoured in advance as an important pronouncement on economic policy — and that it was. In effect, the President was issuing a kind of declaration of economic independence for the United States. He called on the American people to free themselves of old and enfeebling generalities — the myths, cliches and other impediments of the past — and to seek and find constructive and realistic responses to the new challenges of a new age. In this sense, one is reminded of another commencement address delivered 15 years ago at another old and renowned seat of learning, this at Cambridge, Massachusetts. It was at Harvard University in June 1947 that the then Secretary of State George C. Marshall made the proposals that developed into the highly successful and integrated plan of European economic reconstruction which still bears his name and which, though long since ended, helped lay the foundation for much of Western Europe's present unity and strength.

Just as there were those who may have missed the significance of Secrtary Marshall's words when they were uttered back in 1947, there may be some who do not quite grasp the significance of President Kennedy's words in this year of 1962. Yet what the President had to say about the problems of the modern U.S. economy, with specific reference to fiscal policy and the role of government, may well lay the foundation for important innovations in American economic thought and practice. To a large extent, the President's new approaches to economic policy were foreshadowed by the wide-ranging actions of his Administration during its 18 months in office. And certainly, he has spoken often enough about finding solutions to today's pressing problems, as at the recent White House Conference on National Economic Issues. But he has now taken this subject from the all-but-exclusive grasp of the economic specialists and injected it openly and vigorously into the realm of public attention, there to be subjected to the rigours of national discussion and debate.

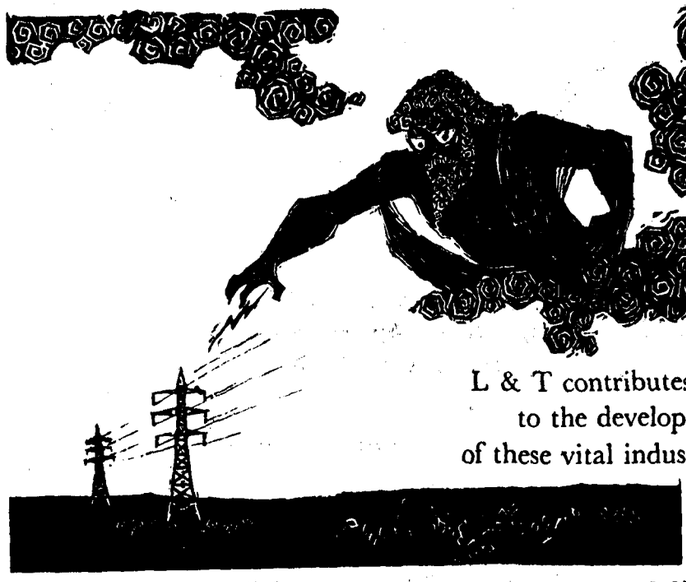
The President indicated more clearly than ever before his interest in seeing some important revisions in Federal fiscal policy, with emphasis on a more realistic measurement of the government's impact on the economy. This would help remove the myth that budget deficits somehow are bad in themselves — or at best necessary evils — and it would permit the government greater leeway in adopting tax and spending programmes geared to national requirements. In this regard, the President noted that deficits or surpluses in the conventional, or administrative, U.S. Budget more often than not appear to bear little direct relationship to the fueling or stifling or inflationay movements. As a matter of fact, despite some apparent budgetary difficulties, the public debt per person and as a percentage of the gross national product (GNP) — the total output of goods and services — has declined substantially since the end of World War II. In the same vein, while Federal outlays have been going up steadily, they have grown less rapidly during the p.s. 15 years than has the economy as a whole. These increases, moreover, have been due largely to expanding governmental responsibilitis in an economy which has been growing in complexity as well as size. In this kind of an economy, the government cannot be expedited to abrogate its authority and influence, but must be prepared to use them wisely and prudently to promote the nation's legitimate interests in economic progress and welfare. It is easier to set, and even to agree on, basic economic goals — such as high employment, rising production, stable prices and a strong currency position — than it is to find ways of at aini g them. This is a matter not of conflicting ideologies, as the President sees it, but of the practical management of a modern economy. It calls not for cliches or labels, but for hard-headed discussion of the sophis.icated and difficult questions involved in "keeping our mighty economic machine moving steadily ahead." These questions, inextricably linked, concern every aspect of economic life — be it fiscal and monetary policy, consumer buying power, business investment, wage and price decisions, technological change, employment opportunities, balance of payments, world markets, or any other. Finding the kinds of solutions to these problems that will best meet the nation's needs and potential within the concept of its traditionally free and democratic society is a challenge President Kennedy has thrown to this generation of Americans.

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited



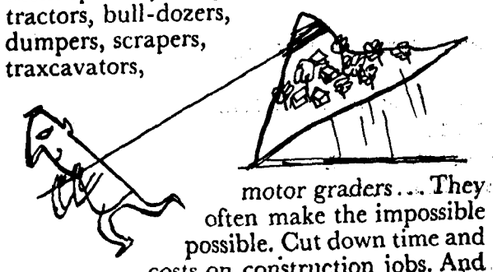
HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1

with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.

offers complete banking service

What happens when lightning strikes a transmission tower?

Imagine a city with its power supply cut off! No lights, no air conditioning, no electric trains or trams! No factories and mills. No theatres... *That* is what happens, unless electrical systems are adequately protected—by switchgear, control and relay panels, like the ones manufactured by Larsen & Toubro. But that is not all! L & T today supplies a wide range of equipment vital to many aspects of the electrical networks—from the generation of power to its control and distribution!



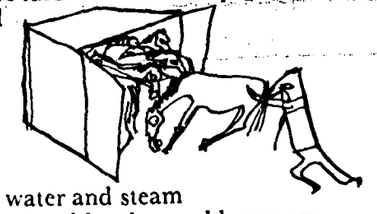
L & T contributes also to the development of these vital industries:

- dairy
- oil
- steel
- food & agriculture
- chemicals & pharmaceuticals
- paper
- minerals
- transport
- construction

man can move mountains...

But not by faith alone! He needs equipment specially designed for the job: tractors, bull-dozers, dumpers, scrapers, traxcavators,

motor graders... They often make the impossible possible. Cut down time and costs on construction jobs. And that is what Caterpillar equipment is doing—helping to build giant dams for hydro-electric projects all over India.



next time when the power fails...

Be thankful the fuse has done its job! Prevented an accident in your house, perhaps—or saved costly equipment from damage. And in large factories, switchgear performs the same function. Cuts off power when it must—and protects equipment worth millions of rupees! Ensures at other times an unbroken flow of current—and prevents loss of vital production time!

50,000 horses on the job?

That is right. Not the horses—but the power they represent. A turbine can develop 50,000 horsepower and much more! Convert the force of water or steam to drive huge generators.

L & T supplies water and steam turbines manufactured by the world-renowned German firms of VOITH and GHH.

guardian angel?

Yes! That's what control and relay panels are. They prevent burning out of giant generators and transformers—avoid damage that might run into crores! L & T designs and manufactures equipment of this type—veritably watchdogs of electrical networks!

Special Article

THE NEXT DECADE

WHAT will be the shape of things in the world after a decade? This is a highly speculative question but an attempt has been made by the United Nations to find an answer, keeping in view the wide disparities in standards of living which exist in the world. On the one hand space research has made possible some scientific feats which were unthinkable a few years ago; on the other, the degree of hunger, poverty and suffering which exists in vast areas of the world is unimaginable. The United Nations, in a special "proposal for action "by the Acting Secretary General, has provided an answer to this question and has decided to designate the current decade as the United Nations Development Decade.

The various agencies of the United Nations will attempt development in terms of not only economic growth but also in terms of social changes so as to meet the rising aspirations of the people in the developing countries. The pattern of economic growth is outlined in these words: "The main economic objective for the decade is to create conditions in which the national incomes of the developing countries not only will be increasing by 5 per cent yearly by 1970, but will also continue to expand at this annual rate thereafter. If this can be done, and if the population of the developing countries continues to rise at its present rate of 2 to 2½ per cent yearly, personal living standards can be doubled within twenty-five to thirty years. If, however, the growth of population should be even more rapid by the end of the decade than it is now—and there are indications that in a number of countries the annual rate of increase is already 3 per cent or higher—it will take correspondingly longer to double living standards."

The United Nations would shun the traditional controversies regarding the demarcation of the public and private sectors in economic life, agricultural development versus industrial development and education versus vocational training. More stress would be put on national planning, the importance of the human factor, reducing under-employment and unemployment, stabilisation of commodity markets, stimulating the flow of capital assistance from developed countries to the developing countries, emphasis on pre-investment work, initiation of new techniques and smooth flow of highly skilled personnel to the developing countries. All these are noble ideals but the attainment of the stipulated targets will depend both on the co-operation that the United Nations is able to obtain from the participants in this process of economic development and the successful application of the new approaches outlined above.

During the 1950's the developing countries of the world did not record appreciable rates of increase in national income. On the average, only one per cent per annum increase was witnessed which kept the living standards at pitifully low levels. This also applied to social progress whose indicators showed only "slow and spotty" improvement. Wherever some improvement was achieved, it was of uneven character, i.e. certain sectors of the economy raced ahead while others lagged behind. Industrial production, for example, in the under-developed countries improved in percentage terms almost at the same level as in the industrially developed countries and in certain cases, the rate of industrial growth was even higher than that achieved in the advanced countries. Unfortunately, the share of the industrial sector in the national economies was very small with the result it failed to bring about any drastic structural change in them.

An analysis of the pattern of growth in income as well as population in the African, Asian and Latin American countries has shown that rates of growth can be accelerated with the help of external assistance. The United Nations has estimated that "a flow of capital representing one per cent of the incomes of the developed countries adds about ten per cent to the national income of the under-developed countries and about 100 per cent to their present net capital formation". If foreign investment of this order were intelligently utilised, it would result, on the average, in raising the national income of the developing countries by three per cent per annum. In order to achieve this target, the United Nations has recommended the following six major tasks which must be performed:

(i) The more systematic survey, development and utilization of physical and human resources in under-developed countries;

(ii) The formulation of true development plans providing for maximum mobilization of domestic resources and the effective utilization of external assistance;

(iii) An improvement in the machinery of administration, in institutions and in production incentives in order to meet the new and increased demands arising from these development plans;

(iv) A redirection of science and technology to increase the attention given to specific problems of low-income countries;

(v) An increase, and subsequent more vigorous growth, of the export earnings of under-developed countries;

(vi) An increased and a more assured flow of capital on suitable terms to the under-developed countries.

The mobilisation of human resources in the developing countries is an essential condition for raising living standards. It is proposed that during the Development Decade efforts should be made at the national as well as international level on these three aspects: (i) better utilisation of the labour force by creating higher levels of productive employment; (ii) improving the quality of the labour force by vocational education and training; and (iii) enlisting popular support for the tasks of national development, and the partcipation of broad social groups in them.

For conducting man-power surveys, the United Nations will provide special assistance. It has been suggested that these man-power surveys must be carried out swiftly so as to size up the problem in its proper perspective in every developing country.

In the sphere of education, UNESCO has made specialised studies and has put forward targets likely to be achieved by 1970-71. These are not very ambitious targets and can certainly be attained if the nations con-

cerned decide to execute their plans with determination. The targets in the various continents are:

"In Africa: 70 per cent of the children of age group 6-12 will be in primary schools (present level 40 per cent): 15 per cent of the appropriate age group in secondary schools (3 per cent): and 0.4 per cent of the appropriate age group in universities (0.2 per cent);

In Asia: 50 per cent of children of primary school age will be in primary schools. On the basis of incomplete information on national plans it is further estimated that 50 per cent of primary school pupils will go to secondary schools, plus a further 20 per cent to trade and agricultural schools. In the area of higher education the present percentage of 2 per cent is expected to move towards a target of 3 per cent of the appropriate age group being enrolled in higher education institutions;

In Latin America: All children of primary school age will be in 6-year primary schools (implying an increase in the primary school population from 26 million children in 1960 to 45 million children in 1970); 30 per cent of the appropriate age group in second level schools; and 4 per cent of the appropriate age group in universities."

An historical analysis made by FAO has shown the wide disparity in consumption standards between the rich and the poor regions of the world. It has also brought forth the slow rate of growth in food production in the developing regions. During the past decade, the increase in food supplies was of the order of 2.5 to 3 per cent per annum while population increase was about 2 per cent per annum, thus indicating a per capita increase of about 1 per cent per annum. This order of rise was hardly sufficient to take the starving millions out of their sub-standard levels of living. The nutritional levels to be attained at the end of the present decade in the four major regions of the world have been substantially increased; they are:

Region	Per Capita Consumption	
	Calories	Proteins (gms)
1. Far East	2,300	10
2. Near East	2,470	20
3. Africa	2,420	15
4. Latin America	2,400	25

The rate of food increase will also be increased from 1 per cent to 1.5 per cent and in certain areas upto 2 per cent. These targets can be achieved only by increasing the use of fertilizers which, according to the FAO estimates, will approximate to 15 million tons in 1970. This is about 8 times the present level of consumption and shows the volume of effort that needs to be put in for increasing production to such a high level.

In the task of promoting public health in the developing countries, targets have been fixed for key-workers so that the programme for education may be conceived in these terms. It is proposed to provide a physician for every 10,000 population, a nurse for every 5,000 population, a technician (laboratory, X-ray etc.) for 5,000 population, a health auxiliary for 1,000 population, a sanitarian for 15,000 population and a sanitary engineer for 2,50,000 population.

The proposal put forward by the Secretary General envisages measures for increasing the earnings of the developing countries through increased international trade and substantial increase in capital assistance. The special agencies of the United Nations such as the World Bank and IDA will continue to assist in mobilising funds for the purpose. The development plan touches upon every important aspect for promoting economic growth but it is not possible to enumerate each one of them in the brief compass of this article. The Report certainly provides a blueprint for making life more cheerful in the less-fortunate lands of the world during the next decade.

THE BUSINESS WORLD

Attitude Towards Industries and Industrialists

By CROESUS

ONE State Government after another has been coming forward to offer attractive concessions to entrepreneurs from both within and outside their States in order to start more and more industries in their areas. Lately, Kerala, Madhya Pradesh, and Gujarat seem to be vying with one another in this race and the latest to join the race in inviting investors and capital from outside is the Punjab Government. The relatively less industrialised States like Orissa and Rajasthan too have not been lagging behind. Even the already fairly well-industrialised States, such as West Bengal and Maharashtra, have not given up wooing entrepreneurs and prevailing upon them to start new industries there. If the less industrialised States want industries to be started anywhere in their jurisdiction, the already industrialised States want new industries to be located in their backward or less industrially advanced regions. The other day, for example, Maharashtra's Minister for Industries, Mr. S. K. Wankhede, whilst inaugurating the Deccan Flour Mills in Aurangabad, assured all help to industrialists and entrepreneurs and urged them to establish more and more industries in Marathwada, admittedly the most underdeveloped region of the State. He further held out the bait that a thermal station would be established in the Marathwada region early in the Fourth Plan period. Pending that, he went on to say, Marathwada need not wait but could go ahead especially with small-scale industries, and promised to make available power, for this purpose, from the Paras-Poorna-Koyna Electrification Schemes. Similarly, Mr. Pratap Singh Kairon, Chief Minister of Punjab, who is also in charge of industries in that State, is believed to be very keen on having more industries located in Punjab. According to the latest reports, as many as eleven textile mills, a wool combing plant, and a newsprint factory, involving a capital outlay of about Rs. 8 crores, are envisaged to be set up in the near future.

While all this enthusiasm is welcomed by business interests, the realists as they are, they do not seem inclined to respond to the same degree in each case. Obviously this cannot be otherwise, because entrepreneurs would naturally like to invest only in those areas where there are ample infrastructure facilities, such as good roads and adequate power and water supply, besides, of course, the availability of raw materials in abundance, reasonably cheap and efficient labour, and nearness to the consuming centres. But even where more or less all these facilities are known to exist, one cannot fail to discern a degree of reluctance, on the part of entrepreneurs, to go and invest.

Recently, I had an opportunity to interview a number of business men with fairly extensive interests in more than one State, to get their reactions to invitations by several State Governments to start new industrial ventures. The replies that I received were revealingly surprising. I was certainly not prepared, for instance, to an emphatic refusal, on the part of a leading industrialist, to have anything to do with the Gujarat Government, for I had been under the impression that State administered by the well-known business community of 'Gujaratis' would leave no stone unturned to attract investors and entrepreneurs. Asked for an explanation for this rather unexpected reaction, I was told, among others, that letters addressed to this Government were not acknowledged even for months, despite several reminders; that the power position in Gujarat, notwithstanding the valiant efforts of the new and energetic Chairman of the Electricity Board, still left much to be desired. This difficulty becomes all the more highlighted by reason of utter dependence of the State for supplies of coal from outside. As in the case of the Southern States, coal has to be handled over very long distances which necessarily makes it inordinately costly to industrial users. Nor is the transport position in Gujarat very satisfactory. And as though this were not enough, the climatic conditions in most parts of the State are anything but inviting. One would have thought, in the context of all these, that the State Government would go all out to placate prospective entrepreneurs and be extra solicitous towards them. This, however, does not appear to be the case, unless things have radically changed over the past few weeks.

At the other end is Maharashtra, according to the industrialists interviewed by me. They say that things move in Maharashtra more quickly and without much fuss. On important matters involving policy decisions, it is said, the Chief Minister himself looks personally into things and tries to be helpful, so that things could be got going. In Madras also, the position would appear to be the same, and, here, again, according to several reports, Mr. Kamraj Nadar himself steps out to tackle any ticklish problem and find a solution to it. I am told that this is also the experience of many businessmen with regard to the West Bengal Government. West Bengal has also a number of other advantages, even as Bombay, such as a network of engineering workshops which can take up or undertake any complicated repair job or even the reproduction of a complicated component of a machinery and a relatively more experienced labour force.

Of course, a very important consideration that weighs with prospective industrialists is the budgetary policy of the State Government concerned. Notwithstanding the fact that the avenues open to State Governments to raise additional resources are severely limited and inelastic, quite a few of these Governments have managed to impose onerous burdens by exploiting such levies as sales-tax. There has also been a tendency lately to call upon industrialists to contribute to all sorts of funds and memorials. All these must naturally get reflected eventually in the price to the consumer, who has even otherwise enough burdens to bear, in all conscience.

In the ultimate analysis, it seems to me that what is even more necessary than the availability of various facilities is the attitude of those in authority towards entrepreneurs. A sympathetic attitude, coupled with prompt and understanding replies to communications seem to command more importance at the hands of businessmen, which is understandable. More often than not, what one is confronted with in some States is the incredibly indifferent attitude of some of those in power, in particular those who have to deal with industrialists and businessmen at almost every turn. If they are really keen on bringing more and more industries into their States, as they profess from the house tops, I am convinced that there must be a thorough reorientation of their approach, attitude and outlook alike.

Business Notes

Inflation

RISE IN WHOLESALE PRICES

THE INDEX number of wholesale prices for the financial year 1961-62 shows a rise of 25.1 per cent over 1952-53. The average annual rate works out to be a little less than 3 per cent per annum. The rise has been, however, extremely un-even over the various categories of commodities covered by the index. The index for food articles which covers a little above half the weightage, showed a rise of only 20.1 per cent indicating that most of the other groups recorded increases far above the average of 25.1 per cent.

Amongst the various groups and sub-groups into which the food articles index has been devided, a higher level of rise was recorded by "other food articles" covering tea, coffee, spices and condiments, bettlenuts and salt. The combined index for all these commodities showed a rise of 71.6 per cent. Pulses indicated a drop of about 8 per cent.

Industrial raw materials in particular scored over all other groups, the index being 42.6 per cent above the 52-53 level. The next place is occupied by manufactures with a rise of 26.6 per cent. Amongst the finished products, metal products with a rise of 51.6 per cent over the period under consideration recorded the highest increase. Amongst individual items, tre highest score was that of oranges from Nagpur whose prices had more than trebled during the period.

The index, however, does not bring out the truly oppressive character of the inflationary spiral. This may be illustrated with reference to the prices of rice, an essential commodity, for the last week of May, 1962. Prices are quoted in the index for the coarse variety of rice in Trivandrum, Raipur, Jagdalpur and Kotma. The price variation in these four centres is very wide. Trivandrum quoted rice at Rs. 61.69 per quintal as against Rs. 48 in Raipur, Rs. 45 in Jagdalpur and Rs. 40 in Kotma. Thus, the coarse rice prices in Trivandrum were higher by 50 per cent than the prices prevailing in Kotma. To such an extent the index levels out the rises as well as the falls which take place for various commodities. Again, even though the index of wholesale prices provides a barometer for prices in general, yet it does not exhibit the true pressure on the consumers who buy in the retail markets at much higher prices.

Electricity

HARNESSING POWER FROM LOW HEADS

IN THE context of the acute power shortage now obtaining in the country, as also the inevitable need to increase economy in all our future power projects by reason of the foreign exchange crisis, any information such as that relating to Micro Power Plants (MPP) which are installed in France and which may help economise our foreign exchange expenditure is bound to evoke considerable interest.

A reference is made to these plants by the Federation of Electricity Undertakings in its latest circular. According to the F.E.U., the M.P.Ps are small hydro-electric schemes suitable for installation mainly in areas of low head. Their interest lies in the feasibility of fitting out inexpensively small local falls with plain and sturdy equipment, which does not involve any high transport, erection or operating costs. Electricite De France (EDF) has applied itself to the development of schemes fulfilling these requirements in the case of heads between 1 million (328 ft.) and 3 million (984 ft.) the "producibility" of which varies between few tens and several hundreds of KW.

It has been found from experience, we are told, that this type of scheme can also be made to apply — under different forms of application — to higher heads. It is pointed out, for instance, that fully automatic operation provides an attractive solution to eliminate operating labour, the operating labour thus eliminated being replaced by personnel for plant supervision and maintenance.

Having this application in mind, the E.D.F. has designed the plants in a way which would reduce the quantity of components and would simplify operation to the greatest possible extent. These components have been so made as to ensure great sturdiness. The new arrangements have added to the quality of the protection and safety equipment, thereby providing the utmost safety of operation.

The E.D.F. has applied these principles to its experimental scheme on the Essone River at Echarcon. The entire experimental unit of Echarcon, with a 120 KW max. capacity for 3 m (10 ft.) head, has been prefabricated and divided into components, each of which does not exceed 1,200 kg (2,645 lb.) as regards the unit proper and 750 kg (1,155 lb.) as regards platework. The largest components are easily loaded on a standard truck. The components, which are easy to handle, can be reassembled on the site and fastened with few anchorages inside a waterway, including two sidewalls and an invert. The electrical instruments being housed inside ventilated outdoor type cabinets, no seperate operating building is required.

Cement

PROBLEMS OF REFRACTORY INDUSTRY

MR. J. DALMIA, Chairman of Orissa Cement Limited, at the annual general meeting of the company, held recently dealt at length with the possible demand for refractories during the coming few years. He was of the opinion that consumption of refractories for steel plants was declining to some extent. In addition to this the actual output of steel by the end of the Third Five-Year Plan was not likely to be at the level of the targetted capacity of 10 million tons. In fact, the 10 million tons mark might not be reached till 1966-67. Naturally, therefore, the expected demand for refractories would be altered. It was estimated that by the end of the Third Five-Year Plan when all the expansion schemes of the basic refractories capacity would be completed, the likely annual capacity might be in the neighbourhood of 1.50 lakh tons against the estimated requirement of nearly one lakh tons. There is, therefore, a clear case for a very careful planning in the creation of future capacity for refractories. It would be just proper if the indigenous capacity in the case of refractories and fire-bricks could be utilised for certain other products.

Mr. Dalmia, touching the problems faced by the industry, cited an instance where certain States had developed the tendency to refuse the mining of minerals required by the refractory industry for use outside their boundaries. It is quite understandable that the States would have before them their self-interest and try to take their respective regions further in the fields of industry as far as possible. But such parochial restrictions on industries of national importance could not be considered justifiable. The Central Government as well as the State Government should pay sufficient regard to such industries of all-India importance and instead should help them to obtain their requirements of essential materials. Such industrial units have to be set up at only one site chosen for various considerations and raw materials have to be obtained from all parts of India. The State Government should, therefore, come forward to help such units.

Another significant point raised by the Chairman was in regard to the study of workloads in the cement industry. The Government of India, while accepting the recommendations of the Central Wage Board for Cement Industry, had promised to undertake the study of workloads, but the Chairman indicated that out of 34 cement factories in the country, so far workload studies had been undertaken at only 3 plants. The study of workloads was likely to provide valuable data for increasing productivity in the industry. It was the considered policy of the Government of India that increase in wages should come mainly from increased productivity. With this end in view, workloads studies would at least provide indications for any future possible wage increases. The Government should accelerate the workload study programme and provide the data for the guidance of the producers, the workrs as well as the consumers.

New Issues

PANYAM CEMENTS AND MINERAL INDUSTRIES

THREE MORE companies have finalised their plans to raise capital from the public.

Panyam Cements and Mineral Industries Limited is entering the market with an offer of 25,000 equity shares, of Rs. 100 each, and 10,385, 9.3 per cent (taxable) cumulative redeemable preference shares, also Rs. 100 each. The lists open on June 25 and shall close on July 2 or earlier at the discretion of the directors, but not before June 27. The issue if fully subscribed (the whole of it is underwritten) will raise the issued capital of the company to Rs. 1 crore, out of an authorised capital of Rs. 2 crores.

The company has been engaged in the manufacture of Portland cement and for this purpose has set up a 200 tons per day capacity factory near Bugganipalli, in Andhra Pradesh. It is now proposed to expand the capacity of this factory to 500 tons per day by installing an additional plant capable of producing 300-330 tons of cement a day. Orders for the supply of complete equipment for the additional plant have already been placed with Messrs. A.C.C. Vickers-Babcock Ltd., Bombay. The new plant is expected to be commissioned into production in the second quarter of 1963.

The expansion project is estimated to cost Rs. 1.2 crores. This expenditure is proposed to be met as follows: (1) loan from the Industrial Credit and Investment Corporation of India — Rs. 40 lakhs; (2) loan from the Bank of Baroda — Rs. 20 lakhs; (3) share capital already issued and subscribed by right shareholders (in two instalments on 28-1-1962 and 12-3-1962) — Rs. 10.975 lakhs; (4) proceeds of the new issue — Rs. 35.385 lakhs; (5) internal resources — Rs. 13.640 lakhs. Any further sums required are proposed to be procured as loans from the company's bankers and other financial institutions.

The working of the company during the past two years has been quite satisfactory. It earned a profit of Rs. 11.78 lakhs in the year ending August 31, 1961, as against a profit of Rs. 8.08 lakhs in the previous year, after raising the provision for depreciation from Rs. 9.32 lakhs to Rs. 10.18 lakhs. Sales in 1960-61 amounted to Rs. 65.07 lakhs, as against Rs. 62.72 lakhs in 1959-60. Arrears of dividend on preference shares upto August 31, 1960, have been cleared. After wiping out a debt balance of Rs. 7.50 lakhs and making the other necessary adjustments, the company brought forward Rs. 9,694 to the current year's account.

NEIVELI CERAMICS AND REFRACTORIES

THE SECOND concern which has finalised its plans for raising capital from the public is the Neiveli Ceramics and Refractories Limited — a new company sponsored by Messrs. Seshasayee Brothers (Private) Ltd., to undertake the manufacture of high quality sanitaryware. It is issuing capital worth Rs. 45 lakhs — Rs. 42 lakhs in equity shares (of Rs. 10 each) and Rs. 3 lakhs in 9 per cent cumulative preference shares (also of Rs. 10 each). The whole of the preference issue has been already subscribed by various insurance companies. Out of the equity capital, the directors and their friends have agreed to take up shares worth Rs. 8.23 lakhs. Equity capital to the tune of Rs. 3.77 lakhs is proposed to be taken up by the foreign collaborators. The Life Insurance Corporation is subscribing to shares worth Rs. 5 lakhs. The balance of Rs. 25 lakhs worth equity capital is to be offered to public for subscription sometime in July.

The company is setting up its factory (capacity 1,800 tons sanitarywares per annum) at Vadalur, in Madras State, where the main raw material, fine quality clay, is available easily from the nearby Neiveli lignite mines. A pilot plant has already been set up and is in production. Commercial-scale production is expected to start sometime in 1963.

Technical collaboration has been arranged with the German group of industries Keramag AG., of Ratingen.

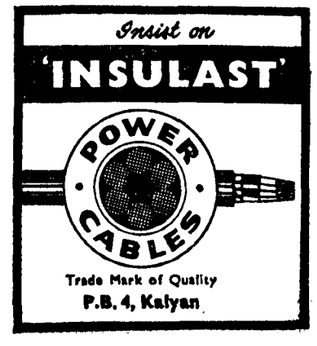
The total capital outlay on the project is estimated at Rs. 75 lakhs. It is proposed to be met as follows: share capital — Rs. 45 lakhs; loan from ICICI — Rs. 20 lakhs; bank borrowings — Rs. 10 lakhs.

The Chairman of the Company's Board of Directors is Mr. S. Narayanaswamy, who heads the Boards of Directors of Aluminium Industries Ltd., Seshasayee Industries Ltd., and Simco Meters Ltd. The South Madras Industrial Development Company (Private) Limited has been appointed as managing agent for a period of 10 years.

AIR CONTROL AND CHEMICAL ENGINEERING

THE THIRD company which proposes to approach the public sometime hence for subscriptions to its share capital is Air Control and Chemical Engineering Company, floated recently to undertake the manufacture of refrigeration equipment and accessories. It has plans to raise Rs. 84.50 lakhs in the form of equity shares. The issue is expected to be offered towards the end of September or in the beginning of October.

The company has entered into technical collaboration arrangements with three Canadian and two U.S. firms — Sheldons Engineering (Canada); Air Coils Manufacturing Company (Canada); Wide Refrigeration Company (Canada); Air and Refrigeration Inc. (U.S.); and Dunhambush (U.S.)



To meet the foreign exchange costs of importing plant and machinery, the company has made an application to the Industrial Finance Corporation of India for a dollar loan equivalent to Rs. 60 lakhs.

Construction of the company's factory is expected to start after the rainy season.

Engineering

WELLMAN INCANDESCENT FORM RUPEE COMPANY

A NEW public limited company under the name of Wellman Incandescent India Limited, has been formed in Calcutta by the Wellman Smith Owen Engineering

Corporation Ltd., and the Incandescent Heat Co. Ltd., of U.K.

The Wellman Smith Owen Engineering Corporation has a world wide reputation as the leading manufacturer of steelwork plants, furnaces and cranes. The Incandescent Heat Group of Companies specialise in industrial furnaces and heat treatment equipment. The Wellman Incandescent Group of Companies with their associates are the largest designers and manufacturers of heat treatment equipment in the world and their experience extends over 60 years. As a member of the ISCON Consortium which built the Durgapur Steelworks, the Wellman Smith Owen Engineering Corporation was responsible for the entire construction of the steel melting plant, comprising of open-hearth furnaces, soaking pits, and also supplied 33 cranes, including several of 280 tons capacity. The Incandescent Heat Company has been supplying for the last 30 years furnaces and heat treatment plants in India. One of its subsidiaries, the Controlled Heat & Air Ltd., has supplied a large number of low temperature drying ovens to the Heavy Electricals (India) Ltd., Bhopal.

The Indian company will have at its disposal the accumulated know-how of its parent company, and will be in a position to offer to the Indian market industrial furnaces fired by any type of fuel and electricity, for all forms of treatment of ferrous and non-ferrous metals and a full range of mechanical handling and other allied equipment largely from indigenous sources. Steps are also being taken for the Indian company to export its products to the neighbouring countries.

Fifty per cent of the capital of the Indian company will be taken up by the parent company, and the balance will be issued between the directors and friends of the Indian company and the public. The percentage to be taken by the directors and friends and to be offered to the public as well as some other consequential details are yet to be finalised. The Commerce and Industry Ministry has agreed in principle to the terms of collaboration agreement between the Indian company and the parent company. Negotiations with the Government are now in the final stage.

Banking

THE BANK OF GOA

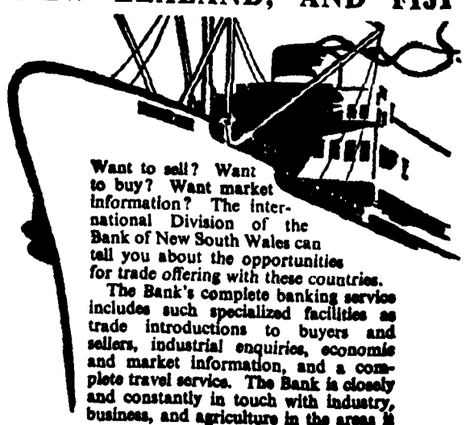
THE GOVERNMENT OF INDIA has so far made an earnest effort to maintain the separate "individuality and personality" of Goa, so that the pace of economic growth — accelerated in recent years by spectacular growth of the mining industry — may be continued. In an atmosphere of rising business activity, it was natural for the Goan industrialists and businessmen to chalk out plans for a new bank of their own. In the past, the Goan business community failed to set up a bank because the Portuguese Government would not let them put up a competitor to the Banco Nacional Ultramarino. An application submitted to the Reserve Bank of India recently by the Goan businessmen for setting up the Bank of Goa has also not received an encouraging response. Taking shelter behind the Banking Companies Act, the Reserve Bank has deferred the decision till the said Act is made applicable to Goa. It should be remembered that earlier the Reserve Bank had authorised the State Bank of India and the Bank of India to start operating in Goa so as to fill the vacuum created by the closing of the Banco Nacional Ultramariano. The very fact that the Reserve Bank has authority to allow these two banks to start their operations in Goa shows that the Banking Companies Act had been made applicable to Goa 'de facto' if not 'de jure'. The people of Goa have rightly demanded that they should also be authorised to go ahead with their plan to set up a Goan bank with their own resources.

The authorised capital of the bank is proposed to be around Rs. 2 crores and paid up capital at Rs. 50 lakhs. It is anticipated that 60 per cent of this paid up capital will be subscribed by the directors and their friends, and the remaining 40 per cent will be offered to the public. It is a foregone conclusion that all Goans whether residing in Goa or in India or outside India will happily participate in this venture so as to hasten the industrialization of Goa. The Bank of Goa manned by local people has greater chances of accelerating business activity. At the same time it will assist in mopping up savings of the people consequent upon the recent prosperity generated by unprecedented growth in the mining industry. It is necessary that the Reserve Bank should come to the succour of the people of Goa so as to assist Goa in rehabilitating itself in the new conditions and circumstances and fulfil a long-cherished dream of the people of Goa.

Industrial Research

PLASTIC - CELLULOSE GRAFTING

CANADA'S UNIVERSITY of Toronto, after four years' research, is stated to have developed a plastic-cellulose grafting process that should bear important results for several industries. Using cobalt-60 in a gamma cell, research chemists are said to have induced a reaction which "permanently grafts certain vinyl monomer plastics to cellulosic materials.



This grafting process, it is claimed, can open up new possibilities for pulp and paper industries and for dyeing certain plastic textiles. It can also provide increased adhesion and further strengthening of automobile tyres.

The new process can also make cotton cloth permanently waterproof, unlike the present coated materials which lose their water repellant qualities if the coating is dissolved away by dry cleaning.

In waterproofing, the new grafting process holds big possibilities in that it can be applied to either fibre or the finished products. Water resistant plastics can be grafted to either wood pulp or finished sheets of paper. Lengths of cotton cloth can also be processed just as easily as cotton fibre.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY

TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The International Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

● Enquiries may be made through your own bankers or direct to

Tourism

CLASSIFICATION OF HOTELS

THE GOVERNMENT OF INDIA have appointed a 3-member Hotel Classification Committee to classify hotels catering to foreign tourists on the internationally-accepted "Star" system. The Committee is expected to finish its work by the middle of December this year.

The terms of reference of the Committee are: (i) To invite applications from hotels which are interested in getting Government's recognition and which fulfil the minimum criteria laid down by the Hotel Standards and Rate Structure Committee for being categorised as a "Starred" hotel. (ii) To inspect those hotels among the applicant establishments which in the opinion of the Committee prima facie fulfil the minimum conditions. (iii) To assess the relative standards of the establishments so inspected and to classify them according to the star system recommended by the Hotel Standards and Rate Structure Committee (iv) To formulate criteria for recognising restaurants which are of sufficiently high standard for purposes of catering to tourist traffic and to inspect those that fulfil such criteria and recommend for Government's consideration the recognition of those establishments which actually fulfil the stipulated criteria. Shri G. R. Kadapa, Deputy Director General, Union Department of Tourism, will be the Chairman of the Committee. The other two members are: Shri L. C. Nirula, Honorary Secretary, Federation of Hotel and Restaurant Associations of India, Delhi, and Col. C. V. Raje, Kowdiyar Palace, Trivandrum. A representative of the Regional Hotel Association concerned will be associated with the Committee when it visits the hotels in that particular region. A representative of the State Government concerned will be associated with the Committee when it visits hotels in a particular State. In view of the increasing importance now attached to tourism, especially as an earner of foreign exchange, any such classification would be welcome. This is likely to be helpful to the foreign tourists who will get better service from the classified hotels and increase the volume of tourist traffic in India.

Export Trade

HOLD PRICES TO PUSH UP EXPORTS

ALTHOUGH OUR export performance last year at Rs. 665 crores showed a rise of Rs. 39 crores compared to that in the previous year, it was achieved more through realisation of higher prices for jute and some other commodities rather than through an increase in the volume of our trade as such. In fact, exports of cotton textiles, manganese ore, spices, etc. actually recorded declines. It is this failure to step up exports, as envisaged in the Third Plan, that has prompted the authorities to spare no effort to boost our exports to earn as much foreign exchange as possible. As Mr. Chinoobhai C. Javeri, President of the All-India Exporters Chamber (A.I.E.C.) observed, it is not merely the Government but the exporters too have been fully aware of this, and what is gratifying to note is that they too are willing and ready to play their part in this all-important work of export promotion.

Dwelling at length on the role of exporters, as also the difficulties they are facing today, Mr. Javeri told the annual conference of the Chamber held a few days ago in Bombay, that not only was export trade a specialised job, but it also called for full knowledge of the present demand, a reasonable forecast of future trends, an insight into the fluctuations of prices, a study of consumers' tastes and of the nature and the extent of foreign competition, and, above all, the art of salesmanship. Mr. Javeri also added that export trade involved the risk in buying as well as in storing goods in anticipation of demand and selling them on long-term credit which sometimes involved sizeable losses. He claimed that the resourcefulness and enterprise of the Indian exporters had been evident from the fact that 70 to 80 per cent of the export trade of the country has been canalised through merchant-exporters. All the same, the A.I.E.C. Chief pointed out that this impressive performance should not make the exporters complacent. Instead, he urged, "in keeping with the times, we must change and adapt ourselves to new circumstances by employing new techniques and methods in our sales organisation supported by aggressive salesmanship."

Analysing the causes for the stagnation in our export trade, Mr. Javeri explained that, with all the talent and initiative on the part of exporters, our exports had remained stagnant, because of higher prices when compared with international prices.

While on the question of price and quality, he drew attention to the fact that a considerable range of our products was out of the world markets. Notwithstanding all this price disadvantage, he expressed the view, the marketability of our goods could be fairly enhanced if only the manufactures exhibited more vigilance and improved the quality of the products, as also their presentation and packing techniques. The snag, according to Mr. Javeri, — and one is inclined to agree with him — has been the existence of a vast domestic market that tempts our manufactures invariably to sell at home instead of venturing out. The imperative need at present was to hold the price-line by examining the cost structure of our major items of export and to take remedial measures so as to bring down the prices to competitive levels. "Unless the price spiral is held" Mr. Javeri was rightly concerned, "all our efforts at promoting exports will prove abortive."

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-
11.	India and Europe Divided	Rs. 10|-

Please take advantage of this offer and mail your enquiries to :

FROM THE CAPITAL'S CORRIDORS

INDIA AND THE EUROPEAN COMMON MARKET

The consequences of Britain's joining the European Economic Community have been dominating the Indian economic scene for the past ten days. The subject during this period was first raised at the Prime Minister's press conference on June 13. Then, the Minister for International Trade, Mr. Manubhai Shah, dwelt on it at some length in the Lok Sabha. Finally, consultations were held on this issue for three days between the Government of India and the British Secretary of State for Commonwealth Affairs, Mr. Duncan Sandys.

Replying to a question on the economic and political implications of an enlarged European Common Market, Mr. Nehru said: "Directly, we are interested in our exports going ahead. Our efforts are to see that our exports will not be hit as a consequence to Britain's joining the ECM. Indirectly, we are interested in other consequences of the Rome Treaty". The Prime Minister expressed the hope that the efforts which India is making to safeguard her trade with the ECM in the likely event of Britain's joining it would succeed.

Referring to the political aspects of the EEC, Mr. Nehru observed that it was not for India to stand in the way of the ECM countries and the United Kingdom coming together politically. The effect on world politics of their coming together depended on the policies which they pursued. If these nations pursued a liberal policy in political terms, it would be a good thing. Otherwise, it might help reactionary elements and forces.

Mr. Nehru expressed the opinion that UK's entry into the Common Market would undoubtedly injure the cause of the Commonwealth.

India's point of view on the safeguards which Britain should seek from the ECM countries for the Commonwealth nations was a matter of detailed discussion between Mr. Sandys on the one side and Mr. Morarji Desai and some other Government of India Ministers and officials on the other. It was stressed that India was opposed to any phased imposition of tariffs by the Common Market countries on India's exports and that she would like nil tariffs to be applied to most of the goods that she exported to these countries. For this purpose, it was emphasised that Britain in her negotiations with the ECM countries should enlarge the list of items for which recently she has suggested nil tariffs.

The talks between Mr. Sandys and Mr. Morarji Desai presumably were conducted on the lines indicated by the Minister of International Trade while making a statement in the Lok Sabha on the present stage of negotiations between the United Kingdom and the European Economic Community, and the memorandum submitted by India to the ECM authorities at Brussels a few days ago. The following extracts from Mr. Manubhai Shah's statement in the Lok Sabha should be read with interest:

"Even before the Common Market was formed, we had many outstanding problems of trade with Western Europe and these have assumed even greater importance since the signing of the Treaty of Rome. We have been negotiating with the European Economic Community to secure suitable changes in their tariffs and commercial policies both under the GATT and bilaterally. As a result of these negotiations, we have obtained some concessions. Germany, for instance, has already agreed in the GATT to abolish the quantitative restrictions on our jute goods by the middle of 1964. There has also been some relaxation in the quota restrictions and reduction of tariffs applicable to us. In relation, however, to our trading problems with the Common Market countries, these concessions are not of meaningful significance. The balance of our trade with the Six Common Market countries has been going steadily adverse. While in 1950 India had a surplus of about Rs. 5 crores in its trade with them, in 1960 she had a deficit amounting to Rs. 135 crores approximately. This deficit is thrice the value of Indian exports to the Community. No other country has a deficit of this order with the Community. We are hoping that substantial concessions would be made available to us by these industrialised countries in pursuance of the Ministerial Declaration unanimously adopted in the GATT for expansion of the trade of the less developed countries.

"UK's joining the Common Market would create a fresh set of problems for us because of the fact that our trade with the UK has been built over a long period of years on the basis of freedom from tariffs as well as quotas and certain guaranteed margins of preferences. It is clear that if our long established rights under the Indo-UK Trade Agreement are replaced by a restricted regime, our trade will suffer great damage. While we have always conceded that it is primarily for the UK to decide whether or not to join the Common Market, we shall be less than fair to ourselves if we did not insist on adequate safeguards for the large volume of trade we have with the UK. The UK Government has taken note of our points in negotiating with the Common Market. In her negotiations, however, UK has to take into account its own interests as well as the interests of other Commonwealth Countries. The extent to which she will succeed in securing safeguards for the trade of the Commonwealth Countries depends, to no small extent, on the attitude of the Members of the European Economic Community. We have, therefore, felt it necessary to present our own case directly to the members of the European Economic Community. The appointment of Shri K. B. Lall as Ambassador to the European Economic Community has given us direct access to it. A Memorandum has been presented to the EEC as well as to its member-countries.

"We trust that the countries of Western Europe which have shown great interest in India's development plans will not fail to devise suitable and adequate safeguards for our export trade. The Members of the Common Market have, over the last few years, increased their trade both amongst themselves and with third countries. Our only disappointment is that India has not benefitted from this increase. I would appeal to the countries of the Community to provide effectively for expansion of our trade with them. I am sure they all agree that the expansion of our trade is the best way of enabling us to repay the long-term credits which we are receiving from the developed countries and that we should have our due share in their increasing imports."

The consultations between the Governments of India and the United Kingdom on the safeguards which Britain should ask for from the ECM countries for her trade with the Commonwealth countries in general and with India in particular are envisaged to be resumed when Mr. Morarji Desai visits London in the first week of July.

The following press communique was issued at the end of the talks between Mr. Sandys and Mr. Morarji Desai.

"Mr. Duncan Sandys, the British Secretary of State for Commonwealth Relations, and Mr. Morarji Desai, the Indian Minister of Finance, have had a series of most useful talks on financial and economic questions of concern to India and Britain.

"The two Ministers reviewed Britain's programme of economic aid to India and Indian's requirements for capital both in the long and the short term.

"Mr. Sandys gave an account of the progress of the Common Market negotiations in Brussels. There was a full exchange of views on the line to be adopted in these negotiations about India's trading interests.

"When he visits London next month, Mr. Morarji Desai will have further discussions with British Ministers on these matters."

PURCHASE OF MIG FIGHTERS FROM USSR

Mr. Sandys during his visit to the Indian capital had also discussions with Prime Ministers Nehru and Defence Minister, Mr. Krishna Menon, on India's proposed deal with the Soviet Union for procurement of MIGs in the first instance and for their manufacture in the country ultimately. While it is not certain whether any proposal was put forth by Mr. Sandys to the Indian Government for supply to or manufacture in India of fighter aircraft of British make, Mr. Sandys disclosed at a press conference after the conclusion of his talks with the Government of India that discussions would take place between the Government of the United Kingdom and India regarding the latter's requirements of fighter aircraft before it takes any final decision on its present proposal to secure MIG supersonic fighters from the Soviet Union. Mr. Sandys added that any specific proposals for supply of fighter aircraft from the United Kingdom to India could be made only after the Government of India had some general discussions with the UK Government.

The main reasons why India wants to have MIG fighters from the Soviet Union, as explained by Mr. Nehru at his last week's press conference, are:

(1) MIGs are simple in design and quite sturdy in performance. It is easy to make them in India, as compared to the similar aircraft of Western countries which are very complicate in design.
(2) There is the advantage of dealing with only one party if MIGs are taken up for manufacture.
(3) MIGs are also cheaper than the Western aircraft and payment for them is to be made in rupees.

FINANCE MINISTER'S VISIT TO THE CONTINENT

The Union Finance Minister, Mr. Morarji Desai, is scheduled to leave for London on July 1, for a three-day stay there. From London he will proceed to Brussels and stay there for a day. Then he will go to Bonn for two days. From Bonn he will proceed to Geneva where he is scheduled to stay for a week for attending the session of the Economic and Social Council of the United Nations. Before returning to India he will also pay short visits, extending over three days each, to Paris and Rome.

The Finance Minister's this tour programme of the Continent apparently suggests that he will be contacting the European members of the Aid-India Club, presumably with a view to persuading them to make available to this country bigger untied loans at the next meeting of the Consortium to be held in Washington in a couple of months' time.

RE-ORGANISATION OF HINDUSTAN STEEL

Broad indications of the lines on which he proposed to re-organise Hindustan Steel Limited were given by Mr. C. Subramaniam, the Union Minister for Steel and Heavy Industries, to the Members of the Informal Consultative Committee of Parliament attached to his Ministry, on Wednesday.

The details of the proposal, Mr. Subramaniam said, were being worked out. July 1, he added, had been fixed as the target date for the implementation of the first phase of this re-organisation programme.

Mr. Subramaniam indicated that as far as practicable, he wanted production to be the exclusive responsibility of plant authorities. It was necessary, therefore, he said, that along with the transfer of this responsibility, the necessary powers should also be transferred to the general managers for an effective discharge of that responsibility.

At present, the general managers of the three steel plants in the public sector look to Hindustan Steel in many spheres of operational functions. The re-organisation programme is aimed at obviating this.

Situated as these plants were away from one another, and at a distance from the headquarters of the Hindustan Steel, a centralised policy of recruitment of personnel involved a great deal of delay, said the Minister. The personnel, he added, also did not look to the general manager alone in matters of transfers and promotions—a practice which was not considered conducive to maintenance of discipline and operational efficiency. It has been found necessary, therefore, that the recruitment of personnel should also be decentralised.

Referring to the financial aspect of the steel plants, the Minister said that at present there were financial advisers and cost accountants attached to each plant, who by training and experience were not appreciative of the requirements of an industrial undertaking. It was proposed, therefore, that there should be an annual budget prepared for each plant, and the general managers given powers to function within the broad outlines of that financial provision without any interference from the financial advisers.

These re-organisation proposals were largely welcomed by the members of the Committee, who were appreciative of the Minister's move. They also suggested that the appointments of the general managers should be made with care, keeping in view the requirements of the steel plants, even if the Government had to pay a little more money to attract experienced personnel. They, however, emphasised that the general manager should be appointed by the Minister, and should hold office only at his discretion.

THIRD PLAN IMPLEMENTATION

A frank appraisal of the implementation of the Third Five-Year Plan in the first fifteen months was made by the Planning Minister, Mr. Gulzarilal Nanda, last week, while addressing the Consultative Committee of Lok Sabha attached to his Ministry. He candidly confessed that there were today much larger gaps in the economy than were anticipated. The achievements recorded on the agriculture, fertilizers, power, transport or coal fronts were not upto the mark.

The additional area which benefited from minor irrigation schemes was 1.67 million acres, as against the Plan target of 12.8 million acres in 1965-66. The area which benefited from soil conservation measures increased only by about a million acres, compared to the Plan target of 11 million acres in 1965-66.

As against the total supply of fertilizers in 1961-62 amounting to 400,000 tons in terms of nitrogen assumed in the Third Plan, the actual availability was about 296,000 tons, made up of 140,000 tons from internal production and 156.000 tons from imports. The supply of fertilizers in 1962-63 is estimated at 404,000 tons, as against the original target of 525,000 tons.

Mr. Nanda disclosed that the Union Government had asked the States not to recommend new industrial licences requiring more than 2,000 kw. power unless "they are in a position to make the necessary power available under their approved Third Plan programme."

T.T.K's PLANS

The Union Minister without Portfolio, Mr. T. T. Krishnamachari is planning to set up an organisation which will get progress reports from the various sectors of the Government, analyse them and bring to the notice of the Cabinet causes which are holding up progress in a certain given sector.

His immediate concern is devising of measures to overcome transport, coal and power shortages. Instead of talking at each other, the Ministries of Railways and Fuel, for example, are being brought together to discuss the coal problem across the table, in order to reach speedy decisions. A watch will be kept on the implementation of these decisions.

COAL PRICES RAISED

The promised marginal increases in coal prices have been announced by the Union Ministry of Mines and Fuel. The increases range from 38 nP. per ton to Rs. 1.50 nP. per ton for superior grades non-coking and coking coals. They came into force from June 13.

According to a notification issued, there will be an increase of Rs. 1.50 per ton in the prices of non-coking coal of Grade Selected A and of coking coal of Grades A, B and C.

The prices of Selected B Grade non-coking coal and D and E Grades coking coal have been raised by Re. 1 per ton. The increase effected in the prices of Grade I non-coking coal and Grades F, G and H coking coal is 75 nP. per ton. The prices of HH, J, K, and I Grades coking coal and Grade II non-coking coal have been raised by 38 nP. per ton.

Simultaneously with these increases in prices, a ceiling has been fixed for the prices of coking coal of HH to L Grades and non-coking coal of Grade II at Rs. 20.50 nP. per ton. Coking coal of Grades HH to L will also be converted into one Grade HH. No. increase in prices has been announced in respect of inferior quality coal.

These marginal increases in coal prices have considerably fallen short of the coal industry's plea for a Rs. 5.43 nP. per ton uniform increase in prices. The industry had also been against fixation of ceiling prices for Grade II coal.

RAIL FREIGHT ON FURNACE OIL

It has been decided that, with effect from July 1, 1962, consignments of furnace oil in wagon-loads booked by rail from Bombay, Okha, Kandla, Marmagoa, Cochin, Madras, Vishakapatnam and Calcutta will be charged only half the freight which is leviable in accordance with the normal tariff rates in force at the time of booking, subject to a net minimum charge of Rs. 5.99 per tonne approximately, which is the charge for the minimum distance of 40 kilometres.

As, however, the quantities of furnace oil available would be limited, preference in the matter of change over from coal to furnace oil will be given to those industries which have a high priority for the allotment of coal.

Industrial units intending to change over from coal to furnace oil will also require burners. The Ministry of Commerce and Industry will shortly invite applications for the import of such burners and the Capital Goods Committee will consider such applications and decide for which of the industries, and for which of the units in each industry, import licences for burners should be given.

SMALL CAR

Addressing a press conference at Madras, the Union Minister for Steel and Heavy Industry, Mr. C. Subramaniam, is reported to have stated that the question of producing small car in the country has gone before the Union Cabinet and a final decision on the project should be reached very shortly. Many States, he added, had pressed their claims for locating this project in their territory, but this question could only arise when a final decision had been taken to go in for the project (which is outside the Third Plan programme as enunciated in the Plan documents).

Mr. Subramaniam, however, ruled out the possibility of licensing manufacture of big cars in the country at least for the present.

MURARJI VAIDYA'S ALUMINIUM PROJECT

Mr. Murarji Vaidya, it is learnt, has been able to finalise the collaboration arrangements with Messrs. Reynolds International, of the U.S.A., for setting up an aluminium manufacturing plant, having a capacity to produce 30,000 tons of aluminium fabrications a year, in the Hubli-Karwar region of Mysore.

According to the agreement he is said to have finalised, a public limited company will be floated, 40 per cent of whose equity capital shall be held by Reynolds. Mr. Murarji Vaidya and his associates will subscribe to 11 per cent of the capital of this company, while the Government of Mysore will be subscribing to 10 per cent of the capital. The Maharashtra Government will also have an interest in this undertaking and shall take up 5 to 10 per cent of its capital. The remaining capital will be offered to the public for subscription.

The company will have 10 directors—four representing Reynolds, one each representing the Vaidya Group and the Government of Mysore and Maharashtra and three representing the public. The Vaidya Group will receive promotors' fee not exceeding Rs. 5,00,000, either in cash or in the form of equity shares.

MANUFACTURE OF PIG IRON

The Government of India has approved four private sector projects for the manufacture of pig iron. Included in these are two schemes, one of Birla Gwalior Private Limited and the other of Kalinga Industries, which envisage collaboration with Messrs. Koppers International, of the U.S.A. The American firm will meet the whole of the foreign exchange requirements (for the import of plant and machinery) of these two projects in consideration for participation in their equity and loan capital.

The other two projects approved are of Kamani Engineering Corporation Limited and of Andhra Cement Limited. The latter scheme has been accepted as yet only in principle.

IRON ORE EXPORTS TO CZECHOSLOVAKIA AND HUNGARY

The following is the schedule agreed upon for export of iron ore to Czechoslovakia and Hungary from here:

Grades	Quantities	Delivery Period
Czechoslovakia		
65/63	5,00,000 long tons, firm	April 1962 to March 1963.
	50,000 long tons (at sellers' option, subject to availability).	
60/57 62/60.01	1,50,000 long tons, firm (Minimum quantity to be supplied in 60/57 grade — 1,00,000 long tons)	April 1962 to March 1963.
Total value of firm quantity is approximately		Rs. 331 lakhs.
Hungary		
65/63	50,000 long tons, firm	July 1962 to December '62
	50,000 long tons (at buyers' option to be exercised by 30-6-62)	
Total value of firm quantity is approximately		Rs. 28 lakhs.

HINDUSTAN CABLES' EXPANSION

The expansion of the Burdwan Factory of Hindustan Cables is expected to be completed in the latter half of the financial year 1963-64.

The following types of tele-communication cables will be manufactured at this factory on completion of the expansion programme:

1. Under-ground Dry Core Telephone Cables.
2. Plastic Insulated Tele-communication Cables.
3. Switchboard Cables and Wires etc.
4. Copper wires to be drawn locally.

The proposed capacity of the factory is as follows:

1. Dry Core Telephone Cables—32 k.m. per year on double shift basis. 2. Plastic insulated Cables — 25 million core metres. 3. Copper Wire Drawing — 1,500 tons per year on double shift basis.

MANUFACTURE OF SULPHA DRUGS AND VITAMINS

A contract has been signed between the Indian Drugs and Pharmaceuticals Ltd., a Government of India undertaking, and Messrs. Technoexport of U.S.S.R. for the supply of plant, equipment and technical know-how by the latter for setting up a synthetic drugs manufacturing plant at Sanatnagar, near Hyderabad.

The plant is expected to go into production towards the end of the Third Plan period. It will produce various drugs belonging to the sulpha group and also vitamin tablets. Its rated capacity will be 850 tons per annum.

MANUFACTURE OF CAMERAS

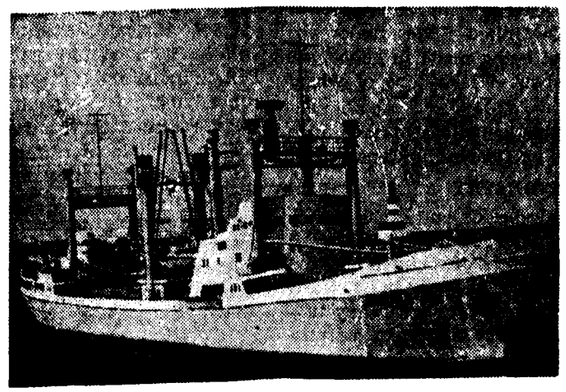
The National Instruments Limited has signed an agreement, for securing technical collaboration, with a Japanese firm, Nippon Kogaka Company, for the establishment of a factory at Durgapur, West Bengal, to manufacture cameras. It has also signed a contract with Messrs. Mitsubishi Shoji Kaisha Limited for the supply of a part of the equipment required for this project. The cost of this equipment will be about Rs. 9.2 lakhs.

Production at this factory is expected to start in the third quarter of 1963.

SUGARCANE PRICES

The Union Ministry of Food and Agriculture has under consideration the question of linking sugarcane prices with the sucrose content, it was stated by Mr. S. K. Patil, the Union Food and Agriculture Minister, in the Lok Sabha last week.

Meanwhile, the Committee of Indian Sugar Mills' Association, in a memorandum submitted to the Government, has urged that the present minimum price of Rs. 1.62 nP. per maund of cane should be linked with the sugar recovery of 10 per cent. For every 0.1 per cent variation in recovery, it has been suggested, the price should rise or fall by 1.2 nP. The Committee is understood to be opposed to bigger slabs, for this, in its opinion, would not be equitable both for the industry and the cane-grower. The schedule, it has further suggested, should operate between 8.5 per cent and 11 per cent recovery of sugar, subject to the minimum price of Rs. 1.44 per maund (factory gate).



The Committee in its memorandum, it is understood, has also suggested that while linking cane prices with the sucrose content, note must be taken of the duration of the crushing season. The schedule, in its opinion, should be made operative between durations of 90 days and 180 days.

The Committee is also of the opinion that for determining cane prices on the basis of sucrose content, the recovery for the season concerned should be taken into account.

PL 480 PACT REVIEW

Mr. V. Shankar, the Union Food Secretary, left for London on June 21, en route to the United States where he will conduct negotiations with the

Interads

US Government early next month at the time of the second annual review of the working of the PL 480 Agreement under which India is purchasing 16 million tons of wheat and one million tons of rice over a period of four years.

The PL 480 Agreement provides for "sufficient flexibility" in the quantity of foodgrains to be imported by India each year, making it possible for the Government of India to regulate purchases with reference to annual requirements, transportation, storage accommodation available and other relative factors. Purchase authorisation for each year are determined on the basis of these annual reviews which are one of the salient features of this Agreement.

The possibility of India asking for slightly smaller imports of foodgrains during the third year of the operation of this four-year Agreement is not ruled out in view of the successive good crops of wheat which India has had during the past two years and also owing to difficulties that may crop up in the way of storing wheat imported from the United States.

During his visit to the USA, Mr. Shankar has plans to tour a number of wheat producing areas, including Kansas, Seattle, and Portland.

There is also every likelihood of Mr. Shankar having discussions with the US Administration on sugar exports from India to the United States. The present Sugar Act of the USA is due to expire on June 30.

Mr. Shankar will be staying in London for a few days before reaching the United States. Here he will have discussions with the representatives of the Australian Wheat Board on the question of commercial purchases by India of Australian wheat during the six month to December, 1962. Although India's imports of wheat are mainly from the United States under the PL 480 Agreement, payment being made in rupee, we have annually to import about 4 lakh tons of wheat commercially.

While in London, Mr. Shankar will also have talks with Batlic Exchange Shipping Chartering Committee.

DIFFICULTIES OF TEA INDUSTRY

The Tea Association of India, Calcutta, has, in the course of a communication to Mr. Manubhai Shah, the Union Minister for International Trade, pointed out that the industry is faced with several handicaps in its efforts to increase tea exports. The handicaps are heavy taxation on tea by the Centre and the States, high transport charges to bring tea from the producing areas to the port; heavy selling expenses due to increased cost of warehousing and sampling; high cost of production of tea; low productivity of labour, etc. Further, a major portion of exportable Indian teas are sold through the London Market and thereby the Indian teas have to bear heavy handling charges such as brokerage, commission, warehousing etc., whereas teas of other countries are sold direct to the blenders and packers of the consuming countries. The Indian tea industry is not allowed to import freely some of its essential machines, equipment, etc., and as a result, it is not able to produce quality teas which will fetch good prices in foreign countries. In this connection, the Association has stated that textile and other industries are allowed a certain percentage of foreign exchange earned by them for importing essential items like dyestuffs, chemicals, machinery parts, etc.

The Association has further stated that the cost of production of tea in India is very high due to various reasons. The price charged for sulphate of ammonia from the tea industry is Rs. 401.30 nP. per tonne, whereas the Indian farmers get it at Rs. 360. Due to inadequate power supply to tea gardens, the gardens have to run their factories with diesel engines. The running cost of these diesel engines is very high. Due to heavy deforestation, rainfall in the tea areas has considerably decreased. The State Governments have so far not given serious thought to the irrigation problem in tea areas. If proper irrigation facilities are made available, the crop and the quality of tea will improve and thereby the cost of production will come down to a great extent.

The Association has, therefore, requested the Minister to assist the tea industry by removing the aforesaid handicaps so that the industry can increase the exports of tea and thus bring home a larger amount of foreign exchange.

THREE NEW PORT TRUSTS

The Government of India has decided to create three new port trusts, one each for Vishakapatnam, Cochin and Kandla. A bill to give effect to this decision will be introduced in Parliament as soon as possible. The provisions of this bill will follow generally those of the Port Trust Acts applicable to Calcutta, Bombay and Madras.

AID FROM THE NETHERLANDS

India figures amongst the seven countries which will be benefitting to the tune of $2,500 each out of $17,500 donation made by the Netherlands to the World Seed Campaign.

This donation has been made by the Netherlands Government under the Gift Coupon Scheme of the United Nations Education, Scientific and Cultural Organisation. The coupons are granted to appropriate institutions in the recipient countries through the National Seed Campaign Committees. They are made use for securing supplies of high quality seed and tree varieties and also for getting technical and educational equipment.

BRITISH TECHNICAL ASSISTANCE TO INDIA

The Indian Institute of Technology, Kharagpur, will shortly be getting £17,000 worth of equipment from Britain under the Colombo Plan for training students in rubber and glass technology. The Institute has previously received British machine tools for its teaching and research laboratories as well as experienced staff.

The tractor-testing station at Bhopal is also receiving £14,000 worth of Britain-made special equipment under this programme for testing the performances and capabilities of different types of tractors for agricultural work. This equipment has been specially designed to suit Indian conditions.

The Central Salt Research Institute at Bhavnagar, one of a chain of national laboratories set up to develop new industrial processes, has just received £6,000 worth of British equipment for extracting efficiently the mineral contents of the numerous salty lagoons and marine bitterns along the coasts of India.

These allocations have been made by Britain following Dr. W. Railston's visit to this country early this year.

NO COMMENTS

The Government of India Audit Report (Civil), 1962, states the following on letting out of Mathura Road exhibition ground to Bharat Krishak Samaj for holdng the World Agricultural Fair in 1959.

"In July, 1959, the exhibition grounds at Mathura Road, New Delhi, were handed over to the Bharat Krishak Samaj for holding the World Agriculture Fair (1959) while the terms and conditions of allotment were still under consideration of Government.

"In November, 1959, Government asked the Samaj to execute the draft licence deed, but the Samaj raised some objections and did not execute the document. A claim of Rs. 35.58 lakhs, representing licence fees for the land and buildings occupied by the Samaj, was preferred in February, 1960, on the basis of the terms of the draft licence.

"The Samaj has so far paid a sum of Rs. 3.30 lakhs only (March, 1962). The Samaj has not accepted the

basis of assessment adopted by Government. The matter is stated to be receiving urgent attention of Government."

IN BRIEF:....

The Orklas' report on the trial tests which this Norwegian firm had conducted on Amjhore pyrites for production of sulphur, reveals a position of uncertainty regarding the suitability of the Orkla process for treating this ore. Efforts are being made to find out another commercially suitable process for the manufacture of sulphur from Amjhore pyrites.

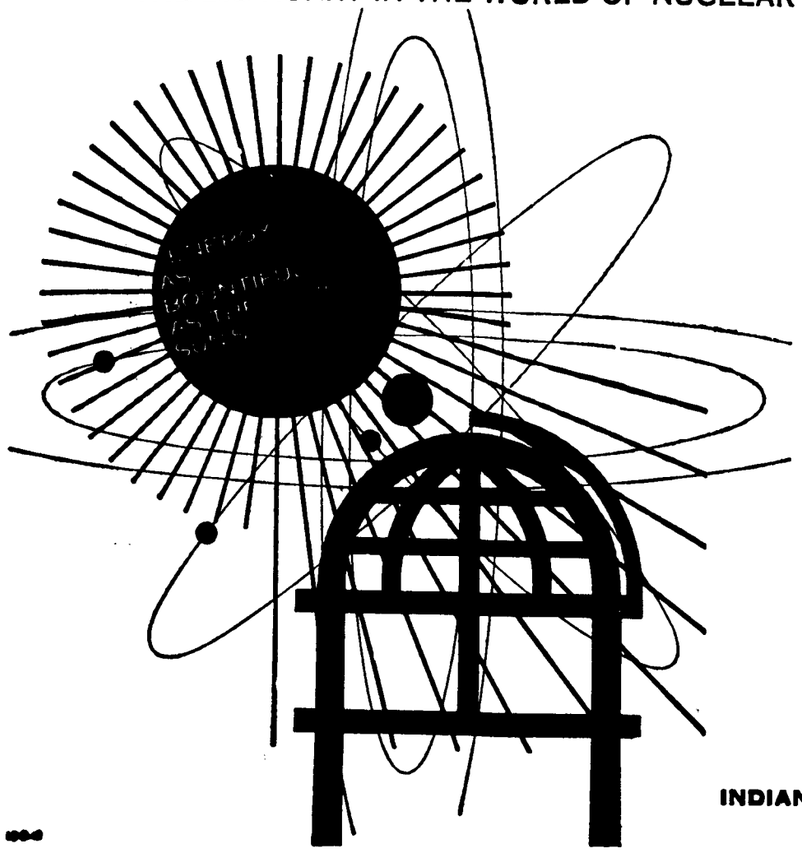
•

As against Rs. 610 crores to be raised by the States through additional taxation for financing the Third Plan, the taxation measures undertaken by the States in 1961-62 yielded about Rs. 17 crores in that year and are expected to bring in an aggregate revenue of about Rs. 100 crores during the whole of the Plan period. An estimate of the revenue resulting from the additional taxation measures proposed by the States for 1962-63 is not yet available.

•

As many as 1,75,000 bales of low quality jute have so far been purchased by the Buffer Stock Association. This Association will continue to make purchases of jute during the next season also. The intention is that these buffer stock operations should continue on a long-term basis in the interest of imparting stability to jute prices.

•

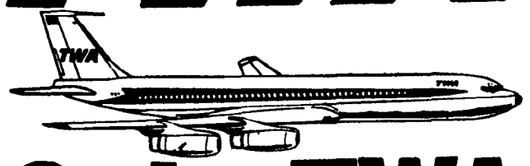


A tea delegation from Iraq is likely to visit India in autumn this year. The total amount of tea exported during the half-year starting on November 20, 1961, the date from which the system of allotment of export quotas for tea estates was suspended, has been 88,950,000 kgs., as against 90,044,000 kgs. and 87,524,000 kgs. exported in the corresponding periods in 1960-61 and 1959-60.

An agreement has been signed between the Oil and National Gas Commission and Burmah-Shell Refineries Ltd., covering all aspects of the supply and pricing of crude oil from Ankleshwar to the Burmah-Shell Trombay refinery. This refinery has been receiving and storing crude from Ankleshwar since September, 1961, and began processing it in February this year. The formal signing of the agreement last week marked the satisfactory conclusion of the discussions on the detailed and complex factors on the supply and pricing arrangements.

•

Gannon Dunkerley and Co. Ltd., which has been manufacturing LPG cylinders in technical collaboration with Rubery Owen & Co. Ltd., of the United Kingdom, has entered the international market by securing a substantial order for supply of domestic LPG cylinders to the Far East. The company has been making these cylinders till now for Burmah-Shell under the trade mark "Burshane". The company has also completed its plans for the manufacture of industrial cylinders; production of these cylinders, it is hoped, will start shortly. The company has as well entered into an agreement with Peebles & Co. Ltd., Scotland, for the manufacture of valves for gas cylinders of all types, including oxygen and acetylene.



THE BIG HURRY IN THE WORLD OF NUCLEAR PHYSICS

The hurry is to find a compact source of energy that will be as prodigious as the sun and will not exhaust though the world live a million years. ■ Closest to the ideal is Uranium 235, a scant one milligram of which, when fissioned or 'exploded', releases more energy than that obtained by burning millions of tons of coal. This great world of power will keep all of us going, and going well, when the present natural sources such as coal give out. Already atomic power stations are an actuality in many countries including India. ■ Shaping the giant pressure vessels enclosing the reactor cores demands a very specialised knowledge of welding. ■ It is this specialised knowledge and application of industrial gases that Indian Oxygen affords Indian industry.

COMPANY AFFAIRS

JAYSHREE TEA

Tea output of the Jayshree Tea and Industries Limited during the last few years has been increasing gradually and during 1961 the company's output at 2.7 million kilograms was the record output. The Directors have added, however, that prices of tea have continued to decline and they add that during the last few months of 1961 the industry faced a near crisis. As the figures below show, export prices in 1961 were considerably lower as compared to the last two years :

1959 season	.. ..	Rs. 5.05 nP. per Kgm.
1960 season	.. ..	Rs. 5.34 nP. per Kgm.
1961 season	.. ..	Rs. 4.66 nP. per Kgm.

The Directors feel that the present heavy incidence of taxation on tea is having adverse effect on exports from India and is consequently giving impetus to other tea producing countries. There is, therefore, a clear case for reduction in the export duties. The company, however, is concentrating on the output of quality teas and for that the gardens are being maintained properly and re-equipped wherever necessary.

For the expansion of its activities, the company has made an application to the Controller of Capital issues for right equity shares in the ratio of one right share for every three existing equity shares. The Directors add that the company has requested that the right shares may be issued at par but the permission was likely to be given to issue the shares at a premium. The company also has applied for the issue of preference shares worth Rs. 29.61 lakhs carrying dividend not exceeding 9½ per cent per annum.

During the year the company made a net profit of Rs. 19.04 lakhs after making provisions for depreciation, taxation and development rebate reserve. The Directors recommended the transfer of Rs. 8.49 lakhs to general reserve and also proposed the payment of a dividend at the rate of Rs. 1.25 per equity share which will absorb Rs. 10.93 lakhs.

SHREE GOPAL PAPER

During the year to December 31, 1961, the working of the pulp mill which was posing certain problems has considerably improved. The Directors have pointed out that the new BTH Turbo Alternator Set which was commissioned during the last year is now operating satisfactorily. With the improved working of the pulp mill and the full availability of the electric power, it became possible to increase the production in the new mill from an average 650 ton approximately per month during the first six months to over 1100 tons per month during the last six months.

The new Soda Recovery House of the company which was commissioned last year experienced certain difficulties in the working of the evaporator to which the Directors are paying sufficient attention. The production during the year was over 30,000 metric tons as compared to over 20,000 metric tons last year. Once the unit runs efficiently the production is expected to be in the neighbourhood of 100—110 metric tons per day.

Profit during the year at Rs. 1.36 crores was nearly 30 per cent higher as compared to Rs. 1.03 crores recorded during the previous year. After making provisions for depreciation and taxation, and other expenses, there was a balance of Rs. 29.59 lakhs out of which the Directors have recommended the payment of a dividend on ordinary shares at the rate of 17.6/7 per cent per annum which will absorb Rs. 22.41 lakhs. In a way the dividend this year remains the same as during the last year and year before and is highest in the history of the company.

PREMIER FERTILIZERS

The construction work of the Premier Fertilizers progressed considerably during 1961 and the erection of machinery was continued. The expenditure during the year 1961 was nearly Rs. 1 lakh. The Directors of the company are hopeful that the production of superphosphate and fertilizers will commence at Kuddalore factory by the end of this year. The Directors, however, have pointed out that there were some delays being experienced on account of the transport bottleneck. Indigenous items required in the construction were not being received in time. Most of the imported items, however, had been received. The company recorded an income of Rs. 49,735 which the Directors have recommended to be carried forward.

FIRST NATIONAL CITY BANK

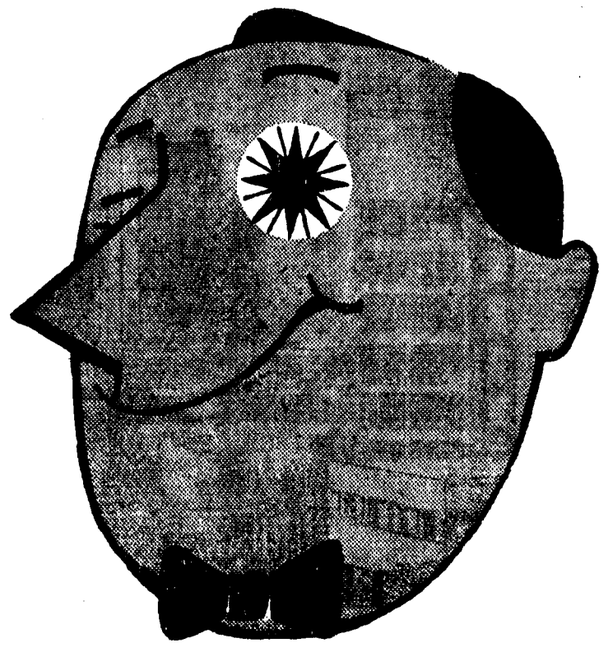
The First National City Bank of New York Limited celebrated its 150th birthday on June 16. During these years the bank changed its name to National City Bank of New York in 1865. In 1955 it merged with the First National Bank of the City of New York and it changed its name to First National City Bank of New York which was shortened later as the First National City Bank. In India it had its branches in 1903 at Bombay and Calcutta. Now it has worldwide system of 87 branches together with its thousands of correspondent banks.

NEW ISSUES

The following companies are among those that have been authorised for new issues by the Controller of Capital Issues.

Heavy Engineering Corporation Limited, a Central Government undertaking, having a paid-up capital of Rs. 2,564.49 lakhs, has been accorded consent to issue further capital of Rs. 1,60,000 lakhs in equity shares of Rs. 1,000 each to be subscribed by the Government of India for cash at par.

Lakshmi-Rieter Machine Works Limited, Madras, has been granted consent to issue equity capital of Rs. 250 lakhs of which shares of the value not exceeding Rs. 18 lakhs will be issued to the foreign collaborators M/s. Rieter Machine Works Limited, Switzerland, and the balance (except 10 per cent of the issue to be subscribed by the promoters) will be offered to the public by prospectus. The proceeds of the issue will be utilised for the manufacture of complete textile spinning machinery.



Tata Oil Mills Limited, Bombay, has been granted consent to the issue of Rs. 35,03,750 (nominal) divided into 1,40,150 equity shares of Rs. 25 each, to be issued for cash at a premium of Rs. 15 per share. The shares will be offered to the existing shareholders of the company in the ratio of one new share for every two shares held. The proceeds of the issue will be utilised on the expansion programme of the company.

Phillips Carbon Black Limited, Calcutta, has been granted consent to issue 3,12,500 eyuity shares of Rs. 10 each for cash at a premium of Rs. 3 per share. The company's existing capital is Rs. 125 lakhs. The issue will be made to the existing shareholders. The capital is required for expansion.

Biermans Paper Coating Mills Limited, Delhi, has been granted consent to the issue of share capital of Rs. 30 lakhs in equity shares of Rs. 100 each for cash at par. Out of this, shares not exceeding 49 per cent would be offered to M/s. Leonard and Bierman S.A. of Belgium. The proceeds will be used for the manufacture of coated art paper and board of all kinds.

Kirloskar Brothers Limited, Bombay, has been granted consent to the issue of capital of Rs. 25 lakhs in 40,000 equity shares of Rs. 25 each to be issued for cash at a premium of Rs. 12 per share and 60,000 9 per cent (subject to tax) preference shares of Rs. 25 each for cash at par. The proceeds will be utilised for augmenting the company's liquid resources. The present paid-up capital of Rs. 55,00,710 is in equity shares.

Durgapur Steel Project: Over 1,50,000 tonnes of ACC Cement have been used on this project

FOR INDIA'S INDUSTRIAL PROGRESS... The most significant development in India since Independence has been the rapid industrialisation of the country. Whole communities have moved in and new townships have sprung up around new industrial undertakings. New homes, schools, hospitals, roads, bridges, dams...huge quantities of cement have been used in the surge of construction all over India. And we are only at the beginning of this era of development and growth. In order that more cement may be available for India's industrial expansion and for the private consumer the Third Plan has set the cement industry a target of 15 million tonnes of cement a year by 1966. And the increasing output of ACC and India Cements factories will help to achieve this.

Company Speech

ORISSA CEMENT LIMITED

Summary of the speech of the Chairman, Shri J. Dalmia delivered at the Twelfth Annual General Meeting of the Company held at Rajgangpur (Orissa State) on 18th June, 1962.

Friends,

1. I extend to you all a very cordial welcome to Rajgangpur on the occasion of the 12th Annual General Meeting of your Company. The accounts for the year 1961 and the Report of your Directors have been circulated. Though your Directors have decided to maintain the dividend on equity shares at 15 per cent, the net value of the dividend to the shareholders will be better, compared to the previous year as 81.60 per cent of the dividend is being paid out of tax exempt profit.

2. The current ex-works prices of cement fixed by Government effective November 1, 1961 are subject to adjustments from time to time for variations in cost arising from any governmental action or increase in the charges for power or fuel. The representation made by your Company for grant of increase in its retention price on the basis of the escalator clause, has been pending with the Government, since over four months. If price increases are not given retrospective effect, as Government is generally reluctant to do, the industry is left to suffer during the intervening period. It is, therefore, necessary to make the escalator clause meaningful and of real benefit to the industry, that an efficient method is evolved so that requests for price increase, based on the escalator clause get prompt consideration and expeditious disposal.

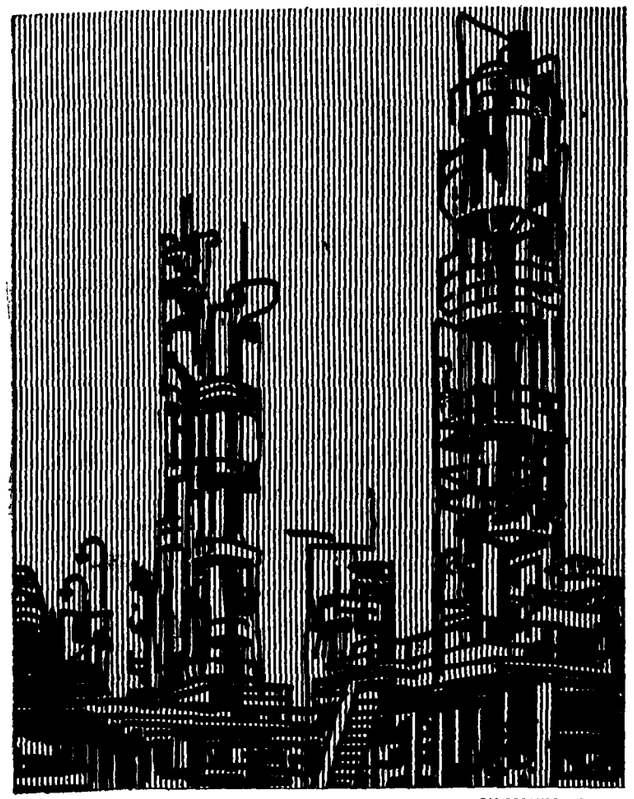
3. I would now like to deal with some aspects of the refractory industry. Last year, I had referred to the uncertainty regarding the pattern and quantum of the future demand of refractories due to the uncertainty of the consumption rate of refractories per ton of steel produced. Recently the consumption rate of refractories for steel production is being placed at a much lower level than before. The forecast of the demand for refractories by the end of the Third Five-Year Plan was based on the steel production capacity reaching a target of 10 million tons per annum by that time. This expansion is, however, well behind schedule and it is expected that the 10 million tons capacity may not be achieved until 1966-67. As a result of this, the operational requirements of refractories by the steel industry must be correlated to an annual steel production of only about six million tons until such time as this expansion is effected. As a result of the foregoing two factors, the forecast of the total annual demand of refractories has had to be altered radically. The estimates made by the refractories panel place the annual requirement of all kinds of refractories upto the period 1963-64 at 6.35 lakh tonnes and the anticipated annual production by then, at 10.51 lakh tonnes. In the case both of fireclay and silica refractories the anticipated production far exceeds the estimated consumption by 1963-64.

4. With regard to basic refractories, it would be found that on the basis of 6 million tons annual production of steel the production of basic refractories will work out to approximately 27 lbs. per ton of steel, which is much on the high side. In this connection, mention might be made that due to the rapid changes and improvement in the furnace operating techniques, the consumption of basic refractories is going down at a very fast rate. Reports have been received from the U.S.A. about a consumption figure as low as 3 lbs. per ton of steel. However, this low figure is resulting from a considerable advance in operating conditions and technique of the running of the furnaces, and the same yard-stick cannot be applied immediately to Indian conditions. The approximate figures for Indian conditions, with the modern plants which we are having, would lie between 10 and 17 lbs. per ton of ingot steel. Further, it is to be noted that the demand for basic refractories might not go up proportionate to the expansion schemes for production of steel which we are likely to have in future because of the growing preference for the L.D. process for the manufacture of steel which requires very little quantity of basic refractories. This point has also to be borne in mind while assessing the future requirement of the Fourth Five-Year Plan, due to further expansion of the steel industry. Under the above circumstances, it is felt that by the end of the Third Five-Year Plan, with the completion of all the expansions of the basic refractories capacity which are in hand, the likely annual capacity would be in the neighbourhood of 1,50,000 tons against an estimated requirement of maximum 1,00,000 tons. There should, therefore, be no apprehension about any shortfall in the capacity for the manufacture of basic refractories.

5. The present situation emphasizes the need of very careful planning in the creation of fresh capacity for refractories. As mentioned above, even in 1966-67 when the steel production would reach a level of 10 million tons per annum, the demand for refractories would be met fully by the indigenous capacity — rather, in the case of firebricks as well as basic bricks, there could still be substantial surplus capacity which could be utilized for the constructional requirements of the steel plants in the Fourth Five-Year Plan. Further, due to gradual conversion of all open hearth furnaces into all basic furnaces there is likely to be sufficient surplus capacity in the silica bricks due to which a part of the capacity of silica bricks can very conveniently be switched on to the manufacture of basic bricks, thus increasing further the capacity for production of basic refractories.

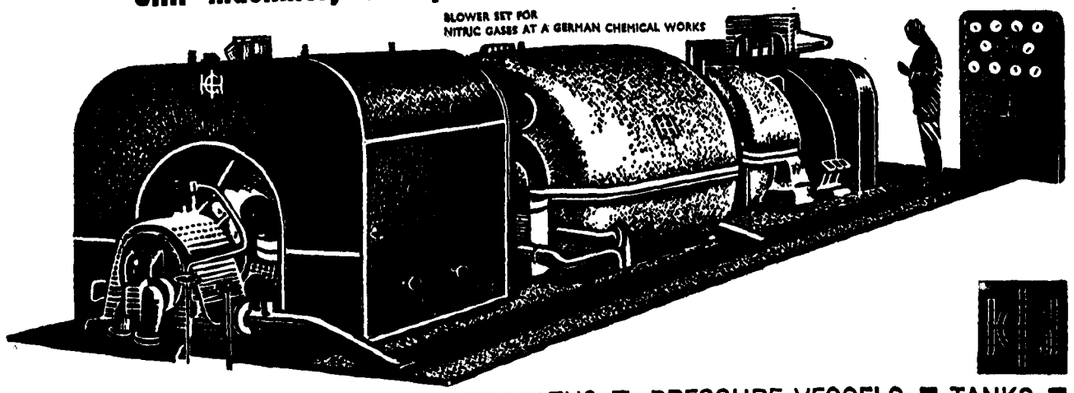
6. I wish to refer to the tendency of certain States to refuse the mining of their deposits of minerals required by the refractory industry for use outside their boundaries. While the underlying principle of developing industries in their own territories is doubtless laudable, such parochial restrictions should not be imposed on an industry which is of national importance and which caters to the needs of such an all-India industry, as steel. While a composite refractory plant can be set up at only one site, chosen for various consider-

ations, the raw materials for such a plant have to be obtained from all parts of India. It is hoped that the Government of India and the State Government will take due regard of this and make it easier for this important industry to obtain its requirements of essential raw materials.



7. I am glad to report that industrial peace continues to be maintained at your Rajgangpur Works and the relations between the management and the workers have been and remain cordial. I am, however, disappointed at the delay in the study of workloads which was decided upon by the Government of India while accepting the recommendations of the Central Wage Board for the Cement Industry. Out of 34 cement factories in the country, so far workload studies have been undertaken at only 3 plants. The study of workloads would provide valuable data for increasing productivity in the industry. Since the Wage increases recommended by the Cement Wage Board were not linked to an increase in labour productivity, the burden of the rise in wage bill had fallen on the consumers by way of higher cement price. This was done despite the policy of the Government of India that increase in wages should flow mainly from increased productivity. The study of workloads will help, at least in future, to consider demands for wage revisions alongside possible increases in productivity. I would, therefore, urge that due importance should be given to the workload study programme and it should be activated and extended to all the plants without further delay.

8. Before I conclude, I wish to express our sincere appreciation of the hard work and co-operation of all the employees of your Company which have contributed in no small measure to the progress which your company has made.



JAI HIND

The wise motorist says

BURMAH-SHELL

"Don't use the clutch as a foot-rest"

After changing gear remove your foot completely from the clutch. The lazy driver is a wasteful driver. Constant pressure on the clutch means more strain on the engine, more petrol consumed. It wears out the clutch plate and shoots up motoring costs.

For further details on how to increase your fuel economy, ask your nearest Burmah-Shell dealer for our leaflet "For more kilometres per litre"

The Resolution on Kashmir

THE resolution on Kashmir placed before the Security Council last week-end and the tenor of the speeches delivered by the delegates of the countries concerned should leave none really happy. No country has felt so unhappy over them as India. The irony was that the fate with which the resolution met was known in advance and still so much harm was allowed to be caused to goodwill, although it was not warranted as inevitable. India has further reason to feel unhappy at the thought that she had to rely on the Russian veto for the rejection of the resolution. But this was a development neither of her making nor of her choice.

Almost all the circumstances attending the resolution make a sorry spectacle. The genesis of the resolution is no longer a secret. When all the countries had their say at the Security Council, a request came for yet another opportunity for discussion and it transpired that the proposal emanated from America. The rest followed quickly. The draft resolution which was intended to be placed before the Council encountered difficulty in attracting a sponsor and eventually Ireland's consent was obtained for sponsorship. The implication of this awkward course was obvious. None of the small five was willing to put up a resolution to which, they knew, India would take serious objection. How Ireland eventually persuaded helself to lend her services may or may not be unfolded in course of time. But the delayed sponsorship conveys its implications which have a bearing on the inherent nature of the resolution.

It called upon India and Pakistan to settle the problem by direct negotiations on the basis of the UNCIP's resolutions of 1948 and 1949. At the last meeting of the Security Council on Kashmir, held as recently as May this year, Mr. Krishna Menon explained at great length how the situation in the intervening fourteen years had changed and he made it quite explicit, in a tone of deep anxiety, that the direct consequence that would necessarily ensue, as a result of a redivision of territory on religious distinctions would be to disrupt the socio-political structure so assiduously built up in both the countries since 1947. So sober and convincing was his exposition of this aspect of the problem that it promptly evoked warm appreciation from Mr. Adlai Stevenson. No events have occurred since then to alter this basic feature.

It was certainly regrettable that in the course of the debate the Kashmir problem was almost forgotten at a crucial stage, when America's distinguished representative took the floor and gave a twist to his speech turning it into a trenchant attack on the Russian use of the veto. This involved an acrimonious exchange. That the veto which Russia was going to exercise on this occasion would be her 100th was a matter of coincidence. The Russian vote on Kashmir, however, had no element of surprise or inconsistency.

India has nourished a grievance that her case is not viewed objectively and, had it been so viewed, the unwelcome relief which came to her through the use of the veto would have been altogether unnecessary. But international politics at the forum of the Security Council being what it is, it is in vain to let passion run high, when a complex of considerations, unrelated to the merits of the subject in a pure sense, are imported into it. Mr. Nehru's strongly worded criticism of the attitude on the resolution taken by America and Britain could have been tempered by some exercise of self-restraint.

The Rajya Sabha debate on foreign affairs came close on the heels of the Kashmir resolution. The Head of Government ought to have purposefully refrained from yielding to the temptation of resorting to forthright outspokenness in giving a powerful vent to his resentment. He spoke of the high value set by India on the goodwill of these two countries, but rushed to nullify the effect of his own appreciation with the sweeping remark that it was washed away by the stroke of a single vote. Why should it? If expediency and political manoeuvring must be accepted as part of the game, a single adverse stroke cannot be allowed to wipe out the entire fund of goodwill. Friendship must not be so brittle; it is well to remember that forbearance has much to commend itself.

The resolution which has become inoperative sought to apply a solution conceived in the situation obtaining more than fourteen years ago and as such it was patently unrealistic. Any future attempt on identical lines will prove unhelpful in solving this problem. This is not the contention of India alone. Five years ago in 1957, Mr. Gunnar Jarring, having studied the political and economic situation in the sub-continent, impressed upon the Security Council that the 1948-49 resolutions had become unsuitable for application.

The UNCIP's resolution of January 5, 1949, provides for a plebiscite subject to the fulfilment of definite preconditions. Important among them is the withdrawal by Pakistan, along with her forces, from the territory in her occupation. After continuous occupation over all these years, she has now entered into a treaty for the settlement of its boundary with Communist China—a startling development which arrested no notice in the course of the debate. It is proof positive, by conduct, that this precondition will not be fulfilled due to complex difficulties raised by the efflux time and a radical change in the situation.

It is in vain to cling to the resolutions whose respective obligations none of the parties can carry out. The only solution lies in direct bilateral talks—the resolution too did not contemplate the presence of a third party. The two governments have now no alternative but to bend their energies to this sole practicable approach with a determination to succeed.

A Self-imposed Obligation

ONE of the essential recommendations of the Import and Export Policy Committee, headed by Mr. Ramaswamy Mudaliar was "not to make exports compulsory by statute." It was suggested that a campaign of public education should be undertaken so as "to awaken the mercantile community to their responsibility of shouldering the burden of export promotion." The first to take up the challenge with a voluntary scheme is the Indian Cotton Mills Federation — a representa-

tive body of the cotton textiles factories throughout the country. According to the scheme propounded by the Federation the textile mills will be obliged to export a certain percentage of its production of cloth and yarn. It is a known fact that cotton textiles exports have been recently indicating a downward trend. In 1961, total exports had dropped to a little less than Rs. 50 crores. In certain markets, such as the United States, the exports had fallen considerably. The decline had occurred primarily due to the fact that a highly remunerative market existed in the country. Now that the foreign exchange crisis has taken a grievous turn and the Aid-India Club had not finalised its commitments for the current year, the rsponsibility has fallen upon the business community to earn more foreign exchange. The Indian Cotton Mills Federation has shown the right way to solve the top priority problem of the country.

The scheme put forward by the Federation is described as "a running scheme", asking every mill having a spinning plant to export 12½ per cent of the turnover in cotton cloth and 3 per cent of the turnover in cotton yarn and staple fibre yarn. The mills can discharge their obligations by exporting either cloth or yarn or both in any proportion so as to achieve their quota of f.o.b. value of exports. In the case of those mills which are not in a position to export their own produtcs, because of lack of foreign buyers for their goods, the obligation may be fulfilled by entering into agreement with the exporting mills. The decision of the Federation provides for penalties for those members who fail to come up to the targets fixed for them. The defaulting mills will have to pay to the Export Promotion Fund of the Federation a contribution equal to one-eighth of the value by which the f.o.b. price of export performance falls short of their export obligations. If necessary, the quotas of cotton are proposed to be withheld to the extent of 6¼ per cent for the mills which fail to abide by the provisions of the scheme.

There is no doubt that India's exports of cotton textiles will show a rise in the current year if the cotton mills measure up to this discipline. The Chairman of the Federation, Mr. Bhagat Ram, ha estimated that India's exports of cotton textiles would be around Rs. 57 crores in 1962 as against Rs. 49.6 crores in 1961. The loss on exports by the mills, according to the Chairman, is likely to be more than made up by the remunerative prices which the cotton textile mills will be able to obtain in the home market. Is it a signal for raising domestic prices? Past experience has indicated that every fresh impost such as an increase in the excise duty is passed on to the consumer. There are strong chances of a rise in domestic prices of cotton textiles as a result of this self-imposed obligation, but it seems that there is no escape from this price inflation. The choice lies between higher prices and the yawning gap in the balance of payments. Obviously the country cannot but opt for the former alterna ive.

There is, however, one danger in imposing this new compulsion. Out of more than 500 mills working in the country, there is a large proportion which has never operated in the foreign markets. For them it will be a herculean task to locate the buyers in international markets. Here the Cotton Textiles Export Promotion Council must come to the succour of these manufacturers, but perhaps the Council can also give assistance of a limited character. The mills will have to fall back upon their own resources and get efficient marketing research agencies as well as sales promotion techniques to assist them in their search for new markets. The cost of these essential aids will be nominal in relation to the targets of increased exports. Instead of letting these obligatory exports to turn into "distress sales" in unwilling markets and letting exports rise in volume without fetching an adequate return, it will be preferable to make on-the-spot market studies for the particular products of the exporting mills. The limited indigenous talent in this field can be supplemented by collaboration with foreign agencies. Indian exporters ought to encounter their competitors with the latter's own sales techniques.

Oil India Marches Ahead

WHILE Oil India's Chairman, Mr. Khandubhai Desai, in his first address to the annual general meeting of the company, has presented a reassuring picture of the working of this partnership concern of the Government of India and the BOC during 1961, which he has rightly characterised as "a momentous year in the history of this young organisation", he has done well in spotlighting two vulnerable spots that threaten to upset all calculations about exploitation of Upper Assam's oil resources. It is a matter of deep concern, not only for Oil India, that the dispute over royalty on the crude extracted from Oil India's concession area continues and a virtual stalemate has occurred in this respect, because of the Mines and Fuel Minister's pre-occupation with the crucial coal problem of the country. While the coal issue requires considerable attention and concentration of efforts by the authorities to resolve it, the solution of the Assam oil royalty dispute is also a matter that does not brook any delay, especially when the country's foreign exchange situation continues to deteriorate at a fast rate.

All the past estimates of the consumption of petroleum products in the developing economy of India appear to be becoming out of date and if attempts are to be made to effect any appreciable saving on import of crude oil ond petroleum products from abroad, it is plain commonsense that the problems faced in the exploitation of the proven crude reserves of the country should be expeditiously resolved. The intransigent attitude adopted by the Assam Government on the royalty dispute and its unwillingness to issue to Oil India a prospecting licence for the new concession ar a are ill-advised. In view of Mr. K. D. Malaviya's offer to the State Government to break this deadlock by reference to a third party, the Assam Government ought to resile from the rigid posture it has adopted. The non-issuance of this prospecting licence has already inordinately delayed Oil India's exploration programme in the new concession area granted to it over a year ago. This programme was to be launched in October last and if the licence is not issued promptly, there is every danger of its being held up beyond the next winter also.

The second factor that Mr. Khandubhai Desai has stressed as hampering Oil India's levelopment programme is the difficulties encountered in the way of acquiring land for drilling purposes.

To expedite exploitation of the already proved crude reserves in its principal concession area, estimated at 45 million tons, the company has been procuring land through private negotiations with the land-owners. But that has been found to be a very expensive proposition. The State Government obviously has a crucial function to perform in this respect. The latest judgment of the Supreme Court in *Shrimati Somawanti and Others versus The State of Punjab and Others* should strengthen the hands of the Assam Government for acquiring private lands for the purposes of a public utility to which category Oil India unquestionably belongs. The acquisition of land for the drilling programme of Oil India is a national obligation enjoined on the Assam Government. Every ounce of crude oil produced and processed in the country counts; it helps in saving foreign exchange so sorely needed not only to maintain the present tempo of industrial activity in India but to raise it in the interests of completing the take-off stage at the earliest.

The Oil India Board of Directors has followed a commendably prudent policy in not declaring any dividend as yet, although there has resulted during the past three years of the operation of the company a net surplus of Rs. 1.15 crores. This has been quite judiciously transferred to the general reserve. The arrears of depreciation carried over from 1960 have also been wiped out. Considering that the company commenced its sales operations only last year, when it sold three lakh tons of crude, and taking into account the fact that only partial development of its oilfield has yet been effected, the financial results achieved during 1961 have obviously been impressive.

A note of caution, however, would not be out of place for the successful working of this enterprise in future. It can apparently improve upon its past performance insofar as completion of the second stage of its pipeline project is concerned. Similarly, considering the heavy odds it has to overcome for developing its Nahorkatiya-Moran oilfield, it has to redouble its drilling efforts if it is to reach the 3 million tons crude output target by 1963 and also is to fulfil the high expectations entertained about its working in the context of the proposed expansion of the Nunmati and Barauni refineries from 2.75 million tons capacity to nearly 4 million tons. If all goes well, it may not be difficult for the company to fulfil its obligations. But managerial efficiency lies in performing an arduous job in the face of all difficulties and mishaps.

A Good Start

THE Indian Investment Centre can turn back to its first year with a legitimate sense of satisfaction and look ahead with a feeling of confidence in the fulfilment of its assignment. The Centre completed its first full year in the formal sense this month, but its effective functioning has been of a shorter duration dating from September last year. Its potential record, therefore, is crowded in the last three quarters only. It can claim on the basis of this record that it is holding steadfast to its basic objective which is "to create in the capital-exporting countries a climate favourable for investment in this country and to generate interest among foreign firms and corporations on the basis of specific investment opportunities."

Mr. G. L. Mehta, Chairman of the Centre, has ample justification, derived from its performance, to be optimistic about stimulating growing interest in private investment from abroad and expanding the area of foreign and Indian industrial collaboration. The foreign investor takes the risk of export of his capital to an unfamiliar region only after the application of certain politico-economic tests. Political stability and governmental policy on foreign private capital belong to the first category. But while they are the *sine qua non* for risking the export of capital, the economic tests are much more important. Among them the dynamism of the domestic market, the progress of the economy in continuously raising the standards of living, the rate of profitability in new industries and the diversification of the structure of the industrial economy to accommodate various types of investments, rank as the principal criteria on which his decision is made. The investment climate in India is standing these tests well as evidenced by the number of enquiries made with the Centre.

The processing of the projects forming the subject-matter of enquiries addressed to the Centre does not by any means follow merely the conventional pattern. The Centre in New Delhi has supplemented this pattern by its own technique and in the task of comprehensive processing the pride of place is given to an assessment of the technical soundness of the project and its financial viability. The experience of international financial agencies stresses the unanimous conclusion that the estimates of indigenous entrepreneurs in developing countries usually err on the lower side in the matter of capital requirements and there is usually a lopsided reliance on bank finance. The Centre has been careful in verifying that these errors do not mar the chances of attracting foreign collaboration.

Within a short period of nine months of effective operation the Centre handled as many as 1,100 enquiries from Indian entrepreneurs and 170 from foreign investors, which is surely a tall order in the relative sense. It is significant that 50 per cent of the enquiries or 550 in absolute number from Indian investors sought guidance for joint ventures and it redounds to the Centre's credit that it has been rigorous in processing the requests, selecting only 100 out of the total of 550 for transmission to foreign countries to sound the investors. The Centre is rightly refusing to budge an inch from its strict criteria for reference abroad.

The flow of enquiries from abroad too reveals an emphasis on joint participation. It is instructive to find that while the number of enquiries emanating from the individual European countries in the first year ranged up to 8, the enquiries from America were of the much higher order of 43. The magnitude of American enquiries is partly a reflection of the reorientation of that country's foreign investment policy under the impact of the Common Market, but essentially it indicates the verdict that India is a sound risk. The Centre's initial performance raises great expectations in the crucial period ahead, when foreign capital and technical know-how will be needed for the diversification of our industrial economy.

THE WEEK'S NOTES

EEC

AGREEMENT WITH INDIA

MR. MORARJI DESAI's statement in the Lok Sabha, striking an optimistic note that the EEC may conclude a separate trade agreement with India, has evoked interest about the probable content of the agreement and the substantive benefit it is likely to confer on this country. The Finance Minister has sound reason to raise optimism in the way he did. Among the Six there is a positive consciousness of the development pressures on India and Pakistan in the context of the external resources they need. This may be summed up in their new appreciation of the advisability of promoting the two-way trade between India (or Pakistan or Ceylon) and the Six with the purpose of improving the lopsided imbalance, resulting in a steadily mounting deficit for the underdeveloped partners. What concrete shape will be given to this appreciation in the body of the agreement. it is defficult to forecast at this stage, in the absence of any available clue. The agreement is likely to entail long negotiations so that it may hardly come into operation before the end of 1966, as now envisaged. Meantime, there is to be an interim arrangement on the nature of which little light has been thrown at the present moment.

But one development connected with the projected trade agreement is significant from India's view-point. Its consequence will be somewhat disconcerting to her. It makes a substantial difference to the equilibrium in the bargaining power of the two sides. Britain will bc required to sign the treaty and join the Market first, an interim arrangement for relief to India (described as the transitional regime) will be provided for and the formal agreement on trade between the enlarged Community and India will be concluded after the negotiations by the end of 1966. Why it should take such a long time is not at all clear. Britain's influence, in obtaining reasonably favourable terms for the developing Commonwealth countries, in the course of the negotiations, will be circumscribed by the fact that, as a member of the enlarged Community, she will need to abide by the discipline of the attitude it will adopt

Canada

INSTABILITY AFTER THE ELECTIONS

PRE-ELECTION FORECASTS in Canada had it that the verdict of the electrorate was unpredictable as it seldom was before. The results have borne out this apprehension. In fact there did not exist very sharp differences, apart from the conventional ones, between the programmes advocated in their election manifestoes by the Progressive Conservative Party and the Liberal Party. But the Liberal Party was in the fortunate position enjoyed by all opposition parties at the hustings. It could drive home the point how the Conservatives missed opportunity after opportunity in consolidating economic prosperity and contentment. An electorate, feeling the burden of inflationary pressures, was easily prone to give credence to this sort of propaganda. Mr. Diefenbaker's task in facing the voters was made more difficult by the aftermath of Britain's application for entry in the EEC. The emotional impact of this factor in Canada, which has always valued the Commonwealth tie, but now saw it likely to be impaired, could not be underestimated. The electorate was in a confused state of mind no less than the two major parties.

Mr. Diefenbaker's Progressive Conservative Party has emerged as the largest single party in the Commons. But its majority is not decisive, it is only relative. Mr. Pearson's Liberal Party could make capital out of the discontent with the worsening of the economic situation and capture more seats than in the previous elections; but even so, it came out as the second biggest. The Social Credit Party, which made its appearance for the first time in Parliament, got 30 seats, while the New Democratic Party had to remain content with only 19. Obviously, the Social Credit Party holds the balance of power.

Would Mr. Diefenbaker invite Mr. Thompson, leader of the Social Credit Party, to form a coalition? This possibility has been ruled out by the Conservatives, who have made a decision that they would run the administration as a minority government, but not by a coalition at the cost of sizable concessions and, then again, continuing on sufferance. The Social Credit Party on its part has decided not to join a coalition, but to continue to support Mr. Diefenbaker so long as his government agrees to their basic demands of tax incentives, freer trade and an immediate programme of expansion of municipal projects. Depending upon these trends in policy, they have no desire to precipitate a fresh election, apparently because they do not envisage a prospect of improving their strength. But the Liberals seem intent on hastening the defeat of Mr. Diefenbaker's minority government exactly for the opposite reason that they hope to emerge with added strength in an early election. It is an unstable government which will hold office, but the instability and the uncertainty which accompanies it are unlikely to survive the current calendar year.

Mysore

IMPLICATIONS OF CHANGE

IT IS not usual for a reshuffle to be carried out in a Ministry in the course of which the entire Cabinet is left intact save the Chief Minister. This has happened in Mysore, although without the least element of surprise. Another significant fact is that the change has taken place, while the Chief Minister who made way for his "chief", enjoyed the confidence of the Party in office. Ever since the defeat of Mr. Nijalingappa in the general elections and the selection of Mr. Kanthi as the Party leader in supersession of Mr. Jatti, it was known that Mr. Kanthi would function as an interim Chief Minister, until Mr. Nijalingappa would obtain entry through a by-election. Like Mr. Kanthi another Congress M.L.A. stepped aside — by vacating his seat. The vacancy thus created facilitated Mr. Nijalingappa's election to the Legislative Assembly. No stigma as such attaches to this modus vivendi of securing at a by-election the success of a candidate defeated at the general election if only because the Party feels that his services are essential. In case a precedent were required to carry conviction in this respect, Bombay State before re-organisatoin offers a telling one. In Madhya Pradesh a parallel technique of by-election was adopted and the former Chief Minister found his way inside the legislature. But the parallelism ends here. The fact that Dr. Katju could not be reinstalled as Chief Minister, but Mr. Nijalingappa could be, makes the most vital difference. Having rejected the claim of Mr. Jatti to the leadership of the Congress Legislature Party, it made no secret of its feeling of helplessness without Mr. Nijalingappa to pilot it.

Mr. Nijalingappa's election as Party leader (leading to his appointment as Chief Minister) is described as "unanimous". What was needed to make the unanimity complete was the concurrence of the Jatti Group. Only until a few days before Mr. Nijalingappa's election to leadership, the two groups, which divided the solidarity of the Party, made no secret of their mutual hostility. How the transformation came about in the attitude of the Jatti group is intriguing. If the transformation is genuine — and not a product of expediency — Mysore State will have acquired a new and dynamic force for vitality in its political life. But in such matters forecasts either way are premature. The true nature of this unanimity ought to be tested by time. Already there are whispers going round that Mr. Nijalingappa is thinking in terms of expanding his Cabinet, whose present size is quite adequate for the needs of the administration of the State. It is said that the number of Deputy Ministers is going to be multiplied on a surprising scale, while the additions to the posts of Ministers will also be surprising in the context of needs. Tne veracity of this report cannot be vouchsafed by anybody. But if Cabinet expansion comes about as whispered, Mr. Nijalingappa will have paid a high and questionable price to maintain unity (or rather the facade of unity) within the Party ranks.

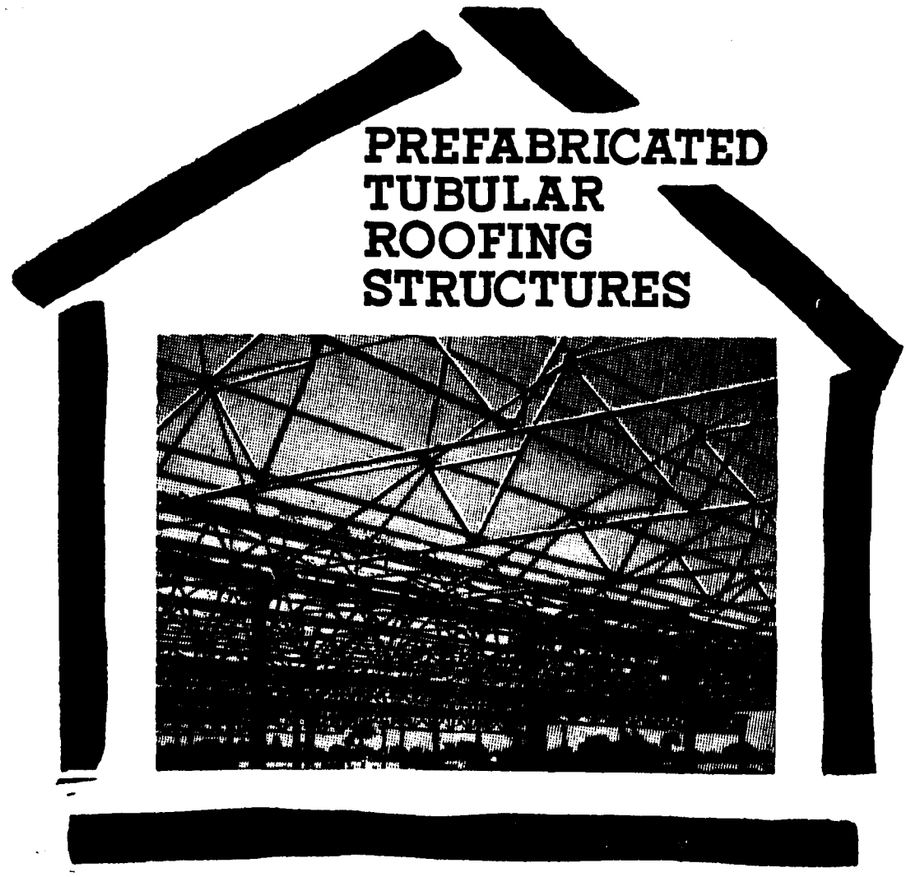
Since the manoeuvring, which culminated in the exist of Mr. K. C. Reddy, began in Mysore, groupism has eaten into the vitals of the Party and the process has been kept alive with successive changes in Chief Ministers. One dangerous feature of groupism in the Mysore Congress Party is casteism. The real test of Mr. Nijalingappa's genuine success and service to the State will lie in wiping out the virus of groupism.

Deputy Leader

ISSUE SHELVED, NOT SOLVED

THE ELECTION of two Deputy Leaders for the Congress Parliamentary Party seems to have settled the issue at long last — but only to outward appearances. It took the Party over sixteen months after the passing away of Pandit Govind Ballabh Pant to arrive at this improvised arrangement. The Congress Party leaders, and particularly the senior among them, are painfully aware that the "unanimous" election as Deputy Leaders of Mr. Harekrushna Mahatab in the Lok Sabha and of Mr. Surendra Mohan Gupta in the Rajya Sabha is a pure make-believe which will deceive none. Even to strike upon it, the Party's constitution had to be amended in a manner which fully exposed the purpose of the two amendments. The first amendment provides for two Deputy Leaders — one in each House — in place of one. The second amendment deletes the clause defining the functions of the Deputy Leader for the very obvious reason that the new ones are no longer to fulfil any effective role in the absence of the Leader, but they are merely to be adorned with the trappings of this position. They will have the honour and distinction to occupy the chair at the meetings and no more. As if to remove any vestige of doubt about the correct position after the deletion of the clause on functions, Mr. Nehru has explained in blunt words that the Deputy Leaders will not lead the Party in his absence.

It was for the Party to choose the Deputy Leader with the implication that his choice means the choice of a successor.Mr. Nehru has taken the position that it is not for him to nominate his successor. Whatever the reason for this attitude, the responsibility to make the choice rests squarely on the Party's shoulders and it can discharge it without disrupting its unity and harmony by making a unanimous choice. But the Congress Party appears still to partake more of the complexion of a platform than a party, in the sense that the shades of opinion, held on the concept of the socialist pattern, are too wide and the gulf between the balanced moderates and the passionate leftists is too large. It is this gulf which has made the Party at the present time incapable of putting its unanimous support behind Mr. Morarji Desai. The leftists' behind-the-scene activities have thwarted unanimity, but they have been unable to produce an acceptable alternative. This is but a major symptom, among many, of the lack of cohesion and unity. For sixteen months a solution could not be found. The escapist device of electing two Deputy Leaders has helped to shelve the problem, not to solve it. The uncertainty that hangs over cannot but be a source of disharmony and dissipation of strength.



Student Community

PARTICIPATION IN POLITICS

MR. A. B. VAJPAYEE'S resolution in the Rajya Sabha, calling upon the Government to convene a conference of all the political parties in the country to agree upon a code of conduct to keep students out of politics, was talked out last Friday. The trend of the discussion on the resolution left no doubt that, if the resolution had not been talked out, but put to vote, it would have been thrown out. A code of conduct is not something that can be imposed; it rests on voluntary acceptance and self-discipline is its sanction. It is astonishing why the Government should be dragged in such matters. If the party in office subscribes to the code, it is enough. Does this reliance on the Government for guidance not betray a lack of self-confidence?

The discussion turned eventually on the advisability or otherwise of students participating in active politics and this was right. The alternatives debated were active politics and intellectual interest in politics. Mr. Vajpayee, however, thought that the alternative to active politics was study of political science. In arguing, therefore, that he was not opposed to students forming study groups to discuss political science, he perhaps overlooked the fact that science is something which is to be learnt systematically at a theoretical level in educational institutions and not by group discussions. There was, of course, some recrimination in which the spokesmen indulged. Mr. Bhupesh Gupta wanted the exclusion from the conference of communalistic parties. Assuming the code of conduct is evolved, would its purpose be served by obtaining the compliance of such parties with it or by excluding them and leaving them free to misuse the energies of the student community? To Mr. Gupta's advocacy of encouraging student participation in active politics (on the plea that they represent a powerful force for moulding the nation's political life), quick came the retort that the Communist Party was vitally interested in exploiting the emotionalism, immaturity and easy impressionability of young students.

The tenor of the sober part of the discussion showed that a broad distinction should be drawn between active politics and intellectual interest in problems of current politics. By and large, the student community's energy should be channelled towards the intellectual aspect as a preparation for those who would choose a political career or retain a deep interest (short of a regular career) in politics. But the fact of the situation is that politics has become such a strong part of our life (and we are still so near the independence struggle) that total abstinence from active politics will be hard for students to practise. If students are too eager to plunge into agitational politics, it is a part of the larger and disturbing problem of indiscipline. How they can be weaned away from active politics in a general way is a part of the problem of removing indiscipline and inculcating healthy attitudes in the student generation.

All S & L Prefabricated Tubular Roofing structures are designed to the requirement of I.S. 806: 1957 code of practice for the use of steel tubes in general building constructions.

Entirely self-supporting S & L structures of the following spans and bay lengths are available ex-stock.

Type	Nom. Single Span	Bay Lengths
SLS/20	20 ft.	10 ft.
SLS/30	30 ft.	10 ft and 13 ft. 4 in.
SLS/44	44 ft.	10 ft. 1 1/8 in. and 13 ft. 4 1/8 in.

The World Abroad

MEET NYANTARA SAHGAL

By ODYSSEUS

THOSE WHO have been good enough to follow the musings of this column since it first started, sixteen years ago, know that it has always been our view that we neglect matters of the mind, the heart, and the spirit at our peril. Let us therefore take a week off from the economic problems, with which we have been pre-occupied here for far too many months now, to consider "From Fear Set Free", a newly published book by Mrs. Nayantara Sahgal, who is the thirty-five year old daughter of Mrs. Vijaya Lakshmi Pandit and the niece of Jawaharlal Nehru.

MRS. PANDIT SCOLDS HER BROTHER

Mrs. Sahgal has exceptional gifts as a writer. She is interested both in people and in ideas. To people, she brings insight, warm, sympathetic, yet humorous, into character. Her pages are a portrait gallery of scores of people met in the United States, the USSR, England, and India. We hear the Prime Minister's views on marriage. We see Mrs. Pandit scolding her brother for not looking after himself. In Europe, the "busiest man takes a week off, or at least a Sunday in the country to collect his thoughts and relax. You listen to the news on the radio even while you eat. Your digestion hasn't a chance to do its work. Would the earth stop turning if you relaxed one day in the week?"

"Anything else, darling?" asked Mamu.

"Bhai, I do wish you'd be serious."

"You're getting old, that's your trouble',, smiled Mamu.

"I certainly am," Mummie retorted, "and I wish other people would realise they aren't getting any younger and live more sensibly."

"What is 'more sensibly'?" asked Mamu.

"Like a human being, not a driven animal."

Mamu, about to leave the room hesitated a minute.

"It would be pleasant," he admitted wistfully, "to be able to do all the reading one wants, and I haven't been inside a restaurant or a shop for years.."

"Then do it, bhai." Mummie sounded urgent, pleading.

"There isn't time," he said quietly. "We are here to work until we're thrown on the rubbish heap."

Such intimate sketches, of politicians, business men, American mothers, British ambassadresses, Indian shop keepers, doctors, nurses, cooks, bearers, and children, are innumerable in Mrs. Sahgal's pages.

Mrs. Sahgal tells a pleasing anecdote of her visit to the USA to stay with her mother (then Indian ambassadress) while expecting her first child. Mrs. Sahgal represented Mrs. Pandit, who had been elected Mother of the Year for India, at an international luncheon at the Waldorf Astoria Hotel. Nayantara, "plumply pregnant" and ill at ease, was relieved to find that the "Mother of the Year for Pakistan, seated beside me, turned out to be a man with a luxuriant moustache and a friendly smile," who had rashly agreed to represent his wife at the function.

Mrs. Sahgal is sensitive to the atmosphere of the countries that she visits and she is skilful in getting it on to paper. Of the USA she says: "It was a joy to be where plenty was framed in every shop window, where the people were strong and beautiful with good health, alert with self-confidence. It was dazzling and disturbing. These men and women were insulated against the trials that beset ordinary people the world over. They [illegible] flourishing in a superbly organised laboratory of a nation" (Is this intended as the latest description of capitalism and free enterprise?!). "For all their talk of the common man they were highly uncommon people. For all their individualism they rejoiced in a crushing conformity. Some of this was what we wanted for ourselves, a share of this material comfort, this technical advance and all the goods of the earth. The Indian ideal of self-immolation belonged to a past of repeated conquest, a resignation complete and utter, a longing for the spirit's release from the body's toil." (Does this, I wonder, properly describe the state of mind of a Chand Bibi, Shivaji, or a Rani of Jhansi?). "Forgetfulness then had been the only remedy. We wanted to be over all that. The self, now charged with a new meaning, clamoured to be asserted, not forgotten. But what was the right level of prosperity, the level that banished need but did not satiate, the level that did not threaten the artist in the individual? And how did one stop when arrived at it?"

Of the many observers who have described how cut off foreigners in Moscow are from the Soviet people, few have done it so imaginatively as Mrs. Sahgal: "Opportunity in Moscow in 1948 consisted largely of dinners and lunches at other embassies, the Sunday night cinema with punch and cakes to follow at the American embassy, and entertainment at our own. No foreigner was allowed to go more than forty-five kilometers beyond Moscow without a permit. Travel in the Soviet Union was borbidden except by special permission to specified places, and we had little contact with Soviet citizens. The diplomatic corps revolved almost entirely about its own axis. It was like being on shipboard on a voyage lasting, for me, six months, with a regular round of amusements and entertainments planned for the passengers, while around us the mysterious heaved. Occasionally a tingling salty spray touched one's cheek and one turned longingly to the ocean for more, but the bold, frothy finger of the sea vanished into the endless stretch. Lekha and I longed to climb out of the ship into a lifeboat at least, get closer to the sea, feel the enormous heaving expanse of it, but we were not permitted."

In ideas, Mrs. Sahgal reveals herself a convinced follower of Gandhian non-violence, to which she clings as the ultimate solvent of all problems. Writing of the time of partition in 1947, when Delhi was filled with refugees, she refers to the "apparent speed with which thirty years of training in non-violence has dissolved like silver in a corroding chemical. Much more than damage to life and property had to be restored. A fundamental faith had been shaken. Recovery would begin when it was steadied."

IS INDIA NON-VIOLENT?

Of Gandhiji, Mrs. Sahgal says that no single fact did more than Gandhiji's loin cloth to re-orient the thinking of an entire nation. It shifted the political spot light from urban intellectuals to the masses. The people had waged non-violent war against the British not, in Mrs. Sahgal's view, because they were physically weak, for a people aroused can find a way, but because the only resource that mattered to Gandhi had been that of the spirit. He transformed India's traditional concept of resignation into the priceless weapon of satyagraha. "Satya-

graha?" bitterly commented Mrs. Sahgal's husband, Gautam, when they discussed it in 1947. "Non-violence? Look what has just happened in the Punjab."

Destruction and hatred, Mrs. Sahghal admits, had made a mockery of Gandhi's life and teaching. Yet his own faith in non-violence never wavered. By preaching it, he restored pace in riot-torn Noakali. "Non-violence, it is true, did not come naturally to the human animal, but which aspect of civilised living came naturally to him?"

"Certainly not non-violence," replied Gautam with emphasis. "That may be all right for the saints, not for ordinary people.. And it's a myth that we in India are less violently inclined than any other nationality."

Mrs. Sahgal, however, insists that it was not non-violence which had proved ineffectual. "It was we who had not proved strong enough to employ it. We had gone backwards into barbarianism during the terrible bloodshed before and after partition... It has, after all, taken millenniums for the human being to learn to walk upright... Why did people imagine that non-violence, the approach of love and peace, the final stage of the refining process, could be arrived at suddenly? The first articulate sounds had not produced language."

Elsewhere Mrs. Sahgal says: "In 1955, on my own first trip to England, I found a blessedly familiar country whose heritage, from nursery rhymes to literature was part of me. The 'damned British', those shadowy figures of my childhood, faded away. An England of real people replaced them, one that would always belong, a little, to me... England gave me the sensation of inviolable safety from that grimmest of dangers, unreason. Whatever was unjust, too complacent or meaningless here would, no doubt, in time be changed, but reason would prevail in changing it. I understood at last why my parents, soon to be arrested and imprisoned by the British Government, had reacted as though to a personal injury when the House of Commons had been bombed. "...British warmth and generosity, so abundant, seemed directed not extravagantly at the world at large, but selectively, flatteringly at oneself. This was the climate of conversation with an individual flavour and an individual significance. It contrasted sharply with their views on security—the problem of the preservation of a way of life—which had little any more to do with the individual. In India, the issue was still the preservation of life itself against hunger and disease, and the distinction between our countries may have accounted for our separate attitudes towards security. For them, security was a system that must engirdle the globe to keep it from exploding with the ambitions of any part of it. For me, security resided in the human being. If he were hungry he would be fed, if naked and destitute eventually clothed and housed, but did the system exist that could banish fear and assure his future? What exactly was a system of security, I wondered? Was it the means to destroy one city, or four or five? At what stage did one feel really secure and what were all the bombs worth if they brought no peace of mind even to their possessors?"

On learning of China's aggression in the Himalayas, Mrs. Sahgal felt that if India had to defend her freedom, she would not be satisfied with a military strength. She would be satisfied with nothing less than pitting her whole self, the determined mind in the determined body, against the enemy. "Wanton destruction would not serve my purpose, only unyielding defence would. I know I should want to bar the way with my body, that I should perhaps die, but that four hundred million others, similarly pledged, would not all die. What else had Gandhi meant, except that he had sublimated the physical to a moral force and believed it to be the greatest force on earth? It had suffered setbacks but never for long. Great good was sometimes eclipsed, but a thin stream of it continued to flow. And the frail stream had been persistent and enduring, evidence of the creative principle that survived all disaster."

For my part, I believe that Gautam Sahgal errs in dismissing the concept of non-violence as chimerical in all cases and that Mrs. Sahgal's faith in it is too simple. I will try to explain why next week.

THE DECLINE OF IMPERIAL TRADE

From Our Special West European Correspondent

PARIS, June 27.

A PAMPHLET called "Appeal to the Commonwealth" was published in London last week by two anti-Common Market, tories, Messrs. Walker and Walker-Smith. According to Press summaries, it develops the argument that trade with the Commonwealth is more valuable to Britain than trade with the Common Market, adducing as evidence the facts that, firstly, British exports to the former in 1960 were worth £1,000 million more than to the latter, and, secondly, that in the decade 1950-60 British exports to the Commonwealth grew by £451 million whereas exports to the Common Market grew by only £285 million. Without vouchsafing the accuracy of these figures (which cables may have got wrong, anyhow), one sees plainly the drift of the argument. It happens to be the contrary of that set out here last September in a series called "The Decline of Imperial Trade." It was shown here, relying on the experience of both Britain and France, that as colonies achieve their independence their imports from the imperial power decline, either absolutely or (more commonly) as a percentage of their total imports. If that is correct, the tory MP's are wrong. The issue has its importance, for if imperial trade is declining, Britain would be justified in seeking closer association with the Common Market; but if trade with the Commonwealth were growing faster than trade with Europe, it would be a mistake to jeopardise it by accepting the condition of the Rome Treaty.

In reality, there can be no denying the decline in imperial trade, and the comparison offered by the pamphlet between British exports to the Commonwealth and the Common Market is quite fallacious. Throughout by far most of the decade 1950-1960, the Common Market did not exist, and at no time was Britain a member of it; only towards the end of that decade did two of its largest members begin their economic expansion (France and Italy), and only at the very end did they, and to a lesser extent their partners, vastly liberalise their trade with the outside world. On the other hand, throughout almost all of that decade many members of the Commonwealth were still subject colonies: Ghana's independence dates from 1957 and the rest of the 77 million English-speaking Africans have just lately become independent or are still awaiting liberation. The decline in imperial trade may begin even before independence, but it gathers pace a few years after it, as the young nation deliberately seeks to diversify sources of supply, receives aid from more quarters, reduces vested trading interests established under colonialism and increases the range of its wants by undertaking industrialisation. Leaving aside such important details as the fact that in 1950-60 may Commonwealth countries were running down sterling balances which (as India has discovered) do not last forever, one sees that it would be more instructive to compare: on the one hand, Britain's exports to a Commonwealth country that has been independent for some years, and, on the other hand, her exports to the Continent as they would be if she benefitted from membership of the six-nation customs union. For the latter hypothetical calculation, the spectacular increase in internal trade between the Six offers a clue.

The place of British exports, expressed as a percentage of total imports, in the trade of various Commonwealth countries is shown in the following table:

	1955	1957	1959	1960
East Africa ..	44	38	37	34
South Africa ..	35	33	31	28
Ghana ..	47	42	40	37
Nigeria ..	47	43	46	43
Rhodesias-Nyasaland	43	38	37	33
Australia ..	44	41	36	33
New Zealand ..	55	51	47	43

The trend no doubt continued last year, for the Common Market increased its sales in 1961 in most Commonwealth countries, at the expense of Britain. West Germany and Holland were the biggest gainers in West Africa, Japan in East Africa, with France and Italy making minor advances, while the USA progressed relatively little. It should be understood that none of this is any reflection on British industry or commerce; it does not prove for example, that British prices were uncompetitive. The affair is not so simple. It is a political adjustment as much as economic, and it reduces the abnormally predominant position that Britain occupied in the trade of these countries after many years of imperialism. One cannot assume that this position will go on being reduced indefinitely; on the contrary, it seems likely that after a long period of decline, Britain will remain biggest single supplier of most of her former colonies. Given the community of language and technical education, and various other historical links that long survive colonialism, that would be normal; the predominance of British goods in the imports of colonies was, on the other hand, abnormal. To base arguments about the future on the trade results of 1950-60 is therefore illicit.

One can see that it is not simply a question of price competition by noting that it frequently happens that Britain loses part of a colonial market to France, while simultaneously claiming a larger share, at France's expense, of the market in a former French protectorate. This happened last year, for example, in Ghana and Tunisia, France gaining in the former and Britain in the latter. It is natural that freshly independent States cast their net more widely, if only to test the reality of their economic independence. More important, once they replace, in their import list, the traditional staples of "colonial trade" (cheap consumer goods) by the capital equipment they require for industrial development, then they must diversify their sources of supply: no one Western country can provide all the machinery they need, and long-term credit facilities are a powerful incentive to change to fresh suppliers.

It is useful to compare British experience with French over the past decade, because in that time France has achieved a massive increase in her total exports. Yet her trade with the franc zone has declined, and her European neighbours have become by far her best customers. The total figures do not tell the full story because they include trade with Algeria, and this increased spectacularly once the war began there; naturally, with one million white settlers still in the country, and an army of half a million, plus the inflation produced by war expenditure, the demand for French goods was great. Since the fighting ceased, the army began to come home and the settlers to quit; this trade has fallen catastrophically; as from last year West Germany replaced Algeria as France's first client;

n contrast, trade with the overseas territories and de-
›artments (i.e. minor possessions for which there is no
›rospect of political liberation and whose budget is
till financed from Paris) has been maintained at 1952
evels.

In between these two extremes are all the colonies
n Africa and the Far East whose independence is com-
›lete, and in all these cases one sees the inevitable dec-
ine of imperial trade. It is most advanced for the
States of Indo-China, not only because they have been
ndependent longest but because the USA and the Com-
nunist bloc deliberately sought to evince French trade.
t is next most noticeable in Morocco and Tunisia. It
s just beginning in Negro Africa, whose independence
s very recent; but its course there is certain, if only
›ecause the statute of association with the Common
Market requires these States to abolish the preferences
hey give to French imports, in favour of other Conti-
ıental exporters. Our tory pamphleteers might reply
hat France gave in too easily to the trend, and that
Britain could fight it; that is no doubt why they talk
f reviving the spirit of Ottawa, i.e. increasing Com-
nonwealth trade preferences. Quite the contrary; in
nost of the former colonies where French trade has
leclined, she retained important economic advantages:
arge numbers of white settlers often remained in the
ountry, a customs union was maintained, France con-
inued to buy most of their primary produce at prices
igher than world rates, most of them remained in the
ranc zone and had big franc balances to spend. Des-
ite all that, the part of French goods in their imports
eclined.

It would of course be absurd for the imperial
›ower to "write off" former colonies. She can well
›ope to remain their largest single supplier, notably
f capital equipment. It would be even more absurd to imagine that the end of imperialism, coinciding with European integration, implied a diversion of trade from the developing countries to industrialised neighbours. The developing nations as a whole constitute, on the contrary, one of the most promising of markets — but on condition that the industries of Britain and France can compete with all Western industries, can offer the goods needed for industrial development rather than traditional colonial exports, and seek their overseas markets, not in a protected neo-colonial reserves, but in all the developing region. The best way of ensuring that they can do those things is to face the challenge in Europe itself, by participating in European economic integration. Those who invite Britain to cling to Commonwealth trade at the expense of exclusion from European integration are asking her to choose the worst of both worlds. Liberated colonies will cut down their imports of consumer goods quite ruthlessly, either because they begin to make them themselves or because they resolve to go without. For their imports of capital equipment, they will expect the former imperial power to compete on a footing of equality with other industrialised nations. The constantly narrowing margin of Commonwealth preference will not serve to keep British goods competitive if a more vigorous European industry is outstripping Britain in technological concentration, scale of operation and capital resources. British exports to the Commonwealth are much larger than to the Common Market, and probably always will be, since the population of the former is so much larger than that of the latter. But that is no argument against joining the Common Market, which does not entail giving up the bigger outlet for the smaller. It is, rather, that the bigger outlet is not only bound to contract but is changing in nature and the only guarantee of continuing to serve it adequately is to be able to meet European competition in Europe.

Advanced ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

The dictionary defines engineering "as the art and science by which the mechanical properties of matter are made useful to man in structures and machines." In the McKee Organization it is much more than that —it is a constant, unflagging effort toward advanced design, increased plant efficiency, improved construction and greater economy.

The results of that effort are readily apparent in the many contributions to the progress of steel-making made by the McKee Metals Division in more than half a century of specialized, world-wide engineering and construction for the steel industry.

Pioneering by McKee engineers in the fields of plant design, ore beneficiation, automation and production methods have been invaluable to the industry. Recent examples are McKee's work in pelletizing and in the first successful application of gas injection in blast furnaces.

McKee can deliver this kind of advanced engineering and construction to the steel industry in India and back it with an unmatched fund of practical experience and specialized knowledge.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

THE McKEE ORGANIZATION
ARTHUR G. McKEE & COMPANY
WESTERN KNAPP ENGINEERING

Economic Report from the U.S.

SEARCHING EXAMINATION OF THE ECONOMY

By GUY SIMS FITCH

WASHINGTON, June 19.

IN this era of complex economic relations, it is important to analyze internal economic policies in the light of their international implications. So it is that the international payments and currency positions of the United States are being subjected to a careful and searching examination as the U.S. Government contemplates and pursues policies to help maintain the economy's upward momentum and accelerate its long-term growth rate. It would be most distressing, and entirely out of keeping with the real situation, if expansionary fiscal or monetary policies aimed at further improving the basically buoyant U.S. economy could not be adopted except at the risk of provoking a loss of confidence in the U.S. ability to meet its international obligations. The fact is there is no need for such a choice as the great majority of experts here and abroad will agree.

Probably the firmest source of confidence in the international position of the United States is the basic strength of its domestic economy — a strength that is central to the effective functioning of world trades and capital markets. Logic thus dictates that measures to reinforce this strength should — and in the final analysis undoubtedly will — reaffirm rather than diminsh that confidence. It would take peculiarly reckless and imprudent moves to violate this logic. It is unthinkable that Government officials and private bankers in the United States or other nations would indulge in such disruptive and unenlightened tactics. Certainly, all recent developments negate such a course, as witness the sound and basically non-inflationary economic expansion in the United States, the vigorous growth in Western Europe and elsewhere, and the exciting moves toward international economic and financial co-operation.

Realism also requires continued recognition of the fact that the United States has provided the reserves, both in gold and dollars, on which the post-war monetary systems of free world economies rely. What is involved, then, is not merely a U.S. problem; it is a world problem. The well publicized deficits in the U.S. balance of international payments, with their consequent gold outflows, are traceable largely to these deliberate and large-scale U.S. effort to support the economic advancement and the national security of other lands throughout the post-war period. In Government economic aid, in military outlays, in private capital investment and in many other ways, the United States has paid out some $24,000 million more than it has carned in this time, despite a consistently large surplus in its trade account — its excess of exports over imports. This transfer of U.S. reserves to other lands, notably in Western Europe, has been the principal basis for the free world's strengthened financial equilibrium.

With this much accomplished, the United States has been turning its attention to the correction of its lingering balance of payments deficits. Its actions in this regard have been fully in keeping with its international responsibilities, and have been conducted against the backdrop of heightened financial co-operation among the free nations. The U.S. Government has emphasized such steps as continued export expansion, the sharing of the international economic aid burdens by other industrial nations, and co-operative efforts by central banks to stabilize currency flow. At home, the U S. Government has conscientiously pursued a wage-price policy that has effectively restrained any potential inflationary pressures, and a debt-management policy which has helped keep short-term interest rates up and long-term interest rates down. It has thereby fostered business expansion while discouraging the outflow of funds and protecting the nation's gold stock. These interest-rate approaches always could be modified appropriately to continue safeguarding the dollar if tax cuts or other expansionary moves promised to over-stimulate the economy. The efficacy of moves such as these may be reflected in the fact that the balance of payments deficit has been declining steadily and substantially in the past two years. Officials are firm in their determination to eliminate it entirely by the end of next year.

With all this in mind, there is no reason to question the ability or the readiness of the United States to pursue policies in keeping with its national and international requirements. Its leverage in this regard is enhanced by its pre-eminent position as the world's leading trader and largest holder of gold reserves, with an economy unmatched in size, power or potential. This is not a matter of boasting or vain glory, but merely a measure of the U.S. capacity to take whatever steps may be necessary to protect its currency and its international position as its economic growth accelerates.

CONCENTRATION OF INDIA'S FOREIGN TRADE—A COMPARATIVE STUDY

By

K. K. BHATIA

&

K. M. BHAKE

MICHAEL MICHAELY of the Hebrew University, Jerusalem made an interesting study* of commodity and geographic concentrations of exports and imports of a number of countries. The examination of commodity concentration indicates the degree to which the economic fortune of a country is dependent upon one or a few goods. Measurement of geographic concentration of exports and imports, on the other hand, indicates the concentration of each country's trade according to its distribution amongst countries, rather than among commodities.

In measuring the degree of commodity concentration of exports and imports, use of common classification consistently for both exports and imports as also between countries is essential. The standard International Trade Classification (SITC) has provided the desired common basis for Michaely's study which covers as many as 44 countries for which trade figures based on (SITC) were available in the 1955 volume of the U.N. Year Book of International Trade.

In India the S.I.T.C. began to be used only from 1957 and, therefore, concentration co-efficients about India are not available in Michaely's study. It was considered useful for comparative purposes to calculate similar co-efficients in case of India based on data according to the S.I.T.C. for the first available year and extend the examination for studying chages, if any, in this important characteristic of India's trade during recent years.

The three digit code of the S.I.T.C. wherein the value of trade is classified into 150 groups has been used for calculating the co-efficient of concentration. The degree of concentration is measured by Gini's co-efficient of concentration (C):-

$$C = \sqrt{\sum_{i=1}^{n} \left(\frac{x_i}{X}\right)^2 \times 100}$$

where X is the total value of exports during the year and xi's are the valucs of export of each of the items and n = the number of items = 150. Co-efficient for imports is similarly divided. The highest possible co-efficient by this method is 100 where only a single item is exported or imported and the lowest possible co-efficient is 100/sq. root of n or 100/sq. root of 150 = 8.2 when the country's exports and imports are equally spread over all the groups.

The co-efficients of concentration of exports and imports and the ratio between them calculated for India are given in the table alongside along with those of other countries available in Michaely's paper, in descending order of export co-efficients:-

TABLE I

COMMODITY CONCENTRATION CO-EFFICIENTS OF EXPORTS AND IMPORTS

No.	Country	Exports*	Imports	Export/ Import
1	2	3	4	5
1.	Mauritius	(77.6) 98.8	28.6	3.46
2.	Netherlands Antilles	(33.6) 93.7	83.0	1.13
3.	Egypt	(26.0) 84.2	18.6	4.54

45.	Netherlands	(27.0) 16.9	16.0	1.06

* Figures in brackets relate to geographic concentration of exports.

* **"Concentration of Exports and Imports: An International Comparison"** by Michael Michaely. The Eliezer School of Economics and Social Services, The Hebrew University, Jerusalem, published in **"The Economic Journal"** of the Royal Economic Society Vol. LXVIII, NO. 272 (December 1958) pp 722 — 736.

An observation made by Michaely from the study of commodity concentration was that in a large majority of countries, exports are more concentrated than imports. It will be seen from Table I, that this is also true for India which further supports the above observation. It may be pertinent to observe here that in case of 5 countries namely, Japan, Yugoslavia, Italy, U.S.A. and France, where imports are more concentrated than exports, the concentration of export itself is very low, indeed amongst the lowest. A few other countries whose imports are of the same order of concentration as exports, as in the case of Norway, U.K. and the Netherlands, also possess a characteristic feature of greatly diversified exports.

Comparing the similarities found among countries whose exports are more (or less) concentrated, Michaely observed that by and large, the more developed the economy (in terms of higher per capita income), the more diversified are its exports and concluded that as a country becomes more industrialised it means as a rule that commodity diversification of its exports becomes higher. This could be expected since a higher degree of economic development is usually associated with a more varied production. It would be very interesting to note that India holds 16th position in matter of diversified exports out of 45 countries whose export concentration co-efficients are given in Table I.

Michaely has mentioned that the more concentrated the exports, the more diversified will the imports be. The logic of this statement is that since exports of a country depend on high degree of specialisation in production, the countries with higher concentration of export specialise in production of but a few commodities and in turn would depend on larger variety of goods being imported. It could, however, be seen from Table I that as a rule the opposite is true: that a positive correlation exists between the concentrations of exports and imports so that if the export concentration is high, the import concentration is also high.

Yet the expectation mentioned in the foregoing paragraph is not entirely refuted. It has been observed earlier that countries with import concentration greater than or about the same as export concentration are invariably those whose export diversification is amongst the highest which in turn has also been mentioned to have close relationship with the degree of economic development. On the other hand, it can also be seen from Table I that countries with highly concentrated exports have comparatively greater diversification in their imports, yielding higher ratios of export to import concentration co-efficient. Thus a suggestion emerges that lower ratios between the export/import co-efficient are found in case of more industrialised or developed countries. It, therefore, appears that while more diversified exports are an indicator towards more developed economy, a further refinement may be possible by considering the concentration of imports which if far less concentrated than exports, provide a 'contra-indication'. In other words, the ratio between the concentration co-efficient of export/import is an important factor in identifying the industrial advancement of a country, lower ratio being found in case of more industrially advanced countries. It would be further interesting to note that by applying the second criterion, India gains as many as seven positions to occupy the 9th place amongst countries listed in Table I.

Michaely also examined the thesis that economic activity would be more diversified in larger countries emphasised earlier by Kuznets* and his findings supported the main contention of this thesis. Defining a "developed country" as one with 'per capita' annual income exceeding U.S. $300 and a "large country" following Kuznet as one whose population exceeds 10 million persons, he calculated the average co-efficient of concentration of exports of countries, classified separately as developed and underdeveloped, each class being divided further into large and small countries. The co-efficients obtained by Michaely are presented in Table II below:-

TABLE II

CO-EFFICIENTS OF COMMODITY CONCENTRATION OF EXPORTS BY SIZE AND DEGREE OF DEVELOPMENT

	Developed Countries	Underdeveloped Countries	TOTAL
Large countries	21.4	57.8	40.7
Small countries	39.1	46.2	41.5
TOTAL	**31.2**	**53.7**	**41.1**

Following the definitions used by Michaely, India is a large but underdeveloped country. However, if India's co-efficient of export concentration is compared (28.0) with averages in Table II, it is found that India's exports are far more diversified than that of the underdeveloped countries. In fact our position is more comparable with the co-efficient of large developed countries. The point is further proved if the ratio of export/import concentrations are similarly classified which is an important factor in identifying the economic development. Table III presents the average of ratios between concentration co-efficients of exports and imports.

TABLE III

RATIOS BETWEEN COMMODITY CONCENTRATION CO-EFFICIENTS OF EXPORTS AND IMPORTS

	Developed Countries	Underdeveloped Countries	TOTAL
Large countries	1.16	2.45	1.84
Small countries	1.95	2.41	2.12
TOTAL	**1.60**	**2.44**	**1.98**

Comparing India's ratio of export/import concentration (1.20) with the averages in Table III above, it is found again that our position is nearest to the average ratios of large developed countries.

Finally, if the co-efficient of export concentration and the ratio of the same with import concentration are important indicators of economic development, it may also be interesting to watch their movement in India over time. In this connection, co-efficients of concentration worked out for four years beginning 1957 are presented in Table IV below. It has been mentioned earlier that trade data began to be compiled according to the Standard International Trade Classification (SITC) for the first time in India for the year 1957 and the year 1960 is the latest for which complete statistics of trade are available. The concentration co-efficients could, therefore, be calculated for four years only.

TABLE IV

CO-EFFICIENTS OF COMMODITY CONCENTRATION OF EXPORTS AND IMPORTS (INDIA)

Year	Export	Import	Ratio Export/Import
1957	28.0	23.3	1.20
1958	30.3	23.4	1.29
1959	28.2	23.8	1.18
1960	27.6	23.2	1.19

The above figures show a slight downward tendency particularly if the co-efficients for 1957 are ignored in which year the S.I.T.C. was first introduced and therefore the trade statistics for the same are known to be somewhat incomplete. Thus our exports have become a little more diversified which may be taken as an effect of the export promotion measures and activities of the export promotion councils in recent years, although a fuller impact has yet to be felt.

* Simon Kuznets "Economic Growth of Nations", Hebrew University, Jerusalem 1958.

As against the commodity concentration, the investigation of geographic concentration of trade is concerned with the extent of dispersion of imports and exports of a particular country with other countries. The co-efficient of concentration is derived by Gini's method described earlier, the only difference being that total value of exports/imports to or from a particular country is substituted in place of the value of exports/imports of each item. The highest possible co-efficient by this method is 100 where exports are directed towards a single country or imports are received from only one country. The lowest possible co-efficient would obviously depend upon the ultimate number of countries amongst whom a country's exports/imports are equally spreadover. For example, if India's trade was equally spreadover the 188 countries taken in the present study, the lowest possible co-efficient would be 100/sq. root of 188 = 7.3.

Direction of trade data for the year 1959 has been utilised for calculating co-efficients of geographic concentration for India. Of the 188 countries taken for this study, India exported her produce to as many as 147 countries and received supplies from 113 countries. The results are as follows:-

CO-EFFICIENTS OF INDIA'S GEOGRAPHIC CONCENTRATION OF TRADE

Exports	Imports	Ratio: Export/Imports
33.5	34.2	0.98

If the above results are placed along with those of 42 countries worked out by Michaely it is seen that India's exports are more concentrated than 20 countries. Of these, 13 countries are the same as listed below India in Table I in descending order of commodity concentration of exports, while seven other countries with greater commodity concentration of export than India have lower geographic concentration of exports (see figures in brackets in Table I). The latter are indeed some examples of the expectation which has also been pointed out by Michaely and earlier by Hirschman that a country which exports but a few commodities would be forced to distribute her exports amongst many customers.

Hirschman's first hypothesis that exports tend to be more geographically concentrated than imports was barely reaffirmed by Michaely's study. He found the opposite to be generally true in as many as 18 countries out of 42 and concluded that although exports tend to be somewhat more geographically concentrated than imports, the difference is so slight that it is perhaps not meaningful. Results for India quoted above go further to emphasise that the tendency could not be generalised one way or the other.

Hirschman's second hypothesis that the higher the commodity concentration of export, the stronger is their geographic concentration was borne out by Michaely's study also. There is, however, another side of the story. Out of the 43 common countries for which both commodity and geographic concentration co-efficients are available, it is found that in case of as many as 23 countries geographic concentration of exports is greater than the commodity concentration while the opposite is true in case of the remaining 20 countries. India belongs to the former category according to the calculations made by us. Could some more meaningful hypothesis be suggested on these differences than just to conclude that exports tend to be somewhat more geographically concentrated in relation to their commodity concentration?

It has been seen that commodity diversification of exports becomes higher as a country becomes more industrialised or developed. In the countries listed in Table I, draw a line at sl. no. 21 below which the commodity concentration co-efficients of exports are lower than 39.1, a figure suggested in Table II to be the average co-efficient of commodity concentration of export associated with developed countries, large or small. For convenience, figures of geographic concentration of exports are given in brackets alongside commodity concentration of exports in Table I. It is now seen that out of 22 countries below the line indicated as developed, geographic concentration is greater than commodity concentration in case of 18 countries. Amongst the 21 countries in the upper half with indications of underdevelopment, as many as 17 have geographic concentration co-efficients lower than the commodity concentration co-efficient. (For one country each in the upper and lower half, geographic concentration co-efficients are not available for want of information on direction of trade). Therefore, there seems to be a fair indication to conclude that geographic concentration of export tends to be stronger than commodity concentration of export in case of economically developed countries (where as a rule the commodity diversification of export becomes higher) and that exports of economically underdeveloped countries characterised by high commodity concentration are comparatively less geograhphically concentrated. It may also be pertinent to mention here that Indian exports have greater geographic concentration than their commodity concentration and, therefore, the country can well be placed among the developed countries by this additional test.

Finally, Michaely also enquired into the effect of size and stage of development on geographic concentration of exports and arrived at the following average co-efficients:-

TABLE V

CO-EFFICIENTS OF GEOGRAPHIC CONCENTRATION OF EXPORTS, BY SIZE AND DEGREE OF DEVELOPMENT

	Developed* Countries	Underdeveloped Countries	TOTAL
Large countries*	29.1	45.7	37.4
Small countries	37.9	58.7	44.9
TOTAL	**34.0**	**50.7**	**41.0**

* For definition of "Large" and "Developed" see Table II and related paragraphs.

If India's geographic concentration of exports (35.5) is compared with averages in Table V, it is found that our exports are far more diversified than that of the underdeveloped countries and in fact more comparable with the average co-efficient of large developed countries.

It is thus seen that the degree of diversification of India's foreign trade both by commodities and by direction is a pointer towards the state of economic development in the country which compares favourably with other developed countries of the world on an average and the fact is further substantiated by analysis of the implications of (i) its low ratio of export to import concentration of commodities and (ii) stronger geographic concentration of exports than the commodity concentration of exports.

THE BUSINESS WORLD

Where are the Leaders?

By WILLIAM REES-MOGG

TEN days after Wall Street had its panic Monday I went over to New York to have a look around. I did something I had always sworn I would not do. I worked in my office on Tuesday, flew over Tuesday night, worked Wednesday and Thursday in New York, flew back on Thursday night, and worked a normal Friday and Saturday in London.

I flew across and back in a Britannia, a most comfortable airliner for long distance travel.

What impressed me most about Wall Street was the low quality, at present, of its people and its thinking. I can remember in London that one used to wonder how it was that the City managed to get its work done. That was some years ago and there has been a great shake-up since. This is now the impression that Wall Street gives.

Of course, it is not by any means true of everyone that one meets. I can think in particular of a couple of men I always call on when I am in New York; they are as quick to take a point as one could wish. But as a whole Wall Street suffers from having been too little competitive for too long. People of no real ability have inherited or been promoted to positions in which they can hardly fail to make $50,000 to $100,000 a year without exercising any real initiative or displaying any real intelligence.

London, as a financial centre, was manifestly saved from stagnation by the refugees from Hitler's persecution. Apart from one recruit from the Welsh Guards, London has been revivified by the banking dynasties of Europe. Somehow on Wall Street the same process does not seem to have had the same effect.

The sheer silliness which results can be exemplified by Wall Street's attitude to President Kennedy. When I went over in March 1961 President Kennedy had been in office for a couple of months. He had said that he intended to get the economy going again, but he had not said how he intended to do it. The previous November almost everyone on Wall Street had cast his votes for Mr. Nixon, a man they neither trusted nor liked—indeed it is even quite arguable that they underrated him—in order to keep Kennedy out. By March they were so convinced that he was the saviour of the United States that they were running up the most unlikely stocks to the most unlikely prices in order to share in the Kennedy boom. Even in Boston I was advised to buy Polaroid on the ground that it was some day producing a colour film; it already stood at 50 times earnings.

This May, Kennedy the hero having tangled with the steel industry had become Kennedy the villain. When he made a really serious mistake, such as the invasion of Cuba, Wall Street went along with him. When he objected to having US Steel decide the level of all steel prices Wall Street immediately became hysterically convinced that Kennedy, the richest President since Roosevelt, was, like Roosevelt, a dangerous socialist opponent of the free enterprise system.

The shake-out which followed showed up a number of weaknesses in the system. Perhaps more than anything else it showed up the lack of any leadership on Wall Street. In the old days one could at least name the great men of Wall Street, Vanderbilt, Rockefeller, Morgan, even that cracker-barrel philosopher Bernard Baruch. But who are the great men of Wall Street now? Surely not Funston whose job as head of the New York Stock Exchange is very like that of a president of a university who has to keep the alumni happy.

When Wall Street wanted to reassure itself who could be found to say he was buying? Who played the role J. P. Morgan would have played 50 years ago? Paul Getty let it be known he was buying shares. But Paul Getty—whether or not he is the richest man in the world—is an oil tycoon who has been resident in Europe for years. The fact is that there is no one who can in any meaningful sense speak for Wall Street, and Wall Street knows it.

The business of stockbroking has also become so large that it is no longer a matter of judgment. Heaven knows, not all London stockbrokers are as wise as Solomon, but at least they still operate on a professional basis. Merrill Lynch, the biggest New York stockbrokers, are first cousin to a chain store. They have over half a million customers. There is, I suppose, no London stockbroker who would not regard it as a matter of course that any client who wanted to meet the senior partner could do so. However skilful the operation—I admire Merrill Lynch efficiency—one cannot make personal professional judgments for half a million people.

Any human organisation depends on the skill and character of the people running it. I doubt whether in recent years Wall Street has really appealed to the imagination and interest of the ablest young men in the United States. It has, of course, always been a symbol of banker domination and Yankee capitalism in the Mid-West and the South. It is, however, possible that the shock which Wall Street has certainly had, combined with the Securities Exchange Commission investigation which is taking place, will lead to a period of self-reform. What it needs is not a new President, nor more money, but better men, more imagination, more self-confidence and fresh ideas.

Business Notes

Budgetary Procedure

DEFECTIVE DISCLOSURES

THERE IS no gainsaying the fact that both the size and the magnitude of the Plan outlays have been assuming massive proportions. These, in their turn, call for a large measure of sacrifice and forbearance on the part of the people. The budgetary policies and the budget proposals which give us an idea of these outlays, therefore, carry a deep significance. They are "the very instrument of the creation and growth of savings and mobilisation of resources, as also the employment of these resources in appropriate productive channels", as Mr. Pravinchandra V. Gandhi, President of the Indian Merchants' Chamber (I.M.C.), observed in his speech at the first quarterly meeting of the Chamber. He was accordingly justified in pointing out that, though the latest budget reflected the true state of affairs in the economy and provided the community with a clear picture of the effect of the budgetary changes on the economy, the Plan expenditure, as was shown in the budget, consisted of conflicting data. This should have been properly reconciled, showing clearly the interrelation of the various correlated magnitudes, he declared, and demanded a seperate statement giving a review of the Plan expenditure and estimates, both for developmental and non-developmental purposes, classified under revenue and capital, along with the budget. Further, Mr. Gandhi felt, the manner in which the budgetary accounts were submitted had still remained unsatisfactory, in that the public are not able to appreciate the extent to which the Plan targets are being fulfilled in physical as well as in financial terms.

In regard to the general scheme of budgeting also, the I.M.C. President gave expression to the widely prevalent view that the Government has been following more or less a consistent policy of under-estimating the revenue receipts and always preparing for sharing additional burdens through taxation. He recalled that even the Public Accounts Committee was of the same view in the Report submitted by it to the Lok Sabha. This report has indicated the urgent need for scrutinising the items of non-development expenditure and for ensuring that the revenues from additional taxation are not diverted to non-developmental expenditure. Mr. Gandhi also stressed that, "in the measures for taxation imposed for purposes of financing planned development, there should be no diversion of these resources for purposes outside the Plan". He was critical too of the practice of debiting expenditure of a capital nature to the revenue account and thus increasing the quantum of revenue deficit.

Referring to the additional taxes levied in the latest budget, the I.M.C. Chief said that the ever-increasing burden of taxation in the corporate sector and in the rates of personal taxation had placed the private sector in a precarious position. It had become extremely difficult for it to provide the resources necessary to function in an effective manner. He felt it ironical that, while the incentives to save and invest were being greatly increased, the sources of finance for the private sector had been getting dried up. This unhappy situation, he went on to say, called for greater reduction in the personal rate of taxation vis-a-vis the tax rate on corporations.

In the sphere of indirect taxation, again, Mr. Gandhi pointed out, the budget proposals for 1962-63 envisaged as many as nine items under Excise Duty which, despite all the professions of the Finance Minister, could not but affect the general cost structure of the public, as also the private sector industry, not to speak of consumer prices. Against this background, it is only natural that he should have found the announcements of relief by the Finance Minister, totalling only Rs. 1.9 crores in the current year, as "wholly disappointing"; they are, according to him, only marginal and not such as to make any significant impression on the progress of the industries affected by the imposts.

Industrial Progress

IMPERATIVES HIGHLIGHTED

THE ACUTE dearth of basic facilities, such as power, fuel, transport and communications and the non-availability of essential raw materials have so unnerved some businessmen that they have gone to the length of even advocating stoppage of creation of all further capacities in the existing industries. It was courageous, therefore, of Mr. G. V. Puranik, the outgoing Chairman of the All-India Manufacturers' Organisation (A.I.M.O.), to take a contrary view, namely to exhort business men to push on with the acceleration of industrial production in the country, whatever the odds. Addressing the 22nd annual meeting of the Organisation held recently in Bombay, he emphasised the urgent need for the Government to tackle some pressing problems, the elimination of which would expedite the achievement of the targets of the Third Plan. According to him, these problems include: (1) the gap between installed capacity and actual production of steel; (2) making available to all industries, and particularly engineering industries, the required grades of pig iron, coal, coke, M.S. sheets and wires, alloy steel, tools, etc., (3) raising Plan targets of basic industries, like steel and cement; (4) encouraging entrepreneurs in the private sector of the coal industry to expand further, and (5) making available all necessary facilities to them for the purpose.

Referring to the problem of increasing productivity in industry, Mr. Puranik opined that a great deal could be done by those in the industry itself; as it is, he said, there is lack of cost consciousness in product design, in the application of research, and in the efficient conduct of our enterprises in the country. This is the unplatable truth. There is vast scope, practically in every industry, for better utilisation of plant capacity, avoidance of waste and greater financial control over capital expenditure, as he noted. As in the western countries, India too must have a continuous and integrated cost reduction plan in every one of the units, and this could be implemented, he suggested, through the setting up of cost reduction committees with personnel selected from the main producing departments. Besides, the A.I.M.O. retiring President felt the imperative need to pay greater attention to the quality of our products, so that we could, at least over a time, match our products favourably with those of our western counterparts. It is interesting to note that the A.I.M.O. has been particularly active in the direction of bringing in greater awareness of this problem, through the holding of a number of seminars, study groups and training courses during the past year. The Government too has not been altogether oblivious of this. Even so, it is just as well that the A.I.M.O. Chief called for equal awareness on the part of the Government too in promoting industrial progress and productivity. In order to achieve it, the elimination of administrative bottlenecks and the judicious use of administrative powers for licensing, price fixation, etc. are felt to be "musts" by Mr. Puranik. His suggestion in this con-

nection that the simultaneous issue of licences, consents for capital goods imports, collaboration agreements, capital issues, etc., along with the industrial licence itself, would minimise delay and maximise efficiency in starting industries is certainly worth a trial.

Antibiotics

PIMPRI'S ACHIEVEMENTS

THE RESEARCH DEPARTMENT of Hindustan Antibiotics Limited, Pimpri, has indeed done a commendable job. Its researches in the production of new antibiotics viz. Hamycin, Dermostatin and Octacillin have brought laurels to it and a due recognition of this is to be found in its Chief, Dr. M. J. Thirumalachar, being invited to attend the International Congress on Microbiology, to be held at Montreal in August, as alternate Chairman. The efficacy of Hamycin against Oral Thrush and Vaginal Monoliasis and other skin diseases and that of Dermostatin as cure of Dermatitis and Dandruff have been established beyond doubt by the trials carried out with these new antibiotics both in the army and civil hospitals in this country and abroad. Similarly, Octacillin has been found to have decided advantages over the injectible penicillin. It is, indeed, encouraging that Hindustan Antibiotics is contemplating early manufacture of these drugs even at the expense of a slight setback to its output of penicillin. Ultimately these drugs are proposed to be manufactured under new projects which have been sanctioned for the purpose, but in the meantime make-shift arrangements are being made within the present installed capacity of the Pimpri factory to undertake their production. This step, besides providing great encouragement to the research workers whose endeavours have resulted in the establishment of these new antibiotics, will help to some extent in earning for the country valuable foreign exchange, which obviously can be expected to be more than the cost of the import of penicillin that may be necessitated by the switchover of some of the capacity of Hindustan Antibiotics from manufacture of penicillin to the new antibiotics.

The slight setback to penicillin production as a signal to the make-shift arrangements being made to manufacture the new antibiotics, especially Hamycin, may, however, to a great extent, be counterbalanced in the course of a few months by going in for the production of new strain of Penicillium Chrysogenum, which has also been developed by the Research Department of the Pimpri factory. This new strain is stated to have been tried out on the plant-scale during the last two months with great success. As a result of this development, the company is said to be planning to expand its vialling of penicillin from the present level of 22/25 lakhs per month to approximately 35 lakhs.

Indigenously manufactured streptomycin is also envisaged to be put on the market by Hindustan Antibiotics by September-end. The company has already produced from its streptomycin plant nearly two tons of intermediate product called Calcium Chloride Complex of Streptomycin, but conversion of this into finished Streptomycin Sulphate or Dihydrostreptomycin will be possible only when the plant required for this job, now under erection, is set up. The company, however, is stated to be considering a proposal to have this intermediate product processed by its collaborators Messrs. Merck & Co., at their works in the United States. If this programme fructifies, Pimpri's streptomycin may be available in the market even slightly earlier than September.

New Issues

ARLABS LIMITED

THREE MORE companies have drawn up plans to approach the public for subscriptions to their share capital during the second half of the current year.

Arlabs, a private limited company now converted into a public limited one, is entering the capital market during the latter half of next month to issue 20,000 ordinary shares of Rs. 100 each at a premium of Rs. 50 per share. Half of this issue is proposed to be offered to the existing shareholders of the company and the remaining half to the public. The company has at present a paid-up capital of Rs. 16.43 lakhs — Rs. 14 lakhs in equity shares and Rs. 2.43 lakhs in preference shares.

The company has been engaged in the manufacture of a wide range of dyestuffs and has on hand an expansion plan the first phase of which has already been completed. The second phase of this scheme is now under implementation. This would require a sum of Rs. 40 lakhs, which is proposed to be made available by the proposed increase in the share capital of the company to the extent of Rs. 30 lakhs and through bank borrowings to the tune of Rs. 10 lakhs. When the second phase of the expansion programme is completed, the company's output of vat dyes will go up from the present level of 1,400 kgs. a month to 6,000 kgs. a month. The company claims to be the pioneer in the manufacture of dyestuffs in the country and has its factory at Bhatgar, nearly 30 miles from Poona.

The company made a gross profit of Rs. 20.38 lakhs during the year ending June 30, 1961, from its sales at Rs. 92.86 lakhs. It paid a dividend of Rs. 80 per share for this year on a capital of Rs. 6 lakhs. In view of its satisfactory working, it may start paying handsome divided on the increased capital from 1962-63 itself.

BARODA BALL AND ROLLER BEARINGS PROJECT

PUBLIC PARTICIPATION in the share capital of the ball and roller bearings project of Messrs. Kamalashankar P. Joshi and Company and Messrs. East Asiatic (Private) Limited, of Bombay, to be undertaken at Baroda in collaboration with the U.S. firm of Messrs. Norma-Hoffman Bearing Corporation, is expected to be invited sometime in September or October. The authorised capital of the company proposed to be floated to undertake this manufacturing programme will be Rs. 2 crores, all in equity shares of Rs. 100 each. Of this, capital worth Rs. 1.05 crores will be issued in the first instance. Shares worth Rs. 77 lakhs are proposed to be reserved for allocation to the promoters and directors of the company and the foreign collaborators. The balance Rs. 28 lakhs worth capital is envisaged to be offered to the public for subscription.

The total cost of the project is estimated to be around Rs. 2.27 crores, including the working capital. The foreign exchange component is estimated at Rs. 83 lakhs.

The company's factory will have a capacity to produce 24 lakh pieces of ball and roller bearings per annum. In course of time, it is proposed to undertake the manufacture of steel balls also.

In addition to participation in the equity capital, the foreign collaborators will be given a small royalty for making available technical know-how and their research results.

USHA FORGINGS AND STAMPINGS

USHA FORGINGS AND STAMPINGS LIMITED, a new company incorporated in Delhi to undertake the manufacture of such tools as double-end nut spanners, rose nails, pliers universal three types, machine dies, pipe and screw wrenches and spanners from chrome vanadium steel and production of various small precision forged components required by the railways, automobiles and other engineering industries, is expected to enter the capital market some time towards the end of the current year with an offer of 56,325 equity shares of Rs. 10 each. The authorised capital of the company is Rs. 1 crore. The issued capital is Rs. 17.50 lakhs, made up of Rs. 11.50 lakhs in equity shares and Rs. 6 lakhs in cumulative redeemable preference shares. The preference shares bear fixed dividend of 9.3 per cent and have a face value of Rs. 100.

The company's factory is to be set up at Baddarpur, near Delhi. It will have a capacity to produce 500 tons of various tools per annum on double shift basis. The project is estimated to cost Rs. 55 lakhs. A loan of Rs. 17.5 lakhs has been arranged from the Punjab Financial Corporation.

Technical collaboration arrangements have been finalised with Messrs. Technoexport of Czechoslovakia who will be supplying, on rupee payment basis, the entire equipment to be imported from abroad as also all the technical know-how.

Paper

BIG EXPANSION PLANS

A BIG expansion programme for the development of paper industry is in the offing. An indication to this effect was given by the Minister for International Trade, Mr. Manubhai Shah, at the annual meeting of the Federation of Paper Traders' Association. Mr. Shah revealed that there is a programme to set up shortly 52 factories for which the necessary foreign exchange had been released. The new factories will increase the production of paper by 405,760 tons a year. In addition 35 schemes for additional 398,830 tons of paper a year had been licensed. At present there are 28 factories in the country manufacturing paper and 23 factories converting paper and paper boards into various other consumable articles. The total installed capacity of paper and paper board factories is 410,000 tons a year.

So far as promoting the exports of paper is concerned, it was revealed by Mr. Shah that the Government was proposed to form a paper and paper conversion products export promotion council. Such a representative body should enable the industry, the distributors, the trade and the Government to periodically review the problems of international trade in the industry. It was also suggested that trade fairs and exhibitions of Indian paper, paper products and paper conversions should be organised in some of the foreign countries. While all this looks impressive, it needs to be emphasized that the Paper Traders' Association should also take steps to organise export of paper. The Paper Traders' Association has a vital role to play and it depends a good deal on it to see that the products for the industry are well-distributed and the consumers are well satisfied. While the President of the Paper Traders' Association might be having his own grievances against the Government, in the interest of industry it is essential that the Government and the Association should extend a helping hand towards each other because it is only through the joint efforts of both that the industry can make a rapid progress.

PAPER PRICES: MARGINAL INCREASE ALLOWED

The Government of India has decided to permit with effect from June 21, 1962, an ad hoc increase of 6 nP. per kilogram for all varieties of paper manufactured in the country.

The step, it is stated, has been taken after considering the representations received by the Government from paper manufacturers to the effect that the fair ex-works ceiling prices of different varieties of paper and paper board in force since January, 1960, should now be increased on account of various factors leading to higher cost of production.

It has also been decided that the rebate of 4 nP. per kilogram on reels hitherto allowed by the paper industry be discontinued.

As a result of the increase allowed, the price of different varieties of paper and paper board will now be as follows:

(nP. per kilogram)

Paper Variety	Fair Ex-works Price	Civil Selling Price*
1. White Printing	132	155
2. Unbleached Printing	125	147
3. Offset|Cartride	132	155
4. Antique-Laid | Wove	132	155
5. Cream-Laid | Wove	137	161
6. Imitation Art	132	155
7. Art Paper	201	230
8. Chrome Paper	176	203
9. Ledger Paper		
Account Book	132	155
Azure	139	162
10. Banks and Bonds	150	174
11. Typewriting	157	183
12. Manifold | Airmail	195	223
13. Duplicating	132	155
14. Poster Paper	132	155
15. Kraft	120	142
16. Wrappers	117	139
17. Cover Paper	132	155
18. Match Paper	126	149
19. Blotting Paper	145	169
20. Pulp Board	132	155
21. Duplex Board	132	155
22. Ticket Board and Triplex Board	130	153
23. Art Board	189	217
24. Chromo Board	164	189

* Exclusive of excise duty, State Government or Local levies.

The other terms and conditions previously notified remain unaltered.

Engineering

METAL BOX INCREASES EXPORTS

AT A time when the country was facing a very serious challenge of foreign exchange shortage, the Metal Box Company of India Ltd. was trying hard to push up their exports. This encouraging aspect of the company was revealed by Mr. K. C. Mahindra, the Chairman of the company, at the annual general meeting held recently in Calcutta. The company had made successful efforts to step up their direct exports of packages, machinery, hardware and publicity materials. Entering the markets of South-East Asia, the company faced sufficient competition from Japan, the country known

for producing similar products at competitive rates. In spite of this tough competition, the company was able to increase the exports to the extent of 36 per cent more than last year (1960-61). The Chairman claimed that their company was one of the first five exporters of engineering goods.

The company made an important contribution to exports indirectly too. It supplied packaging materials of international standards for goods packaged and exported by Indian manufacturers. The packaging materials, it must be remembered, helped in the creation of market and on that score the company's contribution was unique. It is estimated that packaged exports of goods worth over Rs. 4 crores was sent to various countries abroad. The company could supply packages for prawn, cashewnuts, vanaspati, vegetable oils, fruits, toiletries, confectionery and biscuits. To further their exports, the company had set up their Research Division which would produce high quality ancilliary materials of indigenous manufacture. The company therefore, was likely to do well in exports in the coming years.

The Chairman was quite hopeful that their stocks of tinplate, the most important raw material, was satisfactory at the moment, but he indicated that the outlook for the current year was slightly clouded because production at Rourkela was very uncertain. He pointed out that from the first consignment of Rourkela tinplate they found the quality quite satisfactory. But he was not very hopeful as far as their regular supply was concerned. It seems that the company which was playing such an important role in India's exports should not be allowed to suffer on account of raw material shortages. In times of short supplies of raw materials they should be allowed to obtain tin-plate from alternative sources.

A NEW SWITCHGEAR PROJECT

MESSRS. BURN AND COMPANY LIMITED propose to float a new concern by the name Reyrolle Burn Limited, in collaboration with the Reyrolle Company of the United Kingdom, to undertake the manufacture of Reyrolle switchgears and other electrical products which have been hitherto imported into this country.

The new concern will have an initial issued capital of Rs. 30 lakhs which will be contributed by Burns and Reyrolles in equal proportions. The collaboration arrangements entered into between the two companies are said to have been generally approved by the Government which has issued to Burns the necessary industrial licence to venture on the project.

Burns will be responsible for the construction of the factory of the new company at Howrah. Reyrolles will contribute the necessary foreign exchange by supplying the machine tools, testing and other equipment that is to be imported from abroad. They will also provide all such technical and expert assistance, advice and aid as the new concern may reasonably require.

Reyrolle Burn Limited will have execlusive rights to manufacture and sell in this country such of the Reyrolles' products as are agreed to be produced here.

Cement

REVISION OF PRODUCTION TARGET?

MR. V. H. DALMIA, Chairman of Dalmia Cement (Bharat) Ltd., at the annual general meeting of the company held at Dalmiapuram (Madras State) made a pointed reference to the Third Five-Year Plan target of cement. He indicated that the revised estimates now placed the demand for cement by the end of the Third Five-Year Plan at 15 million tons and the Government was, therefore, considering revision of cement capacity target from 15.2 million tons to 18 million tons. This 20 per cent increase in the installed capacity, he said, could be avoided by a better utilisation of the existing installed capacity which would lead to increased cement production without basic investment in installed capacity. In 1961, against an installed capacity of 9.4 million tons the actual output was only 8.4 million tons. It was quite clear that considerably higher output could be made effective through better utilisation of the existing capacity. This, he said, could be achieved at relatively much less expenditure of valuable foreign exchange. What was really necessary was that the units be allowed to import the required spare parts and equipment and they should be given proper facilities in terms of regular supplies of coal and the provision of wagons for the movement of cement.

The Chairman pointed out that the supplies of coal were not making pace with the industry's growing demand. One reason, he believed, was insufficient railway capacity. The Government had tried to resolve this shortage by resorting to sea-cum rail route. This measure did bring about certain relief. But recently it was realised that even the coal output was quite inadequate. There was, therefore, an urgent need to provide these units with sufficient quantities of coal so that they could utilise their capacity to the full and consequently new installed capacity was not necessitated as far as possible.

Referring to the two factories belonging to its subsidiary in Pakistan, he pointed out that the implementation of their programme of rehabilitation and modernisation at these factories was held up on account of the difficulty of getting import licences for the required spare parts and equipment. In Pakistan too the company was facing a similar problem of foreign exchange. The management of the two units was, however, making maximum efforts to revitalise their working. The moment the two units get sufficient plant and equipment for their rehabilitation, they are bound to show better results.

Air Transport

LOW COST AIR FREIGHTS

A NEW scheme is being evolved by Lockheed to introduce cheaper freight rates by utilising big new air freighters. This break-through in air cargo on account of economic rates is expected to increase total freight moved by air twenty times and the Corporation expects even a larger turnover in the following years. In the first instance the Lockheed are likely to bring down freight costs to less than 3 cents a ton-mile. This is to be achieved by the introduction of the new Lockheed C141 Starlifter, the first long-range turbine-powered cargo plane. Along with this the Corporation is likely to introduce various measures for simplified cargo handling which will make the air-lift more economical. This may involve utilisation of devices as Pallets, Pallet Containers and Cargo Containers. New schemes are also likely to be introduced in the economic handling of cargo before the air-lift. This new scheme of economic freight rates is likely to cause a major change in the world market because several commodities which normally are required to be transported urgently are debarred on account of higher freight rates. This systematic approach is also likely to provoke various other companies to come forward with economic freight rates.

FROM THE CAPITAL'S CORRIDORS

STEPPING UP TEXTILE EXPORTS

Mr. Bharat Ram, Chairman of the Indian Cotton Mills' Federation, has urged the cotton textile industry to take effective steps to meet its export commitments under the Obligatory Textiles Exports Scheme, finalised by the ICMF a few days ago and circulated to all the mills on June 18, 1962. He also called upon the industry to produce and export quality goods which would maintain and enhance India's prestige in the foreign markets.

The Obligatory Exports Scheme envisages every cotton mill to export 12½ per cent (by value) of its cotton cloth output and 3 per cent of its turnover in cotton yarn and staple fibre yarn. It comes into force from July 1, 1962, and for the half year to December 31, 1962, the export obligation is to be half of this, calculated with reference to the turnover as shown in the balance-sheet of a company for the year 1961, that is, the balance-sheet for the year ended on any date between June 30, 1961 and June 29, 1962.

The obligation can be fulfilled by a mill by exporting its own products in full or in part, and/or by arranging with other mills to export the balance. The defaulting mills would be required, in the last resort, to contribute to the export promotion fund of the Federation 12½ per cent of the value by which the F.O.B. price of export performance falls short of their export obligation. Besides this sanction, the ICMF Chief, at a press conference held here on June 25, envisaged that defaulting mills might have to forego a part of their cotton quotas. But this measure, he added, would have to have the sanction of the Union Government. The ICMF on its part would not be averse to such a move.

The obligations under this scheme are to be discharged by the mills by actual shipments in terms of F.O.B. value of exports, regardless of whether it is cloth or yarn that is exported.

All those mills which are already exporting greater quantities of cloth than their quotas under the scheme, are required not only to maintain their past record but to improve upon it so as to increase their potential to help the non-exporting mills to fulfil their quotas.

Mr. Bharat Ram did not envisage any increase in the domestic price of cloth as a sequel to larger exports; he said they were not unremunerative and adequate incentives would be given for exports. Dwelling on the latter issue, he said that the Textile Export Promotion Council could increase the incentives upto 25 per cent, if the situation warranted, with the consent of the Textile Commissioner.

There is considerable scope for stepping up exports of cotton textiles from India to a number of countries, not excluding the United States, opined the ICMF Chairman. India, he said, had exported as many as 30 million yards of cloth to the United States in 1959, but these exports declined to a bare 6 million yards in 1960. The major factor that had hampered textile exports from India in the recent past, Mr. Bharat Ram stated, had been the attractive prices realised in the domestic market.

If the export obligations under the scheme drawn up by ICMF are fulfilled by the mills, India, according to Mr. Bharat Ram, can achieve the Third Plan export target of 800 million yards of cloth per year without much difficulty. This would bring in for the country's economic development nearly Rs. 70 crores of foreign exchange per annum.

INDO-U.S. AGREEMENT ON TARIFF CONCESSIONS: LOWER DUTY ON 28 INDIAN EXPORT PRODUCTS

India has signed an agreement with the United States for import duty concessions under the General Agreement on Tariffs and Trade (G.A.T.T.) by virtue of which 28 main Indian export products, such as cashewnuts, sandalwood oil, opium, jute webbing, jute bagging, jute carpets, coir matting, buffalo hides and leather and bells of brass, will pay substantially lower rates of duty in the U.S.A.

The Agreement also provides for concessions on the part of India in regard to import duty on some 25 American products. While agreeing to these concessions, the revenue and developmental needs of the country, it is stated, have been kept in mind. In the case of 17 out of these 25 items, the concessions are in the form of a guarantee not to raise duties above the present levels. Most of these are products which are required in the country such as metal-working machinery, specialised textile machinery, earth shifting machinery, component parts of machinery, chemical raw materials, milo and sorghums and dried skimmed powder. In addition, in the case of refined stockholm tar, polyethylene moulding powder, wood rosin, diatomaceous earth, artificial wood, rubber hoses, electric typewriters and slate pencils small reductions in the present standard rates of duty have been given. All these materials are required by Indian industries and the duty reduction in these cases should assist production.

The United States Administration is expected to take action to effect the cuts in the U.S. tariffs from July 1, 1962, but the details of the tariff concessions exchanged between the U.S.A. and India are published in advance. The practice in India, however, is to announce changes in tariffs simultaneously with their publication and steps have been taken to give effect to the changes in the Indian customs tariff resulting from the Agreement immediately.

The Agreement was negotiateed at the Tariff Conference which began in Geneva in September, 1960. Thirty-nine countries took part in the negotiations at the Conference.

BOARD OF TRADE'S SECOND MEETING

The second meeting of the Board of Trade, set up recently in the Ministry of Commerce and Industry, will be held at Calcutta on July 6. The Minister of International Trade, Mr. Manubhai Shah, will preside.

The meeting will consider an eight-point agenda. The export possibilities of jute, cotton textiles and tea will be specifically examined at the meeting. It will also consider the question of expanding credit facilities for the exporters.

There will be preliminary discussions on the preparation of cost reduction programmes, with special reference to the principal export industries and commodities.

Among the other questions the Board will discuss are the setting up of Free Trade Zones, public recognition for outstanding export performances, widening of the scope of commercial education in the country and review of the working of the commercial sections of Indian embassies abroad.

EXPORT OF SCRAP

The Government of India at present is not favourably inclined to make any changes in the scrap export policy under which a ceiling of 3,60,000 tons is fixed for export of scrap against steel imports which can be

ffected to the tune of 66.6 per cent of the foreign xchange earned through scrap exports. Recently, he Government had received some requests for removng this ceiling. But it does not consider it advisable o do so having regard to the estimated availability of crap in the country and also owing to the considerain that it is better to export this scrap to earn some ree foreign exchange rather than to utilize these export arnings solely for steel imports.

The scrap export policy, however, may be reviewd after some time in the light of the report of Scrap nvestigation Committee which is now under the consideration of the Government.

MPORT OF FRESH FRUITS FROM PAKISTAN

Licences for the import of fresh fruits, fresh vegeables and certain types of fruit plants from Pakistan will be granted on an 'ad hoc' basis for the period April 1962 — March 1963, according to an Import Trade Control Public Notice issued here.

Licences will be issued by the Deputy Chief Conroller of Imports, Central Licensing Area, subject to he condition that payments for the goods imported will e made in non-convertible Indian rupees as provided or in Protocol No. I to the Trade Agreement between he Governments of India and Pakistan signed on March 1, 1960.

The basis of licensing in respect of these items has been indicated in the Public Notice. The last date for applying for import licences will be August 15, 1962.

U.S. ASSISTANCE

Four agreements have been signed between the Government of India and the U.S. Administration providing for American assistance to the tune of $285.2 million (Rs. 135.8 crores) for meeting part of the foreign exchange requirements of the Third Plan. These loans had been earlier announced and negotiated and were only formally signed last week.

The largest of these loans is of $200 million, made available for financing the imports of many raw materials, components and machinery, including the following: non-ferrous metals, steel, fertilizers, synthetic tyre cord yarn, sulphur, carbon black, wood pulp, lubricants, synthetic rubber, other chemical materials, automobile components and spare parts, machine tools, rollers for steel plants, newsprint, rayon-grade caustic soda and other general purpose components.

The second loan is of $43 million, which is to be utilised to purchase 158 diesel locomotives for Indian Railways to be used to move freight in both broad and metre guage sections where the carrying capacity of steam locomotives has reached near-saturation point. Some of these locomotives will facilitate movement of iron ore for overseas shipment. Some others will be used in tandem to move coal trains of 3,000 tons to the steel plants from the coalfields in Bengal, Bihar and Madhya Pradesh. A small number of these locomotives will also be utilised to carry coal and other freight on the Northern Railway. The metre guage locomotives will be used in the Lumbding-Badarpur section and on a new line to be laid between the Himalayas and the Brahmaputra river. Both these areas are in Assam State where severe gradients hamper fast freight traffic and impede exploitation of the large industrial potential of the region.

This loan also makes provision for the supply of spare parts and the training of Indian technicians in American factories where the locomotives will be manufactured.

The third loan of $38 million will meet the entire anticipated foreign exchange costs of 3,00,000 Kw. Bandel Thermal Power Station, located about 35 miles north of Calcutta, work on which was started in April last. When completed in 1964, this power project will be the largest power facility in Eastern India and the largest thermal power plant in the country. The rupee costs of this project are also being provided by the United States out of the P.L. 480 counterpart funds.

This power station is expected to play an important role in alleviating the power shortage which has developed in the region around Calcutta. Power from this project is also envisaged to be made available for railway track electrification and for pumping operations connected with irrigation in the area.

The fourth loan of $4.2 million will go to meet the foreign exchange costs of the coal washery plant to be set up by Hindustan Steel Limited at Patherdih. This washery will be able to process 1.8 million tons of raw coal per annum and yield about 1.3 million tons of washed coal.

The four loans have been channeled through the U.S. Agency for International Development and are repayable in dollars. In order to avoid excessive foreign exchange debt servicing burden, terms of the loans are set at a long repayment period of forty years, with no repayments of the principal falling due in the first ten years. They carry no interest except a nominal charge of ¾ per cent per annum.

WEST GERMAN CREDIT

The Federal Republic of Germany has offered an advance credit of DM 100 million (approximately Rs. 13 crores) to India to help her in tiding over her present balance of payments crisis. The credit is being advanced out of the Rs. 60 crores assistance promised by the West German Government for implementing Indo-German projects contemplated to be undertaken during the second year of the Third Plan.

The credit can be immediately utilised for maintenance imports and later on, when the allocations for the projects proposed to be financed by it have been made and India's foreign exchange position improves, due adjustments would be made for making available all this aid for the specific projects.

BOKARO STEEL PLANT

The U.S. team to undertake a techno-economic survey of the fourth steel plant in the public sector proposed to be set up at Bokaro, arrived here last week. It has already had preliminary discussions with the Secretary of the Union Ministry of Steel.

The Team would examine the processes which have been recommended for production of steel at Bokaro, the availability of raw materials and transport and the general economics of the project. The Team's report is now expected to be completed in less than seven months. It would take nearly 3½ years to complete this project after the submission of this report. If U.S. assistance is available for this project, some pig iron may be available from here even earlier.

The Bokaro plant, it may be recalled, will have an initial capacity of one million tons of ingot steel and 0.35 million tons of pig iron. An Indian firm of consulting engineers has already been entrusted with the task of preparing a detailed project report. This report is expected to be available by the end of the next year.

STEEL PLANT FOR SOUTH

While addressing last week the Informal Consultative Committee of Parliament attached to his Ministry, Mr. C. Subramaniam, the Union Minister for Steel, expressed the hope that it would be possible to set up a steel plant based on Salem iron ore and the Neyveli lignite in the southern region of India. The Government, he said, had appointed a Technical Committee to examine the proposal. Recently, he added, a team of observers had been sent to East Germany, West Germany and Norway in accordance with the recommendations of this Committee to observe tests being conducted there on Neyveli lignite. While in West Germany, this team will study the working of low shaft furnaces in that country. In the meantime, as recommended by the Technical Committee, the Madras Government is undertaking a preliminary site survey for the plant and its units.

The recommendation of the Technical Committee for appointing a firm of consultants for the preparation of a project report for this plant is under consideration, disclosed Mr. Subramaniam.

Referring to the Rourkela Steel Plant, Mr. Subramaniam said that necessary steps were being taken to implement the recommendations made by the Solveen Delegation. It is hoped that production at this steel plant would improve soon. All the major repair works at this plant, it is understood, have already been carried out. It is now proposed to build adequate stocks of spare parts to meet any emergencies resulting from break downs in future.

The total production of finished steel during the current financial year is expected to increase to four million metric tons and of saleable pig iron to about one million metric tons.

SODA ASH PRICES

The Government has revised the ex-port-town prices of soda ash, allowing for an increase in the freight charge for supply of this chemical in different port-towns. This has been done following representations from manufacturers of soda ash asking for increased prices on account of higher transport charges and other reasons.

Under the revised prices, which came into force from June 18, 1962, the ex-works price of soda ash will be the same as before, viz., Rs. 380 per tonne. The freight charge for west-coast ports (Bombay and Cochin) will be Rs. 35 per tonne, as against Rs. 15 before. For east-coast ports (Madras, Vishakhapatnam and Calcutta) freight charge now will be Rs. 45 per tonne, as against Rs. 25 before. The revised prices will remain in force till December 31, 1962.

Simultaneously, the Government has warned the manufacturers of soda ash against any unauthorised charges on account of dispatch, loading and other incidental expenses, in addition to the ex-works or ex-port-town ceiling prices fixed by the Government. It has been clearly stated that the prices have been fixed by the Government after taking into account all such miscellaneous items of expenditure.

GLASS PRODUCTIVITY TEAM FOR AMERICA

A National Productivity Council team on glass and optical glass industry left New Delhi this week on a seven-week tour of the United States and the United Kingdom. The team, sponsored by the U.S. Agency for International Development Mission to India (U.S.A.I.D.), will spend five weeks in the US and two weeks in the UK.

The team will study problems relating to the glass industry. These will include administrtaive problems, labour relations, incentive schemes, materials handling, packing and transportation methods, fuel efficiency and workshop practices. The team will also observe research and education facilities and the latest production techniques. On returning to India it will submit a report on its findings.

The eight-member team is led by Mr. B. B. Sarkar, Managing Director, Krishna Silicate and Glass Works Ltd., Calcutta. The other members of the team are: Mr. K. D. Sharma, Deputy Director, Central Glass and Ceramic Research Institute, Jadavpur, West Bengal; Mr. K. H. Parikh, General Manager, Vibhuti Glass Factory, Varanasi; Mr. S. R. Khanna, Development Officer (Glass), Ministry of Commerce and Industry, Government of India; Mr. D. S. Natik, Joint Secretary, Ogale Kamgar Union, Ogalevadi, Maharashtra; Mr. J. S. Rahi, Production Engineer, Shree Durga Glass Works Ltd., P.O. Barang, Orissa; Mr. K. P. Thampy, Assistant Works Superintendent, Travancore Ogale Glass Manufacturing Co. Ltd., Udyogmandal P.O., Kerala; Mr. P. C. Varshnei, Technical Director and General Manager, Seraikella Glass Works (Pvt.) Ltd., Kandra, Dist. Singhbhum, Bihar.

"Our visit is very appropriately timed," said Mr. Sarkar before leaving. "The industry is in a transitional stage. We are shifting emphasis to automatization of plants."

Pointing out that the glass industry in India has great potential, Mr. Sarkar observed: "The production (in India) of glass and optical glass last year was in the neighbourhood of 230,000 tons. By the end of the Third Five-Year Plan this will increase to 440,000 tons. The target for 1971-72 is 700,000 tons annually and within the next decade 20 additional plants are expected to be set up at a cost of Rs. 40 lakhs each. We expect our report will be helpful to the industry in modernizing it and will also help in conserving our foreign exchange reserves."

MANUFACTURE OF BALL AND ROLLER BEARINGS

The Soviet Union has been requested to prepare a techno-economic survey for the ball and roller bearing project of the Government of India.

The scheme of East Asiatic Company to manufacture ball and roller bearings in India in collaboration with a U.S. firm is now at an advanced stage, it is learnt.

LIGNITE DEPOSITS IN KUTCH AREA

Investigations carried out by the Geological Survey of India during the last several years have revealed the possibility of lignite deposits in Kutch area, it is learnt here.

The estimates of lignite in the upper seam of the Umarsar areas are of the order of 1.22 million metric tons. The lower seam is estimated to contain 9.65 million metric tons, with additional probable reserves of 4 to 4.3 million metric tons.

The Government of Gujarat is understood to be considering the question of exploiting these deposits.

PLANTATION INDUSTRIES

The main emphasis in the three principal plantation industries of India — tea, rubber and coffee — is to increase exports as much as possible even with restraints, if necessary, on internal consumption. This was stated by Mr. K. C. Reddy, the Union Minister for Commerce and Industry, last week at a meeting of the Informal Consultative Committee of Parliament attached to his Ministry.

Mr. Reddy told the Committee that production of tea was going up in the country. In 1961, it reached a record level of 771 million lbs. Twenty per cent of India's export earnings are from tea. Tea exports in 1961 amounted to 452.5 million lbs., valued at Rs. 124.63 crores. Exports in 1961 showed an increase of about 22 million lbs. over those of the previous year.

Mr. Reddy also outlined, for the benefit of the Members of the Committee, various measures that have

been taken by the Government to encourage production and export of tea. Under a scheme known as the Tea Plantation Finance Scheme, the Government, he stated, had decided to place Rs. 5 crores as loan at the disposal of the Tea Board to be used as a revolving fund. This money, he added, would be utilised for replantation, extension or replacement of the old tea areas. Any tea garden having not less than 20 acres of planted area is entitled to receive assistance under this scheme.

With a view to step up exports, Mr. Reddy pointed out, the export duty on tea had been reduced from 44 nP. per kg. to 25 nP. per kg. and a drawback of excise at a flat rate of 15 nP. per kg. at the point of export was allowed. Mr. Reddy further said that exports of tea could now be undertaken without any quantitative restrictions and in all trade agreements with the foreign countries tea was an item stipulated for export. Mr. Reddy expressed the hope that as a result of these and various other measures being adopted by the Government, tea exports would go up in the ensuing years.

Talking about coffee, the Commerce and Industry Minister stated that area under this crop had been going up by about 4,000 acres per annum, with consequent increase in output to the tune of about 3,000 tonnes. In 1960-61, coffee output amounted to 67,925 tonnes. By the end of the current Plan period, it is expected to go up to 80,000 tonnes.

Referring to the rubber industry, Mr. Reddy stated that the gap between consumption and production of rubber in India was becoming wider owing to development and expansion of rubber goods manufacturing industries. In 1961, imports of rubber were in the neighbourhood of 21,693 tons. Steps, the Minister added, were being taken to increase production so that the gap between consumption and production should not go on widening at a strident pace. One such step, he said, was a 10-year scheme that is being implemented since 1957 for replanting 70,000 acres of old low-yielding rubber lands with high-yielding rubber strains. Some loan schemes have also been drawn up and put into execution to help the small growers.

Along with these measures to increase production of natural rubber in the country, Mr. Reddy added, steps had been taken to manufacture synthetic rubber. Two licences have already been issued for this purpose. One of these plants, having a capacity of 30,000 tons per annum, is being set up at Bareilly. It is expected to go into production by the end of the current year. The second plant is envisaged to manufacture CIS-I.4 polybutadiene (a new type of rubber which has lower heat build-up and requires less quantity of natural rubber for compounding) is to be set up in Assam. It may be commissioned into production sometime in 1963. It is also proposed to process in the country about 15,000 tons of reclaimed rubber by the end of the Third Plan period.

PURCHASE OF MOGUL LINE SHARES

The Western Shipping Corporation has purchased the 100-rupee face value shares of the Mogul Line at Rs. 367.62 per share and paid a total sum of Rs. 29,475,697.17 nP. for 80,180 shares. The following are the details of this deal.

Cost of purchase of 80,180 shares by the WSC from the P & O @ Rs. 360 per share	.. Rs.	2,88,64,800.00
Exchange due to Sterling payment ..	„	50,200.22
Stamp duty, transfer fee and Soliciter's fee	„	2,17,390.00
Interest on Loan from State Bank of India	„	11,62,651.95
Safe custody charges	„	20,045.00
Fees for transfer to the name of Shipping Corporation of India Ltd. ..	„	2,500.00
TOTAL	.. Rs.	3,03,17,587.17
Less		
Dividends earned out of profits for 1959-60		(—) 8,41,890.00
Net amount paid	.. Rs.	2,94,75,697.17

TELEPHONE CALLS FROM UK ON CREDIT

"Credit Card" facility will be introduced, for the first time, on telephone calls between India and the United Kingdom from July 1, 1962. Under this system, a telephone subscriber in India who has been issued an International Telephone Credit Card by the Indian Posts and Telegraphs Department, can, by quoting the Credit Card authority number, make calls from any telephone (private or public) in the UK to any telephone in India without payment in the UK and have the charges debited against a pre-specified telephone number in India.

IN BRIEF ....

The Government of India is considering the question of setting up of a second foundry/forge plant in the public sector. A detailed scheme in this regard is, however, yet to be prepared.

•

The Government has approved the terms of collaboration of Messrs. Hitachi Transformers and Electricals (Kerala) Limited, Travancore, with Messrs. Hitachi of Japan. The Kerala company has been permitted to produce transformers upto 50,000 KVA range.

•

The more important new commodities for which steps have been taken to introduce them in the world market in an increasing measure are sugar, ferro-manganese, cement, metals (iron and steel), engineering goods, chemicals and allied products, footwear, plastic goods, woollen manufactures, confectionary and biscuits, animal casings, vanaspati, sports goods and power alcohol.

•

Mr. R. K. Birla and Mr. G. K. Singhania have been elected Chairman and Vice-Chairman, respectively, of the Federation of Woollen Manufacturers of India.

•

Some Belgian steel interests are in India at present for exploring the possibilities of entering into collaboration arrangements for setting up pig iron plants in this country. Five private sector concerns have already been licensed for this purpose. The Belgians are interested in collaborating with them. Italians also have shown interest in these projects.

•

Vickers have offered to sell to India some second-hand Viscounts owned by Trans-Canada and B.E.A. Their representatives were here last week to explain to the Government of India how this offer would be

(Continued on next page)

COMPANY AFFAIRS

BENGAL PAPER MILLS

In terms of physical output, Bengal Paper Mills recorded production of 19,627 metric tons against last year's output of 18,395 metric tons. This was in spite of the fact that the company continued to face certain difficulties in securing adequate supply of raw materials and chemicals. The situation in regard to the wagons too was not quite satisfactory. The Directors add that there has been an increase in the cost of production because of increase in the prices of raw materials and chemicals due to enhancement of railway freight and levy of excise duty on various chemicals. The company, however, is going ahead with its expansion and modernisation schemes. Orders have been placed for purchase of equipment from USA and UK, and the company expects shipments in the near future.

During the year to December 31, 1961, the company made a profit of Rs. 55.05 lakhs which was nearly 10 per cent more than last year's profit of Rs. 50.81 lakhs. After making provisions for depreciation, taxation and development rebate reserve, the Directors proposed the payment of dividend on ordinary shares at the rate of Rs. 2.25 per share which will absorb Rs. 14.85 lakhs.

STRAW PRODUCTS

During the year to December 31, 1961, the Bhopal factory of the Straw Products Limited made satisfactory progress. It manufactured various varieties of boards and introduced some new qualities. The gross sales of the company reached a new peak of Rs. 1.1 crores against Rs. 96.9 lakhs last year. The gross profit too was higher at 18.45 lakhs against last year's Rs. 13.40 lakhs.

The Directors have indicated in their annual report that the paper mill project in Orissa has also been making steady progress. Major portion of the plant and machinery have been erected and by now the total fixed assets of the company are to the tune of over Rs. 5 crores. The factory in Orissa has acquired power from Machkund Hydro-Electric Scheme. The company has been able to secure a loan of Rs. 25 lakhs from the State Bank of India and Rs. 50 lakhs from the Government of Orissa for meeting the financial requirements of the paper mill.

ENFIELD INDIA

The working results of the Enfield India Limited for the year to December 31, 1961, show an increase in production, sales and profits. The most important feature of the working during the year, the Directors point out, was the completion of many-phased programme for the substitution of imported motor cycle components by those made in the country. Thus the process of continued development and expansion in the motor cycle production was completed. Towards the financing of the scheme for the production of scooters, the company raised fresh capital to a tune of Rs. 23.33 lakhs. The company also applied to the Industrial Finance Corporation for the additional loan of Rs. 14 lakhs. As a consequence, the company will soon be able to market its scooters.

The profit for the year at Rs. 4.30 lakhs was higher as compared to last year's Rs 3.31 lakhs. The Directors proposed the payment of dividend at the rate of 4 per cent on equity shares. It may be added that dividend has been recommended on increased equity capital including the equity shares issued during the year. As a result of this issue, the company's equity capital had almost been doubled.

THE SIMPLEX MILLS

The Simplex Mills Company Limited during the year to March 31, 1962, recorded a profit of Rs. 52.82 lakhs, considerably more than last year's 34.42 lakhs. After making provision for depreciation of Rs. 16.14 lakhs, for development rebate reserve Rs. 13.90 lakhs and for taxation Rs. 11.50 lakhs, there was a net profit of Rs. 13.58 lakhs. A dividend of Rs. 11 per fully paid-up share (22 per cent) subject to deduction of tax on the increased capital has been recommended by the Directors. The Directors have pointed out that the sales at Rs. 3.23 crores were slightly lower as against last year's sales of Rs. 3.32 crores, but the gross profit had risen sharply from 10.4 per cent to 17.2 per cent. During the year additions to the plant and machinery were aggregated to Rs. 13.38 lakhs and there were outstanding orders for machinery at the end of the year which were to the extent of Rs. 61.73 lakhs.

(Continued from previous page)

beneficial for this country vis-a-vis purchase of jet planes. The second-hand Viscounts, it is stated, would be costing much less and their cost of operation would also be comperatively lower.

•

Mr. Bowes-Lyon of Lazarus Brothers, the well-known London financiers, was here last week on a mission to study the prospects of institutional British investors collaborating with Indian entrepreneurs. It has been suggested to him that invesment and technical know-how from Britain would be welcome in structural, casting, forging and mechine tool industries.

•

Almost all the automobile manufacturers have made representations to the Union Ministry of Heavy Industries against the cut in their foreign exchange allocations for import of components. This, they have pointed out, would accentuate the existing shortage of commercial vehicles in the country. The Government, it is learnt, is giving consideration to their representations.

•

Dr. Heeny, of the French Institute of Petroleum, is expected to arrive in New Delhi shortly to advise the Union Ministry of Mines and Fuel on problems connected with the petro-chemical industry. His views on the Kane Committee's report on petro-chemical industry will be particularly solicited.

•

The Refractory Manufacturers' Association has lodged a protest with the Government of India against plans to set up a refractory plant at Bhilai with Russian collaboration. The Association has pointed out that already adequate capacity has been installed or licensed for meeting the demand for refractories during the Third Plan period. The Government, however, does not share this view.

•

The State Trading Corporation has concluded arrangements for link trade with various trading houses in Switzerland, France, West Germany, Austria, Belgium, Sweden, Finland, Tunisia and Jordan. The total value of such trade envisaged under these agreements is Rs. 20 crores either way. Uptil now the actual value of exports that have taken place under these deals is of the order of Rs. 7 crores only.

ORDER SECTION
8 - JUL 1962

Company Meetings

DALMIA CEMENT (BHARAT) LIMITED

Summary of the speech of the Chairman, Shri V. H. Dalmia, delivered at the Tenth Annual General Meeting of the Company held at Dalmiapuram (Madras State) on 29th June, 1962.

Gentlemen,

1. I have great pleasure in welcoming you to the Tenth Annual General Meeting of your Company. As usual, I take this opportunity to give a brief review of the working of your Company during the year under report.

2. In 1961, the production in all the manufacturing departments has been better compared to the previous year except for a slight decline in the Refractory Section. Despite improved production, there is no mentionable increase in the profit earned by your Company on account of all-round increase in costs and growing competition in the products of the Ceramics Division, and also due to the adjustment of Bonus to employees for the year 1960 in respect of which no provision was made in that year. The impact of the increase granted to your Company in the ex-works retention price of cement will be felt from the current year onwards.

3. I am glad to inform you that 57.75 per cent of the dividend recommended by your Directors will be paid out of tax exempt profit. In the computation of the tax exempt profit available for distribution as dividend, besides the undistributed balances of the earlier years, the Company's share of tax exempt profit of M/s. Dalmia Magnesite Corporation has also been included.

4. I would now refer to the decision of the Government of India on the question of cement prices. Taking the view that the system of differential prices recommended by the Tariff Commission based on individual costs is not conducive to efficiency and greater production and that there should be a uniform price for the industry, so that there is a measure of reward for those units which are able to achieve economies, the Government fixed the uniform ex-works price of naked cement at Rs. 69.50 per tonne for the industry, with provision for extra price in the case of certain high cost units. The retention price payable to your Company stands increased from Rs. 55.54 to Rs. 69.50 per tonne effective 1st November, 1961. I regret, however, that the revised price was not brought into effect from 1st July, 1961, as recommended by the Tariff Commission, considering that the previous price period expired on 30th June, 1961.

5. The persistent shortage of cement has induced a review of the expansion plans for the industry. The revised estimates now place the demand for cement by the end of the Third Plan at 15 million tonnes and the Government is, therefore, considering revision of the capacity target for the cement industry from 15.2 million tonnes to 18 million tonnes, an increase of twenty per cent. In this context, I would like to say that the fullest utilisation of the existing installed capacity should be accorded paramount importance by the Government as providing a ready means of increasing speedily the production of cement at a time when the country is faced with an increasing shortage of this commodity. In 1961, against an installed capacity of 9.4 million tonnes, the actual production was only 8.2 million tonnes. It should be possible to obtain appreciably higher production through better utilisation of the existing capacity itself at relatively much less expenditure of valuable foreign exchange, if the required spare parts and equipment are allowed to be imported and the other difficulties such as inadequate or irregular supply of coal, wagons for inward and outward movement to and from cement factories, are resolved. Besides, a scheme of incentives should also be introduced to encourage the maximisation of production. I understand that some such scheme is already under consideration of the Government of India.

6. During the past few years, there has been a growing realisation that the supplies of coal were not keeping pace with the growing demand of the country's expanding economy. The shortfall was attributed mainly to insufficient rail movement capacity and last year it was sought to augment this by moving coal by the sea-cum-rail route. While this has brought a measure of relief, it has not proved sufficient. More recently, however, it has been admitted that the production of coal itself is inadequate and recourse to alternative fuels, is, therefore, considered doubly necessary. The Government of India have, therefore, suggested the conversion to complete or partial oil firing of certain industrial units, including the cement factories, which are situated at long distances from the Bengal/Bihar coalfields and have agreed to grant ad hoc increases in the retention prices to cement producers to offset the incidence of the higher cost of oil. The movement of Bengal/Bihar coal by the all-rail route to certain consumers, including several cement factories, was stopped and was replaced by shipments of coal from Calcutta Port following announcement of the scheme to subsidise the movement of coal by sea. In view of this element of compulsion, the Government of India have been requested to modify the subsidy formula in such a manner as would ensure that the cost to the consumer of seaborne coal is exactly the same as the cost by the all-rail route. It is hoped that they will agree to this. There is urgent need for a settlement of the subsidy claims without delay as also for a simplification of the procedure which would eliminate such delays in future. As matters stand at present, the payment of subsidy has not been made till now even against claims submitted more than five months back.

7. Last year, I had referred to the tremendous expansions in the Steel Industry which were being planned on a global basis. Since then, however, there have been indications of a partial recession in Japan, which has led to some hesitancy on the part of the Japanese Steel Industry to increase their commitments abroad in purchasing iron ores. It is hoped that this is only a temporary phase. With the development of new sintering and pelletizing processes, low grade ores of various origins are being used more and more extensively by the Steel Industry in many countries. As a result of this, the importance, hitherto attached to very high-grade ores such as is supplied from your Company's mines, is lessening. The need, therefore, of long-term agreements with various countries for the supplies of such ores from India is greater, particularly when we find that fresh sources of such ore are being exploited in other countries to a larger extent. In view of the urgent need of boosting the country's export trade, particularly where through such exports free foreign exchange can be earned, the State Trading Corporation of India Ltd. will, doubtless, endeavour to conclude such long-term agreements with various countries as rapidly as possible.

8. The Government of India and the Government of Madras have had before them for some time a project for developing the capacity of Cuddalore Port to cope with

the increased exports of iron ore and to handle the larger quantities of fertilisers and coal which are being unloaded at that port. I understand that the plans for this development project have been finally passed and it is to be hoped that the actual work will be taken in hand very soon with the ultimate target, perhaps, of making Cuddalore Port capable of exporting upto one million tons of iron ore per year. To take advantage of the increasing port capacity at Cuddalore and other major and minor ports which are being developed further, however, it is important that the railway capacity for movement of ores should be increased more rapidly. In this connection, it is heartening to note from a recent statement made by Shri Manubhai Shah, the Minister for International Trade, that the Railway Ministry would be persuaded not only to give top priority to the haulage of ores and other goods for export but also to reserve a number of wagons specifically for export purposes. While your Company's ore business has shown a decline, since I spoke to you last, it is hoped that, as a result of possible long-term arrangements for high grade ore exports from India and as a result of the growing port and railway capacities, your Company may also look forward to increased exports of their iron ore.

9. The results achieved for their last financial year by M/s. Dalmia Magnesite Corporation, in which your Company is a partner, continue to show satisfactory progress. The demand for deadburnt magnesite from the Steel Industry and the Refractory Industry in the country continues to show an increase. There are indications that this demand may rise steeply by the beginning of the Fourth Five-Year Plan by which time the Steel Industry may reach its target of 10 million tons of steel production per annum. There are also indications of a possible export market, as I had mentioned last year, and recently some small export of deadburnt magnesite has been made by M/s. Dalmia Magnesite Corporation. In the circumstances, the outlook for the Industry is bright even after the contemplated expansions, including the doubling of the capacity at Salem Works, having been completed.

10. The two cement factories in Pakistan, belonging to your subsidiary, continue to face a variety of problems. Implementation of our programme for rehabilitation and modernisation of these factories is held up on account of the difficulty in getting import facilities for the required spares and equipment. Demand for cement in West Pakistan has been slack and as a result, competition has developed. Every effort is being made to revitalise the sales organisation and improve the despatches. I am glad to add that relations between management and workers at both the factories of your subsidiary in Pakistan have taken a welcome turn. A long-term agreement has been reached at Shantinagar (Karachi) Works covering wages and other demands. A similar agreement is likely to be concluded with the workers at Dandot Works also. Both the factories are working well except for the problems created by the lack of rehabilitation of the plant and equipment for reasons which I have just mentioned.

11. I wish to refer now to the long-term agreement signed at Dalmiapuram in November, 1961 in regard to the payment of bonus to the employees. As a result of the formula by which the quantum of bonus has been linked to the clinker production attained in the relevant year at your Dalmiapuram Works, I am confident that industrial peace would prevail at Dalmiapuram and workers would lend their full co-operation in augmenting production. I wish to express my satisfaction at the growth of sound and cordial relations between your Company and the workers' unions evidenced by increasing willingness to resort to mutual discussions and negotiations for the settlement of outstanding issues. The agreement in regard to bonus is an outstanding example of this growing co-operation.

12. Finally, I would like to express on your behalf and on my own, our appreciation of the services rendered to the Company by all executives, staff and workers.

N.B. : This does not purport to be a report of the proceedings of the General Meeting.

THE TRAVANCORE CEMENTS LIMITED, KOTTAYAM

Speech delivered by the Chairman, Shri C. S. Loganathan, at the Fifteenth Annual General Meeting held at the Registered Office of the Company Nattakom, Kottayam on Friday the 22nd June, 1962.

Gentlemen,

I have great pleasure in welcoming you all to the fifteenth Annual General Meeting of the Company.

The audited Balance Sheet as at 31st December, 1961 and the Profit and Loss Account for the year ended that date and your Directors' Report have been in your hands for some time and with your permission I shall take them as read.

The year's working has resulted in a net profit of Rs. 4,99,058 as against Rs. 5,21,843 for the previous year. In the later part of 1961 we were on White Cement production and the bulk of it is being sold in 1962. This has resulted to some extent in lesser turnover and profit compared to previous year. The revised price for cement came into effect only from 1-11-1961 even though the term of the previous price fixed in 1958 was to expire by July, 1961. The increase in price allowed to us from 1-11-1961, no doubt, gives us some relief in meeting the increased cost of production but there has been again some increase in working cost due to increase in Railway freight, Coal cost etc. The raw-material cost has also gone up as we have now shifted our dredging operations to "Vaikom" area which is nearly 10 miles further away from the place where we were collecting our shells in previous years.

The Cement Manufacturers' Association is taking up the matter with the Ministry of Steel and Heavy Industries to revise the retention price of cement wherever necessary due to increase in Coal price, Railway freight, Electricity Charges, Royalty on raw-materials etc., since the revision of price in November, 1961 and we can reasonably hope that the Government of India will give sympathetic consideration in this matter.

DIVIDEND AND TAXATION

The Directors of your Company have recommended payment of 6 per cent dividend subject to tax for 1961 after providing for taxation. As you are aware the present Company taxation stands at 50 per cent of Net Profit as against 45 per cent in previous year and the divisible profit after taxation is reduced accordingly.

LABOUR

Relation with Staff and Labour have been cordial. The period of the long-term truce agreement entered into with the Labour Unions in 1958 expired on 31-5-1962 and it is hoped that another long-term agreement would be arrived at shortly to maintain Industrial peace.

I wish to bring to your notice with deep regret the death of Shri Parayath E. Raman Menon on 15-2-62 who was a Director of the Company from the inception. I have no doubt that you will join me to place on

double, double toil and trouble!

The toil is out of it now—so also the magic! Chemistry is no longer a "black art" In some measure, it today enters everything we see and touch—and eat! Its applications are limitless—in the manufacture of chemicals, pharmaceuticals, fertilisers, dyes, plastics, fibres. Millions of tons of these are produced annually—and the demand is growing every day. Which means the industry needs more plant and equipment—and that is what Larsen & Toubro manufactures and supplies: complete chemical plants, process equipment, cooling towers, process control instrumentation and Audco valves.

we don't supply swans!

Frankly, we don't even believe in the legend that a swan can separate milk and water! But we know of equipment that can do it—L & T manufactures them! Distillation columns that separate one liquid from another. L & T also specialises in the manufacture of heat exchangers, condensers, reaction vessels, driers and storage tanks, from stainless steel, monel, nickel, copper and aluminium.

everything under control?

It has to be. Control is a vital matter in the chemical industry. Temperature and pressure and flow have to be precisely checked and controlled... When dangerous chemicals are involved, the situation can be really explosive! L & T designs and supplies up-to-date on-line and off-line control systems incorporating electronic computers for industrial and chemical processes.

L & T contributes also to the development of these vital industries:

- dairy
- oil
- steel
- food & agriculture
- paper
- minerals
- electricity
- transport
- construction

it takes more than a pair of hands!

In fact, it's more than a question of manpower—erecting a plant, we mean. There's a lot of thinking and planning—*constructive* thinking that leaves little to chance, saves time, money *and* trouble. And that's the difference between a job done—and a job done well!

not enough water?

It can be a problem—when the demand is, say, for a million gallons an hour! That is why cooling towers are particularly important to the chemical industry. They make it possible to use the same water over and over again—exactly like a car radiator, only on a much larger scale! L & T designs and constructs cooling towers to meet specific industrial needs.

LARSEN & TOUBRO

IN SERVICE L&T LIVES SUCCESS

record our appreciation of the valuable services rendered by the late Shri Parayath E. Raman Menon to the affairs of the Company.

I wish to express my gratitude to my fellow Directors for their valuable guidance and service and the Works Manager and all employees of the factory for their work during the year.

Gentlemen, I thank you all for your presence at this meeting.

I now request that the Directors' Report and the audited amounts for the year 1961 be taken for consideration and adoption.

NOTE: This does not purport to be the report of the proceedings of the annual general meeting.

THE METAL BOX COMPANY OF INDIA LTD.

Review by the Chairman, Mr. K. C. Mahindra

The Twenty-ninth Annual General Meeting of the Metal Box Company of India Limited will be held on Wednesday, the 18th July, 1962 at 59-C, Chowringhee, Calcutta.

The following is a copy of the Review by the Chairman, Mr. K. C. Mahindra, which has already been circulated to members.

SALES

Your Company's sales have grown steadily over the past year; from Rs. 970 lakhs in 1960-61 to Rs. 1050 lakhs in the year under review. This increase of 8¼ per cent as compared with 11 per cent last year was not quite as high as expected. However, I see no reason for discouragement or alarm. I would rather interpret the relative shortfall as a useful reminder of how closely our fortunes are linked with those of our customers. Our sales figures are remarkably accurate barometer of the affairs of the consumer-goods industries. In 1961-62, the high prices of groundnut oil made vanaspati too expensive for some people who had become accustomed to buying it; less toilet powder was bought after an excise duty was imposed in March 1961; in many instances our customers' output was limited by shortages of raw materials and, as a result, some of those who buy industrial components from us took less than we had expected. Besides, there were rises in costs, particularly affecting raw material. I shall refer to them later. Our customers' problems which adversely affected our sales volume, our greater efforts in export fields and rising costs have caused profit margins to narrow. The solution, insofar as it is within our own control, rests in increased efficiency and increased productivity. I believe that Metal Box, measured by any standards, is an efficient manufacturing organisation and that our pursuit of greater efficiency is relentless. There is, however, a limiting factor, the volume of production. Technological progress demands the application of the latest processes and methods to an increasing volume if we are to remain a low cost producer. But in the case of tin containers our productive capacity is not being increased. Government's policy over the licensing of any expansion of existing units or the formation of new ones continues to favour the man who produces both the goods and the packages for them. I cannot believe that Government can continue to turn a blind eye to the obvious long-term consequences: uneconomic fragmentation of the industry, stagnation in technical development and, above all, a high-cost container for the masses of the people. All around us, industrialists are appealing to be allowed to produce more in order to meet their ever increasing costs. How can the price-line be held so long as Government deliberately fosters the emergence and growth of uneconomic methods?

I do not wish to be misunderstood: there is no plea whatsoever that large units be allowed to expand at the expense of the small. In Metal Box we have done and are doing everything we can to foster the growth of small-scale industry. We buy materials from it, we provide it with know-how and we sell machinery to it. My point is that if the targets in the Third Plan for the production of consumer goods—milk products, to take only one example—are to be achieved, I just do not see where the containers in the numbers, at the price and in the quality which all these new manufacturers are demanding from the start, are going to come from. We shall have to wait and watch the prices rise, whereas we ought to be getting on with the basic job.

EXPORTS

In other fields, I am glad to be able to say that we are, indeed, getting on with the job. To conserve foreign exchange, for example, we have extended the manufacture in Calcutta of industrial components and machinery required for can-making and closing, which had to be imported hitherto, and we have made a successful effort to step up our direct exports of packages, machinery, hardware and publicity media. Since we first entered the markets of South-East Asia, competition, notably from Japan, has intensified. Despite this, our exports were 36 per cent higher than last year and their value during the year was over Rs. 25 lakhs. We are now one of the first five exporters of engineering goods. The growth in our direct exports, made possible only by constant touring and by offering very low prices, has had its effect on our profits. Nevertheless, we are resolved to maintain a steady growth and hope to achieve a substantial increase in our exports in the current year.

Our largest contribution in the export field is an indirect one: supplying packaging materals, to international standards of quality, for goods packaged and exported by Indian manufacturers. It is our conviction that every well-packaged Indian product is a potential earner of foreign exchange. This belief is substantiated by the export from India last year in Metal Box packages of goods worth over Rs. 4 crores to more than fifty countries spread all over the globe. Many of these packages were designed to meet the specific needs and tastes of highly competitive overseas markets. My report last year highlighted the part your Company was playing in India's prawn exports. Amongst the other exports, the success of which has been assisted by the high quality standard of our containers, are cashew nuts, vanaspati, vegetable oils, fruit, toiletries, confectionery and biscuits. Here is an important area of achievement at a time when the diversification of India's export pattern is a matter of great urgency.

To those who participate in the closed economy of India, marketing consumer goods abroad may well be an unfamiliar and novel experience. It has not taken long for the fact to be brought home that, when ex-

porting, quality packaging designed to meet the customers' requirements in a particular market is not an expensive frill but a business necessity.

RAW MATERIALS

An important feature in the year's trading was the increased cost of tinplate. Supplies from the Tinplate Company and Rourkela have often had to be despatched by road rather than by rail at greater expense. Most imported supplies now arrive under D.L.F. from America. In earlier years, tinplate came more cheaply from Japan and the U.K. We have also had to resort to Russian supplies in non-standard sizes at prices even higher than the American. Supplies, albeit at a price, have been reasonably available throughout 1961-62.

Stocks at the commencement of the new financial year, though slightly less than the previous year, can be considered satisfactory. But the outlook for the current year is clouded by the uncertainty of production at Rourkela which is struggling with the problems involved in starting up a major steel enterprise. In areas where we can make a contribution we are co-operating closely with this new source of supply and it is gratifying to note that the quality of our first consignment of Rourkela tin-plate was promising. Quantitative difficulties, however, may take long to overcome and, having regard to the length of time taken to plan imports, it is important that D.L.F. or other imports should continue to be made available on the same scale as last year.

Deep-drawing mild steel sheet was in satisfactory supply throughout the year. The production of our industrial components is assured for the present orders on hand; but beyond that, production will depend on the availability of imported sheet steel of the special quality required for this type of work.

The Company's consumption of aluminium sheet and slugs, whilst showing a small increase over the previous year, continued to be limited by the availability of Indian-made supplies and by their high price. With the completion of the Indian Aluminium Company's expansion programme, and the commencement of production by Hindustan Aluminium during this year, it is hoped that consumers of this valuable packaging material will benefit from additional supplies at a lower price.

The increased excise on foil, now Rs. 600 per tonne, is a discouraging levy on a material which we use exclusively for the tamperproof of sealing of tinplate containers and for the development of new laminates for heat-sealed consumer-packages intended for the mass markets.

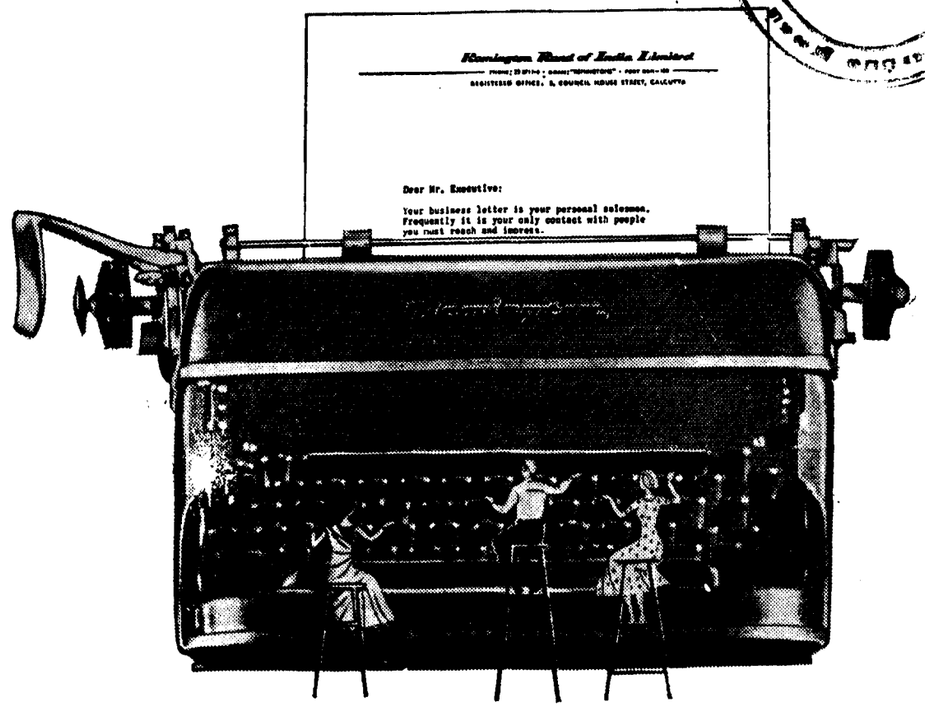
RESEARCH, DESIGN AND DEVELOPMENT

The year under review has seen continued success in the efforts by our Research Division to develop high-quality ancillary materials of indigenous manufacture. Recent successes in collaboration with our suppliers include a range of process resistant decorative materials for collapsible tubes and, on an experimental basis, for processed food cans; an enlarged range of high-gloss flexographic inks which enables us to produce Diothene bags to a quality comparable with any polyethylene printing anywhere in the world; and improved light-resistant inks for use in packages and advertising media liable to continuous exposure to daylight. The Canning Advisory Service offered by Research Division to food canners has continued to expand. Considerable development work has been carried out on complex aspects of plastics production and technology.

Normal product design work continued successfully throughout the year and a number of new products within the scope of our existing machinery were added. The Technical Development Section has made further contributions over the year in the design of new packages, industrial components and machinery. Package development work is primarily directed towards improved pilferproof containers capable of being manufactured and, as far as possible, closed at high speeds. An outstanding development introduced during the year under review was the aluminium 'No-pilfer Diaphragm' designed primarily to seal confectionery containers and make them tamperproof. The use of this development eliminates the need for imported tagger tinplate. We have also developed prototype machinery for addition to our range of sealing equipment for customers, redesigned some of our existing plant, and designed new machinery to accelerate production speeds.

As an important development aimed at providing greater facilities to prawn exporters, we opened in December 1961 our Kerala Service Installation in Cochin which includes a reforming unit. At Calcutta No. 1 a high speed Open Top can-making line of the latest design has been installed to replace obsolete equipment. In the Plastics Works at Calcutta No. 2, machinery for the manufacture of heat-sealing laminates, extrusion-coated products and moulded bottles is being installed. Manufacturing trials are currently in progress and we expect to go into regular production shortly.

Also at Calcutta No. 2 steady progress has been maintained in machinery building; currently we are making a range of twenty-five different machines. The fact that some 10 per cent of our output of these machines was exported is an indication of the high standards achieved.



Your Company has recently received permission from the Government of India to manufacture treated and laminated papers and boards and containers made therefrom. Our entry into this field will enable us, using Indian raw materials, to offer precision-made cartons finished to that standard of quality which is essential for export markets. It will also enable us to develop packaging systems involving the use of tamperproof functional cartons capable of holding semi-solids and possibly liquids, and providing an air-tight seal. This product diversification is a result of the Company's sustained efforts to provide its customers with a complete packaging service. In this, as with all our endeavours, both old and new, we owe much to our associates in the United Kingdom. The new line of laminated papers and boards and containers made therefrom will be substantially assisted by the valuable contribution which our associates can make, and your Company will materially benefit from their long experience in what to us will be a new field of activity.

In Bombay, with the completion of an additional floor on the administrative block, our present site in Worli is now fully developed. We have, therefore, purchased some twelve acres of land at Deonar 9 miles from Worli. Here, Bombay No. 2 Factory will be built in order to relieve congestion, make room for carton manufacture and improve working conditions at Worli. Preliminary planning has been completed and construction should commence shortly.

EMPLOYEE RELATIONS

Good relations between management and employees have continued except for occasional signs of restlessness in Calcutta and Faridabad. The past year was marked by the establishment of representative committees of employees to strengthen bipartite negotiations in all units. To facilitate understanding at all levels management has widely circulated an unequivocal statement of the Company's personnel policy.

I am glad to report that after three years of unsatisfactory relations in Madras, this last year has seen

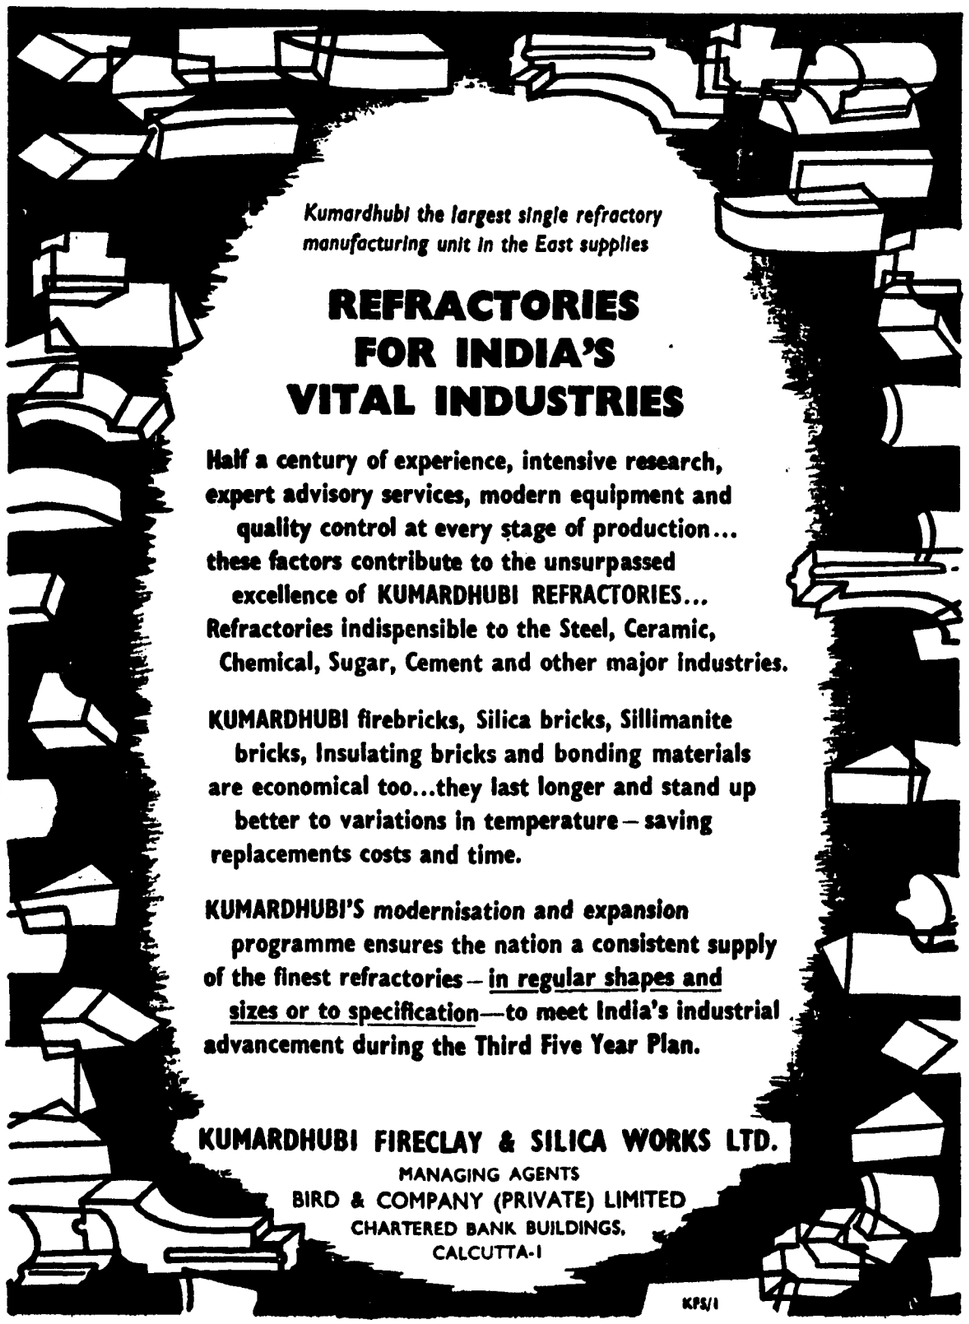
How BIG is Remington ?

The largest typewriter manufacturer in India. The largest in the world. Our Howrah Factory is the largest in Asia . . . we could give you an awful lot of statistics, but statistics leave out some very important things.

Our Howrah Factory is laid out over 1,80,000 square feet : that's a statistic, but it says nothing of the fantastic difficulty of pioneering in large scale typewriter manufacture.

We have 26 branches and a network of service stations, so that you can buy a Remington typewriter anywhere and get a Remington service man in any part of the country. A fully *trained* man. Many years of organisation went into *that*.

More statistics : a Remington typewriter has 1,845 parts and more than 3,700 different press tools, jigs, fixtures and special toolings are needed to make them. The parts are made from 24 varieties of materials in 251 sizes and thicknesses, including special alloy steel in 53 sizes. More than three-quarters of these materials undergo heat-treatment.



Just these few statistics meant setting up our own Tool Room and Heat-Treatment Section in the Howrah Factory, training Tool Room labour and initiating research among local industries for the production of alloy steel. It meant training a full Assembly Department for highly specialised skills from rivet-spinning and type soldering to electroplating and stove-enamelling and many more. It even meant training type-aligners to be always accurate to within .003 of an inch.

We are rather proud that the finished typewriter from the Howrah Factory truly saves Foreign Exchange *without sacrificing an iota of quality.*

Remington Rand of India Limited

3, COUNCIL HOUSE STREET, CALCUTTA-1

RR/G/101

a marked improvement. The terms and conditions of union recognition have been settled and a five year agreement resolving differences has been signed. The second three year agreement on Prosperity Bonus with employees ended with the p yment of last year's bonus. Fresh negotiations were started late in 1961 and they have now been concluded in a new three year agreement.

We have continued to put emphasis on the training of staff and progress has been made in integrating outside courses available both in India and abroad with facilities within the Company. Two of our Indian officers were given special technical training by our associates in the U.S.A., the Continental Can Company Inc. Sixteen Indian officers were sent for training with Metal Box in the U.K. Seventy-four managers have already undergone the Company's residential course in management and one hundred and fifty-four foremen and supervisors have attended non-residential full-time courses organised by the Company. In time, every member of the Company's management cadre will have participated in a programme of formal training. Our in-company courses have benefited from a visit of the head of Metal Box's Education and Training Division in the U.K., Mr. D. G. Sanders. You will be interested to learn that following his visit, our associated companies in neighbouring lands have decided to send their managers to India to participate in our courses.

Aside from formal schemes of training, we have charged management in all our units with the important responsibility of on-the job training and we have generally improved the planning of the career development of our more promising employes. There is, as a result of this training activity, a perceptibly increasing awareness of sound management practice at all levels.

I thank the employees of the Company for their co-operation and for the fine sense of responsibility which they have contributed over the past year to our progress in the face of some formidable difficulties.

RETIREMENT

Sir Robert Barlow, who has been a Director of the Company since its formation in 1933, has retired from the Board. I am sure you would wish me to place on record our deep appreciation of the invaluable services rendered by Sir Robert Barlow in the last thirty years. It was his genius that spear-headed the development of the packaging industry in India and if it had not been for his inspiration and foresight this Company could never have aspired to its present position in the Indian economy.

OIL INDIA LIMITED

Speech delivered by Shri Khandubhai K. Desai, M.P., Chairman at the Third Annual General Meeting of the Company held at Duliajan, Assam, on June 22, 1962.

Gentlemen,

The Report of the Board of Directors gives you an idea of the financial position of your Company and explains in some detail the extent of its operations during the year 1961. I shall refer briefly to some of the salient features in this report later, but I think it is important in the first place for us to realise their context against a more general background.

CONSUMPTION OF PETROLEUM PRODUCTS

The consumption of petroleum products in a developing economy like India is bound to grow at a rate faster than what has been generally estimated in the past. We are at the present moment still dependent to a very considerable degree on imports both of crude and of products and this is again dependent on the availability of foreign exchange for such imports. This is of particular relevance at a time like this, when all else is overshadowed by the continuing foreign exchange crisis with which this country is faced. At present we are spending about Rs. 80 crores every year in foreign exchange on imports of crude oil and petroleum products. It is well to remember this fact when considering or discussing the large-scale programme of oil exploration that has been launched during the last few years by the Government of India. In the public sector the Oil and Natural Gas Commission propose to spend about Rs. 200 crores on esxploration and production operations, and they aim to achieve a production target of about 3½ million tons per year during the final year of the Third Five-Year Plan. I would like to take this opportunity to congratulate the Oil and Natural Gas Commission on the signal successes they have already achieved in the Gujarat Region, and to pay our tribute to the dedicated and unremitting efforts they are making to increase India's oil potential.

OIL INDIA TO PRODUCE 3 MILLION TONS OF CRUDE OIL BY 1963

As far as the programmes of your own Company are concerned Oil India's reserves stand at about 45 million tons of oil and 720,000 million cu.ft. of gas at present and with the existing number of wells drilled by Oil India so far and those to be completed by the end of 1963, Oil India would be in a position to meet its commitments of supplying nearly 3 million tons a year to the Refineries at Gauhati and Barauni and the Assam Oil Company Refinery at Digboi. This total production of 3 million tons would mean a foreign exchange saving of more than Rs. 20 crores a year. If we are fortunate to discover oil in the new concession areas in respect of which an exploration licence is pending with the Assam Government, this in turn would greatly assist not only in saving on further imports of crude, but in further expansion of the Refineries at Gauhati and Barauni. This is a matter therefore which should have priority specially as Oil India's prospecting programme does not involve any foreign exchange expense as the latter has already been underwritten by The Burmah Oil Company, Government's partner in Oil India. We had originally planned to start work in the new area in October 1961. Unless the exploration licence is granted promptly it would not be possible to start the work even in the coming cold weather and any further delay would seriously impede progress in the vital field of oil exploration and development.

Our annual report gives you some idea of the facts and figures of oil drilling and operations during the year 1961.

TRANSPORT OF CRUDE OIL THROUGH PIPELINE

While the achievement of our production target is all important special mention should also be made of the transport problem, viz., the construction of the 720-mile long Oil India pipeline from Nahorkatiya to Barauni. The completion of the first stage of this pipeline to Gauhati was delayed due to abnormally heavy rains in the middle of 1961, which led to the suspension of work. However, as soon as this was foreseen arrangements were made to build up stocks of crude at Gauhati Refinery by means of railway tankwagons to enable the Refinery to commence operations as scheduled on 1st January, 1962. The first stage of the pipeline was actually completed by the beginning of March and pumping of crude oil to the Refinery had commenced. We take this opportunity to congratulate The Burmah Oil Company (Pipe Lines) Limited and the contractors for having done a good job under difficult circumstances. Progress on the second stage from Barauni to Gauhati is satisfactory and we are hopeful that the whole line will be ready when the Barauni Refinery goes on stream early in 1963. This pipeline system traversing a difficult terrain, cutting across three state boundaries is the second largest in the East (including the Middle East) and will be one of the most modern and automatic.

OIL INDIA'S ORGANISATION TAKES SHAPE

The year 1961 as you would see has been a momentous one in the history of this young organisation. This Second Supplemental Agreement brought Government's shareholding on a par with that of The Burmah Oil Company, thus giving it parity on the Board of Directors. The first task to which the newly re-constituted Board addressed itself was the setting up of a separate organisation for Oil India.

As from 1st January, 1962 we took over on Oil India's payroll all the staff required—executive, clerical and labour—engaged on Oil India's work who had hitherto been employees of the Assam Oil Company. The organisational set up, provision for future recruitment, the devolution of powers and duties to the Managing Director and to the officers in the field and other allied matters have been charted out and are now in actual operative effect. This transition I am glad to say has been effected without any friction, and I would like to take this opportunity to convey our grateful thanks for managing Oil India's affairs to Assam Oil Company and for their co-operation since then.

PROBLEMS WE HAD TO FACE

Like any other industrial undertaking however, Oil India has had its own share of difficulties during the year. The new Board was faced almost immediately with a strike by the contractors' labour—but this was fortunately settled in a brief time.

Land Acquisition: Another serious problem that arose was the question of land acquisition for further drilling in our existing concession areas. It is not always possible to acquire land under the Land Acquisition Act 1894 or Rule 119 of the Assam Land & Revenu Regulations. Therefore we had to resort to private negotiations in certain cases. We were however caught on the horns of a dilemma, as we found that adherence to existing procedure for acquisition of land entailed much time and uneconomical use of drilling outfits; although land could be obtained more quickly by private negotiation, prices spiralled and our continuing to pay high prices became impossible not only because of the excessive cost to the Company but also because of the overall effect on land prices for other industrial ventures within the State. We have sought the co-operation of both the Government of India and the Government of Assam in this regard and we trust that with their assistance some solution can be found to this problem.

Utilisation of Natural Gas: The utilisation of natural gas produced along with oil and by itself has presented problems of planning. The Assam Government have now set up a Committee on which Oil India is represented, which would go into these questions regarding market availability of gas, the demands from various consumers, the capital costs involved in storage equipment, the price at which the gas is to be sold etc. It is gratifying to note that the Assam Government is very keen on fostering and developing gas-based industries in the State.

Royalty: Another important matter to which I would like to refer is the Royalty question. I earnestly trust that there would be an early settlement of this question, as this would enable us to proceed more expeditiously with our development programmes.

FINANCIAL POSITION

As far as our financial position is concerned, I do not think it is necessary for me to go into this in any detail as this is fully set out in the report before you. As you would see the financial picture shows that the net surplus after providing for depreciation, taxation and development rebate amounts to Rs. 1.15 crores which is being transferred to the general reserve. Taking into account that we are still in the development stage and our sales in 1961 were limited to about 300,000 tons I think this can be considered reasonably satisfactory.

In conclusion I would like particularly to thank my colleagues from the Board for their co-operation and assistance. From the very beginning it was realised by both partners in Oil India (the Government of India and the Burmah Oil Co.) that the successful working of Oil India with two equal shareholders would depend primarily on a basic understanding and agreement on matters concerning the formulation of policy at the Board level, combined with a certain amount of give and take on both sides. I am glad to say that this system has worked smoothly and successfully. The Board has functioned as a homogenous team and I trust it would continue to function on the same lines in future. This has been due to the spirit of co-operation shown by both the partners and to their understanding of the common objective—namely, to make this new venture a success.

Finally, I would like, on behalf of your Company to express my appreciation to the staff and workers of Oil India who have given their full loyalty to this new organisation and who have spared no pains to contribute to its successful working. In this connexion I must pay here a tribute to Shri M. J. Condon, the previous Managing Director of Oil India, who was instrumental in evolving a basis for the Government and The Burmah Oil Company to work together and in making the transition smooth. I would also like to place on record my appreciation of the excellent team work done by our present Managing Director, Shri J. C. Finlay and the Financial Director, Shri Govindan Nair, which has rendered possible the setting up of Oil India on its feet.

THE NEW GREAT INSURANCE CO. OF INDIA LTD.

Speech of Mr. Tulsidas Kilachand

Presiding over the Nineteenth Annual General Meeting of the Shareholders of the Company held at Baroda on the 23rd June 1962, Mr Tulsidas Kilachand, Chairman, referred to some of the problems facing the Insurance Industry, in the course of which he said:—

REMOVAL OF RESTRICTIVE REGULATIONS AND NEED FOR NEW INSURANCE ACT

"Recently, all insurers carrying on general insurance business in India have received a circular from the Secretary of the Executive Committee of the General Insurance Council, conveying certain decisions taken by the Executive Committee introducing far-reaching changes in the Code of Conduct and the Administrative Machinery. If it is possible to improve the tone of the market by introducing these changes, nobody will be more happy than I. I am, however, personally of the opinion that these changes, far from assisting in the development of general insurance business, will hamper its growth. In fact, a dispassionate examination of the situation will show that all the difficulties encountered by the industry at present are primarily due to the very nature of the provisions included in the Insurance Act, which are unrelated to facts, and because they are unreal, artificial supports such as the Code regulations have become necessary to sustain them.

The Insurance Act governs the carrying on of general insurance business in India, and was passed as early as in 1938, when both Life and General business was in the non-Governmental Sector. Life Insurance was nationalised over six years ago, with the result, so far as we are concerned many of the provisions of the Act originally applicable to Life business, have become obsolete. It is, therefore, high time that the Insurance Act as a whole was reviewed and, as I had occasion to refer to in my speeches in the past, an Act in a more simplified form, based perhaps on the model of U.K. Insurance Act, be placed on the Statute Book.

As mentioned earlier, I am personally convinced that most of our difficulties are due to the plethora of restrictive regulations that are included in the Act and the Code. A smooth and progressive development of the industry on the right lines can only be possible by the removal of all such restrictive provisions that impede its natural growth.

My views on this subject are shared by the other Directors of your Company. However, since all the insurers in India, both Indian and non-Indian are, I understand, giving their full support to the recent changes in the Code of Conduct, your Board have also decided to fall in line with other insurers.

REDUCTION IN FIRE PREMIUM RATES

Another point to which I would like to refer is the decision recently arrived at, at the instance of the authorities, to reduce the Fire premium rates. This is the third reduction during the last eight years. The first reduction took place in 1955, when the average worked out at about 10 per cent. A similar reduction was effected in 1960, and hardly two years have passed before a further reduction of about 15 per cent is being brought into force from 1st July, 1962. I am afraid that this important subject has not received the consideration it deserves on the part of the authorities. We are told that the Fire rates have substantial margin of profits, which enables companies to indulge in the so-called unhealthy practices. It should not, however, be overlooked that the previous two reductions, aggregating in all to about 20 per cent in the Fire rates, have not succeeded in eliminating such practices to any material extent. There is, therefore, very little justification to presume that yet another reduction will achieve this objective. It is also well-known that, comparatively both Marine and Miscellaneous Accident business have not at all proved profitable; yet such practices exist in these two classes of insurance also. It is thus apparent that rates have nothing to do with the so-called malpractices.

Apart from this, insurers have to cater to their clients' requirements for all classes of business, and if they make a profit in the Fire Department, such profits help them in meeting, to some extent, the losses in the Marine and Miscellaneous Insurance Departments. This explains our dependence on the profits of Fire business, but if an accusing finger is pointed to such profits alone, and a Nelson eye is kept in regard to the losses in the other Departments, the picture becomes distorted. It is, therefore, essential that the problem is tackled as a whole and, viewed from this angle, there is no justification for reducing Fire premiums rates and that too in such quick succession.

We are told that Marine and Miscellaneous Insurance Departments should stand on their own merits. Whilst on the subject, it may not be out of place to stress that the unfavourable experience of Marine and Miscellaneous Insurance business is not peculiar to Indian insurers only; it is the same problem with companies the world over. If, therefore, Indian companies unilaterally disturb the Marine rate structure, there is every chance of their losing this business to the powerful foreign market.

However, since a decision has already been taken to reduce the Fire rates for the third time from 1st July, 1962, I can only hope that this will be the final reduction and that the authorities will refrain from contemplating further reductions, as such a step will only weaken Indian insurers and impair their healthy growth.

To sum up, I wish to emphasise that, instead of reducing the Fire rates on the one hand, and introducing more and more restrictive regulations in the Code on the other, to support the unreal provisions of the existing Insurance Act, it would be far better to amend the Act itself, on the lines suggested by me earlier, with a view to improving the market conditions."

Company's Building: Referring to the Company's building, Mr. Tulsidas mentioned that the foundation work had been completed and that the construction of the superstructure had been taken up, but we were still experiencing difficulties in obtaining the required supply of building materials such as cement, etc. If we succeeded in surmounting these handicaps, it was expected that, in the normal course, the building would be completed by the end of 1963.

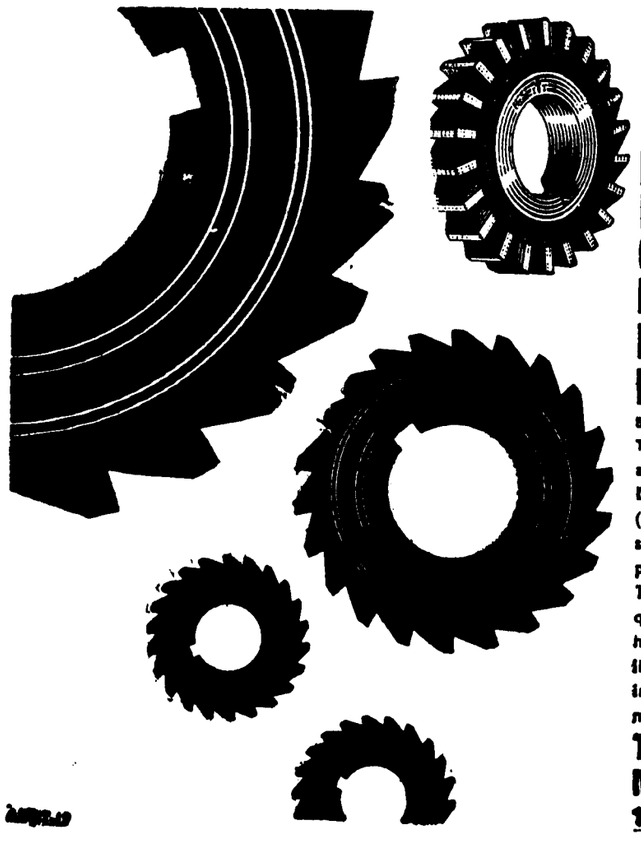
EXPANSION ABROAD

Mr. Tulsidas took the opportunity to mention that the question of starting operations in some of the South-

East Asian Countries where conditions were favourable was under the Company's active consideration, on the basis of a study tour undertaken by an Officer of the Company. In this connection, I would like to mention that, before we extend our activities to a foreign Country, we are required to obtain the permission of the Reserve Bank of India as well as of the Controller of Insurance. Considerable delay is usually experienced in getting such permission, and I would, therefore, appeal to the authorities concerned to cut red tapism to the minimum and assist the Companies in their expansion projects.

COMPANY'S ACCOUNTS

Dealing last with the Departmental Accounts, the Chairman stated that the gross direct premium for the year 1961 was Rs. 60,69,262 in Fire, Rs. 48,97,961 in Miscellaneous Insurance, and Rs. 42,48,244 in Marine, whilst the net premiums were Rs. 50,61,495, Rs. 40,40,335 and Rs. 14,85,797 respectively. After providing for losses and expenses, and reserves at 50 per cent in respect of Fire and Miscellaneous Insurance, and 100 per cent for Marine, and after adding the balance brought forward from the previous year, the net amount to the credit of the Profit and Loss Appropriation Account in all was Rs. 6,61,078. The Directors had transferred Rs. 40,000 to the Staff Gratuity Account and Rs. 3,00,000 to General Reserve and had proposed to pay Thirteenth Dividend on Ordinary Shares at Rs. 3.00 per Share less tax, amounting to Rs. 3,00,000.



N.B. : This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

ANNOUNCEMENT

THE PUNJAB NATIONAL BANK LIMITED

Interest rate on Savings Bank accounts will be Raised to 3% p.a.

• with effect from 1.7.1962

I T

DAGGER BRAND CUTTERS FOR LASTING PRECISION PERFORM. ICE

BACKED BY YEARS OF TRADITION and rigid control at every stage of production **DAGGER BRAND CUTTERS** (available in inch and metric sizes) assure precision performance. They are made of superior quality steel, specially heat-treated to ensure long life, and manufactured in India's biggest and most modern factory for small tools.

1961: Expansion Under Strain

THE calendar year 1961 promises to surpass, at least in terms of national income and the rate of industrial production, any previous year in the history of the Indian Union. It is a little too early to speak about the agricultural year 1961-62 since there still exists some uncertainty as to the damage done by floods, and all that can be said at the present time is that jute has been markedly successful. Nevertheless, assuming that agriculture is no worse than last year, the rise in industrial production of 8.3 per cent in the index—but because of the inadequacy of weighting with base 1951=100, substantially more, perhaps 12 per cent in practice—gives some indication of the buoyancy of the industrial system. Per capita income in the Indian Union has probably risen significantly again, although the rate of rise will not be as high as in 1960-61. All in all, one can look upon the year with assurance reflected in all the indices of economic growth — national income, industrial production and indices of consumption. Less happily, there has been a significant rise in prices and particularly of the working class consumer price index and the improvement in banking deposits has been slow and halting.

Against the fairly optimistic picture presented with the conclusion of the Second Plan which ended in the year, must be set the greater demands of the Third Plan. It is true that foreign exchange for the first two years of the Third Plan has been underwritten, but at the time of writing the detailed sanction of projects included in these proposals has not been obtained; these are to be discussed only at the end of January at a new Aid India Club meeting. Project preparation for the Third Plan has been slow, and now that new additions have been made in the power field, there will probably be more controversy as to where additional finance is to be found for its fulfilment. At the same time, the position on India's foreign exchange payments front has become more critical, and even with a loan from the International Monetary Fund, there is no likelihood of any short-term relief in a critical payments situation. The shortage of foreign exchange has also been reflected in rupee resources, and stringency has now appeared in the banking system with the ratio rising to about 65 per cent with the busy season by no means concluded. It is certain that stringency might be acute at the peak of the busy season.

The year has reflected, as the articles that follow show, both the light and shade of the elements which have been described above. Broadly, the picture is one of vigorous expansion under increasing strain; so long as the strain is taken on the foreign exchange front, one might assume that the internal buoyancy of the system will carry us over without serious mishap. A particular buoyant factor has been the rise in industrial profits which seems to suggest that even heavy taxation can be taken in the country's stride at this moment. The Reserve Bank's figures published both for public and private companies are only for the year 1959, but before tax these showed a rise of about 40 per cent, though gross profits included depreciation and slightly higher figure for profits before tax after depreciation. The picture is naturally a mixed one since some industries are doing much better than others. But there has scarcely ever been a time when the urge to obtain licences has been more powerful and the foreign collaboration so willing to play.

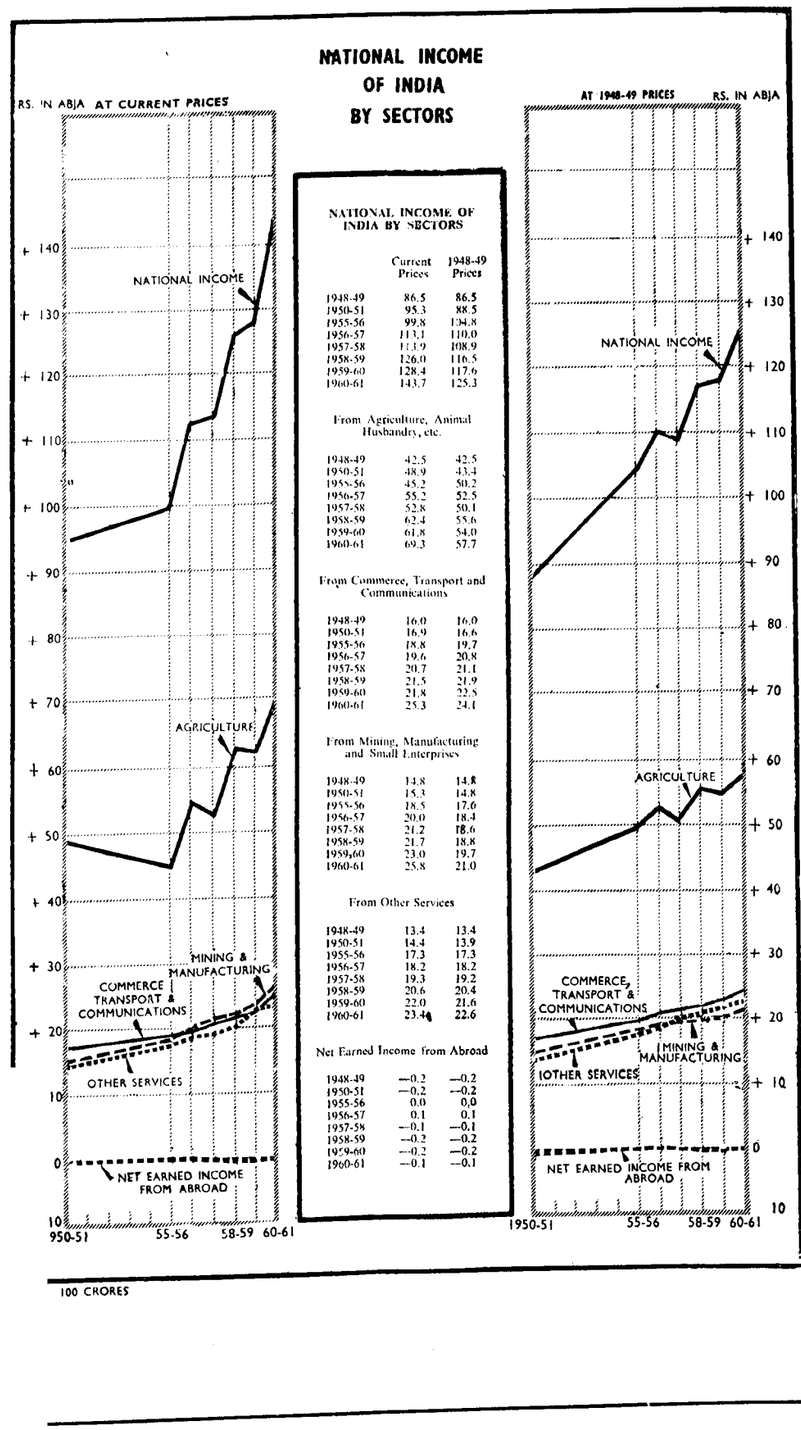
On the other hand, political currents are increasingly uncertain. Foreign reaction on Goa may be transient but it was more vigorous than anticipated and Government expenditure, particularly on defence of the China border, cannot be small. Taxation need be higher than anticipated. How much room is there to manoeuvre? Probably not very much.

Agricultural Production

WITH the near achievement of the Second Plan target of 80 million tons of foodgrains, it would not be an overstatement to aver that the year 1961 has added a refreshing page to the history of Indian agriculture. Despite the persistence of the periodical draughts and floods, to which this country has long been heir, the concerted efforts directed towards agriculture during the last decade of planning would appear to have begun at last to pay dividends, albeit inadequate yet. It is not necessary to compare our agricultural progress with those of the advanced countries to convince ourselves how backward we still are and how much more we have to do to accelerate the rate of growth in this sector in order to meet the needs of our rapidly growing population—10 million a year if the present rate of increase is maintained. It is only necessary to mention that, during the past ten years—1950-1960 — the annual average foodgrain imports amounted to over 2.8 million tons. This, coupled with the fact that, in spite of all the awareness shown and the attention paid to this sector, the problem has persisted, ought to convince anyone of the challenge that confronts this country. As was rightly pointed out by the F.A.O. in its World Agriculture Output and Trade Review, in spite of the higher world agricultural output in 1960-61 than in the previous season, the present level and rate of growth of agriculture has been very low either in terms of the requirements or in terms of exports of underdeveloped countries.

Be that as it may, whatever increase we have had in agricultural production so far is mainly due to such extensive and intensive cultivation as has been undertaken since the last 10 years. The cumulative effect of these efforts has been to bring by the end of the Second Plan, as much as 70 million acres under cultivation, and, by the end of the Third Plan, it is further contemplated, this figure would be around 90 million acres. This means that the additional land that could be brought under cultivation in the years to come would be nominal, and, as Dr. V.K.R.V. Rao, observed in his presidential address to the 21st Annual Conference of the Indian Society of Agricultural Economists, an all-out effort would have to be made in order to increase the yield per acre by about 50 to 60 per cent., on an average, in the next 10 years so as to meet the increased needs that would have to be covered by then. In the context of the huge task ahead, this implies, even if the allocation to agriculture of Rs. 1,280 crores in the current Plan happens to be nearly double that of Rs. 667 crores provided for agriculture in the Second Plan, it still falls very much short of what would appear to be necessary.

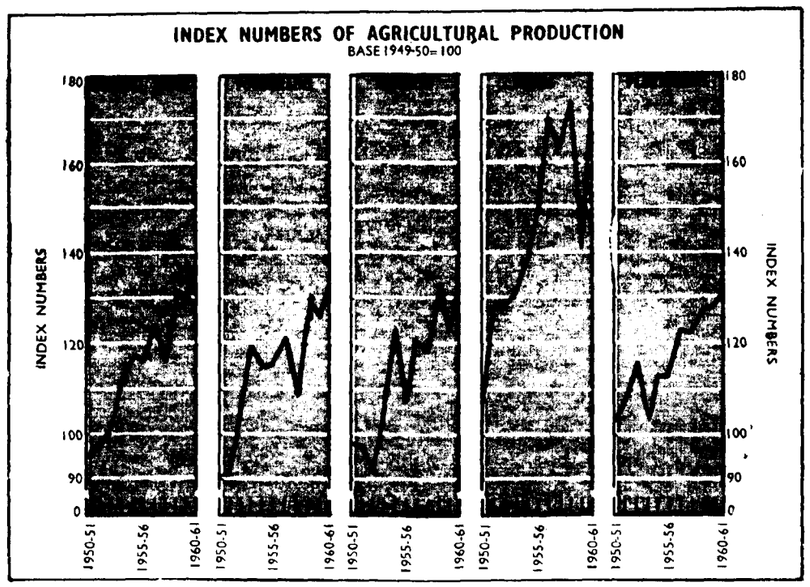
Several far-reaching measures, such as, for example, the proposal to set up a Development Corporation for Agriculture, have been taken no doubt. Hitherto, Central Land Mortgage Banks and State Co-operative Banks used to give only short-term loans, (even these no doubt were of great help to the farmers), but the long-term needs of agriculture remained woefully neglected, as they seemed to be nobody's business.



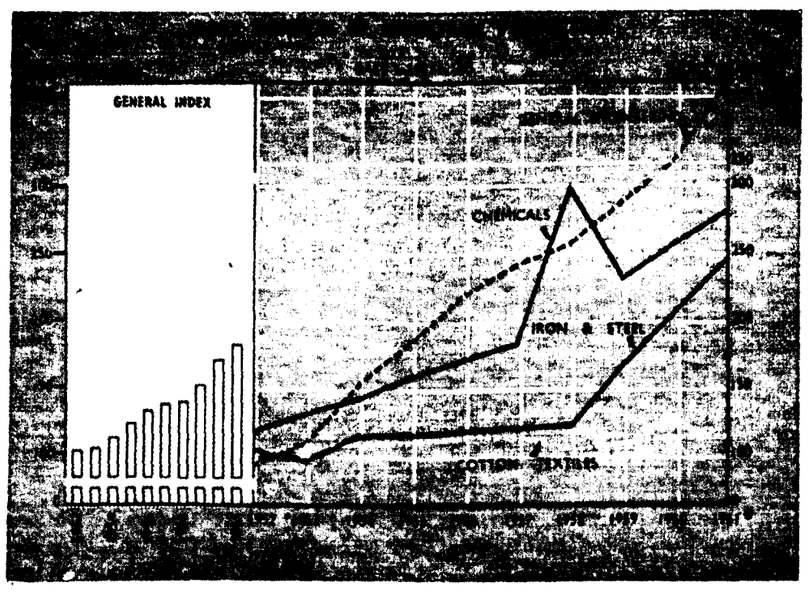
According to the latest available official estimates, agricultural production in 1961-62 is likely to surpass the level of 1960-61. Even the possibility of such improvement in the face of the devastating floods in the U.P., Bihar, Madras and Kerala during the year under review should make gratifying reading. The index number of agricultural production (1949-50 = 100) rose from 127.2 in 1959-60 to 135.0 in 1960-61, an increase of nearly 6.3 per cent. In actual figures, the increase of agricultural production in 1960-61 over that in the preceding period, according to the all-India final estimates released by the Directorate of Economics and Statistics, amounted to 2.7 million tons in rice, 0.6 million tons in wheat, 1.1 million tons in jawar, 0.7 million tons in gram and 0.4 million tons in tur dal.

Among cash crops, sugarcane touched a new peak at 86.9 lakh tons in terms of gur, registering a rise of 13.3 per cent over 1959-60. In the case of cotton, the total production stood at 53.94 lakh bales, thereby registering an increase of 46.7 per cent over 1959-60, but the current season's production, it is feared, would be very much lower, say around 48 lakh bales Except in the case of groundnuts (plus 10.5 per cent), rapeseed and mustard seed (plus 31.8 per cent), there was a fall in production of other oilseeds, especially castor seed and linseed. However, the overall oilseeds production stood at 65.3 lakh tons in 1960-61, as against 58.85 lakh tons in the previous year. But there was a sharp decline in the production of jute, of as much as 12.5 per cent compared to the output in the 1959-60 season, mainly due to unfavourable weather almost throughout the season. But, in the current season, it is estimated, the production of raw jute would improve perceptibly.

Industrial Production



OVERALL, no doubt, industrial production in India in 1961 increased, but the rate of such increase was relatively lower either in comparison with that of the previous year or in terms of growth as visualised by the planners. A number of factors contributed to this, the more important of these being the foreign exchange shortage which limited imports—both developmental and maintenance—the acute power paucity which was especially pronounced in certain regions, and the transport bottleneck, not to speak of shortages of raw materials, such as jute which led to curtailed hours of work, block closure, sealing of looms, etc., all of which affected the quantum of output of certain industries. The sudden breakdown in the Rourkela Steel Plant, as also the increased ash content of the coal supplied had the effect of seriously curtailing the country's steel output, thereby upsetting the hopes and calculations of the authorities who had bargained for a steady uptrend in our steel output. The latter factor—higher ash content of coal—hit the steel production in the private sector also. Even coal production, the monthly average of which was about 5.5 million tons during the first five month-period, fell to the Second Plan period average level, which was distinctly lower. The cumulative effect of all these was a perceptible decline in the rate of production. In fact, while the percentage increase was as much as 12.2 in the first eight months of last year, the rate of such increase over the same period in 1961 was only 9 per cent. The seasonally adjusted general index of industrial production (base: 1951=100) commenced the year at 183.9 and moved to the peak level of the year (186.9) in March. Thereafter, the index number declined to 173.2 in July, though the provisional figure for August appeared better at 174.1.



The actual production trends in some of the major industries may now be reviewed. To begin with the textile industry, which is the biggest organised industry in the country. The total production of cotton piecegoods in the first ten months recorded an increase of 112 million yards over that for the corresponding period of the previous year, the actuals being 4,284 million

yards, as against 4,172 million yards last year. Even so, it is feared, the total production for the entire year might not reach the hoped for level of around 5,550 million yards, that is 10 per cent more than in 1960 as was jointly agreed to by the Government and the industry. On the basis of the average for the first nine months of the year, it may at best apporach the 5,200-million-yard level. The main snag in respect of the cotton mill industry has been the paucity of home-grown cotton. (Indian cotton output in 1960-61 season at 37½ lakh bales was the lowest in several years.)

The total coal production in the country for the first nine months of the current year was an improvement over the previous year at 42.24 million metric tons; the corresponding total for 1960 was only 38.8 million metric tons. Though an improvement, this rate of production in the first year of the Third Plan not only falls short of the average rate of production to fulfil the Third Plan target, but is substantially lower than even the average rate needed to fulfil the target of 60 million tons, as had been set for this industry in the Second Plan. The average monthly output in 1961 for the first nine months (Jan.-Sept.) was no more than 4.7 million tons. In other words, the tempo of coal production has remained slack.

The production of sugar, on the other hand, increased sharply from 2,420,000 tonnes in 1959-60 to 3,000,000 tonnes in 1960-61, resulting in a sizeable rise in sugar stocks. It is expected that, as a result of this, the carry-over will increase from 1.1 million tons to 1.2 million tons, even after taking into account the slight increase in consumption that may be expected with the lifting of the control. In the current season (1961-62) too, despite the 10 per cent cut, the estimated production for the season might be around 2,700,000 tonnes.

Among our major industries, it is the jute industry perhaps which had to pass through one of its worst years, owing to acute raw jute shortage, power cuts, sealing of looms, and reduction in working hours. As a result, the monthly average percentage of sacking production declined from 54.4 in January to 44.5 in August. Since the new crop began to arrive, however, the raw material supply position, and with it, jute goods output also, has started improving. At the time of writing it is gratifying to be able to state that the jute mills have reverted to their level of production in 1960 before the effects of the jute shortage came to be felt. The total production for the 11 months of the year amounted to 8,588,000 tons, as against 9,764,000 tons for the corresponding period of 1960. The output of hessian and sacking fell from 3,889,000 tons and 4,915,000 tons in Jan.-Nov. 1960 to 3,130,000 tons and 4,271,000 tons, respectively, in the 11-month period ended November 30.

In the Iron and Steel Industry, the average monthly production stood at 2.25 lakh tons (first six months' average, as against 1.70 lakh tons over the same period of the previous year. But this performance is certainly not up to the mark, taking into consideration the expansion programmes that were effected in the industry in the public and the private sectors alike. There was also an increase in the average monthly production of pig iron which stood at 4.1 lakh tons (first six months' average), as against 3.32 lakh tons over the same period last year. The production of both pig iron and steel would have been much higher, had there been no coal crisis, no shortage of limestone, no paucity of transport and, last, but not least, no breakdown in Rourkela.

As in the case of steel, in the cement industry also, the production record was hardly satisfactory, although there was an increase in the quantum of output absolutely. Thus, the average monthly production amounted to only 6.77 lakh metric tons, on the basis of the first seven months' figures, as against last year's average of 6.53 lakh tons. In contrast, according to a survey conducted by the ACC, the average requirements per month are estimated to be nearly 10 lakh tons, while, according to the Third Plan estimate the country has to reach an average production level of 13 lakh tons.

Production levels in some of the new industries, especially electrical and engineering industries, as also paper and paper board industries, were higher. Increases in output were noted too in rayon and yarn, copper, aluminium, and chemicals and fertilisers.

Transport

RAILWAYS

THE year that we have put back has verily been a year full of accidents for the Indian Railways. There have been a series of very bad accidents commencing with the derailment of the Madras-Bombay Express at the Kosgi Railway Station resulting in the death of the driver and two fire-men and injuries to nine passengers. Hardly had the public time to forget this than there was the Howrah-Ranchi Express tragedy in which 51 passengers died and 195 were injured. This was followed by the Tundla-Furukhabad down passenger train derailment involving the death of 20 persons and injuries to 61 persons. Published railway accident statistics show that, during the first six months of 1961 alone, there were nearly 1,890 accidents, out of which over 760 were derailments, nearly 60 collisions, 40 averted collisions, and 135 fires in trains, among others That so many accidents should have occurred at a time when all care and caution is claimed to have been taken is not very flattering to our Railways. It is worthwhile noting, in this connection that the percentage of overaged locomotives to the total stock on the broadgauge by the end of the Third Plan is estimated to be higher than at the end of the Second Plan — nearly 27 per cent. Add to this the many weak tracks which have fallen due for urgent repairs, and you have some explanation for the many accidents this year.

However, the year under review also witnessed the first India-made electric locomotive move out from the Chittaranjan Works (some 21 more expected to follow in the series by the end of February 1963 — as many as 16 of these have been ordered by the Southern Railways to be run between Madras and Villupuram, the section that is presently being electrified.) In the context of the prevailing transport condition, the need for more electrified sections is obvious. Yet, unfortunately, out of the total allocation of Rs. 1,375 crores (including the latest proposed addition of Rs. 50 crores) for the railways, only Rs. 70 crores have been earmarked for railway electrification. Perhaps this cannot be helped, to some extent, because of the power shortage in the country.

It is something of a comfort to be told, therefore, that — to make up for this shortage — there are prospects of more diesel oil locomotives being indigeneously produced. With the establishment of Nunmati and Barauni refineries, we are told, sufficient diesel oil would be available for diesel locomotives which are now imported from abroad. A diesel locomotive covers as many as 7,500 miles a month, averaging nearly 250 miles a day, as against only 82 covered by an average steam locomotive. The Indian Railways have today a fleet of 181 diesel locomotives, and another 250 or more ordered from abroad are expected to be received soon.

Among all the Afro-Asian countries, India has not only the biggest network of railways but her own workshops and highly skilled technicians engaged in building locomotives and coaches. As such, she is in a relatively more advantageous position than others to give the lead to several of the yet-to-be developed nations of Asia and Africa through constant help and advice. An opportunity was provided to take soundings, as it were, of the extent to which such co-operation could go, when the third Asian Conference was held in New Delhi on November 13. As our Vice-President, Dr. S. Radhakrishnan, said whilst inaugurating this Conference, "A conference of this kind will help us to understand our special problems and establish closer relationship between the different countries which will be to our mutual advantage." Here is an avenue which, if tactfully and properly exploited, would open up a vista of great potentialities for our exports, both physical and invisible.

ROADS AND ROAD TRANSPORT

ALTHOUGH relatively greater awareness than before is being evinced lately, the problem of road transport has, by and large, continued to remain the weakest link in our transport chain, the planners notwithstanding. The treatment meted out to roads by the powers-that-be is an unrelieved record of the pre-Independence mistaken notion that road development would be harmful to railways. It is a pity that, even with the past experience of other countries like England and Germany to guide us, we have not outlived this concept. In the the result, the Government's whole approach to road transport is anything but realistic and imaginative. This was pithily put by the President of the Indian Road Transport and Development Association, Dr. F. P. Antia, in these words: "If our national income is to increase from Rs. 14,500 to Rs. 19,000 crores during the Third Plan period, our transport facilities should be increased by about 78 per cent. This would involve the provision for long distance transport for 342 million tons of goods in 1965-66, as against 192 million tons carried in 1960-61. The railways would carry only about 245 million tons. Having regard to the limited capacity of other means of transport, the country is threatened with a transport shortage of unprecedented magnitude of approximately 70 million tons." Surely no one can regard a plan that can afford to be complacent about such a sizeable shortage as realistic. The position then is not only serious but also presents a challenge to the authorities concerned, if they are really keen that their good work on the other fronts is not to be foundered on the rocks of road shortage.

The debate on road-rail rivalry has gone on so long in this country that few still have any illusions on the subject. Today, more than at any time before in the economic history of this country, the value of good and ample road mileage is recognised. Although the railways have become the most important means of transport, especially from port areas, even railway interests do not dispute that, to meet the internal demands, it is not only desirable but imperative to allot a greater share to the roads in the country's transport system. Viewed from a purely economic angle roads are any day a better proposition. Thus, road construction needs only a third of the outlay needed for railways. Furthermore, the operating costs on roads work out much lower than the present average railway rate of Rs. 6.10 per ton-mile for revenue-earning traffic. Besides these and a host of other advantages, road development is essential to serve the ever-increasing needs of the nation as a complementary agency. If, in spite of all this, the roads have received from the Planning Commission an allocation of only Rs. 324 crores, excluding Rs. 29 crores from International Development Association, as against Rs. 1,325 crores (since raised by a further Rs. 50 crores) received by the railways in the Third Plan, one can only say it is unfortunate. Road transport today is what it is because of:

(1) Physical restrictions on long-distance road transport,

(2) excessive taxation (for an average vehicle the tax in India is higher than in the U.K., or the U.S.A., let alone in any Asian, undeveloped country), and

(3) lack of good roads.

If this is all the recognition and the reward, what has been the record of roads?

By the end of the Second Plan, that is as on 31-3-1961, the targets set out in the pre-independence Nagpur Plan (1943) were exceeded; the mileage of surfaced roads reached 144,000, as against 123,000 and unsurfaced roads were well above 250,000 miles, as against 208,000 miles. However, about 60 per cent of the total mileage still consisted of earth roads only. Out of the total road mileage in the country, 150,000 miles constitute National Highways, but only about 2,300 miles of these are two-lane carriage ways. No wonder then that the Planning Commission itself has commented that, "despite considerable expansion of the road-mileage over the last ten years, the road net-work remains deficient in certain respects." But this admission hardly means anything. Perhaps the Planning Commission will be proded to action by way of a higher allocation to roads, only after the Neogy Committee on Transport Policy and Co-ordination in its final report comes to the conclusion, after its investigations are over, that deficient road transport acts as a drag on economic development.

Along with our developmental programmes, as is only to be expected, our transportation needs also have risen. This is especially so in the sphere of road transport, covering both passenger and goods transport. Thus, whereas, in 1949, there were only 73,000 goods-vehicles, the number today (1960-61) has gone up to about 160,000. Over the same period, passenger-vehicles have increased from 27,275 to about 50,000. Although seemingly spectacular, this increase has been far from commensurate with the decade's growth in the volume of traffic. This is so because the target set for the manufacture of vehicles in the Second Plan was only 40,000 and the actual production was lower still at only 30,000, thanks to shortage of foreign exchange. This situation calls for a thorough reappraisal of the position and a complete reorientation of approach, as was refreshingly evident the other day when the Planning Commission was reported to have declared that the small car plan could not be accommodated in the Third Plan. For the measures taken so far, such as tax-relief, and liberalisation of licensing policies, though helpful to some extent, have failed to yield the expected results. Further, it is no use merely fixing a target if the foreign exchange required to achieve it is not ensured. During the Third Plan, the target for commercial vehicles has no doubt been fixed at double the production level of 1960-61, but without sufficient foreign exchange to back it, the powers-that-be would only be risking a repetition of the none-too gratifying experience of the Second Plan.

SHIPPING

THE year 1961 will go down in the annals of Indian shipping as the year that saw our shipping achieve international status. This happy consummation followed the inauguration, on November 27, 1961, of the Indian Committee of Lloyd's Register, which is a recognition, albeit belatedly, by Lloyd's Register of Shipping of India's growing importance as a maritime and industrial country. Consequent on this, India can also make her contribution to the solution of world shipping problems by participating in the General Committee of Lloyd's. Another notable development of the year was the acquisition of the 42,000-ton tanker—Adi Jayanti — by the newly formed Indian shipping company, the Jayanti Shipping Co. of Delhi. With this addition, it has become possible to claim that our Second Plan shipping target of 900,000 G.R.T. has been reached. Nevertheless, the actual Indian tonnage as at the end of the Second Plan (31-3-1961), consisted of 172 vessels still totalling only 858,000 G.R.T. However, with the acquisition since of five more vessels aggregating 51,000 G.R.T. (offset to the tune of 1,400 tons, thanks to the disposal of an old vessel of that capacity), the total tonnage today is 908,000 G.R.T. Of this, over two-thirds is employed in the overseas trade, and the rest in the coastal trade.

Notwithstanding this, the share of Indian Shipping in the total foreign trade has continued to remain very low, being of the order of only 7 to 8 per cent. For a coastline of about 3,500 miles, (excluding the erstwhile Portuguese colonies which have become an integral part of the Indian territory now), we have only seven passenger ships, out of which five are being used for the Konkan Service and the remaining two are employed at Danushkodi. Besides these, there are three tankers. (24,000 G.R.T.) which are on charter with the three oil refineries in India for transport of their respective products.

An event of some significance to Indian shipping in 1961 was the amalgamation of the State-owned Eastern and Western Shipping Corporations into the Shipping Corporation of India. It will be recalled that such a merger was recommended by the Estimates Committee as early as in 1959. Better late than never, this merger has at last come about which should enable our country to make considerable headway in the future in not only intensifying the present trade routes but also in opening up new ones. Already two new routes have been opened, one between India and the Far-East and the other between Japan and India/U.K. and the Continent.

On the shipbuilding front, although, early in the year, there was a dearth of orders, the Hindustan Shipyard at Visakhapatnam began gradually to experience brisk activity, so much so that the pending orders with the yard for six new ships are expected to be sufficient to keep it busy till almost the end of 1963. The Government has also sanctioned to the yard a grant of Rs. 2.5 crores for its developmental programmes. Although this has helped relieve the hardship of the yard considerably, its requirements, especially in the form of foreign exchange, are admittedly greater, but help has not been forthcoming in the requisite measure, though this industry is acknowledged to be one of the primary channels for earning foreign exchange. This serves further to underscore the inadequacy of the Third Plan allocation of Rs. 55 crores only to Shipping. It is a great pity that this allocation has not been raised, despite the fact that the attenion of the authorities has been repeatedly and pointedly drawn to this lacuna. One expected that, if only by reason of the tempo of increased industrialisation and the steady rise in the volume of our foreign trade, the authorities would have ensured the maintenance of an annual rate of increase of at least 100,000 tons as during the Second Plan. The irony of it—or is it the tragedy?—is that, even after accepting the need for greater allocation thus, the powers-that-be have chosen not to provide for it.

While shipping generally has been stalled thus, because of limited resources, the fate of coastal shipping has been positively disappointing. Thus, in the First Plan period, as against a target of 3.12 lakh tons, what was actually achieved was only 2.40 lakh tons; during the Second Plan also, as against the set target of 4.20 lakh tons, only 2.68 lakh tons could be achieved. How this came about is common knowledge. It was certainly not due to any lapse on the part of the shipping interests. To quote that acknowledged authority on shipping, Mr. M. A. Master, "The railways continued their policy of diversion....This created a serious crisis for coastal vessels."

AVIATION

AS in the case of shipping, the year 1961 marked yet another milestone in the history of Indian Aviation. The Indian Airlines Corporation made some profit, though not comparable with those of others, and to the gratification of all concerned, the year rolled by without any untoward happening, in contrast to the record of our railways. During the year, there were no air crashes resulting in loss of life or property in India, though the year witnessed elsewhere some of the worst crashes in the post-war years. To the user of India's airways, of particular importance and interest has been the decision of the authorities gradually to replace Dakotas with Viscounts which, it is claimed, are not only better suited but do not also involve any extra operational costs.

The Air-India International also recorded a big increase in its operational profit — from about Rs. 18.19,332 in 1959-60 to about Rs. 1,17.13,500 in 1960-61. This is stated to be the highest profit earned since the inception of this company. If boeings 707 inter-continental jets were introduced on the A.I.I. routes and the A.I.I. entered the North Atlantic routes last year, this year has seen the introduction of Boeing Services on the India-Japan route (January, 1961) and the India-East Africa route (May, 1961). It may not be out of place to note that a super constellation service was extended to Kuwait in the Persian Gulf, via Karachi and Bahrein, late last year (October, 1960).

The report of the A.I.I. for 1960-61 makes the notable point that tripartite arrangements — made between the B.O.A.C. and the Quantas Airlines and the A.I.I. last year — have proved to be of great advantage. In view of the particularly difficult conditions it has been experiencing during the current year, however, it would appear, these arrangements may not prove profitable. According to the A.I.I. Report, there are reasons to believe that the A.I.I.'s profits in 1961-62 might be affected adversely. On the other hand, the trade discussions that are afoot between 'Lufthansa', of West Germany and the A.I.I. to run the Boeing via Dusseldorf, if successful, might be of some advantage to the A.I.I., and, in that event, as the report has pointed out, "the future may continue to be viewed with confidence."

A new chapter was opened in India's aviation history with the successful test flight this year of H.F. 24

jet plane, made in the Hindustan Aircraft Factory at Bangalore. Close on its heels came another successful test flight, also by an India-built transport plane "AVRO 748" from the I.A.F.'s Kanpur Workshop, which is claimed to be completely fabricated from indigenous materials except for the engine supplied by a U.K. firm.

Foreign Trade

ALTHOUGH India had an adverse trade balance in the year 1961 also, the extent of such deficit not only showed a slight decline absolutely as compared to the previous year but also a slowing down in the annual rate of increase in it which was witnessed during the past few years. Thus, as against an increase of Rs. 59 crores in 1959 and of Rs. 37.49 crores in 1960, there was actually a decline of Rs. 3.43 crores in 1961. Another gratifying feature of the country's foreign trade in 1961 was that the average monthly exports were the highest in three years at Rs. 55.44 crores (on the basis of the first ten months's figures). True, the average monthly imports at Rs. 79.44 crores also were similarly the highest for the past three years, but the rate of increase in the average monthly exports was a shade higher. Yet the fact remains that we are still not out of the woods, inasmuch as the tempo of improvement in exports, even taking the best monthly performance of Rs. 61.36 crores in August, 1961, falls short of the minimum monthly average of Rs. 61.75 crores as per the relevant estimates in the Third Plan.

The total imports for the period January-October, 1961 amounted to Rs. 794.44 crores, as against Rs. 761.72 crores for the same period in the previous year representing an increase of Rs. 32.72 crores. Exports, including re-exports, also rose from Rs. 518.21 crores in 1960 to Rs. 554.36 crores in 1961, thereby accounting for a slightly higher increase of Rs. 36.15. In the result, the trade gap between imports and exports over the ten-month period declined by Rs. 3.43 crores, from Rs. 243.51 crores in 1960 to Rs. 240.08 crores in the year under review.

A detailed study of the composition of our imports shows no great departure from the previous years' patterns; only the year saw the restrictive import policy tightened further with 120 more items falling under the import-cut axe. The lion's share of the increase in imports was accounted for by machinery and transport equipment, according to the detailed figures available for the first eight months. The imports of these items rose from Rs. 187.02 crores in 1960 to Rs. 250.80 crores in 1961. There was a further decline in imports of foodgrains in 1961. Thus, whereas wheat imports aggregate Rs. 22.31 crores for the first six months of 1961 as compared to Rs. 26.77 crores over the same period in the previous year, those of rice registered a decline to Rs. 2.73 crores from Rs. 2.91 crores in 1960. Notwithstanding this, however, the country's food import bill ran into Rs. 98.40 crores for the first eight months of 1961, as against Rs. 86.25 crores in the corresponding period of the previous year, due to higher prices. The other items that accounted for the rise in imports included beverages and tobacco, chemicals, mining construction and other industrial machinery, motor vehicles, iron and steel, and miscellaneous manufactured articles.

The better performance on the export front in general during the year under review was mainly due to increases — both in volume and in value — of some of our traditional exports, especially tea, cotton, food, and sugar, as also manufactured goods. There was no visible boosting up of our exports to any market, except to Russia, so that the increased offtake was accounted for only by India's erstwhile and long-standing importers. To some extent, the improvement was also due to the increase in price of the exported items. If the trend noticed in the latter part of the year under review were to last throughout the year 1961, the record for the whole year could be expected to mark at least the beginning of a wholesome trend. Among the individual items that accounted for the increase in exports, mention may be made of food, tea, and coffee, manufactured goods and iron and steel, which registered perceptible increases. There were also slight increases in crude materials, leather, beverages, tobacco and sugar. Items which recorded an actual fall in exports were spices, wool and other animal hair, ores of non-ferrous base metals, vegetable oils, machinery and transport equipment.

The foregoing analysis once again drives home the lesson that we have yet to make a great leeway on the export front even in the case of some of our traditional items, such as cotton textiles and jute manufactures. In the case of commodities with export potentialities like manganese ore, we failed badly not so much because of the price disadvantage as because of our unrealistic and unimaginative policy. In the case of jute manufactures, of course, there was an excuse, in that the Indian industry experienced one of the worst years in the history of that industry, and this on the top of growing competition from other countries, chiefly Pakistan which now possesses the most modern jute industry and has the added advantage of the world's finest golden fibre. The loss of a major market like Argentina (it is said that country's adverse balance of trade with India forced it to resort to cheaper sub titutes in place of jute) ought to open the eyes of the powers-that-be. Other developments abroad, such as the American moves to protect its own cotton industry, call for an immediate re-appraisal of the situation and a re-orientation of our export policy. An active export promotion drive must be launched in order to augment our exports to regions like East Africa, where this country could hope to capture the market for other non-traditional export items as well.

Prices

BY and large, to judge from the trend of wholesale prices, the price situation in the country during 1961 was not as disquieting as one had reasons to believe in view of the heavy plan outlays. The behaviour of prices in the year under review was conditioned by a series of favourable developments. In the first place, the increase in money supply in 1961 fell sharply from Rs. 217 crores in 1960 to Rs. 92 crores (11 months ended November). Secondly, the food situation improved remarkably, due partly to the heavy imports (17 million tons foodgrains) made in 1960 and partly to the record crop of 79 million tons harvested in 1960-61. In fact, it improved to such an extent that not only were the controls on wheat movement lifted but those on rice also were promised to be lifted at an early date. Further, with reports of bumper crops in the offing from the different parts of the country, the price of foodgrains tended to decline noticeably. As a result, the index number of agricultural commodities, which was 124.3 in January, in the year under review, later reached the peak level at 128.1 in July to decline again to 121.8 in October (it was 125.6 in the corresponding month of 1960).

The index number of wholesale prices (Base 1952-53 = 100) showed a rise of 2.4 per cent for the 11 months ended November, 1961, as compared to a sharp rise of 6.5 per cent for the corresponding period in 1960. There was a slight fall in the index number of food articles to 118.7 towards the end of November, 1961, as against 119.2 for the corresponding period of the previous year. In the liquor and tobacco group, there was a visible fall of 17 points to 97.0 in November last, as compared to the position for the corresponding month in the previous year, but there was an increase of a little over three points over the same period in fuel, power, light and lubricants. In the case of industrial raw materials, there was a sharp decline of 10 points from November, 1960, but intermediate products registered, over a like period, a rise of 7.5 points. The index number of finished products remained more or less stationary.

The main commodities that contributed to the 2.4 per cent rise in the wholesale price index during the eleven-month period were fibres and oilseeds. Over the past 11 months, the index number of fibres recorded a rise of 16 points. In respect of oilseeds, the price rise over the 10 months ended October, 1961 amounted to as much as 15 points.

On the whole, the course of the consumer price index also reflected that of the wholesale price index. Commencing the year at 123 (Base: 1949 = 100), the former index moved up by one point in February, remained constant till May, then rose again by 3 points in September, and remained constant during the following month at 128, as against 125 in the corresponding month of 1960. This small rise in the index, even in the face of a decline in foodgrains prices, was occasioned by a sharp rise in the prices of fruits and vegetables.

Banking

REFLECTING doubtless the slowing tempo of economic activity, both money supply with the public and scheduled bank credit showed a smaller expansion over the year than in the preceding year. The table below sets out the major items of money and banking data:

MAJOR ITEMS OF MONEY AND BANKING DATA, 1960 AND 1961

(In crores of rupees)

	As at the end of		Variations over the year	
	Dec. 15, 1961	Dec. 30, 1960	1960*	7961*
I. Money Supply with the public	2,829	2,737	+ 92	+123
II. Reserve Bank data				
a) Notes in Circulation .	1,948	1,869	+ 79	+139
b) Foreign Assets	148	152	— 4	— 61
c) Rupee Investments .	1,814	1,697	+117	+133
III. Scheduled Banks' Data				
a) Aggregate liabilities . .	1,886	1,828	+ 58	+ 1
(i) Demand	772	738	+ 39	+ 16
(ii) Time	1,114	1,095	+ 19	— 15
b) Borrowings from Reserve Bank	5	61	— 56	+ 50
c) Cash and balances with Reserve Bank	119 (6.32)	136 (7.44)	— 17	+ 48
d) Investments in Government securities	606 (32.14)	685 (37.34)	— 79	—154
e) Bank credit	1,241 (65.77)	1.098 (59.88)	+143	+207

Note: Figures in brackets indicate percentages to aggregate liabilities.

* Relates to 11 months for money supply and 11½ months for other data.

During the eleven months upto November, 1961, for which period only the latest data are available, money supply with the public showed an increase of Rs. 92 crores, or a rise of three per cent, compared to Rs. 217 crores, or a rise of 9 per cent in 1960. The smaller increase in money supply compared to the previous year thus was due to the slower rate of increase in bank credit to the private sector, as well as to the public sector. It may be noted, in passing here that the growth in money supply in the Second Plan period as a whole was significantly larger than in the First Plan period, the aggregate net expansion in the former case amounting to Rs. 722 crores or 33 per cent., as compared to Rs. 199 crores, or 10 per cent in the First Plan.

As seen from the foregoing table, active notes in circulation expanded over the year by only Rs. 79 crores (to Rs. 1,948 crores), compared to an expansion of Rs. 139 crores in 1960. The smaller increase in the Reserve Bank's credit to the Government (Rs. 117 crores compared to Rs. 133 crores in 1960) was partly responsible for this smaller rise. It is noteworthy that foreign assets declined by only Rs. 4 crores, over the year to Rs. 148 crores, compared to a decline of Rs. 61 crores in 1960.

Scheduled bank credit also increased over the year by only Rs. 143 crores (to Rs. 1,241 crores), compared to Rs. 207 crores in 1960. Perhaps the larger decline in credit in the 1961 slack season (Rs. 75 crores, as compared to Rs. 20 crores in the 1960 slack season) explains this smaller expansion in bank credit, which, in turn, is due partly to the lower rate of growth in industrial production and partly to the fall in the level of wholesale prices.

The increase in bank credit, such as it was, was facilitated by a rise of Rs. 58 crores in the aggregate liabilities of the scheduled banks to Rs. 1,886 crores. Of these demand liabilities accounted for a rise of Rs. 39 crores and time liabilities for the rest. Borrowings from the Reserve Bank were lower by Rs. 56 crores to Rs. 5 crores, owing mainly to the introduction of a system of slab rates on these borrowings. Thus, the scheduled banks'

access to the Reserve Bank was regulated under a three-tier structure of rates related to the extent of their borrowing. Accordingly to meet their credit demands, banks had to reduce their cash reserves by Rs. 17 crores to Rs. 119 crores and also their holdings of Government securities by Rs. 79 crores to Rs. 606 crores. With these changes, the ratio of credit to deposits moved up from 59.01 per cent to 65.8 per cent, while those of cash and investments went down from 7.4 per cent to 6.3 per cent and 37.3 per cent to 32.1 per cent, respectively.

The question of raising the ratio of capital funds to deposits, as also the liquidity ratio, figured prominently, especially in the latter half of the year, and was debated both privately and in the public (despite the strange attitude of bankers to keep these discussions a closely guarded secret among the participating bankers, though some of these bankers themselves could see no special virtue in it). The curtain was finally rung down however, when the Governor of the Reserve Bank came out with a letter addressed to all scheduled banks impressing upon them the desirability of raising the ratio of capital funds (paid-up share capital **plus** published reserves) to deposits which has steadily declined over the past decade from 9 per cent (1950) to 5 per cent (1960). Respecting the wishes of bankers to give effect to any proposed change in this behalf to meet the prevailing conditions, in the context of the current rapid economic development, by laying down healthy conventions instead of amending the law or issuing a directive, Mr. H. V. R. Iyengar suggested on December 27 that all banks should aim to achieve a ratio of 6 per cent of capital funds to deposits, which, as he has said, should not be difficult. The conventions suggested for the acceptance of the banks by the Reserve Bank Governor are (i) to transfer atleast 20 per cent of their declared profits (i.e. profits after making the usual and necessary provisions) to their published reserves and paid-up capital until these reach a level of at least 6 per cent of their deposits (where the published reserves of the banks are equivalent to or more than their paid-up capital, irrespective of Sections 11 and 17 of the Banking Companies Act); (ii) (where the reserves of any banks have not reached parity with their paid-up capital) to continue to transfer 20 per cent or more of their disclosed profits until the reserves are equal to the paid-up capital and the ratio of paid-up capital and published reserves to total deposits is at least 6 per cent. In addition to this, Mr. Iyengar has commended to the banks supplementary action in respect of capital also whenever called for. Thus, he has exhorted these banks to approach the capital market, as, indeed, a few banks have already done, and to call up unpaid capital, where such may exist, as expeditiously as possible.

No decision has yet been taken as regards the proposal for raising the liquidity ratio of banks. However, almost on the last working day of the year came the announcement that the Deposit Insurance Scheme (as also the Deposit Insurance Act) would be enforced from January 1, 1962. This scheme, it may be noted, is intended to afford protection to small depositors in the event of a bank failure. It is estimated that as much as 75 per cent of the total number of deposit accounts would be fully covered under this scheme. Against payment (in quarterly instalments) of a premium of 5 nP. per Rs. 100 per annum on their deposits, banks would be entitled to receive cover to the extent of Rs. 1,500 for every depositor.

INCREASES IN FOODGRAINS PRODUCTION DURING THE THIRD PLAN

Indo-Danish Collaboration

THIS Blue Supplement is being published to coincide with the visit to this country of Denmark's Prime Minister, Mr. Viggo Kampmann. The co-operation in economic as well as other spheres which Denmark has extended to us in our development programmes has brought the two countries close together in recent years. If pride of place has been given in the pages that follow to the specific schemes of technical and overall collaboration extended by Denmark to this country, it is only an expression of appreciation for the valued help we are receiving.

The remarkable manner in which Denmark's economy is progressing to achieve higher and impressive levels of growth is a subject of much absorbing interest to the outside world. The article that follows immediately gives an insight into this achievement. Denmark provides a very fruitful example of progress with determination in spite of handicaps in diverse ways and it is here that India can draw upon her experience, although in several respects the economies of the two countries and the availability of natural and other resources for them present somewhat divergent patterns.

Through the decades Denmark has made a deep impression upon world opinion by the intensive and high level development of her agriculture. This is in the midst of geographic and climatic factors which were not necessarily altogether conducive to it. Denmark's agriculture and dairy, poultry and other related industries have acquired a prominent place in the export markets of Europe as well as countries in other parts of the world. It would certainly be a revelation to many that this advance has been achieved although Denmark has to depend on the import of some key resources for them. It would, however, be a total mistake to consider Denmark's economy as preponderatingly dependent upon agriculture.

The history of her economic progress in the last two decades in particular shows that industry has been given a very broad base for future expansion with stability and this fact is fully reflected in the remarkable transformation in the composition of Denmark's export trade. The position now is that the shares of agricultural and industrial exports are almost equally balanced around a share 45 per cent for each in the total exports. Here is an instance which shows how a primarily agricultural economy can move with the time, modernise itself, assimilate the fruits of technology and change over to a diversified structure.

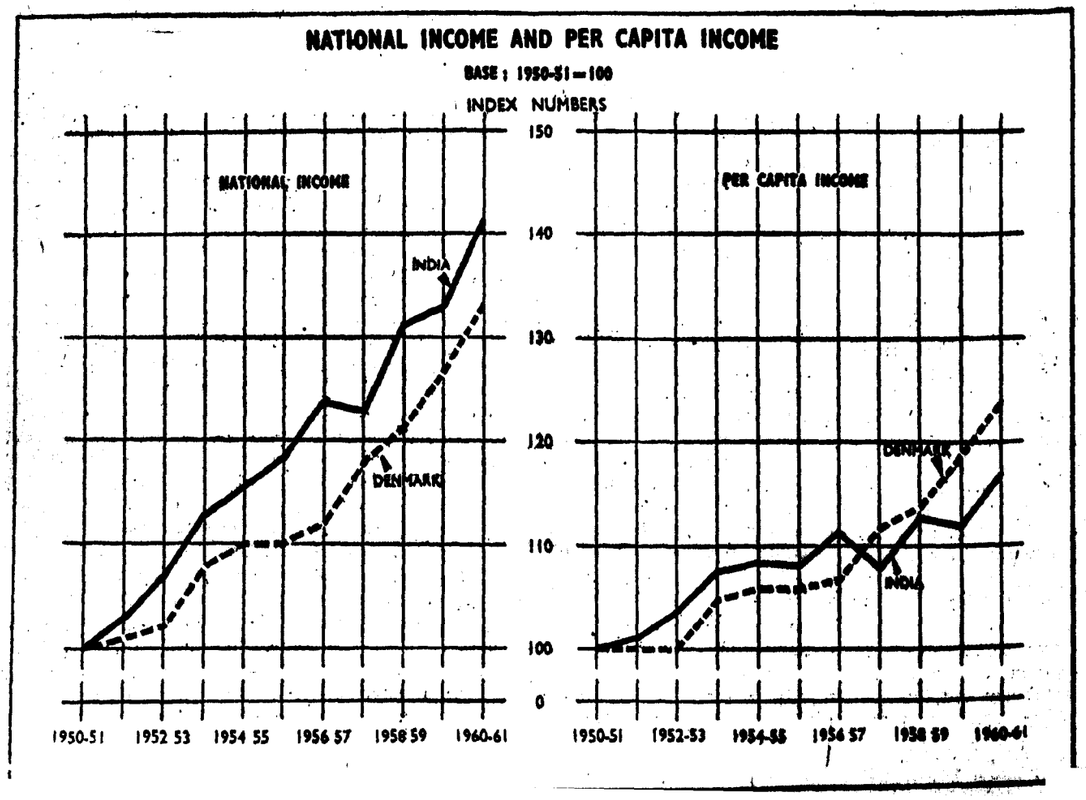
It is interesting that among the industrial exports of Denmark rank not only processed products but also capital goods. This outstanding feature of Denmark's economic progress should focus attention on her approach to setting up a pattern of small-cum-medium scale industries in its various segments. India can draw upon Denmark's experience in this respect. The articles in this Blue Supplement explain the secret of Denmark's dynamic agriculture (her income per farm, which on the average is small, is the highest in the world) as well as her confident onward march in industrialisation.

The visit of Prime Minister Viggo Kampmann has broader implications than those of conventional goodwill contacts and exchange of political views on current affairs. It was only natural, in the context of the intimate co-operation which has been developing between the two countries in recent years, that the question of enlarging its area should figure as one major issue of interest in the course of this visit. The area of co-operation is now sought to be extended in new fields.

Among them mention must be made of Denmark's readiness to collaborate in a joint atomic research programme for peaceful use at the Trombay plant. The visit of her leading atomic scientists was arranged at this time for this purpose. Denmark's folk schools have broken new ground in education and there is a proposal to introduce this pattern in India as a part of her collaboration in the sphere of training of farmers in Mysore State. In the field of health also Denmark is coming forth with her technical assistance and good offices in a special sphere. All in all, the visit has proved a concrete step forward in enlarging the scope of co-operation between the two countries.

India and Denmark: A Comparison in Economic Growth

LMOST every country is currently engaged in a battle to raise the living standards of its people. lia and Denmark are no exceptions to this general le. In both the countries, great stress is laid on lustrial, agricultural and business growth. The pros- rity of both India and Denmark—as of any other coun- —depends today on material progress which consists development of basic resources and growth of in- stries not to the exclusion of other important ter- ry activities such as transport. A narrow attitude laying emphasis on any one particular sector of the onomy is likely to lead to lop-sided economic deve- pment which must result ultimately in a set-back to owth. The harmonious manner in which economic ogress in Denmark has been attained is something be envied.



While the statisticians have not agreed on the ndred per cent accurate measure of economic growth, tional income is usually accepted as the best indi- tor of progress. An attempt is made here to study e rates of growth of the two economies since 1950. historical analysis of the national income data for e past decade for India and Denmark reveals India's periority in growth in percentage terms. With 1950-51 base, India's national income (at 1948-49 prices) se by 42 per cent in 1960-61. During the correspond- g period in Denmark, the gross domestic pro- uct (at 1949 prices) for which data are avail- ble, rose by not more than 33 per cent. However, his advantage in overall rise was lost due to the fast ate of growth in India's population. In per capita erms, the rise in Indian income turned out to be not nore than 17 per cent. As the population in Denmark as increased during the last decade at a very slow ate, the increase in income in per capita terms was round 24 per cent.

In regard to the sector-wise composition of national ncome it may be stated that the share of the services n the Indian Union was slightly less than that in Den- nark. Whereas in 1960-61, the contribution of the services was about 32 per cent in India, the correspond- ing percentage (for 1959) in Denmark was 41. In other words, the contribution of "commodity output"—indus- try, and agriculture taken together—was 68 per cent in the case of the Indian Union and only 59 per cent in Denmark. Thus, a relatively higher percentage of income is derived in Denmark from tertiary activities. It has been revealed by a study of the composition of national income of industrialised countries that they enjoy a relatively higher standard of living because they tend to have a larger tertiary sector. This belief is reinforced by a conversion of both the Indian national income figures and Denmark's gross domestic product data into rupees. It will be seen in the table below

NATIONAL INCOME AND PER CAPITA INCOME

Year	India			Denmark		
	National Income* (Rs. Mils.)	Population (In Mils.)	Per Capita Income (In Rs.)	Gross Domestic Product† (Rs. Mils.)	Population (In Mils.)	Per Capita Income (In Rs.)
1950-51	88,500	357.6	247.5	14,081	4.27	3,297.7
1951-52	91,000	363.6	250.3	14,199	4.30	3,302.1
1952-53	94,600	370.0	255.7	14,291	4.33	3,300.5
1953-54	100,300	376.8	266.2	15,149	4.37	3,466.6
1954-55	102,600	383.9	267.8	15,456	4.41	3,504.8
1955-56	104,800	391.3	267.8	15,465	4.44	3,483.1
1956-57	110,000	399.1	275.6	15,768	4.47	3,527.5
1957-58	108,900	407.3	267.4	16,628	4.49	3,703.3
1958-59	116,500	415.8	280.2	16,999	4.52	3,760.8
1959-60	117,600	424.7	276.9	17,821	4.55	3,916.7
1960-61	125,300	434.0	288.7	18,775	4.58	4,099.3

* At 1948-49 prices.
† At 1949 prices.

that in the year 1960, India's national income was almost seven times the gross domestic product of Denmark. At the same time, Denmark's population was a little more than one per cent of India's total population. That is why in per capita terms Denmark's income was nearly 14 times that of India.

Steady rise in productivity, be it industry or agriculture, is the fundamental reason for Denmark's prosperity. The yields in the dairy industry of Denmark are perhaps the highest in the world. In the case of 50 per cent of all dairy cattle in Denmark, the yield of milk from a single cow is as high as about 8900 kilograms per year with 5.62 per cent of fat content.

The same dynamic spirit pervades Danish industry which has continued to race ahead despite the paucity of essential raw materials and complete absence of coal mines, oil wells or water falls to provide energy. The present level of industrial production shows a hundred per cent improvement over the pre-war level.

The succeeding pages highlight the great stress on productivity and techonology in almost every important sector of the economy in Denmark. It is through these two basic prime movers that the engines of progress in Denmark have been hastened. The Indian Union cannot but adopt the same techniques in order to further her own economic expansion. Therein lies the key to prosperity.

The Danish Agriculture

DENMARK is traditionally known as an agricultural country. But it would be more appropriate to call it a land of "agribusiness". Farming here does not mean merely raising of some crops or rearing of cattle. It implies much more. Through setting up of co-operative milk products and bacon factories, the Danish farmers have combined industry with the primary agricultural activity and this has led to an appreciable increase in their incomes.

But the marriage of industry with agriculture alone has not enabled the Danish farmers to attain a standard of living much higher than that enjoyed by average agriculturists elsewhere by following this avocation in its commonly understood form. During the past four decades, the Danish agriculture has made rapid strides otherwise also. Total harvest, for instance, in terms of crop units (one unit = 100 kg. of barley) doubled between 1910-14 and 1954-58. During the four years 1910 to 1914, average annual harvest amounted to only 66.3 million crop units. It climbed to 133.5 million units a year in the later half of 1950's. Livestock production, similarly, has gone up appreciably. Butter production has risen by 50 per cent, cheese output has been increased sevenfold, eggs and beef production threefold, and pig production by nearly 100 per cent. In 1959 and 1960, output was further stepped up and was almost three times the average production just before World War I.

In the recent past, however, greater stress has been put on increasing livestock output. This has followed the changing food habits on the Continent as a whole. Thus, though Denmark imports about 10 per cent of her grains and animal feed requirements, she exports large quantities — after meeting the home consumption fully — of butter, cheese, eggs and meat to Britain, West Germany and France where "lurmark' (the trade mark for the Danish animal products) has become a household word.

The Danish soil, however, is by no means very fertile. Nor is an average Danish farmer by any standard a big landlord (half of the agriculturists in Denmark own not more than 25 acres of land). What is then the secret behind the Danish farmers wringing so abundantly from the niggardly hands of nature?

The Danish farmer has overcome the obstacles placed in his way by nature through tremendous grit and determination. He has built up a highly efficient farming system which can be the envy of any underdeveloped country. All the none-too-plenty culturable land has been brought under the plough and intensive farming is resorting to to such an extent that no plot of land is left even as "current fallow". Massive use is made of science and technology. And all this has come about through the farmers' own efforts,— without any great help from the Government which, of course, has not hesitated when some assistance has been asked from it. Good farming is a social obligation in Denmark; better farming is regarded as a great social virtue. The result is that Denmark is the only country where the State provides no subsidies to the agriculturists, nor does it levy any protective duties.

The use of science and technology in Danish agriculture in the recent past can be gauged from the facts that use of chemical fertilizers, which was already quite appreciable in 1940's, has increased by about 60 per cent (from 258,000 tons to 413,100 tons) during the fifties and tractorisation has progressed at a strident pace (In 1959, there were over 550 per cent more tractors in use in Danish agriculture than in 1950). Pesticides and herbicides have also come to be used widely. So also the soil conservation measures. Livestock output has been raised through improved breeding of cattle and eradication of animal diseases. The yields per unit-area and per head cattle in Denmark today compare quite favourably with the best in any country on the Continent, except perhaps the Netherlands. From one hectare of land, the Danish farmer produces as much as 30 quintals of wheat or 28 quintals of barley or 356 quintals of sugar-beet. A Red Danish Dairy cow yields as much as 9,698 lbs. (4,400 kg.) of milk and 406 lbs. (184.4 kg.) of butter-fat a year. A Black-and-White cow yields as much as 9,900 lbs. (4,492 kg.) of milk and 399 lbs (181 kg.) of butter-fat. Meat yields from these are sometimes as high as 1,700 lbs. (770 kg.), but in no case less than 1,100 lbs. (500 kg.). Pigs when slaughtered at the ages of 6 or 7 months yield about 145 lbs. (65 kg.) deadweight.

The increased application of science and technology in Danish agriculture has been facilitated largely by the peasant proprietorship system which gives a tremendous incentive to the farmer to produce more; the farmer has not to share the fruits of his labour with anybody but his family. Absentee landlordism does not also hamper the growth, for it simply does not exist there. With a view to create peasant proprietors, large agricultural estates have been taken over by the State-constituted Land Fund and passed on to the agriculturists either to enable them to increase their holdings to the level of about 25 acres or to the former tenants and the new generations to start their own farming business. Approximately 35,000 small holdings have thus been established since 1899 when partitioning of large estates began.

The Danish farmers having acquired proprietory rights and fired with the ambition of improving their lot, have taken quickly to improved methods of farming. To overcome the difficulties inherent in small-scale agriculture, they have gone in for co-operation with others in various fields such as marketing of their products and purchase of aids to production. In the present-day Denmark, one finds a wide variety of agricultural co-operatives — purchase co-operatives; credit

co-operatives, marketing co-operatives, cattle breeding, pig rearing and poultry keeping co-operatives, export co-operatives etc. An ordinary Danish farmer is a member of more than one such co-operative. Co-operation in Danish agriculture however, does not extend to cover joint farming.

Through these co-operatives, the Danish farmers have set up an elaborate agricultural advisory service system on which they draw extensively. The co-operatives engage experts in various fields of agricultural activity who spare no pains in helping the farmers in resolving their difficulties. The farmers seek their guidance without any inhibition, for they are their own employees. An average farmer's interest in farm technology is aroused by means of extensive field tests which these experts carry out every year on ordinary farms under ordinary conditions.

The State on its part has also done quite a bit to change the outlook of the conservatives amongst the Danish agriculturists. It has set up a large number of folk high schools and agricultural institutes. The former are meant to impart education to adults, between the ages 18 to 25, in all farm activities in general. The latter concentrate mainly on giving education in live-stock management, farm accounting, elementary engineering and higher farm economies.

India, whose agricultural economy is patterned more or less on the same lines as the Danish farm economy, has to learn quite a lot from the Danish experience. Co-operation between the two countries in this field has abviously to be fostered. It is, thus, in the fitness of things that the Danish Government, which has already set up a folk high school on the Danish model at Mysore, has offered to set up another on a bigger scale and is providing dairy experts to hold a lecture course at the Aarey Milk Colony.

Danish Industry

DENMARK'S industrial potential compared to other advanced European countries is considered to be on the lower side because from the standards of contribution to national income industry and agriculture both figure prominently. Industry's share is nearly 38 per cent while that of agriculture is a little over 20 per cent. As compared to these figures, the British Industry contributes nearly 45 per cent and agriculture only 4 per cent to national income. But when compared to the Indian economy, Denmark is positively far more advanced industrially. In India 17.4 per cent is the contribution from industry to national income: agriculture contributing nearly 50 per cent.

The largest and the most rapidly expanding industry in Denmark is "iron and metal working industry" which in 1958 produced goods worth, 3,791 million kr. (Table I)—nearly 20 per cent of the total value of Denmark's output. Shipbuilding and transport equipment industries too hold a considerably important position in Danish industrial pattern. Both of them contributed to the extent of 1,503 million kr. in 1958. As regards shipping Denmark holds an important position in Europe. In mid-1960 Denmark had shipping tonnage to the extent of 2.27 million which compared well with 3.43 million tons of the Soviet Union. Among other heavy industries cement making is also important. Stone, clay and glass section contributed nearly 662 million kr. in 1958.

The consumer goods industries hold a significant position in Denmark's economy. In fact a sizeable section of industrial labour is engaged in the manufacture of food, beverages and tobacco. Table I below shows that in 1958 the output in terms of million kr. was 3,796, which was nearly 20 per cent of the total industrial output. This appears very natural about a country which has a large agricultural base. Many agricultural items provide important raw materials for the manufacturing concerns. The canning of various types of food, beverages and tobacco is a flourishing manufacturing proposition for the Danish producers. Then textile mills and clothing manufacturing establishments also figure in a prominent way. Between them they contributed in 1958, 1,845 million kr. to industrial output. Then, wood furniture is produced in Denmark which is considered of a high standard. Paper making and chemicals are Denmark's other important industries. The consumer goods industries like textiles, clothing, food and beverages along with paper and wood furniture constitute over 50 per cent of the total industrial output. Against this, investment industries like iron and metal working, shipbuilding, transport equipment, chemicals, stone clay and glass constitute a little below 50 per cent. Thus there is a balance between consumer and producer goods industries.

TABLE I.

Industry	Number of Establishments (1957)	Manpower Employed (1959)	Value of Production Mill. Kr. (1958)
Food and beverages ..	691	36,400	3,796
Textiles	361	19,700	940
Clothing and footwear ..	726	23,500	905
Wood and furniture ..	771	18,000	658
Paper and graphic industries	651	22,500	1,302
Chemicals	441	17,300	1,751
Stone, clay and glass ..	581	17,100	662
Iron and metal-working	1,317	76,900	3,791
Shipyards and transport equipment	175	25,900	1,503
Other industries	402	10,100	492
TOTAL	6,116	267,400	15,800

Table II on page v gives the growth of Danish industries during the last decade in terms of index numbers. It is evident that the textile sector has not made much progress and this stagnation is shared by clothing, and non-metallic mineral products. There are fast moving sectors such as basic metals and metal products as well as electricity. Growth in these two sectors between 1948 and 1958 was to the extent of 80 per cent. Paper and chemicals output also increased during the decade by nearly 40 per cent. Food beverages and

tobacco remained quite steady and the increase was nearly 25 per cent, which was lower than the total industrial expansion in the country.

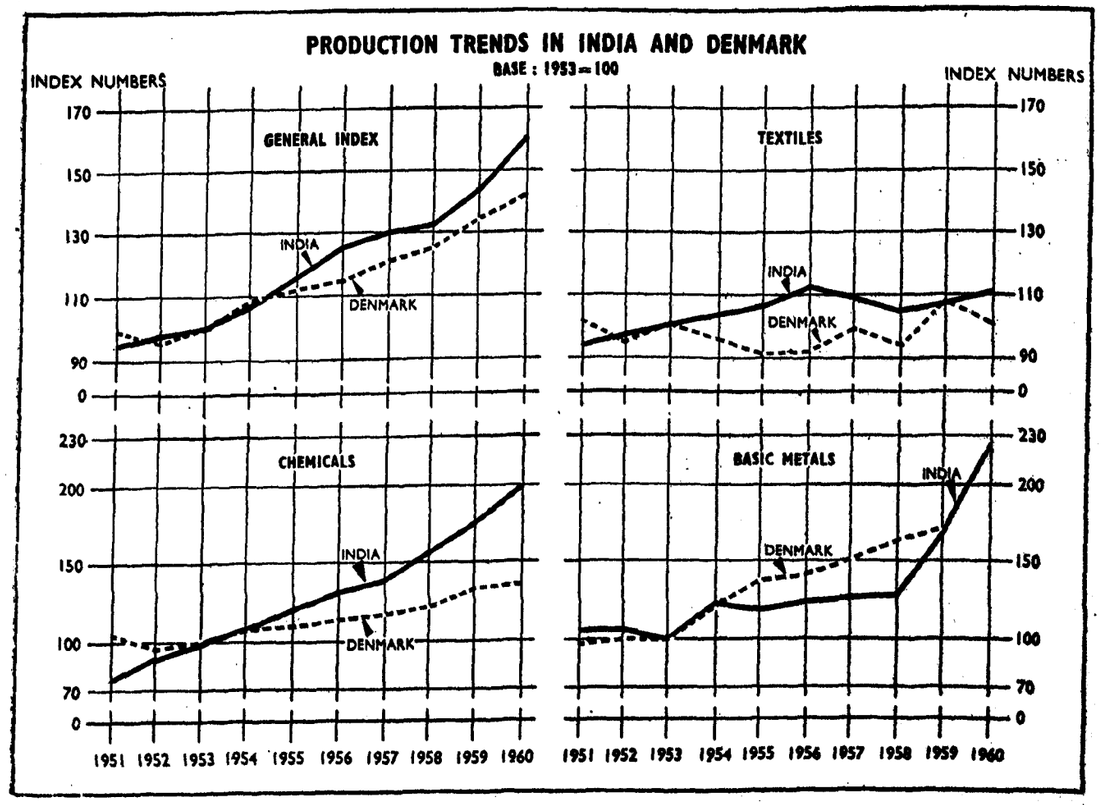


TABLE II.

INDEX NUMBER OF INDUSTRIAL PRODUCTION

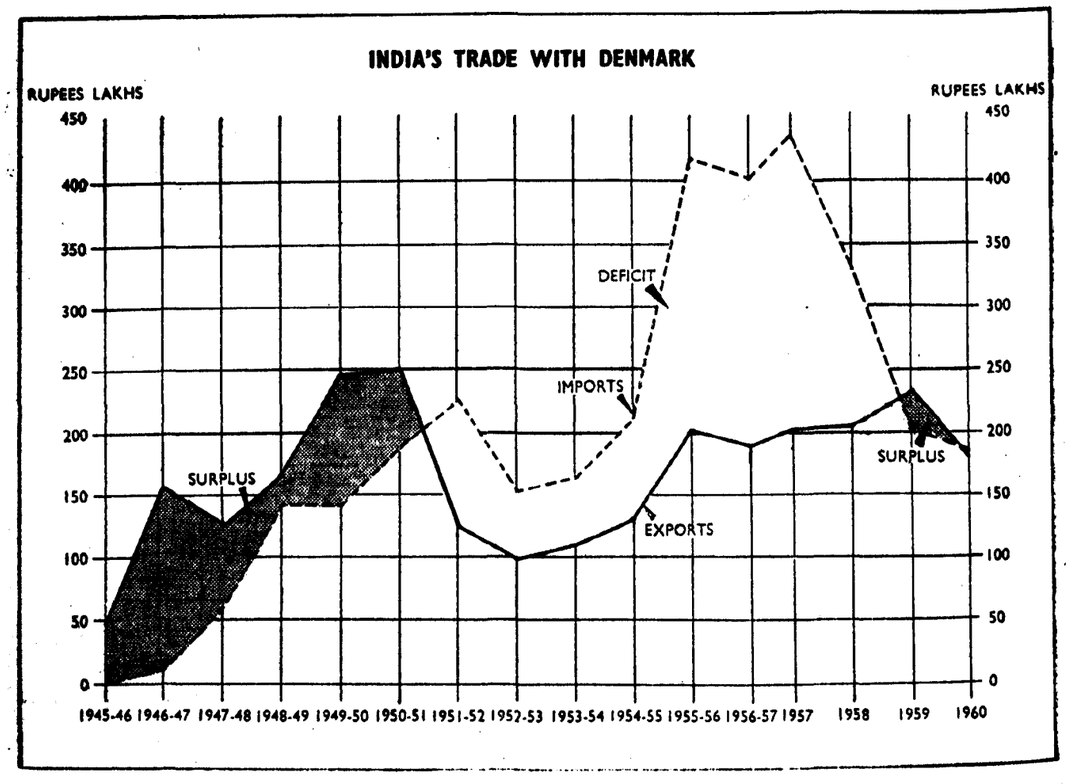
(1953=100)	1948	1958
Food, Beverages and Tobacco	92	118
Textiles	81	89
Wood products	85	114
Paper and paper products	89	124
Chemicals	82	121
Non-metallic minerals	87	91
Basic metals	79	137
Electricity and gas	73	140
TOTAL INDUSTRY	82	121

Danish industry faces the problem of raw materials which has always been the major hurdle in its expansion. There are no coal mines, oil wells or even water resources to provide sources of energy, an important element in industrial expansion. Moreover, there are no ore deposits; even forests are not sufficient. Then, the climate does not allow the growing of cotton. In a way, therefore, the industry lacks nearly all the traditional raw materials which in many other countries form the basis of modern industry. There are, however, some raw materials available like clay, chalk and limestone which help the Denish cement and brick making sections considerably prosperous. Otherwise it is not without reason that Denmark industry is concentrated in food processing.

Danish steel and rolling mills utilise mainly scrap iron which is imported. The textile and clothing industries also largely process foreign materials. In this field technical skill is coupled with artistic sense to produce items which are welcome in the home and foreign markets. The paper industry also bases its production on imports of cellulose and pulp. During the recent years, however, Danish straw produced by the farmers in being used. That the Danish industry is primarily dependent on imported raw materials is very clear from the fact that more than 50 per cent of the imports consist of raw materials.

Foreign Trade

DENMARK presents a typical instance where the people of the country have raised the level of economic prosperity by sheer industry, overcoming genuine and serious handicaps of paucity of raw materials. If building materials are left out of account, it would be quite apparent that most of the staple raw materials need to be imported. Traditionally, Denmark has acquired a reputation of having built its economy on a dynamic agricultural industry. But even in the field of agriculture, cattle-feed must of necessity be imported without which the high level of production of milk and bacon cannot be maintained. Similarly, unless a wide range of raw materials is imported, the processing manufacturing industries would not be in a position to maintain their current levels. Broadly, it has been assessed that, imports of raw materials in particular, and of other goods and services too, amount to one-third of the total value of the production in the country. Denmark, therefore, belongs to that category of countries which are depending in a high degree upon the import trade for the progress of their internal production. It is no surprise, therefore, that the fluctuations in the external trade of the country have a very important bearing on the economic activity inside.



From another angle, Denmark represents a typical instance of a country which has revolutionized the character of its economy in a short span of about two decades. It would be a totally wrong idea to conceive of Denmark as a country relying excessively upon the agricultural industry for a rising level of exports. That may have been true before World War I. But during the inter-war period, and particularly during and after World War II, the character of her export economy has been very rapidly transformed. This is quite obvious from the composition of exports by categories. Between 1938 and 1959, the share of agricultural goods went down remarkably from 71 per cent in the total export trade to 48 per cent, whereas the share of industrial goods rose very steeply during the same period from 27 per cent to 45 per cent. The result today is that agriculture and industry are very nearly evenly balanced in the composition of Denmark's export trade. Canned meat and milk, however, raised their share from 2 per cent in 1938 to 7 per cent in 1959.

The shortage of indigenous raw materials and their high ratio to domestic production has given a definite bias to the tariff policy of Denmark. In the first Tariff Act of 1797 Denmark showed a deliberate preference for low protective duties for the simple reason that the strategic imports, on which the level of production depended, could not be taxed in the interest of the economy itself. Even in the great economic depression of the 1930's, Denmark preferred import restrictions, which can be dismantled without resistance, to high tariffs which cannot.

This background in tariff policy has assumed importance in the wake of the EEC and EFTA controversy. Below is tabulated the regional distribution of Denmark's foreign trade in the year 1958.

(Million Kroner)

Region	Exports	Imports
Common Market (minus colonies)	2,730	3,350
Free Trade Area (minus colonies)	3,474	3,660
Rest of the world	2,405	2,252

As between the two West European trading blocs, it will be seen from the above table that the balance of Denmark's external trade is tipped in favour of EFTA. But this dependence on the trade with EFTA can by no means be considered as preponderating or heavy. Broadly speaking, the external trade relations of Denmark with the EEC and with EFTA are practically equal, and taking the three regions together, the remarkable feature about Denmark's external trade that emerges is that she has not developed a relationship of extreme reliance upon any particular region.

It would appear that, since a choice had to be made, the balance of advantage for Denmark lay in continuing her intimate relationship with the EFTA region and one important consideration which weighed in this decision seems to be that Britain has been traditionally a very important market for Denmark's agricultural exports. Denmark's membership of EFTA necessarily brought a change in her tariff policy. With the coming into existence of EFTA, Denmark has been placed under an obligation to liberalise her policy still further both in regard to import restrictions as well as tariff duties in the intra-EFTA trade. Thus in July, 1960, she applied a reduction of 10 per cent in the intra-regional imports. Likewise, the import restrictions are also being liberalised. But this is a part of the consciously accepted obligations. The latest problems posed for Denmark are two. Denmark has very nearly decided to start negotiations with the EEC for full-fledged membership and not for the associate status. Second, the adoption of a common outer tariff for farm products by the EEC at the high level prevailing in West Germany is likely to raise barriers to her farm exports, but this is a transitional problem which will disappear when she joins the EEC.

The trade between India and Denmark was of a very modest size in the year of our Independence. The trends in the trade have been traced in the table at the end of this article. It will be seen from this table that our imports from Denmark were low at Rs. 60 lakhs, from where they rose to Rs. 186 lakhs in 1960. The peak was achieved in 1957 at Rs. 438 lakhs. Under the import restrictions which India had to impose somewhat severely in view of her extreme difficulties of foreign exchange, this change after the peak years was inevitable. Our exports to Denmark in 1947-48 were Rs. 125 lakhs from where they rose to a maximum of Rs. 244 lakhs in 1949-50 and then reached lower levels of Rs. 232 lakhs in 1959 and Rs. 180 lakhs in 1960. An important development in the trade between India and Denmark, which is disclosed by this table, is that the balance of trade which showed a surplus in favour of India, before the beginning of the First Plan, was converted progressively into a deficit, except for the year 1959. If the size of this deficit has been brought down in value, it is because of the application of import curbs, particularly after the year 1957.

But if this exigency of import restrictions is ignored, the most remarkable development about the Indo-Danish trade is the composition of our imports from that country. At the present time about seven-tenths of our imports from Denmark consist of machinery. A conspicuous place is occupied among them by equipment required for the dairy industry and refrigeration, marine diesel engines for fishing boats, machine tools and surgical as well as scientific and precision instruments. This composition of India's imports from Denmark is also indicative of the nature of the economic and technical co-operation between the two countries.

INDIA'S TRADE WITH DENMARK

Topical Notes

SOCIAL SOLIDARITY IN DENMARK

DENMARK'S social policy is second to none. It looks after not only the welfare of the labour class, but that of the nation as a whole. Whichever Government has been in power, it has always tried to improve upon the existing social legislation. The policy has succeeded in an abundant measure in freeing the Danish people from the fear of serious want; it has fulfilled the nations wants which are beyond an individual's control. The combined expenditure on social insurance and welfare, family policy, and public health in Denmark now amounts to 12 per cent of the country's total annual income, as against only 7.5 per cent in 1934.

A significant feature of Denmark's social policy is that employers have to contribute only a small portion of its costs. National pensions (which in the form of old-age benefits date back to 1890) have been financed entirely through public funds from the very beginning. And so have been many benefits and services which have developed since and which go to make up the social security system of today.

The history of modern social policy can be traced back to the end of the last century. Since then it has grown in dimensions systematically. In the initial stages, the emphasis was on provision of relief at the times of sickness, unemployment and accidents. On the whole, the policy was confined to factory legislation, to accident prevention and improving of public health. But with increased social consciousness in the country, a more active policy was formulated, especially towards the end of 1930's. Today, it forms an integral part of the general policy designed to ensure economic stability and increased prosperity. Virtually all the population groups subject to social risks are covered by one type of insurance or the other—unemployment insurance, industrial insurance, health insurance and old age and disability insurance.

Particular attention is being devoted to the welfare of the aged who cannot manage without special attention. Upto 1957, to qualify for a pension, a person's income had to be below a specified level. Now with the passing of the National Pensions Act, the entire outlook has changed and all persons are paid pensions from the age of 67. Substantially larger amounts are paid to persons having limited means—to men and married women from the age of 65 and to unmarried women and widows from the age of 60. The maximum pension of a married couple with no other income is about 40 per cent of the average earnings of a fully employed unskilled worker. Houses at very low rates of rent are also provided for the aged. In Copenhagen and many other cities, special blocks have been built for old-age pensioners. There is also great emphasis on levelling out the rather wide economic and social disparities between families with children and

without. Apart from tax concessions that are granted to families with children, cash family allowances are also paid along with subsidized housing facilities. Creches, nurseries and recreation centres are, of course, littered all over the country. Children get special care in schools. The State and the local Governments contribute three-fourths of the costs of the facilities provided to the children. The parents and private contributors meet the rest of the expenses.

The health insurance scheme has some excellent features. Nearly 80 per cent of the population receives free medical attention and hospital treatment plus a substantial reduction in the cost of essential medicines. Each new advance in medical science is applied for the benefit of the population in general. Various population groups are also secured by law against loss of income due to illness. These include public and private salaried employees and agricultural and domestic servants.

So far as unemployment insurance in Denmark is concerned, it provides the unemployed with a fairly reasonable standard of living and at present covers 700,000 workers. Although efforts continue to be made to get rid of the menace of unemployment, it still continues to haunt the authorities in certain districts. Possibilities are that with increased economic activity, this social problem may be overcome soon.

PROSPERITY AND PROBLEM OF INFLATION

EVER SINCE Denmark entered her boom period in 1958, economic activity has been accelerating. There is no capacity lying idle or partially unutilised today. With full employment, further industrial production is possible only by the introduction of additional manpower, by technological advancement and by new investment. Capital goods have seen a rapid rise in investment mainly to cope with the keener competition anticipated under the formation of the European Economic Market. The heavy demand for labour in manufacturing industries has resulted in shortages of skilled labour and today demand outstrips supply to such an extent that even unskilled labour is difficult to find in certain sectors particularly in building and civil engineering. In the last four years unemploymet has fallen from 10 per cent to 3½ per cent—a level below which it cannot fall further; for it represents the maximum seasonal and structural unemployment. The incomes of all sections of the Community have mounted rapidly. This general rise in incomes, coupled with a slower rate of expansion in industrial production, has given rise to considerable pressures of demand and to a worsening of the balance of payments position. Prices began to rise in 1961 after the previous period of price stability which prevailed from 1957 to 1960 and it is anticipated that they will rise further following higher charges for transport and postal services. The vigorous boom, in fact, has now threatened the stability of the economy.

All weapons, monetary, fiscal and political have been exercised to dampen the pressure of excessive demand in various sectors of the economy and to put it on an even keel—in step with production possibilities and export earnings. Through two successive surplus budgets as a result of the enchancement of excise taxes on petrol, beer, wines and spirits, apart from the increase in the railway and postal charges, the pressure of demand has been checked considerably. The monetary measures have included the raising of the Bank rate which at present stands at 6½ per cent as a result of which the interest level has risen to 7½ per cent. A restrictive credit policy has also been adopted and it is likely to be maintained till the situation warrants its revision.

It has, however, been realised that however these measures may be necessary to restrain inflationary rises in incomes, the answer to the long-term problem lies in the growth of production. In its report for 1960-61 on Denmark, the OEEC has made certain recommendations for stabilisation. For example, it has suggested the introduction of a pay-as-you-earn system of income-tax "as the time lag (of 18 months on an average) existing at present between the earning and the taxation of income, seriously limits the effect of raising the means for governmental revenue. In regard to correction of foreign imbalances, it has suggested that the Government should try to explore the possibilities of increasing the inflow of foreign capital, either in the form of direct investment or public loans.

INDO - DANISH CO - OPERATION

AMONG THE advanced countries which have signed technical and economic co-operation agreements with India the contribution of Denmark is no less significant. In recent years increasing number of Danish companies have collaborated with their Indian partners in various schemes and projects, such as the production of dairy equipment, switchgear and motor starters, gas cylinders, air compressers, marine paints, dry-spraying plants, collaboration in the manufacture of cement machinery, evaporator thermostats, milling machines, machine tools, marine diesel engines and a number of other industrial products.

The Danish programme for technical assistance for developing countries was started more than 10 years ago. The bulk of Denmark's aid of this nature has been channelled mainly through the United Nations and only very limited resources are earmarked for bilateral assistance. In recent years Denmark's contribution to the UN technical assistance programmes has been the largest of any member nation on per capita basis. A good part of the Danish contribution has been allocated for international training courses to be held in Denmark—under the sponsorship of various UN agencies like FAO, ILO, WHO and UNESCO. Among these UN sponsored international training courses, dairy training courses were arranged in Denmark in 1956 and 1958 but with a view to improving the efficiency of these courses by offering the training in climatic and agricultural conditions as close as possible to normal conditions in the students' home countries in Asia and Africa, the international training course was shifted to Aarey Milk Colony (near Bombay) in 1960 with the support of the Indian Government. Under this programme three training courses have been attended by a total of 68 students—29 from India and the rest from other African and Asian countries. A fourth course was inaugurated recently and it is anticipated that two such dairy training courses will be held annually in India over the coming three or four years.

Denmark's aid also comprises assistance by Danish technical experts overseas and training of foreign students in Denmark either under bilateral Danish assistance programme or programmes financed by other countries. Since 1950 a total of 155 students and trainees from India have studied in Denmark and 44 Danish experts have imparted training in India primarily in the field of health service, agriculture, dairying, forestry, fisheries and school psychology. Besides, many Indians have worked in private Danish industries. In the field of science, close co-operation has existed between India and Denmark, and this co-operation is being extended in the sphere of peaceful uses of atomic energy. Even the Danish non-governmental organisation like "Mellemfolkeligt Samvirke" which is closely associated with the Danish Unesco—National Commission has joined hands with the Mysore State Adult Education Council to establish the Danish Mysore project in 1959. A group of Danish teachers and agricultural experts are also working in co-operation with the Vidya Peeth at Shivaragudda.

Under this programme a poultry form has been established with supplies from Denmark of machinery and equipment including incubators and 2500 day-old chics and work has also been undertaken for soil and seed improvement. Through efforts as these, combining commercial, economic and technical co-operation, it is hoped that relations between Denmark and India will be further strengthened in the years to come.

DAIRIES: CO - OPERATIVE ORGANIZATION

CO-OPERATION has for long been the most outstanding feature of Denmark's agricultural development beginning as far back as in 1882. In the wake of the first co-operative dairy in 1882, many of the sort sprang up all over the country and constituted the major undertakings in the productive field. They have come into being, somewhat spontaneously from within, to meet practical needs as they have arisen.

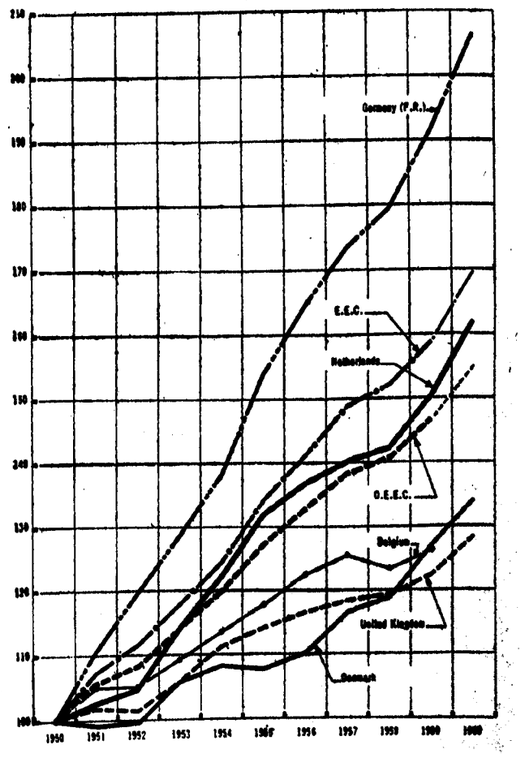
The organisational structure of the Danish Dairy industry has been built up with the individual dairy at its base. Of 1,400 dairies in Denmark about 1,175 are members of co-operatives. A co-operative dairy has a number of milk producers on the list as members who dispose of their milk production and the manufactured products as a joint enterprise. Each member is bound to accept the rules of the dairy as legally binding. The rules of the individual co-operative dairies are based on the set of standard rules for co-operative dairies, as drafted by the Federation of Danish Dairy Associations, though it is not obligatory for the co-operative dairies to follow them. But they are treated as a model and are generally followed with minor modifications.

The most important of these are those governing the joint liability of the members and their obligation to supply. The members are jointly liable for any loan raised by the executive committee of their dairy in accordance with resolutions passed at a general mee ing. Another equally important and uniform rule is that members are obliged to supply the dairy with all the surplus or marketable milk from their healthy crows.

The scrupulous attention paid to quality is noteworthy. There are other rules making specific demands as to the quality of the milk supplied to the dairy and instructing the dairy manager to return milk which falls short of these demands. The payment for the supply is made according to weight, fat content, and hygienic quality of milk. An executive committee of generally five to nine members is elected at the general meeting of members to conduct the affairs of the association. All members are admitted to a general meeti-g and each has one vote no matter what is his quanti y of supply.

There are 24 regional dairy associations covering a county each and almost all co-operative dairies, the private dairies, and all the co-operative condensed milk factories in Denmark are its members. These regional dairy associations are all members of the Federation of Danish Dairy Associations—an apex body—representing the dairies of their respective counties in the national organisation.

The "Union of Denmark's Private Dairies"—an association of private dairies in Denmark—is also a member of the Federation and that being so, the private dairies are adequately represented in the Federation through their membership either of the "Union of Denmark's Private Dairies" or of a regional dairy association.



The Federation of Danish Dairy Associations looks after the interest of the dairy industry at home and abroad by striving to create and maintain, in broad terms, economically sound conditions for the production of milk and milk products. Its supreme authority rests with the Delegate Assembly, the members of which are elected by the individual member associations, the number of delegates from each association having been determined either by the number of dairies in the organisation or by the total quantity of milk processed.

The Federation, besides being represented in the major agricultural organisations, is the accepted body for negotiations with the Ministry of Agriculture a.d for making recommendations in matters pertaining to the interest of the dairy industry at large.

AGRICULTURAL EXPORT INDUSTRIES

DENMARK'S traditional emphasis on agriculture has given her agricultural export industries an important place in her economy. Danish agricultural pr ducts with the "Lur" mark of quality enjoy a high reputation in the export market of the world and are marketed in varying quantities in countries like the U.K., West Germany, the United States, Italy, France, Sweden, Brazil and Venezuela. The chief agricultural exports

EVOLUTION OF THE GROSS NATIONAL PRODUCT AT CONSTANT PRICES
1950 = 100

are butter, bacon, meet, eggs and poultry, cheese, potatoes, horses and breeding cattle. Other more specialised exports are grass, cereal and root seeds and malting barley. The cow and the pig are important sources as foreign exchange earners, particularly the former is a source of many more valuable agricultural exports. The two are closely interlinked and form the basis of Danish farming. Poultry is another industry in which the country enjoys a high reputation in being the second biggest exporter of eggs in the world market.

The export trade in cattle has flourished in Denmark because of strict quality control to which they are subjected before being exported. The compulsary preshipment inspection of cattle by veterinary surgeons requires that exportable cattle must conform to certain specified minimum sandards of yields. The Export Board for Breeding Cattle, apart from building up considerable exports to a number of countries, has extended the knowledge of the Danish cattle industry abroad through its various publications and exhibitions. In 1960 butter production amounted to 165,000 metric tons of which 117,000 metric tons were exported. During the same period, cheese production amounted to 113,104 metric tons of which 75,000 metric tons were exported. West Germany has been the principal customer of Danish cheese, followed by Great Britain and Italy. Denmark's export of condensed and evaporated milk and sterilised cream totalled 36,760 metric tons in 1960. For milk powder the 1960 export figure was 29,567 metric tons. Special export organisations have been formed to organise and expand the export of individual products.

Indo-Soviet Economic Co-operation

IN this Blue Supplement 'The Eastern Economist' is making its first attempt to set out its policy and outlook on the controversial problem of Indo-Soviet economic co-operation. For many years, it should be admitted frankly, this journal was unconvinced that the Soviet Union had a major part to play in economic development of this country. Circumstances have now led to a revision of some inflexible views then presented. There are, indeed, political differences, and the 1962 Annual Number of 'The Eastern Economist' has already set them out in major perspective. Our trade and our interests with the Western World will always be greater than our trade or co-operation in these spheres with Eastern Europe. But a major block has been vacated in that we now recognise that, subject to the difference in this order of magnitude, Eastern European countries have a vital role to play in economic development. For our own economic advantage it is necessary that we should utilise the hand of co-operation when it assists our national effort.

Over the years the image of the Soviet Union has naturally changed in India as well as in the four walls of most Indian newspaper offices. The image now presented by the vital and dynamic Premier of the Soviet Union is one of a reversal of the inflexible line of Communist conquest of the rest of the world and, increasingly, a pattern of co-existence in which violence, and even violent propaganda, will be subdued. It is true that the People's Republic of China provides an illustration that the other image is not dead all over the world. But, by and large, trade and co-operation with Communist countries has now become a feature of Western European economies no less than ours. There is certainly no reason to take fright at the growth of economic co-operation and to foster it by all means in our power. This is a historical trend and not a matter of political philosophy. In the month of February the U.S.S.R. proposed not only a great Disarmament Conference in which Mr. Nikita Khrushchev's message to Mr. Kennedy and Mr. Macmillan breathes a new note, but there is also, after Colonel Glenn's great space achievement, a willingness to pool outer space research. Thus the response from the United States, not less than from Western Europe, has been promising. For the whole Free World to take a more liberal view on co-operation with the Soviet Union there must be some substantial change in attitudes on both sides. India, which has been outside the Cold War, cannot take a less positive view. 'The Eastern Economist' holds the view that there are special facilities in Indo-Soviet trade which do not exist elsewhere and should be more fully explained and understood.

It will be remembered in an Indo-Soviet trade agreement in November, 1958, that the idea of trade in "inconvertible" Indian rupees first came into prominence. This was one of the great pieces of imagination exhibited by the Soviet Union in recognising that underdeveloped countries will be naturally unable to export to the extent required to balance their import needs. They, therefore, provided an arrangement by which the spending of the rupees, or the creation of the corresponding exports from India, was a responsibility removed from our shoulders. The results of that great piece of imagination have illuminated Indo-Soviet trade in the last four years. It is a proud story of both sides. It promises to be more fruitful in the years to come.

In bringing out this Blue Supplement, 'The Eastern Economist' wishes to reiterate its view that the currency arrangements and the bilateral arrangements reached with the Soviet Union are in India's national interest and that the Soviet projects in this country—particularly the Bhilai steel plant and the Heavy Machinery plant at Ranchi—are sound monuments to Indo-Soviet economic co-operation. All this takes place within a framework of differences of political and cultural matters which is sometimes intense because of the presence of the Communist Party in India. But it should not prevent patriots from seeing that they can draw the benefits of association without imperilling their country's integrity in any way. The test, in the last analysis, is on overselves and not to any other country.

'The Eastern Economist' is grateful to the Ambassador of the Soviet Union in India, His Excellency Mr.

I. A. Benediktov, for the article he has written for this Supplement and for the valuable co-operation on detail and opinion for which he has arranged. This itself is a mark of recognition that differences in political and cultural outlook are not a bar to free economic relations, and that the Soviet Union has now acquired the capacity to speak in a democratic dialogue with all the nations of the world.

A Good Example of Co-operation

By HIS EXCELLENCY MR. I. A. BENEDIKTOV, Ambassador of the U.S.S.R. in India

THE 'Eastern Economist' has shown a valuable initiative by the decision to publish a series of materials on Indian co-operation with a number of foreign countries in implementing plans of economic development of India. We are highly grateful to the Editor of the magazine for his kind offer to have a Blue Supplement on the questions of the economic co-operation between India and the USSR in this issue. It seems to me that this Supplement can be of interest to the readers of the magazine since Indo-Soviet co-operation has not only a good past and present but also vast perspectives for the future. Our confidence in favourable development of co-operation between our countries is based upon the fact that there is much in common which unites the two great countries of the world. First of all, this is our common aspiration for the world without wars and oppression where continuous growth of economy and human welfare will be secured. On the one hand the common approach to the problem of war and peace finds its expression in coincidence of the points of view of both governments in respect to many questions of international situation, on the other hand common striving for the development of economy finds its realization in economic development plans.

Of course, our countries are on different stages of development and therefore the targets of their planning cannot be similar. India has recently embarked on the path of building a modern economic base, taking advantage of hard-won political independence to secure full economic independence, while the Soviet Union is now facing a concrete task of achieving the highest in the world level of output both in total volume of industrial and agricultural production as well as in per capita production of all goods. Having a mighty economic potential, the Soviet Union renders unselfish economic aid to the peoples who have set themselves free of the yoke of colonial domination and embarked on the path of independent development.

The beginning of extensive Indo-Soviet economic and technical co-operation was initiated during the visit of Prime Minister Jawaharlal Nehru to the USSR in June 1955 and a return visit of N. S. Khrushchov to India some months later. At that very time the parties agreed that the basis of economic co-operation between the USSR and India would be rendering aid to India in creating a heavy industry of her own—the foundation of economic independence and development of all branches of national economy. A little more than 5 years have passed and the firstling of fruitful co-operation—the Bhilai Steel Plant—is already producing steel, cast iron and numerous metal wares for the Indian national economy. Prime Minister Nehru highly appreciated the Bhilai plant and named it a symbol of Soviet-Indian friendship. As a reply to his words the phrase of the head of the Soviet Government N. S. Khrushchov resounds, "Let our friendship be as strong as the metal smelted at this plant which was created thanks to mutual efforts of the governments and peoples of the USSR and India."

Bhilai was a good beginning of co-operation and today the USSR is already giving help to India in construction of 30 large industrial projects in the key branches of Indian economy, such as metallurgical industry, heavy engineering, oil industry, coal mining, and energetics and pharmaceutical industry.

The Bhilai steel plant is to be expanded from the capacity of 1 million tons of steel a year to 2.5 million tons in the period of the Third Five-Year Plan. The heavy engineering plant at Ranchi will produce 80 thousand tons of finished machinery annually. The mining equipment plant with a capacity of 45 thousand tons of machinery and equipment at Durgapur and many other projects will be set up.

The following figures quite eloquently show the significance of our economic and technical aid for India: the total capacity of power stations, which are being built with the help of the USSR and being supplied according to the trade agreement is 19.7 per cent of total capacity of all power stations envisaged for construction during the Third Five-Year Plan. The share of coal mines which are being built with our help is 12.5 per cent the total coal output in the public sector during the Third Plan and as for coal concentrating factories—26 per cent of existing and would-be factories.

India has achieved a certain success in development of her oil industry in the public sector with the assistance of the Soviet Union. If the Second Plan set the task to find the oil deposits, the Third Plan envisages the creation of a national oil and gas industry. A good deal of work is being done in the field of technical collaboration and particularly in training Indian specialists. You will find minute data on the most important aspects of the Soviet-Indian co-operation in this supplement, so I can relieve myself from going into the details. I would like to stress that the total amount of economic and technical aid of the USSR to India in building industrial enterprises and other projects comes up to Rs 430 crores, with the credits of Rs 380 crores included. During the Third Five-Year Plan in accordance with the existing agreement India intends to use Soviet credits to the extent of approximately Rs 300 crores. It will not be an exaggeration to say that these credits consist almost entirely of advanced and up to date equipment and first class technical aid.

During the coming years the co-operation between India and USSR will be even more extensive. As you know, the Programme of the Communist Party of the Soviet Union adopted by the 22nd Congress, envisages a new powerful development of the Soviet economy in the next 20 years. As a result of it industrial production will increase 2.5 times between 1960 and 1970, and by 1980 not less than 6 fold in regard to 1960. During the first 10 years agricultural porduction will increase 2.5 times, and in 20 years 3.5 times. Such a rapid development of the economy will enable the Soviet Union not only to satisfy all the needs of its national economy during a relatively short historical period, but also to increase its assistance to previously backward but at present developing countries, including India.

Peace is primarily essential for the realization of our programme. That is why the Soviet Union is so energetically fighting for peaceful co-existence, for securing world peace. All people are interested in preserving peace. If disarmament could be carried out according to the time schedule and scale proposed by the Soviet Union then it would free enormous resources for assisting under-developed countries. According to the calculations of some economists more than $ [illegible] billion are spent annually in the world for armements and upkeep of the armed forces. If only a half of this money is channelled for the development of such countries as India, then the rate of economic growth could be increased several times.

Last summer we were interested to learn that the Planning Commission of India started to draw up a long-term development plan for 1976. Speaking in Parliament on August 28, 1961, Prime Minister Nehru quoted the basic objectives of the 15-year plan. We think that long-term economic planning is an asset, which makes it possible to secure better conditions for a balanced development of all the branches of the economy. At the same time long-term planning creates better conditions for the development of co-operation with foreign countries, particularly with countries having a planned economy. It allows for a greater degree of estimation of mutual needs and demands. Here we also have good prospects for long-term co-ordination of plans of economic co-operation between the USSR and India.

Considering the fact that planning is firmly entrenched in India and plays an increasingly important role in the country's economic development, I would like to attract attention to some problems of planning under conditions prevailing in India. Two five-year Plans were fulfilled in the main, although some drawbacks emerged which were largely due to faults in the organizing of planning and securing the implementation of the plans as well. You are very well aware that getting rid of drawbacks can only help.

In accordance with the development of the country's economy and the necessity of solving more than ever complicated tasks, a further tuning up of planning is quite essential. Many Soviet planning experts and economists who studied the state of planning in India, are of the opinion that all the pre-requisites exist in the country in order to make a further step forward in improving planning techniques. It is deemed necessary that certain additional measures should be included in planning, as the working out of control figures, on which base the ministries and the states would draw up calculations and submit them to the Planning Commission. An opinion was expressed on the advisability of drawing up annual plans for development in the public sector on the basis of long-term plans, and also of starting composing plans of geological surveys with clearcut financial lay-outs for each item of planned designing work and material-cum-technical provisions. It was also found advisable to start planning in such important fields as labour and wages as well as production expenses. Quite important is the introduction of obligatory statistical reports by the enterprises concerning a set list of items. The statistical institutes would then be enabled to compile general reports on this basis and submit them to the Planning Commission for use in drawing up the Plans and checking up their fulfilment.

The experience gained by planning agencies in the Soviet Union proved that the Planning Commission should be entrusted with the task of a systematic control over the plans' fulfilment. It should be pointed out that in the Soviet Union assignments allotted to enterprises in conformity with the plans are on the same legal basis as laws of the state, so that each enterprise becomes more responsible for a plan being properly carried out.

Any country which introduced planning or elements of planning faces the structure of her economy getting more and more complicated alongside with the increase in production and the expansion of investments in the state sector. And now the problem in what industries the investments should be made in first is being supplemented with the problem what parts of the country they should be directed as to in order to achieve the maximum of effectiveness. Regional planning thus turns out to become one of the most acute problems intermingling with the problem of national integration. Economists of various countries engaged in planning came to a conclusion of necessity to turn to the regional planning on a nationwide basis. In their opinion it should materialize, first, in developing a frame work of economic regions and, second, in combining the industry-wise planning with the region-wise planning. It was found advisable to have in the plans a special section "Regional distribution of the industries" for this end. The experience of planning in the USSR showed that this method of planning did not only affect the interest of regional autonomy but, on the contrary, contributed to their rapid economic progress.

The same can be applied to India. The working out of the general perspective plan of regional development is one of the most essential tasks of the state. It should be drawn out in the interests of the country as a whole while taking into account local requirements and aspirations of the states. The entire success of the regional planning is dependent upon a comprehensive implementation of this combination. In the course of working out the country's general plan it is quite unavoidable to delimit the spheres of authority as well as the projects of national and inter-state importance, included in the plan. Apart from the general perspective plan, it is desirable that the planning bodies of the states work out local regional plans of their own based on the general plan and being supplementary to it. The Soviet scientists and experts who studied planning in this country are of the opinion that India has definite economic prerequisites and sufficient cadre of specialists to implement such planning.

Trade is another important sphere in the Indo-Soviet economic co-operation. It also has some specific features which reflect a friendly character of relations between the two countries. As in the case of long-term credits, the bulk of the Soviet export to India consists of machinery and equipment, the share of these commodities having been about 43 per cent of the total deliveries last year on her part. India exports to the USSR her traditional goods as well as some new items of industrial production. In order to assist India in overcoming the foreign exchange difficulties the Soviet Union agreed to meet the request of the Indian side to place the trade on a rupee-payment basis with mutually balanced deliveries of goods. The three-year trade agreement, signed in 1960, provides for a continuous expansion of mutual trade, which should reach the level of Rs 100 crores in 1963. I am particularly pleased to note that both the STC and private Indian firms are willing to develop trade with the USSR, being well aware of the fact that USSR is a sound and big trade partner.

In conclusion I would like to express my confidence that many-sided co-operation between the USSR and India which the peoples of our two countries as well as of all countries of the world are so interested in will ever expand and flourish in the interests of peace and friendship among nations.

India and the U.S.S.R.: A Study in Economic Growth

DURING the last 40 years the economy of the U.S.S.R. has revolutionised itself under the stimulating impact of the Five-Year Plans. It is a well known fact that the idea of planning on the national scale was born in the U.S.S.R. and it is now being adopted by all the newly independent resurgent nations which wish to accelerate the standards of living of their people in the shortest possible time. The Five-Year Plans of the Indian Union are also directed to the same aim of raising the level of living all-round.

There has been quite a heated controversy in the economic journals about the actual rate of growth of the U.S.S.R. economy. For a long-term study of the U.S.S.R.

economy, it has been decided to rely on the official figures released by the Soviet Union. According to the preliminary estimates made available by the Soviet Union, the total national income of the U.S.S.R. in 1961 was 153,000 million roubles or 809,200 million rupees (about 6.5 times the national income of India). This indicated a 7 per cent increase over 1960. In 1960, the national income of the U.S.S.R. had increased by more than 50 per cent as compared with 1955, indicating an average rise of about 10 per cent per annum (simple). Between 1950 and 1960, according to the official sources, the rise in per capita income was 120 per cent or 12 per cent per annum per capita. During the same period, the rise in the case of the Indian Union was of the order of 42 per cent in national income and 17 per cent in per capita income. In other words, the 1.7 per cent rise in per capita income in the case of the Indian Union was nearly one-seventh of the per capita rise in the U.S.S.R. Whereas the U.S.S.R. economy is heavily biased in favour of industry—and therein lies the key to its rapid progress—the Indian Union is still dependent for half of its national income on agriculture. The rather slow improvement in agriculture is keeping the overall rate of increase in national income at a very low figure. On the other hand the organised industry in the Indian Union has risen in the past decade at the average rate of 10 per cent per annum which compares favourably with the rate of growth in industry in the economically developed countries including the U.S.S.R.

In per capita terms, the income in the Indian Union is one-twelfth of the U.S.S.R. The gap is indeed extremely large and it is realised increasingly in the Indian Union that the rate of progress can be hastened by laying more stress on technological improvement and productivity. These are the two basic ingredients for economic expansion; that is why the Indian Union has decided to import technical know-how both from the East and the West, without getting involved in the cold war controversies. The increasing participation of the U.S.S.R. in India's experiment in accelerated rate of economic development will certainly bear fruit much faster perhaps than the current trends would make one believe. Bhilai stands as a standing monument to Indo-Soviet co-operation in economic growth. While the gap between the levels of living between the two countries may not be bridged in the short period, there is every possibility of hastening the rate of economic development in the Indian Union with the assistance of aid, financial and technical, received from all the friendly nations including the U.S.S.R.

LOOKING AHEAD

The Seven-Year Plan of the U.S.S.R. will end in 1965 while India's Third Five-Year Plan will close on March 31, 1966. The U.S.S.R. Plan has forecast a rate of rise in national income which will lie between 7.1 and 7.4 per cent per annum. The rate of growth in national income in the Indian economy during the next five years is estimated to be a little above 6 per cent per annum. If the rates of growth in national income in the sixties (1961-70) are compared for the two countries, it will be found that the difference is of the order of 3 per cent per annum. The Indian rate of growth will be between 6 and 7 per cent per annum while the Russian rate of growth is anticipated to be between 9 and 10 per cent. Figures are also available for the next 20 years in the case of the U.S.S.R. It is believed that the long term rate will be slightly lower at 8.4 per cent The Indian rate will also approximate to this figure (about 9 per cent) for the 20-year period ending in 1981. What is more important in the case of the U.S.S.R. is that producer goods are expected to grow at a slightly higher rate than the consumer goods for the next 20 years. The emphasis on raising productivity all-round in the U.S.S.R. is much larger than in the case of the Indian economy. In the U.S.S.R. it is presumed that productivity will rise at the rate of more than 7 per cent per annum through better management and rationalisation of available resources. The table below gives the actual rates of growth in the important sectors of the Russian economy in 1960 along with forecasts for the next 20 years.

ANNUAL RATES OF GROWTH

(Percentages)

Indicators	1960 Actual	1961 Forecast	1956-60 (5-Year Plan)	1959-65 (7-Year Plan)	1961-70 (10-Year Forecast	1961-80 (20-Year Forecast)

N.A.=Not available.

The Soviet Agriculture

ALTHOUGH farm output in the Soviet Union has tended to level off during the past two or three years —the index number (base 1950-52 as 100) remaining steady around 160—the Soviet agriculture has made appreciable advance since the end of World War II. The war had caused great devastation over the wide areas in the Soviet Union and had upset her agricultural economy to a considerable extent. It took nearly seven years for the output to be restored to the pre-war level. In 1953, production of grains amounted to 80.34 million tons, sugar-beet 23.2 million tons, sugar 3.4 million tons, sunflowers 2.6 million tons, meat (carcase weight) 5.8 million tons, milk 36.5 million tons and butter 497 thousand tons.

Between 1953 and 1958, there was recorded a rapid increase in production consequent upon some drastic changes having been made in the agricultural policy of the State. The most important changes that have taken place in the Soviet farm policy since 1953 have been (i) the provision of adequate incentives to the farmers —collective as well as co-operative farmers—in the form of higher prices and reduced compulsory-delivery quotas for their products, (ii) decentralisation of the decisions on crop patterns, and (iii) making available to the collective farms machinery, fertilizers and other agricultural production at subsidised rates. These changes infused a new enthusiasm in the Soviet farmer who went out to put in a greater effort to raise agricultural output. By 1960, the farm output in the Soviet Union had been raised to 132 million tons of grains, 50.9 million tons of sugar-beet, 6.4 million tons of sugar, 3.8 million tons of sunflowers, 8.7 million tons of meet (carcase weight), 61.5 million tons of milk and 8,48,000 tons of butter.

Higher prices and reduced compulsory-delivery quotas have helped in strengthening the financial position of the collective farms, which has, in turn, aided in greater resort to mechanisation. The Soviet agriculture today is highly mechanised. Whereas in 1949 there was only 47.4 m.h.p. (1.5 h.p. per worker) of engine power employed in Soviet agriculture, in 1959 there was employed as much as 141.1 m.h.p. (4.7 h.p. per worker).

Increased emphasis is today being placed on the need to make the utmost use of the latest advances in science and technology and every effort is being made to encourage farmers to study achievements of model farms and experimental stations which have been set up in large numbers in the whole of the Soviet Union. The use of artificial fertilizers in the Soviet agriculture, however, is not as advanced as in some of the highly developed agricultural countries on the European Continent and in the world elsewhere. Average application of nitrogenous fertilizers (pure content) in the Soviet Union in 1957 was only 3.1 kgs. per hectare, as against about 200 kgs. per hectare in the advanced countries of Western Europe. In the U.S.S.R., however, fertilizers are mainly used for boosting output of commercial crops—cotton, sugar-beet and flax. In the case of cotton, the application of nitrogenous fertilizers is of the order of about 108 kgs. per hectare.

An ambitious programme has been prepared to raise production of the main agricultural commodities and animal products so as to bring about a better balance between the domestic output and the growing requirements. Some of the targets fixed for 1965 are as follows: grains 167 to 180 million tons; potatoes 147 million tons; sugar-beet 76 to 84 million tons; meat (carcass weight) 16 million tons; milk 100 to 105 million tons. Whether these targets would be achieved is anybody's guess. The Government, of course, is reported to be making all efforts to attain them. Investment is envisaged to be stepped up to the commensurable degree.

Industry

IT was the overwhelming stress on planned industrial expansion that led to the transformation of an agrarian economy in the Soviet Union to the present state of highly developed industrial structure. In a period of over 40 years, Soviet Union was able to achieve a continuously rising rate of industrialisation. The Soviet planners believed that only a greater output of heavy industry items such as machinery and equipment could ultimately provide a stable base from which balanced industrial output could continue. In fact in all centrally planned economies, the heavy industry forms the core of the economic structure. At present the Soviet industry seems to have achieved a sustained rate of expansion which during the last decade was around 10 per cent per annum. Increase in industrial output over the six years 1955-61, for instance, was nearly 80 per cent.

The table below contains projected output in certain industries for 1970 and 1980. It is evident that the Soviet industry is still laying significant stress on the heavy industry. Coal output is likely to be more than doubled between 1961 and 1980, oil output is likely to expand nearly three-fold and electricity four-fold. Similarly, cement output is likely to go up from the present actual of 51 m. tons to 234 m. tons. Thus even the declared policy of a shift towards consumer goods is not going to change the basic pattern of Soviet industrial structure.

While it would be true to say that the real basis of industrial expansion in the Soviet Union has been by predominant stress on heavy industries, it would be slightly too much to believe that at the moment the output of consumer goods is neglected. The Soviet planners definitely believe that there has to be, in a centrally planned economy, a rigid system of priorities. The high pace of industrial expansion, they believe, has to be achieved through a process of high rate of saving which naturally necessitates a degree of sacrifice on the part of the population in respect of consumer goods. Naturally, therefore, during the earlier years the Soviet people had to face a situation wherein the industrial consumer goods were available to a limited extent.

During the recent years, however, there was witnessed a significant shift in the priorities in respect of consumer goods production. Pig iron output for 1961 for instance was 53 per cent higher than that for 1955 and that for coal for 1961 was 131 per cent higher than that for 1955. It is interesting to note that clothing and leather footwear increased during the same period by 152 and 163 per cent respectively. Sugar output increased during the same period by nearly 200 per cent and furniture output by 281 per cent. It was further outlined recently that the Soviet Government had allocated additional amount of 2,500 million roubles for the development of the textiles and footwear industries and those supplying them with raw materials. Thus gradually the imbalance in the output of producer goods and consumer goods in the Soviet economy has been rectified to a large extent.

INDUSTRIAL PRODUCTION

Development of Indo-Soviet Trade

By MR. G. P. VELIKY, Trade Representative of the USSR in India.

THE USSR pays special attention to the development of trade with the countries which have overthrown the yoke of colonialism and which are doing their best to strengthen their national independence.

The fraternal unity with the peoples who have done away with the colonial and semi-colonial yoke is a corner-stone of the foreign policy of the USSR.

The trade turnover with these countries has grown 4 times for the last five years, the trade with such countries as India, Indonesia, Afghanistan, Arabian countries and others having grown especially rapidly. In this period the USSR has established direct trade relations with many countries of Asia, Africa and Latin America. At present the USSR has trade relations with eighty-one countries, with fifty countries on the basis of trade agreements.

The trade relations of the USSR with the countries of Asia, Africa and Latin America are becoming closer and closer, the conclusion of long-term trade agreements with a number of countries, in particular with India, Indonesia, Guinea and Cuba, testifying to the fact.

The Soviet Union supplies to the countries of Asia, Africa and Latin America various machinery and equipment, manufactured goods which are required by these countries for the development of their national economy. These countries pay for the import of the required Soviet goods by their traditional exports and not by gold or foreign exchange, which fact also contributes to the stabilization and strengthening of the economic position of these countries. The Soviet Union has become one of the main importers of such goods as raw hides and skins, rubber, wool, cotton, oilseeds, dried fruit and many others required by our national economy to satisfy the needs of Soviet people. It should also be mentioned that in recent years the USSR has been purchasing from these countries manufactured goods the production of their developing industries (woollen fabrics, jute goods, footwear, canned foods etc.)

The trade relations of the USSR with the countries which have done away with the colonial and semi-colonial yoke are based on principally new foundations —on the foundations of equality and mutual benefit.

It is the first time in history that former colonial and semi-colonial countries have found in the great power, the USSR, a partner who is not seeking to exploit their national wealth and the peoples of these countries, to impose disadvantageous and one-sided terms in trade, but on the contrary, who contributes in every possible way to the development of national economies of these countries and to the raising of the material and cultural level of their peoples.

The beneficial influence of the development of the mutually advantageous and equal trade relations with the USSR strengthens the positions of the Asian, African and Latin American countries on the world market.

Under the influence of just and mutually beneficial trade, such as being conducted by the USSR with the countries of Asia, Africa and Latin America, industrially developed countries of the West, were compelled to make some concessions and give up th most undisguised forms of plunder and economic pressure.

The development of trade relations of the USSR with countries of Asia, Africa and Latin America is our great material contribution to the noble struggle of the peoples for the annihilation of the shameful colonial system.

The planned great rise in the volume of industrial and agricultural production presents new possibilities for the further development of mutually beneficial trade relations of the USSR with the countries of Asia, Africa and Latin America.

For the past 9 years after the signing in 1953 of the first trade agreement between the USSR and India the trade turnover between two countris has considerably increased.

It amounted to only 9.4 million rupees in 1953 as compared to about 600 million rupees in 1961. This clearly testifies to the fact that India-Soviet trade is mutually beneficial.

After the reciprocal State visits of N. S. Khrushchov and Jawaharlal Nehru, the trade between the two countries began to grow rapidly.

In November, 1958, a new Trade Agreement was signed, which extended the principles of most-favoured nation treatment. The Governments of both the countries undertook according to the agreement to develop and strengthen the trade relations between the USSR and India on the principles of equality and mutual benefit. They also have agreed to study and with utmost goodwill take decisions on the suggestions which either of them would like to present for consideration of the other with the purpose of achieving closer economic relations.

This agreement placed the trade relations between the two countries on a new solid foundation. It provides for an increase in the turn-over between the USSR and India by 1963 upto 1 billion rupees, i.e., more than twice as much as in 1960.

According to this Agreement, the import and export of goods by both parties can be carried out on the basis of contracts to be concluded between Indian physical and juridical parties, including Indian State-owned organisations on the one side, and Soviet Foreign Trade Organizations, on the other side.

The Soviet Foreign trade Organisations are expanding trade operations both with Indian State Organizations and Indian private firms.

A notable feature of the Soviet export to India is the growth of the proportion of machines and equipment. Besides equipment for industrial works, plants and factories, Soviet foreign trade organisations supply metal-cutting machine tools, tractors, agricultural and road-building machines, drilling and mining equipment, rolled steel products, non-ferrous metals, printing paper, fertilizers, chemicals, medicines and many other goods required by Indian developing economy.

In 1960, a new item appeared in the lists of Soviet goods to be exported to India—oil products.

In June 1960 the Soviet foreign trade organisation V/O 'Sojuznefteexport" signed with Indian State organisation "Indian Oil Company" a long-term contract for delivery in 1960-63 of 1.5 million tons of Soviet oil products, on conditions favourable for India.

Apart from direct economic advantage to India this deal has helped to lessen the grip of foreign monopolies which were forced to make concessions in respect of prices for crude oil and and oil products which they are selling to India.

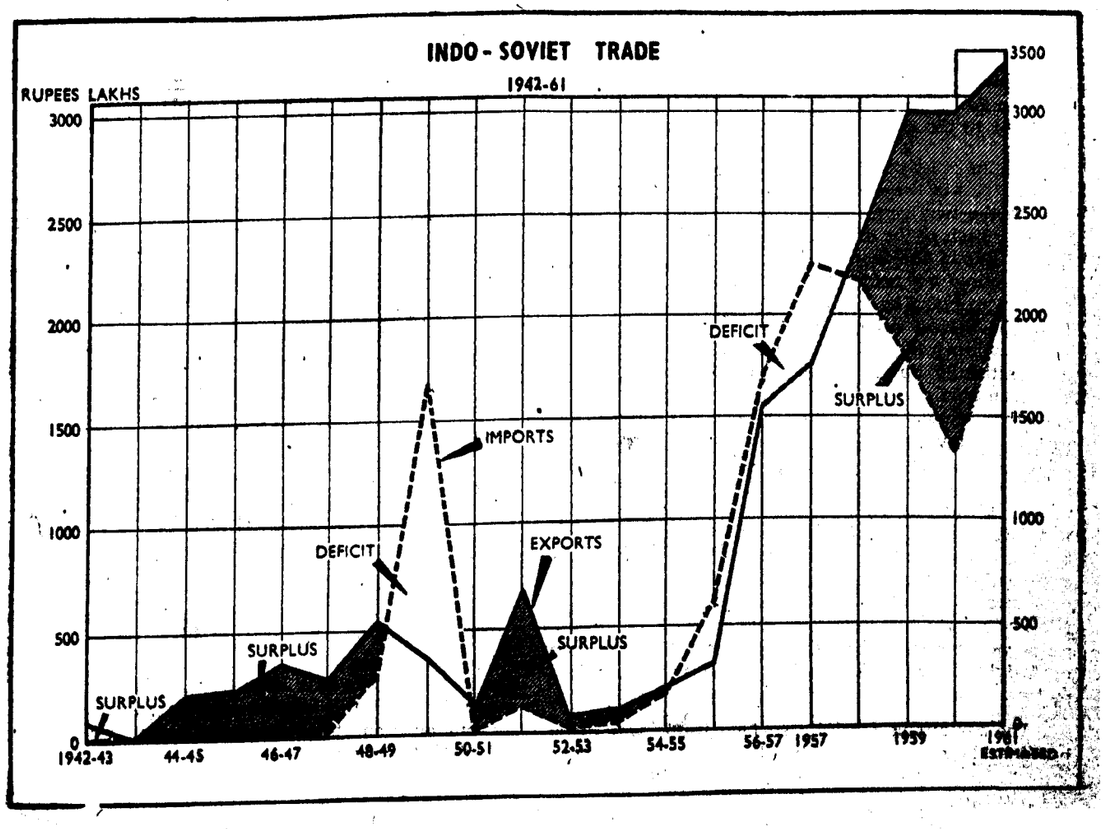
It is notable feature of the Indo-Soviet economic relations that while delivering to India rolled steel products, machinery and equipment, the Soviet Union has built at the same time the Bhilai Metallurgical Combine plant, is engaged in oil exploration in India and is constructing a heavy machine building plant at Ranchi.

In the Soviet import from India in 1960 the largest proportion belonged to such goods as tea, goatskins, wool, cashew nuts, black pepper, leather footwear, mica, shellac. It is worthwhile mentioning that at present the USSR occupies s considerable proportion of Indian export and import of certain goods. India exports to the USSR about 22 per cent of its export of coffee, 20 per cent of black pepper, 15 per cent of wool, 19 per cent of castor oil, 12 per cent of cashew nuts, 10 per cent of shellac, 7 per cent of tea.

The USSR is increasing purchases of Indian manufactured goods, such as leather foot-wear, woollen cloth, jute bags and jute cloth. It also is becoming a regular buyer of products of Indian handloom industry and handicrafts, thus stimulating the employment scope of Indian people.

The purchases of Indian goods are being increased by the USSR from year to year according to the steady increase in imports from the Soviet Union by India.

In its trade with the Soviet Union India does not spend deficit foreign exchange because all payments for the goods are effected in Indian Rupee.



This trade has bright prospects because India finds in the Soviet Union a stable market for its traditional export goods in ever increasing quantities. At the same time India can obtain any goods from the Soviet Union which are essential for the development of Indian economy.

The Pattern of Indo-Soviet Trade: 1942–1961

THE volume of India's trade with the U.S.S.R. was almost nominal till 1954-55 except for 1949-50 when imports from the U.S.S.R. exceeded Rs. 16 crores. This was due to the fact that the Indian Union in that particular year imported wheat alone worth Rs. 9.66 crores. A real spurt to Indo-Soviet trade came with the signing of the first trade agreement between the two countries in 1953. Since then the curve has taken a steep upward course which is amply demonstrated in the graph below. Between 1955-56 and 1957 India's imports always exceeded exports. The volume of deficit, however, was of small proportion. Since 1958, India's exports have exceeded imports showing a sizeable surplus. According to the preliminary figures available for the first nine months of 1961, India's trade with the Soviet Union indicated a surplus of the order of Rs. 9.71 crores with imports at Rs. 15.35 crores and exports at Rs. 25.06 crores. This partnership in trade is likely to grow at an accelerated rate in view of the facilities offered by the Soviet Union to accept rupee payments for all our imports.

A measure of the galloping rate of rise in trade between the two countries is provided by the index of volume of trade (vide table on page viii). With 1942-43=100, the index showed a steady and steep rise from 1954-55, the index was more than four times the 1942-43 level, while in 1960 it was almost 48 times the index in 1942-43. In 1961, the index is likely to be nearly 60 times the total volume of trade in 1942-43.

An analysis of the composition of India's trade with the U.S.S.R. illustrates the direction in which the two countries can participate increasingly in the coming years. The tables on page (xii) give for the year 1960-61 India's exports as well as imports from the Soviet Union. On the exports side, the pride of place is taken by the beverages such as tea, coffee, and cocoa. The total volume of exports of these beverages and spices was Rs. 115.8 million. Hides, skins and fur skins (raw) valued at Rs. 43.9 million were exported as against textile yarn and fabrics valued at Rs. 42.3 million. Next in the order of importance came fruits and vegetables followed by textile fibre and waste and foot-wear. The export of foot-wear has increased at a phenomenal rate, keeping the order books of many of the Indian manufacturers almost full. This is, indeed, a happy trend in view of the fact that the exports in

value can be increased substantially by exporting footwear instead of exporting raw hides and skins.

On the list of imports, the most important item was the base metals consisting of iron and steel, aluminium, tin, and zinc. Next to the base-metals, the most important item was machinery, (electricdl and other machinery) valued at Rs. 39 million. Fertilizers of the value of Rs. 10.5 million were also imported in order to fill the gap in India's total demand of this vital element for raising food output. Another important product which claimed a high figure of Rs. 10.6 million related to paper and paper boards. By and large, the imports picture shows India's hunger for machinery, base metals, and fertilizers. In view of the growing trade relations between India and the U.S.S.R. it is anticipated that the volume of imports, machinery in particular, will rise faster than other items. At the same time, India's traditional exports will find a ready market in the U.S.S.R. As stated earlier, the facility for rupee payments for imports has been the prime mover for growing participation in trade between the two countries.

It is to be conceded that India's traditional exports have featured heavily in the list of commodities exported to the U.S.S.R. If the volume of trade between the two countries is to continue its upward march, it is necessary that concerted efforts should be made to sell India's non-traditional goods such as engineering goods as well where production is rising very fast in the Indian Union.

INDO - SOVIET TRADE

(Rs. Lakhs)

Period	Imports	Exports (incl. re-exports	Balance of trade	Index of total volume* of trade

The Two Transport Systems

WHILE there is not much room for a close comparison between the development of the transport system in the 40 years of crowded and speedy economic development in Russia and in 10 years of India's relatively gradual expansion, there are certain features which deserve to be analysed. Both the countries are eminently suited for a wide network of inland surface transport and the location of the natural resources and of industries, as well as the pressure of demand generating from agriculture in every part of the country, create top priority demand for domestic transport. The size of the home markets and the relatively small scale of foreign trade also add to the pressure on domsetic transport.

But in most other respects there are considerable divergencies in the development of the system of transport in the two countries. In each, railway transport is the very basis of the entire structure of communications. But in Russia the Soviet regime started both with a handicap and a benefit (in the form of a wide choice for freedom to plan) by reason of the fact that it inherited from the Czarist rulers a system of rail transport that was very much in a dilapidated condition. Russian planners faithfully observed the basic dictum of planning that transport and power must precede development in the other sectors of the economy and with that end in view they gave a high priority to the building of a far-flung system of rail transport. In 1960, 80 per cent of the freight traffic and 75 per cent of the passenger traffic in Russia was carried by the rail transport system. That in itself speaks for a predominance of the railways in that country and this predominance has been a matter of deliberate choice. It is unlikely to be changed. The dependence of the economy on the rail transport system is to be gauged from the fact that in 1959 the Russian railways operated 1,429,500 million net ton-kilometres of freight traffic and 164,400 million passenger kilometres.

The remaining domestic surface traffic was distributed in the proportions of two-thirds for inland waterways and one-third for road transport in the freight sector, but in the passenger sector the bulk of the remaining share was claimed by road transport. It is a singular characteristic of the Russian rail transport system that continuous technological improvements are incorporated in the equipment and the minimum of obsolescence is invited by reason of the specialisation of the Russian technicians in fitting modernised and improved components on the old equipment instead of discarding the latter completely. Inland waterways are the second predominant mode of transport for six months when climatic conditions allow them to be navigable. The relative positions of railways, inland waterways and roads are very nearly fixed by the development during the last four decades as a pattern for the future.

India had the benefit of inheriting a sound structure of the rail transport system from her former British rulers. There is need for extending the network of railway lines in some areas which have no easy access to any modern mode of transport. Since planning was inaugurated Indian railways are under great pressure of continuous and rapid expansion and their physical capacity as well as financial resources have begun to show strains. In India road transport must be encouraged in the coming years, but the difficulties of the period of transition, in which co-ordination poses many perplexing problems, have hindered the expansion of the road system. Inland waterways are practically out of use and if investment can be spared in the midst of the strict rationing of finances for the development projects, the revival of the old waterways and the construction of new ones will not only bring economy in cost of operation but speed in the movement of traffic. But the major problem posed before India is to meet critical situations as they arise from time to time by reason of the fact that provision of transport capacity has to be made not from the long-term perspective, as it should be, but on a short-term basis of five years or perhaps below that margin.

Soviet-Indian Economic and Technical Co-operation in Establishment of Industrial Enterprises

By MR. B. S. ROMANOV, Counsellor for Economic Affairs, USSR Embassy, New Delhi.

THE Soviet Union has always attached great importance to the development of economic relations between the States, considering it one of the most significant principles of strengthening friendship and peace. The striving of peoples of the countries in South-East Asia for achieving complete economic independence and progress is near to the heart of the Soviet people.

The Soviet-Indian economic co-operation in establishment of industrial enterprises is an important factor in creation of key branches of the Indian Industry and it facilitates the industrialisation of the country and the streagthening of its economic independence.

During the period of 1954-55, an agreement was reached between the Government of the USSR and the Government of India for co-operation in the establishment of the Bhilai Steel Works. In accordance with this, an agreement was concluded on the 2nd February 1955 for the construction of the Bhilai Steel Works. Under this Agreement, both the Governments have decided to establish within the shortest possible time the steel works to the capacity of 1 million tons of steel per year. The Soviet organisations agreed to prepare the Detailed Project Report, Working Drawings and to supply equipment and materials which, at that time, could not be manufactured in India. They also agreed to offer the assistance of Soviet specialists during the period of the construction, erection, and adjustment of the equipment and for the commissioning of this equipment as well as mastering of their capacities. The Soviet Union also undertook the training of Indian specialists for the Bhilai Steel Works. About 700 Indian specialists have undergone training in the Soviet Union in addition to those trained directly at the Bhilai Steel Works—on the shop floor and in the Technical Institute specially organised there. The credit granted under this Agreement is to be paid off on favourable terms—the period of repayment of credit is 12 years with 2.5 per cent annual interest.

The construction of the Bhilai Steel Works was carried out in a short period; it was started in 1957 and completed in the beginning of 1961. Now the successful mastering of the rated capacities is under way there. As on 1st February, 1962, mastering of the rated capacities can be indicated by the following figures: coke—94.0 per cent, pig iron—97.6 per cent, steel—100.4 per cent, rolled metal from 75-90 per cent depending upon the mill. Steel is the main type of product in the Works and as may be seen from the above figures, the full mastering of the rated capacities has been achieved in steel, i.e., 1 million tons of steel per year. The successful mastering of the rated capacities of the Bhilai Steel Works within the short period has been achieved as a result of the selfless labour and creative co-operation of the Indian and Soviet specialists and workers. This also testifies to a high rise in productive culture of Indian specialists and workers who are successfully mastering operation of modern equipment and complex steel production technology.

During the stay of the Chairman of the Council of Ministers of the USSR, N. S. Khrushchev, in India in 1960, negotiations were held and agreement was reached for the expansion of the Bhilai Steel Works to the capacity of 2.5 million tons of steel per year.

The detailed Project Report for expansion of the Bhilai Steel Works prepared by the designing Institutes of the USSR was accepted by the Indian Government at the end of 1961. The negotiations for the supply of equipment and materials from the USSR for the expansion of the Works have been completed by now and preliminary work is already under way. The expansion of the Works will incorporate the latest achievements of modern iron and steel industry; for instance, at present, there are 3 Blast Furnaces working there with an effective capacity of 1,033 cu.m., each can produce about 350-370 thousand tons of pig iron per year. The expansion of the Works provides for the installation of 2 new Blast Furnaces with effective capacity of 1,719 cu.m., each will produce 608 thousand tons of pig iron per year.

The existing 6 Open Hearth Furnaces have a capacity each of 250 tons of steel per heat and the expansion programme provides for the installation of 4 Open Hearth Furnaces with a capacity each of 500 tons per heat and one of the existing furnaces will be reconstructed to the capacity of 500 tons. The expansion programme provides for the installation of an additional rod mill which will produce wire upto 10 mm. in dia. so essential for the construction purposes. The capacity of the existing mills will be increased and they will be able to produce more rails, shape steel and other types of rolled metal which are so essential for the developing economy of India.

The production of main types of rolled metal at the Bhilai Steel Works with the existing capacities and after the expansion can be indicated by the following:

(Thousand tons)

	Annual Output	
	Before Expansion	After Expansion
Rails, heavy		500
Rails, light		20
Strips for sleepers	)365	82
Structural shapes	)	386
Rolled Wire, 5.4—10 mm.	0	490
Merchant Steel	255	262
	620	1650
Billets for re-rolling	150	315
TOTAL	770	1965

After the expansion of the Bhilai Steel Works is completed, it will produce about 25 per cent of the total production of steel in India planned for the end of the Third Five-Year Plan.

Proceeding from the development of steel industry in the country and the increase of requirements in refractory materials which are partially imported with economic and technical co-operation of the Soviet Union, a refractories plant will be established during the Third Five-Year Plan to the capacity of 125 thousand tons of refractories per year.

The Soviet Union is also co-operating in the field of oil industry which plays the primary part in the development of the country's economy.

Before 1956, the opinion that India had no rich oil deposits prevailed. As is known, oil was produced in Digboi oilfield, Assam State, by the English oil company and later by a joint company in which the English Company and the Government have interests. The production of oil stayed for a considerable time on the same level and amounts to about 0.5 million tons of oil, while the country's annual requirements are over 6 million tons. At the end of 1955, a group of Soviet specialists in oil geology came to India on the invitation of the Indian Government. They had studied available data on oil deposits and seen oil-bearing regions on the spot. At that time, the oil deposits in Digboi oilfield and adjacent areas were estimated at 5 million tons, but the Soviet specialists made essential corrections in this estimation, giving it as about 30 million tons or taking into account the nearby regions as about 100 million tons. These preliminary estimations actually came true later and even those foreign experts who had tried to prove that there were no considerable oil deposits in Assam agreed with them. It was the discovery that became a turning point in the decision on the construction of oil refineries in the Public Sector. The Government of India decided to set up two plants for refining of Assam oil—one oil refinery with an annual capacity of 750 thousand tons of crude oil in Gauhati with the co-operation of the Rumanian People's Republic, which was put into operation on the eve of 1962, and the other refinery in Barauni with an annual capacity of 2 million tons of crude oil with the technical co-operation of the Soviet Union, which is under construction at present. The units of this Plant for refining of 1 million tons of oil will be commissioned in 1962-63. The recommendations of the Soviet experts envisaged oil and gas prospecting in some other regions of India which were taken into account by the Government of India while drawing up the Second Five-Year Plan. This work was initiated by the Oil and Natural Gas Commission with the technical assistance of the Soviet Union in 1956. Since then, 4 oil-bearing regions of commercial value have been found—in Cambay, Ankleshwar, Ahmedabad of Gujarat State and in Rudrasagar of Assam State. Besides, prospecting is under way in the Punjab where the existence of considerable gas deposits is evident. The depth of the drilled well there is 4531 metres. The Soviet specialists willingly share their experience with the Indian specialists and workers. Many Indian specialists have been trained and are now carrying out independently deep drilling for oil and gas at a number of rigs.

The commercial production of oil has been commenced in Ankleshwar oilfield. The construction of the first stage of the oilfield has been completed by now and commercial production of oil is under way with the output of 600 tons per day and with further increasing it soon to 900 tons and above. The discovery of new oil bearing areas in Gujarat State has enabled the Government of India to plan during the Third Five-Year Plan the construction of one more oil refinery to the capacity of 2 million tons of oil per year in Baroda region with the assistance of the USSR. At present, the Oil and Natural Gas Commission has completed a plan of oil industry development under the Third Five-Year Plan. It provides for considerable expansion of prospecting work, mastering of the discovered oilfields and commercial production of oil at the new oilfields. According to this plan, the production of oil from new oilfields will be to the volume of 3.0—3.5 million tons by the end of Third Five-Year Plan, which is a great and complicated task. Besides, it is planned to bring the production of oil in the joint Assam company to 2.5 million tons per year. Thus, the total production of oil by the end of the Third Five-Year Plan will be to the tune of 6 million tons and that will considerably help in meeting the requirements of the country in oil, owing to its being produced indigenously, upto 50 per cent of the expected consumption by the end of the Third Five-Year Plan.

The next important field of Indo-Soviet economic co-operation is the construction of electric power stations. As it is known, the Third Five-Year Plan lays great stress on power development and provides for additional power capacity of 7 million kw. The USSR assists in the construction of 4 thermal power stations: Neyveli (Madras State)—with a capacity of 400,000 kw, Obra (Uttar Pradesh)—250,000 kw, and expansion of Korba power station (Madhya Pradesh) from 90,000 kw to 290,000 kw. The Patratu Thermal Power Station will also be built in Bihar to the capacity of 100,000 kw. of the first stage with expansion to 300-350,000 kw and the Right Bank Bhakra Hydro Power Station—480,000 kw. The total capacity of all these power stations will be 1.7 million kw or about one-third of the present power capacity. As it is known, the first 50,000 kw unit of the Neyveli Thermal Power Station with the total capacity of 400,000 kw is planned to be commissioned in the nearest future.

In the field of heavy machine building industry, the USSR renders assistance to India in the construction of Heavy Machine Building Plant in Ranchi which will produce annually 80,000 tons of heavy equipment, out of which 65,000 tons will be metallurgical equipment. The products manufactured at the Plant in one year will be nearly sufficient for equipping such big enterprises as steel works to the capacity of one million tons of steel per year such as the existing Bhilai Steel Works.

Another big heavy machine building plant is the Coal Mining Machinery Plant with an annual capacity of 45,000 tons of equipment The products of this plant will enable to mechanise mining of about 8 million tons of coal per annum which approximately equals to an average annual increase in the coal production during the Third Five-Year Plan.

At these Plants, the designing departments will be organised with Indian specialists who shall work out independently the designs of machines and equipment in conformity with the requirements for industrialization of the country on the basis of technical documentation supplied from the Soviet Union. The personnel for these departments will be trained in the USSR to a number of about 300 Indian specialists, a part of whom is already there. The training of Indian designers and technologists will also be carried out at the Indian enterprises and organisations.

Another big heavy industry plant is the Heavy Electricals and Turbines Plant which is planned to be set up in Hardwar area. It is envisaged that this Plant will manufacture hydraulic turbines and generators of upto 100,000 kw capacity and steam turbines and generators of upto 200,000 kw capacity. The commissioning of this Plant will enable India to manufacture equipment for large hydro and thermal power stations with the total capacity of 2.7 million kw. per annum, and provide broad possibilities for construction of new power stations.

Rapid development of heavy machine building industry requires indigenous manufacture of instruments and apparatus. The Soviet Union renders India assistance in establishment of the Precision Instruments Plant during the Third Five-Year Plan. The USSR also provides assistance in establishment of coal enterprises. Two coal mines with the total capacity of 1.7 million tons of coal per annum are being constructed in Korba area (Madhya Pradesh). Besides, a coal quarry will be constructed to the capacity of 1 million tons of coal per annum in the first stage with further development of 2 million tons of coal per annum. A repair shop capable of repairing a great number of coal mining equipment will also be built. A coal washery with the capacity of 3.5 million tons of coal per annum is planned to be established in Kathara area.

In the field of medical industry, the USSR also renders assistance in establishment of Antibiotics Plant in Rishikesh (Uttar Pradesh) with the capacity of 300 tons, the Synthetic Drugs Plant in Sanatnagar (Andhra Pradesh) with the capacity of 850 tons, the Phyto-Chemical Plant at Neriamangalam (Kerala) with the capacity of 76 tons, the Surgical Instruments Plant near Madras with the capacity of 2.5 million instruments, and the Ophthalmic Glass Factory in Durgapur (West Bengal) to the capacity of 300 tons of products. The production of these enterprises will make essential medical supplies available to the Indian people.

In the field of agriculture, on the basis of equipment presented as a gift of the Soviet Government to the Gomment of India in 1956, the Central Mechanized Farm at Suratgarh (Rajasthan) was set up, which has reclaimed 12.5 thousand hectares of desert land and now gets high yields of cereals and provides better seeds for adjacent regions of other States.

In the field of training the national cadre, the USSR offers assistance in organisation of Bombay Technological Institute and training of Indian students and post-graduates in the USSR.

The economic and technical assistance of the USSR is rendered on the principles of full equality of rights and mutual benefit. The USSR supplies under credits highly efficient industrial equipment which is the most modern by its technical properties. Besides the Soviet Union deputes highly skilled technical specialists to render assistance in establishment of big industrial enterprises. The repayment of the credits granted by the USSR is effected not with foreign currency but through supplies of traditional goods of Indian export. It does not create a problem for the Indian economy by making more acute the balance of payments and does not affect the Indian reserves in foreign currency but guarantees the increase in marketing of Indian exports.

During the visit of Jawaharlal Nehru to the Soviet Union in September last, the Chairman of the Council of Ministers of the USSR, N. S. Khrushchov, and the Prime Minister of India, Jawaharlal Nehru, noted with satisfaction that the friendly relations and co-operation between the Soviet Union and India were successfully developing to the mutual benefit of the peoples of the both countries. With great satisfaction, they noted considerable progress achieved in the field of Soviet-Indian economic and technical co-operation. With the signing in 1961 of a new Soviet-Indian Economic Agreement favourable pre-requisities have been created for further development of economic and technical co-operation between the USSR and India.

The Chairman of the Council of Ministers of the USSR, N. S. Khrushchov, expressed his firm confidence that the visit of the Prime Minister of India, Jawaharlal Nehru, to the Soviet Union was a new and important mark in strengthening the mutual understanding, co-operation and friendship between the Soviet and Indian peoples.

The 22nd Congress of the Communist Party of the Soviet Union held in October 1961 which plays historic role in the life of the Soviet people, has once more emphasised the life-asserting ideas of Lenin of friendship and peace among the peoples, the ideas of help to the peoples in their struggle for Progress, struggle for Peace, Labour, Freedom, Equality, Fraternity and Happiness of all the peoples.

Import and Export Policy

The Ramaswami Mudaliar Committee's Report

ECONOMICS, like politics, in Bismarck's immortal phrase, is the art of the possible. The recommendations of the Ramaswami Mudaliar Committee need to be examined not from the point of either ideal perfection or from the point of forming a base for an indefinite time in India's import and export policy. This is a report for the present, and nothing is more certain than that changes in recommendations, which apply only to the present, will be inevitable in the future. Secondly, the recommendations have to take account of the vast political apparatus which now weighs heavily on all economic proposals. Recommendations, however sound in their economic aspects, are set for all time in an unyielding mould, composed largely by political force. The Committee has been well advised, notwithstanding the attractions of being dashingly original and far-reaching, to place its recommendations on a solid base of political possibility and immediate economic feasibility.

Within this framework, which is inevitable at the present time, it can be claimed that the Committee has made a notable contribution to a more vigorous export policy, based on effective principles of export promotion. It has been criticized in two or three respects by critics who are far more theoretical than practical in the current context. One of these criticisms is that it has not gone far enough in reducing the structure of costs in Indian Industry. It would be wholly impossible to cover the massive elements that go into indigenous costs in a report even ten times the present size. The Committee has, therefore, been well advised to concentrate on reduction of export costs which follows on fuller utilisation of capacity by the additional supply of raw materials. Its proposals to constitute an Import and Export Stabilisation Fund and to finance it by revolving credit, has the merit not merely of moderation, but would seem from preliminary response received, particularly from the German banks, to be in the range of immediate practicability. If raw materials could be added to this to the extent of 20 to 25 per cent in certain efficient units, cost per unit could perhaps be reduced by about that margin. As the Committee points out, a reduction of cost of this order would make a very large number of India's non-traditional exports competitive. It is, therefore, wholly wrong for armchair critics to argue that the Committee has lost sight of its responsibility in respect of seeking a more competitive level of costs in our new export industries.

The danger is not that the Committee's three-tier level of export incentives—rebates on sales taxes and transport, provision of raw materials from the Import-Export Stabilisation Fund, and income tax relief on a graded basis—will prove insufficient. Taken together, they can provide a formidable shot in the arm for practically all industries which are ready sincerely to work for export promotion under conditions which they have never enjoyed before. The danger is that these recommendations, which are deemed conservative by some of the critics, might be deemed radical by the Government. It is sincerely to be hoped that the Ministry of Commerce and Industry will not lose courage at a great turning point in India's economic history. It is vital that the recommendations of the Committee, which have been the result of unremitting labour for six to seven months, should be fully supported.

"The Eastern Economist" believes this report is far-reaching not merely in its import and export promotion recommendations, but also because of the new psychology it attempts to create in the organisation of our international trade that its acceptance by the Government will not be enough. The Committee has rightly stressed the point that a crusade needs to be undertaken to obtain co-operation at all levels, so that neither institutional nor personal hinderances operate to prevent the export drive from gathering momentum. The high targets for the Fourth Five-Year Plan, to which reference has rightly been made, suggest the need of a rise in exports of at least Rs. 100 crores per year. Whether the recommendations of the Committee are adequate for this purpose or not is a matter to be proved by time. But, in any case, "The Eastern Economist" considers that the country as a whole, and not merely the Government, should be in possession of these recommendations without delay. It has, therefore, taken the extraordinary course of producing a Blue Supplement with a summary of these recommendations only. It is in the hope that a study of these recommendations will lead to widespread support of the main objectives of the Committee not merely in words but in dynamic deeds that this departure from practice has been attempted.

Import and Export Policy Committee's Report

Summary of Conclusions and Recommendations

The Problem

THE Third Plan starts with a legacy of valuable past experience of large-scale planning, as well as with depleted exchange reserves, a sizeable foreign debt, with virtually no net 'invisible' over-sea income, and a yawning gap in balance of payments. The country has taken in hand the formidable task of creating, within the course of a decade, a self-propelling economy, capable of supporting a high level of investment and employment.

2. The balance of payments position will continue to remain under severe strain for many years. If the bill for 'Maintenance' imports goes up, the country would have to redouble its efforts to augment its exports to honour its financial commitments and maintain its credit in the international market. The annual import requirements of the succeeding plans will be even larger; so will be the repayment obligations on account of debt services and interest charges. Already, the country is functioning under a system of stringent import and exchange restrictions. There is little scope for further curtailment of foreign exchange expenditure.

3. We have not dealt with the import requirements of our Defence industries and the export possibilities of some of them. A great deal could perhaps be done to conserve—and earn—foreign exchange through an integral policy for the whole economy. A Commission of Enquiry may be appointed to go into the matter, necessarily working 'in camera'.

4. Overall, it will be necessary to see to what extent the available resources in foreign exchange can be used more economically; how best the country's stock of resources can be distributed to yield an optimum return; to what extent existing capacity can be more fully utilised to enlarge production and augment exports; how far indigenous sources can be more fully tapped for the supply of equipment and raw materials; what measures of import-saving and export promotion can be installed.

5. The task of elevating India's exports to twice their present level by the end of the Fourth Plan will require effective measures which will demand the whole-hearted co-operation of all sectors of the economy.

Import Policy and Procedure

6. The objectives of Import Control as enunciated by official spokesmen are unexceptionable; but the question is one of translating these principles into practical terms, and of evolving the right kind of import priorities.

Maintenance vs. Development Imports

7. The present controversy is due to a misconception about "industrial capacity". For an objective assessment of the problem, only the "effective capacity" can be taken into consideration. 'Maintenance' and 'Development' of the economy are two facets of the same phenomenon, and there can be no hard and fast dividing line between them. There are certain 'developments' which are necessary for keeping the existing industrial units in full production, such as, for instance: (a) power, (b) transport and (c) industries producing raw materials and components for the existing units which are presently being imported.

8. It is also sometimes forgotten that considerable new 'Development'; apart from being necessary in itself, is financed out of the 'tied aid', which is not available for financing 'Maintenance' imports. There, is, therefore, little choice in these cases. Also in order to keep the wolf of inflation at bay, the country has perforce to 'maintain'/'develop' industries catering for the primary needs of the population. Precedence has also to be given to the 'development' of 'export-oriented' industries. Thus, there can be no rough and ready solution to the theory of 'Maintenance' first and 'Development' afterwards and 'vice versa'. The country can neither freeze the pattern of the economy, nor allow its stagnation. A balance has to be struck between competing claims on scarce resources. The approach has to be pragmatic and selective, designed to stimulate the dynamic spread of the cumulative process of economic growth and to disperse and diversify the economy in consonance with the objectives of the Plan.

9. All considered, the policy, in brief, should be to give facilities for the import of raw materials and components etc. to all existing industries, subject to over-riding priority being given to certain types of new industries such as:

(i) power and transport which have proved a serious bottleneck;

(ii) 'Export-oriented' industries;

(iii) Industries producing raw materials and components now imported. Not all "raw material" industries will, however, be equally eligible for priority. It is important that priority should be given to those industries which will save the largest volume of foreign exchange even though it may not be in the shortest possible time. One such industry to which our attention has been drawn is the Alloy Steel industry which, as far as we can judge, is likely to be, next to Steel, a heavy burden on the foreign exchange budget for many years to come; and

(iv) Industries depending almost entirely on indigenous raw materials and finding/arranging their own foreign exchange for the import of plant and machinery.

Industries financed through a programme of 'tied' credits will, of course, be an exception. There may yet be cases on the border line; but these would necessarily have to be decided on merits.

10. The criteria followed at present in respect of the licensing of industrial establishments or the import of Capital Goods are still somewhat general. What is necessary is a systematic and scientific review, industry by industry, to determine how best production can be augmented, costs reduced, imports saved and exports developed. The relative merits of 'Maintenance'/'Development' industries would have to be objectively assessed. The progress of some of the typical existing 'Maintenance' and 'Development' industries should be evaluated.

Unutilised Capacity

11. A part of the industrial capacity in the country is unutilized. But in the absence of precise information, it is difficult to make an assessment of the extent to which the country's industry is under-utilised or otherwise; and to gauge the extent to which production could be augmented by providing balancing equipment and other feeders of industry.

12. The Development Wing may, therefore, be charged with the special responsibility of constantly reviewing the problem of under-utilisation of industrial capacity and of recommending remedial measures. The results of such reviews should be published annually.

13. It is also necessary to study more closely the question of substitution of imported materials in its widest connotation and to see to what extent and in what manner indigenous products can effectively replace the imported stores; how they can be commercially developed and used. Whichever may be the agency responsible for this task, the assistance of institutes like the National Laboratories could well be enlisted in solving some of the technical problems.

Scope for further import restrictions limited

14. The solution to the problem of bringing the balance of payments in equilibrium lies not in further import restrictions—the scope of which is severely limited, but within limits, in augmenting specific imports to remove the bottleneck on exports. The present stringent import restrictions and rigid exchange allocations may continue in respect of production destined for the domestic market. But where exports can be really assured, Government should have no hesitation in making available such raw materials and balancing equipment as are essentially required.

15. The volume of incentive to be given to emerging industries will need to be substantially larger than in the case of our traditional items of exports. The differential which exists between Indian costs and those of our competitors will have to be considerably abridged if our products are to enter significantly into international trade.

16. There would have to be a basic understanding between Government and the mercantile community, and mutual respect and sympathy for the difficulties, needs and obligations of either side. A selective approach may be made, to start with, with the more well run units of Industry. They may be invited—on the basis of a proper assurance of all-round assistance—to come forward with an integrated programme of industrial and export expansion.

17. Primarily, this assistance should be given to stimulate additional exports; and there should be no objection to giving assistance on a 'loan basis', subject to necessary safeguards, where Government is satisfied on the merits and 'bona fides' of the case.

18. Every proposal of this kind would require detailed examination. After completion of the technical scrutiny the case should invariably come up before an inter-ministerial sub-committee.

19. The cardinal importance of the complementary advance of commercial crops and their impact on industrial development and export promotion has not been sufficiently appreciated. A serious attempt should be made to review the role which Agriculture, Horticulture, Pisciculture and Forestry can play in our economic progress.

Licensing procedure

20. Import procedure plays a vital part in the execution of Import Policy. The procedure should be capable of efficient execution of policy.

21. Import Control is a service organization. The public pays for its services and, naturally, expects from it a high degree of proficiency, quick disposal and integrity. Despite improvement of efficiency in the C.C.I's office (the pendencies being only 0.6 per cent), there has been general complaint of delays, which can have far-reaching consequences, and cost the country dearly in foreign exchange. This aspect should be impressed on all concerned.

22. The solution of delays lies in simplification of procedure, decentralisation of work etc. Our suggestions in this regard are detailed below:

23. All important licensing should, in future, be done on an annual basis. Development of indigenous production is by no means so revolutionary as to justify half-yearly revisions of Import Policy. The basic content of an import licence, over the year, should remain intact. If possible, exchange budgetting, too, should be done on an annual basis. If, on grounds of foreign exchange, it becomes necessary to follow a more stringent policy for the second part of the licensing year, a general percentage reduction could be applied by one single public notice to all import licences. Annual licences should be issued on the basis of a single application, duly accompanied by twice the normal fee (in token of two licences issued in one operation).

Period of validity of Import Licences

24. In view of the genuine difficulties of importers, it is proposed that: (i) the initial validity should be one year in the case of Actual Users' and Established Importers' licences and two years for CG/HEP licences except CG/HEP licences issued against 'tied' credits such as the 'Ex-im Bank' Loans, in which case the validity period should be one year, as at present (ii) Actual Users' licences should be revalidated up to six months, and CG/HEP licences up to one year, upon request, without requiring the licence holder to produce evidence as to the unavailability of supplies; (iii) except in the case of licences issued against 'tied' credits, the power of revalidation should be delegated to the regional licensing authorities; (iv) normally, the validity of Established Importers' licences would not be extended; but in special circumstances, such licences may be extended by 3 months.

25. On balance, it is proposed that the present system of I.V.C. numbers may remain; but henceforth they should be valid for three (annual) licensing periods.

26. The regional offices have to refer certain cases to Headquarters for instructions regarding disposal. These cases are considered by the S.S.I. Committee, whose recommendations are transmitted to the licensing authorities along with the applications/files for disposal. Time would be saved if, instead of remitting the cases back to the licensing authorities, the execution of the S.S.I. Committee's recommendations is done at Headquarters. The clarifications/appeals, too, could be attended to at Headquarters.

27. C.C.I.'s Ad hoc committee should be more fully representative of the concerned technical officers of the Development Wing; and it should be possible to take decisions on the applications in the committee itself, in the same way as does the S.S.I. Committee. Cases, involving special difficulty, could be seen on the file by the technical officers concerned, wherever necessary.

28. There is a general complaint about the long delays in the disposal of applications for the import requirements of scheduled industries. It is proposed that where an application has to be scrutinized by more than one technical Directorate, the sponsoring Directorate should try to clear it at an inter-Directorate meeting. The institution of such meetings, to be held every week or fortnight, should be encouraged.

29. While issuing the "Essentiality Certificates' the Directors of Industries do not always follow a uniform policy. C.C.I. should evolve, on the eve of the licensing period, the general criteria for assessing 'essentiality' in consultation with the Directors of Industries.

30. The Development Wing should bring out annually a comprehensive register indicating the availability of raw materials and components, plant and machinery produced in the country, the names of the producers and full information in regard to their installed capacity, actual production, specification etc.

31. Information regarding monetary ceilings for each licensing head should reach all the licensing authorities on the eve of the licensing period.

32. The application forms for the various categories of import licences admit of some simplification. C.C.I. & E. should carefully go into this mater.

Decentralisation of licensing work

33. There is still scope for further decentralization. It is suggested that: (a) licensing of fresh fruits from Pakistan could well be decentralized, under a general policy laid down by the Chief Controller; (b) licensing of newsprint could be decentralized, as it is not necessary to consult the Registrar of Newspapers on each case; (c) other requirements of printing industry (e.g. printing machinery etc.) could be dealt with by the C.C.I.'s Ad hoc Committee. Whenever necessary, the Registrar of Newspapers could be invited to be present; (d) as C.C.I. has a full-fledged Investigation Division under him, all cases of investigation now dealt with by

the "newsprint cell", may in future, be handled by the Investigation Division, in consultation with the Registrar of Newspapers, whenever necessary; (e) Quota licensing of Greases and Lubricants should be done at the regional offices.

34. The entire T.Q.R. work can now be decentralized. Each regional office could have a small T.Q.R. Cell for the purpose. Cases of special difficulty could be referred to Headquarters for advice.

Public relations

35. It has been complained that interviews cannot easily be had with the officers of the C.C.I. nor is it always possible to get a precise answer to the applicant's problems. The importance of good relations with the public should be underscored to all officers.

Attached to the personal staff of the C.C.I. should be a Public Relations Officer of the rank of a Deputy Chief Controller 'au fait' with the problems of Import Control, who should be able to sort out the importers' difficulties. The regional offices, too, should be assisted by P.R.O.'s of the rank of Controller/Assistant Controller.

Organisational changes

36. It is suggested that: (a) the regional office in Rajkot should be abolished; and, instead, a regional office may be established in Ahmedabad, under a Deputy Chief Controller; (b) there should be a similar office in Kanpur, with jurisdiction over U.P.; (c) in view of transit difficulties, specially in winter, a sub-office, under an Assistant Controller, may be opened at Srinagar, with jurisdiction over the State of Jammu and Kashmir; (d) there should be a similar office in Bangalore, with jurisdiction over the State of Mysore.

Miscellaneous problems

37. 'Status quo' may remain in respect of allocation of import licences between Established Importers and Actual Users. However, in the case of industries, with a large number of units, it will be an advantage if the imports of components etc. are canalized through Established Importers to prevent undue locking up of foreign exchange.

38. Small value licences are wasteful of foreign exchange. But the abolition of the present system might lead to displacement of a large number of Established Importers. Recommend 'status quo'. However, Established Importers may be permitted to effect their imports through agents on the basis of 'Letters of Authority', which may be given freely to allow of 'clubbing' of 'small value' licences to prevent wasteful expenditure of exchange.

39. An exhaustive policy should be framed in respect of items licensed on 'ad hoc' basis, by reviewing all cases over the past two years, and case laws evolved. There should be, basically, no 'ad hoc' licensing, except in cases of emergency, or where the necessity of the import of any particular item could not be foreshadowed or a formal policy could not, for any reason, be evolved.

I.T.C. and I.C.T. classifications

40. The institutional arrangements for resolving classification difficulties seem to be in order. But the existing arrangements need to be published. The I.T.C. authorities are planning to adopt the S.I.T.C., which is a detailed instrument of trade classification in international usage. If the Customs authorities, too, adopt the same, it might solve many of the classification difficulties. Also, the description of goods in the import licences should be as detailed as possible. If even so, there is a difference of opinion, the interpretation of the I.T.C. authorities should prevail for purposes of clearance; the Customs authorities being free to levy such import duty as they deem appropriate. A formal understanding to this effect should be reached between the two authorities.

41. There should be a separate 'Appeals Section' at each of the regional offices, so that the 'first-appeals' could be considered more formally and dispassionately.

42. It should be impressed on the Special Police Establishment that, normally, their investigations in respect of Import Control cases should be completed within twelve months. Where, however, an investigation cannot be completed so soon, the ban on the issue of import licences should be removed after the expiry of two (half yearly) licensing periods. This would mean that import licences in such cases would remain suspended for two licensing periods, and a final decision on the type and quantum of punishment would be taken in the light of the results of investigation. The proposal would perhaps necessitate an amendment of the Import Control Order etc.

43. There are over one hundred Writ Petitions against the C.C.I. It is highly necessary that the C.C.I.'s office should scan the 'Law Reporters' for the past several years and prepare a compendium of all judgments so far delivered, duly indexed and annotated in consultation with the Ministry of Law. A separate small 'Legal Cell' should be constituted at Headquarters to undertake the early compilation of the 'compendium of judgments' and to attend to the defence of the numerous Writ Petitions.

Export Promotion

Intricacies of the task

44. The task of doubling the country's exports and raising them to Rs. 1,300 — Rs. 1,400 crores per annum by the end of the Fourth Plan, would be a formidable one for any country. The export demand for our traditional items is by no means buoyant. It is also difficult to foreshadow what repercussion the 'economic communities' will have on the future course of Indian trade; but, undoubtedly, India will have to make much more than ordinary efforts to boost her export business. The whole nation will have to crusade for the export markets — not only in traditional lines but along the entire front of exportable products.

45. The domestic market, ready at hand, offers more attractive, quick and easy returns. The incentives to efficiency become relatively weak; costs tend to go up, the quality goes down. The country has also not developed any great export tradition; much less the necessary export apparatus. A considerable part of India's over-sea trade, specially her exports, goes 'via' the entrepot countries; and only a fraction of trade is manned by Indian merchants.

Lacunae in promotional effort

46. The country has touched only a fringe of the export problem. Whereas targets of a higher order have been, theoretically, drawn up, adequate steps have not yet been taken to dovetail the import-export targets with the Plans and projects of development in the private and in the public sector and to lay the foundation of a big trade. This deficiency is beginning to be repaired, though slowly. The current arrangements are no more than mere 'promises' to export. Where the country's future is mortgaged, any casual acceptance of illusory export prospects at their face value is likely to lead to difficulties. Special attention should be paid to this problem and the 'promises' should be properly appraised in each case; appropriate bank guarantees obtained; failure to export would need to be suitably panalized; genuine difficulties will have to be gone into. A special section, to be created in the Directorate of Export Promotion, should watch the performance of the assisted industries and ensure that the export obligations are duly respected.

47. A detailed and organized study should be made, industry-wise and commodity-wise of the items that could be or should be released for export. These studies should be undertaken urgently, and actually reflected in the export plans which should be an annual feature of the economy.

Export Climate: Export business must become worth doing

48. The high task of export promotion as envisaged in the Plans will demand the willing and enthusiastic co-operation of every sector of the economy. The State Governments do not always seem to be alive to the primacy of export promotion; and more of their policies, particularly in the fiscal field, have hindered the even flow of exports. The nation cannot afford to think and function compartmentally.

49. The Government will have to carry the business community with it in its effort to make a breakthrough in the world market. The promotion of our trade depends upon the efficiency of our merchants and manufacturers. It is the business community that would have to shoulder the main burden of responsibility of augmenting the country's export trade.

50. The mercantile community cannot be expected to be guided by altruistic or patriotic motives and will expect to receive, for its efforts in the export market, a return which stands in a reasonable relation with the profits on domestic sales. It would be Government's responsibility to compensate the trade for its export effort through selective concessions, fiscal reliefs and other incentives to make the export business worthwhile over the long haul.

Revitalisation of the Administrative Machinery

51. It will be necessary to have a co-ordinating machinery, sufficiently powerful to be able to cut through the tangles of conflicting inter-departmental interests, re-orient the thinking of the State Governments and reconcile their stand-points with the national objectives of export promotion. It should be capable of taking quick decisions on the day to day issues and of translating them into practical terms. The problem of securing surpluses for exports, cannot be left to the unaided efforts of private enterprise. It is a matter of supreme national concern — one in which the State must take a direct hand.

52. It is understood that Government is proposing to strengthen the organization for Export Promotion. This is a step in the right direction. We trust it will be adequately staffed and headed by an officer of sufficiently high status, so that the organisation may be able to pull its weight with other departments of Government; secure recognition in the mind of the nation of the vital need for an all round, substantial, expansion in India's exports and make export promotion a profitable, and yet respectable and patriotic avocation.

53. The Directorate of Export Promotion should have a 'Policy Cell' like the 'Import Policy Cell' under the C.C.I. It should be responsible for framing the export policy for specific items, and constantly review the aids and incentives given in other countries with the object of examining how far they can be adopted with advantage in India.

Incentives: Increased allocation of raw materials

54. The incentives so far given have been only moderate and, indeed, often ineffective. India will have to embark on a much more adventurous policy of 'aids and incentives' to augment her export trade.

55. One of the most effective aids would be to permit of an increased allocation of raw materials to industry. A substantial part of the unutilized capacity is by far and large a reflex of shortage of imported raw materials, components and replacements. If additional raw materials could be imported say for Rs. 100 crores per annum, as suggested by Sir Donald Macdougall, they may well serve as the first basis for a substantially new attempt to break the bottleneck of raw materials. The fringe benefits flowing from increased production/additional exports may far outweigh the increased expenditure on the marginal imports required for a fuller utilisation of the industrial capacity or intensification of Agriculture.

56. It is highly important that the existing export-oriented industries should be assured prompt and adequate supplies of essential raw materials at international prices so that they do not suffer from a price disadvantage in relation to their competitors abraod. On balance, India would stand to gain by under-writing in full the foreign exchange required for manufacturing goods for export. The production costs would thus be reduced; and it may well be that much of the differential that exists in some industries can be overcome merely by this provision.

57. A search will have to be made to find a foreign exchange allocation for these additional imports. If internal allocation of foreign exchange does not allow of any significant importation of marginally needed raw materials, stores and replacement equipment, the case studies could be put to the friendly countries; and perhaps, on this plane, it may be possible to secure further assistance to put the Indian economy in an even keel.

Import-Export Stabilization Fund

58. It may also be possible to finance the import of these additional raw materials through the media of a revolving fund which may be specially created for the purpose. There is reason to believe that groups of international banks may be agreeable to provide credits for import of raw materials to be used by approved exporters, who can be relied upon to fulfil undertakings on exports. It would be imperative to ensure that the foreign exchange so lent would be translated into export earnings to form the basis of what may be termed as the 'Import-Export Stabilization Fund' which could be used to enhance the import of raw materials for the export industry. The arrangement would imply the matching of additional 'import credits' with export performance so as to augment both sides of the equation and to improve India's balance of payments in the process.

59. It will be necessary to have an Agency which will have all the authority of the Government to ensure high priority to these activities, but will also carry the conviction abroad that the funds made available for this purpose would not be diverted to domestic production. An autonomous body may be set up as soon as possible under the caption of 'Export Stabilisation Board'. The example of I.C.I.C.I. should serve as a useful guide. It would have control over the export earnings and also possess statutory authority to negotiate credits for the import of raw materials to be translated into export earnings. When the revolving fund has attained the desired level, any surplus foreign exchange that may accrue would revert to Government.

60. For a provisional figure designed to increase India's exports by say Rs. 100 crores per annum, it might be necessary to place at the disposal of the 'imp- exporters' an additional sum of possibly Rs. 25 to Rs. 30 crores as a revolving fund to finance the requisite imports and to supplement them by indigenous stores, wherever possible, at prices corresponding to the competitive world standards.

61. Certain American firms have also shown interest in financing the import of raw materials and components required for our export-oriented industries against rupee payments. The rupees so earned will be used by them for buying Indian commodities for their home market. Such arrangements — affording a line of 'untied' credit for the import of raw materials — need to be encouraged if, on merits, the terms offered by them are mutually beneficial.

Income-tax relief

62. One of the most powerful incentives for export promotion would be remission of income-tax on export earnings. Such a relief has been given by way of 'exporters' compensation' in some of the most advanced countries like Germany, France, Japan with considerable success. India might do something similar. Our initial idea was to confine the grant of income-tax remissions only to earnings from additional exports. But on further reflection it seemed to us that this may not be a step in the right direction, for — unless effective measures are taken to buttress our exports, their present level cannot be taken for granted. It is also felt that unless the remission of income-tax on additional export earnings is linked with the re-

on the basic exports, the system would fail, with serious loss of revenue to Government.

63. Having regard to all aspects of the case, a three-fold system of income-tax remission is proposed viz. :—

(a) a tax remission of 7½ per cent on profits on 'Basic' exports;

(b) a tax rebate of 5 per cent on all export earnings to enable the exporter to build an 'Export Development Reserve';

(c) a special tax remission of 10 per cent on earnings on 'additional' exports i.e. exports over the basic norm.

64. It is important to the success of this significant measure that the method of calculating the tax rebate should be simple. The Income Tax rebates proposed in this report would be based on the exporters' internal and exports turnover; and it would not be necessary to make a meticulous calculation of their actual earnings by reference to their books of account. A tax remission based on a meticulous calculation might lead to acrimony between the exporters and the income tax Department.

65. The system proposed is so devised as to prevent the possibility of exporters' abusing the concession. (The details of the arrangement proposed have been explained in paras 37—46 at Pp. 29—33 of the report).

Enlargement of the scope of Export Promotion

66. The incentive of 'currency retention' has been tried with varying degrees of success in many countries. It is, however, not necessary to let the Indian exporters have a free hold on any percentage of their export earnings. Instead, the scope of the present 'Export Promotion Schemes' should be widened. The exporter's choice to import should not be limited to one or two items as is the case at present; and exporters/manufacturers, under this arrangement, should be able to use their licences for any raw materials, components or equipment which they may care to import for the manufacture of the 'export product', subject to certain restrictions vide Para 50 of the Report). Fnurthermore, the Export Promotion Schemes need not, necessarily be limited to certain specified items as is now the case, but should cover the whole range of items entering the export market. Further, if the import commodities are not required for a particular industry, they may be allowed to be sold to a sister industry. The aforesaid concession may be open to manufacturers as well as to exporters, though the entitlement of the mere exporter (or the manufacturer who does not intend to use the stores himself) may be only two-thirds of the manufacturer/exporter.

Freight concessions

67. As Indian commodities are facing intense competition, and as our overseas salesmanship is still weak, it will help the export effort if the railways give a general rebate of, say, 25 per cent on all goods put on board. Where a commodity requires a freight rebate beyond 25 per cent, a case would have to be made out. As export freight traffic is only a fraction of the total traffic of the railways, the proposed concession is not likely to weigh heavily on the railways.

Specific Assistance to selected commodities

68. The specific difficulties confronting our export industries will have to be tackled. For instance, Tea, which is our foremost exchange earner, was not receiving its full requirements of fertilizer; nor was it getting the supplies of fertilizer at the rate at which it is available to the Agriculturists. Curiously, the export of Tea is still controlled, when supplies are plentiful. Export of Tea should be decontrolled. Similarly, the exports of Coffee suffer from fluctuating supplies. The possibility of stabilising the export quotas through the creation of a 'buffer stock' should be examined, and a larger proportion of 'plantation coffee', which yields a better price abroad, should be earmarked for exports. Exporters of marine products, too, are said to be charged exorbitant prices for tin containers. Their refrigeration and quality control arrangements also need to be improved. As the industry offers promising prospects, its difficulties should be looked into more minutely.

Removal of disincentives

69. The incidence of Import and Excise Duties on typical representatives of commodities eligible for drawback should be worked out in consultation with the representatives of the industries concerned. On the basis of such a study a tariff of drawbacks should be drawn up for all, or at least the more important, items of export. An exporter claiming a drawback would have merely to produce evidence of having exported the particular commodity in requisite quantum and value and having received the right amount in foreign exchange. No reference to his books of account would be necessary; and there would be no need to argue over the exact value of the imported raw material content in the exported commodity. Something in this direction is already being done; but the scope of the scheme needs to be enlarged to cover all, or at least the more important, items of export.

70. Most countries in the world give remission of Sales Tax on exported goods. In India Sales Tax is a State subject; and State Governments are highly averse to parting with their revenues. To cut through the tangles of this vexed question, the Central Government should assume the responsibility for the remission of sales tax entering into export costs; and they may make such financial readjustments with the State Government as they deem appropriate. The method of tax remission should be a simple one. A uniform rebate of say 2 per cent would be a help to the export effort.

71. For the sake of convenience of exporters, the drawback of import duties, the Excise and the Sales Tax should all be given at one central point most convenient to the exporter e.g. Collector of Customs.

Other Measures

72. Indian pavilions in International Fairs are in the nature of 'grand exhibitions'. The participation is at Government level; and Indian merchants conversant with the intricaries of their business are conspicuous by their absence. Little business has flowed from our participation, except perhaps in East European countries where buying is canalized through State agencies. International fairs are forums of big business; they attract the world's foremost suppliers and biggest buyers. In such a setting the kind of 'Exhibition' which India generally offers does not fit in. India's policy in this regard, therefore, needs to be re-oriented; and if an adequate number of the right type of Indian exporters/merchants/producers do not come forward, India need hardly participate in international fairs at all. But Indian exporters may find the task too venturesome. Government, therefore, could assist them by bearing (i) the rent of pavilion, incidental expenses, and the cost of management, publicity, freight of exhibits to and from the destination (this is already being met); and (ii) a part of the travelling costs of Indian participants. Subsidization of participants in international fairs is done even by an advanced country like Germany.

73. The best way perhaps would be to entrust the entire work of participation in International Fairs to an independent 'body' — located in a city like Bombay or Calcutta. It might consist of nominees of Government, but should largely represent the chief exporting interests and be presided over by a distinguished member of the mercantile community. The composition of the proposed agency is described in Para 76 of the Report. The Directorate should be redesignated as the 'Directorate of Fairs' and duly recognized to deal only with questions of policy.

74. There are hundreds of Indian Merchants plying a prosperous business abroad for generations. Their energies should be harnessed in the service of the nation. They should be called in conference, and the Directorate of Export Promotion should be in regular consultation with the Association of our overseas merchants. Our Embassies and Consulates should be enjoined to make a vigorous effort to establish a close liaison with the Indian merchants residing within their beat.

The Chambers of Commerce can play an important part in export promotion. They can liaise between trade and Government; they could keep Government abreast of the happenings abroad; they can dissiminate market information vital to the trading community. Chambers of Commerce in the advanced countries have their representatives abroad; and they supplement the work of the Trade Mission in servicing the country's foreign trade.

Tourism

76. India is a tourists' paradise. But tourism is not well developed in the country. It has been estimated that the country has lost over Rs. 2½ crores la t year because of shortage of acceptable accommodation and lack of air passage. The economic possibilities of tourism should be objectively assessed; and measures should be devised to obviate the difficulties which discourage potential tourists.

77. It is suggested that: (a) steps should be taken to augment proper hotel accommodation throughout the country and to improve travel facilities for the convenience of tourists; (b) facilities for cashing of traveller's cheques should be liberalised; (c) possibility of giving tourists' discounts, as in France and U.K. may be explored; (d) Customs officials should be more helpful; (e) in order to avoid inconvenience to the tourists, the Emigration and the Customs officials should invariably board the ship along with the pilot in mid-stream as was done in the past; and all formalities should be completed before the boat touches the pier, and the tourists allowed to disembark straightaway. Liquor permits, too, should be given to them on board; and (f) there should be also a sizeable shopping centre at each air port to attract the customs of tourists.

Rupee Payment Arrangements, State Trading, etc.

Rupee Payment Arrangements

78. Much has been said for and against the 'Rupee Payment Arrangements'. There may have been an element of diversion of some of our exports, but, on the whole, the 'rupee payment' countries have offered in the net a worthwhile outlet as well as a new source of supply for essential goods at a time when foreign exchange has been particularly scarce. However, fullest care should be taken to ensure that imports from these countries are limited to such goods as are essentially required for the economy; and there should be no easing of the import restrictions just because the goods are coming under a rupee arrangement.

79. To safeguard against undue price mark up on goods coming from rupee-payment countries, it is necessary to have adequate price data. It is proposed that a study unit be instituted in the Ministry of Commerce and Industry. It should constantly enquire, review and compare the prices of products imported from the rupee sources as well as other centres of supply. We attach great importance to the collection of this data, and feel that it could be a source of exchange-saving.

80. A review of the pattern of export trade with these countries, when made with reference to the provisions of our trade agreements with them would suggest that some of these countries are not lifting the quantities prescribed in the Agreements. We feel that the situation would be remedied if all the contracts with the rupee payment countries were registered, so that the flow of our trade could be adequately studied and, if necessary, rearranged. It is strongly recommended that all export contracts should be registered.

Role of S.T.C.

81. Since its inception in 1956, the S.T.C. has come to play a significant role in the country's foreign trade. But there is a great deal of criticism of its activities.

82. The S.T.C. performs some important functions and has been created as an additional organ of trade to give effect to some of the economic policies of Govt.

83. Consistently with its objectives, the S.T.C. has also to be a self-financing organisation. We do not think that the Corporation's role was intended to be confined to trade merely with the curtain countries, as has often been suggested, although trading with State Organisations and 'monopolies' would have to remain its principal activity. There is on the whole, a field in which the S.T.C. can co-exist with private enterprise.

84. There is perhaps some justification in the criticism that the Corporation has not quite succeeded in arranging timely imports; in ensuring satisfactory procurement arrangements from the point of view of price and quality; in holding the price line. The S.T.C., however, works under the directives of Government. If Government were to issue its directives to the S.T.C. after planning forward its import-export programme, and if the S.T.C. utilized the services of trade more fully, with proper safeguards against profiteering and malpractices, many of the complaints against the S.T.C. would disappear. The S.T.C. should also make greater use of the Chambers and Associations in the distributive trade and notify its ceiling prices for the information of the public. Clearly, the S.T.C. need to improve its public relations which seem to have been somewhat neglected.

85. It is also necessary that all export contracts with the 'Rupee payment' countries should be registered with the S.T.C., so that the implementation of the 'trade plans' could be watched and it could be ensured that they remain in better balance. To keep the interested public abreast of the Import-Export arrangements with the 'Rupee payment' countries, the 'trade plans' should be published.

Barter Trade

86. Trade is opposed to Barter trading. But in the conditions of today Barter arrangements often become necessary. Therefore, there need be no wholesale condemnation of the system, if additionality of trade, and a fair price return, could be assured.

Miscellaneous Matters

Compulsory Exports

87. It will not be in the best interests to make exports compulsory by statute. Instead the better course perhaps would be to undertake a compaign of public education to restrain consumption and to awaken the mercantile community to their responsibility to shoulder the burden of export promotion. Perhaps the leaders of Industry and Trade could be induced to levy a small voluntary cess on the product for domestic consumption as has been done by the Bicycle industry. A similar course is capable of wider application.

Quality Control

88. In view of the fact that Agmark and ISI seals are unacceptable to various buyers abroad, having their own specifications, we feel that compulsory quality control or pre-shipment inspection is not feasible. There would be no point in imposing Indian Standards on the foreign importer. What is necessary to ensure is that the goods exported are in accordance with the specifications prescribed in the export contract. It is suggested that the Associations of trade must organise their own 'Inspectorate' to effect quality control and pre-shipment inspection. They must impose upon themselves a code of self-discipline. Offenders could be put on the black list, which should mean their debarment from receiving any incentives or consideration proposed in this report.

89. The Indian Directory of Exporters leaves much to be desired. The preparation of the 'Directory' is a specialised job; and it would be well worth seeking the assistance of an expert under the T.C.M. or the German Technical Assistance Programme.

Export Risk Guarantees

90. In keeping with the Berne Convention, ERIC should guarantee export risks upto a period of five years.

91. India will progressively become an exporter of Capital Goods and Equipment, and her 'Construction Industries' are likely to play an increasingly important part in the future as earners of foreign exchange, the more so if we were to encourage the setting of 'Consultation Bureaux' in collaboration with foreign enterprises, so that India may be able to supply consultative service over a large technical field. ERIC would have to guarantee, in the future, export risks of much larger dimensions. Its scope should, therefore, be enlarged. Alternatively, the export risks beyond ERIC's prescribed powers could be either guaranteed by Government or reinsured with an organisation like the L.I.C. ERIC's management, too, should be enlarged to command greater confidence in the public mind.

Staff of C.I.C. & E.

92. As the fortunes of trade depend so much on prompt action, it is apt to become impatient of any delays on the part of the Import Control authorities; and complaints in this behalf have been voiced everywhere. It is felt that one of the causes of delay is the shortage of staff which seems to be fully stretched. A realistic view of the staff requirements of the C.C.I. & E. should be taken, so that the organization may be able to function more effectively and proficiently.

93. Some of the measures which have been proposed on the procedural side are likely to ease somewhat the burden of the C.C.I. & E's office. But, on the other hand, it will have to prepare and issue 'certificates of basic export performance' to exporters, preferring claims for remission of income-tax which have been proposed. Their number would be considerable. Due regard need to be paid to this aspect of C.C.I's work, when sanctioning his staff. The C.C.I. & E. also does not seem to be adequately equipped to meet any sudden onrush of work such as may emanate, for instance, from the signing of a new trade agreement which may tend to trigger off a series of new problems in the initial stages. The best way to cushion his difficulties would be to place at his disposal a small 'squad', under a Controller, which may be used to bulldoze any pendencies or arrears in whichever section they may be.

Breath of fresh air

95. One more fact which militates against efficiency is the present lack of mobility of the C.C.I. &E's staff. They are not transferable, and gain no experience even of the departments dealing with other aspects of foreign trade. The system leads to inbreeding and stagnation and creates problems of vigilance. We are afraid that a similar situation is likely to arise in the Directorate of Export Promotion which is now being strengthened if, from the very inception, a system of 'inter-change' or 'delegation' is not conceived. It will be an advantage for the C.C.I. & E. and the Directorate of Export Promotion to have a common cadre so that the members of the staff would acquire more varied experience and introduce a breath of fresh air in the organisation. An interchange of officers between the Import and Export Control, the Directorate of Export Promotion and the C.B.R. would also be mutually beneficial. It could be a simple system of delegation for a tenure, on a reciprocal basis, so that the 'inter se' seniority of officers in the various organisations would not be affected, and, at the same time, they would acquire a more integrated experience.

Indian Trade Representatives abroad

96. In the coming years the task of trade and economic promotion is going to be vitally important to the course of our economic development; and India's trade representatives will have to play an important part in the promotion of trade. The various tasks which they will be called upon to perform have been described in para 24, at p. 49 of the Report. In a word, India's Trade Representatives will have to be at once the eyes and the ears of the business community. This is by no means an amateur's job. It requires specialized knowledge and practical training in commercial and economic work, which many of the Indian trade presentatives abroad do not possess. Often they do not have even the aptitude for this type of work; and, on the whole, the Indian business community is none too enamoured of the performance of our accredited trade representatives abroad.

97. Our Trade Representations abroad need to be vastly strengthened both in numbers and in the quality of personnel. It is our considered view that a greater measure of flexibility should be introduced in the staffing arrangements. The Ministry of Commerce and Industry have the primary responsibility for the maintenance and promotion of trade; and, naturally, they should have a major voice in the selection of officers for the commercial and even consular posts. It is also felt that all Consulates and Consulates-General should function primarily as trade promotion centres; and in selecting personnel for these posts due consideration should be given to qualifications, experience and aptitude in commercial and economic matters.

98. India would do well to follow the British model under which the 'trade posts' are manned partly by the Foreign Service personnel and partly by representatives of the Board of Trade. A pool of officers could be drawn from the Ministries of External Affairs and Commerce and Industry, including its attached offices of the Chief Controller of Imports and Exports and the Directorate of Export Promotion and to some degree from the open market. It would be a system of secondment of hand-picked officers of the two Ministries to the pool who would devote the better part of their life and energy to the promotion of economic matters overseas. The officers of the Ministry of Commerce and Industry would not, normally, be posted or promoted to the chancery; whereas the foreign service personnel of the pool would have occasional turns of 'political' assignments, and be entitled to rise as heads of 'posts' or 'missions' in course of time. But, overall, the emphasis in the career of such officers would be on the commercial and economic aspects; and they would be a class of 'commercially-oriented' officers of the Foreign Service.

99. The officers of the pool should have a common cadre of 'inter se' seniority so that they could aspire to legitimate promotion in their own turn as Counsellors, Consul-Generals or as Senior Trade Commissioners. The advantage of the proposed pool would lie in its flexibility, and in its capacity to offer a relatively large base of staff from which to draw 'oversea' officers for commercial posts. It would facilitate cross-fertilization of ideas between the home and oversea elements, and yield more fruitful results.

100. Normally, the tenure of a 'commercial officer' abroad should be five years.

101. Our overseas officers on the commercial and economic side, need a great deal more grounding in their specialised fields; before they leave for their posts, it should be ensured that they go well equipped to their task.

The Revolution of Rising Expectations

IN this Blue Supplement an attempt is made to present the economic facets of the revolutionary changes which are taking place in the Indian Union against the political reflection of some of these factors following the recent General Elections. The political prophets, as well as the political analysts, will differ markedly in terms of the manner in which they interpret these results. In the main issue, "The Eastern Economist" has presented its own interpretation of the results, the leading elements of which are two-fold. Firstly, there is a very large element of discontent in the country, and even the great anchorage which the Congress Party has with its wonderful legend and its glamorous leader, has been unable to prevent a significant setback in at least five important States of the Indian Union, namely, Punjab, Rajasthan, Madhya Pradesh, Uttar Pradesh and Kerala. The argument certainly leads to the conclusion that if political discontent is to be arrested, some economic changes are required in order to fulfil the aspirations that the Indian Union, perhaps mistakenly, has entertained. Secondly in its economic aspect, the question is not, indeed, whether there has been economic progress or not. It is obvious—and no longer catalogue of figures is necessary, whether in terms of national income or targets of individual production, particularly, food, cloth and other consumer goods—that the country is substantially better off in total than before. What this Blue Supplement attempts to set out are the reasons why, in the face of this excellent statistical rendering of Indian economic progress, so few people in the Indian Union are at the moment filled with enthusiasm and with a sense of jubilant participation in the great Indian adventure. Undoubtedly, economics is only a portion of this problem. Psychology is much the larger of the two social elements which go into the description of what has been appropriately called "The Revolution of Rising Expectations". The emphasis is on the word 'expectations'.

It is in respect of expectations, and not in respect of statistical performance, that our progress over the last ten years has to be measured. Nevertheless, there are some statistical qualifications which have to be introduced, such, for example, as the role which has

been played by indirect taxes in eroding the benefits of a rising money income. Equally, there has been the element of an overall rise in prices which bears unequally on different sections of the population. Two articles in this Blue Supplement deal with these particular elements in the Indian picture of economic development. Even statistically, the total economic progress of the Indian people becomes far less attractive when it is noticed how much of this progress has been committed to Government producer goods expenditure and does not enter truly into the rising standard of the people. But quite apart from this problem of discontent which arises because what is given with one hand is partly taken away by another, there is the qualitative change which is constantly taking place in the structure, not merely of the expectations, but of the physical content of the goods and services that the Indian people buy. It may be that food and cloth are largely the same today as they were ten years ago, though there is a wide-spread belief that the movement to finer varieties of cloth and to handloom cloth has been very marked. But in the realm of other things, notably, the urge of the Indian people to travel, their need for better housing, the ineffective attempt to escape from slums in the great cities and in the last analysis, from pestilence and disease, and even from elementary destitution, there are aspects of Indian economic failures which are too often ignored in the "overall" rates of economic progress. When 500 people died in the severe winter of December 1961 in Delhi, there should have been a tremendous sense of shock that after ten years of planning in the Central Capital, the most efficient unit of the Indian Union, we were powerless to prevent our fellow-citizens from succumbing in three nights to the final penalty of pitiful destitution. It is this character of light and shade, sometimes callous, sometimes the reflection merely of deep egoistic discontent, sometimes and more often, a maladjustment for the moment, while economic progress which goes in waves comes back to its native shore, that produces a wide spectrum of economic change which it is the purpose of this Blue Supplement to describe.

In the following articles, the picture is set out with particular reference to the components which make "the revolution of rising expectations" one of the most arduous hurdles which a poor country has to surmount. These are good clothing, housing and education and travel. Everyone considers the Indian people as a whole better fed, better clothed, better housed, better educated and perhaps even better travelled than ten years ago. And yet over half the Indian people, in response to questions on the subject will say they are not better off, and perhaps in a very large number of cases, they can produce chapter and verse.

In what particular elements does this discontent, imaginary or real, reside? It is the thesis of this Blue Supplement that there are, in fact, real economic failures to present along the general side of the economic progress. Indian development has been a two-way affair. A heavy price has been paid for almost every inch gained and the price is not paid by the same people. This is best illustrated in the way in which incomes are distributed and the different ways in which States have emerged from the ten years of "purposeful" planning which, in retrospect, has proved so unequal. Two of the articles in this issue deal with the central theme of inequality of personal incomes. It is probably at the centre of the heart-burning which continues to exist and, unhappily, to spread.

"The Eastern Economist" does not believe that at this stage of India's economic progress it should spread a counsel of despair. On the contrary, it is broadly behind the Third Plan, as it was behind the Second and even behind the First in the sense that a beginning of planning had to be made. It does, however, recognise that some pretty drastic changes have to take place if the Indian people are not to feel further frustrated, not to be further deceived in that peculiar psychological field in which those in power are convinced they have performed their responsibilities, while those without power think they have been misled. In the last analysis, the answer is three-fold. It is, in fact, on the political side a much wider range of participation by all parties in what is called the exercise of power. Secondly, on the economic side, it is essentially a matter of producing occupation of a congenial type which, whether or not it is translated into income, at least contains the idle and discontented mind. Thirdly, and not least of all, there must be, at a few dramatic points, perhaps in housing, perhaps in education, a gift by the nation to those to whom the last ten years have been a source of deep disappointment, and in a few cases even despair.

For these purposes, overall progress is insufficient. It is to the weaker sections of the population, and in the last analysis it should be to the weaker minds—those that lack the courage and patience to wait for a generation—that an immediate call is made in the Third Plan to immediate betterment. We need very much to take to heart Keynes's warning that, if economics is a long period affair, it is well to remember that in the long period we are all dead. Certainly, the revolution of rising expectations is a short period phenomenon and must be dealt with, at least remedially, in the period of the Third and Fourth Plans. If the Third Plan is reorientated in terms now not merely of achieving targets, but of recognising whether and how the fruits of the Plans are to be given back to the Indian people, it may well be that, with very little additional expenditure, we may make much more substantial subjective economic progress. If this Blue Supplement has done something to open a different horizon in respect of the content of the elements which produce economic discontent it will have not been in vain.

Indirect Taxation, Inflation and Erosion of Incomes

IN November last year the Department of Economic Affairs in the Ministry of Finance analysed the incidence of indirect taxation on consumer expenditure from National Sample Survey data and the taxation figures available with the Ministry of Finance. The study related to 1953-54 and 1958-59—the mid-points of the First and the Second Five-Year Plans—and an attempt was made to compare the burden of taxation on various income brackets in rural as well as urban areas. The major findings of the study were:

(1) Indirect taxes in 1953-54 formed 3.6 per cent of consumer expenditure of all households in the country. By 1958-59, the proportion went up to 5.7 per cent. The rise occurred mainly under Central excise duties and the sales taxes.

(2) The incidence of increased taxation was spread unevenly in both the rural and the urban households. In rural areas, the proportion of consumer expenditure paid in taxes rose from 2.9 per cent in 1953-54 to 4.4 per cent in 1958-59. The incidence in urban areas was much heavier. Whereas in 1953-54, the urban households paid in taxes only 5.9 per cent of their consumer expenditure, they had to pay about 9.3 per cent in 1958-59. The major pressure in the case of the urban households emerged from Central Excise duties, though sales taxes also added to this burden.

(3) In 1953-54 the urban households paid twice the proportion of consumer expenditure paid in taxes by rural households. In other words, while rural areas paid only 2.9 per cent of the consumer expenditure by way of taxes, the urban households had to pay 5.9 per cent by way of taxes. By 1958-59, the scales had turned slightly against the urban areas. The proportion paid by the urban households increased to 2.1 times than that paid by rural households, i.e., against 4.4 per cent of tax incidence on urban households it rose to 9.3 per cent of the total consumer expenditure.

(4) The burden of indirect taxes remained progressive both in the rural and the urban areas in 1953-54 and 1958-59. It means that the higher income brackets paid a higher proportion by way of taxes than the lower income brackets. In 1953-54 urban households with monthly expenditure above Rs. 300 paid 8.2 per cent of the consumer expenditure in taxes. The corresponding lowest income bracket in urban areas i.e. Rs. 1-50 per month expenditure household paid only 3.8 per cent of the consumer expenditure by way of taxes. By 1958-59, the proportions of every income bracket rose but in a progressive manner. The incidence on the lowest income bracket rose to 5.8 per cent and on the highest income bracket rose to 13.8 per cent. If the highest income bracket in this study could be further analysed, it would be found that urban households with expenditure above Rs. 500 per month would be paying more than 15 per cent by way of taxes and it would not be a surprise to find that households spending Rs. 1000 per month were paying 20 per cent of the expenditure by way of taxes.

An analysis of the consumer expenditure sales taxes between 1953-54 and 1958-59 shows that the money incomes were reduced considerably by way of taxation and whatever little increase was in evidence in the various income brackets was siphoned off by the rising prices.

The figures set out by the Department of Economic Affairs have been further analysed for price inflation so as to compare the net expenditure position in 1958-59 at 1953-54 prices. The results are set out in Tables I, II and III. Table I gives the comparison for rural areas only. It shows that in overall terms the net expenditure after accounting for tax burden and price increase shows a fall of 3.7 per cent in five years. This clearly contradicts the optimistic picture presented by per capita income data considered for all-India. As indicated elsewhere in this Number, the real per capita rate of rise in income during the last decade had been 1.8 per cent per annum.

The average figures conceal the degree of pressure on different income brackets. For example, in the rural areas the households in the income bracket between Rs. 101 to 150 per month were certainly worse off. The net consumer expenditure in 1958-59 at 1953-54 prices showed a fall instead of showing an increase. Similarly in the income groups Rs. 51—100 and Rs. 151—300 the increase was of marginal nature. In the lowest income

bracket the percentage works out to be 10.9 on the positive side but the real absolute gain is almost negligible. The other tables for urban areas and all-India show a still further deterioration in consumer expenditure.

The conclusion is, thus, irresistible that planning in this country which was supposed to raise living standards all-round has failed miserably in achieving the stipulated target.

The Standard of Comfort: 1950-51—1960-61

With Projections to 1965-66

WHAT has been the achievement of planning in the Indian Union in so far as the availability of comforts is concerned? The ultimate aim of all the development plans is to raise the standard of living of the people in the sense that the people may be in a position to lead a more comfortable life. Before we pass on to an enumeration of the comforts which have been made available during the last decade, it is necessary to answer the basic question if the necessities of life have been made available in the right proportion. For this purpose, the table on page xv serves as an interesting guide in so far as the changing structure of per capita consumption of most of the necessities is concerned. It will be seen that consumption of cereals steadily rose from 317 lbs. per annum per capita in 1950 to 344.5 lbs. in 1960-61. In a decade the rise was of the order of nearly nine per cent. If the fact that the shortage of cereals in any particular year has never been more than 5 to 7 per cent is borne in mind, the great leeway that India has already made in making this basic necessity available to the masses will become evident. Distressing periods of food control and shortages vanished with bumper crops in 1953 and 1954. In fact the year 1953-54 witnessed a surplus of food which pushed prices miserably below the level of even the cost of cultivation. Since then, the availability of cereals has been comparatively assured mostly because of the imports of wheat from the United States of America under P.L. 480. Even in the Third Five-Year Plan liberal imports of foodgrains upto 17 million tons under P.L. 480 are likely to ensure sizeable buffer stocks which will keep the supplies of cereals within reasonable limits, not allowing "shortage" to raise its ugly head again.

In sugar and gur, the position is one of the demand side being unable to cope with the supply side. A sizeable surplus seems to have emerged during the last two years and because of high cost of sugar manufacture in India, exports have not been very encouraging. The market is glutted with sugar and prices are slightly lower than those fixed by the Tariff Commission a couple of years ago. This also applies to the supply of vanaspati, cloth, kerosene and paper. In other words, all the essential commodities are in such a happy state of affairs at the moment that the consumer demand has been fully satisfied.

A study of the consumption figures for cycles, sewing machines, motor cars and radio receivers will show that the Indian Union has done extremely well during the last decade for these items of comfort and entertainment. In 1950, for 100,000 of people, only 75 cycles were available. In 1960-61, the figure rose to more than three times at 245 cycles for every 100,000 of population. Much more interesting was the case of sewing machines. In 1950, there were only 15 machines available for every 100,000 of population. In 1960-61, the figure rose to nearly five times at 70 sewing machines for every 100,000 population. The radio receivers have also done equally well. The purchase of radios stood at only 124 for every million of population in 1950 but it improved to nearly five times to 643 radio receivers for every million of population in 1960-61. Only the motor cars have not exhibited an impressive showing. As against 42 motor cars for every million inhabitants in this country, the present level is 48 for every million population. Perhaps the small car project has been delayed excessively. If and when this project also materialises, the supply of motor cars will also increase so as to eliminate the drudgery of life to a certain extent. An indication of the fact that more people are making use of the electrical gadgets is provided by a survey made by the Indian Institute of Public Opinion in 1960. The Economic Intelligence Unit of the Indian Institute of Public Opinion has also forecast probable demands for these electrical contrivancies in 1965-66. Findings of the Institute are set in the tables on page (xvi).

This urban survey conducted by the Indian Institute of Public Opinion in 1960 indicated the volume of comfort enjoyed by the urban households through electrical gadgets. Ninety-two per cent of the households—picked out of families possessing a radio set—lived in houses provided with electricity. Only 40 per cent used flourescent tubes indicating a sizable shift from the old, pale electric bulb to the soothing effect of the flourescent light. The ceiling fan scored heavily over all the other contrivances in as much as 53 per cent of the families possessed at least one ceiling fan; only 39 per cent took comfort from the table fan but certain families possessed both the ceiling fan and the table fan. Electric iron was another important instrument possessed by almost 50 per cent of the families interviewed. Similarly, electric heater was possessed by nearly 30 per cent of the households. Comparatively in less use were the water heater, the refrigerator, the cooking stove, the electric sewing machine and the gramaphone. While all the households possessed a radio set (the sample having been taken out of households holding a radio license) only 3.6 per cent could boast of a refrigerator. It means that the refrigerator is still very much beyond the financial resources of a majority of the households in urban areas. These tables also indicate the pattern of likely growth in the use of these consumer durables by the end of the Third Five-Year Plan. It is shown that in the urban areas, nearly 1.6 million additional households will use ceiling fans and about 1.2 million more households will draw comfort from table fans during the Third Plan period. The income brackets which will acquire the new fans will lie above Rs. 200 per month. Relatively, the demand for fans will start falling after the income bracket Rs. 201-300 per month. The largest pressure of demand will emanate from the income brackets lying between Rs. 200 and Rs. 500 per month.

Even though the electric iron is a very useful consumer durable for helping the urban families keep neat and smart, only half of the families in the sample reported to be in possession of the electric iron. This indicates that the radio, deemed in India to be more an item of entertainment than of utility, takes precedence over most of the electrical consumer goods including the electric iron. Like the fans, the highest pressure for demand was from the income brackets Rs. 200 to Rs. 500 per month though the percentage share of Rs. 101-200 income group was in no way small. This is perhaps because of the low cost of the electric iron in relation to fans. It is estimated that the rise in urban demand for electric irons is likely to be around 1.5 million during the Third Five-Year Plan.

The number of families which are in a position to make use of these comforts is extremely small and in most cases does not cover more than five to ten per cent of the total population of the country. To the vast masses, comfort of life as understood in the urban areas of India, is something un-imaginable. As and when the Plan propaganda penetrates the interior of the rural areas, the revolution of expectations to be created will be beyond the resources of the country. Planning of consumer goods in the country has to be accelerated keeping in view the coming explosion in demand for not only necessities but the "necessary luxuries" of a growing society.

The conclusion which emerges from a study of these statistics is that inflation in income, from whatever cause, has been an inducement in urging some families to avail of the comforts provided by the rapid pace of industrialisation in the Indian Union. It is true that rising prices have eroded income of a substantial section of urban households, but there are certain other sections of society which have benefited from the inflationary spiral. The Institute in its analysis of the urban market for electrical appliances has rightly concluded that "inflation is one family's meat but another family's poison".

Towards Rapid Modernisation

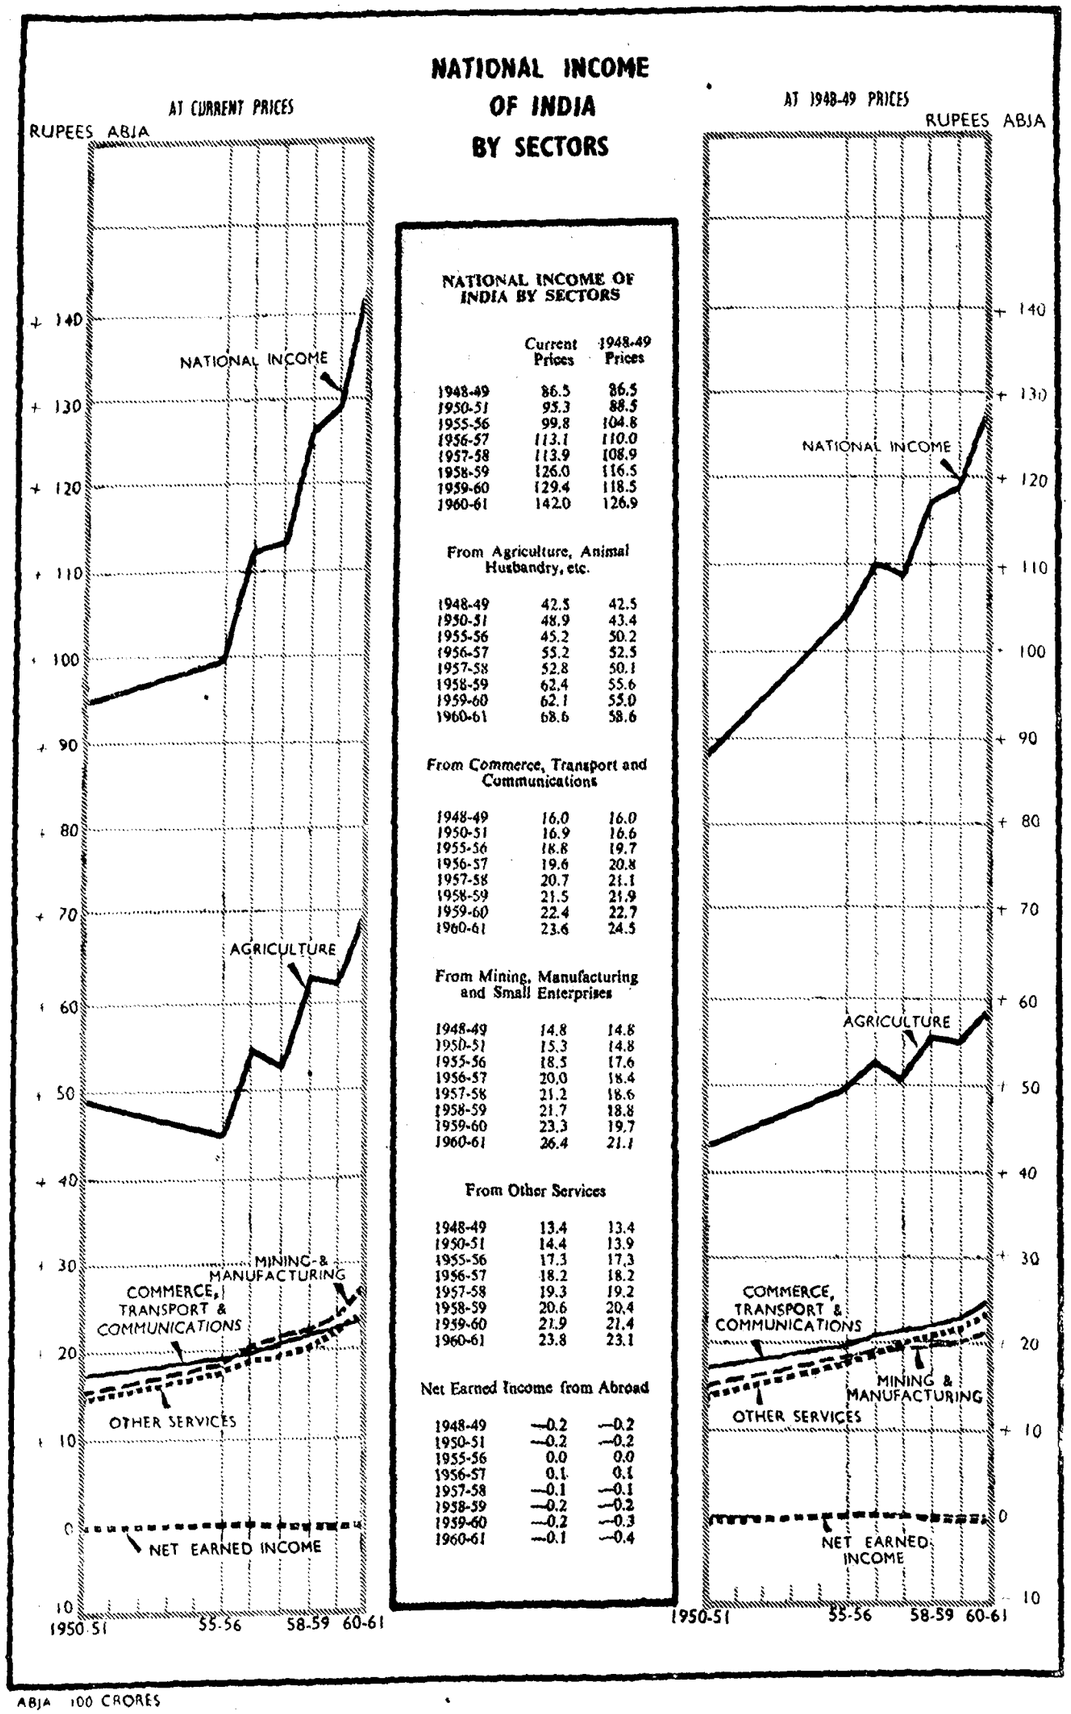
THE achievement of Independence was universally looked upon as only a pre-condition of releasing the social, poplitical and economic forces for a rapid transformation of the traditional society into a modern and progressive one. In this transformation the pride of place was undoubtedly to be assigned to the economic emancipation of the masses, following a general levelling up of the economy with a deliberate bias

industrialization. The economic aspirations of the Congress Party were fairly well known and a positive expression was given to them in the Directive Principles of the Constitution, which enjoined that social justice be meted out to all the classes of the people and equality of opportunity for growth to the fullest stature be also provided to everyone. But these were broad principles and it was only in December 1954 that, with the adoption by Parliament of the Resolution on the Socialist Pattern of Society, a concrete form was given to these goals.

Nevertheless, it was clearly understood that the objectives set out in the Directive Principles and those set out in the Resolution on the Socialist Pattern of Society had to be harmonized. The pattern that was to emerge was to be based on the concept of the mixed economy. This could not be otherwise because, contrary to the popular belief, it is not in industry, but in agriculture and the tertiary sector that the existence of the private sector is profoundly exhibited. To eliminate the private sector involves extermination of this vast fabric. This resolution was adopted practically towards the close of the First Five-Year Plan, and if the truth must be told, not much critical thought was given to verifying how far it was reflected in the policies and the targets of achievement fixed for the Second Plan. There was a robust, practical realization at the bottom that the socialist pattern, based on the co-existence of the two sectors, was to be achieved by a gradual process of change. No violent disruptions to the existing structure or revolutionary departures from the institutions which had been there over time were either intended or expected. Nonetheless, these new visions brought a distinct revolution of expectations on the part of the masses of the people.

If economic prosperity was to be achieved, the first requirement was to redress the gross imbalance between agriculture and industry and this redressal meant a deliberate orientation of the development programmes to industry. The Second Plan was formulated with this object in view. Once these objectives were vehemently publicised during the campaign for the first general elections, the rising revolution of expectations began to acquire a more concrete and clear form than ever before since Independence. The Second Plan, no doubt, placed considerable emphasis on the construction of steel, fuel, power and machine building projects. Side by side with it, a good deal of responsibility was placed on free enterprise to push up the development of industry in segments mostly other than heavy industry. This orientation of the development of the economy towards industry brought in its wake great expectations about a rapid increase in production, national income as well as per capita income.

Although, egalitarianism was no integral part of the resolution on the socialist pattern of society, it had its emotional impact and the least that was expected was that concrete steps would be taken towards minimizing the disparities in incomes. What distinguishes the revolution of rising expectations that emerged in the Western countries and the one that is now forcefully asserting itself in India is the order of priorities. In the industrialized countries of the West, economic expansion and the levelling up of the material well-being of the masses of the people came first. Extension of political rights on a full scale came next, or at best it was a complementary process, but certainly it did not precede economic emancipation. In India, the reverse priorities have chanced to occur. The constitution-makers, in the flush of their idealism, went full steam ahead to give the people a thoroughly modern form of parliamentary democracy based on universal adult suffrage. The voter thus became the master of his rulers and with the first general elections, he sensed the feeling of mastery which he now enjoyed through the ballot box. This brought in its wake a new and forceful consciousness of his political rights as well as of his importance. Political consciousness creates a psychology in which grievances are freely ventilated and the legislative forum is already there to ventilate them and there are the Opposition Parties only too willing to oblige.



Economic expansion and the production of wealth in a traditional society is necessarily a slow process which takes time to gather momentum. But a politically conscious electorate loses patience with moderation. The result is that the rising expectations about a modern and fuller life have been deeply coloured by a feeling of intense dissatisfaction with the pace of change. The people have borne all sorts of sacrifices which were demanded of them in the form of taxation, inflation, and so on. But, by contrast, the returns which they expected from the Five-Year Plans have been too low and a violent query is being made why disparities of income have not been reduced progressively and how far there is sound reason to believe that these disparities have become more aggravated, on the other hand.

As the second general elections are over and the Congress Party returns to office for another term of five years, this revolution of rising expectations, powerfully tinged with dissatisfaction and also with a certain element of disillusionment, is throwing up a great challenge to it. The Congress was admired as a party in office since 1947 as the party which principally fought and won the battle of freedom. This attitude of indulgence on the part of the electorate is vanishing. The electorate is acquiring a mature mood to test with a critical mind the Party's professions proclaimed in its manifesto. During the fresh term of office the Congress Party will be on probation. This is but a natural consequence of the revolution of expectations which it has throughout fostered, perhaps without a full consciousness of its repercussions, or at any rate of their vehemence.

The Countryside: Changing Form

THE GREATEST challenge that will be posed to the new Parliament will come from the countryside, where the people have long waited for some realisation of their expectations without much fulfilment. This challenge is of formidable dimensions. The proverbial pressure of population on land, the erratic fluctuations in the fortunes of agriculture and the marginal levels around which rural standards of living are hovering—this outlook makes the task of changing the face of the countryside from a traditional society to a progressively modern one really difficult. In essence, although the problem needs to be attacked on a social, political and economic fronts, the attack on the economic front obviously comes in the forefront. The goal is to link the countryside effectively and fruitfully with the task of exploiting the potential of a large market of 440 million people. The isolation of the village has become a thing of the past, but, even so, the integration of the rural economy with the nation-wide market has touched the fringe. Transport, and wherever possible truck transport, will need to be developed at a fast rate to achieve this integration.

The major transformation is to be brought about in agriculture, notwithstanding the fact that the present intolerable pressure on it must be relieved and passed

* Rural figures for Assam and Delhi are not available. All-India totals are inclusive of urban areas of Assam and Delhi.

on to industry and other occupations. Today agriculture accounts for nearly 50 per cent of the national income of India, but, with the transformation of the countryside and relief in the population pressure on this basic industry, the shares of the industrial and tertiary sectors are bound to increase, especially the share of industry. Granting this change in the scale of the components of the national income, the preponderance of agriculture in the creation of national income will prevail. It will prevail because agriculture will continue to be the major source of the livelihood of the people and agricultural products will be required for human consumption, for industry and for export. Elsewhere in this Special Number the problem of agriculture has been discussed independently. The dilemma posed is that mechanization of agriculture as a technique of its modernization has an extremely limited scope. Then comes the question of co-operative farming as the basis of the peasant economy. The line of demarcation between co-operative farming by legal compulsion and collectivisation tends to get blurred.

Even assuming that the distinction between co-operative farming and collectivisation is attempted to be maintained and Indian peasantry is not dragooned to the slavery of collectivisation, the element of compulsion in co-operative farming is bound to create stiff resistance. In the result, the change of the agricultural economy will need to be brought about by the gradual process of individual effort, strongly supported by a wide network of service co-operatives. Agrarian legislation has been undertaken on a courageous scale after Independence and a whole range of intermediaries between the peasant and the State is being eliminated. This undoubtedly provides the most powerful incentive for undertaking scientific and intensive cultivation. The incentive is there, but the resources will have to be provided. These resources require large investment outlays on irrigation, fertilizers, improved seeds and implements and, along with these, the establishment of ancillary occupations like animal husbandry, poultry farming, and so on.

According to the provisional figures of the census of 1961, the ratio of the rural population to the total runs as high as 82.16 per cent. Exact figures about the population dependent on agriculture remain to be worked out. But it is easy to see that the major problem is to divert population from subsisting on agriculture to dependence on industry and other occupations. It should be possible to bring about this shift of a good part of the rural population from agriculture to industry in the countryside itself. This shift involves a programme of accelerated growth of medium scale, small-scale and cottage-scale industry. India's Five-Year Plans in the industrial component recognise the urgency and priority for the decentralization of industry in order to break its prevailing concentration in the cities and the adjacent areas. Side by side with decentralisation is posed the difficult problem of modernizing the techniques of production adopted in industries below the large scale. This means introducing mechanization and technological skills. Technical know-how can be imparted to those who come forward to set up industries in the countryside. At the present time the Community Development Blocks, National Extension Service, the Small Industries Service Institutes and a few other agencies have made a beginning in imparting know-how to the countryside, but its scale has touched only the fringe of the problem.

The main problem is that of investment. Imparting of technical skills can be made feasible with a determined drive. But the scarcity of investment capital is difficult to overcome in an adequate measure. At any rate, it is apparent that the flow of investment cannot be artificially channelled in the name of decentralisation, first, because such capital is scarce due to the poor rate of saving and, second, because the direction of capital must be harmonized with the hard laws of industrial location. A word about the supply of power is necessary. Industrial decentralisation in the countryside will cry aloud for adequate supply of power to turn the wheels of industry and this means primarily rural electrification. The pace of rural electrification so far has been very much below the Five-Year Plan targets and far from encouraging. Madras State alone stands out as a proud exception to this poor performance. In the Third Plan the number of villages with a population between 2,000 and 5,000 to be supplied with electric power is proposed to be increased by 10,000 villages amounting to an increase of 50 per cent. This gives an idea of the backlog that will be left for the subsequent plans.

Uplift of agriculture and rural industry in its technical aspect will never be sufficient. Two more reforms are indispensable. Granting that technical education necessary for acquiring the industrial skills is provided, the basic need for levelling up the general standard of the education of the village population is absolutely essential. Nothing can substitute education as a powerful lever to progress. Free and compulsory primary education for children in the age group 6-11 could not be achieved within ten years of the inauguration of the Constitution as provided in it. The difficulties that arose were mainly those of funds and, more significantly, those of the teaching staff. This target is now fixed for the end of the Third Plan and education on a broader scale for boys and girls in the age group 11-14 will be deferred till the end of the Fifth Plan. Thus it is that the pace of education will necessarily be moderate.

A virtual revolutionary change in the countryside inevitably requires devolution of responsibility, because it is the burden of responsibility and a sense of a new obligation it creates which will ensure the discharge of this responsibility. With this end in view the Panchayati Raj is being made the pivot of democratic decentralisation. In the initial stage it may reveal the evils of village factionalism and abuses as well as excesses of the exercise of power. But the risk needs to be taken. The ultimate end is to make the Panchayati Raj the hub of the village administration and of the technological transformation of the village economy which alone can take it to the modern levels.

Urbanisation

PROGRESSIVE URBANISATION operates as an explosive force to aggrevate the revolution of rising expectations. This is basically so for the reason that the urban population tends to become increasingly self-conscious and dissatisfied with the status quo in matters social, political and economic. Urbanisation usually goes on spreading with the progress of industry, the expansion of the market economy and the growing urge for higher norms of life. Another feature which has contributed to the pace of urbanisation in India is the disintegration of the Hindu joint family. The pressure which land can bear and the fragmentation of holdings which the concentration of joint Hindu families in the villages involve soon reach their limits. But the new urge for individual freedom has perhaps given a greater acceleration to the disintegration of the joint family. Coparceners in the joint Hindu family cannot, as in the olden days, cling to the ancestral land and a sizeable proportion migrates with their families to the urban areas for a decent livelihood. Along with decent livelihood is also the compelling urge for giving better education and a better station in life to the new generation.

As a matter of fact, the process of the modernisation of the countryside should create, in the wake of the demand for different types of technical and professional services, a large scope for the educated and trained young men to settle there. But the lack of the minimum standards of comfort to which they become irritrievably accumstomed operates as a great disincentive to migration to the villages. This creates an additional pressure on the educated class in the urban areas for employment.

What are the trends in the urbanisation of the population in India? It has been argued in the previous article that the significant feature of the growth of the rural economy that has emerged is that there are obvious limitations to the diversification of the occupational structure and the shift from agriculture to industry or other occupations is regulated by forces that restrain the speed with which decentralisation of industry can be pushed. The combined effect of these influences is to encourage the migration of population, which agriculture has no capacity to absorb, to the town and the city. This is a matter of universal experience. In the case of India this trend has produced great stresses and strains as is inevitable in any underdeveloped country. The trends in urbanisation of the population as disclosed by the decennial census records are tabulated below:

PERCENTAGE OF URBAN POPULATION TO THE TOTAL

Year	%
1881	9.3
1891	9.4
1901	10.0
1911	9.4
1921	10.2
1931	11.1
1941	12.8
1951	17.4
1961	17.8

This table brings out one fact very prominently and it is that, while pace of urbanisation has been progressively increasing since 1881, it was during 1941-51 that the ratio rose fastest of all. This is understandable as a consequence primarily of the great social upsets that were caused by World War II and the influx of population towards the cities. Between 1951 and 1961, however, the growth of the urban population has been one of the slowest recorded in the table and it amounts to a mere 0.4 per cent. On the face of it, this is unconvincing. The decade 1951-61 coincides with the first decade of India's planned development and it was during this decade that industrialisation took the biggest stride. And this industrialisation has essentially occurred in and around cities. Urban population growth of such a marginal order is incompatible with the two forces of expansion of industry and the normal population shift from the countryside to the urban areas. The real explanation of this discrepency lies in the fact that these two percentage ratios are not comparable because the census of 1961 has changed the definition of an urban area.

In the latest census the three tests which were uniformly applied to the whole of India (unlike in the census of 1951 or before) were population not less than 5,000, density not less than 1,000 per sq. mile and dependence of at least three-fourths of the adult male population on non-agricultural occupations. The result of the application of these tests and of a change in the definition of the urban area was quite significant. As compared to 1951, the total number of urban areas in 1961 in the entire country was reduced by 408. The net effect has been to deflate the ratio of the urban population and to inflate the ratio of the rural population. As the provisional figures of the census of 1961 would have it, the proportions were 82.16 per cent for the rural population and 17.84 per cent for the urban population. However, for reasons of comparability with the ratios for the previous decades, a larger allowance must be made for the ratio of the urban population in 1961.

The impact of urbanisation on the nation's economy is common everywhere. Particularly in a developing economy, where adequate avenues of employment are not available in the urban centres, a number of problems emerge. The primary task to meet this challenge consists in creating employment opportunities, in the first instance, and encouraging a flow of some part of the population to the developing countryside. But rural development has its own limitations. Meantime, the growing congestion of population in the town and the city creates pressing problems of housing, water supply, drainage, sanitary services, transport, education, health, and so on. It is one of the unhealthy features of urban development in India that town planning has not been enforced with the strictness it deserves. The result has been rapid unplanned development, which, in its wake, has created additional problems of the provision of the normal civic services. The problem of slum clearance, instead of being brought within controlled dimensions, is being aggravated by this unregulated development.

While imbalance in the distribution of the population between the urban and rural areas is creating a more complicated situation, the growing concentration of the middle classes in search of jobs and better opportunities of education etc. for the next generation is adding to the social tensions. The economic tensions involved in the expansion of the fixed income middle class, with a growing part of it without employment, threatens to add to the explosion in the situation. This explosion can be averted only by the creation of an increasing number of jobs in the absence of which the Five-Year Plans stand to lose much of their practical utility and their broad appeal to the people.

Employment

ONE OF the basic objects of economic development is to create more and better employment opportunities. In an under-developed economy with a strong preponderance of agriculture, under-employment is a secular trend which must be taken into consideration in tackling the problem of the chronic gap of unemployment. India's five-year plans have disclosed that employment has been a weak link in the chain of the development targets. It is quite reasonable to argue that where unemployment has been a very serious problem all along, its rapid reduction is hard to expect. But the expectations about the five-year plans were that the manpower absorptive capacity of the planned projects would be at least commensurate with the increase in the labour force, so that deterioration may be halted and the status quo maintained. This has not happened at all, and on the other hand, experience has shown that the backlog of employment at the end of a five-year plan has exceeded the backlog at its commencement. It could be argued with reference to the First Plan that there was not much of organic integration of the different segments of planning in it and it was more or less a linking together of the projects which were either already planned or which could be considered as eligible for the available investment. In this situation a firm target of employment was not necessarily an integral part of the First Plan.

But the weakness of the employment aspect of the Plan is vividly brought out in the Second Plan and the situation will rapidly deteriorate during the Third Plan. If better standards of living constitute the final justification of planned development, to the extent the employment demands are being underfulfilled, the realisation of better standards of living will be

postponed. If the test of employment is applied as a criterion of the effectiveness and success of the five-year plans, a verdict of a serious failure will have to be recorded with respect to the Second Plan and the Third Plan will not be able to escape a similar verdict. This regrettable performance can be put in terms of a few eloquent figures.

At the beginning of the Second Plan, the backlog of unemployment was of the order of 5.8 million. During the Plan period, total employment is estimated to have been provided for 8 million employable persons, divided into 6.5 million in non-agricultural occupations and 1.5 million in agricultural occupations. But the final result was that at the end of the Second Plan, the backlog of unemployment shot up to 9 million persons as against 5.8 million at its beginning. Thus the Second Plan ended with a higher level of unemployment. In the Third Plan the original calculations made in the Draft Outline have been upset because of the disclosure of a higher rate of net population growth in the provisional figures of the census of 1961. It is now assumed in the light of these census figures, that the labour force comprising the age group 15-59 years will increase by 17 million persons. The target which has been set for employment in the Third Plan is 10.5 million in the non-agricultural sector and 3.5 million in the agricultural sector, or a total of 14 million.

The aggregate position can now be summed up. The backlog of 9 million persons unemployed at the beginning of the Third Plan and the addition of 17 million by the process of population growth in the employable age bracket take the total number of persons seeking jobs to 26 million. Out of them 14 million persons may be absorbed in gainful employment, on the assumption that the development projects generate this order of new jobs. Even so, 12 million persons will be without jobs and the net position will be that, as against a backlog of 9 million unemployed persons at the beginning of the Third Plan, the number of jobless people will rise to 12 million at its end — a little more than twice the volume of unemployment at the beginning of the Second Plan

One of the explosive elements in the unemployment situation is the increasing volume of educated unemployment. This is illustrated in the detailed statistics set out in Table I included in this article. That table shows that between 1956 and 1960 — the period which roughly coincides with the period of Second Five-Year Plan — the total number of the educated unemployed increased by 108 per cent. An analysis according to the qualification groups makes the revealing disclosure that for graduates the number of the unemployed during this period rose by 77 per cent, for intermediates by 100 per cent and for matriculates by 118 per cent. These victims of frustration later tend to provide explosive material for extreme political ideologies and agitation, not to speak of the great hardship that is inflicted on their families which legitimately expect that the investment for their education should pay at least marginal dividends.

Table II in this Section shows the trends in the growing volume of unemployment, with this reservation that the registration with the employment exchanges do not reflect the 100 per cent picture of this problem. With reference to this table it is argued by official spokesmen that the number of employment exchanges has been steeply increased from 1958 onwards, and therefore, the number of the registration of the unemployed and of those pending on the live registers is impressively large, but not comparable with the corresponding figures in the earlier years. However,

Tripura				

it is forgotten in advancing this argument that there is another side to it — that the existence of a smaller number of employment exchanges in the earlier years definitely concealed the presence of numbers of job-seekers who did not figure in the registers for sheer lack of opportunity to approach the exchanges. The basic argument about the steep increase in the volume of unemployment remains unaffected.

The emphasis on education is rightly shifting towards scientific and technical courses for university degrees or towards training at the diploma level. Technical personnel will be required in large numbers as the diversified industrial projects will be put into commission. But the great handicap about technical specialisation is that if a qualified person does not get a job after the end of his training course, he finds himself incapable of adaptation to any other professional or occupational career. The Draft Outline of the Third Plan contained a table (which, however, has not found a place in final text of the Third Plan) which shows that the outturn of graduates in civil engineering at the end of the Third Plan will be 33.5 per cent in excess of the demnd, of mechanical engineering graduates the excess will be 13 per cent and of electrical engineering graduates the excess will be 15 per cent. Obviously these young graduates cannot be made to wait indefinitely until jobs turn up subsequently. This shows a serious imbalance in the planning of facilities for technical education and opportunities of employment. There is bound to be a swelling influx of students in the technical training institutions. It is, therefore, of the utmost importance that each five-year plan should contain as its integral part a manpower resources budget in the scientific and technical cadres.

How can the serious flaw in the five-yeas plans in respect of the failure to create adequate employment opportunities and preventing a progressive deterioration in unemployment be removed? One way which is suggested is that wherever possible the projects should be implemented with the maximum use of the available manpower and for this purpose construction projects offer an appropriate opportunity. But something positive needs to be done. Why should it be that the unemployment situation should be aggravated on such a significant scale during the Second and the Third Plans, when the emphasis is distinctly on the rapid industrialisation of the economy? One straight reply to this query is that most of the investment in the public sector is directed towards basic or heavy industries which are capital-intensive and with a relatively low employment potential. The establishment of new factories in industry other than heavy industry as well as the replacement of machinery in existing factories tend towards a perference for the most up-to-date plants or equipment which serve to step up productivity. But its inevitable effect is that it contains a positive element of rationalisation which reduces the volume of employment. In the long run this process of high productivity and economic growth is bound to create greater opportunities of employment, but the hardship in the interim period will perhaps be inescapable.

However, positive action needs to be taken in a constructive direction. The major lines indicated for it are that some of the heavy industrial projects in the public sector should be postponed and replaced by other industrial projects with a larger employment potential. After all the goal to complete the period of our economic take-off in ten years is apparently too ambitious. If the rising expectations about employment are not fulfilled on a more significant scale than now, the revolution may bring violent upsets.

TABLE II
