AMALGAMATIONS at work

Here are the illustrations representative of the Amalgamations Group's activities.

Some of the firms in the Group are acquired interests, but the others have been promoted as part of a basic plan for the speedy growth of the automobile and transport industries.

The sole aim is service to the country, contributing in no small way to the national economy, under the Five Year Plans.

putting India on rails

Featured above is the "EXPRESS", Eastern Railway's first passenger locomotive.

UNTIL the advent of John Gray upon the scene in 1829, the main lines of business of the old-established firm of Burn & Company were house-building and cabinet-making. Gray put the affairs of the young company on a firm foundation and expanded its activities into the new fields of civil and mechanical engineering, iron founding and contracting.

Recognised as India's first railway contractor, Gray laid between the years 1851 and 1859 one hundred miles of permanent way for the East Indian Railway Company stretching over two provinces. Gray's pioneering railway work "reflected great credit on the Firm" and earned the Company good profits which went into the purchase of some land at Howrah on which a foundry and workshops—the nuclei of the present Howrah Ironworks of Burn & Co. Ltd.—were erected.

As a constituent of the Martin Burn Organisation, Burn & Co. Ltd., Howrah, have, among other things, specialised in railway engineering and the large-scale building of rolling stock for the Indian Railways. Since 1904, the Company has produced more than 58,000 four-wheeler units of more than 100 types and over 1,12,000 sets of crossings and switches for India's fast expanding transport system. In addition, from their Structural Shops have come many thousands of tons of fabricated steelwork for the building of railway bridges spanning the great rivers of this sub-continent.

Ref No.5368/60-61.

To
Sales Manager,
M/s Ashok Leyland Ltd.,
Ennore, Madras

Dear Sir,

Our Ashok Leyland Comet 203" wheelbase passenger bus has covered over 400,000 miles with the original engine.

It is remarkable that this extremely satisfactory performance has been achieved despite the difficult journeys the vehicle has done all these years. It has carried tourists from Bangalore to Ootacamund making over 460 trips to the hill station, averaging 15 miles per gallon of diesel oil. The majesty of its run over the winding ghat sections has won the admiration of not only the passengers but also of other motor operators.

It is a pleasure to own a Leyland bus, to experience its economy, its great strength and its smooth run over all types of roads. It is a pleasure too to talk about it to others.

Yours faithfully
for S R M S

Pioneers in Plantations

One of the largest groups of planting companies in South India today lies within the Peirce Leslie & Company Limited fold. Resources, experience and skill have combined in PL & Co. to command wide confidence. The diversification of interests from fertilisers to estate stationery has firmly emphasised that PL & Co., are now part of the planter's life. Tea, rubber and coffee interests are blended in the PL & Co. group.

The Rupee companies that Peirce Leslie & Co. Ltd., look after as Managing Agents are:

The Peria Karamalai Tea & Produce Company Limited; The Ouchterlony Valley Estates (1938) Limited; The Kil Kotagiri Tea and Coffee Estates Company Limited; Chembra Peak Estates Limited; The Cochin Malabar Estates Limited; Kumergode Estates Limited; The Kalasa Tea & Produce Company Limited.

Peirce Leslie & Co. Ltd., are also Secretaries and Treasurers of The Savamalai Estates Limited; The Thirumbadi Rubber Company Limited; Cowcoody Estates Limited and Lingapur Estates Limited.

Peirce Leslie & Co. Ltd.
Incorporated in England with Liability of members limited

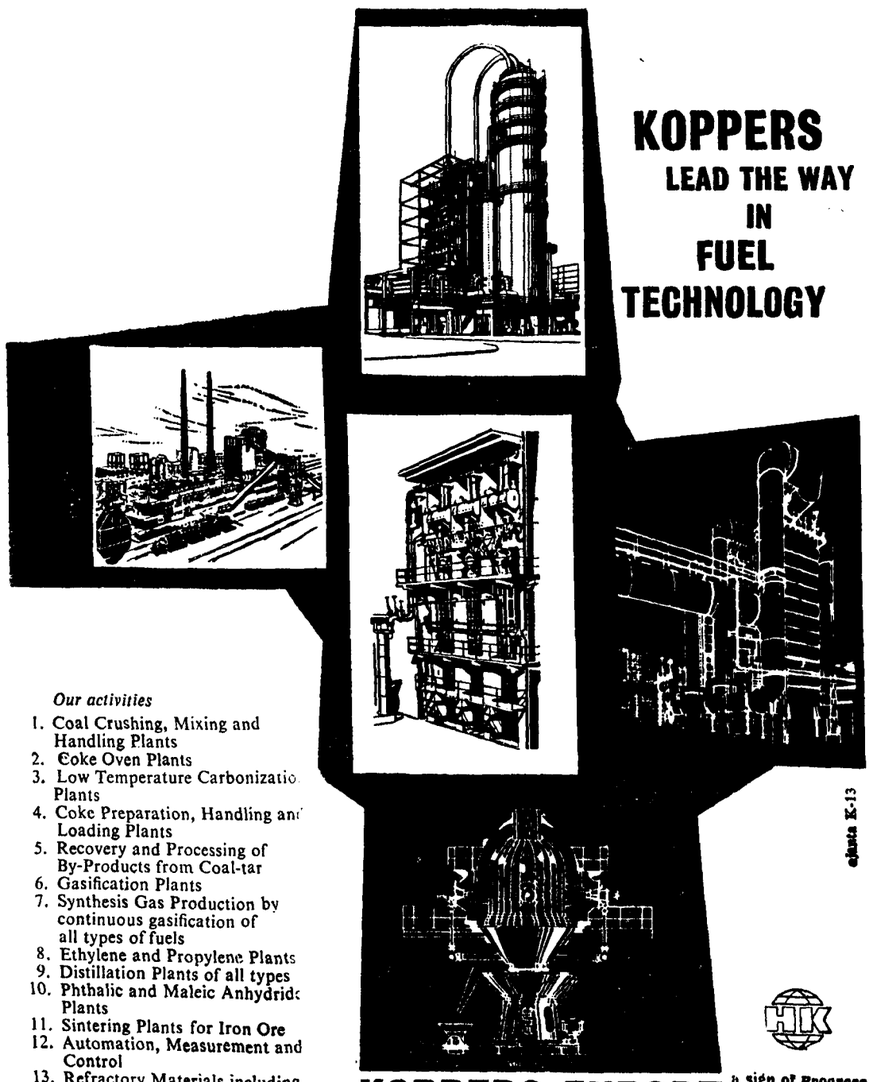
KIRLOSKAR OIL ENGINES LIMITED, POONA-3 (INDIA)

Pilferproof packaging protects your health—your life



PUBLIC ENEMY NO. 1 is the racketeer trafficking in spurious drugs and foodstuffs. He exists—and flourishes—because you cannot always test the purity of your purchases.

Packaging in small pilferproof units, like this tablet bottle protected with a Roll Seal closure, is your surest guarantee of product purity. Roll Seal closures for bottled drugs and foods, foil diaphragms as on vanaspati and baby-food containers, sealed cans for processed foods, tear-off seals on pharmaceutical vials, heat-sealed plastic and laminated packs: these are some of the Metal Box packages which protect your health . . . your life.

Metal Box pilferproof containers and closures, with trade-marks and brand names indelibly printed directly on to the package, have helped to stimulate the manufacture and marketing of a variety of packaged consumer goods—by guaranteeing their purity, by prolonging shelf-life and by promoting brand identification. Today Metal Box packages go to 1,400 packers who pack well over Rs 100 crores worth of goods and employ more than 80,000 people.

Man has conquered
nature by transforming
his ideas into reality.
In this effort, oil has been
his trusted ally, for it
increases his productivity.

By fueling and lubricating
the machines in farms,
factory and home,
oil lessens our burden.

It powers cars, trains. ships,
buses and airplanes,
making travel comfortable.

Without oil,
we would have neither
books nor newspapers.

Thanks to oil,
modern man has the time
and opportunity
to enjoy life in many ways.

As an organisation,
which refines and markets
vitally needed
petroleum products,
Stanvac is participating in
the country's progress.

Road Transport Services maintained in spite of tyre shortage

TYRE RETREADING HELPS TO KEEP VEHICLES MOVING

Certain categories of truck tyres are in short supply. With the present volume of tyre manufacture, it may not be possible to meet in full even the replacement needs of Road Transport. Shortage of new tyres has become inevitable.

Today the retreading industry has assumed national importance. It is estimated that last year over 400,000 tyres were retreaded in India saving road transport operators nearly Rs. 21 crores.

Retreading can do much more: If tyres are retreaded in time, that is, when the tread is just wearing smooth, they can be retreaded over and over again; many truck tyres can be retreaded as many as three times. Retreading will not only save money for the operator, but may avert rationing and control of tyre supply.

INDIA AND EUROPE DIVIDED

Merciful Heaven!
Thou rather with thy sharp and sulphurous bolt
Split'st the unwedgeable and gnarled oak
Than the soft myrtle; but man, proud man,
Drest in a little brief authority,
Most ignorant of what he's most assur'd,
His glassy essence, like an angry ape,
Plays such fantastic tricks before high heaven,
As make the angels weep.

William Shakespeare — *Macbeth.*

We sail a changeful sea through halcyon days and storm,
and when the ship laboureth, our stedfast purpose
trembles like as the compass in a binnacle.
Our stability is but balance, and conduct lies
in masterful administration of the unforeseen.

Robert Bridges—*The Testament of Beauty, Volume I*

All this I bear, for, what I seek, I know:
Peace, peace is what I seek, and public calm:
Endless extinction of unhappy hates.

Matthew Arnold — *Merope.*

It is our true policy to steer clear of permanent alliance with any portion of the foreign world.

George Washington's Farewell Address to the People of the United States, September 17, 1796.

India and Europe Divided

Preface

FOR the Annual Number this year momentous events, as well as "The Eastern Economist's" own choice have decreed that the subject should be 'India and Europe Divided'. There has been, year after year, very little choice in regard to the major themes of "The Eastern Economist" Annual Numbers. They have had, perforce, to be directed to those problems or continents which, to the Indian mind, have loomed large on the political and economic horizon. It is true that just two years ago the Annual Number dealt with 'India and Europe'; the imperatives which make a return to this Continent necessary in so short a time are so compelling that no apology is necessary for dealing with the same Continent though, necessarily, in somewhat different terms. In 1959 there was a picture, by and large, of the need for India to recognise that, for the purposes of the Third Plan, she needed almost every country in this pulsating European world. As 1961 closes, the opportunities for an equal choice of all without offending any country have been quite considerably dimmed. The year ended with the momentous decision to march into Goa, Daman and Diu; India has leaned heavily on U.S.S.R. support and has obviously displeased, to use a classical understatement, what is often described as the Western World. The glaring instance of the differences on our action in Goa have brought home to the Indian mind the presence of Europe in areas far removed from its shores. While the Berlin crisis is geographically a dramatic internal illustration of Europe divided, the divisions of Europe reach out almost to every corner of the globe. They will be found at this moment in a fairly vicious form in the problems of the Congo, notably in those connected in the settlement of the dispute with Katanga. They have been seen by us all too keenly in our own experience in Goa. They have now cast a shadow over Kuwait where the U.S.S.R. is apparently supporting Iraq's claim against British resistance. Over the whole of the world and in its supreme council—the United Nations—the European Cold War is carried over to every continent. If in all political and economic analyses, one looks for causes of political and emotional behaviour today, a great deal, notwithstanding the power of the United States, would still rest in the heart of Europe divided.

THE ECONOMIC GULF NARROWS

This Annual Number seeks to develop what, it is hoped, for Indian readers will be a new and provocative thesis round three central ideas in terms of political and economic philosophy such as might affect Indian thinking in relation to Europe thus divided. The first of these is basically an economic idea, indicating that in the fifties of this century there has been evolved, on both sides of the Iron Curtain, a pattern of economic pragmatism which has made obsolete, on the one hand, classical theories of the essential quality of free competitive enterprise as the main motive of economic progress, and on the other hand, the dogmas of Karl Marx which produced classical socialism assisted by the teachings of Lenin and Stalin in the first half of this century. The essential contrast in philosophy between the two sides of the European Continent was predominantly economic. It has always been believed that the Revolution of October 1917 was more an attack on Capitalism than on the Czar. Marxian doctrine assumed that, while Capitalism was inherently unstable, Socialism could remove the contradictions of this obsolete system and install in its place a system without "exploitation" and without "a class struggle". Exploitation, according to Lenin was practised by Capitalism internationally. Thus Imperialism was a contingent condition of Capitalist success.

Western Europe has now shown, in more than one respect, particularly in Germany, the Netherlands and Italy, that colonies are not a condition of economic progress. Thus, there has been destroyed one of the momentous pillars of Communist thought. Secondly, the argument that foreign trade was a Capitalist ally with the technically advanced countries pitching themselves against the helpless underdeveloped countries, has been shown, in fact, to be an error. In the second half of the twentieth century, the advanced countries are advancing largely on their own markets and not upon the riches of colonial trade. In fact, the current position seems to be that Western Europe is almost sufficient onto herself and, at this moment, Britain is making up her mind to enter the European Community instead of holding fast to her far flung empire, believed to be her source of prosperity for fully two centuries. In a sense, Britain herself is shedding her imperial skin recognising that, if the doctrine of the colonial drain had any force at all, it does not apply to our times. Under the pressure of these developments there lie three major economic forces which are propelling themselves with tremendous impact into the making of new political and economic communities. The first of these is the rapid advance of technology, including in this year the arrival of space flights in which the Soviet Union has tended to surpass all nations of the earth in both skill and daring. The interest in the space flights, at the moment, is much more in the region of illustration of the vast strides of technology in the decade than in their capacity to present new worlds for a planet getting darker every day under the shadow of the destructive powers of the same technology. The truth seems to be that technology in industry and science is now making progress which has no relation whatever to the pattern of investment either by free enterprise or by the socialist or by the mixed economy. In other words, economic systems are now giving place in the current economic thinking much more to forces common to all systems that are prepared to use instruments of economic progress. Second only to technology, which helps to reduce costs, is the expansion of markets, partly by the rise in real incomes, partly by the removal of tariff barriers and handicaps, partly, if one might so express it, by the regeneration of markets in the form of the principle of increasing returns. Essentially, the principle of increasing returns is that the markets which produce incomes are themselves makers of further income since costs are reduced by higher production and, therefore, markets can be expanded by an initial act of faith that lower costs will be more than proportionately rewarded. Large markets can be made to breed even larger markets in their turn; larger because of the capacity of modern technology to multiply supply and of affluent markets to absorb more and more at this time when barriers to trading are reduced. Thus, Western Europe has become one vast market, and Eastern Europe another. Only fierce political walls, and not Marxian differences of economic philosophy, prevent a successful extension to the other side. Both the classical doctrine of unlimited competition of economic theory and Marxian doctrine of central production in a Socialist State are now largely marginal differentials to the central core of economic practice which is a combination of technology, spacious management and expanding markets which are not bound either by the teachings of Adam Smith or Alfred Marshall on the one hand or Karl Marx on the other.

THE POLITICAL GULF DEEPENS

Unfortunately, when the economic differences between 'systems' are being eliminated and their similarities in the modern age are outliving their marginal differences, the political gulf gets, it seems, every day deeper. This is not because either system is incapable of advancing on the economic front or either can advance more rapidly than the other. In the economic articles which follow, it is shown that Western Europe has as good a record to show in this decade as any country of Eastern Europe. Indeed, it has something far better to show because economic progress has been achieved within the framework of individual liberty and, by and large, with a field for experiment in both State and private management, which has been good for the world at large as well as for the countries concerned. We do not need, as so many of us trained in Europe thirty years ago, to take a long course in economic philosophy in order to recognise that much of what we were taught has thus become completely irrelevant to our times. What we were not taught might conceivably be far more relevant since the economic factors seem largely to cancel out; it is on the great spiritual founts on which, it seems, in the last analysis, men's particular choices of systems will depend. If rapid economic progress can be achieved with relatively free political systems, why should we choose dictatorship and all the terrible tyrannies which go with monolithic political systems based on the cult of personality in which one needs to tremble lest one should lose favour with authority often contained in a single mind? What we need now to choose is whether we shall live with liberty or without it; or less controversially, in the one-party system of socialist thinking, or the multi-party systems of the Western democracies. "The Eastern Economist" believes that the Indian people at this time need a clear assessment of the implications of this choice in terms of the national interest.

THE PARADOX: DEMOCRACY MINUS?

The Constitution of India is supposed to have made this choice, and the legal framework of the Indian Government which is derived from the Constitution, is basically a leaning towards the Western European pattern of life, particularly in its parliamentary form of Government — that of the British Parliament. On the other hand, as events in Goa have shown, the emotional leanings of the Indian people are still somewhat against the Western powers believing that they enshrine — as with Portugal — a deep desire for Colonialism or for intervention in the affairs of the peoples of Africa and Asia. The existence of NATO as a supreme military alliance is believed often to contain the seeds of Colonialism in a revised form. The Warsaw Pact, on the face of it, seems to have no such disadvantages, because its members have no colonies in the old sense. Thus the Indian opinion is very prone, at this hour, to assume that when its forms of political thought are more in tune with the West, many of its vital interests, such as in the pursuit of the freedom of the Asian and African peoples, the U.S.S.R. and its associates might have a better understanding of our broad aspirations at this time. This, in the opinion of "The Eastern Economist", is an error and much of the argument in the pages which follow indicates the extent to which it is a mistake for the Indian Union to lean heavily on Soviet support in the belief that, in either economic or political terms, such a leaning is in the interest of the people of India or of Asia. In purely economic terms, the capacity of Western Europe and the United States to help the Indian Union in the fulfilment of the Third, Fourth and the Fifth Plans must be far superior to those of Eastern Europe as the decade which has elapsed can speedily show. But irrespective of whether or not Eastern Europe has this capacity to supply the needs of Asia, the fundamental idea that a monolithic one-party system is interested in extending liberty (as we conceive it in a democratic society), is one of those great illusions which have tended heavily to cloud thinking both in the Asian and African Continents for the last generation. The rise of the Soviet Union and its spectacular success almost everywhere are often confused with the power to assist underdeveloped countries to shape their own ways of thinking. There is nothing that succeeds like success. The greatest of all perils of success, however, is the capacity to blind those who worship it and to cloud the great issues of human choice in matters relating to the creation of human personality. Great technological achievements produce (alas!) no creative power in the moral field; atheism is, if anything, a destroyer of personality, though a mechanical religion may be no better.

The moral should now be clear. Firstly, it is argued that India is on the point of making a major error in her leanings towards the Soviet Union out of gratitude for the quite simple and inexacting support that we have received by a veto in the Security Council on the discussion of our incorporation of Goa, Daman and Diu in the Indian Union. It is possible to be blind to our own larger interests because we are relieved of embarrassment at this moment. Secondly, in a longer study of the Third Five-Year Plan, it is argued that our fences with the West should be mended since it cannot conceivably be wise, having embarked on this Plan, to endanger its fulfilment by an exaggerated dependence on Eastern Europe. Thirdly, the character of thinking of both the East and West should now be set in a quite different context of thinking. The Western nations do not need Colonialism and Eastern Europe does not, except for propaganda purposes, sustain the thesis that only Communism produces rapid economic progress. Exploitation, in the Marxian sense, has been abolished in the West by the Welfare State and the mass consumption affluent society without the elimination of free choice sought in socialist societies. In other words, the elements of economic progress are now not connected with exploitation of labour and the development of Colonialism and foreign markets. Thus Capitalism, in a sense, has redeemed itself by a capacity for performance without exploitation or Colonialism which makes the socialist vision, both unnecessary and cruel.

This is not an argument for Capitalism as such in the Indian context. Equally it is not necessarily a condemnation of Socialism as such. But the argument certainly leads to the conclusion that India can well proceed on her own way of a "mixed economy" without prejudices which the history of the last decade has shown belong to an age which is dead.

DEDICATION

The year 1962, according to astrologers, is to be a critical year for the Indian Union and the exact time of crisis is due in the middle of next month. There are times in history in which it is good for a nation to have a crisis, for then it can test all things and hold fast to those which are good. "The Eastern Economist" believes that in assessing and assaying the vast volume of material which has been collected on both sides of the Iron Curtain, and experimenting with the truth it contains, it has some contribution to make to the Indian people at this time. Slogans—Right, Left and Centre — are now largely meaningless. For the instruments of economic progress seem to be basically the same everywhere — technology, markets, incentives. But greater than these is dedication. There must, however, be first a casting out of current erroneous and prejudiced thinking. Perhaps we shall find again, as Mahatma Gandhi did, the wonderful tonic of experimenting with truth. If that should be assisted, our labours will not have been in vain. As always, it is to the Indian people that our work is dedicated.

PART A

A Politico-Economic Prologue

Europe: The Divided Continent

From Pre-nationalism to Supra-nationalism

THE DIVIDED CONTINENT

EUROPE has always been a divided Continent. In what way does its partition across its middle today differ markedly from the divisions of the past? For three thousand years there has been no European unity and yet, culturally, Europe has tended to be one piece, resting on the magnificent pillars of the culture of Greece and the glory of the Roman legal and administrative legacy. One of the remarkable paradoxes of history is that Greece, with its tremendous empire moving eastwards, was unable to extend its domain over the European Continent. When Alexander wept, perhaps on Indian soil, because there were no fresh worlds to conquer, he was seemingly unaware of the great areas of Europe which had still to feel the sharp edge of his sword and the tremendously vital touch of the Greek cultural renaissance. Even in the glorious fusion of Rome and Greece, which was inherited by Europe at the beginning of the middle ages, there was no single European State. When the power of Rome was broken in the fifth and the sixth centuries after Christ, what looked like a possible universal European state seemed crumbling rapidly to ruin. Nevertheless, there were bequeathed by Rome, even in the process of dying, two mighty elements of union to this divided continent. The first was the common Catholic faith which, until the wars of religion came further to divide Europe, was a magic element of unity almost over the whole of Western Europe. When on Christmas Day 800, the Great Charlemagne, the ruler of the Franks, was crowned Emperor of the West by Pope Leo III, there was apparently a degree of unity greater than any which existed even under Roman rule, for Charlemagne's empire was deeper in the heart of Germany than had been the sway of the Roman emperors. The second element of unity was far less defined, because it applied only to the literates of whom Charlemagne himself, a great patron of learning, was, curiously, not one. This was the use of the Latin language as a single element providing among scholars a bond in the days before nationalism tore Europe apart.

DISUNITY AFTER THE NATION STATES

Division in Europe bred rapidly on the base of nationalism when the English and French nation States confronted one another in a long series of battles in the Hundred Years War; when in the throes of its making, Germany confronted France and Spain confronted England for the profits of sea trade, there were both religious and national economic issues at stake. There are some who would argue that the divisions of Europe today have their deep roots in the rivalries of those centuries and that Western Europe is fighting for a Christian way of life, just as Eastern Europe is fighting for the Communist way of life. There are others who would see it entirely in economic terms in a black and white distinction between Capitalism, as the embodiment of free enterprise (which it has long ceased to be), and Socialism as an embodiment of public or State monopoly. These are all the playthings of fertile but superficial minds. The factors which have made Europe break into two great pieces, as distinguished from the many distinct states, are today as far removed from the period of pre-nationalism as they are from the period of nationalism. They are also far removed from the controversies of religion, Catholic and Reformation, as they are from the simple elements of the Capitalist-Communist antithesis. There are perhaps, elements of all in the controversy. But, basically, the issues now raised are those which in the twentieth century world require massive areas both for security and for economic protection. Security is the greater bond of union on both sides of the Iron Curtain. Today because of Berlin and East Germany it is overwhelming.

It is this supra-nationalism which has produced in Western Europe the NATO alliance and the European Community. It is this supra-nationalism which is driving the United Kingdom, albeit with great hesitation, into the European world, of which she has been so central a part, but with which, traditionally, she has sought never to merge. It is supra-nationalism decreed by the fear of being overpowered by the Soviet Union which is the key to Western European thinking. And Germany, notwithstanding the extraordinary nationalism of its people, has been split in two by the same forces. For the supra-nationalism of the Communist State has created in turn the supra-nationalism of Western Europe, whose hinterland is the United States. Thus Europe has, in a sense, reached its point of minimum division when only two great forces face one another against a dividing wall which is unique in European history.

THE MILITARY COMPONENT

The causes of this particular line of division are certainly predominantly military. This is, by no means, to say that, had World War I and World War II not dramatically intervened to place the exact frontiers where they now are the old frontiers would have rusted. One of the tremendous paradoxes of history is that the German State which has suffered most from the current division of Europe, has been the main instrument of the current creation. When Hindenburg and Ludendorf scored in World War I their momentous victories over the disorderly Russian armies on the Eastern Front they were, unknown to themselves, creating the October Revolution of 1917 and the whole course of subsequent Russian history. When in World War II Hitler launched his senseless attack on the Soviet Union, in a period of mad overconfidence, he, in fact, gave the Russians what they had never had, a foothold in Central Europe. The Conferences of Teheran, Yalta and Potsdam were powerless to stop the relentless march of military events. One might argue that more of Germany might have been held by the West, but then Berlin and much of Austria would have been held by the East. So far as Denmark was concerned a last-minute intervention by Winston Churchill saved a zone which might have fallen with East Germany. But there is nothing to justify the easy generalisation that, against the cold calculations of Stalin aided by his military successes, any large section of Eastern Europe could have permanently escaped the events of 1945 to 1948 which made Eastern Europe very much what it is today.

Europe, for the same reasons, that prevented the West from keeping the Soviet Union outside Central Germany keeps its unity today because of the new military power of the U.S.S.R. Europe has been divided at the will of the East, and on the whole only with the acquiescence of the West. Therein lies the key to the understanding of the dangerous, though probably not unstable, division which will perhaps run its course for this century. Behind this line of division very different forces work. To these it is necessary to turn. But the line of partition has been decreed by World War II backed by the nuclear power of both sides which inhibits action to change this tortuous dividing line. Thus division is deeper than ever; but behind this division, unity is being steadily forged every year. Unfortunately greater unity and greater disunity will never perhaps cancel out.

Part A – A Politico-Economic Prologue

Western Europe: The Imperative of Togetherness?

UNION BEFORE DEATH

IN what manner does the division of Europe into two great blocs of States in unions, mutually antagonistic, differ from Europe divided down the ages? So far as Western Europe is concerned, the essential difference lies in the fact that its cohesion has been imposed from without and yet in a very different manner from the manner in which Rome, Charlemagne and Napoleon — each in their different times — sought European Union. In the case of Rome, there was the superiority of the Roman citizen imposed on a large number of subject peoples. And while the legal structure of Roman law came in time to wear a more liberal look, it was basically authoritarian with the power and authority not only of the Emperors, but of the small ruling class of Imperial Rome. Under Charlemagne, the Holy Roman Emperor, there was the dual power of the authoritarian emperor with his supreme authority based on conquest, allied to the authoritarian power of the Catholic Church giving, in a sense, a unity in a fuller, though more paradoxical, form. For Christian doctrine was based on equality of men before God, whereas the superstructure which, in time, reared feudalism, was based essentially on the powers of classes, giving rise to hierarchies, both in the Church and State. When Napoleon, who has been described as the prime-mover of the early portion of the nineteenth century, sought the union of Europe, it was a grand vision in which France was the apex of the pyramid and Napoleon himself the supreme authority in France. Just as there was a paradox in the association of Christian doctrine with the fuedal system in the Middle Ages, there was a paradox in Napoleon playing upon nationalism and the power of the people to make his army dynamic in the sense that he gave them a cause which was different from his own authority.

None of these movements was essentially democratic. Napoleon himself is credited with the famous saying: "I do not hate freedom though I give it a wide berth when I meet it on my way." His institutions although founded on Roman Law, were predicated on an authoritarian rule even whilst promising every soldier a Field Marshal's baton in his knapsack. Thus democracy in the army, with a free opportunity to rise inside its rigid cadres, was not democracy in the sense of a free choice by the people and yet in one of his great visions, Napoleon saw the power of the mass mind which had run amuck in the French Revolution. "He who moves the masses", he said, "changes the face of the earth."

THE FREE SOCIETY

Western Europe today is different from the whole of its predecessors in that it is a voluntary association of free and equal States, resting on the democratic idea, that the people in these States can choose their governments inside the alliance, predominantly military, which is the common bond of security for all. It is true, there are signs of authoritarianism in Western Europe today, and Portugal, whose name is rightly anathema in India, is a conspicuous example of the stigma which often mars Western European liberalism. Nevertheless, the broad current of Western Europe is one of an association of free societies, freely associated for a common, and wholly legitimate, purpose. The common purpose, which might be called togetherness on the analogy of the new structure of group assertion is, in fact, a response to the need for combined military security facing a great and unfriendly, power.

THE RISE OF NATO

The fact that NATO preceded economic co-operation is shown by the dates on which step by step the North Atlantic Treaty Organisation advanced over Western Europe. It is not necessary here to go into the whole story of how in the disillusion of 1947 and 1948 with a Communist coup in Czechoslovakia in February 1948 and the blockade of Berlin from June 1948 to April 1949, Western Europe was forced into cohesion. The Brussels Treaty of 1948, the North Atlantic Treaty of 1949, the Paris Agreement of 1954, and, finally, the addition of Germany which acceded to NATO on 9th May, 1955, are all steps in a process of cohesion; almost unbreakable now that it has come about, but basically created under fear of Russian military might. Whether that fear was justified or not, it was in fact the cause of union. Thus it comes about that what the nations of Europe could not for eleven centuries after Charlemagne achieve on their own, came about by the outside pressure of the Soviet Union's policy of advance into Central Europe. Whether, on balance, the Soviet Union's policy was wise or not is currently beside the point. It has certainly brought into being a powerful counterpoise; perhaps in this action and reaction are both equal and opposite.

BY BLOOD AND IRON

The Indian observer, even if he has a fine historical sense, cannot enter deep into the spirit of European events between 1945 and 1961. For one thing, they are basically events which turn on the security of the nations concerned and their security, although it seems to involve a global war when violated, does not basically interest the Indian people who are enormously distracted by their own problems, first following the coming of Independence—Kashmir is one such—and then the building up of the Plans. Thus, Western Europe has started its period of cohesion with two great handicaps not understood in India. The forceful character of Eastern Europe's aggression on the West is scarcely appreciated by nations which have always looked upon the West as an aggressor. One of the great historians of Western Europe, Arnold Toynbee, has talked of the siege of the West as the great reversal of the historical current of the eighteenth and the nineteenth centuries when the West ruthlessly besieged the rest of the world. It is natural that we, who still think in terms of our own painful experience, which has been that of aggressiveness by the Western European powers, do not appreciate the fact that the besiegers are now terribly besieged. Yet one cannot explain the tremendous cohesion of Western Europe except on the basis that it has been forced to combine, in Bismark's phrase, by blood and iron. The course of events does not suggest that NATO was, in the first instance, aggressive although views will naturally differ on its capacity to proceed beyond its original context which was purely defensive. Article 5 of the North Atlantic Treaty which described the essential character of the treaty shows that it was a defensive alliance. "The parties agree that 'an armed attack against one or more of them .... shall be considered an attack against them all' and that if such an attack occurs each of them will take 'such action as it deems necessary, including the use of armed force, to restore and maintain the security of the North Atlantic area'." The European Common Market and the European Community are the children of what was basically a military alliance; it seems strange in retrospect that common interest needed to be enforced by the fear of common extinction.

Part A – A Politico-Economic Prologue

Eastern Europe: Union Against Schism?

IF the source of democratic unity in Western Europe has been the fear of Eastern European aggression, by what bond is Eastern Europe herself held together? Undoubtedly, as NATO has grown in strength with the power of the United States, there is a fear of military attack from Western Europe, although, as has already been indicated, this is not within the ambit of the NATO alliance. The Union of Eastern European States is much more a process of extending an undisputed rule of a common doctrine largely, though by no means entirely, dictated from the Kremlin. In a sense, just as Western Europe has been held together by the fear of an Eastern European onslaught, Eastern Europe has been forced to combine itself against schism between its own members no less than the fear of weakening itself before the enemy.

MINORITY GOVERNMENTS

The need for protection against "schism" will be apparent when one recognises that, in every single state of Eastern Europe, the Communist Party which exercises complete executive authority, is in a painful minority. In the U.S.S.R., members of the party number only seven per cent of the population. In Poland, they number only one per cent, and, while the authority of the State has to be maintained, it is obvious that there must be the apparatus of authoritarianism and, if necessary, force to prevent an overthrow by the majority. In this sense, doctrinal weaknesses of the ruling party acquire a power far in excess of what they would be in democratic societies. Administrations, as well as persons, need to fight for survival. How else can one explain the bitter history of purges to avoid deviations in the short history of Communism since the 1917 October Revolution? The truth is that the doctrine of the inevitability of the collapse of Capitalism, which was to have sustained the Revolution when it was consolidated, has proved insufficient to maintain faith in Communist administrations. For one thing, Capitalism is very far from collapsing; indeed, it has, under altered circumstances, acquired a very marked ascendancy over Western Europe. Schism also spreads within, when the picture across the "border" is one so different from that painted by Karl Marx or by current Communist teachings. The Western proletariat, far from dwindling into insignificance, is acquiring its own stake in Capitalism, and the affluent society is placing within its reach practically all the elements of welfare which hitherto belonged to the privileged only — the automobile, the television set, the telephone, scholarships, and above all, political power belong to workmen no less than to the middle classes of our time. The transformation of the bourgeoisie in Western Europe has been the basic challenge to the Communist philosophy of life.

THE CRISIS IN EAST GERMANY

In no area of Eastern Europe has this been more dangerously exposed than in East Germany. Here the classical doctrine of Communist teaching, namely, that Capitalism contained within itself the seeds of its own decay, based as it was on exploitation and on imperial ambitions, have been dramatically disproved. Berlin has been the window of Eastern Germany and thereby of the whole Communist world on the affluence of Western capitalism, freer in West Germany than almost in any country of the world. On December 30, 1961, Herr Ulbricht even admitted that the net result of this unequal competition was that 40 per cent of the national income of the East German State, or possibly nearly £5,000 million in all over the years had been sucked away by the movement of population and the consequent denudation of East German talent and skills. Thus the crisis which has led to Berlin's becoming a great citadel of Cold War, becomes full of meaning. The East demands that this window should be closed. The West, equally determined to demonstrate its superiority, is right to bar the way.

THE BATTLE FOR ECONOMIC EQUALITY

This is, in fact, although it takes the political forms of a new treaty for East Germany and the consequent settlement of the Berlin dilemma, basically an economic matter. What is involved in Berlin is the recognition that two unequal systems are at war and the Eastern European system cannot currently bear (at least before it has established the passage from a low to a high level of income) the comparison which Berlin presents. It is natural that the East should recognise that it must unite against the terrible leak in its body economic. Berlin has been the wound from which Eastern Germany has been bled over all the years since partition. It is right that its doctors of doctrine should attempt, in avoiding schism in their own ranks, to close for all time the wound or its consequences on the body politic whose strain is all the greater by the fact that it is authoritarian and run by small minorities without popular support.

Because the Eastern European system is authoritarian, because it does not enjoy popular support, and because in economic terms it cannot currently afford a traffic in men and a comparison of performance with West Germany, it is understandable that the authorities in the East should be adamant against free movement. This is not necessarily a permanent act of negation. All it means is that, in the long period of transition before Eastern Europe catches up with Western Europe, there will be intolerance and all the consequences of it in authoritarian institutions, lack of freedom of expression and so on. These are what might be described as the defences of a diffident society.

CAN CONFIDENCE RETURN?

If, however, the argument of the economic section (Part B) is true, one might make the assumption that perhaps twenty years from now, when diffidence in this respect has been somewhat destroyed by the undoubted capacity of Eastern European countries to employ the most modern technologies to develop their economies, there will be less fear that the affluent societies of the West can continue to draw the best talent that there is in the East. Meanwhile, however, the problem of defence of the Eastern World has made acute a major political problem. The question of coexistence is no longer a theoretical one, for the closure of the window of Berlin is necessarily an attempt to avoid schism within Eastern European ranks. The closure of Berlin thus conceived is not an attack on the West so much as an instrument in Eastern self-defence. On the other hand, to the West it is a vital element of strategy to demonstrate that its own way of life is more powerful in producing the fruits of material progress added to liberties of the individual citizen. Strategically, Berlin is too vital to both sides for a major reversal of positions to be obtained. Therein lies the danger of the Berlin situation, for retreat is now almost impossible and one cannot advance by nuclear war. That at least is the Russian view. But China and others are more ridden by theory, perhaps because they are further away from the fruits of action. Thus schism has produced more schism, with China and petty Albania calling for a "tough" line, whereas the Soviet Union, close to the major powers of attack, is necessarily more flexible and more calm. This is sometimes described by saying that the U.S.S.R. is becoming more "normal". In fact, it is much more the wisdom of expediency in an age in which nuclear war pays no dividends to either side. The line of division of Europe is hard, because it is probably not negotiable; there is too much at stake, and the only military methods altogether too unpredictable.

Part A — A Politico-Economic Prologue

India and Western Europe: The Perils of Doubt

THE analysis thus far has tended to show that Western and Eastern Europe are now in a dangerous state of stable equilibrium, stable only because the strength of both sides is great, and nuclear war so fearful that a military adventure to upset the balance is extremely unlikely.

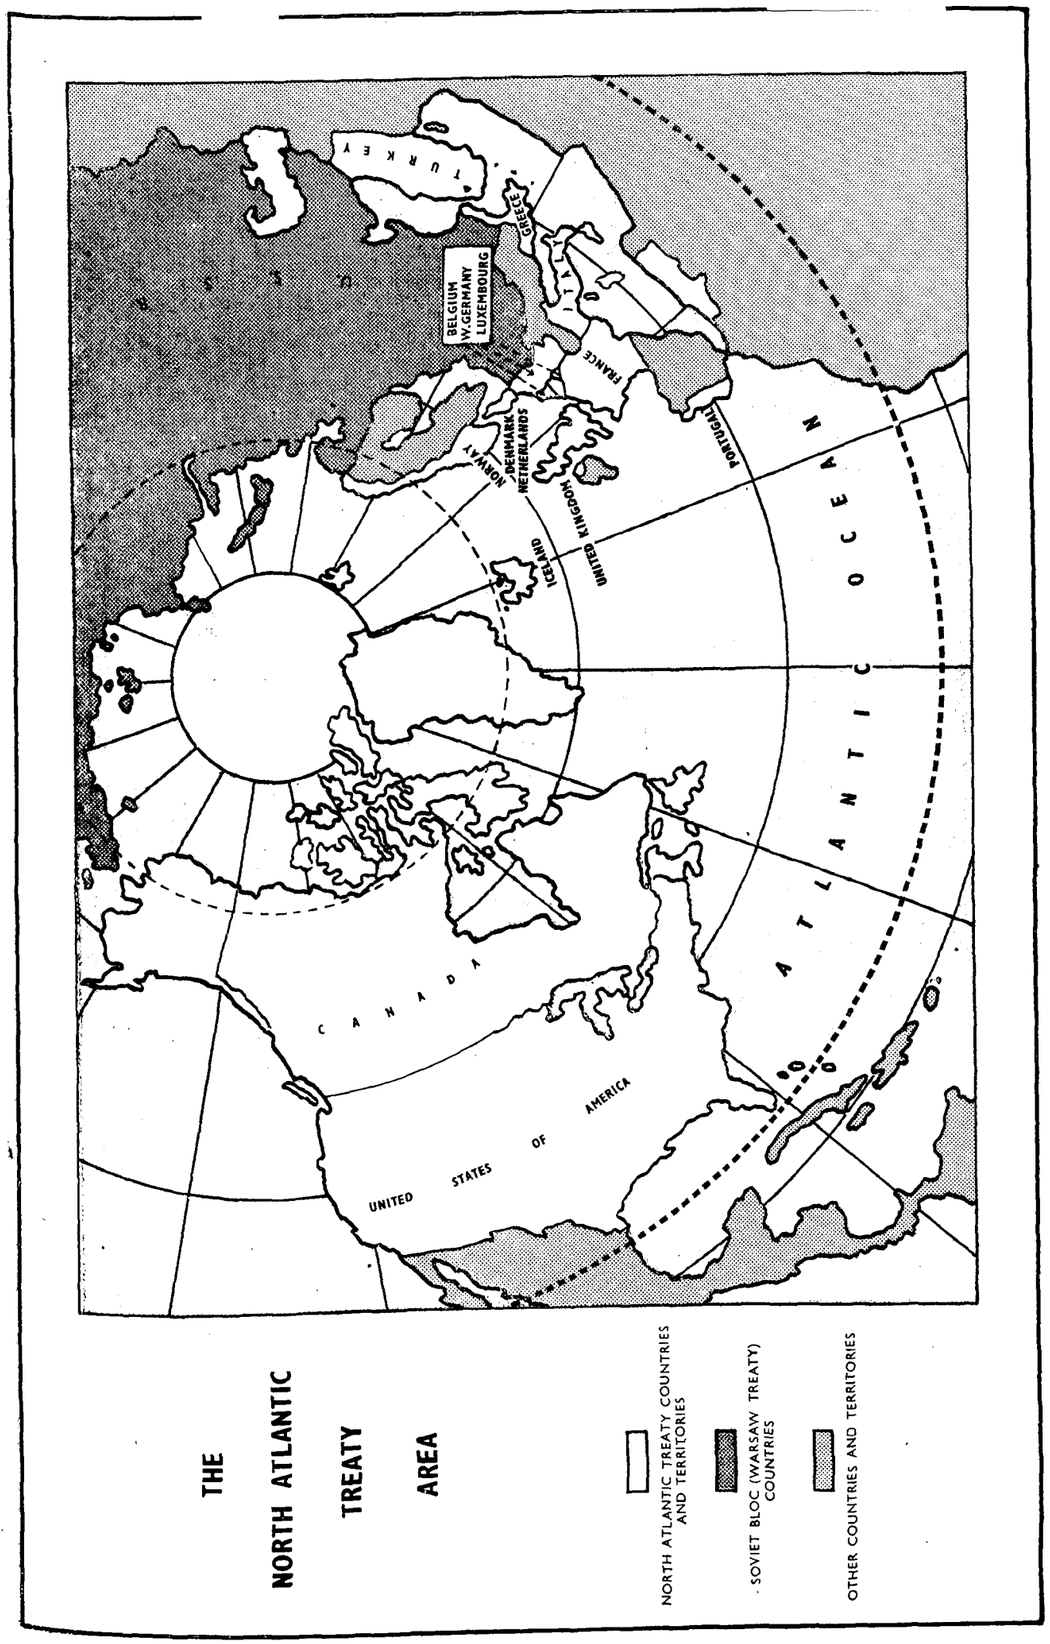
In this quarrel between two great blocs primarily determined on a balance of power in Europe, the Indian Union has no direct interest so far as the dividing line is concerned. It has, however, a major interest in keeping up and extending its channels of communications with both sides. There is nothing immoral in India's failing to take sides in this strictly European battle. It has, indeed, moral overtones, but, if the analysis of the two preceding articles is correct, the essential factor in the European partition is a military balance of power, with the West holding strongly against further Eastern European advance into the heart of Europe. Conversely, the East cannot retreat for fear that its own periphery might crumble. In other words, the problem is one of security and, in the first round, security only. In the problem of their survival, it is natural that the nations of both sides should consider India's economic development or India's neutrality a matter not of the highest priority.

THE DEMOCRATIC IDEAL

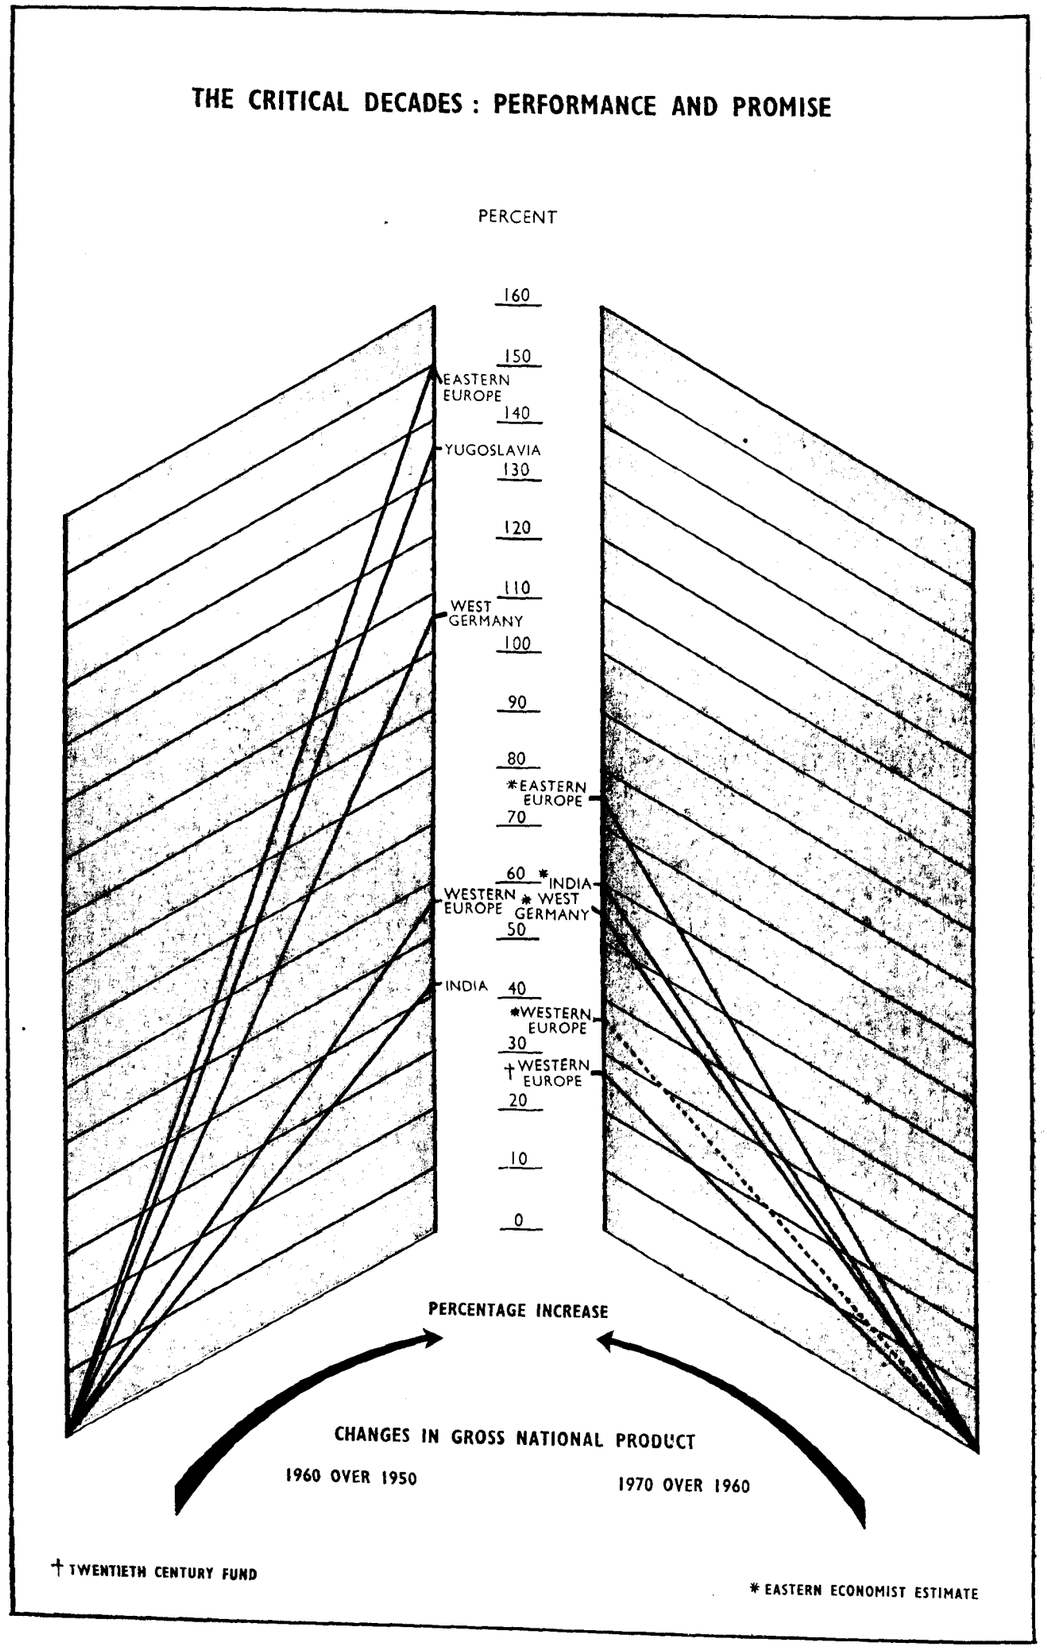
Having said this, namely, that India is not central to the European struggle, we cannot absolve ourselves completely from taking our own sides in what is an ideological, as well as a military, matter. Our sympathies, at least because our Constitution is so framed, should be with the Western European democracies. They are set in the context of the way of life which we have chosen in our own Constitution, and our own Government, fighting on that basis, has to contend with the Indian Communist Party working very much on the lines of similar parties of Eastern Europe. In other words, the majority structure in the country is, so far as the framework of its political thinking is concerned, more committed to Western Europe than to Eastern Europe. This fact implies that in an approach to the European problem our natural sympathies should be with the West. What looks like a straight issue of choice is, however, clouded by several elements of uncertainty, particularly one predominant on each side.

COLONIALISM MINUS ?

So far as our approach to Western Europe is concerned, much of our passion for the democratic way of life tends to be inhibited by the fact that a large number of countries of Western Europe, with whom we should be associated in spreading the democratic idea, are ex-colonial or metropolitan powers or, even today, exercise colonial domination. The case of Portugal included in NATO has already been mentioned. It is not even a democracy in any appropriate sense. But there dies hard in the Indian Union a feeling that, even in regard to some of the best metropolitan powers, what are described as "colonial" interests dominate an excessive portion of their behaviour. Our differences with the United Kingdom do not exist only on the Congo and Katanga, though there they would appear to be significant. There has been in our anti-colonial past, and in the colonial outlook of the Western European countries, a constant jarring of views which has culminated in the great clash of opinion expressed at the end of the year on our action in Goa. Thus, paradoxically, while we should have been closer to Western Europe by the framework of our thinking, in fact, at this moment, India's actions in Goa are only favoured by the Eastern European world.



HESITATION IN INDIAN INVESTMENT



Again, while the Western European countries should look to the biggest real democracy in the world for new proof of the democratic way of life, the character of foreign investment by Western Europe in the Indian Union has been so marked by hesitation as, rightly, to raise the feeling that Western Europe is not entirely convinced of the fact that Indian partnership in the democratic way of life and her plans for progress deserve only partial though substantial support. In the Indian Union, there are some who would argue that it would not have been necessary for India to have gone to Eastern Europe to seek additional assistance had the United States and Western Europe underwritten the relatively moderate demands of her Third Plan, making it quite clear that the balance of payments problem implicit in a tremendous task of economic development of this kind were a democratic responsibility of the richer countries of the world. Undoubtedly, it has been a joint failure of India and Western Europe that they have not been able to find a level of investment at which each would feel that the other had done all it could to maintain the central bond of unity in thinking to prevent dependence on other sources alien to the democratic way of life.

NEUTRALISM THE BAR ?

Apart from the problems of Colonialism and the fact that Western Europe, including the United States, has not been able to rid India of her dependence on other countries, there is India's problem of neutralism in regard to the central problems of the Cold War. Most Western European countries, being heavily involved in an act of survival, tend to consider neutralism somewhat callous forgetting that the whole Afro-Asian world has problems which in their own context, in our own time, seem to us far reaching and more urgent than those of Western Europe.

India and Western Europe which should ordinarily be in full and free partnership are inhibited on both sides. We are constantly doubting the bonafides of the Western European democracies, particularly France and Britain, because of their colonial antecedents and interests. We view the alliance with Portugal with grave misgivings and we are naturally suspect when Europe and its problems are always placed ahead of those of the rest of the world implying a democratic self-interest which seems to us a lapse from the highest morality, just as our own self-interest in ourselves ignores the moral aspects of the Cold War. Secondly, both sides have had insufficient understanding of the problems of investment in the underdeveloped countries and while a significant progress has recently been made, hesitation of investment by richer countries in the Indian Union has produced a feeling of some humiliation since almost every thing that is received has to be asked for, and, in the last analysis, judged by authorities outside ourselves. We are probably, unduly sensitive in asking for assistance which we badly need, and we are probably inadequate salesmen of the commercial merits of investment in India. But the end result is the same, namely, that the doubts and hesitation on both sides have done something to prevent the full development of friendship betwen India and Western Europe such as would assist both groups to advance with ut questioning other's motives and looking on them with suspicion.

Part A – A Politico-Economic Prologue

India and Eastern Europe: Redressing the Balance

THE FAILURE OF THE WEST?

PERHAPS it may be argued that, if Western Europe and the United States, taking a great plunge into unfamiliar waters, had underwritten the development of India and Pakistan in the early fifties—as in fact, Western Europe was underwritten by the Marshall Plan—the course of history in the sub-continent, both politically and economically, might have been different. In fact, India's First Five-Year Plan was hesitant partly because it was believed that India could not "afford" a spacious plan; if assurance had come from abroad its dividends might have been great. The Second Plan encountered repeated foreign exchange crises because of the halting character of assistance from the West. The Third Five-Year Plan, notwithstanding a most helpful indication of Aid-India Club assistance for the two years, is in fact, still in animated suspense. There is a widespread feeling in the Indian Union that the West is not prepared to underwrite India's Plans fully and without reservation. There is justification enough for this view. It seems that Western European, as well as the American, view is that the more assistance that the U.S.S.R. and her associates can give to the underdeveloped countries, the more Eastern Europe will be weakened in the European scene and the less burden there would be on the Western European countries. It is probably, on balance, that this view is mistaken; but, mistaken or not, there is now no alternative. India has, inevitably, called in Eastern Europe to redress the balance of her economic needs.

THE DIPLOMATIC OFFENSIVE

It would be quite erroneous to represent India's current association with Eastern Europe as entirely an economic consequence of the failure of the West to underwrite economic needs. India herself has been anxious to maintain a neutral position arising both from her fear of military alliances, necessarily associated with the Atlantic Community which, as we have seen, is primarily fearful of aggression and, secondly, because, in the United Nations and elsewhere India wishes to take a non-aligned, and not a "prepared" or "influenced" position. This fact of India's willingness to stay outside Western European control has been skilfully used both by India and by Eastern Europe to develop channels of communication which were practically non-existent ten years ago. One of the most remarkable diplomatic operations in the world has resulted in the broadening of relationship between the Communist countries of the world and India—the greatest of all the neutralists. There are both political and economic overtones in this expanding association.

THE TROIKA

To take the political factors first, one must look upon the formulation of the Troika, or the principle that a neutral should be associated with both sides of the Cold War in resolving some major international disputes, as essentially a Russian recognition of the important part that India can play in the settling of Cold War disputes. While the principle of the Troika has not been accepted in so many words by the West, there exists today in fact in the Supervisory Commissions in Laos and Vietnam the Troika principle. Again, in a somewhat different manner, the willingness of the U.S.S.R. to trust India in alliance with the United Nations in the Congo has kept the Cold War somewhat out of that problem area. It is, in fact, a useful and new element in the international scene that India and other neutral countries can enter into international disputes thereby exercising power far greater than might be indicated by their economic or military potential. Thus it has come about that the international balance is being redressed in India's favour by Russian support both in political and in economic terms.

THE NEW RUPEE PAYMENT AREAS

In economic terms, Eastern Europe has seen some of the problems of the Indian economy with a vision substantially greater than that of Western Europe. Recognising that salesmanship in the export markets of the world was not a particularly strong point of Indian industry or trade, the U.S.S.R. was willing, from November 1958, to accept "inconvertible" Indian rupees in payment of practically all its trade obligations. All other countries of Eastern Europe followed suit, thereby creating a revolution in payments which had a three-fold advantage to the Indian Union. In the first place, because foreign exchange had not to be found, projects could be prepared with great rapidity and, indeed, were also hastened where individual nations of Eastern Europe have taken complete responsibility for projects as a whole. Bhilai and the Heavy Machinery Plant at Ranchi are only most remarkable illustrations of forward central planning which have been ahead of our own requests. Secondly, rupee payments have enabled us to explore Eastern European markets without our having trade representations on any significant scale. This is because the "idle" rupees were utilised by these Eastern European Governments for purchasing some of their requirements in India. In other words, these countries gave rise through their substantial imports to a great expansion in our exports. Thirdly, and this is not unimportant, it is possible as a result of the dovetailing of Eastern European plans with our own and with the fairly precise estimation of volume of rupees available for trade both ways to plan Indo-Eastern European trade in a manner which is quite impossible in the fluctuating markets of the West in which a market built today may well be lost tomorrow. One often fears that buying by Eastern European countries fluctuates voluntarily. This may be so in particular commodities, but in total volume it can be made more stable and grows at a much steadier rate than our trade with the Free World. Added to the barter agreements, which the State Trading Corporation has used particularly in Eastern Europe, though also significantly elsewhere, there have been invented for purposes of developing Indo-Eastern European trade devices which, judged by results, have been markedly successful. Indo-Eastern European trade bids fair to grow at several times the speed of our trade with other countries. This is not only connected with the fact that they have started from a low base. Even in absolute quantities increases in trade are very considerable.

It is possible to hold some critical views on the character of some of these operations. Being largely tied credits the prices are not always competitive in an international trading sense. Quality is more restricted and know-how is that prevailing in the countries from which purchases are made which cannot always be the best that the world possesses. "The Eastern Economist", however, reviewing the whole range of India's needs at the present time, and recognising the limitations both of physical supply and of Western foreign exchange, has come to the view that these arrangements are by and large in India's interest and that an attempt to abolish them would be a major error.

REDRESSING THE BALANCE

Thus both in a political and economic sense a partnership has risen between India and Eastern Europe which has had a substantial effect in correcting our dependence on the Western World and allowing India freedom to manoeuvre. It may be that a price has been paid for these developments, but no one who knows the importance of Russian support on Kashmir and, more recently, on Goa, can argue that the political traffic has been all one way. One can argue that while from time to time the leaning towards the Soviet Union has been excessive, and, in the light of our difficult relations with China, caution is necessary, the broad pattern has hitherto been rewarding to both sides.

Part A — A Politico-Eco nomic Prologue

Growthmanship: Thesis, Antithesis, Synthesis?

IT is now time to turn to the central theme of the Annual Number which is an essay in the presentation of the philosophies of the Western and Eastern Europe, as they are now emerging as perhaps a synthesis of what seem to have been dividing principles of economic philosophies on both sides of the Iron Curtain. Indian students of economics trained largely in the West, have tended to see Socialism as an antithesis of Capitalism and based historically on the vitriolic presentation of the arch-prophet of Socialism, Karl Marx. Many of them, seemingly modern, consider Karl Marx out of date because the doom which he had prophesied has not overtaken capitalist societies. But, of course, capitalist societies do not contain, in essence, today the great marks of division between employers and employed, and between entrepreneur and the proletariat, which were the basic postulates of the Marxian vision. On the other hand, students of Socialism see no withering away of the State, and no elimination of "the class struggle" in the central picture of industrial developments in the Communist States. Very much the opposite. The essence of Power, which is division of countries into rulers and ruled, extends with some variables, over every country in the world. For the present, the purpose is not to look at whole societies in change, but to examine the central problem of economic growth to see whether or not some new principles of growthmanship, to use Colin Clarke's telling phrase, can be dimly seen arising from the wreck of both capitalist and socialist economic philosophies as found in economic text-books still read in every Indian University.

THE CAPITALIST PHILOSOPHY

In the first place, much of what Adam Smith, and even Alfred Marshall, saw in the capitalist system has tended to disappear for good. Broadly, the argument was that competition tended to secure the distribution of resources in a manner which "by an invisible hand" became the optimum distribution for the nation as a whole. Classical economic theory propounded the doctrine that the real wage could not differ markedly from "the marginal product" of the labourer, and that, if this could at times depress the rate of wages by an influx of low quality labour, it could also raise it by making marginal productivity high by the heavy association of capital per worker. The United States provided the classical instance of the gospel of high wages, showing everywhere that the Marxian doctrine of the constant deterioration of the proletariat by the iron law of wages was a basic, and foolish, error. Wages could go up as well as down and, in the last century, by and large, they have been steadily up and are still rising. What was wrong with the capitalist philosophy was not its assumption that, when perfect competition was granted, this would result in a fairly beneficial system, depending on market forces, in turn depending on free human preferences, which would work out for the benefit of all. Its error was in its postulation of perfect competition and in the further assumption that equilibrium could be stable at a level of only optimum employment. The depression of the thirties proved that was far from the truth. The Wall Street crash of 1929 killed unfettered enterprise. In the General Theory of Employment, Wages and Interest, Keynes established quickly the doctrine that the capitalist "system" could not be left to itself, and might need increasingly the stimulus of forced public investment as well as forced saving. In other words, after all the great private enterprise system depended at critical times, on public sector action. Thus the capitalist system established the public sector at a central point in its own philosophy of individualistic entrepreneurship.

THE SOCIALIST COMPROMISE

By contrast, the Socialist system based itself on a system of distribution of resources on the facile assumption that a single unit would be much better qualified to determine the requirements of resources of individual units than the free play of market forces. Theoretically, if perfect foresight was given to the men in control and the methods they used were equally not liable to error, there was something plausible in the assumption that any level of development could be charged into an economic system by the enlightened leadership of the planning State. The flaw here was basically the fact that knowledge and foresight were extremely limited, that power produced blindness as well as corruption and that, on balance, the distribution of resources by the State was not necessarily superior to the distribution of resources by the "market" and often, lacking the benefit of competition, reaped only the dubious advantages of State monopoly.

THE MIXED ECONOMY

Partly as a result of the failures of the two extreme principles and by the compromises which have been forced upon them, "the mixed economy", which now operates over the whole of Western Europe and to some little extent in Eastern Europe, has been a substantial winner in terms of current acceptance. It has also been proved much more effectively in practice than in theory. In the process of the mixture, all those great central dogmas of capitalist teaching, competition, "stable" equilibrium, the equalities of saving and investment, have all come to be what, in fact, they are, interesting ornaments to the basic facts of progress. Indeed, it has now come about that the theory of income growth, related to investment, which in turn was related to capital formation, has been finally disproved by Colin Clark. It is not now true that the secret of growth is capital investment, whether in a socialist or capitalist State. In all States, it has been shown that there are great advantages to be gained by positive entrepreneurship by the State, but that it is possible to make the error of excessive "forced" investment no less than of unduly low investment. In other words, all the virtues of the "systems" as systems, have ceased to bear any significant viability in the old debate on which was the superior of the two systems. Western and Eastern Europe, now racing against one another in what looks like the old battle between the old philosophies, are, in fact, operating on the same central base of two prime-movers, technology and markets, powerful in both systems to work the wonders of growth and conversely to work all the difficulties of financial management, such as inflation or unemployment. In this process the prime-movers are killing all the old dogmas on both sides.

TECHNOLOGY AND MARKETS

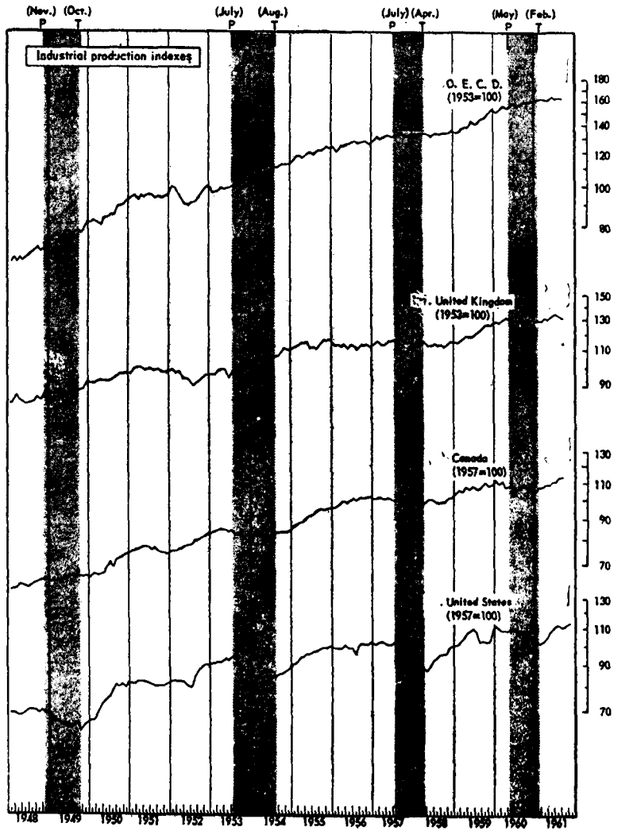
So far as this essay comes out with any positive conclusion it is to the effect that the substance of modern economic growth in the second half of the twentieth century is allied in all the nations of the world to two major elements, — the first of which, Technology, utilises the fruits of scientific knowledge as well as scientific management; the second, the principle of low costs of production follow upon large markets by the employment of the law of increasing returns, equally relevant in a public sector or private sector unit, makes the mass consumption society possible and thus an economic "take-off".

If a new synthesis is to arise on the debris of the "Wealth of Nations" or Marshall's "Principles of Economics" on the one hand, or Karl Marx's "Das Kapital" on the other, it would be a strongly twentieth century

Part A — A Politico-Economic Prologue

document, in which there might be a complete presentation of economic growth without reference to any of the great figures of economic thought in either the Capitalist or the Socialist worlds. In a mysterious way which may, indeed, not be lasting, the major elements of economic growth are now assuming dominion over the philosophies which have brought to birth the warring agencies of Government which seem to employ them. So far as the Indian Union is concerned, the major moral that needs to be drawn is that the true debate in economic philosophy is not between Right and Left, but whether the climate can be made appropriate for the absorption of Technology and the expansion of markets in the most rapid time. It is likely that the mixed economy, when freedom for the mixture to change without the terrible biases which are introduced by political prejudices and political power by those who have learned their economics a long time ago, would be the best solvent of the problems, no less than the acrimonies, of our age.

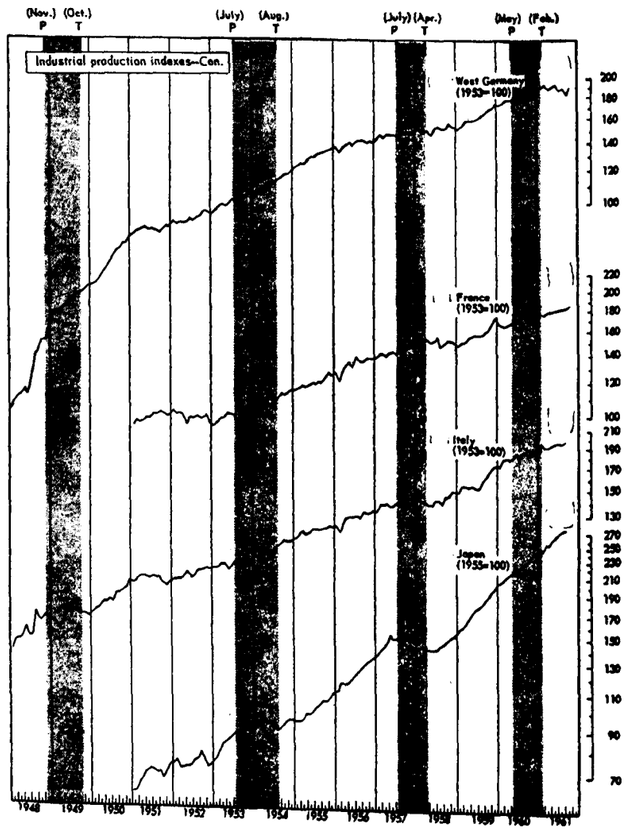
The Changing Spectrum of European Economic Progress



IT is possible to produce chapter and verse to illustrate the main argument of the last piece that "systems" are seemingly irrelevant to the pace of economic progress. There are presented here just a few illustrations of what in Western Europe as well as elsewhere has taken place in the period roughly since India became independent. The two graphs which appear here will show the rate of industrial production in the OECD (Organisation for European Economic Development), the United Kingdom, Canada, the U.S.A., Germany, France, Italy and Japan, showing that in the capitalist systems themselves the forces of economic progress are very unequally matched. Thus the OECD has done substantially better over this period in terms of rate of growth than has Canada, the United States or the United Kingdom. West Germany, France and Italy seem now to be doing equally well, but their rate has been surpassed by Japan. Practically all the countries of Western Europe have doubled their industrial production within a period of seven years. Japan has more than trebled its own.

Against these particular figures, the large claims made for Eastern Europe will be seen in better perspective. Not, indeed, that Eastern Europe has a less spectacular picture to show in industrial production, but its bases of operation are substantially lower than those of Western Europe, and in some respects, such as Rumania and Bulgaria, are lower than those of Japan. In absolute terms, Western Europe is surpassing Eastern Europe in its rate of absolute production although so far as gross national product is concerned there tends to be a rise here and fall there with much of a muchness throughout. In order, however, to give this wide spectrum of economic progress some more factual basis one might perhaps take the figures for the last year in terms of four countries which are now pacemakers of economic progress in Europe. Italy on the Western European side had the highest rate of economic progress with 13 per cent rise in national income in the year 1960. Yugoslavia, betwixt and between, has had a similar rate of rise in 1960 and an average rate of rise of about 10 per cent since 1954-55. Her plans ten years from now assume that this tremendous rate of growth in gross national product will continue in the sixties. Poland has had a similar rate of growth and as tables elsewhere in this issue would show, it has an almost equal capacity to develop with Western Europe. The Soviet Union itself has raised its industrial production spectacularly, but has stagnated in agricultural production in the last two years; it may be it is facing a particular hump, the solution of which is some distance away. On the other hand, the Soviet Union has shown at least in the field of fuel research and space flights that rates of economic progress are no bar to the exploitation of the highest technology and the power of organisation in practically every scientific field. A great stream of economic progress flows out of Western Europe and Eastern Europe and it would be difficult for anyone to contend that here, and nowhere else, is virtue to be found. Virtue is to be found everywhere in one of the most dazzling spectacles of economic progress ever seen. It is against this dazzling spectacle of Europe's economic progress — surpassed in rates of progress though they may be by Yugoslavia and Japan —that the disappointment of the United Kingdom's low progress in that of the Free Trade Area are seen in a new perspective. The urge to join the higher reaches of the spectrum has now become one of the great motivating forces of economic policy. Again the solution is not in terms of 'systems' but in terms of the expansion of markets. This explains the true purpose of the entry of Britain into the European Common Market to be followed shortly by the countries of the Free Trade Area.

This essential point, namely, that all countries are now operating a pragmatic system of both controlled and free trade and are employing the same instruments under somewhat different conditions with variable, but similar, results, is central to an understanding of the Indian problem at this moment. India has everything to learn from both sides of the Iron Curtain. Her rate of economic progress is less than half of any of the important countries of Western or Eastern Europe and when one considers the low base from which these operate one must recognise that the achievements of the Second Plan, satisfactory as they seem to us, are merely a pe ty beginning from which determination to proceed on a much higher level of development must be based. Power, technology and markets, these three, and perhaps the greatest of them all is the power of the human mind, to appreciate truly the predominance of these components of prepetual economic progress.



India and Europe: Striking the Balance

MANY of the conclusions reached in the foregoing articles have tended to be more negative than positively constructive on India's choice. Thus it has been argued that neither system has, in terms of economic efficiency, an absolute proof that it is better than the other and that on both sides of the Iron Curtain there are currently at work forces which seem to suggest that "systems" are irrelevant and the essential prime-movers are technology, markets and scientific management. Similarly, it has been shown that both capitalist and socialist doctrines were mistaken in assigning certain virtues or defects to the other. In particular, Capitalism without Colonialism can well meet the Communist challenge as has been shown by Germany, Italy and the Netherlands amongst other countries. Similarly, on the socialist side, it would be a mistake to suppose that free enterprise has been eliminated. In Yugoslavia, the free market and the chain of incentives is sweeping, and is almost revolutionary in its capacity to trust individual or group production against the

INTERNATIONAL COMPARISON OF INDUSTRIAL PRODUCTION

Business Cycle Series 1948-61.

Part A — A Politico-Economic Prologue

State. Should India's choice at this moment be either the East or the West or the middle way?

Choices are not made in this somewhat neutral way, implying that almost any system can deliver the goods. In the current situation, the Western European system has a power and capacity for both assistance and trade which will rank it higher than the Soviet system and, of course, with Western Europe stands the United States. There is little likelihood at the moment of Eastern Europe's providing even a fifth of India's requirements of capital or even a fifth of India's exports or imports. Thus, while theoretically the systems are both effective, there is no equality in current contributions they make to the Indian scene. In the year 1961 special mention should be made of the tremendous achievements of the Common Market. Payment surpluses of the European Common Market are now running at $3 billion a year, whereas the United States has almost the same deficit in her international payments, and Russia's external surpluses are never large enough for her not to have a very tightly controlled investment operation. Similarly, most of the European Common Market is affected by over-employment and the demand for internal capital. India cannot afford to ignore this trading area although it is obvious we will need to work specially hard in it. It is easy to make the mistake of believing, because one has to work very hard for every increase in European Common Market trade, whereas the increases we have found in Eastern Europe have come relatively simply, that our destiny lies in Eastern Europe and not in the West. There is no error so fundamental as supposing that Eastern Europe can replace the West—the United States and Western Europe—in Indian economic development.

Apart from the fact that proportions are over four to one in trade and much more in aid, as the following sections will show, there is no prospect of the U.S.S.R. and the Eastern European countries being able to produce any absolute surpluses of the same order as those being produced by Western Europe and the United States. It is the view of "The Eastern Economist", notwithstanding the great claims made in Russian literature, that the absolute gap may not narrow very much, although Eastern Europe, because of its lower economic base, will show a higher rate of progress in gross national product than both Western Europe and the United States. Projections can, of course, be anyone's toy and no one can be absolutely sure what the future holds in store. But it will be a matter of great surprise if, in the next twenty years, India's trade relations were even one-third with Eastern Europe and less than two-thirds with Western Europe. In other words, the West will probably be for the next four plans at least twice as important to us as the East. In this sense the two sections of Europe pursue what, in respect of India, should be an unequal race.

The problem for Indian administrators is to recognise both the sources of strength in Eastern and Western Europe and the necessary differentials which must exist so that we can plan our relations with each country in terms which will be most advantageous to ourselves. In the discussion of the European Common Market in the Indian Union, there has been too much concentration on arithmetical workings of tariff changes, and very little on the basic appreciation of the total growth which has carried Western Europe so far ahead of expectations in just two years. A great volume of understanding and analysis needs to be thrown into the understanding of Europe on both sides. With it there must be a new capacity for salesmanship, necessarily much more demanded in Western Europe than in Eastern Europe. India's trade organisations and her business representations are of far too small an order to influence the course of trade. If the projections presented in the next section are even approximately of the right size, India will need to treble immediately her organisation for salesmanship, analysis and understanding in this tremendously pulsating Continent. This is the time to make a major decision, recognising that both tradition and advantage lie, not in a bias towards Western Europe, although Eastern Europe will have tremendous contribution to make as the years advance. The balance is naturally difficult to strike; it will have to be struck annually but in the long period the centre of gravity of Europe will certainly lie inside the Western European field. That is as much as need be said at this moment. Policies designed to raise Indian economic development as rapidly as possible are not necessarily policies dependent on Western Europe or on Eastern Europe exclusively; but they should be based on an accurate knowledge of the capacity of Western Europe and Eastern Europe separately to help and on new channels of communication which at present are very inadequate. A policy for Europe must think big, act big and, perhaps, also be big. India is not so important an economic entity that she will be wooed on her economic merits alone. We must carry an image of greatness into Europe; one wonders whether we have not failed seriously to realise what this means.

Conclusion to Part A

IT is now possible to draw together threads of the argument as presented in Part A. It has been argued, in the first place, that Europe has always been a divided Continent, but that its current division into two great blocs is, in many respects, unique. The coming of nuclear weapons has abolished the chance of a gainful war and, therefore, conquest which was the element of change in a constantly moving European kaleidoscope, is now obsolete. Though the division is irksome—partly because Russia is in the heart of Central Europe and partly because the periphery of Eastern Europe is still insecure—the position, as it now obtains, is one of stable equilibrium. Secondly, it has been argued that this is, primarily, a military situation concerning the European powers and the balance of world power and is not of primary national interest to the Indian Union. Therefore, neutrality, so far as the particular issues raised by the European military war are concerned, should be India's policy. We are sometimes, unfortunately, unmindful of the stake that these countries have in NATO or in the Warsaw Pact or in nuclear detonations, just as they are unmindful of our anti-colonial needs, and indeed, of our pressures for economic development. These might be described as the hesitations on both sides in a situation in which we wish to be friendly with both blocs without sharing their fears.

Thirdly, it has been pointed out that Indian conceptions in regard to the vitality of the two systems represented by the blocs in Europe, are often basically mistaken. Both Capitalism and Socialism have ceased to have the theoretical form which they were given by their preceptors, Adam Smith and Alfred Marshall, on

Part A – A Politico-Economic Prologue

the one side, and Karl Marx or Lenin, on the other. Capitalism is vigorous on its own account and now maintains a constantly rising standard of living of the "proletariat". Under the Welfare State it is helping to abolish even the "class struggle". It can survive without colonies and, indeed, is presently surviving on its own affluence. Socialism, for more reasons than one, is no longer the monolithic State driving private enterprise and the free forces of the market out of existence. It continues to borrow tools and "incentives" from the capitalistic world. In the last analysis, both Western and Eastern Europe rest upon affluence created by technology, scientific management and markets. There is less power in "systems" of thought than ever before.

Fourthly, while in a sense, the old debate on systems has disappeared, India's choice, or rather India's degree of partnership with the two sections, cannot be equal and is never likely to be equal. It is argued that, over the next twenty years, it is likely that India's relationship in trade, aid, and assistance with the West will be two-thirds and with Eastern Europe only one-third. This is consistent with the point that the rate of rise of economic growth of Eastern Europe, because of the lower base from which it starts, will be somewhat higher in percentage terms. All in all, however, there is nothing to show that in absolute quantities the East will win the economic race.

There is only a moral postscript to be added to this analysis. All that has been said before can stand on the basis of Realpolitik without any preference based on the political and moral values which India professes. It is believed, however, that we have a moral obligation to support those systems which approximate to our sense of the dignity of the human individual, freedom of expression, and the democratic way of life sustained by institutions freely built in a plural society. There can be no doubt that here, more than anywhere else, our interest lies in the success of Western European experiments by which economic progress is continually unfolding itself on the basis of the creation of human personality and new patterns of culture in which the purposes of living are often more important than life itself.

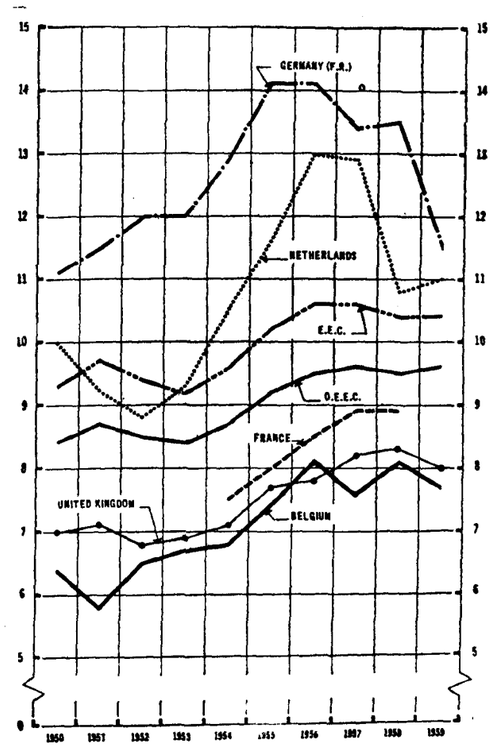
PART B

An Economic Review

Rates of Economic Growth

India and Europe: 1950 to 1960 with Projections to 1970

Introduction



THE vast expansion in the European markets on both sides of the Iron Curtain has sharply focussed attention on the basic criteria which accelerated the economies of the European countries. The various research agencies of the United Nations have attempted to analyse the factors and the conditions of economic growth not only in the industrialised countries but also in the developing countries and the centrally planned economies. Invariably, attention has been rivetted on the importance of capital accumulation. Professor W. W. Rostow, a couple of years ago, stressed that in addition to the rising rate of investment and restraint in population, the existence of a manufacturing section and institutional frame-work and the presence of daring entrepreneurs were essential concomitants of economic prosperity. The European experience of expansion during the last decade has, however, emphasised the importance of technology and productivity in economic growth. The accumulation of capital and a restraint on population growth are "essential" factors for raising standards of living but not "sufficient". They must be supplemented by the new advances in technology so as to raise output per man-hour and reduce costs. The pressure on the present-day mass markets demands even scrapping of inefficient plants. Wherever possible, new power-driven labour-saving machines must be introduced if the engines of progress are not to be retarded. At the same time, the market researcher, the cost accountant and the new class of managers must contribute their skilful knowledge in order to make the whole experiment a success. The cost accountant and the management accountant in particular have come to occupy an important place. It is no more necessary to wait till the end of the fiscal year to know the condition of business. The cost accountant lays out the whole programme of costs and with the assistance of the management accountant puts the finances of any new corporation or business on a sound footing. The services of the market researcher are available to produce goods according to the present-day tastes.

It is, thus, that the "necessary" conditions of economic progress are the same which have been discussed in the earlier Annual Numbers of "The Eastern Economist". The present Number lays stress on conditions of "sufficiency" for ensuring rapid economic growth. It stresses scientific management, mass production and adoption of technological advancement in production. In one word, it advocates "rationalisation" of the whole economy for taking it on to the road of prosperity. Happily, all these ideas, in a different form, are there in the Third Five-Year Plan document but in a very diffused manner. This Number attempts to highlight the significance of these new variables which are likely to play a very great part in India's economic development during the next decade.

Systems Do Not Matter

THE HISTORY of economic growth in Eastern Europe as well as in Western Europe during the last decade brings home one vital truth and that is that the economic expansion witnessed in both the wings of Europe has been phenomenal. Whatever the political machinery, the rates of growth of the economies have been extremely encouraging. It is true that the U.S.S.R. and the East European countries are dedicated to the principles of totalitarian planning and earnestly believe that for an assurance of rapid success, rigid long-term plans are extremely necessary. It is also true that in almost all the Plans of the Communist countries, top priority is assigned to heavy industry while the consumer goods are severely neglected. It cannot be denied that even after discounting the exaggerated figures of the centrally planned economies the prosperity attained is in no way mean. While the West European countries are not dedicated to the principles of planning as they operate in the Communist world, the economic policies provide such incentives that the economies have expanded much beyond expectation. The miracle in West Germany has been followed by another miracle in Italy. France is nowhere behind in this race for miraculous growth in industrial output. At the same time, the West European countries have shown signs of mutual co-operation by integrating their economies. The establishment of the European Common Market in Western Europe has resulted in maximization of resources both in men and materials. The integration of the other West European countries with the Common Market is likely to further accelerate their growth.

IN MACHINERY AND EQUIPMENT AS A PERCENTAGE OF THE G.N.P.

ECONOMIC PROGRESS: 1960 AS COMPARED TO 1950

The table below shows the annual rates of growth in national product as witnessed during the last decade both in the planned economies of Eastern Europe and the free enterprise economies of Western Europe. Statistics for the East European countries are to be interpreted with a little care because they are not exactly comparable with the West European countries, but even then it will be seen that the race between the two parts of Europe is clearly in favour of the West. The Indian Union cannot but learn the lesson of accelerating her own economy by following techniques which have already been tried and found extremely helpful in raising the standard of living of the people. Whether it is a socialist economy or a free enterprise economy, the stress today is on productivity and greater application of technology. At the same time, new methods in management are being tried all over Europe and social studies are being made of labour and employer attitudes which ultimately hold the key to rising productivity. India's Five-Year Plans will have to concentrate on the improvement of the quality of both men and machinery in order to follow the footsteps of European prosperity.

GROSS SERIES VERSUS NET SERIES

A comparison of the rates of economic growth between the Eastern and the Western Europe remains extremely difficult because of the incomplete statistics made available from the East European countries. After Stalin's death the quantity of economic statistics published by the U.S.S.R. and other East European countries has increased. This cannot be said about the quality of these figures. It has been known for a long time that the U.S.S.R. and other East European countries have specialised in publicising gross production series which tend to put them very favourably in relation to the net output series of the West European countries. Statistics relating to particular branches of economic activity such as the national product series, as in the case of U.S.S.R. and other East European countries, are extremely misleading and inadequate. This fact may be illustrated with reference to one of the important series of industrial output in the U.S.S.R.

In one of the recent Soviet publications a new series of net industrial output has appeared under the name of Mr. S. G. Strumilin who is the Dean of the Soviet economists. The results of the gross series are set against net series in table below. It will be seen that the net series are almost half of the gross series. In other words, the gross series of production will need to be deflated upto fifty per cent.

Strumilin's Estimates of Industrial Output (Billions of roubles)	1926-27 Gross	1926-27 Net	Net as Percentage of Gross	Index of Growth 1928 = 100: Official Index of Gross Output	Strumilin's Index of Net Output
1928 ..	21.5	10.1	47	100	100
1932 ..	43.3	19.4	45	202	192
1937 ..	95.5	39.8	42	446	394
1940 ..	138.9	69.3	50	646	686
1945 ..	127.5	46.9	37	593	464
1950 ..	240.6	81.1	34	1,119	803
1955 ..	444.8	136.1	31	2,069	1,347
1956 ..	492.4	147.7	30	2,288	1,462

The East European statistical handbooks make use of the term "national income" very frequently but it is not known whether the definition is comparable to the one used in the West European countries. In any case, it is interesting to study the annual rates of growth of the Eastern and Western European countries in the various phases of development. The table below sets out the annual rates of growth (compound) in most of these countries. The Federal Republic of Germany, amongst the West European countries, shows a clear lead over the rest. The Netherlands and France also show a remarkable rate of growth. Amongst the Com-

munist countries, Poland seems to have done extremely well in the recent past with an average rate of growth of about 9 per cent. Yugoslavia also belongs to the same category. Hungary, Czechoslovakia, and Albania stand at the slightly lower levels of economic development. The U.S.S.R., as usual, has the highest rate of growth of 10 per cent though it is not known if the U.S.S.R. series, for gross national product, should also be deflated in the same manner as Strumilin deflated the industrial output series.

THE WORLD ECONOMIC SURVEY

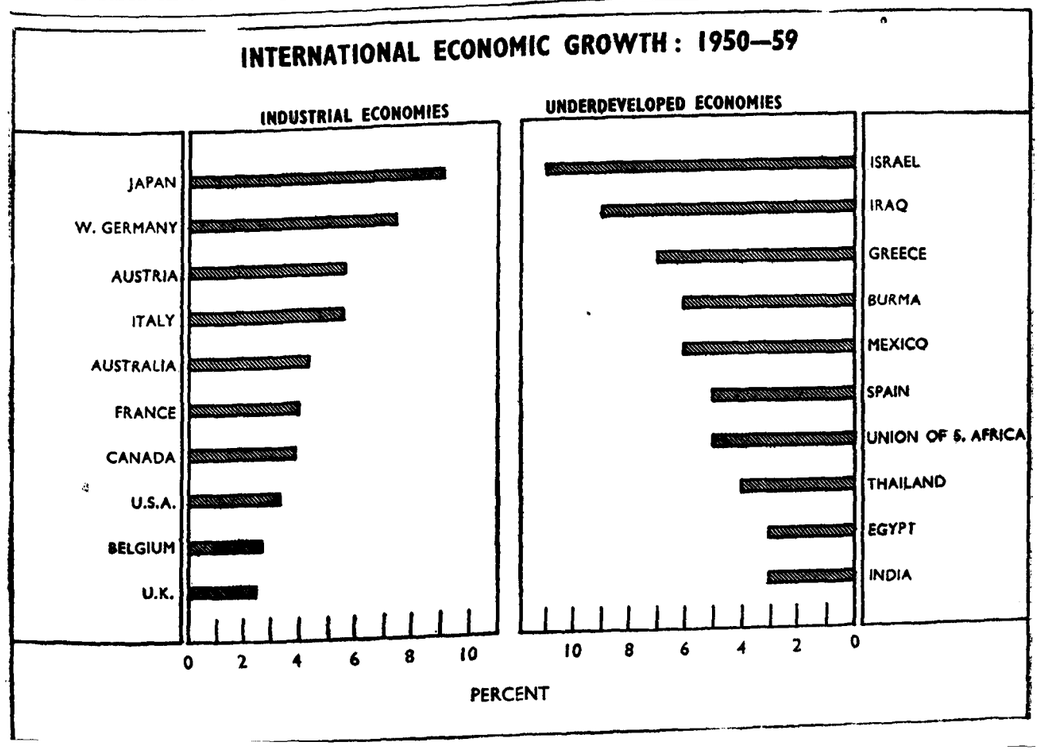
The Secretariat of the United Nations has never missed the opportunity of analysing statistical data published by various countries. In the latest World Economic Survey for 1960, the Secretariat has attempted an analysis of the relationship between investment and economic growth. It has rightly come to the conclusion that there is a positive correlation between the two. It means that any increase in investments should be closely associated with accelerated growth in the economy. It also means that the countries with high percentage of investment are likely to record high rates of growth in gross national product. The table on page 48 highlights this fact especially in relation to the industrialised world.

As stated earlier, the findings of the Survey, however, need to be supplemented by other essential details. High rate of investment is "necessary" for high rate of economic growth in any economy but it is not "sufficient" especially in a developing economy. Unless new developments in the field of technology, management etc. are pressed into service and productivity enhanced in almost all the spheres of economic activity, mere diversion of resources may not be of much avail.

WESTERN EUROPE IN 1970

The Twentieth Century Fund in its latest publication on Europe's needs and resources has estimated the future pattern of growth of gross national product. The projections are based upon the following assumptions:

(1) Labour input for Western Europe as a whole is likely to increase from about 281 billion man-hours in 1955 to approximately 291 billion man-hours in 1970 or by 3.6 per cent. The estimate is based on the assumption that while population would grow at the steady rate of 0.9 per cent per annum there would not be any substantial increase in the working man-hours because of the anticipated fall in the working hours in every week.



(2) Expansion in Western Europe's gross national product during the next decade will emerge from technological progress and higher productivity. It is assumed that labour productivity between 1955-1970 would grow at the average rate of 2.7 per cent.

The results of projections based on these two assumptions are set out on page 70.

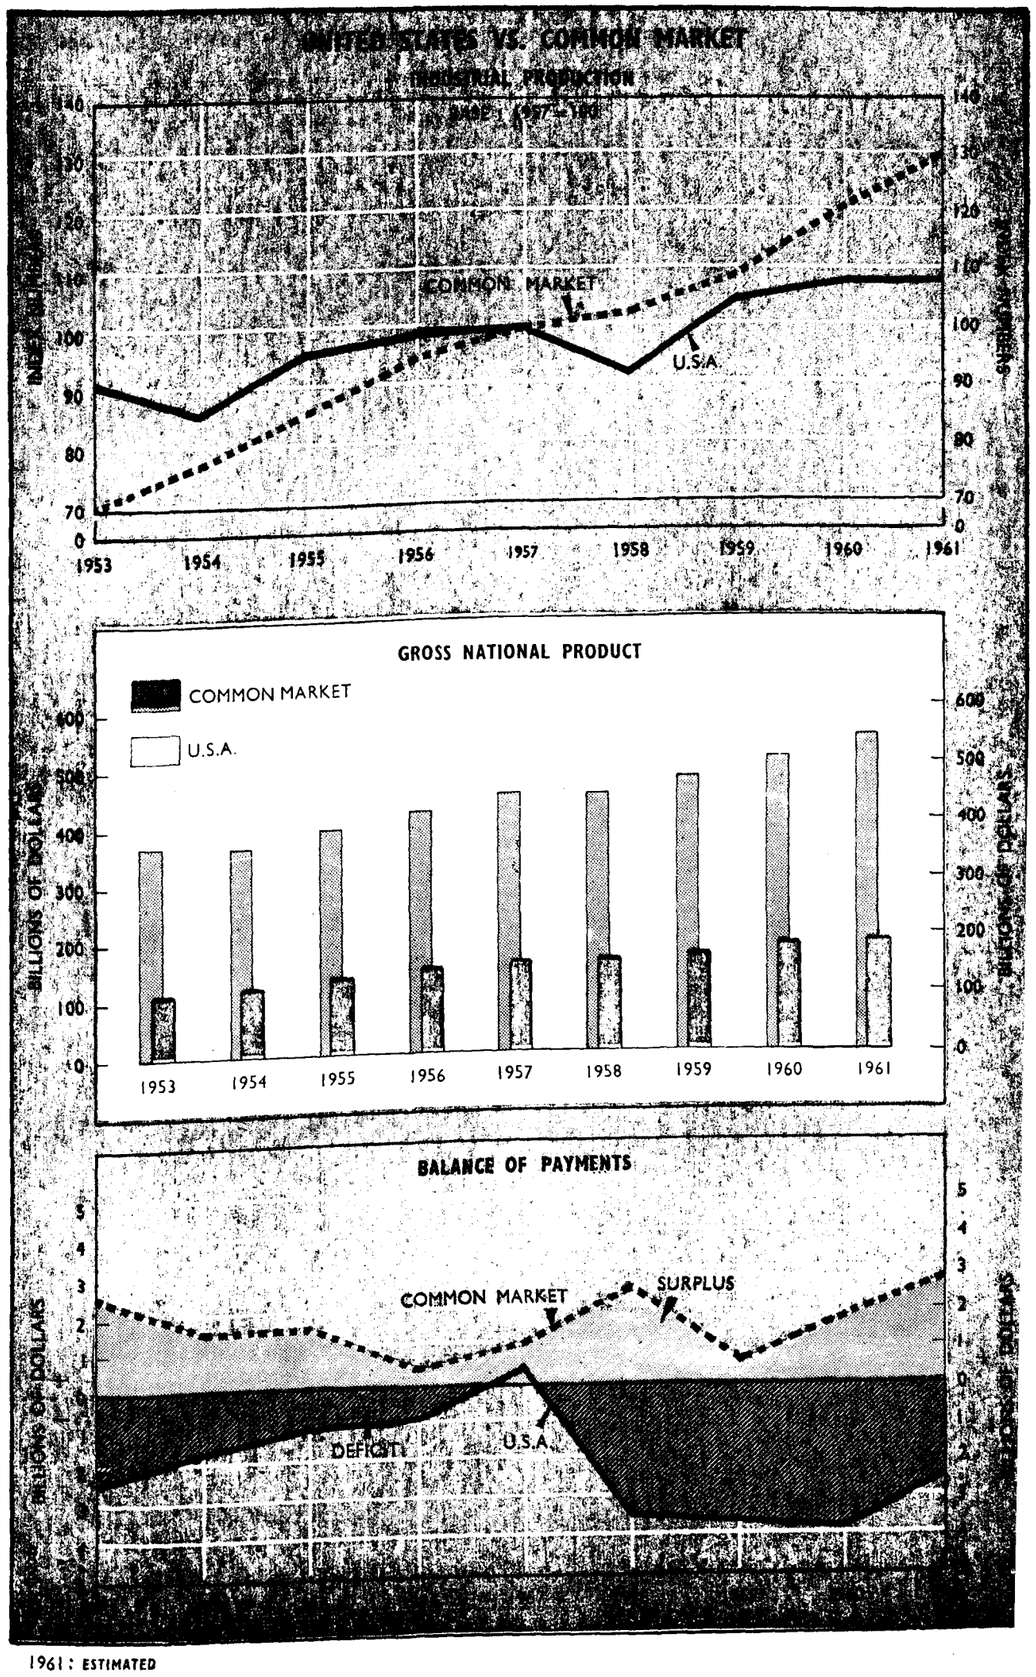
Between 1955 and 1960, certain developments have taken place which have hastened the productivity rate in Western Europe needing a revision in the estimates made by the Twentieth Century Fund. Whereas the Fund has estimated that the total gross national product in 1970 would be around 341.6 billion dollars at 1955 prices, it is now computed by the Research Section of "The Eastern Economist" that there is every possibility of the gross national product rising to 369 billion dollars. This optimistic forecast has been based on the acceleration in the economies of the West European countries, especially the Common Market countries which have registered a significantly fast rate in growth. During the five-year-interval 1955-60, the increase in gross national product is of the order of 23.1 per cent whereas the Fund did not expect an increase of more than 15 per cent. The per capita gross national product in 1970 for the West European countries will definitely exceed the level of 1,100 dollars (U.S.) as against 1,067 dollars (U.S.) estimated by the Twentieth Century Fund.

INDIA IN 1970

India's Third Five-Year Plan envisages a rise of about 34 per cent in national income. Phenomenal growth is anticipated in the mining and factory establishments at about 82 per cent. Agriculture is likely to rise by 25 per cent while tertiary sector may rise by about 32 per cent. It may be stated that during the past decade India's national income rose by 42 per cent. Some of the investments which were made during the Second Five-Year Plan have not borne fruits so far. It is likely that their impact on production will

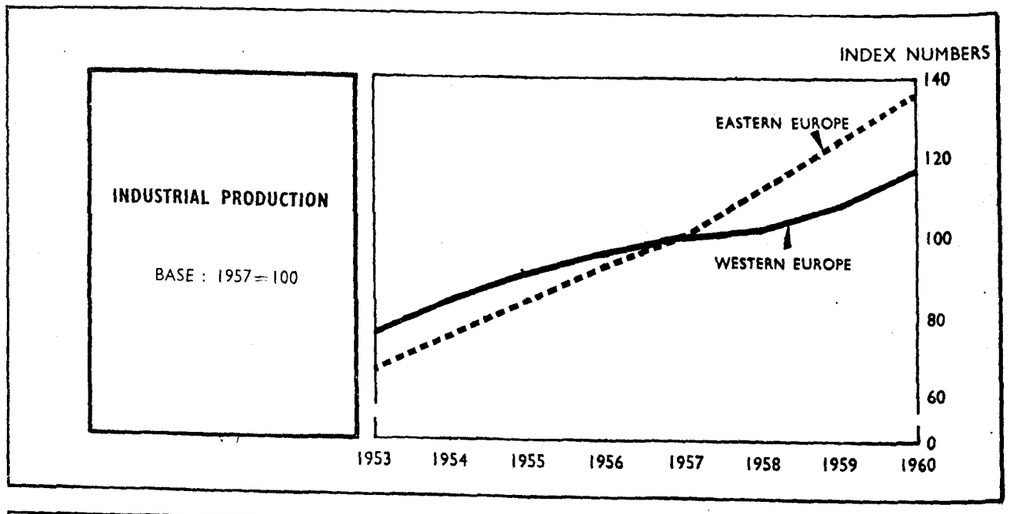
be felt in the Third and the Fourth Five-Year Plans. That is why the rate of anticipated rise in national income has been stepped up. It is estimated by "The Eastern Economist" Research Section that during the next decade it will be possible for the Indian Union to raise its national income by 60 per cent. Thus, at the end of the sixties, India's per capita income is likely to touch the 100 dollars (U.S.) mark.

EASTERN EUROPE IN 1970

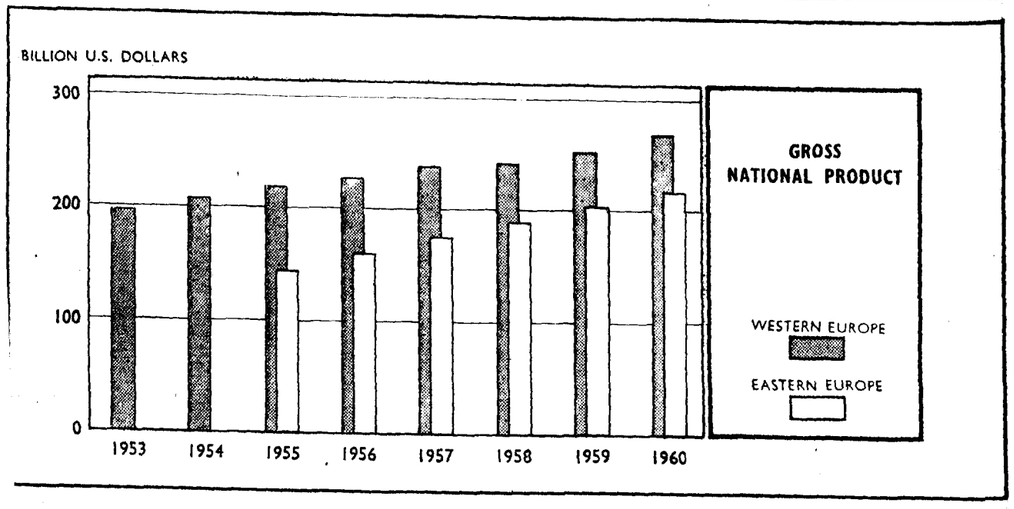


The East European countries during the past decade have registered steep rates of growth. Most of them have recorded a rate of growth of 7 to 8 per cent per annum (compound). It is not likely to continue to grow at this rate during the next decade because the past decade was taken up mostly in recovering from the ravages of World War II. Now that these economies have already reached the maturity stage, it will not be possible to continue to rise at the same rate. It is estimated that the U.S.S.R. and the other East European countries will rise at an average rate of 7.5 per cent (simple). In per capita terms, the Communist world including China may rise to 500 dollars (U.S.) but without China the East European countries are likely to reach the 1,000 dollar (U.S) mark. This figure conceals the lift given to the East European countries by the high rate of development in the U.S.S.R. Separately some of the countries such as Bulgaria and Hungary may not even cross the 700 dollars (U.S.) per capita mark.

INDIA: THE ROLE OF SAVINGS AND INVESTMENT



The problem of capital accumulation has been, during the fifties, the central problem for all developing countries including the Indian Union. Since vast masses of people in the developing countries live below the subsistance level, it is not possible to force them to tighten their belts further without creating social upheaval. National governments in these countries, therefore, advocate further taxation, both direct and indirect, for purposes of national savings upto a limited extent while much greater reliance is placed on voluntary savings. In the last resort, forced savings through deficit financing are attempted in order to fill the gap in resources. It has been observed in general that higher rates of growth result from allocating higher proportion to investment. This is, however, not the universal truth. There are quite a few cases when countries have extended their economies despite very modest allocations to investment. Also, there are certain other countries which have failed to raise their economies despite increased investments. By and large, the European countries fall in the category of those countries



RATE OF GROWTH OF OUTPUT AND RELATIONSHIP BETWEEN INVESTMENT AND OUTPUT 1950 — 1959

	Annual Rate of Growth in Real gross Domestic Product (percentage per annum)	Gross Domestic Fixed Capital Formation	Gross Domestic Capital Formation	Incremental Capital Output Ratio
		Percentage of Gross Domestic Product		
Japan	9.1	22.3	28.5	3.0

WESTERN EUROPE VS. EASTERN EUROPE

19 JAN 1962 PUBLIC DEPARTMENT

which have succeeded in extending their economies by increased investments. The Indian Union also has chalked out her Five-Year Plans based on steadily rising rate of investment which currently lies at 11 per cent of the national product and is to be raised to 14 per cent of the national income by the end of the Third Five-Year Plan, i.e., 1965-66. This is a no mean achievement in view of the extremely low level of India's capital formation immediately before the commencement of the First Five-Year Plan. It has been estimated by the Planning Commission that the rate of capital formation was hardly 5 per cent of the national income in 1950-51. It was raised to about 7 per cent in 1951-52 and to 11.5 per cent in 1960-61.

CAPITAL - OUTPUT RATIO

The problem of capital formation cannot be studied in isolation. It has to be related with the rise in population and the capital-output ratio in the economy. The concept of capital output ratio has come in for severe criticism in recent economic discussions but it must be stated that it is a useful concept which assists in understanding as to what goes on within an economy. It is on the basis of these three basic variables, namely, the rate of capital formation, the rate of rise in population and the capital-output ratio, that, mathematically speaking, the rate of growth of an economy can be worked out. A statistical table based on these three variables, sets out below, the different rates of capital formation which are necessary to maintain the level of per capita income.

MINIMUM CAPITAL REQUIREMENTS TO MAINTAIN THE PER CAPITA INCOME CONSTANT

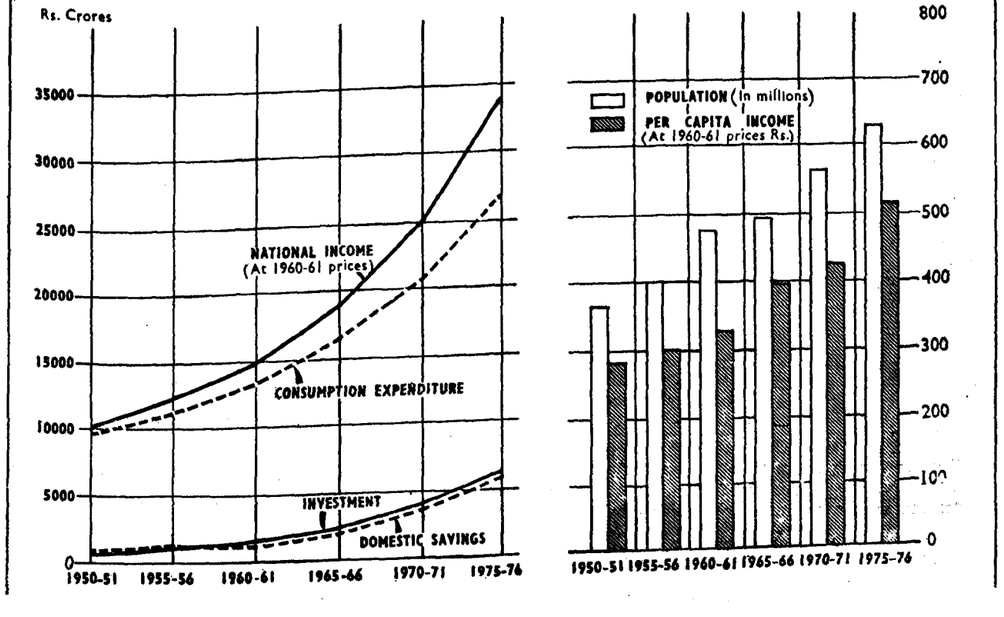
(Rate of Rise in Population)

Capital Output Ratio	1.00	1.25	1.50	2.00	2.25	2.50	3.00
2.00	2.000	2.500	3.000	4.000	4.500	5.000	6.00
2.50	2.500	3.125	3.750	5.000	5.625	6.250	7.500
3.00	3.000	3.750	4.500	6.000	6.750	7.500	9.000
3.50	3.500	4.375	5.250	7.000	7.875	8.750	10.500
4.00	4.000	5.000	6.000	8.000	9.000	10.000	12,000

The capital-output ratio itself is a function of the structure of investment and the sectoral break-up of the national product. In a country like the Indian Union where half of the income still comes from agriculture—which is subject to the vagaries of the monsoons—it is highly likely that the ratio would be disturbed from year to year because of the fluctuations in the behaviour of the monsoons.

In the industrial sector, however, this ratio has a definite role. In nearly all the European countries where production has steadily risen and no spare capacity is usually available, the capital-output ratio has been fairly stable. At the end of 1960, almost all the available capacity in each of the European countries was fully utilised. It means that, unlike India, the capital-output ratio is not subject to the fluctuating pressures of unutilised capacity. This is one of the major weaknesses from which all the developing countries, including India, suffer because they do not have sufficient manpower which can utilise the plant and equipment to full efficiency. Vast investments of capital remain unutilised leading to an unfavourable operation of the ratio. Such leakages need to be averted.

During India's First Five-Year Plan when the monsoons were extremely favourable and agricultural production rose out of proportion with investment, the ratio turned out to be 2.06. During the Second Plan, when no unutilised capacity was available and the monsoons were not very favourable, the ratio rose to a little above 3. The following table shows the impact of the vagaries of the monsoons and the vast unutilised capacity both in agriculture and industry in boosting the ratio.



CAPITAL - OUTPUT RATIOS

(IN THE THREE PLAN PERIODS)

(Rs. crores)

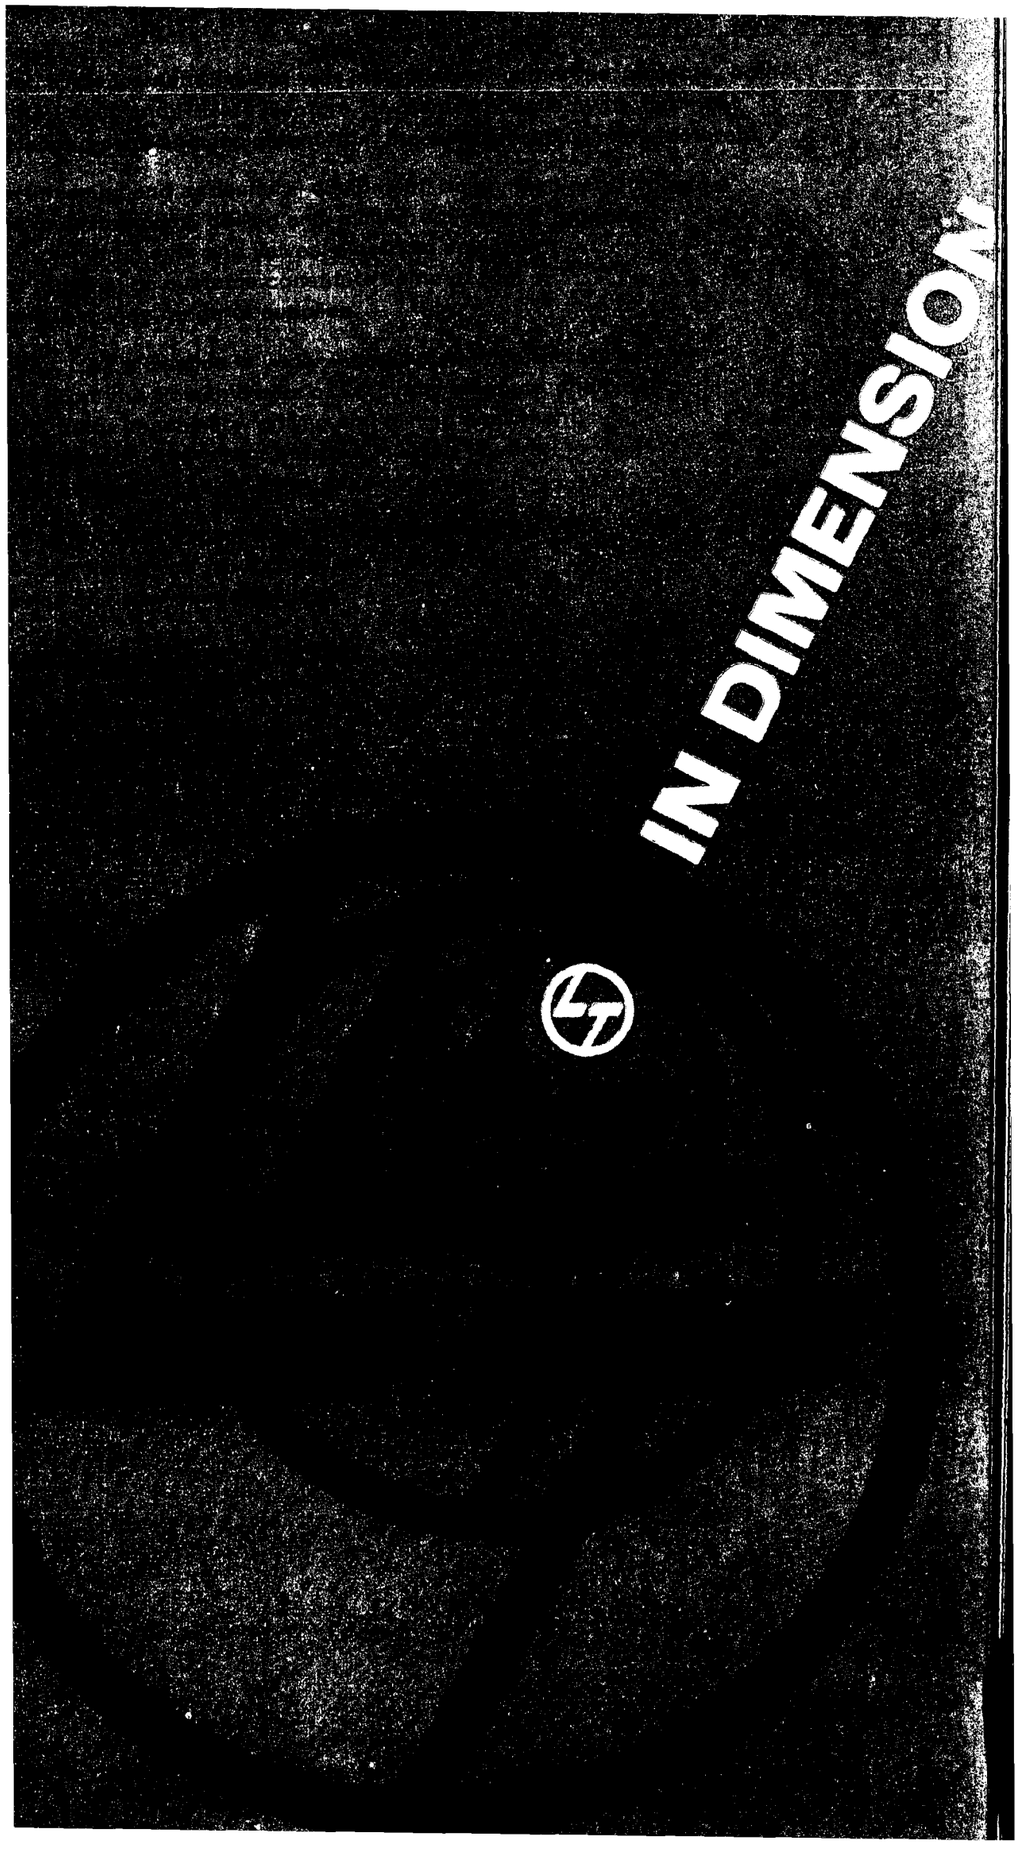
	First Plan (At 1948-49 prices)	Second Plan	Third Plan (At 1960-61 prices)
National income at the beginning of the Plan ..	88.50	104,80	14,500
National Income at the end of the Plan	104,80	125,30	19,000
Absolute increase in National Income (output) ..	16,30	20,50	45,00
Net Investment (input) ..	33,60	67,50	104,00
Input : Output	2.06:1	3.29:1	2.31:1

NATIONAL INCOME, INVESTMENT, SAVINGS AND CONSUMPTION EXPENDITURE : 1950-51 TO 1975-76

INFLATION

Growth and inflation do not necessarily go together. It means that when an economy decides to accelerate its pace, it is not necessary that its price structure must get disturbed. There are some developing countries where despite considerable inflation sizeable rates of growth—usually more than 5 per cent per annum —have been attained. In the Indian Union, the expansion that was planned in the economy during the Second Five-Year Plan created stresses and strains. The new purchasing power distributed to the masses created pressure on the consumer goods and prices indicated a rise of more than 5 per cent per annum. Expansion in the economy as well as inflation went hand in hand and no damage was done to the economy. It is, however, to be conceded that the fresh bouts of inflation, if generated during the Third Plan, will be strongly resisted by the people. The Indian Government has, however, taken long-term measures to keep the prices under control. One of these measures relates to the imports of foodgrains and other agricultural produce under PL 480 from the United States so as to keep buffer stocks of these products.

SOURCES OF FINANCE



Where does the capital come from for investment in the developing countries? By and large, it is the net domestic saving which has been instrumental in mobilising resources for investment though there are a few exceptions such as Israel, Puerto Rico and Cyprus having large proportions of foreign capital. The level of foreign and domestic savings as a percentage of gross domestic product between 1950-59 is set out in the table below. It will be seen that the Indian Union lies

LEVELS OF FOREIGN AND DOMESTIC SAVING 1950 - 1959

(Percentage of gross domestic product)

Country	Total supply of saving	Depreciation	Total net saving	Foreign saving*	Net domestic saving

* Foreign saving is equal to payments for imports of goods and services minus receipts from exports of goods and services. A postive foreign saving reflects an excess of such payments over receipts and a negative foreign saving an excess of receipts over payments.

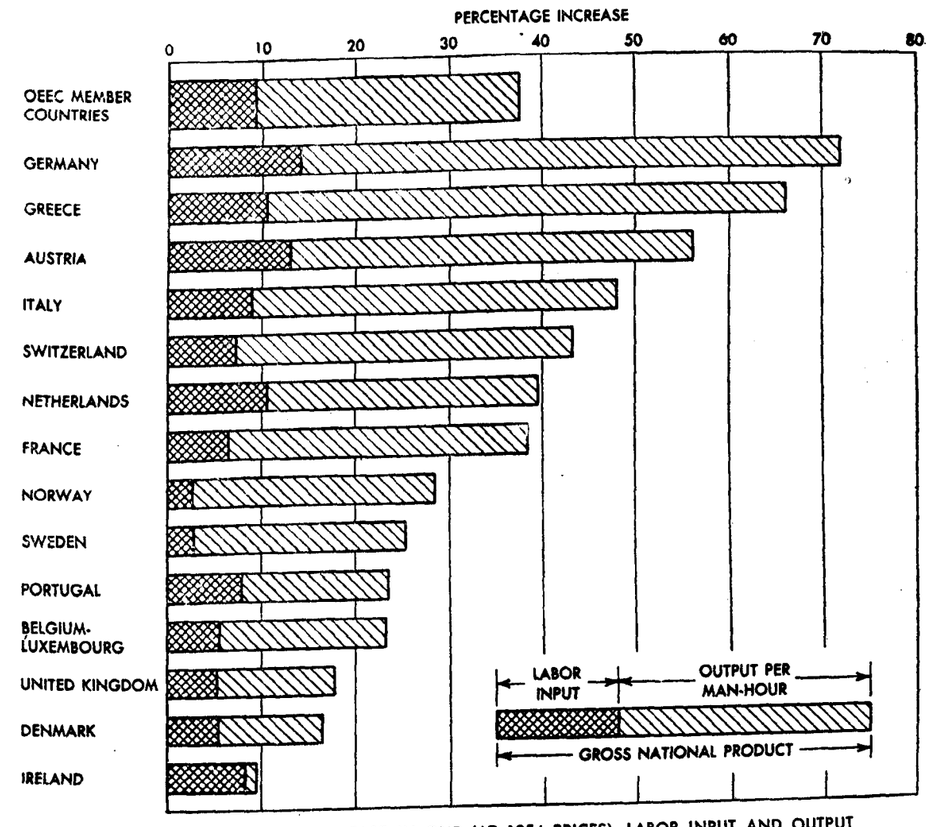
among these developing countries almost at the bottom showing that the rate of saving is almost the lowest (8 per cent). It is, however, to be noted that the foreign savings constitute only one-seventh of the total savings. By and large, despite substantial inflow of foreign capital into the Indian Union, economy has raised itself by its own bootstraps.



Stress has, therefore, been laid in India's Third Five-Year Plan on the machinery to accelerate the rate of domestic savings. India's Third Plan envisages raising of domestic resources from Rs. 3,510 crores during the Second Plan period to about Rs. 5,300 crores during the Third Plan period. In the government sector, balances from current revenues, contribution of railways and surpluses of other public enterprises are to be greatly enhanced. Loans from the public and small savings are also anticipated to rise substantially during the Third Plan period. Additional taxation also will yield substantially more. All this points to the awareness in India about improvement in domestic resources which must be more than external aid. This is all the more important because the cushion in the shape of sterling balances which was available hitherto will not be available during the operation of the Third Five-Year Plan because the balances have currently been reduced to the precarious level of Rs. 130 crores.

Productivity

SHARE OF PRODUCTIVITY IN G.N.P.

An analysis of the growth in gross national product in West European countries from 1950 to 1957 shows that major increases in production have been achieved more by "rationalisation" and "automation" than by increasing the labour force. It means that the share of labour input in the increased volume of gross national product in Europe has been much smaller. It has been estimated that the contribution of innovation and technology has been nearly three times the labour input. This fact is illustrated in the graph below which shows the relative shares of "labour input" and "output per man hour" in the gross national product of the West European countries. It will be seen that Germany during 1950-57 witnessed more than 70 per cent increase in its gross national product. During the same period the labour input in West Germany did not increase by even 15 per cent. It means that the increase in output through productivity alone was 60 per cent or four times the labour input. Roughly, the same proportions between "labour input" and "output per man hour" prevailed in almost all the other West European countries. In Norway, Sweden, Belgium and Luxembourg, the contribution of productivity was slightly higher than in Germany. Ireland alone stood in a different class where productivity had lagged very much behind. This graph amply demonstrates the fact that the key to prosperity in the West has been through productivity (output per man hour), by and large.

How can the Indian Union escape the impact of this new concept which is taking roots slowly but surely in all the Indian industrial units—big or small? Whereas it can be predicted safely that Europe will achieve higher per capita output levels during the next decade or so, it can also be forecast about Indian industries in particular that the widespread use of latest machinery in all the major industries is likely to increase productivity substantially. It is to be conceded that this order of rise in productivity cannot be attained

PERCENTAGE INCREASE IN GNP (AT 1954 PRICES), LABOR INPUT AND OUTPUT PER MAN-HOUR, SELECTED COUNTRIES, 1950–1957

without substantial investments in the capital structure of the industries.

REDUCING COSTS

Adam Smith, Father of Economics, stated that "productivity is inversely related to real cost". This fundamental law continues to be the main key to prosperi y even today. Productivity in the United States is ahead of all the other countries, though not many precise attempts at comparison are available. In general, productivity in the European countries is lower than in the United States of America, while productivity in the European countries is significantly higher than in the developing countries including the Indian Union. Disparities exist even in the West, and variations are large from country to country and from industry to industry. By and large, the long-term training programmes in Europe have raised the level of skill of the labour force and widespread use of latest technology has raised productivity (output per man hour) which has got translated in terms of lower costs and higher wages. A gene al rise in the standard of living is the natural outcome of the operation of the scissors of rising wages and lowering costs.

RATIONALISATION IN INDUSTRY

In the Indian Union, the movement for higher productivity is of recent origin. Every industry is slowly becoming conscious of the virtues of productivity and is willing to invest capital for the new techniques in output so as to reduce costs. Labour has erroneously tended to retard the progress of higher productivity by refusing to co-operate in the installation of automatic machinery. Because of surplus human power in the Indian Union, the spectre of rising unemployment induces the labour leaders to take a line which in the short period looks beneficial to labour but in the long run retards allround development without holding out hopes of raising the level of living. Luckily, resistance to new machinery and innovation is breaking down. The Indian Union is happily placed in one particular respect, namely, it can skip over a number of technological processes through which the Western world has passed and adopt latest methodology in manufacture without any resistance from labour force. It is only in the ca e of the old established industries such as the cotton textile industry, jute industry etc. that opposition fr m labour has to be encountered. The Third Five-Year Plan recognises the importance of productivity and clearly states: "The vicious circle of poverty and unemployment and low productivity can be broken only by a tremendous stress on the maximum possible contribution being made by all the participants in the process of production. For the workers no real advance in their standard of living is possible without a steady increase in productivity, because any increase in wages generally, beyond certain narrow limits, would otherwise be nullified by a rise in prices. Workers have, therefore, to insist on and not resist the progress of rationalisation in their own interest and in the larger interests of the country."

PRODUCTIVITY IN THE U.S.

A page out of the U.S. economic history will illustrate the impact of rising productivity on the standard of living. Between 1910 and 1953, output per man hour in the United Staties rose by about 2 per cent per annum on the average and it was during this period that the American worker enjoyed significant increases in purchasing power as well as standard of living. Produc'ivity rose much faster at 3.4 per cent per annum during a most recent period i.e. 1947-53. The fall in productivity in 1954 and the rather slow recovery in 1955 a d 1956 was reported to be due partly to the shortage of qualified workers.

COMPARISONS IN PRODUCTIVITY

Even Europe has to make a tremendous effort to catch up with the United States of America in productivity. One of the pre-War attempts at comparison in producivity between Great Britain and the Uni.ed States shows that in 1936-37, the produc.ivity index of the United States of America was 238 as compared to Great Britain as 100 and Germany as 107. It means that before World War II, every factory worker in the United States produced more than double in physical volume than his counterpart in Great Britain or Germany. In individual industries, the range of difference was much larger. In such industries as radio sets, automobiles, iron and steel products, the volume of output of each American worker was nearly four times that of his counterpart in Great Britain.

After the War, Great Britain did catch up with the United States of America in specific industries but there were still many branches where it lagged behind. In the case of tin cans, castings and wool spinning, its productivity was one fourth of that in the United State3 while it was very near the United States productivity in cement and razor blades manufacture. In the manufacturing of mirrors and smoked fish, Great Britain had overtaken the United States of America.

FACTORS AFFECTING PRODUCTIVITY

Productivity cannot be raised without the utilisation of up-to-date and modern technology whether it is agriculture, industry, trade or commerce. If a nation is poor in resources it has no alternative but to save (or borrow) and invest in fast moving machinery which may ultimately cut down costs of operation. In other words, there is no escape from increased investment which is a necessary condition for all economic progress. This may either be achieved by stimulating domestic saving or by borowing capital from abroad.

High cost of machinery and equipment which must be imported at the first stage is a big s.umbling block This has been competently discussed in the following quotation from the latest publication of the Twentieth Century Fund, regarding Europe's Needs and Resources:

"With savings so scarce and dear, capital goods—which are themselves much dearer in Europe than in the United States—have to be bought.

"High cost is an indirect result of low productivity. If a machine takes a cumulative total of one thousand working hours to build in the United States and six thousand working hours in Italy or Austria clearly it cannot be sold in Austria for less than the equivalent of six thousand hours' wages, while in the United States it could easily be sold for little more than the equivalent of one thousand hours wages.

"A particular machine may thus be profitable in the United States, and not in Europe, profitable in Paris and not in Athens, or profitable in Milan and not in Bari. This can be demonstrated by a simple example. A certain make of washing machine costs $120 in New York and 110,000 francs in France.

"This represents seventy or eighty hours' wages in the United States and five hundred in France. Thus a French worker has to save wages for at least five hundred hours of work in order to buy the machine in France.

"The housewife is in much the same position as a businessman in deciding whether or not to buy the machine. In terms of wages to be paid out to a substitute for about 100 hours wage payments in New York, but six or eight times that number in France, in order to 'pay for itself'— to the use the Accountant's terminology—be considered "amortized". This is no small difference! The figures for Italy and Greece are even higher—probably two and three times those for France."

THE VICIOUS CIRCLE

"This indicates how the way to increased productivity, by means of investment and modernisation of equipment, becomes a 'vicious circle'; the poorer one is, the more difficult it becomes to achieve wealth—this goes without saying. The greater the need for machinery, the more difficult it is to acquire it and, owing to the low level of wages, the less profitable to use it."

It is thus clear that even Europe needs more capital in order to raise its productivity so as to compete with the United States. Recent prosperity in West Germany, France and Italy is the result of sizeable increase in investments and installation of latest machinery. While new and complex techniques have been pushed in all branches of life, there has arisen the need for men who can handle these complex problems.

ATTITUDES MUST CHANGE

An erroneous impression exists in this country that productivity in the various branches of the economy can be raised by widespread use of machines alone. This is far from the truth. Modern research has revealed that before an economy can make use of scientific and technological research, the users of these techniques must change their age-old attitudes. The employer, the worker and the consumer are all required to alter their attitude if a proper use of the facilities that are available is to be made. This needs to be explained.

MANAGEMENT VERSUS LABOUR

Gone are the days when the head of an institution could run his organisation by being a "boss" i.e. one who had only to give orders to his officers to get them executed impersonally. The widespread consciousness which has been created amongst labour by the fast-spreading trade union movement has created resistance to the old fashioned employer who will not be able to get, through his old techniques, the best out of his men. His men will be hostile to him. They will not trust him. In Europe today the ruling classes have been replaced by a fast-growing middle class which has learnt all about the mood of the present-day worker and this class knows how to make itself understood to the employees. Their whole approach to labour has undergone a great change and it is this middle class management which is capable of taking work out of labour. The worker also knows that the present day industrial jobs cannot be performed by unskilled labour; it is skilled labour today which can claim, whether in India or in Europe, higher wages. At the same time it must be recorded that this process of mutual understanding between management and labour is a very slow one. The climate in terms of human relations has been slow in adjusting itself in Europe. In the Indian Union as well the Third Five-Year Plan will see vast changes in relationship between management and labour because then alone will these two vital units be able to function in a harmonious manner so as to profit by the new plants and equipment which are being imported at a very fast rate.

THE CONSUMER

The future pattern of expansion in industry, commerce and trade will also be governed by the attitude of the consumer. With every lift in the standard of living the consumer also will be on the look out for goods of better quality. The mass media such as the newspaper, the radio and the television set, will all combine to help the consumer in making up his mind about his new demands. The next wave of industrialisation in the Indian Union will bring along with it a new class of practitioners who will be able to translate to management the moods of the consumer. The market researcher of tomorrow will be called upon to forecast the probable changes in consumer tastes and all future plans of expansion will depend upon his findings. The market researcher has already come into his own in the United States of America and Europe. We must borrow Europe's techniques if we buy Europe's machines; we can ignore to take account of these new developments at our own risk and cost.

PRODUCTIVITY MOVEMENT IN EUROPE

Under the auspices of the Organisation for Economic Co-operation and Development, considerable work has been done in Europe in the field of management-labour relations. The promotion of research in the field of human sciences as applied to industries is regarded as one of the elements in the programmes for technical efficiency. This field is described as "neutral territory" where all the European countries can collaborate. Even in the Europe of today, knowledge of physiological, psychological and sociological aspects of work is not complete. Ignorance about these aspects of work is definitely a brake on progress.

Recently, the European nations have, in collaboration with the European Productivity Agency, carried out studies for the first time on the international scale. Frequent exchanges of views have taken place between specialised institutions. The European Productivity Agency has also made grants available to research workers in order to perfect their training. Round Table Conferences and Study Sessions on specific subjects such as the incidence of "office automation" on white collar workers and the evaluation of methods for training managerial and supervisory staff are being evolved.

An interesting aspect of the hunger for technical knowledge is revealed by the activities of the European Productivity Agency. Not only that the Agency prepares a digest of technical articles published in English and in the national languages of Spain, Greece, Italy, Japan and Turkey and a host of other countries, but even Russian technical literature is being translated into European languages so as to learn from the experiences of the scientists and researchers across the iron curtain. In 1960, the Agency permitted the establishment of an European Centre for the translation and diffusion of this literature. It has been decided to house the Centre in the University of Delft in the Netherlands.

Technology

THE TECHNOLOGICAL advancement made so far in the realms of various sciences makes one believe as if the childhood dreams have come true. Most of these scientific achievements had at one time or another been termed as Utopian or unattainable. What is much more significant is the speed with which these achievements have been made. The time scale has changed from 50 years to 5 years. It means that a really significant invention took at least 50 years to come to fruition in the nineteenth century. A similar landmark today is being achieved at one-tenth the time interval. The ushering in of the Sputnik Age is holding out the hope of further reducing the time scale for new discoveries. A fair idea of this aspect of the technological revolution can be had from the following quotation culled out of S.C. Giffillan's article, "Prediction of Invention" in **Technological Trends and Their Social Implications:**

Taking the 19 inventions voted the most useful introduced between 1888 and 1913, the average inter-

vals were: Between when the invention was merely thought of, and the first working model or patent, 176 years; thence to the first practical use, 24 years; thence to commercial success, 14 years; to important use, 12 years—say 50 years from the first serious work on the invention. Again in the study of the most important inventions of the generations before 1930 the median lapse was found to be 33 years between the "conception date", corresponding to second above, and the date of commercial success. Searching for exceptions, it is hardly possible to find an invention which became important in less than ten years from the time it, or some fully equivalent substitute, was worked out and few did it in less than 20 years. (p. 797).

All over Europe technology is being pressed into service according to the particular requirements of each economy. In Switzerland industrial prosperity has been recorded beyond the physical resources of the country. It is a well-known fact that this tiny country midst the snowy Alps lacks all the natural resources which are necessary for industrial advancement. Despite all these limitations, the Swiss watch industry is still the leader in the world. In efficiency, the Swiss industry surpasses all other countries in not only watchmaking but also in the manufacture of quality engineering instruments, tools, pharmaceuticals, fabrics etc.

Another characteristic example of the healthy impact of technological growth is Denmark where animal husbandry has been closely knit into a top-ranking industry. It has evolved its own farmers' co-operatives, state experimental farms and produces today goods of quality which are sold all over Europe and in the United States of America. Denmark's neighbour, the Netherlands has evolved an outstanding electrical industry. Philips is a household name in India and the parent company came from Holland. From the Leyden jar of the 18th century to the present day fluorescent tubes, the electrical industry has made vast progress. Uniliver, the supplier of cheap food and cosmetics, is another outstanding example of partnership in techniques between Holland and Britain. Another outstanding name is that of Shell in the petroleum industry where Holland made a mark by making use of present-day technology.

Examples can be multiplied from Belgium, France and Germany where the European technological revolution has brought not only "muscle emancipation" for the housewife but has made even factory labour extremely easy by the latest push-button system. Mention must be made of the discoveries of Louis Pasteur which made pateurisation of milk possible and has laid the foundations of the fast expanding canning industry not only in Europe, but all over the world. The German thoroughness is manifest from the brilliant academic research in chemistry which has been translated into practical use in the industrial processes being employed in industry today. The synthetic dye-stuffs, drugs, antibiotics and fertilizer industries are today not specialities of Germany alone because their methods have now been employed all over the world but the credit for pioneering work in these lines does go to Germany.

It is for the Indian Union to imbibe the spirit of German thoroughness, French zeal for getting at the truth and the British skill at scientific research and industrial management. India's Third Five-Year Plan no doubt does lay emphasis on India's technological growth. The primary need of the day is to multiply the research laboratories all over the country not only under Government auspices but also in the larger industries. Then alone can the fruits of modern technological knowledge be made available to the man in the street; then alone can the standard of living be raised all-round.

CHEMISTRY IN THE SERVICE OF MAN

The technological progress witnessed during the last 100 years has revolutionised the mode of life all the world over. Many of the pessimistic forecasts about the future of world proved wrong through the pioneering discoveries of the scientists. The Malthusian fear of world getting over-populated has been removed once for all by the manufacture of fertilizers by taking nitrogen from air. It is believed that 50 million tons of nitrogenous fertilizers when mixed with appropriate proportions of phosphate and potash compounds, could be instrumental in raising the production of cereals by 150 million tons—an increase in production which would be sufficient for providing daily ration of bread for 1500 million people a year. The science of chemistry has gone a long way in improving standards of living. Not only does it help in the manufacture of vitally needed fertilizers but also provides today chemicals to eradicate pests which in some countries claim—even today—10 to 20 per cent of agricultural produce. With the utilisation of ever-growing scientific knowledfge, it is possible to save tremendous amounts of agricultural produce from the ravages of pests. Also, with the invention of refrigerators—which are being manufactured in millions in Europe today—food can be preserved for indefinite period. This has assisted in reducing the retail price of foodstuffs. The science of chemistry has also assisted in hygenic packing of these foodstuffs. One of the most recent contributions relates to the manufacture of artificial fibres. The production of cotton has not been able to cope with the world demand, and the science of chemistry has helped in the manufacture of synthetic fibres so as to provide attractive clothing to the world. It is computed that between 1950 to 1959, production of synthetic fibres rose by 750 per cent or an average yearly increase of 26.5 per cent. Practically unlimited range of colours have been produced and made available to the textile industry so as to provide charming fabrics for the people.

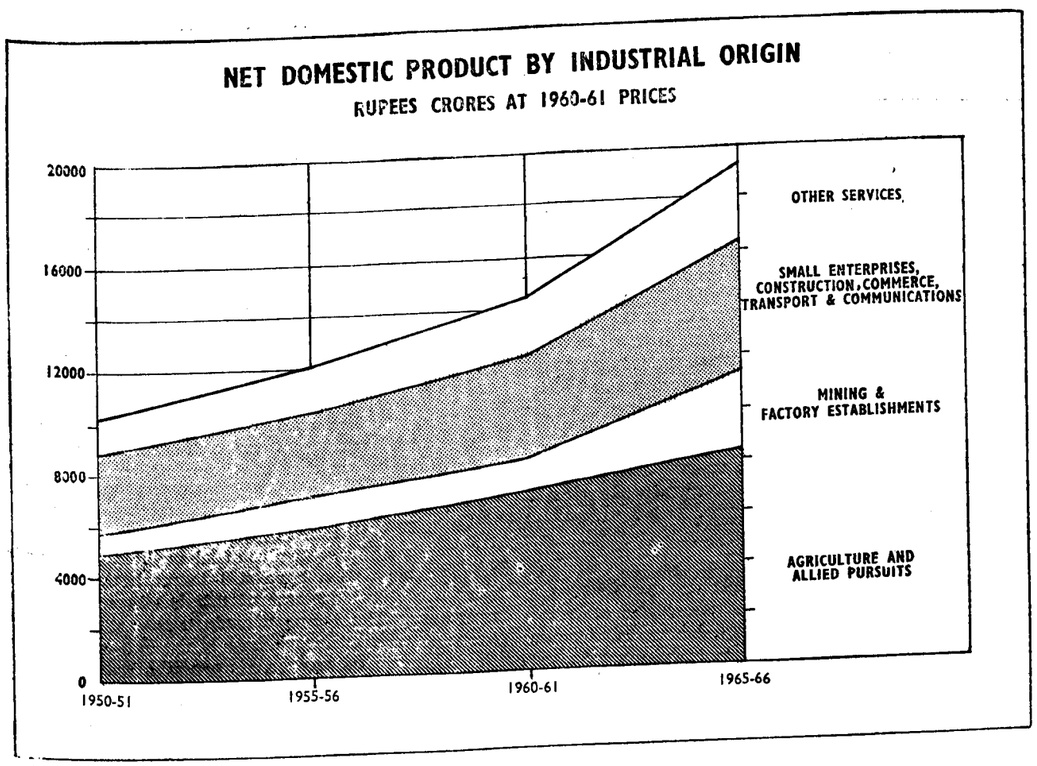
In the construction industry, chemistry has played an important part in providing insulating material at much cheaper cost. The new plastic-based load-bearing components permit a great saving in cost as well as in space. The age of plastics has been ushered in by chemistry at a very fast speed. For a variety of needs, plastics have come to man's rescue. We are today dealing with materials "made to measure". In many other fields, new innovations are fast changing everyday life. In the field of pharmaceuticals, antibiotics such as penicillin have made it possible for thousands of people to enjoy a healthy life.

FORWARD AND FASTER

The jet age has already arrived and the recent scientific efforts are diverted to new machines, which permit a vertical lift and forward propulsion because take-off and landing at big air strips has become obsolete. Much more amusing will be the technique of motoring on air, a demonstration of which was given at the U.S. pavilion in the Indian Industries Fair early this year. The U.S. pavilion had put up for demonstration a car which lifted itself above the earth by a few inches and moved on a cushion of air of its own compression. It had no wheels. Compressed air lifted it above the ground and kept it sustained as it moved forward. Such an invention is likely to make the use of building of roads absolutely redundant. It is a foregone conclusion that the trains, the tracks and the city trains will very soon become obsolete.

TECHNOLOGICAL EDUCATION

All the technological progress cannot be accomplished without having a sufficient number of trained personnel. In all the advanced nations of the world, great stress is laid on the extension of facilities for giving technological education. The number of pure science studies as well as the applied science students is very large in almost all the advanced nations of the world. The following table shows that in 1956 in the U.S.S.R., for every million of the population, there are 280 persons working on the applied sciences while there



are only 56 for the pure science (for every million of the population). Similar is the case in the United States and to a lesser degree in Great Britain and Germany. The estimated figure for 1960 for applied science is 38,000 for U.S., 4,200 for Britain and 90,000 for the U.S.S.R. In the United States, the number of science teachers in 1956 was less than 50,000, in Britain less than 20,000 and in Russia over 2,00,000.

Country	Pure Sciences		Applied Sciences	
	Total	Per Million Inhabitants	Total	Per Million Inhabitan's
U.S.S.R.	12,000	56	60,000	280
United States	23,500	144	22,500	137
Great Britain	5,200	105	2,800	57
France	1,760	41	2,988	70
West Germany	3,450	67	4,450	86
Switzerland	215	44	399	82
Italy	2,436	51	2,200	45

It is, therefore, patent that India's economic growth is a function of its technological expansion. Without new inventions and without the assimilation of new technological advance already made in the world, wheels of industry cannot move at the anticipated rates. The scientific method has to be learnt by our men who have to operate the machines and they can ignore the advancement made in the world in the field of science only at their own peril.

TRAINED PEOPLE

At more than one place, the Third Five-Year Plan has laid stress on the desirability of investment in men and machines to move in unison. In the educational programmes set out for the next five years, top priority has been given to the technological training programmes. The financial allocations for this purpose have also been substantially stepped up. The total outlay for education for the Third Plan is as high as Rs. 5,600 million as compared to Rs. 2,560 million in the Second Plan and Rs. 1,530 million in the First Plan. Schemes of technical training, especially in the field of engineering and technology, will absorb no less than Rs. 1420 million in the next five years. Admission of students for degree courses in Engineering and Technology is anticipated to rise from 14,000 in 1960-61 to 19,000 in 1965-66. Still greater expansion is being planned for the diploma course students; as against the current capacity of 25,570 students, the intake is anticipated to grow by 50 per cent to 37,390 students by 1965-66.

The Burden of Rising Population

VICTORY OVER DEATH

THE 1961 census showed that all the forecasts made during the last decade in regard to the growth of India's population had been gross under-estimates. The most optimistic estimate placed India's population at 431 millions whereas actually it turned out to be 7 millions more at 438 millions. This under-estimation in the growth in population is not an isolated example. There are a number of other Asian countries which had their census in 1960 or 1961 and which revealed that the increase in population had been much beyond expectations. The table below shows the degree of divergence in growth rates between the actual census results and the forecasts made by expert agencies of these countries :

RATE OF POPULATION GROWTH

	Period	Average annual rate of population growth	
		1960-61 Census	Official Estimates
Philippines ..	1948-60	3.2	2.4
Thailand ..	1947-60	3.0	2.0
South Korea ..	1955-60	2.9	1.6
Sarawak ..	1947-60	2.5	1.3
Pakistan ..	1951-61	2.2	1.7
India ..	1951-61	2.1	1.4
Japan ..	1955-60	0.9	1.0

The rate of growth in population in all these countries, including the Indian Union, has risen because modern science, especially in the field of medicine, has taken rapid strides so as to curtail the death rate. Increased knowledge about hygienic living and the abolition of famines have raised the birth rate. The net result of both these factors has been to accelerate the rate of growth in population. The experiment of widespread use of contraceptives which has had a sobering effect in curtailing the growth in population in the U.K., France, Sweden, Italy, Finland, Japan etc. is currently being initiated in India in right earnest and is likely to show some positive results during the next decade. At present, ignorance about birth-control is widespread and mere distribution of contraceptives may not bring about the desired results. An intensive, educative plan for popularising "planned parenthood" must be launched along with free distribution of contraceptives.

FAMILY PLANNING

India's Third Five-Year Plan, like the earlier two Five-Year Plans, recognises the importance of family planning in restricting growth in population. Various steps have been taken in recent months in order to put the family planning movement on a sound footing. The Ministry of Health has decided that contraceptives be distributed free in medical and health centres in rural areas without reference to the income of the individual. For this purpose, a recurring grant of Rs. 1,500 per year is being made to every clinic, hospital, dispensary, maternity home and health centre. Similar grants to the extent of Rs. 1,000 per year are being given to every medical centre, commercial organisation, mill, factory, tea garden etc. Total allocation for family planning during the Third Five-Year Plan is Rs. 270 million.

In rural areas, Family Planning Clinics at the headquarter of the Primary Health Centre and each of its sub-centres would be set up to make family planning services readily available to the people. The Ministry has also agreed to give assistance to voluntary organisations if they set up family planning centres in rural areas on a pattern similar to the family planning clinics at the headquarters of the Primary Health Centres. All these measures being currently taken by the Union Government show the importance which the Indian Government attach to this problem.

URBANISATION IN INDIA

The 1961 census has revealed that during the last decade, the rural-urban structure of India's population has not undergone much change. In 1951, the percentage of the urban population to India's total population was 17.4 per cent and during the last ten years it rose by 0.4 per cent to 17.8 per cent. In the earlier decades, the trend towards urbanisation had been clearly visible, The following table shows that a major shift to urbanisation took place in the decade 1941-51:

PERCENTAGE OF URBAN POPULATION

Year	%
1881	9.3
1891	9.4
1901	10.0
1911	9.4
1921	10.2
1931	11.1
1941	12.8
1951	17.4
1961	17.8

EUROPE: SHORTAGE OF MANPOWER

European countries, whether in the West or the East, do not suffer from any such surplus of manpower as we do in the Indian Union. There are various reasons for that. In the first place, the Second World War created a shortage of able-bodied persons because of the heavy toll taken by War. Post war babies' boom has not created any surplus of labour because new additions to population have still to reach the adolescent age. A natural outcome of this has been the paucity of labour. The tempo of industrialisation which has been hastened in Europe, both in the East and the West, needed more manpower, despite the accelerated use of automatic machinery. Also increased industrialisation and urbanisation have raised standards of living which are not conducive to increase in the size of the families. Rising living standards coupled with widespread use of contraceptives have tended to lower the size of the family. In East Europe, the Communist doctrine of letting population increase unchecked prevails because the Communist ideology on population is deadly anti-Malthus, except for Poland and Yugoslavia where the damaging effect of uncontrolled population increase is realised.

The table alongside compares the growth rates in population during the decade 1950-60. It will be seen that the Indian Union is preceded by only Turkey whose rate of rise in population at 27.5 per cent was significantly higher than that of India. In most of the West European countries the rise during the decade under study was less than 10 per cent. In this category lie Belgium, Denmark, France, Greece, Italy, Norway, Portugal, Spain, Sweden, United Kingdom and Austria. Ireland had a fall in population mostly because of migration of large numbers of people. In the East European countries Bulgaria, Czechoslovakia and Hungary had less than 10 per cent rise during the decade while East Germany lost about 9 per cent of its population mostly because of migration to Western Germany. Poland, Rumania and the U.S.S.R. only enjoyed rates above 10 per cent. It is significant to note that in this comparison between India and East Europe and West Europe, Turkey held the first place, India the second and Poland the third place. The U.S.S.R. holds a very close fourth position. These figures highlight what has already been stated above that the average rate of rise in population in the East European coun ries is definitely higher than what prevails in Western Europe. The problem there is not of restricting the population; it is to encourage the rise in reproduction. But the high level of literacy, rise in living standards, widespread knowledge about contraceptives etc. tend to restrict the growth of population in most of the European countries, whether in the East or the West.

LESSON FOR INDIA

In this regard there is only one lesson to be learnt from Europe. A steep rise in living standards will automatically restrict the size of the family which means that population problem is closely linked with the problem of growth. The barriers caused by caste, religion, language etc. are likely to fall before the onslaught of the rising standards of living. It is usually believed that an increase in the literacy ratio tends to lower the birth rate. The experience of the past two decades has cast doubts on this theory. India's most literate State of Kerala has the highest rate of rise in birth rate and hence in population. It seems that literacy campaign, even if successful, will not result in restricting the growth in India's population. It must be joined by urbanisation and rising living standards for limiting the size of the average family and hence India's total population.

RATES OF POPULATION GROWTH : 1950 — 60

A paying proposition

Low-shaft blast furnaces such as the one shown in the picture offer two substantial advantages: They can be successfully used for the economic reduction of small size, low-grade ores, and the investment costs of the plant are relatively low. The first unit of this type with a daily output of 80-100 tons was set up by KRUPPS at Barbil/India and more are being planned for erection in India and other Asiatic countries where a similar raw materials situation makes the low-shaft blast furnace the ideal solution to the problem of developing a domestic iron and steel industry. KRUPPS have been associated with iron and steel for 150 years and today, with a turnover of about US $ 1.25 billion, give employment to some 110,000 people. From the screw to the complete industrial plant; from the converter to a fully equipped iron and steelworks; from the wharf crane to the sea-going vessel; from the rail to the locomotive; from the motor-truck to the giant excavator — KRUPPS make it! Detailed information can be obtained from KRUPP representatives all over the world or from the Essen Head Office.

** Labour input takes into account not only changes in total employment but changes, if any, in average hours worked during the year, and therefore shows the total labour supply or total number of man-hours worked during the year. Figures in parentheses do not reflect changes in working hours in the countries to which they apply, as no data on working hours were available and it was assumed average working hours were unchanged.

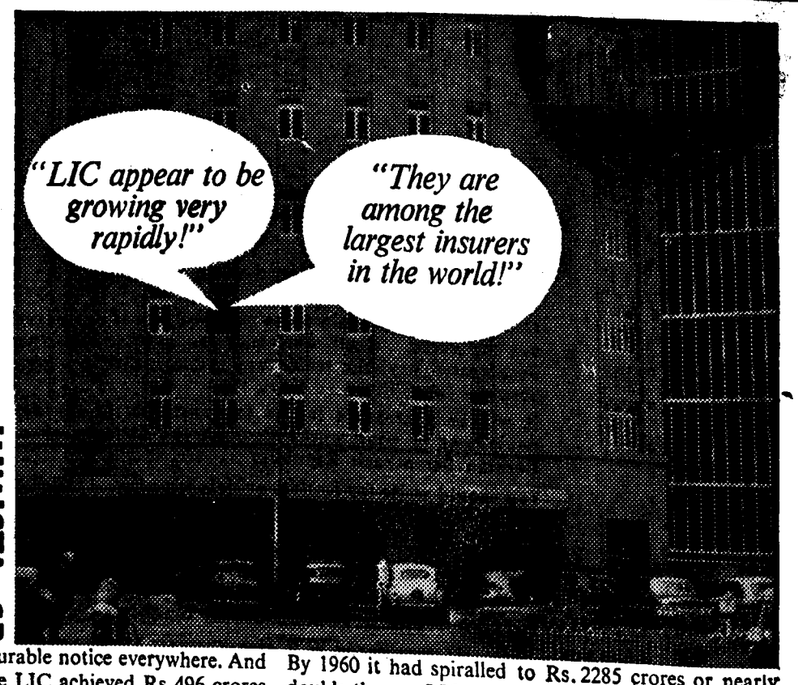
FULL-TIME JOBS FOR FIVE LAKHS

Today, India's Rayon Industry offers employment to 5 lakhs of people.

Besides producing rayon yarn—for which chemicals are essential—the Rayon Industry is the life-blood of other major industries. Paper, Textile, Pharmaceutical and Dyestuff Industries obtain basic chemicals from the Rayon Industry for the manufacture of their products.



The men behind the man-made fibre are now realising their dreams of yesterday; food, good housing, more money for educating their children and security.

With the gradual expansion of the Rayon Industry in India, major organisations like the National Rayon Corporation, are contributing towards the fulfilment of the National Plan for greater employment—employment with better living.

THE NATIONAL RAYON CORPORATION LIMITED

Managing Agents: CHINAI & CO. PRIVATE LTD.
Office: Ewart House, Bruce Street, Bombay-1
Factory: Mohone, Kalyan, Bombay State.

NRC. 39.2-A

PEOPLE ARE TALKING ABOUT LIC

The LIC is winning favourable notice everywhere. And with reason. In 1960, the LIC achieved Rs. 496 crores in "new business". This was an increase of 91% since Life Insurance was nationalized only a few years ago. Consider also the value of the total policies in force. By 1960 it had spiralled to Rs. 2285 crores or nearly double the pre-LIC level.

The rapid strides made by the LIC have created a new confidence in the insuring public—a growing trust in the LIC's business initiative and sense of social mission.

Life Insurance Corporation of India

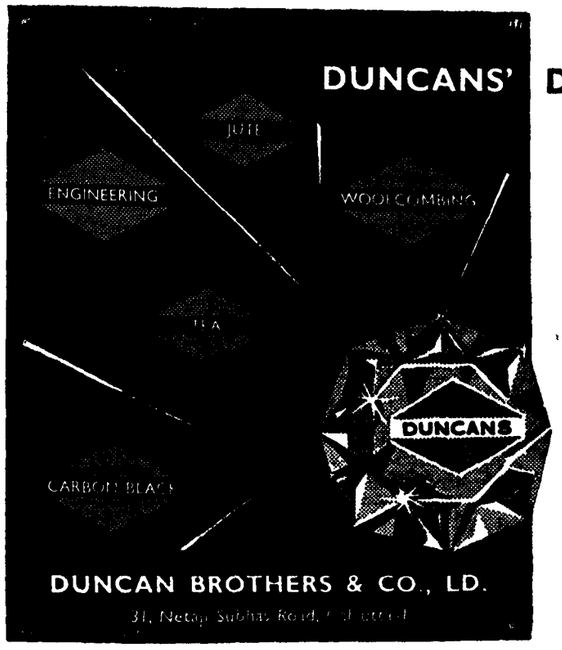
Madras Plans With Boldness And Vision

INDIA, after independence, is astir with new life and new activity in every field, agricultural, industrial and educational. Nowhere is this so much in evidence as in Madras State.

THE record of Madras in the field of education is striking. A twin-movement, one from the Government giving all aids, facilities and incentives to students and teachers participating in this Yagna to root out illiteracy and another from the people, their social conscience stirred into a burst of voluntary effort, offering buildings, equipment and other accessories for the school, have converged to produce a minor revolution in the State. Children are served lunch at their schools. Poor children are given clothing free.

THANKS to this new impulse sweeping the countryside, every village with a population of 300 has an elementary school. The number of elementary schools was only 16,000 in the State ten years ago; today it is 27,000.

About 11,000 villages out of 18,000 villages have been electrified, over a lakh power pumpsets are used in farm operations, and many good roads provide links with the outside world. Advice under the Community Development Programme has been availed of in cultivation methods with excellent results.



NEW industries and factories that have sprung up in neighbouring townships have provided gainful employment to village surplus population.

THE peasant in Madras State today is happy. There is now a new confidence in his face and a new spring in his gait, thanks to the Plans.

DIAMOND
has many facets

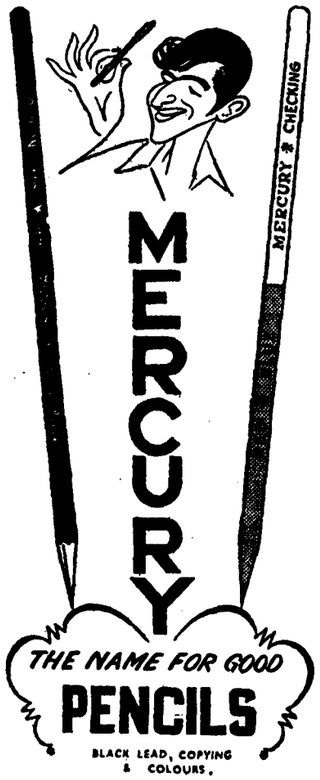
For many years the red Duncan diamond has been known throughout the Tea Industry.

Now it takes on new lustre as Duncans expand to meet the challenge of the times!

TEA — — Annual production over 55 million pounds.

JUTE — — Anglo-India, the Nations largest Jute Mills Company.

WOOL — — Isaac Holdens, India's Commission Combers.



CARBON BLACK — Phillips Carbon Black, first in India.

ENGINEERING — Schrader-Scovill Duncan, the Schrader valve — vital part of your motor car tyre.

Known the world over —
DUNCANS in India

HUME PIPES
FOR EVERY REQUIREMENT

i) Hume Pipes are ideal for Railway and Road Culverts, drainage, irrigation and water supply mains.
ii) Humeogeneous pipes are better quality of Hume Pipes, where electrically welded Steel Cages and Drymixed concrete with minimum water is used to give better consistency and strength.
iii) Prestressed Concrete Pipes are economical with ability to withstand high pressure.
iv) Steel Pipes are best for waterworks where Test pressures of 400' head and above are required.

India and Europe: Agriculture

Old Challenge: New Strategy

A RETURN to the theme of recent agricultural developments in India and Europe with a view to spotlighting the lessons which this country can learn from the experience of the West, barely two years after the first attempt was made in this regard in the Annual Number of 1960, may appear to be retreading the familiar track or pouring old wine in new bottles. But that is not the case. During the past two years, certain momentous developments have taken place in the agrarian economies of European countries which warrant a reappraisal of the situation. Firstly, there has been a stagnation in Soviet agriculture since 1958; the index of farm output (base: 1950-52=100) remaining practically unchanged around 159. This has evoked a sharp reaction in the highest quarters of the Soviet Union itself. Failures on the agricultural front have formed a recurrent theme of Mr. Nikita Khrushchev's utterances in the past one and a half years. Secondly, there has been witnessed in 1959-60 a sharp increase in the farm output in Yugoslavia and an appreciable increase in Poland, which have evoked considerable interest amongst agricultural economists in underdeveloped countries like India. Thirdly, while there have been these contrasts in the Socialist economies, West European countries have maintained their steady growth in farming. Finally, India has completed ten years of planning. It should be quite an interesting exercise to compare the rate of growth in Indian agriculture during the past decade with those of West European countries with their free market economies and of Eastern Europe which is wedded to Communism. This comparison can be very illuminating and instructive in the formulation of our future agricultural policy that has to aim at steady increases in farm output not only to provide food for our stridently increasing population (whose standard of living has to be raised from practically bare subsistance in the vast rural areas), but also to meet the growing demands for agricultural raw materials from the rapidly expanding industrial sector of our economy.

With this end in view, an attempt has been made in the following pages to assess the rate of growth in the agrarian economies of Western Europe, Eastern Europe and India. The three studies among themselves contain an assessment of practically all the means and techniques adopted in the world to foster agricultural development—in Western Europe with its representative character of free enterprise, in Eastern Europe through the socialistic way of collectivisation and State farming and in India through maintenance of private initiative but with stress on voluntary co-operative farming. An effort has also been made to find out the correct line of approach to the solution of the various ills of our agricultural economy. The weak spots in Indian agriculture have been highlighted and some measures suggested to remedy the situation as also to accelerate the rate of growth so that the goal of self-sufficiency in food and the more important agricultural raw materials is attained at an early date.

West European Agriculture: A Record of Steady Growth

THE SIGNIFICANTLY falling share of agriculture in the gross domestic output of West European countries (Table AGR—I) and accent there on industrialisation may suggest that agriculture in these countries is being relegated to a secondary position. But nothing is farther from truth than this superficial impression. In the post-Second World War era, most of the countries of Western Europe have set before them the goal of achieving self-sufficiency in food, the primary objective of farming in these countries. Today, sixteen years after the termination of the Second War, the percentage share of domestic output in total food consumption in these countries has gone up quite appreciably (Table AGR—2). This is a clear pointer to the fact that agriculture in Western Europe is not treated as anything of secondary importance and that concerted efforts are being made to help the farmer to raise his output.

Three factors appear to have combined to bring about great stress on agricultural development in Western Europe in the past fifteen years. The first and the foremost reason has been the new consciousness in these countries about national security in the form of an assured food supply during war-time; it has necessitated efforts to produce within national borders not only more foodstuffs, but a balanced output as well. However ill-suited for particular crops, the land in almost all the West European countries today is devoted to produce some of virtually every kind of foodstuff which forms an important element in national diets. Wheat, thus, has come to be grown in Switzerland and Austria on lands which could have been better utilized for raising forage crops. Belgium similarly has attempted to grow grapes, though climate there is hardly suitable for this purpose. Some of the North-Western countries of Europe have tried to produce oilseeds as well.

The second major factor contributing to added stress on agricultural development in Western Europe

has been the recurrent balance of payments difficulties experienced in the past few decades by most of the countries in the region. In countries like Denmark, the Netherlands and Italy agriculture has been promoted to earn foreign exchange to meet the growing demands of industry. In many others it has been fostered to conserve foreign exchange.

Finally, there has been the powerful influence of the "farm populations" in the political set-up in all these countries and the need to raise incomes from farming to something comparable to returns in industry. Agriculture in most of the countries of Western Europe had been a 'depressed' industry upto the outbreak of the Second World War. With the growing disparity between agricultural incomes and industrial returns, a discontented peasantry would have been a source of constant irritation to the politicians in these countries.

RATE OF GROWTH

The growth of agriculture in Western Europe in 1950's is reflected in Table AGR—3. The table reveals that while the progress has been slow in Ireland, Norway, Portugal, Sweden and Switzerland, it has been strident in Greece, Italy and Yugoslavia. Total farm output in Greece went up by as much as 57 per cent in the eight-year period to 1959-60, in Italy by 30 per cent and in Yugoslavia by 141 per cent (by 110 per cent if the average for 1957-58, 1958-59 and 1959-60 is taken into consideration in view of the sharp fall in 1958-59). In most of the other countries the gross rate of growth during this period has been of the order of 2 to 2.5 per cent per annum.

The strident increase in the total farm output in Greece, Italy and Yugoslavia has to not an inconsiderable extent been due to increase in area under cultivation. But the increases in output elsewhere, except in Spain and Portugal, have been primarily owing to increases in productivity—yields per hectare. In most of the countries of Western Europe, particularly North-West Europe, E.E.C. countries and the British Iles, there had been reached a saturation point in regard to area under cultivation in late 1940's; there was left little scope for further extension in crop area. Whatever minor increases might have been there in cultivated area in these countries in 1950's due to reduction in "current fallows", they have been more or less offset by diversion of land from agriculture to other uses—house-building, industrial uses etc.

INCREASES IN UNIT-AREA YIELDS

An idea of how farm yields per hectare in West European countries have gone up during the past two decades can be had from Table AGR—4. Compared to the average yields per hectare during the four-year period 1934 to 1938, yields of wheat in the United Kingdom, Italy, Germany and France have gone up by nearly 30 per cent, in Sweden, Denmark and Norway by about 13 per cent and in the Netherlands by nearly 44 per cent. More or less similar has been the case with barley and sugar-beet. The increases in the yields of rye, oats and potatoes, of course, have been comparatively lower. But there has been a steady increase all-round.

Compared to the average yields during the three-year period 1949 to 1952, wheat yields per hectare have gone up by 43 per cent in Greece, 25 per cent in France,

TABLE AGR—2(b).

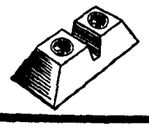
Have you placed your order for **JOLLY INSULEX** *-the real insulation board?*

Now you can place your order for JOLLY INSULEX—real insulation board manufactured for the first time in India by ANIL HARDBOARDS LTD. Demand for JOLLY INSULEX exceeds the supply, so write for your quota now.

JOLLY INSULEX is the ideal all-purpose material for thermal insulation, sound absorption and countless other uses. Available in an attractive natural finish and WHITEFACE—a factory applied white finish which aids light reflection and saves decorating costs. Also manufactured with a FLAME-RETARDANT coating which gives effective resistance to spread of flames.

JOLLY INSULEX



manufactured by **ANIL HARDBOARDS LTD.** Lakshmi Insurance Building, Sir Pherozeshah Mehta Road, BOMBAY.

Yugoslavia ..	70	115	90	119	105	147	126	169

22 per cent in Austria, Spain and Yugoslavia and by 14 to 17 per cent in West Germany, Italy, Norway and the United Kingdom. Elsewhere the increase has been comparatively lower, but it is there. Barley yields similarly have gone up by 49 per cent in France, 37 per cent in Yugoslavia, 26 per cent in Austria, 24 per cent in Greece, 20 per cent in Italy, 12 to 17 per cent in the United Kingdom, West Germany and Switzerland and to a slightly lesser extent in the Netherlands, Belgium, Norway and Sweden. Maize yields have doubled in France, gone up by 59 per cent in Yugoslavia and Italy, 43 per cent in Austria, 39 per cent in Spain and by 25 per cent in West Germany. Sugar-beet yields have increased by a comparatively lower order than wheat, barley and maize yields, except in Yugoslavia where they have gone up by 96 per cent and in Austria where they have increased by 43 per cent.*

What are the factors which have contributed to increases in yields per hectare in West European countries? Among the various factors that are said to have resulted in higher productivity in agriculture in these countries, the following four are the most important: (1) increased application of chemical fertilizers, pesticides and herbicides: (2) growth in mechanisation: (3) use of improved seeds and strains of plants; (4) greater emphasis on agricultural education and advisory services.

FERTILIZERS, PESTICIDES AND HERBICIDES

Although the more advanced countries of Western Europe, notably the United Kingdom, the Netherlands, Sweden and Denmark, had stolen a march over the rest of the world in the use of chemical fertilizers early during this century, which revolutionized their agrarian economies, most West European countries did not take resort to this innovation till the outbreak of the Second World War. The war, however, gave a tremendous fillip to application of artificial fertilizers in West European agriculture.

The use of fertilizers in West European countries has become widespread since the end of World War II. This is evident from Table AGR—5. Consumption of fertilizers in West European agriculture has not only increased during the past one decade in the less developed countries like Austria, Greece, Ireland, Italy, Portugal and Spain, but also in the highly developed ones where they had already been in widespread use before the Second World War. The application of all the three inorganic manures has gone up by nearly one and a half times their average application during the four-year period 1948-59 to 1952-53 in Austria, Greece, Ireland, and Spain. In the case of Yugoslavia the increase has been over thirteen times. In Denmark, Finland, France, West Germany, Italy, Portugal and the United Kingdom, consumption of fertilizers has gone up by 50 to 90 per cent. In the case of other countries the increase has been of a slightly lower order. The slow increase in the use of fertilizers in the Netherlands and Sweden during 1950's is explainable by the fact that they were already being made use of extensively by the farmers in these countries before 1950.

Consumption of chemical fertilizers per hectare of arable land and the manner in which it has gone up during the past one decade in West European countries is reflected in Table AGR—6.

Chemical fertilizers in Western Europe are not only used to increase yields of foodgrains, but of grasslands also. This fact introduces considerable bias in assessing the application of inorganic manures to food crops. The use of fertilizers for boosting grain yields, thus, is considerably of a higher order than is revealed by this table.

Another important fact that has to be taken note of in this connection is that all the three plant nutrients —nitrogenous, phosphatic and potash fertilizers—are extensively, and in a balanced proportion, made use of in West European countries.

The widespread use of fertilizers in Western Europe has been facilitated by the general high level of education; high farm incomes and better organisational methods obtaining there.

If the use of fertilizers has contributed to improving the yields of crops through provision of nutrition to the soil, the use of pesticides and herbicides has led to reduction in losses to crops through damage by pests and plant diseases. The application of pesticides and herbicides in West European agriculture is of more recent growth than fertilizers. But today they are in general use in most of the advanced countries.

Planning TOWARDS
A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Second Five-Year Plan period has considerably changed the type of cargo tc be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operaton from all fronts,—from those who use and also from those who serve it.

MEN & MACHINES MAKE
A BETTER PORT

MECHANISATION OF FARMING IN WESTERN EUROPE

The second important factor that has led to increases in yields of agricultural crops in West European countries is mechanisation. The use of farm machinery and tractors in European agriculture dates back to only after the First World War, when rapid industrialisation started depleting the labour force in the countryside. Tractorisation did not make much headway in West European agriculture right up to the Second World War because of various reasons, the most important of them being the small size of holdings and the none-too-happy financial position of the farmers of those days. World War II gave a good fillip to tractorisation in agriculture of these countries. The trend gathered further momentum after the war when the leading countries of Western Europe started taking keen interest in increasing the size of agricultural holdings by means of consolidation.

The vastly improved financial position of the West European agriculturist after the Second World War also helped in fostering mechanisation of farming to a considerable extent. Full employment achieved by these countries after the war necessitated switch-over to mechanised agriculture. Labour inputs in West European agriculture, thus, have shown (Table AGR—7) a distinctly downward trend in the recent past. An idea of the progress made by West European countries in mechanising their agriculture can be had from Table AGR—8.

There has been a sharp increase during 1950's in the number of tractors deployed for cultivating a thousand hectares of arable land in Austria, Finland, Denmark, Belgium-Luxembourg, France and West Germany. The comparatively lower increase in the case of the Netherlands, the United Kingdom and Switzerland is due to the fact that these were the countries where tractors had been in considerable use before World War II. An important result of tractorisation, apart from the saving in labour, has been increase in productivity per acre, resulting from timely sowing, cultivation and harvesting of crops.

The use of combine harvesters in Western Europe, however, appears to have not made much headway except in West Germany, Austria, Norway, Sweden and the United Kingdom. But that is probably due to the fact that fuller data about other countries are not available. Generally, of course, the agricultural expenditure estimates in some of the major agricultural countries indicate that outlay on machinery other than tractors is approximately equal to the expenditure on tractors.

IMPROVEMENT IN SEEDS AND PLANT STRAINS

Increased use of fertilizers, pesticides and herbicides and resort to tractorisation by themselves would not have yielded bountiful results. A great part has been played in boosting farm outputs by use of improved and high-yielding varieties of wheat, barley and hybrid maize. In fourteen West European countries (out of the eighteen) the total area sown to barley increased by 34 per cent between 1949-53 and 1954-58, whereas that sown to oats decreased by 13 per cent. This has been all due to evolving of improved strains of barley. Similarly, there has been extensive shift from rye cultivation to wheat in North-Western Europe.

Cultivation of hybrid maize has caught up well in Italy and Yugoslavia. In the former, hybrid maize yields as much as 51.8 quintals per hectare, while the other varieties yield only about 21 quintals. In Yugoslavia, the average yields from hybrid maize amount to 46.2 quintals, as against only 22.2 quintals from other varieties. The area sown to hybrid maize increased from barely 3.6 per cent in 1949 to 30.1 per cent in 1958 in Italy and from almost nil in 1955 to 17 per cent in 1959 in Yugoslavia. The use of improved plant strains has been helped to a great extent by easy availability of certified seeds.

EXTENSION SERVICES

No small part has been played in the agricultural development of Western Europe by the great emphasis that has come to be placed in the recent past on agricultural education and advisory services. Agricultural education in these countries today covers the entire range of technical and economic problems facing the peasantry. Formal educational institutions and Government agencies carry on basic research in all aspects of agriculture, including soils and the use of chemical aids to production. Governmental and co-operative organisations are active in imparting technical training to agriculturists and in disseminating information on new farming methods and techniques. Agricultural demonstration programmes and field advisory services, assisted in many countries by instructional work carried on by farm equipment and fertilizer manufacturers' representatives, reach into remote farming areas. An idea of how far Government alone interests itself in various West European countries in providing funds for agricultural research, educational and advisory services can be had from Table AGR—9.

No reliable statistics of non-Governmetal expenditure in this respect are available. But in most of the countries of the North-Western Europe non-Governmental organisations are reported to be spending substantial sums on agrarian research and provision of services to the farmer. The figure for Denmark, for instance, is estimated to be just about the same as that for Governmental expenditure in this field.

§ Including subsidies.

PRICE SUPPORTS AND SUBSIDIES

The farmer in Western Europe has been encouraged to make increased use of chemical fertilizers, pesticides, agricultural machinery and improved seeds by the protection granted to his products in almost all these countries during the post-Second War era in the form of guaranteed minimum prices. The measure of protection afforded to farm products in various West European countries is indicated in the chart on page 87. On an average, the element of protection in most of the advanced countries has been of the order of 20 to 40 per cent. Protection has been granted not only to agricultural commodities in whose case estimated cost of production has been higher than world norms, but also for the most competitive commodities.

The most common form that protection to farm products has taken in Western Europe is the fixation of support prices for these commodities. Consumers, of course, usually pay world market prices, but the producers receive deficiency payments from public funds when the market price is below the guaranteed minimum. The support price may cover the whole of a farmers output or be limited to a certain quantity or a certain sum. In a majority of countries the support prices are higher than those obtaining on the world market; only in two countries—Sweden and the Netherlands—they have some close correlation with world prices.

To keep the burden of indirect subsidisation at the minimum, resort has been taken to fixing of impor

DESIGN...
for finest performance

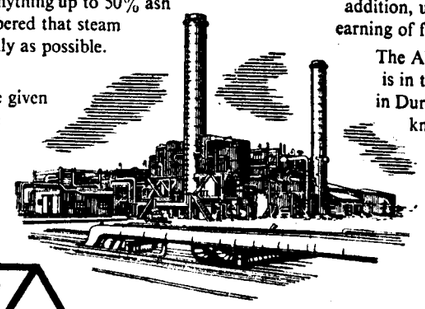
Of all aspects of industrial endeavour the most intriguing is thermo-dynamics, for it is this medium that provides industry with its greatest power—steam. Therefore, wherever high pressure steam-raising plant is used, there is a story...a story of experience, analysis and design.

Varying Conditions

Wherever new steam-raising plant is to be installed, either for generating power or in industry, it is essential that skilled investigation and analysis be carried out to ensure that the plant is *tailor-made* to give optimum performance under varying *local* conditions and requirements.

Fuel

Having established the purpose for which the steam power created will be required, it is necessary for the design engineer to identify the type of fuel to be used, either oil, gas or coal. Coal is by far the most widely used fuel, but its thermal content varies and it is therefore necessary to make an analysis to establish the percentage of principal heat-producing elements present. The thermal content of fuel has an important bearing on the designing of the kind of plant to be installed. Generally low-grade coal is used with anything up to 50% ash content. It should be remembered that steam must be raised as economically as possible.



Waste fuel

Particular attention has to be given to industries that wish to use waste material as fuel For instance, the sugar industry absorbs vast quantities of waste material in the form of bagasse for fuel; again in the pulp and paper industry it is now the practice to combine the processes of chemical recovery and steam raising by burning the 'black liquor' from the digestors in a special type of boiler unit. Of course, these industries cannot keep their steam-raising plant functioning entirely on waste materials. So, in their designing and planning, the technicians and design engineers must allow for varying fuels to be used and at the same time achieve optimum performance.

Powerful Ally

The new and powerful industrial group of ACC-Vickers-Babcock Ltd., with its vast resources of technical knowledge and the rich, wide experience of its partners, will undoubtedly prove a powerful ally in achieving the high target set by the government for the installation of boiler and thermal power plant during the third Five-Year Plan. AVB will be able to draw on the finest engineering minds to study, design and draw up plans that will *tailor-make* not only vital steam-raising plant but also heavy mining and cement-making machinery which will help meet the exigencies of industrial expansion and, in addition, ultimately contribute towards the earning of foreign exchange through export.

The AVB industrial plant at Durgapur is in the final stages of erection. Here, in Durgapur, all the advanced technical knowledge of AVB will be utilised to the fullest extent to ensure that each project is designed for the finest possible performance.

AVB ...a Powerful Partnership for Progress

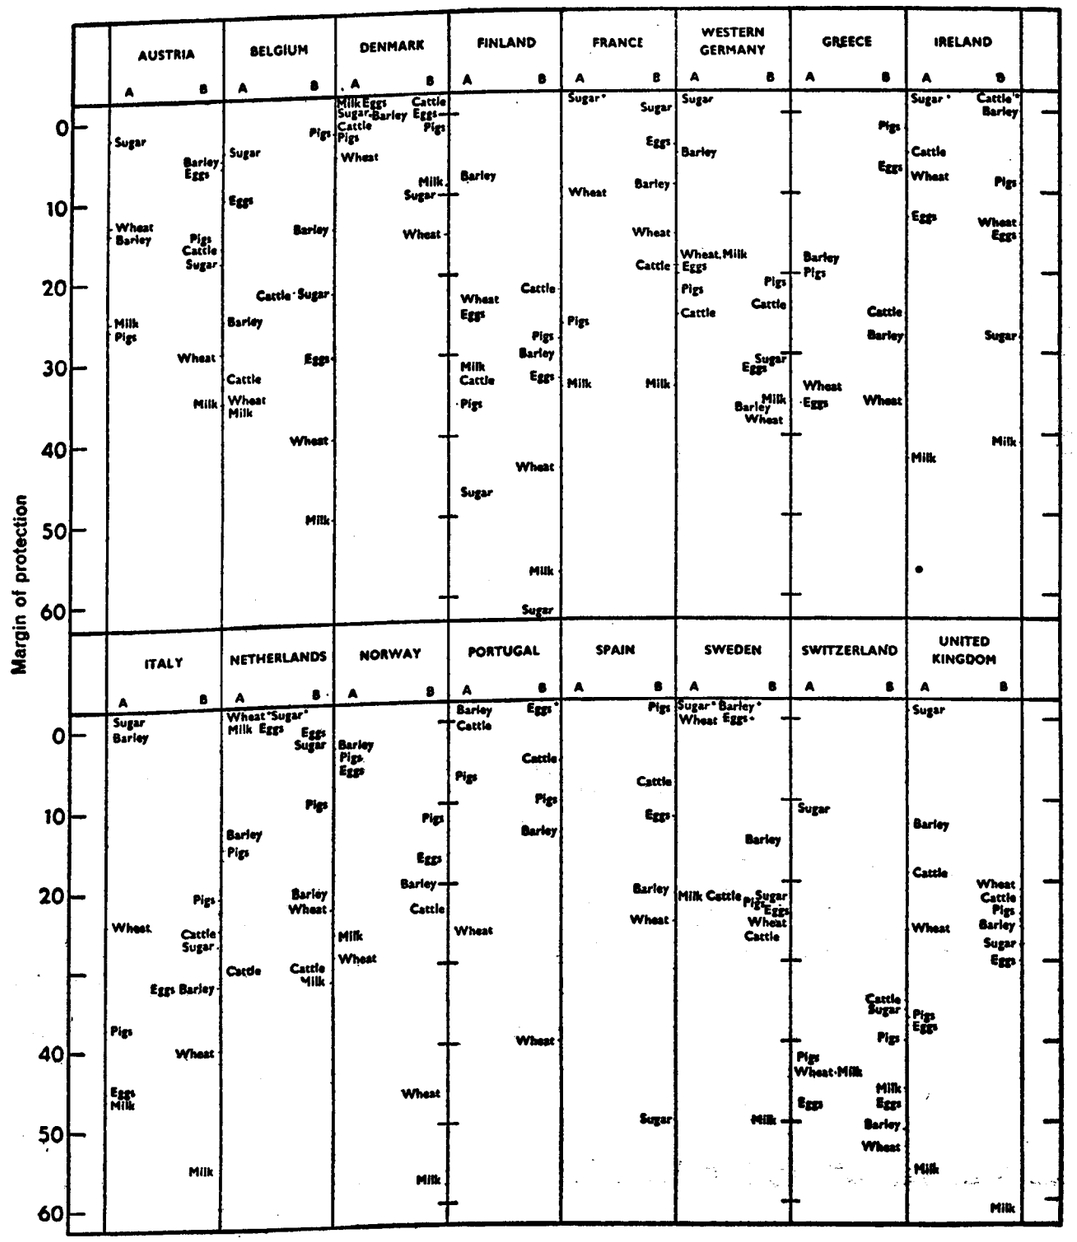
quotas and imposing of import tariffs. In the recent past quantitative restrictions have been the general rule rather than imposition of import duties. The lever of price supports has also been widely made use of to increase production of particular commodities. Preferential prices are fixed in such cases.



In some countries of Western Europe, there also prevails a system of provision of income subsidies unrelated to inputs and outputs. This is the case with countries where farm incomes are particularly low as compared to returns from industry.

While the incomes of farmers have, thus, been sought to be raised, concerted efforts have been made to bring down their production costs as well. This has been done in almost all the West European countries by providing farming requisites—fertilizers, pesticides, herbicides, seeds, machinery, petroleum etc.—at concessional rates. In North-Western Europe and the United Kingdom the stress has been on provision of subsidies on purchases of farm machinery, while in the Southern European countries emphasis is on provision of high-quality seeds and fertilizers at subsidized rates. Government in practically all the West European Countries have also taken steps to provide cheap credit to the agriculturist, free information and education particularly useful to farmers and assistance in marketing.

All this has been done to arrest the increase in production costs which have shown an upward trend during the fifties as is evident from Table AGR—10. Intensive cultivation invariably pushes up operating costs. This should be more so in the case of West European countries where labour inputs are declining and non-labour inputs going up.

Rough estimates of the degree of protection for selected agricultural commodities in western Europe 1950/51-1952/53 (A) and 1956/57-1958/59 (B) : country by commodity

Percentages

Sources and methods : See Appendix B.

—NOTE: The margin of protection is measured by the percentage difference between the import or export unit values and adjusted domestic farm prices.* Domestic prices are well below import or export unit values

SPECIALISATION

Increases in farm yields in Western Europe have also been made possible by improved transportation facilities. Since the turn of the century subsistence farming has been relegated to a minor position. With the springing up of commercial markets and food processing centres, there has come about, despite the practice of protecting local agriculture in various countries during the past decade, greater specialisation in raising of selected farm products.

Growth of urbanisation too has helped this trend towards specialisation to not an inconsiderable extent. There has also been witnessed a virtual revolution in food processing and storage in Western Europe which has pushed up farmers' incomes. Farmers in the Netherlands, Denmark and Sweden have even set up their own food processing units, either severally or in co-operation with others.

LIVESTOCK YIELDS

Increases in yields and productivity in Western Europe have not been confined to only farm crops. The story of increases in livestock output is a parallel one. In some countries, livestock yields have gone up even more impressively than yields of farm crops. The way milk, meat and eggs production has increased in some West European countries during the past two decades is reflected in Table AGR—12. The increase in the number of cattle —in some countries there has been actually some decrease—has been comparatively less than the increase in output. Productivity in the livestock sector, thus, has gone up in all the West European countries.

The 1950's have witnessed a steady increase in milk yields in Western Europe, as is evident from Table AGR—11.

TABLE AGR—11.

* Number of milking machine installations per thousand cows; Netherlands 1958.
** 1958. † 1957.

The most important factor which has helped in raising livestock yields in West European countries has been the application of scientific and technical knowledge in improving cattle breeds. Some contribution has been made to improvement in milk yields by use of milking machines. The use of milking machines (Table AGR—13) has increased during the fifties in all West European countries except in Portugal and Spain and three Southern European countries—Greece, Turkey and Yugoslavia.

FUTURE PROSPECTS

If the present policies of increasing farm and livestock outputs are kept more or less unchanged in Western and Southern Europe, it is estimated (Table AGR —14) that production of various food items will rise at a much faster rate than growth in demand, both at the medium rate of increase in per capita income (38 per cent rise upto 1970 over the current per capita income) and at a high rate of increase (62 per cent rise up to 1970) which brings down the proportion of cereals and potatoes in diet and pushes up that of higher quality food. Many West European countries may by 1970 face surpluses in some items of food, while the deficits in others may appreciably dwindle. In the first category fall cereals, potatoes and eggs; all the three regions of Western Europe will be having surpluses in these commodities. European Economic Community region may have surpluses in milk as well. There will continue to be deficits in meat and sugar, though the margin may be narrowed, in most of the countries. The three regions as such will be in deficit.

The comforts of life are spreading

Rising standards of living are finding their way into the remotest village and are coming within the reach of people with quite modest means. Consider Kerosine, for instance, which by bringing illumination to the humblest home is playing a part in this welcome development. By the end of the Third Plan, Burmah-Shell estimates that demand for Kerosine will increase by 41.6%. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth and Burmah-Shell believes that

for tomorrow's needs we must act today

East European Agriculture: A Halting Growth

COMPARED TO Western Europe, the growth of agriculture in Eastern Europe during 1950's appears to have been rather slower. While most of the West European countries had regained their pre-Second World War level of farm production by the close of 1940's, this was achieved in East European countries only by about 1953. The pre-occupation of East European countries, which came under the influence of the Soviet Union after World War II, with building up of an industrial base for their economies and the drastic upsets created by resort to collectivisation after the Communist fashion probably explains that.

The increases in gross agricultural output in the centrally planned countries of Eastern Europe upto 1959 are given in Table AGR—15. Since there have been sharp fluctuations in output from year to year, due mainly to wide fluctuations in harvests, the average for some years should be a safer index of rate of growth.

RATE OF GROWTH

Average gross agricultural output in late 1950's, thus, has been about 20 per cent higher than the average production in 1950-53 in Bulgaria, Hungary, Poland and Rumania, nearly 30 per cent greater in Albania, only 13 per cent higher in Czechoslovakia and as much as 51 per cent more in the Soviet Union. Per annum rates of growth came to 2 per cent in Bulgaria, Hungary, Poland and Rumania, 3 per cent in Albania, 1.3 per cent in Czechoslovakia and 5.1 per cent in U.S.S.R.

The year 1960 witnessed some sizeable increase in gross agricultural output in Czechoslovakia, Albania and Poland. In Czechoslovakia the increase was about 7 per cent over the 1959 level. In Poland it was of the order of 5.4 per cent and in Albania to the tune of 9 per cent. Bulgaria, Hungary, Rumania and the Soviet Union recorded only small increases ranging from 1.5 to 2.5 per cent. In all the East European countries, except Poland and Czecoslovakia, the increases were far below those actually planned. (In the Soviet Union the planned increase was 7.9 per cent over the 1959 level. The actual increase amounted to slightly over 2 per cent). The increase in Czechoslovakia's output was slightly less than the planned increase. Poland was the solitary country which could achieve—and even slightly exceed—the planned growth.

The high rate of growth in Albania and more particularly in the Soviet Union has been due more to increase in area under cultivation than in productivity per unit-area. In the case of U.S.S.R. net addition to sown area between 1953 and 1959 has been to the tune of 25 per cent. Another important factor that has inflated the index of gross agricultural output in these countries has been the shift towards higher-valued technical crops like sugar-beet and oilseeds.

A pertinent fact that is revealed by Table AGR—15 is that there has come about more or less stagnation in Soviet agriculture since 1958. This has accentuated the imbalance between the requirements of agricultural products in the Soviet Union and indigenous output. The requirements have tended to increase progressively not only owing to increase in population and growth of industry, but also due to improvement in living standards.

IMPROVEMENT IN YIELDS PER HECTARE

The contributions of increases in yields per hectare to the growth of crop production in East European countries in the fifties are indicated in Table AGR—16. Wheat, barley, oats and sugar-beet yields per hectare have gone up in all the countries though in varying degrees; over 25 per cent in wheat in the Soviet Union Bulgaria and Poland; over 20 per cent in barley in East Germany, Hungary and Poland; nearly 15 per cent in oats in U.S.S.R., Bulgaria and Hungary and 22 to 27 per cent in sugar-beet in Bulgaria and Hungary, as against much less in the remaining countries. Generally, yields per unit-area in East European countries have increased to a lesser extent than in West European countries.

Data not included in the table for crops of major importance to only a few countries do not greatly change the general picture. In Bulgaria, yields of cotton, tobacco and sunflower seeds have all increased, though for the first two crops they were no higher in late fifties than immediately before World War II. In Albania, yields of both cotton and tobacco have gone up appreciably.

A greater portion of the increase in productivity in East European agriculture appears to have come after 1953; till then output per hectare in these countries had shown not much improvement due to various reasons, the most important of them being the upsets created by resort to collectivisation of the hitherto privately-owned farms and low investments.

Expert opinion in the Soviet Union has in the recent past asserted that upto 1953 the work of improvement of collective and State farms had not been properly organised in some branches of agriculture, particularly livestock breeding and vegetable and paddy growing. No concerted attempt had been made to provide collective and State farms with material incentives to improve productivity. Nor were the communal and personal interests of collective farmers adequately co-ordinated. The machinery given to the Machine-Tractor Stations by the State was insufficiently employed and hand-labour predominated in many fields. "Side by side with the economically sound and advanced collective and State farms contributing their full share to the supply of the country with food and raw materials were a good many backward and neglected farms."

Since 1953, a number of steps have been taken in the Soviet Union, and in the other East European countries following her lead, which have helped in raising

what makes an expert?

This is a section of the Compounds Laboratory of the Dunlop factory at Sahaganj. At work is Shri B. C. De, M.Sc., A.I.R.I., Dunlop's able compounds expert, who presides over the vital work of developing rubber compounds which give Dunlop products long life and dependability.

The Sahaganj factory no longer depends wholly on the U.K for know-how although this is always available when required. Today, there is, in fact, a regular exchange of experience and information on technical developments. Dunlop in Birmingham now accept from Sahaganj proposals for new compounds based on the experience of conditions in India. In the rubber industry, it is experience of how products behave in service which is the keynote to success.

Over the years a strong technical team has grown up at Sahaganj—men who have literally devoted a whole life-time to rubber technology and have become acknowledged experts in the different branches of the rubber industry.

productivity in agriculture. The most important of these measures are: (1) institutional changes introduced to decentralise decisions on crop patterns; (2) provision of incentives to collective farmers in the shape of higher prices and reduced compulsory-delivery quotas for their products; and (3) making available to collective farms machinery, fertilizers and other aids to agricultural production at subsidised rates.

INSTITUTIONAL CHANGES

The institutional changes that have been effected in the Soviet Union (and to some varying degrees in the other East European countries) since 1953 to foster agricultural development are aimed at giving more weight to the economic criteria in determining location of output and increasing investment in the agarian sector. A new planning system has been evolved giving greater freedom to the "men-on-the-spot" to take decisions about crop patterns; formerly these decisions were made at the central level and foisted on State and collective farms. Increases in investments have been brought about not only by greater allocations of funds from the State exchequer, but also by encouraging the collective farmers to plough back greater part of the returns accruing to them from their collectivised farms as well as private plots. To enable them to have sizeable surplus, there have been effected drastic upward revisions in prices fixed for compulsory deliveries to the State and heavy reductions in the sizes of these quotas. These are discussed below at some length under the heading "Incentives to Collective Farmers".

Long-term State investments in collectivised farms in the Soviet Union have risen by some 60-80 per cent over the 1951-53 level. Besides, there have been deployed huge sums for reclamation of land which has led to increase in area under cultivation by about 25 per cent between 1953 and 1959; in 1959 the total area sown in the Soviet Union was about 39 million hectares.

Another important institutional change that has been effected in the Soviet Union in late 1950's has been the transfer of MTS machinery to collective farms. Collective farms have now come to be treated more or less at par with State farms. Before this was done, there were exerted, however, great efforts to strengthen the collective farms by amalgamation of weaker units either with the State farms or amongst themselves to make more viable units. The average size of collective farms, thus, has risen from 453 hectares of sown land in 1948 to 2,316 hectares in 1959. The optimum size is considered to be 2,500-3,000 hectares of arable land. The average size of State farms similarly has been raised from 2,600 hectares in 1948 to about 8,500

Encouragement has also been given, though in varying degrees in the years following 1953, to raise output on private plots of farmers and urban workers. Private farming was particularly encouraged between 1953 and 1956 by lowering the agricultural income-tax to less than half and other measures. In 1958, private holdings were released from obligatory deliveries. To curb expansion in private farming, a decree was, however; passed in March, 1956, which provided for the size of the private holding to be related to the labour contribution of the household to communal task. A more serious reverse for private farming came in 1959 when urban workers were forbidden in some Soviet Republics to keep any productive or working livestock.

The pattern of institutional changes effected in the other countries of Eastern Europe in the latter half of 1950's is almost the same as in the Soviet Union. There have been, however, two exceptions to this and they have been in Poland and Hungary. In Poland, about 80 per cent of co-operative farms were dissolved in 1956 and "agricultural circles" were set up to perform the functions of MTS and to render advisory services to farmers. A similar step was taken in Hungary also in late 1956 and nearly 50 per cent co-operatives were dissolved there. This trend, however, has been reversed in Hungary, but no such reversal has yet come in Poland.

Although the final goal in Poland still remains to set up a socialistic system of production in agriculture, the agricultural policy since 1957 has been oriented towards more efficient farming both in the private and the "still remaining" socialist sector. The size of private holdings of land has been increased in the last four years to some 15 to 20 hectares of arable land, especially in the new settlement areas. To achieve the ends of socialism, the stress is not so much on collectivisation of farms, but on voluntary co-operative farming. State support for producer co-operatives, voluntarily established on sound foundations, thus, continues.

INCENTIVES TO COLLECTIVE FARMERS

The incentives to collective farmers provided in the Soviet Union since 1953 with a view to raise farm output, have taken the shape of reduction in, even abolition of in the case of some agricultural commodities, compulsory deliveries to the State, increase in prices fixed for such quotas and replacement of payments in kind for MTS services by payments in cash.

The system of marketing and pricing of agricultural

unchanged for nearly 20 years since it was first introduced in 1932-33. It envisaged compulsory delivery of part of the produce to the State at a fixed price (which, of course, provided for some regional differences in production costs), sale of the surplus produce to State procurement agencies at a higher price and in peasant markets where prices realised were still higher, and obligation to pay for MTS services in kind. Generally, the hectare principle was followed in fixing compulsory-delivery quotas, which implied surrender of a certain percentage of the yield per hectare, estimated by the State, to the Government at a stipulated price.

This system suffered from two main defects. Firstly, the compulsory-delivery quotas for majority of farm products were fixed at levels so high that only very small surpluses were left for sale in the high-priced above-quota markets. Secondly, the prices fixed for compulsory deliveries were sometimes even below production costs. Since the crop pattern was also planned and decided centrally, collective farm managements were left with no choice to use their own initiative in selecting crops to be grown on their fields.

The marketing and pricing system of 1932-33 was fairly drastically reformed in 1953. Though multiple prices and compulsory delivery elements were retained in their essentiality, compulsory-delivery quotas were considerably reduced so as to leave fair surpluses for sale in peasant markets. The prices for compulsory-delivery quotas too were revised upwards by about 2½ times over the levels prevailing in 1952.

This system was further reformed in 1958. In a way, the 1958 reforms were even more revolutionary than the 1953 reforms — they substituted the multiple price system relating to deliveries to the State into a single-type of delivery at a single price for each product. In these reforms, the obligation of the collective farms to pay for the MTS services in kind was also abolished; they were now required to pay for these services in cash. Another improvement that was effected in the marketing system by the 1958 reforms was that flexibility was introduced in the fulfilment of compulsory-delivery quotas by the collective farms by virtue of which they could substitute one crop for another. Deliveries to the State under the procurement schemes were also liberalised. Procurement quotas were fixed for more than one year. The shortfall in one year could be made up in the succeeding years.

The 1958 reforms, however, raised prices for compulsory-delivery quotas by only a small margin — at the most by 18 per cent over the 1956 levels. In the case of some commodities, prices were even brought down slightly. Changs in prices in 1959 were done very marginally; the new prices were only about 20 per cent higher than the 1956 levels (Table AGR—17).

Changes in the marketing and pricing policies in respect of products of private plots of collective farmers have been on the same lines as detailed above with reference to collective farms. The 1958 reforms abolished compulsory deliveries from the private holdings of collective farmers.

An important fact that is to be taken note of in respect of compulsory-delivery quota prices is that prices fixed since 1953 have been more in tune with production costs than had been the case before that year. Regional differentiation has also been given better appreciation.

The new marketing and pricing system has considerable advantages, going beyond the value of administrative simplification and the improvement of incentives implied by the increase in the average price level. Under the old system, average price had tended to vary inversely with unit costs from year to year. Since compulsory-delivery quotas were fixed, in principle, for fairly long periods and were affected by harvest fluctuations, above-quota surpluses for sale at premium prices were largest in the years of good harvests; and in poor years lower average prices intensified the contraction of incomes resulting from lower output. The system introduced in 1958 not only eliminated this tendency, but introduced a provision for counterveiling price adjustments; in years of high yields (and thus lower unit costs) prices were lowered by 10 to 15 per cent. In bad years they were raised by about the same margin. Thus, the interrelation of output and prices is now similar to that which would normally exist in a market economy.

The revised system of fixation of compulsory-delivery quotas has also led to great specialisation in agri-

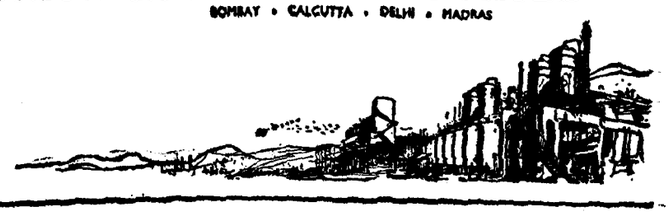
** Prices only of flax fibre; cash receipts of flax fibre and flax seeds.

Alcohol—a major by-product of India's cane sugar industry—was largely unutilised industrially until Union Carbide India commenced manufacturing operations at Trombay Island, Bombay, in 1961.

The Union Carbide India plant now consumes over 3 million Imperial gallons of alcohol every year to produce 15 million pounds of organic chemicals and polyethylene resins and compounds — together valued at Rs. 2.5 crores. The chemicals and polyethylene made by Union Carbide India help save Rs. 2 crores in foreign exchange annually by replacing products that have hitherto been largely imported.

Acetic Acid, Butyl Alcohol, Ethyl Acetate and Butyl Acetate produced at Trombay serve as solvents and intermediates in the manufacture and processing of a wide range of products—from antibiotics and drugs to paints and lacquers ... from artificial pearls to textiles and dye-stuffs.

Union Carbide polyethylene compounds and resins go to make an almost endless variety of finished products with numerous applications in agriculture, industry and the home. On the farm, polyethylene is introducing such modern methods as mulching, pond- and canal-lining and ensilation. Flexible, easy-to-handle polyethylene pipe helps carry water wherever it is needed. Polyethylene has proved to be an ideal insulating material for power transmission lines and telecommunication cables. In building construction polyethylene film is being increasingly used for roof-lining, concrete curing, pre-casting and damp-proof coursing. Houseware, drapes and furnishing fabrics of polyethylene are helping make homes brighter, household chores easier.



Yes, you might say, for once a yen for alcohol is justified.

Products of Industrial Products Sales Division include : "Union Carbide" Polyethylene • "Union Carbide" Butyl Acetate • "Union Carbide" Butyl Alcohol • "Union Carbide" Ethyl Acetate • "Union Carbide" Acetic Acid • Miscellaneous Chemicals, Plastics and Resins • Zinc Sheets, Strips and Coils • "Karbate" Chemical Equipment • "National" Cinema Carbons

India gives Technical Know-how...

We have a proud record of leadership in the Light Engineering field.

We are pioneers and the largest exporters of light engineering goods in the country. Usha Sewing Machines and Fans are exported to about 50 countries. Last year we earned valuable foreign exchange amounting to over a crore.

And now we are giving Technical Know-how to other countries. Shortly a group of Usha Engineers and Technicians will be heading for Saigon and Colombo to help them in starting Usha Sewing Machine Assembly Plants.

We look to the future with confidence and in a spirit of dedication to serve the country well.

culture as between various regions of the Soviet Union. Under the old system there were very limited possibilities for only a small minority of farms to escape the obligation to produce grains, potatoes etc., specially for compulsory deliveries. The 1958 reforms introduced greater regional differentiations in procurement quotas, freeing some areas from deliveries of products for which they were particularly badly suited.

The net result of the above reforms in marketing and pricing system of the products of collective farms and the private plots of collective farmers has been appreciable increase in their income. Gross money income of collective farms is estimated to have gone up from 42.8 billion roubles in 1953 to as much as 136.9 billion roubles in 1959. This increased income has enabled the collective farms to push up investments out of their own funds from 7.4 billion roubles in 1952 to nearly 33.3 billion roubles in 1959.

In the other countries of the Eastern Europe, the post-1953 farm-price and procurement policies have varied in their details and phasing. But everywhere they have involved progressive reductions in compulsory-delivery quotas — and in most countries their eventual elimination — and increases in prices for all State purchases. The reforms, thus, have been essentially on the same pattern as those in the Soviet Union.

SUBSIDIES ON FARMING AIDS

Alongwith raising of incomes of the collective farms and the collective farmers from their private plots through wholesome changes in marketing and pricing system, thus making available some surpluses to be ploughed back for investment in land, the Governments in East European countries, including U.S.S.R., started in late fifties extending the benefits of provision of various aids to production at subsidised rates, hitherto enjoyed by only State farms, to collective farms as well as private plots. The latest instance for this is the reduced prices of various non-labour inputs in agriculture which came into effect in the Soviet Union from February 1, 1961. The reductions have been of the order of 17 per cent in the prices of lorries, 9 per cent in the prices of tractors and as much as 40 per cent on an average in the prices of spare parts and gasoline.

The financial resources of collective farms in the Soviet Union have also been sought to be improved in other ways. These include: (i) Abolition up to the end of the Current Seven-Year Plan of income-tax on 80 per cent of the cash incomes of collective farms resulting from sales of meat, milk and eggs; (ii) reduction of the rate of interest on short and long-term credits to collective farms; (iii) deferment for five years of repayment of Gosbank loans and for 5-10 years of payments still due for ex-MTS machinery.

The way investment in agriculture has gone up in the Soviet Union and the other East European countries in 1950's is indicated in Table AGR-18. The effect of the changes in agricultural policies of these countries since 1953 is adequately reflected in this table. Everywhere investment in agriculture has risen markedly since 1954 — not only in absolute terms, but also as percentage of total investment in the economies of all these countries.

The increased investment in agriculture in all the East European countries has helped not only in fostering strain technology and research, but also in mechanisation of farming and greater use of chemical fertilizers. The increase in non-labour inputs in the fifties has been one of the primary reasons of increase in the productivity of land in Eastern Europe.

MECHANISATION

The growth of mechanisation in agriculture in the Soviet Union and the other East European countries in 1950's is reflected from Table AGR—19. The tractor

park in every East European country has expanded by two to three times since 1950. Resort to tractorisation has been greater in Czechoslovakia and East Germany—the two countries of labour shortages in the East European bloc.

In late fifties, there was one tractor in use on every 290 hectares of agricultural land in Poland, on every 102 hectares in Czechoslovakia, on every 150 hectares in East Germany, on every 220 hectares in Hungary, on every 262 hectares in Bulgaria, on every 413 hectares in Rumania and on every 250 hectares in the Soviet Union. In late forties, the position was that there were about 710 hectares of agricultural land per tractor in Poland, 230 hectares in Hungary, about 688 hectares in Bulgaria and slightly over 1,000 hectares in Rumania (the figures for the Soviet Union and East Germany are not available).

The use of other farm machinery has gone up appreciably in the U.S.S.R. during the past decade, but it has grown only slowly in the other East European countries. Sowing of grain, cotton and sugar-beet and harvesting of grain, in the Soviet collective farms had been mechanised to the extent of 90 per cent or more by 1959. Harvesting of maize, potatoes and hay-mowing, however, had been mechanised only to the tune of 32, 20 and 53 per cent respectively. Mechanical water supply was available for about one-third of collective farm livestock.

USE OF FERTILIZERS

Use of chemical fertilizers too has gone up quite appreciably in the East European countries during the past decade. This is indicated in Table AGR—20.

Use of artificial fertilizers per hectare in the East European countries, as revealed by Table AGR—21, is however, much lower than in the countries of Western Europe. But fertilizers in East European countries are mostly used to boost yields of technical crops. In the Soviet Union, for instance, application of nitrogenous fertilizers (pure content) per hectare in 1957 was 108 kilogrammes for cotton, 43 kilograms for sugar-beet, 21 kilograms for flax, but only 0.4 kilograms for grains (excluding maize). The average application per hectare of agricultural land in that year was 3.1 kilograms.

The smaller use of artificial fertilizers in some countries of Eastern Europe is probably due to the fact that quite good use is made in these countries of natural manures. In Hungary, for instance, on an average 274,000 tons of natural manures were used annually between 1957 and 1959, as against 118,000 tons of chemical fertilizers. Total annual supply of soil nutrients in Hungary — both natural and artificial — increased from 313,000 tons in 1950--52 to 340,000 tons in 1954-56 and 392,000 tons in 1957-59.

INVESTMENT TRENDS SINCE 1960

Investments in agriculture in the East European countries have been stepped up further in 1960. This has taken the form of increased supplies of farm machinery and other aids to production. The position in the individual countries is as follows:

Soviet Union: At the beginning of 1961, the collective and State farms owned nearly two million trac-

d. Production of chemical fertilizers.

tors (15 H.P. units), about 750,000 lorries, almost half a million combine harvesters and millions of other farm machinery. Increased expenditure was incurred on improving the supplies of other farming aids. No clear picture of investment that is envisaged to go into the Soviet agriculture upto 1965 is yet available. (The estimates are constantly under revision). But the announced aim is that the investment would be commensurate to creating conditions which would permit agriculture to become independent of the caprices of nature and would lead to attainment of targets as shown in Table AGR—25. Large sums are envisaged to be spent on provision of irrigational facilities in Central Asia, South of RSFSR and the Ukraine and in Transcaucasia.

Czechoslovakia: The supply of farm machinery in 1960 was increased by 21 per cent, while application of artificial fertilizers rose by 5 per cent. In 1961, investment was to be further increased to attain a level of more than 25 per cent in mechanisation over the 1959 level. Investment in agriculture and forestry during the current Plan period (1961-65) is to be stepped by 60 per cent above the volume in the five years to 1960.

East Germany: Supplies of farm machinery to the socialist sector in this country increased enormously in 1960. The tractor stock rose by 50 per cent and the stocks of several other important machines by 20 to 25 per cent. It was planned to deliver another 14,000 tractors — 20 per cent of the existing stock in the socialist sector — to State and co-operative farms and MTS in 1961.

Hungary: State and co-operative farm investments in 1960 rose by 32 per cent over the 1959 level. The tractor park increased by more than 50 per cent and stock of grain-combines by two-thirds. In 1961, investments were envisaged to be made more for increasing the supplies of fertilizers and improved seeds than farm machinery. Fertilizer supplies, for instance, were planned to be raised by 30 per cent over the 1960 level which was approximately the same as in 1959.

Poland: Investment in agriculture in 1960 rose by 14 per cent over the 1959 level and absorbed 12.4 per cent of the total investment in the Polish economy. Supplies of machinery to agricultural circles and individual and co-operative farms rose by 24 per cent (in the case of tractors they doubled). Application of fertilizers increased by 15 per cent and of insecticides by 72 per cent. In 1961, investment was envisaged to be stepped up by 15 per cent over the 1960 level. Over the whole of the current Plan period (1961-65) direct investment in agriculture is to be 86.6 billion zlotys.

Rumania: Investment in agriculture in 1960 in this country rose rather by a smaller margin as compared to the previous two years — by 10 per cent as against 31 per cent and 43 per cent in 1959 and 1958. Output of tractors is rising pretty fast and supplies in 1960 were supposed to have increased by 17,000 units, representing an increase of 55 per cent over the 1959 level. Fertilizer production was supposed to have gone up by 36 per cent over the 1959 level.

FARM MANAGEMENT

Apart from trying to increase yields by effecting greater investments, concerted efforts have been made in the Soviet Union at least to improve management of State and collective farms by release of specialists from administrative work and effecting of transfers of technicians from industry to agriculture. This happened particularly in mid-fifties when new stress came to be placed on agricultural development. The process has continued in late fifties though at a slower pace. It is likely to gather momentum again to enable the attainment of the current Seven-Year Plan (ending in 1965), target of total agricultural output, which, if it is to be achieved, implies an increase of about 10.5 per cent per annum over the 1960 production level.

LIVESTOCK YIELDS

Livestock output and yields in Eastern Europe during 1950's have gone up at a fast rate than crop yields. This is clear from Tables AGR-22 and 23. The increases in livestock yields have been brought about by consistent efforts to improve fodder supplies and breeds of cattle. The faster growth in livestock output has been necessitated by the changing food consumption pattern in Eastern Europe.

FUTURE PROSPECTS

All the East European countries have drawn up ambitious plans for agricultural development upto 1965. These are indicated in Table AGR—25, which also gives actual output of various farm products in 1960. To achieve these targets sharp increase in yields per unit-area and per head livestock are envisaged. These are indicated in Table AGR—25 (see page 105).

No doubt, some wholesome results should follow from the heavy investments that have gone into the agrarian economies of all these countries in late fifties in the form of greater mechanisation and higher non-labour inputs — application of fertilizers, use of improved seeds and spread of agricultural education and training — but much will depend on how far investments progressively increase in the years to come and what further incentives are provided to collective and co-operative farmers to put in their best. The average rate of growth during the fifties in the agricultural economies of these countries hardly evokes optimism about the fulfilment of these targets, except in Poland. The Polish targets of total agricultural production, crop production and animal output appear to be more realistic. Table AGR—24 gives the linear and cumulative increases that can be expected in the agricultural outputs of the Soviet Union and four other East European countries during the five years to 1965, in the light of the past experience, alongwith the increases that are required to accomplish the 1965 planned targets. The planned targets obviously are far above even the cumulative increases that can be expected especially in the Soviet Union, Czechoslovakia, Hungary and Rumania.

Indian Agriculture: A Decade of Fairly Rapid Growth

HAVING considered the growth in the agrarian economies of East and West European countries during the fifties, we now turn to India which completed ten years of planning in March, 1961. A decade of planning has accelerated the growth of Indian economy as a whole, but here in this section we are concerned only with the development of agriculture.

Indian agriculture, despite serious setbacks in 1957-58 and 1959-60 due to vagaries of weather, has made some rapid strides during the whole of the past decade. This is evident from Table AGR—27. The index number (base 1949-50=100) for total agricultural output (excluding livestock production) went up from 95.6 in 1950-51 to 139.1 in 1960-61. This shows that total agricultural production in India in the last year of the Second Plan increased by as much as 45.5 per cent over the 1950-51 level—giving 4.6 per cent linear rate of growth per annum. But 1960-61, despite its fair share of annual floods and drought in various parts of the country, was a slightly more favourable year for agriculture. Taking the average for the past three years, total agricultural output in India went up by 40 per cent compared to the 1950-51 level and by 35 per cent compared to the average annual output from 1949-50 to 1952-53. Foodgrains output in 1960-61 was higher by 52 per cent than the 1950-51 output. The average annual production during the three years 1958-59 to 1960-61 was up by 47 per cent over the 1950-51 output and by 39 per cent over the average annual production from 1949-50 to 1952-53. These three types of averages have been calculated to make the comparison with the European countries more appropriate. The comparison has been attempted in the succeeding section.

Slightly over 50 per cent increase in total agricultural output during the past decade appears to have resulted from increase in area under cultivation which went up from 131.9 million hectares in 1950-51 to 150.7 million hectares in 1958-59 (Table AGR—28). There must have been some further additions to the gross area cultivated during the last two years of the Second Plan, but no reliable statistics of this are available. Total addition to the net sown area upto 1958-59 had been of the order of 12.2 million hectares; the rest of the increase is accounted for by expansion in multiple cropping.

YIELDS PER HECTARE

The role that increased productivity of land has played in boosting total agricultural output in India during the fifties should be apparent from Table AGR—29. Although yields of some crops like linseeds, sesame seeds and tobacco have gone down slightly, significant increases have been recorded in yields per hectare of various crops, particularly rice, jowar, gram, maize, tur and ragi. The increases in unit-area yields in the case of wheat, bajra, cotton and sugarcane, though less impressive, have been fairly large. The increase in productivity has been faster in the latter half of the fifties as greater portion of the increases in yields has been achieved during this period.

The increase in productivity of land in India has been achieved, as in any other advanced country of the West, mainly through concerted application of science and technology. The various means that have been adopted in India to raise farm yields per unit-area during the past decade are:

Increased Irrigation: The net irrigated area (Table AGR—30) is estimated to have gone up from 20.9 million hectares (51.5 million acres) in 1950-51 to about 28.3 million hectares (70 million acres) in 1960-61. The total new irrigation potential created under the first two Plans through major and medium projects is 5.3 million hectares (13 million acres). Of this, only about 76 per cent (10 million acres) had been made use of upto the end of 1960-61 agricultural year. The rest of the 7.5 million hectares (18.5 million acres) have benefitted from minor irrigation works.

Use of Improved Seeds: Sporadic attempts had been made in this country to evolve improved strains of seeds since the turn of the present century and more particularly after 1928 following the recommendations of the Royal Commission on Agriculture. But concerted efforts were made only under the Second Five-Year Plan when long-term programmes were drawn up for saturating the entire agricultural area with improved seeds. The progress achieved under the Second Plan has been appreciable though the target has not been accomplished. Out of 4,328 Seed Multiplication Farms of about 10.1 hectares (25 acres) each, which were to be set up by March, 1961, in various States, in all about 4,000 farms had been established. It is estimated that as a result of the efforts made under the Second Plan, nearly 22.3 million hectares (55 million acres) of agricultural land have been brought under improved seeds. A special programme has been drawn up to evolve and propagate maize and jowar hybrids. The plans in respect of maize hybrids have already been executed in some areas. Production of hybrid jowar seeds is intended to be taken up soon.

Use of Improved Implements and Mechanisation: Concerted efforts have been made in 1950's, particularly during the Second Plan period, to make available to the agriculturist improved farm implements. But the progress in this regard has not been very encouraging because of foreign exchange shortage hampering import of steel. Mechanical cultivation had been extended to about 0.21 million hectares (0.5 million acres) by the end of 1960-61 agricultural year.

Use of Fertilizers: Chemical fertilizers were scarcely used by the Indian cultivator right upto the end of 1940's. Their rapid application during the fifties is reflected from Table AGR—31. In the past three years, there has been phenomenal increase in demand for fertilizers, but due to inadequacy of domestic production and lack of compensatory imports from abroad owing to foreign exchange shortage, supplies have fallen short of demand by a very big margin. In 1960-61, for instance, availability of nitrogenous fertilizers—most commonly used by the Indian peasant—amounted to only about 45 per cent of the total demand. Between 1950-51 and 1960-61 consumption of nitrogenous fertilizers (in terms of N) increased from 55,000 tons to 230,000 tons, of phosphatic fertilizers (in terms P2O5) from 7,000 tons to 70,000 tons and of potash fertilizers from 7,700 tons (in 1951-52) to 25,000 tons.

Organic Manures: Along with fostering the use of chemical fertilizers, attention has been paid in the last decade to the development of urban compost and local manuring resources. It is estimated that about 3 million tons of urban compost and 83 million tons of rural compost were produced during 1960-61. Green manuring practices have also been resorted to in a greater measure. By the end of the Second Plan 4.8 million hectares (11.8 million acres) were estimated to have been brought under green manuring.

TABLE AGR—31.

CONSUMPTION OF CHEMICAL FERTILIZERS IN INDIA

Period	Nitrogenous Fertilizers (In terms of N)	Phosphatic Fertilizers (In terms of P205)	Potash Fertilizers (In terms of K20)
1951-52 ..	57.9	6.9	7.7
1952-53 ..	56.7	4.6	3.1
1953-54 ..	67.2	8.1	8.5
1954-55 ..	94.7	14.8	14.2
1955-56 ..	105.6	12.8	10.8
1956-57 ..	131.3	15.6	10.9
1958-59 ..	164.0	27.2	16.5
1959-60 ..	231.0	38.9	N.A.
1960-61 ..	230.0	70.0	25.0

Improvement in Agricultural Practices: Considerable contribution has been made towards increasing farm yields by adoption of improved agricultural practices such as crop rotation, line sowing, proper spacing eradication of weeds, protection of crops and Japanese method of paddy cultivation. The last practice has been of particular help in stepping up rice yields. It is estimated that 2.9 million hectares (7.2 million acres) of land under rice cultivation had been brought under the Japanese method upto 1959-60. The target of extension of this method to 3.2 million hectares (8 million acres) during the Second Plan period was probably attained in 1960-61. Increased use has also been made of pesticides, insecticides and herbicides, especially during the late fifties. The plant protection programme covered about 6.5 million hectares (16 million acres) of land at the end of the Second Plan.

Extension Services: No small part has also been played in increasing the productivity of soil, particularly in the latter half of the fifties, by extension services provided under the Community Development Programme. It is estimated that yields in many an intensive development block have gone up by nearly 25 per cent. By the end of 1960-61 about 3,70,000 villages, containing well over half the country's rural population, had been brought under the Community Development Programme. This programme is envisaged to be extended to cover the entire country by 1963.

FERTILIZER CORPORATION OF INDIA

PLAYS AN IMPORTANT ROLE IN INDIA'S EXPANDING ECONOMY

The Corporation is the nation's biggest producer of chemical fertilizers and is a Government of India undertaking entrusted with the responsibility of managing fertilizer units in the public sector.

The constituent units of the Corporation at present are the two operating factories at Sindri (Bihar) and Nangal (Punjab) and three projects which are still in the construction stage, namely, Trombay in Maharashtra, Nahorkatiya in Assam and Gorakhpur in U.P.

By the end of the Third Five-Year Plan all these units of the Corporation will be responsible for a total production of over four lakh tons of nitrogen annually out of the overall targeted capacity of one million tons of nitrogen. There will be an additional 45,000 tons installed capacity in terms of phosphate per year.

Apart from substantial economic gains in terms of increased food production, the pooled resources of all these units under the Corporation will greatly benefit the country by advancing technical knowledge and technical skill.

Chemical fertilizers produced by the Corporation's factories have made an effective contribution towards increasing India's food production and saved the country so far over Rs. 66 crores in foreign exchange.

GENERAL INSURANCE AND THE NATIONAL ECONOMY

GENERAL INSURANCE is essential to the national economy. It cushions unforeseen losses due to accidents . . . and thereby makes for a smooth and orderly progress of modern industrial society.

The 'NEW INDIA', with its fine record of solid security and efficient service, occupies a premier position in the field of general insurance in India. As in the past, so in the future, the 'NEW INDIA' will continue to serve the national economy in general and Indian industry in particular.

THE NEW INDIA ASSURANCE Co., Ltd.

Mahatma Gandhi Road, Bombay

Land Development and Soil Conservation: Some concerted efforts have been made in land development and soil conservation in late fifties. By the end of 1960-61, about 1.1 million hectares (2.7 million acres) were covered by soil conservation measures.

Credit and Marketing: To help the agriculturist to effect technological improvements on his land, credit has been made available to him at cheap rates. Measures have also been taken to help him in getting a fair return for his produce by marketing it through co-operative societies. At the end of the Second Plan period there were 2,10,000 primary agricultural societies —almost double the number in 1950-51—to provide credit facilities and about 1,870 co-operative societies primarily engaged in marketing of agricultural produce. The tempo of construction of Central and State warehouses has also been stepped up to foster the growth of co-operative marketing societies.

LIVESTOCK YIELDS

Although attempts have been made for over two decades to improve livestock yields in India through improvement of cattle breeds, the falling percentage of protective food in an average Indian diet suggests that no material changes have, as a general rule, come about in livestock yields. The total milk production is estimated to have gone up from 17 million tons in 1950-51 to about 22 million tons in 1960-61. How much of this increase has been due to increase in the number of milch cattle and how much owing to improvement in yields per head it is difficult to say. Meat production too has increased only marginally.

The total outlay that has gone into agriculture over the past decade has been of the order of about Rs. 1,200 crores.

TABLE AGR—32.

TARGETS FIXED FOR VARIOUS AGRICULTURAL PRODUCTS IN THE THIRD PLAN

Commodity/Unit	Base level Production 1960-61	Target of additional production 1961-66	Estimated Production in 1965-66	Percentage increase
Foodgrains (Million tons)	76.0	24.0	100.0**	31.6
Oilseeds (Million tons)	7.1	2.7	9.8	38.0
Sugarcane (gur) (Mil. tons)	8.0	2.0	10.0	25.0
Cotton (Million bales)	5.1	1.9	7.0	37.2
Jute (Million bales)	4.0	2.2	6.2*	55.0
Coconut (Million nuts)	4500	775	5275	17.2
Arecanut (Thousand tons)	93	7	100	7.5
Cashewnut (Thousand tons)	73	77	150	105.5
Pepper (Thousand tons)	26	1	27	3.9

Lac (Thousand tons)	50	12	62	24.0
Tobacco (Thousand tons)	300	25	325	8.3
Tea (Million lbs.)	725	175	900	24.1
Coffee (Thousand tons)	48	32	80	67.7
Rubber (Thousand tons)	26.4	18.6	45	70.5

* Excludes mesta which may provide an additional 1.3 million bales in the Third Plan.

** It is estimated that the production of rice in 1965-66 may be about 45 million tons, of wheat about 15 million tons, of other cereals about 23 million tons and of pulses about 17 million tons.

FUTURE PROSPECTS

India has planned for a big rise in total agricultural output during the Third Plan period which extends to March, 1966. The targets fixed for various crops along with the percentage increases envisaged over the 1960-61 production levels are indicated in Table AGR—32. The index number of total agricultural output (base 1949-50=100) is envisaged to rise from 139 in 1960-61 to 176 in 1965-66. The Third Plan, thus, assumes substantially stepping up of the annual rate of growth in Indian agriculture.

The higher rate of growth is to be brought about by increased application of technology (Table AGR—33). Gross area under irrigation is proposed to be increased by 10.4 million hectares (25.6 million acres). Soil conservation measures would be extended to 4.5

TABLE AGR—33.

TARGETS OF AGRICULTURAL PROGRAMMES— THIRD PLAN

Programme/Unit	Target
I. Irrigation	
1. Major and medium irrigation (gross) (Million acres)	12.8
2. Minor irrigation (gross) (million acres)	12.8
(a) Agriculture (Million acres) ..	19.5
(b) Community development (million acres)	3.3
Total (million acres)	25.6
II. Soil Conservation, Land Reclamation etc.	
(a) Soil conservation on agricultural lands (Million acres)	11.0
(b) Dry farming (Million acres) ..	22.0
(c) Land reclamation (Million acres) ..	3.6
(d) Reclamation of saline and alkaline lands (Million acres)	0.2
III. Additional area under improved seeds — Foograins	148.0
IV. Comsumption of Chemical Fertilisers	
(a) Nitrogenous (N) (Thousand tons) ..	1000
(b) Phosphatic (P2O5) (Thousand tons)	400
(c) Potassic (K20) (Thousand tons) ..	200
V. Organic & Green Manuring	
(a) Urban compost (Million tons) ..	5.0
(b) Rural compost (Million tons) ..	150.0
(c) Green manuring (Million acres) ..	41.0
VI. Plant protection (Million acres)	50.00

million hectares (11 million acres) and dry farming to 8.9 million hectares (22 million acres). Nearly 1.5 million hectares (3.8 million acres) of waste, saline and alkaline lands are intended to be reclaimed. Total consumption of fertilizers is envisaged to be increased nearly five-fold. Supply of urban compost is proposed to be stepped up to 5 million tons per annum and of rural compost to 150 million tons. Green manuring is envisaged to be extended to 16.6 million hectares (41 million acres). Area under improved seeds is proposed to be expanded by 59.9 million hectares (148 million acres). Plant protection is to be extended to 20.2 million hectares (50 million acres).

Increased application of technology to Indian agriculture during the Third Plan period is envisaged to step up average yields per unit-area by 16.5 per cent over the average for the Second Plan period in the case of foodgrains (rice 27.5 per cent and wheat 20.1

per cent), by 10.9 per cent in the case of oilseeds, by 18.2 per cent in the case of sugarcane, by 13.7 per cent in the case of cotton and by 15.9 per cent in the case of jute. Major portion of the increases in unit-area yields are expected from **selected districts** where all the aids to farm production are proposed to be provided in adequate measures through what is styled as the **"package programme".** Extension services to argiculturists in general, to enable them to raise yields per unit-area, are proposed to be provided by extension of the Community Development Programme to the entire country by 1963.

To enable the farmers to have a better return for their produce, the co-operative marketing system and storage facilities are not only envisaged to be strengthened but also extended substantially. Further facilities are to be provided in respect of both short and long-term credits to enable them to effect structural improvements on their lands and to encourage them to make use of technology in a greater measure than hitherto.

The total outlay on production programmes in agriculture, including large and small irrigation schemes, soil conservation and co-operation, to be incurred during the Third Plan period is envisaged to be of the order of Rs. 1,281 crores, as against Rs. 666.65 crores under the Second Plan.

How far the Third Plan agricultural targets would be actually fulfilled—the actual output in 1960-61 (see Table AGR—27) falls short of the planned targets by only a small margin in the case of foodgrains, exceeded the stipulated target in the case of sugarcane, but was substantially lower in the case of commercial crops (oilseeds, cotton and jute)—only time will show. But they are not beyond reach if concerted efforts are made and the administrative machinery is tightened up. Any shortfalls in the expected increases in yields per unit-area can easily be made up through expansion in gross area under cultivation through greater resort to multiple cropping which can be extended appreciably in the areas having assured rainfall and irrigational facilities.

Growth in Indian Agriculture Not Less Impressive

THE FOREGOING analysis should suggest that the rate of growth in Indian agriculture during 1950's, if only the increase in total agricultural production is taken note of, has not been in any way less impressive than the rates of growth accomplished in European countries over the same period. It may not have been as high as in Yugoslavia, Greece or the Soviet Union, but it has been substantially above the rates of growth in most of the countries on either side of the Iron Curtain.

It may be alleged by some that the rate of growth in Indian agriculture has been inflated to some extent by improvements in yield assessment and reporting practices (yield assessments are now being increasingly made by crop-cutting experiments instead of the arbitrary method of assessment by village patwaris and the annawari system of reporting is being replaced by the more modern system of communicating actual yields) and that most of the European countries suffer from the statistical disadvantage of starting from comparatively much higher initial levels. But that does not alter the picture much. If the rate of growth in Indian agriculture is brought down slightly and those of European countries adjusted slightly upwards to allow for the above two factors, some allowance should also be made for the fact that whereas production of food is the primary concern of the farmers on the whole of the European Continent, except in a few East European countries, in India they have to produce all sorts of agricultural raw materials as well. The yields per unit-area of such agricultural products as cotton and oilseeds are much lower in physical terms compared to the yields of food crops. The rate of growth in Indian agriculture, if food production is only taken into account, has been much faster than in all the European countries, except Yugoslavia.

Taking Eastern and Western Europe as two regions to approximate them to the Indian sub-continent in respect of area (in India, States like Punjab have recorded a much higher rate of growth than the all-India figure suggests the progress achieved in such States during the past decade can compare quite favourably even with that of Greece and the Soviet Union and is only slightly less than the progress made by Yugoslavia) the average output of food crops in the last three years of the past decade works out to about 40 per cent above the average output in early fifties in the case of Eastern Europe, about 17 per cent in the case of Western Europe and nearly 39 per cent in the case of India. This way also the rate of growth in Indian agriculture has not been less impressive than in the Eastern and Western Europe. It may, however, be noted that the comparison between Eastern and Wes-

tern Europe themselves on this basis is not a proper one. In the case of Eastern Europe the percentage is inflated by the large size of the Soviet Union, while in the case of Western Europe it is deflated not to any small extent by the backward agrarian economies of Spain and Portugal.

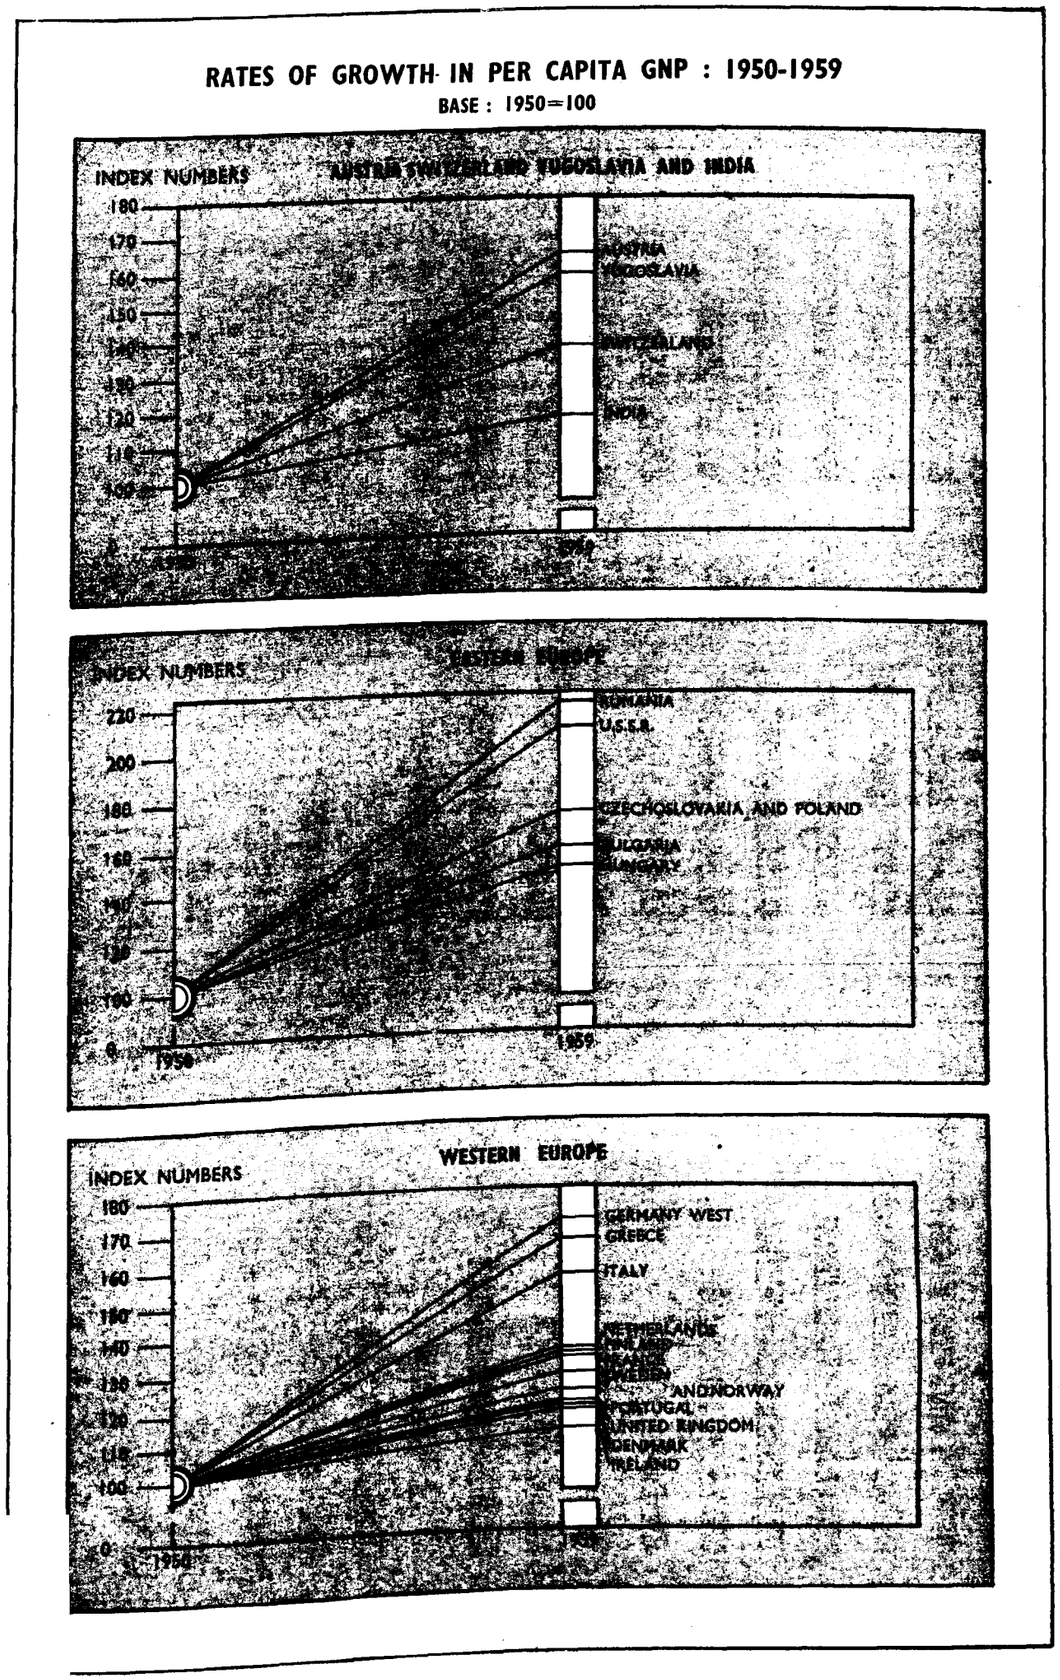
In terms of increase in yields per hectare, however, the rate of growth in Indian agriculture over the past decade has been much lower than in most of the countries of Europe. India's rate of growth (linear) has been of the order of approximately 1.7 per cent per annum, compared to 2 to 2.5 per cent in majority of the European countries.

Though we may take legitimate pride in our performance on the agricultural front during the past decade, we cannot afford to sit back and relent in our efforts to raise our total agricultural output as well as yields per unit-area in the years to come. Both these rates of growth, especially the latter, have to be stepped up appreciably if our agricultural economy is to be enabled to shoulder the burdens of a rapidly expanding population whose standard of living has also to be raised progressively. It is needless to emphasize that unit-area yields of farm products in India are amongst the lowest in the world and bear no comparison with the yields in the advanced countries.

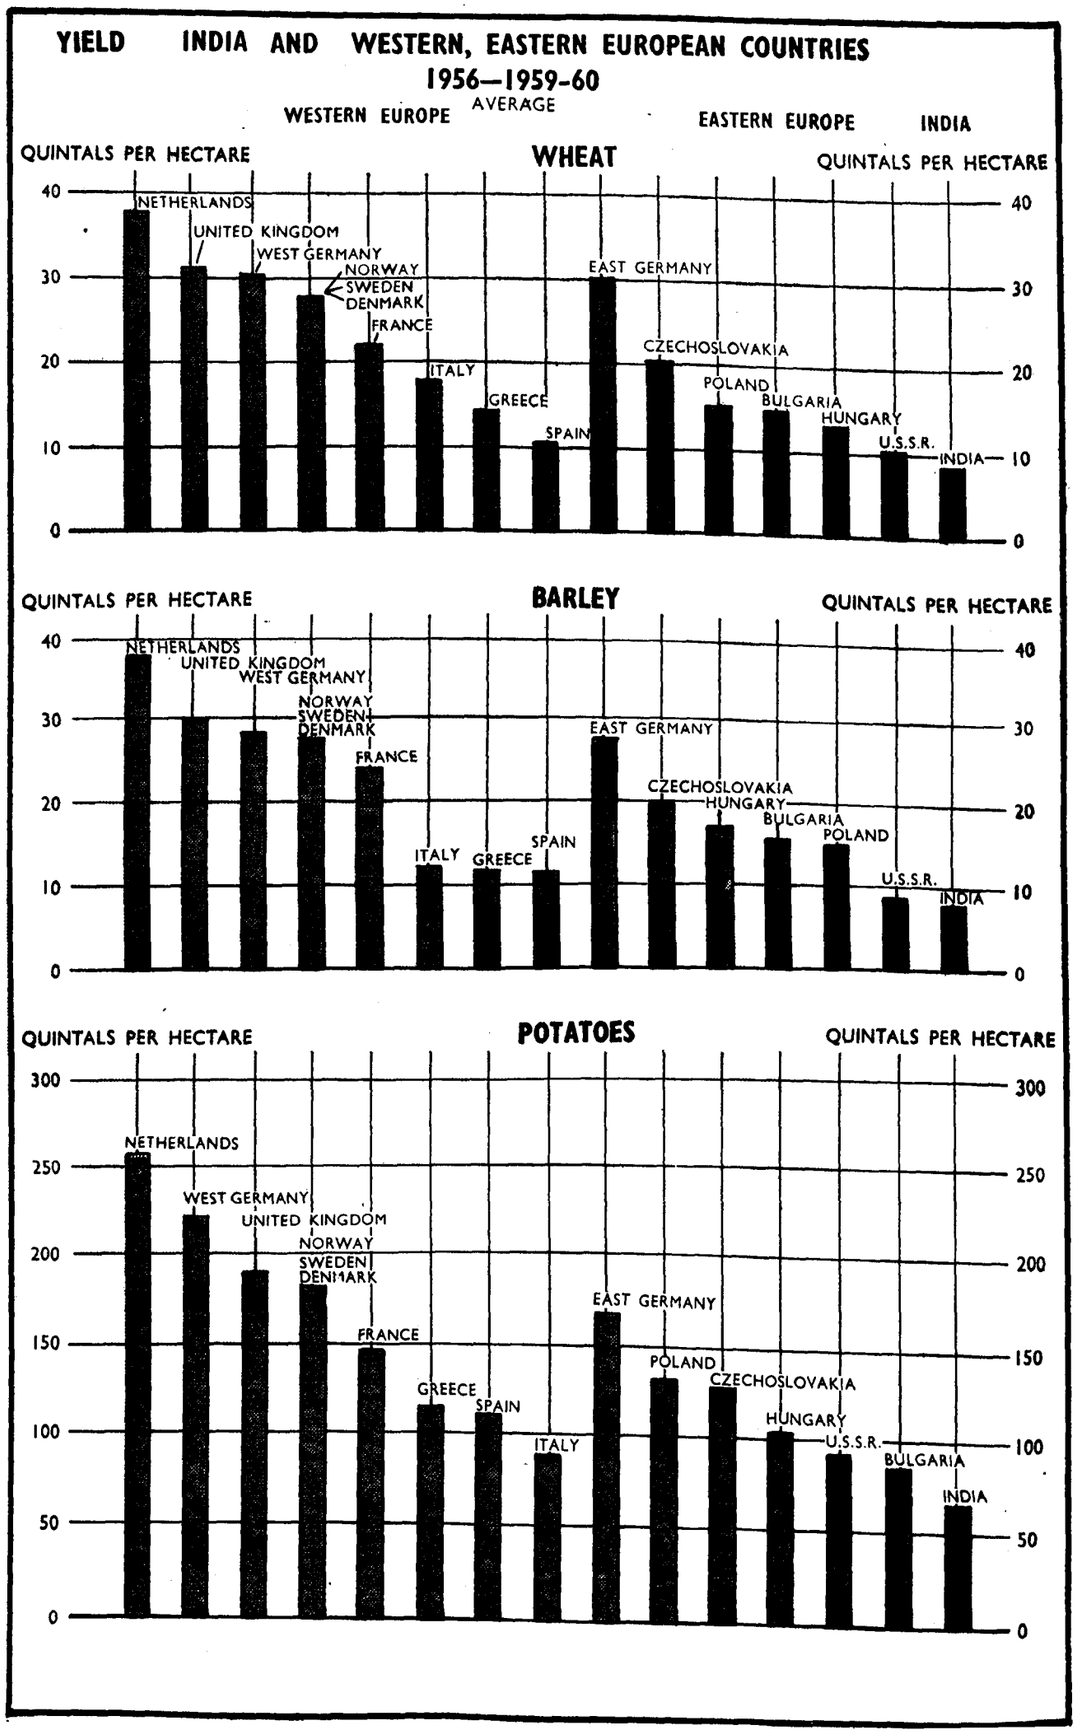
Lessons for India

How can the rate of growth in Indian agriculture be accelerated? The experience of the European countries during the past decade is of invaluable assistance in framing a correct approach to this problem. India can learn a lot from the countries of Europe in matters pertaining to agricultural growth.

The foregoing survey of development of agriculture in Western and Eastern Europe and in India makes one thing clear, that is, that economic systems do not matter. Yugoslavia has been able to attain a strident increase in farm production, both in terms of absolute output and in terms of increase in yields per hectare, by following a system peculiar to it alone. The system is modelled more or less on the socialistic pattern, but contains some essential elements of a free market economy. The growth of agriculture in Western Europe as a whole has not been slow during the past decade. The strides made in the East European countries since 1953 have been primarily due to the institutional and other changes brought about in their agricultural policies and not owing to any superiority of the socialistic system over the free market economy.



The four most important factors which foster the rate of development in an agricultural economy, as the foregoing study reveals, are expanding markets, increased use of technology, efficient farm management and provision of adequate incentives to the farmer in the shape of assured minimum returns for his labour. The first factor is already there for fostering the growth in Indian agriculture. The stridently rising population of the country, the rapidly expanding industrial sector and the need to improve the standard of living of the masses provide tremendous scope for raising agricultural output.



The increased application of scientific knowledge and technology to remedy the ills of Indian agriculture can hardly be over-emphasized. The progress made in this regard so far, as has been repeated ad nauseam in these columns, has been only slow because of three reasons: (1) low level of literacy in the countryside; (2) poor economic position of the farmer; and (3) large surplus and under-employed labour in rural areas. Whereas the last factor hampers resort to mechanisation of farming, the first two factors have produced conservatism in the mental outlook of the peasantry and inertia in its efforts. This conservatism and inertia have, of course, come to be shed in the recent past, but still they hamper use of technology in Indian agriculture to a very great extent. This malaise has to be broken through by means of spreading education and improving the economic position of the farmer.

Among the new aids to farm production which have been perfected by modern technology, the foremost stress obviously has to be placed on the use of chemical fertilizers and pesticides. It is, indeed, a pity that while, on the one hand, decision has been taken to increase the installed capacity in the country for the manufacture of chemical fertilizers even beyond the level that was contemplated when the Third Five-Year Plan was drawn up, some apprehensions have grown recently in the minds of the experts of the Planning Commission on going whole-hog in fostering the use of fertilizers. Of course, the pre-condition for application of chemical fertilizers is the availability of moisture in the soil and efforts have to be made to provide irrigational facilities and in the direction of soil conservation to enable moisture to be retained in the soil for longer periods than is possible at present due to tropical and sub-tropical climatic conditions of the country, but there are vast areas (nearly 180 million acres) which have assured rainfall and irrigation facilities. When it is suggested that use of chemical fertilizers should be fostered at a rapid rate, one has only these lands in mind. To relegate increasing the use of fertilizers to a low priority after the provision of irrigational facilities to the maximum extent in the country is, thus, not a judicious approach. The current use of chemical fertilizers even on agricultural lands which have proper irrigational facilities or assured rainfall stands no comparison with their application in the advanced countries of the world. It obviously has to be increased. Efforts as well need to be redoubled to foster application of all the three types of soil nutrients—nitrogenous, phosphatic and potash fertilizers. If need be, to overcome the prejudice of the peasantry against the use of inorganic manures in certain areas, crop insurance schemes may be taken resort to. The second priority in regard to application of modern technological methods apparently belongs to provision of irrigational facilities and improved seeds and farm implements.

Farm management in India, of course, can be made more efficient only gradually with the spread of education in the countryside. In view of the slow progress that can be expected in this regard, one wonders if the increased stress being placed on fostering co-operative farming in the country is not misplaced. Co-operative farming, no doubt, has some advantages such as increasing the size of the holdings, which makes possible application of technology in a greater measure. But all these advantages can be thwarted by not-so-efficient management as has been the experience in countries like Poland. Efficient management is the prerequisite for the success of any co-operative venture. In view of the shortage of efficient managers, with imagination, in the country today, it is hazardous to go in for co-operative farming on any large scale.

The most important change in the agricultural policy of India that is warranted at the present juncture, however, is the provision of adequate incentives to the farmer in the form of minimum assured prices for his produce. The one commonly heard argument against introduction of price support schemes for various agricultural commodities is that the rapid rise that has been witnessed in the general price level of the country

has provided enough incentives to the farmers. The situation, however, appears to have changed radically during the past two years. In these years there have been instances when the prices realised by the agriculturists for some of their products have been lower than warranted. An obvious example of this was the slump in jute prices in 1958-59 which led to curtailment of area under jute cultivation in the subsequent year. Rice prices at the harvest time also were reported to have gone down appreciably in some surplus areas.

That assured minimum prices for agricultural products have a vital role to play in increasing output has been demonstrated not only on the European Continent, but in India itself. Sugarcane output during the past two years has gone up appreciably primarily due to the increase in the minimum prices guaranteed for it in U.P. and Bihar. Unhappily, there has been some diversion of land from under other agricultural products to sugarcane cultivation. But that is all the more reason why reasonable prices should be fixed for all the crops. It is usually argued that introduction of price support schemes for various farm products would entail heavy expenditure on the part of the State if prices go down below the statutorily fixed levels. But "The Eastern Economist" does not share this view. The State will have to go in for purchases of some farm products if their prices fall below the fixed minima, but these purchases cannot be expected to be of great magnitudes since the prices of most of the agricultural commodities are not likely to fall appreciably and in many areas. The introduction of price support schemes itself will be a deterrent to the fall of the prices of farm products below the statutorily fixed minima. The agriculturist will have the much-needed incentive to produce more because he would not have any fears about undue decline in the returns for his labour in case prices go down below his expectations.

The agricultural policy in this country also needs re-examination with a view to encouraging specialisation in agriculture amongst the various States. The unit-area yields of various crops in different States (Table AGR—34) show wide disparities all of which cannot be explained by the relative backwardness of some States. It is only an indication of the fact that some crops are grown — may be for personal consumption only — very often on lands which could be better utilized for growing some other crops. The lever of price supports can be effectively made use of in this regard.

Livestock yields, particularly milk, can be increased only if the quality of our milch cattle is improved. The biggest hurdle in the way of improving the quality of livestock in India is the disproportionately larger number of cattle that we have. Religious sentiments of the majority of Indians do not allow slaughter of even the unnecessary and useless cattle, especially of cows. Their number can only be decreased, and that too gradually, by such measures as compulsory confinement of studs kept for natural service, mandatory castration of young ones not required for breeding and compulsory sterilisation of surplus cows and heifers.

TABLE AGR—34.

ANNUAL AVERAGE YIELD PER ACRE IN LBS. FOR THE PERIOD 1958-59 TO 1960-61

	Rice	Wheat	Maize	Barley	Gram	Sugarcane	Cotton	Tobacco	Oilseeds

India and Europe: Industry

A DUAL IMAGE

INDIAN industry today presents a dual image. While there is ample evidence of the dynamism in Indian industry, the country has still to make up a leeway to evolve a real industrial society. On the one hand there are half a dozen steel plants utilising the latest techniques, jute and textile mills with a history of over a century and gigantic power projects newly completed all over the country that give the impression that India is fast progressing towards industrialisation. This image is supplemented by the annual rate of growth in industry of the order of 9 per cent during the last decade. But on the other hand, it is significant to observe that even after the successful completion of two Five-Year Plans the contribution to the country's national income from the organized sector of industry is still below 15 per cent. Moreover, even after the completion of the targets laid down in the Third Five-Year Plan (1961-66) as many as 70 per cent of the Indian people would be dependent upon the agricultural sector for their living. This dual image leads us to the conclusion that during the next two decades the foundations are to be laid for a broad-based industrial society. It is of considerable importance, therefore, to give sufficient thought to the manner in which the industrial advancement takes shape in India. In the context of the theme of this Annual Number it is quite interesting to visualise the limits to which India can gain from the experience of industrial growth in the European countries.

INDUSTRY IN WESTERN EUROPE

The idea of industrialisation is associated with the European countries for the last one hundred years. Ever since the wave of industrial revolution rising from Great Britain spread over the European continent, the European economic history has been the history of a continuous application of advanced technlogy to more and more industries. Although there is not one explanation for this sustained evolution of higher technical progress and the application of new innovations to the means of production, broadly it is the expanding market, at home and abroad, for more and more goods, that explains this industrial progress. Even today the industrial picture of Europe presents what may be called a highly technical system involving the application of accumulated skill and high investment rate along with what may be called "high consumption market", the result of constantly rising income levels.

It is not very intriguing to observe that it was not high investment that initiated industrialisation. The real dynamism was provided by the rising propensity for consumer goods which encouraged improved methods of output and technical progress which, in turn, made higher investment necessary. Thus, the motive force of high industrial rate of progress in Europe was an extended demand for goods from the side of the consumers and the desire for higher profits from the side of the producers. This also necessitated the application of low cost techniques and it was advanced mechanisation that ultimately led to lower costs. The process of rapid industrialisation, therefore, made higher rate of investment a necessary ingredient. For instance, it was the need for large-scale production of cloth which in the early periods of industrial revolution was the major motive force. But this had to be accompanied by a revolution in power. A large-scale mining of coal and later increased generation of hydro-electric power gave Europe its added spurs towards industrialisation.

INDUSTRY IN EASTERN EUROPE

There is another picture, too, and that is of Eastern Europe—a convenient expression for European Communist countries like Poland, Hungary and Czechoslovakia and also the Soviet Union. It was the Soviet planning technique which within a period of 40 years converted an agrarian economy into a first class industrially advaced system. Starting in 1928 with the First Five-Year Plan and later on the seven year plans, the Soviet Union was able to evolve by 1959 an industrial system which is claimed to be as advanced in many ways as that of any other European country. This system did not allow the economic forces to gain their own momentum. On the other hand everything was directed by the State planning authority. It is claimed by the Soviet planners that industrial advancement was achieved by the maintenance of a balance between production and consumption as between heavy industry and consumer goods. But it is a question of common knowledge that high rate of industrialisation by the Soviet planning techniques presupposes a certain degrec of consumption sacrifices. The Soviet planners, however, believe that "the higher the level of country's industrial development, the greater is the demand for machine tools, machinery and equipment. But to make machinery, you must have metals, electrical power, chemical products, building materials and so on. Thus, priority development of heavy industry is the basis of technical progress and of development of all other branches of economy."

This, therefore, is the crux of the Communistic industrial progress. Unlike the West European industrial advancement the Communist industrial progress claims to have attained similar results but the initiative came from the machines and not from the consumer demand. It is ungenerous to deny the evident fact that within the Soviet orbit of influence, the industrial progress achieved was quite comparable to that achieved in Western countries. But it is also interesting to study the cost at which all this was done. A society in which it is not the consumer demand, but an abstract planning authority that determines the invesment priorities in industry, can certainly achieve desired results, but not without neglecting some essential human values. It definitely tells upon the human minds and values.

LESSONS FOR INDIA

Thus there are two pictures presented by Europe. One is the State-directed investment in industries in the Soviet orbit and the other is tne consumer-demand-directed-investment in industries in the Western Europe. Both led to a rapid rise in industrial progress in the Divided Europe. An overwhelming investment in the basic industries was only a means in Western Europe; in the Soviet orbit it was an end. If the planners in India have to learn from the experience of these two systems—as they should—they definitely present a choice. Although the history of industrial growth in these countries may not have that validity for Indian industry that their experiences could be transplanted. But there is always a possibility of not copying blindly but keeping the broad image of industrial growth in both the regions in view while we forge ahead.

Stress on Heavy Industry

WHILE it is clearly understood that sustained growth in industry has become a basic necessity in India it is still within the choice of our economy to follow a specific pattern of investment in various sections of industry. Perhaps the most important section about which a choice has to be made is heavy industry. While doing this enough can be drawn from the experience of the European countries. In fact heavy industry in Western Europe and Eastern Europe has developed in fairly peculiar circumstances providing a variety of experiences.

In the years immediately after the second World war in Western Europe considerable momentum was gained by investments in heavy industries which become an automatic process on account of special considerations of reconstruction and rehabilitation of the war-torn economies. These investments were financed to some extent by loans received under the Marshall Aid from the United States. The object, however, was not only to moderate scarcities, especially of raw materials, but also to channel investment to those industries which called for priority. As a result of this initial momenttum, most of the West European countries reached their pre-war level of industrial base by 1950.

During the post-war years fixed investment in the key sectors of industries like mining, manufacturing, and construction, varied widely from country to country in Western Europe and from year to year. The total investment in United Kingdom, for instance, was quite stable. Investment in coal mining expanded rapidly and in the engineering industry it was maintained at its original level. In most other countries the pattern of investment changed considerably. In Norway it was concentrated mostly in the state-owned steel works. In Germany, Denmark and in the Netherlands, there was a rapid expansion of investment in the coal and the engineering industries. In Belgium, France and Sweden, investment in these industries remained fairly constant. The table below gives the gross investment in metal and engineering industry as percentage of total manufacturing between 1950 and 1954 in these countries which shows a heavy bias in favour of heavy industry. This, in a way, is an indicator of the priority that heavy industry section assumed during these years of rapid growth. In fact it is clearly stated by keen observers of European growth that the boom of the 1950's in Western Europe was due to a sustained expansion of fixed capital investment in heavy industry:

GROSS INVESTMENT IN METAL AND ENGINEERING INDUSTRIES AS PERCENTAGE OF TOTAL INVESTMENT IN MANUFACTURING

(Estimates based on Value in Current Prices)

Country	1950	1953	1954
Belgium	44	44	—
Denmark	24	33	31
France	—	62	62
West Germany	32	50	56
Netherlands	26	39	30
Norway	32	43	40
Sweden	47	46	42
United Kingdom	37	40	42

It has, however, to be remembered that investment in heavy industry in all the European countries was not very steady. One explanation for its being erratic was that the industrial application of innovations is always so and investments follow innovations.

CO-ORDINATED GROWTH

In the view of the Communist States heavy industry is connected with the task of creating a "material and technical basis for the construction of communism" and is of great importance for consolidating and expanding the U.S.S.R. military potential. The importance attached to heavy industry in the centrally planned economies is, therefore, even more than that in the free economies of Europe. The process of rehabilitation in the Eastern European countries was completed nearly as rapidly as in the case of Western Europe. This process was, however, accompanied by tight economic planning and severe restraints on the consumption levels. The bias in favour of heavy industry is evident from the table below where even during 1959 the output in Eastern European countries was very much in favour of producer goods.

PERCENTAGE RISE IN INDUSTRIAL OUTPUT DURING 1959 OVER 1958

Country	Producer Goods	Consumer Goods
Bulgaria ..	31	20
Czechoslovakia ..	13	8
East Germany ..	14	9.4
Hungary ...	16	7
Poland ..	11	6
Rumania ..	14.6	7
Soviet Union ..	12.0	10.3

The Soviet Union's strength in respect of heavy industry is revealed by the machine tool output. As many as 153,700 machine tools of various sizes and types were produced in 1960 and this rate seems to be growing. The stress has been on heavy types of special purpose machines.

The communist countries have, however, gone a step further. They have evolved a sort of co-ordinated plan for the growth of heavy industry in the East European countries. This Plan is significantly different from the Common Market which is being evolved in Western Europe. The degree of collaboration is much larger because in the centrally planned economies, ruled more or less by the same ideology, it is a matter of decision at the top. The plan includes more or less a scheme for specialisation in certain countries of specific items which can then be obtained by other countries, which in turn specialise in certain other items.

It is believed that in most of the countries in Eastern Europe mass production of heavy industry items is yet relatively less developed. To rectify this drawback the Soviet Union has laid down this plan. The range of products included in the plan are medium and heavy equipment for the manufacture of fuel and building material and also several types of complex machinery for various manufactures, the chemical industry, power production, steel construction and atomic energy development. Poland, for instance, desired to be relieved of the obligation to manufacture heavy presses which will now be produced primarily in Czechoslovakia. Production of a varied types of cement equipment was also concentrated in Czechoslovakia and East Germany. At present the chief burden in realising this plan is borne by Czechoslovakia and East Germany while the U.S.S.R. figures primarily as a supplier of raw

INDUSTRIAL FINANCE CORPORATION OF INDIA

(Incorporated under the Industrial Finance Corporation Act, 1948 (XV OF 1948)

HEAD OFFICE:

Reserve Bank Building, Parliament Street, New Delhi.

BRANCH OFFICES:

Liberty Building, 8, Marine Lines, BOMBAY. | P-11, Mission Row Extension, Calcutta. | 38, Whites Road, Royapettah, Madras.

AUTHORISED CAPITAL: Rs. 10,00,00,000

ISSUED AND PAID-UP CAPITAL: Rs. 5,00,00,000

TOTAL LOANS OUTSTANDING (AS ON THE 30TH JUNE 1961) Rs. 42,22,75,719

AUTHORISED BUSINESS:

(i) Granting of medium and long-term loans and advances in Rupees to or subscribing to the debentures of existing public limited companies or registered co-operative societies engaged in, or new ones proposing to engage in the manufacture, preservation or processing of goods, or the generation or distribution of electricity or any other form of power, or mining, or shipping or hotel industry with an option to convert at its discretion the loans and/or debentures into stock or shares.

(ii) Granting of loans in foreign currency under arrangement with the Development Loan Fund of the U.S.A. to the aforesaid categories of industrial concerns excepting textiles including manufacture of wearing apparel and madeup textile goods, ship building, tobacco, beverages, petroleum refineries and hotels.

(b) Guaranteeing of loans raised by aforesaid industrial concerns (i) which are floated in the public market and are repayable within a period not exceeding twenty-five years and (ii) from scheduled banks or state co-operative banks.

(c) Guaranteeing loans raised from or credit arrangements made with any bank or financial institution in any country outside India by aforesaid industrial concerns in foreign currency.

(d) Underwriting the issue of stock, shares, bonds or debentures by aforesaid industrial concerns;

(e) Subscribing to the stock or shares of aforesaid industrial concerns;

(f) Guaranteeing of deferred payments in respect of import of capital goods from abroad or their purchase in India by aforesaid industrial concerns;

PURPOSES FOR WHICH LOANS ARE SANCTIONED:

Purchase of new or second hand machinery, renovation or modernisation or replacement of worn-out or obsolete machinery, purchase of land for factory site, and construction of factory buildings.

IMPORTANT TERMS AND CONDITIONS OF LOANS:

(i) **SECURITY**: First charge of all the fixed assets such as land, buildings, plant and machinery & fixtures. Raw materials, stock-in-process and finished goods will not be mortgaged and will, therefore, be available for raising working capital from elsewhere.

(ii) **MARGIN**: Generally 50% of the value of total assets including those to be acquired with the loan. This margin may be reduced to 40% in case of industrial concerns importing plant and machinery under the U.S. Export-Import Bank Loans or other foreign currency loans (tied credits) taken by Government from foreign governments or financial institutions abroad where the cost of imported plant and machinery is 60% or above of the total capital cost of the project. The margin may be further reduced to 35% in special cases.

(iii) **INTEREST**: The current rate of interest for rupee loans is 7% per annum subject to a rebate of ½% for punctual repayment of instalments of principal and payment of interest. D.L.F. loans carry interest at 8½% p.a. less a rebate of ½% for prompt payment (net 7¾%) plus an extra ¼% p.a. to provide for incidental expenditure.

(iv) **REPAYMENT**: Rupee loans are repayable within a period not exceeding 25 years to suit borrower's convenience. D.L.F. loans are repayable within a period not less than 5 years and not more than 15 years from the date of the disbursement of the final instalment of the loan. Repayments shall not however, commence earlier than one year from the date of the final disbursement of the loan.

D. R. MADHOK GENERAL MANAGER.

K. P. MATHRANI CHAIRMAN.

ASSISTANCE TO SMALL INDUSTRIES

Are you a small industrialist or wish to start a small scale industry? Various agencies have been set up to assist you in this regard as indicated below:—

1. **THE NATIONAL SMALL INDUSTRIES CORPORATION LTD., RANI JHANSI ROAD, NEW DELHI.**
   - * Supply of machines on easy instalment payment basis.
   - * Assistance in securing contracts from D.G.S. & D. and Railways for supply of stores.
   - * Assistance for internal marketing of footwear through Jansevak Footwear Depot., Agra.
   - * Assistance for export marketing through Footwear procurement centres at Agra, Delhi and Bombay.

   Import of Cycle Components and Knitting needles and distribution to small units.
   - * Producing prototypes of machinery and training of artisans of P.T.C., Rajkot and Okhla.
2. **SMALL INDUSTRIES SERVICE INSTITUTE, OKHLA INDUSTRIAL ESTATE, OKHLA, NEW DELHI.**
   - * Technical advice on matters pertaining to planning, production and selection of industry including model schemes thereof.
3. **DIRECTOR OF INDUSTRIES**
   - * Assistance in acquiring land or factory building in the industrial Estate, if any, securing raw material, power, import licence etc.
4. **STATE BANK OF INDIA & STATE FINANCE CORPORATION**
   - * Short, medium and long term loans.

SMALL SCALE INDUSTRIES *for* **NATION'S PROSPERITY**

DA 61|460

materials. In East Germany specialisation of rolling equipment is fairly advanced and Soviet Union has also urged East Germany to elaborate electronic programmes, which would become standard for the entire Eastern Bloc. Engineers from the U.S.S.R. and Czechoslovakia are working on this project. There are many similar instances which go to prove that Soviet Union is evolving a specialisation plan in all these countries. But many planning experts in Eastern Europe are afraid that Soviet planners, who believe in special emphasis on heavy industry even at the cost of agriculture and consumer goods, will in the end lead these countries to serious social and political unrest. Strangely enough Soviet thesis that every state should have a well-developed heavy industry of its own is noted to have been departed from in certain cases and is not being applied so thoroughly. But this plan does indicate the overwhelming significance attached to heavy industry in the Soviet orbit.

AVOIDING THE PITFALLS

In the light of the importance attained by heavy industry in both Eastern and Western Europe, certain conclusions can be drawn which have considerable relevance to Indian industrial growth. In the first instance, it emerges from the experience of all the European countries that there has been a high rate of investment in heavy industry during the years of initial industrial expansion. This fact has, however, to be qualified because there is a major difference between the investment in heavy industry in Eastern and Western Europe. In Western Europe it was a spontaneous process which was initiated by high consumer goods market. In the Eastern Europe, on the other hand, it was the result of the decisions of the planners. In view of a free market economy existing in India, one lesson that our planers can learn is that they should not limit the efforts on the part of the private sector to go forward in the field of heavy industry. If they, apply any curbs they definitely ruin the chances of spontaneous investments which were possible in Western Europe. It is not implied that, at the moment, the hurdles are too many. But there are certain instances like the coal industry where the private sector is definitely debarred from contributing its full might. There can be other instances too. In the light of this experience the Indian Industrial Policy which reserves certain sections of industry for the public sector, appears less imaginative. It may, however, be added, as has been indicated by the U.S. experts in the case of Europe, that the public investment in heavy industry becomes necessary only in the fields where private sector finds itself less capable. To controvert this argument it can be stated that similar results were attained in Eastern European countries by heavy investment in the public sector. But it has to be remembered that in a closed economy such experiments are possible.

HEAVY INDUSTRY IN INDIA

The experience of the last decade in respect of Indian industrial expansion reveals that already there has been a considerable bias in favour of heavy industry. For instance, during the decade 1950-51 to 1960-61 the general index of Industrial Production went up by nearly 94 per cent. Against this the index for Iron and Steel went up by 138 per cent, for machinery by 403 per cent and for chemicals by 188 per cent. This is a clear indication that the bias was definitely in favour of heavy industry. Even the Third Five-Year Plans lays down considerable emphasis on heavy industry. This is quite clear from the fact that after the successful execution of the Third Plan the general Index of Industrial Production is expected to go up by 70 per cent. Against this, that for iron and steel may go up by 168 per cent, for machinery by 143 per cent and for chemicals by 150 per cent. This bias has been detailed in the following pages where the picture of energy involving coal, hydro-electricity as well as iron and steel has been discussed in details in the light of European experience.

The Energy Picture: Europe and India

WESTERN EUROPE

FROM THE early years of industrial revolution Europe was fortunate in respect of coal reserves because industry was secured of its energy supply. With the rising tempo of industrial expansion, coal output also increased and, till 1925, there was no shortage. In a way it was the secure coal supply position that gave Europe its initiative in industrial revolution. By 1925, nevertheless, the situation remained unaltered. Imports, in that year, of about 9 million tons of energy materials indicated that a deficit had begun. In 1950, the imports of energy materials of the region were nearly 130 million tons equivalent of coal and at present they are nearly double the 1950 figure. Even now, however, net imports represent 30 per cent of apparent primary energy consumption of Western Europe.

Coal production dominates the energy supply position in Western Europe and even after radical changes in the availability of other energy sources like hydro-electric power and oil, the pattern of energy consumption is heavily in favour of coal.

The table below indicates the sources of energy materials in 1955, in Western Europe. It is apparent that coal held a dominant position.

	Million Tons of Coal Equivalent
Hard Coal	486
Lignite	31
Crude Oil	13
Natural Gass	7
Hydro-electricity	19
Peat	3
Wood	23
TOTAL	582

In Austria coal constituted 30 per cent of the total energy output. In Spain, the Netherlands and France coal and lignite continued throughout the last three decades to constitute more than 80 per cent of the total energy output. And in the United Kingdom and Belgium virtually all of it. Even during the last 30 years there has been only a modest shift and today coal constitutes a major source of European energy. Six countries—United Kingdom, W Germany, France, Belgium, Spain and the Netherlands—in Europe produce at present nearly all Europe's coal. The United Kingdom produced 43 per cent of the total, Germany 31 per cent, France 11 per cent, Belgium 6 per cent, Spain and Netherlands 5 per cent, nearly evenly divided between them. The total output of these countries is 99 per cent of all the coal produced and 83 per cent of energy material of all kinds.

A look at the Table on page 132 would make it clear that during the last decade coal output has remained almost stationary. The problem before West Europe has been to adjust the supply of coal to flagging demand. To this end the producing countries have tried to adjust their output by concentrating production in new or reconstructed mines and by closing marginal pits. In 1960 these efforts were continued and it seems the most severe crisis faced by the Industry since the depression of inter-war period has come to a turning point. The sharp decline in consumption of solid fuels in Western Europe in 1958 and 1959 came to a halt by the beginning of 1960. By the summer of 1960 apparent consumption of solid fuels was some five per cent higher than the year before. The recovery in demand stemmed principally from the steel and electricity generating industry.

One effect of the rising oil consumption in Western Europe has been that its dependence on imports ha

increased. It is outlined that Europe's ability to produce its major energy source—coal—at competitive prices has declined. A shift in technology leading to a shift in demand and the aging coal industry have combined to lessen one of the great advantages Europe enjoyed in the early period of industrial development. A serious question is posed today: should Europe attempt, by heavy investment to maintain its level of coal output for the next few years with the prospect that much of such investment might have to be written off quite suddenly with more technological improvements in the field of nuclear energy? Should Europe go on progressively throwing itself more at the mercy of outside suppliers for its primary energy material over a period of the next 30 years even if it can be certain that by 1980 or 1990 it will have reversed the trend and begun to recover the balance between its energy needs and resources?

It is not only the decreasing consumption of coal that poses a problem to Europe today but the fact that oil on which dependence is increasing has mostly to be imported. Extremely limited oil fields have been known to exist in France and Germany and more recently some additional deposits have been located in these countries and in Austria, Italy and the Netherlands. But these form only a fraction of the total needs. In a way, perhaps, the European involvement in Middle East is explained by its dependence on oil.

MORE HYDRO-ELECTRICITY

In this general depressing picture of rising costs of mining coal and dependence of Europe for oil on imports, one rather satisfactory picture that emerges is in respect of hydro-electricity, though it is not evenly distributed all over Europe. By and large most of the countries do get the benefit and in the Alpine region except in Austria, 40 to 60 per cent of the potential hydro-electric power was being used in 1955. Bulk of Europe's hydro-electricity potential estimated at 500 million kwh. is in the Alpine region and Northern Scandinavia—strangely enough, the region where mineral and fuel resources are extremely scarce.

Italy and France are among the larger hydro-electricity producers in Western Europe with output in 1956 at 36 billion and 32 billion kwh. respectively. These countries, along with Norway, Sweden, Finland and Switzerland, accounted in 1955, for more than two-thirds of total output of electricity and produced nearly the same amount of hydro-electricity as in the United States and four times as much as in the Soviet Union. By 1959 output of these nations had risen to 130 billion kwh. Apart from the countries noted above only Germany and Spain with output in 1959 of 11 billion and nearly 14 billion kwh. are other major producers of hydro-electricity. Thus under the stress of demand growth of European hydro-electrical output has been quite rapid. From 22 billion kwh. by 1929, in 1959 it had reached nearly 200 billion kwh. This rise has caused a marked shift in the pattern of primary energy consumption raising new problems for governments and the industries in the Western Europe.

THE COAL COMMUNITY

The energy picture in Western Europe would not be complete unless the role of an important institution like the European Steel and Coal Community was not described. This institution was set up in 1952 as a pilot project for a united Europe. It tried to solve the problem that faced the coal industry on account of flagging demand of coal because of an increasing dependence of European producers on oil. Total coal cosumption in the area declined from 252 million metric tonnes in 1957 to 225 in 1958 and 212 in 1959. It is significant, and perhaps, goes to the credit of this Community, that the output was not affected to that extent. The production declined only by 5 per cent, though the stocks at pitheads increased from about 7 million tons at the end of 1957 to about 25 million tons in a year latter and to over 31 million tons at the end of 1959. Productivity remained considerably high. Despite the reduction of working hours the number of miners employed in the coal industry decreased by 32,000 in 1958 and 29,000 in 1959. France and Germany refused to implement the proposals for the reduction of coal output as well as regrouping and reorganising of the industry, on the ground that their individual governments must deal with the situation. After this rejection of its proposals the high authority of European Coal and Steel Community concentrated its attention on the situation in Belgian coal industry. The measures taken jointly with the Belgian Government facilitated the industry to a large extent. A number of unprofitable mines were closed down and some others were to be closed by the end of 1963. The Community, therefore, is contributing its best to regain the lost balance of coal industry.

EASTERN EUROPE

The pattern of energy output and consumption in Eastern Europe has closely followed that of Western Europe. In East Europe and Soviet Union there is a marked shift in reliance from coal to oil. In the Soviet Union a radical re-orientation in regard to the consumption of energy occurred during the last few years and the share of coal from 65 per cent in 1955 shrank to below 60 per cent in 1958. This shift is progressing still and by 1965 it may be nearly 43 per cent. This will naturally mean a consequently increased reliance on oil. The table below shows percentage change of reliance on each energy material in East Europe, the Soviet Union as well as the OECD area.

PERCENTAGE OF DEPENDENCE FOR ENERGY

	1958		1965 Plan	
	Coal	Oil & Gas	Coal	Oil & Gas
Eastern Europe	85	12	83	14
Soviet Union	58	30	42	49
Total	66	25	53	39
TOTAL OECD AREA	69	21	53	34

The overall shift between 1958 and 1965 in the combined Eastern Europe and Soviet Union region may be nearly the same as the OECD Area. But these figures conceal a sinister fact. In the Soviet Union there will be increased consumption of oil which will not be the case in Eastern Europe. Eastern Europe's degree of choice in making this shift is in fact reduced by the possibility of the oil imports for which it depends upon the Soviet Union. It is only Czechoslovakia and Hungary where oil resources exist. The table below shows the relative position of coal as against the other sources of energy in the Eastern European countries.

PRODUCTION OF PRIMARY ENERGY
(Million Tons of Standard Energy)

	1951	1958	1965 (Plan)
East Europe			
Coal	177.2	237.3	316.1

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-

Please take advantage of this offer and mail your enquiries to :

In East Germany, Poland and Czechoslovakia and Hungary to some extent, sufficient quantity of coal is produced. On the other hand, Albania, Bulgaria and Romania do not share this prosperity. The planned increase outputs by 1965 are due to substantial increases for Czechoslovakia, East Germany and Poland.

If Lenin described coal "as the bread of industry" he was definitely using this expression in the broader sense of energy. Soviet Union, in its urge to keep pace with the American industrialisation, has made substantial efforts to increase oil output. This is evident, as has been pointed out above, from the fact that the share of coal in the total energy picture would be as low as 43 per cent in 1965 against the present 60 per cent. The planners believe, however, that this would not mean the slowing down of coal output. In fact they claim that over the next 25 years the Soviet Union coal output may reach a 900 million ton mark.

Oil, nevertheless, is considered, as a source of energy, more efficient than coal. Soviet Union today is a major producer of oil in the Communist world. In Eastern Europe, Romania and Hungary are the only two producers on recognisable scale. In fact, the Soviet Union plans to construct a 3,200 miles long trans-European trunk pipeline to Czechoslovakia, Bulgaria, Hungary, Poland and East Germany. This is likely to orientate the energy consumption pattern by raising oil export to these countries.

There has been a shift in the location of Soviet oil wells. Baku and Grozny in the Caucasian region produced as much as 96 per cent of the total Soviet Union's oil in 1920 and at present some new areas between Volga and Ural mountains have started producing more oil and in fact account for 70 per cent of the total. This area is now called the "Second Baku". By 1965 as much as 232 to 240 million tons of oil is likely to be produced in the Soviet Union.

INDIA

From the experience of the Western as well as the Eastern European countries, it can be gathered that choice between various sources of energy would not pose any problem in India. Apparently it is a problem for the advanced countries where sufficient energy resources have developed and it is a question of costs. At the present stage of industrialisation in India, what is important is the meeting of demand. It appears that all the sources of energy have to be developed simultaneously because the shortage is definitely going to be magnified in the years to come, when on account of rising tempo of industrial output, demand for energy will be multiplied several folds. Every effort is, therefore, being made to raise output of all energy resources.

Coal output, for instance, increased during the last decade by over 50 per cent, from 32 million tons in 1951 to 54 million tons in 1960. This output could have been higher. The Government of India's restrictive policy with regard to the mining in the private sector has been one of the major sources of frustration. During the Third Plan, when coal mines are expected to yield nearly 97 million tons, it may prove equally frustrating if the Government does not yield to the private sector's legitimate demands of mining rights in the new regions.

As far as hydro-electric power is concerned, the public sector investment has been considerable and the construction of Damodar Valley, Bhakra Nangal, Tungbadra and Hirakud have definitely created higher capacity for hydro-electric power. With more additions during the Second Plan, the installed capacity of hydro-electric power increased from the 2.3 million kW. in 1951 to 5.7 million kW. in 1961. Even if the figures look impressive, India has a long way to go to produce sufficient power resources. After the Third Plan it is estimated that the installed generating capacity would be around 13.4 million kW, which would mean a 123 per cent increase over the Second Plan. With the execution of this programme per capita generation of electricity would have risen from 18 kWh in 1951, 28 kWh in 1956, 45 kWm in 1961 to about 95 kWh in 1966. This though much lower than the Western Europe countries would be of some significance.

Considerable efforts have been made to locate fresh oil resources and fortunately efforts have been rewarded with a fair degree of success. Both the public and the private sectors have shown resourcefulness in exploration. Foreign firms have been invited by the Government of India to join the search for oil. Though the present output at Digboi in Assam is not very substantial, Oil India, a joint venture of the Assam Oil Company and the Government of India, is expecting an annual output of 2.75 million tons in the Nahorkatiya area in Assam. The Standard Vacuum Oil Company, too, has been trying to locate oil in West Bengal and the Government did pay a part of the cost of these explorations. The Oil and Natural Gas Commission too is to operate in Ankleshwar in Gujarat and may have the capacity to produce, by the end of the Third Plan, as much as 2 to 2.5 million tons of crude oil. Thus there is likelihood of India's producing nearly 6.5 million tons of oil by 1966. It will take, however, another decade to reach a level of near self-sufficiency.

Steel: The Measure of Economic Strength

TODAY, RIGHTLY or wrongly, steel represents the economic strength of a country. A high level of steel utilisation implies access to energy resources at reasonable costs, a high degree of industrialisation and consequently a high standard of personal consumption. This apparently seems true because the countries where the levels of living are higher have considerably strengthened their steel output. Steel is also a measure of military strength. It is not the armies but the armaments that count today. While studying the picture that steel industry has evolved in Western Europe, Eastern Europe and India, it is to be remembered that the three economies present a sharp contrast to one another. While in Western European steel production increased spontaneously just in line with industrialisation and rising steel requirements, in Eastern Europe it was a sense of competition with Western Europe that lead to an accelerated growth. In India it is a peculiar picture of an under-developed country trying to break through the poverty-line through industrialisation.

WESTERN EUROPE

A century ago, Western Europe completely dominated world's production of iron, consuming much of it at home, particularly in the United Kingdom and supplying the whole world with industrial products. This dominant position was the result of early industrialisation in the region. Towards the end of 19th century certain technological changes occurred in the steel industry. The open hearth furnace developed in England by Siemens and in France by Martin Brothers carried the industry forward. In 1870, therefore, West Europe produced some ten million tons of pig iron, 83 per cent of the estimated world total of 12 millions. By 1910, however, other countries had come in and West Europe's share had been reduced to less than half of the world's iron and steel output; since World War II it has been less than one-third.

West Europe's position in world production of iron and steel had to come down because United States provided a steel making potential with lower material costs than those prevailing in Europe. Moreover, the two World Wars provided impetus for expansion in the markets elsewhere. Recently, the rapid growth of steel making capacity in the Soviet Union further reduced Western Europe's predominant position.

The growing rate of iron and steel industry in Western Europe in 1950's was again phenomenal and was sufficient to increase Europe's share in world production. By 1950 crude steel production regained its pre-war level of over 50 million tons. Between 1950 and 1959 steel making capacity increased at an annual average rate of about 4.5 million tons. Today the capacity is over 100 million tons. There was, during these years, virtually no slack in production. Coke ovens were fully employed, iron ore output was at a record level and was supplemented by imports.

United Kingdom, East Germany and France constitute the three major producers of steel in the region. In 1959, United Kingdom produced 20.5 million tons of steel, Germany 30.6 million tons, France 15.2 million tons, other member countries of EEC 17.3 million tons and the remaining Western European countries beyond the EEC 8.2 million tons. Thus Western Europe's output in 1959 of 91.8 million tons was more than the U.S. output of 84.8 million tons and Soviet output of 60 million tons.

Western Europe today holds the position of one of the major producers of steel; it will continue to hold that position, but its chief problem would be that it would become progressively less able to depend on the region's depleting primary materials for the industry. Several studies during the recent years have shown that there may be increasing shortage of domestically produced ore, scrap and coke. Naturally these will have to be imported at higher costs. Nevertheless, the industry is facing the future with considerable courage. The British Iron and Steel Board, for instance, viewed the output of 29 million tons of crude steel in Great Britain by 1962 as a minimum forecast for that country. Similarly European Coal and Steel Community forecasts that the needs for crude steel for domestic consumption and net exports of its six member countries would rise from 67 million tons in 1960 to 78.5 million tons in 1965. Further it is projected that Western Europe's crude steel output will rise by 1970 to 140 million tons. Thus Europe is preparing itself for a larger availability of steel for its future industrial expansion.

EASTERN EUROPE

The East European countries as far as steel output is concerned have been far behind the Western European countries. Czechoslovakia, East Germany and Poland are the three major producers of steel in the region. In 1958 for instance, Eastern Europe's total output was 16.98 million tons of crude steel. This output was achieved during the last 10 years at a fairly rapid rate and the region showed an increase of 75 per cent between 1951 and 1958. This rising steel production greatly strengthened the productive capacity of basic industries in the region which in turn gave a significant fillip to general industrial expansion.

While these East European countries are trying their best to increase their steel output, it seems that their dependence on Soviet Union is going to stay. Nevertheless, as indicated in the following table, by 1965 these countries plan to produce nearly over 30 million tons of steel which will nearly be 80 per cent higher than 1958 output. In Czechoslovakia original investment allocation in steel industry has been raised to 20 per cent of the total and new capacities are scheduled for early completion. In East Germany too, the emphasis is on qualitative improvement in steel output with an overall growth of nearly 50 per cent. They have planned a ten-fold increase in production of stainless and heat-resisting steels and five-fold rise in output of certain special steel alloys.

In 1960 Soviet Union produced 46.8 million tons of pig iron and 65.3 million tons of steel which is now over nearly 20 per cent of world output. One advantage to Soviet Union is that it has sufficient iron ore with output at 107 million tons in 1960. The Soviet Union is the world's leading producer of iron ore and will, therefore, have no problem of raw materials. According to the current seven-year plan, by 1965 Soviet Union output of steel may be between 86 million tons and 91 million tons.

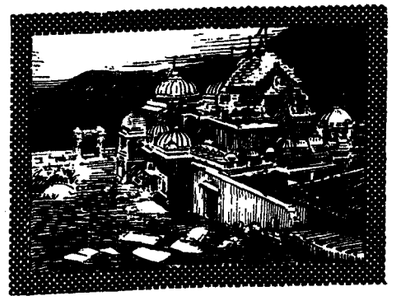
PLANNED PRODUCTION OF CRUDE STEEL IN EASTERN EUROPE

(Million tons)

	1958	1965 (Plan)
Bulgaria	0.21	0.90
Czechoslovakia	5.51	10.52
East Germany	3.04	4.63
Hungary	1.63	2.40
Poland	5.66	9.00
Rumania	0.93	3.00
Total six countries ..	16.98	30.45
Soviet Union	54.87	36.00 to 91.00

It is intriguing to observe that this rising rate of steel output in the Soviet Union as well as Eastern Europe if not translated into rising level of consumer goods markets, would clearly reveal that it is the defence armaments which consume considerable portion of steel output. In Western Europe, however, the steel output matches the higher consumer goods markets. This in a way leads us to an important conclusion that the private sector's steel output in Western European countries is being financed by profitable utilisation of steel for the manufacture of consumer goods. On the other hand, in the Eastern European countries and the Soviet region, steel output goes to strengthen the armament structure of their countries and is being financed by the State revenues. So the people of Eastern Europe and the Soviet Union are taxed to sustain and expand their steel industries. In Western Europe it is the consumer who buys the goods and pays to sustain and expand steel output.

INDIA



So far as India's steel industry is considered, its present output of nearly 3 million tons though appears very meagre when compared to the Eastern and Western European economies gives the satisfaction that this installed capacity was raised three-fold within a period of five years. India's steel producing capacity of over a million tons though was there for the last two decades or so. It is only the post-Independence overall expansion of the industrial potential that provided necessary initiative for the higher steel output.

Today the public sector dominates the steel industry in India. While there were two steel plants in the private sector—the Tatas and the Indian Iron—public sector at the moment runs three steel plants at Rourkela, Bhilai and Durgapur. From the experience of Eastern and Western European countries it can be gathered that steel output, whether produced in the private seector or the public sector, has to be matched to the consumer demand. If the steel capacity is raised only to strengthen the country's defence armaments it ultimately will be financed by the State Exchequer. This may be political necessity but will be an economic folly.

During the Third Five-Year Plan, the steel plants in the private sector are likely to raise their capacity to three million tons and the public sector plants—Bhilai, Rourkela and Durgapur—are likely to produce nearly six million tons. Bokaro steel plant would produce an additional one million tons though it would be planned for a capacity of two million tons. Expansion programme of Mysore Iron Works also is under consideration. On the completion of these pants the total added private and public sector capacity would reach 10.2 million tons of ingots. While this rate of expansion of our steel industry is higher than that in Europe or even in the Soviet Union in terms of actual quantity the output would still be very low. It goes, however, to India's credit that latest techniques are applied in the steel plants.

VISIT GUJARAT

Come to our State and you will enjoy your visit - be it for a holiday, be it for sight seeing, be it for seeing the Lions, or be it for business.

There are the Jain Temples of Shetrunjaya at Palitana where the Jain Sadhus young in age, old in wisdom reside and give religious discourses. Palitana, literally a city of temples, (about 863) - some of which are attributed to the 11th Century, will be a pleasant sight to all tourists. The temple jewels, which can be seen by special request, are of fabulous value.

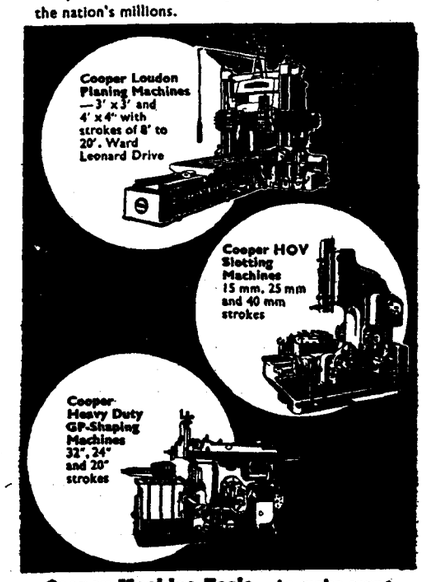
Government of Gujarat,
Sachivalaya, AHMEDABAD-15.

Assisting India in her stride towards rapid industrialisation

WALCHANDNAGAR INDUSTRIES LTD.
NOW MANUFACTURE COMPLETE SUGAR FACTORIES

In a few fleeting years Walchandnagar Industries Limited made industrial history by completing the manufacture of India's first two sugar factories in quick succession. These two factories were installed at Karad in Maharashtra, and at Sankeshwar in the State of Mysore.



As time marches on, Walchandnagar Industries continue to serve the nation's sugar industries. More and more sugar factories will roll of their assembly lines, while special machinery and essential parts are being supplied throughout the country.

WALCHANDNAGAR INDUSTRIES LTD.,
Walchandnagar, Poona Dist., Maharashtra
A "Walchand Group" Industry

COOPER Machine Tools
to build more Indian industries

Today, with their big, new Machine Tool Division at Chinchwad, Cooper Engineering Limited are producing more Machine Tools of exacting standards to build more Indian industries, which, in terms of employment and production, mean a higher standard of living for the nation's millions.

Cooper Machine Tools — to make more machines for India's industries

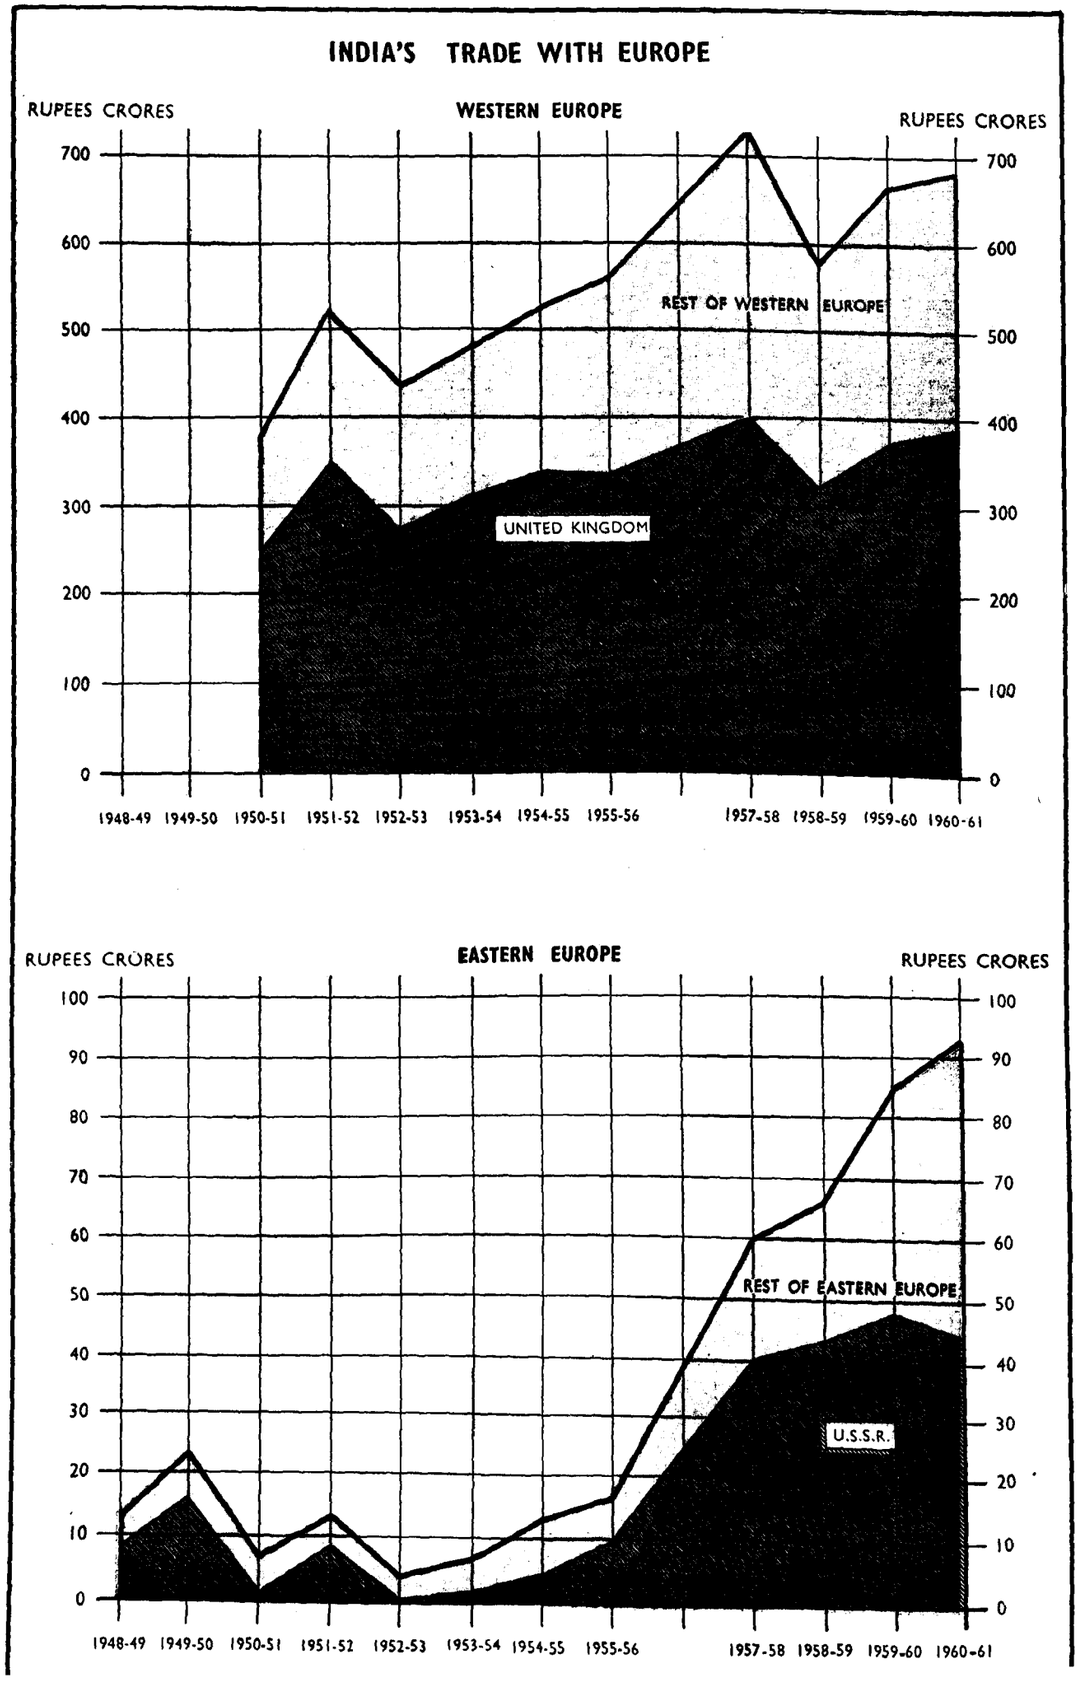
Includes power produced by both central plants and plants installed in industrial enterprises. Most countries data cover all installations, but Czechoslovakia excludes plants with an installed capacity under 100 kilo-watts and Poland excludes enterprise plants of under 500 kilo-watts capacity.



TRENDS IN INDUSTRIAL PRODUCTION

* For Western European countries, internal consumption (excluding bunkers) outside the refineries of all energy products (excluding lubricants, bitumen and similar products) and for Eastern European countries, the consumption of all Oil fuels (excluding Bunkers).

**Relates to 1960.

Consumer Goods Industries

ECONOMIC GROWTH

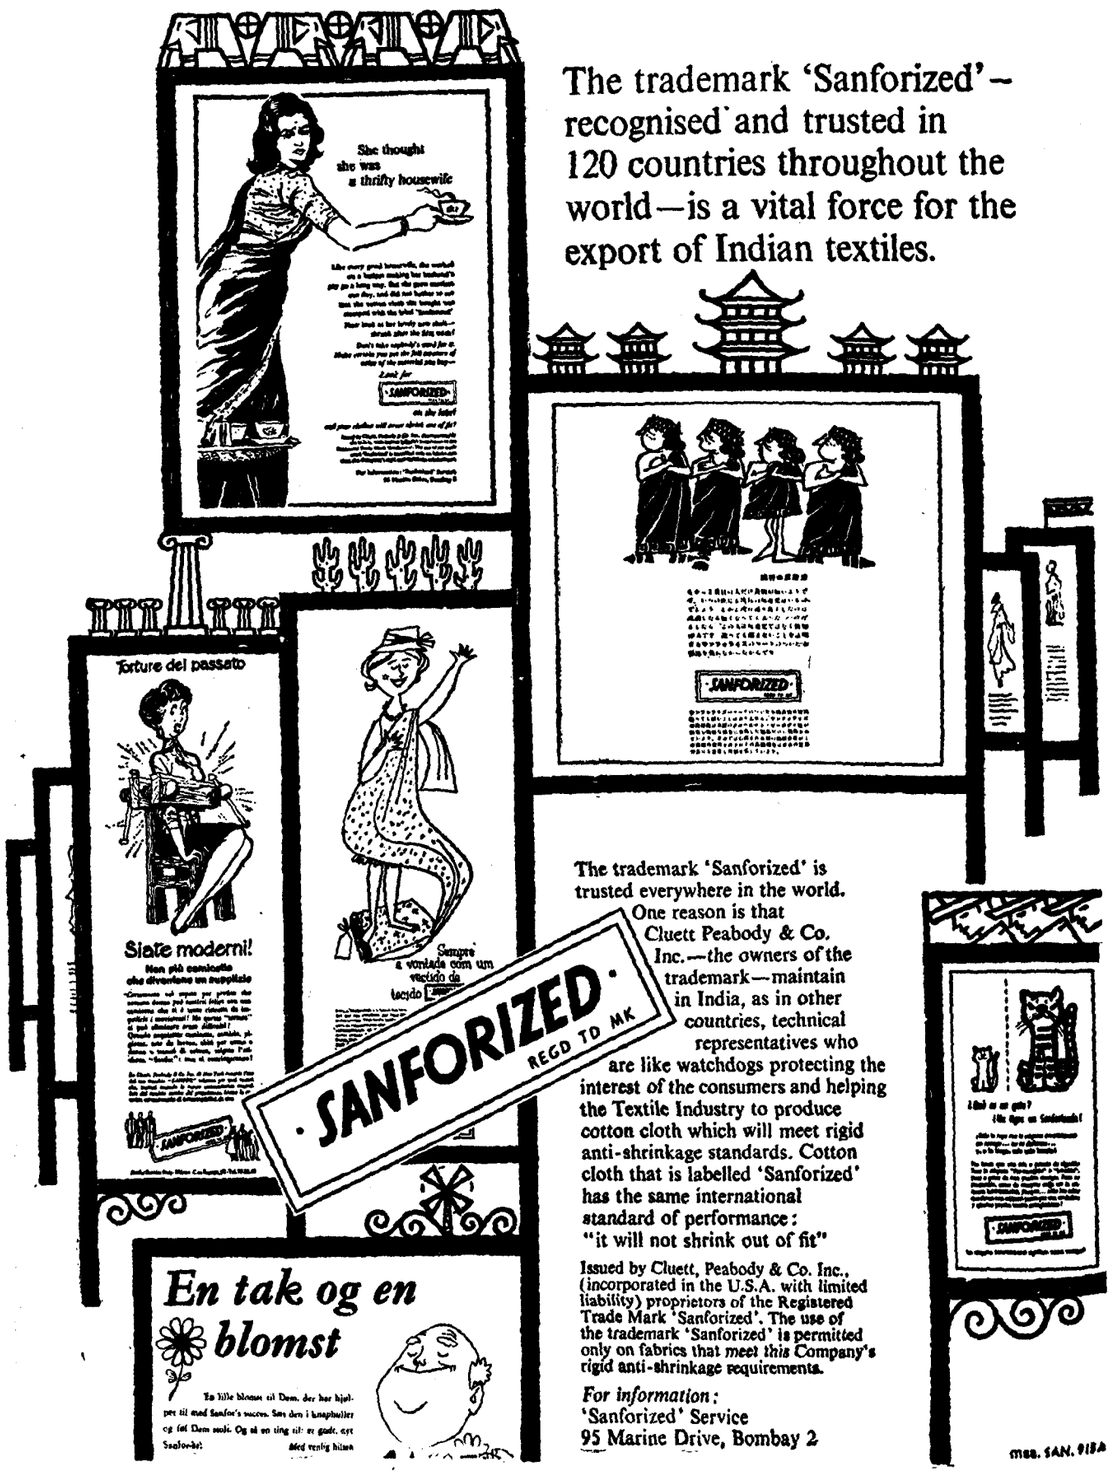
IN the context of the Indian industrial set-up in which consumer goods predominated in the past and still form a sizeable sector of our developing economy with an increasing accent on basic industries, the importance of this component of industry can hardly be over-emphasized in the process of the economic growth of the country. Apart from the fact that the consumer goods, durable or semi-durable satisfy direct human wants, their greater importance lies in being earners of the much-needed foreign exchange so vital for our overall economic development. An analysis of our foreign trade figures will reveal that out of total Indian exports of the value of Rs. 635.2 crores in 1960, 469.80 crores (about 74 per cent) were earned in respect of the consumer goods, cotton and jute textiles being our staple exports.

The new economic thinking, that capital (investment) by itself will not produce output (or economic growth) and that there are other complementary factors, such as entreprenureal talent, organisational skill, technology, management and research apart from other social determinants, which are equally important and the lack of which acts as a serious bottleneck to economic growth, is also being progres ively applied to the consumer goods industries in both the Western and Eastern Europe.

INVESTMENT IN HUMAN CAPITAL

In India serious doubts have been expressed against the savings-incomes—Capital-output approach of the planners to promote and foster economic development, for the institutional social structure of the country has been difficult to reconcile with the ap'itudes needed to transform a traditional economy into a modern one, based on specialisation of labour, the habit of thinking for tomorrow and therefore saving for investment. Although the value or savings in a developing economy cannot be exaggerated, it is of great importance that in the context of Indian social set-up and habits greater attention is also paid to social determinants, other than the strictly economic ones. Fuller utilisation of the human and material factors of production holds the key to the growth of economy. Investment in human capital is at least as important as an investment in machinery and equipment. As stated earlier, consumer goods industries satisfy the direct human wants and their importance and contribution to the process of economic growth cannot be over-emphasized, especially when some of the consumer goods industries are the principal foreign exchange earners of our country. Good results can be achieved in these industries, if efforts are also directed towards re-organisation, market research, expansion of markets, productivity, utilisation of capacity and rationalisation. All the major consumer goods industries particularly the ones which are export oriented such as jute, textiles, sugar and tea must reduce their costs of production in order that they are not only priced out of the world market by other countries but that they are able to extend their sales to new markets and face competition from substitutes which are increasingly being used as a result of the advances that have been and are being made in science and technology.

FOREIGN COMPETITION



All our traditional exports are losing ground in the foreign markets and further cuts in some of our exports, particularly cotton textiles are being threatened as a result of Britain's proposed entry into the European Common Market. The British textile indus.ry is already asking for further cuts in cloth imports from Asian countries, though there already exist temporary ceilings imposed voluntarily by the exporting countries, Hong Kong, India and Pakistan. As a matter of fact, the Board of Trade has announced that as from the first of January 1962, imports of cotton textiles from India and Pakistan will be controlled. Even as it is, the exports have been on the decline this year and it is estimated that the total exports of cotton textiles in 1961 may not exceed 10 million yards against 30 million yards in the previous year. The compensating gesture that has come from West Germany and France who have agreed to relax their quota restrictions on Indian imports does not solve the long-term export interests of the Indian industry. Similar resistance from competition confronts other export commodi.ies. In view of the keener competition and having regard to the fact that India lags behind in science and technology apart from the paucity of domestic and foreign capital, the conclusion is irresistible that we should lay greater emphasis on increasing the efficiency, particularly of our export industries, thus earning more of the much needed foreign exchange and on reducing costs to the consumers at home.

OUTLOOK IN THE THIRD PLAN

The table on the next page will show that India has made steady progress both in diversification and in raising the production of some of the traditional major consumer goods since 1950-51. In the Third Plan, produc ion targets and capacities for most of the consumer goods industries have been substantially raised. Paper and paperboard's target has been doubled. New-print's capacity has been increased by five times. Production of security paper will be undertaken for the first time. Similarly, targets for the jute and cotton textiles have been raised by 13 per cent in textiles and only by a nominal figure in jute. Drugs and pharmaceuticals which were not included in the First Plan and got a start in the Second Plan have received a larger allocation of resources and diversification in the Third Plan. Although oil seeds' target has been raised from 7.1 million tons to 9.8 million tons in 1965-66, it is feared that this production may just suffice the internal demand.

It may, however, be remembered that the per capita consumption of some of the major consumer goods is still low and will remain so in comparison to those of most of the countries of Western Europe. It cannot also be claimed by the industries concerned that they have made any advance in increasing the efficiency of their performances. Most of the European countries have already embarked upon several plans to reorganise, adjust and modernise their industries with a view to increasing efficiency of their capital equipment, labour and management and to meet the changed pattern of demand and competition. The way the British textile industry is coming back to hold its own through reorganisation and integration after the crisis of the late fifties has perhaps a lesson for the Indian textile industry to learn.

Cotton Textile Industry

THERE ARE about 50 countries in the non-Communist world and all among the Communist countries which are making significant contribution to the world's total output of cloth. Total production in non-Communist countries has risen from an annual rate of about 29,000 million yards before the War to over 36,000 million yards in 1960. The share of India is about 5,550 million yards, i.e. about 14 per cent of the total free world's production. A study of India's export trade in textiles against the background of world trends in recent years reveals that whereas the total world trade has gone up by over a 1,000 million yards in the past six years — from 5,463 million yards in 1954 to 6,577 million yards in 1960, the share of India has declined from 863 million yards (both mill-made and handloom cloth) to 722 million yards. Indian exports have thus fallen from 16 per cent in 1954 to 11 per cent in 1960. India, no doubt, ranked as the second largest exporter of cloth in the world during 1960, the first place being occupied by Japan, but its share was only half that of Japan.

BRITISH TEXTILE INDUSTRY

Great Britain has launched a counter-attack and is fighting back to regain its lost hold in the textile world. This is being achieved through reorganisation of the industry through horizontal and vertical integration, improvement of quality, lowering costs and better designs. The first step has been to eliminate excess capacity which, it was felt, acted as a brake on efficiency, in which task the Government has rendered invaluable financial assistance. The Cotton Industry Act 1959 was specially enacted to give this assistance. The U.K. Government has paid two-thirds of the cost of compensation for scrapping machinery and the remaining one-third and the cost of compensating redunant employees has been met by levies on the industry. Further, a grant to the extent of 25 per cent will be paid by the Government towards modernisation or the cost of approved investment in new machinery provided that expenditure is incurred by July 1962 and that equipment is installed by July 1964. By March 1960, 49 per cent of the installed spinning spindles, 35 per cent of the doubling spindles, and 40 per cent of the looms had been scrapped. By the end of 1961, 26 per cent of capacity in yarn processing and 21 per cent in woven cloth finishing will have been eliminated. The result of all these measures has been that spindles are now running 25 per cent longer and looms 16 per cent longer than they were when the reorganisation schemes were first introduced in 1959. They could have worked still longer hours if there had been no shortages of workers. The production side has been matched by equally remarkable changes in the industry's organisational structure. The cotton and man-made fibres sections of the industry have been brought together in a cohensive whole.

INTEGRATION AND RATIONALISATION

The Indian cotton textile industry comprising over 500 units spread over the entire country is still this country's biggest enterprise in the organised sector with the value in production well over Rs. 500 crores annually and as the third biggest earner of foreign ex-

Selling milk for better living

That is what the farmers are doing in Kaira District— selling milk to the village co-operative societies, which in turn sell it to the Kaira District Co-operative Milk Producers' Union Ltd.

The Union's Amul Dairy pasteurise the milk. The bulk of it is sent to the Aarey Milk Colony to meet the needs of Bombay city. Moreover, free milk is given to 16,000 children, and the surplus is made into Amul milk products.

The earnings made at every stage of sale provide the farmer members with free veterinary service and artificial insemination facilities for better breed, the best cattle feed at fair prices. The earnings have already brought schools, libraries, hospitals, metalled roads, electricity networks and fresh-water supply to Kaira villages.

Enough money all around, to improve the living standard.

Good ideas sell themselves

Realising the importance of developing India's dairy industry on sound CO-OPERATIVE lines, the following provisions have been made in the draft outline of the Third Five-Year Plan:

- Rs. 40 crores allocation for dairying
- Seventy-five milk supply schemes for cities with population exceeding 100,000 and for new industrial townships
- Thirty new rural creameries
- Eight new milk products factories
- Four cattle feed compounding factories

Working together — prospering together.

Amul shows the way

TO THE MARKET...

change. But the cost of production which is admittedly the key to the growth of the textile industry is very high. Many committees have suggested various measures to improve the performance of the industry. It seems, modernisation, rationalisation and integration on the lines of its counterpart in the U.K. will provide the answer to the industry's problems. The cost structure of the industry is such that it militates against its competitive capacity. It has been estimated that cotton constitutes about 50 per cent of the cost of production of cloth and 64 to 68 per cent of the cost of production of yarn and labour accounts for 27 per cent and 22 per cent of the cost of production respectively of cloth and yarn. The corresponding figures for stores and spares are 10 and 4 per cent and for power 3 to 5 per cent and 2 to 3 per cent. The other expenses are approximately 3 to 5 per cent and 5 to 8 per cent of the cost of production of cloth and yarn. It has been estimated that no sizeable reduction in the costs of the various factors can be made in the existing set up. It has also been said that the prices of some varieties rule near the ceilings because production lags behind. The answer to the problem, therefore, is clear that production schedules should be maintained and this can only be done in the larger context of modernisation and rehabilitation as done in the U.K. together with rationalisation and diversification of production. The problem of finance has slowed down the pace of modernisation and rationalisation in India but industry should play its part in paying its share of the cost of modernisation apart from improving the quality of production and reducing the cost of production through better management and greater productivity. Above all, technology and research alone will go a long way in maintaining the traditional markets and opening new ones.

PRODUCTIVITY ABROAD

Although Soviet Union and other East European countries are paying increasing attention to the production of consumer goods, particularly textiles, their emphasis is only on ths development of heavy industry. But the fact remains that they too depend on technology for efficient production. Perhaps the only lesson that the Soviet Union's textile industry providss is that it shows a clear trend towards establishing the so-called vertical combines, that is, multistaged mills. A study of the textile industries in Western and Eastern Europe further reveals that the productivity per loom with 1938 = 100 as base in the six East European countries averages about 265, given that the published figures are correct. The corresponding figures for other countries are: U.S.S.R. 213, Western Europe 167, U.S.A. 259 and China 226. The higher productivity in Eastern Europe seems to be due to the three shift system combined with simplification of production methods. The reason for the lower productivity of Western Europe has been ascribed to the manifold increase in production per loom. China's higher productivity is largely a result of the modern machinery that she is using for her newly developed industry. Despite all this, the per capita consumption of cotton and man-made fibres in the East European countries and the U.S.S.R. is far behind that of Western Europe and America, though it exceeds that of India. Following are the figures of per capita consumption of various countries:

U.S.A.	78	Western Europe	42
U.S.S.R.	32	Eastern Europe	19
China	12	India	16

(17.5 new target for 1965-66)

The following table will give a picture of the relative positions of the textile industries in Western and Eastern Europe.

COMPETITION FROM PAKISTAN

It will be seen that India is fast losing ground in the world markets in a commodity which was the nation's top foreign exchange earner. Pakistan has made heavy inroads into her export markets. In 1955 India's share in the combined exports of jute goods from India and Pakistan was 94.1 per cent. By 1960 it had fallen to 80.9 per cent. For the present the competition is more serious for sacking than Hessian. India's share of combined sacking export fell from 87.6 per cent in 1957 to 71.6 per cent in 1960, while that of Pakistan increased during the same period from 12.4 per cent to 28.4 per cent. But an alarmist view need not be taken of Pakistan's potential in this industry. The limits to its expansion are obvious. The following figures will show how India's major export markets are being lost to Pakistan:

EXPORTS OF SACKING ('000 tons)

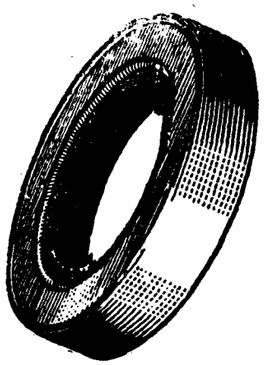
Countries	1957 India	1957 Pakistan	1960 India	1960 Pakistan
Nigeria	17.0	—	9.1	12.8
Rest of Africa	94.2	5.6	50.8	14.8
Burma	24.9	7.2	5.2	12.0
Australia	81.4	0.6	56.5	30.1
West Indies	4.9	1.8	1.7	4.0
Cuba	51.4	1.2	34.4	10.8
Peru	10.4	0.5	5.3	4.8

Indications are not wanting that by the end of 1961, 75 per cent of the Australian market and 50 per cent of the Cuban market will have been lost to Pakistan. Besides almost the entire Egyptian market has been lost because of the development of indigenous production. Thailand has started getting its supplies from Japan in exchange for raw jute. The European and the U.S. markets are shrinking mainly because of the increasing use of substitutes etc.

DIVERSIFICATION

Apart from the declining position of the jute industry in the export markets, the industry at home suffers from certain handicaps which militate against its growth. For example, the fortunes of the industry in the recent years have been fluctuating from year to year between the sealing and unsealing of looms, depending upon how the supply position of raw jute was. The consequences for such a state of affairs are very far reaching for the industry. Besides, the legacy of war time labour which couldn't be retrenched without difficulty has been a drag on the industry and it goes to the credit of the jute manufacturers that they have been able to cope with this problem which is essentially a human problem. The question arises, to what extent those foreign users who changed over to substitutes when prices were high, will be enticed back to jute goods, now that they are quoting more reasonable prices. Much depends on the capital expenditure involved in the changeover but it is unlikely that all the ground lost can be retrieved. Modernisation of the weaving process apart from the introduction of automatic spindles which has been taken in hand is the answer to the problem, if the growing threat from Pakistan with modern machinery and equipment is to be countered. But in the context of large world competition modernisation is only half the answer. What is needed is research into the new uses of jute and diversification of production. The industry to survive must stop depending excessively on standard mill products like hessian and sacking. European jute industries were already ahead in development research and other promotional activities.

DUNDEE JUTE INDUSTRY



The Dundee jute industry is gaining confidence to face the future without set-backs. To apply science and technology requires a capacity on the part of the industry to absorb new ideas and to adjust its outlook so that it comes to regard almost anything possible. In recent years Great Britain has made significant advances in jute technology. For example, they are now making permanent fire proofing at low cost, jute wrapings to prevent abrasive damage to bright steel products and odourless jute materials. They are also continuing research to combat the use of plastics in laminated packings. Redeployment and work study have been carried out to a degree unusual in Britain. The jute industry was the first in the country to introduce in 1952 a wage structure based on jute evaluation. In India most of the jute is used for bags, in the U.K. more than half of the raw jute processed is used in the manufacture of yarns for backing carpets, cloth for linoleum backing, rope, tarpaulin cloth and roofing fabrics.

FUTURE WORLD DEMAND

Although jute products are essentially utilitarian and are little affected by fashion and design, it is nevertheless important that new uses of jute should be discovered and propagated effectively. According to a special report prepared by the National Institute of Economic and Social Research for the Food and Agriculture Organisation of the United Nations, world demand for jute (outside the Far East and the Sino-Soviet group) at the end of the next decade is likely to be about the same as it is now. The report states that over the period the uses for jute were likely to shift away from sacks and packaging to the making of carpets and floor-coverings, particularly in such industrial countries as the United States, the United Kingdom and Western Europe. On the other hand, decreased use of jute for packaging in these countries is likely to be made up, to some extent, by increased use of jute for this purpose in primary producing countries such as Australia, New Zealand, Latin America and Africa, which pack their products with jute goods.

RECOMMENDATIONS

It will be relevant to give below the conclusions of the delegation of the Indian Jute Mills Association which visited Argentina, U.S.A., Canada and the U.K. in late 1960. According to the delegation, the volume of agricultural produce requiring transport is expanding considerably and this means an increase in the potential market for hessian as a packaging medium in the U.S.A. Jute fabrics in North Americta, the delegation adds,

"REMCO" is the ANSWER
WHEN YOU NEED OIL SEALS

NEW DELHI-1.

face competition from paper, plastics and bulk handling as a packaging medium, and from paper, cotton and other substitutes in the industrial spheres. A rise in the price of jute, therefore, must weaken its competitive position and adversely affect its sales. Emphasizing the need for regular supplies to the U.S.A. at fairly stable prices, the IJMA delegation recommends the following:

(1) Manufacture of hessian with a lower oil content than the average for the movement of foodstuffs in the U.S.

(2) Reduction in the cost of canal lining as, for example, through a downward revision of freight for the shipment of cloth from Calcutta and rot-proofiing of hessian cloth in India before shipment.

(3) Development of new uses for hessian as an industrial packing medium.

(4) Maintenance of a high standard of quality at all times.

(5) Strict adherence to specifications.

(6) Continuity in the supply of speciality goods.

(7) Elimination of manufacturing faults by effective supervision in the mills.

(8) Proper promotion and publicity work.

Paper Industry

PRESENT OUTLOOK

THE FOLLOWING targets have been fixed for pulp and paper in the Third Five-Year Plan:

1. Paper and Paper Board	700,000 tons, the capacity to be increased from 410,000 to 820,000 tons.
2. Newsprint	150,000 — a fivs-fold expansion from the present 30,000 tons.
3. Security Paper	1,500 tons per year (a Security mill is to be established at Hoshangabad).

Phe Planning Commission claims that the expansion programme of the paper and paper board industry broadly conforms to the aim of achieving self-sufficiency in respect of this essential item. With the estimated population at 492 million at the end of the Third Plan, the per capita consumption works out to about 3.2 lbs. It has, however, been claimed that the per capita consumption would far exceed 3.2 lb. For instance, according to the study made by the 'Indian Institute of Public Opinion' the per capita consumption in 1960 would be of the order of 78.36 oz. (about 4.15 lbs.) as a result of heavy educational expenditure which is partly associated with a rapid rise in literacy, the rise of industrial production and the increases attendant on population. The following table gives the fluctuations in per capita consumption of paper and paper board from 1948 to 1966. The paper industry also had made representations to the Government for raising the capacity to produce 900,000 tons:

PER CAPITA CONSUMPTION OF PAPER AND PAPER BOARD
(1948-66)

Ysar	Consumption of Paper & Paper Board ('000 tons)	Population (million)	Per Capita Consumption (oz.)	Percentage change over Previous Year
1948 ..	146.48	350.3	14.65	—
1949 ..	169.09	354.8	17.08	+16.59
1950 ..	140.36	358.5	14.03	—17.86
1951 ..	185.28	363.9	18.25	+30.08
1952 ..	169.18	368.7	16.45	— 9.90
1953 ..	182.03	373.3	17.48	+ 6.26
1954 ..	192.53	377.1	18.30	+ 4.69
1955 ..	255.35	383.0	21.89	+30.55
1956 ..	266.41	388.4	24.55	+ 2.76
1957 ..	253.21	393.0	23.13	— 5.80
1958 ..	264.87	398.0	23.85	+ 3.29
1959 ..	330.00	405.0	29.20	+22.43
1960 ..	400.00	412.1	34.79	+19.14
1961 ..	480.00	419.3	41.03	+17.94
1962 ..	560.00	426.7	47.03	+14.26
1963 ..	650.00	434.2	53.65	+14.07
1964 ..	750.00	441.8	60.84	+13.40
1965 ..	860.00	449.5	68.57	+12.70
1966 ..	1,000.00	457.4	78.36	+14.28

With the introduction of compulsory primary education and free further education upto a certain level in most of the States, the demand for paper is bound to rise considerably. Greater literacy and higher education will not only raise demand for writing paper and books etc. but will also considerably add to the number of newspaper reader. Although in India one newspaper is read by many more people than in some of the advanced countries where people buy more than one newspaper, it can safely be said that demand for newsprint will increase. It is gratifying to note that more newsprint factories are being set up during the Third Plan and foreign collaboration has been sought for the purpose. The projections of the Indian Institute of Public Opinion for paper and paper board seem therefore to be nearer the mark. But with the target production of 700,000 tons and with an estimated population of 492 millions in 1966 the per capita consumption comes to only 3.3 lbs. This falls short by about 1.9 lbs. of the projected estimates which are more realistic. Even so, this figure is lowest as compared to the corresponding figures for the countries of Western and Eastern Europe:

APPARENT PER CAPITA CONSUMPTION OF PAPER AND PAPER BOARD
(Kg. per capita)

RESEARCH

The greatest problem that confronts the Indian paper industry today is the lack of indigeous raw materials. The manufacturing capacity cannot be increased unless the raw materials are there. India is dependent totally on wood pulp from abroad. Bamboos, as a raw material, is the only mainstay for the industry. New industrial uses of bamboo e.g., for rayon grade pulp will accentuate the shortage of bamboo for the paper industry. The answer, therefore, to the main problem of paper industry lies in research into the discovery of new raw materials, although new plantation and replantation programme for bamboos can, to some extent, provide a long-term solution of the shortage of this raw material. It is gratifying to note that steps are being taken to utilise paper bagasse which is currently being used as fuel by the sugar mills. The diversion of bagasse to the paper industry will have to be based on providing the sugar mills with an alternative fuel, which, of course, is not an easy task. It is true that the major paper producing countries like Sweden and Finland have very great advantage over India and that is that a large part of their areas is devoted to forests which constitute the backbone of their economies. For example, 71 per cent of land area in Finland and 57 per cent in Sweden are forested. Russia, too, has a large area of timber land. India has a forest coverage of immense potentialities. But the mere availability of forest wood would not by itself solve the problem. It is research and greater research through chemical technology in forestry and in its uses for quality paper making that is needed of the industry. Apart from this, pulp from jute and mesta sticks can also be explored.

Towards Rising Consumption

DURABLE CONSUMER GOODS

IT WILL be abundantly clear from the preceding analysis that the consumer goods industries play an important part in the process of the economic growth of the country. They not only provide the essential goods and services which people want but earn a substantial part of the country's foreign exchange. But there is much that is desired in their performance as compared to their counterparts in some of the advanced countries in both the blocs of Europe. The costs of these commodities are still very high, though most of them thrive behind tariff walls. It is of poramount importance for the optimum use of our scarce resources that these resources are utilised efficiently, if the standard of living of the people is to reach anywhere near the levels attained by other advanced countries. This can only be achieved, though slowly because of our population growth, if we lower our costs and thus leave enough of income for the people to buy durable consumer goods, what to speak of more holidays and leisure as is being increasingly demanded in other advanced countries. India is miles behind in per capita consumption of goods like radios, television (almost nonexistent) motor cars, watches, cameras, although the per capita consumption of cycles, sewing machines and the number of radio receivers have marked an advance since 1948. The table overleaf gives the trend in production of some of the durable consumer goods.

It will be seen from the table that refrigerators, radios, electric fans, sewing machines, bicycles have recorded high rates of growth varying from 15.9 to 55 per cent per year. It may be stated here that the main reason for the tremendous spurt in production of these items has been the protective import restrictions. Production of electric lamps and cars also received fillip to a considerable extent from the protective restrictions but have nevertheless shown relatively moderate rates of growth. Cars could have done better as there is a potentially unsatisfied demand but the retarded growth was perhaps due to technical inadequacy.

INTERNATIONAL COMPARISON

Since data for the production of all the durable consumer goods in the Eastern and Western countries of Europe are not fully available, a comparison in respect of one item, radios for instance, will give us an indication of how India fares in respect of it. Radios can be taken as an indicator of the rising standard of living and for this reason the comparison acquires importance.

Assuming that the production figures in East European countries represent the number of receivers, it will be seen that India with a much larger population than any single country of Europe is ahead only of Hungary and Rumania which also happen to be still economically under-developed. As compared to the rest of the countries, India lags far behind. India has a long road to traverse before she can catch up with the advanced countries of Europe. One error in our planning is the lopsided emphasis on heavy industry. It ought to be rectified by a reasonable and balanced allocation to consumer goods in order to increase their flow so as to absorb rising incomes. Such a step will also be in the right direction for countering inflation.

By concept and planning, The Economic Times is a special newspaper for exclusive readers like company chairmen and directors, government planners, business men, investors, bankers, entrepreneurs and students of economic affairs generally. These are precisely the people whom your advertising must reach - because it is they who shape the destinies of the India of tomorrow by influencing her buying decisions today.

THE ECONOMIC TIMES

A TIMES OF INDIA PUBLICATION. Dr. Dadabhai Naoroji Road, Bombay-1.

Defer rebore - prolong engine life

Yes, this is a maintenance problem in the modern engine. You rightly feel the milage done is too small to warrant a rebore.

But you cannot afford to tolerate wasteful leakage of compression gases and lubricating oil due to worn cylinder bores. Time you thought about changing PISTON RINGS.

The reringing stage in the maintenance of your modern engine often comes early. By attending at the right moment you save money and avoid costly rebore.

BRICO, HEPOLITE and WELLWORTHY packaged ringsets offer an exclusive combination of VACROM chromium plated top compression ring, DUAFLEX sectional steel oil control ring along with other conventional types of rings, for all reringing requirements.

THE HUNGARIAN CHAMBER OF COMMERCE

invites you to contact Hungarian Foreign Trading Companies as listed below:

Heavy Industry and Mining Products

KOMPLEX
Budapest 51, P.O.B. 88.
Design and construction of complete power plants or factories
METALIMPEX
Budapest 62, P.O.B. 330.
Metalurgic material, Semi-finished metal products.
MINERALIMPEX
Budapest 62, P.O.B. 130.
Export/import of Mining and Mineral Oil Products, Refractory Materials.
NIKEX
Budapest 4, P.O.B. 103.
Motorships, Mining-machines, Rolling-stock, Furnaces, Cranes, Lifts.
GABOR ARON IRON FOUNDRY
Budapest 72, P.O.B. 39.
Gas products and Gas generators.
GANZ-MAVAG
Locomotive and Railway Carriage Manufacturers and Mech. Engineers.
Budapest 10, P.O.B. 136.
HUNGARIAN RAILWAY AND CARRIAGE WORKS
Budapest, V. Guszev u.25.
Cars, Vans, Motor Cars, Tramway Cars.

Machine Industry, Motors and Instruments

FERUNION
Budapest 53, P.O.B. 190.
Pneumatic and Precision Tools **"ELZETT"** Locks, Building Materials.
METRIMPEX
Budapest 62, P.O.B. 202.
Instruments for electric and electronic measuring, for industry and research, for medicine and nuclear science, etc.
MOGURT
Budapest 62, P.O.B. 249.
Dumpers, Trucks, Buses, Electric-service Benches.
PANNONIA
Budapest 62, P.O.B. 354.
Motorcycles, Sewing Machines, Steel-tubes, Electrodes, Fittings.
TECHNOIMPEX
Budapest 62, P.O.B. 183.
Lathes, Boring Mills, Saws, Presses, Grinding Machines, Caloric Machines.

Electrical Industry

BUDAVOX
Budapest 62, P.O.B. 267.
Telephone Exchanges, Broadcasting Stations.
ELEKTROIMPEX
Budapest 62, P.O.B. 296.
Radios, Microwave Equipment, Vacuum Flasks, Lenses.
MEDICOR
Budapest 4, P.O.B. 225.
X-Ray Apparata f. Industry and Medicine.
TRANSELEKTRO
Budapest 62, P.O.B. 377.
High/Low voltage Electric Equipment, Cables, Transformers, Electric Motors.
UNITED INCANDESCENT LAMPS AND EL. CO.
Budapest 4, Vaci ut 77.
Lamps, Radio Valves, Fluorescent Lamps.
GANZ METER FACTORY
Budapest 53, P.O.B. 172.
Electric Supply Meters.

Chemical and Pharmaceutical Industry

CHEMOLIMPEX
Budapest 62, P.O.B. 248.
Chemicals, Paints, Rubber-products, Photo-papers, Beauty-products.
MEDIMPEX
Budapest 502, P.O.B. 34.
Pharmaceutical Chemicals, Medicinal Herbs and Oils, Biologicals.

Textiles—Clothing

HUNGAROTEX
Budapest 4, P.O.B. 100.
Textiles, Export of Wool-, Cotton-, Rayon-, Nylon-goods.
IMPORTTEX
Budapest 53, P.O.B. 168.
Importers of textile raw materials and semi-manufacturers.
MODEX
Budapest 52, P.O.B. 85.
Exporters of Wearing-apparel.

Art—Culture—Films—Science

ARTEX
Budapest 62, P.O.B. 167 "Herend" Chinaware, Jewellery, Fancy-goods, Toys, Furniture.
HUNGAROFILM
Budapest 5, P.O.B. 5.
Films, Features, Cartoons, Scientific films.
KULTURA
Budapest 62, P.O.B. 149.
Export-import of Books, Periodicals, Music, Records, Didactical Material.
LICENCIA
Budapest 4, P.O.B. 172.
Purchase and sale of Patents/Licences.

Forestry — Agriculture — Food

LIGNIMPEX
Budapest 62, P.O.B. 323.
Import/Export of Timber, Paper, Fuel.
AGRIMPEX
Budapest 62, P.O.B. 278.
Seeds, Vegetable Oils, Rice, Sugar, etc.
MAVAD
Budapest 62, P.O.B. 205.
Shot-game, Arrangements for Hunting.
MONIMPEX
Budapest 62, P.O.B. 268.
Wines, Fruit-brandy, Paprika, Honey, Tobacco.
HUNGAROFRUCT
Budapest 62, P.O.B. 386.
Fresh Fruits and Vegetables.
TERIMPEX
Budapest 4, P.O.B. 200.
Salami, Canned-goods, Gooseliver, etc.

Companies in service of trade:

MASPED
Budapest 4, P.O.B. 77.
International Forwarding.
MAFRACHT
Budapest 62, P.O.B. 194.
Representation of Liner Shipping Companies, Chartering.
MERT
Budapest 5, P.O.B. 42.
Quality control, Testing and Supervision, Arbitrage.
PRESTO
Budapest 4, P.O.B. 120.
Advertising over the world markets, Executing foreign publicity in Hungary.

For further information please approach also the Offices of

THE TRADE REPRESENTATIVE OF THE HUNGARIAN PEOPLE'S REPUBLIC IN NEW DELHI

and Trade Commissioners in Bombay and Calcutta.

Higher capacity... higher efficiency

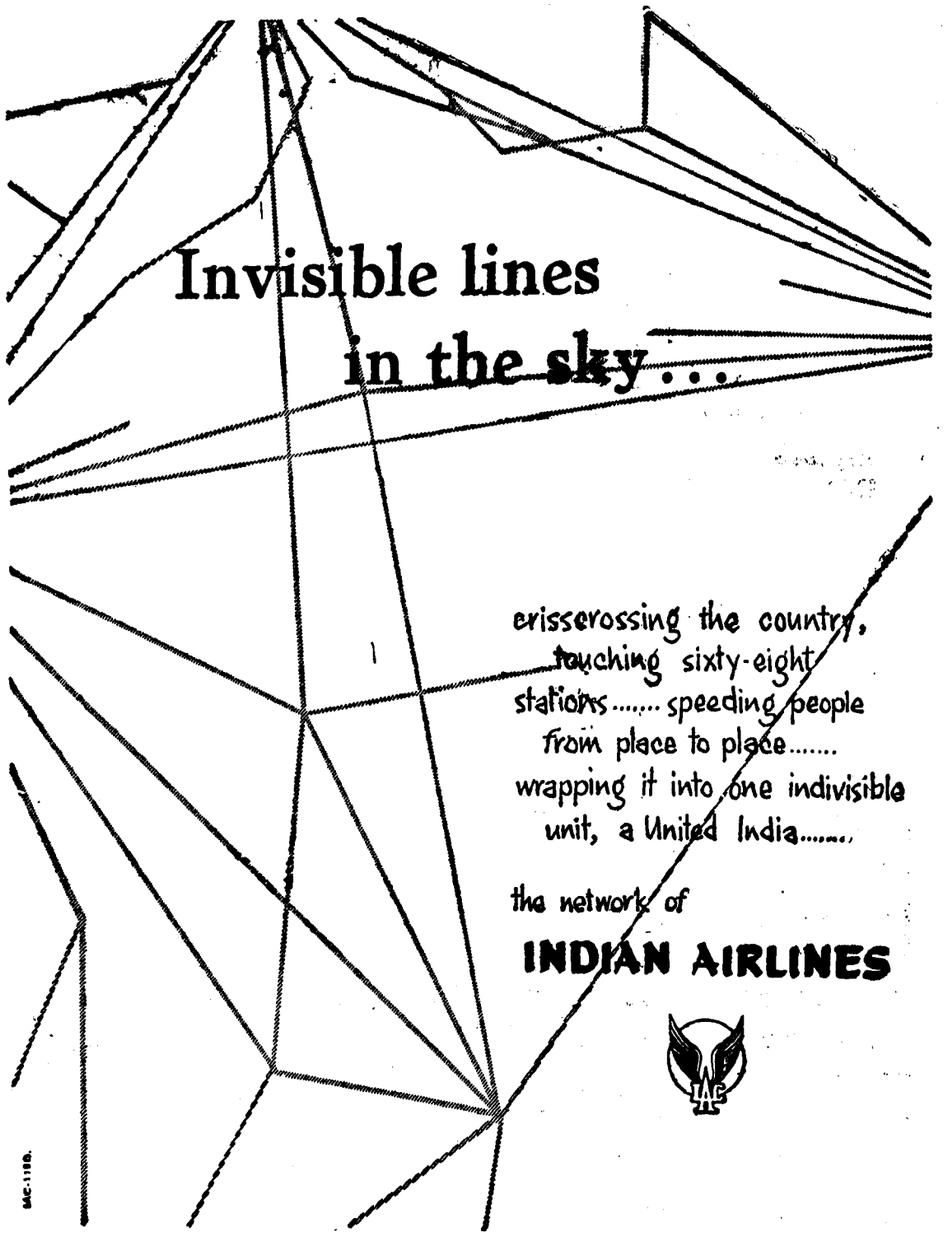
THE TI GROUP COMPANIES manufacture the largest number of cycles, cycle fittings, ERW steel tubes, cycle chains and saddles in India. Their growth and expansion to their present pre-eminent position confirms the high quality of their manufacture and the consequent popular demand.

A partnership that has produced outstanding results

The TI Group owes its leadership to the truly abiding partnership between Messrs Murugappa & Sons of Madras and Tube Investments Limited of Birmingham, U. K. As future plans unfold, Tube Investments of India Limited will be in a position to offer cycle dynamo lamp sets, industrial chains, cold rolled steel strips, high pressure gas cylinders and a wider range of bicycle components.

MT/TI-152a

TUBE INVESTMENTS OF INDIA LIMITED
52/53, Jehangir Street, Madras-1



Proprietors of: T. I. CYCLES OF INDIA—Manufacturers of HERCULES and PHILLIPS cycles and BRAMPTON cycle fittings • TUBE PRODUCTS OF INDIA—Manufacturers of TRU-WEL ERW steel tubes and cold rolled steel strips • THE WRIGHT SADDLES OF INDIA—Manufacturers of cycle saddles
Subsidiaries: TI DIAMOND CHAIN LTD.—Manufacturers of cycle and industrial chains • TI MILLER LTD —Manufacturers of Miller lamps and dynamo sets

cycle fittings

Transport—India and Europe

THE CHALLENGE OF TECHNOLOGY

THE problem of evolving an integrated structure of transport, incorporating its various forms, old and new, raises many common issues of policy in India as well as Europe. In the treatment of this Annual Number, the two parts of Europe — Western and Eastern — have been taken as separate entities for the very obvious reason of the economic systems which govern them. Following this broad treatment, it would be nearer the truth to say that there is a greater element of similarity of issues of transport policy between India and Western Europe than between India and Eastern Europe or the Soviet Union in particular. In Western Europe, with its decades of intensive exploitation of economic resources and relatively high density of population, the traditional modes of transport have come to acquire a place in the overall transport structure which can be changed for adaptation to the new requirements of the economies by progressive modifications alone. The pace of transformation cannot be forced by artificial direction of resources. This is also true in a substantial measure in the case of India. The Soviet Union, however, stands in a somewhat different situation. It inherited a ramshackle structure of transport from the Czarist regime and the spectacular tempo of economic development which it acquired after the Revolution made it a matter of top priority that transport should be given a place among objects of the highest priority. The existence of a mediaeval system of transport, in a sense, facilitated the task of the new Soviet rulers to lay the broad foundations of precisely a system of transport of their choice. It is remarkable to note how Soviet transport has developed and progressed in a spectacular manner that has hardly any parallel elsewhere in the world. But this freedom of choice to pursue an imaginative policy of transport, without the hindrances of inheritance, makes the Soviet model somewhat different for our guidance from the model in Western Europe.

This distinction notwithstanding, there is a fundamental principle of policy to be derived from the experience of Western Europe as well as of the Soviet Union. It is that if continuous progress in the development of transport is to be sustained in order to enable the economies to maintain their dynamic vitality, that progress must assimilate the fruits of technology. One of the problems which transport, whether in Western or Eastern Europe, is repeatedly called upon to meet is to face the new challenges of technology in maintaining a reasonable degree of co-ordination between its different forms, Co-ordination is not something which can be achieved finally at any definite point in the evolution of transport. In this sense it is an elusive goal as experience everywhere demonstrates. Technological changes shift the balance and the relative weights of the different modes and the essence of co-ordination lies in trying to catch up with technological progress. Air transport in the Jet Age and pipeline communications have thrown up such a challenge in both the halves of Europe. Additionally, motor transport has flung another challenge in Western Europe, but not in the Soviet Union. Of India it may be said that the real challenge in the coming decades emanates from road transport. Air transport is a matter of relatively lower priority in any under-developed country.

INDIA: LACK OF POLICY

A policy for transport did not pose any mentionable issues of principles during India's First Five-Year Plan, since that period was fully occupied with completing the unfinished task of the post-war reconstruction of rail transport, in the first instance, and road transport, in the next. Development in the real sense started only with the Second Plan. There is no evidence in the scheme of the Second Plan to prove that the transport programmes were conceived on the basis of any policy. The traditional pattern of the railways predominating the transport system was practically taken as unchangeable and road transport in particular was put under the restraints which were necessary only in a bygone period of ruinous competition. Shipping, however, got a relatively better deal than roads, coastal shipping was reserved for Indian bottoms and a debut was made in the distant oceans. Transport development without the basis of any rational policy in the Second Five-Year Plan has passed on a difficult legacy to the Third Plan. During the Second Plan, acute transport shortages, like acute shortages of power, retarded the progress of production and, on a few occasions, even brought it to a virtual standstill in certain areas. It was quite obvious that the main cause of the recurring crises lay in putting an excessive pressure on rail transport, which was quite out of proportion to even its expanded capacity to bear. The error once committed in not assigning proper magnitudes to road and shipping could not be rectified at a late stage primarily because expansion of transport facilities requires a fair period of gestation and also because the available resources were already committed in other sectors. It is surprising that the moral of the transport crisis in the Second Plan has been lost on our planners.

In the Third Plan, it is anybody's guess as to the demand which will be made on the rail transport capacity by freight traffic. The freight target for the Third Plan has been fixed at 245 million originating tons. Now, an originating ton is anything but a scientific measure of the demand which the load of traffic will create for transport capacity. The real yardstick is expressed in terms of ton-miles which is conspicuously absent in the railway plan. It is true that in order to arrive at the ton-mile target there must be a workable basis provided by the anticipated average lead of traffic and this has been somewhat difficult to estimate for the reason that the locational pattern of the industries, which will be the primary users of transport, is yet far from clear and some of the projects included in the Third Plan may not reach the stage of starting production. But some reasonable guess could have been made and the ton-mile target could have been fixed in tentative terms which was the best that could be done. During the Second Plan the average lead of railway freight traffic increased from 292 miles to 354 miles. It would not have been wide of the mark to presume that, in view of a large number of factories and other industrial establishments to be dispersed beyond the areas of conventional concentration, the average lead of railway freight traffic in the Third Plan would be in the neighbourhood of 400 miles. On this rough assumption the target for the Third Plan comes to 98,000 million ton-miles. This is to be compared with the level of 54,700 million ton-miles achieved at the end of the Second Plan. Railway transport has thus to provide a massive increase of about 80 per cent in its carrying capacity. The allocation of Rs. 1,325 crores for railway expansion in this Plan has been made without reference to the ton-mile target. No surprises need be felt if the economy comes face to face with recurring bottlenecks on the railways.

AD HOC PLANNING

Road transport has been held firmly at its subordinate position and it has been given a parsimonious allocation of Rs. 297 crores. There is another significant factor in the planning of transport policy. The Committee on Transport Policy and Co-ordination was appointed late in the Second Plan and it is at least largely true that its genesis is to be found in the rival

claims put up by the Railway Ministry for co-ordination-cum-restriction of road transport and by the Transport Ministry for dismantling the shackles on motor transport. This Committee tendered its preliminary report sufficiently in advance of the emergence of the final version of the Third Plan. But the final version is practically the same as the Draft Outline of the Third Plan, from which it is obvious that the Committee's report was not availed of even for a preliminary modification of policy. When the final Report will be ready, the Planning Commission and the National Development Council will be confronted with the stiff problem of being unable to make any substantial changes in the overall transport plan. All that may be attempted with some heroic effort and determination, provided they are shown, is to make some minor modifications. A pragmatic approach and not an approach grounded in well-conceived policy is to shape the development of transport in the Third Plan. This situation can hardly be remedied. But it is to be presumed that at least in the Third Plan the main co-ordinates of an integrated policy will be evolved. In this undoubtedly difficult task, rather continuous process, the experiences of Western Europe and the Soviet Union can provide much useful guidance.

WEST EUROPEAN PROBLEM

A brief review of the post-war developments in transport in Western Europe markedly brings out the fact that France and West Germany have made the most spectacular strides in rail transport in the region. In the other countries, the development and density of traffic ranged at varying but lower levels. In 1957, the freight traffic carried by the French railways reached the peak level of 54 billion ton-kilometres and in Germany 52 billion ton-kilometres. But in terms of per capita volume of rail freight traffic, Sweden came on top with 1,413 ton kilometres, France next with 1,216 ton-kilometres, Austria and Germany 1,000 ton-kilometres, while at the lowest rung were Portugal 87 ton-kilometres and Greece 43 ton-kilometres. In Western Europe inland waterways have always assumed a position of relatively high importance. In the post-war period inland navigation received attention, but not on the same scale as bestowed on other and particularly the new forms.

The greatest dilemma of a reasonably co-ordinated development of transport has been posed by the forceful emergence of road transport. The automobile industry has received a powerful stimulus in the wake of economic growth generating higher incomes and creating demands for cars and trucks for private owners and individual industrial enterprises, apart from operators for hire. Indeed, the growth of motor transport has become phenomenal and a very serious challenge has been thrown to the railways. But one factor of profound importance in Western Europe has made it difficult to give the required acceleration to the change in the relative weights of rail and road transport. The density of population, concentration of industries in and around the old cities and towns, the comparatively narrow scope for changing this pattern have given railway transport an element of inevitable importance which is not strictly justified by considerations of economic operation.

FINANCIAL DILEMMA

As in India, in Western Europe, too, railway transport is operated on the mixed principle of a public utility-cum-commercial undertaking. This is quite manifest in the structure of freight rates. It is not necessary to go into the details commodity-wise, but the preference shown for assigning low rates to the staple raw materials and semi-manufactures essential for industry and for low cost in the transport of farm products is to be seen in Western Europe as in India. In many of the smaller or inadequately developed countries of Europe rating policy was and is used as an instrument of industrial protection. Exports also receive in some cases a positive stimulus from rebates on freight rates.

To point out these pecularities is not to argue that these trends in policy were not rational. The point of emphasis is that the situation in which their origin was justified has ceased to exist, railway transport also has ceased to be the primarily indispensable mode of transport and the continuance of the conventional financial structure has already begun to operate as a drag on the railway system. In 1957, among the railways of the West European countries, the railways in Belgium, Denmark, France and Switzerland showed a net profit. The Swedish railways balanced their account, while the railways in all the remaining countries, by and large, incurred losses of varying magnitudes. If there had been a dynamic display of courageous change in policy while the post-war boom was on and the price charged for rail transport service had been raised reasonably, Western European railways would not have found themselves in financial straits. Meantime, motor transport is making its competitive strength and efficiency felt more and more keenly in spite of a brief span of operation. Indian railways have not reached the stage of getting into the morass of heavy losses, but their war-time and immediate post-war financial buoyancy is on the wane. The European parallel, therefore, is a source of much useful lesson.

MODERNISATION

The transformation of the transport system, whether in Western Europe or in India, does not mean relegating the railways to a subordinate position far too below the emerging forms of transport. Railways will always retain their basic value as a suitable mode for long distance and heavy traffic in bulk as well as a convenient mode of movement of goods of lesser bulk but higher utility to the community. Nonetheless, the point has been reached at which railways do require to be assigned a lower priority in the sphere of future expansion of overall transport. The very fact that the railway systems will retain their vital place in the general structure of transport makes it a matter of compelling necessity that they must be modernised in order to cope with the demand of adjustment to new transport situations. This is now well-recognized in each country and modernisation of railways has been given a top priority in the expansion programmes.

Steam traction is being replaced by electric and diesel locomotives and wherever possible gas-turbine engines are contemplated to be introduced progressively. But the scope for the last type of traction is limited in Western Europe in contrast with the Soviet Union. The rolling stock is being rapidly modernised with acquisition of high capacity equipment and the other directions in which progress is proceeding are improvement of track and terminal facilities. This is not all. One of the short cuts to tide over the financial dilemma is to dismantle railway lines where their operation is uneconomic in the extreme and the economy of the areas will not suffer since motor transport will step in vigorously. Railway rates are being readjusted and the commercial complexion of the railway enterprise is being more and more conspicuously recognized in contrast with the traditional principle of operating it also as a public utility.

EUROPEAN ECONOMIC INTEGRATION

The parallelism between the rail transport problem of Western Europe and that of India can be pursued up to the point of tiding over the acute weakness of the railway system vis-a-vis road transport by an energetic resort to the modernisation of the railways deeply root-

HIT THE BULL'S EYE

There is a surer way of getting your rightful share of the rich export market. If you exercise strict quality control in the manufacture of your goods, maintain regular supplies, produce according to the buyer's specifications, arrange for after sales service facilities, a tidy sum in foreign exchange is yours. In the Export markets you are competing face to face with the highly industrialised countries of the west. For the buyer to select your goods in preference to those of other countries you have to compete on quality.

ed in the opportunities of progress offered by technological changes. But it is hardly justifiable to pursue it further with reference to the radical reorientation which is being given to the railway transport policies in Western Europe in the achievement of the European Economic Community. It is elementary knowledge that the integration of the different national transport systems is a vital link in the overall economic integration of Western Europe. One of the worst handicaps from which the Western European railways suffered was the division of the sub-continent into small nation states, each struggling to hold its own by means of discriminatory policies against neighbours, the impact of whose economic competition was hard to bear. The bold and imaginative experiment of economic integration, based on the subordination of national sovereignties and a dynamic market heading rapidly towards mass consumption, has brought a unique opportunity to solve the problem of the revitalisation and modernisation of the railway systems of the region. The process of the merger of the former princely States with the Indian Union brought some measure of economic integration and in its wake conspicuously came the integration of the multiplicity of the railway systems in the Indian sub-continent. However, the benefits of the economies of large-scale operation which are theoretically supposed to ensue from integration, were not realised in the case of the integration of the Indian railways. The causes of this failure and the distinction between the character of the Indian integration on a modest scale and that of the European economic integration will need brief elaboration later, when we turn to the prospect before the Indian railways.

The European Coal and Steel Community gave the initial push to the reorientation of rail transport policies relating to freight rates. The smooth operation of trans-frontier train services was the first requisite in the movement of traffic created by the coal and steel industries. It was essential that the flow of coal, iron ore, manganese, scrap and steel should be uninhibited by national restrictive policies followed for generations in self-defence. "Through" train services for trans-border transport were not difficult to secure nor novel, but what was urgently needed was the introduction of "through rates". This meant, in plain words, that all barriers of discriminating rates should be removed and uniform rates on a tapering basis should be prescribed for the traffic. Along with this came the abolition of frontier charges, which are somewhat analogous to our terminal charges. The acceleration which this innovation gave to the Community's traffic was so full of future potential benefit that even the non-member countries like Austria and Switzerland became parties to the new "through rate" system.

TOWARDS LOWER RATES

Apart from this through service and rate system, there has emerged another arrangement to overcome the hurdles created by narrow national restrictions. Trans-frontier rail movements in Western Europe were a common feature of intra-continental trade, but they involved a return of rolling stock and the inevitable transhipment of goods, which prolonged transport time and enhanced its cost. The EUROP agreement was signed by the Western European countries in 1953 in pursuance of which a common pool of locos and wagons was created to eliminate handing back at border points. This pooling arrangement necessitated the adoption of standardisation of stock. To speed up the establishment of the pool on an increasing scale, acquisition of new equipment was necessary, but many of the railways could ill afford to make this investment without strain on their finances. The Council of Europe, acting on the motion of the Ministers for Transport, established the EUROFIMA—a specialised inter-continental bank to advance credit for the purchase of the individual member countries' quotas of equipment for the pool. When the political irritants between India and Pakistan will be wiped out and geographic factors will stimulate economic co-operation, this trans-frontier rail arrangement will be useful to us.

The pace at which the European Economic Community is forging ahead is to be seen from its impact on rail rates. The final aim, when economic integration is consummated, is to adopt a common transport policy. The first offensive which the Community is launching is on discriminatory practices against free trade inside its borders. Discriminatory national rail rates are a vital part of these practices and along with the progressive reduction of tariff barriers, they are on the schedule of elimination. This elimination is to be spread over a phased programme like the tariff rates, but finally discriminatory rates and uneconomic rates, which produce adverse effects on prices, will be wiped out. An important exception is to be made in the case of subsidies, which will be permitted to be retained, subject to the specific condition that they will be used only for the co-ordination of rail with other forms of transport. The economic integration of Europe, of which transport integration is an inseparable part, has promised to bring the boon of a downward trend in freight rates on the railways in the domestic sphere too, which, otherwise, would not have been feasible for several years. Indian railways are not placed in such an enviable position.

THE SOVIET RAIL SYSTEM

When the fact is highlighted that in 1960 the Soviet railways carried 80 per cent of the country's freight traffic and 75 per cent of its passenger traffic, the supreme importance of the rail system in the Soviet Union's structure of transport is vividly set out. The volume of traffic carried is no less spectacular. In 1959 the railways operated 1,429,500 million net ton-kilometres of freight traffic and 164,400 million passenger kilometres. The latter figure is to be considered in relation to the Union's thin population and long distances. The rest of the domestic surface traffic was distributed roughly in the proportions of 13 to 14 per cent for inland waterways and 6 to 7 per cent for road transport in the freight sector. In the passenger sector, however, the residual share of 25 per cent largely passes to motor transport. This relative allocation in inland surface transport is a matter of deliberate choice, partly influenced by climatic factors. The Soviet rulers of Russia had to labour under the critical handicap of having acquired an outmoded and poorly developed transport system. But with characteristic determination to overcome difficulties of any magnitude whatsoever, they built a transport network which would precisely subserve the type of economic development which they selected consistent with their ideology. The whole progress in rail transport, which was spread over a period of more than a century in Western Europe, had to be compressed in a short span of about four decades in Russia. The locational pattern of the Soviet heavy industry, the bulk in which freight is to be carried over long distances, the low density of population and the inexorable demands of climate over a greater part of the year dictated such a preponderance to rail transport over the other forms. It is extremely unlikely that this relative scale of importance in the overall transport structure will be modified substantially. The choice has been made from a long-range view and, although road transport will receive greater stimulation than heretofore, its subordinate place will not be altered. Russia has a great natural advantage in her inland waterways, but they are frozen for about half the year.

In two vital respects, the Soviet transport system stands in a unique position—planning and co-ordination. Planning in Russia is not an exercise in projections

based on estimates of developments which may or may not occur as anticipated, as in the case of a free or mixed economy, where the individual choice of decision finds ample scope for play. The State owns the enterprises and, in the final analysis, it is the predominant user of freight transport. Planning is thorough down to the detail and the regimentation of resources directed towards the fulfilment of targets normally rules out the margin of shortfalls. A centralised and ever-vigilant system of control and follow-up acts as a sharp corrective. Planning for the Russian railways is elaborate right up to the targets for individual stations and operations are conducted almost with clock-work regularity. Regimentation serves as an instrument to overcome the absence of the spur provided by competition in a free or mixed economy. There is another distinctive feature, which facilitates and perfects planning in the Soviet Union. Allocation of resources, financial and physical as well as human, can be made as first prescribed and carried out without lapses. Since the State is the real user of freight transport, distribution of traffic and its flow do not create upsets in co-ordination. In fact, the major co-ordination that is required to be carried out meticulously is to reserve rail capacity on the eve of the spring to carry goods to the river ports, so that no time would be wasted in the utilisation of inland waterways once they are free for navigation.

TECHNOLOGICAL IMPROVEMENT

It is in the sphere of the continuous search for technological improvement that India can emulate, within the limits of her capacity, the Soviet model. The central aim in the modernisation of equipment at any level on the Soviet railways is to adapt the system to techniques of superior qualitative performance. As has happened in France and West Germany, in the wake of post-war rehabilitation the Soviet railways have now a sizeable rolling stock which is young in age. More important than that, rationalisation has been incorporated in a degree which would otherwise have taken much longer time. India, too, enjoys this advantage in some measure. The Russians have evinced a great passion for technological advance as the new slogan now is to overtake American economic progress. But the tradition of science and technology in the Soviet Union dates much earlier. The Indian Railway Board's delegation which went to Europe in 1954 to study the Soviet railway system (as also the railway systems in eight Western European countries) has collected a fund of technical data and it is for the technician to determine the extent to which Russian devices can be incorporated in our system. A student of the economics of transport can draw inferences on broad outlines of policy.

The special tasks of the Soviet railways are that they have to cope with a long average lead in freight traffic (over 775 kilometres as against our 570 km. last year), high-powered engines and heavy freight train loads around 6,000 tons. It goes without saying that this performance depends on the sound condition of the permanent way. Automatic mechanical instruments are used (for instance, the flaw detector) to locate defective points calling for prompt repair. Automatic signalling (which Indian railways are also introducing) and other automatic installations direct traffic over sections of high congestion. Wagons are fast changing over from the screw couplings to the automatic central couplings which save shunting time and provide effec-

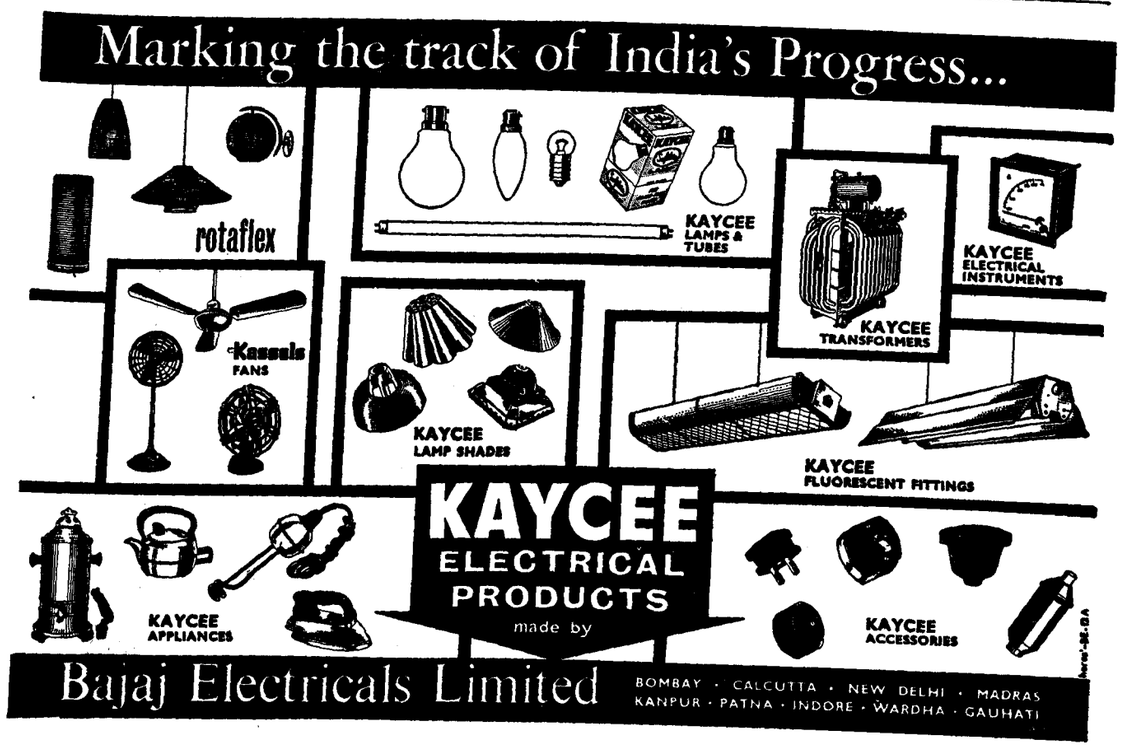
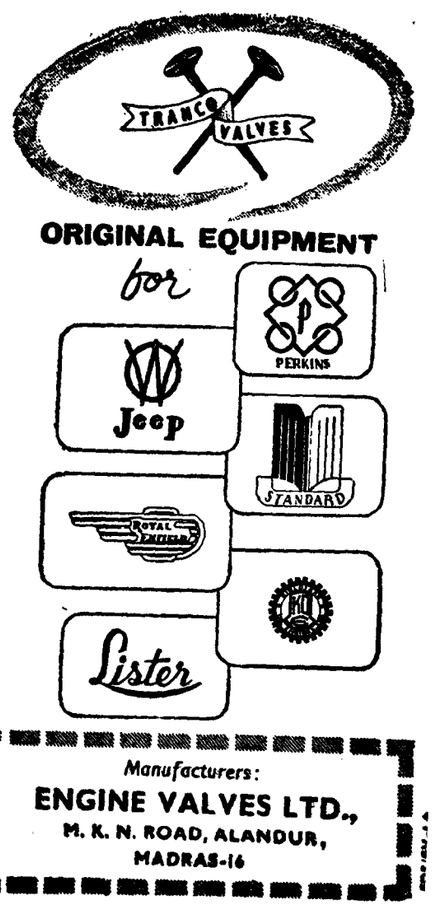
tive control at track curves. But by far the most spectacular feature in the modernisation of equipment is the high-powered locomotives. Steam traction is being rapidly reduced, but even so continuous research is devoted to the analysis of water qualities in different regions for their suitability for steam generation. Already half the locos are either electric or diesel operated. The next move is to raise the proportion of electric engines at the cost of diesel ones, but in the arid regions the latter will stay. Russia has the supreme advantage of cheap electricity and diesel which constitutes the secret of her modernisation of locos. Now in the wake of technological change is coming a new type of greater tractive effort—the gas-turbine engine. More significant than the change of type of locomotive is the introduction of modernised components for the same stock. One of the outstanding achievements of Soviet railways is to secure the latest benefits of change without radical replacement of stock. New mechanism and devices are fitted into the old stock as far as practicable to raise operating efficiency. The largest measure of modernisation combined with the minimum of obsolescence is an innovation devised by the Russians.

INDIAN RAILWAYS: DYNAMISM



Over a century of their existence and particularly during the twentieth century, Indian railways have served as the backbone of the nation's transport system and have displayed their dynamism except during the brief spells of economic depression. They have met the challenges of phenomenal growth in the volume of traffic during the war and after. As India entered the phase of the planned development of her economy, they stood the test of the mounting pressures of traffic. This is not to overlook the intermittent shortages of transport capacity (many of which were very acute), but the support which they extended to the high tempo of economic activity is far more vital than their failures. Table TRNS — I in this Section traces the comparative trends in the growth of rail freight traffic, national income and the three basic sectors of production. The rail transport co-efficient of agricultural output (plus imports) is low as Table TRNS—II indicates. Making allowance for this fact, it will be seen from Table TRNS—I that the index of railway freight traffic (in ton miles) moved much faster during the first two five-year plan periods than the index of industrial and mineral production except during 1953-54 and 1954-55. A more accurate relationship usually traced is that between the growth of the national income and the growth of freight traffic. On this count, the impressive advances made by the freight traffic (ton-mile) index over the index of national income since the last year of the First Plan speak for the performance of the railways. A reservation, however, must be made in interpreting the trends set out in Table TRNS—I which is that the traffic moved is not equivalent to the traffic offering.

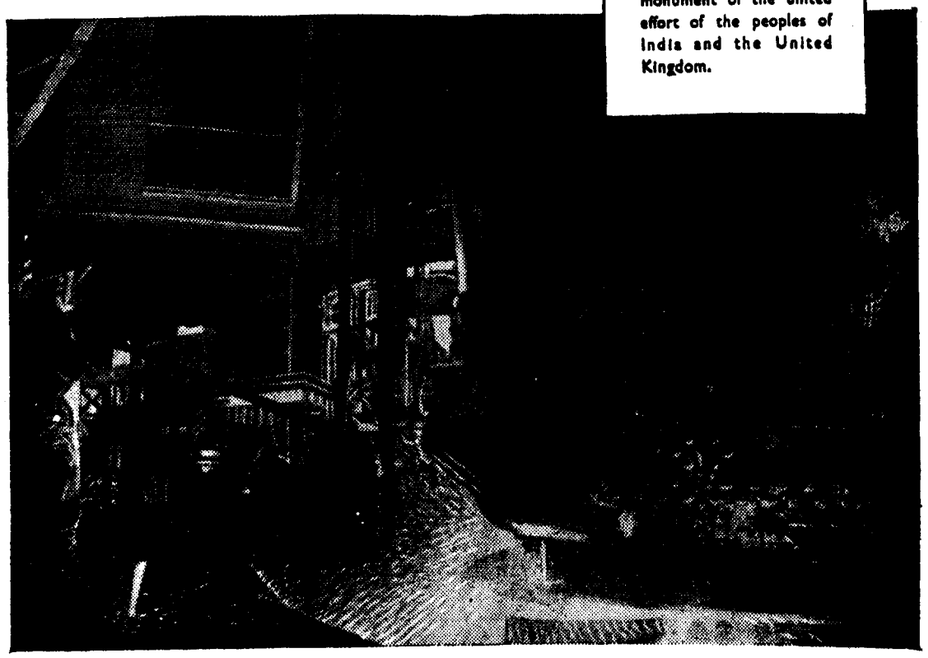
Another angle from which the key position of the railways in the overall transport system may be judged is to assess the rail transport co-efficient of sixteen selected commodities of importance in the economy. The details will be found in Table TRNS—II. Coal, cement, iron and steel, ores, tea, raw jute, raw cotton, cotton textiles, paper, sugar and salt lean very heavily on railway transport. The projections made by the Committee on Transport Policy and Co-ordination in this table for traffic trends in 1965-66 may be accepted as broadly realistic, but the same assumption cannot strictly be made about the projections in 1970-71. In absolute terms the volume of rail-borne traffic will keep on increasing at a modest rate, but not on the present massive scale in respect of many commodities for which motor transport can offer an efficient alternative. As stated at the outset, there is hardly any elbow room for a substantial modification in the transport policy of the Third Plan. Table TRNS—VII gives the consolidated transport load on the railways for the selected sixteen commodities. It makes the startling revelation that this load will be raised precipitately from 53.7 billion ton miles at the end of the Second Plan to 83.0 billion ton miles at the end of the Third Plan. The extreme strain which it is bound to exert on rail capacity is self-evident. But if economic growth is not to be inhibited by an irrational adherence to the traditional policy a shift must be envisaged for the Fourth Plan. We can ignore only at our peril the hard fact that the dynamism of our railways is now about to reach its plateau.



THE PROSPECT

It is not in India alone that this stage is being reached. In Western Europe and America it has already arrived. In Soviet transport alone the railways will retain their weightage around 80 per cent with minor fluctuations in the realm of domestic surface transport. The point of the flattening of the growth of the railways in India or elsewhere relates to the future expansion of overall transport capacity. It does not imply that there will be a retrograde change in their present size. The actual volume of traffic on the railways will increase within small margins, but projections for perspective planning (which is what is basically required for the infra-structure of the economy) ought to be worked on the assumption that in the relative scale their preponderance will tend to diminish. The superior competition of road transport in India, as in Western Europe, makes it necessary to revitalise their operating and financial efficiency. Transport policy must be directed to this task. A major plank in this policy will be, as stressed above, the modernisation of equipment. Already some degree of rationalisation has been achieved in the process of normal replacement and post-war reconstruction of the railways. But its pace needs to be accelerated. This principle is now being incorporated in Indian rail transport policy. Electrification of railways in India is proceeding slowly as it is not feasible to give it early priority. Dieselisation is restricted by the dearth of indigenous fuel and the pool of diesel engines which the railways have set up is primarily meant to serve as a standby. But the steam locos offer scope for acquisition of higher power. Automatic central coupling of wagons has been started with a small beginning and the special high capacity bogie wagons are pressed into service in the coal and steel belt. Automatic mechanism has got off to a similar slow start. But in spite of claims to the contrary, the permanent way is not receiving the direction of resources for its strengthening that is urgently called for. There is ample room to draw upon the modernisation programmes of the Western European and Russian railways. But the crux of the problem is that if technological change finally makes for economy in costs of operation, initially it involves heavy outlays.

The prospect for the Indian railways is thus bound up with their financial vigour. Its dissipation must be halted. International comparisons cannot be read too closely, but in broad terms they can be relied upon for generalisations. Table TRNS—III discloses that, among the West European countries included in it, it is only Spain above whom India ranks in respect of average earnings per ton-kilometre of traffic. India's average receipts of 0.666 cents per ton-kilometre in 1950 are surpassed by nearly 50 per cent by France and Austria which come immediately above her. If India's index of receipts rose to 118.0 in 1958 and stood next only after those of the UK and West Germany, it is subject to the important qualification that its base is very low. Table TRNS—IV which gives the corresponding index for passenger receipts has the same experience to repeat. In the first place, India's average receipts per passenger-kilometre rank last but one with 0.311 cents. Further, if the index rose to 119.0 in 1958 and stood at a



10,00,000 TONS

much higher point than the indices of all the other countries except West Germany, it is the combined result of two factors—high density of passenger traffic and the comparatively lesser impact of motor transport rivalry than in Western Europe.

Table TRNS—V speaks eloquently for a root cause of the financial weakness of the Indian railways particularly against the background of heavy outlays on rapid expansion. Indian railway rates and fares are among the lowest in the world. They are not being adjusted reasonably to sustain rising operating costs, not to speak of providing for amortization. The index number of the average rate per ton mile (base pre-war year) rose to 202 in 1959-60 and in the case of passenger fares it reached a much lower point at 170, in conspicuous contrast with the rise in the general index of wholesale prices to 456. This directly reduces in a steep measure the real value of railway earnings. The increase in the index of the cost per employee to 304 in the same year need not be grudged in view of the spurt in the cost of living. But it is one of the gravest flaws in railway management that political sensitivity seriously undermines progressive norms of labour productivity.

Neither the Soviet nor the West European model provides a guide for the financial invigoration of our railways. Higher standards of discipline are enforced in the management of the Soviet railways and investment in development poses no problems. In Western Europe, economic integration is coming when the individual economies of most of the members of the EEC have gone through the stage of maturity and are about to enter the mass consumption phase. A bold experiment in this setting has enabled the EEC to contemplate policies of non-discriminating and lower freight rates. India has commenced her economic take-off, she is in the midst of a high cost expansion programme and therefore stands on quite a different plane. Development must be financed in a reasonable measure by the direct beneficiaries or else its incidence will shift to the community. There is a compelling necessity to discard the conservative policy of rates and fares. A levelling up of the charges for rail transport service is inescapable on the basis of a mixed principle of what the traffic can bear and competition will not nullify—a formula of selective pricing. This is also the essence of one of the oft-repeated suggestions made by the World Bank's technical teams in the course of their surveys of the Indian economy.

ROADS

THE AGE OF ROADS

THE ARRIVAL of the Age of Roads, whether in Western Europe or India, had a lukewarm reception. This was because railways had served the transport requirements so profoundly and they had come to acquire such a stake that they were considered entitled to a place of precedence, irrespective of the changing requirements of the pattern of transport. In Russia road transport even now occupies a very minor place and its assignment during all the four decades of Soviet rule has been to serve the needs of urban and semi-urban localities and the countryside where the railways have not penetrated. In Western Europe, as in India, the bias for the "immutable" precedence of railways was demonstrated in transport policy by the imposition of severe restrictions in the form of licensing and taxation of motor transport to suppress its competition. In spite of these inhibitions, motor transport asserted its intrinsic vigour and developed to acquire the position of growing importance in the overall transport system.

In Western Europe motor transport made the most impressive strides after World War II and this is in spite of the fact that its foundations were not allowed to be firmly laid during the inter-war period. This is demonstrated by the spectacular expansion in the ownership of motor vehicles. Between 1950 and 1957 the number of passenger cars in Western Europe increased by 153 per cent and reached a level of 15.6 million. The number of truck and buses rose by 71 per cent during the same period to attain a new peak of 4.9 million vehicles. Had it not been for the policy of restricted growth in catering to commercial traffic, there can be no doubt that the number of trucks and buses would have shot up at a much higher rate. Taking cars, trucks and buses together, Western Europe reached the aggregate stock of 21.5 million in 1958. At the top stood the United Kingdom with 5.5 million, France 5.2 million, Germany 4.2 million and Italy 1.6 million, whereas on the lowest rungs were Greece 61,000 and Iceland 18,000. Because of its mountainous terrain Greece offers a poor scope for the expansion of motor transport, whereas civil aviation predominates the pattern of transport in Iceland. Luxembourg's total vehicles stock of 35,000 is to be seen in the context of the small size and the relatively low density of traffic in that country. Another important angle from which the actual growth and future potential of motor transport could be assessed is the comparison in percentage terms between the number of private cars and the gross national product of the countries concerned. This is significantly seen in the case of Western Europe. Between 1950 and 1957 in a majority of the countries of this region the percentage increase in passenger cars was 4 to 5 times as great as the percentage increase in the gross national product of the countries. Details countrywise are not necessary in this context.

DEVELOPMENTS IN INDIA

Since India entered the era of planned development of her economy, the growth of motor transport and, of course, of the road mileage reveals the effects of suppressed expansion. Between 1950-51 and 1959-60 the total road mileage rose slowly from 399,930 kilometres to 482,154 kilometres (Table TRNS—X). Of these only 218,393 kilometres in 1959-60 were surface roads, whereas the length of unsurfaced roads was higher at 263,761 kilometres, which are described as motorable, but it is far from clear whether they are seasonal or all-weather roads. The parsimonious allocations of finance for road development can be inferred from the comparative trends in the annual revenue from road transport and expenditure on roads. The total annual revenue of the Centre and the States from roads increased from Rs. 47.26 crores in 1950-51 to Rs. 132.42 crores, whereas total expenditure on roads (including also expenditure on unmotorable roads) rose from Rs. 34.47 crores to Rs. 92.46 crores in the respective years. Theoretically it could be argued that the principle of applying the revenue proceeds of a certain sector of the economy to its development cannot be sustained as low revenue-bearing segments would suffer in that case. But this argument totally ignores the overriding consideration that basic services like transport and power stand in a separate class as they constitute the prerequisites of economic growth.

Table TRNS—X in this section sets out the detailed statistics about roads and motor transport. It is significant to note that the number of trucks increased from 81,888 in 1950-51 to 149,594 in 1959-60, showing an increase of 82 per cent, but by contrast the volume of freight traffic in ton-miles moved on the roads rose during this period by not less than 100 per cent. This performance is to be interpreted by bearing in mind the fact that motor transport has been hamstrung by restrictions of operating licences and handicaps of taxation which ranks among the highest in the

world. As in Western Europe, so in India, the potential of motor transport for growth and its rightful place in the new Age of Roads is self-evident.

ROAD - RAIL RIVALRY

Reading the trends in the development of railway transport and road transport in recent years, one cannot help considering them in the context of keen rivalry. It serves no purpose to adopt an ostrich-like attitude and to shut one's eyes to its existence. This atmosphere in which these two modes of transport are functioning must be changed and that change depends upon a new and rational view that ought to be taken of the concept of co-ordination. Co-ordination is not anything fixed and unchangeable, but the idea and the policy based on it ought to undergo periodical readjustments in response to the rapidly evolving new patterns of demand for transport. It is often argued that the volume of traffic in India is expanding at such a rate that there is ample scope for the growth of rail and road transport and the idea of rivalry should be substituted by the idea of their complimentary nature. This argument is plausible at best. When road transport is held at low levels by a conscious direction of policy, its plain consequence is to deny it the opportunities to provide newer and more efficient and economical services which the economy now requires. At the risk of repetition it must be stressed here that the primary importance of rail transport will be there, with this difference that, in view of the financial results of their working and the heavy outlays that are required for investment to extend their net-work, a fast increasing scope ought to be assigned to motor transport, which satisfies the ends of low investment and cheap as well as efficient service.

In spite of the fact that throughout the period of the Second Five-Year Plan the railway system of the nation revealed clear signs of severe strains and at times also cracks (it will be noted that coal could not be transported to the consuming ends of certain sections without diverting the wagons booked for other sections for the consumption requirements of railway locomotives), planning in the Third Plan has not seen its way to elevating road transport to a level, where substantial relief would be provided to the railways, on which a very heavy volume of traffic is contemplated to be thrown. In terms of the Third Plan targets, the share of freight that may be moved by roads has been kept low at about 25 per cent. In the passenger sector of traffic, road transport is asserting its own place, within the limits of its permissible operations, as will be seen from Table TRNS—VIII that between 1950-51 and 1960-61 the percentage share of motor transport increased from 25.8 to 40.5 as measured by passenger miles. This increase has taken place because of the fact that there is a pent-up demand and the allocation for railway development in the passenger sector admittedly faces the inescapable prospect of overcrowding in passenger trains.

Table TRNS—IX in this Section is significant from two angles. In the first place, it shows that the available capacity of railway transport is being so heavily taxed that users who would be loath to turn away from railway transport are switching over to truck transport. In the second place, it proves the capacity of motor transport to carry goods on a regular contract basis (analogous to scheduled services) over long distances in respect of a wide range of commodities. Two important illustrations there relate to two leading cotton textile mills in UP and Madras. Then there is the noteworthy case of the Cement Marketing Company of India which diverted as big a slice as 11.4 per cent in 1959 of its bulk traffic. Martin Burn Limited illustrate the case of diversion of engineering goods to trucks. In passing, reference must be made to the impressive reliance which the Aluminium Corporation of India found it imcumbent to place on truck transport.

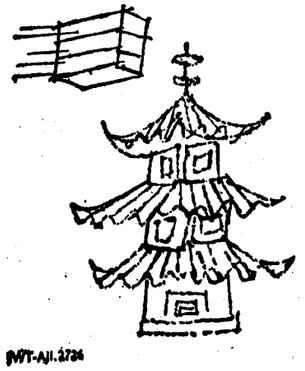
REORIENTATION OF POLICY

The mounting pressure of goods traffic in particular and the point of upper limit which is practically being reached on the railways, their expansion notwithstanding, cry aloud for a rethinking on transport policy now that roads are bound to come into their own. The wheels of progress cannot be reversed nor can we put spokes in them and deceive ourselves that we are helping to regulate their speed. It is one of the fundamental defects of our planning in the Second and Third Plans that a blunt diregard has been shown to the basic dictum that provision of transport must be made on a more than adequate scale and at least a short time in advance before the demand for traffic materialises. The Government is clearly in a state of utter confusion of mind and as an escape it has sought refuge in the handy device of appointing committees of enquiry or investigation. This is too clear from its hesitancy to allocate a place of decisively rising importance to road transport. The Road Transport Reorganization Committee tendered comprehensive recommendations which would have served as useful guides for the formulation of a more balanced transport policy than what was followed heretofore. But the spokesman of the Railway Board on the Committee submitted a note of dissent challenging the Committee's recommendations which impinged on railway transport on the technical ground that they were not governed by the terms of reference.

Soon after the labours of this Committee were finished and railway finances were found to be in a tight corner, the Railway Ministry became apprehensive (perhaps, nervously) of the impact of the competition of road transport. While protestations were being made that the growing volume of traffic can absorb the capacity of rail as well as road transport, a new inquiry was demanded on the plea of a search for a new policy for overall transport and the co-ordination of its various forms. It is rather strange that the Committee on Transport Policy and Co-ordination was assigned a vague term of reference calling upon it to recommend policies for "five or ten years". It is obvious that the Government was not clear in its own mind whether it wanted a policy for the Third Plan or for the Third and Fourth Plans. This is to function on an ad hoc basis and to make a search not for a long-range policy but for expediency.

Transport like power in our planning must be based on a perspective view covering possibly the period of our economic take-off, which is likely to extend over 20 to 25 years starting with the Third Plan. The expansion of the railways ought now to proceed at a modest rate since the dilemma of their financial working is bound to become much more complex, if road transport is relegated to its conventional low level and development outlay is allocated for substantial expansion of the railways. The time has come when in the relative scale the positions of the two ought to be changed. This is not to ignore that the railways in that case will be exposed to greater competition in respect of several revenue-earning commodities of traffic. But a judicious system of partial reservation of spheres of traffic, combined with necessary quotas in the best revenue-earning categories, can be evolved to ensure that the financial interests of the railways are not injured. This process will need periodical adjustments. But in any event the major brunt of bearing the new or additional traffic cannot now be thrust on the railways.

INLAND WATERWAYS



AMONG THE two halves of Europe, the Soviet Union possesses a decisive natural advantage of command over the widest network of inland waterways. Inland waterway exploitation is generally associated with the revival of the ancient navigable routes across the rivers or canals. In the European part of the Soviet Union

it is radically different. There a well-knit system of waterways has been developed by linking the basins of all the navigable rivers into a deep water integrated system so that a wide range of cargo in heavy bulk—timber, ores, industrial raw materials, foodgrains, to mention the chief ones—can be carried cheaply over long distances without transhipment. The entire network of 88,000 miles of waterways consists of natural waterways except for about 6 per cent share that is claimed by canals and artificial reservoirs. But this extensive system is also hampered by Nature as the waterways are frozen for over 5 months in the year. This has given an added importance to the railways which are appropriating the major part of the increasing traffic. It is obvious that in spite of the future growth of inland navigation as well as roads, the dominant position of the railways in Soviet transport will remain unassailable, unlike in most other countries. The Russians have introduced modernisation to raise the productivity of their inland waterways by deepening and linking them and now the hydrofoil ships are being introduced.

With the exception of the UK, where inland waterborne traffic has undergone a steep decline in the post-war period, all over Western Europe vigorous programmes of the revival of inland navigation are under way. It promises to reassert much of its earlier importance in the transport system. The Rhine—providing an international waterway across 1,400 km. of distance—typifies the state of Western European waterways at its best. The average annual cargo that flows through this river has risen to 100 million tons and it includes a variety of freight from timber, which is common, to cattle and potatoes and in between come heavy or industrial goods like coal and automobiles. In 1957 the total cargo which passed Western Europe's navigable rivers and canals reached the level of 66,183 million ton-kilometres, out of which a little more than half was carried in West Germany, the Netherlands came next with 17,184 million ton-kilometres and lowest was Austria with 639 million ton-kilometres, if Switzerland, which is geographically least suited for this transport, is excluded. But it is the Netherlands with its nation-wide and imaginatively planned network of waterways which stands out as a model in the world. She has 21 kilo-metres of navigable waterways per 100 sq. kilometre of land area. Western Europe's inland waterways exemplify the significant role which inland navigation can be assigned in this industrial era. Between 1950 and 1955, over 50 per cent of the cargo traffic in this sector comprised freight for heavy industry. Belgium, France and West Germany have programmes of extensive development of inland waterways.

In India the traditional part played by inland navigation in the nation's overall transport was sacrificed and considerably eliminated in the interest of the railways in the last century. Since then waterways transport has rapidly dwindled to an insignificant role. What is needed is a bold programme of the resuscitation of many of the navigation routes across the rivers and particularly canals. Assam, West Bengal and Bihar rely substantially on inland navigation for cargo traffic. Between Calcutta and Assam the annual volume of traffic carried is 2.5 million tons of which 50 per cent is borne by inland waterways. In Orissa this mode is still of some importance and its revival is receiving greater attention. The Buckingham Canal in Andhra and Madras recalls its one-time importance as a transport highway. But it is Kerala in the South which has the most extensive network of waterways relatively to the land area. One could find an analogy here with the Netherlands. A link has been established between the inland waterways in Kerala and a majority of the minor ports as well as Cochin and they are studded all over with small or medium-sized industrial establishments. But no analogy can be complete.

A small beginning has been made to revive the waterways and the Ganga-Brahmaputra Board, jointly managed by the Centre, U.P., Bihar, West Bengal and Assam Governments, is running its management. It is administering a few waterways of about 100 miles in length and one of 200 miles. Country-craft are being modernised and co-operative waterways services are being encouraged. Among the multi-purpose river projects, it is on the Damodar that some attention is bestowed on navigation. The outlay on inland waterways in the Third Plan is raised to Rs. 7.5 crores, the earlier two plans having made a token provision of Rs. 1 crore together. Two years ago the Inland Waterways Committee prepared an elaborate scheme for restoring and constructing a wide network for navigation. The main hurdle is finance, but when it will be provided, cheap domestic transport will be available to supplement the other two internal surface modes—railways and roads. One difficulty posed is points of intersection between the waterways proposed by the Committee and the railways, apart from the fact that some waterways will be either parallel to or within short distances of the railway lines. Duplication must be ruled out except where the areas are poorly served by the railways.

SHIPPING

IT WAS only natural that the phenomenal growth of world trade in the post-war period should be accompanied by a similar rapid expansion in the world's merchant fleets. Only a few figures are necessary to bring out this simple fact. Between 1929 and 1938 the total world tonnage increased marginally from 66.4 million GRT to 66.9 million GRT. But from the latter level there was a steep rise to 84.6 million GRT in 1950 and another jump to 110.2 million GRT in 1957. However, the growth in the percentage share of the combined tonnage of the countries of Western Europe in the world merchant marine showed a reverse change.

CALCUTTA 1

Western Europe's share in 1929 was 42.7 million GRT and in 1938 it was 42.3 million GRT. In these two years the percentage ratios of Western Europe's aggregate tonnage to the world tonnage were 64.2 per cent and 63.2 per cent respectively. But after the war there was a steep decline in the percentage share of Western Europe in the world total to 47.9 per cent in 1950 which recovered slightly to 49.8 per cent in 1957. This is explained by certain obvious factors. The USA emerged as a mighty partner in world trade in the post-war period and her merchant fleet also expanded tremendously. In the next place a number of maritime countries achieved political sovereignty and it was inevitable that they started expanding their national merchant navies. Furthermore, the expanding size of the merchant fleets of the Soviet Union and other Communist countries of East Europe also contributed to the decline in the majority share of Western Europe ranging in the neighbourhood of about two-thirds in the pre-war period.

Among the West European countries, six leading maritime powers are the United Kingdom, France, Italy, the Netherlands, Norway and Sweden. In absolute terms all of them increased their fleets in 1957 as compared to 1938. Even now the United Kingdom maintains its lead as the world's chief maritime nation. The United Kingdom's tonnage in 1957 was 19.9 million GRT and next among the countries came Norway with 8.5 million GRT, followed by the Netherlands, Italy, France whose tonnage was about half the size of that of Norway. Sweden's 3 million GRT is surely quite impressive for the size and the role she has traditionally played in the overseas carrying trade.

One of the most outstanding features of the growth of merchant shipping in the world is the top priority given to the acquisition of tankers. This development came in the wake of the insatiable demand of all the countries, developed or undeveloped, for consumption of oil fuels. It is important to recall that in the six countries the increase in the dry cargo tonnage and the passenger steamships in 1958 as compared to 1929 was only of the order of 0.5 million GRT, but during the same period the expansion of the tanker fleets took place by an increase of 300 per cent to 16.6 million GRT. Taking the six countries separately, the additions to their merchant fleets between 1947 and 1958 were of the order of 17 million GRT, out of which 66 per cent were accounted for by tanker tonnage. It is too premature to expect that nuclear-driven ships and submarine tankers and dry cargo ships would make their presence felt as normal competitors within the next 10 to 15 years. But their advance cannot be postponed much further. Fifteen years is a very short span in the history of world shipping. Its fierce implication is that this technological development will pose a very serious challenge to the developing countries which are, as the naked reality exists today, driven to a desperate struggle against odds created by the established nations in expanding their merchant marines.

In the Soviet Union very impressive strides were made in the expansion of the merchant navy since the Revolution. During the Czarist regime shipping operated on a very narrow plane, but today it occupies the second highest place in the Soviet Union's transport system. During World War II the merchant fleets of the Soviet Union were destroyed or badly damaged on a very substantial scale and rehabilitation was a task of immediate priority. Not only was rehabilitation completed within a short time but very substantial additions to the tonnage were made. The additions to the pre-war tonnage are of the order of 66 per cent. With the characteristic Soviet policy of introducing rationalisation every where, the ships which were constructed in the Soviet ship-yards either for replacement or new additions were of the most up-to-date modernised designs. They also possess high capacity and in the case of dry cargo vessels it ranges around 5,100 tons while the tankers have a capacity of 15,000 tons to 20,000 tons. Practically the whole of the Soviet merchant fleet is employed in the overseas trades while a small component is reserved for the coastal routes.

In India the way was clear for launching a programme of expansion of shipping after Independence. Already before the First Plan started coastal shipping was exclusively reserved for Indian bottoms in conformity with the universal practice among the maritime countries. Some measure of expansion came during the First Plan and the tonnage increased to only 4.81 lakh GRT primarily because the backlog of post-war rehabilitation had to be cleared on a relatively large scale. In the Second Plan an allocation of Rs. 53 crores was made for the development of shipping and the tonnage was nearly doubled to 9.05 lakh GRT. This, however, was quite a small achievement considering the extensive sea-board of the country and its enormously growing volume of trade in the wake of the five-year development plans of India's tonnage in her external trade is merely 8-9 per cent. In the Third Plan the National Shipping Board suggested a net target (after making allowance for replacements) of 14.2 lakh GRT, but on considerations of strict rationing of foreign exchange it was pruned to 11 lakh GRT. The capacity of the Hindustan Shipyard at Vishakhapatnam is throughout fully booked and the consequence is that a substantial part of the acquisition of tonnage has got to be procured from foreign countries. But it should not be presumed that constructing ships at Vishakhapatnam yard or making outright purchases from foreign shipyards makes much difference to the foreign exchange expenditure, because the indigenous component of ships built at Vishakhapatnam is small and of the order of about 20 per cent, while the engines and all the other important parts are imported and fitted into ships constructed at Vishakhapatnam. This fact is often ignored when the number of ships built at Vishakhapatnam is highlighted in discussions on shipping.

Why
this symbol
now means
more to you

Familiar as you are with this symbol as the mark that identifies the finest products in tyres, tubes and automotive accessories, it now gains added significance as Goodyear India's giant factory goes into production on a 70-acre site at Ballabgarh, 21 miles from New Delhi.

Representing a capital investment of Rs. 6 crores this factory houses the most modern tyre-making machinery including the revolutionary, exclusive 3-T Process developed by Goodyear India's American associates after 5 years of research and an expenditure of 5 million dollars.

The Indian factory is the 59th Goodyear plant in the world... the latest manufacturing unit to help further Goodyear's programme of serving people everywhere, in all walks of life. This factory will have full access to the experience, know-how and technical resources of the vast Goodyear international organisation, which is continually engaged in developing new products and improved processes.

At Ballabgarh, Goodyear India has not merely laid the foundation of a factory but also of an ideal—the ideal of serving India's expanding economy and at the same time, building an international edifice of progress and goodwill.

India has made her debut in the field of tanker tonnage and in the Third Plan there is a provision for acquiring one coastal tanker of the capacity of 7,500 GRT for carrying the products processed at the refineries in India and three tankers of total tonnage of 53,000 GRT for plying the overseas trade. But, in effect, their operations will be completely absorbed by the transport of crude oil from the Middle-East to the refineries in India.

India's five major ports of Calcutta, Bombay, Madras, Vishakhapatnam and Cochin could not bear the rising pressure of traffic and further the first two had to take the additional load created by the diversion of India-bound cargo from Karachi consequent on partition. A major port was built at Kandla to fill the vacuum. Table TRNS—XI traces the trends in the traffic handled at the six major ports between 1950-51 and 1960-61. The last four years of the Second Plan are vital as the development programmes generated a sudden spurt in the demand for imports as well as in exports and for port facilities on an unprecedented scale. The traffic at Calcutta shows that the saturation point was being approached. Imports in Calcutta port declined from the 1957-58 level of 5.6 million metric tons in the next two years, but recovery in 1960-61 was short of the former peak year. Exports have a similar experience. In Bombay port there was, by and large, a progressive handling of the cargo except in 1958-59 which was the year when congestion in the two premier ports reached a high proportion due to the concentration of arrivals of foreign ships carrying imports for the plan projects.

The importance of Madras is due more to the sizeable imports than to exports. Incoming cargo in Vishakhapatnam rose steeply in the Second Plan by more than 150 per cent, while the port cleared a larger than its conventional share of exports partly due to ore exports to Japan. Cochin has a minor role to play. Kandla is demonstrating the extent to which it is relieving the pressure on Bombay and Calcutta of incoming ships from abroad. Imports in Kandla increased in the Second Plan nearly three-fold. The total cargo handled at the six major ports at the end of the Second Plan was 34.05 million metric tons, which is to be compared with the volume of 24.42 million metric tons at the end of the First Plan. During the Third Plan outlay is to be devoted to improving facilities at the major ports and completing the projects thrown forward from the Second Plan. As the capacity of these ports is now raised to 49 million tons together, and it is estimated to be adequate for the inward and outward cargoes, no additions to it are to be undertaken in the Third Plan.

CIVIL AVIATION

AVIATION DEVELOPED as a very potential defence arm during the last war and this key position which it acquired all of a sudden gave it a prominent place in the civil transport system of all the countries without any exception, whether industrialised or backward. For it was of the essence of defensive preparation that in normal peace times there should develop in each country a powerful network of airlines as a second line of defence. During the post war period whenever emergencies arose, civil aircraft have been switched over to defence purposes on the limited scale of requirements without any difficulty. A powerful network of civil airlines also helps to build up a potential force or pilots and other technicians. This is the root cause of the spectacular stimulus which civil aviation has received in the post-war period. Apart from this, there is also an important factor to reckon, namely, that the exigencies of business and its rapidly growing size necessitated vast expanding aviation services. Comparisons between the modest performance of the Western European airlines immediately after the end of the war and at the present time are not necessary because the phenomenal growth speaks for itself and, besides, what appears a mighty achievement today might dwindle into a small performance only in a matter of another decade or half.

The most important development which has taken place to strengthen the structure of the Western European airlines, apart from the efforts contributed by international civil aviation co-operation, is the trend towards integration. In fact, it is well-nigh impossible today to think in terms of the economic growth of Western Europe without thinking in terms of more and more intimate integration. In the wake of the establishment of the European Economic Community came the move for the merger of the airlines owned by four leading countries and the result was the unification into a single European airline of Sabena, Alitalia, Air France and Lufthansa. This integration is based on the pooling of aircraft, spares and equipment, common use of maintenance facilities and navigational aids, not to speak of common commercial management including convassing for business. This is no small advantage when it is considered that the arrival of the Jet Age, the compulsion to resort to obsolescence at a heavy financial cost and acquisition of jet or turbo-propelled aircraft at a still higher cost threaten to create extreme strains on the finances of the airlines. Integraion will reduce the size of the air fleets without any detriment to the carrying capacity. Parallel with his came another move of integration. It was the agreement between the Scandinavian Airlines System participated in by Norway, Sweden and Denmark (SAS), on the one hand, and Swissair, on the other. This agreement is not tantamount to a total merger of the physical stock and the capital funds, but it extends to the arrangement of pooling the jet fleets and a common arrangement for their maintenance and repair. Integration inevitably brings along with it standardisation not only of the equipment but also of the operating modes and the navigational facilities. To this end a common system of control of air transport in Europe is envisaged and it will operate under the name of Eurocontrol.

The most urgent need for the rationalisation in the field of civil aviation is the provision of long runways for the landing of jet planes. The whole system of navigational aids also will require a complete rehaul in order to place their use at the disposal of aircraft flying at abnormally high altitudes. Sabena (which is now a partner in the single airline of the Four referred to above) made history by introducing its international helicopter service which promises to expand inter-city travel on the Continent on a rapidly increasing scale. Coming to the question of inter-city travel, it would not be an exaggeration to say that Western European air travel partakes of a very powerful complexion of inter-city travel for the reason, that Western Europe is divided into such a number of States for its size, that even this travel may be regarded as inter-city travel within the borders of the Continent. The distances are so relatively short that they are a positive hindrance to the flying time as well as operating costs. In America, Russia, India, Brazil and China, long distances give air flights the true character of flights. But, by contrast air travel within Europe is not like flights but like taking hops at short intervals. This causes interruption and enhances costs. Air fares for inter-European travel will not be so cheap as in America or any other country with a large land mass. One outstanding pecularity about civil aviation in Europe relates to Iceland. This is a unique country where no form of transport except

air travel is normally suitable for domestic traffic. It will be certainly a revelation that even ordinary consignments like cattle and everyday provisions, not to speak of other bulk commodities, are transported even to the villages of Iceland by air transport.

In the Soviet Union, the Aeroflot has made impressive strides as in most of the countries in the post-war period. In the domestic sphere, too, civil aviation has expanded rapidly chiefly because the geographical factor favours the growth of internal air travel. The distances are long and therefore the operating costs as well as the waiting time tend to be lower. This enables the Soviet Government to reduce air fares which are now being put on a parity with the fares charged for first-class travel on the Soviet railways. The record progress made by Russia in space flight presupposes that here position in the normal air transport will remain outstanding.

In India, civil aviation has registered the same speedy progress as in most other developing countries which stand near about the level of her economic growth. The progress recorded after Independence can be gathered from the figures tabulated below:

	1948	1959	% increase in 1959 over 1948
KM flown (mill) ..	20,352	39,817	96
Passenger KM (mill)	283,772	938,730	231
Cargo ton KM (mill)	4,622	30,624	563
Mail ton KM (mill)	1,073	11,051	930

One of the difficulties which civil aviation in India has had to face throughout the post-war period is the balancing of revenue and expenditure. To start with, civil aviation was a private enterprise, but the domestic airlines especially demonstrated by their operations that nationalisation would solve the problem of bearing the financial burdens which the private investor cannot be expected to do. The experience over the years has shown that there is a limit also to the capacity of the State to cope with the burdens imposed by civil aviation. It was in 1959-60 that the state-owned Indian Airlines Corporation could manage to earn a small profit. Otherwise the record has been one of deficits. This is not the full part of the story. It would appear that for the time being at least a saturation point has been reached in the capacity of the Indian Airlines Corporation (which plies the internal routes) to cope with the pressure of genuine business demand for air travel. A pragmatic approach has been made to this problem and flexibility has been introduced in the policy to allow private airlines to ply the air services, whether domestic or international. Air India International, however, has a record of good operating performance, comparable with that of the external airlines of many other countries, and, besides, its financial management on the whole has been quite sound. As in other countries, so in India, the immediate problem posed is to provide extensive runways for the jet planes and also to provide navigational facilities for their high flights. Air India International has in its fleet 3 jet aircraft and one more is due to be delivered shortly. In the Third Plan, 4 more jets will be acquired raising the total strength of the jet component of the fleet to eight.

PIPELINES

THE LATEST addition to the forms of transport on national scales is pipeline communication. Practically everywhere the beginnings have been made, but what is of great significance is the future potential of this mode of transport with leaps and bounds in the demand for oil and oil product consumption. It is well to remember at the outset that pipelines are used not only for the export of fluid cargo but also of solid fuels like coal products. Western Europe has made a beginning in this field and action is being taken to meet the situation that will be created when coal will be substituted by oil fuels as well as by gas. The two countries which have made a great headway in pipeline construction in Western Europe are France and Germany. In France more than a million tons of petroleum products were transported by pipelines from Le Havre to Paris in 1957. The construction of the longest pipeline of Europe between a point on the Atlantic coast and another on the frontier between Germany and France was taken in hand in 1958. The first pipeline for carrying natural gas runs through France and the second major line is planned from Genoa to Switzerland and possibly to Germany. This pipeline acquires special significance in view of the fact that it will be the first trans-alpine pipeline and will solve many of the problems of transport to which barriers have been created by the Alps.

In Russia the construction of pipelines was retarded for the first few years after the end of the war only because of the urgent priority demanded by the railways and water transport and partly because of the insufficient availability of steel pipes. But during the last decade pipeline construction is being pursued with vigour and there has been a three-fold increase in the length of the lines and about 10½-time increase in the throughput.

The discovery of more oil resources in India and the promise of still more has made it possible for this country to add pipelines as a new form of transport to its network of communications. Two pipelines were taken up for construction, to begin with, from Assam to Nunmati and the other one to Barauni. The pipeline terminating at Nunmati refinery will extend over a length of 250 miles out of which about 30 miles remain to be laid, whereas the pipeline to Barauni covering a distance of 470 miles is expected to be completed in 1963. These two pipelines are intended for the transport of crude petroleum from the Assam Oilfields to the refineries at the two towns. During the period of the Third Plan two more pipelines are envisaged for carrying the processed oil products from the Barauni refinery to Calcutta and to Delhi, for it is the Barauni refinery which will market its products in the rest of the country excluding Assam.

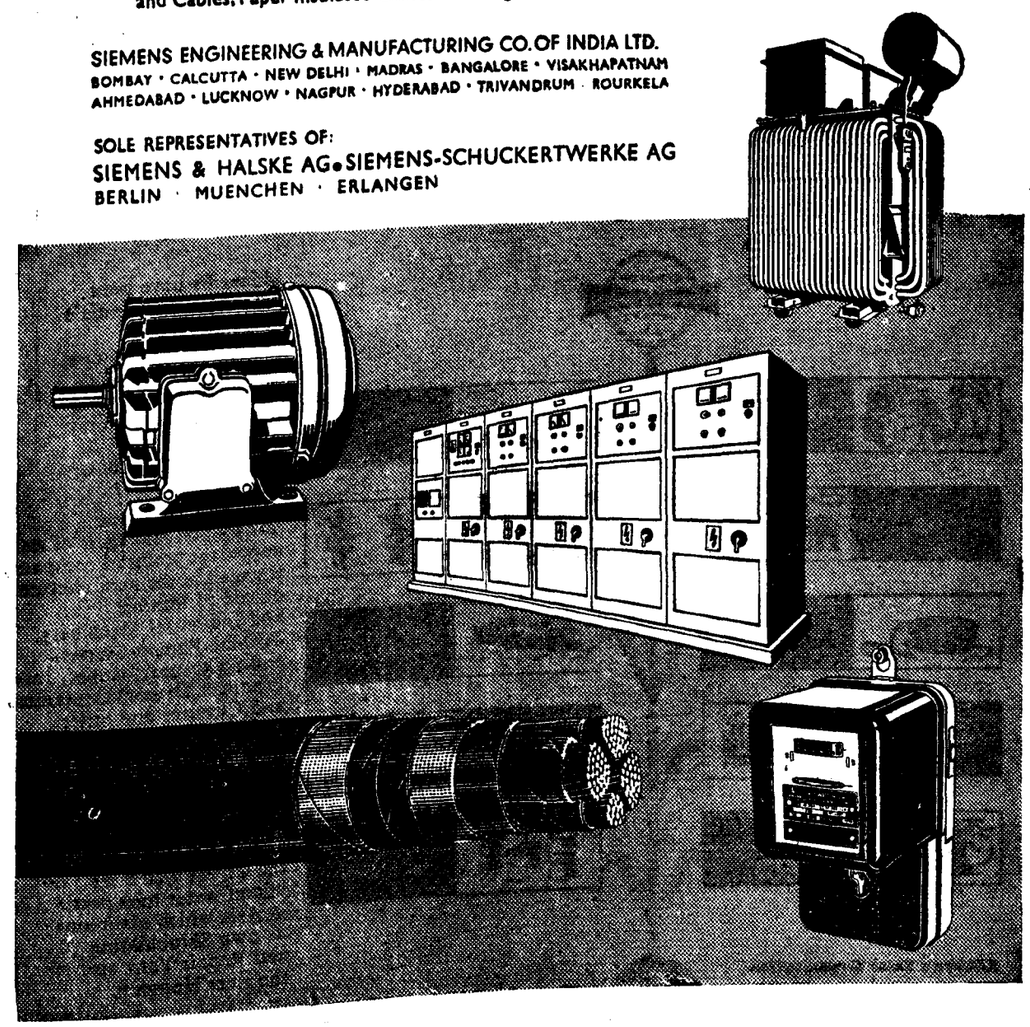
SIEMENS
INDIA

POWER FOR PROGRESS

The Siemens Organisation makes significant contributions to every aspect of the electrical industry.



Siemens offer a wide range of equipment to generate, convert and convey electric power—to scale power down into the microwatt range and to step it up to the megawatt range.

All these Siemens products are backed by over a century's experience in all spheres of electrical engineering.

Equipment manufactured in India in collaboration with independent Indian Enterprises, under Licence Siemens Germany, includes Motors, Transformers, PVC Wires and Cables, Paper Insulated Cables, Switchgear, Meters, etc.

EXPORT ENQUIRIES INVITED FROM Countries in MIDDLE EAST, SOUTH EAST ASIA AND AFRICA.

EVERY MACHINE IS FULLY GUARANTEED.

Macneills have been associated with India's commercial and industrial development for almost a century, and with the growth of the country's economy, Macneills' services to commerce and industry have grown.

Macneills today are owners and managers of an important group of companies engaged in the manufacture or sale of Mining and Industrial Machinery, Turbine Pumps, Starters and Switchgear, Ropes, Jute Products, Drums, Containers and Closures and other Light Industrial Products for the home market and for export.

They are important producers of Coal and Tea and also operate the largest system of inland water transport in Asia which maintains its own Shipbuilding and Repair Yard on the river Hooghly.

Kilburn's Sales Organisation throughout India is actively utilised for the Group's Products.

* Excludes Bunkers — 101 thousand metric tons. ** Excludes Bunkers — 80 thousand metric tons.

Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products, paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.

THE HONGKONG BANK GROUP

YOUR KEY TO WORLD TRADE

During 1959 and 1960 this Group of Banks, comprising over 120 branches throughout the world, pooled their vast resources. With their extensive experience and intimate knowledge of world affairs each is superlatively well equipped to offer a comprehensive service. Their informed counsel and invaluable help could be your 'key' to profitable trade.

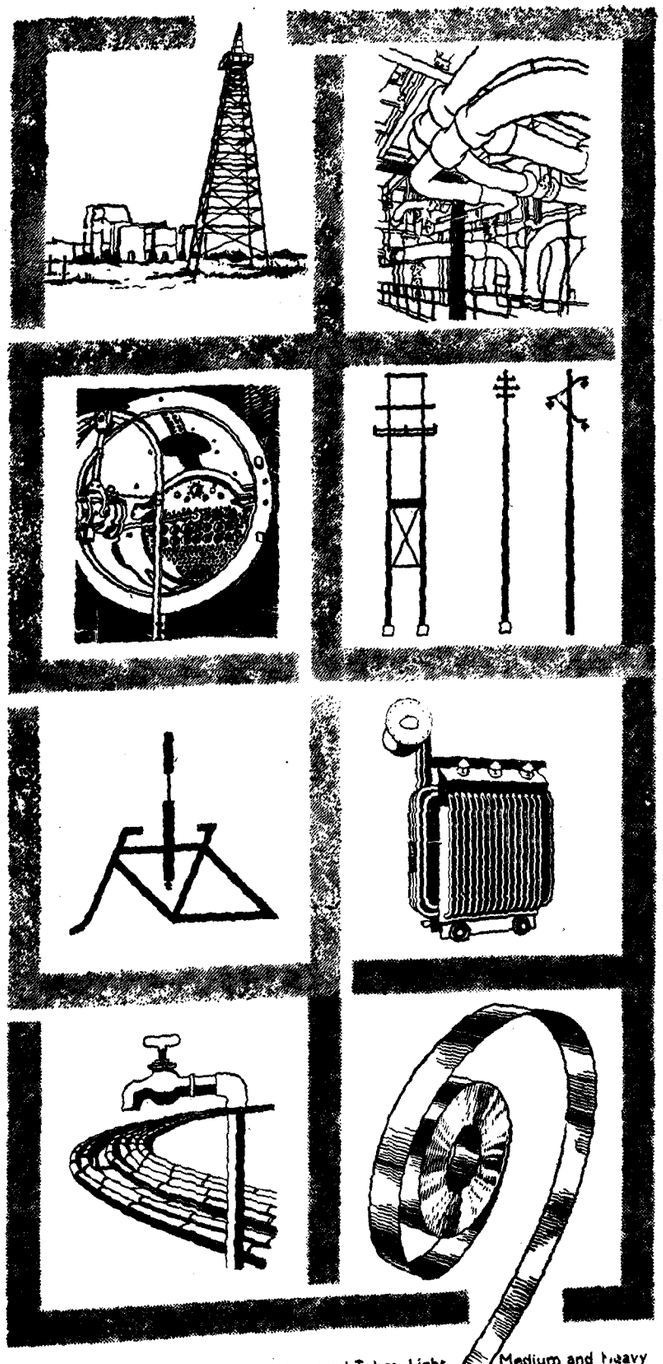
Trade: India and Europe

GLOBAL SHIFTS

A DISTINCTIVE development which has taken place in the world trade in the last two years is a shift in the relative weights of the shares of the main regions. Apart from this, a vital fact to note is that the year 1960 recorded a peak level of $125,000 million in world exports including those of the Communist bloc. Industrial output in 1960 showed a lower rate of increase of 7 per cent as against 10 per cent in 1959, but, in spite of it, world exports went up by 11 per cent in 1960 as against 8 per cent in 1959. This was the year in which America was fighting the recession and, more important, she was launching a frontal attack on her balance of payments deficit. Her imports underwent a contraction as a result of this pre-occupation, but the intake of her exports by Western Europe increased substantially. America's trade balance began to look up in 1960, though the overall balance of payments deficits persists for reasons which are well-known.

Easily the highlight of world trade in 1960 is the impressive expansion of Western Europe's share in it. In particular, this is remarkably evident about the European Economic Community. The exports of the EEC in the global context underwent an acceleration, but the vital fact is that intra-EEC exports rose much faster. This point is elaborated further at a subsequent stage. The share of the Communist bloc of Europe in world exports showed an increase in contrast with some decline in the intra-East European exports. In absolute terms the value of this increased share may look small, but its important aspect is that it has stimulated East-West trade.

America and Britain are the two countries whose trade balance as well as the balance of payments assume importnce by reason of the fact that the dollar and sterling are the accepted universal currencies of external payments. Both these countries suffered a decline in the share of their trade in world exports. Taking a long-range view, between 1948 and 1960 the value of the combined exports of 9 Continental countries of Western Europe (West Germany, Belgium and Luxembourg, Denmark, France, Italy, the Netherlands, Sweden and Switzerland) increased by 190 per cent, but America and Britain had a much smaller increase in their exports during the period of the order of 50 per cent and 54 per cent respectively. This significant trend not only shows the phase of prosperity which Continental Western Europe has embarked upon but also a long-term shift in the regional balance of world trade.



The economically backward countries had a comparatively poor luck in their external trade in 1960. This is too true of their exports to the advanced countries which underwent a slowing down of the rate of expansion. In absolute terms, however, the exports of the backward countries to the advanced ones increased in 1960 by $600 million in a telling contrast with a steep increase of $7,000 million in the trade of the latter among themselves. But the fact remains that in the expansion of world exports their share is declining. Their imports from the countries showed a very steep rise largely owing to their programmes of economic development, but the net effect was to raise their import surplus much higher. This is virtually equal to their balance of payments deficit because invisibles play an insignificant part in their external account. In this disconcerting picture a ray of hope was that the trade between the backward countries 'inter se' registered an increase.

SPOTLIGHT ON COMMON MARKET

It was but inevitable that such an epoch-making development as the rapid emergence of the European Common Market should hold the spotlight on the world trade scene during 1960. While the economies of the U.S.A. and Britain were struggling hard with the problems of balance of payments, the Common Market was rapidly forging ahead because of the comfortable surplus position in the external account of its leading members. For a time it looked as if the bifurcation of Western Europe between the European Common Market and the European Free Trade Association would hold a threat of acute regional competition and avoidable dissipation of the resources of the two trading blocs. The logic of experience, however, has proved that not bifurcation but progressive integration is in the best interest of Western Europe, because if Western Europe is to rise it must do so by remaining unified. Bifurcation would only mean the weakening and the ultimate relegation of Western Europe to an unimportant place in the global economic scale.

The Common Market undoubtedly throws a mighty trade challenge to the rest of the world, the Communist bloc not excluded. But the present pre-occupation with the impact of the Common Market is largely confined to the new challenges which the outside countries of the non-Communist world will have to face. In this category come not only the industrialised countries of the U.S.A. and the members of the E.F.T.A. but more significantly the under-developed countries also which lie outside the Communist orbit. The present is a phase when the Common Market has just launched the common external tariffs. It may give the superficial impression that this move is indicative of narrow economic regionalism inasmuch as the common regional tariff, which will apply to the imports from the non-member countries, will undoubtedly range much higher than the tariffs which are levied on intra-Common Market imports. But the truth of the situation is — and this is one of the basic principles behind the Rome Treaty — that, once a sufficient measure of economic integration has been achieved in the fields of trade and industry, the external tariffs too would be lowered in progressive but slow stages, so that the Common Market will be one of the powerful levers for restoring freer trade on a multilateral basis.

The Common Market as it rises from strength to strength will create new problems of competition in world trade and this would mean that the outside countries will have to make a two-pronged attack in their struggle to retain and increase their shares in the world export market — in the direction of lower prices and superior quality of the goods they produce for export. This essentially will be a function of higher productivity in their industrial as well as agricultural production and it can be brought about by successive advances in technology. The long-term effect of the Common Market, therefore, will be to stimulate a powerful effort for absorbing the gains of technology not only in the industrialised but in the under-developed countries. This will be no small benefit to the world economy as a whole. What it would mean is production for catering to the requirements of mass consumption. Mass production presupposes higher incomes and a higher standard of living. This effect cannot be restricted to the economically advanced parts of the world, but its gains will also be distributed among the under-developed countries, since there can be no compartmentalisation widening the gulf between the rich and the poor countries without creating dangerous instability. The area of economic co-operation and assistance will perforce need to be widened. It is in this comprehensive and long-term setting that the role which the Common Market is destined to play in the years to come ought to be seen.

BRITAIN LEADS THE QUEUE

Undoubtedly a very important development which has taken place in relation to the Common Market is Britain's decision to apply for the membership of the Common Market. This decision is a clear recognition of the experience in the recent past that E.F.T.A. cannot function with dynamic vigour. Britain's decision to negotiate for the membership of the Common Market may be taken as a positive indication that EFTA is on the way of progressive disappearance as one after the other of its members, or at least a majority of them, seek to join the Common Market. The developments which have taken place subsequent to the British Government's decision on joining the Common Market are too fresh to require reiteration here. It would be in the last quarter of the current year that the final decision and the conditions on which Britain would be admitted in the Common Market may be finally settled. Britain's task is two-fold: To enter the Common Market with the minimum of disturbance to the pattern of trade of the rest of the Commonwealth countries and, next, not to cause any upsets to the trade and production patterns of the remaining members of EFTA.

How far the boundaries of the Common Market will extend is not precisely predictable at the present moment. Britain's readiness to join is significant in the sense that the possible trend towards Western European division is being reversed. Thus it may very likely be that the Common Market will be practically co-extensive with the whole of the major part of Western Europe. But the Common Market policies have extended beyond the frontiers of Europe because the dependencies of the members of the Common Market Six have, in pursuance of the Rome Treaty, been admitted to the associate status, whereby they come within the beneficiary jurisdiction of the policies of the Common Market without, however, being full-fledged members and having a voice in their determination. A new problem was, nevertheless, posed with regard to the associate status by the achievement of independence by a number of countries which were former dependencies of some of the members of the Common Market. By reason of the colonial tie the economies of these newly independent countries were so closely bound up with those of the metro-politan countries, and their trade is so heavily dependent on them, that it is undesirable in the extreme to bring an abrupt end to it. Such a situation, in fact, was never contemplated in the process of transfer of power. A modification was, therefore, introduced and associate status was also accorded to certain countries, which, at the time of the signing of the Rome Treaty, would have been entitled to it, but were not, according to the strict letter of the Treaty, subsequently entitled to it by reason of the transformation of their dependent status. But the idea of associate status is now being liberally enlarged to bring in a number of countries other than the dependencies of the members desirous of direct ties with the Common Market.

ASSOCIATE STATUS: NEW LOOK

Greece set the ball rolling in this process. She was the first to apply for the associate status and an agreement was signed on July 9, 1961, between the Common Market and Greece whereby certain special provisions were made to accommodate Greece during a period of transition. For instance, in the case of specified competitive imports of Greece from the EEC countries, her tariffs are to be dismantled over a period of 22 years. A loan of $125 million will be provided to her from the European Development Bank according to a phased programme of 5 years and repayable in 25 years. The essence of these provisions is to accord a special treatment to the agricultural exports of Greece and to enable her to raise her economic level over a period of 25 years, so that she may be enabled to discard the special concessions and be eligible for membership. It is most likely that at the end of 25 years, when Greece raises herself to a position of economic strength where she could bear the strain of the Treaty obligations, in regard to the abolition of internal tariffs and adoption of common economic policies, resulting from the membership of the Common Market, she will be welcomed in the European Economic Community as a full member. The whole tenor of the agreement conferring the associate status on Greece seems motivated by this object. The Greek precedent sets a pattern which may be extended and applied to more countries with suitable variations.

MORE MEMBERS

The process of the enlargement of the area of the Common Market is bound to continue in the near future. With the inevitable dissolution of EFTA in the course of time, it was only to be expected that its other members would follow the example of Britain and seek membership of the Common Market. It is not suggested that this change is taking place either by a unanimous decision or on a large scale simultaneously. But the trend towards the change does not leave room for doubt that the majority of the members of E.F.T.A. would like to align themselves with the Common Market. Denmark finds a compelling reason to seek entry in the Common Market in view of Britain's initiative. Inside the Common Market, Denmark's biggest customer for agricultural products was West Germany, but she found the balance of advantage in keeping out since the British market was much more valuable for her exports and therefore for her economy. This is the main reason which has influenced Denmark's decision to follow Britain. Norway is another member of the E.F.T.A. which would find that entry is to her eventual benefit. Turkey's candidature for membership of the Common Market is pending consideration, but here a number of issues are involved which are not capable of direct or easy solution. Turkey stayed away from alignment with either so far, but her political and defence commitments with Western Europe and her vulnerable situation on the Russian frontier argue for special treatment to her. Then there are certain other countries whose position is undecided at the present time like Spain, Portugal and Ireland. Among the neutralist countries, Sweden and Switzerland have to make up their minds. But political compulsions rule out any change in the neutral status of Austria and Finland. If Austria is a member of E.F.T.A., it is because E.F.T.A. has no political goals.

ECE: ACCELERATED GROWTH

Between 1950 and 1959, the rate of economic growth in the Common Market countries had been of the order of 6 per cent in contrast with the rate of 2.5 per cent recorded by Britain, the leading member of E.F.T.A., during the same period. This picture virtually puts in the correct perspective the difference in the potential of the economies of the Common Market countries and the E.F.T.A. countries in a broad manner. But after the formation of the Common Market, its rate of growth got an acceleration. This is reflected in the trade pattern of Western Europe within itself. Below is tabulated the pattern of intra-Western European trade between the years 1957 and 1960. The percentages mentioned there are based on the export values. At the outset the fact ought to be emphasized that the reduction in the internal tariffs of the E.E.C. started at the beginning of the calendar year 1959 and the change in the tariffs of E.F.T.A. was introduced much later in July 1960, so that these tariff changes represent a two year period for the E.E.C. in the tabulation below. Two years is a very short time in which to expect anything like a fair effect of their changes. But whatever effects are noticeable ought to be taken as a small beginning, giving a reasonable idea of the deep impression which they will make on the trade flows in the coming

years. Furthermore, there is another clarification to be made which is that the benefit of E.E.C.'s first internal tariff reduction of 1959 was extended to almost all its external trading partners:

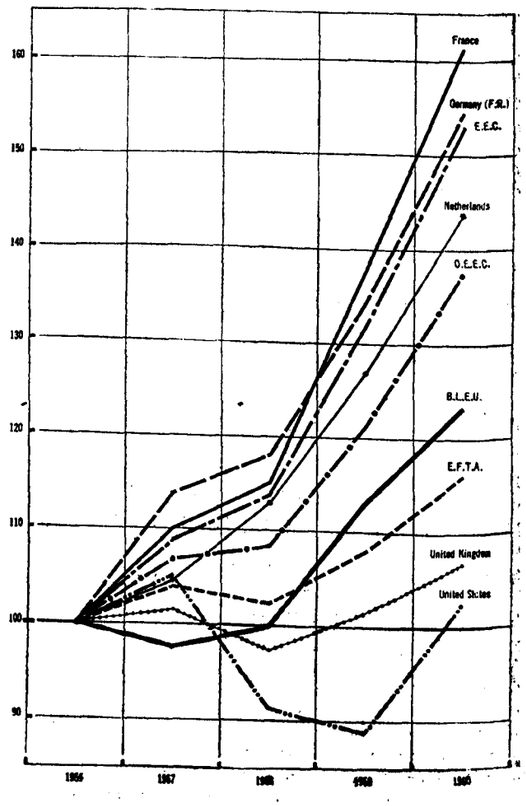
THE PATTERN OF INTRA-WESTERN EUROPEAN TRADE

(Percentages based on Export Values)

Exporting Area	Year	Importing Area			
		EEC	EFTA	Other Western Europe	Total Western Europe
European Economic Community	1957	32.0	22.1	5.0	59.1
	1958	31.6	22.8	5.1	59.5
	1959	33.8	22.4	4.8	61.0
	1960	35.2	22.4	5.0	62.6
European Free Trade Association	1957	16.6	13.1	4.0	33.7
	1958	16.3	12.8	4.2	33.3
	1959	15.9	12.4	3.9	32.2
	1960	14.7	11.9	3.8	30.4
Other Western Europe	1957	3.2	3.6	0.4	7.2
	1958	3.1	3.7	0.4	7.2
	1959	3.0	3.4	0.4	6.8
	1960	3.1	3.6	0.3	7.0
Total Western Europe	1957	51.8	38.8	9.4	100.0
	1958	51.0	39.3	9.7	100.0
	1959	52.7	38.2	9.1	100.0
	1960	53.0	37.9	9.1	100.0

Sources: OEEC Statistical Bulletins — Foreign Trade, Series IV and A, February 1961.

The above table, even within the restricted room for interpretation of trends that it allows, shows the advance recorded by the EEC over EFTA. It will be seen from this table that the EEC's share in intra-Western European trade increased in the year of the introduction of the new rates of internal tariffs by about 1.5 per cent. But from 59.5 per cent in 1958, it jumped to 61 per cent in 1959 and to 62.6 per cent in 1960. An important fact to be noted is that the share of the intra-EEC imports went on increasing, whereas imports from EFTA into the EEC not only remained static during the last two years but declined from the peak of 1958. EFTA, however, shows a contrary trend which is to be gathered from the fact that its share in the intra-Western European trade declined from 33.3 per cent in 1958 to 30.4 per cent in 1960. The intake of its exports by the EEC also declined by 1.6 per cent between 1958 and 1960. It is significant that intra-EFTA trade showed a slow decline of 0.9 per cent between the same years. These initial indicators show the comparative stage of stagnation in which EFTA economy as a whole found itself involved and the vigour with which the EEC's internal trade rose.



The EEC's external tariff was introduced in 1961. This is its distinguishing feature from EFTA. It need not, however, be apprehended that the adoption of a uniform external tariff is a measure to shut out competitive trade of outside countries with the EEC. It is a part of the strategy of the Rome Treaty to reduce the external tariffs after a transitional period, when the internal economy is fully consolidated. The instrument of a common external tariff will thus be used for the liberalisation of trade with outside countries, for that alone will lead to its objective of the achievement of freer trade. The pace with which the Common Market is marching ahead has not only belied the original doubts about its success but even surpassed the expectations which were raised once these doubts were dispelled. This change in the outlook for the Common Market and the hard logic of the great harm that will be caused to Western European economies by dividing them into two trade blocs has induced the incipient trend towards the widening of the frontiers of the Common Market and the entry of the member countries of EFTA as well as the association or entry of countries which belong to other regions.

AMERICA'S ATTITUDE

America's attitude to the Common Market has been one of unflinching support from the very start and it is no secret that she used her moral pressure on her Western allies from the beginning to participate in the Common Market. When it is recalled that the wage and price structure of the American industry is higher than that of the Westsrn European countries, it should at once be clear that the attitude of ardent advocacy of the Common Market was by no means a matter of indifference to her. She is fully conscious of the fact that she has to lay a greater stress on productivity based on rapid technological advances in production techniques. America's staunch support to the idea of the Common Market is based on a long-range and imaginative outlook. The EEC, EFTA and America taken together would represent something like 85 to 90 per cent of the industrial potential of the non-communist world. Here lies the basic reason why integration, accompanied by a sort of co-ordination on the part of the Market, has been deemed necessary, as a counterpoise against the fierce offensive of competitive co-existence which Russia has already launched against the Western countries.

The main argument for establishing and vitalising the European Common Market is quite simple. It is

EVOLUTION OF EXPORTS BY VOLUME
1956 = 100

that a cohesive and integrated economy of Western Europe would race ahead and make for a growing and healthy market in which the standards of consumption would go on rising progressively which, in turn, would give an impetus to still greater production and trade all round. That alone is the way to sustain the strength of the non-communist world in safeguarding democratic values based on individual freedom. But there is yet another powerful reason which has motivated America in lending full support to the Common Market. Prosperity in Western Europe and its capacity for a rapid rate of capital formation would enable it to share the responsibilities of assisting the economic growth of the underdeveloped countries. Throughout the post-war period and until the Western European countries achieved convertibility of their currencies at the end of 1959, American aid, whether economic or military, has been a potent factor in their recovery and expansion. It only reasonable for America to expect that the Western European countries should play their part in relation to the underdeveloped countries of Asia, Africa and Latin America.

INDIA'S REACTION

India's reaction to the Common Market was somewhat passive until the last year, when Britain made her decision to join it. Since then it has become one of grave apprehension to her trade interests, particularly her exports to Britain. It will be recalled that Britain's share in the export trade of India has conventionally been the largest and, although there has been some measure of diversification in our exports, her relative share remains at the top. At present, it ranges around 29 per cent. This high share is attributable, apart from the logical consequences of colonialism, to the entry of duty-free exports or exports at low preferential rates from India as an integral part of the scheme of preferential tariffs introduced since the Ottowa Agreement. The apprehensions are based on the ground that the abolition of these tariff concessions and the obligation for Britain to adopt the common external tariff of the EEC will raise barriers against India's exports at a time, when they are finding the weather already unfavourable for their flow. There is no doubt some element of reason and truth in these fears.

But there are two factors which have not received the full attention that they deserve in an assessment of the consequences of the entry of Britain into the Common Market. They are that, although the Common Market's external tariff introduced last year ranges as high as 23 per cent for jute, cloth and bags or 18 per cent for tea or 15 per cent for cotton piece-goods, as against the free entry of these staple exports of India into Britain, the inelasticity of demand for most of them is an important determinant to be taken into account in assessing the impact of the external tariffs. It should be conceded at once that so far as our grey or unbleached cotton cloth is concerned, the loss of absence of duty in Britain will draw us into strong competition with Japan and China. But taking most of the other staple exports like tea, jute, and so forth, there is the positive advantage of virtually inelastic demand in their case. On the contrary, with the increase in population, the consumption of tea will go up and what is more important, the rapid pace of industrial growth in Britain, when she gets out of the state of stagnation, will generate a continuously rising market for most of our exports which have an important place in our trade. But more important than that, a long range view ought to be taken of the direct effect of the fast growth of the economies of the Common Market countries, the spectacular demand that will be created for industrial raw materials as well as consumer goods. It is a mass consumption market that will emerge and develop rapidly in the EEC projecting into the world market. Preferential or no tariffs may have been quite appropriate in the context of the historical past, but in the post-war era when the mass consumption market is coming into its own in the West, it is futile to rely on the marginal advantages accruing from tariff discrimination. The hard way by which our export trade has been obliged to make its progress since the Second Five-Year Plan has already served as an eye-opener to us that the abiding secret of our export potential lies in our competitive efficiency and the growing market in Western Europe will provide opportunities for it. It is too premature to be pessimistic about the outcome of Britain's negotiations with the EEC and assume that the economies of the Commonwealth countries will be jeopardised and, furthermore the cancellation of the preferences which cannot be retained wholly or partially will be phased over a period to obviate distortions.

WEST EUROPEAN TRADE

The highlight of Western Europe's role in world trade in 1960 was the impressive expansion in its share for the second consecutive year. In fact, 1959 constitutes a turning point in the post-war history of Western Europe's foreign trade. The higher level achieved in 1960 justifies the action taken by several of the countries of this region in making their national currencies convertible. The strong position of external reserves which Western Europe, and in particular West Germany, were building up, constituted a reflection of their vigorous industrial growth. Production in this Continent went up by 9 per cent in 1960 as against 7 per cent in 1959—both the records constituting spectacular strides. It is, however, noteworthy that as between the EEC and EFTA, the EEC's industrial expansion was twice as large as that of EFTA. Taking the intra-Western European trade as a whole, it went up to $29000 million in 1960 or $5,000 million in excess of the previous year, creating a new peak for several years. Full particulars will be found in Table TRD—I on page 161, but a reservation that needs to be made is that the data in this table do not include the trade of the Communist world.

Western Europe's trade with the rest of the world shows a closer relationship developing with North America. Imports from North America rose to a level of $7,825 million showing an increase of about 34 per cent over 1959. The EEC's share of imports from North America recorded an increase of $1,300 million equivalent to a rise of 44 per cent above the previous year. The increase in EFTA's imports from North America was a shade lower at $1,000 million, equivalent to an increase of 35 per cent above 1959. But by contrast the intake by these two trading blocs of the exports of the backward countries showed a tardy expansion of $500 million, raising the total to $13,000 million. The vigorous industrial growth of the EEC especially and EFTA's expansion also did not extend the benefit of higher trade to the backward countries in any significant measure. This inference cannot be resisted. While development imports are steeply increasing their trade deficits with the advanced countries, it is becoming increasingly difficult for them to push up their exports to reduce the magnitude of their deficits.

Table TRD — II which also appears on page 161 vividly illustrates this proposition with reference to the typical case of India. During the financial year 1960-61, India's trade deficit with the EEC increased to Rs. 144 crores, nearly Rs. 17 crores higher than two years before. The rise in the deficit has been on a progressive scale. Again, India's trade deficit with EFTA repeats the growth of its size to Rs. 24 crores in 1960-61. India's deficit with Britain increased by more than 166 per cent in 1960-61 above the preceding year to Rs. 39 crores. Taking Western Europe as a unity, between 1958-59 and 1960-61 India's trade deficit with this Continent jumped from Rs. 135 crores to Rs. 201 crores.

The growth of intra-West-European trade is significant, the rise being from $24,000 million in 1959 to $29,000 million in 1960. This was the peak increase registered ever before with the solitary exception of the year 1951. Dividing this trade bloc-wise, a conspicuous contrast is seen. More than half of the expansion in intra-Western European exports was claimed by the EEC. Inside the EEC trade in agricultural commodities, raw materials and foodgrains showed a slow rate of expansion and the real acceleration came from industrial materials, notably, coal and metals. By far the most significant feature of the expansion of the intra-EEC trade was the impressive increase of $1,000 million in manufactured goods. Here was a clear demonstration of the claim of the Common Market that its vigorous growth in industry and trade would stimulate economic activity outside this trading bloc. The trade of EFTA countries showed a relatively much lower increase of $460 million or 15 per cent during 1960. One significant fact about the expansion in EFTA'S trade was the intake of primary products in a high proportion — accounting for 50 per cent of the increase. For this trading bloc, too, 1960 was a year of advance.

RELIEF FROM RUPEE ACCOUNT

India's trade with the Communist countries of Eastern Europe has been steadily increasing in the recent years. It was of the essence of the planning of India's external trade that the sources of supply should be as much diversified as practicable for two reasons—to enlist the economic and technical co-operation of different countries in the development projects and to safeguard against the error of putting all our eggs in too few baskets and building up enormous import surpluses with any individual country or group of countries.

Admittedly the outstanding feature of India's trade with the Communist countries of Europe is the crucial condition in the bilateral trade agreements that the payments relating to the specified commercial as well as non-commercial transactions (exports, imports, freight, insurance, outlay on diplomatic establishments, cultural and other tours) should be made in non-convertible Indian rupees. This payments clause has set a new pattern in international trade for the benefit of the backward countries which are facing a problem of mounting trade deficits, practically equivalent to their balance of payments deficits, and, therefore, of intermittent foreign exchange crises. In so far as it is practicable, the strategy in the execution of the bilateral trade agreements with Communis countries is to balance the two-way trade. But it is inevitable that some imbalance should ensue more often than not. Bilateral balance does not rest on a policy of restricting the two-way traffic to obviate the emergence of a deficit for one party and a surplus for the other. On the contrary, as India's experience shows, the volume and value of trade between herself and her East European trade partners has kept on increasing.

It is true that the accounts opened by the East European countries in India are not locked up there for inordinately long periods and purchases of Indian goods are made for shipments at home by those countries with these balances. In this sense, thers is a rupee counterpart of a portion of the export trade of India. This fact is immaterial because the rupee account arrangement enables India to procure imports for which she finds it difficult to earmark foreign exchange of the required order. Another significant characteristic of this arrangement is that aid in economic development is available on the principle of aid with trade—not aid with mounting deficits payable in scarce foreign exchange. The strain on the balance of payments is eased and development is saved from the prospect of some slowing down of its rate.

Table TRD—III on page 162 sets out in some detail the commodity-wise and destination-wise distribution of India's trade with the European Communist countries. It will be seen from there that chemicals, paper and paper board, manufactured articles and machinery rank among India's imports from those countries with a value in excess of Rs. 1 crore per annum. Among India's exports to these countries, exceeding Rs. 1 crore in value, are included food articles, crude materials, oils and fats, manufactured goods and footwear. Their intake of India's exports of sewing machines, textile machinery, diesel engines, to mention the principal items, illustrates the stimulus which the process of diversification of our exports is receiving from the Communist countries.

The share of these countries in India's total exports increased from 6.02 per cent in 1958-59 to 7.67 per cent and a little higher in the next year. Similarly, the share of India's imports from the Communist countries in her aggregate import bill rose from 3.60 per cent in 1958-59 to 3.69 per cent next year and then to 4.05 per cent in 1960-61. Thus it is that the two-way trade is showing a healthy expansion. In absolute terms the share of the trade of the Communist countries with India in her total external trade is now very modest, but the trade account has taken an encouraging trend in recent years, so that India's trade surplus with this bloc as a whole increased from Rs. 3.46 crores in 1958-59 to Rs. 6.02 crores in 1960-61, while in 1959-60, when the volume of this trade rose sharply, our surplus was of the order of Rs. 13.65 crores. As in the case of the rest of the world, so in the case of India, the Communist bloc is creating closer commercial ties.

INDIA'S FOREIGN TRADE

The gap in India's foreign trade is not unexpected, since it is the result of the heavy import surplus incurred for the plan projects and occasionally for food imports due to crop failures. For the last four years, however, it has widened to almost unmanageable proportions. In 1959, imports exceeded exports by Rs. 325 crores. Again in 1960, the gap rose to Rs. 442 crores and during the first ten months of 1961 it is estimated to be as high as Rs. 240 crores. The average annual imports during the Second Five-Year Plan period were Rs. 1,072 crores as against the average exports of Rs. 614 crores, making an average gap of Rs. 458 crores. Despite this dismal performance of India's export trade, th Planning Commission has estimated that under the proposed policy of "agressive salesmanship" in the next five years, exports are expected to be Rs. 740 crores a year, on the average. A realistic assessment leads to the view that this is a target which may be obtained, but in the present circumstances it is rather ambitious.

A study of the commodity-wise exports during the la. five years shows that three-fourths of India's exports consist of a dozen commodities such as tea, jute manufactures, cotton piece goods, manganese ore, iron ore (and concentrates), leather and leather manufactures, oils, cashew kernels, cotton (raw and waste), tobacco (unmanufactured), wool and other animal hair, spices, mica (and manufactures thereof) and hides and skins (undressed). More than a thousand other items whose exports fluctuated from year to year provided the remaining one-fourth of the exports. While there is no

possibility of reducing the import bill in view of the impressive expansion planned for the various sectors of the economy during the present plan, there is ample scope for expanding exports provided the right incentives are provided. Presently the Ramaswami Mudaliar Committee is examining the whole problem of foreign trade and it is likely to put forth some fruitful suggestions in order to increase our exports. The Government recently held out the threat of compulsory exports through legislation. But on second thoughts this instrument of dubious efficacy is being held in abeyance. Some incentives have also been provided, but all the measures so far taken have not produced the desired results. Even the direction of trade has not altered on any appreciable scale. Our main partners in trade continue to be the United Kingdom, the USA Japan, the USSR, West Germany, Pakistan, Canada, Australia and New Zealand. These nine countries together take up about two-thirds of India's exports. Thus the efforts at diversification of exports commodity-wise or country-wise have brought home the lesson what a tough job it is.

It was assumsd that with the completion of the first two Plans, which had a heavy bias in favour of industry, the export pattern would be noticeably changed. The impact of industrialisation on the export trade has yet to show itself. Some success has been recorded in the case of engineering goods, but it does not add up to any substantial value. The table below shows the particular processed articles where substantial increases have taken place.

(Rs. crores)

The Common Market Bogey

From Our Special West European Correspondent

JUDGING by some of the alarmist stories that have appeared in the Indian Press at the New Year, the Common Market bogey is being overworked. The picture of a highly protectionist European union shutting out the exports of developing countries is nothing short of fantasy. Such exports are indeed restricted by import quotas and might continue to be so when the Common Market has a unified trade policy with the rest of the world. But then, the various national economies of West Europe already practised this discrimination, on more or less rsspectable grounds. From the point of view of Indian exporters, nothing is lost and a great deal might be gained when a group of European nations seek to harmonise their stand on the issue. Firstly recent experience shows (at least during a period of expansion) that when governments co-ordinate their various restrictive policies, the solution usually is to choose the most liberal course, because this is the one on which agreement can most easily be reached. Secondly, when a question of restriction of imports is posed on the inter-governmental level, it becomes a political matter that involves the responsibility of Europe, and far-sighted considerati ns at once outweigh the sectional interests that could have their way inside any one nation.

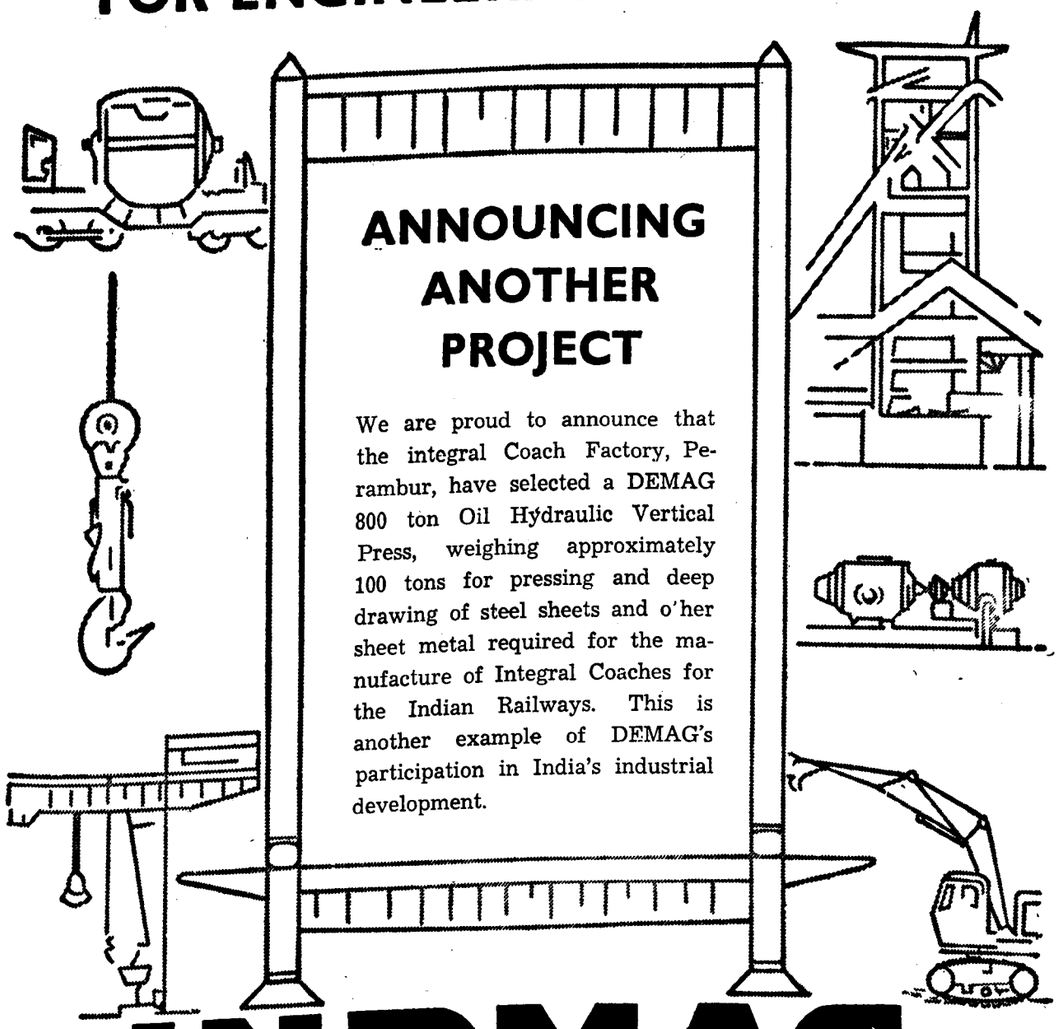
Besides, what is the history of these quota restrictions in the past year? In bilateral negotiations with the two main members of the Common Market, India has succeeded in securing relaxations and, in one case, the grant of the first quotas ever allowed. Japan has managed much better, because her bargaining position (i.e., her importance as a market for European exports) was stronger. The improvement has been modest, perhaps, but there is no sign of the deterioration that we would expect if the Common Market were indeed "protectionist". As from the first of this year, the Common Market countries have no import quotas left on trade with OECD members. This disappearance of quotas was scheduled for some years later, and was intended to refer only to trade inside the Common Market; it has come earlier and has been extended to a wider field. True, developing nations are not part of that field but the new situation is welcome because it poses the question more plainly. It was harder to stigmatise quota limits (or prohibitions) on Indian goods when all Western nations practised them among themselves; now that the only remaining quotas affect nations outside the OECD, the case for their liberalisation becomes easier to argue.

As for the future of European quotas, the drift is plainly toward liberalisation and the sectional interests fighting it realise that when they put up a plan to the ECM Commission for application over the whole Common Market area they have to make it look as generous as possible. Thus, the scheme drawn up by the textile industries of the six countries for joint adoption retains the principle of regulating the volume of Indian and Far Eastern cloth entering West Europe, but proposes annually increasing quotas which would in fact leave to Asian exporters much or most of the yearly increase in European consumption. This might be denounced as miserly but at least it is an advance over the blanket prohibitions that protected each national industry a few years ago. One has the feeling that European textile interests are trying to cover their retreat, to allow time for necessary conversions and to open the tap gradually in order to avoid sudden depreciation of their investments or local pockets of unemployment. Telling me of a new French quota for Indian goods that were previously shut out, an official here said to me lately, "For heaven's sake, don't make a big story out of it. Our people will let this sort of thing pass quietly but you mustn't frighten them". The evolution that has begun in textiles has yet to be started in regard to bicycles, sewing machines and similar simple equipment manufactured in India. Progress might be slow, but if Japan can gain (very gradually, it is true) free entry for her transistors, where the devastating consequences are familiar from US experience, there is hope in other fields.

On import quotas, then, improvement is slow but undeniable, and one sees no evidence for the alarmist statement that the Common Market will oppose removing more barriers to Asian goods than did the separate nations of West Europe. On import tariffs, the case is clearer

because we know where the trend is heading: toward the common external tariff, whose level is already fixed in most cases. The only uncertainty is whether or not this common external tariff will be reduced by 20 per cent; this is almost sure to happen and, in any case, as the Six move toward a common tariff they are assuming that it will be so reduced. That is, French and Italian tariffs are coming down faster than German tariffs are going up. Since the Six made their original offer to cut their common external tariff, Mr. Kennedy has suggested even more ambitious tariff reductions between the Western nations, and of course it is understood that all concessions that these nations make to each other will be extended to all outsiders. The Common Market, therefore, has touched off a universal tariff disarmament from which Indian exporters will benefit. The Six, indeed, have reason to fear that the economic unit they sought to build will be dissolved in a general free-trade area. That is their worry; at least it is clear that from India's point of view there is no trend toward higher tariffs.

Indian comment sometimes speaks as though the common external tariff were some additional customs barrier, when in fact it is what will replace all the previous national customs duties, and is lower than their average. "Under the Treaty of Rome", says a Bombay paper, "the Europeans in the Common Market have framed their common external tariff to protect themselves against third countries". In reality, of course, they were always so protected, by their national tariffs, and the common external tariff will protect them much less. The confusion comes (and the sequel to the above quotation showed that this was what the writer meant) from comparing the common external tariff with the low or zero duties that Indian goods now pay on entering the United Kingdom. What reason have we to compare those two things? None whatsoever for the Latin American nations and the vast majority of developing countries, which have never benefited from Britain's discriminatory favours for the Commonwealth. For most of them, Britain's surrender of her present highly protectionist tariffs on non-Commonwealth goods, for the generally lower common external tariff of the Common Market, will represent an important measure of trade liberalisation. Naturally, Indian exporters are entitled to make this comparison, but they need to see that the question is not about greater or less European protectionism but about the future of the conflicting zones of preference that have survived European imperialism.



In this regard, the worst that could happen is that the various European ex-imperial powers agreed to put all their favoured clients on one footing. Former British dependents, like India, and former French dependents, like much of Negro and Arab Africa, would lose their special advantages in the markets of the mother-countries, and would get equal entry (which they would share with Latin America and all developing countries that were not lately colonies of Britain or the Six) into the one big market constituted by Britain, the Six and such other European nations as eventually join the union. This solution to the question of harmonising Commonwealth preference with "associate status" has not yet been worked out, but it is clearly the most likely one. Third parties, such as the USA, would be inclined to regard it as the fairest answer and would not see in it any deterioration of the position of developing nations in general. (And of course third parties would benefit from such an arrangement because they would get equal entry to all former colonial markets, without suffering the discrimination of Commonwealth preference in favour of Britain or France.) Particular interests in one former colony or another might suffer from being put on the same footing as competitors in other developing countries, especially if Hong Kong were fraudulently passed off as a "developing country". Yet this equalisation of treatment between West Europe as one unit and all its former colonial possessions will seem to many the normal outcome of the long struggle against imperialism. After all, anti-colonialism played a large part in creating European unity and one must accept among its consequences the disappearance of special favour-zones that are described as "neo-colonialist" by those that do not benefit from them.

That solution would still leave open the question of how generously a united Europe dealt with the trade of developing nations as a whole. This will be decided in the course of this year, as Britain and the Six seek to co-ordinate their respective favour-zones. It is reasonable to expect that agreement will be reached everywhere by adopting the most generous line and extending it to all developing countries. Everything that has happened since the Common Market was set going has shown that there is a sort of dynamic of liberalism, that low tariffs drive out high, and that liberal trade measures are contagious. Why else would the Common Market have grown by attracting new associates, touched off a rival zone of tariff disarmament in Europe, stimulated imitation of its freer regional trade in Latin America and the Communist bloc, secured Britain's conversion to European unity, permitted the Six to make offers of duty reductions inside GATT, and finally prompted the USA to break with its super-protectionist past? There is not one case of the Common Market having caused an increase in tariff protection, except in so far as introduction of the common external tariff involves increases that are more than compensated for by decreases elsewhere. The same mechanism will operate in discussions of common European tariffs on imports from developing countries. The imports in question, it must be remembered, are the raw materials of European industry (and to a lesser extent the food of its workers), and duties on them are an element in costs—and the effect of unification of national markets is to reduce costs.

The crop of scare stories from informed sources in Delhi about the Common Market menace (apart from echoing the chronic xenophobia of some foreign participants at the recent conference on an Asian common market) might have another object: to prepare Europeans for the responsibilities toward India and other developing nations that they must shoulder when they are united in an economic union with a single trade and aid policy. If this is the calculation, I think it is quite praiseworthy. None of the foregoing optimism about the Common Market's impact on India should disguise the fact that, for reasons having nothing to do with the formation of the European trade bloc, the terms of trade are evolving alarmingly in India's disfavour. The reasons are familiar: raw materials are losing markets to synthetics, or are being economised by improved technology, or the goods made from them are less demanded by populations with higher living standards. The Common Market is not the cause of this process, but the upshot surely is that internal European trade is growing faster than trade with developing countries, prices of raw materials lag behind prices of manufactures, and the industrialising economies seem doomed to chronic deficits. This will require energetic action by Western nations, and GATT (which is concerned with 'mutual' and reciprocal exchange of concessions) is not the place for it. Once Britain and her followers are inside the Common Market, "the West" will be represented by two organisms: the US Government and the Common Market, and it is good that responsibility be firmly placed in those two quarters. Because the Europeans are forming the Common Market, it is good policy to insist on the duties of that organisation toward India. This is not because the Common Market is a menace, but because it groups the nations that, in concert with the USA, can reverse the current disastrous trend in world trade.

DEMAG

FOR ENGINEERING EFFICIENCY

ANNOUNCING ANOTHER PROJECT

We are proud to announce that the integral Coach Factory, Perambur, have selected a DEMAG 800 ton Oil Hydraulic Vertical Press, weighing approximately 100 tons for pressing and deep drawing of steel sheets and other sheet metal required for the manufacture of Integral Coaches for the Indian Railways. This is another example of DEMAG's participation in India's industrial development.

ERIC extends an arm of co-operation to every exporter by covering credit risks flowing from the changes in Economic and Political conditions abroad. Some of the more important of these risks are Import restrictions, Exchange control, War or Civil war, and the insolvency or protracted default of the buyer.

INSURANCE with ERIC enables the exporter to successfully compete with exporters from other countries by offering credit terms. Secondly, the Corporation with its own status collecting agencies in all parts of the world gives the most reliable information about financial standing of overseas buyers; and finally insurance of exports with the Corporation is likely to make export finance facilities more readily available.

Social Security

IN ancient times, risks like death, sickness, unemployment, incapacity to work etc., inherent in a man's life, were looked after by the village community, the joint family or the friendly societies. But this concept of social security has changed with the times. Industrialisation on a large scale, which came first in Europe, changed the structure of society there, sowing the seeds of the modern social security system. That the European countries were first in the field in the development of social insurance stems from the fact that Europeans were also the first to develop an industrial society. The stepping in of the State in the field of social security is based on such considerations as that individuals having small means cannot today stand up to the task by themselves or even in private combinations. The evolution in India of the modern systematised methods of social assistance and social insurance are, of course, the result of the influence and impact of the West, where various experiments have ben made by the Community and the State to provide social security.

The methods can be broadly divided into three parts. First one takes the form of social assistance where the element of insurance is absent and where most of the money comes from the State Exchequer. Second one is that of voluntary social insurance and the third is of compulsory social insurance. India, following the Western European countries, has thrown her weight in favour of the compulsory social insurance. Although various measures have been enacted in the social security field, yet this country is far behind the West European and East European countries where the principle of comprehensive social security has taken deep roots.

One can count on one's finger tips the social security measures that have been enacted in India. They take the form of workmen's compensation Act, 1923, the Maternity Benefit Acts (1929-1948); the Employees State Insurance Act, 1948; the Coal Mines Provident Fund and Bonus Schemes Act, 1948, the Employees Provident Funds Act, 1952; and the Industrial Disputes Amendment Act. Of these, the first three provide security against the risks of employment, injury maternity and sickness, the next two against old age and the last one against retrenchment and unemployment.

GREAT DIVERSITY IN EUROPE

In Europe, there is a great diversity. For example, in almost all the European countries it is the health insurance programmes which boast of the longest history dating back in some instances to the latter part of the nineteenth century. Many of the social security measures were enacted before World War I and many were enacted after World War II. The greater variety of services and the entire coverage of the population was, for instance, brought about in U.K. in 1948. Before that it closely resembled the systems in France and Germany. In Britain now a person is looked after from the cradle to the grave. Western Europe, however, can be divided into three distinct groups in matters of social security. The first group is Greece, Spain and Portugal where social security as an integrated system is still in embroynic stage. The great majority of the population in these countries has not been covered as yet. One finds in these countries certain health and unemployment insurance schemes, pensions and even family allowances organized on corporative lines for a few occupations only, largely paid for by employers but offering a rather limited range of services and benefits. The second group comprised the West Central countries like the Netherlands, Belgium-Luxembourg, Germany, France, Switzerlands, Austria and Italy, though Italy in some respects belongs to the first group. Although in each of these countries quite a full range of social security facilities is offered to the insured worker (and to some extent to his dependents), various categories of the population are left uncovered and are expected to make their own voluntary insurance arrangements. The third group consists of the Scandinavian countries and the British Isles almost all of which possess comprehensive social security systems. The United Kingdom and Sweden are probably the two European countries with the most far reaching social security and welfare systems which provide for not only general medical care, sickness and unemployment benefits, etc., but also for birth, marriage and funeral grants, home services for the bed-ridden and for working mothers, psychologists at child guidance clinics, special homes and schools for difficult children, convalescent homes for the nervously exhausted, retraining for the unemployed or physically incapacitated, welfare programmes for the blind, paralyzed or otherwise crippled and so on. This, of course, does not mean that they spend the highest amounts on social security programmes. An idea of how expenditure on social security has grown in various European countries and in India since 1949 can be had from the following table.

Country	Expenditure as percentage of National Income			Expenditure per capita at constant Prices 1955 = 100	
	1949	1955	1957	1949	1957
1. Austria	7.4	8.5	8.8	88	104
2. Belgium	14.0	14.5	14.8	77	117
3. Czechoslovakia	—	—	—	77	129
4. France	14.0	17.0	17.9	62	120
5. Federal Republic of Germany	17.6	17.6	20.0	52	127

PER CAPITA EXPENDITURE

It will be observed that the per capita expenditure on provision of social security is the highest in the U.S.S.R. Then come Poland, Czechoslovakia, Federal Republic of Germany, France, Italy and Sweden. It is lowest in India and has not changed much during the last three or four years. Expenditure is larger in Belgium and Federal Republic of Germany, because they incur heavy expenditures on payments of pensions, in France because she has large outlays on health and family allowances, in the U.S.S.R. and other Communist countries because there provision of social security is an integral part of the basic social policy. The wide range over which the figures of social security benefit expenditures (expressed as percentages of national incomes) vary reflects the differences in social security development. One fact, however, is clear, that is that there is a general trend towards expansion of social security measures in these countries. The indices of per capita benefit expenditure at constant prices reveal a sharper upward trend, indicating that social security benefits have kept pace with the rapid and sustained growth of real income per capita during the last decade in most of the countries.

Contributions for provision of social security measures vary widely. While in some countries they are tripartite, in some others only employers pay for the social security programme. In certain others workers and employers only contribute. Greek pension schemes and the Italian unemployment schemes are jointly financed by the workers and employers. The Netherlands and Spanish pension schemes are financed by the State and the employers. One fact to be noticed is that the employer contributes in every case because it is considered that he benefits most from the industry. This

view is prevalent not only in India, but in most of the West European countries as well. In East European countries, there is the system of the socialist protection against all forms of insecurity for each citizen irrespective of sex, caste, and religion. Main reference is here to the U.S.S.R. as she dominates the Eastern bloc. Social security in the U.S.S.R. is extended to all workers and employers without exception. Before the launching of the First Five-Year Plan, maximum amount of social security was the slogan in the Soviet Union. In 1938, the principle was abandoned and stress came to be laid on maximum production. But again after some years the slogan of maximum social security was brought to the fore principally because of the reason that incentives provided to the workers in the form of social securities would help the workers to put in their best and thereby bring in greater production. This indeed is quite a high ideal and has been practised in both the Western and Eastern European countries with gusto.

So far as survivors insurance in the Soviet Union is concerned, it is based on the principle that not all survivors of the insured are to be treated as beneficiaries, but only those among them who are unable to work and who are dependents of the insured persons. This condition, however, does not apply to the parents or the spouse if they have reached the age of 60 for man or 55 for woman. One novel feature of social security schemes in the U.S.S.R. is that it is mainly administered by the Trade Unions. Unemployment has been totally abolished in the U.S.S.R., so there is no question of unemployment insurance in that country. Under the system of socialist care, it may be emphasised that as the national income rises, the share going to finance social security measures is raised.

NEED FOR EXTENSION IN INDIA

To what extent social security can be extended in India is now the main point. The large-scale measures as one witnesses in the East and West European countries, of course, cannot be undertaken in this country as our financial resources are limited. An extension of the sickness and health insurance would immediately require a plethora of medical personnel which cannot be provided overnight. However, the question of old age pensions for the workers should be considered in right earnest. A lump sum accruing by way of provident fund on the death of the bread winner is generally meagre and cannot remain as the mainstay of the family members for long. All said and done, what is immediately required is an integration of all the schemes and an improvement in the service particularly at the dispensaries where the Employees State Insurance Scheme is being administered. A study group on social security had recommended the integration of existing social security schemes and the conversion of the various provident fund schemes into a statutory schemes for old age, invalidity and survivorship pension-cum-gratuity. No time should be lost to give an immediate consideration to it. Initial difficulties of administration, of course, there would be, but they ought to be faced boldly and squarely.

Housing

ALTHOUGH construction of new houses in Eastern and Western Europe has been large enough during the last few years, yet it has not been sufficient to overcome the shortages that were brought about as a result of the devastating war, low pre-war housing standards and low priority previously given to housing in some of the European countries. The rate of construction has been quite high in the USSR where it has risen from 7 per 1,000 inhabitants in 1954 to 10.8 in 1957, and 14.8 in 1959. In the year 1957, the USSR Government had set for itself the goal to eliminate the shortages of houses for the industrial workers and accordingly a programme to that effect was launched. This goal implied a further rise in the tempo of construction. During the period 1959-65, nearly 15 million dwellings are to be built in the cities, while an additional 7 million dwellings are to be built by collective farmers and rural professionals and technicians. Completion of this plan is likely to give adequate relief to the housing shortage that still persists in the USSR. It is estimated that the overall increase in urban housing for the period of the current Seven-Year Plan will amount to 650 to 660 million sq. metres. The daily average over 7-year period for urban housing has been set at 587 apartments, while in the countryside about 2,740 houses will be built per day. To put it concretely, three to four times housing construction is envisaged in the next seven years.

CONSTRUCTION ACTIVITY IN EUROPE

The increase in construction activity has not only been rapid in the USSR, but also in the Federal Republic of Germany, where it has been more or less to the same extent. The Federal Republic of Germany is followed by Sweden, the Netherlands, Norway and France where the rate of construction has been as high as 7 or 8 new dwellings per 1,000 inhabitants per year. The countries of Southern Europe, however, do not show the same progress and the favourable trends that we witness in the USSR and some of the other Western European countries. The housing shortages are quite chronic in Southern Europe where average density of occupation of a room is pretty high. It may, for instance, be noted that Portugal and Spain depict a rate of construction below 4.0 per 1,000 inhabitants which is insufficient to meet the housing needs satisfactorily, leave aside the elimination of shortages and needs arising from internal migration. Greece and Italy can be said to have accomplished a better record as compared to Portugal and Spain. In these countries the rates of construction achieved are around 6.0 per 1,000 (or slightly more) inhabitants, but the large portion of the new dwellings are still small rudimentary structures and they by no means can be compared with those of the advanced countries like the U.K. and France. The table below gives the volume of new residential construction by countries in 1950-54 and 1955-57:

TABLE I

VOLUME OF NEW RESIDENTIAL CONSTRUCTION BY COUNTRY, 1950-1954 AND 1955-1957

Average Annual Dwelling Units Completed

Country	Total, (thousands) 1950-54	1955-57	Per 1,000 Inhabitants 1955-1957
Western Europe (a)	1,399.5	1,886.9	6.4
Germany	454.2	542.1	10.9
Iceland	0.8	1.4	8.9
Norway	29.3	28.6	8.3
Sweden	48.6	60.0	8.2
Switzerland	29.6	39.1	7.7
Finland	29.6	32.1	7.5
Netherlands	62.0	73.5	6.7
Greece	50.1	54.4b	6.5b
United Kingdom	273.1	316.2	6.2
Austria	39.0	41.7b	6.0b
France	101.7	240.1	5.5
Belgium	39.5	46.1	5.2
Denmark	21.1	23.4	5.2
Italy	122.5	239.6	5.0
Spain	65.5	110.7	3.8
Ireland	13.0	10.4	3.6
Portugal	19.9	27.5	3.1

a. Excludes Luxembourg, the Saar and West Berlin.
b. 1955-1956.

A notable fact to observe is that there has been an increasing tendency to build houses for families with incomes too low to meet market prices and housing for groups with special needs, both in India and Europe. Subsidies and State credits have been provided on a large scale in Eastern Europe and particularly in the USSR. For instance, out of the new houses constructed covering a total of 80.4 million sq. metres of floor space in the USSR, 58.8 million sq. metres were built by State and Co-operative organizations and 26.6 million sq. metres by urban dwellers at their own expense or with the help of State loans. These figures, of course, do not include the houses constructed by collective farmers themselves.

SUBSIDISED SCHEMES IN INDIA

In India also, there has been a good deal of emphasis in the past few years on subsidising industrial house-building activity. A number of schemes have been drawn up to remove shortages of houses that exist in many parts of the country. Of these, the Industrial Housing Scheme, Low-Income Group Housing Scheme, Slum Clearance Improvement Scheme, Plantation Labour Housing Scheme, Village Housing Scheme, Land Acquisition and Development Scheme, Middle-Income Group Housing Scheme, Rental Housing Scheme etc. are noteworthy. These schemes, no doubt, have made a good deal of progress during the Second Plan period, but still a lot of leeway has got to be made up. Shortages are perennial in many of the Indian cities and most of the houses are below standard. But so far as rural housing conditions are concerned, they have begun to change for the better in at least a few areas. Community development and self-help housing programmes are now reaching an important part of the rural population in India with material assistance and advice in improving the traditional methods of construction provided under the Community Development Programme. Rural electrification programmes are also spreading reasonably well. The distribution of the outlay for various schemes in India in the Third Plan is as given in the table alongside.

The targets for the number of houses or tenements under the subsidised housing scheme, low-income group housing scheme, slum clearance and village housing schemes are 73,000, 75,000, 1,00,000 and 1,25,000 respectively. Not only in the public sector but in the private sector too, there has been an increasing amount of construction in this country, but it is, of course, difficult to assess it in precise items. The net investment on housing and other private construction which was reckoned at Rs. 900 crores in the First Plan and Rs. 1,000 crores in the Second Plan, is now put at Rs. 1,125 crores in the Third Plan. The extent of the housing shortage which exists in urban areas can only be broadly estimated. For an urban population of 62 million there were in 1951, about 10 million houses. The shortage of houses in that year was roughly reckoned at about 2.5 millions. And it was reckoned in the Second Plan that the shortage of houses in the urban areas might increase by 1961 to about 5 million. Although efforts on an increasing scale have been made in housing during the First and Second Plan, the problem still continues to remain acute. The total outlay on public housing during the Second Plan was of the order of Rs. 250 crores and about 500,000 houses were constructed. Public authorities provided during the First Plan about 742,000 houses or tenements. In the First Plan about 600,000 units were provided in the private sector. Thus in the First Plan about 1.3 million houses were added.

THE COST ELEMENT

In regard to construction of houses in European countries, it may be interesting to observe that the cost of materials is in the region of 50 per cent of the total cost, ranging from a minimum of 40 per cent (Austrian house) to a maximum of 63 per cent (USSR flat). The proportion of site, labour costs varies from just over 11 per cent (Hungarian house) to 44 per cent (Austrian house). The percentage of labour cost is significantly lower in Eastern than in Western Europe. The percentage of site costs other than labour are much greater in Eastern than in West European countries. The total indirect costs, i.e. plant and equipment, site overheads and builders establishments overheads are significantly higher in Eastern Europe than in Western Europe.

The common factor amongst all these countries is that construction costs are going up and there is no likelihood of their coming down in the near future. The chief elements in the cost of housing are building costs, land values and financing expenses. The prospect for a decline in building costs cannot be envisaged till building industry completely modernises itself. Pre-fabrication methods and other new modern techniques perhaps could reduce costs to a certain extent. Under the circumstances, it appears that efforts will have to be devoted to bring about an effective check on the rising population particularly in India. Happily the importance of it has been realised in the Third Five-Year Plan. What is now required is a concerted enforcement of the methods that have been talked about for so long.

TABLE II

OUTLAY IN THIRD PLAN — 1961-66

(Rs. crores)

Scheme	Outlay
(1) Ministry of Works, Housing and Supply	
Subsidised Industrial Housing	29.8
Dock Labour Housing	2.0
Slum Clearace, Slum Improvement and Construction of Night Shelters	28.6
Low income group housing	35.2
Middle Income Group Housing in Union Territories	2.5
Village Housing	12.7
Plantation Labour Housing	0.7
Land Acquisition and Development	9.5
Provision for Experimental Housing, Research and Statistics	1.0
TOTAL	**122.0**
(2) Other Schemes	
States' Housing Schemes	2.3
Two Planning including Preparation of Master Plans	5.4
Urban Development Schemes	12.3
Programmes included in the Plan	20.0
TOTAL	**142.0**
(3) Prommes to be financed from the funds expected to be provided by the Life Insurance Corporation	60.0
GRAND TOTAL	**202.0**

Health

THE cry for a long life with good health is as old as the man and, considering that much of a country's prosperity originates from and depends upon the extent of good health enjoyed by its population, the responsibility for public health and welfare has come to be devolved upon the Government. In assuming the responsibility for public health the European countries have undoubtedly shown the way as also in extending that responsibility to water and sewage systems, pure food laws, industrial hygiene plus, in some countries, a comprehensive health service with free medical care and liberal cash benefits in cases of loss of income owing to illness.

HEALTH INSURANCE

The compulsory health insurance for the majority of working population has for long been the most common way of buying health care in Western European countries and something like four-fifths of all medical goods and services are bought through those funds which include numerous voluntary funds catering to particular occupations or income groups. In India, a beginning has been made in this direction with the provision of health and medical facilities for industrial workers under the Employees' State Insurance Scheme and for the employees of Central Government in Delhi under the Contributory Health Service Scheme.

Now, what is the criterion for gauging satisfactorily the health of a population? It is difficult to select any one, since whichever is chosen the relative ranking of the countries emerges almost in identical order. The infant mortality rate perhaps serves as well as any to demonstrate the relationship between per capita expenditure for health and the general level of health in a country.

When infant mortality rates and per capita expenditures for health and medical care are brought together, most West European countries are found to be lying close to the trend line, extending from Spain to Sweden. Apart from Portugal, with a particularly high rate of infant mortality, the chief exceptions are the Netherlands and, to a lesser extent Finland, countries in which private expenditure for health play a significant role. Among the Eastern European countries, Czechoslovakia ranks high in reducing her infant mortality rate from 27.8 per thousand in 1949 to 18.0 in 1958. In Poland the rate was 56 in 1958 as against 107.1 in 1949. While West Germany has reduced her rate from 58.7 in 1949 to 36.0 in 1958, East Germany has been able to bring down her rate from 78.1 in 1949 to 44.5 in 1958. Compared to the European countries, the rate of infant mortality in India is high and will continue to remain so until per capita expenditure on health shows marked rise. Nevertheless, infant mortality in India over the period from 1941 to 1961 has gone down as is evident from the following table:

Period	Infant Mortality Rate		Expectation of life at birth	
	Male	Female	Male	Female
1941-51 ..	190.0	175.0	32.45	31.66
1951-56 ..	161.4	146.7	37.76	37.49
1956-61 ..	142.3	127.7	41.66	42.06

The collective expenditure for health for the whole of Western Europe—through funds and by the Government—amounted to some $4.4 billion in 1954 and has increased since. Added to this is a further amount of the order of $1 billion, representing the private outlay on medical goods and services. The total Western European outlay on health and medical care in 1954 was probably about $5.4 billion, or about the same as the expenditure on education.

This health bill amounted to $18.4 per capita, or about 2.7 per cent of Gross National Product. In India the total public expenditure on health during the past decade of planning was Rs. 356 crores which amounted to about Rs. 8 per capita. This excludes private expenditure on health incurred through charitable trusts and other welfare bodies.

One visible sign of improvement in a nation's health is success in delaying death by making available to the people a congenial environment for living accompanied by health services. Environment is one that enables people to develop resistance to disease and health services enable them to fight against diseases successfully. In just over half a century death rates have been halved in most of the West European countries, infant mortality cut to a quarter or a sixth and child mortality to one-tenth. As a result of improved expectation of life, an average male child can at birth anticipate living an additional 17 to 25 years. These changes are attributable primarily, though not entirely, to progress in medical care.

During the past ten years, India has made substantial progress in several directions of various health programmes. As a result of the measures taken for the control of malaria, there has been marked decline in the incidence of the disease. Communicable diseases such as filaria, tuberculosis, leprosy and veneral diseases have been controlled to an appreciable extent. The number of subsidiary centres for leprosy in 1960-61 was 135 as against 33 in 1955-56. The number of clinics for veneral diseases was 83 in 1960-61.

An intensive effort is under way for the eradication of malaria and small-pox and the control of filaria, cholera, tuberculosis, leprosy and other communicable diseases where they still persist on a large scale.

INDUSTRIAL HEALTH

Industrial Health in India is by any standard low and considering that good health of industrial workers is as much a precondition for higher productivity as technology, there remains much to be done in this direction. A special aspect of industrial health is atmospheric pollution, occasioned by the smoke from factories, which extends its damage to the entire population of any industrial area. Under certain atmospheric conditions it becomes concentrated in "smog" and tells upon the public health. According to the report of the Committee on Air Pollution (1954) in the U.K. the smog in London in December 1952 caused the death of some 4,000 persons.

Several countries have long had regulations which specify the minimum height of chimney stacks in certain classes of industry, but the Clean Air Act of 1956 in the U.K. was more specific and drastic. The Act empowers the Minister of Health to establish completely smokeless zones and areas where the smoke from certain classes of buildings is subject to control. Smokeless zone in central Manchester having been proved beneficial, similar zones are being created gradually elsewhere in Britain and are under consideration for some German cities in the Ruhr.

Medical Education

In East European countries, public health services occupy an important place under the responsibility of

the State. In Hungary the number of doctors per 10,000 of inhabitants in 1960 was 157 against 153 in 1959, while in Poland in the same year the number of doctors per 10,000 of population was 93. The number of hospital beds in Hungary has steadily increased from 46,922 in 1938 to 71,173 in 1960. In Rumania, the number of beds of medical attendance (including beds in hopsitals, T.B. sanatoria and maternity homes) has increased fairly steadily from 33,763 in 1938 to 133,850 in 1960.

In India, public health services are yet to enlarge substantially so as to cover the larger section of the masses. The provision of general health services to the people has been based on the setting up of a network of primary health centres.

W.H.O.

The World Health Organization is playing an increasing role in the activities designed to assist in the solution of national health problems of under-developed countries, apart from its work of an international nature. The Organization has been rendering increasing assistance to India in her bid to control malaria and tuberculosis, improve maternal and child-health and professional technical training. In Europe the assistance of this organization has been made available in the fields of mental health, nursing, communicable eye diseases, social health and medical care, tuberculosis and public health administration.

The intensified W.H.O. medical research programmes in the period 1960-64 are to deal mainly with communicable diseases—especially those prevalent in the tropics—and with virus diseases, problems of nutrition, cancer, cardio-vascular diseases, health problems arising from the use of ionizing radiations, and studies in human genetics.

MEDICAL FACILITIES IN EUROPE AND INDIA

(In Numbers)

Country	Year	Physicians	Dentists	Midwives	Pharmacists	Population (Thousands)	Inhabitants per physician

Education

WHERE quality counts quantity must necessarily suffer and it is nowhere more true than in Europe. The European institutions of higher education have for long been noted more for their quality than for quantity and, in being so, advancement in all fields of knowledge has been much greater from European seats of learning than from any other. The central problem which lies ahead for the peoples of Europe is how to democratise their institutions and multiply the opportunities for higher training without affecting their qualitative education.

The high degree of selectivity in the European educational structure may be said to have arisen from the attitude that, while a certain quantity of education should be provided by the state to all children irrespective of their capacity, beyond a certain stage, public money should be spent only on those who have proved themselves mentally the best equipped.

Educational structure in India, however, is not as rigidly discriminative in higher levels of education as in Europe, though, lately, there is a growing awareness in many quarters that it should be discriminative in order to save those students from burden who are less gifted and to do full justice to those who are more gifted.

In the U.S.S.R. the expansion of higher education has continued fairly steadily since the end of the Second World War. Over the period from 1914 to 1960 the number of higher education establishments grew from 105 to 753 and the number of college students from 127,000 to 2,395,000. By 1960 there were 140 trained specialists for every 1000 factory and office workers throughout the economy, compared to 77 in 1940.

The proportion of Europe's school-going child population is undoubtedly highest in the span of 7-12 years of age. Below the age of 7 practice varies widely, while above the age of 12 the numbers begin to dwindle, as primary education gives way to secondary education and the period of compulsion ends in a number of countries. In most European countries compulsory schooling runs from 6 to 14 years of age, or from 7 to 15 years in the Netherlands and Scandinavian countries. In Portugal school attendance is compulsory for only five years and in Spain and Greece for only six years.

Under the Constitution of India, education is to be made universal, free and compulsory for the children up to the age of 14 years, but, in view of the huge magnitude of the task and the paucity of resources, it has been brought down to 11 years in the Third Plan to be followed by extension for the entire age-group 11-14 during the Fourth and Fifth Plans.

PRIMARY EDUCATION

During the past hundred years the provision of primary education has become universal in Western Europe. In England and Wales the relatively high ratio of 25 per cent enrolled in "private" primary establishments represents mainly Church of England schools, almost wholly integrated into the State system, and to a small extent the so-called preparatory schools, which admit pupils on a fee paying basis. The pupil-teacher ratio (which is only 17 in the U.S.S.R.) ranges from 23 in Sweden up to nearly 46 in Greece. In India, the ratio is as high as 37 as against 35 in Portugal and 33 in Poland. European average of pupil-teacher ratio is around 30 pupils per teacher. In France, Belgium and most of the Scandinavian countries the ratio is higher than average. Everywhere the ratio is declining throughout the present century.

In India, over the decade 1951-61 the number of students increased from 23.5 million to 43.5 million. The

increase in the number of pupils in the age-group 6-11 was 79 per cent, in the age-group 11-14, 102 per cent, and in the age-group 14-17, 139 per cent. The proportion of children in these groups attending schools rose respectively from 43 to 61 per cent. In the course of the Third Plan, the total number of pupils at schools is expected to increase by 20.4 million, 15.3 million in the age-group 6-11, 3.5 million in the age group 11-14 and 1.6 million in the age-group 14.17 During the ten years of planning, the number of schools increased by 73 per cent from 230,555 to 398,200 increase in the number of primary schools being 63 per cent, in middle schools 191 per cent, and in high schools 128 per cent. Progress in basic education at the elementary level is demonstrated by the increase in the proportion of junior basic schools and senior basic schools from 16 per cent to 29 per cent and from 3 per cent to 30 per cent respectively.

SECONDARY EDUCATION

Secondary education in Europe until the nineteenth century was confined to those who were able to pay fees or those selected by the Church in religious seminaries in which case fees were paid by the latter. The State's responsibility for providing free schooling was limited to those who could pass a fairly stiff entrance examination and at reduced cost to those who could pay part fees, the balance being met out of Government grants. During the last ten years, attempts have been made in the direction of universalizing free secondary education; though no European country has attained the goal of free secondary education, the number of secondary schools is being rapidly increased everywhere. From 1938 to 1955 secondary school enrolment more than doubled in Finland, Italy, Portugal, Spain and Sweden. In almost all other countries the increase was over 50 per cent.

Notwithstanding this progress, it still remains true that an unsatisfactory small proportion of Western Europe's adolescents obtain a general secondary education. In several European countries a significant proportion of the secondary education is still privately controlled and administered, though in most cases these private schools are State-subsidized—almost completely so in the Netherlands and Ireland. In India, while in general education the pupil-teacher ratio is 18 in vocational education the ratio is 20. In Yugoslavia the ratio in general education is 16 and in vocational education 23.

Reorganization of secondary education in India was taken up following the report of the Secondary Education Commission and, accordingly, high schools were converted into higher secondary schools and multipurpose schools providing for a variety of courses were established.

In the first two plans the number of secondary schools increased from 7,288 in 1950-51 to nearly 16,6000 at the end of 1960-61. The number of children enrolled in classes IX to XI increased from about 1.2 million to 2.9 million. Although the number of girls in these classes increased from 200,000 to 520,000 during this period, constituting less than one-fifth of the total number attending secondary schools, at the end of the Second Plan only about 4.2 per cent of girls availed of high school education as compared to 18.4 per cent of boys of the age-group 14-17. In the Third Plan the number of girls in schools will be nearly doubled, but their proportion in the age-group as a whole—at about 7 per cent as compared to about 24 per cent in the case of boys—will remain low.

Educational programmes in the field of technology and engineering have been designed to help in building up the trained technical personnel required for schemes of industrial development, teaching and research. In the Third Plan, therefore, Rs. 142 crores have been provided for schemes of education in the field of engineering and technology. As against 13 and 19 per cent respectively in the First and Second Plans, technical education represents about 25 per cent of the outlay on education in the Third Plan. The number of engineering colleges has gone up during the Second Plan from 65 to 100, the annual admissions increasing from 5,890 to 13,860. In the Third Plan provision has been made to increase the annual admissions at degree levels to 19,140, and at diploma level to 37,390. Over the Second Plan the annual out-turn of graduates has increased from 4020 to about 5700 and of diploma holders from 4,500 to over 8,000. The growing imbalance between the demand for and supply of graduates and diploma-holders is a pointer to the fact that, apart from the lack of teaching personnel, there exists the need for making available the technical education to a larger section of the masses. This will necessarily call for the diversification of technical education in India to meet the growing need of technical personnel in the country. The minimum requirement for admission in an engineering college is a pass in higher secondary examinatio and not as in Western Europe where it represents by far the most post-primary educational activity. A survey published in 1957 by the Economic Commission for Europe has arrived at the conclusion that, notwithstanding the increase in output of science graduates by 50 per cent compared with the late thirties, the rate at which new engineers and other technicians are being trained is too low.

UNIVERSITY EDUCATION

It can be roughly estimated that the proportion of young people of 20-24 years of age attending universities averages some 4.5 per cent in Western Europe as a whole and exceeds 6 per cent in some Scandinavian countries. Luxembourg has no university and half of Norway's university students study abroad. In India, 833,450 students were enrolled in 1957 for university education. Enrolment in institutions of higher education has been on the increase throughout the present century. From 1900 to 1956 the number of students per 10,000 of population rose in France from 7 to 34, in Germany from 8 to 26, in the Netherlands from 6 to 28 and Switzerland from 9 to 23. The comparable figure for the United States was 155 (including college students) in 1954 and for the Soviet Union 64 in 1956.

The rapid increase in the number of students in universities has brought in its wake many new universities which have glorious traditions like those of older universities in Europe. The difficulty they experience in obtaining the services of top quality staff is great. And, apart altogether from quality, staff members have entirely failed to keep pace with the increase in the number of students. The number of universities in India has increased from 27 in 1950-51 to 46 in 1960-61 and about a dozen more are likely to be added by 1965-66. The rapid expansion in the number of universities and colleges in recent years has led to a number of problems which have been reviewed in the report of the University Grants Commission for 1959-60. The Commission has laid stress on the expansion of physical and other teaching facilities corresponding to the increase in the number of students so as to avoid deterioration in standard. The problem is, however, one of large dimensions and, even after taking into account these facilities, the number of those seeking admission to the courses of higher education in arts, science and commerce will be large.

EXPENDITURE ON EDUCATION

That rich countries spend a higher proportion of their gross national product on education than do the poor, is somewhat axiomatic. But before they reach such a stage of prosperity proportion of it on education remains rather small. According to some analysts, the tendency for a rising ratio of expenditure for education to GNP to accompany rising national prosperity reaches a saturation point. It is true that since 1955 the ratio has been stable in several countries but, in view of the ambitious plans which many of them have for

Nothing like Leather...

Nothing like Woodroffe Leather

For over five-thousand years, versatile and long-lasting leather has faithfully served mankind. To-day, too, the tradition is very much in evidence—in Woodroffe leather.

Book-binding or industrial beltings, handbags or upholstery...woodroffe leathers can buckle down to the job!

expanding their educational facilities, the ratio is likely to rise further in the coming decade.

It is interesting to note there is close uniformity in the proportions of expenditure on primary, secondary and higher education. Primary education in recent years has accounted for some 50-58 per cent of the outlay, secondary education for 23-28 per cent (but in Germany and the U.K. as much as 36.38 per cent and in Denmark as little as 10.2 per cent) and higher education for 5-10 per cent.

While the percentage of the total expenditure is falling in the case of primary education, percentage is rising in respect of both secondary and higher education. This demonstrates the great expansion of secondary and higher education enrolments in the past two decades. In the United Kingdom, expenditures for secondary and higher education taken together have risen from 32 to 48 per cent of the total educational outlay.

In India, the total outlay on education, including engineering and technological education has increased from Rs. 153 crores in the First Plan to Rs. 256 crores in the Second Plan ended in 1960-61. It is envisaged that a total outlay of Rs. 560 crores will be made in the Third Plan. The distribution of outlay of schemes of general education under the First, Second and Third Plans, is shown in the following table :

DISTRIBUTION OF OUTLAY

	Amount in Rs. Crores			Percentage		
	1st Plan	2nd Plan	3rd Plan	1st Plan	2nd Plan	3rd Plan
Elementary Education	85	87	209	63.9	41.9	50.0
Secondary Education	20	48	88	15.1	23.1	21.1
University Education	14	45	82	10.5	21.6	19.6

Public expenditure on education in India in 1958-59 was Rs. 218 crores—Rs. 5.5 per capita, or 1.7 per cent of national income. In Finland the percentage in 1957 was 6.5 closely followed by Belgium 5.2 per cent and Netherlands and Norway 5 per cent. Among the East European countries, Poland's expenditure on education as percentage of her national income is 4.2 Yugoslavia 3 per cent and Hungary 2.3. In U.S.S.R. expenditure on education in 1959 per inhabitant was 452 roubles.

Despite all the loud talk about educational reform and improvement of standards, Indian educational system has remained in a doleful state and as far as quality is concerned it is far behind the needs of the time. A qualitative education is the need of the day.

DISTRIBUTION OF STUDENTS BY MAJOR BRANCHES OF STUDY

PART C

A Cultural Comparison

Europe Divided: The Cultural Choice

IN Part A an attempt was made to present what might be described as the politico-economic choice, between Western Europe and Eastern Europe. There the point was made that in terms of India's interests there can be no doubt that while developments were favouring Eastern Europe in terms of rates of current progress, there was no period on our current horizon when Eastern Europe would catch up in terms of its importance, politically and economically, with the West. So far as the cultural picture is concerned, Eastern Europe does not begin with similar advantages and, indeed, it seems to start with a major historical handicap, which arises from the fact that the great cultural waves emerging from Greece and Rome and then the Italian Renaissance and the liberal movements of France and England were almost entirely confined to the West. Eastern Europe received, inevitably, as the waves spent themselves, currents of the cultural vitality of Western Europe, but in total volume, largely because the sources of cultural power were in the West, Russia and even Poland and Czechoslovakia must take a lowlier place in the historical spread of what has comprehensively been described as European culture. In the field of literature, to Indian readers, there is nothing so grand as William Shakespeare in any 'foreign' language. Our own education perhaps has blessed us in terms of English prose or poetry. But it is probably true even without this bias that the volume of Western literature, as well as the volume of Western art has been, in intensity and quality, far greater than anything that Eastern Europe has produced in the past. Compare in the field of music in modern times the tremendous power of Beethoven and Brahms and then place it in balance with the lighter music of Fredrick Chopin of Poland and Chaikovsky of Russia. There have been tremendous artistic creations in the East as well as the West. The Bolshoi Theatre to this day presents a tradition in ballet dancing second to none in the world. But, all in all, an Indian observer looking at the great flood of Western literature and the flood of Western music and, possibly, of painting and architecture might look less appreciatively at what now stands in the world as a monument to the creative capacity of the people there. Much of Russian art is recent and in the Communist world it is necessarily inhibited by its environment though creative genius is unpredictable and one cannot say whether it is related to political systems. From the fact that the great Cathedrals were built in the Feudal Middle Ages and that some of the finest music has been produced under autocracies, and even the Italian Renaissance was the fruit of the patronage of the Italian nobility, one might hesitate to say that freedom in the democratic sense is a condition of creativity. On the other hand, authoritarianism is definitely a bar to creative criticism. Is creative criticism itself an element in the creation of original qualities in culture? The answer is probably in the negative, but who can say?

The brute fact remains that Eastern Europe, notwithstanding the glory of some of its achievements—and Prague and Warsaw today are wonderfully beautiful cities, perhaps no less than some of the great ancient cities of the West—so far as the past is concerned, has shown itself less creative than the West. Today the problem of what effect the political and economic systems prevalent in Eastern and Western Europe have on literature is one on which opinions may well differ. Opinions even differ on the works themselves. Dr. Zhivago by Boris Pasternak might have received the Nobel Prize, but there are some Indians who would argue that it is not in the highest class of the moving literature of the West and Boris Pasternak, even if not inhibited in his writing, was persecuted to the point of having to refuse the Nobel Prize. These are powerful elements in the view that the seed for literary creation is probably not as good in Eastern Europe today as it is in the West. A somewhat mechanical educational system, spaciously deployed, is tending to produce far more quantity than quality. The original genius, largely because he has to conform, inhibits himself at the start and tends to lose his original quality. This is not, indeed, a criticism exclusively applied to Eastern Europe. The view has for some time been presented that the mass culture of the West is producing what, in W. H. Auden's phrase, is called "the horizontal" man—a "brotherly type" absorbing all the popular arts, notably, movies, jazz, journalism, all of which are diffused with a skill which, whether in Western or in Eastern Europe, grows day by day, but does not produce the original lone genius who has made cultural history down the ages.

It is probable that Europe's old class system produced more of the "vertical" man who could stand on his own feet on the basis of the quality of his own mind and the quality of his own creation, but who, again, can tell that the lone wolf provides better soil for culture than any other? Nevertheless, one might perhaps hazard the guess that for a sheeplike culture, forming everywhere in Europe today, there is more congenial ground in the East than in the West. For the West has room for great eccentricities as it has for outspoken criticism. It has, indeed, even outside Oxford University, many homes of lost causes. Popular breezes ventilate cultural angularities, and the very process of individual democracy tends to breed a ferment in which it is possible that both political and economic factors, controversies, lend themselves to a ferment in the cultural environment. All in all, one might hazard the guess—and it can be no more than a guess, since we do not know the springs of original culture—the climate is better set in Western Europe than elsewhere for the great movements of the human spirit which, when they come together massively, create a Renaissance and, when they come singly, constitute what we call genius.

Humanism and the Liberal Test

THE DARK AGES

THE "creative" character of the environment is not the only test by which the Indian people will judge of systems external to themselves. It is natural that, with the great tradition of tolerance which has spanned Indian history from Asoka to Mahatma Gandhi, that one should look in systems abroad for that practice of tolerance and ready acceptance of other views which is often, in secular terms, described as humanism or the liberal current. So far as the West is concerned, liberalism is of comparatively recent growth. Indeed, one might argue that, notwithstanding a fine religious tradition and the overwhelming power of the Catholic Church, liberalism was the exception, rather than the rule, until the early 19th century. Both the State and the Church were authoritarian in character, decreeing that their mandates should be carried out often with punishment which was exemplary. Those who displeased the authorities were often, as in Tudor times, beheaded or later in the Spanish Inquisition and elsewhere, burnt at the stake for heresy. Scientific enquiry was to a great extent inhibited by the fear of displeasing those in authority, and whilst controversy existed

down the ages, the broad current of European thinking, whether in the West or in the East, was authoritarian and not liberal. In the East, particularly under Peter the Great, cruelties of the State tended to be even more severe than in the West. All these are, in fact, now looked upon as exhibitions of the Dark Ages in European intellectual thought.

FREEDOM OF EXPRESSION: THE LIBERAL TEST

The central elements in liberalism have now become one of the major factors of our times. It is a fact that their absence in Eastern Europe implies that Humanism, in one of its central features, is not present there. One must recognize, however, that the volume of tolerance tenable in any society, in Bernard Shaw's phrase, is directly proportionate to the stress under which it is preserving its cohesion. We often talk as though the Fundamental Rights of the Indian Constitution were based on principles of "natural rights" deemed obvious by all. What the American Declaration of Independence set forth as "self-evident" principles in the equal rights of all men as natural gifts of their Creator, is by no means an axiom of political life, although it came, in its high-sounding prose, soon to be accepted as a commonplace slogan or what we call the Age of Enlightenment. But slavery existed for a long time thereafter and Jeremy Bentham, the utilitarian philosopher, who had so much to do with the widening character of liberalism in Britain, often called the natural rights idea "nonsense upon stilts".

The natural rights of men form, in the Indian mind, a convenient base for mass democracy. It is doubtful whether either Western or Eastern Europe looks upon them except as means of expediency in the twentieth century; the one to proclaim its doctrine of democratic equality of men by a vote, the other, by its doctrine of people's democracy, implying the protecting of the masses from the classes. Into these great confusions it is not necessary to enter, but the fact remains that Indian sympathy will tend to be with those societies in which the freedom to vote, based on the doctrine of the equality of men, is allied to a freedom of expression in which men can join other parties or group themselves against the ruling party in the State. In other words, Indian tolerance would tend to be Western democracy, rather than Eastern "democracy", in outlook.

The elements of democracy itself, however, in the humanistic age need careful consideration. The fact that the vote is generally spread in Western Europe is not an indication that there is equality of opportunity or, indeed, any economic equality which can be seen as such. The unequal base of property rights, which a socialist state is supposed to have abolished by vesting practically all property capable of production in the hands of the State, is itself a great maker of inequality. This is deemed consistent in Western Europe, as in India, with the progressive recognition of the power of common men to decide the political apparatus in which the country should live. How free the vote can be in unequal societies is a question on which opinions may well differ. But there is something in the criticism that the greater political privilege given to a voter in Western democracies is offset by the greater privilege given to the "classes" in terms of property rights and the use of higher incomes for the purpose of securing privileges. 'U' and 'non-U' today may not have the same significance as in the nineteenth century where the "classes" were separated powerfully by the character of the economic stratum to which they belonged; in the twentieth century expenses accounts have produced a new rich class with moderate incomes in terms of that fraction subject to tax. Nevertheless, privilege for the masses under our present democratic societies in political terms might well be described as a compensating clause for the lack of their economic privilege.

The position in Eastern Europe is, from the humanistic point of view, obviously far less attractive. There is no freedom of expression as we understand it and, broadly, the sense of tolerance in politics is small with no alternative vote possible, even if one differs markedly from the Communist Party ruling in each State. On the other hand, it is claimed that in terms of welfare—education and the core of economic uplift—there is more association of the poor with the State as beneficiaries than there is in Western Europe. It can be contended that marked improvements have been made, and when one recognises that under the Czars in Russia the position was chaotic in both political and economic terms, one can look sadly at the loss of political freedom, while conceding at substantial benefits that have been conferred on workers as a result of the Revolution. The balance, however, still remains markedly in favour of the Western world, and we Indians cannot cease to be Indians without making an act of personal choice in favour of the liberal and humanistic currents that are in evidence in the Western world today.

Religion and the Moral Order

VOLTAIRE is credited with the remark that 'if God did not exist, it would have been necessary to invent Him'. Not, indeed, that while Voltaire acknowledged the existence of the Creator, he accepted the God of Christianity with the doctrines of the Atonement and the Resurrection or ultimate salvation implicit in Christian teaching. He saw the image of God as a powerful element in maintaining political patience and in exercising control over society by an inner discipline which, in his view, it was impossible to avoid. He saw expediency, rather than faith, in religion. Before the Enlightenment, of which he was one of the great spearheads, culture had been essentially religious. It is true the Enlightenment itself sought to make culture essentially secular. But just as Alexander Pope had said that the proper study for mankind is man, the proper study of society had previously been "the will of God." The great philosophers were often, like Diderot, frankly atheistic, but this was not so of the great majority of the great men of science, including Newton and Galileo. Nor was the Enlightenment to detract anything from the deeply religious power of the Renaissance. It was religion which liberated the creative energies of those great masters of art and it may be that this is what led to the view—probably mistaken—that the world's greatest art was fundamentally religious at core.

Whether this is so or not, the issue has been raised whether we in India, who have a deep attachment to a religious conception of life based in its essence on a principle of Natural Law or Karma, leading eventually to rebirth and a merging with the Infinite, can avoid a spiritual approach in even political or cultural matters. Mahatma Gandhi saw in his 'Experiments with Truth' a new appreciation of this spiritual, or mystical, approach of life. This is not, indeed, shared by Jawaharlal Nehru, and one might wonder whether India's political leaders, at this moment, have any basic religious approach to problems, though a great mass of the Indian people look on atheist or agnostic administration as somewhat repugnant to their way of life. In this sense, Western Europe, which is still predominantly Christian—Catholic or Protestant—will probably commend itself more to the great majority of the Indian people than does Eastern Europe, tending under its new rulers to be agnostic or atheistic, even while permitting some religious freedom. The real issue is not, however, in respect of religious freedom. This can be very large.

In Poland where 99 per cent of the people are Catholics, the Catholic Church has a tremendous power. The point arises here whether or not the State should be guided by religious ends. One such is the teaching of religious education in schools and the right to propagate worship in particular forms even if it should conflict with the views of the rulers involved. A balance has had to be struck. In this balance currently Western Europe is liberal; Eastern Europe much more restricted. In the Indian Union, in our Constitution, the right of freedom of worship is conceded. The exact extent to which the Secular State and the religious freedom granted in the Constitution conflict has not been proved. But few people would look upon the Indian Constitution, or the Indian background of the Constitution except against a religious approach. By and large, the Indian social order is based on the fact that the various leading religions have powerful followings by reason of religion. The Sikhs, the Muslims and the Christians, apart from the militant Hindus, would be unable to accept Atheism as a background for the social or the moral order.

Thus one might have expected, at first sight, some repugnance in the Indian mind to the acceptance of Eastern Europe as a friendly and understanding partner in many cultural problems. For a deeply spiritual country as we are supposed to be, the somewhat materialistic presentation of programmes of action in the Eastern European countries might seem to imply a different world. In point of fact, the differences in religious background between India and the U.S.S.R., in particular, are of almost no consequence in producing support or opposition. Apparently the Indian spiritualism in the East and the materialism of Socialism in Eastern Europe can march well together. It may well be that the current is, in the secular State of India, to be less and less religious, and possibly more and more agnostic in its governing classes.

It is not necessary to argue here whether or not a sound moral order can be based on Atheism or Agnosticism. A view of the universe, which does not postulate an act of creation and a Creator, has been possible in the Western Age of Reason; but for the great masses of the Indian people the Age of Reason has not yet dawned and political patience is more easily imbued with religion than into the agnostic mind. There are dangers in Atheism as there is an element in the creation of deep religious consciousness. Not, indeed, that religion should be, as Marx described, the opiate of the people. But the time may come when, in a crisis, the Indian people will need their religion. It will endure to the extent that it is true over the long period; it will lapse where it falls. All in all, one might view the rising materialism of the Indian Union with some serious misgivings. For the present purpose, however, one might argue, that it is making easier an understanding with Eastern Europe and the time has come when Agnosticism and Atheism seem to trouble little those who feel they need every support in a world in which only the fittest are deemed to survive. The conclu ion seems to be that spiritual India does not find any contradiction in free and even enthusiastic partnership with atheists or agnostics in the modern world.

The Consolidation of the Revolutions

NOT a small portion of the cultural environment in which both Eastern Europe and India are now placed is affected by the fact that they are both emerging from their revolutions into a state of "normalcy". In theory, the Communist revolution is still very much in force, and the 22nd Session of the Communist Party was designed to show that there is, in fact, a new revolutionary horizon in that the U.S.S.R. is committed so to raise the standards of living of its people that it can abolish all direct taxes and draw level with the Capitalist world in the standard of living in the next fifteen years. The coming of an affluent society in Eastern Europe is, in fact, a revolutionary idea, although now that it has been achieved so fully in the West, one might wonder how revolutionary the idea will be to Indian audiences. But a state of normalcy is descending on the Soviet Union in at least three respects. Firstly, from being in a state of seige, at least psychologically, the Soviet Union is now forcing the pace in terms of megaton explosions, an East German Treaty and, a much more provocative line, on international commitments. The use of the Russian veto in the United Nations on India's side is just one part of an offensive in a new context. A state of normalcy, in which the Russian state is playing a "natural" hand in international affairs, is a concomitant of the feeling that the fierce international struggle for world revolution has currently ended with the decline of the Stalinist group and the rise of Khrushchev. Exactly how stable or co-existensional the Kremlin is, it is difficult to say, but it is probable that Russia's modern rulers have become more liberal by reason of the fact that they are not facing elimination at home. In this sense too, therefore, the revolution might be deemed to have been consolidated in the direction of the pursuit of an economic race against the problem of political influence or survival.

India, too, after a period of Gandhian moderation in international affairs, has now imparted what might be described as an aggressive element to her international image. What was revolutionary in the Indian situation was not, in fact, the revolution itself which merely transferred power from the civil servants to the politicians, but the Gandhian doctrine which stood behind the philosophy which was supposed to be the spearhead of the Indian Revolution. The Gandhian doctrine was not obviously the whole prime-mover and now that on Goa we have shown that it is not necessary to resort to Gandhian teachings all the time, one might say that our external relations are assuming a more normal situation, in the sense, we have secured release from the revolutionary Gandhian heritage.

"Normalising", as this process might be called, is a two-edged weapon. While we might, in fact, have lost revolutionary fervour on the Gandhian stage, we may perhaps have found more ferment in forging a new industrial society. This has been concealed by what looks like a change on the political front. At this time, there is some doubt as to whether or not the action on Goa is, on balance, going to leave our Revolution stronger or weaker as an instrument of international peace. It is probably true that the Prime Minister's intention was not to reduce our influence in the international affairs. The United Nations, in particular, has obtained a significant proof of India's willingness to commit her forces to international tasks. But the internal revolution is burning low. One sign of its return to normalcy is the fact that popular enthusiasm has to be whipped up by a call to the country not merely to face economic hardships, but to embark on military operations outside the cease-fire line in "Azad Kashmir". The session of the Congress at Patna, mounting it seems on the base of popular enthusiasm in Goa, has tended not merely to reverse Gandhian doctrine, but to place a much more questionable purpose on our military priority. In a sense, therefore, India's revolution might be said not to have consolidated itself so much as to have sought a new direction.

Whether or not the internal changes by which Indian industrialisation is transforming the countryside are a factor in the abrupt change from the Gandhian doctrine of non-violence is a question which may be asked. It is possible to hold the disturbing view that this is not consolidation so much as a new restlessness which follows on the end of one age and the beginning of something new. Consolidation implies only that the revolutionary fervour should cease to be revolutionary and the Governments of the day should be based upon consolidating their philosophy as well as their successor. In the current consolidation of Indian industrial societies there is, in fact, a struggle between the old and the new, between the urban urge for development and the stagnant countryside, between the Gandhians and the non-Gandhians, and possibly, between groups inside the Congress Party, some of whom wish the State to dominate the individual in the development of the new society.

This is a restlessness which Eastern Europe shares in a somewhat different way. The hard core of authoritarian planning is giving place to more and more recognition of the place of the individual in the modern Soviet State. Individuals and professional persons are vigorous in many portions of Eastern Europe. It may be that in the current trend of consolidation in the Indian Union we are tending to rely more and more on the State as against the individual. This is, however, not a position of permanence. It may be said that the social restlessness, which is now apparent almost everywhere in the Indian Union, is, in fact, the result of the oscillations between Gandhian and an Ancient Hindu society to a vigorous and modern society attempting, under industrialisation, to begin a brave new world pursuing materialism above the fruits of the spirit. One of the great contradictions of Indian social thought at the present time is that the disciple of Mahatmaji should be the instrument of a revolution designed not to consolidate but to destroy the Gandhian Age.

Company Meeting

THE CONSOLIDATED COFFEE ESTATES (1943) LTD.

Registered Office: POLLIBETTA, Coorg, S. India

Chairman's Speech

Speech delivered by Mr. C. I. Machia, Chairman of The Consolidated Coffee Estates (1943) Ltd. At the Eighteenth Annual General Meeting of the Company held on the 29th December, 1961.

Ladies and Gentlemen,

It is with great pleasure that I welcome you to the Eighteenth Annual General Meeting of the Company. The Directors' Report and the Audited accounts for the year under review have been in your hands and with your permission, I propose to take them as read.

The year's working has resulted in a profit of Rs. 21,93,249 after taxation as compared to Rs. 13,08,089 in the previous season. The increase in profit is mainly attributable to the record crop harvested. The Coffee crop for the season amounted to 2,585 tonnes of Arabica and 1,633 tonnes of Robusta or a total of 4,218 tonnes as against 1,451 tonnes of Arabica and 998 tonnes of Robusta or a total of 2,449 tonnes in the previous year. The total crop of 4,218 tonnes exceeded the blossom and revised estimates and the possibility of such an increase has been referred to in my speech last year. The Arabica and Robusta crop for the season under review is the highest since the inception of the Company and is nearly 988 tonnes more than the previous record crop of 1956-57. The average yield per acre of Robusta at 626 kilograms or nearly 12½ cwts, per acre is a record. The average yield per acre of Arabica is 553 kgs. or about 11 cwts. and is slightly lower than the previous record of 575 kgs. or 11½ cwts in 1956-57.

Your Board has considered it prudent to adopt a valuation of Rs. 1.90 per point in view of the present falling prices of coffee, particularly in respect of exports. This valuation is considered reasonable and it is possible that the final return may exceed this figure slightly.

The income over valuation for 1959-60 received into this year's accounts is the lowest since 1948. I had indicated in my last year's speech that the surplus over that year's valuation would not be much. We have finally received only 4 naye paise per point or a total of Rs. 2.24 per point and with the lower crop of that year the amount received on account of 1959-60 coffee was only Rs. 1,58,579. During the year under review, we also received a small Bonus payment of about 2 naye paise per point amounting to Rs. 87,036 on account of 1956-57 coffee crop. Against these receipts from previous season's coffee crop, we have had to set off a loss of Rs. 12,613 incurred on the 1959-60 season's pepper stock over the previous year's valuation, a loss due to the steep fall in pepper prices.

I will now refer briefly to our subsidiary crops. The total income from subsidiary crops such as pepper, cardamom and oranges was Rs. 7,40,433 and was a little higher than the income of the previous season.

PEPPER

The production for the year was 74 tonnes as against 58 tonnes in the previous year. The income from pepper this year on a crop higher by 16 tonnes was only Rs. 2,66,731 against Rs. 2,83,047 for the previous year's crop. This lower realisation was due to a marked fall in prices. Due to constant fluctuations in the pepper market, we have not disposed of our entire yield, but have carried forward much of our current season's crop. Pepper is a very highly speculative commodity and the prices have recently been subject to wide and erratic variations.

CARDAMOMS:

The income from cardamoms at Rs. 97,409 is the highest since the inception of the Company and the total yield of 6 tonnes is a record.

ORANGES:

The income from oranges was Rs. 70,807 higher than the record income of Rs. 1,23,469 received for the previous year and was due to a larger crop and better prices.

PADDY AND STRAW:

Our income from paddy and straw has gone down considerably due to a very low yield of 560 cartloads of paddy against 733 cartloads in the previous year.

TIMBER SALES:

Our income from timber sales is much lower. In view of the large coffee crop it was considered unnecessary to effect any sales on a large scale. Such sales as were made were limited to the removal of trees affecting cultivation.

It is proposed to sell a fair quantity of timber this year to supplement the income from our very much lower coffee crop.

In keeping with the policy of increasing our subsidiary crops, we have planted during the year 20 acres of oranges and other citrus fruits, 7 acres of cardamom and 11 acres of arecanut. We have also planted about 10,000 pepper vines and we expect to improve our cultivation of paddy.

The income from our Curing Works was lower than that of the previous year due to their curing a lesser crop than in the previous season and to the increase in the labour Wage Bill.

The income from trading is also lower and is due to the delay in obtaining nitrogenous fertilisers owing to scarcity of wagons and to import restrictions on Power Sprayers etc.

Our production, trading, selling and administrative expenses show an increase of Rs. 10,75,201 over that of the previous year and is accounted for as under:

(1) To an increase of 1,769 tonnes of Coffee over that of the previous season, resulting in a corresponding increase in crop charges such as gathering, curing, transport etc.

(2) The application of extra manure to heavy bearing areas resulted in an increase in cost under the heading 'Consumption of Stores and Spare Parts.'

(3) The Wage Agreement entered into with labour with effect from the 1st August, 1960, which accounted for nearly Rs. 3 lakhs increase in wages, Provident Fund etc.

The Dividend at 20 per cent on the Ordinary Share Capital recommended by your Board is consistent with the need to allocate larger amounts to reserve and to provide for a big carry forward in anticipation of a lower income in the coming year.

During this year the total capital expenditure

Only in "MICHIGANS" do you get
Power trains—designed, built and matched by one manufacturer——Clark

Michigan Tractor Shovels, Dozers, Scrapers, and Logging equipment—18 models and sizes—all use the efficient all-Clark power train.

Of all earthmoving machines now on the market, only Michigan gives you unquestioned efficiencies of a power train engineered and built by one manufacturer.

Designed specifically for earthmoving, Michigan power trains are produced entirely by Clark Equipment Company. This firm needs no introduction in the highly-technical business of designing and manufacturing heavy-duty power-transmissions and axles for heavy "working" vehicles...this has been Clark's specialty for over 50 years. Every Michigan power train represents this half-century of accumulated design and manufacturing experience. **You can't buy better experience anywhere.**

You can't buy a better testimonial of efficiency and durability than the one Michigan gives you. Since the introduction of the Michigan Tractor Shovel, over 12,000 units have been built and sold. Each has the same basic power train. Not a single major design change has been needed . . . dramatic proof that the power train was *right* from the start . . . . . and that it is *right* today.

This is truly an electrical age ! We need electricity... to turn the wheels of industry...help us grow more food. .brighten our homes: indeed, electricity is rightly described as mankind's best servant ! And this "servant's servant" is aluminium, the amazing metal which serves the supply industry from point of generation to point of ultimate use.

Besides ACSR and All-Aluminium Cables ALIND produces covered aluminium conductors for outdoor weatherproof and indoor applications.

ALIND ALL-WEATHER Weatherproof wire : Polythene-Insulated, taped, braided and

Best Servant's Best Servant!

Company Meeting

THE MADRAS INDUSTRIAL INVESTMENT CORPORATION LTD.

38, Whites Road, Madras-14.

SHRI R. VENKATASWAMY NAIDU'S ADDRESS

Speaking at the Twelfth Annual General Meeting convened on the 15th of December, 1961, at 11 a.m., Shri R. Venkataswamy Naidu, Chairman, said:

I welcome you all to this Twelfth Annual General Meeting of the shareholders of this Corporation.

The accounts have been circulated to you, as also the Directors' Report. Although we closed our accounts on the 30th June, we were unable to hold our Annual General Meeting earlier because of the fact that our accounts, after being audited by the commercial auditors are subject to a test audit by the staff of the Accountant-General and under Sec. 619 of the Companies Act, the Annual General Meeting cannot be held without placing before it the comments of the Comptroller and Auditor-General of India. The Office prepared the balance sheet and profit and loss account on 13th July, 1961. The auditors completed the audit by 31st July, 1961 and the balance sheet and profit and loss account were signed by the Directors at the Board meeting on the 10th of August, 1961. After these were signed by the auditors it was sent to the Accountant-General on 21st August, 1961. The test audit by the staff of the Accountant-General's Office was conducted between 25th September, 1961 and 21st October, 1961. The Office has been urging the Accountant-General's Office to send the comment of the Comptroller and Auditor-General, for being placed at this meeting. Actually the comment has not yet been received and consideration of the balance sheet has to be postponed. I refer at length to this matter because one of the shareholders, at the last Annual General Meeting complained about the delay in our holding the Annual General Meeting. It is rather anomalous that the Companies Act prescribes the time for the holding of the Annual General Meeting by companies and has imposed severe penalties for non-compliance with the provision; at the same time makes the holding of the meeting dependent upon the co-operation of the Audit Department, on whom no statutory duty has been imposed.

REVIEW OF THE WORKING OF THE COMPANY

You will see from the accounts that during this year we have made a net profit of Rs. 13,60,638 as against Rs. 8,89,368 for the previous year. As much as Rs. 8,12,500 is accounted for by underwriting commission on the considerable underwriting business which we did during the year. Although we may not do the same amount of business every year, underwriting has become a part of our normal business. Among the State Finance Corporations we are alone in taking to the business of underwriting of shares. We find that in some States, Development Corporations have been started for the purpose of underwriting and equity participation in new issues. We think it was a wise decision on the part of the Government to entrust this new line of financial activity to our Corporation. This has resulted in considerable saving in administrative expenditure, while the knowledge gained by our staff in long-term loans over the last twelve years and the administrative set up built up over the years have proved equal to the new responsibility.

I am glad to inform you that the ordinary shares of new issues which we have underwritten have all been fully subscribed involving no financial commitment for the Corporation. The investing public appear to prefer ordinary shares because of the prospects of capital appreciation and they do not go in for preference shares to the same extent. In the case of one company, for which, we had underwritten ordinary shares for Rs. 10 lakhs and preference shares for Rs. 5 lakhs we have had to subscribe for preference shares for Rs. 3,34,000 in fulfilment of our underwriting agreement. All the same, as preference shares are more or less assured of a fixed return and at an earlier time, the Corporation chooses to underwrite preference shares to some extent along with ordinary shares which are more popular with the investing public.

In this connection, I wish to deal with some stray criticism that by investing in such large measures in the shares of new issues with funds obtained mostly by way of deposits for which we have to pay interest all the time, our working results will be badly affected Reference is also made to the depreciation on our investments. The essential of capital formation is the ability of the investor to wait. With the pursuit of egalitarian ideals by the State and with the gradual disappearance of large private investors who can afford to wait for a long time without a return on their investments, new industrial ventures cannot be started without institutional support on the scale which we in common with other financing institutions have undertaken. In every case of our underwriting or subscription, institutions like the Industrial Finance Corporation, the Industrial Credit and Investment Corporation and the Life Insurance Corporation and in some cases leading commercial banks have also taken financial interest in a large way. The risk of industrial venture is thus shared between a number of institutions. We are living in an era of planning and with Governments — Central and State — taking interest in rapid industrialisation and giving necessary assistance and protection against unfair competition from within and without, industries started these days and under such circumstances have every prospect of success so far as it can be humanly predicted. The depreciation on our investments is only a temporary feature due to irrational market sentiment and it is not a matter over which we should be alarmed.

During the year, the Refinance Corporation included us among the institutions eligible for refinance. We have obtained refinance in respect of one loan for Rs. 15 lacs during the year of account; subsequently refinance has been sanctioned in respect of a loan for Rs. 5 lakhs. Last year, I mentioned that the facility of refinance which is repayable over a period of seven years and in exceptional cases over 10 years it may suit well-established industries which take loan for expansion and that it will not be suitable to new industrial ventures which take two to three years for being established and not have sufficient margin of profit to repay the loan within the limited period envisaged under the scheme. After dealing with the Refinance Corporation for some time, we find that although the Refinanc Corporation looks to us primarily for repayment, elaborate scrutiny of the borrowers' position is done by the Refinance Corporation and the procedural details also entail a good deal of delay. We are representing to the authorities of the Reserve Bank and the Refinance Corporation for Industry Ltd. to cut out needless formalities and to sanction refinance in all cases where by the accepted canons of industrial finance, the applicant companies should be given aid.

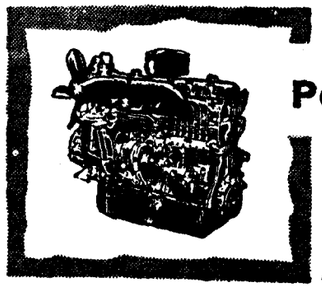
INTEREST RATES FOR DEPOSITS

During the year, the commercial banks not only raised their interest rates for deposits but have gone

in for deposits upto five years. Inspite of the fact that our deposits are guaranteed by the Government, we cannot attract deposits unless we give slightly higher rates than the leading commercial banks because commercial banks, by the nature of their business can offer powerful incentives, whereas we, who do an entirely different type of business will never be able to offer the same incentives. Therefore, with effect from 15th April, 1961, we raised our interest rates for our deposits as under:

1 year and above	..	4½%
2 years and above	..	4½%
3 years and above	..	4½%
4 years and above	..	5%
5 years to 20 years	..	5½%

On 30-11-1961 our deposits stood at about Rs. 4 crores and 20 lakhs.



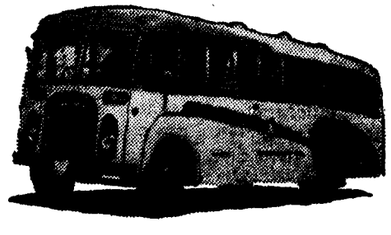
In this connection, I must mention that there is really no conflict of interests between us and the commercial banks. The success of institutions like ours resulting as they do in the development and growth of industries will benefit banks who get increased business in the shape of demand for working capital. Our rates have been adjusted to our demand and we have never gone in for deposits for the purpose of flaunting our resources or in a spirit of unfair competition. The fact that leading commercial banks have given sizable support to our bonds and even to our deposits should set at rest any doubt about clash of interests between us and the commercial banks.

Last year we amended our Articles enabling us to receive deposits for less than one year and also short-notice deposits. These short-notice and short-term deposits are obtained at comparatively lower rates of interest and result in considerable saving in interest charges. They are not treated as part of our resources for our lending or other business. On 30-11-1961 the amount of such deposits stood at a little over Rs. 50 lakhs.

Total guarantees given by us on behalf of our constituents to machinery suppliers and counter-guarantee to banks on account of machinery purchased on deferred payment terms amounted to Rs. 26,61,082.71 on 30-11-1961.

We continue to receive a good number of applications both for long-term loans as well as for underwriting of new issues. As the funds at our disposal are not sufficient to undertake fresh commitments, we are arranging to float bonds in the market which will be guaranteed as to principal and interest by the Government of Madras. Our Corporation continues to grow in size and usefulness to industrialists of all types.

Note: This does not purport to be the proceedings of the Meeting.



Proven Performance

Perkins DIESELS

Diesel Economy is a by-word. And coupled with reliability, long life, low depreciation, easier maintenance PLUS proven performance, the economics become absolute.

MADRAS-2

Branches: OOTACAMUND—BANGALORE—TIRUCHIRAPALLI—SECUNDERABAD (Dn.)

(Continued from page 228)

amounted to Rs. 7,30,904, Estate Machinery, Pulphouses, Barbecues etc., accounting for nearly Rs. 2,11,380.

Labour housing has been completed on all our Estates excepting two which still require about 50 new units and the conversion of 26 substandard houses to prescribed standards. Our main capital works in the future will be the modernising of about 4 pulphouses, building of barbecues, construction of reservoirs for storage of water for pulping and spraying etc.

PROSPECTS:

It is feared that the estimated crop for the coming season given in the report may not be harvested, as the setting of the Robusta crop has been poor throughout Mysore State.

Last year, I referred to the prevalence of a malady in coffee. At the initiative of the Bombay Burmah Trading Corporation Ltd., Dr. F. J. Nutman of Kenya, one of the foremost Coffee Scientists in the World was invited to India, and your Company also shared in the expenses of his visit. He visited the properties of the Bombay Burmah Trading Corporation Ltd., and our Estates and his report has proved to be of great interest. His general conclusion was that the Die-back did not appear to be caused by a pathogen but was likely to be due to a certain combination of circumstances such as over-bearing, shade, debility due to leaf disease etc.

As Dr. Nutman is a recognised authority on coffee leaf disease, his advice on this subject was taken and a series of experiments are now being laid out by the Company's Scientific Officer, who is in regular correspondence with him. On your behalf, I should like to record our grateful thanks to Dr. Nutman, for his kind and very ready advice and help.

LABOUR:

Our relations with labour were generally cordial. A disquieting feature is the increase in the number of Labour Unions who are not truly representative of labour. In many cases, the new Unions are confined to a single estate and the leaders of such Unions also demand the right and are allowed to attend Conciliation proceedings instituted in respect of industry-wide demands. Exaggerated claims far beyond those put in by long existing and established Unions are made, and most attempts at conciliation and settlement are obstructed. It may be necessary for the Labour Department to investigate the representative character of such Unions.

As you are aware, the Government of India has constituted Wage Boards for Tea, Coffee and Rubber.

The Wage Boards are to consider among other matters the question of paying a Fair Wage and also whether the wage should be based on a single wage earner per family or on family earnings as at present.

There is little doubt that the wages will be increased and this will naturally affect the Coffee industry vitally, geared as we are to a high cost per acre.

It is to be fervently hoped that the examination of the subject of wages will be related to output. We accept as inevitable a certain amount of absenteeism as peculiar to any agricultural enterprise, but when labour insists on having all the benefits of industrial employment, we have a right to expect less laxity in attendance and a greater exertion to earn the wage. As enlightened employers we cannot be against a rising wage level, but we are fast approaching a stage when we have to make much better use of our labour or we and our labour will suffer together.

I reported to you last year that despite the International Coffee Agreement, the world coffee situation is likely to deteriorate further. This has unfortunately come true and our export sale averages reflect the depression in the world Coffee market. The average prices realised at the export sales from July 1960 to June 1961, for the two main varieties of coffee, are noted below:

			Plantation A 50 Kgs. Rs.	Robusta Flats 50 Kgs. Rs.
1960	July 7	..	208.34	—
	August 4	..	201.11	95.02
	September 8	..	200.11	91.14
	October 14	..	184.24	88.20
	November 9	..	176.62	84.43
	December 15	..	—	81.09
1961	January 25	..	190.56	—
	February 23	..	175.95	—
	March 23	..	166.07	—
	April 11	..	164.71	73.20
	May 5	..	164.50	73.33
	June 8	..	172.09	67.96

There has been a discernible weakening of coffee prices despite the strong and world wide effect of the International Coffee Agreement and its regulated exports. Apart from the erratic and substantial fall in our export prices, what has further depressed our return per point has been the excessive weight of our export in relation to our total crop.

The world coffee situation is not likely to improve for many years and it would be imprudent to plan our future marketing policy on the assumption that world prices would improve. The Government policy is markedly in favour of increased export. For the first time in twenty years we were forced to export a greater proportion of our total crop than is consumed here. If we can export an increasing volume of selected coffees, there is the advantage of familiarising the foreign market with the particular characteristics of our produce. But if coffee is dumped abroad at whatever price it will fetch, in the interest of an export drive which is unfortunately being forced upon every commodity without due regard to their individual economy, nothing but loss can result. It is very important to us all that Government should think over its coffee export policy with great care and that the Coffee Board should advise the Government with clarity and truthfulness even if it is contrary to the avowed policy of the Government. The Board owes this duty to both the Government and the coffee industry, whose welfare is the Board's first responsibility.

This year the producers have made attempts to represent a case for a new marketing policy and several reforms in marketing procedures. As the largest single coffee producer in the country, your Company is naturally interested in helping to devise a sound and helpful coffee policy. It is my view that an export policy which merely looks to an immediate increase in physical volume of export without understanding or accepting its long term effects on the Indian coffee industry is not only short-sighted but dangerous.

There are two conditions which are essential to improve our capacity to export more. One is that the return to the grower could be such that he will continue to be in business. The other is that the export drive should be realistically linked to creating a preferential acceptance for Indian coffee in the world market. Otherwise, export promotion becomes a purely mechanical operation of diverting larger quantities of Coffee from the Pool over which the Government, through the Coffee Board, exercise statutory control.

It is to be realised that not all coffee produced in this country is of export quality and it is essential in the interests of the industry that only the very best quality which is capable of earning a premium should be exported.

A sound internal market expansion programme is vital to the increasing production of coffee and we trust the Coffee Board will be able to persuade the Government to accept such a policy.

We constantly make every effort to effect economies in our cost. We have always worked on the basis of a high unit yield and our level of expenditure has been related to that policy. There is no advantage to be gained from lowering our standards for doubtful economy but there is always the need to exercise vigilance that each rupee we spend is put to the best use. Every care is being taken towards that end. You will doubtless appreciate that for producing 72 per cent or 1,769 tonnes more crop, the expenditure of the company increased by 11 per cent or by less than Rs. 11 lakhs. What we are, however, faced with is that a prospective fall in Coffee production without any compensating rise in prices would leave us in the position of having to spread the same weight of expenditure over a smaller crop.

This brings me to the problem of increasing costs and declining prices. After my intimate association with the coffee industry over the past fourteen years, I have no doubt that the ultimate solution to the present problem lies here in our home market. We must expand this market to absorb at least 2|3 of our increasing crop so that the loss on the export of the remainder can be maintained at a tolerable level. I do not envisage a lowering in the quantities for export—in absolute terms — since the size of the 1|3 reserved for export will increase in proportion to the expanded production. The first and foremost step to be taken is to assure the producer of a fair price at which his interest in improved production can be maintained.

In simple terms, the position is that with the selling of coffee for exports at whatever price it may fetch the Board is unable to pay to the grower even the so called minimum return.

There are four specific measures immediately open to the State and Central Governments to afford reasonable relief to coffee. One is to abolish excise duty altogether and to maintain the existing minimum release price so that the benefit accrues to the grower. Another is to offer a direct subsidy to coffee by making up the difference between the cost of production and the export price. The third is to reduce the rate of Agricultural Income-tax on coffee and to liberalise the rules relating to depreciation, New clearings etc. The fourth, to revise the excise duty on an **ad valorem** basis. Perhaps a judicious use of all these four measures should be adopted so that the fall in revenue from coffee is not unduly heavy on any particular account. Encouragement given to coffee now is bound to pay the State and Central Governments handsomely, as our production and sales in the internal and export markets expand.

In 1951, on a production of 1481 tonnes of coffee, this company recorded a profit of Rs. 22,39,598. The amount available for disposal after tax was Rs. 17,17,598. Taxation absorbed slightly more than 23 per cent of the profit whereas for the year under review, on a production nearly three times greater, the profit was only Rs. 37,44,249 and after taxation which absorbed nearly 41 per cent, the amount available for disposal was Rs. 21,93,249. In spite of this heavy taxation and the requirement of a higher working capital, your Company added to its fixed assets by incurring Rs. 7,30,904 in capital expenditure.

The burden of direct taxation is heavy enough, but the cost of indirect taxation adds considerably to our costs. For example, a standard farm tractor with all duties and taxes now costs over Rs. 19,000 to a planter, whereas his competitor in Kenya could buy such a tractor off the show room for a little below Rs. 11,000. Such comparisons are possible in a wide range of Estate machinery, affecting materially our ability to compete in exports.

A matter of great concern to your Company has been the passing of the Mysore Land Reforms Bill in its present form. We are the largest single coffee interest in the country, with a record of intensive development of our properties, a reputation for maintaining our workers. The many representations made to the State Government pointing out the consequences of some of the measures of the Bill on organised plantation industry and the relatively liberal provisions made in the neighbouring States in regard to plantations have gone unheeded. We are greatly disappointed at the restrictions placed on the reserve land that can be held and the disruption of the entity of compactly managed units. For instance, it is provided that the land that may be held as reserve for expansion should not exceed 100 acres, irrespective of the present size of a property. A company like ours with about 8,000 acres under cultivation will therefore be allowed only 100 acres as reserve, the same extent as is permissible for say a 5 acre or 10 acres cultivator. The bill also contains a proviso that the 100 acres should be planted up within five years, a condition of little advantage to the small grower due to the heavy finance required. The Bill does not also provide for the replacement of unsuitable and spent land by planting on new land—a continuing process essential to maintain the maximum productive efficiency of the planted area.

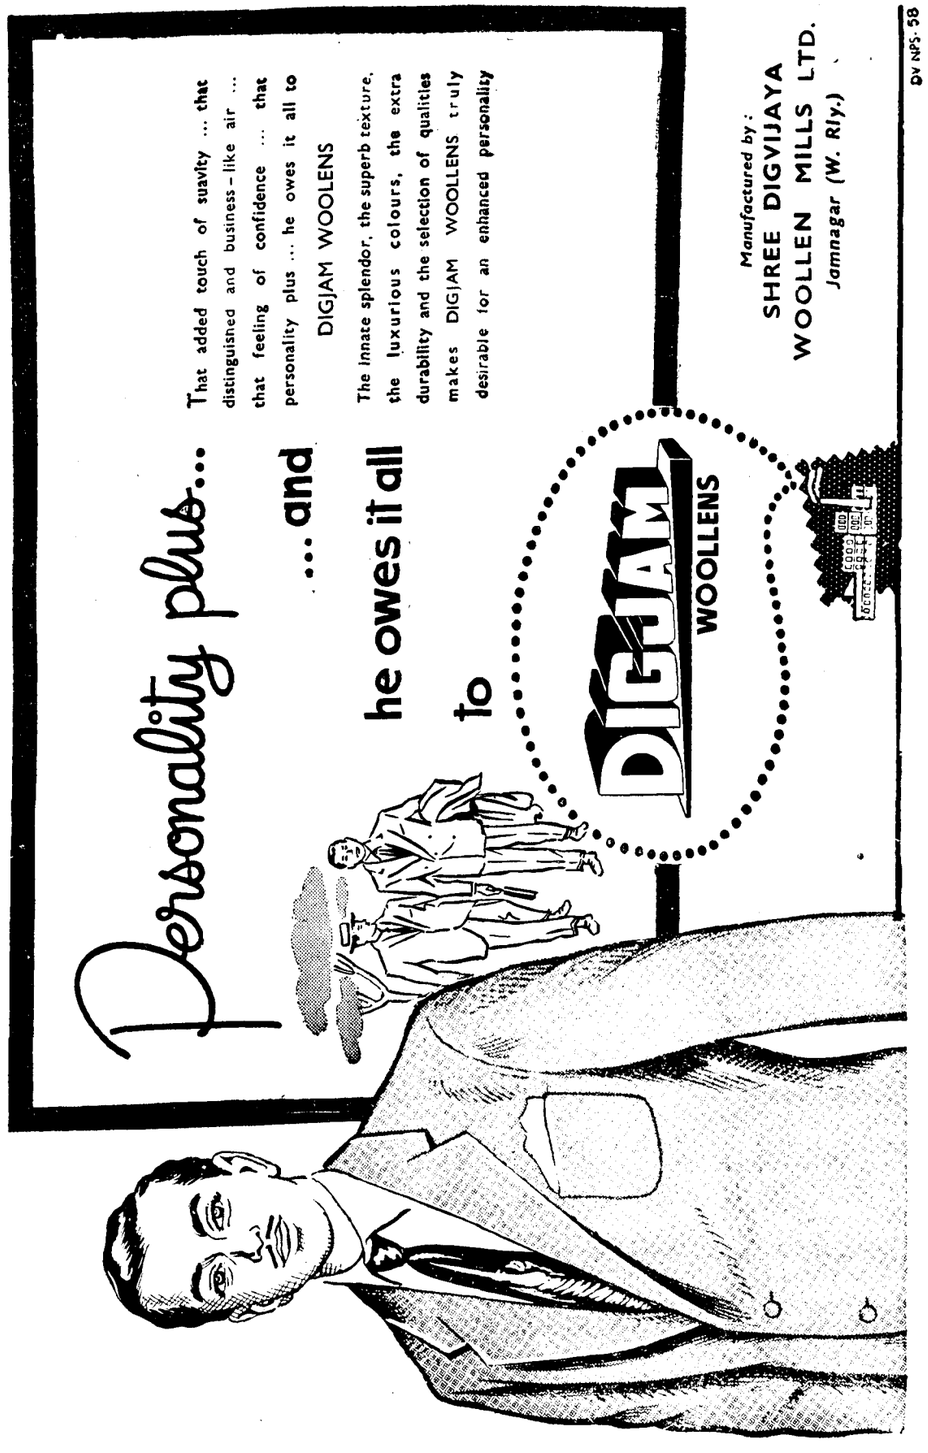
In regard to Agricultural land interspersed in Plantations, a plantation owner may retain only one ceiling area or 18 standard acres of such land.

By these provisions your Company which under the Act is treated as a person will be entitled to retain only one unit of 18 standard acres of paddy land out of its present holdings of some 600 acres, and 100 acres for development, out of about 2000 acres of Reserve land. The balance is to be surrendered.

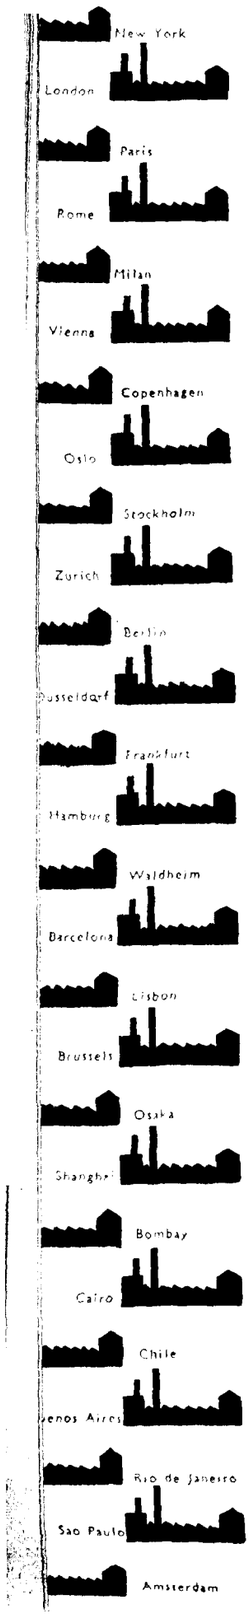
The Act has failed to take account of the difficulties a Company such as yours will have to face. All water sources required for labour, pulping and spraying are situated in the low-lying paddy fields and the difficulty that must result in outsiders controlling these sources can well be imagined. Some of our reserve land is not suitable for cultivation, but requires to be maintained, as such land serves as windbreaks, as sources of fuel to labour, as grazing grounds for estate and labourers' cattle, as sources of jungle soil for coffee nurseries and many other uses so essential for running a coffee Estate. The position becomes more difficult when it is realised that our reserve and paddy lands are distributed over some 13 estates.

Your Company is owned by about 3000 shareholders, mostly of the middle class and the justification for the imposition of ceiling in this context is difficult to understand.

The long-term effect of this Bill will be to cause a gradual deterioration of the industry and of its revenue earning capacity with attendant unemployment. These points are being forcibly brought to the notice of the Union and the State Governments by the United Planters' Association of Southern India and the Mysore State Planters' Association. It is hoped that the Government will at least realise that the imposition of restrictions on plantations in Mysore is unjust especially when compared to the position of plantations in Madras and Kerala.



The development of Tea, Coffee and Rubber is governed by Central Acts, but the Mysore Land Ceiling Bill will certainly affect the development of plantations particularly coffee in this State contrary to the aims of the Central Government.



The matters I have touched upon are matters which will affect the expansion and production of coffee and it is to be hoped that these problems will be dealth with expeditiously and that the position of coffee growers will to some extent at least be ameliorated.

I must now thank all our Managers and members of our staff both at Head Office and on the Estates and at the Kushalnagar Works for another year of hard and efficient work.

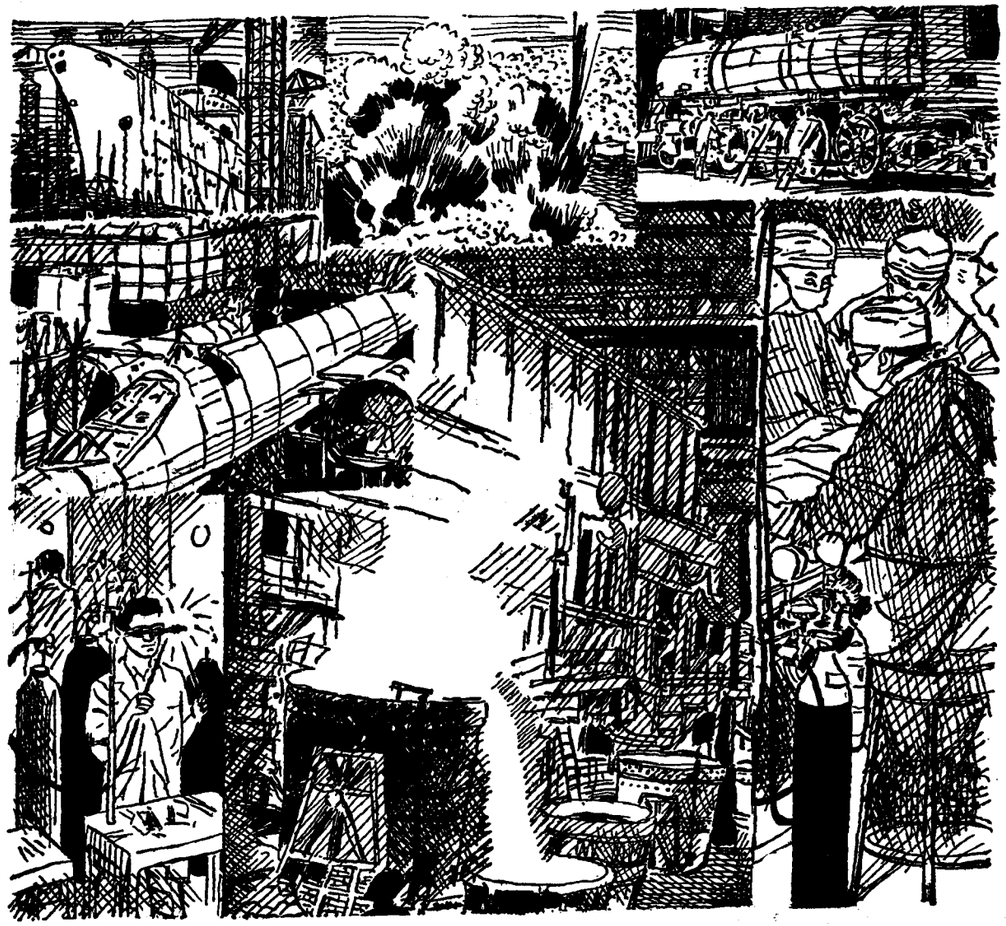
Finally, I must thank my fellow Directors for their wise guidance and help.

POLLIBETTA, C. I.MACHIA.

27 *factories*

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.



If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose ''KORES'' when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

KORES (INDIA) LTD.

KORES For your Kores-ponden

PROMISE OF PROGRESS

With the Third Five Year Plan, India enters the most momentous decade of her development. Today's battlegrounds are in the steelworks and mines, the very foundations of our economic growth; in the shipyards, the aircraft factories and the locomotive works that help us to meet our transport needs; in the schools and institutions where the new techniques of industry are assiduously acquired and imparted; in the hospitals where life is so often triumphant because it is aided by science.

Indian Oxygen Limited is happy to be participating in this exciting race for progress. Its fast expanding supply of industrial gases and welding and cutting equipment is helping these industries to meet the strenuous challenges of development; its medical gases and anaesthetic equipment are in use in every hospital; and its welding schools and research keep India abreast of the latest advances in industrial processes and techniques.

It takes the patience of untiring men to make the land yield a golden harvest. So with a nation.

And so with a company like HINDUSTAN LEVER.
Many heads, many hands work and plan...building up knowledge regarding modern marketing methods. Guiding the training of a body of technicians. Diversifying to meet changing consumer needs. Developing new consumer goods, new ideas in foods, like dehydrated vegetables, and constructing milk plants. Establishing research laboratories. Experimenting in ways and means of making use of neglected resources of the country. Increasing the utilisation of partially used resources, for example, by cottonseed oil extraction. Working up new methods to help the national economy.

Work and patience. Work to educate for tomorrow. A tomorrow that will bring a little less of care, a little more of joy.

Today and tomorrow...Hindustan Lever serves the home with soaps, foods, toilet preparations

Industrial growth of a country depends on its ability to manufacture products for its requirements. And products require plants to manufacture them.

To this end, Simon-Carves' contribution is truly impressive. The above map shows only some of the plants designed and engineered by Simon-Carves. The total capacity of coke oven plants installed by Simon-Carves is approximately two-thirds of the entire carbonisation capacity of the country. Likewise the total capacity of sulphuric acid plants built to Simon-Carves design is about half the entire acid production of the country. Apart from the specialities, some of which are shown on the map, Simon-Carves engineer and build plants based on clients' know-how.

At any industrial centre in India, be it Jamshedpur, Burnpur, Durgapur or Ennore, to mention only a few, Simon-Carves are there—helping India attain self-sufficiency.

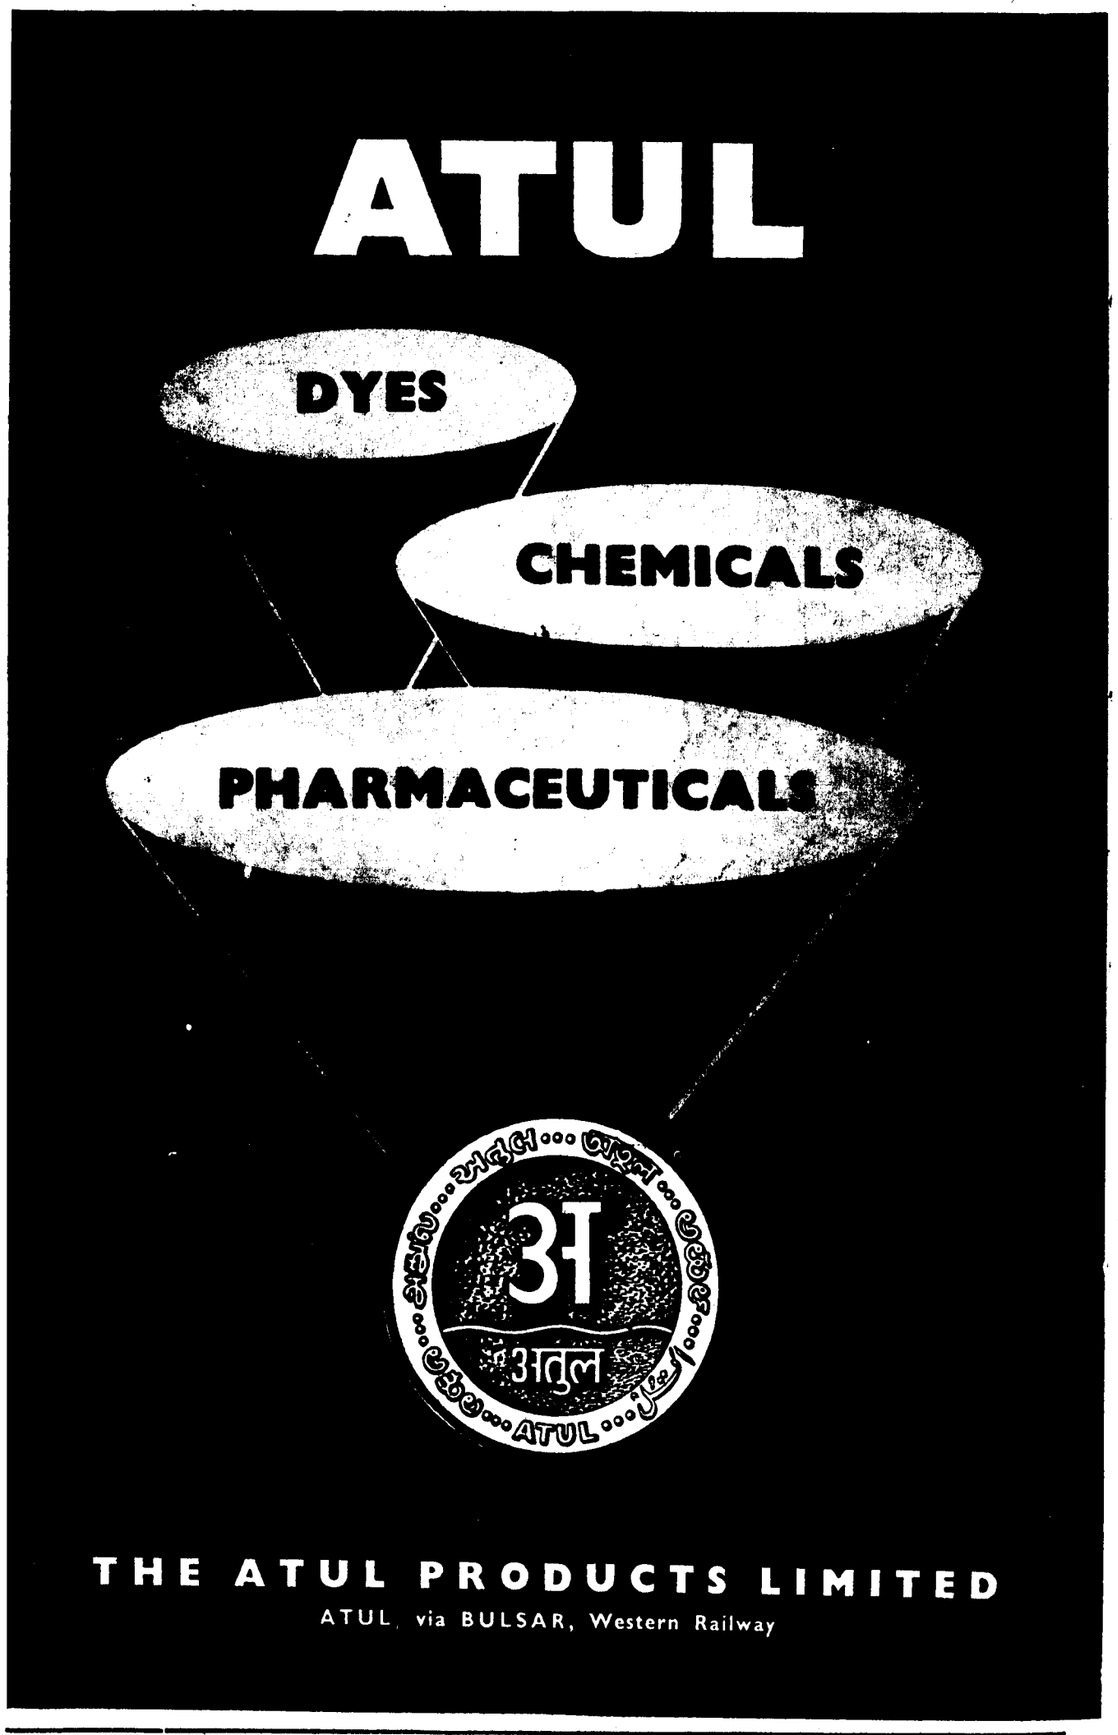
In this we believe



SINDRI. The miracle of man-made chemistry works unceasingly to make fertilisers for the farmer. When Sindri first started production, sceptics scoffed at the excess stocks of ammonium sulphate. Today the demand far exceeds the supply. The Indian kisan has joined hands with science in a partnership that promises a harvest of joy.

We of the Mafatlal Group believe in this way of life. That is why our production is geared to the hungry demands of a growing nation. We produce today a wide range—textiles, jute, sugar, dyes and chemicals. To people in every walk of life we pledge these products, with confidence and faith in the future.

INDUSTRIAL **IBCON** CONSULTANTS

in the expansion of TEXTILE INDUSTRY

IBCON offers to intending promoters of textile industry, comprehensive consultancy services comprising :

- Project study and financial estimates.
- Project design including equipment, buildings, power, steam, water-supply, etc.
- Advice on purchase of equipment from India or abroad by tenders or negotiations.
- Supervision of construction of buildings and erection of equipment and services.
- Commissioning and operation.
- Senior and supervisory staff selection:
- Management organisation, clerical procedures, quality control, scientific cost and wage schemes.
- Technical assistance after commissioning to ensure successful and profitable operation.
- Also production planning, waste control, stores, dyes and fuel consumption.

The Congress: Dropping the Compass?

THE Patna Session of the A.-I.C.C has acquired some quick notoriety which, it would appear, will be difficult for the organisation to live down in a hurry. Quite apart from the unseemly stampede which broke up a whole Session—which suggests that the organisation was unable to exercise the necessary self-control over its own meetings from which the authorities of law and order seem to have been carefully excluded—there is the larger question of the pronouncements at this meeting, many of which seem to have been very ill-considered. It is natural that many of the speeches on foreign policy and on Goa should have been designed to justify Indian action there. Much of this reiteration seems unnecessary because there can be no question that the Indian people as a whole are fully convinced that this action was right. The small minority who hold that this was a great lapse from Gandhian teaching will not be converted; that, perhaps, is one of the glories of the Gandhian teaching that it has left a permanent residue of conviction which cannot be blown back and forth by political pronouncements even by the Prime Minister himself, however painfully reiterated and however convincing they might appear to those already convinced. The speeches seemed to show a loss of nerve; seeing how popular action on Goa was, it seems a mood of military bravado was encouraged. The necessity of action on Goa seems to have prompted important speakers to draw the conclusion that vacating the aggression across the Cease-Fire Line in Kashmir would be equally "popular". The prime responsibility for this very bad sense of proportion, which has serious international consequences, must rest with the Congress President, Mr. Sanjiva Reddy, who first declared that India was committed, presumably at no distant date, to the vacation of Pakistan's aggression in Kashmir. The placing of Pakistan and China in the same bracket was militarily and politically unwise; it is obviously unnecessary for us to increase our problems by leaving the impression that we are to attack both the problems at the same time. The immediate effect has been greatly to strengthen the hands of President Ayub Khan in arguing that India has "aggressive" intentions. Public opinion in Pakistan has only been too willing to work itself into a new frenzy on India's "aggressive" designs. To argue that this was exactly our policy in the past is a total misrepresentation, since India has accepted the Cease-Fire Line for the time being and the Prime Minister has even given an indication of some "adjustments". Both the Prime Minister and Mr. Sanjiva Reddy seem to have yielded to Mr. Krishna Menon, whose favourite theme has been to place Pakistan's aggression before China's so as to defer action on the latter.

Quite apart from the fact that we will now be militarily extended on two long fronts, India stands to gain nothing by this new declaration of intention which, as every one knows, is not to be implemented and is merely for the consumption of the Indian public on the eve of the elections. Undoubtedly, in the Security Council Pakistan will receive sympathy on Kashmir, and possibly we will be in the odious position of using the Russian veto a second time in order to avoid an adverse vote. The West as a whole is now reconciled to a position of stability in Kashmir in which vital Indian interests in the valley will be secure. If, however, it is seen we are threatening to cross the Cease-Fire Line, it will be extremely difficul. for the West to support an Indian move; and the fact that high authorities in the Congress Party have lent colour to the view that we intend to take some military action across the border can only lead to a further deterioration of our relations which need to be repaired at this time.

The placing of Pakistan in the same bracket as China is designed to produce more uncertainty in the Sub-Continent, and eventually to strengthen only the forces which are working for further ill-will between the two neighbours, whose friendship and goodwill is vital for healing the wounds of Partition. The only possible beneficiaries of hostilities between the two countries must be those who wish to profit by the fruits of disorder and revolution. Almost no one in India agrees with the *Dawn* of Karachi, but at least the analysis of that paper that the weakening of India and Pakistan is only favourable to the Communist cause will be accepted with very little demur.

It cannot even be that the Congress *demarche* at Patna will assist the Congress Party in the elections. The Muslim vote in the Indian Union is still extremely significant and could be in many constituencies decisive. The feeling that some action is being contemplated against Pakistan is bound to raise in the Muslim mind the idea that this is an attempt to weaken Pakistan; it is not unlikely that in certain important areas in the country the Muslim vote will be turned against Congress, instead of being attracted towards it. On the other hand, the Jan Sangh and the Hindu Mahasabha vote will not be appeased by the proposal to equate Pakistan and China, particularly as there is a general feeling that the Minister of Defence is seeking to work up feeling against Pakistan in order to defend our inaction against China. There may or may not be justification for the view that this is part of the Defence Minister's strategy. Again, even after Goa, the country is not attracted by the somewhat belligerent line taken by the Congress President on this issue. It is the course of wisdom—now that a serious error has been committed—for the Prime Minister to declare that there is no current intention whatever of departing from the undertaking that the Cease-Fire Line represents a stable situation so far as India is concerned. India has no current intention of crossing the Cease-Fire Line and none of Pakistan's fears on this account are justified. This will at least show that we have in no way changed our basic policy and have not lost both radar and compass in the rough seas which, it seems, the 1962 General Elections have unaccountably produced.

West Irian

THE precipitate developments which took place in the past few days over the West Irian dispute show that Dr. Soekarno's desperate strategy of creating a sudden sense of crisis to hasten an immediate solution will not turn to be miscalculated. The battle cry and the preparations for mobilisation to execute the threat of launching the offensive were inevitable consequences of the extreme tactics he consciously chose to adopt. They could not, therefore, be burked once the initial step was taken. But although the crisis thus appeared to be heading towards the brink, there was time to prevent a plunge into a war, so long as none of the parties was averse to negotiations. President Kennedy urged Dr. Soekarno not to resort to the use of armed force and with equal earnestness he used his influence with Holland to abandon her insistence on the condition that the principle of self-determination for the inhabitants of West Irian be accepted as the basis for transfer of power. A substantial shift has taken place in the relative positions held by the two parties following this move to facilitate settlement by discussion. The gulf between the two has been narrowed down in a marked degree. But this provides only a brief spell for effecting an immediate settlement.

If Dr. Soekarno considers himself driven to the course of action he has chosen, the explanation may be found in the unfortunate and protracted history of this dispute. In 1950, the second year of Indonesia's independence, she made a demand for the transfer of West Irian on the strength of the treaty for the devolution of sovereignty to the people of the archipelago. The Dutch had their own interpretation of the treaty in so far it concerned West Irian. It is of little avail for Holland, in the interest of peaceful and friendly relations between the two countries, to prefer technical interpretation (assuming it is correct) to the spirit of the treaty. To insist that the Papuans are entitled to self-determination because they belong to a different racial stock is to hang the claim on a slender thread. It is to ignore the basic fact that in an archipelago, comprising myriads of islands, a wide diversity is but natural. But the real objection to the Dutch contention goes much deeper. West Irian, infested with dense forests and sparsely populated by about 700.000 persons, cannot be given any pretence to viability. To insist on self-determination in such a case is to create suspicion, even if unwittingly, of using subtle tactics to set up neo-colonialism. But Indonesia's claim to West Irian as her integral part rests on sound ground. In the matter of the territorial integrity of a State there can be no bargaining.

In giving up its insistence on self-determination as a condition precedent to the transfer of power over West Irian, therefore, the Dutch Government has made a concession to realism and removed the big hurdle in the way of a settlement by negotiation. But the shift in this original position has not been made in a language free from equivocation, for the Prime Minister, Professor Jan de Quay, announcing the change in policy in the Lower House, added the qualification that in the proposed discussion for transfer of power the interests of the population would be entitled to their first consideration. Probably, the qualification is intended to make the retreat from the original position look dignified. It is of the essence of fruitful negotiations that the parties should be enabled to reach an agreement with dignity and grace. Indonesia has shown the inclination to be helpful in expressing her readiness to agree to de jure transfer at a later appropriate occasion, provided de facto transfer is effected without delay.

If Indonesia is giving publicity to her mobilisation operations — rather an unusual course to follow — the intention would appear to be to emphasize the supreme necessity to settle the dispute at the earliest. But in the midst of this publicity has come the Dutch military in elligence report from Hollandia, capital of West Irian, that Indonesian troops have not been deployed within striking distance of the disputed island. They could be, but probably Indonesia implies a gesture of a fair chance for talks. The ultimatum, or more precisely the deadline, of "one week to ten days" for diplomatic efforts to be carried out by friendly powers also seems to be intended more as a renewed accent on the urgency of early settlement than a decision to fix zero hour. Dr. Subandrio, Indonesia's Foreign Minister, disclosing the fact of the ultimatum, was not dogmatic in his explanation that action shall follow the expiry of the time limit. And Dr. Soekarno has chosen to clarify in his public speeches at Macassar and Jakarta that liberation would be brought about "this year". It may be that the 17-nation Committee on Colonies, to be set up early under the directive of the General Assembly, may be of help, or the good offices of Asian neighbours — Thailand and the Philippines are hinted as acceptable — may be utilised. The chances for a peaceful settlement are thus brightening up. But the basic fact cannot be ignored that the crisis has been worked to a pitch where indiscreet irritants and delays may touch off a war.

Guest Editorial

Britain in Deficit

By PAUL BAREAU, Editor, 'The Statist'

AS Britain steps into 1962, there is no question as to which of its many economic problems should be placed at the top of the list. It is that of the balance of payments. It justifies its priority because it comprehends all other important elements of economic policy. Unless that problem can be tackled with sufficient vigour to yield success in the coming year, the prospect before Britain must be deemed gloomy indeed.

The facts are not in doubt. Britain began to slide into balance of payments deficit during the closing months of 1959. In 1960 it was to plunge so deep that the final figure for the year showed a current deficit of no less than £344 million. The situation has improved slightly in 1961 but not sufficient to establish anything like equilibrium. The figures for the first three quarters of the year show a deficit on current account of £118 million. The final quarter of the year normally shows a deficit even in a good balance of payments year because of the substantial interest payments that have to be made on December 31st on the money borrowed from the United States and Canada immediately after the war. It can thus be assumed that for the whole of 1961 a deficit of nearly £200 million will have been incurred. There is as yet no evidence in the trade figures or in what is known as the invisible items in the balance of payments to suggest that 1962 will do other than yield yet another, though it is to be hoped very much smaller, deficit.

Britain will thus have been in consecutive balance of payments deficit for more than three years. This suggests that the forces at work are deep-seated and more chronic than those responsible for previous monetary dips of the balance of payments into "the red".

The position is rendered more serious and the performance more reprehensible because the terms of trade during this period have been more favourable to Britain and other industrialised countries than at any previous period in history. Allowing for the depreciation in the value of money, it is probable that the terms of exchange between raw materials, including foodstuffs and manufactured products, are even more unfavourable to the primary producers today than they were during the great depression of the 1930s. In those days it could be said that the industrialised countries, however hard hit they may have been, maintained their standards of well-being at the cost of the much poorer primary producers. The same accusation can be made today.

Part of the damage to the British balance of payments has been caused by the virtual disappearance of those sources of net invisible income which used to keep Britain in external solvancy in spite of a substantial adverse balance of merchandise trade. There does not appear to be much hope of improvement on this front. Britain, the great maritime nation, is actually spending on foreign shipping services more than overseas traders pay Britain for shipping freights. The balance on overseas interest and dividend account, which used to be a massive creditor item in the British balance of payments, is rapidly nearing vanishing point. The position in this respect is likely to get worse rather than better by the very fact that Britain's balance of payments deficit is in large part being covered by short term borrowing incurred on extremely expensive terms. It would also seem that the foreign capital which has recently been invested in Britain, has yielded higher dividends for its holders than the capital invested abroad by British companies and through official channels.

To add a final coat of black to this sombre picture, it should be stressed that Britain is not alone among members of the sterling area in running a deficit. Most other countries in the sterling family are doing likewise—either on current or capital account. The gold and convertible currency reserve which must take the main strain of the whole sterling area's balance of payments deficits, is therefore bound to be severely tested. One cannot depend in 1962, as one did in 1960, and 1961, on the balance of payments deficit being covered by massive inflows of hot money. That inflow, in fact, did Britain a grave disservice by veiling the harsh realities of the situation and blunting the keenness of the urge to put remedial measures into effect.

If exceptional help is required in the coming year it will be made available through the International Monetary Fund whose resources are again to be reinforced by the recent acceptance of the so-called Jacobsson plan. The ten major industrial countries of the free world have undertaken to make available to the Fund credits amounting in all to $6,000 million. It should not be assumed from this, however, that the Jacobsson plan has been agreed to intact. The opposition to irrevocable credits which became apparent at the I.M.F. meeting in Vienna and was very effectively led by the French representatives, has won the day. The International Monetary Fund will not be able to call on these facilities and use them at its own free discretion. The countries which make these credits available will retain their right to control and even to veto their use. In the final resort we may yet see the French Minister and the Governor of the Bank of France sitting in judgment on the economic policies that may have led the United States or Britain to require this particular form of assistance from the Fund.

It is to be hoped, however, that this form of assistance will not be needed for sterling and that Britain will be able to move out of its chronic deficit position by the appropriate expansion in merchandise exports. In order to achieve this three conditions will have to be satisfied. The first is that some restraint will have to be maintained on domestic demand. It is the greed of that demand which has hampered Britain's export drive, rather than uncompetitive British prices. The second is that the British economy will have to move once again into a phase of expansion that will at one and the same time be rapid and yet consistent with stability of prices. If that is to be secured, the Government's plans for setting up a National Council for Economic Development and for securing the loyal co-operation of the trade unions in the activities of the Council, will have to prove successful.

Thirdly, more selective help will have to be given to British export trade, whether by fiscal or by credit facilities. A great deal of thought has already been given in Government departments to ways and means of giving tax concessions to firms with a specially good export performance. The problem, however, bristles with difficulties of demarcation and also of adherence to international agreements such as those of GATT. More hopeful progress is being made on the credit front where a scheme is being devised to provide for effective collaboration between the banks and the insurance companies, to satisfy the demand for medium term export credits. The recent performance put up by British exports to Western Germany, now the most competitive of all markets, suggests British industry can make good use of special credit facilities of this kind.

Unless the export drive succeeds 1962 will be grim for Britain and may lead to the climax of another run on sterling in the latter part of the year.

A DELHI DIARY

A HAPPY NEW YEAR!

THE year 1962 has begun on a somewhat cheerless note. Not that this will prevent any of us from wishing our friends the greatest happiness possible in the best of all possible worlds. My fan mail has noticeably subsided since I expressed some doubts on the means employed to liberate Goa. But I am still wishing all my readers the most non-violent year in their experience. I see that my naughty cartoonist has singled out some international figures in a special form of numerology. I append this without any comment. May I also express the hope that all the gentlemen concerned will escape their serious intestinal troubles within the year?

What a Life!

A new year?

Courtesy: "The Hindustan Times"

I have not yet been able to come to a firm conclusion on the subject of what the stars foretell between January 16 and February 12—the days when, I believe, eight planets are entering Capricorn or whatever seems to suggest tidal waves, rising mountains or, perhaps, world catastrophe in general. In Delhi last week we were treated to a long process of chanting with a number of Sadhus participating in a 'Yajana' designed to protect this unfortunate world from the malevolent (is it maleficent?) operation of the said astrological conjunction. Whether we are actually rid of the maladies involved or not, it does seem a little odd for the stars to relent so easily because of the cries of those in Delhi, many of whom, it seems, were put up at considerable expense and who drew to themselves crowds far outnumbering the significance of their personalities. I thought the stars were made of sterner stuff, but perhaps more things are really wrought by prayer than this world dreams of. Only one wonders whether the prayer has to be organised with such a show of storming the heavens in order to prevent the evil designs of the planets from descending on the earth by an act of supernatural intervention.

I leave this cheerful subject of what is to befall us within the next month to deal with a matter which was, unfortunately, not in the astronomical calendar, or even in the agenda of the Congress meeting at Patna. I refer to the extraordinary stampede in which a very large number of persons were injured, and which resulted in the breaking up of the Congress session under circumstances which reflect no great credit on the Congress. I think it is quite wrong to blame the members of the Reception Committee when, in our truly non-violent way, to which we have now grown so accustomed, the official police are not permitted to use force. There were curiously many mutual congratulations on the last day because things were not much worse. But may I make a humble attempt to express myself through my naughty cartoonist, who refuses to be suppressed on these, as well as other, matters!

What strikes me as odd is the extraordinary manner in which only Congress meetings get broken up. The Prime Minister, it seems without any specific evidence, has complained that the Opposition has been responsible for this particular disaster. Surely, it should now be possible to investigate this point and find out whether, in fact, the Opposition has employed such a clever trick by which it encourages people to surge forward to fall upon one another in order to have a view of the Prime Minister which, in any case, was always available from a distance. Almost any stick at election time seems to be good enough with which to beat the Opposition dog. But it seems unnecessary that the Congress Party should indulge in this kind of recrimination, seeing, as the latest poll of the Indian Institute of Public Opinion makes clear, that its popular vote, although it has some ups and downs in some particular States, notably Kerala, the Punjab and Rajasthan, stands pretty firm. Do not ask me whether or not this means that the Congress Party will have the same number of seats. I gather through some mysterious application of the Rule of Three that this is not likely. But mere arithmetic, of course, has little to do with politics. It all depends on Alliances!

THE NORTH BOMBAY ELECTION

Meanwhile, it does seem to me that election fever has caught the Congress Party badly even outside North Bombay. In North Bombay, Mr. Krishna Menon on Tuesday seems to have had another altercation with the Press. I have not yet gathered exactly what the point of dispute was and, to tell the whole truth, I am going to Bombay in order to acquaint myself with this and other highly important matters. Curiously, after the first flush of victory the reports that are coming from Bombay are to the effect that Goa has not made any difference. People on whom it should have exercised some kind of fascination seem to be curiously fickle; others say that for an election purpose a miscalculation of thirty days took place. Can it be that Acharya Kripalani's campaign, which is now gathering force, is in fact terrifying top brass in the Congress? Was it necessary for Mr. Sanjiva Reddy—and the Prime Minister by implication—to strengthen Mr. Krishna Menon's hand by raking up the problem of vacation of aggression by Pakistan, meaning that area of Kashmir which was to be held by Pakistan temporarily until the plebiscite could be arranged? It seems a somewhat inopportune moment to have raised this question of vacation of agression, but politics is an exacting mistress and, I suppose, North Bombay is an environment in which she can play her mischief quite effectively.

What a Life!

I think they were saying something about avoiding all kinds of internal strife . . .

ARGUS.

THE WEEK'S NOTES

Laos

THE END OF THE DEADLOCK?

HOPES RAISED three months back, when the Geneva Conference unanimously agreed on a neutral government for Laos, to the effect that Laos would be enabled to return to peaceful life, have not been realised so far. It is paradoxical that a deadlock should be created by one of the three parties in Laos itself. Prince Souvanna Phouma was the obvious choice for premiership in a neutral Government and not Prince Boun Oum, Premier in the Rightist Government, or Prince Souphanouvong, the Pathet Lao leader. The latter readily agreed to the formation of a coalition under Prince Souvanna Phouma.

Prince Boun Oum, however, adopted an uncompromising attitude and, although he did not press an outright claim to the leadership of the neutral government, he made specific proposals apparently to obstruct the formation of the neutral government. He insisted on the portfolios of Defence and Interior being allotted to his nominees. This was nothing short of asking for the substance of practically the whole power to be vested in the rightist group, thereby reducing the neutral character of the government to a shadow. A solution was found in the offer of Prince Souvanna Phouma to take over both these portfolios himself. This offer was calculated to allay the fears of the rightist group that the control of any key portfolio would pass to the Pathet Lao. Meantime, the Geneva Conference continued to be seriously handicapped by the absence of an agreement between the three princes. The latest appeal issued by the two co-chairmen on Friday last week, summoning the three princes to Geneva, underscored the consequences of a failure of the efforts of the Conference after the problem was very nearly solved, if a plenipotentiary could not be appointed on behalf of the neutralist Government of Laos to participate in the deliberations and enter into commitments regarding the conduct of the government.

Evidently, a good deal of pressure was necessary to be brought to bear on Prince Boun Oum, since he seemed to treat very lightly the grave consequences of the resumption of civil war. With developments taking an ominous turn in South Vietnam, America could not brook Prince Boun Oum's obstructionist attitude. As we go to Press comes the report that he has agreed to fly to Geneva. This is good news. But the solution of the subsequent problems cannot be taken for granted. The integration of the armed forces of the three groups and the disbandment of the irregulars will not see the end of the military reorganisation. The continuance of Laos in SEATO after neutrality will be an immediate issue for solution. But these problems need not be deemed insuperable since the Big Powers are agreed on neutral Laos.

Mysore-Maharashtra

CENTRE MUST INTERVENE

THE FAILURE of the committee appointed towards the close of 1960 to settle the border dispute between the Governments of Mysore and Maharashtra was formally announced at a Press Conference held at Bombay on January 2. The representatives of the two governments on the committee tried to impress upon the conference that they met in a spirit of cordiality and discussed the eight issues referred to them in a spirit of understanding. This white-wash is unlikely to mislead anyone conversant with the history of this unfortunate dispute. The truth of the matter is that there is very little common ground between the two governments and so far there is little evidence of agreeing to a formula governing the readjustment of the disputed areas, much less of accommodation. The areas involved are not very large and one full year is by any test too long a time to settle the merits of the claims. It is obvious that a solution based on the consent of the two governments is hard to evolve.

It is significant and no less curious that, instead of the committee tendering its report to the two State Governments, with whatever number of notes of dissent that individual members may choose to append, the abnormal course of the representatives of the two governments submitting their reports to their respective governments has been reportedly followed. This is another proof of the remote possibility of the governments coming to an understanding. At the last meeting of the Southern Zonal Council, Mr. Lal Bahadur Shastri exhorted the two governments to emulate the example of the Andhra and Madras States and settle this thorny question to pave the way for cordial relations. Mr. Shastri specifically pointed out that the solution could best be found on the basis of certain clear principles. This suggestion was, perhaps, addressed to the Mysore Government. The matter cannot rest there. Technically, it is Parliament which can act in this matter; but Parliament cannot act unless it is moved by the Central Government. The initiative seems to have passed to it. The Centre stands in the position of a disinterested authority seeking to decide the issue on the basis of broad equitable principles. It is to be trusted that the two governments would invoke the Centre now, but, in the event of their omission or reluctance to do so, the Centre should assume responsibility to give finality to the delimitation of the border.

Nagaland

PROGRESS WITH CONFIDENCE

THE TRANSFORMATION of Nagaland to statehood gathered momentum with the New Year. This is a direct reflection of the waning influence of the rebels notwithstanding their sporadic act of terror in this strategic frontier area. The extreme elements among them are finding themselves severely embarrassed by reason of Dr. Phizo's adoption of British citizenship. This has accelerated the process of the rapid decline of their influence and undermined their morale. Meantime, Mr. Shilu Ao and his colleagues on the Executive Council are proceeding with their de facto responsibilities with a noticeable degree of confidence. At the beginning of this month, Mr. Ao was here in the capital city for talks with the Ministry of External Affairs on the subject of changing the administrative set-up during the period of transition to transfer of power to the new State Cabinet and the Legislative Assembly. The appointment of Colonel G. S. Puri, Commissioner of Nagaland, as Chief Secretary to the Nagaland State, is likely to be the first major change.

On January 17, the interim body is to hold its session. The main agenda it will consider is the formation or reorganisation of local bodies. This, in fact, demonstrates that the Executive Council and the Interim Body are functioning as the de facto cabinet and legislature. The confidence with which the moderate and realistic elements in the Nagaland are proceeding in their task has been greatly strengthened by these developments. Mr. Ao had also discussion with the Planning Commission a direct outcome of which was to raise the original allocation to Nagaland for development programmes during the financial year 1962-63 by nearly half a crore of rupees to Rs. 2.31 crores. Priority is being given among the development projects to roads and communications which are not only of strategic importance to the new State but essential prerequisites for stimulating economic activity. The Executive Council is to take simultaneous action to raise internal resources by means of taxation.

The World Abroad

THE BIGGEST NONSENSE IN THE WORLD

BY ODYSSEUS

ONE OF THE MOST striking contributions to "Agenda For A Free Society" (Hutchinsons for the Institute of Economic Affairs. London. 1961. Price 25 sh.), an assessment by ten leading philosophers, lawyers, and economists of F.A. Hayek's monumental work "The Constitution of Liberty" (Routledge. London. 1960), is that on agriculture by Mr. E. F. Nash, Professor of Agricultural Economics at Aberystwyth University, of which I will give a brief account, because it seems of particular interest to India and other developing countries.

Hayek observes in his "Constitution of Liberty" that the basic problem is to extricate governments from a system of agricultural controls in which they have become entangled, and to restore the working of a free market. We have reached a state of affairs in agriculture in which the authorities no longer ask which would be a rational policy to pursue but only which of the courses that seem politically feasible would do least economic harm! Agricultural policy in many countries is dominated by ideas which are not only self-defeating but, if generally applied, would lead to totalitarian control of all economic activity.

WHY INDUSTRIAL INCOMES ARE HIGHER THAN AGRICULTURAL

Agricultural incomes tend to lag more and more behind incomes from industry. Why? Because as living standards rise, consumers, with stomachs of limited capacity, spend a decreasing proportion of their higher incomes on rural produce, and an increasing proportion on the infinitely varied products of industry. Normally, therefore, as standards rise, one would expect to see that movement of workers from agriculture into industry, which it is the object of most developing countries to promote.

If the rate of increase in output per worker in agriculture equals the average rate per worker in industry, the total supply of agricultural products must increase more rapidly than the demand for them, unless the number of the national labour force engaged in agriculture is simultaneously decreasing. If the number remains constant, or decreases with insufficient speed, there will be an over-supply of agricultural products, leading to a fall in their prices relative to the prices of industrial products, and to a similar fall in agricultural, relative to industrial, incomes.

The world-wide disparity between agricultural and industrial incomes is evidence of the continuous tendency for agriculture to over-supply its markets because the transfer of workers from the land to industry habitually takes place too slowly. One important reason for this is the contrast, between life on the land and in industry and the reluctance of the average rural dweller to adapt himself to so big a change. But too slow a rate of transfer results not only in a reduction of individual agricultural earnings below the level that they would otherwise have attained, but also in the sacrifice by the whole population of the increased industrial output that it would have enjoyed if agriculturalists had moved more quickly into industry or other non-agricultural pursuits. "Agriculture in the World Economy" (Food and Agricultural Organisation. Rome. 1957) says the percentage of a country's population engaged in agriculture is thus usually (though not invariably) an index of its people's standard of living — the greater the proportion of agriculturists, the lower the standard of living. Mr. Nash points out that wealthy countries can afford to use most of their workers outside agriculture because agriculture (their own and/or foreign) is productive enough to supply their needs with few land-workers. Countries with large agricultural populations are usually poor because most of their workers are required to supply basic needs and few remain available to produce the machinery, amenities, or luxuries, without which living standards cannot rise much above subsistence level.

THE VICIOUS AGRICULTURAL CIRCLE

The inference to be drawn from these facts supports Hayek's main argument, for Mr. Nash brings out that the reason why programmes of government aid to agriculture are nearly always harmful is that the relationship between agricultural and industrial incomes is not merely one of the effects of the operation of a free market, but is also one of the governing forces required to enable a free market to multiply wealth. Government aid to agriculturists starts a vicious circle because it almost inevitably makes it less profitable for them to move to other occupations, and more profitable to remain on the land, where they increase the volume of agricultural output, which adds to the initial excess of their production, which evoked government aid in the first place!

Even if we count as a social gain the lessened disparity of income which may follow government aid, we must set against it the failure to transfer resources required if the best use is to be made of them, and the loss of income due to the sacrifice of alternative industrial, or other, production of greater value. What is more, we must not forget the marketing boards and the mass of regulations so widely imposed on agriculturists, which constitute a substantial loss of individual freedom and initiative.

From the world point of view, agricultural protection is equally harmful. An exporting country which aids its agriculturists, tends, by thus stimulating production, to create surpluses which are difficult to sell, except at a loss which leads to dumping, and to subsidies to compensate for the losses. To farmers of agricultural importing countries, their difficulties seem to arise from the competition of imports rather than from the increasing volume of domestic agricultural output, and most of the aids to agriculture in importing countries seek to limit this competition and to replace imports in some measure by domestic output. An agricultural importing country, which reduces its imports by protecting its home market, may thus lower the prices that it has to pay abroad for its agricultural imports, and because the volume of its manufactured exports required to pay for agricultural imports is likewise reduced, it may sell its manufactures more easily and at higher prices.

In fact, most countries decide their agricultural aid policies for political reasons, and I doubt that any consciously use protection to secure better terms of trade. However, this side effect of such policies must be noted, and also that they invite retaliation. If many countries adopt them, all suffer.

Does agricultural protection economise foreign exchange? The implication of this argument is that world agricultural products are highly priced, but the agricultural surpluses of all kinds which are wandering round the world in search of buyers quickly answer that argument. World agriculture is not suffering from a shortage of supplies but of markets, and any protectionist country is merely adding to the shortage. Since for the reasons outlined above, world agricultural prices, at any rate for as far ahead as one can see, are likely

prices slashed by 10%

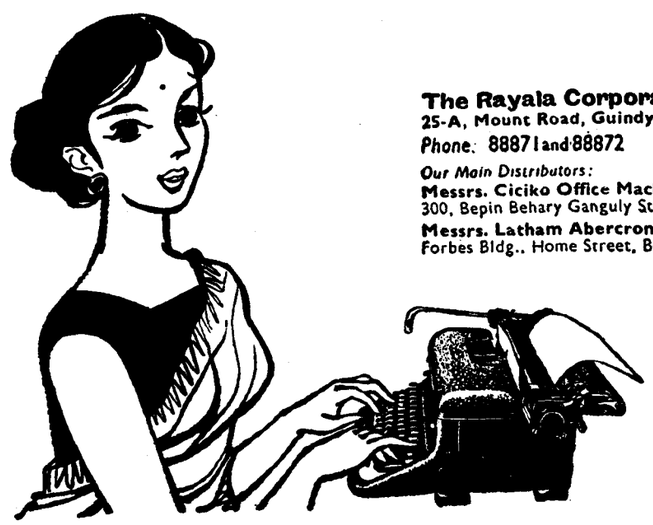
Phased programme completed...
sanctioned production target reached

WE HAVE PLEASURE in announcing the successful completion of the progressive manufacture of Halda typewriters as per schedule. The licensed capacity of production has also been reached.

We are happy to herald this occasion with a substantial cut in prices.

Model		Current Price	Price from Jan. 1962
Foolscap	29 cm.	Rs. 1,050/-	Rs. 950/-
Brief	38 cm.	Rs. 1,220/-	Rs. 1,100/-
Policy	45 cm.	Rs. 1,400/-	Rs. 1,260/-
Manifest	52 cm.	Rs. 1,500/-	Rs. 1,350/-

The above prices are ex-factory



High quality, Precision construction and Dependability

HALDA—the beloved of the secretaries—is the product of closest and effective technical collaboration with the Facit Group of Companies in Sweden, manufacturers of business machines ranging from typewriters, calculators, adding machines, duplicators and office furniture to electronic computors.

HALDA typewriter embodies the same high quality, technical skill, craftsmanship, precision construction and dependability for which the Facit products are world-renowned.

HALDA typewriters are available with English, Hindi, Tamil, Canarese, Malayalam, Gujerathi and Marathi keyboards, to suit our regional needs.

HALDA typewriters are sold and serviced in 40 important centres throughout India.

PARTNERSHIP WITH INDIA

Through the development of modern industries, countries with ancient civilisations are experiencing a new heyday. DEMAG helps to create the technical facilities for this development. Rourkela is a fine example of this. We help to explore material resources and construct loading and handling installations. We design and make machines, equipment, and plant both for India's iron and steel producing industries, and processing industries. Our deliveries included wide-strip, blooming, billet, and section mills, O.H. furnaces, cranes, hydraulic installations, and bay structurs. DEMAG's equipment is operating in more than 100 countries to contribute towards the world's industrialisation.

to fall rather than rise, the balance of payments arguments in support of increasing domestic production is untenable.

Most aid programmes assume that protection can be combined with measures to improve domestic agricultural productivity and a reduction in the cost of government aid. This explains the multiplication of educational and advisory experts to improve methods. But, as Mr. Nash shrewdly insists, increased yields per acre, or per cow, or volume of output per worker, have no meaning unless markets exist in which the higher output can be sold. When markets are dominated by the competition of lower-priced imports, together with the inelasticity of consumers' demand for them, an increase in the physical output per domestic agricultural worker does not improve economic efficiency if the value of that output is simultaneously reduced by its bigger volume. Even if the rate of subsidy per unit can be reduced because average costs are lowered, the increased volume of output may still prevent reduction in the total subsidy. The fact is that nothing can reduce agriculture's dependence on aid unless the number of its workers is reduced as their output rises.

What is wanted to end the world nonsense in agriculture is not bigger and better plans worked out by bureaucrats, but the recognition that agriculture flourishes in a free market in the same way as any other industry. The fatal defects of protection of agriculture, and of any industry, is that it hides from farmers, and industrialists, the information needed to decide what kinds of output are most valuable and which productive methods the most efficient.

If free markets were introduced, the initial repercussions on agriculture in many countries might be severe, but governments could legitimately give massive aid in the transition period. Mr. Nash suggests that all redundant agriculturists could be compensated by a life annuity, not transferable to their heirs. A scheme resembling this has in fact been carried out in the U.K. cotton industry. There is ample room to discuss the details, but the ingenuity of officials would be more profitably employed in working them out, and in promoting the required re-organisation of the agricultural and industrial structure, than in elaborating existing schemes of subsidy and protection. One of the biggest benefits from such a reconstruction would be to end the present disparity between agricultural and non-agricultural incomes.

Do I hear someone observe, whether sadly or sarcastically, that this is all very logical, but that the agricultural vote throughout the world is too strong to allow governments to "put the clock back" to a free market? The answer is that there are fashions in opinions as in all else, and that fashions can be changed by determined leaders of thought. Hayek himself points out that the argument that clocks cannot be put back "expresses the fatalistic belief that we cannot learn from our mistakes, the most abject admission that we are incapable of using our intelligence." Ten years ago any criticism of welfarism in the U.K. was equivalent to blasphemy. The rising tide of criticism in the past five years supports Hayek's rejection of fatalistic acquiescence in nonsense simply because it is fashionable.

Economic Report from the U.S.

AUGMENTING I.M.F.'S RESOURCES

By GUY SIMS FITCH

WASHINGTON, January 9.

THE free nations have achieved a measure of co-operation in the field of international finance that exceeds the hopes of many an expert. There were few economists 15 years ago who really expected to see the kind of progress that has been made towards stabilizing currency flows and easing potentially disruptive effectives of balance of payments inequities. The latest evidence of this progress is the formulation of final plans for a standby 10-nation pool of convertible currencies to augment the resources of the International Monetary Fund (I.M.F.) and help meet pressing international financial problems. The pool will be administered through the 73 nation, I.M.F. which was created — largely as an outgrowth of the dislocations engendered by World War II — precisely to help its members cope with financial difficulties. The standby arrangement was agreed to in principle at last fall's meeting of the I.M.F. and the World Bank, its sister U.N. body.

The 10 nations participating in the special pool include the world's leading commercial powers. Assuming final approval by their legislative bodies, they have agreed to lend up to a total of $6,000 million to the I.M.F., over and above their existing quotas. The Fund then could relend these additional resources to any of the 10 participants which might need it to meet international accounts, subject to agreement by the other participants. Of the $6,000 million total, the United States has pledged the largest amount, $2,000 million, and the other nine an aggregate of $4,000 million. These nine are the United Kingdom, the Federal Republic of Germany, France, Italy, Japan, Canada, the Netherlands, Belgium and Sweden. Actually, there is little likelihood that the United States would have to make its $2,000 million available in the near future. That is because the I.M.F. and the other industrial countries, by and large, already have plenty of dollars and are not likely to need more as long as the United States is running a balance of payments deficit.

Furthermore, the other 9 countries in the standby group for the most part have relatively low I.M.F. quotas, dating back to the early post-war period when they were short of dollars and needed financial and economic help. How, however, their economies are in good shape, their currencies are convertible in world markets, and their international payments balances are generally favourable. Thus, although the largest potential contribution to the new plan would be in dollars, its main advantage at this time would lie in its build-up of the I.F.M.'s access to additional marks, francs, and other foreign currencies. It should be borne in mind, of course, that conditions could change, and the standby pool would be available for use by any of the 10 participating nations if necessary. The United States has been a driving force behind the new plan, which U.S. Treasury Secretary Douglas Dillon says carries out the U.S. policy in the strengthening of international operation and resources. In addition, Mr. Dillon gives much of the credit for the new plan to the initial sponsorship of I.M.F. Managing Director Per Jacobsson. The new standby pool will not affect the continuing use of the I.M.F.'s existing resources. The United Kingdom, for instance, drew $500 million from the I.M.F. last year to help meet its international accounts. The United States, the major contributor to the I.M.F., has not as yet made any drawings despite its balance of payments difficulties. This new standby plan, one of the most significant steps of its kind ever taken, represents the culmination of steady and substantial progress in stabilizing international currency flow.

There have been a number of important bilateral moves within the last year involving such countries as the United States, the United Kingdom, Switzerland and Germany, to stem the flow of speculative funds — notably the U.S. dollar and the British pound sterling. Of particular interest was an agreement at Basle, Switzerland, whereby heads of major central banks would hold each other's currencies in emergency situations. Principal beneficiary has been the United Kingdom, but any member of the Bank for International Settlements, which has its head-quarters at Basle, conceivably could receive similar emergency assistance.

The new Organization for Economic Co-operation and Development (O.E.C.D.) also can play an important part in helping to stabilize the international financial situation. It brings together officials of the United States, Canada, and 18 West European countries, and one of its principal endeavours is the co-ordinating of economic policies. Its potential effectiveness in the field of international finance is enhanced by the fact that with the exception of Japan, all nations in the I.M.F. standby plan also are members of O.E.C.D. In these ways, leading commercial nations are working together to counter any disruptive attacks on the world's key currencies. They are helping to strengthen the international monetary mechanism on which all nations rely, and are making it more responsive to the need for orderly economic relationships and growth around the world.

Registered Office: Industry House, 159, Churchgate Reclamation, Bombay-1.

NOTICE

NOTICE is hereby given that the Twenty-ninth Annual General Meeting of the Shareholders of The Oudh Sugar Mills Limited will be held at the Registered Office of the Company at Industry House, 159, Churchgate Reclamation, Bombay-1, on Tuesday the 30th day of January, 1962 at 2-30 P.M. to transact the following business:

(1) To consider and adopt the Report of the Directors and Audited Accounts of the Company for the year ended 31st July, 1961.

(2) To sanction the declaration of dividend on ordinary shares.

(3) To appoint a director in place of Shri Kamalnayan Bajaj who retires by rotation and is eligible for reappointment.

(4) To appoint a director in place of Shri P. R. Jhunjhunwala who retires by rotation and is eligible for reappointment and to consider and, if thought fit, to pass the following resolution as a Special Resolution, in respect of which Special Notice as required by Section 261 of the Companies Act, 1956, has been received by the Company from some members:

"RESOLVED that pursuant to the provisions of Section 261 and other applicable provisions if any of the Companies Act, 1956, Shri P. R. Jhunjhunwala who retires by rotation and who is a partner in the firm of M|s Shriram Ramniranjan which firm is a co-sharer in the Managing Agency Commission received from the Company by the Managing Agents, The Cotton Agents Private Limited, be and is hereby re-appointed a director of the Company

(5) To consider and if thought fit to pass, the following resolution:

RESOLVED that the Company hereby approves of and accords its consent to the appointment of the following parties as Distributors of the products of Berar Oil Industries, Akola, a proprietory concern of the Company commencing from the dates, and for the products and areas respectively set out against the name of each party and on the terms and conditions contained in the agreements entered into by the Company with each of the said parties:

(6) To appoint Auditors to hold office from the conclusion of this meeting until the conclusion of the next Annual General Meeting.

By Order of the Board,
for THE OUDH SUGAR MILLS LIMITED.

Managing Agents,

THE COTTON AGENTS PRIVATE LIMITED,
S. G. NEVATIA,
Director.

BOMBAY, Dated 2nd January, 1962.

Special Article

GOA AND ITS MINERAL ASSETS

By R. K. SINHA

GOA, covering an area of 1,301 sq. miles, lying between latitude 15° 44' and 14° 53' and longitude 73° 45' and 74° 26' on the western coast of India merged with Indian Union on December 19, 1961 after 451 years of foreign domination. This small enclave is important for its mineral assets like iron and manganese ores. These are the two chief minerals produced in Goa at present besides salt recovered from sea water. There are as many as 500 salt works in Goa (besides Daman and Diu where also salt is recovered) engaging more than 2,000 men. There are more than 100 concessionnaires for iron and manganese ores and nearly 200 important working mines. Most of the iron ore mines are mechanised. Machinery like bulldozers, shovels, air compressors, belt conveyors, jaw crushers and screening plants are maintained by every important mine owner. The spate of mechanisation of mines was started only after 1951 when it entered into long-term contracts for exports of iron ore to Japan and Germany and manganese ore to the U.S.A.

Out of a total area of 1,301 sq. miles nearly 75 sq. miles are covered under mining lease having nearly 200 mines. Besides iron and manganese ores, occurrences of asbestos, bauxite, china clay, copper, gold, mica, ilmenite and ochres are reported. But the extraction of these minerals has not been reported so far; may be that the reserves are insignificant. With all its mineral resources and advantage of nearness to sea, the possession of excellent natural harbour namely Marmagoa is an added asset for its export trade. The harbour lies on the mouth of Juari river. It has a long break water and is sheltered from storm and wind. It is accessible to shipping throughout the year. Marmagoa is connected by a metre-gauge railway line for a distance of 31.2 km. to the east Castle-Rock railway station of the Southern railway. Prior to putting embargo on export of commodities through Marmagoa about 6 to 7 years ago, most of the manganese and iron ores originating from Hospet, Bellary, Shimoga and Hubli areas were finding outlet through Marmagoa. In fact Goa has two anchorages, one the famous port Marmagoa situated near the mouth of Juari river and the other in north known as Aguada at the mouth of Mandavi river. Aguada is not connected by rail and iron and manganese ore deposits worked north and north-east of Aguada are brought to this port through rivers or by trucks.

GEOLOGY

There is no official report available regarding the geology of Goa. Its geology can, however, be guessed from the geology of surrounding areas. Two types of rocks are exposed namely gneisses and schists of Dharwar age and the other laterite of Pleistocene age. These rock types are well seen along the railway line between Castle-rock and Marmagoa. They form the usual strike of N.S. and N.W.-S.E. of Dharwar. At a number of places they have been intruded by the mica bearing pegmatites. As the geology of the area is obscure, it is difficult to say precisely about the potentialities of mica pegmatites. Thick beds of hematite schists are found under the mantle of laterite. Hills of both low and high levels have been encountered containing good bands of hematite. Iron ores and manganese ores are found as concentrations in the laterite and also in the schistose rocks. Both iron and manganese ores occur together as in many other areas in the country. The average iron content in the iron ore varies between 55—65 per cent. Manganese ores found are of low to medium grades containing 36 to 44 per cent. The occurrence of high grades containing 46—48 per cent manganese is patchy.

MINING CENTRES

Sanguem and Quepem districts situated in the south of Marmagoa-Castle Rock railway lines, Ponda and Bicholiom districts in the north are the four important districts where mining of iron and manganese ores is extensively being carried out. Most of the villages under these four districts are covered under mining leases. Varlem, Nuem, Vadem, Darbandora, Colomba, Patiem, Rivona, Netorlim, Sigonen, Vichundram etc. in Sanguem district; Malcarnem, Sulcorna, Caurem, Maina, Udorna etc. in Quepem; Candola, Tiurem, Siroda in Ponda and Cudnem, Carapur in Bicholim are the important villages where mines are situated. Working of mines is also reported in Bardez, Satari and Pernem districts.

Dobolim, Margao, Sanvordem, Kalay and Collem are the important loading stations for manganese and iron ores on Marmagoa and Castle-Rock line. But due to increasing trade it has not been possible for the railway to meet with the situation of handling transport by rail to port. The mine owners have therefore taken an alternative recourse of sending the ores by trucks. The farthest mining areas are hardly more than 40 miles from the port. A number of navigable rivers and rivulets close to many mining centres greatly facilitate transport and solve the problem of ore movements. The ores are transported by country-craft or power barges to be unloaded and stacked at the yards or loaded directly into ships in mid-stream. More than 50 per cent of the minerals shipped are carried through rivers.

HISTORY OF MINING

Systematic mining in Goa started only around 1906 when some Bombay industrialists acquired mining concessions for manganese ore in Rivona, Curpem and Naturlim near Marmagoa. Six concerns obtained licence and as many as 21 mines were opened. Iron ore mining was also started during the same period by a French firm and leases were acquired in Bicholim, Sanquelim, Collera and Kalay areas. The mining activities in Goa have waxed and waned according to international situation. There were boom periods in mining during 1908-1913, 1924-1929, 1937-1942, and after the end of World War II till now. The actual mechanisation of the mines and large scale production started only after 1951 when Japan and West Germany showed interest to enter into long-term contracts to import large quantities of iron ore. The production of manganese and iron ores which were of the order of 40,000 tonnes and 1,00,000 tonnes annually during 1951 and 1952, rose to nearly two lakh tonnes and six million tonnes during 1960. Out of six million tonnes of export of iron ore in 1960 Goa has supplied 2.5 million tonnes each to Japan and West Germany and remaining quantities have been exported to France, Italy, Belgium, Sweden and Holland. Bulk of manganese ore export was made to U.S.A. Mining activities were helped by foreign technicians especially from Japan and West Germany.

MINING LAWS

Grant of mineral concessions were governed by the rules 'Disposicoes Regulamentares Solore a Pesquisa e laora de minas nas provincias Ultra marines'. According to these rules all mineral deposits belong to Government. For working of minerals prospecting licence and mineral concession is required from the Government. But a person can prospect a mineral in his own land without obtaining a prospecting licence. Prospecting licence is obtained after making a 'Manifest' to Government and by paying the sum of Rs. 150 for each Manifest or claim. Mining concession is obtained by paying the fees varing from Rs. 5,000 to Rs. 8,000. The period of mining concessions granted is unlimited. No royalty is probably charged but the mine owners are required to pay fixed taxes each year depending upon the area granted. These mining leases are different than the one prevalent in India as per the Mineral Concession Rules, 1960.

DEVELOPMENT PROGRAMMES NEEDED

No definite geological record of the area is known so far and thus it would be of interest to rapidly survey and assess the mineral deposits. The production of six million tonnes of iron ore and nearly two lakh tonnes of manganese ore per year indicate the richness of this tiny area in these resources and high standard of mechanisation. There is no metallurgical industry in this area, the development of which will depend upon harnessing hydro electricity for which many rivers and rivuletes in Goa have the necessary potentiality. It is learnt that no waterfall in this area has been harnessed for generation of hydro-electricity. Most of the mines have their own generating plants for electricity. Volume of export trade in recent years through Marmagoa port is already so large that it leaves little scope to increase additional exports. Moreover, the railway also is unable to handle all the mineral traffic in Goa. Taking this situation into account, our efforts to develop other ports like Karwar, Hannavar etc. in South and Vengurla, Redi etc. in the North of Goa should not be slackened to meet the growing export trade in the country.

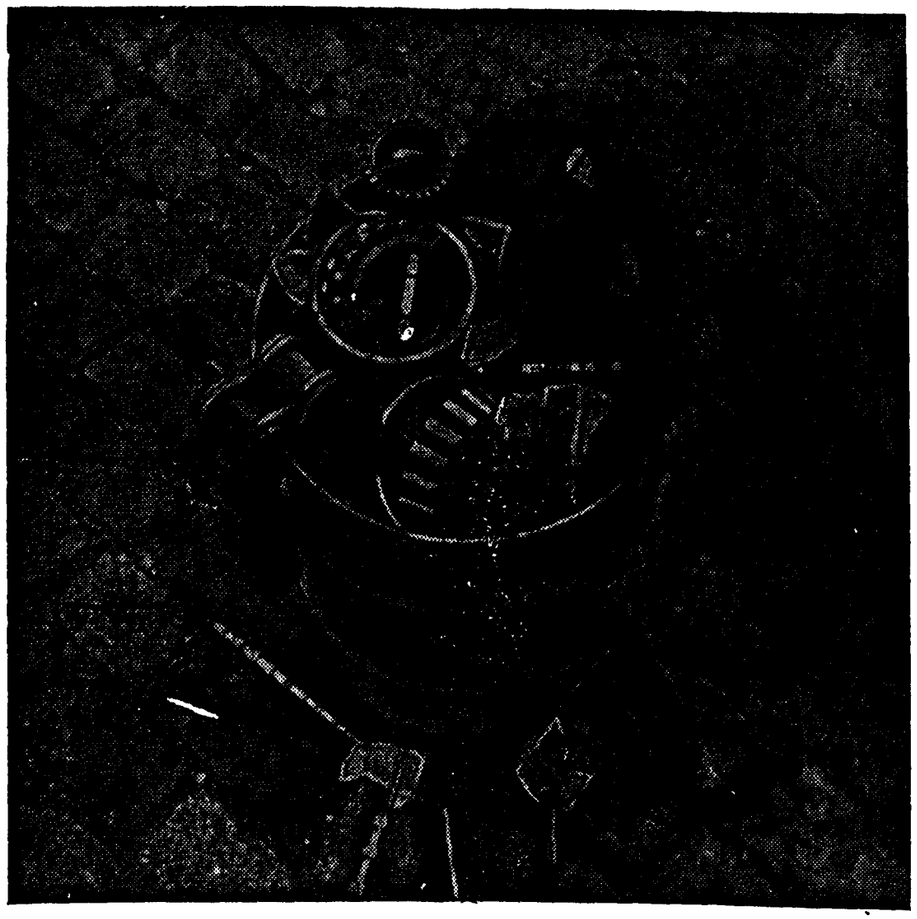
We raise our hats to them !

We of Remington Rand today raise our hats to the Remington service mechanics of the early 1900's. When called out on a job they were often away from home for months at a time. Transportation was crude and when journeying into the interior by bullock cart they had to face the dangers and hazards of jungle and desert.



Not so today ! Remington Rand has been continually growing through the years, and there are now 30 fully staffed branches strategically placed throughout India. This complex organisation has been set up to ensure that a Remington Rand service engineer is always available at short notice, no matter how remote the area.

Our motto — PROGRESS WITH THE TIMES ! Our factory at Howrah is the largest of its kind in Asia. As India grows commercially and industrially, the demand for typewriters and other office equipment grows correspondingly. Negotiations are under way to double our present output so that we may contribute further to the prosperity of the New India.

Don't throw away parts and money...

It sounds like an impossibility, we know, but it is none the less true. Many hard-to-replace parts costing valuable money are literally thrown away because they have been ruined due to faulty lubrication.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

CALTEX PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

CALTEX (INDIA) LIMITED Bombay · New Delhi · Calcutta · Madras

THE BUSINESS WORLD

Crisis in Brick Kiln Industry

THE Chief Commissioner of Delhi has extended to the Union Territory of Delhi the East Punjab Control of Brick Supplies Act, 1949 according to which the ceiling price of bricks (1st class) has been fixed at Rs. 30 per thousand. According to the spokesmen of the brick kiln industry, the Administration has imposed this control at an extremely low price level without regard to the economics of brick making in the Capital. It is feared that this drastic step is likely to put most of the brick kilns out of action.

The root cause of the crisis lies in the paucity of coal. The brick kiln manufacturers have agreed to provide bricks even at the price of Rs. 30 per thousand if coal is supplied at controlled rates continuously. The history of coal supplies to the brick kiln industry is significantly disappointing because most of them have not been given even 1/10th of their total needs of coal. In these circumstances, the owners of brick kilns had no alternative but to buy coal in the open market paying a premium of about Rs. 1,000 per wagon. This naturally enhanced the cost of brick making in the Capital.

The brick kiln industry is willing to provide bricks at the fixed price against all the coal provided at the controlled rates. In the recent past a formula was evolved whereby one wagon of coal was deemed to be enough for "firing" 100,000 bricks. According to this rule of thumb, the brick kiln owners would provide the Administration with bricks at the controlled price for every wagon of coal provided to them at controlled price. Beyond that, the industry has three alternatives; either to burn other fuels such as wood or to buy coal from the free market or to carry coal from coalfields by private carriers. All these courses will raise the cost structure by Rs. 10 to 12 per thousand of bricks. In the neighbouring State of U.P., two prices have been fixed—one for bricks fired with coal and the other fired with other fuels. The difference between the two rates is about Rs. 12 to 13 per thousand. The brick kiln industry feels that if the industry is given a free hand in the manufacture of bricks by making use of "other sources of fuel" in the absence of coal, the premium on these bricks which currently rates at Rs. 13 per thousand could be reduced further. The present policy will not only continue the famine of bricks in Delhi but will also create a scarcity which will last longer than a year.

It is legitimate that the "fair" demand of regular supply of coal to 250 kilns in the Capital be met. If the Government is not in a position to provide them with coal, then the industry should be allowed to tap other sources. A higher price should be fixed for the bricks manufactured through coal imported by other means at higher cost.

The claim made by the Bharat Sewak Samaj that it can offer to the Administration and to the public bricks at the controlled price has no elements of surprise; if the brick kiln industry is also given the same facilities which the BSS enjoys, the industry could perhaps offer bricks at a slightly lower rate. The comparison between the two is unfair in the sense that BSS has not only received financial assistance from the Government but has also been promised continuous supply of coal. The 4 kilns to be set up by the BSS will not provide more than 2 per cent of the total needs of the construction industry in the Capital. All the time lost in this useless debate is going to be reflected in chronic shortage of bricks in the coming months. It is not usually known that brick-making is a seasonal industry and after the onset of the rains, the kilns will have to suspend all their activities. It is in the fitness of things that a workable formula should be evolved whereby the supply of bricks is not hampered. Any prolonging of the "crisis" is likely to be reflected in the widespread unemployment of labour engaged in brick kilns and also thousands of other artisans who are employed in the construction activity in the Capital.

Business Notes

Power

ELECTRICITY INDUSTRY IN LUCK?

THE SPECTACULAR rate of increase in the demand for power owing to the rapid growth of industries in the absence of a commensurate rate of increase in power generation in the country has been instrumental in creating the recurring power shortages in several parts of the country in recent years. Pinpointing this anomaly in the country's plans for power generation, Mr. S. M. Zubair, Chairman of the Federation of Electricity Undertakings of India (F.E.U.I.), told its general body meeting (in Bombay) recently that the present situation demanded that the power system in the country—whether operated by State Electricity Boards or Licensees —should continuously anticipate and plan for the needed expansion. But the attitude of the Government does not appear to be equally catholic. Its policy so far has been one of favouring only the State Electricity Boards, which have the advantage of being subsidised by the Public Exchequer whenever they run into losses, while holding out threats, at the same time, of premature acquisition of licensee-held power undertakings even when they are reasonably well run. The policy of unwarranted delays in liberalisation of the Electricity (Supply) Act to boot which has only served to bar the doors for raising any development finance by privately-owned public utility undertakings, is yet another hardship.

Commenting upon the short-term remedy suggested by the Government, namely, of installing diesel plants as nursery units for power development by industrial undertakings, Mr. Zubair observed that installation of uneconomic steam plants or diesel sets by them would be a self-defeating policy; even if they should afford some short-term relief for the pressing power shortage

4½ PERCENT

WEST BENGAL STATE ELECTRICITY BOARD

BONDS, 1972

For Rs. 200 Lakhs

Payment of Interest and Repayment of Principal Guaranteed by the Government of West Bengal

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE RS. 99.25 PER CENT

REDEEMABLE AT PAR ON THE 21ST JAN. 1972

SUBSCRIPTIONS will be received in cash or cheques. Applications will be received at the State Bank of India at Calcutta, Bombay, New Delhi and Madras from 15th January, 1962 to 20th January, 1962 both days inclusive. But the list may be closed earlier without notice if the total subscription is reached.

Copies of loan prospectus and application forms are available at all the offices mentioned above and at the Head Office of the State Electricity Board, 1, Hastings Street (7th Floor), Calcutta-1.

problems, he went on to say, such a policy would be less enduring as compared to plant installed by private-owned public utility undertakings in the region. As such, the F.E.U.I. Chief pointed out, the answer to the problem lay in permitting electric supply undertakings to instal the types of plants that are needed and best suited to the region. To enable these undertakings to proceed in this direction, Mr. Zabair called for certain immediate changes in the Act, such as (i) elaboration of the permissible appropriation ("all taxes on income and profits") to cover all forms of taxation, including the tax at the prescribed rate deductible from the dividends (the object being that all tax liability or tax relief should redound to the consumer's account); (ii) an increase in the "Standard Rate" by at least one per cent (so that the return to an investor could be on a level at least approximating to the cost of money), and (iii) addition of specific provision in the Act to enable undertakings which are obliged to raise loan finance at rates of interest above the level of the "Standard Rate" to charge up the actual rate of interest plus half per cent.

Contrary to expectations or, rather, unlike last year, the Union Minister of Irrigation and Power, Mr. Hafiz Mohammad Ibrahim, who was present for a second time at an annual meeting of this body, also seemed to be in agreement with a major part of the Chairman's observations. Perhaps this is an indication—unless it be, as some uncharitable critics would have it, a pre-election gesture or a parting gift—that the Government is at present more alive to the problems of Electricity Undertakings. In any case, the Union Minister's assurance that no private Electric Supply Undertaking would be taken over by the Government so long as it functioned satisfactorily and rendered efficient service, is a refreshingly welcome one at this juncture. Apparently the electricity industry is in luck.

ICICI

A SEVEN - YEAR STORY

THE INDUSTRIAL CREDIT & INVESTMENT CORPORATION OF INDIA, (I.C.I.C.I.) completed seven years of working last week—on January 5, 1962, to be precise. Completing seven years for an institution is more or less the same as traversing the traditional seven paces —'Sapta padi'—by an individual. Just as, in the case of an individual, the seven paces mark the start of a new status, so also, in the case of an institution, the passing of seven years postulates that it has reached maturity. Well may it be said of the I.C.I.C.I. that it has attained maturity, considering its achievements during this brief seven-year spell. The institution has, indeed, played an important part in accelerating the tempo of industrialisation in India.

The subscribed capital of this truly international financial institution—28 per cent of it is owned by the British, the Americans and the Germans—is only Rs. 5 crores. And this share capital too is widely dispersed, in that, at the end of 1961, there were over 1800 shareholders on the ICICI's Register. But the resources of the I.C.I.C.I. are not limited to these five crores of rupees only. Three foreign exchange loans from the World Bank, amounting, in all, to 40 million dollars, a five-million dollar grant from the Development Loan Fund, and a sum of Rs. 17.5 crores borrowed from the Government of India have served substantially to augment these resources. Thus, the total capital and borrowed resources of the I.C.I.C.I. at the end of 1961 amounted to Rs. 44 crores, not to speak of the sizeable reserves built up by the Corporation over the past few years.

The net assistance of all types extended by the ICICI to private industry, i.e. by way of loans, direct subscription and underwriting, by the end of 1961 amounted to approximately Rs. 42 crores, and it is significant that, out of this amount, as much as Rs. 19 crores was in foreign exchange, undoubtedly a great boon in these days of acute shortage of foreign exchange.

The number of companies to which financial assistance was sanctioned was 166, out of which 91 sought rupee assistance and the remaining 75 foreign exchange loans. Some of these companies—33—were granted both rupee and foreign exchange assistance.

On the underwriting front, from January 1, 1956, to June, 30, 1960, of the total amount of newly issued capital of Rs. 35.2 crores underwritten, the share of the I.C.I.C.I. alone was no less than Rs. 6.92 crores, that is nearly 19 per cent. This makes it easily the largest single underwriting institution in the country today. Besides all these forms of help, the I.C.I.C.I. has also played a key role in introducing and familiarising our people with new forms and concepts of term finance, but its great value to this country lies perhaps in the fact that it has been instrumental in arranging participation loans and other operations in which Indian and foreign financial institutions alike combine together to meet the capital requirements of the private sector in this country. How valuable this service is will be appreciated only when it is remembered that, in the scheme of resources for financing our Five-Year Plans, nothing much is stated about how the finances required by the private sector to fulfil its share of the Plan targets have to be garnered.

New Issue

HINDUSTAN OXYGEN TO RAISE RS. 19 LAKHS

HINDUSTAN OXYGEN GAS COMPANY LIMITED is entering the market next week to raise from the public, capital to the tune of Rs. 19 lakhs. The list opens on January 18 and will close on January 27 or earlier at the discretion of the Directors, but not before January 20. The issue, if fully subscribed, will raise the issued capital of the company to Rs. 30 lakhs, out of an authorised capital of Rs. one crore, consisting of 30,800 equity shares of Rs. 100 each, 4,200 cumulative redeemable preference shares of Rs. 100 each and 6,500 unclassified shares also of Rs. 100 each. The capital being offered to the public is all in the form of equity shares.

The proceeds from the issue along with the Rs. 11 lakhs already subscribed or agreed to be subscribed by the promoters, directors, their friends and associates, will be utilised for meeting 75 per cent of the capital outlay on the company's factory proposed to be set up at Ahmedabad. The remaining 25 per cent of the requirements are envisaged to be financed through bank and other borrowings. The plant is expected to go into production by the end of the current year.

The company has been formed mainly with the object of manufacturing industrial oxygen and dissolved acetylene gases to the tune of 2,81,16,000 cubic feet of oxygen and 70,29,000 cubic feet of dissolved acetylene. Technical collaboration has been arranged with two U.S. manufacturers — Messrs. Superior Air Products Co., New Jersey, and Messrs. Rexarc, Ohio, who will be supplying complete design and layout for the Ahmedabad factory as also equipment and machinery for it. The technical collaborators will as well train Hindustan Oxygen's engineers at their works and may even depute one of their trained engineers, in case of need, to erect and commission the plant at Ahmedabad. Cylinders are proposed to be imported from rupee payment countries. The necessary sanction for the import of plant and cylinders has already been received from the Government of India.

The chief raw materials that will be required by the company are caustic soda, calcium carbide, acetone and calcium chloride which are easily available and indigenously manufactured.

With the rapid industrialisation envisaged under the Third Five-Year Plan, the demand for industrial gases is bound to increase stridently. At present, there is only one company—The Indian Oxygen Co., Ltd.,—producing such gases in this country. The products of the new company, thus, should have a ready market. In view of this, there should be little difficulty in the new issue being fully subscribed.

Electric Meters

A NEW VENTURE

A NEW company, Messrs, Electro-Equipments Corporation Ltd., Bombay, is likely to put on the Indian market, by March next, its house service electric meters, single phase, produced at its works in Mulund, in technical collaboration with Messrs. Cekop, Warsaw (Poland). The company has plans to manufacture for the present 60,000 meters a year on single-shift basis. In course of time, production is envisaged to be increased to 1,20,000 meters a year and ultimately to 1,80,000 meters a year on double-shift basis.

Messrs. Cekop are providing not only technical know-how, but also plant and equipment on deferred payment basis. Unlike the other house service electric meters manufacturing units in the country, which mostly assemble these meters from imported components (the indigenous components in them being only small), the Electro-Equipments Corporation intends to progressively raise the indigenous content in its products in the least possible time.

The total outlay on the project, including the working capital requirements, is estimated at Rs. 50 lakhs. Of this, Rs. 35 lakhs will be available from the share capital of the company (the promotors, directors, their friends, associates and nominees are subscribing Rs. 17.85 lakhs and capital worth Rs. 17.15 lakhs was offered to the public for subscription at par in the form of equity shares of Rs. 10 each this week), Rs. 10 lakhs through a loan from the Bombay State Financial Corporation and the remaining Rs. 5 lakhs from a loan from the company's bankers.

The company is negotiating with its Polish collaborators manufacture of poly-phase meters as well at its Mulund works. An application has been submitted to the Government of India for the grant of the necessary permission.

Nickel

A REVIEW OF THE INDUSTRY

FROM A review made by Mr. Henry S. Wingate, Chairman of the Board of Directors of International Nickel Company of Canada Limited, it is apparent that the 1961 nickel producing capacity of the free world, exclusive of Cuba, attained a new all-time high estimated at over 625 million pounds. At this record, capacity exceeded 1961 consumption of nickel by about 125 million pounds. This new high in nickel producing capacity established in 1961 is fully 15 per cent above the industry's capacity in 1960 and is more than 100 per cent over that of ten years ago.

Consumption of nickel from all sources by countries of free world for the year 1961 is estimated as follows:

Country	Percentage of Total
United States	44
United Kingdom	16
Common Market Countries	36
Japan	9
Sweden	4
Canada	2
All Others	5

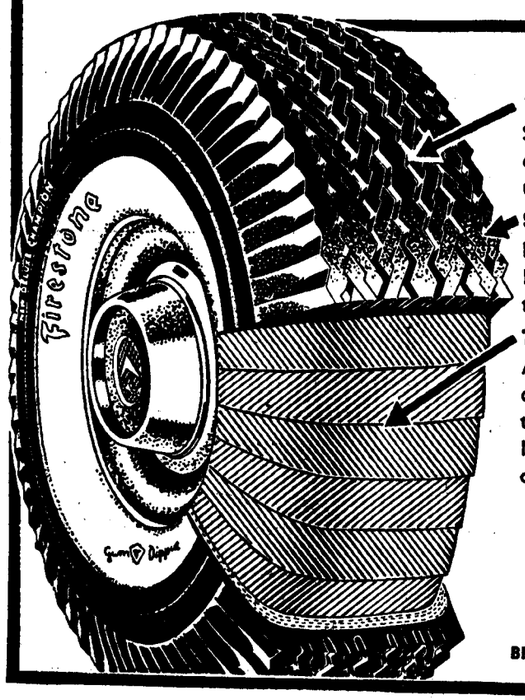
It is interesting to observe that the most significant factor contributing to this increase was the completion of International Nickel's new nickel project at Thompson, Manitoba, at which commercial production was begun before mid-1961. Its annual capacity of 75 million pounds brought the company's total capacity from operation in Canada to over 385 million pounds. Another encouraging factor during the year under review has been that the industry continued its research and marketing activities aimed at increasing the use of nickel in new and existing fields. Various programmes were launched in the U.K. and France to promote wide use of nickel stainless steel. Keeping in view the recent production trends, it can safely be said that increasing quantities would be available to satisfy the ever-increasing demands of a growing scientific world.

Engineering

RISING COSTS—A SERIOUS PROBLEM

AT THE 19th Annual General Meeting of the Engineering Association of India, Mr. K. L. Chowdhary dwelt at length on many of the problems facing the engineering industry. The most crucial problem, Mr. Chowdhary pointed out, was rising costs which were a great handicap in giving a fillip to the export promotion drive. It may be noted that as a result of increasing prices of pig-iron and steel, shortage in supply of fuel and power and rising wages without adequate productivity, costs have been rising over a long period as can be seen from the following figures:

Year	Input	Output	Input as % of Output
	(In crores of rupees)		
1956 ..	86	134	61.6
1957 ..	104	162	64.3
1958 ..	112	174	63.7
1959 ..	128	199	64.5
1960 ..	159	239	66.0
1961 ..	181	267	67.5



From these figures it would be observed that there is a steady rise in the input factor with consequent increase in its ratio to output. As cost of production increase, the profiability of the industry declines, even though it expands and develops, and its competitive position gets adversely effected. The object of export promotion cannot be realised in the face of rising production cost. It is, therefore, essential that prices must be held in check and productivity of labour increased in order to make the engineering industries compete in world market. It is the need of the hour that the Government should augment the facilities which they have granted for export promotion work by additional measures of relief such as granting of price preference in Government contracts to exporting industries.

The other problems referred to by Mr. Chowdhary related to shortage of raw materials (coal and coke) and bottlenecks in transport. Mr. Chowdhary made the plea that for the successful growth of the engineering industry in this country immediate steps should be taken to do away with these shortages. Since there was a shortage of coke, Mr. Chowdhary suggested that a commission should be appointed to examine how far oil can be used as alternate fuel to coal in general, except for industries using very low grade coal and industries requiring coal essentially for technical processes, and at what reduction of prices oil can be offered. The Commission may also enquire into the position of indigenous manufacture of oil burning equipment.

Here's Why Firestone

GIVES YOU
EXTRA SAFETY-FOR LONGER

Firestone Safety Tread Design
Still exclusive, with its thousands of non-skid angles to ensure the utmost in braking control.

Specially Compounded Rubber
Long-lasting, wear-resistant Firestone rubber, compounded to keep you safer—for longer

Canada's Economy

A REVIEW AND PROSPECTS

A CLEAR picture of how the Canadian economy has been shaping in 1961 is provided in a review released recently by the Trade Publicity Branch of the Canadian Department of Trade and Commerce. In the review it is succinctly depicted by Hon. George Hees, Minister of Trade and Commerce, that exports kept on increasing at a faster pace than imports, resulting in a further improvement in the merchandise trade balance. National output increased sharply from the beginning to the end of the year. There was more employment and industrial production showed further signs of growth. Personal income accelerated and corporate profits reversed their decline. Housing activity took a sharper turn and a resurgence in sales of automobiles and other durable goods occurred in the year. New federal measures of a far-reaching character were implemented to help Canadian producers extend their markets and expand production. Of major importance was the change in exchange rate policy, resulting in a lesser external value of the Canadian dollar. This provided an important lift to the wide range of Canadian industries competing with foreign goods, both domestically and abroad. Other new measures contributing to business growth included the provision of guaranteed bank loans to small business; extension of the operations of the Industrial Development Bank; the provision under income-tax regulations of accelerated depreciation for specified categories of capital outlays; and the establishment of new arrangements providing for increased attention to product design.

So far as outlook for 1962 is concerned, the Minister for Trade and Commerce is on sure grounds when he says that an upward trend will be maintained. Information available on investment plans for 1962 indicates distinctly a sustained level of business outlays for new plant and equipment, and a further growth in institutional and public building. Besides, there is much to show that Canadian producers have made a good start towards achieving the kind of competitive strength and resilience necessary to extend their position in the present day competitive world. Since the economy is based on a solid footing, further achievements in the years ahead can naturally be expected. This, however, does not mean that efforts should be relaxed to give a further tempo to the economy. A positive action is the need of the hour without which there can be many slips between the cup and the lip. This applies not only to Canada but to India as well where there is greater need to act with initiative, enterprise, energy and enthusiasm to make the Third Five-Year Plan a success.

I.M.C.'S NEW PRESIDENT

IT IS very rare to get elected as President of a Chamber of Commerce at a young age. This distinction now goes to Mr. Pravinchandra V. Gandhi who has been unanimously elected as the President of the Indian Merchants Chamber for the year 1962. Only 39, he is well-known in the banking circles for the prominent part he has played in initiating schemes for making available a varied banking system. To him goes the credit of sponsoring the idea of promoting a training college for bankers in addition to the one that has been functioning under the aegis of the Reserve Bank of India. The experience that he has gained during his visits abroad, he is trying to utilise fully and is pioneering in introducing in the Indian banking system some of the methods practised in the West. The Indian Merchants Chamber is bound to make a swift advance under his dynamic leadership.

FROM THE CAPITAL'S CORRIDORS

TARIFF COMMISSION'S REPORT 1960-61.

According to its Ninth Annual Report for 1960-61, the Tariff Commission examined the cases for the continuation of protection to fourteen industries, namely:

1. Automobile Hand Tyre Inflators,
2. Wood Screws,
3. Calcium Lactate,
4. Piston Assembly,
5. Engineers' Steel Files,
6. Automobile Sparking Plugs,
7. Power and Distribution Transformers,
8. Sheet Glass,
9. Plywood and Tea Chests,
10. Aluminium,
11. Bare Copper Conductors, A.C.S.R. and A.A.C.
12. Ball Bearings,
13. Cotton Textile Machinery and
14. Bicycles.

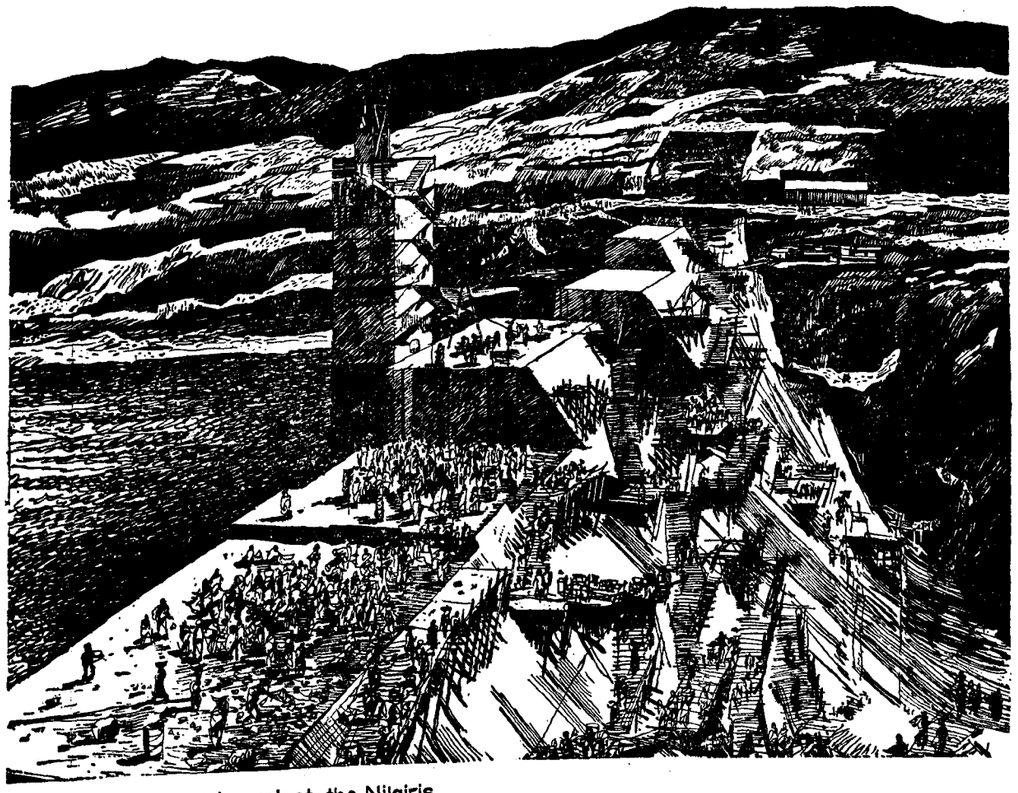
Cotton Textile Machinery: It will be recalled that "on the recommendation of the Tariff Board the Industry manufacturing spinning ring frames, spindles, spinning rings and plain looms was granted protection in 1950 by a levy of a protective duty of 10 per cent **ad valorem.** The protective duty was also applied to parts of ring frames. Consequently, fluted rollers and tin rollers, which are parts of ring frames, received incidental protection at the same rate of duty. Under the Finance Act, 1951 a surcharge of 5 per cent of the customs duty was levied and the effective duty on cotton textile machinery was thus raised to 10½ per cent **ad valorem.** The claims of fluted and tin rollers sections of the industry to substantive protection were independently examined by the Board in 1950 on a referenc from Government. The Board came to the conclusion that the then existing duty of 10½ per cent **ad valorem** on fluted rollers and tin rollers afforded adequate protection and recommended that these articles should remain in the protected category as long as complete ring frames continued to enjoy protection, namely, up to 31st March, 1953. The Government accepted the recommendation. On the advice of the Commission protection was extended first up to 31st December, 1953 and then up to 31st December, 1954. In 1954 a fresh inquiry was undertaken by the Commission and on its recommendation protection granted to tin rollers was discontinued. But the then existing rates of protective duties on ring frames, spindles, spinning rings and fluted rollers were continued up to 31st December, 1957. In regard to looms the scheme of protection was widened to cover all kinds and the rate of duty was the same as was applicable to plain looms. The fifth inquiry into the industry held in 1957 led to continuance of protective duty on complete ring frames, spindles, spinning rings, fluted rollers and automatic looms up to 31st December, 1960 at the existing rate of duty while protection granted to plain looms was discontinued from January 1, 1958. The last inquiry was conducted in 1960 and the Commission submitted a Report to the Government."

Reviewing the progress made by the industry the report says that "the industry has registered considerable progress since 1950, despite the set back it received in 1958 and 1959 on account of fall in demand for its products. The principal units in the industry have diversified their pattern of production and are embarking upon new lines of manufacture like doubling frames, draw frames, speed frames, fly frames, carding engines, high speed warping and winding machines. Some of the manufacturers have also made attempts to effect improvements in their designs and process of manufacture. There are at present 13 units engaged in the manufacture of protected categories of cotton textile machinery. From the evidence available, it appears that the cotton textile machinery manufactures are in a position to meet adequately the domestic demand for protected items of spinning equipment."

In view of the rapid development in textile machinery towards automation and higher speeds in advanced countries and the importance of industry due to its size and its foreign exchange earnings, the Commission has attached great importance to the aspect of improving quality of indigenous textile machinery. The Commission also reiterated its earlier recommendation emphasizing the need of an objective and impartial technical agency for assessing the requirements of the textile industry and assisting the textile machinery manufacturers to meet them. The indigenous industry is at a considerable disadvantage on account of shortage and high cost of raw materials and high prices of bought out components which have increased their costs. The industry is diversifying the range of its manufacture. By the end of the Third Plan period, the country's requirements of textile machinery are anticipated to be met to the extent of 75 per cent by the domestic producers. Having regard to these factors the Commission came to the conclusion that the cotton textile machinery manufacturing industry is still in need of protection and recommended protection till 31st December 1963.

IRON AND STEEL INDUSTRY

The Government of India have appointed a central tripartite wage board for the iron and steel industry with headquarters at Patna. The seven-member board consists of Mr. G. K. Shinde (Chairman), Mr. Akbar Ali Khan, M.P., and Professor M. L. Dantwala (Independent members); Mr. M. S. Rao and Mr. Saradindu Gupta, (employers' representatives) and Mr. Michael John, M.P., and Mr. Gopeshwar (workers' representatives).



Terms of reference include: (a) to determine the categories of employees (manual, clerical, supervisory, etc.) who should be brought within the scope of the proposed wage fixation and (b) to work out a wage structure based on the principles of fair wages as set forth in the report of the Committee on Fair Wages. It is stated that in evolving a wage structure, the Board should, in addition to the considerations relating to fair wages, also take into account the needs of the industry in developing economy; the requirements of social justice and the need for adjusting wage differentials in such a maner as to provide incentives to workers for advancing their skills. The Board should bear in mind the desirability of extending the system of payment by results. In this the Board shall keep in view the need for fixing a minimum (fall-back wage) and also to safeguard against over-work and undue speed. The demands in respect of payments other than wages raised by the unions will be taken into consideration by the Board in making its recommendations.

COAL WASHERY, KATHARA

Broad agreement has been reached with Russia on the National Coal Development Corporation's proposed coal washery at Kathara to be completed in March 1965. A small team of three Russian experts will visit India by the end of this month to study the site of the washery at Kathara before drawing up a detailed project report. The coking coal washery will have an annual intake capacity of three million tonnes and will feed the proposed Bokaro Steel Plant.

COAL SAMPLING

It will be recalled that the Government of India had appointed a Study Group to visit the individual Steel Plants in order to examine the facilities of sam-

Kundah hydro-electric project, the Nilgiris

Life-giving water, light and power to help transform our wastelands into smiling fields pour out from Bhakra-Nangal, Konar, Gandhisagar, Tungabhadra, Kundah and other projects. These great hydro-electric systems dramatise our progress and stress the fact that concrete is playing a vital part in our nation's growth and well-being.

The Third Plan has provided Rs. 1,712 crores for irrigation and power projects and huge quantities of cement will be required for their construction. In order that more cement may be available for the great projects and for the private consumer the Third Plan has set the cement industry a target of 15 million tonnes of cement a year by 1966. And the increasing output of ACC and India Cements factories will help to achieve this.

UNDER SECRETARY TO GOVERNMENT 23 JAN 1962 PUBLIC DEPARTMENT

pling of coal. It was found, as the Group visited one steel plant after the other, that the procedure of sampling varied considerably from plant to plant and that manual sampling was not suitable. Besides, it was costly and led to operational delays.

In these circumstances, the Group felt that the obvious solution was the introduction of mechanical sampling in all the steel plants and although the position of each plant was different, it was found that as all the steel plants used conveyor belts from the point of unloading of the wagons for carrying the coal towards the dumps, it was possible, without any undue cost or disturbance to the existing installations, to incorporate mechanical device for sampling. It was thought that mechanical sampling will not only result in saving employment of a large number of workers but also eliminate the human element in actual drawing of the sample to the minimum, without at the same time not hindering operations or introducing delays in the chains of operations of coal handling which would otherwise have been the case. If any particular plant found it more convenient to buy a mechanical device from abroad, the Group recommended that such plants should be granted necessary foreign exchange for the purpose particularly where the object is to save time in devising and manufacturing one at the works and to ensure that a tried mechanical device is being insalled.

AERIAL ROPEWAYS

The Indian Coal Board has placed on order with Breco-Ropeways of London to supply an aerial ropeway at an estimated cost of £2 million. It will be a composite plant which will include a sand-winning apparatus, feeder ropeways and heavy-capacity trunk ropeways delivering sand to a number of stockpiles for distribution to the various collieries. The whole plant, which is expected to be completed by the spring of 1964, will consist of three mono-cable ropeways, each less than a mile in length and each capable of conveying 200 tons an hour. These will be connected with a single bi-cable ropeway split into five sections and 16 miles long with a capacity of conveying 450 tons an hour. The British firm is sending out about 30 experts to plan and supervise the operation.

FURNACE OIL

The Ministry of Commerce and Industry has suggested the use of furnace oil to replace coal by the industries in Madras and Gujarat. A beginning was to be made with the new cement plants, recently licensed by the Government. Under the plan suggested by the Ministry of Commerce and Industry, the Centre will have to reduce substantially, if not altogether abolish, excise and other duties on furnace oil in order to make it competitive with coal. It is pointed out that excise duties are levied commodity wise and not industry or region wise. As against this, the carriage of coal by sea to feed the industries in these very areas is subsidised by the Centre and is region wise. It is further argued that while in the case of coal it is the consumers of coal, including those in the coal subsidised regions, who pay for the subsidy through an increase in the price of coal, it will be the Central Exchequer in case of furnace oil which will have to forego a part of its excise duty if it were reduced or abolished to replace coal by furnace oil in certain regions. The Government is engaged in examining the various aspects of the fuel economies of the various types before reaching a decision. It may be added that the plan envisages to lay a pipeline from Bombay or Madras to industrial areas concerned.

TEXTILE INDUSTRY

The Union Government has decided to license 10,000 Automatic Looms in units of 500 each as part of the programme of expansion of the Cotton Textile Industry during the Third Plan perid. According to a Press note issued by the Ministry of Commerce and Industry during the week, licences will be granted subject to the condition that 75 per cent cloth produced on these looms should be compulsorily exported. Failure to carry out this obligation will entail a penalty which will be related to the shortfall in the export performance. Bonds will have to be executed and bank guarantees will have to be given for the fulfilment of the export conditions.

NEW HEAVY ELECTRICAL AND BOILER PROJECTS

Detailed negotiations for the establishment of two new heavy electrical projects and a high presure boiler plant have been finalized.

SISTA'S

The heavy electrical project to be established at Hyderabad with Czechoslovakian assistance is expected to cost about Rs. 23 crores, excluding township. It will have an annual production of about Rs. 18 crores in the first phase and will be doubled during the Fourth Plan. The Heavy pressure boiler plant to be located at Trichy in Madras will also have Czech collaboration. The project is expected to cost nearly Rs. 18 crores, a third of which will be in foreign exchange. Only heavy furnaces and heavy equipment will be imported. The annual production of this plant will, in the first phase, be between Rs. 12 and Rs. 15 crores, with provision for doubling in the next stage.

SODA ASH AND CALCIUM CARBIDE

The Government of India have fixed with immediate effect the ceiling price (ex-works) of light soda ash at Rs. 19 per 50 Kg., effective till December 31, 1962. In fixing the price, Government have taken into account the manufacturing costs in the units examined by the Tariff Commission and the scope for economy in establishment and labour costs in the higher cost units to which attention had been drawn by the Commission. Government are satisfied that the price fixed by them would provide a reasonable return to the capital employed in the high cost unit and at the same time impress on such units the desirability of improving their efficiency and reducing the conversion charges.

It will be recalled that the Tariff Commission, in its Report on the fixation of prices for soda ash, had recommended that the ceiling price (ex-works) of light soda ash should be fixed at Rs. 20 per 50 Kg. exclusive of excise duty and that the ceiling price of heavy soda ash sold ex-works should be fixed at Rs. 21.50 per 50 Kg., exclusive of exicse duty.

Similarly, the Government of India have fixed the ex-works selling price of calcium carbide. The price for calcium carbide per 50 Kg. of 4/80 mm. size in 50 Kgs. packing will be Rs. 44.00 and in 100 Kgs. packing will be Rs. 43.25. Price will come into force with immediate effect and will be operative till December 31, 1962. The Tariff Commission had recommended the price of Rs. 45.50 for 50 Kgs. of calcium carbide of 4/80 mm size in 50 Kgs. packing and Rs. 44.75 in 100 Kgs. packing.

NEW RUBBER SHOE FACTORY

Complete shoemaking machinery equipment for a rubber shoe factory in the province of Andhra, with a capacity of 40,000 pairs a day will be supplied by AB Svenska Skolastfabriken, Jarrested (Sweden). The order, worth Kr. 13,000,000 (£9,000,000), is one of the largest ever obtained by a Swedish company from India. The delivery will include all types of machines, from big rubber-mixing plants to small industrial sewing machines. At the same time, as has been the case in the establishment of similar factories in North and South America, Korea, Japan and various African countries, the Swedish company will give technical assistance in running the plant.

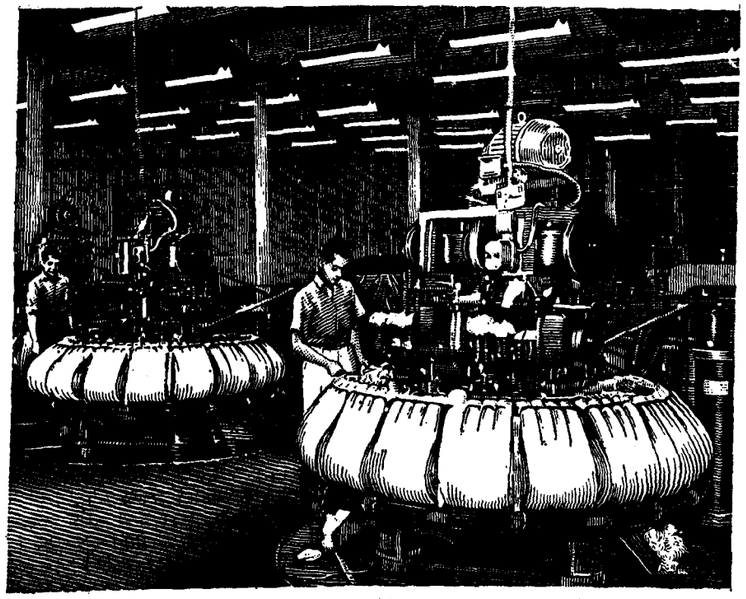
INDO-EAST GERMAN TRADE

Trade talks between the German Democratic Republic and the officials of the Government of India concluded here during the week with an exchange of letters signed by Mr. Eric Renneisen, Leader of the German Democratic Republic Trade Delegation, and Mr. B. N. Adarkar, Joint Secretary, Ministry of Commerce and Industry. As a result of the talks, it is anticipated that the Indo-German Democratic Republic trade will increase during 1962. The commodities to be imported into India will continue to include capital goods and machinery items, power generating equipments, printing paper, industrial raw materials, cinematographic film (raw), fertilizers, machine tools and other precision and measuring tools.

WANTED

CHARTERED ACCOUNTANT

AN INTERNATIONAL PHARMACEUTICAL COM PANY REQUIRES A CHARTERED ACCOUNTANT TO ASSUME CONTROL OF ALL ACCOUNTING FUNCTIONS FOR ITS INDIAN ORGANISATION IN BOMBAY.



FIRST-CLASS ACCOUNTS AND ADMINISTRATIVE EXPERIENCE TOGETHER WITH DETAILED KNOWLEDGE OF THE COMPANIES AND INCOME TAX ACTS IS ESSENTIAL; SO IS HIGH GENERAL INTELLIGENCE AND A LIVELY MIND. THE PREFERRED AGE GROUP IS 30-40. SALARY WILL BE APPROPRIATE TO THE RES PONSIBILITY OF THE POST WHICH CARRIES ATTRACTIVE PROSPECTS.

INITIAL SCREENING AND SHORT LISTING HAS BEEN ARRANGED THROUGH THE COMPANY'S AUDITORS, WHO WILL TREAT ALL APPLICATIONS IN THE STRICTEST CONFIDENCE. INTERVIEWS WILL BE HELD IN BOM BAY.

PLEASE REPLY TO THE ADVERTISER, C|O THE EASTERN ECONOMIST, POST BOX NO. 34, NEW DELHI.

THE ISAAC HOLDENS MILL

AT JAGATDAL, WEST BENGAL

LIGHTING BY PHILIPS

Isaac Holdens (India) Limited, India's commission woolcombers, are a Company of the Duncan Group and their mill, the only one of its kind in India, covers 114,000 sq. ft. . . . twice the size of a hockey field. Licenced to produce 10 million lbs. of wooltops per year, Holdens' workers are engaged in the wool sorting, scouring, carding and combing—operations that require a high and even level of illumination.

Naturally, the mill management specified Philips lighting.

Philips' modern, streamlined fittings provide the right amount of illumination and thereby contribute towards the overall efficiency and high productivity achieved in this mill.

Philips' exclusive lighting—consisting of lamps, fittings and accessories—ensures ultimate economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of research and development aimed to meet the ever-growing demand for better lighting. And hand-in-hand with Philips' unrivalled quality comes the invisible *plus* of Philips' international experience and know-how.

FREE: *For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.*

PHILIPS **PHILIPS** *quality lighting for ultimate economy*

PHILIPS INDIA LIMITED

JWTP 5114A.R

The exports from India to German Democratic Republic will be rolled steel products, cotton, silk and woollen fabrics, leather footwear, tinned fruits and juices, coir products, wood screws, jute manufactures, linoleum, sports goods, handicrafts, chemicals, deoiled cakes, drugs and medicines, tanned and semi-tanned hides and skins etc. apart from other traditional goods namely, tea, coffee, spices, cashew kernels, essential and vegetable oils, iron ore, mica and other mining products.

INDO - JAPANESE FINANCIAL AGREEMENT

Under the Second Yen Credit agreement concluded between the Export-Import Bank of Japan and certain other Japanese Banks on the one hand and the Government of India on the other, imports of capital goods from Japan into India against contracts of a value exceeding Rs. 4.76 lakhs c. and f. can be financed against the credit. The Government of India has announced the procedure for the imports of capital goods specifyfying interalia that: (a) "Payment for the goods can be effected only under a confirmed irrevocable letter of credit opened on a specified Japanese bank through the applicant's bank in India which would be the one which will furnish the bank guarantee to Government. (b) The letter of credit would provide for payment by the Japanese bank against the Second Yen Credit. No foreign exchange remittance from India will be permitted. (c) The letter of credit should be in the form specified. (d) All contracts should be on c. and f. basis. (e) Insurance, if required, should be effected against payment in Indian rupees in India. The amount of insurance payment will, however, be debited to the c.i.f. value of the licence. (f) As and when payments are made by the Japanese bank to the Japanese suppliers, the rupee equivalent should be deposited with a specified government account with the State Bank of India. The rupee equivalent of Yen payments should be calculated at the Indian Monetary Fund parity rate on the date of Yen payments (at present this rate is Rupee 1=75.6 Yen). Interest at the rate 6 per cent will be payable from the date of payment to the Japanese supplier to the date of deposit of rupee equivalent by the importer into Government account.

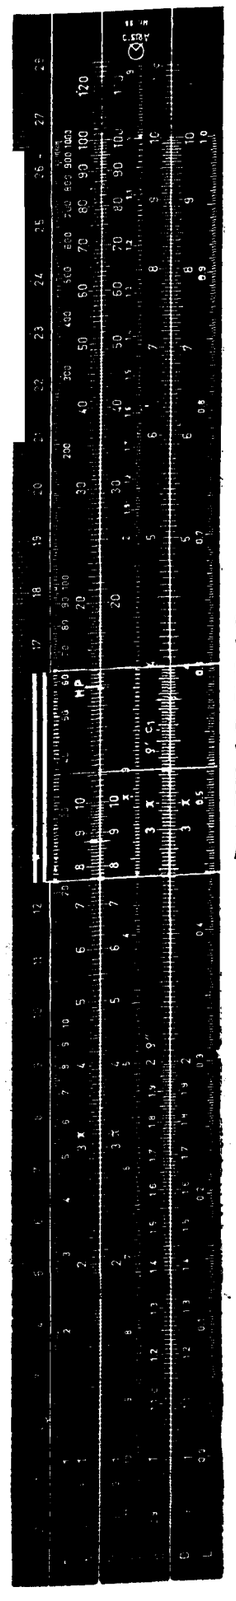
WEST GERMAN AID

The West German aid to India agreement has been signed and the French agreement for thirty million dollars is about to be signed shortly. The German agreement is for five hundred million DM for the first year of the Third Five-Year Plan. The total aid to India by West Germany is as under:

	Million DM
Technical assistance programme	32
German Participation in Indus Project ..	126
Finances for Rourkela Steelworks	660
Financial Assistance for 2nd Plan	420
Financial Assistance for 3rd Plan (to date) ..	1700
Guarantees for Exports	2100
TOTAL	5038

INDO - SWISS CREDIT ARRANGEMENTS

Switzerland's credit for India, amounting to about £8.5 million, will be used to buy various types of Swiss-made industrial equipment. Among the items to be purchased are: water turbines for the Upper Sileru project; electrical equipment for an Andhra Pradesh power plant; machinery for textile mills—particularly automatic looms for an Indo-Swiss joint venture; printing machinery; and equipment for sugar refineries and pharmaceutical laboratories. First contracts concluded are for the supply of equipment for various chemical products factories. The installations will be planned, supplied, and put into operation by an engineering office in Zurich. Three factories producing caustic soda, chlorine, and related products are to be equipped, and several textile machinery and electro-technical firms will be entrusted with the manufacture of the necessary machinery and plant. A Swiss alarm clock factory, in collaboration with a French firm of the same branch, has founded a company with Indian capital for the manufacture of alarm clocks.



FERTILIZERS

A plea for the supply of fertilisers to the countries of the Asia and Far East region "on easy terms" has been made by the Working Party of the International Rice Commission, dealing with rice soils, water and fertiliser practices, which met in New Delhi recently. It said that this matter was of "urgent importance," as fertilisers could be used more widely for stepping up agricultural production in the region. The Working Party expressed "great satisfaction" with the steps already taken by the Director-General of FAO to bring this problem to the attention of fertiliser exporting countries. The Working Party stressed the need for having not only accurate annual statistics on fertiliser production and consumption in member countries for the present but also estimates covering the coming years upto 1975. Such information would, besides helping individual countries in planning their own fertilizer economy, help exporting countries in developing potential markets. In view of the diversity of responses obtained with nitrogenous, phosphatic and pottassic fertilisers, depending on the time and method of application, it was suggested that member countries should undertake fundamental studies on the uptake of nutrient elements by paddy at different stages of growth in relation to grain yield under different growth-promoting and environmental factors. As yields of over 10 tons of paddy per hectare had been obtained under optimum conditions, studies should also be initiated to find out how the various factors could be combined to attain such high yields. The Working Party, meeting jointly with another dealing with rice production and protection, recommended that in all countries great emphasis should be given to the development of rice varieties with high fertiliser response. Further research should also be carried out by member countries on the agronomy and water requirements of rotation crops and on the most suitable crop rotations for particular irrigation areas. The two Working Parties were in session in New Delhi between December 11 and 16, 1961. The meetings were attended by representatives of 16 Governments.

DEPOSIT INSURANCE

The Government of India have issued two notifications under the Deposit Insurance Corporation Act, 1961 bringing the Act into force from January 1, 1962 and constituting the Corporation with effect from the same date. The Corporation will be an autonomous body with a paid up capital of Rs 1 crore wholly allotted to and subscribed by the Reserve Bank of India. The Act provides for a five-member Board of Directors, with the Governor of the Reserve Bank as the Chairman of the Board. Shri M. V. Rangachari, Deputy Governor of the Reserve Bank, and Shri A. Baksi, Joint Secretary, Ministry of Finance, Department of Economic Affairs, will be the nominees of the Reserve Bank and the Central Government respectively. The two non-officials appointed to the Board by the Central Government will be Professor G. S. Dewan, and Shri S. N. Desai, President of the Institute of Chartered Accountants of India.

The Act requires that all commercial banks functioning normally should be registered by the Corporation as insured institutions within one month of the date on which it is brought into force. It is anticipated that all the 293 banks which are eligible under the Act, including the State Bank of India and its eight subsidiaries, will be registered within the prescribed time limit. The insured banks will pay at quarterly intervals a premium of 5 nP. per hundred rupee per annum on their deposits and will be entitled to the benefit of

STEEL PRODUCTION SOARS BY 425% AT MUKAND

We reckon our production in 1960-61 to be 69,552 tonnes of rolled products and 5,624 tonnes of castings. In other words a rise of 48% over the previous year.

In 1951-52 MUKAND employed 1,064; in April 1961—2,306. Over the past ten years production figures have soared—13,615 tonnes of rolled products and 704 tonnes of castings in 1951-52; and 425% more in 1960-61.

	57/58	58/59	59/60	60/61
		(Rs. in lacs)		
CAPITAL	51	51	71	61
Depreciation provided to date	32	36	41	50
Profits retained in business to date	25	35	45	57
Profit for the year	19	30	31	53
Dividend for the year	5	5	8	10

MUKAND manufactures high grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing flux of big orders—like the one placed by the Railways with MUKAND in October 1961 for 4,862 sets of Centre Buffer Couplers valued at Rs. 1,14,00,000.

MUKAND provides India's new and growing industries with the quality components that they must have.

MUKAND IS STEEL

BIRDS are stepping it up

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

BIRD & COMPANY (PRIVATE) LIMITED
and
F.W. HEILGERS & COMPANY (PRIVATE) LIMITED
Chartered Bank Buildings, Calcutta-1

cover to the extent of Rs. 1,500 in the case of each depositor. In the event of liquidation, payments up to Rs. 1,500 will be made by the Corporation and any expenditure thus incured will be re-imbursed to it subsequently from out of the dividends in liquidation as and when they are declared. In the event of the enforcement of any scheme of reconstruction or amalgamation, the Corporation will be responsible for the payment of the deficiency, if any, in the amounts credited to the depositors up to a limit of Rs. 1,500 and it will recover the expenditure incured by it from the subsequent payments which are due to be made to the depositors.

The Act also provides for the limit of the insurance to be increased at any later stage beyond the sum of Rs. 1,500 in case this is considered necessary or desirable. It also provides for the liabilities to the depositors to be discharged most expeditiously, and it is expected that, in actual practice, the payments due to the depositors will be made within a few weeks of the date on which the Corporation's liability arises. With the establishment of the Deposit Insurance Corporation, it is hoped that the commercial banking system will be improved and strengthened and a substantial measure of protection in respect of their bank accounts and savings will be available to the public. Approximately, 75 per cent of the total number of deposit accounts in commercial banks will be fully covered by the arrangements now being brought into force.

INDO - POLISH ARBITRATION AGREEMENT

Facilities for the amicable settlement of commercial disputes arising between parties in India and Poland are now available as a result of the agreement entered into between the Arbitration Tribunal of the Federation of Indian Chambers of Commerce and Industry and the Polish Chamber of Foreign Trade, Warsaw. The Agreement was signed by the President of the Federation of Indian Chambers of Commerce and Industry, and Mr A. K. Adamowicz, President of the Polish Chamber of Foreign Trade, Warsaw.

BRIEFS

A team of experts which was sent to Goa by the Ministry of Mines and Fuel to make on the spot survey returned to New Delhi and will shortly make its report to the Government.

*

The Central Warehousing Corporation is to open 17 warehouses during the next financial year. The Corporation at present has 50 warehouses spread all over the country. Ten of these were opened during the current year and an equal number are expected to be opened during the next three months.

*

The Government of India has agreed, in principle to grant an industrial licence to Shaw Wallace and Company in partnership with Rallis India, Limited and with the foreign collaboration of the Dutch States Mines to set up a fertilizer factory at Mangalore.

*

A team of Davy Ashmore of Great Britain is expected here on January 10 to finalise and sign the consultancy agreement for setting up the twin projects of Heavy Structural and Vessel Plate plant in India. The Government in the Ministry of Finance and Industry has appointed Mr. S. Raghupathy, till recently a Deputy Secretary in the Ministry of Steel, as the officer in charge of the project.

*

The Indian Investment Centre in New Delhi announced on January 1, 1962, that Indian industries involving a total outlay of over Rs. 30 crores, have sought its assistance in finding technical and financial partners with firms in Canada, Japan, West Germany, U.K. and U.S.A. Indian firms are seeking partners for the manufacture of wire ropes, water meters, seamless tubes, malleable castings, electric house service meters, galvanised iron pipes and steel tubes. Assistance is also being sought for the production of tyres and tubes, cellulose acetate flakes and fibre, insulators and optical instruments. Of the requests forwarded, 19 went to the USA, 10 to the UK, 6 to West Germany and one each to Canada and Japan.

*

Associated British Machine Tool Makers, who have been marketing machine tools in India for over 40 years, have recently completed a collaboration agreement between one of their member firms, Messrs. H. W. Ward & Co. Ltd., Birmingham, and the Textile Machinery Corporation Ltd., of Belgharia, West Bengal. The CAPSTAN LATHE covered by this collaboration is the WARD 3C —a machine of a very high standard. A bar capacity of 1½" and a centre height of 7½" combine with a range of 12 spindle speeds and automatic longitudinal feed to the Intermediate Saddle and Capstan Rest to make the WARD 3C an extremely versatile machine.

*

Five new employment exchanges have been opened in the States of Assam, Madras and Punjab, bringing the total number of employment exchanges in the country to 326 including 5 university employment bureaux. The Directorate General of Employment & Training have by now approved opening of 28 additional employment exchanges and 9 university employment bureaux against the Third Plan target of 65 employment exchanges and 33 university employment bureaux.

A PASSENGER FROM WEST BENGAL WRITES.....

....I think I should express to you the keen satisfaction which I felt as a result of the KLM service. I had an excellent flight and could not have been better looked after ....

THIS IS NOT A PROSPECTUS BUT ONLY AN ANNOUNCEMENT

Applications are invited on the basis of the Prospectus issued by the Company.

Consent of the Central Government has been obtained to this issue a complete copy of which is open to the public for inspection at the Registered Office of the Company. It must be distinctly understood that, in giving this consent, the Government of India do not take any responsibility for the financial soundness of any scheme, or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence has been obtained from the Central Government for the establishment of this Industrial Undertaking at Kurla, Bombay. Licences have also been obtained for the expansion programme. Copies of all the Licences are open to the Public for inspection at the Registered Office of the Company. It must be distinctly understood that in granting these Licences, the Government of India do not take any responsibility for the financial soundness of this Undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

A copy of this Prospectus with copies of the documents referred to hereafter has been duly delivered for registration to the Registrar of Companies, Bombay, as required by Section 60(2) of the Companies Act, 1956.

Applications will be made to the Bombay and Calcutta Stock Exchanges for permission to deal in and for an official quotation of the Preference and Equity Shares of the Company.

The Subscription List will open at the commencement of Banking hours on the 19th January, 1962 and will close at the close of the Banking Hours on the 25th January, 1962. The Directors reserve the right to close the subscription list earlier than the 25th January, 1962, but in any case, not earlier than 22nd January, 1962.

KHANDELWAL UDYOG LIMITED

SHARE CAPITAL

AUTHORISED .. .. **Rs. 1,50,00,000**

Divided into:

1,00,000	Equity shares of Rs. 100 each	„ 1,00,00,000
50,000	Ten per cent (free of Company's tax but subject to deduction of tax at source) redeemable cumulative preference shares of Rs. 100 each ..	„ 50,00,000

11,071	Equity Shares subscribed and fully paid by the Promoters, Directors and their friends and associates	Rs. 11,07,100

RESERVED FOR FIRM ALLOTMENT:

Equity Shares:

9,249	Equity shares for the Promoters, Directors and their friends and associates .. .. .. (no underwriting commission or brokerage is payable in respect of these shares.)	„ 9,24,900

NOW OFFERED FOR PUBLIC SUBSCRIPTION:

19,700	Equity shares of Rs. 100 each	Rs. 19,70,000	
20,000	Ten per cent (free of Company's tax but subject to deduction of tax at source) redeemable cumulative preference shares	„ 20,00,000	„ 39,70,000
			Rs. 60,02,000

No shares will be issued for consideration other than cash.

The Project has been examined by the Industrial Finance Corporation of India, The Life Insurance Corporation of India, The Refinance Corporation for Industry Pvt. Ltd., and The Chartered Bank and has been supported by them as under:

1) The Industrial Finance Corporation of India has underwritten 15,000 Ten per cent (free of Company's tax but subject to deduction of tax at source) redeemable cumulative preference shares of Rs. 100 each for the value of Rs. 15,00,000.

2) The Life Insurance Corporation of India has underwritten 5000 Ten per cent (free of Company's tax but subject to deduction of tax at source) redeemable cumulative preference shares of Rs. 100 each for the face value of Rs. 5,00,000 which the Company has agreed to reserve for firm allotment to them.

3) The Refinance Corporation for Industry Pvt. Ltd., has sanctioned a loan of Rs. 20 lakhs through the Chartered Bank, Bombay.

The issue of Equity shares is not being underwri ten but the Managing Agents have agreed to subscribe or procure subscriptions for the shortfall, if any, between the amount offered for public subscription and the amount of applications received in response to the offer.

ACCOUNTS

Year ending	Sales	Depreciation	Net Profit before provision of taxation	Net loss before provision of taxation
16-10-56 to 22-10-1957	Rs. 907.00	Rs. 4426.00	Rs. ..	Rs. 8725.00
23-10-1957 to 10-11-1958	„ 60891.00	„ 34930.00	„ ..	„ 97910.00

		Rs. 263808.00	Rs. 104726.00	Rs. 381655.00

Total depreciation provided: Rs. 2,63,808 Total net loss Rs. 2,76,929.

It will be observed that during the year ending Diwali 1961 the Company has definitely turned the corner. In this year the Net Profit has been Rs. 1,04,726 after allowing Rs. 97,113 for Depreciation. From the commencement of the working of the Company to date the total loss of Rs. 2,76,929 mainly represents allocations from Gross Profit to Depreciation amounting to Rs. 2,63,808.

The Chartered Bank has recently had the entire block assets of the Company valued by Messrs. Gregson Batley & King, Chartered Architects, and according to their report the assets are valued at Rs. 35,05,795 as against a book value of Rs. 14,86,243. The promoters small be making available to the investing public the entire benefit of this appreciation by retaining the value of the assets only at their book value. The consent of Messrs. Gregson Batley & King has been obtained for making the aforesaid statement and the same has not been withdrawn.

In the opinion of the Directors, the resources of the Underwriters are sufficient to discharge their respective underwriting obligations.

The amounts payable in respect of shares comprising the present offer are as follows:

	Preference Shares	Equity Share
With application ..	Rs. 10 per share	Rs. 10 per share
On allotment ..	Rs. 15 per share	Rs. 15 per share

The balance of Rs. 75 in respect of each Preference Share and Equity share shall be payable in such calls as may be determined by the Directors, provided that no call shall exceed the sum of Rs. 25 per share and that prior notice of at least 30 days shall be given in respect of each call and there shall be a minimum interval of one month between any two calls.

The calls on preference and equity shares shall be made simultaneously and proportionately.

The Punjab National Bank Ltd., Bombay & Branches.
The United Commercial Bank Ltd., Bombay and Branches.
The Allahabad Bank Ltd., Bombay & Branches.

OBJECTS:

The main object of this issue is to expand the present activities of the Company in accordance with the various programmes mentioned below:

LAND, WATER AND POWER

The Company is fortunate in having acquired early enough a large plot of land in heavy industrial area measuring over 8 acres in Kurla, an industrial suburb of Bombay. The site is close to the Bombay-Agra Road being connected to it by a pucca road. It is also within a few minutes' walk of the newly opened Vidya Vihar suburban station on the Central Railway. The Central Railway have approved the possibility of making available a Railway Siding to the Company.

Sufficient water supply for the Company's requirements is available from the Bombay Municipal Corporation's mains.

Adequate power is also available and the Bombay Suburban Electric Supply Ltd., have already put up their sub-station in the Company's premises for this purpose.

HISTORY AND PROSPECTS

The Company was incoporated on 16th October, 1956 for carrying on the business of Steel Fabricators. It functioned as a private limited company upto 12th January, 1960, when it was converted into a Public Limited Company.

The Third Five-Year Plan envisages large scale developments in the sphere of Heavy and Light Engineering Industries in view of the increased availability of steel in the country. A relevant extract from the Third Five-Year Plan bearing on the subject of 'steel fabrication' is reproduced below:

> "As against the current structural fabrication capacity estimated at 500,000 tons, inclusive of the capacity of the wagon builders, the target for the last year of the Third Plan is visualised at 1,00,000 tons. The accent is expected to be much more on developing fabrication facilities for heavy structurals than has been the case in the past. Allied to these structurals shop facilities for the manufacture of items like pressure vessels, heat exchangers and other types of chemical plant and equipment are envisaged to be developed through the establishment of heavy plate and vessels works. The manufacture of cranes is another important line of allied activity."

The Company has already embarked on the above lines of manufacture and has made considerable progress; and plans have been finalised for further expansion and development to meet the vast demand in the country that remains unsatisfied, for fabricated steel structurals, pressure vessels, cranes, etc.

STEEL FABRICATION

The Company received an Industrial Licence, bearing No. L|1-A(4)|N-II|57 dated 28th October, 1957, for the fabrication of 3,600 tons of steel structure per annum and after completion of the first phase of the workshops, production was commenced in March 1958. During the initial years the Company has overcome most of the teething troubles common to new engineering industries and has established itself in the Structural Engineering Field. The capacity shown in the above mentioned Industrial Licence for steel fabrication has also since been doubled to 7,200 tons per annum vide Industrial Licence No. L|1-A(7)3|60 M.E.I. of 30th August, 1960.

The Company has been fortunate in obtaining for its Structural Division the exclusive Technical Collaboration of LES ETABLISSEMENTS EIFFEL, who are one of the world's leading construction companies and who have built amongst other Structures, the famous 'EIFFEL TOWER' in Paris. Under this collaboration, while getting the full benefit of the long experience and now-how of "EIFFEL', the Company shall also be undertaking the construction of patented 'EIFFEL STANDARD BRIDGES' which owing to their low erection and maintenance costs, have been very successfully used all over the World, particularly so, in the underdeveloped countries.

CONSTRUCTION MACHINERY

In addition to its steel fabrication activity, the Company obtained an Industrial Licence bearing No. L-11|3|LEI(B) 60 dated 26th November, 1960 for the manufacture of certain items of Construction Machinery, namely, Concrete Mixers, Asphalt Mixers and Roller Pan Mixers. Of these the manufacture of Concrete Mixers has already been taken in hand, production having commenced nearly two years ago. The Company's present production of this item compared favourably with the output of other leading Indian Manufacturers, and it is proposed to increase this production even further in the near future. The Company has come to an arrangement with the Indian Associates of Messrs. MILLARS' MACHINERY CO. LTD., London, under which the Company shall be manufacturing these machines in India under the Designs and Specifications of MILLARS and an agreement has been signed with Messrs. Millars' Timber & Trading Co., Ltd., Bombay the Indian Associates of the U.K. Company, whereby the Company's entire production of Concrete Mixers shall be taken up by them initially for a period of 3 years. MILLARS' Construction Machinery is already widely known in the country for several decades and enjoys by far the largest share of the Market in India.

E. O. T. CRANES

An Industrial Licence for the manufacture of Electric Over-head Travelling Cranes upto 20 tons capacity bearing No. L-8B-2|7|MEI|60 dated 6th September, 1960, has been received by the Company.

The Company has been fortunate enough to secure the technical collaboration of the well-known 'MUNCKHAMJERN' Group NORWAY, who are world-renowned in the manufacture of these cranes.

The Company has entered into a collaboration with Messrs. S. P. A. ING. F. FERRE & C., OF MILAN, ITALY, for the manufacture of Electric and Combustion Industrial Furnaces, Ovens, etc. Under this collaboration the Company would be particularly taking up the manufacture of various types of Heat Treatment Furnaces, which are in great demand by the growing Engineering, Iron and Steel and Non-ferrous Industries. These furnaces have hitherto been imported.

The Company is thus well-set to take the fullest advantage of the increasing opportunities which are open to the Engineering Industry.

When all the schemes under contemplation are completed, a turnover of about Rs. 1 to 1½ crores per annum is expected. Upon completion of these schemes, the Company expects profits which after providing for depreciation, development rebate and income tax shall leave an adequate surplus for an appreciable dividend to the Shareholders.

It is not considered necessary to fix any minimum amount of subscription.

The financial requirements of the Company are comprised of:

		Existing Rs.	Proposed Rs.	Total Rs.
1.	Cost of Land and Building	7,14,000	6,75,000	13,89,000
2.	Plant and Machinery	6,89,000	16,44,000	23,33,000
3.	Brokerage, Underwriting Commission and Preliminary expenses	1,382	1,50,000	1,51,382
4.	Contingencies	—	31,000	31,000
5.	Working Capital	—	25,00,000	25,00,000
	TOTAL	**14,04,382**	**50,00,000**	**64,04,382**

BROKERAGE AND UNDERWRITING COMMISSION

Brokerage of 1 per cent will be paid to recognised Bankers or Brokers on allotments made in respect of applications bearing their stamps. An underwriting commission of 2½ per cent will be paid to the underwriters. Brokerage at the rate of 1 per cent will also be payable to the underwriters to the issue of allotments made in respect of applications bearing their stamp. An additional Brokerage of ½ per cent will be paid to the Managing Brokers, on Equity shares.

MANAGING AGENTS

M|s Khandelwal Industries Private Ltd., Khandelwal Bhavan, 166, Dr. Dadabhai Naoroji Road, Bombay-1, a Private Limited Company with a subscribed capital of Rs. 5,00,000 are the Managing Agents of the Company with effect from 1st July, 1960, for a period of ten years.

Shri Ramprasad Khandewal and Shri Premnath Khandelwal who are the Directors and Members of the Company are also Directors of the Managing Agency Company, and Shri Beharilal Khandelwal who is a Director of the Company is also a Member of the Managing Agency Company.

RIGHTS OF PREFERENCE SHARES

The Preference Shares shall confer on the holders thereof the right to a fixed cumulative preferential dividend at the rate of 10 per cent (free of Company's tax but subject to deduction of tax at source) and shall rank in winding up as regards return of capital and payment of arrears of dividend whether earned, declared or not, down to the commencement of the winding up in priority to equity shares, but shall not confer the right to any further participation in the Profits or Assets of the Company.

Any further preference share issue ranking **pari passu** with the present preference share issue will be made only after prior approval of at least three fourths of the then holders of the present preference issue.

TERMS OF REDEMPTION OF PREFERENCE SHARES

The Company shall have the right after five years from the issue of such preference shares, or, earlier if

so determined by the Company in General Meeting, to redeem at par from time to time the said preference shares or such of these by drawing lots as the Directors of the Company may from time to time decide after giving six months' previous notice in writing in that behalf addressed to the Shareholders of Preference shares to be redeemed or, by such shorter notice, if so determined by the Company in General Meeting.

All outstanding Preference shares, if any, will be redeemed within ten years from the date of issue.

APPLICATIONS AND ALLOTMENT OF SHARES

Applications for Preference and Equity shares must be made on the respective forms copies of which may be obtained from the Registered Office of the Company and from any office of the Bankers or Brokers.

APPLICATIONS MUST BE MADE FOR A MINIMUM OF FIVE SHARES OR A MULTIPLE THEREOF

APPLICATIONS must be completed in accordance with the directions contained therein and delivered before the closing of the subscription list to:-

1) Khandelwal Udyog Ltd., Khandelwal Bhavan, 166, Dr. Dadabhai Naoroji Road, Bombay-1.
2) The State Bank of India, Bombay and Branches.
3) The Chartered Bank, Bombay and Branches.
4) The Central Bank of India Ltd., Bombay and Branches.
5) The Punjab National Bank Ltd., Bombay and Branches.
6) The United Commercial Bank Ltd., Bombay and Branches.
7) The Allahabad Bank Ltd., Bombay and Branches.

Where no allotment is made, the deposit will be returned in full within three months and where the number of shares allotted is less than the number applied for, the balance deposit will be applied towards the amount remaining payable on the shares alloted and any balance thereafter remaining will be returned within three months. The Directors reserve the right to refuse any application wholly or in part without assigning any reasons. Failure to pay any amount on shares allotted when due will render the previous payment liable to forfeiture.

The shares issued will be subject to the Memorandum and Articles of Association of the Company, a copy of which can be inspected at the Registered Office of the Company during office hours.

The Share Certificates will be issued within six months of the date of allotment.

Chairman's Speech

MYSORE KIRLOSKAR LTD.
Harihar

EXTRACT of the speech delivered by the Chairman of the Mysore Kirloskar Ltd., at Harihar at the time of the Twentieth Annual General Meeting.

The Mysore Kirloskar Ltd., Harihar held their Twentieth Annual General Meeting at Harihar on the 29th December, 1961. Sri Channageri Rangappa presided. In his address to the shareholders, he gave an account of the progress of the Company and referred to the new issue of Rs. 40 lakhs.

The response from the shareholders and the public to the new issue was very substantial and could be regarded as an index to show the extent to which they have confidence in the prospects of the Company in the years to come.

As a part of the expansion scheme, the Company had opened a Branch Factory in Hubli and the building construction for the said factory was well in progress.

During the year under report, he pointed out, that the Company had added to its existing plant and machinery new machinery valued at about Rs. 18.14 lakhs as against Rs. 9.45 lakhs in the previous year.

He further pointed out that in view of the large expansion programme envisaged by the Company, large investment in capital goods would be required. This would in turn necessitate the provision for adequate depreciation and Development Rebate etc. Such provisions would be quite sizeable and he therefore cautioned that during the next 2|3 years, the Company may be required to pass through a difficult period.

The sales of the manufactured goods during the year amounted to Rs. 1.57 crores as against Rs. 1.41 crores in the previous year. The sales of Stores and Sundries during the year under report amount to Rs. 6.05 lakhs as against Rs. 5.85 lakhs in the previous year. He also gave the percentage allocation of the revenues towards the different factors of production.

He then pointed out to the peculiar nature of the Machine Tool Industry where the capital investment required is on a very large scale whereas the profits are comparatively lower than in other industries. He therefore pointed out that the progress in a Machine Tool factory is rather slower than in other industries.

He then referred to the serious difficulties experienced by the factory in regard to the availability of quality Hard Coks and Pig Iron and also referred to the serious transport bottlenecks. These difficulties, he said, apart from increasing costs, created several critical situations in the day to day working of the Company. He therefore appealed again to the authorities concerned to give their very earnest and serious consideration to these problems.

He informed the shareholders that the Company, after protracted negotiations, was able to arrive at an agreement with the workers in respect of all the pending disputes and that the said agreement would be in force for a period of three years ending 31st December, 1964. He further pointed out to the need on the part of the employees themselves to play their part fully in enabling the Company to offer their products to the customers at competitive prices.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

West Irian: Mediation

MONDAY this week witnessed an ominous development in the West Irian dispute which is fraught with grave potentialities. This was the sinking of an Indonesian motor torpedo boat off the south coast of West Irian by a Dutch frigate. The first armed engagement came altogether as a surprise, when hopes were raised that the dispute would be ended by an amicable settlement.

The two reported versions about the circumstances culminating in the destruction of the motor boat were expected to miss no material particular. This precaution was essential. The first report of the details of the naval engagement, released by Rear Admiral J. E. Reeser, Commandant of the Dutch armed forces in West Irian, states that the Dutch Neptune plane, which spotted the three Indonesian boats, was fired upon from one of them and retaliatory action was taken in ordering the frigate to chase them, resulting in the destruction of one. But it omits to mention the location of the incident. The official communique, released by the Defence Ministry from The Hague, explains that the incident took place twelve miles off the West Irian coast. O her details confirm the first version. Whether the engagement took place within the territorial waters of West Irian, as the official communique later clarified, or it took place on the high seas, this communique purports to emphasize, would make no considerable difference in the final analysis. The Hague statement specifically points out to Article 51 of the UN Charter which safeguards the right of self-defence under the international law against an armed attack.

Whatever the precise facts, the incident is a pointer that Indonesia, which, hitherto, did not mobilise her armed forces within striking distance of West Irian, now feels her patience strained. The possibility cannot be ruled out that this was a move to land the troops in West Irian. That itself must be regarded not only as an unfortunate change in the position which she held up to the last week but a precipitate course whose implications are difficult to weigh at the moment. One could find in the announcements of President Soekarno and Dr. Subandrio encouraging hints to defer extreme action. Never heless, in "notifying" this incident to the UN Secretary-General, Indonesia has opened up a fresh opportunity for diplomacy to intervene and prevent any ugly deterioration of the situation.

It was no secret that for one full week before the Indonesian report on the incident, U Thant was intensely busy conducting exploratory talks with diplomats to bring the two parties across the conference table. This Monday's incident could turn into a boon in disguise, since it has provided an appropriate occasion to him to offer his good offices for mediation. U Thant's appeal to Holland and Indonesia to instruct their representatives at the UN Headquarters to start talks with him forthwith has been followed by an urgent appeal from the United States to accept the Secretary-General's offer at this critical juncture. As this issue of *The Eastern Economist* goes to Press, the heartening news has arrived that Holland has responded to the gesture to find a *modus vivendi* for a peaceful settlement under the Secretary-General's auspices. And no auspices could inspire greater confidence.

However, Holland's response has been accompanied by a positive suggestion to the Secretary-General to depute one or more observers or his personal representatives to West Irian. This suggestion could have been held in abeyance at this delicate stage. The Dutch Government has pointedly stressed in its reply the fact that this is but a reiteration of its request to the late Mr. Dag Hammarskjoeld. Indonesia, on her part, has disclosed her first reaction to the proposal by recalling the Dutch opposition to India's resolution in the General Assembly in November last urging negotiations for a final settlement — opposition which resulted in the resolution being defeated. The situation has now assumed too grave a proportion for either party to rake up earlier developments in this protracted dispute.

It is hard to persuade oneself to believe that Indonesia merely wanted to give an intimation of the incident to the United Nations and let the matter lie there. As we stressed in a leading article last week, there has been a good display of restraint from both the sides. The gulf between the contentions of the two parties has been narrowed down substantially to the point of reducing it to a small margin. To wipe out that margin is the test of successful mediation. With Holland having given up her original insistence on self-determination for the Papuans, what remains for settlement is the exact plan of transfer to Indonesia. Considerations of prestige are holding that marginal difference and they are understandable. The naval engagement, whatever its genesis, has added pungency to them. Indonesia has shown her readiness to agree to a postponement of *de jure* transfer, if the administration of the disputed island is handed over to her. Overt commitment on this condition would apparently militate against prestige. Would it not be possible for high diplomacy to obtain a gentleman's agreement on this sensitive issue and prevent the explosion?

The Brussels Accord

THE dramatic announcement on Monday, after a marathon session of the Council of Ministers of the European Economic Community at Brussels, on an accord having been reached on a common agricultural policy for the Community, is momentous for more than one reason. The agreement achieved not only takes the Common Market to the point of "no return", but also opens up a bright prospect for Britain's entry into it. The integration of the economies of the Common Market countries can now be accelerated because the decisions on economic policies will no longer be required to be unanimous. It will be possible henceforth to decide controversial issues on the basis of a "qualified majority" and these decisions will have to be carried out even by members who might vote against them. The stipulation of "qualified majority", however, will necessitate the concurrence on any decision of the three major partners in the Community, namely, West Germany, France and Italy, who amongst themselves have 12 votes out of the 16, or alternatively the concurrence of the two major partners and the representatives of the Benelux countries.

The optimism about the United Kingdom's entry into the Common Market being facilitated as a sequel to the accord on farm policy emanates from the fact that the political expediency that has taken ascendency over the economic factors should prove to be a great magnetic force in attracting Britain to the Community. The agricultural community in Britain will also feel satisfied and may find sufficient reason to withdraw its opposition because the safeguards which the major agricultural countries of the EEC — France, Italy and the Netherlands — have been able to wring at Brussels provide adequate protection to the British farmer. The common external tariffs for agricultural commodities, primarily cereals and other foodstuffs the provision of which is the principal objective of farming in Britain and the EEC countries, Press reports suggest, will provide in the initial stages additional protection to farmers in Italy, France and the Netherlands, because they are to be adjusted more in line with the high protective tariffs of West Germany. This can give a tremendous fillip to the agricultural sectors of the French and Italian economies particularly; the spokesmen of these countries have hailed the accord with great enthusiasm.

How the Brussels agreement will affect the under-developed countries which, along with the advanced exporting countries of the United States and Canada, provide the bulk of farm products imported into the Common Market, it is difficult to assess at this stage in the absence of the precise details of the agreement. But the misgivings expressed in Canada and the USA are a clear pointer to the fact that the added protection which the farmers in the Community will now get will lead to a curtailment of trade between the EEC and the under-developed countries, unless some bilateral agreements are concluded with them also on the pattern of the tariff cuts negotiated with the United States. Such agreements, in fact, appear to be in the offing in the case of Canada, New Zealand and some of the exporters of farm products on the Continent itself. The difficulties which these countries will experience during the seven and a half years' transitional period from July 1962, will, no doubt, be mitigated by the escape clauses which provide, among other things, for imports by West Germany of cheap foodstuffs from sources outside the Community.

How far in the long run exports of farm products from the under-developed countries to the ECM will suffer depends on whether the consumers in the Community are to be permanently condemned to eating only high-cost food produced in the region. This should pose a big problem for Britain in her negotiations for entry into the Community, since she is committed to secure lower external tariffs on the farm product imports in general and especially from New Zealand, Australia and Canada, the three most important Commonwealth suppliers of foodstuffs to her. What attitude France, Italy and the Netherlands will take when Britain presses for lowering these tariffs to levels somewhat comparable to world market prices, it is difficult to say at the moment. Agriculture in the Common Market countries is obviously high cost and there will have to be retained a sufficient margin of protection if agricultural interests in the Community are not to be upset. There is, however, a possibility that greater specialisation in production of farm products in the various regions of the Community best suited for them and the rapid further industrialisation that the ECM countries can now be expected to go in for will alter the balance as between agriculture and industry, reduce the pressure of population on land and lead to improvement in farm incomes, toning down opposition to lower protection. In view of the necessity to keep industrial costs at lower levels, it may also not be prudent for the ECM countries to shut off imports of farm products at cheaper rates from sources outside the Community. The growth of agriculture in the EEC countries may, therefore, not be as much a deterrent to the trade of under-developed countries as is feared.

India's interest in the Brussels agreement at the present juncture is, of course, purely academic. We do not today export any foodstuffs. The agricultural raw materials which we export to the EEC countries are not covered by this agreement. But India is concerned in this problem because of the improved prospect of Britain's entry into the Community. Britain's membership of the Common Market, as has been argued in these columns previously, will not be ultimately to our disadvantage, although there may be some upsets in our trade pattern in the initial stages. Britain's entry will undoubtedly step up the rate of development there. India can partake in this prosperity and push up her exports in the long run.

Even in the short-term period we will do well to impress upon the Common Market countries that we can continue to import from them only if our exports to them pick up commensurably. Perhaps the way shown by the United States, by means of which she has been able to negotiate with the E.C.M. countries a mutual 20 per cent reduction in tariffs on their industrial products and also some cuts in tariffs on agricultural products, can be followed by us. Even if Britain is able to obtain some safeguards for her trade with the Commonwealth countries, it is open to us to have direct negotiations with the EEC. Such negotiations have been resorted to in the recent past, but only limited success has attended them. The problem can be posed to the Common Market members with greater force now.

Guest Editorial

The Monopoly Problem in Britain

By WILLIAM REES-MOGG

THE British Government is now coming under pressure to make a thorough review of its policy on monopolies, and it may well have to introduce new legislation. In the last few weeks there have been three major developments in British industrial monopolies. The first was the I.C.I. bid for Courtaulds; the President of the Board of Trade had to confess, he had no powers even to consider it. The bid is for the moment in cold storage but talks are going on to merge the man-made fibres interests of the two companies.

Next the Board of Trade rejected the Monopolies Commission recommendation that the Imperial Tobacco Company should divest itself of its large holding in Gallaher, its main competitor. As a result the two linked companies will continue to have 90 per cent of the tobacco market. Now Mr. Charles Clore, the property magnate, is bidding for Saxone, Lilley and Skinner, a large shoe company. This bid will give him a £50 million shoe group, and about 50 per cent of the British shoe market.

Whatever view one takes of monopolies, and the economic arguments vary in strength from industry to industry, the state of law on monopolies is obviously defective. British monopoly legislation rests on the Monopolies Act of 1948 which set up the Monopolies Commission. The Commission has power to examine and to make recommendations but not to act. On average it takes five years for the Commission even to report.

In contrast the Restrictive Trade Practices Act of 1957, which deals not with monopolies but with agreements to reduce competition has strong legal sanctions. Associations of firms are not allowed to set fixed prices, or restrict competition in a number of other ways. The effect of this has been very considerable, and on balance it has been advantageous.

Yet the Restrictive Trade Practices Act has also acted as a positive encouragement to monopoly. The effect of strong legislation to stop voluntary associations to limit competition, with no legislation to check mergers to limit competition, is inevitably to encourage mergers. A monopoly firm can do with impunity things forbidden to a group of small firms, even if they have in total only a small share of the market.

There are, of course, arguments in favour of allowing many mergers. It is still true that in terms of modern industry the average size of unit in Britain is probably too small rather than too large. In both motor cars and computers Britain needs to encourage mergers rather than stop them.

In some cases Britain can only support one firm of internationally competitive size, where the American economy can support three or four. Large firms tend to devote larger sums to research, and they also in general have a good export record.

With the approach of British entry to the Common Market — if it is achieved — even the largest industrial monopolies (though not the retailing groups) will face much greater competition. Yet it remains true that Britain has much less effective monopoly legislation than the United States, and that there is a strong trend to monopoly development, not all of which has any sound economic justification.

It is difficult to make adequate comparison between the degree of monopoly in different countries. Germany and Japan had much higher monopoly concentration before the war. During the occupation these groups were broken up, and though they have partly been reorganised the degree of monopoly is still much less than it was before the war.

Nationalisation produced in Britain a monopoly on the railways, in electrical supply, in coal, and in gas. Changes in advertising and the impact of printing costs have led to concentration of the press. There is not, however, any monopoly in the national London press. Twelve groups publish twenty different London daily, evening or Sunday papers. The Mirror Group, which is the largest, publishes four and as many as eight of the groups publish one apiece.

Britain need not to go as far as the American anti-trust laws with their formidable penalties, and their granite-breaking jaws. She certainly, however, shall need legislation which empowers the President of the Board of Trade to intervene and order an enquiry if he suspects that a merger is likely to lead to a reduction in the amount of effective competition.

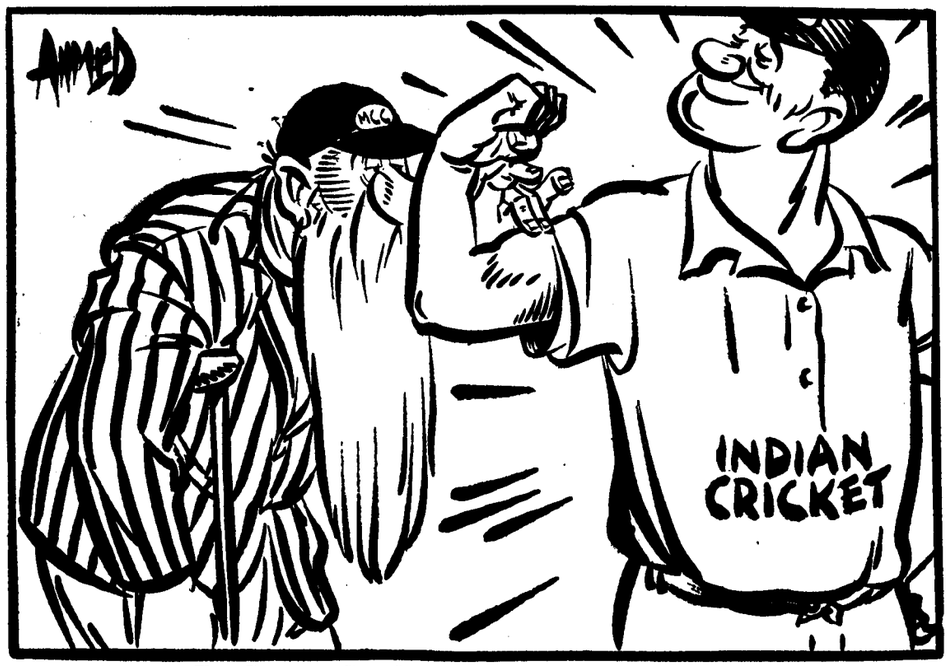
The other obvious reform is to do away with the main defect of the Restrictive Trade Practices Act; that is the power of enforcement of fixed prices. Under that Act individual firms were given power to enforce fixed selling prices in the courts, though associations were forbidden to boycott retailers who sold below list price. In the hands of the small firms this legal power is unimportant and may even be ineffective. It is of course a powerful weapon of a monopoly firm, and it is one which should be taken away.

A DELHI DIARY

MORE ASHES FOR BRITAIN?

I LEAVE all the great crises of the world to deal with what is uppermost in everyone's mind, namely, India's victory over Britain in the current series of cricket Test matches. Any one who has seen the film rendering of the crowd at the Calcutta test, or heard the noises which emerged on the radio when victory was near at Madras, will appreciate the volume of wild enthusiasm which seems to have captured the country. Apparently, contrary to the astrologers, India is on the up and up. The fact that our cricket, which lived so much in a permanent state of somnolence, has achieved two remarkable victories, has put us again on top of the world. As usual victory has tended to throw into some unfavourable light those that have been defeated. I have been hearing again some comments on British cricket, which recall those memorable days in 1882 when, in the most stirring match of all cricket history, Australia rattled out a British side, including the famous W. G. Grace, for less than 80 runs. Many friends of mine have been asking me, as though a great memory had been revived, what the significance is of the word 'Ashes' in terms of the Test series with Australia. From the deep researches I have now undertaken on this most fascinating subject (which has come to the surface very much, as our quick victory has helped us to ride a wave of enthusiasm) I am now fully able to expound. Immediately after this famous Test 'Punch'—that perennial source of much enduring comment—made the observation that British cricket died that day at the Oval and the "ashes" were being taken to Australia. British cricket did not die either in Calcutta or Madras, but perhaps one might well ask whether or not India, that has hitherto won only two matches in about 50, can claim that it has performed an equally stirring task which will be remembered in every newspaper of India. What a pity we have no real Punch to immortalise the occasion!

INDIAN CRICKET COMES OF AGE



The truth is that it is not as if the British have lost so much in their traditional cricketing skills as that the Indian side has grown significantly in competence in a surprisingly short interval. Some naughty cartoonists are even proclaiming that the revival of Indian cricket has taken place only after Goa. It seems it has been a wonderful shot in the arm to help our batsmen bat and our bowlers bowl. Certainly the last two Test matches have been quite different from the first three, and it may be that while the number of dropped catches continues to dismay the stoutest heart, our fielding has shown very substantial improvement.

It is quite true that the British side was not the best that could be put into the field. But it certainly contained some stalwarts and it is doubtful, if three or four aces, who might have improved the side, would have made all the difference. Is it not a fact that one of India's great virtues is now that she always wins the toss? Who can believe that in all the five matches in this series, it was India that won the toss? May it not be that the most important portion of the cricket match on wickets which wear badly, is this skill of calling the right side of a coin? Can it even be that the coin in question had only one side on which it could truly fall? My statisticians tell me that the chances of "Heads" coming right five times out of five are unusually small!

In regard to this cheerful subject I now append—such is the exaltation which I feel!—a cartoon of twice the usual size in order to adjust myself to the volume of jubilation inside the country. Whether "flexing" muscles is a good thing or a bad thing, morally, here perhaps there will be no dissenting voices!

AJOY GHOSH

I pass from this stirring event to a sad one—the departure on Saturday night of Ajoy Ghosh, Secretary of the Communist Party of India. Those of us who knew him little and were on a quite different side of the political fence knew of him largely by reputation only. But what I have since heard of Ajoy Ghosh makes me regret deeply that I did not take the trouble to meet him and hear from his own lips the powerful conviction which seems to have carried him through a turbulent life. Apparently, even when one is seeking revolution, there is need of the power of democratic persuasion and Ajoy Ghosh is now deeply missed because he had this quality in abundance. In the highly strained meetings of the C.P.I. Executive, he is supposed to have exercised "moderation". I wonder why it is so difficult for Communists to exercise moderation. Perhaps when one seeks Revolution without, one tends to be somewhat turbulent within. However, the succession in the Communist Party seems to be nearly as difficult as it is in the Congress; all of which shows that one does not need to be a political giant to make replacement difficult!

THE WEEK'S NOTES

The Congo

MR. GIZENGA'S ARREST AND AFTER

THE TRAGEDY of secessionist activity in the Congo has taken a vicious turn and it has given unexpected proof of moving in a circle. Hitherto it was Katanga which wanted an independent existence. But in the very heart of the late Mr. Lumumba's stronghold of Stanleyville, his lieutenant, Mr. Antoine Gizenga, staged the rebellion against the Central Government. Mr. Gizenga never reconciled himself to the position of Vice-Premier in the Central Government under Mr. Cyrille Adoula and, for a time, quite crucial in the days following Mr. Lumumba's assassination, his aims were inscrutable to all including his own followers. In the larger interest of stability at the Centre, his colleagues in Parliament from his own province of Orientale voted Mr. Adoula as Premier. Mr. Gizenga, who considered the succession as his by right, stayed away, but at long last he was pursuaded to respond to Mr. Adoula's gesture and accept the office of Vice-Premier. But it was an acceptance with extreme reluctance and since then this seeming champion of the unity of the Congo has been nursing a deep personal grievance. A feeling of revenge finally seized him and he raised the banner of revolt against the Central Government.

This blunt fact could not be camouflaged by his clever strategy of moving his forces, recently raised, to North Katanga to lend his activities the appearance of fighting secession there. The real motive was unmasked when he defied Mr. Adoula's summons to return to his post at Leopoldville and, in the result, General Lundula, assisted by the UN forces, was deputed to suppress this incipient rebellion and bring back Mr. Gizenga. The action was not prolonged, the new threat of subversion was put down and now Mr. Gizenga is under house arrest, having forfeited office. Thus Mr. Gizenga made his exit by his own rebel activity. Speculation surrounds the question of filling the vacancy of Vice-Premier in the Central Cabinet and if, as reports go, a nominee of Mr. Tshombe is selected, the way for rapprochement will have been paved considerably. But the course of politics in the Congo is wayward and unpredictable, though sympathisers of this strife-torn republic would very much wish that this latest opportunity should serve to bring back Mr. Tshombe into the fold.

Madhya Pradesh Congress

ELECTION OUTLOOK

THE MADHYA PRADESH CONGRESS PARTY has demonstrated its complete inability to compose its internal divisions and to put an end to the dissipation of its strength. It is a major test of the intrinsic vigour of a political party that in times of crises or trial of strength with the opposition parties its leadership should close the ranks that divide it and present a united front in the larger interests of the party. The fact that the Madhya Pradesh Congress Party finds itself helpless to forge unity on the eve of the general elections speaks for a deep-seated malady. It is an open secret that acute differences between the ministerialist group and the non-ministerialist group have prevented the restoration of party solidarity. At one time, the division was between the legislative and organizational wings, but the cleavage has now assumed wider proportions on either side. The Prime Minister's mediation to patch up the differences between the two wings produced, it would appear, a semblance of harmony.

But as the fateful issue of allocation of party tickets for candidatures at the general elections was settled, except for a few constituencies, dissatisfaction and frustration revived the rift, giving it a new and more pernicious dimension. Defections from the party are a common reaction on such occasions, but in this case they have been marginal so far. The vital factor, however, is whether the campaigns in support of the official candidates in the individual constituencies, which have been the storm centres over the distribution of tickets, will be as unified and vigorous as the election battle requires. The Pradesh Congress Chief (who himself was not, until a few months ago, free from the infection of partisan group politics) discounts the probability of the disgruntled elements (by no means insubstantial) playing foul. One has to look, however, to other judges for an appraisal of this sort and they are frankly sceptical about his confidence. The scramble for tickets has brought to the surface some ugly aspects of party organization in most States, but Madhya Pradesh claims a special distinction.

This unhappy situation notwithstanding, the return of the Congress Party to office in this State need not be held in doubt. The opposition parties are no more than small groups in the Legislative Assembly and the likely emergence of the princely bloc in the election contest will at best serve to split the vote or capture some seats. In the State legislature of 288, the Congress at present commands an overwhelming majority of 238, from which the strength of the two groups immediately below—the Praja Socialist Party 14 and the Jan Sangh 10—is a far cry. Their coalition in the next House is ruled out and to hope to secure even a bare majority of 145 seats is nothing short of wishful thinking on their part. But there can be no doubt that the Congress Party will suffer a sizeable reduction in its present massive majority—not so much on account of the vigour of the opposition parties as due to its own acute weakness.

Commonwealth Education

THE SECOND CONFERENCE

TWO OR THREE years is but a short span for Commonwealth co-operation to show concrete results in that comprehensive sphere of education. But between the first Commonwealth Education Conference held at Oxford in 1959 and the second one convened in New Delhi last week, a genuine conviction based on experience has grown among the participants that the framework of collaboration has been laid on objective lines and the new institution will serve its purpose with positive achievements. When Sir David Eccles, Britain's Minister of Education, entered an earnest plea for the cause of the humanities not to be suffered to be obscured by a pre-occupation with linking education to economic growth, he apparently did not underrate the urgency and immediate significance of technical and scientific education to the less developed members of the Conference. But since the deliberations were intended to be concerned with their live problems, it was but inevitable that issues of technical education should dominate them.

The burden of the speeches of the delegates from most of the member countries was the distressing teacher-student ratio in the technical institutions at all levels. Britain (and, next after her, Canada) has taken the lead in providing the pool of 2,500 teachers for the Commonwealth countries. It is, however, not clear how many of them answer the requirements in the technical sphere, but presumably a majority of them does. With the process of political liberation gaining momentum in the African continent, it is only natural that this pool facility should be absorbed by them more than by

the rest of the Commonwealth. Dr. V. S. Jha, Director of the Commonwealth Education Liaison Committee, disclosed in his report tendered to the conference that the overriding requirement of the developing countries was a quick rate of the outturn of teachers to man the technical institutions. It is not a question of numbers only, but a pressing demand is growing for teachers of the requisite quality. But it would appear that the requirements of quality may be modified as these countries have realised that their needs of technical courses at the diploma level are far more urgent than those of degree courses. In fact, the Indian delegation was drawing up a plan for the conference for the introduction of technology in the curricula for secondary education. It will not, however, reduce in any substantial measure the need for setting up a network of polytechnics at least in the big towns in each country. Partly, the demand for teachers will be met by the scheme of scholarships—a total of 1,000 out of which half are provided by Britain and a quarter by Canada. As under the Colombo Plan, such schemes are participated in by other countries, including India. Then there are about 35,700 students from the Commonwealth countries receiving education in Britain—a good part having opted for scientific and technical courses. Some of them will be drafted for the teaching profession. Cadres of teachers will need to be raised from various sources in each country, indigenous as well as foreign, but their partial provision will be a test of the constructive work of the Conference.

Workers' Participation

A MINISTER SPEAKS OUT

THERE ARE no two opinions in this country—as clearly evidenced on a number of occasions at the tripartite labour conferences — on the need to promote workers' participation in industrial management, whether in the private or public sector. In fact, the initiative was taken in the private sector and public enterprises followed suit. The main argument for bringing about this transformation is that active sharing of the privilege and responsibilities of management would give workers a real sense of belonging to the enterprise and a genuine feeling of identity of interests. But however laudable this bold reform, it was hardly reasonable to expect that it should be introduced in haste without the workers' representatives having imbibed a full sense of the new responsibilities they are called upon to shoulder. Workers' association with the machinery of management and conferment of a consultative status, until they attain the requisite degree of maturity, were the logical intervening steps for full participation. Such a practical but gradual approach found little advocacy for reasons of political embarrassment.

Mr. K. C. Reddy, Minister for Commerce and Industry at the Centre, had the courage of conviction to declare at a Press Conference at Bhopal, after his visit to the Heavy Electrical Plant, that the experiment of workers' participation in management has brought disappointment in some public undertakings. The essence of participation in management is to discard the narrow conventional outlook of antagonism of interests, to substitute community of purpose in its place and to extend unqualified co-operation in promoting productivity in the enterprise as the abiding secret of its dynamism, which alone would lead to a progressive increase in efficiency, output and workers' real incomes. Mr. Reddy was forthright in making the disclosure that workers' representatives could not get out of the old groove and they were excessively pre-occupied with workers' sectional interests to the point of overlooking the interests of the enterprise. This set-back, however, cannot be regarded as a signal for reversing the bold reform. But its moral is that second thoughts ought to be taken to ascertain how it can be modified on a basis of gradualness.

4th–13th MARCH 1962

LEIPZIG TRADE FAIR

Industrial Equipment and Consumer Goods from over 50 Countries

The Leading Centre of Trade for East and West

A Unique International Survey of Modern Industry

Direct flights • Reduced fares by train over the continent • Literature from all leading travel agencies

A wide range of Indian Traditional and Non-traditional export items will be exhibited in the special Indian Pavilion, in an area of 1016 square metres.

INDIAN EXPERIENCES IN THE U.K. TODAY

By **ODYSSEUS**

THE 1,513 Indian students in the UK constitute the largest group from any one overseas country in British universities. As a thesis for his Ph.D. in the Department of Psychology at the London School of Economics, Mr. A. K. Singh made an investigation of their experiences, a summary of which Political and Economic Planning (16, Queen Anne's Gate, London, S.W.1) has just published (32 pp. Price 4sh.).

Mr Singh offers a survey, as objective as it is instructive, of the reasons which lead students to go to Britain, their initial experience, their problems in adjusting themselves to British life, and the attitudes that they form towards British people and British society, which I bring to the notice of intending students and their parents in India. Indeed, substantial parts of the survey apply not merely to students but to any Indian who intends to make a prolonged stay in Britain, and many findings apply not only to Indian expatriates in Britain but in any foreign country.

Mr. Singh interviewed a sample of 400 male Indian students at London, Oxford, Cambridge, Manchester, and Leeds. They are classified into two broad groups, 'upper' and 'middle', according to the social class of their families as defined by parental occupations. Upper class students tended to be more westernised and to have parents, or grandparents, who had themselves been educated in Britain. In most cases, too, their families in India lived in large cities, and so they had more first-hand experience of city life than students from rural or small town backgrounds. Middle class students, on the other hand, tended to be older, to have been employed in India before they came, and to be postgraduates rather than undergraduates. Many were married. Of these, 92 per cent were undergoing the added strain of living in the UK without their wives, compared with 20 per cent of upper class students. Whereas nearly all upper class students were being supported by their families, most middle class students were being supported by loans, by their own money, by jobs in the UK, and by scholarships or grants.

For most of the students, going to Britain had been a major event in their lives. They went to gain advanced training and to better their future prospects. One aim of the upper class students was to maintain their established status in society and a foreign education was one way of doing this. For example, a junior lecturer at an Indian university was told by his father, a supreme court judge:

"I am satisfied with the careers of your brothers. (One was a foreign diplomat and another was in an administrative post in a British-owned firm). You have to raise yourself up to the social level of your brothers and the family....Unless you get a higher degree from Britain, you have no chance in your profession."

For the middle class student, the problem was to raise his family up to a higher social position. One student said:

"Apart from my personal ambitions, I feel that I owe something to my family, which has been so kind and so affectionate to me. My father has struggled all through his life to make a place for himself and our family in society. Otherwise we were nobody. 'I have laid the foundation-stone, you have to build up the house,' he once said to me."

As many as 70 per cent of the middle class and 43 per cent of the upper class were disappointed in their expectations about something or other in the UK. The upper class were less disappointed, presumably because most had obtained prior advice and information from members of their own families who had previous experience of the UK, and because some had already been to schools in the UK, or visited it with their parents. On the other hand, more middle class disappointments probably arose because they had no first hand experience, and obtained their information from friends, who tended to give a glamorous picture of life in the UK. The students' experiences when they first arrived were influenced by such factors as whether they had friends to receive them, letters of introduction, or accommodation booked in advance. More upper class students had introductory letters, which they found of more help than did the middle class students. Only 6 per cent of all middle class students had letters (which they found to be a great help).

Those who had booked accommodation in advance and had friends to introduce them to life in the UK saved themselves the trouble and embarrassment of finding things out for themselves through mistakes. In general, students who had their first accommodation in hostels or college halls on arrival felt more assured than those who stayed in rooms and hotels.

The first problem that faces an Indian student when he arrives in Britain is to find a suitable place to live. At a time when he is pressed on many sides with problems of adjustment—social, academic, dietory, to the weather, and to his physical surroundings—the difficulties of accommodation increase appreciably the strain on him.

Colour discrimination was the difficulty most cited by both upper and middle class students, though the middle class mentioned it more often than the upper. It is interesting to note that the least colour discrimination was reported from Oxford and Cambridge. As these universities are commonly assumed to attract undergraduates from the best educated sections of British society, this suggests that these sections are freer from colour discrimination than others.

It is possible that some students who expected discrimination imagined it where it did not exist, because they misinterpreted certain situations. For example, a saleswoman that a student thought was neglecting him may simply have been absent-minded; a liftman who kept a student waiting may have been careless or tired; the number of European customers who have been ignored by saleswomen and liftmen must run into uncountable millions; a person who did not sit beside a student in a bus may have wanted to sit next to the window; a landlady who did not remove her advertisement from the shop window for several days after telling a student

that the room was let may have already been paid for for those few days. But such happenings arouse the suspicions of some Indian students because they expect discrimination.

It is a vicious circle. There has been discrimination against Indians in the past and it still continues. Accordingly, Indians expect it, and in some cases think that they detect it when it is not there. It seems to be a social threat to many Indians. Though they might not have experienced it personally, nevertheless it alienates them further from the British. It makes them avoid meeting British people and discourages them from visiting public places.

More upper class students visited families—both British and Indian—in the UK than middle class students. Forty-four per cent of the middle class students visited no families at all. Differences in ways of thinking and general outlook on life, the reserve and insularity of the British, and pressure of work, were the reasons that students most often gave for their difficulties in making friends with the British. Many students experienced difficulties in their relationships with girls, because of their different cultural conditioning, which made them shy and inhibited with girls, their unfamiliarity with dancing, clubs, cocktail parties, and so on, their fear of getting involved in marriage, and their consciousness that the type of girls willing to be friends with them were of social and educational levels inferior to their own.

Mr. Singh reports that according to a psychiatrist who has treated a number of Indians, many of his patients considered the freedom to meet members of the opposite sex a heaven-sent opportunity after the inhibitions of Indian society. But, because of their early training, they suffered a sense of guilt, which was increased by the social disparity between them and the girls they met. One student, who used to go to dances regularly and had observed the behaviour of some Indian students, said:

"Many Indian students come to this country with wild expectations of meeting girls too easily. Their friends at home and here keep on asking them about their sexual achievements. It is not surprising that some of them make fools of themselves by their sex-obsessed attitudes to all Western girls and offend friendly girls of good families and upbringing."

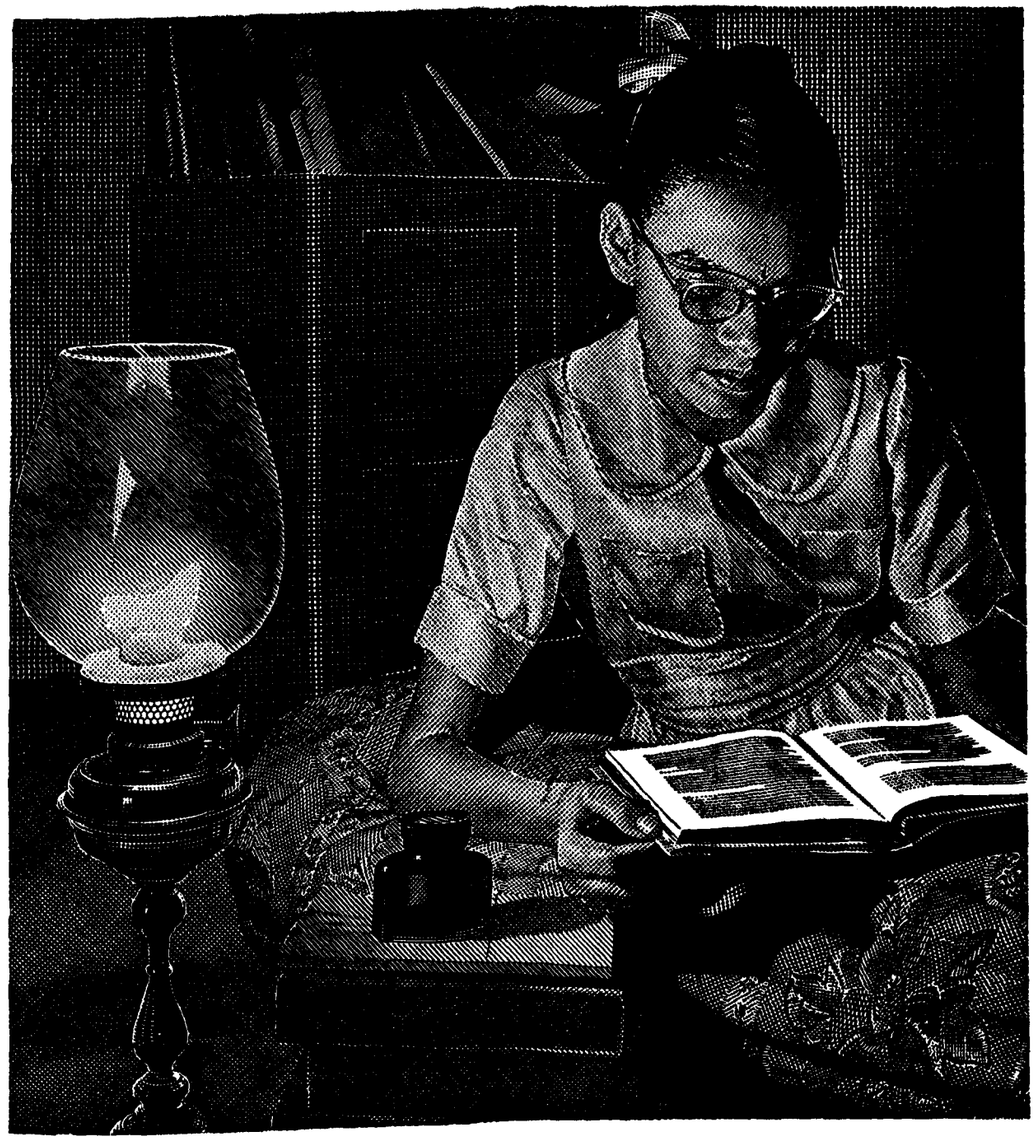
AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.



The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

● Enquiries may be made through your own bankers or direct to

The comforts of life are spreading

Rising standards of living are finding their way into the remotest village and are coming within the reach of people with quite modest means. Consider Kerosine, for instance, which by bringing illumination to the humblest home is playing a part in this welcome development. By the end of the Third Plan, Burmah-Shell estimates that demand for Kerosine will increase by 41.6%. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth and Burmah-Shell believes that

for tomorrow's needs we must act today

The European Scene

WATCHING WASHINGTON'S STEP

From Our Special West European Correspondent

PARIS, January 14.

IN presenting to the Press this week the $6,000 million defence fund put up by the USA, Britain, the Common Market, Canada, Sweden and Japan, the French Finance Minister who was the architect of the scheme said, "The mere announcement to the world of this new agreement will constitute an element of financial stabilisation by showing that the IMF can at any moment draw on the resources it needs to cope with monetary movements. Besides, my wish is that this agreement never has to be used, because movements remain small enough for the normal resources of the Fund to be able to iron them out". What chance is there really for the psychological impact of the new arrangement to stop currency speculators rocking the boat? And if M. Baumgartner sincerely believes that the mere earmarking of billions of dollars for defence measures is enough to stop speculation, why did he (at the Vienna IMF meeting and consistently since then) attach so many strings to France's contribution—which he has succeeded in keeping down to 550 million dollars, against Britain's and Germany's $1,000 million? If the emergency fund were in reality a sort of bluff, never to be used, France could have afforded to be more generous.

One suspects that the psychological impact, on which M. Baumgartner sets so much store, is not designed for speculators only but for governments too. An equal sum placed at the disposal of the IMF for lending according to its normal rules would have impressed speculators. By accumulating this sum outside the IMF and making it exceedingly hard to borrow, M. Baumgartner has sought to force governments to take reform measures at home which will bolster their currencies, discourage speculators and, eventually, make recourse to the emergency fund unnecessary. Besides, the very ratification of this agreement is going to have an adverse psychological effect on one currency, the dollar. In two countries, France and the USA, parliamentary ratification is required by the constitution. This will present no difficulty in France, where deputies see that the French commitment is limited and is hedged about with all the safeguards their own Finance Minister dictated. Mr. Douglas Dillon, US Treasury Secretary, will have a different task. He will have to ask Congress to approve the US contribution, the largest, $2,000 million. Congress will want to know why, and Mr. Dillon will have the delicate job of explaining that the US contribution will probably never be drawn upon, because the whole idea of the fund is to support the dollar itself. The American and British quotas, though large, are mainly symbolical; as far ahead as one can see now, the fund will be the means of mobilising Continental currencies in the event of an attack on the dollar. No one has been tactless enough to say so, but Mr. Dillon will have to make Congressmen see this, without further shaking confidence in the dollar.

Some people think that an attack on the dollar is not a remote possibility, that can be exorcised by mere announcement of a defence fund. "The Banker" has lately forecast "a significant increase in speculative pressures on the dollar" in the first half of this year, for which danger it blames the Kennedy Administration's inability to balance the budget otherwise than in paper estimates. Speculators note that last month US gold holdings were only $16,900 million (of which $900 million were borrowed from the IMF) and are still falling, whereas US short-term indebtedness to foreigners is far in excess of $22,000 million. The discrepancy between these two figures does not, by itself, warrant distrust; it is well known that throughout the last century the Bank of England always owed more than it could pay with the bullion it had in stock. The US Treasury could operate similarly for the rest of this century if confidence were restored in its currency. In time, the ten-nation defence fund will come to be seen as one reason for having confidence in the dollar, but international opinion is still getting used to the idea that the dollar needs to have second lines of defence, that it needs to be propped up. The news that some one has just received a good crutch inspires confidence in his ability to walk if we have got accustomed to the idea that he is a cripple; in the short run, however (the period that "The Banker" had in mind), M. Baumgartner's psychological impact might work the other way.

The terms on which the ten-nation group will lend to one of its members in difficulty have been left deliberately vague. Strictly speaking, they will lend in an emergency to the IMF, which will pass on the money according to its usual rules; this device saves the face of the IMF, which in theory is not being supplanted but provided with a lender-of-last-resort. In reality, the procedure will be this. A nation in trouble will warn the director of the IMF, who will consult the other nine members, i.e. the candidate-borrower will have no voice in the decision. The nine will examine the situation of the applicant and try to reach a unanimous decision, or, failing that, a majority consisting of two-thirds of members representing three-fifths of the funds. They will then decide how the loan they agree to give should be split up among lenders; any one of the nine has the right to prove that its currency should not be drawn on, whereupon the others will make up its share. It is likely that these negotiations will take place in Paris, not in the USA, to mark the lenders' independence both of the IMF and of the most likely candidate for a loan, the US Treasury.

Pressed with questions about the attitude the other nine would take if the USA requested a loan, M. Baumgartner said that they would consider the state of the US trade balance, US private capital movements, and also the US Government's foreign aid programmes. In mentioning this last point, M. Baumgartner might have been recalling simply what everyone knows, that if the US finds itself in grave payments trouble, exposing its currency to speculative attack, this will be because it is lending and giving so heavily to foreign governments that it is converting a large trade surplus into a payments deficit. However, he might also have meant that before the Common Market powers consented to lend to Washington, they would have a word to say about the wisdom of US aid policies. For example, if an American request for a loan came in next week, I think it very likely that certain Continental capitals would ask searching questions about, e.g., the cost of the Congo operation and of the support the US is giving to a near-bankrupt United Nations. Many people here believe that US actions in these fields are hare-brained, and if it emerged that they were responsible for part of the American payments deficit, Washington would have to expect to hear the observations any banker makes when called upon to finance an operation he disapproves of.

Similarly, someone among the nine would be bound to ask questions about the $2,000 million lent to Brazil, and which is still being disbursed although Janio Quadros has been thrown out and his economic reforms sacrificed for a return to inflation. There would be

eries about the US decision to finance the Volta pro-
t in Ghana, a scheme that many here consider un-
nomic in view of the glut of aluminium, and which
s the further disadvantage of prompting neighbouring
rican leaders to demand lavish support for their own
ually dubious projects. It is possible, too, that some
ench-speaking lender other than Belgium would ask
w much aid to Colonel Nasser weighed in the US
yments balance, and it might be pointed out that, in
t, a loan was being sought in order to continue sup-
t for a dictator who expropriated the goods, expelled
citizens and persecuted the diplomats of one of the
der-nations.

It is not being suggested that the ten-nation emer-
ncy fund will become a forum for settling political
res. And there is not the least doubt that, if the
lar were ever threatened, the other nine would, in
er self-defence, give it all the help they could, be-
se the consequences of a collapse of the master-
rency would be grave for everybody. On the other
nd, it is plain that Washington, if it ever seeks
p, will have to come before the Europeans and ex-
in that it is spending the huge trade surplus it earns
commerce with them by giving aid to a number of
ses of which Europeans disapprove, and some of
ich they see as aimed against their own interests.
e moral is that in this sphere Washington will have
admit that its independence has been reduced. A
nservative New York weekly put it this way, "Where-
five years ago this country, in its political and eco-
nic dealings with the rest of the world, operated
olly as a free agent, today it must weigh the conse-
nces of its acts...As a hard-pressed debtor, Washing-
had better watch its step". The ten-nation mone-
y club set up in Paris according to the principles
Baumgartner proposed in Vienna last September
l, in an emergency, have just that function; watching
shington's step.

This watchfulness will have its effect long before
real emergency develops. The pledge of European
itals to place funds at the disposal of a threatened
lar will not make Washington feel that it can pursue
open-handed policy on foreign aid with impunity;
will naturally tend to adjust its hand-outs so that,
if the dollar were weakened, it would be able to pre-
sent an arguable case to the lenders assembled in Paris.
The payments outlook for 1962 is already unhealthy
enough for it to begin thinking of this. Last year end-
ed with a payments deficit of $1,750 million—all of it
due to foreign aid, since the trade surplus was no less
than $5,000 million (imports $15,000 million and exports
$20,000 million). No abridgement of foreign aid has
yet been announced, and yet the recovery of business
activity means that imports this year will exceed
$16,000 million, and hence reduce the trade surplus, for
US exports are not cheap enough to win larger markets
in West Europe. If a worsened payments deficit is to
be avoided, foreign aid will have to be pared; or if
European assistance is to be sought to meet any conse-
quent attack on the dollar, foreign aid will have to be
adjusted to make it seem reasonable to Europeans.

The alternative is to persuade Europeans, and not-
ably West Germans, to shoulder more of the foreign
aid burden directly. But this will have the same politi-
cal results: the Europeans will only take on aid com-
mitments that seem reasonable to them and one cannot
imagine, for example, the Common Market powers sink-
ing money in operations such as the war against Ka-
tanga, the rescue of the United Nations from bankruptcy,
aid for the evincers of Janio Quadros, hand-outs to Mr.
Nkhruma, not to mention various aid programmes in
support of Far Eastern regimes. On the other hand,
fortunately, one does not see them questioning aid to
India (to which most of them are already committed
anyhow). Opposition to that comes from certain circles
inside the USA (example from a New York business
paper: "Despite aggression by India against the Por-
tuguese territory of Goa and the outrageous defense
offered by the Indian spokesman—who contemptuously
dismissed international law as 'part of the atmosphere
of colonialism'—our government shows no sign of chang-
ing its benevolence toward the saintly Nehru"). But
it finds no echo in West Europe, although, Heaven knows,
Messrs. Nehru and Menon count few friends on the
Continent. Aid to India is seen here as rational policy,
both on economic and political grounds, and thus is in
no danger of being caught up in the agonising re-ap-
praisal to which European lenders propose to submit
US foreign aid.

Economic Report from the U.S.

PRESIDENT'S TRADE PROGRAMME

By GUY SIMS FITCH

WASHINGTON, January 16.

THE trade plans outlined by President Kennedy in his State of the Union Message are among the most ambitious ever presented by a chief executive to Congress. They go beyond anything ever seriously proposed in the United States with regard to trade liberalization, and in many ways even exceed the promise excited by the President's earlier and more general statements about a bold new approach to international trading relations. Details of the President's trade programme are still to be made public. From what he revealed last week, however, it is evident that Mr. Kennedy will be asking Congress for authority to gradually and completely eliminate all tariffs on a wide range of goods, and to reduce tariffs on all other goods by as much as 50 per cent. Bargaining would be permitted, moreover, by major categories of products instead of the present item-by-item, procedure, thereby further enlarging the opportunities for broad tariff reduction.

The tariff elimination proposal refers to items in which the United States and the European Common Market together supply 80 per cent of the world's trade, and it would apply to both parties. There are items, by and large, of which the United States sells abroad substantially more than it imports, and which it has demonstrated an ability to compete. They include a wide variety of industrial and consumer products. Thus, the President's proposals would not only provide the framework for a vast expansion of international trade generally, but would make it possible for U.S. industries to continue competing equitably with their counterparts in Western Europe for access to European consumers. In this way, the United States would be keeping abreast of a rapidly changing world trade situation. The six nations of the Common Market or European Economic Community, France, Italy, the Federal Republic of Germany, Belgium, the Netherlands and Luxembourg, have been—step by step—reducing their internal tariffs and progressing towards the establishment of a common external tariffs structure. The goal of European economic unity has been brought a step closer this week with the announcement of Common Market agreement on internal agricultural policies. This was followed by a reported agreement with the United States which would help safeguard the large U.S. farm export market in Western Europe. These moves appear to have paved the way for U.S.-E.E.C. agreement on broad reciprocal tariff reductions, mainly on industrial goods.

Meshing of U.S.-E.E.C. trade policies can contribute significantly to the strength of all free nations everywhere, since together the United States and the Common Market make up a large and powerful trading partnership. In this sense, President Kennedy's proposals represent a challenge not only to the American people and Congress, but also the E.E.C. This challenge is underscored by the nature of the President's trade proposals, which are considered by many U.S. economists as bolder than anything yet suggested by the Common Market countries. The challenge is emphasized, moreover, by the President's reminder in his State of the Union Message that tariff concessions must be reciprocal, and the Common Market will not fulfill its promise unless its outside tariff walls are low and essentially non-discriminatory. The President made it clear that the United State is not abandoning its non-European trading partners, or its traditional most-favoured-nation principle, under which tariff cuts negotiated with one country are as a general rule extended to others. In this connection, he noted specifically that his proposed trade legislation would provide "new encouragement" for the "sale of tropical agricultural products, so important to our friends in Latin America." Nor is the President about to abandon U.S. industries which might be serious and adversely affected by sharply reduced U.S. import barriers. This seems to take into account not only a basic equity as far as American business interests are concerned, but also a recognition that some domestic safeguards probably will be required if approval for the new trade programme is to be obtained from Congress. There is little doubt that substantial acceptance of President Kennedy's trade programme at home, coupled with a reciprocation in spirit and in deed abroad, could contribute importantly to the reduction of trade barriers and the expansion of trading opportunities in the United States, Western Europe and around the world. The ultimate objective is to enlarge the prosperity of free men everywhere.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50|-.

THE CHANGING STANDARD OF LIVING: A SUBJECTIVE ANALYSIS OF THE PAST DECADE

EVER since the pronouncement made by the Planning Commission that India's two Five-Year Plans had resulted in raising the national income by 42 per cent, great interest has been evinced in the distribution of this increment in national income. The Government of India in October 1960 appointed a special committee headed by Prof. P. C. Mahalanobis, Statistical Adviser to the Cabinet, to work out an objective analysis of the distribution of national income from available evidence, statistical and otherwise. It is now learnt that a draft report has been prepared by the Secretariat of the Committee, but a discussion on this report has been deferred till after the elections. It is feared, perhaps, that the findings of the Committee are likely to have some explosive material which might be used by Opposition parties in the coming elections; delay and discretion might, therefore, appear wise. But for the country as a whole this was unnecessary.

The political and economic pundits have, however, not missed the opportunity of giving their own impressions as to whether people in general have or have not improved their standard of living during the last decade. An interesting "subjective" analysis has just been released by the Indian Institute of Public Opinion which conducted in September-October 1961 a country-wide pre-election Gallup poll which also included pertinent questions regarding the changes in the economic conditions of the people. The all-India random sample consisted of 3,540 respondents spread over all the States of the Indian Union except Assam and Jammu and Kashmir. The sample, according to the Institute, was taken from the electoral registers in all the States and consisted of people in almost all walks of life. The uneducated in the sample constituted 40 per cent while an equivalent numbers (40 per cent) were under-matric. The rest of the respondents were either matriculates or holding higher degrees. In regard to income it may be stated that nearly 50 per cent of the people belonged to the income group of less than Rs. 100 per month. Eighty per cent of the sample consisted of respondents with income of less than Rs. 200 per month. Thus it will be seen that the sample is fairly representative of the areas covered.

ECONOMIC CONDITIONS: 1952, 1957, 1961

* No check: provision for multiple answers.

NOTE: The all-India sample consists of 540 urban respondents (50 per cent of the actual urban sample) and 2460 rural respondents.

The findings of this survey in regard to the economic conditions of the people are summarised in the table on page 318. It will be seen that nearly one-fourth of the respondents stated that their economic condition had improved as compared to 1952. An equal percentage stated an improvement in living standards over 1957. In other words, about 75 per cent of the respondents indicated either no change in living standards or a definite fall in their level of living for the periods considered.

The fact that only one-fourth of the respondents stated that their level of living had definitely improved does not go to prove that incomes in general have not risen. In fact a supplementary question indicated that nearly 54 per cent of the people in the sample had stated that their incomes had either increased or remained unchanged over 1957, but the benefits of increased monetary income had been eroded by the rise in prices. In other words, the people are very much alive to the pressures of rising prices and, by and large, are not satisfied with the course of economic trends. In the ultimate analysis this "subjective" enquiry reveals that every sixth respondent in the Indian Union has succeeded in attaining the standard of living of his or her expectations. Nearly 50 per cent of the people are definite that the Five-Year Plans have not assisted them in achieving the standards envisaged by them for themselves, while nearly one-third of the respondents are still "undecided".

Another interesting conclusion emerging from this poll is that the people in urban areas are, in percentage terms, definitely better off than the people in the rural areas. Respondents in the rural areas have, by and large, stated that there has been no change either for good or worse in their level of living. While the immigration of population from rural to urban areas is going on a very slow pace, it is necessary that greater financial allocation should be made in India's succeeding plans in favour of projects which would assist the backward rural areas to raise their standards of living in general.

THE BUSINESS WORLD

Let Power Play Its Part

By CROESUS

ALMOST everyone is now convinced that, unless something drastic is done soon, power shortage will seriously retard the tempo of our economic development, if not stall the further all-round progress of this country. It is not that our Planners are unaware of this. Far from it. For, were they unaware, they would not have steadily stepped up the provision for power from Plan to Plan, as they have done. Thus, against actual outlays of Rs. 302 crores in the First Plan and of Rs. 525 crores in the Second Plan, the Draft Outline of the Third Plan provided for an outlay of Rs. 975 crores, but, getting wiser no doubt from their experience of the working of the two Plans, more so the Second Plan, they have stepped up this figure further to Rs. 1,089 crores in the final version of the Third Plan. Although even this upgraded target is considered inadequate by apex commercial organisations, such as the Associated Chambers of Commerce of India (a resolution adopted by this body, in December last, considered the investment on electric power generation and transmission in the Third Five-Year Plan to be insufficient and felt that, even if the proposed targets were achieved, a serious power shortage would remain), it must be conceded that the higher target, 'if achieved', would, by and large, improve the power position of the country. But "if achieved" is a big 'if'. The stage of talking in subjectives thus has passed. What is relevant to the situation, what is vital is how best to achieve the target.

The question of how best to achieve the target immediately raises the question of a suitable agency and a proper organisational structure. It is common knowledge that all power problems are being handled by the Central Water and Power Commission. Only recently, the Gokhale Committee, appointed by the Government of India, went into the working of the Central Water and Power Commission, and it may seem irreverent to question the wisdom of the findings of that Committee about the organisational structure of the C.W. & P.C. The Gokhale Committee, despite a fairly vociferous, and what seems to many a very legitimate, demand for the separation of the power and the irrigation wings, favoured a combined commission, that is, more or less a continuation of the 'status quo'. Among those who favoured—and still favour—a separation of the two wings, besides, of course, the Power Wing of the C.W. & P.C., which has been urging such a separation for quite some time, and the State Electricity Departments and the State Electricity Boards, were the Federation of Electricity Undertakings of India and the Associated Chambers of Commerce of India, to name only the more important. Supporting a resolution on the subject adopted at the last annual meeting of the Associated Chambers of Commerce of India, Mr. S. Srinivasan had this comment to offer, 'inter alia':

"First, the 'irrigation bias' of most of the State Public Works Departments and, to a certain extent, of the Central Water and Power Commission has led to a comparative neglect of thermal development."

One has only to turn one's eyes to pages 407 to 409 of the "Third Five-Year Plan" to get some idea of what is expected of the C.W. & P.C. Having done this, one must ask the question, as the Federation of Electricity Undertakings in India has wisely chosen to do, whether the present organisational structure of the C.W. & P.C. can cope with it all. To an impartial observer, a layman like me, the answer is obvious. It is that, as it is constituted, the Commission, instead of furthering the work, will only hamper it by inhibiting the high degree of drive and initiative that the implementation of the power project in the Third Plan calls for. In considering this question, one must bear in mind the fact that, with the completion of first decade of Planning, we have completed the commissioning of practically all multi-purpose and hydro projects, leaving mainly if not only, the purely power projects to be taken up. In other words, the projects visualised in the future have very little or no bearing at all on irrigation or flood control. I would go further and say that even some of our so-called multi-purpose projects are more fondly, or rather fashionably, termed so. Be that as it may, from now on—we are already lagging behind in all conscience—we must attach more and more importance to thermal and nuclear power development, apart from such vital issues as inter-State grid, if only to promote the cause of national integration in practice.

May be, I am no constitutional lawyer, but, all the same, I am able to discern the validity of the contention of the Federation of Electricity Undertakings in India that the present set-up — the combination in one organisation of both the Irrigation and the Power wings — suffers from some handicap in relation to our Constitution. Let me quote the relevant extract from the Memorandum of the Federation to the Ministry of Irrigation and Power on this point: "Electricity is a 'Concurrent' subject (Item 38 List III, Seventh Schedule), whereas Irrigation and connected matters fall under the State List (Item 17 List II, Seventh Schedule), subject only to Item 56 of the Union List (List I of the Seventh Schedule) which reserves to the Central Government powers over regulation and the development of inter-State River Valleys to the extent to which such regulation and development under the control of the Union is declared by Parliament, by law, to be expedient in the public interest." In a nutshell, this means that, in so far as electricity is concerned, a greater responsibility which has to deal more with power than with irrigation devolves on the Centre. And the Centre can discharge such responsibility only through some organisation which is devoting itself exclusively to problems of electricity.

Again, if Irrigation and Power (or Electricity) could be dealt with separately by the State Governments, as they are at present, there is no reason why the two wings of the C.W. & P.C. should not be separated in the interests of better results, greater efficiency and more expedition. It is only in the fitness of things that, to meet the challenge of the future that our power problems are certain to pose under planned development, there should be an Electrical Engineer to head the requisite organisation, and this cannot always be ensured under the present set-up, although Electrical Engineers have headed the C.W. & P.C. at times in the past. The present incumbent, for instance, is a Civil Engineer of considerable repute, but, even so, it would be unfair to blame him if something goes wrong on the power front. The crux of the matter is, we can ill afford to let anything go wrong on this front, especially after the bitter lessons we have learned at such considerable cost from past mistakes. This is what prompts me to urge, as the F.E. U.I. has done, that all efforts should be made to create a Central Power Commission dedicated to ensure accelerated power development in our country.

Foundations of Fine Chemicals Industry Laid

ON the export front, we are today verily like the drowning man catching at a straw. Situated as we are, we are not prepared to let go any chance. No avenue, even if it be only remotely promising, is allowed to remain unexplored. Strange as it may seem, it is such seemingly unassuming avenues that often tend to spring pleasant surprises on us. Whoever thought, for example — even as late as 1958, when our Planning Commission drew up "Programmes of Industrial Development: 1956-61" — that India would be an exporter of beta-ionone, the starting material in the manufacture of Vitamin A? We were then still talking of producing Vitamin A. The precise position about three years ago was, to quote the Planning Commission: "A proposal to produce Vitamin A from lemon grass oil, the supplies of which are plentiful in Travancore-Cochin, is also under consideration of the Central Government." Perhaps, the proposal referred to was that of Glaxo Laboratories (India) Private Ltd., who initiated, in that year (1958), two proposals, both involving basic manufacture, one for a Milk Drying Factory at Aligarh, in Uttar Pradesh, and another for a Fine Chemical Factory at Thana, in the State of Maharashtra.

As between the two propositions, one would naturally attach greater importance to the second, because with it, one may say, has started the foundation of a Fine Chemical Industry in India. But the importance of the first cannot be minimised either. For, apart from being the source of supply of the popular brands of quality childrens' food — Ostermilk and Glaxo — which takes care of the health and growth of new generations, it has already resulted in a saving in foreign exchange, we are told, to the tune of Rs. 40 lakhs annually. Surely a saver of foreign exchange is as valuable to our country today as any that earns foreign exchange. The time may not be far distant when Glaxo Laboratories may figure not only as savers of foreign exchange by manufacturing Glaxo and Ostermilk for this country's consumption, but also as earners of foreign exchange for India by exporting these well-known chillrens' food to neighbouring countries (subject, of course, to any territorial or regional marketing agreements with their principals in the U.K.). But, in the case of Vitamin A or, to be more precise, of beta-ionone, Glaxo Laboratories are already not only saving but also earning foreign exchange for us. This is why one is tempted to attach more importance to this fine chemical project. Moreover — and this is an additional reason — the new factory, which has already successfully experimented on the manufacture of Vitamin A from lemon grass oil, was formally inaugurated early last week — on January 9, 1962 — by Maharashtra's Chief Minister Chavan.

Although the importance of lemon grass was recognised long ago — at any rate since its use as a base for essential oils came to be known — it is a pity that reliable statistics of lemon grass production in the country are not available. Even the Commerce and Industry Ministry has only this to say: the production of lemon grass oil in 1959 was 1,067 metric tonnes and that it was about the same figure in 1960 also. Fortunately, we have figures of exports of lemon grass oil for the past three years. These, together with their value, are as follows:

LEMON GRASS OIL EXPORTS

Year	Quantity (in lbs.)	Value
1958 ..	27,76,572	Rs. 103,54,137
1959 ..	20,45,856	„ 88,96,860
1960 ..	21,68,804	„ 165,39,569

On the basis of these figures, it would appear that the internal consumption of lemon grass oil is still around three lakh pounds, or about 13 per cent of our total exports — not production. While lemon grass oil is no doubt a good foreign exchange earner, sound economic considerations demand that, as far as possible and as far as practicable, we should try to process the oil within the country and export the processed products, such as, for example, beta-ionone and Vitamin A. By so doing, we would not only have contributed to the building up of an important industry but would also create a new avenue of employment to the young men of this country.

It is for these considerations that the new enterprise of Glaxo Laboratories deserves to be welcomed. It is estimated that Vitamin A being manufactured by the Glaxo Laboratories today results in a saving of Rs. 16 lakhs per annum of valuable foreign exchange. To this must be added a further 10 lakhs of rupees, which is the amount realised by the export of 15 tons of beta-ionone out of the 50 tons which Glaxo Laboratories are now manufacturing.

Considering the demand for Vitamin A in this country, what the Glaxo Laboratories are producing is a drop in the ocean. The consumption of Vitamin A by the vanaspati industry alone is around 4,000 kgm. or 8,800 lbs., but this is likely to go up appreciably with the increase in the consumption of vanaspati. There are other uses also to which Vitamin A is put. All this goes to underline the fact that there still remains a vast field to be exploited if this country is to become self-sufficient with regard to its needs of Vitamin A. In other words, the enormous scope for any enterprise seeking to engage itself in the production of Vitamin A is quite obvious. But, before anyone can be made to interest oneself in this line, it behoves Government of India, more particularly the Kerala Government in this case, to take a greater interest in the production of lemon grass and place its cultivation on sound and scientific lines. It does not redound to the credit of the Kerala Government that, even after 14 years of independence, it has not done enough to exploit the potentialities of this particular cash crop. And the surprise is that lemon grass cultivation is essentially a cottage industry, every unit of which, the powers-that-be proclaim, is receiving maximum encouragement.

Similarly, if the maximum advantage is to be taken of another line of production of Glaxo Laboratories, which bids fair to yield (when the full capacity of the

concerned plant is commissioned) a further Rs. 14 lakhs of foregin exchange per year, the authorities have to bestir themselves and devote some attention to the cultivation of sisal, the values of which have so far been left to be sung only by people like Mr. J. K. Sircar, the noted fibre expert of this country. It is from the juice of sisal, we are told, that we get hecogenin, a natural product from which corticosteroids are manufactured. To a layman, the term Corticosteroid may not mean anything, unless he is told that it is one form of this product, namely Cortisone, that has ere now proved itself to be effective cure for Rheumatic Arthristis.

All these compounds — except Vitamin A — thanks to Glaxo Laboratories, are now being made in this country for the first time. This, however, is still only the beginning and the entire gamut of the industry remains there just awaiting to be explored, provided the powers-that-be also make up their minds to make their contribution without any mental reservations. Meanwhile, all glory to those who have made a beginning in the face of so many odds and obstacles. Incidentally, Glaxo Laboratories have traversed the same path as many a reputed British firm has done in the past, namely to begin as a sales agency and then take to manufacturing of the same products which used to be imported by it before. Perhaps this is one of the many visible forms in which the fruits of Independence tend to manifest themselves.

Business Notes

Scrap Exports

PLEA FOR REMOVAL OF CONTROLS

FOLLOWING THE lifting of restrictions in 1957, scrap exports shot up from 2,000 tons in that year to as much as 70,000 tons in 1960 and amounted to 50,000 tons in the first half of 1961. But, with the imposition of the curbs again in the later half of last year, the trend was reversed, with the result that exports have shown a visible sign of decline. It is noteworthy, however, that, despite several handicaps during the last five years (of which lifting and imposing of controls too frequently as above is just one) scrap exports aggregated Rs. 20 crores, but these would have doubled but for the policies of the Government, it is believed by the interests concerned, and there would appear to be very good grounds for such a belief.

The worries and vicissitudes of the scrap interests are the outcome of the unimaginative and unrealistic policies of the powers-that-be, according to Mr. Sultan A. Nathani, President, Scrap Traders' and Exporters' Association, (S.T.E.A.), who dwelt at length on this subject at the Association's annual meeting, recently, in Bombay. He contended that the argument that scrap exports had been curtailed only to overcome the billet shortage in the country would not hold currency, as the facts showed otherwise. Indeed, there could have been no billet shortage, if, as he said, the total domestic scrap melting amounted to one and half lakh tons per year and, that throughout the year, no domestic capacity ever remained idle. The imposition of a ban on export of scrap to augment billet supplies could have been justified, he went on to say, had domestic consumers the capacity to melt it. But this was not the case. Mr. Nathani's own explanation for the billet shortage, which seems to have become a permanent feature these days, on the other hand, was that it had resulted from breakdown in the steel plants. Moreover, No. 2, 2a, 3 bundles have no domestic users, according to Mr. Nathani. He felt the imposition of the ban on the export of these must have been the result of some misconception on the part of the authorities; perhaps it might also have been motivated by the desire for fuller utilisation of the surplus scrap within the country, thereby helping to conserve the physical resources of the country.

Referring to the question of price control, the S.T.E.A. Chief recalled the Saxena Committee Report (1956) which had recommended the decontrol of scrap prices, but this had not so far been implemented. On the other hand, the controls had been continued which had forced down the prices to a new low, a level at which collection of scrap at an economic rate would be impossible.

Speaking on the occasion, Mr. R. G. Saraiya, Hon. Export Promotion Adviser, observed that the case of the scrap exporters had been very ably put forward by them before the Scrap Enquiry Committee appointed by the Government of India and also, in his speech, by the President of the Association. He, however, disclosed that the final decision in regard to scrap policy would rest not with the Ministry of Commerce and Industry, but primarily with the Ministry of Steel, Mines and Fuel. All the same, Mr. Saraiya was of the view that as much of the scrap should be utilised in India as can be economically done, the balance being exported with as few hindrances and restrictions of a policy or procedural nature as possible. The price settled for scrap should not be too low, he cautioned, as that would drive scrap underground to gather dust and rust and ultimately to deteriorate and perish, nor should it be so high as to encourage the collection of man-hole covers, balconies, gates and so on, he said. Generally speaking Mr. Saraiya seemed to appreciate the complexity of the scrap trade, particularly in view of the many types of scrap, many types of prices, control on prices and the apparently unrealistic rates, as also the obligation to deliver heavy scrap as a pre-condition to allow export of unwanted scrap, and expressed the hope that the Scrap Enquiry Committee would recommend realistic rates, simplified procedures, and reduction of controls.

Foreign Trade

EXPORT INCENTIVES HAVE FAILED

THE EXPORT performance of textiles, tea, and jute, the acknowledged standard-bearers in the march of our export trade, has not only failed to come up to the level of the increasing needs of the country, but, unfortunately, a contrary trend has become discernible in the exports of these items. Thus, textile exports have declined from Rs. 64.14 crores in 1959-60 to Rs. 57.64 crores—a decline of seven crores; tea exports, in spite of higher production, have declined by about Rs. 6 crores over the same period, while jute has suffered owing no doubt to a great fall in raw jute supply. Even vegetable oil exports have declined from Rs. 14.80 crores in 1959-60 to Rs. 8.50 crores in 1960-61.

This is the dismal and disturbing picture that Mr. Chinoobhai C. Javeri unfolded to the six-monthly general meeting of the All India Exporters' Chamber, (A.I.E.C.), a few days ago, at Bombay, in his presidential address. What is tragic, according to him, is that it is not so much the foreign competition from which these exports have suffered as they have from "lack of proper approach that clogs the wheels of our export drive." Mr. Javeri's thesis appears to be that the export incentives, which are solely or largely granted to manufacturers in boosting up exports, have not yielded results, because, he alleged, these manufacturers become indifferent towards exports the moment that the local market appears to be more remunerative. Mr. Javeri, therefore, called for a complete review of these so-called incentive schemes. In fact, he wanted a reorientation of the entire export policy in general.

Referring to the problem of price disadvantage the A.I.E.C. President pointed out how Indian exporters have so far failed to get greater margins of profits 'vis-a-vis' their foreign counter-parts because of the price disadvantage which has stalled them on every front in competition with Japan, Hongkong, China, Ceylon, and Pakistan, especially in our traditional export commodities. Here, again, Mr. Javeri felt the situation warranted a thorough examination of the cost structure of all export commodities and so urged the appointment of a special committee to go into this matter.

According to the Government's policy of favouring the State Trading Corporation more and more, Mr. Javeri was afraid that the future of export/import trade through private channels would be anything but bright. In the light of the new policy of the Government, he said, there appeared to be little or no future for the small and the medium categories of exporters. The S.T.C. had come to be a danger to both the export and the import trade. Even the criticism levelled against this body by the Estimates Committee of the Lok Sabha had been rejected and its achievements had been extolled as spectacular. "It should, however, not be forgotten", he noted "that the facilities and favours given to the S.T.C. are not given to the private trade. In order to assess the real efficiency of anybody, the conditions of work and competition should be the same." This is only asking for the moon, after our experience of what has happened in the field of industry since the parallel ownership of industry became a feature of this country's economic policy.

Referring to the most-debated problem in the world today of the U.K's entry into the European Common Market (E.C.M.), Mr. Javeri observed that, beyond doubt, the growth of such manmoth organisations out of the pale of the G.A.T.T. would pose a problem, and that, in any case, such monopolitic trade blocs by the advanced countries did not augur well for the future of developing countries. When considered opinion even in the U.S. regards Britain's proposed entry into the E.C.M. as a problem with serious import, India cannot afford to be complacent, as he said, with her export promotion drive any more.

New Issues

KHANDELWAL UDYOG

THREE INDUSTRIAL concerns are going in for public subscriptions this week to raise capital for their expansion programmes.

Messrs. Khandelwal Udyog Limited are entering the market to raise capital to the tune of Rs. 39.7 lakhs in the form of 19,700 equity shares (of Rs. 100 each) and 20,000 10 per cent (free of company's tax, but subject to deduction of tax at source) redeemable cumulative preference shares (also of Rs. 100 each). The lists open on January 19 and close on January 25 or earlier at the discretion of the Directors, but not before January 22. This issue, if fully subscribed, will raise the issued capital of the company to Rs. 60.02 lakhs, out of an authorised capital of Rs. 1.5 crores, consisting of 1,00,000 equity shares and 50,000 redeemable cumulative preference shares. Capital worth Rs. 20.32 lakhs, all in equity shares, has already been subscribed by, or reserved for allotment to, the promoters, directors, their friends and associates. The Industrial Finance Corporation of India and the Life Insurance Corporation have underwritten 15,000 and 5,000 preference shares respectively. No underwriting has been arranged for the equity capital as the Managing Agents, Messrs. Khandelwal Industries Private Limited, have themselves agreed to subscribe or procure subscription for the shortfall, if any, between the amount offered for subscription and the amount of applications received in response to the offer.

Khandelwal Udyog has been engaged in steel fabrication business since 1956 as a private limited company. It was converted into a public limited company in January, 1960, with a view to expand and diversify its activities.

The proceeds of the new issue, along with the capital already subscribed or promised to be subscribed by the promotors, directors, their friends and associates, will be utilised not only for expanding the existing business of steel fabrication and manufacture of concrete mixers, but also for embarking upon certain new lines of production, among which are included manufacture of asphalt mixers, roller pan mixers, electrical overhead travelling cranes (upto 20 tons capacity) and electric and combustion industrial furnaces, ovens etc.

The steel fabrication capacity of the company is envisaged to be doubled from 3,600 tons of steel structures per annum to 7,200 per annum. Technical collaboration for this job has been arranged with Les Etablisements Eiffel, one of the world's leading construction companies, who has built, amongst other structures, the famous "EIFFEL TOWER" in Paris. Included in this technical arrangement is also the construction of "EIFFEL STANDARD BRIDGES" which owing to their low erection and maintenance costs, have been very successfully used all over the world, particularly in the under-developed countries. Technical collaboration for the manufacture of construction machinery (concrete mixers, asphalt mixers and roller pan mixers) has been arranged with Millar's Machinery Co. Ltd., London. Technical know-how for the manufacture of E.O.T. cranes has been secured from the well-known "Munck-Hamjern" Group, Norway. Industrial furnaces and ovens will be produced in collaboration with Messrs. S.P.A. Ing. F. Ferre and Co., of Milan (Italy). When all the schemes under contemplation are completed, the company is expected to have a turnover of Rs. 100 lakh to 150 lakhs per annum.

In view of the rapid industrial expansion that is envisaged under the Third Five-Year Plan, the products of Khandelwal Udyog should have a ready market. The proposed issue can, therefore be expected to be fully subscribed.

SESHASAYEE INDUSTRIES

MESSRS. SESHASAYEE INDUSTRIES LIMITED are offering for public subscription, at par 4,00,000 equity shares of Rs. 10 each. The list opens on January 24 and will close on January 31 or earlier as soon as the subscriptions approximating to the amount issued are received, but not before January 27. The issue, if fully subscribed, will raise the issued and subscribed capital of the company to Rs. 80 lakhs, out of an authorised capital of Rs. one crore, consisting of 7,20,000 equity share (of Rs. 10 each) and 2,80,000 6¼ per cent cumulative tax-free preference shares (also of Rs. 10 each). The new issue is fully underwritten (the Life Insurance Corporation has underwritten 25 per cent of it) and will rank for dividend and be in all respects pari passu with the existing equity shares of the company.

Of the new issue, preferential allotment to the tune of shares of the face value of Rs. 10 lakhs is to be made in favour of the Life Insurance Corporation, to the extent of shares of the face value of Rs. 2.50 lakhs in favour of the New India Assurance Company and to the extent of a similar amount in favour of the Investment Corporation of India. The Life Insurance Corporation is to be accorded preferential treatment in view of its having underwritten these shares. The New India

Assurance Company and the Investment Corporation of India have agreed to take up the shares envisaged to be allotted to them.

The proceeds of the issue are to be utilised for financing the expansion programme of the company, (to the extent of 60 per cent, the remaining 40 per cent finance will come from borrowings) which envisages stepping up of production of electrical insulators from 1,200 tons to 3,000 tons per annum. The company has been engaged in the manufacture of these insulators since early 1961 and has effected deliveries of high-tension and low-tension insulators and hardware components to several State Electricity Boards and private undertakings against orders received and according to specifications required.

The plant and machinery for the expansion programme is to be imported from West Germany. Orders have already been placed for this after getting the necessary permission from the Government. Technical assistance is being received from Dr. Ing. K. Draeger of Honef, West Germany. The technical consultant will be providing personnel for erection of the new machinery and shall arrange training facilities for a team of Seshasayee Industries' engineers and technicians in one of his associated factories—Rhein Westfallische Isolatern Werke—at Siegburg, West Germany.

In view of the ambitious programme drawn up under the Third Plan for development of electric power and the railways going in for electrification, little difficulty should be encountered by Seshasayee Industries in marketing of its insulators. The proposed issue, therefore, should have a good response from the investing public.

SPECIALITY PAPERS

ANOTHER COMPANY, Speciality Papers Limited, is expected to go in for public subscription probably next week, to raise capital to the tune of Rs. 10 lakhs in the form of 1,00,000 shares of Rs. 10 each. This company is setting up a plant at Udavada, nearly 120 miles by road from Bombay between Vapi and Bulsar (in Gujarat), to manufacture a wide range of speciality papers such as tracing papers, tissue papers (including electrical, industrial and commercial), all varieties of impregnated paper and ammunition papers for high explosives. The total cost of the project is estimated at about Rs. 20 lakhs. The share capital will meet half of this cost the rest of the requirements are envisaged to be met through a loan of Rs. 5 lakhs from the Gujarat State Financial Corporation and some further loans, aggregating Rs. 5 lakhs, from the company's bankers.

Technical collaboration for the project has been arranged with Messrs. Escher Wyss, G.M.B.H., Ravensburg, West Germany, who will also supply the required machinery and equipment. The plant is expected to go into production during the current year itself. It will have an installed capacity of 3,000 tons per annum.

The company has simultaneously drawn up an ambitious expansion plan as well. This is expected to be completed by the middle of 1964. On the completion of the expansion plan, the company will be in a position to manufacture papers of any rigid specifications. Supply of machinery for the expansion programme is being negotiated with Messrs. Krauss-Maffei-Imperial G.M.B.H. & Co. The fixed assets of the company after the expansion is completed will be Rs. 35 to Rs. 40 lakhs.

Most of the varieties of paper proposed to be manufactured by Speciality Papers Limited are at present being imported. When their production starts at Udavada, it is estimated that foreign exchange to the tune of Rs. 20 lakhs a year would be saved. After completion of the expansion programme of the company, the saving may increase to Rs. 80 lakhs a year. Possibilities are also to be explored for the export of these papers to the neighbouring countries.

The new venture obviously marks a turning point in the paper industry in this country. It should go some way in solving the present difficulties arising out of inadequate availability of special type papers required for various industrial uses.

Coffee

RISING COSTS AND FALLING WORLD MARKET PRICES POSE SERIOUS PROBLEM

THE SPEECH of Mr. C. I. Machia, Chairman of the Consolidated Coffee Estates Ltd., at the 18th annual general meeting of the company, held recently, throws ample light on the travails through which the coffee industry in this country is passing today. Indian coffee industry's difficulties at the present juncture are the outcome of two factors: (1) falling world market prices; and (2) rising costs.

There has been an appreciable fall in the world market prices of coffee; since July 1960, the price of Plantation A coffee has gone down by approximately 20 per cent and that of Robusta Flats by even a slightly greater margin. This has necessitated export of Indian coffee at unremunerative prices, the loss having come to be spread over an almost stationary consumption in the domestic market. World prices are not expected to improve at least for some years, despite the International Coffee Agreement signed by the major coffee-producing countries of South America and Africa, with a view to regulate exports. Production in these countries is likely to stay at a high level in the face of none-too-rapidly expanding consumption. It is, therefore, necessary, as called for by Mr. Machia, to bestow some second thoughts on our coffee export policy.

The advice tendered by Mr. Machia in this regard is quite wholesome. The two conditions to improve our capacity to export more coffee are: (1) that the grower should be assured of such a return on his investments and from his labours that he would continue to be in business; and (2) that export drive should be realistically linked to create preferential acceptance for Indian coffee in the world market. So far as the first condition is concerned, it can be fulfilled if the loss on coffee exports is spread over a greater domestic consumption or alternatively the cost of production is reduced substantially. This calls for various measures such as reducing the burden of taxation on the industry and provision of aids to production at subsidised rates. Reduction in taxation can be achieved by scaling down the excise duty and agricultural income-tax or by levying the excise duty on ad volerum basis. Some relief can also be granted through a system of subsidy for making up partially the difference between the cost of production and the export price. A judicious use of all these four measures can well be adopted to obviate any undue heavy fall in the revenues of the State and the Central Governments from this source. So far as the second condition is concerned, the plea of Mr. Machia to ship abroad only superior quality coffee deserves acceptance. Superior coffee from India can fetch some premium in the world market. This can bring down the losses from exports to not an inconsiderable extent.

While the coffee industry, thus, deserves to be given some relief in taxation, both direct and indirect, it passes one's comprehension why its woes in Mysore State should be increased by the enactment of the Mysore Land Reforms Act. Some of the clauses of this Act, particularly those restricting the land that can be reserved for expansion of a coffee estate to 100 acres, irrespective of the size of the estate, and those relating to the ceiling of 18 standard acres on agricultural area interspersed in plantations, put serious limitations on the expansion of the industry which can lead to some economies resulting from large-scale operations. The act also fails to take into account some of the difficulties inherent in the working of large coffee estates which have water resources, required for labour, pulping and spraying, situated in the low-lying paddy fields enclosed in these estates. Surrender of such land under the Act to the State for being passed on to "outsiders" would create unnecessary complications for many coffee estates. Compared to similar legislations in Madras and Kerala, the Mysore Act appears to be rather more stringent and can have quite an adverse affect on the development of industry in the State. The Mysore Government will do well to look into the matter. Obviously, it is not in its interests to drive out or stagnate a well-established industry within its bounds.

Tea

HALTING GROWTH

IN A memorandum on taxation on tea submitted to the Finance Minister at the Tea Conference held recently in Shillong, the Tea Association made some important observations regarding the growth of tea industry, especially in Northern India, during the last ten years. It was observed that the period witnessed a halting growth and one major reason that led to this was the rising wages, which it was believed in Northern Indian gardens were always higher in comparison not merely with South Indian gardens but also with other tea producing countries. Moreover the number of persons employed per hectare in Northern Indian gardens were always more than in other tea producing countries. This was, perhaps, because the distribution of rainfall in this area was very uneven. Ceylon and certain other countries, were quite fortunate and had two rainy seasons. Moreover the Northern Indian gardens were comparatively distant from the ports which led to higher transportation costs.

One single factor which has led to the halting growth in tea industry has been perhaps the rising taxes. Northern India, the memorandum adds, has to bear more heavy excise duty together with Assam Road Tax and the West Bengal Entry Tax. In 1953-54, for instance, the total of export duty, excise duty and cess was 72.4nP. per kilogram. There was no road tax before 1953-54 and no entry tax before 1956-57. The total of all these taxes has now gone up to 112.18 nP. per kilogram. Secondly the revenue from this source has also increased. In 1953-54 the total revenue from excise and export duty was Rs. 13.17 crores and it touched in 1959-60 a figure of Rs. 20.03 crores, although the quantity of tea exported from India declined from 203.19 million kilograms to 195.11 million kilograms. In fact this has led to a rather slow increase in area under tea in Northern India during the last decade. The area under tea has increased only by 2.88 per cent while in some countries like Pakistan it has increase by 7 per cent and in African countries it has increased by several folds. The output has increased only by nearly 3.9 per cent. Thus it appears that the rising costs of production have definitely hampered the output. Under these conditions the recent interim relief of 15 nP. suggested by the Wage Board for Tea Plantations Industry to the workers in tea gardens in South India may be responsible for further hinderances in the way of increasing output in the industry. It is time that the whole question of costs was reviewed and a policy formulated to encourage the expansion of tea output in the country.

Trade

YUGOSLAV TRADE DELEGATION

THE VISIT last week of a Yugoslav trade delegation to this country led by Mr. Vidomir Krunic, Deputy Chairman of the Committee for Foreign Trade, has created great interest in view of the fast growing trade between India and Yugoslavia. While our exports to Yugoslavia have been mostly ores and scrap, and beverages such as tea and coffee, the list of imports shows base metals, machinery and transport equipment as the leading items. In view of expansion of the Common Market and its possible repercussions on India's foreign trade, it is necessary that India's channels of trade with other countries should be strengthened so that the initial shocks which India's trade might get because of U.K's entry into the Common Market may be successfully faced. A happy new development relates to the diversification of India's exports to Yugoslavia. In addition to iron and manganese ores and other traditional Indian exports of primary products, exports of Indian industry such as textiles, linoleum, pumps, chemicals and other industrial products have been made possible because of India's expanded trade with Yugoslavia.

It is instructive to tabulate here the various projects which are in the process of coming up through the assistance of Yugoslav companies.

1. Thermo Power plant, Barauni, 3x15 MW.
2. Gas grid and gas purification plant at Durgapur.
3. Salt lake reclamation, Calcutta.
4. 460t. over-head electric crane, Bakhra-Nangal.
5. Gates for Matatila Hydel Plant.
6. Hydro power plant, Joldhaka, 2x9 MW.
7. Ramagundam boiler 90 t/h.
8. Basin bridge boiler 70 t/h.
9. Cement plant Cherapunjee t/d.
10. Hydro power station, Sholayar, 3x18 MW.

The Indian Union has also bought three Yugoslav ships. Coupled with these trade relations stands the Yugoslav credit to India amounting to 190 million rupees. The expanding trade and credits relationship between the two countries clearly points out to still further expansion of trade relations in the coming years for the mutual benefits of the two countries.

FIRST MEETING OF D.I.C. BOARD

THE FIRST meeting of the Board of the Deposit Insurance Corporation, which commenced business on January 1, 1962, was held this week, in Bombay, in the Reserve Bank. Besides the Governor of the Reserve Bank who is the ex-officio Chairman of the Corporation, the Board consists of Mr. G. S. Diwan, Retired Lecturer in Acturial Science, Sydenham College, Bombay, Mr. S. N. Desai, President of the Institute of Chartered Accountants, Mr. M. V. Rangachari, Deputy Governor, Reserve Bank of India and Mr. A. Baksi, Joint Secretary to the Government of India, Ministry of Finance, Department of Economic Affairs, New Delhi.

The subjects considered by the Board at its first meeting were, as is only to be expected, more or less of a formal character. Even so, the fixation by it, (of course, with the approval of the Central Government) of the premium payable by insured banks at five 'naye paise' per year for every one hundred rupees of its deposits (or 1/20th of 1 per cent per annum) was an important decision. Among others, the Board considered the organisational set-up of the Corporation and the initial set of Regulations for the Corporation (that had been framed by the Reserve Bank) and also decided to prepare and issue a brief pamphlet setting out, in simple language, the functions of the Corporation and the manner in which they are to be carried out, in due course, in English and the regional languages in order to enable the general public to know and appreciate the protection afforded by the Corporation to the depositors of all banks.

FROM THE CAPITAL'S CORRIDORS

GATT ON TEXTILES

THE next session of the GATT which commences in Geneva on January 29 is scheduled to consider long-term plans for the textile industry. In this connection it will be of interest to record the main findings of the Committee Number Three of the GATT.

Quantitative Import Restrictions

One of the most serious barriers confronting the exports of less-developed countries has been identified by the Committee as being quantitative import restrictions. Exports from less-developed countries of such important products as vegetable seeds and oils, coffee, raw cotton, tobacco, tropical timber, manufactures of jute, of cotton and of coir, and sewing machines are often adversely affected by quantitative import restrictions which are sometimes applied in a discriminatory manner. The Committee notes that the less-developed countries, as a group, have not benefited significantly from the widely observed movement towards trade liberalization by industrialized countries as a result of their emergence from balance-of-payments difficulties. In certain instances industrialized countries, when proceeding with their programme of relaxation of import restrictions, have extended the removal of restrictions only to imports of raw materials while the products processed from these materials have continued to be subject to restrictions. The Committee notes with some concern that certain industrialized countries have liberalized trade on an area basis, while maintaining restrictions against other areas in which most of the less-developed countries are located. The maintenance of such restrictions by industrialised countries is a serious threat to the balanced expansion of exports of less-developed countries and to sound patterns of growth in the international economy; the maintenance of such restrictions does not only seriously affect export possibilities for less-developed countries, but also has the effect of concentrating imports in markets where goods can enter freely, thus sometimes contributing to strains on the capacity of these markets to absorb imports. Moreover, many of these restrictive measures, particularly discriminatory restrictions, are in clear contradiction with obligations of the importing countries under the General Agreement; a conscientious application of the General Agreement by all contracting parties will in itself go a long way towards removing many of the barriers at present still confronting exports from less-developed countries.

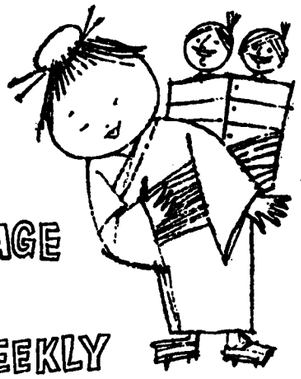
Tariffs

High tariffs and tariffs which differentiate disproportionately in favour of imports of raw materials, as compared to duties for processed goods, have also been identified as constituting serious barriers to exports from less-developed countries, particularly with respect to vegetable oils, coffee, tea, cocoa products, manufactures of jute, of cotton and coir, sports goods, aluminium, ferro-alloys and copper rollings, leather products, and certain other manufactured consumer goods. It has been found that a reduction of these barriers would be of considerable assistance to less-developed countries. In addition, it has been found that tariff preferences may cause significant diversions of trade.

Revenue Duties and Internal Fiscal Charges

High revenue duties and high fiscal charges have also been emphasized as major barriers to such important traditional exports from less-developed countries as coffee, tea, cocoa, and tobacco, and for some of the newer exports of manufactured consumer goods. In the case of coffee, tea and cocoa, these taxes apply only to imports from less-developed countries since there is no domestic production in the countries imposing the taxes. The incidence of revenue duties on these commodities is particularly heavy in various European countries. It is also emphasized that a reduction of these barriers would be of considerable assistance to less-developed countries in increasing export earnings from these commodities.

State Monopolies



The Committee has also found that the activities of restrictive state monopolies, whether in countries with centrally-planned or market economies, have an adverse effect on imports from less-developed countries of items such as coffee, cocoa, tea and tobacco, particularly where retail prices fixed for these products are very high in relation to import costs. It has been found that decisions, followed by action, by these monopolies and purchasing agencies in State-trading countries, to import larger amounts of these products and to provide liberal access to imports from less-developed countries, combined, if necessary, with significant reductions in internal prices, would make a considerable contribution to an expansion of the export earning capacity of less-developed countries.

The above list of obstacles to the expansion of trade of less-developed countries is by no means exhaustive. For example, a possible loss of trade opportunities for less-developed countries arises from the operation of price-support schemes, surplus disposal operations, and mixing regulations in some countries. Also, the Committee is well aware of the paramount importance of seeking a solution to the problem that exists as a result of price fluctuations in the field of commodity trade, but notes that this problem is being considered elsewhere. Nevertheless, the Committee retains a strong interest in this problem and has borne it in mind in its detailed deliberations and in the preparation of this report.

It is feared that attempts at the Conference might be made to divide the world into regions with a view to limiting exports of the chief exporting countries. Indian exports of cotton textiles are apparently being subjected to all sorts of restrictions. The reduced target of 850 million yards of cotton textiles valued at Rs. 67 crores as against the 1000 million yards mark originally estimated in the Second Plan is a reflection of the growing number of curbs being imposed by importing countries on Indian textiles. Besides, the restrictions imposed by traditional buyers in the West, there is another formidable competitor to reckon with by India in the South-East Asian markets and that is China which is not a member of GATT and as such will continue to dump its cotton textiles there.

FOREIGN COLLABORATION

One hundred and one foreign collaborations for setting up Industrial units in India were approved during three months, October-December 1961. The United Kingdom heads the list with thirty-four collaborations followed by the U.S.A. twenty-four, Japan nine, West Germany six, France and Switzerland five each, Italy four, East Germany and Denmark two each, Australia, Austria, Czechoslovakia, Netherlands and Finland one each.

IWT-AII. 2726

Following is the list of British firms, which have entered into colloborations for the manufacture of products shown set against each of them:

M|s. I.C.I. Limited.	Polyethylene.
„ Pyrotenax Limited.	Mineral insulated copper cables.
„ International Teeth Co.,	Consumable dental products.
„ Thomas and Sons (Rodley) Ltd., and M|s. John Smith (Keighley) Ltd.	Steel structurals and cranes.
„ Densfield Holdings Ltd.	Cop Loaders.
„ Formica International Ltd.	Laminates, including copper laminates.
„ Measuring Instruments (Pull in) Ltd.	Measuring instruments.
„ G. R. Herron & Son Ltd.	Wool tops.
„ Delta Metal Co. Ltd.	Non-ferrous metals seamless tubes.
„ Pye Ltd.	Transistors.
„ The Villiers Engg. Co. Ltd.	Villiers engines for industrial, agricultural and other applications.
„ Constructional Engg. Co. Ltd.	Malleable casting.
„ The Mond Nickel Co. Ltd.	S. G. Iron castings.
„ Vokes-Cardwell Ltd.,	Tobacco machines.
„ Streamline Filters Ltd.,	Special types of Filters.
„ M. S. S. Recording Co.	Magnetic tapes for tape recorders.
„ Dexion Ltd.	Slotted angles.
„ L. Dennis and Co. Ltd.	Magenta dyestuffs.
„ Midland Electric Mfg. Co. Ltd.,	Electric motor starters and swi ch gears.
„ Fellows Bros. Ltd.	Electric Overhead Travelling Cranes, Electric Hoists and Chain Pulley Blocks
„ Newall Engg. Co. Ltd.	Grinders.
„ Robert Jowitt & Sons, Ltd.	Wool tops.
„ Mather and Platt Ltd.	Stenter clips.
„ Joseph Sankey and Sons Ltd.	Automobile Wheels.
„ James Finlay and Co. Ltd.	Formation of Tea Packing Co. in India.
„ Johnson and Phillips Ltd.	Cables, switchgears & power factors capacitors.
„ Ranco Ltd.	Rotor|stator units used for sealed unit compressors for domestic refrigerators.
„ U. G. I. (Meters) Ltd.	Domestic gas meters.
„ Harry W. Dietert Co., USA. and M|s. Ridsdale and Co. Ltd., Yorkshire.	Sand testing equipment.
„ Wolf Electric Tools Ltd.	Portable Electric tools.
„ Merley Electrical Engg. Co. Ltd.	Complete Colliery Haulages.
„ South Eastern Tar Distillers Ltd.	Coal tar enamels and primers.
„ Associated Electrical Industries Ltd.,	Electric watthour. meters.
„ A. E. I. Lamp and Lighting Co. Ltd.,	Flourescent tubes and miniature lamps.
„ Shieldrop and Co. Ltd.	Oil Burners.

BHILAI STEEL

Radio-active isotopes are now being used in the Bhilai steel works for controlling various production processes. A laboratory equipped with uptodate equipment and instruments dealing with radio-active isotopes is functioning at the plant. The work with isotopes is carried out with mechanical and pneumatic manipulators enabling the persons to control the process from a safe distance. The isotopes for the present are being used to control the level of charging the bins in the Sintering Plant and control the level of liquid in closed tanks in the coke ovens and bye-product plants. These are also being used to control the searing off the roofs of the open hearth furnaces and mixture lining and in controlling the quality of welding in important steel structurals.

It is planned to use the isotopes for other purposes, such as to control the speed of movement of the charge in the blast furnaces and in the cupolas of the foundry, etc.

COAL INDUSTRY

A two-day session of the conference of representatives of Coal Mine-owners' Organisations was held in Delhi during the week to discuss the problems facing the coal industry. The representatives of the coal industry, it is learnt, claimed that while labour, export promotion and agriculture needed incentives to increase productivity or promote exports, they alone had been selected to produce coal even at a loss. It was demanded by the industry that the coal prices should be raised by at least Rs. 3.5 per ton to enable it to meet the rising cost of production. The Government it is reported asked for the data to substantiate the claim for higher prices for coal.

The conference also discussed the problems of power, transport shortages and inadequacy of explosives. It was pointed out that the coal production during twelve months ending March 1961 was of the order of 55.5 million tons and that production for 1961-62, according to present trends, may not therefore exceed this figure. During the first six months of the Third Plan, daily loadings of coal on all-India basis were 5,997 wagons and 1,186 short of the assessed demand. The Railways, it is learnt has indicated that the maximum number of wagons they could make available during 1962 would be less than 7,000 a day. Power position was even worse than transport. According to estimates, due to power shortage, coal production may not be stepped up beyond 1962 level till new units went into generation in 1964.

COAL MOVEMENT

The State-owned shipping corporation has already chartered three tramp ships and is planning to charter four more for the carriage of coal by sea. The coal will be carried at the existing rates, the corporation bearing the losses, if any.

In regard to carriage of coal by road the Government of India has indicated to the States that it would be prepared to advance loans for strengthening and widening of roads and bridges. The Railways have agreed to go into partnership with State Road Transport Companies, taking up as much as 25 per cent of equity capital. The Railways will also leave goods traffic to road transport within a radius of 50 miles of a town.

RAILWAY SHED ACCOMMODATION

The shed accommodation on Indian Railways will be increased by one million sq. ft. to provide warehousing facilities for general merchandise. The decision follows the enforcement from January 1, of the Indian Railways Amendment Act.. The Act lays down

that, after the period of transit, which includes the period allowed free of demurrage and wharfage, the Railways will extend warehousing facilities for general merchandise for a maximum period of 30 days. During this period, the responsibility of the Railways will be that of a bailee, under the Indian Contract Act. The warehousing facilities, however, will not be available for livestock, explosives and other dangerous goods carried by the Railways. The amended Act sets at rest the controversy about the responsibilities of the Railways for the goods after the expiry of free time at destination. There had been a consistent demand from the trade that the Railways' responsibility should not cease with the expiry of the transit period which included the time allowed free of wharfage and demurrage, as was the case hitherto.

RAW WOOL IMPORTS

Seaborne imports of raw wool rose further in the second quarter of 1961 to 2½ million lb, actual weight, which was 78 per cent higher than in the second quarter of last year. The cumulative total for the first six months of the year came to 4½ million lb. or 60 per cent above the corresponding 1960 total. This included a 62 per cent increase in receipts from Australia to 3.1 million lb, but those from New Zealand fell. Tops imports rose between the first and second quarters and amounted to 4.7 million lb, or a rise of 38 per cent. The January-June total, at 8.2 million lb, was 9 per cent higher than a year ago. Imports from Japan rose five fold to 2.2 million lb. and those from Australia were 30 per cent larger at 2.5 million lb. By contrast, imports from the United Kingdom fell by 38 per cent to 3.1 million lb. Yarn imports during the second quarter came to 35,000 lb. little changed from either a quarter or a year earlier, while the six months' total amounted to 68,000 lb. or half the previous year's figure. Receipts of wool fabrics during the same six months were 34 per cent down at 82,000 linear yards.

SHODDY PLANT

A new public limited company by the name of Modella Woollens Ltd. has been promoted to make shoddy yarn and wool tops in India. The company has already entered into financial and technical collaboration with Messrs. Robt. Jowitt and Sons Ltd. of the United Kingdom. Equity shares of Rs. 10 each will be sold in the market to raise a capital of Rs. 5.5 lakhs from the public. The shoddy plant is already in production and the wool combing plant is expected to start production by April|May 1962. The production capacity of this plant is 1.5 million lb. The company will have foreign exchange worth Rs. 13.3 lakhs by issuing equity shares to their foreign collaborators. This amount will be used to meet the future foreign exchange requirements of the company for expansion or any other purpose. For the combing machinery M|s. Kanshi Ram Kidar Nath, the promoters, have arranged to make deferred payment.

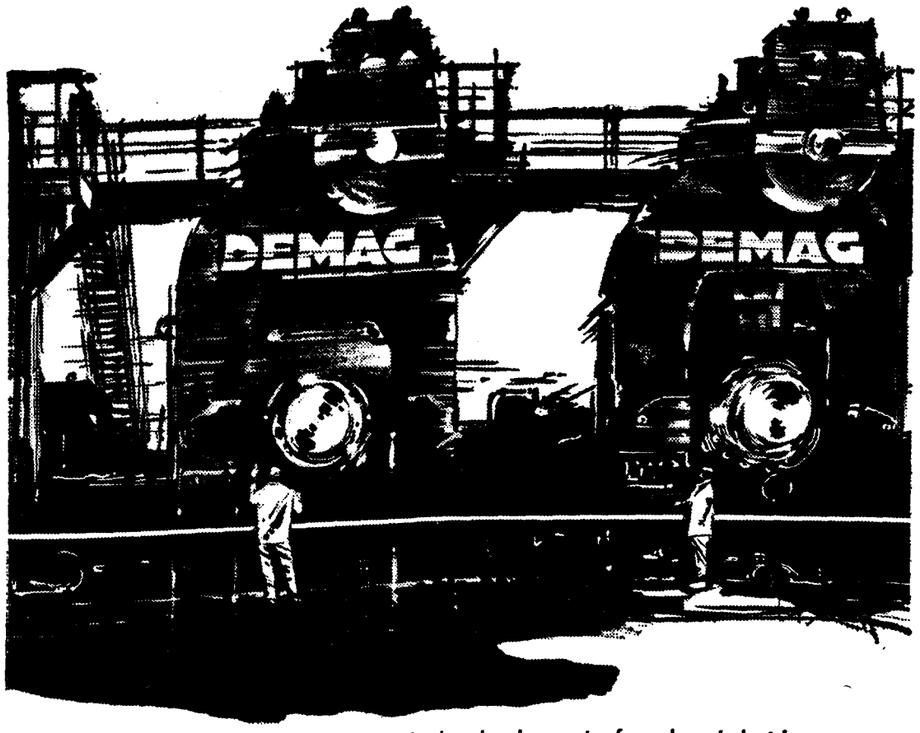
INDO-YUGOSLAV TRADE TALKS

Trade talks between Yugoslavia and India began in Delhi during the week to finalise trade arrangement for 1962. The Yugoslav Delegation, led by Mr. V. Krunic, Deputy Chairman of the Committee for Foreign Trade, met Mr. B. N. Adarkar, Joint Secretary, Ministry of Commerce and Industry. The two delegations will also review the development of trade between the two countries over the last few years. At present, there is a three-year trade agreement between India and Yugoslavia, which was signed on January 21, 1960. Under the terms of this agreement, trade will be on a balanced basis and payments between the two countries will be regulated through non-convertible Indian rupees.

U.N. SPECIAL FUND ALLOCATION

The Governing Council of the U.N. Special Fund during the week announced the allocation of 2,025,000 dollars for three projects in India. They are the National Institute for Training in Industrial Engineering, Bombay, the Central Instructor Training Institute, Hyderabad, and the Rajasthan Sheep and Wool Institute.

The allocation for the National Institute for Training in Industrial Engineering, Bombay, which will be an autonomous body amounts to 669,000 dollars with the Government of India's counterpart contribution of 1,620,000 dollars. The institute will train managerial staff for industries in the various fields of industrial engineering. The International Labour Organisation will act as the executing agency.



The allocation for the Central Instructor Training Institute, Hyderabad, will be 612,000 dollars as against the Government's counterpart contribution equivalent to 1,690,000 dollars. The Institute will give training for the industrial trades in metal working, electricity and buildings construction.

The allocation for the Rajasthan Sheep and Wool Institute will be 744,000 dollars. This will assist in establishing an institute to improve the productivity of sheep and the quantity and quality of wool products. Government of India's contribution to the project will be of the equivalent of 4,272,000 dollars. The project, spread over a period of five years, will be executed by the Food and Agriculture Organisation. The Institute will be set up at Malapura, a few miles from Jaipur.

COLOMBO PLAN PROGRESS

According to the Tenth Annual Report of the Colombo Plan Consultative Committee the total value of external assistance directed to the countries of South and South Asia since the inception of the Colombo Plan in 1950 to the end of June 1961 amounted to over $10,000 million (£ 3571.5 million). During this ten year period 26,373 trainees learnt new skills or attained higher standards of efficiency in skills previously learnt and 5,755 experts visited the region to perform a wide variety of highly technical tasks. In the year 1960-61 alone external assistance of the value of $1,500 million (£535.7 million) came into South and South-East Asia; 4,417 men and women received training and 786 experts visited the region. The development expenditure incurred by the countries of South and South-East Asia increased from £1,187.9 million in 1957-58 to £1724.9 million in 1959-60 and £2017.6 million in 1960-61. From a total of about £650.2 million in 1954-55 the development expenditure incurred by countries in the region increased by £1367.4 million, over 200 per cent, in a period of six years.

A distinctive feature of Colombo Plan Co-operation is the growth of mutual assistance within the region. Of the thirteen countries which provided training facilities during 1960-61 to their Colombo Plan partners, India with 266 awards comes fifth after U.S.A. (2356), U.K. (623), Australia (446) and Japan (305). In the matter of the supply of experts India (135) comes next after U.S.A. (369). India has provided both capital aid and technical assistance to fellow member countries. India's assistance to Nepal during 1959-60 was of the value of Rs. 180 million and during 1960-61 over Rs. 21 million. In addition four new agreements were signed providing for Rs. 13 million to continue aid in various fields. Since the inception of the Colombo Plan, India has provided training to 1694 nominees of different countries. Other countries in the region which have provided training are Burma (16), Ceylon (65), Indonesia (17), Federation of Malaya (30), Pakistan (116), Philippines (14), Singapore (39) and Thailand (10).

PARTNERSHIP WITH INDIA

Through the development of modern industries, countries with ancient civilisations are experiencing a new heyday. DEMAG helps to create the technical facilities for this development. Rourkela is a fine example of this. We help to explore material resources and construct loading and handling installations. We design and make machines, equipment, and plant both for India's iron and steel producing industries, and processing industries. Our deliveries included wide-strip, blooming, billet, and section mills, O.H. furnaces, cranes, hydraulic installations, and bay structurs. DEMAG's equipment is operating in more than 100 countries to contribute towards the world's industrialisation.

INDMAG PRIVATE LTD. Esplanade House, Woudby Road, POB 10012, Bombay 1

DEMAG AKTIENGESELLSCHAFT DUISBURG GERMANY

Technical Assistance under the Colombo Plan continues to play a vital part in the economic development of the area. It takes three forms—the provision of training facilities, the supply of the services of experts and the grant of equipment. Since the inception of the Colombo Plan the total expenditure on technical assistance has amounted to over £66.6 million. In 1960-61, the total cost was £20.2 million of which about £5.83 million was spent on the provision of training, £8.67 million on the supply of experts and £5.67 million on equipment. By far the greater part of the assistance under Colombo Plan comes from the six member countries outside the area—Australia, Canada, Japan, New Zealand, United Kingdom and United States. The International Bank for Reconstruction and Development (World Bank) is another important source of economic aid to the countries of South & South-East Asia. Up to June 1961, the Bank made available over $1,100 million to member countries in the region. About $180 million out of this amount was provided during the last year. The International Development Association, an I.B.R.D. affiliate which came into being in 1960 provided $60 million in the course of the year.

Discussing the "task ahead" the Report concludes that the vicious circle of low production, low income, low savings and therefore low production has to some extent been broken. But the task has proved to be even more formidable than was expected in 1950. Population growth has been far more rapid than was estimated. According to 1950 estimates the population of the region was expected to reach the 720 million mark by 1970. In fact it had passed this level by 1960. The Governments of the region have to continue to take resolute action to improve the living standards of their people. There also remains a challenge to the more developed countries, within the limits of their resources, to help the less developed countries to help themselves.

BRIEFS

It is learnt that the Government of India has approved the Kiloskar-Cummins Project for the manufacture of Diesel Engines of a certain range. The U.S. collaborator will have fifty per cent of the equity capital of Rs. 1.5 crores and will have 2.5 per cent technical assistance fee. The proposed company hopes to build up an export target of Rs. 60 lakhs a year to pay for components in the initial years.

*

The Government of India has agreed to advance a loan of Rs. 20 crores to Jayanti Shipping Company on three basic conditions, it is learnt. Firstly, all the ships shall be registered in India. Secondly, they will be mortgaged to the Government of India till such time as the loans were fully paid. Lastly, the Company will be a public limited liability company.

*

The Central Leather Research Institute, Madras, run by the Council of Scientific and Industrial Research has initiated a programme of exchange of technical personnel of the Institute with those of Industry. Under this programme, the organisations connected with the Leather Industry will depute a suitable senior person to the Institute as "Guest Worker" for a period of about six to eight weeks, to get acquainted with the investigations carried out in the various departments of the Institute and also to work on problems of special interest to Industry. In exchange a member of the senior research staff of the Institute will be deputed to work in this organisation during this period.

*

The State Trading Corporation of India will shortly commence the stocking of seedlac from the Katki crop at their godowns in four principal lac-producing centres—at Gondia, Balrampur, Daltonganj and Ranchi. The centre at Gondia will start functioning in a few days, while at the other centres, the purchases will be organised shortly. The stocks assembled at these mofussil centres will later be moved to Calcutta after suitable checking. The Corporation has secured facilities for storage there, pending sale to the shippers. The organisation of these purchase centres has been undertaken in pursuance of a 4-point programme announced in October 1961 for stabilising the purchase and export prices of lac.

*

At their last meeting the Committee of the Indian Jute Mills' Association reviewed the market situation in the light of the stocks of manufactured goods at the end of December and have decided that, as a temporary measure to relieve the continuing shortage of ready goods, the mills should continue to be allowed to operate the additional 2½ per cent of the looms unsealed from 13th November, 1961, and also the further 2½ per cent unsealed since 1st January, 1962, for a further period of two months until the end of March, 1962.

*

The third Blast Furnace of the Rourkela Steel Plant was blown in recently. Speaking on the occasion, Mr. S. T. Raja, General Manager, said, "the three Blast Furnaces at Rourkela have been named as 'Parvati', 'Lakshmi' and 'Saraswati' and now that all the three were in operation let us hope that the three godesses of wealth, knowledge and love will shower their blessings on us."

BOOK REVIEWS

OUR NEW RULERS

Our New Rulers: By "Vighneswara" (N. Raghunathan): Publishers: B. G. Paul & Co., 4, Francis Joseph Street, Madras-1: Pp. xvi + 396: Popular Edition Rs. 5: Library Edition Rs. 6: 1961.

This is the second in the series "Sotto Voce" papers, the first having appeared in 1959. The author had served on the editorial staff of the 'Hindu', Madras, for more than 30 years — until his retirement in 1957 as its Chief Assistant Editor. As such, the papers bear the stamp of an experienced and astute journalist.

The volume is a collection of nearly 200 short articles which had appeared in the weekly 'Swatantra' between February 1949 and August 1952. It was during this period that the Indian Constitution was formed, followed soon after by the passing of the highly controversial First Amendment Act. The first general elections in free India under adult franchise were also held towards the end of this period. While many of the articles in the present series naturally revolve round these events, the centre of the stage is occupied by the shift in Congress policy towards Socialism (or to be more precise, Statism) and the implications thereof. Naturally, Mr. Nehru also comes under fire and so do many of his colleagues, both at the Centre and in the States. One may not always agree with Vighneswara's views, but it must be conceded that he wields the English language with the skill of a superb craftsman: the billiance and charm of his style linger even when one discerns loop-holes in his logic or feels a little exasperated over the vehmence of his statements.

The present reviewer was particularly impressed by the non-political articles in the volume, e.g., those dealing with the B.C.G. campaign, the building of a posh hotel in Delhi, the pranks of the Princes, the virtues of soap, a certain point of grammar, the synthetic life, happy myopia, the protest of the students of the Udipi Sanskrit College against the ban on shirts in class, the quest of the Mystic Rose, etc. etc. At every turn, he came across fresh delights; the combination of pungent satire and deep scholarship was most exhilarating.

N. DAS.

STATISTICS

The Statistical Outline of India: Prepared by Department of Economics and Statistics, Tata Industries Private Ltd.: Published by Vora and Co., Publisher, Pvt. Ltd., Bombay: Pp. 88: Price Rs. 3|-.

This pocket edition of a collection of useful economic statistics about the Indian Union is the fifth in the series brought out by the Department of Economics and Statistics of Tata Industries Private Ltd. It lays special emphasis on the economic progress made by India during the two Plans along with the targets for the Third. Most of the statistical tables end in 1960 or in the fiscal year 1960-61. For the busy executive, this is an extremely useful handbook as it provides almost all the essential statistics which are normally needed in day to day work. The details covered relate to national income, population, agriculture, fuel and power, mining and manufactures, transport, foreign trade, external assistance, joint stock companies, public finance and social services. A set of nine tables at the end shows India's position in the international scale especially in relation to the standard of living, production (both in agriculture and industry), vital statistics, area and population.

CAPITAL ANNUAL NUMBER

Annual Review of Trade, Commerce and Industry: Published by W. H. Targett and Co., 5, Mission Row, Calcutta: Pp. 164: Price Rs. 5|-. Editor: George Barrell.

Our contemporary "Capital" from Calcutta has brought out its Annual Number which, as usual, contains a collection of articles written by leaders in the field of trade, commerce, industry and economic research. The very first article dealing with India's Third Five-Year Plan by Sir Theodore Gregory brings out some of the weaknesses of the Plan in the light of the criticism offered by Sir Gregory in his work entitled "India on the Eve of the Third Five-Year Plan". Sir Gregory has been intrigued to find the following quotations in the Third Five-Year Plan: "Lack of delegation within the enterprise is another common failure". "Lack of quality of managerial personnel is another factor prejudicing the success of an enterprise". "That the consciousness of profit and cost is also not so widespread as is necessary!"

Mr. C. D. Deshmukh, India's former Finance Minister, has drawn attention, in a provocative article, to the shortage of teachers which is likely to retard the educational progress in the Indian Union in the next five years. Mr. G. L. Mehta has analysed the work so far done by the Indian Investment Centre in attracting foreign capital while Mr. G. D. Birla, in a very lucid article, has highlighted the reasons for the stagnation of India's exports. He has explained in detail the basic weaknesses of the barter transactions. The high cost of our products, accordir to him, is the main cause for our failure to capture the markets abroad. Prof B. R. Shenoy has made the point that the Third Five-Year Plan's estimates of deficit financing are misleading and the Third Plan, like the Second Plan, is likely to suffer from inflationary pressures. The list of other contributors includes Mr. Geoffrey Tyson, Dr. P. S. Lokanathan, Prof. C. N. Vakil, Mr. Neil McInnes and Mr. M. R. Masani.

COMMERCE ANNUAL NUMBER

Commerce, 1961 Annual Number: Published by Commerce (1935) Ltd., Brady House, Veer Nariman Road, Bombay-1: Pp. 216: Price Rs. 10|-: Editor: S. V. Rayan.

The Commerce Annual is largely a collection of contributions made by eminent economists, leading industrialists and senior government officials and contains a mine of useful information for the students of Indian economics. Prof. C. N. Vakil in his article on "Planning and Human Welfare" has drawn attention, on the basis of his experience abroad, to the failure of the State Governments and municipalities in not playing their part well in matters of town planning. Prof. P. C. Jain in his article on "Consumers' Plight under the Plan" has suggested ways and means of protecting the interests of the consumers. L. Bharat Ram has emphasised the need for a new approach to the problem of export of cotton textiles. The leading article by the editor on "A Year of Economic Co-operation" rightly states that the most significant development of the year 1961 has been in the field of mutual co-operation among free countries in tackling the economic problems, particularly those relating to balance of payments and aid to under-developed countries. In the long list of contributed articles mention needs to be made of the following: "Some Lessons from American Agriculture"; "Coal in the Perspective of Third Plan"; "Shadow Pricing as a Development Tool"; Foreign Exchange Problem" and "Additional Taxation by States".

The Annual Number also includes comprehensive reviews of the progress made by the leading industries such as coal, textiles, jute, sugar and a faithful record of the important developments during the year in food and agriculture, trade, banking and labour. As usual a survey of the major markets has also been included.

COMPANY AFFAIRS

TATA CHEMICALS ACQUIRE BOMBAY MINERAL

Mr. J. R. D. Tata, the Chairman of the Tata Chemicals, informed shareholders that the negotiations for the purchase of the Bombay Mineral Supply Company which owned extensive bauxite deposits in Saurashtra were proceeding. He stated that the proposal was for Tata Chemicals to acquire the Bombay Mineral Supply Company in exchange for 5,20,000 Tata Chemicals' shares to be issued at par to the owners of that Company. This was subject to the management of Tata Chemicals satisfying itself with regard to the quantity and quality of bauxite available in the deposits and also to ensuring that these deposits were capable of being profitably exploited.

The Chairman mentioned that tentative and exploratory discussions had taken place between Tata Chemicals and the Bombay Burmah Trading Corporation regarding the formation of a partnership between the two Companies for the acquisition of the Bombay Mineral Supply Company and the industrial exploitation of its bauxite deposits. Further consideration of this matter had been deferred until the deposits had been proved and Tata Chemicals had secured a preliminary technical-cum-economic survey of the industrial potentialities of the project. These were expected to be available in two or three months.

In seeking the approval of the shareholders to a contribution of Rs. 1 lakh to political parties, two-thirds of which was to go to the Congress and one-third to the Swatantra Party, the Chairman stated that, while supporting the Party in power which had done so much to provide the country with a period of stability and progress, it was necessary to assist in the building up of a responsible and non-extremist opposition if parliamentary democracy in India was to survive and grow. Mr. Tata also mentioned that the decision of various Tata Companies to support the Swatantra Party in addition to the Congress had been intimated well in advance to some of the seniormost leaders of the Congress Party. These leaders had not made acceptance of a contribution from Tatas conditional on support being denied to any other Party, and in fact renewed requests for support to the Congress Election Funds had been received by Tatas both from the Centre and from the States even after this decision was known.

R.R. ENGINEERING CO. LTD.

This newly formed company which has taken over R.R. Engineering Co. situated in Uttar Pradesh has streamlined its blue prints for the manufacture of Machine Tools, Sugar Mill Machinery, Steel Castings & Alloys and Steel Structures in technical collaboration with foreign manufacturers. The authorised capital will be of Rs. 40 lakhs and out of this the directors and promoters will subscribe to the value of Rs. 9 lakhs. Out of the balance, shares to the value of Rs. 16 lakhs will be offered to the public for subscription before the end of February 62. The U.P. Government has already consented to participate in the capital issue by way of underwriting of the shares.

DEVKARAN NANJEE BANKING CO. LTD.

The net profit of Devkaran Nanjee Banking Co. Ltd. for the year ended 31st December, 1961, after providing for taxation and bonus to staff and including Rs. 7.86 lakhs brought forward from last year's account, amounts, subject to audit, to Rs. 34.01 lakhs. Out of this, the Directors provided Rs. 2 lakhs towards interim dividend paid for the half-year ended 30th June, 1961 at the rate of Rs. 2.00 per share and Rs. 15 lakhs towards raising the Reserve Funds to Rs. 75 lakhs. They have now proposed the payment of Rs. 3.50 lakhs towards a final dividend for the half-year ended 31st December, 1961 at the rate of Rs. 3.50 per share (making in all 11 per cent per annum, subject to deduction of tax. Rs. 13.51 lakhs are to be carried forward.

Some of the more important figures are :

(Rs. lakhs)

	1959	1960	1961
Net Profit	13.05	23.55	26.15
Appropriations			
Dividend	4.38	4.38	5.50
Reserve Fund ...	6.00	8.00	15.00
Income-tax ..	..	9.00	..
Carry Forward ..	2.67	2.17	5.65

Last year, the bank had made a net profit of Rs. 23½ lakhs, out of which Rs. 9 lakhs were provided for taxation. This year, the bank has, after providing for taxation, made a net profit of Rs. 26 lakhs. The bank has continued its policy of strengthening its Reserves by transferring Rs. 15 lakhs this year to the Reserve Fund as against Rs. 8 lakhs last year. The Reserve Funds have now been increased to Rs. 75 lakhs as against a Paid-Up Capital of Rs. 50 lakhs. The bank has increased its dividend for the whole year from 8.76 per cent gross to 11 per cent gross. The bank has also increased the bonus payable to staff from 1 month's salary (Rs. 2,65,000) to 1¼ month's salary (Rs. 3,50,000). The bank's deposits, which were Rs. 35¾ crores at the end of 1960, have gone up to a little over Rs. 43 crores, indicating a rise of nearly 20 per cent. The number of offices of the bank has increased from 96 to 107.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

Notice is hereby given that the Board of Directors of this Company have declared payment of an Interim Dividend on the Company's Ordinary Stock at the rate of £3¼ per cent net (tax applicable at 7s. 9d. in the £) for the year ending 31st March, 1962. Payment will be made on 15th February, 1962, to those stockholders whose names are registered in the Company's Stock Register on 30th January, 1962.

Applications for transfers received in this Office before 12 O'Clock noon on Tuesday, the 30th January, 1962, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above Dividend.

BY ORDER OF THE BOARD

H. C. BOWKER

AGENT.

VICTORIA HOUSE,

CALCUTTA, 11th January, 1962.

GOVT. SECRETARIAT TO GOVERNMENT 27 JAN 1962 PUBLIC DEPARTMENT

THIS IS NOT A PROSPECTUS BUT ONLY AN ANNOUNCEMENT

A Prospectus together with the documents specified herein has been duly filed with the Registrar of Companies, Madras.

The consent of the Central Government has been obtained to this issue by an order No. R. 388—CCI|61 dated 14-11-1961 of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

An Industrial Licence L. 34(6) 21|60|L—IND. dated 30-8-1960 issued under the Industries (Development and Regulation) Act 1951 has been obtained from the Central Government for effecting a substantial expansion to this existing industrial undertaking at Serakuppam, P.O. Vadalur, District South Arcot, Madras State, of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this licence, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

The Company's shares are dealt in and are officially quoted by the Madras Stock Exchange Ltd. Application is being made to the Madras Stock Exchange Ltd. for permission to deal in the present issue of shares.

The Subscription lists will open at 11 A.M. on Wednesday, the 24th January, 1962, and will close at 5 P.M. on Wednesday the 31st January, 1962, or earlier as soon as the subscriptions approximating to the amounts issued hereinunder to the public have been received but not earlier than 5 P.M. on Saturday 27th January, 1962.

SESHASAYEE INDUSTRIES LIMITED

(Incorporated under the Companies Act 1956) Date of Incorporation 12th December 1957.

SHARE CAPITAL

Authorised:

720,000 Equity shares of Rs. 10 each ..	Rs.	72,00,000
280,000 — 6¼% Cumulative tax-free Preference shares of Rs. 10 each ..	,,	28,00,000
TOTAL ..	**Rs.**	**1,00,00,000**

Issued, Subscribed and Paid-up Capital:

316,000 Equity Shares of Rs. 10 each	Rs.	31,60,000
84,000 — 6¼% tax-free Cumulative Preference shares of Rs. 10 each ..	,,	8,40,000
TOTAL ..	**Rs.**	**40,00,000**

Present Issue and Offer:

400,000 Equity shares of Rs. 10 each ..	Rs.	40,00,000

The said shares are offered for subscription in cash at par in terms of this Prospectus and the subscriptions for the said shares are payable as follows:-

On application	Rs. 5 per share
On allotment	Nil

and the balance will be payable in two calls of Rs 2.50nP. each, the first call will be made three months after the date of allotment and the second call three months thereafter.

The Preference shares carry a fixed cumulative preferential dividend at the rate of 6¼ per cent on the capital paid up thereon from the date of allotment and free of any deduction for Indian Income tax and to a right on a winding up to be paid all arrears of preferential dividend whether earned declared or not down to the commencement of the winding up and the capital paid up thereon but to no other rights in the profits or assets of the company. The said dividend will be computed and paid in accordance with the Preference Shares (Regulation of Dividends) Act, 1960.

The shares now issued will rank for dividend and be in all respects **pari passu** with the existing equity shares of the company and will be entitled to participate equally with the existing equity shares in any dividend that may be declared after the date of their allotment irrespective of the date on which such allotment has been made.

The entire present issue of 400,000 equity shares has been underwritten. No shares are issued for consideration other than cash.

OBJECTS

The following are the main objects of the Company as contained in the Memorandum of Association:

1. To carry on the business of manufacturers, importers, and exporters of and dealers in ceramic products of all kinds including electrical insulators and other porcelain products and their parts and accessories.

2. To carry on the business of manufacturers, importers, exporters of and dealers in all kinds of transformers, switchgears, meters and their parts and accessories.

HISTORY OF THE COMPANY

Messrs. Seshasayee Brothers (Private) Ltd., Tiruchirapalli, obtained for the benefit of this Company two licences under the Industries (Development & Regulation) Act, dated 29th October, 1956 and 7th October, 1958 for the establishment of an industrial unit for the manufacture of porcelain High Tension and Low Tension insulators and associated cast iron and non-ferrous castings and malleable castings and mild steel forgings. The Company constructed a factory at Vadalur in South Arcot District and went into trial production early in 1960 and has now standardised the production of conventional transmission-line insulators and their associated metal parts.

Commercial production started early in 1961 and the company has effected deliveries of high tension and low tension insulators and hardware components to several State Electricity Boards and Private Undertakings against orders received and according to specifications required. The materials delivered have afforded full satisfaction to customers.

High Tension Insulators and porcelain accessories are being overwhelmingly imported into this country, as the small number of factories in India which are engaged in the manufacture of these products are able to meet only a fraction of the present demand. The Directors have carefully considered the demand for high tension insulators and are satisfied that a growing market exists for these goods. They believe, it would be of immense advantage to the Company to enlarge the plant and augment its installed capacity for production of insulators and malleable cast iron parts in order to meet the pressing demand that is in evidence from the various sectors of electrical industries. While the main consumers of high tension insulators are State Electricity Boards, electricity undertakings, manufacturers of switchgear and transformers, the Indian Railways who have recently been enlarging the area of their electrification have started making their demands for high tension insulators. The Directors believe that it is not only desirable but absolutely essential that the present capacity of the factory should be augmented with a view to meet both existing and anticipated demand.

The Company has now obtained a licence from the Government of India for expanding the present capacity from 1,200 tons to 3,000 tons of insulators per annum. The Directors expect that the entire output will be absorbed by current demands. The Company's Technical Consultant, Dr. Ing. habil Kurt Draeger, in consultation with the Company's engineers, has prepared a detailed scheme for the expansion of the factory and has recommended its immediate implementation. The more important items of plant and machinery required for this expansion will be supplied by Messrs. Franz Kirchfeld, Dusseldorf, West Germany. The Government of India have kindly allotted to this Company the foreign exchange required for the import of plant and machinery. Dr. Draeger has agreed to send technicians from Germany to India who will stay and work in both the Ceramic and Foundry Sections of the factory until such time as rated production capacity has been fully established. He will also be periodically coming over to India to advise on quality control and on the expansion of the range of the Company's products.

PLANT AND MACHINERY

The Company has obtained an Import Licence (No. 991677|TPWG|61|HQ-G-I dated 26-10-1961) for importing the necessary plant and machinery for this project and firm orders have been placed with the Company's suppliers, Messrs. Franz Kirchfeld, G.m.b. H., Dusseldorf, who have been able to negotiate and secure advantageous prices.

TECHNICAL COLLABORATION

The Company has entered into an agreement dated 1-7-1958 with Dr. Ing. Draeger of Honef, West Germany, in terms of which he has to render assistance to this Company, in the planning and supervision of the factory erection and in attaining rated capacity of 1200 tons of porcelain insulators per annum.

In pursuance of the said agreement Dr. Draeger has been responsible for the design and lay out of the existing 1200 ton plant. He has assisted in the purchase of plant and machinery for this project in Germany and India, provided personnel for erection of the plant, trained a team of the Company's engineers and technicians in one of his associated factories, namely, Rhein Westfallische Isolatern Werke at Siegburg in West Germany and two of his senior technicians are at present in the factory supervising production and training labour.

Dr. Draeger has agreed to give his assistance for the expansion scheme and the Company has agreed that the Company will seek the approval of the Government of India for payment of additional know-how fee and royalty and to pay him such amount as the Government may approve for the services to be rendered by him and his deputies in connexion with the expansion project.

Dr. Draeger has now completed the selection of the plant and machinery pertaining to the expansion project and has enabled us to place orders for the same. He is at present busy planning the lay out of the buildings and taking such further steps as are necessary to speedily implement the expansion programme. He has also agreed to send to India such technical personnel as his deputies and assistants as may be considered suitable for the purpose. He and his deputies will be entitled to such travelling and living allowances in India as may be in vogue from time to time in contracts for engaging foreign technicians.

MINIMUM SUBSCRIPTION

The minimum subscription on which the Directors will proceed to allot is equity shares of the face value of Rs. 15 lakhs.

The capital requirement for the proposed expansion is estimated is follows:—

It is proposed to provide for the above capital requirement as follows :—

(a) Buildings	.. .. ..	Rs.	11.00 lakhs
(b) Imported machinery including Import duty, freight and insurance	.. ..	,,	40.00 ,,
(c) Power Plant, Indigenous machinery & erection charges and contingencies	.. .. ..	,,	6.50 ,,
(d) Expenses of this issue	.. ..	,,	2.50 ,,
TOTAL	.. .. ..	Rs.	60.00 lakhs

It is proposed to provide for the above capital requirement as follows:—

By issue of fresh capital	.. ..	Rs.	40.00 lakhs
By Borrowings	.. ..	Rs.	20.00 ,,
TOTAL	.. .. ..	Rs.	60.00 lakhs

The present issue of Rs. 40 lakhs has been fully underwritten.

ESTIMATED PROFITS

It is estimated that within a short period after the completion of the expansion, the expected profits would be sufficient after payment of dividends on Preference shares to provide a reasonable and attractive return to the Equity Shareholders.

MANAGING AGENTS

Seshasayee Brothers (Private) Ltd. were appointed as the Managing Agents of the Company with effect from 6-3-1958 for a period of fifteen years by the Articles and by an agreement dated 6-3-1958 on a remuneration of 10 per cent of the net profits of the Company subject to a minimum of Rs. 12,000 per year in the absence of or inadequacy of profits which minimum shall, however, be increased to Rs. 18,000 per year if and when the paid up capital of the Company exceeds Rs. 20 lakhs.

PREFERENTIAL ALLOTMENTS

The Company has agreed to make the following preferential allotments, out of the present issue, namely, to the Life Insurance Corporation of India, shares of the face value of Rs. 10 lakhs in consideration of their having underwritten a like amount of shares, and Rs. 2,50,000 face value shares to the Investment Corporation of India Bombay, in consideration of their having agreed to subscribe for the said shares.

UNDERWRITING COMMISSION

An underwriting commission of 2½ per cent of the face value of the shares will be paid to each of the underwriters in respect of the shares underwritten by them respectively.

BROKERAGE

A brokerage of 1 per cent of the face value of the shares will be paid to the authorised brokers and bankers including the underwriters in respect of share applications bearing their rubber stamp.

All applications must be made on the form accompanying the Prospectus which can be had from the Registered office of the Company, the Company's underwriters, Bankers and Brokers.

THE EASTERN ECONOMIST

JANUARY 26, 1962

The Western India Coal Crisis

THE news that two mills in Baroda have closed down and the fact that practically all the mills at Ahmedabad might have closed down this week, brings into sharp focus the special coal crisis which attends on Western Indian factories. It should not be necessary to argue that, under the perilous circumstances in which coal supplies are allocated, adventurous business can hardly be undertaken. A radical policy is required for a desperate situation. The special Blue Supplement on the coal industry which was issued on December 22, 1961, has made it plain that the shortage of coal is a matter not for a year or so, but throughout the period of the Third Plan. Indeed, the current shortage is partly the result of the failure to achieve the Second Plan targets; in the opinion of *The Eastern Economist* it will not be relieved in any way by the Third Plan arrangements now proposed. The true demand for coal of good quality is likely to be well over 100 million tons in 1965-66. At the present time the manner in which good and bad coal are pooled together will require, in terms of quantities, something significantly larger.

It is right that Mr. N. Stenhouse, the retiring President of the Associated Chambers of Commerce and Industry, should have drawn attention to this particular crisis and have asked for a three-year 'crash' plan to deal with Coal, Power and Transport as the essential pillers of industrialisation. Unless coal and power in particular are dealt with on an emergency footing, all India's plans are likely to be built upon sand. There has been the wildest misrepresentation of the position on power and now a terrible penalty is being paid for the failure to think spaciously in the first instance. The Western Indian coal crisis which is rapidly coming to a head proves that the current supplies of coal and transport are totally inadequate to meet the needs of growing industries there. In addition to this, our export costs are being raised by the provision of supplies of second and third class coal which is leading to a great deal of wastage in casting as well as a rise in costs prohibiting exports from factories using high ash and badly selected coal.

There is only one immediate remedy for a situation whilst long term plans are changed to adjust themselves to the serious shortage of power and coal which will be developed in the next three years. The first priority should now be the import of high quality coal. This can be done for rupees, since Poland has an abundant surplus which it is able to supply continuously over a long period of years. It is suggested that in order to save Western India industries from the dislocation which is constantly threatening them, India should now make arrangements with Poland for the import every year of two million tons of high quality coal which will be supplied to the industries all along the Western Coast. It is possible that ships taking Indian ore to Western European and Eastern European ports may come back loaded with coal, and thus it might be an economical shipping operation as well as an essential strategic defence for India's industrial production in a strategic area in the country. It is sincerely to be hoped that the current emergency will lead to a final decision to recognise that the failure to import good coal at least two million tons a year will involve the country in much greater losses both in terms of domestic production and in important new exports.

The Crisis in Sugar Industry

THE news on the sugar front this week has indeed been critical. While the decision of the U.S. Government to abolish country-wise quotas for sugar imports into that country threatens to upset all calculations about the export of the commodity from here, the reported communication addressed by some 30 sugar mills of Eastern U.P. to the State Government, expressing fears that they may have to suspend crushing operations as a consequence of fall in prices from about Rs. 39 to Rs. 36 per maund during the past three months, poses a serious social problem. Sugar manufacture is the only well-established industry in the eastern districts of U.P. and the sufferings which the closure of over two dozen mills in the area would entail for thousands of labourers and cane-growers, who depend on this industry for their livelihood, can be well imagined.

The closure threat, coming as it does on the eve of the General Elections, is likely to be interpreted in some quarters as a coercive step on the part of the Eastern U.P. sugar mill-owners. Cynics might well argue that these sugar magnates are trying to wring some concessions from the politician who has an eye on the votes of the Eastern U.P. agriculturists and the sugar mill workers, by dangling before his eyes the serious contingency that would arise from their contemplated step. Faced with the dilemma of losing so large a vote, the politician can well be expected to yield under pressure. But is this interpre-

tation justified? *The Eastern Economist* does not subscribe to this view; in its opinion, to behold the move of the East U.P. mill-owners in this light is nothing short of perversity.

The present difficulties of the Eastern U.P. sugar mills — as a matter of fact, of a large number of others as well — obviously are the outcome of the huge surplus stocks which they were obliged to carry forward from the last season, when production reached an all-time record of 29.4 lakh tons, while consumption remained more or less static around 21 lakh tons. Exports to the tune of a couple of lakh tons have been of some help, but the burden of unprecedented carry-over of 11.5 lakh tons, in the face of an appreciable surplus expected from the current season, is crushing indeed. To service these stocks, the industry has had to foot a huge interest bill on the advances made to it by the banking system in the interest of avoiding a crash in the sugar market. Situation could have been relieved in no small measure, if the Union Food and Agriculture Ministry had taken the decision to remove all controls on movement, distribution and prices of sugar in time. But this decision came at least six months too late. During this period easy availability of sugar could have helped in raising consumption by at least 1.5 lakh tons and pushing another two to three lakh tons into the pipeline, bringing down the stocks with the mills by a corresponding margin. All this, however, is of only academic interest now.

To find a solution out of the current impasse in the sugar market, it is necessary to analyse the facts disinterestedly. The first important fact that is to be taken note of is that while despatches from the mills during the first two months of the current season have been 4.0 lakh metric tons (including 31,000 metric tons for exports) compared to 3.23 lakh metric tons (which included 21,000 metric tons for exports) during the corresponding period in 1960, the closing stock with the factories on December 31, 1961, was about 13.30 lakh metric tons, as against 10.07 lakh metric tons on the same date in 1960. Secondly, prices of all qualities of sugar, since October last, have gone down, though in varying degrees. While there has been about 8 per cent fall in the prices of inferior quality sugar, prices of bold grain sugar have receded only marginally. (Bold crystal sugar still enjoys a premium of 15 nP. to a rupee per maund over the pre-October controlled ex-factory prices). Thirdly, whereas there has been witnessed a recessionary trend in the sugar market under pressure of abundant supplies, export outlook for the commodity has become obscure as a result of the U.S. Administration's decision to go in for global tenders after the expiry, in another five months, of the present International Sugar Agreement, instead of effecting imports at a premium of about 60 per cent over the world prices from specified countries under a quota system. All this has shown up the Achilles heel of the Indian sugar industry, which obviously is the high cost of production.

The solution of the present-day difficulties of the sugar industry lies in stepping up of exports to whatever extent possible and encouraging the domestic consumption. Sugar exports from India can be effected, of course, at a heavy loss. But that should not deter us from making an all-out effort. The loss on exports also should not be passed on to the consumer who has felt some welcome relief from the break in prices. The consumer in this country has already paid too dearly for the development of this industry; he should not be expected to shoulder the burden of providing any additional crutches for it. The three vested interests —the State, the manufacturer and the cane-grower — who have prospered at his expense, must find among themselves the finances to meet the loss on exports.

While exports should alleviate the distress of the industry to some extent, the exigencies of the situation demand that no stone should be left unturned to increase domestic consumption. This implies that not only the current sugar prices should be maintained, but, if possible, they should be allowed to fall further slightly. How this can be done is the crucial problem. Two steps need to be taken with this end in view. Firstly, the excise duty on sugar should be immediately cut by at least Rs. 2.50 nP. per maund. This reduction would compensate the industry for the three-anna increase in cane prices effected two years ago, allow for some increase that has taken place in the cost of other materials used by the industry, and also for some further recession in prices. It will as well bring the cost of production more in line with the prevailing conditions in the sugar market. Any further loss that the industry may have to incur in marketing its huge surplus should, of course, be borne by itself out of the substantial profits which it has made in the last two years. It is legitimate to expect this gesture on the part of the industry for the record production of 1960-61 season was to a very large extent the result of the special concession given to it by the Government in the form of 50 per cent rebate in excise duty on production in excess of the average for the previous two years.

To put the industry on a sounder footing and to keep the cost of production at a lower level during the current season, so that exports may be possible at a smaller loss, it is also imperative to somewhat cut cane prices so as to bring them more in line with the return to the agriculturist from the competitive crops. It is an admitted fact that fixation of cane prices at Rs. 1.62 per maund for supplies at factory gates has been instrumental in diversion of land from under other crops to under sugarcane, implying thereby that this price of cane is rather too high. A cut in cane prices, say by 1½ annas per maund, will restore the balance. The Government may hesitate to take this step for it may not find it proper on its part to reduce cane prices arbitrarily having once fixed them. But *The Eastern Economist* does not think that the cultivator will have any objection to it since he will find a market for his produce which otherwise might not be there. The 10 per cent cut in sugar output during the current season over the 1960-61 level should also be strictly adhered to. This will not entail any big sacrifice on the part of the agriculturists.

If a solution is hammered out on the lines indicated above, many of the difficulties of the sugar industry can be resolved. The East U.P. sugar manufacturers would do well to reconsider their decision to close down their factories, for any precipitate step on their part will only alienate the sympathy of the general public for their cause. Of course, there can be little theoretical objection to any entrepreneur stopping his business provided he fulfils the conditions of the law. The social consequences of such a course on the rural community, however, cannot be overlooked. The wholesale closure of a vital industry in a particular region is not something which can be allowed. The suggestion put forth by these mills for the suspension of further monthly releases of sugar till the time the already released sugar is taken up by the trade is not a judicious approach. It may temporarily halt recession in prices, but it will only postpone the evil day. By hampering growth in consumption, it will lead to further accumulation of stocks since production has to go on.

Guest Editorial

Across the Widening Atlantic

By WILLIAM REES-MOGG

THE Bermuda Conference has come and gone, successful but unremembered.; Mr. Macmillan has already seen President Kennedy four times in his first year of office; in the Prime Minister's view, as he explained to the readers of *The Sunday Times*, relations between Britain and the United States remain very close, although there is freedom to differ. This is a somewhat different story from the one that has often been heard in Washington of an ending of the special relationship, and of a new concentration on Europe. What then is the truth about Anglo-American relations?

To some extent Britain has retained a most-favoured position, the closest ally and the closest confidant, in default of a challenger. The Americans have found President de Gaulle to be almost as impossible as President Roosevelt and Cordell Hull thought him during the war. No American administration entered office more francophile; on Inauguration Day they were humming "I Love Paris" as they rode in procession; no administration has been more quickly disillusioned or more exasperated. President de Gaulle seems to Washington to take a perverse delight in snubbing and obstructing American policy.

Nor has Germany been able to step into the role, though no doubt willing to do so. For much of the year Washington and Bonn have been in disagreement about the possibility and form of negotiations over Berlin. In the German elections Dr. Adenauer's political position was critically weakened.

Thus in many matters the Americans have to talk to Britain, or they have nobody useful to talk to. This has helped to re-establish a confidential position. Britain has also remained the steadiest of the allies of the United States. President Kennedy does not have to spend his time looking over his shoulder to see if Britain has gone absent without leave. Finally, of course, there is the question of language and of moral tone. Usually the Americans and the British are bad linguists; they also depend on the acceptance of some residual Protestant ethic; they prefer to do business with countries which see the difference between right and wrong in the same way as themselves.

Yet there are pressures which are pushing Britain and the United States apart. The first is the decline in British power. When the Empire was still an Empire, the Americans disliked it and on anti-colonialist grounds disapproved of it, but they had to reckon with it. The Commonwealth, however valuable to its members, does not work that way; it is not a power-group in this sense at all. Britain can no longer automatically deliver the combined weight of the Commonwealth and Empire, and many American observers exaggerate the degree to which the Commonwealth is in dissolution.

Oddly enough the decline in power also makes Britain less dependent upon American friendship, because it involves a comparative decline in responsibility. During the phase of unwinding the colonial empire, Britain was dependent on American support in recurrent crises; when, as at Suez, she tried to act alone, she was humiliated. Britain no longer has so many vital overseas commitments to be safeguarded.

More important, however, is the British decision to go into Europe. The Anglo-American relationship has normally in the past been the second closest of British ties, coming after the Commonwealth. Now, whichever order may be applied to Commonwealth and Europe, it is plain the United States cannot be put higher than third.

How sharp this contrast will be depends on the development of Europe herself. There is undeniably a third force tendency in the European movement as such. If Europe develops, as she can and should, into an economic power equal to the United States and the Soviet Union, then she is bound to pursue foreign policies of an independent character, though Europe is probably too mature for this to lead to an actual split with the U.S., particularly if Britain is a member.

There are still, however, many possibilities in this area. In particular the future of the French Government is unknowable; if the worst came to the worst, and an O.A.S. Government succeeded, then the economic arrangements of the Common Market might survive, but the European powers would not be likely to move towards closer political unity.

Another pressure on Anglo-American relations is the growing feeling of nationalism, probably in both countries. In America it is expressed at its worst in the activities of the lunatic right-wing fringe groups. But both in Britain and in the United States perfectly level-headed people are taking the view that a country must stand up for itself or be kicked around.

The United Nations has become the focus of much of this suspicion. Certainly the voting arrangements in the General Assembly are absurd, with one vote for each country, however large or small. Certainly also the Afro-Asian bloc is revelling in its now-found power. Britain and the United States do not see eye-to-eye over the U.N., and of course they particularly disagree on the admission of China.

These are important trends which will tend to worsen the present Anglo-American association. A certain vigorous style of independence is creeping in. Yet the ties of language and sentiment have in the past shown astonishing power of survival; they are not dead yet.

A DELHI DIARY

T. T. K.

THE news of the week, and perhaps for the year is — T.T.K. I happened to be in Madras when the bombshell burst. From profound knowledge of what is called business opinion, I prophesied correct (without consulting the stars) that there would be a Stock Exchange crash. May I, therefore, say proudly by a piece of scientific research — as distinguished from the fearful astrological predictions which the Prime Minister condemns so much in others —that I have become a true prophet. Unfortunately, I failed to back my own opinion on the Stock Exchanges. The net result is that, having failed to display the courage of my convictions, I am no richer than before. I am told, however, a very large number of people are poorer. Such is apparently the power of personality in the Indian political system; more things are wrought by personalities than this world dreams of.

People are asking me, as though I were a source of profound original news, how it has all come about so suddenly. I have deep respect for T.T.K. and I know that he had reconciled himself — unwisely, in my opinion — to a life of retirement. His vigorous mind and his great dynamic power of management — which made him the greatest Commerce and Industry Minister that India is ever likely to have — were valuable assets which the country should have been able to use. I myself have not thought that as a Finance Minister of India he was at his best, and I am hoping very much that when he comes back he will be Commerce and Industry Minister, and Minister of Steel, Mines and Fuel combined to evolve a co-ordinated policy of industrial development for the Third Plan covering every facet of that complex operation. If this should happen, in my opinion, the Stock Exchanges that have reacted so bearishly at his arrival, will be right to behave like the proverbial mad bulls. I, for one, will "bull" wildly on that occasion.

ELECTIONS: INSIDE AND OUTSIDE

Electioneering is an interesting fever whether one is in the hurly burly or whether one looks at it with what I would call detachment. T.T.K.'s case is one of the most fascinating operations of its kind. Mr. Kamaraj Nadar who, as is known, is a great personal friend of T.T.K., had not one, but two, seats in readiness should T.T.K. change his mind to stay out of the elections. The green signal appeared very late in the day in the form of a letter, it is believed, from the Home Minister to Mr. Kamaraj, indicating that T.T.K. could "certainly" stand. Almost by magic the great wheels of politics began to whirl. Apart from the South Madras constituency where T.T.K.'s nomination papers were first filed, in two days both Mr. Kamaraj and T.T.K. were at the Tiruchendur constituency, where another Mr. Nadar, who will go down in history for fame or notoriety (depending on the party affiliations of the persons commenting) was standing on the Swatantra ticket. The same concatenation of circumstances — this time men's not stars' — brought C.R. rapidly from Bangalore to the same turbulent scene. After a great deal of argument — I have no evidence of horse trading — Mr. Nadar agreed to stand down and T.T.K. was elected unopposed. Thereupon he withdrew his nomination from the South Madras constituency and except for the Stock Exchanges all was for the best in the best of all possible (Congress) worlds. I personally tender my congratulations to T.T.K. for one of the most brilliant operations that he has performed in a distinguished career.

NORTH BOMBAY

I cannot deal with the subject of elections and fail to deal with the most important election, almost for all the world, which is being conducted in North Bombay. The Prime Minister's trip which ended in a fierce speech in which members of the Anti-Menon Youth Front, led by Mr. Rama Krishna Bajaj, were invited to go to hell, was, it seems to me, to use a classical understatement, an unwise political expression. These ferocious outbursts which are sometimes popular when they come from the Hero of the Revolution can boomerang. Since the old tide is receding, the voter has got into his head that he has to be treated with some courtesy, and now in the Congress Party itself there is a feeling that the soft answer is a better instrument for turning away wrath. The present view is that the Prime Minister has lost some thousands of votes by throwing a very large number of energetic Congress volunteers into the anti-Menon camp. Also an assertion that Goa was an election issue has reduced a good deal of the halo from Mr. Krishna Menon's somewhat less impressive head. All in all, the election has been turned, my reports tell me, in favour of Acharya Kripalani. Without consulting the planets, may I make a prediction that Acharya J. B. Kripalani — other things being equal — will win by what, in racing language is called a 'short head' which might, with a constituency of this kind, be a matter of ten thousand votes. Even the Indian Institute of Public Opinion dare not predict victories with such adventurous accuracy.

THE PLANETS

So far as the Planets are concerned, we are awaiting this week, or to be precise on February 3 and 4, the coming of doom. But for the present, all I need to do is to record the view of my naughty cartoonist who, having been absent, for a week, has now returned from consultations in another world!

What a Life!

As you know, we're gathered here to determine how grave a threat to our existance the Earthlings pose.....

ARGUS.

THE WEEK'S NOTES

Saving-Income Ratio

AN OPTIMISTIC ESTIMATE

THE NATIONAL COUNCIL of Applied Economic Research released last week its findings of two household surveys — one directed to urban areas and the other to the rural areas. While the survey of the rural households was of a pilot nature, covering not more than ten villages, the study of urban households in regard to income and savings was on the basis of an All-India sample covering 4,650 households in no less than 30 towns with a population of more than 10,000. The findings of the urban household survey were:

(1) Eightyfive per cent of the households having income of less than Rs. 3,000 per annum owned 52 per cent of the aggregate net income.

(2) The remaining 15 per cent of the households having an income of Rs. 3,000 or more per annum owned 48 per cent of the aggregate income.

(3) The aggregate gross saving in urban areas was 17.2 per cent of the disposable income, while the net saving was 13.7 per cent of the income.

(4) There was a close correlation of income with occupation, education, age of the head of the household and the number of earners for households.

(5) The top 15 per cent of the households in the urban areas accounted for practically the entire amount of aggregate saving, while the remaining 85 per cent of the households either did not save, or dissaved.

(6) While the average propensity to save was 13.7 per cent of the disposable income, the marginal propensity to save was as high as 34 per cent of all income classes and 24 per cent when the lowest and the highest classes were left out.

The Council reiterated its belief in India's overall average saving ratio being 10 per cent of the total national income as established in another study published by the Council last year. The confirmation of the high rate of saving at 10 per cent was based only on the urban household survey because the rural pilot survey did not provide anything but too meagre an evidence, one way or the other.

Whether India's rate of saving is 8 per cent or 10 per cent of the national income, what has intrigued the students of economics is whether the large financial expenditure incurred by the Council on these household surveys has added to the information already available on the subject and whether they are sufficiently reliable in view of the vast element of error to which the household survey approach itself is vulnerable. Apart from the statistical errors, the administrative errors including that of the "interviewer bias" are likely to make the estimates of the Council highly questionable. On top of that, the urban sample has not provided regional break-downs of incomes and savings. Nor has the Council disclosed the list of the thirty towns included in its sample, when secrecy has no warrant whatsoever. There was every likelihood of the sample being heavily weighted in favour of some of the progressive States such as the Punjab and that element alone might have raised the saving ratio. Again 1960 was in no way a typical year in the sense that the incomes in the urban areas were fast expanding, at least in money terms, due to the vast increase in development expenditure. The inflationary pressure in the Indian economy in that year was one of the major causes of rising money incomes in urban areas. It is thus not logical to deduce possible trends of income and saving ratio on the basis of a static picture for a particular year. Unless surveys of a similar type are conducted from year to year over a period of 5 to 7 years, the thesis of the Council about the high saving ratio may not be confirmed. The highly fluctuating character of India's national income itself is likely to show wide fluctuations from year to year and on that score alone, it may not be wise to be carried away by the Council's "high optimism".

U.S. Budget

MR. KENNEDY'S COURAGEOUS STEP

CONFIDENCE AND ambition are deeply imprinted on President Kennedy's budget for the fiscal year ending June 1963. To his critics he has made it absolutely clear that pre-occupation with transient problems of the immediate future must not be allowed to distort the long-range perspective and America must face up boldly to the responsibilities which have devolved upon her as the leader of the non-Communist world. This explains the imaginative plan for defence expenditure for which generous appropriations are asked for from Congress. The overall expenditure is pitched at over $92,500 million which shows an increase of $10,900 million above the outlay in the budget for the current year. It is no surprise that a sizeable slice of 10 per cent in this increase goes to space research and something like 65 per cent of the increase is allocated to the strengthening of defence. Civil expenditure devoted to the domestic economy has been held practically at the level of the current fiscal year and certain economies have been invisaged. But in the face of the bold defence and space programme these economies totally disappear in the final shape of the budget. The President has categorically stated that neither the stresses and strains on the balance of payments nor the pressures of inflation ought to be allowed to make the nation deflect from its obvious responsibilities. Nevertheless, the budget shows a recognition of appropriate action to reduce the pressure of the payments deficit in the sectors from where it arises powerfully. Military aid abroad is being curbed and greater emphasis is being laid on foreign economic aid, which is now being pushed to higher levels.

In spite of this forthright increase in expenditure, the President strongly hopes that the economy will stoutly begin to look up as the revenue yield will rise appreciably. The corporation tax gets no relief in a phase of acute export competition and the other taxes have not been readjusted either for downward revision or virtual elimination. The tax-collecting machinery is to be enlarged and strengthened and this step, along with the higher rate of growth in the economy, is expected to create a nominal surplus of $500 million. It is in essence a balanced budget which the President is aiming at. Further indication of his confidence in the nation's capacity to bear a budget of a higher magnitude is to be gathered from the assertion that price stability and the competitive efficiency of American industry in the export market are to be boosted. When the Reciprocal Trade Agreement Act comes up for renewal after its expiry at the end of the current fiscal year, the President is asking for a five-year authorisation in the interest of a continuous and longer tariff policy.

Newsprint

ARBITRARY RESTRICTION

THE GOVERNMENT could not have exercised the discretion to clamp control on an essential import more arbitrarily and capriciously than in the case of newsprint. If dearth of foreign exchange is the justification behind the promulgation of the Newsprint Control Order, it could not have been pleaded more frivolously. Considered from any angle, this new restriction on the ceilings on increased supplies of newsprint may be

interpreted as vindictive, since it again seeks to make an indivious discrimination between newspapers and periodicals with a larger circulation, on the one hand, and those with a small circulation, on the other. The only saving grace is that, during the critical pre-election phase, additional quotas are to be made on an ad hoc basis, the presumption, of course, being that the ad hoc allocation will be fair and impartial. For the current calendar year as a whole, daily newspapers with a circulation of 10,000 copies will be entitled to an additional supply of 10 per cent in excess of their average certified circulation during 1961, while dailies with a circulation of less than 10,000 copies will be eligible for an additional quota up to 25 per cent on the same basis. This smacks of an attempt to revive the same type of discrimination to give an artificial boost to the smaller newspapers through the imposition of the price-page schedule — an attempt which was foiled by the Supreme Court as repugnant to the right of freedom of expression. But the more weighty objection to the Order rests on a fundamental ground.

The growth of newspaper circulation in a country is a vital index of the growth of the democratic consciousness of its people. The aggregate circulation of daily newspapers in India has yet to cross the 5 million mark. For a country with a population of 438 million it is a poor index in itself and no international comparisons are necessary for such a self-evident fact. To try to hold the growth of circulation at a margin slightly above this speaks for a deplorable lack of imagination. But to invoke balance of payments strain in this case is ridiculous. Between 1952 and 1960 imports of newsprint increased from Rs. 4.72 crores to Rs. 6.17 crores and the estimate for 1961 may be placed a little higher by Rs. 0.30 crores. An additional demand of Rs. 1 crores in 1962 on a very liberal reckoning is not going to distort, by any stretch of reasoning, our payments position, nor is it going to make any mentionable inroad on any other import requirement. The free flow of information on national and international affairs, the diffusion of ideas on these topics and moulding or influencing public opinion are basic functions of the Press — they are also basic to the healthy growth of democracy. To restrict them on a frivolous plea is in itself reprehensible — and much more so where the growth of the Press needs an enlightened policy of stimulation.

Nepal

SPORADIC VIOLENCE

THE DASTARDLY attack on the person of King Mahendra on January 22 at Janakpur, about 78 miles from Khatmandu, will stand condemned everywhere, as it has already been condemned in this country. The King is to be congratulated upon having escaped the nefarious design of the assailants. It speaks for his complete composure and equanimity that the outrage left him quite unperturbed and he fulfilled his engagements of the day according to the fixed schedule. This outrage is not an isolated act and for quite some time now violence and lawlessness on a sporadic scale are being resorted to by a small minority of anti-national elements in Nepal. The confidence with which the King is conducting the affairs of his State has won him nation-wide support for his regime and the activities of a disgruntled few cannot deter him from his set path.

The Government and the people of India have always maintained, ever since he assumed the reins of power, an attitude of detachment, believing fully in the principle that it is for the King and the people of Nepal to evolve a type of government best suited to their genius. At least the Ministers of the King should have taken note of this rational attitude. But it is certainly amazing that Nepal's Foreign Minister, Dr. Tulsi Giri, should take the licence to make certain insinuations calculated to impute to the Government of India connivance at this lawless activity. Normally, there exists a voluminous two-way flow of people coming from Nepal into India and going back to their home country. In the next place, the terrain on both the sides of the border between the two countries makes it extremely difficult to enforce strict vigilance and security measures. These two factors explain how subversive elements can exploit it to their advantage. But since the Government of India got the first inkling of the abuse of this situation by anti-national elements in Nepal, our State Governments on the frontier are taking, under its instructions, all practicable measures to prevent smuggling of arms into Nepal. No Government could do better than that.

If Dr. Giri chooses to make unwarranted insinuations against India, the proper inference to draw would be that this is an attempt to find a scapegoat. But without doubt the internal security of Nepal and harmonious relations between the two countries will best be promoted by the Minister and his colleagues, if they concentrate their energies on stamping out violence inside Nepal on the marginal scale that it exists. It is gratifying that the Finance Minister of Nepal, Mr. R. K. Shah, made forthright observations at a press conference held at the Nepalese Embassy in New Delhi on the day of the Janakpur outrage. What, in effect, he explained, was that neither the Government nor the people had anything to do with these activities. In robust contrast with Dr. Giri's attitude, he wisely stated that any misunderstanding that has arisen could be removed by patient diplomacy. King Mahendra is to visit this country very likely in March and this opportunity will no doubt be utilised to clear the atmosphere.

The World Abroad

PERSONAL DIFFICULTIES OF INDIANS IN THE U.K.

By ODYSSEUS

THE CHIEF PROBLEMS that confront Indian students in the UK, apart from those of social adjustment described here last week, are emotional, financial, and academic, according to a survey made by Mr. A. K. Singh, just published by Political and Economic Planning, 16 Queen Anne's Gate, London. S.W.1. (32 pp. Price 4sh.).

Out of the sample of 400 Indian students questioned by Mr. Singh, 44 per cent had not foreseen emotional difficulties. These seem to me of particular interest because not only students but Indians of any type, who remain abroad for long periods, are likely to encounter them, not only in the UK but in any foreign country.

PERSONAL PROBLEMS

(Percentages)

	Upper Class Students 100%=150	Middle Class Students 100%=250
Felt lonely	29	68
Felt homesick	48	79
Had food difficulties	43	64
Had difficulty in shopping, washing, cooking etc. ..	13	57
Worried about domestic problems	27	74

More middle class than upper class students were vegetarians. Food taboos produced emotional difficulties for vegetarian students in particular, who hesitated even over vegetarian dishes because they suspected that they might have been cooked in animal fat. Even some non-vegetarians, who had no "rational" objection to beef, felt emotionally repelled after a few attempts to eat it. A greater number of vegetarians from both upper (64 per cent) and middle (74 per cent) classes experienced food difficulties than non-vegetarians (for whom the corresponding figures were 35 per cent and 52 per cent).

Emotional difficulties were a special strain on the predominantly middle class, older students. Eighty-six per cent of 131 married students were living without their wives in the UK. Seventy-three per cent considered that "separation from wife|children" was of "great or very great importance" in contributing to their dissatisfaction in the UK. Seventy-three per cent of the married students had been married for more than three years and 69 per cent had one or more children. Some were particularly worried about the finances of their families, which they had supported when they were in India. They had deprived their families of their financial help by going to the UK and had also put an extra burden on them by leaving their wives and children for the family to support. Some had arranged for their wives to be maintained and their children educated at the expense of friends and relations, who became less enthusiastic as time went by, so that the promised payments were delayed or ceased. A few students were forced to take temporary jobs, or use money from their scholarship grants, in order to send money to their dependents at home.

Most students had had no experience in looking after themselves in every day matters. Before going to the UK many "had not made even a cup of tea." To save money, many middle class students did their own cooking, washing, and shopping, which absorbed much time and energy. Older students, used to the comforts of family life, found it difficult to acquire new habits. One who had been married for eight year and was in the UK without his wife said:

"When I was unmarried I was the responsibility of my mother and sisters. Eight years of married life spoiled me. I had got used to a life in which every morning I found the bath ready, blade put into the safety razor, fresh clothes on the hangers, breakfast on the table. Now I have to do everything myself, and I cannot do them properly. My landlady always complains that my room is not organised and tidy. I often forget to take my key when I go out, which adds to her annoyance."

MONEY DIFFICULTIES

Most middle class students were handicapped by their finances. More middle class students than upper found that living costs were higher than expected and that jobs were more difficult to get. Some had had the false impression that they would be able to earn easily and study at the same time. Some came with just enough money to support themselves for one year, hoping to earn enough thereafter in part-time jobs. Many middle class students had arranged their finances from more than one source, scraping up all the available resources of their family and relations. Some were greatly inconvenienced in the middle of their stay in the UK when their arranged resources suddenly failed, because some relation was unable to keep his promise to send money, or the earning member of the family died, or a scholarship or grant came to an end.

ACADEMIC PROBLEMS

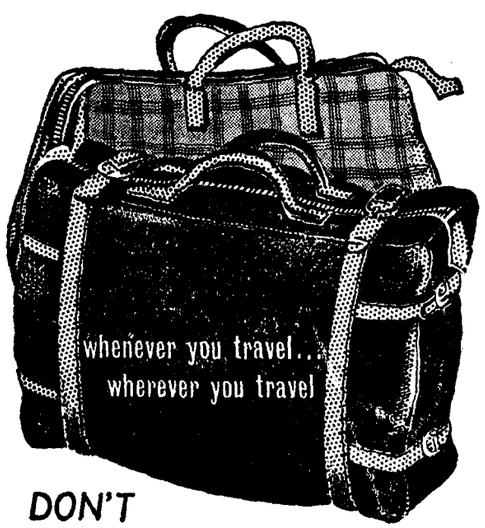
Two reasons for going to the UK mentioned most often were to gain advanced training in their subjects and to better their future prospects, which, of course, depend on academic success. Most students, therefore, were primarily concerned with their academic adjustment and only secondarily with other problems. Many, particularly the middle class, felt that academic achievement would amply compensate them for hardships and social and emotional deprivements: it was a British degree that would gain them a job on their return, not their acquaintance with the British people, however valuable that might have been as an experience. Fiftyfive per cent of middle, and thirty-five per cent of upper, class students were worried by fear of academic failure. Generally, their academic difficulties arose from the use of the language and the higher standards of British compared to Indian universities.

LANGUAGE DIFFICULTIES

Twentyfive per cent had experienced difficulties in their studies, arising particularly in expressing themselves in spoken English and participating in seminars. Ninetyseven per cent of those who experienced difficulties mentioned the language and seventyfour per cent considered it the "most important" of their academic problems. Their second most important difficulty was in writing essays. Sixtyone per cent who experienced academic difficulties mentioned this and fourteen per cent thought it the "most important" problem.

Perhaps an extreme example may help to explain the kind of language difficulties that we are talking

about. On his arrival, one post-graduate in political science went to see his tutor. After asking him about his plans, the tutor, omitting "If I were you," said to him: "I would write an eassay on...." The student was pleased to know that his tutor was interested in his subject, but when they met again he was puzzled to discover that his tutor expected him to have written the essay himself. He could only say: "Sir, I thought you were writing it!"



DIFFICULTIES OF HIGHER UNIVERSITY STANDARDS

Many students, particularly the post-graduates, who were predominantly middle class, soon realised that they were inadequately prepared for the level of study required. Thirtyone per cent of the post-graduates, as opposed to seven per cent of the undergraduates, urged that future students should have a better academic preparation before they went to the UK. Some of the research students arrived hoping to obtain a higher degree, but without prior training in research and without any clear idea about their work. To make up academic deficiencies, many had to put in extra work. They used up much valuable time in acquainting themselves with research techniques, and were only able to begin actual research after they had spent almost half of their available time and financial resources. They found the demands of the British universities both higher and different from those of India. It was not so difficult to make up for deficiencies in their knowledge of the subject, at least to some extent, by extra work, but it was more difficult to unlearn habits and acquire new attitudes of mind. As one student explained:

"In India, a student is given credit if he is merely able to memorise a number of quotations. Here, the teacher judges him by what he writes after these quotations, how he interprets them .... Here it is not enough only to know what others think, it is also essential to think for oneself. The transition from one approach to another is difficult, and takes some time and, of course, adaptability."

One of the main anxieties for many post-graduate students was their transfer from a Master's degree to a Ph.D. There is an appreciable difference between the two degrees in India, where the social and professional recognition of the Ph.D. is much higher. Many post-graduate students had registered themselves for a Master's degree, because they could not get direct admission for a Ph.D., and hoped to be transferred retrospectively to the latter after a year or so. Some found themselves in a difficult position when, with only a few months left to prepare for the Master's degree examinations, they were finally told that they could not be upgraded to Ph.D. An adviser to overseas students has commented that this has been a source of frustration to many "students who had to leave the university with a degree qualification lower than they had hoped to get, e.g. a Master's degree instead of a Doctorate." This put a great strain on the older students, particularly those who had already worked for a number of years in responsible jobs in India before going to the UK.

COMMON AGRICULTURAL POLICY

From Our Special West European Correspondent

PARIS, January 21.

NONE of the products covered by the joint agricultural policy that has just been sketched by the Common Market is of direct concern to India's foreign trade. (One forgets that protective duties for cereals, which caused so much trouble at Brussels last week, date from the time when cheap Punjab wheat was flooding Europe!) So the length and Byzantine complexity of the negotiations probably exhausted Indian interest in the affair; now that they are concluded, one ignores the details and retains only the fact that the Six succeeded in the intricate task they had set themselves. And indeed this is the main point. Whether the farm policy they have worked out is a good or bad one is a question that only specialists can judge and that only time will settle; and besides, which nation has a "good" farm policy?—certainly not the USA, Russia or Britain, all of whom have incoherent and uneconomic agricultures. The Six may have done no better, but the important fact is that, for the first time, a group of nations have managed to adjust the tangle of special interests that govern farm policy everywhere. GATT has completely failed on this chapter, and has never been able to get beyond trade in industrial manufactures; while the seven-nation Free Trade Area never even tried.

The Six took a long while about it, but then experts who participated in the Brussels battle estimate that it would have taken at least a year, if not two, to get a similar programme through a national parliament. At the risk of being disrespectful to parliamentary democracy, one is tempted to note that the issue of farm prices can be dealt with rationally only when it is taken away from the parties and lobbies who rule in national parliaments, and handled in the eminently undemocratic style of diplomats and technocrats horse-trading behind closed doors. Notice too that the plan worked out in Brussels, which will decide the future of tens of million of peasants and affect the lives of 160 million consumers, will not even be submitted to parliamentary ratification in any country; if it were, it would no doubt be rejected, because in every country there will be some powerful vested interest that finds its profits threatened. Since West Europeans talk so much about parliamentary democracy, it is worth noticing that they have succeeded in this vital and difficult affair only by pocketing [illegible]

Of course, they would have consented to do so only in the name of something else that is, just now, more vital without being inconsistent in the long run with parliamentary democracy: European unity. The dispossession of national parliaments of their powers over farm policy signifies the appearance of a supra-national authority in this field. Under the new plan, the Council of Ministers will have a real legislative power, and it will exercise it, on many subjects, by majority vote, i.e. even the biggest countries, France, Germany and Italy, lose their veto power. This raises the question of some sort of all-European parliament to control the use of this power. Once a supra-national authority emerges, there must be some supra-national representation to check abuses, unless democracies are to retrogress to the [illegible] where economic affairs can be controlled by irresponsible powers. By opting for a supra-national solution of their agricultural difficulties, the Six have brought nearer the day when they must attend to their political unification. Meantime, what is striking is how far the joint farm policy is a European affair, to what extent it views problems in the light of general interests, rather than a mere contract between nation-states. For all the bargaining that went on in Brussels this month and last, the plan as it emerges is remarkably similar to the original proposals of the EEC executive, specifically the plan drawn up by M. Mansholt who used to be Dutch Agriculture Minister and is now vice-president of the EEC Commission.

One must dwell on this victory of the European ideal not only because it is the most significant political aspect of the farm-policy agreement but because of what it foreshadows for the negotiations with Britain, where agriculture will once again be the greatest stumbling block. Several national delegations entered the recent Brussels conference highly suspicious of the "supra-national technocrats" of the EEC Commission, determined to keep the discussion on a government-to-government plane, and to seek contracts bringing short-term benefits. It was soon evident that, on that basis, the talks would fail, and they would have broken down if it were not for the tactful and resourceful intervention of the Commission's officials, who displayed treasures of ingenuity and patience. Without seeming to override Ministers, they guided the course of the talks at every critical moment, and eventually managed the tour de force of getting the Six delegations to accept, in substance, M. Mansholt's plan. Those nations that made sacrifices—and all did, notably West Germany—did so in the name of the European ideal; and the delegation that is doctrinally most opposed to supra-nationalism, the French, found itself arguing for a joint or communal management of Europe's agriculture.

The Six will carry over this community-approach to the bargaining with Britain, whereas it is highly unlikely that—at this early stage, at least—the British will be moved by a similar attachment to European unity. London, perforce, will enter the negotiations with a list of vital interests to be protected, i.e. just the approach that the Six had to abandon lately in Brussels, in order to place themselves at the community point of view that inspired M. Mansholt's proposals. It is evident that the Six and Britain will be on different wavelengths for a time. The Brussels talks lead one to foresee harder going in the discussion of Britain's application than was at first imagined. Besides, it would be as well not to hide from the Commons, who are quite opposed to supra-nationality, the real meaning of the Common Market's joint farm policy. Not only does it entail a majority vote on numerous questions, but it will oblige a co-ordination of national farm programmes, limit freedom in writing trade pacts with third countries, deprive national authorities of the power to fix independent support prices, and in general reduce sovereignty in everything that touches agriculture. Eventually, a single support price for each product will be fixed for the whole region by a conclave of Ministers meeting in Brussels. True, some of the specific timetables set in Brussels last week cover only the next three years, after which there will be review; and if Britain is in the organisation in time, she will be able to influence later developments—but only to influence, for no one will have a lone veto power.

On the other hand, the victory of the supra-national Commission (while it will offend British political preferences) is a guarantee that the Common Market's farm trade policy will be essentially liberal, for the Commission has a less protectionist approach than several of the national governments. M. Mansholt, perhaps because he is a Dutchman, has it in mind that Europe should concentrate on farm products containing much

dded value" and gradually reduce its output of crops
t are really the raw material of more profitable pro-
cts, i.e. Europe will promote the output of products
animal origin (meat, eggs, dairy produce) and im-
t freely cereals from North America. This squares
h the real food needs of Europe's populations and
l cause less conflict with overseas producers of tem-
ate-zone foodstuffs.

Nevertheless, the formation of a common agricul-
al policy for this region inevitably awakens the fears
other food producers, notably the USA and the tem-
rate Dominions of the Commonwealth, so it must pre-
itate a round-table conference between the lot of them
what to do with their surpluses. This is where the
estion becomes of direct concern to India. A show-
wn between Europe's united farmers and the food
porters of the Americas, north and south, and the
mmonwealth will inevitably bring them face to face
th the reality that there is no solution for their dilem-
a as long as they are pouring expensive food on to a
orld market where there are few buyers with the
sh to pay for it. They will not recognise this at first,
turally. The Americans will press for freer entry for
eir immense surpluses into the Common Market,
ritain will try to place there as much as she can of
e exports of Australia and New Zealand, Denmark
ill have to squeeze into the association with surpluses
at duplicate Holland's, and everyone will complain of
e system of export-subsidies included in the Common
larket's programme. One cannot foresee how long
e nations concerned will keep up this bickering before
eaking down and admitting that you cannot fit a
quart into a pint pot, but they will have to admit it
in the end.

At that point, they will have to take further the proposition of M. Wilfrid Baumgartner at the GATT ministerial conference at the end of November. Roughly, the then French Finance Minister suggested that the well-fed West as a whole would need to adopt something like the Common Market's joint farm policy, on a larger scale and suitably modified. The essence of this is the cautious introduction of as much free trade in primary produce as is consistent with the preservation of national farm groups whom no one wants to sacrifice; the joint fixing of support prices high enough to maintain the living standards of those under-privileged groups but low enough to discourage constant over-production; and then—granted that surpluses will continue to be produced—joint financing of their disposal. At the Common Market level, this joint financing means that West Germany will, in a few years, be subsidising the export of costly French surpluses, which will have the effect of worsening the situation in world food markets, by increasing the excess of supply over effective demand. But if the West as a whole adopted this policy, it could only mean that all the advanced nations were financing the disposal of their net surplus in regions outside the zone of well-fed peoples. In short, they would be channelling their excess food to that part of the world—and it is the greater part—where men today cannot eat their fill. It is as the first step toward this rational solution of the West's agricultural problems that the Common Market's agreement last week has its historic importance.

important beginnings

In December 1911, Bihar acquired the status of a separate province. This marked the dawn of a new phase in the history of this ancient state.

The birth of the new province synchronised with another epoch-making event. In December 1911, shattering the silence of the jungle hamlet of Sakchi, as Jamshedpur was then called, the newly-built Tata Iron and Steel Works roared into life and produced the first cast of pig iron. The commissioning of India's first iron and steel works helped to put Bihar on the industrial map of India and to set the country on the path to economic maturity.

In the course of fifty years, with the steel works as its nucleus, Jamshedpur has grown into a major industrial centre in India and the second largest city in the fast-developing State of Bihar...a city where industry is not merely a source of livelihood but a way of life.

Economic Report from the U.S.

FEDERAL BUDGET

By GUY SIMS FITCH

WASHINGTON, January 18.

ANY national budget obviously must be designed to carry forward efficiently the legitimate activities of government. Beyond that, an enlightened fiscal policy will also seek to achieve a relationship between receipts and expenditures that will contribute to economic growth, high employment and price stability. These objectives are inherent in the Federal Budget President Kennedy has submitted to Congress for the 1963 fiscal year, which begins next July 1. At first glance, there is a seeming paradox in this situation, with a budget that appears to be expansive and restraining at the same time. Yet closer examination demonstrates that the two elements are not at all contradictory. The budget is expansive in the sense that it will contribute significantly to the nation's economic growth and strength. It calls for Federal expenditures of $92,500 million, an increase of $3,400 million over estimated outlays for the current 1962 fiscal year ending June 30.

These expenditures would make it possible for the Federal Government to meet all its priority obligations —not only in such fields as national security and foreign aid, but also in such diverse areas as space exploration, scientific research, education, urban improvement, and expansion of employment opportunities. Projected expenditures have been curtailed, postponed or eliminated only for those purposes deemed clearly marginal under present circumstances to the growth, strength and international responsibilities of the U.S. At the same time, the budget would act as a restraining force in the economy in the sense that fiscal 1963 estimates envisage a slight surplus of $500 million in the U.S. Government's accounts. This surplus is based on the expectation that budget receipts will total $93,000 million, a substantial gain of nearly $11,000 million over estimated receipts for the 1962 fiscal year. Since these anticipated receipts are related to projections about the state of the U.S. economy, it is evident that the Kennedy administration is looking forward to a continuation of the U.S. economic upturn in the year ahead. The thinking is that the gross national product (GNP), or total output of goods and services, will reach an annual rate of better than $580,000 million by the fourth quarter of the current year. Recent calculations have put the rate achieved during the fourth quarter of 1961 at about $540,000 million, and this may be revised upward slightly when an official estimate is released next week. This rising level of output is expected to bring with it substantial growth in personal incomes and business earnings, with consequent increases in government revenues from individual and corporate income tax payments. It is entirely possible, of course, that the rate of economic advance, which has been noticeably brisk since the early months of last year, may slow down a little during the second half of this year and the first half of 1963 as the economy comes closer to full capacity operations. But whether it slows down or not, the advance is expected to continue.

Judging from past experience, an economic upsurge generally can be expected to last 30 months or more. Continuation of this pattern would see the current period of expansion extending well into 1963, at least. In fact, the administration is hopeful that appropriate government policies will help the economy move ahead for a much longer period. What has been discussed so far is the so-called administrative budget for fiscal 1963, which is essentially the traditional projection of programmed Federal spending. But the essential soundness of the Federal financial picture is reinforced by other types of budget calculations. Federal accounts on the basis of the consolidated cash budget, for instance, show an estimated surplus — an excess of receipts from the public over payments to the public — of $1,800 million. This cash budget combines the regular administrative budget with other types of Federal activities — mainly the social security, highway and other trust funds. Most optimistic of all is the budget projection based on what are known as the national income and product accounts, which use accrued rather than cash receipts and expenditures, and include only transactions directly affecting production and income. This method of accounting, which is regarded by many experts as the most accurate representation of the actual state of Federal finances, indicates a surplus of $4,400 million for fiscal 1963.

The fact that the Federal government is expected to operate with a moderate budget surplus — no matter how it is figured — during the 1963 fiscal year is considered particularly constructive at this time. A deficit of any substance during a period of rising economic activity, when prospects are favourable for continuing expansion in consumption and investment, might only increase the risk of inflationary pressures, and will be damaging both to the domestic economy and the international balance of payments. On the other hand, some slack still is evident in the use of productive facilities and manpower resources. Thus, a large surplus, with its deflationary influences, would run the risk of choking off the economic expansion before it reached its full potential and of contributing to a premature downturn. Under the existing circumstances, therefore, a surplus of the general magnitude projected for fiscal 1963 is regarded as the most appropriate to meeting the nation's needs and objectives.

Some Company Law Problems

By CROESUS

IT could not have escaped anyone who has followed the proceedings at annual general meetings of joint-stock companies in India, particularly in Bombay, over the past 25 years, that steadily rising number of shareholders, especially equity owners, have been taking increasingly keener interest in the working of these companies. We owe this, in a very considerable measure, to the indefatigable efforts of a few individuals, like the late Mr. Jagmohandas Kapadia, who was responsible for founding the Bombay Shareholders' Association, and Mr. Shamdasani. Although, to begin with, they were probably interested in the working of only a few selected companies in which they might have had a professional interest, some discoveries they made presumably led them to extend their sphere of activities. Both were well-read and well-equipped, especially Mr. Jagmohandas, who was once aptly described as a "Veritable Walking Dictionary on both Company Law and Income-Tax Law". It is no exaggeration to say that the Company Law we have today would not be what it is, but for the unflinching labour of love of Mr. Jagmohandas. I can vividly recall his rushing to me for a copy of the Cohen Committee Report on Company Law in the U.K. immediately after reading an editorial on the subject I had written in "Commerce" after managing to secure the first copy that reached India and the several fruitful discussions that followed after he had gone through that Report. Anyone claiming to serve shareholders must first make obeisance to the memory of Mr. Jagmohandas and then start his work, taking care, at the same time, to become as well-equipped as was that great man (may his soul rest in peace!).

The late Mr. Jagmohandas' institution, as also his work is, of course, being continued, albeit in a modest way, thanks to the interest of a few educated young brokers. It is a pity that an organisation avowedly functioning for the benefit of shareholders should have more broker-shareholders than non-broker shareholders. This is not the fault of broker-shareholders. Nor am I suggesting that broker-shareholders must not be members and take active interest in the affairs of such associations, but, in order to lend balance and so as not to give the semblance of a Cabal of vested interests, shareholders' associations ought to have a fair sprinkling of shareholders drawn from all walks of life and from all over the country. This should not be impracticable, inasmuch as we are having more and more shareholders, thanks to a bulk of the expansion of our economic activities entailing an expansion of our corporate sector; further, more and more of these shareholders have begun to attend and take part in company meetings lately. One has to attend the annual meetings of the Tata Iron and Steel Co. Ltd., or the Associated Cement Companies Ltd. to believe this. In fact, the growing attendance has compelled the managements of these companies to hire out the biggest hall in the city—Birla Matusri Sabhagar or Sunderabai Hall—to hold these meetings.

Until I listened to the address of Mr. P. A. Macrory, Secretary of Messrs. Unilever Ltd. (London) to the Company Law Association last Monday, I felt hopeful that more shreholders would join these organisations and take an active part. But when he revealed that, out of about 190,000 shareholders of his company, not more than just 26 evinced any interest in what both the management and the Financial Press in the U.K. expected would raise a storm of controversy, I am beginning to despair. After making all allowances for several shareholders living hundreds of miles away and their other pre-occupations, not to speak of the difficulty of getting accommodation on the day or days needed, whether in trains or planes, or even in buses, I am afraid the number can never be much. My expectation of a maximum attendance at any company meeting does not go beyond 1,500 for some years to come. Maybe, there will be a marked improvement if the companies concerned undertake to arrange for free travel to and fro, free accommodation, free food, and free transport, if only for the day of the meeting, at the place of meeting, but how many of our companies—or, for that matter companies anywhere in the world—can afford this seemingly necessary luxury? If even a fairly representative, let alone a large, body of shareholders, cannot be present, then, for a variety of reasons, into which I need not go here now, one may well ask: where lies the security for the shareholder? It is here that I thought Mr. Macrory had a more or less acceptable dictum to offer, when he said: "Every company has a triple responsibility—responsibility to its shareholders, responsibility to its employees and responsibility to the public (in particular, the customers)". But I was not prepared for the remark that immediately followed, namely that "this is not the strict test of the present Company Law in the U.K." I wonder whether the Jenkins Committee which is perhaps drafting—if it has not already drafted—its report on the amendment to the present Company Law in the U.K. will have an answer to offer. Here, again, after hearing Mr. Macrory, I must say I don't feel quite hopeful. For the consensus of opinion among those who have tendered evidence to the Jenkins Committee in particular and the British public generally would appear to be that as the 1948 Act has worked well on the whole, there cannot be any great changes.

Even so, I feel, it would not be out of place for me to tell the readers of this column something about what the public in the U.K. think about some of the company law problems that interest us here, on the basis of Mr. Macrory's address.

(i) **Shares of no par value:** On this question, about which there have only recently been some discussions in the Indian Press, I gathered that a majority of the people in the U.K. are in favour, so that the new version of the Company Law in the U.K. to be based on the Jenkins Committee recommendations would probably provide for it. Two of the arguments heard in favour, I believe, are that (1) this would avoid the confusion among a considerable section of the public as between the face value (paid-up value) and the market value of a given share. (It is amazing that, despite all the education by the fairly old and established Financial Press in the U.K., such confusion should still persist!); and that (2) labour interests keep on pointing to high dividends (conveniently calculated as a percentage of return on the face or paid-up value) as fleecing the labour and the public. Here, again, it is not a little surprising that the public—atleast some shareholders thereof—(not only in the U.K. but probably everywhere) should be so gullible as to swallow this half-truth, if not a lie.

(ii) **Voting rights:** The provisions in the present Company Law in the U.K. are believed to be not quite satisfactory and there is an insistance on making a clear demarcation between shares owned by the promoters or other interested parties usually styled as 'A' or 'B' shares and holdings of the general ity of shareholders. The demand particularly of the Stock Exchanges, it would appear, is for specifically styling the former as non-voting shares.

(iii) **Disclosure of ownership of shares:** This problem is not unknown to us and arises e pecially in the case of nominee holdings. About 40 per cent of those who tendered evidence before the Jenkins Committee are believed to have demanded a disclosure, partial or full, if the holding by any one party should exceed 10 per cent of the total paid-up capital of a joint-stock company.

(iv) **Disclosure of parties interested in take-over bids:** Here too,—by no means an unfamiliar trend to us—there would appear to be more and more public pressure for disclosure of the interests concerned. This is not surprising that, in the year 1961 alone, there were reported, in Britain, as many as 21 prop sals for mergers or take-overs, the combined assets in the largest of these aggregating as much as £900 million.

(v) **Transfer of shares:** I was under the impression that it was only in our country that the procedure for transfer of shares was so complicated and cumbersome. But even the U.K. obviously is no exception, considering that there is stated to be a growing demand there also for simplifying the procedure. One suggestion, I believe, is that this should be left to the stock and sharebrokers so as to eliminate avoidable delay and red-tape.

(vi) **Accounts:** The stress in regard to accounts would appear to be rightly on providing a correct view of fixed assets, in the context of frequent revaluations of assets by unscrupulous persons.

(vii) **Annual returns:** An interesting suggestion which seems to be confronting the Jenkins Committee is that for doing away with the provision in the Company Law to furnish information regarding shareholders every time, when the number of shareholders of a company runs into several thousands. Considering that even the hoary provision requiring directors to sign all share certificates has been amended in exceptional cases, it is not improbable that this demand too would be conceded.

(viii) **Qualification shares for a director:** There is no provision in the British Company Law on this point, but the stock exchange authorities there have certain regulations. Public opinion would still seem to be crystallising on this question. For instance, there is a school of opinion that wants that no whole-time directors should be subjected to such a requirement. In view of the increasing trend for more and more directors to be whole-time directors, especially if they happen to be drawn from the technician or expert staff who are slowly coming into their own (this is so even in this country) there is validity in this argument.

(ix) **Directors' duties:** Incidentally, the foregoing demand raises the question of what should be the duties of directors. (In India, we may have to ask also: what should be the duties of "deemed directors", a special creation of our new Company Law, even as the term "deemed public-limited company"). There is a feeling in the U.K., we are told, that these duties require to be clearly defined, in the context of the controversy as to whether (and if so, how far) the Directors' powers should be curtailed and those of shareholders increased. Mr. Macrory was brutally frank when he said that there was a lot of woolly talk on the subject of more powers to shareholders, in that not many shareholders care to evince interest in the working of their companies, the greater percentage being content to receive a steady and handsome return on their investment. He, therefore, suggested: "Give them sufficient information at frequent intervals to enable them to decide whether they would like to keep on the investment or switch over to another or to retain or remove the management. Shareholders should be treated neither as sheep nor as sacred cows"!

Generally speaking, Mr. Macrory seemed inclined to the view that shareholders ought not to be allowed to be unduly inquisitive. For he asked: Do investors in government securities ask the Government to answer all and sundry questions? This maybe a very clever question, but it does not provide an answer to the question of safeguards for the investor. Unlike in the case of a Government, there is no parliament of shareholders. However, one must agree with Mr. Macrory that the best safeguards for our investor lie in the Stock Exchanges and the Financial Press, but I must enter a caveat here: 'provided both the authorities and the company managements look upon these two in this spirit'. Unfortunately, if the stock exchanges are always suspect in the eyes of our Government, the Financial Press, even such as we have today, is often looked upon by company managements with an air of lofty patronage. With the removal of untouchability, Harijans may have access to the sanctum sanctorum of our most sacred shrines, but even the seniormost financial journalist in the country cannot have access, as in the U.K. (in that country, a financial editor is, in fact, specially invited and his views are eagerly solicited) to some of the captains of our industry even for days together. So 'busy' are some of them!

(x) **Donations to political parties:** This would appear to be much taken for granted that no one (excepting, of course, the Trade Union Congress) seriously wants any change. The directors have the discretion to make donations to any political party or to any charitable purpose, only bearing in mind the best interests of the company, but there would appear to be a growing insistence on the amount being disclosed at the end of every year. We can at least flatter ourselves that we have already anticipated this change.

Business Notes

Co-operatives

REMARKABLE BUT UNEVEN PROGRESS

DESPITE THE remarkable progress recorded by the Co-operatives between 1951-52 and 1958-59, their level of development was rather uneven as between one selected district and another, according to the Report of the Third Rural Credit Follow-up Survey which was recently conducted by the Reserve Bank of India. This unevenness in the development, the Report observes, was mainly due to factors relating to co-operative planning, structure of the Movement, and working of the Co-operatives. Thus, among the five selected districts, the proportion of cultivating families borrowing from Co-operatives increased from 4 per cent to 31 per cent in Ahmedabad, from less than 1 per cent to 13 per cent in Hissar, and from 4 per cent to 11 per cent in Mirazapur, while in the rest of the two districts, namely Cuddapah and Jalpaiguri, it was negligible. The report also says that the average borrowing from Co-operatives rose from Rs. 22 to Rs. 188 per family in Ahmedabad, from less than one rupee to Rs. 75 in Hissar, from Rs. 4 to Rs. 9 in Mirzapur and from Rs. 7 to Rs. 12 in Cuddapah. It is noteworthy that borrowings from the Co-operatives as a portion of total borrowings also showed a sharp rise from 6 per cent to 42 per cent in Ahmedabad, from less than 1 per cent to 14 per cent in Hissar, and from 3 per cent to 7 per cent in Mirzapur.

Another important finding of the Report was that the average size of the cultivated holdings was fairly large in Hissar and Ahmedabad, but relatively smaller in other districts. Except in Jalpaiguri, in all the districts, the Report disclosed, the cultivated area was concentrated in the hands of big and large cultivators. In all the districts, excluding Mirzapur, a high proportion of output (ranging from 44 per cent to 59 per cent) was sold by cultivators. Ahmedabad and Cuddapah showed a fairly high degree of commercialisation and monetisation, followed by Jalpaiguri and Hissar, while Mirzapur revealed a still low monetised subsistence type of economy.

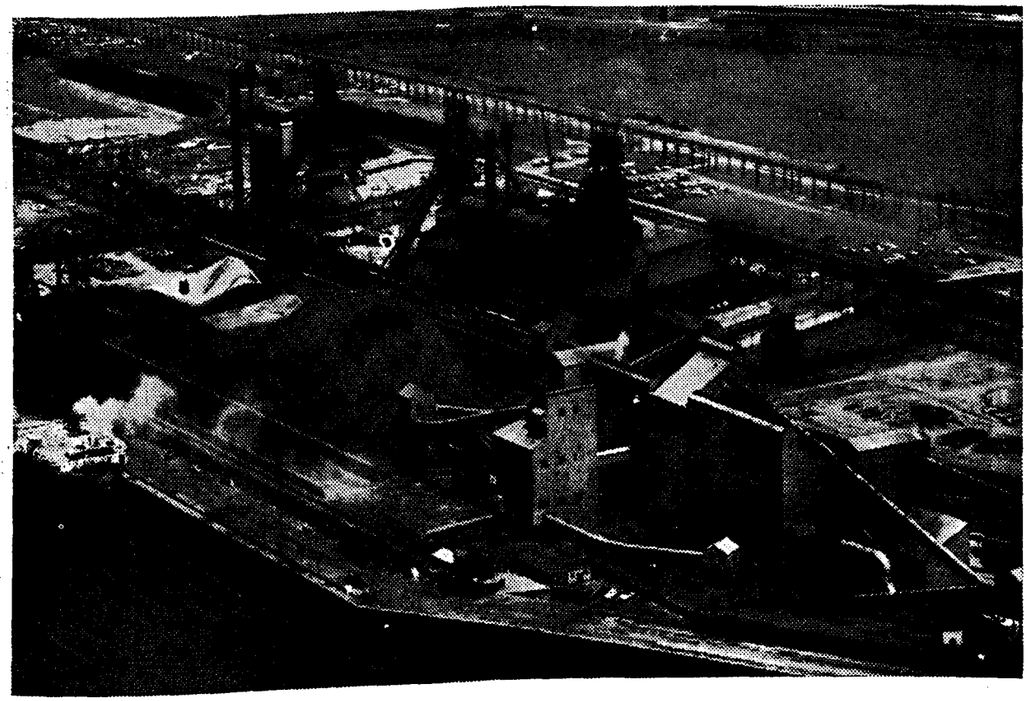
At the end of the Survey year, according to the Report, the outstanding debt was still quite high. While, in Ahmedabad, Cuddapah and Hissar, it ranged from Rs. 640 to Rs. 800 per family, it was around Rs. 200 in Mirzapur and considerably low at Rs. 33 in Jalpaiguri. Furthermore, the latest Survey would appear to have disclosed a substantial rise in the proportion of indebted families, as also in the average debt per family, when compared to previous years. The major purpose of borrowing in all districts, except in Ahmedabad, was generally for family expenditure; in Ahmedabad, the current expenditure on agriculture accounted for 57 per cent of the total borrowings. The rates of interest charged were relatively higher in Mirzapur and Hissar, as three-fifths or more of the borrowings were obtained at rates exceeding 18 per cent. It is revealing to note that, of the total borrowings, a major part was still being contracted from money-lenders and traders in all the districts, except Ahmedabad; only about 42 per cent of the total borrowings of cultivators in Ahmedabad was provided by the Co-operatives, while it formed still less at 14 per cent in Hissar and lower still at 7 per cent or less in the other districts.

The Report has emphasised among other, the need for reorientation of the loan procedure, for introduction of the crop loan system, and for making the primary credit society a 'Viable Unit' so that it might employ a full-time trained Secretary.

Agriculture

PACKAGE PROGRAMME FOR OILSEEDS

THE INDIAN CENTRAL OILSEEDS COMMITTEE (I.C.O.C.) has recommended, at its 15th annual general meeting, held in Madras recently, a 'package programme' for oilseeds production in the country. The programme, covering 25,000 acres in each of the major oilseeds-producing states, namely Uttar Pradesh, Maharashtra, Madras, Andhra Pradesh, and Mysore — it is later hoped to extend the scheme to Punjab also — entails on outlay of Rs. 15 lakhs, and embraces intensive production of oilseeds, through supply of selected seeds, resort to improved agricultural practices, adoption of greater plant protection measures, and application of better fertilisers. The I.C.O.C. feels that the implementation of the programme should yield a 40 to 50 per cent increase in the production of oilseeds. The Committee has also taken certain decisions regarding the Integrated Oilseeds Development Schemes which have already been launched in some States. Following these decisions, the expenditure on this programme has been pruned from Rs. 200 lakhs to Rs. 213 lakhs, and further, this expenditure is to be borne by the Centre and the State Governments concerned on a fifty-fifty basis. In the event of higher expenditure by any State, however, the Committee has agreed to extend some monetary help.



Yet another important decision taken by the I.C.O.C. relates to technological research which is estimated to cost another Rs. 25 lakhs. The proposed research programme is to consist of experiments in milling extraction of oil, research on cottonseed oil and also castor oil. More significant than even this is the contemplated research on a variety of non-edible oils like neem, with a view to ascertaining their suitability for industrial purposes. If the results are satisfactory, this would mean a welcome decline in the pressure of demand for our edible oils. This research is to be jointly conducted by the Council of Scientific and Industrial Research at the Oilseeds Laboratory in Hyderabad, the Oilseeds Technological Institute in Anantapur and the Department of Chemical technology in Bombay, as also the Technological Institute in Kanpur. In this connection, several proposals were also dismissed by the I.C.O.C. for exploring the uses of sesame, linseed, rape and mustard seeds in a greater measure than now inside the country, so as to permit of as much as possible of groundnut and other oilseeds, for which there has been a great demand abroad, to be exported.

As a result of action to be taken on these lines, it is hoped, the Third Plan target of 98.2 lakh tons oilseeds output would be achieved. The porgramme is believed to be practicable by the concerned circles, in that it is realistic, especially as there has been no glib talk about bringing more land under oilseeds cultivation. Not only oilseeds, but practically everyone of our cash crops is in the unenviable position of being unable to extend the area under its cultivation. Intensive cultivation and application of modern and scientific methods of farming would appear to constitute the only royal road to richer harvests of many of these precious foreign exchange earners of our country.

Cement

RISING COSTS

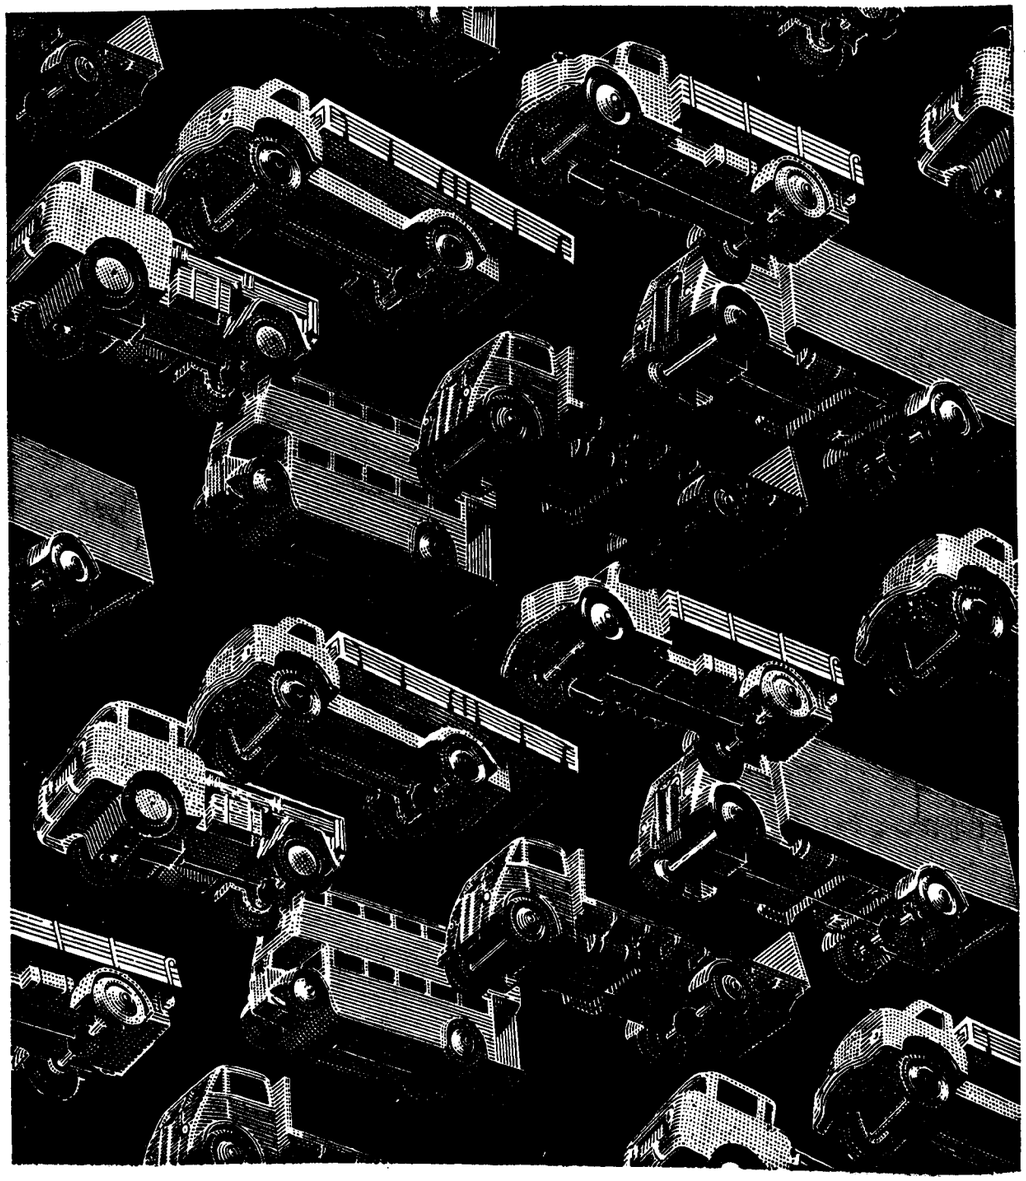
SHRI DHARAMSAY M. KHATAU, Chairman of the Associated Cement Companies Ltd. at the annual general meeting reviewed the conditions that led to rather disappointing results of the company during the

Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.



Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

New avenues of progress

The rapid development of India's road transport has opened up new avenues of progress. Diesel trucks, lorries and buses now link every part of the country...carry goods and people to once-remote areas. With the growth of road transport has grown demand for High Speed Diesel Oil. Today over 1 million tons are consumed.

By the end of the Third Plan the country's needs will increase by 117.2%. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth, and Burmah-Shell believes that

for tomorrow's needs we must act today

year 1960-61. The year, he pointed out, had witnessed a progress for the cement industry in the country in terms of increased production and dispatches but the rather gloomy picture in terms of profits was due to the rising costs of materials and services which offset the benefits accruing from increased output. The cost of coal which had been rising during the last few years was perhaps one major factor which led to this increased costs. Apart from the price, shortages and deterioration in the quality of coal supplies further created problems for the industry. The coal shortages, Mr. Khatau added, could, however, be got over as a result of the timely action taken by the Ministry of Commerce and Industry following the representation by the company. But the Government's policy to conserve high grade coal for consumers like steel plants and railways led to certain complications.

Mr. Khatau further indicated that the introduction of new B.O.X. type wagons introduced by the railways were responsible for considerable shortloading of coal. Apart from this the paucity of railway wagons which to some extent was aggravated by the strike of Central Government employees in July 1960 also influenced the results of the company adversely.

Another factor that caused higher costs was the Government's arbitrary decisions in fixing the packing charges for cement for the last quarter of 1960 below rates recoverable from consumers. An urgent representation by the company ultimately persuaded the Government to allow the industry to pack a portion of its cement in sound reusable bags as from January 1, 1961. The decision in itself quite welcome, was vitiated by the fact that a charge of Rs. 13 per metric ton fixed on the average packing charge for new and used bags taken together was low and unrealistic. It was only after further repeated representations that the Government adopted a realistic basis for fixing the average cost of new and reusable packing materials. Some damage was done during the intervening period.

Another factor which led to rather discouraging results was the fact that the price revision by Tariff Commission was awaited by July 1961 when the previous formula was to expire. The revised price, however, came into effect only on November 1, 1961, thus putting the industry to a further loss of earnings. The Chairman expressed satisfaction in regard to the fact that the general approach of the Tariff Commission to the question of revision of cement prices was by and large quite fair. It revealed a sympathetic awareness of a difficulty which the industry had to face. But the effective increase recommended by the Commission will not cover the full requirements of the industry and the Government further scaled down even that increase in price of Rs. 12.11 per ton by Rs. 1.25 per ton. Moreover the Tariff Commission had recommended that the new prices should come into operation from July 1, 1961 and remain in force till June 30, 1964. The Government has however made these prices operative from November 1961 and extended the duration to March 31, 1966. In a period of steadily rising costs a fixed price for a period of nearly 5 years can possibly affect the industry adversely.

Paper

STAR PAPER MILLS TO RAISE CAPITAL

STAR PAPER MILLS LIMITED is entering the market to raise from the public a sum of Rs. 27,78,830 through 2,77,883 equity shares of Rs. 10 each. The issue comprises the residue of he 5,00,000 shares offered by the company some time ago to its existing shareholders. The list opens on January 29 and will close on February 7 or earlier at the discretion of the directors, but not before January 31.

The proceeds of the issue are proposed to be utilised for meeting part of the expenditure on the company's expansion programme which, according to the revised estimates, has cost it Rs. 415 lakhs. (The expansion plan has already been executed and the full rated production is envisaged to be reached shortly.) Two MG paper-making machines have been installed — one having a daily production capacity of 20 to 25 tons of thin substance paper and the other having a capacity of 30 to 35 tons of heavy substance paper. These machines are suitable for the manufacture of MG kraft paper of superior quality not previously manufactured in the country. Besides MG kraft paper, M.G. sulphites, pressings, Manilas, posters and other varieties of M.G. papers can also be manufactured by these machines. The present capacity of the company is about 6,500 tons paper output a year — mainly writing and printing papers.

The raw material for the manufacture of kraft paper is twisted pine wood. The company has obtained a long-term lease in Almora and Nainital forest divisions of U.P. to ensure adequate supplies of it. The company's plant is located at Saharanpur.

The Industrial Finance Corporation of India, which has already made available a loan of Rs. 137 lakhs for the company's expansion plan, has underwritten 50,000 of the shares offered for public subscription. The remaining shares have been under-written in varying proportions by the Bank of Baroda and three stock brokers of Calcutta and Delhi.

The new shares will rank, as regards dividend and in all other respects, peri passu with the existing equity capital, except that they will not rank for any dividend that may be declared in respect of the company's financial year ended September 31, 1961. The company declared a dividend of 12.5 per cent in 1955. But since then the rate of dividend has gone down progressively to 10.5 per cent in 1956, 6 per cent in 1957 and 1958 and 3 per cent in 1959. Dividend had to be gradually reduced due to increase in the company's share capital, which went up from Rs. 40 lakhs in 1955 to Rs. 70 lakhs in 1956, Rs. 87.85 lakhs in 1957, Rs. 100 lakhs in 1958, Rs. 123.25 lakhs in 1959 and Rs. 169.98 lakhs in 1960. The expansion programme, the directors think, will lead to substantial increase in the gross profit of the company during the current and the subsequent years and despite reduction in selling prices of paper and the rising costs of raw materials, chemical stores, fuels and overhead charges, the profit would be commensurable to enable declaration of reasonably good dividends.

Ball Bearings

SHRI RAM GROUP'S NEW VENTURE

A NEW enterprise, Bharat Ball Bearing Co. Ltd., is being added shortly to the Shri Ram group of industries. This company will have an authorised capital of Rs. 2 crores, of which Rs. 75 lakhs, consisting of Rs. 55 lakhs in equity shares and Rs. 20 lakhs in preference shares, will be paid-up in the first instance. The preference shares will carry a fixed cumulative dividend of 9.3 per cent per annum, subject to statutory deduction of tax.

The company proposes to set up its plant at Ranchi which has low humidity and narrow temperature variations, considered to be conducive to the attainment of high surface finish and precision so essential in the manufacture of bearings. Ranchi has been selected as the site for the plant on some other considerations as well as such that it is within easy reach of Calcutta where the bulk of the company's products will be consumed and Tatanagar and Durgapur from where supplies of alloy steel are to be obtained. The company

CORRIGENDUM

Regarding Announcement of Public Issue by

SESHASAYEE INDUSTRIES LIMITED

It is regretted that an error has crept in under the heading, 'Preferential Allotment' in the abovementioned announcement. The New India Assurance Company Limited and The Investment Corporation of India Limited have not been given any preferential allotment of shares as stated therein. The Investment Corporation of India Limited are the Underwriters only to the extent of Rs. five lakhs face value of equity shares offered for public subscription.

proposes to specialise in the manufacture of precision type bearings for fans, fractional horse-power motors, machine tools etc. The installed capacity envisaged is 2.5 million bearings a year.

The gross outlay on the project, it is estimated, will be of the order of Rs. 2 crores. Share capital will provide Rs. 75 lakhs. A 15-year loan of Rs. 60 lakhs has been arranged from the Industrial Finance Corporation of India. Another Rs. 35 lakhs are proposed to be secured through borrowings from the company's bankers. The current earnings of the company will provide the rest of the Rs. 30 lakhs. The plant is expected to be commissioned into production by July this year. The land development and building construction work has already been taken up.

The foreign exchange component of the project is estimated at Rs. 65 lakhs. The company has been given import licence under the U.S. D.L.F. credit.

Technical collaboration is being arranged with the Fafnir Bearing Company of New Britain, which is one of the largest integrated manufacturers of ball bearings in the United States. Fafnir will not only supply all the technical know-how and train Bharat Ball Bearings' technicians, but also make available to it the benefit of its research in the field.

The company is expected to go into the market for public subscriptions for the whole of the preference issue and Rs. 26.95 lakhs worth of equity shares sometime next month. The remaining equity shares have already been subscribed or committed for privately.

The Shri Ram Group has also plans to set up an integrated PVC-Calcium Carbide-Caustic Soda plant and a Rayon Tyrecord factory under the auspices of the Delhi Cloth and General Mills, a new sewing machine factory under the aegies of the Jay Engineering Works Limited, an integrated Tungston Carbide Tools Plant under the control of India Hard Metals P.L., and a plant for the manufacture of Sealed Compressor units for air-conditioner and refrigerators. The manufacture of Sealed Units is envisaged to be undertaken by a newly formed company which will float a public issue of shares sometimes in the middle of the current year. Technical collaboration for this project has been arranged with the Westinghouse Electric International Company, U.S.A. This plant is to be located at Hyderabad.

Engineering

MANUFACTURE OF CUMMINS DIESEL ENGINES

AT A press conference held recently, Mr. S. L. Kirloskar, Chairman of new Company Kirloskar Cummins Ltd., formed for the purpose of manufacturing cummins diesel engines in the country disclosed that an agreement has been arrived at between the two major companies Kirloskar Oil Engines Ltd. and Cummins Engine Company of the U.S. for the aforesaid purpose. The Government of India has approved of the agreement and a licence has been issued to the company to go ahead with its plans i.e. the manufacture of cummins diesel engines upto 800 h.p. The participation is on a 50-50 capital basis. At present Kirloskar Oil Engines Ltd. is manufacturing stationary diesel engines within the range of 3 h.p. to 440 h.p. The project will be located at Poona and is likely to go into operation within 18 months. Nearly 1,000 workers are expected to be provided with jobs at the works. The engines will be sold abroad through the Cummins international sales organisation. Cummins Engine Company of the U.S. is one of the largest concerns in the world and is already operating in Scotland, Australia, Japan and Brazil. Its service locations extend to 115 countries.

The authorised capital of the company is Rs. 3 crores and the issued capital Rs. 1.50 crores—all in equity shares. Of the 50 per cent of the capital to be subscribed by Indian participants, 25.5 per cent will be offered to the public. The company is likely to go in the market in April. That the issue will have an immediate response from the public is, of course, a foregone conclusion. It is because of the fact that the concern is very sound and the engines are going to have an expanding market. The terms extended to Cummins are quite favourable and they will get 2½ per cent commission by way of technical fees. The greatest advantage that will accrue by the production of these engines is that a good deal of foreign exchange will be saved. It is estimated to be round about Rs. 5 crores.

Indian Oxygen

BRIGHT PROSPECTS

THE STATEMENT circulated by Sir John Douglas Keith Brown, Chairman, Indian Oxygen Ltd., to the members of the company with annual report for the year 1961, presents a bright outlook for the company. It is also clearly visible that the company in the past has been faring pretty well. The profit for the year 1961 after providing Rs. 44,95,981 for depreciation and Rs. 36,25,000 for taxation, amounted to Rs. 71,30,284 as compared with the net profit for the previous year of Rs. 62,98,449 after charging depreciation of Rs. 37,10,806 and taxation of Rs. 38,85,900. Although the profit after taxation shows a fair increase over the previous year, it was earned at a relatively lower rate. This low rate can be attributed to increase in works costs and a shortage of power experienced by the company. Calcium carbide which has been giving unsatisfactory yields and has been in short supply has been one of the factors for this increase in works costs. Sale on the whole have been quite satisfactory and reached a level of just over Rs. 756 crores, about Rs. 1.1 crores higher than the previous year. This represents an increase of little over 17 per cent. So far as dividend is concerned it was maintained at the rate of 15 per cent.

Since the demand for industrial gases is increasing by leaps and bounds the company is considering the next phase of the expansion programme. Steps have already been taken to install three additional 400M3 oxygen plants in Jamshedpur factory to augment production from the existing plants. Production at the Bangalore factory has started and the oxygen plant set up at Gauhati in the Indian Refinery Ltd. will begin production soon. An industrial license for installing a secondary 400M3 oxygen plant in the Bombay factory was obtained during the year and arrangements are now in hand for its installation in order to increase oxygen availability in the Bombay area. Plans are also in hand to increase the production of electrods at the factory at Khardah near Calcutta. Steps have also been taken to supplement the machinery installed in the equipment factory at Beliaghatta and to extend the factory premises. It is hoped that the expansion and modernisation of facilities at the electrode and equipment factories will allow the production of not only larger quantities but also a wider range of products.

Regarding exports, Sir John underlined that measures have been taken to export nitrous oxide and electrodes on a bigger scale. With the successful execution of the plans, it is expected that the exports of nitrous oxide and the electrodes would increase considerably to the South-East Asian countries. Demand for company's products no doubt is bound to increase with the advance of industrialisation and with increased sales profits will not only be maintained but they might also show some reasonable increase in the years to come. From a record of the Indian Oxygen Ltd., it can be safely said that the tempo of progress would be maintained.

Shipping

SCINDIA STEAM NAVIGATION

AT THE 42nd annual general meeting of Scindia Steam Navigation Company Ltd., Mr. Dharamsey Mulraj Khatau, Chairman, revealed that the company was fortunate in making the nominal profit of Rs. 4.5 lakhs and declaring a dividend of 60 nP per share after drawing Rs. 25 lakhs from the Dividend Equalisation Reserve. The position cannot be said to be satisfac-

tory because cost of operating ships showed continued signs of increasing. There was also the problem of uneconomic rates of freight, serious delays and detentions to ships and reduced cargoes due to the deteriorating Hooghly draughts. Mr. Khatau pointed out that unless these problems were tackled expeditiously and the much needed relief and assistance given, the future of coastal shipping will continue to remain in jeopardy. As costs continued to increase, it was fair that there must be an upward revision of freight rates.

It is a welcome development that Mr. R. G. Abbhi, the Government's director on board of Indian Shipping Companies has been asked by the Government to go into the costs of operations on the coast and it is to be hoped that keeping every thing in view he would be able to recommend to the Government a level of freight rates for the coast which would not only take care of increased costs but would also give a satisfactory return to the companies and the capital employed in the coastal trade.

The Chairman felt that in view of the size of the company's business and fleet, it was very necessary to work out a steady programme of building new vessels every year. Since ships were ready earners of foreign exchange, it was imperative that requisite foreign exchange should be made available for the aforesaid purpose. So far as future prospects of the company are concerned, it is expected that as a result of rationalisation of services by all member lines of the India-U.K.-Continent Conference, the next year would show better results.

TIFR

IS FUNDAMENTAL RESEARCH FUNDAMENTAL?

ADVANCED STUDY and fundamental research into nuclear science and higher mathematics are as essential and important as any industrial project or economic programme, at any rate in this era of space science. Maybe, fundamental research will not yield direct or short-term results nor the knowledge stemming from it of any practical value, on the face of it. Even so, it is considered to be of vital importance to Society for two very valid reasons, among others: first, it helps train and develop young men of the highest intellectual calibre in a society into people who can think about problems with a freshness of outlook and make an original approach to them, such as what was instrumental for the invention of Radar and Atomic Energy (which have since turned out to be of immense use to humanity); secondly, the history of science teems with endless examples to establish that there is, in fact, no genuine knowledge of the universe that is not potentially useful for man.

Making these much-needed points, Dr. H. J. Bhabha, Director, Tata Institute of Fundamental Research (TIFR), disclosed, in the course of his speech at the opening of the Institute's new buildings at Colaba, (Bombay), that the establishment of the Institute was the outcome of the awareness and far sightedness of men like Mr. J. R. D. Tata, and the Government of Maharashtra. Incidentally, T.I.F.R. is the oldest of our post-war National Laboratories. As much credit is due for this achievement to Dr. H. J. Bhabha, whose drive, initiative and imagination it is that have primarily contributed towards this consummation, as Mr. J. R. D. Tata declared publicly, much to the embarrassment of Dr. Bhabha, though. Within a decade of its existence the T.I.F.R. came to be recognised not only as the National Centre of the Government of India for advanced study and fundamental research in nuclear science and higher mathematics, but al o as an important international institute. During the past sixteen years, besides conducting research, the Institute has trained scientific personnel for the Atomic Energy Commission and has facilitated the establishment of the Atomic Energy Establishment at Trombay, which is now producing most of the electronic instrumentations used at Trombay, including the control systems of reactions, as also others needed in agricultural, biological, industrial and medical work with radioactive materials. Prime Minister Nehru aptly described the T.I.F.R. as "the cradle of India's atomic energy programme", whilst formally opening the new buildings in which the Institute will now be fully housed.

It may not be out of place to mention some of the important inventions and advanced studies that the Institute has to its credit. These include, 'inter alia' the historic discovery of the 'K-Meson', a negatively charged particle which makes it possible, for the first time in the world, to use emulsions without glass backing for studying phenomena at high energies; the development of large plastic balloons capable of carrying loads of scientific equipment upto 250 lbs. to altitudes of some 110,000 ft. for high energy research, and the designing and construction of what has been termed a cloud chamber, which is operated by a special device, the only one of its kind in the world, for measuring the energy of particles upto a hundred thousand billion electron volts. In short, as Professor Niles Bohr, Nobel Laureate, said in his message that was read out on the occasion, the study of cosmic radiation which the Tata Institute has pursued so purposefully and with such success is a suggestive example of how co-operation between people living in distant parts of the globe and under different climatic conditions can be achieved by the exploration of nature. Needless to add, it is the intellectual eminence of Dr. Bhabha and his world-wide contacts which are mainly responsible for the international prestige and reputation that the T.I.F.R. enjoys today.

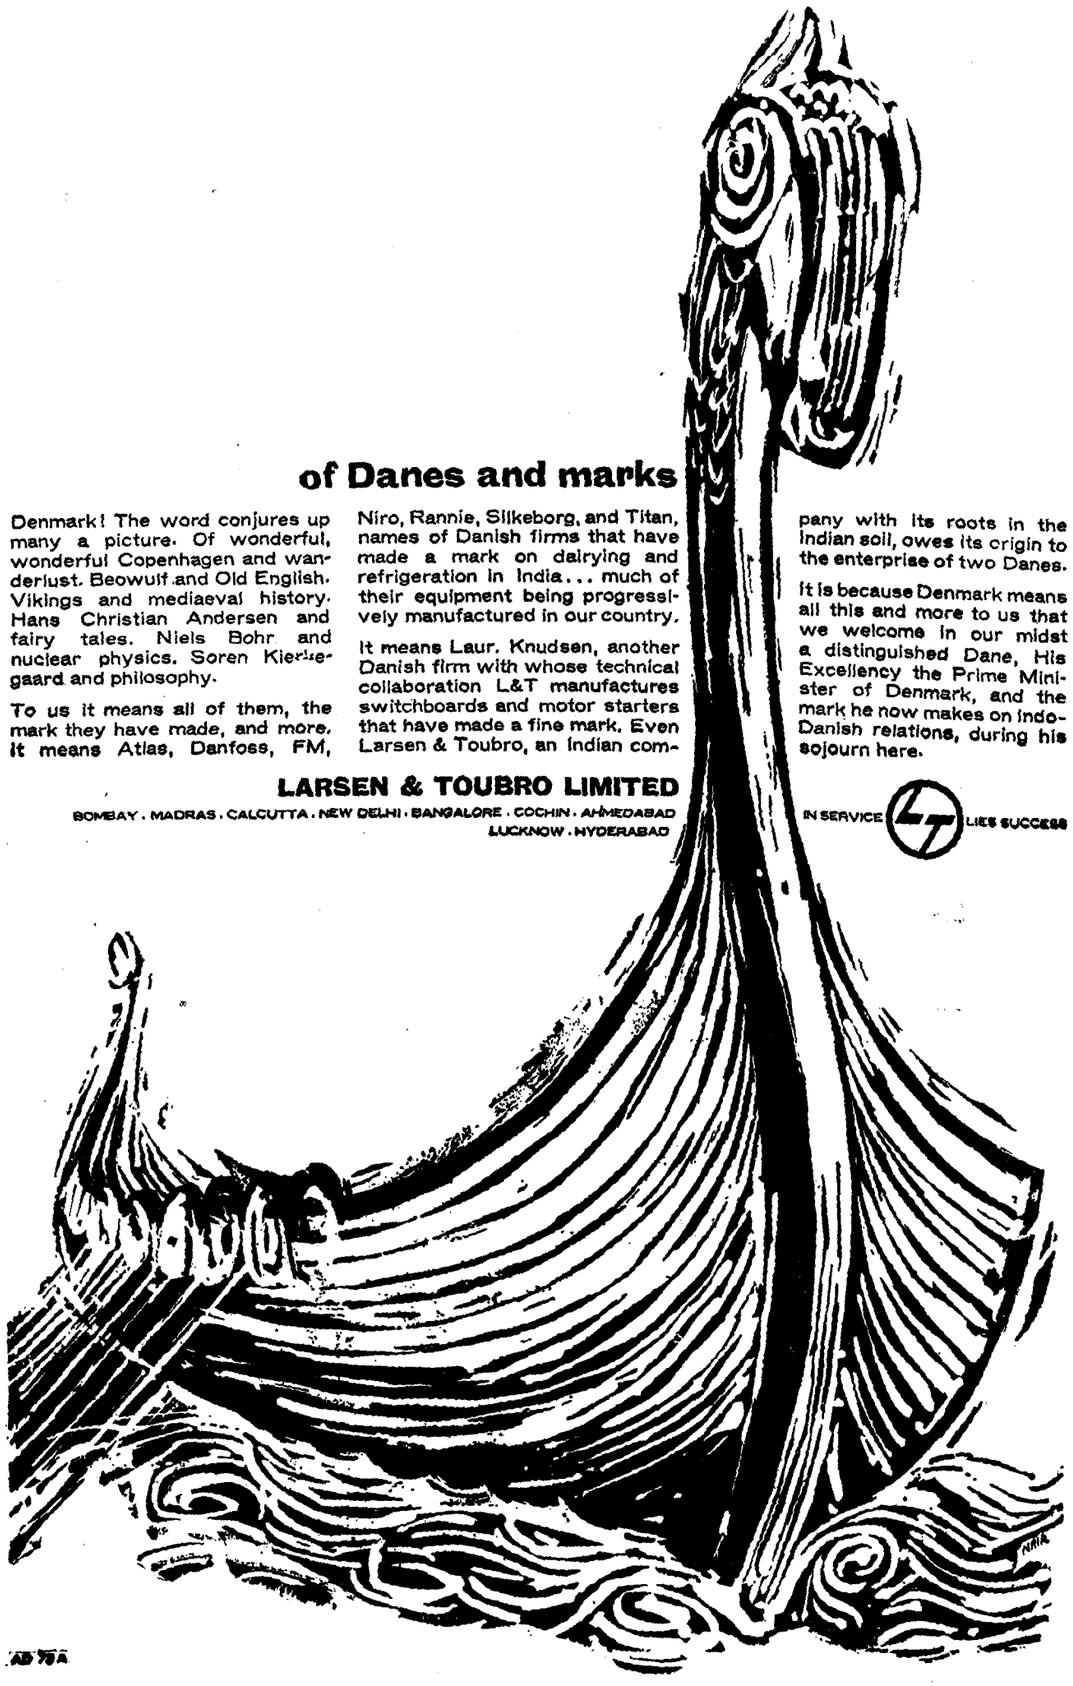
Foreign Trade

INDO-BULGARIAN TRADE

NOW THAT the Bulgarian Trade Delegation is in the country to hold trade negotiations with the Government of India, it is time to review the development of trade between the two countries over the past few years. At present the trade between the two countries is governed by the three-year Trade Agreement signed on March 3, 1960, under the terms of which trade is on a balanced basis and payments are regulated through non-convertible Indian rupees. The table below gives an idea of the trade between the two countries:

(Rs. lakhs)

Year	Imports from Bulgaria	Exports to Bulgaria	Balance of Trade
1956 ..	23	6	—17
1957 ..	13	2	—11
1958 ..	7	7	Nil
1959 ..	25	24	— 1
1960 ..	37	15	—22



It will be interesting to note that trade between India and Bulgaria has progressively increased during the last two or three years. While the total trade was to the tune of Rs. 49 lakhs in 1959, it was Rs. 52 lakhs in 1960 and Rs. 1.2 crores in 1961. During these years India has been having all along an adverse balance of trade. In 1960, the adverse balance of trade was Rs. 22 lakhs. Imports and exports both, of course, have been fluctuating. Imports were highest in 1960 and exports to Bulgaria were highest in 1959 in the table referred to above.

Exports from India to Bulgaria consist of mostly coffee, tea, cocoa, spices, hides and skins, leather and leather manufactures, textile yarn, textile fabrics and footwear. Imports from Bulgaria into India on the other hand consist of animal and vegetable crude materials, chemical elements and compounds, dyeing and tanning materials, medicinal and pharmaceutical products, electrical machinery, apparatus and appliances, scientific and controlling instruments, photographic and optical goods, watches and clocks.

Trade talks are being held in a favourable climate and it is expected that this might lead to encouraging results.

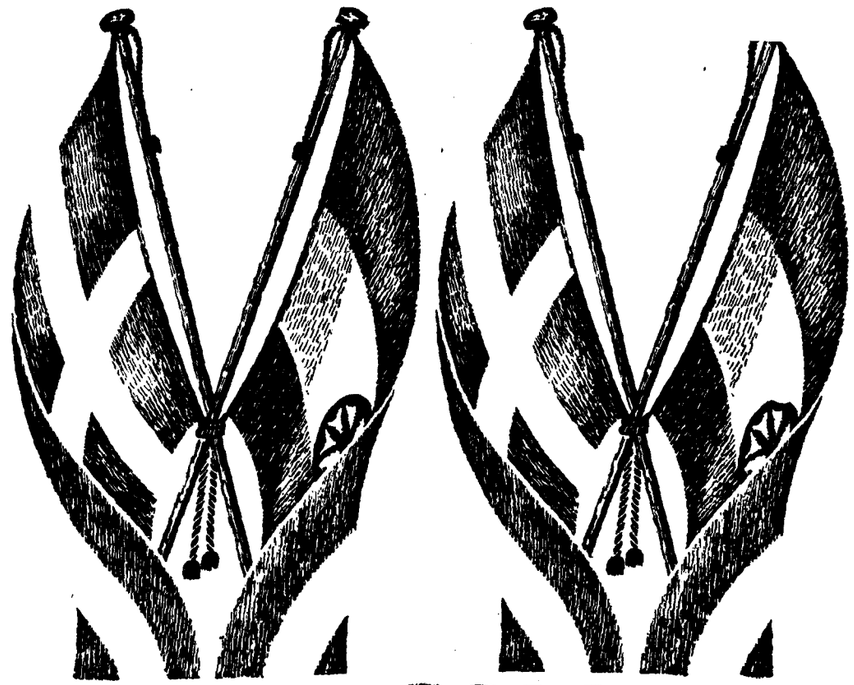
UNDER SECRETARY TO GOVERNMENT
1 FEB 1962
PUBLIC RELATIONS

of Danes and marks

Denmark! The word conjures up many a picture. Of wonderful, wonderful Copenhagen and wanderlust. Beowulf and Old English. Vikings and mediaeval history. Hans Christian Andersen and fairy tales. Niels Bohr and nuclear physics. Soren Kierkegaard and philosophy.

To us it means all of them, the mark they have made, and more. It means Atlas, Danfoss, FM, Niro, Rannie, Silkeborg, and Titan, names of Danish firms that have made a mark on dairying and refrigeration in India... much of their equipment being progressively manufactured in our country.

It means Laur. Knudsen, another Danish firm with whose technical collaboration L&T manufactures switchboards and motor starters that have made a fine mark. Even Larsen & Toubro, an Indian company with its roots in the Indian soil, owes its origin to the enterprise of two Danes.



It is because Denmark means all this and more to us that we welcome in our midst a distinguished Dane, His Excellency the Prime Minister of Denmark, and the mark he now makes on Indo-Danish relations, during his sojourn here.

NEW WRIST WATCH FACTORY

FULLER details are now available for the proposed wrist watch project likely to be located in Jammu. This project will also have Japanese collaborators, Seikosh Watch Company, Ltd., of Tokyo.

It will be recalled that the Government of India has, so far, approved four schemes for the production of 1,260,000 watches a year. One of them is the State undertaking, Hindustan Machine Tool Factory, Bangalore, which is in collaboration with Citizen Watch Company of Japan to manufacture 3,60,000 watches a year.

The proposed factory will be established with an annual capacity on single shift basis, of 4,80,000 watches as indicated below:

Year	Annual Capacity in Numbers
First	60,000
Second	1,80,000
Third	3,60,000
Fourth year and onwards	4,80,000

Imports of components will be on a sliding scale basis, as under:

	C.I.F. Value of imported components per watch in each phase
First phase (one year)	Rs. 13.31
Second phase (one year)	upto „ 8
Third phase (one year)	upto „ 3
Fourth phase (one year)	upto „ 3

The c.i.f. value of components from second year may be reduced by Rs. 1.33 per watch. In the first six months of the first phase of the manufacturing programme import of complete watch components for assembly of a limited number of watches is not ruled out. The import of both the components and raw materials will always be regulated by the Government's overall import policy in force, and announced every six months. From the fifth year onwards, however, no imports of any part is envisaged, except some quantities of main springs and hair springs under special circumstances.

The investment in the Project has been placed at Rs. 155 lakhs; Rs. 10 lakhs for land and building, Rs. 95 lakhs for Plant and Machinery and Rs. 50 lakhs for working capital. Thirty per cent of the total value of plant and machinery, namely Rs. 24 lakhs will be invested in the Indian company by the Japanese collaborator and the balance will be a loan to be paid as under:

i. No payment in the first three years from the last date of shipment of the machinery.

ii. Payment will start from the 4th year, extending over a period of 7 years, each annual instalment being 10 per cent, (about Rs. 8 lakhs) of the cost of machinery. Interest at the rate of 6 per cent per annum will be payable to the collaborator on deferred payments.

iii. The instalment payments referred to in (ii) above will be met from the export earnings of the wrist watches.

iv. The Indian firm expects to export 21,000 watches at Rs. 35 each (total value Rs. 7,35,000) annually in settlement of the dues. However, if larger exports are possible during the initial years, the extra foreign exchange earnings will be utilised for payment of imported machinery.

v. The import of components and raw materials will be financed by the foreign collaborator on a loan basis to be settled by export of watches.

The foreign firm will furnish complete know-how drawings/specifications etc. to enable manufacture of watches of a quality no less superior than their own product. They will also provide the facility for training Indian personnel in their works and send their experts for guiding the manufacture of watches in India. The foreign collaborator will furnish a guarantee on terms acceptable to Government to export watches from India of substantial value each year, in any case to cover the value of imported capital goods, components etc.

AID TO INDIA

Mr. T. Swaminthan, Additional Secretary, Ministry of Commerce and Industry, left for Bonn, West Germany on Tuesday, January 23, primarily to persuade the German Government to further step up its aid to India and later to lead the Indian delegation to G.A.T.T. meeting on textiles.

A part of German aid is totally untied, permitting India to utilize it to finance any project or on maintenance imports from any source. It will be noted that a portion of the United Kingdom and U.S.A. aid is also untied with the reservation that it can be used on purchases from these two countries. The rest of the aid is tied to projects.

To all appearances no new members are likely to join the Aid to India consortium, which meets in Washington on January 29. Indian aid is short by 220 million dollars for the Second year of the Plan. The commitment indicated for the United States in 1962-63, namely five hundred million dollars is related to the prospects of additional and commitments by other members, new or old. It has been estimated that if the U.S. were to abide by this undertaking, there would then be a gap of 440 million dollars for the second year of the Plan. The net effect of the gap in aid, if it remained unbridged, will be that certain projects awaiting financing, will be held up or may be crowded out into the Fourth Plan. By and large the gap will hardly have any effect on the tempo of industrial production during 1962-63, which, by better house-keeping, the Government expects to maintain, if not better, at least on the 1961-62 level. Incidentally, some Japanese businessmen are reported to have indicated their country's desire to step up its aid.

It may, however, be added that no agenda for the Consortium meeting has yet been indicated. What will be the size of the gap will only be known after the meeting. One view here is that this forthcoming meeting will largely be a stock-taking meeting, leading to another meeting, during summer, which should indicate foreign commitments for the remaining three years of the Plan.

AGENDA FOR E.C.A.F.E.

The Chief Controller of Imports Mr. Satarawala, is leading the Indian delegation to the Bangkok meeting of E.C.A.F.E., which commenced on January 22. This meeting is a prelude to the fuller Session, on ministerial level, commencing in Tokyo from March 6. The Bangkok meeting is likely to hold preliminary discussions on the K. B. Lal report, which has envisaged the organisation for Asian Economic Co-operation. A study of the working of the ECM and the European Free Trade Association will also be made by the Committee. Other items on the agenda are a review of the development of trade in the region and consideration of proposals for organising and Asian trade fair.

HIGHER COAL OUTPUT TARGET

The Coal Industry in the private sector which had submitted plans for 16.83 million tons of additional production in the Third Plan period has now raised the figure to 23.63 million tons following the grant of a loan by the World Bank. As the plan allocations are made on yearly basis, the Government has asked the Industry to go ahead with its plans for achieving the higher target. It is presumed that efforts would be made to secure foreign exchange for the additional 6.80 million tons in due course. Meanwhile every effort is being made to secure the rupee finances to match the World Bank loan for the private sector of the coal industry.

The National Coal Development Corporation, has similarly raised its target of additional production by two million tons thus raising the Plan target of 97 million tons to nearly 106 million tons.

The Government has also appointed a study team for assessing requirements of electric power for the coal mining industry in the Third Plan in the country. The team, with Mr. P. P. Agarwal, Joint Secretary, Union Ministry of Irrigation and Power, as Convenor, will also recommend steps to be taken to meet the demand for power by the coal mining industry during this period. Other members of the team are Mr. T. N. Idnani, Member (Utilisation), Central Water and Power Commission; Mr. Chhedi Lal, Joint Secretary, Union Ministry of Steel, Mines and Fuel; Mr. A. Zaman, Coal Controller, Mr. Balwant Singh Nag, Adviser, Planning Commission, and Mr. V. Kalyanasundaram, Director, Minerals, Planning Commission. According to the terms of reference, the team will assess requirements of power of the coal mining industry, collierywise and yearwise, examine the present position in regard to power supply, and suggest measures for augmenting it to meet future needs, year by year, in the Third Plan period. The team has also been asked to examine whether private licencees supplying power to collieries are utilising their full firm capacity, and if this was not being done, the team should go into the reasons for it.

The recommendations of the team will include revised allocations of power to various consumers of Damodar Valley Corporation power supply, keeping in view the requirements of the coal mining industry. The coal mining industry which is mainly concentrated in West Bengal, Bihar and Madhya Pradesh is also located in Andhra Pradesh, Orissa and Maharashtra. At present, the demands of coal mining industry are met by their own thermal generating units and State Electricity Boards. The Damodar Valley Corporation power system also supplies approximately 80 per cent of the power requirements of colleries in West Bengal and Bihar. The study team, which will also review measures for matching power supply with the programme of coal raising in various coalfields in the country, will submit its report within a period of one month.

ALUMINIUM INDUSTRY

Mr. Nathanael Vining Davis, President of Aluminium Limited of Canada, arrived in New Delhi on 21st January on a short visit to India. During his visit Mr. Davis will meet Government officials, leaders of industry and other important people and study at first-hand the progress achieved by industry in India, particularly in the field of aluminium. In addition to being President of Aluminium Limited, a two billion dollar corporation, Mr. Davis is also a Director of the Bank of Montreal and the Canada Life Assurance Company apart from being a member of the Board of Overseers of Harvard College, an honour which he shares with President John F. Kennedy of the United States.

Another Aluminium magnate who is shortly visiting India is Lord Plowden. His organisation, it is learnt, has developed a new process which uses less electricity than conventional aluminium producing units.

INDIAN COTTON YARN

At the invitation of the Indian Cotton Mills Federation, a four-man delegation from Britain's Cotton Board is arriving in Delhi next week for consultations on imports of yarn into Britain. On its return journey, the delegation will visit Karachi, where it will hold similar discussions with representatives of the Pakistani cotton industry. The delegation consists of Sir Cuthbert Clegg, President of the United Kingdom Textile Manufacturers Association, who is also the Chairman of Combined English Mills Ltd., and of Clegg and Orr Ltd.; Colonel J. B. Whitehead, President of the British Spinners and Doublers Association and Managing Director of the Lancashire Cotton Corporation Ltd.; Mr. C. Henniker-Heaton, Director of the British Spinners and Doublers Association; and Mr. T. D. F. Powell, Deputy Director-General of the Cotton Board.

POULTRY INDUSTRY

The Government of India has recently sanctioned a collaboration programme with Messrs. Arber Acres Farm, Connecticut, U.S.A. for the setting up of a composite plant comprising commercial hatchery, breeding farm, feed manufacturing unit and poultry processing plant. The authorised capital of the programme will be Rs. 25 lakhs on a 50:50 share basis. Under this collaboration it is proposed to establish two farms, one at Bombay and the other at Calcutta. It is expected that these farms will produce about half a million breeding stock of egg-laying and meat type strains of poultry for further multiplication in the country. It is also planned to breed the well-known Ventessa male bird in India. The possibility of Rockfeller Farms giving aid to India is not ruled out.

It will be remembered that Poultry industry in India is essentially a cottage industry with employment potentialities in both the rural and urban areas. At present it is not linked with commercial hatcheries, commercial feed industry and organised marketing of its products. During the Second Plan, five Regional Poultry Farms and 269 Poultry Extension Centres were established and equipped for the production of nucleus stock of superior birds. During the Third Plan, it is proposed to establish three more Regional Poultry Farms in addition to expanding some of the existing State Poultry Farms. It is also proposed to set up commercial hatcheries. All these measures are designed to increase the annual average egg production from 60 to 70 eggs per hen. The adoption of mechanical means for multiplication and rearing has revolutionised the poultry industry all over the world. Sound poultry industry depends upon three basic requirements, namely (i) large sized hatcheries for production and supply of breeding stock (ii) availability of compound poultry feed and feed supplements, and (iii) proper marketing facilities so as to provide remunerative prices to the producers and supply quality products to the consumers at reasonable prices. The advancement of the Industry is possible only if the poultry raising is done on a commercial scale.

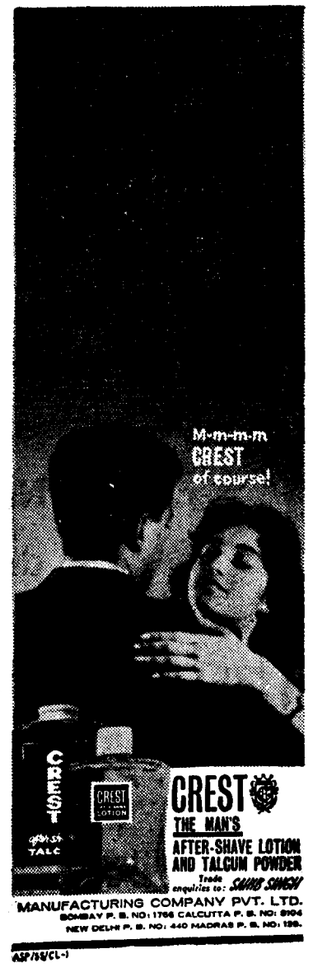
MORE GENERATING CAPACITY FOR BENGAL AND BIHAR

The Planning Commission has agreed to the installation of one additional 75,000 kw power generating unit in the Durgapur Coke Oven Plant power station of West Bengal and to the procurement and installation of six 1,000 kw package units. These decisions have been taken in the light of the Sachdev Committee Report which was set up to enquire into the causes of recent failure of power supply in West Bengal and Bihar and to assess the power situation in these States. Installation of two 50,000 kw units at Barauni in lieu of two 30,000 kw units originally included in the Third Plan has been accepted. The Calcutta Electric Supply Corporation are also going ahead with the installation of an additional 50,000 kw unit which had been approved earlier but had not yet been implemented.

The aggregate installed generating capacity throughout the country which was 2.3 million kw. in March 1951 rose to 5.7 million kw by March 1961. The augmentation of the generating capacity during the five years of the Second Plan, despite foreign exchange and other difficulties was almost equal to the total generating capacity installed up to March 1951. Installed generating capacity by 1965-66 is expected to be about 13 million kw, an increase of nearly 125 per cent in the five years as compared to 66 per cent in the Second Plan and 48 per cent in the First Plan. The shortage experienced in the West Bengal area has been attributed by the Sachdev Committee to two or three factors: (a) inexorable growth of demand for power in the Calcutta area, (b) delay in the installation of a 50,000 kw unit by the Calcutta Electric Supply Co., permission for which had been obtained earlier and (c) the delay in commissioning three 75,000 kw generating units in the Damodar Valley Corporation area.

PEOPLE'S SHARE HOLDING

The Government, through the Controller of Capital Issues is evolving a pattern of greater participation of the public in the capital structure of public limited liability companies. By an unwritten convention, the Government has insisted that at least forty-nine per cent of the equity capital should be offered to public, even in undertakings where foreign capital participated. It is claimed that, at least in urban areas, industrial stock was rapidly replacing gold and ornaments as a store of value. This tendency is partly responsible for the boom conditions in industrial shares, it is stated.



NEWSPRINT CONTROL

The Government of India has, during the week, promulgated the Newsprint Control order to regulate the acquisition, sale and consumption of newsprint in the country. The Order, which comes into force immediately, has been issued under the powers conferred on Government by the Essential Commodities Act, 1955.

Following are some of the provisions: Under the order, no person, other than an importer, shall acquire newsprint except under an authorisation issued by the Controller, who will be the Chief Controller of Imports and Exports or any officer appointed by the Central Government to exercise the powers under this Order. It has also been stipulated that no dealer in newsprint shall sell newsprint, unless such sale is authorised by the Controller. The Order further stipulates that no consumer of newsprint shall, in any licensing period, use newsprint in excess of the quantity authorised by the Controller from time to time. Where there has been an increase in the circulation of a newspaper or a periodical, the printer or publisher may, however, consume or use some of his reserve stock of newsprint required to meet the increase to the extent permissible under the Import Control Policy announced from time to time. The Order empowers the Controller to require any person, other than the consumer, holding stocks of newsprint to sell such stocks to the Government or to such other persons and at such price as may be specified by the Controller. Similarly, any such person may be required not to sell or deliver the stocks without the permission, in writing, of the Controller. Dealers and consumers of newsprint have been required to maintain a true and correct account of newsprint acquired and disposed of by them. They shall also submit to the Controller within one month of the commencement of this Order a return showing the stock of newsprint held by them as at the commencement and later, at such intervals, as the Controller may specify.

URBAN SAVINGS

The results of the survey conducted by the Council of Applied Economic Research of a number of households in the urban areas show that urban household saving is about 14 per cent of the household incomes (including savings in consumer durables). This together with the Government and Corporate sectors saving lend support to the view that the "average rate of saving in India is now well over 10 per cent". It will be

recalled that the Planning Commission has estimated an overall saving rate of 8.5 per cent in India.

The survey further reveals that Income distribution of households and savings were highly uneven. 85 per cent of the households having an income of less than Rs. 3,000 owned 52 per cent of the aggregate net income, while the remaining 15 per cent having an income of Rs. 3,000 or more owned 48 per cent of aggregate income. Only top 15 per cent of the households in the urban sector accounted for practically the entire amount of aggregate saving while the remaining 85 per cent either did not save or dissaved.

The Council has expressed the view that even at the present level and distribution of income, increase in saving is possible by the extension of life insurance and provident funds, which at present constitute a small percentage of income but which have considerable scope for increase. The Government, the Council adds, can also mobolise saving through higher direct or indirect taxation.

INDO - BULGARIAN TRADE TALKS

Trade talks between an Official Delegation from Bulgarian People's Republic and the Government of India began here during the week. The Bulgarian Delegation was led by Mr. Dragan Draganov, Deputy Director in the Ministry of Foreign Trade, Bulgarian People's Republic. The Delegation from Bulgaria has arrived to hold trade negotiations with the Government of India and review the development of trade over the past few years. Prospects of developing trade to a much higher level than in the previous year will also be discussed.

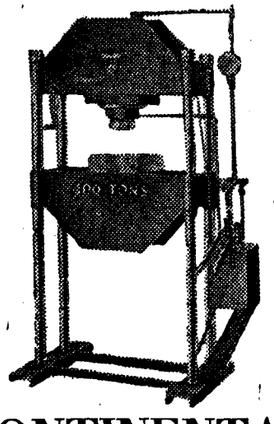
At present, there is a three-year Trade Agreement between India and Bulgaria signed on March 3, 1960, under the terms of which trade between the two countries will be on a balanced basis and payments regulated through non-convertible Indian rupee. In the past few years, India's trade with Bulgaria has been progressively increasing. In 1961, India's trade with Bulgaria is estimated to exceed Rs. 1.12 crores approximately both ways, as against Rs. 56 lakhs for the year 1960.

BRIEFS

The Government of India, in the Ministry of Finance has appointed Mr. P. Govindan Nair, I.C.S. as a Special Officer in-charge of Oil Industry, in the public and private sectors. Mr. Nair, till recently, was the Counsellor for Economic Affairs in the Indian Embassy at Washington.

*

The rate of employers' special contribution towards Employees' State Insurance Programme would be raised in the areas where the scheme has been implemented from 1¼ per cent to 2½ per cent from April 1, 1962. The employers' special contribution in the non-implemented areas would continue to be at the present level, namely ¾ per cent of the wage roll.



*

The practice of drawing persons from private industrial firms and employing them in a department dealing with private industry when they have liens on their old posts has been stopped, except in very exceptional circumstances.

*

Workers of the Rourkela Steel Plant earned their first bonus for the month of December 1961 along with their normal monthly wages on January 1 this year under the Hindustan Steel Bonus Scheme. The scheme came into force on December 1, 1961. The bonus has been received by all the units in the Production, Maintenance and Service groups. The Coke Ovens earned the highest percentage of bonus. Following implementation of the bonus scheme, it is claimed that production in the steel plant has shown an upward trend.

KRUPP

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-portal level-luffing wharf cranes.

Products and Services:
Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

COMPANY AFFAIRS

FERTILIZER CORPORATION OF INDIA

All-round progress marks the first year's working of the Fertilizer Corporation of India during 1960-61. One highlight is the declaration of dividend amounting to Rs. 39.27 lakhs. The integration of fertilizer projects under the overall administrative control of the Fertilizer Corporation of India was effected in January 1961 with a view to securing co-ordination in policy and ensuring efficient and economic expansion and working of fertilizer factories in the public sector. As a result of this integration, the constituent units of the Corporation are the two operating factories at Sindri in Bihar and Nangal in Punjab and three projects which are still in the construction stage, namely Trombay, near Bombay, in Maharashtra, Nahorkatiya (Namrup) in Assam and Gorakhpur in Uttar Pradesh. The Corporation has an authorised capital of Rs. 75 crores and a subscribed and paid up capital of Rs. 39.63 crores.

Production in the Sindri factory showed an appreciable improvement during 1960-61. The total production of ammonium sulphate was 3.05 lakh metric tons as against 2.90 lakh metric tons in the preceding year. There was a corresponding increase in the production of ammonia from 73,797 to 84,174 metric tons. Various short-term and long-term measures, some of which have already been initiated, are being devised to ensure the establishment of full production conditions at Sindri by the end of 1962-63.

The Nangal Fertilizer Factory was successfully commissioned on February 22, 1961. By October 31, 1961, the factory produced a total quantity of 1.18 lakh metric tons of calcium ammonium nitrate, out of which 88,000 metric tons were sold to the Fertilizer Pool by that date. The erection of the Heavy Water Plant at Nangal is nearing completion and it is expected that the installed plant will be commissioned early in 1962. The plant will have an output of 14.5 tons of heavy water per year.

In the light of the up-to-date progress in the execution, it is expected that the Trombay factory will go into initial production sometime during the first half of 1964. The factory will have an installed capacity of 2,54,000 metric tons of nitro-phosphate, a complex fertilizer containing two soil nutrients, nitrogen and phosphate, and 97,500 metric tons of urea per year. The project is estimated to cost about Rs. 25 crores.

The Nahorkatiya factory will have an installed capacity of 1,00,000 tons of ammonium sulphate and 55,000 tons of urea per year, while the installed capacity of the Gorakhpur Factory will be 1,80,000 tons of urea per year. The Nahorkatiya factory is expected to go into production by the end of 1964 or early in 1965. It is estimated to cost Rs. 20 crores. The Gorakhpur Factory is expected to be commissioned by the end of 1965. It is estimated to cost Rs. 25 crores.

A significant development has been the establishment of a Central Institute of Fertilizer Technology at Sindri, where an increasingly large band of engineers and scientists are engaged on research and technological experiments, development of new designs and processes and construction and operation of pilot plants.

The Corporation has been entrusted with the construction of the nitric acid and nitrolimostone plants at Rourkela for Messrs. Hindustan Steel Ltd. with storage and bagging and other ancillary facilities. Considering the present state of the job, it is hoped that two out of the four streams in which the Rourkela plants have been designed and arranged will be installed and commissioned by the autumn of 1962 and the rest of about 6 to 8 months' time thereafter.

NEW CAPITAL ISSUES

Six companies have received recently authorisation for the issue of further capital totalling over Rs. 2 crores. Two of them have been permitted to issue Bonus shares and the other Equities. The consent is valid for 12 months in all cases. A seventh company has been given extension for the redemption of mortgage debentures.

The Modern Mills Limited, Bombay has been granted consent to the issue of bonus shares of the value of Rs. 15,49,117 in ordinary shares of Rs. 50 each on capitalisation of share premium of Rs. 2,80,220 and general reserve to the extent of Rs. 12,68,897.

The Madras Circle Pipe Dealers Association Ltd., Madras, is to issue bonus shares of the value of Rs. 3,33,300 in the ratio of one bonus share for every three equity shares held by the existing shareholders.

Kanoria Chemicals and Industries Ltd., Calcutta, will issue capital of Rs. 1 crore divided into 8,00,000 equity shares of Rs. 10 each and 20,000 cumulative redeemable preference shares of Rs. 100 each carrying dividend of 9.5 per cent free of tax but subject to deduction of tax at source at the prescribed rates. The capital is required for the establishment of a factory at Pipri, District Mirzapur, U.P. for the manufacture of caustic soda, chlorine and dicalcium phosphate at a capital cost of Rs. 198 lakhs which will be met by issue of capital and by loans from the Industrial Finance Corporation.

Lepetit Ranbaxy Laboratories Private Ltd., Delhi, has been accorded consent (in supersession of one issued on August 17, 1961) to issue capital of Rs. 35 lakhs divided into equity shares of Rs. 100 each to be issued to the foreign collaborators and Indian nationals in the proportion of 50 : 50 for cash at par. This Company was incorporated in June this year for the manufacture of chloramphenical in collaboration with an Italian firm.

The Indian Overseas Bank Ltd., Madras, will issue further capital of Rs. 25 lakhs in equity shares of Rs. 100 each for cash at a premium of Rs. 10 per share. The proceeds will be utilised for strengthening the banking company's capital base.

Globe Motors Ltd., New Delhi, has been authorised to issue further capital of Rs. 25 lakhs in equity shares of Rs. 100 each, for cash at par. The proceeds of the issue will be utilised for undertaking manufacture of Laminated springs and Malleable steel castings. This Company has a paid up capital of Rs. 25 lakhs.

The Chrestien Mica Industries Ltd., Calcutta, has been granted an extension of the date of redemption of the First Mortgage Debentures issued in 1946 from December 31, 1961 to December 31, 1971 subject to the condition that those debenture-holders who are not agreeable to the postponement should be paid in cash before March 31, 1962.

THE BANK OF INDIA LIMITED

The Profit of the Bank of India Limited for the year ended 31st December, 1961, after providing for Income-tax and Super-tax and making the usual provisions for contingencies and subject to audit, including the sum of Rs. 12.85 lakhs brought forward, amounts to Rs. 1,23,16 lakhs. A sum of Rs. 15 lakhs has been transferred to the Reserve Fund. Interim Dividend at the rate of 8 per cent subject to deduction of tax at the prescribed rates for the half-year ended 30th June, 1961 absorbed Rs. 24 lakhs. The Directors propose to pay a final Dividend at the rate of 12 per cent subject to deduction of tax at the prescribed rates making 20 per cent for the year, which will absorb Rs. 36.00 lakhs.

Company Meetings

INDIAN OXYGEN LIMITED

The following is the statement circulated by Sir John Douglas Keith Brown, Chairman, Indian Oxygen Limited to the Members of the Company with the Annual Report for the year 1961.

Following the precedent established last year, I am again circulating with the Directors' Report and Accounts for the year ended 30th September last the statement which I would otherwise make at the forthcoming 27th Annual General Meeting.

PROFITS, TAXATION AND DIVIDEND

The profit for the year, after providing Rs. 44,95,981 for depreciation and Rs. 36,25,000 for taxation, amounted to Rs. 71,30,284 as compared with a net profit for the previous year of Rs. 62,98,449 after charging depreciation of Rs. 37,10,806 and taxation of Rs. 38,85,900. Although the profit after taxation shows a fair increase over the previous year, as stated in the Directors' Report, it was earned at a relatively lower rate. The reason for this lay primarily in an increase in works cost which, I am afraid, is today all too familiar a trend throughout the Indian economy. Persistent shortage of power in several regions where your Company operates contributed significantly towards these increased costs. Calcium carbide which, as stated by me last year, is now procured almost wholly from indigenous sources, continued to give unsatisfactory yields and also remained in short supply, leading to multiple transfers of our stocks between consuming points at heavy additional cost. The result of all this was an appreciable increase in the cost of production of dissolved acetylene, which has not been compensated by any increase in selling prices.

A refund of tax on profits of an earlier period received during the year and an amount rendered surplus in the tax provision account on the finalisation of the relative assessments have accounted for a total credit in the appropriation account of Rs. 10,50,133. The question of the disposal of the available balance on Profit and Loss Account of Rs. 57,06,872 has received the most careful consideration of your Directors in the light of commitments in respect of our various expansion schemes and the further demands which seem likely to be made on us to meet the country's requirements of our products. Having regard to all these considerations we decided to recommend a dividend at the rate of 15 per cent, which is the same rate as was declared in respect of the previous year. This dividend, however, will be paid early in March on the share capital of the Company as increased during the year through the rights issue to which members subscribed between the middle of April and the middle of May, 1961.

SALES

You will see from the accounts that sales during the year reached a level of just over Rs. 7,56 crores, being about Rs. 1.11 crores higher than the previous year. This represents an increase of a little over 17 per cent and I am sure you will agree that it may be considered very satisfactory, particularly bearing in mind the limitation placed on our sales by power cuts suffered by our customers. Sales of all products increased, including, I am glad to say, a satisfactory increase this year in the sales of dissolved acetylene, the sales of which in the previous year, you will recall from my statement, were a little disappointing. I told you last year about the argon purification facilities which the Company had installed at its Burnpur factory and which would for the first time allow argon to be produced in India. The benefits accruing to those who use argon in their production processes are clearly indicated by the spectacular increase in the sale of this gas, which is particularly essential in fabricating aluminium. Substantial increases were recorded in the sales of gas-user equipment and electrodes, both of which were manufactured in the two works at Beliaghatta and Khardah respectively in larger quantities during the year. Better availability of bought-out items from feeder industries also allowed us to sell increased quantities of electric welding equipment and equipment for the administration of medical gases.

FINANCE

The issue of further share capital which was approved at the last Annual General Meeting was completed during the year and provided additional finance to your Company to the extent of Rs. 1.08 crores, of which Rs. 48 lakhs was accounted for by the share premium. The scubscription of The British Oxygen Co. Ltd., of Rs. 64,80,000 towards this rights issue was a valuable contribution towards meeting our requirements of foreign exchange for expansion and this sum has since been earmarked for major projects in hand.

Capital expenditure incurred during the year amounted to Rs. 1,43,09,027 and almost half of it was accounted for by the purchase of oxygen and dissolved acetylene cylinders from the United States of America against accommodation received from the Export-Import Bank. This provides a timely increase in the stock of cylinders carried by the Company, which otherwise would be considerably strained in meeting the increasing demand for industrial gases.

Arising out of the increasing tempo of the industrialisation of the country based on a growing volume of steel production, as I have already indicated a further large increase in the demand for our products is anticipated during the Third Plan period and subsequently. In view of this we are already giving thought to the next phase of our expansion beyond the programme now under way. Ours being a capital-intensive industry, this will necessarily give rise to additional requirements of finance, particularly foreign exchange, and this important matter is at present receiving careful consideration.

DEVELOPMENT AND EXPANSION

In my statement last year, I referred to the fact that by including our industry's requirements, the draft outline of the Third Five-Year Plan had recognised the importance of industrial gases and electrodes in the country's economy. I have been grateful to find that the Plan as finally published has also recognised the importance of liquid oxygen explosives and included requirements thereof in the official plan targets, showing incidentally a larger than fourfold increase during the Plan period.

Oxygen requirements in the Jamshedpur area have continued to grow and the Company has in hand a programme to install three additional 400M3 oxygen plants in the Jamshedpur factory to augment production from the existing plants. The first of the three additional plants has just recently been installed and trial runs are scheduled to begin almost immediately. The second and third additional plants have been shipped from the United Kingdom and should be installed at the Jamshedpur factory shortly.

The oxygen and dissolved acetylene factory which has been built at the new site at Bangalore was completed during the year, together with an administrative block. Production of dissolved acetylene at the new factory commenced in September this year, while the oxygen plant came on stream in November.

I mentioned last year that at Gauhati, we had installed an oxygen plant within the premises of Indian Refineries Ltd. You will be glad to learn that during the year the Company acquired its own plot of land and commenced erecting an oxygen and dissolved acetylene factory at the new site. The oxygen plant which had been installed in the premises of Indian Refineries Ltd. was transferred to the new factory and oxygen production commenced last September. A dissolved acetylene producing plant is now being installed in this factory and it is hoped that production will commence in February, 1962.

An industrial licence for installing a second 400M3 oxygen plant in our Bombay factory was obtained during the year and arrangements are now in hand for its installation in order to increase oxygen availability in the Bombay area, which practically throughout the past year has been barely sufficient to meet the rising demand there.

Plans have been laid to increase the production of electrodes at the factory at Khardah, near Calcutta, within the present licensed capacity and work was commenced during the year on extending the factory buildings to house additional plant and afford further storage capacity. An industrial licence has also been obtained for setting up, a wire mill within this factory and the necessary plant and machinery has already been ordered against import licences inhand. The setting up of this wire mill will render our electrode production independent of suppliers of core wire on the basis of arrangements that are envisaged for obtaining suitable rods for wire drawing.

Steps ave also been taken to supplement the machinery installed in the Equipment Factory at Beliaghatta and to extend the factory premises. The expansion and modernisation of facilities at the Electorode and Equipment Factories will allow the production not only of larger quantities but also a wider range of products.

The Company continued during the year to pursue actively the development of indigenous manufacture of items of equipment hitherto imported. As explained by me last year, wherever possible and economic, this is being done by encouraging the growth of feeder industries wihch are helped with technical assistance and designs. Notable among last year's achievements were the production of the 'Cub' machine, a small oxygen profile cutting machine, as well as items of medical equipment, for the production and assembly of which at the Equipment Factory at Beliaghatta an industrial licence was received during the year. Another important step was the indigenous development of 'Indarc' welding transformers, which are now marketed by us.

From all that I have said on this subject of development and expansion you will appreciate that our efforts are not confined to increasing our sales of industrial oxygen and dissolved acetylene in cylinders, with which products we are probably principally associated in the public mind, but that we are making substantial progress on the engineering side of our business also. Those of you who have seen our pavilion at the Indian Industries Fair currently in progress at New Delhi may have been surprised at the range and diversity of our production, which has increased in both respects to a remarkable degree in recent years. Incidentally, we have been gratified by the many favourable comments which have come to our notice on our exhibit at this Fair, with its accent on progress, indigenous manufacture and diversification, and it gives me great pleasure to commend those responsible for its organisation.

COMPETITION

In my statement last year, I referred to the policy of the Government of India, which envisaged a widening of the base of ownership in the industrial gases field through new entrants into the industry. In pursuance of this policy sixteen new industrial gas units have been licensed in the last year and a half. A significant increase has taken place in the total licensed capacity of our competitors in this field, and in the year under review these licensed capacities have about doubled in both oxygen and dissolved acetylene.

Perhaps the most important outcome of Government's policy in this regard was the development which took place during the year in connection with the tonnage oxygen plant which your Company had agreed to install at Jamshedpur so as to make available to The Tata Iron & Steel Co. Ltd. its requirements of oxygen in the process of steel making. This projected arrangement was referred to by me in my address to members at the 26th Annual General Meeting held on the 14th February, 1961. Government's reaction to our application for a licence for substantial expansion at Jamshedpur to allow the installation of this plant has best been summed up by Mr. J. R. D. Tata in his statement as Chairman attached to the 54th Annual Report of The Tata Iron & Steel Co. Ltd., in the following words:

> "In this connection, I regret to have to report that the Government of India have refused to sanction a very satisfactory arrangement we had concluded with Indian Oxygen Co. whereby that Company was to put up, at its own cost, a tonnage oxygen plant at Jamshedpur from which the Steel Company was to purchase on favourable terms its greatly enlarged requirements of oxygen. On the ground that the Indian Oxygen Co. already has too large a share of the business, Government have decided that the plant should either be put up by another company in collaboration with a different foreign firm or that the Steel Company should put up the plant itself. As the first alternative would have resulted in delay and unnecessary complications through the presence of two oxygen suppliers at Jamshedpur, and in the loss of certain financial benefits which would have accrued from the proposal initiated with the Indian Oxygen Co., we had no alternative but to decide to put up a tonnage plant of our own and to shoulder the additional capital expenditure which will amount to over a crore of rupees."

Mr. Tata's statement gave rise to some comment at the time when it was published in August last, the burden of which was hat this was a case where economic considerations appeared to be overlooked in favour of ideology. This brings me to the point that while the social objective of planning is not disputed, in my opinion the attainment of planned industrial development on an economic basis must receive equal consideration; and I feel that a compromise between the two is possible within the framework of the Government's policy. My suggestion is that on the basis of the estimated demand during the next five or ten years, an allocation of at least a portion of the considerable additional production

UNDER 1 FEB 1962

capacity required may be made among the existing enterprises after taking into account their relative sizes and technical and financial resources. This will enable them to proceed with perspective planning on a fairly firm basis and will ensure that at least a part of the additional capacity is made availble in the most economic manner, in step with the increase in demand, without allowing a particular unit to grow too large. I fear that unless something like this is done not only the economies but indeed some of the products themselves of large-scale organisation in this field will be denied to Indian industry.

EXPORTS

No one connected with industry in this country today can fail to be acutely conscious of the absolute necessity of increasing exports to enable the mounting demand for imports of essential raw materials and components to be met, and we in Indian Oxygen Ltd. are wholly in sympathy with the Government's aspirations in this regard. I must, however, point out the difficulties that are encountered by an industry such as ours since products like oxygen and acetylene are basically unexportable. However, inasmuch as these products constitute the raw materials for industry in general and facilitate indigenous metal fabrication, their contribution to the solution of this problem lies in the saving of foreign exchange which takes place by the progressive elimination of imports of manufactured items and by incorporation in the manufactured products exported by the Indian engineering industry. Nevertheless, mindful of our responsibilities, we arranged during the year for one of our senior executives to visit the South-East Asian countries to assess the market for such of our products as can be exported. Your Company now exports nitrous oxide and electrodes to this region and we are hopeful that this flow will increase and widen in time with the reorganisation and modernisation of our Electrode and Equipment Factories.

MANAGEMENT AND PERSONNEL

Your Directors are keenly aware that the years that lie immediately ahead contain a challenge that in the final analysis must be met mainly by the competence and stature of the management. Following from this awareness, the top management structure of the Company was strengthened and reorganised during the year by the creation of functional divisions each headed by a Chief Executive. Considerable thought has also been given to training schemes within the Company, some of which were satisfactorily started during the year. A search for talent within the organisation was made and I am glad to say that four members of the staff were selected for intensive management training. You may be interested to know that as at the close of our financial year we employed in all 3763 men and women. Of these, 131 were in the officer grades of whom only six were non-Indians. I take this opportunity to extend once again to our Managing Director, Mr. A. K. Sen, and to his colleagues in the management and to all staff and workpeople our thanks for their part in producing the results which are before you.

In these days it is essential that an organisation should develop its own personality and this can be done no better than through an efficient system of communications within the organisation itself. Towards this end, and also with a view to projecting the personality of your Company to individuals and bodies outside, the publication of a House Journal called "Oxygen News" was commenced during the year. You will be glad to know that this publication has been well commended for its quality and presentation.

TECHNICAL COLLABORATION

Active technical assistance continued to be received during the year from our parent company, The British Oxygen Company Limited. Specialist personnel from the parent company visited our factories, studied our problems and gave us most valuable advice to enable us to improve our efficiency. A number of our personnel also visited the establishments of The British Oxygen Company Limited in Great Britain and have undoubtedly benefitted from the specialist guidance and training so readily offered them.

We were particularly glad to welcome a few weeks ago, Mr. T. E. Potts, Managing Director of The British Oxygen Company Limited Group. Mr. Potts stayed with us for about three weeks, visiting Calcutta, Jamshedpur, Burnpur, Madras, Bangalore, Bombay and Delhi in a strenuous and crowded programme. Your Directors look forward with interest to receiving shortly from The British Oxygen Company Limited their commens and advice on our future expansion plans, of which Mr. Potts made a particular study during his visit. Visits such as this are invaluable for the opportunities which they afford us to discuss our problems with those who are able to draw on a world-wide experience of our industry. I take the opportunity to record here our thanks not only to Mr. Potts but also to the Chairman and the other members of the Board of the parent company.

In June last The British Oxygen Company Limited celebrated the 75th anniversary of its incorporation and on the occasion held a conference of Chairmen and Managing Directors of all its associated companies overseas. Your Managing Director, Mr. A. K. Sen, and I had the pleasure and the privilege to attend this conference, which gave us a welcome opportunity of meeting our counterparts in the other companies and discussing common problems. We also gained an insight into the wide range of interests covered by the parent company and the scale of effort which is being devoted to research and development, in the benefits of which we in Indian Oxygen Limited will continue to share.

PROSPECTS

It is too early in the new financial year to give you any firm indication of the likely trend of profits this year. Sales so far compare favourably with the corresponding period in the previous year and having regard to the continuing development of the metal using industries, we would expect this progress to be maintained. At the same time, we found that in the second half of our last financial year, our activities were affected by power shortages, and I fear that this is a feature which will, unfortunately, recur for some years yet. We have also to bear in mind the increase in the cost of production to which I have referred earlier in this statement. Nevertheless, we have no reason to fear that our profits will not be maintained and indeed, it would be reasonable to expect some modest increase. At the same time, I must again point out that the extent of our existing foreign exchange liabilities and the prospects of our having, within the next few years, to shoulder further loan liabilities, demand from shareholders the exercise of a degree of patience. Our prosperity is, I would repeat, tied up with the growth of important sectors of the country's expanding industry and I am confident that, organised as we are on the basis of technical competence, service to our customers and personnel who have the welfare of the Company and its growth at heart, our performance in the years ahead will be found not wanting.

CALCUTTA,

23rd December, 1961.

ISCON-67

THE ASSOCIATED CEMENT COMPANIES, LIMITED

TWENTY-FIFTH ANNUAL GENERAL MEETING OF THE COMPANY

Speech by the Chairman, Shri Dharamsey M. Khatau

PRODUCTION AND PROFITS

Speaking at the 25th Annual General Meeting of the Associated Cement Companies Limited held in Bombay on Friday 19th January, 1962, the Chairman, Shri Dharamsey M. Khatau said: "Although the year under review has been one of further progress for the Cement Industry in the country—in terms of increased production and despatches—rising costs of materials and services have more than offset the benefits accruing from this increase in production. Our financial results for the year are rather disappointing despite the fact that the effective installed capacity and actual production were higher. Profits have declined due to an abnormal rise in the cost of coal, stowing excise duty, railway freight and electric power-supply rates. The incidence of these increases was higher than the economies effected by continuous technical and other improvements. There was also loss of production at some Works mainly due to coal and power shortages, and loss of despatches due to paucity of railway wagons, which to some extent was aggravated by the strike of the Central Government employees in July 1960. The cumulative result of all these factors was that the ratio of production to capacity could not be maintained at the level of the previous year."

COAL SHORTAGE

Referring to the acute coal shortage in the country, the Chairman stated that the timely action by the Ministry of Commerce and Industry, following representations by the Company, had enabled its factories to tide over this coal famine. "I would however refer here", Shri Khatau continued, "to two factors which currently threaten to make matters difficult for the Cement Industry—viz. the deterioration in the quality of coal supplied and the new B.O.X. type wagon introduced by the Railways. While the quality of coal has been lowered as a matter of Government's general policy of conserving high grade coal, the new type wagons, which owing to their outsize dimensions cannot be weighed on the existing weigh-bridges, have been responsible for considerable short loading of coal resulting in heavy losses to the consumer. Your Company is continuously taking such steps as are possible to meet the situation."

PACKING CHARGES

The Chairman mentioned another set-back suffered by the Company as a result of Government's arbitrary decision in fixing the packing charges for cement for the last quarter of 1960, at rates far below the rates recoverable from consumers. This decision caused heavy losses to the Company, though repeated and urgent representations by the Industry persuaded Government later to allow the Industry to pack a portion of its cement in sound reusable bags as from 1st January, 1961. "While the decision was in itself most welcome it was vitiated by the fact that a completely unrealistic low charge of Rs. 13 per metric ton, which bore no relation to the prevailing market prices, was fixed as the average packing charge for new and used bags—taken together. This further added to your Company's losses on account of packing charges. Further repeated representations by the Industry finally led Government to adopt a realistic basis for fixing the average cost of new and reusable packing materials. However, the heavy initial losses which your Company suffered on this account could not be recouped during the period under review."

DIVIDEND

"Blocked as we were by a fixed retention price, already too low, it was inevitable that, against the tide of rising costs of materials and services, the profits of the Company should steadily diminish over the past three years. During the year under review, the unexpected hapennings to which I have referred above made further inroads into our profits. In the last three years the Company has had repeatedly to dip into its meagre reserves to be able to pay a modest dividend to shareholders. This year the withdrawal from Reserves has been as high as Rs. 98 lakhs.

"Despite the reduction in the net distributable profits as compared to last year, your Directors have decided to maintain the dividend at the same level, namely Rs. 12 per share, subject to deduction of tax. Your Company has been emboldened to do this in the hope that the relief which has come—although belatedly—by way of a higher retention price, will yield better results in the next few years."

TARIFF COMMISSION

Reviewing the circumstances that led to the belated Tariff Commission enquiry into cement prices, after Government's refusal to grant interim relief despite Industry's numerous representations, the Chairman said: "It was hoped that the enquiry would be completed in time for Government to announce the revised price from 1st July, 1961,—that is, immediately after the expiry of the previous price-period. The revised price, however, came into effect only on 1st November, 1961, thus putting the Industry and your Company to a further substantial loss of earnings."

"I think I must dispel the belief held in certain quarters that the price increase granted to the Industry by Government is generous. The increase awarded falls considerably short of what was expected to enable your Company even to earn a reasonable net return on capital employed, much less to recoup past loss of earnings or to energise it for a vigorous future."

The Chairman continued: "I should like to say that the general approach of the Tariff Commission to the question of revision of cement prices was, by and large, fair. It has shown a sympathetic awareness of the difficulties which the Industry has had to face. Stating that Cement ranks in importance next to Iron and Steel in the economic development of the country, it recommended certain steps to stimulate the Industry's

growth on a high priority basis. The fact that its final recommendations, pruned still further by Government fell short of our expectations, does not take away the basic merit of its method of approach."

"After carefully investigating all the factors involved, the Tariff Commission recommended an effective increase of Rs. 12.11 per tonne in the retention price allowed to your Company—which did not cover its full requirements. Unfortunately, Government has scaled down even this increase in price by Rs. 1.25 per tonne. It is frustrating to note that the recommendations of an independent statutory body, made after a most detailed and searching scrutiny of costs, should have been scaled down by Government."

"It is to be regretted that, once again, the Tariff Commission declined to consider the payment of bonus to employees and Managing Agents' remuneration as legitimate items of cost. It is also to be regretted that the Tariff Commission has not recommended automatic escalator clauses to cover subsequent increases in the price of fuel and power, railway freight rates, and increased dearness allowance linked to the cost of living index. The Commission has apparently left it to Government to vary the price in relation to these factors as circumstances may warrant. This is unfortunate because our past experience shows that redress in such matters by Government is, unhappily, too long delayed.

"The Tariff Commission recommended that the new prices should come into operation from 1st July, 1961 and remain in force till 30th June, 1964, i.e. for three years. Government has, however, made the new prices operative only from 1st November, 1961 and has extended the duration to 31st March, 1966. In an era of steadily rising costs a fixed price for a period of nearly five years is, in my opinion, bound to affect the Industry adversely."

The Chairman added that all these matters will be taken up with Government through the Cement Manufacturers Association which was formed in February 1961 to protect the interests of the Cement Industry.

DEMAND FOR CEMENT

On the question of the current and future demand for cement, the Chairman mentioned that during the year under review there was a rise in the tempo of demand in all sectors, which available supplies were unable to keep pace with, due partly to shortages in production and partly to inadequacy of rail transport. To meet this transport gap at least partially, the Company had been developing the transport of cement by road where conditions are favourable and during the year, the Company was able to transport nearly 25 per cent of its despatches of cement by road. Mentioning the reimposition of control over distribution of cement by State Governments, the Chairman felt that the shortage of cement was likely to continue for some time.

THIRD FIVE-YEAR PLAN

"The Planning Commission has estimated the demand for cement at 13.2 million tonnes in 1965-66 and has fixed a target of 15.24 million tonnes of capacity to be achieved by the end of the Third Five-Year Plan period. This seems to be a realistic target both financially and technically."

Judging from the present trends, however, the Chairman felt that a prodigious effort was necessary to achieve these targets. While welcoming the appointment by Government of the two important Panels for the Cement Industry—one to look into the problems facing it and to stimulate research and development, and the other to increase its productivity, he hoped that these Panels would see that bottlenecks impeding production and productivity are expeditiously removed.

Shri Khatau continued: "Judging from the performance of the Industry under prevailing conditions, production is likely to be about 10 per cent lower than demand over the next few years, unless prompt action is taken to secure for the Industry reasonable foreign exchange facilities, adequate supplies of coal, power and wagons for the movement of raw materials as well as the finished product. It is also necessary that the resources and 'know-how' of established manufacturers of cement should be utilised to the fullest extent possible."

EXPANSION AND REHABILITATION

Reviewing the Company's planned programme of expansion, rehabilitation and modernisation, Shri Khatau reported the completion of the second unit at Mancherial raising its rated capacity to 3.3 lakh tonnes and that of the Blast Furnace Slag Cement project at Chaibasa and the slag granulation plant at Jamshedpur. Though the manufacture of blast furnace slag cement had commenced soon after, owing to preliminary teething troubles the licensed capacity of 1.7 lakh tonnes of slag cement could not be fully achieved. The Chairman said, however, that the Company as well as TISCO were making every effort to increase the slag cement output. The work on the construction of administrative and residential buildings for the Company's new dry process cement plant at Jamul (formerly Durg) was progressing according to schedule and the bulk of the machinery for this plant was being manufactured at ACC Workshops. The construction of factory structures for the extension to Dwarka Works which would raise annual capacity from 2.46 lakh tonnes to 3.5 lakh tonnes had already commenced.

REFRACTORIES AND SILVICRETE

The extension to the Company's refractory plant at Katni raising its capacity from 17,640 tonnes to 30,000 tonnes a year, was also completed and the annular kiln was put into operation recently. Efforts in diversification in the manufacture of products like Accoset-50, Accocid, ceramic grinding media etc. were being intensified. The demand for the Company's Silvicrete white cement was steadily growing and that product has been well received. The construction work on the foundations and structures of the new white cement plant at Kymore with an annual capacity of 25,000 tonnes had been completed.

NEW PRODUCTS

Shri Khatau also announced that the Company had commenced at its Shahabad Works the manufacture, for the first time in India, of a special cement known as Oil Well cement for the Oil and Natural Gas Commission, for use in oil wells in Assam and Gujarat. The demand for this product was at present small, but it is likely to increase with the development of the country's oil resources. The Chairman also reported that the Company had successfully manufactured a portland cement with water-repellent properties which would overcome in a large measure the storage and handling difficulties experienced at present by the cement consumer under highly humid and moist conditions. The new product will be marketed in the near future.

NEW ENGINEERING WORKS AT SHAHABAD

Continuing, the Chairman reported that the Company's new Engineering Works at Shahabad which was only in the planning stage last year had made considerable progress. The factory buildings and housing colony were coming up and most of the plant and machinery required for the project had been ordered from abroad and some had already arrived at site.

ACC - VICKERS - BABCOCK LTD.

Referring to the completion of the AVB Heavy Engineering Works, the Chairman stated that the factory had commenced partial production and had already secured orders for the manufacture of boilers as well as cement machinery. The Chairman cautioned, however, that a capital-intensive project like the AVB would take a few years before it could materially add to the profits of ACC.

PAKISTAN

The Chairman also announced that negotiations for the sale of the Company's factories in Pakistan had now reached the final stage and the matter would be placed for the consideration of the shareholders at the meeting.

MANAGING AGENCY

The Chairman then refered to the Company's proposals for the extension of the duration of the Managing Agency Agreement from five to ten years and raising the Managing Agents' remuneration to 7½ per cent. The matter was under negotiation with Government and the Chairman expressed the hope that, in view of the time-consuming nature of the Company's development projects and the special responsibilities shouldered and services rendered by the Managing Agents, Government will appreciate the Company's views and accede to its request.

LABOUR - MANAGEMENT RELATIONS

Reviewing labour-management relations Shri Khatau stated: "The labour situation at our Cement Works was fairly peaceful, principally because in cooperation with our Unions, we had voluntarily implemented the Wage Board recommendations. A part of the credit for this satisfactory position must also go to the Chairman of the Wage Board whom the Government of India constituted as the Central Machinery to resolve differences of interpretation arising in the process of implementing these important recommendations."

"I am afraid our Collieries have a different story to tell because there were no less than five strikes during the year 1960-61, and similar interruptions in production have continued during the current year also for no valid reasons. The principal cause of this sorry state of affairs is the irresponsible attitude and behaviour of union leaders whose continued indulgence in factional fights has seriously interfered not only with the production of coal but also with the peace of the Kotma Colliery and its colony. The Code of Discipline which all the Central Organisations of Labour had accepted is not always being implemented. This is most unfortunate for, if it is to bring about any appreciable improvement at all, it must be continuously acted upon as an article of faith by all the contracting parties. In this joint endeavour, the role of the Government cannot be over-emphasised. There have been frequent complaints against the procedure adopted by the Machinery set up by the Central and the State Governments to implement the Code."

BONUS

In spite of lower net profit this year the Chairman said, the Directors had decided to maintain the rate of bonus to the employees at the same level as the previous year, solely with a view to preserve cordiality of labour-management relations. As a result, the large majority of employees, particularly those in the lower scales of pay would receive substantially higher amounts of bonus, in view of the increase in their basic wages, as recommended by the Cement Wage Board.

Shri Khatau concluded with an expression of warm appreciation of the hard work and unstinted co-operation of all the Company's employees.

NOTE: This does not purport to be a report of the proceedings of the Annual General Meeting which will be sent separately to shareholders on request.

A PASSENGER FROM CALCUTTA WRITES:

... Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostesses charming ...

This extract is from an unsolicited letter; a photocopy can be obtained from KLM, Calcutta.

For that extra personalised service, there's nothing like flying "the Golden Circle"

to EUROPE by KLM DC-8 JET

Departure : Calcutta Tuesday night
Departure : New Delhi Saturday night
Excellent connections from Amsterdam to the U.K.
Arrival : London, the next day—afternoon.
Also choice of 5 KLM DC-8 flights a week ex Karachi.

Sincerely yours

KLC-54

SCINDIA STEAM NAVIGATION CO. LTD.

SUMMARY of the Address of Shri Dharamsey Mulraj Khatau, Chairman, The Scindia Steam Navigation Co. Ltd., delivered at the 42nd Annual General Meeting of the Shareholders, on Wednesday, the 24th January, 1962 at Scindia House, Ballard Estate, Bombay-1.

After welcoming the Shareholders the Chairman referred to the Audited Accounts and Directors' Report for the year ending 30th June, 1961 and stated that the results of the year could not be considered to be encouraging and that they reflected the situation faced by shipping companies all over the world and India in particular. Despite this adverse economic situation, the Company was fortunate in covering its costs, making a nominal profit of Rs. 4.5 lakhs, and declaring a dividend of 60 nP. per share after drawing Rs. 25 lakhs from the Dividend Equalisation Reserve.

The Chairman stated that the level of freight rates in Overseas Liner trades showed no improvement during the year whereas costs of operating ships showed signs of continued increase. However, as a result of rationalisation of services by all member lines of the India/UK-Continent Conference, the next year should show improved results.

Shri Dharamsey added:

"One significant event of this year has been the decision of the Shipping Corporation of India to join the Conference covering the India|Pakistan| U.K.-Continental trades as also in the U.S.S.R. trade. I sincerely hope that their association with India Steamships and ourselves will be a source of strength and will enable the Indian Lines to cater more effective and efficiently to the requirements of the trade because this co-operation between the Government Corporation and the Indian Lines will lead to the growth of mutual confidence. I say this because I believe that there is considerable scope for expansion of Indian Shipping in trade not yet served by Indian ships. It, therefore, is very necessary that this expansion should cover trades and routes not yet catered for and take place along strictly planned and rational lines."

He further stated that the Conference members were greatly concerned over increased expenditure to cover which an increase in rates was the only answer. The Conference representatives have placed this position before the Ministers of Transport and Finance, who whilst appreciating the situation, felt that owing to the difficult foreign exchange position of the counry, the problem of freight increase had become a little difficult of solution. It could, however, be expected that this situation would not continue for long and would soon right itself.

In regard to coastal and adjacent trades, the Chairman pointed out that there was further deterioration and hence the coastal results were very disappointing. The basic problems facing coastal shipping are uneconomic rates of freight, serious delays and detentions to ships and reduced cargoes due to the deteriorating Hooghly drafts. Unless these basic problems are tackled expeditiously and the much needed relief and assistance secured, the future of coastal shipping will continue to remain gloomy. The obvious answer, therefore, lies in permitting upward revision of freight rates as costs increase. In this context the Chairman said that Shri R.G. Abbhi, the Government director on boards of Indian Shipping Companies, had been specially asked by the Government to go into the costs of operations on the coast. It was a sincere hope that when Shri Abbhi had finished his examinations he would be able to recommend to Government to fix a level of freight rates for the coast which would not only take care of increased costs but would also give a satisfactory return to the companies on the capital employed in the coastal trade.

The Chairman mentioned that in addition to the delivery of m.v. 'Jalakirti', further orders were placed with the Hindustan Shipyard Ltd., and felt that in view of the size of the Company's business and fleet, it was very necessary to work out a steady programme of building new vessels every year. As ships were ready earners of foreign exchange he hoped that the requisite foreign exchange would be made available for this purpose.

As regards future prospects Shri Dharamsey stated:

"You naturally expect me to tell you something about our future. I know it will not satisfy you if I say that it is difficult to forecast the future with any degree of certainty. On the other hand, there are so many "imponderables" in the shipping business and possibly the uncontrollable items of expenditure far exceed the controllable one. The adjustment of freight rates can be the only answer to compensate for increased and increasing costs of operation and the maintaining of a modern fleet. I feel that in our developing economy, transportation has still to receive the priority it deserves in terms of planning and quick execution. If this important industry is to survive and if the confidence of the investing public is to be restored, it is very necessary that early steps should be taken to decide upon a suitable machinery that would enable the industry earn reasonable rates of freight having regard to the factors mentioned above. It would also create a feeling amongst the shareholders that theirs too is an industry whose problems receive the same consideration from Government as those pertaining to the other industries ashore. The National Shipping Board could play an important part in this context by advising Government as to how the shipping industry could maintain its proper place in our economy. However, I do not wish to place before you a gloomy and pessimistic outlook as to the future of this Company. As you are no doubt aware, the shipping industry the world over is one where lean periods by far exceed the boom periods; I would, therefore, venture to express the hope that the lean period is more or less over and that we should see signs of an improvement, even though gradual, before long."

The Chairman referred to the Konkan Services and the report submitted to Government in 1960 by the Konkan Coastal Shipping Services Committee and added:

"We conveyed the acceptance of recommendations of the Committee early in January 1961. The decisions of the Government of India, on the report of the Committee were conveyed to us only in October 1961. These decisions, however, fell far short of the recommendations of the Committee. Due to this disturbing development, the B.S.N. Co. (1953) Ltd. had no alternative but to announce the closure of its services from 1st December, 1961. I am happy to say that both the Government of India and the Government of Maharashtra have shown due appreciation of the Company's position and negotiations with the two Governments are still continuing. In the meanwhile, in the hope of a satisfactory settlement, the Company has agreed to maintain its services till the end of May, 1962. The situation will be reviewed before then."

After placing on record the long and valuable services rendered by Shri Dinshaw D. Romer, a director of the Company who retired due to ill health, Shri Dharamsey thanked the Minister of Transport and his colleagues in the Transport Ministry for the interest shown by them in furthering the cause of Indian shipping. He also appreciated the services rendered by the Company's agents abroad and in India and thanked the shippers and consignees for their continued support.

The Audited Statement of Accounts were placed before the Shareholders for their approval and adoption

'But can I sell my product there?'

Of course he can—with the help of Voltas! Whatever the size of his business, and wherever its site, the enterprising Indian manufacturer can depend on Voltas to distribute and sell his products efficiently, economically. For Voltas is everywhere in India! With its vast network of branches, agencies, sales depots and warehouses, Voltas touches every market in every part of this great country. The effective Voltas system of distribution is designed to answer fully the needs of both producer and consumer, and in the process to serve the larger interests of the nation.

Briefly, Voltas' activities comprise

- **Marketing and Distribution of goods:** Representing leading manufacturers, both foreign and Indian, Voltas supplies a wide range of goods—Electrical, Mechanical, Air Conditioning and Refrigeration, Textile and Paper Machinery, Agricultural and Construction Equipment, Machine Tools, Pharmaceuticals, Chemicals, Bulk Vitamins, Plastic Raw Materials, Processed Foods.
- **Manufacture and Development:** Air Conditioners, Water Coolers, Switchgear, Farm Implements, Drilling Machinery... and the list is growing!
- **Service:** Voltas after-sales service is a by-word in India. Voltas sales are fully backed by its nation-wide service and spare parts organisation.

For taking products to their markets VOLTAS IS THERE

INDUSTRIAL **IBCON** CONSULTANTS

in the expansion of
TEXTILE INDUSTRY

IBCON offers to intending promoters of textile industry, comprehensive consultancy services comprising:

- Project study and financial estimates.
- Project design including equipment, buildings, power, steam, water-supply, etc.
- Advice on purchase of equipment from India or abroad by tenders or negotiations.
- Supervision of construction of buildings and erection of equipment and services.
- Commissioning and operation.
- Senior and supervisory staff selection:
- Management organisation, clerical procedures, quality control, scientific cost and wage schemes.
- Technical assistance after commissioning to ensure successful and profitable operation.
- Also production planning, waste control, stores, dyes and fuel consumption.

FEBRUARY 16, 1962.

Interest Rates on Bank Deposits

THE meeting of bankers scheduled at Bombay for Friday, February 16, has naturally awakened substantial interest amongst depositors, no less than among the bankers themselves. For a long time the position on rates of interest accorded to depositors has been anomalous. While, in fact, the bankers have exercised restraint in regard to raising interest rates very much in their own interest—as though a cartel were operating—they have been driven by the Reserve Bank to raise the rates of advances so that they have become the fortunate beneficieries of a widening gap between the rates charged on advances and the rates they pay on their deposits. It is obvious from the balance sheets of various banks that this has been a great windfall to them; it has been achieved almost with only a small murmur of discontent either from bank employees or from depositors who, by and large, have not noticed that their opportunities in circumstances such as prevail at the moment, could well have been exploited by concerted action.

If money has high price because of its scarce character to users of money in industry, surely depositors, as the providers of this money, have an equal right to share with the bankers—the middle men—in the advantages accruing from the higher rate necessarily to be paid for the scarce commodity. As it happens, the bankers themselves and the Reserve Bank of India have joined together to prevent depositors from benefiting adequately from conditions prevailing. When the bankers meet in Bombay on February 16, they will naturally consider whether or not a rise in interest rates is likely to be a major element in the attracting of new deposits. It is not doubted that a marginal rate of rise is no answer to a great campaign for deposits. Evidence has been obtained from recent surveys to the effect that 'convenience' and 'safety' rank higher among depositors than a marginal rise in interest rates so far as attracting current deposits are concerned. So far as time deposits are concerned, they tend naturally, because money is not immediately required, to seek the higher interest rate possible. The diversion towards time deposits from current deposits is, in fact, merely a reflection of this fact that a higher interest rate is effective in this field. This analogy should suggest that, if the banks could raise their rate on deposits by about 2 per cent, the interest rate, far from being a marginal effect in attracting new deposits, might well be decisive. It is extremely unlikely that the bankers will take this adventurous step. It is even more unlikely that the Reserve Bank, which is responsible for raising vast sums for Government loans, would advocate a higher rate of interest of this order. The Reserve Bank rate itself would need to be altered since there would be no meaning in having a rate out of line with that available to depositors for savings bank accounts, which can be drawn on quite readily under various attractive terms now available. It may safely be stated, therefore, that an adventurous rise by 2 per cent in the rate of deposits is quite out of the question. In fact, things are likely to remain very much as they are with the banks declining to help their depositors with the higher rate of interest, while, nevertheless, charging as high a rate as 8 per cent on their advances and sometimes more where personal guarantees are not available.

Irrespective of the decision reached by the banks and the Reserve Bank of India on this matter, there is here an issue of national policy which needs to be decided as much in political as in economic terms. Rising bank profits are already raising anew the question of the Bank Award and the controversial rates of scales of bank employees. But the fact remains that there must be a major campaign for deposits. If the answer is not to be found in interest rates it must be found elsewhere. Are the banks in a position to attract substantial additional deposits under present conditions? The answer is contained in the statistics on scheduled bank deposits over the last year. There is no doubt that the current policy has failed. It is not enough for the bankers to decide that a rise in interest rates is not the solution of their particular problem of raising deposits. They will need to take the whole problem a stage further and find the means whereby they can sell to all holders of money the attractions of banking instead of hoarding money or, indeed, revolving it in a pattern of rising consumer expenditure which is threatening increasingly to add to inflation within the country. There seems something to be said for a commission on the lines of the Radcliffe Committee to examine the whole purpose of financial and banking policy in the management of India's financial resources in the Third Five-Year Plan.

Power Demand and Heavy Electrical Machinery Production

THE opening of the impressive AVB factory at Durgapur last week has naturally turned attention to the problem of India's manufacturing of heavy electrical machinery and equipment, not in isolation but in terms of growth of power demand over the next decade. Too often Indian statistics are so absorbed with percentages that complacency is induced by the fact that we are rising from nothing to, say, Rs. 20 or Rs. 25 crores. The improper feeling is generated that this is an act of remarkable achievement. The Government of India has recently been circulating a statement of production of machinery and equipment in 1961 and estimates of production at the end of the Third Plan. The list is a very large one with 25 elements in the production of machinery outside electrical machinery and equipment. It is argued that production will rise from about Rs. 192.54 crores in

1961 to Rs. 642.42 crores in 1965. The conclusion is intended to be drawn that India is moving in a grand manner in the heavy machinery field.

Anyone looking at this list, and bearing in mind the desperate shortage of power, will wonder whether or not India is wise to spread her attention in a machinery field with this enormous range, instead of concentrating it on the elements most important for the development of power units in the shortest possible time. Recent studies have indicated that the target of 13.4 million KW in 1965-66 will be substantially short of demand. In Quarterly Economic Report No. 30 the Economic Intelligence Unit of the Indian Institute of Public Opinion made an estimate that power requirements in 1965-66 would be 5.9 times the figure for 1955-56 and 3.31 times the figure for 1960-61. This seems to be the most detailed estimate which has yet been made relating power consumption to industrial production as well as other uses. It has been pointed out that the factor relating consumption to industrial growth as a result of the change in the structure of certain industries is rising continuously so that whereas power consumption in 1960-61 was only 1.79 times the figure for 1955-56 the new co-efficient for 1965-66 against 1960-61 is almost double the old one. In other words, whereas supply in the Second Plan was only moderately short, the contemplated rate of development in the Third Plan will leave us desperately short at its conclusion. A strong bias towards power must now invade the Plan, changing priorities in terms of foreign exchange requirements. It surely is equally important, since foreign exchange will be a bottleneck in any case, to manufacture as much as possible power machinery in the country. The proposal, therefore, to raise heavy electrical machinery and equipment from nothing to Rs. 25 crores is an absurd underestimation of the crisis which invades the power field. Similarly, a figure of Rs. 30 crores for boiler machinery is inadequate. A substantial revision of priorities inside the machinery field is as important as the change in priorities all round.

Since new factories will take considerably more time to expand than other factories, there

* Estimated.

Note: Power requirements in 1965-66 are based on the latest estimates published by the Power Wing.

is everything to be said for pressing existing units to throw forward their expansion plans by two to three years in order to bring about, within the next five years, a revolutionary change in regard to boiler machinery and heavy electrical machinery and equipment. It is believed that the figure for boiler machinery should be nearer Rs. 60 crores and that of heavy machinery and electrical equipment should be Rs. 100 crores, if necessary, setting back several items including machine tools which are now absorbing an unduly large area of capacity. It is much more necessary in the realm of maintenance of existing units to provide power than to provide machinery to the new units which, in these circumstances, must take a lower place in the queue.

So far as both private sector and public sector plans are concerned, it seems increasingly clear that incentives do not exist for a throw forward of expansion plans in the power machinery field. This is time for a high-powered committee to investigate the prices to be paid for boiler and heavy machinery and electrical equipment so as to generate funds rapidly for a much more rapid expansion than is at present contemplated.

Pakistan's Internal Crisis

THE demonstrations staged by the students of the Dacca University early this month could not have taken such a riotous turn so swiftly, if the grievances that provided the provocation were entirely superficial. Nor can their intensity be explained largely with reference to the surprise arrest of Mr. Suhrawardy, although it is obvious from the subsequent flare-up that the arrest was also resented. Mr. Suhrawardy's arrest and the move for the compulsory closure of the university at best advanced the commencement of the lawless activity. In any event, the tenth anniversary of the Language Martyrs' Day—due on February 21—was not far off and ominous developments were apprehended around that time. The fact that the student community indulged in violent acts of lawlessness during the presence of Field Marshal Ayub Khan in the city and in its frenzy went to the extremity of making an ugly exhibition of personal disrespect to the Head of State gives enough measure of the depth of the discontent which was simmering for quite some time.

The state of siege under which the trouble spots in the university were laid for about four days and the chain reaction of the Dacca riots in Chittagong, Sylhet, Barisal, Comilla and Noakhali districts provide an index of the determination of the younger generation to resort to agitation. It is not surprising that the agitational approach should find ready practitioners in East Pakistan even during the military regime. The Eastern Wing had always been politically conscious in a high degree—and vociferously articulate, too. Unlike the Western Wing, which is a blend of regional patterns, the Eastern Wing commands the benefit of homogeneity by reason of the population's Bengali extraction—a source of strength as demonstrated in the overthrow of the Muslim League from office over the language issue.

Political consciousness, combined with a profound sense of dissatisfaction, derived from regional disparities of national income and perhaps still more disparities in per capita income due to a prolific population, has made East Pakistan a source of explosion. The administration is trying sincerely to remove genuine economic grievances by making a greater allocation of outlay on development projects, but the sensitive population has little patience with the inevitable lags involved in their gestation. Development of backward regions cannot but be a gradual process. Meantime, the intelligentsia in East Pakistan went on reviving the demand for parity with the Western half. In the days of parliamentary democracy this demand took the major form of parity of seats in the legislature (and, though not in a strict sense, also in the distribution of ministerial offices). With the establishment of the present interim regime, the emphasis was switched on to parity in the civil services and the armed forces. Field Marshal Ayub Khan showed a conciliatory mood in making concessions to this demand, but obviously he could not allow parity to be elevated to a fetish. As a result, frustration and embitterment, generated by a feeling of discrimination, continued to grow.

It will be an error to suppose that all the impatience and discontent are confined to the Eastern Wing alone. Their manifestation in the Western half was more subdued, but political dissatisfaction is tending to grow there too. It must have taken the West Pakistan High Court Bar Association at Karachi effort to summon courage to adopt a forthright resolution making a demand for a regular trial of Mr. Suhrawardy in a court of law, casting a direct reflection on the military administration's action in depriving him of personal liberty without trial and conviction. And the Lahore District Bar Association was neither slow nor hesitant to follow suit. The Khulna District Bar Association (in East Pakistan) went a step ahead in defying the ban on its meeting and passing a similar resolution. The Government Press Note makes grave charges against Mr. Suhrawardy of open association with anti-Pakistan elements inside and outside the country. The demand that treason cannot be merely alleged but must be proved is, in part, an indication of a powerful urge for the restoration of democratic rule.

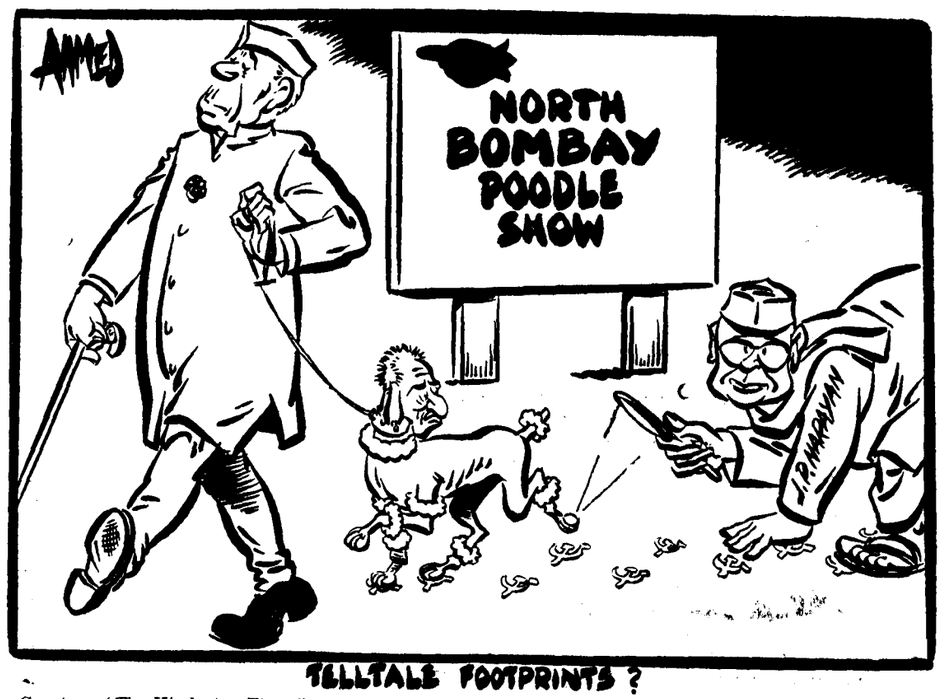
Undoubtedly, the dictatorship is losing popularity. Whether the new constitution, to be announced soon, confers basic democracy or some other variant of democracy need not, in fact, be regarded as important as whether any genuine pattern of democracy will not be allowed to be reduced to a travesty, as under the shifting Cabinets before the abrogation of the original constitution. The real question appears to be: After the military regime, what? It is as much in the interest of Pakistan's neighbours as well as distant allies, as it unquestionably is in her own interest, that a stable and progressive government should be established after the interim regime transfers power. Pakistan's citizens themselves will not countenance a situation in which the country is handed back to opportunistic career-seekers, masquerading as politicians. Pakistan's protective regime seems to face the prospect of having to accept an extended tenure in a substantially modified form incorporating the representative element. Is this the beginning of a return to more normal conditions? We in India should hope this will be possible; unrest in Pakistan is no gain to India, very much the opposite.

A DELHI DIARY

NORTH BOMBAY ABOVE ALL

A LEADING daily newspaper in New Delhi sends a story from its special representative now in Bombay to the effect that North Bombay is the "Talk of the Town". I am in a position to say that it is not merely "the talk of the town" in Bombay, it is very much the talk of the town in Delhi. I have heard, even in the corridors of the Secretariat, some anxious speculation on what might happen, should Mr. Krishna Menon return or should he not return. There has been a marked feeling of loyalty in certain areas to the Defence Minister, and I am not surprised that those who have looked not so much upon their merits but upon what we used to call a benevolent godfather to support their claims are a little disturbed about the possibility of his defeat. However, this, I expect, is only human nature and one must not allow oneself to rant on the dissensions in the civil service or in the army. On the latter there is, however, certainly criticism here in regard to a Court of Inquiry in which a Lieutenant-General was apparently charged without any basic substance in the charges as the Court of Inquiry seems to have demonstrated. It is relevant to ask if the Defence Minister approved of this witch-hunting and, if not, how it has come about. However, the talk of the town is not concerned with acts of omission and commission: it is primarily concerned with the chances of the central candidates in North Bombay. At this moment, electioneering is at its height and, with the tempo rising, apparently there has been recourse to methods and insinuations which, to say the least, do no great credit to many who preached a short while ago about the highest standards of conduct in this battle.

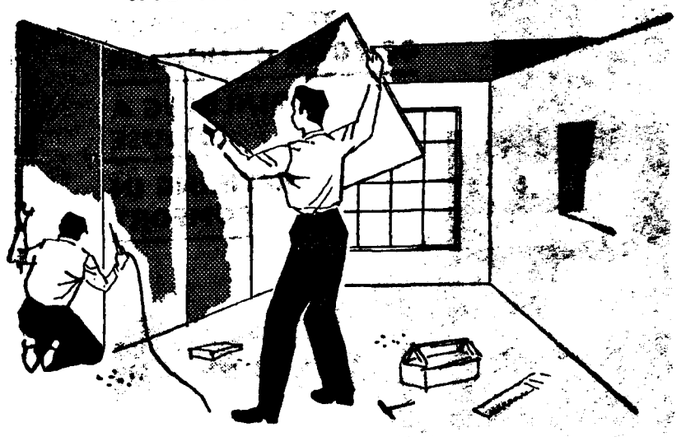
THE COLD WAR



The Prime Minister on his side has started with the suggestion that certain nations are "intervening" in the election. This naturally has high international interest. He has not mentioned these nations; surely it is vital for him to name the nations who have intervened, so that the country should know exactly which 'nations' and what 'intervention' is involved. On the other hand, Mr. Kripalani's supporters are openly saying that the Communist Party of India has recruited part of its funds from abroad and that Mr. Krishna Menon is benefiting in some mysterious way from Communist international support. I do not think either of the charges are provable, and it does seem to me a very wrong thing on both sides that people should be making these charges of 'intervention' of foreign countries without the requisite evidence on which they should be based. I suppose even if they were both true, neither side should indulge in these accusations without proof, as it is always dangerous for the pot to call the kettle black!

AN UNHOLY ALLIANCE

Nevertheless, and while I deprecate Mr. Krishna Menon's being charged with seeking international Communist support, since it is quite unproved, there is an unholy alliance between the Congress and the Communist Party. This is because it is an electoral alliance plain and simple, such as the one which supports Mr. Mehr Chand Khanna in New Delhi. It is a fact that the Support Menon Committee which is running the campaign is predominantly Communist in outlook and does not wear a different complexion by the fact that Dr. Baliga has recently obtained entrance into the Congress ranks with Mr. Krishna Menon's support. The hard core of the Committee and the vigorous passion being thrown into it that has come particularly from the Communist leaders on the campaign front exceeds anything seen anywhere else. Certainly, the Congress Party in the eyes of its own supporters is somewhat damned by the fact that the initiative has been taken by the Communist Party so much more than the Congress Party in this particular election. It is one thing to support a Congress candidate; it is another thing to fight for him with a passion which does not exist, it seems, anywhere in India for a straight Communist candidate.



ENTER JAYA PRAKASH NARAYAN

It is this extraordinary picture of the Congress Party, leaning heavily on the Communist Party for its election strategy, that has justified Mr. Jaya Prakash Narayan's statement issued this week. I need only, on this point, submit as usual the view of a cartoonist who has employed a canvas of twice the usual size to express his disapproval!

THE WEEK'S NOTES

Nuclear Tests

RESUMPTION AND BAN

THE ANGLO-AMERICAN decision to resume nuclear tests and immediately in the wake of this decision to issue a proposal to Russia for a conference of the Foreign Ministers of the three powers for discussing a ban on nuclear tests may superficially appear to be incongruous in the highest degree. But in reality there is no incongruity at all between resuming the tests and proposing a ban on them. Resumption has been forced upon the two allies by the merciless logic of facts. It was Russia which broke the moratorium on nuclear tests and went ahead with the resumption. Whatever the explanation offered in justification of the breach of the moratorium, the intervening period has undoubtedly enabled Russia to gain a lead. It was foolish to expect America and Britain to be inactive spectators to this unilateral race. In the context of this background, it will not lie in the mouth of Russia to charge America and Britain with insincerity in making their proposal. The risks involved in choosing to lag behind were only too obvious. America has offered facilities to Britain to conduct her underground tests in Nevada and Britain has offered the facilities to America to conduct her atmospheric tests in the Christmas Islands in the Pacific. The possibility of progress in nuclear tests by all the three powers instead of by one is conducive to a better mood for a serious consideration of imposing the ban—and observing it faithfully.

How far the Anglo-American proposal for the conference of the Foreign Ministers is acceptable to Russia is not officially known at the time of writing. But well-informed speculation has it that Russia's reply does not take kindly to the idea of a conference at the ministerial level. Is it the implication that it should be held at the summit level? The Geneva experience is everything but reassuring. On the other hand, a thorough thrashing out of the problems at the ministerial level would narrow down the issues and crystallise the viewpoints for a clear-cut discussion at the summit level, if necessary. In the meantime, Russia has proposed a summit conference of Heads of the Governments of the 18 members of the Disarmament Committee scheduled to start in Geneva on March 14. This proposal has been rejected by Britain. The main hurdle to be crossed in the agreement on the ban on nuclear tests is Russia's opposition to international inspection and control. If the same opposition is maintained by her in regard to general disarmament, the possibility of detracting seriously from the effectiveness of a ban on nuclear tests or of general disarmament will remain there.

Das Commission

DEFAULT AND DENUNCIATION

THE DAS COMMISSION'S report, in so far as can be gathered from its summary published in the Press, deals exhaustively with the issues referred to it, but its findings are qualified by the fact that the Akali Dal boycotted its proceedings. On the basis of the memoranda, statements and data placed before it, the Commission has given a verdict of non-discrimination against the Sikhs. It may be that the Akali Dal may attribute scantiness to the data at the disposal of the Commission. For this result responsibility will be placed squarely on the Akali Dal. Whatever case it had, the Dal has allowed it to go by default as far as the inquiry before the Commission was concerned.

The Akali Dal's boycott of the Commission is a matter purely of its own choice. But it is to seek to introduce a preposterous precedent to demand that some of the members of the Commission should be selected from a panel named by the aggrieved party. It is not necessary to go into the findings of the Commission. Nevertheless, the denunciation of the report of the Commission that is now being made, by some of the leaders of the Akali Dal, as an election stunt by the ruling Party, cannot be sustained. The timing of the appointment of the Commission had to be fixed in the context of Master Tara Singh's fast and the negotiations that took place afterwards. The fact that its appointment preceded the general elections was thus purely coincidental and in no way a product of manipulation by the Government. Why co-operation was deemed unacceptable by Master Tara Singh and what considerations led him and the Dal to make the decision on the boycott are also matters which need not be gone into in this context. But default and denunciation in the same breath is an indefensible attitude to take.

Common Market

PACE OF NEGOTIATIONS

IT WAS a very brief session which Mr. Heath had with the Council of the European Economic Community on January 18. But this is not to imply that the negotiations for Britain's entry are proceeding tardily. Very elaborate data relating to the export trade of the individual Commonwealth countries with Britain commodity-wise have been collected and the two sides are wrestling with the tough job of a meticulous investigation into these data in the light of the accomodation that will be essential after Britain's participation. The indications of the probable approach to this problem are now becoming clearer. The Commonwealth countries are being divided into two groups—the African members of the Commonwealth, which are highly vulnerable to the competition of the African dependent territories of the Common Market Six enjoying the associate status, forming the first group and the rest of the Commonwealth countries forming the second group. There appears to be a consensus of view among the Six to extend association to the first group. India, of course, had declared her policy to keep aloof from the associate status. There is a genuine understanding of the difficulties which the second group of countries will face and a readiness on the part of the Six to make accommodation by way of a downward modification of the outer tariffs, which Britain will be under an obligation to apply to imports from them. Among the commodities which are likely to be admitted duty-free, tea is the one in which India is vitally interested. This is good news and India appreciates the attitude of the Six. But if the report about the transition period being limited to five years is based on reliable information, it is well to stress that it is too short for adjustments in the pattern of exports and Britain should be urged to secure a reasonably longer period.

How far will the next session for negotiations, fixed for February 22, expedite the solution of the problems? It would be hasty to be optimistic. At least one important development points out to further delays. Negotiations between the Common Market Six and the Sixteen African dependent territories, admitted to association under the Rome Treaty, are now under way for forging a new convention to give a revised form to the associate

status. This convention is to be introduced in January 1963. The negotiations here involved are also elaborate and time-consuming. The final form of the projected convention may not be decided until late in 1962. Its essentials, however, will be clear towards the end of the second quarter of the current calendar year or at the beginning of the Third. The Six led by France are insistent that the question of conferring the associate status on the African members of the Commonwealth ought to await the evolution of at least the main structure of the new convention for association—which means postponement till mid-1962. The idea of simultaneous negotiations, it would appear, has not found favour. A prolonged period seems to be inevitable for Britain's negotiations. First anticipations of her entry in January next now appear optimistic.

Malaysia

SOLIDARITY WITH PATIENCE

THE MALAYSIA SOLIDARITY CONSULTATIVE COMMITTEE, sitting in its fourth and final session, has brought out a blue-print for the proposed federation of Malaysia. This Committee, sponsored by the Commonwealth Parliamentary Association, has been apparently successful in producing a unanimously agreed document. But this fact should not lead to any premature conclusion that the federation is round the corner. Its admitted purpose is to present its view-point to the Cobbold Commission, shortly visiting Sarawak and North Borneo, to ascertain the local views on the issue of federation. The one unexceptionable principle on which the blue-print rests is the unsuitability of a unitary government as the form of the projected constitution. But this is in no sense a contribution made by the Committee to tackling the diverse and complex problems which confront the five separate territories. A unitary type of government is incompatible with the scheme of a federation which is agreed upon for Malaysia and autonomy for the five territories is almost an inherent condition, where the five units of the proposed federation set store on the maintenance of their individual identity. The blue-print mentions external affairs, defence and security as the principal federal subjects, leaving many of the other subjects as the concern of unit autonomy.

To stress the diversity in the outlook, aspirations and claims of the five component units is by no means to cast doubts on the feasibility of the federation. But they are hard realities and solidarity within the federation will be a function of patient and liberal handling of these claims. Even the blue-print mentions that Islam will be the accepted religion of the Federation, ostensibly because that is the religion of the giant partner Malaya. But to allay the likely fears of the other units, the explanation is added that there will be complete freedom of religion for all the citizens. It is in the sphere of another vital issue, namely, citizenship, that the blue-print has to find a solution in a compromise. Common citizenship is to be incorporated in the constitution, but migration into Sarawak, North Borneo and Brunei is to be controlled. These three units, now sparsely populated, would not take kindly to large-scale migrations from the remaining two densely populated units. Sarawak and North Borneo are still to be transformed from the status of Crown colonies to sovereignty. They have their own apprehensions about a junior partnership which can be tactfully removed with patience. Brunei is under British protectorate and awaits somewhat similar change in status. Nevertheless, the basic fact remains that there is a real urge for the formation of a viable State of the five which federation alone can guarantee. But the formation of the West Indies Federation in haste and its dissolution have a timely moral to convey.

Student Indiscipline

AUTHORITY FOR ACTION

THE JUDGMENT of the Madras High Court upholding the rustication of a student and the authority of the heads of educational institutions to impose punishment in appropriate cases has wide implications and should help to raise the morale of university, college or other institutional heads to resort to firm action against the canker of student indiscipline on any pretext. It sounds rather strange that a judicial pronouncement should be necessary to uphold the right of educational authorities to take corrective action against defiance of discipline. But in this case Mr. Justice K. Veeraswami had to give a finding on this point as it was raised as an issue of contention by the appellant student. The facts in brief were that a student in a training institution was suspected of gross misbehaviour. Pending the inquiry, he was put under suspension and when the Deputy Director found him guilty of serious misbehaviour, he held consultation with the Director and eventually the punishment of rustication was imposed. In moving the High Court to set aside his rustication, the student contended that there was no authority vested in the Deputy Director or Director to expell him from the institution, except in the event of his failure to take interest or to show progress in his studies and that the punishment was arbitrary and against natural justice. These contentions typify the extent to which the litigious tendency has seeped into quarters which should be immune to it and how seriously the quasi-parental authority of teachers is being undermined. In rejecting all the contentions raised, Mr. Justice K. Veeraswami ruled that so long as the head of an educational institution did not act arbitrarily or dishonestly or on extraneous evidence, his discretion to award exemplary punishment must remain untrammelled.

The problem of student indiscipline and the factors that go to foment it are very complex and no one has ever argued that it could be simplified to the extent of putting the entire blame on the student community. But undoubtedly there are a large number of cases where the politician or trade union organizer is responsible for inciting students to indulge in rank indiscipline or where students themselves take the situation in their hands and become self-appointed judges of the rights and wrongs of an issue. It is here that vice-chancellors of universities or principals of colleges or heads of other institutions falter to take action for fear of pressure from the politician or physical injury or a similar harm in other cases. This sort of vacillation has been responsible in part for contributing to the subversion of discipline and educational standards. The judgment of the Madras High Court will have gone in vain, if the heads of institutions do not show firmness to exercise their discretion to take disciplinary action, but drift into dereliction of duty.

6" spindle ram type horizontal mill and boring machine

No. 14|36 combination turret lathe installed in the AVB light machine shop

The REAL POWER of AVB...

Vast Technical Resources... Modern Workshops...

Immensely rich in experience and technical knowledge, with modern workshops equipped with some of the world's most up-to-date machine tools... here is the *real power* of AVB. The essential combination to generate *real industrial power*.

This real power and potential of AVB will give added impetus to the continued and large-scale expansion of industry... by providing the finest facilities for the manufacture of high pressure steam-raising plant and pressure vessels and heavy machinery for the cement-making and mining industries.

Among the modern machine tools in the AVB workshops are

1. **6" ram-type horizontal mill and boring machine: This machine has a vertical movement of 14 6" and a horizontal movement of 20' and is the largest of its kind in India**
2. **Numerous capstan and turret lathes: Upto 36" diameter swing and central lathes upto 42" diameter.**
3. **28/60 vertical model hydrotel milling machine: With 360° profile milling equipment.**

The World Abroad

THE PROBLEM OF THE APATHETIC CITIZEN

By ODYSSEUS

WE SAW here last week that British workers are becoming affluent. Most own TV sets and refrigerators, very many a car, many their own homes, and a rising minority are investing in insurance and stocks and shares. In his fascinating study, "The British Worker In An Affluent Society" (Heinemann. London. 1961. Price 25sh.), Professor F. Zweig says that if economic cleavages between the classes are disappearing, if the worker is losing interest in class solidarity and militant Socialism, new cleavages of culture and education are emerging. There is a widening gap between the well fed, property owning masses, and the leaders, creators, or active participants in art, culture, science, and politics.

Can democracy and freedom survive cultural and political apathy? The worker sets his material targets higher every year, and expects automatic wage rises to attain them. How can he be made to see the risks of overfull employment, to recognise that he has no automatic claim to the entire benefits of any rises in productivity, which, if inflation (with its deadly threats to the balance of payments and to the worker's living standards) is to be avoided, must be shared between capital in rising dividends, workers in rising wages and, not least, consumers in lower prices? How can the worker be made aware of the value of political freedom and of the dangers of state encroachment on individual rights? How can he be turned into a responsible citizen, with widening cultural and political interests? By better and wider education? Yes, may be up to a point, but in all countries only a minority are interested in abstract ideas expounded in class rooms by philosophers and economists. The average non-intellectual learns from being forced to undertake practical responsibilities in the course of his life, rather than from books. The problem is, therefore, to marry affluence to personal responsibility. This suggests a reconsideration of the Welfare state.

The Welfare state was conceived in the inter-war era when, in the UK, average earnings were Rs 40 a week, when millions lived, if not at subsistence level, at any rate within sight of it. You can't talk about individual freedom to people living in fear of want. But, now that poverty has been virtually abolished throughout the industrial West, now that economic fluctuations can be mitigated, the masses are in a position to plan their own and their children's future. They need no longer rely on the state for direct benefits.

THE IRRESPONSIBLE CITIZEN

In other words, as Professor Alan Peacock says in his "Welfare Society" (Liberal Publications. 58 Victoria St., London. S.W.I. 14 pages. Price 1 sh. 6d.), we must now decide how far we identify individual freedom with individual responsibility for the purchase of goods and services, or how far we believe that the state should buy for the individual because he is considered too irresponsible to buy for himself. Professor H. C. Wallich observes in his "Mainsprings of the German Revival" (Yale Univ. Press. 1955) that, in a Welfare state, the relation of cause and effect between personal effort and a higher income is blurred. This decreases the supply of productive factors. A 48 hour week is dropped to 44 and then to 40. Agitation for a 36 hour week follows automatically—while living standards are still infinitely lower than an expanding economy could offer. Restrictive practices and earlier retirement diminish output and raise costs. The government is driven to intervene more and more in the economy because (1) the price mechanism cannot effectively distribute resources when inflationary demand is taking up too much of national resources, and (2) saving becomes more difficult under steeply rising progressive taxation, and social security seems to make it less necessary. Increasing inroads are made on static resources by consumers, by nationalised industries and by private companies trying to expand in response to artificially swollen demand, and by the Government seeking to win the next election by increasing expenditure on health, education, pensions, and unemployment benefits.

Professor Peacock invites us to consider the growth of government influence on economic choice, and the extent to which, under existing policies in the UK, Britons are committed to handing over to the government continuing responsibility for their well-being in these vast fields. The proportion of national income spent by the UK government on buying goods and services, and on many transfers and subsidies, has risen from 9 per cent in 1890 to 35 per cent today. 3.6 per cent of the working population in 1891 were employed by central and local government compared with 14 per cent in 1960.

Professor Peacock is but one among a steadily increasing number of leading economists, and publicists, who point out that full employment has rendered obsolete the assumptions behind the Welfare state. In "Agenda For A Free Society" (Institute of Economic Affairs. London. 1961), Professor Fogarty says that before the cement had set on the massive structure of state security built up in the 1940's, a second revolution was rocking its foundations. Personal and family insurance has increased, although the extension of state services checked some of its branches (e.g. insurance for medical care) after 1945. But the dramatic change lies in the rising tide, swelling to a flood in the 1950's, of benefits provided as part of the terms of employment Today most firms of any size have at least a voluntary contributory sick pay plan. An increasing minority promotes plans for hospitalisation, operations, and other additional medical care, on the lines of the privately managed British United Provident Association. In 1960, over a million participated in these schemes. Pension schemes, which in the inter-war years spread rapidly among white collar staffs, have since 1945 extended to manual workers. By 1957, half the adult male labour force was earning pension rights outside the state scheme. Firms increasingly offer unemployment compensation, severance pay, and family allowances. Paid holidays at full rates are now standard for all workers. In 1955, holiday, pension, and sickness contributions by employers (excluding their contributions to state schemes) added 16 per cent to the salary bill and 7.5 per cent to the wage bill of a sample of seven industries. Today there are three levels of provision for contingencies: personal, occupational, and state.

THE ROLE OF THE STATE

The state should provide in the last resort for extremes of poverty, but it should protect taxpayers against charges falling on them through the irresponsibility of citizens willing to leave their future to the state, by compelling all citizens to insure themselves to an extent that would make public assistance unnecessary. This should be done not through a state monopoly: the citizen should enjoy his choice of the varied alternatives offered by private insurance companies in competition with each other. The British National Health Service (as we saw here on December 8, 1961) is a state monopoly, which guarantees a bad average standard of service, whereas progress depends on allowing experiment in services in which competition raises standards above the average. Insurance is

the creation not of one mind but of millions, and its progress depends on the freedom of its practitioners to compete, and its customers to shop around among alternatives.

I do not deny that in many countries the state services are competently run, but competent administration is no substitute for individual enterprise and fresh thinking. We do not get fresh thinking or revolutionary experiment from state officials. The revolution in occupational benefits has been carried out by business leaders in the UK and by trades unions in the USA.

The state should facilitate all forms of insurance by ensuring a stable currency. It has been a widespread and bitter experience for pensioners to find that inflation has severely eroded their occupational rights. Professions (University teachers, for instance) which, with a stable currency, could have managed their pensions schemes unaided, have been reduced to begging for state aid. This makes salaries and pensions a political question, with disgruntled delegations to the government, airing grievances, which under private management would not have come into existence.

In short, the state should educate citizens for responsibility, not by taking over their responsibilities, and so turning them into children discontentedly asking for more and more, and irresponsibly using their votes to blackmail politicians into bribing them to keep quiet (until the next election). Citizens are more likely to grasp the relation between the level of demand and prices, and to support government policies that avoid inflation, if they manage their own social security schemes.

The short answer, then, to the questions with which we opened this discussion, is that the object of the Welfare state should now be to teach people how to do without it, to plan for themselves as adults, not to encourage them to behave as spoiled children.

At present in the UK, as in most countries, it is only the (electorally powerless) minority who are alarmed at the constant growth in taxation, and at the level of income tax. But as wages rise, an ever increasing proportion of the masses will pay the full standard rates of tax and enter the surtax range. When the present exploited minority is swallowed up, the new majority may develop a lively interest in state expenditure, and insist that they can themselves lay out their own money on education, health, and pensions, better than any official.

How about cultural apathy? Professor Zweig's enquiries revealed the affluent worker's keen desire that his children should be better educated than he was. If the state, which now provides free an averagely bad education, with discontented, overworked, and underpaid teachers, were to encourage private schools, competing with each other to raise standards, state expenditure could be halted and gradually decreased, and the worker would have more money in his pocket to send his children to the school of his choice.

Little of all this applies to poverty stricken India today. But the principle of encouraging individual responsibility does apply. For a thoughtful criticism of the degree to which the Government of India erodes individual responsibility by elaborate controls and excessive taxation, see Theodore Gregory's "India On The Eve of the Third Five Year Plan" (Associated Chamber of Commerce. Calcutta. 1961. Price Rs. 5), in which he concludes that nothing in the theory of planning necessitates such detailed restrictions and curbs on individual initiative as are enforced in India.

The European Scene

ITALY'S OPENING TO THE LEFT

From Our Special West European Correspondent

PARIS, February 10.

THE latest business sentiment poll conducted in Italy reveals that the majority of Italian industrialists are very optimistic about the immediate future, despite the fact that tney have just completed a record quarter, October-December 1961. However, 30 per cent of those questioned confessed that they had doubts and anxieties about the effects of the "opening to the Left" that has just been decided by the governing Christian Democrat Party. The "apertura a sinistra", or opening to the Left, means in fact that the Catholic Party, which cannot govern by itself and can govern only insecurely by patching up coalitions with the small centre parties, has decided to find a firmly based coalition by accepting the support of the big Italian Socialist Party, of Signor Nenni. Of course, in order to get that support (which might take the form neither of Socialist participation in the Cabinet, nor even of Socialist votes for the Ministry, but simply Socialist abstention in votes of confidence), the Catholic party will have to adjust its economic and social policies in a Leftist sense. It is surprising that 30 per cent of business men should think that this would have any effect on Italy's economic performance in the coming quarter (the period they were questioned about), but over the longer run 100 per cent of business men and observers are convinced that Italy's future will be indelibly marked by this historic decision.

On both sides, the decision is a courageous one, for it involves evident risks. The Catholic Party, which has founded the new Italian democracy and free-enterprise economy and which has brought the country to a peak of prosperity that is the marvel of Europe, is consenting to co-operate with a party that was, until the bloodbath of Budapest, the unconditional ally of the Communists and which even today retains many sympathies with the Muscovites and professes a theoretical Marxist philosophy. The Socialists, for their part, are admitting, by agreeing to co-operate with the big bourgeois movement, that there might after all be something in the notion of "neo-capitalism", that gradual reforms can be introduced for the benefit of the workers and peasants without revolutionising the free-enterprise economy and without revising the parliamentary framework of Italian democracy. If nothing else, both sides are sacrificing a myth and this is always dangerous for a big political party. The Catholics are giving up the myth that the allies, past or present, of the Communists are agents of the Devil, and that any collusion with them must lead eventually to a coup de Prague. The Socialists are foreswearing the apocalyptic vision of an overthrow of capitalism and of bourgeois democracy, to be secured not piecemeal but all at once and with the support of the entire labouring class, be it Communist or not.

Of course, neither side would take such risks were it not that they are calculating that the other will run the greater danger. The Socialists expect that collaboration with the Left and implementation of a welfare policy, including several nationalisations, will put an intolerable strain on the motley Christian Democrat Party (which contains more factions and tendencies than the Indian National Congress), so that it will split. The ultraclerical wing, which is completely subservient to the Vatican, will be forced out, they reckon, as soon as the implications of a modern educational policy become clear, and the most conservative capitalist elements will be obliged to break away when the State undertakes economic planning and more generous welfare legislation. These guesses are not so improbable, and so Signor Nenni is entitled to calculate that the net result will be an isolation of the Right-wing forces that have long governed Italy and a wholesale shift of power to the Left. However, the Christian Democrat calculation is highly probable too: they foresee that the experience of fruittul collaboration inside the democratic framework will win millions of Italians away from the temptation of Communism. Gradual but tangible improvements, won by democratic means and without overturning the social structure, will show them that by staying doctrinally pure they have been missing the substance for the shadow. The Communists and the many near-Communist Marxists of Signor Nenni's party have been inviting them to damn the bourgeoisie and all its works while they "wait for the Revolution", whereas a little honest co-operation with neo-capitalism will soon show that there is something more solid to be gained than empty Muscovite rhetoric. The upshot could be, not only to woo the Socialists away from their alliance with Communism, but vastly to weaken the Communist Party itself—millions of whose members and voters are not Communist by conviction but simply because they feel that the democratic society offers them no real hope of betterment.

Students will know that similar disagreements about the consequences of collaboration with bourgeois parties are as old as socialism itself, for that movement has always been split into "maximalists" and "possibilists"—those who favoured revolutionary isolation, and those in favour of gradual reform in co-operation with the bourgeoisie. The movement has never been able to decide which was the "right" line, which obviously depends, not on Marxist scholasticism, but on the local and temporary conditions. Given the conditions in which Italy finds itself today, one would incline to the opinion that Signor Nenni is wrong, and the Christian Democrats and the Communist purists are right—for both these latter are agreed on this, that the opening to the Left will weaken the pro-Communist cohorts (today about 40 per cent of the Italian electorate) and "ensnare" the labouring class into peaceful, reformist co-operation with the forces of democracy. The reason, of course, is Italy's phenomenal economic expansion, which promises to continue through most of this decade. The large annual increment in national wealth permits a redistribution of resources that will satisfy the classes that now consider themselves underprivileged, without doing much absolute damage to the present possessing classes; in other words, there is a chance of securing more equality by equalising upwards, without any vindictive equalising downwards. Moreover, the exparsion of an industrialising economy creates new opportunities for enterprise and investment that are so numerous that the capitalists can consent to lose some (e.g. by nationalisation, more State intervention or even planning) without feeling that they are being cramped and obstructed by proliferating government action.

Not that everything will go smoothly, because politics is not merely about "who gets what", i.e. the share-out of material gains; it also involves matters of principle, concerning ideas and ways of life. It is not hard to foresee some head-on collisions between the philosophical Marxists of the Socialist Party and the Catholics of the Christian Democrat Party, and these will concern other matters besides education; and between the exponents of planning for planning's sake and the practitioners of free enterprise. However, by undertaking

the opening on the Left only when she could afford it (unlike, say, Mr. Nehru who sometimes tries to force through purely doctrinaire socialist policies in an economy that cannot afford them yet), Italy has a chance of conducting even the debate about matters of principle in a climate of optimism and compromise. This is the interest of the experiment that begins this month in Italy; for once, a country that is divided into irreconcilable classes (the Communists are more numerous in Italy and the Catholics more devout, the rich are richer and the poor poorer, than in any other nation in the world) is seeking to find more national unity while it is also the fastest-growing economy in the West.

Apart from the opposed calculations of the two sides in the new coalition, one may ask whether Italy could have continued much longer in her recent situation. That is, even if neither side hoped to do down its "partner" by collaborating, they were probably condemned to work together by the revolution in Italy's economy and political thinking. This is most evidently true in the parliamentary sphere. The Christian Democrats have long since lost their absolute majority and the small and forever bickering centre parties could not provide an adequate coalition. An attempt at an opening on the Right was made by Signor Tambroni when he was Premier: he sought to govern with the tacit support of the neo-Fascists, and the immediate result was bloody rioting in a dozen Italian cities because republican opinion would not tolerate this "solution". The parliamentary machine was threatening to stall, and, the worse it performed, the more people were being thrown to the two anti-parliamentary extremes: the neo-Fascists and the Communists, until elections had become a highly dangerous way of seeking to find a parliamentary majority. If Parliament were to be rescued from the ridicule of impotence, which seemed to confirm the Fascists and Communists in their denunciation of it, some sort of governable majority had to be found. The price that will have to be paid—nationalisation of electricity and less State aid for confessional schools are sure to be part of it—for a big Catholic-Socialist coalition, is small if it succeeds in making Parliament work again.

Similarly for the Socialists, the political situation was becoming more and more ambiguous. They had renounced collaboration with the Communists after Budapest, and everything that has been publicised since about the evils of the Stalinist dictatorship confirmed them in this break. (No one in Italy, not even the Communists and not even Signor Togliatti, can swallow the story that Stalin was some sort of accident and that Communist society has been restored to health by the transfer of his corpse to a more modest tomb.) Yet having broken with the Communists, the Socialist Party was hesitating to enter the democratic system; poised uncomfortably between two stools, it was forced to ask itself, if you don't support the Communists and you don't play democratic politics, just what are you doing anyhow? It had to go back or forward, and if going forward was risky, going back was impossible.

Yet it was the economy that laid most imperiously on the national parties, whether Left or Right, the obligation to collaborate. Wealth is today being created in the peninsula at a rate that is beyond the dreams of the nation at any time in its long history, but it is being created in a curiously mixed hybrid system that marries the State monopolies inherited from Mussolini with the free enterprise corporations that have swollen since the war. These two lusty centres of economic power, the public and private corporations, virtually escape any democratic control because a good 40 per cent of the population is not admitted to be part of the "political nation"—they do not have any influence, even that of a controlling opposition, because the parties they vote for do not play any effective part in parliamentary democracy. The results, naturally, have been vast regional inequality, the growth of bureaucratised monopolies both private and public that owed no accounting to an ineffectual parliament, the appearance of corruption and irresponsibility in both of them, and generally unplanned and uneven development. Just to handle its own growing wealth, the Italian nation needed a working parliament where the governing coalition represented a real majority of the people and, to some extent, all the regions of the country. The compromise programme that the Christian Democrats have now to work out with the Socialists and Social-Democrats (that is, in all, about 65 per cent of the electorate) will be less important in its Leftist or Rightist flavour than in its attempt to give a national purpose to the upsurge of Italian prosperity.

NEW RESOURCES FOR THE INDIAN PULP & PAPER INDUSTRY

TATA-KMW
Pulp & Paper Machinery
MADE IN INDIA

You can now obtain your pulp and paper machinery here in India—with a high indigenous content and incorporating the latest developments in the field.

Tata-Johnson produce pulp and paper machinery for large scale mills. Technical know-how is provided by Sweden's *AB Karlstad Mekaniska Werkstad*, KMW, century-old experts, *AB Kamyr*, and *AB Rosenblads Patenter*, as well as the *Cellulose Development Corporation (Celdecor)*, pioneers in modern methods of pulping bagasse and agricultural residue.

Machinery designed by these leading firms is manufactured at TELCO's well-equipped Jamshedpur works.

Tata-Johnson have on their staff pulp and paper specialists with international experience who now work in very close co-operation with the TELCO works engineers.

Economic Report from the U.S.

ECONOMIC IMPACTS OF DISARMAMENT

By GUY SIMS FITCH

WASHINGTON, Feb. 6.

ECONOMISTS have found an understandable fascination in examining the challenge that large-scale defence cutbacks would pose to U.S. economic growth and stability. An expert panel, made up of Government officials and of private citizens from the business, labour and academic worlds, has just completed the latest report on this subject, which seems to have taken on a new urgency now that international disarmament talks are scheduled to resume in Geneva next month. The panel agreed on the basic conclusion that the U.S. economy can afford to do whatever circumstances require, and that the sharp curtailment of Government defence spending likely to accompany effective disarmament moves need not have any serious or adverse effects on the nation's economic activity. As a matter of fact, it is their view that effective arms control would free for civilian use valuable manpower and industrial resources now used in defence production.

These civilian uses embrace both the public and private sectors of the economy. Among them are urban redevelopment and transportation, scientific, and industrial research and development, public health and education, international economic development, and rising levels of private production and consumption. The net result could be a significant boost in the nation's welfare and living standards. Just what proportion of the nation's resources would go into the public sector and what into the private sector is a determination the panel has been loth to make. The theory is that this is basically a political judgment for the President and the Congress, as is the judgment of how much to spend or not to spend on national defence in the first place. The panel is of the strong opinion, however, that a smooth transition to curtailed defence spending would require careful and determined planning and action on the part of the Government. Steps would have to be taken not only to build up Government outlays for public services and facilities, but also to stimulate private expansion with tax reductions named as one effective device. Such Government action, it is felt, could help assure an adequate rate of economic grow h for the nation. It also could overcome the structural peculiarities inherent in the defence programme, in terms of the industries and regions likely to be most affected by defence cutbacks. Those who worked on the study, under the chairmanship of Professor Emile Benoit of Columbia University, recall that the United States has a noteworthy record of weathering past industrial demobilization problems. This was evident in 1953, at the end of the Korean hostilities, and on an even larger scale in 1945, at the end of World War II. In both instances, timely Government action helped smooth the way for the successful conversion of economic resources to civilian pursuits.

The chances for success of such efforts are deemed even brighter today, in view of the expansion that has taken place in the nation's economic capacity and resources, to say nothing of the knowledge and experience that has been gained in the handling of economic policy. As part of its responsibilities, the U.S. Government's newly created arms control and disarmament agency already has started studying the consequences of possible arms reductions—consequences that are bound to entail many difficulties arising from the realloca ion of national resources. It is for this new agency that the panel has prepared its report, which is formally titled "economic impacts of di.armament." For working purposes, the panel has assumed that the economic readjustment is likely to be a gradual process, related to whatever stages of arms control and disarmament may be negotiated internationally. Specific defence spending cuts would, presumably, be keyed to each stage. Estimated projections by the panel envisage a decline in annual U.S. defence spending from about $56,000 million to about $10,000 million over a span of a dozen years or so, beginning in 1965. In this way, the panel is allowing for the time it might take for meaningful disarmament negotiations to proceed and become effective. These projections, of course, are by no means official, and they can only be hypothetical at this point—a reasonable fascimile, so to speak, of what might happen. Essentially, then, this study represents a preliminary approach to a long-range problem. It contains no fixed positions, but it should serve to stimulate further discussion of a question which, it is hoped, will become real enough as other nations agree to move along the path to sensible and effective arms reductions.

Special Article

PUNJAB AND RAJASTHAN: AN ASSESSMENT IN THE PADDOCK

IN a leading article last week 'The Eastern Economist' set out broadly the forces working against the Congress Party throughout the country so as to reduce its majority in the Lok Sabha and the weakening of the Congress in the State legislatures. The two States which are under extremely heavy pressure are those of Rajasthan and Punjab. It is proposed in this special article to analyse the forces at work and to indicate trends of opinion on the likely outcome.

Tables I and II give the strength of the various parties as a result of the 1957 elections both in the Lok Sabha and the State legislatures in so far as these two States are concerned. An effort has also been made to assess the Assembly as well as the Lok Sabha seats in the forthcoming elections. Reports from these two States have indicated that the Congress Party has been weakened to a very large extent by the forces which have operated from within the Congress Party as well as from without. In Punjab, the Sikh minority has been in a ferment for a long time. Their demand for a Punjabi Suba under the auspices of the Akali Party has kept the passion of division burning, and the hope that the Das Commission's appointment would result in ironing out some of the differences between the two major communities has been belied because of the co-operation with the Commission of the Akali Party. Thus, in the present election, the Akali Party, in 1957 allied to the Congress, has built up in the Sikh minority a substantial following which is likely to be reflected in the downfall of many a Congress candidate in Punjab. Added to this is the major challenge from "rebel" Congressmen. No less than 30 Congressmen have been suspended in Punjab alone, especially those belonging to the Hariana area. Reports have just been received that no less than three District Congress Committees have been suspended (Gurgaon, Hissar and Karnal) and 'ad hoc' Congress Committees have been appointed in view of the fact that these officially elected Congress Committees had been working against the official candidates. This is a threat which is likely to weigh very

My choice of a truck? FARGO of course

Bhaiya, I have been a truck operator long enough to know that there can be no two opinions about the superiority of Fargo trucks. For instance take Axles. A Fargo vehicle is fitted with *Timken* axles now known as *Rockwell Standard* which have a world-wide reputation. These axles have great load carrying capacity and are absolutely dependable-which means a great deal to us truck operators.

There are several other superior features, besides. Taken together they lead to only one conclusion, namely, that the Fargo is a great truck. It is great in hauling power, great in endurance, great in earning capacity. You'll make Fargo your truck, too, I am sure.

SISTA'S-PAL-406

heavily upon the Congress Party. The Jan Sangh, possibly also because of the provocative activities of the Akali Dal, has also been very aggressive and has been successfully enlisting the support of Hindus in the urban areas.

The number of contestants per Assembly seat in Punjab works out on the average to be five, though there are no less than 48 Assembly seats for which the number of contestants is either six or more than six. For six seats, the number of contestants is as high as 9, though there are two seats, one from Dabwali and one from Tosham for which the number of contestants is 10 and 13 respectively. Does the plurality of candidates work against the Congress? In fact, no general statement may be made because it all depends on the structure of each constituency. There are, however, chances of the Congress Party being hurt because the usual "floating" vote is likely to be split due to the local politics ignoring the national appeal of the Congress Party. This three-pronged attack on the Congress Party is likely, as stated earlier, to weaken it considerably. The leftist parties such as the Communist Party, may at best retain six out of their seven Assembly seats in Punjab.

In Rajasthan the picture is slightly different, though the political climate is not nearly as favourable to the Congress Party as in 1957. This State abounds in "erstwhile rulers" whose hold on the masses is still large. Because of the age-old traditions, the people still favour the old rulers. Wherever a Maharaja or a Maharani is contesting the election against a commoner, he or she seems to enjoy better chances of success. It is precisely for this reason, it seems, that the Congress Party has decided not to contest the election against the Maharaja of Bikaner. Leaving apart the influence of the princes, another important element is the great discontent in the rural areas of Rajasthan against the land reform policy. The new laws abolishing the Jagirdari system deprived the Jagirdars of their property without vesting the proprietary rights in the cultivators. Even where the cultivator enjoyed the proprietary rights, the Tenancy Act made him a Khatedar — a cultivator with certain privileges but without the right of ownership. Certain conservative sections of society both in the rural and the urban areas stand estranged with the Congress Party because of the Public Trust Act according to which the Government has taken over the administration of temples and temple properties. There are some dissidents in Rajasthan such as Mr. Jai Narain Vyas, ex-Chief Minister of Rajasthan, and Mr. Adityendra, ex-P.C.C. Chief, but the malady of "dissidence" is not as widespread as in Punjab.

All these forces against the Congress Party are likely to reduce its strength in the Rajasthan Legislature from 119 in the last elections to less than 100 in the current elections. Similarly, amongst the Lok Sabha seats, the Congress Party may not be able to win more than 12 out of 22 seats. In Punjab the Congress Party may not have more than 15 Lok Sabha seats and in the State Legislature the number of seats of the Congress Party might be reduced from 120 in the 1957 elections to 95 or less in the 1962 elections.

THE BUSINESS WORLD

Coal Crisis Complete

By
CROESUS

DIFFICULTIES in regard to production and supply of coal have multiplied to such an extent that one need not be afraid of being dubbed an alarmist if one were to say that a coal crisis has been staring us in the face. What is peculiar about the present coal cisis is that it is complete, in that crisis conditions have enveloped practically every facet of our coal economy—production, demand, movement, and price. That this should have come about in spite of all the professed awareness and the several emergency measures taken by the powers-that-be makes one wonder whether the policies adopted to meet the situation are at all correct and adequate. Whether one agrees with this reasoning or not, it is common ground among the industrialists that the situation calls for an immediate reorientation of the present policies even to maintain the present level of production, let alone taking up the expansion programmes contemplated.

In the past few days, two commercial bodies have come out with tales of woe of their members in the matter of coal supplies. Mr. Lalchand Hirachand, President of the Maharashtra Chamber of Commerce, stated, at the first quarterly meeting of the Chamber: "The shortage of coal is causing anxiety to industry. It has been found that all estimates and arrangements for provision of fuel to industries go wrong and one industry or the other always faces a crisis on account of shortage of coal".

In a memorandum on "Coal Crisis and the Fuel Problem of Industries," submitted by it to the Ministry of Commerce and Industry, the Committee of the All-India Association of Industries (A.I.A.I.), has observed: "The position regarding supplies of coal to industries has been causing concern. Several industries — large, medium and small in different parts of the country have been experiencing continuing difficulty of getting adequate and timely supplies of this vitally essential material and this is seriously coming in the way of expansion and even maintainance of the level of production. More recently the problem has assumed a serious proportion in certain industrial centres situated away from the main coal producing regions and some of the manufacturing units there have been facing the unhappy prospect of being forced to close down or to curtail production. The position regarding coal supplies has thus deteriorated and developed into what may be called "Coal Crisis".

The problem of coal supplies has been rendered difficult for a variety of reasons. It is so not merely because we are not able to raise as much coal as the rising tempo of our industrialisation warrants, but also because the quality of the coal raised has been steadily going down, with the result that even in respect of those fortunate units of industry whose supplies have not gone down quantitatively, the same results in production are not assured. Quantitatively, while production during the Second Five-Year Plan fell short of the target by nearly 5 million tons, for the first 7 months, in the first year of the Third Five-Year Plan (our current Plan), total production has been only of the order of 23 million tons as against 30 million tons for the corresponding period of the last year of the Second Five-Year Plan. This means that even the higher tempo of output already reached is not being sustained.

Secondly, not unoften, the country is being faced with the anomalous situation of paucity in the midst of plenty. There have been several instances where factories in many parts of India had to carry on on a hand-to-mouth basis, not because production by the collieries lagged behind demand but because the railways were not ready with the number of wagons required to move the coal to its destination. As often, again, it would seem that, when the railway wagons were there, the pithead stocks were not adequate. In other words, the gap between the wagons offered by the railways and the wagons required for the movement of coal has been considerable. In the year 1961-62, according to the Committee of the A.I.A.I. the railways allotted only 5,979 wagons, as against the requirements of 7,183 wagons. More often than not, the irregularity of wagon supply also seems to aggrevate the difficulties.

Thirdly, to no small extent, coal production has been affected adversely by the unimaginative coal pricing policy of the Government. A curious thing has happened with regard to coal prices, in that, in so far as the consumer is concerned, prices (that is, the delivery cost of coal to consumers) have risen, whereas the coal industry has not benefitted to any extent from this rise. As a matter of fact, the claims of the coal industry even for neutralisation of costs on account of (i) implementation of the grades and time-scales laid down by the Colliery Arbitration Award and (ii) the loss in the average weighted sales realisation — though these were accepted by the Coal Price Revision Committee for Fixing a Fair and Reasonable Return to the Coal Industry — have been turned down by the Government. Here is a definitely inhibitory factor as regards coal raisings.

Viewed against this background, one can readily believe the recent headline report in the Press that the "Plan to raise coal output target (the Planning Commission has proposed to raise the target from 97 million tons to 110 million tons) runs into difficulties". To be precise, it is not merely the plan to raise coal output that is running into difficulties; it is also the plan to provide enough transport to move the additional output, as witness the reported tussle between the Planning Commission and the Railway Board in regard to the funds required to provide more wagons, and the proposal to limit coal production in certain coal-producing areas while increasing it in others. The frantic appeal to the cement industry to take to the use of furnace oil in place of coal is an eloquent commentary on the unsatisfactory coal movements position in the country today. No wonder then that we are told that the Working Group on Coal will shortly be proposing major changes in the pattern of production of transportation of coal.

That the authorities are amply alive to the problem is not disputed. Nor can one say that they have not at all attempted to meet the situation. For have they not introduced the coal dumps schemes? Have they not encouraged transportation of coal by sea-cum-rail routes to meet the coal requirements of industries in the Southern and the Western regions? And, have they not also compelled industries located near the coalfields to move as much as possible of their coal requirements by road? But even the cumulative impact of all these measures has failed to improve the position appreciably. This should make the authorities to rub their eyes and bestir themselves, unless they want us to believe that they are really not very serious about achieving the targets set out in the Third Five-Year Plan. That would perhaps be both unfair and uncharitable. But, then, in the absence of definite indications to the contrary, what is one to make out?

Be that as it may, if the targets are to be achieved, it is imperative to take certain steps, as has been repeatedly urged by more than one commercial body. The latest to offer certain constructive suggestions in this behalf is the A.I.A.I. Bombay. These may be briefly noted here:

(1) Coal production must not be hindered by allowing coal to accumulate at pitheads; all incentives, including higher price, must be extended to the coal industry. (It is significant that an apex body of industrial undertakings such as the A.I.A.I. should publicly declare that "the choice before us is between 'no coal' and 'coal at higher cost'!

As the A.I.A.I. rightly observes, "unless the coal industry is allowed a fair margin of profit, the development of coal mines will be retarded. Fair and reasonable return for any industry is necessary to attract fresh capital to it and the coal industry is very much in need of additional investment."

(2) The wagon and the line capacity of the railways must be sufficiently raised and all necessary facilities, including foreign exchange, for imports of steel required for wagons and rails, must be extended to them.

(3) Allocations out of the World Bank loan of Rs. 17 crores for private collieries must not be delayed any further. As it is, about 7 months have elapsed since this loan was sanctioned and, apart from delaying the implementation of the programmes of these collieries, any more delay would be not only unconscionable but also inexcusable.

(4) Industries other than cement (those units that are situated far away from the collieries) also must be encouraged to switchover to furnace oil. (There are two swags here, though. The first is the extra foreign exchange that would be needed, and the second is the probability of paying the way for an eventual —not immediate — coal surplus, as in the case of sugar recently, by a deliberate move to discourage the use of coal). This could be facilitated by the provision of appropriate relief in taxation to the units concerned.

Business Notes

Rubber

NEEDED A REALISTIC APPROACH

THERE HAS been a phenomenal increase in the demand for rubber during the past few years, owing to the present industrial development. The production of the commodity, on the other hand, has lagged very much behind. In the current year, for example, it is estimated that the demand for raw rubber would be nearly 80,000 tons, made up of 62,000 tons natural rubber, 12,000 tons synthetic rubber and 6,000 tons reclaimed rubber. As against this, the indigenous production would be only about 27,000 tons, which means that the rest of 53,000 tons would have to be made good either by indigenous production of synthetic rubber (still a long way off!) or by imports which would entail a foreign exchange outlay of nearly Rs. 16 crores.

In this connection, it is a matter of regret that as much attention as is necessary has not been given to exploring the prospects for increasing the acreage under rubber. The Andaman scheme has, of course, been there, hanging fire for the past eight years and more. Apart from the reports that nearly 13,500 acres of land suitable for rubber cultivation have been found to be available in Andaman and Nicobar Islands, nothing concrete seems to have been done as yet. The recent proposal of the Rubber Board to send a team of officials to these Islands for preparatory work on a 2,000-acre plot is, therefore, a good, albeit belated, start.

Although we are moving in the right direction thus, it remains to be seen how the proposition will work in actual practice. The success or failure of the rubber development project in Andaman hangs on the slender thread of realistic approach. As Mr. K. M. Philip, President of the Indian Rubber Industries' Association (I.R.I.A.) has pointed out, the authorities would have to bear in mind the experience in Kerala, where 95 per cent of the rubber plantations are held by small holders in 20 to 50 acres plots, which has proved beyond doubt the uneconomic nature of small-hold plantations. In order to put to better use the fertile lands of Andaman, considerable scientific knowledge and experience are called for. The Rubber Board, which has little or no experience is, no doubt, brave in undertaking this task, but it might lead to disastrous results. Rather than court such a risk, the authorities would do well to accept the advice of Mr. Philip to alter their decision and entrust the work to private entrepreneurs whose experience and know-how in the field have been long, and also provide adequate long-term finance, if necessary. The Government could lease the land on a crop-sharing basis, if it is averse to an outright sale, in which event, it could also have a share in the profit. In short, as the I.R.I.A. Chief has pointed out, this problem needs to be tackled in a bold and imaginative way so as to subserve the larger interests of the nation.

Coal

COAL MINING MACHINERY PROJECT

THE ERECTION of the machinery at the Coal Mining Machinery Plant, being put up at Durgapur as a public sector enterprise, is envisaged to start by the third quarter of the current year. The plant is expected to go into partial operation by the end of the next year. This was disclosed to the distinguished guests who were taken around the plant site recently after the inauguration of the AVC project at Durgapur.

The plant, by the time it goes into full production and attains the target output of 45,000 tons of coal mining machinery per annum, would have involved a capital outlay of nearly Rs. 35 crores. The value of the final products at the full rated capacity is estimated to be of the order of Rs. 24 crores. When in full production, the plant will be manufacturing the following items of machinery:

Items	Quantity	Weight in Tons
Coal Cutters	600 pieces	1704
Loaders	250 "	1371
Conveyers	1800 "	22487
Trolley & battery type electric mine locomotives	150 "	1300
Haulages	400 "	3804
Electric winders	25 "	1167
Main axial fans	100 "	1154
Booster fans	250 "	50
Centrifugal pumps	500 "	998
Sand pumps	300 "	550
Automatic cage keps for use in vertical shafts and safety detaching hooks, rope clips etc.	—	2000
Light drill rigs for exploration drilling	25 "	28
Spare parts	—	8323

The plant will be self-sufficient in respect of its castings and forgings, except for the heavier pieces

which are envisaged to be obtained from the Foundry Forge Plant (also a Government enterprise) to be set up at Ranchi. Besides, some finished and semi-finished products, such as electric motors, starting apparatus, alloy steel, ball and roller bearings, lubrication equipment etc., costing nearly Rs. 1.5 crores per annum, will be procured from outside sources. On the other hand, the plant will have a spare capacity to supply to other industries every year nearly 2,000 tons of steel castings, about 50 tons of non-ferrous metal castings and approximately 750 tons of drop and hammer forgings.

The main units of the plant will be a Gray Iron Foundry, a Steel Foundry and Forge Shop and three machining and fabricating shops. The Grey Iron Foundry will have a capacity of 1,100 tons of iron castings and 300 tons of non-ferrous castings per annum. It will have two nos. 5-ton per hour capacity cupolas and will be fully mechanised. The Steel Foundry will produce nearly 9,000 tons of castings a year and will have two nos. 5-ton capacity and possibly a 1½ tons electric furnace. This Foundry will also be fully mechanised. The Forge Shop will have an annual capacity of 10,000 tons of forgings and will contain various sizes of hammers upto a maximum 3-ton capacity. The three shops for machining, fabricating and assembling operations will contain about 530 units of machine tools and accessories. One of these shops will produce coal-cutters, loaders, electric mine locomotives and pumps. The second one will manufacture electric winders, haulages, main axial fans, boring rigs and cage safety devices. The third shop will produce belt and scraper chain conveyors.

While mechanisation in coal-cutting has been resorted to to a fair extent in India, mechanisation of loading and conveying of coal at the mines is still a far cry. Coal-cutting was mechanised in this country to the extent of 28.4 per cent of the total output in 1955. Loading and conveying of coal in that year were mechanised only to the tune of 0.3 per cent and 4.7 per cent of the total production, respectively. By 1961, coal-cutting through mechanical means covered nearly 43 per cent of the total output, while loading and conveying had been mechanised only to the extent of 12 per cent of the production. Under the Third Plan, great stress is to be put on mechanisation of the various processes of this industry. Coal-cutting by mechanical means is envisaged to be raised to about 64 per cent of the output, while loading and conveying are proposed to be mechanised to the tune of 70 per cent. Attempts are to be made to keep the haulage and winding through mechanical means at the current level of 90 per cent of the total output. The Durgapur plant is expected to help in the attainment of these targets.

Lubricants

A NEW VENTURE IN THE OFFING ?

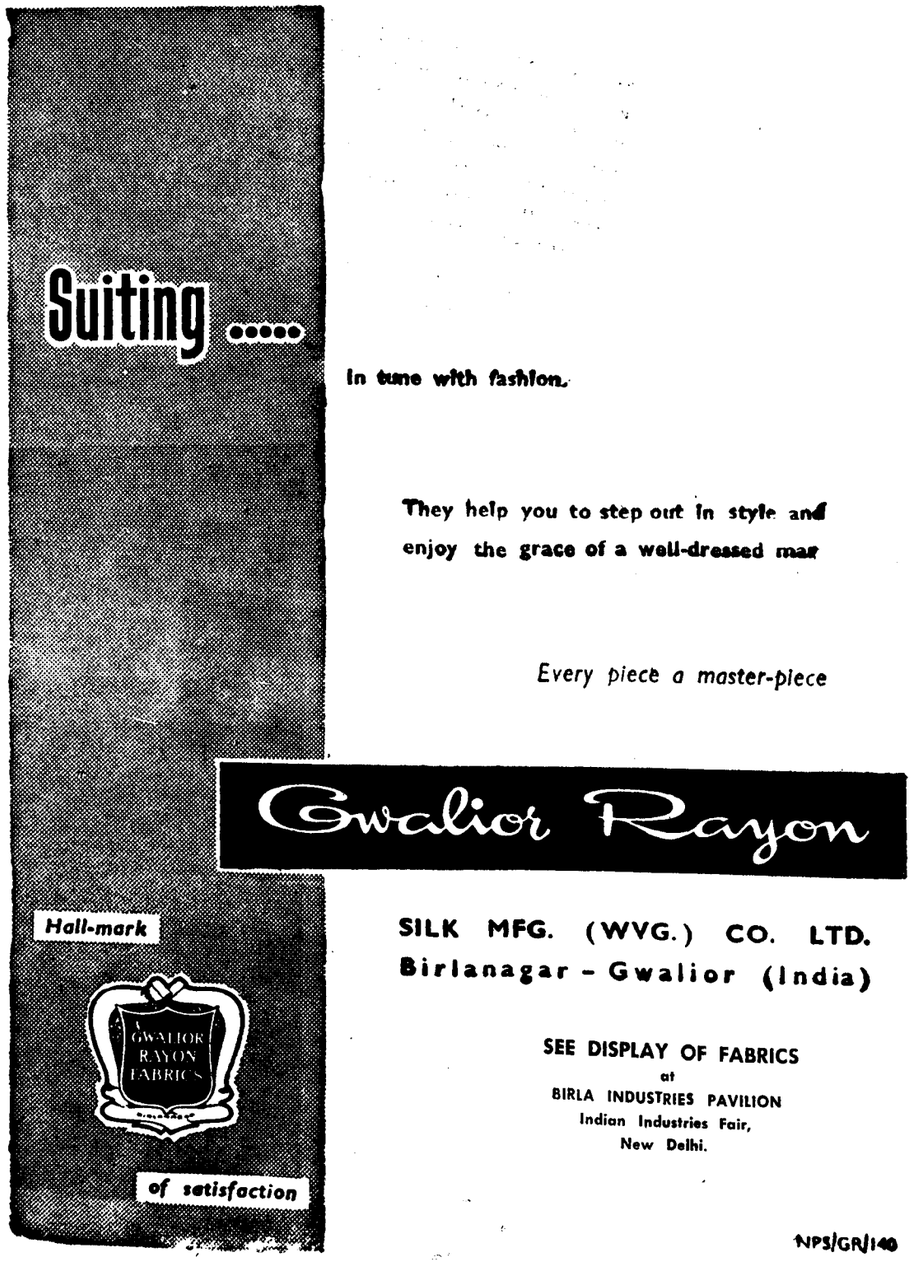
THE WELL-KNOWN British lubrication engineering firm, Tecalemit Limited, which over the past few years has built up a substantial business in this country and is already manufacturing some of its goods (nearly 60 per cent of its total sales) for the Indian market through sub-contractors in India, proposes to set up a rupee subsidiary company to undertake directly the production of bulk of its products here. The Managing Director of the concern, Mr. P. R. Scutt, is here at present to discuss the matter with the Government of India.

The subsidiary company is envisaged to be established in Calcutta. In the initial stages, the parent company expects to be the majority shareholder. Indian capital is proposed to be associated with it as a minority holding for some time after which, probably after the expansion of its activities, Indians will be made the majority holders. An application for the grant of a licence under the Industries (Development and Regulation) Act is envisaged to be made in the near future—probably during Mr. Scutt's current visit itself.

Three main factors are said to have prompted the management of Tecalemit Limited to go in for a manufacturing programme in this country. They are: (i) the immense potentiaities for the expansion of the industry in India, probaby greater than anywhere else in the world; (ii) the political stability obtaining here; and (3) the availability of intelligent labour. Referring to the last factor, Mr. Scutt is said to have observed: "We have been agreeably surprised at the quality of some of our products now being made in India for us."

Pharmaceuticals

PLACE OF RESEARCH



THE PROGRESS made by the drugs and pharmaceutical industry in India in the manufacture of modern drugs during the First and Second Plan periods has indeed been remarkable. The value of the annual production of drugs and pharmaceuticals in the country presently is estimated at around Rs. 70 crores. But to be able to catch up with the actual requirements of the country —we are still importing annually another Rs. 30 crores worth of drugs and pharmaceuticals—and to familiarise an increasing section of the population in the use of modern medicine, say the planners, a three-fold increase in the output of this country would be necessary during the Third Plan period.

Mr. G. L. Mehta, Chairman, Industrial Credit and Investment Corporation, referred to, and also commended, the progressive decline in the use of imported raw materials and the increasing reliance on indigenous raw materials, whilst speaking at the opening of the Vitamin C Plant of Sarabhai Merck Limited, at Wadi, Baroda, recently. In order to attain cent per cent self-sufficiency in the use of indigenous raw material as also to produce enough to meet the internal demand fully, collaborations, such as the Sarabhai's with the well-known German firm of R. Merck, were particularly needed, opined Mr. Mehta. With this collaboration, said the I.C.I.C.I. Chief, a stage had been successfully reached, where a wide range of fine chemicals, laboratory chemicals of guaranteed reagents and vitamins would be produced in this country. Moreover, Mr. Mehta said, "Colloboration with firms such as these ensures beyond doubt the quality and standard of products which is an important factor in the successful development of this industry."

A very pertinent reference was made by Mr. Mehta to the problem of research. He recalled the phenomenal progress made by the pharmaceutical industry in the more advanced countries during the past few decades and said how such was made possible—by continuous study and research, over years. This aspect, he rightly exhorted, should be borne in mind by both the Government and the private entrepreneurs, as this is one of those industries which could not be expected to progress if divorced from study and research.

Another important aspect of the pharmaceutical industry that the I.C.I.C.I. Chief touched upon was exports, which are at present only around Rs. 60 lakhs a year. Collaborations such as this, he felt, would facilitate the boosting up of exports, inasmuch as the trade names of the collaborating countries could well be utilised to maximum advantage. But he also added that, though it had become imperative to export more and

more in view of the country's parlous foreign exchange position, priority should be given to the satisfaction of internal needs.

Cables

EXPANSION ENVISAGED

CONSEQUENT UPON the increasing demand for power cables as a sequel to electricity output going up, the factory of the State-owned Hindustan Cables Limited is envisaged to be expanded to produce cables worth Rs. 8 crores per annum. The factory is expected to attain a rate of production of Rs. 2 crores worth of cables a year by the end of the next month and orders for securing equipment for the first phase of its expansion, which will increase its capacity to Rs. 4 crores worth of cables a year by 1964, have already been placed. Expansion plans include setting up of a new copper wire drawing plant, a plastic cable-making plant and certain other ancillaries which will make equipment required by the tele-communications department.

Meanwhile, the Minister for Industries in the Union Government has been thinking aloud in respect of setting up another cable factory in the country with Swedish collaboration. Whether this project will fructify or not depends on crossing of one great hurdle, which is that the present agreement with the British Standard Telephone and Cables Limited, the collaborators of the Hindustan Cables Limited, stipulates that the British company has to be given the first right of refusal in the event of any expansion of the Hindustan Cables' factory or for starting of any new unit by the Government. This agreement is working quite satisfactorily and has still to run for a number of years.

There are three more units manufacturing cables in this country—the Indian Cable Company, Asian Cables Limited and the Cable Corporation of India. But in view of the great shortage of cables that is expected to persist for years to come, the country may have to go in for another cable manufacturing unit, besides expansion of the existing ones.

Engineering

GLOBE MOTORS

ANOTHER COMPANY which is entering the market at the end of this month for raising capital is Globe Motors Ltd. Its authorised capital is Rs. 100 lakhs, divided into 100,000 equity shares of Rs. 100 each. The issue being offered to the public is around Rs. 12.25 lakhs.

The company is setting up a plant at Ballabgarh, near Delhi, to undertake the manufacture of 6,000 tons of silico manganese spring steel and 1,200 tons of malleable castings per annum on single-shift basis. The plant will also manufacture 1,200 tons of laminated springs for automobiles per annum, on single-shift basis. It may be mentioned here that there are 6 units in the country engaged in the manufacture of laminated springs for automobile industry. Their combined installed capacity is 28,590 tons per annum, three-shifts basis, but their production is much lower, due to inadequate and irregular supply of imported spring steel. Globe Motors will, however, enjoy a great advantage in this respect since it will be making its own steel for manufacturing the laminated springs.

The necessary industrial licences for all these activities have already been granted by the Government of India. The factory building is now fast nearing completion and the plant equipment from the U.K. and West Germany has arrived at the site. The plant will go into production towards the middle of 1962.

Because of the wide market for the products of the new unit, the profits of the company are likely to be enhanced considerably. For that reason alone, the new issue is bound to receive a very encouraging response from the market.

Dyestuffs

SANDOZ'S NEW PROJECT

THE BELIEF that the Swiss firms are taking an active interest in building the economy of India is now strengthened with Sandoz starting a new project for the manufacture of dyestuffs and chemicals in Maharashtra. The execution of this project would help save foreign exchange to a certain degree that is now being spent on the import of dyestuffs. It is estimated that the saving would be to the tune of Rs. 80 lakhs a year. At present dyestuffs worth Rs. 15 crores are consumed in this country. Fifty per cent of them are imported.

The project has been licensed to manufacture 540 tons of dyestuffs and intermediates per annum. Of the 58 items, 47 will be produced for the first time in India. The installation of the plant at Kolshet, Thana (Maharashtra) would no doubt have salutary effect on the economy of the State. Besides providing employment to many, this venture of Sandoz would go a long way in helping the advancement of the textile industry in the developing State of Maharashtra.

The association of Sandoz with the Indian textile industry in India can be traced back to 1910. And from then on many favourable developments have taken place. In 1956, the company was granted a licence to manufacture a wide range of pharmceuticals and leucophor, an optical bleaching agent. The factory was formally inaugurated on February 4, 1961. According to the Managing Director of the firm, the project will operate on the basis of self-sufficiency in regard to payments for the import of raw materials necessary for its 58 products by exporting a part of the output.

ILO

REPORT ON DEVELOPING AREAS

THE ILO experts' report on developing areas, made available recently, has little new to offer. Steps that have been urged for full employment are already known. The experts were asked to make a thorough analysis of the problems of employment creation in the context of economic development and suggest measures for expansion of employment opportunities both under national plans and through international action.

The ILO team has urged that the developing countries should aim at achieving full employment within a reasonably short time and to this end raise the levels of investment in their national plans. Needless to say that this is already embodied in the plans of most of these developing countries. It was expected that an expert team from an international organisation would suggest something which would not only cater to the needs of these areas but would also be at the same time really constructive. It, however, would be being harsh on the team to expect too much as problems in these areas have to be tackled by setting up labour-intensive industries and framing policy in a manner that would put an end to the unemployment and under-employment problems. A geographically balanced growth of employment is no doubt only possible through a policy

of regional location of industries. But the disclosure that limited funds are earmarked for small-scale industries need not be taken at its face vaule as in India's Third Five-Year Plan Rs. 200 crores have been provided for promotion of small-scale industries.

Then again it is all very well to say that investment be increased and foreign capital be attracted to these developing countries, but this cannot be achieved until the policy is framed in such a manner that it would not impinge heavily on the foreign investors. India on this score is well aware and the setting up of the Investment Centre in Delhi is recognition of the need to do something in this sphere.

So far as the suggestion that developed countries should participate in a programme "of a counter-cyclical nature" under which standard types of equipment could be produced and stored for purchase as required by under-developed countries is concerned; it undoubtedly has aroused a lively interest.

In regard to utilisation of under-employed in the rural areas, the report suggests that an increase in agricultural production would facilitate the expansion of non-agricultural employment and investment. It says that labour intensive programme might be promoted through local capital construction, development of rural industries and rural production activities such as animal husbandry, afforestation and fisheries. In urban areas, the report underlines, that additional employment could be created through fuller utilisation of existing capacity of industrial plants and the introduction of multiple shifts. While concrete steps are being undertaken in the shape of works programme and industrial estates in the rural areas to put the rural economy on an even keel, it is a pity that existing capacity of industrial plants is not being utilized fully. Perhaps the shortage of raw materials could be assigned as the reason for this state of affairs; but it goes without saying that the Government should become alive to the situation and provide the necessary facilities with a view to avoiding a set-back to the economy.

Rural Manpower

WORKS PROGRAMME: A NECESSITY

THE QUESTION of utilising rural manpower in various regions of the country has of late been exercising the mind of the Government. In the Third Five-Year Plan it is envisaged that along with the problems of development for large and small-scale industries, for agriculture and other economic and social services, there should be a large-scale programme for rural works, especially in densely populated regions and for periods of under-employment during slack agricultural seasons. This is now being given a practical shape. Two conferences have already been held, one in Delhi covering the northern and central regions and the other in Calcutta covering the eastern region. The recent regional conference on the works programme for utilising the rural manpower in the States of the southern region is just a further step to put the machinery into motion for achieving the desired goal.

It may be recalled that 32 pilot projects were started in the States in order to furnish experience at the State, district and block levels in the organisation and direction of the works programme. The areas for locating the pilot projects were to be selected on the basis of their high incidence of unemployment and under-employment. The works programmes consisted of schemes which were designed primarily to accelerate increasing agricultural production and creating community asse'ts. This was a step in the first series and for the second series, the Government of India had decided to have 156 pilot projects all over the country. The recent conference has proposed about 10 projects in each State. A thing to note in this programme is that it is a Centrally sponsored one with the Government of India meeting the entire expenditure, half by way of loans and half by way of grants. The execution of the scheme is to be in close collaboration with the Panchayati-Raj agencies. Since conditions in the rural areas need to be improved at the earliest, works programme can be said to be a necessity. The projects not only would provide employment during agricultural lean seasons, but they would also help in accelerating the increase in agricultural production. This programme would be supplementary to the programmes of development included in the Third Plan. The schemes considered suitable for inclusion in this programme are of the nature of land reclamation and construction of irrigation channels that would directly help the economy of the area.

Another measure to strengthen the rural economy that is under consideration is the setting up of rural estates in the rural areas. Mr. Shriman Narayan, Member, Planning Commission, has hinted that 200 rural industrial estates would be established throughout the country during the Third Five-Year Plan. These estates would be located in smaller towns and villages in order to provide employment as well as opportunities to the rural people. All these steps are in the right direction and it can be reasonably assumed that works programmes along with rural industrial estates if administered properly can go a long way in raising not only the standard of living of the masses but also in solving the under-employment problem—the solution of which has been baffling the planners for quite some time.

SWISS INDUSTRIES FAIR IN MARCH

The Swiss Industries Fair, to be held at Basle in March next, is likely to draw visitors from the four corners of the world. It is the greatest annual event in the industrial life of Switzerland.

Occupying an area of 1,416,000 sq. ft., 2,300 exhibitors at this fair will be showing a wide range of products made in Switzerland where the paucity of raw materials has led to increasing emphasis to be placed on the production of quality goods, having a high labour content.

Perhaps, the Swiss Watch Section will be the best show in view of the country's traditional fame in the field. It is expected to display the latest creations of about 160 Swiss watch manufacturers. Nearly 95 per cent of the watches manufactured in Switzerland are exported to all over the world.

The Swiss machine tools industry is also anticipated to make a special feature of the Fair by giving a complete picture of its highly reputed quality products. Among the vast range of consumer goods on display will include textiles, clothing, fashion, shoes and leather goods which are among the other important exportable items from Switzerland. The plastics industry will also be putting up a good show.

CORRIGENDUM

In the issue of "The Eastern Economist" dated February 2, 1962, there appears, on page 408, an advertisement of the United Commercial Bank. In this advertisement, the reserve fund of the Bank is erroneously shown as Rs. 2,05,00,000. The Bank's reserve fund today amounts to Rs. 2,35,00,000. This inadvertent error is deeply regretted.

FROM THE CAPITAL'S CORRIDORS

TECHNICAL ASSISTANCE FOR BOKARO COALFIELDS

IN March 1960, the Government of India had approached a number of coal producing countries for technical assistance in the expansion of coal production during the Third Five-Year Plan. As a result, British, Americans, French and Germans had sent their coal experts. The projects planned or in the course of execution were: (1) Opencast and drift mines at Ramgarh (U.S.A.). (2) Deep mine of 6,000 tons per day in Jharia coalfield (Poland). (3) Deep mine in the Korba coalfield (USSR) (4) Special method of working in Karanpura coalfield (France). (5) Kargali coal preparation plant (Japan). (6) Coal preparation plant at Dugda (U.S.A.). (7) Coal preparation plant at Bhojudih (Belgium) (8) Coal preparation plant at Pathordihi (not allocated). (9) Coal preparation plants in Bokaro coalfield to total capacity of 3 million tons per annum (U.S.S.R.). (10) Coal-burning power station at Chanderpura (U.S.A.).

These projects are the ones that were directly concerned with coal; there were many other projects in the wider industrial field sponsored by foreign countries. In all the above projects, aid from the particular sponsoring country for the purchase of equipment, etc., was available in one form or another. Thus, in the case of the U.S.A., technical assistance was provided under the International Co-operation Administration (I.C.A.) and the capital assistance from the Development Loan Fund (D.L.F.).

So far as the British were concerned, Mr. H. A. Longden, then Director-General of Production of the National Coal Board, made a visit to India in June-July 1960 to "obtain a better understanding of the National Coal Development Corporation's requirements." He made his report in August 1960. His general conclusion was that technical assistance should be concentrated on a narrow front to establish, what might be termed "model" units, a Deep Mine, Drift Mine, Open Cast Mine, possibly a coal preparation plant and a Central Workshop, which should set the highest possible standards for emulation elsewhere.

In January 1961, the Government of India requested the British Government for technical, a sistance to prepare project report for the development of Bokaro coalfields in Bihar. The projects specifically mentioned were deep mines at Jarangdih, Kathara and Sawang. All these mines would exploit large reserves of coking coal required for the programme of expansion in steel production in Bihar, West Bengal and elsewhere.

At present the mines in operation in the Bokaro coalfield are:

1. Kargali Colliery:

This mine has a capacity of about three-quarters of a million tons per annum mainly from opencast workings in the Kargali seam, but also some 50,000 tons per annum from deep mining. Production in 1960-61 was 686,000 tons. An interesting feature was that pillars previously developed by deep mining were now being extracted by strip mining.

2. Bokaro Colliery:

This mine of 1.6 million tons annual capacity is entirely opencast working and in 1960-61 produced 1.17 million tons. Technical scope for the mechanisation of coal mining and transport in tremendous. Much increased output would be possible with but relatively small capital expenditure.

3. Jarangdih Colliery:

In this take a deep mine was sunk and equipped in the late 1920's but was closed in 1936. This mine had partially developed the Kargali seam in the easterly end of the take but heavy emissions of gas, difficult roof conditions and considerable make of water resulted in its closure. At present a number of drift mines, having an annual capacity of 120,000 tons, are working an upper (Jarangdih) series of coals at relatively shallow depths.

4. Kathara Colliery:

This is a fully-mechanised opencast working using electrically-operated shovels for overburden and coal. The mine has an annual capacity of 1.5 million tons and has a labour force of 900.

5. Sawang Colliery:

In this take to the north-west of the exposed coalfield there are two drift mines and a small hand-worked opencast mine giving an annual capacity of 120,000 tons.

From the Bokaro coalfield, in which the National Coal Board engineers are directly interested, an annual output at the end of the planning period of 5 million tons is expected against the target of 4 million tons in the Second Plan. (Actual output in the last year of the Second Plan was 2.9 million tons). The shortfall in the Bokaro coalfield was due principally to inadequate transport clearance from the collieries and, to some extent, lack of coal preparation facilities. Although all coals are of coking quality they require to be cleaned before being acceptable to the steel works.

In order to start the work in India, arrangements were made for Mr. Elliott and, on a temporary basis, Mr. G. Armstrong (Chief Geologist, National Coal Board) to be available in India in August 1961. At the request of the Government of India it was also agreed that the Board Member for Production, Mr. H. E. Collins, should visit India.

It was made quite clear to the National Coal Development Corporation that the proposed deep mine projects in the Bokaro coalfield could not make any contribution to the Third Plan since more than five years would be necessary to plan, sink, equip and bring any of them into production.

The report submitted to the Government of India by Mr. H. E. Collins contains certain significant observations: "It is important to appreciate that, at present, limitation of transport facilities prevents the full utilisation of even existing production capacity. For example, the opencast mine at Kathara, which is fully mechanised, is producing at only half its actual capacity. Thus the provision of additional production capacity will be of no avail unless transport is so very much improved as to afford continuous clearance from the collieries.

"Moreover, although the coals in the Bokaro coalfield are of coking quality, adequate preparation is essential before the coals can be used for metallurgical purpose. We studied washability characteristic curves from which it was clear that all these coals presented a difficult preparation problem. The only economic solution is to make a considerable middlings fractions, the outlet for which is for steam raising in thermal electrical generating stations. Already the Bokaro thermal station takes the middlings from the Kargali coal preparation plant. It is possible that the proposed thermal station at Chanderpura will take middlings from the Bokaro plants as well as from the new preparation plants in the Jharia coalfield. Suffice it to say that with the provision of additional coal preparation capacity, urgently needed

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH AIR-INDIA AND QANTAS

the Bokaro coalfield, outlets must be provided for ldlings to ensure reasonable economic working.

"The need for additional washing plants is fully reciated by National Coal Development Corpora- and already a large central coal preparation plant been built by Japan at Kargali. This has a rated acity of 460 tons per hour of raw coal throughput. plant serves the Kargali and Bokaro collieries but ot yet up to full capacity.

"We were informed that the U.S.S.R. were pre- ed to erect coal preparation plant in the Bokaro lfield upto an annual capacity of 3 million tons. A ject for a two million ton per annum plant at thara has been finalised and it is likely that work l commence on erection shortly. The remaining acity of one million tons per annum has not yet en allocated but will probably be split between angdih and Sawang.

"Obviously it will be 1964-65 before this additional l cleaning capacity will be available and until this e coal from the Bokaro coalfield suitable for metal- gical purposes will be limited to the output of the Kargali coal preparation plant.

"Despite these current limitations of transport and l preparation it is important to plan now the addi- nal production capacity. This is necessary because wards the end of the Third Plan, the proposed new karo steel plant should be in operation, and will have draw its coking coal supplies from both the Jharia d Bokaro coalfields. This relatively short-haul for l should help considerably in transport clearance m the collieries in both coalfields."

Following are the recommendations made by Mr llins in his report:

1. "It is considered essential that the planning and velopment of the Bokaro mines be on a coalfield- ide basis and not confined to individual and unco-ordi- ted projects.

2. Opencast operations should be intensified at athara and the reserves re-estimated by considering extension of permissible overburden | coal ratio and timate depth of working.

3. At Kathara opencast operations can continue at e present target rate of 1.5 million tons per annum r some 20 to 30 years. Development of a deep mine this take, although ultimately necessary, can be def- rred for at least 20 years.

4. At Jarangdih the reopening of the deep mine hich was closed in 1936 is not recommended. The pper (Jarangdih) series of coals should be worked to mits of opencast operations by intensive fully-mechan- ed methods, including the de-pillaring of the Jarangdih eam. As soon as possible drift mine operations should ease in favour of intensive opencast working. The pencast operations would be followed directly by deep ining. The proposed deep mine would have available or working not less than 50 million tons of coking oals at depaths ranging from 1300 feet to 2000 feet.

Although it is not yet possible to state exactly the ite of this large deep mine in the Jarangdih take it eems likely that it would be within the area in which he principal seam of the upper series has already been orked into pillars from the drift mines. The proposed pencast operation would, among other things, clear he site of the proposed deep mine which will come nto production when the opencast output declines. lanning of the opencast operation should therefore be ully in accord with the deep line project the planning of which can start as soon as sufficient geological information is available. A drilling programme extending over a period of some twelve months will be necessary to obtain all the geological information ultimately required.

5. At Sawang the introduction of intensive and fully--mechanised opencast minning to the exclusion of drift mining is recommended. This form of mining can be relied upon for the necessary output from this take for a period of five to ten years, depending upon the results of a further drilling programme. Considerable geological data pertaining to the deeper areas of the Sawang take must be collected from a deep drilling programme which could well occupy two or three years. Then it would be possible to plan a deep mine project for this take.

6. It is recommended that a progarmme of exploratory drilling be drawn up in order to prove fully the coking coal reserves in the whole of the Bokaro coalfield. This applies particularly to the lower seams, namely, Bermo and Kara seams, on the northern outcrop, and in an extensive area to the north and no heast of the Jarangdih take. It is extremely likely that of the extensive reserves which are almost certain to be proved, considerable quantities will be capable of efficient opencast exploitation.

7. In order to obtain full value of the increased production capacity envisaged above, coal cleaning plant will be required at Jarangdih and Sawang, plans already being in hand for Kathara. These plants will deal initially with opencast output but eventually will be required to treat deep mine output. Therefore they should be sited in such a manner as to satisfy this dual purpose.".

It has been observed in certain circles that the report submitted by Mr. Collins gave the impression that he had recommended the nationalisation of metallurgical coal mines in India. The question of such nationalisation does not arise because the recommendation relates to mines already in the public sector. It may be added that while negotiating a loan of thirty-five million dollars for the private sector, the Government has assured the World Bank that nothing would be done, say during the period the loan were not repaid, which would have an adverse effect on the incentive to raise additional coal to the targetted level. This is a further indication that no further nationalisation is envisaged by the Government of India.

DEVELOPMENT OF ELECTRIC POWER

A broad outline of the programme for development of electric power in the Fourth Plan is being prepared by a team of three high officials of the Government of India, Mr. P. P. Agarwal, Joint Secretary, Union Ministry of Irrigation and Power, Mr. Balwant Singh Nag, Adviser, Planning Commission, and Mr. K. P. S. Nair, Member (Power), Central Water and Power Commission. The groundwork for planning of the power schemes to be included in the Fourth Plan has also been taken up.

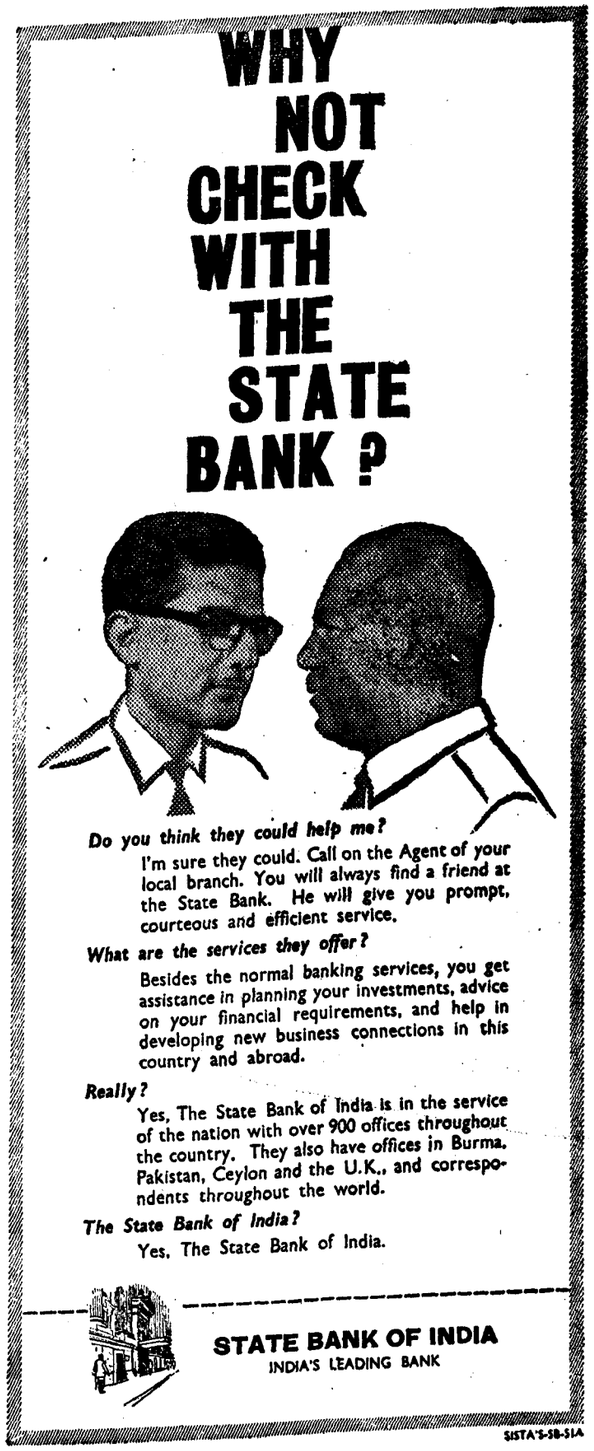
The early start on the drawing up of the plans for the development of power resources during the Fourth Plan period and the setting up of the three-man team has been the outcome of one of the main recommendations of the Sachdeva Committee which had been set up sometime ago to study the power requirements of Bihar and West Bengal, including the Damodar Valley Corporation area, during the Third Plan period. The Committee has opined that since no new plant that has been sanctioned or may be sanctioned during the current Plan period will come into operation before 1964, the power position in Bihar and West Bengal is likely to

remain acute and will particularly affect the Calcutta area, the coalfields and some other important industries in the region such as the heavy engineering works; throughout the greater portion of the current Plan period, there will be shortage of electric power in this region. Many of the plants commissioned in the area, the Committee observes, have been running continuously with the risk to the equipments for want of spare capacity. The load conditions in the region are advancing rapidly and the requirements will have gone up appreciably by the beginning of the Fourth Plan. The Committee, therefore, had recommended that the question of power requirements of this area during the Fourth Plan period should almost immediately be taken on hand and preliminary steps completed in good time. Unless this is done, the Committee visualized serious shortage of power during the early years the Fourth Plan.

The Committee has also made certain pertinent observations on delays encountered in setting up of new power plants and the working of the Damodar Valley Corporation. Its findings and recommendations on these are as follows:

"The question of the delay in obtaining necessary foreign exchange and import licences, etc., for import of essential equipment and spare parts (for power plants) has been highlighted before us (the Committee) by the various authorities concerned. No import licence can be sanctioned unless necessary clearance has been obtained from the Development Wing of the Ministry of Commerce and Industry. This generally takes considerable time. The Committee recommends that a wholetime officer should be appointed under the Ministry of Commerce and Industry (Development Wing) to deal with all such requests in respect of power plant requirements, in direct consultation with the Central Water and Power Commission and the Ministry of Irrigation and Power. It should be the responsibility of this Officer to ensure that all such requests are promptly dealt with and necessary clearance given within a matter of a few day. The Committee trusts that the Ministry of Irrigation and Power will establish a procedure in consultation with the Ministry of Commerce and Industry and the Department of Economic Affairs, Ministry of Finance, under which all requests for foreign exchange and import licences can be cleared within a fortnight to three weeks of the application having been forwarded by the Central Water and Power Commission.

"The Committee is aware of the difficulties that are being faced in the matter of procurement of proper grade coal for the types of plant that are already installed. The difficulties of transport accentuate the problem of obtaining proper grades of coal. Discussions are occassionally held between the Railway Board, the Coal Board and the power supply authorities, as represented by the Central Water and Power Commission in this regard. We would recommend the setting up of a Standing Committee for the purpose to deal with these problems, as they arise, from time to time.



D.V.C's WORKING

"During our discussions we found that there were some serious differences in the approaches of the participating Governments and the Damodar Valley Corporation in the matter of power development within the Valley and outside it. Bihar has interest in power development, which is financially a paying proposition but very little or none in irrigation and flood control. West Bengal is greatly interested in flood control and irrigation, but there have been acute differences between them and the Damodar Valley Corporation over the question of settlement of dues. In the matter of generation of power, West Bengal would like the Damodar Valley Corporation to restrict its activities to supplying power to areas within the Valley except for loads which have already been committed outside. Even in respect of commitments of loads outside the Valley, West Bengal has some reservations. The Damodar Valley Corporation has, in its turn, pointed out that there have been considerable arguments and delays over the sanctioning of its additional power generating units on the part of the participating Governments. We feel that such differences must inevitably lead to friction and want of smooth and harmonious working when consultations with the participating Governments are necessary and there are basic differences in approach in some important matters. It is necessary that in the light of the difficulties mentioned above and the existing provisions of the Damodar Valley Corporation Act, the entire working of the Damodar Valley Corporation should be reviewed by the Central Government in consultation with the Governments of Bihar and West Bengal so as to evolve suitable procedures as would make for smooth and harmonious working. One of the suggestions made to us is that the Central Governments should directly take over the existing installations of the Damodar Valley Corporation, both in respect of power and irrigation and flood control, and administer them in the best interests of the Valley, as also of the two State Governments after necessary financial arrangements have been worked out and accepted. Some other suggestions have been made also but we trust that the entire matter will be speedily gone into and difficulties resolved as soon as possible.

"The troubles experienced with the turbo-generator plant, the "slagging" problem in respect of the boiler plant and the defects in the coal mills are of a nature which could hardly be categorised as "teething" troubles. On the contrary, they appear to us to be instances of serious defects in design. It would appear that the manufacturers have not had sufficient past experience of the successful designing and putting into satisfactory service 75 MW plants of the required specifications and have been engaged in making experiments for now 15 months at Bokaro and nine months at Durgapur to rectify various defects. This has naturally resulted in a huge financial loss to the Damodar Valley Corporation by way of sale of power and a great deal of inconvenience to all concerned.

"We have discussed these difficulties at great length with the Engineers of the Damodar Valley Corporation and our conclusions would be as follows:

1. If the order had to be placed with Messrs. M.A.N. for turbo-generator plant, with due regard to price considerations and ethics of our tender system, the Committee considers that an order for at least two units for Durgapur could have been on the basis of the 3-cylinder design with standard steam conditions, of which Messrs. M.A.N. are understood to have adequate past experience. They had originally tendered for the 3-cylinder design, though they had put in subsequently a bid for the 2-cylinder machines, as specifically called for by the Damodar Valley Corporation. It is our view that the 2-cylinder design developed by them to meet the requirements of the Damodar Valley Corporation has given rise to design problems, which apparently have a bearing on the troubles that have been experienced with thrust bearing, necessitating long continued experiments to remedy the defects. It has been stated that the space considerations at Bokaro necessitated a 2-cylinder machine. Space considerations at Bokaro are understandable, but the Damodar Valley Corporation had two choices: (i) accepting a 2-cylinder design with likely difficulties that might arise necessitating long drawn out experiments or (ii) extend the power house already built (and this could not have been impracticable) in which case the 3-cylinder machine would also have been suitable for Bokaro also, so that all the three units could be identical 3-cylinder machines. It appears to us that the best choice for the Bokaro extension could have been a 50 MW machine preferably of IGE manufacture and identical to the three old machines. The Committee, however, does not propose to make any further observations in this regard, as it is understood that the price quoted by the General Electric was exorbitant and they were not prepared to bring it down.

UNDER SECRETARY GOVERNMENT 19 FEB 1962 PUBLIC LIBRARY

2. Having had satisfactory experience with the Raymond Coal Mills for the three old Bokaro units, it is not understood why the Damodar Valley Corporation did not go in for Raymond type mills for Bokaro's 4th unit, but deviated from the same by accepting loesche mills of a different design. Had Raymond type mills been purchased for Durgapur as well, acute troubles that are being experienced with loesche mills could have been avoided.

3. In regard to the boiler plant, it should be stated that the Damodar Valley Corporation's original recommendation was in favour of boilers manufactured by Messrs. Stein Rubain of France. This firm is a licensee of Messrs. International Combustion Engineering of U.S.A. and is known to have special experience in building large boilers suitable for burning low grade fuel. The offer of Messrs. Stein Rubain was not accepted because it was on the high side. Fresh tenders were called, but this time Messrs. Stein Rubain did not quote. Finally it was decided to place orders with Messrs. M.A.N. It would appear that Messrs. M.A.N's design resulted in a smaller volume plant.

RECOMMENDATIONS

"The present unfortunate experience of the Damodar Valley Corporation in regard to these 75 MW thermal units should serve as a lesson to all Power Project authorities in the country. These large units with high steam conditions have their complications in regard to design and operation and the operating problems multiply when boiler plant has to use very inferior grade fuel. With a view to minimising difficulties in securing satisfactory service and trouble-free operation of these plants, the Committee would venture to make the following recommendations:

(a) In regard to turbo-generator plant, every effort should be made to purchase standard plant and equipment, well tried out in other parts of the world over a number of years. Utmost emphasis should be laid on "prototype" experience in design and material, even though the plant efficiency may be somewhat less than that claimed by the manufacturers of plants not well tried out over a period of satisfactory service. If the selection of plant on this basis involves payment of a higher cost, it would be judicious to accord necessary price preference on the score of extensive experience of the manufacturer and proven reliability of his products.

(b) Extensive experience and proven reliability are factors to be given the highest consideration in selecting other vital equipment such as boiler feed pumps, coal mills, water treatment plant, etc., and if need be, necessary price preference should be accorded in the matter of purchasing such equipment.

(c) In regard to the boiler plant, it is difficult to secure standard plant of prototype design and material as the characteristics of fuel available in other parts of the world would, in certain respects, be different from those available in India. In case of boiler plant it is recommended that judicious selection of plant should be based on the following considerations and again substantial price preference should be accorded, if necessary:

(i) Extensive past experience of the manufacturer in building boilers of required and higher capacity. If dry bottom boiler plant is required, the selected supplier must have adequate and proven experience for boilers of dry bottom type with well-tried firing system. The same remarks apply if wet bottom type of boiler is required.

(ii) If the required boiler plant has to use very inferior grade fuel whether of high ash content or low volatility or both and with other difficult fuel characteristics, the qualification at (i) above will have to be coupled with the need for extensive experience of the manufacturer in the design and successful service of boilers for burning such low grade fuels.

(d) It is recommended that some form of standardisation should be adopted by all project authorities in the country in selection [illegible]. It is further proposed that the Central Water and Power Commission should undertake a world-wide survey, by reference to all well-known manufacturers and prepare a list of plants of standard design and steam conditions, for various sizes of units as above in different countries, the extent of proven satisfactory service of such units, the manufacturers who have specialised proven experience in building boiler plant using inferior grade fuel and other relevant data. If necessary a delegation of thermal engineers could undertake a study of selected installations abroad. This list should be circulated to all Power Project Authorities in the country."

The Committee also considered the priorities to be accorded to the consumers in the event of any unforeseen breakdown resulting in power shedding in the system.

The Government has accepted a number of these recommendations for meeting power requirements of Bihar and West Bengal during the Third Plan.

NEW SCHEMES IN WEST BENGAL

The Government has, for South Bengal, approved the installation of an additional 75 MW units in the Durgapur coke-oven power station. In addition, six 1.5 MW packaged generating sets will be procured and installed in the State.

These new power schemes, with an installed capacity of 84 MW, will greatly relieve power shortage in South Bengal.

Further, the Calcutta Electric Supply Corporation is going ahead with the installation of an additional 50 MW generating set in Calcutta. The possibility of further augmenting the installed boiler capacity of C.E.S.C. is also being explored.

The shortage of power towards 1965-66 in the North Bengal region will be met by proposed installation of an additional unit of 9 MW at the Jaldhaka Project, undertaken by the West Bengal Government.

NEW SCHEMES IN BIHAR

For North Bihar, the Government has approved installation of two 50 MW thermal units at Barauni, in place of the 30 MW units originally included in the Third Plan to meet the power requirements in this region.

For the South Bihar region, the Committee has recommended that against the Third Plan scheme of extension of Pathratu thermal station by 5 units of 50 MW each, the possibility of installing three numbers of 100 MW units should be explored. This suggestion is being pursued with Russian authorities, who are to supply the plant for this power station.

PRIORITIES FOR POWER ALLOTMENT

The Government of India has also accepted the priorities laid down by the Committee for allotment of power in the event of unforeseen breakdowns, necessitating load-shedding in the West Bengal, Bihar, and DVC systems.

The high priority consumers which will get power before other industries are: railway traction, coal production, iron and steel production, including alloy steel, aluminium smelting and electro-metallurgical industries, fertilizers, electro-chemical industries, defence equipment, cement, food products, water works, hospitals, broadcasting and street lighting.

The next priority has been accorded to copper smelting, rolling etc., mica-mining and processing, steel re-rolling, steel fabrication, paper mills and chemicals, jute mills, and all domestic and commercial services.

Other primary and second industries have been given third priority for allotment of power in case of shortages due to breakdowns in the power systems.

LICENCES UNDER INDUSTRIES ACT

The Government of India has decided that industrial undertakings having fixed assets not exceeding Rs. 10 lakhs, should not be required to obtain a licence under the Industries (Development and Regulation) Act, 1951,

irrespective of the number of persons employed in such undertakings.

This decision has been taken in order to further facilitate the development of small and medium-scale industries by reducing the formalities in connection with industrial licensing. Early in 1960, the Government of India had announced that industrial entrepreneurs, coming forward to set up undertakings with fixed assets not exceeding Rs. 10 lakhs, could do so without applying for licence under the Industries Act, provided the number of persons employed did not exceed 100. The latest decision represents a further liberalisation in that the stipulation about employing not more than 100 persons has been waived.

BHILAI STEEL PLANT AND KOYALI REFINERY

Two contracts have been signed this week with the Soviet Union, one in respect of the expansion of the Bhilai Steel Plant and the other in regard to the setting up of a refinery at Koyali, near Baroda, in Gujarat.

The Bhilai Steel Plant expansion contract, which involves a sum of Rs. 5.42 crores, envisages: (1) supply of equipment and materials for the expansion of this steelworks from one million to 2.5 million tons of steel ingots per annum; (2) deputation by the Soviet Union of some specialists for rendering practical assistance in the designing, construction, erection and commissioning of the expanded plant; (3) provision of facilities for training of Indian engineers in the metallurgical works in the U.S.S.R.; (4) rendering of services by the U.S.S.R. for the expansion of the Rajhara iron ore mines and the limestone quarries at Nandini (the Rajhara iron ore mines and the Nandini limestone quarries were originally developed to meet the requirements of the one-million-ton Bhilai Steel Plant. Their further development is envisaged to meet the additional requirements of this steelworks after its expansion).

The refinery contract entrusts to the Soviet Union the work of preparation of a project report and working drawings for setting up a 2 million-ton refinery near Koyali to process Ankleshwar crude. This contract has been signed with "Tjazhpromexport," a Soviet organisation, and stipulates the supply of the project report within a period of about 8½ months.

The refinery is proposed to be built in two stages. The first stage, which is expected to be completed during the second half of 1964, will create a refining capacity to the tune of one million tons. The second stage, which will take the refinery's capacity to two million tons, may be completed in another 6 to 9 months. Tjazhpromexport has offered to deliver all the equipment and material required for the first stage during 1963-64.

The contract makes the Government of India responsible for designing a number of units within the refinery and also for preparation of working drawings for some of the units initially designed by the Soviet organisation. The contract further provides for the association of a team of Indian engineers—civil, electrical, mechanical and chemical—with the designs to be prepared in the U.S.S.R. Provision has also been made in the contract for the use of Indian equipment and materials to the maximum possible extent, to enable the Indian engineers to undertake increasing responsibility for the designing and execution of refinery projects in future.

The Third Five-Year Plan contains a provision of Rs. 30 crores for setting up this refinery. Of this, Rs. 10 crores is estimated to be the foreign exchange component. Koyali refinery is the third one to be set up in the public sector. The first state-owned refinery at Gauhati has already been set up with Rumanian aid. The second one at Barauni is under construction and is expected to go on stream some time early next year. This refinery is being set up with Russian aid.

The foreign exchange cost of both the expansion of the Bhilai Steel Plant and the establishment of the Koyali Refinery is envisaged to be met out of the Rs. 180 crores credit made available by the Soviet Union for financing certain specified projects under this country's Third Plan.

PANNA DIAMONDS

The Government has approved the project report prepared by the National Mineral Development Corporation for the exploitation of the diamond deposits in Ramkherya area, in Panna district of Madhya Pradesh. The scheme is estimated to cost Rs. 46.2 lakhs, of which expenditure to the tune of Rs. 27.9 lakhs will have to be incurred in foreign exchange. The annual output of diamonds from this area is estimated at 12,500 ratties.

The Corporation has prepared another project for exploitation of the diamond deposits of Majhgawan area, also in the Panna district of Madhya Pradesh. This scheme is estimated to cost Rs. 90 lakhs, of which the foreign exchange component will be of the order of Rs. 29 lakhs. The annual production of diamonds from this area is estimated at 30,000 ratties.

NEW AFRICAN DEPARTMENT OF IBRD

The World Bank has decided to establish a new Area Department to deal with the independent countries on the African continent, including the Malagasy Republic, but excluding the Union of South Africa and the United Arab Republic. The decision has been taken in view of the rapidly developing burden of work for the Bank and IDA in Africa, and the particular problems attaching to the economic development of the new African independent countries. The new department of operations for Africa will come into existence on April 2.

As from April 2, the present Department of Operations—Europe, Africa and Australia will be renamed the Department of Operations—Europe. It will, however, continue to handle matters relating to South Africa, Australia, New Zealand and the dependent territories of Western European countries in Africa (with certain exceptions) elsewhere. The other Area Departments of the Bank are: (1) Western Hemisphere; (2) South Asia and Middle East; and (3) Far East-Burma-Japan.

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

COMPANY AFFAIRS

HINDUSTAN LEVER

Net profit for the year to December, 1961, is Rs. 225 lakhs after providing Rs. 193 lakhs for taxation at current rates. Net profit for 1960 was Rs. 250 lakhs after providing Rs. 208 lakhs for taxation.

The Board of Directors propose to recommend the payment of a dividend of Rs. 2.60 per share, subject to tax, for the year. The Board considered it desirable that the issued capital of the Company should be brought into closer relationship with the capital employed in the business. Accordingly, they announced their intention to apply to the Controller of Capital Issues, Government of India, for consent to the capitalisation of certain reserves, which if granted would be capitalised in issuing ordinary shares, credited as full paid, to the holders of the existing ordinary shares of the Company on the basis of 12 new ordinary shares of Rs. 10 each for every 25 of the present issued ordinary shares held. The new ordinary shares will rank equally for all purposes with the present issued ordinary shares except that they will not rank for dividend in respect of the year ended 31st December, 1962.

It is likely to be proposed that the new ordinary shares be allotted to the holders of existing ordinary shares registered in the books of the Company on 10th May, 1961.

NEW ISSUES

The Controller of Capital Issues has authorised the following companies to raise fresh capital.

Mahindra and Mahindra, Bombay, is to issue 6,60,000 equity shares of Rs. 10 each for cash at a premium of Rs. 2.50 per share on rights basis and 6½ per cent first mortgage debentures of the value of Rs. 50 lakhs to the Life Insurance Corporation. The capital will be used for financing the manufacture of jeeps.

The Cannanore Spinning & Weaving Mills Ltd., will raise capital totalling Rs. 15,00,000 in equity shares of Rs. 100 each to be issued for cash at a premium of Rs. 5 per share on rights basis. The money will be used for setting up a textile mill at Mahe.

Alembic Chemical Works Co. Ltd., Baroda, will raise Rs. 49.50 lakhs. Of this, 40,000 equity shares of Rs. 100 each will be issued for cash at a premium of Rs. 30 per share and the balance of 9,500 shares will be issued as bonus shares. The capital will be used for balancing its capital structure and paying off loans.

Kirloskar Oil Engines Ltd., Bombay, will raise Rs. 20 lakhs, in ordinary shares of Rs. 10 each to be issued as bonus shares to the company's existing shareholders on capitalisation of reserves to a like extent. Three hundred and eighty bonus shares will be issued to the exsisting non-resident shareholders.

The Bukhia Tea Estates Ltd., Calcutta, has been granted consent to the issue of 83,200 equity shares of Rs. 10 each as fully paid-up bonus shares on capitalisation of Rs. 8.32 lakhs.

The Huldibari Tea Association Ltd., Calcutta, is to issue 82,500 equity shares of Rs. 10 each as fully paid-up bonus shares on capitalisation of reserves to the extent of Rs. 8,25,000. The bonus shares will be issued in the ratio of one bonus share for every share held.

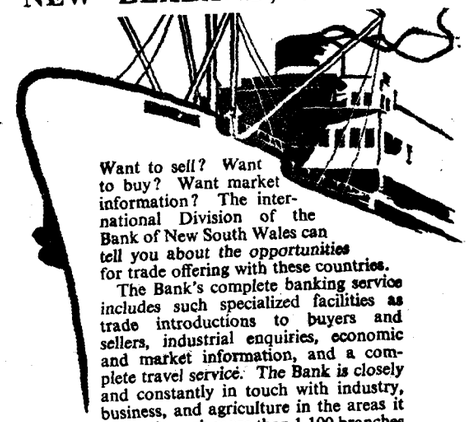
Caprihans (India) Private Ltd., Bombay, will issue bonus shares of the value of Rs. 4,50,000 on capitalisation of reserves to a like extent.

The Hyderabad Allwyn Metal Works Ltd., Hyderabad, will raise capital amounting to Rs. 86,06,550 in equity shares of Rs. 10 each for cash at par. The proceeds will be utilised for financing the expansion of the manufacture of household steel furniture, bus bodies etc.

The East Anglia Plastics (India) Ltd., Calcutta, will issue 8,50,000 equity shares of Rs. 10 each at par out of which 1,00,000 will be issued to the company's foreign collaborators as free shares for technical services, etc. The cash shares will be issued to the existing shareholders in the ratio of three new shares for every share held. The capital is required for establishing a factory in Andhra Pradesh for the manufacture of cellulose acetate flakes.

Shamsher Sterling Cable Corporation Ltd., Bombay, is issuing capital of Rs. 35 lakhs, for cash at par, in 50,000 equity and 10,000 9.5 per cent (taxable) preference shares of Rs. 50 each. The capital will be spent on the expansion of manufacture of household and industrial cables.

R.R. Paper Mills Ltd., will raise capital of Rs. 30 lakhs, for cash at par, divided into 25,000 equity and 5,000 7½ per cent (free of company's income-tax but subject to deduction of taxes at source at the prescribed rates) preference shares of Rs. 100 each. The proceeds will be utilised for establishing the manufacture of paper.



The Catalyst Private Ltd., Maharashtra, has been granted consent to the issue of capital of Rs. 20 lakhs in equity shares of Rs. 100 each at par. Out of this, shares worth Rs. 10 lakhs will be issued to Petolclor Construction & Finance Corporation, Panama, for consideration other than cash against the cost of imported equipment. The remaining shares will be utilised for establishing the manufacture of catalyst required in the manufacture of sulphuric acid, etc.

Tamilnad Cardboards & Paper Mills Ltd., Madras, is raising Rs. 20 lakhs. The proceeds will be utilised for the manufacture of Strawboards.

Hindustan Ideal Insurance Company., Ltd., Hyderabad, has been granted consent to issue further capital of Rs. 5,78,950 divided into shares of Rs. 25 each at par to be allotted to the shareholders of Hyderabad United Insurance Co. Ltd., Hyderabad, for the purpose of amalgamation of the latter with the former. The amalgamation is in terms of the scheme sanctioned by the High Court of Andhra Pradesh.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY

TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

The World's Greatest Election

THIS week, throughout the length and breadth of India, millions of people, men and women alike, with the prized power of the ballot are exercising a sovereign right to determine what Government India and her constituent States are to have for the next five years. In terms of numbers, this is the greatest election the world has ever seen. The total number of names on the voters' lists has reached the stupendous figure of 210 million. First indications are to the effect that an average turnout between 50 and 55 per cent may be expected, which is somewhat higher than in the last elections. There are also clearly visible some signs of a qualitative improvement in the electorate's political judgment. No one need argue that the choice is based on any very solid information of the large issues involved. For the most part, the intelligentsia itself is deeply divided on what the issues are. The great majority of the Indian people are still unaware of these issues, but they are, nevertheless, groping in their own uninformed, yet seemingly mature, way for an answer which might be as good as anywhere else in the world. This is a proud, as well as a critical, moment in our history. For we have committed ourselves, knowing well the degree to which illiteracy and "groupism" prevail, to a judgment of our people on a matter which might well be decisive for the country's future for all time. There are some who, at this moment, regret adult suffrage. *The Eastern Economist* does not. Maturity is not a matter of education alone; in any case, the defences of a political system consist in dispersing influence, no less than in dispersing wealth. We are now testing whether or not this hypothesis can be proved for the third time in a generation.

The newspapers have naturally been full of various incidents which tend to detract from the assumption that the election is, on the whole, a process of good judgment. There are tales of old women carried to the polls seeking dreams of the past and two particular longings have been unfulfilled—one of these in Bihar where a woman's choice was "Gandhi Baba", and the other in Uttar Pradesh where a blind man came to vote for "Angrezi Sarkar"—the British Government. These might be described as the comedies of a serious decision. One of the great elements in this choice is that it will decide the place of the Congress when the Prime Minister is no longer at the helm of affairs of Indian political life. In this sense, his excessive canvassing has been a step in the right direction. This is a turning point in India's ultimate choice, for it is the last election which will be won by the Hero of the Revolution.

One of the results of the election is sure. This is that the Congress Party will be returned to power in the Centre as well as in all States of the Indian Union with doubts in regard to the majorities it will enjoy in the Punjab and Rajasthan. But it is now becoming clear that inside the Congress Party factions are much keener than in 1957, and it is extremely unlikely that the popular vote of the Congress will be much above 40 per cent of the total vote. This itself would involve a loss of 20 per cent of the popular vote for the Lok Sabha. It might conceivably, though this does not follow, involve a loss of nearly 40 seats in the Lok Sabha. It may well be that, in the moment of its victory overall, these losses will be read as a significant reverse. If this should happen in the time

of the Prime Minister after the extensive and almost whirlwind character of his election tours, the prospects of the Congress in 1967 cannot be promising and in 1972 they might well be bleak. The inevitable swing of the political pendulum is probably under way already.

The interesting thing about the Indian electorate is that, contrary to the nice predictions of academic persons about the "natural movement of the Left of a have-not" and some of rebellious society, from which urban leaders are drawn, in this particular election, there are likely to be substantial gains for the parties on the Right. Quite apart from the emergence of the Swatantra Party, it is now clear that the Jan Sangh has fastened itself in many areas in North India. The D.M.K., similarly, operating without a Leftist economic philosophy will make gains in the South. It is not unlikely that the Congress Party's losses will be predominantly to the Right, but they will also be some to the Left. It is likely that both the Communist Party and the Praja Socialist Party will gain as against their position in 1957. It would thus appear that Indian politics is not subject to that easy polarisation which seemed to mark the first election in 1952, when the Congress Party seemed pitted against the Communists in an over-simplified picture of opposing philosophies. It would appear that organisation is as important as any other factor, and the organisation of the Jan Sangh and possibly the organisation of local parties affiliated to the Swatantra Party have been able, in a very short time, to make a serious dent in Congress ascendency.

One cannot rule out, in the week that is ahead of us, some unpleasant surprises for the Congress Party. This, too, would not be a misfortune. It has currently become complacent and, in some places, arrogant. It is fortunate that no one can displace it immediately from power. But it would be good for both the country and the Congress Party if it realised that its power was conditional on a much readier response to the changing needs of the country; it cannot rely indefinitely on the continuing popularity of its great leader. It would be good for all the world if there was a major demonstration that the Prime Minister's sway does not cover every constituency in the country. In this sense, North Bombay might well be in embryo the best proof that the Indian electorate is truly sovereign in the affairs of this nation.

The Crisis in British Guiana

HISTORY has no parallel to offer to last week's crisis in British Guiana in which the very foundations of orderly government were threatened by a revolt against drastic budget proposals. Dr Cheddi Jagan's People's Progressive Party commands a decisive majority in the Legislative Assembly and this factor presumably created over-confidence in Dr. Jagan and his colleague Dr. Jacob, the Finance Minister, in their ability to carry the tax proposals through the Assembly. But their over-confidence presumably blinded them to the fact that, where the tax burden is unbearable, there is the superior force of the popular will, which may supersede the legislative majority and prove to be decisive in the final analysis. Dr. Jagan had a foretaste of the total general strike of February 16 and after, staged by the workers and white collar employees, when, only a few days prior to it, acute public discontent against the proposed taxation was given a free vent during the visit of the Duke of Edinburgh to Georgetown and the Prime Minister was treated to acts of physical insult. But the die was cast.

The deep austerity which the budget proposals aimed at inflicting on the people at all levels of income was clear enough. In determining it Dr Jagan's Marxist zeal paid inadequate attention to the capacity of his government to wring sacrifices from the people under a democracy. His keeness to fight poverty and unemployment is understandable, but what is not comprehensible is his impatience and the ruthless means with which he started off to wage the war. The loan assistance from Britain and the World Bank could not match the requirements of development which he considered immediately necessary, and in absolute terms rightly so. But he failed to take cognizance of the scanty internal resources and the country's marginal ability to fill the gap externally. The prospect of American aid on some scale has now been deferred as a result of the postponement of the visit of the technical team to assess the objective needs until full normalcy is restored.

Obsessed with ideological proclivities and obviously hustled into an extreme course by his pre-election wild promises, he set on the path of making good, by additional taxation, the best part of the shortfall of over 40 per cent in the capital budget pitched at $41 million. No section of the population, except the indigent, could escape the sharp clutches of the proposals. In the sphere of direct taxation (with a limited potential to yield revenue), the income-tax was raised by a slash in allowances, the tax on property was imposed, the capital gains tax was levied at the rate of 45 per cent and security holdings were made compulsorily registrable. There may be theoretical justification for this fall of the hammer. But the middle and lower income groups were also chased in the hunt for tax-revenue. Consumption came in for ruthless levies with steep rates of excise and import duties. Then there was compulsory saving at 5 per cent for private incomes and 10 per cent for business incomes in State bonds redeemable at the end of seven years. A nation with poor resources, leaning heavily on imports for consumer necessities and with its masses living on a subsistence level, was confronted with the horror of inflation and all the hardships that it connotes.

It is significant that the general strike which was organized as a challenge to the austerity budget was broad-based and incorporated complex elements. The Trade Union Council was, of course, in the forefront. Of the two main opposition parties, Mr. Daguiar's United Force Party may be deemed an inevitable participant owing to its orthodox creed. But Mr. Burnham's People's National Congress, with its socialist philosophy, was an enthusiastic sponsor. The civil service members plunged into the strike, despite the fact that under the Guillebaud report they were due to receive salary increases with retroactive effect from January 1961. Apparently they could clearly see that their increments would be nullified by price inflation. School teachers also jumped into the fray. Public utilities were paralysed. When the surging masses indulged in violence, loot and arson in Georgetown, the fire brigade services were neutralised as the water and sewage workers joined the strike. When hospitals were flooded with in-patients, the staff was absent on strike and only a small number of nurses responded to the Government's appeal to return to their posts. Such a total strike no doubt requires elaborate organisation, but no attempt at organisation can succeed unless such heterogeneous elements are knit together by genuine and common grievances.

If law and order has been retrieved after total collapse and the state of siege has been ended, it is because of the reinforcement of the tiny garrison at Georgetown by British troops 2,000 strong and the arrival of 5 warships. Their help was invoked by the Governor Sir Ralph Grey at the request of Dr. Jagan. The strike has been called off. But the concessions in the budget that have been promised will not by themselves restore normalcy and stability. Dr. Jagan can repair the breaches and then keep himself in the saddle only if he substitutes for his dogma that pragmatism which is based on the "inevitability of gradualness".

The Cotton Textile Trade Agreement

THE protracted negotiations at Geneva on world trade in cotton textiles have fruitfully concluded. A draft agreement (for five years) has been drawn up. It is now to be ratified by the nineteen participating countries—included in them are the major importers of textile goods on the European and the North American Continent and exporters of the so-called "cheap cotton manufactures" like Japan, India, Pakistan and Hong Kong—by October 1, 1962. Even a cursory glance at the provisions of the pact evinces that the arrangement has been negotiated in an imaginative spirit of give and take and should satisfy the majority of the participating nations.

The agreement envisages orderly expansion of international trade in cotton textiles, though it provides adequate safeguards to the industry in the main importing countries, the United States and the United Kingdom. It is a substantial gain for the exporting countries which are to continue to have access to the markets of the developed countries in a freer manner than it would have been possible otherwise. The restrictive policies adopted by some countries of the West under pressure from their own textile interests are envisaged to reverse the gear and relax the present restrictions on imports gradually. The countries, like the U.S.A. and Canada, which have been allowing imports of textiles freely are to persist with their present policies unless unrestricted imports cause or threaten to cause disruption in their textile economies. Even in the latter case, the importing countries would be required to adjust their economies over a period of three years on the basis of the 1961-62 imports plus five per cent increase per annum in the second and third year in view of increase in population and rise in standard of living. Imports are to be regulated by means of fixation of quotas through bilateral agreements. At the end of the three-year period, the situation of disruption would be deemed to have ended and free trade would flow. It is gratifying to note that the measures to be designed to restrain imports with a view to avoid disruption are to be resorted to only sparingly and are to be limited to the processed products and groups or categories of products causing or threatening to cause disruption. The proposed move of the United States Government to levy a duty of 8.5 per cent on the cotton content in imported textiles is likely to be withheld in view of this arrangement. It will only jeopardise the agreement reached after long-drawn talks.

The entering of bilateral agreements between the importing and the exporting countries, cynics might say, would give the former a long handle to discriminate against some exporting countries which may not see eye to eye with them in the political arena. But these misgivings are only imaginary. The mischief that can be played by this mechanism can at best be limited. On the other hand, it may be beneficial for the under-developed countries which have the requisite resources for this trade in the form of adequate raw material supplies and technical skills. On account of their special needs to earn foreign exchange for the over-all development of their economies, the under-developed countries can expect some favourable treatment in their negotiations with the importing countries since neither these countries are going to disrupt the latter's textile economies nor their clamour for slightly bigger quotas is likely to be objected to by the other exporting countries which have a big chunk in the world textile trade. This optimism emanates from the increasing appreciation in the developed countries about extension of aid to the under-developed countries.

The doubling of textile imports into the European Economic Community from all non-EEC sources—from about 60 million yards to 120 million yards—in a period of five year, though not spectacular, should lead to relieving of some pressure on the acute balance of payments problem which some under-developed countries like India have vis-a-vis these countries. But this is possible only if they may make a concerted effort to seize the opportunity. The fixation of higher quotas for textile imports from a particular country by itself does not lead to stepping up of exports from there. It only helps to the extent imports from the competing sources are cut off by a ceiling. But when ceilings for competing countries are fairly high, the exporting countries like India, which have a comparatively higher cost of production, can gain little unless they go all out to make the best of the opportunity by exporting even at some loss. But will the textile industry here take up the challenge? The case of sugar, where exports are possible only at a loss, does not evoke much enthusiasm. Only time will show whether the experience of the Indian textile industry is going to be different. There may be need to give some further incentives for pushing up these exports. It is hoped the Government will not be found wanting in granting reasonable requests of the industry. But, at this stage, the ball is in the industry's court; let us see if they play it with new determination. Any failing on the part of the industry or the Government in the crucial five years ahead will do an irreparable damage to the export trade in textiles.

A DELHI DIARY

THE SPACE RACE

I CANNOT pursue the excited movements near at hand without casting an admiring glance at the far away space world. The achievement of Colonel John Glenn, who, on February 20, orbited the earth three times, is, it seems, all the greater because of the tremendous strain of waiting which in this case occupied sixty-one days. One must have nerves of steel in order to be able to face death almost every day for over two months. I believe now the uniformed opinion expressed in Delhi that the U.S.S.R. was far ahead of the United States in spacemanship will slowly give way to the feeling that the giants are now running nearly equal. I do not know exactly how much more arduous Major Gherman Titov's ordeal was than that of Colonel Glenn's; but since orbiting the earth has now become so easy, there cannot be much difference between three and twenty orbits. In fact, one great day before I obtain my happy release from this planet, I hope to orbit the earth in our own space machine. I hope it will not be called Vostok or a Friendship Seven. Let us have a nice Indian machine prepared by the Defence Ministry, with or without the present Defence Minister! No one will claim that the private sector can accomplish spacemanship on its own. Thus, I accept the view, that when the biggest of all businesses come under view, one must accept partnership with big government. Let us, therefore delegate with a good conscience the responsibility of building a spaceship to the Defence Ministry.

THE ELECTIONS

I can pass from the space race to the elections without any brake in my thinking. They seem, as far as I can see, to be equally arduous as makers of tension. I do not know how much blood pressure has risen in the country in the last month. But I would be very surprised if there were no coronary attacks in the two or three months following. The Prime Minister himself, whose performance would do credit to a cosmonaut—or is it an astronaut in the Free World?—has rushed about day after day and almost night by night to sustain the Congress over the whole country. As a feat of endurance alone, I think, no one can deny that he has beaten all previous records, including his own which was remarkable. To top this achievement on Tuesday, he rushed round almost every mohalla in Delhi working for the Congress it seems like a house-to-house canvasser. His tremendous popularity was clearly visible. But I only ask my elf the question whether or not the Prime Minister of India should come in like a whirlwind and canvass like this with his personal popularity. Are there not enough local stalwarts to take even the burden of house-to-house canvassing off his hands? Short of kissing babies, I believe, he has done everything to attract the popular vote. No doubt he has greatly influenced the fierce struggle between Mr. Mehr Chand Khanna and Professor Balraj Madhok in the New Delhi constituency. I happen to have a say in this particular election. I have now, however reluctantly, come to the conclusion, like the gentleman in the picture alongside, that it is best for me to be non-aligned. I trust that the respective candidates will, therefore, spare me long harangues on the merits of their respective parties or, worse still, their personalities. Just as in respect of paramountcy the leading characteristic is that it is paramount, the best definition of non-alignment that I can find is that it is non-aligned!

What a Life!

No, I'm not voting. You see, I'm *non-aligned*!

Courtesy: The Hindustan Times

FOOT AND MOUTH DISEASE

I remember, many years ago, the Prime Minister who had even then acquired the habit of addressing hundreds of meetings and rushing from place to place, said humourously in description of himself, that he was suffering from foot and mouth disease. The passion which has been thrown into this election makes me believe that there are many others who are suffering from foot and mouth disease, without anything like the justification which the Prime Minister has. I doubt whether the market for shoes has gone up as much as the demand for microphones. I am told now that cars have done a great deal to destroy the morale of workers in the political arena. In the (bad) old days civil servants were told that they should, in order to maintain contact with villagers, abjure motor cars, because they were not good for personal contact. A horse, or even better, a cycle was a mark of that slow and stately movement which showed that the mind was ready to tarry on any petition however small. The car has an element in it of both violence and discourtesy. Why, I keep on asking myself, has it become so universal an instrument of Indian political democratic machinery?

NORTH BOMBAY: THE BONFIRE

In the old days all roads used to lead to Delhi. But now all roads, at least in political controversy, lead to North Bombay. Even on Tuesday, when the Prime Minister was talking at various places in Delhi and in Shahdara just outside, he seemed to be more exercised about North Bombay than about local problems, although the Jan Sangh acquired a fair share of his wrath. Meanwhile, in Bombay I see that Mr. M. R. Masani, General Secretary of the Swatantra Party, has issued a protest against Mrs. Violet Alva, encouraging a bonfire of newspapers in the Express Group, together with a procession which was designed to bring pressure to bear on the group to abandon its support for Mr. Kripalani and to support Mr Krishna Menon. I am not myself conversant with the details of the case, but since this has been repeated more than once, I take it that the facts are not incorrect. The temperature continues to rise and perhaps the best one can do is to ask that no bonfires should be allowed to add to the heat being currently generated.

ARGUS

THE WEEK'S NOTES

Kenya

THE FATEFUL CONFERENCE

THE PROCEEDINGS which started at Lancaster House in London on Wednesday last week for constitutional talks on Kenya's future have only confirmed what was obvious—that the tribal alignments of the two major parties would present a tough problem for settlement and, in comparison with it, the racial issue will occupy quite a minor place. Kenya could hardly escape from the powerful intensity of the prevailing mood in the African Continent where nationalism is equated with racialism. Both for the Europeans as well as the Asians, who have settled in Kenya and contributed to its economic growth in particular, it would be well to recognise that the nationals of the country ought to be taken on trust in their profession of fair treatment of people of non-African races. The Europeans have been given the assurance that the land which is highly developed or which is half-way through the transition to development will not be taken away from them, but under-developed land will be distributed among the landless nationals on payment of compensation. Asians who have taken to business have been given the assurance of non-discriminating treatment. Apprehensions that these assurances may be nullified in practice by a complex of forces within as well as outside the government's control may be based on the experience of what has happened in other newly independent African countries. But both these groups need to recognise that the revolution of political liberation is now in full swing across the African continent and the danger lies in anything that may cause delays and postponements in the freedom of Kenya.

The major problem is, however, the one between the entrenched positions taken by the KADU and the KANU. The KADU, the more powerful of the two, has the domineering influence of the Kikuyu tribe and other allied tribes. They are collectively stronger than the group of tribes that has rallied under the banner of the KANU. The major difference in the constitutional approach of the two parties appears to be deeply rooted in the suspicions of the KANU about the domination of the stronger tribes. The KADU stands for a unitary government with local power distributed among the 38 local authorities, while the KANU stands for the substance of the power being vested in the regional governments and the residuary powers being reserved for the centre. To this the objection of the KADU is that this sort of a federal constitution is a luxury for a small country like Kenya, which cannot afford a number of governments at the unit level, for reasons of a strong administration as well as effective planning for economic development. At Lancaster House both the parties have been questioned closely about the details of their constitutional proposals. If, at the present moment, the doubts of the KADU and the KANU about the positions taken up by the other party are not cleared, there is still time for patient diplomacy to bring about harmony in outlook on the basis of a broad compromise. The proposals of both the parties appear rather vague at this stage and it is for Mr. Reginald Maudling to handle the conference skilfully to bring about a rapprochement by means of reassuring safeguards.

West Irian

STALEMATE UNBROKEN

IT IS a depressing thought that U Thant's offer to mediate in the West Irian dispute has not received whole-hearted and energetic support without which his mediation could not make headway. Why Indonesia has not been able to lend support to this approach is not clear. But it seems that she now prefers direct talks with the Netherlands in a bid to settle the dispute without the modification of her original position that de facto transfer of West Irian to her should be effected immediately, while the de jure transfer could wait, to the new offer of self-rule to West Irian on transfer of power to Indonesia and a referendum under the UN auspices for the Papuans and other residents at the end of ten years. This offer needs amplification and fuller clarification before its merits and implications could give an indication how far it would be helpful to resolving the deadlock. The reaction of the West New Guinea Council, an advisory organization set up by the Dutch, is not responsive. But it is possible to question how far the Second Vice-President of the Council, who has expressed it, may be presumed to speak with final authority and how fully the Council represents the Papuans. He has expressed the apprehension that the right of access to Indonesians in West Irian may be utilized for their substantial penetration and the way could be paved to influence the referendum. The difficulties in the way of immediate referendum in the jungle-infested territories are unsurmountable, while it is likely that they could be reduced in the intervening ten-year period. As for the proposal of self-rule, the West New Guinea Council's spokesman has stated that no Papuan suitable for the office of Governor or Commander of the armed forces is available. If this is true, what was to be the genuine character of transfer of power after self-determination as contemplated in the Dutch plan? The Indonesian offer is being discounted in these quarters as propaganda and for this very reason its elaborate exposition seems necessary.

Charges and counter-charges of infiltration are being made by the two parties. On one side, the allegation is that 10,000 Indonesian volunteers are being trained to land in West Irian. On the other side, the charge is that Dutch servicemen are infiltrating as civilians, travelling in commercial planes. In this context, it is pertinent to recall that on February 14, the court at The Hague dismissed the suit of a Dutch father against the Government for damages, holding that the State had the right in law to send servicemen (like his son) to West New Guinea in civilian clothes and to identify them in their passports as civil servants. Mutual su picion may exert strains on the relation between the two parties leading to a worse alternative to the stalemate. Meantime, there is some hope of direct negotiations emerging from behind-the-scene contacts. But how strong or slender may this hope turn to be? It is essential that the good offices of a third party—the USA—should be enlisted to end the deadlock.

Foreign Aid

STATE GOVERNMENTS' CONTACTS

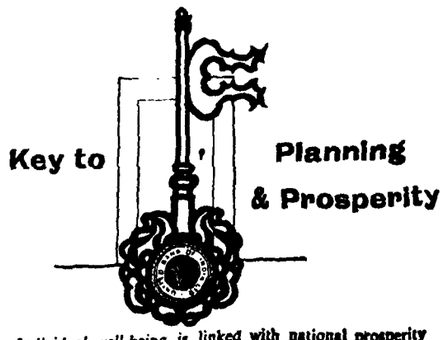
IT IS as astonishing as it is highly regrettable that the Central Government should be constrained to address a communication to the State Governments reminding them the inadvisability of the action of some among them in making direct approaches to or negotiations with foreign Governments or organisations in foreign countries for financial or other assistance in implemen ing economic projects of their own choice. This communication emphasises the fact that instances had come to the notice of the Government of India where such approaches were made either for external assistance or for facilitating the deputation of State Government officials to foreign countries. The communication further urges the fact that the implications of such approaches and contacts are many and varied and requests the State Governments to conform strictly to the procedure laid down by it and to refrain from such a course of direct action, emphasising that the contacts cou'd be made with the prior consultation and approval of the Ministry of External Affairs.

clear that the kind of attitude indulged in (not for the first time) merits a strong warning. The simple but plain implications of such approaches are that non-plan projects and non-plan expenditure, both rupee and foreign exchange, may cause distortions. But there are more far-reaching consequences than this. Whether the interpretation that might be put, for instance, by a foreign government, which has been approached for aid by a State Government, about basic differences between the latter and the Central Government, is right or wrong is absolutely immaterial. But this course holds the possibility, even if remote, of improper tempting offers. The constitutional position leaves no room for doubt. Whether the contacts are made for foreign financial assistance or for foreign economic collaboration, either at the government or private level, by a State Government, they come under the category of requests for foreign loans or trade and commerce with foreign countries. These two subjects are solely within the Union List and they are excluded from the Concurrent List. It is ultra vires of the State Governments to take the jurisdiction which the Constitution does not confer on them. If anything, the Central Government must share some blame for allowing this tendency to grow. It surpasses comprehension why it allowed a repetition of this course of action in several instances as its communication discloses. Any pending negotiations of this type should be subjected to a searching scrutiny and, if their merits so warrant, the State Governments should be asked to rescind them.

Afro-Asian Writers

IN THE POLITICAL ARENA

THE DELEGATES to the second Afro-Asian Writers' Conference, which met in Cairo from February 12 to 15, found themselves landed in a political arena. They had to range themselves on the side either of China or of Russia. And China triumphed in the end. The tone was set for the conference by the controversy—which objective claimed precedence, the end of colonialism or the end of armament? The Sino-Soviet conflict was carried right into the heart of the writers' meet at Cairo, China dogmatically adhering to the view that the liquidation of colonialism must come first and the liquidation of all weapons of mass destruction can come as a matter of next priority. It was a field day for China because she had to carry the conference with her to endorse her resolution that imperialism was the only source of war. There were, however, heretics even in this gathering of carefully picked representatives. Mr. Serwadda of Uganda raised the issue of Russian and Chinese imperialism and withdrew from the conference as a protest against its failure to condemn it. As for the thesis that imperialism was the only source of war, Nigeria's delegate sought to raise a discussion on the Sino-Indian border dispute. But Dr. Mulk Raj Anand and Mr. Mao Tun, China's Minister for Culture, came forward with the plea that the dispute existed between the governments of the two countries and did not concern their people, as if the government and the people had no identity of purpose. But each one's conscience must hardly be in doubt as to how far this plea rested on convenience rather than on conviction.



This conference of Afro-Asian writers was destined to meet the fate of its predecessor and end up in a smoke of hollow platitudes. Writers, whether they are poets, playwrights, novelists, essayists or masters of prose, cannot remain aloof from the contemporary political current and the works of some of them quite reasonably voice the political aspirations of their time. But writers have other important functions and pre-occupations too. A conference of writers is presumed to be held on a high plane of cultural exchange and is expected to be ennobled by a lofty meeting of minds capable of creative work. How many works of Afro-Asian writers have been introduced in other languages to the people of other countries in this region? And, in fact, how many creative pieces have been produced by Afro-Asian writers from independent countries, since independence? Is the political arena elsewhere is conducive to such a performance? There was little evidence of these fundamentals at the conference. Did the delegates from the thirty nations travel all along to Cairo to listen to the sermon—unto ye is it given to play a creative role in the liberation of the Afro-Asian people from the bondage of colonialism? This harping on a time-worn slogan betrays the genuine purpose of these rallies of this brand of progressive writers.

Foreign Firms

INDIANISATION OF STAFF

THE GOVERNMENT OF INDIA'S policy of non-intervention in foreign investment in this country and sustained encouragement of closer co-operation between foreign investors and Indian nationals has paid good dividends in that important sphere of increasing absorption of Indians in the staff of foreign firms. The Government has been proved right in insisting that moral suasion and not any legislative or administrative pressure will bring about the desired result. What is now happening shows that the managements of the foreign firms are evincing a genuine desire to man their business offices or industrial establishments with Indian nationals in a marked degree at the higher levels. Absolute numbers of the strength of the Indian staff of foreign firms cannot give the precise idea of the pace of Indianisation since the overall strength of the staff is increasing with the expansion of the business of foreign firms. The real index of expansion is the increase of Indian employees in terms of percentages.

In the salary groups of Rs. 1,000 per mensem and above, the percentage of Indians rose from 33.0 in 1954 to 70.1 on January 1, 1961. There are variations from this overall percentage increase. Only a few industries like jute mills and presses, banking companies, planting companies and a few others show themselves up as laggards with lower percentages. But an impressive majority shows a higher than the average figure. In the salary group between Rs. 1,000 p.m. and Rs. 2,000 p.m., the percentage of Indians rose to 88.9 on January 1, 1961, while in the salary group between Rs. 2,001 p.m. and Rs. 3,000 p.m. it rose to 58.2, whereas in the highest bracket it went up to 23.9. The present anticipations are that by the end of 1962 all posts with salaries of Rs. 2,000 p.m. and below will be Indianised and 70 per cent of the posts in the salary bracket Rs. 2,001 p.m. Rs. 3,000 p.m. will be Indianised during the year. As for the top bracket, wisdom lies in hastening slowly. The details will be found elsewhere in the Statistical Section in this issue.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

TRADE UNIONS IN AN AFFLUENT SOCIETY

By

ODYSSEUS

THE PROBLEMS of trades unionism in India and in the UK differ, but they have two features in common: (1) the excessive concentration of power in the hands of a few people at the top, who, more often than not, have little contact with the worker on the factory floor; and (2) the identification of union policy with Socialism.

In the affluent society, which is well on its way in the UK, as long as the Trades Union Congress is committed to the nationalisation of basic industries, steel, road haulage, machine tools, aircraft and key sections of engineering, and to public intervention in building, it is hindering the spread of unionism to the middle class, white-collar workers, and impeding the return of the Labour party to power. As Mr. B. C. Roberts (Reader in Industrial Relations at London University) says in "Trade Unions In A Free Society" (Hutchison for the Institute of Economic Affairs, London. 1962), what has happened in the UK and the USA has been that the course of economic and social development has completely changed the character of Capitalism and, in so doing, has left Socialism high and dry, an obsolete alternative. As we saw here in the previous two weeks, the affluent UK worker no longer feels himself a wage slave. He has become a property owner (of durable goods, often of his own house, and even of stocks and shares). The worker's experience in the nationalised industries has shown him that the state tends to be a less attractive employer than private enterprise, and less progressive, so that opportunities for better pay and conditions are fewer.

To win a general election, the Labour party must secure the votes of over half of the UK's 15,000,000 electors. Yet of the 8,000,000 workers in unions affiliated to the TUC, about 2,500,000 are in unions not affiliated to the Labour party, and it is generally agreed that about 30 per cent of unionists vote Conservative. Thus, although the Labour party is professedly based on the workers, it must woo several million middle class voters. The conservatism (in a non-political sense) of so many union leaders prevents the break with old fashioned Socialism that the Labour party must make if it is to survive.

The dilemma which the UK unions face is that, whereas, on the one hand, they founded the Labour party to achieve a legal frame work in which they would be free to do their true job of protecting and bettering the worker by collective bargaining, and strikes if necessary, on the other, when they adopted Socialism as their aim, they adopted an ideological goal which can only be achieved at the expense of their true functions, precisely those which they formed the Labour party to protect. The choice before them is either to accept private enterprise and a market economy, since free trade unionism can only flourish in a free society, or to accept the implications of Socialism, which must end in abandoning free bargaining, the right to strike, and the exercise of democratic political pressure; they must become an agency of the state, as in the USSR where the role of the unions is to "knock sense" into the workers, restrain them from big wages claims and strikes, and encourage them to raise their productivity, to ensure the success of the Five-Year Plan.

MISTAKE OF THE UNIONS IN INDIA

I repeat, the trade unions' basic job is economic, not political. Politics are for the worker in his capacity as a citizen, not as a unionist. The unions in India have made the same mistake as in the UK. Unless they have since modified their aims, the last time that I looked at the objectives of the Indian National Trade Union Congress, they included the elimination of the profit motive, and although the All India Trade Union Congress says that it is not subject to the control of any political party, its 1947 constitution includes among its objectives the establishment of a Socialist state in India, and the nationalisation of the means of production, distribution, and exchange. To anyone who observes that progress toward these objectives is so slow as to cause no alarm, Mr. M. R. Masani quotes an apt story. Once when Robert Benchley, the American humourist, was having a cocktail, a keen prohibitionist said to him: "Take care. That is slow poison." To which Benchley replied: "I don't care. I'm in no hurry." India's workers would seem to resemble Robert Benchley. They don't mind the advance towards Socialism and the extinction of their rights to bargain freely and to strike, providing that it is slow. However, India's advance towards complete state control of the economy seems to illustrate the aphorism "Slow but sure."

I have no idea whether UK unionism will continue to support Socialism, but I guess that if the economy maintains its progress towards real affluence, the rank and file of unionists will disassociate themselves from their leaders' policy and will vote Conservative.

Mr. B. C. Roberts points out that, paradoxically, it is the union leaders, who so vehemently proclaim their Socialism, who are most likely to refuse the limitations on their freedom which the attainment of Socialism would entail. The irony of the present situation, in which the Labour party is divided between those who are extreme Socialists and those who, like Mr. Gaitskell and the moderate majority of Labour electors, wish to disembarrass themselves from the party's commitments to Socialism, is that this division has largely been ensured by the same union leaders who reject limitations on their freedom of union action. The National Union of Mineworkers, for example, asserts its independence of the National Coal Board, and allows its members a freedom of action, which makes Socialist planning impossible

If the Labour party wins the next election, the self-proclaimed trade union Socialists are, by their insistence on the right to agitate freely for higher wages, and to reject all wage controls, likely to make sure that Socialism cannot be inaugurated. This may demonstrate, what many people feel already is the fact, that

it does not matter much, from the unions' point of view, which party is in power. The way would then be open for both parties to accept by pragmatic experience the same broad policies, including an agreed status (a) for private enterprise, and (b) for a degree of voluntary, co-operative, state-planning on the French model.

IF THE LABOUR PARTY LOSES

If Labour does not win the next election, the party is bound to break up. In which case, Mr. Roberts suggests, the Liberals might win back from Labour the support they lost in the first decades of this century. The unions might feel that they had little to gain from a Labour party in political decline and revert to the more independent position of the 19th century. You would then have in the UK a situation comparable to that in the USA, where the unions are not tied to one political party, but support candidates from both, although inclining more to the Democrats, who can usually rely on winning most of the organised Labour vote.

In India, as in the UK, the problem seems to be to get the union leadership out of politics. How? In the UK, for various reasons, union leaders have concentrated power in their hands in distant head offices. Since they are also grossly overworked, it is no wonder that they have lost contact with the rank and file, and tend to live in an ideological world of their own. Affluence is giving the erstwhile "workers" middle class values, reducing their dependence on the unions, and making them increasingly critical of the tight discipline that the unions impose. This discipline survives from the days when workers' "solidarity" was essential for economic advance. The unions aim to create "closed shops" in which no non-union member can be employed. They can make life unbearable for any worker who does not conform. They can ban him from the trade in which he has spent his life, and which is the only trade he knows. They are empowered to do this for any breach of their rules, which are rules that they impose, and which he has no real opportunity of accepting or rejecting.

The union leaders reply that they are not prepared to win benefits for workers who make no contribution. This is another example of failure to shed an archaic outlook, because with full employment and labour shortages, non-unionists do not depress wages. Moreover, compulsory unionism both spreads resentment against the unions and works against the interest in union affairs, which promotes active union democracy.

If democracy in the unions is to flourish, responsibility and authority must be removed from distant head offices and restored to the factory floor, and the less compulsion there is, the more likely are members to be keen and interested. But nobody wants to see the unions break up, least of all employers, who need an authorised body to negotiate bargains covering all workers. Mr. J. A. Lincoln offers an ingenious solution in his contribution to "Agenda For A Free Society". Pointing out that wage bargains in the UK today are "gentleman's agreements", he urges that they should be made legally binding contracts for definite periods. To establish the worker's contractual status would promote (a) his sense of responsibility, and (b) stability in industry. The non-unionist should, on signature of a contract, pay to his employer a fee fixed by a Registrar of Industrial Contracts, who would then pay it to the union. This would preserve (a) the union's revenues and bargaining status, and (b) the individual's right to his independence. Mr. Lincoln, like Mr. Roberts, believes that there would be fewer non-unionists if membership were a privilege and not an obligation.

The European Scene

SPAIN APPLIES TO COMMON MARKET

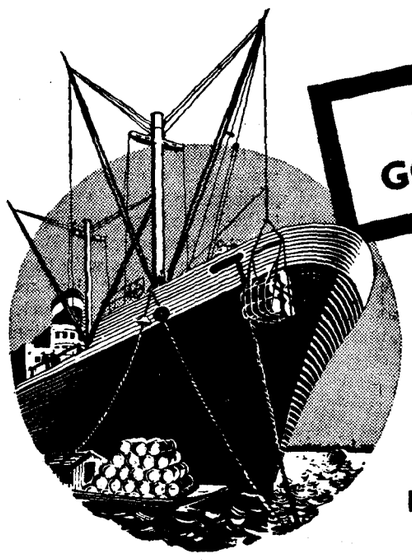
From Our Special West European Correspondent

PARIS, February 18.

ON the same day as the Count of Casa-Miranda, General Franco's ambassador to the European Economic Community, presented a formal application for Spain's association with and eventual full membership of the Common Market, the leader of the liberal monarchist opposition, Senor Satustregui, was fined in Madrid the sum of 25,000 pesetas for having made "a speech containing ideas hostile to the nation's organisations". The speech, which was not only read in public but printed and published without authorisation, was made last November and developed the theme: Spain needs a political structure capable of being integrated into the community of West European nations. It contained (as far as the trial reports show) no direct criticism of the present Spanish regime, but merely stated what is evident, that Spain's place is with her neighbours but she can take that place only when she brings her system of government into line with theirs. That the dictatorship should find such ideas "hostile" and should punish their publication gives an inkling of the ulterior motives that accompanied its application for membership of the European Communities. Apparently, General Franco believes that a dictatorship can play a part, and eventually a full part, in a union of national economies and of governments without relaxing its grip over its own people.

This is a double illusion. Illusion, first, to think that democrats would unanimously consent to co-operate with a dictatorship on those terms—and since admission to the Common Market requires a unanimous vote of existing members, Spain's entry could be blocked, as her admission to NATO has been blocked, by one or two resolute opponents. Illusion, secondly, to think that a dictatorship could survive the liberation and opening up of economic life implied in membership of a customs union. As usual, it appears that General Franco's decision has been taken without any thought for such details and is simply another application of his Machiavellian and invariably unsuccessful policy: sell Spain's neutrality at a good price when there is international conflict, and once the conflict is over, leap to the aid of the victor. He used these tactics during and after the war between the democracies and totalitarianism; he tried to do the same in the long conflict between the Europeans and the Arab world; he offered a little cameo of the method during President de Gaulle's struggle against the rebellious settlers of Algeria; and he has followed the same line in the trade dispute between the Six and the Seven. When, for a time, it seemed that West Europe was to be divided into rival trade blocs, Madrid refused to join the rush of minor powers to enter one or the other; it was explained how membership of either was impossible for the Spanish economy, and Madrid was content to keep an iron in both fires. Once the EFTA began to be wound up, after Britain's decision to seek entry into the Common Market, and this latter was well set on its course by agreement about a joint farm policy, the see-saw tactics were inapplicable, so Madrid has chosen to join the winning side.

The incongruity of a dictatorship rallying to a union of democracies no more disturbs Madrid in this case than when she applied for admission to the anti-Communist alliance or UNESCO. However, it very much disturbs many of her would-be partners. The European Federalist Movement, the Belgian Socialist Party and a variety of Leftist organisations have lost no time in declaring Spain's admission to the Common Market unacceptable, and the opposition is bound to swell in coming months. There can be little doubt of the attitude of Signor Nenni's Italian Socialist Party, which is about to be admitted to the governing coalition in Rome (Signor Nenni is himself a veteran of the Spanish Civil War). Unlike the Continental neutrals, who are asking for favourable commercial arrangements short of a politically undesirable membership of the Communities, Spain's application asks for "negotiations about the possibility of association with the European Economic Community permitting, at a suitable moment, complete integration, after a series of stages that are necessary to allow the Spanish economy to conform to the conditions of the Common Market". So it is an arrangement like that made with Greece that Madrid has in mind: a period of adaptation running to 15 or 20 years, after which Spain would become a full partner.



On purely technical grounds, the authorities of the Communities were not anxious to repeat the Greek experience. Although they posed no political problems, the negotiations with Greece were long and infinitely complex; they succeeded in the end, but the notable lack of enthusiasm with which similar applications from Turkey and Israel were received (and from Denmark and Ireland, too, as far as they want special interim arrangements before accepting full membership) show that the EEC has been intimidated by the difficulties of associating even small economies with their enterprise when those economies are backward and mainly agricultural. Exactly parallel problems will be posed by Spain's application, if ever it comes to be taken seriously. Her exports of citrus fruits and olives, and above all of wine (of which she exports more than France) are directly competitive with those of France, Italy and Greece, and Madrid will be asking for a breach to be broken into the common agricultural policy that has just been adopted with so much trouble. But these economic technicalities are complicated by political differences. It is not literally true, as Belgian Socialists are claiming this week, that a democratic regime is a pre-condition of membership of the Common Market, but it is correct that the Rome Treaty assumes implicitly that member-states are democracies. For example, when it associates free trade unions with the Economic and Social Council, it assumes that they exist; well, they don't in Spain. However, it is not such juridical points that will decide the issue; the question depends on whether the democracies want to co-operate with Spain.

There is no doubt that they all want to have as little to do with the Francoist regime, but that they all want to bring the Spanish people back to the free Western community. The debate that is beginning concerns whether the first is necessary and in fact the only possible way, to achieve the second. There is ample reason to think that the answer is yes. It is already notable that the decision to seek admission to the Common Market marks another defeat inside Spain for the Phalangist Movement, the remnants of the organisation that staged the Francoist rebellion; the Movement fears, pro-

perly it seems, the destructive effect on the present Spanish tyranny of close association with a more liberal Europe. Admittedly, the "European party" inside the Government is no liberal force; it comes mainly from the Opus Dei, a reactionary Catholic organisation that practises the devious policies of a secret society and would be rejected, not merely as illiberal in most democracies, but as irreligious in many Catholic countries other than Spain. However, this faction is a progress toward liberalism compared with the original fascist party, and it has the support, in its pro-Europe policy, of the really liberal forces in the opposition that manage (mostly illegally) to make their voice heard.

Moreover, intentions count less than tangible consequences and it is clear that all the timid steps Spain has so far taken to open her economy more freely on to the outside world have had liberating effects inside the country. Even the apparently technical decision to join the OEEC (now the OECD) has had the result of authorising public study—by impartial experts, whose findings are published—of the Spanish economy, and this has broken the long silence in Spain about the country's real economic situation. The annual OECD reports nowadays contain information that you used to get shot for revealing only a few years ago, e.g. the extent to which output in some major industries and prices have deteriorated throughout the Francoist regime. Publicity about the nation's accounts seems to us the most natural of rights, but its effect in a country that has been submitted for almost a generation to a regime of silence and immobility is immense, over the not so long run. Ills are soon exposed, to which even a dictatorship cannot refuse to bring remedies. For example, the most superficial study of the Spanish economy at once revealed the disastrous consequences of the stranglehold of a group of banks over the nation's industry, and the chaos that resulted from the absence of any central bank capable of controlling the volume of credit. The upshot, this month, is a banking reform which nationalises the Bank of Spain (hitherto a private concern), sets up an effective credit mechanism and takes steps to prevent industrial-investment banks exercising a hidden, monopoly control over national industry. That Franco is obliged to father this Bill himself, and that it will be passed by the powerless Cortes (the Spanish "parliament") should not blind one to the fact that it is a step forward, and one that results directly from Spain's admission to the Western economic system.

The effects of association with the Common Market, with a view to full membership, would be much more revolutionary than admission to the OECD. Apart from increased publicity (for example, about labour's earnings), the Government would be obliged to undertake at last the vast reforms in the fiscal, agricultural and social departments that it has evaded for over 20 years. Powerful pressure groups will seek to resist such change, and they are represented in the Government—the owners of the latifundia (zemandaris) are among the keenest supporters of Francoism. But the experience of all the other European countries is that vested interests of that kind can best, and perhaps only, be dispossessed as part of a national effort to modernise an economy that is committed to lining up with its neighbours. Reforms that a Spanish government—not only a fascist one but even a democratic one—could never put through in isolation could be implemented in the name of European integration; we have seen this in all the Common Market countries, notably as regards agriculture. Europe's socialists regard Franco as a villain who is personally responsible for Spain's plight; in reality, he and his miserable dictatorship are the symbol of Spain's inability to solve national problems that the rest of Europe began to tackle in 1789. With him out of the way, we cannot assume that Spain will succeed at last in getting into the modern world, all by itself. Its association with Europe is the best chance for Spain, even if Franco is there to claim the credit for the first benefits.

RED LEAD GOES ABROAD

Red Lead, manufactured by D. Waldie & Co. (Lead Oxides) Ltd. in India, is now being exported to Cambodia and the Far Eastern countries. This makes yet another item for India's export drive to earn valuable foreign exchange.

A proved anticorrosive primer Red Lead has been extensively used by engineers for over 100 years all over the world for protection of metal structures, bridges, ships and buildings from rust and corrosion damage.

Economic Report from the U.S.

NEW LABOUR-MANAGEMENT CONTRACT

By GUY SIMS FITCH

WASHINGTON, February 13.

THE curtain is rising this week on a drama which has been played in the United States eleven times in the past 15 post-war years, with varying degrees of success. Its theme is the negotiation of a new labour-management contract for the steel industry. Its principal players are the United Steel Workers of America (U.S.W.), the union representing some 800,000 workers in steel and related industries, and a management team representing eleven major steel companies. Watching closely from the wings, presumably ready to step in should the drama show serious signs of faltering, is the U.S. government.

There is reason to hope for a happy ending this year. The circumstances and the mood surrounding the 1962 negotiations seem to point in that direction—to a speedy non-inflationary agreement which would benefit labour, management and the public at large. But the recollection of six steel strikes since 1946 is enough to temper optimism with caution. One indication of the desire of all parties concerned to avoid a similar development in 1962 if at all possible is the fact that the negotiations this year are opening on February 14, earlier than ever before. This early start, it is believed, will allow time for the collective bargaining process to reach a successful conclusion well before the July deadline, when the present contract expires. An early settlement would have obvious economic advantages. It would discourage excessive inventory accumulation in anticipation of a possible work stoppage. Orders could be spread more evenly throughout the year, production would not be disrupted and would tend to reflect actual demand. All this would help assure a continued and steady expansion of over-all economic activity, in line with general expectations. At the same time, the hope is that the final agreement will be essentially non-inflationary in character. Results of the steel negotiations could have a decided impact on prices and wages generally—directly, by affecting the costs of everything made of this basic material, indirectly by setting a prominent example for other industries.

The steel industry and the union have indicated their awareness of the advantages they would gain from a speedy and basically non-inflationary settlement. Apart from the benefits to the general economy in which they would share, there is the matter of keeping steel prices competitive with those of foreign producers and such other materials as aluminum, glass and plastics. The U.S. government does not fix price and wage levels, but it can influence them—and this it evidently has set out to do in steel. President Kennedy and members of his administration have made clear their interest in seeing steel prices kept under a tight rein. They have stressed that all increases should be earned through rising productivity, which would permit higher pay at no increase in prices. This approach could have a restraining effect on the labour-management negotiations.

The administration's interest in pushing steel negotiations to a successful conclusion also is seen in the fact that U.S.W. President David McDonald and U.S. Steel Corporation Chairman Roger Blough both have conferred with President Kennedy at the White House in recent weeks. In addition, there have been meetings in labour and management quarters to complete their plans for the contract talks. It is too soon, of course, to tell just what specific issues may figure prominently at the bargaining table, or what the precise outcome will be. It is likely, however, that such non-wage matters as job security and seniority rights will receive a good deal of attention. These are issues that experience has shown account for most of the local grievances in steel plants, and that have taken on a new importance with the growth of automation and other technological advances. One notably encouraging factor so far has been the absence of harsh or inflammatory pre-negotiation statements by labour and management leaders. Also, both sides—up to now, at least—have indicated some willingness to make concessions in the interest of reaching a fair and reasonable agreement. This moderation in tone and approach is in sharp and heartening contrast to the rancour and inflexibility which clouded the unfortunate 1959 negotiations.

A PASSENGER FROM CALCUTTA WRITES

... Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostesses charming ...

Departure : New Delhi Saturday night
Excellent connections from Amsterdam to the U.K.
Arrival : London, the next day—afternoon.
Also choice of 5 KLM DC-8 flights a week ex Karachi.

Sincerely yours

KLC-34

It happened some years ago in the steel melting shops at the Jamshedpur works. A large ladle, carrying 75 tons of molten iron, suddenly crashed to the ground with a deafening noise from an overhead crane. The spattering sparks and red-hot metal seriously injured a number of brick-layers working at what seemed to be a safe distance. The air was rent with the frenzied shouts of the men and the hissing of steam.

The first ambulance could remove only five of the injured to the hospital. General Manager Keenan could take only three more in his car. He chose the three who had a better chance of survival than the rest. One of these men, a Hindu worker, however, refused to go. "Do not take me away", he said. Disregarding his own agony, he feebly nodded towards a half-burnt Muslim colleague, and said: "*Hamare bhai ko le jao.*" As Keenan recalls, "The Hindu who was in pain and danger of death remembered, not that the Mohammedan was of a different faith, but that he was his brother."

This feeling of comradeship, born of the common bond of labour, is the spirit that characterises Jamshedpur, where industry is not merely a source of livelihood but a way of life.

SOAP, TEA AND CONTRACEPTIVES

By J. L. ENOS

IN the decade between 1951 and 1961 the population of India gratified every chauvinist and mortified every demographer by surging from 357 to 438 million people. The consequences of such anthropomorphic affluence have been quite apparent to many, from statisticians and planners who lament an inauspicious progression of numerals to villagers who see more mouths for less food. And with some perplexity they observe that there are no overwhelming religious, political, social or physical deterrents to the repression of births. The Hindu religion encourages continence. Moreover, continence is considered not only an individual virtue but also a social one, promoting order in the realm of human affairs. The Indian Government approves of such attitudes, and through educational programmes in numerous clinics is trying to encourage family planning.

Why then are births not prevented more frequently? What is there that prevents the people from practising this highly laudable art? The answer lies in the often sterile area of economics: quite simply the various paraphernalia of birth control are impossible to buy. People either cannot procure them, or cannot afford them, or both.

To write a prescription for this malady, one must first examine the patient. It is his or her condition that should be diagnosed. What are the needs of the individual who is considering the purchase of a contraceptive? They are for a device which is reliable in use and cheap and easy to procure. The consumer must have confidence in the quality of the device, a confidence which will not be shaken by any local irregularities. To be reassured the consumer must find the devices identical wherever he buys them: identically manufactured, identically packaged, identically labelled, identically distributed and identically priced. In other words a consumer should be able to buy contraceptives with the same confidence that he or she buys other nationally distributed branded products.

In order to be easily procured, the contraceptive should be readily available to the individual, wherever he or she is. The device should be brought to the consumer, not vice versa. For convenience, the town dweller should be able to buy them in his own town, and the villager in his own village. Since there are nearly six lakhs of towns and villages in India, six lakhs of outlets are needed. Only then will the individual be as close to this means to restrain population growth as he now is to the means to sustain it.

But six lakhs of outlets is a large number, so the question arises by whom are contraceptives to be dispensed? The requirements are that there be at least one of these suppliers in each village, that the supplier be experienced and desirous of dispensing, and that the suppliers' relations with consumers be without embarrassment. By these standards all the types of suppliers now being used are ludicrous. The family planning clinics of the Indian Government are too few and patronizing.* The chemists shops are too few and associated with abnormalities.

The village midwives are predisposed against selling contraceptives just as civil engineers are against selling shovels or meteorologists thermometers. The only suppliers who meet our criteria are the village shopkeepers: they exist in almost every village; they are readily accessible to all individuals, men and women; and they are in business to sell.

Considered from the point of view of the consumer, then, the contraceptive should be not a muffler for the population explosion but a very ordinary, mundane, commercial product—mass-produced, mass-distributed, and it is hoped, mass-consumed. It most resembles that other mass-produced, mass-distributed, mass-consumed product—the ubiquitous cigarette.

Since the two products are so alike as to be almost congruent, and since the adoption of the cigarette has been as wide as could be desired for the contraceptive, the manufacture and distribution of the cigarette could well be used as a guide. How, without any public assistance or support and in the face of some social and moral qualm has the cigarette trade been built up? The answer is a uniform product, precisely manufactured in antiseptic factories, hermetically sealed in attractive and distinctive packages, rapidly and solicitously distributed by the manufacturer directly to shopkeepers and seductively promoted to an entire population—with profit to all. And what does every consumer in India receive? A reliable product readily available in his or her village at a price of from one-hundredth to one-twentieth rupee per piece. What could be better?

If the cigarette trade is to be the model for the contraceptive trade several pre-requisites will have to be met: the volume of output will have to be high enough to obtain low unit costs, which means operating factories at full capacity, three-shifts a day, and maintaining a steady and substantial flow through the distribution channels. Manufacturers' representatives—not doctors or nurses or dais but salesmen who can solicit orders from shopkeepers—will have to be trained and posted to ten thousand or so distribution centres in India, and an equal number of wholesalers will have to be selected and supplied. Finally the product will have to be advertised—deliberately, extensively and skilfully, so that consumers know why, where, and how much contraceptives are. The advertising agencies and mass media, those much-maligned organizations whose standards are accused of being so low, whose performance so inane and whose social contribution so meagre, should be utilised. After all it is they that are most effective in promoting new, intimate and delicate products.

The aid of the cigarette companies, or other companies with nation-wide distribution—e.g. soap and tea—might also be enlisted. Several of these companies already have the superb distribution organizations, the contacts with shopkeepers, and the 'savoir faire' that is needed, and might find it profitable to add another product to their line.

Let us assume that the Indian Government wishes to encourage the distribution of contraceptives and that it is willing to adopt the most suitable methods. Its aim would be to present conveniently to every potential consumer a cheap and reliable product.** In order to achieve this aim, we have argued, the Government should create a distribution system for contraceptives similar to the ones that already exist for other low-unit-cost nationally consumed products.

If the Government does not feel any great urgency it could create this distribution 'de novo'; building a factory and assuring that it produces at full capacity, selecting and stocking distribution points, hiring and training supervisors and salesmen, and initiating advertising and other promotional programmes. Such a project would consume more than three years: if it were carried out effectively, contraceptives would become generally available by the beginning of the Fourth Five-Year Plan.

If the results are wanted quicker, use will have to be made of existing distribution channels. This means persuading one or more of the distributors of cigarettes, soap, or tea, to add contraceptives to their line. At this stage a question of public policy arises: with how many private firms should arrangements be

made? If the Government wishes to encourage competition among the private firms, it will wish to select several distributing agencies. But if it divideds the total business among several distributors, it will have to grant substantial and continuing subsidies, for no single distributor among many competing ones would be likely to achieve a scale of operations sufficiently high to return a profit. If, however, the Government wishes the distribution of contraceptives to become self-supporting, i.e. to subject the distribution of contraceptives to the disciplines of market, it will initially have to discriminate in favour of one or possibly two firms. Thus the issue, at least for many years until the volume of contraceptive sales has increased substantially, is competition cum subsidy versus monopoly (or perhaps duopoly) cum profit.

The forces affecting this issue are the conventional economic ones existing in any product market, for a private firm to be willing to add new product to its existing line it must be confident that revenues will exceed costs. For widely distributed, low-price items this means the level of operations must be sufficiently great to achieve economies of large-scale operation. These forces would act on the contraceptive trade just as they do on, say, the cigarette trade. Only if the expected volume of sales for a single brand of contraceptives were of the same order of magnitude as the actual volume of sales of a cigarette manufacturer then would private firm find the market attractive to enter. Let us therefore make the same calculation that the prospective distributor would make.

First of all we shall have to make some assumptions about the consumption of contraceptives. Assuming that condoms are readily available in all villages at a price of, say, 25 nP. per package of five, how many packages will be purchased? Let us assume that the yearly consumption of each purchaser is fifty pieces or ten packages. Let us also make two different assumptions about the proportion of the total virile male population that purchases contraceptives; the first that the proportion is one in ten, the second that it is one in a hundred.

According to the estimates based on the 1951 Census of Population, there were in 1961, 103,250,000 men between the ages of 15 and 44. This figure is equal to the number of males who, in 1951 fell in the 5-14, 15-24 and 25-34 year age groups. Assuming that deaths occurring during the years 1951-1961 among these groups were offset by under-enumeration in the census, this is equal in 1961 to the number of males in the 15-24, 25-34 and 35-44 year age groups. If one out of ten used condoms at a rate of 10 packages per year, annual sales would be 103,250,000 packages. If the proportion using condoms were only one out of a hundred, sales would amount to 10,325,000 packages per year.

Let us now compare these estimates of contraceptive purchases with those of the nationally-distributed low-unit-priced packaged items listed in the table. Since there are little published data on sales of branded products in India, the figures are probably not very accurate. Hopefully though, they are of the correct order of magnitude, which is all that is needed for our purpose.

The data given in the table imply that a private firm can manufacture, promote and market profitably through its own distribution network branded products if it achieves a total sale of operations equal to about 200 million packages a year. It may even be possible to make a profit at a lower volume, as several of the firms listed in the table did while building up their sales to the present level. But let us assume that a yearly volume of 200 million packages is necesary to support without subsidy a national distribution. Given our larger estimate of the size of the condom market, 100 million packages per year we find that at most only one distributor, selling only condoms, could operate profitably. The market for the foam tablet, and the oral contraceptive when this becomes available, might each support another.

ESTIMATES OF YEARLY SALES OF CERTAIN CONSUMER GOODS, 1961

(Crores of Packages)

Product	Company	Estimated Volume of Sales
Cigarettes	Imperial Tobacco	204
	National Tobacco	25
	Vazir Sultan	21
Soap	Hindustan Lever	32
Tea	Brooke Bond	73
	Lipton	40
Condoms	—	10 (high estimate) 1 (low estimate)

If the Indian Government limited its custom to two distributors—one for condoms and one for foam tablets—it would incur the least subsidy, although it would not eliminate entirely the need for public investment in distribution and perhaps manufacturing facilities. During the interval between the start of the programme and the time that sales volume reached, say, 100 million packages per year, the distributor would operate at a loss, for his distribution costs—inventories; hiring, training and maintaining salesmen and promotion—would exceed revenues.

How long might this period last? The answer ultimately depends upon how effectively the product is promoted and thus how readily the consumer adopts it, but the period of loss will be at least as long as the time necessary to establish the ditribution network and to lubricate its channels. If the distributor already had such a network and merely added contraceptives to his existing product line, this minimum interval would be relatively short, say six months; but if he had to create a distribution system 'de novo' the minimum interval might well be two years.

How much then might this subsidy amount to? Assuming that condoms sold at 25 nP. for a packet of five, the cost of manufacture would be about 10 nP. and the cost of distribution 15 nP.***

If the distributor selling only condoms broke even at a volume of one hundred million per year, his yearly distribution costs (including normal profit) would be Rs. 15,000,000. Since the bulk of the costs would be incurred from the beginning, the first year's subsidy would have to approach this maximum amount. As sales rise, the subsidy would diminish; assuming that the 100,000,000 sales volume were achieved after five years, in the fifth year the subsidy would be minimal. The total over the five years might range from Rs. 20,000,000 to Rs. 50,000,000 or Rs. 2 to 5 crores for condoms, and an equal amount for foam tablets.

Since Rs. 27 crores have been allocated in the Third Five-Year Plan for family planning, an expenditure amounting at the most from one-seventh to one third of this sum to achieve nation-wide distribution of contraceptives would seem to be an excellent investment.

*The procedure for procuring contraceptives at family planning centres appears to be as follows:

The prospective consumer is interviewed: the intimate answers are recorded in three different registers. He or she is subjected to a pelvic examination and finally a thumb print is made. After this humiliating experience the supplicant is given a few contraceptives. It is little wonder that the family planning clinics have not been more effective in distributing contraceptives. No commercial firm would think of subjecting its customers to such an ordeal.

**The aim should not be confused with other aims, such as collecting information on attitudes towards family planning, providing employment for already scarce doctors and nurses, or measuring pelves.

***Customarily, for low unit price, nationally distributed, branded items the costs of distribution, including advertising, are over half the total retail price. We have assumed it to be 60%.

THE BUSINESS WORLD

The Yugoslav Economic Plan for 1962

By BORIVOJE JELIC

THE basic principles of the plan for 1962 stand out more clearly when the continuity of the policy of economic development and the perfecting of the economic system, which has characterized Yugoslav economy for the last six or seven years, is taken into account. This policy can be summarized as a stimulus to accelerate economic development with high rates of growth in all fields, especially in industry and agriculture as the leading economic branches. All this has strengthened the system of self-management of the working people by offering a broader material basis and better forms of direct participation of the working people in all domains and at all levels of economic and social life.

Significant results were achieved in 1961, but at the same time new problems, imposed by the logic of speedy economic and social advance, were created. The tasks and principles outlined in the Federal Social Plan for 1962, are based on these results, and problems as well as the further adherence to policy in economic and social development.

As pointed out in the plan, many important changes in the economic system took place in 1961. The system of distribution of the income of economic organizations was modified, with the aim of augmenting self-management in the economy by strengthening the role of the communes as active factors in economic policy. Measures were taken to reorganize the banking mechanism and the instruments of credit policy, and to introduce reforms in the foreign trade and foreign exchange regime, with a view to adapting these delicate instruments of economic policy to the changed conditions, methods, and system of management. In this connection a significant step was the adjustment of relations between the prices of some groups of products so as to secure better economic conditions for transactions in certain economic branches, and thus to contribute to more harmonious relations on the market. The whole of this comprehensive programme was carried out in 1961, with the full engagement and active participation of all organs of social self-management.

As regards the pace of economic development, it should be emphasized that production, employment and labour productivity increased in 1961. If the growth in production was somewhat slower than in former years (the rate of growth of the social product was about 5.5 per cent calculated at unchanged prices) this was due partly to reduced agricultural production caused by unfavourable weather conditions and partly to the slightly slowed down rhythm of the growth of industrial production (8-9 per cent in 1961), which had to perform the complicated task of adapting itself quickly to the new conditions of earning created by these changes.

In view of these results and conditions, one of the aims of the plan for 1962 is to accelerate the rhythm of production and to bring it back to its former rate. An important objective in this respect is the planned growth of 13 per cent in industrial production in the coming years. While stressing the importance of these tasks, the Federal Plan also outlines the material and other pre-requisites needed to carry out programme.

In this connection it should be borne in mind that substantial investments have been made in the past years to erect new industrial enterprises and to reconstruct the existing ones, through which the pre-conditions for the continuous growth of production have been created. In 1962, large investments will be concentrated on energy sources (especially electric power and naptha) and on the ferrous metallurgy and chemical industries. The previous trends in employment and productivity of labour show that in this respect the planned growth of industrial production, as a whole is secured. However, the supply of the manufacturing industry with raw materials and component goods will be a serious problem especially in the case of articles to be imported. The plan for 1962, while pointing out the importance of these factors and the need for the full activation of all elements that can contribute to the solution of these problems, defines the measures to be taken in the individual branch, and emphasizes the importance of foreign trade. At the same time, the plan outlines a more elastic credit policy to expedite the growth of industrial production at the planned rate.

The planned increase of almost 23 per cent in agriculture should be viewed in the light of the low production in 1961. In fact, the total planned volume of agriculture is only about 5 per cent higher than that attained in the abundant year of 1959. Thus, agricultural production in Yugoslavia, especially socially organized production (on socially owned farms and in their co-operation with individual producers) has undoubtedly shown considerable progress. Its stagnation or slow progress of many years was followed in the last four or five years by changes which have—at least in some sectors of agriculture revolutionized production methods. The application of modern agro-technical measures, the increased number of tractors, the rapidly growing use of fertilizers, and high yielding varieties of wheat, have led to important results in paving the way for stepped-up production. The process of reconstruction through increased and modernized production has also been started in livestock raising, and although the results achieved are considerable, further development depends on favourable economic conditions to create the direct economic interest of all economic organizations, communes, and other organs in more profitable production and in greater investments in this branch. It should be emphasized that the recent increase of the purchasing price of wheat was quickly followed by a favourable reaction from the producers, a fact reflected in the acreage sown with grain this autumn. The plan outlines the principles to be followed in this respect and encourages constructive efforts.

One of the essential aspects of the plan is in the field of foreign trade, and the measures outlined should stimulate the growth of export. If it is borne in mind that increased export of agricultural produce cannot be expected in 1962, (owing to the poor harvest in 1961) the leading role in increasing the volume of export is expected to be taken over by industry, which has shown favourable tendency in this direction in recent years. At the same time, the plan stresses that import should be better and more economically organized so as to cover the most important requirements of raw and semi-finished goods, capital equipment, and consumers goods, within limited capacities.

In accordance with the established policy to raise consumption and the living standard in step with the growth of production and productivity of labour, the plan

for 1962 provides for an actual increase of over 6 per cent in per capita consumption, along with an increase of about 4 per cent in the personal income of workers and employees. At the same time, investments in the basic funds for the social standard should amount to more than 280 million dinars in 1962 (12.4 per cent more than in 1961). These investments will render it possible to increase the building of dwelling houses by 14 per cent (85,000 flats in 1962), to increase to approximately the same extent investments in communal services, and to invest in educational and health institutions at a speedier rate. A 10 per cent growth of expenditure on the services covered by the budgets is planned.

The plan provides for adequate measures to attain these aims. They refer, first of all, to tasks to facilitate the development of the economic system by a more elastic adaption of credit policy and the credit mechanism to the needs of economic advance, to create favourable conditions for increased productivity in all domains, especially in agriculture, and to promote foreign trade.

Another important aspect of the plan is the emphasis on the role of the People's republics and communes in economic policy, in giving them the necessary authority and material base for augmented activity. The changed role of the communal and republican commercial banks, through which the funds earmarked for the economy will be mobilized and channelled, is expected to have a considerable effect.

Discussions and debates during the adoption of the plan showed the interest of all responsible circles in assessing and establishing the tasks of the economy in 1962, and in the problems created in the economic system and in the system of planning. The general assessment reflected in the adoption of the plan is that the tasks are serious but can be carried out.

ECONOMIC RELATIONS WITH FOREIGN COUNTRIES

The most important aspect of the balance of payments in 1962 will be the maximum increase of commodity export. This increase should be attained solely by the export of industrial products, since agricultural export will be smaller than in 1961 owing to the smaller agricultural production in that year. The increase of internal consumption should, therefore, be such as to secure the planned increase of export and the decrease of the deficit in the current exchange of goods and services.

The following increase of the export volume as against last year is planned (per milliard dinars at the official rate of exchange):

INDEX OF GROWTH

	1960	1961	1962	1961 1960	1962 1961
Total Export of Goods	169.8	170.0	202.0	100.0	118.2
Of which Export Industrial Goods	126.9	129.3	163.5	101.9	126.5
Export of Agricultural Produce	39.5	36.4	33.2	92.2	91.2
Export of Forestry Products	3.4	4.3	4.3	126.5	100.0

To achieve the rise in industrial export it will be necessary to adapt industrial production in due time to the requirements of increased export, not only in respect of the volume, but also of the structure and quality of export articles. This is all the more necessary as in 1962 changes in the direction of Yugoslav export must be taken into account and will require production of higher quality.

An increase in the volume of industrial export is expected, first of all, in the metal manufacturing, shipbuilding, ferrous metallurgy, timber and wood, chemical, and textile industries. The most important items for increased export will be machines and installations, sawn timber and pressed wood boards, processed copper products, basic bricks and sinter-magnesite, caustic soda and superphosphates, cotton fabrics and cotton yarn.

The export of indutrial products will be facilitated by adequate measures to regulate internal consumption. For this purpose the balance of payments provides for the necessary funds to credit industrial export or the export of industrial equipment.

Along with the increase of export it is necessary to obtain more assets in the non-commodity items in the balance of payment in order to earn more foreign currency. Non-commodity income is expected to increase from 54 milliard dinars to nearly 62 milliard, and non-commodity expenditure from 27 milliard dinars to about 33 milliard, calculated at the official rate of exchange. The increase of assets in non-commodity transactions will be mainly from increased foreign currency earnings from tourists turnover, railway and river traffic, and income in foreign currency.

The balance of payments in 1962 anticipates a slackened pace of total import to reduce its deficit. The expected increase of the import of raw and semi-finished material is only 9.2 per cent. To keep the import within these bounds it will be necessary to select the articles to be imported, to use imported raw materials rationally and—in general—to orient industrial production towards the increased use of domestic raw material sources. In view of the import of food, the import of categories of goods will be reduced.

In 1961 the regional structure of Yugoslav foreign trade weakened to some extent. In this connection, it is necessary to make special efforts to improve the balance of trade with the area of convertible currencies, to utilize in due time the outstanding earnings in clearing with various countries through import from these countries, and to import primary raw materials from the countries producing them.

Improvement in the regional structure of foreign trade and planned increase of export are the basic requirements to be attaind as fully as possible in 1962. For this among other measures adequate adaptation will be made in the regime of foreign exchange and foreign trade.

PROBLEMS FACING EASTERN INDIA

IN A thought-provoking address to the Bengal Chamber of Commerce, the President, Mr. Stenhouse, dwelt at length on many of the problems facing Eastern India and particularly Greater Calcutta. Mr. Stenhouse pointed out that the difficulties in this region were not of shortage of natural resources, but of power and transport. In the Calcutta industrial area, and throughout Bengal and Bihar, existing supplies of electric power were uncertain and there was little possibility of their being expanded much in the next two or three years. Then again, it was exceedingly difficult to obtain wagon space in any reasonable period of time for the movement of commodities into and out of the Calcutta industrial area. There is no doubt that the country as a whole is faced with such shortages, but they are to a greater extent in Eastern India. And until or unless something is done to provide additional electricity supplies, better service from the railways, improved roads to allow road transport to move more freely and more cheaply, and increased facilities for river transport, the fear is that the tempo of progress in this part may not be maintained.

The danger in the whole situation is, Mr. Stenhouse opined, that stop-gap short-term remedies are being imposed, which will in the long run, seriously hamper the interests of this part of the country. The policy of assisting the so-called under-developed areas at the expense of Eastern India is not only short-sighted, it is repugnant to the fundamental principles of planning. In the long-term, to try to maintain high cost producers in areas where industry is not naturally favoured merely means in national terms less efficient utilisation of our natural resources than could be otherwise achieved. It is all very well to talk of decentralisation, but it is not quite relevant to the basic issues involved which is one of accelerated economic growth. Arbitrary transplantation of industries can defeat the very objectives of planning. Unfortunately the Union Government seems to be oblivious to all this. Needless to stress that sooner it changes its attitude the better it would be for economic development of the country. The economic advantages flowing from the development of Eastern India can certainly be beneficial for other parts as well. Time is ripe to recognise the importance of all this and to offer the needed assistance and facilities to Eastern India. With some justification Calcutta continues to be regarded by shipping lines as one of the most expensive ports. It is only by gently increased efficiency that this can be remedied. While much has been achieved in the last few years in respect of port facilities, there is still a great deal to be done to improve efficiency in many other ways.

Cotton

CRISIS OF PRODUCTION

UNFORTUNATELY COTTON production in our country has again failed to come up to the anticipated levels, thereby causing a shortfall of about 14 lakh bales, when compared to the estimated demand for the current year. Even if cotton already imported, as also that licensed to be imported, is taken into account, the Indian Mill Industry faces a shotage of over five lakh bales, which means that the cotton textile industry will be forced to depend on the carry-over stocks of 22 lakh bales, meagre as they are in all conscience. Mr. Madanmohan Ruia was not at all exaggerating, therefore, when he told the Fortieth Annual General Meeting of the East India Cotton Association Ltd., (E.I.C.A.) that, "unless imports are arranged forthwith, the balance at the end of the current year may be precariously small". "Indeed," he went so far as to say, "we are in the midst of a crisis created by short supplies and the position appears alarming". After having stressed the urgency of imports thus, however, Mr. Ruia seemed to have second thoughts. For he seemed to water down his demand by exhorting the cotton trade to appreciate the difficulties of Government and "be prepared to face it", (that is, the likelihood of severely limited imports of cotton).

Strangely enough, in the name of shortage of supply, the E.I.C.A. President not only approved of all the restrictions placed on cotton, but even suggested the possibility of more restrictions, if the trade, industry and everybody concerned failed to co-operate with the Government in implementing these measures. Lest there should be any misunderstanding of this comment, we reproduce below the relevant extract from his speech: "The shortage of supply has necessitated continuation and re-introduction of certain restrictive measures like compulsory surveys at the Ginning and Pressing stations, allocation of quotas to mills on the basis of past consumption, variety-wise distribution so that mills can buy according to availability of supplies of each of the varieties, requisitioning of cotton, and prohibition on holding stocks beyond certain limits. All these measures cause hardships, but these are necessary in the circumstances prevailing, and we ought to co-operate with the authorities whole-heartedly. I am afraid more restrictions would be inevitable if the trade, industry and everybody concerned do not co-operate in implementing these measures and none can then blame the authorities."

But Mr. Ruia was more realistic in his approach when he dwelt on the need for an "assured and adequate supply of indigenous cotton of desired varieties", which he described as "the remedy for all the ills of the present cotton situation". In this connection, he said: "It is now quite apparent that efforts must be concentrated on bringing about continuous increase from year to year in cotton production. It is the general wish of the trade, and also of the farmers, that the price control on cotton be lifted or, in the alternative, the present ceilings, which were fixed in 1951-52, be revised so as to bring them to realistic levels. There has been undoubtedly a considerable increase in the cost of production, i.e. cost of seed, labour, fertilisers, etc. and, therefore, a revision in ceiling is now urgently called for."

There was similar realism in the E.I.C.A. Chief's pointed insistence on the need to increase the per-acre yield of cotton. He quoted the yield figures in different parts of India and compared them with those of other parts of the world. In the light of these figures, he suggested a careful study of the potentialities and the facilities available in each region and also the concentration of special efforts on areas considered promising, such as Marathwada. "If necessary", Mr. Ruia added, "cotton should be included in 'package Plan' so that extra supplies of fertilisers, pesticides, etc. could be adequately provided". He also wanted priority to be given to the production of cotton in the new areas which are shortly coming under irrigation. "Positive efforts" on these lines and also price incentives are necessary, as he said, if production is to be increased in the shortest possible time.

Antibiotics

A STEP FORWARD

WITH the establishment of an Antibiotics Fermentation Plant at Atul, Bulsar, by the Lederle Laboratories (India) Limited, a local affiliate of the American Cynamid International, New York, one more milestone was achieved by the Pharmaceutical Industry in India. Since their establishment in India in 1946, the Lederle Laboratories

have covered a wide field. It was they who introduced the first broad-spectrum of antibiotics, i.e. Aureomycine Chlortertracycline, which, it may be recalled, was the invention of a well-known Indian scientist, the late Dr. Yellapragada Subba Row. And now, with the inauguration of the new plant by Nawab Mehdi Nawaz Jung, Governor of Gujarat, a few days ago, India has gone ahead and a full circle has been completed in the production of antibiotics. The present plant, we are told, will provide a local source of production for several antibiotics, including Aureomycine. It is interesting to note that this plant, which will provide employment for more than 700 people, will also facilitate the production of drugs to fight tropical diseases and Vitamin 'P' that is Folic Acid.

When India was on the threshold of Independence, she was wholly dependent on foreign sources for a number of her vital needs, such as fertilisers, drugs, dyestuffs and other chemicals, but, during the last two plan periods, India has made great strides. She has been able to construct not only a mammoth fertilizer plant in Sindri, but a number of pharmaceutical companies besides. The Vice-President of American Cynamid Company, Dr. R. C. Swain, who flew from New York specially to attend the function, rightly reminded his audience that no large nation could achieve economic self-sufficiency without a basic chemical industry, and recalled how it was the undaunted efforts of Mr. Kasthurbhai Lalbhai, the man behind the Atul Products, that brought about the partnership of American Cynamid with the Indian Industry to build up such a basic industry.

The inauguration is undoubtedly a significant event for the country. It will save India, which used to import large quantities of antibiotics, vitamins, and other disease-fighting agents, sizeable foreign exchange. The accomplishment of the highly complicated process of manufacturing antibiotics from start to furnish, without the necessity of importing bulk raw materials and intermediates from other countries, is undoubtedly a break-through into the most important field of antibiotic manufacture. But, as the Governor of Gujarat remarked, antibiotic manufacture is "A Saintly Act", in that it helps fight disease and offers longevity to people, unlike "the devilish field" of armament manufacture which has only annihilation to offer to humanity.

New Issues

BHARAT BALL BEARING COMPANY

THE DETAILS of the capital issue of the Bharat Ball Bearing Company are now available. The company is entering the market on February 26 for raising capital from the public to the tune of Rs. 41.95 lakhs—Rs. 15 lakhs in the form of 15,000 redeemable cumulative preference shares of Rs. 100 each and Rs. 26.95 lakhs in the form of 2,69,500 equity shares of Rs. 10 each. The list closes on March 7 or earlier as soon as the directors decide (presumably on the whole of the issued amount being subscribed), but not before February 28. The public issue, along with the capital already subscribed or promised to be subscribed by the promoters and their friends, will raise the issued and subcribed capital of the company to Rs. 75 lakhs, out of an authorised capital of Rs. 2 crores, consisting of 50,000 preference shares and 15,00,000 equity shares. The preference shares carry a fixed cumulative dividend of 9.3 per cent per annum, free of company's income-tax but subject to deduction of tax at the prescribed rate, and are redeemable at par at the option of the company, wholly or in part, at any time or times after the expiry of 12 years from the date of issue but not exceeding a period of 15 years.

The company, as already reported in these columns, is setting up a plant at Ranchi to manufacture ball, roller and tapered bearings. It proposes to particularly concentrate on the production of precision bearings required for electrical fans, fractional horse-power motors, machine tools etc. The capacity of the plant will be 2.5 million bearings output a year. The plant is expected to be installed during the current year. The full capacity is expected to be attained by 1964. Orders for the major part of the plant have already been placed.

The total financial requirements for the project are estimated around Rs. 1.92 crores. Share capital will be yielding Rs. 75 lakhs. The rest of the expenditure is proposed to be met through a loan from the Industrial Finance Corporation of India (Rs. 60 lakhs), from cash credits from the company's bankers (Rs. 32 lakhs) and from the current earnings of the company, comprising part of the provision for depreciation and development rebate, (Rs. 25 lakhs).

The foreign exchange component of the project is estimated at Rs. 65 lakhs. To meet this, the company has been given import licences out of the U.S. D.L.F. funds.

Technical collaboration for the project has been arranged with the Fafnir Bearing Company of New Britain, Connecticut, one of the largest integrated manufacturers of ball bearings in the United States. The foreign collaborators will not only supply all the technical know-how and train Bharat Ball Bearing technicians, but also make availble to it the benefits of its research in the field.

In the initial stages, the company will be importing its essential raw material—high carbon chromium alloy steels—from West Germany, Sweden and Japan. But when the alloy and special steels plants proposed to be set up in India go into production, the major part of the raw material will be procured indigenously.

At the end of the Third Five-Year Plan, the requirements of bearings are estimated to go up to 15 million per annum. The present indigenous output of the commodity is not more than 2.5 million. In view of the expanding market for the commodity and due to the fact that most of products of the new company will be consumed by its own associated engineering units, the company is not likely to encounter any difficulty in marketing its production.

BARIUM CHEMICALS LIMITED

TWO MORE companies are entering the capital market next month. The most important of these is a newly floated concern, named Barium Chemicals Limited, which will be raising from the public Rs 40 lakhs in equity shares of Rs 100 each. The list opens on March 9. The company has an authorised capital of Rs. 100 lakhs. Out of this, it is issuing capital worth Rs. 50 lakhs. The promoters, directors and their friends have already taken up shares worth Rs. 10 lakhs.

The company proposes to set up a plant at Kothagudam, near Dornakal, Andhra Pradesh, to undertake the manufacture of all types of barium compounds and inorganic chemicals. The capital outlay on the project is estimated to be Rs. 53.6 lakhs. The issued share capital will be providing Rs. 50 lakhs. The remaining sum of Rs. 3.6 lakhs is envisaged to be procured through bank borrowings.

The plant will have a capacity to produce annually 2,250 tons of blanc fixe (pigment quality), 450 tons of barium chloride of technical quality, 25 tons of barium chloride of BP quality, 25 tons of barium sulphate of BP quality, 1,100 tons of barium nitrate, 600 tons of barium carbonate and 100 tons of barium hydroxide. Besides, it is expected that 1,800 tons of barium sulphide (black ash) and 600 tons of sulphur will be recovered annually as by-products. The company has also plans to expand its range of production to include the manufacture (for its own requirements) of sulphuric and nitric acids.

Technical collaboration for the project has been arranged with the world-renowned British firm of Messrs. L. A. Mitchell Limited, of Manchester. The technical collaborators have agreed to supply and erect the plant and machinery and provide the technical know-how, plant management and staff training at a total cost of Rs. 24.60 lakhs. Of this, 13.60 lakhs are to be paid in sterling in England and the balance in rupees in India. The Government of India has approved of this arrangement.

The collaborators have guaranteed the quality of barium chemicals to be produced by this company, to B.S.S. requirements. They have also guaranteed the cost structure and the performance of the plant and machinery. The supply of plant and machinery is to be completed by June this year. The factory is expected to go into production by the end of 1962 or latest by February, 1963.

The Board of Directors of the company includes Mr. V. P. Menon, former Governor of Orissa and the Chairman of Nizam's Trust, (Chairman), Mr P. S. Rau, former Governor of Kerala and Chairman of Damodar Valley Corporation, Mr. V. N. Narhari Rao, former Auditor-General of India and Executive Director of the World Bank, and Mr P. N. Balasubramaniam, the promoter of the project. Mr Balasubramaniam is the managing director of the company.

STAR TEXTILE ENGINEERING WORKS

THE SECOND COMPANY which is entering the capital market next month is the Star Textile Engineering Works Limited, Bombay. It will be issuing 20,000 equity shares of Rs. 100 each, with a view to raising its share capital from Rs. 5 lakhs to Rs. 25 lakhs. Of these, the present share-holders, the directors of the company and their friends have agreed to take up 7,750 shares. The balance 12,250 shares are being offered to the public. The list opens on March 1 and closes on March 7 or earlier at the discretion of the directors, but not before March 5.

The stepping up of the capital of the company has been necessitated by the expansion plans it has drawn up to expand its activities. These include increasing the production of ring and fly frames, rollers and cylinders and undertaking the manufacture of components for top arms and ball bearing jockey pulleys, steel bosses for ball bearing arbours, conveyor chains, grinding lathes, mounting machines etc. The company is already engaged in the manufacture of a wide range of textile machinery and accessories, including knurled rollers and drying and finishing cylinders, at its plant at Lower Parel, Bombay. To expand its activities, it proposes to set up a new factory near Dombivli.

The company's total turnover in 1960 amounted to Rs. 37.40 lakhs, which yielded a net profit (befor taxation) of Rs. 4.42 lakhs. Last year, its total sales amounted to about Rs. 45 lakhs and the profit is not expected to be less than that in the previous year.

I.F.C.

CAPITAL TO BE RAISED BY RS. 2 CRORES

THE INDUSTRIAL FINANCE CORPORATION OF INDIA has been authorised by the Central Government to issue further 4,000 fully paid-up shares of Rs. 5,000 each (worth Rs. 2 crores). The shares are guaranteed by the Central Government as to the repayment of principal and payment of an annual dividend at the minimum rate of 4 per cent.

The Central Government and the Reserve Bank of India will each subscribe for 800 shares and the remaining 2,400 shares are offered for public subscription to scheduled banks, insurance companies, investment trusts and other like financial institutions, registered in India under the Indian Companies Act, and the co-operative banks in the following proportions:

Scheduled Banks	1,000 shares
Insurance Companies, Investment Trust and other like financial institutions	1,000 shares
Co-operative Banks	400 shares

The shares of the Corporation are deemed to be included among the securities enumerated in Section 20 of the Indian Trusts Act, 1882, and are also deemed to be approved securities for the purposes of Insurance Act, 1938, and the Banking Companies Act, 1949.

The subscription list will be open from March 12 to March 15 (both days inclusive). The dividend on the new shares will acrue and be paid to the shareholders from March 12.

Shipping

WITH THE granting of a loan of Rs. 20.25 crores to Jayanti Shipping Company by the Shipping Development Fund Committee, the stage seems to have been well set for the company to go ahead with its plans. The Committee, however, stipulates that the company should raise its paid-up capital of Rs 1.5 crores before it can become eligible for any portion of the loan. Thereafter the company will have to build up its equity capital prgoressively upto Rs. 5 crores as further instalments of the loan fall due. The Committee has also tipulated that the company will convert itself into a public limited company within a period of one year from the date of signing of the loan agreement immediately before the first instalment of the loan is due for payment whichever is earlier. The interest to be charged will be only three per cent and is in conformity with all loans granted by the Shipping Development Committee for acquisition of ships. When the ships are acquired, employment to about 700 seamen of various ranks will be provided and they will be manned entirely by the Indian crew from the very beginning. The managing director will be a resident Indian national and there will also be a nominee of the Shipping Development Committee who will function on the board of directors of the company for the entire duration of the loan. In this way the interests of Indian merchant shipping are intended to be protected. The provisions of Section 21 of the Indian Merchant Shipping Act 1958 in regard to the quantum of foreign participation in equity capital will, of course, be complied with fully.

This loan is for the construction of about 13 new cargo ships totalling 200,000 GRT to be obtained before the end of 1964. The order has already been placed on the Mistsubishi Shipyard in Japan for the construction of bulk carriers approximately totalling 160,000 GRT. The first ship is contracted to be delivered next year while the other 7 are expected to join the Indian fleet by June, 1964. The acquisition of tramp shipping and bulk carriers by the Jayanti Shipping Company is likely to come in very handy as the Indian merchant fleet has been very short of these ships. Thus five tramp ships and 8 bulk carriers will not only help correct the deficiency in the Indian merchant marine but will also place the fleet on a more balanced basis. When used on the Indian trade these ships will save foreign exchange and will earn foreign exchange when they are engaged in cross trading. The noteworthy feature is that no payment in respect of a ship is to be made to the Shipyard until the ship is delivered and the first payment is only 10 per cent of the price of the ship. It is considered that when payment is made the ships will be in a position to earn or save sufficient foreign exchange. The total payment to be made during the Third Plan period to the Shipyard would amount to about Rs. 7 crores.

FROM THE CAPITAL'S CORRIDORS

ECONOMIC CO-OPERATION BETWEEN ASIAN COUNTRIES

A Ministerial-level meeting is envisaged to be convened at an early date to set up an organisation for Asian Economic Co-operation. This is indicated in the draft of a Joint Declaration circulated by the ECAFE Secretariat amongst its Asian members, along with the report of the K.B. Lall Group on the need and possibilities of fostering co-operation on the economic front between the countries of this region.

The Government of India, it is learnt, has already sent a reply to this communication from the Executive Secretary of the ECAFE, stating that India accepted in principle that there should be greater economic co-operation amongst the members of the ECAFE and assuring that if there was general acceptance by the ECAFE members to co-operate further in this field, India would be glad to extend full co-operation.

Japan's reaction towards the formation of this Organisation is understood to be only lukewarm, but she is likely to agree to the proposition in principle. So the proposed conference may be held at none-too-distant a day.

The following is the text of the Joint Declaration which the ECAFE Secretariat has sent to its Asian members:

"The Governments of the countries of Asia, members of the United Nations Economic Commission for Asia and the Far East,

Considering that the rapid development of the economy of their respective countries is essential for the improvement of general well-being of the Asian peoples, the promotion of their prosperity, and the maintenance of peace;

Expressing their deep concern that the slow rate of growth of Asia's exports, the wide fluctuations in their volume and prices, the wide gap between export earnings and import requirements of Asian countries and the inadequate progress in the utilisation and development of Asian resources, constitute major obstacles to rapid economic development;

Realizing that closer economic co-operation among the countries of Asia is a pre-requisite for an accelerated rate of economic development, and for the mitigation of various difficulties facing them;

Noting that other areas of the world are benefitting greatly from regional economic co-operation;

Recognizing that greater economic co-operation among Asian countries will promote and strengthen the growth of trade and economic co-operation with the rest of the world;

Taking into consideration the current plans of economic development in Asian countries and the need and the urgency for greater regional co-operation in Asia;

Determined to take practical measures for promoting regional co-operation in various fields including trade, industry, agriculture, transport and communications;

Resolved to create the conditions and to establish the institutions necessary for the success of Asian economic co-operation;

Do hereby declare:

First, that regional economic co-operation shall be animated by a spirit of goodwill, mutual respect for national sovereignty, and the desire to assist one another in furthering their respective developmental programmes, with due recognition of the importance and desirability of co-operation with countries outside the ECAFE region;

Second, that the objectives of regional economic co-operation shall be:

1. To co-operate, subject to the requirements of their respective development plans, with one another, for the expansion of mutual trade and for the progressive reduction of tariffs and other trade barriers among themselves, with due regard to their obligations to countries within and outside the region;

2. To promote new lines of production and trade in industrial, agricultural and mineral products by means of exchange of information in long range import requirements and export possibilities, as also joint studies of and mutual consultations on national development plans with a view to encouraging efficient utilisation of resources of the region;

3. To assist one another, by means of appropriate measures, including long-term contracts and agreements, in the expansion of production and trade in agricultural and mineral products;

4. To co-operate in the formulation and execution of industrial projects, especially through the establishment of such units on a regional or sub-regional basis, paying special attention to the requirements of the industrially less advanced countries of the region, and to the possibilities of pooling the region's technical and financial resources;

5. To study problems of international commodity trade; to initiate in co-operation with international agencies concerned appropriate measures for safeguarding the interests of primary producers and augmenting their capacity to contribute to the expansion of international trade; and to adopt joint promotional measures for expanding commodity trade with other regions on a basis of mutual benefits;

6. To co-operate in the development of intra-regional transport and communication facilities and in the promotion of joint or co-ordinated measures in this field;

7. To co-operate in ancillary fields such as banking, insurance, settlement of commercial disputes, and travel and tourism; and

8. To facilitate and co-ordinate within the regional framework sub-regional co-operation and sectoral arrangements in specific fields of economic endeavour.

Third, that for the purpose of fulfilling the above objectives, an organisation for Asian Economic Co-operation shall be established, and that this organisation shall be under the direction of a Council of Ministers, comprised of plenipotentiaries of all member States and be assisted by the Secretariat of the United Nations Economic Commission for Asia and the Far East;

Do according AGREE to convene a Meeting of Ministers at an early date to take further steps in this regard."

The report of the K.B. Lall Group, which will form the basis of the discussions at the proposed meeting of the Ministers, is largely in the form of suggestions on the need and possibilities of fostering economic co-operation among the Asian and the Far Eastern countries. Some of the basic and fundamental observations made in this report are as follows:

1. Individual countries in trying to solve their balance of payments difficulties by curtailing the import of goods produced in neighbouring territories are likely to set in motion a chain reaction that will eventually recoil on them and make their own task more and more difficult. A concerted effort is, therefore, called for to liberalise trade in regional products amongst regional countries so that both production and commerce, as also related economic activities, are freed from the cramping effect of restrictive regulations.

2. While the creation of a full-fledged customs union or a free trade area may not be immediately feasible, it should, nevertheless, be possible to set up a joint regime to evolve measures that may be necessary in the field of tariff reductions, enlarged quotas and other facilities for expansion of exports which may be mutually agreed upon by participating countries to secure an increase in intra-regional trade. Such aids and incentives would be justified on grounds of 'infant' trade which needed special treatment.

3. It is sometime contended that since the countries in the region are in different stages of economic development, it is not easy for them to co-operate with one another. It is true that co-operation in Western Europe is essentially of the horizontal type, namely, the industrially developed countries exchange among themselves a wide range of manufactured products. In Latin America, co-operation is being attempted in the first stage largely among developing countries on a horizontal basis, with provision for vertical integration. In the ECAFE region there is need of a scope for both horizontal and vertical types of co-operation. For countries which are not in a position to achieve economies of scale and have yet to make appreciable progress in industrial development, co-operation will be of great value. Co-operation between countries in different stages of development will be equally essential, if intra-regional trade is to be developed in raw materials, agricultural and mineral as also in industrial goods. As the less-developed countries succeed in establishing procesing and manufacturing units, their capacity to produce for export to the other countries of the region will develop appreciably, and, ultimately, when all the countries of the region become industrialized, of course in different sectors and with possibly varying specialisations, horizontal co-operation will become a more important means of exchanging goods.

4. Experience in other regions shows that in implementing additional import quotas among the countries of the region, some countries will emerge with surpluses and others with deficits and these imbalances will require to be taken care of by some regional payments and compensation mechanism. It is not possible for the export group to examine in detail the various technical aspects of the payments problem and the compensation mechanism. Nor is it possible to estimate the finances required for the compensatory mechanism unless reasonable estimates of the additional intra-regional trade and the emerging surpluses and deficits are available. However, the Group is of the view that experience in Western Europe and other regions in this regard has been most useful and can be drawn upon, with suitable modifications, to institute the multilateral compensatory mechanism needed for the ECAFE region.

5. It is desirable to promote intra-regional trade also by means of regional industrial units which would involve sectoral or partial integration in certain commodity markets and industries. The advantage of large-scale economies can be ensured by establishing industrial units in economical locations, with opportunities of marketing their products in other countries of the ECAFE region. Some element of tariff-cum-quota preference can be applied with great advantage to the products of such regional or sub-regional industrial units. Such preference will enable the industrial unit to market its products at competitive prices despite the difficulties during the infant stage. The advantage of an ensured larger market in several countries will attract investors and entrepreneurs from within and outside the region to invest their capital in those units.

6. Countries which at present are mainly dependent on the export of agricultural and other primary products for their foreign exchange resources and on imports of manufactured goods and equipment and machinery from other countries within or without the region, will need to diversify their economies, organise the processing of domestic materials and increase their exports. Regional co-operation measures in the form of regional or sub-reginal industries catering to multi-nation markets, the establishment of processing industries and long-term trade agreements and contracts can make a significant contribution in achieving the above ends.

7. A factor retarding the development of new industries, even when other favourable conditions are present, is the relatively small size of the domestic market. This is true not only of countries with small populations, but also of large countries with very low levels of income. This is also true of industries which produce by-products or require semi-processed products of other industry. The inter-relationship among industries tends to be more and more complicated as the process of industrialisation proceeds, and this necessitates larger and larger markets. There is undoubted scope for selective action to ensure that advantage is taken of the economies of scale to establish industrial units in locations where production can be planned economically, provided the promoters are confident that facilities will be available to them for marketing their products in neighbouring countries or perhaps in the region as a whole. It should be possible for countries in the region by mutual agreement among themselves to provide access to their respective markets for the products of industrial units which are set up in different locations of the region.

8. In the case of sugar, regional production and consumption are almost equal, but only half of the regional requirements are met from within the region. These possibilities broadly indicate the need and scope for the co-ordination of targets of production of several agricultural commodities in the region.

9. It is necessary for Asian countries to ensure that too great an incentive is not given to substitutes in Western Europe and that Asian exporters are not placed in West European markets at a disadvantage in comparison with producers in other regions or territories. The organisations which are being set up in Latin Amerioa to co-ordinate commercial and economic policies are likely to provide facilities for protecting their commodities on a regional basis. It seems, therefore, essential for Asian countries not only to safeguard their interests through regional measures, but also to co-operate with global bodies to seek a fairer deal for primary producers and primary products.

10. The establishment of freight study units is naturally the first step which could be taken up in order to ascertain the incidence of freight on the competitive position of a country's products in foreign markets. Such units could be set up in co-operation with the commercial organisation concerned with the various major export commodities. Most of the member countries of the region have to depend upon foreign shipping lines for the movement of their cargoes and it is reported that they suffer considerable freight disadvantage in a number of commodities vis-a-vis the countries of other region which have developed their own national shipping. Another factor hampering long-term development of trade has been the frequent changes in the freight rates. If intra-regional trade is to be developed, suitable machinery will need to be devised so that these problems are studied from the national as well as the regional angle, and whenever necessary, consultations with the foreign shipping lines are held. This could probably be achieved by setting up a regional shipping and freight committee which might be set up in the member countries. It would also be necessary to bring about greater co-operation among the commercial interests in the region so that they are able to negotiate with the shipping lines. The experience of countries, such as Australia and the Netherlands, which have set up exporters' associations and shippers' councils would be of interest in this regard.

11. The advantage of having a fleet of small ships which could make short runs and call at minor ports and generally work economically towards promoting the trade of the region is obvious. For example, a service which takes cargo from Persian Gulf ports to Pakistan, India, Ceylon, Burma and Malaya and back could be

conceived. Branch lines from Singapore to Hong Kong and Japan or Djakarta and Australia could also be set up. It is possible that if left purely for commercial exploitation, the route may not at first appear quite remunerative. But if an intelligent assessment of cargoes between particular ports is worked out, the proposal might be feasible.

12. A suggestion which would appear to merit serious consideration in this connection is the establishment of a joint shipping line by countries of the region. Considerable economies in the operation and pooling of resources can be secured thereby. Such a service would open up new channels of intra-regional transport and trade and facilitate a greater utilisation of ships building and repair facilities available within the region.

13. The proposed organisation for the Asian Economic Co-operation is conceived as an executive agency for taking concrete measures and for implementing agreed programmes of action. One of its chief tasks will be to try to give practical shape to and to put into effect the conclusions which are reached as a result of studies by and discussions in different ECAFE organisations. In view of the close links which are envisaged to subsist between the Regional Commission and the Regional Organisation, it is obvious that the headquarters of this Organisation should be located at the same place as the headquarters of ECAFE.

14. It will be essential to clothe the Organisation with the authority to make decisions binding on the participating Governments. Without such authority, the Organisation may not be able to make any significant contribution to the growth of co-operation in the region. Provision may, however, be made to provide for remedies to members who, for good reasons, dissent from the Organisation's decision in any particular respect. It is, however, to be hoped that because the field of work proposed to be covered is so limited, the commitments expected of participating Governments are so small and the objective to be attained is so much in the interest of all that occasions to invoke such a provision will be few and far between.

WORLD TRADE IN TEXTILES

The draft agreement on international trade in cotton textiles, negotiated recently at Geneva, has been interpreted here as providing an opportunity to the Indian textile industry to push up its exports to the United States and Europe. The agreement, which is to be ratified by the nineteen participating countries before October 1, 1962, envisages entering of bilateral arrangements between the member countries on the quantum of trade in textiles between them.

The following are the salient points of the agreement:

(1). Countries continuing to apply import restrictions — especially in Europe — undertake to increase access to their markets for exporting countries in phased stages. In most cases, the actual extent of access would be determined by bilateral negotiations. The increase of access to these markets would correspondingly reduce the pressure on the markets which do not at present apply restrictions and would, to that extent, reduce the need for such markets invoking restrictions on exports to their markets by the exporting countries.

(2) Countries which do not at present restrict exports to their markets--namely, the U.S.A., Canada—would continue unrestricted access to their markets. If, however, any country or countries, by a sudden increase of their exports to these markets, cause or threaten to cause disruption of the domestic industry, the importing country would request restraint on the exports of the exporting countries. The minimum level at which such restraint would be requested would be the average exports during 12 monthe ending 3 months before the request for restraint is made, during the next 12 months period. If restraint is needed for more than 12 months, there would be ordinarily an increase of O to 5 per cent in the permitted exports during the next 12 months period and a further increase of 5 per cent in the third year. Normally at the end of three years the situation of disruption would be considered to have ended as there would have been time for the adjustment of the domestic industry to the new conditions in world trade in cotton textiles. No restraint would be placed on the exports of countries not causing or threatening disruption.

(3). The measures envisaged in the long-term arrangement, enabling application of measures of restraint, are to be resorted to only sparingly and to be limited to the precise products or groups or categories of products causing or threatening to cause disruption.

(4) In applying the long-term arrangement, importing countries will have due regard to the emphasis on orderly expansion of trade in cotton textiles and, while having regard to equity, would give particular consideration to the needs of the less-developed countries possessing the necessary resources such as raw materials and technical skill to have larger opportunities for increasing their exchange earnings from the sale in world markets of products which they can efficiently manufacture.

(5) The GATT Cotton Textile Committee will annually review the working of the arrangement and, at the end of three years, would conduct a major review of the working of the arrangement.

It is expected that a large number of the 19 participating countries would accept the draft long-term arrangement in time for it to enter into force on October 1, 1962. There is provision in the arrangement for the participating countries to meet at lease one week before October 1, 1962, in order to take a decision, depending on the status of acceptances, in regard to the entry into force of the arrangement.

Indian textiles, it is pointed out here, can stand competition in the world market quite well on the basis of quality. They, however, are high-priced as compared to Japanese textiles and may have to be exported at some loss.

India is totally opposed to the proposal of the U.S. Government to levy a duty of 8.5 per cent per pound of the cotton content in imported textiles. The draft agreement, it is explained, provides a remedy to deal with such cases. As a last resort, Article 35 of GATT can be invoked. The levy may jeojpardise the ratification of the agreement if it is imposed earlier.

U.S. AID TEAM CONCLUDES TALKS

The U.S. Aid Team, led by Mr. William S. Gaud, concluded its talks with the Government of India on February 17. The talks lasted five days. In his this mission, Mr. Gaud, the newly appointed Assistant Administrator for the Near East and South Asian Region in the United States Agency for International Development, was primarily interested in familiarizing himself with the U.S. aid operations in the area as also with the progress made on the projects and programmes previously financed by the United States. Mr. Gaud had exploratory talks with Mr. L. K. Jha, the Economic Secretary, Union Ministry of Finance, and Mr. N. N. Wanchoo, Secretary, Department of Iron and Steel, concerning possible aid from the United States for setting up the Bokaro Steel Plant.

He had also discussions with the Union Ministries of Irrigation and Power and Commerce and Industry and the Railway Board on the applications made for loans to make up the remainder of the U.S. commitment of $545 million (approximately Rs. 257 crores) for the first year of the Third Plan.

After his discussions with the Government of India, Mr. Gaud left for Pakistan for similar talks there. His principal adviser, Mr. John A. Ulinski has stayed behind for a period of two weeks to examine the progress made on the projects financed previously with the U.S. aid and also to investigate the new projects which may qualify for assistance from the U.S. Government.

Further talks on U.S. collaboration in the Bokaro Steel Plant are envisaged to be held next month.

PRESS NOTE ISSUED BY THE GOVERNMENT OF INDIA, MINISTRY OF COMMERCE & INDUSTRY DEPARTMENT OF COMPANY LAW ADMINISTRATION, NEW DELHI

It has come to the notice of the Government of India that a Society called the "All India Society of Corporate Accountants & Auditors" has been registered in Calcutta under the Societies Registration Act reportedly for training up students in the profession of accountancy. The Government would like to make it clear that the Institute of Chartered Accountants of India constituted under the Chartered Accountants' Act, 1949 is the only statutory body the Members of which, namely Chartered Accountants, are, along with the Restricted State Auditors, entitled to be appointed as auditors of companies under Section 226 of the Companies Act, 1956. The Society referred to above is not recognised either by the Government of India or by the Institute of Chartered Accountants and its members are not eligible to be appointed as auditors of companies under the Companies Act or to undertake any other audit work required by law to be done only by Chartered Accountants. As this Society has no statutory backing and its members no recognised status in the eye of law, public are hereby informed that engaging any member of this Society for performing any work which is statutorily required to be performed by a Chartered Accountant would result in non-compliance with the relevant provisions of law with the penal consequences thereof.

(INSERTED BY THE INSTITUTE OF CHARTERED ACCOUNTANTS OF INDIA, NEW DELHI)

STEEL IMPORTS FOR RAILWAYS

The requirements of the Indian Railways during the current year are placed at 4.5 lakh tons. Of this, only half the quantity is likely to be available from indigenous sources. The Railway Board, therefore, has arranged to import 30,000 tons of rails from Russia (10,000 tons of these have already arrived), 85,000 tons from Poland, 40,000 tons from Czechoslovakia and 55,000 tons from Yugoslavia.

BIRLA'S NEW VENTURE IN NEPAL

Birlas have signed an agreement with the Nepalese Government for setting up a modern textile mill at Birganj, in South Nepal. The entire capital investment for the mill, estimated at a little over Rs. 2 crores, is to be provided by Birlas. The Board of Directors of the company will have three Nepalese nominated by the Government of Nepal.

The mill will have 400 looms and 15,000 spindles.

THE SWISS CREDIT

Approval has been accorded to import Swiss plant and machinery to be financed from the Swiss credit. The following companies are to benefit from this credit.

The Mettur Chemicals and Industrial Corporation will import 22 Caustic Soda Mercury Cells, valued at 1,395,100 Swiss Francs, and Chlorine Scrubbing and Drying Plant, valued at 204,900 Swiss Francs, from the KREBS. From the same Swiss Firm, Century Rayon Mills of Bombay will import 2,500,000 Swiss Francs worth of Caustic Soda Plant. Another Indian undertaking, Fertilizer and Chemicals Limited of Travancore will import from the KREBS and Company 110 KW Switchgear valued at 497,500 Swiss Francs. The fourth Client of KREBS and Company is National Newsprint and Paper Mills, Limited, which has contracted to import one Chlorine and Caustic Soda Plant valued at 2,493,800 Swiss francs.

The Kanoria Chemicals and Industries Limited has contracted to import through the KREBS one complete Cell Plant and its auxilliary equipment valued at 2,610,000 Swiss francs. The KREBS will also supply the Travancore and Cochin Chemicals, Limited eleven Mercury Cells to manufacture Caustic Soda, valued at 867,650 Swiss Francs and one complete plant for the manufacture of Sodium Sulph with accessories valued at 320,000 Swiss Francs. Lastly the Doaba Co-operative Sugar Mills of Nawanshahr has contracted to import 1,000 KW Turbo set valued at 222,900 Swiss Francs from Brown Boveri and Company.

Moreover, the Hindustan Electricals and Brown Boveri have entered into collaboration. Approval has been accorded to the terms of collaboration under the expansion scheme in which the Swiss firm will meet all the requirements of foreign exchange upto 5.5 million Swiss francs. The expansion programme includes the manufacture of Switchgears, generators, electric furnaces, rectifiers and lighting ancesters. It was agreed to export twenty-five per cent of the production, so created, provided Brown Boveri and Company were satisfied that Indian product came up to their standard and specifications. The Swiss firm, at present holds fifty per cent in the equity capital plus one share of the Indian undertaking. It has been permitted to retain the existing pattern in the equity capital.

THE YUGOSLAV CREDIT

Broad allocations of the Yugoslavian credit of forty million dollars have now been agreed upon. Ten million dollars will be available for the purchase of ships, another ten million dollars for Power projects and the remainder will be utilized by the Ministry of Commerce and Industry and the private sector.

IDA CREDIT

India has asked assistance from the International Development Association, an affiliate of the World Bank, for four irrigation and power projects. They are the Parambikulam project, a joint venture of Madras and Kerala Governments, the Purna project in Maharashtra, the Tawa project in Madhya Pradesh and the Sone project in Bihar. The Parambikulam project, when completed, will irrigate 240,000 acres of land and produce 180,000 kw. of power. The Tawa multipurpose project will provide irrigation facilities for 787,000 acres and generate 42,000 kw of electricity. Purna also is an irrigation-cum-hydro-electric project. While it will irrigate 152,000 acres, it will generate only 15,000 kw. The Sone project will irrigate 307,000 acres in Bihar.

As a result of the discussions, assistance by the World Bank and the International Development Association for the multi-purpose Beas project in the Punjab, the Sone barrage in Bihar and for a detailed survey to assess the power potential in the country is now assured.

NORWEGIAN FISHERIES EXPERT IN INDIA

A Norwegian expert arrived here recently to help draw up the final project report for the Fisheries Operatives Training Institute, proposed to be set up by the Government of India at Cochin. The Institute, for which Norway is expected to supply technical aid, will train a wide range of personnel, including fisheries engineers, boat-building foremen, master-fishermen, gear technicians and refrigeration and processing staff. The draft outline of the project report for the Institute, it is gathered, has already been prepared and it has been approved in principle by the Planning Commission.

MORE COAL WASHERIES

The Government of India has decided to give preferential treatment to the manufacturers of coal washeries. At present there is only one such manufacturer in India and the equipment is obtained on the basis of global tenders. With the setting up of additional capacity in India, the tenders will be restricted to the indigenous manufacturers.

In order to meet the increasing needs of the steel plants for coking coal of good quality, Government of India has planned to create 12.7 million tons of additional capacity for the washing of coking coal under the Third Plan. Part of this washing capacity is being set up by the Hindustan Steel and part by the National Coal Development Corporation. The Hindustan Steel's programme comprises setting up of a Second unit at the existing Dugda Washery with a capacity of 2.4 million tons and by expansion of the Bhojudih washery which is expected to be commissioned shortly, by about 0.8 million tons.

Of the washeries for coking coal being planned by the National Coal Development Corporation, Kathara, with an input capacity of 3 million tons and Karanpura with a capacity of 2.8 million tons are being financed from Russian and Polish credits respectively. These washeries will be commissioned by about the end of 1964. The project reports for two other washeries, namely, one at Chalkari (0.5 million tons), which will be an extension of the present Kargali Washery and the other at Swang (1 million tons) are expected to be ready by March and June, 1962, respectively.

While the washeries at Kathara and Karanpura are tied with foreign credits, those at Swang and Chalkari offer scope to indigenous manufacturers. Subject to price and delivery being reasonable, the indigenous manufacturers will be given preference over foreign suppliers. The expansion of the Dugda washery offers similar scope to the indigenous manufacturers.

The National Coal Development Corporation propose to set up two more washeries with input capacities of 1.5 million tons and 2.2 million tons respectively at Ramgarh and Sudamdih. Although the mines in respect of these are being planned respectively with American and Polish technical assistance—the manufacture and installation of washeries for these projects will be by indigenous manufacturers, subject to price, delivery, etc., being found reasonable. A few more coking coal washeries may be set up by the Corporation and the private sector steel plants. These will also be within the scope of supply of indigenous manufacturers, who will have preference over foreign suppliers depending upon the ...ory price and delivery term.

RECORD EXPORTS IN 1961

India's export earnings in 1961 were of the order of Rs. 668 crores, the highest ever except during 1951-52 when the value of exports was slightly higher on account of the Korean War boom. Compared with 1960, export earnings last year were higher by as much as Rs. 34 crores. The 1961 export performance approximates the Plan estimate of Rs. 667 crores worth of exports in the 1961-62 financial year.

Official circles, although still anxious to step up exports in view of the country's none-too-happy foreign exchange position, have expressed much satisfaction over the last year's performance due to the fact that record earnings have been achieved despite a fall in the world prices of some of our traditional exports, like tea, manganese ore, undressed hides and skins, spices, oilcakes and tobacco. Despite a fall in average prices, the earnings on account of exports of tea, tobacco and coffee increased substantially last year. The shortfall in respect of some other items was made up by the increased export earnings from jute manufactures, sugar and art silk and fabrics.

Foreign exchange to the tune of Rs. 16 crores was earned through exports of iron and steel, metal manufactures, machinery and transport equipment during the 11 months to November, 1961, as against Rs. 11 crores during the corresponding period in 1960.

INDIA'S TRADE WITH U.K.

India's unfavourable trade balance with the United Kingdom increased from £2,019,000 in 1960 to £6,865,000 in 1961. Total exports from India to Britain during this year amounted to £144,929,000, while imports from these amounted to £151,794,000. The corresponding figures for 1960 were £148,464,000 and £150,483,000.

Major declines in exports were in tea, leather and leather goods, cotton yarn and woven fabrics and miscellaneous textile manufactures. The exports of the last two items fell by as much as £2,758,000, from £26,241,000 in 1960 to £23,473,000 in 1961. Tea exports declined by £1,101,000 from £63,518,000 in 1960 to £62,417,000 in 1961.

Notwithstanding the fact that imports from Britain of almost every major article were lower in 1961 than in the previous year, total imports were up by £1,311,000 over the 1960 level. Imports of machinery other than electrical machinery, apparatus and amounted to £42,568,000 as against £43,550,000 in the previous year. Imports of electrical machinery, apparatus and appliances were of the order of £13,546,000 as against £14,809,000 in 1960. Imports of road vehicle and aircrafts suffered a sharp decline from £22,381,000 to £14,658,000.

INDO - RUMANIAN TRADE

The existing trade agreement between India and Rumania has been extended upto December 31, 1962, as a result of the signing of a new protocol.

The commodities available for import from Rumania continue to be machine tools, oil prospecting and drilling equipment, power transformers, electric motors (permissible types), water and electric meters, diesel generating sets, refrigerating compressors, petroleum products, petroleum coke, carbon black, caustic soda, dyes and intermediates, bleached wood pulp, other chemicals and pharmaceuticals, printing paper etc.

The commodities that can be exported from India to Rumania are rolled steel products, jute manufactures, coir products, cotton textiles, woollen products, asbestos textiles, hides and skins (tanned and semi-tanned), tanning materials, fountain pens, plastic goods (including spectacle frames), animal casings, dry salted fish and tinned fish, sport goods, paper and pulp-making machinery and equipment etc., besides the traditional goods like tea, coffee, pepper and spices, shellac, essential oils, iron ore, ferro-manganese, mica, cashew kernels seasum seeds etc.

The volume of trade between India and Rumania during 1961 is estimated to have been slightly over Rs. 6 crores both ways. During the current year, the trade between the two countries is expected to develop further.

INDO - YUGOSLAV TRADE

As a result of the talks held between a trade delegation from the Federal Peoples' Republic of Yugoslavia and the officials of the Government of India, trade between the two countries is envisaged to be stepped up to a higher level than approximately Rs. 13 crores achieved in 1961. A fresh schedule of goods available for export and import between the two countries for the current year has been arrived at.

The commodities that can be imported into India from Yugoslavia during the current year are machine tools, cranes, marine and diesel engines, rails and railway equipment, textile machinery, telephone and railway signalling cables, metals and metal products, refractories, mineral lubricating oil, explosives and accessories, bleached wood pulp and printing paper.

Exports from India to Yugoslavia will be rolled steel products, machine tools, textile machinery and accessories, railway materials, cotton and woollen fabrics, leather footwear, tinned fruits and juices, coir products, wood screws, diesel engines, precision and scientific instruments, industrial pumps, air compressors, zip fasteners, vacuum bottles, bicycle parts, spectacle frames, fountain pens, cosmetics and toiletries, rubber goods, plastic goods, asbestos manufactures, coke-oven bye-products, plywood and veneers, jute manufactures, linoleum, sports goods, handicrafts, chemicals, drugs and medicines, tanned and semi-tanned hides and skins etc., apart from such traditional goods such as tea, coffee, spices, tobacco, cashew kernels, essential and vegetable oils, mica, shellac, iron ore, mining products etc.

ANKLESHWAR CRUDE FOR BOMBAY REFINERIES

Bulk supply of Ankleshwar crude to the Burmah-Shell and the Standard Vacuum Refineries in Bombay started last week when the first bulk consignment of 600 tons of crude from the Ankleshwar oilfields was despatched to the two refineries. The supply is envisaged to be gradually increased to 1,500 tons a day by the end of the current year. This will lead to a daily saving of well over Rs. one lakh in foreign exchange for the country.

So far 31 wells have been drilled in the Ankleshwar oilfield. Of these, 16 have turned out to be producers of good quality petroleum; 2 have proved dry and 4 are under test. The Ankleshwar crude has a high API gravity and is superior to the crude at present imported by the Burmah-Shell and the Standard Vacuum Oil companies from abroad. The two refineries have agreed to pay a premium for this crude over the landed cost of the imported crude.

BRIEFS

Due to inadequacy of foreign exchange, the Government of India has advised the Automobile Industry to lay greater emphasis on the manufacture of Commercial Vehicles, for which provision is being made during the next licensing period. The original allocation for the Third Plan period for the Automobile industry was Rs. 35 crores. The production of cars was to be stepped up from 20,000 to 30,000 a year by 1966. A re-assessment of the foreign exchange requirements of this industry is now placed at Rs. 70 crores.

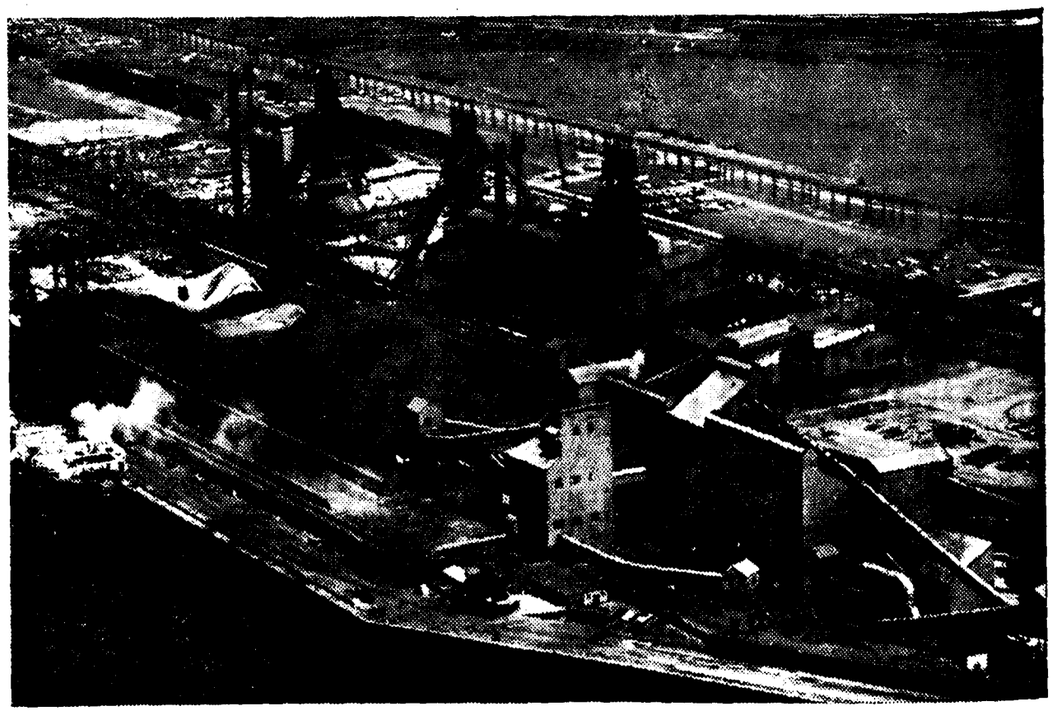
•

There was little chance of India getting cotton from the U.S.A. under PL 480 in 1962. This was revealed here last week by Mr George McGovern, the Director of the U.S. "Food for Peace" programme.

•

The six monthly meetings of the Import and Export Advisory Councils will be held here on March 5 and 6. The Minister for Commerce and Industry, Mr. K. C. Reddy, will preside. As was agreed in September last, the two Councils will hold a joint session.

UNDER SECRETARY TO ... 27 FEB 1962 PUBLIC DEPARTMENT



THE DAY BREAKS
BRIGHTER TOMORROW

PLAY BECOMES HAPPY SERVICE.
Today's service. Today's effort. Continuous, successive.
Work-laden, face shining with a smile.
Tomorrow...a little less of care, a little more of joy.
And for HINDUSTAN LEVER, too, tomorrow begins today.
In the research laboratory, in the factory and office.
Work, patience, care
to serve tomorrow's homes and the nation's needs
with products that grow better and better.

TODAY AND TOMORROW...HINDUSTAN LEVER SERVES THE HOME
WITH SOAPS, FOODS, TOILET PREPARATIONS

Specialized ENGINEERING AND CONSTRUCTION FOR THE IRON AND STEEL INDUSTRY

For more than half a century McKee engineers have specialized in the design, engineering and construction of steel-producing facilities. Our comprehensive mine-to-metal services include every phase of the work necessary for any steel-plant project, from preliminary studies to completed plant ready for initial operation.

The McKee Organization has executed contracts in 49 countries including India. Among these are some of the world's largest and most modern completely integrated steel plants and hundreds of individual units, including blast furnaces, open hearth shops, rolling mills, agglomerating, sintering and pelletizing plants. Most recent examples of large-scale integrated plants are the new Somisa plant at San Nicolas, Argentina and the C.S.N. plant at Volta Redonda, Brazil.

To the steel industry of India the McKee Metals Division offers the services of its large, well-qualified staff with a fund of sound, practical experience and specialized knowledge that is unmatched anywhere in the industry.

Comprehensive engineering-contracting services, similar to those of the McKee Metals Division, are supplied by these specialized divisions of the McKee Organization:

PETROLEUM & CHEMICAL DIVISION
Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and certain types of chemicals and chemical products.

WESTERN KNAPP ENGINEERING
Plants and facilities for production of Non-ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals.

COMPANY AFFAIRS

STATE BANK OF INDIA

The State Bank of India's Peddar Road Branch in Bombay was inaugurated on February 12 by Mr. P. C. Bhattacharyya, the Chairman of the Bank. He said that from its inception, the Bank had adopted the policy of taking the Bank nearer to the people and making them bank-minded. It was in pursuance of this policy that the Bank had opened over 400 new branches in the rural and semi-urban areas of the country in a period of 5 years from its inception. Many of these places did not have a bank at all before the State Bank of India went in. So far as big cities like Bombay were concerned, many suburban branches were opened. Apart from bringing the Bank nearer to the homes of the people and thus making it possible for a larger section of the people to utilise the services of the Bank, it would result in a definite improvement to the Customer Service. It would save the customer's time, energy and trouble. An incidental benefit would be that the congestion and pressure on the older branches in the City would be reduced and this should improve our service at all these branches also.

NEW ISSUES

Six companies have been authorised by the Controller of Capital issues to issue equity shares totalling Rs. 4.71 crores. Of these, one is a Central Government undertaking. The consent given to five of the companies is valid for 12 months. The consent for the sixth is valid only up to June 30, 1962.

National Mineral Development Corporation Ltd., Delhi, a Central Government undertaking, has been accorded consent to issue a further equity capital of Rs. 290 lakhs for cash at par. The proceeds will be utilised for mining operations of iron, copper and diamonds at various centres in the country. The Corporation has a paid-up capital of Rs. 263.03 lakhs.

Ralliwolf Limited, Bombay, is to issue capital of Rs. 10 lakhs divided into 10,000 equity shares of Rs. 100 each at par to be subscribed privately. Of this, shares of the value of Rs. 3 lakhs will be issued to Wolf Electric Tools (Holdings) Limited of U.K. against supply of plant, machinery, jigs and fixtures. Ralliwolf has a subscribed and paid-up capital of Rs. 19,36,400 all in equity.

Republic Forge Company Ltd., Hyderabad, is issuing a fresh capital of Rs. 120 lakhs for cash at par, divided into 1,00,000 equity shares of Rs. 100 each and 20,000 9.3 per cent (subject to tax) preference shares of Rs. 100 each. The proceeds will be utilized for setting up a commercial forge shop. The consent for this issue is valid up to June 30, 1962.

Nanubhai Industries Private Ltd., Bombay, will issue a further capital of Rs. 19.12 lakhs in equity shares of Rs. 1,000 each for cash at par. The proceeds will be used in connection with nylon yarn project of the company. This company has a paid-up capital of Rs. 130.88 lakhs.

Coates of India Private Ltd., Calcutta, is to issue privately 28,153 equity shares of Rs. 10 each, at a premium of Rs. 65 per share. The proceeds will be utilised for financing substantial expansion in the manufacture of printing inks and surface coating materials etc.

Amalgamated Electricity Company Ltd., Bombay, is raising a further capital of Rs. 28.63 lakhs in equity shares of Rs. 10 each for cash at par. The proceeds will be utilised for the installation of generating sets and the establishment of a solvent extraction plant. This company has a paid-up capital of Rs. 125.75 lakhs.

SHREE SITARAM SUGAR

During the year to August 31, 1961, Shree Sitaram Sugar Company Limited made a gross profit of Rs. 6.29 lakhs which was slightly lower than the previous year's balance of Rs. 7.48 lakhs. After providing for interest (Rs. 4.60 lakhs) depreciation (Rs. 1.28 lakhs) and other expenses, there is a net profit of Rs. 3.34 lakhs. Rs. 2.05 lakhs have been set aside for taxation. The directors have proposed the payment of dividend at the rate of 75 nP. per share which will absorb Rs. 1.19 lakhs.

During the season 1960-61 under review, the factory achieved a record crush of total quantity of 42.52 lakh mds. of cane with an overall recovery of 9.25% as against cane crush of 34.42 lakh Mds. and recovery of 9.46% during the season 1959-60.

The increase in crush is as direct result of the development activities of the factory towards bringing in more area under cane, and improvement of varietal position resulting in better yield. The lower recovery during the season under report is mainly due to the early start of crushing.

In view of the record sugar production throughout the country and heavy carry over of stocks with the factories, the Government of India have under an Ordinance restricted the production of sugar during 1961-62 and the factory's quota has been fixed at 13,205 M|Tons for the current season.

THE EASTERN ECONOMIST

MARCH 2, 1962.

The New Political Spectrum: Right Wheel?

THE sovereign people have spoken; it seems clear from the results already available that they are determined to exercise their sovereignty in their own independent way. Delhi itself has been so overwhelmed by the complete victory of the Congress Party in five Lok Sabha seats as well as in the Corporation that it does not seem to have taken note of the major vote of censure that has been inflicted on the Congress Party almost throughout the country. Similarly, for the outside world, whose attention was improperly riveted on North Bombay, the overwhelming vote of confidence that Mr. V. K. Krishna Menon has received might again lead it to believe that the Prime Minister and the Defence Minister have received a new and abiding vote of confidence. Anyone who reads the election results in this simple way will be doing great violence to the facts. The essence of the major results of this election has been a severe rebuke to the Congress Party in the States, with only two or three exceptions. The Chief Minister of Madhya Pradesh has been unseated; a number of Ministers in the States have fallen, the total number of such Ministers being no less than 34. The Congress Party has failed to get a majority in Madhya Pradesh and Rajasthan; in the Punjab the loss of thirty seats and the Chief Minister's victory by 34 votes in one of the most dubious elections in the country, must make one feel that the majority of thirteen seats there means very little in itself. In the South, the D.M.K. has inflicted a terrible blow even upon the placid ascendancy of Mr. Kamaraj Nadar. For the present the emphasis is so much on Congress discomfiture that the larger meaning of all these reverses has not been seen.

A little reflection will, however, show that this election means nothing more or less than that Congress of Socialism has not been fastened on the country. There is no vote for socialism in the results of this election. The hard core of the Congress which is its legend and its magnificent organisation has delivered, with the Prime Minister's personal popularity, undoubtedly a factor in this legend. But it is the legend and the organisation—not the ideology—that seems to have won.

On the other hand, the Swatantra Party, with just two years of electioneering, has already become a major contender for power, being the chief Opposition party in Bihar and Rajasthan and a major force to reckon with in Gujarat. In fact today the Swatantra Party with 164 seats in the State Assemblies is the largest Opposition Party in the country. When to its regular seats are added the Ganatantra Parishad Lok Sabha victories and three Akalis, who are really Swatantra men in origin, the showing in the Lok Sabha would also be large enough to carry conviction that the country has moved substantially to the Right. If this is a vote of confidence in the Congress Party, it can only be one of warning that, while the Congress is still to be in power, its policies will need to be trimmed to other prevailing winds. The Swatantra Party is one of the waves of India's future.

It is not merely a move to the Right in an economic sense that is indicated in the pattern of the new Opposition. The rise of the Jan Sangh, decried as a 'communal' party by the Prime Minister among others, is as spectacular as that of the Swatantra Party. It is the Jan Sangh which has made itself the leading Opposition in Madhya Pradesh as well as in Uttar Pradesh. It is the Jan Sangh again that promises, because of its militant and disciplined character, a far greater Opposition to the Congress in the years to come. One might, or might not, like this particular expression of opinion of the Hindi electorate, but it is undoubtedly, a force of great importance which needs quickly to be evaluated. *The Eastern Economist's* guess is that the successes achieved will bring it soon much more respectability and not a little monetary support.

If this argument is correct, it implies that, while the Congress has been voted back to power in practically every State of the Indian Union, it is visibly on the decline so far as its appeal to the Indian electorate is concerned. There are personal currents to endorse this view. The Prime Minister's own majority over Dr. Ram Manohar Lohia was much lower than expected, and the majorities of most Chief Ministers—except that of Dr. B. C. Roy, who has had a resounding triumph in the difficult constituency of Chowringhee—do not carry intense conviction that the electorate is wholly satisfied even with the leading personalities. The vigorous rebuke given to Dr. Katju, who had been imposed on that State for no better reason than that the Prime Minister seems to have blind confidence in him, is a warning which should not pass unheeded. There will now be much greater pressure on the Congress Party to provide leadership of much more dynamic kind. Quite apart from the question of new blood in leadership, there is the problem of making concessions to the basic currents in the Hindu way of thinking or in the individualist way of life. The Jan Sangh and the Swatantra Party have won so much largely because they appeal to something deep in the emotions of the Indian people. If the Congress Party does not heed these signs, there will be worse to come in 1967.

At the present time the outlook in Delhi can be described as uncertain. In the first place, it is believed that the Prime Minister, particularly with his lieutenants, Mr. T. T. Krishnamachari and Mr. V. K. Krishna Menon, might wish to demonstrate socialism in their time by a dramatic further movement to the Left. If this should happen—though it would be, in fact, a defiance of the electorate's mandate—it will only lead to the eventual strengthening of the Rightist currents which have already shown that the country is by no means wedded to a rapid movement to the Left. This is perhaps a sense of rebellion in a 'have-not' society—particularly in the towns, because of the high cost of living in the lower income brackets—and because of vast rural unemployment in the villages. This is one of the great paradoxes of Indian life. Poverty, desperate and in some respects unforgiveable, is not yet a revolutionary force. Quite the contrary; it is now expressing itself in terms of a policy of containment of Leftist revolutionary elements.

The Eastern Economist believes that, should the Prime Minister proceed Left, and somewhat recklessly embark on public sector experiments which prove costly or wasteful, he will hasten the decline of the Congress, which is written into the figures already

released. It does not believe that so astute a politician as Jawaharlal Nehru will make this error. But should it be accomplished by his lieutenants in the mistaken belief that they have all power vested in them by the majority they enjoy, particularly in the Centre, the damage that can be done to the country as a whole may look great in the short period, but it might be an actual advantage to the Right Centre parties which will eventually obtain control of the political machine. There is, therefore, no need for much long-term concern at things as they are. The Indian electorate has done what it has always done, which is to choose the only government that is possible, but to surround it, as if by a policy of containment, with both Right and Left wing elements of growing strength.

In 1952 the warning came from the Left. In 1962 it has come from the Right. By and large, the Indian people want a Centre party which will maintain stability, foster economic progress, maintain confidence and, in the last analysis, make the opportunities for a reasonable standard of living, but associated always with reasonable freedom and the individual life. It will be five years before the electorate speaks decisively again. The Congress Party is now in no position of indefinite choice. It can prolong its life for a short period by a wise concession to the electorate. It can hasten its own downfall by the worship of dogma and the refusal to recognise the warnings that it has clearly received.

Co-operation in Outer Space

THE proposal for co-operative effort in the exploration of outer space may superficially convey an unfamiliar ring, coming as it does, this time, from Mr. Khruschev. But it is positively encouraging and intended to raise high expectations. Apparently a new desire for collaboration inspires the suggestion. For Mr Khruschev seeks to amplify his object in resounding words. The proposed collaboration is to be directed to peaceful uses of outer space by pooling the scientific, technical and material resources of the two countries which have made demonstrable progress in unfolding the mystery of space. Mr. Kennedy responded to it promptly—within a matter of hardly twelve hours—with the sincere desire that the representatives of the two Governments should meet early to discuss the issues frankly in a genuine spirit of co-operation. The Kennedy Administration has lost no time in moving its expert machinery to draw definite schemes for space co-operation. This mood shows neither impatience nor any amateurish zeal. It has been an article of faith with the United States long since to seek to enlist international—not merely bilateral—co-operation in space exploration. The offer was made as far back as 1958 by Mr. Eisenhower and it extended not only to exploration of outer space but to experiments for a probe into mars and venus. It was renewed by Mr. Kennedy in his first State of the Union Message of January 1961.

The sequence in which events moved quickly helps to explain the move for collaboration which Mr. Khruschev has made for the first time in happy contrast with his previous lack of response. Col. Glenn's triple orbit round the earth on February 20 proclaimed to the world the effective sharing of the knowledge and experience of space science and technology by the United States with Russia. It gave redoubled content to the acknowledged theory that access to the secrets of science recognises no national frontiers. The one spectacular aspect of the American experiment was that it was conducted openly, which in itself was a practical demonstration of the readiness to break the veil of secrecy. The confidence that Col. Glenn has created is responsible for America's advance announcement that 18 orbits round the earth would be performed in December this year or at any rate in January next year. It may be that by that time Russia may improve upon Maj. Titov's 17 orbits. If so, it would be a healthy pursuit in the cause of the advancement of the conquest of outer space. Mr. Khruschev's proposal for collaboration followed the next day on February 21 as part of his message of congratulation on Col. Glenn's achievement. But his proposal limits the participation in collaboration to the United States and Russia, ostensibly because of their proved capacity to undertake space exploration.

The idea of enlisting co-operation in outer space has now definitely caught on. The United States has announced its decision to convene an international conference at Seattle from May 8 to 10 this year to discuss at a high expert level the problems giving rise to the utilisation of outer space for peaceful objectives. What now appears a vague goal will be given a definite shape at Seattle. And the United Nations committee on the peaceful uses of outer space is to hold its first session on March 19 next, promising at long last to end an empty period of inactivity. Russia has hitherto chosen to stay aloof, but her new mood of participation could well be channelled towards this forum too, since she commands authority to give a joint lead to the committee in its mission. What these two conferences, rather the conference to be held at Seattle, would succeed in doing is to make a positive contribution to the theoretical background for space exploration. Mr. Kennedy has suggested for it a definite agenda comprising weather satellites, communication satellites and research relating to mars and venus. But undoubtedly it is reserved for the bipartite collaboration between the United States and Russia, during the foreseeable future, at least, to give a massive form to more intensive activity for exploration. They possess both the knowledge and the experience in this mysterious sphere.

Easily the greatest gains from Russo-American collaboration would be elimination of duplication of exacting effort and avoidance of enormous outlay on individual ventures. While these benefits argue forcefully for co-operation, joint enterprises in exploration will be feasible only on the basis of concrete propositions about the specific programmes to be taken in hand. They could be implemented on the basis of a bilateral agreement, to be reviewed and improved upon from time to time in the context of the progress and advances that may prove the value of collaboration. Agreement on the principle of co-operation would go a long way to foster concrete effort, but a definition of the rights, obligations and functions of the parties would be vital to the success of collaboration. The complex problems it would raise cannot be underrated, for instance, the presence of observers of one party at the enterprises to be launched by the other. Complete and unqualified disclosure of technical data collected and communication of the results of their analyses present another set of significant problems. These and similar issues will crop up and they will demand unequivocal concurrence. Presumably, the object of the exchange of ideas about collaboration on which Mr. Kennedy has laid forthright emphasis is to thrash out problems such as these.

Both the sides are too seasoned in diplomacy to allow their enthusiasm for collaboration to outrun the limits of its feasibility. It is apparent that a line of demarcation will need to be drawn in the bilateral agreement between the peaceful uses of space research and its military potential, notwithstanding the protestations made by Mr. Khruschev about eschewing its exploitation for the cold war. At the present time the potentiality of space satellites for reconnaissance and relaying by radio the information gathered is beyond question. But installation of military bases, space fortresses or use of satellite bombers, at a later stage, need not be ruled out. These issues of the military uses of space technology could be tackled at an appropriate stage. They merge into the larger problem of disarmament. But the new temper of collaboration must be conserved and directed initially towards exploration of outer space for peaceful purposes.

Guest Editorial

The Problem of the Pause

By PAUL BAREAU, Editor, The Statist

"PAUSE" is becoming a very typical word in British economic parlance. It applies to the Government's income policy and defines the first phase of that policy which is due to end on March 31. By wider application, it also applies to the whole behaviour of the British economy over the past two years. Figures have just been published of the Index of Industrial Production for the final month of 1961. They show that over the year there was a net setback of 2 points and that over the two years 1960 and 1961 the level of industrial output in this country has, on balance, hardly changed. This may be stagnation at a high level and in the context of a still decidedly affluent society; but it is stagnation, nonetheless and it strikes a somewhat ominous note when regard is paid to the rate at which economies on the Continent of Europe have been expanding while we in Britain have been virtually standing still. The pay pause is thus being criticised because it is regarded as part of that body of restrictive economic measures which must be held responsible for the disappointing behaviour of the British economy. This is too harsh a view to take of the Government's attempts for an incomes policy.

Over the two years that preceded the emergency measures taken last July, wages in Britain had increased by between 6 and 7 per cent a year while output per head had risen on an average by between 2 and 2½ per cent. In the disparity between these figures lies the main explanation of the balance of payments deficit and the push towards inflation from which the measures applied last July were intended to save us. In those measures the wages pause held a logical and, indeed, essential place. The pause has been far more successful than the prevailing criticism of it would suggest. It has held back the rise in wages and has prepared the ground for a period of restraint in the growth of money incomes. It has done so at a period when wages, costs and prices have been rising fairly fast on the Continent of Europe. This helps to explain the optimism with which the Government views export prospects for 1962 and awaits the competitive tests that will come when Britain enters the Common Market.

The time has now come to end this first phase of the pause and to replace it by a long-term policy or understanding about incomes. It is to this objective that the setting up of a National Economic Development Council was decided. This Council has now been appointed and a small permanent staff enlisted. From the start it was decided that the trade unions should collaborate in its work. After considerable hesitation the T.U.C. have now appointed their representatives and all is ready for the first session of a body which has inevitably and familiarly become known as "Neddy". A great deal is expected from it.

The main danger that has to be guarded against lies in over-expectation. No long-term planning and no logical incomes policy can be effective unless an appropriate, sound economic policy is pursued. The White Paper on Incomes Policy gives too little attention to this fundamental aspect of Britain's economic problem. It sets out very eloquently and convincingly the dangers of "push-cost" inflation. This has in the past been induced by the practice of increasing wages either by adjusting them to the cost of living or by fixing them in relation to earnings prevailing in comparable industries, or by "leap-frogging".

The Chancellor of the Exchequer then proceeds to argue that since wages and salaries are a large proportion of total incomes and since increases in pay do not in general come out of profits, it follows that "a substantial pay increase obtained by one set of workers must ultimately be paid for by their fellow workers." This is not so. If the prevailing economic conditions are of an inflationary character and if the level of demand is, therefore, excessive, the result will be that all wages will tend to go up together and that profits will also rise because producers will be able to pass on their higher costs in the form of higher prices to the consumers. These increased earnings, whether wages, salaries or profits, will be received in the form of depreciated currency.

An incomes policy and an appeal for restraint in wage demands will, therefore, work only if the appropriate economic policy is followed. Although that is basic dogma and can only be disregarded at the peril of the Government's whole income policy, the fact remains that new ground is being broken in trying to wed economic policy to a conscious and direct attempt to control wages and other forms of income. The Government need have no fears that the incomes derived from profits will get out of control. Recent indications from the large number of companies which have declared their profits and dividends for 1961 show that in this slice of incomes there has been not only a pause but a very substantial retrogression. The restraint of trade unions in pressing for higher wages, the absence of serious official strikes and, therefore, the relative success of the pay pause, can be attributed to the change in the economic climate for which the measures of last July can be given some responsibility. Profit margins have fallen. The wherewithal to pay higher wages is not there. Most trade union leaders are sufficiently intelligent to understand these particular facts of economic life. Their understanding will become greater as "Neddy" gets into its stride.

The success of the pay pause so far and the launching of this new experiment in planning and income policy may well be a turning point in the economic history of Britain.

A DELHI DIARY

FUN AT THE FAIR

HAVE general elections their funny side? It seems pretty terrible that when politicians, or those not so described who enter the political arena, fall from their pedestals every one laughs with unholy joy. I have not seen this week much charity dispensed to those who have fallen in the fray. In particular, Dr. B. V. Keskar, Minister of Information and Broadcasting, who has presided over the destiny of the Information Ministry, and, as a consequence, of the Press, has received very little sympathy. It seems a hard thing to have to exercise all the responsibilities of power and then to see them depart from one's hands with the immediate loss of the halo which surrounds seats of power. A very distinguished administrator once put it to me cynically when he said, "When you leave office, your friends leave you." I have seen literally dozens of instances of persons roaring with laughter at the discomfiture attendant on political assassination which the electorate has committed ruthlessly this week.

In no particular case that I remember has feeling run so high as against the Chief Minister of Punjab whose escape from political death has been the narrowest possible, if one excepts the case of the tossing of the coin in one crazy case in Maharashtra or the Jan Sangh candidate in Uttar Pradesh who won by one vote. Somehow there is the impression that a victory by 34 votes for a Chief Minister is somewhat undignified. My naughty cartoonist has been unable to restrain his particular delight and has actually allowed himself to commit what I think is a great injustice. But what can I do except to produce him publicly and show his unworthy effort?

What a Life!

A close shave, you say ?

Courtesy "The Hindustan Times"

Far away in North Bombay, I see that I have been proved wrong by not less than 145,000 votes, all of which shows the dangers of prophesy. Whereas the Indian Institute of Public Opinion seems to have been remarkably right in the Punjab and Rajasthan as well as on the total votes and the number of seats in the Lok Sabha—which follow not at all from the popular vote percentages!—I must admit that my feminine institution misled me into believing that Mr. Kripalani might win the election. I confess my sin in public and must now, greatly humbled, congratulate Mr. Menon for having achieved the impossible. Only I am hoping that next time he will be able to do it without Communist support. In the event this seems to have been unnecessary.

But before I depart let me congratulate Dr. Ram Manohar Lohia and submit for your consideration the somewhat different predicaments of the two most courageous members of the Opposition that have contested this election. It is on men like Lohia and Kripalani, fighting great uphill fights, that the spirit of democracy ultimately rests. The courage to take a defeat, knowing that it is likely, is a different kind of courage from those who rush in where the angels fear to tread!

What a Life!

Courtesy "The Hindustan Times"

THE PRESS ROOM

Before I leave elections, I cannot refrain from paying an ungrudging and even enthusiastic tribute to the Ministry of Information and Broadcasting. It has lost its Minister, but has, in the process, acquired a new image of efficiency the like of which I have not previously seen. I refer to the Press Room organised for Election News and the wonderfully organised distribution of material coming through on many tickers and then dispersed cheerfully to hundreds of greedy journalists. The public relations impact of the Press Information Bureau has reached a level so high that (alas!) it can now only recede.

THE LONDON PHILHARMONIC ORCHESTRA

I leave politics (with some considerable pleasure) to say an all too brief and inadequate word on the London Philharmonic Orchestra which performed to an enthusiastic audience at Vigyan Bhavan on Thursday night. Comparisons are always odious, but being an odious person, I insist on making them. I remember well the visit of the Vienna Philharmonic Concert, under Herbert von Karijan, nearly two years ago and in my mind the contrast with the London Philharmonic was as interesting as you can make it. The music was beautiful in both cases, but the programme of the Vienna Philharmonic was, it seemed to me, much more vivacious than that of the London Philharmonic Orchestra. In much the same way, the two brilliant Conductors are almost poles apart. Karijan, perhaps being a Continental, could throw his whole physical system and his flaming hair into conducting; Sir Malcolm Sargent is the polished English gentleman, correct, dignified and a little distant from the audience. He has, however, equally endeared himself to the musical circles in Delhi. And, people keep on asking me, how do great musical conductors keep themselves so young and handsome? Sir Malcolm Sargent at 67 must, it seems, be the fittest man of his age; his figure is as attractive as his charm. But did the music chosen do full justice to his tremendous range? I think not; but how could the London Philharmonic, with a British Council sponsorship, avoid giving so much of its programme to a British composer?

ARGUS

THE WEEK'S NOTES

Rhodesia

THE UNWANTED FEDERATION

MR. DUNCAN SANDYS' fifteen-day mission in the Federation of Rhodesia and Nyasaland has served to underscore the radical differences between the leaders of the three territories on the constitutional issue. It is clear beyond any possibility of pretence that there is no common ground and no hope of a compromise between Sir Roy Wellensky, Dr. Banda and Mr. Kaunda. Dr. Banda who has emerged to power in Nyasaland and Mr. Kaunda who is rising fast in Northern Rhodesia are determined to put an end to the make-believe of the "federal" constitution for the three territories, howsoever adamant Sir Roy Wellen ky may show himself to be in maintaining the status quo.

Since the federal constitution was brought into force in its entirety on October 23, 1953, the supermacy which Southern Rhodesia enjoyed in the set-up was an open secret. In terms of the constitution, the protectorate status of Northern Rhodesia and Nyasaland was retained unaltered. How truly representative the Federal Assembly is of the inhabitants of the three units is clear from the composition of its membership even after its size was enlarged in July 1957. Out of the total strength of 59 members, 44 (including 24 from Southern Rhodesia) are elected from "any race", meaning, in practice, overwhelmingly the European settlers, only 8 are exclusively elected Africans, 3 are European members "charged with special responsibility for African interests" and the remaining 4 are Africans specially elected in equal ratios from the protectorates of Northern Rhodesia and Nyasaland. Southern Rhodesia has a weightage of about 50 per cent in the membership. The elections are based on a restricted franchise.

The day of reckoning is approaching fast since a review of the constitution and a decision on its future must be made by a conference of the delegations of the three federal units and the British Government to be convened not later than October 23, 1962. While the ostensible object of the federal constitution is to forge a multi-racial society, it is as far off as ever before. Vesting the substance of power in the settlers and withholding it from the nationals is by no stretch of imagination a means to achieve it. Nyasaland and Northern Rhodesia are insisting on a genuine independent status which is incompatible with the existing federal constitution. By a combination of intransigence and astonishing support drawn from certain powerful quarters in Britain, Sir Roy Wellensky has succeeded in maintaining his inflexible opposition to a change. It is high time the British Government made up its mind to call his bluff and radically alter the federal structure which cannot be foisted any longer on Northern Rhodesia and Nyasaland. The situation threatens to become more explosive with signs of procrastination. The present indications are that the British Government is most unlikely to show vacillation at least in so far as Sir Roy's resistance to constitutional progress is concerned.

Government Servants

RIGHT TO STRIKE OR DEMONSTRATE

A RECENT decision of the Supreme Court on the right of government servants to stage demonstrations or to resort to strikes in matters pertaining to the conditions of their service is of more than usual interest in so far as it relates to the right to strike. On the right to strike the Supreme Court has made a pronouncement which may prove to be of decisive influence on the controversy raised on this issue.

A rule framed by the Bihar Government in August 1957 under the Bihar Government Servants' Conduct Rules, 1956, prohibited government servants from participating in demonstrations of any sort or to resort to strike. The rule was challenged on the ground that it offended against the fundamental right to freedom guaranteed by Article 19(1) of the Constitution in regard to freedom of three types—(a) of speech and expression (b) to assemble peacefully and without arms and (c) to form associations or unions. The Patna High Court dismissed the writ petition to restrain the State Government from putting it into effect. The High Court's reasons for dismissal were that the Article in question did not confer the right to strike or the right to demonstrate so far as the government servants were concerned and it further recorded its finding that the rule was in the nature of a reasonable restraint on those freedoms.

The finding of the Patna High Court on the right to demonstrate was reversed by the Supreme Court on the strength of Article 33 of the Constitution under which alone this right to freedom could be restricted or abrogated. There it is specifically laid down that the restriction contemplated could be placed only on the members of the armed forces or the police force which is charged with the maintenance of public order. It had no application to the other categories of government servants. The State Government's contention on this point was based on the reasoning that demonstrations would disturb the public order and as such they would not be covered by Article 19(1)(b). In rejecting this contention the Supreme Court ruled that demonstrations could be peaceful and the impugned rule put a blanket ban on demonstrations of any variety wha soever. The constitutionality of the rule could have been upheld if it had set out specifically the prohibited types of demonstrations which were likely to lead to a disturbance of public tranquility. The Supreme Court's ruling, in effect, retains the right to peaceful demonstrations.

The question of Article 19(1)(c) conferring the right to strike was raised in the Supreme Court in an earlier appeal against the decision of the Bombay High Court filed by the All-India Bank Employees' Association against the ruling of the National Industrial Tribunal (Bank Disputes, Bombay). In that appeal the Supreme Court held that no right to strike was guaranteed by the Article cited. This ruling was re-affirmed in the Bihar case. The judicial interpretation, therefore, lays down that the right to resort to strike is not necessarily implied in the right to form associations or unions. In the wake of the Central Government employees' general strike the question of the right of these employees to strike had caused a considerable controversy. The second Pay Commission had recommended that although this right existed in India, it should not be withdrawn, but should be held in abeyance, and the machinery of Whitley Councils should be given a full trial. The Supreme Court's ruling in this behalf is of direct relevance to this disputed point.

Turkey

AFTER THE COUP

THE FAILURE of the mutiny of a handful of military officers in Turkey on February 22 was hardly surprising. The officers who indulged in this foolhardy attempt had little solid backing from the armed forces and their only sympathisers were a few hundred cadets from the Military Academy, the Gendarmerie Academy and a battalion from the Tank School The overwhelming majority of the military officers entertained no idea of staging a coup to overthrow the Government and seize power a second

time in a short span of a year and a half. The swift support action extended to the Government by the air force proved timely and quite decisive in putting down the rebel activity. The decision which the Government has taken not to adopt drastic or other legal action against the organizers of the coup constitutes a censure on them and speaks for the scanty support they could muster.

On the following day the entire National Assembly without distinctions or divisions of party affiliation, gave an enthusiastic ovation to Premier Ismet Inonu. The ovation needs to be interpreted more as a mark of jubilation at the collapse of the coup and the unscathed survival of the Assembly and the Government than an expression of profound acknowledgment of Mr. Inonu's firmness in putting it down. That mark of gratitude is due to President Gursel whose personal popularity and influence over the armed forces (which he commanded at the time of the May Revolution of 1960) were really responsible for maintaining their allegiance. The halo which Mr. Ismet Inonu wore (and quite deservedly) as the political heir to Kemal Ataturk has virtually faded out over the years—particularly with the public resistance and disapprobation which a long, tiresome and degenerating tenure of office for the People's Republican Party created. If he finds the qualities of firmness and capacity for vigorous action slipping fast, it is partly the fault of age, but more so the disrupting effect of the divisions inside his party. The elections held last October under the new constitution found no party gaining a grip and the Justice Party which emerged with some relative strength is but a successor in a veiled form to the Democrat Party of the late Mr. Menderes. It is this party with which Mr. Inonu's Republican Party has formed a coalition, presumably owing to President Gursel's intervention. The coalition partner has turned to be a liability to Mr. Inonu in launching a campaign to meet the reasonable demands of his people for rooting out corruption and introducing liberal reforms. The coup of the younger army officers (with the support of youthful cadets) was a token expression of impatience with the sluggish activity of the coalition Government in regard to reform—a meaningful pointer which Mr Inonu can hardly brush aside.

Higher Education

CEILINGS ON ADMISSIONS

THE AVAILABLE sketchy summary of the report tendered by Sir John Sargent to the Government of West Bengal on the reform of the education system in the State at all levels discloses some controversial suggestions in the field of higher education. Perhaps, the most controversial one is the strongly argued recommendation on the limitation of the maximum number of students to be admitted to colleges and individual universities. Theoretically considered, his views are based on very sound reasoning inasmuch as their aim is to restore a rational balance in the student-teacher ratio without which the quality of education cannot be improved from its rapidly declining standards. Sir John has recommended that no college should admit more than 1,000 students and he has argued a strong case against the undesirability of colleges running two or three shifts. He has further suggested that no university should admit more than 6,000 students. These recommendations, if acted upon, would confront the State Government with very difficult alternatives—either to limit the number of students aspiring to receive college education or to multiply the number of universities and colleges to cope with the requirements. The second course is financially well-nigh ruled out. But the limitation of the students seeking higher education to such a disproportionately small number against the present strength of colleges and universities would result in denying opportunities of education and causing socio-economic upsets in the middle class. This also is not desirable. The present influx of students seeking admissions to universities for the conventional careers will diminish as openings become available for technical jobs.

Sir John has made one pointed suggestion in respect of technical education in the sphere of engineering. He has urged that the outturn of engineers should be in alignment with the requirements of the economy. Seemingly this recommendation is superfluous, but in reality it is astonishingly not so. The programme of engineering education in the Third Plan discloses precisely such a disparity. A relevant table published in the Draft Outline of the Third Plan (but not reproduced in the final version) makes the startling revelation that during the Third Plan there will be a serious maladjustment between the outturn of engineering graduates and the demand for them. The outturn of graduates in civil engineering will be 33.5 per cent in excess of the demand, in mechanical engineering it will be 13 per cent in excess and in electrical engineering 15 per cent in excess. These graduates cannot change over to any other avocation because of their technical specialisation. Nor can they afford to wait for an indefinite period of time for jobs to materialise since it would invite financial strain on their families, not to speak of the frustration and demoralisation that may overtake these unemployed specialists.

Burma's Dilemma

IMPORT LICENSING

COMMENT BASED on the scanty report about the particulars of Burma's new import licensing policy made effective from March 1 must be brief and, even so, subject to the possibility of correction. From the available facts one development which is clear is that the reaction of import traders to the policy has been one of strong dissatisfaction and protest. A drastic revision has been made in the procedure of issuing import licences which will affect some 3,000 erstwhile licence-receivers. The depth of the discontent is to be gathered from the fact that Prime Minister U Nu felt it necessary to clarify the policy and the objects behind it in a radio broadcast.

U Nu had some truths to be publicly brought home to the disgruntled licence-seekers. These 3,000 strong importers will no longer be entitled to the issue of licences in their individual names as a result of the attack the government was launching on traffic in import licences. The Prime Minister made the startling disclosure that 90 per cent of the licence-holders did not possess either the investment capital or the business acumen and they procured the licences only to sell them at heavy premiums to foreign businessmen operating in the country. The traffic inevitably led to steep price-inflation and fomented the black market. The policy which the Government has now introduced is to make it obligatory on the ousted individual licence-sellers to acquire shares on graduated scales in the State-controlled Joint Venture Corporation. Clandestine sales of licences will thus be prevented. One significant feature about the Corporation is that the Government will be a sleeping partner in this business and the joint issue of licences will aim at ensuring that the licence-seekers are true importers. Here seems to lie a flaw in the new policy. Licences appear to have been issued hitherto to all and sundry without ascertaining whether they were established traders, genuine new entrants or actual users. If this precaution is not taken under the new procedure (and this point is not clear from the available report), the true importers, so-called, may sell the imported goods to their former licence-purchasers and, so long as supply and demand are in disequilibrium, it will be difficult to control the black market which is the real aim of the new policy.

FOR A PROGRESSIVE COUNTRY...houses, hospitals, schools...

During the Third Plan period, India will build about 26,00,000 new homes 96,300 schools and 2,000 hospitals and dispensaries. These great social welfare schemes involve construction work on an unprecedented scale and enormous quantities of cement will be required for this vast building programme

In order that more cement may be available for these welfare schemes and for the private consumer, the Third Plan has set the cement industry a target of 15 million tonnes of cement a year by 1966. And the increasing output of ACC and India Cements factories will help to achieve this. **ACC and Sankar Brand Cements**

RISING PRICES IN GERMANY

By ODYSSEUS

SEVEN STUDY TOURS, of a fortnight each, in Germany between 1957 and 1962 inclusive, have won me the nickname "Tacitus" from the cabinet ministers, officials, industrialists, bankers, trades union leaders, and others, who give me so generously of their time. Tacitus (I had forgotten) was the historian who sermonised the decadent consumption-orientated (panem et circenses) Romans on the virtues of the simple (abundans labor non nocet) German tribes. This year, however, it was the tribal chieftains who wanted to know what the Romans were doing—about rising wages and prices! It may be, as Professor Erhard last week assured Germany's trade union leaders, that he has no intention of introducing a national wages policy, but my off-the-record discussions with authorities close to him, and with others in key positions, revealed that one and all are pondering the problems involved in a wage policy, and are watching the birth pangs of Britain's National Economic Development Council with the anxiety of a husband straining for a glimpse into the maternity ward.

Hitherto, Germany's economic success has compelled awe. She has expanded industrial production at a rate at which the fantastic percentages of the 1950's level out to an average the exact double of the UK. Real wages between 1953 and 1960 rose by 38 per cent. The OEEC's 1961 report, "The Problem of Rising Prices", has become the bible of the DGB (German TUC) because its statistical analysis suggests that, even with the achievement of full employment, there was little evidence in the years 1951-59 that negotiated wage increases were an independent cause of rising prices in Germany, where wages rose in accordance with the classical text book proposition that, in a free market, increasing demand for any commodity causes its price to rise. Moreover, one of the OEEC's more significant findings is that wage negotiations in Germany have been sensitive to variations in local demand. Although the average rate of wage increase was higher than the average increase in productivity, there were several long periods when the increase in wages was substantially below the long-term growth of productivity so that, in particular industries, the rise in productivity could, as it should, be shared by capital in higher dividends, the workers in higher wages, and consumers in lower prices. A very moderate slackening in the rate of local expansion sufficed to bring wage negotiations back into relation with the growth of productivity. This important achievement is explained by the widespread realisation by German popular opinion, the unions, and the government, that inflation, far from being the mark of a buoyant economy, chokes the rate of growth.

THE TRIBES GROW RESTIVE

So far my exposition is in line with what was to be expected from a Tacitus upholding the example of the noble tribesmen to his decadent compatriots. But now varied and contradictory forces have emerged in Germany, which are causing the wage earning tribesmen to become restive.

One is that although the total labour force was 20,837,000 in 1952, of whom 6,410,000, or 41 per cent, were unionised, today it has risen to 27,011,000 of whom 6,829,000, or only 32 per cent are unionised. There are three unions, the BB (civil servants) the DAG (white collars), and the overwhelmingly industrial DGB. From a peak membership of 38 per cent of the labour force in 1951, the DGB's present 6,378,800 members represents only 30 per cent. DGB members pay one hour's earnings a week in dues, which, at today's average rates, is Rs. 3.50 out of a weekly average take-home wage of Rs. 150. Union officials are conscious that a majority of workers ask why they should belong to a union at all, when, through market forces, wages rise of themselves. Nor, for the same reason, do many of those who are union members see any point in building up huge strike funds; surpluses should, they grumble, be switched to pensions or insurance schemes. Apathy is widespread. Few vote in union elections. "It's no use appealing to class solidarity today," a union official told me. "The workers want to see value for dues paid." Many responsible observers (including some union officials) therefore expect the unions to become increasingly militant merely to justify their existence.

A second factor is that, although employers are making strenuous efforts to recruit fresh labour from Italy, Spain, Turkey, so that there are some 525,000 foreign workers in Germany today, the closing of Berlin to immigrants from the East (13,000,000 to date) must, in a growing economy, increase the demand for labour. Some union officials even regret the cessation of the flow of refugees. "They helped to keep wage demands reasonable and avoid inflation, which leads to rising nominal wages with falling buying power," I was told. Several deplored the militancy of "doctrinaire Socialists, like Otto Brenner," leader of the Metal Workers. "Militancy harms the unions, gives us a bad name with the public, makes non-union workers even more reluctant to join," a prominent union official told me. "Instead, we should campaign to popularise ourselves by striving to secure what wage increases may be possible without employer-worker show-downs, and, above all, by concentrating on improving fringe benefits rather than direct wage rises. By deferring consumption, fringe benefits are anti-inflationary. Then, again, we could organise cheap facilities for travel and holidays, and build up legal aid services for social security and other causes."

Basically, it has been the buoyancy of the economy which has enabled Germany's workers to enjoy steadily rising (real) wages. Output per man-hour rose between 1953-60 by 5 per cent a year. Clearly, the higher the rate of productivity achieved, the less the incentive, and the ability, of the unions to push the rate of wage advance to the point of endangering stability of prices.

RISING GERMAN EXPENDITURE

This idyllic picture of life among the tribes changed, however, in 1960-61 when wages began to rise faster than productivity. So far the effect on prices has been largely countered by reducing profit margins, by a noticeable rise in private savings, attributable in part to the sale of £93 million of Volkswagen shares to 1,600,000 small shareholders, and by the accumulation

of unspent federal and state cash balances. But federal budget expenditure has risen between 1955-56 and 1961 as follows:

	1955-56 £ million	1961 (Estimates) £ million	1955-61 rise per cent
Total budget ..	2,650	4,299	162
of which			
Defence	545	1,048	192
Social Security*	876	1,264	144
Housing	788	1,674	215

*Federal expenditure only, i.e. about one third of total Social Security revenues. Remaining two thirds come from employer-worker contributions.

Is this, then, the end of the German "miracle"? All my informants feared that rising wages due to the strong demand for labour would now be reinforced by union militancy, that social security and housing expenditure would gather pace, and that these forces, combined with rising defence expenditure, would substantially slow the rate of growth, even if inflation could be avoided.

Before, however, we indulge in any malicious pleasure at the prospect that Germany is about to join the many countries wallowing in the inflationary mud, it is well to point out some important characteristics of Germany's economy.

The first is psychological. Whatever their problems, German employers and workers feel on their toes in a genuinely competitive economy. The UK is still dominated by memories of pre-war unemployment. On any structural change being proposed in coal mining, textiles, or any other industry, up goes the cry "This will put thousands out of work"—in total blindness to the fact that UK unemployment stands at 1.73 per cent today and has never been above 2.17 per cent since 1950! In Germany, feather bedding and restrictive practices do not exist. The unions may press for higher wages, but they will co-operate to economise labour. Moreover, the unions cover industries: demarcation disputes are unknown. Next, wage negotiations end in legally enforceable contracts for definite periods, enabling employers to plan ahead on the basis of known costs, and employers and workers to enjoy clear periods of industrial peace in which they can both concentrate on getting on with their jobs.

Another outstanding difference is that Germany is not bowed down by a huge burden of inflationarily financed nationalised industries. As heirs to Hitler's state monopolies, Germany's federal government, states, and municipalities own a very substantial sector of the economy. But nationalised enterprises compete for capital on the market. Their borrowing terms depend on the market's estimate of their earning capacity. The prices charged for their output must, therefore, be those of the market. It follows that Germany's state-owned enterprises are run in as business-like a manner as private enterprises. The government just happens to be a shareholder. If a company's record is persistently poor, the government, like any other shareholder, puts in new directors. The capital value of federal owned enterprises in 1953 was £134 million, yielding a dividend of 4.2 per cent. In 1958, capital value was £238 million, yielding 25 per cent. In the UK, investment yield of nationalised industries has been about 5 per cent, compared with 15 to 20 per cent in private enterprise, and since the "public interest", as defined by electoral considerations, largely prevails over business principles, it seems that a substantial proportion of the £6,827 million (no less than 26 per cent of total UK investment) invested in them between 1948-58 was allocated uneconomically, and used wastefully, and so distorted the economy and slowed its growth. It is one of the strengths of Germany's economy that it is free from such distortions.

[This is the first of three articles. The second will discuss Germany's Social Security system, and the third "Socialim" as understood in Germany.—Ed.]

This is one of the oldest and most commonly used of standards. But it is certainly vague. And when you use it, you are never sure of getting your exact requirements.

This is where Indian Standards come in useful. Developed by the Indian Standards Institution, each standard helps you to easily specify your requirements, ensures quality of the product and good value for the money you spend.

ISI prescribes standards for industrial and consumer goods. Under its certification marking scheme, goods produced to relevant standards qualify for carrying the ISI Certification Mark. This is a third-party guarantee of the products' continuous satisfactory performance and service. The next time you buy anything, look for the ISI mark.

The European Scene

ALGERIA'S CHANCES

From Our Special West European Correspondent

PARIS, February 24

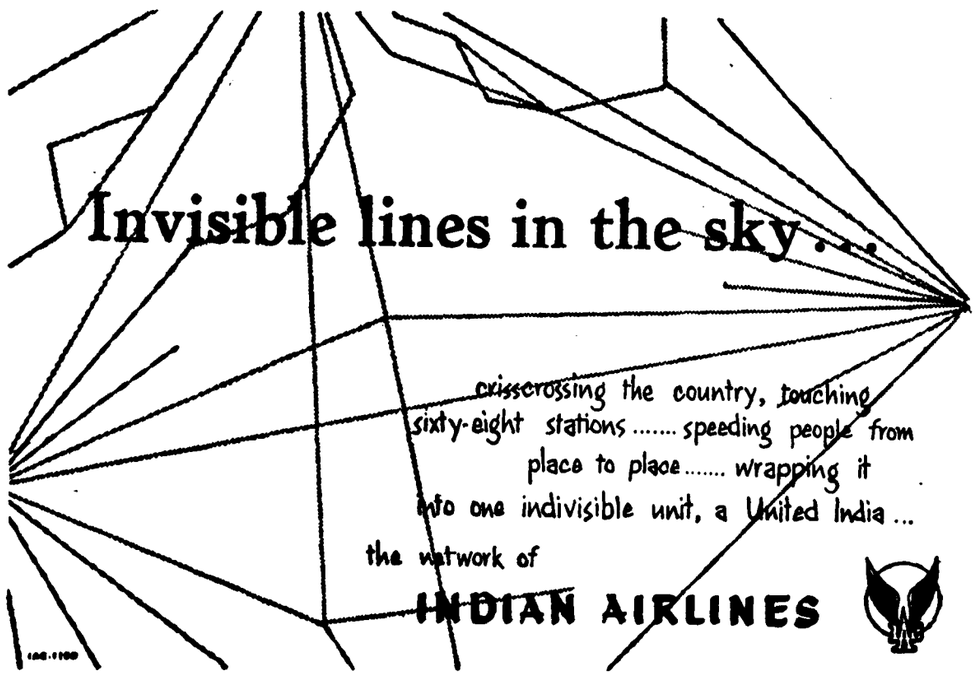
WRITING before the terms of the agreement between the French Government and the FLN are known (and before the white community's Secret Army has staged whatever violent reaction it is planning to greet that agreement), it might seem premature to try to assess the chances of the Algerian Republic that will no doubt be born this year. Yet it is clear that the details of a written treaty are less important (once granted that both the FLN and the French Government regard it as a generally acceptable document) than the spirit in which each side approaches the problems of cohabitation and co-operation. And as for the Secret Army, it is only important in so far as it represents the permanent mood of the white community; what matters is less the support the non-Muslims might give to a brief and violent gesture, than the frame of mind in which they will envisage, once fighting is finished, the possibility of living on in a country where the majority are at last free men. So little do these abiding problems of cohabitation and co-operation depend on what we might learn in the coming week that they are in fact the same as in 1954, before the long and bloody war began.

It was already clear then that the Algerian question concerned the possibility of liberating seven million Muslims without depriving a large minority, of over a million, of their only homeland. It is still the same today. Yet how many refused to see this, over the past seven years! On the one hand, many non-Muslim Algerians and some Frenchmen pretended not to see the necessity of emancipating millions of Arabs in a world where colonialism is dead. On the other hand, most anti-colonialists preferred not to see the problem of the white community, which is at home in Algeria as much as the Arabs who arrived, in small numbers, some time before it, to impose their colonial will on the Kabyle aborigines. (Their present numbers, far from representing some sacred right to obliterate the minority, result very recently and directly from the benefits the minority brought them in agriculture and hygiene.) Those who chose the first of these errors imagined that, by some miracle, the Algerian Muslims could be excluded from the wave of national liberation that has changed our age, and could be fobbed off with second-class citizenship and myths about integration. Those who chose the second, affected to believe that Algeria was another open-and-shut case of colonialism, and the white community just a handful of interloping burra sahibs who could be shipped home overnight. In reality, adjusting the Algerian population and time-scale to Indian standards the minority was the equivalent of 40 million non-Hindus that the British might have left behind firmly implanted in Indian commerce and farming in 1947; i.e., it was comparable rather to the Muslim problem than to the Clive Street problem.

Many years of violence were required to drive home the fact that these two attitudes were completely erroneous. Instead of shuddering and averting our gaze from violence, it is as well to look at it squarely and ask whether the claim of the Algerian Muslims for freedom could have been enforced otherwise than by the long and nauseating procession of murders, ambushes and indiscriminate killings—and whether the claim of the non-Muslim minority to its Algerian home could have been enforced otherwise than by the counter-terrorism, insurrection and murders of the white community and its Secret Army. Peoples usually make wars to win them, in the hope of the Napoleonic victory that crushes the adversary; but in this case neither side ever had the least chance of winning and must have known it. No FLN leader could have dreamed of driving the French and the minority they protected into the sea, as by the quick surgery that cured India of the Goa canker; and the non-Muslims, even at moments of paroxysms of violence, have known for at least three years past that the creation of an independent Algerian Republic is inevitable. Each made war to state a claim that otherwise would not have been listened to; to the extent they have succeeded, a settlement has a chance of being realistic, in the sense of addressing itself to the real problem.

In this light, the long war is not simply to be deplored as a calamity that prejudices the future of the young Republic with its trail of remembered horrors. It is also to be seen as the only way everybody concerned could be brought to recognise all the realities of the Algerian predicament. To say that the problem is now seen on all sides in all its aspects is not, however, to say that it is soluble. The insurrection of the Muslims and the ferocious counter-insurrection of the non-Muslims have produced agreement that the Algerian question is not a simple colonial issue and not an internal problem of French administration; it is concerned with arranging the cohabitation of two communities of totally different race and mentality within the one free republic. At various stages of the war, I have written here that the problem is probably insoluble, and that in the end the smaller community will be forced out. If that is correct, the ending of hostilities merely means that a long, painful but relatively peaceful process of expropriation and expulsion is about to begin, and that it will conclude, after maybe a generation of constant friction, with the disappearance of the minority community and the regression of the majority to the condition of poverty and insecurity that it will have to accept once it loses the co-operation of France.

Perhaps one is incorrect in this; one would hope so. The Algerian problem has been different to other national and colonial issues throughout its evolution, despite indolent or interested attempts to fit it into familiar categories, and so perhaps one is entitled to guess that it might find a different upshot: that, in the end, two peoples will learn to live in the same land without one crushing the other. There is no precedent for this, certainly not in the recent history of decolonisation. While remaining sceptical, one may admit that the economic factors surely suggest that solution. If the "economic substructure" were as all-important as some people imagine, one would have no hesitation in forecasting peaceful cohabitation between the Algerian communities and (what guarantees the first) fruitful co-operation between the Algerian and French Republics. For both sides have an evident economic interest in working together, without, for all that, being so dependent on each other as to create uneasiness and resentment.



Algeria, and for that matter the Maghreb generally, is a narrow strip of unattractive country between the Mediterranean and the Sahara, with limited fertile land and no possibility of irrigation on a large scale, lacking coal or hydro resources. From the most ancient times, including Carthage and the Roman settlements, the pre-Islamic and Muslim ages down to French imperialism, it has never supported more than a small number of

people living in symbiosis with the rest of the Mediterranean basin. The numbers it supports today are an entirely artificial—and perhaps disastrous—result of French settlement, which brought more improvements in hygiene than in local productivity and which imbricated the region into the French economy. It draws the largest part of its revenues from direct and indirect French subsidies, from the sale of agricultural products (notably wine, not drunk by the Muslims) to France—sales which take place at favoured prices—and, finally, from sending hundreds of thousands of its men to work in French industry. These facts are recalled not to argue that Algeria could not be self-supporting (that is the usual argument of colonialists opposing liberation of a territory) but to point out that it could not necessarily support the numbers it now contains, which result from peculiar conditions. It could perhaps support them and—though this is taking a very optimistic view—cope with the vast demographic expansion that is in trian while increasing living standards, if it managed to maintain this same economic imbrication with a European economy. In other words, if it continued to receive French preferential assistance, as the price for the security of the non-Muslim minority and of various other French interests (or what General de Gaulle believes, perhaps mistakenly, to be French interests).

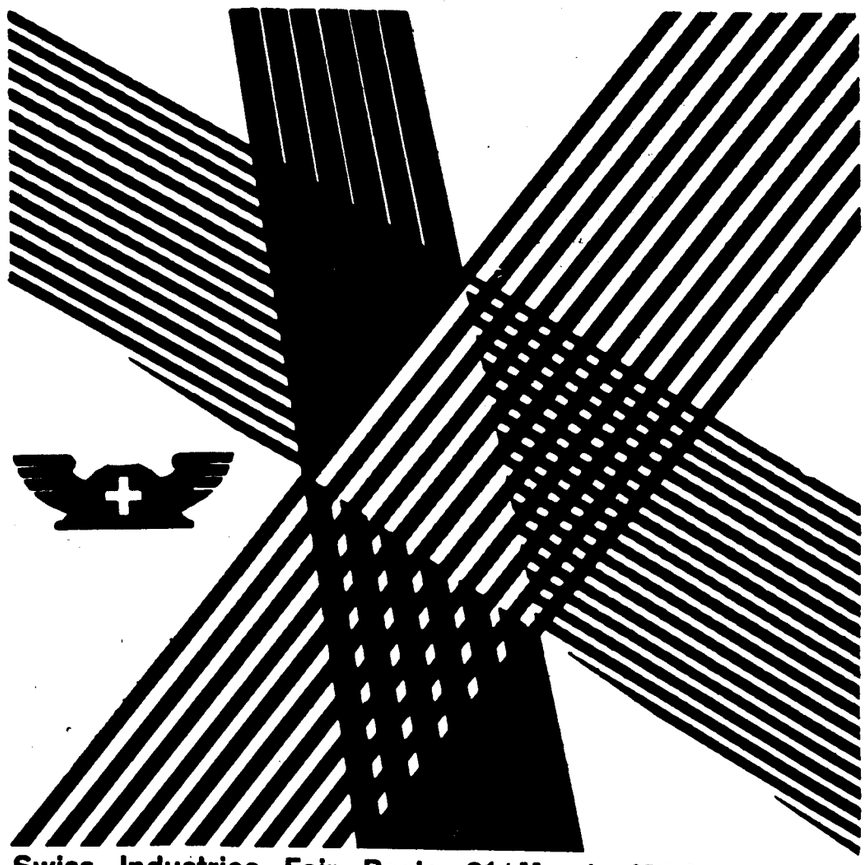
There is nothing particularly degrading in this prospect for the Algerian nationalist who knows that it was always thus with his country when it lived (with a much smaller population) in intimate economic relations with the Roman and Islamic empires. Provided the terms of the collaboration are arranged equitably, taking full account of Algeria's sovereignty, the country's perpetual economic reliance on whichever nation happens to be most powerful in the Mediterranean could be reconciled with its liberation from direct French domination—though one must always expect to see a degree of reliance on France that will leave it open to people of bad faith to raise the "neo-colonialist" accusation. People of bad faith will not be lacking: the Algerian Communist Party and the Trotsky-ite MNA (both eclipsed by the FLN so far but liable to operate independently henceforth) and the FLN's wartime allies, Egypt and Communist China, will no doubt hypocritically attack as neo-colonialist any close co-operation with Europe such as Algeria needs to live, possibly because certain of them have less interest in a viable Algeria than in a disorderly one.

At this point, someone who has not seen the squalor and stagnation in which most oil-producing countries live will ask whether the Saharan oil strikes do not guarantee the country's future. Firstly, the oil is not in Algeria but in the remote Saharan hinterland; the French were powerless to dispute the FLN's quite implausible claim to this territory but neighbours, who kept silent out of anti-imperialist solidarity, will soon raise their voice. Granted the Algerians manage, with French help, to maintain their claim to the desert and exploit its oil, they will be offering a surplus product on a glutted market at prices higher than elsewhere (because of the wells' distance from the coast), and will find that the only buyers are the French. The oil is an asset, no doubt, but one that reinforces Algeria's economic reliance on the major Mediterranean power.

The country's main "economic" asset will be that of other desert peoples throughout history, its warriors. Issued directly from the war with France, the Army of National Liberation will constitute the most effective military force in the Arab world and in much of Africa, and could revolutionise the balance of power south and east of the Mediterranean—notably in the Maghreb where conservative regimes rest on insecure foundations in Morocco, Tunisia, Mauritania and Libya. But in the absence of all domestic industry, this force must be armed from outside; it has been so by anti-French, or more generally anti-Western, powers during the war with France. In the event of that close collaboration with France that economic factors indicate, it will no doubt be armed henceforth by the French. In the event of a break with France, the army of the poverty-stricken and unstable Algeria that would result would no doubt be open to use by others, whose purposes then could not be concealed under anti-colonialist rhetoric.

Economic Report from the U.S.

GENEVA AGREEMENT ON TEXTILE TRADE



By GUY SIMS FITCH

WASHINGTON, February 20.

ANY time a group of nations with diverse interests can agree on a course of action regarding a common and difficult trade problem, it is cause for gratification. It is doubly gratifying when that agreement enhances the prospects for an expansion of exports while safeguarding the vital interests of importers. Such is the promise inherent in the history-making accord on cotton textiles hammered out by 19 nations in Geneva. It is to be expected that the United States and the other participating nations had to give as well as receive concessions. Their willingness to do this, and in the process agree on a plan which can work for their mutual benefit, is a tribute to the statesmanship and courage of the governments taking part in the conference. The agreement in effect puts on a long-term basis some of the principal elements of a short-term arrangement worked out last year. Under that arrangement, so-called low-wage exporting countries, such as India, Pakistan, Hong Kong, and Japan, agreed to hold down their shipments to the United States, Canada and other large consuming countries which do not impose official limits on imports. If voluntary restraints on exports were not forthcoming, these consuming nations had the right to limit imports.

The five-year plan just concluded in Geneva carries this principle into new and important areas of agreement. It declares that the United States or any other nation that does not officially restrict cotton textile imports may ask one or all foreign producing nations to limit shipments to certain levels. An importing nation can do this if it finds itself subject to or threatened by market disruption on any cotton textile item or category. If a solution is not worked out in consultation among the parties concerned in 60 days, the importing nation could freeze imports for one year to the level of shipments during the first 12 of the 15 months preceding its initial request for limitations. If the market trouble continues, the freeze could be extended another year in exceptional cases. After that, increases in imports could be limited to five per cent a year until the agreement runs out in October 1967. This five per cent, it should be noted, is a minimum; conceivably, the import increase could exceed that rate. Thus, the agreement would bring a desired degree of order to world trade in cotton textiles. This trade, always highly competitive, could very easily become chaotic, particularly as sharply rising production in exporting nations tended to disrupt international markets and the cotton textile industries in other lands. Such a situation, if allowed to develop unchecked, obviously could carry with it the seeds of serious and wide-spread trade restrictions. The logical solution clearly is the kind of international agreement which now has been drawn up in Geneva. The agreement emerges, then, as a realistic and workable response to a recognized need. It is an agreement that is permissive rather than mandatory. It allows nations to apply brakes on imports for temporary periods, but it does not require that they do so. It is an agreement, moreover, that over the years encourages rather than discourages the expansion of cotton textile exports. One of its important advances, in this connection, is its implication that many of the West European nations, notably the Common Market group, will be relaxing their currently stiff restrictions against textile imports. The agreement's usefulness is further augmented by the fact that it sets no specific or rigid quantities of cotton textiles that can be exported or imported by various nations. Rather, it provides a framework within which all 19 participants can co-operate to assure an orderly growth of international trade in cotton textiles. Significantly, the nations that took part in the Geneva talks account for some 90 per cent of the world's cotton textile trade. It follows, then, that administration and implementation of the agreement will be important keys to its success. The governments concerned have until October 1, 1962, to sign the agreement. After that it will be up to them to continue the statesmanlike co-operation they already have demonstrated in making the plan work for the benefit of all.

Swiss Industries Fair Basle 31st March - 10th April 1962

Why is this exhibition worth your visit? Because:
Times are past when the Swiss were known mainly for milking cows and blowing the alphorn. To be precise: some still do milk cows, and some still do blow the alphorn. But many, many others have taken an interest in entirely different occupations, long ago.
They construct turbines higher than a stately house and design tiny watches that keep good time by fractions of seconds. They make powerful machines, helpful tools, useful precision instruments. They weave enchanting textiles and create jewellery of breathtaking beauty.
All these marvels—and a wealth of others—are presented at the exhibition of Swiss craftsmanship: in 21 halls, Swiss industry puts its quality products on view. For information, booklet, catalogue...and for advice on how to get to Basle, simply call

THE BUSINESS WORLD

Life Insurance Looks Ahead

By CROESUS

WHEN Mr. P. A. Gopalakrishnan, Chairman of the Life Insurance Corporation (L.I.C.), was recently interviewed by the All India Radio and asked by the Question Master as to what precisely was the job of the L.I.C., he gave this reply: "One of the principal objectives of nationalisation was to plan the expansion of life insurance on a national basis and extend life insurance protection to every insurable family in the country." Another objective, he said, was "to mobilise savings through life insurance all over the country and make funds available for the country's Five-Year Plans". To another question as to how far these objectives had been fulfilled, the L.I.C. Chief claimed that the Corporation had given an excellent account of itself and was well on its way to realise the objectives of nationalisation. He also added that "it should be possible for the Corporation to realise its target of Rs. 1,000 crores by 1963."

But, the other day,—i.e., not very long after the above interview—when the preliminary figures for the year 1961 were released to the Press, he was inclined to be a little more cautious and said that the target might be reached, "perhaps with some difficulty." Notwithstanding this, it is not incorrect to say that, by and large, the L.I.C. has continued to make headway. The completion of a new business of over Rs. 608 crores in 1961 is unquestionably an all-time high annual business. Not only was it absolutely higher than in the previous year, but, even percentage-wise, the improvement was perceptible, the percentage increases over the previous years for 1960 and 1961 being 15.9 per cent (an earlier figure given by the L.I.C. itself was 16.1 per cent, though) and 22.3 per cent, respectively. The L.I.C's explanation for the performance in 1961 falling below its expectations (as adumbrated in its own Five-Year Plan —1959-1963—to reach the Rs. 1,000-crore target) was that "1961 was a difficult year for the Corporation, inasmuch as there were natural calamities and disturbances in some parts of the country". This surely cannot be the complete explanation, for, every year, we in India are accustomed to have natural calamities in one part of the country or the other. Perhaps, the rising cost of living provides part of the answer. Although the L.I.C. organisation has been growing by leaps and bounds, one cannot yet rule out that it is not sufficiently streamlined to cope with the inevitable and growing pace of increase in the volume of life insurance, and this may also explain the lower rate of growth than that envisaged earlier. To quote from a thought-provoking article in a recent issue of "Yogakshema", the L.I.C's official organ, "with such a large expansion in economic activity, with consequent increase in employment and national income, a commensurate increase in the volume of life insurance business is inevitable 'even if the Corporation does not pursue what may be called an active organisation policy' ". I do not mean to suggest that the L.I.C. today lacks an active organisation policy; only it has still to become active enough.

That the L.I.C. has been striving hard to spread the gospel of life insurance is evident from the fact that 70 per cent of the total policies (that is, 5,78,897 policies out of a total of 8,23,470) were issued to persons who took up life insurance for the first time. This must be set alongside the fact nearly 35 per cent of the total policies (over 284,000) came under the non-medical schemes which now cover the entire country. Normally —and more so in the latter context—in respect of new policies, one has to wait for atleast a couple of years before assuming all of it to be 'pucca' business. It seems too early, therefore, to treat these as the final figures for drawing any considered conclusions.

The zonal position in respect of the total new business shows that the Southern Zone has again maintained its lead with a completed business of Rs 151.68 crores, followed by the Eastern Zone (Rs. 138.91 crores) the Western Zone (Rs. 132.90 crores), the Northern Zone (Rs. 96.38 crores) and the Central Zone (Rs. 79.25 crores) in the order given. Here, again, it does not seem correct to rush to such general conclusions as that more work requires to be done in the zones lagging behind and so on, expecially as the divisional ranking has placed divisions in the Eastern and the Western Zones above those in the Southern Zone. Moreover, the extent of new business depends not merely on the effort put in but also on the extent of life insurance cover already taken by the people of a given zone. Thus, if people in the Western Zone generally have already taken reasonably large cover, their capacity to take further or fresh cover would be severely limited. In other words, for a proper assessment of the efforts of the different zones of the L.I.C., an essential pre-requisite would seem to be the 'per capita' life insurance figure for each of the regions. It is to be hoped, therefore, that, along with several other proposed surveys, such as those on attitudes to life insurance, the L.I.C. would also institute a survey of the 'per capita' life insurance in the different zones.

As regards the average size of life insurance policies, it is gratifying to note that the steady rise from year to year has been maintained. From Rs. 3,671 in 1959, the figure has steadily risen—to Rs. 3,903 in 1960 and to Rs. 4,097 in 1961. An equally notable feature is that every zone has participated in this improvement.

The L.I.C. has also reasons to congratulate itself on the progress being made by its group and superanuation schemes, a comparatively new field for it. The total business underwritten under this scheme rose from Rs. 4.22 crores in 1960 to Rs. 5.15 crores in 1961. However, no noteworthy gain would appear to have been made by the L.I.C. in it annuities business.

In order to assess the contribution that the L.I.C. has made to the economic development of the country, one has to examine the L.I.C's investments. These cover practically every industry, and Mr. Gopalakrishnan was only stating a fact when he declared that "there is not a single important industry in the country which does not have the benefit of L.I.C's investments." But, then, the country's needs, especially of industries, are growing at a very fast pace, and some fear that their needs for the investment of the L.I.C's funds may be relegated to the background 'vis-a-vis' the needs of the Exchequer in the form of Government loans. The insuring public, in particular the with-profit policy-holders, is interested in this also because of the relatively lower yield (as compared to the return on equities) that any in-

vestment in Government Securities offers. To the extent that more of the L.I.C's funds are invested in Government Securities, therefore, there is a double loss to the public, first, by way of a lower amount that would then be available for investment in private indu tries and, secondly, by way of a lower return realisable from the investment in gilt-edged.

In conclusion, I would like to revert to the article in 'Yogakshema'—"A prospect—Not a Flight of Imagination" by Mr. T. S. Krishnamurthi. An annual turnover of Rs. 2,000 crores (or Rs. 2,500 crores for which a blue-print was originally invited) is not impossible or impracticable, but the question is whether the L.I.C., as it is today, is adequately geared to the task. Some idea of the immense magnitude of the L.I.C's operations to handle a Rs. 2,000 crores annual business has been indicated in the above article. "The L.I.C. will then have on its roll over two crores of policy-holders. Everyday some 20,000 policies will be issued and more than Rs. 2½ lakhs of collections made and receipts issued. Similar figures for 1959 are 3,000 policies and 40,000 receipts per day". All this means streamlining every facet of the Corporation's administration and that, in my opinion, calls for more than a multiplication of divisional offices and abolition of with-profit policies. The laudable goal of operating a simple economic and efficient life insurance to everyone needing it in the country which the L.I.C. has in view is indeed a stupendous task.

Given below is a synoptic table of the L.I.C's progress over the past five years:

	Total Sum Assured (in crores) Rs.	Total business (in crores) Rs.	Average Policy	Lapse Ratio %	Life Fund (in crores) Rs.	Claims (in crores) Rs.	Investment (in crores) Rs.	Premium (in crores) Rs.
1957	283.07	1,473	3,424	6.4	409.55	28.70	381.90	88.12
1958 ..	344.68	1,682	3,551	5.1	447.81	25.05	420.94	73.08
1959	429.17	1,958	3,671	6.0	504.75	28.14	456.63	84.46
1960	497.54	2,285	3,903	6.6	560.38	30.69	527.11	96.89
1961	608.75	2,906	4,097	—	—	—	—	—

Implications of Geneva Agreement

By CROESUS

ALTHOUGH, quantitatively, the recent Geneva Cotton Textile Agreement may not mean much—not that small mercies don't matter or are not welcome at the present juncture—its psychological effects are considerable. No one can afford to miss the point that the Agreement represents a major shift in emphasis, a shift from restraint to orderly expansion of textile exports from the less developed countries. This was to be expected, though, in the prevailing context of a refreshingly reorientated outlook on the part of the industrially advanced countries, especially the United States, to view the development—normal and natural, and, therefore, logical—of the under-developed and undeveloped economies as a desideratum and an essential pre-requisite to any expansion in world trade. But one shou'd not forget that these are times when one cannot take anything for granted. Hence the conclusion of the five-year Cotton Textile Agreement by the 19 participating nations at Geneva really marks an important milestone in the history of international trade. It only remains now for the concerned governments to ratify the Agreement, and, judging from the reactions to it in the World Press so far of the governments of all the 19 participating countries, there should be no difficulty about it. In fact, knowledgeable circles expect the ratification to be completed well in time for the Agreement to come into force on October 1, 1962, as scheduled, thereby replacing the present short-term Agreement due to expire on that date.

The value of the Geneva Agreement lies in the opportunity that has been afforded to countries like India and Pakistan to increase their exports to some European countries, as also to the U.S.A., where the recent tendency seemed to be unduly restrictive, thanks to the 'cry wolf' compaign of interested sections in these countries that unrestricted imports from under-developed countries would lead to a disrup'ion of the market for the domestic industry. The discussions at Geneva preceding the Agreement, however, not only belied these fears but also made the participating countries realise that nothing would be lost, and much would be gained, in fact, by allowing access to textiles from the less developed textile-exporting countries. Here is a clear indication of the liberal tendencies that have begun to manifest themselves in the trade policies of industrially developed countries. One need not bother to probe whether this is the outcome of enlightened self-interest or uninhibited self-sacrifice. If one can argue that the resulting increase in the share of world imports by the developing countries would benefit the developed countries, it is also possible to argue that some of these developed countries have only lately modernised and rationalised the textile industries in their respective countries which can well take care of whatever growth there may be in demand for textiles not only in their own countries but in their region as well.

Now, there are both countries which have been applying restrictions on imports of textiles as, for instance, in Europe, and countries which have not been doing so, as, for example, the U.S. and Canada. It is significant, from the point of view of developing countries, that the chances of access for their textiles have improved in both the cases. Whereas, in the former case, the countries concerned have agreed to allow more imports, albeit in phased stages—the exact rate of permissible increase being subject to bilateral agreements—countries falling under the latter category have undertaken to allow unrestricted access to imports from textile-exporting countries so long as such imports do not threaten the domestic indu try. It is noteworthy that a built-in safety valve has been introduced in the Agreement which prevents the domestic industry from "crying wolf", so long as imports do not exceed the average imports of the 12-month period three months prior to the date of request (by the affected domestic industry in these countries) for imposition of restrictions on imports of textiles from the developing countries. Even when restraints are imposed, it should be added here.

the proposals as per the Agreement are quite reasonable. And the restraints themselves, it is made clear in the Agreement, are to be used sparingly.

A particularly notable feature of the Agreement is the insistence on importing countries paying particular attention, having regard to equity, to the need of the less developed countries possessing the necessary resources, such as raw cotton, and technical skill to have larger opportunities for increasing their exchange earnings from the sale to world markets of products which they can efficiently manufacture. India and Pakistan fit nicely into this description of less developed countries. Not only are these countries less developed compared to European countries like the U.K. and the U.S.A., but they are also less developed 'vis-a-vis' Asian countries like Japan, but unlike both, they raise the raw materials required by their textile industry. On the face of it, thus, it might seem that India and Pakistan particularly would stand to gain much, but these countries have not only to face the challenge of the admit ed efficiency of the Japanese textile industry but also the known advantage that Hong Kong, Spain, and Portugal enjoy—and will continue to enjoy even af.er the new Agreement comes into force—in West Germany and France, especially in the latter. So, although a doubling of, or a cent per cent increase in, the present volume of exports may sound very big, it is anybody's guess as to what share of the increased markets precisely would fall to India. This would depend on the success of our bilateral agreements with the countries concerned, in particular of the European Common Market, but, to a like extent, if not more, on the efficiency of our textiles. Only to the extent that we are able to offer them at competitive rates would it be possible for us to avail ourselves of the prospects of increased exports, which means that a great responsibility, greater than ever before, now devolves on the Cotton Textiles Export Promotion Council.

It is necessary, while on the subject of cotton textile exports, to utter a note of caution. For we are too often and too much prone to take things for granted, whether it is a question of our traditional exports or it is one of our traditional markets. True, so long as population continues to increase, the demand for textiles in these markets also increases, but, unless our exporters keep a continuous watch on the changing tastes of the people in our traditional markets, as also the twin competition from rival countries and rival synthetic fibres, and suitably and promptly adapt their marketing technique, we might find even our traditional exports to our traditional markets slipping under our very feet.

Business Notes

Electricals

EXPANSION OF EXISTING UNITS URGED

OUR ELECTRICAL industries have made considerable progress during the last decade. Not only have they attained the targets set for them in the first two Plans but have, in some cases, exceeded them, thus reducing the dependence of the country on foreign supplies. This was disclosd by Mr. Gurjar in his Presidential Address at the 14th Annual General Meeting of the Indian Electrical Manufacturers' Association, the other day.

The targets fixed for the Third Plan could only be achieved if the electrical industries made an attempt to overcome bottlenecks, such as shortages of raw materials and transport, which prevent them from utilising their full capacities, according to Mr. Gurjar. Import licences should be liberally given by the Government to the industry to ensure adequate and regular supplies of specialised and up-to-date materials at reasonable prices till they are developed in the coun.ry. Rail and road transport should be increased to help the supply of coke and coal, as also to facilitate movement of essential raw materials.

Proceeding, Mr. Gurjar referred to the Government proposal to set up two more heavy electrical factories and said that this would not be in the interests of the country. On the other hand, he felt that it would be easier and far more economical to expand the existing factories than to start new ones. This expansion would, incidentally, also be helpful in utilising their capacities to the fullest extent. Accordingly, he urged the Government to expedite sanction of applications made by a few units to expand their activities. Referring to the export promotion drive on the part of the electrical industries, Mr. Gurjar said that, unless the in talled capacities of these industries were fully utilised and unless the workers put forth their best, the country would not be able to achieve its export targets.

Mr. Gurjar observed that the electrical industry covered a vast field and that, so far, only few major units in the field had been developed. He, therefore, wanted the manufacture of more elctrical items to be taken up in the country, as, for instance, the electronic industry, and the Government should play its role in assisting such new industries by granting tax reliefs, continuing facilities for initial and additional depreciation allowances and giving approval, without u due delay, to colloboration agreements between Indian manufacturers and reputed foreign firms.

A NEW VENTURE IN KERALA

A NEW company, called Kerala Hitachi Electricals Limited, is to be formed in the near future for setting up a heavy electricals plant in Kerala with Japanese collaboration. The sponsor of this venture is Mr. N. J. Nair, Managing Director of Messrs. Textile Supplies Syndicate (India) Private Limited, Bombay. The total capital of the company will be Rs. 1.1 crores. Of this, Rs. 27.5 lakhs will be contributed by the foreign collaborators, Messrs. Hitachi of Japan, in the form of plant and machinery. Capital worth Rs. 55 lakhs is envisaged to be raised through public subscriptions. The remaining capital will be the Kerala Government's share.

The project envisages manufacture of power transformers up to 50,000 KVA in two stages to be completed in a period of 3½ years. No other private sector firm is at present allowed to manufacture the range of transformers for which this company has been licensed.

The Japanese collaborators have also agreed to provide technical assistance for the manufacture of some other electrical goods such as switchgears, capacitors, motors, etc.

The collaboration terms provide for the payment of a royalty of two per cent and technical assistance fee of one per cent on the value of the goods produced, besides a 5 per cent royalty on the value of exports. The foreign firm is also to receive a "handling and testing charge" of 3 per cent on the value of machinery which will be procured by it from non-Hitachi sources. One-third of the output is to be exported.

Banking

S.B.I's WORKING IN 1961

IN 1961, once again, the State Bank of India was able to report good results, both in its traditional business

and in its developmental activities. Thus, the demand for bank credit rose considerably during the year 1961. The S.B.I's total advances increased from Rs. 211 crores to Rs. 272 crores during the busy season of 1960-61 (October-end 1960 to April-end 1961), while those of other scheduled banks rose from Rs. 819.9 crores to Rs. 1,036.9 crores.

The Bank's aggregate deposits liabilities stood at Rs. 511.7 crores in December, 1961, as compared to Rs. 557.4 crores in December, 1960. As in the previous year, this decline was mainly attributed to the transfer of a part of PL 480 funds to the Reserve Bank of India. If, however, the deposit liabilities of the State Bank, exclusive of PL 480 funds, were considered, there was an increase of Rs. 37.7 crores in 1961, as compared to an increase of Rs. 131.6 crores (1,467.3 crores) in the deposit liabilities of other scheduled banks.

The Bank undertook during the year under review several steps in order to attract more deposits. Thus, the Bank not only began accepting call deposits and other short-term deposits from January 1, 1961, but also offered higher rates of interest on these deposits.

A notable feature of the Bank's activities was the introduction of a Special Credit Transfer System so as to facilitate the spread of the banking habit in the country. According to this scheme, a constituent can utilise the services of any of the 954 branches and offices of the Bank for transferring money paid in cash for credit of his account, free of charge, but only when the deposit is not in excess of Rs. 1,000. However, the scheme still being in experimental stage, its scope and the results may not be available till July, 1962.

During the year 1961, the Bank intensified its work of assisting small-scale industries. The number of units assisted and the credit limit sanctioned, as also the outstandings, both by the S.B.I. and its subsidiaries, registered increases. The number of units assisted by the S.B.I. rose from 2,451 to 2,811 and those assisted by the Bank's subsidiaries increased from 384 to 463. Similarly, the credit limits sanctioned of the S.B.I. and its subsidiaries improved from Rs. 7.8 crores and Rs. 2.7 crores to Rs. 10.1 crores and Rs. 3.4 crores, respectively. So also the outstandings which rose from Rs. 3.7 crores and Rs. 1.1 crores to Rs. 5.1 crores and Rs. 1.5 crores respectively. The increase in outstandings amounted in either case to more than 50 per cent.

The S.B.I. was able to earn a net profit of Rs. 2.71 crores in 1961 as compared to Rs. 2.18 crores in the previous year. This was in spite of the fact that earnings from interest and discount fell slightly from Rs. 14.87 crores to Rs. 14.12 crores, mainly due, it is stated, to the decline in the Bank's Investments.

New Issues

PAPCHEMI CORPORATION LIMITED

FOUR COMPANIES are entering the market shortly to raise capital from the public either for setting up new industrial units or for financing their expansion programmes.

Papchemi Corporation Limited, a company incorporated in Bombay in November last, is to raise capital to the tune of Rs. 25 lakhs in the form of 25,000 equity shares. Of this, shares worth Rs. 12.50 lakhs have either been already subscribed or promised to be subscribed by the promoters, directors, their friends, associates and nominees. The remaining 12,500 shares, worth Rs. 12.5 lakhs, are to be offered to the public for subscription.

The list opens on March 1 and closes on March 9 or earlier at the discretion of the directors, but not before March 5. The authorised capital of the company is Rs. 50 lakhs, consisting of 40,000 equity shares (of Rs. 100 each) and 10,000 unclassified shares (also of Rs. 100 each).

The proceeds of the issue are to be utilised for setting up a factory at Kalyan to manufacture 3,000 tons of pulp and 3,000 tons of paper per annum from rice straw, waste paper, cotton rags and waste wood pulp. The total capital outlay on the project is expected to be of the order of Rs. 40 lakhs. Since the share capital will only be making available Rs. 25 lakhs, the company is negotiating with the Industrial Finance Corporation of India a loan of Rs. 15 lakhs. The company may also obtain loans to the tune of Rs. 2 lakhs from its bankers and will be having Rs. 3 lakhs as deposits from the prospective setting agents.

The directors, among whom are included Mr. J. R. Mehta (Chairman), Mr. Devji Rattansey, Mr. G. Bhagwandas, Mr. L. S. Dabholkar and Mr. S. H. Shah, claim that they will be able to save considerable expenditure on transport costs through elimination of intermediaries because the essential raw materials to be made use of are available in abundance in the neighbourhood of Kalyan. The company has outstanding debentures or debenture stock or any other loan capital.

URMI CHEESE AND CHEMICALS

THE URMI CHEESE AND CHEMICALS COMPANY, which proposes to manufacture all varieties of cheese, butter, ice-cream and other dairy products and chemicals at a factory to be set up at Manuya, in Mysore State, is entering the market on March 22 to raise from the public capital worth Rs. 25 lakhs, in the form 2.5 lakh equity shares of Rs. 10 each. The promoters and the directors of the company and their friends have already agreed to put in another Rs. 25 lakhs. The list closes on March 29 or earlier at the discretion of the directors.

The manufacturing programme is envisaged to be implemented in two phases. The first phase will cover manufacture of such specialised varieties of cheese as Cheddar, Bali, Edam and Craft, together with butter and ice-cream. In the second phase, the company will undertake the production of condensed and concentrated milk, baby food, skimmed milk powder and allied dairy chemicals like casein glue, casein hydrolysate, loctose, calcium lactate, protein hydrolysate, whey etc. The plant will have a capacity to produce 27 tons of cheese, 14 tons of butter, 9 tons of casein and 8 tons of calcium lactate per month and 2,000 litres of ice-cream per day.

The total capital outlay on the project is estimated to be around Rs. 59.68 lakhs. Since the share capital will be making available only Rs. 50 lakhs, the company proposes to borrow from banks and other institutions a sum of Rs. 9.68 lakhs.

The project is to be implemented with Czech collaboration. The plant is to be supplied by Messrs. Strotexport, one of the leading manufacturers of such machinery in the world.

The Board of Directors of the Company include Maharaja Fatehsinghrao Pratapsinghrao Gaekward of Baroda (Chairman), Kumararajah M.A.H. Muthiah Chettiar of Chettinad, Dr. Raman C. Amin, the promoter of the scheme (he will be the Managing Director and the technical consultant of the company), Mr. S. G. A. Naidu, Mr. Kanti Lal Keshavlal Kapadia, Mr. Raojibhai Patel, Mr. Mulraj Goculdas Dungersey and Mr. Susserwanji Hormusjese C. Dinshaw.

ELCON ENGINEERING COMPANY

THE ELCON ENGINEERING COMPANY, Bombay, is entering the market, probably towards the end of this month, to raise from the public Rs. 34.50 lakhs in equity shares of Rs. 100 each. The company has an authorised capital of Rs. 100 lakhs, of which Rs. 10 lakhs is already paid-up. The new issue is for a total sum of Rs. 50 lakhs. Of this, the directors and their friends are taking up capital worth Rs. 13.10 lakhs and shares worth Rs. 2.40 lakhs are to be given to the foreign collaborators. The rest of the issue is being thrown open to the public for subscription.

The proceeds of the issue are to be utilised to meet part of the expenditure on the expansion programme of the company which includes undertaking the manufacture of such engineering items as reduction gears, troughing idlers, etc., at its new factory set up in Anand, in Gujarat. The company is at present manufacturing mechanical equipment like belt conveyors, screw conveyors, gravity roller conveyors, etc., at its Parel factory. Technical collaboration for the new lines of manufacture has been arranged with the Birmingham firm of Alfred Wiseman and Company. The company has entered into another agreement with the U.K. firm of Spenser (Melksham) Limited of Woltshire, for acquiring this firm's goodwill in regard to manufacture and sale of its patented idlers.

The expansion programme involves an outlay of Rs. one crore. Half of this cost will be met by the new issue. The Industrial Credit and Investment Corporation of India is providing a loan of Rs. 20 lakhs (Rs. 12 lakhs in foreign exchange and the rest in rupees). The balance of Rs. 30 lakhs are envisaged to be procurred through bank borrowings and customers' deposits.

The Company's present production facilities have a capacity to give annually a turnover of about Rs. 25 lakhs. The new facilities are expected to account for a turnover of Rs. 35 lakhs a year. The company is said to be having on hand orders for about Rs. 75 lakhs and more are stated to be under negotiation.

PRABHAT UDYOG LIMITED

PRABHAT UDYOG LIMITED, Bombay, a public limited company which has taken over the Prabhat (Stove and Lamp) Products Company (Private) Limited as a going concern, is to raise from the public capital to the tune of Rs. 29.40 lakhs, all in equity shares of Rs. 100 each. The authorised capital of the company is Rs. 3 crores. The issued capital is Rs. 60 lakhs. Of the issue capital, the directors and their friends have already taken up shares worth Rs. 30.60 lakhs—Rs. 7.20 lakhs worth of shares in consideration of the purchase price of the private company taken up by them and the balance Rs. 23.40 lakhs worth of shares against cash.

The proceeds of the issue are to be utilised to expand the manufacturing programme of the company, which is estimated to cost Rs. 70 lakhs. A loan of Rs. 10 lakhs is being negotiated with the ICICI. The expansion programme includes raising the present production facilities to enable manufacture of 5,00,000 liquid gas stoves, 1,00,000 lamps, 1,00,000 gross gas mentals and spare parts worth Rs. 18.50 lakh per annum.

Technical collaboration is envisaged to be secured from a well-known Swedish firm. Negotiations have almost been completed in this respect; a collaboration agreement is expected to be reached soon.

When the expansion programme is completed by the end of 1964, or early 1965, the turnover of the company is expected to go up to about Rs. 2.25 crores. At present the turnover is around Rs. 81 lakhs.

Economy

PLEA FOR TAX CONCESSIONS

FROM THE speech of Mr. Mariwala at the 54th annual general meeting it is clear that he in no way wanted to raise the controversy regarding the private and public sectors. As a matter of fact he never questioned the role of the public sector. What he stressed in his address was that there should be a reapparaisal of the tax structure and the difficulties in obtaining industrial licenses for various projects should be done away with. His plea was that the earlier position should be restored, according to which it would be possible to get a license by a letter without the production of a collaboration agreement. He did not deny the incentives that have been provided by the Government to the private sector. What actually he meant was that the disincentives that exist in the form of present taxation structure should be re-examined. It is all very well to say that our taxation structure should be integrated as has been underlined by Mr. Morarji Desai, Union Finance Minister; but the great inconvenience that is caused to the assessees and fruitless expenditure that is involved in the administration of taxes like wealth tax, estate duty and gift tax, one wonders whether they have much utility. It goes without saying that they yield very little revenue. Besides they not only act as a damper on savings and investment but even cause a good deal of harassment.

Then again the plea made by Mr. Mariwala against the proposal of having a ceiling on urban incomes is quite justified as a proposal of such sort can act as a disincentive to expansion. There is definitely a logic in the statement the ideological consideration should not weigh with the Government in devising measures for mobilising the resources for the public sector only because the existing sources of revenues would not adequately meet the requirement of investments in the private sector. There is no doubt that there should be a healthy co-ordination of the different sectors and it is only to be wished that such an approach would always be followed.

Regarding the loan to the Jayanti Shipping Company it was questioned if the financial assistance given to it was justified under the circumstances to build up a balanced merchant navy for India. The Minister for Finance, however, remained quiet on this issue. The fact cannot be denied that private sector is put to a lot of inconvenience in obtaining licences and the taxation structure is quite cumbersome. It is high time that the whole problem is viewed in a right perspective and an end is put to disincentives that stand in the way of the rapid economic growth of the country.

Hindustan Lever

EXPANSION PLANS

HINDUSTAN LEVER would soon be making a big leap forward as its expansion plans are now more or less ready. Besides strengthening its activities in the existing fields, Hindustan Lever proposes to enter into new industrial fields like human foods which they would try to preserve by dehydration in initial stages and later by more sophisticated methods. They would also try to secure a balanced food for cattle as it is considered that a balanced food might help in procuring better yield in the form of milk and other milk products. Hands in the oil seeds field are also likely to be strengthened. The most notable project is likely to be the establishment of research departments on the lines of those in the United Kingdom and United States. Research facilities have been lacking and it is considered that by adopting the methods practised in the Western countries better results perhaps may be achieved. Research has an importance in every field of the economy and there is no doubt that here also it would help in delivering better goods.

So far as modernisation programme is concerned, it was emphasized by Mr. Tandon, Chairman of Hindustan Lever Ltd. recently that their existing equipments would be modernised as far as possible. The foreign exchange difficulties, of course, were there but a good deal would be done within the resources. Although

the share of Hindustan Lever in the Indian market in soaps was not very large, the quality of the goods produced by it cannot be questioned. At present its share was not more than 16 to 17 per cent whereas the total quantity of soap consumed in the country was in the neighbourhood of 5 lakh tons of which about 1,60,000 tons came from the organised or powered sector and the remaining two-thirds from the small or non-powered sector. Prices of Hindustan Lever were more or less the same in most countries except in Indonesia where they tended to be distorted. Needless to say that Uni-Lever has made good progress in its selling and marketing methods, still a good deal remains to be achieved. Propaganda in countries like Africa and other under-developed countries needs to be much more intensive in case progress of the concern is to be enhanced.

Voltas

AN EXPANDING ORGANISATION

FROM THE statement of the Chairman of Voltas Ltd., Mr. J. D. Choksi, circulated with the annual report, it is apparent that the company has entered new fields, new products and an ever widening horizon with increasing pursuits and increasing activities. Marketing and distribution is the important part of Voltas activities. Such an excellent network of regional facilities and services has been built up that it can be compared with any top organisation any where in the field. Its focal points are the large branches at Bombay, Calcutta, Madras, Delhi and Bangalore, which in turn are served by regional offices, area offices and service establishments within the territories of these branches. The branches themselves are again sub-divided into administrative units and into product-wise trading sub-divisions. Close co-operation is maintained in all important matters, between general management, branches and divisions to achieve speedy and quick service and smooth movement of the various complicated parts of the Voltas organisational machine.

In the field of manufacturing activities, Voltas have tried to promote local manufacture by bringing about collaboration between foreign associates and suitable Indian manufacturers retaining for itself the distributorship of the locally made products in succession to the distributorship of the previously imported products, and by associating with other foreign principals as partners in manufacturing ventures. The result of all this is that today Voltas have achieved a position where more than 50 per cent of their business is in products of Indian manufacture, as, for instance, pharma division (94 per cent), machine tools (54 per cent), textile mill-stores (63 per cent) and airconditioning 52 per cent. A number of obstacles, of course, are still there within the manufacturing field and sooner they are done away the better it would be. From the progress attained, one can say with confidence that Voltas have a bright future ahead.

FROM THE CAPITAL'S CORRIDORS

POWER SUPPLY IN W. BENGAL AND BIHAR

FURTHER details are now available of the Sachdev Committee's findings in regard to the recent failures of power supply in West Bengal and Bihar. The Committee had reviewed the present power situation in these two States, including the areas served by the power system of the Damodar Valley Corporation, in consultation with the engineers of the West Bengal State Electricity Board, the Bihar State Electricity Board and the Damodar Valley Corporation, and assessed the power requirements in different parts of West Bengal and Bihar during the Third Plan period in the light of the demands for power anticipated to mature by 1965-66.

The West Bengal State Electricity Board's memorandum on the proposed augmentation of the generating capacity in West Bengal, submitted to the Committee on August 16, 1961, was considered in detail. In this memorandum, the State has been divided into the following four 'power' regions: (i) Areas covered by the Damodar Valley Corporation; (ii) Areas covered by Bandel-Durgapur-Calcutta-Azimganj system; (iii) Malda-Dinajpur area; and (iv) North Bengal area.

In the West Bengal areas covered by the Damodar Valley Corporation, both inside and outside the valley, the Committee assessed the load demands as presented by the West Bengal State Electricity Board in its memorandum, in reconciliation with the corresponding estimates made by the Central Water and Power Commission according to its detailed load survey. The final estimate of loads by 1965-66, as accepted by the committee, is as follows:

Name of Load	M.D. as anticipated by 1965-66 (M.W.)
(a) Inside the Valley.	
Licensees:	
i. Dishergarh E.S.	18.39
ii. Seebpore E.S.	24.20
W.B.S.E. Board's loads at Pandaveswar, Benachetty and Burdwan.	16.00
Ropeway Project, Seebpore	6.50
Indian Iron and Steel	
i. Kulti	9.00
ii. Burnpur	9.00
Hindustan Steel, Durgapur	64.00
Hindustan Cables, Rupnarayanpur	0.80
Chittaranjan Locomotives	14.40
N.C.D.C. Loads	5.60
Panchet Development Scheme	20.00
Traction loads at Burdwan, Durgapur and Ramkanali.	25.79
Aggregate	213.68
Simultaneous demand (diversity factor 1.2)	=178.07 MW
(b) Outside the Valley.	
Licensees:	
Calcutta E.S.C.	99.00 (Firm)
W.B.S.E. Board's loads at Kharagpur, Midnapore and Purulia	22.40
Traction Loads:	
i. Howrah	10.50
ii. Belmuri	10.00
iii. Purulia	8.50
iv. Kharagpur	7.00
v. Kolaghat	9.50
Aggregate	166.90
Simultaneous demand (diversity factor 1.2)	**=155.58 MW**

BANDEL-DURGAPUR-CALCUTTA-AZIMGANJ SYSTEM

This area would cater to the power requirements of the newly developing industries in Bandel and Durgapur regions as well as the tube-well irrigation loads and Farakka Barrage construction, power in the Azimganj supply area and the Calcutta region (with the exception of 99 MW of bulk supply to be obtained from the Damodar Valley Corporation by the C.E.S.C.). The anticipated demands for this region, as finally accepted by the Committee, are as follows:

Name of Load	M.D. as anticipated by 1965-66 (M.W.)
Group A—Durgapur System.	
Coke Oven, Durgapur	9.90
J. K. Industries (Aluminium), Asansol	15.00
B&C Machinery Mfg. Co. ACC-Vickers-Babcock group	6.00
Mining Machinery Project	16.00
W.B.S.E. Board's loads at Durgapur, Sonamukhi, Bankura, etc.	6.00
Bulk supply to Damodar Valley Corporation from Durgapur Power Station of West Bengal	7.50
Small Industries, Refractories, etc.	4.00
Kreba scheme	6.50
Optical Glass	3.00
Binani Metals	10.00
Misc. Industries	2.00
Sub-Total	85.90
Fertilizer Plant	40.00
Alloy Steel Plant	40.00
Aggregate Group A	**165.90 MW**
Simultaneous Demand	**138.25 MW**
GROUP B—BANDEL-AZIMGANJ AREA	
1. Railway Traction:	
i. Eastern side of River Hooghly	42.50
ii. Bandel	10.00
2. Tube-well Irrigation	20.00
3. Calcium Carbide, Birlapur	10.00
4. Gourepore E. S. including Gourepore Rayon	26.00
5. Farakka Barrage	10.00
6. Unforeseen	16.50
Group B Aggregate	**135.00 MW**
(Simultaneous demand	**112.50 MW)**
GROUP C—CALCUTTA AREA	
1. Bulk supply to Calcutta Electric Supply Corporation System comprising:	
i. C.E.S.C. Licensed area	167.00 MW
ii. Section 27 consumers	65.00
iii. North Calcutta, South Calcutta, Howrah, Amta and Singur-Tarakeswar grids	33.00 MW
Group C Aggregate	**265.00 MW**
Grand Total of Simultaneous Demand	**515.75 MW**

The Damodar Valley Corporation claimed that the Fertilizer Plant and the Alloy Steel Plant loads really fell within its area of supply. The Committee, however, found that the Fertilizer Plant will be located within the Durgapur Industrial Belt and the Damodar Valley Corporation could not meet the Alloy Steel Plant load by the end of 1963, when it was stated to be required. The Committee, therefore, decided to include these two loads under West Bengal's Power System. Accordingly, the total simultaneous demand in the Durgapur-Bandel-Calcutta-Azimganj area by 1965-66 is estimated at 515.82 MW.

MALDA-DINAJPUR AREA

The anticipated loads in this area, as finally accepted by the Committee, are as follows:—

Name of Load	M.D. as anticipated by 1965-66 (M.W.)
1. Tube-well Irrigation	4.50
2. Spinning Mill	1.50
3. Food Preservation	0.50
4. Bulk supply to English Bazar, Dinajpur, Balurghat, Raiganj etc.	4.00
Aggregate	10.50 MW
Simultaneous Demand (diversity factor 1.2)=8.75 MW	

NORTH BENGAL AREA

The anticipated loads, as finally accepted by the committee, for the North Bengal area as follows:

Name of Load	M.D. as anticipated by 1965-66 (M.W.)
Bulk supply to Darjeeling, Kalimpong, Gindharia, Jalpaiguri including rural loads	15.00
Tea gardens outside Darjeeling Municipal Area	5.00
Unforeseen	4.00
Aggregate	**24.00 MW**
Simultaneous Demand (diversity factor 1.2)=20 MW	

With regard to the present power situation in the Calcutta area and the demands anticipated there by 1965-66, the Committee met the representatives of the Calcutta Supply Corporation as well as the representatives of the various Chambers of Commerce and Industries in West Bengal, besides the engineers of the West Bengal State Electricity Board. According to the load forecast submitted by the Calcutta Electric Supply Corporation, a basis of 9 per cent annual increase has been adopted and the present demand of 406 MW (1960-1961) was thus anticipated to grow to 640 MW in 1965-66. Taking into consideration the restrictions now imposed by the Government of West Bengal under Section 22 B of the I.E. Act in this area, and also the estimates of the Central Water and Power Commission and the West Bengal State Electricity Board in respect of North and South Calcutta, Howrah, Amta and Singur and the area served by the Calcutta Electric Supply Corporation under Section 27, the Committee reckoned that the 1965-66 demand would be of the order of 670.00 MW in the Calcutta system, as against the estimate of 640 MW by the Calcutta Electric Supply Corporation. The representatives of the Chambers of Commerce and Industry, however, reckoned the present load in the Calcutta area to be of the order of 430 MW on an unrestricted basis and estimated that by 1965-66 this demand would be 935 MW. Further, they felt that the conditions such as the facts of growing population and certain other industrial developments including the development of the port at Calcutta, called for planning for power development in the Calcutta area on the basis of 1000 MW demand target by 1965-66. The Committee, however, taking into account all possible factors and in particular the power shortage position till the end of 1963, felt that the estimate of 670 MW for Calcutta area by the end of the Third Five-Year Plan period, would be more realistic.

BIHAR'S REQUIREMENTS

The final estimates of loads, as accepted by the Committee, for South Bihar and North Bihar regions are as follows:—

Name of Load	M.D. as anticipated by 1965-66 (M.W.)
SOUTH BIHAR INSIDE THE VALLEY	
Licensees:	
i. Sijua (J) E.S.	28.00
ii. Dishergarh E.S.	10.70
A.C.C. Sindri	6.40
Sindri Fertilizers	10.00
Hindustan Steel, Bokaro	40.00
Bihar State Electricity Board.	
i. Ganeshpur	6.70
ii. Digwadih	6.00
iii. Bokaro	8.50
iv. Tilaiya	5.00
v. Ramgarh	12.00
vi. Badjna	6.60
Multipurpose Engineering Works Ramgarh or Ranchi	15.00
Refractory, Ramgarh	2.50
National Coal Development Corporation loads	60.00
Traction loads:	
i.. Tilaiya	12.40
ii. Nimiaghat	10.50
iii. Maithon-Kumardhubi	10.80
Unforeseen	9.00
Aggregate	**260.10**
Simultaneous demand	**216.75 MW**

SOUTH BIHAR: OUTSIDE THE VALLEY

(a) Loads committed by Damodar Valley Corporation for supply.	
1. Tisco	81.00
2. ICC, Ghatsila	6.00
3. Bihar State Electricity Board:	
i. Sultanganj	10.00
ii. Patna	15.00
iii. Jamshedpur	8.00
iv. Gaya	6.00
v. Barun	27.00
vi. Mosabani	1.00
4. Traction loads:	
i. Barun	10.00
ii. Manikui	13.50
iii. Gaya	9.50
iv. Mosabani	6.50
Aggregate	**193.50 MW**
Simultaneous Demand	**174.75 MW**
(b) (Loads beyond Damodar Valley Corporation's commitment and to be supplied by the Bihar State Electricity Board.)	
5. Tilaiya	5.00
6. Maithon-Sultanganj	19.40
7. Jamshedpur	60.60
8. Mosabani	5.60
9. Gaya	7.75
10. Patna	31.25
11. Barun-Pipradi	54.20
12. Tisco	59.00
13. ICC Ghatsila	4.00
14. Kenskosi	10.00
15. Hatia	50.00
16. Karamnasa	5.00
17. Traction loads	36.10
18. Unforeseen Industries	12.50
Aggregate	**360.40 MW**
Simultaneous Demand	**310.16 MW**

The aggregate load on the Damodar Valley Corporation system inside the Valley is estimated to be 260.10 MW and the Committee's estimate of aggregate demand outside the Valley amounts to 193.50 MW, giving a total of 453.60 MW. Assuming a diversity factor of 1.2 on all the loads excepting the TISCO demand of 81.00 MW, the system demand by 1965-66 is estimated to be 391.50 MW. on the Damodar Valley Corporation system. As regards the loads outside the Valley, in South Bihar, which are to be supplied by the Bihar State Electricity Board, the aggregate is 360.40 MW. This aggregate load will result in a system demand of 310 MW with the application of a diversity of 1.2 on all the loads excepting on item 12 above, which relates to a specific bulk supply demand of the steel mill.

NORTH BIHAR REQUIREMENTS

Name of Load	M.D. as anticipated by 1965-66 (MW)
1. Oil Refinery, Barauni	15.00 (Firm)
2. Railway Coach Factory	1.50
3. Steel Re-rolling Mills	4.00
4. Sugar Mills	0.50
5. Paper Mill, Darbhanga	3.00
6. Paper Mill, Samastipur	3.00
7. Cotton Mill, Samastipur	1.70
8. Dairy Products, Barauni	0.50
9. Cold Storage	2.00
10. Industrial Carbon	2.50
11. Drum Manufacturing	1.00
12. Railways at Barauni	2.50
13. Bulk Supply to West Bengal at Katihar	10.00 (Firm)
14. Bulk supply to Nepal at Biratnagar	5.00
15. Mokameh	6.00
16. Fertilizer and unforeseen	25.00
17. Rural and town loads	36.70
Aggregate	**119.90 MW**
Simultaneous Demand	**104.08 MW**

The aggregate of 119.9 MW in North Bihar will result in a system demand of 104 MW by 1965-66 by considering the demands under items 1 and 13 as firm and not subject to diversification.

To sum up, the anticipated system demands by 1965-66 in the West Bengal, the Damodar Valley Corporation and the Bihar areas, on the basis of both fertilizer and steel alloy loads considered under West Bengal, are as follows:

West Bengal	M.D. as anticipated by 1965-66 (MW)
Bandel-Durgapur-Calcutta-Azimganj area (including 405 MW at Calcutta)	920.75
Malda-Dinajpur area	8.75
North Bengal area	20.00
	949.50 MW
DAMODAR VALLEY CORPORATION	
West Bengal Territory:	
i. Inside Valley	178.07
ii. Outside Valley	155.58
Bihar Territory:	
i. Inside Valley	216.75
ii. Outside Valley	174.75
	725.15
BIHAR	
North Bihar area	104.08
South Bihar area	310.16
	414.24

AVAILABILITY OF POWER

The power availability (in MW) during the Third Plan period in the Bandel-Durgapur-Calcutta-Azimganj region is estimated to be as follows:

Name of Station	1961-62 Inst. (MW)	1961-62 Firm (MW)	1965-66 Firm (MW)
Durgapur	60	60	210
Bandel			247
Aggregate-firm capacity less 12½ per cent towards auxiliaries & losses	—8		—57
Net saleable capacity	52		400
Add available capacity from the CESC including bulk supply from the Damodar Valley Corporation	361	382	405
Total saleable capacity	413	484	805

The anticipated demand in this region by 1965-66 in 921 MW and, therefore, the shortage will be 116 MW.

The West Bengal State Electricity Board has put forward the following proposals for augmentation of generating capacity during the Third Plan in addition to its Bandel Thermal Power Station scheme:—

(i) Extension of the Durgapur Termal Power Station by a third 75 MW generating unit at an estimated cost of Rs 677 lakhs.

(ii) Installation of a new thermal power station at Azimganj with 2 Nos. 50 MW generating units and necessary transmission lines at an estimated cost of Rs 1037 lakhs.

(iii) Extension of the Gourepore Thermal Power Station by installing a packaged thermal generating unit of 15 MW at an estimated cost of Rs 180 lakhs.

PROPOSALS TO MEET SHORTAGES

The Committee has carefully considered these proposals. Considering the anticipated power shortage in the Durgapur-Bandel-Calcutta-Azimganj region and with particular reference to the acute shortage in the Calcutta area, the Committee feels that steps should be taken to provide additional generating capacity over and above that which has been accepted under the Third Plan of West Bengal. The Committee has recommended the following for consideration:—

(i) Installation of one 15 MW power plant at Gourepore, stated to be available from an East European country. This will take about two years for commissioning under a guarantee. This will help in reducing the shortage of power in 1963 to this extent.

(ii) Installation of a third 75 MW generating unit at the Durgapur Coke Oven power station of West Bengal. This should be completed and commissioned by 1964-65.

(iii) A new thermal power station proposed by the West Bengal Government at Azimganj, consisting of two 50 MW units each. The Committee understands that certain preliminary steps, such as selection of the site, have already been taken by the West Bengal Government and the latter feel confident that the commissioning of these units could be achieved by the close of the Third Plan or latest by the beginning of the Fourth Plan period.

With the sanction and achievement of the works mentioned above, it should be possible to make available an additional firm power of 122 MW as below:

	Installed capacity	Firm capacity
Gourepore	15 MW	15 MW
Durgapore	75 MW	75 MW (one 75 MW unit at Bandel has been kept out for overhaul)
Azimganj	100 MW	50 MW (one 50 MW unit out for overhaul)
Total	190	140

After allowing for auxiliaries and transmission losses at 12½ per cent, the net firm power available will be 122 MW.

The Committee considered the question of finding the necessary resources for the projects mentioned above. The cost of these works has been estimated by the West Bengal Government at about 19 crores. While the Durgapur extension will need a foreign exchange component of about 4.5 crores, the balance of the foreign exchange component in respect of the other projects, is proposed to be met under trade agreements with East European countries. The Government of West Bengal has assured us that the total capital cost will be available by adjustment within the State ceiling laid down by the Planning Commission.

It will be seen that while the above projects, if accepted, will go a long way to meet the situation as will develop by the end of the Third Plan period, the

shortage of power will continue till the end of 1963, when the two 75 MW units under erection at Durgapur, are commissioned. This shortage, the Committee is afraid, will have to be faced.

Planning being a continuous process, the Committee has urged that the planning for the Fourth Plan should be taken up from now. The target for power production was 5.7 million KW in 1961 and is placed at 13.4 million KW in 1966, 23 million KW in 1971, 35 million KW in 1976, and 50 million KW in 1981. It is already known that due to transport difficulties, it has been decided to locate the power station at the site of coalfields. It should be clear that it is easier to transmit power than transport coal. It is also intended to operate power stations with diesel in the areas, where coal were not available. Regional grids is another device in the plan to secure eqitable distribution of power within a region.

BOKARO STEEL PROJECT

The U.S. Ambassador in India, Professor Galbraith, confirmed that negotiations for the Bokaro Steel Project were in progress. This plant, he stressed, was likely to produce steel at competitive prices. It is gathered that a million ton plant with the American equipment might cost fifty per cent higher than the British or the German sponsored plants at Durgapur or Rourkela. This increased cost would naturally be reflected in the cost of end products. One alternative of avoiding this higher cost of steel would be to start the Bokaro Project with five million tons capacity. The Bokaro Steel Project is no longer a project for the Third Five-Year Plan so far as its production was concerned. The Ministry of Steel is already having second thoughts and is examining the possibilities of making it a two-million tons project with possible extension later to five or six million tons.

MORE U.S. GRANT

Agreements have been concluded with the Government of India which provide for American grants to the extent of Rs. 25.3 crores for five projects. The Malaria Eradication Programme and a Project to double India's grain storage capacity are the largest recepients of the grants. The three remaining projects are concerned with the training of engineers and craftsmen.

The grants total $8.4 million (Rs. 4 crores) in dollars and Rs. 21.3 crores in Indian currency. The latter amount has been raised by the sale proceeds of agricultural commodities supplied to India under the U.S. Food for Peace (PL. 480) programme.

The Government of India's Malaria Eradication Programme will receive two American grants to the extent of Rs. 11.3 crores. Of this, $7.2 million (Rs. 3.4 crores) is in foreign exchange and will be utilised for the purchase of 12,000 long tons of DDT powder and 85 million tablets of chloroquine phosphate (an antimalarial drug) from abroad. The grant from PL. 480 proceeds will be utilised for the rupee expenditure of the programme.

For modern storage of foodgrains a grant of Rs. 10.3 crores will be given from the PL. 480 funds in order to double existing foodgrain storage capacity of 2.5 million tons during the course of the Third Five-Year Plan. The American grant will meet the entire anticipated cost of the programme during the first two years of the plan.

During the Third Plan, the Central and State Governments have undertaken the establishment of fourteen regional engineering colleges which will have a total annual admission capacity of approximately 3,500 students. In addition to the basic branches of engineering, the colleges will conduct degree courses in certain specialized fields like mining, metallurgy and chemical engineering.

The United States will make available a grant of Rs. 2 crores from PL. 480 sale proceeds to meet the expenses incurred on the colleges during the first two years of the Plan.

It is estimated that during the Third Plan 1.3 million craftsmen will be required to meet demands of fast growing industries. At the end of the Second Plan there were 167 craftsmen training centres. The Third Plan proposes to increase the number of these centres to 318. This will increase their admission capacity to 100,000 trainees from 42,000. A grant of Rs. 1 crore from PL. 480 funds will be available to meet the costs of this programme during the first two years of the Third Plan. By earlier agreements the United States had made available $1.4 million (Rs. 67 lakhs) in foreign exchange for the supply of equipment to a number of craftsmen training centres in India.

The Indian Institute of Technology, Kanpur, is being developed into one of India's finest institutions of higher technological learning. A consortium of nine well-known American educational institutions was formed recently to aid the Kanpur Institute. A dollar grant of $1.2 million (Rs. 57 lakhs) has been provided to meet the cost of securing the services of one American Programme Director, and twenty professors and consultants. The grant will also provide for the training abroad of 30 Indian members of the staff of the Institute and for the purchase of certain commodities. The latest grant brings the total American contribution to the Institute to Rs. 2.2 crores, of which some 70 per cent has been in foreign exchange.

OUTPUT CAPACITY OF WORKSHOPS

The Government of India is making a detailed study of the production capacity of workshops in India, both in the private and the public sectors, which are supplying major items of equipment required for irrigation and power projects in the country. These items include gates, hoists, penstocks, tubing, gantry cranes and transmission line towers, some of which are at present imported and involve expenditure of foreign exchange.

The study will be undertaken by a group of officers with Mr. P. P. Agarwal, Joint Secretary of the Ministry of Irrigation and Power as the Chairman.

The study group will also draw up a phased programme, in the context of the needs of irrigation and power projects in the Third Plan, with necessary financial implifications, particularly in terms of foreign exchange, for manufacture of items, presently imported, to the extent to which indigenous capacity can replace them.

It will also recommend on the balancing machinery to be installed in selected public works departments and irrigation and power workshops in the States, so that these might be equipped for the manufacture of items of machinery, for which they are best fitted. Moreover it will study what type of additional design and testing facilities should be provided for manufacture of transmission towers and ancilliary equipment. The report is expected to be ready in April 1962.

PATHRATU THERMAL POWER STATION

A two-member technical delegation will leave for Moscow towards the end of the current month to finalise designs, contracts, and orders for equipment for the Pathratu thermal power station in Bihar. Mr S. S Kumar, Chairman, Central Water and Power Commission, and Mr. P. R. Sundaram, Chief Engineer, Bihar State Electricity Board, will be in Moscow for a period of about two weeks. The Soviet authorities have agreed to supply plant and equipment for the Pathratu power station, which, under the Third Plan, will have 5 additional units of 50 MW each. There is, however, a possibility of installing three units of 100 MW each, and the delegaion will discuss the proposal with the Soviet authorities.

The Secretary of the Ministry of Irrigation and Power, Mr. M. R. Sachadev, has addressed the various State Governments seeking their consent to set up a River Board, initially for the River Basins of Mahanadi, Mahi, Narmada and Tapti. The Boards are intended to advise the Governments interested in relation to such matters concerning, the regulation or development of an inter-State river or river valley or any specified part of it. A Board may be empowered to perform all or any of the following functions:

(a) advising the Governments interested on any matter concerning the regulation or development of any specified inter-State river or river valley within its area of operation and in particular, advising them in relation to the co-ordination of their activities with a view to resolving conflicts among them and to achieve maximum results in respect of the measures undertaken by them in the inter-State river or river valley for the purpose of:

(i) conservation, control and optimum utilisation of water resources of the inter-State river;

(ii) promotion and operation of schemes for irrigation, water supply or drainage;

(iii) promotion and operation of schemes for the development of hydro-electric power;

(iv) promotion and operation of schemes for flood control;

(v) promotion and control of navigation.

(vi) promotion of afforestation and control of soil erosion;

(vii) prevention of pollution of the waters of the inter-State river;

(viii) such other matters as may be prescribed;

(b) preparing schemes, including multi-purpose schemes, for the purpose of regulating or developing the inter-State river or river valley and advising the Governments interested to undertaken measures for executing the scheme prepared by the Board;

(c) allocating among the Governments interested the costs of executing any scheme prepared by the Board and of maintaining any works undertaken in the execution of the scheme;

(d) watching the progress of the measures undertaken by the Governments interested;

(e) any other matter which is supplemental, incidental or consequential to any of the above functions.

The Central Government, after consultation with the Governments interested, may empower the Board to perform all or some of the functions.

OIL INDIA'S PROGRESS

Oil India Limited had drilled 122 wells by February 23, 1962—105 in Nahorkatiya and Hoogrijan Concessions and 17 in Moran. A total of 83 wells have turned out to be commercial producers of oil, 74 in Nahorkatiya and 9 in Moran. Seven wells in Nahorkatiya and one in Moran have turned out to be gas producers. Sixteen wells in Nahorkatiya have to be tested further. It is hoped that a good number of these will eventually turn out to be producers of oil. Fifteen wells (8 in Nahorkatiya and 7 in Moran) have proved to be dry. The following table sets out the position clearly:

Type of Wells	No. of Wells	
	Nahorkatiya & Hoogrijan	Moran
Drilled	105	17
Oil Producers	74	9
Gas Producers	7	1
Awaiting further test ..	16	Nil
Dry	8	7
Being Drilled	1	Nil
Footage drilled upto 23-2-62	11,45,051	1,92,275

With the wells already drilled and tested, Oil India is capable of producing slightly over two million metric tonnes of oil per annum. It is supplying about 2.5 lakh tonnes per annum to the Assam Oil Company and a total quantity of about 68,500 tonnes of crude had been supplied to the Noonmati Refinery by rail tankwagons upto 22-2-1962. The company expects to complete a minimum of 40 more wells by mid-1963 in order to meet its commitments of supplying crude to the public sector refineries when Barauni goes on stream.

MANGANESE ORE EXPORTS

The State Trading Corporation has been able to step up the export of manganese ore to Norway and Sweden as is evident from the following figures of total imports of manganese in these countries against India's exports:

(In Thousand Tons)

Country	1956	1957	1958	1959	1960	1961 (upto Nov. '61)
Norway						
Total imports	2,17.53	2,86.60	1,96.58	2,18.10	3,08.37	2,25.37
India's exports	9.70	9.50	4.86	2.50	10.80	8.20
Sweden						
Total imports	29.00	39.31	72.57	85.73	54.10	87.48
India's exports	7.60	9.80	17.32	4.50	16.42	6.11

BRIEFS

A World Bank economic mission led by Mr Peter Wright is arriving in India shortly to assess India's foreign exchange requirements for the last three years of the Third Plan. It will include Mr. R. Pantanali, Mr. S. Plasschaert and Mr. R. Sadobe. It will appraise economic progress India has made since Mr. Paul Hoffman made his report. This appraisal will enable the consortium of aid giving countries meeting in Washington in May to announce aid for three remaining years of the Plan. Another important visitor arriving here is the Vice-President of International Finance Corporation Mr. Morton Rosen. He, it is expected, will explain new policy of his organisation which has decided participation in equity capital and thereby become risk taking investor. Mr. Rosen arrives here on March 19, to stay in India till April 3, including one week in New Delhi. He will be preceded by Mr. Von Hoffman of IFC who arrives here on March 4.

An order for £400,000 worth of machine-tools has been placed with the British company of William Asquith Ltd. by Heavy Electricals Ltd., of Bhopal. The contract is for 35 machine-tools, including heavy-duty boring, milling, and radial drilling machines. All are to be made within the next 12 months. These machines are to be used in a new factory at Bhopal.

COMPANY AFFAIRS

BANK OF INDIA

The Bank of India during the year to December 31, 1961, improved its deposits to over Rs. 125 crores as against Rs. 109 crores a year before. This rise in deposits was accompanied by a similar increase in advances which were recorded at Rs. 98.53 crores against Rs. 83.86 crores a year before. Naturally enough, the bank improved its profits. After providing for taxation, development rebate reserve and depreciation there was a balance of Rs. 1.10 crores which nearly 7 lakhs more than the previous year's profit of Rs. 1.03 crores. An interim dividend was paid for the half year ended June 31, 1960 at the rate of 8 per cent subject to deduction of tax at the prescribed rates on the paid up capital of Rs. 3 crores which absorbed Rs. 24 lakhs. Rs. 15 lakhs were transferred to the reserve fund and Rs. 19 lakhs towards the payment of bonus to staff The directors have now proposed the payment of a final dividend for the half year ended December 31, 1961 at the rate of 12 per cent subject to deduction of tax making 20 per cent for the year which will absorb Rs. 36 lakhs. The bank during the year under review opened new branches at Bhavnagar and Jamnagar in Gujarat, at Ghatkopar, Tardeo, Mandvi and Electric House in Bombay, at Janpath, Karol Bagh and Khan Market in Delhi, at Ernakulam in Kerala and at Madurai and Coonoor. From the above working it seems the bank had a favourable year of working.

STATE BANK OF PATIALA

After providing for taxation and necessary provisions, the net profit of the State Bank of Patiala for the year 1961 amounted to Rs. 5.31 lakhs as against Rs. 2.92 lakhs for the nine months ended December, 31, 1960. The income of the Bank is placed at Rs. 58.75 lakhs as against Rs. 37.57 lakhs for the nine months ended December 31, 1960. A sum of Rs. 1.10 lakhs has been allocated to the Reserve Fund and the provision to bonus to staff amounts to Rs. 2.04 lakhs. The proposed dividend at the rate of 6 per cent (subject to tax) will absorb Rs. 2.10 lakhs.

Against a paid-up capital of Rs. 35 lakhs, the Reserve Fund now stands at Rs. 23.70 lakhs. The deposits and other accounts have gone up from Rs. 10.72 crores to Rs. 12.01 crores at the end of 1961. The Bank's investments have recorded an increase of Rs. 74 lakhs during the year and at the end of the year 1961, the investments at or below market value stood at Rs. 7.44 crores which was 61.95 per cent of the deposits. Advances outstanding as on December 31, 1961 amounted to Rs. 4.16 crores as against Rs. 3.55 crores at the end of 1960. The ratio of advances to deposits was 34.64 per cent as against 33.12 per cent at the end of 1960. In addition to the three branches opened during the year, the Bank secured licenses for opening six more branches.

INDIAN ALUMINIUM

The Directors of Indian Aluminium Company, Limited have recommended a divided of Rs. 1.50 on each ordinary share and a dividend of Rs. 5.55 (less Income-tax payable by the Company) on each preference share of the company to be paid in respect of the year 1961. Both these dividends will be subject to deduction of income-tax at source.

Sales of the Company's products totalled Rs. 839 lakhs in 1961 compared to Rs. 801 lakhs in 1960. Net profits in 1961 were Rs. 111.0 lakhs, after providing Rs. 60.6 lakhs for depreciation and depletion, Rs. 455 lakhs for Development Rebate Reserve, and Rs. 53.0 lakhs for taxation. This compares with a net profit in 1960 of Rs. 119.9 lakhs after providing Rs. 55.3 lakhs for depreciation and depletion, Rs. 2.6 lakhs for Development Rebate Reserve and Rs. 99.0 lakhs for taxation.

The company made significant progress during the year on the expansion programme. The expansion of the smelter at Hirakud in the State of Orissa from a rated capacity of 10,000 tons per annum to 20,000 tons per annum was completed in November, five months ahead of schedule. More than half of the expanded facility was put into production in November and the balance is scheduled for production in April 1962 when it is expected that the additional hydel power will become available. The company's new extrusion press at Alupuram, Kerala State, started production in November and the expansion of sheet rolling facilities at Belur, in West Bengal, is scheduled to be completed in July 1962. Most of the expanded facilities at the company's alumina plant at Muri in Bihar have already been commissioned. The latest estimate of the total capital expenditure on these projects indicates that the expansion programme will be completed within the original budgeted figure.

THE MADRAS INDUSTRIAL INVESTMENT CORPORATION LIMITED.

N.B. This announcement is not an offer to sell. The offer for sale is made by the prospectus, on the terms of which alone will applications be considered.

ISSUE OF Rs. 1,00,00,000/- 4-3/4% 1974 BONDS AT PAR.

(Principal and interest of the above issue guaranteed unconditionally by the Government of Madras - vide G.O. Ms. 895 (Industries) dt. 12.2.62)

Copies of the prospectus and forms of application in connection with the above issue of the Madras Industrial Investment Corporation Ltd. may be obtained from the Corporation's Registered Office at 38, Whites Road, Royapettah, Madras-14.

***

The subscription list will open at 10 A.M. on 1st March 1962 and will close at 4 P.M. on 15th March 1962 or earlier as soon as subscriptions approximating to the amount issued to the public have been received, but not earlier than 4 P.M. on 7th March, 1962.

Corporation Meeting

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LIMITED

STATEMENT OF THE CHAIRMAN, SHRI G. L. MEHTA

The Annual General Meeting of the Shareholders of the Corporation will be held at the Registered Office of the Corporation, 163, Backbay Reclamation, Bombay 1, on Tuesday, March 27, 1962, at 4 p.m. The following is the Statement by the Chairman, Shri G. L. Mehta, circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1961.

I have great pleasure in welcoming you and placing before you the Seventh Annual Report of the Board of Directors of the Corporation for the year ended December 31, 1961.

2. On January 5, 1962, ICICI completed seven years of operation. During this period, we have assisted 133 industrial concerns and in the process, have developed our own procedures. Industrial development is an inter-related process: no enterprise is self-sufficient. We, ourselves, come to realise this more fully as we build up our portfolio. Industrial development is a chain reaction and has a multiplier effect and we are gratified that ICICI's finance has been contributing to this growth in various ways.

3. The business of a development bank like ours is often taken to be merely that of providing finance for industrial projects. While this is true and the need for finance is the basic factor which brings together a development bank and its clientele, I feel that finance is not the only common ground in this relationship.

4. The process of development basically consists in drawing into industry a large number of people hitherto engaged in other occupations. It means that a trader or a landlord or a technician decides to become an entrepreneur, that an agriculturist or an artisan decides to become a factory worker. This is what happened in the industrially developed countries a century or two ago, and this is what has been going on in India for some decades, although the pace has been accelerated only during the last few years.

5. What is this recent upsurge due to? On the one hand, import cuts and re-direction of channels of trade have closed traditional avenues of vocation for many businessmen. On the other, with sudden curbs on imports, rewards in manufacturing activity have become more attratcive; for, much of the recent upsurge in industry is based on import substitution, where demand is assured.

6. Recently, however, the situation has been changing. The projects planned on the basis of the 1958 foreign exchange crisis are beginning to yield results, and gradually the supplies of many goods have started to catch up with the demand. The next phase of development will have to be based on the general growth of the economy and will require a much more acute cost consciousness on the part of the promoters. The search for worthwhile projects will have to be more painstaking, and quick and large profits more difficult to come by.

7. It is in this context that this Corporatoin's policies and procedures for appraising applications should be judged. I say this because there seems to be a misunderstanding in some quarters about the manner in which we process applications and the time taken in this exercice. I shall try to explain briefly how and why we act as we do.

8. What do we want to be assured about? First, about the market. Many promoters base their calculations on the prevalent shortages. However, the project planned by them may come into production two or more years later—which is the time relevant for considering the demand for the product. Moreover, others are likely to have had the same bright idea, and consequently, the market situation in the future is not likely to be the same at the time the project goes into production as it is today. Hence, in assessing the the market for a product, we take into account not only the present shortages (as evidenced by high market prices or long waiting lists with manufacturers) but also the likely growth in demand, the scope for further import restrictions and the probable increase in internal supply based on licences given and likely to materialise. Recently, we have taken steps to build up a market assessment cell in our Project Department, which we trust will go to strengthen our appraisals on the marketing side.

9. Another matter we want to be assured about is the cost of the project and the means proposed to be adopted to finance it. As regards the cost of a project, we have observed that there is generally a tendency to underestimate it. Promoters are prone to ignore a large amount of financial expenditure which is not for "hardware." Expenditure on buildings, machinery and equipment is more easily visible than pre-operative items. In fact, we have calculated that such financial expenditure often forms about 30 per cent of the expenditure on what I have called above the "hardware" of development. Similarly, working capital needs tend to be under-estimated. It is for these reasons that we endeavour to obtain a detailed break-up of the cost of a project according to certain standard categories.

10. A simple rule which too many promoters tend to ignore is the need to arrange for the total financing of the cost of the project in advance. I referred, in my last Annual Statement to you, to the tendency of many promoters to keep the equity base small. While we try to consider each case individually and allow for a large debt element in the capital structure where necessary, we feel that a company, particularly a new one, should have a strong equity base, for several reasons: a large equity base keeps the burden of interest low during the unproductive period of the enterprise; and by keeping the borrowing capacity unimpaired it enables the enterprise to borrow when actual costs go above the estimates, as they normally do; moreover, in the more competitive conditions which are likely to come about, a strong equity base will strengthen the capacity of the entrepreneur to withstand competition and weather temporary adversities. Although such advice on the capital structure may not always be palatable to some promoters, in the long run, it is sure to stand them in good stead.

11. In this connection, I would like to refer to recent developments in the stocks markets. After the spurt in 1960, the market for industrial shares has recently quietened down. For quite some time, preference shares have, owing to various factors, been almost orphaned on the market. As we seek to attract investment in industry, it will be necessary to offer investors securities which appeal to their requirements. Financial institutions whose eventual objective (even when they immediately take up shares or grant loans) is to dispose of their holdings on the market and thus to turn over their resources to be able to help newer industries, are interested in seeing that promoters offer securities acceptable to the public. In the more discriminating times ahead, it will be necessary to offer to investors securities like preference shares and debentures with varying features like participation in extra profits, option to subscribe to or convert into ordinary shares and so on. Unless our entrepreneurs are willing to offer such terms, they will find themselves more and more inhibited in their development plans by lack of finance.

12. As a financial institution whose profits are dependent on the prosperity of its client, we naturally look closely into the profitability of an enterprise before deciding on our assistance. One factor which governs profitability is the prospective market for the product to which I have alluded earlier. A second factor is obviously the cost of production of the article proposed to be manufactured. Our entrepreneurs have become so used to conditions of artificial scarcity brought about by import and licensing restrictions, that the need to produce at economic costs is not adequately recognised. Besides lack of cost control procedure, this is also due to a failure to spread overheads over the maximum possible output. The results are vividly reflected in our performance in the sphere of exports which has failed to keep pace with the requirements of the economy. The somewhat easier supply position in the markets for many products recently has made entrepreneurs more cost-conscious, and I trust this will help not only our exports but also the domestic consumer.

13. It is on an independent and careful assessment of all these factors that ICICI takes a decision for providing finance. This necessarily takes time which, in its turn, depends a good deal on the thoroughness with which requisite information and data are supplied and relevant queries answered. On an average, we find that it takes 3 to 4 months from the preliminary approach by a client to come to a decision although in some cases it takes much less.

14. But the sanction of finance by ICICI does not end the relationship between the Corporation and its client—rather, it is only the beginning. Legal formalities have to be gone through, agreements signed, import licences obtained, and all the procedures involved in operating an industrial enterprise in a planned and complex economy gone through. The completion of legal formalities alone takes considerable time, as the company has to satisfy various conditions, titles have to be examined, and so on. On an average, we have found that it takes about six months after sanction is given, to enter into the Heads of Agreement with a company. This, however, is not a net loss of time as it is used to push ahead the project further in other respects.

15. Some of the formalities which have to be fulfilled before a loan is disbursed—for example, those connected with import control which is intended to prevent imports of goods which can be locally manufactured—cannot be avoided. We ourselves try to expedite decisions where we can. What is more, we try to adjust our procedures so as not to let them come in the way of expeditious carrying out of the project.

16. Disbursement of funds is a slow process. Some who look at our liquid funds, perhaps, feel that we are not using our funds fast enough. This is not so. Money, for a development banker, is his raw material and he has to keep a sufficient stock of it to enable him to continue sanctioning finance. Moreover, unlike raw materials where supply is continuous, for a development banker the funds do not ceaselessly flow in—we cannot hope to approach the market for funds every now and then and for small amounts. Hence, we have to carry a stock of funds which will last us a year or more. By now, you will find that our sanctions have more or less caught up with our resources of about Rs. 45 crores.

17. Even after all the legal and procedural formalities have been completed and disbursements have started, it takes quite a while to complete the utilization of funds and bring the plant to the stage of production. Machinery and equipment are not normally readily available across the counter; delivery periods for equipment are anything from one year to three years or even more. This means that even when disbursement starts, it has to be spread over a period of two to three years. According to our estimates, out of our sanctions we can expect to disburse about 20 per cent in the first year, about 40 per cent in the second and about 40 per cent in the third year. But this kind of time lag is inherent in the business of development banking.

18. I have spoken at length on all these aspects because the services we provide incidental to the provision of funds are no less important. We have familiarised entrepreneurs with modern practices of preparing project reports to assess the viability of projects. We help them to have a capital structure which in our view, would stand up to difficult times. We assist them with their problems with the Government and we watch over the progress of the project both during the construction and the operating years. We do so in a helpful and constructive spirit keeping the broad requirements of development in view. Over the years, we have found that our clients have come to understand and appreciate our procedures and the need for them. There is a growing interest among the investing public in industrial growth. The appearance of two financial dailies should help them to judge intelligently industrial prospects.

19. I should say in fairness that the emphasis which we have been laying over the years on the need to have a full and detailed appraisal of each project and on the desirability of having closer understanding at all stages among the different financing institutions participating in a project is being increasingly appreciated by the various agencies concerned. This is a healthy development in the sphere of industrial finance which should pave the way particularly for financing large-sized projects which could only be carried out with the joint efforts of a number of financing institutions, including the Life Insurance Corporation, commercial banks, investment trusts as well as development banks.

20. I had mentioned the total cost of the projects assisted by us in 1960, in my Statement to you last year. In 1961, of the gross assistance of Rs. 13.76 crores sanctioned, Rs. 11.94 crores is in respect of new projects. The total cost of these projects would be Rs. 65.49 crores (Rs. 48.66 crores for fixed assets and Rs. 16.83 crores for working capital). This cost will be incurred over the next two or three years. When the units reach full production, the turn-over of the projects would be about Rs. 54 crores. The companies will finance the cost of the project by raising ordinary share capital of Rs. 16.72 crores, preference share capital of Rs. 0.81 crores, loans of Rs. 23.07 crores, and bank borrowings and cash accruals of Rs. 24.89 crores. Of the foreign exchange cost of Rs. 10.53 crores for the projects, ICICI has agreed to provide Rs. 7.40 crores.

21. In keeping with our increasing operations, we have been making efforts to increase our resources. In

the third quarter of 1960, we were able to obtain from the Kreditanstalt of the Federal Republic of Germany, a loan of DM 5 million (about Rs. 60 lakhs); other institutions in India have also obtained loans from the Kreditanstalt. This is the first West German credit we have been able to secure and legal formalities for operating it are being worked out.

22. In September 1961, when I visited the United States, I initiated discussions for a further substantial loan from the World Bank. Since then, negotiations have been going on both with the World Bank and with the Government of India on various aspects of the loan. I am glad to report that these negotiations have reached an advanced stage. I take this opportunity to express our gratitude to the World Bank for their continued confidence in ICICI. I would also like to thank the Government of India for its co-operation and assistance in our work.

23. ICICI's operations have been growing steadily, and as a result, the Corporation's profits before tax increased from Rs. 62.61 lakhs in 1960 to Rs. 74.27 lakhs in 1961. After providing for tax (Rs. 27.75 lakhs), the balance carried to revenue appropriation account is Rs. 46.52 lakhs in 1961 against Rs. 37.67 lakhs in 1960. As required by Article 163 of the Corporation's Articles of Association, we have set aside Rs. 11.50 lakhs out of this to the Special Reserve and Rs. 1.00 lakh to the General Reserve. We have also transferred the entire amount of realised profit of investment being a sum of Rs. 24.26 lakhs (net) to Capital Reserve. The Directors recommend a higher dividend at the rate of 6½ per cent as against 5.75 per cent last year.

24. In my last Annual Statement to you, I had referred to the need for budgetary relief to finance corporations in view of their important role in industrial development. The Government of India, in its last budget for the year 1961-62, was good enough to give finance corporations some relief in taxation. I should like to express our thanks to the Finance Minister for providing this relief, which will strengthen to some extent the financial position of finance corporations. However, I hope that in view of the increased role envisaged for finance corporations in future, the Government will see its way to provide some suitable incentive to strengthen their financial position.

25. For effective implementation of the Plan objectives, mobilisation of capital is required on a much larger scale than in the past. We who are charged with the responsibility of assisting the private sector have a heavy task in future and only through the co-operation of all concerned can we hope to accomplish it. I trust in this constructive endeavour we shall have your good wishes and support.

26. Before concluding, I should like to mention that towards the end of March a conference is being convened under the auspices of ICICI, of development banks in Asia, to discuss various problems of development banks operating in Asia. This conference will be the first Regional Conference of Asian Development Banks and I am sure that, besides the useful personal contacts that would be brought about, the deliberations of the Conference would help to focus attention on various important aspects of development banking in Asia and assist us in our day-to-day tasks.

Company Meeting

VOLTAS LIMITED

STATEMENT OF THE CHAIRMAN, MR. J. D. CHOKSI

The 7th Annual General Meeting of Voltas Limited was held at Bombay House, Bruce Street, Bombay, on the 26th February 1962.

The following is the Statement by the Chairman, Mr J. D. Choksi, which had been circulated with the Annual Report:

This statement on the Company's affairs rounds off a seven year span in this year of the gathering of the Constellations. Not a long period in the life of individuals, much less of corporations; but nonetheless in the ephemeral world of trade and commerce, to which we belong, where fortunes are made and lost every day, it is an innings of respectable dimension.

2. At this seventh milestone, I propose to describe to you the organisation of the Company, how it works, and enumerate its many-sided activities so that shareholders may have a more clearly defined image of Voltas.

3. What is Voltas? What do they deal in? A typical answer is: "They are airconditioning people, of course"! This is true as Voltas has become a by-word for airconditioning and refrigeration. However, the important airconditioning and refrigeration department represents only 13 % of our gross turnover.

4. I should describe our Company as firstly and primarily an importing and distributing house. We are not mere selling agents, or even sole selling agents, according to the normal understanding of that term. We purchase from manufacturers as principals and sell to clients in our own name. We normally hold ourselves responsible not only for selling a product, but also for its erection, where it is plant or machinery, and for elaborate after-sales-service. This is an important side of our activities often overlooked. For a buyer, who acquires a piece of complicated equipment, it is important to have the seller provide after-sales-service for many years. The legal restriction of a 5 year tenure of distributorship, therefore, is hardly appropriate in our case and should not be made applicable to organisations like ourselves, since most plant and machinery have a longer life than 5 years and can best be served after sale by the manufacturers or their representatives. This is one of those instances where the Company Law ill serves the Indian importing house, which performs services such as ours, and discriminate against the Indian importing house in favour of his foreign rivals incorporated abroad.

5. Marketing and distribution, as far as we can foresee the future, must remain the most important part of our activities, because we are essentially a trading organisation. This trading organisation is divided into two

Once again Hanover becomes the meeting place of the Industrial World—here you learn the latest production methods and techniques...exchange ideas with leading International Industrialists...see over 5000 exhibits from all over the World...feel the driving force of Modern Industry!

Groups exhibited include:
Mechanical and Electrical Engineering, Iron and Steel, Non-Ferrous Metals, Chemicals and Plastics, Rubber, Building materials, Precision Mechanics and Tools, Optics, Office Equipment China, Ceramics, Glassware, Clocks and Watches, Jewellery, Hardware and Cutlery, Handicrafts, Gift Articles—and many others.

GERMAN INDUSTRIES FAIR
HANOVER • WEST GERMANY

35, Mount Road, Madras 2

main groups—one 'Engineering' and the other, for want of a better name, called the 'Marketing' group.

6. The Engineering group consists of 6 independent divisions, each of which handles a range of products which can be conveniently grouped or brought together into one division and handled as such by the staff of that division. Among these 6 independent divisions are the Airconditioning and Refrigeration division, the Agricultural & Construction Equipment division, the Mechanical division, the Electrical division, the Machine Tool division and the Textile and Paper Machinery division each with its own specialists and technicians serving our nation-wide centres and our clients in the remotest parts of the country.

7. The Marketing group consists of two main divisions—one dealing in Drugs and Pharmaceuticals and the other in Chemicals, Vitamins and miscellaneous items of general merchandise.

8. Each of the divisions to which I have referred, while making use of the Company's Central Services, such as Accounts, Publicity, Personnel, Marketing Services, Liaison and Warehousing operates on an all-India basis under the control of General Management. Each division is headed by a manager with wide operating authority, who is fully responsible for the business results of his division. The sales organisation of each division is tailored to satisfy the requirements of consumers. In some divisions, sales are made direct to the end users and consumers; in others, the services of dealers, wholesalers, retailers and stockists, are utilised. The operation of some of these divisions depends on the provision of adequate personnel and facilities for continuous after-sales-service where these are required, since in India reliable service facilities are few or non-existent. Some divisions maintain a fully equipped all-India service organisation to serve the country-wide needs of our clients. The standing and reputation of our Company is due, in large measure, to the excellent after-sales-service provided to clients, large and small, for a wide range of equipment.

9. The central organisation just described, with its trading divisions, is supported by widespread regional service units and stations. For a marketing and distribution organisation of our size and complexity this is essential, if we are to reach every distribution point effectively. We have over the years created and built up a network of such regional facilities and services which, we believe, is second to none. Its focal points are the large branches at Bombay, Calcutta, Madras, Delhi and Bangalore, which in turn are served by regional offices, area offices and service establishments within the territories of these branches. The branches themselves are again sub-divided into administrative units and into product-wise trading sub-divisions. These operate under the control of the branch manager who is the chief representative in the area of the branch within the general framework of the policies laid down by general management and specific policies devised by the divisional managers in regard to the handling of their respective lines and products. Close co-operation is maintained in all important matters, between general management, branches and divisions to achieve speedy and quick service and smooth movement of the various complicated parts of the Voltas organisational machine.

MANUFACTURING ACTIVITIES

10. I have given you a fair picture of the organisation covering our trading operations in the above paragraphs and I should now like to deal with the other major branch of our activities, namely, manufacture. I repeat what I have said on previous occasions that, in the context of our national Plans, the foreign exchange situation and the development of the Indian Commonwealth of States within this Continent of ours, we are firmly convinced of the necessity of promoting local manufacture. We have endeavoured to achieve this objective in one of three ways:

(i) by bringing about collaboration between foreign associates and suitable Indian manufacturers retaining for ourselves the distributorship of the locally made products in succession to the distributorship of the previously imported products;

(ii) by either ourselves, or our parent body, Tata Sons, associating with other foreign principals as partners in manufacturing ventures;

(iii) by undertaking certain lines of manufacture ourselves.

Local manufacture has made substantial progress. Many of our divisions have today achieved a position where more than 50% of their business is in products of Indian manufacture, as for instance, Pharma division (94%), Machine Tools (54%), Textile Millstores (63%) and Airconditioning (52%).

11. A programme for transfer and expansion of our facilities and lines of manufacture from the restricted area of Chinchpokli to the new Thana unit has been worked out.

12. A number of obstacles lie athwart the manufacturing field. A manufacturing licence granted today by the Government does not commit the Government to import essential components and raw materials provided in the phased programme submitted in the licensee's application for manufacture. Consequently, every manufacturer today, who has to rely on even a small amount of imported components and raw materials, lives in constant dread of his requirements being cut substantially if not banned altogether. This is hardly an inducement for the starting up of new enterprises. Even while one appreciates Government's difficulties in the matter of foreign exchange, some way must be found if the country is to progress into ever widening fields of industrial activity. We, for our part, would prefer to see a stricter control over the grant of licences for new manufacturing units, which depend to some extent on imports of components and raw materials, rather than have these licensed in the first instance and then come to grief later for want of essential components or raw materials which can only be imported.

13. Your Company has made steady progress over the last few years both in the trading and manufacturing fields. In spite of severe import restrictions leading to the belief in some quarters that "import houses have had it," we are firmly convinced that there will always be room for a flexible, well balanced and well organised import organisation in India's economy. We refuse to consider our trading activities as a thing of the past or on the wane. On the contrary, we plan to consolidate and expand our position in this field. We hope to retain our pre-eminent position as importers and distributors and at the same time to strengthen our industrial base within the country. New fields, new products and an ever widening horizon with increasing pursuits and increasing activities—that is what sums up Voltas. We look forward to the future with well-founded confidence.

14. Once again, I will close, by expressing our appreciation, on behalf of the Board and all of you, of the excellent services performed by one and all within the organisation during the year.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Report of the Auditors

TO THE PRESIDENT OF INDIA,

We, the undersigned Auditors of the State Bank of India, appointed under Section 41(1) of the State Bank of India Act, 1955, do hereby report to the Central Government upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1961.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office and the Local Head Offices at Bombay and Calcutta and the Returns submitted and certified by the Secretaries and Treasurers of the Local Head Offices at Madras and New Delhi, by the Manager, Pakistan Branches and by Branch Agents, which Returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory; (iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank; (iv) that the Returns received from the Local Head Offices at Madras and New Delhi and from the Branches of the Bank have been found adequate for the purpose of our audit; (v) that the Profit and Loss Account shows a true balance of profit for the period covered by such account; (vi) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with the law; and (vii) that, in our opinion, Books of Account have been kept by the Bank as required by law.

The audit of the Books and Accounts of the Central Office has been carried out jointly by Messrs. S. B. Billimoria & Co. and Messrs. Ray & Ray. The audit of the Books and Accounts of the Local Head Offices has been carried out at Bombay by Messrs. S. B. Billimoria & Co. and at Calcutta by Messrs. Ray & Ray.

8th February, 1962.

A Standard of Excellence

Century's
FASHION FABRICS

More than 60 years ago people used to wear CENTURY Fabrics. The demand is more today. Why? Because they know now, as they knew then that these fabrics are backed by unique experience in textile manufacture and earnest striving to produce better and better quality.

INDUSTRIAL **IBCON** CONSULTANTS

in the expansion of TEXTILE INDUSTRY

IBCON offers to intending promoters of textile industry, comprehensive consultancy services comprising:

- Project study and financial estimates.
- Project design including equipment, buildings, power, steam, water-supply, etc.
- Advice on purchase of equipment from India or abroad by tenders or negotiations.
- Supervision of construction of buildings and erection of equipment and services.
- Commissioning and operation.
- Senior and supervisory staff selection:
- Management organisation, clerical procedures, quality control, scientific cost and wage schemes.
- Technical assistance after commissioning to ensure successful and profitable operation.
- Also production planning, waste control, stores, dyes and fuel consumption.

IBCON PRIVATE LIMITED

Head Office: Adelphi, 119, Queen's Road, Bombay 1

Branches:
5, RUSSEL STREET, CALCUTTA 16.
BRADY'S BUILDING, MAHATMA GANDHI ROAD, KANPUR.
GEORGE OAKES BUILDING, SRI NARASIMHARAJA SQUARE, BANGALORE 2.
85, WARD PLACE, COLOMBO 7, CEYLON.

Also in: U.K., Pakistan, Burma, Iraq, Chile, Argentina, Brazil, Mexico and Hongkong

MARCH 9, 1962.

A New Export Policy?

THE Joint meeting of Import Advisory Council and the Export Promotion Advisory Council on the 5th and 6th March, provided a quite exceptional new slant on export promotion. For one thing, this is the first time that the two Councils have met together and the conclusion was quickly, and rightly, drawn that in the current payments position this could only mean that import demands would be greatly subdued and much the greater portion of time occupied by export promotion. Secondly, the Ramaswami Mudaliar Committee's report was presented to Government on 5th morning and there were abundant references to it in Mr. K. C. Reddy's reply, although as he explained, the subjects to which references were made were not those arising from the report only, but had been under the purview of the Government for some considerable time. Finally, Sir Ramaswami Mudaliar himself addressed the meeting, making some particular recommendations "in his personal capacity," but leaving no doubt in any one's mind that a national crusade for export was essential if the very serious problems facing the country were to be solved. All in all, the meeting was a rewarding one, with a feeling that something dramatic is to come when the Government of India passes orders on the Committee's report at the end of this month.

The meeting was particularly useful because it created this feeling of animated suspense. Much the biggest obstacle to be overcome is the relatively neutral attitude taken both by businessmen and the Government towards the problems of export promotion. Various suggestions were made in the meeting and particular attention was devoted to the possibility that each industry might co-operate to raise a fund so as to help export promotion such as, in fact, the bicycle industry has already done for itself for some time. It was pointed out increasingly that the emphasis had moved away from compulsory exports, but that the element of compulsory performance for the country as a whole lost no element of its force. The general psychology of the country had to be geared to an all-out effort. In this crusade some special monetary incentives had to play a part; but the first step was a great effort of national will.

Both Sir Ramaswami Mudaliar and the Minister of Commerce and Industry, Mr. K. C. Reddy, spoke in particular about the need for some additional incentive in the form of income-tax relief for export earnings above a certain standard quantum. The loss of revenue involved might not, in ordinary circumstances, be significant if in fact exports rose substantially and profits rose with them. There are, indeed, certain circumstances in which a rebate of this kind might, in fact, be a positive gainer in rupees as well as in foreign exchange. But there is no need to assume that this will be the case in the short period. These incentives are for the long haul, and must be backed by a large number of others, particularly the provision of raw materials of adequate quantities and suitable prices and transport facilities which should be available to those units which can export. But as Sir Ramaswami Mudaliar made it clear, not every unit could export. The facilities should be available to all to see whether or not obstacles could, in fact, be overcome if reasonable facilities were available. Not the least of the Government's contributions in addition to these incentives, it was argued, was an entirely new approach to International Fairs with businessmen selling their products hard and contracting with their counterparts overseas instead of presenting what is usually a drab collection of exhibits without any immediate business sales effort.

There seems to be a new sense of reality in respect of Government of India's policy in this matter. It is hoped that the Ramaswami Mudaliar Committee's report, when available, will spell out the needs of policy and provide a concrete framework in which action might be taken over a long period. But even before the orders of Government issue, some preliminary attack needs to be made on the citadels of "safe" finance, particularly in the States.

Particular attention was directed at this meeting to the wide range of levies which went into the structure of costs of India's export industries. This was by no means confined to sales taxes on final products, on which refund was not available, or export duties, such as that on tea, which continue long after they are helpful in the national interest. It was pointed out that the States were very apt to assume that, because they had a source of revenue in sales tax, they should hold the Centre to ransom and argue that they would not release any revenue unless it was made good by the Central Exchequer; in other words,

that all remissions were to be guaranteed by the Centre before the States co-operated. These very States demanded further resources from the Centre by way of planning grants. It is not clear how the Centre is both to meet all remissions and grants and at the same time promote exports in the manner which India's balance of payments now requires. One cannot be quite sure as to what exactly the position of India's exports would be if all sales taxes were remitted. But there is a great likelihood that India as whole would gain on the swings what we lose on the roundabouts. In other words, the foreign exchange would be made available in larger quantities as a result of increased export earnings. There would be no objection, it would seem, to linking additional foreign exchange allocations to the States to their rupee remissions under some reasonable basis. There are great administrative problems here involved, but immediately the Government of India must convene a conference of State Finance Ministers to make it clear that the direction of its policy is to remit all taxes on exportable goods and that States could not, in a national effort of this kind, argue that their rupee finances were more important than the earning of desperately required foreign exchange as a whole.

Some procedural changes, such as an annual licensing period and simplification of procedure, are necessary on their own account. But whether this is possible or not, India's export industries must now operate with a flexibility and an assurance equal to that displayed by our main competitors abroad. This cannot be done when uncertainty prevails, as, for example, in the cotton textile industry where the great shortage of cotton is causing serious concern. Immediate action is called for by the Government on the raw cotton front. This can well be treated as a touchstone of the anxiety which the Government of India professes in respect of the long delays of procedure and debate before a major crisis descends upon the industry. If this could be solved within the month, it would be more powerful in carrying conviction on the new look in policy than many pages of recommendations on the Ramaswami Mudaliar Committee report.

Burma Under Military Rule

GENERAL Ne Win is back again in the saddle with the reins of power firmly seized. The coup came as a bolt from the blue not only to the world outside but to the entire Burmese nation. The thoroughness with which secrecy was maintained by the military junta is an index of its determination to retain control over the governmental machinery until it is fully satisfied that civilian rule could be restored with safety and that may mean much longer than General Ne Win's first tenure of a year and a half. Between October 1958 and March 1962 is a wide gulf. There was no seizure of authority then, but the General was installed in power by Prime Minister U Nu and his colleagues as there was no alternative means to put an end to the rot. How far the invitation to take over the government was voluntarily extended by the Cabinet and how far it was arranged has remained an object of speculation. The correct position seems to be that it was a combination of both. The justification offered for the interim army rule in 1958 was "grave disturbance" and it was acknowledged to be true. After eighteen months the parliamentary form of government was restored. General Ne Win earned a reputation as a sensible and moderate army leader without lust for power. That is a saving grace and a positive source of hope for the Burmese people.

What was the impelling motive behind the present coup? The suddenness with which military rule was clamped without the accompaniment of drastic army measures (save the arrest and removal of U Nu and other ministers to an undisclosed destination) and the calm which has prevailed without a sense of terror have left most observers wondering why the army leaders took this action. General Ne Win's announcement over the radio on the fateful day makes a cryptic mention of "vastly deteriorating situation" and the threat of "disintegration". These are two distinct sources of trouble and the attention of those who have a genuine curiosity about the raison d'etre of the coup has been focused more on disintegration than on the deterioration in the situation. There have been two major developments which corroborate both the reasons. In the immediate context and on a superficial view, the threat of likely disintegration may appear to be more serious, but in the longer and keener perspective the creeping deterioration was a greater potential menace to the future of Burma.

The widespread commotion which was caused by the U Nu Government's decision to nationalise the import trade was a symptom of economic instability, which opened up an excuse for the penetration of Communist influence in the administration. There was no doubt an illicit traffic going on in import licences, which were sold at a high premium and they, in turn, caused severe price inflation, giving a boost to the black market in a tight situation of physical shortages. The Government decided to nationalise import licensing through the agency of the State-owned Joint Venture Corporation in which participation was made obligatory for the individual licence-seekers of Burmese nationality on the ground that it was they who sold the licences to foreign traders operating inside the country. About 3,000 importers stood the risk of being seriously affected. But the vital aspect of this drastic and unpopular remedy was that the people were left unconvinced how inflation could be curbed by mere nationalisation, when the supply of goods was totally out of alignment with the demand. The three-day strike, staged in Rangoon against the move on the eve of its enforcement on March 1, created a mood of strong resentment against the Government's leftist import policy which was believed to be barren.

Thakin Tin, Minister for Finance and Planning, with profound pro-Chinese leanings, was the author of this policy and one who seems to have influenced U Nu in applying it. Was this the thin end of the wedge? U Nu had reaffirmed his intention to retire in about two years more. Thakin Tin seems to have been gathering the strings of power in his hands with the help of the hard core of a pro-Communist group inside the Cabinet. The army officers read the signs and the younger elements are believed to have exerted pressure on General Ne Win to wait no longer.

Disintegration was the more tangible and the more immediate of the two threats to Burma's security. This threat came from the border hill tribal States which renewed intermittently their demand for full internal autonomy and the autonomy of their conception was equated with virtual independence. The Chin State on the Indian border and the Karen State contiguous with Thailand were not such potential threats to territorial integrity as the Kachin State and specifically the Shan State on the Chinese border. Their persistent demand for concessions led U Nu to refer the investigation to the Advisory Committee under Dr. Ba U, a former President of the Union, and their report was under study. Meantime, the Shan leaders had gathered in the capital city for a high-powered conference at the time of the coup. They attempted to bully the Government under threat of secession and insisted on a federal form in substitution of the unitary form of government. General Ne Win is reported to have asserted after the assumption of power that federalism was impossible since it would lead to the destruction of the Union.

The army officers' diagnosis of the potential dangers to the security of the State seems plausible. But the remedies they will have to devise and apply successfully raise real difficulties for General Ne Win and his lieutenants in the Revolutionary Council. The Regional Councils for the border hill States have been dissolved, but the identity of the States is preserved and local councils with a narrow base are being set up under amy commanders at the head. In the economic sphere priority in development is to be given to agriculture which is the mainstay of the domestic and export economies. But the fight against inflation demands a multi-pronged attack. The General has re-affirmed the policy of non-alignment and friendship with all, but the giant neighbour in the North-East will have his own view of the changed set-up in Burma. Parliament has been dissolved, but the constitution has not been abrogated so far. General Ne Win is speaking of the need to reform it.

The Assam Oil Royalty Dispute

THE breeze that has been blowing of late over the oil royalty issue in Assam appears to be gathering itself into a storm. The State Government has not only refused to issue a prospecting licence to Oil India Limited in respect of Second Supplementary Agreement signed by the latter with the Central Government in July last, but has also threatened to attach the company's property if royalty on the crude extracted in Nahorkatyia, Hoogrijan and Moran oilfields is not deposited with the State Treasury on the old basis, i.e. at the rate of approximately Rs. 7 per metric ton. The company has paid royalty at the rate of Rs. 4.8 per metric ton, consequent upon the reduction in the wellhead price of crude in terms of the new pricing formula evolved by the Central Government. The reduced royalty, the State Government contends, will adversely affect its finances. But this view is not shared by the Central Government which is of the opinion that the loss to the State would be more than made up by the increased production of oil.

It is indeed intriguing why the Assam Government raked up the issue just before the elections, having not opened its lips for nearly a year when the new pricing formula, which while keeping the rate of royalty at 10 per cent of the wellhead price of crude, reduced the wellhead price by Rs. 22 (the cost of transporting crude from the oilfields to the Nunmati Refinery) to Rs. 48 per metric ton, was evolved. But that apart, the dispute threatens to upset the development of this vital industry and, unless it is resolved expeditiously, it can do incalculable damage to the economy of the country. Oil India's exploration programme in the new concession area, which was to start in November last, has already been delayed by full one year; monsoons in the State will set in shortly. There is fear that should the State Government carry out its threat of seizure of the company's property, operations in the Nahorkatyia-Moran area, where work has not yet been adversely affected, may also come to a standstill. Further, if the State Government applies the same rules to the public sector ONGC operations, as it should, the oil prospecting programme in the Sibsagar area would also be put out of gear.

The State Government may be justified to some extent in its attitude on the matter, for the Central Government effected the change in the crude pricing policy without taking it into confidence. It has a right to protest. But if the protest goes so far as to jeopardise the development of the industry, it can hardly be endorsed by any right thinking person. The Central Government has, thus, done well in advising the State Government not to take any precipitate step without its permission. It is to be seen whether the State Government would heed this advice in the larger interests of the country's economy.

On the basis of the facts available, the intransigent attitude of the Assam Government is not easily understandable since the revised crude pricing formula had to be evolved to make the working of the Nunmati Refinery, which was set up under great political pressure from the State, economic. On the old basis of royalty calculation, this refinery would have to pay about Rs. 92 per ton of crude supplied to it. This obviously is too high a price. Moreover, the State Government levies sales tax on the petroleum products produced in the State. That should compensate it for any loss on royalty account. Assam Government cannot have it both ways. It will be injuring its own interests by persisting with its demand for restoration of the *status quo ante* in regard to oil royalty.

Undoubtedly, the storm cannot last very long. Regulation and development of oilfields and mineral oil resources under the Constitution is the task of the Central Government, although the States are entitled to royalty from these resources. Strangulation of the development of oilfields by the States only on the score of royalty payment can hardly be justified in terms of the provisions of the Constitution. But this dispute, along with the recent West Bengal's controversy with the Central Government over the leasing out of coal-bearing areas, raises an important issue which has to be faced squarely. The issue is whether for fostering the development of the mineral resources of the country, the decisions taken by the Central Government should be binding on the States or not. In the interests of accelerting the tempo of economic development and to avoid unnecessary disputes between the States and the Union Governments, especially in the event of different political parties being at the helm of affairs in the States and at the Centre, it is imperative that Parliament should define Central ascendancy in such cases.

A DELHI DIARY

THE MIGHTY BALLOT

NOW that the elections are over, I think we can all pay a handsome tribute to the mighty ballot which has accomplished so many things which neither parties nor personalities could ever achieve on their own. Quite apart from the dismissal of the Chief Minister of Madhya Pradesh and 34 other Ministers, there is the lavish indication of displeasure in ways which it is difficult here for me to analyse quickly. I will, however, produce shortly some new statistics to show how difficult it is to assess or digest the millions of votes which have been cast. The famous Rule of Three by which one might be tempted to conclude that one gets as many seats as one can get votes has fallen even more terribly than any other electoral assumption. Whether this makes a case for Proportional Representation or not I dare not say. When I was young—a quarter of a century ago!—the Liberals in the United Kingdom had a massive campaign for proportional representation, the leading apostle for which was Professor Ramsay Muir. As a young man it looked to me as an extraordinarily fair way of reflecting the electorate. Alas, there were weightier arguments in practice against it. One of the weightiest against it now would be that the Congress Party would not have a majority either at the Centre or in any except five States. This is too drastic a measure of equity for the appetite of a party which is strongly favoured by our non-proportionate electoral system!

While I am not in favour of proportional representation (P.R. for short) as this would hurt my favourite (?) party, I think there is something to be said for the West German method of election by which there is a pool of votes after the election so that defeated candidates might get in on a basis of a second round preference. The theory is that that portion of the popular vote which does not get reflected in the seats needs some consolation. I suggest that a beginning be made at once to consider how parties like the P.S.P., which have suffered heavily can receive some representation. The West German method would, I think, bring back Mr. Asoka Mehta quite easily. I do not know whether Mr. Dange and Prof. Ranga can be made equal beneficiaries. I would be willing to encourage them all to come in and say their pieces with even more vehemence than before. So far as Acharya Kripalani is concerned I think the House will miss him more than anyone else. In addition to this constitutional amendment which has the precedent of West Germany before it, I suggest an extra-constitutional institution of booby prizes. Anyone securing less than 3,000 votes in a Lok Sabha election and 1,000 votes in an Assembly seat should be eligible for a booby prize. Suggestions are invited as to what form this should take. My own view is that it should be a book on 'The Perils of Politics.'

Before I proceed to discuss some new statistics, may I pay the greatest and warmest of all tributes to the Election Commissioner, Mr. K. V. K. Sundaram, and his wonderfully able organisation. The status of the Election Commission, always high, has been raised to a new pedestal and I believe that it can do nothing to raise itself further. One of the great disadvantages of a summit, it seems, is that on arrival one can only decline. Or can one stay on the summit for ever? The best that I can wish the Election Commission is a period of complete stationariness at its present elevated peak!

A NEW STATISTIC

The political arithmeticians are busily at work on an analysis of the structure of voting, seats, votes polled, votes polled for each party, percentages and so on and so forth. I am told all the calculating machines in Delhi have been kept enormously busy for the last week. I have, however, managed to discover a statistic —this is a new American word which, I believe, is as new as it is disturbing. This relates to (coming) crisis in Uttar Pradesh. The Congress Party has won 60 seats with less than 40 per cent of the votes polled in that State. The Jan Sangh with a little less than half the Congress votes in Uttar Pradesh has managed to obtain only 7 seats. If the Jan Sangh had concentrated in Uttar Pradesh on half the seats, as the D.M.K. did in Madras, some dreadful things might have happened.

The new statistic I produce is to the effect that D.M.K. in Madras, with 142 candidates, secured as many as 50 seats, with D.M.K. candidates polling as many a 24,000 votes against 28,000 votes polled by the Congress. If the D.M.K. can snatch 10 per cent of the Congress popular vote, this would mean that the D.M.K. vote would rise to 26,400 votes per candidate and the Congress Party decline to 25,300 votes per candidate. In other words, the D.M.K. might have greater strength than the Congress in the seats contested. People tell me—some fearfully and some gleefully—this is exactly what is going to happen in Madras and that the D.M.K. will win 100 seats in the next election as against 50 this time. I view this particular statistic with considerable alarm, but if it should happen also in Uttar Pradesh with the Jan Sangh in place of the D.M.K., the result might be calamitous. Consider, for example, what would happen if the Congress vote dropped 10 per cent in Uttar Pradesh, that is to about 35 per cent and the Jan Sangh vote rose 10 per cent, thus rising to 27 per cent. If following the D.M.K. this were delivered at half the seats contested, the Congress might lose 30 seats in the next election with just a loss of 4 percentage points in its popular vote. In other words, it is conceivable that the Congress Party might lose between 35 and 40 seats and in addition a most critical position of instability would arise in both the States.

I submit that while everyone is talking about Madhya Pradesh and Rajasthan as the States to watch for balance, we might have to look upon Uttar Pradesh and Madras as requiring more drastic treatment. The show of success that Mr. Kamaraj Nadar presents has to be intensely qualified. But what is to happen to Mr. C. B. Gupta?

THE PROPHETS: A BOUQUET

Having concluded my political arithmetic, I think I should take time off, having failed miserably myself in North Bombay, to pay a tribute to the Indian Institute of Public Opinion whose pre-poll prediction for the popular vote in the Lok Sabha published in the Monthly Public Opinion Surveys as well as in the 'Statesman' of January 12, accords as follows with the final position:

Party	Percentage (Actuals)	Gallup Prediction
Congress	45.06	45.00
Communist	10.00	12.30
P.S.P.	6.88	9.5
Jan Sangh	6.38	2.9
Swatantra	6.45	6.0
Others	25.21	24.3 (undecided and others)

This looks almost too good to be true. Can there be a snag somewhere? Or has the sampling error suddenly disappeared from statistical assemblies-made out of ballot boxes? I call upon the eminent statisticians to tell me how much luck there is in this sampling game. And is there any money to be found from hitting the jackpot? I am anxiously in search of profitable (non-journalistic) occupation!

ARGUS

THE WEEK'S NOTES

The Test Talks

SUBDUED OPTIMISM

MR. KHRUSHCHEV'S communications to Mr. Kennedy and Mr. Macmillan on March 5 are rightly hailed as making a welcome change in the Russian attitude on the negotiations for a treaty to ban nuclear tests. His first proposal to hold the talks straightaway at the summit was wrongly conceived, especially when the failure of the earlier attempt on identical lines had not only failed but given a thorough reorientation to the idea of "summitry". America and Britain could not but be firm in declining to accept the invitation to climb the summit without prior preparation at the base. Negotiations at the level of foreign ministers was the correct and most practical course, which holds the possibility of exploring the maximum common ground after a frank discussion of all the questions relating to the treaty and that alone can provide the basis for the final talks to forge an agreement with precise terms for the ban. Mr. Khrushchev's acceptance of the proposal breaks the deadlock. He is deputing his Foreign Minister, Mr. Gromyko, to Geneva, where he will start the round of discussions with his opposite numbers from America and Britain before the 18-nation disarmament conference starts on March 14.

Mr. Khrushchev could have added grace to his welcome response if he had refrained from denouncing Mr. Kennedy's announcement to resume atmospheric tests in the second half of April unless the former consented to sign a treaty for the ban. The truth of the matter is that in the same announcement Mr. Kennedy unequivocally undertook to send his representative to Geneva for talks with the Russian spokesman before March 14. No motive could be imputed to him and his Administration, in the face of this offer, to wreck the disarmament talks. In the event of this offer not having been accepted, the disarmament conference could have proceeded but obviously America could not hold up resumption indefinitely. The reasons were plain and they are to be found in Russia's unilateral breach of the moratorium and conduct of a chain of something like 40 nuclear tests. In his announcement Mr. Kennedy had disclosed that the American tests would be below this mark and he further gave the assurance that the effects of radiation would be kept within the limits of safety. The course charted was based on a modest strategy of self-defence. There will be gratification that the right approach is now accepted by Mr. Khrushchev to make the summit meeting feasible. But as on all previous occasions of disarmament or nuclear test ban negotiations, optimism on this fresh occasion will be subdued.

Pakistan

THE NEW CONSTITUTION

PAKISTAN'S NEW constitution, promulgated on March 1, reaffirms the continuance of the presidential system, in preference to the party system of parliamentary government, as provided by the original constitution. But it is a presidential system with a significant accretion of powers and authority to the Head of State. Under the American prototype the power of the purse is vested in the legislature, but Pakistan's latest constitution withdraws some of the major powers of the control of the budget from the National Assembly. The safeguard of the impeachment of the President has been retained, but its enforcement has been made difficult by the provision that the sponsors of the motion would forfeit their membership of the National Assembly, if they fail to get the requisite majority. The theocratic prefix, "Islamic", has been removed from the style and description of the Republic of Pakistan. But the original provision entitling only a Muslim to be the president has been preserved. It is possible to argue that in practice the same result would have been obtained, except, perhaps, in rare cases. The rights of the minorities are to be safeguarded and this is what really matters. The effectiveness of these safeguards, like that of any other safeguards, will depend upon the degree of coincidence between the letter of the statute and the spirit in which it is observed; but the constitution has done the best it could. An Islamic Advisory Board, consisting of a complex of experts, is to be set up for consultation by the legislature to ensure that its enactments do not offend Islamic principles.

One of the major challenges to Pakistan's constitution-makers is to hold the balance reasonably between the Eastern and Western Wings. Urdu and Bengali are to be the parallel national languages (English will have a tenure of ten years) and parity in all spheres of the federal government is to be maintained between the two wings as far as practicable. Dacca is to be the venue of the National Assembly which is to meet twice a year. These provisions aim at satisfying the main aspirations of East Pakistan, but the available summary of the constitution does not throw light on the specific provisions, if any, for redressing the economic imbalance between the two halves and this is a fundamental point. The federation will have a unicameral legislature—the National Assembly—and the two provinces will have Provincial Assemblies. The powers of the National Assembly have been enumerated, there are no concurrent powers for the two sets of Assemblies and all residuary powers will vest in the Provincial Assemblies. Matters requiring co-ordination are included in the National Assembly's jurisdiction, but their execution will be in the hands of the provincial governments.

Some of the inherent powers that belong to the judiciary in a democratic set-up have been taken away. Thus the judiciary is not competent to declare legislation passed by the Assembly ultra vires. The fundamental rights (it is irrelevant how they are technically described) have been enumerated, but the central flaw is that they are not made justiciable. The ban on the political parties remains, but the power has been reserved for the National Assembly to enact legislation for the amendment of the constitution (a complicated and difficult procedure) to lift this ban. Elections to the Assemblies are to be indirect by means of the vote of the members of the electoral college, who in turn are to be elected by the basic democracies governed by adult franchise. All in all, the constitution is a cautious step forward towards the restoration of full democracy.

Mr. Phizo's Latest

"SAFE CONDUCT"

THE INDIAN HIGH COMMISSION'S statement of March 2 from London makes it abundantly clear that Mr. A. Z. Phizo rates his own skill in the game of diplo-

matic manoeuvring too high. He has made a request to the High Commission for a "safe conduct", under the Government of India's responsibility, to Nagaland to attend a meeting reported to be likely to be held in Nagaland between the Naga Government Party and the hostiles who have been staging rebellious activity against the Government of India for independence and secession.

Mr. Phizo is obviously in a fix, making a desperate move to riggle out of a situation entirely of his own making. He has been granted British citizenship on his application after he made his way to London, leaving his associates to fend for themselves in their subversive activity. On what considerations the British Government granted him citizenhip is obscure. Ordinarily India would be uninterested in this question, provided the recipient was a person having no involvement against her territorial sovereignty. It has been Mr. Phizo's contention that Nagaland is not and never was a part of India and it does not recognise India's sovereignty. He could not conceivably have applied for British citizenship on the ground of his citizenship of India—a sister Commonwealth country. The grounds of the grant of British citizenship is a matter within the British Government's discretion. This issue apart, as a British citizen, how is it open to him to claim the leadership of the Naga subversionists in case the reported talks do not bear fruit? And strangest of all, he considers the Government of India gullible enough to be duped by his seemingly innocent request to claim protection at its hands and create a profound psychological impression on the hostiles that he was specially conducted all the way from London by the Indian Government to carry on the negotiations as their accredited leader. Any rapprochement to be brought about will be between the majority party of Mr. Ao which has accepted to run the de facto government and the hostiles. The Indian Government's obligation extends to holding elections on the basis of adult franchise in Nagaland after law and order are securely established and to entrust the Government of this new federal unit to the party which wins the electorate's mandate.

China

OPEN RIFT?

THE RIFT between China and Russia on the ideological issues raised over Albania's segregation at the twenty-second Soviet Party Congress held in Moscow in October last has set a spate of speculation about the depth of the differences and the possibility of their emergence above the surface. Mr. Chou En-lai's famous walk-out immediately on Mr. Khrushchev's ruthless denunciation of Albania for the position she took on Stalinism was then interpreted as a protest against the implied criticism of China's stand on the same issue. This speculation has not been set at rest, but on the contrary it has gained a fresh momentum. On February 26 there was a clash of arms over the radio—the most powerful and far-reaching propaganda medium in any Communist country—when the Peking radio gave expression to the ideological rift in Russian and there could be no doubt about the motive behind the choice of the language. Within a few hours the same day the Moscow radio hit back by a broadcast in the Chinese language, the subject being a bitter and vehement attack on the leaders of the Albanian Communist Party—and by implication on China which extended overt support to it.

Is this clash in the air to be carried forward at the cost of a declared deeper breach within the Communist bloc? There are fresh straws in the wind coming from both the sides. The Polish official organ "Polityka" has published the text of the speech of Signor Longo at the World Conference of Communist Parties convened in November 1960 in Moscow in which one significant point was made that is of direct relevance to China's bid for ideological leadership—Signor Longo's demand that a ban should be put on the attempts and activities of the party from any country to make direct factional approaches to the members of other parties ignoring their organizational hierarchy, a demand, as the context clearly showed, was aimed against China. The publication of these developments of over a year ago at this time cannot be accidental. Meantime, the National People's Congress, China's Parliament, which was to meet after a long interval of two years in Peking on Monday this week, has been postponed for about three weeks. This Congress, to be attended by about 1,800 delegates, is to receive the agenda and the line of policy from the Central Committee of the Communist Party of China. But Chairman Mao Tse-tung and the Central Committee's high-powered members, a little less than 200 strong, are closeted together for crucial discussions at an undisclosed place. Will a lead be given to launch an offensive against Mr. Khrushchev's "revisionism" in the form of his advocacy of co-existence with the capitalist bloc? The rift may be brought into the open to force the issue. But it is unsafe to attempt to decipher in precise and positive terms the inscrutable Communist techniques.

The Press

NO PRESSURES, PLEASE

THE CHIEF MINISTER of Orissa, Mr. Bijoyanand Patnaik, has lapsed into a grave blunder in identifying himself with the undemocratic force to exert pressure on the Press to restrain its freedom of expression, ostensibly because it is inconvenient. The tone of his letter to Dr. Harekrushna Mahatab, who is the Chairman of the Board of Trustees of "The Eastern Times" and the "Prajatantra", an Oriyya daily, is threatening and the threat is intended to silence the criticism of Mr. Patnaik's government made in the two papers. In his anger he has taken the hasty step to stop the publication of government advertisements in the two papers which is a thoroughly indefensible attitude to take. Not content with this action, he has attempted to silence the criticism by advancing a curious logic attributing liability to Dr. Mahatab which is unsustainable. How can the views expressed in the papers be held up as likely to be interpreted as the views of the Congress High Command, simply because Dr. Mahatab happens to be one of its members, as Mr. Patnaik maintains? Dr. Mahatab has brought home to the Chief Minister the elementary lesson that as Chairman of the Board of Trustees he was not in the "inherent" position either of dictating the views or the publication of news of any particular type. Mr. Patnaik's threat of "counter-action" by the State Government or the Congress organisation betrays intolerance of criticism. If the articles and the news (characterised by the Chief Minister as "tendentious") are objectionable in law, the proper course is to take legal action and let the law courts decide the issue. But exerting extra-legal pressure is a violation of a basic democratic principle.

Mr. Patnaik would do well to digest Mr. Nehru's dictum contained in a candid expression of his views on a very recent occasion: "Our opinion is that even if we sometimes are not in agreement with certain articles written in newspapers, they should have complete freedom of expression. We are not in favour of having official newspapers. We do not want that newspapers should refrain from writing anything out of fear of the Government."

GERMANY'S SOCIAL SECURITY SYSTEM

By ODYSSEUS

WHAT DO YOU DO when you come up against a fact which (a) is indisputable, (b) too vast to be overlooked, and (c) wrecks the thesis that you want to put forward? Do you discard your thesis as untenable? If so, you are an honest man, but what the average polemicist does with a fact that he cannot explain away is to denigrate the achievement that it represents.

Take the fact, indisputable and vast, that Germany's gross national product rose from £8,678 millions in 1950 to £22,226 millions (at constant prices) in 1960. This spectacular rise was achieved in an unplanned free market economy, so the only escape for a Socialist critic is denigration. The party line is to say that the "miracle" was achieved at the expense of the workers; to urge that income distribution is such that the rich have become richer, the poor poorer; that a free market economy is a free for all for the strong, who can shrug off the burden of the weak; and that Germany's old age pensioners are the forgotten people of the miracle.

To comment upon these charges I call two witnesses. The first is the German Social Democratic party (SPD). By its repeated prophecies that the initiation of the free market in 1948 was making the rich richer and the poor poorer, SPD politicians did more than anyone else to dramatise the "miracle" and to create for themselves a situation from which the only way out was to stop talking about nationalisation (which the "miracle" had made a dirty word to the masses), and to insert whole new paragraph in its election programme proclaiming the importance to a free society of consumers' choice and free competition.

My second witness is a newly published report, "The Cost of Social Security: 1949-1959", which is as fascinating as it is exhaustive. Nor can its scholarly authors be suspected of disguised reactionary propaganda, because it is published (Price Rs. 13) by the International Labour Office of Geneva, whose object is to promote social justice impartially in all countries. The Report is not, of course, concerned with arguments and refutations; it is a bald compilation of statistics, which it leaves to speak for themselves. From its 237 pages, I extract the following:

Total social security expenditure (excluding housing and education) in Germany rose from $1,043 millions in 1949 to £3,110 millions in 1957, while UK expenditure rose from £1,246 millions to £2,137 millions.

INCENTIVES HIGH: TAXES REASONABLE

Although Germany's national income was only £5,633 millions in 1949, even then 18.5 percent of it was being spent on social security, compared with a national income of £11,099 millions in the UK, of which only 11.2 per cent went to social security in 1949. By 1957, Germany was spending on social security 20.8 per cent of a national income of £14,937 millions, and the UK 12.1 per cent of £17,604 millions. Expenditure on social security benefits as a percentage of total consumption expenditure rose in Germany from 16.8 per cent in 1949 to 21 per cent in 1957, compared with 10.7 to 11.2 per cent in the UK. That the UK's percentage was below that of every country in the European Economic Community is not surprising, because you can only cut bigger slices for distribution out of a cake that is growing bigger: the index of the gross national product of the EEC countries rose from 100 in 1950 to 170 (at constant prices), while the UK's rose only to 125. With Germany's maximum income tax at 55 per cent, the upper income groups have been able to save much. Incentive has not been dulled by high rates of tax, and the masses have benefitted, not lost, by this, because it has ensured a rapid growth of (1) real wages, which rose 38 per cent in 1953-1960 (compared with only 22 per cent in the UK), and (2) the gross national product, which, as previously mentioned, has enabled social security expenditure to re-distribute 20.8 per cent of a big cake, compared with only 11.2 per cent of the small UK cake.

Let us take a quick glance round Germany's social security system. It covers sickness, unemployment, industrial accidents and diseases, family allowances, and pensions. Whereas in the UK contributions are flat rates, in Germany all benefits and contributions are related to wages and salaries. Broadly, the average maximum deducted from the worker equals 13 per cent of his earnings; and the employer's maximum average is 15.5 per cent of each worker's earnings. The Federal Ministry of Labour has supervisory responsibilities, but the individual insurance schemes are run by over 2,000 independent friendly societies, self-administered by the elected representatives of contributors (workers and employers). Contributions to, and benefits from, sickness funds are not fixed by law but by the individual societies. This means that although insurance is compulsory for all wage earners, irrespective of their total wages, and for all white collar workers with a salary of less than £60 a month (with the option of remaining in if their salary rises higher) insurable persons can shop around for the society whose combination of benefits seems to them to offer best value for contributions paid. Competition between friendly societies is as keen as between insurance companies in the UK. This ensures a wide variety of flourishing societies with differentiated services which prevent the emergence of the dead level of routine that characterises nationalised health services. Sickness insurance is self-supporting and needs no aid from government funds. Expenditure by the sickness funds totalled £735,537,000 in 1959, which was spent thus:

		£ millions	Cost averaged among all fund subscribers £
1.	Medical and dental care	182,190	69
2.	Medicines prescribed and dentures	118,930	45
3.	Hospital in-patients care	114,340	43
4.	Sickness cash benefit	194,210	92
5.	Confinement allowance	31,310	1.19
6.	Death grant	13,200	.5
7.	Administrative expenditure	39,800	1.5
8.	Other expenditure and reserves	41,390	1.57
		735,537	

Doctors are not paid direct. Each friendly society pays a negotiated sum to the federation of doctors, which distributes it among its members according to a formula. The competition between friendly societies to give specialised services leads to different structures of membership, and the doctors take full advantage of this competition to push up the negotiated agreements. But whereas the limit to what doctors can earn in the UK is set by what the government thinks that the taxpayer will stand for in heavier taxes and/or inflation, in Germany the limit is set by the realities of the financial positions of the friendly societies. In 1954, 34,900 doctors were receiving an average of £3,060 a

year from the friendly societies. By 1959, 36,500 doctors were receiving an average of £4,969 each, i.e., higher fees had attracted no less than 1,600 additional doctors into the service of the societies. In 1955, the average earnings of an NHS general practitioner were £2,058. Today they are £2,425.

White collar workers are compulsorily insured up to a salary of £1,340 a year (thereafter they may opt out or in); all manual workers are compulsorily insured, irrespective of their earnings. Contributions are 14 per cent, shared equally by employers and workers, on the first £76 a month. Earnings above £76 are not subject to deductions for insurance.

TAKING PENSIONS OUT OF POLITICS

The criticism of the pension schemes used to be that the amount earned did not enable a pensioner to maintain the standard of living that he had acquired while working, and that as the national standard of living rose with the growth of the economy, a man on a fixed pension increasingly lost status. So, in 1957, an Act was passed whereby (unlike other social security benefits) the amount of a pension is no longer determined by the contributions that originally constituted it but is calculated by an independent Advisory Commission, who apply a formula which takes into account rises in earnings achieved by men still at work in the pensioner's former trade or profession, a corresponding percentage of which is added to his pension. This meant in 1960 that receipts of pension funds from contributions amounted to £1,030 millions, to which taxpapers were called upon to add £508 millions in order to enable the new "dynamic" pensions to be met.

The machinery of the Advisory Commission set up by the 1957 Act has some parallel with the proposed British National Economic Development (although its function is limited to pensions). The Commission is a fact finding body, which publishes a report with its recommendations to the government. Its existence has removed pensions from the political arena. Government and opposition alike are in a strong position to discount popular demands that would increase pensions above the statistically justifiable level, because they can shelter behind the Commission's recommendations. On the other hand, the government would give the opposition a tremendous lever if it took leave of its political senses and tried to reduce pension increases below those recommended. The "dynamic" pensions formula cannot itself cause inflation, but it can add to inflation in so far as it may already exist in the data on which the Commission bases its calculations.

Since contributions to social insurance now average 30 per cent of all insurable amounts of earnings, many friendly society officials consider that saturation point has been reached, but, since the demand for medical care is infinitely elastic, they believe that sickness expenditure could be kept within common sense bounds by making patients pay cash contributions towards expenses incurred, on the lines of the British United Provident Association. They fear, however, that electoral considerations will induce the state to impose increased benefits paid out of general taxation. They point out that wherever this happens social security ceases to be social insurance and becomes a free-for-all for political bribery and economic nonsense. All experience shows that the greater the area of state action, the wider the spread of social discontent as the voters are told by politicians that they are not being given a square deal. In contrast, the German system promotes individual thrift, initiative, and responsibility, and makes for social harmony.

(In a final article next week, Odysseus will discuss (a) what led Germany to adopt a competitive economy in 1948, when the climate of opinion throughout Europe favoured Socialism, and (b) what change to expect if the German Socialists were to form a government. ED.).

The European Scene

FRANCE AFTER THE 23-YEAR WAR

From Our Special West European Correspondent

PARIS, March 3

HAVING ventured some forecasts last week about the economic prospects of the independent Algeria that will emerge from the imminent North African peace, one might do the same now for the independent France that will re-appear this summer—independent at last from her imperial ball-and-chain and freed from 23 years of almost uninterrupted warfare. (France went to war in 1939 and has been there since, in Europe, then Indo-China, then all of North Africa from Suez to Morocco). Release from these burdens, it would seem, must have an excellent effect on an economy that is already one of the world's healthiest. Yet the anti-war party, which for years has been tallying up the economic cost of the Algerian struggle and arriving at unverifiable figures of the order of one million pounds sterling per day, has suddenly muted its promises of the profits of peace. No one is willing to say that France will find herself notably the richer when fighting ceases some time this month. In part, no doubt, this is because the anti-war party grossly overestimated the net economic loss caused by a war carried on outside the homeland, and thus entailing no destruction of the nation's productive equipment, and now that peace is approaching this exaggeration is liable to be exposed. The point is that a long, minor war, if it is conducted properly, i.e. by an economy that is placed on a war footing, can be conducted without any great loss that can be reckoned up in monetary terms. Provided the nation consents to forego several consumer satisfactions (and in a democracy there are plenty of sacrifices of non-essentials that can be made without much pain), a sound economy can easily afford an endless, stupid war.

In condemning a war of that sort with economic arguments, the liberals make the usual mistake of people with only a little economic knowledge: they think they can make moral arguments more effective by putting a figure on them. (Similarly, in India there are democrats who thought they could condemn Prohibition as entailing a net loss of wealth, when in reality, given suitable economic policy, it entailed only redirection of resources). If you are opposed to colonial war (or Prohibition), you must stick to the moral arguments against it and hope that people will find them conclusive. Any attempted demonstration of the economic loss involved can be set at nought by a Government ready to undertake the required diversion of resources. And this is what happened in France in 1958. Up to then, the Socialists had tried to carry on the war while maintaining subsidies and price-controls at home, seeking to shield consumers from the inevitable consequences of the war and letting producers expand investments behind a protective tariff. The natural result was inflation and near-bankruptcy. The Gaullist regime had the courage to make the necessary adjustments and, seeing that the majority wanted the war to be fought on to an honourable conclusion, asked them to pay for it. They consented to pay for it, on the understanding that it would not last much longer—but in fact the Algerian war has been conducted longer by the Gaullist regime than by the preceding party regime. In that time, nevertheless, the French economy has prospered as never before in its history, showing that the cost of the war was a hypothetical gain-foregone (what French accountants call manque-a-gagner) rather than a real loss, and was in any case easily borne by the nation once it pulled in its belt in the right places. The two leaks where even the best-conducted war is liable to cause trouble are in the foreign-trade balance and in the budget, because the nation, though prosperous, might need to expensive war material, and the Government might need to hide the diversion of resources to war-fare by means of inflation generated by budget deficits. Yet France since 1958 has scored persistent and notable payments surpluses, wiping out most of her foreign debt and accumulating reserves which last month exceeded for the first time $3,000 million; as for the budget, it has been in balance and the Government has not even floated a loan for three years!

Accordingly, the cost of the war was hard to prove, and the gains of peace are similarly hard to show. People who don't get their morals mixed up with their economics will rejoice because peace is a good thing and colonial butchery a foul one, but will not expect to see any sudden appearance of surplus resources in private or public hands. As with the war, the peace will entail a redirection of resources, this time to morally preferable uses, but without any short-term gain in the national product expressed in money terms. Indeed, there will be evident monetary losses in various sectors; not only the gun-makers (i.e. the steel industry) but the shipping and textile industries will have to contract, thus offering less employment and paying less taxes.

There are other reasons for not expecting any spectacular improvement in the French economy with the end of the war. Firstly, the commotion will not end abruptly for it is obvious that Algeria's future is not settled when Paris and the FLN sign a piece of paper. The minority community is apparently determined to oppose the cease-fire and in any event a country given over for seven years to terrorism and anarchy will require a substantial reserve of armed force to be kept on the spot for some time the peace treaty foresees the stationing of a large French force in Algeria for three years. So the size of the Army and the length of military service cannot be reduced quickly. Besides, it is known that every franc that France saves from the reduction of her colonial army, President de Gaulle proposes to spend on its modernisation and conversion into a nuclear force; his main objection to the Algerian imbroglio he inherited has always been that it obstructed his plans to increase France's military might. The absolute size of the arms budget is more likely to rise than to fall in the years ahead. Not that it will, for all that, be as uneconomic an investment as the maintenance of a 19th-century style colonial force. The modern army that de Gaulle has in mind is a technicians' army: few soldiers, and thus little diversion of manpower from production; many technicians, and thus general stimulation of technological education from which not only the Army benefits; and much outlay on modern equipment (notably electronics) which is made by industries working for the most strongly felt of consumer needs. At equal cost, an army of that sort fits into the modern industrial economy, whereas the colonial force is an economic anachronism.

Secondly, the Algerian problem is that of arranging the cohabitation of two enemy communities of unequal size in a land they both claim as theirs, and the security of the minority has to be bought by France at the price of lavish economic assistance for the young republic. The scale of this aid will be far beyond that received by any other backward country in the world to date. The peace settlement binds France to maintain the size of the current Constantine Plan, but it is probable that costs will mount quickly if visible results

are to be attained, for Algeria has far too many inhabitants for its resources and the familiar demographic explosion is under way. Thus the cost of the war will be replaced by the cost of development, and the budgetary burden on France will not decrease. Naturally, development outlays are, in the long run, much more profitable for French industry than military expenditures, and as peace is restored Algerian demand will be a powerful stimulant to the capital-goods producers —even if the ultimate source of that demand is French taxes, as is the case with many American so-called "exports" which are paid for by US economic aid. Algeria was, until the minority lately began to fear for its future, France's principal client; she will not be long in reclaiming that first place from West Germany, and many traditional industries will receive a fillip. Incidentally, a point to be noted is that the Algerian settlement will enable France to make her peace with the Arab world in general (at the cost perhaps of being a less ostentatious ally of Israel), and she could gradually reclaim her position as Islam's main trading partner and educator.

Against these long-term gains that will accrue from a maintained Algerian and military budget, there are possible short-term costs. Having made no secret of my scepticism about the possibility of two communities co-existing in Algeria, I expect that many members of the minority will seek to migrate to France. (This is sometimes incorrectly called "repatriation"; most of them have never seen France and are treated as virtual foreigners here, with the nickname "Blackfeet"). Paris is committed to bearing the full cost of this migration, and of the installation of the migrants; since most of them will return with a grudge, feeling that Paris "gave away" their homeland, they will agitate for generous treatment, no doubt using the methods of agitation they learned in war-torn Algeria. One could thus see the anomaly of France lavishly supporting Algerian development in order to secure the rights of the minority, while the minority drifts back to France at Government expense; the French taxpayer would thus get the worst of both worlds. This will certainly be true at first. An initial wave of migration has already begun, because there are thousands of families of colonial die-hards who will not consider living on in a free Algeria, no matter what the guarantees. Their accommodation will have to be paid for immediately, while the cost of the military establishment in Algeria will not have fallen and while outlays on the Constantine Plan will pick up at once, because many projects have been held up by disorder. For a time at least the budgetary burden will rise sharply, and the taxpayer, after cursing for years the cost of the war, will find himself faced with a bill to pay for the cost of the peace.

The most important effect on the economy generally will be the reaction in the labour market. On the one hand, the main limit to expansion is the manpower shortage, which lies behind part of the recent rise in prices (part only; the rest is higher farm support prices) and the shortening of military service will steadily increase the supply of labour. Further expansion will thus be possible without wage-price inflation. On the other hand, it is said that labour has restrained its pressure for wage increases in order not to jeopardise the Government's chances of ending the war; once peace is declared it might put in a bill (swollen by loose talk about the cost of the war) for higher wages made possible by the supposed gains of peace. Which of these guesses proves correct, the next few months will show. In sum, bright promises about the impact of peace after 23 years on the French economy seem hazardous. One can simply conclude that, for the rest of the decade that may be one of Europe's most progressive, France will have ceased to be "the sick man of the West".

"I got your message —and I'm here!"

Everyday, in many places throughout India, a scene like this occurs. A mishap, an accident— and the call goes out for Voltas Service.

On remote farm and distant hamlet, in country town and in urban metropolis, in factory and in office—the Man from Voltas comes promptly in response to that call for aid.

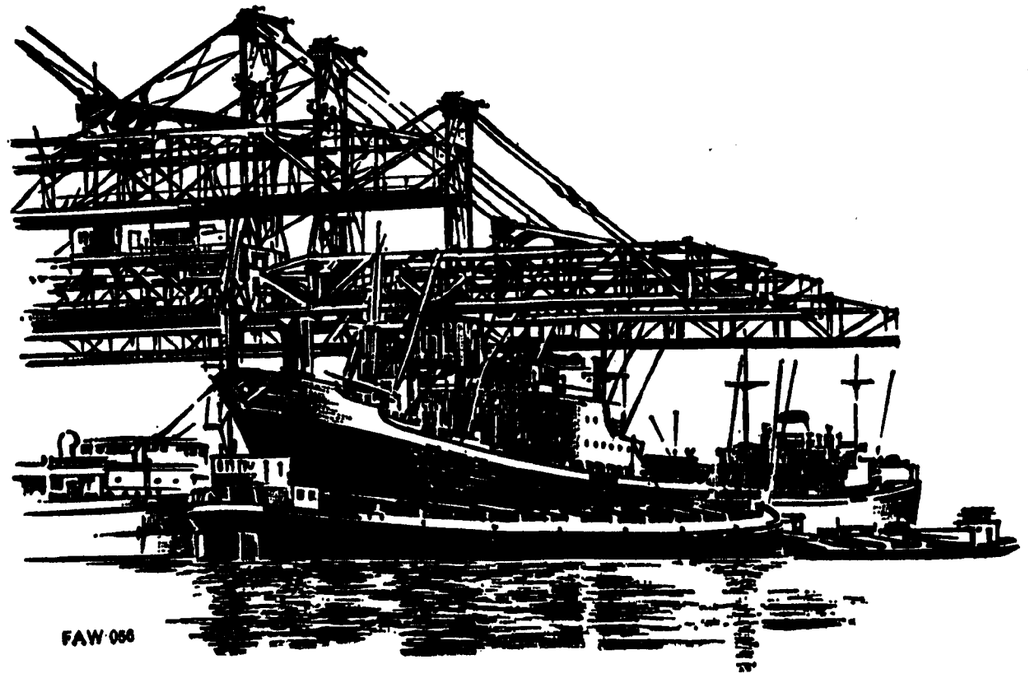
It is these Voltas Servicemen—specialists in their line, trained mechanics and expert technicians, who, with prompt attention and skill, have built and maintained the great Voltas reputation for after-sales service.

Briefly, Voltas' activities comprise:

Marketing and Distribution of goods:
Representing leading manufacturers, both foreign and Indian, Voltas supplies a wide range of goods—Electrical, Mechanical, Air Conditioning and Refrigeration, Textile and Paper Machinery, Agricultural and Construction Equipment, Machine Tools, Pharmaceuticals, Chemicals, Bulk Vitamins, Plastic Raw Materials, Processed Foods.

Manufacture and Development:
Air Conditioners, Water Coolers, Switchgear, Farm Implements, Drilling Machinery...and the list is growing!

Service:
Voltas after-sales service is a by-word in India. Voltas sales are fully backed by its nation-wide service and spare parts organisation



Always, where Service is called for...
VOLTAS IS THERE

150 YEARS
1811-1961
KRUPP

4 man-trolley bridges, each capable of lifting 16 tons at a speed of 90 m/minute. Span 65 m. Apron 48 m. These bridges were built by Krupp-Ardelt, Wilhelmshaven.

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.
