THE BUSINESS WORLD

The Budget Impact

MR LLOYD'S many tax changes are themselves broadly neutral in their net effect on this year's revenue; but his budget as a whole and in its wider setting looks distinctly restrictive. His minor reliefs in direct taxation involve a net fall in revenue of only £8½ million this year, to which his complicated juggling with indirect taxes adds a net loss of just £1 million—expected to be transformed into a gain of £14 million in future years. The upshot for this year is a release of under £10 million; and this leaves the expected budget surplus as high as £433 million, some £23 million larger than the surplus attained in 1961-62, despite the loudly lamented (and artificially exaggerated) increase in the supply estimates. Nor is this surplus swollen, as it has been in past years, by an undue buoyancy of the revenue as a consequence of inflation itself. Indeed the buoyancy that has been budgeted for is quite exceptionally low—on the basis of existing taxes, total revenue was expected to rise by only £162 million, compared with a comparable estimate of £506 million in the 1961 budget. This slackness of revenue receipts, as is pointed out overleaf, is largely a reflection of the decline in company profits that occurred in 1961.

But whatever the cause of the slackening in the revenue inflow, a surplus of £433 million is in these circumstances a sharp restraint. It leaves a borrowing requirement of £74 million, in line with last year's budget estimate and comparing with the out-turn of £211 million. Even this was comfortably covered. The Government was able to pay off some market Treasury bills and still avoid pressing the gilt-edged market for new money.

It is clear indeed that the public could comfortably finance far larger net borrowing by the Government. The recent official drive to very large ordinary budget surpluses and very small residual borrowings has occurred at the very time that personal savings have taken a further leap—to over £2,000 million in 1961, if the official figures are to be believed, twice their total two years before and more than twice the accompanying "personal" investment. Thus today's budget surplus involves incomparably more disinflation than the similar Crippsian surpluses could have done twelve years ago, when personal savings were negative. This year, admittedly, a belated recovery in hire purchase business may help to curb net personal saving—though the secular rise in personal saving has consistently been underestimated in recent years. But if personal savings do fall and personal spending rises sufficiently to get the economy growing again, then there should clearly be some recovery in corporate savings in 1962, following their squeezing last year by lower sales, higher costs, higher dividends and also higher taxes (assessed on earlier years' profits). The fall in corporate profits, estimated at 6 per cent in 1961, has been directly related to the deflationary impact of public finance, and was worsened by the curbs in personal spending. Does the Chancellor wish this to be repeated this year?

Mr Lloyd gives little clue. Indeed his budget statement largely eschews specific discussion of this kind. The expected net borrowing of £74 million is "about right from the general economic point of view"—by what precepts there is no indication. It "is also well within what I expect to be able to borrow from National Savings and other non-market sources," and one suspects that this crude rule of thumb or the even cruder one of "avoid as much borrowing as you politically can" have become the real influences. This shapeless budget of unrelated fiscal changes marks a yet further retreat from the Keynesian concept of using the budget to regulate the whole economy in a calculated way.

NOR is this made good by any positive policy on interest rates. The shift of emphasis a year ago from monetary to fiscal controls is not explicitly repeated, and understandably. Within three months of referring to the international embarrassments in using Bank rate, after all, the Chancellor had hoisted it again to 7 per cent. So this time Mr Lloyd is almost entirely non-committal. The high Bank rate played a useful, temporary part in the crisis; now lower short-term rates "will be helpful" first to exports (but surely export finance has been largely insulated from Bank rate?) and secondly to investment. One would have thought that long-term rates were of more influence here; but these are not even mentioned.

On export incentives, the Chancellor finds easy authority in the negative recommendations of the Federation of British Industries. Yet while his budget does go some way towards reducing the differentiation and broadening the base of indirect taxation, it does nothing to increase the relative role of indirect taxation as a whole (which was the FBI's main plea) and nothing to help costs or investment. The budget's one contribution to the external problem is its disinflationary impact. But this could be double edged. The Government is resting its whole policy on the assumption that by keeping home demand sufficiently tight this summer the required rise in British exports will follow. It may; the March trade returns offer mild encouragement. But what if it does not? The Chancellor, as he recalled in his budget speech, still has his regulator. But which way, in these conditions, would he move it—down for unemployment or up for sterling?

The End of Schedule A?

THE Royal Commission on Taxation would have none of the argument that tax under Schedule A should not be charged to owner-occupiers on the ground that a notional income was not a fit subject for taxation. There can, it said, be taxable income that is not received in cash, but it argued too that a current basis of assessment was far more desirable than "conventional figures remaining unaltered from one revaluation to the next." The next revaluation is upon us; Orpington is just past; and back-bench pressure is unremitting. Mr Lloyd has now promised that "Schedule A for owner-occupiers of residential property will go."

But not yet. He still insists that the time for deciding the future of Schedule A will be in next year's Finance Bill, "when the new valuations for rating purposes in England and Wales would take effect." But he holds it to be already obvious that owner-occupiers of residential property could not be charged on the new valuations; to treble or quadruple their Schedule A burden would be "intolerable." Then followed an example of near double talk:

> Indeed, the new situation, which the revised rating valuation will bring about, indicates the unsatisfactory character of this tax in its application to the owner-occupier of residential property. Unless it is charged on current values it is difficult to find a firm basis for the tax which is, in any event, a tax on what has been described as notional income.

The first objection is not to the tax, but to the politically timed application of revaluation. As for "notional income," there is a point in equity between the taxable capacity of owner-occupiers and of rent-paying occupiers that Mr Lloyd, now preoccupied with equity, may soon have bluntly brought to his notice. Whether owner-occupiers will be relieved (of about £50 million) in one year remains for decision. Many owner-occupiers, particularly of older property, relieve themselves of much or all of the Schedule A burden by using the repair allowance—though many, too, have evidently still been unaware of this relief. What will remain of Schedule A when owner-occupiers are exempted from it is puzzling to see. A landlord paid rent from which his tenant has deducted Schedule A, pays tax under Schedule D on the net rent. A clean Schedule D tax cut from gross rents would seem preferable to this. But the overthrowing of Schedule A, a fiscally and socially sound tax if properly based on current valuations, is a thing to regret. The next thing will be that future Orpingtons will take exception to taxes assessed on income. That really will put governments in a fix.

The Budget Arithmetic

THIS year's budget arithmetic is particularly interesting, if also particularly tangled. The outstanding phenomenon in the revenue estimates is the expected rise of only £75 million, or 2 per cent, in inland revenue before budget changes—compared with a rise of 12 per cent. budgeted (and attained) in 1961-62. The clue to this year's lag is in the estimate for profits tax, of an increase of only £39 million this year. Since an additional £70 million was expected in 1962-63 as a result of the higher rates of profits tax imposed in both the 1961 and 1960 budgets, it is clear that the actual amount of taxable profits is expected to fall. For income tax, equally, the unusually small rise of £71 million expected on the basis of existing taxation must be the net result of a reduction under Schedule D paid by companies and the self employed on the previous-year basis, and an expected rise from PAYE.

The official estimate of buoyancy here is likely to have been on the same basis as that used to project revenue from customs and excise, which on the basis of existing taxation was expected to rise by about 3 per cent, without the distortion of the surcharge. This rise was kept down by the expected slight fall in real spending on tobacco; in practice the Chancellor recognises that consumption may fall further, and that the budgeted increase of £15 million (from the higher duty for twelve months instead of eight) may in practice not be forthcoming. Personal incomes were buoyant also in previous years: this is reflected in the expected fall of only £36 million from surtax, for £58 million was expected to be lost in 1962-63 as the first impact of the 1961 reliefs. In total, without last year's special debt repayment of £60 million by Germany, ordinary revenue was expected to rise by £162 million before tax changes, and by £152 million after them.

But the rise in ordinary expenditure is also smaller than the government itself was implying when presenting the supply estimates. These are now partially offset by a sharp fall in debt interest, to £600 million—which is not only £111 million below the 1961-62 out-turn but also £60 million below last April's estimate. Since Bank rate was 5 per cent then as it is now the Treasury estimate for its own debt payments will have been broadly unchanged. But there is a rise of £70 million in interest receipts into the Exchequer. Of this, £38 million derives from the higher amount of advances outstanding to nationalised industries, but a further £32 million is an intended payment of accumulated accrued interest to the Exchequer by the British Transport Commission—from the proceeds, of course, of the Exchequer subsidy. This repayment swells to the same extent as the rise in supply expenditure, which should therefore be £352 million rather than £384 million on a comparable basis.

Taxing Speculative Gains

AFTER the recent excitement about Mr Lloyd's tax on speculative gains, the sketch of his proposals seems almost to abound in sweet reasonableness. Before the City's cheering dies down, a reminder is needed that innocent sounding phrases in a Budget speech can sometimes be translated into ferocious clauses in the Finance Bill. Perhaps there are some anti-avoidance measures up the sleeve of Somerset House that will cause operators who feel stronger this weekend to blanch when the bill comes next week. But in important respects, this tax on short-term gains is an optional tax, easily and legally avoided, and for some easily and illegally evaded. *The Economist* was among the first to make this point about a short-term gains tax, writing last November about Mr Lloyd's difficulties in drafting it. He has in fact not chosen a capital gains tax at all for his purpose; and this, as he explained on Tuesday, is not a fiscal purpose in any direct sense:

> While the main function of any system of taxation must be to bring in revenue, it must also be designed to produce a feeling of broad equity of treatment between taxpayers. At present, it is pretty widely felt to be inequitable that those who supplement their incomes by speculative gains should escape tax on those gains. I do not think that they should continue to do so; and I tell the Committee frankly that it is on this account, and not mainly for the yield, that I put forward this proposal.

Whether it is pretty widely felt that a speculative gain in a security is one garnered within six months, and that equity will be served when gains garnered within six months and a day escape taxation is something for Mr Lloyd to judge. It is, he said, quite impracticable to estimate the yield, but yield is not his purpose so much as "fair treatment between taxpayers."

Many capital gains are already taxed as trading profits of people who are in the business of making them. Many others have hitherto escaped because the tax authorities could not establish that the beneficiaries were carrying on a business. The method the Chancellor has chosen to catch these tax-free operators, who range from the little man (or woman) in an investment club to the biggest casino-style gambler, is to label as income gains not now chargeable resulting from sales of

> stocks, shares, securities, land, including buildings, commodities and other property, or interests or rights in such assets

but not from sales of movable property, personal belongings (these would include pictures and jewellery), a house (or the main house) owned and occupied by the seller, or of fixed assets of a business. Gains on sales of interests in land will be taxable if realised within three years of purchase. In all other cases, chargeable gains arise only where the period of retention is six months or less. Such gains will be taxed as income "in the normal way" as a new Case VII under Schedule D—for an individual, chargeable (with no earned income relief) to income tax and surtax, and for a company to income tax and profits tax.

There is, despite City fears, no retrospection; the new charge applies to transactions originated from April 10th. Cognate losses incurred in transactions that, if profitable, would have given rise to a charge to tax, will be allowable against gains (and, moreover, may be carried forward to offset gains in subsequent years, with no expressed time limit) but not against ordinary income. A comprehensive capital gains code would have the logic not only of complete equity (if that, and not revenue, is the material consideration) but also of a specific rate on gains. Mr Lloyd's objection to such a code is principally that it would impede saving, genuine investment, and economic growth. The denial of 17s. 9d. in the £ to any top bracket taxpayer who is in future incautious enough to take taxable speculative gains could have some effect on his enterprise too, but if such cases occur, they are more probable in connection with land than with securities. Tax free funds (such as pension funds) will be exempt from the new rules. Special provisions will be introduced to cover gifts. Property passing at death, or sold by or on behalf of beneficiaries, will be disregarded.

MR LLOYD advised the House to await the Finance Bill for full details of the new tax. It may be even more sensible for any investor who reflects on the chaotic and ill-considered rush with which Finance Bills are sometimes finally passed to await the Finance Act itself. But the Chancellor did elaborate a little on three specific matters:

Bonus Shares: A bonus issue itself will not attract tax. If sold subsequently, bonus shares will be regarded as having been acquired when the parent shares were acquired. *Ergo*, any bonus share in respect of a holding bought more than six months earlier can be sold without tax on any gain. But there are still problems of valuation here, similar to those created by Mr Dalton's futile tax on bonus issues, and also in connection with the sale of rights, for which special rules of computation will be required.

Rights Issues: Existing shareholders will be treated as having acquired their rights when they acquired the parent shares—if held for more than six months, no tax on the disposal of rights. Rights bought and sold (as rights or as shares) within six months will involve a liability for gains or yield an allowance for losses.

Options: A buyer of shares through a previous option is deemed to buy them when he exercises the option—that is, when he closes it. Since Mr Lloyd has promised to allow "proper and relevant expenditure incurred by the seller" in computing short-term gains, presumably option money will be deductible as an expense. If A pays 3s. for an option to buy XYZ in three months at the current price of 40s. and he exercises the option at 50s., his taxable gain (subject to dealing expenses) will be 7s. The seller of an option will be regarded as having sold his shares when he entered into the contract.

All this is by way of illustration. Provision will have to be made for "a number of special situations." The effect on the markets of what is already known must be to exaggerate short-term movements in prices, since the correcting mechanism of short-term and option dealing will be frustrated. Markets will be thinner and more "one-way." There may, as a later note shows, be serious side-effects on the new issue market. There are also questions about executive options, recently given a boost by the decision in *Abbott v Philbin*. This case established that what was taxable was the "value" of the option when it was granted, not when it was exercised—and rough administrative practice imputes the value as one-tenth of the market price of the shares when the option was granted.

ESTIMATED EFFECT OF FISCAL CHANGES

(£ million)

INLAND REVENUE	1962-63	Full Year
Income Tax :—		
Small income relief	− ½	− 1½
Age relief	− 1½	− 2½

Charge on immovable property abroad	+ 1	+ 2
New relief on overseas taxation	− ½	− 1
Total Inland Revenue	− 8½	...

CUSTOMS AND EXCISE†	1962-63	Full Year
Confectionery, soft drinks, ice cream	+30	+50
"Breakfast table" duties	−15½	−16
Changes in Purchase Tax Rates	− 9	−13
Lifting of surcharge on fuel oil, etc.	− 6½	− 7
Total Customs & Excise	− 1	+14
Total Fiscal Changes	− 9½	...

* Cost £4 million in 1963–64 and nil thereafter. †This presentation ignores consolidation of surcharge into basic rates and is concerned only with effective tax changes.

The presumption is that if the holder, having exercised his option, sells his shares immediately, he would be liable to assessment ; if he held for six months and a day, he would escape.

Information on short-term gains will be sought through the normal income tax return. The Revenue will not seek powers to obtain general returns from agents of all transactions carried out for clients—that would create "an unmanageable mass of paper." But the Revenue will seek power to obtain from brokers, estate agents, banks and others details of transactions for account of named persons. So, with massive powers of scrutiny and policing, Somerset House will pursue Mr Lloyd's quest for equity ; it no doubt wishes that there could be some adequate revenue for its pains. And the proposed powers imply a massive breach in the established doctrine and law that govern the confidentiality of a customer's business with his banker. This barrier of confidence is not utterly unbreachable, but hitherto a banker could only be required to divulge any part of his client's affairs by invoking the authority of a High Court order. This first move to apply a general statutory power in one area of tax assessment could obviously be the precursor to other powers in other areas. The terms in which this section of the Finance Bill are drafted will call for the most stringent scrutiny.

Though reappearing in growing numbers in recent years, speculators in commodities who are not traders for tax purposes are comparatively rare birds, and few will be snared by the Chancellor's speculative gains tax. Facilities exist for dealing in wooltops and rubber 18 months forward. Silver is normally dealt in only two months forward, but dealers are accommodating people and deals can be arranged up to one year ahead. The London Metal Exchange's forward contracts in the four major metals offer delivery only three months forward. Neither "legitimate hedgers" (manufacturers and traders who, like commodity dealers, pay tax on any market gains) nor outright speculators who play a useful role in London's markets, often have any physical use for the commodity that is represented by their paper deal. This is true whether their deal is left open for three or thirteen months.

Adding in the Surcharge

FORMALLY, Mr Lloyd's powers to surcharge Customs and Excise duties would have lasted until August 31st. But he wants this regulator to use at his discretion between budgets, and prefers the term to run from one budget to the next; moreover, he has used the powers taken last year to their upward limit of 10 per cent. By consolidating the surcharge into new duties for 1962-63 on most items, though removing it on one or two, and asking for fresh powers to vary 10 per cent either way, the Chancellor will regain (when Parliament grants it in the Finance Act) the full flexibility inherent in his original conception of short-term regulators.

His consolidation at present rates includes tobacco, on which many people expected an increase in duty, drink, and light oils including motor spirit. The Chancellor made a passing genuflection to concern with lung cancer, but was not prepared to "take smoking, even in moderation, quite out of reach of many people of limited means"; moreover, he argued not very convincingly that any distinction between cigarettes and pipe tobacco would set smokers rolling their own, "shifting manufacture from the factory to the home." His real caution, as he indicated was about the Treasury's vested interest in "this duty, which yields so large a proportion of the revenue."

Mr Lloyd could not bring himself, either, to remove the "revenue duty" put on fuel and diesel oils last year, though this was one of the few duties from which he did remove the surcharge. The others were on matches and mechanical lighters, and on betting at dog races: football pool betting, however (more heinous, or just more productive of revenue?), will have the surcharge consolidated, making duty on it 33 per cent as of late, against the basic 1961-62 rate of 30 per cent.

Continuance of the surcharge on all these duties would have brought the revenue £139 million for the rest of this year. The almost general consolidation of its effect will bring in £132 million for this year or £138 million in a full year: so the net difference from what has recently been happening is a reduction of only about £6 million this year.

More Scope, Less Spread

SUCCESSIVE Conservative chancellors have had a go at purchase tax reform. Mr Selwyn Lloyd waited for his second budget to do so ; he did not reduce the tax as much as taking the surcharge off it would have done, but he used the leeway this ten per cent gave him to achieve some genuine reform. Three sacred cows were slaughtered on Monday. One was the rule that nothing edible should ever attract purchase tax, although some items have long been taxed under some other head, such as import or excise duties. The surprise purchase tax of 15 per cent to be levied next month on sweets, ice cream, chocolate biscuits and soft drinks, none of them exactly a staff of life, is the first break with this tradition. It promises to raise £50 million revenue in a full year—against

which, perhaps, should be offset the £5½ million lost by ending the excise duty on sugar.

The other two sacred cows were clothes and furniture, most of which were tax-free during the war and as long after it as the utility schemes lasted. Even when those schemes ended ten years ago, clothes and furniture were still given favoured treatment, being taxed at the specially low rate of five per cent. Mr Lloyd has doubled this ; he has lumped goods now taxed at 5½ per cent (including the surcharge) and those attracting 13¾ per cent (stationery, wallpaper, most kinds of floor covering and household odds and ends) into a new tax group at a 10 per cent rate. A few pennies will come off goods that had been taxed at the higher rates and a few shillings, rising to a few pounds in the case of furniture, will go on clothes and furniture that had been taxed at the low rate. The increase in revenue could be substantial. The lowest-taxed category of goods had been yielding more than £60 million a year, £50 million of it from clothes, and doubling the rate of tax on them seems unlikely to check consumption. Nevertheless, the Chancellor expects these gains to be more than offset by concessions at the other end of the purchase tax scale and by the lifting of the 10 per cent surcharge imposed last year. He has reduced the highest tax rate of 55 per cent (50 per cent basic plus the surcharge) to its lowest ever level of 45 per cent, and in doing so must have sacrificed tens of millions of revenue. There are few items in this high tax class, but they include cars, products of the radio industry, and cosmetics, and between them have been yielding about £250 million, nearly half the total tax.

Had Mr Lloyd merely left on the surcharge, he might have obtained £585 million this year from purchase tax (apart from the new rate on sweets) against £521 million last. With the changes, the revenue expected is £576 million, or £606 million counting the sweets tax. In trying to reduce the spread of rates, Mr Lloyd is following in the steps of Mr Butler and Mr Amory who inherited a structure with rates varying from five to 100 per cent. Over the years the top rates have been brought down, but Mr Lloyd is the first chancellor with the courage to raise the bottom levels of tax upwards to meet them, an essential step towards non-discriminatory sales taxation.

Touch on the Throttle

MOTOR manufacturers were barely able to conceal their surprise that Mr Lloyd, even incidentally, accepted their arguments for a reduction in purchase tax ; they thought their annual memorandum on the subject had fallen on deaf ears once again. Home sales had not been particularly depressed this year, though customers had been holding off more than usual before the budget. But the fillip to home sales will be none the less welcome to an industry that seemed likely to operate at two-thirds of capacity this year ; now it feels that home sales may get back on to the growth curve this year instead of next. Forecasts in the industry had put home sales this year at anything from 750,000 to 800,000, with *The Economist* on the side of the optimists. The first industry guesses since the budget are that sales may now rise five to ten per cent above this rate.

At any rate, those who were waiting to see how the budget went are now pouring into the dealers' showrooms, and for some weeks at least the trade may find itself enjoying something like the boom conditions it experienced two years ago. Some makers expect that this rush will be sufficient to clear their stocks and restore waiting lists ; BMC finds itself with smaller stocks than it would like after losing the production of about 10,000 vehicles in the latest strike, while both Rootes and Vauxhall already have some waiting lists for the Super Minx and Victor—which will now lengthen. Where the industry feels less confident is over the length of the boom.

Domestic appliance manufacturers feel that they will gain virtually nothing from the cuts of a pound or two in the price of their goods, but the television makers may get some benefit from having more than £3 off the price of a popular set. Both of these depressed industries would much have preferred a return to a 10 per cent hire purchase deposit. For domestic appliances, most hopes this year have to be pinned on the Chancellor's expectation of a four per cent rise in personal expenditure—plus, for refrigerators, a really hot summer. Retailers are suffering rather less severely from excess stocks than they were a year ago. But refrigerator makers hold quite a large cushion to absorb any increase in demand.

Sucking a Penny

TO the indignant cry of "a tax on food" from confectionery manufacturers at the news that chocolate-covered biscuits, along with chocolate and sugar confectionery, ice-cream and soft drinks were to be taxed, Mr Lloyd has replied in advance: "The tax on sweets . . . will be welcomed by the medical professions, or ought to be. . . ." His zeal to safeguard the taxpayers' teeth and pancreas stopped short, however, of éclairs.

Chocolate biscuits were already roughly twice the price of plainer varieties ; now they will go up another 5d. or 6d. a pound. Consumers might switch to plainer biscuits: so could the manufacturers. Substitutes are not so clearly available for sweets, ice-cream and soft drinks, unless housewives start making their own, an attractive but unlikely change. The Government's estimates of the yield from this tax seem to be based on the assumption that consumption will not drop, and it is probably right. Mr Lloyd hopes to raise £30 million from this source in the eight months of this year, and £50 million in a full year. Of these totals, nearly two-thirds is expected to come from confectionery.

The British eat just over half a pound a head a week ; that is slightly more than in 1959, but still below the post-rationing peak of 8.9 oz in 1954. But in value sweet sales have gone on up: they were £272 million last year compared with £251 million in 1954. If both prices and consumption remain steady, the government will net about £30 million in a full year on sales of sweets, leaving £2-£3 million to be provided by chocolate biscuits.

Estimates are little more than guesses when it comes to the yield from taxing ice-cream and soft drinks. Not even the manufacturers know how much ice-cream is consumed a year: estimates vary from 50 million to an optimistic 110 million gallons. The government appears to be taking a cautious view of the climate as well as of consumption when it tentatively forecasts roughly £4 million from ice-cream tax this year, and £7 million in a full year.

Comparable estimates for soft drinks—including fruit juices and non-dutiable cider and perry—are roughly £6

million and £10 million. The soft drink trade is divided between squashes and fizzes, each at the moment producing roughly £45 million in turnover a year. Demand has been increasing; but vigorous price competition has brought squashmakers' profits down and increases are inevitable with the tax, probably 4d. to 5d. a bottle. Among carbonated drinks, the "mixers" are unlikely to suffer from a penny increase on a 9d. tonic water; worse off may be the plebian bottles of pop, which are already losing ground to squashes.

Less Tax at Breakfast

WITH a gentle acknowledgment of their "inherited complexities which are out of all proportion to the revenue" the Chancellor has decided to let sugar, cocoa and coffee slip like tea in 1949 (the last occasion on which these breakfast duties were altered) through his revenue net. For Commonwealth producers, customs duties on these commodities disappear, with the exception of sugar of a polarisation of more than 99° (a near substitute for refined sugar). Refiners have presumably been afforded this small measure of protection (1s. 0.8d. a cwt.) in recompense for their assistance in ensuring that all the raw sugar which the Government has contracted to buy under the Commonwealth Sugar Agreement is absorbed.

Relief from his bafflement will cost the Chancellor the modest sum of £1¼ million a year for cocoa and coffee. The loss on sugar involves more: in a full year £8 million in customs dues (£7¼ million in 1962-63); and £5½ million in excise duty on sugar, glucose and saccharin. The excise duty levied on home grown sugar seems disproportionately large compared with customs duties on the far larger volume of imports because of the heavy drawbacks on exports.

The rump of customs duties will eventually be pushed into the Import Duties Act where, as protective duties, they properly belong. These remain at 2s. 4d. a cwt. for cocoa, 9s. 4d. for coffee and normally upwards of 3s. 10d. for sugar. The Chancellor inadvertently increased the margin of preference granted to Commonwealth producers in his July measures last year, which raised the graduated duties on sugar, coffee and cocoa in the same proportion as duties on beer, wine and spirits simply because, historically, they were revenue taxes.

Customs duty on all imported sugar has been cut by 4s. 6d. a cwt. (96° polarisation); 4s. 8d. on coffee and 11s. 8d. on cocoa. The corresponding excise duty on sugar has been abolished. In a rich country like Britain a cut of ½d. a lb. in the price of sugar, though comparatively large, will have little effect on consumption. Chocolate manufacturers have bought cocoa heavily to absorb part of the world surplus at attractive prices. But most of their supplies remain in bond, so that the sharp reduction of £11½ a ton in the value of duty-paid stocks will not greatly affect them. The full cost of the breakfast tax reliefs will be £15½ million this year. The reliefs will please primary producers, remove some of the complexity from these commodity markets and make it clear that the import duty (as opposed to internal taxes) on Commonwealth supplies is nil; Britain's prospective colleagues in the common market will presumably take note.

Small Reliefs and Loopholes Stopped

ALL the changes in Inland Revenue are modest indeed in their impact on revenue. The largest contribution to this year's expected net reduction of £8½ million is £6 million from the granting of speedier tax relief on *trading losses*; more than half this benefit will go to the shipping industry. The new rule proposed is that in computing a trader's loss (which can be set off against general income, or carried forward) the capital allowances to be taken into account will be those for the same period, instead of those for the previous year. Thus the benefit is not a continuing one: the loss to the revenue is expected to tail off to £4 million in 1963-64 and to nil thereafter.

For individuals, Mr Lloyd made two minor changes in income tax at the lower end of the scale. First the income limit on *small income relief*, under which the earned income allowance of two-ninths is given on investment incomes, too, is raised from £300 to £400 (still only half the limit on the corresponding relief given on investment incomes of people over 65). A single person under 65 with an income of £400 drawn solely from investments will now save £22 a year in tax. Secondly, *special reliefs for old people* with small incomes are being extended so that the point at which no tax is paid is raised from £275 to £300 for single old people and from £440 to £480 for married couples. These reliefs are desirable and cost only £4 million in a full year; but has not the time come for a blanket exemption from income tax for all incomes of below, say, £400?

The lower limit is also being raised on liability to *estate duty*, from £3,000 to £4,000, exempting about 18,000 estates each year; there are appropriate adjustments in rates of duty up to £6,000, giving relief to a further 20,000 small estates. This concession will cost £1¼ million in a full year. The Chancellor hopes to recoup the whole cost by bringing into liability for British duty land and immovable property held abroad, thus striking a sensible blow at the Jersey and Bahamas land boom. At the same time, to avoid hardship, the Treasury is allowing credit for any death duties paid on overseas property to the overseas governments, even where this is not covered by a double taxation agreement. This offset is also available on movable property, which was already within the embrace of the British tax authorities. In all, the changes in death duties involve a small net concession.

These, together with the abolition of duty on *settlements* which will cost a mere £30,000, are the minor reliefs. They are accompanied by the now inevitable new instalment of miscellaneous anti-avoidance legislation to close the latest series of loopholes that the smart operators and their tax advisers always find in the most carefully drafted legislation. This year's Finance Bill will strengthen the 1960 provisions against *dividend stripping*; impose an appropriate charge on premiums and sales of reversions that have been used to avoid tax on *building operations*; include within Case VI of Schedule D certain transactions in land and property that at present escape tax through formation of a chain of companies; and include within the new Case VII, taxing short-term capital gains, operations in *land* that involve sale of shares in the land holding company rather than the land itself.

BUSINESS NOTES

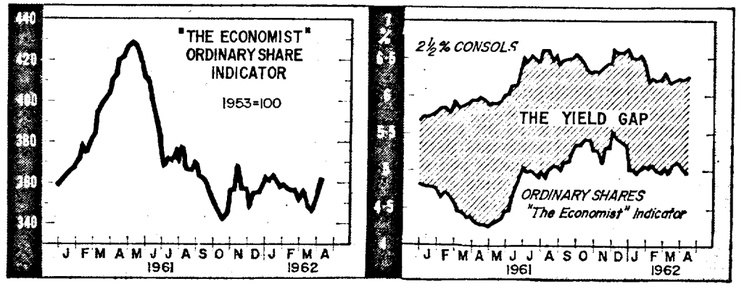
IN THE MARKETS

A Guarded Response

RESPONSE to the budget in the financial markets has been unusually small; the logic of the budget has not been followed through. Sterling was scarcely affected, equities were very mildly encouraged, and gilt-edged were plainly subdued. The gilt-edged market seized on the technical influence of the tax on short term gains, even though this was in the mildest form expected; and, like the equity market in its opposite movement, it paid remarkably little attention to the restrictive impact of the budget as a whole. The gilt-edged market may well have been chastened by its premature post-budget rise a year ago—though it was the breakaway in equities which then suffered the sharpest reaction. The same balance of payments question-mark overhangs both sections of the market now. Restrictive budgeting on this scale ought indeed to allow, as the Bank of England desires, an easing in interest rates and monetary restrictions (and investors have found new appetite for bank shares). But the premise on which the whole argument rests is the bearing of tough budgeting on the balance of payments.

Dealers in the gilt-edged market are certainly worried about the possible implications of the speculative gains tax, which will not be settled until the Finance Bill is published. Their forebodings were sufficient after the budget to keep business in the market very restricted and make prices listless. The first fear is that the new tax will impede switching operations. If individuals and, more particularly, life funds become liable for tax on short-term switches (as professional dealers are already), the market could be seriously affected; it is estimated that about two-thirds of the big bargains in gilt-edged are of a switching nature. The threat of tax is liable to cause potential switchers to look for a wider spread to ensure a reasonable profit, or to hold stock longer than six months. And it has to be noted that switching operations, and not merely by professionals, play an important role in the process whereby the authorities are able to sell stock through the tap.

The second fear is that the new tax will make the absorption of new issues by the stock market just that much more difficult. This applies with more force in fixed interest securities than in the equity market, where really important issues are usually made through the offer of rights—and if the shareholder has held the parent stock more than six months he will be free of the tax. The tax makes the risks of investing on the chance of a small turn, as on a fixed interest stock, look less worth running than where the chances of a good premium are high, as in some equity issues and placings. Many fixed interest issues are so finely priced as to be unattractive to the stags; here the danger is that the impact of the gains tax might slow down the process of digestion after the subscription lists are closed. It will operate against those investors who come in to buy a new issue when it is standing at a small discount with the intention of selling it as soon as it has improved to the issue price. It is in the new issue market that the tax could perhaps do the most harm, though the most obvious casualty is the market in share options which appear likely to be severely penalised. Those who dabble in options will have to get used to the idea that the profits they make will be reduced by the incidence of tax; once they have done so the option market could revive, though it might not be so spirited as it was in the past.



Second Thoughts on Equities

THE overriding point about the new tax is that because it will make the stock market thinner prices are likely to move more sharply; and to some extent the jobbers were anticipating such conditions in responding to the investors' initial reactions to the budget itself. Equities had been firm on its eve and they rose quite strongly after. The response was described by one experienced dealer as being one of almost hysterical relief, which is an acid way of saying that the speculative gains tax was far less fierce than the City had at one time feared. The market soon became quieter but prices remained reasonably firm and over the week to Wednesday's close *The Economist* indicator gained 7.4 points to 362.7. At first investors in equities tended to ignore the disinflationary implications of the budget and to base their hopes on the various statements made by government spokesmen both before and after it about the opportunities for exports and the prospect of a marked rise in consumer spending and hire purchase credit.

There was the usual crop of immediate gainers and losers on specific budget proposals. Motor and consumer durable shares rose on the reduction in purchase tax and, initially, furniture shares fell. Tobacco shares went ahead sharply on relief that there was no further discriminatory tax against cigarette smoking while property shares moved up on relief that, apart from the speculative gains tax and the renewed threat of the closing of loopholes against avoidance, the Chancellor had not imposed specific measures against property development. Shares in the soft drinks, ice cream and confectionery industries were marked down sharply at first on the imposition of their new 15 per cent purchase tax; but the stock market soon had second thoughts about the possible effect on consumption and much of the loss was quickly regained. In all, the equity market in the last fortnight or so has enjoyed its strongest rise for some months and a pause for reflection on the more sober aspects of the budget would not now be out of place.

THE EXCHANGES

Budgets Barely Noticed

FIRST reactions to the budget in overseas financial centres were barely perceptible, nor are they to be expected, except perhaps in St Helier. But any foreign operator or financial official who still believes that sterling's troubles are due to soft budgeting should try putting the figures in Tuesday's financial statement on a comparable basis with his own country's. Sterling had fallen before the week-end as a result of some bear selling from the Continent, on the view that the Chancellor might announce a further cut in Bank rate; the Bank of England appeared to offer no resistance to the slight fall in the rate to $2.81\frac{1}{8}$, and it is believed to have picked up some dollars when the disappointed Continental operators covered their positions on Tuesday and Wednesday. But activity as a whole has been noticeably lower in the past week.

The dollar has continued firm in Switzerland, with the rate at 4.34¼ near the recent peak, though no further intervention has been reported from the Swiss National Bank. For the week to April 7th, the National Bank shows a fall of 65 million francs in its gold holdings, partially offset by a rise of 35 million francs in its foreign exchange. The dollar has also been firm in Germany, but in Italy commercial selling has pushed it back to its lower support point of 620.60 at which the Italian control takes dollars off the market.

Canada, too, had its budget this week (reported on page 160) but the Canadian dollar showed little response: it is being pretty firmly held at a discount on New York of just under five cents. Mr Fleming appears to have confirmed earlier indications that the Canadian authorities have now switched towards a *de facto* stabilisation: the "substantial" exchange fund which was referred to in his last (June) budget as an instrument for bringing the rate down is now cited as a means of preventing "sudden or erratic movements in our exchange rate."

The most sharply depreciating currency at the moment is the Argentine peso. Most international operators make it a practice to hold as little in Latin American currencies as possible, but the recent political upheaval, which has caused misgivings among European investors who had put new hope in stability for Argentina, led to heavy pressure on the exchange. After sustaining substantial losses the Argentine central bank withdrew support from the peso at the level of 83 to the dollar (233 to the pound) that had been maintained since the exchange reform of 1959. The rate is now depreciating in an uncontrolled market and there are no indications at what point, if at all, the authorities will re-enter the market. Argentina's reserves had already fallen from over $700 million in early 1961 to $461 million by the end of the year, and they may now be below $300 million.

OVERSEAS TRADE

Exports Creeping Up

"SOME modest encouragement" was derived by the President of the Board of Trade, Mr Erroll, from the March trade returns, and this seems an appropriate response. Exports, seasonally adjusted, have edged up a shade further, in their third monthly rise from the very low December figure of £297 million, though at £312 million in March they were still barely one per cent above the average for the first quarter of 1961. Imports fell back a little further, to £359 million, so that after crediting re-exports the crude trade gap narrowed to £36 million—which is just about the parity figure for a true balance between imports and exports as evenly valued in the payments accounts. Mr Lloyd stated in his budget speech that prospects for invisible earnings —which in 1961 were down to only £65 million net, at least from the Treasury's identified transactions—are now "slightly better"; this presumably reflects coming relief for the Government's military expenditure in Germany.

UNITED KINGDOM TRADE

Seasonally adjusted values — £ million per month

		Exports fob	Re-exports fob	Imports cif	Crude gap
1961	1st qtr.	309	12	385	64
	2nd "	305	13	363	45
	3rd "	309	15	357	33
	4th "	304	13	362	45
1962	1st qtr.	306	12	367	49
1961	Oct.	311	12	378	55
	Nov.	305	14	359	40
	Dec.	297	14	350	39
1962	Jan.	300	12	380	68
	Feb.	307	11	362	44
	Mar.	312	11	359	36

In the first quarter of 1962 as a whole the crude trade gap averaged £49 million a month, which implies a substantial true trade deficit. Exports themselves in the first quarter of this year were actually below their level a year before. The small but consistent increases of recent months could, as Mr Erroll points out, mark a turn in the tide. But the tide will clearly have to move a good deal faster, and before the tide in imports turns too.

BUSINESS ATTITUDES

Merchants Add their Opinions

IT is now nearly five years since the Federation of British Industries began to poll manufacturers in order to sample the state of mind of businessmen in the economy. Now the Association of British Chambers of Commerce has started to do the same for import and export merchants: its first sampling of the mercantile state of mind appeared last week. This should have a particular value because of its overseas orientation.

The study, completed in March, uses much the same technique as the FBI and similar inquiries in other countries: its questions are all answerable by "More," "Less" or "The Same." Just under 500 merchants replied, two-thirds of them London firms: 400 of them were involved in exporting and 223 in importing. These firms handled about 6-7 per cent of Britain's export trade and 3-4 per cent of total imports, but the distribution of their interests is widely out of line with the division of trade between different classes of products. Nobody quite knows how important merchants are within foreign trade in different kinds of products and industries. The association published an unweighted analysis, and also one in which the replies are weighted according to the size of merchants' turnover (a refinement in which the FBI has never cared to indulge).

These merchants are not as optimistic about the future course of exports as Mr Lloyd and his Treasury forecasters. Most of them expect little change in export orders and deliveries during the next four months. In no trade do more than a third of the firms expect the rate of new ordering to become higher than of late and an even smaller proportion expect deliveries to rise during these four months. On the other hand, a sizeable majority of the firms concerned expects both imports and orders for them to rise, which would reverse experience over the last four months. These experts' guesses, for what they are worth, are not too promising for the trade balance.

AMERICAN STOCKS

Wall Street Uneasy

A correspondent cables:

THE mood on Wall Street is a curious mixture of apathy and uneasiness; this is reflected in the downward drift in equity prices and the dwindling volume of trading. The Dow Jones industrial average dropped below the 700 mark this week and those addicted to chart-reading believe that the decline may continue somewhat further. But even the outright pessimists do not foresee a serious or prolonged slide. The fact is that the demand for equities has ebbed, and though heavy selling is not in evidence, the absence of any buying pressure is producing a general mark down in prices.

Investors are not despondent, but they are disappointed by the moderate nature of the rise in business activity and as inflation no longer appears to be a threat, there is not compulsion to buy equities. On the contrary, investors are becoming increasingly attracted by the yields on fixed interest securities. The change in thinking on Wall Street has developed only slowly, but it has been encouraged in recent weeks by the failure of the economy to move ahead more

We're thinking of setting up in Australia

Many expanding U.K. firms have already done so, helped more often than not by Australia and New Zealand Bank. And to other manufacturers contemplating the same development, the Bank will gladly give similar assistance. A valuable introduction to such a move is provided by the Bank's 70-page book *Establishment of Industry in Australia*, produced especially for industrialists who may be considering that country as a further base for their company's operations.

Subjects include company formation, market potential, taxation, labour, transport, power supplies, tariff protection and local regulations. We shall be pleased to send you a free copy if you write to

rapidly and by the administration's own retreat from its earlier, more confident forecasts. As their reactions to the steel settlement made clear, investors have discarded the habit of discounting the immediate future in present market prices. Steel shares fell to a new low point this week as the industry temporarily reduced its output and though the prospect is that the results of the steelmakers in the second half of the year will be good, Wall Street prefers to wait and see. Dealers are apprehensive about the policies that the administration may pursue in regulating business, now that the President has shown his anger at the steel price increase. But they note that if the increase goes through, it might provide some stimulus to the economy and to the stock market. Many other equity groups are weak, but the biggest declines are due to special circumstances. The fall in tobacco shares, for instance, reflects the increasing attention given to the British report on smoking and lung cancer and the decline in chemical shares accompanies a persistent squeeze on profit margins.

Plainly, Wall Street is anticipating only a modest rise in business, but its mood could change again if a sharp spurt in economic activity occurs and if corporate profits jump. But there is now so much scepticism that the chances of a strong rally, which seemed bright only a few week ago, have faded. Institutional investors who began to take their profits at the end of December and who have piled up cash this year can be counted on to support the market if the prices continue to decline, but they, too, are taking the view that there is no reason to rush in to buy until they have a clearer view of the extent of the rise in business activity.

STEEL

Hope for Some

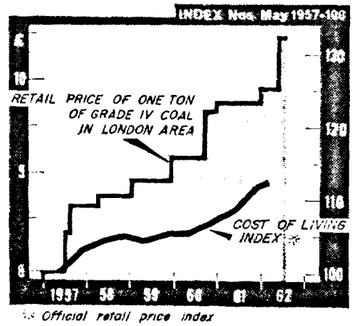
In the last week of March, steel output picked up a little, making the month's average of 412,700 ingot tons rather better than had been expected. But it was still less than in February, and 12.4 per cent less than in March, 1961. For the first three months of 1962, crude steel production was at a rate of about 20.9 million tons, a sixth lower than in the same quarter of last year and nearly 18 per cent lower than the peak quarterly rate at the end of 1960.

The Iron and Steel Board thinks that the substantial reduction in consumers' stocks is continuing, though this process slowed down for a short period while consumers were rightly predicting a price increase. Output this year will depend largely on the duration and amount of the reduction: during the twelve months, there may well be a fall of three-quarters of a million tons in stocks. The heavy end of the industry, serving mainly home investment, remains depressed, though rollers of flat steel who were already not doing so badly, should gain some business from the purchase tax reductions. Exports in this quarter have been sagging somewhat, though export orders are up. But the prices steelmakers are having to take to get the business are sharply down.

SMALL SAVING

Rise and Fall

Calculated as a residual between income and expenditure, total personal savings in 1961 amounted to £2,072 million, an increase of £478 million over 1960 following that year's record increase of £582 million over 1959. The bulk of last year's increase, admittedly, stemmed from a big drop (from £622 million to £355 million) in unidentified dissaving. Net acquisition of identified assets rose by £178 million, to the higher total figure of £2,186 million. The largest and most remarkable increase was in net personal bank deposits, by £271 million in 1961—£155 million larger than in 1960 and the largest increase here for fifteen years. Bank deposits have evidently been flowing away from companies in favour of individuals. By contrast, net investment in National savings, at £213 million, was £125 million lower than in 1960.



This fall in the rate of new national savings was even more marked in the fiscal year to March 31st. In 1961-62 new savings, net of accrued interest, brought in only £76 million; this compares with £244 million in 1960-61, and £301 million in 1959-60. Moreover, some £57 million of this increase of £76 million was accounted for by new deposits with the special investment department of the Trustee Savings Banks, which in the past year have attracted rates of 4½ or even 5 per cent. These funds are invested by the banks themselves; the direct inflow to the Exchequer, from savings certificates, defence bonds, premium bonds, and the ordinary departments of the savings banks, was only £19 million in 1961-62, compared with £269 million in the previous fiscal year.

The poor return from National savings in a year when personal savings have reached a new peak suggests a switch to other forms of saving. The sharp rise in interest rates, following last July's little budget, made the unchanged yields on national savings securities relatively unattractive. Interest in National savings in general seems to be flagging and the principal weakness lies in the diminishing appeal of the tenth issue of national savings certificates and the 5 per cent defence bonds. These netted £159 million in new savings in 1960-61, but only £1 million in 1961-62. It is now six years since the tenth issue made its debut and many members of the Savings Movement had hoped that the budget would introduce an entirely new issue or at least raise the limit on the existing issue above 1,200 units—many savers have probably now reached this maximum. Now that Bank rate is back to 5 per cent, Lord Mackintosh, chairman of the National Savings Committee, expects the flow of new savings to pick-up in 1962-63. However local authorities are still offering the small saver 6½ per cent on two to ten year mortgages, which is well above the 5¾ per cent currently offered by defence bonds held for the full seven years. For the more venturesome, 3½ per cent Conversion 1969 at the moment has a grossed-up redemption yield, allowing for tax at 7s. 9d., of £7 9s. 10d., which compares with the grossed-up yield on savings certificates, held over a similar period of seven years, of £6 17s. 6d. The yields offered by gilt-edged and local authority mortgages have still some way to fall before National savings are once more a fully competitive investment.

COAL

Selective Pricing for the Grate

Before approving the National Coal Board's proposals at the beginning of this year for increases in house coal prices that are to be higher in divisions where the pits are losing most heavily, the Minister of Power had an exchange of arguments with the Domestic Coal Consumers' Council. The Coal Board planned larger than average increases in house coal from Scotland and Lancashire and anthracite from South Wales, areas where it has been incurring its biggest mining losses. The consumers' council regretfully accepted the necessity for an increase, but argued that this should be spread uniformly over the whole country. The Minister, Mr Richard Wood, patiently argued the quite obvious case for increasing prices where output is most sharply uneconomic (Scotland has lost far more than the whole Coal Board since nationalisation). The council does not seem to have raised the rather more subtle question of whether house coal as a selection from production right across the country (and quite largely from some fairly profitable divisions?) is necessarily losing money as such. The allocation of cost between grades, even allowing for the higher pre-

BONUS DECLARATION
FOR THE YEARS 1959, 1960 & 1961

The following table shows specimen rates of reversionary bonus per £100 assured allotted to with-profit whole-life and endowment assurances, in respect of each annual premium falling due in the years 1959—1961:

AGE AT ENTRY	TERM OF ASSURANCE			
	WHOLE LIFE	15 YEARS OR UNDER	20 YEARS	25 YEARS OR OVER
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
20	3 0 0	3 8 0	3 1 0	3 0 0
30	3 2 0	3 8 0	3 3 0	3 2 0
40	3 5 4	3 9 4	3 5 8	3 5 4
50	3 10 4	3 12 4	3 10 8	3 10 4
60	3 18 4	3 18 4	3 18 4	3 18 4
65	4 3 8	4 3 8	4 3 8	4 3 8

A further reversionary bonus at the uniform rate of £2 0s. 0d. per cent. per annum was also allotted on all bonus additions already existing.

Bonuses have been allotted to with-profit Personal Pension policies in the form of additions to the deferred annuities at the rate of £1 17s. 6d. per £100 of annuity and existing bonus additions in respect of each year's premium falling due during 1959—1961.

BONUS NOTICES ARE BEING DESPATCHED TO ALL WITH-PROFIT POLICYHOLDERS

Ah, Edgar,
you point a moral!

The gamp, Edgar, has a lesson for us all.

What lesson, Alfred?

That, in commercial and industrial terms, a spread of customers is always desirable. Umbrella coverage, in other words.

Ain't much coverage from this one, Alfred.

Agreed, Edgar. And this indicates a further moral: that the fewer the gaps in your cover, the less your chances of gettin' wet. The rains of fate may fall; the heavens of circumstance may open; but a company shielded by a diversity of interests will always weather them. We, Edgar, are a standing rebuke to those who ....

Still, Alfred—saves a fru-penny wash and brush up, don't it?

Sheet steel is the basis of so many appliances which go to meet the call for a better standard of living throughout the world. As the standard of living rises so does the demand for sheet steel. All the time new uses are being found for sheet steel and all the time John Summers are developing their products to meet these needs, and by so doing are broadening their market.

JOHN SUMMERS & SONS LTD STEELMAKERS

Hawarden Bridge Steelworks, Shotton, Chester.

paration costs imposed by demand for large coals, must be somewhat arbitrary.

The Coal Board later agreed to moderate the double effect on some of the cheapest coals that would have resulted from narrowing the price range between grades and at the same time charging more in the most unprofitable areas. In Scotland, therefore, it has postponed its re-grouping of certain grades of coal: consumers of these will anyway be paying £1 a ton more as against the average increase of ten shillings a ton right across the country. Even for areas such as London which bear only this average increase—though paying much more for coal than Scottish consumers do—coal prices have gone up 30 per cent in the last five years.

OIL

OPEC Delays its Decisions

UNTIL now, bi-annual conferences of OPEC, the Organisation of the Petroleum Exporting Countries, have taken about a week, after which their resolutions have been kept secret until ratification by the member governments—which has meant publication of the resolutions two to three weeks afterwards. Last week, after two days of governors' meetings to prepare an agenda and three days' meetings of full delegations and committees, OPEC's fourth conference decided not to close but to adjourn until early June before passing any resolutions.

Only five of OPEC's members, Iran, Kuwait, Qatar, Saudi Arabia and Venezuela, were represented at this meeting at the organisation's Geneva headquarters. Iraq is at present unwilling to attend meetings where Kuwait is represented: this was so at OPEC's last conference also, and the Iraq government had the resolutions that the other members had drawn up sent to it for approval. This time it is said to have made clear its views in advance on some of the points discussed. What these were remains undisclosed, though clearly the controversial issue of prices and returns on investments in oil—on which these governments had commissioned advice from no less than three Western consultants—must have come up. As to specific discussions within the OPEC delegations keep their secrets well: though hospitable and pleased to discuss general problems in oil with the outside inquirer, they keep what's said inside their committees to themselves.

One impression, however, can readily be gained: OPEC wants recognition by Western consumer governments. Nor is this wholly unlikely to happen during the formulation of a European energy policy by consumer governments and supra-national organisations. The organisation also often professes a desire for contacts with the Western oil companies; but these, understandably, regard such overtures with caution. They are not short of contacts with these governments individually: contact with the collective organisation might enhance OPEC's prestige, but not necessarily their own.

How Much for Iraq?

AS was predicted in these columns last week, British Petroleum at the weekend posted a price of $1.72 per barrel for Basrah crude from the new deepwater loading terminal of Khor el Amayeh, which has just come into operation offshore south of Basrah. The Shell group followed suit. Equally predictably, the Iraq Government is said to have refused to recognise this price, which is the same as all companies charge for the crude at the oil port of Fao in Basrah harbour. (The oil is sold by these shareholders of the Iraq Petroleum Group, BP, Shell, *Compagnie Française des Petroles,* Standard Oil of New Jersey, and Mobil, not by IPC itself, which is a non-profit-making company handing over crude to its shareholders in proportion to their ownership. Iraq taxes are based on the port or border values they put on the oil by "posting" prices for it.)

The Iraqis, very naturally, would prefer the significantly higher price, $1.78 a barrel, that CFP posted for the same crude from the same new terminal a few days before BP took the plunge. Quite apart from any difference in port dues, the French price would give Iraq three cents a barrel more in its 50 per cent share of profit.

The valuation put on this crude by BP takes account of quality comparisons with Iranian and Kuwait crudes, which are said to have technical superiority in terms, for example, of lubricating oil yield. The French say this difference doesn't bother its customers for Basrah crude. The deepwater terminal should certainly offer tankers some savings in costs and dues; BP and Shell have posted the same price as at Fao because, they argue, in recent years the Fao price, with increased loading dues, had itself become unrealistically high.

But it is fair to note that this is basically a public disagreement about how much IPC shareholders should pay the government, rather than about prices. All posted prices for crude in the Middle East are unrealistically high: nowadays crude is never sold at them except to affiliate refining companies of the same integrated groups, and not always then. Independent customers of CFP, as of BP and Shell, will anyway obtain significant discounts below the prices posted at the new terminal. All that posted prices do, as the Shell group pointed out this week, is to determine the notional level of profits of which host countries get 50 per cent in taxes. Hence the Iraqi reaction.

TAX REFORM

Towards Unification

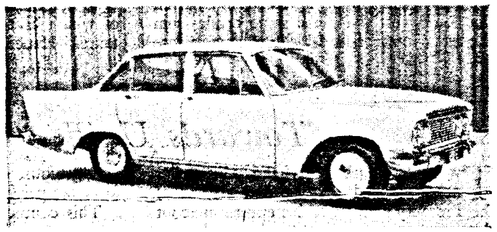
TWELVE months ago the Chancellor acknowledged that he had arrived at the Treasury with an undue optimism about the simpleness of simplification. He was quite clear that he wanted to rationalise the tax system by assimilating income tax with profits tax in order to create a single tax for companies and, at the same time, to combine income tax with surtax for individuals. He had read the Royal Commission's report and he knew the difficulties; in spite of them he hoped a solution would be possible. A year later he reveals that the Inland Revenue have gone a considerable way towards framing a scheme for unification of corporate taxation and that a draft scheme is to be discussed confidentially with the professional bodies concerned.

This is good news; Mr Selwyn Lloyd already knows that the difficulties will argue themselves and his approach promises something of the determination that Sir Kingsley Wood showed when he instructed Mr Paul Chambers to invent Paye at the beginning of the war. Of course, the difficulties are formidable; the Royal Commission, which found that there were considerable attractions in a single-tier company tax, was daunted by them. In the main they arise from the problems of allowing credit for taxes paid by companies when their profits flow to individuals as income and from the treatment of charges paid out of taxed income. The British system based on the principle of deduction of tax at source is ingenious, delicately balanced, and not to be tampered with irresponsibly.

This conceded, it is fair to ask whether most of the trouble does not stem from the commonly held assumption that the rate of company tax must differ from the standard rate of income tax. Why should it? Except indeed for companies, the standard rate is virtually a legal fiction—in the Royal Commission's own words, little more than one step up the ladder that stretches from the lowest reduced rate to the highest combined rate of income and surtax, from 1s. 9d. to 17s. 9d. in the pound. If there were a new basic rate of 10s., it would not be beyond the powers of algebra to arrive at allowances, reduced rates and surcharges which would leave the curve of progression for individuals very much where it is today. The main difficulty, it would seem, would be the combination of the basic rate with surtax for individuals because by the nature of things it is not possible to determine the surtax rates until a later date when the individual's total income from various sources has been aggregated.

The Chancellor is trying to achieve something worthwhile; quite apart from the basic simplification of having one tax instead of two or three, success would open the door to a current year basis of assessment which would sweep away the anomalies of the commencement and cessation provisions and would provide the simplest anti-avoidance measure ever enacted.

CIGARETTE ADVERTISING



After Nine o'Clock

THE decision of the tobacco manufacturers to limit their cigarette advertising on television to the two and a half hours or so available after 9 p.m. is likely to cut down total cigarette plugging on the screen, but will not have any dire financial consequences for the television companies. Before the decision, about half of cigarette advertising already took place after the prohibited time. The rest was spread through the afternoon and evening at the weekends but concentrated between 7 p.m. and 9 p.m. on weekdays, thereby avoiding programmes designed for children. Published statistics suggest a total value for all cigarette commercials (as opposed to those for pipe smoking and cigars) of about £4.7 million a year, but this figure ignores the widespread granting of special rates for one reason or another. Allowing for these, the real total was probably more like £3.5 million, so that the prohibited time may only leave about £1.75 million worth of commercials to be redistributed.

There is unlikely to be any lack of applicants for the peak-time vacated by cigarettes, but some of these will want to shift commercials at present occupying off-peak times —including later in the evening where cigarettes are permitted. But no programme contractor wants an overwhelming concentration of any one type of advertisement; not long ago detergent commercials were spaced out at the insistence of contractors. A lot of haggling will go on over the allocation of the remaining peak-time after 9 p.m., and the manufacturers may not think it worth their while to make full use of the final hour or so of diminished audiences. But as this period is often in less demand as well as being cheaper, the overall effect on the finances of the contractors may be slight. What is certain is that tobacco manufacturers will save money.

A NEW FORD

Reaching for the Stars

THE new Zodiac is Ford's entry for the Rover-Jaguar market. Finding that many owners of the old Zephyr and Zodiac were switching to Rovers or Jaguars, and envious of the steady sales that these makes have maintained through recent car recessions, Ford has decided to try to make a car that would tempt such buyers to keep to their old choice by offering something better than before at only £1,070. So the new Zodiac is a more distinct model than its predecessor was; and it has been given a powerful enough engine to make it comparable in performance with cars like the 3-litre Rover and Humber Super Snipe. It is, Ford claims, its first 100-mph car.

The new Zodiac is still closely related to the old: the only tooling changes are for the body and the four-speed gearbox, which is the major mechanical innovation. With synchromesh on all forward gears, it helps to make the performance noticeably better than that of the old car when combined with an engine developing 109 bhp instead of 90 bhp. Alternatively the car can be fitted with the new Borg-Warner automatic transmission, lighter and (at £110 extra) cheaper than the old, while giving rather smoother gearchanges and more control for the driver. Top gear ratio is higher, helping to make the car quieter, and there are minor changes to the suspension. Dimensionally, the body is virtually identical to the old one—except that the car is 7½ inches lower, making a low rear seat necessary and helping to make leg room in the back seat inadequate when the front seat is adjusted for a tall driver. To meet the current demand for less maintenance, greasing intervals have been lengthened to 5,000 miles, by sealing the bearings and adopting molybdenum disulphide grease—though this may make it necessary to take the car to the Ford agent for lubrication, which about half of present Ford owners now get done elsewhere.

The most noticeable changes in the car's road behaviour are lighter steering and better acceleration. Though it has enough power available in the lower gears for a leaden-footed driver to be able to make the rear wheels slide on a corner, it is essentially an easily controllable car. There is a noticeable degree of understeer when cornering with a small throttle opening, and the steering is precise and high-geared enough to make it easy to correct any slide. The car also has good stability in cross winds. The springing is relatively firm, limiting roll on corners, yet it still gives a reasonably comfortable ride. And the servo-assisted disc brakes are both light and fade-proof.

RATING REVALUATIONS

Official Figures

LAST month's white paper on the 1963 rate revaluations gave the percentage changes in the rate burden between the different classes of property—domestic down by 1.6 per cent and industrial up by 43.3 per cent—but it did not give, except for houses, the actual valuation multipliers upon which these changes were based. The official figures are now available and are set-out in the table below. These compare changes in the current list as a result of revaluation and give a clearer impression of the facts than the calculations made by *The Economist* in the issue of March 31st which on the basis of the white paper were calculated on 1939 values of houses without allowance for the increase of one-third introduced in 1956. Hence the increase of four times in gross values of houses between the 1939 and 1963 valuations, mentioned in the white paper implies an increase in current gross values of about three times, allowing for the one-third up-valuation. On a current value comparison the increase in industrial rents since 1956 as worked out by the Inland Revenue, allowing for the ending next year of the 50 per cent derating, is in fact 1.9 times and not 2.6 times as implied by our table. The increase in the net annual value of domestic property over the twenty-four years to 1963, as the table shows, is 2.66, against the increase of 1.9 imputed in industrial property over seven years from 1956.

	1963 value divided by value in current list		
	Gross values	Net annual values	Rateable values
Houses	3·01	(a) 3·26 (b) 2·66	...

ADVISING CAR BUYERS

Troubles on Delivery

BUYERS are getting an increasing volume of published information about the vices and virtues of cars. Apart from *Which?*, now into its second car supplement, that journalistic pioneer of frank criticism, *Motor Sport*, published in its April issue the first fruits of a survey of its readers' experiences with a number of cars. This is based on replies from 25 per

FAMILIAR COPENHAGEN SIGHTS: IN THE RAADHUSPLADSEN, THE LURBLOWERS STATUE; IN OFFICES, THE IBM ELECTRIC.

Fanfare in Copenhagen

riding endlessly past Copenhagen's City Hall, these bronze war-ors with their antler-like lure horns blow a silent fanfare for the days hen dragon ships ringed the western world. These Viking ships, ich bore such ear-tingling names as "Horse of the Gull's Track" and lk of the Fjord," were superbly efficient—and strikingly handsome. Today the Danes have again shown that useful things can be beau-ul. The Viking past echoes in the magnificent design that rns chairs and plates into works of art, makes Danish furni-re, silverware, porcelains sought after the world around.

At IBM, we like to think the IBM Electric typewriter is itself a notable combination of fine design and performance. The Danes apparently agree, for they received it enthusiastically, have kept its sales soaring year after year. We can almost imagine them reviving the old Viking custom and calling their IBM Electrics "The Quiet Word-Smith," "Wolf for Work," "Master of the Letter-Weavers." Any of these may be appropriate—but none could make us prouder than the name already given IBM Electrics by secretaries everywhere: "Friend." Let the lure horns sound!

IRVING TRUST COMPANY

One Wall Street, New York 15, N.Y.

Capital Funds over $155,000,000 *Total Assets over $1,750,000,000*

GEORGE A. MURPHY, Chairman of the Board WILLIAM E. PETERSEN, President

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

cent of the 125,000 forms sent out in its February issue. The survey thus covers a wide, if perhaps not wholly typical, sample of car owners (*Motor Sport* readers are an expert, cantankerous crew). From studying it a potential buyer of the cars covered—Triumph TR3, Volkswagen and the Minis in this first section—can get a pretty good idea of the troubles he may expect, and confirmation of many of the criticisms already made. But comparisons between the cars are made more difficult by a lack of uniformity in the reporting of the results.

One revealing set of figures shows the percentage of owners saying whether they would buy the same car again. For the BMC Minis the proportion was 64 per cent, though 11.2 per cent of those who would change would buy a Mini-Cooper; for the Triumph 77.8 per cent, and for the Volkswagen 84.7 per cent. Another shows how many owners are satisfied with the service they get—53 per cent of Triumph owners, 67.6 per cent of Mini owners, and 81.2 per cent of Volkswagen owners. The brands of petrol said to be used do contain one surprise: Jet is chosen by 13.8 per cent of Volkswagen owners, second to Esso, used by 22 per cent, while Shell is third, chosen by 9.7 per cent. Among Mini owners Jet ranks third, being used by 9.2 per cent; Esso comes first at 21.8 per cent; and Shell second at 20 per cent. But none of the TR owners chose Jet. The oil used produced no surprises; Castrol came first by a long way.

Which? follows the same course as in its first tests: any improvements in its test procedure will have to wait for its third report. But it has had rather less difficulty in deciding which cars it prefers, and gives the Austin A60 and Ford Classic as joint "best buys" in their medium range. Yet it has again found cars delivered in a disgraceful state, and dealers' standards seem to vary as much as those of cars. The cars which gave most trouble were the (virtually identical) Singer Vogue and Hillman Super Minx, to which the makers report a formidable list of modifications since the cars tested were bought—covering, Rootes claims, all the faults found. Apart from the usual excuse that these were new models, and so—as appears to be thought inevitable in British industry—liable to teething troubles, the Super Minx was bought when Rootes had only made a few models, during its strike, for dealers to put in their showrooms or to demonstrate. The Victor was another car that developed some mechanical faults; and the handbrake of the one tested was too inefficient to pass the seven-year test. The troubles with the two Ford models were relatively minor. But none of these cars seems to be much of a credit to the British motor industry.

BIDS AND DEALS

Kindred Spirits

RUMOURS of a bid for Gilbeys have been prevalent for some weeks and it came as no surprise to the market when a bid by United Wine Traders of six shares for every seven in Gilbeys was announced. Like most of the remaining independent wine and spirit businesses Gilbeys is controlled by family interests but the same terms are being offered for the £1,500 management shares, which carry all the voting rights in Gilbeys, as for the deferred. With UWT at 36s. the bid values Gilbey deferred at about 30s. 10½d. to yield 2½ per cent on a dividend which will be effectively raised from 14 to 17.1 per cent. This is based on UWT's forecast of an increase in its dividend from 60 to 100 per cent for the year to June 30th next when its profits before tax are estimated at £1,000,000, against £675,000 in 1960-61.

UWT's rapid growth in recent years has come mainly from its success in selling its J. & B. Rare whisky in the United States in association with the Paddington Corporation. Sales have been mainly in New York State and shipments this year have risen from 600,000 to 1,000,000 cases. As Showerings found with its "Babycham" there are limits to expansion in virtually a one-drink business and the merger gives UWT shareholders a stake in Gilbeys 200 off-licences (through which UWT hopes to sell J. & B. Rare) as well as its gin and Smirnoff Vodka. For Gilbeys shareholders the major attraction is their association with the rapidly growing UWT group whose profits record is in sharp contrast to the disappointing performance of Gilbeys in recent years. Moreover Gilbeys' products stand to benefit from the link-up with UWT's sales organisation. Not surprisingly both boards are in favour of the merger and there seems little doubt that it will go through.

Mixed Brew

IN January Charrington disclosed that merger discussions were afoot with United Breweries. Since then Charrington £1 shares have been firm in anticipation of the merger terms and last month's excellent results stimulated further interest. Recent buyers are not likely to be disappointed with the terms, which comprise a bid for both companies by a new holding company, Charrington United Breweries, in which Mr John Charrington will be chairman and

Overseas Investment

DIRECT private investment by United Kingdom companies overseas fell by £36 million to £211 million in 1961, partly, no doubt, as a result of the Treasury's closer scrutiny of non-sterling area investment since last July. Classification of the 1961 figures into areas and countries is not yet available. Investment by overseas companies in Britain rose by £90 million to £225 million in 1961, but £131 million of this total was attributable to the purchase of the remainder of the Ford Motor Company shares by the American parent. The figures also show that in 1961 earnings were slightly down on both sides of the table. Unlike the British companies, however, the overseas companies remitted an increased amount to their parent companies from their lower earnings.

The principal field of investment for British companies, and still a rapidly growing one, is still the sterling area, from which earnings in 1960 amounted to £167 million, an increase of £43 million over 1958, and 67 per cent of the 1960 total. Earnings from British investments in the common market rose from £10.3 million to £14.8 million between 1958 and 1960.

Overseas direct investment in the United Kingdom comes mainly from the United States and earnings on this rose from £76.9 million to £112.3 million between 1958 and 1960. Earnings of British investments in the United States over the same period fell from £38.5 million to £36.2 million. These tables do not include Britain's large oil and insurance interests in the United States.

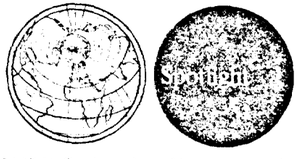
* Including Ford Motor Company transaction.



Mr E. P. Taylor of United Breweries vice-chairman. Charrington shareholders are offered twelve 5s. shares in the new company for each £1 share and United Breweries shareholders nine 5s. shares for every eight 5s. shares they hold. With United Breweries shares standing at 15s. 7½d. this imputes a value of about 166s. to Charrington shares which had already gained a further 5s. to 152s. 6d. this week ahead of the terms. After the terms were announced the shares shot ahead to 165s. but profit taking brought them back to 161s. 3d. At the beginning of the year the shares stood at 106s. 9d. United Breweries expects its profits to be "materially greater" this year while Charrington expects "some increase" after the sharp advance in 1961. On the combined capital the holding company expects to pay a dividend of not less than 12 per cent, which would be covered 1.7 times. This gives a small increase in income from 12½ to 13½ per cent to United Breweries shareholders and a bigger one from 25 to 36 per cent to Charrington's shareholders. On this forecast the shares offer a prospective yield of about 4½ per cent, which is above the average return offered by leading brewery shares.

Bush, Rather than Thorn

The need for concentration of the radio and television industry into bigger units explained the preliminary discussions between Thorn Electrical and Murphy Radio about the possibilities of a merger. These discussions seem not to have been very satisfactory from the point of view of the directors of Murphy Radio, who now recommend shareholders to accept an offer for the company's preference and ordinary capital from the Rank Organisation, which owns Bush Radio, is interested in Pay-television and has a shareholding in Southern Television. The intention is to co-ordinate Murphy's activities with those of Bush Radio. The Rank Organisation is offering one "A" ordinary share plus 3s. in cash for every two ordinary shares in Murphy. With Rank shares at 31s. 6d., the bid imputes 17s. 3d. for Murphy, against a pre-bid market price of 14s. 4½d. In all the bid is worth £3¾ million.

Though the bid offers a good turn in market values, it is in non-voting stock and acceptors will not rank for the interim dividend of 7½ per cent to be declared shortly by the Rank Organisation; nor will they be entitled to participate in the proposed new issue of £5¼ million of convertible loan stock by way of rights by the organisation needed "to finance an existing programme of expansion." Murphy shareholders did not receive a dividend in 1960; in keeping with an earlier forecast the Rank Organisation intends to pay a final of 17½ per cent for 1961-62. The bid is attractive to Murphy and the directors, who recommend it, have a large shareholding.

WORLD BANK

A Billion a Year?

Last week Mr Eugene Black, president of the World Bank, made his thirteenth annual appearance before the Economic and Social Council of the United Nations. Since his first address the bank's total loans outstanding have risen from $750 million to nearly $6,500 million. In recent years a plateau in the rate of lending appeared to have been reached, at $650-$700 million a year; but now, with only three months of the current fiscal year still to run the bank has already lent $664 million and Mr Black says that total lending will clearly exceed that of any previous year. Including the lending of its two affiliates, the International Finance Corporation and the International Development Association, the bank's total contribution should soon reach one billion dollars a year.

The bank is by far the largest single source of multilateral development aid, and more remarkable, these vast sums have been lent without further calls for new subscriptions on the bank's member governments. The balance beyond the original subscription of $1.7 billion has come from direct borrowing in the world's capital markets, by selling portions of the bank's loans to commercial banks, and from the bank's own earnings. Of increasing importance recently have been the bank's technical assistance activities. Its Development Advisory Service was set up last November to provide resident advisers for development programmes. The supply of suitable people is limited and Mr Black hopes to establish a career service.

The recent amendment of the charter of IFC to permit equity investment is expected to be used freely; one interesting possibility is underwriting of local stock issues, which should provide a boost to developing capital markets. The bank's other affiliate, IDA, has now signed twenty credits totalling $200 million in the first year of its existence. They are all interest free with repayment spread over forty years after an initial period of grace of ten years. Lending on these terms naturally prevents IDA from borrowing in the capital markets, so that very soon, if the momentum of lending is to be maintained, member countries will have to put up additional subscriptions. Mr Black has long urged that a far higher proportion of development aid must now be on terms similar to those offered by IDA.

MAN-MADE FIBRES

Takes All Sorts...

As manufacturers of synthetic fibres do not trust one another with their production figures, the most that can be said of the breakdown of man-made fibre production in 1961 issued by a committee of producers is that it broadly confirms estimates of output let slip by producers in the course of the ICI-Courtaulds argument. Talk that "Terylene" did not do as well last year as expected can however be reconciled with the achievement of the forecast growth in synthetic production from 134 million to 146 million lbs, if output of newer fibres, particularly the acrylics, had been underestimated.

The most revealing fact in the producers' figures—collected in secret by an independent firm of accountants—is that acetate and triacetate fibres, which include "Tricel," outstripped synthetics in growth last year even though their output is less than half that of all synthetics combined. But two-thirds of the 12 million lb rise in acetate production was in filament yarn, caused mainly by greater demand for dress materials. Weight is a poor guide to the relative importance of a fibre, particularly in filament, where a little nylon used, for example, in the production of stockings is made to go a lot farther than other fibres of equivalent weight. Apart from the success of "Tricel," acetate staple tow is now used in about two-thirds of all filter-tipped cigarettes, which in their turn now account for about a quarter of the cigarette market.

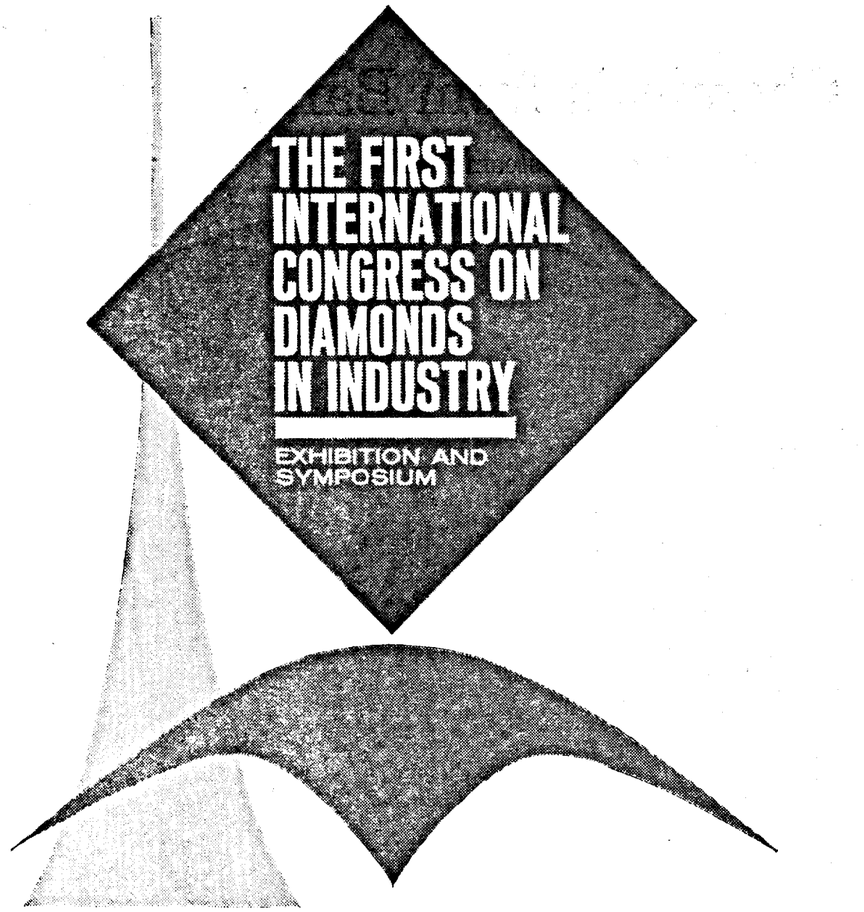
After the big increase in output of synthetics in 1960, for which no audited figures are available, the slowing down to an increase of 11½ million lb appears to represent near-capacity working, although capacity based on weight is somewhat elastic—finer deniers take longer to spin than the coarser yarns. The fall of 12 per cent in viscose rayon production from 398 million to 350 million lb caused a contraction in total output of man-made fibres last year from 592 million to 568 million lb, most of it in the first half of the year; the later improvement has continued through the early months of this year.

World output of synthetic fibres rose by about 16 per cent last year (compared with 9 per cent here) and production of viscose and acetate rose by 4 per cent. In Britain and overseas, the share of the market held by the cellulosic fibres, viscose and acetate, declined last year to about 75 per cent.

Chemicals from Barry

... and Mrs Yeoman's steam iron

CHEMICAL COMPANIES • INTERNATIONAL ENTERPRISE •



Devoted husband, Henry Yeoman. Likes to get the best for his wife—including the latest in electric steam irons. No old-fashioned methods for Mrs. Yeoman. No danger, either, from moisture and mains electricity working together in the same appliance. And that's where chemicals from Barry come in.

Midland Silicones Limited—one of the companies of the Albright & Wilson Group—produces Silastomer at Barry. Silastomer is a silicone rubber with many applications, including sealing, and is especially useful where electrical products are exposed to moisture. It provides a moisture-tight seal, ensuring additional safety in a wide variety of domestic appliances—like Mrs. Yeoman's steam iron.

This is only one of the many ways in which A & W chemicals play a part in the life of Mr. and Mrs. Yeoman. As one of the biggest organisations in the British chemical industry, the Albright & Wilson Group contributes—but we could go on like this...

The Albright & Wilson Group

BA/88

PARIS MAY 25th - JUNE 3rd

The first International Congress, Exhibition and Symposium on *Diamonds in Industry* is to be held in Paris at the Centre National des Industries et des Techniques (Palais du C.N.I.T.).

PURPOSE: To demonstrate today the production techniques of tomorrow, in relation to the ever-increasing use of industrial diamonds and the contributions they make to economy and efficiency in production.

FEATURING: **Papers, Discussion Groups and Films**

Practical demonstrations of:

- Metal Machining—grinding, turning, honing, lapping.
- Concrete, Stone and Tile Working.
- Diamond Drilling for mining and civil engineering.
- Glass Grinding.
- Diamond Powders—die polishing, watch stone manufacture, etc.

ORGANISED BY
De Beers Consolidated Mines Ltd,
Industrial Distributors Ltd,
The Diamond Research Laboratory,
The Industrial Diamond Information Bureau.

In association with

SCIENCE

Down With Fred

ONE of the chief concerns of the Minister for Science is to see the results of research applied in industry; this is infinitely more difficult than seeing that the research itself gets done. Lord Hailsham left his after-dinner audience at last weekend's research conference organised by the Federation of British Industries in no doubt about his opinion of present performance. He complained that on the FBI's own showing, only three or four industries are genuinely "science-based" and these by no means the biggest. He defined this adjective in a way that must have jolted those of his hearers who fondly believe their obligations end with the hiring of a few scientists. An industry can be science-based, said Lord Hailsham, and yet do little or no actual research. But its building, its production methods, its design and its administration will all bear traces of new thinking.

The biggest obstacle to this kind of innovation was Old Fred. Old Fred on the factory floor blocked new methods of training. "We cannot afford," said Lord Hailsham, taking aim at this lay figure, "a system of apprenticeship which involves unfortunate lads fetching endless cups of tea for five years for Old Fred, who can certainly teach him more than he learned himself fifty years ago." Old Fred is sometimes also in the managing director's chair, and Old Fred in the universities looks sideways down his nose at anything that smacks of commerce—and does not take at all kindly to the Minister's suggestion that industry's top scientists might do a turn in the universities. This heavy sugar coating of whimsy concealed a sharp cutting edge to the Minister's criticisms that industry was not making sufficient use of technical facilities already existing in the universities and technical colleges, either to up-grade its staff or get some of its own technical problems solved. His main complaint was that industry does not make full use of the facilities provided by the Government through the Department of Scientific and Industrial Research for research that companies do not undertake themselves. "I want to see the top brass in the management hammering on the doors of the DSIR and the Ministry for Science, bubbling over with ideas for industrial research." Lord Hailsham is in for a long wait. Industry's opinion of what the department or the ministry have to offer, after all, may not be as high as his own.

HOVERCRAFT

Kits and Controls

HOVERCRAFT are potentially versatile, and the Land Rover is already. So it is appropriate that Vickers should choose the Land Rover as the first vehicle to offer a hovercraft conversion kit. Looking rather like a giant rubber bustle skirt around the car, with a vast paddle wheel on each side—in fact a centrifugal fan—the purpose of this eccentric-looking conversion is to provide something capable of use on normal roads and on ground too soft for normal vehicles. The air cushion, provided by a separate engine powering the fans, can be made to take as much weight off the wheels as the driver wishes—but not all, for the car still has to be steered and driven normally with the wheels. It therefore avoids the problems of control that make ordinary hovercraft unsuitable as yet for use on roads. Vickers believes that there may be a big market for its conversion kits among farmers who want to do crop spraying, building contractors, and other people needing to drive over soggy ground.

The thorny legal problem of the hovercraft's ambivalent nature remains unsettled. The Ministry of Aviation—in consultation with the Ministry of Transport and the Air Registration Board—will issue "permits to fly" to makers and users of hovercraft to cover test "flying" and the commercial operations planned for this summer (British United Airway's service from Hoylake to Rhyl, using the Vickers VA3). Road use will be allowed only on a limited and strictly controlled basis. As most hovercraft are intended for marine use, however, the Ministry of Aviation has decided that the Civil Aviation (Licensing) Act of 1960 should not be applied to them—so all the applications for licences to the Licensing Board have done no more than gain publicity, as no doubt they were intended to do. What legislation should be introduced if hovercraft come into general commercial use is being "given consideration"; is it too much to ask that in its early life at least free competition should be allowed?

SHORTER NOTES

Dunlop Rubber has maintained its total dividend for 1961 at 1s. 7d. per 10s. stock. Although sales fell from £275 million to £265 million, trading profits advanced from £23.2 million to £24.8 million and net profits from £5.6 million to £5.9 million. Sales were practically unchanged in the second half of last year but profits were higher and the gross profit margin was 9.8 per cent, compared with 8.9 per cent in the first half of 1961 and 8.7 per cent in the second half of 1960.

★

A new monthly publication collating existing financial statistics and including some new information was promised for next month by Mr Selwyn Lloyd in his budget speech. This was recommended by the Radcliffe Committee in 1959, and since then much new financial information has already been released through the *Monthly Digest* of the Central Statistical Office and, more extensively, through the Bank of England's Quarterly Bulletin. The Chancellor also said he would be making proposals later this year about how the Exchequer Accounts themselves might be "radically improved."

★

Sales of units by unit trusts exceeded repurchases in March for the eleventh successive month. Sales, helped by four block offers, totalled £3,447,000 against repurchases of £1,073,000 and the value of the funds rose from £243.8 million to £245.3 million.

★

Following the fall in market rates for local authority loans the Treasury has announced cuts in rates. Loans for under fifteen years are cut from 6⅞ to 6½ per cent while loans for over fifteen years remain unchanged at 6¼ per cent.

★

Western Deep Levels, the new gold mine in the Anglo American stable, is making a rights issue worth £9¼ million, offering holders of "A" and "B" shares one new £1 "B" share at 32s. 6d. for every four held. In addition, Anglo American proposes to make available fresh loan facilities of up to £5 million.

★

British Drug Houses has maintained its ordinary dividend at 16 per cent for 1961, though the ordinary "B" shares issued to Mead Johnson in July do not participate. Profits before tax rose from £642,000 to £708,000.

★

Gestetner, makers of duplicating machines has announced a 20 per cent rise in gross profits from £2½ to £3 million in the year to March 31st. The ordinary dividend is maintained at 20 per cent and a one-for-three scrip issue is proposed.

COMPANY MEETINGS

CO-OPERATIVE INSURANCE SOCIETY LTD

TEN YEARS OF RAPID PROGRESS

SUBSTANTIAL INCREASE IN PREMIUM INCOME

MR S. LEONARD KASSELL'S REVIEW

At the Ninety-fourth Annual General Meeting of the Co-operative Insurance Society Limited held in Manchester on April 10th, **Mr S. Leonard Kassell,** Chairman, said:

Before submitting my detailed comments on the ninety-fourth Annual Report and the Statements of Accounts and Balance Sheet of this Society for the year ended December 31, 1961, I should like to take this opportunity of emphasising its very strong financial position and the rapid progress which it has made in recent years. This clearly indicates the confidence which the public has in the Society. During the past ten years the Society's total income from all sources has increased from £32,415,683 to £75,962,827, and its assets from £112,256,634 to £295,778,560. During that period nearly 15 million claims have been paid, totalling over £230 million.

The market value of the Society's assets as at December 31, 1961, was considerably in excess of their Book Value. In addition to this, there are substantial special reserves to meet unforeseen contingencies which arise from time to time, such as an exceptionally heavy claims experience in the Fire, Accident or Motor Departments.

In the circumstances, therefore, it is not surprising that the C.I.S. continued to make excellent progress in 1961. The premium income in 1961 was £60,175,069. This showed the very substantial increase of £3,866,250 over the previous year. The principal increases were in the Industrial Life Section (£1,495,150), the Ordinary Life Section (£817,201) and the Motor Department (£1,395,740).

INVESTMENTS

The investment of the Society's Funds is a matter to which the Directors devote a great deal of time. The amount of new money available for investment grows each year and our total assets are now approaching £300 million. The bulk of this money relates to the Life Assurance Funds, which means that we must follow an investment policy which, in our judgment, is in the life policyholders' best interests.

As I anticipated in my Report last year, 1961 was another year of high yields on long-term fixed interest securities, and full advantage has been taken of this situation by substantial investments in such securities, not, however, to the exclusion of other classes of investment.

One avenue for new investment was the House Purchase Scheme under which new advances totalled £5,464,096, but after allowing for repayments the net increase in House Purchase Mortgages as at the year end was only £1,902,894. The total amount outstanding under such loans at the year end was £44,304,407 secured upon 43,461 properties. The average House Purchase mortgage outstanding was £1,019.

Our investments in freehold and leasehold properties continue to grow. During the year we have taken steps to place this section of our investments on a long-term basis by entering into continuing arrangements with several first-class property companies on terms which are advantageous to the Society. We are, of course, in the meantime supporting the Chancellor's request for the curtailment of finance for speculative investments.

These long-term arrangements will not in any way preclude us from continuing to finance suitable Co-operative developments. During 1961 substantial investments were made in well secured co-operative properties and we hope that this form of investment will continue and expand.

Investments in British Government and British Government Guaranteed Securities amounted to £53,132,715 as at December 31, 1961, being an increase of approximately £1,300,000 during the year, and representing 17.96 per cent. of our total assets.

Your directors decided in January, 1962, to join with other Insurance Offices in making a proportionate contribution to the £100 million pool for Export Credit finance established at the request of the Government. There can be no doubt that it is in the best interests of our policyholders that we should take our share in any scheme which will increase the country's export trade and hence employment in Great Britain.

During the year we continued to make investments in selected Ordinary shares. Quite apart from the fact, as I have emphasised before, that this gives our policyholders a share in the profits of the companies for which they work, we feel it would be most unwise to neglect this field of investment. I say this having regard to our responsibilities to the policyholders and the need to have a balanced portfolio of investments. This year we are giving tangible proof that our investment policy (which has been criticised from time to time by some of our friends) has been sound and fully justified.

The Directors have decided that in the interests of the present generation of policyholders the time has come to take credit for part of the improved real worth of our investments in Ordinary Shares. They have therefore authorised the writing up of the book value of these shares by £10 million. This has enabled us to declare special bonuses to our Ordinary Life and Industrial Life policyholders, details of which I shall give in dealing with the Life Department Accounts.

Following my usual practice I will proceed to give a brief review of the Departmental activities during the year.

LIFE DEPARTMENT

The premiums paid in the Ordinary and Industrial Sections of this Department during 1961 totalled over £41 million and were in respect of 11 million premium-paying life policies which were in force.

The total new sums assured were over £107 million as against £100 million in 1960. For the first time the new sums assured in the Ordinary Section (£54,200,000) exceeded those in the Industrial Section (£53,500,000). This is a trend to which I referred last year and which has been in evidence for some time, but even so the total new sums assured in the Industrial Section was over £3 million greater than in 1960.

The C.I.S. business in the Ordinary Section consists almost entirely of individual policies. Unlike many of our competitors we have not undertaken a large volume of pension and group life assurance business—the Pension Schemes of the Co-operative Movement are nearly all self-administered schemes. Despite this, as will be seen, we have continued to expand our Ordinary Section business.

The average sum assured in the Industrial Section shows a very substantial increase of £3 15s. 0d. from £63 5s. 0d. to £67, which is a most encouraging feature of our new business.

BONUSES

I have already indicated that as a result of the increase in the real value of our investments in Ordinary shares we have been able to declare special additional reversionary bonuses in respect of with-profit policies at present in force in both the Ordinary and Industrial Life Departments. The amount of the special bonus is 10s. 0d. per cent for Ordinary Life policies and 8s. 4d. per cent for the main classes of Industrial Life policies in respect of each of the years 1947-1958 inclusive. The maximum additional bonus is thus £6 per cent for an Ordinary Life policy and £5 per cent for an Industrial Life policy.

These substantial special bonuses are additional to the normal bonuses, and I am pleased to be able to say that the normal bonuses in both the Ordinary and Industrial Sections have also been increased. In the Ordinary Life Department the normal bonus rate for assurances has been increased by 4s. 0d. per cent from £2 8s. 0d. per cent to £2 12s. 0d. per cent, and in the Industrial Life Department the normal bonus rate for the main classes has been increased from £1 5s. 0d. per cent to £1 13s. 4d. per cent.

It is very gratifying to us that largely because of the success of our investment policy it is possible to provide these increased bonuses for our Life policyholders.

MOTOR DEPARTMENT

During 1961 the Motor Department continued to expand and the premium income rose from £10,688,831 in 1960 to £12,084,571 in 1961.

Our total expenditure in the settlement of claims absorbs an increasing proportion of the premiums received, and the claims ratio in 1961 at 65.44 per cent proved to be the highest since 1954. The deterioration was most marked in the private car portion of the account but some measure of relief is anticipated from the selective premium adjustments which were introduced last September.

There is no doubt that motor insurance business is being conducted at rates of premium which will continue to produce results of a marginal character only, and we count ourselves as fortunate to have finished the year with an underwriting profit of a little over 2 per cent of the premium income, amounting to £255,743. Interest earnings of £202,253 are credited to the account, producing a total surplus of £457,996, of which £252,475 has been transferred to the Profit and Loss Account.

FIRE DEPARTMENT

The steady progress of this department continued during the year and the premium income rose by £170,071—the largest annual increase since 1951—to a total of £2,439,774.

Fire wastage in the United Kingdom during 1961 continued at a high level and the estimated total of a little over £39 million was only slightly better than the unprecedented figures of the two previous years. In addition claims from the allied perils of Storm, Tempest and Flood have been substantial and in these circumstances it is satisfactory to find that the Society's claims ratio was some 4 per cent less than in 1960.

After including interest on the fund there is a surplus of £379,675, of which £311,225 has been transferred to the Profit and Loss Account, the balance being added to the additional reserve.

ACCIDENT DEPARTMENT

The premium income in the Personal Accident Account amounted to £209,006, an increase over the previous year of about £15,000. Claims were a little higher than in 1960, but commission and expense ratios were almost unchanged. There was a surplus of £68,221, of which £55,925 was transferred to the Profit and Loss Account.

ADMINISTRATION

Administration and its cost is a matter which is constantly under review by the Directors and I feel that it is a matter for some satisfaction that although there has been some slight increase, our overall expenses have been held at a steady figure of between 24 per cent and 25 per cent for the past five years. In 1961 the overall commission and expense ratio was 24.86 per cent as against 24.14 per cent in 1960.

PROFIT AND LOSS ACCOUNT

The sum of £1,016,300 has been transferred to the Profit and Loss Account from the Departmental Revenue Accounts, of which £200,000 has been added to the General Reserve Fund.

DISTRIBUTION OF PROFITS

After making this transfer and providing adequate reserves for contingencies we are able to distribute the sum of £18,706,540 as the combined result of our operations for the year 1961, and the writing up of the book value of our Ordinary shares to which I have previously referred. The whole of this amount will be distributed for the benefit of the Society's policyholders; £18,126,540 will go to our Ordinary Life and Industrial Life policyholders and the balance of £580,000 will be payable to Co-operative Societies as a dividend on the Fire, Accident, Motor and Collective Life premiums paid to the C.I.S. during the year.

The rate of dividend on Fire and General premiums has been maintained at 3s. 6d. in £ of premium and this should be ample evidence to the Societies and their members of the advantage of insuring with their own Insurance Society.

TAXATION

The amount of tax payable by the Society in respect of our transactions for the year was £2,435,794. Of this total £479,695 has been reserved for taxation on the profits of the Fire and General Departments; £126,141 charged to the Industrial Life Account, and the balance was paid during the year by deduction from interest earnings.

CONCLUSION

In a few weeks I shall be retiring from the Board of the C.I.S. (of which I have been chairman for the past eight years) and this is the last occasion on which I shall have the pleasure of submitting my annual survey of the Society's activities to the Shareholders.

At the outset of this Report I referred to the progress made during the past ten years. If we go back to 1946, the year in which I was first appointed to the Board, the progress is even more impressive. At the end of that year our total assets amounted to about £71 million and our premium income for the year was approximately £17,000,000. Broadly speaking our assets and our premium income have quadrupled during the past 15 years. Naturally I think, I take pride at having had some share in this phenomenal growth and in helping to prove that the Co-operative Movement is capable of establishing and running such a successful organisation which will achieve its century in a little over five years' time.

My experience has proved that this success was not achieved without effort or automatically—it is a result of sustained effort in a highly competitive business by all members of the Management and Staff. We are also ever mindful of the loyal support which the Retail Societies give to their own Insurance Society.

I am very happy to have had the opportunity of being associated for many years with an organisation which is surely a credit to the Co-operative Movement. I am confident that the Society's success will continue under the Chairmanship of Mr A. Wild, whom the Board have appointed to succeed me. Mr A. Wild was first elected to the C.I.S. Board in 1944.

The Report and Accounts were adopted.

EQUITY & LAW

LIFE ASSURANCE SOCIETY LIMITED

EXCELLENT OUTCOME OF TRIENNIAL VALUATION

A FIRST-CLASS ORGANISATION IN A HIGHLY COMPETITIVE INDUSTRY

MR G. GODFREY PHILLIPS ON BOARD'S INVESTMENT POLICY

The Annual General Meeting of Equity & Law Life Assurance Society, Ltd., will be held on May 2, 1962, at 29, Lincoln's Inn Fields, London, W.C.

The following is the statement by the chairman, **Mr G. Godfrey Phillips, CBE,** circulated with the report and accounts:

A number of changes have taken place in the Board of the Society since our last Annual General Meeting. In April 1961 Mr Gerald Russell resigned, and it was with sadness that we learned of his death on March 3rd this year. Gerald Russell had been a Director since 1951, and I wish to record our appreciation of his services to the Society during the ten years that he was with us.

Some little time ago our senior Director, Mr Owen J. Humbert, who joined the Board in 1937, mentioned to us his desire to retire at the end of 1961; we accepted his decision with regret, and I express here our warm regard for him and our sincere thanks for the long and able service which he gave to the Society.

As is known, our traditions embodied in our Articles of Association require us to preserve a nice balance on the Board between lawyers and laymen. Recently we have appointed Mr John Witt and Mr W. D. Macpherson, both of whom are solicitors, and also Mr J. F. Crittall, an industrialist, to seats on the Board. We were delighted that these three gentlemen agreed to join us and we are well satisfied that they will help greatly in the direction of our affairs.

I do not propose to devote much of this statement to the events of the year 1961, but rather to deal with the triennium 1959-1961, leading up to the valuation made as at December 31, 1961. It has been an excellent triennium.

NEW BUSINESS

The first year of the triennium—1959—showed a quite dramatic increase in gross new individual life assurance business, nearly £21m. as compared with just over £12m. in the last year of the preceding triennium. If we include group business and deduct reassurances, the total new life assurance business written during the triennium 1959-1961 amounted to £107m. as compared with £59m. written during the preceding triennium. I draw attention to these figures to emphasise the Society's expansion.

BONUS DECLARATION

We are well pleased with the results of the triennial valuation and the bonus declaration of "60s. and upwards" on with-profit life assurance policies, 37s. 6d. on with-profit personal pension contracts, and 80s. on Equity Pension Schemes. The Society's with-profit policies do indeed provide "outstanding value in life assurance," and I think that the following table is of interest:

ENDOWMENT ASSURANCES WITH PROFITS

Annual Premium £100
Policies Maturing in 1962

Policy Effected	Age at Entry	Sum Assured	Bonus	Maturity Value
		£	£	£
1927	27	3,458	3,352	6,810
1937	30	2,510	1,675	4,185
1947	40	1,340	796	2,136

Whole-life with-profit policies also show outstanding results.

For 1962 we are continuing our interim bonus on with-profit life assurance policies at the same high rate of "56s. and upwards" as we have been paying for the last three years; interim rates on with-profit personal pension policies and with-profit group pension policies will also remain unchanged at £1 15s. 0d. and £3 15s. 0d. per annum respectively.

LIABILITIES

A summary of the Actuarial Basis used in the valuation of liabilities is given on page 15 of the Report & Accounts. Certain changes have been made in the basis used on the occasion of the last triennial valuation as at December 31, 1958, principally by the use of higher rates of interest. The valuation basis used in 1958 had in one important respect remained unchanged for twelve years, namely, the rate of interest employed in the valuation of ordinary life assurance policies, which was put into force as at December 31, 1946, when 2½ per cent Consols yielded fractionally over 2½ per cent and when the gross yield on the Society's funds was 4¼ per cent; 2½ per cent Consols now yield over 6 per cent and the gross yield on the Society's funds last year was 7½ per cent. The continuation of the valuation basis unchanged would have caused an undue withholding of surplus from the current generation of policyholders. The bonus now declared was earned during the triennium 1959—1961 and the reserves released due to the change in the actuarial valuation basis attributable to the period prior to 1959 have been used to increase the carry forward.

ASSETS

During the triennium the Society's funds increased by £33m. and the following items extracted from the Balance Sheets indicate in very broad terms the investment policy pursued:

	31st December, 1958 £ millions	1961 £ millions
Mortgages and Loans (including Loans on Society's Policies)	4·5	5·8
British Government and British Government Guaranteed Securities	8·7	22·0
Debentures and Debenture Stocks	9·3	12·5
Ordinary Stocks and Shares	22·6	32·6
Property Investments	3·6	7·9

It must be remembered, of course, that the three years in question were, from the point of view of investment policy, far from homogeneous. The year 1959 saw an increase from 225 to 338 in "The Financial Times" Index for ordinary shares, whereas the years 1960 and 1961 saw that Index fluctuate between 285 and 366. The triennium finished with uncertainty surrounding profit margins in industry and the entry of this country into the European Common Market. While in my view this is an aim to be pursued with determination not only for its vital importance to the United Kingdom but also to the Commonwealth as a whole it is difficult to see it being accomplished without a period of acute change for British industry.

In my statement of two years ago I mentioned the investment of a modest portion of our funds in equities overseas—principally in the U.S.A., Canada and Australia—we have continued this policy over the last two years.

The Report & Accounts show that the rate of interest earned on the funds continued to increase and—as indicated earlier—reached the very high figure of £7 10s. 4d. per cent. How long increases will continue one hardly likes to conjecture; we expect a windfall during 1962 in the way of a special dividend from our subsidiary, The Law Reversionary Interest Society Limited, but apart from this I think that we are hardly likely during the current year to receive increased dividends from our portfolio of ordinary shares sufficient to increase still further the gross rate of interest earned. The other important factor is, of course, the rate of interest at which we are able to invest the growth of our funds.

The margin by which the market values of our assets exceeded their Balance Sheet values at the end of last year was greater than at the end of any previous year excepting only 1959. This excess is concentrated almost wholly in the item "Ordinary Stocks and Shares." I would stress that too much importance should not be placed upon market values, which naturally tend to fluctuate.

CAPITAL AND DIVIDEND

I only propose to deal briefly in this statement with our intention to call the unpaid capital—11s. 6d. per £1 share—and thereafter to split the shares into four shares of 5s. each fully paid. This is explained fully in the relevant circular. The only comment I would make is that we are calling up this sum and not paying it up since it would not be proper—nor do our Articles permit it—to use the reserves of the Life Assurance & Annuity Fund for this purpose; in other words, any such sum would have had to be paid up out of the Proprietors' Fund, which would not have been sufficient for the purpose unless we had been prepared to deprive Proprietors of any but a minute dividend for the forthcoming triennium. The dividend recommended in the Directors' Report—5s. 4d. per £1 share net of Income Tax at the standard rate—is based on the assumption that the necessary Resolutions enabling us to call up the capital will, in fact, be passed; the £575,000 called up will be credited with interest in the Proprietors' Fund Account once it has been paid, and we estimate that this interest will provide a net dividend of about 5d. per £1 share; this has been included in the 5s. 4d. recommended. The recommended dividend, if continued for the second and third years of the current triennium, will mean full distribution of the amount now transferred to the Proprietors' Fund and also the interest which we expect to be credited to that Fund for the current triennium.

PENSIONS BUSINESS

The triennium has seen a landmark in the development of pensions business, namely the entry by the Government into the field of graduated pension schemes through the coming into force of the National Insurance Act, 1959. We have been much occupied with the results of this Act, making the necessary arrangements for "contracting out" where desired, and I believe that we have given service second to none in this respect. The Act stimulated general interest and we would urge all employers who have not already pension schemes in force to consider installing them; we have already urged those who have schemes in force to consider whether they are substantial enough and whether or not they require bringing up to date. Our pensions business has grown steadily and we expect it to continue to expand. We offer excellent contracts and we are in a strong position to give most efficient and knowledgeable service.

OUTLOOK

Life assurance has always been a competitive industry—it has become highly competitive. We start our new triennium with a first-class agency organisation spread throughout the country, backed by an active organisation of Branch Managers and Inspectors, and they in turn are backed by our Head Office staff. We believe that not only do we offer outstanding life assurance and annuity contracts, but also that we are able to give first-class service and advice. During the last triennium we paid particular attention to the training of staff, including the training of Inspectors in the more difficult problems which they are liable to face.

STAFF

As usual, I close with a word of thanks to the staff for their work, not only during the last year but during the whole triennium. The running of a life assurance office is a complex and responsible operation in its many aspects. Your Society is admirably served throughout and I want to record here the Board's most genuine appreciation of the way in which the staff carry out their work. At the end of a successful triennium I would wish to say a special word of thanks to the General Manager, Mr R. J. Kirton, and to my colleagues on the Board who watch over our affairs with comment and criticism which help and stimulate.

CORNHILL INSURANCE CO. LTD.

CONTINUED GROWTH AND PROSPERITY

ASSETS EXCEED £12M.

The annual general meeting of the Cornhill Insurance Co., Ltd., will be held on May 3rd in London.

The following is the statement by **Sir William Christie, KCIE, CSI, MC,** the Chairman, which has been circulated with the report and accounts.

I am glad to report that the expansion of our business continues. In 1961 the growth of premium income was £770,162 and of investment income £65,477. Total assets reached £12,819,148. The principal items of the accounts for the last three years appear in the following table:

	1959	1960	1961
	£	£	£
Premium Income	6,583,884	7,261,548	8,031,710
Underwriting Profit	303,073	121,506	420,735
Investment Income	305,578	476,266	541,743
Surplus after Taxation	373,651	312,772	464,978
Dividend (net)	122,500	122,500	122,500

The last item reflects your Directors' recommendation of a final dividend of 2s. a share, making a total dividend for the year of 4s. a share.

As will be seen from the detailed figures below, underwriting results were excellent. Partly this was the outcome of improved claims experience, partly of a lightening of the expense factor which runs through all the revenue accounts. For some years the management has devoted particular attention to the costs of administration. Major departments have been re-sited and office processes re-grouped to advantage; repetitive human processes have been minimised and controls and routines simplified; paper work attendant upon the changing requirements of policy holders has been abbreviated and documentation speeded up. In consequence of these measures the ratio of management expense to the worldwide fire and accident premium income has fallen to the lowest level for the past six years. The process is not at an end and we hope to bring costs down still further in the future.

The underwriting results are as follows:

ACCIDENT DEPARTMENT

	Premiums £	Profit £	
1961 ...	5,100,983	282,976	5·5
1960 ...	4,161,339	51,791	1·2
1959 ...	3,970,928	173,622	4·4

Two-thirds of the total accident premiums are for motor insurance business in this country and the results of this major section were profitable. We feel sure this gratifying result, the best for some years, is a reflection of our emphasis upon underwriting by reference to the individual records and characteristics of drivers rather than to broad categories and classes of vehicles and areas. We work on the principle that discrimination by loaded rates and other penalties, against the driver with an impaired record, should be matched by factors which afford positive and substantial recognition to the policyholder whose experience is lengthy and whose record is consistently good—hence the Cornhill Plan of 1957 which first introduced a no-claim bonus scale under which discounts rising to 50 per cent were allowed for the driver with the long claim-free record.

Automobile insurance overseas still presents many problems and resulted in an underwriting loss. This matter is engaging our close attention. The remaining sections of the account embracing public liability, engineering and miscellaneous accident business at home and abroad all continued to grow and made useful contributions to the final underwriting profit.

FIRE DEPARTMENT

	Premiums £	Profit £	
1961 ...	2,354,068	102,750	4·4
1960 ...	2,255,096	49,715	2·2
1959 ...	2,072,360	114,451	5·5

Fire department business nowadays extends to every kind of property damage and a very wide variety of contingencies. The range includes hazards of nature which are making a heavy impact on underwriting accounts, and the effects of these and of the great concentrations of value exposed to fire wastage are creating new problems.

MARINE AND AVIATION DEPARTMENT

	Premiums £	Marine Fund at 31st Dec. £	Percentage of Premiums
1961	575,759	979,219	170·0
1960	543,113	978,761	179·0
1959	541,996	941,944	173·9

The volume of business was slightly larger but the underwriting indications of the past year suggest some deterioration compared to the reasonably favourable outcome of the 1959 account from which £35,000 has been transferred to Profit and Loss account.

Profit and Loss Account: Underwriting transfers amount to £420,735 and after adding investment income of £541,743 there is a surplus of £962,478 before taxation. The provision for income tax takes £497,500, leaving £464,978 available. We have transferred a further £250,000 to general reserve and it is notable that, notwithstanding the considerable growth of premium in recent year, our constant transfers to general reserve have maintained the Company's reserve strength at the customary high level. We have also transferred £50,000 to pensions reserve and after allowing for the dividends to shareholders, the balance carried forward will be £354,349.

Mr D. C. Cann joined the Board during the year and his wide experience is proving of the greatest assistance. You will be asked to confirm his appointment at the annual meeting.

No review would be complete without offering our warmest thanks to the management and officials of the Company everywhere. In reporting on a year when the return from underwriting and the aggregate profit is so substantially greater than anything previously achieved, it is my privilege to acknowledge how well the Company has been served at all levels. I must also offer our warmest thanks to our agents all over the world.

SHELL

THE "SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

"Oil—by far the largest commodity in international trade"

In 1961 Royal Dutch/Shell Group sales exceeded 1,000,000,000 barrels for the first time

OUTLOOK FOR OIL: 'In 1962 and after, the growth of demand for oil should be well maintained', says Mr. F. J. Stephens, Chairman of The "Shell" Transport and Trading Company, Limited, in his Statement in the company's Annual Report for 1961. 'Looking ahead as far as 1975, the prospects for a continued rise in the overall demand for energy are good.'

If living standards are to be raised, the rate of economic expansion will have to be not only sustained, but accelerated in many countries, requiring abundant supplies of energy.

Meeting the increased needs will involve virtually doubling the present rate of oil supply by 1975. Nuclear power's contribution to the ever-increasing demand for energy will still be relatively small; nuclear and hydro-electric power together are not expected to provide more than about 8% of the total need. The volume of coal's contribution is expected to rise slightly, but the major responsibility, as it has in the past decade, will again fall on oil and natural gas.

The prices at which oil products are delivered are an important factor in stimulating and expanding demand. Competition in the oil industry is intense; this has a direct effect on price, quality and service, and leads to a continuous drive to reduce costs by improving the efficiency of operations.

'There is no likelihood that the present potential surplus of oil will disappear in the immediate future,' says Mr. Stephens, 'but since demand continues to be buoyant there is hope that restoration of a better balance between supply and demand may not be unduly delayed.'

INVESTMENT

The investments of "Shell" Transport and Trading (40%) and Royal Dutch Petroleum Company (60%) in the Group increased to £2,250,000,000, the return on which was approximately 8½% or the same as in 1960.

FIXED ASSETS

The gross value of Group property, plant and equipment—in production equipment and installations, refining and chemical plants, tankers, pipelines, marketing facilities, etc.—was £3,365,000,000 at the end of 1961.

SALES

For the first time, Royal Dutch Shell Group companies' sales of oil exceeded 1,000,000,000 barrels, representing an increase of 6% over 1960. In addition, sales of chemicals amounted to nearly 3,500,000 tons.

Total sales proceeds and operating income was £2,790,000,000, of which £783,000,000 —or over 28%—was absorbed by sales taxes and customs and excise duties.

OPERATING EXPENSES

These increased to £1,521,000,000, but at a lower rate than the increase in sales volume, a reflection of the continued drive for increased efficiency and productivity in all companies of the Royal Dutch Shell Group.

"SHELL" TRANSPORT AND TRADING		1955	1957	1959	1961
Equity (40%) in Group net income	£ million	67	98	70	75
Dividends paid on Ordinary Shares	£ million	12	16	23	28
Cash dividends*	per Ordinary Share	7½d	9d	1s 0d	1s 3d
Number of issued Ordinary Shares at year end	millions	65	82	96	460
Number of registered Ordinary Shareholders at year end	thousands	147	164	208	251

** Adjusted for the share distributions in 1956 and 1961 and for the division of £1 shares into 5s 0d shares in 1961. Cash dividends are declared free of U.K. income tax.*

CAPITAL EXPENDITURES

During the last five years, these have totalled almost £2,000,000,000. They are being subjected to the same degree of rigorous control as are operating expenses, and capital expenditures in 1961 were lower than in any of the preceding four years.

NET INCOME

The Group net income for the year was £187,011,000, of which about 38% has been distributed as dividends to the parent companies, "Shell" Transport and Trading and Royal Dutch. The balance has been retained to provide for further expansion and development.

Copies of the Annual Report, and of the accompanying "Shell Review 1961", can be obtained from The "Shell" Transport and Trading Company, Limited, Shell Centre, London, S.E.1.

AMALGAMATED ROADSTONE CORPORATION

reports a highly successful year's trading

MR W. H. GATTY SAUNT'S STATEMENT

The 26th annual general meeting of Amalgamated Roadstone Corporation Limited was held on April 9th at 15, Stanhope Gate, London, W.1, Mr W. H. Gatty Saunt (chairman and joint managing director) presiding.

The following is his statement which had been circulated with the report and accounts:

The Consolidated Accounts for the year ended October 31, 1961, show that Operating Profits and Investment Income were £1,407,323 compared with £1,196,733 in the previous year and Net Profit (subject to Taxation) £945,819 compared with £787,846. The balance of available profits for the year after taxation and minority interests amounted to £568,294 compared with £464,806 the previous year. In round figures, therefore, Operating Profits and Income were up by £210,000 (17½ per cent), Profits subject only to Taxation by £158,000 (20 per cent) and Net Profits after Tax by £103,000 (22 per cent). In addition, Capital Profits realised during the year amounted to £24,540.

Operating Profits included approximately £15,000 contributed by two of the new acquisitions effected during the year, one for nine months and the other for only three months.

The Investment Income comprised nearly £41,000 dividends on our holding in the Kenya Company, to which we referred in our letter to Shareholders of August 28, 1961, circulated with the Directors' Annual Report of that Company.

You will note that Depreciation and Amortisation amounting to £367,639 is £43,524 higher than last year's provision. This results from the year's substantial Capital Expenditure, a considerable proportion of which had not become productive in the year under review and which, indeed, to a large extent, cannot until the latter part of the current year.

After placing to Capital Reserve £6,000 and providing for the net cost of Preference Dividends £60,000 and Ordinary Dividends £230,000, there remain Undistributed Net Profits of the year of £272,000 which means that the Ordinary Dividend is covered more than twice.

CAPITAL EXPENDITURE

Capital Expenditure during the year amounted to over £1,250,000 of which approximately half was financed by the cash flow, namely, Depreciation and Undistributed Profits. Consequently, having begun the year with a cash balance of just over £170,000, we finished the year with a net Overdraft of nearly £400,000.

Of this Capital Expenditure £600,000 was incurred in additions and improvements to existing properties and plant, £286,000 on the purchase of new ships, one delivered in February and another in October, and an initial deposit on another contracted for completion in 1963, and £350,000 (plus a further £50,000 payable by deferred instalments over a period of up to seven years) on new acquisitions.

NEW ACQUISITIONS

Of the latter, one is a leasehold quarry in Montgomeryshire adjacent to one of our most valuable quarries, for which it provides important additional reserves of stone. Another is the whole of the Issued Share Capital of Yorkshire Granite Limited owning and operating quarries in the West Riding; an old-established concern in one of the few areas in which we have not hitherto been active. The third comprises the whole of the Issued Share Capitals of a group of three small Companies now operating at a new factory recently constructed on our own quarry property at Borough Green in Kent, for the manufacture of fluidized bed-drying equipment and ancillary plant marketed under the name "Fluostatic."

The application of the fluidized bed to sands and stones is mainly that of drying and cleaning or classifying. The advantages of this fully automatic system are very low fuel consumption, low maintenance costs, cleanliness of application and ease of control. Materials up to ¼in. can be treated and moisture contents can be reduced from more than 30 per cent to less than 0.1 per cent. Many such plants supplied by this new subsidiary of ours are successfully operating throughout the country drying a variety of materials in a number of industries.

This venture in the manufacture of equipment of great interest to our basic business of producing and treating stone is therefore also of much wider application and is by no means our first venture in what is nowadays so often called diversification.

BULKER TRANSPORTER

Some years ago, arising out of our own considerable consumption of cement in the manufacture of precast concrete with our own stone aggregates, we became interested in the development of what has come to be known as a Bulker Transporter, namely, a pressurised tank which can be fitted to road or rail vehicles for the transport and handling of cement and other dry powders in bulk.

The development of this equipment involved certain patents, one of which has been in dispute for several years. The matter has now been settled on royalty terms which give us the sole and exclusive licence to operate the patent at home and abroad. This is the explanation of £41,542 "Provision for Royalties and Expenses relating to Previous Years" deducted from Undistributed Profits carried forward at the end of the previous year.

As usual, our Consolidated Accounts ignore the earnings attributable to our 45 per cent interest in the Share Capital of British Standard Portland Cement Co. Ltd. of Kenya, except to the extent of dividends of approximately £41,000 above referred to, which were a very small proportion of that Company's profits.

In last year's Statement I was able to tell you that our proportion of this Kenya Company's profits for the year ended October 31, 1960, amounted to £248,000. We have not yet received that Company's draft accounts for the year ended October 31, 1961, but we do know that although tonnage exceeded by about 10 per cent that of the previous year, trading profits appear to be somewhat down. Shipment from the Works at Mombasa to Dar-es-Salaam and other Indian Ocean Ports of an increasing proportion of the output offsets the inevitable reduction of Kenya demand under present conditions.

The Kenya Directors' Report for the year to October 31, 1961, will, as usual, be circulated to Shareholders as soon as available.

CONTINUED EXPANSION IN CURRENT YEAR

As regards our own Company's current year, sales for the first four months November to February are again up on the previous year in spite of adverse weather conditions experienced since Christmas. Prospects for the rest of this year and indeed for the foreseeable future are good.

We have again, following our practice since 1955, obtained professional valuations of Fixed Assets which compare with book values as follows:

	Balance Sheet £	*Valuation* £
Freehold and Leasehold Property	1,339,000	2,200,000
Fixed Plant and Machinery	2,277,000	4,246,000
Loose and Mobile Equipment	483,000	1,436,000
Ships (including payment on account of new ships)	1,281,000	1,610,000

In conclusion, our thanks are due to the executives, staff and workmen throughout our Corporation whose excellent work and loyal co-operation have produced the satisfactory results now before us.

The report and accounts were adopted.

Amalgamated Roadstone Corporation Limited

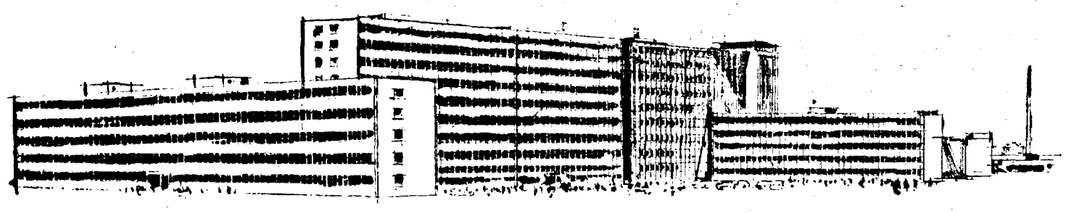
Quarry Owners, Manufacturers of Roadmaking Materials, Concrete Aggregates, Tarmacadam, Asphalt, Paving Slabs and Kerbs, Producers of Agricultural Lime and Limestone.

SIEMENS

Approaching 5 Thousand Million DM

With its 230,000 employees, the Siemens Organization is the largest private business enterprise in West Germany and West Berlin. Founded 115 years ago, it is active in practically all branches of electrical engineering. Its production spectrum extends from microminiature semiconductor devices to giant power stations. Over 10,000 employees are engaged in research & development work alone. Often passed down from generation to generation, the experience and knowhow of a highly qualified staff of engineers and technicians have established for the products of the Siemens Organization a worldwide reputation for superior reliability.

The turnover of the Siemens Organization has risen from a thousand million DM in 1951 to four thousand million DM in 1960 and 4.8 thousand million DM in 1961. Exports rose by about 12% above last year's figure to over a thousand million DM.



For the fiscal year 1960/61, the Siemens & Halske AG declared a dividend of 16% on a capital stock of DM 520 million. The capital stock is to be increased by DM 104 million, issued at 100%, to DM 624 million.

The Siemens Organization has agencies and representatives in 79 countries in all parts of the world. At all branches the services of a staff of technical consultants are always available to customers.

Summarized Consolidated Balance Sheet of the Siemens Organization as of September 30, 1961 (in DM million)

Assets	30. 9. 61	30. 9. 60
Fixed Assets	874	679
Investments	133	116
Total Fixed Assets and Investments	1,007	795
Inventories (including Communications Equipment Leased to Customers)	1,393	1,052
Accounts Receivable from Customers	807	720
Other Receivables	406	337
Cash and Other Liquid Funds and Marketable Securities	451	504
Total Current Assets	3,057	2,613
	4,064	3,408

Liabilities	30. 9. 61	30. 9. 60
Capital Stock	520	510
Surplus	653	495
Minority Interests	7	6
Total Stockholders' Equity	1,180	1,011
Reserves for Pensions	498	444
Other Specific Reserves	647	539
Loans and Bank Credits	506	428
Customers' Down-Payments	655	479
Accounts Payable	184	159
Other Liabilities	309	264
Total Liabilities	2,799	2,313
Net Income S & H	85	84
	4,064	3,408

The Communications Research Laboratory of the Siemens & Halske AG in München has a staff of over 3,000; in Erlangen the Siemens-Schuckertwerke AG is at present building a large new research center.

Some of the companies belonging to the Siemens Organization are the following:

Siemens & Halske AG
(All branches of communications technology, including data processing and telemetry, electrical signaling)

Siemens-Schuckertwerke AG
(All branches of power engineering)

Siemens-Electrogeräte AG
(Electrical household appliances, radio and tv sets)

Siemens-Reiniger-Werke AG
(Medical electronic equipment)

Deutsche Grammophon GmbH
(Phonographs and records)

Siemens-Planiawerke AG
(Graphite electrodes, carbon products for electrothermal and chemical industries)

Vacuumschmelze AG
(Production and processing of special alloys)

Siemens-Bauunion GmbH
(Civil engineering)

Constructa-Werke GmbH
(Full-automatic washing machines)

REA BROTHERS LIMITED

ANOTHER YEAR OF MARKED PROGRESS

CAPITAL INCREASE AND SCRIP ISSUE APPROVED

The fortieth Annual General Meeting of Rea Brothers Limited was held on April 5th in London.

Mr Walter H. Salomon (chairman and managing director) presided and, in the course of his speech, said:

Again I am glad to say that I think you will consider our results for the year to December 31, 1961, satisfactory. The profit for the year before taxation, but after making a transfer to inner reserves, was £274,527, which is nearly a 50 per cent increase over the corresponding figure for the year ended December 31, 1960. After taxation the profit was £113,774, which compares with £84,550 for the previous year.

A NOTE OF CAUTION

As three months of the current year have already passed, I can tell you that the growth of your company is continuing, and, given favourable economic conditions, we have every hope that we will be able to present to you next year a report no less favourable. However, I would like to add a word of caution. We as Directors are not directly concerned with the Stock Exchange price of the shares. We can only do our best to produce good results. We are, however, concerned if in anticipation some investors buy the shares and the price reaches a level at which it will be difficult for your Directors to live up to their expectations.

SCRIP ISSUE PROPOSALS

The purpose of the Extraordinary General Meeting, which is to follow this Meeting, is to pass Resolutions to increase the Authorised Capital of the Company from £1,000,000 to £1,500,000 and by capitalisation of reserves to increase the Issued Capital to £1,025,000 on the basis of one new 'A' or 'B' Ordinary Share for each two 'A' or 'B' Ordinary Shares respectively on the Register at the close of business on March 12th. I feel sure that these proposals will meet with your approval.

GENERAL OBSERVATIONS

Last year I asked for your indulgence and to allow me to make some general observations which I feel are of interest not only to you but to the public in general. I should like to be permitted to do so again this year, and to start where in this respect I left off in my last review. Some progress has been made in helping our export industry during the last year, but I deliberately say only some, because there is still a lot to be done if in the long run we want our goods to be competitive in world markets.

I wonder whether our educational authorities could not perhaps be encouraged to change part of the curriculum in schools and to put more emphasis on live languages than has been done hitherto. After all, times have changed and it is not only necessary to educate people to be good administrators in countries where English is, or was, the predominant language, but also it is now necessary to meet the fiercest competition from countries, some of which consider the teaching of languages in their schools as one of their prime responsibilities.

TAXATION SYSTEM COMPLETELY ARCHAIC

Having said this, I want to switch to another subject which is also closely linked with the stability of the pound sterling. In my remarks last year I said that one thing is necessary above all—a new respect for money and the ethical principles associated with economic and monetary policies. I said that without the Government giving a substantial lead in this respect the position of the pound sterling in the long run can only cause deep concern. The continuation of reckless and uncontrolled Government spending during the period under review can only cause the gravest anxiety, and the more people raise their voices in protest the better. The growth of our national economy is of paramount importance, but with close to 40 per cent of the gross national product being taken away in taxation of one form or another, to save sufficient for equipping industry with the necessary tools is almost impossible. To take approximately 40 per cent can no longer be considered as taxation—it amounts almost to confiscation. So far as taxation is concerned, there is no doubt that our system is completely archaic. A complete and radical change of our taxation system is absolutely necessary. Today it penalises those who are thrifty and who want to work, and this can certainly not produce the sense of purpose which is necessary to create a thriving growth economy.

The report and accounts were adopted.

At the subsequent Extraordinary General Meeting the proposed increase of capital and scrip issue were approved

GRAND HOTELS (Mayfair) LIMITED

Summary of Mr. Maxwell Joseph's review

Year ended 30th September	1961	1960	1959	1958
	£	£	£	£
Issued Ordinary Capital	767,750	511,833	511,833	400,000
Group Net Assets	2,296,255	1,735,070	835,846	469,108
Net Trading Profit	511,483	431,717	303,904	126,331
Taxation	304,896	207,966	171,766	74,029
Dividends (Net)	105,806	86,211	61,189	30,250

continuing expansion

Results have fully justified your Board's policy of concentrating on medium-class hotels offering modern amenities at competitive rates. Demand for this type of accommodation has been well maintained. Despite the tendency of the tourist season to lengthen, the majority of guests in your hotels are business visitors from this country and abroad. Increased banqueting business and the letting of office and residential accommodation make a very useful contribution to profits. Considerable renewals are ensuring that your hotels remain in first class repair and your Board is continuing its policy of expansion. The extension at the Green Park Hotel is completed and the extensions to the Clifton-Ford and Mandeville Hotels are expected to open later this year. Six smaller banqueting rooms and further restaurant facilities are being added to St. Ermin's Hotel, Flemings and Green Park Hotels.

The merger between your Company and Eglinton Hotels (Scotland) Limited has been successfully concluded. The Eglinton properties, mostly in Scotland, are all freeholds. In January of this year, the Grosvenor Court Hotel in Davies Street, W.1, having nearly 100 bedrooms with private bathrooms, was acquired.

300-room building project

Reports have appeared of proposals to build numbers of new hotels in London. Some are planned by property companies lacking experience of hotel management, others are to be leased to foreign companies lacking local knowledge. I see a danger of their pricing themselves out of the market with a consequent loss of tourist business. After taking all factors into account your Board is considering erecting a new 300-room hotel with large banquet facilities. We are convinced that this hotel will be profitable while offering reasonable prices.

Mount Royal merger

Details of the proposed merger of your Company and Mount Royal Limited have been published. If the offer becomes unconditional, the dividend receivable by Grand Hotels Ordinary Shareholders would be the equivalent of 25 per cent (less tax) compared with 22½ per cent (less tax) paid in respect of the year ended September 30, 1961.

The merger of the two companies will result in the formation of one of the larger Hotel Groups in this country and will place it in a strong position to achieve further expansion both in the hotel and allied fields. The combined Group can accommodate over 4,000 persons nightly and its 47 banqueting rooms provide excellent facilities for conferences and other functions.

THE UNITED STATES DEBENTURE CORPORATION

The annual Ordinary General Meeting of The United States Debenture Corporation Limited was held on April 4th in London, **Mr Ion H. T. Garnett-Orme** (the chairman) presiding.

The following is an extract from the Directors' Report:

The Corporation's ordinary revenue for the year increased from £907,197 to £936,720 and the net amount brought into the appropriation account from £483,441 to £506,995. The increase in the net revenue may be considered satisfactory, particularly as the rate of Profits Tax was increased in the last Budget.

The maintained dividend of 12 per cent recommended for the year would represent a distribution of 86 per cent of net available income in comparison with 87 per cent last year, leaving an undistributed balance amounting to £72,511 to be carried forward. In addition, a net sum of £31,612 in respect of additional Double Taxation Relief is being added to the carry forward, making the total retained profits £104,123, which is the largest amount we have ever put to reserve in any one year, and is the equivalent of a dividend of 3 per cent gross on the ordinary capital of the Corporation. We therefore feel that we start the current year with a reasonable margin in hand.

Towards the end of 1961, we reduced certain of our holdings in American Banks and Electric Utilities, and repatriated part of the proceeds of these sales to the extent of approximately £500,000. Nevertheless, the proportion of our dollar investments at market is now rather higher than last year.

The effective overall yield on our portfolio, allowing for both Double Taxation Relief and the effect of Profits Tax, is now 4.2 per cent against a yield of 5.1 per cent on the Financial Times index of Industrial Ordinary Shares. This is because the effective yield on our dollar holdings is relatively low which provides scope for increasing our income should we think this desirable.

The report was adopted.

ROYAL DUTCH PETROLEUM COMPANY

(N.V. Koninklijke Nederlandsche Petroleum Maatschappij)

established at The Hague, The Netherlands

ANNUAL GENERAL MEETING OF SHAREHOLDERS

to be held on Thursday, May 3, 1962, at 11 a.m. at the Company's office at The Hague, the Netherlands (entrance: 23, Carel van Bylandtlaan)

AGENDA

1. Appointment of a Director.
2. Appointment of a Director owing to retirement by rotation.
3. Annual Report for 1961.
4. Approval of the Balance Sheet and the Profit & Loss Account for 1961 and declaration of dividend for 1961.

This agenda, the nominations relating to items 1 and 2 of the agenda, the documents named under items 3 and 4 of the agenda with relevant notes in accordance with Article 42 of the Netherlands Commercial Code, and with the proposals submitted by the Board of Directors, together with the proposals referred to under item 4 of the agenda, will be available for inspection from today until after the Meeting, and may be obtained by shareholders free of charge

at the Company's office

30, Carel van Bylandtlaan, The Hague, and at the offices specified below.

In order to attend and address the Meeting and to exercise voting rights thereat in person or by proxy:

(A) Holders of share certificates to bearer will be required to deposit against receipt

either their share certificates

or evidence that their share certificates have been deposited in open custody with De Nederlandsche Bank,

not later than Friday, April 27, 1962, at one of the places mentioned below, viz.:

IN THE NETHERLANDS at Nederlandsche Handel-Maatschappij, N.V., Amsterdam
Kas-Associatie N.V., Amsterdam
Amsterdamsche Bank N.V., Amsterdam
Banque de Paris et des Pays-Bas, Amsterdam
Messrs. Hope & Co., Amsterdam
Messrs. Pierson, Heldring & Pierson, Amsterdam
Rotterdamsche Bank N.V., Amsterdam
Twentsche Bank N.V., Amsterdam
at Messrs. Schilf & Capadose, The Hague
Messrs. Pierson, Heldring & Pierson, The Hague
at Messrs. Van der Hoop, Offers & Zoon, Rotterdam
Messrs. R. Mees & Zoonen, Rotterdam
at the branches and sub-branches of these banking houses in the Netherlands;

IN THE UNITED STATES OF AMERICA at The Chase Manhattan Bank, New York;

IN THE UNITED KINGDOM at Messrs. N. M. Rothschild & Sons, London;

IN FRANCE at MM. Lazard Frères & Cie., Paris;

IN SWITZERLAND at Crédit Suisse, Zürich;

IN BELGIUM at Banque de la Société Générale de Belgique, Brussels, and Crédit Lyonnais, Brussels;

IN GERMANY at Deutsche Bank A.G. and Dresdner Bank A.G., Frankfurt-Main, Düsseldorf, Hamburg and Munich;
at Saarländische Kreditbank A.G. and Dresdner Bank A.G., Saarbrücken;
at Berliner Disconto Bank A.G. and Bank für Handel und Industrie A.G., West Berlin;

and

(B) Registered holders of registered shares must make known to the Company in writing their desire to attend and address the Meeting and to exercise voting rights thereat by not later than Thursday, April 26, 1962: (1) with respect to shares of New York registry, at the office of The Chase Manhattan Bank, Corporate Agency Department, 80, Pine Street, New York 15, New York; (2) with respect to shares of Amsterdam registry, at Nederlandsche Handel-Maatschappij, N.V., Amsterdam; and (3) with respect to all other registered shares, at the office of the Company in The Hague or at any of the offices listed in Paragraph A above.

THE BOARD OF DIRECTORS

April 11th, 1962.

SCOTTISH AMICABLE LIFE ASSURANCE SOCIETY

ANOTHER RECORD YEAR

TOTAL FUNDS APPROACHING £96,000,000

The one hundred and thirty-sixth Annual General Meeting of the Scottish Amicable Life Assurance Society was held in Glasgow on April 11th, **Mr C. J. Y. Dallmeyer, DSO, TD, WS** (Chairman of the Ordinary Directors) presiding.

In moving the adoption of the Report and Accounts, the Chairman said that 1961 had been another very successful year for the Society. New individual assurances had been issued for net new sums assured of £22,600,000—a figure which exceeded that for the previous year by more than £4,000,000. In addition, new group pension and life assurance schemes had provided initial sums assured of almost £3,700,000 together with pension benefits of £720,000 per annum. The corresponding new annual premiums amounted in all to £1,029,000—while single premiums and considerations for annuities represented a further £860,000. Almost £A4,000,000 of new sums assured had been secured in Australia—a feat of no mean order in the second year of the Society's operations there. This early justification of the decision to enter the Life Assurance field in Australia was most encouraging.

CONTINUED EXPANSION

The Society's premium income had increased last year by £850,000 to a total of rather more than £13,000,000. It was a remarkable reflection of the Society's expansion that the premium revenue had doubled within so short a period as the past six years. Within this same period, the total Funds had more than doubled—rising from £44,500,000 to almost £95,900,000—and last year's increase of £11,400,000 had created another new record. Fully one-half of the Society's premium income now arose under Group Pension and Life Assurance Schemes and the rapid growth in the Funds was due in no small measure to the sums entrusted to the Society by so many firms, both large and small, for the provision of future pensions to their staff and works employees. Clearly, the Society's Pensions Department continued to enjoy the confidence of all those employers who had placed their pension arrangements in their hands.

THE CERTUS POLICY

The Society had reported record net new sums assured under individual assurances in each year since 1946—and last year was no exception. Today, young men were more willing than ever to recognise the importance of life assurance as a basis for their long term financial plans. At the start of their careers, however, they could seldom afford as much cover as they would wish. To meet this human dilemma, the Society had designed and recently introduced the Certus policy. It could be called a 'package deal' for it combined in one policy both permanent and temporary life assurance and gave the member the specific right to convert the 'temporary' portion to 'permanent' at any time within the first fifteen years, whatever the state of his health. A young man could thus know for certain that, when he received the financial rewards of success in his chosen career, he could not be denied on medical grounds the right to invest substantially in life assurance. Although introduced little more than two months ago, this novel scheme had received a warm welcome from agents and friends in all parts of the country.

NEW INVESTMENT

The Society's holdings of British Government Securities had been increased by more than £4,000,000 and of other fixed interest stocks by more than £3,000,000. The greater part of this new investment in long-term fixed interest stocks had been made in the later months of the year when exceptionally high yields could be secured for many years to come. New investments in Ordinary Shares, amounting to approximately £2,000,000, had been made on a very selective basis, having regard to the uncertainties attaching to many branches of industry and commerce under the conditions ruling during the past year, and also to the high level of market prices in the early summer months. The remainder of the new investment had been distributed in relatively small amounts between mortgages, loans and properties. The sustained rise in the overall yield on the Society's funds—a rise which it was hoped to maintain during the present year—should lead to excellent bonus prospects for the current quinquennium.

The Report and Accounts were adopted.

GLYNWED TUBES LIMITED

(Copper tube and fittings, steel tube, fittings and fabrications, plastic tube and fittings, mineral insulated cable, lead sheet and pipe, bright steel bar, bolts, nuts and studs, rolled steel products.)

The Consolidated Accounts of the Group for the year ended 31st December, 1961, show:

	1961 £	1960 £
GROUP PROFIT FOR THE YEAR	1,978,568	1,811,496
NET SURPLUS AFTER TAXATION	1,015,519	937,928
TOTAL NET DIVIDENDS	378,984	344,531
ISSUED SHARE CAPITAL	2,750,000	2,500,000
CAPITAL AND REVENUE RESERVES	4,302,462	2,916,008

The Twenty-first Annual General Meeting will be held at the Queen's Hotel, Birmingham, on 4th May, 1962, at 12 noon.

Points from the statement by the Chairman, Mr. W. G. A. Russell, F.C.A., circulated with the Accounts for the year ended 31st December, 1961:

Our investment in fixed assets at the close of the year 1961 was £4,070,848 (1960 — £3,336,259). Capital expenditure during the year amounted to £1,063,730 of which £400,000 was incurred in building and equipping the two new departments which have yet to come into production.

Current assets at £4,871,181 exceeded current liabilities of £1,889,567 by £2,981,614 as compared with an excess of £2,079,749 at the beginning of the year. This improvement was mainly the result of the rights issue which produced £981,871 (net).

Apart from short term variances the future pattern of the building trade indicates a still rising home demand for domestic water service tube. This is the largest single department of our activities and our productive capacity has been expanded during the past year by improved techniques to meet our share of this anticipated further increase in demand.

The mineral insulated cable department is now nearing completion and should commence production of cable of the highest quality during this year.

The new copper fittings department is also now commencing production and when we have completed tooling we shall market a full range of capillary fittings of high quality.

We view the future with confidence. Additional earnings from our new products should begin to accrue to a modest degree in the current year and they should yield important contributions on an increasing scale in the years which lie ahead.

(Copies of the full Report and Accounts and Chairman's Statement will be sent on application to the Secretary at Oxford Street, Bilston, Staffs.)

ANGLO-SWISS SCREW COMPANY LIMITED

(Precision Turned Parts, Cash Tills, Nameplates)

The forty-third Annual General Meeting was held at West Drayton on April 5th, 1962.

The following are extracts from the Chairman's statements dated February 27th and March 30th:

Profitwise, 1961 was an exceptionally satisfactory year in view of the prevailing conditions.

A record volume of output produced a net profit of £258,000 which, due to rising costs and reduced margins, was £4,000 less than in 1960.

The recommended allocations to reserve result in Consolidated Capital and Revenue Reserves, excluding Tax Reserves, of £373,000.

Net capital expenditure in 1961 was £27,000 and capital commitments at the year-end were £66,000.

Aircraft General Supplies and Petronic Ltd. has increased its volume of business with the aircraft industry and has achieved a notable increase in exports of the PETCO cash till to every corner of the globe. The range of roller bearing tills introduced a year ago has proved highly satisfactory in service.

A one-third shareholding in British Engraving and Nameplate Manufacturing Co. (London) Ltd. was acquired for £14,000 in 1956. The remaining share capital has now been purchased. The price, including their two small subsidiaries, was approximately £100,000 in cash. There is a new freehold factory in Hove with room for expansion and a leasehold factory and offices in London.

After deducting tax reserves and prior charges the present net equity assets of British Engraving are about £120,000.

Mr R. Lansdown, former Managing Director and controlling shareholder, has resigned from the Boards of the Engraving Companies.

British Engraving's recent net profits have been in the range £25,000/£30,000 per annum before tax and for 1960/61 were certainly no less.

I cannot give more precise figures until certain sums due to British Engraving have been evaluated and audited Accounts are available.

Our turned part order book, which was very heavy indeed a year ago, is now considerably reduced, but it remains substantial.

We have opened a new Sales Office in Leicester and have moved and reorganised our Manchester Office.

It is with a full sense of my responsibility as Chairman of the largest independent Company producing turned parts in the U.K. that I say how important I feel it to be that the ownership and control of our industry should be clear and open.

According to my understanding of the matter, this is no longer the case today as a result of the absorption of a number of our smaller competitors into one orbit, aggregating an appreciable proportion of U.K. production, without any detailed public announcement of the fact.

I must make it clear that I am not criticising integration. That is no new phenomenon, and I have no fear of our ability to compete efficiently. But if it is true that a large part of our industry

is now effectively under one control, then I think that fact should be made known.

It is still too soon to make any reasonable forecast of the Group results for 1962, in which nine months' profits of British Engraving will be included, but you need have no fear that the rate of dividend will be reduced. The first twelve weeks were satisfactory and we have no plant idle.

However, results in the coming months cannot be brilliant. Nor is this to be expected with the industrial production index lower than for two years past, our output being very largely dependent on the general level of light industrial activity.

By the same token, when the prevailing stagnation is shaken off we shall go forward again and as in the long term the economy expands so shall we.

The Directors' Report and Accounts for the year to December 31st, 1961, were adopted, the recommended final dividend of 7d. a 5s. shares, less tax, making 10d. a share less tax for the year, was declared, and the Chairman, Mr Oscar Frey, was re-elected to the Board.

THE ENGLISH ASSOCIATION OF AMERICAN BOND & SHARE HOLDERS, LIMITED

ANNUAL GENERAL MEETING

The Seventy-seventh Annual General Meeting of The English Association of American Bond and Share Holders, Limited was held on April 5th at the offices of the Company, Moor House, London Wall, London, E.C.2.

The Rt Hon Lord Ritchie of Dundee (the Chairman) presided.

Mr F. S. High, managing director and secretary, read the Notice convening the Meeting and the Report of the Auditors.

The Chairman moved: "That the Report and Statement of Accounts for the year ended December 31, 1961, be received and adopted and that a final dividend of 2s. 6d. per share, less Income Tax, be distributed, which, together with the interim dividend of 1s. 6d. per share already paid, makes a total of 4s. per share, less Income Tax, on the paid-up Capital of the Company."

Mr R. D. Guthrie seconded the motion, which was carried.

The retiring directors, Mr L. W. Farrow, CBE, FCA, and Sir Walter Barrie, were re-elected.

Lord Ritchie, addressing the meeting, said that he was particularly pleased that the negotiations for the acquisition of the "Marking Name" business of Messrs Akroyd & Smithers had been concluded, thus cementing a very long family association with that firm.

A hearty vote of thanks was accorded to the Chairman for presiding and to the Board for the excellent results of the past year. In moving this proposition, Mr C. R. Hardy said that he felt that the coming year would be equally successful and hoped that the Association would further extend its usefulness to investors in the City.

Seconding the motion, Mr R. Layton said that he was particularly pleased to see that Mr High had been appointed Managing Director.

In reply, the Chairman thanked the Meeting and paid tribute to the exceptionally good services the Association had received from the Staff.

THE ALGOMA CENTRAL AND HUDSON BAY RAILWAY COMPANY

SIR DENYS LOWSON ON THE COMPANY'S MODERNISATION PROGRAMME

SATISFACTORY PROGRESS

The Annual Meeting of Shareholders of The Algoma Central and Hudson Bay Railway Company was held in Sault Ste. Marie, Ontario, Canada on March 30, 1962.

Sir Denys Lowson, Bart, Chairman of the Board, presided. In addressing the meeting, he pointed out that the results of the Company's operations for 1961 had been very satisfactory. Total revenues were $11,519,090 and net earnings per common share increased to $2.10 for the year, as compared with $1.60 per share on a comparative basis for the preceding year. The cash flow per common share, after all expenses but before depreciation, was $5.30 in 1961, as compared with $4.86 in the preceding year. The Company's net profit after taxes was $1,181,663, a 25 per cent increase over the previous year.

The Chairman referred to the Company's excellent business relations with the industrial companies located in and around Sault Ste. Marie. He referred particularly to the expansion programme of The Algoma Steel Corporation, Limited, with the subsequent benefits to the Railway Company brought about by increased shipments.

CAPITAL PROGRAMME

He stated that the Company had in 1961 invested $1,106,403 in plant and equipment additions, including seventy-five new gondola cars costing $850,000 which were placed in service late in the year. The slag ballasting of the Railway's yards and main line had begun, and would be continued in the coming year; and it was expected that this programme would result in substantially lower maintenance costs. In addition the Company was budgeting for the purchase of additional machinery in the coming year for improved track maintenance. The Chairman anticipated that the Company might conceivably become the first railway company in North America to have fully mechanised track maintenance; in the same way as the railway had been the first in Canada to be completely dieselised. In addition, the Company this year was pioneering the use in Canada of oxygen steel rails, as two miles were being purchased from The Algoma Steel Corporation, Limited and installed in the main line for test purposes.

In addition to this capital programme, the Company had continued, during 1961, to purchase bonds, debentures and preferred shares and redeem trust equipment certificates. The Company now had a substantial credit against future sinking fund requirements on its funded debt. In spite of all these expenditures, the working capital stood at $2,639,271 at December 31, 1961, an increase of $182,484 during the year 1961.

The Chairman reviewed the progress made by the Company over the past ten years and pointed out that during this period the Company has made large capital expenditures to improve and modernise its equipment. It had also commenced payment of regular dividends to its shareholders, and at the same time had been able to reduce its over-all funded indebtedness by no less than $15,175,160; from $26,127,660 at the end of 1951, to $10,952,500 at the end of 1961.

Exploration of the Railway's land grant lands and adjoining Crown lands by Franc. R. Joubin & Associates Limited is continuing, and the data which has been acquired to date has shown the value of this programme; although no specific deposits meriting development work have as yet been discovered.

PRESIDENT'S REMARKS

The Company's President, Mr L. C. Waugh, stated to the meeting that current forecasts for the first six months of 1962 indicate that the results for this period will continue to be favourable.

In 1957 the Company commenced the cycle maintenance system of maintaining the main line. This method entailed the dividing of the main line, totalling 321 miles, into three sections of 107 miles each. Suitable machines were purchased and a gang of 54 men were engaged in the installation of a year's tie requirements, surface lining and trimming the track, and the piling and disposal of the old ties on the 107 mile section.

Through the purchase of additional machines, the gang has now been reduced to 40 men, and this method of maintenance had proved very beneficial to the Railway through direct economies and better track condition. The President stated that the results of five years' experience had indicated that, commencing in 1962, it would now be possible to extend the cycle period to four years, thus effecting further savings.

The Railway's steamships had a satisfactory year, but due to the smaller tonnage of sinter for export through Michipicoten Harbour, it was again necessary to move a substantial tonnage of grain through lower St. Lawrence elevators. The Company had, as last year, experienced costly delays at these elevators due to congestion of boats.

The President pointed out that the Company's fleet totals approximately 48,000 gross tons and, during a normal year of about eight months, will transport 2,500,000 tons of bulk commodities, i.e., ore, coal, grain, coke breeze, etc. The flag ship, the S.S. "E. B. Barber," a photograph of which appears on the cover of the Company's Annual Report, carries 13,000 gross tons. She was built in Port Arthur in 1953 at a cost of $4,000,000. The Company is continually exploring the possibility of replacing some of its older tonnage by the construction of modern and larger vessels.

He viewed the future with optimism and expressed appreciation for the assistance of his staff and the continuing support and interest of the Company's customers and shareholders.

The various resolutions were carried unanimously, and the proceedings terminated with a hearty vote of thanks to the Chairman, President, Directors and other officers.

COSTA RICA RAILWAY COMPANY

NORTHERN COMPANY'S BEST YEAR

The Annual General Meeting of the Costa Rica Railway Company Limited was held on April 3rd in London.

The following are extracts from the circulated Statement of the Chairman, **Sir Robert Adeane, OBE:**

THE SUBSIDIARY COMPANY

The Northern Company, which operates the line of the Costa Rica Railway Company jointly with its own, had its best year to June 30, 1961, since becoming our subsidiary in 1941.

Net operating profit, before charging Rental payable to the Parent Company but after depreciation of £97,122, increased to £278,320 compared with £146,656 in the preceding year. Again no provision was made for the disputed Real Estate Tax.

Out of the year's profit a total of £141,834 was applied in special debt reduction, viz., £94,099 off the Diesel Loans and £47,735 off the Standard Fruit Company Loan. The final balances of the Diesel Loans were paid off last January. Railway profits will not, therefore, be encumbered in the future with the need to provide the heavy annual loan repayments of the past seven years.

THE PARENT COMPANY

Because of those large loan repayments the Northern could only slightly increase the amount remitted on account of Rental, viz., £118,000 which together with investment and other income made a gross income of £134,470 compared with £108,419 in the previous year. After deducting expenses and Sinking Fund Appropriation, there was a net balance of £59,623 which, added to the residual balance of £10,687 brought forward, made £70,310 available for interest on the Second Debentures.

Investments sold during the year reduced the portfolio to a book cost of £77,034 but the market value at the year-end was some £195,000, an appreciation of 153 per cent (compared with 133 per cent at the close of the preceding year). In addition, there was added to the Investment Reserve the net profit of £35,198 made on the year's sales.

The Debenture Holders' Committee substantially increased their holdings so that today there are left in the hands of the public only 12 per cent of the Firsts and 9 per cent of the Seconds.

POLITICAL

In Costa Rica there was an official rate of $5.67 to the US$ and a free rate of around $6.63. On September 5, 1961, the official rate was discontinued and only the free rate now applies. It would not appear that this will greatly affect the Northern directly because only limited preferential purchases of dollars were previously permitted at the official rate.

Friendly relations continued with the Government in Costa Rica and with Labour. At the recent Presidential Election for the 1962-66 term of office, Sr. Francisco Jose Orlich, of the National Liberation Party was elected President with a substantial majority but it is understood that his party will have only a small majority in Congress.

These Debentures having been sold, this announcement appears as a matter of record only.

NEW ISSUE

$50,000,000

International Telephone and Telegraph Corporation

4.90% Sinking Fund Debentures Due April 1, 1987

The offering of these Debentures was underwritten by an investment banking group managed by the undersigned.

Kuhn, Loeb & Co.
Incorporated

New York, N. Y., April 6, 1962

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, Sir Robert Adeane said that he had recently returned from discussions with the Northern's Board in New York. The Railway was doing well at the present time. The increasing banana traffic could become considerable and might need more locomotive power and increased wharf facilities. In assessing prospects, however, stockholders must remember the unfortunate history of investment in foreign railways and must not forget that the Caribbean area, where the Railway was located, was a troubled one.

Costa Rica itself was extremely stable and had a good Government—the recently held Elections had been model ones—but the recent surprising default on the External Sterling Debt of Costa Rica was disquieting.

A Scheme to deal with the large notional Interest Arrears on the Second Debentures would be submitted in the Autumn based on accounts to June 30, 1962, which, if things went on as they were, should pave the way to early resumption of Ordinary dividends.

HENEKEYS LIMITED

RECORD TRADING RESULTS

The Forty-second Annual General Meeting of Henekeys Limited was held on April 11th in London, **Sir Bernard D. F. Docker, KBE, JP,** the chairman, presiding.

The following is an extract from his circulated statement:

It is with pleasure that I am able to report that we have had, in general, another satisfactory year.

The profit before taxation is a record of £216,786, being an increase of £30,333. Taxation takes an additional £16,599 at £108,210, leaving a net increase of £13,734. £4,500 has been brought in, being excess taxation no longer required as against practically nil last year.

Our home trade continues satisfactorily almost everywhere, and the policy of opening "off-licences" in place of the smaller bars in some branches has proved the right one. During the year trading commenced at the rebuilt Reading branch, and the "off-licence" within the branch at Richmond; takings at both show satisfactory increases.

On the other hand, our export whisky business, never large, has shown a small decline, and as we consider this a field in which we should make profits, as well as spread our interests, we are making efforts to establish world-wide markets.

Since the end of our financial year sales have continued to increase, in fact, the Christmas, 1961, turnover proved to be a record.

The report and accounts were adopted and a distribution of 5 per cent, free of tax, was approved.

Copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Company Meetings Department,
The Economist,
22, Ryder Street, S.W.1.

COMPANY AFFAIRS

Equity prices continued to go ahead after the budget and over the week The Economist *indicator gained 7.4 points to 362.7. The gilt-edged market was subdued after the budget and prices tended to slip back on fears about the possible implications of the speculative gains tax. The equity market, on the other hand, was relieved that the tax was not as stringent as had at one time been feared. Motor and consumer durable shares rose on the reduction of purchase tax and tobacco shares went ahead on relief that the budget did not include any specific discriminatory measures. Soft drink, confectionery and ice cream shares fell back sharply on the news of the new tax but soon recovered.*

Unilever and Africa

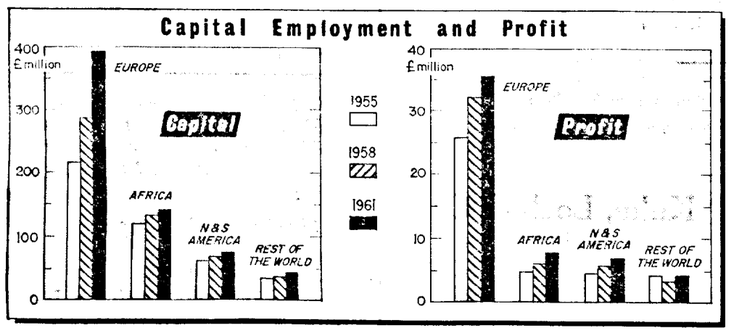
WHAT the Unilever directors describe as "the chill wind of economic uncertainties" in Africa is making a considerable impact on the diarchy's policies and fortunes. In a number of African countries Unilever, through the United Africa Group, is reducing its commitments in the produce and merchandise trades, placing the emphasis instead on more specialised and technical activities and on manufacture. The amount of money Unilever invests in Africa is still large; but, relatively, its dependence on the African trade is becoming smaller. This, in addition to the political and economic troubles of Africa itself, is reflected in the fall of the turnover of the UAG from £295 million to £279 million last year: sales of merchandise fell from £220 million to £213 million and the value of produce handled from £60 million to £50 million. UAG's trading profits fell by 25 per cent and they are now exposed to another strain, for the directors say that the revised tax laws in Ghana could have a serious effect on the group's business.

The profits of UAG fall within the province of Unilever Limited and this explains why its profits were so sharply affected, despite a small increase in turnover. But profits also fell in Britain, because of more competitive conditions and of changes in the selling organisations. In South Africa and Australia, profits declined because of intense competition in the detergent market. On the other hand, there was a marked improvement in profits in Europe where Unilever NV trades, and in North America profits were practically unchanged. Thus, in contrast to 1960, NV's profits were a good deal better than Limited's and the revaluation of the guilder and the mark in March last year gives them a sterling value about 5 per cent greater than would have been the case using the old rates.

As usual the directors preface their review with a broad sketch of the international economy:

> The year was one of mixed trends. The United States economy began a strong recovery from recession in the spring but expansion was then checked in Europe. In the United Kingdom and some continental countries production actually fell during part of the year. Prices of most primary products were depressed. A number of countries, notably in Africa, had recourse to more stringent import and exchange controls.

Against this background, combined sales rose last year from £1,847 million to £1,890 million, of which sales to third parties went up from £1,387 million to £1,444 million. But trading profits fell by almost £4 million to £100¾ million. Thus the ratio of net profits, after tax but before loan interest, to turnover fell from 2.9 to 2.7 per cent, the lowest since 1958. The return on capital employed fell from 8.7 to 8.1 per cent, the lowest since 1953. For the first time the review contains a breakdown of both profits and capital employed by geographical areas. The charts are reproduced below; they illustrate the build-up of Unilever's interests in Europe, which now account for over 60 per cent of the capital employed and over 68 per cent of the total profits. Some 28.3 per cent of the group's turnover is in the Six and 29.6 per cent in the Seven.



What of the products themselves? With butter cheaper and in ample supply, sales and profits from margarine declined but in Holland sales of Planta margarine improved. Profits from toilet preparations also suffered a further setback largely as a result of a sharp drop in sales of toothpaste in the United States. However, the directors report better results in animal feeding stuffs and detergents; in the latter field, sales of liquid detergents were boosted by the acquisition of Pinoya Holdings. By far the biggest advance in sales last year was in food products in which Unilever has concentrated much of its capital spending in recent years. But profit margins continue to be squeezed and some of the newer businesses have yet to reach their profit-making stride. Sales of ice cream last year rose by 50 per cent, but in Britain the rise was limited by "a determined invasion of mobile vendors" and now ice cream is to be subject to tax.

One inference that can be drawn from the report is that profits from quick frozen foods continue to be small both in relation to sales and to the large capital employed. The food industry absorbed a big proportion of Unilever's capital expenditure of £55 million last year; capital spending is likely to be higher again in the current year but the directors are confident that the group's financial resources will be sufficient to cover the commitments.

From the shareholder's point of view the most important event last year was the listing of the shares of Limited and NV on Wall Street. There was a brisk demand from American investors, and Limited, now quoted in 5s. units, rose sharply to 55s. and NV to £12⅝. At these levels some British institutions were prepared to sell part of their holdings. Limited are now 25 per cent below their peak at 41s. 6d. xd, and yield 3 per cent on the 24.79 per cent dividend; as a result of the revaluation of the guilder this payment is slightly more than the 24.54 per cent paid in 1960. NV at £10⅞ yield 2¼ per cent on the maintained dividend of 21 per cent. There is little in the report to suggest that those investors who sold shares last December will have immediate cause for regret, for in some fields the group will still have difficulty in earning higher margins. But the effect of low margins on profits should be largely offset by returns accruing on new capital investments and the current dividend, covered three times by combined earnings, is obviously secure. Even if the "present wind of economic uncertainties" were to reach gale force proportions in Africa, Unilever through its size, diversity and its management would come out of a storm better than most.

Whitbread

WHEN the Whitbread interim dividend was raised from 8 to 9 per cent in September the directors made the usual disclaimer about the total dividend but the proposed final payment of 21 per cent against 19 per cent, means that the total dividend for 1961 is raised from 27 to 30 per cent. This increase is fully matched by an advance in profits before tax from £2,948,000 to £4,115,000. This includes nine months profits from Tennant Brothers so that the true comparison for the group excluding Tennant is an increase of £600,000, or 21 per cent, in profits before tax and of £356,000, or 24 per cent, in net profits. The bigger dividend is covered just over twice by earnings, and the 5s. "A" shares at 38s. 3d. made a net gain of 3s. 6d. since the results were published and yield just under 4 per cent.

At the annual meeting last July the chairman Colonel W. H. Whitbread said that Whitbread's trade had risen by over 10 per cent in the first six months of 1961 with Whitbread Pale Ale and "Tankard," a container draught beer served under pressure, in greater demand than ever before. But he warned shareholders not to be over-optimistic in view of the 10 per cent surcharge imposed by the Chancellor in the little budget, now consolidated into the excise duty and hence a more permanent restraint on beer consumption.

In the current year the group's investment income is likely to fall again since a further block of its investments in other breweries with a market value of £4¼ million in January has been sold to the Whitbread Investment Company. These investments are part of the Whitbread "umbrella." Whitbread has substantial minority holdings now amounting to between 25 and 30 per cent in other breweries. So far this has protected most of them from take-over bids.

Royal Dutch/Shell Pushes On

IN a year of "intensified competition" in which credit terms had to be extended in some marketing areas, the net income of the Royal Dutch/Shell group was nearly £10 million higher at £187 million. Much of the increase occurred in the fourth quarter of the year; oil prices then were perhaps a little firmer and the progress made in bringing down "controllable expenses" (including the early retirement of some of the group's executives) then became more fully apparent. The volume of crude oil and oil products sold by the group was about 6 per cent higher and sales of chemicals were "approximately the same." Net of sales taxes, excise duties and similar levies,

the value of sales was only about 2½ per cent higher, pointing to the pressure on oil prices. The value of chemical sales probably rose about as much as that of oil, for an unchanged volume. This does not mean a general rise in margins: prices of some petrochemicals were being reduced. But the group's production of the newer and more highly priced petrochemicals was probably growing as a proportion of the whole.

Chemical plants were one of the few items on which the group spent notably more on capital account last year. But total capital and exploration expenditure was £45 million lower at £374 million, and lower than in any of the five preceding years. This was reflected in an increase in liquid resources of £27 million to £446 million. Expenditure on exploration and production was reduced and outlays on marketing and transport facilities were lower; these reductions more than offset increased payments for oil rights, notably on the offshore concession in Kuwait, and higher spending on oil refineries and chemical plants. Commenting on recent capital expenditure, the chairman of Shell, Mr F. J. Stephens, says:

> The reduction in the rate of capital expenditure which has been achieved has been facilitated by large outlays made in recent years which provided group companies with plant and equipment adequate for many of their requirements. Scope for further reductions in the rate of expenditure will, however, be limited by the continuing need to provide facilities to handle the expected increase in trade and to replace outworn and obsolete assets.

Not unnaturally for a group as big and international as Royal Dutch/Shell, one of the themes that emerges from Mr Stephens' comments on posted prices is the interdependence of the various parts of the organisation. He points out that on an investment of £1,838 million, group companies outside North America earned £156 million—representing a return of 8½ per cent, virtually the same as in 1960. Of this £156 million, £129 million, or 83 per cent, represented the profits of group companies which operate in producing areas. But virtually the whole of this income was dependent upon the operations of other group companies engaged in other countries on refining, transporting and marketing. And the capital invested in these "downstream" operations amounted to £1,440 million, or 78 per cent of the total.

While Mr Stephens says there is no likelihood that the surplus of oil will disappear in the immediate future he believes that the growth in demand for oil should be well maintained this year and later and that the restoration of a better balance between supply and demand may not be "unduly delayed." There is, however, the prospect of further expansion in Russian oil exports and a continuing world surplus of tankers for some years. And the dispute about Iraq Petroleum has to be settled. Manufacturing capacity for many chemicals has grown more quickly than demand and widespread reductions in prices and margins have affected the group. But on the longer view Mr Stephens believes that the demand for chemicals should continue its rapid growth, restoring the industry to a better balance within a few years.

Oil shares, like chemical shares, already figure prominently in most portfolios and although there are signs of improvement in earnings, a rapid growth in their value is unlikely. They fell out of favour with investors earlier than did chemical shares and their yields are consistently higher. For those who do not already hold them (though not conspicuously for tax free funds) the income attractions of such shares as "Shell" cannot be ignored, not least because the group probably earned more in the first quarter of this year than it did in the first quarter of 1961. The tax free dividend of 25 per cent was maintained after the one-for-five scrip issue and in the 5s. form "Shell" now stands at 30s. 6d. and yields 6¼ per cent.

Fremlins

ONE of the many breweries in which Whitbread has a stake and with which it has trading agreements is Fremlins, the Kent brewery. This investment was increased when Fremlins acquired Frederick Leney from Whitbread in exchange for shares and debentures in Fremlins. At the same time the trading agreement was extended so that brands of Whitbread bottled beer as well as Mackeson stout are now sold in Fremlins' houses. Profits of Fremlins for the year to January 31st last include a full year's contribution from the additional 189 licensed houses of Leney, against only three months in the previous year, and this accounts partly for the sharp rise in profits before tax from £549,000 to £783,000. The ordinary dividend, raised in 1960 from 17 to 20 per cent, has now been raised to 22 per cent. These results gave a further boost to brewery shares and Fremlins' £1 shares jumped 8s. 6d. to 107s. to yield just over 4 per cent.

Thomas Tilling

AT the time of the one-for-nine rights issue in September the directors of Thomas Tilling said that trading results for the first seven months of 1961 had shown "a satisfactory increase" and added that they were confident that they could maintain the final dividend at 11½ per cent on the bigger capital. In the event they have done so, thus maintaining the total dividend on the bigger capital at 20 per cent. Earnings rose from 37¼ to 42 per cent on the bigger capital but the directors, as they hinted in September, have deferred to the wishes of the Chancellor in not increasing the final payment.

The spread of this industrial holding company is very wide, ranging from "Pyrex" glass to bookpublishing and a Volkswagen agency, but it is important to note that of the increase of £577,000 to £3,681,000 in gross profits new acquisitions contributed no less than £475,000. Net profits rose by 27 per cent from £1,597,000 to £2,029,000. Part of the expansion in profits appear to reflect the consolidation of some of its holdings; various minority interests were bought out, and there were several new acquisitions. Thomas Tilling is in the first rank of industrial holding companies and its 4s. shares, at 27s. 10½d., yield 2¾ per cent.

London Brick

BRICK production rose by only two per cent in this country last year so that the rise of 23 per cent in the trading profits of the London Brick Company from £3,076,000 to £3,777,000 clearly reflects the benefits of the extensions and modernisation of its plant and higher average prices for bricks. The small reduction in brick prices announced last September can by no means have offset the two increases announced in 1960. The stock market was impressed by the results and the ordinary shares (to be split into 5s. units) gained 12s. 6d. to 104s. 6d. to yield 3.4 per cent.

The treatment of depreciation has, however, created something of a puzzle. In 1960 depreciation, amounting to £507,000 was treated as a charge against gross profits; last year only £8,000 was treated in this way but in addition £500,000 was transferred from the net surplus after tax to a newly created depreciation reserve. This change in accounting procedure is responsible for £500,000 of the rise in the net profits from £1,227,000 to £1,966,000. In a conservative reckoning the transfer to depreciation reserve would be deducted from net profits before assessing earnings and on this basis London Brick's earnings have risen from 30.3 to 36.3 per cent, covering the maintained ordinary dividend of 17½ per cent just over twice. The directors said in January that profits would justify a higher payment than this but clearly they are continuing to bear the Chancellor's request for restraint in mind. But shareholders may not be wrong in seeing in the announcement of a one-for-four scrip issue something more than a tidying-up of the balance sheet.

ICI as it Was

WITHIN a matter of weeks the image of strength, efficiency and benevolence that it had taken ICI years to create was dented. The bounce and bustle with which ICI first announced its bid for Courtaulds caused misgivings; then Mr Frank Kearton and other Courtaulds directors began to hammer at ICI's weaknesses and lessened the esteem in which ICI was held by the investing and lay public. It may be that the white was stained too deep a shade of black and too quickly. But ICI in the medium-term future can hardly be quite what it was in the past; and the old sense of purpose in its leadership has suffered a blow. Ultimately the substantial minority sharcholding in Courtaulds may be a source of strength for ICI; but at the moment ICI must pay the price for having fought for complete control and failed to get it. Wall Street listing or not, ICI ordinary shares are not in the old sense an automatic choice for everyman's portfolio.

	1957 £ mil.	1958 £ mil.	1959 £ mil.	1960 £ mil.	1961 £ mil.

To the more stringent scrutiny to which they are now exposed, the 1961 report contributes little, being little more than a ritualistic report of the past. Most of its facts are already known to shareholders and it says nothing about the future. But Mr Chambers has done that already. The facts can be put briefly on record:

Profits

Last year's reduction is attributed to substantial falls in chemical prices, largely as a result of "abnormal surpluses" in the United States; some price adjustments in deliberate anticipation of Britain's entry into the common market; and "fiercely competitive conditions" in export markets.

Sales

Though sales constituted a new record by volume, they fell in value from £303 million to £298 million in this country and from £255 million to £252 million in other countries. Exports were nine per cent higher in volume but only one per cent higher in value. The directors say: "Once again the newer products increased their share of exports, and dyestuffs, plastics and 'Terylene' accounted for about half of the total value. Exports of the anaesthetic 'Fluothane' were doubled." At home, sales of fertilisers, plant protection products, nylon polymer, 'Terylene' and pharmaceuticals were higher. Sales of heavy organic and inorganic chemicals were "about the same." The metal, plastics and paint divisions were affected by the recession in consumer durables; but higher sales of decorative paints more than outweighed smaller sales of motor and industrial paints.

Prices

Imports of polythene from the United States "at dumped prices" brought the price of 'Alkathene' down again—to half what it was six years ago. Either involuntarily or voluntarily the prices of fertilisers, methanol, polyvinyl chloride, 'Propathene,' 'Terylene' staple fibre and chlorine products were reduced.

Capital Expenditure

Capital expenditure in 1961 amounted to £46 million, against £34 million in 1960 and £32 million in 1959; "every effort is being made to bring new plants into commercial operation quickly." Capital expenditure sanctioned during the year was "exceptionally high" at £73 million, against £40 million in 1960.

Finance

Last year, ICI required £46 million for additional fixed capital, £4 million for additional working capital and £12 million for additional investments in subsidiary and associate companies, mainly overseas, making £62 million. About £81 million of cash became available, of which £41 million came from retained profits, depreciation and miscellaneous capital receipts and £40 million from the rights issue of ordinary shares.

So ICI ended its year—with slightly more employees on its books, 114,229 against 113,699 at the end of 1960—weaker than when it began it. The directors have already said that profits this year will be "appreciably higher," with the improvement coming mainly in the second half of the year. Presumably, the dividend will again be maintained at 13¾ per cent. On this footing, the yield on the £1 shares at 56s. 7½d. is 4.9 per cent and the prospective cover should be higher than the 1961 level of 1.4 times but lower than the 1960 level of 2.1 times. The directors expect the record profit of 1960 to be exceeded "within the next two or three years." Shareholders should note however, that this does not necessarily mean a higher return on the capital ICI employs. In accepting ICI's convertible loan stock for their Courtaulds shares, the institutions opted for the best bid price; but their actions also indicated to other investors the advantages of hedging one's investment in chemicals—and ICI—until the middle of this decade. The loan stock now stands at 104½, attributing a price of 65s. 3d. to ICI's ordinaries on the first conversion date in 1963.

Insurance Dividends

AMONG the most buoyant sections of the stock market this week have been insurance shares and a number of them have shown sizeable gains. The insurance dividend season is now well advanced, but the latest batch show few surprises. As the table shows dividends have generally been maintained, while the Guardian and the Royal have paid the dividends forecast at the time of their rights issues. The Pearl at least would have paid more but for the Chancellor's request for restraint and it follows the example of the Prudential in telling shareholders how much more they would have received. The increase would have been 6d. tax free per 5s. unit which would have raised the total tax free distribution to 100 per cent. It is proposed to retain the additional sum of £120,000 in the profit and loss account for distribution at a later date. There was no such proviso with the unchanged final dividend from Commercial Union but a higher payment had not been expected in view of the group's continued underwriting difficulties in North America.

DIVIDENDS AND YIELDS

	Dividends 1960	Dividends 1961	Price	Yield
				%
Commercial Union (5/-)	2/3	2/3	60/9	3·7
General Accident (5/-)	1/6	1/6	99/–	1·6
Guardian (5/-)	3/9	Int. 2/–‖ Fin. 9d.	57/3	2·3§
London & Manchester (5/-)	2/8½*	2/8½*	£12⅝	1·9‡
Pearl (5/-)	4/6*	4/6*	£12⅝	2·9
Royal (5/-)	5/–	Int. 2/8‖ Fin. 9d.	45/11½	3·3†

* Tax free. † On assumed dividend of 1/6 after rights issue. § On assumed dividend of 1/4 after rights issue. ‡ Adjusted for scrip issue. ‖ On smaller capital.

With insurance shares so highly regarded it is not surprising that those companies not already eligible are seeking trustee status for their shares. London and Manchester Assurance is increasing the authorised capital from £500,000 to £1,050,000 and in making a 11 for 10 rights issue of 5s. shares at par. With the existing shares at £11¼ the rights are worth about £6 to give an ex rights price of £5¾. The directors expect that the net sum available for distribution in 1962 will be not less than the sum of £295,651 carried to the profit and loss account in 1961 plus the net interest on the £543,000 proceeds from the issue. This suggests a dividend on the increased capital of about 1s. 6d. a share. A much bigger rights issue is announced by General Accident which is to raise almost £13 million by a one for ten issue of 5s. units at 60s. With the units at 99s. the rights are worth about 3s. 6d.

Harland and Wolff

IN 1961, for the second year in succession, Harland and Wolff, the Ulster shipbuilders, has halved its ordinary dividend; it is now only 2½ per cent. The stock market was prepared for the reduction, the £1 ordinary shares having fallen from 14s. 6d. to 10s. 10½d. in the past month rose to 11s. 6d. after the announcement. Gross profits were not, in fact, so sharply reduced as may have been feared, falling by 7 per cent from £1,121,000 to £1,042,000. But a heavier tax charge was reflected in the sharp fall of 39 per cent in net profits from £247,000 to £152,000. Preference dividends now absorb more than the reduced ordinary dividend, which does not appear to be covered completely by earnings. The directors said that profits in 1960 fell largely because of the need to make adequate provision for anticipated losses on contracts. The programme of launchings and completions was not matched by new orders and workers were laid off even though the group won several contracts in 1961. Modernised slipways and a new prefabrication shop should be fully available by the middle of this year but the critical question is whether there will be sufficient orders to keep them fully employed.

Delta Metal

THE chairman of Delta Metal, Mr W. E. Ogden, says that the higher output of the group and the record profits earned in 1961 cannot be attributed to any particular factor or to any one section of the group. Gross profits rose by 18 per cent from £3,777,000 to £4.457,000; the later figure includes six months' profits from Davis and Timmins of £346,000 and stock credits of £11,000 and if these items are excluded the rise in Delta's profits is 13 per cent. As forecast, the ordinary dividend is maintained at 20 per cent on the capital as increased by shares issued on the acquisition of Davis and Timmins and is covered about 1¾ times.

Mr Ogden says that the results are evidence that the group has succeeded in its policy designed "to rationalise production" and it is therefore better placed to meet the challenge of the common market. The main interests of the group lie in non-ferrous metals, particularly brass, and the group seems likely to strengthen these further by an arrangement with Guest, Keen and Nettlefolds, which will transfer some of its non-ferrous metal interests to Delta, which in turn will dispose of Davis and Timmins' factoring section (mainly concerned with steel) to GKN. Among the group's associated companies Delta-Enfield Rolled Metals, established in August, seems to be working satisfactorily. But Mr Ogden says that James Booth Aluminium, run jointly with Kaiser Aluminium, has met delays in the introduction of new equipment; these have hindered the growth of its earning capacity in an industry where competition both at home and overseas is becoming more severe. At least one export market, however, seems promising, for sales of brass rods and extrusions in the United States and Canada rose by 40 per cent last year. On a broader front he says it is too early in the year to forecast results; indeed, he is rather guarded pointing out that certain sections of the group are still experiencing a mild recession and though "there are good prospects of another successful year's trading it would be unwise to assume a repetition of last year's record profit figure." But in the eyes of investors the 5s. ordinary shares remain attractive; at 22s. 3d. xd they are near their high point for the year and yield 4½ per cent.

News of the World

SHAREHOLDERS in the News of the World Organisation have had several reasons to hope that the final dividend for 1961 would be increased. The first interim dividend was raised from 5 to 5½ per cent, the second interim from 5 to 6½ per cent and a sharp increase in trading profits was announced in the preliminary figures in January. Now, after the customary interval between the announcement of profits and the final dividend, shareholders' hopes are realised: the final dividend has been raised from 15 to 18 per cent, increasing the total from 25 to 30 per cent.

Gross profits rose from £1,521,000 to £2,033,000, net profits rose by 16 per cent from £816,000 to £949,000 and the dividend is covered twice. Some of the improvement in profits may have come from the *News of the World* itself, since its average weekly circulation last year went up by 178,000 and its price was raised. The group's other interests should have contributed more in profits also last year.

THE MONEY MARKET

THE discount market was forced to borrow from the Bank of England on each of the first three days of this week. The market has now been in the Bank seven times since Bank rate was cut to 5 per cent three weeks ago. Continuation of this tough line on the part of the authorities can only mean that they feel the bill rate is falling away too quickly.

At last Friday's Treasury bill tender the average rate of discount fell by 8.54d. to £4 7s. 4.62d. per cent. The syndicate of discount houses raised its bid at the tender by 2d. to £98 18s. 2d., but with the increase in outside bids fractionally higher, and total applications £7 million higher at £399 million, the market's allotment of bills fell to 46 per cent compared with 57 per cent in the previous week.

Credit has been tight throughout the week and on Monday three or four houses were forced into the Bank for a small amount. On Tuesday and Wednesday the authorities gave the market fairly large amounts of help but this was still not enough to prevent four or five houses borrowing a small amount on Tuesday and one or two taking a small amount on Wednesday.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Greece is manufacturing only. United Kingdom includes construction. Germany excludes West Berlin and the Saar. (2) Special trade (excluding re-exports) with the exception of Ireland, Denmark, Norway and Sweden, which cover general trade. Belgium includes Luxembourg. Italy includes Trieste. The Saar is included with France before July, 1959, and with Germany after that date. Turkey liras per U S dollar; beginning September, 1960; 9 previously, 2·8. (3) March 375·0. (4) March 322·4. (5) In capital cities only for France, Turkey, for Greece prior to January, 1960, and Austria prior to March, 1959; Austria (prior to March, 1959), Denmark and Belgium exclude rent; Denmark includes direct taxes; Ireland based on August, 1953=100. (6) Index numbers of unit value which are influenced by changes in the composition of trade as well as price movements. Ireland seasonally adjusted. Turkey index in terms of U S dollars. (7) Holdings of the government and central bank. German figures from 1959 exclude long-term and earmarked assets; Norway and Sweden include foreign investments. Ireland includes some long-term British securities. (8) March 3,452. (10) Special trade. (11) Average for third quarter. (12) Average for fourth quarter (13) February 112.

BRITISH RAILWAYS

FINANCE AND ADMINISTRATION

The Railway Administration in Great Britain is entering a new phase. In this, new ideas in organisation will need to be introduced. New concepts of management will need to be applied to the use of manpower and equipment, and to control at all levels.

Key posts in this challenging task will be those of the six Regional Directors of Finance and Administration. Each of them will be a Member of the appropriate Area Board. Four will work in London, one in Glasgow and one in York. Some of these men will have to be newly recruited from industry. The magnitude of the business, the complexity of the problems involved, the need for a broad-minded approach to the use of finance as a factor in management decision-making, these are some of the things that will appeal to men of wide commercial and industrial experience prepared to become absorbed in a fascinating assignment.

Some of these appointments will be made in the next few months. As only few people will be equipped with the skills and personality required, it may well be that the type of person we are looking for is already earning a salary on which the Railways would not be able to offer an improvement. At the same time, the appointments carry a future as interesting as any. Probably more so than most.

Those interested and qualified will very likely be 40 or a little over. If you would like to be considered, send particulars of your career (mentioning your present salary) to Mr. A. R. Dunbar, British Transport Commission, 222 Marylebone Road, London, N.W.1.

COUNTY COUNCIL OF ESSEX

COUNTY PLANNING DEPARTMENT

Applications invited for following vacancies:

SENIOR PLANNING ASSISTANTS, A.P.T. III/IV (£960-£1,310)

Vacancies exist in the Research and Survey Sections in Area Planning Offices at Romford and Wanstead.

Candidates should possess an appropriate University Degree and be prepared to study for the Final Examination of the Town Planning Institute. They should have had experience of research and survey work with a local planning authority.

Five-day week, assistance towards costs of removal, day release and financial assistance for study purposes. Superannuation, medical examination.

Applications, stating age, qualifications, experience, present and previous appointments and salaries, together with names of two referees, should reach the County Planning Adviser, Broomfield Place, Broomfield, Chelmsford, Essex by April 25, 1962.

PROFESSIONAL ACCOUNTANTS in the CIVIL SERVICE. 25 pensionable posts in London, Chessington (Surrey), Manchester, and Glasgow for Chartered or Certified Accountants (men or women) with suitable professional experience. Candidates must be at least 25 and under 40 on May 1, 1962; preference will be given to those under 35. Inclusive recently qualified accountants who wish to make a career in the Government service. Starting salary (Inner London area) £986 (at 25) to £1,413 (at 31 or over). Scale maximum £1,868. Salary scale under review. Good prospects of promotion to senior posts carrying salaries up to £2,858 or higher.—Write to Secretary, Civil Service Commission, Burlington Gardens, London, W.1. for **application form quoting 57/62/11. Closing** date May 15, 1962.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT LECTURER in STATISTICS to begin duties on October 1, 1962. Initial salary according to qualifications and experience on the scale £800 x £50—£950, with F.S.S.U. provision and family allowance. A grant towards removal expenses will be made. Further particulars may be obtained from the Registrar, to whom applications (four copies) should be sent by May 5, 1962.

YOUNGER EXECUTIVE & TECHNICAL APPOINTMENTS DIVISION

MSL have been retained to advise on this appointment

ECONOMIST/STATISTICIAN

for the Port of London Authority

who will analyse and assess factors influencing the one-third (by value) of Britain's sea-borne trade which uses London River.

This new appointment on the staff of the Chief Accountant carries responsibility for establishing an economic intelligence service within the Authority; for reviewing and improving statistics in current use; and for assisting with cost and market researches. An I.C.T. 555 computer is available for use in this work.

Candidates, preferably between 30 and 35, must be qualified in economics, commerce or accountancy and possess expertise in statistics. Commencing salary about £2,250. Please send brief details in confidence to D. A. McDonnell, quoting reference 4950.

No candidate's identity will be disclosed without permission

MANAGEMENT SELECTION LIMITED
17 Stratton Street, London, W.1.

ECONOMIC AFFAIRS REFERENCE SERVICE

CENTRAL OFFICE OF INFORMATION (ECONOMIC UNIT) requires an Information Officer (unestablished) to write reference information papers and provide factual briefing for overseas use on British and international affairs. Desirable qualifications are a university degree in economics or related subject, research experience, and the ability to present factual information concisely and accurately. Candidates may be asked to produce examples of written work. Salary £1,252—£1,490. Write, giving age, full details of experience and qualifications, to Manager (PE/1436), Ministry of Labour Professional & Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

MARKET RESEARCH MANAGER

of an international food manufacturer requires an

ASSISTANT

who will be capable of taking responsibility for research into a number of the Company's existing products and development lines.

Applications from men or women age 24-30, preferably with at least two years' Market Research experience, are invited. Salary range £800-£1,100 plus substantial bonus. Pension/Life Assurance benefits.

Replies to Box 1615.

UNIVERSITY OF GHANA

DEPARTMENT OF ECONOMICS

Applications are invited for the post of SENIOR LECTURER IN ECONOMICS (considerable teaching or research experience essential).

Salary scale: £G1,750 x £G75—£G2,200 p.a. 20 per cent. addition for non-Ghanaian. Entry at appropriate point. Appointment normally five years in the first instance.

Outfit allowance £G60. Car allowance £G150 p.a. Family allowance for non-Ghanaian for each child in West Africa £G50 p.a. or, if under age of 21 and being educated outside West Africa, £G100 p.a. (maximum five children). Part-furnished accommodation at charge not exceeding 7.5 per cent. of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.

Passages for appointee and family on appointment and normal termination. Annual leave with three overseas return passages in every four years for non-Ghanaian and one every three years for Ghanaian.

Applications (six copies) with full details of qualifications, experience, etc., and naming three referees to be sent before May 7, 1962, to the Registrar, University of Ghana, P.O. Box 25, Legon, Accra, or to the Assistant Registrar (Overseas), University of Ghana, 13 Gordon Square, London, W.C.1, from either of whom further particulars may be obtained.

HASTINGS EDUCATION COMMITTEE

HASTINGS COLLEGE OF FURTHER EDUCATION

Required in September, 1962, a Grade A Assistant for Commerce and Commercial Arithmetic to R.S.A. II Standard and able to assist with Economics.

Salary £570—£1,170 with Allowances in accordance with Burnham Report, 1961.

Application Forms and full details from the Principal of the College, Archery Road, St. Leonards-on-Sea, Sussex.

Completed forms to be returned to the College with not more than three testimonials within 14 days from the date of the advertisement.

Canvassing will disqualify.

For further appointments and other classified advertisements see pages 209 & 210

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for appointment to a Lectureship or Assistant Lectureship in Economics. The salary scale for Lecturers is £1,050 x £50—£1,400 x £75—£1,550; thereafter x £75—£1,850 a year plus £60 a year London Allowance; and for Assistant Lecturers £800 x £50—£950 a year plus £60 a year London Allowance; with superannuation benefits and family allowances in both cases. In assessing the starting salary consideration will be given to age and experience. Among the specialisms which would be considered eligible would be agricultural economics, economic development or business economics.

Applications, with the names of not more than three referees, should be received not later than May 4, 1962, by the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

IRON AND STEEL BOARD

ECONOMIST

The Iron and Steel Board have a vacancy in their Economics Division for an Economist to work on general economic problems affecting the iron and steel industry.

Candidates should have a good Honours Degree and several years' industrial, Civil Service or academic experience. The salary will be commensurate with the responsibilities undertaken. The Board operates a contributory superannuation scheme.

Please write in confidence, giving full particulars of qualifications and experience, to the Establishment Officer, Iron and Steel Board, Norfolk House, St. James's Square, S.W.1.

FORD OF BRITAIN

ACCOUNTANTS

Ford of Britain offers an attractive career to qualified accountants in a modern integrated accounting system which is directed towards the supply of management information as well as statutory requirements. The Company is of such a scale that all aspects of cost and financial accounting are covered and extensive machine and computer installations are used.

Present vacancies are at three different levels from recently qualified accountants to experienced men up to the age of 35.

Prospects will not be limited to the finance field as the Company management development policy ensures that men of high general ability are detected and advanced as rapidly as their capacity can sustain. Salary and promotion therefore depend entirely on ability.

Applications, giving age and brief details of experience and qualifications, should be addressed (with envelope marked "Reference A1A") to:—

MR H. G. PEARMAN, Training and Recruitment Office, Ford Motor Company Limited, Dagenham, Essex

---

NORTH WESTERN GAS BOARD
HEAD OFFICE — MANCHESTER

ASSISTANT ECONOMIST

Applications are invited for the above pensionable appointment, at a commencing salary within the range £716-£1,015 per annum according to qualifications and experience.

Candidates must be graduates (or about to graduate this summer) and should preferably be not more than 27 years of age. Preference will be given to Honours graduates in Economics with some knowledge of Accountancy.

The Assistant Economist will be concerned with cost and price studies within the business and with the analysis of economic trends, as they affect the gas industry. The work offers ample scope for initiative in the application of the economist's approach to the solution of business problems.

Detailed applications, giving the names of two referees, should be sent to the Secretary, North Western Gas Board, Bridgewater House, 60 Whitworth Street, Manchester, 1, within 14 days

---

UNIVERSITY OF EDINBURGH

DEPARTMENT OF ECONOMIC HISTORY

Applications are invited for the post of LECTURER or ASSISTANT LECTURER in the Department of Economic History. Preference will be given to candidates whose main interest is in Economic History since 1750. Salary scales—Lecturer: £1,050 x £50 to £1,250; Bar: £1,300 x £50 to £1,400 x £75 to £1,850 per annum; Assistant Lecturer: £800 x £50 to £950 per annum. Placement on the scales will be according to qualifications and experience. The posts are subject to superannuation, and family allowance is payable where applicable.

The successful candidate will be expected to take up duty on October 1, 1962.

Further particulars may be obtained from the undersigned, with whom applications (six copies), giving the names of two referees, should be lodged not later than May 4, 1962.

CHARLES H. STEWART,
Secretary to the University.

April, 1962.

University of Cambridge Faculty of Engineering

SENIOR RESEARCH FELLOWSHIP

It is the intention to appoint a Senior Research Fellow on a D.S.I.R. Grant to study the methodological problems of Management training associated with the Churchill College Management Course. He will be required to develop both the methods of data collection already in use, and the methods of analysing and collating the data acquired.

The appointment will be for a period of two years in the first instance, beginning September 1, 1962. Salary will be in the range £1,500 to £2,000 a year with a maximum of £1,925 the first year and £2,000 the second year. The salary is pensionable.

Application forms and further information from the Secretary of the Faculty Board, University Engineering Laboratory, Cambridge. Closing date May 14, 1962.

COUNTY BOROUGH OF EAST HAM
EDUCATION COMMITTEE

TECHNICAL COLLEGE

DEPARTMENT OF COMMERCE AND GENERAL EDUCATION

Applications are invited for the post of Lecturer in Accounting to teach Accountancy to General Certificate of Education Advanced Level and Intermediate professional and Ordinary National Certificate standard and to carry some administrative responsibility within the Department. Qualifications or experience in Costing or Local Authority Finance will be an advantage.

Burnham Scale (London Area), £1,600 x £40 (5) to £1,800 plus London Weighting.

Application forms (returnable May 11, 1962) and further details from Chief Education Officer, Education Office, Town Hall Annexe, Barking Road, East Ham, London, E.6.

THE UNIVERSITY OF HULL

Applications are invited for a Lectureship or Assistant Lectureship in Public Administration. Candidates should have a good honours degree and some research experience. Salary scales: Lecturer £1,050—£1,850 p.a.; Assistant Lecturer £800—£950 p.a. with F.S.S.U. and children's allowances. Further particulars may be obtained from the undersigned, to whom applications (five copies) should be sent not later than May 5, 1962.

W. D. CRAIG,
Registrar.

THE AUSTRALIAN NATIONAL UNIVERSITY

RESEARCH SCHOLARSHIPS

Applications are invited for scholarships in Anthropology and Sociology (including Oceanic Linguistics), Demography (including social and cultural aspects), Economics (including Economic History and Economic Statistics), Geography (most branches but not at present with any emphasis on soil geography and climatology), Modern History (particularly in the fields of Australia and the British Commonwealth, Far Eastern History (China and Japan)*, International Relations, Law, Pacific History, Political Science (including public administration), Philosophy (including, as well as the traditional branches of philosophy, social and political philosophy, the philosophy of education, the logic of the natural and social sciences and of history, the history of ideas), and Statistics (including Mathematical Statistics).

Applicants should be post-graduate students with capacity for research. Scholars will normally enrol for a Ph.D. degree, the course for which extends over three years. A scholarship is initially awarded for two years but will normally be extended for the whole period of the approved course.

The basic scholarship allowance is £A950 per annum. Married scholars with children receive additional allowances for dependants. A grant will normally be made towards travel costs.

Application forms and further particulars are available from the University or from the Secretary, The Association of Universities of the British Commonwealth, Marlborough House, Pall Mall, London, S.W.1. Applications should reach the University by April 30th or October 31st in any year, although special consideration may be given to applications at other times. Scholarships may be taken up at any time after award, subject to agreement of the Head of Department concerned.

*A substantial knowledge of the relevant language is a pre-requisite.

D. K. R. HODGKIN,
Registrar,
Institute of Advanced Studies,
Box 4, G.P.O.,
Canberra, A.C.T., Australia.

ECONOMIST/STATISTICIAN
(male or female)

●

required for the Market Research Department of an international company in London. Candidates should be in their twenties and have a degree in Economics with Statistics, or Mathematics with Statistics, and some previous experience. Holders of a Diploma in Statistics will also be considered. Pleasant and energetic personality essential.

Commencing salary around £800-£850 per annum. Employee benefits include contributory pension scheme; luncheon vouchers; five-day week.

Applications, which will be acknowledged, should be addressed, in complete confidence, to:

Personnel Manager,
Cyanamid Of Great Britain Limited,
Bush House,
Aldwych, London, W.C.2.

THE DE LA RUE GROUP

is expanding its Overseas International interests and has a vacancy for a

MANAGEMENT ACCOUNTANT

We are looking for a fully qualified Accountant with some years' experience in the field of international commerce and up-to-date ideas in management accounting techniques.
A good knowledge of European languages including French is essential.
The person appointed will be based in the United Kingdom, but there is a possibility that in a year or two's time, this person could be called upon to take up residence on the Continent.
Age 25-33 years.
A good salary will be paid to the successful applicant and the post holds very good prospects for the right man. There is an excellent superannuation scheme and other benefits.

Please write, asking for an application form, to:—

The Group Personnel Officer
(Quoting Reference A.32).
The De La Rue Company Limited,
Berkeley Square House,
Berkeley Square, London, W.1.

UNIVERSITY OF GLASGOW

National

NATIONAL BENZOLE CO. LTD.

requires a

Senior Statistician

The ideal candidate would be aged 25/35, have a degree in Arts or Economics with at least some statistics and/or an appropriate professional qualification. He will be required to tackle a wide range of problems concerned with marketing and distribution, including sales forecasting, market research and analysis. There is considerable scope for initiating inquiries and research and the ability to present crisp and clear reports is most important. The Company offers excellent conditions of employment. A contributory pension scheme operates. Applicants should reply to:

Staff and Administration Manager,
NATIONAL BENZOLE CO. LTD.,
Mercury House, 195, Knightsbridge, S.W.7.

HEINZ 57

MATHEMATICIAN

A qualified mathematician is required to work with our Industrial Engineers on a number of interesting projects which require mathematical or statistical techniques.

Candidates should preferably have a degree in mathematics or anticipate graduating in mathematics in the Summer of this year.

Full details of duties will be discussed during interviews, together with conditions of employment but, initially, applicants should please forward a brief summary of personal history to:

The Personnel Officer,
H. J. Heinz Co. Ltd.,
Waxlow Road,
Harlesden, N.W.10.

For other appointments see pages 208 & 209

AVIATION MARKET STATISTICIAN

A major Company holding a leading position in the aircraft equipment industry wishes to appoint a statistician in its Research Department to study long term trends in the world demand for aircraft equipment and the requirements for meeting this demand.

The successful applicant will require the following qualifications:

1. A good University Degree and a sound statistical background.
2. Experience in the aircraft industry.
3. Enthusiasm and the ability to organise his work with the minimum supervision.
4. The ability to prepare concise reports for top Management for use in the formulation of operating policy.

The Research Department is located in pleasant surroundings and a good salary and competitive fringe benefits will be offered.

Apply Box 1614.

RESEARCH INFORMATION WRITER

CENTRAL OFFICE OF INFORMATION requires a Senior Information Officer (unestablished) to act as head of a unit writing reference information papers for overseas use on British home affairs, mainly on governmental and social topics. Candidates should have a university degree, a wide knowledge of current affairs, research experience and some administrative capacity; they should be able to present factual information concisely and accurately and be prepared to submit examples of written work. Salary £1,573—£1,967. Write, giving age, full details of experience and qualifications, to Minister (PL/59), c/o PO1, Ministry of Labour, Professional & Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

APPOINTMENTS REQUIRED

COMMON MARKET

Graduate Hons. Cambridge, 25, fluent French, Italian, knowledge of German. Three years' experience abroad, keen to work for organisational or industrial, federal, international relations, information, etc.—Write Box 1613.

Investment Opportunities in Japan!

It's a well-known fact that you don't need a high income before you are able to own a house or a car, or send your children through expensive colleges, and on top of that enjoy the good things in life. A modest income is enough . . . that is, if you know how to get the most out of your money.

Daiwa Securities, the largest securities company in Japan . . . capitalized at £8 million sterling and having 4,000 employees . . . is engaged in a wide range of business, acting as broker, dealer and underwriter of securities and distributor of investment trusts. The "pioneering spirit" which has been the motivating power behind its 60 years of expansion is still very predominant today.

Make your money work for you in Japan's booming industries by investing through expert and experienced hands. For investment trusts, etc., write

'FOR RICHER FOR POORER'

THE PRIME MINISTER has said '*most of our people have never had it so good*'.

As he later reminded us, he was not making a boast, but giving a warning. The indispensable condition for this prosperity, he said, is the control of inflation.

Is our prosperity assured?

Or is Britain losing ground to the Germans, the French, the Italians?

There are signs of strain.

Granada, advised by Robert Collin, George Cyriax, and Michael Shanks of the 'Financial Times', is making an investigation into the state of the nation's economy.

Cameramen have travelled more than 7,000 miles throughout Britain, recording the attitudes, snobberies, inefficiencies—and triumphs—of the Business of Britain 1962.

'Bingo'; the first of five programmes in the series 'For Richer For Poorer', will be transmitted on ITV on Wednesday April 18 at 9.45.

GUIDE TO CONTENTS | SEE OVER

HOW DO YOU MEASURE A PIECE OF EARTH?

Time and money are important dimensions in earthmoving. And they have a way of being favourable or not depending on the equipment used on the job. With Caterpillar at work, the time measurement is short. The cost measurement is low. No other company has devoted so much time, invested so much money, towards producing the machines that make this so. And because there is a right Caterpillar machine for every earthmoving job, there is always a right measurement of cost-per-cubic yard.

CATERPILLAR WORLD'S GREATEST NAME IN EARTHMOVING

Caterpillar, Cat and Traxcavator are Registered Trademarks of Caterpillar Tractor Co.

TRACTORS · EARTHMOVING EQUIPMENT · ENGINES · PARTS

Caterpillar Tractor Co., General Offices, Peoria, Illinois. Caterpillar Americas Co., Peoria, Illinois. Caterpillar Overseas S.A. Geneva. Caterpillar of Australia Pty. Ltd., Melbourne. Caterpillar Brasil S.A. São Paulo. Caterpillar Tractor Co. Ltd., Glasgow. Caterpillar of Canada Ltd., Toronto. Caterpillar France S.A. Grenoble.

Published weekly every Saturday, fifty-two times a year in London, England.

In The Economist this Week — April 21, 1962

INDUSTRY ON TRIAL

The **American steel industry** is not being allowed to push the United States into inflation (p. 223).

While President Kennedy has slapped down United States Steel in a case of **price leadership,** Lord Chandos recommends it to British industry as "the right lines on which we should work" (p. 263).

Radical's Choice

The three parties have shifted, if indecisively, on the radical preference-scale. The **Tories** are dragged down by their anti-expansionists; **Labour,** on this count, is up a notch or two from a low start; the attractions of **Liberal** policies can be vitiated by some wobbly candidates (p. 221).

The Perils of Huffing

Someone in Bonn has stuck his finger into the house of cards Mr Rusk has been trying to construct over **Berlin** (p. 224)

Expatriatism

The **white man's burden** can no longer be borne by the traditional misfits of Britain; the new and qualified generation that volunteers for service overseas deserves more support than it gets (p. 226).

Tortoise and Hare

With the Algerian war behind it, **France** is able to expand its influence in **Africa. Britain** should respond by trying to break down African (and European) barriers (p. 225).

NOTES OF THE WEEK (pages 228-237)

Europe : Belgium and Holland are reluctant to become satellites to a Paris-Bonn axis.

Budget Debate : Some interesting differences of emphasis among the Government's four spokesmen.

China : No one really knows what is going on in Peking.

UN and Rhodesia : With exquisite courtesy, four senior British ministers have exchanged information with the exquisitely courteous United Nations mission on Southern Rhodesia.

Parliament : At the end of this session the Government can look back to a better performance in the House than in the country.

Apprentices : A report from the engineering employers proves the case for Government action to improve training in industry.

Nuclear Disarmers : The view of the courts and of the country.

Moral Rearmament : Mr Wolrige-Gordon's battle with his parliamentary constituents seems more a family than an ideological affair.

France : General de Gaulle has to weigh retribution against mercy in the case of General Jouhaud. The balance should be for mercy.

West Indies : Poverty continues to confound the thoughtful politicians—and to threaten the security of the fiery ones.

Doctors : Higher pay for "star" general practitioners may not be welcomed by the medical profession.

THE WORLD OVERSEAS (pages 253-259)

France : M. Pompidou's appointment as first minister has brought out a little more clearly, to the discomfort of liberals, the constitutional realities of the Fifth Republic.

Kenya : Back home, the politicians are as far as ever from ceasing to love themselves and learning to love their country.

Spain : General Franco has strong reasons for prolonging the uncertainty about who will be his successor; and he is not doing badly.

HOME REPORT (pages 238-239)

Tees-side : A bold innovation by the Local Government Commission might create England's eighth largest town.

Pope and Presbyter : Anxious Scots presbyterians are pondering their Moderator's visit to the Vatican.

VOLUME CCIII - NUMBER 6191

The Radical's Choice

THE swing in the North Derby by-election went distinctly further away from the Conservatives than that at Stockton two weeks ago. If one assumes—for the purpose of rough estimation—that the 2·7 per cent of electors who voted for the small shopkeeper's candidate raided the potential Tory and Liberal vote about equally, the Liberals did approximately as well as at Stockton, the Conservatives about 5 per cent worse, and Labour about 5 per cent less badly. But these changes, though interesting in themselves, are still in one sense marginal. The most intriguing question for the thoughtful observer just now is not how other floating voters seem to be reacting, but whether at the next general election—or earlier, at a by-election, if one occurs in his constituency—he might feel inclined to float himself.

The Economist has always liked to think of itself as belonging to one school of opinion from which floating voters have traditionally come: the school which it calls the genuinely radical school, however much others may dispute its right to that name. In the words of its leading article immediately before the general election of 1955, this paper has always believed that the party which would make the best government for Britain is the one most likely to "foster the reformer's zeal, to be willing to probe down to the roots of every stalk of the national life and to cut and graft wherever an improvement can be seen"; its whole impulse is to favour the party which is the enemy of "passive tranquillity," and which comes nearest to having "nothing timid or tepid, nothing cautious and not too much that is merely judicious" in its policies. It prefers a government that is willing to be audacious in accepting and welcoming and pursuing change. In 1955—despite the antipathy bred by the Conservative party's name—*The Economist* found that the momentum of the ideas that it tries to represent had carried it to the point of supporting the Tories, who seemed at that time to be the party best adjusted to the mid-twentieth century, while their main opponents still looked rather maladjusted to the late nineteenth. In 1959 we repeated this support, though less confidently. It may therefore be interesting to set down an interim judgment on where, looking at all three parties, matters seem to us to stand now.

The best way to judging a Government is by its record. During this Parliament the Conservatives have got their policy for Europe and Africa (though with the Central African Federation still hanging in the storm-laden air) broadly and competently right; this in itself provides them with a pretty clean sheet in foreign affairs, for there are few other foreign issues in which the independent action of a British Government could be immensely effective. In domestic affairs, the Tories also deserve praise for at last attempting to move towards an incomes policy, but criticism for sometimes not pushing it fully home. In social and libertarian matters (despite the Immigration Bill), the Tories also deserve credit for some real advances, particularly the reforms that Mr Butler has introduced while at the Home Office and Mr Powell at the Ministry of Health. The Tories' last party conference also suggested that their local constituency associations, hitherto supposed to be one of the main blots on their liberal escutcheon, are in a healthier state than for some time. But the great demerit has lain in the Tories' failure to expand the economy. The radical's criticisms of the last two and a half budgets are now no longer merely matters of slightly differing emphasis. Temporarily, at least, there is a fundamental difference between his own and the official Tories'

whole attitude of mind. One can best see this in the very adjectives that Government spokesmen use. The words that Tory ministers used to defend last week's budget were "sound," "prudent" and "not based on wishful thinking"; the words that the radical wants to see inscribed on this country's banner are "restless and dynamic drive."

In these circumstances there is a real and emerging temptation to say that the country might be well served if after the next election the Conservatives were driven into Opposition for a while. This might be good for the party, too. Presumably Mr Macmillan will retire during the next parliament; the Tories might swiftly recapture their dynamic under a new leader while they were in Opposition, but if Mr Macmillan retired while still Britain's prime minister there might be more danger of his successor (whoever he is to be) coming under constant pressure from the start to show what a conventional stereotype he was. But if one has by now almost talked oneself into the position of wishing the Tories out, what of those whom one would thereby be wishing in?

IF the Conservatives were voted out of power at the next election, the Government that would take over from them would be a Labour one. Let it be said straightaway that Labour is now much less of a scarecrow to thoughtful men than at any time for over a decade. This is largely the result of the party's conference at Scarborough in 1960. All through their dreary 1950s, Labour leaders seemed to be the prisoners of the constant retreats they considered they had to make in order to remain leaders; everything they did or said or wrote in their "policy rethinking documents" had to depend on what they thought might happen in votes in so many organs of the party. But at Scarborough they reached the ditch of no retreat; and once they had turned to fight, it quickly became apparent that votes in the different official organs of the party could be safely disregarded or resisted—after all.

Mr Gaitskell is now in virtually complete control of his party's policy, particularly in defence and foreign affairs (precisely because it was in these vital fields that he was first compelled to make his stand). Provided Britain had first got into the common market, there seems no reason to fear that a Gaitskell government's foreign policy would be in any way worse than a Conservative government's one; indeed in some respects it might be actively useful to have Mr Gaitskell, rather than Mr Macmillan, as Britain's prime minister during what are presumably likely to be the Kennedy administration's second four years.

In economic affairs Labour would be unlikely to repeat the Tories' mistake of pumping too little demand into the economy; the danger, of course, is that they might pump in too much. One is also beginning to foster slender hopes that they might be more willing than they have been in the past occasionally to annoy the trade unions, although one does wish that their leaders would be braver about saying this. At any rate if by the time of the next general election the Conservatives have still proved themselves too frightened to do anything really effective to check wage inflation during a dozen years of office, this will not leave them greatly to be preferred to a Labour party which has proved too petrified to say anything derogatory about it during twelve years of opposition. But the remaining main defect of the Labour party unfortunately is an all-important one, especially for radicals. There is still every sign that Labour leaders are instinctively more inclined than the Tories to shelter any vested interest which might be hurt by any change, to regard change as an enemy instead of an ally. This can constantly be seen *de minimis* in Labour's immediately reactionary reaction to very small innovations, such as the new tax on soft drinks; it can be seen more profoundly in Labour's attitude to the whole changing pattern of industry (Labour is instinctively more inclined than the Tories to protect declining industries and areas, at the expense of not actively encouraging expanding ones); it can be seen most disastrously and unimaginatively of all in Labour's crafty and costive reaction to massive historical opportunities such as that of joining the European common market. This issue of the common market may deserve in itself to be the final touchstone in 1963 or 1964; it will be virtually impossible for any thoughtful radical to switch to Labour at the next election if it really has managed to get on the conservative side of the Conservatives over that.

THERE remains the third alternative: the Liberals, who are likely to fight more than half the constituencies in the country at the next general election, and probably more than three-quarters of the constituencies in which most British-domiciled readers of *The Economist* live. The Liberals base themselves on the tradition which radicals hold as their own: they profess to welcome change, and proclaim a belief in pushing the economy forward past all obstacles at the fastest speed instead of slowing it to the pace necessary to help every lame dog to clamber half-way up on every stile. They also have by far the best name of any party for the mid-twentieth century; there should be millions of forward looking people who thrill to the label "Liberal." But can one always thrill to all the attractions offered to the voters as part and parcel of it?

What the radical cannot thrill to is any Liberal candidate who bases his appeal on advocating, say, further favours to railway season ticket holders who are being heavily subsidised by especially cheap fares on a railway system that is massively in deficit already; or who proclaims to interested parties that he favours giving more money to particular groups at present caught in the pay pause. (Unless he says in the same breath which particular groups he would prefer, in compensation, to see given smaller rises than they are being offered already.) This issue of the pay pause is a test that thoughtful radicals should apply even if—indeed especially if—the people for whose wage claim the candidate speaks up are such worthy-sounding groups as all nurses and all teachers. The most convincing form of honest opposition at the moment is that which prods the Government to push up production, not that which enters into an auction with it to bid up wage and salary costs.

The Liberals may well say indignantly that they support the incomes policy, and that their candidates do not enter into such auctions. If so, that is fine; they pass the test, for it is only where such vestiges of opportunist electioneering might appear—say in any addresses sent out at the time of the coming local government polls—that the radical needs to shy away from them. In broader matters of economic policy he has every incentive to float away from the Conservatives instead—until and unless they drive forward to get economic expansion going again.

United States *versus* United States Steel

President Kennedy's victory over the steel producers should not be the start of a war with the whole business community

PRESIDENT KENNEDY has demonstrated the effectiveness of a system of government in which power centres in one man—provided, of course, that he has the courage and conviction to protect what he deems to be the public interest as dramatically as the President of the United States did last week. Mr Selwyn Lloyd's economic policy would be better understood and more acceptable to the average Briton if the Chancellor could defend it as Mr Kennedy did his very similar policy—both aim at stabilising wages and prices. But then Mr Lloyd is unlikely to be given the opportunity offered to the President by the political maladroitness of Mr Roger Blough, head of the United States Steel Corporation which produces over a quarter of the steel made in the country that is responsible for nearly a quarter of the world's output.

In announcing last week that his company was raising its prices by 3½ per cent on the average—a move which was copied at once by all but two of the other leading American steel producers—Mr Blough followed the traditional but, it had seemed until then, archaic businessman's approach to the federal government: that what is done in New York and Pittsburgh need not concern Washington. Earlier this year the attitude of the steel companies had been different; then they had welcomed the Administration's help in bringing the steel workers to the bargaining table to negotiate a new labour contract well in advance of the expiry of the old one and in pressing them to moderate their demands.

But as soon as the contract was signed Mr Blough broke what everyone had presumed, although it had not been stated specifically, was his side of a bargain which had been praised, particularly by the President, for its non-inflationary nature. For the steel industry to increase its prices at this point, without warning and without consultation, was therefore for it to deceive and defy the President. If it acted thus in protest against government interference in its affairs, it has brought upon itself the full weight of that interference to an extent which may have serious implications for the future of all business activity in America.

It was not what the steel companies did but how they did it that was deplorable. There is in fact a case for raising steel prices (discussed on page 246) and with the economy running well below capacity, as it still is, higher prices, even for this basic component of industrial operations, might not indeed have been enough in themselves to set off a new round of inflation. But the companies' disregard of the President's declared policy, after the steel workers had co-operated so fully with it—and had been criticised by other labour groups for doing so—would have ended Mr Kennedy's hope of inducing other trade unions to show similar restraint in the coming negotiations in other industries. Indeed, the resentment engendered by the steel industry's action (fanning again the old charge of not a few Americans that "administered" steel prices, passing on higher wage costs, have been a chief cause of past inflations) may have ended this hope in any case—even though the increases in steel prices have now been very sensibly withdrawn, as a result of the combination of public condemnation and administrative pressure which the President mobilised against them, and of the refusal of a minority of the companies to copy Mr Blough.

Equally, if not more, important, however, the basic difficulty of the steel companies remains. They wanted to push up their prices to push up their profits, so that they could afford to modernise their facilities and improve their competitive position—which are urgent present needs. The difficulty of the steel industry is the basic economic difficulty of the United States today; the problem of an economy which has suddenly slowed down, at least when compared with the expansion going on in other parts of the world. The simplest way to stimulate the economic growth that is needed, and the one which is advocated by the President's liberal friends and advisers, would be to step up government spending, even though this meant a substantial deficit in the Budget. But this would bring the risk—it is strongly argued by those whose views have so far prevailed—of a run on the dollar that would unbalance still further the already shaky international accounts of the United States. The danger of this may well have been lessened now that the President has shown, by dealing so swiftly and sharply with the steel industry, how determined he is to keep inflation under control.

The aberration of the steel industry has strengthened the case of those, both in the government and in Congress, who argue that the President is wrong to put his trust in businessmen and that he should take a more active hand in economic affairs. Maybe he should, and maybe he will have to if the economy does not soon pick up strongly from its present uncertainty. And if he does, he may even find that the effect on the balance of payments is not so calamitous after all; that a real spurt of economic growth is the reassurance which foreign investors need most.

President Kennedy has now silenced the critics who have been accusing him of not being a leader. But he is also a politician and this was an occasion on which his political interests and the national interest seemed to him to match. Part of his anger at the steel industry was inspired by his suspicion that its leaders were attempting to force him off the middle path which he follows both by principle and for political advantage. He is therefore not likely to change his course, whatever the jubilant liberals and the self-satisfied trade unionists may now be hoping. But it is not so sure that he will be able to continue the good relations with the business community for which he has worked so hard, somewhat against his own personal inclination. Last week steel companies momentarily did their best (or worst) to bring back to Washington the antagonism between business and government that has always in the past been associated with a Democrat in the White House. But the President is not vindictive or likely to let victory go to his head and many American businessmen—including some of those in steel, as was clear last week—have a vastly better understanding than Mr Blough has on the necessities of today.

Perils of Huffing

An American attempt to discuss Berlin in its context has had no help from Bonn

If the diplomats are left to build their house of cards in peace, the chances of constructing an agreement on Berlin look just a little better than they have been for a couple of years. Mr Rusk and Lord Home came home from the foreign ministers' meeting at Geneva on March 27th in a mood of optimism (however qualified) which the public record of their talks with Mr Gromyko left distinctly unaccountable. Since then, however, events have followed the mood. The Russians have ceased skylarking in the air corridors to Berlin; they also appear to have accepted the idea of international oversight of the access routes, even if they are still arguing as dourly as ever about how it should be applied. The Americans, for their part, have taken an equally distinct step forward. If the proposals that Mr Rusk had prepared for presentation to the Russian ambassador in Washington, Mr Dobrynin, have been correctly reported, the United States has now given up the idea that the Berlin crisis can be settled in isolation—an idea doggedly and fruitlessly pursued in the five meetings which the American ambassador in Moscow had with Mr Gromyko between January 2nd and March 7th.

Instead, it has been acknowledged that the western interest in keeping Berlin free is inextricably linked to the Russian interest in keeping certain other matters in central Europe the way they have been for the past seventeen years. This does not mean (though some west Germans will take it to mean) that the United States is prepared formally to recognise east Germany, kiss the ground along the Oder-Neisse line, and detach the west German army from its present degree of access to nuclear arms. It does mean, however, that the Americans have realised the need to make some gesture concerning the boundaries and state of armaments in the area if Berlin is to be left to sleep easily at nights. Mr Rusk's task, if his talk with Mr Dobrynin on Monday is followed by others, is to build up the limited selection of gestures available to him into a structure capable of supporting the continued freedom of Berlin.

Heaven knows this is a delicate enough operation, not to be hazarded by the huffing and puffing which, unfortunately, it has been getting from the sidelines. There is some obscurity about the circumstances in which the American proposals (which the Americans thought they had cleared with their principal allies in advance) came to be published in despatches from Bonn last Saturday, April 14th. The west German government claims that they were not given away by officials in Bonn, which may or may not turn on the definition of "officials." The haste with which Dr Adenauer, temporarily back home from his holiday on Lake Como, called a meeting of party leaders on April 13th to discuss Washington's intentions suggests that a good deal of apprehension had built up; and somewhere, apprehension blew a valve.

Whoever did it, it is clear that the result is to make Mr Rusk's task considerably harder. The proposals which the United States had circulated among its allies represented positions towards which Mr Rusk hoped to move in his talks with Mr Dobrynin, in return for appropriate Russian concessions (for instance, the withdrawal of the demand that allied troops get out of Berlin). Having been made public knowledge, the proposals may now be treated by the Russians as starting positions. Mr Dobrynin may have blandly thanked Mr Rusk for his kind offers, and asked how soon they could be put into practice. This was not at all what the Americans intended. The other danger is that, in order to calm the fears raised in west Germany by the disclosure, the Americans may feel obliged to explain that they are not really offering any concessions at all: whereas the real need is to convince the Russians that the concessions, modest as they are, are sufficient to justify Moscow's offering something concrete in return.

In the confusion caused by someone in Bonn on Friday the 13th, it is best to cling on to two essential points. The first is that the American proposals are, in fact, only a limited departure from the total immobility that has gripped western policy since Dr Adenauer's visit to Washington last November. The degree of recognition that would be extended to east Germany amounts to no more than the inclusion of its government in an international body charged with supervising the access routes over its own soil. Since east German officials have long handled all the civil traffic moving to and from Berlin, this hardly seems an intolerable addition.

The only blessing that would be bestowed upon the post-war border between Poland and Germany is that involved in a general east-west undertaking not to violate existing demarcation lines—an undertaking the west Germans have many times given already. The only move towards a limitation of armaments would be an undertaking by Russia and the United States not to let nuclear weapons pass into the control of nations that do not possess them now—and the west Germans claim to be satisfied with their present nuclear relationship with America.

The other point to be kept firmly in sight is that, unless Russian interests are met by some such moves as these, the harassment of Berlin will go inexorably on. The inter-allied arguments of the past year have made it clear that the west German government has no alternative policy for securing Berlin's freedom, unless to sit tight and hope that the worst will not happen is to be called a policy. But the Russians' tolerance of the present status of Berlin is connected with the allies' tolerance of the present state of things east of the Elbe, as one part of a house of cards leans on the other. If disapproving fingers are continually being poked at east Germany, or the Oder-Neisse line, Berlin is made to wobble.

Tortoise and Hare

French influence in Africa is reviving, freed of the Algerian curse. British policy still carries too much ballast

Britain started, but France has won, the postwar race to acquire merit by dropping colonies. By acknowledging Algeria's claim to independence and, momentously, by turning French guns against recalcitrant Frenchmen, General de Gaulle has both cured Africa of an intolerable ache in its head and cleared the way for a widespread reinforcement of French influence and prestige within the black world. France plodded steadily towards the post; the British hare, a trifle self-satisfied, is still having one of its periodic rests.

Nothing about British policy in Africa was changed on March 18th, when the French and the Algerian nationalists signed a cease-fire agreement at Evian. Yet, since that date, British actions in Africa have seemed worse to Africans and Asians simply because the French have stopped doing far more terrible things in Algeria. With Portugal, Britain can now be regarded as the only major (western) colonial power left. Britain's greatest remaining commitments, like Portugal's, lie in Africa's white-governed south: it is on this target that the wrath of the black man and, indeed, of the entire "anti-colonial" world will now be concentrated.

The effect is likely to be more than the mere laying of part of the blame for oppression in Angola and intrigue in the Congo at Britain's door. Petulant foot-stamping of this kind is generally unjust and best ignored. But its cause is Britain's genuine entanglement elsewhere. The central African federation is still a direct British responsibility; Northern Rhodesia and Nyasaland are colonies. Southern Rhodesia, it seems, is being made into a British colony by the United Nations. And, like it or not, South Africa and South West Africa are still associated with Britain in many minds. Dr Verwoerd has left the Commonwealth, it is true; but the British ambassador to the republic is also the man in charge of the British protectorates of Bechuanaland, Swaziland and Basutoland; and the current South Africa Bill, and the debates on it, have done much to advertise the value the British Government places on South Africa's contribution to the British economy. Reluctance to endanger this asset is understandable, fair enough, but the reasons for it are remembered every time there is a "soft" British vote at the United Nations on South West Africa, or on *apartheid*.

Yet General de Gaulle, no respecter of the United Nations, is getting away with a brand of power-politics no British Prime Minister would dare to contemplate. Since the Evian agreement, all good things have seemed to flow towards France. President Nasser, conscious, perhaps, of his need to woo France away from its understanding with Israel, was one of the first to say that the Algerian cease-fire opens up opportunities for new relations between France and Africa. What gesture is he likely to make towards Britain equivalent to his release of the French diplomats on trial on charges of espionage? President Sekou Touré of Guinea was quick to speak of a rapprochement between his own troubled country and France: and the Guineans were previously thought to be the most radical of them all.

Head of a Commonwealth?

Less surprisingly, President Leopold Senghor of Senegal proposed that new efforts should now be made to refashion the French community as a kind of French Commonwealth. With the support of President Houphouet-Boigny of the Ivory Coast, the proposal was taken up at the meeting of the twelve French African states of the "Brazzaville Group," held late in March at Bangui, capital of the Central African Republic. It was not universally well received, but there was praise from all for General de Gaulle, and the conference decided to set up a common market (it already runs "Air Afrique") and a flag for the "Afro-Malagasy Union." As a result of this conference there is still strong pressure for an annual meeting of the twelve presidents with President de Gaulle, after the manner of Commonwealth prime ministers. Far from the radical Casablanca group winning new adherents, it is Guinea and Mali, the outspoken members of the group, who seem to be gravitating in some degree back towards France.

One way of looking at the division between the "radicals" and the "reformers" in Africa is to judge their attitudes to the twelve of Bangui. Because of the reliance these countries are forced to place upon France—and because of Algeria—countries like Ghana and, until now, Guinea, Mali and Egypt have found it difficult to work with them. Countries like Nigeria and Sierra Leone have been able to work with the twelve in spite of Algeria. With the Algerian war removed, the whole picture is altered. At first sight, this change seems to be more in the direction of strengthening Franco-African ties than of crossing pan-African barriers; one reason is that the urge to associate with France is just as strong in Abidjan, Dakar and Niamey as it is in France.

This is not necessarily a culmination of what in some African capitals is referred to as the "wicked" policy of assimilation and "neo-colonialism" pursued by the French; it is simply recognition of the fact that most French-speaking African states have not the money, the resources, or the trained manpower to sustain genuine independence. France spends many times as much in Africa as Britain; admittedly much of this goes to French civil servants who repatriate their savings, or to highly-priced French consumer goods. Even so, Niger, for example, would be nowhere without direct French subventions to its budget; it would not necessarily be better off if it insisted on the highest commands in its army being transferred from French officers to Niger men.

This kind of reliance on France is likely to continue as long as unlikely countries like Niger do not join up in larger, more viable federations. Yet the richer French-speaking Africans

(currently headed by Francophile presidents) are unwilling to take their poorer compatriots on. The Ivory Coast, Gabon, and Senegal, well-off and pro-French, help to keep "French" Africa French. As for the others, they have seen, from Guinea's shocking experience, what it is like to sell oneself to the Russians and all other comers. Strong feelings against the French presence are, however, expressed by the militant educated young in most French African capitals. French influence will last if these men (the most articulate of whom are still largely Paris-educated) are assimilated in turn; it may, however, come to a sticky end if pressure from the hungry followers of these new black intellectuals piles up too strongly to control.

WHERE, in these circumstances, does the British interest lie? The first priority must be to get out of the embarrassments in central and south Africa. Further, Britain must be prepared to meet calls for larger amounts of aid to Africa: it is not even a close second to France at the moment. Nigeria, one of Britain's best pieces of work in Africa, has launched a six-year plan that will cost £676 million, half to be raised externally. America is providing £80 million; Britain £5 million, so far. This plan might well be an incentive to Nigeria to look at the advantages of associating with the European common market. The Nigerians are in deep need of whatever they can get from the community's development bank. Tempting "English" Africa into the nexus of the common market must be one of the main aims of British policy now.

The reason is plain: it is no use attempting at this late stage to compete with France for an old-fashioned extension of power and influence throughout Africa; there can be no wish to do so. Nor is it sensible to look at policy as just a popularity contest before the panel of Africans. Rather, working within the common market and with whatever African associates decide to join, the aim must be to broaden the base of the French-speaking African economies and to promote the kind of unity that would enable them to approach a more real independence. This would work in the best interests of the Commonwealth Africans by getting them inside tariff barriers which would be damaging to them if they were outside. Britain's aim must be to break down divisions. It is time for the hare to wake up.

Expatriatism Is Not Enough

The old escape to the tropics and a life of masterful ease is all but closed to anybody lacking specialised training

MUCH play has lately been made with the need to give young people in Britain an ideal to live up to such as has already been given, in popular estimation, to young Americans by the Peace Corps. Sometimes the recruits proposed are of the Peace Corps type; sometimes most definitely not. To judge from some recent letters to newspapers it remains fixed in the minds of many earnest Englishmen that loose ends can still be tidily tucked away, misfits fitted and misanthropes made philanthropes by being packed off, unqualified, unprepared and often uneager, to the "black countries" of the tropics (where Rhodes, a squeaky-voiced intellectual, was made into a Man). To them, the obvious candidates for the underdeveloped countries are jobless young delinquents and anti-nuclear demonstrators.

It is all in vain. The new countries are no longer the hunting grounds of either outrageous maladjustment or earnest do-gooding. They do, indeed, need people from Britain—as is made clear by a report* recently published by Oversea Service, a non-profit-making body (originally run with the help of a Government grant, but now financed by business houses' contributions and private donations) which is working energetically in this field. But they rightly resent the imputation that anyone's cast-offs are good enough for them.

The report from Oversea Service reveals, not unexpectedly, that the leading need in the new countries (and it is a desperate one) is for technical expertise of a high order—and this is a commodity in as small a surplus in Britain as anywhere else. The largest number of jobs on offer are in education, followed closely by science and technology, medicine, agriculture and, quite a long way down, management and administration. As far as it can be estimated, the number of vacancies waiting to be filled by highly qualified people approaches 9,000 at any one time: and this would be actual demand which, being dictated partly by financial possibility, is clearly less than the real need.

THE real need is not being met from Britain, and it is a terribly difficult task to enable it to be. Most people who would like to go to an overseas country feel that way because the market for their generalised skills is overcrowded and not often overpaid in Britain; but the technically-apt, towards whom most overseas vacancy advertisements are directed, are seldom interested in anything that would remove them from the rewards of the affluent society. Even when they are interested, however, considerations of the shape and continuity of their careers may deter them: most new countries will not, in general, offer career posts to expatriates, since the short contract system is cheaper (especially where single, definite

* An Inquiry into Recruitment in the United Kingdom of Personnel for Posts in Developing Countries. Oversea Service: London, January, 1962.

projects are contemplated); politically more acceptable (as the process of "indigenisation," which has narrowed managerial opportunities, is now being steadily extended to technical posts also); and, in the long run, more useful (in opening to young natives the posts for which they are trained by the contracted expatriates).

Some mitigation of the physical shortage of trained people will no doubt be achieved by the newly-established Council for Technical Education and Training for Overseas Countries, set up by the Department of Technical Co-operation. But the idea still has to be driven home (particularly to British employers) that a period of work overseas is an excellent thing for the minds and purses of developing young Englishmen. Once that attitude is established, the system best suited both to the countries in question and to British employers could follow: willing secondment, for short periods, of trained people. (The joint Anglo-American scheme to second 150 teachers to the East African Territories might be followed elsewhere and in other fields; doctors specialising in mass tropical diseases, for instance, are needed in West Africa.)

Oversea Service has, in recent years, done much to overcome the reluctance of young people to accept overseas posts. But the degree of public education which is necessary is beyond the scope of a voluntary organisation. Some new step by the Government is now required. The best such step might be the formation of a liaising body which could act as a detailed, rather than a general, clearing house for vacancies and applications as well as information. It could well take over some of the functions of the multitude of recruiting organisations which at present act independently of each other, not always with the greatest efficiency or success. A step further might be the foundation of a Commonwealth Service, with its servants drawn from the whole Commonwealth, which would be an international pool of secondable skill and experience available for tapping by any Commonwealth country: the Department of Technical Co-operation (which has just published, in "Technical Co-operation"—Cmnd. 1698—a useful exposition of its function and purpose) does not fill this bill, since it is intended to be the midwife to, rather than the begetter of, aid schemes.

BUT even with an ideal broker, marrying mutually compatible candidates and vacancies, there would remain an enormous number of enthusiastic, humane, energetic and skilled young people who could not be directed into any acceptable salaried post. Some, at least, would be willing enough to pursue for a time not particularly rewarding jobs, for their keep alone, for the sake of their immortal souls. They need not all be frustrated: several organisations exist to channel their efforts into places where they will do the most good. Many are teachers: and there has been an overwhelming response from them for vacation posts to do teacher-training in Nigeria, but hardly any—only 13 for 400 posts—have answered the Government's efforts to recruit for overseas education authorities under the pledge given at the Commonwealth Education Conference in 1959.

One of these bodies, Voluntary Service Overseas, specialises in sending unqualified young people, mainly school leavers, to Commonwealth countries where their willingness and toughness alone are valuable: it was founded in 1958 and has so far despatched 322 volunteers to projects in most of the ex-colonial territories. It is now engaged on the training of 100 sixth-formers at Sevenoaks for work overseas from September: most of them are 18 and due to go to universities in 1963, and until then they would rather be doing a useful service (overseas governments want more of them than VSO can provide) than bowing to the cake at Queen Charlotte's Ball. Another is International Voluntary Service, the British branch of *Service Civil International*, which has begun to make use of unqualified volunteers, many in Britain—where last year 30 welfare projects were undertaken, such as the construction of a fresh water supply to remote crofts, or the redecoration of pensioners' homes. Recently discussions have taken place, to seek some sort of co-ordinating mechanism for all their efforts, between representatives of all these organisations, the Department of Technical Education and, catalytically, the Overseas Development Institute (which is jointly financed, in roughly equal proportions by the Ford Foundation and the private contributions of British industry and business, and has found the need for a selective clearing house at the heart of the development problems, which it was set up to study, focus and publicise). Another development, different in kind and tiny as yet, is the "Scheme for Service" planned by some Birmingham students, whereby training communities in this country would prepare for voluntary service at no cost to anyone but themselves.

All this is sensibly far removed from the past. It is indeed the difference between parasitism and symbiosis for, if the old colonial system taught the turbulent young how to govern and how to get the most out of "their" people, these voluntary excursions have the great merits of teaching them a proper humility and how to get the best out of themselves. They deserve support.

British Peace Corps

The following is a representative, not an exhaustive, list of organisations assisting overseas service:

The Department of Technical Co-operation, Carlton House Terrace, London, SW1. (Government department: liaison, information, some recruiting.)

Oversea Service, 2 Eaton Gate, London, SW1. (Voluntary organisation: training, liaison, recruiting.)

International Voluntary Service, 72 Oakley Square, London, NW1. (Voluntary organisation: training, promotion of voluntary welfare schemes.)

Voluntary Service Overseas, The Royal Commonwealth Society, 18 Northumberland Avenue, London, WC2. (Voluntary organisation: training and dispatching volunteers, generally school-leavers aged 18 or 19.)

United Nations Association of Great Britain and Northern Ireland, 25 Charles Street, London, W1. (Voluntary organisation: liaison and dispatch of volunteers.)

Scheme for Service, 156 Oaktree Lane, Birmingham 30. (Voluntary organisation: training and preparation of new graduates in self-supporting volunteer communities.)

Among the many religious bodies which operate schemes for voluntary aid, the World Council of Churches is important: its British branch is:

British Council of Churches, 10 Eaton Gate, London, SW1.

All the voluntary organisations are urgently in need of money.

NOTES OF THE WEEK

EUROPE

Discord

GENERAL DE GAULLE'S design for the political organisation of a western European group of states has been in circulation for nearly three years. That time has seen a really fairly steady drift towards a general acceptance of his idea of how to do it, for all the cries of "never, never" that have been heard from time to time. Tuesday's meeting of the six foreign ministers in Paris saw a hitch. It would be hasty to assume that the setback is decisive; but it will have repercussions.

For a fortnight before this meeting the statesmen had been busy bridge-building. General de Gaulle had seen Signor Fanfani, who in turn had seen Dr Adenauer. Their talks produced agreement if not about the realities to be pursued, at least about forms of words to be used in pursuing them. But the objections of Belgium and Holland, two relatively small countries interested in western European federation but not in the position of satellites to a Paris-Bonn axis, remained alive. On Tuesday they dug in their heels and the ministers parted for once in open disagreement, leaving the next move in doubt.

If a new element has to be looked for to account for this failure, it is hard not to look for it in Mr Heath's unpublished speech to the ministers of Western European Union a week before. Mr Heath did not complain of the French-German-Italian arrangements; but he did indicate a British interest in being brought into these political talks soon. It must be this that decided the Dutch and Belgians to be positive in their refusal to be hurried into a political treaty. And Mr Spaak's dissent was fortified by dislike of France's attitude to Nato.

CHINA

Let Fifty Flowers

PEKINOLOGY is the murkiest of arts, and it takes something like extra-sensory perception to glean much about Chinese policy from the session of the National People's Congress which ended on Monday. By Wednesday the three-week secret meeting had yielded to public gaze little more than a summary of the speech Mr Chou En-lai made at its beginning. For what this limited evidence is worth, it confirms that food shortage has obliged China's leaders to change their order of economic priorities radically. Mr Chou said that the cutting down of capital investment would go on this year, and that inventories would be reduced. He explained that industrial workers who came from the farms would be persuaded to go back to them; and he mentioned light and heavy industry in that order (which is the kind of clue that Pekinologists have to fall back on). Since it has now been admitted that the hardships of the past three years have not been due solely to bad weather, but also to the inflexibility of the planners, Mr Chou also promised a return to the policy of letting a hundred flowers, that is, different points of view, "blossom and contend together."

This looks like at least a partial victory for the faction in Peking which wants to slow down the pace of industrialisation, turn some resources back to agriculture, and keep people happy with more food and consumer goods; and thus, by extension, a victory for Mr Khrushchev, who has the same ideas. The arrival in Peking on April 13th of Mr Patolichev, the Russian trade minister, at the head of a delegation presumably charged with repairing the battered economic relationship between the two countries, suggests that Mr Khrushchev is willing to exchange olive branches.

But there is no evidence that China is ready to capitulate unconditionally in its differences with Russia. The Chinese, unlike Mr Khrushchev, still insist on being publicly beastly to Mr Kennedy (Mr Chou spoke of his "peace tricks") and sweet to the Albanians: on the day the Russian trade team got to Peking, a delegation of the Albanian Society for the Promotion of the Army and Defence was being told by its hosts that Albania was a "glorious giant" of the socialist camp.

UN AND RHODESIA

Four and Six

LORD HOME and Messrs Butler, Maudling and Sandys formed an impressive quartet in close harmony—the Colonial Secretary seeming a little low-keyed—during last week's talks with the six United Nations emissaries to London. The occasion had its odd side. The Government contends that it will not allow UN recommendations to influence its colonial policies (the Foreign Secretary restated this flatly in the Lords on April 5th), and that in any case it cannot interfere in Southern Rhodesia's internal affairs. To put up four Cabinet ministers to inform Mr Jha and his colleagues of these simple doctrines may seem rather excessive—or rather intelligent.

The envoys from the Assembly's special committee on decolonisation matched their hosts with contrapuntal courtesy. They were conscious of the importance of the experiment in collective UN diplomacy that their mission represents, and behaved accordingly. They were more concerned to emphasise British responsibilities than to trespass on them. They argued that Britain shares with its fellow members of the UN a common interest in averting the serious danger that is liable to arise from the imposition in the colony of a new constitution that the African majority rejects. They dwelt on British democratic patterns. They noted that, at least by convention, the Government takes no initiatives in Salisbury politics; but they expressed a general belief that British influence there was strong enough to bring about the revision of a constitution which, they pointed out, had required endorsement in London in order to take effect. (The very existence of the Rhodesian federal government was, it appears, passed over in discreet silence on both sides.) They appealed to their hosts to ponder these matters.

But last week's London consultations were by no means the end of the UN season for Southern Rhodesia. A draft resolution still before the committee of seventeen calls for the abrogation of the colony's 1961 constitution and its emergence as an independent African state within a year. The committee may ask the General Assembly to consider Southern Rhodesia either at its regular session, beginning in September, or during June, when the assembly will be resuming its meetings in another connection. What course is actually taken in committee or assembly will largely depend on whether the Government, after due pondering, contrives to modify the position it has just restated so firmly.

BUDGET DEBATE

Four Voices

FOUR further speeches from the Treasury front bench last week did not throw very much more light on the Government's economic policy, but they did reveal something about the *mélange* of ministerial influences which have helped to form it. The most firmly anti-reflationary speech came from the President of the Board of Trade:

> A rise in output generated by expanding exports leads to higher productivity and lower unit costs. These in turn encourage further exports. . . . On the other hand, a growth which depends wholly on an artificial stimulus to home demand . . . and which is not accompanied by a rise in exports, contributes nothing to the sound growth of the economy. It only creates inflation. . . .

Most people may feel a little puzzled at this idea that if two motor cars are passing

down the same production line, one in response to an "artificial" stimulus to demand and the other to a different sort of stimulus, the former will somehow have a different effect on unit costs to the first. But it is an idea that is deeply embedded in one section of the present Government's economic thinking just now.

On the opposite—or more expansionist—side of the Government's battle line, stood Sir Edward Boyle, the Financial Secretary to the Treasury. Sir Edward is still hoping that automatic factors will "bring about a considerable rate of expansion during the next twelve months"; if not, he said, the Chancellor could always "stimulate the home economy" by using the indirect tax regulator or "he can also relax the present degree of restraint of monetary policy as well." But Sir Edward did not really dissent when Mr Ginsburg complained that the Chancellor's similar prognostications of expansion pressing on last July had proved "utter nonsense" in the event. Advocates of growth would probably not have so very much to complain about if the rest of the Government's economic thinking did manage to get back on the Boyle.

Mr Barber, the Economic Secretary to the Treasury, played straight down the middle of the official line. Mr Selwyn Lloyd himself, in his second appearance, leant perhaps a little more Boyle-wards. "I will watch the situation carefully and will not hesitate to relax if need be, if that is wanted and it is adjudged right." One's guess and hope is that later this year, out of pure boredom if for no other reason, the Government may in fact edge into a more re-expansionary policy; and there is nothing in the present state of the economy to suggest that the growth of exports will be in any way less rapid after domestic re-expansion has started than before it. But the best comment on this budget came from Mr Roy Jenkins (Labour), who compared it to Lord Amory's "excessively cautious" budget of 1958:

> I have no doubt at all that between 1958 and 1959 we lost a year [although] we could have expanded more safely in 1958 than in 1959.

For 1958 and 1959, read 1962 and 1963?

PARLIAMENT

Whose Happy Easter?

PARLIAMENT has adjourned this week for the Easter recess with the Government's legislative programme reasonably well advanced. Bills which have already received the royal assent include the Immigration Bill, the Army Bill, the Criminal Justice Bill, the Export Credits Bill, and the Education Bill. Constitutional legislation affecting Southern Rhodesia, Tanganyika, and the West Indies has also reached the statute book. The South Africa Bill is through the Commons and since it is due to come into operation on May 31 will presumably by then have received the royal asset. The Road Traffic Bill has been through the Lords and is waiting for its committee stage in the Commons. The Transport Bill should have passed from the Commons to the Lords by Easter. The Scottish Housing Bill is in the Lords, and the Scottish Licensing Bill has had its second reading in the Commons having been through all stages in the Lords. The Sea Fish Bill is half through its report stage in the Commons and the Health Visitors Bill is also there waiting for report. The Pipelines Bill has been held up in the Lords. The Tories think it gives too sweeping powers of compulsory purchase, and the Labour peers think it does not go far enough. The Weights and Measures Bill has never appeared at all.

This fairly rapid progress has been due partly to the wise Government decision not to overload the legislative programme as heavily as in the last session, and partly to the equally wise decision of the Opposition not to carry out their threat of all-out obstruction to Government measures. The use of the guillotine on the Transport Bill has also helped, and did not lead to the Labour explosion which had been prophesied. Credit should also go to Mr Macleod, who is proving a more efficient Leader of the House than has so far been generally recognised. In Parliament, as distinct from in the country, things have gone better for the Government in the second than in the first part of the session. The revolt of the right over Northern Rhodesia's constitution proved to be a fiasco, and so far the common market negotiations have produced only a mildly worded warning motion. The real battle there is presumably still to come. Mr Macmillan has had his usual ups and downs; and Mr Butler, by becoming responsible for Central Africa, has had a very definite up. The session has also been good for Mr Gaitskell, who has continued to keep his left wing in check. For Mr Grimond—with his volume of parliamentary support increased from six to seven—this pre-Easter quarter has naturally been the happiest time of all.

FRANCE

Expedient Bullets?

GENERAL DE GAULLE must now, or soon, make the difficult decision what to do about General Jouhaud. The rebel leader was very properly condemned to death on Friday, April 13th, for his part in the murderous and treasonable campaigns of the Secret Army; but the date may prove to have been unlucky for more than him if the French President, pondering whether or not to exercise his prerogative of mercy, decides wrongly. Here is a prisoner who can be said to have earned the firing squad if any honest man ever did. But the French President has to decide whether or not it is expedient that this one man should die for the sake of the country.

In favour of his death it can be urged that the French government has never shown itself sufficiently ready to discipline its mutineers. This leniency has been one of the factors causing many Frenchmen to think it both safe and respectable to conspire. Furthermore, General Jouhaud has admitted his responsibility for the assassinations carried out under his command: unless he is shot it will be difficult to execute the actual perpetrators of the crimes. The Algerian nationalists may well need some reassurance that the French are doing all they can to stamp out the Secret Army and implement the Evian agreements. A bloody stroke might convince the Europeans of Algeria that they have nothing to gain by continuing their struggle.

But it might also make them afraid to stop. It might furnish them with a martyr. Above all, France and Algeria now need reconciliation, and an exemplary act of mercy might do something to produce the climate of calm and reassurance without which reconciliation is impossible. If, on grounds of expediency, General de Gaulle does decide to be merciful (and it is strangely distasteful, as well as difficult, to envisage him in the role of a Robespierre) he can take comfort from various subordinate considerations. His Algerian-born prisoner was, after all, acting from a misguided patriotism. To execute a Secret Army terrorist would be out of tune at a time when so many Arab nationalist terrorists are being released. General Jouhaud is himself the subordinate of the real culprit, General Salan, who may never be captured. Capital punishment is a dangerous weapon in politics, and as ineffective as a deterrent to this sort of violent crime as to any other.

SYRIA

Once More with Feeling

OUT of the cooler and back to the presidential chair, Dr Kudsi has Syria's fate on his hands again. During his three weeks' detention by the mixed-up military men he countered their pleas for his comeback by insisting that it be constitutional. And this, by a near shave, it is. The deputies who elected him have resigned in a heap, entrusting him to form a government; new elections, it is thought, should follow in a few months' time.

Dr Kudsi reappears with a slightly leftward bearing. To judge by his broadcast to the nation on April 14th, he is going to tackle the abuses that, according to the professions of the military, impelled them to throw the politicians out on March 28th. Corruption is one; another, the misapplication of the confused agrarian laws. He promises a new constitution, a referendum on Arab unity, and elections to be fought on real issues in contrast to the passionless polling of last December, when persons, not policies, were voted for. The Syrians, in brief, are being asked to go back on their tracks to the time when they broke from Egypt and then pace them out again. No

doubt they will do so with feeling if given the chance. The dominant internal issues of land reform and nationalisation should really be put to the country, although it would be wrong to couple them in a doctrinaire left-right contest. Land reform is vital to Syria; nationalisation is a good deal less than vital. What is more difficult to envisage is this voting on Arab unity; the more Arab unity is talked of, the further it gets from the ground. As a subject of referendum it has acquired new facets since the Homs conference of the army factions on April 1st sought a plain poll on union with Egypt. The last word, Dr Kudsi's, is that Syria will seek only such unity as will guarantee its "dignity and entity and ensure . . . its power of attraction for other Arab countries."

APPRENTICES

Too Little, Too Late

An inquiry carried out by the Engineering Employers' Federation revealed that the number of craft apprentices employed in engineering has risen by only 3 per cent, to some 75,000, since 1958. This is disgraceful. It might be encouraging to note that there are more junior than senior apprentices, were it not for the wastage rate which shows that many of the boys will never finish their time. (This wastage rate opens up many questions. What incentives are being given? How much care is taken to see that the right boys are taken on as apprentices? What is being done to counter the feeling of some trainees that they are simply wasting their time?) Slightly less discouraging is the increase of nearly 20 per cent in the number of "technician apprentices" training for more highly skilled work, from whom some educational qualifications are demanded. But this increase brings the total number of such young technicians up to a mere 7,178 young men: and only 379 firms (out of the federation's 4,500 members) employ people in this grade at all. Ten fewer firms had training schools in the works to give instruction to their apprentices. Girl apprentices were employed by only 39 of the federation's firms, so that a mere 119 girls were receiving apprentice training—although women make up a growing proportion of the industry's labour force. It must have taken some guts for the federation's leaders to publish such a condemnation of their own members.

For Britain as a whole the record may not be quite as dreadful. Some firms outside the federation are known to do better than most of their federated rivals. In some of the most go-ahead industries trainees cannot be classified as apprentices, since the old trades for which the five-year training period is demanded have no relevance to the newest technologies: girls training for useful skilled jobs such as draughtswomen, typists, comptometer operators and so on are outside the survey. And it is encouraging to see that 70 per cent of apprentices were being released during working hours for study outside the plant. (But the federation did not even ask about full-time release for study.)

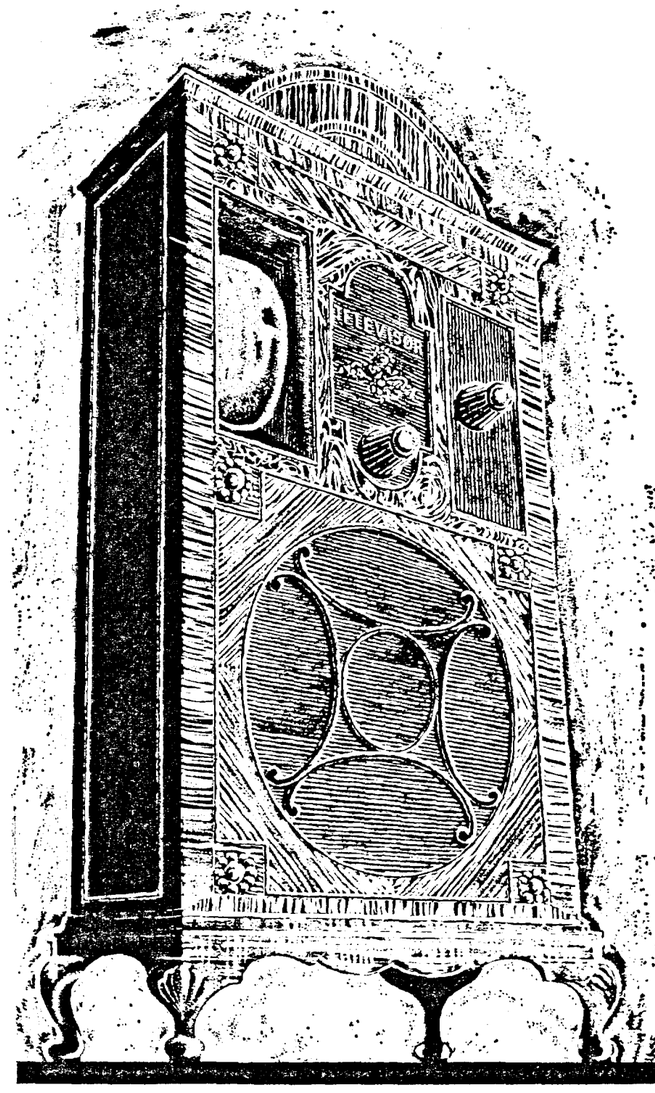
The truth of the matter is that the hidebound five-year apprenticeship "sitting by Nelly" is totally out of date. No doubt trade union restrictions bear a lot of the blame for this, but by no means all; if employers were to approach the unions with entirely new plans, they might meet a warmer welcome than they seem to expect. The unions in the building industry, for example, have welcomed the idea of shortening the period from five to four years. But firms are still afraid that the money they spend on training apprentices will in the long run only benefit other firms who do no training, but spend the money on poaching skilled labour from their rivals. This attitude has become particularly prevalent in the less prosperous regions, from which so many skilled young people have in the past found their way to London or to Birmingham; the result of the attitude is that declining areas are likely in future to decline faster still. The case for government action to promote the training of many more young workers is proved—and urgent.

NUCLEAR DISARMERS

Interests of State

The Court of Appeal, having dismissed the appeal of the members of the Committee of 100 against the sentences of imprisonment passed on them for their demonstration at Wethersfield airfield in December, is clearly correct to allow a further appeal to the House of Lords on the ground that the case involves a point of law of general public importance. The Official Secrets Act of 1911 declares it to be an offence "if any person for any purpose prejudicial to the safety or interests of the State . . . enters any prohibited place within the meaning of the act." This was the section under which the accused were convicted.

Wethersfield airfield is obviously a "prohibited" place within the meaning of the act and there was no dispute that the accused intended to enter the airfield and obstruct aircraft which they suspected of carrying nuclear weapons. The defence put forward three main arguments. First, it was said that the operation of the act was confined to those engaged in spying. The act contains no express words to this effect and the court held that they could not be implied. The second and more important submission was that it had to be shown that the persons entering the prohibited place did so with an intent to prejudice the safety and interests of the State. Under common law the intent and the act must both concur to constitute the crime—but this has not always been applied to statutory offences. The court held that a guilty intent could be treated as essential only if the statute expressly required it. In the past a body of judicial opinion has taken the opposite view, holding that a guilty intent is required for a statutory offence unless expressly excluded. The court's decision gives



The Economist

APRIL 19, 1862

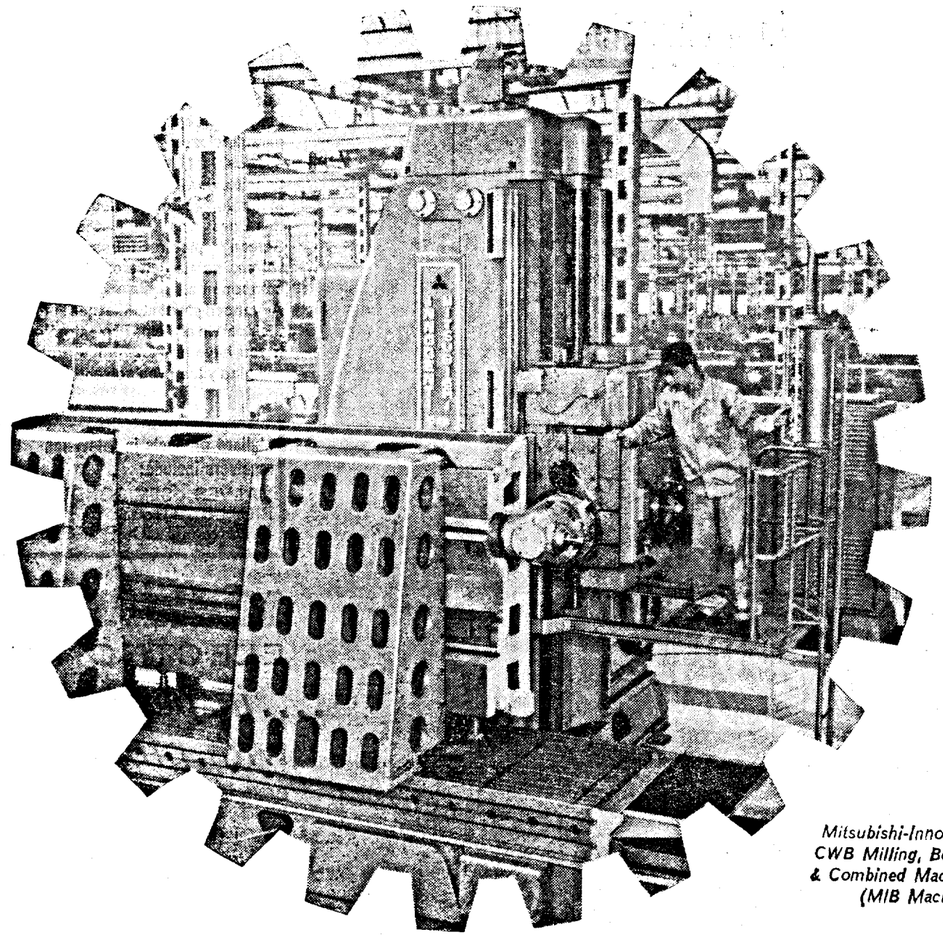
IMMOBILITY OF LABOUR

One of the chief difficulties in the way of rectifying many of our social mischiefs and anomalies arises from the want of pliability and flexibility—the deficient faculty of accommodation to new circumstances—which belongs to a low state of intelligence and education. . . . Many years ago there was great distress in Buckinghamshire owing to the superabundance of labour. At the same time there was considerable embarrassment in Lancashire owing to the deficiency of labour. Workpeople were a positive burden to the one county, and a positive want in the other. The wages of a family were ten shillings a week near Aylesbury; they were thirty shillings a week near Manchester. The parish authorities in the South and the manufacturers in the North were about equally willing to pay the expenses of removal for some hundreds of actual or prospective paupers. Yet nothing was found more difficult in practice than to negotiate and effect the transfer. The labourers were boorish and untrained. They did not know how to realise the new life proposed to them, nor how to *adapt* themselves to it when they had entered on it. They dreaded a journey of 200 miles as if it were exile to the antipodes. They shrank from the idea of a new occupation, new neighbours, an unknown climate, and unknown surrounds. They went, indeed, but they went after much persuasion and in small numbers; and many of them returned after a short sojourn, from simple inability to accommodate themselves to work and food and a way of life to which they had never been accustomed. Something of the same incapacity and inertia is operating now to prevent that equalisation of wages and population in several districts which would be a common gain to all. In spite of national schools, in spite of cheap newspapers, in spite of penetrating railways, in spite of spreading habits of locomotion, the wages of a Dorsetshire labourer are still nine shillings a week, while those of a Yorkshire or Lancashire artisan are fifteen and twenty; yet labourers do not flow from one place to the other as they should do; and in busy and prosperous times, manufacturers entertain more sanguine hopes of being able to arrest the stream of German emigration as it crosses the country to America, than of attracting their own ill-paid and redundant fellow-citizens to a distance of twelve hours from their old homes.

in a changing world

It may be very amusing to recall that people once viewed television on sets like this. Yet, by 1962 standards, even the set of five years ago is obsolete.
Today's television receiver, with its bigger screen, its brighter and incomparably clearer picture, and its beautiful slim cabinet, has brought new proportions to viewing.
Mullard have contributed a great deal to this progress with their "Radiant Screen" picture tubes, Frame Grid valves, semiconductors and magnetic components.
Advanced products like these are playing their part in all fields of electronics today.
If you have an electronics problem, we will gladly help you solve it.

Mullard products in television receivers include:
VALVES · SEMICONDUCTORS
PICTURE TUBES
MAGNETIC COMPONENTS



Mullard
ELECTRONICS
....in partnership with progress

ELECTRONIC VALVES AND TUBES
MAGNETIC COMPONENTS
TRANSISTORS AND OTHER SEMICONDUCTOR DEVICES

Mitsubishi-Innocenti CWB Milling, Boring & Combined Machine (MIB Machine)

Top Shipbuilder Makes Top Quality Machine Tools

The MIB Machine is one of the world's most superior large-sized machine tools. This machine can do various types of machining without changing the setting and is capable of completing many precision processes with ease. As a result of a technical agreement concluded in 1960 with Innocenti S.G., Ltd. of Italy, Mitsubishi Zosen has world-wide (excluding Italy) rights for the manufacture and distribution of the universally known MIB Machine. So far we have completed 18 units, including those exported, and 45 units are now in the manufacturing stage with orders for more steadily on the increase.
According to the British periodical "Shipbuilding & Shipping Record" Mitsubishi Zosen, in 1961, again placed first among the world's shipbuilding firms with a total of 246,606 tons actually launched. Ships are a complex of precision machinery which demand a far higher degree of safety than machinery used on land. Mitsubishi Zosen makes a wide variety of land machinery, such as power machinery and plants, iron and steel manufacturing machinery, chemical machinery and plants, loading and unloading machinery and machine tools. Mitsubishi Zosen's superior technology and most modernized facilities, which made it the world's leading shipbuilder, guarantee high quality and reliability in all its products.

"purpose" in the act a very narrow interpretation. It limits it to the physical act which was the purpose of entry and excludes the intent with which the act was to be performed.

The third argument by the defence was that it had to be shown that the purpose for which entry was to be effected was in fact prejudicial to the safety or interests of the state. On this point the court held that these matters pertain to the prerogative of the crown—and once evidence has been given on behalf of the crown saying that the safety of the state has been prejudiced, such evidence cannot be challenged. On the face of it, all this makes the Official Secrets Act into a pretty sweeping measure affecting the liberty of the subject; there are clearly vital questions here which it is right that the House of Lords should consider.

Divided Battalions

THE Aldermaston-London march is an Easter rite; for some marchers it even has a Christian significance. It also happens to be one of the few remaining occasions on which the nuclear disarmament sects can make common cause. Three major divisions are currently visible among those who will be thronging into central London this weekend: (1) Canon Collins and the bulk of the Campaign for Nuclear Disarmament still hold firmly aloof from the civil disobedience of Lord Russell and the Committee of 100. The persistent (and commendable) multilateralist tendencies of the CND have not exactly endeared it to a number of zealots; they merely find it convenient to proselytise among the big battalions. (2) Certain activists are now moving towards industrial action against the bomb; this is already rousing trade union hackles. Another group has just launched an independent committee to put up candidates at by-elections and general elections. Their jump on the hustings will not please the Canon (who had meant to leave the issue to CND's annual conference). Nor will it please the cannier heads who have seen that the electoral test merely reveals CND's weakness: the last example was a poll of 500 for the Independent Labour Party (and unilateralist) candidate at the Bridgeton by-election last November, where a staunch Gaitskellite walked away with an old ILP seat.

(3) The frankly neutralist element is increasingly showing its colours. Placards in a London demonstration last weekend declared: "For a neutral Britain." If this segment—or the "fight by-elections" segment—has its way, sympathisers like Mr Frank Cousins are likely to find themselves on the spot. So far they have been noticeably reluctant to admit whether their antipathy to the bomb extends to Nato as an institution. This Easter's marchers have plenty to mull over. A movement that sprouts breakaway shoots in such conflicting profusion, but all claiming to be in full sympathy with its aims, could do with a weekend's introspection.

JUGOSLAVIA

Djilas Again

AFTER fifteen months at liberty, Mr Milovan Djilas finds himself in prison again. He was arrested, without explanation, on April 7th; five days later an official spokesman stated that he had broken the conditions under which he had been released on parole in January, 1961, because he had "provided material for articles published abroad which served an anti-Jugoslav campaign." The reference is understood to be to Mr Djilas's latest book, "Conversations with Stalin," which he had sent to the United States for publication. Mr Jovanovich, Mr Djilas's American publisher, flew to Belgrade last week with an offer to stop the publication of the book if Mr Djilas were set at liberty. But the Jugoslav government has refused to bargain over Mr Djilas's release.

"Conversations with Stalin" describes, from the inside, the background to Jugoslav-Soviet relations during the later stages of the war and up to 1948. According to Mr Jovanovich, it is a contribution more to history than to politics, and there is nothing in it to harm the present Jugoslav government. This claim may well be true, although without a knowledge of the whole book one obviously cannot judge whether or not Mr Djilas has broken his promise not to engage in any political activity contrary to the law or injurious to the state. What in fact the Jugoslav authorities really seem to object to is that Mr Djilas should have insisted, contrary to their express wishes, on publishing in a foreign country a book based on material gained when he was a senior member of the government.

Clearly, however, what are really important in this case are not so much the details of what Mr Djilas wrote or promised, but the personalities and emotions involved. If Mr Djilas were a prudent man, he would not now be back in prison; but he is above all a political animal and an individualist who apparently finds it as necessary to stick his neck out as to eat and sleep. On the other hand, the extraordinary course of his relations with the present Jugoslav leaders —from their closest friend and colleague to their bitterest critic—makes it peculiarly difficult for them to deal with him objectively. Mr Djilas in fact can either get away with a great deal, or with nothing at all; at the moment, it seems to be the latter. These considerations help to explain the latest twist in the Djilas affair; they do not necessarily suggest it is being handled either wisely or judiciously.

WEST INDIES

Bleak Busta

JAMAICA, Cuba's offshore island, will march to independence on August 6th fully committed to retaining the Queen as head of state and guarding the beaches against communism. Sir Alexander Bustamante's government has also promised a defence treaty with the United States. "Busta" was voted in by the hearts of Jamaica's many desperate poor on April 11th; his more thoughtful cousin, Mr Norman Manley, lost the election as he lost last year's referendum on keeping the West Indies federation going. Mr Manley's appeal was to the thinkers and the planners: but they have not been able to bring Jamaica far enough out of its poverty. Relieved of financial involvement with the even poorer other islands of the West Indies, Sir Alexander has now to find ways of raising his people's standard of living and reducing Jamaica's dependence on outside economic assistance. These would constitute the only effective barricades against some form of Castroism.

Similar problems face the other British West Indian Islands; and they are likely to be made easier to solve if some new kind of unity can be forged. Two conferences in London in May are to decide on independence for Trinidad and a possible separate federation of the remaining "little eight"; a more attractive idea is attaching the small islands to the unitary state of Trinidad. Many of these small islands are saved from being ruled by county councils only by the water that separates them. Mistakes have been made because of hasty decisions on the West Indies taken by past Colonial Secretaries; Mr Maudling would do well to go for a good solution rather than an early one. Whatever happens, Britain will be called on to give more aid to all the islands; the Immigration Bill presents the West Indians with an argument in favour of this. Mr Maudling hopes to salvage some kind of common services organisation. He might also usefully point out to the islanders the advantages of looking to a much wider future association in the Caribbean, linked at least as closely to North America as to Britain.

Europe's Missing Link

WHILE the problem of the Commonwealth and common market continues to excite debate in London, in Brussels the deputy heads of the seven negotiating teams have been calmly (before the storm ?) drafting a report on the progress of the negotiations so far. The report, which was submitted to the ministers on April 14th, charts the ground, and the areas of agreement and disagreement, covered so far. It does not present complete solutions to the ministers ; these will have to be fought out between the delegations in the phase of hard bargaining that lies ahead. All the same, through the technical obscurities it is possible to make out the shadowy outline of what will emerge when the real bargaining gets going.

Since November, when the negotiators got down to business, the Commonwealth problem has been gradually broken up into five main sections:

(1) The impact of the common tariff on exports of **manufactures** from **developed Commonwealth countries** (Canada, Australia, New Zealand) has been studied by a working party which began work in November. These exports are minute in scale, a mere 1 per cent of British imports from the Commonwealth, and it seems likely that no specific reductions in the common tariff will be made to help them. The hope is that tariff bargaining between Europe and the United States will give the Commonwealth exporters better opportunities in these two major markets.

(2) The same working party has been studying a second problem, which is called the **zero tariff** list. On most raw materials, which make up 40 per cent of Britain's imports from the Commonwealth, the common market tariff will be zero. But there are certain products, of great interest to Commonwealth exporters, where the Six have agreed to impose a tariff on imports from outside their market. On 24 raw materials (including woodpulp, newsprint, aluminium and a long list of non-ferrous metals) and a range of processed foods, Mr Heath has therefore asked for the common tariff to be reduced to zero.

The Six will not find it easy to satisfy this request in full. Most of the disputed items were in their own "List G," a list of tariffs only settled within the common market after a long negotiation. On aluminium, to take one important example, the French support their case for a continuing measure of protection by pointing out that in Britain, where there is none, the industry has largely fallen into American and Canadian hands. Is there to be virtually no European aluminium industry at all, they ask ?

The British, on the other hand, argue forcibly that their entry to the community will not merely affect Commonwealth interests, but will change the balance of European interests. The present community, which satisfies 75 per cent of its home consumption of aluminium from imports, fixed the tariff at 10 per cent. Is not a lower tariff more appropriate to an enlarged community, which satisfies a mere 55 per cent of its own needs ? Eventually a compromise seems likely on the "zero list," with some tariffs reduced, and some removed, and low-tariff or tariff-free quotas granted to the Commonwealth where the common tariff remains high.

(3) Serious discussion on a third matter, exports of **manufactures** from **Asian countries,** did not get going until February, partly because the British were still clinging to the possibility of association for major Asian countries, like India and Pakistan. Once they agreed (on February 6th) to give up this idea, the way was opened to discussion of other solutions for Asian manufactures. Here again the indications are that the Six will not be prepared to waive the common tariff permanently for the benefit of Asian manufactures, but they do recognise that a way has to be found of giving the new nations growing export outlets for their manufactures. Since the new Japans can push their exports across a low tariff barrier with relative ease, the removal of quota restrictions matters most to them.

A SOLUTION may thus be found on the lines of the recent textile agreement reached in February under the auspices of the General Agreement on Tariffs and Trade. This solution, however, raises what may be called the problem of the "link": The aims of the Geneva agreement (expansion of quotas over a five-year period and ultimate removal of all restrictions) are excellent, but the detailed provisions for carrying it out still leave uncertainties which worry Commonwealth exporters. What kind of guarantees are to be given to the Commonwealth countries in Asia that, as they lose their privileged position in the British market, they can be certain of equivalent opportunities in western markets generally ? Can tariff-free quotas provide an escape mechanism if imports from Asia fall below a certain level ? What institutional machinery can be devised ?

(4) **Temperate agriculture** poses the same problem of the "link" between preferential and worldwide arrangements. The Six accept that the Commonwealth may keep some transitional advantages in the British market, but hold that in the long run the problem must be solved by worldwide arrangements. This position may have to be accepted by the British negotiators, but they point out that the transitional arrangements need to last until the worldwide ones are effective. The Six accept this, but point out that Commonwealth countries must not be given a veto over the passage from the preferential set-up to the worldwide one. Again, an institutional mechanism has to be devised which safeguards both sides.

Temperate agriculture also poses a host of complex technical and economic problems. Australia, like the Six, favours a world wheat agreement which would stabilise wheat prices at a fairly high level. Canada thinks the idea wholly impractical. The Six believe that a world agreement on beef is also possible. New Zealanders doubt whether perishable commodities of this kind can be dealt with in the same way. For butter a combination of methods may have to be adopted—an element of deficiency payment in Europe (as in Britain) plus a world agreement on prices and quantities sold.

(5) The most obvious part of the bargain may be the last to be put down on paper. The Six seem likely to accept **association** for the **African** members of the **Commonwealth, the West Indies** and some small territories in the **Pacific,** but this cannot be finally settled until the Six themselves have agreed on the form their existing association with Africa is to take. A meeting in Brussels on April 10th and 11th between ministers from the Six and their sixteen African associates made some progress. Another meeting of ministers is to be held in June.

Here again a problem of political trust arises where the Commonwealth is concerned. The British, knowing that some Commonwealth countries, like Ghana, are opposed to association at present, and that others are still bewildered by the rush to independence and the swiftly changing African scene, would like the door to association to be left open for some three years. Some of the Six have doubts about this delay. Last week the British government consulted in London with the High Commissioners from four African Commonwealth countries.

To sum up, the work of the negotiators so far suggests that the terms the Commonwealth gets will be very much a compromise. Inevitably the negotiations will not provide permanent guarantees for every Commonwealth product going far beyond the short-term guarantees Britain gives the Commonwealth at present. Who can tell how much lamb Europeans will be eating in 1975 ? Much will have to be taken on trust. And as the problems of the "link" between preferential and worldwide arrangements suggest, the devising of institutional machinery which safeguards both sides is at the heart of the negotiations.

...your fastest link with the business world!

Your company is a good one. But do people *abroad* know it? And have you really looked closely at your export potential? There's only one way to make sure of your expansion into profitable markets overseas: fly out there and get yourself known. Make contacts personally. Do business with them face to face. Wherever you want to go—chasing new business, following it up or seeing it completed—BOAC can fly you there in a matter of hours. You'll like the efficiency of BOAC service, in the air and on the ground. No other airline can match it.

B·O·A·C helps speed the export drive

BRITISH OVERSEAS AIRWAYS CORPORATION

It's just struck me. Of course. Though Halex will have the answer, too—they're always thinking years ahead in plastics. They've probably already worked out that if you under-rallify the potterpin, using a moulded oval *whirly, the whole sprig-system will be revolutionised. Difficult—but Halex will be able to do it, with their knowhow and facilities. I expect they'll be delighted to find someone as forward-looking as themselves, when I ring them. Wonder what plastics problems of 1972 Halex and I will be solving in 1967?*

If you've a problem—*any* problem—involving plastics, then Halex can do a great deal to help you with it. The size of the problem doesn't matter a bit. The bigger the better. Halex are in business to offer a total plastics service—a service which begins with one of the most effective consultancy services in the plastics industry through to development and final production. As a division of the British Xylonite Company Limited, Halex can offer you the most *comprehensive* plastics service in the country—perhaps in Europe. If you need *any* help on *any* problem involving plastics, all it takes to secure the facilities Halex command is a phone call to LARKSWOOD 2345

DOCTORS' PAY

Merit Awards?

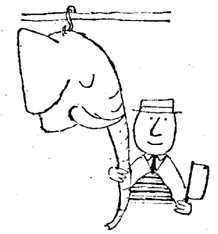
THE Pilkington commission on doctors' pay, which reported in February, 1960, spawned three further working parties on its proposals relating to general practitioners. The first was concerned with the distribution among individual doctors of the extra money that the Pilkington commission recommended should be available to the "central pool" from which family doctors as a body are paid. It had done its job by August, 1960; but it proposed that from the pool the sum of £1 million should be reserved each year so that further, more deliberate, consideration should be given "of making the best possible general medical service available to the public."

This consideration has been given in the last eighteen months by another working party. It has proposed that a quarter of the reserved £1 million should be set aside for payments to doctors who attend post-graduate courses while in general practice. They will be eligible to receive a sum of £60 in a five-year period. The remaining £750,000 will be used to increase the loading of capitation fees for a certain number of a doctor's patients. In addition to a flat capitation fee, now 19s. 6d., for each patient on a doctor's list up to a prescribed maximum, there is a loading, now 14s., for every patient after the first 500 (400 in the case of a single-handed doctor) and up to the 1,700th (1,600th). In future this loading will be 15s. 6d. for patients between the 1,000th and 1,500th, thus further encouraging doctors to keep their lists to a size that should enable them to look after their patients more effectively.

But, as the Pilkington commission recognised, the loading payments, together with a limit on the size of a list, reduce the spread of general practitioners' incomes and thereby discourage good general practice. It therefore recommended that £500,000 should be made available, outside the central pool, for giving merit awards to family doctors, just as they are already given to consultants. A third working party has been duly engaged on working out an acceptable scheme for making these awards; it proposes that they should be made by a selection committee, appointed by the Minister of Health and consisting mainly of general practitioners, and assisted by recommendations from local assessors drawn from various branches of the medical profession. This last suggestion is an improvement on the system by which consultants are recommended; at present, this seems to be exclusively in the hands of other consultants but could with advantage use the advice of general practitioners. Meanwhile it is still uncertain whether general practitioners as a whole will accept a scheme that will give a few of their colleagues £500 or more a year in addition to their other earnings, while giving nothing extra to most of themselves. But if they turn the scheme down they will have to watch the £500,000 reverting each year to the Exchequer, as it has done since the Pilkington commission reported.

MR WOLRIGE-GORDON

All in the Family



THE dispute between Mr Patrick Wolrige-Gordon, Lord Boothby's successor as Tory MP for East Aberdeenshire, and the lairds of his constituency association is as muddled and bitter as any family row—which, in a real sense, it is. Mr Wolrige-Gordon says his critics want him to give up the seat because of his leanings towards Moral Rearmament and his prospective marriage to the daughter of an MRA official. ("I put my trust in Almighty God, in Aberdeenshire and in Anne.") If these are their real grounds the local Tories have no leg to stand on. They say, however, that Mr Wolrige-Gordon has "shortcomings" as a member, in particular a "lack of local knowledge," and they assert that his MRA interests have made him neglect his parliamentary duties. These are always difficult matters to judge, but it is obviously preferable (and normal practice) to give a member the benefit of the doubt unless the neglect is incontrovertibly glaring. Several MPs have involved themselves with MRA without laying themselves open to this particular charge—although prolonged absences on MRA business in 1955-59 helped to precipitate the final breach between Mr John McGovern and his constituency Labour party at Glasgow Shettleston.

What should be making Scottish Tories sit up and look at their image is the ingrown, eighteenth-century atmosphere that has pervaded East Aberdeenshire politics since Lord Boothby departed. Mr Wolrige-Gordon, then aged 23, was given the seat in 1958 after his grandmother, Dame Flora MacLeod of MacLeod, had vigorously exhorted the local association to recognise his prime ministerial qualities. Major David Gordon, the president of the association who has been spokesman for the critics, describes himself as "a family friend." It was in this role, apparently, that he took the initiative last March in order to save Mr Wolrige-Gordon "the unnecessary expense of setting up a home" in a constituency where there was a clannish movement to throw him out. It now emerges that one of the local branches (at Ellon) which first expressed disquiet at the member's activities has as its chairman Captain Robert Wolrige-Gordon, the member's eldest brother. This glimpse of Aberdeenshire politicking would have rejoiced the heart of Sir Lewis Namier.

FOOD RESOURCES

Wild Animal Farm

OVERCROWDED humans may take what reassurance they can from Mr Colin Clark's recent estimate to the Royal Statistical Society that, by using the best methods known in agricultural laboratories, one person's minimum requirements of food can be satisfied by the continuous cultivation of a mere 25 square yards. It makes neo-Malthusianism look a bit silly. But long before these standards of productivity (and consumption) are imposed on the human race the biologists should have come up with the answers to two crucial questions which could alter all calculations even more for the better. First, is the extension of west European and north American methods the best way to tackle Asian and African problems? Second, how close are we to the development of entirely new forms of food—drawn from tropical plant life, new animal types and the seas? From another speaker at the society's symposium, Dr N. W. Pirie of the Rothamsted Experimental Station, came the most spirited of biological analyses. Telling students in underdeveloped countries to stop worrying about nuclear physics and get down to ergometric research on the hand hoe, Dr Pirie saw possibilities in every swamp and mango grove.

His best bets ranged from the extraction of leaf protein in bulk (with the development of multipurpose plants giving commercial and nutritious products) to the domestication of the promising forms of wild animals and an efficient system of farming the sea. The idea of eating the hippopotamus has its admirers; its meat productivity is enormous, but breeding and ranching it might be expensive as it competes with other land animals for its food. The wholly aquatic manatee—"readily eaten in Guiana"—may therefore be a better prospect. Dr Pirie found it humiliating that man's total fish catch is only four or five times higher than that of Peruvian sea birds. He was not happy at the protein-converting efficiency of carnivorous fish: the breeding of a sea carp could be the answer. There is plenty of food for thought here, not only for governments but for food technologists.

EIU Quarterly Economic Reviews

covering 57 countries or groups of countries

Out next week:

SPAIN

The Review discusses Spain's application for negotiations with the E.E.C. against a background of rather more open politics. The future of Spain's development planning, wage levels and agricultural schemes is assessed in the context of its probable integration with Europe, and industrial statistics are presented, which suggest that the economic reforms of 1959 have been followed by improvements in productivity likely to ease Spain's exposure to international competition.

HOME REPORT

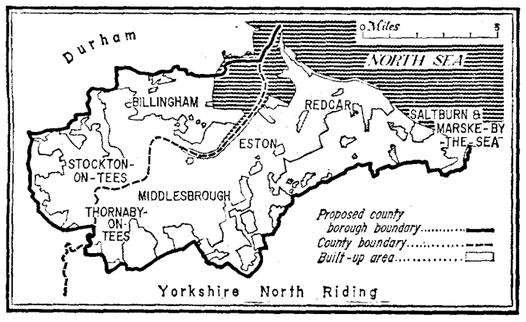
Members of the editorial staff and local correspondents report on life and happenings in and around Britain

Introducing Teesbrough

FROM OUR SPECIAL CORRESPONDENT

ON Tees-side the Local Government Commission has had its biggest natural opportunity for innovation, so far, outside the special review areas. In plumping for a single county borough, embracing both Middlesbrough and Stockton and most of the neighbouring built-up areas of the eight other local authorities in the region, the commission has bravely struck out for rationalisation.

Its arguments in its draft proposals are interesting. It is not at all apologetic at creating the eighth largest town in England (below Bristol and above Leicester) at one blow. It believes that a population of 390,000 is, in fact, an inducement to what it calls "bold and imaginative planning." This size has raised some eyebrows, but one's guess is that this will prove to be the minimum population capable of sustaining an effective cultural life in the provinces; it is likely to prove a far livelier place than the controlled environments for 100,000 people or less that are now fashionable among amateur planners.



The commission is not particularly worried, either, that Teesbrough (or whatever it will be called) is still a fairly scattered region of 42,000 acres, with the steel and chemical industries holding large reserve areas of land for future expansion and with estuarine land being steadily reclaimed. It has simply acknowledged the "underlying unity" of Tees-side, even to the point of including the seaside towns of Redcar and Saltburn as growing suburban dormitory areas.

Tees-side shows up clearly as a major area of postwar development, and despite its present rate of unemployment of over double the national average it is likely to go on growing apace. Between the last two censuses the population in the existing ten authorities rose by 50,000 (14 per cent). The commission, after recommending the "continuous county" experiment for Tyneside, feels that Tees-side is still not big enough (or inflexible enough) for this two-tier solution. It has come out for a single-tier merger chiefly on the ground that the present impetus of expansion makes it all the more necessary to get the new development "right first time."

The need for this organic unity seems to have ruled out the main alternative, which would have been to put responsibility into two hands: Stockton north of the river and Middlesbrough south of it. This was the way the local authorities actually lined up in their evidence, and it is the way that established loyalties (Stockton has been a borough since the thirteenth century) were most likely to coalesce peaceably. But in the longer view two strong authorities dividing the region between them is not the best way to secure a reasonable coordination of planning and services.

AT present there is a degree of cooperation between the existing authorities on the police, fire, ambulance and civil defence services, but the commission remarks that the effectiveness of this is limited by rival imperialisms. Once Tees-side's redevelopment of old housing areas really gets under way (and there is an immense backlog) the need for integrated planning should become obvious.

The local opposition, taking its stand on very recognisable identities, will need to be out-argued on the point of administrative efficiency if the new arrangement is ever to take root. But the chief sufferer, at least in resources, may turn out to be the North Riding of Yorkshire; it is conceivable that the commission can find grounds for extending the North Riding's sway elsewhere, possibly at the expense of the heavily-populated and burdened West Riding authority.

Pope and Presbyter

FROM A CORRESPONDENT IN GLASGOW

NEXT Thursday 40 Roman Catholic priests and laymen will hold informal talks at Dowanhill Convent, Glasgow, with 50 Church of Scotland ministers and elders and 10 Scottish Episcopalians. The convent is a foundation of the teaching sisters of Notre Dame and the nuns will provide tea and cakes while the theological discussion goes on. It will be the fourth such meeting on church relations to be held within the year, but the first to be constitutionally endorsed by the Presbyterians. The earlier gatherings took place secretly, and once the word leaked out these became highly controversial, just as contention continues to surround last month's get-together in Rome between the Pope and the Moderator of the General Assembly of the Church of Scotland, the Rt Rev Dr A. C. Craig.

The Moderator, a former secretary of the British Council of Churches, has devoted his life to the cause of healing interdenominational relations. In Roman Catholic eyes he may not be quite such a heretic as John Knox, but he is still one of the separated Christian brethren. All of Scotland's 1,300,000 kirk communicants are in the same boat, and their return to the Roman fold is hardly imminent. Even after the last prolonged negotiations with the Church of England, the kirk would have nothing to do with the bishops-of-a-sort that were the Anglican price for unity.

The Scots as a race still affect to be great theologians, even in an age when ever fewer of them actually attend church. The non-believers among them also acutely distrust the political implications of popes and prelates. It is true that a good many churchmen approve of seeking an understanding (however unofficially) with Catholicism. But some do not and others never will. It is revolutionary that the talks are taking place at all.

Those not bred in places like Clydeside, Ulster and Liverpool cannot properly scale the emotional heights of religious animosity that have become synonymous with the Battle of Boyne Water. "Are you a Billy or a Dan?" runs the classic childhood challenge in working-class Glasgow (and, in effect, on the football terracings when Rangers play Celtic). The social effects of these divisions can spread surprisingly widely and damagingly.

Dr Craig's "courtesy visit" to the Pope last month has certainly added a new dimension. It had its beginnings last year at the General Assembly in Edinburgh, but was finally accomplished only after some dubious ecclesiastical wangling which became necessary to overcome both Roman and Presbyterian protocol. The summit had to be contrived to make it look as though Dr Craig was not desperately seeking an audience with the Pope (which was, in fact, the case). Yet it was the Pope who saved the day by bending Vatican rules and then receiving the Moderator warmly.

The Dowanhill Convent talks are again at Catholic instigation, this time by the Cistercian Abbot of Nunraw whose abbey lies close to Knox's birthplace at Haddington. The abbot, a jolly little (Southern) Irishman, is president of the Scottish Council of Religious Superiors which comprises the heads of the Scottish committees of the various orders. He was careful to forward Thursday's invitation formally through the Presbytery of Glasgow.

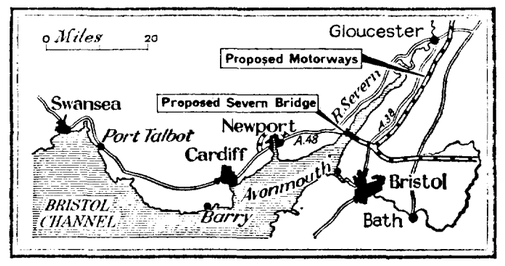
Many people in the presbytery, otherwise willing to slacken off some of the old prejudice, do not know what to think of it all. What confuses the issue for them is not so much the enthusiasm within the Church of Scotland for improved Christian relations, but the enormous zeal with which some ministers and elders pursue it. The less-dedicated often feel this "reformist" lobby is willing to yield too much of the kirk's hard-won traditions (as with the bishops-in-presbytery plan).

Pope John (left) and Moderator Craig

Protest rallies on no-surrender lines are being organised already by Catholicism's more bitter opponents, and in May the General Assembly will inevitably be urged to hold to the faith. There are a number on either side who believe privately that the Dowanhill affair is all hog-wash, and they are certainly right if anyone expects a decisive step towards unity to emerge from it. But given luck and the right follow-through the talks could provide a basis of mutual respect on which the two systems can slowly begin to live peaceably together in what has been intolerant Scotland. This is badly needed.

Expansion Bristol Fashion

FROM A CORRESPONDENT IN BRISTOL



THE Rochdale committee, which is expected to report later this year on the dock facilities in the main ports, has a difficult dilemma to resolve at Bristol. The city's port at Avonmouth is booming: it is the seventh in the country in terms of the value of its combined imports and exports. It is thinking of expansion as new road communications and the prospect of entry into the common market bring more trade its way. But across the Severn estuary in south Wales existing dock facilities are languishing.

Future planning in the region cannot ignore the steady social and economic merging of the industrial complex around Bristol with the sprawling semi-conurbation of south Wales. Daily, more hands reach out across the water. An independent television company, serving Wales and the West, both reflects and encourages the merger, the speed of which will soon increase with the building of the Severn Bridge.

There are sound economic arguments for a recommendation by the Rochdale committee to link Bristol with a south Wales port. Today Bristol (the only major port to be controlled by the local corporation) is the busiest of the six that line a 70-mile stretch of the Bristol Channel. Its problem is that it is almost too busy to cater for more ships. Last month a peacetime record of 858,000 tons of cargo passed through the port. The south Wales ports, now handling together only a few million tons of coal a year, lament empty berths.

A century ago Swansea, Port Talbot, Barry, Cardiff and Newport were together exporting up to 40 million tons of coal a year. But Bristol was well behind the other main ports in providing facilities for the great steamship companies which were riding high on exports. Only in the 1870s were docks built for oceangoing ships at Avonmouth and Portishead.

The new docks brought prosperity to Bristol. But the results of the delay still remain. The exporters stuck to their old ports, and today exports through Bristol account for only about 134,000 tons of the 7½ million tons of cargo handled each year.

Business in the Bristol region will be further stimulated by the Imperial Chemical Industries' scheme to build a £100 million petro-chemical plant at Severnside. Work has already started on the project, which will be extended over a 1,000-acre site in the course of 10 years. The city also expects to benefit from the new London to south Wales and the Birmingham to Bristol motorways which will attract more traffic to Avonmouth. The chance to pick up trade improves with every revelation of restrictive practices and communications bottlenecks around London. Since the original city docks chiefly handle continental and coast traffic any increase in trade with Europe should equally benefit Bristol.

The Bristol port authorities are already spending £1 million a year on improvements. A £5 million project to increase petroleum, grain and general cargo handling facilities at Avonmouth is already half completed. The improvements in the oil basin will enable oil companies, through the use of a common-user pipeline, to draw their fuel from any of the berths.

The corporation has bought 600 acres of land in the Portbury area, on the Somerset bank of the Avon between Portishead and Avonmouth, for new dock development. Test boreholes have been sunk, and hydrographic tests are being carried out by the Department of Scientific and Industrial Research at Wallingford.

There is undoubtedly pressure within Bristol to build at Portbury in order to attract exporters and shipping companies in the hope of reducing the gulf between imports and exports. But Bristol has no reason to worry about this particular imbalance as long as the goods it handles are so diverse. A working association between Bristol and perhaps Newport would avoid unnecessary capital expenditure; it would also give Wales a shot in the arm. This rationalisation should look more acceptable when the new Severn crossing and its linking motorways are actually in being.

LETTERS

Pre-Pilkington

SIR—Dr Ralphs, in the letter which you published in your issue of April 7th, confuses, like a number of other people, the specific functions of the proposed educational television service with the general educational responsibilities incumbent on the public broadcasting services.

Those who think the opportunity should now be taken to reserve some of the limited air space available in the United Kingdom for systematic use in the service of education recognise that certain educational tasks can never be adequately fulfilled by the general services. The most striking example of the type of activity which no general service can undertake is the broadcasting between, say, 8 o'clock and 10 o'clock on four evenings a week of sustained courses in such subjects as public administration, languages or philosophy.

I have in recent weeks looked fairly closely at the educational situation in the United States. Although in many respects this is dissimilar from ours, there is the same urgent need for a substantial widening of educational opportunities. The staffing difficulties in universities and technical colleges on both sides of the Atlantic are so serious as to make such a widening impossible except by the help of television. Having begun with similar doubts and reservations as those now current here, educationists in the United States have, in the last five or six years, largely been converted; and the Federal administration is now committed to legislation which will extend widely the educational use of the medium.

I hope it will not be long before educationists in this country also overcome their natural hesitation and explore with an open mind the possibilities of using television more widely in common with other means of extending educational facilities. They can do this without in any way abandoning their belief in the general educational functions of the BBC and Independent Television.

It is with a view to exploring these possibilities that the proposed Institute for Educational Television is being set up. I might add that it will not be the object of this new body to duplicate the admirable work of other organisations in this field but only to supplement what they are already doing.—Yours faithfully, BESSBOROUGH

London, W1

Drumbeat in Fife

SIR—I read with no little interest and some amazement your Special Correspondent's report on the current industrial situation in the County of Fife in your issue of April 7th. A pithy digest, of sorts, was prepared which does little to present anything resembling the real nature of the problem in the heavy industrial sector of Fife.

I am amazed to note the conclusions so easily arrived at, and the gross misstatements which are no doubt added to lend colour to an otherwise drab account. For example, the description of the "traditional hard-drinking, bingo-haunted, communist-voting mining population of the industrial districts." The incidence of drinking and bingo can be no greater than that of any other similar district, and is possibly less than most. Does your special correspondent have any basis for a sweeping generalisation of this nature? A little inquiry would have revealed that the area could claim an enviable reputation for social progress in public health, housing and social services of all types, of civic pride, of well-established retail co-operative trading societies, of a wide range of cultural associations, and a generally high level of thrift and well-doing as a community. A bare reference would also serve to show that a section of the industrial area returned a Communist member to Parliament 17 years ago, and that since then the Communist party's parliamentary candidature has had a history of poor "also-rans" and, indeed, lost deposits. Why, please, the gratuitous reference to a potential industrialist's meeting with "workpeople with very decided ideas on how things should be run"?

I could forgive your correspondent for listing the county council house property as 30,000 units for 13,000 houses owned, and am ready to pardon him for describing a Labour party member as the "Conservative" Convener of the County. These blunders will be counted petty by comparison with the studied attempt to denigrate the industrial potential of Central West Fife, and its working population. The information and detail supplied by the article is a desperately poor attempt to depict anything resembling the real situation, and is completely unworthy of a journal with the standing and reputation of *The Economist*.—Yours faithfully,

J. MCWILLIAM
Convenor of the County Council

Crossgates, Fife

Walls of Fame

SIR—Your Special Correspondent's recital (March 10th) of the fate of certain controversial plaques on historic sites in London omits the most shameful outrage of all. This was the nocturnal smash-and-grab robbery of the plaque outside the Criterion Hotel in Piccadilly, which commemorated the historic meeting at the former Long Bar of that hotel between young Stamford and Dr Watson which led to the introduction of Watson to Sherlock Holmes. The cost of the plaque—£60, not £30, I recall as organiser of the belated tribute to the memory of one of England's greatest sons—was contributed by members of the Baritsu Chapter of the Baker-Street Irregulars in Tokyo and was formally unveiled in 1953. (Devoted members of the Baritsu chapter included the former Prime Minister Yoshida, the late Count Makino and the chief of the Tokyo metropolitan police force.)

The plaque was ravished from the wall on the early morning of Derby Day 1956 by two or three men, who drove off in a car in the general direction of the Café Royal. No clue to the fate of the plaque or the identity of the criminals was ever discovered. Indeed, there is not the slightest doubt in my own mind—after two fruitless personal calls on leave at Scotland Yard and Savile Row station—that the contemporary Lestrades and Gregsons took only the most perfunctory interest in the blasphemous crime.

The plaque, it must be admitted, was not popular with the Piccadilly police, because it frequently caused pedestrian congestion at the busy corner while visitors took photographs. Spiritually and historically, the city is the poorer for its loss.—Yours faithfully,

Hongkong RICHARD HUGHES

AID's Progress

SIR—Iran respects the new philosophy guiding America's foreign aid programme (your issue of April 7th, page 35) which emphasises the "self-help" principle calling for basic reforms. Indeed, Iran is already embarked on long-range reform programmes impinging on its social and economic life.

Sharing, as it does, a 1,500-mile common frontier with the Soviet Union, Iran recognises only too well that its salvation as a viable nation—and perhaps that of the entire Middle East—lies irrevocably in its ability to provide its people with a decent standard of living.

To bring about conditions of economic and social well-being for Iran's 20 million people, the government—with the fullest support of the Shah—is launching in September a massive Five-Year Economic Development Plan at an estimated cost of $2,500 million. The plan, largely self-financed together with foreign investment, encompasses extensive land reform, industrial and mining development and diversification, road-building, expanded education and improved public health facilities, among other goals. This programme is expected to raise Iran's national income about 6 per cent annually.

Iran is helping itself in the fight against communism, but needs help from other free nations fighting the same fight. This is a two-way street.—Faithfully yours,

M. RAZMJOO
Press attaché

Imperial Iranian Embassy, London

BOOKS

The Insatiable Revolution

The French Revolution: *From its Origins to 1793.*

By Georges Lefebvre. Translated from the French by Elizabeth Moss Evanson.

Columbia University Press. London: *Routledge.* 384 pages. 35s.

GEORGES LEFEBVRE, Professor Emeritus of the History of the French Revolution in the University of Paris, died in 1959, twenty years after the publication of "Quatre-Vingt-Neuf," his contribution to the sesquicentennial celebration of the Revolution, which the Vichy Government tried to suppress by destroying every copy it could seize: an unwitting testimonial to his integrity by reactionaries foolish enough to think that the old regime could be resurrected if its death were not discussed. Not that Lefebvre was one of those too numerous French historians who have won academic notoriety by publicising their political prejudices. Possibly the translation of Bishop Stubbs's "Constitutional History of England" may have had a sedative effect. Till the age of fifty he devoted his abilities to teaching, and to those researches into the pre-revolutionary life of the peasantry on which he based his studies of rural psychology in the Revolution, and of that phenomenon of crowd psychology which he described in his "The Great Fear of 1789."

Fortunately, as the efficiency of the Vichy Government was much less comprehensive than its folly, a few copies of "Quatre-Vingt-Neuf" survived; and in 1947 a translation by Robert Palmer was published by Princeton University Press and called "The Coming of the French Revolution." Its argument, that the Revolution was preceded by a second Fronde, which continued in aristocratic conspiracies, becomes the main thread of his discussion in this volume of the revolutionary years 1789-93. It is not a novel thesis: incendiary denunciations of plots against the "People" were frequent during the Revolution and made useful republican propaganda long after Waterloo. But Lefebvre has analysed the evidence, arranged it cogently and put it into its historical context. Resentment against Richelieu's ruthlessness and Mazarin's subtlety had persisted, bitter and barely concealed, even under the Grand Monarch. Concessions by the Regent Orleans were enlarged and exploited under Louis XV; and the attempts of Louis XVI's ministers to repair the rusty machinery of central government evoked provincial revolts led by nobles in 1788-89. A few talked, vaguely if sincerely, of imposing an English type of constitutional monarchy on Louis; but most of the noblesse would have been more at home in the Wars of the Roses than among the great English peers who quietly controlled the Georges.

Open aristocratic resistance before the Estates-General met at Versailles in May, 1789, became conspiracy afterwards—nullifying Louis's somewhat nebulous good intentions and inflaming the tempers of all who mistrusted king and nobles alike. Lefebvre does not justify all the actions of middle-class deputies or sansculottes; but he justifies the suspicions that prompted them. Nourished by the hostility of "The Privileged" to the formation of a National Assembly, and by their subsequent frustration of the lukewarm efforts of Louis to co-operate with the reformers, suspicion infected both revolutionaries and counter-revolutionaries: the court-conspirators mistrusted the king, and he misled Lafayette and Mirabeau, whose mutual dislike undermined what may have been the last chance of saving the monarchy. Louis's flight to Varennes certainly destroyed it, for he discredited Lafayette by deceiving him. From then on charges of royalism, counter-revolutionary plotting, and collaboration with the enemy on the frontiers were hurled across the Assembly and repeated venomously in speeches, songs, and pamphlets in the streets. Feverish fears incited the invaders of the Tuileries on the *journées* of June and August, 1792, and turned to bloodthirsty panic in the September massacres, of which Lefebvre says "the collective mentality that made them possible resulted from circumstances and not from the will of any particular individual." The "circumstances" included reports of treachery at Verdun, which had just surrendered to Brunswick, and rumours that a merciless royalist rising was to take place as soon as "patriots" had left for the front.

Lefebvre's narrative is undramatic and uncensorious. He is equally fair to the Montagnards and the Girondins, to Danton and Dumouriez—and to Robespierre, whose personality is emerging as this volume ends with the execution of the king and the break with England. The translator and her publishers deserve the gratitude of all British and American students of the Revolution, though this edition is not flawless: dates at the beginning need scrutiny and there are a few phrases that arouse curiosity about their French originals.

The next volume will presumably open with Robespierre's efforts to purify the Revolution and close with Napoleon's to end it. Neither succeeded—nor, for that matter, has General de Gaulle: the Revolution continues to devour its children.

How to Shop

Your Money's Worth

By Elizabeth Gundrey.

Penguin. 272 pages. 7s. 6d.

MISS GUNDREY served the ideal apprenticeship for a book of this kind: women's magazines, the *News Chronicle's* woman's page and then editorship of the British Standards Institution's *Shopper's Guide*. Five years of testing consumer goods and handling complaints about them has given her encyclopaedic knowledge of one-upmanship in the distributive trades. The stupidity, greed and occasional dishonesty of manufacturers, shopkeepers and their advertising agents have lost their power to shock her. Her illusions, her anger and her indignation have all been spent; what remains is a detached and worldly-wise compassion for Eve's foolish children on a shopping spree.

For them, and for all natural-born suckers, Miss Gundrey has written what amounts to two books. Social historians of future generations will value the first section for the way it pinpoints the inferior status of the consumer in mid-century Britain; it is the best survey of its kind that has yet appeared. This is Moloney territory, where the high cost of litigation inhibits shoppers from exercising their considerable legal rights and the law will not permit more powerful organisations to go to court on their behalf. Miss Gundrey does not paint the pot blacker than it actually is; her purpose is to put shoppers on their guard against everything from hire purchase charges to telly advertisements (she does not much like the advertising fraternity) and sharp practices, but she also gives credit where it is due.

The second part of the book is simply a shopper's vade-mecum in the course of which Miss Gundrey takes the opportunity to de-bunk a number of household gods, the prefabricated "dream kitchen" among them. But it would be unfair to create the impression that she has set out primarily to criticise and shock; she has not. Miss Gundrey has kept admirable control of her temper when describing conditions that leave much to get shocked and angry about. Whether readers can keep theirs is a different matter altogether.

The Least Understood . . .

President James Buchanan:
A Biography

By P. S. Klein.

Pennsylvania State University Press. 524 pages. $7.50.

JAMES BUCHANAN became President after nearly half a century in the public life of the United States, and "with more advance training than any man who has ever held that post." But his administration ended on the eve of "the Great Rebellion,"

the war between the States, and he felt his whole life had been a failure. It is odd that, as the author of this overdue biography says, Buchanan's life should have been so little studied by scholars; but the omission is nobly repaired by this volume. It is detailed, documented, annotated, illustrated, indexed in the best traditions of American scholarship; and its vast bibliography and *apparatus criticus* are a monument to the long study of Buchanan which Professor Klein has made since his student days. His style is not so distinguished as his scholarship; but the best tribute to the latter is that it carries us on, through occasional passages both bleak and purple, at a smart canter of sustained interest.

Even in the palmy days of the United States, when it was the hope of liberals everywhere, not every one of its public servants could boast such amusing experiences as Buchanan's mission to Russia. Perhaps the family's well-known tolerance of alcohol helped. James himself

> would dispose of two or three [bottles of wine] at a sitting, beginning with a stiff jorum of cognac and finishing off with a couple of glasses of old rye. . . . There was no headache, no faltering steps, no flushed cheek. . . . All was as cool, as calm and as cautious as in the beginning.

Very few American or British public servants could live up to that in their dealings with anybody, let alone Russians.

Buchanan was a Southerner in origin and sentiment but no extremist. He planned to appeal to the North for justice to the South: and only if that were denied would he "be with them" (the Southerners). When President he warned all his Southern visitors that "the South ought not to assume any sympathy for secession from the Administration." He was an example of a politician hoist by his own beliefs. He had long upheld the separation of powers, long defended the judiciary and legislature from encroachments (or possibilities thereof) by the executive. So when he became Chief Executive, he found himself unable to nip the impending rebellion in the bud by extreme executive action, without swallowing all he had worked for. Thus Professor Klein is probably right in saying that Buchanan is "the least understood" of Presidents. No one, till now, even wanted to study this "Judas," as he was termed by the North: no one saw his tasks as hopeless; no one gave the man credit for his works, his sense of justice and his respect for the rule of law.

Buchanan was not a strong man; otherwise he might have reinforced the Federal forts in the South—which it took Lincoln a month to do. Buchanan had time enough, without the will. Machiavelli said: to be a good man, but weak, in a world of evil-disposed men, is to be undone. The moral of Buchanan's life is as old as the politics of ancient Greece: it is not enough in political leaders to be good, just or even right; they must be strong and able, possibly even corrupt, enough to get the right and good things done. The weaker the leaders, the greater their failures. This scholarly biography is surprisingly topical.

Impious Emperor

Napoleon and the Pope

By E. E. Y. Hales.

Eyre and Spottiswoode. 222 pages. 21s.

SOME two years ago Mr Hales wrote "Revolution and Papacy," a useful outline history of the relations between the popes and the states of Europe at the end of the eighteenth century and the beginning of the nineteenth. He has followed it up with the work under review, which adds nothing of importance to his earlier sketch of Napoleon's stormy love-hate affair with Pius VII. Indeed, in certain respects it is clearly less adequate than was "Revolution and Papacy." There is no index, and for bibliography the reader is referred to the earlier book. And Mr Hales has sprinkled his book with small but disturbing inaccuracies. He gives the wrong date for the feast of St Napoleon, and so misses half its significance. He has Napoleon landing at Fréjus on his return to France in 1815 instead of at Antibes. The most famous of the epigrams attributed to Talleyrand ("pire qu'un crime, une faute") is given, amazingly, to his master.

In form, "Napoleon and the Pope" is commendably brief, but it is written in a style that is at times strikingly like that of Lord Beaverbrook's employees. Nor is the thought much superior to theirs. Throughout, the complex issues in this most famous of quarrels are reduced to the simplest possible terms, and expressed, wherever possible, through personalia. Even at this level, the author is not altogether successful. We are told a great deal (no doubt on good authority) about Pius's inmost reflections, but no shaft of insight or grace of writing enables us to know that singularly attractive figure more than superficially. Mr Hales, for example, missed a great opportunity by failing to tell us what it meant to be a Benedictine in the eighteenth century; to tell us how the Rule was observed, how it moulded the future Pope's character, and what difference, if any, it made to his conception of the papacy's functions. The Emperor, shown almost solely as he appeared to the variously imperceptive members of the Curia (and only the papalist members at that—no explanation is given of the behaviour of the "red" cardinals beyond a suggestion that they were mere hirelings) seems wilful and crass beyond belief. It is not necessary to applaud Napoleon's ecclesiastical views to hold that he was not so blind as he is here painted.

The fact is that, as in "Revolution and Papacy," Mr Hales has relied too much on papalist documents. This is not intended as an insinuation that he has neglected, for example, the correspondence of Napoleon. He merely seems to be more at home—much more at home—with Vatican papers than with Parisian ones. The result is that he never gets the measure of the Emperor. He fails, for example, to note the astounding virtuosity of Napoleon's ideological performances. The upstart was capable of saying, more gaullist than the general, "I identify myself with all French history, from Clovis to the Committee of Public Safety." One day, he would be the restorer of the monarchical system; the next, the incarnation of the Revolution. In the case of the papacy, he presented himself consistently as the heir of Charlemagne—that is, as a Roman Emperor, the pope's true sovereign.

Napoleon did not, of course, more than half-believe in his various poses. But they were useful to him, and he flung himself into them with the enthusiasm of a brilliant actor. To make them seem authentic he drew on his considerable historical knowledge. It is this that makes his quarrel with Pius so interesting. The papacy and the papal states lay across his path. Being what he was, he was not content to exterminate them (he would have been unwise to try, as he well knew), but tried to fit them into his system. As they proved recalcitrant, he launched a campaign designed either to bully or charm the pope into acquiescence, into being no more to Napoleon than the pre-Hildebrandine popes had been to the Holy Roman Emperors. In short, the ghost of caesaro-papism, laid since (at latest) the failure of the conciliar movement in the fifteenth century, walked again. The resultant debate sharpened the papacy's definition of its position and claims, just as it exacerbated the passions of the other side. It was a clash of principles—a clash that explains the perennial fascination of the drama, a clash that Mr Hales wholly fails to do justice to. Indeed, it is hard to feel that he ever tried. Why did he write this book?

Joyce's Dublin

Twice Round the Black Church

By Austin Clarke.

Routledge. 178 pages. 25s.

THE Black Church is a gloomy and fortress-like building on the north side of Dublin, roughly equidistant from the King's Inns and the Blessington basin. (It must be made clear at once that this is a book about Dublin by the dean of Irish poets and that it is a delightful addition to the Dublin legend). Fortress-like the church should be, because it is supposed to have been designed by a Protestant Archbishop of Dublin in the 1820s against the day when Dan O'Connell would lead his hordes to the massacre of heretics. *Ad majorem Dei gloriam* Mr Clarke might (but does not) add because he, too, was at Belvedere to learn from the Jesuits.

He was some years after James Joyce. Father Conmee does not still walk through the Georgian streets. Lord Dudley no longer drives in vice-regal procession. But the city is still Joyce's Dublin. It is no wonder that when the author called on the Master in Paris the talk should have been of "the ancient Liberties of Dublin, of Tenter's Fields now brick, of changing shops and repainted, or auctioned, publichouses. . ."

The theme, too, has not changed: the book is another testimony to the love-hatred between the Jesuit discipline and the Irish mind. Some day this must be examined by someone fit to do so, not by an American PhD. Perhaps Mr Clarke himself. . . .? Here again there is the recollection of uneasy confessions and impossible scruples: "the murmur of classes and chalk squealing on the blackboard until teeth cringed, the faces of boys that I had hated and Jesuits in black soutanes. . . ."

But Mr Clarke did not leave Dublin. He recalls what has happened more lately and notes with distaste the increasing *bon dieuserie* of the capital. And yet he dwells in almost loving detail on the Dublin custom of visiting seven churches on Holy Thursday, a custom whose discontinuance in recent years has caused some suspicion that a queer crowd got into the Vatican after the war.

This, it will be seen, is a book about Dublin; and it can hold its place in high company. It enriches the continuing love-affair between Dubliners and their city. *Wien, Wien, nur du allein. . . .*

Defenders of Duties

Her Majesty's Customs and Excise

By James Crombie.

Allen & Unwin (New Whitehall Series, No. 10). 224 pages. 30s.

WHILE Mr Gladstone once described the two forms in which the revenue is raised, direct and indirect taxation, as two sisters, equally repulsive to many but to him attractive, there has always, so far as a wider public is concerned, been a certain glamour attached to the Customs Service. This romantic aspect must not be confused with anything so unambivalent as friendship: indeed to this day, in many coastal districts, a deeply rooted suspicion of the Customs is still part of the local folklore.

This study by Sir James Crombie, the chairman of the Board of Customs and Excise, by appealing to the schoolboy within every reader, thereby capitalises his latent interest in the department and from the literary standpoint does full justice to the traditions of an organisation that is proud to have included within its ranks Chaucer, Burns, Congreve, Defoe, Addison, Prynne, Adam Smith and Tom Paine. Sir James describes Customs procedures and the administrative rationale meticulously, and, as he does so, the smell of the sea rises, pungent and unmistakable; but herein lies a fault. Times have changed: air travel is of growing significance both for passengers and freight, and yet the author devotes but two paragraphs to comment on Customs arrangements at airports. This fault could be of more than formal significance. The ability of a piece of governmental machinery to evolve in order to meet changing conditions is of supreme importance, and it is not unfair to say that we need convincing on the score of the department's up-to-dateness and adaptability.

The reader is certainly indebted to Sir James for a lucid description of the Customs and Excise organisation, for an exposé of the taxes which it administers and for an illuminating account of its expenses in operation—2d. per £ collected, including the Custom House cat, which costs the taxpayer some £15 per annum. At the same time, Sir James has put forward an essentially establishment view, and the work is consequently deficient as far as self-criticism or a forward look is concerned. The treatment of purchase tax is particularly disappointing; there is no serious discussion of anomalies, let alone mention of Mr Gerald Nabarro. Indeed, Sir James's dismissal of any form of sales tax is made after only a most cursory examination of the problem. As for the future, some thoughts about the problems of the Customs and Excise in the common market would at this stage have been more than topically welcome. Clearly, much midnight oil has yet to be burned at King's Beam House.

Collected James

The Complete Tales of Henry James:

Volume I, 1864-1868. 430 pages.

Volume II, 1868-1872. 446 pages.

Edited and introduced by Leon Edel.

Hart-Davis. 35s. each volume.

THE publishers are to be congratulated on this enterprise: a new edition of the *nouvelles* of Henry James, all 112 of them to be printed, in the order in which he wrote them, over the next three years. In his general introduction to the whole series Dr Edel describes James's theory of the short story, a theory that enabled him to call "The Turn of the Screw" (53,000 words) a tale and "The Reverberator" (58,000 words) a short novel. It was a question of organic form and nothing to do with an arbitrary word count. It is because many of his tales were so long that in former collections editors have tended to pick the shortest.

This new, complete, edition is therefore extremely welcome. The first volume contains the tales written during the American civil war and its aftermath. As might be expected, says the editor, "they are pervaded by the national gloom, and they reflect a personal melancholy as well." In the tales of the second volume James "embarked on his study of human types and human behaviour." The volume also reflects, in "Travelling Companions," "A Passionate Pilgrim" and "At Isella," his discovery of Europe. The reader's pleasure in this well-produced edition is certainly enhanced by the way in which Dr Edel, briefly but sensitively, relates the tales to James's life and his development as a writer.

Fifty-First State?

The American Invasion

By Francis Williams.

Anthony Blond. 158 pages. 18s.

MR WILLIAMS, about to become a Labour life peer, has been editor of the *Daily Herald*, a hard worker in the cause of Anglo-American understanding, and a free-lance journalist on the politico-intellectual side of radio and TV. The blurb on his latest book tells us that he has drawn on "the labours of a team of research workers" to support "his own intimate knowledge of what is going on on both sides of the Atlantic" in the compiling of "this comprehensive intelligence report on the progress" of the American invasion of British business and the British people's way of life.

Sir Winston Churchill on a famous occasion said the two peoples ought to get "much more mixed up together." Mr Williams does not like the way it has been happening. He throws the late Senator McCarthy (dead, disowned and disgraced) in Americans' teeth today. He contrasts "the American way of life" with Britain's former, sterner, better, and less materialistic because less affluent way of life, now threatened by "the American invasion." His researchers state that "well over £1,000 million of American capital is now invested in British industry," increasing by £150 million a year, without pointing out that this is under 2½ per cent of the capital value of that industry; or that it is under 2 per cent of what is invested in all the capital of British business, including commerce and finance and insurance, and private limited companies as well as public. Nor do they bring vision into perspective by pointing out that British businesses invest on an average £250 million a year abroad, some of it in the United States. Nor do they assess the problems of American owners of British subsidiaries—like Ford and Hoover at the present time—who cannot just repatriate everything from Britain and concentrate somewhere else (as the author seems to think can be done, to the danger of the United Kingdom). That is why the American Administration is so concerned at the rate of setting-up of subsidiaries abroad by American firms and why they are going to tax them differentially.

Mr Williams and his team have produced, for these and many other reasons, a misleading book. But it is also a sad book. Some people make swans out of their geese. Mr Williams has made a vulture out of an eagle. Even the Russians nowadays lament some of the outward and visible signs of what Mr Williams lumps together as the "American invasion" in social and cultural habits; and certainly the Americans are not in the way of taking over Russia. If this is what Mr Williams can do to his old partner in "my love affair with America," heaven help anyone he takes a dislike to.

Minor but Exuberant

Thomas Nashe: *A Critical Introduction.*
By G R. Hibbard.
Routledge. 273 pages. 35s.

GRUB STREET may have been a typically eighteenth-century phenomenon; but in Elizabethan London, too, there were plenty of minor writers engaged in pamphleteering, patching up plays, adapting foreign fiction for the English market—quill-driving as hard as they could in pursuit of bread and butter, or cakes and ale. Thomas Nashe had vigour, humour and invention enough to lift him high above the rank and file of these professionals; yet "he is, and always has been, a minor writer." These words conclude a most acute comment:—

> Instead of his eye being fixed on a topic, it is fixed on himself writing about that topic, on the kind of figure he is cutting in the public eye, on the effect he is making.

In this book, the first full-length study of Nashe, each work is examined in turn, with copious quotations, so that the reader can sample the ingenuities and the rumbustious forcefulness of the prose, and appreciate how readily this university wit turned his hand to this, that and the other. Early in his London career, he railed against Martin Marprelate; years later, he engaged in a vehement campaign against Gabriel Harvey. He lamented the miseries of authorship in "Pierce Penilesse," turned dramatist, made a bid for patronage with "Christ's Tears over Jerusalem," produced a "The Unfortunate Traveller" (well analysed by Mr Hibbard) an entertaining potch-potch of adventure and satire, and, having established a literary personality for himself, exploited it brilliantly in a discourse in praise of Yarmouth and the red herring, Nashe's Lenten Stuffe." But even if, enticed by this introduction, we explore his pamphlets and are entertained by his Falstaffian exuberance, we shall recognise that his one indisputable claim to immortality is the great dirge, *Adieu, farewell earth's bliss*, with its unforgettable verse:—

> Beauty is but a flower
> Which wrinkles will devour,
> Brightness falls from the air,
> Queens have died young and fair,
> Dust hath closed Helen's eye.
> I am sick, I must die:
> Lord, have mercy on us.

Paperback Selection

Paperback publishing is now in its spring flush. From Penguin come, among others, four by George Orwells, Professor Galbraith's "The Affluent Society" and "The Complete Plain Words" by Sir Ernest Gowers—the plain man's handy guide to a better use of English. Out of print for some time, "Hereditary Genius" by Francis Galton, with its family trees of great names, has been reissued by Collins Fontana Library. This edition, which appears fifty years after Galton's death, has an introduction by Professor Darlington, who assesses the importance of Galton's work in the light of modern knowledge.

Below is a guide to some of the paperbacks reviewed by this journal in recent weeks:

Archaeology and Archaeology:
METHOD AND THEORY IN AMERICAN ARCHAEOLOGY. By G. R. Willey and P. Phillips. 270 pages. 10s. 6d. *University of Chicago Press.*

WHAT HAPPENS IN LITERATURE. By E. W. Rosenheim, Jr. 173 pages. 8s. 6d. LEARNING TO LISTEN. By G. W. Cooper. 175 pages. 10s. 6d. LEARNING TO LOOK. By J. Taylor. 162 pages. 15s. *University of Chicago Press.* All three are textbooks for the University of Chicago's one-year course in Humanities, an introduction to music, art and literature.

THE LANGUAGE OF MUSIC. By D. Cooke. 303 pages. 7s. 6d. *Oxford University Press.*

ART AND TECHNICS. By L. Mumford. 168 pages. 9s. *Columbia University Press.*

THE TESTIMONY OF THE SPADE. By G. Bibby. 478 pages. 10s. 6d. *Collins Fontana Library.*

History:

A STUDY OF HISTORY, Vols. 1, 2 & 3. By A. J. Toynbee. 508, 460, 557 pages. 15s. each. OPERATION SEA LION. By R. Wheatley. 209 pages. 6s. 6d. THE JEFFERSON IMAGE IN THE AMERICAN MIND. By M. D. Peterson. 558 pages. 16s. (Galaxy). ANDREW JACKSON—SYMBOL FOR AN AGE. By J. W. Ward. 286 pages + 8 plates. 10s. 6d. (Galaxy). *Oxford University Press.*

THE STORY OF ANCIENT HISTORY. By J. T. Shotwell. 405 pages. 14s. *Columbia University Press.*

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Easter Breather

WASHINGTON, DC

THERE are times when President Kennedy's relations with Congress seem like those of an unusually brisk mahout to an exceptionally lethargic elephant. But this is not new in American political experience. Tapping the presidential desk, Mr Truman is said to have prophesied about his successor: "He will sit here, saying 'Do this' and 'Do that' and nothing will happen." It is not known if General Eisenhower passed on the warning. What disapproving people with short memories look upon as the sluggish and selfish Eighty-Seventh Congress is sometimes said to show more appetite for trifles, such as its own toy underground railway and its proposed new $40-million parking garage, than for the splendid array of solid legislative dishes that Mr Kennedy has set before it in its second session. These add up to almost forty courses. They include expanded trade abroad and accelerated economic growth at home; medical care for the elderly, respectfully designated as senior citizens, and better education for youth; more voting elbow-room for Negroes; and more physical elbow-room for everyone through parks and highways.

Congress now rises from the groaning board for its Easter breather. It has been in session for three months of this year. In that time it has passed one new measure, the Manpower Retraining Act, and has rejected the proposed Department of Urban Affairs. Its chronic sluggishness arises from an internal obstruction, the cumbrous system of committees. President Kennedy has tried to ease the blockage, but failed. This year, in addition, Congress is as cross-eyed as the Scottish housewife who, in the old Gaelic saying, had one eye on the pot and the other up the lum. In theory its members ought to be thinking only about great national questions. But most of them cannot help thinking about their own prospects in the elections that will be held in November. It is greatly to the credit of Congress that, even in an election year, it usually works up enough steam after Easter to make respectable inroads on its backlog of work. Generally its members also manage to resist the temptation to cut the session short, to get out of Washington and spread across the land in order to mend their fences at home.

The United States is a vast country rich in local peculiarities which make it difficult sometimes to see the wood for the thick undergrowth. There are political strata, rather than chains of command, and the national committees of the two great parties repose on successive layers of organisation at state, county and city levels. Each layer has its independent set of problems and motives related to local conditions. Politics at the local level has a patronage, or loaves-and-fishes, aspect that is of great importance. Last year, when a Republican captured the City Hall of Louisville for the first time in twenty-eight years, the political booty was said to include 3,000 jobs in local government.

This year's elections, and the preliminary primaries and state conventions for choosing candidates, are taking place against a background of vast changes, occurring or pending. There are still states whose two Senators and all of whose members in the House of Representatives always belong to the same party. Nevertheless, one-party states are on the decline in the South, at the same time as the Negro vote is becoming increasingly important in the northern cities. In view of the Supreme Court's recent decision, it is now possible that the present over-representation of rural areas will be rectified and that the cities will come into their own.

Yet most members of Congress woo local voters rather than study trends. Mr Dirksen, the Republican leader in the Senate, has campaigned in Illinois for re-election this year by inveighing against high state taxes and bad state roads and the iniquitous licensing of rowing-boats, rather than by discussing foreign policy on which he is quite knowledgeable. Jet aircraft and six-lane motorways notwithstanding, Washington is alien territory for many people and Congressmen are spokesmen for their districts. It is said that no Representative in his right mind will vote on a major issue in opposition to how his district feels about it.

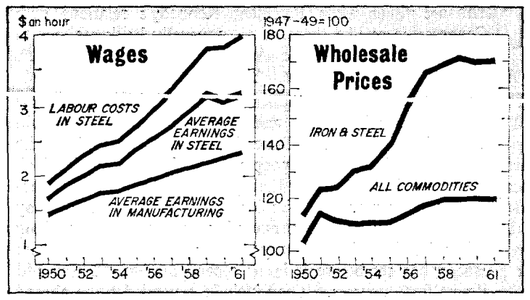
This year the trick seems to be to find out first of all what the major issues are. In voting on the trade expansion Bill, a Congressman from a district that makes bicycles will naturally not sell bicycles short. But there has so far been less furore than was anticipated about cuts in tariffs. The extreme right-wing might have supplied an issue but it seems sickly. Some Democrats, and also some Republicans, thought that Mr Roger Blough had made it possible for discomfited Republicans to be nailed to a cross of steel, as alleged accomplices of wealthy malefactors and economic royalists. But this now seems less likely, even though the six-dollar drama of steel raised all sorts of questions of public policy that may not be answered easily. The steel companies beat a hasty retreat when it became clear where public sentiment lay and, luckily for the Republicans, it is a long time to November.

THE Democrats—despite the many upsetting things that could happen between now and then—are looking forward to the election with high hopes and full treasure-chests. They are well aware of Mr Kennedy's great popularity, which recently proved able to raise three-quarters of a million dollars for the party's funds in a single brief tour. They expect the President's popularity to rub off on his party in November. They point out that the religious issue, which certainly cost them votes in 1960, is very unlikely to do so again—unless through the loss of the votes of some Roman Catholics who are disgruntled because the President refuses to give federal financial aid to Catholic schools.

Of the 100 seats in the Senate, 37 are being fought for this year. The Democrats think that they might win 5, or perhaps 7, of the 16 of these that are held by the Republicans and that they might not lose more than 4 of their own 21. In the House of Representatives the Democrats have 262 seats, the Republicans 174, and there is one vacancy. The Democrats hope to win some seats in California and to regain, in the middle west, some of the 16 Representatives that they lost in 1960 because, they say, of the religious issue. There are 35 state Governorships at stake this year. Of these, the Democrats hold 21; it is predicted that they may lose as many as 9. Their problem is that every state which is regarded as usually voting for the Democratic party and some that are traditionally Republican have Democratic Governors,

so that in this sphere the Democrats are believed to have "nowhere to go but down."

Only once in a century, and that in 1934, the year of the congressional elections that followed Mr Roosevelt's first presidential victory, has a party in power added to the number of its seats in the House of Representatives in an off-year when the Presidency is not at issue. But, according to one interpretation of figures produced by the Gallup poll, this could happen in 1962. The poll indicates that, if the elections were held now, the Democrats would get 61 per cent of the votes and the Republicans would get 39 per cent. This is said to mean that the Democrats are capable of adding 25 or more seats to the 262 that they now have in the House.



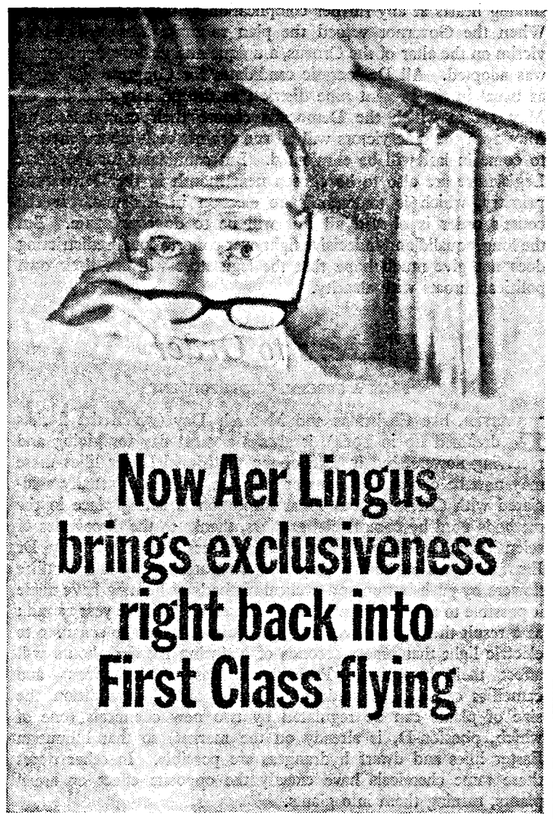
The Republicans meanwhile are suffering from a number of irritations. Mr Kennedy is as popular as only film-stars are supposed to have a right to be. The "radical right" has succeeded in siphoning off much-needed funds from the Republican party to its own purposes, while its antics may well have cost the Republicans the votes of some moderates as well as donations from the eccentric. But, like Job counting his boils, the Republicans are fearful that they may be suffering from a still deeper malaise. They have been in control of Congress for only four out of thirty years and in that period have had only one President, who at the start at least was a much better soldier than he was a Republican. Is it possible that they may be shrinking and ossifying? Can America be becoming a Democracy rather than a Republic?

Again like Job, the Republicans tend to wonder a trifle resentfully what they have done to deserve this. They find contradictory answers. Some say that they must modernise themselves and strive to capture the cities, even if it means supporting medical care for the aged provided by the government. Others, like Senator Goldwater, reply sternly that this is sheer me-tooism and that the right road lies in just the opposite direction—a philosophy that has earned for Mr Goldwater the comment that even his watch goes tock-tick instead of tick-tock. But more moderate, or perhaps just more realistic, Republicans like Mr Nelson Rockefeller, and even the crisis-prone Mr Nixon, are inclined to walk more warily, if only because they are both deep in gubernatorial campaigns and attach importance to the state Governorships that Republicans could acquire this year by playing their cards right.

Steel's Sad Story

THE leading steel companies, all of which have rescinded their across-the-board rise of $6 in the average price of steel (about $160 a ton), must be regretting that they allowed themselves to be stampeded into following the giant United States Steel Corporation up a road about which many of them had doubts from the beginning. Quite apart from the damage which such an affront to the President and the public was bound to do to the industry's reputation (this aspect is discussed on page 223) there was never any certainty that a general increase in prices could be maintained or, if it was, that it would bring the higher profits which it was supposed to provide. Mr Blough, the head of US Steel, admitted that there would be difficulties unless the few companies which had stood their ground, companies which control about 30 per cent of the country's steel capacity, followed his example quickly. They did not and on Friday the 13th, with the Administration's pressure against the increase gathering force, the Bethlehem Steel Corporation led the industry back to price stability, three days after it had broken away. The final push came from the Secretary of Defence when, as he had said he would do, he awarded a big military contract to one of the companies which had not raised its prices.

The resistance to the rise was led by the Inland company, whose officials are close to the Administration; but it, like other holdouts, is also doing better than the big companies. They have long been concerned about the squeeze on their profits, declining for years and particularly in recent months, at least in the case of US Steel. Steel prices have not gone up since 1958, although there have been several additions to labour costs since then; the proposed rise of 3.5 per cent was only a "partial adjustment" to catch up with increases of 6 per cent or more in costs of all kinds, without allowing for the new labour contract which had just been signed. Steel companies would have liked to put their prices up last autumn but felt that demand was not strong enough then; it is surprising that they thought it was now. What had been expected, and what is still likely to come as the pace of the recovery quickens, was a series of selective price increases for those steel products which were in short supply and which could stand up to competition from imports and from other materials.



The Administration does not accept the statistics with which the steel companies justify their need for higher prices. Nor is it sure about their contention that there was no illegal conspiracy involved in the simultaneous decision to raise prices. President Kennedy is said to be prepared to forgive and try to forget, now that the increases are withdrawn, but the Department of Justice has not yet given up its investigation of possible violations of the anti-trust laws (with particular reference to US Steel). Even if the Administration's hounds are called off, a whole pack of congressional committees is determined to carry on with a hunt which seems bound to have voting appeal next November. An effort is being made, however, to divert them with a long-term, non-partisan study of the industry as a whole.

Unhappy Christmas

THIS week is the final date after which President Kennedy said that the United States would be forced to resume nuclear testing, if no workable treaty providing for adequate inspection of suspect explosions were in sight at Geneva. There is no prospect of such a treaty and military necessity, the need to ensure the free world's deterrent strength, is thus forcing Mr Kennedy, reluctantly, to authorise new tests, probably before Mr Macmillan arrives in Washington at the end of next week, even though this will inevitably mean a new round of Russian tests. Indeed, it is partly because they are sure that a new round of Russian tests is already in the making, whatever the Americans do, that Mr Kennedy's advisers are so anxious that the United States should carry out its own series.

For each test not only proves or disproves a scientific theory but also opens the door to a new theory which must be proved or disproved in its turn. American scientists were able to collect much information about the recent series of Russian tests from seismic records and acoustic and electro-magnetic observations, and later from radioactive phenomena, and to draw conclusions not

LONDON-DUBLIN LONDON-SHANNON

Aer Lingus introduces the *only* First Class service to Dublin—a special service for particular people. People who need quiet to relax, or to work in, who want roominess, comfort, good food.

QUALITY—NOT QUANTITY Our First Class cabins take only 8 people—and give them a lot of extra space *in the quietest part of the plane.* The food is first class too, with specialities such as turtle soup with Madeira, grilled Limerick ham, salmon steaks. Drinks and cigarettes, of course, are free. You can say the same for Aer Lingus direct London-Shannon service. Fly First Class to Ireland by Aer Lingus—discover what First Class really means.

all of which were merely speculative. But the scientists only know that there were "over forty" Russian tests. They have reason to believe that they missed some, either of small weapons or in caves which muffled the reverberations, and this is only one of the glaring omissions in their analyses. This is their answer to those people who think that the United States need not conduct its own tests, since it can follow the Russian ones so closely. More important, from what they did discover, the scientists are convinced that the American military position, compared with the Russian, must have deteriorated perceptibly in the 3½ years since tests were last held by the United States—although they do not think that it is inferior to the Russian one yet.

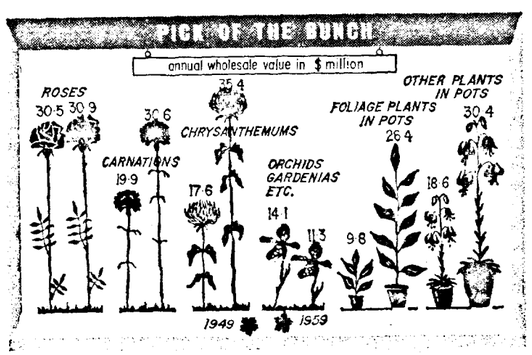
The President has promised that the tests will be as few and as small as possible, certainly fewer and smaller than were the Russian ones, and that every effort will be made to minimise radio-active fall-out. There is apparently some desire in the Department of Defence to increase the number planned, in order to try weapons which other authorities feel do not really need to be tested. About thirty tests are expected in the next two or three months: low-level ones of developed weapons, perhaps including some under water, will be held in the 600 by 800 mile rectangle which has already been closed off around the British-owned Christmas Island in mid-Pacific; later, high-level tests of anti-missile defences will be held over the American Johnston Island, a little further north, and these will affect some of the trans-Pacific air routes as well as the outlying parts of Hawaii. This at least is what the rumours say. There is also interest in the effect of high-level explosions on communications and guidance systems. Everything has now been prepared on the spot by Joint Task Force 8, with 11,800 members.

Reluctant Guinea-pig

In a number of states urban voters are already acting on the Supreme Court's decision last month that they may ask the federal courts for relief from the rural bias in their State Legislatures; this arises because many states have not redrawn the boundaries of electoral districts for many years. And in Alabama the courts have actually delivered an ultimatum—the first order to a State Legislature to modernise the method by which its members are chosen. On April 14th a three-judge federal court declared that both the State House of Representatives and the State Senate must be redistricted before new legislators are elected in November; it set a tentative deadline of July 16th. Unless a special session of the State Legislature is convened and draws up a satisfactory plan, the court will submit its own scheme and put it into effect—or so it says.

In some ways Alabama is a very suitable guinea-pig for this tremendous political revolution. It has not redistricted since 1901 although under the State Constitution this is supposed to be done every ten years, with each new census. As a result the 40 per cent of Alabamians who live in the five most populous counties elect only 16 per cent of the members of the State House of Representatives and 13 per cent of those in the State Senate. At the other end of the scale, the 16 per cent of Alabamians who live in the thirty smallest counties elect over a third of each house. Moreover, rural distrust of the cities is so acute that, when Alabama found that it must give up one of its nine congressional seats, the first instinct of the Legislature was to rob its metropolis—Birmingham—of its voice in Congress. The big cities are the centre of such leanings to Republicanism as exist in the one-party South. This is the opposite of the situation in the North, where, on balance, electoral justice for the cities and suburbs would probably benefit the Democrats. In the South a bigger voice for the cities would almost certainly help the Negroes.

Even progressive Alabamians have, however, some cause for sinking hearts at any further complication of this year's elections. When the Governor vetoed the plan to make Birmingham the victim on the altar of the Census, a unique and elaborate substitute was adopted. All Democratic candidates for Congress will stand as usual in the present nine districts in the primary elections on May 1st in which the Democrats choose their candidates; on May 29th the nine victors will all run against each other; the one to come in last will be eliminated. But candidates for the State Legislature are also to be chosen next month in the Democratic primary, which is tantamount to election in Alabama. If the court's order is obeyed all this will be to do over again. But the long, squalid and indecisive fight over congressional redistricting does not give much hope that the legislators will cut their own political throats with alacrity.



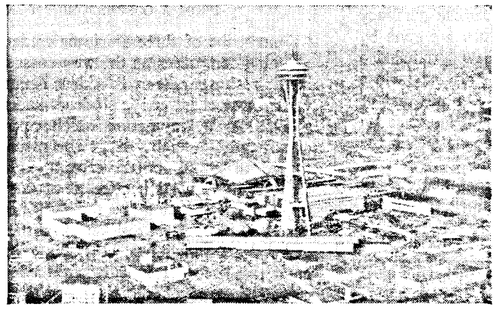
Flowers to Order

FROM A SPECIAL CORRESPONDENT

Easter, like Christmas and Mother's Day (which the florists dreamed up in 1914), is always a great day for giving and receiving flowers, but instead of the traditional Easter lilies these may now be chrysanthemums or even the poinsettias usually associated with Christmas. A great revolution is taking place in the methods used by commercial growers, thanks to the discoveries of scientists at the Department of Agriculture who are led by Dr Emsweller. It is child's play now to water, spray and fertilise flowers by push-button and cyclical methods of lighting have made it possible to raise chrysanthemums successfully all the year round; as a result their sales have shot up. Poinsettias are so sensitive to electric light that ninety seconds of it during the dark hours will affect their blooming. Probably azaleas, rhododendrons and camellias can also be made to bloom to order. In addition, the size of plants can be regulated by two new chemicals (one of which, phosfon-D, is already on the market) so that lilliputian Easter lilies and dwarf hydrangeas are possible. In other doses these same chemicals have exactly the opposite effect on small plants, turning them into giants.

The backbone of the florist's business still consists, however, of four old favourites—roses, carnations, chrysanthemums and gladioli. But the popularity of foliage plants is shooting up; one grower in Florida ships as many as 30,000 philodendrons a week. On the other hand, corsages are only a wistful memory to most florists; the day has vanished when every pretty Miss expected gardenias from her admirers and her mother and grandmother wore orchids. The fashion seems unlikely to revive, short of a press photograph of Mrs Kennedy with a corsage of violets.

California produces more flowers and seeds than any other state,



followed by New York and Florida, but some of the most exotic contributions come from Hawaii. San Francisco is the shipping centre for western flowers destined for eastern markets and one airline handles nearly 600,000 pounds a month; the charge to carry 100 pounds across the country is $20. Southern growers are more fortunate because they can reach the profitable markets in northern cities by rail or road. One interesting sight in North Carolina is the bulb fields on the flat coastal plain; these were started fifty years ago by Dutch settlers. There, as in most parts of the country, polyethylene plastic is used instead of glass for hothouses.

Most flowers move through the hands of wholesale florists who operate on consignment and often charge 25 per cent. But when the big chains of supermarkets and variety stores started to sell flowers, they often went direct to the source. This cutting out of the wholesaler means cheaper flowers for the public but it has its disadvantages for the growers. The chains prefer to sell flowers at the end of the week, when people's minds turn to brightening their houses, and, in spite of the march of science, the ordinary grower cannot guarantee that his crop will bloom only on Friday and Saturday. Good weather may also bring it on too soon for some important holiday or other occasion.

Flowers are cheaper and more abundant than they were fifteen years ago and the Society of American Florists asserts that the industry is worth a billion dollars a year. The Florists' Telegraph

World Going West

FROM A CORRESPONDENT IN THE PACIFIC NORTH-WEST

On Saturday President Kennedy will open the first World's Fair in the United States for over twenty years, and the first anywhere in the space age, in the far northwestern corner of the United States, beyond the Rocky Mountains, at Seattle in the State of Washington, on the shores of Puget Sound. In the next six months more than 10 million visitors, 50,000 a day, from all parts of the world, are expected to attend the greatest public display ever undertaken in the region known more than a century ago as the Oregon Country. In addition to the Seattle Fair, Victoria, British Columbia, just over the Canadian border, is celebrating the centenary of its establishment as a trading post and to the south Oregon and California hope to draw millions of holiday makers to their out-of-door playgrounds on the way to or from Seattle.

The most spectacular symbols of the Fair are a 600-foot-high, cream and orange Space Needle, supporting a revolving sky restaurant, the tallest building west of the Mississippi River, and a monorail railway with two trains carrying 124 passengers each, at 75 cents a time, on an elevated track from the business centre of Seattle to the fair grounds about a mile away, in 90 seconds. This monorail is being billed as "a preview of the mass transit system of the future" and the promotors hope that visitors will insist on their home towns building something similar. The Space Needle sets the theme of the fair, Century 21, and that of the federal government's exhibit, "the role of science in modern civilisation," was suggested by President Kennedy when he signed the authorising Bill.

This House of Science cost $9 million and covers seven acres. It contains working models of biological functions and of the newest technical discoveries and visitors, including children, will be able to try their hands at simple scientific experiments. It is designed to communicate to those who see it what science is capable of doing. Great Britain's contribution to the Fair will cover more than 10,000 square feet following a scheme created in England, with the parts being sent to Seattle mainly by ship. Research and development in space exploration, atomic power, medicine and aviation are featured and the displays include such British products as the latest Jaguar car and a working model of the Selwood orbital engine. The result is supposed to be "the major event of the year in the overseas projection of British achievement." Altogether over forty national governments and those of many American states have invested some $80 million in displays, most of them new and most of them dealing with space in some way.

The Boeing Spacearium, sponsored by the industrial giant of the Pacific Northwest, the Boeing Aircraft Company, will take visitors on a simulated journey to Mars, Jupiter, Venus and other heavenly way-stations by means of a three dimensional film that embraces the audience with the 160-degree arc of its screen. In the Washington State Coliseum, which rises eleven storeys under a huge hyperbolic-paraboloid roof sheathed in aluminium visitors will go up in a "bubbleator" to a floating city where they will take a look at life in the twenty-first century.

But science will not be the whole show. Paintings and sculptures, insured for over $20 million, have been collected from many museums and include works by Titian, Rembrandt, Goya, Monet, Renoir, Bracque, Rouault and a group of contemporary American artists, with Mark Tobey, Seattle's pride, among them. A unique exhibit, the most extensive of its kind in history, will be that of American Indian Art from the surrounding region. It is here, in the Thunderbird country, from Seattle northwards, that American Indians achieved their most brilliant self-expression in carving and costumes.

The world's performing arts will be well represented throughout the Fair's six months' run. There will be, of course, a Gayway with the strip-tease and other entertainments without which a fair would not be a fair. At a higher cultural level the Old Vic company will appear during British week, from May 27th to June 2nd, and the D'Oyly Carte company towards the end of September. Other representative national groups of dancers or actors will come from Ceylon, Sweden, Norway, the Ukraine, the Philippines, Japan, France, Korea, Mexico, China, India and Rumania. These performances will be staged in a 3,000-seat Opera House, an 800-seat Playhouse, a 5,500-seat Arena and a 12,000-seat open-air stadium.

They are all permanent structures as are other of the Fair's buildings which are later to become Seattle's new civic centre. They are clustered in a 74-acre area around the Space Needle and the monorail terminal. The entrance fee will be $2 for adults, $1 for children, with extra charges only for the Space Needle ($1), the art display (50 cents) and presumably the various performances. Naturally the paint is not yet dry on the twenty-first century.

Delivery Association, which is the clearing-house for out-of-town and overseas orders, alone handles about 8.5 million orders annually. But fresh flowers in the house are still a luxury—a far more expensive one than in Britain—and average Americans cannot afford them except on special occasions. Popular demand needs constant prodding to satisfy the 25,000 or so florists and the 12,000 or so large commercial growers.

A new competitor is the imitation flower made of polyethylene plastic; the boom in these which started about ten years ago still seems to be in full swing. Though they are not seen so often now in elegant drawing-rooms, the importers seem to be quite happy; (at least 80 per cent of these flowers come from abroad and have to pay a duty of 35 per cent). They are now invading the garden as well as the house. One firm does nothing but rent a temporary garden of seasonably appropriate plastic flowers to hostesses who lack green thumbs. These blooms have an unfortunate tendency to fade in sunlight, but this is no problem since they are gone by the next morning. Now, however, the French have produced a geranium which is guaranteed to be sunfast and this may win a share of the window-box trade at a retail price five times that of the antiquated geranium that grows. Florists do not all agree on the effect of "phony" flowers on their trade. Some claim that the imitations do good since they make people more conscious of flowers. Other florists concede that the plastic blooms are a real danger. But to be on the safe side most wholesale and retail florists stock them.

Locking the Defence Door

SENATOR MCCLELLAN, who put trade union abuses in the dock a few years ago, is now focusing his attention upon businessmen and specifically upon the excessive profits which, it is said, have been made by defence contractors in the lush space and missile fields. These so-called profits arise in large part because of the widespread system of subcontracting which has grown up, partly for technical reasons, partly because the government has been anxious to give smaller firms their fair share of the work. It is said that prime contractors now retain only about half of the value of the contracts awarded to them in the first instance and much of their profit comes from what are in effect fees for managing subcontracts.

As an example the investigators picked the Nike guided missile which is to defend American cities from air attack, on which $2.5 billion has been spent since 1946. The prime contract went to the Western Electric Company, which provided most of the electronic gear, but over 40 per cent of the work was subcontracted to the Douglas Aircraft Company, which produced the airframe and designed other components; in its turn it subcontracted the work further. For example, the Consolidated Western Steel Company produced launcher-loaders which cost $146 million, plus $9 million in profit; according to the investigators, Douglas then added $10 million of profit for itself and Western Electric another $9.8 million, so that total profits on the operation came to $29.5 million, or about 20 per cent of the original $146 million. It is also said that Douglas took $45.5 million in profits on $598 million of contracts, although it farmed out all but $104 million.

Douglas hotly disputes these figures, although such "profit-pyramiding" is a perfectly legal part of defence contracting and accepted commercial practice. The company claims—although it failed to convince Mr McClellan—that many items should be deducted from its supposed profits: costs of interest, special depreciation allowances, advertising and charitable contributions. It insists that profits cannot be assigned accurately to individual projects and that it earned only 3.2 per cent before taxes on the Nike programme as a whole.

The subcommittee wants to discover whether the government could not save money by placing subcontracts directly. One witness testified that this had been proposed as early as 1954, but Western Electric refused to accept the responsibility for the whole job if it could not choose its own producers. However, Senator McClellan is late in locking this door. Mr McNamara, the able and energetic Secretary of Defence, is already bringing costs under control. "Cost plus fixed fee" contracts are losing favour and incentive payments for good work are being introduced. Direct subcontracting is being undertaken and non-profit organisations may act as "systems managers." Business, however, is left with a black eye at a time when it can ill afford it.

Seamen on Ice

FROM A CORRESPONDENT IN SAN FRANCISCO

THE strike of three maritime trade unions against twelve shipping companies on the west coast has almost been lost to sight in the rushing wake of President Kennedy's victorious engagement with the steel industry. Indeed, had the government not secured a Taft-Hartley injunction which suspends the five-week-old trial of strength for eighty days, the maritime strike might have continued to go unnoticed except in Hawaii and the District of Columbia. Hawaii is affected because the islands are dependent upon ocean shipping from the mainland to satisfy most of their needs. Although no real hardships had been caused up to the time when the injunction was issued, the strike might have brought great discomfort if it had continued. Washington was also concerned because of the risk that the dispute might hamper the government's attempt to keep the economy on a stable, non-inflationary keel. This risk was considered great enough to warrant the direct intervention of the Secretary of Labour, Mr Goldberg, and of the Under Secretary, Mr Wirtz. But neither was able to achieve a settlement.

One of the major difficulties confronting the would-be mediators was that the reasons for the strike were not clear. Ostensibly, the major cause was the failure of three unions (representing the sailors, the cooks and stewards, and the firemen, oilers and wipers) and the Pacific Maritime Association to agree on the amount of a wage increase. But there seem to be other equally important issues which are hidden from view. The shipping companies claim that the original increase of 11.8 per cent in wages and welfare benefits which they offered—a figure very close to that which the maritime unions on the east coast had accepted—had been agreed to by the unions in principle, although only informally, during the five months of negotiations which preceded the strike. The employers maintain that it was not until the negotiations had been almost completed that additional increases were demanded.

Before the strike was called there were indeed rumours that two of the three groups, the sailors and the cooks, were willing to accept the association's offer. The push for the strike appears to have come from the smaller firemen's union, whose new and vigorous president took office only recently, after a revolt of the members against his predecessor. In such circumstances militancy is almost required of a new leader, especially since pressures have been building up inside the union from the lower-paid wipers and oilers who feel that their interests have been sacrificed to those of the more highly skilled. In the past, however, it has been the more numerous sailors who have determined the general strategy; the present curious reversal of parts has caused great speculation along the waterfront, in the companies' headquarters and in Washington.

In contrast the ship operators seem less divided than usual and better prepared for a long strike. There are few signs of the rifts which normally separate the lines receiving government subsidies from one like the Matson Navigation Company which receives none. (Matson, alone among the large operators in the association,

gets no subsidy; this is because its passenger service to and from Hawaii has no competition from any foreign carrier. Thus while the other lines can pass any wage increases on to the government, Matson must pay the bill for them itself.)

All the companies fear that if they exceed the wage increase given on the east coast they will face new demands from the other trade unions which agreed to accept a rise of 11.8 per cent. In addition, the subsidised lines believe that it might be difficult to justify a larger increase than this to Congress. Paradoxically, however, the east coast settlement may be one of the anchors which keep the three unions from changing their position. No trade union likes taking just what others have already won and, besides, there is an old, bitter rivalry between the west coast unions and the National Maritime Union, which represents many of the maritime workers on the east coast.

As if this were not enough to complicate the negotiations, the issue of size of crews is also involved. The west coast docks are now being mechanised as the result of an agreement with the longshoremen, who will receive millions of dollars of compensating benefits. Naturally the ship operators are anxious to carry out a similar programme of modernisation on board their vessels. But they are likely to meet with much greater resistance. During the days when the strike was still on, the beached crews made no secret of their anxieties. Their employers insist that the number of sea-going jobs must be reduced if the lines are to compete with foreign ships. The men fear that if their unions refuse to accept smaller manning tables, west-coast cargoes will be diverted into east coast ships or foreign ones. That anxious talk will continue at sea during the 80-day period of the injunction and may prove to be the most serious obstacle to ending the strike satisfactorily.

In the meantime the shipping companies are trying to take advantage of the impasse to build up support for some form of compulsory arbitration in maritime disputes. But even if such legislation were to be passed by Congress, which seems unlikely, it could not be put into effect before the injunction expires. Both the association and the trade unions opposed the government's request for an injunction since, in their views, it only postpones the strike. Twice before injunctions have been granted in maritime strikes; both times these broke out again as soon as the 80-day period was over. The seamen and the ship-owners may prove more impervious to pressure from the Administration than was the steel industry. If so, the west-coast waterfront will once more become a desert—just as the Hawaiian tourist season reaches its peak and the pineapple and sugar crops are being harvested.

Crime Capital?

IN the last two years the streets of the District of Columbia have become more dangerous at night although where other crimes are concerned the capital is a law-abiding place. In 1959 there were 497 street robberies with violence; last year there were 1,012. Nearly half of these attacks were committed by youths, most of them Negro boys of 16 or 17. The big majority of serious crimes in Washington—over 80 per cent—are committed by Negroes, although they make up only 54 per cent of the population. The natural reaction, particularly on the part of the Southerners who dominate the congressional committees which really run the District, is to call for more police, more dog teams and harsher penalties.

But this time there are a few signs that Congress is beginning to realise that this is not enough. Recently it authorised two new judgeships for the Juvenile Court which, with only one judge at present, has a back-log of some 2,000 cases. This represents a notable victory over the obstructive southern forces which do not believe in "softness" toward young criminals and which preferred to let Washington do without the needed judges rather than run the risk that a Negro might be appointed to the court. Congress has also just done away with a very doubtful distinction which the District has enjoyed—that of being the only place in the country with a mandatory death penalty for certain kinds of murder. Now the District Commissioners are asking for $148,000 to carry out a study of juvenile crime in Washington, which the federal government thinks is needed.

Last month Senator Dodd, the chairman of the Senate sub-committee on juvenile delinquency, told Congress that it must deal with the problem of violent crime in the capital from two angles: by strengthening the police and by attacking its causes. One of the most obvious of these is that one out of every ten young people of 16 and 17 is neither at school nor in a job. To prevent these idle hands from turning to crime will require better schools and more probation officers and social workers; it also means keeping young people in school where possible, training them in skills and finding them jobs. But a solution will not come easily. The labour market in Washington, a city devoted to government, consists on the one hand of jobs in the civil service, for which many boys and girls who have dropped out of school early are not qualified, and on the other of work in shops and services. And most of the openings in shops are reserved for whites in this semi-southern city.

Senator Dodd suggests that Congress should pass a Fair Employment Act to end this racial discrimination which is so out of place in the national capital. This step is not likely to be taken until Washington is allowed to govern itself. But until Negroes feel that they are given equal treatment racial resentment will continue to inspire and condone acts of violence. Not long ago a bus driver was beaten and robbed by a gang of young toughs while his passengers sat passively by; none aided the police to find the criminals. The bus driver was white; his passengers and his attackers were all Negro.

SHORTER NOTES

European exporters of small motor cars will welcome the news that the Ford Motor Company is not to manufacture its Cardinal—a long-rumoured rival to the Volkswagen—in the United States. It would have been the smallest American-made car. The decision seems to have been taken because, apart from the Volkswagen, the small foreign cars are not thriving even in the present flourishing market in the United States. Even the demand for the larger domestic compacts is declining; those which are doing best are the bigger and more elaborate models. But on their home ground European manufacturers cannot count on being spared. So far plans to produce the Ford Cardinal in Britain and Germany have not been scrapped and the General Motors Corporation has just announced that its German subsidiary, Adam Opel, A.G., is to bring out a tiny car, the Kadett, later in the year.

* * *

Congress evidently feels that the Peace Corps, which sends volunteers to help in under-developed countries, has proved itself. The legislators have approved its expansion from its present 2,400 members to nearly 10,000 by the autumn of 1963 and have authorised an increase in its funds from $30 million to $64 million. This money still has to be appropriated.

COMMON MARKET THOUGHT

There are two good reasons to start thinking about the Common Market: you may be in it, and you may not. Those inside may have to face increased competition; those outside may lose their grip on the fastest growing market in the world.
Thinking, you'll need facts and perhaps advice. May we suggest that you apply to our bank. We can give you information on business with the Netherlands, the establishment of subsidiaries in Holland and other matters relating to commerce and industry. We shall be glad to give you the benefit of our experience in handling Common Market problems.

THE WORLD OVERSEAS

The Pompidou Succession

FROM OUR PARIS CORRESPONDENT

IT all looked like a real government crisis. The President of the Republic called party leaders to the Elysée Palace. The prospective prime minister, M. Pompidou, consulted potential members of his cabinet. Nostalgic parliamentary tipsters were almost tempted to calculate whether the new government would have a majority in the Chamber. But, in fact, the crisis was far from typical. M. Debré's government had not been defeated in the Chamber nor was M. Pompidou's brought in after an electoral victory. On the contrary, the change of prime minister followed the decision not to hold a general election. General de Gaulle came to the conclusion that M. Debré had outlived his usefulness and that the prime minister's subordination to the president must now be emphasised. The choice of M. Pompidou—the trusted former *chef de cabinet*, who had never sat in parliament—was perfectly logical. Once this decision had been taken it was possible to indulge in the niceties of the parliamentary game of cabinet making; the result was announced on April 15th.

In practice, however, there was not much scope for the game. None of the key portfolios—finance, defence, foreign or Algerian affairs—changed hands. This is partly attributable to the general's dislike of new faces and partly to the proximity of the next reshuffle. It is generally expected in Paris that once the Algerian problem is out of the way M. Joxe, whom many had thought to be the best choice for premier, will be rewarded for his services with the job of minister of foreign affairs. The present head of the Quai d'Orsay, M. Couve de Murville, is an *inspecteur des finances* and could, therefore, be shifted to the ministry of finance. Either for this or other reasons, only minor posts could be offered to console the faithful or tempt the reluctant.

The neo-gaullist members of the UNR (Union for the New Republic) were badly in need of consolation last week. Many of their deputies complained that to put off the election for a year faced them with the prospect of an electoral slaughter. All of them deplored the fact that gratitude was not a political virtue. M. Debré was a leader of the party; M. Pompidou, though a faithful gaullist, is not even a member. Whimpers could be heard in the disciplined ranks of the general's parliamentary supporters. M. Pompidou appeased them with portfolios; there are eleven UNR ministers in his team compared with nine in M. Debré's cabinet.

The other parties presented a slightly more difficult problem. The Radicals were not tempted by the bait of ministerial office and the adroit M. Edgar Faure had, therefore, to decline the ministry of education. The Christian Democrats of the MRP could not bring themselves to resist the call of ministerial duty, but their decision was not reached without heart-searching. The left wing of the movement, trying to prove that Catholic and progressive are not contradictory terms, argued that the party should not reinforce the government just when the whole system was moving towards more personal rule. But these arguments did not prevail with the party which has managed to stay almost permanently in office ever since it was formed after the war. It now has five ministerial posts instead of the three it had in the Debré cabinet, and M. Pflimlin, the unromantic hero of the surrender of May, 1958, has come back as minister of state for co-operation with the French Community (substantially in Africa).

Party politicians are merely a dressing for the dish of presidential government. But they behave, with their eyes fixed on the electoral map, as if little had changed since 1958. When the gaullist constitution was then introduced learned lawyers emphasised the twin-headed nature of its executive and forecast conflicts between president and premier. Less legally-minded commentators replied that the prime minister would simply be the president's servant, and that the whole system had been devised to give General de Gaulle the maximum of power with the minimum of answerability to parliament. This diagnosis is now amply confirmed by events. The only possible constitutional clash would be between the president and a hostile parliament. The manner of M. Pompidou's appointment, the use of "rule by referendum," these and similar conventions of the constitution—if Dicey's terms can be applied to the gaullist system—are designed to give the president the upper hand if such a conflict should arise.

Liberals in Paris seek comfort in the belief that General de Gaulle is not a man to abuse the powers at his disposal. They are, nevertheless, perturbed by the Pompidou succession. When the goodwill of the ruler is the major safeguard of freedom precedents have to be carefully watched.

Kenya's "Collision Government"

FROM OUR CORRESPONDENT IN NAIROBI

APPROPRIATELY, the week after the Kenya delegates in London approved Mr Maudling's framework for a constitution, Nairobi has had its traffic reorganised into what is cheerfully called "the rotary system." In the spacious African tradition, this city has several streets in which it was (until now) possible to turn a wagon team of oxen round. This week Nairobi is filled with barricades and pointing policemen, with drivers crawling bewilderedly round once familiar streets and the more reckless souls moving at their old pace and risking a dozen collisions from all directions. Blocking the main highway is a large "parking area," so cordoned off that it is impossible to enter at any point. This is, officially, progress. Most Kenyans feel the same way about the results of the London conference.

As soon as they landed in Kenya, the rival party leaders, conveniently forgetting that they were now joint ministers of state for constitutional affairs, set off in opposite directions. Each claimed that nearly everything had gone his own way in London. But it is clear that Mr Maudling intends to send Kenya off in the direction neither of federalism (the goal of the Kenya African Democratic Union) nor of an orthodox unitary state, which the Kenya African National Union wants. It seems possible, however, that the colonial secretary has left a side-street unblocked down which Mr Kenyatta and Kanu may hope to seek their original route. Having secured its primary objective of getting into government without conceding anything very tangible, Kanu will almost certainly use the general election at the end of this year as a referendum for toning down (Kadu would say repudiating) the parts of the agreement that it dislikes as "too regional."

Although it was a considerable achievement to persuade fourteen

politicians of such differing views to become ministers in the new coalition, many Kenyans have already nicknamed it the "collision government." Their cynicism has been encouraged by Mr Masinde Muliro, probably the ablest Kadu minister in the last government, who at first accepted his old portfolio of commerce and industry and then, within the week, asked for permission to resign in order to build up his minority party's flagging strength for the next election. If most leading politicians spend the rest of the year putting party before national government the climb out of the present trough will not be swift.

Yet there are some with energy and dedication. Mr Tom Mboya has briskly set about his difficult new job as minister of labour. He seems little perturbed to find himself in that dangerous zone Mr Nyerere inhabited for so long, where frequent praise from European journalists becomes a heavy liability. Each Kanu minister is blessed with a Kadu parliamentary secretary, and vice versa, in the hope that this will breed real co-operation. Several senior officials even hope that this year will see a merging of the two parties, with a joint renunciation of "extremist" wings. But any belief that Kanu would shuck off its vice-president, Mr Oginga Odinga, and his associates merely shows a poor appreciation of where power lies. Mr Kenyatta knows better. Asked what part this impish apologist for communism would play now that Mr Maudling would not have him as minister of finance, Mr Kenyatta said, "he will become the leading personality in our party."

THERE are many likely points of collision between the two halves of this national government. The most obvious is still the land question. The Kadu map for six regions confines the two main Kanu tribes, the Kikuyu and the Luo, to the smallest areas, and attempts to take away from Kikuyu influence the neighbouring Embu, Meru and Kamba tribes. Encouraged by the rest of Kadu, the 60,000 Masai are calling fiercely for the "return" to their tribe of the bulk of the Highlands. The Boundaries Commission will have a hard task soon deciding into what area the landless Kikuyu should be allowed to flow, but they will surely recognise the suicidal nature of the Kadu plan for bottling up the Kikuyu. Officials of the Land Settlement Board, while calculating that there is alongside the present Kikuyu borders only enough purchasable land for 2,000 families, are hesitant about letting Kikuyu farmers leapfrog into the middle of the Highlands, "because of this regionalism business." Yet a decision must be made soon, and it must be based on the realities of population pressures. There is need, too, for swift agreement on what part the politicians want a future provincial administration to take. So far no official has canvassed their views. The Institute of Administration, which gives expensive six-months' courses to African district officers, is almost a caricature of British public school ideas about leadership, complete with bugles, mountain climbing, and mess nights.

Who, again, will be able to help the economy recover and lead Kenya back towards full employment? As always, eyes and palms are turned towards Britain, which is already giving Kenya £16 million this year in grants and loans. The Christian Council of Kenya, which has called for higher taxes on "the affluent few," was emotionally attacked by three English-language newspapers. The rational objection is that higher taxation would more speedily drive away the despondent groups of Europeans who have been leaving at the rate of 240 a month. A better scheme would be for Kenya to start a national fund, something that Tanganyika left until independence. But Kenya needs its stimulation now. Such a voluntary fund could not be said to be driving Europeans away; yet it would serve better than taxation to show the British taxpayer that Kenyans are prepared to pay towards their own recovery.

The situation would be desperate—rather than just critical—if the coalition government had not been formed. There should also be relief that Kanu, representing two-thirds of the voters, has shouldered the larger burden in facing this crisis: it has secured all the most important available ministries—finance, economic development, education, labour, health and land resettlement. On the other hand, the governor, Sir Patrick Renison, has departed on indefinite leave and will be away during the crucial months when the constitutional details are to be negotiated. The fact that he shipped his car to England before the London talks began has encouraged some to think that the governor will not return at all. Perhaps it has been recognised in London that he could not avoid a collision with the new minister of state whom he referred to one improvident day that is only yesterday in many memories as "the leader to darkness and death." If Kanu and Mr Kenyatta cannot lead Kenya elsewhere today, no governor and no loan from Britain will suffice.

Spain's Eroding Interregnum

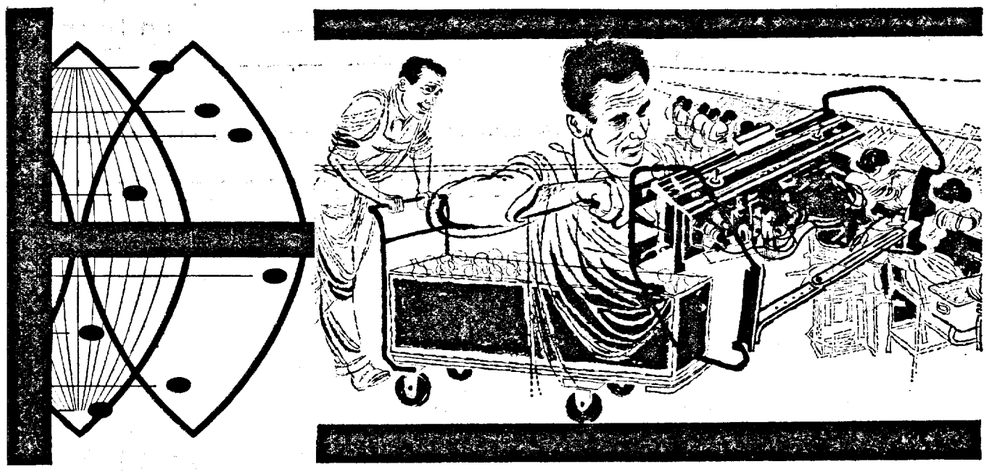
FROM OUR SPECIAL CORRESPONDENT

"Franco has shot himself!" a Madrileño told his wife.

"*Thank God! Who is succeeding him?*"

"Franco."

"*Thank God!*"



LIBERALS, socialists, and admirers of the Caudillo alike tell this little story, which sums up the problem of the Spanish succession and the ambivalent feelings of many articulate Spaniards toward the regime. It is the general's brilliance as a politician, not popularity, that has kept him in power all these years. His most determined opponents have, of course, been exiled, imprisoned or buried; and the majority of his fellow-countrymen—weary of strife, wary of politics—have been fully occupied trying to make ends meet.

But the Caudillo's regime has never been a monolith: it is a mobile, the survival of which has depended on his skill in offsetting one component with another—in balancing Church and Falange, Falange and monarchists, general and general, faction and faction. Within the Falange a delicate equilibrium has been maintained between traditionalist, corporative and *jonsista* (Catholic trade union) tendencies. Within the Church, *Opus Dei* has been cultivated as a counterweight to the Jesuits and other traditional influences, and Catholic Action fraternities have been allowed sufficient scope to preoccupy *Opus Dei*. The leverage of Don Juan's supporters has been weakened periodically by shrewdly-timed gestures in favour of Don Jaime (his brother), Don Juan Carlos (his son), Don Alfonso (Jaime's son) and the Carlist Don Xavier. Fiefs and fringe benefits have been carefully apportioned among the generals.

Who other than General Franco could keep this precarious contraption in being—and hold in check not only the groups that support the regime, but its opponents as well? No sane Spaniard wants a second round of the civil war, and even the Caudillo's critics are in no hurry to see the mobile upset until they form a clearer idea of what is likely to replace it. In theory, Spain is a kingdom to which the Bourbon monarchy will be restored one day. But the Council of the Realm, whose nominal purpose is to assist the Caudillo in making arrangements for the restoration, has little prestige and less authority; and whereas the ultra-reactionary Carlists are allowed to propagate their cause, the statements of the principal Bourbon pretender, Don Juan, are censored and his more outspoken supporters are apt to be harassed and fined, though they are rarely put in prison. Don Juan's brother Jaime, the eldest surviving son of Alfonso XIII, disqualified himself in the eyes of most monarchists by contracting a morganatic marriage, and in July, 1945, signed a renunciation of his claim to the throne. In August, 1961, however, he appeared to be reasserting his rights and urged the Caudillo to allow the Spanish people "to choose in peace and freedom the political regime they wish to govern them."

bread and butter men of this 'tron world

"Bread and butter" men are most of the 225,000 Philips men and women who **make** Philips products in many countries of the world... a 'tron world more and more reliant on the fast-expanding science of electronics. They are the technicians who interpret the findings of researchers and scientists with metal, glass and synthetics. They are practical, methodical, skilful... electricians, engineers and thousands of people along the line of production. All, in some way, contribute to the finished product, whether it is a synchro-cyclotron, television set, or common household light bulb. Philips products entertain, comfort and brighten the modern world... also help industry at work. The "bread and butter" men of this 'tron world are the people who build, assemble and test components for reliability, performance and longevity. These are some of the "built-in" qualities which have made the vast range of Philips products famous, and have seeded this name in the minds of people around the world.

WORLD FEDERATION OF INDUSTRIES

Philips aim towards stability now and security for the future - as is witnessed by their wide scope of products and their world-embracing activities.

PHILIPS

It is in the nation's interest that, without compromising the quality of work, construction costs be kept in check. Only by making full productive use of all resources — manpower, materials and machines — can genuine economies be effected

COST CONTROL

Cost control techniques are practised extensively by the Laing organisation. Advance planning in detail of every phase of a construction project gains precious time by ensuring that men, materials and plant are available when and where they are needed. The application of work study is increasing productive output, cutting out unnecessary or overlapping effort and achieving a faster and smoother flow of operations.
Utilisation of mechanical aids is planned to realise their full potential, while regular maintenance reduces costly breakdowns. Site surveys and rigorous quality control of all building components prevent delays through faulty materials once work has started. All these measures are primarily savers of time, and time is the essence of economy in large scale construction today.

LAING For completion on time

Obviously, the moment all doubts about the succession are removed, and detailed arrangements made for the transfer of power, General Franco will cease to be indispensable. He has every incentive to prolong the uncertainty. When the unexpected—a shooting accident—occurred last Christmas Eve and General Franco had to undergo an operation, he hurriedly and imprecisely authorised three of his generals (the minister of the interior, the minister for the army, and the chief of the general staff) to act as his political executors. Civil members of the government and of the Council of the Realm were not informed until after the brief crisis was over. This fact, and reports of disagreement between the three officers on procedural matters (though all were in favour of offering the throne, sooner or later, to Don Juan), disturbed Churchmen, falangists, monarchists and republicans alike, and set off a flurry of discreet lobbying, manoeuvring, pamphleteering and claim-staking during the next few weeks.

Early in March sources close to the Caudillo let it be known that he, too, somewhat shaken by his accident, now considered it advisable to strip the constitutional question of all ambiguity. Shortly afterwards the Vatican jogged his arm with a statement on preparations for the marriage of Don Juan Carlos which referred to the young man as "Prince of Asturias." As this title is reserved for the eldest son of the reigning monarch, the Church was clearly putting on record its support for the prince's father, Don Juan. The crucial phrase was omitted from Spanish press and radio reports of the Vatican statement, which was front-page news in all but the falangist papers; but informed sources suggest that General Franco may shortly follow Rome's example.

Although a few Catholic papers have recently published articles favouring early restoration of the monarchy, it is not yet clear whether Spain's ecclesiastical hierarchy intends to mobilise its powerful information media on Don Juan's behalf. Certainly, one should not expect the Church suddenly to break with General Franco. Similarly, although the balance of sympathy among Spain's senior officers has tilted in recent months in Don Juan's favour, the army remains loyal to the Caudillo. Its key officers—

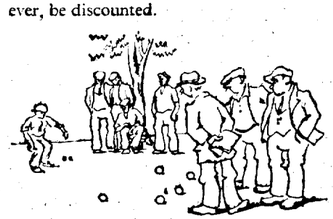
Living with Pétanque

FROM OUR CORRESPONDENT
IN SOUTH-WEST FRANCE

"I'M sorry," said the man at the door. "I've broken your bathroom window with my little pig."

Spring had come. And spring in southern France brings not only blossom, tom-cats and a new edition of the Guide Michelin, but *pétanque*. Saturday and Sunday afternoons and seven evenings a week are punctuated by an insistent metallic clicking, as of woodpeckers attacking street-lamps; an eager citizenry, tense one minute, cheering and laughing the next, assembles beneath the plane-trees in every congenial square. The season continues until the first chill of winter, and on at least two Sundays every self-respecting town and village plays host to *boulistes* from the rest of its district. Then even sedate avenues and sacrosanct public gardens resound with the whizz and thump of shot and shell. Small steel cannonballs, weighing just under two pounds, rain out of the sky; but nobody minds, there are prizes galore, and the losers are consoled with a bottle of *mousseux*.

The more formal French bowls game, whose centre is Lyons (it is called *la boule lyonnaise*, or *la longue* for short), requires a smooth surface and a clearly marked pitch: it has much in common with English bowls. *Pétanque*, which dominates Mediterranean and south-west France, can be played on any firm surface: a patch of gravel and a tree-root or two add variety and hilarity. Teams are usually of three players, each of whom has two bowls. In startling contrast to English bowls, a player may "shoot" an opponent's bowl out of the way by hurling his own bowl at it. Occasionally, tactics may dictate that the jack (*cochonnet*, "little pig") be shot out of the way on to a more favourable patch of ground. The jack is small, light and volatile; fortunately, it is made of wood, so casualties are few, but overhanging lamps are frequently smashed by players who toss bowls into the air in order to avoid a rough patch or a barrage of their opponents' bowls.



The intellectuals of *pétanque* have traced its origins to a game played by the Greeks four centuries before Christ, and credit Greek sailors with introducing it at Marseilles. Hippocrates is alleged to have declared it the most beneficial of sports, and Galen to have praised its effects on the legs and kidneys.

Two French kings—Charles IV and Charles V—tried to ban the game in the fourteenth century because it diverted their subjects from archery and other pastimes of military value. Rabelais informs us that Gargantua was a player, and in the sixteenth century the faculty of medicine at Montpellier recommended the game as conferring immunity from "all rheumatisms and similar ills." In 1697 the Paris clergy was forbidden to play "bowls and games of chance" in public, but authorised to do so in the privacy of monasteries and presbyteries; by that time the click of bowls was already as often heard, in some cloisters, as the drone of prayer. On October 22, 1870, the Prefect of Marseilles castigated the "bad citizens" who played bowls instead of participating in military exercises: "*Laissons dormir les boules quand les boulets déchirent le sol sacré de la patrie. . . .*"

Today some 200,000 Frenchmen play *la boule lyonnaise* and about 500,000 are addicted to *pétanque*. The latter total is increasing at a rate of about 10 per cent a year. A highly esoteric newspaper, *La France Bouliste*, is devoted to bowls, and more than one earnest foreigner has been seen studying it in the belief that he has discovered a new political movement.

Moralists claim for *pétanque* the sort of virtues that used to be claimed for cricket. It keeps youths off the streets and their elders away from TV screens; it does not lend itself to commercialisation and is rarely an excuse for gambling (though Sunday morning games generally decide which team shall pay for the apéritif). Most important, it is a cohesive social influence of a kind England could do with; a social cross-section of any small town can be seen on its *boulodrome*.

Pétanque will establish a foothold in England in July during Harrogate's annual French week. The town has invited two French teams to demonstrate the game and spend a few days coaching such local talent as may emerge. The visitors will also try their hand at English bowls. Rumours that negotiations between Britain and the EEC may be held up pending the outcome of this confrontation should, however, be discounted.

General Barroso, minister for the army; General Galeras, commander-in-chief North Africa; General García Valiño, captain-general of the Madrid region; General Menendez, captain-general of the Burgos region; General Alonso Vega, minister of the interior; and General Muñoz Grandes, chief of the general staff—have all been won for the monarchy and Don Juan, but they are far from clear about the kind of monarchy they want. General Barroso, for example, favours a "strong" regime in which the army will play an important part, while General Menendez is a comparatively liberal monarchist. General García Valiño was once a Carlist sympathiser and thought the Caudillo too "soft" (he recently considered it politic to stress his "complete loyalty" to General Franco). It is on such doubts and divisions that the present regime has hitherto thrived.

But as anticipation of Don Juan's accession takes root in the army and Church and permeates the levels of society, impatience with the Caudillo's interregnum grows. Don Juan, in his early fifties, is after all old enough to dispense with a regent. The log-jam could break if the European Economic Community were to turn down Spain's application for association on political grounds. Spanish expectations of the benefits to be derived from association with, and ultimately membership of, the Community are soaring to such heights (and the consequences of exclusion are being depicted, even in the press, in such gloomy terms) that the shock, disappointment and humiliation of rejection could impel the army leaders and ecclesiastical hierarchy jointly to request General Franco to make way for a more widely acceptable regime headed, or presided over, by Don Juan. This is the kind of scenario most moderate critics of the Caudillo seem to favour.

Finland's Forty Days

FROM A CORRESPONDENT IN HELSINKI

It took more than forty days, and talks involving over a hundred members of parliament and trade union leaders, to reach a compromise on Finland's long-awaited majority government. The new cabinet was finally born on April 13th; it is the 47th in Finland's 44 years of independence. At its head is Mr Ahti Karjalainen, a member of the Agrarian party, who at 39 is the country's youngest-ever prime minister. Mr Karjalainen, widely regarded as the "crown prince" of President Kekkonen, has been minister of trade and foreign minister in past cabinets, and took a leading part in the negotiations that led to Finland's association with the European Free Trade Association last year.

The new cabinet includes five members of the Agrarian party (which with 53 seats is the leading group in the 200-member Diet elected in February); three Conservatives, of whom only one is actually a member of the party's parliamentary group; two representatives apiece of the Swedish People's party and of the Finnish People's party; and—most interesting of all—three representatives of the main trade union federation, SAK. Although only eight of the 15 ministers are members of the Diet, the political groups taking part in the Coalition have a majority of 113 votes to 87.

February's election had led many people to expect the formation of a cabinet drawn entirely from the parliamentary parties. But at an early stage of the negotiations after the resignation of the Agrarian minority government on March 1st, the Agrarians made it clear that SAK, which represents the majority of the divided Finnish trade union movement, must be represented in the new cabinet; since President Kekkonen himself comes from the Agrarians' ranks, this wish was virtually law. The unexpressed reason lay in Finland's relations with the Soviet Union, which made it desirable to include some Socialists to balance the Conservatives.

Most Finns are relieved to have a majority government, except for the Social Democrats, who are still not thought of as suitable partners in a coalition, and the Communists, who see the ghost of fascism behind the three Conservatives. But it should be added that the solution of Friday, April 13th, could have been reached a month earlier. There had been plenty of time to plan the programme of the new cabinet, and the distribution of portfolios, after the parliamentary election in the first week of February. Thus the opportunity for a month's creative work by the coalition was lost, and the forty days of discussions and back-stairs bargaining did nothing to facilitate future co-operation within the cabinet. Neither the new foreign minister, Professor Merikoski, who led the first search for a coalition, nor Mr Karjalainen was able to find his way alone in the jungle of party give-and-take. President Kekkonen's help had to be called upon to make those involved realise that coalition means compromise.

Several things require the new government to buckle down. The prospect for Finland's exports is less bright than it has been in the recent boom years. The budget of 1962 is balanced only by recourse to large loans. A general scheme of health insurance is one of many projects demanding capital outlays. The new cabinet's programme also promises to study the possibility of achieving the Finnish worker's dream of a 40-hour week without jeopardising the economy. Moreover, before very long Finland must decide what to do about the common market.

Quite possibly the Finnish Communists will protest about the shape of the new government and find support in the Russian press. But Mr Khrushchev must know that the cabinet has been formed with President Kekkonen's blessing and according to his wishes—which means that it conforms with his determination to preserve Finland's neutrality and its good relations with the Soviet Union.

Tougher Thoughts in India

FROM A CORRESPONDENT LATELY IN THE HIMALAYAS

In a nuclear age the idea of a revival of Kipling's nineteenth-century "Great Game" over India's northern frontier, with China replacing Russia as the poacher on Indian soil, may sound far-fetched. But India's policymakers have begun to stop being inhibited about inheriting problems that date from the days of British rule. The Chinese threat is now seen as real. Few people in India believe that China's rulers actually contemplate an invasion of their country; but many have come to think that Peking must be prevented from continuing to make dangerous assumptions about Indian vulnerability and docility.

India, it is argued, may be forced at some point to react with considerable strength against Peking's pinpricks, to stop the Chinese from deluding themselves into the belief that their southern neighbour is a "soft option." It is clearly one of Mr Nehru's main anxieties that he may be forced into over-reacting, on a scale that would amount to a deterrent-type operation. This anxiety was revealed in the curt language of his last note to Peking in March, in which he gave warning that India will take all the necessary steps to protect its territorial integrity, and said bluntly that Chinese troops must withdraw from Indian soil. It is instructive to compare this message with the much milder tone prevailing in his long seven-year correspondence on the frontier question with Mr Chou En-lai.

It is in Nepal that India now faces the most potentially disturbing threat of all those that China's actions have ranged along the Himalayas. East of Nepal the Chinese have laid claim to parts of Sikkim and Bhutan and raided across the Indian border in the North East Frontier Agency. West and north of it they have established themselves in the Ladakh area of Kashmir solidly enough to build a military road across the territory they have occupied. But in Nepal the Indian government has got itself into a weak position politically as well as militarily; and Nepal directly flanks the great central Gangetic plain. Along this most crucial sector of India's northern frontier it has no forward line of military outposts up on the Himalayan ranges, and if it cannot count on Nepal as a dependable "buffer" the great plain lies open to an immediate threat from the north.

India's present trouble with Nepal is largely the result of past unwillingness to think objectively about strategic problems, or to shape a policy that leaves no doubt about capacities and intentions. While India has lost influence in Katmandu, Chinese influence and pressure there are subtly increasing. The Chinese are playing a shrewd game, having evidently learnt something from the mistake they made in handling the Tibetans too roughly. Memories are reviving of the period four years ago when parts of eastern Nepal were under the effective control of local communists.

Mr Nehru is, of course, right in regarding the autocratic regime that King Mahendra re-established at the end of 1960 as inherently unstable. But he must soon realise that the king will not put his house in order in the democratic way that Indians would like simply to please them and make them feel more secure. The king says that he intends to institute "*panchayat* democracy," with elective representation at the village level, but he remains unresponsive to Mr Nehru's hints that something more substantially representative would be better still. If the Indian government hoped that the recent wave of border raiding directed by the Nepal Congress leaders in exile from their Calcutta headquarters would spur King Mahendra on to revive democratic processes, this hope has proved false. It now seems clear that the raiding must be stopped before the king can be brought to adopt a more conciliatory attitude. Much hope has been pinned on his visit to Delhi this week.

Two other new factors may have great influence in shaping India's new defence policy. The first is the general and genuine Indian anger at foreign reaction to the occupation of Goa. This has gone very deep. From Mr Nehru downwards Indians feel that precious few people in the outside world understand their case over Goa; and it is now often said in Delhi that India would run into similar heavy criticism if it got really tough with China. This is irrational; but Indians do feel badly misunderstood.

The second factor is the political advance of Mr Krishna Menon, with the accompanying development of large and potentially powerful armed forces. Mr Menon remains something of an enigma; but he has already produced an interesting variation of the historical link between soldiers and the political left. He has buckled down to the job of defence minister with intriguing zest. The possibilities of an Indian arms industry seem particularly close to his heart.

Ministers and senior officers are cagey about the deployment and potential of the army; but there is no doubt that the things the soldiers want to do with it include seeing the Chinese off Indian soil in Kashmir, stiffening the Nepalese army and strongly and permanently garrisoning Sikkim and Bhutan.

Despite this tougher attitude it remains true that not many people in Delhi have been prepared to admit that Chinese aims and strategy are unambiguous in intention if devious in execution. Yet the Chinese objectives are plain enough. They are to embarrass and harass India politically, economically and militarily, in order to block any democratic challenge to the communist system.

Komsomol Fashions

A PLAIN leather jacket was, for years, almost the uniform of a young Russian communist. Girls belonging to the Komsomol wore no frills and used neither powder nor lipstick. Until quite recently, communist youth papers were taking the lead in the campaign against the *stilyagi*, the Russian teddy-boys. But the campaign is now dying down and *Komsomolskaya Pravda* itself is taking an interest in fashion, as shown in the article, published some weeks ago under the significant title: "It's pretty, but you will not buy it."

The article was inspired by a letter from a reader, A. Aleksandrova. This young lady had seen a smart ski-ing suit at a fashion show and was assured that she would soon be able to get it in the shops. But now, although the winter was drawing to an end, the smart suit was still not to be seen.

The writer adds that there have been similar complaints about other kinds of clothing. When, she complains, will our fashion people stop working just "for show"? To answer this question, the communist youth paper asked the help of a woman designer in the All-Union Fashion House.

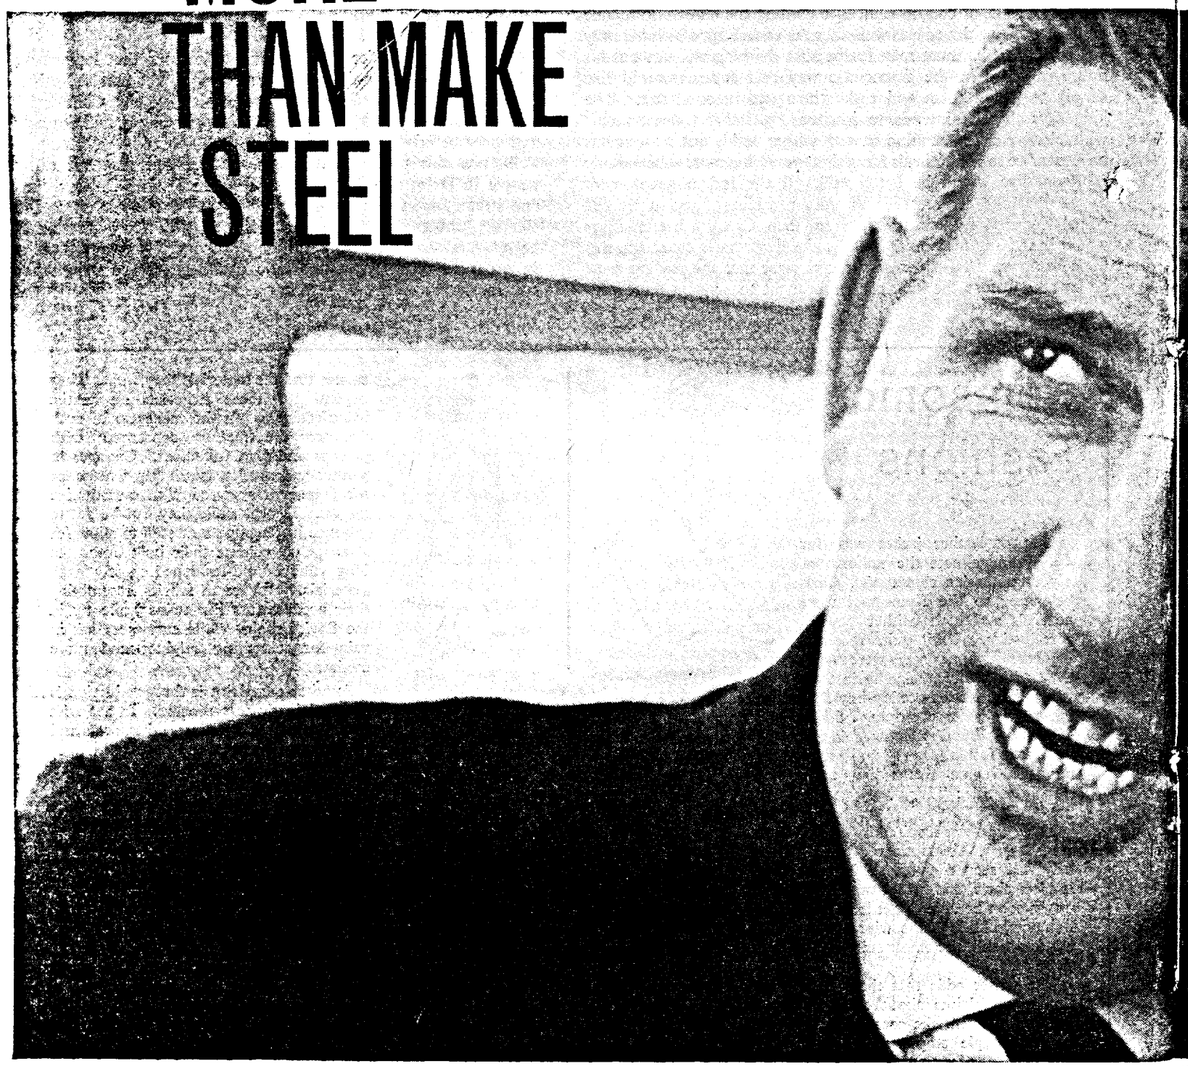
A. Levashova, the designer, begins her explanation, tongue in cheek, by recalling the praise lavished by French papers on the Soviet fashion show in Paris. A French communist journalist tried to explain this success by the fact that, while western houses of *haute couture* work for the privileged few, Soviet designers work for the masses. That is how it ought to be, argues Mrs Levashova and then goes on to explain why Soviet reality does not quite correspond to this lofty ideal.

In practice, the snags occur when a model is worked out and approved for production. The dressmaking workshops cannot find the materials they want. They depend for these materials on textile manufacturers, but the managers of such factories are mainly concerned with yardage and plan fulfilment. Changes in pattern and quality are simply a nuisance for managers obsessed with quantitative targets. Hence, while they can be got to produce just enough new stuff to allow for shows, they confine their bulk output to long runs of old-fashioned mostly drab materials. "Veteran fabrics, resembling their predecessors like twins" pile up in the Soviet shops, while customers ask in vain for something brighter and more modern.

Another complaint is that production is not sufficiently co-ordinated. In a Soviet shop you will find dresses, skirts, coats and all, yet nothing seems to go together. It is like "the table of a bad housewife: there are lots of dishes, but you don't feel like eating." Mrs Levashova understands that all this cannot be changed overnight, but she pleads for reforms. In particular, she suggests that the Gosplan and the ministry of trade should include fashion councils to advise on patterns and proportions in textiles, clothing and footwear.

A Soviet Dior for the millions is not for tomorrow. The trend, however, is significant. Consumers, particularly the young, are becoming fashion-conscious. And the once puritan Komsomol backs this demand for a brighter appearance.

RTB DO SO MUCH MORE THAN MAKE STEEL



RTB steel is made at Ebbw Vale* by men highly experienced in making hot rolled and cold reduced sheet, strip and light plate, electrolytic and hot dipped tinplate, and galvanised sheet. They give a service that understands and meets your needs . . . looks after your supplies . . . and exercises stringent quality control. In addition, RTB offer an ever helpful technical advisory service, staffed by qualified engineers ready to go anywhere at any time, bringing to your problems an unrivalled breadth of experience and knowledge.

RICHARD THOMAS & BALDWINS LIMITED

RTB

STEEL THAT SELLS

RICHARD THOMAS & BALDWINS LIMITED
RTB HOUSE 151 GOWER ST. LONDON WC1

*All the vast experience RTB has accumulated at Ebbw Vale, where so much of modern steelmaking has been pioneered in Britain, is being built into the great new RTB Spencer Works at Newport. These Works, soon to start production, will make RTB the only British steel company with the resources and flexibility of two continuous wide hot strip mills.

THIS IS THE EAST...

Economic development in Asia is bringing higher living standards to these young people and to the vast population of that continent. Demand for an ever increasing range of merchandise is steadily rising. If you are interested in trade with these expanding markets, you are invited to avail yourself of the banking and information services of The Chartered Bank and its subsidiary, The Eastern Bank Limited. The combined organisation of the two banks comprises one hundred branches in twenty-seven territories extending from the Eastern Mediterranean to the Pacific Ocean.

THE CHARTERED BANK

Incorporated by Royal Charter, 1853

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2

West End, London branch: 2 Regent Street, London, S.W.1 · Branches in the United Kingdom also at Manchester and Liverpool, in Germany at Hamburg and in the United States at New York

The Eastern Bank Limited HEAD OFFICE: 2 & 3 CROSBY SQUARE, LONDON, E.C.3

Associated Banks: Allahabad Bank Ltd. (Incorporated in India) · The Irano British Bank (Incorporated in Iran)

THE BUSINESS WORLD

Lords of the Cloister

On the same day last week that the chairman of one of America's largest companies was practising price leadership and getting slapped down for it, the chairman of one of Britain's largest companies was advocating price leadership as "the right lines on which we should work," and arguing that "our rulers, if they were properly instructed, would see how much better such a system is than either the cloister or the jungle." Lord Chandos, talking to Scottish engineers and shipbuilders, had defined his terms with a characteristic, cynical urbanity. The cloister he defined as "combinations of manufacturers, price-fixing associations, cartels and so forth, causing an arthritic condition in industry." The jungle was what the Monopolies Commission and the Restrictive Practices Court were designed to promote: "cut-throat competition, which will leave behind it many corpses—and not only the corpses of employers but of employed—on the field of battle." Lord Chandos had little doubt that in practice both these alternative patterns of business behaviour would lead one day to "very much the same end product. . . . bigger and better monopolies."

What was his definition of price leadership? A company, he said, becomes recognised as the price leader in a single commodity or a single product. Its competitors do not contract never to sell below this company's prices; but—so long as "it is generally understood that . . . these prices give no more than an adequate return on the capital"—it is understood that its prices will be followed. In such a system of "self-discipline" it is "equally understood that if for reasons of immediate gain the smaller competitors start cutting prices, in order to gain more of the big man's business, they must face the consequences of a price war, which will lose them a great deal of money and possibly lose their existence." And although in price leadership thus defined no formal understanding is needed to encourage this self-discipline, "you must have co-operation in compiling statistics" on the shares held of the market for the product concerned, so that each manufacturer can be satisfied that he is not being outsmarted by his comrades in the ranks (or even by the leader?).

This cold-blooded definition of price leadership and what it is designed to do may go rather farther than any American industry used to admit. (The term, once admissible in American companies' rationalisation of how they behaved, has dropped out of their vocabulary since the anti-trust authorities began to argue that competition may be restrained without any collusion at all, and that mere "conscious parallelism" may be a crime.) Lord Chandos links his conception more bluntly with implicit market-sharing than some other exponents of price leadership might like. With or without this specific connotation, however, there is not much doubt that over quite a wide range of business in Britain, and most other western capitalist economies, what Lord Chandos thinks desirable does obtain: price leadership, be it firm or loose, is customary.

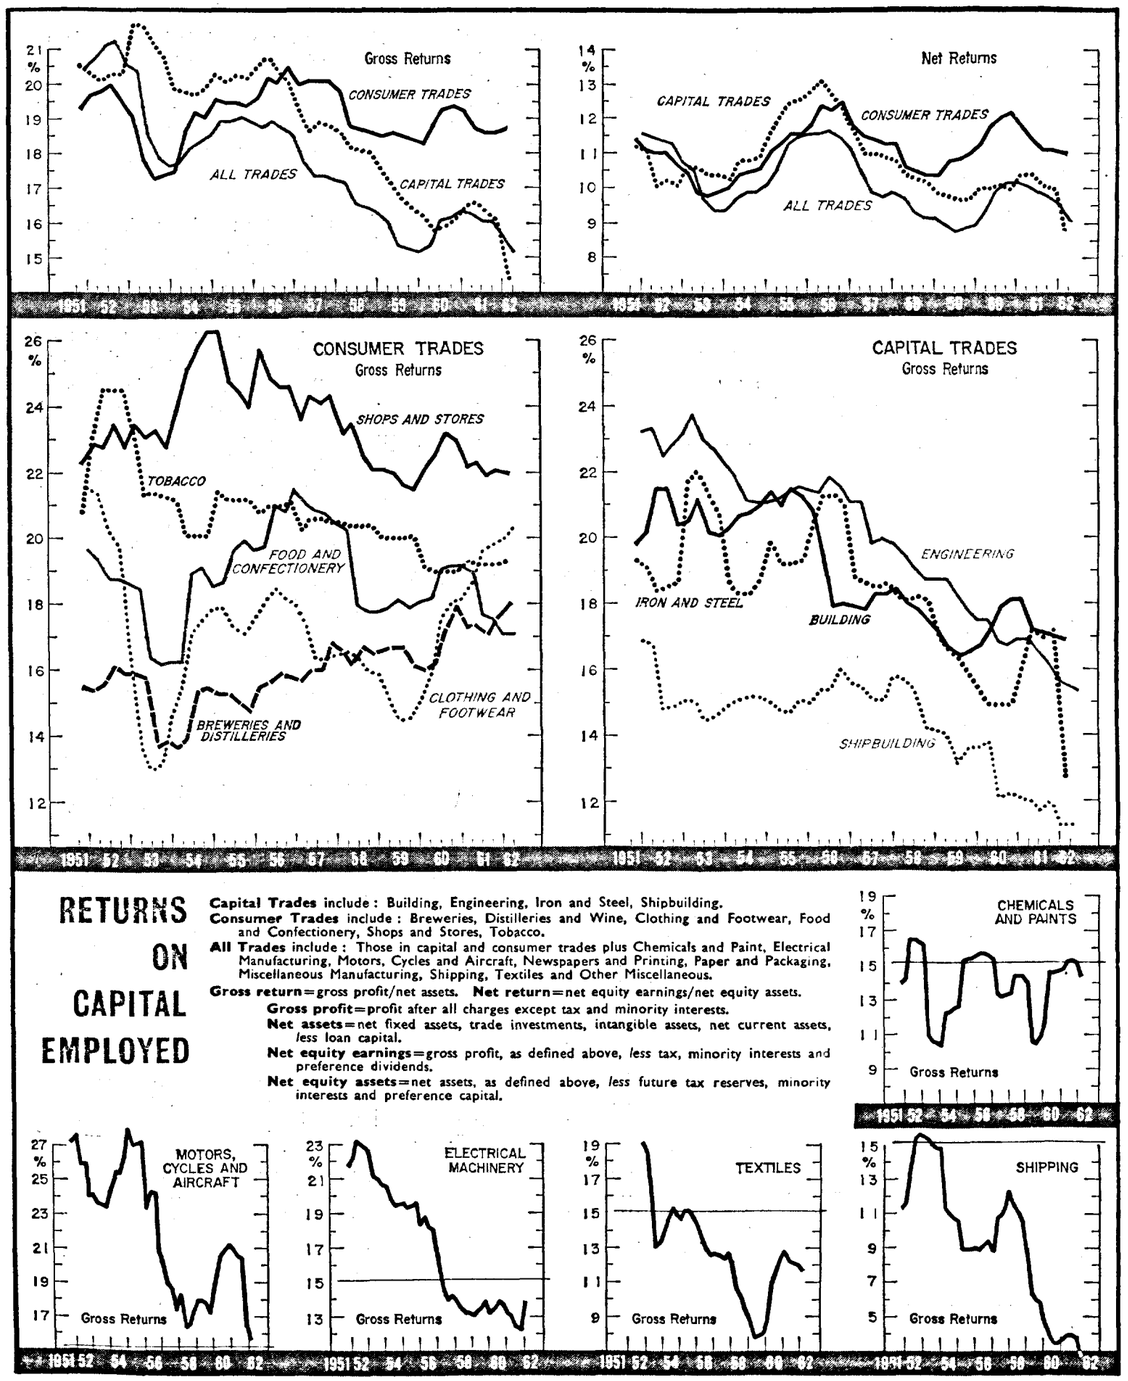
It is often argued, indeed, to be an inevitable corollary of "competition among the few," between the sizeable business units into which highly-capitalised industries are "naturally" organised. (Most industries consider themselves highly-capitalised and believe they are getting more so.) Where demand for any product is pretty inelastic to price, but without too much loyalty to particular makes, a cut in price will have to be followed by all one's competitors but won't much increase total sales: so internecine price competition will leave each maker's share of the market much as it was, but leave all with lower margins. Better trust the price leader (Americans sometimes use the phrase "reference marketer," which is not yet illegal) to move when costs or the opportunity of tapping new levels of demand, in his judgment, justify a move up or down in price. Trust the leader; fall in behind. By temperament and convention as much as commercial rationalisation, many British businessmen always do.

Price leadership, it will be noted, need not fall foul of the Restrictive Practices Court: no agreement need be involved, beyond perhaps one to exchange information. It can be much less formal, indeed, than the "open price agreements" to exchange information about prices, without obligation, that have replaced price-fixing agreements in many trades since the Restrictive Practices Court began to outlaw them. Abolition of resale price maintenance, in final sales to the consumer, might strengthen the countervailing power of any retailers or wholesalers who were inclined to buck a price leadership system: but it extends perhaps more widely in intermediate sales to business. Only American anti-trust legislation has ever tried to tackle price leadership, and so far without great success. It is certainly difficult to imagine national or supra-national departments in the European common market trying—and while Britain's entry into the common market may begin with a sharpening of price competition between national industries, it is perfectly possible that this, in various types of

industry, will eventually be checked and replaced by some assertion of price leadership from the biggest units. Moreover, it is perhaps only fair to add that in some really heavily-capitalised industries where it is prevalent (though not all those in which the arguments for it are advanced) it might be difficult to suggest what kind of pricing, if this leadership were outlawed, should replace it.

Lord Chandos can reasonably draw a distinction between the long-term commercial policies of the modern corporation, run by salaried managers, and the "get-rich-quick" mentality of the enterpreneur, seeking immediate gain, who is taken as the noble savage of the perfectly competitive jungle. In the same way, recently, Mr Paul Chambers could point to the simplifying assumptions implicit in theories of competition as ultimate economic virtue—"we cannot insert into the calculations the reality of imperfect and unequal knowledge." And it is true that some moral homilies about the business behaviour of the twentieth-century corporation continue to be delivered in terms that were somewhat idealistic even as a rationale of an 18th-century produce market.

But these lords of British industry—flushed out of the cloister, but too civilised to choose the jungle?—should perhaps also consider the corollary of their realism. No theory of "imperfect competition" or of "industrial self-discipline" yet evolved has been able to suggest that this kind of real behaviour in a real world can be relied upon to bring about that rightness of price, that optimum efficiency, that ideal allocation of resources that the theories of perfect competition were so sure would arise from unreal behaviour in an unreal world. Remove the simplifying assumptions, and one removes any automatic acceptance of business behaviour too. Lord Chandos would probably say that went years ago, anyway. But its removal positively invites the intervention of society into the sphere of decisions that many of his fellow-businessmen, less ruthlessly realist, still consider their own prerogative. If the businessman is not going through the motions that should, doctrinally at least, ensure the rightness of the resultant of whatever he and his fellows decide, other people may feel they could take the decisions better. (Whether they could or not is beside the point, but that they should try will be increasingly believed.) It may be symbolic that President Kennedy did not react to US Steel's decision about prices last week by arguing that it was taken in an uncompetitive way. He said the decision was wrong. And changed it.



Profits: A Ten-Year Look

One most useful weapon in the armoury of investment analysis is the return earned by a company on the capital it employs. Inter-company comparisons of such rates provide the investor with an important statistical test of the quality of management. Among companies that produce similar products, a declining trend in the rate of return earned by one company and a rising trend for another provide an obvious investment inference. The test is not infallible: but such comparisons help to limit the area of choice in investment.

Comparisons of this kind begin with industries rather than companies. The accompanying charts, based on some delving into the quarterly analysis of profit and loss accounts and balance sheets prepared in this office over the last decade, provide inter-industry comparisons. They show moving averages of the returns on capital employed, plotted by the quarters in which the relevant accounts were published. Accordingly the latest figures in the chart reflect the average experience of companies which published their reports in the year from April 1, 1961, to March 31, 1962—since accounts appear roughly three months after the end of the financial year to which they refer, the latest figures can be said to reflect the combined experience of companies in 1961. Figures in the table are based simply on the accounts published in the first quarter of this year; it is intended to publish such a table with each quarterly analysis of profits and the charts will be brought up to date annually.

The charts are not merely economic history: they have relevance to private investment decisions now and even to broader planning decisions about investment in future. Returns both before and after tax (gross and net) have been declining in the last decade, net returns less steeply than gross returns because of the reduction in the standard rate of income tax. The decline in gross returns from 20.4 per cent to 15.1 per cent has been broken twice only—around 1954, reflecting the inflationary profits of the early fifties, and around 1960, reflecting a year of genuine economic expansion in 1959. A decade of steady capital accumulation at rising current prices would inevitably have reduced the average rate of return on capital employed, even if the real rate of profit had been maintained. But it is also true that lower profits have become the rule on new investment; inflation has been pushing up costs while competition now has an increasing influence in keeping selling prices down.

This is the general pattern. But the trades closely in touch with the consumer show up more favourably than the capital goods producers. The charts reflect the cyclical nature of the capital goods industries, and the motor industry too; but the steep fall in the rate of return on capital invested in the capital goods groups, compared with three or four years ago, has occurred despite a high level of activities in most of these industries. Shipbuilding, to nobody's surprise, is in a persistent earnings decline with the rate falling in ten years from 16.8 per cent to 11.2 per cent; and the sudden drop in the steel industry's earnings last year from 17.1 per cent to 12.8 per cent shows the frightening impact of reduced rates of operation after a period of extensive investment. The ten-year fall in engineering earnings from 23.2 per cent to 15.2 per cent is quite as disturbing as the failure of investment in electrical manufacturing to earn an adequate keep. Shareholders who have so often been asked to contribute new money to the electrical manufacturing industry in the last decade cannot fail to be disturbed by and dissatisfied with a current rate of 13.8 per cent, against 21.8 per cent ten years earlier. The earnings record of these industries does not suggest that they have adequately adjusted their organisation and policies to the pressure of international competition.

In the consumer trades, clothing and footwear appear in recent years to have made more positive responses to the forces of competition than textiles. In footwear particularly, rationalisation has been widely and radically applied. The same is true of the brewers which have achieved steadily rising returns. Food and confectionery and shops and stores show a good rise in the late 1950s, but their returns have been falling more recently. Competition between retailers is beginning to bite severely, and already the charts pose the question whether thin growth yields on many food and supermarket stocks are entirely justified today.

Past performance is of some help to the investor by showing the industries in which genuine growth is proceeding. The charts also serve a further purpose—as a yardstick against which the performance of individual companies can be measured. If the investor uses the definitions of "assets" and "profits" set out on the preceding page and fits the mid-point of the company's accounting year to the mid-point of the notional accounting year for the industry, a reasonably synchronised comparison emerges. If this shows that the company is doing consistently worse than the industrial average, solid reasons will be needed to justify buying the share. If the company has performed better than the industrial average, it is no time to sell. There are statistical hazards in such comparisons, particularly when companies have revalued their assets; but the danger is less sharp when a company that has revalued is set against the industry averages (which automatically take in the revaluation) than when it is compared directly with another company which has not revalued.

THE charts provide a long-term guide while the latest quarterly analysis surveys near-contemporary events. Neither provides an unequivocal assurance to the investing public about the money that British industry is making after a decade of active investment. Compared with a year ago, the gross return earned on the capital employed by the 371 companies reporting in the first quarter of this year (and referring roughly to a trading year that ended in September) fell from 16.5 per cent to 14.3 per cent. This reflected a fall of nearly 2½ per cent in trading profits, from £601½ million to just under £587 million, and a rise in total net assets from

The New Statistics

IN the first quarter of a new year the opportunity has been taken to revise the analysis of profits and balance sheets made in this office since 1949. A self-balancing method has been retained but the manner in which the collated statistics are presented has been altered. Several important accounting sub-totals and ratios are now shown; these include total income, profits before tax, net equity earnings, dividend cover, net fixed assets, net current assets and net total assets. The order in which the items appear in the combined profit and loss accounts and balance sheets has been altered so as to give prominence to the new sub-totals.

Some items have now been combined. Other current income has been merged with investment income; administrative charges, contingencies and provisions and pensions have been amalgamated into a new item, "other charges"; and profits retained by subsidiaries, parent company reserves and the difference in the parent company's carry forward have been added together to form another new item, "retained earnings." The new form excludes non-recurring credits from "net equity earnings," as in the past. On the asset side of the balance sheet, "net balances due to parent company" have been incorporated with "debtors" and on the liabilities side "net balances due to subsidiaries" and "other provisions" are now both included in "other current liabilities." "Total net assets" consist of net fixed assets, net current assets, trade investments and intangible assets.

A separate table, which will be published with each quarterly analysis, has been prepared to show changes in trading profits and in the gross and net returns earned on the capital employed for the individual industrial groups. The "gross return" is the ratio of profit before tax to "total net assets" *less* loan capital; the "net return" is the ratio of "net equity earnings" to net assets attributable to ordinary shareholders. The latter is defined as "total net assets" *less* loan capital, reserve for future income tax, minority interests and preference capital.

In the new grouping, rubber and tea plantation companies and finance companies engaged in hire purchase are excluded. "Property" and "entertainment" companies now form two new groups; "entertainment" includes hotels, restaurants, holiday camps, television contractors, cinemas, theatres and dog and horse racing. Printing and newspaper companies are shown in a separate group from paper making companies. "Other textiles" have been merged with "silk and rayon." The "miscellaneous manufacturing" group and "other companies" have been replaced by two new miscellaneous groups, split broadly between manufacturing and distribution. The slight element of discontinuity between the old and new series can be bridged by deleting the rubber and tea plantation statistics from the old series.

£3,175 million to £3,493 million. Net current assets were practically unchanged as the rise in stock and debtors was balanced by increases in creditors and bank overdrafts, but net fixed assets went up from £1,885 million to £2,173 million. The fall in trading profits worked its way through an increase in depreciation to a decline of 6½ per cent in profits before tax; and, as tax was proportionately higher, net equity earnings fell by just over 9 per cent, slightly reducing the dividend cover. Expressed as gross percentages on the end-year issued ordinary capital, equity earnings fell from 43½ per cent to 35¾ per cent and dividend payments from 17¾ per cent to 16½ per cent. Earlier comments on the monthly totals of reported profits have shown that the latest fall in profits and gross returns is due largely to the experience of the steelmakers in the year to end-September; their trading profits fell by 17¼ per cent and the gross return on assets employed slumped from 17.5 to 11.6 per cent. The biggest increase was reported by the entertainment group, reflecting the experience of Granada; but statistically this was not an important group and the most cheering results came from the brewers.

The latest results and the longer-term charts strengthen the belief that in competitive trading conditions investors cannot blindly follow equities in general or a particular stock market index. Nor in the atmosphere of a restrictive budget can they really expect any rise in equity prices to be strongly based. The task is increasingly to find the company whose management record is better than the rest. These charts and statistics, we hope, will give the investor some help in this search.

BUSINESS NOTES

IN THE MARKETS

Budget Reappraised

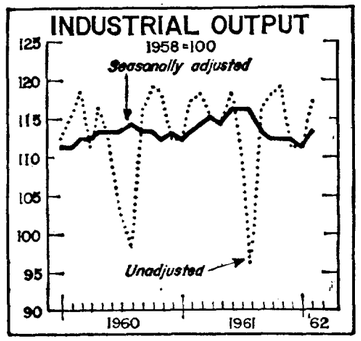
ONCE the initial feeling of relief that the speculative gains tax was not really tough had evaporated, investors appraised the implication of the budget more soberly, accepting that on balance it might in the short-term be more comforting to gilt-edged stocks than to equities. Just before the budget buyers of equities had been looking for signs of revival and expansion. Mr Selwyn Lloyd did not provide them, and equity prices tended to slip back. The fall was not steep and indeed prices rallied briefly this week. A neutral budget leaves equities in much the same uncertain state as they have been for months. There is the reasonable expectation of expansion at some time within the next twelve months, and therefore equities around their current levels may at some points look cheap; but the budget postpones the date when signs of revival are likely to appear. Profits, moreover, are still under pressure and the longer term trends as depicted in the returns British industry is earning on its invested funds, as examined in an earlier article, are not assuring. Equally, however, with the prospect of an upturn in the economy still beckoning there is no point in selling at what many people believe is the ground floor of the equity market. Until there are definite indications of expansion, equity prices will presumably continue to fluctuate between narrow limits; and if the investor decides to buy now he has to be prepared to hold.

The outlook for the gilt-edged market is more reassuring and prices of the longer-dated and undated stocks have begun to move up again on a moderate amount of buying from institutional as well as private investors. Restraint in the economy, reinforced for a time by the tough budget accounting, is good for gilt-edged so long as sterling remains strong. The Chancellor has again declared that he does not expect to be looking for new money through the bond market, and funding sales seem unlikely to press heavily on prices. Toughness in the budget measures may give the authorities a further opportunity for relaxation in interest rates and bank credit. Not surprisingly, talk about another reduction in Bank rate began within a few days of the budget statement. The authorities, however, are pulling hard on the official brake to check the downward slide in money market rates and at last Friday's Treasury bill tender the market raised its bid by only 2d. to £98 18s. 4d.—the pressure on the current low bill offers is very heavy—and the bill rate fell by 8d. to £4 6s. 8.54d. per cent. Gilt-edged stocks, in fact, provide a suitable repository for funds which are waiting for more decisive signs of recovery.

Steel Grey Shadows

A Wall Street Correspondent cables:

WHILE Washington appears to be rejoicing over the rollback in steel prices there is no flag-waving on Wall Street. Steel rather than general economic trends has become the major influence with private and institutional investors, who now regard rising profits and a boom in capital investment as uncertain. They are taking the view that the administration's success in forcing the steel industry to rescind the price increase represents an indirect form of price control and they fear that its application elsewhere would lead to a revision in price/earnings ratios of common stocks that would make them less attractive than they are now. Steel shares were particularly hard hit and US Steel fell to its lowest point for three years, reflecting the fear that it will be the specific target of the administration's wrath and the more general feeling that the entire industry is likely to suffer from a sustained pinch on earnings.



Washington could help by accelerating its efforts to stimulate corporate spending but in the present atmosphere of uncertainty the response of business men might be only half-hearted. This is not to say that the rollback in steel prices was a mistake; but it has certainly come as a blow to investors' confidence, which in any event had been growing weaker. Business, in fact, appears to have shaken off its lethargy and the economic indicators show a generally satisfactory resumption of growth. Normally that could be counted upon to encourage investors but the contretemps in steel has created new doubts—temporarily at least. It would be most unusual for the stock market to enter into a period of prolonged decline so early in the business recovery and the chances are that the big improvements in profits, including those earned by the steel industry, will prevent a serious fall. Nevertheless, confidence has been impaired and though many equities are now selling at prices that the analysts consider to be attractive, there is no demand for them. Some big institutions do not rule out the possibility of a stock market decline that could lead to a lower level of business activity. Such thinking can be traced directly to the steel battle and if it were to be translated into action it could lead to widespread selling. For the moment however the institutions are staying on the side lines, waiting to see whether Washington will make some gestures to bolster business and investors' confidence; until the outlook is clearer it looks as if the stock market will see-saw.

THE ECONOMY

Output Turns Up

PERHAPS one of the two points by which the production index for February is reported to have risen over January should be discounted: last month the January figure was officially held to have been

specially affected by bad weather. But there seems clearly to have been some upturn in industrial activity. The seasonally corrected index for all industries was put at 113 for February, against 111 for January, while the seasonally corrected index for manufacturing rose from 110 to 113. There have been no new amendments to the indices for the last few months; so output from December to January now looks to have been at about the same level as in the three months before.

Output in both the motor and the steel industries was already known to have risen more than seasonally in February, and the increase in automotive production will have influenced the business of some engineering suppliers. But there have been few reports of higher output in other consumer durables industries; and engineering output is reported to have fallen again in February. Some of the "soft" consumer goods trades may be responding to the continued rise in retail trade. It is not easy to trace the pattern of this industrial improvement and one cannot place too much reliance on one month's figures. There was nothing in the statistics of engineering orders to justify special optimism about exports. Home orders rose, but orders from abroad remained at about the same level as they have been for twelve months.

GOLD

Two Prices in New York

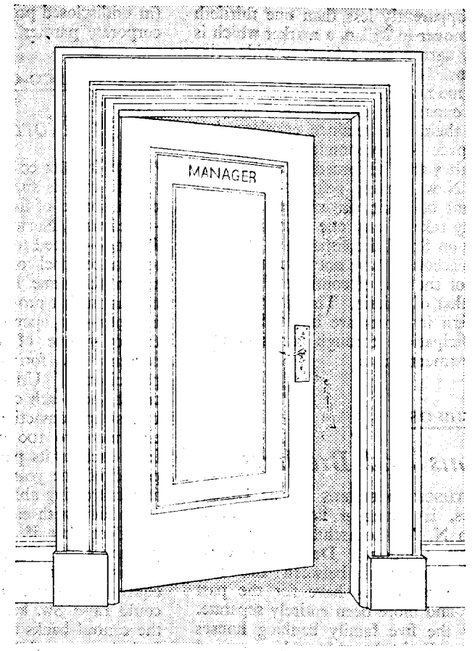
THE central bankers managed to discuss their new gold plan at their monthly meeting in Basle a fortnight ago without any new leak—it is said that there was quite an inquisition over the last one—but the perspective of the plan is now reasonably clear. It is essentially an extension of earlier and informal agreements on gold, first between the American authorities and the Bank of England to feed gold to London over the "gold bridge," and secondly between Continental central banks to hold off the London market when it was under pressure. The next step, which is the essence of the new plan, was an attempt by the United States to maintain the counter-speculative mechanism of the gold bridge but to tap European gold reserves, as well as its own, to feed it. As early as November 11th last a report from New York in these columns could say: "It seems that the United States has been promised help at least on a temporary basis to keep the price of gold in London stable with no immediate diminution in the United States gold stock."

The Europeans, it seems, have committed themselves to the extent of $250 million, and the scheme is ready for use whenever it is needed. Officials strenuously deny that there is any question of a gold guarantee. The European central banks that sold gold in the London market would add the accruing dollars to their reserves in the normal way; plainly the scheme would have no point if these accruing dollars were quickly converted into gold in New York. But it is now certain that the scheme does involve the dropping of the ¼ per cent commission charged by the New York Federal Reserve for gold transactions. Indeed the commission has already been dropped for certain central banks—presumably those that are in the pool. Thus there are now two official buying prices for official funds in New York, $35 an ounce for the favoured and $35.08¼ on the regular basis; and one wonders whether the United States authorities will be able to maintain this differentiation, even though it can perfectly well be justified. One by-product is that there are now also two "shipping parities" in the London market—the old $35.17-20, and, for central banks that need to pay only transfer costs from New York and no commission, around $35.08-10. The present London price, in a quiet but by no means dormant market, is well within this lower range.

The question mark that remains over the scheme is how it can be expected to cope with a real crisis of confidence on the basis of the present potential fund of $250 million—and without any change in European central banks' gold holding policies, some of which are tightly prescribed by statute. Of all the many essays in pragmatic financial co-operation that have emerged in the last eighteen months this one is perhaps the least convincing. Its main worth is perhaps as a gesture, and that is not to be underestimated. As Dr Per Jacobsson observed in a speech of characteristic optimism to the UN Economic and Social Council earlier this month, the exchange markets have been helpfully calmed by "a growing feeling that in monetary matters there is a greater measure of international co-operation and that sufficient resources are available to overcome difficulties that may emerge." This is true. But bankers must not, from Basle, overestimate the strength of a Maginot Line.

AIR SAFETY

Doubts and Fears



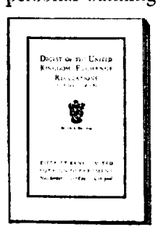
THE Ministry of Aviation is hyper-sensitive to criticism about its rules for air safety—and rightly so. A run of six major air crashes in little more than a month, some involving British aircraft, shocked public opinion last autumn and prompted some questions about the adequacy of the Ministry's arrangements, which it thought fit to answer at length this week in a White Paper describing what is being done already and what improvements are planned for the future. This is not a wholly satisfactory document, for accidents occur most frequently in places where the writ of Her Majesty's Government does not run; and reassuring as it is to learn of the measures taken by the Ministry to modernise airports and improve air traffic control, there is little it can do to see that pilots get the same facilities once they cross the coast.

Present standards of aircraft building are high; so are the standards for testing them. Accidents caused by the structural failure of an aircraft, which were common a few years ago, are rare today. Air crashes now seem to be due most often to errors of judgment; a pilot does something during take-off or landing that he should not have done, or he flies off course into a mountain. Flying would be a great deal safer if some-one could suggest why such errors are made by sober, experienced men acutely alive to the consequences of a small slip in judgment. There are four possible explanations, that the pilots themselves are not up to standard, that their aircraft are too difficult to fly, that their instruments are at fault, or, in the case of charter flights, that the pilot does not know the route. This last criticism the Ministry has answered obliquely by tightening up its check on the airlines themselves.

. . . and Cures

SOBERLY the Ministry spells out its misgivings about some of the arrangements in this country for crew training. This was a courageous thing to do, since nothing can prevent the impression from gaining ground that some pilots are only barely up to scratch. Air crews are examined and licensed, and their proficiency checked at stated intervals. The majority used to come from the RAF, but the numbers who do have been dropping off at a startling rate—from 340 in 1958 to 33 in 1960. For the first time, therefore, the airlines are having to recruit air crews fresh from flying school with no previous flying experience.

Only two schools, the new and government-supported College of Air Training, and Airwork Services Training owned by British United Airways, are judged good enough to be allowed to train professional pilots. And among aspiring crew members who sit for the Ministry's examinations for professional licences or for special instrument ratings to add to their licences, only one in three pass at the first attempt. This, says the Ministry, could be a sign that the



DO YOU KNOW YOUR BANK MANAGER -AND DOES HE KNOW YOU?

In any bank, the moment of truth comes when you need help. Not necessarily money. Perhaps just advice, or guidance through some labyrinth of regulations. Perhaps an introduction, or information about a foreign firm.

That's when you call on the manager. How much he can help you depends partly on how much time he has. Inevitably, it makes a difference if you're already well acquainted and he knows your circumstances.

All banks want to be helpful. It's much easier when the branch you deal with is not so big that service becomes impersonal. Most District Bank managers are able to know practically all their customers—in general, we like our branches to be of a size where this is possible.

There are over 570 District Bank branches, and more are being steadily added. In each of them we aim at giving a complete and unusually personal banking service, both for businesses and for private people.

HELP FOR EXPORTERS Through any branch you can call on the full service of our Foreign Department, which has a reputation for sound information on overseas markets and expert handling of foreign transactions. A copy of our *Digest of the United Kingdom Exchange Regulations* (14th edition) will be sent on request. This brings together in handy form the main requirements of the exchange regulations—arranged and indexed for ready use.

DISTRICT BANK 1829

standards are high, but "it also argues that too many candidates are either inadequately prepared or are of inadequate calibre." In future, no one will be allowed to sit for any of these examinations until he has undergone a government-approved course of instruction.

What about making the actual job of piloting less hazardous? People who have watched a mature pilot battling with a big jet wallowing close to the ground to land it on a rain-swept, badly-lighted runway at night may ponder whether it is reasonable to demand such a high standard of skill and judgment from anyone. In this country, early marks of Comet were allowed to go into service which were far from easy to handle during take-off, and several accidents followed. The Ministry says less than one would like about this aspect of safety, and less, too, about the weak point in every modern aircraft, its flying instruments. The Ministry is looking now into take-off and landing accidents; it claims to have pioneered a new, less confusing altimeter, but this could be described as leading from behind.

SPANISH SHARES

Watching Bulls

SPAIN is emerging from its chrysalis of economic torpor; foreign investors, who are still kicking themselves for missing the first signs of Italy's industrial risorgimento, have been anxious to get in early here. From Monday of this week, following a ministerial decree of March 15th, these investors are free to repatriate their capital gains, and their dividends. The only remaining restriction is that foreign investors may not acquire more than 50 per cent of the capital of any Spanish company. Kleinwort, Benson, the British member of the European investment banking group "Sogefina," has already placed privately part of the capital of "Inespa," a Spanish investment trust. Through an agreement with Banco Urquijo of Madrid, the managers of the trust, just under half of the capital of 200 million pesetas (£1.2 million) has been acquired by "Sogefina." Interest has been strong and Kleinworts hopes to be able to place more shares in the near future. The 1,000 pesetas shares at their present price of 1,120 pesetas yield 3.5 per cent.

The freeing of foreign investment had been expected for some time and many European investors had been anticipating it: the Union Bank of Switzerland has started a unit trust for Spanish shares. In the last two years the Spanish share index has risen by 27 per cent and yields on bank shares, the most popular section of the market, are no more than 2¼ per cent. The banks are indeed a major element in the Madrid stock exchange, and hold all the equity of many important companies for which there is no public quotation. There are some 870 shares registered, but 90 per cent of the turnover is in 50 or so large companies. Turnover in shares in 1960 was 3 billion pesetas—apparently less than one thirtieth of the turnover in Milan, a market which is itself very narrow and subject to wide price fluctuations.

At the moment many Spanish companies rely for expansion on finance from the banks or their own retained earnings, but as the pace of economic development quickens they may be forced on to the stock market. New banking reforms may limit the amount of equity investment that the banks may take in any one company. Information on Spanish companies is sketchy; published accounts have not yet reached the standard of the rest of continental Europe, let alone that of Britain. This is one reason why foreign investors are inclined to take their participations through banks or outright investment trusts.

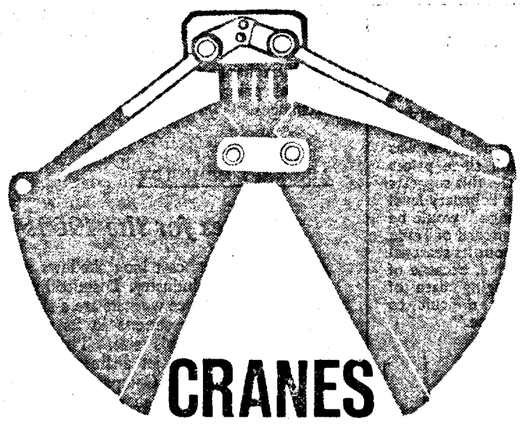
ROTHSCHILDS

Sons and Brothers

DE ROTHSCHILD FRERES of rue Lafitte, Paris, is taking a limited financial interest in N. M. Rothschild and Sons of New Court, London. Despite the close informal connections between the two houses, the businesses have for the past fifty years and more been entirely separate. Originally the five family banking houses in London, Paris, Frankfurt, Vienna and Naples were in full partnership. In 1909, in a commercial world that was clearly losing its earlier internationalism, this link was severed. By then the Naples and Frankfurt branches had ceased to exist; the Vienna house was wound up by the Nazis in 1939. The London and Paris houses continued to work closely together, but Rothschild & Sons gradually became more distinctly English in its practice while Rothschild Frères became more distinctly French—acting as a true *banque d'affaires* with permanent interests through a wide range of industry and trade, not to say politics. The new link may have been given its historical logic by the approach of the common market and the new drawing together of the financial communities.

Because London is considered the obvious financial centre for the common market it has been considered appropriate for the French houses to take a stake in the London house rather than the other way round. The link is still a limited one. It is being formed through a new corporate partner, Second Continuation Ltd., with a fully paid capital of £1 million. Of this, the French Rothschild family, including the partners of de Rothschild Frères, will hold £600,000. The remainder will be split evenly between Rothschild Investment Trust and other Rothschild interests in Britain. The stock exchange got quite excited about this "first opportunity to get a stake in Rothschilds as a bank," and shares of the Trust shot up from 25s. to over 32s.—above their break-up value. Investors are expecting a lot from investment of 10 per cent of their equity in a 20 per cent stake in a corporate partner that itself shares its interest in Rothschild (in undisclosed proportions) with one other corporate partner and five individual ones.

FINANCIAL CO-OPERATION



Nordic Basle

THE itch for co-operation in international finance is spreading. Last month the central banks of five Scandinavian countries—Denmark, Norway, Sweden, Finland and Iceland—agreed to the creation of a mutual assistance pool of short-term credits on much the same lines as the wider Basle operation that provided support for sterling in 1961—an operation in which Sweden, the only one of these countries whose currency is formally convertible, itself participated. Under this new Northern credit pact, each central bank may borrow, by a swap transaction, credits to a maximum equivalent to 100 million Swedish kroner from each of its partners in the pact for a period of one year. Iceland's contribution and borrowing ability is limited to Sw. kr. 10 million with each partner. This means in effect that if, say Norway, runs into payments difficulties it can raise credits among its neighbouring central banks equivalent to Sw. kr. 310 million. Iceland could raise Sw. kr. 40 million. If one of the central banks asked to provide a credit finds it cannot do so because of difficulties of its own, then the remaining central banks will be expected to make up the difference.

There are, however, limitations on the scope of the scheme. No bank will be obliged to have credits totalling more than Sw. kr. 200 million (one tenth that for Iceland) outstanding at any one time. This puts an effective limit on the resources available to the pact in any one year of Sw. kr. 520 million or $100 million. A bank may only ask for help after it has made "reasonable" use of its own foreign exchange reserves and after it has made drawings on the International Monetary Fund equivalent to its gold subscription and first credit tranche of 25 per cent of its quota. On this basis, as the table shows, the resources of the pact compare very favourably with these initial and almost automatic drawing rights at the Fund. Credits under the pact carry what is in effect an exchange guarantee: when the year is up the borrower must repay, in the borrowed currency, "an amount equivalent to the gold content of that currency when the transaction was entered into." In global terms the scheme provides only a modest increase to international liquidity, but for the Scandinavians it adds a very useful third line to their currency defences.

IHI cranes serve as the hands and arms of modern industry

Fast and economical handling of materials is so important to industrial progress that the cranes which do this work are literally, as well as figuratively, the hands and arms of modern industry. IHI's many years of experience in making various types of cranes—level luffing cranes, floating cranes, unloaders, and bridge transporters—have won for them a world-wide reputation for reliability. No matter what the job or type of crane involved, IHI cranes are built to provide years of efficient service.

IHI is Japan's leading heavy-industry company. It has been designing and manufacturing all kinds of heavy equipment for over 100 years —from ships, engines, and boilers to heavy machinery for use in the chemical, construction, iron and steel, power generating, and mining industries. Brochures outlining IHI's capabilities and our informative quarterly "IHI Letter" will be sent on request.

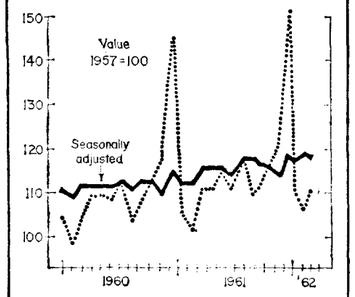
MACHINE TOOLS

Orders Down

ORDERS for machine tools from both home and export markets were lower in January than in the last quarter of 1961. The drop of about eight per cent in the total covered a fall of 11 per cent in home orders but one of only three per cent in those from export markets. Though this fall in home demand ended the period of relative stability that the industry had recently been experiencing, it is perhaps hardly unexpected when industrial production had been drifting downwards, and capital expenditure by private industry is expected to fall. The change in export orders is probably too small to be significant.

The fall in orders meant that, though deliveries in January were about six per cent below the level of the preceding quarter, the value of orders on hand fell slightly from the December level. Compared with a year before, however, orders on hand from the home market were the same, but export orders were 31 per cent higher. The industry still has about 10 months' production on its order books ; though it may not have quite so hopeful an outlook as last summer, it should still maintain a high level of output for this year at least.

NATIONAL STOCK EXCHANGE



Adding to London?

THE recent suggestion by the chairman of the London Stock Exchange, Lord Ritchie, that there should be a National Stock Exchange has been taken a step further with the setting up of a committee to consider the possibility of merging the various stock exchanges in this country. The committee will hold its first meeting soon after Easter and will consist of six representatives of the London Stock Exchange, four representatives of the Associated Stock Exchanges (which have members in the 21 large cities and towns which have their own exchanges) and the chairman of the Provincial Brokers' Exchange (whose members trade in smaller towns without exchanges). In a speech to representatives of all the provincial exchanges at the end of February, Lord Ritchie did not underestimate the technical difficulties that would have to be overcome before a "willing merger" could be achieved. But he emphasised that he considered such a move necessary.

His speech came soon after the first advertisements from Merrill Lynch appeared in the national press and clearly Lord Ritchie is aware of the challenge (modest though it is at the moment) offered by this and other American broking firms. At present Merrill Lynch's business in this country is confined largely to the buying and selling of dollar securities for its customers ; but in time this business could be widened to cover

RETAIL SALES

Retail trade may have been a little less buoyant in March than in the first two months of this year. The Board of Trade provisionally estimates that the value of sales, seasonally adjusted, was 117–118 (1957=100) and since prices had probably risen a little, this suggests a slight decline from the February level of 118. But "little change" would be a safer conclusion ; the Board of Trade is once again cautious about its seasonal correction which this time, because of the effect of the changing date of Easter, is "particularly difficult to assess with great confidence."

British securities and through the establishment of branch offices in the provinces. Merrill Lynch already has branches on the continent and there seems little doubt that before long members of the London Stock Exchange will follow its example. Until the present discussions on the merger of the exchanges are completed it is unlikely however that London brokers will be allowed to open branch offices in the provinces.

Even if they were allowed to do so it is doubtful whether many would be prepared to go, as the total business in the provinces is small compared with that transacted in London and is mainly of a local nature. Fears have been expressed particularly in the provinces that the result of any merger would simply be additional business for the London jobbers. But it is unlikely that the London Stock Exchange will argue that dealings in local stocks should be channelled through London even if there is a National Stock Exchange, though it might well take a different view about dealings between provincial stock exchanges in stocks in which the dealing price is effectively made in London. This is only one of a number of important questions which will have to be settled. Members' qualifications, advertising, compensation funds and listing requirements are others on which the various exchanges will have strong and sometimes conflicting views. Clearly there will have to be accommodations on all sides. Meanwhile stockbrokers in Scotland are discussing the possibility of creating a Scottish Stock Exchange even though they are prepared to take part in the London talks. One concession already made in London can be seen at the foot of the first series of prestige advertisements to be put out by the London Stock Exchange: attention is drawn, though in small print, to the existence of the other exchanges.

AIRCRAFT INDUSTRY

Shapes for the 1960s

COMING events cast long shadows across the aircraft industry. Dismissal notices to 3,000 Rolls-Royce workers are a sign that the government is serious in its plans to reduce the industry's size. The wooden mock-up of a small jet airliner shown by the Douglas Aircraft Company in America is a sign that the British Aircraft Corporation's 111 jet may not have the market all its own way. The relative absence of excitement accompanying the wheeling-out of the same company's big VC 10 jet (contrast this with the ballyhoo a few months back for de Havilland's Trident) is a sign that no one expects this machine to make much impact on world markets ; if the government and BAC between them recover their investment in the VC 10 there will be grateful sighs all round. BAC's profit on its first year of trading was a bare £1.6 million on £75 million worth of sales, too small to allow for slips. But the longest shadow is being cast by the smallest aircraft ; when the Bristol 188 (Bristol is now part of the British Aircraft Corporation) was delivered to the Ministry of Aviation last week, one era in flying was ended and another begun.

This is a steel research aircraft, four years late and not built to any particularly imaginative design. It is, however, one of the very few machines in this world built or being built to fly at three times the speed of sound. This speed has come to stand for one of the milestones in aviation. Just as 500 mph marks the point where aerodynamics oblige the designer to change over from propellors to jets, so Mach 3, or approximately 2,000 mph, has come to symbolise the point where skin friction and surface temperatures of 350° C oblige him to forgo the traditional light alloys and move on to the steel-and-titanium aircraft.

Strong Francs and Weak Francs

The pattern of European external payments is changing in important ways. The six countries of the common market are still in strong surplus with the rest of the world. But the size of the basic surplus is expected to fall significantly this year from the high level of $3 billion and more reached in 1959, 1960 and 1961. The most chronic creditor, Germany, at last seems in sight of reasonable balance—though now, under official guidance, its short-term interest rates are creeping up again. Our special correspondent who reported on the changing views at the Bundesbank three weeks ago turns this week to the unfamiliar problems of chronic surplus in France and the equally unfamiliar problems of yawning deficit in Switzerland. No movement of citizens is reported to be streaming out of Geneva to put its money in private banks in Annecy ; but otherwise there is much in Europe's present payments conjuncture that seems like Alice in franc-land.

FRANCE, like Italy, expects little reduction in its basic surplus this year, and neither of these countries yet looks on its surplus or the level of its reserves as starkly excessive—for in neither do the financial officials who are concerned with these matters take the present political stability for granted. France expects a further basic surplus of $600-$800 million this year, of which about half may be taken in an increase in reserves to $3½ billion ("which won't hurt anyone") and the remainder disposed of in further prepayments of external debt. A further $58.7 million is to be paid to the United States this month ; but France is now running out of debt to prepay. The French authorities are fully in sympathy with the United States pleas, strongly expressed in the Paris meetings of the influential "Working Party Three" of OECD, for a larger outflow of long-term capital: but they do not quite see how to promote it. Restrictions on portfolio investment overseas were lifted earlier this year with the abolition of the *devise titre*—with little effect. Applications for direct investment are dealt with liberally ; but they are few. And, to the embarrassment of the authorities in Paris as well as Washington, French firms are borrowing in New York rather than American firms in Paris. M. Rueff in particular has ideas of how to get French long-term interest rates down ; but the authorities have taken only cautious steps here, encouraging the banks to put more money into industry through medium-term credits in the framework of the same total liquidity ratio.

If the private capital market in France fails to provide an offset to the French external surplus, the authorities realise that they, like their counterparts in Germany, will be under pressure to provide the offset in public exports of capital—which invariably involve political difficulties. But the Bank of France has no intention of bypassing this problem by shifting surplus foreign exchange into the hands of the commercial banks. Because they strongly dislike hot money, the French authorities still do not allow their commercial banks to take up short-term investments in foreign money markets against francs. The Paris banks can and do deal actively in foreign currencies, and the pool of Euro-dollars and other external deposits in Paris is $800-$900 million ; but the foreign deposits cannot be converted into francs.

This continuing fence between Paris and outside money markets, combined with a particular conjuncture of commercial operations, has meant that while the dollar is almost constantly at its floor against the franc in spot markets, the forward dollar is at a premium. The French authorities were somewhat surprised, therefore, when the Americans proposed that they should be granted a credit in francs equivalent to $50 million (actually on a mutual basis —the Bank of France has been given the same unwanted addition to its reserve of dollars) for exchange operations on the line of those successfully conducted in other centres, where the objective has been to strengthen the dollar in the forward market, to cheapen swaps. In Paris this was unnecessary and (because of the tight controls on short-term capital flows) irrelevant ; while in the spot market the Americans' 245 million new francs would be a drop in the ocean compared with the amounts the French authorities have needed to keep the dollar from falling through the floor. The upshot is that the Federal Reserve's franc facility has not been used ; it is essentially symbolic ; and it is not certain that it will be renewed when it falls due in June.

IN Switzerland, meanwhile, the earlier American official purchases of forward dollars have now been unwound in the wake of the sharp weakening of the Swiss franc. These forward purchases, which reached $150 million, were fully approved by the Swiss National Bank as a useful measure to encourage holders not to repatriate their dollar funds and thus unload still more dollars on its reserves. As the market tide has turned, the Americans have been able to liquidate their commitments and also repay their short-term credit of 200 million Swiss francs; the purchases of Swiss francs for dollars that this has involved have worked precisely in line with the need of the moment and must have kept down the amount of support purchases needed from the Swiss authorities themselves. These reached only small proportions (probably around $20 million) and the authorities intervened in small doses at an ascending scale of rates, from 4.3410 to 4.3480, indicating that their intention was to check any secondary speculative repercussions rather than provide a continuing floor under the Swiss franc at this rate—which is still well above the parity of 4.37. The formal lower limit of the Swiss franc is only 4.45—though paradoxically, while the Swiss have had the widest theoretical margin of fluctuation for their currency, the effective range at 4.31½-4.34 has until recently been among the narrowest.

The size of the Swiss commercial deficit, of 600 million francs on current account in 1961, with another billion francs flowing out in foreign capital issues, could carry the Swiss franc down into this unaccustomed range in the months ahead—provided world politics and world finance remain sufficiently at peace to hold back any new inflow of flight money. But it is not the external problem that worries the Swiss—the authorities there have long been conscious of having too much rather than too little liquidity. The real concern, which is voiced with strange uniformity by a wide section of the business community, is with what is happening inside Switzerland. The rise of 4 per cent in the cost of living in the past year, equivalent to the whole increase in five preceding years ; the continued boom in Swiss shares, which in some cases reduces yields to sums smaller than is needed to pay the annual property tax that some cantons levy at fractions of one per cent ; the equally soaring price of real estate, which has made the *Bahnhofstrasse* dearer than Wall Street and lakeside villas the most sought after in Europe ; above all, the growing proportion of foreign workers, now one in four of wage and salary earners in Switzerland—these are daily topics of complaint, and they are seen as signs of a deep-seated malaise. "We Swiss are growing soft. Look round in Zurich. Custom built Lancias and Europe's most expensive shop windows. All the dirty and tedious jobs are being left to foreigners. It is an old danger—we must remember the Romans." All this from a well-heeled private banker who does not ride in a Volkswagen and no doubt has a modest country place in the Ticino. He also arrives at his desk at eight in the morning. There have been deficit countries that created more convincing alarm.

Possibly because of their experience in building the Bristol 188, designers in this country have an almost unreasoning dislike for the steel aeroplane, although designers in the United States are seriously considering whether this will not be the right machine for supersonic civil flying. Now that the 188 is about to start its flying programme, it will provide some factual evidence to show whether British designers are right in their belief that they and the French should co-operate on a light alloy supersonic aircraft, or merely wrong-headed. The commercial future of the British aircraft industry hangs to a large extent on what can be learnt from the 188.

Out of Hours

BRITISH bankers are becoming increasingly aware that many potential new customers see a bank door only when it is closed. Reform of the Victorian pattern of bank hours is being closely considered; and there is no easy answer. Banks on the continent certainly open their doors earlier and close them later than their British counterparts: but, as British tourists have discovered, they close for a long lunch, do not open on Saturday, and enjoy a liberal sprinkling of public holidays. Over the whole year, all of them, except the German banks, offer their customers fewer hours of banking than do the British. English and Scottish bankers cannot draw too much comfort from the comparison; for their continental counterparts are not really out for popular banking; that they leave largely to the post offices and the "giro" banks.

Britain's bankers are pressed by their customers to extend their service and by their staff to resist. While the banks maintain uniform hours across the country there seems no rational way out. There might be if each branch tailored its hours to the needs of the community it serves. For example, branches in English country towns might follow the continental and Scottish banks and close during lunch. Branches in the West End of London might stay open late on Thursdays with the big stores. Suburban branches might stay open on Friday evenings to facilitate payment of wages by cheque. Most of the banks' potential new customers live in industrial and residential suburbs of cities. To cater for their needs, branches in such areas ought to open at 8.30 in the morning and extend their hours on Fridays to say 7 in the evening (as many trustee savings banks do). Banking during the extended hours might be restricted to a limited counter service, worked on a shift system by the cashiers, to take deposits, cash cheques, and pay bills. At the moment perhaps the only branches that seem to serve adequately the community in which they exist are those in the City of London—and by Act of Parliament these are forced (like the rest) to open on Saturdays, which presents a tremendous and costly handicap to getting and keeping staff, particularly girls. Over the rest of the country the banks could also get a useful saving from Saturday closing—but they could justify it only by major, and flexible, extensions on weekdays.

INVESTING IN CANADA

Britain Earns Least

BRITISH investors were late in discovering the Canadian postwar boom; they were not noticeably discriminating; and they were hit by special influences such as switches in the Canadian government's defence programme. In this major field, Britain's postwar investment has yielded disappointing results; and experience here can clearly not be any general guide to Britain's experience in overseas investment elsewhere. In an article in the current issue of *Moorgate and Wall Street* (published by Philip Hill and Harriman Ripley) Dr John H. Dunning of Southampton offers specific investigations of British experience in Canada that are interesting and useful. Dr Dunning calculates that over the five-year period 1955-56 to 1959-60, average net profits earned by British companies were only 4.9 per cent of net worth. For manufacturing the ratio was 6.8 per cent and for mining investment there was a net loss. Dr Dunning finds that these earnings are lower than those of Canadian companies and lower still than those of American companies in Canada. He sensibly points out that profit is not the only consideration in overseas investment: interestingly, he finds that 40 per cent of British companies thought they had increased their exports to Canada as a result of having subsidiaries there and only 16 per cent thought that exports had been reduced thereby.

Dr Dunning then goes on to ask: "Why is it that British firms in Britain earn lower profits than American or Canadian companies, British firms in the US earn less than American companies, British firms in Canada earn less than Canadian or US companies and British firms in Australia earn less than Australian and US companies?" To this staircase of a question, Dr Dunning returns an equivocal answer:

> To argue from these facts that American, or firms of other nationality, are always more efficient than British firms may be unwarranted without further evidence,

Unwarranted or not, Dr Dunning adds:

> but it may well be that the failure of UK subsidiaries overseas to earn at least average profits is no small reflection of the competitive ability (or lack of ability) of the parent companies themselves.

It may well be. But research is one thing and inferences are another.

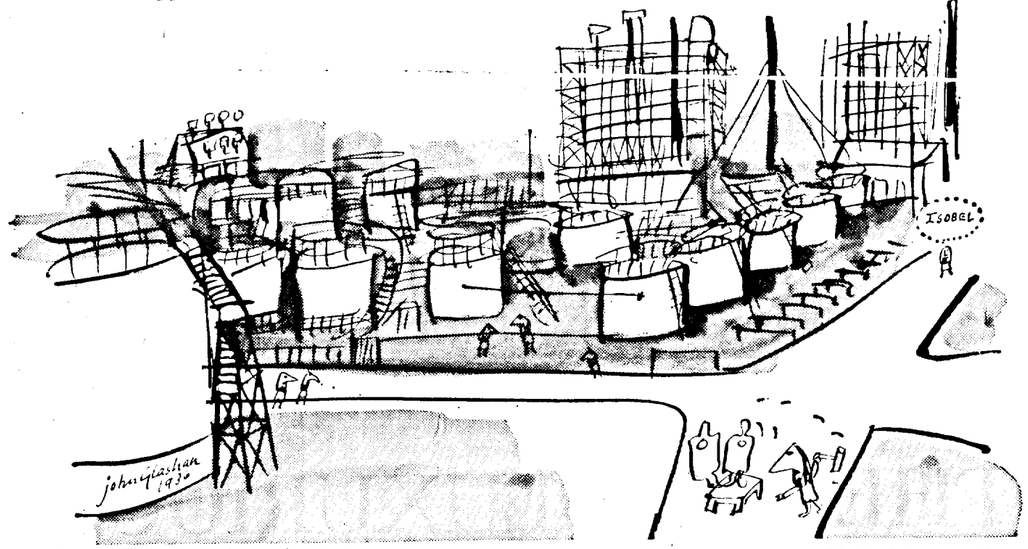
GAS TURBINE CARS

Rover's Hopes

ROVER is the only car manufacturer in Britain that is definitely attempting to develop a gas turbine car; and, as befits a relatively small firm, it is trying to make this

PROJECT 304

The story of the great
Shell Chemicals
Sculpture Competition
by A. N. Other—Carter

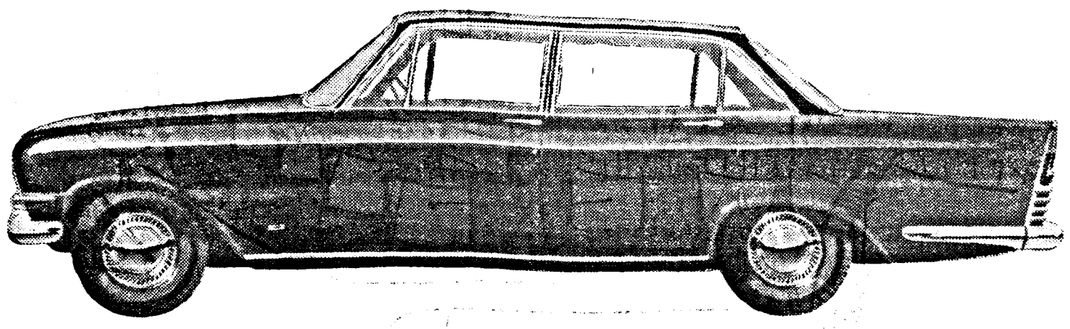


Chapter Six:
Over the Sea to Stanlow

Our director Mr. Carter, who conceived the plan for the great sculpture competition for *The Spirit of Shell Chemicals*, was not so naive as to suppose that all the method and the irrationality of your true artist produced a crop of droll encounters that would make a novel, let alone a series of twelve advertisements, of which this is No. 6 (advertisement). Take the group that went on the ship chartered for a trip from the Port of London to our plant at Stanlow, on the Manchester Ship Canal. The idea was to go round Wales and have a few briefings during the voyage by chaps like Carter from Polyolefins and Carter from Low Pressure Waxes and Greases. It seemed to attract all the wild ones – the great but unconventional Spaniard Paella, Max Grob, the leading Destructionist and so on. They persuaded the captain to anchor off Aberystwyth and disappeared for days to secret drinking parties in Welsh valleys. They brought back with them a wild-eyed man called Jones the Statue . . .

Arrived finally at Stanlow they showed little interest in the way olefinic gases are separated into streams containing propylene and butylene (source of synthetic rubber), in the production of alcohols, ketones, Epikote resins (for paints). Yet how unpredictable is Art! Max Grob, rather rudely, I thought, leafing through a pamphlet during a lecture by Carter from Ketones, suddenly shouted 'Nitra-Shell, Dieldrex, TP5101.' Nothing to do with Stanlow; it was a Shell Haven (Essex) pamphlet. But he instantly began to form strange figures (Carter, the Sculpture PRO, saw that there was always clay to hand) infinitely moving in their doom-laden savagery.

Largely because of Paella I was glad Isobel (ah, those old sculpting days in Paris) wasn't on this trip. Had I but known . . .



participants would go round our plants and laboratories taking notes, looking, listening, learning, then go quietly home and, in the white-hot crucible of Art, transform the concept of plastics, resins, expanded polystyrene (for insulating buildings, etc.) horticultural sprays, seed dressings, monoethanolamines, detergents and the rest of it into 'some noble and moving form, some passion of advancing and receding planes, some marvellous, positive, joyous occupation of multilinear space', as Cosmo Fanlight, TV panelist, articist, Chairman of the judging panel, put it.

Some did, of course; but in others the clash between scientific

A new concept in Ford motoring...

THE NEW LUXURIOUS 100 M.P.H. ZODIAC MK.III

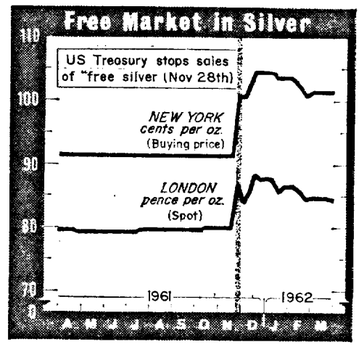
The Zodiac Mk. III is powered by a newly-developed 2553 cc. unit, designed with twin exhausts to deliver 112 bhp. The four-speed gear box has synchromesh on all four gears. Front wheel power disc brakes and four sealed-beam headlamps are standard. The road holding is superlative in any circumstance. And the latest no-maintenance fluid-drive automatic transmission can be fitted.

With all this goes the quietness, comfort and security of a prestige limousine. Nearly five feet of interior width in front and rear seats. (The Zodiac Mk. III is an easy 6-seater that is yet neat and nippy to handle in the tightest corners.) Fitted pile carpets. Foam rubber seating trimmed with new Cirrus 500 and optional extra of fully reclining adjustable-rake separate front seats. Two-zone heating and ventilating system. Zero-torque non-slam door locks. Variable-speed electric wipers with washers. Electric clock. Cigar lighter. Vast luggage space. And everywhere everything finished and polished as it should be, as *you* want it, in 1962's *top* car. **£1070.15.3** (£178 + £292.15.3 p.t.) *Invitation.* The Zodiac Mk. III is now available at your Ford showroom. You are cordially invited to inspect it, and, if you wish, test-drive it.

1962's TOP CAR FROM FORD OF BRITAIN

a self-supporting exercise by selling the gas turbines that it has developed for industrial uses. Its latest prototype, sent off for exhibition in New York this week, is a design that could be put into production, with a handsome four-seater saloon body. The cost would, it guesses, be 25 per cent more than that of a conventional car of the same size; and with design problems and the handicap of unfamiliar servicing techniques to be overcome, Rover is cautious about starting production. But it sees good chances that costs will fall and performance improve—good enough for it to feel that a decision to start production is a matter of when rather than whether.

Rover reckons that it can save cost by designing for cheaper materials or simpler production techniques, and it hopes that the price of the expensive heat-resisting alloys it has to use for the turbine may fall. Where its present car uses a stationary block-type heat exchanger—like a car radiator—to transfer waste heat from the exhaust gases to the ingoing air, it is considering a change to the rotating type of heat exchanger used by Chrysler. This can be made from cheaper materials than the stainless steel sheet Rover uses for its present heat exchanger (though BMC is experimenting with mild steel for a similar unit). And by going over to a radial turbine—in effect, a centrifugal compressor running backwards—for the turbine that drives the compressor, it will be able to cast both units—using the bronze age lost-wax technique.



Even on the most optimistic assumptions, however, a gas turbine is unlikely to be as cheap as a piston engine. It will have to be sold at some premium over conventional cars, on the appeal of novelty and smooth performance. A specialist manufacturer like Rover may be better placed to exploit such a car than a bigger firm, which would find it more difficult to fit any small-volume production line into its factory. Indeed, the gas turbine may never be more than the power unit of luxury or sports cars and heavy lorries.

SILVER

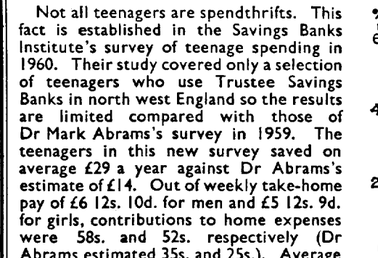
In the Groove

To the disappointment of some over eager speculators, silver has not run wild in its first four months of freedom. If it continues to maintain the degree of stability it has exhibited over the past month, in which the London and New York spot markets have been virtually stuck in a groove at about 84½d. and 101½ cents an ounce respectively, silver will soon earn a reputation for being the best behaved commodity enjoying unfettered freedom. In fact, the less exuberant market for silver might hinder the passage of legislation for rounding off the first step taken by the United States at the end of November to set silver free.

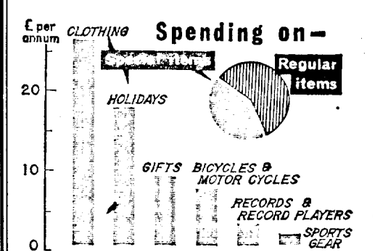
Silver miners in the United States have obviously gained from the Treasury's suspension of silver sales at 91⅛ cents an ounce delivered to customers. But only when the Silver Purchase Act of 1934 and subsequent silver legislation is repealed will they lose their right to sell their silver to the Treasury at 90½ cents. They will not therefore be so keen to see that side of President Kennedy's silver policy enacted. Since no immediate point of principle is at stake, the Administration might not therefore force matters, though this means that existing restrictions on dealings in silver will remain for the time being.

In London the premium on forward supplies of silver has recently vanished for the first time since the scramble for silver began in 1960. Forward silver normally stood at a discount because the mines usually chose to offer supplies for forward delivery and buyers preferred to deal for cash. When speculation reached its zenith, buyers wanted forward silver to postpone the need to finance their purchases. Since their demands could not be met from the usual sources, dealers bought spot silver and sold it forward adding their carrying charges to the price.

According to Samuel Montagu's annual bullion review, forward purchases of silver last year reached 50 million ounces. But forward silver is a very subdued market today. Though arrivals of Chinese silver have not been resumed, in view of China's continuing purchases of grain which cannot be financed by cuts in other imports, further deliveries are likely. Oversize stocks held by silver users, as yet unliquidated holdings of speculators and other miscellaneous sources of silver appear to ensure adequate supplies for this year. Save for the unexpected, silver looks set for a comparatively quiet year.



PLASTIC PIPES



Joining Them

The biggest makers of cast iron rainwater and soil pipes, Allied Ironfounders, has announced that it is producing a range of soil pipes in polyvinyl chloride and plans to introduce a range of rainwater goods later on in the year. They will sell at about 5 per cent below the price of the cast iron pipes. With an eye on the continent, the pipes are being made in metric dimensions. This should not be taken as an admission that cast iron will shortly be superseded; Allied Ironfounders feels that an architect building for posterity will

Thrifty Teenagers

Not all teenagers are spendthrifts. This fact is established in the Savings Banks Institute's survey of teenage spending in 1960. Their study covered only a selection of teenagers who use Trustee Savings Banks in north west England so the results are limited compared with those of Dr Mark Abrams's survey in 1959. The teenagers in this new survey saved on average £29 a year against Dr Abrams's estimate of £14. Out of weekly take-home pay of £6 12s. 10d. for men and £5 12s. 9d. for girls, contributions to home expenses were 58s. and 52s. respectively (Dr Abrams estimated 35s. and 25s.). Average spending was 58s. 8d. a week (Dr Abrams 64s.) but of this 24s. 4d. was spent on the "special items" shown in the chart alongside which were paid for partly through savings. Dr Abrams's average teenager spends 2s. 3d. a week more on clothes but 2s. 2d. less on holidays. The "regular items" total of 34s. 4d. a week includes cigarettes and tobacco 3s. 10d. (Dr Abrams 6s. 10d.) meals out 3s. 2d. (5s. 10d.) cinema admissions 2s. 9d. (1s. 7d.) and alcoholic drinks 2s. 5d. (3s. 10d.).

still use cast iron. However, other manufacturers of these pipes in conventional materials are also turning to manufacture in plastic, usually through subsidiaries: Universal Asbestos owns half of Allied Structural Plastics, and Burn Brothers is behind AB Plastics. In this way, the existing producers hedge against future competition.

It has not been an easy task to persuade builders, architects and public authorities to accept plastic where they were accustomed to something more substantial, and this task is by no means complete. Unfamiliar materials must be proved and early failures are, rightly, given quite disproportionate weight. The pipes have obvious advantages in lightness and do not need to be painted, but they have not been tested at length and will meanwhile be regarded with caution.

The first company in the field was La Brecque, followed in 1959 by Marley Tile and Osma. In 1961 three companies (Yorkshire Imperial Metal, Associated Builders' Merchants and Allied Structural Plastics) introduced ranges which included injection-moulded fittings—a technique which is better suited to mass production methods than the hot-forming methods previously used. The companies more recently entering the field have the advantage of possessing selling organisations which are already established in the building trade—indeed, which already sell virtually the same goods. The business for which pvc rainwater and soil pipes are competing amounts to about £6 million a year; it is hoped that sales will be running at an annual rate of £1 million by the end of 1962. So far, the market for plastic rainwater goods has been limited by lack of experience with the new products and the builders' traditional unwillingness to gain it by learning a new technique. But the high cost of tooling up to make the wide range of fittings needed has saved the market from overcrowding. This will not last if the competitive pressures so familiar in the plastics fabricating industry continue to be felt.

COCOA

Unsettled Season

THE tail-end of an extraordinary cocoa season might still have some surprises in store, but the only big doubt still unresolved is the size of Brazil's temporao crop—will it be 1.5 million bags or 400,000? The main season in West Africa has been scarcely less predictable; everything pointed to a sharp fall in production in the opening months, but near record output resulted. Producers appeared to be in danger of holding a large surplus of cocoa at the end of the season, but they have disposed of most of it with surprising ease. After all the gyrations, the price of cocoa (about £164 a ton) is back where it started at the beginning of the season and its problems are just as far from solution.

Gill and Duffus estimate that production this season, based on a prediction of 1.1 million bags for Brazil's unharvested temporao crop, will reach the record level of 1,172,000 tons. If consumption rose by 10 per cent this year as it did in 1961, there would still be a surplus of some 70,000 tons to add to the surpluses of the previous three seasons. Warehouse stocks in consuming countries have risen to levels unprecedented since the war. Consumption is now far higher and manufacturers have never had the opportunity since the war of bringing their stocks up to what they consider a satisfactory level. Therefore what has gone before need not be considered injurious though it has produced what growers consider uncomfortably low prices. It is what lies ahead that gives cause for concern.

Had crops fallen this season, the record out-turn of 1960-61 might have been considered as something of a freak. It is not considered a freak now and there seems every chance of higher crops in the future from Brazil, whose output has been disappointing, and in West Africa. The rise in cocoa grindings reported so far this year has been well below expectations. The first three months of the year are not as important as in the fourth quarter though, because most chocolate is eaten in the northern hemisphere, they are more important than the summer season. Grindings rose most sharply in Britain, but the sweet tax, partially offset by reduced import duties on cocoa will not help matters.

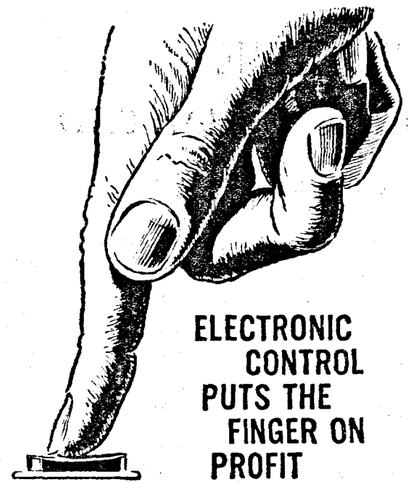
This season, the five main producing countries have formed themselves into an alliance to devise means of checking the downward trend in cocoa prices. This is the sort of news that in earlier seasons might have had a strong market impact, but it has been largely robbed of its influence by familiarity. The projected international cocoa scheme is marching forward at a pace that suggests it cannot arrive before the start of the new season, so that the alliance might become an effective interim force. The major change in marketing this season has been the transfer of Ghana's selling activities from London to Accra; which has caused a loss of business to some London dealers but no great hardship. Nigeria also sells in Lagos now but its selling agency in London appears to have done most of the business.

SHORTER NOTES

Tramp shipping freight rates rose slightly in March; the index was 1.7 points higher than in February at 96.9 This has not, however, been reflected in any improvement in the market for ships; in its quarterly report Harley Mullion records a continued fall in prices. A standard war-built steamer has fallen in price from £125,000 at the end of last year to £95,000 now.

* * *

Railway freight revenue in the first 12 weeks of this year was £3,990,000 lower than in the same period of 1961. Mineral traffic was over 20 per cent down and merchandise fell about eight per cent. Passenger traffic, by contrast, rose by over two per cent because of higher fares. Total revenue was 1.6 per cent lower at £150 million.



* * *

The Stock Exchange Council has now confirmed the alteration to its rules proposed last month. It has made some amendments to its original proposals, the most important of which gives one-man firms until March, 1967, instead of March, 1963, to change their status.

LONDON CLOSING EXCHANGE RATES AND GOLD PRICE

Demand for sterling continues strong, and the authorities have taken in more dollars for the reserves. Markets became quieter with the approach of the Easter holiday. The gold price has been stable at $35.08.

ELECTRONIC CONTROL PUTS THE FINGER ON PROFIT

The profitability of many industrial processes depends on accurate methods of weight control. And as competition hardens, both at home and abroad, profit margins are becoming tighter. Increased profits come from decreased wastage of materials and better use of manpower—direct results of faster handling and more accurate, sustained control of materials. In view of this, more and more industries are turning to automation, using Avery weighing equipment with electrical and electronic control systems.

Avery have perfected weighing mechanisms coupled with punched card and tape machines which provide fully automatic and foolproof operation for all kinds of control processes. The use of electronics has enabled ultra-sensitive weighing mechanisms to operate control systems, computers, typewriters and other business machines. Where a lower order of accuracy is acceptable Avery also supply load cell weighing installations with the associated instrumentation and control systems.

By linking such modern sciences as electronics and solid state physics with two centuries of experience in weighing, Avery have achieved a combination that is profiting trade and industry.

COMPANY MEETINGS

PROVIDENT LIFE
ASSOCIATION OF LONDON LIMITED
MR J. R. DAVY'S STATEMENT

The annual general meeting of Provident Life Association of London Limited will be held on May 9th in London.

The following statement on the directors' report and accounts for 1961 has been issued by the Chairman, **Mr J. R. Davy, JP**:

I am pleased to report that the Company's record of satisfactory and consistent progress continued during the year 1961 and that a number of new landmarks were passed. Before summarising the results, I would first call attention to the increase in the rate of Bonus—perhaps the most gratifying achievement of the year. The declaration for 1961 of a Bonus of £3 per cent upon With Profit Policies in the Participating Fund is an outstanding result and exceeds by 10s. per cent the highest rate previously declared by the Company. This renders our With Profits Policies even more attractive and competitive and should result in a further rapid expansion of new business of this class.

CONTINUING PROGRESS

The Company once again achieved a record total of New Business both as regards Sums Assured and Annual Premium Income. The new Premium Income at £524,388 showed a substantial improvement on the high total for the preceding year. New Sums Assured at £20,566,163 exceeded a total of £20 millions for the first time. It is a remarkable indication of our rapid progress of recent years that as recently as 1953 our total new Sums Assured were only about £9 millions —showing that our new business has more than doubled in only eight years.

A substantial contribution to the new Annual Premium Income has been made by Deferred Annuities issued during the year. A year ago I predicted a further increase in this class of business, which mainly consists of policies issued in connection with pension schemes and arrangements of various types, and I am glad to report that we are satisfied with the rate of increase which has been achieved. The combination of attractive rates of premium, exceptionally flexible contracts and our increased staff of specialist Pensions Inspectors has enabled us to give a service which has been welcomed by employers and which should continue to give rise to further improvement in business in this field.

INCOME AND OUTGO

Largely as a result of the high rate of new business now being achieved, the income of the Assurance Funds continues to expand satisfactorily. The premiums received during the year exceeded £2½ millions and, in addition, single premiums for Annuities amounted to over £¼ million.

The other main item of income is, of course, the interest and dividends upon the Company's investments, which in 1961 totalled £1,458,095, an increase of over £90,000 upon the total for the preceding year, and resulted in a gross interest yield on the Assurance Funds of £5 1s. 5d. per cent. Bearing in mind the effect upon the Company's interest yield of the low rates of interest charged upon mortgages granted in connection with policies issued under our special House Purchase Scheme in earlier years, this is a satisfactory rate which should increase steadily as older loans are replaced by new mortgages at the higher rates at present being charged. In this connection, I would again point out that, in considering the interest yield upon our funds, it must be borne in mind that the premiums charged under the special House Purchase Scheme contain an allowance for the effect of these mortgage obligations upon the Company's investment policy.

Payments to Policyholders during the year totalled £1,963,746 and showed some contraction compared with the total for the preceding year. This decline, however, conceals contrary movements in the various headings under which such payments are made. Death claims at £205,141 showed a reduction of £140,000 as compared with 1960. The high total for that year was largely due to certain special claims to which I drew attention a year ago, and the figure for 1961 reflected a continuance of our favourable mortality experience and yielded a satisfactory mortality profit. Maturity payments also were below the level of recent years, but the amount paid under the heading of "Surrenders" increased sharply to a total of £426,337, an increase of £116,000 over the preceding year. An analysis of this increase shows that about half of it was due to the growth in the Company's Assurance and Pensions business in the last few years, whilst the balance was due to an unusual number of substantial refunds on withdrawals from service in respect of Pensions Policies.

Commission and expenses were substantially higher than the previous year. The growth of these two items is watched with considerable care and, although we are, of course, not immune from the effect of inflationary increases, improve efficiency and the use of modern office equipment are enabling us to absorb the additional work involved in the rapid expansion of our business without appreciable increases in staff. Accordingly, I am able, largely as a result of the various measures to which I have just referred, to report that the greater part of the increase in expenses in 1961 is due either to the cost of our increased new business or to direct costs incurred in connection with the re-organisation of our capital and obtaining a quotation on the London Stock Exchange.

ANNUAL VALUATION

It will be seen from the usual summary of the results of the annual Actuarial Valuation which appears in the Directors' Report that the ordinary new Surplus for 1961 was £460,193. This figure shows a gratifying increase upon the corresponding total of £403,272 for 1960 and is again a record for the Company. Acting on the advice of the Actuary, the Directors, as I have already mentioned, have been able to declare a Bonus for the year 1961 at the high rate of £3 per £100 of Policy—well in excess of the rate of 50s. per cent paid for many years before 1939 and again achieved a few years ago, and therefore an all-time record for the Company.

In dealing with the valuation results, I would mention certain changes in the rates of interest assumed in the valuation of Single Premium Annuities. I have previously referred to the interest basis (3½ per cent) adopted in valuing these contracts up to 1960. The Actuary now reports that, in the light of the higher rate of interest earned and the terms upon which new moneys can be invested, he regards such a basis as unduly stringent and advises that a valuation rate of 4½ per cent for these contracts would be more in line with current conditions and the Directors decided to adopt this course. It is a remarkable commentary on the change which has taken place in the last few years that, when the previous rate of 3½ per cent was adopted, it allowed a smaller margin compared with the yield on new investments than does the rate of 4½ per cent now adopted. The whole of the surplus released by this change has been used to strengthen other reserves of the Company, £350,000 being added to the Life Assurance Contingency Fund and the balance of £130,000 (in addition to the usual amount of £25,000 from the ordinary surplus) being applied to writing down investments.

ASSETS

During 1961 the total of assets passed the £30 millions mark and by the end of the year exceeded £31 millions, an increase for the year of £2,059,713. As will be seen from the summary of the Company's investments given in the Balance Sheet, the increase in mortgages on house property within the United Kingdom (which now exceed £24 millions) absorbed the whole of the increase in the Company's funds. They were all granted in connection with the Company's special House Purchase Scheme which I have already mentioned. The total number of individual advances is now nearly 17,000 secured upon houses being acquired by the Company's Policyholders—in almost all cases for personal occupation. It has always been the Company's policy to seek business of this class amongst persons requiring medium sized houses and, as a result, the average amount of the new advances granted during the year was only £2,098. Advances of this type form an excellent security upon which losses are very small, as will be evident from the fact that at the end of the year the proportion of cases where there was any interest due and unpaid was less than 2½ per cent of the total. Of these cases, the great majority were not more than three months in arrear, whilst the cases in arrear for more than six months represented no more than one-fifth of 1 per cent of the total. We regard such a result as a remarkable testimony to our borrowers and to the social value of the Company's special House Purchase Scheme, which is specially designed to assist those who have only small capital resources.

Turning to the Stock Exchange securities, the Balance Sheet shows some reduction in our holdings of fixed interest securities, whilst our holdings of ordinary stocks and shares rose by £230,000 as a result of further selective purchases, mainly during the early part of 1961. In recent months, however, we have felt, in common with other institutional investors, that the attractions of the high rates of interest obtainable upon gilt-edged and other fixed interest securities were such that we have preferred to invest in this class of security.

DIVIDEND

After meeting the special expenses connected with the re-organisation of our capital and the obtaining of a Stock Exchange quotation and crediting the first of ten special Income Tax rebates, the Profit and Loss Account shows a balance of profit for the year of £122,057 (1960, £116,558). The Directors have decided to recommend the payment of a Final Dividend upon the Company's Ordinary Shares 'A' and 'B' of 4½d. This distribution, with the Interim Dividend of 4½d. already paid, makes a total of 9d. (15 per cent) for the year and represents a distribution of the same total amount as was distributed for 1960.

CONCLUSION

I am very pleased to report that Major Philip Profumo, who is a grandson of the Company's Founder and first Managing Director, has accepted the cordial invitation of your Directors to join the Board of this Company. He was appointed as from April 5, 1962, and the next Annual General Meeting will be asked to confirm this appointment.

Finally, I wish to thank on my own behalf and for my colleagues on the Board our Managing Director and General Manager, Mr R. J. W. Crabbe, FIA, for the invaluable contribution which his leadership has made to the successes achieved in 1961 and to express our appreciation of the keen and loyal service given to the Company alike by Management and Executive and by our Staff throughout the country and at Head Office.

A. REYROLLE AND COMPANY LIMITED

RECORD ORDERS RECEIVED

MR H. H. MULLENS'S STATEMENT

The Sixty-first Annual General Meeting of A. Reyrolle and Company Limited will be held on May 11th at Hebburn, Co. Durham.

The following is an extract from the statement by the Chairman, **Mr H. H. Mullens, BSc, MIEE,** circulated with the report and accounts for the year ended December 31, 1961:

TRADING

Last time I addressed you, I referred to signs of an improvement in the order book after a period of a serious shortage of work. This improvement has continued with the result that the orders received for 1961 were a record. Competition, particularly overseas, has not abated, and this expansion of our business undoubtedly owes much to new designs developed in recent years. Some of these designs are to general specifications agreed between the manufacturers and the Area Electricity Boards and the Central Electricity Generating Board. Close collaboration of this kind with our main customers in the home market is most welcome and will, we hope, lead to more standardisation and thus to economies in production. These new designs are being readily accepted in our markets abroad.

During the year, substantial orders were received from the Central Electricity Generating Board for 275,000 volt and 132,000 volt switchgear and also for air-break medium voltage circuit-breakers to control auxiliary equipment in their power stations. Orders from the Area Electricity Boards for medium sizes of switchgear continued at a high level, there being a particularly strong demand for our 33,000 volt metalclad switchgear, for which we increased our manufacturing capacity a year ago. We also received important orders for extra high voltage and other switchgear from both the Scottish Boards and the Northern Ireland Electricity Authorities.

The demand for industrial switchgear from the steel, chemical and motor industries was substantial, and here again our new designs contributed to our success in the face of much competition. There was a welcome revival of business from the Divisions of the National Coal Board.

Orders from abroad were also at a high level, and those secured in South Africa established a new record. The Australian, Indian and Far Eastern markets again made substantial contributions to our export business.

THE RESULTS

As 1961 was a year of great activity for your Company, better results had been anticipated. Unfortunately the effect of short time working in 1960 spread over into 1961 and final output figures for the year were not up to the expected target. We had the burden of certain business taken at low margins as part of our policy to provide work for our employees, and direct and indirect costs continued to rise. Adjustments to selling prices to cover such rising costs do not begin to be reflected in our accounts for several months.

The trading profit shows a reduction of 7½% from £2,199,123 to £2,028,583, but this is partly offset by an increase in the income from interest and dividends. After providing £1,383,508 for tax compared with £1,322,896 in 1960, the resultant net profit is £1,381,17? compared with £1,560,306 in the previous year. The Board have allocated £450,000 to general reserve and £400,000 to fixed assets replacement reserve, and recommend a final dividend of 6½%. This, together with the interim dividend of 3½% paid on October 7, 1961, makes a total distribution for the year of 9½%.

Last year I referred to the increase in our liquid funds. Since then a large part of these funds has been absorbed in stocks and work in progress and invested in additional facilities. Outstanding capital commitments are higher than last year. Our investment in additional plant are long term projects, and an immediate return in the form of increased trading profit cannot be expected. This applies particularly to heavy capital expenditure on research and development which we undertake in order to keep abreast of new techniques which are a pronounced feature of the electrical industry.

Your Company exports a substantial portion of its output in the face of severe world wide competition. The return on this business is not as good as we would like, and we feel that the Government who exhort manufacturers to increase the volume of exports in the national interest should provide practical encouragement. Far from doing so, recent increases in profits tax and rates create additional burdens and hinder a company like yours from ploughing back sufficient profits to finance the sums needed for research and development. If Government policy remains unchanged, there is a chance of the British electrical industry lagging behind that of other countries and becoming technically uncompetitive.

SUBSIDIARY AND ASSOCIATED COMPANIES

Your Company had owned about 25% of the equity capital of Nalder Bros. & Thompson Limited for some years, and during 1961 arranged to purchase all the preference and ordinary shares not already owned by the Company. The completion of this transaction resulted in Nalder's becoming a wholly owned subsidiary. This firm specialises in the development and manufacture of indicating and measuring instruments primarily for the electrical industry, including Reyrolle switchgear.

The Bushing Company Limited, with works adjacent to our own at Hebburn, have an increasing demand for their high quality products. To cope with this growth of their business, they are embarking upon an expansion programme to provide more development facilities and manufacturing capacity.

Our income from investments in associated companies has again increased, but future revenue from these sources will mainly depend upon the results achieved by the heavy plant section of the electrical industry.

To support increased sales in South Africa, it has been decided to extend our manufacturing capacity in Johannesburg. The present manufacture in the factory is in the lower voltage range and new designs are now being introduced from our Hebburn works. There is a considerable demand on the Johannesburg factory for a mining switch unit designed and developed by the local engineering staff.

Last year I referred to the arrangements made in Australia with O. J. Nilsen (Australia) Ltd., to set up a jointly owned manufacturing unit in Melbourne. This venture is proceeding well with the enthusiastic co-operation and help of our Australian associates. A number of orders have already been accepted by Reyrolle Nilsen (Australia) Pty. Ltd. and the first locally assembled switchboards will be delivered to customers in 1962.

THE FUTURE

The signs are encouraging. In the home market, the plans for future development which have been outlined by Sir Christopher Hinton, Chairman of the Central Electricity Generating Board, indicate an increasing demand for main transmission switchgear at voltages up to 400,000. It seems probable that the Area Electricity Boards will, in addition to their normal system development, have to undertake a programme of reinforcement to the lower voltage systems to avoid a repetition of the experiences of last winter.

Our future prosperity in this field, and more particularly in export markets, depends upon our ability to meet the trend of rising costs and still remain competitive. In addition to national wage and salary awards there are recurring instances either in regard to labour or materials which add to the direct and indirect costs. We are very near the limit of cost concessions which can be accepted without jeopardising the future.

New assembly shops are being erected at the Hebburn Works, and in spite of some hindrance from the severe weather during the winter, it is anticipated that they will be completed before the autumn. We have embarked upon a larger programme than usual for the purchase of machine tools to add to our machining capacity.

The continuing increase in the voltage and power to be dealt with by large switchgear now visualised will require more expenditure on research and development. Some of the plant necessary for proving tests will be extremely costly and it is hoped that collaboration may be possible so that some of the major costs can be shared. If such an arrangement can be achieved there will be substantial saving with benefit to customers.

IMPROVED OVERSEAS RESULTS

HEALTHY BALANCE SHEET

MR JAMES EWING'S REVIEW

In his statement accompanying the accounts, **Mr James Ewing,** the Chairman, said (*inter alia*):

ACCOUNTS

It will be seen from the Consolidated Profit and Loss Account that, whilst trading profits of the Association's Branches and Subsidiary Companies in this country have declined, those of the Overseas Subsidiary Companies have improved. The total trading profit of £664,665 compares with £766.251 in the previous year.

Depreciation amounting to £437,380 has been written off Property, Plant and Equipment, whilst £28,595 has been allocated to Buildings and Plant Replacement Reserve; corresponding figures for 1960 were £429,209 and £32,553. This depreciation charge ensures that full provision is made for wastage of the Group's Buildings, Plant and Machinery, whilst the allocation to Reserve takes into account the high cost of replacement of capital assets.

The net amount provided for United Kingdom taxation on profits of the Group for the year is £21,783, after having taken credit for Double Taxation Relief.

After deducting minority interests and taking account of the adjustments in Reserves of Subsidiary Companies, there remains a net profit of £184,578 dealt with in the Accounts of the Holding Company, against the corresponding figure of £246.964 in 1960.

Including the balance of profit brought forward from last year, and after crediting £35,000 in respect of over-provision for taxation in previous years, the total available amounts to £392,302.

DIVIDENDS AND BONUS

The year's dividend on the Preference Stock, less tax, is £78,070 which, together with the proposed dividend on the Ordinary Stock of 6 per cent less tax, requiring £124,516, makes a total amount of £202,586, and there remains a balance carried forward by the Holding Company of £189,716.

In addition your Board has decided to recommend a Capital Bonus payment of 2 per cent, not subject to tax, to Ordinary Stockholders. This special payment will require a further sum of £67,764, and is being paid out of the surplus so far realised on the sale of shares in Beida Dyers SAE, Egypt.

In the past ten years the gross profits of the Association have aggregated £13,305,622; the charge for Depreciation and Replacement Reserve has amounted to £6,068,325 and today the net book value of the Property, Plant and Equipment stands at the conservative figure of £5,563,635. During the ten years UK taxation has absorbed £3,322,167 and the net profits attributable to BDA shareholdings have been £3.307.663; Preference and Ordinary Dividends have amounted to £2,105.901 (net) and the amounts retained in the business over the same period aggregate £1,201,762. Since the Bonus issue of Stock in 1954, the average Dividend paid on the Ordinary Stock has been 6¾ per cent augmented in the last two years by tax free Capital distributions of 2 per cent.

The trading results of our Dyeing, Printing and Finishing Branches in the United Kingdom, taken as a whole, show no improvement on the results of the previous year but are better than those for the year 1959. On the other hand, our Overseas Subsidiary Companies have shown improved results. Our turnover and yardage in both Home Branches and Overseas Subsidiary Companies have been well maintained, which is an indication that, despite the serious fall in total yardage available, our Branches have held their own against the fiercest competition.

ANNUAL GENERAL MEETING

At the sixty-fourth Annual General Meeting of The Bradford Dyers' Association Limited held on April 17th, the Chairman said: Ladies and Gentlemen, a summary of the trading results for the year ended December 31, 1961, accompanied the printed accounts circulated to you on March 19, 1962. I am glad to tell you that the sterling turnover of the United Kingdom Branches for the year 1961 was slightly higher than in 1960 and during the first three months of 1962 it has increased by 6 per cent compared with the first quarter of 1961.

Our Overseas Subsidiary Companies have also maintained their volume and turnover during the first quarter of their financial year and their outlook is reassuring. Mr Naylor, a Joint Managing Director, is at present abroad visiting our interests in Australia, Tasmania, USA and Canada, and his reports are encouraging. In Australia, in particular, where the textile industry during the past two years has been in the depths of a serious slump, trade is now recovering and we believe that before long Davies, Coop & Co. Ltd., Melbourne, in which we have a substantial interest, will return to the dividend paying class.

AMPLE FUNDS

The Consolidated Balance Sheet as at December 31, 1961, presents a healthy appearance with a very substantial cash position of over £2 million. The Company has ample funds to cover the cost of its re-equipment programme and is thus in a strong position to face the future and to overcome whatever difficulties and uncertainties may arise.

This does not include the outstanding claims arising out of the Egyptianisation of our former assets in Egypt. Our certified claim against the British Foreign Compensation Commission for the Egyptianised property amounts to £1,774,470, against which we have received distributions to date aggregating £448,455, leaving a balance outstanding of £1,326,015 which, bearing in mind repeated promises made by members of HM Government, it is reasonable to hope will in time be honoured. There is a further amount of £E535,222, appropriated from our Bank Account by the Egyptian Tax Administration in respect of an unjustifiable tax assessment, against which we have appealed, and we are competently advised that there is a good chance of the appeal being settled in our favour.

DYEING & FINISHING SECTION

I personally had hoped for a substantial improvement in the profitability of the Dyeing & Finishing Section of the United Kingdom industry as a result of the Government sponsored Reorganisation Scheme. There has not yet been time for the industry to obtain the full benefits of concentration. As already stated, I do not consider that sufficient plant was scrapped, and this was probably due to the fact that the full significance of the continuing growth in volume of imports (mainly from Asian countries) of finished goods and garments was not grasped by dyers and finishers when they were determining whether to take advantage of compensation offered under the Scheme. Additional plants have been scrapped since the closure of the official Scheme, and if this trend could be accelerated, even if it means voluntary co-operative schemes, it would soon have a beneficial effect upon the profitability of the Dyeing & Finishing Section.

I am not one of those who take a gloomy view of the future of the Finishing Section, despite its recent vicissitudes. But if it is to make progress, there is need for closer integration in the industry, probably organised vertically rather than horizontally. This will be all the more necessary if, as seems likely, the United Kingdom enters the European Common Market, as the textile industry will then have to compete with Continental vertical companies.

BULK LIQUID TRANSPORT LIMITED

As announced in the press recently, a satisfactory cash offer has been received from Mounton Holdings Limited (a subsidiary of United Transport Limited) for the whole of the share capital of Bulk Liquid Transport Limited. The Bradford Dyers' Association Limited and Cawood Holdings Limited have accepted the offer and have disposed of all their interests in Bulk Liquid Transport Limited.

DIRECTORATE AND HIGHER MANAGEMENT

In June last the Board appointed Messrs J. G. Evans, T. L. Leckie, T. S. Naylor and H. H. B. Priestley Joint Managing Directors in succession to the Management Committee. All these gentlemen have had long experience in our industry.

Mr P. A. Holt, who does not seek re-election to the Board, retires as from this date, having reached pension ago. Mr Holt joined the BDA as a works chemist in 1920, became a Branch Director in 1933, was appointed to the Central Board in 1939, and in 1946 was appointed a Joint Managing Director. In 1958 he became a Vice-Chairman of the Company. I am sure we all wish him a happy retirement.

Mr A. V. Symons has been elected Vice-Chairman of the Board.

CHAIRMAN'S RETIREMENT

I have intimated to my colleagues that I do not wish to be re-elected to the Board and, after 52 years' service with the Association, I also retire as from today. I have been Chairman of the Association since January 1, 1946, and I was also a Joint Managing Director from that date until December, 1958, when I relinquished my executive duties. Since then my main duties, in addition to those of Chairman of the Board, have been the negotiations in connection with our claims that arose from the Suez incident, and the initiation, on behalf of the Piece Dyeing & Finishing Section, of the Government sponsored redundancy scheme which was completed last year.

As regards the choice of my successor in the Chair, Mr A. V. Symons will be nominated by the Board for that position and I feel sure that with his experience as a former Chairman of a large textile manufacturing and merchanting company, he is eminently suited to fill the office in the difficult days that lie ahead. The Board have asked me to continue as a Consultant for three years, and I was very pleased to accede to their wishes.

THANKS TO STAFF AND WORKPEOPLE

On behalf of myself and the Board I express our thanks to our staff and workpeople, including those working for our subsidiary and associated companies both at home and abroad, for their efforts and wholehearted co-operation in the past year.

The Report and Accounts and the new Articles of Association were adopted.

POLLARD

BALL & ROLLER BEARING COMPANY LIMITED

Major expansion programme nearing completion

The annual general meeting of Pollard Ball and Roller Bearing Company Limited will be held on May 10th in London. In his statement which accompanied the 1961 Report and Accounts, the Chairman, **Mr. John King,** said:

The Group accounts for 1961 show that there was a gross profit for the year of £546,642 before providing for taxation. The provision for taxation amounts to £235,383 (44 per cent) leaving net earnings of £311,259 and with the amount brought forward the balance of profit available for distribution is £460,200. The proposed final ordinary dividend of 15 per cent less tax amounts to £113,385.

At the time of the Rights Issue in September, last year, I stated that the indications then were that the profit for the full year to December 31, 1961, would show a satisfactory increase. However, in the last three months of 1961 turnover was affected by the setting back of scheduled deliveries to certain major customers in the motor industry and, at the same time, competition became keener and prices tended to fall. Notwithstanding these adverse trading conditions, turnover for the year exceeded that for 1960, but not by a margin sufficient to offset increased expenses and a depreciation charge heavier by some £88,000 due to recent substantial additions to plant and machinery.

The expansion of the past two years, which will be completed during the current year, has been of a major character designed not only to enlarge the productive capacity of the business, but also to make it more self-supporting and to extend the scope and range of our production.

OVERSEAS SALES AGAIN EXPANDED: Our sales abroad have again expanded. Every effort is being made to develop overseas markets, and, with this end in view, we have formed and taken a controlling interest in the Pollard Ball and Roller Bearing Corporation of New York.

Canadian Pollard Bearings has again experienced a disappointing year, resulting in a small loss.

Our French Subsidiary, Pollard Roulements S.A., had a very satisfactory year and made its first direct contribution to the profit of the group. It is now well established and should continue to grow and flourish. The success of this venture has strengthened your Board's view that it should prove advantageous in the event of the United Kingdom joining the Common Market.

Whitehouse Industries Ltd. has had a record year in the sale of "Philidas" Self-Locking Nuts and is responsible for an increased share of the group profit. The manufacture of high tensile steel bolts will add to our range and turnover this year. As in the case of our ball and roller bearing companies, Whitehouse Industries is using some of the most up-to-date machine tools and techniques in the industry.

It has already been announced that the offer which your Company made for R. & J. Dick Ltd. has been successful and we anticipate that it will be an additional source of profit this year.

THE CURRENT YEAR: The present rate of intake of new orders and the current order book are at a high level and it is expected that the increased capacity arising from your Company's recent major expansion programme will come into full use during the current year. It cannot be anticipated that the full benefits from this programme will be seen before 1963, but given reasonably stable conditions of trade, we expect to be able to achieve some improvement in 1962.

I end this statement with a sincere tribute and an expression of thanks to our staff and workpeople. The happy relationship we have always enjoyed continues and has been invaluable during the past year.

NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

A SPLENDID YEAR FOR NEW BUSINESS

SUMMARY OF MR KENNETH MOORE'S STATEMENT

The one hundred and thirty-second annual general meeting of the National Mutual Life Assurance Society was held on April 17th at the head office of the Society, 5 Bow Churchyard, London, E.C.4. **Mr Kenneth A. E. Moore, FCA,** the chairman, presided.

In his statement, which had already been circulated to the members of the Society together with the annual report and accounts for 1961, Mr Kenneth Moore said that the move to a thoroughly modern head office building had proved an unqualified success and had enabled the staff to cope successfully with the busiest year in the history of the Society.

NEW LIFE ASSURANCE

The net new business for 1961 had, at approximately £6,800,000, been roughly double the average of recent years. There had been special lines of business available during the year which had helped the Society to reach such a high level of new contracts.

In addition the opportunity had been taken to improve the balance of the Society's annuity portfolio. The unusually large sum of £3,000,000 had been received as consideration for new immediate annuities.

EXPENSES

In spite of the absolute increase in expenses due to the growth in new business and the setting up of an organisation adequate to cope with increased business, it was satisfactory to report that the adjusted expense ratio had again shown a modest decrease to 15.8 per cent.

RATE OF INTEREST

The gross rate of interest earned on the Life Assurance Fund (i.e. excluding the Capital Redemption Fund) amounted to £6 0s. 3d. per cent, which was a slight improvement on the previous year. The net rate of interest, however showed a satisfactory increase to £5 2s. 9d. per cent—a rise of 5s 5d. per cent over the previous year.

INVESTMENT EXPERIENCE

The year 1961 was a difficult one for investors but the Society's portfolio had appreciated by more than £1,000,000. Inasmuch as this appreciation had been achieved at the expense of a possible improvement in yield it had been thought appropriate to transfer £250,000 to the Life Assurance Fund. The balance had been transferred to the Investment Reserve bringing it to a total of £2,089,000 against ordinary shares of a market value of £9,573,000. This was in addition to the Reserve Fund of £1,000,000 carried on the liabilities side of the balance sheet.

PROSPECTS

In conclusion Mr Moore referred to the policies which the Society had designed recently to be of special attraction to the younger section of the public and to executives for pension purposes. In this and other respects the Society is thoroughly well equipped to move with the times.

The report and accounts were unanimously adopted.

THE BRITISH WAGON COMPANY LIMITED

MR R. A. DYSON'S REVIEW

The 93rd Annual General Meeting of The British Wagon Company Limited was held on April 13th in Rotherham.

The profit of the Group for 1961 before taxation was £322,461 (1960 £429,432).

The following is an extract from the Statement of the Chairman, **Mr R. A. Dyson**: Last September I expressed some uncertainty about the outcome of the remainder of the year. The profits for the first six months compared very closely with those of the corresponding period of the previous year. The second half of 1961 was burdened with increased money costs following the rise in Bank rate to 7 per cent. In addition, partly due to the general tightening of credit, the sale of motor vehicles declined still further which not only reduced business, but also made the sale of repossessed vehicles more difficult and costly, even though over the last two years the proportion of new vehicles financed has been running at a very satisfactory level.

Later in the year Bank Rate was reduced to 6 per cent, but this occurred too late to have any really beneficial effect in 1961. The further reduction in March, 1962, is most welcome. Business during the first two months has been running well below the corresponding period of 1961, although the seasonal improvement is now beginning to have effect. The hire-purchase balances outstanding have increased by 8 per cent and the Deferred Income is up to £3,148,000, an increase of about 10 per cent. This is some encouragement for our prospects in 1962.

In view of the fall in profits and the uncertainties of 1962, your Directors feel that a final dividend of 5 per cent should be paid, compared with 7½ per cent last year.

A major problem facing Finance Houses a few years ago was the uncontrolled competition in commissions for the introduction of business. It is clearly in the interests of the public, the motor trade and ourselves that we keep our charges as reasonable as possible. In these circumstances the adoption by Finance Houses Association in 1957 of a standard Code of dealers' commission was a valuable achievement.

It is therefore deplorable that one of the largest Finance Houses has decided in the face of opposition from all the other members of the Association to launch a scheme of increased commission. Rather than risk the break up of the Association, it was reluctantly decided to suspend the Code so that the Association could carry out its other valuable functions. A material increase in the cost of commissions must follow.

In conclusion, although this year has been even more difficult than the previous one I am hopeful that during 1962 your Company should be able to halt the recent trend of diminishing profits, provided that the outside influences over which management has no control do not become unduly pronounced.

The Report and Accounts were adopted.

How can Gestetner produce copies of their Report and Accounts so quickly?

Because they print them on Gestetner Duplicators — Stencil and Offset!

Copies of the Report and Accounts are now being mailed to Shareholders—barely a fortnight after the close of our financial year.

We will gladly send you a copy of these Accounts and details of the Gestetner duplicators on which they were produced.

Write or telephone Mr. Henry Howell at:

Gestetner GESTETNER DUPLICATORS (B.S.O.) LIMITED
210 EUSTON ROAD LONDON NW1 EUSton 7021

ZANDPAN GOLD MINING COMPANY LIMITED

(Incorporated in the Republic of South Africa)

DEVELOPMENT PROGRAMME OUTLINED

The seventh annual general meeting of Zandpan Gold Mining Company Limited will be held on May 21st in Johannesburg.

The following is an extract from the circulated review of the chairman, **Mr B. L. Bernstein:**

Operations at the mine during the period under review were concentrated on the completion of No. 1 shaft, which reached its final depth of 7,428 feet in November 1961. The installation of all steelwork in the shaft, including that on stations and loading points, was completed during March 1962, and the shaft has now been commissioned. In the early part of June 1961, Vaal reef was intersected in the shaft at a depth of 6,852 feet below the collar. The results of sampling were reported at the time and are set out in the technical advisers' report.

In my review last year I told shareholders that, because of faulting disclosed during the period of sinking operations, no development would be undertaken until the shaft had been equipped and that development would then be advanced simultaneously on several horizons. During the past year further structural information obtained has confirmed that as a result of block faulting, reef in the immediate vicinity of the shaft is confined to a relatively small block of ground. It has also confirmed the necessity for advancing crosscuts from several stations between the upper 6,660 feet level and the lower 7,250 feet level in order to enter blocks of ground which surround the shaft but are separated from one another by major faulting.

The initial development programme has, as its primary aim, the exploration of as comprehensive an area as possible within a radius of about 2,500 feet from No. 1 shaft. At present development, including station crosscutting and orepass raising, is in progress on the 6,950 feet, 7,100 feet and 7,250 feet levels. The rate of development will be built up as rapidly as possible, and a limited amount of development on reef is anticipated in the second quarter of this year.

It is estimated that the balance of capital funds available will be sufficient to finance development operations for a period of approximately a year from now. However, in order to bring the mine to initial production it will be necessary to raise further capital to sink a second shaft and erect a reduction plant.

Operations at the mine are, in the interest of economy, still under the control of the manager of the Hartebeestfontein mine.

The Ordinary Shareholders' Meeting, held in Genoa on the 12th April, 1962, approved the Balance Sheet as at 31st December, 1961. The dividend for the financial year 1961 has been fixed at 10 per cent, namely Lit.50 for each share of nominal Lire 500 fully paid up and Lire 32.50 for each share partially paid in the proportion of eight-tenths. The sum of Lire 800,000,000 was placed to Reserves.

J. BIBBY & SONS

SALES MAINTAINED

The forty-eighth annual general meeting of J. Bibby & Sons, Ltd., was held on April 13th at Liverpool, **Mr H. P. Bibby, JP,** chairman, presiding.

The following are extracts from his circulated statement for the year 1961:

The Group profit before taxation was £849,227 compared with £932,712 for 1960. The net profit after taxation was £440,930 compared with £553,769. The charge for taxation was higher in 1961 because in 1960 an amount of £44,847 was brought back in respect of tax over-provided in previous years. Group sales remained the same at £38,000,000.

The directors have recommended a final dividend of 4½ per cent, making 7 per cent, the same as for last year.

THE YEAR'S TRADING

Although our sales of animal feeds have been maintained at the same level as last year, competition remains very keen and margins are still low. The rate of increase in the national consumption of animal feeds is now very small and there is still over-capacity in the industry: the competitive situation will therefore remain exacting but we are continually striving to increase both our efficiency and the value we give to the farmer. We have extended the scope of our advisory department, which is of great service to customers and continuous work is being done in our research department to improve the nutritional quality of our feeds. These two departments are making an important contribution to our sales effort. Steps have also been taken to improve the presentation and marketing of our products.

The likely entry of the United Kingdom into the Common Market is stimulating all branches of agriculture to make greater efforts to improve efficiency and in the poultry industry in particular important changes are taking place. Egg production for example is following broiler production in becoming more and more a 'factory' operation and there seems little doubt that this tendency will increase.

NEW DEVELOPMENTS

During the year we invested heavily in the London area in our new instant mashed potato product Quip and we hope soon to see some return on that expenditure. In the TV age the launch of a new brand is an expensive affair and this promotion drained away some of our grocery trade profit. Another interesting new development was the launch of our low-foaming detergent Pat, a product specially designed for fully-automatic washing machines. Pat is a unique product in this country.

There can be no doubt that British farming, as indeed all industry, is confronted with a period of change and we must adopt a positive attitude to what seems inevitable. The Common Market is a challenge and an opportunity to improve our standard of life. There will no doubt be considerable transitional difficulties in entering a broader economic community but also considerable long term opportunities for farming and industry as a whole.

The report and accounts were adopted.

KAYSER BONDOR LIMITED

LARGER TURNOVER AT HOME

The Thirty-fourth Annual General Meeting of Kayser Bondor Limited will be held on May 25, 1962, at 24, Albemarle Street, London, W.1.

The following is an extract from the statement by the Chairman, **Mr Michael Colefax,** which was circulated with the report and accounts for the year ended December 31, 1961, and which commenced with a tribute to the late chairman, Mr John Goodenday who served the Company devotedly for more than 30 years:

The turnover of the Group in the United Kingdom has increased by 7½ per cent, an improvement which was partly offset by slightly lower figures in Australia and South Africa. Both the Parent Company and the Group profits have increased, a reduction in those of the South African subsidiary having been more than offset by an increase in Australia.

HOSIERY

There is a continuing change in fashion in favour of seamfree hosiery, which is now estimated to account for 55 per cent of domestic hosiery consumption, and this trend is even more pronounced overseas. Our domestic full fashioned hosiery sales have fallen in each of the last five years and it is therefore gratifying to be able to report that, for the first time in that period, total hosiery sales in 1961 showed a slight, but welcome, increase and with the sizeable seamfree production now at our disposal the Hosiery Division's profits showed a satisfactory increase. Increasing seamfree production should ensure the maintenance of our domestic hosiery turnover during the current financial year.

In the United States, where the demand for seamfree hosiery developed several years earlier than in the United Kingdom full fashioned sales continue to account for more than 30 per cent of the total sales and, allowing for climatic differences, there is every reason to believe that the eventual percentage here will be higher than in the States.

Underwear: Turnover in garments increased by 10 per cent, but the profitability of the Underwear Division did not keep pace with the improvement in sales. This shortfall was due in part to a reduction in profit margins and in part to production difficulties which should be eliminated during the current year.

DEVELOPMENTS

In the autumn we announced the acquisition of the business of Wovenair, a leading manufacturer of housecoats and dressing gowns. The new company which was formed to operate this business took over the lease of a factory at Port Glasgow, which is large enough to handle an anticipated increase in the output of Wovenair products, now marketed by the Kayser Bondor sales organisation.

At the close of the year there were 92 Kayser Bondor Hosiery Boutiques in leading stores throughout the United Kingdom and in addition there were 32 Kayser Bondor Underwear Boutiques, handling exclusively Kayser and Bondor lingerie, brassieres and corsetry. This development is equally beneficial to the retailers concerned and to your Company. The employment of Kayser Bondor trained personnel results in a specialised sales force which achieves increased turnover and which ensures the proper marketing of our range. We look forward to the opening of more Boutiques during 1962.

As has been announced, since the close of the financial year arrangements have been made to purchase the issued share capital of the Mayfair Manufacturing Company Limited, a company engaged in the manufacture of lingerie, which has been a major supplier to Marks & Spencer Limited for more than thirty years. The company will continue to be operated as a separate entity.

OVERSEAS ACTIVITIES

Europe: New developments have also taken place on the Continent. A sales company has been established in Western Germany which started to trade last autumn and which, in addition to marketing Kayser hosiery produced there, is importing garments produced in the United Kingdom.

Since the end of 1961 we have acquired a half interest in Etablissements Grimonprez S.A., our existing concessionaires in France, the name of which has been changed to Kayser Bondor France S.A.

Australia: In an endeavour to stabilise prices the Australian Government introduced various deflationary measures in 1960 and 1961, including a relaxation of import restrictions which resulted in a large increase of imports of cheap textiles. These measures led to a rise in unemployment and a reduction in spending power and their combined effect was probably more serious in the textile industry than in any other form of industrial activity. The performance of the Australian subsidiary in materially increasing its profits against this background, and despite a 2 per cent fall in turnover, is particularly praiseworthy. The purchase of part of the business of Lincoln Mills (Australia) Limited should increase the turnover of the Australian subsidiary by at least 15 per cent in a full year.

South Africa: Sales of the South African subsidiary fell by just over 5 per cent and profits are materially lower than those of the previous year. The Company is building up its seamfree hosiery and underwear business and should improve its profits this year.

Accounts: The profit for the year before providing for taxation amounts to £696,952, compared with £609,865, and the profit after taxation amounts to £392,217 against £364,109. Your Board recommends a final ordinary dividend of 12½ per cent, less tax.

THE FUTURE

Despite the effects of the prolonged spell of cold weather, sales in the United Kingdom for the first quarter of 1962 (excluding those of new acquisitions) have been maintained. It will therefore be disappointing if the Group's turnover does not show an improvement for the full year. Little contribution to profits can be expected in 1962 from the new acquisitions, as it is necessary to effect some reorganisation in the course of integrating these units with the group. Competition and increasing costs continue to reduce profit margins but the Group should continue to prosper.

F. W. BERK & CO. LIMITED

A CHALLENGING YEAR

The seventy-first Annual General Meeting of F. W. Berk Limited will be held on May 10th in London, **Mr C. H. Tanner,** the chairman, presiding.

The following is an extract from his circulated statement:

Nineteen-hundred-and-sixty-one was a challenging year. Group Sales were just under £11,000,000. St. Albans Sand & Gravel Company Limited had a turnover of £1,184,000.

The Group profit of £287,899, after providing £329,574 for taxation, is approximately 14 per cent lower than 1960.

Profits before tax from our general chemical activities have dropped by 29 per cent. The main reason for this fall in profitability is rising costs and falling margins. Profits from the sand and gravel side do, however, show an increase commensurate with improved turnover and, at £160,000 before tax, are in excess of the forecast made at the time of the acquisition.

It is rather difficult on this occasion to pick out sections for special mention, though most of them have operated satisfactorily in the circumstances prevailing. Coating Division and Industrial Dryer Department have been markedly successful and our general exports in 1961 show an encouraging increase accounting for nearly 11 per cent of our total turnover.

All our Associated Companies have done well, particularly Abbey Chemicals Ltd., the constant expansion of which is most gratifying. It is worthy of comment that, although the Associated Companies are contributing to published profits, they are, in the aggregate, retaining about half of their earnings to provide for the furtherance of the individual businesses.

During the year under review, we have acquired the whole of the share capital of Greenspiat China Clays Ltd., which adds another facet to our mineral winning and processing operations. St. Albans Sand & Gravel Co. Ltd. have acquired a fifty per cent interest in two Companies producing ready mixed concrete in Trinidad.

Apart from our determination to expand the output and sales of our existing organisation, we are constantly looking for businesses to acquire or in which to invest, where such additions would increase the scope of any section of our operations, and also benefit the earning power of your company.

I believe the probable advent of the Common Market will provide your Group with additional opportunities, both in the export and import fields, and every endeavour is being made to take advantage of them.

The current year is proceeding satisfactorily, and provided general business conditions remain stable, I expect the sales volume to be maintained against a background of severe competition.

I should mention that your Directors have decided to put increased emphasis on Research and Development, and Publicity, both of which are essential but costly. Improvements have also been made in our Pension Scheme, particularly for long service staff and hourly paid workers. In spite of the foregoing, I anticipate some recovery in the Group Profit for 1962.

Your Directors recommend the payment of a final dividend of 5½d. per share, less income tax, which will make a total of 8¼d. per share, less income tax, for the year 1961.

LEGAL AND GENERAL ASSURANCE SOCIETY LIMITED

YEAR OF FURTHER PROGRESS

The one hundred and twenty-fifth Annual General Meeting of Legal and General Assurance Society Limited will be held on May 9th at Aldwych House, Aldwych, London.

The following is an extract from the circulated statement by **The Rt. Hon. Viscount Harcourt, KCMG, OBE, DL,** the chairman:

The report and accounts for 1961, the second year of the Society's current triennium, show a further year of satisfactory progress.

THE SOCIETY'S NEW HEAD OFFICE

We shall very shortly be moving our head office in London to our fine new building, Temple Court, 11, Queen Victoria Street, close to the centre of the City of London. I am only sorry that, due to a delay beyond our control, it will not be ready in time for this year's annual general meeting.

This move will be an historic event for the Society, whose head office has been near the junction of Fleet Street and Chancery Lane for a century and a quarter, and will undoubtedly lead to greater efficiency in the conduct of our business.

LIFE ASSURANCE AND ANNUITY FUND

New life sums assured, net of re-assurances with other offices, amounted in 1961 to £285,000,736, an increase of £13,493,811 (or 5 per cent) over the previous year's figure. This increase is smaller than we have experienced recently, but we have for some time thought that there must be a slowing down in the rate of growth in the new life assurance business transacted by the Society. In recent years this has included exceptional increments arising from the reorganisation of pension business and the installation of special schemes for contracting-out of the graduated part of the national insurance scheme. We could not expect these increments to continue on the same scale indefinitely and I think we can be pleased with the progress we have made.

PENSION BUSINESS

Last year I referred to the special efforts we were making to assist our pension scheme policyholders, who so wished, to contract-out of the graduated part of the new national scheme in good time. These efforts were successful, and you will be interested to know that, in all, about 2,450 employers who have schemes with the Society have completed the formalities for the contracting-out of some 285,000 employees.

I am also glad to report the completion of most of the work of recasting large numbers of schemes which had to be undertaken as a result of the Finance Act, 1956, although some time will still be required to complete all the details and the necessary documents.

The success of our efforts is shown by the year's increase of about £3,000,000 in the premium income for pension business alone.

RATE OF INTEREST

The gross rate of interest earned during 1961 on the life assurance and annuity fund, omitting the amount invested in the purchase of reversionary interests was £6 0s. 8d. per cent, compared with £5 17s. 5d. per cent in the previous year. After deduction of income tax, the net rate of interest in 1961 was £5 13s. 5d. per cent, showing an increase of 4s. 7d. per cent over the previous year's figure of £5 8s. 10d.

FIRE AND ACCIDENT BUSINESS

I am pleased to report an excellent year for the Society's fire and accident departments, resulting in a record underwriting surplus of £682,412. In the fire insurance account claims amounted to 40.8 per cent of the premium income and there was an underwriting surplus of £359,240. In the accident insurance account claims were 50.5 per cent of the premium income and there was a surplus of £323,172.

Fire business in the United Kingdom was exceptionally profitable. Compared with the previous year, we did not experience such serious individual losses by fire and there was fortunately in this year no repetition of the heavy losses by flooding.

Accident business in this country was also profitable, the outstanding feature being a welcome improvement in the motor section. We can only hope that the increase in premium rates recently introduced will prove adequate to ensure a reasonable margin of profit to underwriters, but what we would most like to feel is that our experience last year provides some evidence of an overall improvement in road safety.

MARINE ACCOUNT

The figures for 1961 are almost doubled due to the inclusion, for the first time, of those for the British Commonwealth Insurance Company Limited.

ASSETS

The Society's total assets increased during 1961 by 10 per cent, and at December 31, 1961, stood at £488,377,378 compared with £441,970,625 a year previously.

The life department balance-sheet shows investment assets represented as to £187,594,904 by Stock Exchange investments, as to £125,954,731 by mortgages and other loans, and as to £122,709,929 by freehold and leasehold properties.

PROFIT AND LOSS ACCOUNT

To the balance of £1,813,596 brought forward from last year there has been added £621,901 in interest and dividends as well as the underwriting surplus from our fire and accident business which, as already mentioned, amounts to £682,412.

Finally, I would like to pay a tribute to the able management of the many and varied aspects of the Society's business by Mr P. Cahill, our general manager, and all his colleagues on the management and staff. Without their enthusiasm and skill I should not be able to present to you this favourable review of progress.

CITY CENTRE PROPERTIES
LIMITED

Summary of the Report, Accounts and Mr Jack Cotton's Statement for the FIFTEEN MONTHS ended 24th June, 1961.

Resumed Annual General Meeting—16th April, 1962.

The Accounts combine the revenue of City Centre Properties Limited for a period of 15 months with that of City & Central Investments Limited for a period of 12 months.

	15 months ended 24th June, 1961
Gross Income of Group	£6,418,895
Net Income (after Taxation)	£982,956
Dividends Paid (after Taxation)	£604,586
Issued Capital: 18,898,042 Ordinary Shares of 5s. each	£4,724,511

Dividend paid at the rate of 25½ per cent. per annum.

An issue of £18,939,830 Convertible Loan Stock 1965/70 was made during the period with conversion rights as follows:—

Conversion During the month of December in	Rates of Conversion One fully paid Ordinary Share of 5s. for each
1962	60s. Loan Stock
1963	62s. Loan Stock
1964	64s. Loan Stock

Interest at 5 per cent. per annum is payable on the Loan Stock up to and during the period available for conversion and 6 per cent. per annum thereafter.

The Group owns properties in 268 cities and towns throughout the United Kingdom.

THE FUTURE

The cumulative results of the Group's enterprise throughout the world become increasingly apparent and dividends have grown uninterruptedly in the past years. The aim is to increase the revenue of the Group and to provide security of income by development of first-class commercial properties throughout the world.

At the Annual General Meeting the Chairman stated that the accounting date would be changed from 24th June to 25th March and that the next accounts would be for the 9 months to 25th March, 1962. These accounts were expected to be available in September and the Annual General Meeting held in October, 1962.

The Chairman stated that the Gross Income of the Group for:—

Year ending 25th March, 1951, was	£124,791
Year ending 25th March, 1956, was	£687,700
15 Months ending 24th June, 1961, was	£6,418,895

The rate of growth of the Gross Income of the Group each year is considerable.

THE SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

SUBSTANTIAL INCREASE IN LIFE BUSINESS

CONTINUED EXPANSION IN ACCIDENT BUSINESS

MR PATRICK J. OLIPHANT'S REVIEW

The following is a summary of the statement by the Chairman, **Mr Patrick J. Oliphant, WS,** circulated with the Report and Accounts of the Scottish Union and National Insurance Company for the year 1961:

During the year the premium income again rose substantially, the increase amounting to approximately £550,000.

The new sums assured in the Life Department totalled £12,394,034 and immediate and deferred annuities granted amounted to £1,661,372 per annum, both figures being substantially higher than those for last year. A material proportion of the new business was in respect of staff pension and life assurance schemes. The annual premiums under new Life business amounted to more than £600,000, an increase of 20 per cent over the previous year's figure.

Valuations of the Life and Annuity business are now made annually and at December 31, 1961, the very satisfactory surplus of assets over liabilities of £1,178,265 was disclosed. The stringent bases on which the liabilities are calculated and the substantial surplus in the account gives cause for considerable satisfaction and augurs well for the future prospects of the participating policy holders. The satisfactory yields on the investments and the steady improvement in the mortality rates experienced have made it possible to effect substantial reductions in the premium rates for non-participating life policies.

Fire premium income at £5,300,678 showed an increase over the previous year. Home business and business in overseas territories with the exception of the USA. and Canada expanded satisfactorily. In North America there has been a selective restriction of the business written. Fire waste in the United Kingdom continued at a very high level in 1961 although there was some reduction compared with 1960. Whilst Canadian losses showed a welcome reduction, Fire losses were heavy in other overseas territories and in addition hurricanes in the USA took a severe toll. The Fire Account showed a loss of £83,253.

There was a substantial increase of £364,916 in the premium income of the Accident Department which totalled £4,267,478. Unfortunately the claims experience deteriorated due largely to unexpectedly heavy claims in the miscellaneous section of the home account on which in the past profits have been regularly made. There was, however, a substantial improvement in the experience in the USA and Canada. The unexpired risk reserve is on the unusually strong basis of 50 per cent of the premiums and after providing for this the final result was an underwriting loss of £275,358.

In the Marine Department premiums decreased slightly to £1,844,140 whilst claims paid increased by £199,413 to £1,470,755. The increase in claims was a general market experience and was largely due to the adverse results in the USA and to the series of major casualties which occurred in the latter part of 1960 and in the first half of 1961. It was considered prudent to make no transfer to the Profit and Loss Account and the marine underwriting fund now stands at £1,915,922.

In the Profit and Loss Account interest, dividends and rents totalled £536,203. There were transfers to the Account of £58,882 being Shareholders' profits from the 1961 life valuation and of £10,000 from the Capital Redemption Account. Transfers of £83,253 and £275,358 respectively were made to the Fire and Accident Accounts. The net profit for the year was £118,729 and after charging £183,750 for the year's dividends (increased from 20 per cent to 25 per cent) a balance of £858,929 was carried forward.

Mr Oliphant concluded his statement by thanking the members of the Boards and the Agents at home and overseas for their wholehearted support and co-operation during the year.

He also paid tribute to the General Manager and Executive, Managers and Staff at home and overseas for their excellent work and loyalty and to the Norwich Union Societies for the very valuable co-operation and assistance so freely given.

NORTHWESTERN RUBBER COMPANY
(Manufacturers of Reclaimed Rubber)

The Annual General Meeting of The Northwestern Rubber Company Limited was held on April 16th in Liverpool.

Mr J. Riddell, OBE (Chairman), presided and, in the course of his remarks, said: The year 1961 must be regarded with considerable disappointment. Sales were maintained and reached a new record, but the trading profit fell from £91,895 to £68,334.

This fall can be attributed to the increasing but still highly variable percentage of synthetic rubber in scrap tyres resulting in reductions in refining rates made necessary if quality is to be maintained, difficulty in plant installation and the full effect of wage increases granted in 1960.

The Directors have given considerable thought to the final dividend and having regard to the prospects for the coming year have decided to recommend maintenance of the dividend.

Demand for our product remains buoyant and output is again rising. The results for the first month of 1962 show a reasonable improvement over 1961, but the directors are by no means satisfied with the profitability.

Northwestern have entered as equal partners with H. Muehlstein & Co., of New York in a joint company to deal in the re-processing and colouring of plastic materials. Our incursion into the plastics field and certain further capital projects we have under contemplation which offer substantial labour savings in relation to the sum involved make it desirable that further permanent capital should be raised, probably by means of a Rights Issue.

A resolution to increase the authorised capital was presented at the meeting and duly sanctioned.

The report was adopted.

NORTHGATE EXPLORATION LIMITED

RESULTS HIGHLY ENCOURAGING

The Forty-Second Annual General Meeting of Northgate Exploration Limited was held on April 3rd in Toronto, Canada. The following is an extract from a review by **Mr Patrick J. Hughes,** the President.

We have been saddened by the loss of our general manager, Mr Walter Maybank. For the time being, or until a successor is found for Mr Maybank, General Engineering Company, Limited, will act as managers for the Tynagh project.

We are all very enthused over the progress which has been made to date on the Tynagh property. Our drilling programme has continued with success. At present a staff and work force of some sixty people is pressing forward our exploration programme at Tynagh. Results have been highly encouraging.

At the moment we must beg the question of when production will begin for much more work and many more facts are needed before we can set a date.

LONDON STOCK EXCHANGE HISTORY

I would like to make a short comment regarding Northgate's relationship to the London, England, Stock Exchange. Some confusion has arisen over activities in London and we feel that these have incorrectly caused some prejudice towards our company.

Under a regulation of the London Stock Exchange, regulation 161B, member brokers are allowed to trade occasionally, on a private basis between themselves, shares of issues which are not listed on the exchange. During the last part of 1961, when great interest was centred on our work at Tynagh, this trading in the company's shares reached the point where there was substantial trading by some London brokers in one day. Since this activity was not within the meaning suggested by regulation 161B, the London Stock Exchange cautioned its brokers against further trading and suspended regulation 161B with respect to Northgate. This action took place without notification to or consultation with our company. Northgate has never been listed on the London Exchange and we have found that a good deal of documentation and expense would be involved to obtain listing.

While the company, as a convenience to our English shareholders, would like to see all possible trading facilities open to them, we feel that application for trading privileges on the London Exchange would not be justified at the present.

HIGHLIGHTS

The highlights of our progress to date are:

Your company has made the most important new base metal discovery in the British Isles in the past 100 years;

In the short space of four months we have advanced a major exploration programme with great speed;

Indications are that we should be able to move quickly from our present period of exploration;

Finally, I would like to pay tribute to the Irish Government and its officials for its wise legislation, help and collaboration.

THREE NEW DIRECTORS

Mr Hughes then announced the appointment of three new directors, Mr Robert M. Hamilton, Dr Duncan R. Derry and Mr Warren Armstrong.

Mr Hamilton, President of General Engineering Company Limited, Industrial Engineers, Toronto. He organised the firm with his brother in 1933, and has since been responsible for the design, construction and operation of a wide variety of mining and industrial plants throughout Canada, the United States and abroad. He is a director of Canadian Arsenals Ltd. and Canadian Vickers Ltd.

Dr Derry, Consulting Geologist to Northgate. He is a former Vice-President (Exploration) of Rio Tinto Mining Co. of Canada and was Chief Geologist for Ventures Limited.

Mr Armstrong, a graduate of Osgoode Hall, Toronto, was in private law practice in Toronto for many years. For the past two years he has been Secretary of the National Energy Board in Ottawa.

TYPHOO TEA (HOLDINGS)

A MOST SATISFACTORY YEAR

The thirteenth annual general meeting of *Typhoo Tea (Holdings) Limited* was held on April 16th in Birmingham, **Mr J. R. Hugh Sumner, CBE, DL, JP** (the chairman), presiding.

The following is an extract from his circulated statement:

Last year, in my statement, I referred to the fact that the then current Tea prices were higher than they were in 1960 and might adversely affect profits for the year ended December 31, 1961. I am therefore happy to report that the Group Profit for the year amounted to £2,869,820 as compared with £2,584,935 last year; this profit is subject to a charge of £1,535,780 for Taxation which is equivalent to 10s. 9d. in the £.

Your Board recommends a Dividend of 30 per cent less Tax, as before.

Turning to the Balance Sheet, your attention is drawn to the conservative figure of Fixed Assets. You may be assured that the insurable value is many times more than the Book Value.

Current Assets amount to £7,787,838 in excess of Current Liabilities, a fact which no doubt will be appreciated.

The year 1961 proved to be most satisfactory from a sales angle and I am more than happy to report that once again there was an increase over the previous year.

As far as 1962 is concerned, we must bear in mind the possibility of fluctuating prices in the Tea Markets of the World and the intense competition throughout the food industry, but we can, however, assure you that there will be no relaxing of effort to further the interests of your company.

The report was adopted.

Copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:
The Company Meetings Department,
The Economist,
22 Ryder Street, S.W.1.

COMPANY AFFAIRS

The improvement in equity prices before and immediately after the Budget was not maintained and shares fell at the end of last week. Despite a few gains this week The Economist *indicator fell by 7.8 points to 354.9 by Tuesday's close. The limelight has been taken by the gilt-edged market and stocks have made some good gains with hopes of an early cut in Bank rate outweighing fears of the impact of the speculative gains tax on switching transactions. Insurance and brewery shares have again been prominent and property shares have been in demand. Motor shares fell back sharply on the BMC interim statement but they staged a recovery this week.*

BMC Punctures the Boom

THE interim statement from the British Motor Corporation comes as a rude shock. After the optimistic tone of Mr Harriman's statement last November, when he spoke of his "firm confidence in the future of . . . the British Motor Corporation," nobody expected to hear that the company's earnings in the first 32 weeks of the financial year from July 31, 1961, had suffered a "severe setback compared to the same period last year." But "the general outlook, coupled with purchase tax reductions and the availability of the dividend equalisation reserve" were thought by the directors to justify an unchanged interim dividend of 7½ per cent. Does this statement mean that earnings were not sufficient to cover this payment?

The fall in profit is all the more disturbing as BMC made nine per cent more vehicles than in the same period a year before, which covered the winter of 1960-61 when the company was for some time making only a small number of cars. Its share of the home market, moreover, rose steadily from last August to a new record in January—nearly double Ford's sales. Price increases introduced last October had been designed to improve margins, especially on the "Minis," on which margins had been described by the directors as inadequate in July. Now the interim statement repeats what was said then: lower margins resulted from sales of a higher proportion of lower-priced vehicles. But it adds a second reason: increased sales in competitive export markets—a reminder that exports are generally less profitable than domestic sales. All this suggests that prospects for better profits in the motor industry are much less good than the rise in production had suggested.

There are, however, some special factors that may have depressed BMC's profits. The introduction of the revised versions of its bigger models and the more expensive versions of the "Minis" seems to have disrupted output more than might have been expected. Production has been higher since mid-January and will rise still more in the summer and thus profits should be higher in the last 20 weeks of the year. But they seem unlikely to cover much of the heavy capital commitments—£52 million in the three years from last July. And in the longer term, the low profitability of a period when the company was operating at about 75 per cent of capacity hardly bodes well for a company that is unlikely to be able to average a much higher rate of working than this when its new plants are complete. Higher prices may be the only solution to BMC's problems; perhaps the growth in sales is being gained by under-pricing. The yield of 6.4 per cent offered by the 5s. shares at 15s. 10½d. is not too high.

Bowater Paper

THE £1 shares of Bowater Paper have been depressed for some months with buyers holding off ahead of the results which it had already been indicated would show a fall in profits. This week the shares have had a brighter look for the results were certainly no worse than expected; they gained 9d. to 43s. to yield just under 6½ per cent on the dividend which has been maintained at 13¾ per cent. Total sales in 1961 rose by 4½ per cent from £142 million to £148½ million, but trading profits fell by 7 per cent from £23.5 million to £21.9 million. A maintained dividend does not reflect any immediate improvement in the prospects of the paper industry in this country. The directors say that the trading difficulties have continued into 1962 and that any prediction for the future will be impossible until certain problems peculiar to Britain's economy, not least a decision about the common market, have been resolved. However, they feel "on balance" that it would be right to maintain the dividend at this time. Their decision was no doubt helped by a sharply lower tax charge, but nevertheless the dividend is now covered only 1.3 times.

Last year overseas activities accounted for 78 per cent, against 70 per cent, of the group's trading profits and one bright spot is the continued progress made by the North American subsidiary whose accounts, covering the Tennessee operations as well as the Canadian, are expressed in Canadian dollars. Its trading profits rose from $41.7 million to $43.8 million and the dividend paid to the parent company has been raised from 38 to 40 cents, to absorb $6.4 million against $5.7 million. As a result of the fall in the value of the Canadian dollar in terms of sterling, however, the further improvement in dollar earnings is not reflected in the group's trading surplus as expressed in sterling. The whole of the reduction in trading profits and the fall in sales in the second half of 1961 is attributed to the United Kingdom where the Bowater companies faced a marked fall in demand and a sharp drop in profit margins.

Six months ended	June 30, 1960	Dec. 31, 1960	June 30, 1961	Dec. 31, 1961
	£000's	£000's	£000's	£000's
Sales	65,403	76,597	75,617	72,883
Trading surplus	10,998	12,496	11,051	10,816
Depreciation	3,560	4,258	4,327	4,268
Taxation	2,509	3,294	2,420	1,983
Net profit of parent	2,809	2,835	2,202	2,593
Trading Profit/sales	% *16·8*	% *16·3*	% *14·6*	% *14·3*

A year ago the shares stood at 60s. and in 1960 they nearly touched 80s. and buyers at the current depressed level are likely with patience to show a useful profit. While the immediate outlook particularly in this country remains clouded and margins both on sales and capital employed have fallen sharply it should not be forgotten that in recent years the group has invested heavily in furthering its policy of diversification of products and expansion within the paper industry. This is reflected in a further sharp rise in the charge for depreciation, but many of these developments in America and Australia as well as in Europe and this country have yet to make a full contribution to the earnings of the group.

Sears Holdings

IT has become the custom of Sears Holdings effectively to raise the ordinary dividend and to forecast a further increase while maintaining the rate at 25 per cent. Despite the dividend pause this tradition has been maintained with the dividend, as forecast, kept at 25 per cent on the capital as increased by last year's one for five scrip issue (which in fact represents an increase from the equivalent of 20⅝ per cent); this is accompanied by a forecast of 25 per cent for the current year on the capital after the proposed one for six scrip issue. The trading results for 1961 are very much as expected, following the forecast at the time of the Saxone, Lilley and Skinner take-over that British Shoe's profits would show only a small increase in profits. But it is one of the merits of an industrial holding company that if profits in one particular section are less buoyant this is often compensated by a better showing elsewhere. And the table shows that the engineering division reported a 10 per cent increase in gross profits and accounted for most of the increase from £10.2 million to £10.7 million in the group's profit before tax. This bears out the confidence expressed by Mr Clore in his statement a year ago on the growth prospects of this section of the business—particularly of Bentley Engineering, the hosiery knitting machinery group.

Years to December 31	1960 £'000	1961 £'000
Group trading profit	11,783	12,431
Depreciation	1,366	1,511
Profit before tax	10,206	10,718
Tax	5,200	5,518
Net profits	4,790	4,902
Ordinary dividend	1,964	2,357
Ordinary dividend (per cent)	20⅝	25
Subsidiaries' gross profits:—		
British Shoe	5,669	5,833
Sears Engineering	3,915	4,311

For the current year however the main improvement in earnings is again likely to come from British Shoe which has consolidated its dominance in the British shoe industry by acquiring Saxone, Lilley and Skinner. This should bring in around £2 million in additional trading profits and it offers the prospect of economies through the rationalisation of the businesses. There is now however a large minority interest in British Shoe and investors can now choose between a direct stake in British Shoe (in which the 5s. shares at 23s. 3d. yield 3.2 per cent on the forecast of a 15 per cent dividend) or in the group as a whole through the 5s. "A" shares of Sears Holdings (which at 40s. 10½d. offer a prospective dividend yield of 3.6 per cent). Both shares have a high growth rating merited by their past record. The yield gap between the shares reflects the more rapid growth in the shoe companies' earnings in the past and some uncertainty whether the engineering companies will be able to continue to make good any fall in profits from Furness Shipbuilding.

Gallaher

SINCE the report on lung cancer tobacco consumption has fallen, though by how much it is too early to judge. But cigarette sales are down and there has been a further switch to tipped brands. In framing his budget, the Chancellor reckoned on a slight increase in the yield of the tobacco tax but he added that he had taken account of the possibility that the yield might be lower. The Chancellor will be lucky this year if tobacco consumption remains unchanged, but dealers in tobacco shares were pleased that he had not imposed any special discriminatory tax on cigarettes and marked share prices up. Gallaher, like the other tobacco manufacturers, must expect the going to be tougher this year, but its recent success in the tipped market with "Nelson" should help.

Now that it controls Wix, Gallaher is responsible for nearly 40 per cent of cigarette sales in this country and its directors are fully alive to the fact that it will be increasingly difficult to add to this share of the market. The acquisition of Wix, however, could easily add over £2 million to the group's profit this year and it gives Gallaher a direct interest in coupon trading. The acquisition came too late to have any effect upon the group's results for 1961; no dividend was paid by Wix and Gallaher in respect of that year and the shares issued by Gallaher in acquiring the company do not rank for the latest final dividend. As forecast then the ordinary dividend has been maintained at 20 per cent, following a rise in trading profits from £11,743,000 to £13,661,000 and in net profits from £5,828,000 to £6,344,000. This means that the dividend is covered just over twice as the directors indicated at the time of the acquisition in December. In all, investors in Gallaher, whose shares now yield 6½ per cent at 31s. 3d., cannot expect the same rate of growth as occurred over the last decade; equally, this should reduce the calls made on the stock market for new money though there may be still some past debts to be funded. But investors should not underrate the ability of Gallaher's management to reframe its policies in the light of a changing and less buoyant market. On a short term view the present dividend looks safe and it could go higher if coupon trading and sales of tipped cigarettes continue to do reasonably well.

Hudson's Bay

IT was clear from the preliminary results that the impact of a full year's trading from Henry Morgan on the results of Hudson's Bay had been considerable. Thus a 19 per cent increase in the group's retail turnover from £88 million to £105 million comes down to an increase of 3.6 per cent when Morgan's sales are included for both years. However, no similar comparison is made in the case of profits, which rose from £5.2 million to £6.1 million before tax. The directors say that Morgan's sales increased "satisfactorily" but that profits were affected by the cost of improving and expanding stores and by higher operating costs; and it seems clear that Morgan's failed to make good the 13 per cent fall in profits in the previous year. The group's stores generally held their own against increased competition, reporting a modest advance both in sales and profits.

Among the group's other interests fur sales reached a new peak but lower prices for the company's own raw furs partially offset the good returns from the three auction houses. Wholesale sales were slightly up but the directors say that because of keen competition in tobacco products profits were kept to "marginal levels." But the most important event of the year was probably the receipt of a maiden dividend from Hudson's Bay Oil and Gas in which it has a 22.6 per cent interest. This boosted Hudson's Bay income by £286,000. Net income of HBOG rose from 6 cents to 39 cents per share. The directors say that the growth in demand for both oil and natural gas has continued into the current year. Hudson's Bay's holding stands in the balance sheet at £3.6 million against a market value of about £26 million.

The maiden dividend from HBOG coincided with a clear indication that the distribution from land sales is not likely to continue much longer. After the present distribution the balance in the Land Account will be sufficient only to provide for distributions at the present rate of 2½ per cent for a further three years. These distributions are tax free and for a number of years they have provided a useful sweetener to the dividend. It now remains to be seen whether increased profits from the retail side and a bigger income from HBOG will enable the company to raise the dividend from 12 per cent to at least the present effective dividend rate of just over 16 per cent. As the ordinary dividend alone is covered over three times this is quite possible, and at the current price of 88s. 9d. the £1 ordinary shares yield just over 3½ per cent on the total trading and land payments.

Hire Purchase Débâcle

THE number of hire purchase company chairmen that are having to eat their words is still growing. Last year Sir Mark Turner, chairman of **Mercantile Credit**, softened the blow of a cut in the final dividend from 7½ to 2½ per cent, by saying "the back of the problem has been broken." And Sir Mark reiterated this point when he said at the general meeting in January that though there were still difficulties he felt that in the provision made this year the directors had broken the back of them. Now the interim is cut further to 2 per cent and because of new uncertainties the board "wish to state that the interim dividend should not be taken as any indication of the total distribution for the year." In the previous week the chairman of **Lombard Banking**, Mr E. G. Spater, was far from shaken in reporting a halving in the group's gross profits. "I am confident," he said, "that in all the circumstances members will not be displeased with the profits disclosed." Shareholders in the hire purchase finance companies have been treated rather roughly by some of the industry's spokesmen, who could have been more frank in revealing the full plight of the industry and the companies within it.

Industrial Profits and Assets

The tables below continue the analysis of company balance sheets and profit and loss accounts which was introduced in *The Economist* of January 22, 1949; the figures are discussed on an earlier page in this issue.

Comparative analysis of 371 profit and loss accounts published January - March, 1962 (£'000)

APPOINTMENTS

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT, PARIS

seeks staff members for

DIRECTORATE FOR SCIENTIFIC AFFAIRS

Nationals of Member countries only are eligible.

Tax-free salary according to qualifications and experience, allowances and Provident Fund.

Functions

1. Review of science policies in Member countries and also of national policies affecting the needs, education and utilisation of scientific and technical personnel.
2. Studies on investments in scientific research, technology and education in relation to economic growth in advanced and developing countries.

Qualifications

Honours degree in economics or social sciences and/or qualifications in natural sciences or engineering. Excellent knowledge of English and/or French and willingness to travel.

Experience: Administration of or research into problems of science policy and scientific and technological education (1).

Research in economics, preferably with relevance to investments in science, technology and education (2).

Send candidatures in French or English, before May 14, 1962, to Personnel Division, O.E.C.D., 2 rue André Pascal, Paris, XVIe.

NUFFIELD COLLEGE OXFORD

STUDENTSHIPS

Applications are invited from men or women graduates who wish to undertake research in economics; politics; sociology; recent economic and social history and political history; industrial relations; African studies; public and social administration; international and public law, or any other branch of the social studies. Further particulars and the necessary forms are obtainable from the Warden. Applications should reach him by May 15, 1962.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT LECTURER in STATISTICS to hold duties on October 1, 1962. Initial salary according to qualifications and experience on the Scale £800 x £50—£950, with F.S.S.U. provision and family allowance. A grant towards removal expenses will be made. Further particulars may be obtained from the Registrar, to whom applications (four copies) should be sent by May 5, 1962.

NORTH WESTERN GAS BOARD
HEAD OFFICE—MANCHESTER

ASSISTANT ECONOMIST

Applications are invited for the above pensionable appointment in the Statistics Department, at a commencing salary within the range £1,070-£1,015 per annum according to qualifications and experience.

Candidates must be graduates (or about to graduate this summer) and should preferably be not more than 2[5] years of age. Preference will be given to Honours graduates in Economics with some knowledge of Accountancy.

The Assistant Economist will be concerned with cost and price studies within the business and with the analysis of economic trends, as they affect the gas industry. The work offers ample scope for initiative in the application of the economist's approach to the solution of business problems.

Detailed applications, giving the names of two referees, should be sent to the Secretary, North Western Gas Board, Bridgewater House, 69 Whitworth Street, Manchester, 1, within 14 days.

HEINZ[57]

MATHEMATICIAN

A qualified mathematician is required to work with our Industrial Engineers on a number of interesting projects which require mathematical or statistical techniques.

Candidates should preferably have a degree in mathematics or anticipate graduating in mathematics in the Summer of this year.

Full details of duties will be discussed during interviews, together with conditions of employment but, initially, applicants should please forward a brief summary of personal history to:

The Personnel Officer,
H. J. Heinz Co. Ltd.,
Wawlow Road,
Harlesden, N.W.10.

COUNTY COUNCIL OF ESSEX

COUNTY PLANNING DEPARTMENT

Applications invited for following vacancies:

SENIOR PLANNING ASSISTANTS. A.P.T. III/IV (£960-£1,310)

Vacancies exist in the Research and Survey Sections in Area Planning Offices at Romford and Wanstead.

Candidates should possess an appropriate University Degree and be prepared to study for the Final Examination of the Town Planning Institute. They should have had experience of research and survey work with a local planning authority.

Five-day week; assistance towards costs of removal on reserve and financial assistance for study purposes; superannuation; medical examination.

Applications, stating age, qualifications, experience, present and previous appointments and salaries, together with names of two referees, should reach the County Planning Adviser, Broomfield Place, Broomfield, Chelmsford, Essex, by April 25, 1962.

CITY OF LEEDS

LEEDS COLLEGE OF COMMERCE

Applications are invited for the following posts, duties to begin on September 1, 1962.

SENIOR LECTURER in MANAGEMENT STUDIES with specific reference to one of these aspects: Sociological; Production; Economic; Business Policy.
LECTURER in MANAGEMENT STUDIES with special reference to PERSONNEL MANAGEMENT.
LECTURER in MANAGEMENT STUDIES.
LECTURER in ACCOUNTANCY with special reference to MANAGEMENT ACCOUNTING.

Salaries in accordance with the Burnham Technical Scales, i.e.:

For Senior Lecturers: £1,800 x £50=£2,000.
For Lecturers: £1,600 x £40=£1,800.

Appointments may in all cases be made above the minimum of the scale.

Further particulars and application forms may be obtained from the Principal, Leeds College of Commerce, 43 Woodhouse Lane, Leeds 2.

GEORGE TAYLOR,
Chief Education Officer.

Education Department,
LEEDS 1.

UNIVERSITY OF EDINBURGH

DEPARTMENT OF ECONOMIC HISTORY

Applications are invited for the post of LECTURER or ASSISTANT LECTURER in the Department of Economic History. Preference will be given to candidates whose main interest is in Economic History since 1750. Salary scales—Lecturer: £1,050 x £50 to £1,250; Bar: £1,300 x £50 to £1,400 x £55 to £1,550 per annum; Assistant Lecturer: £800 x £50 to £950 per annum. Placement on the scales will be according to qualifications and experience. The posts are subject to superannuation, and family allowance is payable where applicable.

The successful candidate will be expected to take up duty on October 1, 1962.

Further particulars may be obtained from the undersigned, with whom applications (six copies), giving the names of two referees, should be lodged not later than May 4, 1962.

CHARLES H. STEWART,
Secretary to the University.

April, 1962.

MAKERERE UNIVERSITY COLLEGE, EAST AFRICA

EAST AFRICAN INSTITUTE OF SOCIAL RESEARCH
APPLIED RESEARCH UNIT

Applications are invited for the following Research Fellowships:

(A) (i) HISTORIAN (Senior Fellow)—documentary study of the history of land consolidation measures in Central Province, Kenya (Kikuyuland).
(ii) ECONOMIST (Junior Fellow)—study of the problems of game utilisation in Tanganyika.

(B) (i) SOCIOLOGIST (Senior or Junior Fellow)—socio-economic study of the teaching profession in Uganda.
(ii) SOCIOLOGIST (Senior or Junior Fellow) of the problem of wastage in the Uganda secondary school system.

Tenure: Posts (A) 15 months in East Africa (at the end of which a preliminary report will be required) followed by one month's leave. Posts (B) two years in East Africa followed by three months' leave and three months' study leave, but terms of service may be varied to include retirement leave period in East Africa. Salaries determined by qualifications and experience in scales: Senior Research Fellow £1,850—£1,981 p.a.; Junior Research Fellow £1,496—£1,251 p.a. Passages on appointment and termination for appointee and family (up to full adult passages). F.S.S.U. Child Allowance £50 p.a. per child (maximum £150 p.a.). Rent £48—£84 p.a., including basic furniture. Detailed applications (six copies), naming three referees, by May 10, 1962, to Secretary, Inter-University Council for Higher Education Overseas, 26 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

Stockbrokers want man 28-42 to run Investment Department dealing with institutions. Hard work, initiative, accuracy, speed are needed. Graduate now employed in financial journalism preferred. We are fully prepared to provide terms required by a suitable applicant.—Box No. 1617.

MARKET RESEARCH MANAGER

of an international food manufacturer requires an

ASSISTANT

who will be capable of taking responsibility for research into a number of the Company's existing products and development lines.

Applications from men or women age 24-30, preferably with at least two years' Market Research experience, are invited. Salary in range £800-£1,100 plus substantial bonus. Pension/Life Assurance benefits.

Replies to Box 1615.

ROYAL COLLEGE OF ADVANCED TECHNOLOGY, SALFORD

DEPARTMENT OF LIBERAL STUDIES

Applications are invited from suitably qualified persons for the post of Head of Department, at a salary within the range £2,410 rising to £2,600 per annum.

The Department provides courses in Liberal Studies (including English, foreign languages and social sciences) for all full-time students of the College and also offers part-time evening courses in Russian and German for scientists and technologists engaged in industry. Extensive developments are taking place in the Department as well as in the College as a whole.

Candidates should possess good academic qualifications. Research experience is desirable; teaching experience, though desirable, is not essential.

Further particulars and application forms are obtainable from the Secretary, Royal College of Advanced Technology, Salford 5, Lancs., to whom applications should be returned by May 15, 1962. Please quote reference LB/1.

THE DISTILLERS COMPANY LIMITED

ECONOMIST

The Plastics Group of The Distillers Company Limited invite applications from women holding honours degrees in Economics, who are also competent in shorthand and typing, for a new post involving both economic studies and secretarial work.

The person appointed will be based in London, and will work in the Market Development Department, in which a wide range of economic and market research studies is undertaken; these relate to the Group's activities as large-scale manufacturers of raw materials for the plastics industry.

Write: STAFF MANAGER,
THE DISTILLERS COMPANY LIMITED,
21/22 BOLTON STREET, LONDON, W.1.

Quote Reference: 240 I.C.

UNIVERSITY OF NEW ENGLAND

ARMIDALE, NEW SOUTH WALES

SENIOR LECTURER OR LECTURER IN ECONOMICS

Applications are invited for the position of Senior Lecturer or Lecturer in Economics.

Commencing salary will be determined according to qualifications and experience within the ranges: Senior Lecturer, £A2,550 x 95—£A2,900; Lecturer £A1,730 x 105—£A2,155. Cost of living allowances are payable. Provision is made for superannuation, travel, removal expenses, assistance in buying or building a house, and research grants.

In the case of a Lectureship in Economics applicants must indicate whether they seek a permanent position or a short-term appointment for a period of three years. In the latter case superannuation will not be available but the usual allowance for fares and removal expenses will be paid; a maximum sum of £A400 will be provided to assist in return travel and removal expenses at the end of three years. Should the Lecturer appointed on a short-term basis may apply to have his position made permanent at the end of one year's service.

Further information and conditions of appointment may be obtained from the undersigned with whom applications (two copies) together with a recent photograph, close on May 14, 1962. For the benefit of overseas applicants, further information and conditions of appointment may also be obtained from the Secretary, Association of Universities of the British Commonwealth, Marlborough House, Pall Mall, London, S.W.1, with whom two copies of the application must be lodged, an additional copy being forwarded direct to the Registrar.

*I. C. LAMBLE,
Registrar.

*Armidale, N.S.W., Australia.

THE REED PAPER GROUP

is a world-wide partnership of Companies producing pulp, paper, packaging and plastics.

The Group Publicity Department invites applications for the following vacancies to meet growing demands on its services to the Group:

A PRESS OFFICER

To undertake a full range of press office duties, including product promotion and other public relations activities. Both journalistic and agency or company public relations experience desirable. Age: 28-35 years.
(Reference PO/GP)

A WRITER

To work on briefs, booklets and feature articles on a wide range of industrial and management subjects. Journalistic experience on a leading newspaper or journal essential. Age: 25-35 years.
(Reference W/GP)

These appointments, in Central London, carry progressive salaries and attractive working conditions, superannuation benefits, and if required, assistance with house purchase.

Write quoting the appropriate reference to: Group Personnel Officer, Albert E. Reed & Co. Ltd., Group Office Building, Larkfield, Near Maidstone, Kent.

UNIVERSITY OF LEEDS

DEPARTMENT OF MATHEMATICS

Applications are invited for appointment as Lecturer or Assistant Lecturer in STATISTICS at a salary on the scale £1,050 x £50—£1,400 x £75—£1,850 (efficiency bar at £1,550) a year for a Lecturer, or within the range £800—£950 a year for an Assistant Lecturer, according to age, qualifications and experience. Duties to commence by October 1, 1962. Applications (four copies) stating date of birth, qualifications and experience, together with the names of three referees, should reach The Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than May 14, 1962. Applicants from overseas may apply in the first instance by cable, naming three referees, preferably in the British Isles.

UNIVERSITY OF EDINBURGH

DEPARTMENT OF POLITICAL ECONOMY

ASSISTANT LECTURESHIP

Applications are invited for the post of Assistant Lecturer in Economics in the above Department. Salary Scale £800 x £50 to £950 per annum with superannuation benefit and family allowance where applicable. Tenure is normally for three years. The successful candidate will be expected to take up duty on October 1, 1962.

Further particulars may be obtained from the undersigned, with whom applications (six copies), giving the names of two referees, should be lodged not later than May 5, 1962.

CHARLES H. STEWART,
Secretary to the University.

March, 1962.

PROPERTY

CITY OF HALIFAX NOVA SCOTIA, CANADA

Call for Development Proposals
Central Redevelopment Area

Halifax, the Capital City of Nova Scotia, together with its fast-growing Metropolitan area, has a population of approximately 200,000. It is an important administrative, cultural, commercial, and industrial centre and one of Canada's major ports open the year round.

The City Corporation, with the assistance of the Government of Canada represented by Central Mortgage and Housing Corporation, has acquired and cleared 13.9 acres of land in the Central Business area of the City as a first step in a Phased Redevelopment Programme.

The City is offering the cleared area for residential and commercial development by private enterprise. Plans, development conditions, and proposal forms may be obtained on application to the undersigned on payment of a certified cheque or Bank Draft for $50 (Canadian funds) payable to the City of Halifax to be refunded on submission of proposals.

Development Proposals will be received by the undersigned at the City Hall, Halifax, Nova Scotia, Canada, up to 3 p.m. Atlantic Standard Time, October 31, 1962.

P. F. C. BYARS, City Manager.

City Hall, Halifax,
Nova Scotia, Canada.

EDUCATION: BUSINESS AND PERSONAL

EXPERT POSTAL TUITION

for Examinations—B.Sc(Econ.), Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30, Queen Victoria Street, London, E.C.4. Established 1910.

SECRETARIAL TRAINING, especially for university graduates and other students. Six-month and intensive 14-week courses.—Write, Organising Secretary, Davies's, 158, Holland Park Avenue, W.11. PARK 4654.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ENGINEERING

POST-GRADUATE COURSE IN STRUCTURES AND MATERIALS

The 1962-63 Post-Graduate Course in Theory of Structures and Strength of Materials will be held in the Department of Engineering, Cambridge University, beginning on October 9, 1962, and finishing in June, 1963.

The latest advances made in the understanding of the behaviour of metallic structures under static, repeated or fatigue loading will be the principal subject of the course, with particular emphasis on welding as a method of fabrication. No attempt will be made to teach conventional methods of design, but present-day practice and possible future developments will form the subject of critical study.

The object of the course is not to train research workers, but to help engineers to apply the latest advances in knowledge. The course will include lectures, colloquia and laboratory work, and each student will be encouraged to make a detailed study of some problem of particular interest to him.

The course is open to university graduates with industrial experience, and to others with suitable equivalent qualifications and of sufficient experience to obtain full benefit from a post-graduate course.

Further details and forms of application for admission may be obtained from the Secretary, Cambridge University Engineering Laboratory, Trumpington Street, Cambridge. The completed forms of application should be returned to the Secretary not later than May 31, 1962.

BRISTOL COLLEGE OF SCIENCE AND TECHNOLOGY

Ashley Down — Bristol 7

PROBLEMS OF BUSINESS FORECASTING

An introductory course for those concerned with marketing and production planning will be held at the College from

11 a.m. on FRIDAY, MAY 25th to 1 p.m. on SATURDAY, MAY 26th.
Fee £2 10s.

Lectures

The interpretation and uses of economic statistics—two lectures by W. A. H. Godley, Economic Section, H.M. Treasury.

Techniques of business forecasting—F. A. Friday, Electrical & Musical Industries Limited.

The allocation of costs in a multi-product firm—Gordon Mills, Department of Economics, University of Bristol.

Linear programming as a guide to policy making—J. Parry Lewis, Department of Economics, University of Manchester.

BOOKS FROM INDIA

★
THE COLLECTED WORKS OF MAHATMA GANDHI
All that the Mahatma wrote and spoke.
First six volumes now on sale.
Further volumes under production.
I & II Volumes—**16s. 6d.** each
III & VI Volumes—**35s.** each

★
MAHATMA
by D. G. Tendulkar
A biography of Mahatma Gandhi in 8 volumes. New revised edition.
First four volumes on sale.
Further volumes under production.
30s. per volume
200s. per set

★
THE WAY OF THE BUDDHA
Pictorial story of the life of the Buddha and the evolution and spread of Buddhism.
80s.

★
2500 YEARS OF BUDDHISM
Edited by P. V. Bapat
A comprehensive survey of Buddhism by eminent scholars from India and abroad. Second edition.
12s. 6d.

★
BASOHLI PAINTING
An album of about 40 paintings of great charm and beauty from Basohli school: superbly reproduced in their original colours.
80s.

★
NUCLEAR EXPLOSIONS AND THEIR EFFECTS
"A valuable and dispassionate account of a supremely important subject".—*Nature, London.*
Second edition.
25s.

★
FACE OF NEW INDIA
An album which depicts, in beautiful photographs, the "temples of the new age" as seen in the country's mighty projects, giant industrial undertakings and rural uplift schemes.
30s.

★
INDIA—A PICTORIAL SURVEY
An album of 140 photographs depicting an exceedingly interesting panorama of India.
Second edition.
15s.

★
INDIA'S FOREIGN POLICY
by Jawaharlal Nehru.
A collection of speeches unfolding the basic concepts of India's foreign policy in the words of its architect.
40s.

★
HISTORY OF THE FREEDOM MOVEMENT IN INDIA
by Dr. Tara Chand.
A dispassionate account of the history of the freedom movement in India—right from the beginning up to 1947—written by an eminent historian: in three volumes.
Volume I on sale. **35s.**
Further volumes under production.

★
LURE OF EVEREST
by Brig. Gyan Singh
A first-hand account of the mighty adventure of the first-ever Indian expedition to the world's highest peak undertaken in 1960 under the leadership of the author.
25s.

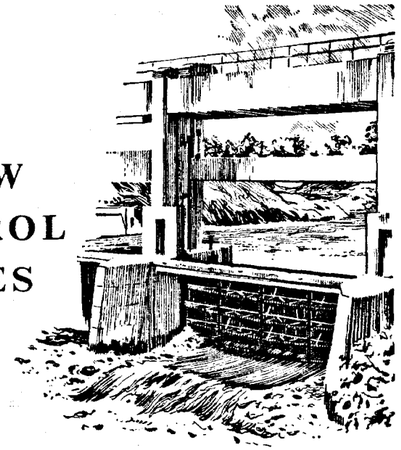
Japan's Investment Maze

To the uninitiated foreign investor many aspects of the Japanese securities market must seem like an intricate maze. Besides the language problem, there are customs peculiar to Japanese corporations which at first glance are confusing. Today's market is further complicated by an increasing tendency toward selectivity.



To make the best investments in Japanese securities today, you need accurate data, careful analysis, and the kind of expert advice that Yamaichi has the experience and know-how to give. We have been helping investors, large and small, for 65 years. Our 115 offices throughout Japan and our staff of 50 trained research specialists are in constant touch with every segment of the economy. Our wide range of English-language publications is available on request, and our experienced English-speaking staff will be happy to serve you, all without obligation.

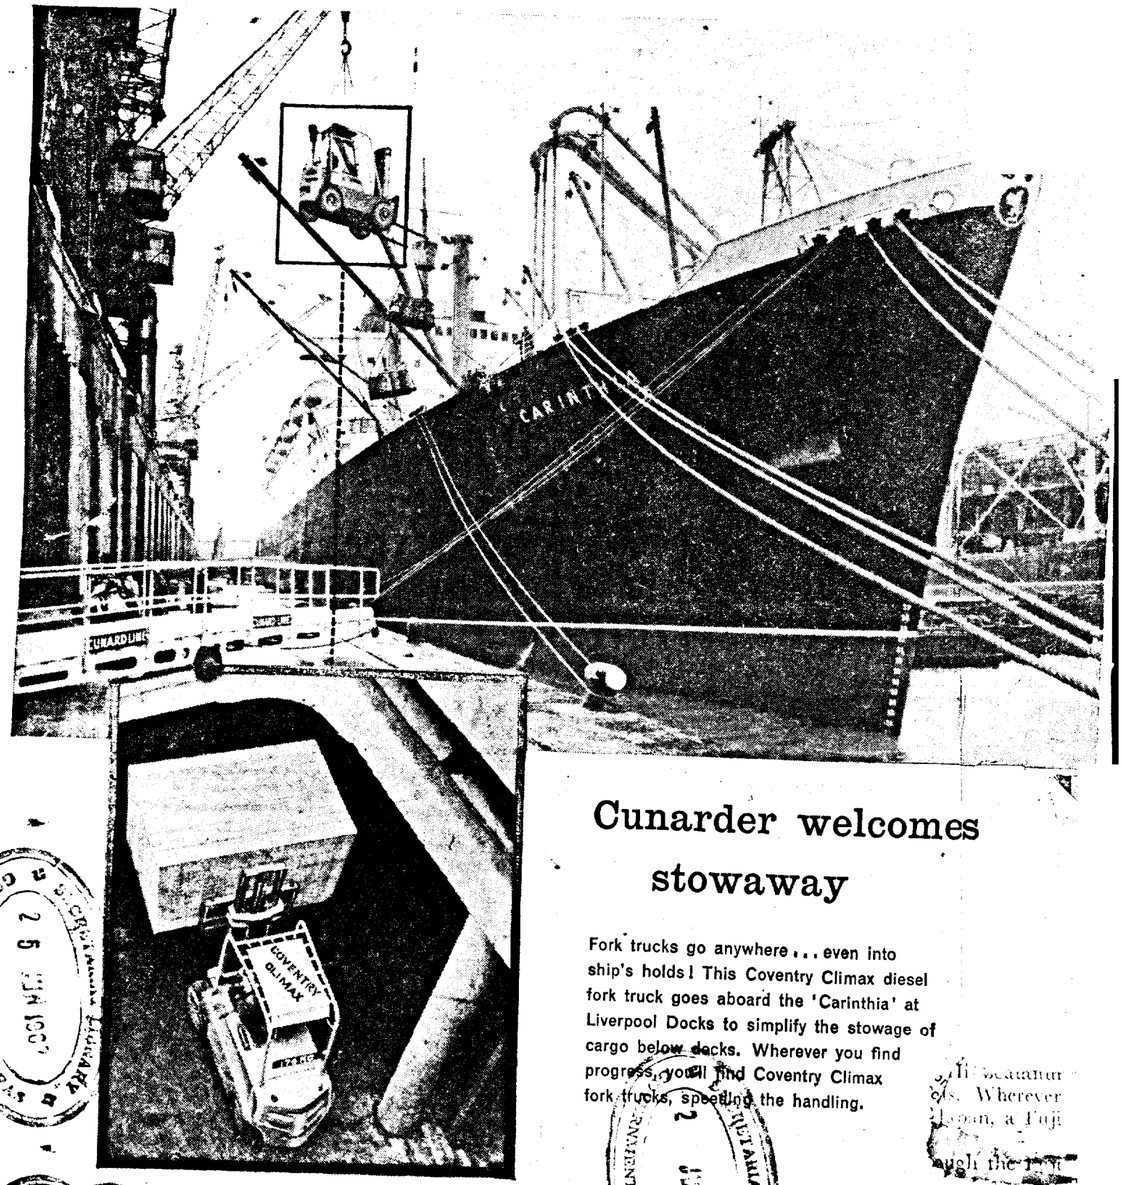
IPCORN
can give you all these services!

If you intend starting a new industry in Northern or Southern Rhodesia or Nyasaland, or if you want to expand your existing plant, IPCORN (which exists to stimulate industrial growth and development) can give all these advantages.

★ **ADVICE** Through its excellent relations with Governments, Municipalities and industries, IPCORN is in a unique position to give impartial advice to prospective investors (particularly from overseas) on such subjects as sites, labour availability, local finance, etc. IPCORN is also able to give technical advice on production costing, accounting, marketing, etc.

★ **CAPITAL** Subject to certain broad principles, IPCORN will assist in the financing of approved projects. Proposals involving equity or preference participation, fixed or variable interest loans (convertible or otherwise), the underwriting of public issues or a combination of any or all of these will be considered.



★ **ON THE SPOT NEGOTIATIONS** IPCORN will negotiate on your behalf with Governments, Municipalities or other parties.

★ **FACTORY PREMISES** If you intend starting an industry in Rhodesia or Nyasaland, IPCORN's associated property company can buy or finance the building of a factory for you . . . to your own specifications . . . and can rent it to you on a long lease for a fair price. If you already have a factory here it can (a) buy it from you . . . thus giving you more working capital . . . and long lease it to you at a fair rental, and (b) rebuild it for you when you want to expand and modernise.

★ **CONTACT** A. C. Bartrum, General Manager of IPCORN at Bank Chambers, 76 Jameson Avenue, P.O. Box 134. Tel. 60830, Salisbury, Southern Rhodesia.

Three basic models constitute the Jaguar range; the Mark 2, the Mark 10 and the "E" Type. Each is endowed with its own individuality, each is outstanding in its performance and, together, they satisfy every requirement of those motorists who, however diverse their needs, have a common aspiration—to enjoy a special kind of motoring which no other car in the world can offer.

INTERNATIONAL

The Tangledbombs Tale

In Washington, Mr Macmillan and Mr Kennedy are meeting just as the American nuclear tests have started. But the real nuclear problem of the moment may well be the Bomb's place in the western alliance (p. 319). It begins to look as if Britain will have to make some nuclear concession to France, if France is to allow this country to enter the common market (p. 325).

In Geneva, the Disarmament Twist continues, with variations but little sign of an ending (p. 320).

One thread of a silver lining is the low (though, at the moment, rising) level of fall-out from last autumn's Russian tests (p. 325).

Cwthmesses

Mr Butler's impending visit to the Central African Federation will be more important than any earlier tour by a British minister (p. 346).

The Cobbold Commission is expected to report on the Malaysian project in the next six weeks; meanwhile internal and external pressures for and against the project ebb and flow (p. 353).

The Canadian elections in June will turn essentially on Mr Diefenbaker's position in the hearts of his countrymen (p. 350).

Generals' Posts

In General Qasim's fourth year the Iraqi revolution has lost its zeal but not its direction (p. 345).

Tough and gentle generals quarrel in Argentina: the bone is constitutionalism, now largely chewed to bits (p. 329).

UNhappy

Debts are high, money is short, and member-governments slow to help the Secretariat (p. 354).

Much against its will, the UN has had to watch the Siamese twins, Ruanda and Urundi, separate themselves and prepare for strife and probable bankruptcy (p. 329).

Reich, Right and Rights

Germany's lunatic fringe, with its Nazi hankerings, is not a serious threat at present, but it repays watching (p. 349).

West Germany deserves credit for its labours to expiate the wrongs the Third Reich did to the Jews (p. 333).

New copyright arrangements are needed if Verdi, and others, are to be protected from posthumous protectors (p. 353).

Soviet Silences

Official youth in Russia is still ostensibly sedate (p. 326); Russia and China still seem slightly less than just good friends (p. 330); Mr Khrushchev has left the foreign policy limelight at the Supreme Soviet, for once, to Mr Gromyko (p. 326).

State of the States

The United States Treasury is experimenting with two new techniques—Operation Stretch and Operation Nudge—in a valiant attempt to hold the line for the dollar (p. 366).

There is no real alarm about the American economy but no one is much impressed by its recent advance (p. 357).

HOME

Critics' Choices?

Mr Lloyd's capital gains tax is cunningly devised to produce the minimum revenue for the maximum inconvenience; for good measure its author has riddled it with inconsistencies (p. 365).

Ice-cream manufacturers are wondering how to pass the new sweets tax on to the consumer (p. 380).

The Attorney General bumbled through his performance over the possible return to Britain of Messrs Burgess and Maclean—but there may have been sound reasons for his dim showing (p. 326).

Doctors: merit awards reviewed (p. 333).

Curtain Up

Two big battles have been joined at the trade unions' annual conferences, over Europe and the government's development council; but the unions are unlikely to consider their real problem this year (p. 321).

Unemployment figures went up in April (p. 370).

A new approach to freight aircraft should encourage the unhappy manufacturers (p. 376), of whom one of the most famous has recently died (p. 380).

Some glimmerings of sense appeared amid the froth at last weekend's conference of Young Socialists (p. 326).

Dress Rehearsal

Fruit may be fresher for British housewives as a result of a new plan by importers (p. 335).

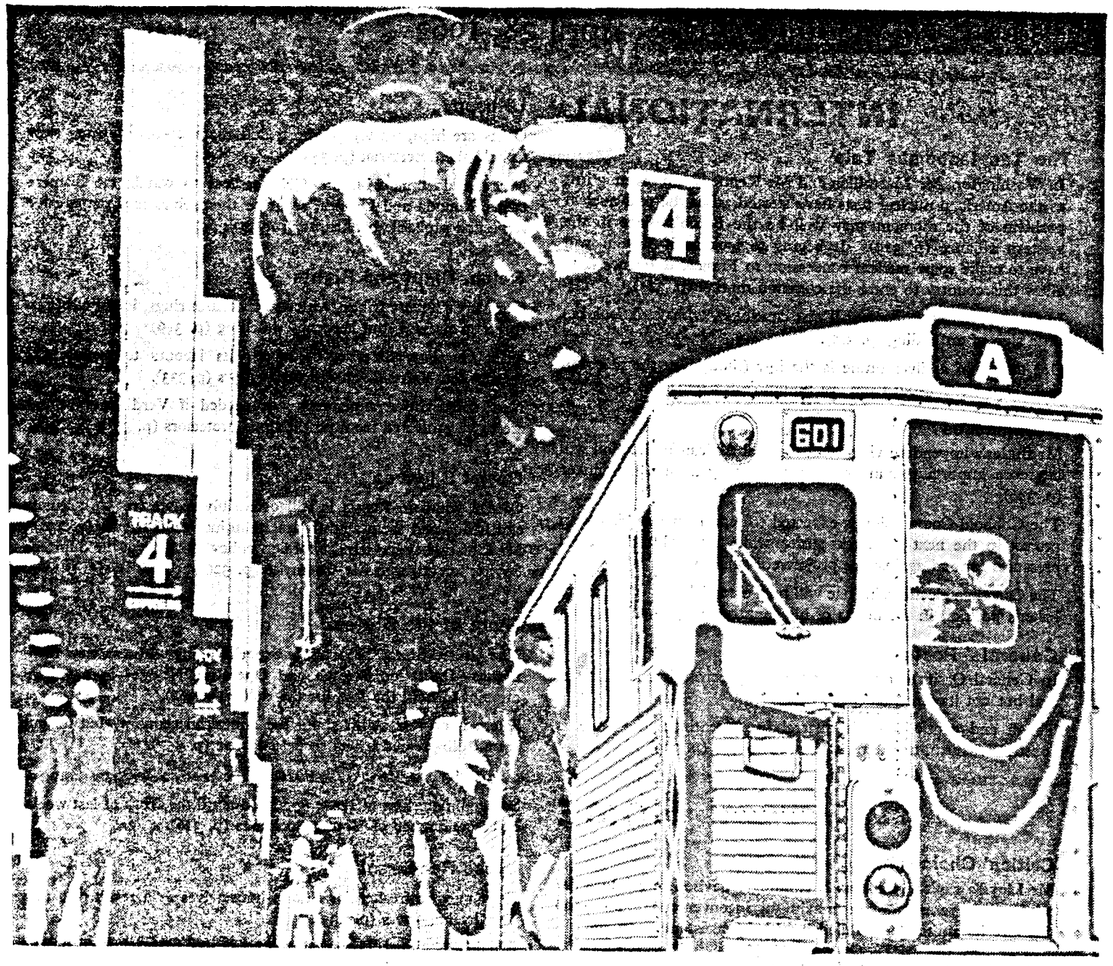
Britain's National Theatre is a step nearer to bricks and mortar (p. 338).

Some young Tory lawyers comment sensibly on the early stages of the administration of justice (p. 330).

Spring Zephyrs have wafted in from Fords (p. 380).

Cobalt is being seen around in mufti (p. 375).

In the Limelight



The necessary expansion of education in Britain is hampered not only by lack of money: more flexibility—and more ruthlessness—are also needed (p. 323).

An uncontroversial budget in Ireland reflects the government's shaky parliamentary majority (p. 336).

The loss of spectators by association football will not be cured by the latest report on those who stay away (p 332).

Pakistani immigrants face a nasty racket at the airports (p. 329).

Detailed contents on page 319

Budd progress rides the rails

Budd has pioneered railway progress for over 25 years. Today, Budd-built passenger cars of all types—mainline, multiple units, self-propelled rail diesel cars (RDC) and subway cars—are in use on six continents. Railways around the world prefer cars built by Budd and its licensees because of the advantages of sound stainless steel construction: lightness, dependability, economy and low maintenance. They also like such extra features as unique Budd-designed trucks and efficient disc brakes. Budd continually seeks new ways to improve rail service, lessen maintenance and reduce operating costs. Unique skills in engineering . . . metallurgy . . . tooling . . . welding . . . research . . . testing and production have helped place Budd high among the world's 250 largest industrial concerns. For information about our railway activities, write THE BUDD COMPANY, INTERNATIONAL DIVISION, Philadelphia 32, Pa., U.S.A.

Mallory are at home in many fields

Mallory are the only firm to specialise in powerful miniature batteries. Some are as small as a ladybird; many are not much larger. Yet they can push a signal across more than 400,000 miles of space; have helped the airborne recovery of a satellite from orbit; made 'invisible' hearing aids more than a dream; fostered the trend towards pocket-size radios, tape recorders, paging systems... All this could be achievement enough. But remember the transmitter swallowed like a pill?—essentially a Mallory battery. A substitute pacemaker for the human heart?—also Mallory. A battery driven wristwatch that runs for more than a year; self adjusting camera shutters and lenses; illuminated novelties of many kinds—these and more are Mallory powered. Mallory pioneered miniature cells for field transmitters during the war. Uniquely dependable and long lived, they can be of great help to all manufacturers who plan to make their products smaller and retain full power.

Mallory Batteries Limited, Crawley, Sussex
Sales Office; 33 Duke Street, London W1

Certainly not..

Clearly, no one in his senses would use chewing gum at a time and place such as this.

However there are times and places where the use of chewing gum can be most beneficial; in fact its discreet use is a mark of tact and consideration for others as it is a definite aid to oral hygiene.

Doublemint chewing gum is especially made for such people. Its ingredients are carefully selected throughout, even its flavour has been double distilled; in fact, as its name implies, Doublemint is double good and gives you double benefits in many ways.

Try some at the right time and in the right place and see for yourself. £37/2

AROUND THE WORLD WE GO...

Winging round the world . . . at the speed of light . . . go words and music, facts and opinions, public pronouncements or personal secrets. In the development of modern telecommunications STC has played a leading role. This Company pioneered microwave radio links for telephony and TV. They produced wide band coaxial cables giving greatly increased telephone traffic capacity. Their submerged telephone repeaters and submarine cables span seas and oceans. STC radio transmitters and receivers provide important intercontinental communication links. With these and countless other achievements, STC contributes vitally to Britain's industry and exports, and to her leading position in the field of world telecommunications.

STC *Telecommunications and Electronics*

FACTS ABOUT STC: 26,000 employees working in England, Scotland, Wales and N. Ireland; part of major international telecommunications and electronics group.
Products include: local, trunk and international telephone systems · submarine cable communication systems · radio communication and navigation systems · electronic control and data systems · electronic components

Vic Hallam build ...

BEA

a sports centre for *BEA*

The new Sports Centre at Northolt, built by Vic Hallam Ltd. for B.E.A. commands 20 acres of sportsfields, caters for the recreational needs of the staff of a busy airport.

The Vic Hallam systems — Derwent and Type 6 — are tuned to the tempo of fast-moving enterprises. That is why they are in demand today as never before.

Derwent and Type 6 are ideal when the need is for quick erection and modern appearance at competitive cost.

The Sports Centre at Northolt consists of a dance hall, bar, lounge, skittle alley, two squash courts, billiard room, showers and changing rooms. It also incorporates kitchens and a steward's flat. Architect in charge of the project was Mr. R.S. Harvey, D.A. (Edin.), A.R.I.B.A. Chief Staff Architect, B.E.A.

Status Symbol

For some people prosperity means owning a Cadillac. But for Signor Brunetti, living in a remote Italian village near Caserta, a Fiat 'Piccolo' represents the achievement of a long-cherished ambition. Formerly this was one of the poorest parts of Italy —over-populated and with its soil impoverished by endless cultivations.

Now, as part of the Italian Government's ten-year development plan for the South, roads, railways and aqueducts are being built and new water power projects carried out. For Signor Brunetti and millions like him, this means a new lease of life and a standard of living higher than they have ever enjoyed before.

Atlas Copco compressed air equipment and Sandvik Coromant drill steels were widely used to quarry rock for these vital engineering undertakings. And this is only one of the many major projects in which Atlas Copco and Sandvik Coromant equipment has played a part.

VOLUME CCIII - NUMBER 6192

H-Test for Britain

MR MACMILLAN, sitting in the White House this weekend, will have one ear bent to his host and the other cocked to the noises that his host is causing around Christmas Island. He may wonder whether he should have made a bigger effort to persuade President Kennedy to put off the latest round of nuclear tests. The answer, on balance, is that he should not—not only because Mr Kennedy's decision to set the tests going again was pretty well inescapable, but also because there is another problem involving nuclear weapons that has an even more urgent claim on the two men's attention.

The decision to resume explosions in the atmosphere boils down to a choice between the medical dangers of having more tests and the military dangers of not having them. On the whole, as a note on page 325 suggests, the amount of fall-out produced by the Russian tests last autumn (and therefore the amount produced by the present much smaller series of American tests) seems likely to come well below the generally accepted danger level.

Had Mr Kennedy refrained from testing, on the other hand, the danger was that the Russians might have seized the chance to get in one more round of their own by surprise, and thus gain a lead in one or two potentially decisive kinds of weapon. The American tests that began this week will doubtless bring another Russian series in reply, not to mention some megaton displays of mutual indignation. But the net military effect will be to leave the balance of power more or less as it is now ; and the remarkably temperate tone of Mr Gromyko's remarks to the Supreme Soviet on Tuesday about Berlin suggests that the forces of moderation are still in command and even the indignation may be relatively short-lived.

If this is so—if the renewal of tests brings a few weeks of ritual recrimination, but nothing worse—the really important nuclear question of the moment is not the general east-west balance of strength ; it is the disposition of atomic arms within the western alliance. This is a question chiefly for the British, since it involves the two strands of foreign policy that Britain is currently trying to weave into one. One strand is the attempt to join the European community. The other—which has markedly different origins from the first, and often seems to conflict with it—is the attempt to calm some of the tensions of the cold war, and in particular to limit the risks entailed in letting atomic arms be spread too widely.

What Britain does with its own nuclear arm in the next year or two may affect both these aims materially. There will be Europeans who think the British entry into Europe less than wholehearted so long as this important part of the British anatomy is kept outside. Nothing looks likely to stop General de Gaulle going ahead with a French nuclear force ; how many others will follow, and how soon ? It may become clear that the further proliferation of nuclear weapons cannot effectively be stopped unless Britain becomes prepared to renounce its nuclear isolationism. The issue may begin to crystallise very soon, perhaps even in the summer's common market negotiations and the argument about western Europe's political organisation that may accompany them.

Just what form a British renunciation might take would depend on various things. It might range from a total scrapping of British atomic weapons to their merging in a combined force (it might be under the joint command of France and Britain). The precise form would depend on whether most Europeans could

be persuaded to rely entirely on the United States for their nuclear protection (as distinct from wanting something in their own hands as well), in which case one might even fulfil the hopes so many people have of actually cutting the number of nuclear powers. It would also depend on what Britain got in return for its sacrifice. Whatever the details, the aim ought to be to emphasise Britain's unity with Europe, not its separateness from it; and, within this context, to keep the control of nuclear arms—especially those in the sensitive area of central Europe—in as few hands as possible. This may be the best opportunity of weaving together the two main objectives of current British policy.

Questions for Geneva

Most parts of the disarmament problem are painfully clear —but a few are now hopelessly indistinct

ONCE upon a time—last year, in fact—it used to be assumed that a ban on nuclear tests would be a very apt pilot project to lead the way toward general disarmament. In particular, it was argued that the comparatively limited amount of international inspection that a test ban involved would be a dose that Russia might be got to swallow, in spite of the Soviet distaste for inspection of any sort; and that, if the test ban scheme worked reasonably smoothly for a while, it would not only improve mutual confidence in general terms, but also take the edge off the more pathological Soviet fears about foreign bodies. But that was last year. This year, from the beginning of the Geneva disarmament conference that opened on March 14th, it was pretty generally believed that although progress in the field of general disarmament might be glacier-slow, the most rigidly deadlocked sector of all was that of a nuclear test ban; and Wednesday's explosion off Christmas Island has given the key another turn in the lock.

Once upon a time—and indeed, up to a couple of weeks ago—it was continually argued that there could be no hope of achieving disarmament if it was made conditional upon the settlement of political issues. In particular, it was a recurrent Soviet theme that the West must not try to link disarmament with a German settlement. But that was last month. On April 12th Mr Khrushchev, in his letter to Mr Macmillan, appeared to link the two issues himself. He said that Russia would not be able to permit foreign inspectors to set foot on its territory unless confidence was improved by the West accepting the German peace treaty that he had proposed.

OTHER instances could be cited of the strange way in which the kaleidoscope of the disarmament problem—or, rather, of the whole complex of interlinked problems that here come together—continues to change under the eyes of a frustrated world. This constant change is responsible for much of the cynicism that now surrounds the subject. It is easy for many people to get the impression that the whole process of negotiation is a meaningless dance in which, whenever one party advances, the other retreats, there being a tacit understanding that the two will never get close enough to bring the thing to an end. (This kind of diplomatic dance used to be commonly called a minuet; today, perhaps, a twist.)

It is not quite so simple or so meaningless as that. Nor does the surface movement necessarily imply any change in the fundamentals, which have in fact remained strikingly constant. Admittedly, both western and Soviet disarmament proposals have regularly been marked by a common preference for terms that would give one side a distinct advantage over the other. But this is little more than the normal business of bargaining. No negotiator likes to enter upon a prolonged haggle without something to discard. A more disquieting cause for cynicism is the reluctance that has been shown—habitually by the Russians, and not seldom by western negotiators—to examine the other side's proposals carefully, or even to ask elementary questions about them.

One of the encouraging features of the present Geneva talks is that there has been a good deal of asking of questions. True, the Russians have remained unenthusiastic about either asking or answering them. On the other hand, they managed to set the pace from the opening day by tabling at once a full draft of a general disarmament treaty. Although the Americans had arrived at Geneva with a detailed and comprehensive programme, essentially the same as the one that they had made public in September at the time of Mr Kennedy's address to the United Nations Assembly, it was not couched in the form of a draft treaty. The Russians were thus in a position to argue that the conference should concentrate on their draft alone, since it was the only one available. The uncommitted participants resisted this demand, but at the same time privately urged the Americans to get their programme into treaty form, so that the two could be discussed in parallel. On April 18th the United States delegation duly tabled a draft which, although not fully in treaty form, largely remedied this situation; and it is to be hoped that this move will get the conference moving a little more purposefully out of the procedural wrangling that it had got itself into.

The American plan, in its latest form, goes a long way to meet previous Soviet objections. It spells out in more detail than before American acceptance of the goal of disarmament on just as sweeping a scale as Russia has proposed. (Strictly speaking, despite the now universal commitment to what is termed "general and complete" disarmament, nobody is proposing that it shall be truly complete, and nobody has yet tried to define very clearly the scale of the forces that would be retained for "domestic security" and international peace-keeping.) The new American terms are still somewhat vague about the problem of ensuring that, in a disarmed world, the direction of the international peace-keeping forces should be both effective and impartial; but they are more realistic on this score than the Soviet proposals. As for inspection, the American draft now includes one of the most hopeful suggestions recently made for breaking the deadlock—the "Sohn zone" idea of progressively extending inspection from one or two initial "sample" areas as confidence builds up.

The problem of inspection remains, however, one of the unchanged fundamentals. In the part of the latest Geneva talks devoted to a test ban, Mr Gromyko made it bluntly clear that even an occasional entry into a very limited part of Soviet territory by a handful of inspectors drawn exclusively from uncommitted countries was unacceptable to his government. In the Soviet draft treaty, it is laid down that "inspection" will be concentrated on watching the destruction of arms, and the withdrawal or disbanding of forces, whose existence has been voluntarily notified by each government; and this does not eliminate the risks of clandestine retention or production.

Some hopes are being pinned on Article 14 of the Soviet draft, which allows for international "control of compliance" with a provision limiting the movement of warships and aircraft. This is at least a breach in the outwardly rigid Soviet rejection of any "control over armaments" as opposed to mere supervision of the "bonfires" on which declared arms would be destroyed. So too, it may be noted, is the Rapacki Plan, which would require inspection of the forces retained in the central European area it covers. It would seem that "control over armaments," which is intolerable "espionage" on Soviet soil, becomes quite respectable on the Polish side of the border. This may be a pointer to some more questions that still need to be asked at Geneva.

Unions in Conference

Three main issues will be faced—or avoided—at this year's crop of trade union conferences in Britain's seaside pavilions

LAST weekend the season for trade union conferences was declared open. From now on throughout the summer, the gnarled veterans and the new generation of gradually smoother executive men who run the constituent unions of the Trades Union Congress will be exposed to the breezy enthusiasms of that inner ring of militants who, because amateur trade union politics are their spare time hobby, can help to decree the decisions made in the name of apathetic millions. Mandates imposed and moods established at these jamborees will, in September, determine the voting of the Labour party's giant partner. The issues to be considered are of more than average importance; but the most important issue of all will barely be discussed.

This year the unions will be sinking their teeth deep into two topics of concern as much to their own members as for the whole future of Britain. They will vote whether to oppose Britain's entry into the European common market; and they will decide whether to play ball with the Government in the National Economic Development Council. For the past few years the bone of contention in the wordy and bitter conflicts within the unions has been the Bomb. Whatever government may be in power the unions may bark, but it is now recognised that they cannot in the end painfully bite anyone over defence (Mr Gaitskell learned that after Scarborough, when he turned and fought again). But the Labour party has not properly made up its mind either about Europe or about Ned; and the signs are that its leadership will let its policies, or at least its image, on these two issues once again be influenced far too much by the desperate accident of the particular wording of the motions that individual big trade unions consider themselves mandated to oppose or to approve.

Most of the TUC's elder statesmen are remarkably forward-looking men on both issues; a majority of them, in their hearts, would like to see Britain in Europe and are eager to keep the unions in Ned. The last Trades Union Congress came down with the vaguest of reservations in favour of negotiations with the European community; it also left its general council's hands free to collaborate in a national planning body. But that was before the debate in the country on both these subjects had got seriously under way: it was not until July, when the unions' conference season was more than half over, that the Government announced its intention to open the Brussels negotiations or started to talk really seriously about Ned. And even last year it was clear that opposition within the Labour movement to joining Europe would come from an awkward alliance: the extreme left wing xenophobes can hope for support not merely from the extreme right wing which dislikes the idea (in the words of one of them at Blackpool) of "seeing Eyetalians in the pits," but also from some normally moderate Labour intellectuals who have cooked up abstruse anti-European theories of their own, and from a much larger group of left-of-centre democrats who feel uneasy at the mere mention of the names of Dr Adenauer and General de Gaulle.

The result is that those trade unionists who, for whatever reason, want to weaken the position of Mr Gaitskell can find in the European issue yet another means of embarrassing him. A fine example of the tactics that might be followed by them was given by Mr Frank Cousins this weekend. Mr Cousins has no delegate conference to face this year (the Transport and General Workers hold theirs once every two years); but up he bobbed at the Scottish Trades Union Congress. Without saying whether he himself is in favour of Europe or against it, he urged the Labour party's leadership to commit itself ("When you get a political issue, you are entitled to look for some guidance to the political party"). There is not much doubt that Mr Cousins's advice is right; but Labour's leaders are at present less inclined to see this than to see (all too clearly) the tactical reasons that have led him to give it. What Mr Cousins wants is that Mr Gaitskell should declare himself in favour of joining Europe, so that he (Mr Cousins) can then lead the assault on Mr Gaitskell for doing so. Under these circumstances Mr Gaitskell (and, still more, his executive) is likely to feel under an instinctive temptation not to put himself in any such position. His usual way out will be to hatch up some abstrusely fence-sitting composite motion which—even if (as seems probable) it is eventually passed—will give away far more hostages to the Cousinsites than a forward-looking Labour party should do.

The debate over Ned cannot be quite as dangerous for

Labour, although it will probably give some nasty moments to the trade union leaders who are already seated on the council. Admittedly they are in possession of the field, which is more than half the battle. And it is less than likely that any one of them (well, at least any two of them) would wish to follow the advice of those left-wingers who have in effect urged them to hamstring the council from within. The danger is that the union conferences (two of which, the draughtsmen and the clerical workers, have already urged that the TUC representatives should withdraw from Ned) will try to saddle their representatives on the council with absurd restrictions.

Moreover, there is a real issue here for the future of trades unionism in Britain. One of the most vocal opponents of the development council, the left-wing Mr Clive Jenkins of the supervisory staffs union, recently argued that it "cuts away at the very basis of trade union organisation in the United Kingdom." He is bang right. Even those unions that enjoy undisputed supremacy in their own industry—say the transport workers in the docks or the steel workers—have regularly shown themselves quite unable to collaborate in any coherent way with other unions on wage-fixing or any other subject of major importance. The most adamant "socialists" within the movement are bitterly opposed to any diminution of the autonomy of individual unions (perhaps because they realise that the mild reformists would then be able to prove that they are the majority). The idea of co-operation, not just with other unions, but with the employers and the government as well, could stand the present unco-ordinated system on its head. This is part of the background to the mounting opposition to Ned. On the other hand, those—and they are an increasing band—who would like to see the TUC become a far more purposeful body, co-ordinating and directing (subject to general consent) the policies of its constituent bodies, could find that the need to act together in Ned will give them the impetus for which they have been waiting.

For there can be no doubt that many trade unionists are worried about the disarray in which their movement finds itself at present. This winter the Government has faced—and, where it has faced, beaten—the unions over the pay pause. The TUC general council frankly admitted, at what must have been one of its most agonising meetings, that it could do nothing to organise resistance among its members. Last autumn it seemed inconceivable that the spring would arrive before a major official strike. But what has happened?

THERE have been ineffective work-to-rule campaigns by public service unions. Some white-collar organisations have shown a new willingness to consider joining up with their manual brothers in the TUC. A new white-collar federation of teachers, local government officers and others has been mooted, but not effectively formed. There has been the usual crop of unofficial strikes, and two symbolical one-day stoppages by around two million engineering workers. But, save in those nationalised industries where employers have run away before any real strike threat appeared, all these actions have proved singularly ineffective.

The supreme absurdity is that the strike ballot organised by the Confederation of Shipbuilding and Engineering Unions is not yet concluded, with the pause almost a month past. In the eyes of some, an engineering strike by the 39 unions was to have been the culmination of a campaign that would prove the power of the unions. But the executive of the confederation has tied itself hand and foot. It has hitherto refused to talk to the employers until the ballot is concluded, but it is perfectly clear that, whatever the result, the employers cannot give all that is being asked. If the necessary two-thirds of the members voted in favour of a strike, the executive could hardly not call one; but if there is no majority for a strike, they would have no counter to bargain with the employers. Now there are rumours that the voting will, in fact, be against a strike: next week the executive of the confederation will meet again to seek an escape from this mess. Such being the disarray of the unions' shock troops, it is small wonder that some employers in less tightly organised industries are beginning to lose all faith in the power of the official union leaders—either to start an official strike, or to stop an unofficial one.

This dilemma of vanishing power is realised by just a few top people in the trade union movement. The indefatigable Mr Bryn Roberts of the National Union of Public Employees has been pegging away for years at the argument that the central power of the TUC needs to be strengthened; now he can claim support from such eminences as Mr Jack Cooper, the new general secretary of the general and municipal workers, Mr Ray Gunter of the transport salaried staffs (and of the Labour party executive), and Mr Harry Weaver, new general secretary of the building trade workers. There is not much doubt that Mr George Woodcock, general secretary of the TUC, thinks the same way. But it is a fair bet that this summer's union conferences, whose decisions could conceivably affect the future of Britain's two great economic experiments, will barely consider the need for self-reform. The flight back to reality has not started yet.

The Economist

APRIL 26, 1862

THE MEANS OF AFFLUENCE

The prodigious advance of the productive arts since 1851 may not be very apparent to those who do not know much either of the state of those arts eleven years ago, or of their state now. But every one who remembers the old Exhibition at all will be able to say that the things now collected are much more numerous and much more splendid than those then collected. Machinery especially, which was rather impressive last time, will be much more impressive now. The things made in our present civilisation are less wonderful than the means of making them. The greatness and the littleness of material civilisation never perhaps *both* present themselves to the mind so fully as in looking at varied and wonderful machines. Can anything seem more clever, more convenient, more creditable to human skill, than those half-living things? says the practical man. Can anything be more absurd than to employ so much ingenuity in contriving tools for doing so little, for making useless luxuries more accessible, petty comforts more comfortable, things which rational men do not want more attainable by and more suitable to irrational people who do want them? So says the dissatisfied moralist. But real philosophy is rather on the side of the eulogist than of the objector. Whatever may be thought as to the precise wisdom or as to the extreme rationality of many wants in our artificial and elaborate civilisation, it is certain that a vast system of industry and labour is occupied in the supply of those wants. The dinner may not be what an ascetic moralist can consistently approve, yet still the cook lives by it. The immense apparatus of productive industry by which the complicated wants of civilisation are supplied, is much more interesting than those wants themselves, or than the realised products which minister to them. In the improvement of these arts, we, in fact, witness an improvement in the productive happiness of millions.

Where Education Pinches

The growing points of British education are being cramped by lack of professional flexibility and of willingness to concentrate on essentials, as well as by lack of money

QUITE suddenly it has become fashionable in the last few years to talk about the crisis in British education. This is not because things are getting worse but because they are actually getting better: British education is at the stage where enough people are wearing patent leather shoes to be able to say, very loudly, where they pinch. Unfortunately, it is sometimes difficult for the voice of the consuming public (or its parents) to make itself heard clearly enough above that of some established and very articulate producer interests. The important point, for educationists and politicians, is to get the priorities right in the expansion and the reforms that are under way and, still more, in those that will have to be bulldozed through in the mid-1960s.

What this should entail in the upheaval of some traditional attitudes is still far from being generally understood. Treasury ministers will have to stop purring over what they regard as the largesse they have handed out to the universities when they have still not done enough to keep up with the expansion of the sixth forms. Junior university lecturers must not jib at salary differentials favouring colleges of advanced technology when the biggest potential growing point is plainly in technical institutions. Teachers must learn not to pooh-pooh mechanical aids or drastic reappraisals of curricula if these devices mean that basic education can be sustained (and sometimes improved) while crash programmes are mounted elsewhere. And ratepayers will probably have to stump up for the schools a still larger proportion of their increasing incomes. This is what crash programmes involve. When the horrified outcries of comfortable and self-satisfied men resound through the length and breadth of the country, expansion will really be beginning.

The most important bottleneck now staring everyone full in the face is that at 17-plus (i.e. at the entrance to higher education). Safely after the Commons debate on the universities, the arguments underlying the still-unpublished financial recommendations put to the Treasury by the University Grants Committee have now been outlined in Cmnd 1691. In England and Wales the percentage of 17-year-olds staying on in school has risen from 8.5 in 1956 to 10.9 in 1960. But still only 6 per cent of boys and 2 per cent of girls can hope to enter a British university (in Scotland, which seems to retain a slight historical advantage, the figures are some 8 per cent and 3 per cent respectively). Current expansion plans will do no more than keep the proportion of entrants constant while the "bulge" passes through; they will not provide for the rapidly increasing "trend" towards staying on in the sixth forms. The University Grants Committee reports that failure rates in the universities actually fell in the later 1950s: so much for those who argued that letting in more students would mean letting in worse ones.

While Treasury grants for universities rose dramatically (recurrent grants by 72 per cent and non-recurrent by 143 per cent) between 1956-57 and 1960-61, it is a salutary comment on past neglect that, by the UGC's reckoning, half of the capital needs of the next ten years will be simply to make good for obsolescent buildings. The entrance bottleneck may be partially relieved by an overspill of brighter candidates into technical colleges and teacher-training colleges. But even in the teacher-training colleges (where places are, belatedly, being doubled) the pinch is already evident. Sir Ronald Gould told the National Union of Teachers last weekend that 500 suitable candidates for teacher training were turned away in 1961 (after years of little or no selection) and that 2,000 might be unable to get in this year.

Even if the Robbins committee gives a strong twist to the Treasury tap it should be obvious that future building will have to be concentrated on the essentials: lecture rooms, laboratories and libraries. The UGC bewails the fact that the proportion of students living in college or in halls of residence has remained at little more than a quarter, with the remainder in lodgings or at home. But this is precisely where, in the short run, savings should be insisted on (in particular, by locating new institutions for student commuters—for example, second universities in the suburbs of big cities). It is still better to be a Scot (49 per cent of whom live at home during the term) and have a university place, than bow to the English tradition and have none.

IT is ironic that just when university entrance standards are rising (so that candidates for particular faculties may need high marks in three GCE "A" level subjects) there should come the first stirrings of academic recognition for a more rounded education. Two culprits are responsible for over-specialisation in the sixth forms. The first is the universities' own requirements; the second is the compulsive competitiveness to ensure a place by hitting very high marks in the candidates' "special subjects" at "A" level GCE. The universities' Committee of Vice-Chancellors and Principals has now given its blessing to a broadening of university entrance requirements to include a paper on the use of English, a general paper and (with some inexplicable hesitancy) a foreign language paper. This is admirable, in both an educational and a severely practical sense, and so is the approval in principle given by all the universities except (let the names be broadcast) Cambridge, London and Reading. But there should be no illusions that, for as long as the shortage of places exists, these requirements will mean anything other than more cramming—from which the medium-to-bright sixth formers (capable of a good second-class degree) will suffer most.

The chief hope that meaning, and continuity, will be given to a reformed sixth-form curriculum rests in the aspirations of the new universities (like Sussex) to break out of the old faculty mould themselves. Here Sussex promises to outstrip Keele, the pioneer in this field. There are signs that the new foundations will attract the more versatile type of undergraduate and teacher away from Redbrick; the real test will be

whether they can actually rattle Oxford and Cambridge into moving with the times.

In the schools themselves the Ministry of Education is putting its shoulder behind curricular reform. Its research projects (initially dealing with science and mathematics) may even please the dons if they help to produce students who have tackled their subjects in twentieth-century terms. The nonsensical subject of Euclidean geometry looks doomed at last, but the new knowledge will almost certainly claim even more school periods than it took up. Can new teaching methods make up the difference elsewhere—for example, in giving scientists (and historians) their necessary foreign language in less time and with fewer tears?

This type of reform tramples on innumerable sensitivities; if it is to materialise it will need professional support and enthusiasm. The schools inspectorate should welcome the chance to labour in this field, as a final release from the Victorian inhibitions of payment by results. Plainly, there will have to be a stepping up in the rewards for teachers' refresher and re-training courses (in vacations), both to achieve a general mastery of new methods and to encourage a greater flexibility in the profession, for example, to fill science and mathematics posts below grammar school level.

In physical terms, the Minister of Education has two priorities to tackle. The first is to get the teachers needed to cope with the expanding secondary schools, with the next primary "bulge" and with oversize classes generally. (In Essex, a county where the school population has risen rapidly because of commuter immigration, one-third of the junior classes and two-thirds of the senior ones are oversize; other blackspots are in older towns like Middlesbrough and West Bromwich.) Television and similar aids may help, but the real need is to increase the opportunities for teacher-training; the new day colleges—now offering 1,700 places—look like a sound step in attracting older aspirants. At the heart of the problem is the ruinous wastage of qualified women teachers in primary schools: last year 17,000 women joined the profession, but 15,000 left—the great majority of them to get married or to have children after a year or two of service, not to get other paid employment. This should finally establish the point that the teacher shortage is not really caused by supposedly low pay at the bottom of the basic salary scale; the best way to bump up salaries in future will be to give an even more visible incentive to long-term teachers, and to married women who return when their families grow up, by a sizeable salary step after five years' total service. If drastic measures have to be taken to staff the new further educational institutions, the least harmful way to do it would be to raise the compulsory school entrance age to six or seven—not to cut back insensibly by cramping opportunities for educational advances at sixth form level.

The second priority (which has been depressed in the scale as new school building has tried to keep up with the population drift into the south-east) is to replace the high proportion of old, all-age schools in places like Lancashire and County Durham. Sir David Eccles seems anxious to start this—in time; if his Ministry's new computer reveals the true extent of the problem to public opinion it will be a real investment.

Expansion, reform and redevelopment have all to be paid for. Parental answers to opinion polls are adamant on improvements, but hazy on how they should be financed (except in condemning fees). In the past decade the proportion of the gross national product devoted to education has risen from 3 per cent to over 4½ per cent. A further increase of this order is urged by most educationists, and is, indeed, roughly in line with a number of official pronouncements about 1970. A proportion of this may, and certainly ought, to be squeezed from the rates if the semblance of local control of the schools is to be maintained; but the great bulk will have to come from the general taxpayer. The growing predominance of the Government as the chief paymaster raises its own problems for institutions, professional unions and local authorities. But it is a predominance that could and should induce the central government to play an increasingly bolder part in determining priorities and the ways they should be implemented. Political parties that claim radical support for educational advance have a duty to spell out fully what it implies.

NOTES OF THE WEEK

EUROPE AND COMMONWEALTH

Many Cooks

With what is by now his characteristic timing in common market matters, the Prime Minister informed the House of Commons of the plans for a conference of Commonwealth prime ministers on April 19th, the day before the Easter recess. Once again he has scored a tactical success. In the next three months, crucial for the negotiations, the Government will be able to disarm critics by pointing out that the green table has been prepared for the Commonwealth. Yet the date fixed, September 10th, allows time for the outlines of an agreement with the Europeans to be worked out first. The danger of a premature and time-wasting conference which would have nothing but feelings and hypotheses to work on has been avoided. Only in one respect—that of time—has Mr Heath lost some freedom of action. He now has more reason than ever to get over the hump of the Brussels negotiations before September.

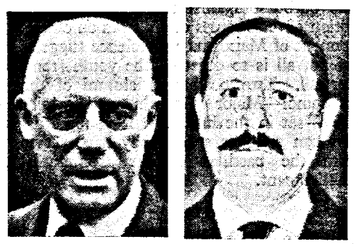
Mr Menzies, who has his own political problems, has been careful not to commit himself to come in September. Possibly Mr Diefenbaker might have preferred to have the meeting before his elections in June. But even the Canadian government, though pressing loudly for a Commonwealth summit before there is a common market decision, has never publicly committed itself to a particular time. And the other Commonwealth governments apparently see sense in meeting after the pattern in Brussels has become clear, but before the final decision is made in London.

Almost certainly the conference will see some vigorous argument. But it has become apparent in the last few weeks that even the old dominions are by no means unqualified anti-common marketeers. Thus, New Zealand has been balancing the big problems posed by British membership against the equally big problems that might arise if Britain stays out. Would an isolated Britain be forced to rely even more than at present on the cheap food policy advocated so persistently by Mr Douglas Jay? That would not suit New Zealand's book. What implications for British politics—and hence for the future character of the Commonwealth—would follow from a decision to stay out? Lord Beaverbrook's idea of Empire is not New Zealand's. That rough diamond, Mr McEwen, Australia's minister of trade, made it plain during his trip to Europe that Australia has cards of its own to play on both sides of the Brussels game. While the Australians want continued preferences against California on products like canned fruit, they want higher prices—on the lines proposed by France—on wheat. The Commonwealth prime ministers will evidently need the help of the finance or trade ministers and experts who are to attend with them.

More Haste, Less Speed?

Perhaps the Government's carefully calculated European timetable—a climax in Brussels in early summer, followed by the Commonwealth conference, followed by debate and decision in the House of Commons in the autumn—can be seriously upset only by a serious bout of obstruction by the French. But just this possibility is raised by the failure of the Six to agree on their plans for political co-operation. The Dutch and Belgians rejected the latest variant on the French proposals on April 17th, adamantly refusing to sign any treaty until the British were in the European communities. The gesture from Benelux to this country could prove a case of more haste, less speed, for some of the French predict, in private at any rate, that their government will retaliate by blocking the negotiations for British entry to the common market by which the Benelux countries set such store.

The odd thing about last week's breakdown is that it occurred just when all the major powers involved, including Britain, seemed near an understanding. Mr Heath's suggestion to the Council of Western European Union (on April 10th) that Britain should be brought into the political talks was as close to the position accepted by the French at the meeting of the Six as it was to that of the Benelux countries. At a press conference after the WEU meeting Mr Heath suggested that Britain should be consulted after the Six had reached broad agreement on their political plans, but before they had got them signed and sealed. This was accepted by the French, but it was not enough for the Dutch and Belgians, who went on to refuse to sign any kind of political treaty until Britain was in.



A mutual blockade, with the French obstructing Britain's entry to the common market and the Benelux countries obstructing the political plans, will do no one any good. The stand by Belgium and Holland makes sense only if they would be willing to relax it in return for French co-operation in the negotiations about British entry to the common market. It cannot be taken as quite certain that that co-operation will be obtainable at all. M. Spaak's brusque rejection of the political plans for Europe is reported to be due, in part, to General de Gaulle's own rejection of American proposals for joint control of nuclear weapons within Nato. This theory leads to what may prove a key piece in the puzzle (discussed on page 319): will some kind of gesture to France, in nuclear matters, be required to get this country into the common market?

FRANCE

Then There Was One

General Salan's capture on April 20th is a notable success for the French government, to whom his long impunity had been a reproach and a source of ridicule. His arrest, following so soon on that of General Jouhaud, does show that the necessary stamping-out of the Secret Army has been taken seriously in hand. Added confirmation may be seen in the appointment as commander-in-chief of the conspicuously loyal General Fourquet (not to be confused with M. Fouchet, the High commissioner, who is strenuously attempting to rally European Algerian opinion to the cause of peace and common sense). The orders issued to the new all-Moslem security force, to shoot Secret Army men on sight, and the massive preparations for mopping-up in Oran, tell the same story. It is time. With little more than two months to go to the referendum, the French have strong reasons for hastening to bring order before the inevitable transfer of power.

In a gesture that looks like bravado, the last of the fugitive generals, General Gardy,

Before and after: General Salan

has announced that he is to replace General Salan as the Secret Army's chief. He is likely to have even less control than had his predecessor (now reported from Paris to be busy disclaiming all influence). Murder remains the order of the day in Algiers and Oran, but there is substance in the reports of a split between the advocates of insane terror and the "moderate" advocates of "psychological warfare." If General Salan's disappearance can thus affect the Secret Army itself, its effect on sympathisers may easily be imagined. The courage and cohesion of desperation seem to be cracking. Lastly, the arrest seems to have come at a good moment for Mr ben Khedda and most of his colleagues in the provisional government. Mr ben Bella's release from prison was welcomed suitably; but since then he has shown himself to be somewhat out of touch with the relatively moderate temper of his colleagues. A report that he wanted to send "a hundred thousand Algerians" to reconquer Israel was promptly denounced as false by Mr Yazid, the minister of information; but stories that, because the French were ineffective, he wanted to lead the Army of National Liberation into Algeria to destroy the Secret Army were nearer the mark. Such action would also have destroyed the Evian agreements: fortunately for the moderates in the provisional government, who negotiated the peace with the French, the capture of General Salan deprives Mr ben Bella's militancy of some of its point.

FALL-OUT

Strontium in Springtime

With the sun comes the strontium. The radioactive strontium created by last autumn's marathon Russian nuclear tests was not expected to reach this country until the spring, and it is now coming down in significant quantities that should reach their peak some time next month. The pattern is much as predicted. Scientists guessed that the two biggest bombs tested, of 30 and 60 megatons, might blast some of their fission debris so high that these fragments would escape the wind and air currents that normally carry fall-out down to earth, and would reach a layer of stagnant air where they might float for some considerable time. The rate at which strontium is now descending seems to confirm this guess.

The Russians exploded something well in excess of 100 megatons in 28 tests in September and October. Yet measurements of strontium taken now are almost identical with those recorded in the spring of 1959, after a series of tests little more than half this size. Such figures are well below danger level, indeed they are almost insignificant. In which case, why does the Government not disclose them? Can it believe the public's memory is so short that it forgets the scare of six months ago with its warnings about strontium in springtime? The Atomic Energy Authority takes detailed, continuous measurements of fall-out, and although the really crucial measurements—of strontium in the bones of young children—need several weeks of painstaking chemical analysis, there can surely be no objection to publishing preliminary estimates, particularly if they are as reassuring as reports suggest. One can only conclude that, just now, the desire prevails to avoid the whole subject as too sensitive.

SOVIET UNION

Frozen in April

For once Mr Khrushchev has not stolen the limelight. At this week's session of Russia's newly elected Supreme Soviet (parliament) he left it to Mr Gromyko to deliver on Tuesday the major speech on foreign policy, balancing the hopes of a Berlin settlement with the prospect of further competition in nuclear bangs. Mr Khrushchev contented himself with introducing the plan to draft a new constitution, and being chosen as chairman of the commission that will do the drafting. In keeping with parliamentary practice, he also handed in the resignation of his government to the new Soviet and, after his own unsurprising re-election, presented the deputies with a new team.

But not really new. The government has scarcely altered. More conspicuous than any changes was their absence in cases where change had been expected. Mrs Ekaterina Furtseva, for instance, has clearly been in disfavour of late. She has been removed from that crucial body, the party presidium, and has not even been elected a deputy to the Supreme Soviet. Yet she keeps her job as Minister of Culture. Marshal Voroshilov's survival, if less important, is also strange. Six months ago, at the party congress, he was violently attacked for both his anti-party activities and his participation in Stalin's crimes. He nevertheless keeps his honorary post in the presidium of the Supreme Soviet. The aged marshal may owe his survival to memories of his past glories, but there seems to have been a general agreement among the Russian leaders to leave the pattern unchanged, at least for the moment.

Soviet society will not be changed by a stroke of a constitutional pen. Stalin's constitution, approved in December, 1936, was remarkably democratic on paper, but this did not prevent the crimes so vehemently condemned by the party congress last October. That congress heralded changes in Russia, but efforts have since been made to slow down the pace of reform. Some of the international questions then outstanding have not yet received an answer. The Sino-Soviet argument has waned a little but not vanished. The Russian leaders cannot make up their minds how relations with the West are going—a little better over Berlin, perhaps, but worse over Christmas Island. The internal stalemate is probably connected with these international question marks. Mr Khrushchev may have chosen not to occupy the centre of the stage until the script is sorted out.

Quiet Young Men

Where is the radicalism of Soviet youth? Not, if the eye and the ear are any guide, in the Young Communist League, which held its congress last week. The Komsomol now groups 19.4 million young Soviet citizens. Yet, during the five days of proceedings there was no real debate, no lively controversy, no outward sign of ferment arising from the public denunciation of Stalin or any other source. An explanation can be sought for this apparently uncritical mood in the way such meetings are organised. Those of the 3,862 delegates who climbed the rostrum were mainly local secretaries, the younger members of the party establishment, well aware that Mr Khrushchev now wanted to keep in check the reformist movement he himself had helped to set in motion.

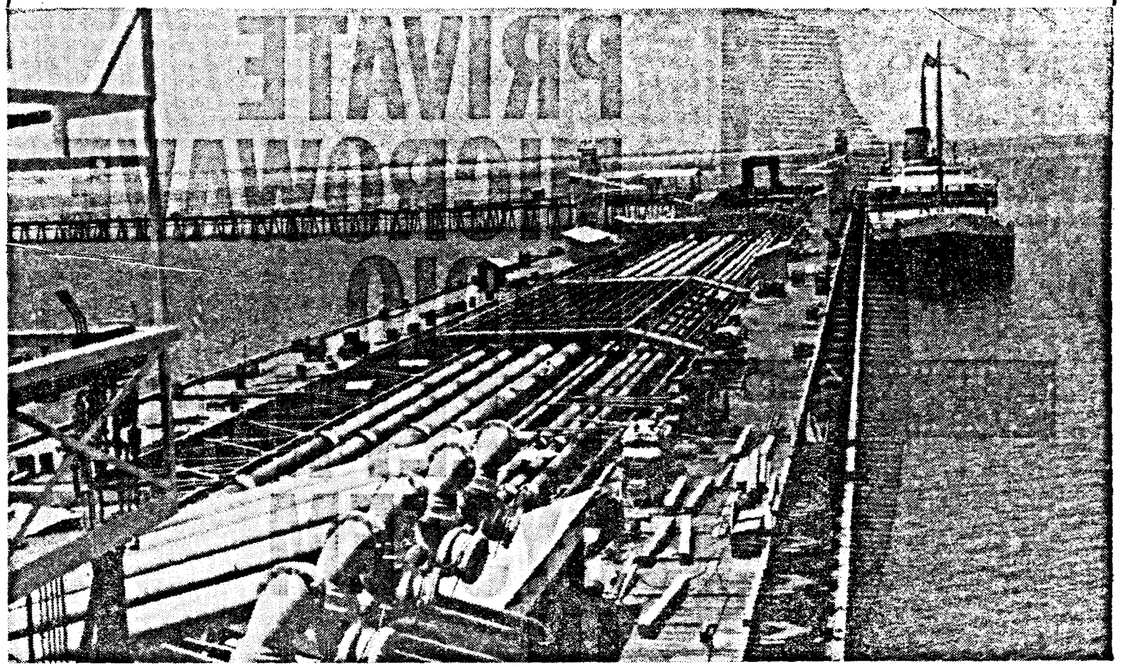
The Komsomol is a part of the Soviet establishment. Mr S. P. Pavlov, its first secretary and the main speaker at this meeting, has his foot on a fairly high rung in the party ladder. His two predecessors—A. N. Shelepin and V. Ye. Semichasny—are now exalted dignitaries. Thus it was idle to expect anything but an innocuous report, garnished with quotations from Khrushchev, from Mr Pavlov. But debates were equally respectful of authority. Post-mortems, and the embarrassments of last autumn's party congress of the seniors, were avoided. Passion was not even expressed when the new educational reform came under discussion, for all that it puts the school-leaving age at 15, and "matric for all" was one of the most popular slogans of the Komsomol.

If this disciplined gathering revealed traces of the restlessness among ordinary young members, they were faint and indirect. Mr Pavlov felt compelled to attack the prevailing literary fashion of showing the seamy side of Soviet life. He took to task novelists who "violently emphasise the so-called complexity of life, the complexity of man. The young hero is shown as a chequered blanket. It is, apparently, a man's characteristic to be contradictory." This outburst against the dialectical conception of man comes oddly from an official exponent of Marxism. Its violence suggests that not all is so quiet on the youth front, after all. Two celebrated alumni of the Komsomol—Major Gagarin and Major Titov—sat in the hall. But if young Russians can conquer space, they have yet to storm the bastilles of the Communist establishment.

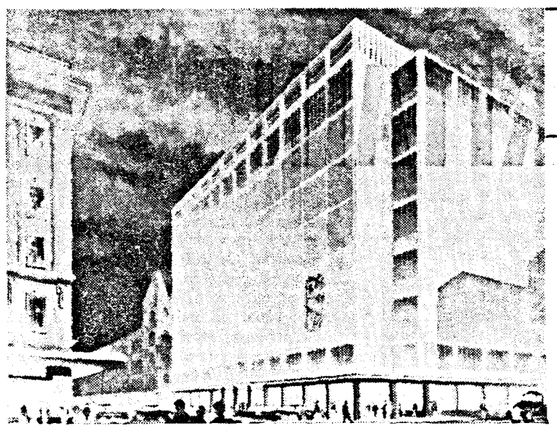
BURGESS-MACLEAN

Shoo?

Sir Reginald Manningham-Buller is not generally criticised for being excessively cunning. It is therefore possible that his own peculiar explanation of his peculiar action in the latest chapter of the saga of Messrs Burgess and Maclean is in fact the correct one. He told Parliament that the advance issue of a warrant was the only way in which he could ensure that these espionage suspects could be promptly arrested if they came here in transit; that he knew that, because "a great many people have to be informed at all the ports and airports" about any warrant, the press would be likely to get hold of the story anyway; and that he therefore decided to "reduce the area of speculation" (the phrase has a wonderfully meaningless bureaucratic ring about it) by announcing his intentions himself, in blithe disregard of the fact that this would obviously warn off either of the two men from coming here at all.



Nevertheless, whether by accident or design, the end-result of this Easter ragtime story has not necessarily been disadvantageous to this country. As Burgess and Maclean have decided to make the Soviet Union their bed, they might as well lie in it as in Brixton gaol. If either flaunted himself again within British jurisdiction, prosecution would have to follow. But in the eyes of simple people the prosecutable element about their flight eleven years ago (the fact that, as civil servants, they were and are obviously under suspicion of having offended against the Official Secrets Act) might not always be easily distinguished from the alleged political emigrant element in it. It is not in the West's interests to wax policemanly about the odd communist sympathiser who scuttles off voluntarily to the East, when for each such emigrant there will be more than ninety and nine communist-oppressed refugees who want to flee in the opposite direction. In all these cloak and dagger stories, no outsider can see more than one hundredth part of the iceberg; dogmatic comment about last week's apparent official gaucheries would therefore be absurd. But one can think of several reasons, not all of them unrespectable, why the Attorney General might, after all, have been right to play the gawky scarecrow rather than the efficient apprehender.

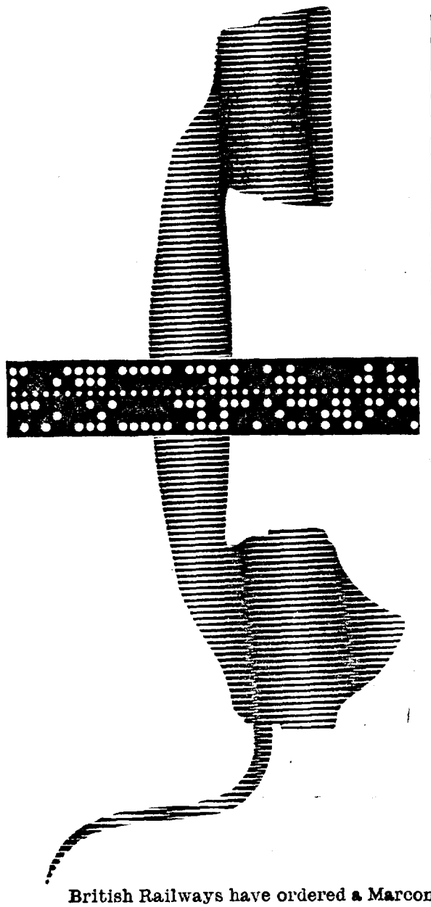


YOUNG SOCIALISTS

Trotsky and Points Left

The Young Socialists had their allotted Easter fling at their annual conference at the St Pancras town hall last weekend. Three hundred and sixty delegates "representing" 25,000 members enthusiastically passed resolutions lambasting the party leadership. The delegates passed a comprehensive resolution advocating Britain's renunciation of all nuclear weapons, withdrawal from military alliances, and the withdrawal of all British troops from overseas. They went on to demand that Mr Gaitskell should withdraw his comments supporting American nuclear tests or resign the party leadership. A motion supporting official policy on defence was swept aside, and one calling on the party to organise protest meetings against Polaris bases and German troop training grounds passed by an overwhelming majority. With defence out of the way, the delegates proceeded to reject a resolution supporting Britain's entry into the common market by a huge

Kharg Jetty, Persian Gulf TAKES 100,000 TON TANKERS



Birks Store, Adelaide
LARGEST IN SOUTH AUSTRALIA

The largest tankers afloat can now berth at Kharg Oil Terminal in the Persian Gulf, built by Costain as a joint venture with Raymond International (above). Shoppers in Adelaide can now be served in their £A3 million store (left) which is due for completion this summer. Costain's name is associated with these two developments, completely dissimilar, in different parts of the world. (*Consulting Engineers for Kharg: Frederick R. Harris, N.V. Architects for Birks Store: Hassell & McConnell*)

majority, substituting one more to their taste which called on the party to take the lead "in organising the working class in the struggle for a socialist United Europe." The delegates went on to pass a motion calling for the unconditional diplomatic recognition of the German Democratic Republic. The party's policy statement "Signpost for the Sixties" was then buried in contumely, and with no sense of inconsistency the delegates passed a resolution calling on party members to sink their "marginal differences" in favour of party unity.

All this need not be taken too seriously. These are the sorts of resolutions one expects Young Socialists to pass, and the appearance of Mr George Brown at the conference (himself once a stalwart in the Labour League of Youth) shows what metamorphoses time can effect. More significant was the stand that the conference took against Trotskyite infiltration. Trotskyites have been the bane of the Young Socialists since their foundation. Last year they more or less wrecked the conference, but this year they had apparently split into two rival factions and were too busy fighting among themselves to spare so much time for the conference itself. Allegations were, however, made that some delegates had been threatened with violence if they failed to toe the revolutionary line. This incensed most delegates and in a secret session they passed a resolution requesting the national executive to investigate one group which has been accused of Trotskyite affiliations. Party elders will doubtless be comforted by this faint glimmering of sanity among the socialist leaders of the future; they can also hopefully point out that the anti-Gaitskell majorities were not as large or perhaps even quite as sharp as last year.

Growing-up?

IMMIGRANTS

Held to Ransom

THE Pakistani High Commission has stepped in to try to stop an appalling racket operated by a small group of taxi drivers at London airport. The taximen seized on the more gullible Pakistani immigrants and drove them direct to their destinations in the Midlands and North, claiming payment (with an undisguised element of ransom) from the passengers' relatives and friends once they got there. In some cases where payment was refused the immigrants seem to have been dumped in the countryside "to teach them a lesson," or even taken back to London to be hawked round bidders for cheap labour there. The traffic has thrived on the fact that some of the Pakistanis have no money of their own on arrival; they therefore feel that they need a form of transport which will land them right at the door of some contact in this country who may agree to pay for their fare. Although the airlines warn them on the plane, it is then too late to do anything for people in this plight. A good deal of the Sunday newspaper revelations about "slavery" have plainly been sensationalised; but their reporting helped to drive home the nasty truth that, at the height of the traffic, an average of 15-20 Pakistanis on each flight of 80 passengers were being taken advantage of in some way.

The High Commission has stationed officials at London airport since just before Easter to guide the immigrants and keep a watch on the taximen. It says it has known of the trouble for the past six months. The officials' presence may be needed for some time. Pakistani coach operators (charging £1 a head for the run to Birmingham, compared with £25 or more asked by some taxi drivers) have complained that when they attempted to enter the airport buildings in the past they were hounded out by some of the spivs. It is certainly desirable that licensed and reliable coach operators should be encouraged to enter this business; where there are sizeable Pakistani communities, as in Birmingham and Bradford, a standard service at reasonably cheap rates can be maintained. But there is also a case for running official guidance bureaux, possibly staffed by the voluntary services, at the main ports of entry to give necessary advice on the intricacies of British geography and public transport. And cannot something more be done at ports of departure to ensure that intending immigrants have a minimum of sterling in their pockets to see them to their destinations and be given general instructions about the cheapest way to get there?

RUANDA AND URUNDI

UNreconciled

SURE of a civil war, almost certain of bankruptcy, and against the will of the United Nations, Ruanda and Urundi will triumphantly proclaim themselves separate independent states on July 1st. Economics and the UN antipathy to balkanisation both dictate that the Belgian-administered trust territories be made one. But local politics say no. After ten days of trying in Addis Ababa, a mere thousand miles from the Ruanda-Urundi border, the UN special conciliation commission admitted on April 20th that conciliation was not on. A joint council of economic union and a common coffee board were agreed on by the Ruanda and Urundi delegations; that was all. Stubbornly, the UN men told the delegates that the UN remains convinced that the best possible future lies in political unification.

If it were possible, this would be true. But is it possible? In Ruanda the short Hutu, who make up 80 per cent of the population, have overthrown their old overlords, the tall Tutsi; a close understanding between the departing Belgians and the new republican, Hutu, government has been established. But the former Tutsi monarch, Kigeri V, still roams the radical African and Asian capitals, basking in the warmth of having been opposed by Belgium. Fifty thousand refugees have fled across the borders to the Congo and Uganda.

Urundi, on the other hand, is still a monarchy; Hutu and Tutsi political divisions are comparatively blurred, and the politicians are not at all fond of the Belgians. There has been no revolution, but Urundi's first prime minister was assassinated last October barely a month after he had taken office. Two-thirds of Ruanda-Urundi's main crop, Arabica coffee, is grown in Urundi, where lies the main port, Usumbura (on Lake Tanganyika). Urundi leaders lean towards the radicals of Tanganyika and the Lumumbists of the Congo; if the territory joined Tanganyika (or an east African federation) this might help solve its economic problems. Both territories suffer from a rapidly-growing surplus of population: Ruanda-Urundi is the most densely-populated region in central Africa. Both, too, are to be governed by men only a little more experienced in the arts of politics than the Congolese were two years ago.

ARGENTINA

Rough Riding

EVERY day now in Argentina sees a new political convulsion as the service chiefs force their orders through a stalling constitutional machine. Last Saturday the military leaders who last month deposed President Frondizi were themselves faced with open rebellion from a gentler military

THE MOTOR INDUSTRY

The current issue of the quarterly research bulletin, "Motor Business", contains articles on:

- The Budget and The British Motor Industry
- The Canadian Motor Industry
- The market for motor vehicles and tractors in Turkey.

faction who thought that President Guido was now getting too rough a ride. Tanks rolled into Buenos Aires, supported by columns of soldiers, a shooting war was just averted and the gentle ones won the day. But only a day it was. On Monday the navy, with a show of marines, came down on the side of the roughnecks, and President Guido surrendered all but a shred of free will. Since then the tough soldiers and sailors have had things mostly their way.

The dispute among the military was not on a matter of substance. All were agreed that the Peronists must be politically outlawed, but they differed on how this be done. The tough ones had called for the annulment of the March 18th elections which had given the Peronists twenty-two provincial governorships and forty-five of the 198 seats in Congress. The gentler ones supported Dr Guido in seeking the same result by more constitutional means. His surrender seems to be in instalments. On Monday he formally cancelled the provincial elections and put the provinces under the federal government's control. But the fate of the Peronists elected to the chamber of deputies he may still try to leave to an engineered vote in the chamber. Not that getting a vote out of congress is an easy thing. On Tuesday the sulky deputies, meeting in extraordinary session, would not even pass a bill endorsing his succession as president. The prospect is of nothing but hurdles for this sadly roughridden upholder of constitutionalism.

CHINA AND RUSSIA

Mountain and Mouse

SOME trade is better than none at all; but the Sino-Soviet trade agreement for 1962, concluded in Peking on April 20th, hardly seems to justify the fulsome phrases used by the signatories. The signing, said a communiqué, would further enhance the "great, unbreakable and everlasting friendship" between the Chinese and Soviet peoples; and the Soviet ambassador, Mr Chervenenko, declared that imperialist attempts to find fissures in Sino-Soviet relations were doomed to failure. These mountainous claims cloak what may be a mouse of an agreement. Russia is to take Chinese ores and textiles, and send back rolled metals, oil and chemicals, lorries and machinery. Neither quantities nor values have been disclosed.

There is no sign that Sino-Soviet trade will do more this year than maintain last year's meagre level; there has been a sharp decline since 1960, that is, since political relations between the two countries began to deteriorate seriously. Last week's uninformative communiqué made no reference to the agreement of April, 1961, under which China is making good its deficiency on the repayment of Soviet loans by instalments, and without interest, over five years. Soviet exports to China now seem to be running at a level that roughly corresponds in value to imports from China less the instalments on Soviet loans. This is enough to keep the twin hearts beating, but not enough to enable the poorer partner to put on weight.

The signing of the protocol does, however, coincide with a few cracks in the ice of Sino-Soviet contention. Mr Patolichev, the Soviet foreign trade minister, went to Peking for the occasion. It is something to have got an agreement at all; at the end of last year a Chinese trade delegation came home empty-handed after a frustrating stay in Moscow. The presence of a Soviet scientific delegation in China for joint work on the Amur river valley project, on both sides of the Sino-Soviet border also suggests that things may be a little better. But a real thaw probably presupposes a purge of those Chinese leaders, headed by President Liu Shao-chi, who have asserted Peking's ideological independence at the expense of Soviet aid.

LEGAL REFORM

Scales of Justice

THE latest Bow Group pamphlet, *Scales of Justice* (Conservative Political Centre: 2s. 6d.), written by a group of young practising lawyers, is something of a legal dog's dinner. In general, it is a very respectable dog. The system of lay justices is supported because, in a phrase worthy of the Young Conservatives, "it has the supreme merit that it works." No criticism is made of the controversial method of appointing justices except for the somewhat curious complaint that not enough justices are appointed from those over the age of sixty. The most valuable suggestion here is that training courses should be provided for newly appointed justices, and also refresher courses every three years. The report also sensibly suggests that the remnants of justices' civil jurisdiction—principally matrimonial and bastardy jurisdiction—should be transferred to the county courts when this can be afforded (radicals would give this reform a higher priority than that). Committal proceedings come in for some well justified criticism, but instead of recommending the radical step of abolishing them altogether and leaving the question of whether to indict to the police, the report merely recommends simplification of the procedure.

The authors of the report are rightly concerned about the delays in trying accused persons. In 1956 30 per cent of those

THE WELCOME SERVICE

Yours for the asking in every major city . . .

NEW !

To help you enjoy your journey even more, not only on your jet flight, but also during your stay, Air France now introduce the new Welcome Service on its vast world-wide organisation.

Whenever you visit any major city served by Air France, you will find the Welcome Service with its staff specially trained to give you helpful information and advice: to simplify your stay and to make it more enjoyable; to help make contacts, and to assist you in so many other ways.

But the Welcome Service is only one of many Air France services created to help you on your way, services found everywhere on the largest air network in the world. Air France has adapted its famed hospitality "a la française" to the needs of every air traveller, and especially for you . . . that's why you are certain to *enjoy flying Air France.*

"How can I help you?"

You don't speak the language of the country? Do you know where to get theatre tickets? Hire a car? Find a guide or interpreter? A Shorthand typist? Do you know what's best to buy, and where to get it? — You have only to ask me: I'm the Air France Welcome Service hostess.

AIR FRANCE

In the Air France office, the Welcome Service can be readily recognised by its blue and white sign and the same insignia is worn by its staff: tell them your problems—they are your friends in a strange city.

THE WORLD'S LARGEST AIRLINE

accused had to wait from 8-16 weeks for a trial; and 9 per cent more than 16 weeks. About a third of the accused were detained in custody and of these 10 per cent were acquitted. The radical reform, which the report shies away from, would be a system of crown courts such as those at Liverpool and Manchester, sitting permanently and spread throughout the country. Instead of this, the authors, hypnotised by the need of barristers and judges for "long holidays", suggest that new regional criminal courts should be grafted on to the present assize system (which the radical would like to sweep away root and branch). Some sensible suggestions are made for reforming appeals procedure. There is still in England no properly constituted Court of Criminal Appeal, only an *ad hoc* gathering of puisne judges which for the occasion styles itself an appellate court. The report (surely rightly) argues that criminal appeal work should be discharged by those members of the Court of Appeal who have direct experience of such work. The new court of criminal appeal should also have the power to order a re-trial. At present many guilty prisoners are able to escape condign punishment because of technical errors in the court of first instance. The report also recommends that defendants in criminal cases should have a *prima facie* right to costs and that victims of crimes of violence should be compensated by the state.

In motoring law, the report urges abolition of that legal monstrosity of an offence "causing death by dangerous driving," an offence constituted not by the quality of the driving but by its consequences. It also suggests that "recklessness" should be a necessary ingredient in the offence of dangerous driving, but unfortunately cannot make up its mind whether this should be wilful or merely very foolish conduct. It thinks that parking should be lawful unless expressly prohibited.

FOOTBALL ATTENDANCES

After the Ball

Ebbing fervour?

ALTHOUGH crowds of 130,000 have turned up at Hampden Park, Glasgow, on the last two Saturdays (to see an international match and a cup final), routine league football in Britain has seen its less-fervent followers drifting steadily away. Seasonal attendances at Football League games seem (at a guess) to have fallen by 11 million in a decade—which suggests that perhaps 250,000 spectators have turned to other pursuits. At an outlay of £6,000, a firm of market researchers has revealed to the league that British week-enders are certainly not what they once were, thanks to the family saloon, the telly, the garden and do-it-yourself. Most of these distractions from muddy terraces under a weeping sky did not exist for the great bulk of the spectating millions in the heyday of the game just before and just after the war; and nothing the league can do can change them.

The consultants have thrown in complaints of bad teamwork, bad play and bad sportsmanship on the part of too many of the league teams; have rightly attacked the outmodedly Spartan accommodation and facilities at the grounds; and have added a gratuitous attack on the magnanimity of British wives (who are portrayed as selfish harpies determined to deprive their menfolk of enjoyment) and on inflated press treatment of transfers and squabbles.

As another sign of a strange itch for not enjoying publicity, the report sponsors the Luddite proposal that less football should be shown on television. Much of this seems considerably less than useful.

Advice on how to stop the rot has come from many sources: the league itself wants to relegate and promote four teams in each division every year, but the extra clubs that might be relegated may object. It has not so far shown signs of streamlining the cumbersome divisions themselves, although it has hinted that any club having to apply twice for re-election to the fourth division will be retired forthwith—which might help some of the better non-league clubs on to the ladder. It is also suggested that all international matches should be played either on the same day of the week or in mid-week, since these are thought to drain supporters from league games. This last would almost certainly be a step in the wrong direction. The only way to make football an economic industry is likely to be to try to attract larger individual crowds to a smaller number of really star games (which will eventually involve a smaller super-league, probably thereafter a European league, perhaps also more international tournaments). To try to cut down star games (or television) in order to shelter continued fulltime professionalism at the Accrington Stanley level will be self-defeating.

BRITISH HONDURAS

Odd Man In?

SOME day British Honduras, plodding to independence, will have to shake down more comfortably in its central American frame. Last week's talks at Puerto Rico between Britain and Guatemala, arising from Guatemala's claim to this hurricane-swept British colony, could point to some ways of doing so. The claim *qua* claim was left in the air (the best place for it); but some quite down-to-earth proposals that might help to reduce present tensions were agreed.

These were for a joint committee to promote economic development in Guatemala and British Honduras, and for possibly bringing British Honduras into central America's plans for a common market. The need to improve roads and ports was particularly stressed. This is an important factor. Guatemala's territorial claim is juridical fantasy, but it does spring from a real annoyance. British Honduras bars Guatemala's whole northern province of Peten from the Atlantic, and the province's splendid forests are in consequence barely exploited. Given better communications a great new industry could thrive there, and British Honduran woodmen, their own forests largely worked out, might play a part in it.

Guatemala's President Ydígoras may not like the Puerto Rico proposals. They could well seem an anticlimax to all the passion he has spent on territorial claims. In recent months he has pitched these even higher, the better to draw attention away from his shaky internal position. To tone them down cannot be easy. The idea that British Honduras might at length join a regional common market may nevertheless appeal to him. For he tends to see economic union as a step to political fusion; although this is not a logic to which all his neighbours subscribe.

GERMANY AND ISRAEL

Expiation

WEST GERMANY deserves credit for the effort it has made to recompense the Jews. Five million Jews were exterminated by Hitler. Millions more suffered imprisonment and persecution, had their property confiscated and were forced to leave their homes. Today's Germans cannot turn back the clock. But they have, at least, accepted responsibility for doing what they can to compensate those who remain.

The bulk of west Germany's *£280 million* reparations to the state of Israel has now been paid. Just over £1,000 million of compensation has already been paid to individual Jews who suffered persecution, and there is about as much again to come. This does not include over £100 million that has been paid to Jews who lost property in Germany; another £160 million of property claims should be settled in the next few years.

A small chapter in this massive effort is recorded in a new book on the Jewish Trust Corporation in Germany.* This small trust, set up as a British company in 1947, but operating in Germany, had the task of acquiring former Jewish property seized by the Nazis, or at present in other hands, which no Jewish owner now claims. The trust, together with its sister bodies in the French and American zones, has taken over some £30 million of former Jewish property in Germany since the war and has spent the money on helping individual Jews who had a hard deal from the normal process of compensation. The money has built schools, and homes for elderly Jews, in and outside Germany. The restitution courts in west Germany have sometimes been slow; some Jews have got less than they should have, or have got it too late. But an effort of expiation has been made.

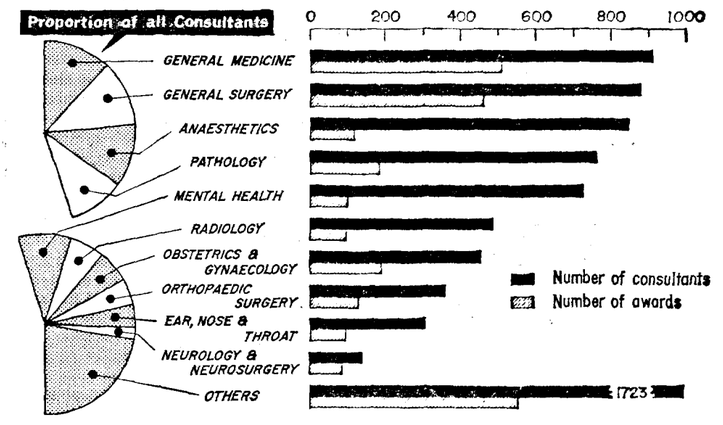
DEVELOPMENT

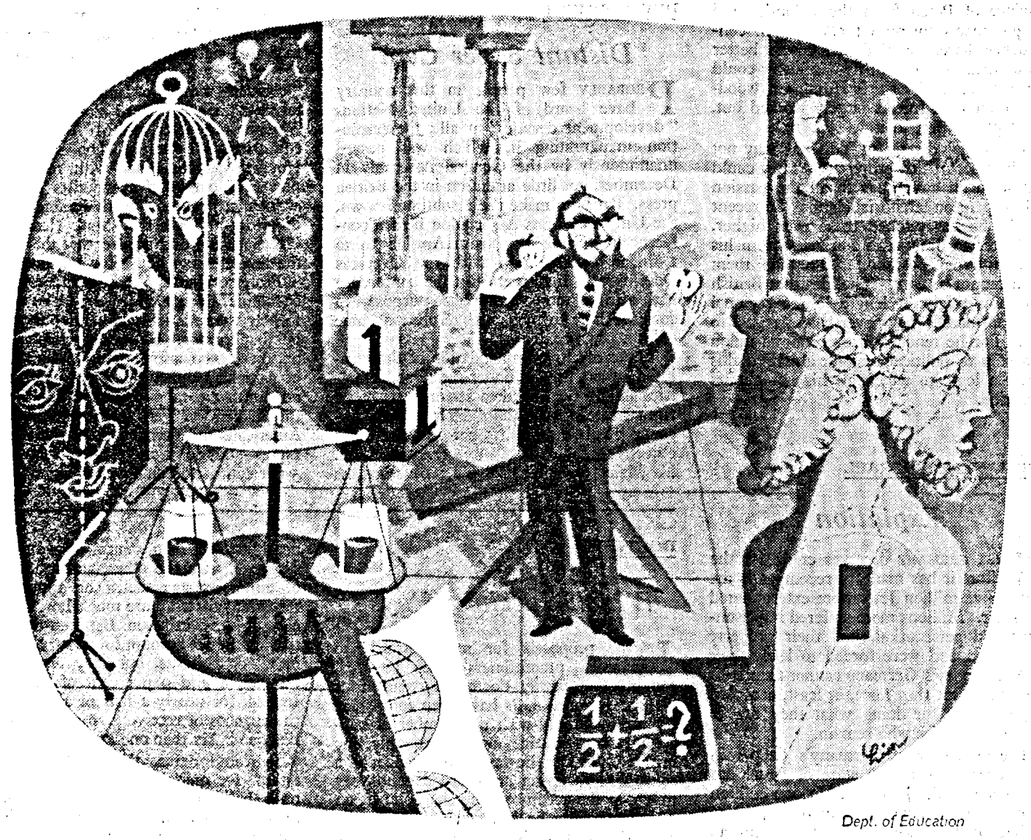
Distant 5 per Cent

PROBABLY few people in this country have heard of the United Nations "development decade" at all; the resolution inaugurating it, which was passed unanimously by the General Assembly in December, got little attention in the British press. Partly to make the resolution known, the United Nations Association held a conference at Cambridge from April 13th to 15th, in collaboration with the Overseas Development Institute. But the conference had also a more ambitious purpose, to consider how to make the resolution come true in practice.

The central recommendation of the resolution was that the under-developed countries should be helped to attain by 1970 an annual rate of growth of their national incomes of not less than 5 per cent; and this objective was the main subject of discussion. Mr Malcolm Adiseshiah (Unesco) laid stress on the "missing factor" that accounted for the fact that Japan, among other examples, increased its agricultural production by 20 per cent between 1950 and 1960, while the "classical factors" of land, labour and capital investment remained more or less static. The missing factor, said Mr Adiseshiah, was education. Mr Andrew Shonfield (Chatham House) was concerned with reducing the power of orthodox economists to impede economic progress in the name of their theories; and Dr Paul-Marc Henry of the UN Special Fund argued that the UN was the best clearing house for economic aid.



Professor James Meade pleaded for "uneconomic" loans and trade policies designed to help the recipients to service them without bankruptcy. He was particularly hard on those who argue that Britain's balance of payments difficulties should put a brake on assistance to poorer nations. Certainly the British, as well as the more generous Americans and French, will have to do much more—and do it more effectively—if that 5 per cent is to come within sight.



DOCTORS

Which Specialty Pays?

IF the proposals for merit awards to general practitioners are adopted, roughly one family doctor in twenty-four will receive one. GPs have been comparing this unfavourably with the number of consultants who receive awards—roughly one in three. In fact, however, the chances of a consultant receiving an award depend very much, as the accompanying chart shows, on which specialty he has taken up. At the end of last year in England and Wales, 7,627 consultants were receiving 2,558 awards, over a thousand of them worth, for whole-time health service work, £750, and 90 of them £4,000. But, as against this average of an award for one-third of consultants, over a half of both general physicians and surgeons receive awards and nearly two-thirds of neurologists and neurosurgeons. On the other hand, the chances of either an anæsthetist or a psychiatrist receiving an award are much lower than the average—one in seven. Between them these two specialties account for about 20 per cent of all consultants, but they received only between 8 and 9 per cent of the awards. Indeed, for nearly a half of all consultants the chances of receiving an award are more like one in six than one in three.

It would defeat the whole purpose of awards for merit were they to be allocated on a basis of fair shares. But does the present allocation really represent the distribution of merit among the different specialties? Or does it, at least in part, reflect the composition of the selection committee, with its membership almost exclusively drawn from fellows, including the presidents, of the three royal colleges of physicians, surgeons, and obstetricians and gynæcologists?

TV

schweppsicolor

Our humble function is to entertain, but equally our proud trust is to acknowledge the requirements of the growing mind. In *Prefect*, last Sunday, we interviewed a village postmistress who had refused to take up decorative glass making, as a hobby. You never know when some day it may not be your turn to take part in *Back to Back*, our interview programme in which differences are so frankly stated that the participants refuse to speak to each other. Every fortnight three Professors of Popular Archæology and one Reader in O.K. Taste are shown a photograph of Schwepton Tunnel, and asked if it is Schwepton Tunnel, and, if so, what its date is.

Here, in our Programme of Completely Pure Science, we see Dr. Zü in action. Not only is he a genuine Doctor, really foreign, who lectures at an actual college, but he is also a natural T.V. personality, which means that a clever producer makes it possible for us to distinguish him from the compère in Teen Magazeen, the programme which precedes him.

Here Zü is making clear to us the meaning of division by two. "We speak of an object being divided into two equal portions", he says. "We talk of cutting an apple with an ordinary pen-knife, so that neither of the recipients is dissatisfied with his 'half'. Yet we have only a very vague idea of what this word 'half' truly signifies. Now I think it will help if we get out of our head for the moment phrases like 'semi-detached', 'semi-colon', 'half a league', 'half seas over', etc. and all objects which though perfectly comprehensible in themselves are not usually associated with halving ..."

It is by methods such as this that, for the mass viewer, the more abstract problems of science are made concrete and comprehensible.

The Fruit is Overripe

FROM OUR SPECIAL CORRESPONDENT

COMMON market or no common market, Britain is the world's biggest importer of fruit and vegetables. Unfortunately (as any visitor to the Royal Opera House on a warm summer's night can tell) the importing is performed in conditions of maximum physical squalor. The more efficient fruit and vegetable traders are delighted that, at long last, Covent Garden market is to be removed and reorganised (even though this process will arouse squeals of rage if any tender toes are too heavily trampled on). And now it is encouraging to learn that the importers are finally making a serious effort to get rid of some of the grosser inefficiencies that attend their business before the central markets are reached.

The Fruit Traffic Organisation (it includes vegetable traffic, too, but sensibly *concertinas* its name) arose out of a survey conducted in 1959 for the London fruit and vegetable traders' federation. The survey showed that almost half of Britain's imports pass through the ports, terminals and markets of the capital. Two-thirds of this produce reached the markets through the Port of London, and one-third by rail and road after having been landed elsewhere: almost all of this did the final few miles by road. But the space on the roads for this unorganised traffic, and the space available in the docks to unload it, was quite inadequate. An extreme but not uncommon case is that of an importer who recently sent a lorry to the docks to pick up a consignment on a Monday morning, and finally received the load on the Wednesday afternoon. During the interval the lorry was unavailable for other work, and its driver was raking in overtime money.

Inspired by continental examples and spurred on by the impending reorganisation of Covent Garden market, the new body has enrolled some 50 importing firms—less than half the businesses in London, but with over half the trade. The organisation has acquired temporary headquarters under the fostering wing of the official Horticultural Marketing Council, and, as general manager, a recently retired brigadier whose last job was organising military movements in Cyprus. It is to be financed by a contribution from each member of 1/5 of a penny per package; once it has got under way the idea is that each year a sort of "divi" should be declared on these payments, whereby the members would get back a certain percentage of their subscription.

The organisation's aim is to reduce costs, including the heavy cost of produce banged about or left to go bad, by co-ordinating the activities of importers both among themselves and with those of shippers, carriers, stevedoring companies and port authorities. It could also investigate ways of improving handling methods, perhaps negotiate on rates for handling, and eventually co-operate with foreign exporters on subjects such as packaging, invoicing and the rest (exporters in New Zealand and Israel have already shown a benevolent interest).

No doubt, however, the very first job will be the hardest. At present there is not even any effective mechanism for letting importers know when their consignments are ready to be picked up by their own transport. Trucks are simply sent to meet the boat or train on which goods are expected; they spend much of their time physically reserving a place in a queue of other lorries. This system reaches a peak of wastefulness when an importer gets delivery earlier than he had expected and before he has space free in his own warehouse: then the lorry is used as a moveable warehouse until the goods are wanted. The stevedoring companies and the railways, too, complain that goods often pile up in their docks and terminals awaiting the consignees' lorries. If (say) tomatoes are selling slowly the traders may postpone taking delivery for as long as possible—thus blocking the terminal facilities and preventing themselves from getting out the oranges that could (and must) be sold right away.

At this early stage the organisation will have to go carefully. Since the essence of competition in the importing business is to have the right quantity of goods at the right time to get a decent price for all of it, the FTO must preserve the deepest secrecy about some of the information for which it will be a clearing-house. And it cannot afford to antagonise either the hauliers or the stevedoring concerns by running its own transport or its own sorting accommodation.

The most controversial part of its work lies in its powers to investigate the economies that might be made through the use of "alternative ports and stations outside the London area." Costs in London are already well above those for other ports: and there has in recent years been a trend to bring in cargoes through several ports away from the Thames. But much Commonwealth produce arrives in general cargo liners that must come to London; and the difficulty about bringing in vegetables from the continent to such ports as Shoreham is that, as yet, there is no guarantee that labour will always be available to unload it. And there is a growing tendency for grapes from Spain or lemons from Italy to travel by train in one rail-car from terminal to terminal, which may limit the organisation's scope for action at the conventional ports. Obviously not all fruit traffic can be taken away from London, but the power to recommend even a partial move would give the FTO a strong bargaining counter against rising charges.

The hottest argument in the docks will remain untouched for the time being. The FTO has no desire to get mixed up in arguments about whether importers should be allowed to use their own labour to get produce out of the docks when the registered dockers are on strike. Sensibly enough, the organisers are concerned to keep friendly with the Transport and General Workers Union. On the prospect for a reduction in tariffs on continental food, too, the importers (who usually handle large quantities of British produce as well) remain unmoved. One leading importer has even found that increased demand on the continent in recent years has cut down the price advantage of most of the European vegetables that are eaten in Britain. So perhaps the consumer's best prescription for a cheaper apple a day lies with the importers themselves, to succeed in this first serious attempt to improve their service.

Mr Lemass's One Worry

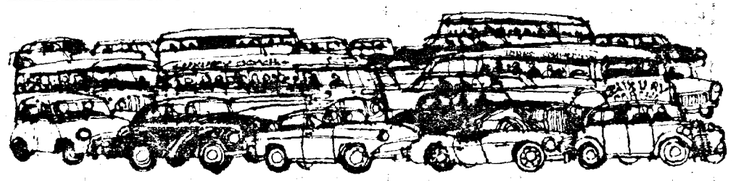
FROM OUR CORRESPONDENT IN DUBLIN

In spite of gloomy ministerial prophecies earlier in the year, the Irish budget turned out to be a tame affair. The taxes on beer, spirits and cigarettes were increased by small amounts which leave prices still well below British levels. On the other hand, entertainment tax was abolished and old age and other pensions were raised. Grants to agriculture were increased while tax allowances on new industrial plant and building were doubled. Loans are to be made available for industrial re-equipment.

The growing preoccupation with the common market was further suggested by the announcement that continental methods of sale, purchase and turnover taxes were now under study. These methods were examined by the commission which has just finished its inquiry into income taxation. The commission was deeply divided in its recommendations; but it is clear that the revenue should benefit from these forms of indirect taxation since the number of income-tax payers in Ireland is exceptionally small.

Nobody, therefore, has been greatly hit or greatly benefited by the budget. Whatever was going went to the farmers and to the pensioners. There are, of course, quite a lot of pensioners; and the farmers have made a good deal of play lately with the fact that agricultural prices are still much what they were nine years ago. The budget debate was a reminder of what almost everybody had forgotten, that Mr Lemass's government has no effective parliamentary majority at all.

This situation, however, has existed on several occasions in the past; and there is no reason why it should not continue now for some time to come. When Mr Lemass decides to go to the country, he will have no lack of comforting statistics. The volume of national production is estimated to have increased by 4½ per cent in 1961, which suggests a cumulative increase of almost 15 per cent in the three years 1959-61, compared with only 8 per cent in the nine years 1950-58. In the last three years industrial production has increased by 27 per cent. In the same period, imports and exports have been establishing new records.



Finance minister Ryan

There have been two causes for anxiety. It has happened all too often since the war that a burst of expansion has turned into balance of payments difficulties. Growth in 1961 was accompanied by large-scale wage increases which, on past experience, suggested heavy trade deficits this year. The figures for the first quarter of the year, however, show a further increase in both exports and imports. Imports have indeed gone up by a greater amount but the gap has widened by only £1 million. If this relationship can be maintained, there will be nothing to worry about.

The second, and much deeper and more important, problem is the comparative stagnation of agriculture. Politically, this is dangerous to the government because farm prices have remained much the same since 1953 while urban wages and salaries (and local rates) have steadily increased. Economically, it is impossible to expect continued progress while the major exporting industry remains in the doldrums.

The present government has always paid a great deal more attention to industrial development than to what happens on the farms, but it cannot afford to do so much longer. The department of agriculture has at long last announced the formation of study groups, which include representatives of producers and processers, to consider EEC policies affecting the main categories of agricultural produce: cereals, milk and milk products, meat, poultry and eggs, fruit and vegetables.

This is a step in the right direction; but it remains to be seen how long a step it will be. The department's reputation for energy has not been impressive in the past. Fingers should be kept crossed until preparations for the common market are as convincing in agriculture as they begin to be in industry.

Arrested Juggernaut?

With anything up to seven million cars on the roads on sunny Easter Monday it was virtually inevitable that the provisional number of deaths for the day should have risen to 21, compared with 12 on Easter Monday last year. Despite a good deal of premature congratulation on drivers' better manners (possibly intended to have a psychological effect after reiteration on radio and the telly), the total number of deaths in the five days of the holiday period reached 74—and for the fall of 12 compared with 1961 the chilly and discouraging weather of last week seems to have been primarily responsible. Even so, such improvement as there was is mildly hopeful, particularly in the context of long-term figures on road safety.

Last year, for the first time since the fuel restrictions of Suez year, the number of people killed on British roads fell minutely, from 6,970 to 6,908, instead of rising remorselessly. At the same time, the registration of vehicles increased by 8 per cent, and there is therefore some room for what Mr Marples, in his doomy way, has called "guarded optimism." It really does look as if the exhortations against carelessness, together with mild improvements to antique carriageways, have had some effect. The danger now may be that optimism goes too far, supported by official calculations that show Britain to be more safety-minded than almost any European country and better off, in absolute as well as comparative terms, than it was thirty years ago (see table).

Mr Marples's Easter message declared roundly that, in the end, the only way for a driver to keep his head while all around him are putting theirs through windscreens is to drive defensively, as if every corner concealed, in the words of a famous motoring journalist, "a steep hill with a steamroller, out of control, driven by a drunk." Most drivers only drive like this for a few shaking minutes after they have just missed the steamroller; nor is that surprising, since most tuition does not concentrate on the increasingly frequent need in Britain for evasive or emergency action. This is one of the points made by the Royal Society for the Prevention of Accidents, which has just launched a national road training year campaign in the hope of adding something to the distinctly mediocre skills of the average British motorist.

Perhaps it is because of that mediocrity that the latest "safety" innovation, the Panda crossing, has not been a wild success with its users: with its pulsating coloured lights and its black-and-white chevrons and

INDICES OF POPULATION, MOTOR VEHICLE REGISTRATIONS AND ROAD DEATHS
(1926=100)

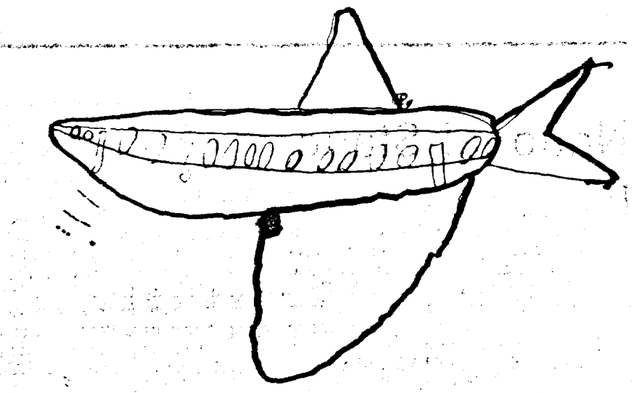
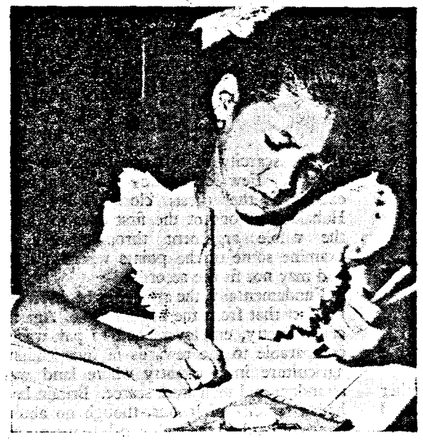
RIO DE JANEIRO: CHILDREN MEET JETS



Men and Jets SUPER DC-8 S AND CARAVELLES - two of the finest and fastest Jets in the world – flown by million-mile pilots, trained to perfection in keeping with this modern Jet Age.

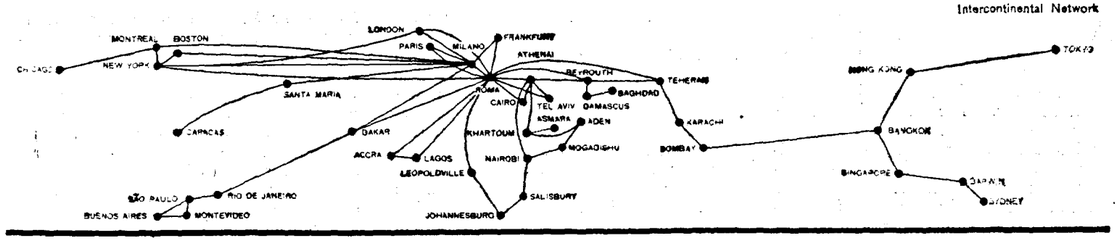
The Winged Arrow Service All the warmth and atmosphere of Italy greets you the moment you step aboard – prompt, courteous hospitable ALITALIA service awaits you. ALITALIA's stewards and stewardesses are anxious to show you the true meaning of the Winged Arrow Service.



Be Budget - Wise Business meetings or congresses in distant places – sporting events - trade shows – group travel or family travel – businessman or tourist – ALITALIA offers you the most advantageous rates and most economical solution.

Air Freight City to City - Continent to Continent – fly your freight the ALITALIA way. Careful handling, speedy and punctual delivery at conveniently low rates. As far as cargo goes, ALITALIA goes all the way.

Think Ahead The modern traveller always plans and thinks ahead. Carefully planned itineraries afford you the opportunity to see more places at no extra cost. Think ahead – plan ahead – consult your Travel Agent, take his advice – realise what is to be gained in planning your trip.



ALITALIA AIRLINES

Do you believe in love at first sight?
This happened when ALITALIA invited members of the younger generation to visit various airports throughout the world in order to see for the first time, the ALITALIA Caravelle and Super DC-8 Jets.
They spent one full exciting day as ALITALIA guests-and devoted a part of their day to drawing and painting the ALITALIA Jets which were leaving for other lands on ALITALIA's world-wide network.
The children's excited concentration can be seen in the picture taken at "Galeao" Airport

Fascinating Rio!
Fascinating rhythm of Rolls-Royce Super DC-8 Jet engines as they wing you on your way to Rio.
Flying high to Montevideo and Buenos Aires-stop off in Dakar, Rio or Sao Paulo on the way-at no extra charge.
Make your South American way the ALITALIA way.

ALITALIA is in all of ITALY and goes EVERYWHERE in the world

48 countries, 76 cities, 18.000 approved agents all over the world

yellow-and-white stripes, it is altogether too complicated to be absorbed in a short time by a man whose available stock of skill is already being extended by avoiding turning taxis. Ordinary pedestrian-controlled lights, as installed at Slough, would be less confusing, if no more successful in keeping pedestrians from under the wheels. And there are some simple rules which might be enforced to ease the pressure on drivers' skills—such as the almost universal (elsewhere) rule of "give way to traffic on your right." Another improvement would be the provision of more advanced training for drivers, particularly in keeping control in emergencies—mainly skidding; loss of control is the largest single cause of accidents listed by the Ministry of Transport.

National Stage

IT really looks, at last, as though London will one day have a National Theatre. The project has been bedevilled since its inception by all possible bogies: shortages of cash, artistic disagreements (and now and then artistic pique). Last month the Royal Shakespeare Theatre at Stratford-on-Avon withdrew from the partnership that was to provide the artistic impulse for the new endeavour, leaving the Old Vic and Sadler's Wells opera on their own. But now the Joint Council of the National Theatre has announced its plans for two new buildings in the shadow of the Shell building south of Waterloo Bridge, and the London County Council has agreed to provide the sites.

On one site a new opera house will be erected: Sadler's Wells will occupy this, and its old site in farthest Islington will be sold. The other site will have an amphitheatre auditorium, while the present Old Vic auditorium down the road will house plays needing to be presented behind a proscenium. Eventually a proscenium theatre should be built alongside the amphitheatre, to replace the existing Old Vic. The Arts Council is to recommend to the Government whether or not to go ahead with all this (and it seems exceedingly unlikely that it will say no): finally, then, the Government will release the £1 million voted in 1949 to build a national theatre—a sum which, in those happy, far-off days, might just have been enough for the job. The LCC will put up a further £1.3 million in capital: some of the LCC's idealists believe that they have in effect blackmailed the Government into spending its share by voting their own rather larger one.

The one advantage of waiting so long may turn out to be that all the parties have actually thought about the longer-term question of continuing subsidies for the theatre. The LCC seems to be thinking in terms of around £55,000 a year for the theatre and £45,000 for the opera house; the Government should be giving £300,000 a year between the two. (At present Sadler's Wells gets some £275,000 a year from the Government and £45,000 from the LCC, while the Old Vic gets £40,000 from the Government.) This should allow the new institutions to make a few experiments free from the demands of conventional commercialism. The real danger is that the National Theatre Board (itself appointed by the Chancellor of the Exchequer in consultation with the LCC) will not be able to get a good—and brave—enough man for the job of artistic director.

Finally, this project increases yet further the proportion of Government subsidies to the arts that are spent in London rather than in the provinces (which are far more in need of such a boost). Tours by companies from the new Sadler's Wells and from both the new national stages are no substitute for artistic centres in the main regional capitals. Only the artistic performance of the national theatre will show whether the Government has been wise to let itself be persuaded to put so many golden eggs in one central basket.

BOOKS

Men, Machines and America

American and British Technology in the 19th Century

By H. J. Habakkuk.

Cambridge University Press. 222 pages. 32s. 6d.

ABOUT once every generation during the last century or more, it has become fashionable for British men of business to discover how much more ready American industry is than British to install machines to save labour. The productivity teams of the early nineteen-fifties, who organised this into a form of modern industrial pilgrimage, were only following a path of inquiry that groups of technicians had trodden a century before, and drawing comparisons that individual observers such as Cobden had drawn in the eighteen-thirties. These modern teams' reporting of the higher degree of mechanisation in the United States—and hence its higher labour productivity—could often be more quantitatively precise than that of their nineteenth-century counterparts. But their reasoning about the causes of it was seldom, on the whole, as perspicacious.

Few of the early nineteenth-century observers of American mechanisation were in any doubt about the cause. Businessmen bought more labour-saving machines than on the British side of the Atlantic, it was taken for granted, because labour was scarcer, more expensive, more worth saving. This is a plausible and simple argument, so much so that many sophisticated analysts have always shied away from it; and certainly it has too often been put without qualification and without enough care in tracing the convolute consequences of a relative scarcity of this one factor of production. Few economic historians have examined the thesis closely. Professor Habakkuk is one of the first ever to think the whole argument through, and to examine some of the points where it may and may not fit the record.

Fundamentally, the argument begins from the fact that from the beginnings of American industry, employers had to pay wages comparable to the rewards of independent agriculture in a country where land was abundant and men were scarce. Britain had had a scarcity of labour, though no abundance of land, in the eighteenth century, and this had partly stimulated the technical innovations of its classic industrial revolution. But from the turn of the century, its "population explosion" was beginning; with the release of manpower from the Napoleonic Wars, some movement of labour from the land into industry, and Irish immigration, employers had a very elastic supply of unskilled labour at subsistence wages (while improvements in agricultural productivity, per acre instead of per man as in America, tended to keep down the cost of subsistence). Skilled labour was possibly even scarcer than in the United States; but that tended to stimulate more economical organisation and the division of labour, rather than mechanisation *per se*.

The American industrialist, with a more expensive and less elastic labour supply, had a greater inducement to mechanise. It is true that if wages, the prices of machines, and the prices of the products made had all risen in step, the adoption of more labour-saving methods would not have helped him. But in practice the prices of machines and of products rose more slowly. America was not a closed economy; the levels of its protective tariffs, which remained unchanged over long periods, set ceilings to the prices of products and of machines (which, after 1843, could legally be imported from countries where the labour involved in making them was markedly cheaper).

American businessmen were readier to scrap the machines they had sooner (and made them lighter and less robust): they were more bothered than British businessmen about obsolescence, and the growing costs of labour-intensive maintenance. Imperfections in their localised markets gave American manufacturers high profits up to a certain point; made the marginal cost of getting extra labour much higher than the average; prevented the migration of local finance from areas where it was cheap to those where it was extremely dear; and gave the manufacturer less scope for putting his profits into forms of investment other than his own business. Yet the total market was expanding faster; the sustained growth in demand for American manufactures "warranted a rate of investment, in relation to the supply of factors as a whole, which was more rapid than in England."

Professor Habakkuk is concerned in this essay to examine *a priori* whether and how this generally plausible argument could have been true; broadly, he thinks it could. He then sets the various ways in which factor endowment could have influenced the composition and rate of American investment against the salient facts of labour and capital supply, during the period, in America and Britain; and finds them broadly congruent with the thesis, without assessing the relative importance of the different influences it exerted. A concluding chapter looks briefly at the comparative industrial circumstances and technological performance of the two countries in the later nineteenth century. During this period he feels that the faster growth in America (and other industrial economies), and the difficulties of readjusting the complex industrial structure that Britain had developed, outweighed though they may not have invalidated the ideological contrasts some historians draw between confident dynamism in the one economy and complacency shot through with incipient doubts in the other.

Neither of these theses—the response to a scarcity of labour, and "the penalty of taking the lead"—is new. But what is here, in this lucid and sinewy discussion, is a closer and more critical examination of them, illumined with a more confident reference to the technological record, than we have had before. And, in passing, it indicates many promising byroads for more detailed inquiry by other economic historians.

A Writer in Society

Maxim Gorky: *Romantic Realist and Conservative Revolutionary.*

By Richard Hare.

Oxford University Press. 163 pages. 21s.

"UNDOUBTEDLY the most significant representative of proletarian art." Lenin's judgment on Gorky is the despair of those who still retain any inclination for exact thinking. What is proletarian art? Gorky was not proletarian in social origin, but middle class; nor can his outcasts and vagabonds be described as proletarians. However, in the sense that Gorky in the long run, in spite of frequent disagreements with them, did more than any other writer to help the bolsheviks to win, consolidate and retain power, Lenin's view may be right. The story of Gorky's part in the rise of bolshevism is still largely untold, and Mr Hare's essay does little to fill the gap. It is, of course, the case that the vital correspondence relating to the formative period of bolshevism has not been published and according to the Marx-Lenin Institute has not yet even been located. But even on available information Mr Hare's sketch of this side of Gorky is very inadequate. For example, Mr Hare says that Gorky's fund-raising tour of the United States in 1906 failed to raise any funds. In fact quite a substantial sum was raised for the Russian social democratic movement as a whole, which was quite unscrupulously handed over to the sole use of the bolshevik faction. The matter remained the subject of acrimonious dispute for some years.

Aside from its treatment of Gorky's political activity, this little volume must be welcomed for two reasons. The last study of Gorky in English appeared in 1932. In Soviet criticism his work has been so much overlaid with hero-worship that a sober reassessment of his literary stature was much needed. This is what Mr Hare has done in a sympathetic and clear study. He sees him as a "journalist of genius"—a judgment with which few who have read his autobiographical volumes and his reminiscences of his contemporaries (especially of Chekhov) will disagree. On Gorky the artist Mr Hare is rightly more reserved. His talent lay in acute observation rather than in literary perfection. "Rugged, strained and patchy" it "fell far below the artistic genius" of Tolstoy, Turgenev and Dostoevsky—and, it may be added, Chekhov, as Gorky himself freely admitted. The novelty of his subjects, the force of his descriptive power and the intensity of his feeling rightly won him an immense reputation at an early age. But he had neither the intellectual force of Tolstoy nor the human charity of Chekhov to produce work to which the description "great" can be applied.

Mr Hare has also tackled the problem of Gorky's moral position as a writer in relation to the new society, of much of which he disapproved. As a good biographer should, Mr Hare has put the case for Gorky as fairly as it can be put, but it is not a very strong case. Since in the last years of his life both his doctor and his secretary were NKVD agents, and since Stalin accused others of murdering him, it is a reasonable guess that Gorky was murdered on Stalin's instructions. If so, he was one of the many silent victims who in the end paid with their lives for belated resistance to horror which they had for many years condoned. But was it worth it? In 1917 Gorky, then in Russia, opposed the bolshevik *coup d'état* only soon to become reconciled to it. Then, after a period of voluntary exile, he returned to Russia once again to be feted and hero-worshipped in exchange for writings glorifying the regime in all its works—including (in 1934) a volume devoted to the Baltic-White Sea Canal, built by the unfortunate inmates of the vast concentration camps. We know today what value to attach to claims that the inmates saw their fate as a well merited penance for opposing socialism. One has an uncomfortable feeling that Gorky knew it in 1934—after all, seeing through government cant was the main virtue of his pre-revolutionary writings.

It is only fair to recall that Gorky worked hard behind the scenes to save many individuals from the tyranny of the regime which he was outwardly supporting. But what of his integrity as an artist? Mr Hare shows how much this was endangered by the fatal attraction of his native Russia for a simple-minded, lonely and somewhat disorientated exile in strange Western Europe. Herein lay his tragedy.

A Trimmer in the Terror

Bertrand Barère: *A Reluctant Terrorist*

By Leo Gershoy.

Princeton University Press. London: *Oxford University Press.* 470 pages. 68s.

A SUB-TITLE suggesting an uncertain starter from Baroness d'Orczy's stable, or a nervous rogue in Georgette Heyer's, does less than justice to Bertrand Barère. He was not, in the melodramatic sense, a terrorist: he disliked heads on pikes and would have strongly disapproved of the pétroleurs of 1870 or the plastic-bomb patriots of 1962. He was, temperamentally, a "politique": he distrusted extremists of left or right and was prepared to remove them ruthlessly in the name of moderation. His actions were, therefore, sometimes unpredictable, and pronounced treacherous by those who suffered from them.

Born into the lesser nobility on his mother's and the privileged legal hierarchy on his father's side, Bertrand Barère de Vieuzac read law and practised in Toulouse, a traditional stronghold of resistance to the crown's recurrent attempts to override provincial Estates and Parlements. In fact, Barère enters history as a minor "frondeur"; his reputation as advocate and pamphleteer grew rapidly during the aristocratic revolt of 1788 and ensured his election to the

Estates General at Versailles in May, 1789.

His political progress was, in a sense, an epitome of the Revolution itself, but his personal story seems, at times, to illustrate the evolutionary law of survival by adaptability. A constitutional monarchist, like most "liberal" deputies in '89, he was in '93 the spokesman of the Convention that tried and condemned the king. Louis's flight to Varennes in June '91 had disillusioned Barère; but he still believed in limited monarchy as a bulwark against the mob-rule which he and his associates, Robespierre included, feared. But the royal family's collaboration with the invasion of '92 converted Barère to republicanism and eventually convinced him that the king's execution was essential to the safety of the nation. For this was a principle on which, at any rate before Brumaire, he never compromised. It explains the part he played in the proscription of the Girondins, the trial of Danton, and the overthrow of Robespierre: the factious incompetence of the Girondins, the corruption of Danton's patriotism, and the persecution-mania of "The Incorruptible" endangered the Government and unity of the Republic.

Barère always claimed to have risked his own survival for that of Revolutionary France. His enemies after Thermidor, many of them with records much bloodier than his, accused him of saving himself by sacrificing his friends; they consigned his constructive work to oblivion and, with the later assistance of the majority of nineteenth century French and English historians, have immortalised him as a cold-blooded careerist, who composed pseudo-legal excuses for the cruelties of the Revolutionary Tribunal. Indeed, his contribution to the superhuman achievements of the Committee of Public Safety in the critical year 1793-94 only recently received recognition in Robert Palmer's "Twelve who Ruled" (*Princeton University Press*).

Full justice to that contribution is done by Professor Leo Gershoy in this excellently produced and generously documented biography. It is not his fault that the last hundred pages are as much of an anticlimax to the reader as the four decades they record were to the unfortunate Barère, whose prolonged efforts (interrupted by dismal periods of exile) to re-establish himself in public service under Napoleon and the restored Bourbons were ignored or contemptuously rewarded with hack-work handed out as charity. Nor is it the biographer's fault that the personal qualities that attracted some lifelong friends, as well as the sacrificial devotion of three women, are not particularly noticeable. His personal records (apart from those industriously compiled by the police) are scanty. Barère's memoirs, published soon after his death in 1841, are an apologia rather than an autobiography. They were mercilessly reviewed by Macaulay, to whom it did not occur that Barère was, in Whig terminology, a "trimmer." That is what Professor Gershoy calls him. It is not necessarily an uncomplimentary political label; but it reads rather like a grim pun sneered in the shadow of the guillotine.

Face Lift

The Whig Supremacy, 1714-60

By Basil Williams. 2nd edition revised by C. H. Stuart.

Oxford University Press. 534 pages. 42s.

MR STUART'S revision of this standard work incorporates the revaluations of the twenty-three years since the first edition. Namierism makes predictable inroads; but the penetration has been slight. The big guns are still hammering away at the ruins of George III's England, and the hero of Dettingen is still almost unscathed. We now know that ministerial solidarity was less developed than Professor Williams thought, and that he exaggerated the personal indispensability of Newcastle and the use of the secret service funds in the manipulation of politics. Walpole is even less of a Peelite than he used to be, and the dropping of the veto appears to be more an indication of ministerial capacity to control members than a proof of the ability of Parliament to pass what legislation it liked—not something to surprise us in this age of Cabinet rule. Professor Williams too easily attached virtues to great men of action. Mr Stuart is more sceptical. Frederick II of Prussia and Charles Emmanuel of Sardinia come down a peg, and appear more as clever politicians than as great patriots.

But little is called in question beyond that narrow field of politics in which Namier, like his beloved Newcastle, found his natural home. The author's fifty pages on social history are virtually untouched—though the production of one iron foundry has fallen, and the sources for the prices of provisions have eluded the reviser at one point. It is a pity that the hand that revised the bibliography has not made good Williams's omission of the acutest book about what life was like for the great bulk of Englishmen in the eighteenth century—Dorothy George's "England in Transition."

Mr Stuart has sensibly limited himself to adding and correcting and eschewed rewriting. He could not have been more careful: the rate of fire of the Prussian infantry has dropped from five rounds a minute to not more than four, and the exact position of Commodore Martin's watch as he timed the expiry of his ultimatum to poor Don Carlos is now in doubt—indeed, far from laying it on the table or holding it in his hand, Martin may not, in fact, have done either. The "baseness" of Governor Drake in leaving the male inhabitants of Calcutta to the Black Hole is reduced to a charge of feebleness; his previous bravery is now taken into account. This "tiresome investigator" (as Churchill might call Mr Stuart) casts doubts on the authority for "wry-necked Dick" Boscawen's splendid rejoinder to his pilot at Quiberon.

Small matters perhaps: but these proofs of the searching qualities of Mr Stuart's eye increase one's faith in the reliability of the great mass of the work that remains untouched. It is old-fashioned history, pre the age of the Common Man, but it will go on doing sterling service until the eighteenth century finds its Halévy. A successful piece of Oxford restoration, in fact.

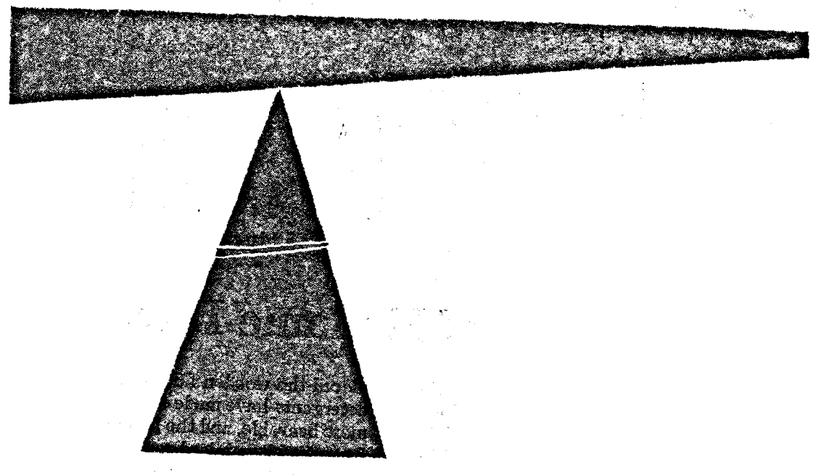
Pre-Colonial Africa

Black Mother. *Africa: The Years of Trial.* By Basil Davidson.

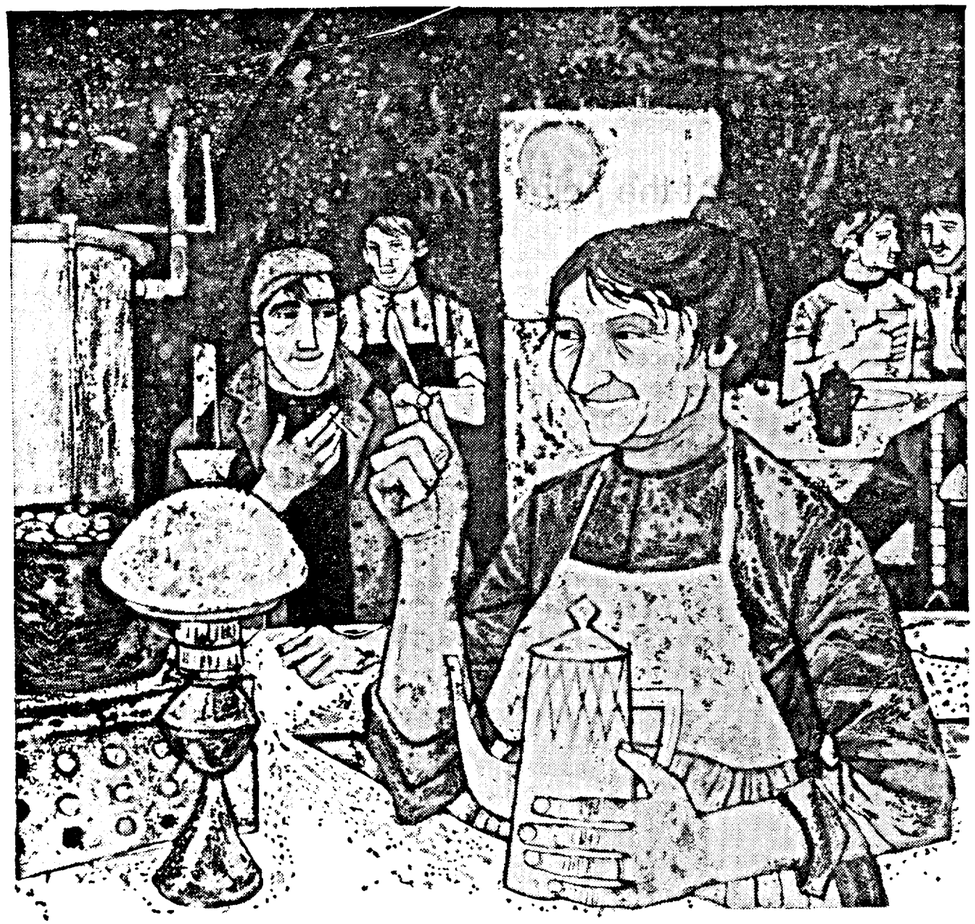
Gollancz. 269 pages. 25s.

IN attempting to explain the nature of the European-African connection in pre-colonial times, the author has selected three areas: the old Congo kingdoms, the city-states of Guinea Coast and some "strong societies" of the Guinea Coast. The selection is somewhat narrow since all these areas were fatally stricken by the abomination of mass slavery, and thus were a special case rather than a general rule. Mr Davidson devotes a substantial part of his book to this problem rather than to the African states themselves, though they are a subject of absorbing interest. However, we should be grateful for what we are given; it is informed and very readable. Books dealing with African history are all too rare in the current avalanche of indifferent and heavily-loaded Africanist literature.

It is nevertheless a pity that while trying to trace the outlines of Afro-European relations, the author omitted from his selection a very considerable area and a very long period—almost ten centuries—when these relations developed organically, if not always harmoniously, and were untainted by mutual hatred and contempt. The Mauretanian and Numidian kingdoms, the Meroitic civilisations of the Sudan, "Agisymba, where the rhinoceros foregather," the Pentapolis of Cyrenaica were centres of an Afro-European "koiné." Its extent and significance are barely scratched by modern historians and archaeologists, the late Stephane Gsell standing out in this field like a solitary beacon. Almost certainly North African civilisations between the third century BC and the seventh AD crossed the barrier to the Sahara. To take but one example, how else can the riddle of Fezzan be explained? It is possible, too, that the Severi Emperors of Rome were Africans of Libyan or Berber extraction and almost certain that they had a strong admixture of Negro blood in their veins.



Mr Davidson maintains that slavery has distorted the relations between the white and the black races, and he quotes a wealth of shocking evidence to support his contention. But the principal villains were not the slave traders and owners and their corrupted African partners. The vilification of "the Blacks" could flourish only on European ignorance of Africa: this was the result of the Moslem barrier, which separated Europe from Africa during the centuries when there was no technological disparity between the two. The history of Africa beyond the Sahara requires no impassioned pleading today: it is a fact.



At the point of balance

Weigh the opposing forces. Are they nicely balanced? Or weighted against you? Tip the scale in your favour by knowing the true weight of every fact and factor, the major technical developments, the economic moves. Read the Financial Times every day.

Study the science reports, the letters from other business men to the Editor.

Enjoy the personal side, too, the columns on Travel and Holidays, the Motoring Notes. **THE FINANCIAL TIMES** is much more than its name implies.

The easier life of Madame Duval

Always in summer the sun woke her and, when the nights were longer, it was the bell from the local church. Her first chore was to collect firewood for the stove and carry it from the bottom of the hill. Within half an hour her morning customers would wait in the café for her to bring them breakfast.

Her cooking was famous in a land famed for its cooking, and the quarry workers who used her café called her Mother Duval. But by the age of fifty the strain of her life was already too much for her.

Today, although she is ten years older, she runs her café as efficiently as ever, and finds she has time for leisure. The butane gas cooker has done away with the need for firewood; the plastic tiles which replaced the wooden floor are easy to clean. Today's detergents have made dish- and clothes-washing far more bearable, and the labourers tramp in less mud from the bituminised road outside.

Although she may never know it, Shell is responsible for a lot of these improvements. And the Shell facilities, not only for research but for carrying their products to the most out-of-the-way places, is making life easier for Madame Duvals all over the world.

YOU CAN BE SURE OF SHELL

Five Centuries of Malaya

A History of Malaya

By J. Kennedy.

Macmillan. 319 pages. 30s.

PROFESSOR KENNEDY has attempted with success the compression of five and a half centuries of Malayan history into one volume of 300 pages. The result is a clearly defined picture within the imposed limits, though in such an abridgement there must perforce be omissions of important matter and the inclusion of matters of lesser importance with some distortion and faulty emphasis.

The "pre-European" history of the Malay peninsula is shrouded in uncertainty, and contemporary sources like the "Sejarah Melayu," which claims to be history, have about the same relevance to the truth as do the Arthurian legends in this island. Malayan history inclines to long lists of princes with recurring Moslem names and high-sounding titles whose deeds—or misdeeds—stand out against the background of an empty treasury and an oppressed peasantry.

Mr Kennedy succeeds in bringing alive the history of fifteenth century Malacca and its "Empire" in the context of eastern and southern Asia. He emphasises the revolutionary impact of the Portuguese and the Dutch in the sixteenth and seventeenth centuries, and reminds us of the other formative pressure bearing upon the peninsula and its adjacent islands from the Javanese, the Achinese, the Bugis and the Siamese, and of the large shadow of Imperial China waxing and waning in the background. For the significant study here is really one of all south-east Asia—an area with a unity of its own between China and the Moghul Empire.

When the British stepped on to the stage at the end of the eighteenth century, the future course of Malayan history was decided for the next century and a half, and the quantity of historical material increased enormously. Then your short history has to become scientifically selective, and it is here that Professor Kennedy is open to the criticism that in dealing with social and economic developments in the past century and with the recent political and constitutional changes, he has allowed too many details to obtrude at the expense of emphasis upon the fundamental things.

The central fact of modern Malayan history is the immigration into the peninsula of great numbers of economically tough Chinese, posing the problem of how to preserve the economically softer indigenous peoples and to amalgamate the two elements into one Malayan nation. Raffles encouraged Chinese settlement in Singapore, whereas the British administrators in the Malay States a few years later looked upon themselves as trustees for the indigenous Malays against exploitation in an age of rapid economic expansion. One of the many means of protection was the creation of Malay Reservations, where interests of any kind in land could not be owned by non-Malays. Professor Kennedy mentions these reservations twice and implies that they were so extensive as to diminish seriously the amount of land available for development and for the settling of the Chinese in new villages as part of the recent anti-Communist Campaign. In fact these areas were not extensive enough to embarrass development and without them a rather feckless peasantry would have lost their lands to foreign moneylenders and speculators.

When speaking of the growth of population and the development of towns, public health and education, Professor Kennedy tends to substitute statistics for analysis. Thus, when discussing education he fails to point out that before independence the protecting power appeared to be interested in primary education for its Malay citizens only. The Chinese were always willing to pay for educating their children and they were allowed to do so—a false economy. So long as overt sedition was not taught in Chinese schools they were not interfered with, and the opportunity of educating the Chinese half of the population to become true Malayan citizens was never seized. This was most significant, because once the people of the Peninsula began to turn to politics the policy of trusteeship for the Malays—right though it may have been—was not enough.

But, despite a few misprints and some errors of detail—for instance, Perlis is ruled by a rajah, not a sultan—this book is valuable, for there is a scarcity of short and readable histories of Malaya.

OTHER BOOKS

THE LIFE OF SAMUEL JOHNSON, LL.D. By Sir John Hawkins. Edited and abridged by Bertram H. Davis. *Cape.* 371 pages. 42s.

This is a good abridgment of the much abused biography by the discursive Hawkins, on whom Mr Davis is an authority. (His "Johnson before Boswell," an assessment of Hawkins as a Johnsonian biographer, was reviewed in *The Economist* of September 24, 1960.) The editor has excised or abridged those parts of Hawkins's 300 pages of digressions which serve no real purpose as background, to the book's great benefit. It is now a handy, readable document, essential for all Johnsonians—if over-priced for the poor scholar.

ORDEAL BY HUNGER.—*The Story of the Donner Party.* By G. R. Stewart. *Eyre & Spottiswoode.* 414 pages 25s.

In our review of the new edition of this book, which appeared in our issue of March 31st, we did less than justice to the author, Mr George Stewart. It is he who has added to his original edition the contemporary accounts, appendices and notes. Professor Cunliffe has written the historical foreword to the English edition.

INDUSTRIAL MATERIALS IN CANADIAN-AMERICAN RELATIONS By Bernard Goodman. *Wayne State University Press, Detroit* (1961). 244 pages. $7.00.

This is a useful compendium of information about the changing requirements of the United States for industrial materials and of the role which Canada is playing—and is likely to play in future—in meeting these requirements. Modestly described as "grist for the theoreticians' mill," it is of considerable interest in itself as an admirably clear and comprehensive appraisal of significant trends in the demand and supply for each of the main forest and mineral products that enter American-Canadian trade. The author deplores the lack of adequate data on changes in costs and prices, but comparative cost considerations are inherent in his analysis. He also takes into account the impact of American protectionism, expressed in quotas and administrative controls as well as in tariffs, and gives due emphasis to the importance of policy decisions by international concerns and cartels. Economic, security and political factors favour Canada as a source of materials for America. The trading partnership is so close that it suggests the emergence of a "continental" economy, within which the needs of an industrial giant are met increasingly from the natural resources of its northern neighbour; a relationship that raises many questions about the proper national and international management of these resources and the role of "resource booms" in Canada's general economic development.

LABOR PROBLEMS AND PROCESSES. By L. Reed Tripp. *Harper,* New York. London: *Hamish Hamilton.* 528 pages. 48s.

An introduction (meant for American college students but also of use to the British reader) to the American labour scene, it ranges over the history and present organisation of trade unions, wage policy, collective bargaining, labour legislation and unemployment.

GRANTS, LOANS AND LOCAL CURRENCIES. By Robert E. Asher. *Brookings Institution,* Washington. London: *Faber.* 154 pages, 11s.

This skilled and timely monograph analyses the advantages and disadvantages of using grants or loans to speed international development and casts real light on the problem of the hoards of local currencies that have been built up in underdeveloped countries as a result of American gifts. Mr Asher does not believe that it is realistic to substitute loans for grants in all cases and argues strongly that the proliferating institutions that now provide aid to the underdeveloped countries must co-ordinate their efforts, in the interests of both lenders and borrowers.

NUCLEAR POWER TODAY AND TOMORROW. By Kenneth Jay. *Methuen.* 270 pages. 25s.

Kenneth Jay is probably the best living writer on atomic energy; his outstanding characteristics are the limpid simplicity with which he describes abstruse technicalities and the subsequent candour with which he explains what prevents some of the cleverest ideas from working as they ought. Although (and perhaps in spite of) he is one of the Atomic Energy Authority's official authors, it is not the dutiful pæan of praise that might have been expected. According to a foreword written by Sir Roger Makins, chairman of the AEA, Mr Jay has "been given latitude to express his own opinions," and the outcome is the best and most impartial survey at present available of the present state of the nuclear art.

THE WORLD ROLE OF UNIVERSITIES. By Edward W. Weidner. *McGraw-Hill.* 378 pages. $6.95.

The author, of Michigan State University, describes and assesses the exchange programmes of American universities, covering students and teaching staff. He also discusses the technical assistance programmes in the same context and provides an extensive bibliography.

LETTERS

Milk . . .

SIR—Your comments about the retail price of milk in Britain and in selected continental countries (April 14th) are neither fair nor accurate.

To talk about "the board's present monopoly price" is incorrect both in form and in substance. You can hardly be unaware of the fact that the retail price of milk is controlled by the Government and that this has been the case for the last twenty years.

There is no need for "heavy" but only for adequate adjustments before comparing retail prices of milk in difference countries, but the figures quoted by you fall short of this essential requirement.

For Austria, you quote a figure of 36.1d. per gallon, which is the shop price of milk of 3.2 per cent fat content sold loose. The current shop price of bottled milk of 3.6 per cent fat in ½ litre (about 1 pint) bottles is 43.6d. per gallon. There is no home delivery. In addition, there is a subsidy of 7.2d. per gallon on all milk sold ex farm "in order not to endanger the existing structure of wages and prices and thereby the stability of the whole economy." In terms of the United Kingdom, this would be equivalent to a subsidy of £72 million. For France (apparently you mean Paris) you quote a figure of 48.3d. per gallon which refers to milk of 3 per cent fat content, sold loose ex shops; the corresponding shop price for 3.7 per cent milk in ½ litre bottles is 63.3d. per gallon, or almost exactly the same as the United Kingdom price for milk delivered to the doorstep. For Italy (apparently you mean Rome), the "almost exactly comparable price" is not 56.3d. per gallon; there is no reason to equate milk of 3.5 per cent fat in 1 litre bottles from shops with milk of 3.7 per cent fat content in ½ litre bottles delivered; the comparable Italian shop price is 58.4d. per gallon, but in Rome provision is made for delivery to the doorstep for an extra charge which brings the cost up to 70.9d. per gallon, compared with 64d. in the United Kingdom.

In virtually all countries except the United Kingdom, the price of milk in bottles varies with the size of the container which constitutes an important service element, as evidenced by local complaints in this country whenever milk is not available in half pint containers which are usually entirely unobtainable abroad. In addition, bottle deposits are invariably charged abroad but not in this country.

Far from proving that liquid milk in this country is more expensive than abroad (which would not be unreasonable, considering how much cheaper butter and cheese are in the United Kingdom than almost anywhere on the Continent), your comparisons prove only the need for a comprehensive and objective study of the available evidence such as the Milk Marketing Board, in co-operation with the marketing organisations of most western European countries, is at the moment preparing.—Yours faithfully,

E. STRAUSS
Senior Marketing Officer,
Milk Marketing Board

Thames Ditton, Surrey

. . . and Potatoes

SIR—Some of the statements which you make, and the conclusions which you appear to draw, in your note on the potato shortage (April 14th) are liable to give a distorted picture of the Potato Marketing Board's responsibilities and I hope you will allow me to put the record straight.

The board bases its allocation of quota acreage on its assessment of likely plantings and yields and not primarily on an estimate of consumption which changes very little from year to year. It would be very easy to allow every producer to plant as many acres as he wished but unfortunately the farmer is not "guaranteed a price of about £13 a ton (at 9 tons an acre)" as you indicate. The Government guarantee is limited to the quantity of maincrop potatoes sold for human consumption, which is of the order of 3½ million tons a year. If farmers produce more than this, after allowing for seed and waste, the board has to take up the surplus and dispose of it as best it can and it is scarcely in anybody's interest that the surplus should be increased by the production from acres planted in excess of the quota; for the chief effect of such excess is to increase still further the costs which the board incurs (and therefore potato producers in general). The excess acreage contribution is intended to help in meeting this additional cost. There is no question of the Board "making money out of such contributions," as you suggest.

Most of the additional contribution for which the board is seeking authority is to enable it, in agreement with the government, to set up a market support fund which the board can draw to cover the cost of surplus buying. To the extent that the new system will allow the board to pay a higher price than it can at present for potatoes which do not otherwise find a market it will help to counteract the depressing effect on prices which a surplus can produce. This should be an encouragement to farmers and the extra contribution which is necessary to operate the system is unlikely to be a deterrent. In any case it can have had no effect, as you imply, on the acreage planted in the spring of last year since no announcement of the proposed amendments was made until well after the crop had been planted. The reduced acreage, from which the present shortage partly results, was due to the exceptionally bad weather at planting time and the depressed prices received in two successive years of heavy surplus.—Yours faithfully,

A. J. D. C. LOCH
General Manager,
Potato Marketing Board

London, SW1

[We have had our whack at both these marketing boards in recent weeks, and willingly give them space for their reply. But this does not mean that our view of the "comprehensivity and objectivity" of the figures in the first letter (though there are some valid points in this one), still less of the remarkable mode of economic reasoning in the second letter (which requires some re-reading), coincides with those of Mr Strauss or Mr Loch.]

Algerian Quicksand

SIR—I wish Mr Gillie, in his letter published by you on April 14th, were right about the crucifixion-amputation atrocity. But in *A Scattering of Dust* Mr Greer reports instances of it in both Oranie and the Constantinois, and on page 83 he tells how he discovered the bodies of two Moslem youths he had known who had been treated in this way. The purpose of this atrocity was, I am told, to add religious to physical dread in the minds of wavering Moslems, since the Koran prescribed this treatment for "enemies of Allah and those who corrupt the earth" (Sura v, 33).

I cannot agree with Mr Gillie that most Frenchmen were unaware of what was happening. Letters (often amazingly indiscreet) from the troops, and conversation with returned conscripts and vacationing *pieds noirs* (one met them, eager to impart their "inside information," in every spa and resort), played an important part in informing the public. Even conformist papers reported that General Massu had tested certain methods of torture on himself. Had "most Frenchmen" been unaware of—or unconvinced by—reports of torture, M. Malraux would not have deemed it necessary to declare at his fatuous press conference in June, 1958, that torture had ceased to be employed in Algeria since General de Gaulle's visit a few weeks earlier.

In my experience, in 1957-58, typical reactions to torture reports were (*i*) "That is the only language Arabs understand"; and (*ii*) "After all, other nations commit atrocities, don't they? Remember what the British did in Kenya, the Americans in Korea, the Russians in Hungary. . . ." Admittedly, I was in contact chiefly with conservatives and right-wingers, but they, rather than liberals, were the typical Frenchmen of those years.—Yours faithfully,

YOUR REVIEWER

Thwarted Exports

SIR—*Twice* I have tried to order a suit of clothes from a London tailor, but have received no reply to my letter from a large English firm from whom I purchased in 1955 on a tour of England. Perhaps there is some export policy I do not know.—Yours faithfully,

FREDERIC B. BAXTER

West Bend, Wisconsin, USA

THE WORLD OVERSEAS

Caliph of Baghdad

FROM OUR SPECIAL CORRESPONDENT

As the Arabian night falls over the clay-coloured sprawl that is modern Baghdad, what might be the court of the Caliph Harun al-Rashid explodes into a glittering carnival of coloured light. This is the ministry of defence where the prime minister, General Qasim, lives, works and occasionally sleeps; and the place of honour, as always, is held by the smiling face of the Faithful Leader, outsize and illuminated. During the day the voice, too, is familiar as excerpts from past speeches are broadcast in bursts like a machine-gun firing blanks. Few decisions—even on such matters as how wide a road should be—are made without his consent. But as a form of public relations this campaign has gone crazily off the rails. Since General Qasim, as Sole Leader, has pledged himself solely responsible, the failures, inefficiencies and misdemeanours of government bounce like rocks on his head; the shrewdness and ability that are his have become twisted into a circle of self-exalting and self-preserving manœuvres.

It is difficult to distinguish true achievements in the turgid currents of swank, disillusion and political back-biting. The revolution of July, 1958, has long ago shed its zeal, but has perhaps kept its goal of greater social justice more steadily in sight than its Egyptian counterpart did. It is salutary to remember amid all the present dismay with General Qasim that the Egyptian revolution, four years after its birth, might, if it had not been for external pressures, have seemed just as meandering. The impediments that slow down Iraqi progress are the general's own unpredictability, the absence of a driving creative force and, perhaps above all, a general feeling of impermanence. At this stage of the revolution many Iraqis who want to end up on the winning side behave as if it were safer to criticise than to create.

General Qasim's success in dividing his opponents, one against the other, has deeply eroded the efficiency of the government machine that should implement the revolutionary programme. Civil servants are kicked up or down stairs on political grounds, and ministries, many of them pockets of one or other underground faction, glare unco-operatively at each other. The five-year economic plan, 1961-65, is a hotch-potch of pre-revolutionary projects with new ideas thrown in, some of them apparently at random, by the various ministries. The ministry of economic planning has an exaggerated title; there is little planning, co-ordination or fervour. Without any legislative body or any central authority but the prime minister himself, complaints and suggestions trail away in the air; public servants are working at too far a remove from any source of power. There is little encouragement, in the way of salaries or spirit, for good men to enter the public service.

Yet, through a bog of dissatisfaction, economic development is struggling ahead at roughly the rate of its pre-revolutionary peak in 1957, with the emphasis now bent towards construction and industry. Construction is not basically of the Mussolini post-office type, but has not altogether escaped the disease; the prime nonsense, and pride of the regime's heart, is the new "army canal" a mile or two from Baghdad. This, which cost, with the roads on either side, £10 million, is designed eventually to irrigate the gardens of the people who may one day be drawn to settle on its banks. The idea of expanding Baghdad eastward as well as north and south is sound enough; but building the canal now reflects a queer order of priorities. Two huge monuments honour the revolution, the more handsome paying specific homage to the "unknown soldier"—which provoked some curiosity since, as far as is known, no soldier lost his life in the revolution. The slums of Baghdad are being demolished for wider and better streets and for small, attractive parks; the slums that still remain are gradually having water and electricity brought to them. There are several low-cost housing projects, but perhaps more is being done to encourage middle-class house ownership—and to build houses for army families. Demolition in the slummier quarters is way ahead of reconstruction; General Qasim hands out gifts to the poor with the pomp and publicity of Lady Bountiful with her soup.

The revolution can chalk up two major achievements: the number of children getting education has shot up (with some schools running four shifts a day) and land reform has at least been started. So far about 2½ million dunams (something over half a million acres) of land have been distributed out of the 14 million dunams of government and expropriated land that is presently available. Nothing about land reform goes smoothly. The regime has inherited the immense technical problems of the previous government; since drainage has not kept pace with irrigation, both new and old lands have run hopelessly to waste through the excessive salination caused by flooding. In addition, Iraq's state system of irrigation brought water only to the estates, not to the individual farms. This has made the fair distribution of water to the new smallholdings almost impossible and, with the ministries quarrelling, the attempts to implant co-operatives have had little success.

Except for the major irrigation projects, development spending outside Baghdad comes down with a bump. About half the development and ordinary budgets are being spent in Baghdad—which holds a seventh of the Iraqi population. Communications with Basra are being improved, but Mosul, that unhappy town in the north, is left to its own destructive devices. The aftermath of the bloody fighting at Mosul in 1959 is a long sequence of private revenge and reprisal. Nowhere is the bitterness between General Qasim's divided opponents, communist and nationalist, stronger than there.

THIS cleavage is the key to General Qasim's survival. With discontent as general as it is, and with the army baffled, and perhaps made mutinous, by its failure to end or even contain the Kurdish revolt, the organisation of a counter-revolution is not thought too serious a problem. What comes next is the rub. No one faction feels sure enough of its ability to stay in control. The March coup in Syria is pointed to as an example of what happens when a group acts first and thinks afterwards; in Iraq it would be lives that were lost in the process and not, as in Syria, face and dignity.

All major political parties are banned in Iraq; the underground activity is constant, intense and involved. There are three main factions, probably roughly equal in strength: communists, nationalists and a middle group, less concerned than the others with secret plotting, of independents, some Istiqlal members and the remnants of the National Democratic party. The communists, as in other countries, are the best organised and the most homo-

geneous; the nationalists the largest numerically, the most active and much less unified than the communists. Because they stand strongest against communism, the nationalists are called right-wing; because they have a record of violence, at Mosul and for their attempt on General Qasim's life, they are also called "national socialist" in the European sense. But the strongest current among the nationalists is the Ba'ath party, with its wavering, and sometimes converging, principles of socialism and Arab unity; the other, less cohesive, factions tend to stress unity rather than socialism. Leaning far back from reality, groups of nationalists toss around polemics about the terms on which they would, or would not, consider some form of unity with the United Arab Republic. On questions much more immediate, such as the conditions under which they might negotiate with the Kurdish revolutionaries, they tend to be silent and undecided.

On General Qasim's tactical see-saw, the communists are now perceptibly rising as the nationalists slip down. Several Ba'athist leaders have recently been imprisoned for greeting the Algerian leaders with a display of party slogans. General Qasim, forced to walk under the Ba'athist banners, was badly put out; but prison sentences, as indeed most Iraqi security measures, are taken fairly lightly, and few prisoners stay long inside. The Ba'athists have been encouraged by events in Syria and by the new slogan of Nasserism without Nasser. They, more than other parties, have adherents in key points in the armed services and they, again more than others, tend to let action overtake thought. However unenthusiastic the communists are about General Qasim's way of running things, his foreign and Arab policy pleases them well enough. It seems unlikely that they themselves would precipitate a change; as they watch the Ba'athists, their thoughts may be rather on the regime after next. But this may be some way off. General Qasim's leadership of Iraq is autocratic, erratic and far from popular, but he is, at least, the Caliph that's known.

Mr Butler's Rhodesia

FROM A CORRESPONDENT IN SALISBURY

On the eve of what will certainly be the last general election to be fought within the present constitutional framework, under a franchise so loaded against the blacks that only a minority of whites will defend it, the Federation of Rhodesia and Nyasaland is stricken with a strange political apathy. After the strident invective of recent months the electorate is emotionally fatigued and even Sir Roy Welensky's own supporters are no longer prepared to follow him uncritically in his bitter denunciations of the British Government. The result of the election will settle nothing and satisfy no one—except possibly the man who called it. With 41 United Federal party candidates already returned unopposed, Sir Roy is virtually assured of at least fifty seats in the new assembly.

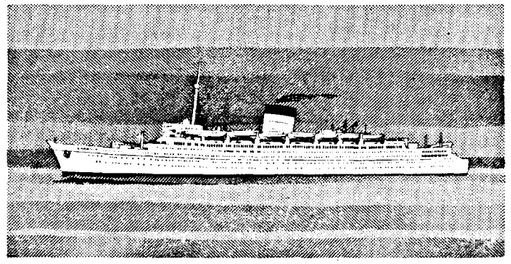
He himself has campaigned with greater vigour than any of his cabinet colleagues; his personal popularity among Europeans is unimpaired, and he still draws large audiences to hear him identify all African nationalism with the ambitions of extremist leaders. He even bearded the lion in his den when he addressed a meeting in Nyasaland recently, but Dr Banda never stirred; he slumbered on, dreaming, perhaps, of juicier fare to come. On the whole, the UFP campaign and Sir Roy's own appearances have had a defensive air which has been particularly apparent in his hostile response to well-directed questions. In private the prime minister is a genial and friendly man: on the platform at Blantyre his evasions and truculence made a different impression.

The conflicting reasons given for holding the election at all have only served to increase the general apathy. Most people felt that Sir Roy already had a mandate to negotiate with Britain about the future of the federation, and parliament still had nearly two years to run. Matters were not improved when he told a startled audience in Southern Rhodesia that if he had known earlier of the creation of the Central Africa office in Mr Butler's charge he would not have gone to the country. The next day Mr Julian Greenfield, the minister of law, who cannot have read his newspaper that morning, announced in Salisbury that in any case an election would have been held in July.

Neither statement was convincing. In the face of an effective boycott by all the opposition parties and, of course, the African nationalists, the election's only interest lay in Northern Rhodesia, where the newly formed Rhodesia Republican party under a Lusaka lawyer, Mr Colin Cunningham, has contested nine seats. This disparate group of right-wing extremists has found no support except on the lunatic fringe. The fact that the candidate whom they put up to oppose Sir Roy at his constituency at Broken Hill interrupted his campaign to take three weeks' leave gives the measure of their political weight. The UFP is in no danger except from the confusion within its own ranks, which is considerable. If the party had a coherent policy for saving the federation it did not emerge during the present campaign.

Mr Butler's impending arrival in the federation will therefore have a greater significance than any previous visit by a British minister. He will stay a fortnight and travel to all three territories. It will be essentially a federal visit and presumably he will have in mind the consequences that would follow far-reaching changes in the federal structure. It is now widely accepted among the Europeans that these must come; recent months have brought a growing realisation that any future association must be inspired from below—from the territories themselves—and not imposed from above. The advantages of preserving the economic ties are practical and manifest, but in the current heady atmosphere of African nationalism they will require a most skilful advocacy. For the first time the problem is being openly discussed in the press, with a welcome absence of passion. Under the terms of the federal constitution the constitutional review conference must be held not later than October of this year, but the two Rhodesias are unlikely to have their territorial elections before then, so there will probably be a further period of waiting.

In the past month the two Rhodesias have come under close and hostile scrutiny at the United Nations. Mr Joshua Nkomo, the president of the Zimbabwe African People's Union, returned to Salisbury greatly heartened by the support and publicity he received in New York. The party is in an ebullient mood and little disposed to toy with Sir Edgar Whitehead's policy of partnership or to participate in the October elections. This may turn out to be a tactical mistake, at least in the short run. Although 17,000 Africans assembled to greet Mr Nkomo at Harare township the day after he returned, Zapu still cannot claim a mass following in Southern Rhodesia and their propaganda success at the United Nations may be short-lived; it will certainly not deter Sir Edgar Whitehead from pursuing his chosen part of partnership in defiance of all vocal African opinion. But partnership presupposes a desire for partnership.



Mr Kaunda: time for tears?

In Northern Rhodesia the situation is simpler but hardly brighter. Mr Kenneth Kaunda has also made his impact at the UN, but

CRUISE IN 'CARONIA' 1962-63

These two unforgettable cruises take you to many of the loveliest and most romantic places in the world. You sail in air-conditioned luxury in 34,000 ton *Caronia*, largest liner built exclusively for cruising. Before either cruise you can, if you wish, see something of America and Canada.

MEDITERRANEAN AND BLACK SEA CRUISE

NEW YORK, MADEIRA, CASABLANCA, TANGIER, ATHENS, DARDANELLES, YALTA, ODESSA, CONSTANTA, VARNA, ISTANBUL, BEIRUT, HAIFA, DUBROVNIK, VENICE, CATANIA, MESSINA, NAPLES, VILLEFRANCHE, BARCELONA, GIBRALTAR, LISBON, CHERBOURG, SOUTHAMPTON, PORT SAID

52 DAYS : 24 PORTS
11,974 MILES
Rates from £393

Including first class North Atlantic passage to New York by any Cunard liner. Sailing from New York October 5th 1962.

WORLD CRUISE

NEW YORK, NASSAU, CRISTOBAL, BALBOA, ACAPULCO, LOS ANGELES, HONOLULU, YOKOHAMA, KOBE, HONG KONG, MANILA, JESSELTON, BALI, SINGAPORE, BANGKOK, COLOMBO, BOMBAY, ADEN, SUEZ, PORT SAID, ALEXANDRIA, HAIFA, NAPLES, LISBON, NEW YORK

A luxury voyage of 92 DAYS : 23 PORTS
29,007 MILES
Rates from £1,018

Including first class passage to New York via the West Indies in the *Caronia*, or direct by any Cunard sailing AND first class rail travel from Naples or Lisbon to your starting point in Europe.

Sailing from New York January 25th, 1963

The famous 'Mauretania' will also be cruising to the West Indies and the Mediterranean next winter.

CUNARD

Consult your local agent or CUNARD LINE, Cunard Building, Liverpool, 3 (Liverpool CENtral 9201): 15, Lower Regent St., London, S.W.1 (WHItehall 7890): 88, Leadenhall St., London, E.C.3 (AVEnue 3010).

THAMES BOARD HAVE THE MEN TO HELP YOU

Thames Board don't just make boxes. They make "FIBERITE" cases, tailor-made to your special needs. That's why they have a large team of technicians and designers, whose job is making sure that every customer's product—be it detergents, day-old chicks, or petrol pumps—always reaches its destination safe and sound. And when they have designed the right "Fiberite" case they don't just sit back and relax—they test it over and over again. (At Thames Board there are testing devices that can do things to a "Fiberite" case that even its worst enemy wouldn't.) Here is just one example of the many different problems dealt with by Thames Board.

A Quatermassian cloud

Mr. P. sells liquid detergents in bulk. And containers for transport were his problem. Traditional containers were safe—but not exactly cheap. Other, more economical forms? At the very thought, less courageous spirits might have had nightmares of gallons of liquid detergent breaking loose on a rainy day amid a Quatermassian cloud of foam.
But not Mr. P. He went to the Thames Board experts. Together they developed a way of packing the detergents in polythene cubes inside "Fiberite" cases. The cases (perforated for easy pouring) are made of "Aquapruf" board developed during the war for dumping supplies on invasion beaches. These "Fiberite" cases are so liquid-proof that they have even survived being tethered in the River Thames for several weeks.

FIBERITE PACKING CASES

ARE MADE ONLY BY

TBF 43-6269-65

back home he will find that endemic tribal rivalries are now further bedevilled by the mounting hostility between the two African groups—his own United National Independence party and Mr Nkumbula's African National Congress. No doubt blame should be apportioned on both sides, but it is high time that Mr Kaunda shed a few tears for the murderous activities of the unrestrained young thugs who make up too large a proportion of Unip membership. Mr Butler, after he has been and seen and listened, will need all his wisdom to find a solution. It is a sad thought that for the Federation of Rhodesia and Nyasaland even the judgment of Solomon would not satisfy the litigants.

Germany's Lunatic Right

FROM OUR BONN CORRESPONDENT

JUDGMENTS like that of Mr A. J. P. Taylor's, that "nothing is normal in German history except violent oscillations," come hauntingly to mind as one opens the report of the federal minister of the interior on extreme right-wing and anti-semitic tendencies in west Germany in 1961. Should Mr Taylor be right, in which direction, and with what force, is the pendulum swinging now? The minister of the interior admits the need—born of "terrible experience"—"not to let right-wing radicalism in the federal republic out of sight a single day. For even though the unteachable old National Socialists are gradually dying out there are always some young visionaries or fanatics ready to take their place." Yet he is clearly satisfied that, at least in 1961, the wild men of the Right were few and far between, at loggerheads among themselves, short of money and largely unheeded by the electorate during a year remarkable for such disputatious events as the Eichmann trial, the erection of the Berlin wall and a general election.

The minister's report is based mainly upon evidence provided by the Office for the Defence of the Constitution, whose headquarters are at Cologne and whose agents in the year under review, as in previous years, found most to watch in Berlin, Lower Saxony and North Rhine-Westphalia. It estimates that over the last two years the right-wing organisations and publishers—some 90 in all—have lost roughly a third of their supporters.

On December 31, 1961, membership of the extreme right-wing parties had fallen to 12,300 from the 17,200 counted in 1959, and that of similarly minded youth organisations from 2,300 to 2,100. (Some 4.5 million young west Germans, the report points out, in comparison, were enrolled in democratic associations.) Convictions of "nationalists" for actively disturbing the peace fell from more than 200 in 1960 to 79 in 1961. Of the perpetrators, 44.8 per cent were over 35 years old, 42.5 per cent between 35 and 21, and 12.7 per cent between 20 and 16. That there were a considerable number of "ultras" (as the east German communists like to dub them), who had not yet shown their colours, is suggested by the estimate that the 46 newspapers and periodicals run by the extreme Right increased their combined circulation from 130,000 in 1959 to 160,000 in 1961. But the minister dismisses them as negligible in relation to the publications of the democratic press, which, omitting the popular illustrated weeklies, together have a distribution of some 29 million.

So much for the official figures. They bear out probably most resident foreigners' individual assessment—partly reasoned, partly sensed—of the continuing influence of ideas that erupted into the excesses of the Nazi era. But they will certainly not be accepted by the east German regime. From his watchtower in Berlin the pace-setter of east German propaganda, Herr Albert Norden, takes a special pride and pleasure in exposing the "Fascists" running the Federal Republic—his latest particular interest being in the re-emergence of journalists whose conformist writings of the nineteen-thirties can be reproduced in blush-making facsimile for all to read again. Herr Norden and his own conformist writers of the nineteen-sixties would not give the benefit of the doubt to any dubiously converted former Nazi now taking part in the public life of west Germany. They see there a steadily developing neo-Nazi or Fascist conspiracy to begin again in due course where Hitler was compelled to leave off. The picture they draw of west Germany is too distorted to be convincing. Yet the danger of a return to "German normality" in Mr Taylor's melancholy sense of the term—the possibility of another violent national oscillation—is not ruled out in the report of the Bonn minister of the interior. "An increase of internal political tension and a deterioration in economic conditions," it is remarked, "could lead to political radicalisation. We have learnt from terrible experience that on such a seedbed forces grow that could devour the legal state."

MISCELLANEOUS as they are, the right-wing radical groups that proselytise, overtly but raggedly, in west Germany today have much in common. Resentful misfits and congenital malcontents make up their membership. These imagine some vague kind of personal fulfilment in a "restored German Reich," where they would belong to an "élite" and be absolved from the worry of having to think and fend for themselves in a complex world. For many, "loyalty to the Reich" is a substitute for supernatural religion. It would be a neutral Reich, in which neither capitalism nor communism would prevail but "our own brand of German socialism." Much is left deliberately obscure, including the position of minorities and the whereabouts of the Reich frontiers. It is, in the lump, the perilous stuff out of which mass hysteria, dictatorship, persecution and war could be raised.

Although Herr Erhard has lately been sounding the alarm, there are no convincing reasons for supposing that the health of the west German economy is going to deteriorate dangerously in the foreseeable future. Existing resources, plans for making the most of them on the market and elsewhere, and shrewd manipulation of west Germany's "social market economy," seem safely to preclude a catastrophe with dire political consequences. But other constituents of the seedbed of discontent feared by the minister of the interior are at hand. On too many occasions, for example, the Bonn government has put itself into the position of seeming to tolerate corruption in the civil services. And the continuing division of Germany, which has been accompanied by spectacular somersaults in allied policy, tends to swell the number of those who resent the government's deep commitment to the west. A good deal of cynicism has been engendered by German rearmament, and not a little bewilderment by the readiness of some

EIU Quarterly Economic Reviews

covering 57 countries or groups of countries

Out this week:

UNITED KINGDOM

The Review sets out to consider how far Government policy is apposite to the range of problems facing the economy: Mr. Lloyd's budget is put under the microscope to discern its relevance. Having set the stage, the Review offers forecasts of the likely course of production and consumption in 1962, and the outlook for exports and sterling.

western politicians and publicists to lecture the Federal Republic for undemocratic practices, while seeming to turn a strangely blind eye on the shortcomings of the authoritarian east German Democratic Republic.

Since danger threatens the west German state—as it does all more or less democratic states—both from the extreme Right and the extreme Left, torpor and complacency in the middle are the real enemy. A child's prayer for the night published recently in *Simplicissimus* nicely caricatures current cosy preoccupations in the midst of political perils:

Dear Lord,
Please, please turn me
Into a television set.
For I want my parents
To rejoice likewise in me.

An Alternative to Dief?

FROM OUR OTTAWA CORRESPONDENT

AFTER months of turning up the heat under Canada's political pressure cooker until the pressure was almost explosive, on April 17th Mr John Diefenbaker put the cooker under the cold tap and removed the lid. He announced that the general election would be held as expected on June 18th. Parliament will adjourn as soon as it has finished some essential business, and it will be dissolved *in absentia* whenever Mr Diefenbaker can make another trek to the Governor-General, Mr George Vanier in Quebec city.

The announcement followed a long succession of what T. E. Eliot once described in a higher connection as "only hints and guesses, hints followed by guesses." Mr Diefenbaker had drawn out the suspense to the bitter end, teasing his own party members as much as the opposition. When at last he accepted the final curtain he recalled another Eliot quotation: "This is the way the world ends, not with a bang but a whimper." He claimed that his intention to call an election in September had been overborne by parliamentary obstruction from the opposition. It was like a strip-tease girl saying she would never have removed more than her stockings if only the audience had not whistled so much.

The opposition has been whistling wildly for weeks past and the orderly conduct of parliamentary business has been impossible. But if any striptease artist ever invited wolf-calls, Mr Diefenbaker incited the opposition to be obstructive and encouraged his own followers to join in the same disorderly game. In the past the Canadian parliament reached its nadir in the mismanaged pipeline debate of 1956 when a bungled attempt at closure, attempted by Mr St Laurent, Mr C. D. Howe and the Liberals' leader in the Commons, Mr Walter Harris, provoked the opposition to every form of obstruction known to the order book. Mr Diefenbaker never tires of throwing this unhappy incident in the teeth of Mr Pearson and the new generation of Liberals. Indeed, his many recent electioneering speeches suggest that he is prepared to campaign for a third time, as he did in 1957 and 1958, on the arrogant disregard for the rights of parliament by a past generation of Liberals. How this is to be reconciled with the charge of Liberal obstruction in the late parliament is a problem that may worry the logical and the sophisticated, but Mr Diefenbaker obviously has no fear that it will worry the electorate at large.

To judge from current comments heard from the public, and reflected in many editorial columns, parliament has sunk even lower in popular esteem than it did in 1956. The great difference is that, while it was a Liberal government that was generally held responsible for the 1956 débâcle, Mr Diefenbaker obviously thinks he can pin the present blame on the opposition. No close observer of the Ottawa scene, not even intelligent conservative back-benchers, accept this judgment. But many of them, especially among the Conservative members, think that Mr Diefenbaker has manoeuvred his opponents into a position where he can put the blame on them. The public opinion polls over the last six months have shown Mr Pearson and the Liberals to be ahead of Mr Diefenbaker and the conservatives by four or five per cent. The most recent trend gives no increase to the Conservatives, nor to the New Democratic Party (NDP) led by Mr T. C. Douglas, the bright and entertaining former premier of Saskatchewan. But it does show a slide from the Liberal column into the "undecided" column.

The polls reflect the public bewilderment which will make this the most unpredictable election in Canada since the war, and which fills Mr Diefenbaker with assurance. Through all his ups and downs in the last year, through all the Coyne row last summer and the Fleming fiasco at Christmas, through every shift of the Gallup polls, Mr Diefenbaker has remained supremely confident—some of his enemies have said "psychotically confident"—that as soon as he got back to the hustings he could recapture the vote. In the art of wooing the voters, as all the Liberals recognise, Mr Pearson is no match for the ageing Gypsy Rose Lee. He shows no sign of trying to meet Mr Diefenbaker on this ground, and if he does try he will throw away the election. In the House of Commons Mr Pearson has learnt a vigorous debating technique, coupled with a shrewd ability to keep silent, which has flummoxed Mr Diefenbaker's virtuosity through the last two sessions and has consistently outwitted more ham-handed ministers like Mr Fleming. In contrast to the innocent victim which Mr Pearson was when he first succeeded Mr St Laurent just before the 1958 election, his recent parliamentary performance has been a revelation of how much an intelligent man can still learn in his sixties. Every parliamentary observer marvels at the change. But it has not got across to the electorate at large.

FOR the last two years at least, the evangelical fervour which Mr Diefenbaker evoked in the 1958 electors has been at a discount, as the Gallup polls show. Disillusionment was the general public reaction and disillusionment, far more than any growth of the Liberals' public appeal, has tipped the polls to the Liberal side. Mr Pearson has obviously been aware of this in the two basic policies he has followed. One was to recreate a liberal image of the Liberal party. The other was to present a responsible opposition. He had to try to give disillusioned voters an acceptable and sensible alternative to Mr Diefenbaker.

No other course would really have been possible, given the contrasting characters of Mr Diefenbaker and Mr Pearson and the "delayed resentment" (as Mr Douglas calls it) against the former Liberal regime to which Mr Pearson is the reluctant heir. But the result is to leave Mr Pearson and the Liberals as relatively colourless challengers to Mr Diefenbaker's spell-binding oratory. Mr Douglas, the NDP leader, who is a very colourful character in his own right, is beginning to look like the Duke of Plaza Toro: "celebrated, cultivated and underrated." It is not that he leads his troops from behind but that his troops are showing a tendency to disappear into the wild blue yonder somewhere in his rear.

More and more therefore the election campaign shapes up as a test of the enduring quality of Mr Diefenbaker's highly individual appeal. Without question or argument it has palled in the last four years upon those who have been over-exposed, including the loyal legions who have sat behind him. But the loyal legions and many other less partisan observers believe that millions of voters who have not been similarly immunised may still be susceptible to the appeal which was so successful both five and four years ago. If it does work in the same way, it is difficult to see any possible opposition tactics to beat it. The question is whether it will work again or whether disillusionment is now too deep.

Mr and Mrs White live comfortably in their own house in Palmers Green, London. He is a toolmaker; she works part-time in a solicitor's office.

We heard about the Whites from our City Editor, Derek Dale. As Mirror readers, they had written to him for advice. For Mr and Mrs White are investors . . . they are buying banks and breweries.

Last year Derek Dale advised on the investment of a million pounds by Mirror readers!

Where do they get the money? Dale explains: "Inland Revenue figures show a phenomenal growth in the number of people earning from £15 to £20 a week. For the first time, these skilled workers have money to spare".

SEVEN MILLION of the Mirror's 15 million readers are prosperous skilled workers like Mr and Mrs White. Sell to them in the paper that offers the largest readership at the lowest cost.

Verdi's Purgatorial Term

FROM A CORRESPONDENT IN ROME

THERE is something about copyright that resembles purgatory; an artist is kept there after death for his own good, though how long he should stay there to obtain the best effect is constantly debated. Conflicting interests and outlooks press to have him out, or else more securely in; and the method of estimating the proper length of time is apt to be as devious as trying to fix the effective length of an indulgence—unless of course the artist is Portuguese, when his time under protection, by Portuguese law, is simple perpetuity.

For all its intricacies, the question of the duration of copyright has been the subject of public controversy in Italy for some months now. The arguments will all be loudly raised again in May, when the committee of experts of the Berne Union—the international agreement on copyright—meet in Rome to continue studying suggestions put forward by the Italian government's delegates for a longer period than the 50 years of protection laid down as the minimum by the Berne convention. The supporters of prolongation claim to be defending the artist—or his works—from the growing commercial interests, such as recording companies, publishers of cheap editions, and the cinema, that are thought likely to pounce on his work and misuse it as soon as it becomes public property. The exponents, in Italy at least, of stopping at 50 years claim to be trying to protect the artist against exploitation by commercial interests in the name of copyright itself. Both sides assert that their conflicting positions are in line with international opinion.

At the moment the principles of copyright are being publicly debated in Italy because they are immediately relevant to the works of Verdi. The fiftieth anniversary of the composer's death fell in 1951, and since then his operas have been constantly on the verge of emerging from copyright, only to be kept inside by a series of prolongations approved by parliament. The exclusive rights for Italy are held by the Milan publishing house of Ricordi, which also holds most of the Verdi manuscripts. The condition of the scores, as published by Ricordi, has caused growing concern because of the number of changes introduced from edition to edition with no indication whether they can be taken as following the master's wishes, or indeed that changes have been introduced at all.

The last request for prolongation came before the Italian parliament at the end of this year. It was apparent from the discussion there and in the press that Verdi had become a touchstone of the issues involved in copyright.

Probably the strength and informed nature of the attack on further prolongation surprised official opinion; they may even have given Ricordi some anxious moments. But the deterrent effect does not, so far, seem great; the pull towards a longer period of copyright seems still to be strong. It is expected that the Italian representatives at next month's meeting here will propose an extension of copyright to 65 years instead of 50. This will take the form of a protocol to the Berne convention, to be underwritten by those countries favouring extension. (At the moment apart from Italy, they are Brazil, Lebanon, Spain and the Holy See.) According to the report of the Berne Union's permanent committee, after a meeting last autumn in Madrid, 22 countries declared themselves opposed to extension, seven did not reject the possibility, and five were in favour. It is difficult to see how this can be interpreted in any other way than that international opinion is predominantly for stopping at fifty years.

Ideally the Ricordi monopoly over Verdi in Italy, and the question whether copyright in general should be extended, ought to be separate matters. For two reasons they are not. First, prolongation being so obviously in the commercial interests of Ricordi, there is not much doubt felt that so influential a business house, with ramifications running deep into the musical life of Italy, would be using its influence to the hilt for prolongation. (The only other well-known works directly affected by prolongation at the moment are those of Carducci, who died about the same time.) The second is that the state of the published scores has been fully revealed to the Italian public and to international opinion by the researches of the Australian conductor, Mr Denis Vaughan, who has been able to show effectively how far the incrustation of changes has gone. He has demonstrated, for instance, that for every page of the score of "Falstaff" there are 66 changes from the composer's known intentions, with no editorial explanation of how they came about.

The malpractices of a monopoly were a natural theme for the left wing in the parliamentary discussions. In a striking attack from the Socialist side, they were alleged to go a good deal wider than inaccurate scores. But the opposition to further prolongation was not limited to the Left. Senator Russo, for the Christian Democrats, joined in the attack, which led to the government's proposal (a five years' extension) being reduced to one year. Senator Russo demolished the opinions procured officially from certain leading musicians with the frank statement that musicians could not give calm and dispassionate opinions on the matter, "being tied to questions of interest with certain stated firms." The government agreed to make this extension the last on the understanding that in the meantime the copyright situation would be reviewed. A possible complication, introduced by the fact that a part of the Verdi royalties go, according to the composer's wishes, to a home for old musicians, is to be settled by new legislation.

The combination of official encouragement for a longer period of copyright and the cautionary case of the Verdi scores served to illustrate a crucial point—that copyright must also afford protection for the artist's work against the copyright-holders. Unless this is established, discussion of a longer or shorter duration can have little meaning, looking either like pure theory or a protection of interests rather than of works of art. In Italy, however, the government's powers to protect works of art against modification are stronger than the Berne convention requires. A reasonable corollary to an Italian proposal in May to extend the period of copyright would be a proposal for strengthening international practice against modifications, bringing it up to the level of the Italian legislation. This would naturally have to be preceded by the strict application at home of this law. Such a move would reassure public opinion that in the Italian official position it is art that really matters. And Verdi, even if he remains longer in copyright, will no longer be suffering the purgatory presumably experienced by dead artists at every little change or inaccuracy in their printed works.

Malaysian Malaise

FROM OUR CORRESPONDENT IN THE FAR EAST

IT is generally believed that Singapore's prime minister, Mr Lee Kuan-yew, had intended to include Peking and Moscow in his impending world tour, but that the Tunku Abdul Rahman, the Malayan premier, frowned on these far-left wanderings. Certainly, as a tough and able realist, Mr Lee would place far more importance at this moment on the Tunku's approval than on peony bouquets in Peking and caviare and vodka in Moscow. All considerations for Mr Lee are subordinated to Malaysia—which means, in effect, to the Tunku.

He will now content himself, while awaiting the Cobbold commission's laboured findings on the attitude of Sarawak and North Borneo towards Malaysia, with calls on General Ne Win, Mr Nehru, President Nasser, President Tito and Mr Macmillan. Officially, his tour is designed, modestly enough, to "widen his political education," but he will undoubtedly do what he can to muster neutralist support for Malaysia.

The Cobbold commission, which was appointed at the end of last year by the Colonial Office, has made heavy going in the sultry air of North Borneo. Misgivings and opposition mounted as the commission extended its earnest inquiries among a welter of newly-formed political "parties," which argued that independence and self-government for the territories should come before federation, and which clung jealously to native rights. If most responsible interests accept grudgingly that Malaysian federation was ultimately unavoidable, they still argue strongly against unseemly haste. "Hustling us, just for the sake of political expediency in Singapore, is neither decent nor wise," as the new English-language edition of the *Borneo Times* put it. Articulate elements in the Borneo territories are not greatly agitated by the communist menace which the Tunku and Mr Lee anxiously proclaim.

It is now expected that the Cobbold commission will issue its report in another six weeks, no doubt recommending that local adjustments be made in the proposed federation to allay misgivings. The doubters in Borneo want to retain local migration laws, the local taxation system and so on. But the crux of the problem is that, while North Borneo and Sarawak want to wait, Mr Lee can hardly afford to do so and the Tunku refuses.

An interesting recent development has been the growing restraint of the far leftist Barisan Socialis opposition in Singapore since its leader, Mr Lim Chin-siong, boldly took the line—now quietly dropped—that it would be preferable for Singapore to merge with Indonesia rather than with Malaya. Whether this is just a pause or a considered shift in policy remains to be seen. Strikes, anyway, have fallen off sharply after last year's widespread industrial unrest—which was the worst since the violence of 1955. The prime minister cracked down sharply on the strikers, and the Tunku angrily promised to "close the Johore-island causeway" if Singapore voted against merger with Malaysia. But there has also been speculation that the Barisan Socialis might prefer to show their strength after the merger has taken place.

The revival by the Philippines of historical, if not legendary, territorial claims to North Borneo has precipitated a new and unexpected complication. Launched initially as a newspaper stunt, the campaign appealed to the nationalist instincts of the Philippines' new vice-president and foreign secretary, Mr Emmanuel Pelaez. With the support of the Sultan of Sulu, who claims sovereignty over North Borneo, Mr Pelaez won the blessing of the House of Representatives for action to "recover" the territory. The new president, Mr Macapagal, had not taken the issue seriously but he has now become the captive advocate of Sulu nationalism and cannot afford to withhold his nominal support.

Indonesia, which already regards the Malaysia project with a sour and jaundiced eye, will certainly jump in with rival claims to North Borneo if the Philippine case gains support. It is assumed, however, that combined American and British pressure will manage quietly to smother the Filipinos' inconvenient campaign. Mr Lee's proselytising tour will bring him back to Singapore just ahead of the expected time of release of the Cobbold report. Significantly, the Tunku has suggested to the Foreign Correspondents' Association in Singapore that he might be able to deliver a speech to members at a luncheon on May 27th. That will be the anniversary of his surprise announcement at a similar lunch last year of the project for Malaysia.

UN versus IOU

FROM A CORRESPONDENT AT THE UNITED NATIONS

THE United Nations is well placed just now to test the theory about the road to hell being paved with good intentions. While governments make qualified pledges to buy UN bonds sometime, UN bills are falling due now and past debts remain to be paid. Declarations by governments of their intent to purchase bonds continue to flow into the organisation's headquarters. Without counting the United States, the tally had risen to $63.6 million by April 12th, Italy having announced its intention to take up nearly $9 million worth. Japan and Kuwait have yet to be heard from, and Brazil, Venezuela and Iceland are nibbling at the bait.

And yet only $6 million worth of bonds have actually been bought and paid for (by Scandinavian countries), and the proceeds from these have already been spent. Meanwhile, expenses of approximately $21 million monthly are still being incurred, with no immediate prospect that costs in either the Congo or the Middle East can be reduced.

The Sixteenth Assembly did not provide for assessments on member states to cover emergency costs beyond June 30, 1962. Apparently it was expected that enough money from the sale of bonds would come in by that date to defray expenses until the Assembly can consider assessments again next October. No doubt it was also hoped that the International Court would have given its blessing to assessments for emergency costs before the Assembly had to grasp that financial nettle again. In other years, the Assembly has authorised the Secretary-General to obtain short-term loans from governments at going rates of interest. It did not do so this year because such loans would have looked odd beside the twenty-five-year bonds at 2 per cent interest.

The UN's working capital fund was exhausted some time ago. Cash for emergency costs is being borrowed at present from the Special Fund (the "pump-priming" fund for economic development). This is legitimate, as the fund has money lying idle which has been subscribed for future projects; but repayment will have to be made fairly soon.

OFFICIALS are not indulging in day-dreams about being "forgiven" debts to governments supplying troops and services to UN peace-keeping operations. Experience with the UN Emergency Force in Gaza and Sinai has taught them that all nations involved will send bills for extra pay for troops, for materials supplied, and for wear and tear on equipment. Although Britain, Russia and the United States all wrote off the cost of the original airlift of troops and supplies to the Congo when that crisis first arose, they cannot be counted on to wipe out similar debts incurred since then. Up to the beginning of this year the UN owed the United States $31 million for such items as transport and aircraft parts.

This debt to the United States is not making it any easier to gain support in Washington for an American purchase of UN bonds. The House of Representatives being notably less internationalist than the Senate, it is not at all certain that the House will accept the compromise bill already passed overwhelmingly by the Senate.

It was estimated in December that the UN would be $170 million in debt by July 1st. As the secretariat's estimates of emergency costs are usually cautiously high, the figure may prove somewhat lower when that date arrives. However, the fourth quarter of 1962 will be the time when the organisation expects its cash deficit for all operating expenses to reach its peak.

If the United States finally adopts the plan of buying bonds worth $25 million, and matching purchases by other nations up to $75 million more, the UN must sell $75 million elsewhere in order to obtain the full amount from the Americans. Even then the total would fall $25 million short of the goal of $200 million.

There are other parliaments which must vote on their governments' good intentions. Parliaments are not famous for speed in such matters, so that the secretariat is left in doubt not only whether, but when, it may expect (actually) to get some money. Although the Assembly resolution on the bond issue permits him to, the Secretary-General does not wish to offer bonds to "non-profit institutions or associations" until all governents have had ample opportunity to subscribe the full amount required.

'I always read newspapers from the back to the front, to avoid the anti-climax of doing it the other way round.'

'ANCOCK AND THE 'ERALD

Anthony John Hancock (better known as Anthony Aloysius St. John Hancock), twice TV Comedian of the Year, talks, sometimes seriously and sometimes rather less so, about the new Daily Herald.

PHOTOGRAPHS BY ROGER WOOD.

Behind the public image, that 'Ancock front you present, I don't think people really know anything about the Man Himself: Anthony Hancock, Citizen . . .

Thank heaven for that, mate. It's been a well-kept secret for many years.

All the same, could we probe deep enough to know whether or not he reads a great many newspapers?

Oh, yes. All the Sunday papers, and six dailies. Times, Guardian, Herald, Mirror, Express, Mail.

And had you noticed anything about the Herald in the last year or so?

Plenty. It's a very lively and entertaining paper now.

Some people, feeling that newspapers are for selling hard news, think you can go too far in making them entertaining. Do you agree?

Put it like this. People talk to me about small theatre groups putting on good stuff, and not pandering to whoever it is you shouldn't pander to. But what's the point of working at, say, the Penge Globe, and you're saying big things and nobody's listening? You've got to get 'em past the box-office first. It's the same thing with the Herald. You can't go on preaching to the converted, especially if there aren't enough of them these days. If you get people to buy the paper because it's entertaining, they'll go on and read the serious things you've got to say. But it's no good talking to yourself, now, is it?

Fair enough. Now, would you tell us what you find especially entertaining in the Herald at present?

Well, for a start, Dee Wells. I think she's great. That thing she did on 'Coronation Street' the other day had me paralysed for most of the morning. And I like Paul Dehn, the film critic. And David Nathan . . . he does a very good job on the theatre.

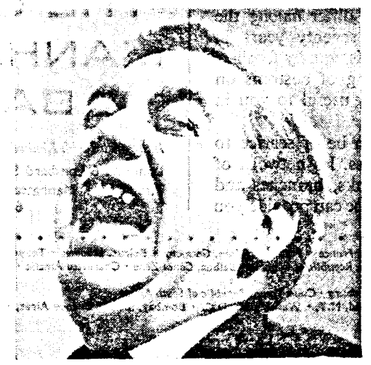
What about that controversial character Malcolm Muggeridge? What do you think of his 'Life and Books' column?

I like it. I like that needling technique of his. (This is getting to sound like a commercial, isn't it?) He's honest, too. As Chancellor of the Exchequer he'd probably be a disaster, but as a columnist he's first class.

Do you read 'The World This Morning,' the contents guide on the front page, before you open your Herald?

No, I don't, but then I always read newspapers from the back to the front, to avoid the anti-climax of doing it the other way round. I end up with Michael Foot in 'As I see It' on page 2, then the front page, and then I look at 'The World This Morning' to see what I've been reading.

Talking of 'As I See It,' do you think the Herald is right to have people of all political shades writing in that column?



Oh, yes, I think that's the attraction. I like it to be unexpected, like having Boothroyd, this morning, writing on the horrors of smoking. As an intermittent chain-smoker, I enjoyed that. I like Joyce Egginton, too. Yes, I'm all for having a wide selection in that column.

Are you a reader of gossip columns? Do you look to see what Henry Fielding has to say?

Well, he can't really touch the heavy stuff we get in the country, where I live. Still . . .' the Duke of Buccleuch picked up his own bag . . .' It's got something.

And what about the Herald horoscopes? Do they appeal to you as light reading?

Only for my dogs. You get some very interesting results with a dog's horoscope. Listen to this: Aries the Ram . . . 'a progressive day, but be careful to avoid friction with a close friend.'

And Sagittarius . . . 'you are told it can't be done, but you make an extra mental effort and do it.'

So you wouldn't agree with any spoilsports who say a serious Left-wing newspaper shouldn't have such things as horoscopes?

No, no. It's a nice bit of jam. Doesn't do any harm.

Now, if you suddenly found yourself editor of the Herald, is there anything you would want to change?

Well, it doesn't look as good as it is yet. When I look at it first thing in the morning—half asleep, you know—it seems to me a bit grave-looking. A pity, because it isn't at all. It still reminds you a bit of words like *Labour*. Terrible word, that. Breaking stones in a quarry . . . done more harm to socialism, that word has than . . .

Quite, quite. Now, is there anything you think the Herald should do, or do more of, with a view to getting large numbers of young people as readers?

Yes; I think you've still got to give them more of a lead. Young people are much more politically conscious than we were—at any rate than I was—and they expect to be taken very seriously. They care deeply about things, but they don't care for our values, and I don't blame them. It's the same in other things besides politics. For instance, to take just one thing . . . the Herald ought to make much more of a thing of its records column. If it's youth you're after, that would be far more of a big deal down at the youth club than those music criticisms beginning 'Don Pasquale last night . . .'!

What made you decide to raise a flag for the Herald in public?

Well, I wanted to as soon as you asked me; because I like the paper, because I like the people I mentioned earlier—personal reasons like that. But I was nervous because of this business of being a temporary celebrity, and perhaps having my opinions made too much of because of that. After all, you may be completely uninformed about a subject though you're very good on the tight wire. Then I read this piece I was talking about, by Dee Wells, and decided I must do it. But, in more general terms, let me say this: without the Daily Herald, the Press would be completely unbalanced. It would be like having Parliament with only one party; an absolute disaster . . .

Do you take the lift . . . or the elevator?

The difference may be slight . . . but even small distinctions in language and in customs can assume importance, when people in Great Britain do business with people in the United States.

The Chase Manhattan Bank, with the largest network of correspondent banks in the U.S., naturally has close familiarity with American trade practices and usages —and with the ways in which they differ *among* the fifty states. And after more than seventy years in London, too, The Chase Manhattan is equally familiar with British ways. This understanding of customs on both sides of the Atlantic can be very useful to you in your dealings with the States.

Indeed, The Chase Manhattan can be of service to you almost anywhere you do business. Its network of more than 51,000 correspondent banks, branches and representatives' offices all over the globe can provide you with every type of modern banking service, promptly, efficiently, and on a personal, *localized* basis.

When you do business anywhere abroad . . . it will help to talk with the people at The Chase Manhattan, in either of the London Branches.

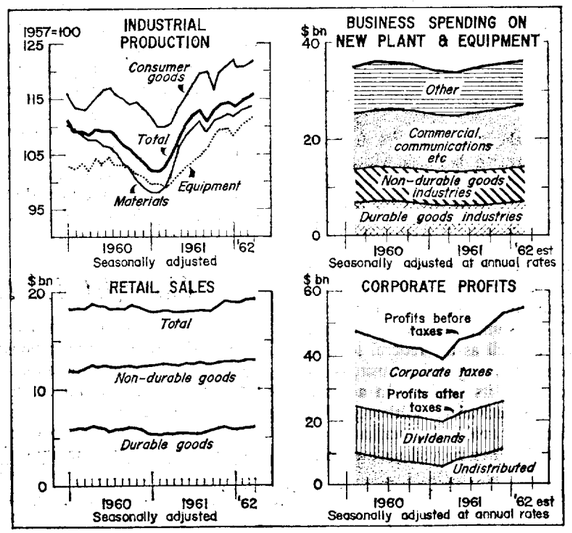
AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.



Economic Moodiness

NEW YORK

WITH the spring, activity has quickened in almost every section of the American economy. But businessmen are still suffering from the winter's discontent and everywhere the prevailing sentiment is a mixture of disappointment that things are not a good deal better and anxiety about the prospects for future improvement. The Administration's officials have toned down their earlier forecasts and are expressing concern about the slow rate of economic growth and the persistence of unemployment. Similarly Wall Street, where share prices are well below the peaks reached last December, reflects widespread doubts about the vigour and duration of the new rise in economic activity. The business community is the most disaffected; sales and profits, although rising, are not up to its earlier optimistic projections and hopes for a boom have been dimmed by Mr Kennedy's determination to maintain price stability. Even retail merchants, whose sales registered a big improvement in recent weeks, partly because of the late Easter, are not convinced that demand will be maintained and are reluctant to add to their stocks. Consumers are more cheery, but they seem far from embarking on a spending spree.

The state of the economy is admittedly not all it could be but it does not seem to justify the querulous uneasiness now so much in evidence. In March the economy advanced at a faster than seasonal pace, with the Federal Reserve Board's index of industrial production reaching a new peak and personal income running at an annual rate of over $435 billion, as against $407 billion a year earlier. The number of new houses started, after declining for four straight months, shot up to an annual rate of 1.4 million, indicating that it was the abnormally severe winter weather and not a falling-off in demand which had been the trouble. Automobile sales also picked up, to an annual rate of over 7 million, and sales of both durable and non-durable goods hit new peaks. The advance has been maintained in April; in fact, with a few exceptions—steel production being the most notable—the expansion in economic activity has been accelerated and broadened.

But discontent among businessmen is so deep-seated that it has not been dispelled even by the substantial rise in corporate profits during the first quarter of this year. Nor did the gross national product come up to expectations in the first quarter; at an estimated annual rate of $549 billion it increased less than 2 per cent over the fourth quarter of 1961, which had also been disappointing. Businessmen have been lacking in confidence ever since the "soaring sixties" failed to materialise, although they have gone on hoping for a miracle. But after the economy stalled last September and paused again in January, they became cautious and apprehensive. They are willing to admit that today activity compares extremely favourably with the levels of a year ago, when the country was just emerging from recession; but they point out that the gains since last summer have been painstakingly slow and hardly merit a new wave of enthusiasm.

Business economists think that the lag in new orders for machinery and the modest increase in corporate expenditures on new plant support the view that industry is plagued by an excess of productive facilities. The need to modernise plant in order to increase efficiency and lower costs is conceded, yet corporations are committing themselves to new outlays at a much slower rate than in previous periods of expansion. The Administration still looks for a substantial increase in business spending on plant and equipment, particularly if Congress approves the President's proposal for a tax credit for capital improvements. This was designed specifically to encourage corporate investment and to lay the base for sustained growth. The survey made by the Commerce Department and the Securities and Exchange Commission in the first two months of this year reported that businessmen would spend 8 per cent more on capital investment in 1962 than in 1961 and a survey just released by the McGraw Hill experts shows a rise of 11 per cent; normally corporations spend more in an upturn than they planned to do originally, so that a greater rise is still a possibility. But usually such additions have been made in a bullish atmosphere, under the threat of higher prices; corporations feel under no compulsion to add to their commitments with the prospect of stable prices confirmed by the steel industry's rash attempt to raise them and by the President's bold reaction to this attempt.

Mr Kennedy and his economic advisers, however, want to see the dust settle over the steel dispute and to repair the damage, real and imaginary, to business confidence. In fact, capital investment by corporations has been responsible for a declining proportion of the gross national product since

1957 and the Administration is determined to reverse this trend. It is proffering one olive branch in its proposal for tax credits ; it is offering another in the form of liberalised depreciation rules to allow new equipment to be written off faster by a long list of industries, including steel ; and it is working on a comprehensive tax reform Bill, to be presented to Congress in 1963, which, according to Mr Walter Heller, chairman of the President's Council of Economic Advisers, will probably involve reductions in present rates of taxation. Business has been somewhat lukewarm towards the tax credit but, if it is combined with faster write-offs, it should spur corporate investment and a reduction in tax rates, whether corporate, individual or both, would almost certainly have a stimulating effect.

But the leisurely progress of the economy and the conflict with the steel industry are prodding the Administration to make greater efforts. In March Mr Kennedy asked for an additional $600 million for public works as a means of coping with unemployment and now some officials are talking of a much more expensive programme, even though it would mean a deficit in the coming fiscal year. A balanced Budget, which has been given priority because of the fear that a deficit would tend to weaken the international position of the dollar, is no longer regarded as sacrosanct. On the contrary the Administration is now taking the position that a sluggish economy hand-in-hand with a balanced Budget may be more of a risk to the dollar than a growing economy accompanied by a deficit. In part, Washington is accepting the inevitable, because the slowing down of the advance in the first quarter of this year has brought a short-fall in tax revenues. But Mr Heller's announcement that a tax cut is being considered was evidently timed to give a psychological lift before taxes are actually reduced. The unorthodox idea of cutting taxes before expenditures have been held down makes it clear that the Administration is seeking fresh ways of ensuring faster long-term growth.

A little more nudging by the Administration now, followed by a tax reduction later, may well provide the stimulus which both businessmen and consumers need. Rises and falls in the business cycle, however, rarely conform to past patterns and it is already obvious that the present expansion has its own individual characteristics. The rise began with an unusually big pool of unemployed and an exceptionally large amount of excess capacity. As a consequence, there has been no excessive demand for goods and none of the upward trend in prices which generates more demand temporarily. Businessmen find it difficult to adjust to a recovery that is not accompanied by inflationary fever. Indeed, the very lack of price pressure tends to make the expansion appear feeble if not actually spurious.

But in fact the economy is not about to lose its forward momentum. Some sectors may be lagging but the widespread perturbation about the slow rate of growth obscures the fact that not a single significant area is declining or is likely to decline. And, despite the hesitancy during the winter months, industry is nibbling away at unused capacity and unemployment ; as this process continues business will be forced to increase its investment in new plant. By and large, corporations have the funds available for greater investment and the Administration intends to make credit available to both consumers and corporations. Government spending—at the local as well as the federal level—is increasing and, with consumers following suit, business is bound to begin adding to its stocks and its profits. In a sense the economy is better served by a slow advance. Although this means some deterioration in confidence, it avoids the concentration of activity in one sector or another that has proved so injurious and unstabilising in the past.

Moods, after all, are changeable. At worst, the current dissatisfaction could delay expansion but it is unlikely to prevent it. Sentiment will probably brighten as the fresh rise in activity continues to make itself felt and as President Kennedy smoothes the ruffled feathers of the business community. If dramatic surprises —and unsettling disputes—can be avoided, the economy may be pressing close to the limits of productive capacity sooner than either Wall Street or Washington now expect.

Republicans Steel Themselves

The Republicans, or at least the conservatives who lead the party in Congress and who therefore dominate the headlines, think that at last they have an issue which will enable their party to win next November's election. That no unbiased observer agrees with them does not seem to worry them—although it should since, as members of the minority party, Republican candidates cannot do without the support of independent voters. The issue has been found in an unexpected place: the President's struggle with the steel industry in which he forced it to capitulate ; it is this apparently overwhelming victory which has given the Republicans what they hope is their chance.

When the United States Steel Corporation increased its prices Republican leaders refrained from comment, except for reactionaries like Senator Goldwater who believe in tarring themselves with big business's brush. But when the President mobilised all the arms of government for his succesful *blitzkrieg* againt the steel companies, the Republican leaders, after a long pause for reflection, launched a united attack against

> a series of government actions that imperilled basic American rights, went far beyond the law, and were more characteristic of a police state than a free government.

The exaggerated language of this statement weakened a case which is not without its appeal. For many people who felt with the President that the steel companies had acted not only unwisely but also deceitfully were concerned, nevertheless, at the future implications of his massive use of the powers of the executive. In this group are certainly many trade unionists, worried—and with reason—that the President may deal as severely with any attempt to increase wages.

It is on such fears, and on the widespread American aversion to interference from Washington and to "big government," that the Republicans are playing ; they will contend that the only way to keep the Democratic President under control is the constitutional one of checks and balances—to elect a Republian Congress. But the Democratic leaders have taken up this challenge with joy, declaring that the Republican condemnation of the President's fight against an inflationary price rise shows

> once again that the Republican party puts the selfish and narrow interests of the few ahead of the welfare of the average American family.

There is little doubt that most voters will find this argument more acceptable and easier to understand than the Republican one. Once again it looks as if the Grand Old Party had managed to get itself on the unpopular side of an election issue.

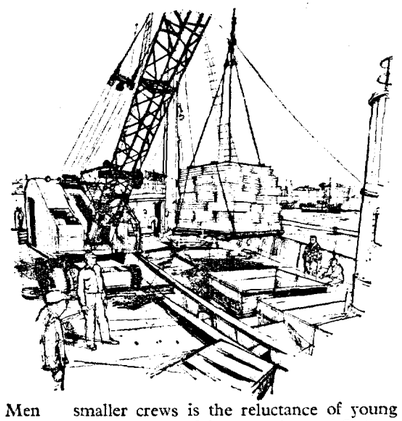
Caught in the Networks

FROM A CORRESPONDENT IN CHICAGO

The Federal Communications Commission's fact-finding inquiry into television programmes available in Chicago has ended where it began, as an attack on the three national networks which distribute programmes all across the country. While no corporation is allowed by law to own more than five stations—each of the networks owns one in Chicago where there are four commercial stations in all—the networks have large numbers of affiliates which contract to carry a certain number of their shows. The proceedings in Chicago, which are likely to be followed by hearings

in other cities, are a sequel to an investigation of national programming held in Washington early this year ; this grew out of the declaration by Mr Newton Minow, the chairman of the FCC, that network television is a "vast wasteland."

Last month when scores of critical citizens had the floor in Chicago, Mr Minow's home town, the consensus was that absentee network owners—greedy to make programmes cheaply and sell commercials dearly—dictated what the viewer should see, leaving scant chance for the local managers to serve the needs of the local community. But this month, when the managers of the network-owned stations had their innings, they argued that they put on as many local programmes as the market would bear, that they had all (or nearly all) the "autonomy" that they needed and that in any case presenting shows which originated locally was not the only way to meet a community's needs and interests.



One instance in which a network overruled its manager in Chicago involved keeping a programme off the air rather than putting it on. This was the showing of a film, "Chicago—Portrait of a City," produced by Mr Dennis Mitchell for the British Broadcasting Corporation, in partnership with the ABC (American Broadcasting Company) station in Chicago. Officials of the network thought that it gave Chicago a "black eye" (indeed, its realism offended some British viewers), although the resident manager fought in vain to show it. But otherwise there was no evidence of revolt in the ranks.

Although each resident manager cited instances in which he had rejected network programmes in order to put on Chicago shows, the Commissioner who presided over the hearings, Mr Robert E. Lee who, despite his name, is a Wisconsin Republican, closed the inquiry with the observation that, as a practical matter, the head offices in New York require the captive stations to carry substantially the entire network schedule. He had already disturbed the networks by demanding any records since 1958 which might throw light on the question of absentee control. Mr Lee, who will report to the full seven-member commission in the middle of May, feels that the FCC "should clear the air" on this question of local autonomy. In other words, the resident managers may well have thrust upon them the discretion which they contended that they had enjoyed all along.

Once again, as at the time of the scandals over the granting of licences during the Eisenhower Administration, it is apparent that there is no more confusing or vague body of administrative law than that of the FCC. In theory the agency's powers relate only to individual stations, not to networks, which did not exist when regulation was first authorised. In practice, the FCC does control many aspects of the operations of the networks, although it does not licence them. It is impossible, after all, to regulate the station cart without regulating the network horse, whether the station is owned by a network or merely affiliated to one of them. Legislation to give the commission statutory power to regulate the networks has been introduced in the current Congress. Even the FCC rule which permits one corporation to own up to five stations may now be in jeopardy if multiple ownership is deemed incompatible with local responsibility.

Fishermen's End

FROM A SPECIAL CORRESPONDENT

Most people think of the United States as an economic giant which dominates the world markets and even during a recession suffers only the mildest discomfort. But several important industries are now facing stiff competition. One of the hardest hit is New England's fishing industry, notably in the quaint old town of Gloucester, Massachusetts. Men fished out of Gloucester as early as 1602 and by 1700 the city was a flourishing port. Since then the fishing industry has been carried on without interruption, reaching a peak in the years following the second world war. Since 1950, however, the number of vessels of five tons or over operating out of Gloucester has droppd from 196 to 129. Even more significant, the total yearly catch has dropped by almost four million pounds and its value by nearly $3 million.

In an effort to cut costs fishermen have put off buying new vessels or repairing old ones: the average Gloucester fishing boat is well over 20 years old. They have also reduced crews to increase the share of money each man takes home with him after each trip. Another reason for the smaller crews is the reluctance of young men to become fishermen. Men of Sicilian descent, who used to take to the sea as soon as they came of age, now find less demanding and more secure employment elsewhere.

Gloucester specialises in "ground-fish," such as cod, halibut, haddock, redfish and flounder. These can also be caught in Japanese, Canadian and Danish waters and therein lies the rub. Now that fish can be quick-frozen foreign fishermen can easily ship their catch to the American market where it competes successfully with Gloucester fish; not only are workers in foreign plants paid less than American workers, but foreign frozen fish is also often of better quality. Boats from Nova Scotia and Iceland, for instance, can get their catch to the freezer in a matter of hours, while a Gloucester trawler may have to go as far as 400 miles to the Grand Banks and then has to keep its catch in the hold for more than a week before reaching shore.

About 70 per cent of the fish eaten in the United States is imported; most of it comes in raw because the tariff is much higher on cooked than on uncooked fish. The picture shows massive slabs of frozen fish from abroad being unloaded at Gloucester, where it is cooked and packed as "fish sticks," to be sold all over the country. In general tariffs have been restricted to cooked fish because it is felt that if they were imposed on raw fish prices would rise, the supply would become more uncertain and retaliation would be invited.

When President Kennedy was the Senator from Massachusetts he introduced various Bills to provide tariff and other forms of protection for the New England fishermen. One of those which became law allocates 30 per cent of the money collected from the tariff to research to help the domestic fishing industry. But the fishermen are sceptical. One from Gloucester states the problem: "The government might find something good in all those laboratories but, when they do, there won't be any fishermen left to use it." Thus the Gloucester fishing industry seems doomed to extinction and with it an era when gaily-coloured fishing boats, and not pleasure craft and freighters, filled Gloucester's harbour and when the atmosphere was pervaded, not by factory odours, but by the unforgettable smell of drying codfish.

In theory, the FCC does not censor programmes. The standard set by law for them is that they should serve the "public interest. convenience and necessity." The Chicago hearings, although novel in form, were ostensibly no more than a "forum for civic leaders" and an opportunity to discover how the stations met community needs and how they determined those needs. According to most of the witnesses, these were served best by the independent station belonging to the *Chicago Tribune* (WGN) and by a non-profit-making educational station (WTTW), which is supported by contributions and suffers from a weak signal. Although the FCC does not use a blue pencil and lacks the Lord Chamberlain's powers, it does possess an ultimate sanction. Its power to revoke a licence or to refuse to renew one is a club in the cupboard which the industry never forgets, though so far no television station has ever lost its licence.

But the dilemma remains: Is television to be primarily an educational and "cultural" medium or one for entertainment? If the former, this would represent a triumph of mind over popularity ratings because the educational station has the smallest audience and often, by any criterion, the dullest fare. And even the manager of the *Chicago Tribune's* station, thankful though he was for praise, complained that the public often ignored "culture" and that commercial sponsors were even less interested in it. The criticisms last month fell into two general categories: that "cultural" and "educational" programmes were scarce and that special interests, such as Negroes and religious groups, were ignored, ill-served or given poor viewing hours. (Even the Japanese-American Citizens League came forward to protest that the reshowing of war films libelled the Japanese.) But the spokesman for the *Tribune's* station said that with a limited number of hours a day it was impossible to please everybody in so large a city as Chicago.

Although the hearings which have just been held had nothing to do with the renewal of licences, those of the three network stations are, in fact, up for renewal. It is clear that a new pattern of pressure is being exerted, not only on stations in Chicago but, as the FCC repeats its road show elsewhere, on the entire industry. Mr Lee carefully disavowed any intention of prejudging the renewal of licences in Chicago; this will be considered at formal hearings later in Washington. But it would be a naïve television executive who did not catch his message.

Washington's Own Wall

SOME of the most flagrant racial discrimination in the country flourishes in the District of Columbia, right under the nose of the federal government. The capital's racially integrated schools provide a good example of colour-blindness but housing is a very different story. Last year the Administration had to intervene, and with only indifferent success, to secure suitable flats for representatives of the new African countries. Now the Civil Rights Commission, in two days of open hearings, has turned the spotlight on the near-ghetto conditions in which native Negroes live in the only major city in the country where they are in a majority and one where Congress, which still governs the city, has not lifted even a protesting finger.

The figures speak for themselves. Negroes provide about a quarter of the population of the whole metropolitan area but in the central city, the District itself, they account for 54 per cent while in the surrounding suburbs, where they were once numerous, they make up only 6 per cent. This is the prevailing metropolitan pattern but it is harsher in Washington than elsewhere because the capital is embedded in two southern states, Virginia and Maryland. Even inside the District of Columbia racial segregation prevails in housing and Negroes testified to the difficulty of obtaining mortgage money if they wished to move into a white area. To pin down responsibility for this situation is not easy. Those who are interested could not do better than to read Mr Davis McEntire's definitive book* which considers the problem in the national setting. But briefly, covenants restricting the sale of houses to minority groups—chiefly Negroes and Jews—are still in use although legally they cannot be enforced; local officials, builders, lending agencies, and estate agents all help to retain racial segregation, partly because of their own prejudices or out of respect for those of other whites, partly out of fear that if Negroes are introduced into desirable white developments, values will come tumbling down. Even where prejudice is absent, the properties available to Negroes are usually not as credit-worthy as those available to whites. In all this the federal government is a silent partner because it advances money and insures mortgages on segregated housing.

On the President's desk there has been lying for months an order to end this scandal, but it has been withheld in the interests of securing co-operation from Congress on other issues. If, however, the District of Columbia had legislation outlawing discrimination in housing the federal agencies could help to enforce it; just recently they have decided to make the builders and developers who use federal credit respect the laws of the seventeen states and the many cities which prohibit discrimination in housing. Unfortunately it is far from certain that the District has the power to adopt such legislation and all too certain that Congress will refuse to do so. Moreover, the fact must be faced that the capital will never solve this problem satisfactorily until Virginia and Maryland help to pull down the wall which imprisons Negroes in the centre of Washington.

Paying for Democracy

THE President's Commission on Campaign Costs, appointed last October, met its deadline of April 30th with twelve days to spare and its report is equally businesslike and practical. It is also unanimous, even though the nine members, all men with experience of raising political funds, either in practice or in theory, came from both parties. That they could agree is not so surprising as it might seem, for it has become obvious to politicians that something must be done about a situation in which it cost $20 million to choose a President and Vice President in 1960, half again as much as in 1956, and somewhere around $170 million to run all the federal, state and local election campaigns in that year.

From the commission's point of view, perhaps the most serious aspect of this is that the total outlays for the 1960 election campaigns were only $28,300,000, as reported under the law. From this the commission deduces, as many others have already done, that the present limits on spending by interstate political committees—not more than $3 million each—and on contributions by individuals—$5,000 each—are meaningless. Last year the Senate approved a measure which would raise these ceilings, but the commission recommends that they be abolished altogether, with an effective system being set up to make it clear where the money comes from and where it goes to in election campaigns. This, the commission feels, would increase public confidence in political activity and would counteract the widespread feeling that it is inevitably dirty. To increase public participation in such activity, the commission proposes that contributions to party funds, however small, should be deductible, in part, from tax payments. If more people subscribe to political parties, this will not only spread the cost of campaigning but will also lessen the dependence of candidates

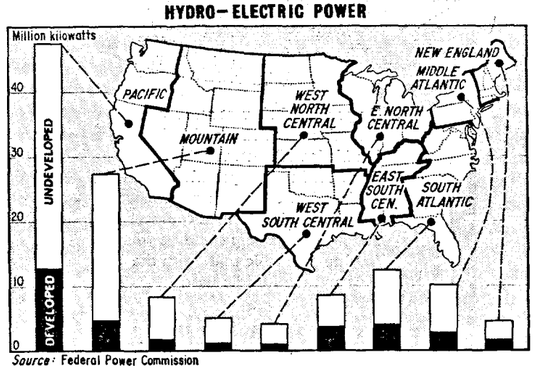
on the large contributions which must always carry with them the suspicion that they have post-election promises attached.



The commission does not, for the present, endorse the suggestion that the government should subsidise election costs in some way, although it recognises that this may be necessary if its proposals do not achieve their objectives. The commission does, however, want the government to pay the expenses of an incoming Administration between the time a new President is elected and when he takes office; between November, 1960, and January, 1961, President Kennedy cost the Democratic party $360,000. The commission also recommends that television and wireless stations should again be permitted, as they were in 1960, to give free time on the air to the major candidates without being obliged to do the same for all the minor ones; this would relieve the parties of substantial outlays. Another way of encouraging wider political interest would be for the costs of non-partisan undertakings, such as getting voters to register, to be tax deductible, even when handled by the business corporations and trade unions which are forbidden, and should continue to be forbidden, to take part in partisan campaigns. The commission's report deals with federal elections, but it hopes that the states will take similar steps to reduce the costs of, and increase contributions to, their own local campaigns.

Electricity without Fireworks?

When the Kennedy Administration came into office it was announced with a flourish that the Eisenhower policy of partnership with private firms in the development and distribution of electricity was a thing of the past. Indeed, the new Secretary of the Interior, Mr Udall, so frightened the private companies with his talk of a federally-constructed national grid—to begin, probably, with a link between the federally-owned dams in the Pacific Northwest and southern California—that they hastily drew up an $8 billion scheme for building transmission lines themselves.

It created a sensation, therefore, in February when Mr Udall revealed that he had agreed to let private firms build some of the transmission lines and connections needed to carry electricity from the federal dams being built for the Upper Colorado Storage Project to users in five states: Colorado, Utah, New Mexico, Wyoming and Arizona. The municipal electricity authorities and co-operatives felt that they had been sold down the river. Even Mr Seaton, Mr Eisenhower's last Secretary of the Interior, had come down in the end on the side of a wholly federal system of transmission lines. Last year Congress appropriated about $13 million to make a start on the $178 million job. Now private firms are to build $27 million worth of the lines, although the backbone of the system will still be federal.

HYDRO-ELECTRIC POWER

Source: Federal Power Commission

Mr Udall's explanation is that this modest private participation will save the tax-payer about $77 million by the time the dams are paid for in 2042. Moreover, he argues that co-operation between the federal government and the private companies will provide the consumer with a more reliable, more extensive and cheaper system of transmission. But he denies that the step represents a return to the Eisenhower policy of partnership. He points out that the Administration was "bargaining from strength"; it could afford to reject the companies' first proposals and demand more favourable terms from them because it had the authority and money to build the whole system itself. There is no intention, either, of allowing private enterprise to cream off the most remunerative projects, leaving the taxpayer to finance those which are uneconomic at present or too large for private firms. Mr Udall has christened his approach "competitive co-operation" and is convinced that the goal of cheap, abundant electricity will best be served by a friendly race between the public and private sectors. There is room for both. In the next twenty years investment in electric power is certain to double, if not to triple.

Stamping Out Hunger

Since last June food coupons have been used in eight American communities, not to restrict consumption but to enlarge it. This has been a pilot programme to determine whether there is not a better way of relieving hunger amid plenty than by simply handing out surpluses of lard, flour, dried milk and rice. About 6 million Americans are now receiving such hand-outs, at a cost of some $250 million a year, but they add up to neither a very balanced nor a very tempting diet. The 146,000 certified needy now receiving food-stamps do better. With the money which they would normally spend on food they buy coupons—or stamps—worth nearly twice as much in the shops. The average family spent $63 for each $100 worth of food which it received. The coupons can be used for any food—apart from a few imported items—but for nothing else.

Special studies have just been completed which show that the participating families used nearly all their "bonus" coupons and that 80 per cent of the increase in their purchases of food consisted of meat, eggs, fruit and vegetables, milk and fish. In Detroit, one of the pilot communities and one with much unemployment, food-stamp families bought about a pound more meat a week for each person. The shopkeepers (who dislike outright donations of surplus foods, for obvious reasons) also benefited; their sales rose about 8 per cent with small shops doing better than big ones. Moreover, the cost of administration, at about 5 per cent of the total, is not considered to be excessive. One of the reasons why the Eisenhower Administration declined to revive food stamps—which were first used, not altogether successfully, by Roosevelt—was their supposed costliness of administration; another was that they do not make as direct an attack upon surpluses as outright donations of such commodities; a third was the risk of abuse. So far, however, only 11 of the 4,000 participating shopkeepers have been suspended because of trading in the stamps or accepting them for tobacco or other non-foods.

The programme is now to be expanded, but still only on an experimental basis, to about 500,000 people; this will cost less than $50 million a year. Even if the plan became nation-wide, it is not likely that more than 4 million people would take part. As a way of eliminating farm surpluses and sustaining farm income the food stamps are not to be compared with Food-for-Peace, which last year allocated 60 billion pounds of food to 64 million hungry foreigners. But the stamps—which allow hungry Americans to share in their country's abundance—are becoming popular in Congress; over a hundred Representatives would like to have their districts included in the scheme. In skilful hands it may become a Democratic asset in the coming congressional elections.

PER-CENT or PER-HAPS?

Fluctuations on the Stock Exchange reflect the uncertainty of the times. Better by far to invest in Abbey National where savings do not depreciate by a single penny and will earn a good return.

SAFETY Abbey National has the complete confidence of over 700,000 members. Furthermore, Shares and Deposits in this Society are Trustee Investments.

INTEREST The rate is 3¾% per annum on Shares with income tax paid by the Society. This represents £6.2.5d. per cent when income tax is paid at the standard rate. Build-Up Shares yield 4¼% —equivalent to £6.18.9d. per cent when tax is paid at the standard rate.

EASE OF WITHDRAWAL
Should the need arise, sums up to £100 may be withdrawn on demand—larger sums at short notice.

THE BUSINESS WORLD

Hard Look at the Gains Tax

WHEN Finance Bills become pellucid, the ancient springtime rite of using them as a kind of Easter hare pie for the pleasure of the honourable band of Somerset House knockers will disappear. The bill, these worthies declare, is the thing—not the glosses that Chancellor, Economic Secretary, or the Inland Revenue, seek to put on it. This year they have, for the first time, a 12-page White Paper entitled "Taxation of Short-Term Gains" to help them to absorb the inner meaning of Chapter II of the bill, headed "Charge on Gains from Acquisition and Disposal of Assets" (no saver here about short-term) with its modest assembly (by number) of six clauses and a side array of fifteen pages of miscellaneous rules. What are to be taxed are gains made by residents in this country from dealings in assets that are not within reach of the Revenue as profits of a trade. These assets are principally land, securities, commodities and "currency of any description." The bill taxes such gains on land held for three years or less and on other chargeable assets held for six months or less. What the White Paper describes as taxation of short-term gains can at any time be made to apply to long-term gains by inserting ten years for three years and changing six months to five years.

Mr Lloyd has produced a capital gains tax without intending it, and perhaps even without knowing it. He has missed the chance of framing a capital gains tax that could logically accompany reforms in corporate and personal taxation. The motto has been the maximum of bother for the minimum of revenue. Few of these elaborate rules will affect anybody with sufficient sense to stroll around them; they merely ensure the taxing of unavoidable short-term gains at the highest marginal rates of income tax and surtax. Why bother with artificial transactions within the length of one's wife's arms or get into the complications that govern donor and donee of "chargeable assets" when by holding them a day longer than the limit no one is liable for this tax or any other? This will be the costliest exercise to collect an exiguous revenue in the history of our tax administration. It is an effort that ought to have been put to better purpose, and Mr Lloyd is wholly to blame for burdening Somerset House with it. His successors, we can be sure, will build on his bad foundation a bad capital gains tax.

He is also to blame for allowing the Inland Revenue to attempt another dangerous (and tendentiously presented) foray into the remaining preserves of personal liberty. The White Paper says:

> Persons who act on behalf of others (such as banks, estate agents, solicitors and stockbrokers) will be under an obligation to state, in reply to Revenue enquiries, whether they have acted on behalf of a named person in acquiring or disposing of a chargeable asset or assets, and to give details, including dates of transactions and prices.

This is by no means what the bill says:

> Where it appears . . . that a person is or may be chargeable to tax . . . they may by notice in writing *served on any person* require him within . . . not less than twenty-eight days . . . ,
>
> (*a*) to state whether he has acted on behalf of the first-mentioned person in connection with *any acquisition or disposal* of assets by that person;
>
> (*b*) if so, to furnish information in his possession with respect to the acquisition or disposal . . . relevant to the question whether the first-mentioned person is chargeable . . . or to the computation of the gain or loss . . . accruing to that person. . . .

The simple method of direct question to the taxpayer—"State who are your agents"—would at least be better than this. Instead, there is to be a fishing enquiry starting with "any person" and then narrowed to those who are in fact agents to tell all, under penalty. This seems to ride roughshod over a client's professional privilege in his relations with his banker, solitictor or accountant. Section 414 of the Income Tax Act 1952 provides protection for such advisers; no such safeguards have been put into the Finance Bill.

These are gains which are being treated as akin to trading profits or earned incomes under Schedule D, with provisions for charging them under a new Case VII. Why, in that logical arrangement, is there to be no earned income relief for personal gains? They provide, say the Revenue in effect, a means of additional income. We have never been able to bring them satisfactorily within the net of trading profits; but we are taking special steps to do so now. But we are not prepared to recognise them as earned income. Mr Lloyd can presumably explain the equity of that.

For at least one class of transaction, a "bear operation" opened after April 10th, the gains tax will be not limited to a time-limit of six months as a "bull" purchase will be. The "bear" is vulgarly regarded as a raffish or mysterious freak, and his influence on steadying a market that threatens to get out of hand is something that only his professional brothers can readily appreciate. If there is merit in taxing gains made from short-term purchases, there is no doubt merit in taxing gains made from short-term sales. But what merit is there in a clause which, according to the White Paper, brings about this result:

> Since in the case of a "bear" transaction the disposal *precedes* the acquisition, the transaction is a chargeable transaction however long the interval between disposal and acquisition.

Even the authors' italics fail to make the logic of this argument

clear. In one voice, the knockers shout "Why?"

They are also shouting about the odd treatment that the different forms of life offices are likely to get. If a gain forms part of a profit of trade, it would be taxed under Case I. That is the reason why the proprietary life companies will not be liable to gains tax on their short-term switching profits—they are "trading," though their profits figures are worked out in a distinctly special way. But the mutual offices, non-proprietary and representing a joint venture by the policy holders, are not profit making bodies in the usual sense and for them the Inland Revenue intends no escape from the gains tax—presumably on the ground that they cannot be got at otherwise. The gilt-edged jobbers have made their views known on this and other aspects of the gains tax in a letter to the Government transmitted through the Governor of the Bank.

There are any number of small points that could be taken on this small tax. The treatment of bonus issues, rights and options is sensible, as the Chancellor had already shown. How trustees will react to the liability to pay (unless they hold for another person absolutely entitled against them, when the beneficiary pays) is not easy to see. There could be a conflict, perhaps, between doing the best for the fund and not getting involved in the gains tax. These are irritating points for those who have been encouraging the cloth-cap investor by way of unit trusts, who on a first reading of the bill might be caught under the rules about disposal from a block of securities. The "one house" rule is qualified by a pernicketty limitation of the garden grounds—an acre and no more, unless the commissioners see fit. But, to the universal relief, the United Kingdom Atomic Energy Authority is free to dabble in short-term gains with no liability to tax.

One comes back to asking what all this elaboration is about—what contribution it makes to equity between taxpayers, what openings it leaves for avoidance, what constructive purpose it brings to a modern fiscal system whose primary aims should be to collect the greatest revenue with the least deterrence to earnings and enterprise. This is not, in its present form, a tax that deserves serious fiscal attention; the danger is that this nuisance will eventually become a bad capital gains tax when a reasonable one was needed.

Experiment in Forward Exchange

FROM A CORRESPONDENT IN WASHINGTON

A CENTRAL element in the Administration's strategy for the dollar is that a satisfactory balance in America's basic international accounts is not likely to be achieved before the end of 1963. The Treasury's recent ventures into the gold markets and the foreign exchange markets—Operation Stretch—are intended to ensure that the deficit over the next eighteen months can be financed without leading to a speculative run on the dollar and without forcing the need for a seven per cent discount rate. The aim is to prevent the deficit in the basic accounts being aggravated by excessive outflows of US short-term capital, and to prevent the drain on US gold reserves being worsened by repatriation of foreign-owned dollar balances from New York.

The Treasury has sought to show the markets that it is in control, even with net outflows that may range from $2-$4 billion before the accounts are brought into balance. It is not unlikely that US gold reserves will fall below $15 billion and perhaps even approach $14 billion, before the corner on the basic accounts is turned. The US authorities have worked extensively with the European central bankers in developing new measures to protect the system from excessive and destabilising flows of short-term capital. The European authorities, already surfeited with reserves, have themselves not welcomed the complications for domestic monetary management resulting from large inflows of short-term capital. Britain differs from Continental countries on both counts: its reserves are far from comfortable, and it is not, as one of the world's two great international money markets, embarrassed to the same extent by inflows by foreign funds, though as Thursday's Bank reduction again shows it does not solicit them.

Recent quotations on the forward dollar in the foreign exchange market and on gold in the London market indicate that the first round in Operation Stretch has gone to the US Treasury. About a year ago it acquired a stock of D-marks from the proceeds of a repayment of German debts; since then the American authorities have arranged short-term credits in Swiss francs, Italian lire, and French francs. They have operated in the exchange markets for three of these currencies, the mark, the Swiss franc, the Italian lira; and also in the Dutch guilder. The Treasury has apparently set up a special account to deal in foreign exchange, in addition to reactivating its Exchange Stabilisation Fund for the same purpose. At the same time, the fund's role as a limited buffer between the weekly reported changes in US gold stocks and US gold sales to foreigners, has been expanded considerably. To supplement these limited financial resources, the Federal Reserve System is now dealing in foreign exchange on its own account.

Policy guidance has originated within the Treasury, and various official statements suggest that this will remain so even if the commitments of the Federal Reserve should grow to exceed those of the Treasury. All the official foreign exchange operations of the last twelve months—those of the Treasury, of its Stabilisation Fund, and of the Federal Reserve System—are being undertaken by the Federal Reserve Bank of New York as fiscal agent. This bank has long participated in the New York exchange market as the agent of foreign central banks, so that its trading desk has developed a technical expertise; what is new is its intervention on instructions from Washington. Most such intervention has been in the New York market, not so much to develop a better market—the New York market in some of the continental currencies is relatively thin—but rather as a matter of convenience. But when the dollar is under pressure, the trading desk works both London and New York hours; operations in Europe are channelled through the respective central banks.

The new American operations differ in an important way from the regular operations of European exchange funds. These are primarily in the spot markets, to keep the home currency within its prescribed limit against the dollar. The American authorities can thus rely on this task being performed for them, and the European funds are willing to acquire dollars in their support operations because the United States in turn guarantees to convert these dollars into gold at a fixed price. The US authorities have therefore concentrated in their own operations on the largely uncontrolled (and more easily influenced) forward exchange market, in order to make a direct impact on interest arbitrage. These operations are partly a response to the outflow of around $2 billion of short-term funds in each of the last two years.

The continued outflow of short-term funds reflects the limitations of Operation Nudge, the attempt to keep credit plentiful for domestic business reasons while tilting the structure of interest rates so that short-term rates, which have a more direct impact internationally, are relatively high and long-term rates are relatively low. While the relatively high short-term rates in New York may have deterred some shifts of funds to foreign money markets, it has clearly not prevented a large increase in commercial credits extended to foreigners. With financing through bankers' acceptances available at 3 per cent or less and, more important, freely available, foreigners have found New York an attractive centre in which to borrow. About $1 billion of the outflow of US short-term funds, in both 1960 and 1961, was connected with the credits extended by US banks to foreigners. These bank credits have been granted mainly to borrowers outside Europe and the main financial centres—though European banks have played an active intermediary part in other dollar credits through the Euro-dollar market. The biggest borrowers have been the Japanese. These credits have thus helped finance US exports, so that their true impact in increasing the payments deficit has been smaller than their gross amount.

The limitations in the success of Operation Nudge are partly to be made good, in the Treasury conception, through Operation Stretch, operating on the cost of exchange cover itself. The Treasury's basic aim in its forward exchange operations has been to reduce the cost of exchanging European currencies for dollars in conjunction with the accompanying forward swap to undo the transaction: it has sought to prevent the discount on the forward dollar from moving beyond the "natural" level set by the interest parity. Where foreign commercial banks and other foreign private parties have been likely to transfer funds from the United States to their own country, the Treasury has participated with foreign central banks in making swap facilities look attractive. By persuading private operators to keep part of their funds in dollars for at least the length of the forward contract, the Treasury has protected its gold reserves from the demands for conversion that might occur if private foreign funds were repatriated and official foreign reserves increased. There have been no operations in sterling, for, in contrast with 1960, the market discount on forward sterling has itself been broadly sufficient to offset the gross interest differential in London's favour.

IN its annual report for 1961, the Swiss National Bank recalls that the sharp weakening of the forward dollar early in 1961 made covered interest arbitrage from Switzerland to the United States unprofitable. The high discount on the forward dollar also made it unprofitable for commercial operators who were awaiting dollar receipts to secure forward cover in the normal way, and they found it cheaper to cover in the spot market by selling dollars to the Swiss National Bank—which was as anxious as the American authorities to stop this movement but is forbidden by law to operate in the forward market. It therefore welcomed, and co-operated with, the United States' purchases of forward dollars, which totalled $150 million. The Treasury loan in Switzerland provided part of the francs (equivalent to $46 million) to make delivery on the forward commitment, but this appears not to have been necessary on a sizeable amount. In practice the American commitments were comfortably unwound in the wake of the weakening of the Swiss franc early this year.

While the US authorities have held various foreign currencies accumulated through advance debt repayments and borrowing abroad, these holdings have not been strictly necessary for their "short" sales in the forward market: their main purpose is appearance. The funds have not been used significantly for spot operations; thus in France, where the dollar's weakness is wholly in the spot market and, because

ABC of Forward Exchange

A forward exchange operation is a contract to exchange one currency for another at a future date at a rate of exchange fixed now. These markets are relatively thin and they are more volatile than spot markets.

Uses (1) *Commercial*—importers and exporters want to fix their receipts and obligations in their own currency.

(2) *Interest arbitrage*—operators who shift funds for maximum interest do not ordinarily want to take an exchange risk and they therefore secure forward cover in the same way as traders.

(3) *Speculation*—some operators do want to take an exchange view; one simple form of bear operation is to sell a currency forward.

Rates, usually expressed as premium or discount on the spot rate, are a resultant of these three influences. In the absence of speculation, normal processes of interest arbitrage will ordinarily bring the forward margin to its "interest parity."

If sterling in New York three months forward is 2.79 while the spot rate is 2.81, this represents an annual rate of discount (premium on the dollar) of 2.85 per cent ($2 \div 2.81 \times 4$). This means that if interest on funds invested in London for three months exceeds that available in New York by this figure or more, a transfer of funds on a covered basis will still be worth while: and the effect of arbitrage on both the forward exchange margin and (normally to a smaller extent) on the interest rates themselves will, in a speculatively neutral situation, bring the forward discount to its interest parity.

If the forward discount is smaller than this, sterling or other European currencies are said to be at an *intrinsic premium* and the dollar at an intrinsic discount. This will encourage not only the transfer, on a covered basis, of funds from New York to Europe for direct interest arbitrage, but also transfers in the same direction by cost-conscious *traders*. Thus European exporters who expect to receive dollars and American importers who expect to need European currencies find it too expensive to secure cover in the forward market: they do better by borrowing dollars in New York and selling them spot at the markedly better rate. Conversely, European importers who expect to need dollars and American exporters who will be receiving European currencies find it cheaper to buy dollars forward, at their large discount, and keep their funds in Europe meanwhile.

of tight French controls on transfers of short-term funds, the forward dollar is actually at a premium, the Federal Reserve has found no use for its credit in francs. In Italy the forward dollar is also at a premium, but this has been partly induced by American operations, which the Italian authorities welcome because they prefer Italian banks to secure forward cover in the market rather than take advantage of the official cost-free swap facilities.

Besides operating on the straight arbitrage calculation, the Treasury has sought to prevent bearish expectations from becoming self-justifying and cumulative. This was particularly important in its first major series of operations in Germany a year ago. As interest rates in Germany were then rather higher than those in the United States, the forward mark should ordinarily have been at a discount against the forward dollar. From March to July the speculative pressure was so intense that the price of forward marks against dollars was well below the lower limit for the spot dollar of 3.97. With forward marks so expensive, traders as well as financial operators found it profitable to keep funds in Germany. These transfers of funds to Germany, it should be noted, were prompted not by a speculative view but on straight considerations of cost. The large premium on the forward mark, itself a result of speculation, turned the "leads and lags" further against the United States, perhaps by as much as $300 million.

To check adverse "indirect arbitrage" by traders it has broadly been necessary to push the price of the forward mark back inside the support limit on the spot rate. But to reverse the flow of funds in direct interest arbitrage, the US authorities would have had to operate on a much bigger scale, buying forward dollars until the rate went to a premium on the spot rate. This would clearly have brought the danger of adverse psychological repercussions, based on the Treasury's huge forward commitment; and it would have made speculation against the dollar completely costless. In the balance the Treasury limited its forward operations to keeping the forward rate under control; the discount in Germany on an annual basis was reduced from 3½ to 1½ per cent in April and May, 1961, though it widened temporarily to 2½ per cent in mid-1961. By then total US forward commitments had reached 1 billion marks, $250 million.

As their forward contracts have matured, the American authorities have had the option of making delivery by using foreign currencies already held or by buying these currencies in the spot market. Intervention has not been unprofitable, since the mark and Swiss franc have been more expensive in the forward market (where the US authorities were sellers) than in the spot market (where the US authorities were buyers). On the basis of partial and probably doctored figures available in the quarterly reports of the Exchange Stabilisation Fund, it appears that the German and Swiss operators (and for that matter, American operators as well) who chose to go short on forward dollars in a speculative flyer may have lost several million dollars to the US Treasury in the second and third quarters of 1961.

The decline in the discount on the forward dollar is partly traceable to this first costly experience in trying the mettle of the US authorities—but only partly. Quite plainly the US authorities have been greatly helped by the simultaneous shift in the underlying balance of payments in Germany and Switzerland. Their operations have been successful in snuffing out speculation when it was already on the wane; and in keeping down movements of short-term funds that were quickly shown to have been unjustifiable. But this very success is in part a function of the American authorities' limited aims, as seen in their caution and their careful timing. This important experiment does not bear out the views of those who look to forward exchange intervention as a panacea and a substitute for other measures; it does show that an active official policy on forward exchange has a very useful part to play alongside them.

BUSINESS NOTES

BANK RATE

Logic of the Budget

The further reduction in Bank rate on Thursday by ½ per cent to 4½ per cent can no longer be described as a reduction from a crisis level or even from an especially high one. Five per cent in recent years has been about the norm: and Thursday's reduction brings Bank rate below the level of last July. This move can indeed be seen as the first step of active official stimulation of the economy. One may still feel that it would have been wiser to relax first on fiscal policy and use interest rates as an effective cover for the balance of payments. But this route has quite plainly been rejected, and the logic of Mr Lloyd's stiff budgeting clearly calls for the relaxation on the monetary side for which the Bank of England and the City have long been pressing. The one surprise is perhaps that Bank rate was reduced below 5 per cent before any release of the banks' special deposits. This regulator, like the tax regulator, has so far moved only upward. Since the Bank of England has not been disturbed by the mild increase in bank advances this year, following the unexpectedly large fall in July-December last, a gesture to reduce special deposits from their present 3 per cent should certainly take precedence over any new cut in Bank rate.

GILT-EDGED NET PRICES

	April 26, 1961	August 4, 1961	April 19, 1962	April 26, 1962
Treasury 5½% 1962	101¼	99^{1}/$_{32}$	100^{17}/$_{32}$	100^{9}/$_{16}$
Conversion 4½% 1964..	98^{1}/$_{32}$	94^{7}/$_{8}$	98^{7}/$_{8}$	99^{1}/$_{8}$
Savings 3% Bonds 1960-70	78^{13}/$_{32}$	74^{15}/$_{16}$	79^{7}/$_{8}$	80^{3}/$_{32}$
Conversion 5½% 1974..	93⅜	87^{23}/$_{32}$	91¼	91^{1}/$_{2}$
Funding 5½% 1982-84..	95⅜	87⅞	90^{11}/$_{16}$	90^{7}/$_{8}$
Treasury 5½% 2008-12 .	90⅜	82¼	88⅜	89¼
War Loan 3½%	57	49^{27}/$_{32}$	55^{7}/$_{16}$	55^{29}/$_{32}$

At 4½ per cent this is still high by international standards. But the bank lending rates that it governs are not, and even money market rates in London are now no longer very far above Continental rates. In Holland and Germany, as recorded below, the course of rates has now turned upward. This may be seen to be in line with the new pattern that is emerging in European payments—but Britain is hardly a surplus country yet. Foreign funds have continued to flow to Britain since the March reductions in Bank rate, though the pace has slackened. Bank rate at 4½ per cent should certainly begin to act as a brake. But to say that the reductions in Bank rate have been specifically designed to discourage the inflow is not quite the right emphasis: rather, the strength of sterling has permitted, and the condition of the domestic economy has not ruled out, reductions in interest rates that the Bank is glad to make as a matter of principle.

Rates on bank advances again came down correspondingly, to ½-1½ per cent over Bank rate; but the blue chip borrowers paying 5 per cent have now hit their minimum. While the reduction may be passed on by some hire-purchase companies, especially on large unit business, the building societies had the prescience to make their usual announcement that mortgage rates would be unaffected by a Bank rate reduction the day before the reduction took place. In the gilt-edged market, short bonds had anticipated the change earlier in the week, and actually dropped back a shade on Thursday. But demand at the long end of the market was encouraged and prices edged up further.

IN THE MARKETS

Equities Jump Ahead

ANTICIPATION of the reduction in Bank rate helped to push up equity prices as well as gilt-edged stocks and in the week to Wednesday's close *The Economist* indicator had risen by 3.6 points to 359.4. Apart from property issues and brewery shares rated as take-over possibilities, there was no great thrust in the equity market before Thursday. The further easing of monetary policy has a more direct impact on fixed interest securities than equities; but it has inspired the market as a whole with a little more confidence and equities rose strongly on Thursday afternoon. But investors must still weigh the disinflationary impact of the budget and, in the international scene, the effect of the latest setback on Wall Street. And definite signs of an expansion in the economy and of an upturn in profits have yet to appear.

A rise in equity prices would not be strongly based unless it were supported by institutional buying and as yet there is no sign that the life offices have changed their attitude towards equity investment. They appear to be largely content to wait for the new issues to come along and their caution is directly reflected in the current popularity of convertible loan stocks. The latest of these has come from the Rank Organisation, which is offering £5¼ million of a 6¼ per cent stock, 1977-82, at 99 and convertible into ordinary shares at prices equivalent to 33s. in 1963, 34s. 2d. in 1964 and 36s. in 1965. As the ordinary shares already stand at 34s. 6d. its success seems assured. So, too, given the current popularity of property shares, does the rights issue on bonus terms by Land Securities Investment Trust; it is raising just over £4½ million by offering stockholders one 10s. ordinary share at par for every three they hold, with the promise of a maintained dividend on the increased capital. With the shares quoted at 47s. the rights are worth nearly 9s. per share. The £4¼ million rights issue proposed by Rugby Portland Cement is also on bonus terms, being in line with the directors' policy of making periodic scrip issues or rights issues on favourable terms without reducing the rate of dividend; shareholders are offered one new share at 45s. 6d. for every four they hold and as the existing shares are quoted at 71s. the rights are worth about 5s. per share.

Setback on Wall Street

A correspondent cables:

NEITHER excellent corporate earnings in the first quarter of this year nor other signs that the economy is expanding have done anything to reassure Wall Street. On Wednesday, for instance, US Steel announced an unchanged dividend and this should have helped to steady the market; but in fact prices suffered a sharp fall and US Steel in very active trading conditions fell to a new low. The Dow Jones industrial average lost more than nine points to close at 683.69, its low point for the year so far. Investors appear to feel that the price stability enforced by Washington is detrimental to profits and equities and they seem unlikely to regain confidence until there are more positive signs that the administration is prepared to improve the lot of business.

If the decline on Wall Street continues it could have an effect on business expectations and confidence. Since the end of the war the stock market has had a surprisingly good record in forecasting the major cyclical turning points in the economy, but even the theorists do not believe that the current decline in equity prices presages an early halt to the expansion in business. The stock market has usually anticipated the swings in the economic cycle by about six months, and with expansion seemingly assured for a longer period than this it would be strange if the stock market fails to make some recovery. But any rally will probably be modest for, in the absence of inflation, equities have lost a good deal of their appeal. This week's selling came in part from Europe and brokers suspect that American investors with foreign accounts were largely responsible. Institutional investors, on the other hand, have not been big sellers in recent weeks and, as they have accumulated funds, they may step in to buy at any time; the belief is, however, that they will wait for selling by small investors to rise to a climax before adding to their equity holdings again.

THE EXCHANGES

Sterling Softens

BUSINESS in the foreign exchange markets over Easter is invariably confused and restricted by the different national holidays and the complications for value dates two days ahead. As the underlying tone of the exchange market remains calm, turnover has been relatively small. Sterling dropped slightly to $2.8130 in anticipation of the Bank rate reduction, and after the change it fell to $2.8110: at this point some support from the control was detected in the market. The weaker tone in sterling is also attributable to commercial influences and the normal swing from the highly favourable first quarter of the year to the more or less seasonally neutral second quarter.

The exchange markets were distinctly surprised by Tuesday's increase in the Dutch Bank rate, but the international repercussions are not expected to be large: since the Dutch commercial banks burned their fingers in foreign money markets with the appreciation of the guilder in March, 1961, they have understandably been markedly more hesitant to place funds abroad, at least without forward exchange cover. And while the guilder has now hardened against the dollar in the spot market, from 3.60 to 3.59½, the premium on the forward guilder has narrowed—this is the normal conjuncture of movements in response to a Bank rate increase—so that there may be no net effect on the margin on covered interest arbitrage against New York, which the United States authorities through sporadic intervention have been trying to turn in their favour.

The United States Treasury lost a further $75 million of gold in the week to April 18th, bringing the loss since January 1st to $355 million. Most of these sales are believed to have gone to Britain, and this year rather more than of late may have stayed there. In 1961, when the Federal Reserve showed sales of $300 million of gold to Britain, Britain's own holdings of gold metal, as published by the International Monetary Fund, fell by $500 million. The difference of $800 million was presumably some measure of the re-sale of US gold through the London market.

OVERSEAS TRADE

Turn of the Tide?

BRITISH exports to the overseas sterling area recovered sharply in March. In the first quarter of 1962 the steady deterioration that occurred throughout 1961 appears to have been halted. Total British exports were only slightly higher than in the final quarter of 1961, but the seasonally adjusted figures suggest that December might have been the low point for exports to sterling area countries which increased in each of the first three months of this year; Australia accounted for half the recovery.

Exports to the common market countries rose by a further 1 per cent between the last quarter of 1961 and the first quarter of this year. They are now 16 per cent higher than a year earlier. Exports to both France and west Germany are advancing strongly; exports to France are 24 per cent higher. But the American market is not proving quite up to expectations. Exports to the United States in the first three months of this year were unchanged at the fourth quarter's level, following the strong recovery towards the end of the last year from the earlier setback.

Imports also continued to expand in the first quarter of 1962. The rise of 1½ per cent between the last two quarters was caused partly by increases in imports of foods and animal feeding stuffs which rose by 3½ per cent; imports of industrial materials declined by a similar amount. Higher prices for foods and animal feeding stuffs helped to swell the value of these imports in the first quarter, but this was offset by a fall in the prices of industrial materials. Imports of fuels and finished manufactures also rose in the first quarter. The Board of Trade believes that the increase in finished manufactures was temporary and does not yet imply an upturn in the trend.

Britain's Falling Share

THE Board of Trade has filled some gaps in published statistics of world trade and has shaken them down into a seasonally adjusted quarterly series. Like all recent statistics of this kidney they make enlightening, but not very encouraging, reading for Britain. Imports by all countries (including Britain, whose imports contracted in 1961) continued to rise last year, while Britain's exports stood still. Britain's exports were kept down because imports of British goods by the rest of the sterling area, particularly Australia, New Zealand and India, fell sharply. Lower prices for primary commodities provided an acceptable explanation of this decline, but the new provisional estimates show that even the primary producers, taken as a whole, increased their total imports last year. Thus Britain's poor performance was again attributable to a decline in its share.

WORLD TRADE*
($ billion)

Quarterly averages	Exports by Industrial countries	Exports by Primary producers	Imports into Industrial countries	Imports into Primary producers
1957.....	16·9	7·81	18·0	9·03
1958.....	16·1	7·41	16·8	8·49
1959.....	17·2	7·82	18·3	8·31

4th „	21·3	8·20†	23·0	9·30†

* Seasonally adjusted. † Provisional.

Despite lower prices for commodities in 1960 and 1961, the value of exports by primary producers continued to rise in these years, as a result of an increase in their volume. However, the seasonally adjusted quarterly figures of exports by primary producers still bear clear marks of the fluctuations in the general level of commodity prices. In the second quarter of 1961, when prices recovered, exports by primary producers reached a peak; but the subsequent setback at the end of the year caused a significant fall in these countries' exports in the last three months of the year.

Neither Australia nor India suffered any appreciable fall in their total earnings in 1960 or 1961, but their imports were reduced from the high level of previous years. And where imports have been cut back the impact has been largely on Britain. Thus, in the first nine months of 1961, Australia's imports fell by 5 per cent; Britain's exports to Australia declined by 12 per cent in this period while west Germany's fell by only 2 per cent.

Exports from industrial countries to primary producers show a clearer trend than imports by primary producers from all sources. If these provisional estimates prove accurate, there has been a continuous increase since the second quarter of 1961. Trade between industrialised countries continued its remarkably steady expansion of about $200-$300 million every quarter.

THE LABOUR MARKET

Unemployed or Unemployable?

UNEMPLOYMENT in mid-April was higher, allowing for seasonal variations, than it had been for just over two years. The end of 1959 had been in no sense a peak in these figures, after several months of boom; but after about a year of stable and then slipping output the number of people wholly unemployed is now up to about the levels to which it had then fallen—from much higher figures in the spring of 1959. The actual total of people wholly or temporarily unemployed last month was still two per cent of the estimated total of employees in Britain, much the same proportion as at the end of 1959. It was higher than this in 1958 and early 1959, but much lower, down to 1.2 per cent, in the middle of last year. At that time, a survey carried out by the Ministry of Labour suggests, only about a third of the people on the books could easily have been placed if the jobs had been available. About a half, through age, disability or "lack of enthusiasm for work" were effectively unemployable.

The statistics of vacancies notified to Labour exchanges display the expected broadly inverse pattern to those of total unemployment. Allowing again for seasonal variations, these are down to the levels of mid-1959, but considerably higher than during most of 1958 and well into 1959. From about the middle of 1960 until early last autumn there were more jobs on offer in Britain than people wholly unemployed. But now there are about nine people out of work, leaving out those temporarily stopped, for every five vacant jobs.

HOLLAND

Turn of the Screw

Money rates in Europe are no longer moving uniformly downwards. Following the recent upturn in money market rates in Germany, the Dutch authorities have this week raised their official discount rate. An Amsterdam correspondent cables:

THE raising of the Dutch bank rate on Tuesday from 3½ to 4 per cent, the first change for two and a half years, is designed to reinforce the restrictive credit policy that the Netherlands Bank has been carrying out for the past year or so to restrain domestic demand. The main objective is internal rather than external. The commercial banks may admittedly now repatriate some of their funds at present held in London and New York, but at the same time the Dutch authorities are reopening the Amsterdam capital market to foreign borrowers to a limited extent.

While the 5 per cent revaluation of the guilder in March, 1961, helped to reduce the 1960 balance of payments surplus of £131 million on current account to £73 million in 1961, and an outflow of capital has led to a net fall in reserves, the internal economy is as strained as ever. The trend towards over-spending is still in evidence and may be intensified by a series of recent wage increases. At the same time the demands of industry for bank credit have led the commercial banks to grant loans in excess of the agreed rate of expansion embodied in a gentlemen's agreement between the Netherlands Bank and the commercial banks—originally 1 per cent a month and since January of ½ per cent a month. The banks have had to deposit around 125 million guilders, equivalent to their overlending, with the Netherlands Bank in the form of non-interest-bearing deposits. Last week the Netherlands Bank also increased the percentage of the special deposits the banks must lodge with it from 6 to 8 per cent.

Permits for the issue of foreign guilder loans will amount to 150 million guilders (£15 million) to be spread over the next six months. The granting of such permits was suspended in the middle of last year after 580 million guilders of foreign guilder bonds had been placed in the Amsterdam market. It is expected that the main borrowers will be Belgian and Scandinavian concerns. The amount is lower than in 1961, the central bank has said, because of "less favourable prospects" for the Netherlands balance of payments.

TRANSPORT

Nationalised Manufacture?

WHEN the tidying-up operation that is the Transport Bill is carried out, railways will be stripped to their essentials, canals and docks will be left by themselves, and the pile of debris that remains will be gathered under the control of a holding company. This will include many bus lines, the British Road Services, shipping companies, travel agents and three companies that make lorries and coaches, Bristol Commercial Vehicles, Eastern Coachworks and Starbodies. These three have caused a quite disproportionate amount of trouble compared with their importance.

Some Conservative MPs are pressing strongly for the three to be sold off, for

For what kind of horse is that?

Your astonishment is understandable. To reach this saddle you'd have to climb two thousand feet en route from Springs Junction to Reefton in faraway New Zealand. And if that seems a surprising piece of information for a bank to dispense, let us quickly add that we bow to nobody in our knowledge of New Zealand. For we are the National Bank of New Zealand and, as such, can claim to know practically all there is to know about our country. This is explained both by the fact that we have been established since 1872 and that we have more than 160 branches and agencies in the North and South Islands. Against such a background, we have acquired an intimate understanding of New Zealand's way of life. So if you want to know anything about anything to do with New Zealand, ask us –

The National Bank
OF NEW ZEALAND LIMITED

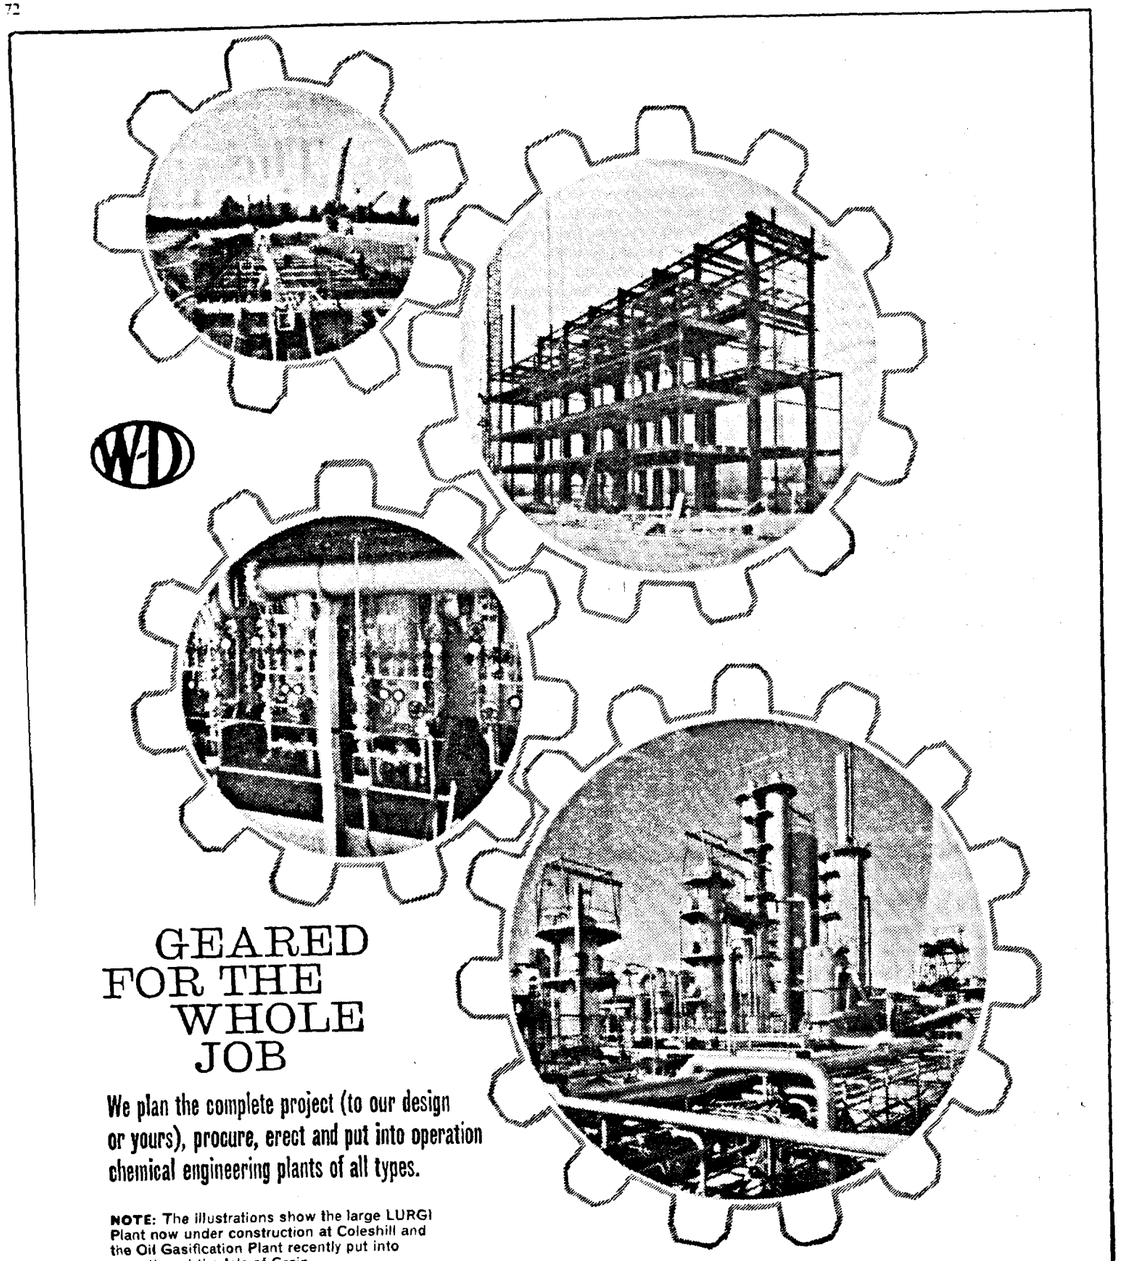
NOMURA

The Economic Mirror

What single factor reflects, most completely, the economic picture of Japan? The Japanese stock market. And what is the picture now? After some fluctuation, the market looks good for investors who are interested in growth stocks.

The basic policy of Nomura Securities is that investments are a type of savings. That is why we have always recommended long term growth stock to our clients. We can't say that investing in Japan is the direct road to wealth. And we can't promise certain results from all investments. But we can promise that the data which we give you about investing are complete and factual.



We place research above everything else when we consider the economic situation in Japan. May we help you with your investments?

Write to Nomura Securities for timely information on the Japanese economy which is backed by facts . . . through research.

THE NOMURA SECURITIES CO., LTD.

Head Office: 1-1, Tori, Nihonbashi, Chuo-ku Tokyo, Japan.
New York Office: 61 Broadway, New York 6, N.Y., U.S.A.

This is neither an offer nor a solicitation of orders for any particular securities.

GEARED FOR THE WHOLE JOB

We plan the complete project (to our design or yours), procure, erect and put into operation chemical engineering plants of all types.

NOTE: The illustrations show the large LURGI Plant now under construction at Coleshill and the Oil Gasification Plant recently put into operation at the Isle of Grain.

A MEMBER OF THE WOODALL-DUCKHAM GROUP OF COMPANIES

reasons which are at best doctrinaire and anyway look curious perched on the commercial intentions of this bill. It is argued that the three will compete with private industry in a way that is intolerable in a nationalised undertaking. Yet, when they were nationalised, they were restricted to selling to the Transport Commission and BRS and were set a maximum quota of their owners' purchases, so that their share of the total commercial vehicle market is now about a half of one per cent. Under the new Bill, the quota would be relaxed, although they would still be limited to the transport organisation as sole customer. But it is questionable whether BRS and the bus companies, which have been giving these captive suppliers about a third of their vehicle business, would have increased this much. Mr Marples has said that there is nothing in the bill to force the sale of the companies, nor is there anything in the bill to prevent it. If a good enough offer were received, it would probably be accepted.

It is hard to see a logical reason why these companies should have been singled out. Most of the companies to be gathered under the new holding company compete with private industry: the receipts of nationalised bus and tram interests, excluding London Transport, comprised nearly a quarter of the national total in 1960. If competing with private interests is to be the criterion, there is no reason why all of the companies in the holding company should not be sold off. Is there some magic about a company which makes money from manufacture rather than a service? Or is it just that some are more profitable than others, and that Tories dislike the existence of any state-owned business that they cannot complain is losing public money?

OIL PRODUCT SALES

Elastic to Taxation?

Even before last year's budget, the rate of increase in consumption of fuel oil in Britain had moderated somewhat, though a mild winter may have been blurring the trend. In 1960 consumption of this oil had been 26 per cent higher than in 1959: from October, 1960, to March, 1961, it was only 16 per cent higher than in the previous winter. From April onwards, with an excise duty of 38s. 6d. a ton later increased to more than £2 a ton, the increase was significantly further eroded: in the remaining nine months of the year, fuel oil consumption was only about 8 per cent higher than in the same months of 1961.

In one of the few petroleum products that can be readily replaced by other fuels, this evidence of price elasticity is not surprising. Paraffin oil used in heating actually showed a fall in consumption of five per cent: part of this can be put down to twopence a gallon and part to lingering distrust of the safety of paraffin heaters is a matter of opinion, though the growth of full central heating is in any case partly reducing demand for occasional heaters such as these. Rather more surprising, the industry is reckoning that last year price elasticity even reared its unfamiliar head in the British gasoline market. For the first time in two years, there was an increase in sales of regular-grade gasolines, which the companies put down to switching by motorists after the 10 per cent surcharge on petrol duty; it was, however, only fractional, while sales of higher-grade gasolines through dealers rose by 12 per cent.

Sales of motor spirit to commercial consumers fell nearly four per cent in a year when road ton-mileage and bus movement of passengers appears to have risen significantly; but sales of derv fuel for diesel-engined road vehicles rose eleven per cent. This was in line with sales of gas and diesel oils in the general fuel market (these fuels are less open to direct substitution than fuel oil). But the biggest increases came in liquid petroleum gases (up 34 per cent) and naphtha for gasmaking (up 24 per cent). These "light distillate feedstocks," plus the petroleum gases, are quite rapidly taking over from gas oil in gasmaking: the use of black oil by the gas industry last year was less than half what it had been in 1958.

MOTORS

Edge of a Boom?

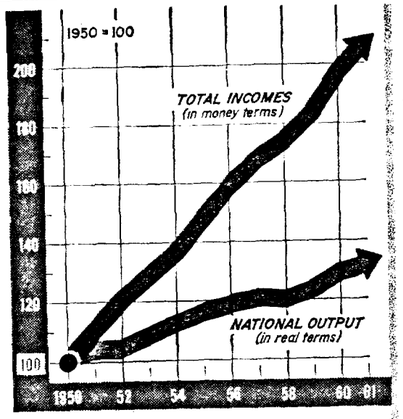
Car production crept up about 2½ per cent in March, to a rate of 26,176 a week. Strikes among some of the manufacturers' suppliers prevented a bigger increase. Ford's output seems to have risen rather more than the total—it was unaffected by strikes and busy raising the production of its new Zephyr-Zodiac range. BMC's production was on average little different from February, though in strike-free weeks it rose about 10 per cent; Rootes was also affected by strikes, which kept down its output. Vauxhall was already making as many cars as it could with its present labour force by February; Standard-Triumph made rather more cars in March.

Home sales seem to have risen about 50 per cent after the budget, compared with a depressed opening to the month and are running at or above the record level reached in March, 1961, when 89,000 cars were sold. This year sales in March were 18 per cent lower, depressed by budget hopes. Despite the big increase recorded, dealers profess themselves disappointed by the situation; they have been expecting too much. If the present rate of sales is maintained, waiting lists for many cars will return by next month.

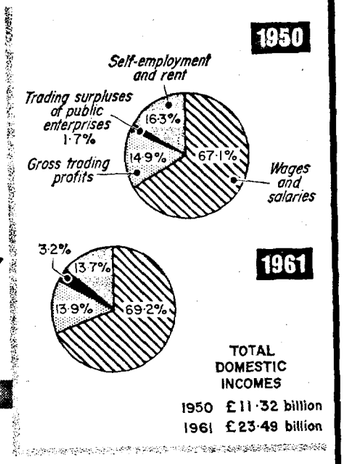
Exports at 46,201. were much the same as in January and February; though shipments to the United States fell a little, there was a sharp rise in those to Australia, and exports to Europe remained high. Exports of commercial vehicles showed some improvement from the disappointing level of January and February, but they were still 14 per cent below those of March last year. For the first quarter of 1962, the exports showed a fall of 25 per cent, whereas car exports were 66 per cent higher.

BREWING

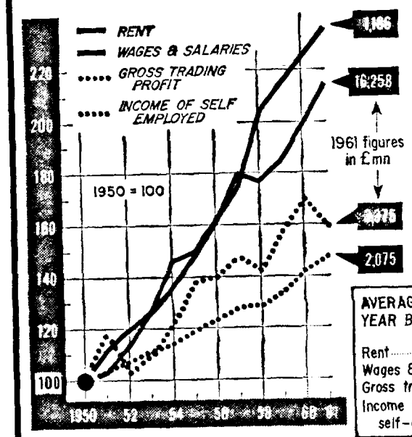
Whitbread Plucks Flowers



For the third time in less than six months, Whitbread has made a bid for all the ordinary share capital in a brewery in which it already had a minority interest. Tennant Brothers was the first, Norman and Pring the second and the third is the biggest of the three—Flowers of Luton and Stratford-upon-Avon. The three bids do not mean that the Whitbread umbrella is becoming tattered; but they do suggest that Whitbread's minority holdings may not in some cases be strong enough to prevent other brewers from considering the possibility of a bid nor tight enough fully to secure economies in distribution. To preserve the family's control over Whitbread, its directors have sought expansion through a network of minority shareholdings and trade agreements; but their recent actions have shown that they are prepared to go further to protect the interests of Whitbread and its associates. And the bid sent the prices of brewing shares, particularly those considered to be take-over possibilities, up sharply on Thursday.



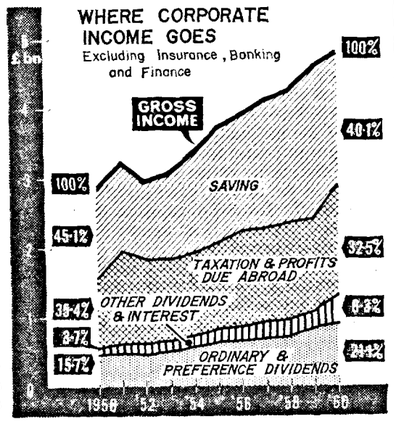
Against the competition of the national brewers Flowers, a medium sized concern, seems to have found the going increasingly hard; it was one of the first, for example, to exploit the market for container draught with its "Keg" bitter, but recently a number of the big brewers have entered this market. Its shares had risen to a high point and the yield offered on them was so low as to suggest that the stock market rated them as a take-over possibility. Its directors saw that the only prospect for expansion lay in a merger and, apparently, it was they who made the first approach. Whitbread, already owning 14 per cent or so of the Flowers equity, welcomed it and both boards strongly recommend shareholders to accept the terms offered—three Whitbread 5s. "A" ordinary shares for every five 5s. ordinary shares in Flowers. With Whitbread "A" shares at 41s. 6d. this imputes a value of about 25s. for Flowers, which stood at 21s. 10½d. on the eve of the bid. As Flowers' directors and their associates and the Whitbread interests hold between them over 30 per cent of the equity, another brewery would find it difficult to counter this bid, which because of the geared voting structure of Whitbread leaves the Whitbread family firmly in control.



The Growth in Incomes

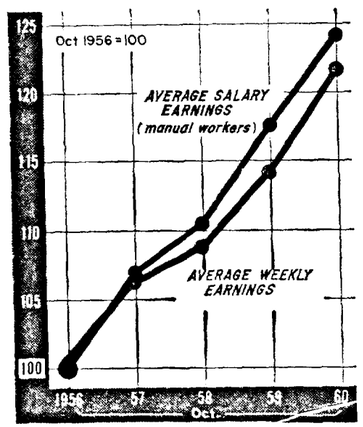
This page illustrates some of the information in the Ministry of Labour's new bulletin which is designed to help arbitrators and wage bargainers.

While the nation's output, in real terms, has gone up by less than a third and productivity per worker by little more than a fifth since 1950, Britain's income, in money terms, has more than doubled. Rent, partially released from the controls which have kept it artificially low, has been the source of the fastest growing income in that period. Growth has been slowest in income from self-employment and, only a little more vigorous in gross trading profits.



The charts alongside relate to the categories of wages and salaries, etc. as a whole; the chart and tables below to individual rates of pay, including the new index of average salary earnings, which applies to administrative, technical and clerical employees, and the hitherto unpublished information about movements in wage rates in individual industries.

The selection of men's actual earnings includes some industries in which pay is comparatively high, and some in which it is comparatively low; all the figures are averages for skilled and unskilled workers in the categories shown.



AVERAGE % INCREASE A YEAR Between 1950 & 1961	
Rent	8·1
Wages & salaries	7·2
Gross trading profits	4·3

NOISE

The Price of Peace

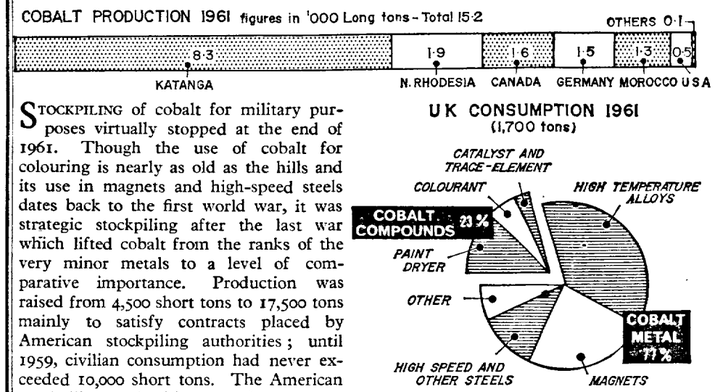
AFTER two years' intensive work, Lord Hailsham's committee on noise has announced that its closing date for evidence will be May 15th. The memorandum just released by the Royal Institute of British Architects is a good example of the difficulties that will face the committee when it gets down to drafting the report that might, at a guess, be on the Minister for Science's desk by the autumn. Noise, like weeds, becomes a nuisance only when it is unwanted, and although the volume of sound can be measured scientifically, the amount of nuisance that it causes cannot. The body can adapt itself to a surprising amount of noise. There is no evidence that it is medically harmful below those ear-splitting levels that actually damage hearing. Yet there is almost universal agreement that

mechanical noise is rapidly coming into the category of a public nuisance. If, the RIBA told the committee, this nuisance is tackled by trying to shut out the noise, it might add a fifth to the cost of all new building that is sound-proofed and air conditioned. The architects therefore pleaded for noise to be tackled at source. "Plant designers appear to have practically no awareness of their responisbility in this respect."

The difficulty facing the committee, most of whose members have technical qualifications and whose chairman is Sir Alan Wilson, is that judgments about noise are subjective, and new noises tend to arouse stronger feelings than the old. Thus the RIBA's memorandum contains no reference to railway noise, or to trains that run in the night; it complains half-heartedly about the noise of road traffic, although there is no reason why manufacturers should not be required to produce quieter engines (if Rolls-Royce can do it, why not BMC?). Its strongest guns are reserved for the newest nuisance, the jet engine and the helicopter. Is this fair? A properly conducted research programme balancing the intensity of noise in built-up areas against its duration might produce interesting results. But nothing can change the fact that the same man who tolerates the racket of a steel mill may be driven berserk by a crying baby, a dripping tap or a love-lorn cat, while his neighbour sleeps through the lot.

BRITISH PETROLEUM

A Third of a Penny



AT the time of the one-for-five scrip issue in September, the directors of British Petroleum said that the total dividend for 1961 was unlikely to exceed that of 1960; but the scaling down of the final to allow for the scrip issue would have involved the odd payment of 1s. 4¾d., tax free, per share and a rounding up of the final to 1s. 5d., tax free, was expected. A final dividend of this amount has duly been declared; this makes the total on the present capital 1s. 11¾d., tax free, which is one third of one penny more than the equivalent payment in 1960. To free itself of these thirds, BP will obviously have to declare an interim of 7d., tax free, this year. On the assumption of a dividend of 2s., tax free, the £1 shares at 35s. 6d. yield just nearly 9¼ per cent, covered about 2¼ times.

SALES AND PROFITS
(£ million)

Six months ended	June 30, 1960	Dec. 31, 1960	June 30, 1961	Dec. 31, 1961
Gross sales	447·5	489·5	479·0	532·6
Net sales	312·2	334·8	323·7	355·7
Gross profit	62·1	62·7	57·7	59·8
Net income	31·5	30·8	26·3	33·8
Gross profit/net sales %	*19·9*	*18·7*	*17·8*	*16·8*
Net income/net sales %	*10·1*	*9·2*	*8·1*	*9·5*

Because of the government's shareholding BP could not have been expected to ignore the chancellor's request for dividend restraint as Shell, aware of its international obligations, did. But BP's results hardly form an appropriate background for an

Cobalt in Civvies

STOCKPILING of cobalt for military purposes virtually stopped at the end of 1961. Though the use of cobalt for colouring is nearly as old as the hills and its use in magnets and high-speed steels dates back to the first world war, it was strategic stockpiling after the last war which lifted cobalt from the ranks of the very minor metals to a level of comparative importance. Production was raised from 4,500 short tons to 17,500 tons mainly to satisfy contracts placed by American stockpiling authorities; until 1959, civilian consumption had never exceeded 10,000 short tons. The American stockpiling authorities now have 39,000 tons of cobalt surplus to their requirements which they might try to sell, barter or give away. Capacity for producing cobalt will increase this year, particularly in Katanga, which already produces much more than half the world's supplies and which raised its output last year despite political troubles.

Cobalt would have been in trouble: in fact, at the free market price of 12s. a lb (£1,344 a ton) to which it has fallen, compared with 14s. at the beginning of 1960, it seems likely that Rhodesian producers like Rhokana and Chibuluma (in the Rhodesian Selection Trust group) are earning no profit. RST's costs two years ago were said to be 11s. 11d. a lb, delivered USA. But since 1958 cobalt has switched its allegiance decisively from the military back to the civilian camp. In 1958 industry accounted for not much more than half total production, but it now absorbs over 90 per cent of output.

American industry was the first to switch to large-scale use of cobalt. The replacement of piston engines by jet and turboprop aero-engines caused a sharp expansion in its application, but after the Korean war and the switch from military aircraft to rockets, America's consumption flattened out. The growing use of nickel—about half as expensive as cobalt—also seems to have impeded growth there. But western Europe, which in the late fifties was catching up America in industrial techniques, doubled its consumption of cobalt after 1958, and is now a far more important consumer than the United States.

Cobalt compounds sprayed on grasslands in Australia have saved cows dying of a deficiency in their diets. Mechanisation and new control techniques will increase the need for magnetic materials, and the use of cobalt alloys and steels seems likely to expand. Consumption is therefore thought likely to double again in the next ten years. By comparison with tin, cobalt will not then be really rare or expensive.

increase. Last year the volume of its sales rose from 72.9 million tons to 78.3 million tons and their value, net of custom and excise duties, went up from £647 million to nearly £679½ million; but its gross profits, excluding dividend and other income, fell from £124½ million to £117½ million and, as the accompanying table shows, the pressure on gross margins intensified in the second half of the year.

AIR TRANSPORT

An Important Move

THE bare announcement that Pan American World Airways has ordered two jet freighters from Boeing does not at first glance seem of great importance, but it very well could be. The market for big passenger-carrying jets is temporarily saturated. The next big round of re-equipment may have to wait for the supersonic airliner, which is ten to fifteen years away. Manufacturers' hopes of work during the lull depend on persuading airlines that they need specially-designed freight aircraft; so far the air lines have been conspicuously reluctant to buy them.

Freight is carried today, with one or two exceptions, either in the holds of passenger airliners, or in old pensioners cheaply converted from passenger-carrying to cargo. All the major airlines have an embarrassment of such obsolete aircraft, including Pan American. The fact that this airline, the largest freight carrier this side of the Iron Curtain, has chosen to invest about £6 million (with spares) in two new Boeing jets specially converted for cargo carrying, rather than making over a few more old piston-engined aircraft at a cost of a mere £100,000 apiece, could be a break-through for the manufacturers who have in the past year or so acquired a noticeably lean and hungry look.

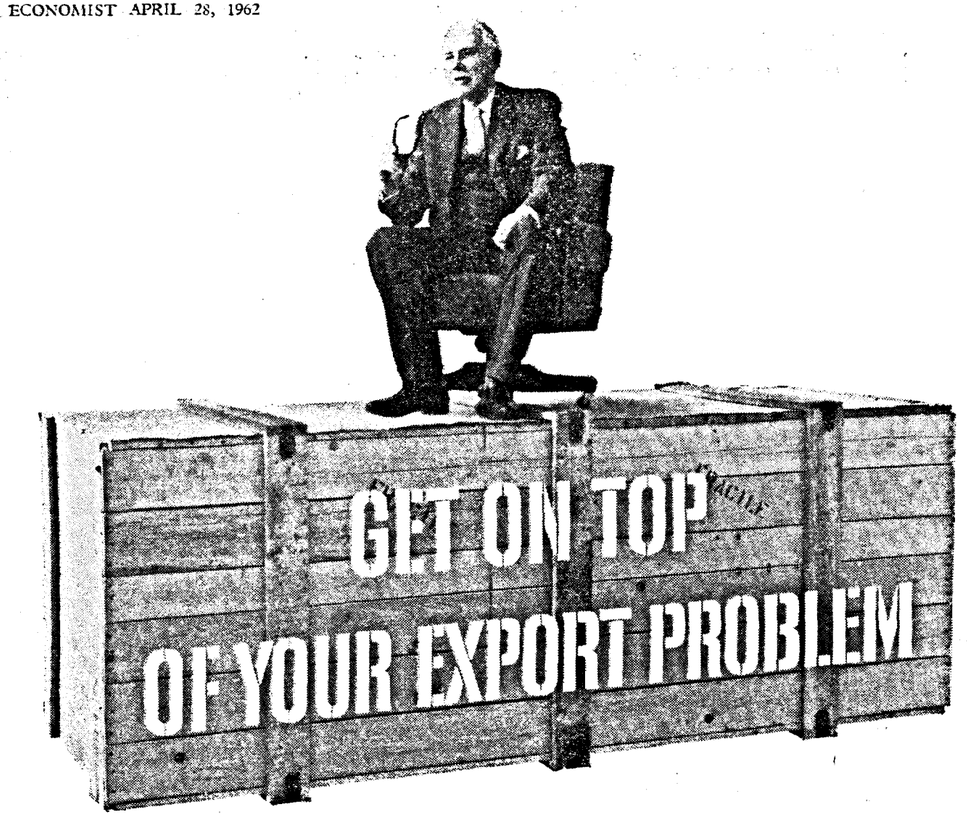
Why is Pan American doing it? The simple answer is that new low cargo rates introduced last summer have produced a big enough tonnage of new freight to justify the investment. But a truer explanation might be the fact that a jet, particularly the Boeing 707, is conspicuously cheaper to operate than a piston-engined aircraft, even one standing at nil on the books. Pan American may have discovered that the new

ARCHITECTS

What Sort of Profession?

ARCHITECTS need dual personalities: they have to be both artist and engineer. From this often over-demanding specification stems many of the problems of the profession, discussed in a massive survey of a sample of architect's offices prepared for the Royal Institute of British Architects.* It recommends many drastic changes in the practice of the profession: education should be more technical in nature, and there should be a place in the profession for the technologist; practical training in the architect's office should be better integrated with the school courses, and give the student some idea of the administrative problems of running an office; technicians should be employed to assist architects in preparing plans; fees for small jobs should be higher and those for large and simple ones should be reduced, while the RIBA should more closely control the service its members provide; and attempts should be made to use more direct means than drawings to give an architect's instructions to the builder.

The RIBA has yet to decide whether it accepts all the recommendations of the survey, but it has appointed an officer to study management problems and a research officer to see how practical training can be fitted in with school courses. But the proposals seem no more than is necessary to fit the architect for the complex role he has to fill; lack of technical knowledge among those in charge of building operations—a branch of technology, if a backward one—has been the most pointed recent criticism of the profession. This is repeated by many of the architects interviewed as a fault of the newly trained, who view design as a matter of self-expression and fail to co-ordinate design and construction. All the major technical skills in architecture now are mostly provided by consultants, without apparently satisfying them or the architects. The only solution that the survey can suggest is "bringing back a substantial proportion of the technical design skills into the architectural profession itself." To do so students should have the chance to specialise in the last two years of their courses; but one wonders whether there should not also be an effort to raise the general standard of technical knowledge in the profession—a five-year course should leave time to acquire a sound knowledge of engineering.



For the majority of architects interviewed to suggest that technical assistants should be used shows the strain on the supply of architects, and recognition of the absurdity of having 42 per cent of unqualified people among their architectural staff—who nominally hope to become architects, but nearly half of whom have little chance of getting qualified. However, the technical assistant should not, the survey suggests, be used as a replacement for a qualified architect, as unqualified staff is now, but should have a specific role excluding the design function. And another load could be taken off the architect if the administration of the office was more generally handed over to another non-professional specialist.

Asking architects what they earn for different types of work revealed some surprising variations; where houses brought in only 13s. for every man-hour of work, commercial work earned 42s., industrial 50s. and conversions 39s. At this rate house designing is clearly unprofitable—though it is the standby of the small architectural practice. It is hardly surprising, therefore, that the average gross income of the principals in offices with a turnover of under £2,000 a year (which formed 27 per cent of the sample) was £580, and that of offices in the turnover range £2,000-£4,999 (26 per cent of the sample) was £1,290, which does not compare very favourably with the earnings of assistant architects shown in the table. The median salary of principals in the offices visited was, however, £4,680. The survey therefore suggests that instead of the fee dropping from 10 per cent for jobs costing under £700 to six per cent at £7,000, the rate of fall should be slower and six per cent not be reached until £30,000 to £50,000. The custom-built house looks like becoming still more of a luxury—though this will not be much of a loss architecturally.

WHAT ASSISTANT ARCHITECTS EARN IN PRIVATE PRACTICE

	Median salary, 1961	Per cent increase since 1955
Age 20–29....	£1,000	37
30–34....	£1,200	44
35–39....	£1,500	44
40–44....	£1,450	42
45–54....	£1,400	33

E.C.G.D. COVER
HELPS YOUR BANK TO BACK YOU

In financing your export business you should find ECGD doubly valuable. An ECGD policy tells your bank manager that your export trade is soundly based. What's more, an ECGD policy assigned to the bank provides collateral that may relieve the burden on your other assets, and so extend the range of your borrowing. The policy covers you—and your bank—against all the main risks: sterling shortages, insolvency of the buyer, and many more. Are you out to expand overseas sales? ECGD is at hand to help—to back you (more cheaply than ever before) so that you can press ahead with singleminded confidence. Insured business is sound business. ECGD makes helpful bank managers even more helpful. Get in touch with ECGD straight away.

Danish molecules dance an English jig

New landmarks have appeared on Copenhagen's waterfront. Early this spring a valve was opened in a pipeline from the Maersk refinery, which supplies the city with most of its gas, and a stream of ethylene began the intricate journey through compressors and reaction vessels that transforms it into one of the world's most versatile plastics: polythene. The high-pressure process that persuades the invisible molecules of an invisible gas to choose partners, link up in long chains and form a tough, resilient plastic, was discovered by I.C.I., Britain's leading chemical company; and today it is used to make most of the one million tons of polythene produced every year throughout the world. In Britain, Australia, Canada and India, I.C.I. and its subsidiary companies operate plants making 'Alkathene' polythene for everything from squeeze-bottles and nailbrushes to packaging film and cable insulation. In seven other countries, 14 manufacturers are licensed by I.C.I. to make polythene, and to build the new polythene plant in Copenhagen, I.C.I. has joined forces with the A. P. Møller Shipping Companies. Once again, I.C.I.'s mastery of mammoth pressures and capricious temperatures will make the molecules dance.

The influence of I.C.I. research and production is felt today in every corner of the globe

Imperial Chemical Industries Ltd., London, S.W.1

freight rates do not pay in the old aircraft and more efficient equipment is needed to break even. If this is so, manufacturers can at long last look forward to a new market in freighter aircraft, and the prospect becomes considerably brighter.

SHIPBUILDING

The World's Largest Importer

THERE is one measure by which British shipyards can usually claim to head the league table of world shipbuilding—the volume of work in hand. Unfortunately, this criterion seems to be influenced largely by the fact that we build ships more slowly than foreign yards, and it certainly seldom matches the record of final achievement—i.e., ships launched and completed. According to Lloyd's Register returns for the first quarter of the year, there are 1,359,297 tons gross of merchant ships under construction in Britain, which is 15½ per cent of the world total. Next comes Japan. But this total is the lowest since the end of the war, and 42 per cent less than the postwar peak of 1958; since that time tonnage under construction abroad has declined by only 7 per cent.

In terms of output during the quarter, however, British shipbuilding is shown up in an unflattering light, as the following figures show:—

	Begun	Launched (tons gross)	Completed
Japan	643,665	472,407	529,741
United Kingdom	226,860	177,293	291,216
West Germany	148,372	218,638	213,511
Sweden	193,194	151,458	177,994

Another illustration of the plight into which the British shipbuilding industry has let itself into over the last few years is the fact that from being the world's largest exporter of ships Britain has now become the world's largest importer. Ships under construction here for export now total only 246,033 tons gross, or 18.1 per cent of the total. Ships being built abroad for British registry total 781,855 tons gross, compared with 571,895 tons for Liberia and 544,262 tons for Norway. Japan, Sweden, Germany, France and the Netherlands all have more export work than Britain.

The export component of the British orderbook is improving, however. According to the Shipbuilding Conference, British yards took orders during the first quarter for a total of 150,000 tons gross, of which 48.4 per cent were for overseas registration, compared with only 7.6 per cent of the 131,000 tons ordered in the same quarter of last year. Total orders booked in the 12 months ended in March amounted to 766,000 tons gross (36.6 per cent for overseas account), compared with 562,000 tons (5.6 for overseas) in the preceding 12 months. Despite the improvement, this intake of new orders is still equivalent to only about one-half of the average annual output capacity; and in the absence of orders from British shipowners work in hand will continue to contract.

RAILWAY ELECTRIFICATION

Reducing Clearances

SERENDIPITY eludes British railways in its technical developments: it is only now, after most of the bridges on the London-Midland line have been rebuilt, that it has been able to persuade the Ministry of Transport that the clearance above the electric conductor wires can be reduced from eleven inches to eight inches. As the clearance between the wire and a moving train has also been reduced, from eight inches to six, the effective saving in space is five inches—which would often have been enough to make the difference between raising a bridge and not.

The only saving that can now be made through this change in London-Midland electrification comes from the possibility of using 25 kV current right through to Euston, instead of switching over to 6.25 kV in London. This will mean rather more work on raising London bridges and tunnels than was planned, as the clearance needed at the lower voltage is only four inches. But it will cut out transformer stations and make the locomotives simpler—building for dual voltages has already proved troublesome. The total saving, therefore, is put at £750,000. But if any new electrification scheme were to be started, the saving would be significant, and make electrification a rather more attractive proposition.

The original eleven-inch clearance had been chosen as the standard used in Europe, where the 25 kV system originated. Most European railways have fewer bridges and bigger clearances, and hence less incentive there to squeeze down the gap. British Railways has, therefore, belatedly, done its own tests—complicated by the need to allow for the effect of smoke in the air, for example—which have convinced it that even with very small clearances there is little risk of a "flash-over" of current from the conductor wire.

HIRE PURCHASE

Peace Manœuvres

IT now seems possible that the hire purchase finance houses will in the near future settle their differences over dealers' commissions, and end the regrettable scramble for dealers' loyalties that has been in progress since United Dominions Trust torpedoed the Finance Houses Association's 10 per cent limit on dealers' commissions two months ago. UDT then offered a sliding scale of commissions of up to 20 per cent despite strong objections from other FHA members. Discussions designed to lay the groundwork for a compromise reached the formal stage last Wednesday when the FHA members met for one of their regular meetings and dealers' commissions, at the suggestion of UDT, were on the agenda—for the first time since the limit was abandoned. The meeting produced no concrete proposals—it was not expected to do so—but presumably it cleared the air.

UDT has obviously hinted that it is willing to climb down from its original position—without that there would have been little point in holding formal discussions. The other members may now agree to a new commission limit of 15 per cent, of which part is dependent on bad debt experience. It seems to be impossible to submit UDT to losing face and returning to 10 per cent; and dealers' commissions of 15 per cent are obviously a good deal better than the commissions of between 20 and 30 per cent that some companies are at present paying their dealers. But it is still a lamentable backward step to have intensified competition in this sphere at all, rather than in reducing charges to the public. The episode should not be at an end in the government's mind.

LIFE ASSURANCE

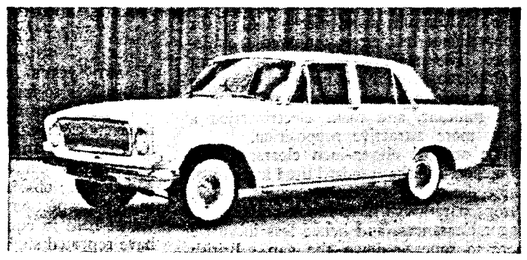
Less Enthusiasm for Equities

LAST year's operations of the life offices so far revealed strongly suggest that the offices were less ready to add to their stake in equities than they had been in 1959 and 1960, though they took up rights issues almost as a matter of course. Most of the offices show a slight reduction in the proportion of total assets at book values held in equities and only a handful have reported slight increases. The Britannic, for example, increased its equity holding from 24.1 to 26.4 per cent of total assets and the Scottish Equitable from 26.9 to 31.5 per cent while the Equity and Law, which had cut its stake from 37.8 to 32.8 per cent in 1960, raised it last year to 34.2 per cent. The National Mutual, which alone shows its securities at market prices, had 39 per cent of its assets in equities at the end of last year, compared with 35.4 per cent the year before.

Two of the leading exponents of equity investment reduced their stake last year. The Scottish Widows' equity shareholding, which reached a peak of 41.4 per cent of total book assets in 1957, fell from 35.3 to 31.6 per cent while the United Kingdom Provident reduced its holding from 36.5 to 35.9 per cent. The life offices, moreover, were most selective in their investments. The Prudential, for instance, restricted its purchases in the first half of 1961, when a short-lived and uneasily based boom took place, to the lowest level "in any six-month period for several years" though ultimately it invested £29 million net in ordinary shares over the year. It sold about £4

million of ordinary shares whose high prices were not "justified by the prospects of the companies concerned" and its end-year stake amounted to 25.7 per cent of total assets, against 24.9 per cent. On the same cautious grounds, the London and Manchester, which in the past has built up its equity portfolio, reduced its holding of ordinary shares from £15 million to £13¼ million, out of total assets of £83¼ million. Over the year as a whole, the leading indices of British ordinary shares fell slightly and gilt-edged prices fell by about 5 per cent: even so most of the offices have reported an increase in inner reserves last year and clearly their cautious attitude towards equity investment has done their policyholders and shareholders no harm.

AIRCRAFT INDUSTRY



Last of the Dynasts

SIR FREDERICK HANDLEY PAGE, who died at Easter, was the last of the aircraft barons who began to build aeroplanes at the start of the century in the same spirit as a man builds a sailing boat today in his garage, and who went on to build companies which they continued to direct until they dropped out one by one in the past few years leaving only Sir Frederick. They were remarkable men who kept an unusually strong family control over their businesses until the scale of aircraft production forced them to seek more and more capital from outside. The price that Sir Frederick paid for retaining this control longer than most was that his company stayed small in an industry that increasingly favoured the giants. His bent was for big aircraft, but it became steadily more obvious that the Handley Page factories lacked the facilities for this kind of production. Their last big order was for the Victor bomber, placed shortly after the war and before the industry began the metamorphosis that led ultimately to the mergers of the 1960s. The company would not get such an order today.

Sir Frederick stayed outside the recent mergers because he was a cooler poker player than his critics were prepared to credit. According to balance sheet values, the company's assets are worth 21s. a share; the shares themselves stood at his death at 11s. but have subsequently risen to 13s. 4½d. It does not have much by way of aircraft orders, so it is unlikely that on the many occasions when mergers were discussed either big group, Hawker Siddeley or the British Aircraft Corporation, were prepared to bid anything approaching 21s. Sir Frederick reasoned that he should not accept any offer that left his shareholders worse off than they would have been had the company been liquidated. The government would dearly like to know whether his successors will continue this policy. Apart from Handley Page, there are few independent aircraft companies left.

NEW FORDS

Faster But Dearer

ZEPHYRS Six and Four, which were announced this week, represent the more utilitarian section of the new big Ford range; the posh end was catered for by the Zodiac announced a fortnight ago. But the prices of these new cars demonstrate pressure on the car makers' costs more than the traditional Ford cheapness; at £929 the Six costs £27 more than the Vauxhall Velox, while the Four, at £847, costs £41 more than the Austin A60—its closest competitor—and the smaller Hillman Super Minx, and £109 more than the Vauxhall Victor. So Ford is relying heavily on the appeal of novelty to sell this car. Both Zephyrs are identical except for the grille, which is divided on the Six though sharing the maw-like appearance of the Four's. The shell is the same as the Zodiac's but for the roof line, with four windows instead of six and two headlamps in place of four. In the back seat the leg room is equal (and inadequate), but the trimming is rather less luxurious—more like a Ford.

Mechanically, the Six is the same as the Zodiac except that the engine develops 98 bhp instead of 109 bhp; the top speed is therefore a little less than the 100 mph achieved by the Zodiac, and the acceleration slightly inferior. The Four has the engine of the Consul 375 that it replaces, modified to develop 68 bhp instead of 59 bhp; it also shares the new four-speed gearbox with the sixes, and its performance is in consequence now comparable to that of its rivals like the A60, where the old Consul was noticeably inferior. Both the Zephyrs are available with the new Borg-Warner automatic transmission for £110 extra, like the Zodiac. This gives a satisfactory performance even on the Four (which has a higher top gear ratio when fitted with it). Ford does not expect to sell many on this car. It charges £16 more than BMC for the same transmission, so it may indeed hardly seem to be trying.

The Zephyrs, naturally enough, share the Zodiac's pleasant handling characteristics. The Four, with its less powerful engine, cannot be provoked into a rear-wheel slide on dry roads even by using maximum throttle, and is therefore a more foolproof car for the unskilled driver. Its ride is rather bouncy, however, over wavy road surfaces; the lighter engine seems to make it smooth out the road less effectively than the sixes. But the Four, like the Six, has power-assisted disc brakes.

ICE-CREAM

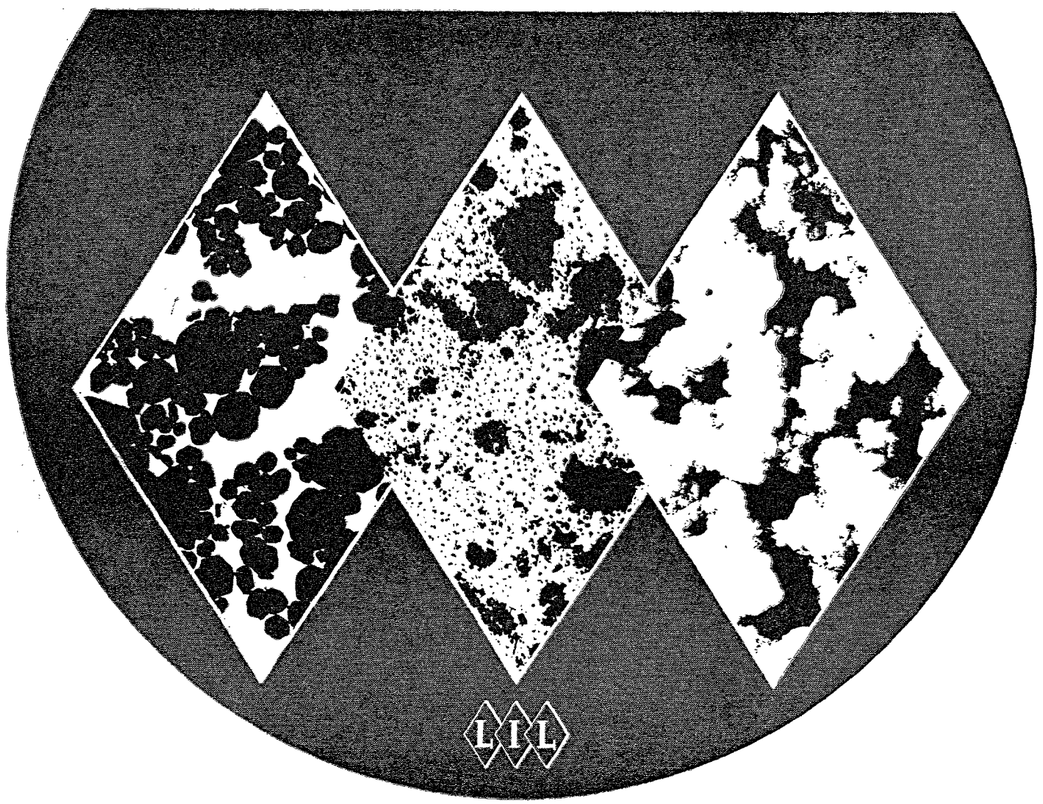
Tax on What?

THE week's grace given to ice-cream manufacturers for working out the exact effect of the 15 per cent purchase tax on their prices seems likely to be largely taken up with the usual representations to the tax authorities of the particular problems of individual firms. For retail purposes the big manufacturers deal mostly in standard sizes and shapes packaged in the factory, as opposed to quantities scooped out in the shop, originally the only way in which ice-cream was sold. Bulk ice-cream is sold to caterers, and still, by small manufacturers, to shopkeepers. More significantly, the increasingly popular soft ice-cream can only be handled in this way, for this is made from dry ingredients in a freezer in the shop.

This is one reason why the large makers have been particularly anxious to find out how the inevitable price increases are likely to affect the retailer of family bricks and ice-lollies as against the man whose bulk ingredients, bought wholesale, cost perhaps half as much—and who therefore may have to pay only half as much of tax on a given quantity of ice-cream as he eventually sells it to consumers. Indeed, the retailer here might argue that he buys no ice-cream at all wholesale; how is one to impute a value to what he "manufactures" on the spot? The Customs and Excise Department's old friend "uplift" may now make a new appearance in the ice-cream scoop.

The crux of the matter is that the cost of producing ice-cream is largely in the freezing, whether this be done in the factory or in the shop or restaurant. Ready-moulded ice-cream bears an additional cost of having to be kept frozen hard from the production line onwards to the point of sale. Even if manufacturers decide to go to the expense of altering their equipment so as to make smaller ice-lollies instead of dearer ones, the saving in ingredients, which anyway make up a fairly small proportion of the total cost, would make too little difference to absorb the tax. When it comes to deciding where and where not to add on their extra pennies, the manufacturers are looking primarily at distribution costs.

"Coal? You're kidding!"



Every schoolboy knows that seeing is believing – and you can't blame the young sceptic for refusing to believe something incredible. Incredible? It was. But today, coal is being delivered under pressure, invisible and dust-proof in its flexible hose – a ton every three minutes – from road tankers to more and more customers. If you want the most economical heat nature can provide, you want coal. And now, coal can be delivered without dust or disturbance, without extra labour or lost time.

The coal industry today is a leader in the development of new techniques; constantly and vigorously demonstrating in so many ways that coal and progress are synonymous.

PROGRESSIVE INDUSTRY PLANS ITS FUTURE ON COAL

ISSUED BY THE NATIONAL COAL BOARD

LAPORTE

LAPORTE STANDS FOR PROGRESS IN THE CHEMICAL INDUSTRY

The chemical industry plays an invisible but vital role in the course of our daily life, entering into the making of almost all the things we eat, touch or use. The main products of the Laporte Group are Hydrogen Peroxide, Titanium Oxide Pigments, Aluminium Compounds, Fullers' Earth, Barium Compounds, Catalysts, Inorganic Acids, Phthalic Anhydride, Fluorides, Plasticisers.

LAPORTE INDUSTRIES LIMITED, Hanover House, Hanover Square, London W.1.

LAPORTE

AIR TRAFFIC

Europe on a Knife-edge

SOME sober words about prospects for Europe's airlines during the next four years have been uttered this month by the *Institut du Transport Aérien*. The trend of air traffic between Britain, the continent and the Middle East, obviously points to expansion: even last year traffic increased by 13 per cent, making a rise of 392 per cent in ten years. Between now and 1965, forecasts the institute, traffic might increase by a steady 14 per cent per annum, giving an increase of 69 per cent over four years. Why then the long faces in the airline business?

Europe's airlines are, with one or two honourable exceptions, generally inefficient. All of them have fallen into the error of increasing their capacity faster than their traffic, although by smaller margins than on the North Atlantic. Last year, for example, capacity inside Europe increased by 19 per cent and outstripped the growth in traffic so that on average only 54 seats out of every 100 were filled. A cost-conscious airline using the most efficient aircraft available might have broken even with these loads. But the costs of most European airlines are high, and even with high fares they need to sell between 65 and 70 per cent of their seats to break even. The institute sees no chance of reaching such figures with the capacity on order unless traffic proves more buoyant than is estimated. By the end of 1965, the airlines' combined capacity seems likely to have increased by 60 per cent. These forecasts of traffic therefore suggest a rise in average load to only about 57 per cent.

TYRES

Gripping Developments

THE new Dunlop C41 tyre, and more particularly the high hysteresis variant of styrene-butadiene rubber that is used for its tread, is one reason why Dunlop is less interested than American companies in the new polydiene synthetic rubbers. The company's research has been concentrated on improving the grip that tyres give, to improve the braking and cornering of cars on the winding and often wet roads of Europe; and this the group has found how to get, cheaply and simply, by varying the composition of oil-extended SBR. The polydienes give long tread life—especially polybutadiene—but they give a less good grip of the road than an ordinary SBR tyre, and are markedly inferior to the new SBRs, which Dunlop calls "high mu" or "road hug" rubbers.

These rubbers have been in production on a small scale for some time past at Fort Dunlop, and were used in the tread of the Elite—the first high hysteresis tyre—and of the Road Speed tyre. They are now in production at International Synthetic Rubber's Hythe plant, and will be used in the treads of all Dunlop tyres; the C41 is being made in sizes that will cover 85 per cent of cars in use (it has been in production since last autumn for Minis and Super Minxes), while the old Gold Seal pattern is retained for the others. The tread pattern of the C41 is the same as that of the Road Speed tyre, and shares its resistance to steering wander on longitudinal ridges. The combination of tread and new rubber gives, Dunlop claims, an increase of 15 per cent in resistance to skidding on a polished asphalt surface—on a rougher surface the gain would be less, but should still be noticeable. The new tyre is also quieter than the old, though producing an odd squelching sound over transverse ridges in the road.

MERCHANT BANKING

Moscow Makes Money

THE Moscow Narodny Bank Ltd. of London reports another forward surge in 1961. Its balance sheet total rose from £55.6 million to £72.1 million—three years earlier it was £8.6 million. The great bulk of the bank's funds comes from correspondents abroad, mainly the central banks of the Soviet block. The funds are lent primarily to finance East-West trade, through advances and discounts to a total of £54.4 million. The Moscow Narodny has also been increasing its activities in the foreign exchange market, and by end-1961 outstanding forward sales and purchases were £22 million either side.

The bank maintains strictly orthodox principles of liquidity: it has £15.9 million in the London money market. It also keeps a careful eye on its capital ratio, and in 1961 made a further call on the Russian banks and trading organisations that are its shareholders, raising the paid up capital to £2 million. This is nearly four times higher than the figure three years ago. But the Russian institutions have seen a good return. Disclosed profits have risen by nearly seven times to £281,585, and Mr A. I. Doubonossov, the vigorous chairman, is paying a dividend of 12 per cent after tax. One wonders whether Soviet bankers manage to get an equivalent return on their domestic operations—on which a little more light may be shed at the international bankers' summer school which takes place this July in Moscow.

SHORTER NOTES

Several stockbrokers have recently asked the Council of the London Stock Exchange for permission to open branch offices abroad. The council is considering these applications and, in the meantime, it is asking members for their views. It is difficult to believe that the council will stand in the way of brokers who wish to extend their services abroad.

*

Despite an increase in the cost of imported food, beverages and tobacco, the index of import prices (base 1954=100) has remained at 96 for six months. A rise of 3 points in food prices has been offset by a reduction in prices of basic materials. The index of export prices in March was 113 for the fourth consecutive month. Since August, the terms of trade (the ratio of import to export prices) have remained at the extremely favourable level of 85, compared with an average of 89 in 1960.

*

Production of man-made fibres recovered to 50 million lb in March, bringing output in the first quarter of the year to 147 million lb, compared with 139 million lb in the corresponding period of 1961. Increased exports account for nearly all of this improvement.

*

Net profit of Rea Brothers, the merchant bankers, rose from £88,000 to £114,000 in the year to December 31, 1961. In his annual address Mr Walter Salomon, the chairman, warned shareholders that while the company continues to grow, the current price of the shares indicated expectations that it would be difficult "to live up to." Shareholders in other merchant banks might also heed this warning.

*

Import quotas are to be imposed on refined sugar from May 1st. In the eight months to December 31st imports will be limited to 135,000 tons, equivalent to an annual rate of 200,000 tons. Imports in 1961 were 222,000 tons, compared with 80,000 tons in 1960. The quota is said to be necessary to protect the marketing of supplies of raw sugar imported here under the Commonwealth Sugar Agreement.

COMPANY MEETINGS

THE PRUDENTIAL ASSURANCE COMPANY LIMITED

(Incorporated in England)

SIR FRANK MORGAN ON DECIMAL COINAGE

COMPANY'S ROLE IN FINANCING EXPORTS

The Annual General Meeting of the Prudential Assurance Company Limited will be held on May 10, 1962, at 142, Holborn Bars, London, E.C.1.

The following is an extract from the Statement by the Chairman, **Sir Frank Morgan, MC,** on the Report of the Directors and Accounts for the year ended December 31, 1961.

Before reviewing the affairs of the Company during 1961 I will refer to a subject of general interest in which insurance companies, and particularly those transacting industrial assurance, will be very much concerned.

DECIMAL COINAGE

Shareholders will be aware that serious attention is being given to the question of decimal coinage and that a committee under Lord Halsbury is now considering the problem, including the most suitable currency unit if a change is to take place. It is the manner of the change that is of peculiar importance to the business of industrial assurance where there are tens of millions of policies, under a large proportion of which premiums amount to a few pence per week.

Two main types of change have been put forward. The first is to use the present £1 or 10s. and to break this down into new sub-units; for example, to divide 10s. into a hundred cents, each of the value of 1.2 pence. The second type is to build upwards from the penny and to have a new unit of a hundred pence of our present currency, viz. 8s. 4d. Under either of these alternatives the labels given to amounts in the present currency have to be changed to the labels of the new currency. For example, an amount of 17s. 6d., i.e. 210d., in the present currency, would have to be re-labelled 1.75 of a new 10s. unit, or 2.10 of a new 8s. 4d. unit. What is not generally realised is that although the labels have to be altered for either system, many realities are affected if the first is chosen, whereas realities are unaffected under the second. A great many of our everyday transactions for such things as bread, milk, bus fares, postage stamps, newspapers, and industrial assurance premiums, are expressed in pence or in shillings and pence. Under the first system, pence cannot be changed exactly into cents and, therefore, the real prices would have to be altered. For example, under the 10s. unit a fare of 5d. becomes 4 and a fraction cents, and would have to be changed either to 4 cents or to 5 cents. The real price must, therefore, either go up or go down. I have little doubt that in many, if not most, cases it would go up. With an 8s. 4d. unit on the other hand, all such amounts can be expressed exactly in terms of the new currency unit and no changes in real prices are necessary.

Any system under which the penny is abolished inevitably creates a most serious difficulty for industrial assurance business. The policies are long-term contracts and the compulsory alteration of the premium during the existence of the contract produces a major administrative problem not only in accounting changes but in the adjustment of benefits to accord with the change in premium. This adjustment would vary with the time the policy has yet to run and while the effect on a policy nearing the end of its course may be trivial, the effect on a contract just issued could be substantial.

There are, no doubt, arguments on both sides, but I feel there may not be a sufficient public awareness of the importance for the everyday life of the community of the provision of exact equivalents in the new coinage.

BONUS DECLARATIONS

Increased rates of reversionary bonus have been declared for policies issued in this country and in most of the major overseas territories in which we operate.

Final bonuses have been declared in both Life branches at the same rates as last year, and again apply to policies of assurance issued in the United Kingdom up to the end of 1958 which become claims by death or maturity during the current year. The total amount allocated by way of final bonuses since we introduced them six years ago is £19½ millions, a significant addition to the contractual benefits, and as such warmly welcomed by Prudential policyholders.

The increases in bonus have been made possible, partly by some increase of surplus from the usual sources, partly because we have felt able to dispense with transfers to the Investment reserve accounts (a feature to which I shall refer later) and partly by changes in the bases of valuation. In view of the continuing high level of market rates of interest in the United Kingdom and certain territories overseas, the rates of interest used in the valuation have been increased as shown in the Valuation Report of the Chief Actuary. The effect of these changes on the year's figures is that the surplus, though not thereby significantly altered in amount, provides a higher rate of reversionary bonus.

The changes in the bases of valuation also have the effect of releasing reserves and these have been amalgamated with existing additional reserves to provide, *inter alia*, a stabilising fund to facilitate the declaration of equitable bonuses. The last few years have seen considerable developments in our bonus declarations, in the variety of bonuses declared and in the much higher level of the rates declared. Bonuses are now a more important factor than at any time in the history of the Life branches.

ORDINARY BRANCH

The total new business figures were again a record.

In the United Kingdom the new premium income was £10½ millions, being more than £2½ millions higher than the corresponding figure for 1960. Of this increase about a half was due to group pension business and over one-quarter to immediate annuities. In my Statement last year I remarked on the increased scope for the sale of immediate annuities due to the provisions of the 1956 Finance Act, and I am glad the hopes I then expressed that our improved rates would lead to an increase in this class of business are beginning to be realised.

In the past our "Heritage" family income benefit policies have normally been issued for a basic sum assured combined with a fixed income benefit payable on death for the balance of 20 years from the date of the policy, but to satisfy the growing market for this type of contract we introduced during the year a flexible arrangement whereby a family income benefit could be assured for various terms and amounts to meet the differing needs of our clients. There are already indications that this modern version of a type of policy first introduced in 1931 will prove very popular.

In the Overseas branches the new premium income again exceeded £3 millions but was slightly lower than in the previous year, due in part to economic difficulties in some territories. Record amounts of new premiums were, however, secured in 1961 in South Africa and in the Rhodesias.

PENSION SCHEME BUSINESS

I was able to tell shareholders a year ago that the introduction of the state graduated pension arrangements had resulted in the setting up of many new occupational pension schemes with the Prudential. The figures for the past year must, therefore, be regarded as unusual. The new premium income for this class of business in the United Kingdom was about 60 per cent greater than for the previous year: about one-half of the new business arose under new schemes and the balance represented new entrants and

increases in benefit under existing schemes. Among the new schemes were some large ones and, in the absence of some special and unexpected stimulus, we cannot hope that schemes of such magnitude will commonly be available in the market in future. Indeed, I feel that for future pension business we must look increasingly to schemes for small firms. I am very conscious of the opportunity—and indeed the obligation that rests perhaps in a particular degree on our Company—to provide facilities through insurance for the retirement of employees of these smaller firms. This class of business does, however, present problems, not the least being that the complex formalities of the Income Tax Acts, which in the case of large organisations may be no more than an irritation, may well constitute a real deterrent to the smaller employer and his employees.

INDUSTRIAL BRANCH

The new sums assured and new premium income in this Branch exceeded the 1960 figures, which were themselves a record, by a substantial margin. Gratifying though this is, I should mention that some part of the increases in new business arises from the replacement of the particularly large number of endowment assurances which matured last year. A more satisfactory measure of progress is the net increase in premium income and last year's figure was the highest for many years. A large proportion of the wage-earning population still turns to industrial—or home service—assurance to meet its life assurance needs, the appeal to the public being based on the convenience and assistance to thrift provided by the regular visit of the agent.

GENERAL BRANCH

In the General Branch the premium income for 1961, including that of our American subsidiary, exceeded £24 millions, an increase of nearly £2 millions over the previous year.

The over-all gross underwriting profit of £537,000 compares with £770,000 for 1960. Each of our main Accounts, however, produced a profit and in the light of the varying results to be anticipated in this Branch the year's operations can be regarded as satisfactory.

Although national fire wastage in the United Kingdom in 1961 continued at a very high rate, it was slightly below that in 1960 and our Home Fire Account produced an improved result. The profit from our Home Motor Account was, however, less than for last year and this is a class of business which continues to have its special difficulties. Motor premium rates were increased in 1961, but the full effect of the increase will not be felt until the current year. Unfortunately, the high level of accidents and the continuing trend of a rise in the average cost of claims absorb the increase in premiums and the position is one which has to be kept under constant review.

In 1961 we were spared anything in the nature of a catastrophe, such as the floods of 1960, but in 1962 severe damage has occurred in Yorkshire and elsewhere as the result of violent storms. This does not, of course, come within the scope of a review of our 1961 figures, but I mention that once again the value of the protection we provide and the prompt service rendered by our staff have been fully appreciated by our policyholders.

Turning to our operations Overseas, which produced a small underwriting profit, satisfactory results in the Sickness and Accident classes more than compensated for underwriting losses in other classes.

Our Marine insurance business still continues satisfactorily despite difficult underwriting conditions, and we have released into surplus the sum of £60,000, most of which is required to cover taxation.

Gross interest earnings in the General Branch have again increased but the benefit of this on our trading profit has been affected by the increase in the rate of profits tax, and the net trading profit of £858,000, after allowing for taxation, is less than the previous year's record figure of £977,000.

DIVIDENDS

The Directors have given careful consideration to the Chancellor's request for restraint in the payment of dividends as part of Government policy aimed at improving the economic position of the country and securing the stability of sterling, and we have decided that it is proper to observe this request. The aims behind the Government's policy are of special importance to the future of insurance.

In the Life branches the increased surplus available has made possible the increased bonuses to policyholders I have already mentioned and also an increased allocation to A shareholders. The dividend has been maintained at 8s. 4d. per share free of income tax and the sum of £286,458 has been transferred to the Dividend reserve fund. This sum would have been distributed as a further dividend of 11d. per share but for the Chancellor's request. The policyholders' allocation of the distributable surplus in each of the Life branches is now 93.78 per cent.

In the case of the B shares the dividend has been maintained at last year's figure of 1s. 10d. per share free of income tax. There would also have been an increase in this dividend were it not for the Chancellor's request but I feel it right to point out that the increase would have been smaller than of recent years. As I have already mentioned, there was a further increase in the interest earnings on the General Branch funds, but this was partially offset by the increased rate of profits tax. A further minor factor is that following the paying up of the B share capital last year there is a charge of £10,000 for the benefit of the A shares on the profits of the General Branch before apportioning the profits between the A and B shares.

INVESTMENTS

During 1961 our total funds increased by £76 millions. We sold investments amounting to £14 millions and the proceeds of these together with repayments of debentures and mortgages gave us a total of £103 millions for new investments.

This new investment was carried out against the background of the economic uncertainties caused by yet another critical situation in the country's balance of payments. Our view of security markets during the first half of the year was affected by the expectation that the authorities would take special action in order to contain this situation, and in the second half of the year we had the effects of the measures which the Chancellor of the Exchequer did in fact announce in July. We took a cautious view of the short-lived rise in ordinary share prices which reached a peak in May and our ordinary share purchases during the first half of 1961 were lower than in any six month period for several years. We did, however, take some advantage of the lower prices ruling in the latter months of the year.

The purchase of all ordinary shares made during the year amounted to £33 millions. This figure includes U.S.A. stocks of £8 millions and an amount of £9 millions which we have subscribed for rights issues. We have also made sales of ordinary shares where high prices were not in our view justified by the prospects of the companies concerned.

I mentioned last year that we undertook substantial commitments during 1960 for investments in connection with property developments to be subscribed in later years and a number of these obligations were met during 1961. During the year we also entered into further commitments in this field, until the Chancellor of the Exchequer made his request to the insurance companies to restrict the supply of finance for property development.

RISE IN YIELDS

The year 1961 saw the highest level of long-term fixed-interest yields of any year this century. The rise in yields had been almost uninterrupted during 1960 and in the spring of 1961 the rise continued as the market began to anticipate the monetary measures eventually taken by the Chancellor in July. Bank rate which was raised to 7 per cent has since been reduced to 5 per cent and long-term yields have been drifting gently downwards. These developments have meant that the fixed-interest investments made by us during the year were on terms which must by historical standards be regarded as extremely favourable.

In addition to the £33 millions of ordinary shares purchased last year we invested over £7 millions in Commonwealth Government Securities, £18 millions in debentures, £3 millions in preference shares, £19 millions in mortgages and £19 millions in the purchase of freehold and leasehold properties.

The dividend receipts from our United Kingdom ordinary share holdings, apart from new investments, again showed an increase but to a much smaller extent than in 1960. In view of the current level of industrial profits and the restraint at present being exercised in the declaration of dividends, it is likely that 1962 will show little, if any, increase in dividend income over 1961.

As far as our new investments are concerned, although high yields were secured on fixed-interest investments, ordinary share purchases were generally made on somewhat lower initial yields. As a result of all these factors the yields on our funds have not increased in 1961 to the extent that was achieved in 1960. The gross yield on the Ordinary Branch fund increased by 1s. 8d. to £6 11s. 8d. per cent and that on the Industrial Branch fund by 4s. 1d. to £6 19s. 0d. per cent.

As I have mentioned earlier in this Statement, we are not this year making transfers to Investment reserve account in the Revenue accounts of any of the three branches. The practice of making these transfers was initiated in 1950 to make provision for future contingencies in respect of the higher yielding classes of securities, Although we still carry securities of this type in our portfolios and will doubtless purchase others in the future, our overall asset position over the last few years has improved to an extent where we feel it unnecessary to continue the practice for the time being.

AID TO EXPORTERS

In April of last year the Chancellor of the

Exchequer announced material improvements in the insurance facilities granted by the Export Credit Guarantee Department. These permitted, *inter alia*, the lengthening in certain circumstances of the maximum period for repayment beyond the previous limit of five years. As five years is the longest term for which the banks normally grant credit, approaches were made to the insurance offices to provide the longer term finance required. Notwithstanding that such commitments are of too short duration to be wholly suitable as investments for life funds, the need for credit was clearly of such urgent national importance that we, in association with other insurance offices, undertook in certain cases to meet the emerging demand for the longer part of the credits. It soon became evident, however, that the requirements of industry in this connection were likely to be of such a volume as to require the setting up of a special organisation to deal with them. In the event a new company has been formed in the creation of which we took an active part and through which the majority of British Insurance Offices have agreed to make available up to £100 millions of finance for export. Of this sum we, the Prudential, are committed to providing the largest individual share. Interest on all commitments entered into during the first five years of the Company's operations is to be at the rate of 6½ per cent per annum throughout the term of the credit.

With the banks agreeing to meet the requirements up to 5 years (also at a fixed and favourable rate of interest), the appeal by industrialists for finance for export to be made more freely available would appear to have been met generously. It is to be hoped that with this help our manufacturers will succeed in securing greatly increased export orders.

STAFF

The continued progress of the Company is a tribute to the enterprise and loyalty of all grades of the staff at home and overseas and there is genuine pride amongst them not only in the achievements of this vast organisation but also in the efficient insurance service which it renders to the public.

I am glad to take this opportunity of expressing our warm appreciation and thanks to all those who have contributed in their respective ways to the results of the year's work.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

OUTSTANDING INDUSTRIAL BRANCH BONUS

The hundred and first Annual General Meeting of the Royal London Mutual Insurance Society Limited was held on April 24th at the Chartered Insurance Institute, 20, Aldermanbury, London, EC.

Mr E. H. Haynes, FIA, chairman and joint managing director presided, and, in the course of his speech, said:

I would like to refer in detail to the position of each of the Society's Branches.

ORDINARY BRANCH

The premium income in the Ordinary Branch (including consideration for annuities granted) amounted to £5,114,000 an increase of £278,000 over the previous year. The Fund at the end of the year amounted to £46,215,000 an increase of £2,203,000. The rate of interest earned, after deduction of income tax, was £4 19s. 5d. per cent, an increase of 5s. 0d.

The amount paid by way of claims and surrenders during the year was £4,096,000.

The new business results in this Branch in 1961 were frankly a disappointment; we had hoped to celebrate our centenary year with yet another record. In point of fact the new sums assured written fell short of the previous year's figure by £507,000. During the year 21,000 contracts were written assuring £22,595,000.

Interim Bonus will be allowed on with profit policies becoming claims etc. during the current year at the rate of Two Pounds Sixteen Shillings per cent. This high rate of Interim Bonus will apply to each of the years 1961 and 1962.

INDUSTRIAL BRANCH

In the Industrial Branch the premium income for the year amounted to £11,908,000, an increase of £419,000 over the previous year. Claims and surrenders amounted to £7,793,000. The Fund at the end of the year amounted to £109,162,000, an increase during the year of £5,724,000. The rate of interest earned, after deduction of income tax, was £5 18s. 2d. per cent, an increase of 2s. 6d.

The sum assured on new policies issued in this Branch shows a small increase over the figures for the previous year. In 1961 303,000 new contracts were written assuring a total of £26,650,000, an increase of £149,000.

Interim Bonus will be allowed at the rate of Two Pounds Five Shillings per cent in respect of the year 1961. In addition the special bonus on claims and maturities announced a year ago is to be consolidated into the Interim Bonus.

The Interim Bonus rate of 45s. per cent is an improvement on the previous rate of no less than 5s. per cent. In the history of Industrial Assurance this bonus stands out as exceptional and makes the Royal London Industrial Branch policy one of the most attractive propositions on the market today.

GENERAL BRANCH

The premium income for this Branch in 1961 was £1,170,000, an increase of £82,000. This increase in premium income represents by a small margin a record for the Society.

The total income of the Society during 1961 was £27,033,000. The benefits paid to policyholders amounted to £11,889,000, bringing the total payments to policyholders since the inception of the Society to more than £198,000,000.

The total funds at the end of 1961 amounted to £169,791,000, an increase during the year of £7,957,000. This sum represents the savings of our members entrusted to our care during the year and is a measure of the confidence of the public in our Society.

The Report and Accounts were unanimously adopted.

INTERNATIONAL NICKEL COMPANY OF CANADA

MR HENRY S. WINGATE LOOKS TO "AN ERA OF PROMISE"

The annual meeting of The International Nickel Company of Canada, Limited, was held on April 18th in Toronto.

Mr Henry S. Wingate (the Chairman) presided and, in the course of his speech, said:

On the same day that our 1961 Annual Report went to press a free world astronaut was rocketed into space. He orbited the earth three times, re-entered the atmosphere and was recovered.

This coincidence has symbolic significance for the shareholders of International Nickel. For the American Mercury Project dramatises, in a way, the new role for nickel created by modern science. The skin of the capsule which carried Colonel Glenn through space was made of a heat-resistant high-nickel alloy. The Atlas rocket that launched the astronaut was sheathed with nickel stainless steel less than 1/25th of an inch thick, and nickel-tubing formed the walls of the thrust chamber in the rocket engines.

The era we are entering will make spectacular and heavy demands for materials to be exposed to extremes of temperatures and stresses. For us it is an era of promise because of the unique qualities present in nickel and in nickel alloys, and of our ability as a Company to assist the industries of the world in solving their rapidly changing materials problems.

Commenting on the effect on the Company of the possible entry into the Common Market of the United Kingdom and other non-member European nations, the Chairman said:

Many important enterprises from other parts of the world are building industrial facilities in Europe, confident that they can share in the opportunities presented and contribute to their development. This forward progress will mean a greater demand for nickel and for the other products which we produce. The economic growth within the Common Market, therefore, in and of itself, will have a direct and beneficial effect upon the business of this Company.

Mr Wingate continued: The outlook for our 1962 business continues to be favourable. North American demand for our nickel is running well ahead of the rate for 1961. For the time being, however, this is offset by lower European demand, with the result that for all areas demand in the first quarter will not reach our record high rate for last year but will be as strong as that for our next best year 1960. As for copper, our total deliveries everywhere should be well above last year.

In summing up the overall effects, I am glad to say that the financial results of all of our operations for the first quarter are likely to show the second highest quarterly earnings we have had in our history.

Finally I bring you special news of present and future importance about our production of nickel in Manitoba. For the first quarter production exceeded the planned capacity of the facilities by 20 per cent. Our ability to lift our Manitoba production from its planned annual capacity of 75,000,000 pounds to an actual output of over 90,000,000 pounds and, if demand requires, to bring our combined Ontario and Manitoba production to 400,000,000 pounds, has now been demonstrated.

The report and accounts were adopted.

THOMAS TILLING LIMITED

MR. W. LIONEL FRASER

reports profits surpassing all previous records

"We are a Family of Firms
We invest in people
We believe British best is unbeatable
We build for the future"

Industries and Companies in which Thomas Tilling holds an interest

The figure beside each industry is the percentage contributed to the 1961 profit before tax attributable to Thomas Tilling Limited as shown by a table in the Annual Report. The figure shown after each Company is the percentage of the equity now owned by Thomas Tilling.

It is very pleasing to report that 1961 was another record year in the history of the company. Group profits exceeded £4,850,000, with the amount attributable to Thomas Tilling Limited topping £3,650,000. Group turnover has now passed the £65 million mark. These figures have not been achieved by sitting back. The going has been tough. But I do claim that our policy of diversification, soundly applied, has proved itself to be a reliable buttress against the economic instability to which some of our industries were subjected during the latter half of 1961. The beginning of the year gave promise of even higher profits than finally transpired, for by the summer all our larger industrial classifications, except textiles, indicated rises, in some cases sizeable ones. Three main factors retarded this forward march—it is the familiar tale—the intensified credit squeeze; increased costs, which had hitherto been absorbed by higher turnover, but which could no longer be offset in the prevailing conditions; and appalling weather which hit the building industry especially towards the end of the year. Nonetheless, before taking into account the profits arising from new acquisitions and additional participations in our present companies, our interests in building supplies and services, engineering and insurance all produced higher results than ever before and more than redressed the balance of others less happily placed. In view of the general malaise in business and the pull on margins and profits, your Directors venture to consider this a really gratifying performance.

Our activities are wide-ranging and substantial and in themselves alone they hold high promise over the years. All the same we still have room for robust, well-directed concerns which can flourish and grow more quickly and on a broader basis than if they were to stay on their own, especially those whose functions lie within the field of our existing interests. Enforced take-overs may well be suitable for others, but as I have said before, they do not conform with our philosophy. We are a Family of Firms and all our companies joined us of their own free will.

We have never deviated from one basic principle—integrity and ability of management—and that principle is uppermost in our thinking when assessing a new candidate. The stark economic facts of our country require a hard-work approach—energetic, productive and ingenious employers as well as energetic, productive and ingenious employees. The key is alert, forward-looking, understanding management which has the courage to be different and does not suppress fresh ideas but reaches out for them. These are times of intensified competition. We cannot merely tread water. In Tillings we are hungry for new ideas and we appreciate those who have them. We invest in people. We build for the future.

What of 1962? Trade in general is not brisk just now, for one reason or another, and of course our own best intentions could be hindered by a lack of national buoyancy if it persists: needless to say, we shall strive ceaselessly to overcome such eventuality. The growth in the country's economy has hitherto disappointed me, but I feel that it is now improving, and beyond this lies the prospect of the stimulus which we anticipate if Britain joins the European Common Market. At this early stage of the year, it is obviously not possible to give a forecast of the profits for 1962, but if present hopes prove to be well-founded, shareholders will again find the results to their satisfaction.

My colleagues and I remain unshakably confident in the further prosperity of Thomas Tilling Limited, as we are in the future of our country. We believe in both because we know that British best is unbeatable.

Above is an extract from the Review by the Chairman, Mr. W. Lionel Fraser. If you would like to receive a copy of the full Review, Report and Accounts please write to:

The Secretary, Thomas Tilling Limited, 19. Crewe House, Curzon Street, London, W.1.

Thomas Tilling Limited and Subsidiary Companies Ten-year Record—1952 to 1961

Year	Profit	Funds				Ratios			
	Profit before tax attributable to Thomas Tilling Limited (A)	Preference Capital	Ordinary Capital	Reserves (*excluding Tax Reserves*)	Total Funds (B)	Profit (A) to Funds (B)	'Earnings' on Ordinary Capital*	Gross Rate of Ordinary Dividend*	
	Thousands of £'s					Percentages			
1952	865	300	4,120	2,559	6,979	12.39	14.1	7½	(6.2)
1953	911	300	4,120	2,710	7,130	12.78	13.6	7½	(6.2)
1954	1,014	300	4,120	2,904	7,324	13.84	16.2	10	(8.3)
1955	1,521	2,500	4,200	3,155	9,855	15.43	22.9	10	(8.3)
1956	1,675	2,500	4,245	3,739	10,484	15.98	24.9	11¼	(9.3)
1957	1,984	2,500	4,593	4,147	11,240	17.65	25.7	13¼	(11.0)
1958	1,831	2,600	4,967	5,132	12,699	14.42	21.7	13¼	(11.0)
1959	2,573	2,600	5,464	5,555	13,619	18.89	33.9	17	(15.5)
1960	3,104	5,275	6,208	6,323	17,806	17.43	39.4	20	
1961	3,681	5,535	7,140	10,448	23,123	15.92	41.9	20	

NOTE: *The 'Earnings' percentages and the dividend rates which are shown in brackets take account of the one for ten capitalisation issues made in May, 1959, and May, 1960, and are thus properly comparable with subsequent rates.

THOMAS TILLING LIMITED—A FAMILY OF FIRMS

LONDON AND MANCHESTER
ASSURANCE COMPANY LIMITED

VALUE OF HOME SERVICE INSURANCE

INCREASED DEMAND FOR ENDOWMENT SHARE PURCHASE PLAN

SUBSTANTIAL INCREASES IN RATES OF INTEREST EARNED

The ninety-third Annual General Meeting of London and Manchester Assurance Company Limited, will be held on 9th May, 1962, at 50, Finsbury Square, London, E.C.2.

The following is the statement by the Chairman, Mr Lewis G. Whyte, FFA, circulated with the report and accounts for the year ended December 31, 1961:

I wish on your behalf to tender thanks to Lord Grantchester for the work he has done for the company during the eight years he served as Chairman. During that time the company has become better known, its reputation has grown, its financial strength has improved, its business has expanded, and the foundations have been laid for further growth and prosperity in years to come.

On succeeding to the Chair I would first like to thank the executive directors for their hard work and skilled advice: Mr Mann, our Managing Director; Mr Wilson, our Actuary; Mr Reed, whose chief responsibility is with the field staff; and Mr Browne, our Secretary. It was with pleasure that the directors co-opted Mr Browne to the Board at the beginning of the current year. We also extend a warm welcome to Mr Denys Oppé. He has a wide experience of investment and industrial matters and will prove to be a valued colleague.

No company can be greater than the men and women who work for it, and I would like to begin rather than end my Statement by thanking all members of the staff for their loyal and efficient work during the year. As the Report indicates, it has been a successful year, but expansion brings its problems and the challenge has been well met.

In nearly all the important aspects of the company's business it has been another record year but, as is also the case with many other companies, when records become the custom, they lose some of their significance. Records should not be an end in themselves. We believe the primary approach should be to give increasingly good value, better personal service, to offer contracts which meet the needs of the times, and to present them fairly and vigorously to our potential policyholders. In such ways the continued progress of the company should be assured.

ORDINARY BRANCH

The following table shows the premium income, the new sums assured and the rate of bonus declared for the last five years:

	Premium Income ('000s)	*New Sums Assured* ('000s)	*Rate of Bonus*
	£	£	%
1961 ...	4,001	12,723	52s.
1960 ...	3,678	9,967	50s.
1959 ...	3,380	7,795	48s.*
1958 ...	3,198	6,180	45s.
1957 ...	2,991	5,649	42s.

*Plus a special bonus equal to 25% of bonuses already declared.

The business written by our field staff has shown a satisfactory increase: the rate of increase from business transacted through insurance brokers, especially in respect of the company's special schemes, has accelerated in recent years. The Endowment Share Purchase Plan is meeting with an increasing demand, and the sums assured arising from this business have more than doubled during the year under review. We have also had a satisfactory increase in the business written under our special non-profit rates for sums assured of £5,000 and over. Both these classes of business are additional to what is obtained directly by our field staff and in no way diminish their scope. There is ample room for business derived from these two separate parts of our organisation to expand side by side in a complementary manner.

It is interesting to note that the total new sums assured under all policies within our Ordinary Branch have doubled during the last three years. This rate of expansion is, in the main, responsible for the increase in the expense ratio over this period. For the year under review it was 17.18 per cent compared with 16.18 per cent a year ago, taking into account in both instances the contribution to the Staff's Pension Fund. While it is too much to expect expansion to continue at this rate, your directors look forward to a satisfactory growth of business in the foreseeable future.

INDUSTRIAL BRANCH

The following table shows premium income and new sums assured in this branch during the past five years, together with the total cost of reversionary bonuses allocated to policyholders. Growth of business has continued at a steady rate. The figures for reversionary bonuses demonstrate as clearly as possible the increasing value which our policyholders obtain in this branch.

	Premium Income ('000s)	*New Sums Assured* ('000s)	*Cost of Bonuses* ('000s)
	£	£	£
1961 ...	4,551	8,403	1,424
1960 ...	4,355	7,657	1,235
1959 ...	4,143	7,289	1,057*
1958 ...	3,977	6,886	731
1957 ...	3,825	6,526	580

*Plus a special non-recurring bonus costing £1,028,700.

The expense ratio was 30.53 per cent compared with 30.66 per cent for the previous year, including in both cases the contribution to the Staff's Pension Fund. A substantial proportion of the expenses arises from the provision for frequent collection, mainly weekly, at the policyholder's home, without which it is doubtful whether the vast regular savings through Home Service Insurance would ever be made. This is the form of home service which the policyholder greatly values and is prepared to pay for, as well as for the benefit of life assurance cover and the ultimate financial reward. The bulk of new policies issued continues to be of the endowment type, and all policies in the Industrial Branch share in the profits of that branch.

CLAIMS

You will notice that claims in the Ordinary Branch have increased by £481,000 and in the Industrial Branch by £714,000. In both branches this arises mainly from claims by maturity and for the following two reasons. The first is the relatively large amount of fifteen-year endowment assurance business written in the immediate post-war years and the second is the growing amount of bonus attaching to claims.

FIRE AND GENERAL BRANCH

The premium income of the Fire and General Branch was £455,462 against £428,721 for the previous year. The amount carried to Profit and Loss Account is £7,909 compared with £13,312 for the previous year. Although this branch may appear relatively small compared with other branches, it is nevertheless an important part of our business. Last year some 21,000 new policies were issued, and we look upon this business as a useful extra service which we can give to many of our life assurance policyholders in both branches. All the business is reinsured with the County Fire Office, and I would like on behalf of the Board to thank their directors and staff for the efficient and kindly help given to our own staff during the year.

INVESTMENT TRUST RETIREMENT ANNUITIES

This fund has now grown to £2,379,000 and the benefits to policyholders augur well, especially for those who took out their policies in the early years of this contract's existence. The price of Investment-Trust-Units (upon which the single premium deferred annuity is based) is now some 2.8 times the price ruling when the policy was first introduced in January, 1957. Owing to the necessity of building up reserves and to the lower yield currently available on the units, the fund has shown only a very small surplus and it may be some time before the question can arise of distributing any profit.

PROFIT AND LOSS ACCOUNT AND DIVIDEND

The sum transferred to the Profit and Loss Account from the Ordinary Branch is £111,000, compared with £102,400 in the previous year. In the Industrial Branch the sum is £158,250, compared with £137,200 in the previous year. In both cases these sums represent one-ninth of the cost of bonuses allocated to policyholders, thus preserving the 10-90 per cent proportion which is now the company's normal practice. In accordance with the Chancellor of the Exchequer's request for dividend restraint, your directors recommend the payment of a final dividend of 1s. 8.25d. per share, free of tax, making a total of 2s. 8.25d. per share, free of tax, for the year, the same as for the previous year. You will notice that the balance of Profit and Loss Account has increased over the year by £30,131. In normal circumstances your directors would have been able to recommend a moderate increase in the rate of dividend.

INVESTMENTS

Substantial changes have been made in the investment portfolio during the course of the year. They have brought about a reduction in the investment in ordinary stocks and shares and an increase in mortgages on property and on shares and also in debenture stocks and preference stocks. The main reasons for these changes arose from an objective assessment of the value of many securities, especially at times when the ordinary share market was particularly strong. Although your directors are satisfied on the long-term merits of your company's ordinary share portfolio (the market value of which is substantially in excess of the Balance Sheet value), they felt that in quite a number of cases prices had reached levels where the future was being assessed too optimistically and insufficient allowance was being made for possible adversities. They felt also that prices of long-dated British Government stocks and guaranteed stocks had, in the latter half of the year, fallen to attractive levels and a considerable re-arrangement of the portfolio of these stocks was made, which has resulted in increasing the average term and also the yield.

The aggregate value of the Stock Exchange investments shows a satisfactory margin over the value shown in the Balance Sheet and this margin is significantly higher than the comparable figure for the previous year. The average rate of interest earned on the funds has increased from £6 7s. 3d. per cent to £6 15s. 8d. per cent in the Ordinary Branch and from £6 7s. 5d. per cent to £6 15s. 11d. per cent in the Industrial Branch. Notwithstanding the substantial increase in the rates of interest earned last year, your directors are reasonably confident that these rates can at least be maintained during the current year, provided always that no severe and unexpected misfortunes occur.

COMPUTER

The Insurance Industry is becoming more appreciative of the great potential value of electronic computers, and your company continues to occupy a leading position in this new development. During the past year we have made increasing use of our Pegasus computer and the actuarial valuations for both Life Branches, which used to necessitate considerable overtime work by the staff, are now carried out on it.

We have extensive scope for Automatic Data Processing in our accounting systems, which have to deal with 750,000 individual premium payments per annum in respect of Ordinary Branch and Fire and General Branch policies and to cater for nearly two million Industrial Branch policies, the premiums for which are payable weekly. The transfer of these systems to the computer is progressing well and part has already been completed.

CAPITAL

I refer now to the Resolution which will be put before you at the forthcoming Annual General Meeting, to increase the authorised capital of the company from £500,000 to £1,050,000. If this Resolution is passed, it is the directors' intention to offer to shareholders on May 11, 1962, 2,173,565 shares of 5s. each at a price of 5s. per share in the proportion of eleven new shares for every ten shares held. In the case of shareholders who do not take up their entitlement, and in cases of fractional entitlement, the shares will be sold in the market and the shareholders concerned paid the appropriate amount in cash.

The purpose of this issue is solely to bring the issued capital of the company to over £1 million and thus bring its shares within the wider range section of the Trustee Investments Act, 1961. I think you will agree that this proposal is to the general advantage of the company. As was indicated in the preliminary announcement, the increase in capital will affect the Profit and Loss Account and the sum distributed as dividend only to the extent of the extra interest earned on the proprietors' fund brought about by the increased capital.

Your directors hope that these proposals will meet with your approval.

GEORGE

AND CO.

WORK DONE IN 1961

The Annual General Meeting of George Wimpey and Co. Limited will be held on May 16th in London.

The following is an extract from **Sir Godfrey Mitchell's** statement:

The year 1961 proved to be the busiest year in your Company's history. The value of works carried out by us for clients exceeded £90,000,000, but rising costs of labour and materials created unforeseen burdens which imposed on us a year of quite unprecedented strain.

ACCOUNTS

The Accounts show that the group profits, before taxation, amounted to £3,209,217 as compared with £3,137,207 in 1960, whilst the profit after taxation was £1,777,217 as against £1,854,207 in 1960.

	1961	1960
	£	£
Profit before taxation	3,209,217	3,137,207
LESS taxation	1,432,000	1,283,000
Profit after taxation	1,777,217	1,854,207
Retained in business	1,477,857	1,554,847
Dividends (net)	299,360	299,360
Issued Share Capital	5,545,000	3,545,000
Revenue Reserves	8,361,260	8,883,403
Capital and Reserves	13,906,260	12,428,403

CIVIL ENGINEERING AND INDUSTRIAL DEVELOPMENT

We were again active on a large number of important projects.

Among those completed during the year were the wide flange beam mill for South Durham Steel & Iron Co. Ltd., our comprehensive work for Barrow Steelworks Limited and site preparation works for the Park Gate Iron & Steel Company Limited at Rotherham.

Several contracts with the British Transport Commission were completed and work continues on others. Our contract for an oxygen plant in South Wales for British Oxygen Company Limited was extended to include the construction of a hydrogen and nitrogen plant.

We obtained further contracts at London Airport and the major project at Severnside for Imperial Chemical Industries Limited progressed most successfully.

A 4½-mile dual carriageway on the A.1 was completed and a start made on our £6 million contract for a section of the M.2 motorway in Kent. Our contract for 4½ miles of roadworks and bridges on the Torryburn By-Pass, Fife, is well advanced.

Work continues on the Loch Awe hydro-electric scheme and on our Tunnelling contract for the National Coal Board at Parkside Colliery.

Our contract with Steetley Magnesite Company Limited for the construction of a jetty and off-shore pumping station at Hartlepool is approaching completion and work continues on a large settling tank for the same client.

HOUSES AND FLATS

We again built a very substantial number of dwellings for local authorities throughout the country.

Among the many high flats schemes were three 20-storey blocks for the City of Glasgow; five 14-storey blocks for the City of Liverpool; the comprehensive redevelopment scheme for the City of Sheffield and fourteen 12-storey blocks for the City of Leeds. We also undertook several schemes embodying 12-storey flats for the City of Manchester and a mixed development of 455 dwellings including 16-storey blocks at Preston. A project featuring 9 and 15-storey flats in the City of Edinburgh was completed and work continues for the City of Bristol.

In all, we completed during the year over 14,000 houses and flats; of these 8,014 were for local authorities, of which 6,357 were built in No-Fines concrete. Between 1948 and 1961 we received contracts from local authorities for some 138,000 dwellings, of which 120,850 were constructed in No-Fines concrete.

In 1961 we built and sold some 6,000 houses and flats for private purchasers on 157 sites throughout the country.

OTHER BUILDING

The construction of the Queen Elizabeth II Grandstand at Ascot Race Course, including the demolition of the old stand, was completed in less than ten months.

Other substantial building contracts included a new office block and laboratories at Harrogate for Imperial Chemical Industries Limited, warehouse extensions for Grattan Warehouses Ltd., extensions to the Papyrus paper board mill at Tadcaster; a new machine shop and office block for Hepworth & Grandage Ltd., and several bakeries for leading groups of companies.

To the schools and hospitals programmes we are contributing the new Billingham Campus School and a Student Nurses Home and teaching block at Peterborough.

CITY DEVELOPMENT

On the construction of offices and shops in London and the provinces, progress has been disappointing owing to delays in obtaining planning approvals and other complications inherent in this type of work. We are, however, pressing on as hard as we can to completion and letting, so that the ultimate aim of addition to our income may be achieved as soon as possible.

You may have seen comments in the Press and elsewhere about the Wimpey interests in this type of property development. The main business of your Company is in civil engineering and building on a normal contract basis, but in recent years substantial additional work has been obtained by entering into closer association with parties interested in the development of office and shop properties. If the developments are successful, net equity income will arise and the Wimpey share will add to the Company's income over the years succeeding the terminations of the developments. There are many uncertainties and it would be most undesirable to forecast the income involved, but it is emphasised that this income cannot be estimated simply from the cost of the project. The income arises from the excess, if any, of rent received over the interest on the cost.

You will recollect that, in my report for 1960, I made the Shareholders aware of the extent to which we are interested in this field by quoting the approximate total of £33 million as representing the site values and estimated cost of the buildings for the projects in which we are financially interested.

WIMPEY

LIMITED

EXCEEDED £90,000,000

It would appear that many have the impression that, immediately after initial acquisition of a promising site, a very appreciable profit accrues to the purchaser. This, of course, is absurd, and entirely ignores all the costs and other related factors. As an indication of what is involved, on the average a period of anything from five to six years elapses between the initial acquisition and the year when a developer can expect to receive the first normal full year's net income from a project. From one to two years can be taken up in satisfying Planning Authorities, the Fine Art Commission, Local and Traffic Authorities, before it is clear to proceed with development; thereafter large projects can absorb the best part of a year in such matters as demolition, excavation, piling and foundation work, followed by up to two years for building; some further time elapses before the building is let and re-financed, and only after all these operations have been disposed of can net equity income available for distribution arise.

Our target in these matters is a share of the ultimate net equity income arising from these developments, so that after the intervals indicated above they will be reflected by dividends receivable by our Group from the Property Investment Companies concerned, and these are set out in the Profit and Loss Account.

MECHANICAL, ELECTRICAL AND CHEMICAL ENGINEERING

Our mechanical and electrical engineering division continues to carry out many design, procurement, and construction contracts for leading industrialists at home and abroad.

Substantial progress has been made on the Fibres factory for Imperial Chemical Industries Limited at Kilroot, Northern Ireland, and on the petrochemicals plant at Carrington for Shell Chemical Company Limited. At Grangemouth, we completed the extension of the polyethylene plant for Union Carbide Limited and a methanol plant for Chemical Construction (G.B.) Limited and British Hydro-carbon Chemicals Ltd.

Our two major projects at the Kent Oil Refinery for British Petroleum Company Limited are well advanced.

Work continues on the erection of mechanical plant and equipment at the new Spencer steel works near Newport for Richard Thomas & Baldwins Limited in conjunction with United Engineering & Foundry Company of Pittsburg and also on our sub-contract for Davey & United Engineering Company Limited for similar work.

Work continues at the Shell Stanlow Refinery including the construction of a microcrystalline wax plant. The design and construction of a coal handling plant at Richborough Power Station is in progress.

OPENCAST COAL

Our production during the year continued on a similar scale to that of the previous year, but will run down in 1962 if further contracts are not secured.

WIMPEY ASPHALT

A considerable tonnage of asphalt and coated macadam was manufactured and laid for many local authorities and we started our surfacing contract for 18 miles of the M.6 Motorway in Staffordshire.

Our limestone quarries in Lancashire and Derbyshire were active and we acquired a sand and gravel company in Kent. The Margam Slag Company Limited, owned jointly with the Steel Company of Wales Limited, was in production throughout the year. Our mastic asphalt section continues to increase its activities.

OVERSEAS

Union Carbide Limited awarded us a contract for the design, procurement and erection of a polyethylene plant in Sweden being built in conjunction with their Swedish associates, Stockholms Superfosfat Fabric A.B. The £3 million polyethylene plant in Australia, which we constructed for them, was completed and the various contracts awarded us by C.S.R.C.-Dow Pty. Ltd., at Altona, Australia, are also virtually finished.

Our other operations in Australia continue to expand and we are developing building estates in Sydney, Melbourne and Canberra.

In Canada, we again undertook a large volume of building and civil engineering work.

Recently, an agreement was signed between the Government of Peru and an international consortium formed by English Electric Company Limited, Siemens-Schuckertwerke A.G. of Erlangen, Germany, and ourselves. This agreement covers the construction of Peru's largest power station at an estimated cost of £30 million. Also in Peru, work on our major contract for the development of Salaverry harbour continues.

We won a contract for constructing a causeway and slipway at Bahrein for Messrs Yusuf Bin Ahmed Kanoo and our harbour and marine work continues at Das Island for British Petroleum Co. Ltd. Elsewhere in the Arabian Gulf we completed additional berthing islands for Basra Petroleum Company at Fao and, in conjunction with Kuwait Bechtel Corporation, we continued to work for the Kuwait Oil Co. Ltd.

The hydro-electric scheme in Brazil for Central Electrica de Furnas, S.A., is making good progress.

Off the shores of Trinidad, we continued the construction of marine oil-drilling platforms and are engaged on shore facilities and refinery work. In Nigeria we completed a bitumen plant and also formed a company with the Conder Engineering Co. Ltd. similar to one already formed in Australia for the manufacture and sale of Conder Steel buildings.

Following the completion of our £6 million oil storage scheme for N.A.T.O. in Malta, we are linked with Royal Netherlands Harbour Works Company Ltd. in a contract valued at nearly £2 million, awarded by Bailey (Malta) Limited for alterations to the Naval Dockyard.

Millspaugh Wimpey Limited, owned jointly with Millspaugh Ltd., obtained a contract valued at over £3 million for a complete pulp and paper mill in Yugoslavia.

CENTRAL LABORATORY

Many authorities in Great Britain and abroad entrusted us with site investigations, a particular feature being marine investigations involving the collection of hydrographical and meteorological data and geophysical explorations.

Equipment was developed for drilling and grouting large steel tubes into the rocky seabed in the construction of dolphins for a tanker berth for Abu Dhabi Marine Areas Ltd., in the Arabian Gulf.

Our hydraulics laboratory constructed and operated models for a number of leading consulting engineers.

STAFF AND WORKPEOPLE

I know you would wish me to record our warm appreciation of the efforts of our staff and workpeople throughout the world. Their loyalty, hard work and enthusiasm during the year have been beyond praise.

As to the current year, since our industry depends, above all, on general confidence in the country's economic future and this confidence is an intangible very hard to gauge, I have never found it more difficult to attempt to assess the prospects. But our operations and resources cover such a wide field that I expect we shall secure a full share of whatever work is available.

BICC

SIR WILLIAM McFADZEAN'S STATEMENT

The following are extracts from the circulated statement of the Chairman, **Sir William McFadzean, CA, Companion IEE,** on the 1961 Accounts.

TRADING RESULTS

1961 was a year of great activity in the BICC Group and also one of considerable achievement.

The recovery in overall profit rate on sales to 4.3% from 4.0% in 1960 is certainly welcome, but the present returns are still inadequate having regard to the vast sums we must spend on research, development, new plant, and the like, and the onerous technical commitments our progressive Group must undertake.

SOME DETAILS OF GROUP ACTIVITIES

Power Cables.—Production has been at a record level, and the good load factor in the Parent Company, W. T. Glover & Co., Ltd., and Scottish Cables Ltd. has permitted very efficient use of the plant.

At our Erith Works we received the largest cable contract ever placed by the Central Electricity Generating Board, for the supply and installation of 132,000 volt oil-filled feeders from Lessness (Belvedere) to Wimbledon, value £1,750,000.

Scottish Cables received the South of Scotland Electricity Board's 1962 annual contract for the supply of underground cable worth over £1,500,000.

Important overseas orders included one from the Central Electricity Board of Malaya for 132,000 volt oil-filled cable and lower voltage cables, with a total value, including overhead transmission line, of some £330,000; one from Hongkong for 66,000 volt oil-filled cables, value £435,000; and another from the Karachi Electricity Supply Corporation for the supply and installation of 66,000 volt oil-filled cables, value £100,000.

Submarine Power Cables.—In the face of intense international competition we were proud to receive the contract, value £2,700,000, from the New Zealand Electricity Department for the supply and laying of three 25½-mile lengths of single core 250,000 volt d.c. cables to provide a power link between the North and South Islands. These cables will be laid by British Insulated Callender's Construction Co. Ltd.

Metals.—The BICC Group's consumption of aluminium has further increased and we continue to be the largest individual purchaser of copper in the world, our 1961 figure reaching the record level of 250,000 tons.

Output at British Copper Refineries Ltd. was a record at 103,000 tons, one-third of which went in direct exports—a substantial increase over 1960. The productive capacity has recently been increased by some 20%, the benefits of which should be progressively felt during 1962.

Thomas Bolton & Sons Ltd., in which we acquired all the outside interests during the year, continues to maintain its eminent position in the field of copper and copper alloy products. Export orders showed a further increase – those to Europe being 30% up on last year.

Telcon Metals Ltd. has also had a successful year, and world-wide demand for the Company's products resulted in record sales with 27% being exported.

Construction.—Since our Construction Company was set up in its present form in 1949 to provide specialist services primarily in support of our electrical manufacturing interests, it has achieved a record of steady expansion, averaging a 12½% per annum growth in turnover. During 1961 one quarter of the business was in respect of overseas orders received from every Continent.

Work on the 400,000 volt overhead line crossing of the River Thames at West Thurrock for the Central Electricity Generating Board was successfully completed ahead of time, in spite of the many new problems this challenging contract presented. The main towers are 630 feet high and carry the 2¼ inch diameter smooth-body steel-cored aluminium conductors 250 feet clear above the river on a span which is nearly seven-eighths of a mile long.

The Central Electricity Generating Board is embarking on an extensive network of 400,000 volt overhead lines and on the conversion of many 275,000 volt lines to 400,000 volt working. We have been successful in obtaining orders totalling some £8,000,000 in connection with this most important work.

OVERSEAS AFFAIRS

For 1961 our direct exports from this country and sales by overseas subsidiaries amounted to £46,000,000, or some 30.4% of our total sales—with export orders on hand at a record level. The real contribution is, however, greater, for many of our products sold to customers in the United Kingdom are incorporated in manufactured goods finally sold overseas.

A notable feature during 1961 has been the developing prospect before us in Europe. Whatever may be the outcome of the Government's negotiations regarding Britain's possible entry into the European Common Market, I envisage a liberalisation of trade with European countries in the years to come—a prospect which confronts us with a great challenge and, I believe, with an even greater opportunity.

With these prospects before us we have recently formed jointly with Felton & Guilleaume—with whom we have had a long and happy technical collaboration—a Company called European Cables Ltd.

I believe we can look forward to a great expansion of World trade, the volume of which has almost doubled in the last ten years. Surely this trend will continue with the growing prosperity of this World and the movement towards the abolition of tariffs and quotas.

We must, and can, participate to the full, for I believe a vital part in our future expansion lies in the export field.

FUTURE PROSPECTS

I believe that the universal movement towards higher standards of living to which our Group endeavours to make its full contribution, will continue in the future certainly no less rapidly than in the past.

We have certainly increased our capacity and improved our capabilities. In my view we are now better equipped and better organised throughout the Group than ever before to face the challenge of national and international trade in a World of ever-widening opportunity. We shall face fierce competition and have our problems, but in the absence of abnormal circumstances I and my colleagues look forward to the future of the BICC Group with confidence and high hopes.

THE BICC GROUP

Consists of 9 Divisions of the Parent Company and 44 Operating Subsidiary Companies
Employs 41,000 people
Manufactures in 11 Countries
Trades in well over 100 countries

The Swan Hunter Group

THE CHAIRMAN,

Mr. John Hunter, on the Shipbuilding Outlook

	1961	1960
GROUP PROFIT BEFORE TAX	£2,647,000	£2,613,000
GROUP PROFIT AFTER TAX	£1,616,000	£1,419,000
PREFERENCE DIVIDEND	£32,000	£31,000
ORDINARY DIVIDEND AND BONUS	£560,000	£557,000
WORKMEN'S PROVIDENT FUND	£111,000	£100,000

PROSPECTS

There is, as yet, no sign of any improvement in the world shipping situation and the demand for new ships is, if anything, lower than when I reported to you last year. In these circumstances, competition for the contracts available remains keen and profit margins, where existent, very small.

On the other hand, shiprepairing activity improved somewhat last year and remains reasonably buoyant, though increased earnings from this source depend on increasing turnover. For many reasons it is extremely difficult to forecast the outcome of trading in the current year, but only a small number of the new construction contracts on hand are scheduled for completion in 1962 and our income from this source will be markedly reduced. In consequence, the overall profit position will certainly be less satisfactory than in 1961.

Despite an adverse trend, the order position, taking the Group as a whole, remains comparatively favourable and though it is necessary to continue strenuous efforts to secure more work, all the available evidence suggests that the competitive ability of our companies is, in general, of a high order.

PRODUCTION

Nine ships, a floating dock and a mobile works barge were launched by the Group during 1961, representing 117,900 gross tons in comparison with 111,900 gross tons in the previous year.

Ships delivered included the passenger liner "Principe Perfeito", built for Companhia Nacional de Navegacao, Lisbon, and the 65,000 tons d.w. oil tanker "Solen" built for Shell Tankers Ltd.

The Dry Docks Departments repaired in dock or afloat 494 ships with an aggregate gross tonnage of 3,792,000 tons (1960: 4,136,000).

The Tender submitted jointly last year with Vickers Ltd. for the new Cunarder was the lowest and the most attractive technically and had the contract been placed it would have come to the Tyne. The postponement was disappointing but we have every reason to be satisfied with our efforts in this direction.

GENERAL

The British shipowner remains, and is likely to remain, the mainstay of the British shipbuilding industry but, with certain exceptions, British owners are not in a position to order new ships at the present time. We have the paradoxical situation that foreign owners can build ships here on more advantageous terms than British owners and British owners can build abroad on better terms than in this country.

The British merchant fleet earns or saves between £600 millions and £700 millions per annum in foreign exchange and though it can be said that the necessity for special taxation treatment of the shipping industry has already been recognised by the granting of the 40% investment allowance, unfortunately in the present unprofitable condition of the shipping industry this is, in most cases, of little assistance. In view of the vital importance of British shipping to our balance of payments British owners building ships in this country should be enabled to receive at least the same credit terms as our banks and insurance companies give to foreign shipowners.

BANK LEUMI LE-ISRAEL B.M.

CONTINUED SATISFACTORY GROWTH

The eleventh Annual General Meeting of the Bank, being the sixtieth since the establishment of the business of the Anglo-Palestine Bank, was held in Tel-Aviv on April 15, 1962.

In his address the Chairman, **Dr Y. Foerder,** pointed to the Bank's 60 years of service and to the important role it had played in re-building the country both before and since the establishment of the State of Israel. He then drew attention to the Bank's satisfactory growth in 1961. Total assets had increased by IL167 million (or 29.3 per cent) to IL739 million. Both the amount and the percentage of growth were larger than in all recent years.

Current, deposits and savings accounts had risen from IL455 million to IL591 million including IL71 million of special Government deposits. Advances and Loans had risen from IL177 to IL217 million. Documentary credits, guarantees, etc., from IL108 million to IL131 million. Eleven new branches had been opened, bringing the total up to 136.

The Consolidated Assets had grown most markedly during the year from IL822 million at the end of 1960 to IL1,200 million or by 46 per cent. This reflected in part the first inclusion of the Union Bank of Israel which had become a full subsidiary, but mainly the growth of the Bank itself and many of its subsidiaries.

The net profit for the year was IL1,633,850 as against IL1,334,243 for 1960, after the usual provision for taxation, depreciation, etc., and after ample provision for contingencies.

The Bank's capital was small in relation to the size of the business and this had been brought into sharp relief by the recent devaluation of the Israel pound, in view of the Bank's international business. While the Chairman could not yet indicate the Board's plans in detail he stated that arrangements were under way with a view to increasing the Bank's capital.

DEVALUATION

He then dwelt on the recent devaluation of the Israel pound and stressed, in particular, that it did not affect the Bank's accounts very materially as all obligations in foreign currency were properly covered by foreign currency assets. After the devaluation foreign currency deposits and other liabilities as well as the corresponding foreign currency assets were, of course, reflected in the accounts by larger figures in Israel pounds, in correspondence with the new rate, a fact which would undoubtedly increase future balance-sheet figures to no small extent.

The Chairman then referred to the currency devaluation and to the Government's new economic policy. The Bank would do everything possible to help carry this policy into effect. The devaluation itself had been unavoidable, and it was now up to the Government, labour, industry and the general public to exercise all possible restraint so as to prevent too sharp a rise in the cost of goods, services and wages. While credit restraint was very necessary, monetary policy and general economic policy must carefully and consistently mesh together.

The General Meeting approved a final dividend of 6½ per cent, again making 12½ per cent for the year.

HASTINGS AND THANET BUILDING SOCIETY

Chairman reports on excellent year

The 112th Annual Meeting was held at the Chief Office, Thrift House, Collington Avenue, Bexhill-on-Sea, on the 19th April, 1962, and in the course of his speech the Chairman, Lt.-Col. V. C. Donaldson, F.R.I.C.S., F.A.I., said:—

I am happy to be able to report continued success, above-the-average growth, and especially mention the following items:

	£		£
Total assets	44,159,517	Share and deposit receipts	7,811,419
Cash at bank and trustee securities	6,853,589	Mortgage advances	7,918,531
Reserves and surplus funds	1,889,820	Income tax and profits tax	617,500

Lt.-Col. V. C. Donaldson
F.R.I.C.S., F.A.I.
Chairman

Assets

Our Assets have increased by approximately 13%, which is considered to be a splendid achievement, reflecting continued public confidence in the Society, during a period when the Bank rate varied from 5% to 7%. Our liquid funds, increased by over £1.3 million, represent 15.5% of total assets. This is roughly double the statutory minimum necessary to qualify as a 'designated society' and for our shares and deposits to be Trustee Investments.

Shares and Deposits

I am glad to say that the total of our Share and Deposit Accounts has grown by almost £3.5 million. Many savers allow interest to be credited to their capital accounts, thereby more rapidly swelling their nest-egg by interest on interest.

Trustees are, in increasing numbers, investing in our Shares and Deposits, which are now officially in the 'gilt-edged' category. Regular remittances of tax-paid interest, either to themselves or direct to the beneficiaries, are a labour-saving boon to them as well as to the personal saver. All this, with the gratifying knowledge that should it suddenly become necessary to seek withdrawal it can be arranged quickly and without charge.

Our interest rate on Investment Shares was increased from 3½% to 3¾% during the year, the latter being equivalent to practically 6⅛% to those liable to tax at full standard rate. The deposit rate is 3½% (almost 5⅝% gross) whilst our new Bonus Shares offer to regular savers the extremely attractive rate of 4¼% (nearly 7% gross). I cannot too strongly urge you not only to invest your own savings to the limit in our Society but also to recommend it to your families and friends.

Advances

Although during the year we have lent nearly £8 million on mortgages, the demand has exceeded the supply of cash we had available: 95% of this was direct to owner-occupiers and almost the whole of the remainder in an equally good cause—the provision of houses and flats for letting. From our insignificant loss ratio can be deduced the fact that we lend your money with care and an adequate safety margin, but nevertheless, we lend it to people who need it. We do not confine our loans to the man earning £1,000 a year and upwards; we lend also to those in the lower income groups where circumstances warrant it. I have in mind particularly the many tenants who purchased their homes as a result of the decontrolling provisions of the 1957 Rent Act.

Modern trends encourage more people to own their homes and every repayment they make to a Building Society is a hedge against inflation. The borrower is, in the long run, saving because his equity in the property grows as his debt diminishes.

Taxation

Whilst reasonable growth is normally praiseworthy, there is one sphere in which it gives cause for complaint, and here I mean income tax and profits tax. This is costing us well over half a million pounds a year and the 1961 figure exceeded that of 1960 by over £100,000.

However unpleasant it may be, it has come to be an accepted fact that we should all pay a reasonable proportion of our income or profits towards the cost of public services, but for profits tax to be charged to an institution which does not work for profit is an anomaly and a brake on progress.

Offices

The Society's new London Office, at 12/14, Wigmore Street, W.1, was opened on 4th December.

We have also opened new offices in Bexhill Town, Nottingham and Chelmsford, and the work of modernizing our Hastings and Ramsgate Regional Offices is now complete.

Transfers of Engagements

The trend for smaller Societies to merge in larger units continues and since the end of 1961 we have welcomed into our ranks the members of the Chard and District Mutual, the West Lancashire and the Darwen and District Permanent Building Societies. The larger national organization is best able to attract funds, and surmount the vagaries of fluctuating business conditions, and we shall be happy to consider approaches from other Societies who would like to join us.

The Report and Accounts were adopted and New Rules were approved.

A full copy of the Chairman's Review and the Directors' Report and Accounts will be gladly sent on request.

CALEDONIAN INSURANCE COMPANY

The one hundred and fifty-seventh Annual General Meeting of the Caledonian Insurance Company will be held in Edinburgh on May 15, 1962.

The following is an extract from the Statement by the Chairman, **Sir John Imrie, CBE, JP, CA:**

Life Department.—New sums assured after deducting reassurances amounted to £16,378,000, a record for the Company and an increase of almost £4,000,000 on the figures of the previous year. It is gratifying to be able to report such vigorous growth. This is evident from the fact that we have had substantial additions to our Life business in each of nine successive years. Annuities, including Pension Annuities, for £1,009,000 per annum were issued as compared with £790,000 in 1960.

Our Assurance Premium Income increased by £325,000 to £2,013,000 and Annuity Income, including Purchase Prices for Immediate Annuities, at £2,604,000 was higher by £302,000. A rise in Interest Income of £226,000 brought the year's total to just under £1,544,000, and the yield on the Life Assurance and Annuity Fund was £6 19s. per cent before deduction of tax as compared with £7 per cent a year ago. Our net yield was £5 14s. per cent as compared with £5 12s. 1d. per cent in the previous year, a most satisfactory return considering that less than ten years ago our net yield was under 3½ per cent.

On the outgo side, claims by death and maturity rose by £191,000 to £1,131,000, the addition being mainly due to larger payments under maturing Policies. Surrenders at £270,000 were £58,000 higher and Annuities paid increased by £198,000 to £382,000, reflecting the exceptional rise in new Immediate Annuity business. At just under £350,000, Expenses of Management, including Commission, increased by £53,000, more than half of this being accounted for by Commission on our new business. The Life Expense Ratio, however, shows a slight improvement at 17.4 per cent as compared with 17.6 per cent for the year 1960.

The Life Assurance and Annuity Fund now stands at £24,679,426, being more than £3,666,000 over last year, and in this connection I am able to say that the market value of our Stock Exchange Securities substantially exceeds the value placed upon them in the Balance Sheet.

Fire Department.—The Premium Income for 1961 was £2,788,194, an increase of £53,821 on our 1960 figure.

We had an exceptionally good year both at home and overseas, and we have been able to transfer a sum of £140,745 to the Profit and Loss Account.

Accident Department.—The Premium Income for 1961 was £5,343,313 and represents an addition of £141,865 to the 1960 figure.

Marine Department.—The trading continued satisfactory, resulting in a transfer of £70,000 to the Profit and Loss Account.

The Fund at £1,011,165 represents 172 per cent of the Premium Income.

Total Premium Income.—The total Premium Income for all Departments was £13,344,531, compared with £12,526,514 for 1960, an increase of £818,017.

Profit and Loss and Appropriation Accounts.—The amount of interest, dividends and rents (less tax) on Shareholders' Funds was £321,703.

The balance for the year transferred to the Appropriation Account was £363,346 after providing for taxation.

The Directors' recommendations for dealing with the surplus are stated in the Report and, if approved, the balance carried forward will be £699,598.

ARAB BANK LIMITED

Head Office: AMMAN, JORDAN

BALANCE SHEET AS AT 31st DECEMBER, 1961
(To the nearest J.D. (Jordan Dinar))

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY, LIMITED

(Incorporated in Northern Rhodesia)

NEW PLANT COMMISSIONED

MR H. F. OPPENHEIMER REVIEWS METAL PRICES

Production of lead and zinc for the year under review was again satisfactory and we have been fortunate in that our Southern African markets have, as hitherto, readily absorbed the greater part of our production. The profit for the year, however, was substantially affected by the further weakening of the London Metal Exchange prices for these metals, particularly zinc, during 1961. Our operating profit on zinc was over 45 per cent less than in 1960, and as zinc sales comprised nearly 70 per cent of the total tonnage sold during the year, this factor was mainly responsible for the fall in the profit before tax to £678,000, as compared with £1,156,000 in 1960. In 1961 capital redemption allowances exceeded the profit assessable to tax and no Federal income tax is payable. It has, however, been necessary to appropriate the sum of £15,000 to cover the additional tax payable on the profits for 1960, following the increase in the Federal rates of tax from 7s. 6d. to 8s. in the pound.

FALL IN METAL PRICES

By the beginning of 1961 the London Metal Exchange cash prices for lead and zinc had dropped to £63 and £80 per long ton respectively. Slight rallies in the price of both metals during the first few months of the year were not sustained and prices deteriorated until at the end of the year, lead stood at £60 10s. 0d. per ton and zinc at £71 17s. 6d. per ton. The zinc price subsequently weakened still further during the current year. Markets for both metals in the United Kingdom suffered from increased deliveries from the Eastern bloc and as a result of competition from this source. Commonwealth producers found it necessary to reduce their premium for high grade zinc by £3 per ton with effect from October 1, 1961. The reduction has been passed on to our Southern African consumers and, therefore, represents an additional drop in our realised prices from that date.

When it was decided in January, 1960, to proceed with the installation of the Imperial Smelting Furnace and ancillary plant, it was anticipated, on the basis of the estimated cost of the plant and prevailing metal prices of £70 per ton for lead and £95 per ton for zinc, that dividends could be maintained at a rate of 9d. per unit per annum until the new plant was commissioned, after which it was expected that increased distributions might be practicable. However, the capital cost of the plant has proved substantially higher than originally estimated and coupled with the lower revenue from sales, this has placed a severe strain on the Company's cash resources. Anglo American Corporation of South Africa Limited has assisted us to a major extent in financing the increased cost of the new plant by granting additional loan facilities of £750,000 at 6½ per cent per annum until December, 1963, but in the circumstances the maintenance of an annual dividend rate of

9d. per unit was not justified and we were compelled to declare a final dividend of 3d. per unit which, with the interim of 3d. previously declared, makes a total of 6d. (net) per unit for the year.

INCREASED INSTALLATION COSTS

The increase in the cost of the Imperial Smelting installation, presently estimated at £5,400.000 as against the original estimate of £4,350.000, has been due to a number of factors. In the first place the original cost estimates were prepared on the assumption that the designs supplied by the licensors, as used in the initial installation in Swansea, could be adopted without significant differences at our mine. In the event, it was found that certain sections of this design required extensive modifications, partly because of experience gained in the operation of the Swansea plant while our own was under construction. Other major factors which raised the cost of the plant were difficult foundation conditions, statutory wage increases, a revaluation of the Deutsch mark, and the necessity to aim at a higher standard of waste gas cleaning for health reasons. Finally, it became necessary to employ a design staff in Salisbury to provide the liaison necessary to ensure that the installation of Broken Hill would be up to date and efficient.

At the time of writing, the Imperial Smelting Furnace plant is still undergoing commissioning trials. Although it has not yet been possible to obtain a complete assessment of performance, continuous production of lead and zinc has recently been achieved following initial teething troubles with accessory equipment. It is expected that as experience is gained the plant will soon achieve its full rated production on a steady basis.

The Federal Prime Minister, the Right Honourable Sir Roy Welensky, KCMG, accepted an invitation to open the new plant on April 7, 1962.

FUTURE OUTLOOK

The mine is now equipped to produce large tonnages of zinc and lead at reasonably low cost, although the profits earned will, of course, depend on metal prices. While we may have to face a period when low prices will strain the Company's resources, I am hopeful that prices will soon be restored to more satisfactory levels.

Copies of the annual report and accounts are obtainable from the London office of the company, 40 Holborn Viaduct, E.C.1.

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 10/- a year; single copies are priced at 2/6 each. The Index to Volume CCII (January to March, 1962) is available from:

LABU CHEVIOT RUBBER LIMITED

BENEFITS FROM PAST POLICIES AND PLANS

SIR JOHN HAY ON GROWING IMPORTANCE OF RESEARCH

The Ninth Annual General Meeting of Labu Cheviot Rubber Limited will be held on May 17th in The Queen's Room, Baltic Exchange, St. Mary Axe, London, EC3.

The following is an extract from the circulated Statement of the Chairman, **Sir John Hay, PMN:**

I said in my last Statement that it was not to be expected that the 1961 profit could be at the same level as the previous year's, due to the considerably lower market price for our product which was then prevailing. Over the full year the average London market price for standard grade rubber was nearly 7½d. per lb less than the average for 1960, a fall sufficiently heavy to have a very considerable effect on trading results. In these circumstances it is a matter of much satisfaction to me to be able to submit Accounts which show that our final figure of profit falls little below that of the preceding year. Although we have been helped to this result by an unusually high refund of cesses, paid when the price of rubber was much higher, and by a reduction of export duty, it has by no means been wholly fortuitous. The fruits of past policies and plans expressed in terms of higher output, the possession of modern equipment enabling us to process our product in the form that is most advantageous and a saving in costs have played the more important part in our success.

After providing for United Kingdom and Malayan Taxation and the expenses of the scrip issue and increase of capital, the profit for 1961 was £318,036. The Board has transferred to Reserve £100,000, and now recommends payment of a final dividend of 30 per cent, less tax. Making allowance for the scrip issue the total payment for the year of 40 per cent represents a reduction of only 1⅓ per cent on the previous year's payment.

ESTATE OPERATIONS

Turning to operations on the Estates, I should like to refer first of all to the successful completion of clearing and planting the Glendale jungle reserve. A small proportion (245 acres) was planted in 1960 and the balance which after survey was found to comprise 901 acres, was planted in 1961. A jungle planting on this scale on an isolated estate like Glendale, which is also suffering from competition for available labour from a nearby Government scheme for smallholders, is a quite formidable undertaking. There is a complicated chain of operations from the initial extraction of the valuable heavy timber, through the felling, clearing and burning of the remaining timber and scrub, terracing, weeding and cover crop planting to the actual planting of the rubber. These operations have all to be carefully phased so that all is ready for the planting season in the autumn, and unfavourable weather can cause delays which not only are exasperating at the time but may prove costly in the long run. Our thanks are due to Mr Readshaw, the Glendale Manager, and his staff, for the energy and skill with which this extension has been carried out. On Middleton Estate the replanting of 246 acres of old rubber was successfully completed during the year, and in 1962 we intend to replant 561 acres on that estate.

Production for the year amounted to 12,350,000 lb, which exceeded the 1960 output by 545,000 lb, and represents, for the third consecutive year, an average output per mature acre of over 1,000 lb. The actual figure was 1,078 lb. During my recent visit to Malaya I received from the Agents and the Managers very satisfactory reports of the condition of the Company's estates, and I should like to express to them, to their staff and to all who work under them, our thanks for a very good year's work. At the end of the year Mr Readshaw, who had served the Company for ten years, latterly as Manager of Glendale Estate, decided that for health reasons he must leave Malaya. We are sorry to lose his services and would express our best wishes for his early recovery and for his future welfare.

RESEARCH

On some past occasions I have used this Statement as a medium for brief comment on research, a matter which gains in importance as the industry is made subject to increasing competition. As a Group we have our own research organisation, but on a scale too modest to be capable of dealing with much more than our own domestic problems. For more comprehensive and intensive research we are dependent, in common with others, on the activities of the central research organisations which are financed from the proceeds of a cess levied on exports at the rate of three-quarters of a Malayan cent per lb. Last year the amount so collected in Malaya was approximately $12 million, equal to £1,400,000, and if other rubber-producing territories made contributions at the same rate the amount available annually would be approximately £4 million—a sum sufficient to maintain research over a wide field.

The amount collected in Malaya is used to finance and maintain three organisations, the largest of which is the Rubber Research Institute which operates in that territory. In addition to research it gives an advisory service which, in the main, benefits smallholders. Whilst the desirability for this service is generally accepted, it is important that it should not diminish the resources available for its main purpose—research. In the division of the total funds, the Research Institute receives, as is its due, the largest share. From the very nature of its work its findings are such as can be more clearly appreciated by the rubber producer, for whom its activities have a more evident value than those of the other two organisations. But considerable as its achievements have been, there are still many problems outstanding in the field of rubber production which call for sustained and extensive research. To serve adequately its dual purpose it is necessary that its prior claim on available resources should continue to be fully recognised.

We are grateful to those who through service on committees have done valuable work in reorganising some of the research programmes, which in certain respects and for too long followed along lines laid down in the 1930's and had little relevancy to present problems. In our varied research activities there is a gap which I am sure has not escaped attention. If we are to assess with any accuracy the growth and character of the developing competition of synthetic rubber and substitutes we should not continue to rely on information collected in a rather haphazard and accidental manner. Developments in this field, in all their economic and technical implications, should be made the subject of organised research and study.

OUTLOOK

As is now my custom, at the forthcoming Annual General Meeting I shall report progress for the current year.

JAS. WILLIAMSON & SON, LTD.

UNCONTROLLABLE FACTORS AFFECT PROFITS

INCREASE IN COSTS

LORD PEEL ON NEW DEVELOPMENTS

The 31st annual general meeting of Jas. Williamson & Son, Ltd., was held on April 19th at Lune Mills, Lancaster, **The Rt Hon The Earl Peel,** chairman, presiding.

The following is the chairman's statement circulated with the report and accounts for the year ended December 24th, 1961:

In my statement last year I said that business was bedevilled by factors outside the control of the manufacturer, and that situation continued throughout 1961 with a consequent fall in profits.

You will see that the Net Profit before tax is £260,723 compared with £728,638 after adding £73,000 transferred from General Reserve in 1960. Of this sum taxation absorbs £121,598 compared with £346.748, leaving £139.125 against £381,890. We propose placing £80,000 to Plant Replacement Reserve and recommend a final dividend of 5 per cent less tax on the Ordinary and "A" Ordinary Stock, making a total payment of 7½ per cent less tax for the year. The carry forward is thus reduced from £57,897 to £24,690, but your Directors feel justified in making this reduction since the General Capital Reserve has been increased by £203,749 to £418,029.

This increase is accounted for largely by the sale of the West Ham properties which were transferred from The Leather Cloth Company Limited in 1956, and which produced a surplus of £201,667. You will recall that I mentioned last year that the plant from the West Ham factory had been transferred to Lune Mills and that the factory itself was available for disposal and I am now pleased to report that this asset was realised advantageously.

REASONS FOR DISAPPOINTING FIGURES

There are several reasons for the disappointing profit figures. In the export field which has regularly contributed more than a third to our business, we suffered large falls in turnover in New Zealand, Australia and South Africa, through import and credit restrictions over which we have no control. In other markets we succeeded on balance in increasing our turnover and I look forward to this trend continuing in 1962.

In the Home Trade the continued pressure on the economy with consequent restrictions on credit has adversely affected our sales in the domestic qualities of floorcoverings and there has been a general reluctance on the part of the buying public to spend money on consumer durable goods, and a lack of confidence on the part of the wholesale and retail distributors to stock them. At the time of the announcement of our interim dividend in September there were signs that the second half of the year would show some improvement over the first half, but the upsurge in orders was short-lived and the last three months, which usually constitute an active trading period in our business, proved to be the worst of the whole year. In the main I have been referring to the floorcovering trade, but my remarks apply also to the coated fabric side of our business which has suffered in common with most house-furnishings and textiles.

RESTRICTIVE PRACTICES JUDGMENT

Some two years ago the Linoleum Manufacturers' Association of which we are members, was referred to the Court under the Restrictive Trade Practices Act in respect of the majority of its joint arrangements. These arrangements were fundamentally based on the practice of first fixing a reasonable price for Linoleum and then encouraging members to compete at that price by quality, design and finish. The Linoleum Manufacturers' Association believed very strongly, as indeed I still do, that its practices were clean, fair and more in the public interest than competition by price. We decided, therefore, to defend our arrangements and the case was heard in the Restrictive Practices Court last April. The Court did not find that we had in any way charged excessive prices, but ruled that by force of the statute the majority of our practices must be declared contrary to the public interest.

The consequences of that Judgment will be far reaching, and its most damaging effect is indirect, in the undermining of general confidence. It is always easier to destroy than to construct and the forging of a new pattern of trade to replace practices built up gradually over twenty-five years may well prove a slow and arduous task. Having defended our practices until the case was lost we are, of course, undertaking this task with vigour, but it is only fair to warn shareholders that the effect on profits during the next year or so may be adverse.

NEW DEVELOPMENTS

As against this I would refer to a number of new developments. You will notice in our accounts that during 1961, we increased our plant and buildings by £397,355, and that constructional work in progress at the end of the year is £150.426. The former figure includes the completion of a very fine plant for laminating Sandtan, a rotogravure printed vinyl floorcovering to which I referred in my last report and which we make for our associate company Williamson-Sandura Limited. It is the first stage towards the complete manufacture of Sandtan in this country and although the development of sales has been affected by the generally slow conditions prevailing in the floorcovering industry I am confident it will prove profitable in the long run. The figures also include substantial additions and improvements to our plant for heavy gauge linoleum and a modern and much more efficient plant for vinyl-coated fabrics. Our sales of vinyl floorcoverings increased markedly in 1961, and included Crestalux tiles which have been added to our already well-known Crestaline vinyl products. We shall be expanding very considerably both our capacity and range of these materials during the coming year. The benefit of these investments will be partly felt in 1962 but not fully until 1963.

Profits in 1961 were seriously affected by increased costs brought about by a rise in wages in the first half of the year and an increase in the price of several of our raw materials, notably linseed oil and hessian. These increases have not been wholly passed on to the consumer in the form of increased prices and efforts are being made to counteract them where possible by a reduction in overheads. Our policy over the years of keeping our plant up to date and making use of modern labour-saving devices has helped to this end, but there is a limit to what can be done in this direction.

SOME SALES INCREASED

Although our total turnover in 1961 was lower than in 1960, sales of the heavier contract qualities of linoleum have been maintained or have even increased in volume. Our sales of linoleum tiles were stimulated by the successful introduction of the Florfast adhesive-backed tile—the first of its kind in our industry. With linoleum tiles, Dadolin washable wallcovering and similar articles we are well equipped to cater for the large "do-it-yourself" market.

Finally, I would like once again to thank all our employees for their loyalty and service during a year which has often not been easy. Our joint consultative committees have continued to play a valuable part in maintaining good relations.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, The Rt. Hon. The Earl Peel, Mr J. D. Taverner and Mr J. M. H. Grey, were re-elected and the remuneration of the auditors, Messrs Viney, Price and Goodyear, was fixed.

BROWN BROTHERS LTD.

SIR RICHARD YEABSLEY'S STATEMENT

The sixty-fifth Annual General Meeting of Brown Brothers Ltd. was held on April 19th in London.

Sir Richard Yeabsley, CBE, JP, FCA, the Chairman, presided. The following is an extract from his circulated statement:

The sales of the Company and its Subsidiaries showed a slight decrease when compared with the figures of the preceding year, mainly due to the recession in Radio and Electrical turnover.

The Net Profit of the Group before charging taxation amounts to £832,664 (£875,524).

Provision for Taxation absorbs £444,801 (£449,860), leaving the Net Profit of the Group for the year, after charging taxation, at £387,863 (£425,664). Of this Group Net Profit £25,730 has been retained in the subsidiary companies, leaving a net profit of £362,133 to be dealt with in the Profit and Loss Appropriation account of the Parent Company.

It is recommended that £125,000 (same) should be transferred to General Reserve, increasing the General Reserve figure to £1,850,000.

The Directors propose a final payment of 11½ per cent on the issued ordinary share capital, which, with the interim distribution of 3½ per cent, already made, makes a total of 15 per cent for the year. This compares with a total distribution of 17½ per cent on the ordinary shares in respect of the year 1960.

The Unappropriated Profit carried forward is increased by £16,572 to £401,556.

TRADING CONDITIONS

Increased sales were recorded for the year in most groups of our business, but there has been a decline in the demands made upon our Radio and Electrical departments.

The number of vehicles on our roads continues to increase and, despite the recession in the automotive manufacturing industry, increased sales were achieved in our Motor departments.

The special departments created for the supply of automotive paint and refinishing products have again made considerable progress.

The number of tyres sold in our Tyre departments has again increased, and as we have opened additional service branches throughout the country, so has the demand increased for the service facilities we offer.

It is pleasing to report that some small increase has been achieved in the sale of cycle accessories, and also in the sales of our Vindec machine.

FUTURE PROSPECTS

We have opened during the year a full branch in Chatham, and specialised service branches in Gloucester and Chester. One additional full branch and several specialised service branches are in course of erection and will be opened during the present year.

Much work has been done over past months in the reorganisation of our business and some saving in labour has been achieved. However, some costs which we cannot control continue to rise. Nevertheless, unless any further control of credit or other restrictions on spending are introduced, we hope to be able to report satisfactory results for the present year.

The report was adopted.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

A NOTABLE YEAR IN SOCIETY'S HISTORY

OUTSTANDING VALUE AND SECURITY OF LIFE ASSURANCE

The One Hundred and Thirty-eighth Annual General Meeting of the Clerical, Medical and General Life Assurance Society will be held on May 2, 1962, at the Society's Chief Office, 15, St James's Square, London, S.W.1.

Sir John Hathorn Hall, GCMG, DSO, CBE, MC, the chairman, will make the following statement in moving the adoption of the report and accounts:

MUTUALIZATION

Last year I referred to the proposal that the Society should become a wholly independent mutual life office, and I have now to report that the Parliamentary Bill to give effect to that proposal, and to make provision for the management and control of the Society in its new form, received the Royal Assent on May 9, 1961. The broad effects are twofold. In the first place, all profits made by the Society now accrue to the participating policyholders; and in the second place, as a mutual office, the Society will enjoy a constitutional security which should be proof against any attempt to deprive the policyholders of the ownership and control which is now legally vested in them.

NEW BUSINESS

Once again our new business figures show an increase over those of the preceding year, and in 1960, it may be remembered, the total of new net sums assured under individual and group life assurance was 33 per cent higher than the corresponding figure for 1959. The figure for 1961, £18,300,000, not only exceeds that for 1960 but is three times as large as that achieved ten years ago. New deferred annuities for £827,000 per annum were written under our pension contracts, as compared with £668,000 in 1960; and in addition, increments were received to deposits under our old deposit pension scheme which, we estimate, will provide pensions in due course of some £300,000.

New premiums of more than £1,000,000 were secured during the year and, of this sum, the new annual premiums of nearly £750,000 are larger than ever before and show an increase of about 10 per cent on the corresponding figure for 1960.

CLAIMS

Claims by death at £656,000 were unusually light, in spite of the growth of the total sum at risk.

Claims by maturity, amounting to nearly £1,150,000, were heavier than those of 1960. This is a reflection of the increase in the amount of business on our books.

INVESTMENTS

Our investment policy was much influenced by the need to finance mutualization which involved the provision of £4,700,000 during the year. £2,200,000 was immediately available because our investment programme had been adjusted in advance to provide it. The balance of £2,500,000 was provided by means of a bank loan; this is being steadily repaid and stood at £1,800,000 at the end of the year.

After making these payments, and financing outstanding commitments and new opportunities, arising through our valuable property connections, the amount of new money remaining available for stock exchange investment has been relatively small. Some rearrangements have, however, been made in both the gilt-edged and the equity sections of the portfolio in addition to those occasioned by the financing of mutualization.

The gross yield on the Life Assurance Fund is £6 16s. 1d. per cent, and the corresponding net yield £5 2s. 7d. per cent.

PROGRESS OF FUNDS

During 1961, the Life Assurance and Annuity Funds increased from £39,161,000 to £42,164,000, a growth of more than 7½ per cent, which is particularly satisfactory in a year in which substantial cash bonuses were paid.

THE VALUE OF LIFE ASSURANCE

The many and diverse uses to which our policies are put tend to obscure the simple fact that we exist primarily to provide life assurance. There is nothing that we do which is more important or which gives us greater satisfaction than the provision of security for wives and families.

Estate duty and high taxation are formidable impediments to the accumulation of capital and few can achieve by such accumulation full security for their dependants while the need is greatest. A life assurance policy, on the other hand, creates an immediate estate and can be designed to ensure that no dependant is left without proper financial resources. The value of the protection thus provided is, in human terms, incalculable; its cost is small, so small as not seriously to encroach upon the heavy expenditure on luxuries which is customary today. Moreover, whereas the cost of almost everything, luxuries and necessities alike, mounts mercilessly year by year, the cost of family security, provided through the Society, has significantly fallen in recent years. This is something that young married folk, and those not so young, might profitably ponder.

We have, in London and throughout the country, a staff who are eager and able to give skilled advice and assistance in the application of life assurance principles to the practical problems of family life.

JOHNSON GROUP CLEANERS LIMITED

PROVIDING QUICKER SERVICE

NET PROFIT £380,000

The Annual General Meeting of Johnson Group Cleaners Limited will be held in Liverpool on May 16th. In the course of his review, **Mr Douglas Crockatt** says:

Mr Douglas Crockatt JP

The trend of trading during the year strikingly reversed the experience of the year before, which opened badly but ended well. In the first quarter of 1961 trade continued unusually buoyant and there was an exceptional rise in our quarterly profit. The remaining three quarters, however, due to the economic crisis, and unsettled conditions in many industries, proved most disappointing. Turnover rose, but more slowly; costs climbed, but at a greater speed. The ground gained in earnings from January to April was lost in the poorer trading conditions of the later months of the year.

We thus ended 1961 with a reasonable increase in turnover but with a reduced trading profit. The net profit, after a lower tax charge, amounted to £380,000 against £385,000 in 1960. The maintained 10 per cent dividend involves a higher cost owing to the rights issue made last summer and together with the Preference dividends absorbs £187,624. The sum of over £192,000 has been retained in the Group.

The flow of work in this trade is often very variable. The industry is relatively stable in its annual results from year to year but frequently shows violent fluctuations within the trading year. It is for this reason that the Company has never issued quarterly or half-yearly progress reports. In this industry such statements would often prove misleading, providing no true guidance to the experience of the year as a whole.

SHOP UNIT-PLANT DEVELOPMENT

The major trend today in dry cleaning is towards quick service. "On the spot" shop unit-plants are increasing in number, and competition is in consequence intensifying. After some years of initial experiment the Group has made a successful entry into this field and is operating 118 of these shop unit-plants. The results to date are satisfactory. The cost of installing so many modern quick-service plants has been very substantial, and care is needed in integrating their operation with that of our various centralised works. The capital sum already invested in this direction exceeds £570,000. It has been decided that certain development costs forming a relatively small part of this total outlay will be written off over a five-year period. In addition, substantial expenses arising from the programme have been charged to revenue during the year.

As time goes on a satisfactory return on this new investment is confidently expected. Customers are using the new shop plants very freely and there is obvious appreciation of the merits of "on the spot" service. The technical resources of our various centralised works serve to support the service of the shop unit-plants. Dyeing and elaborate and difficult cleaning work is processed at our 15 major works where there are high standards of scientific and technical knowledge and achievement.

Changed methods are therefore giving the Group a new appearance. In addition to the 15 main works we are operating 10 small satellite factories, 118 shop unit-plants, 4 laundries and 1,600 normal receiving offices. The new Johnson Cleaners (South West) Company now operating 111 branches with works at Cardiff and Plymouth has traded profitably in its first full year.

FURTHER MODERNISATION

Other schemes of modernisation, the refronting and refitting of branch offices, together with improvements at certain of our central works, have gone forward alongside this programme. Over 200 branches have had a major refitting carried out during the year. The total expenditure on capital account has therefore been exceptionally high in 1961. It will revert to a somewhat more normal level in 1962.

Professional valuations of further properties of the Group have been recently carried out. The enhanced values are now reflected in these accounts. Lease-back arrangements have been satisfactorily concluded during the year in respect of properties to a value of £108,000. In addition a number of retail shop properties have been sold (mainly owing to compulsory redevelopment schemes) at profits totalling over £50,000. These surpluses are included in the accounts under "Exceptional Items."

In credit squeeze conditions, with a long cold spring and a very late Easter, the present year has not opened in promising fashion. During recent weeks, however, turnover has been running at a more satisfactory level. In the long term, barring any national catastrophe, I am fully confident as to the future of the business.

My colleagues and I are grateful to all in the Group for their services during 1961. In a year of difficulty and active change an excellent spirit of loyalty and co-operation has been shown throughout the business.

LOBITOS OILFIELDS, LIMITED

CHAIRMAN'S STATEMENT 1961

The following are extracts from the Chairman's Statement for 1961 which has recently been circulated to Stockholders:

1961 has been a year of consolidation for the Lobitos Group and satisfactory progress has been made in dovetailing and development of various activities and interests at home and overseas.

In Peru the maintenance of stable prices and economic conditions permitted the continued development of your Peruvian Company's Concessions and consolidation of its market with satisfactory trading results.

In the UK and Eire the marketing Companies and Manchester Oil Refinery have concentrated on the adaptation and development of their markets to the best advantage under the prevailing competitive conditions in the petroleum industry. Construction of the new Distillation Unit and Ancillaries at the Ellesmere Port Refinery was nearing completion.

In Canada progress has been maintained and a significant feature of the year's operations was the commencement of gas exports from Alberta to California. In the Arctic your Subsidiary Company has participated with a consortium in the first well to be drilled in the Arctic Islands.

While the outlook for the current year must be viewed against the background of the intensely competitive conditions in the petroleum industry, it is the aim of your Board to ensure that the Group continues to develop and strengthen its position particularly in the petroleum specialty market. Your Board, however, consider the Group can view the future with reasonable confidence, subject as always to the political and economic conditions which obtain in those countries where the Company has interests.

COMPANY AFFAIRS

Both gilt-edged stocks and equities moved higher this week in anticipation of a reduction in Bank rate from 5 to 4½ per cent and further gains were recorded on Thursday afternoon after the reduction had been announced. The announcement that switching operations by proprietary life offices would not be subject to the speculative gains tax strengthened the market in gilt-edged stocks and insurance shares. Property issues were well supported and brewery shares went further ahead after the proposed merger between Whitbread and Flowers had been announced. Several of the leading equities reacted favourably to profit and dividend announcements, though the one from Pressed Steel came as an unpleasant shock; and on the publication of the full report Dunlop made a further advance.

Dunlop's Progress

At 38s. and yielding 4¼ per cent on the maintained dividend of 1s. 7d., covered twice, the 10s. shares of Dunlop are at their high point for the year so far. The stock market was pleased with the company's preliminary report which revealed an improvement in margins in the second half of last year and it had no cause to be other than satisfied with the full report. The fall in sales, from £275 million to £265 million, was due to the exclusion of the results of the Japanese company last year as this company has now become an associate of Dunlop instead of a subsidiary. In volume the group's sales rose by about 2 per cent. Tyres and associated products make up about two-thirds of the group's sales while about two-thirds of all sales and all profits stem from the group's overseas activities. Exports from this country rose by about 13 per cent last year and profits from overseas activities as a whole expanded by about 12 per cent.

Outside the United Kingdom, Germany and France are Dunlop's most important markets but in these countries Dunlop's dependence upon original equipment orders, as opposed to replacement demand for tyres, is less than it is in this country. Not surprisingly, Dunlop's sales and profits were slightly lower in this country, reflecting the lower level of activity in the vehicle industries, among others, and while sales in France were higher, profits seem to have been lower, reflecting stronger competition not merely from domestic companies but also from some American producers. The clear inference is that the German market made an important contribution to the rise in profits. In the last few years Dunlop has been building up exports and sales in the British replacement market (where margins are higher than in the original equipment market) and last year these sales, the

directors say, "largely compensated for the loss of earnings" in the original equipment market. From its miscellaneous range of products, other than tyres, Dunlop appears as a whole to have earned a slightly higher profit.

Dunlop, in fact, has a well balanced range of products and it is very much an international company. Again, it spent more on capital account abroad last year than it did at home: £7¼ million by overseas companies and £5½ million by British companies though in both instances the emphasis was more on replacement and modernisation than on expansion. Capital expenditure at this rate left the group heavily in debt to the banks, but since the end of the financial year the company has raised about £12 million by a debenture issue. End-year capital commitments amounted to nearly £7 million and it would be surprising if capital spending fell very much below the rate of recent years.

Dividend yield: 4·2% equal to 11·1 years' earnings.
* Including investments and goodwill.

To justify this expenditure, Dunlop must seek to improve the return it earns on the capital it employs. It succeeded in doing so last year, when the great majority of companies earned less. This is partly due to the more stable price of natural rubber and the greater use of synthetic rubbers (the proportion of which in Dunlop's total consumption rose from 44 to 47 per cent last year); indeed the directors specifically say that these two factors had a "significant effect on material costs" which was only "partly offset" by higher labour and other costs and lower selling prices. But behind the reckoning of costs and profits lies a more enterprising spirit among the managers of Dunlop and this ultimately explains why investors are prepared to give the stock a higher ranking than they did, say, in the middle of the last decade. But the prospect is one of steady growth in competitive markets, not a spectacular bound forward.

BICC

Commenting on the 1961 results of British Insulated Callender's Cables, the chairman, Sir William McFadzean, says that "the outstanding general features of the year were the heavy demand for practically all our goods and the necessity almost throughout of quoting extremely keen prices to obtain orders." BICC's turnover rose by 5½ per cent from £143 million to £151 million and its trading profits by 16 per cent from £9.4 million to £10.9 million. Sir William says that the improvement "is mainly due to the benefits of increased turnover, heavy capital expenditure in recent years and the still further improvement achieved in overall efficiency coupled with some recovery in prices . . . from the uneconomic levels previously applying." Compared with 1960 the gross profit margin on sales rose but this is not the full story, for the rise of 9 per cent in the physical volume of output only brought about a rise of 5½ per cent in the value of sales. A bigger tax charge trimmed the rise in net profits to 11½ per cent from £3,326,000 to £3,719,000, while an acquisition issue and a one-for-seven rights issue raised the monetary cost of the maintained ordinary dividend of 13½ per cent, now covered just over twice by earnings.

Price (£1 shares): 62s. 9d. Earnings yield: 8·7%.
Dividend yield: 4·3% equal to 11½ years' earnings.

The balance sheet reflects the proceeds of the rights and debenture issues, amounting to £14.9 million in all, with the net overdraft of £6.6 million at the end of 1960 giving way to a cash balance of £48,000. End-year capital commitments amounted to £2.3 million and Sir William says there will be continued investment and draws attention to "a fearless approach to capital expenditure." But Sir William does not say whether the group will be able to cover its future expenditure by retentions from profits, which including depreciation amounted to over £6 million last year, or whether BICC will have at some time to come to the market again. On the subject of profits Sir William makes no specific forecast; he says that last year the group sold over 30 per cent of its output abroad and export orders are at a record level. He adds that "we have increased our capacity and improved our capabilities. In my view we are now better equipped and organised than ever before to face the challenge of national and international trade." At 62s. 9d. the £1 shares yield 4.3 per cent and reflect some, at least, of this optimism.

Shipbuilding Results

On Tyneside, **Swan Hunter and Wigham Richardson** did remarkably well last year with a fall of only £8,000 to £2,089,000 in gross profits from trading and a rise in net income from £1,419,000 to £1,617,000 reflecting a lower tax charge and bigger realised profits on investments. Shareholders receive an unchanged dividend of 12 per cent, and other British shipbuilders must feel envious. Clearly earlier development and modernisation has made Swan Hunter a markedly efficient shipyard; in association with Vickers, it will be recalled, it submitted the lowest tender for the Q3. But the outcome of a year's trading in shipbuilding is dependent upon the number of completions and Mr John Hunter makes it plain that profits this year will be less satisfactory than last, for only a small number of construction contracts are scheduled for completion.

The demand for new ships continued to fall; competition is keen and profit margins, where they exist, are very small. Mr Hunter describes ship-repairing as "reasonably buoyant" though he adds the qualification that higher earnings from this source depend upon increasing turnover. The order book is "comparatively favourable" though it must be slimmer than it was. Obviously this is going to be a more difficult year for Swan Hunter; but the group is well provided with liquid resources and the fall in profits would have to be very sharp to lead to a cut in the dividend. The 7¼ per cent yield offered by the £1 shares at 33s. 3d. xd is not in these circumstances unreasonable.

On Merseyside, **Cammell Laird** appears to have earned a higher profit from its shipbuilding and marine engineering interests last year but received smaller dividends from its interests in steel and railway rolling stock through its shareholdings in English Steel and Metropolitan Cammell Carriage and Wagon, for while its gross income has fallen from £812,000 to £660,000 the investment income included within this total has fallen more sharply, from £619,000 to £387,000. When they maintained the interim dividend at 3 per cent in September the directors referred to a falling off in demand for steel plates and railway rolling stock and these, together with difficulties in the shipyard, would, they said, result in an appreciably lower profit. They added that it was unlikely that the total dividend would be maintained at 12 per cent. Shareholders were thus given ample warning and they should not be surprised now by the reduction in the total dividend to 10 per cent following the fall in net income from £622,000 to £584,000. On the lower dividend the 5s. shares at 5s. 3d. yield 9½ per cent.

Pressed Steel

The passing of the interim dividend in November and the warning from the directors that the 1961 results would be most disappointing prepared the shareholders of Pressed Steel for bad tidings. But they can hardly have anticipated such a violent swing from profit to loss as is revealed in the company's preliminary announcement. After charging expenditure of £778,000 incurred by aircraft subsidiaries (including BEAGLE) on the design and development of prototypes, Pressed Steel made a net loss of £2,668,000 last year, compared with a net profit of £1,885,000. As the loss is struck after crediting tax write-backs of £962,000 and as the 1960 net surplus was struck after charging £1,069,000 for tax, the swing in the trading surplus is from a profit of just under £3 million to a loss of over £3½ million. The ordinary dividend has been cut from 30 per cent to a nominal 5 per cent.

The directors explain that the motor body division was hit by the trade recession and by numerous strikes in the motor industry and that, in addition, it had to bear extra heavy costs associated with the bringing into production of new manufacturing facilities. The railway division suffered from the general scarcity of home and export orders. The refrigerator division was hit by credit restrictions, intense competition and price cutting; stocks had to be written down and extra costs were involved in transferring manufacturing facilities to the new Swansea factory. The division is still faced, the directors say, with "many uncertainties," but the railway division is doing slightly better and the results of the motor body division in the first quarter are described as "encouraging." As a result Pressed Steel returned to profitable trading in the first quarter of this year. But the size of last year's loss came as a shock to the stock market, where the 5s. shares lost 2s. to 16s. 4½d.

Reyrolle

In his statement with the accounts of Reyrolle, the electrical engineers, the chairman, Mr H. H. Mullens, refers to encouraging signs for the future. A year ago the order book was improving after a period of serious shortage of work; the improvement has continued and orders received in 1961 were a record. The improvement was not, however, fully reflected in output last year, as the effects of short-time working in 1960 spread over into 1961. Together with the slender margins on certain orders accepted earlier by the group this led to a fall of 7½ per cent in trading profits from £2,199,000 to £2,029,000. Interest and dividend income rose from £701,000 to £759,000, reflecting the higher dividend paid for 1960 by C. A. Parsons in which Reyrolle has a 20 per cent holding. But this was more than offset by a heavier tax charge and net profits fell by 11 per cent from £1,560,000 to £1,381,000, slightly reducing the cover on the maintained ordinary dividend of 9¾ per cent to 2½ times. The £1 shares at 43s. 9d., yield 4½ per cent.

Mr Mullens attributes much of the expansion in business to new designs developed in recent years. But competition remains fierce and he emphasises the continued pressure on margins; the company is "very near the limit of cost concessions which can be accepted without jeopardising the future." In particular, he notes that the continuing increase in the voltage and capacity of large switchgear require more expenditure on research and development. Obviously shareholders cannot expect much improvement in Reyrolle's financial results this year, for the margins are slim; AEI, in which Reyrolle has an investment, has already cut its dividend for 1961; and C. A. Parsons has left its dividend unchanged.

C. A. Parsons

Mr H. H. Mullens is also the chairman of C. A. Parsons and a year ago he said that profits for 1961 should be at a fairly high level. Now, in a full report that reveals a fall of 45 per cent in trading profits from £5,005,000 to £2,733,000 he says that the results "reflect as well as could be expected the competitive climate in which trading has been done over the last few years" and "the profit for 1961 is much in line with earlier results." The stock market in marking the £1 shares down from 58s. 9d. to 47s. 9d. clearly did not take such a comforting view. It is well aware of the problems facing the heavy electrical manufacturers and marine engineers, but it saw something more amiss than the erosion of margins in the fall of 42½ per cent in net profit from £2,700,000 to £1,551,000; and it was not mollified by an unchanged ordinary dividend of 12½ per cent on which the cover had contracted from just under 4 to 2½ times.

A year ago Mr Mullens said that "lower profits must be expected" after 1961 and he

now affirms that " it will be difficult to maintain the present level of profits," for though orders rose last year they extend over longer periods and the group is working below full capacity.

Babcock and Wilcox

OUTSTANDING surprises in this period of falling margins and lower profits are few and far between and for shareholders in Babcock and Wilcox to receive one was against all the run of expectations. Only last October, when a mere three months of the financial year remained, the directors passed the interim dividend. They then referred to the low level of manufacturing activity in the early part of the year, losses on nuclear power contracts and a number of claims outstanding on contracts. But they also said that provision had been made against nuclear power contracts and that, though there was excess capacity in the boiler-making industry, the order book was fuller than for any time in the four preceding years.

Now they have announced an unchanged total dividend of 9 per cent, covered just over 1½ times, following " the settlement of some of the important outstanding claims and a marked improvement in results during the second half of the year." The group's income before tax has risen from £891,000 to £1,507,000, but this includes a rise in investment income from £251,000 to £424,000. In 1960, moreover, losses of £650,000 were sustained on nuclear power contracts and the gross surplus was struck after providing for these losses ; in 1961 a provision of £150,000 for nuclear power losses was appropriated from the net surplus after tax. Thus, after allowing for these provisions, the rise in the gross profit from trading appears to be from £640,000 to £933,000. It has to be assumed that the accounts are now free of nuclear power losses and the improvement in profits on more conventional contracts and the payment of 9 per cent were enough to push the shares up by 1s. to 28s., to yield 6¼ per cent.

Allied Suppliers

THERE are over 50,000 shareholders in Allied Suppliers—the Home and Colonial and Lipton chain of grocery stores —and the most important of these is Unilever, which owns 12.4 per cent of the ordinary capital and controls 33.2 per cent of the votes. Unilever does not intervene in the management of the group but its presence effectively rules out the idea of a bid from another grocery chain. Thus the shares, standing at 22s. 9d. to yield 4.4 per cent on the maintained dividend of 10 per cent, now covered just over 2¼ times, have to be considered simply in terms of the trading merits of the company. Allied Suppliers is not a supermarketeer ; but over 500 of its 3,700 odd stores have been converted to self-service and its shops have long been established in busy shopping centres. Its shares, fortunately perhaps, have not had the glamorous tag of " supermarket " pinned upon them and its 1961 results suggest that it is meeting fierce competition in the food business with better success. Gross profits are up from £5,158,000 to £5,715,000 and net profits from £1,631,000 to £1,901,000; the group has practically recovered from the 1960 setback, when competitive price cutting in tea and losses on butter and cheese stocks were primarily responsible for the fall in profits. But Allied Suppliers remains essentially a chain of small shops and perhaps the best that can be expected is that it may hold its share of the trade ; the shares seem to have little of the dynamic about them.

Consolidated Zinc and Rio Tinto

CONSOLIDATED ZINC had a bad year in 1961—worse in fact than in any year since 1953, the first year in which lead and zinc were freely traded on the London Metal Exchange after the end of emergency bulk buying. The group had been holding smelter and mine production of lead below capacity since 1959 in accordance with international agreements to support prices. But the group has suffered from disproportionately high overhead charges because of these restrictions without benefiting from the higher prices the restrictions were intended to produce.

Consolidated Zinc's trading profits fell last year from £5,165,000 to £3,454,000 but the tax charge was cut from £1,146,000 to £299,000 presumably partly as a result of tax allowances in respect of Consolidated Zinc's big capital expenditures, which in 1960 amounted to £6 million. Outstanding commitments at the end of the year were £3¼ million. Net profits fell from £2,296,000 to £1,526,000 and the ordinary dividend has been cut by 1s. to 3s. per share.

Consolidated Zinc is heavily committed to develop aluminium in partnership with Kaiser Aluminium. It therefore needs the reinforcement that can be provided by Rio Tinto's uranium income under the proposed merger between the two companies. Rio Tinto's preliminary results show the expected expansion in profits. Its income in 1961 rose from £4,635,000 to £7,150,000, the beginning of the flow of earnings from the group's uranium interests in Canada being mainly responsible for the rise.

An increase from £375,000 to £1,057,000 in the group's provision for the amortisation of investments and the rise from £738,000 to £1,235,00 in profits attributable to minority interests has limited the advance in net profits. These have risen from £2,042,000 to £2,881,000 and the ordinary dividend has been raised by 3d. to 3s. a share. The terms of the proposed merger between Consolidated Zinc and Rio Tinto are 41 shares in the new holding company for every 20 Rio Tinto 10s. units and 58 new shares for every 20 Consolidated Zinc £1 units. Rio Tinto registered units stand at 38s. 1½d. compared with a high point of 43s. 9d. this year and Consolidated Zinc £1 shares have fallen to 51s. 6d.

Thomas Tilling

AS much as £386,000 of the increase of £580,000 to £4,896,000 in the gross profits of Thomas Tilling last year came from new acquisitions and only £194,000 from the businesses in which the company had earlier secured an interest. At the same time the group's turnover rose from £55,369,000 to £65,743,000, and to this increase new acquisitions contributed £3,007,000 and existing interests £7,367,000. Thus it becomes clear that Thomas Tilling's diverse range of industrial interests was, like most of British industry, earning smaller margins on sales.

The chairman, Mr Lionel Fraser, considers the results " really gratifying " in view of the " general malaise in business and the pull on margins and profits " though he admits that the beginning of 1961 held out the promise of higher profits than those actually achieved. He attributes the lack of buoyancy to the credit squeeze, higher costs and the bad weather (which hit the building industry particularly hard). The fact remains, however, that in a difficult year of trading Thomas Tilling, which has always been rated in the top flight of industrial holding companies, earned better profits: earnings from building supplies and services (contributing 25.9 per cent of gross profits), engineering (12.6 per cent) and insurance (13.7 per cent) " more than redressed the balance of others less happily placed."

The ordinary dividend was maintained at 20 per cent on the capital as increased by acquisition issues and the one-for-nine rights issue. Despite the £3.2 million injected by the rights issue, the group's bank overdraft was only £598,000 lower at £3,628,000 at the year-end. Thomas Tilling has done well and Mr Lionel Fraser can fairly claim that shareholders will find 1962 " to their satisfaction." But a lot of growth is implied in a dividend yield of 2.8 per cent and an earnings yield of 6.2 per cent offered by the 4s. shares at 28s. 6d.

THE MONEY MARKET

THURSDAY'S cut in Bank rate from 5 to 4½ per cent was fairly widely expected in the City. It was followed by the usual corresponding cuts in the money market's fixed rates. The discount market had already brought the Treasury bill rate down to 4½ per cent: at the previous week's tender the market increased its agreed bid by a further 4d. to £98 18s. 8d. This brought the fall in the bill rate since the previous cut in Bank rate at the end of March to ⅝ per cent, and the market has recently been paying more for its marginal finance than it has been earning on the bills it has taken up. Last week the authorities cut the bill allotment by £10 million to £220 million but total applications fell by £19 million to £387 million and the market received an allotment of 46 per cent compared with the previous week's 41 per cent.

Credit has been notably easier in the past week. There was no borrowing at Bank rate and only once did the authorities find it necessary to help the market by the special purchase of bills. On Wednesday funds were so plentiful that the authorities sold a fairly large number of bills to absorb the surplus credit.

APPOINTMENTS

FORD OF BRITAIN

COMPUTERS

Ford of Britain is employing and developing the most modern and effective systems and techniques to assist in managing and operating its large-scale activities. An important contribution is already being made by computers and considerable expansion in their use is planned. Exceptional opportunity is therefore offered to staff at both senior and junior levels on the following work :—

SYSTEMS ANALYSIS
COMPUTER PROGRAMMING
COMPUTER OPERATIONS
COMPUTER MAINTENANCE

Prospects in this expanding function in the vigorous Ford organisation ensure that the able man will make rapid progress. Applications, giving age and brief details of experience, should be addressed (with envelope marked "Ref CC") to

Mr. H. G. PEARMAN, Training and Recruitment Office, Ford Motor Company, Limited, Dagenham, Essex

UNIVERSITY OF SYDNEY

LECTURESHIP IN INDUSTRIAL RELATIONS IN THE DEPARTMENT OF ECONOMICS

Applications are invited for the position of Lecturer in Industrial Relations in the Department of Economics.

The salary for a lecturer is within the range £A2,730 x 105-2,835 per annum, plus cost of living adjustments for present £A1 a week and will be subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful applicant.

Under the Staff Members' Housing Scheme, in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on *9th June, 1962.*

GROUP ACCOUNTANT

A diversified group with Head Office in the North West which has been reassessing the place of accounting, has been convinced by consultants of the positive help that true accounting can offer to management.

It now needs the right man to show results by pressing through the necessary reforms with energy, determination and tact. First class commercial accounting, some O & M and confidence in the future are necessary requirements in the qualified man who will take on this challenging job.

The Consultants invite, in strict confidence, applications from men currently earning not less than £2,000 per annum which must give full details including age and present salary.

Write to Box No. 1275, J.P.C., 60-62 St. Martin's Lane, London, W.C.2.

ECONOMIST

Established major oil company has vacancy for Economist for operational and market research studies. Applicants, who should be under 35 years, must have Honours Degree and relevant experience.

Applications, giving full details of experience and qualifications, to Box 1618.

DORMAN LONG & COMPANY LIMITED

Invite applications from young men to work as

SYSTEMS ANALYSTS

for an expanding I.B.M. Computer Installation

Graduates or men with professional qualifications preferred, but vacancies exist for others with a good educational background. Some experience of organisation and methods, techniques or work study would be an advantage.

Applications, marked "Private," giving age and brief details of experience and qualifications, should be addressed to :

Chief Accountant,
Dorman Long & Co., Ltd.
G.P.O. Box 2,
Dock Street,
Middlesbrough.

UNIVERSITY OF ST. ANDREWS

APPOINTMENT OF ASSISTANT SECRETARY, UNIVERSITY APPOINTMENTS BOARD

Applications are invited for the post of Assistant Secretary to the University Appointments Board, to start, on a date to be agreed, after August 1, 1962. Applicants should be graduates, and a scientific or technical background would be an advantage. The initial salary scale will be £1,050 x £50-1,400 x £75-1,550, with F.S.S.U. and family allowance benefits. A grant towards expenses may be made.

Applications (which expire) should give the names of three referees and should be sent not later than 15th May, 1962, to The Secretary of the University Court, The University, Glasgow, W.2, from whom further particulars may be obtained.

ROBT. T. HUTCHISON,
Secretary of University Court.

ECONOMIC AND MARKETING RESEARCH

The Market Research Department of the Co-operative Wholesale Society Limited serves one of Britain's largest and most varied manufacturers. The department has its own team of interviewers conducting 35,000 interviews a year; it runs a library and considerable intelligence service; examines and reports to the Board on the effect of commercial, economic and political developments on the activities of the Society; and is continually increased in the study of retailing development and operations.

The department has vacancies at various levels in its head office at Manchester and would welcome applications from :—

(a) Students expecting to graduate in economics, statistics or commerce.

(b) Persons whose experience would qualify them to maintain liaison between the department and a selected group of the Society's productive and distributive enterprises.

(c) Persons whose experience and interests suggest they would be useful to the department in any of the activities indicated above.

The department's salary scales for Research Assistants run from £500 to £1,500 a year, and posts may be offered at any point within this range. Applications, which should include an indication of the salary expected, should be addressed to The Labour Officer, C.W.S. Ltd., Central Labour Department, 1 Balloon Street, Manchester 4, endorsed "Research Assistants: Market Research Department," to be received by May 7, 1962.

UNIVERSITY OF GLASGOW

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH

SENIOR LECTURESHIP, LECTURESHIP AND ASSISTANTSHIP IN URBAN STUDIES

Applications are invited for a Senior Lectureship, a Lectureship and an Assistantship in Urban Studies in the above department, which is about to embark on a study of the social and economic problems of cities. The salary scales are £1,850 to £2,275 per annum for the Senior Lectureship, £1,050 to £1,850 per annum (efficiency bar at £1,550) for the Lectureship, and £800 to £950 per annum for the Assistantship. Membership of F.S.S.U. and the Family Allowance Scheme will be available. Appointments to the Senior Lectureship and Lectureship will be for a five-year period. Appointment to the Assistantship will be for a three-year period. Applications from economists, sociologists, or social statisticians will be considered. Applications (eight copies for the Lectureship and three copies for the Assistantship) should give the names of three referees, and should be sent not later than May 18, 1962, to the Secretary of the University Court, The University, Glasgow, W.2, from whom further particulars may be obtained.

ROBT. T. HUTCHISON,
Secretary of University Court.

UNIVERSITY OF NEW ENGLAND

Armidale, New South Wales

SENIOR LECTURER OR LECTURER IN ECONOMIC HISTORY

Applications are invited for the position of Senior Lecturer or Lecturer in Economic History.

Commencing salary will be determined according to qualifications and experience within the ranges: Senior Lecturer, £A2,500 x 95-£A3,000; Lecturer, £A1,740 x 105-£A2,235. Cost of living allowances at present amounting to £A44 per annum are payable. Provision is made for superannuation, travel and removal expenses and assistance in buying or building a house. In addition research grants are available to members of staff.

Applicants must indicate whether they seek a permanent position or a short-term appointment for a period of three years. In the latter case, superannuation will not be available, but the usual allowance for fares and removal expenses will be paid, and a maximum sum of £A800 will be provided to assist in return travel and removal expenses at the end of three years. The Lecturer appointed on a short-term basis may apply to have his position made permanent at the end of one year's service.

Further information and conditions of appointment may be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on *May 28, 1962.*

UNIVERSITY OF GLASGOW

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH

Salary scale: £1,050 by £50 to £1,400 (efficiency bar) by £75 to £1,850 per annum, placing according to qualifications and experience but it is hoped that an appointment may be made at a point above the efficiency bar. F.S.S.U. University allowance; grant towards furniture removal expenses. Applications (6 copies) with names of three referees, to Secretary of the University, c/o Queen's College, Dundee, from whom further particulars may be obtained, not later than May 19, 1962.

H.M. TREASURY
(ECONOMIC SECTION)

at least 2 appointments as ECONOMIC ASSISTANTS for work in London on economic trends at home and overseas are offered to men or women aged at least 21 and preferably under 30 on 1.4.62, with 1st or 2nd class honours degrees in Economics or closely related subjects. Final year students may apply. Salary scale £741-£1,382; starting salary according to age and experience. Initial appointment for 2 years or less by arrangement. F.S.S.U. Application forms, obtainable from Civil Service Commission, Burlington Gardens, London, W.1. (quote S460/62), should be returned by May 18, 1962.

AUSTRALIAN NATIONAL UNIVERSITY
INSTITUTE OF ADVANCED STUDIES
RESEARCH FELLOWSHIP IN GEOGRAPHY

Applications are invited for a Research Fellowship in the Department of Geography. Other things being equal, preference will be given to candidates who have specialised in the fields of Agricultural Geography or Geomorphology.

Senior Staff of the Department in 1962 will comprise Professor O.H.K. Spate (Political, Social, Historical Geography); Mr. J. N. Jennings (Geomorphology, especially coastal and limestone geomorphology); Dr. H. C. Brookfield (Social Geography, especially tropical studies); Drs. D. Walker and R. G. Robbins (Biogeography, especially Malaysia and Melanesia); and Dr. G. J. R. Linge (Urban and industrial geography). The Department has strong interests both in Australia and the Pacific Islands, including New Guinea.

The salary range for Research Fellows is £A1,625/£2,450 p.a. with annual increments of £75; initial salary will depend on qualifications and experience. Appointment is for three years with possible extension to a maximum of five years.

Superannuation is on the F.S.S.U. pattern. Reasonable travel expenses are paid and assistance with housing is provided.

Further particulars should be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on *June 8, 1962*.

WOOLWICH POLYTECHNIC,
LONDON, S.E.18

Principal—Harold Heywood, D.Sc., Ph.D., A.C.G.I., Wh.Sch., M.I.Mech.E., M.I.Chem.E.

Applications invited for the following appointments. An applicant should have a good honours degree and/or a recognised professional qualification. For posts (i) to (v) a Higher Degree and/or Research experience are desirable.

(i) Lecturer in Government and Political Theory for B.Sc.(Econ) Degree Courses.
(ii) Lecturer in Monetary Theory and International Trade for B.Sc.(Econ) Degree Courses.
(iii) Lecturer in Economics (Principles and Applied) for B.Sc.(Econ) Degree and Management Courses.
(iv) Lecturer with special qualifications in Modern Economic History and ancillary Economics for B.Sc.(Econ) Degree and Business Administration Courses.
(v) Assistant Lecturer, Grade B for Accounting and Allied Subjects.
(vi) Assistant Lecturer, Grade B for English and a modern foreign Language (French and/or German).

Salaries: Lecturer £1,600-£1,800, plus London Allowance £45-£60. Assistant Lecturer, Grade B within £770-£1,070, according to qualifications and experience, plus London Allowance £45-£60.

Particulars and application form from Clerk to Governors, to be returned by May 11, 1962.

BOARD OF TRADE
BANKRUPTCY EXAMINERS

The Bankruptcy and Companies (Official Receivers) Service has vacancies for 20 Examiners (men or women). The work involves investigating the affairs of companies in compulsory liquidation and of partnerships and individuals in bankruptcy, and should appeal to those with an insight into human nature and a liking for an active life in the world of affairs. An accurate appreciation of words and legal connotations, and the ability to grasp the significance of a balance sheet and account books are essential.

Applicants must be at least 20 on 1.6.62, and must have passed *either* (i) the Intermediate Examination of the Institute of Chartered Accountants in England and Wales, Scotland, or Ireland, the Association of Certified and Corporate Accountants, or the Society of Incorporated Accountants; *or* (ii) the Final Examination of the Chartered Institute of Secretaries or the Corporation of Secretaries.

Starting salary in Inner London for successful candidates aged 20-24 ranges from £596 to £781, according to age; for those aged 25 or over it ranges from £810 to £1,090, depending on qualifications and experience. The maximum of the scale (Inner London) is £1,490, but there are prospects of promotion to posts carrying salaries well above £2,000. All posts are pensionable.

For further information and an application form, write to Civil Service Commission, Burlington Gardens, London, W.1, quoting 454/1062/13. Early application advised.

BBC requires Assistant, Sound Transcription Promotions. Duties include general assistance to Transcription Distribution Manager in promoting use of BBC transcriptions by sound broadcasting stations throughout the world, and, in particular, responsibility for production of catalogue, booklets, pamphlets and illustrations. Applicants must have a lively and creative publicity sense, a good general understanding of broadcast programmes as well as ability to discern those elements in BBC programmes which are likely to appeal to broadcasting stations overseas. Ability to write with a good literary style essential, some knowledge of typography and layout desirable. Salary £1,575 (possibly higher if qualifications exceptional) rising by five annual increments to £2,000 max. Pen. Resumes (or application forms (including addressed envelope and quoting reference 623/9417) to Staff Appointments Officer, Broadcasting House, London, W.1, within five days.

AUSTRALIAN NATIONAL UNIVERSITY

CITY OF HALIFAX
NOVA SCOTIA, CANADA
Call for Development Proposals
Central Redevelopment Area

Halifax, the Capital City of Nova Scotia, together with its fast-growing Metropolitan area, has a population of approximately 200,000. It is an important administrative, cultural, commercial, and industrial centre and one of Canada's major ports open the year round.

The City Corporation, with the assistance of the Government of Canada represented by Central Mortgage and Housing Corporation, has acquired and cleared 13.9 acres of land in the Central Business area of the City as a first step in a Phased Redevelopment Programme.

The City is offering the cleared area for residential and commercial development by private enterprise. Plans, development conditions, and proposal forms may be obtained on application to the undersigned on payment of a certified cheque or Bank Draft for $50 (Canadian funds) payable to the City of Halifax to be refunded on submission of proposals.

Development Proposals will be received by the undersigned at the City Hall, Halifax, Nova Scotia, Canada, up to 3 p.m. Atlantic Standard Time, October 31, 1962.

P. F. C. BYARS, City Manager.

City Hall, Halifax,
Nova Scotia, Canada.

DO YOU KNOW

that this little ball could run you out of business?

VULCAN KNOW The most simple things can cause a disaster to all kinds of industrial machinery. But, simple or complex, every potential danger spot needs an expert eye to find and correct it. The expert who knows where to look, and what to look for, is the Vulcan Engineer Surveyor. Industrial accidents need never happen if he regularly inspects machinery—your machinery. The inspection and protection of boilers and cranes, lifts and hoists is what Vulcan provide. It is a specialist's job. Vulcan are the specialists. That's why Insurance brokers know that safety first is Vulcan first.

May we send you FREE 'Vulcan'—a journal for all users of plant and machinery with reports of accidents and safety hints. Write to us.

An extra specialist Vulcan Service!
We were the first insurance company to offer industry Non-Destructive Flaw Detection by Ultrasonics, Radiography, or Magnetics. This extra specialist service is now available to *all* industry—whether Vulcan insured or not. Write to us for complete details.

Vulcan ARE SPECIALISTS

THE VULCAN
BOILER & GENERAL INSURANCE CO. LTD.
DEPT. 17, 67 KING STREET, MANCHESTER 2

* *Today, thanks to skilful machining, there is an endless variety of uses for ball bearings and roller races. But choice of wrong type of bearing, or incorrect fitting, or excessive loading, can result in expensive failure. And in most cases, the failure can be blamed on the user, and not on the manufacturer . . .*

Accidents do Happen!

AND not only to the other fellow. Life is full of hazards. Most Accidents happen about the home—burns—scalds—cuts—electrical shocks. Some may entail disablement.

Have YOU thought what the financial consequence would be to you and your family?

Insurance is inexpensive—ask us for details.

Kellogg again at work for I.C.I.

Once again Kellogg is proud to be co-operating with ICI. This latest in a long series of projects is to execute ICI's first crude distillation unit, having a capacity of 1,000,000 tons per year and scheduled to be in operation in 1963 on Tees-side.
Kellogg will be responsible for the design, engineering, procurement of materials and construction of the unit which will provide some of the light distillate naphtha required by ICI in its three olefin plants at Wilton. Kellogg was associated with ICI in the development of all three plants. The new distillation unit, normally a step in petroleum refining, will allow the chemical concern to handle crude oil for the first time and will provide ICI with greater control over the raw materials needed for ethylene production at Wilton.
If you are planning to build new processing facilities at home or abroad—in the refining or petrochemical field.—you will be interested in the new brochure, "On the Job with Kellogg International Corporation". Write for your copy.

INTERNATIONAL

After the Ball

Mr Macmillan's visit with President Kennedy was a cosy one—so cosy that their differences of outlook seem to have been glossed over (p. 448).

Now Mr Macmillan has to steer Britain ahead in the crucial stages of the voyage into Europe (p. 429).

After the Boom

In **Europe,** growth and the propensity to invest are faltering a little—but thoughts about **planning** remain imaginative and progressive (p. 424).

Things are moving fast enough, however, for Europe to avoid the word "**stagnation**" (p. 473).

Although required by the coal and steel community to allow free market conditions to rule, the **French** government is unwilling to relinquish all control over **steel prices** (p. 471).

In **America,** businessmen are watching Mr Kennedy to see if he applies the same sauce to the **trade unions'** gander as he did to the steel industry's goose (p. 449)—and few of them can find any comfort in their first quarter's profits (p. 450).

In **Egypt,** planning for boom times is somewhat haphazard—but no one minds so long as it is called "socialism" (p. 457).

AFTER THE BAN the United States has imposed on various **imports from Hongkong,** the colony's freebooting manufacturers are more alarmed than hurt (p. 461).

After the Battle

Rhodesia : With white rule proved unworkable, African nationalists should calm down and turn to taking over responsibility for the federation—under a new name, of course (p. 427).

Algeria : The next two months will show whether or not the Evian compromise stands a chance of success (p. 458).

France : Many deputies have already thrown off their Algerian preoccupation and are ready to make parliament useful again (p. 429).

Uganda : Another collection of tribes will soon acquire independent "nationhood"—after a constitutional wrangle in June (p. 433).

United States : If the South's attempt to stage a freedom ride in reverse succeeds, the region may regret it (p. 450).

Goa : settling dust (p. 462).

APRÈS LE DÉLUGE : An English view of the French (p. 433)—*and two French views* (p. 442).

After the Bang

Oddly enough, the present series of American **nuclear tests** may be the last (p. 449).

Oddly enough, it seems that **Nato** is not after all to be the world's fourth nuclear power yet awhile (p. 428).

Oddly enough, the **west Germans** are showing restraint in nuclear matters and over Berlin (p. 428).

AFTER THE BARREL—completely about **beer** (p. 465).

HOME

Laborare est orare

Strike-threatening, and apprehensive, dockers hope that their threats will have the usual result—no strike and an inflationary wage rise. No doubt the alternative of standing up to a long drawn out strike causes trepidation to a Government fearful of its prospects ; it is nevertheless the right and least dangerous course (p. 421).

The inter-union squabble at **Liverpool docks** has temporarily died down : but it will flare up again and again until the necessary reforms in the labour system are brought about (p. 437).

The late bitterness between the **seamen's union** and its rebels is having some useful side effects on the union's leadership (p. 434).

Failure to get a majority for strike action in the **engineers' union** ballot may mean a clearing of the mind in rank and file unionists (p. 429).

Nil desperandum

Dr Hill has had to give in to the wheedling and tantrums of fringe boroughs anxious not to be drawn into **Greater London :** by doing so he is weakening the props on which the Greater London plan must stand, and prejudicing much-needed reforms in local government (p. 425).

Parliament went sluggishly back to work: but some tough questioning presages a rough session for the Government (p. 430).

Labour has polled extraordinarily well in Scottish **local elections :** next week they may do as well or better in England and Wales (p. 430).

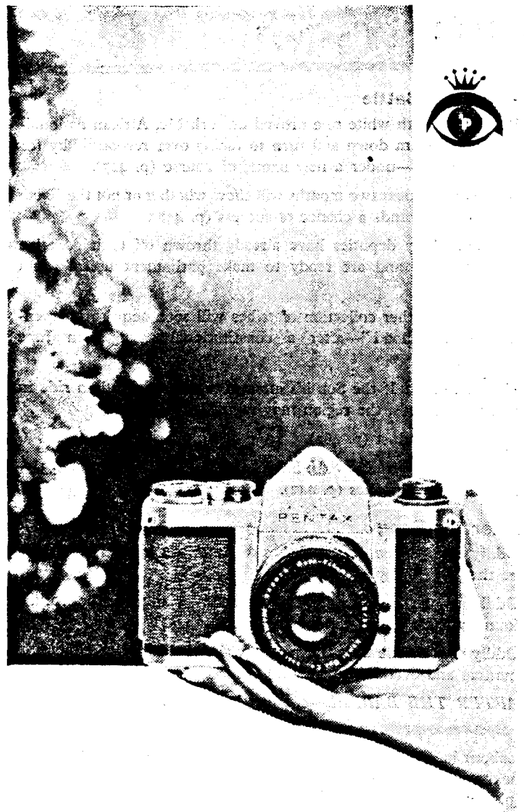
Quid pro quo

The British **newspaper press** is canalised by economics ; but fiscal and financial penalties on its proprietors—such as are being urged on the Royal Commission inquiring into it—cannot force it into the new and needed channels : only journalists can do that (p. 422).

The rosier economic outlook could herald a rise in **share prices,** short of a boom : the wise investor will not be carried away (p. 469).

Mr Lloyd has plugged one of the holes through which a good deal of his pelf has leaked, in the past few years, to the island state of Jersey (p. 438).

Fiat lux



The **National Economic Development Council** meets again next week : it is to be hoped that it will save itself from the useless docility some people wish on it (p. 430).

The uneconomics of running the **Atomic Energy Authority** are made manifest in their accounts (p. 476).

Some sections of industry are criticising the Government's **energy policies** on economic grounds, to its hurt surprise (p. 475).

Norwich's new university has high ambitions, and the chance to achieve them (p. 439).

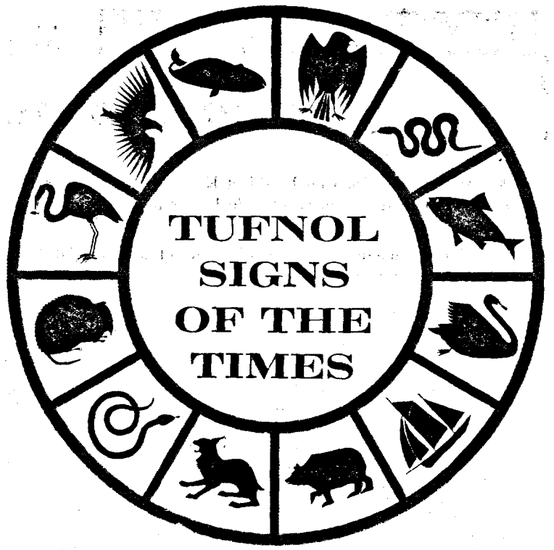
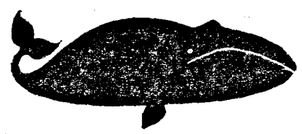
ASAHI PENTAX



There are many satisfactions to owning an Asahi Pentax. The smallest and lightest of all single lens reflexes, it is admired by professional, and amateur alike for its handling ease, mechanical perfection, and most important, the new quality it gives to their 35mm photography.

When you invest in a Pentax—for yourself or for a really fine gift—you do so with the confidence that this camera will not only perform magnificently in almost every picture situation, but will also grow in value as other Pentax equipment is added to your system.



The Pentax camera system will lead you all the way from the intimate world of the micro-photograph to the wide-open adventures of imagination-inspiring tele-photography. In the meantime, you know you have the finest camera in the world at its price, with automatic diaphragm, Pentax-invented instant-return mirror, positive, brilliant focusing, smooth shutter release, and a host of other features designed to help you take better pictures.

Choose a Pentax S1 or S3 according to your individual preference. Each one is a fine product of precision manufacturing—each has an individual personality.

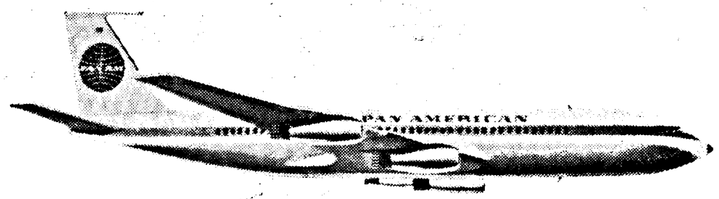
Whale-sign of Tufnol

Those people born under the sign of the Whale have something to spout about. They become chief purchasing officers, chief engineers, chief draughtsmen and chief designers. Whale men leave it to Jonah's disciples to wail about the inadequacies of the materials they have at hand. Whale men are perfectionists who travel far when they find one material that is light yet strong and hardwearing, resistant to corrosion and a good electrical insulator. They also find that this ideal material resists deterioration in storage, machines easily with ordinary tools, and is available in sheets, tubes, rods, angles, and channels. Many whale men have already discovered this remarkable material—"WHALE" brand Tufnol. They have also discovered that Tufnol is available in eleven other brands, each with pre-determined properties.

All brands of Tufnol are laminated plastics; each formulated to satisfy specific requirements. If your birthday falls between January 1st and December 31st this could be your lucky week—the week you discovered Tufnol.



'Phone or write to your local Tufnol Branch Office and we predict you'll thank your lucky stars.

EXPORTERS! IMPORTERS!

Speed your U.S. cargo on any of 218 weekly Pan Am flights!

Never before such frequency, such convenience as you'll have on Pan Am starting June 15!
THIS SUMMER ON PAN AM: more transatlantic Jets than the next 2 airlines combined! 92 jet flights weekly . . . plus 9 weekly 18-ton-capacity all-cargo flights, plus 8 piston flights. You have 109 opportunities to reach your United States markets every week—109 more to bring in imports.

No matter what you're shipping or importing, your shipment gets extra care on the World's Most Experienced Airline. Pan Am knows much more about cargo handling, because Pan American carries *more cargo* than any other international airline.

Air shipments are lower now too! Up to 63% lower than last year. You also save in other ways. Delivery *in hours* means more sales, smaller inventories, less "tie-up" of your capital. Insurance rates for air shipment are much lower than surface shipment rates. Less packing and crating, too.

Ship by air—ship Pan Am . . . and if you're importing, specify shipment by Pan Am! It's never been easier, or more convenient! For details, call your Cargo Agent, Freight Forwarder, or local Pan Am office. Ask, too, about Pan Am's exclusive World-Wide Marketing Service that can help you get new business in 114 major markets 'round the world.

PAN AM

WORLD'S LARGEST AIR CARGO CARRIER
WORLD'S MOST EXPERIENCED AIRLINE

"Speaking as a Refractory pupil, dad..."

"You're taking the very words out of Old Squirt's mouth, Son. His most refractory pupil, I'd say"

"I must admit he's been pretty peeved lately, Dad. He's been blowing his top and cursing and swearing; so that's why I started to study refractories"

"I don't get the connection, Son"

"Well, it suddenly struck me, Dad . . ."

"Before Old Squirt struck you, Son?"

"No, Dad, after; that steam-raising and blasting had something in common"

"In this case, Old Squirt himself apparently, Son"

"Yes, Dad; but something else besides. They both depend on refractory linings; in the one case plastic and in the other case bricks"

"Son, I'm not with you"

"Well, Dad, many of the best ships' boilers are lined with TRIMOR Mouldable and Castable and the stacks of blast furnaces are increasingly being lined with MR2 bricks"

"With what results, Son?"

"At Appleby-Frodingham's, Dad, (you know, part of United Steel), Queen Victoria's stack has not been relined for nearly four years, after producing over 1½ million tons of iron; Queen Anne has just been blown in, and Queen Bess has been on blast for . . ."

"I'm beginning to see the connection with Old Squirt, Son. Now that's three Queens you've mentioned; anything else up your sleeve?"

"Well, the Queen Mary and the Queen Elizabeth have been plying the Atlantic with Trimor in their boilers for the last few years"

"Son, that's five Queens in one pack"

"Yes, Dad; the cards have been nicely stacked"

"A rotten pun, Son"

"Of course it's not only royalty that's served—you realise that, Dad, don't you?"

"I was beginning to wonder, Son"

"There's the France, Leonardo da Vinci, Caronia and Windsor Castle, to name only a few more well-known ships; oil tankers by the dozen; and numbers of other blast furnaces at home and abroad too, Dad"

"There's international democracy for you, Son! But you've forgotten something, I think"

"What, Dad?"

"To name the makers of these world-beating bricks and plastic refractories—who, of course, are . . ."

"Dad . . ."

"Don't interrupt, Son. I'm determined to have the last word for once. Who, of course, are Morgan Refractories Limited"

VOLUME CCIII - NUMBER 6193

In the Dock

THE threat of a national dock strike from May 13th is the sort of threat that has been constantly hallowed by success, especially on the railways, in Britain during the last fifteen years. Few people expect that the strike will really happen; they assume that the port employers—possibly plus Mr Hare—will now huddle together in the usual hurried concourse of pacification, and come up with the normal "solution" of some slightly inflationary settlement shortly before the union's ultimatum expires. This will then be called "saving the country from an impossibly expensive disaster"; and nearly every organ of national opinion seems to be standing ready loudly to applaud any such comfortable "statesmanship," the bill for which would then be added to overseas trading costs.

All the conventional arguments for justifying this further twist to cost inflation have been duly stacked into place by every national newspaper in the last few days. It is exceedingly easy to stack them. A lengthy and effective dock strike would indeed be a grave national misfortune; not only because some of the export orders that would miss their promised delivery dates would then be lost for ever, but also because the losses caused by a strike could serve to dissuade some British industrialists and some of Britain's customers from relying so heavily on exports out of Britain in future. A national dock strike might easily be a long-drawn-out business. As the Transport and General Workers' Union would have to provide strike pay for only 70,000 of its million members, it could keep up these subventions for a much longer period than, say, any railway union could; the tradition in the docks of regarding work as in some way casual labour, with wildly fluctuating daily earnings, means that dockers might also be personally readier and abler than other workers to stay away from their normal work for several weeks, some of them by taking other temporary employment in the meantime.

Mr O'Leary of the docks section of the Transport and General Workers' Union is, like the railway union leaders, essentially a moderate man; although Mr. Frank Cousins is nominally his superior, and although the recent official actions of his docks section in Liverpool (see page 437) have hardly been a shining example of wise and liberal trade union management, everybody assumes that Mr O'Leary will be eager to settle if only some sort of face-saving offer from the employers is forthcoming. The port employers' federation has recently been holding discussions with Mr Cousins and Mr O'Leary about the possibility of moving away from the present semi-casual system of labour hiring in the docks; it might therefore seem tempting to some people to say that the employers should offer a little more on piece work rates now, and then recoup themselves by delaying decasualisation and thus payment of the fairly considerable initial bill that might be needed to get a decasualised system running. This, too, might be called statesmanship; but it would blithely disregard the fact that progress towards decasualisation would be in the interests of the country and of everybody in the docks industry in the long run, while a short-term addition to the unit costs involved in handling each marginal export cargo could not.

If there is a mildly inflationary settlement to this dispute, and if the consequences of this then spread slowly throughout the economy, officialdom will no doubt say that this is a sign that Britain is indeed still suffering from a tendency towards over-demand; consciously or not, the Treasury may then proceed to slow down the rate of re-expansion of economic activity. There could hardly be a

more absurd result or conclusion. Those who say that all cost inflation is caused by an excessive pull of demand upon resources, not by trade unions' wage push, should ponder on this example of the dockers' demands which now lead the wages struggle. One half of the activities in which dockers are engaged is concerned with the shifting of British exports; it is no part of conventional current Treasury argument that this particular activity has recently been excessively overheated. The other half consists of the handling of British imports, the physical volume of which has recently been dropping. Indeed, it is largely because the total volume of their work (and thus of their piece-work earnings) is lower than it was a short while ago that dockers are indignantly pushing forward this claim to raise wages and unit costs.

THE docks dispute is therefore both a test case and an example in microcosm of most of the main things that are madly wrong with the present British economy. That is why it is important to face facts about it, even at the risk of being called reactionary and provocative. No doubt the happiest solution would be for the strike to be called off in return for an advance to decasualisation; an immediate increase in the fall-back pay secured by dockers on the days when they cannot get any work would be a wise interim step in this direction. But if Mr O'Leary says that the only settlement which he can accept is one that would significantly and permanently increase the cost of shipping exports, then it would be better to stand up to the strike, provided that the Government handles it resolutely.

Resolution in this respect would mean allowing both troops and non-striking labour to handle cargoes during the stoppage. This should not apply only, as some people have suggested, to allowing perishable imported cargoes to be taken off the ships; imports are not the most vital things to safeguard nowadays. It should also involve using and allowing and enabling outside labour to put export cargoes on to the ships, even though this might mean running the gauntlet of sympathetic action by some other unions. This would be unpleasant, but much less unrealistic than most people think. The number of strikers whose places would need to be filled by troops or affected firms' own labour would not exceed 70,000, not all of whom find active employment every day and many of whom sometimes work in gangs that employ more men than are strictly necessary to do some jobs anyway.

It will be said that any such strike-breaking action by the Government would be political suicide. In point of fact, like President Kennedy's intervention against United States steel-masters, it would be the reverse. Among floating voters "firm action" in resisting a strike would be exceedingly popular, perhaps indeed too flamboyantly so. The general British attitude towards strikes nowadays is to welcome any inflationary compromise which avoids one, but also to rally fiercely against the strikers once a stoppage actually breaks out. It is necessary in a democracy to remind people both that strikers are not public enemies, and that it is often better to stand up to strikes than to accept a constant inflation of costs. As the deadline of May 13th approaches, the latter lesson will deserve to be the more urgently emphasised. But one very much doubts whether it will be.

Small and Great

The Press is too much with us: small and great;
We are undone of chatter and on dit,
Report, retort, rejoinder, repartee,
Mole-hill and mare's nest, fiction up to date.

TIMES have changed since Austin Dobson wrote. It is the great, but not now the small, that are too much with us. The second Royal Commission on the Press since the war is now in the last agonies of deciding what to say about this state of affairs. Tested by counting output and sales or by weighing social, cultural, and even political, significance, this is a major theme in this better-off twentieth century Britain which, under the top layer of old ways and attitudes, is changing into something quite new, and as yet unknown.

Just as the British people eat more sweets a head than anybody else, so do they read more copies of newspapers. It does not follow that the Shawcross commission should therefore follow the example of Mr Selwyn Lloyd and propose to clap on a tax: though the notion of a tax on the largest revenues from newspaper advertising, designed either to push up the price of papers for the help of the smaller ones, or to turn some advertising from large to smaller papers, has been on the carpet since before the commission started work. But it does follow that liberals particularly should now be making up their minds about the sort of thing that they would like the commission to say, or not to say, about the nation's daily printed fare of news, views and entertainment.

The only by-blow of the first Royal Commission, which reported in 1949, was the voluntary Press Council, the newspapers' self-appointed ombudsmen to hear complaints about their own conduct. This had at least the virtue of paying tribute to the truth that the press's rights are really duties to readers and to citizens. It is in this light that the crux of concentration and choice in this big business and industry, left aside thirteen years ago, should now be contemplated. The commission at present in labour was set up in March last year after a six-year chain reaction of mortality and mergers among newspapers and magazines, sparked off by higher costs, by intenser competition and by commercial television as well, had telescoped the British press in London and outside. Lord Shawcross and his colleagues were asked to unravel the economic and financial process that was bringing this about, and to judge the upshot, and any possible new public policy, in terms of the public interest in true news and free opinion. What is the interest of the citizen, the consumer of the press?

One thing at any rate should be said. In liberal eyes, the consumer's interest cannot simply be to try to put back the clock by cutting down every efficient producer that has grown larger and longer in the stalk than the rest. Commercial success is not a bad word to real radicals, in the press or in

television any more than elsewhere. It is indeed by the best, the newest and the most fruitful exploitation of all the modern means of print, dress and words that the twentieth century citizen can most hope to get the choice of fare that suits his needs and aspirations. The snag, of course, rests in the word "choice"; it is the diminution of diversity in newspaper ownership, and therefore in readers' choice, that the new royal commission was asked to pass upon. But the growth of the King empire in the press cannot be countered by the means of King Canute. There is no right way of keeping unprofitable papers alive, and free, by passing laws or by putting on taxes. The diversity that is wanted will not be achieved, whether in the press or in broadcasting and television, by state-shaped arrangements or edicts, however benevolent. What a free society really needs in its organs of information, opinion, entertainment and culture is nonconformity; that is indeed what a free press means; and the only sure free way of getting this burst of new and unfettered ideas is by the originality and enterprise of non-conforming editors and managers.

THIS in fact is the worthwhile core of the hurly-burly of a book* which has just been published by Mr King's Hugh Cudlipp, the journalist-editor turned tycoon or, as he would call it, "operator." The book is written in short pants (not well-connected) of biography (often very well done), anecdote, gossip, tub-thumping and shrewd sensible argument, with the inside story of the *Mirror's* battle for Odhams Press; and the bits in the palimpsest which have commanded least attention so far are the most relevant to the great theme of the British press, even though they are flawed by the presumptuous faith that all the answers already reside in the new *Mirror* building. Among all the bright, jangling words the diagnosis is there: "the problem is not whether greater diversity of ownership is desirable but whether greater diversity of ownership is possible; no newspaper, magazine or periodical can survive without charity unless it can balance its books." These were the *Mirror's* words to the royal commission. So, too, was this guide to the way out: "the real problem is not so much the paucity of proprietors as the passing scarcity of brilliant editors who can conceive ideas successful enough to increase the number and variety of publications"; and, speaking of the *Daily Herald*, "only journalism of an outstandingly original level will reverse the present trend—journalism backed by skilful promotion." "The truth is, of course," Mr Cudlipp lectured (or hectored) the Commonwealth Press Union four years ago,

> that the social habits of the people are changing all the time. And the papers that do not change with them—for instance, papers that are slow to recognise the tremendous revolution that television has caused in the social life of families all over the world—will die or lose their influence.

Mr Cudlipp recognises the economic trap the British press has got itself into. Since Northcliffe, the formula has been to sell papers well below cost and to make profits from the advertisements got on the footing of the cut-price sales. The key to survival is advertising; this is even truer of the quality papers, the "good" dailies, Sundays and weeklies, which live by a special kind of quality advertising addressed to the affluent or the discriminating, than of the millionaire papers, which thrive by mass appeals to this island's mass market. And, since 1955, television advertising has bitten its way in. Mr Cudlipp himself says that the only answer now to this lop-sided dependence for profits or for survival upon advertisements is to raise selling prices. The problem put to the royal commission is whether this can, or should be, pressed upon the press by uncertainly effective but certainly discriminating fiscal means.

No doubt it can be said that the commission's duty is to suggest countervailing discriminations to those built into present press economics; that is the case, too, for another proposal to make mergers over a certain size, in this industry only, subject to special sanction. But even if such open interferences could work fairly or be freely tolerated, they would give not the tiniest surety that the wanted diversity of papers in theme and opinion and size would then appear and thrive: only the skill—and success—of managers and editors could do that. The challenge of the press is still to the press, and its readers.

Mr Cudlipp is not too worried by the challenge: if diversity and nonconformity are wanted, are they not there in the *Mirror* group—defying conventions, hastening social changes, cocking a snook at traditions and pomposities, fighting taboos, attacking the ruling clique and the upper crust? What is more, and this is perhaps the proudest boast in the book:

> Significantly on January 1, 1962, the *Daily Mirror*, Britain's most popular paper, introduced two pages of serious and informed comment on the night's late news into every issue.

Nobody would wish to rob the *Mirror*, with its unique capacity for making itself understood in word and theme by its millions of readers, of its contribution to critical and outspoken journalism and, in its intelligently forthright way, to popular instruction. But the readiness to speak out is a journalist's duty anyhow. Sticking pins in the old stereotypes of authority is not, by itself, the nonconformity the British press most desperately needs to keep: significantly, the chapter in this book on the *Mirror's* "denunciation" of Suez is headed, with a brave shudder, "How to lose 70,000 readers." The *Mirror*, by its nature, has its own synthetic conformity at least as marked as the conformity that Mr Cudlipp, so passionately and so old fashionedly, attributes to *The Times*; its ball-and-chain is not the established clique but *vox populi*; its risk, as it tilts so rudely, so romantically and, sometimes, so refreshingly and so effectively against aristocrats and oligarchs, is plain demagoguery.

IT is the journalism of ideas and dissent, from all the sorts of conformity, that Britain most lacks and most needs. In no society do those who run it or those who man it ever know what is happening to it, or where it is going. Change and growth come from the odd men out. These are the real nonconformists. It is for these that we most need lively and living small papers (the "problem publications of public importance or political significance" which Mr Cudlipp says, too, too beguilingly, will be best off in, and by favour of, a larger group able to "swallow or submerge" their losses). The royal commission cannot do much to help these, however it seeks to tilt the economic balance of the press. Only journalists can do this—with new ideas in their trade to match those of the nonconformists.

Planned Europe?

As full employment closes in on Europe, new thoughts about economic planning are in the air

THE British Left's picture of postwar western Europe as a Papist oligarchy, where a rampant private capitalism grinds the faces of the poor, has never held much water. France has been planning investment since 1947. Holland has been operating a thorough national wages policy ever since the war. Public ownership is more widespread in France and Italy than in Britain. And though the pattern of social services varies from country to country, with Germany excelling in pensions and sick pay, France in family allowances and Britain in medical services, throughout western Europe the welfare state is established in the social fabric. On May Day PEP published a pamphlet* by a member of the Amalgamated Engineering Union's research staff, which admirably describes this scene.

Yet one fundamental economic factor—the absence of full employment—has weakened the power of organised labour on the continent in the past fifteen years, and until lately helped to create a somewhat different social climate from our own. Some countries have had less unemployment than others. In France the labour market has been stretched for some years and unemployment has often been below the British level. In west Germany, though the labour market has been tight, especially in the summer, for five years past, the steady influx of refugees from the east has always, until last autumn, provided the employers with a backlog of labour from outside. Southern Italy provided a vast reserve of idle hands, whose existence helped to keep wages down, not only in Italy, but in other parts of the continent.

This situation is coming to an end. Last August the influx into west Germany from the east was stopped. Firms in northern Italy are now having such difficulty in getting the kind of labour they need that they are trying to persuade Italian emigrants in south Germany to return home. There are still at least 1.3 million unemployed in Italy, mostly in the south, but many of these are men who cannot or will not move easily elsewhere. While British firms recruit West Indians and Pakistanis, German firms are having to seek labour in Spain and Greece. The European Commission's latest quarterly survey of the economic situation in the common market points out that expansion has been slowing down "mainly due to labour shortages, which have become a fairly general problem in the northern areas of the community." In the last quarter of 1961 France and west Germany, which together have a labour force about twice as large as Britain's, had together only about two-thirds as many unemployed as there were here. In the community as a whole (including Italy), about 2.4 per cent of the labour force was unemployed compared to 1.7 per cent in Britain. The strains on the economy of the continent are described on page 473.

In facing the problems of full employment, continental western Europe has three economic advantages over Britain. The huge exchange reserves accumulated during the past ten years provide a strategic weapon which it has been possible to deploy with good effect to increase imports, holding down domestic prices and permitting demand to expand without inflation. Industry can also still draw on the large reserve of labour on the land, provided a determined attack is made on agricultural protection; this reservoir is a traditional source of industrial growth. Above all, continental western Europe has acquired the habits of growth and high investment which are preconditions of future expansion without inflation. The attitudes of unions, management and officials alike are still less defensive than in Britain.

FOR all that, the transition to full employment is bound to bring, indeed is bringing already, a change in the economic, social and political climate on the continent. Just when incomes a head in France, north Italy and west Germany are reaching the British level, these countries are beginning to face some of the problems of economic policy that Britain has faced for many years. Growth, and the propensity to invest, are faltering a little. The industrial output of the Six rose by only 6.5 per cent last year compared with 13 per cent the year before. As the labour force tightens there is a tendency to invest less in expansion of capacity and more in rationalisation, less in industry and more in services. Above all, at the same time as profit margins and investment yields shrink (notably in Germany), wage claims flourish (far more than the rise in productivity in both France and Germany). As the symptoms of full employment and "maturity" close in, German and French officials are actually beginning to look with some admiration and envy at Britain's partly-successful wage pause.

There are signs already that the economic policy-makers are beginning to respond to the new situation. Dr Erhard has provided a clear-cut lead, calling on the Germans to show self-restraint in wage claims and price policies, slapping restrictions on new building, and threatening tariff cuts if manufacturers raise prices. The motor manufacturers have not responded; nor have the unions: it is high time, they retort, that wages and consumption did take a larger share of the west German national income. Government economists remind them that the fabulous wage increases of recent years have in turn been the result of high investment; why kill the goose that lays the golden eggs?

The upshot of the argument will not be clear for some time, but there is no doubt that full employment has strengthened the German unions' hand. The debate is also throwing up a good many new ideas. There is talk of a national incomes policy, or a system of forced saving to put excessive wages into a kind of public investment fund. The *Volkswirt* has called for a more systematic economic policy, backed by better statistics and a closer consultation with industry on investment plans.

New thinking in France is even more interesting. While the British are trying to learn from the planning structure the French set up in 1947, the French are considering how to adapt it to the nineteen-sixties. With resources under strain, the choice of various alternative policies becomes more important and more difficult. Last year the French planners began work on forecasts of growth up to 1975, to give depth to their forecasts for the four-year plan which came out in January. In preparing the fourth plan, they worked out not one but three different estimates for growth, so that the implications—for investment, foreign trade and so on—could be seen clearly, before the choice of a certain rate of growth was made. Eventually the middle estimate—an increase in national product of some 5.5 per cent a year—was chosen, with special emphasis on public investment in such things as schools and roads. Even the minister of finance seems to be catching a little of the new mood of *gaullisme social*. M. Giscard d'Estaing, General de Gaulle's young finance minister, announced in February that he would hold meetings with the unions as a step towards a new national incomes policy. An article on page 471 describes his efforts to hold steel prices down. His tone sounds different from the high orthodoxy of M. Baumgartner, his predecessor, who once dismissed talk of inputs and outputs in the committee of national accounts with a brusque: "Tell the gentlemen to speak French."

BOLDER, left-wing thoughts on the future of French planning were thrown out in three articles in *Le Monde* in March by M. Gilbert Mathieu. The first French plans, he pointed out, had been empirical devices thought up by the technocrats for breaking through certain bottlenecks in the investment industries and getting businessmen used to growth. Now that the choices had become so much more complex there was need for a more effective democratic control. Parliament, for example, should be able to choose which of, say, three growth objectives should be followed and, where there was room for further choice, whether to go for, say, more leisure or more consumption, more public investment in schools or more private investment in the television industry. Planning, in short, should have social objectives, in the choice of which the popular voice should be heard.

Italy's "opening to the left" provides the most tangible political sign of these new currents. Since Mussolini's fall there has been plenty of planning and state enterprise in Italy. The Institute for Industrial Reconstruction has owned and guided industrial developments in most branches of engineering. Signor Mattei has built pipelines, refineries, chemical plants, swimming baths and motels. There has been a plan for the Italian south and a plan for agriculture. At the Bank of Italy Signor Carli has been carefully keeping liquidity in line with the increase in the national income. But in-fighting has been bitter between the leaders of the different public and private enterprises. Indeed, it has not always been clear who is master—the young Italian state or its mighty industrial subjects. Signor Fanfani's government, with socialist support, now plans to set up a central planning authority to harness the industrial *condottieri* to a consistent policy.

The approach of full employment and affluence on the continent is thus being accompanied by an increasingly left-of-centre preoccupation with planning and an inclination to define its social as well as economic purposes more clearly. The trend should reassure those members of the Labour party who fear that membership of the common market would mean surrender to the forces of *laisser faire*. In France and Germany the search for a new balance in social and economic policy still has to find political expression; one may suppose it will make itself felt once Dr Adenauer and President de Gaulle have left the scene, and it may soon have its impact on life in the institutions of the common market. M. Mathieu points out, as critics of the common market have done in Britain, that as Europe unites it will become less easy to plan on a national basis, and more necessary to do so on a European scale. It is intriguing to hear M. Mathieu ask whether Dr Erhard's Germany and "liberal-conservative" Britain will accept a plan on a European level, akin to the one France will want. National planners can perhaps be reassured by the resemblances in the ways Europeans are thinking as they search for a new blend of planning and economic liberty.

The New London

The Government is in danger of fluffing the test case for local government reform in Britain

DR HILL really must not let himself be browbeaten by suburban witenagemots. On Monday he succumbed to the agitation by Surrey County Council and exempted three flourishing urban districts (population 120,000) from inclusion in the Greater London local government grouping that is to come into being by 1964-65. The Surrey Tories may dance in the streets because they still have sack and soke in Banstead, and the rest of the country may simply shrug its shoulders at London's enduring parish-pumpery. But this is a decision that needs to be questioned—if only because the fate of another dozen peripheral districts wanting to wangle their way out of the Herbert commission's recommendations is now in the balance. The Herbert commission's report opened the door to the most hopeful and stimulating reappraisal of local government in this century. Because it dared to question every vested parochial interest in the London region it is being fought tooth and nail by bumbledom everywhere: by entrenched Tory councillors in Surrey and the plush suburbs, as well as by entrenched Labour councillors in the old London County Council area. London's readjustment will not be advanced if Dr Hill's first action has to be to placate those of his political friends who make the loudest noise.

The Ministry of Housing and Local Government, says Dr Hill, exempted the three Surrey districts because "they do not form part of the continuously built-up area." The first thing to be said about that is that the green belt shutting off these spinal developments from London is uncommonly hard to find; certainly the Herbert commission thought so. The second thing is that to adopt this one physical criterion is nonsense anyway. Take Banstead itself: 47 per cent of its employed population is believed to work in London, 27 per cent actually in central London. As some people have to be employed in running local shops and so on, these are high figures for any-commuters' suburb; they mean, in strict truth, that Banstead relies on central London for its daily bread just as much as Battersea does, or Camberwell. It almost looks as if Conservative Central Office has done a little sum: to give just enough back to Surrey to keep it quiet without prejudicing the Tory chances of carrying the Greater London Council in an average election year.

There is a very real need now for Dr Hill to show that he is in earnest about tackling London's problems and, particularly, in giving the Greater London Council the authority it needs for its job. There are four main points that call for his attention.

First, he must put his foot down in dealing with the remaining "beyond the fringe" councils—although, if he simply adopts his Banstead criterion, places like Romford and Hornchurch have a fair claim to be counted out, too. And if he does make more peripheral concessions, then there will be the more urgency for the creation of effective joint planning machinery over the wider Home Counties region. The deathbed repentance of the counties, in professing to want to do something more positive about overspill housing, main roads and commercial development than their original evidence to the Herbert commission suggested, ought to be promptly taken up.

Secondly, he should increase the size of the area over which the proposed new *ad hoc* educational authority in central London will hold sway.* The Government rejected the Herbert recommendations on education and plumped for giving all the Greater London boroughs, except those in central London, full county borough status in educational matters. (Its first ideas about the large Greater London boroughs along the southern ring seem, in fact, to have been drawn up with the outline of existing educational authorities sensibly in mind.) But in central London the threatened disintegration of the co-ordinating power over education at present exercised by the London County Council is a serious matter. The London schools system has been built up without any regard for existing metropolitan borough boundaries; most London children, particularly at the secondary school and further education stages, blissfully cross from one borough to another every day of their lives.

In his white paper (Cmnd. 1562) last November Dr Hill proposed to set up an *ad hoc* educational authority to take over the Greater London boroughs' responsibilities in the inner ring. He thought it "appropriate" that it should cover a population area "of the order of 2 million"—compared with the LCC's $3\frac{1}{2}$ million. On strict educational grounds (such as continuity of schooling, exercise of parental choice and even guaranteees of teaching standards and conditions) Dr Hill will do a great dis-service if he does not increase the size of this central area: it should certainly include all eight of the proposed Greater London boroughs in the existing LCC area north of the Thames and at least three on the south bank as well.

Thirdly, Dr Hill still must decide to make the Greater London Council into an effective authority, capable of dealing with the tasks of London's growth and renovation—instead of obliging it to content itself with matters like the fire service, ambulances and refuse disposal. The Government has decided that the GLC should be directly elected (which should help it to face the boroughs without constant ministerial intervention on its behalf), but if it is not seen to exercise effective regional power, the elections themselves will become a farce. They will mean that the citizens of Greater London, one-sixth of the population of Britain, will turn out to vote in three-yearly protests against whatever government is in power at Westminster—on hustings that will no doubt be fought over on general political and even foreign policy issues—in order to elect a body with about as much effective importance as the Metropolitan Water Board.

The GLC will have a visible purpose and attract public and administrative loyalty only if it is seen to be tackling such issues as housing and roads on a regional scale. In Cmnd. 1562 Dr Hill seemed reluctant to back the GLC wholeheartedly against the boroughs' claims. But the need for a live authority is real enough. Between 1959 and 1961 only one-third of families rehoused by the LCC could be accommodated in the metropolitan borough where they were already living; two-thirds had to be housed in other boroughs or in out-county estates. The GLC will need pretty strong powers if it is to try to increase densities in the fringe areas where this is practicable—and such increases are probably the chief way to assist slum clearance in the inner ring.

Equally, the GLC is the right authority to deal with traffic and highways, but it will not make a go of this on piecemeal grants or if improvements (like the Chiswick and Hammersmith flyovers on the road to London airport) still have to be bulldozed through several local authority interests. It is true that the boroughs in the north and west have been designed, geographically, to keep the main routes in a limited number of hands. But there is a very strong case for five-year grants to the GLC by the Ministry of Transport in order to ensure continuity of planning and construction.

FINALLY, although less important, Dr Hill needs to sort out some of the more unsuitable shot-gun marriages designated within the GLC area. He has had certain conspicuous successes: boroughs No. 2 (Westminster, Paddington and St Marylebone) and No. 3 (Hampstead, Holborn and St Pancras) seem to be settling down happily. He should certainly disregard a good deal of the amateur empire building and local feuding that have gone merrily on for the past six months—discrediting their advocates in the process. The "Greater Willesden" plan is one that can be safely cast into limbo and the love-hate relationships between Kensington, Chelsea, Fulham and Hammersmith need not be taken too seriously. ("No, I won't have anything to do with Aunt Ethel on the wrong side of the park.") But some complaints are worth looking at. For example, West Ham and East Ham are existing county boroughs with considerable administrative experience; instead of being lumped together they might better become nuclei for two new Greater London boroughs—particularly as Barking, with its new civic centre, seems ready to go in with East Ham. Again, there is something to be said for not letting the new Wandsworth start off without any public buildings while its old ones merely duplicate Battersea's.

The worst thing that could happen to London would be if, after glimpsing the prospect of a fresh start in keeping with the planning and administrative demands of the second half of the twentieth century, it should find itself the prey of political deals and parochial primacy. Mr Macleod told the Commons in the debate on the reorganisation last February that it was not just London or the south-east that was involved; local government itself was on trial and London was the test case. The Government must live up to his words.

* As we go to press Dr Hill announces that he will, in fact, preserve the LCC education area for five years at least—a decision that we warmly applaud.

Colossus of Rhodesia

African nationalists—near victory in central Africa—can cap their success if they show magnanimity

AFRICANS in Northern Rhodesia, Southern Rhodesia and Nyasaland should now be thinking about how to save the federation that binds their three territories. Save, because it is valuable and could be theirs. Dr Banda has Nyasaland. Delimitation of constituencies permitting, the parties favouring white man's control will be permanently out of power in Northern Rhodesia after the elections in October. The white federation itself—the one that extended white Southern Rhodesian control over the two northern territories—was resoundingly defeated by boycott at the federal elections on April 27th, when only fifteen seats out of 59 were contested. The new federal government rests on about fifteen thousand votes in a population of nearly nine million; on this basis it is doomed already.

African governments in Nyasaland and Northern Rhodesia may remain extremely reluctant to associate in any way with a Southern Rhodesian government still controlled by white men. But Dr Banda and Mr Kaunda will do well to realise that magnanimity at this time would, by reducing white fears, serve African nationalism better than a continued assault on Salisbury and London led by an intransigent Zimbabwe African People's Union (the Southern Rhodesian nationalists) and a well-meaning United Nations. The second of these two approaches could conceivably mean a quicker victory over Salisbury; but it would surely mean a bloodier one.

The time for this kind of private rethinking is now. Next week, after a debate in the House of Commons, Mr Butler will set off for a fortnight's tour of his new central African domain. He has already been told what to do by the United Nations; further advice will no doubt be forthcoming from the same source. If this seems irritating, and not really in order, it should be remembered that the African nationalists of Northern and Southern Rhodesia have, so far, gained considerably by enlisting international support; and they have at any rate caused the British representative in New York to promise before all the world that nothing will be done in central Africa against the will of its peoples. This is the point they have been trying to win since long before the federation was formed in 1953.

Apart from the ghost of the United Nations, Mr Butler will find within Rhodesia a great deal of worry about the forthcoming elections in the north and in the south. The African nationalists are, wrongly, boycotting the Southern Rhodesian elections under a new constitution that allows them a possible 15 seats out of 65. At the same time, there are fears that the right-wing parties may bring down Sir Edgar Whitehead's reforming government at the polls this year. While Sir Edgar himself will have no truck with African nationalists (but will remove race discrimination everywhere except in parliament), the right-wingers in Southern Rhodesia might well be more likely than Sir Edgar to take a last-ditch violent stand against African pressures.

In Northern Rhodesia, Mr Butler can help matters along by providing an unquestionably impartial delimitation commission (one sent from London) and by telling his officials in the administration not to obstruct the African parties and politicians when they seek to register branches, hold meetings, or canvass for support. But, on the other hand, violence has already broken out between Mr Kaunda's party and the smaller, opposition, African National Congress. The ANC is said variously to receive money and support from Mr Tshombe of Katanga and the United Federal Party led by Sir Roy Welensky; these political emotions have been further inflamed by tribal differences. This is not Mr Butler's easiest mission.

EVERYONE, including Sir Roy Welensky, expects something other than the present federal structure to emerge out of Mr Butler's trip and the horse-trading that might follow. The worst that could happen would be a sulky swing to the right in Southern Rhodesia, followed by some OASinine thinking on the part of a number of whites and, not altogether impossibly, intervention from South Africa. The best way to give the worst a chance of happening is for the southwards-advancing African nationalists to treat the entrenched white Southern Rhodesians as if they were departing British administrators. The Southern Rhodesians (and the South Africans) control their own destinies; there is no Britain (or France) to withdraw from power and, in withdrawing, attempt to negotiate new friendships between white and black. Slogan shouting, anti-white speeches, strikes, boycotts and the like become more

dangerous the further south they are carried; Sir Edgar Whitehead is more likely to be defeated pragmatically, by diplomacy, generosity, and fighting elections even on his terms. The new policy must be to win the whites over, not to drive them to armed cover.

If Dr Banda and Mr Kaunda are big enough to show magnanimity, the best that might happen would be to save the undoubted benefits of the federation for all its inhabitants. The first—and most important—benefit is the existence of its white population, with all its skills. Fewer white Rhodesians would leave if fear of what black governments might do were proved groundless by the speeches and the deeds of those governments.

From this flows the economic advantage of the federation. Mr Kaunda has already spoken of his desire to keep Rhodesia Railways and the Kariba dam and power station as going concerns shared between the two Rhodesias. Why

not the whole common market of the federation, the central economic guidance, and parts of the civil service too? The heavy costs of a complete break-up would thus be avoided. Apart from the burden of compensating departing civil servants, the federal public debt—amounting to some £264 million—would have to be reallocated among the three territories if they split up. Some of this money is guaranteed by the British Government; much of it was lent by British institutions and private investors. If there is to be a loss, or risk of a loss, the British Government would be legally bound to pay some of it (mainly loans from the World Bank) and, as much of it is trustee investments under British law, morally bound to cover much of the rest. But none of this would do any good to the credit-worthiness of the three territories; separate chairs in the tall building in New York might thus be expensive.

Again, as chairman of the pan-African freedom movement for east, central and south Africa, Mr Kaunda is avowedly against the balkanisation of Africa; so is Dr Banda. Both must be aware how much more influence a federation would wield in African and international affairs than three separate countries. Short of provoking Dr Verwoerd to fight, such a Rhodesian colossus might give him much to think about. This does not mean that any of the features which made the present federation unworkable can be retained. White control is an anachronism.

Ten years ago, *The Economist* supported federation on the grounds that it would make economic sense, and that it would both liberalise Southern Rhodesia and save it from South Africa. Today, after a certain amount of argument when things went awry, African politicians (and this paper) could support the same idea—under a different name—for the same reasons.

The Economist said on May 9, 1953: "The whole case for proceeding with federation rests on the assumption that the Europeans, now that greater powers are to be transferred to them, will show that African fears and suspicions are largely groundless." On that basis, the case fell through. Now "European" and "African" can for all practical purposes be reversed. Are the Africans, too, to let central Africa down?

NOTES OF THE WEEK

NATO

Not the Fourth

BETWEEN December and May, the idea of making Nato into the world's fourth nuclear power has visibly withered; which is unseasonable, but almost certainly a good thing. When the foreign ministers of the western alliance met in Paris last December they were urged (notably by Herr Strauss, the west German minister of defence) to look into the possibility of setting up a strategic nuclear force under the joint command of the Nato powers. The proposals that have emerged from the subsequent deliberations, and which were laid before the allied foreign and defence ministers when they assembled in Athens on Thursday this week, are a very different kettle of fish. They amount to no more than an offer by the United States to give its allies rather more information about its own deterrent. The allies would be told where in Europe the Americans' nuclear warheads were stocked, and would be invited to discuss just when and how they would be fired. But the decision to fire them would remain the President's alone; the European allies would have neither a finger on the button nor (as some people have suggested they might) a string that could pull the President's finger off it.

This is a far cry from a truly multilateral Nato deterrent. The retreat from multilateralism is due partly to the enormous difficulty of working out a system of joint command; and partly to the blunt refusal of the Americans to share control over nuclear arms just when they are trying to find a way of halting the proliferation of these weapons. Herr Strauss and the other advocates of a Nato force seem to have reconciled themselves with unexpected composure to not getting what they wanted. The idea of a jointly controlled deterrent will doubtless be revived. For the moment, however, most west Europeans are apparently willing to go on relying on the Americans for their nuclear protection, provided they get the comparatively minor extra comfort of being members of a committee to discuss how it is operated. Those who want to stop the spread of atomic arms will thus turn their attention back to Britain and France. Will they persist in their straining after nuclear independence? Or can they be persuaded, perhaps, to merge their efforts in a single force that could adequately guard Europe without adding another name to the list of nuclear powers?

Good Germans

BONN'S new moderation on atomic weapons is welcome. Herr Strauss, who has long been keen on a Nato deterrent, now seems to be acquiescing in the American policy of emphasising conventional weapons, and has accepted a much more limited programme of nuclear co-operation. The west German government will be content with information on the whereabouts of atomic weapons and stocks in Germany, a guarantee that they will not be withdrawn, and some political consultation on the general strategy of nuclear arms. Some people may doubt the wisdom of a guarantee that nuclear weapons should stay permanently on German soil, but on the whole these seem reasonable concessions to a country which provides the base for most of Nato's nuclear weapons on the Continent.

The west Germans are also showing restraint about Berlin. For all the doubts they obviously feel about the developing negotiations between the Americans and Russians, they seem to be taking their medicine unusually well. True, the leak in Bonn last month on the American proposal for a new international body to supervise traffic to Berlin looked like attempted sabotage by somebody. In the United States Herr von Brentano, the former foreign minister, has been saying that the creation of such a body should not imply recognition of the east German state; Herr Schroeder, the present foreign minister, has been saying much the same. But both Dr Adenauer and Herr Schroeder evidently see that Bonn cannot indefinitely block negotiations on Berlin and related matters. The Bonn government even seems prepared to accept some east Germans in the new international authority. Its main anxiety is to ensure that this body genuinely helps to guarantee access to Berlin, and does not provide a means for east German obstruction.

The new moderation in Bonn is a tribute both to American diplomacy and to Dr Adenauer's realistic appreciation that Germany must in the end go along with the United States. Herr Schroeder is emerging as a conciliator, at least in inter-allied diplomacy. But there are still powerful forces in Bonn which will do all they can to obstruct the unfolding east-west talks. And as yet Dr Adenauer shows no signs of giving a public lead against them.

ENGINEERS BALLOT

Raspberry Response

THE engineering workers' ballot has plainly not even come near to providing the two-thirds majority for militant action which many of the union leaders had confidently expected and asked for. When the final figures are published next week the interesting thing to see will be not merely the proportions of votes cast for and against a strike, but whether the men positively in favour of a stoppage amounted to more than a small fraction of the total membership; it can reasonably be assumed that most of those who did not stick out their necks by returning any votes at all were not particularly militant men. Has this engineering vote been a very special case, or has it been a sign that most potential strikers themselves are heartily sick of the strike weapon?

Probably, it has been a bit of both. It has long been clear that the 100 per cent "support" which most strikes secure from the rank and file often springs from fears of consequences to blacklegs—and from a vague sense of group solidarity—rather than from eager voluntary militancy. Strike votes which are taken on an open show of hands are influenced by some of the same considerations. The £1,000 a year industrial worker knows quite well that he is likely to lose much more in pay during any stoppage than he might conceivably gain in extra wage increases (say, at most, £15 to £20 a year) at the end of it. Even wage increases based on the threat of strikes, which may seem to have paid off in recent years, have not in fact increased the proportion of national income going to wage earners; they have merely added a little bit of inflation all round, and more and more ordinary trade unionists (who are not blind fools) realise this. In any case, in engineering, where most workers' income levels depend mainly on bidding up by individual plants, national trade union bargaining has come to play a not much bigger individual role than, say, the size of the Christmas bonus does for some of the salariat—and it is beginning to be regarded by many engineering workers in the same less-than-holy light.

A Special Case?

NEVERTHELESS, two factors would probably influence the outcome of other strike ballots, if the holding of them became a matter of more common and democratic course. First, that mystical thing, the sense of solidarity in an industry. One suspects (although one cannot now be quite sure) that miners and dockers would usually be likely to vote a large majority "yes" to any official strike call, even though workers in the more amorphous engineering industry have now refused to do so. Secondly, the percolation, with rising income levels, of middle class attitudes. Last year a ballot of the teachers showed them to be much less heavily in favour of strike action than their own union leaders had expected, and now workers in engineering have shown that many of them are sufficiently affluent to feel and think like the same sort of people.

In a sense, therefore, the prosperous engineering industry has provided rather a special case; but as Britain grows richer more and more industries are fortunately likely to move in the same direction. It is more than high time that trade union leaders' attitudes, trade union organisation, trade union custom—and, for that matter, the attitude of some outside people towards the problem of protecting individual trade unionists' rights through a democratic reform of trade union law—caught up with this evolving change in the whole nature of British industrial society.

RUSSIA

Pay-off Pause

STALEMATE keeps governments stable as often as ministerial unanimity. Perhaps stalemate is the reason why only a few minor changes were made in the Russian government at the session of the Supreme Soviet which ended on April 25th. It has now been officially disclosed that this parliamentary show session was preceded by a meeting of the party's central committee, where all the important issues of home and foreign policy were discussed behind closed doors. It was there that the decision was taken to leave the government almost unchanged but to make one alteration in that even more important body, the party secretariat—to replace Mr Spiridonov with Mr Kirilenko.

Mr Spiridonov: Too anti-Stalinist

Mr Kirilenko's promotion is less significant than Mr Spiridonov's demotion. Mr Spiridonov, a party leader from Leningrad, first caught attention by his vehement attacks on the "anti-party group" in general and Mr Malenkov in particular. But he was also the most outspoken critic of Stalin's era at the party congress last October. It is worth recalling that Mrs Ekaterina Furtseva, who also led the attack on Stalinism in October, has since been removed from the other crucial party organ, the presidium. True, their downgrading is limited. Mr Spiridonov has been given the honorary post of chairman of one of the houses of the Supreme Soviet, and Mrs Furtseva has kept her job as minister of culture. But the demotion of the pair suggests that Russia's leaders (perhaps by arrangement with their Chinese colleagues?) have agreed on a pause in their struggle against the remnants of stalinism.

EUROPE

Pilot for the Narrows

FRESH from his efforts to cheer British opinion by talking gaily of European opportunities and planning the Commonwealth conference, Mr Macmillan has now entered the international common market fray. In Washington last weekend he firmly reminded President Kennedy that Britain cannot join the common market unless the interests of the Commonwealth and the European neutrals are properly taken care of (see page 448). In Ottawa on Monday and Tuesday he put the case for European unity, and assured Mr Diefenbaker that Britain will look after Commonwealth interests. In early June he is to visit President de Gaulle in Paris, a month before Dr Adenauer pays a six-day visit to France. Mr Macmillan is evidently to be on the bridge in the crucial stages of the common market voyage.

Britain is not the only country where the European argument is becoming heated. On April 28th the Norwegian parliament agreed by 113 votes to 37 that Norway should seek full membership of the common market. The debate in Norway has been the fiercest political discussion there since the war. Norway has good reason to seek membership of the community if Britain and Denmark join too, but it has special problems in fishing and agriculture; and if Sweden is unable to obtain association the whole future of Scandinavian co-operation might be seriously jeopardised.

General de Gaulle, who holds the door keys for all these countries, has as yet given no clue to his intentions now that France's international position is so vastly strengthened by the Algerian peace. Undoubtedly three questions—France's ambition to have its own deterrent, Britain's application for membership of the common market, and the talks on European political co-operation—form related parts of President de Gaulle's view of the French place in world affairs. What the British can do in the atomic field is limited in part by the views of the United States. But it might help if Mr Heath were able to explain that Britain's wish to be consulted about European political co-operation is certainly not meant to prevent the Six from making further progress before Britain joins them.

FRANCE

Rumblings

GENERAL DE GAULLE has reason to ponder the vote of the National Assembly which approved M. Pompidou's government on Friday, April 27th. The president's new prime minister showed himself anxious to conciliate parliament by affirming his scrupulous determination to abide by its rights under the constitution. But, following M. Paul Reynaud's lead, most of the Independents, plainly unhappy about the

M. Pompidou : will do better

"indescribable intellectual disorder" they discerned in the workings of the constitution, abstained. So did many of the Christian Democrats, unhappy about the general's doctrine of "*l'Europe des patries*." The extreme right-wing supporters of French Algeria joined the Communists, Socialists and Radicals in opposition. Only the discipline of the gaullist party and the loyalty of half the Christian Democrats and a quarter of the Independents carried the government to harbour. It received 259 votes, a majority of only 12 over the rest of the chamber.

M. Pompidou will do better hereafter, when debates are held on single topics which do not arouse such heterogeneous opposition. But the voting showed that many deputies have already thrown off their Algerian preoccupation, and are ready to return to the good old days when parliament meant something. The anxiety of many of them about General de Gaulle's foreign policy and his constitutional intentions afford them excellent, and probably permanent, excuses for expressing their feelings.

ADDRESS .....

It is possible that General de Gaulle has missed the tide, and that he would have been wiser to take M. Debré's advice and hold elections this month, so as to ensure, while the glow of the Evian agreement was still in the sky, a new assembly as unanimously subservient as this one used to be. He may yet have to resort to dissolution to keep parliament tame. Much depends on whether he proposes to revise the constitution, making it even more explicitly presidential than it is now. The chief difficulty of crystal-gazing just now is that nobody knows how much stuffing is left in parliamentary ideals in France after four years of the new *système*.

SCOTTISH LOCAL ELECTIONS

Large Swing to Labour

LABOUR has had a humdinger of a success in the Scottish burgh elections. It claims 43 net gains in seats that were last fought over in May of 1959, five months before the last general election. No fewer than 251 of its 354 candidates have been elected. So far as one can see, this has been its best performance ever in these elections: better than 1945, better than 1952, better than in any of the other periods of dissatisfaction with the Tories in any mid-term of a Parliament. Part of the Labour success has resulted from the fact that some Scots citizens who have normally voted Tory (under one of the Tories' various Scottish pseudonyms) this time either stayed away or voted for the Liberals (who secured 5 gains, of which four came from Tory and one from Labour) or even voted Social Credit or Scottish Nationalist. But in most places there was a clear rise in the total Labour vote as well.

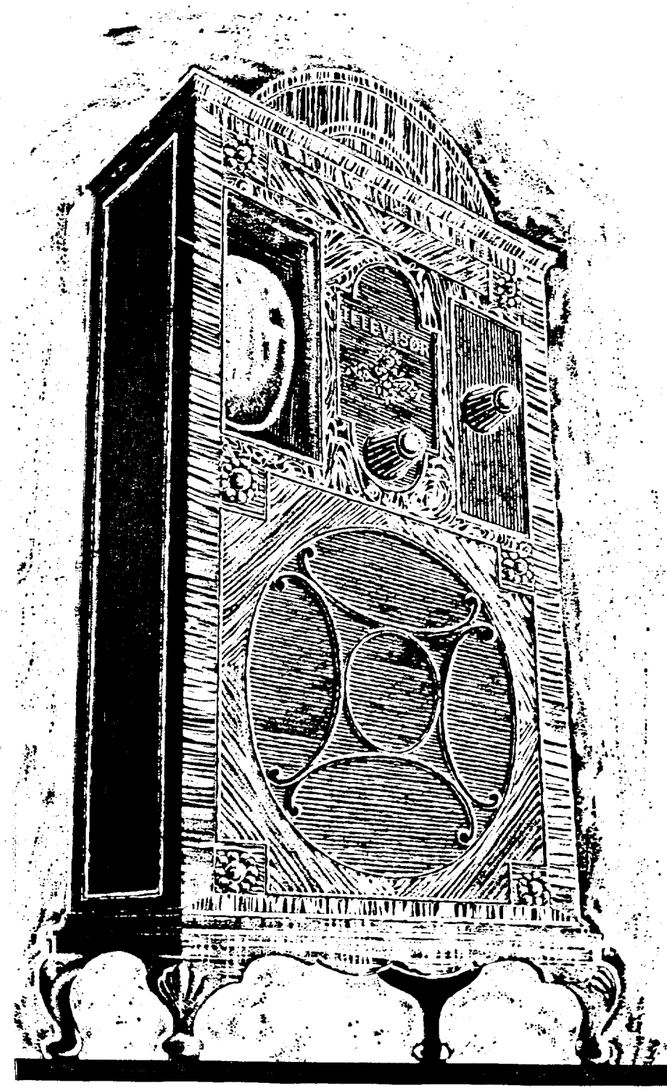
Attention will now turn to the local elections in England and Wales, which will be taking place throughout next week. Some bogey scores for interpreting these results—particularly those in the borough elections on May 10th—will be published in our next issue. But the basic electoral arithmetic as between the two bigger parties this year is fairly easy. Most of the councillors who are retiring next week were elected in May of 1959, just before the last triumphant stages of the Tories' pre-general-election swing got moving. After those local elections in May of 1959 analysts were saying that they indicated a probable Tory parliamentary majority of somewhere between 40 and 50, compared with the majority of 100 that the Tories actually eventually achieved five months later. It follows that any net Labour gains next week will be genuine gains compared with the situation at the last general election ; if net Labour gains of seats in the provincial (i.e., non-metropolitan-London) English and Welsh boroughs next week went significantly above 100, that would begin to show Labour as favourites to win any early general election. After the Scottish results Labour can reasonably expect considerably more gains than this, perhaps indeed more than three times as many. And the Liberals, who could turn the borough swing away from the Tories into a real landslide this year, must be licking their chops more eagerly still.

PARLIAMENT

Back to Work

A LIFELESS and thinly attended House was back at Westminster on May Day to pick up the political threads of the session after the Easter recess. The questions that had been put down were so few—25 for departmental ministers and 9 for the Prime Minister—that twenty minutes before the end of the first question hour they ran out altogether. Mr Butler, standing in for the absent Prime Minister, was so unforthcoming about the American nuclear test series that Mr Gaitskell, to the fury of his own left wing, rose to the rescue, pointing out that the fall-out from the present high altitude tests is likely to be much less than that from other tests. On smoking Mr Butler was equally sybilline: "A line has already been taken in relation to the education and health services. . . . In some of the other provinces the Government have not acted hitherto, and that is why we are examining them." A consensus of opinion emerged that this was a hint that something was being prepared to control cigarette advertising ; but nobody really knows.

On Wednesday in the Lords the Liberal Lord Ogmore fought the Montgomeryshire by-election (on a policy of even huger subsidising of small mid-Welsh farmers), while in the Commons Labour fought the local council elections (on a policy of larger direct and indirect subventions for all sorts of tenants). Both debates made the Conservatives look respectable by contrast.



The common market is clearly going to dominate this second half of the session. A peep at what is in store for the Government came on Parliament's second day when Mr Heath was savaged by questions from Mr Shinwell and Mr Harold Wilson on the political implications of Britain's entry. Unperturbed by accusations of secretly "selling Parliament down the river" Mr Heath managed blandly to evade the issue, but he will have to face it—as he ought perfectly well to be able to do—later in the summer. So will the itinerant Prime Minister.

NED

Got a Little List?

THE National Economic Development Council is due to hold its second meeting next week. This is the meeting at which the staff of Ned is supposed to present a suggested schedule and timetable for its work ; it might, therefore, also be the meeting which will determine whether Ned eventually becomes an effective policy-influencing body or just a rather pussy-

in a changing world

It may be very amusing to recall that people once viewed television on sets like this. Yet, by 1962 standards, even the set of five years ago is obsolete.
Today's television receiver, with its bigger screen, its brighter and incomparably clearer picture, and its beautiful slim cabinet, has brought new proportions to viewing.
Mullard have contributed a great deal to this progress with their "Radiant Screen" picture tubes, Frame Grid valves, semiconductors and magnetic components.
Advanced products like these are playing their part in all fields of electronics today.
If you have an electronics problem, we will gladly help you solve it.

Mullard products in television receivers include:
VALVES · SEMICONDUCTORS
PICTURE TUBES
MAGNETIC COMPONENTS

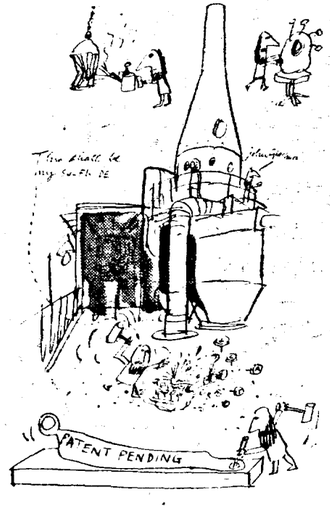
PROJECT 304

The story of the great
Shell Chemicals
Sculpture Competition
by A. N. Other—Carter



Chapter Seven:
The Metamorphosis of
Carter the PRO

You'll remember that quite early on in this story (Chapter Two, if you've been keeping them; if you haven't, don't worry, they'll be available later in an attractive bound volume scented with perfumes based on certain allyl esters such as salicylate and malonate), Carter from Polyglycols found himself PRO for the sculpture competition for *The Spirit of Shell Chemicals*, that brilliant inspiration of one of our directors, Mr. Carter.

I've never seen such a change in a man. Previously rather reserved (although he was of course a top chap in plasticisers and gelling agents), he now wore a bow tie and boasted incessantly of his friendship with Cosmo Fanlight, the TV panelist and articist, key man of the judging panel. We got endless remarks like 'As I told Cosmo, Canova is really just Leftova from the Renaissance.' Much of his time was spent showing parties of interested sculptors round our establishments at Stanlow (butylenes, alcohols, ketones, Epikote resins, Teepol . . .), Carrington near Manchester (glycols, polystyrenes, toluene and lots of other stuff including pitch. The director of a Shell Chemicals choir up there—Hyphen-Carter from the Colour Service it was—used to say at rehearsals 'Disgraceful! The pitch has dropped a semiketone!') and Shell Haven (all the agricultural stuff, fertilisers and that)—it was at Shell Haven that Max Grob the famous Destructionist, got the idea for his terrifying study for *Sulficide; The Ultimate Sin* (actually it controls mildews and apple scab).

Well, Carter the PRO got this idea of building a grandiose Sculpture Competition Information Centre and Permanent Exhibition at a point midway between these three, and actually bought a site for this, a field between Lutterworth and Husbands Bosworth.

Jarker, Cromp and Barlby-Towson, the Three Hard Men from Accounts who'd been against this whole thing, thought they'd got him now and complained bitterly to Mr. Carter the director. But Mr. Carter merely said mildly 'It's *not* the geographical centre if you count Agricultural Research at Woodstock, Kent, and the Technical Service Laboratories at Egham, not to mention associated research in Holland and America.'

I'd have thought about those labs. more if I'd known it was there that Isobel, the friend (*friend!* What am I saying?) of my own mad old Paris sculpting days, first met Carter of Triethylene Glycol . . . .

Do not miss Chapter Eight: 'Who Will Win?'

footing official research seminar. The first and most important point to emphasise is that Ned's plans—including its studies of the forward investment programmes of different sectors of the economy—will make sense only if they are tied to a specific annual target rate for national economic growth. Some people would like Ned to fudge on this commitment, and concentrate only on studying the "obstacles to sound growth." Ned will be dead or in desuetude within three years unless it overrides this advice, and blazons a specific target forth as soon as possible.

This is not to say that its study of "obstacles to sound growth" will be unimportant. The Chancellor said this week that he "hoped in the next few months through the NEDC to give a new impetus to action on such matters" as Britain's

> lack of technical skills, inadequacy of training arrangements, immobility of labour and capital, trade practices related to a period of mass unemployment, insufficiently high standards of management, of work and of industrial relations.

Good, but let's be specific. In inquiring into the inadequacy of technical skills and of training arrangements, one of Ned's wisest earliest tasks would be to propound and work out a scheme whereby adult workers (i.e. those of above apprenticeship age) can be retrained, partly at public expense and with publicly subvented wages or salaries while retraining, in new skills required by growth industries. In inquiring into the immobility of labour, Ned should examine why redundant workers are not sacked quickly enough; this point has relevance to the need for a national scheme for redundancy pay (discussed in the following note). Immobility of capital springs partly from the fact that declining industries are kept alive too long, sometimes by ill-judged public subsidies or protection; Ned should ceaselessly attack these.

Any inquiry into "trade practices related to a period of mass unemployment" should concern itself with examining certain trade unions' restrictive practices. Any inquiry into inefficiency of management should deal with the wide gap in standards between the most quickly growing firms in certain industries and the worst and most stagnationary firms in them. In both cases, reports should be published—specific and continuing—until and unless the laggard organisations reform themselves. The vital point is that Ned should become a needling body rather than a tame domestic animal; it should never be too afraid of the idea of "stirring up antagonism," and always utterly appalled at the idea of letting sleeping dogs lie.

REDUNDANCY

Hard Cash Handshake

A USEFUL little bill was moved in the Commons on Tuesday by Mr Jack Diamond: it would compel firms to pay at least a week's wages for every year of service as compensation to employees who are dismissed through no fault of their own. It was useful not because it is likely to pass into law (there is unlikely to be sufficient parliamentary time for it); nor even because the remedy it proposed was the right one; but because it drew attention to a problem of real importance to the national economy. One of the reasons why workers in Britain are not quickly shifted out of jobs where their employment has become uneconomic, and why firms with redundant labour have often faced irrational and ill-motivated strikes, is that standards of severance pay in British industry are too often a national disgrace. This is one reason why some trade unionists act with the sublime craziness of the Amalgamated Engineering Union's national committee, which argued this week that redundancy should be fought first by banning all overtime and then by reducing the working week to 34 hours.

Nevertheless Mr. Diamond's proposal should not be adopted. If employers have to pay out large lump sums whenever they sack workers, they will be even less willing than they are now to release temporarily surplus labour for more productive employment elsewhere. In the worst possible case, a bankrupt firm would not be able to pay compensation at all. Mr Diamond's answer to this was that the setting up of a redundancy fund would entail the setting aside only of 2s. for every £100 paid out in wages. Surely this shows the way that legislation should go.

What is needed is a national fund, financed by employers' contributions to ordinary national insurance, to provide compensation to sacked workers according to the time they have been in employment altogether, not just in employment with a particular firm. The contributions and benefits should be graded—i.e. expressed as a proportion of each worker's earnings while in work. Even if Mr Diamond's calculations are too optimistic, a levy on employers equal to less than one per cent of their wages bill should enable a national redundancy scheme to provide benefits actually more generous than those in his bill; there should be something left over to increase ordinary unemployment benefit as well. Just as firms can at present contract out of the national graduated pensions scheme by joining a funded private insurance scheme, they should be able to set up their own arrangement for redundancy insurance and contract out of the purely "severance pay" element in the national scheme: this insurance should be transferable when the worker voluntarily changes jobs. Of course, there would be lots of insurance, administrative and other difficulties (including those of devising safeguards against abuse). But if the Chancellor is serious in his desire to foster greater mobility of labour, here is something that he—and Ned—should be thinking hard about.

UGANDA

Tribes and Tribulations

NOT many people care about Uganda; this applies to most of the people within the embryo-state's boundaries. Uganda's tribal and local loyalties are better organised and more vociferously supported

The Economist

MAY 3, 1862

THE POLITICAL FRENCHMAN

There is something strangely and offensively cynical in the ideas and language of the political Frenchman. We doubt whether any French statesman can be found . . . who in international matters has the faintest perception of morality or justice,—of any principle, that is, that ought to be respected or of any alien rights that ought to be considered when the interest or the glory of France is at stake. Liberals and Conservatives, Orleanists and Imperialists, Legitimists and Republicans, Voltairians and Ultramontanists, are all alike in this respect. They do not appear even to understand that another nation or a weak nation can by possibility have rights which must be held sacred, or possessions which may not be encroached upon, if the wishes or the welfare of their own country dictate the violation of the one or the annexation of the other. This singular mental perversion or incapacity in men often remarkable for ability and high-mindedness on other subjects and where no national objects are involved, is the result partly of an inherent dullness of the moral sense, and partly of a national vanity which unquestionably has much to justify both its vagaries and its excess. It is impossible to read any French historian without noticing that the immutable claims of justice seldom appear to be thought applicable to public or to foreign affairs: with them the *moral* qualities of an action are nothing—its *adaptation* to its end is everything. The Frenchmen who have carried this peculiarity to its greatest length and in whom it has been most offensively manifested are M. Thiers, the First Napoleon, and the present occupant of the Imperial throne. But this natural obtuseness is fostered by another national characteristic. A Frenchman has a sincere and ineradicable conviction that he can govern and develop any country far better than its native rulers; that it must be an absolute blessing for any land to pass under his administration; that he cannot even occupy a foreign territory for a short time without leaving traces of good behind him; that in truth, with him, a course of conquests is *ipso facto* and of necessity a course of beneficence. He really thinks that he is the great civiliser and improver of humanity. He goes about doing good.

Mr Obote : out of the bickering

than in many other African countries. It is, as a result, more noticeably a collection of bickering tribes than many of the other similar collections that, because of the unifying colonialists, now call themselves countries. The election on April 25th was fought by two modern-minded African nationalist parties, both believing in unity and the eradication of tribalism. The governing Democratic party, in power because it once won seats in Buganda at a time when most of the Baganda tribe was boycotting the polls, has now lost power because the Baganda have come back to voting.

The People's Congress, under the able Mr Milton Obote, has become the government as the result of an electoral pact with the Baganda, whose parliament, by the new constitution, sends a block of 21 nominees to the central Uganda parliament. The Democratic party and the People's Congress each have about the same number of seats as before. The alliance between Mr Obote and the Kabaka of Buganda may work—if it can get round the claims for genuine federal status now put forward by three smaller tribal kingdoms, and a boundary quarrel between one of these kingdoms (Bunyoro) and Buganda. These quarrels are, like disarmament conferences, both intermittent and continuous.

The next round is due at the pre-independence constitutional conference in London in June ; Uganda becomes independent in October. The hope must be that Mr Obote's political skill—and the tribal leaders' patience—will be enough to hold the country together long enough for real unity to grow. If the World Bank recommendation of a £53 million five-year development plan is carried out (and Britain should contribute what it can towards this) the economic advance that might result could help to forge a genuine and widespread concern on the part of these interlacustrine tribes for the thing that is called Uganda.

TURKEY

Red Light for Politicians

If Turkey's politicians carry their animosities too far, it will not be for lack of warnings from the highest quarters. Last weekend President Gursel pointed out that during the six months of its existence the Turkish parliament had failed to tackle a single one of the thousand and one problems facing the country. He added that if the politicians did not mend their ways, "other means" of governing the country would have to be sought. No one doubted that he was hinting at a return to military rule. A few days earlier, Turkey's elder statesman and present prime minister, Mr Ismet Inönü, bluntly told a meeting of his Republican People's party that the coalition was in danger ; he indicated that his own party might have to throw in its hand.

It has always been clear that a cabinet divided between representatives of the RPP, which was Mr Menderes's chief opponent, and the Justice party, which is the direct heir to Mr Menderes's Democrat party, would find the going rough. In the event the members of the cabinet have managed to work reasonably well together. But the Justice party politicians seem unable even to shelve the past, let alone forget it ; they are apparently more interested in securing the release from prison of Mr Menderes's former colleagues—admittedly there are a great many of them behind bars—than in making Turkey safer for democracy by helping to demonstrate (principally to the armed forces) that the Turks can operate an efficient parliamentary democracy. Last week they very nearly wrecked the coalition by threatening not to vote for a government bill granting a legal amnesty to 69 officers involved in last February's abortive coup, unless there were also a political amnesty for Mr Menderes's former supporters now in prison. Eventually they gave way, and the coalition was saved—but for how long ?

The Justice party's attitude towards a political amnesty undoubtedly reflects a good deal of popular pressure. The men sentenced at Yassiada may turn out to be a greater threat to political stability inside prison than at liberty ; but to release them might precipitate another military coup. If this is avoided, what the parliamentary regime will stand or fall by is its ability to reinvigorate the country's stagnant economy. In a speech to the nation on April 13th, outlining the government's economic development plans, Mr Inönü declared that they would not be retarded by "petty political activities." One hopes he may be right.

SEAMEN'S UNION

Sea Lawyers?

The leadership of the National Union of Seamen is probably more remote from its members than the leadership of any other British trade union—which is (a) saying a lot, but (b) also hardly surprising, since so many of the members spend much of the year in Sydney or Valparaiso. But there are signs that the unofficial strikes organised against the union leadership by the dissident National Seamen's Reform Movement in 1960 have had their effect. The election that was in progress at the time of the unofficial stoppages led to the election of Mr Jim Scott as general secretary: Mr Scott, who could have been relied on to follow the policies of his predecessor, Sir Tom Yates, has since died suddenly. A further election is now in progress (it drags on for months, until all members have had a fair chance of getting within range of a ballot-box) and there is a strong candidate from the reform movement. The need to show themselves as militant as the best of their critics is no doubt one reason why the interim leaders on Wednesday presented a stiff demand for more pay and better conditions to the shipowners.

But the greatest triumph for the unofficial agitators (whose headquarters is in Liverpool, and who act with all the militant determination associated with that troubled waterfront) is that the union's executive council has set up a committee to examine the feasibility of having ships' delegates—waterborne shop stewards—on British merchant ships. The highly centralised and traditionally right-wing leaders of the NUS have always persuaded their delegate conferences to resist this suggestion, claiming that it would weaken the authority of ships' officers (and no doubt thinking that it might weaken the authority of the union leadership). But ships' delegates work on American, Scandinavian, Australian and a host of other nations' merchantmen ; they can be particularly useful in sorting out petty grievances about messing arrangements and so on, and they can provide some sort of workers' viewpoint to set alongside the mate's in case of accidents aboard. Properly selected, and if possible properly trained, ships' delegates could be as useful at sea as shop stewards are in most factories ashore. And ashore it is (to some employers' deep regret) never possible to put an insubordinate shop steward in irons ; at sea outright mutiny would still be an offence.

SERVICE DOCTORS

Juicier Carrots

Britain as a whole is short of doctors, though not because, as is wrongly alleged, a large proportion of the output of the medical schools is emigrating to escape the national health service. It is short of doctors, as indeed are many other countries including the United States, because there is more work to be done than the existing

Why Ford has had plants in Antwerp for almost 40 years.

Henry Ford decided on Antwerp as location for a plant in 1922 — and the reasons for his decision still apply.

Geography played a big part in causing Mr. Ford to choose Antwerp as the site for an assembly plant nearly four decades ago. Antwerp is ideally situated to reach the whole West European Market. Within a 200-mile radius from Antwerp there are a hundred million well-paid consumers... a market equal to over one half the entire U.S.A. What's more, the unsurpassed port facilities enjoyed in Antwerp greatly simplify the shipment of parts and materials.

An efficient labor supply. Companies like Ford have good reason to consider the intelligent hard-working qualities of the Antwerp labor force when deciding where to locate plants and offices. Productivity and quality, in terms of work done per dollar spent, is better in Belgium than in any other European country.

A friendly business climate. Formalities are few for setting up a business in Antwerp. Foreign firms are treated exactly like local ones. New enterprises may qualify for special tax concessions, low-interest loans, and specially-priced plant locations.

Industrial sites — tailor made. Antwerp is unique in the amount of land it has available for industrial purposes — over 2000 acres. These sites have easy access to inland waterways, highways, railroad spurs, and docks for ocean vessels.

WHO RUNS BRITAIN?

How decisive in our lives is the influence wielded by unassailable officials in Government departments? Who are these men, anyway? How great is their power? How do they exercise it? Anthony Sampson brings fresh insight to these questions in a far-ranging series in The Observer.

MAY 6 THE CIVIL SERVICE

MAY 13 THE TREASURY

MAY 20 THE FOREIGN OFFICE

Read Anthony Sampson on Sunday in the

OBSERVER

medical strength can perform and it takes several years for extra doctors to be trained. The armed forces, now that national service has ended, are feeling the shortage particularly severely, for they cannot, as civilian hospitals can, draw on the services of foreign or Commonwealth doctors in search of postgraduate training in Britain. The Secretary for War said recently that the Royal Army Medical Corps was facing the greatest crisis in its history: 300 medical officers had left in the previous twelve months, and another 400 were due to go within the next two years, whereas only eight doctors had joined the RAMC from civil life in the whole of 1961.

This is why the new pay scale for the three services, announced last week, offers financial inducements far above what a young service doctor has hitherto been receiving and also well above what he would earn at the beginning of a civilian career. A newly qualified doctor will now receive, with his marriage and ration allowance, £2,000 a year at the age of 25 in the armed forces. In general practice in the health service, he would be earning at the same age about £1,500. Over the age span 28-56 the average income for a service doctor will be about £2,750, compared with £2,400 for a general practitioner. As additional inducements, the age of retirement for doctors in the services is to be raised, and medical officers will be given the chance of looking after the families of servicemen in order to meet the objection that their medical training is wasted in caring for the fittest section of the population.

Nevertheless, the new pay scale and the new recruiting drive are likely to have most success among the newly qualified. Some of these may well be tempted to serve for, say, three years if an attractive health service job is not immediately in prospect; to the extent that they accept the bait the shortage of young doctors in hospitals will be exacerbated. Other young doctors may be afraid that they will miss good health service opportunities while they are in the forces, and it is at least doubtful whether many of those who are recruited will want to serve for all their working life. The services may still have to adopt more drastic measures for economising in their medical manpower than they have felt willing to contemplate hitherto.

PERSIA

Mr Ebtehaj

When the Persian prime minister, Dr Amini, was in London two months ago he told the press, at a conference on March 8th, that he hoped Mr Abul Hassan Ebtehaj would soon be released from jail. A good deal of mystery has surrounded the imprisonment since last November of this great Persian public servant who, as head of his country's planning board from 1954-59, carried out the Khuzestan projects —the most conspicuous development projects yet achieved in Persia. Formerly the governor of the National Bank and spokesman for Persia in innumerable international negotiations, Mr Ebtehaj had a high reputation wherever he went in the world. Dr Amini's expectations that he might soon recover his freedom have not yet, however, materialised. The weeks have dragged on with neither the prisoner released, nor precise charges brought against him.

According to Mr Alamuti, the minister of justice, the general charge against Mr Ebtehaj is that of "illegally using government money, not for his own benefit, but because he was head of an organisation that used the money of the people in wasteful ways." In brief he is accused of spending too much in Khuzestan. An impatient man, with unfaltering vision and energy, he would doubtless spare no expense in getting a job done how and when he wanted it. But he made many enemies in doing so. Brusque and disdainfully outspoken, he has never guarded his words in criticising persons or policies he does not approve of. American aid has come in for a drubbing from him; he believes it would be far healthier to get aid through the United Nations. In the conflict that still rages between the army's demands for money and those of economic development he, like Dr Amini, was not on the army's side. His removal from the planning board in 1959 was brought about by quarrels with the various ministries with which his activities overlapped. So long as he was in charge there was not much room at the top for anyone beside him. But, as Dr Amini said of him, after he had been arrested, "I have no doubts of his integrity, honesty and virtues."

The Mersey Muddle

Still no closed shop

HOME REPORT

Members of the editorial staff and local correspondents report on life and happenings in and around Britain

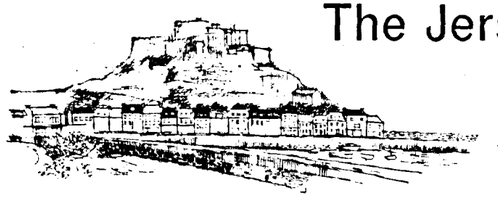
FROM OUR SPECIAL CORRESPONDENT

The threat of the national dock strike on May 13th has prevented another fight-to-the-finish in the local, but venerable, squabble between the dockers' unions in the port of Liverpool. With the workers wanting to fill their pockets, and the employers wanting to empty their ships, before the fatal date all is, very temporarily, at peace. The Transport and General Workers' Union has never won complete control of the Liverpool waterfront: a far older and far smaller body, the National Amalgamated Stevedores and Dockers, obstinately continues to exist in the port (there are also a few NASD members in London docks, but the conflict in London remains below the surface). The NASD—known as the blue union, from the colour of its membership cards —has regularly proved itself a thorough nuisance both to the TGWU and to the Liverpool port employers.

The employers' complaint is that the NASD is more militant than the transport union and that its leaders always refuse to guarantee that they will carry out any agreement that has not been ratified by their members—which makes negotiation immensely harder. The transport union's complaints are more bitter: it had the blue union expelled from the Trades Union Congress in 1955 for "poaching" its members. The NASD's militancy is a continual embarrassment to the transport union's local leaders, whose co-operation with the employers is regularly denounced as a "sell-out" by the blue union. Above all, the rivalry between the two unions has encouraged a fair number of dockers to pay dues to neither. The hard fact is that the blue

union has stubbornly continued to exist despite the weighty denunciations of everyone else within earshot.

Just over a month ago Transport and General dockers unloading a ship from New Zealand refused to work alongside non-members of their union. Militants in the transport union, worried by the large number of men belonging to no union, have for long been pressing for a closed shop. The union gave the strikers its official support, and the port was almost entirely stopped. Work began again after a meeting of some 6,000 transport union dockers had voted unanimously in favour of the elimination of all non-members from the port. Their leader, Alderman O'Hare, then persuaded the employers to refuse to hire anyone who could not produce a white card showing him to be a fully paid-up member of the transport union. The employers foresaw trouble, but no doubt it was in their minds that Mr O'Hare could stop the whole port anyway by calling out the tug-boat men.



This new rule was to apply from the Tuesday after Easter. By this date, Mr O'Hare claims, almost 4,000 men had paid up their arrears to the transport union—revealing, thereby, that the allegiance of about one-third of the 12,000 dockers in the port had been slipping. (Only 409 dock workers remained outside the transport union, which may well show the true size of the blue union's membership on Merseyside.) But when it came to the pinch the dockers declined to victimise the non-conformists. They refused to produce any card, whatever its colour, and boos and catcalls greeted any man who tried to do so. Work continued only in those berths where cargo was already being moved when the new ban was introduced and in a few small areas where Mr O'Hare's closest supporters carried the day. By the end of last week 5,000 dockers were refusing to produce their union cards—and were drawing compensation pay from the Dock Labour Board as workers for whom jobs could not be found.

On Sunday Mr O'Hare's hopes of a closed shop were blasted. A private meeting of some 3,000 of his members reached no decision: Mr O'Hare has complained of a "rabble" of his members who attended the meeting, and it seems that he was shouted down. The employers promptly withdrew their demand that employees should produce a transport union card. This week the port (despite some isolated stoppages) has been back at work, with blue and white card men side by side. The moral seems to be that most Liverpool dockers will not stand being mucked about either by the employers or by the transport union, or *a fortiori* by both acting together.

This turgid row is not, as some people are saying, typical of Liverpool: industrial relations on the new estates around the city are no worse than those in any comparable area of Britain. What it does show, however, is the kind of confused impulses that govern the conduct of working people in an unprogressive industry suffering from a temporary slump. In the first quarter of this year, with fewer dockers on the local register than there have been since 1913, over 8 per cent of port employees were not finding work. Men jostle and fight to get to the front of a queue to be taken on by the employers' foremen, or make do on the fall-back pay of £8 7s. 6d. a week. It is for men in these conditions that moderate and sensible union leaders (like Mr O'Hare) are trying to secure a completely new deal by the abolition of casual employment in the docks. But as long as they are subjected to such conditions the dockers have little patience with moderation or with anything that smacks of well-fed officialdom. Intellectual dockers have not failed to notice that since piece-rate payments were improved in Liverpool in late 1960 (leaving them still well below those paid in London) the pace of handling cargoes has increased, but trade has gone down and job opportunities have dropped. The rank-and-file dockers, who would certainly benefit in the long run from decasualisation or from the increases in fall-back pay and other unearned benefits that have been offered by the port employers, at present see only the need to increase their earning power at once. Hence the pressure from below in the transport union that has led its leaders to call an official national dock strike.

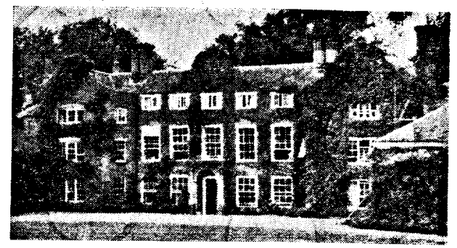
Last week's mess in Liverpool, whose characteristics were those of the old-fashioned, almost anarchistic class struggle, is bound to break out again in some form. It can only be eliminated by fostering, as fast as possible, the growth of social and occupational stability and self-confidence among a group of workers who are still living in a world that most people in Britain suppose to have died out over thirty years ago. However unpopular the transport union has just made itself in Liverpool, its policy (and that of the port employers) of decasualisation—getting a smaller labour force permanently employed—is the only possible one for the future.

The Jersey Haven

FROM OUR SPECIAL CORRESPONDENT

The staff of Jersey's relatively easy life is undoubtedly tourism, with horticulture supplying the relish which raises mere fodder to a continuously satisfying nourishment. But the gravy on the top until recently came from the pockets of non-Jerseymen who never visit the island and who seldom have any truck with such homely fare as tomatoes and potatoes, let alone milk. They are the rich old men of England, seeking a haven from the fiscal storms of their homeland, to whom the quirks and paradoxes of Jersey money law were a homing beacon which shone like a naughty deed in all-too-good a world. Since the first war, tax avoiders and the primogenitively ambitious have been able to escape into a financial sunshine much more important to them than mere good weather.

Now it has ended. In 27 words on budget day Mr Selwyn Lloyd upset a system which has given nothing but pleasure to its participants and has even done good: immovable property held abroad by British subjects is no longer to be free of death duties. While it was, Jersey was the ideal place to have that property for, by a trick of translation (Jersey law is promulgated in French), a simple mortgage loan could be interpreted as immovable, without the lender having to go to the trouble and dangers of actually buying anything. If the rate of interest the lender could get for his money was small, he was compensated by having his return taxed at half the English rate, in addition to saving anything up to half his capital for his heirs when he finally cashed in.



Even ten years ago, this avenue of escape had occurred to only a few people, and the traffic in hypothetical mortgages had, by 1954, reached a modest £175,000—most of it lent legitimately to Jerseymen anxious to build at the fixed maximum rate of interest of 5 per cent to which Jersey has been bound since 1771. But by this year the amount of money hawked about the island by agents and eagerly bought by Jersey speculators approached £14 million, most of it at heart-stopping rates—3, 2, or even 1 per cent.

Cheap money tends to raise property values, and on this score and on another, more serious (that too many hotels and shops, and not enough houses, were being built with the money), the Finance Committee of the States (the island's parliament) grew worried, and decided to subject every offer to the test of public interest; but they could not stop the flow, in spite of turning down one offer of £100,000 at no interest at all. Nor could their warnings that the Chancellor might do exactly what he has done deter the borrowers, the majority of whom were accepting English money at 3 per cent and reinvesting it at once in English securities at twice and three times that rate—which is an extremely comfortable way of making money, even when the loans are repayable at six months' notice, as almost all of them are.

The committee was right to be worried; but it was unable to hammer the point too hard because the cheap money has been undeniably useful to the island's economy. No building societies operate in the island (not unnaturally, with the restriction on interest rates), and few of the many luxury hotels and blocks of flats which have been built in the past few years would have seen the light of day but for cheap money. On the other hand, had there been no cheap money, the situation could not have arisen in which hotels are so plentiful that one of them (closed, like most, for half the year) could specialise in Scandinavian guests exclusively while houses are so scarce that a fisherman's cottage will fetch £3,500 without trouble.

Now that the beneficial racket is over, there is a reasonable fear that all that flowed in so readily may flow out again as rapidly, leaving behind a credit vacuum which nobody would be willing to fill. It is for this reason that the States last week took the radical step of abolishing the restriction under which the island has lived for nearly 200 years. The bill to repeal the "Code of 1771," containing the 5 per cent interest rate provision, was passed without a murmur by a house purged of its opposition by the Chancellor's sentence. It is as well that so anachronistic a measure should go, and the time is opportune: in addition to the replacement of the lost incentive to investors, the timing will ease the shock for Jerseymen suddenly confronted with the rigours of modern finance. When the opposition to repeal was at its height, the British Bank rate was 7 per cent, and that would have been too much to swallow.

East Anglia Emerges

Earlham Hall: Quaker quietism?

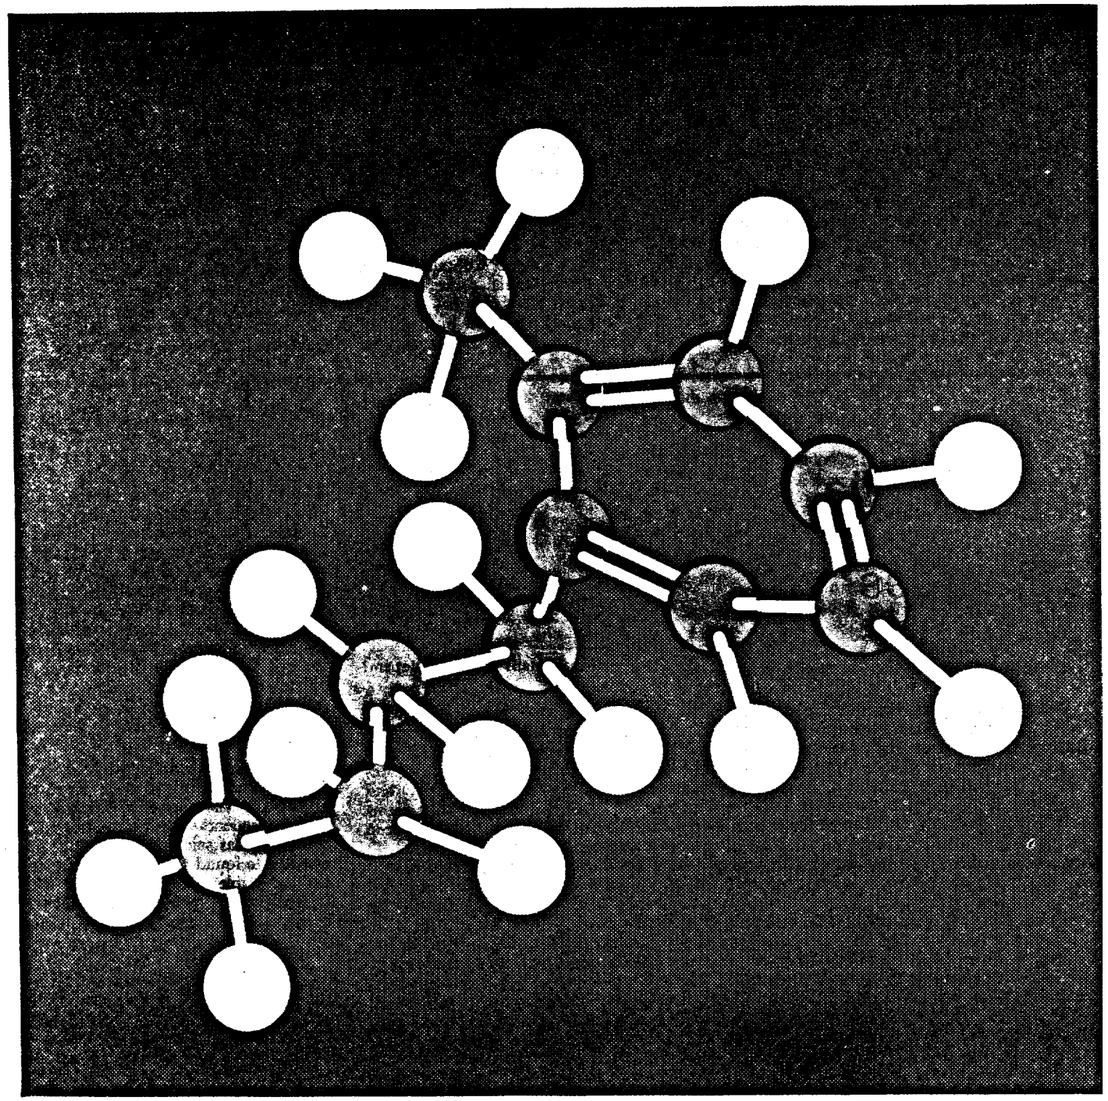
FROM A CORRESPONDENT IN NORWICH

The University of East Anglia expects to receive its first hundred students next year at Earlham Hall, a seventeenth-century mansion on the outskirts of Norwich. (It was the childhood home of Elizabeth Fry, the prison reformer.) Up to now East Anglia has not beaten the drum nearly as loudly as its immediate predecessors, Sussex and York. Its vice-chancellor, Mr Frank Thistlethwaite, was educated at Bootham and perhaps imbibed a Quaker quietism there; he seems however to have a Quaker knack of getting on with the job.

The university will accommodate 3,000 students within ten years (Sussex's rate of growth), the majority of them in actual residence. The new buildings (architect Mr Denys Lasdun) will stand on a site which is at present the Norwich municipal golf course. This caused the first row. The golfers did not care where the university went, so long as it was not on their course. They cheerfully joined forces with the local aesthetes, who argued that the university ought to be integrated with the old city, on a site of only 40 acres in the Conesford ward which the corporation was about to clear and redevelop. The dispute went on for more than a year, and was ultimately referred to a planning inquiry. Educational expansion has unsuspected troubles.

Once the Minister of Housing and Local Government had decided for Earlham, last May, the university's promotion committee moved quickly. Its chairman, Viscount Mackintosh of Halifax, has now been designated the first chancellor of the university. His committee, consisting largely of other notabilities in East Anglian commerce, administration and education, had already been strengthened by two masters of Cambridge colleges, Lord Adrian (Trinity) and Sir John Cockcroft (Churchill). The country houses of Norfolk and Suffolk have been valuable recruiting centres.

Mr Thistlethwaite, himself a former Cambridge lecturer and co-founder and first chairman of the British Association for American Studies, was appointed vice-chancellor last August. He is now 47, has an American wife, and since 1938, when he was a Commonwealth Fund fellow at the University of Minnesota, he has had a wide experience of American as well as English university administration. Some of this experience may have to be kept under the vice-chancellarian hat; East Anglia invariably prefers its boosters to be discreet.

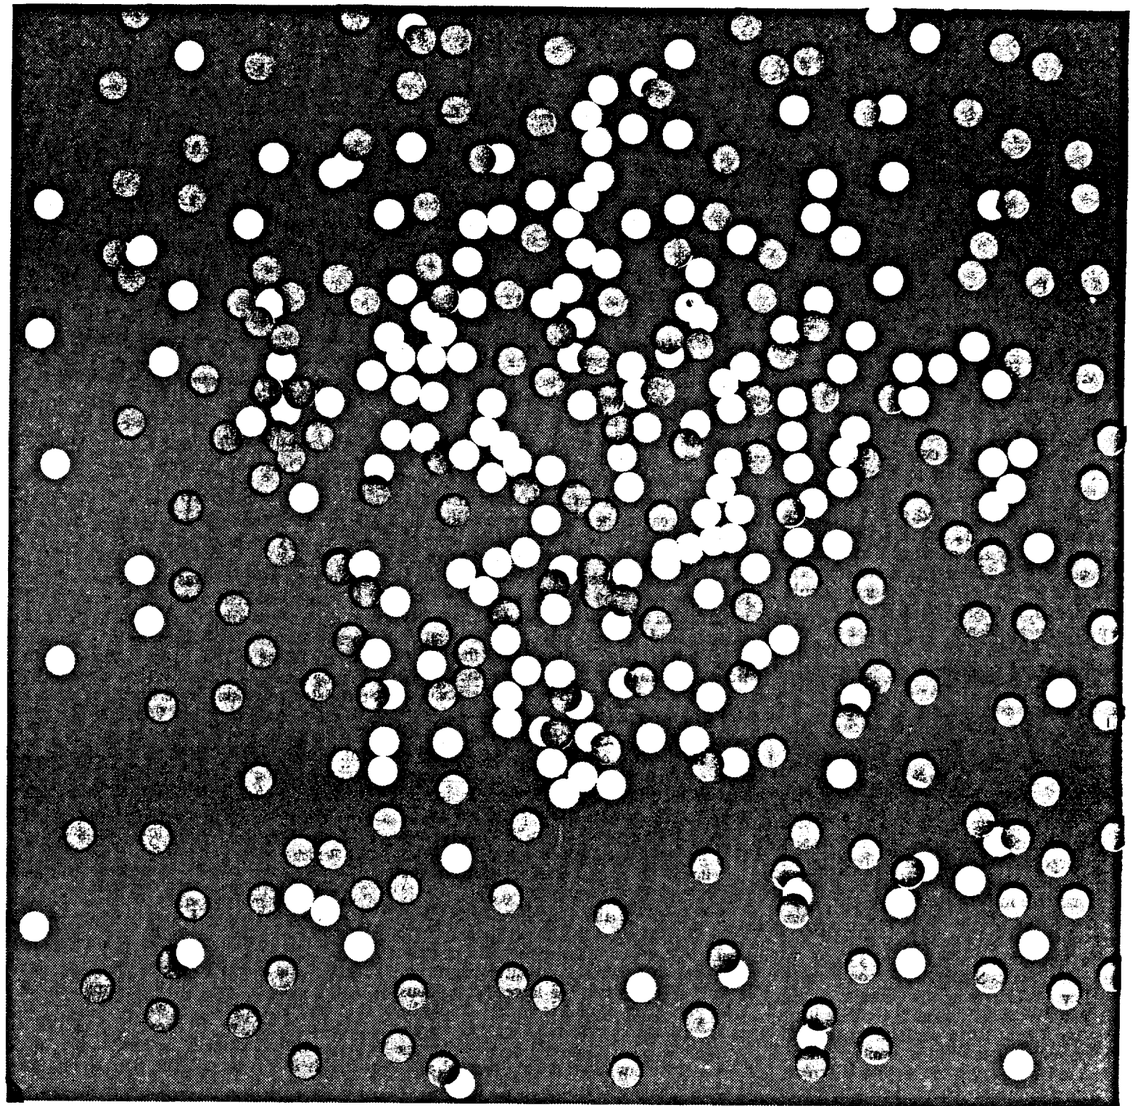


The prospective scheme of studies has been designed to contradict some donnish assumptions that "of course, East Anglia is bound to specialise in agriculture." Mr Thistlethwaite has plumped for schools of English, European and Overseas Studies, related to one another by a common first-year course approaching the study of civilisations through their history and literature. Overseas Studies will branch out into special studies of the Commonwealth, the United States, the Soviet Union, Africa, and India and Pakistan. Social Studies will be a kind of Modern Greats—based on social and economic history, politics and philosophy—which, he hopes, will produce "the sort of widely-educated general-purposes executive industry says it is not getting."

East Anglia will teach a full range of sciences, but will cultivate a single biology school, in which all the biological subjects will be taught together, and linked to the study of bio-chemistry. This is considered essential to the later development of post-graduate studies in, for example, genetics, the structure of soils, and food technology. The first two professorial appointments have been those of Dr T. A. Bennet-Clark, Professor of Botany at King's College, London (who is to be Dean of the School of Biological Studies) and of Mr I. P. Watt, Professor of English Literature at the University of California, who will be Dean of the School of English Studies.

Since Norwich is only 60 miles from Cambridge, it is confident of attracting good men to its staff, who may even bring their own research students with them. The promotion committee has said from the outset that its object is to found a university which will be an acceptable alternative to Oxford or Cambridge. A great deal of teaching will be done in tutorials.

The university will have to be chiefly residential (a disappointment to advocates of rapid expansion). Norwich is growing industrially and already has a large technical college and school of art, and a teachers' training college. Students' digs are therefore difficult to find, and most local housewives betray little ambition to launch out into a career as landladies.



The promotion committee is now on the point of launching an appeal for £1,500,000, to supplement the funds from the University Grants Committee and the annual income of between £50,000 and £60,000 which is being contributed by the education authorities of Norfolk, Suffolk and Huntingdonshire. The feeling is that the university's quality and character (as well as its halls of residence) will depend very largely on the voluntary fund, which it will be free to use as it wishes. East Anglia has waited for half a century for its own university; it has its chance now.

GULF IS THE MAKE-UP OF A MOLECULE

GULF IS OIL Across the world, the great Gulf complex covers every aspect of oil. From the Harmarville laboratories near Pittsburgh, where the smallest petroleum molecule is probed, to well heads in Texas, Kuwait or Venezuela, where output is measured in millions of tons – Gulf *is* oil. Gulf is tens of thousands of people whose combined skills produced 77 million tons of crude oil in 1961 and more than 400 different petroleum products. Motor fuels; lubricating and insulating oils; oils to keep machinery cool; oils to keep houses warm—Gulf supplies all these and many more. Gulf *is* oil at work for you.

GULF—ONE OF THE WORLD'S GREAT OIL ORGANISATIONS

GULF IS MILLIONS OF TONS OF FUEL

BOOKS

Steel Pricing in America

Pricing Power and the Public Interest

By G. C. Means.

Harper, New York. London: *Hamish Hamilton*. 380 pages. 60s.

THIS book is topical and important. Mr Means describes how "administered" pricing in the American steel industry has pushed up prices and profit margins, and how it gives rise to conflicts between the directors' duty to their companies and the wider need for gains from efficient production to be shown quickly in lower prices.

He defines administered prices as prices set by producers—and sometimes by unions—rather than by the market. The "follow my leader" attitude of producers supports these prices. They do not equate supply and demand, at least in the short term, and they present problems with respect to "inflation . . . income distribution . . . and the effective use of resources."

Mr Means first looks at the American record from before the war up to 1953. He concludes that administered pricing succeeded in securing higher gross profits, but that net profits after tax were no higher than before the war. Corporate income tax had been increased to just over 50 per cent by 1953. Even so, steel companies were still earning about 8 per cent on their assets after corporate tax (though before tax on earnings distributed as dividends). "The great increase in peacetime taxes was passed on to customers."

In contrast to the earlier period, Mr Means finds that in the years 1953 to 1959 the United States Steel Corporation pursued a policy of increasing its after-tax profit margin and was successful in pushing it up from 8 per cent to 16 per cent. Other investigators have reached a similar conclusion, but have usually described the increase as fixing prices to secure the same profit margin at a lower percentage of capacity working. One observer concludes that the break-even point was reduced from nearly 50 per cent of capacity in 1953 to about 30 per cent by 1959.

This policy led to an increase in steel prices of 36 per cent between 1953 and 1959. During the same period the wholesale prices of other goods changed little. The steel companies make much of their moderation, pointing to a 50 per cent increase in employment costs over the same period. But they measure these costs in terms of wages per hour, whereas employment costs per ton, Mr Means asserts, rose by only 18 per cent when account is taken of increased productivity (adjusted to working at a constant percentage of capacity). The costs of capital and materials rose by not more than those of wages. But profit margins per ton were doubled (at the same rate of working), whereas a 20 per cent increase might have been reasonable.

The high margins are criticised by Mr Means because they limit the use of steel and preclude the adoption of many improved techniques which fail to show the excessive return aimed at. The high return also provides grounds for high earnings to be claimed by labour.

In the event, the firms may well not receive any better return on their total invested capital, because the high price provides an umbrella under which old capacity can remain in production; imports are attracted, and excessive expansion looks profitable and is engaged upon by firms which in fact fail to secure an adequate market. One justification claimed for the high margin—that it permits self-financing—may at the same time result in excessive capacity and in the slow growth of the market and of efficiency.

The second part of Mr Means's book is an attempt to suggest an alternative to the present legal duty of directors to maximise profits—encouraged by profit bonus schemes and share options as recently given to US Steel Corporation executives. These incentives may be reasonable in themselves, but they are objectionable when associated with the power to raise prices inherent in the administered price situation.

He dismisses the breaking up of large corporations as a solution. This would be ineffective and contrary to the trend of technical progress. As an alternative, he recommends that directors of large corporations with powers to administer prices should be made subject to standards of "economic performance." This would involve changes in company law relating to directors' obligations and also the setting of standards of "economic performance." The auditing of "economic performance" would be in the hands of independent professional people, with accounting, economic and engineering experience. But his suggestion has grave practical difficulties, not least in the determination of the "economic performance" standards.

The direct control approach is dismissed in the book, without any specific examination of the record of the Iron and Steel Board in Britain. Mr Means's objections are that control encourages a fight with the regulating agency, and that this body may either become a political instrument or be subservient to the enterprises it regulates. His further objection—that control extracts the gains from success—depends on the principles on which it is operated. The object, after all, is to extract excessive gains.

Although the author's own solution of a difficult problem can be questioned, so too can most others. His book bravely tackles a vital problem. Administered pricing, when it aims at an excessive profit margin, could be one of the best instruments for slowing down growth. Other industries in the United States have probably been worse offenders than the steel industry. Nevertheless, in default of any better countervailing power, the President's attack on steel is explained, and perhaps justified, by Mr Means's analysis.

The Great Illusion

The Ideal Reader

By Jacques Rivière.

Harvill Press. 254 pages. 25s.

The Intellectual Hero

By Victor Brombert.

Faber. 255 pages. 25s.

JACQUES RIVIÈRE was the editor of the *Nouvelle Revue Française* from 1919 till his early death in 1925: to say this is to say enough. He must rank as the finest literary editor of the century; and his own writings, of which this book contains a well-translated selection, are brilliant. They are difficult, but suggestive. Whether they will find an audience in this generation is doubtful. They are literary journalism at its best: written for the time and the place, which are not ours; and written in the style and manner of a Frenchman of that time. His one weakness appears in this passage:

> French intelligence has no equal; no other is more powerful, more keen, more profound. . . . We alone have been able to preserve an intellectual tradition. . . . We are the only people in the world, I repeat coolly, who still know how to think. In philosophical, literary or artistic matters, only what we say will count.

Even if one allows for the notorious patriotism of the French, and perhaps for an element of leg-pull (of which the context gives no sign), what an extraordinary illusion. One can grant the first rank to the French in all the fine and applied arts, in science and technology, in diplomacy and administration, and in sheer power of survival, prosperity and enjoyment—but not in thought, and least of all in logic. Self-conscious French thinking (short of formal philosophy, which a non-professional must leave to the philosophers to judge), when the handle is turned, as Rivière turns it, seems like a survival of an older world, pretentious, turgid and devoid of rigour. The one fault of these essays is that in them there is far too much elaboration of this kind of thought; fortunately Rivière's fine literary instinct constantly bursts through.

Mr Brombert's stimulating book gives a clue to this odd illusion. It is a study of the intellectual as hero in a number of French novels from 1880 to 1955, with *Jean Barois* deservedly at the centre. He traces the importance of the intellectual as a feature of French life and, in particular, ever since the Dreyfus Affair, as a man politically committed. What he mentions, but stresses rather too little, is the immense importance of the Ecole Normale in forming French thought, and producing generations of vocal and politically minded intellectuals. Many of the books which he quotes have normaliens as heroes or authors; nearly all show their influence; Rivière tried, but failed, to enter the Ecole Normale; and the products of that great school, as teachers, mould the minds of the next generation of Frenchmen. How is the chain to be broken? Dare one hope for a takeover of French thought by the Polytechnique or the Ecole Nationale d'Administration? It needs a strong-minded prince to wake this sleeping beauty.

Spanish Phantom

Falange: *A History of Spanish Fascism*

By Stanley G. Payne.

Stanford University Press. London: *Oxford University Press*. 325 pages. 36s.

THE Falange is General Franco's domesticated zombie. Morally it died with its founder, José Antonio Primo de Rivera, in 1936. Politically it died in 1943, when the defeat of Italian and German fascism came clearly into sight and General Franco hurriedly transformed the party into a mere bureaucratic tool (though he allowed it to keep its pathetic fascist salute until 1945). Its epitaph was supplied by Serano Súñer, "the brother-in-awissimo," who manipulated it for four years on the Caudillo's behalf: "Nothing can undo the ill we have done Spain."

Mr Payne's fascinating book is subtitled "A History of Spanish Fascism," but he would agree that neither José Antonio nor Franco was ever a convinced fascist. José Antonio—poet, orator and sorcerer's apprentice—borrowed some of the trappings and language then fashionable in Italy and on the French right, but he was too civilised to go the whole fascist hog. He saw the Falange as a "poetic movement" rather than as a party encumbered with a prosaic political and economic programme. Dionisio Ridruejo, who was the Falange's propaganda chief from 1938 through 1940, estimates that ninety per cent of its members had no clear political ideas.

General Franco was, and is, quite simply a *franquista*—a supporter of General Franco. Mr Payne shows clearly how useful it was for him to have some sort of ideological cloak, and how well providence served him in thrusting on to his lap the leaderless Falange, whose ideology was so vague that it could be interpreted and oriented at will to suit all tastes and circumstances. In every town his troops occupied, communists, anarchists and opportunists of all kinds flocked to join the party, as eagerly as grateful right-wingers, in order to acquire protective colouring. It rapidly became a mass movement.

After 1944 its membership diminished. It was already, in Mr Payne's words, "mired in corruption and bureaucratic pettifoggery," and its acting secretary-general, Vivar Téllez, "could not see why the farce had to be kept up. . . . He suggested that the most logical thing to do would be to disband the whole party structure." But General Franco still found it useful—as an instrument for controlling the workers and students (through its ancillary *sindicatos*, membership of which is compulsory) and as "a bulwark against a monarchist restoration, which would bring a precipitate end to his regime." Today, workers go on strike in defiance of the *sindicatos*, and monarchists easily outnumber falangists in every part of Spain. The Falange's newspapers have the lowest circulations in the country. Significantly, whereas General Franco has always, hitherto, supported a falangist uniform when addressing falangist or syndical meetings, at this year's *sindicato* congress he wore a suit.

Though concerned primarily with the Falange, Mr Payne's well-written, well-documented book offers insight into most other attributes of the Franco regime.

Castle and Inn

Studies in Building History

Edited by E. M. Jope.

Odhams. 287 pages. 63s.

THIS is a memorial volume for Bryan H. St. J. O'Neil, who was Chief Inspector of Ancient Monuments in the Ministry of Works in the decade immediately following the end of the war. He was a man of very wide interests in archaeology, with a large circle of friends in his profession, fourteen of whom have written the papers that make up this volume.

All of these concern building practice. Some are on surprising subjects: mediaeval chimney pots, for example, and early domestic window glass. Three, including the one on glass, concern Roman work in Britain—rural construction techniques and timber buildings, which, if not surprising, are at least off the beaten track. Two are upon castle building, and another is upon the fortified Scottish tower-houses. Cornish houses, seventeenth century Irish houses and one particular house in Northamptonshire account for four more papers. Mediaeval inns, an Anglo-Saxon church at Deerhurst and the origins of the perpendicular style complete the catalogue.

It is a little difficult to know exactly for whom this volume was intended. Presumably the publishers hope it will be read beyond the body of professional archaeologists, and archaeology, with its concern for recovery and preservation, has currently

McGraw-Hill

Mathematical Models of Economic Growth

by

Jan Tinbergen and H. C. Bos

This study by an outstanding economist and his younger colleague presents a collection of mathematical models as a basis for economic planning and development. The models are developed in order of increasing complexity and have been selected for their practical applicability to planning in low-income countries.

Presentation is clear and simple, with an emphasis on the economic meaning of the various elements. The dynamic input-output method is the main approach used. Careful distinction is drawn between national and international industries and the use of world demand schedules in long-term planning.

Among the interesting features are: the subdivision of the economy into sectors (industries) and regions; the explicit introduction of export prices; the use of transportation costs between regions as a variable; the discussion of second-order capital goods, and a study of the connection between the adaptation period and a change in growth rate. **53s 6d**

Two important new books

The Politics of Western Defence

F. W. MULLEY, M.P. 30s

This important and challenging book examines the principles upon which Western defence has been based since the late nineteen forties and discusses the success—and, most dramatically, the shortcomings—of NATO.

Africa and the West

ARNOLD RIVKIN 21s

(Paperbound edition 10s 6d)

A new multilateral approach for channelling Western aid to Africa, and a plan to insulate the continent from the arms race are amongst the radical and closely argued proposals in this significant and scholarly study.

Two books by MILOVAN DJILAS from our backlist:

The New Class 21s.

Anatomy of a Moral 25s.

30 *Bloomsbury Street, London, W.C.1*

a wide appeal in a world infiltrated with destructive forces. But most of this book seems to have the professional archaeologist as its target, for it is cast in the mould of learned society transactions. It would have been more suitable surely for a memorial volume to be less strictly treated.

Even so there is much interest here for the reader who has at least a nodding acquaintance with the study of old buildings. A fascinating example is one of the papers on castles, dealing with the organisation of the labour and materials for Edward I's programme of castle construction in Wales. It is an astonishingly personal and detailed story, including even memoranda of discussions such as would come from any executive meeting today. For instance: "N.B. to seek 300 [amended to 500] carpenters from the counties, to be sent to Chester so that they are there by a fortnight after Whitsun. Urgent." One can picture exactly the kind of meeting to produce notes of this kind; seven hundred years have not changed them much. A more unconventional problem was the movement of vast quantities of specie to pay wages for the castle workers. The silver penny was about the only coin in use and several million of these had to be transported to each castle each year. This study came from the pen of A. J. Taylor, Mr O'Neil's successor.

Mediaeval inns are another subject of natural and perpetual interest in Britain. Not a great many survive that were actually built as inns, and all are well known to travellers. Here is an excellent study both of individual buildings and of the type of life that prompted their origin and design, able to add usefully to the enjoyment of a visit.

The 32 pages of photographs are adequate and sometimes very good. Drawings are numerous, but archaeologists could with advantage improve and systematise their technique of presenting plans and sections. They are often amateurish and consequently less clear and useful than they might be.

First Airborne Invasion

Battle for Crete
By John Hall Spencer.
Heinemann. 318 pages. 30s.

It is surprising that the battle of Crete in 1941 has not attracted more attention. It was not only the first airborne invasion. It was also a battle won and lost by a hairsbreadth. Both General Freyberg, the allied commander of Creforce, and his victorious opponent General Student of Fliegerkorps XI, might well have echoed that it was "the nearest run thing you ever saw in your life."

The story is full of "ifs." If one New Zealand battalion commander (a holder of the VC from the first world war) had held his ground a little longer; if his brigadier had mounted a counter-attack more rapidly; if a guide, leading forward the Australians, had not lost his way and so forfeited the vital hour before daybreak brought back the German planes; perhaps even if an incompetent ordnance orderly had not loaded the wrong ammunition into an I tank—or if the tank crew had checked the ammunition before the battle: if any one of these events had occurred, the Germans would almost certainly have been defeated.

As it was, they had at best a Pyrrhic victory. Their casualties in Crete were greater than those they had suffered in all the previous campaigns in Poland, the Low Countries, France and the Balkans. Never again did Hitler risk a major airborne invasion—and so Malta was saved. But to all this could have been added a decisive victory for Britain at the darkest moment of the war.

Here indeed is dramatic material for the historian. But it cannot be said that Mr Spencer brings through the drama in this recital of the events leading up to the battle, and of the battle itself. He writes in a clear, fast moving, laconic style. His evaluation of the rights and wrongs of the command decisions is sensible, except when he makes a quite unjustified suggestion that the official New Zealand history of the battle put the blame on to junior commanders "as a matter of policy." He makes use of some vivid eye-witness material from survivors on both the German and the allied sides.

But somehow the whole shape of the battle, and the atmosphere of it, get lost. It is not only that the maps are inadequate. It is that all the parts of the story, though each is told with admirable clarity, do not add up to a readily comprehensible whole. None of the feel of this extraordinary battle, fought primarily with rifles on the Allies' side and rifles and dive bombers on the other (neither side had any proper artillery) in the brilliant spring Aegean sunshine, comes through. The battle of Crete merits a richer book than this.

JFK

Why England Slept
By John F. Kennedy.
Sidgwick and Jackson. 192 pages. 8s. 6d. Paperback edition. May Fair Books Ltd. 2s. 6d.

To Turn the Tide
By John F. Kennedy. Edited by John W. Gardner.
Hamish Hamilton. 252 pages. 21s.

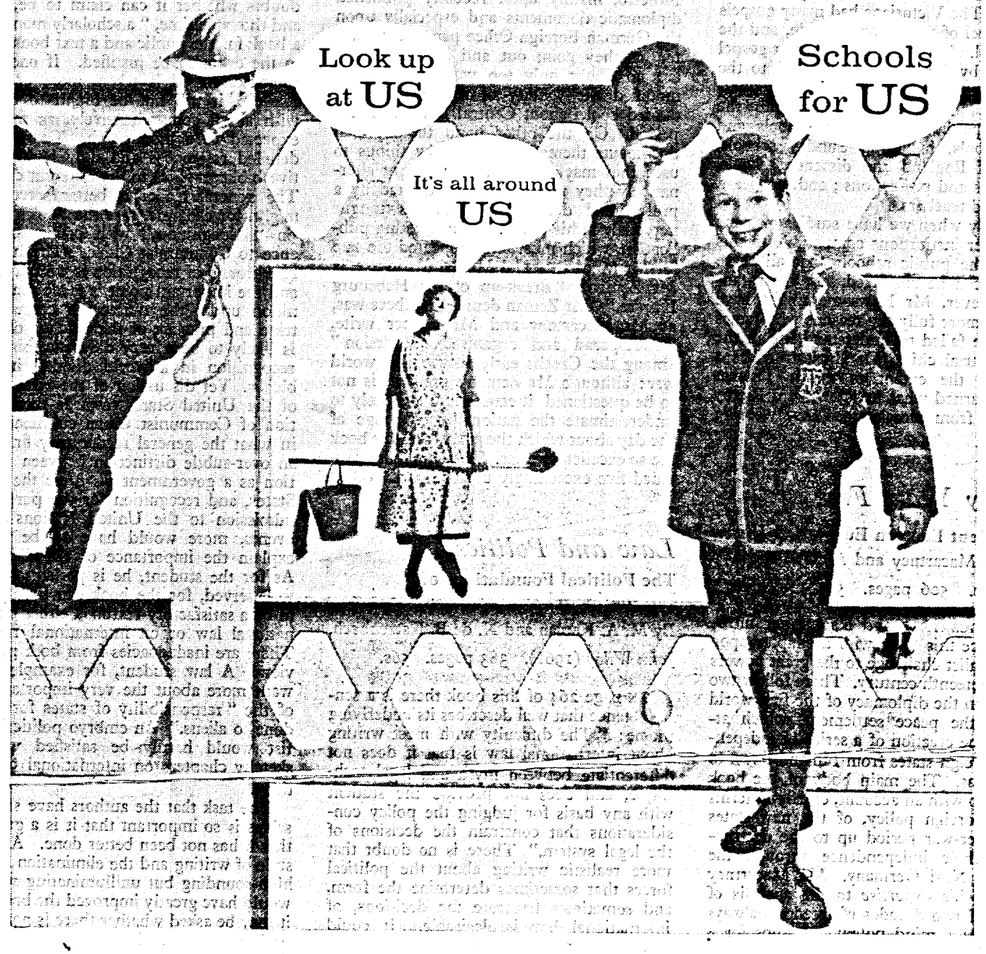
The Wartime Adventures of President John F. Kennedy
By Robert J. Donovan.
Anthony Gibbs and Phillips. 160 pages. 16s.

The Remarkable Kennedys
By Joe McCarthy.
Victor Gollancz. 192 pages. 21s.

The first of these books, written in 1940, was begun by a young man as the thesis required from him as part of his degree course at Harvard University. It was not the denigration of Britain that might have come from the son of an American Ambassador in London who was considered an advocate of appeasement, but a warning to Americans. The second of these books, a selection from the speeches, congressional messages and answers to press questions by the President of the United States, still a young man, twenty-one years later, is also a warning to Americans. But this time it is a warning accompanied by a prescription for victory both abroad and at home. The first book shows the intelligence, the clear-sightedness, the analytical mind that have come to their full development in the second. This second book also shows the courage and readiness to lead which Mr Kennedy had demonstrated already, in more obvious ways, during his wartime career. This is described very convincingly and readably by Mr Donovan in the third book under review, while the fourth is a simple and laudatory account of President Kennedy's large and lively family.

Victorian Élite

Godliness and Good Learning
By David Newsome.
Murray. 303 pages. 28s.



Mr Newsome's "History of Wellington College" is one of the best recent histories of public schools. In his latest volume he extends the scope and expands the themes. He starts with the first enunciation of the gospel of "godliness and good learning" as it was preached in the early Victorian public schools and ends in late-Victorian England with the ideal of godliness transformed into manliness and good learning passing under the control of the agnostics.

He describes this development in general terms and collects his material from a wide range of Victorian sources. In addition he includes two case studies, the first of a headmaster-bishop, James Prince Lee, the second of a Winchester schoolboy, Martin Benson. Prince Lee served for eight years under Arnold at Rugby before moving first to the headmastership of King Edward's, Birmingham, and then to the newly-founded bishopric of Manchester. Young Benson was a remarkably precocious and introspective boy, whose life and death were fully chronicled by his father who later became Archbishop of Canterbury. Both case studies are interesting, particularly in their detail. This is perhaps the best way to study the Victorians. The ideals look over simple when they are stated as general propositions.

As an account of what happened inside the Victorian public schools Mr Newsome's book is rich and rewarding. It makes the most both of godliness and manliness, the latter a particularly fascinating Victorian ideal. It is full of relevant anecdote and revealing quotation, and establishes its main case without exaggeration. The criticisms of Arnold's work are examined as fairly as the praise it received, and the advocates of

talk about structural steel

Schoolboys appreciate modern buildings. So do charwomen. And United Steel Structural Company puts them up. Puts up steel skeletons for town halls and office blocks. Bridges and schools. And (dare we remind you?) Jodrell Bank radio telescope. Got a lot of up-to-date ideas has United Steel Structural. Like the well-known weight-saving beams called 'Castella'. And now, castellated universal beams. Time-saving. Cost-cutting. As befits a member of United Steel—one of Europe's biggest steel producers.

more and more games, who figure in the last chapter, are not forced into absurd postures but are allowed to condemn themselves out of their own mouths. Leslie Stephen's philosophy of life is fully explained before we are presented with Maitland's delightful remark "The Lord delighteth in a pair of sturdy legs."

Where Mr Newsome is less successful—and much less ambitious—is in trying to relate his account of what happened to boys in public schools, an élite of boys—he ought to make this clear—to the general trends of Victorian social and intellectual development. How well did the ideal equip the boys for living in a century of great change? How did it stand up to all the pressure of the age? The Victorians had many gospels—the gospel of work, for example, and the civic gospel. How was the particular gospel described by Mr Newsome related to the rest? The answers to such leading questions demand a deep probing into the relationships between public schools and other schools, including Sunday schools, Church of England and dissent; schools, universities and professions; and, not least, parents and teachers.

It is only when we have studies of some of the other institutions comparable to this study of the public schools that all these questions can be answered. In the meantime, however, Mr Newsome might have examined more fully the reasons why James Prince Lee failed to understand life in the new industrial cities (Dr Hook provides a clue) and the extent to which Thomas Hughes learned what he knew from Rugby and what from meeting ordinary working men.

Twenty Years Free

Independent Eastern Europe: *A History*
By C. A. Macartney and A. W. Palmer.
Macmillan. 506 pages. 50s.

MR MACARTNEY and his partner introduce this book with a chapter upon the nationalist challenge to the great powers in the nineteenth century. There follow two chapters on the diplomacy of the first world war and the peace settlement, which attempted the creation of a series of independent sovereign states from Finland down to the Balkans. The main body of the book is taken up with an account, chiefly in terms of their foreign policy, of the new states of the inter-war period up to the destruction of their independence through the power of Nazi Germany. Mr Macartney brings all his *expertise* to the analysis of those brief two decades of freedom, always having in his mind potential lessons for a perhaps happier future.

There is no nostalgia, here, for the pre-1914 past. As the authors write,

> Prussia and Czarist Russia (in its latest years) were national states of the German and Russian peoples in which the non-Germans and non-Russians were only citizens of the second rank. The Magyars were aiming at making Hungary into another such state. In the Ottoman Empire the non-Moslems lived in a condition of deep degradation. Austria after 1867, indeed, offered its peoples full equality in law, but even in Austria there existed a real *de facto* differentiation, rooted in past history, between its nations in terms of wealth, social status and share in the government.

They conclude that a "new multi-national state would have to avoid any form of national inequality . . . and it seems reasonable to hope that the great levelling-up and levelling-down of the inter-war period will have made this possible." They are particularly aware, throughout, of the disastrous nature of the vendetta between the Czechs and the Poles.

Mr Macartney and Mr Palmer have relied, apart from the authorities accepted hitherto, mainly upon recently published diplomatic documents and especially upon the German Foreign Office papers; the latter, as they point out and as the authors are no doubt only too well aware, have modified the validity of several regularly quoted books about Central Europe in this period. On the other hand the German documents themselves are tricky things to use: they may conceal a Nazi ruse or alternatively they may have been drafted by a professional diplomatist with his tongue nervously in his cheek. An interesting publication, which must have appeared too late for Mr Macartney and Mr Palmer to use, is Mr Zeman's "Break-up of the Habsburg Empire." Mr Zeman denies that there was, as Mr Macartney and Mr Palmer write, "widespread and organised subversion" among the Czechs early in the first world war: although Mr Zeman's accuracy is not to be questioned, it causes him curiously to underestimate the nationalist challenge of the day about which the authors of this book are so excellently clear. They have also provided five exceedingly useful maps.

Law and Politics

The Political Foundations of International Law

By M. A. Kaplan and N. de B. Katzenbach.
John Wiley (1961). 383 pages. 56s.

ON page 264 of this book there is a sentence that well describes its underlying theme: "The difficulty with most writing about international law is that it does not differentiate between myth and legal technique, and does not provide the student with any basis for judging the policy considerations that constrain the decisions of the legal system." There is no doubt that more realistic writing about the political forces that sometimes determine the form, and sometimes frustrate the decisions, of international law is desirable. It could come very appropriately from a political scientist and an academic lawyer (although now Professor Katzenbach is Deputy Attorney General of the United States) in a country where a widespread movement for "World Peace through World Law" has raised exaggerated hopes of the purely legal contribution to international settlement. There is, however, also in the United States, a much older "realist" school of legal philosophy, *in its current application* to international relations particularly associated with Professors Harold Lasswell and Myres McDougal. This movement can go to the opposite extreme of submerging law altogether *in a thick syrup of sociological* verbiage, which aims at describing the "fact-situations" and "policy decisions" that are said to underlie the "formal" law. It is to be regretted that the authors of the work under review have not altogether escaped this latter danger.

There is the initial difficulty, of which the authors were clearly aware, of deciding for whom the book is intended. Their doubts whether it can claim to be, at one and the same time, "a scholarly monograph, a book for the public and a text book" seem in the event to be justified. If one of the topics discussed is taken, more or less at random, it will not be found to be dealt with at all comprehensively, as might be expected of a monograph. There are no detailed references and only highly selective bibliographies to the different chapters. The general reader is better served. He might, for example, take the book's chapter on "Recognition," with particular reference to Communist China. The historical background of recognition is well explained, and the important point is made that recognition under the nineteenth century doctrine and practice of the balance of power is likely to be a very different thing from recognition in a world divided into two blocks. Yet discussion of the vital attitude of the United States towards the recognition of Communist China culminates only *in what the general reader may find to be* an over-subtle distinction between recognition as a government *vis à vis* the United States, and recognition for the purposes of admission to the United Nations; at all events, more would have to be said to explain the importance of the distinction. As for the student, he is perhaps the least well served, for the book can hardly claim to be a satisfactory textbook either on international law or on international relations. There are inadequacies from both points of view. A law student, for example, would want more about the very important topic of the "responsibility of states for wrongs done to aliens." An embryo political scientist would hardly be satisfied with the sketchy chapters on international organisations.

The task that the authors have set themselves is so important that it is a great pity that it has not been better done. A simpler style of writing and the elimination of many high-sounding but unilluminating sentences would have greatly improved the book. But it may be asked whether there is not a more basic weakness in its thesis. In destroying the "myth" of much of international law, the authors unintentionally create another: that the inconclusive discussion of political trends (entirely permissible and, indeed, valuable in itself) represents a more scientific approach than that of the conventional international lawyer.

This is the fourth in a series of advertisements inserted by Svenska Metallverken

Having a kitchen like this Swedish-made Primus stove may be the nearest that millions of Eastern housewives will get to the laboursaving havens that so many Western housewives take for granted. And yet, Mrs. Shamin Ali in Bahawalpur may still prefer her Primus. For one thing it is handy — and the shining brass that goes into making it will fill her heart with pride for many years to come. We know. We've delivered this brass for fifty years. Yet another example where Svenska Metallverken has helped make a good product better.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

Relaxing with Mr Macmillan

WASHINGTON, DC

PEOPLE like to hear what they want to believe. Mr Macmillan's fifth chat with President Kennedy was therefore very well-timed. In spite of bold plans to use the new American nuclear tests to blow the Van Allen radiation belt down to earth in smithereens, nobody seems to want to talk any longer about shelters against radioactive fall-out. Mr Khrushchev himself appears to have tired, no doubt only momentarily, of threatening to do undefined but terrible things, like King Lear. Perhaps everyone has become a bit more unflappable, like Mr Macmillan. Perhaps unflappability is contagious. Mr Macmillan conveyed a sense of gracious non-urgency that seemed to be appreciated even by the human pressure-cookers of the New Frontier, who rarely like anyone who does not look taut. But at present they are rather fed up with leaking Teutons and aloof Gauls, in the light of whose behaviour Mr Macmillan must have seemed all the more refreshing.

He certainly managed to make it appear that the President and he enjoy a relationship which can only be described as domestic (and therefore possibly somewhat irritating to outsiders). What went on, everyone insisted, was not negotiation, just easy conversation. The emptiness of the *communiqué* was turned into a virtue before it was even issued. The conversationalists wore, as it were, their mental slippers—or, to use an American metaphor, they just tossed ideas into a hopper and neither was bound by what was tossed around. In this relaxed atmosphere Mr Macmillan's soothing mumble was a pleasant contrast to what Mr Kennedy would certainly have had to hear from a white-faced, tight-lipped Frenchman or from a reproachful German (Herr von Brentano arrived in Washington on Mr Macmillan's departing heels).

Though there may still be a meeting at the summit this year, and perhaps even one in the form of an American-Russian duet, it will assuredly not be as cosy as these White House talks. Even Mr Khrushchev agrees that people do not and should not ascend summits merely to have informal chats with him there. (He usually does the talking while the others try vainly to negotiate.) But the American and British leaders just chatted and nobody much expected that anything startling would emerge or was dismayed when it did not. That was the joy of it.

Nevertheless, even between two such good friends, there were moments, it seems, when the dialogue, while not of the deaf, must have sounded rather like talk between Henrik Ibsen and some theatre-goer unaware that Ibsen's plays are written on two levels. For Mr Macmillan seemed to think that the Americans, who, he knows, are anxious about the trade relations of Japan and Latin America with the European Economic Community, agreed with him when he said that the European common market should develop on the lines of an open association benefiting the world (and the Commonwealth) and should not become an exclusive grouping. So of course they do—but only on one level of their thinking and that not the level with which they are chiefly concerned.

What many influential Americans are really saying is that seven or, just possibly and at a stretch, eight countries may make a sensible grouping in Europe, but that fourteen can only make for dilution and that to include neutral countries makes nonsense. If Sweden and Switzerland really want to become members of the sort of European grouping that the Americans (but not necessarily Mr Macmillan, or some other Europeans) have in mind when they talk about the common market, these two countries ought to be told that their path to nuptial bliss lies through a door over which is written, "Abandon neutrality, who enter here."

In short, the common market that many of the Americans around Mr Kennedy long to see has an organic connection with the President's proposals about west Berlin (just as Mr Khrushchev links disarmament inspection with his version of a German peace treaty). The common market that these Americans want is a grouping, more political than economic in significance, that will, among other things, help to tie west Germany firmly in with western Europe. It is even hoped that the free mobility of workers within the European common market will become a factor in the rejuvenation of ageing west Berlin.

Thus, when Mr Macmillan is believed to have mumbled something about the European neutrals being only technical and not spiritual neutrals, he may have missed these Americans' point—and, if he remarked, as he probably did, that the Americans surely wish to see what is left of free Europe hanging together and not falling apart, he was right but he was also somewhat irrelevant. For these Americans do not want just a revived, united Europe. They want a positive, crusading, anti-communist Europe that, together with Japan and the United States, will give the lie vigorously to communist economic theories (which the Americans because of their very detestation of them have tended to take rather more seriously than many Europeans) that deny any possibility of genuine growth to under-developed countries which associate with developed non-communist ones.

Because both western Europe and Japan are undergoing what Americans regard as the most extraordinary decade of growth in their histories, it is confidently felt that trade problems between them, as well as with Latin America and Africa and the Commonwealth, can be solved. The American concept of the European common market can co-exist peacefully even with Mr Gaitskell's notions of planning as well as with Professor Meade's protectiveness towards New Zealand farmers and manufacturers in India and Hongkong. What it cannot co-exist with apparently is Mr Khrushchev's bland interpretation of peaceful co-existence as

democracy slowly retreating before communism's advance—or with neutrality. The British Ambassador tried to reassure Americans on this last point this week when he told the Cincinnati Council of World Affairs that Britain does not believe that it will ever be possible for western Europe to take a neutral position in the struggle between communist totalitarianism and free democratic societies.

The realistic American view of nuclear tests is that these will go on as long as the scientists on either side feel that there is a chance of a break-through on weapons or on defence and that, when they feel that there is no such chance, the problem will solve itself. This does not preclude a summit meeting with Mr Khruschev, when the current tests end, to talk about Dr Sohn's zones—the American proposal to break the deadlock on disarmament by expanding inspection from one or two initial areas as confidence grows. Mr Khrushchev probably broke the moratorium on nuclear tests in order to try to close a real gap between Russia and the United States, which had alarmed him by increasing its military spending partly in order to close a "missile gap" that apparently turned out to be only a phantom.

The Americans are in rather a confident mood, especially since the exploit of Colonel Glenn. Mr Macmillan is believed to have ventured the theory, which General Clay had already voiced, that at the moment the Russians are not looking for trouble over Berlin because they do not care to take the risk of a minor issue being mishandled by the east Germans and turning into a major one. But the American feeling is that communism is now also displaying marked failures elsewhere and that the incompetent east German regime has its parallels in North Vietnam and even in Peking. Mr Khrushchev might like to have a Soviet man on the moon to celebrate the fiftieth anniversary of the Russian revolution in 1967, but it would probably cost him $50 billion to attempt it. He is still out-gunned, in spite of having bigger boosters, and he admits that the Russians are still being out-eaten. The United States can certainly out-spend him and, roused by his own taunt, is prepared to bury him, at least in the Pickwickian sense in which he afterwards claimed to have employed the verb.

But Americans are optimists who persist in feeling reasonably confident about the future of the human race and they would prefer a less strained situation. Mr Macmillan told his audience of newspaper publishers in New York that it may take a generation or two for the Russians to change. This is no doubt a more realistic time-scale than that which depicts the two societies getting more like each other every day. But many Americans doubt if history, or the problem of proliferating weapons, will wait. Therefore they agree with the British Prime Minister about the need to use periods of reduced international tension, like the present, to persevere with talk that may lead to more stability, pending the happy day of general and complete disarmament. As Mr Rusk, the Secretary of State, has remarked, there is nothing stable about sixteen years of discouragement ending in the commitment of increasingly massive resources to an arms race.

Sauce for the Unions

MR KENNEDY came to the fiftieth anniversary meeting of the United States Chamber of Commerce on Monday bearing an olive branch: he insisted that, in spite of his successful engagement with the steel industry, he had no desire to fix prices and only wanted businessmen and the trade unions to co-operate in holding down costs, in the interests of the consumer and of the country's balance of payments. But his hearers remained disgruntled; indeed, the very next speaker defended the steel industry and attacked the President. There is little doubt, moreover, that the business community—and the Republicans—will be watching suspiciously to see whether, when the national interest is at stake, the President treats trade unions as ruthlessly as he treated the steel industry. Already the railways, frightened that a presidential commission which reports this week is going to recommend an increase in wages for their "non-operating" workers, are insisting that this is a perfect test case and that what is sauce for the business goose is sauce for the union gander.

Wage negotiations are also coming up in the oil industry, in communications, paper, aluminium, the aero-space industry and others. Fortunately for the Administration's wage policy—unfortunate though it is in other senses—unemployment is too widespread for the trade unions to be exorbitant; many of their leaders feel that they will be lucky if they can win as much as a 3 per cent rise. This figure—approximately equal to the annual increase in productivity since the war—is the rough official ceiling on yearly wage increases. But there are corners of the economy where the trade unions enjoy a monopoly of skilled labour and where they are showing no undue delicacy about using it. In New York, where not long ago the electricians won a five-hour day (with overtime at higher rates of pay), plumbers and bricklayers are also demanding higher wages and shorter hours to "spread the work," although in their trades there is little or no unemployment. In construction it is particularly difficult for the Administration to enforce respect for the public interest since, whatever the leaders of the national unions say, individual branches have the power to fix their own terms. This cynicism not only angers businessmen; it also infuriates co-operative trade unions such as the steelworkers.

Besides wanting to maintain a steady price level, Mr Kennedy is also anxious to avoid strikes which would hold back the economy. Just this week his Labour-Management Committee recommended changes in the Taft-Hartley Act which would enable the President to intervene more rapidly and effectively in industrial conflicts. But most of the representatives of management and some of the public members were unhappy about this further intrusion of the government into collective bargaining—an intrusion which they felt would be unnecessary if only the power of business and labour monopolies could be curbed. But the prospect is that from now on the Administration will be intervening more actively both in labour negotiations and in pricing decisions, even though as yet it is far from certain about the methods it will use to obtain compliance from recalcitrant trade unions and employers.

Final Tests?

NO newspapermen are witnessing the nuclear tests which were begun by the United States on Christmas Island last week, no photographs are being circulated, announcements are being kept to a minimum. The series is being played down deliberately, to emphasise that the United States does not glory in being forced to resume testing and that this has been done, after three and a half years, with the greatest reluctance as a matter of what is believed to be grim military necessity. The imaginative, sympathetic way in which President Kennedy has approached this situation was underlined when on Sunday he honoured the American winners of Nobel prizes, for peaceful as well as for scientific achievements, including Dr Pauling who had worked up an appetite for his dinner at the White House by demonstrating outside it against nuclear testing.

Every effort has been and is being made to stress, both at home and abroad, that the explosions are to be as small and as few as possible, that radio-active fall-out is being held to a minimum and checked with care and, above all, that it was the Soviet Union

which broke the moratorium and compelled the United States to follow its example. And this campaign of public education seems to have been as effective as could have been expected.

Expert opinion is more nearly unanimous than ever before in agreeing that at this time the United States had no choice but to test. It is surprising, therefore, to find that a growing section of that opinion, including people who have always favoured nuclear testing before, is now saying that this may be the last series of American tests—in the atmosphere, at least—even if it remains impossible to reach an international agreement banning them everywhere. It is even more surprising to find that the present series is only likely to be the last if it is a failure, in the sense that it fails to provide any great "break-through" in nuclear technology. The argument, in an over-simplified and unproven form, is that, if American scientists merely find in the tests that confirmation of their theories which they expect to find, and not a new set of possibilities to be exploited, then they will be justified in assuming that the Russians did no more than this in their last tests and will do no more in the next series which they are expected to carry out before long. Therefore the United States would be in no danger of being surpassed in defensive power by some fresh development in the Soviet Union. In addition it appears that underground tests are now considered to be fairly adequate for proving weapons. Thus after the current series the military case for atmospheric testing may cease to be strong enough to outweigh the moral and psychological case against radioactive fall-out with its unknown consequences for future generations.

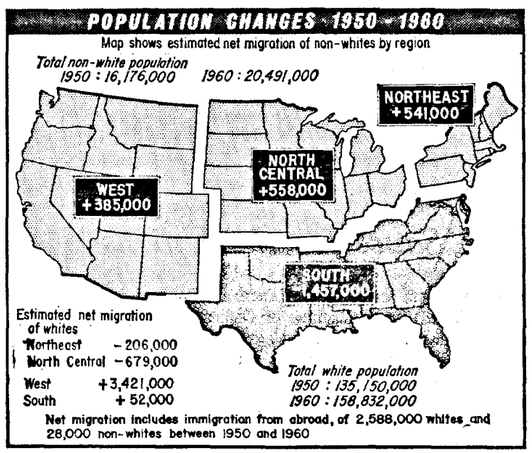
Profits in Recovery

OFFICIAL estimates of business profits during the first quarter of this year will not be available for some weeks but unofficial estimates of about $53 billion or so before the payment of taxes—at seasonally adjusted annual rates—make complaints of "profitless prosperity" look a trifle overdrawn. The corresponding figure a year ago, in the trough of the recession, was $40 billion. Moreover, although cyclical industries such as steel and motor cars naturally led the procession, gains were widely shared; in the major categories, only the airlines and the moving picture firms did worse than they did twelve months ago, though the domestic oil companies suffered because of sharp competition and lower prices for petrol.

The shadows on the picture are two. The first is the very slight growth in profits during the first quarter (if, given the standstill in production, there proves to have been any at all) over the fourth quarter of last year, when they rose to a rate of $52 billion. The other is the expectation that profits will continue to grow only slowly during the rest of the year, reaching their cyclical peak sometime in the second half; at that point rising costs will have started to eat away at profit margins. In the steel industry profits are probably starting to fall already because heavy buying in the first quarter, as insurance against a possible strike, has taken the cream off sales for months to come. Only the motor car industry looks forward with confidence to increasing its earnings substantially in the second quarter. It has already done handsomely. The General Motors Corporation, for example, doubled its earnings between the first quarters of 1961 and 1962, to achieve an all-time record.

The Administration must now face the fact that a tremendous and rather improbable upswing in profits during the rest of the year is needed if its hopeful estimate of over $56 billion for 1962 is to be justified. In private it is presumably trimming this figure by $2 billion or even more and recognising reluctantly the probable effect upon its precariously balanced Budget. And businessmen are pointing out that, though profits are certain to reach a new high this year, in certain industries they are insufficient to provide for the modernisation to which the President attaches so much importance. Mr Blough, for example, said last week that though the earnings of the United States Steel Corporation rose from $32 million in the first quarter last year to $55.8 million this year, this was enough only to cover the dividend and meet necessary repayments of debt, leaving no margin for reinvestment. In the second quarter of 1957, when the volume of production was much the same, the profits of US Steel were over twice as great and those of most other firms in the industry were substantially higher than they are now. The President's solution, as he told the US Chamber of Commerce this week, is faster economic growth. But until that materialises and brings with it higher sales, businessmen, who are now officially discouraged from raising their prices, will have to redouble their efforts to cut costs.

Exporting Negroes



FROM A CORRESPONDENT IN NEW YORK

CLUTCHING a brown paper bag filled with clothes, one dilapidated suitcase and a portable wireless, Mr Shelby Williams, aged 24, an unemployed dock-worker, and his 20-year-old wife, Sarah, arrived in New York on Sunday afternoon after a 42-hour "freedom ride" by bus from New Orleans. Their journey, and those of sixteen other Negroes during the past week, had been sponsored by that gracious city's White Citizens Council, in an effort to prove to Negroes that they would be treated no better in the North than they were in the South. The Council has circulated handbills among the city's Negroes announcing:

> Freedom Bus to Washington, DC, or any other city in the North. Free Transportation plus $5.00 for expenses to any Negro Man or Woman, or Family (no limit to size) who desire to migrate to the Nation's capital, or any city in the North of their choosing.

This apparently is New Orleans's answer to last year's freedom rides, in which both whites and Negroes from various northern cities challenged racial segregation in public transport.

So far the New Orleans' plan seems to have been pretty much of a failure, from its sponsors' point of view. The first Negroes to arrive in New York, Mr Louis Boyd, an unemployed dockworker,

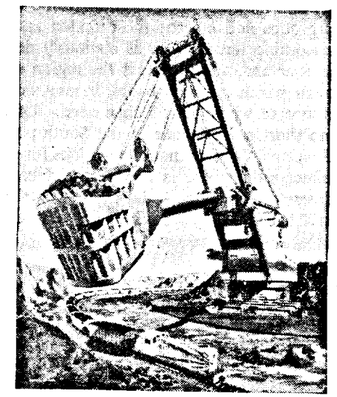
Coal Conspiracy

FROM A CORRESPONDENT IN TENNESSEE

IN at least one American industry the manifold problems of the age of automation are being solved by a hidden alliance between the classical rivals, management and labour. The odd way in which the bituminous coal industry is struggling to survive in an automated, competitive world was brought to light last year through a lawsuit in a federal court in Tennessee. This established that Mr John L. Lewis's United Mine Workers of America agreed secretly with the healthier and larger companies in the coal industry to speed the introduction of mechanical mining with its efficiency and economy. In addition, also secretly, the trade union acquired what amounts to a controlling interest in one of the country's ten largest coal-mining operations and lent $35 million to one wealthy industrialist involved in coal and allied business activities, Mr Cyrus Eaton. In the process thousands of members of the union who work in small mines lost their jobs permanently and scores of little mining companies were forced out of business. And finally Mr Lewis himself has now become chairman of the association which speaks for the coal industry as a whole.

If moral questions were put aside, this strange affair could be rationalised as a necessity of the industry and of the times. As a domestic fuel, coal lost its economic hold on America years ago with the arrival of substitutes—oil, natural gas and electricity—that were cheaper, cleaner and easier to transport. In the last decade, coal lost a large slice of its industrial market as well and the most plentiful fossil fuel in the country came to be considered a has-been. The law of supply and demand was working no longer and this was due mainly to the power of Mr Lewis's union. It had negotiated for its members the highest hourly wages in American industry. After a series of strikes during the last war, Mr Lewis added to his winnings a royalty of 10 cents a ton on all coal mined; this went into the miners' welfare and retirement fund and subsequent negotiations raised the amount to 40 cents a ton.

Because of this high, fixed charge—and for other reasons—it became impossible for coal to compete with other fuels. Either these labour costs had to be reduced—and to agree to this would be unthinkable for the leader of an American trade union—or costs of production and transport had to be trimmed somewhere else along the line. This, in turn, meant the introduction of more, and more efficient, machinery, which also meant fewer jobs for the members of the mining union. To allow them to learn that their leader had accepted, and indeed encouraged, a policy of putting machinery before men was equally unthinkable. So this was kept secret.



By now the welfare fund fed by royalties had grown to many millions of dollars. It was managed by trustees, but Mr Lewis was the trustee representing the union, the other two were controlled by him and under the law as it stood neither the public nor the members of the union were able to examine the handling of the fund; moreover, it was tax-free. So it too was secret. The union has still another fund, drawn from members' dues and interest on investments, which also now amounts to millions of dollars. Though this fund's income from dues is shrinking, as the number of union members declines, its income from investments is growing.

ONE of these investments is the oldest, and third largest, bank in Washington, DC, the National Bank of Washington, which is controlled by the union. It was through this bank, where both funds are on deposit, that the UMW entered the business of industrial banking. Over the years it has made loans amounting to millions of dollars to, and acquired holdings in, coal mines, water and rail transport facilities and electricity companies and is in a position to influence, if not to set, their policies. Today the heaviest single demand for coal is from electricity undertakings, whether privately or publicly-owned (as is the Tennessee Valley Authority); they need it for the gigantic steam plants which produce their power.

One of the newest of these steam plants provides an outstanding example of how coal has come to be handled automatically through the combined efforts of Mr Lewis and the industry. At Paradise, Kentucky, the TVA is building the world's largest steam plant for producing electricity, directly on top of a coal deposit of sufficient size to last beyond the expected life of the plant. The Peabody Coal Company, which owns this deposit, has set up an automatic shovel of awesome proportions to strip out the coal. Placed alongside the Statue of Liberty, its extended boom would tower above the lady's torch and it is taller than the Niagara Falls. At maximum height, it equals a 20-storey building and it can bite out 200 tons of earth and rock above the veins of coal with a single scoop. Two somewhat smaller monsters will lift out 5,000 tons of coal a day.

Pit and shaft mining is thus in its death throes. Into industrial extinction with these methods will go the traditional miner with his head lamp. The operation described above can be handled by three men. Conceivably, at maximum around-the-clock working it could put $4,000 a day into the UMW's welfare fund, which receives its 40 cents a ton whether the coal is mined by men or machines. At the same time, there will be fewer men needing help from the fund. In the mining areas of America, therefore, chronic unemployment is becoming a way of life; in places where there are only small mines, it has already.

This situation, however, is being attacked by President Kennedy on at least four fronts. The 1958 Welfare Fund Disclosure Act has been amended, to give the federal government policing powers over such funds, already estimated at $50 billion. If they

are to provide the capital for underwriting the age of automation, at least it should no longer be possible to use them for this purpose, as Mr Lewis did, in secret. Realising how the land will be damaged by such mechanical mastodons as the Peabody shovel, the President has asked for an extensive study to be made of all surface mining, with a view to requiring that damage be made good.

In order to make coal more competitive by improving its means of transport, the President wants to facilitate its shipment by pipeline, a modern method in which the coal is powdered, mixed with water and flushed through the pipe. One such pipeline is now being proposed by a private company, leading from the depressed coalfields in West Virginia to electricity plants on the eastern seaboard. Finally, the President has sponsored various measures designed to redevelop regions which have lost their economic base and to retrain workers whose jobs are gone forever. So far these measures have not worked well in the coal areas, where miners are uneducated and untrained in any other skills, but it is expected that before long the Administration will offer a plan for meeting the specialised problems of these areas in a specialised way.

Continued from page 450

his wife and their eight children, had no sooner stepped off the bus than he was offered a $100 a week job and provided with a home on a racially integrated housing estate. But the National Association for the Advancement of Coloured People, warning Negroes that they could not all expect to do so well, called the plan a "cruel hoax" and the Mayor of New York expressed his disgust. He has been studying the possibilities of using National Guard armories and other public buildings to house Negroes from New Orleans, if the White Citizens Council there does in fact send bus loads, and even train loads, of up to a thousand Negroes north, to Chicago and Los Angeles as well as New York, as it hopes to do; but Negroes in New Orleans are showing little interest in the offer.

In attempting to export Negroes wholesale the South is also exporting its unemployment and social welfare problems. But in the end this attempt may backfire severely. If, as seems likely, Negroes are still leaving the segregated South without this special stimulus at the rate they did during the past decade, about 400 are departing every day. Whites as well as Negroes are moving away and normally such migrants come from the most productive age groups and are the most skilled and intelligent members of the working force. This is obviously depleting the South's pool of labour and, as a result, if the region ever attains the industrial growth which it wants badly, it may well find itself without the workpeople whom it will then need. Of course, at present there is no shortage of labour in the South; although the region lacks technicians, there are not enough jobs for semi-skilled and unskilled workers. But there is a widespread campaign to bring in new industry; if this succeeds, eventually the South may wish that it still had the Negroes whom it is now trying to export.

Saving in Style

NEW YORK

SAVING has come back into fashion. Normally it increases when economic conditions are unsettled and the confidence of consumers is shaken, but the current trend set in after the end of the recession last year and has been gaining momentum ever since. In 1961 liquid savings reached a record total of almost $26 billion, while the amount of consumer credit outstanding showed only a small rise of less than $1.5 billion; savings amounted to 7.1 per cent of personal income, the highest percentage since 1958, with most of the improvement coming in the second half of the year. But saving has become really conspicuous only since the beginning of 1962, when the Federal Reserve Board relaxed Regulation Q, the provision governing the interest rates which commercial banks may pay. The ceiling was raised from a flat 3 per cent to 3.5 per cent on regular savings deposits and to 4 per cent on funds held for a year or longer. Although the central bank's move was taken mainly to help New York City's big banks to hold foreign deposits, it touched off a domestic rate war that has been a boon to savers.

Many commercial banks, particularly in metropolitan areas, immediately adopted the new maximum rates and accompanied the rises with expensive advertising campaigns to attract depositors. Mutual savings banks and savings and loan associations, which had been gaining deposits because they had been able to offer from .5 per cent to 1 per cent more than the commercial banks, were hit hard by the narrowing of the spread and they retaliated by increasing their dividends to maintain their advantage. However, the commercial banks which are able to offer complete "one stop" banking service—including current accounts, consumer loans and so on—registered the most impressive gain in savings deposits during the first quarter of this year and this forced competing institutions to push through yet another increase. In New York, one savings bank has announced that it will pay a 4¼ per cent dividend on money left with it for two years and others are talking about the same rate on one-year money; in California, most savings and loan associations (which are comparable to Britain's building societies) are offering 4.75 per cent, with a few going as high as 4.8 per cent.

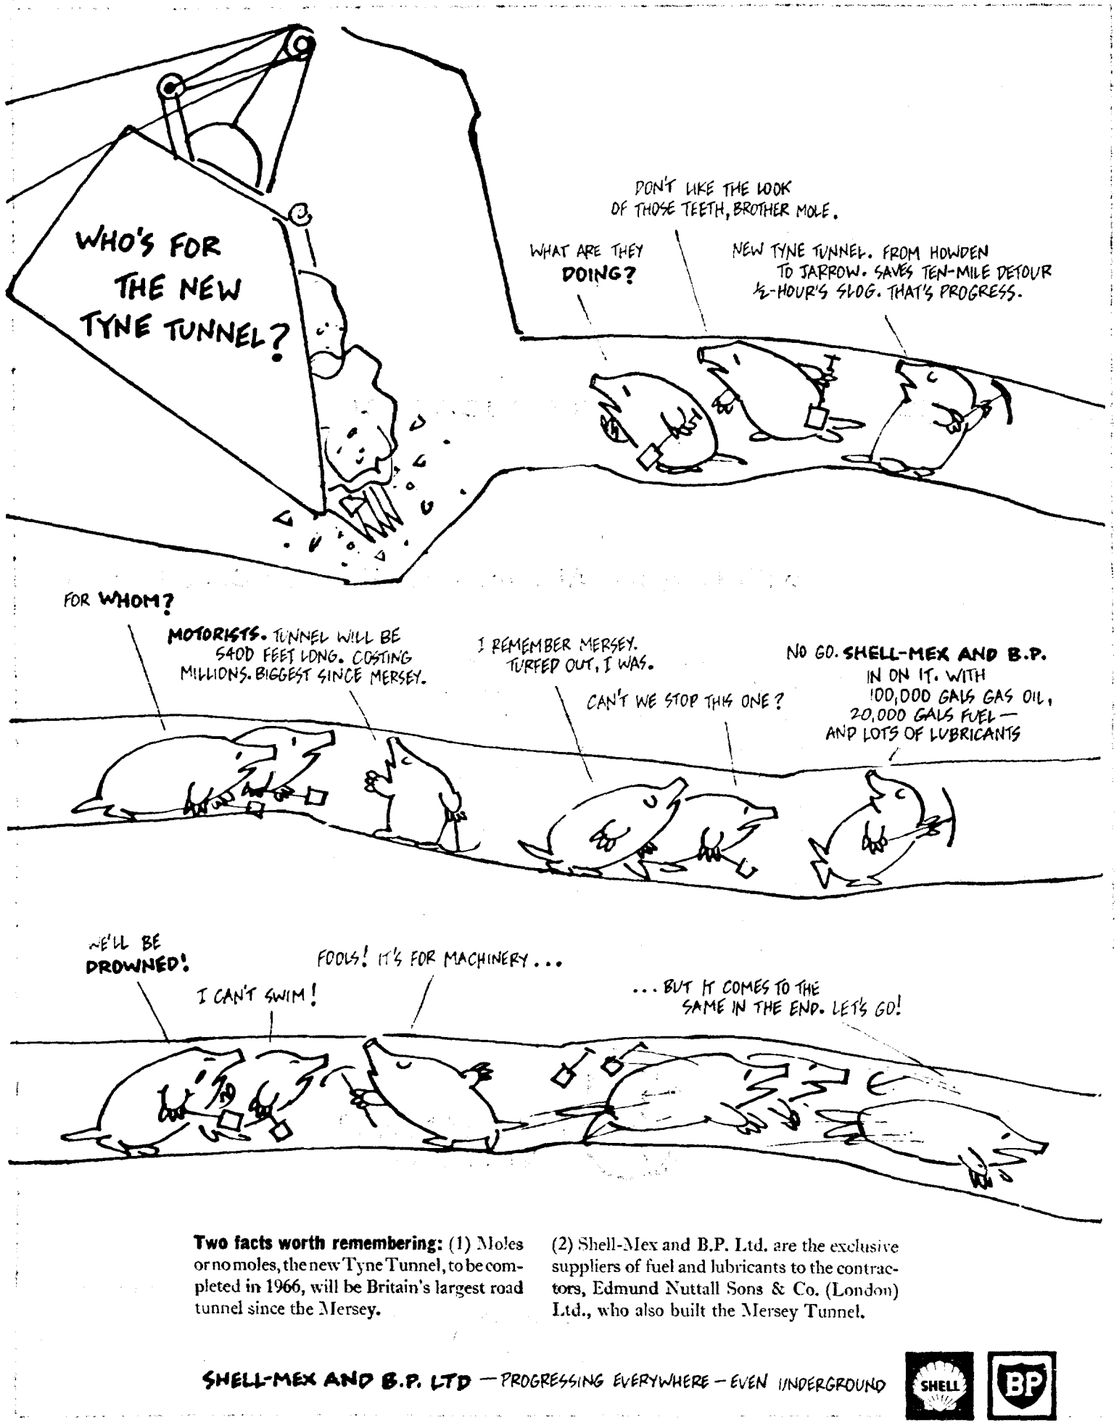
This emphasis on higher rates—along with free gifts and the compounding of interest on a weekly or even a daily basis—has encouraged a considerable increase in savings. In January alone, commercial banks showed a $2.5 billion increase in savings deposits, a bigger rise than they have experienced in many twelve-month periods. Unquestionably part of this represented a shift from demand—current—deposits to savings within the same banks but some of it also came from their competitors, for the savings and loan associations reported a net drop of 23 per cent in January compared with deposits a year earlier and mutual savings banks showed no gain. People are becoming more aware of the rate of return on their money and sales of government savings bonds, whose rates are no longer competitive, have declined.

PERSONAL incomes have been rising but the surge in savings is accelerating at an even faster pace. This has been a factor in the slower-than-expected rise in sales of consumer goods. It has also had a marked influence on Wall Street, which has experienced a sharp fall in turn-over and a decline in the drive to buy equities as investors have preferred the assured yields provided by savings accounts. Moreover the flood of funds flowing into savings institutions has forced them to buy mortgages to offset the higher interest costs which they are paying. In turn, this has resulted in a lowering of mortgage rates and has touched off a hunt for other, more attractive, investments. The National Association of Mutual Savings Banks has seen fit to warn its members against making unsound loans in order to assure enough money for dividends and the head of the Federal Home Loan Bank Board, which supervises the savings and loan associations, threatened recently to impose a ceiling on dividends. But he changed his mind, on the grounds that this would not prevent unsound investment practices. Most of the institutions engaged in the battle for savings are facing a squeeze on their earnings but no one is talking about calling off the war. Meanwhile Americans are getting the double benefit of higher yields on deposits and somewhat lower mortgage costs.

Nevertheless some falling-off must be expected in the rate at which savings have been growing. The response generated by the big jump in rates during the first quarter of the year is unlikely to be repeated. Indeed, many bankers feel that, if the Fed had raised the ceiling to, say, 6 per cent or had eliminated it altogether, rates would not have been pushed up so fast. Whether or not this is true, another rise in rates of 20 per cent or more is out of the question. And as the impetus of the new level of interest rates wears off, a slower increase in savings can be expected. Moreover the expansion of the economy, accompanied by higher employment and rising incomes, should bolster consumer confidence and spur spending.

But, with the threat of inflation abated and attractive returns available, the propensity to save may not lose all of its appeal. Competition for deposits has come to stay, with the commercial banks well to the fore. This should accelerate the trend towards bank mergers and perhaps even towards mergers between commercial and mutual savings banks. It should also speed the formation of a national mortgage market and will almost certainly increase the mobility of funds throughout the country. These developments may not be what the central bank meant to bring about when it raised the ceiling on interest paid by commercial banks, but some of the effects on financial institutions are lasting.

THE air OF SUCCESS!



with Chrysler Airtemp—genuine Air Conditioning

Every business with a use for air cooling and conditioning equipment can call on the vast technical resources of the Chrysler Organisation. Every business can take advantage of Chrysler's 25 years of experience in this field.
Chrysler Airtemp Equipment cleans the air. Filters it. Removes dirt, fumes and smells. Warms or cools it as necessary. Then gently circulates it. A wide range of Airtemp units is available and there's one that is tailor-made to solve your particular problem. You'll be surprised how simply it can be fitted into your premises.

Apprenticeships

SIR—Your comment on the Apprentices Report of the Engineering Employers' Federation (April 14th) takes a very jaundiced and biased view of it. Great efforts have been made to increase the number of apprentices. The effective number of apprentices taken on, after deducting wastage, during the twelve months ending October, 1961, was 16,960. The number engaged was greater by 15.5 per cent than for the twelve months ending March, 1958, the time of the last federation inquiry.

Blame for wastage seems to be placed on employers. Every incentive is given to youngsters to enter the industry by the prospect of secure, well-paid jobs. There can be little doubt that firms are becoming more "choosey" in taking on apprentices, thus making it more likely that the right type of boy is taken on. As to any feeling on the part of apprentices that they are "wasting their time," there is no evidence whatsoever that this is more prevalent amongst apprentices than amongst any other category of employee.

The use of the word "mere" to describe the number of technician apprentices is derisory, but the fact remains that 7,178 young men are being trained as technician apprentices, an increase on previous figures of 20 per cent. As to girl apprentices, can you produce any evidence of girls crying out for apprenticeship and being unable to find the opportunity? There is again no evidence that conditions in firms outside the federation are better than those within it.

What you mean by "the hidebound five-year apprenticeship 'sitting by Nelly'" it is hard to find out. If you mean that the would-be craftsman cannot learn by working with a fully skilled man, then it is a palpably absurd statement. How else are all skills handed on? If you mean that insufficient skilled training is being given, then the report shows this to be untrue.

As to the length of apprenticeships, there are many pros and cons to the argument. But one thing is certain. Shortening the period of apprenticeship will not increase the numbers of apprentices.

This is not to argue that much does not remain to be done but to stress that during the last three years much has been done and to express the hope that much more will be done in the years ahead.—Yours faithfully,

B. MACARTY
Director
Engineering Employers' Federation
London, SW1

[We were careful to congratulate the leaders of the Engineering Employers' Federation on their courage in publishing a report so discreditable to their own members.]

Where Education Pinches

SIR—Until recently the four old universities in Scotland (which stretch their staffs farther than the two old, and many new, universities in England and Wales) were able to provide seats to all qualified comers. But the Government now seems determined to hold back university extension in Scotland to allow the English and Welsh position to be brought level. The result will be that by 1970 a far bigger proportion of fully qualified students will be denied entrance in Scotland, in the very country that traditionally seated them all, than in hitherto backward England and Wales.

At present there are some 17,500 students in Scotland and about 86,500 in England and Wales. But by 1970 the student body in Scotland will have expanded to only 21,500 while that in England and Wales will be swollen to 148,500. Naturally there are those of us in Scotland who do not object to university education in England and Wales being pulled on, but object very much to Scottish education being braked back.—Yours faithfully, DAVID MURRAY
Cambuslang

Neo-Colonialism

SIR—In your issue of April 21st on page 225 you state that Northern Rhodesia and Nyasaland are colonies. Is it not a fact that they are protectorates and therefore subject to treaties with the Crown; and the people are not British subjects but British protected persons?

Southern Rhodesia is a self-governing colony, is it not?—Yours faithfully,
London, W1 JOHN FISHER

Pétanquisme

SIR—I was very interested to read in your issue of April 21st your correspondent's account of the playing of *pétanque* in the south of France and to see that the game is attributed to the Greeks of the fourth century BC whose sailors introduced it to Marseilles.

During many years of travel throughout Greece and the Aegean Islands I have only on one occasion seen a similar game being played. This was in the village of Potamós in Amorgós, which I visited in the summer of 1959. Two teams of villagers were competing one Sunday evening on a narrow donkey path, full of rocky outcrops and hemmed in by dry-stone walls, which debouched on the village square.

The bowls consisted of extremely crudely fashioned wooden spheres and this, together with the irregularities of the surface on to which they were tossed, must surely have neutralised any acquired dexterity of the players.

I should be interested to know whether this is a survival from ancient times or an example of refertilisation in which Greek seamen in modern times have brought the game back with them from Marseilles.—Yours faithfully, MICHAEL WARD
London, SW3

Capital Gains

SIR—A still harder look at the gains tax than that in your issue of last week might have led you nearer to an answer to your own question—what is it all for?

In these days of strongly inverted values the last thing that any politician is likely to claim for his own proposals is that they have any but utilitarian merit. It is conceivable, nonetheless, that a Conservative Chancellor has come round to the view that speculation, especially in shares, is irresponsible. The gains tax, by reducing the marketability of shares, tends to make shareholding more like the responsible function in society that it should be. When private property-owners again become conscious that, as such, they have duties as well as rights, the defensibility of private ownership will have been restored.

Less clumsy ways of reducing over-free marketability have, of course, been suggested.—Yours faithfully,
Edinburgh KENNETH R. MIDDLETON

Ulster

SIR—Having recently completed a study of Ulster's chemical industry I must agree with your lucid analysis of the Northern Ireland economy (March 17th).

I found that the financial inducements offered by the Northern Ireland Ministry of Commerce to foreign industrialists are extremely generous and have in fact succeeded in attracting a range of industries from abroad. With regard to the chemical industry it would seem, however, that a large number of plants have been built recently to make the more "sophisticated" chemical products, such as synthetic rubbers and fibres, while there is as yet little capacity in Ulster for producing basic and intermediate chemicals. Would it not be healthier for the economy, in the long run, to foster an inorganic heavy chemical industry by the side of these organic plants?

Against this contention many Ulster economists will argue that the sea freight charges from Liverpool to Belfast or Londonderry are reasonably low and reliable, thus making the import of basic chemicals from the Midlands an economic proposition. However, if the Ulster chemical industry is to expand in a common market and supply the South with consumer products, it must be as integrated as possible, without undue reliance of basic imports from across the Irish channel.—Yours faithfully, I. L. HEPNER
London, NW1

THE WORLD OVERSEAS

Socialism on the Nile

FROM OUR SPECIAL CORRESPONDENT

SCOTCH whisky, alka-seltzer and American cigarettes are the constant hard currencies of under-development. One sign of sterner times in the United Arab Republic is that American cigarettes have gone under the counter (though not very deep) and the Scotch in Cairo bars may, with a bit of bad luck, turn out to be Czech. This outrages the princely traditions of hospitality that upper-class Egyptians have retained through all their tribulations. A visitor to Cairo is torn between nostalgia for gracious times passing, and enthusiasm for the new ideas that are pushing their way through the tangle of imitation and experiment, excess and lethargy that goes by the name of Arab socialism.

Socialism is the sesame that opens almost any door. "A perfect example of socialism" declared a lyrical member of Cairo's city council defending the way that some Egyptian charities collect from passers-by by bombarding them with tickets. "A perfect example of begging" was the growled response of another member, a leading authority on Islamic law. This confusion about the beginning or end of socialism is both a strength and a weakness. Egypt is refreshingly free of dogma; except for one newspaper that used to produce remarks by Marx and Lenin as the original thought of its editor, few people pad out their ideas with quotations from the masters. President Nasser has evidently borrowed heavily from his friend President Tito; everybody hopes that Egypt will be able to profit from the experience, and mistakes, of Jugoslavia. But decisions are taken pragmatically, and often capriciously; the government swings this way and that in making the agonising choice, common to all developing countries with limited resources, about whether to put economic or social development first. But on one issue, Cairo's mind seems fixed; the answer to the innumerable problems that push their way on to the economic scene is more, and yet more, government planning and control.

At one and the same time, Egypt is trying to increase its national wealth and to distribute more fairly what wealth already exists. This target has twice been confused by political events in Syria. It is generally believed that if it had not been for the union with Syria in February, 1958, the nationalisation and socialisation decrees that were announced in July, 1961, would have been brought into effect at least a year earlier. As it was, they precipitated the break-up of union. The Syrian secession, when it came three months later, put an end to the orderly carrying out of the July decrees: the Egyptian government was panicked into increasing the speed and severity of the programme; and into using economic weapons as a means of frightening and silencing potential political enemies.

This is the ugly side of Egyptian "socialism." While there is everything to be said for the government's efforts to make the rich in Egypt rather less rich, it is much harder to defend the political persecution of certain families. Apologists for the regime deny that there is any racist element in the government's policies; it just so happens, they explain, that the Copts, the Greeks and the Jews mainly belonged to the upper crust of society and so automatically have to face a cut in income. But the lists of families (believed to be about 1,500) who have had their property sequestrated show marked deviations from the straight and narrow line of social justice. To begin with, the government cracked down on families whose political loyalty was uncertain; then, not unreasonably, it extended its whip to such anti-social groups as the hashish traders. But the interpretation of "anti-social" is flexible; one of the most worrying things about the sequestration of foreign property is that about 90 per cent of it hits Jewish families. An even more shameful hint of anti-semitism was the tendency of some foreign embassies in Cairo to fight rather harder for the rights of their non-Jewish, rather than their Jewish, citizens.

Compared with their argumentative neighbours in Syria or Iraq, Egyptians are a passive people to govern, good-humouredly accepting, or shrugging off, the orders that trickle down to them from high places. Government controls are not new to them; the lives of most Egyptians are conditioned by the distribution of Nile waters, and this has long been the trust of a centralised government. Moreover, once President Nasser had reached the point of deciding to make a major effort to alleviate Egypt's intolerable economic and social problems, there was no workable alternative to government action. Once more by contrast with Syria, and to a lesser extent Iraq, Egypt was not blessed with much of a tradition of efficient private enterprise. Egyptians who made money before the revolution tended to invest in land; after the revolution and the land reform laws, they put their money into blocks of flats or managed to stack it away abroad. If the country was to approach its target of doubling the national income within ten years, the government had to be the major partner in the economic drive. The question is whether it can still be called a partnership.

The momentum of the swing towards nationalisation seems to be steadily squeezing private enterprise out of business. In the end, perhaps, only the goldsmiths and other skilled craftsmen of the bazaars in Khan el Khalili will feel themselves truly independent. The government has three ways of taking over control: by outright nationalisation, by taking 50 per cent of the shares, or by limiting the holding of any family in a concern to £10,000. If the government holds a quarter of the shares in any company it has the right to appoint the managing director. Although the old directors are often urged to stay in a less high-sounding capacity, many of them are deeply discouraged at having to work under the government's nominee—who, more likely than not, is an army officer, maybe efficient at his own military job but clueless when it comes to business.

A rather cumbersome pyramid of economic organisations is responsible for supervising, and perhaps co-ordinating, what goes on. There are about 35 of these organisations, each responsible

for one particular line—such as food, building or chemicals. The obvious drawback to this system is that bright ideas tend to get stuck somewhere in the middle of the pyramid. Egypt has much greater reserves of talent than other Middle Eastern countries (except Israel), but this great bite at nationalisation has drained its resources. The splendid theories that emerge from the Presidency crumble away in the lethargy and low spirits of those who are supposed to be carrying them out. With the plunge into heavy industry, the UAR has run seriously short of qualified engineers: a shortage that is one of the factors restraining the government from drawing on all the foreign credit that is now available to it.

Despite this, the government is managing to keep pace with the high industrial targets set by the five-year economic plan (July, 1960-June, 1965). But construction and, more important, agriculture are running behind the plan's schedule. Egypt will need time to recover from the shock of last year's disastrous harvest when about a third of the cotton crop was gobbled up by pests. Nobody seems to know the reason ; perhaps the insects had become immune to the insecticides, perhaps the insecticides had somehow got diluted or arrived too late. Somebody had to be the scapegoat, and the ministers of agriculture and land reform both lost their jobs. The government, coming forward with its usual panacea of more control, is making urgent efforts to save this year's threatened crop. But already the loss on last year's harvest is calculated at about £50 million of foreign currency.

If it were not for the steady £1 million a week coming in from Suez canal dues, the government's anxious position over foreign exchange would be ominous. As it is, the resourceful minister of economics, Dr Kaissuny, has to perform feats of day-to-day juggling to avoid defaulting on foreign payments. Egypt has become heavily reliant on American aid, which comes mainly in the form of surplus wheat, maize and tobacco, and is now worth about £60 million a year. If the Egyptian army depends on Russian weapons, the Egyptian people, at the moment, depend no less urgently on American food. Loans and credits from western countries (especially from Germany and Italy) are gradually approaching the level of the massive Russian credits for the Aswan dam and the industrial programme.

The old canard about President Nasser guiding Egypt into Russian hands is as wrong-minded today as ever. True, the government's deep faith in planning and controls, its suspicion of private enterprise, its police system and its dive into heavy industry are modelled on eastern rather than western systems. But this is a moon-journey away from implying that President Nasser takes orders from Moscow. The Egyptian rich are being soaked, but not (except for the unfortunate families sequestrated) very painfully. The lower middle classes are gradually becoming more vigorous, and this is all to the good. Although in the villages the bad old times persist, and nobody can see how to change them, the working class children in Cairo looked brighter and healthier than they did even four years ago. And Egyptians who have made the journey to Moscow tend to refer to the Soviet capital with something of the same delicate horror that they evince when they sip Czechoslovakia's whisky.

Deadline in Algeria

FROM OUR PARIS CORRESPONDENT

In the seventh week after the signing of the Evian agreements a reasonably bright record of developments in Algeria can be drawn up. Nothing irreparable has happened. The Secret Army Organisation (OAS) has failed in all its major objectives. It has proved, so far, unable to goad the Moslems into blood reprisals. It did not prevent, as it had boasted it would, the setting up of the provisional executive at Rocher Noir. It has had no success in winning over entire units of the French army. It has been unable to gain full control of any town, let alone to establish strongholds in the countryside. Finally, as a symbol of all these failures, the OAS has been beheaded: General Jouhaud has been sentenced to death and General Salan is awaiting trial in a Paris jail.

But the picture is not quite as bright as it is drawn. The top generals have been caught, but the colonels who have always been the mainspring of OAS activity—Godard, Argoud, Gardes and their henchmen—remain. Provocative murders of Moslems go on ; the record-breaking casualty figures in Algiers on Wednesday—some hundred dead and scores of casualties—are a tragic illustration of the unending massacre. The provisional executive sits at Rocher Noir, but it has little effective control over the country's administration. The army has not been disobedient, but it shows little enthusiasm for carrying out its orders. The country is paralysed by anarchy and its economic life is slowly coming to a standstill. Isolated in their quarters as in a ghetto, unable to go to work or to shop in European districts, the Moslems are getting restive. Nationalist cadres are finding it increasingly difficult to keep them in check after provocative outrages by the Secret Army.

This growing exasperation is important, since it is everybody's secret that not all the Algerian leaders were very pleased with the Evian agreements. Some of them see in the settlement an obstacle in the path of the Algerian revolution. The mood of frustration is apparently strongest among the young, the guerrilla fighters and, in particular, among the army units stationed in idleness across the frontier in Tunisia and Morocco. It is no accident that Ahmed ben Bella, the most famous and unorthodox of the Algerian leaders freed by the French, was greeted enthusiastically in those frontier bases. True, Mr ben Bella has since then toed the official line of the Algerian government. But that line may have been strengthened in the process. Above all, the Algerian leaders, who are getting ready to return from exile, cannot afford to ignore the mood of the masses. They cannot run the risk of appearing indifferent to the crimes that are being perpetrated during the interim period. They are bound to press the French for more action against the OAS or, alternatively, for a share in the task of repression.

Thus the French government can regard the situation in Algeria as good or bad depending on what it really wants to achieve there. At one stage General de Gaulle used to talk of "disengagement." French resources were not to be poured wastefully down the Algerian drain, because they could be much better used at home. If disengagement were the general's only purpose and if he were eager to turn his mind to ambitious projects in Europe, the chaos left behind in Algeria would matter little. French aid would be cut, French troops shifted across the Mediterranean and all Europeans who wanted to get out would be given shelter in France. The Algerians would be left to their own devices and the killers of the OAS would have a chance to show whether they had the courage of their convictions.

But such, apparently, was not the purpose of the Evian agreements. They were reached on a basis of co-operation. The unwritten assumption was that economic ties would keep Algeria within the French orbit and that the price of French aid would be Algerian moderation. The assumption, obviously, had its risks ; the French negotiators were fully aware that possibly half the European population would have no future in an independent Algeria. But they hoped that their evacuation would be as gradual as the transformation of Algeria itself. These hopes will be dashed if the Algerian nationalists are left with the task of destroying a Secret Army whose members seek and find shelter among the European population.

Concrete: so light it floats!

You can take a block of Durox Aerated Concrete and float it in water. That's how light and how non-absorbent it is. Yet it is strong enough to withstand compressive loads up to 850 p.s.i.—without reinforcement. When you build with Durox you need less labour (because the units are so light and strong in relation to their size); you need less insulation (because Durox itself is an excellent insulant); you need less surface preparation (because Durox is so smooth that it requires little, if any, plastering). In fact, you need less of practically everything. Except imagination.

Durox is distributed through the various depots of Hall & Co. Ltd., Croydon, and other builders' merchants. Details, specifications and performance figures from: Durox Building Units Ltd., Chantrey House, Eccleston Street, London, S.W.1. Sloane 7122. *A member of the Hall & Ham River Group of Companies.*

DUROX

For this reason, the two months or so separating Algeria from its referendum are crucial. The task of the French forces is not easy. The OAS leaders, after their initial blunders, are even occasionally showing glimmers of intelligence. At Easter the French command foreshadowed an anti-OAS offensive in Oran. The rooftops of the town's highest buildings were taken over and troops occupied the centre of the town. The Secret Army, preserving its commandos for raids against Moslems and the police, sent pretty girls to court the "invaders." The troops were rapidly withdrawn.

It is clear that French army commanders show no enthusiasm for their troops' being used in the ruthless police operations that are indispensable if the gangsters of the Secret Army are to be uprooted. But it should be made plain what is at stake. The possibility that the Algerian nationalists will not be able to contain the anger of their followers is not the only risk. Even if the Moslems do not react to provocations, somebody will have to finish the task that the French army or the mixed forces under French control have failed to complete. If the transfer of power comes after months of bloodshed, and nationalist Moslem troops are compelled to invade the European fortresses of the Secret Army, they are unlikely to show more mercy than did General Massu's paratroopers in the notorious "battle of Algiers" against the National Liberation Front (FLN). The Europeans, accustomed to being masters of the country, would not recover from the shock of such an awakening. The exodus would turn from a trickle into a flood and the policy of co-operation between the two communities would be stillborn. The next two months will show whether the compromise devised at Evian stands a chance of success or whether there is no alternative to disengagement.

Buccaneers Scuppered

FROM OUR CORRESPONDENT IN HONGKONG

HONGKONG'S textile operators are, so far, more alarmed than really hurt by the ban the United States has imposed on various import lines from the colony. Undoubtedly the Americans were rough—but within their rights. And certainly Hongkong remains a victim of political horse-trading in the United States. But the stupidity and greed of sections of the colony's uncontrolled—and it would seem uncontrollable—textile industry not only invited but demanded American action.

Whenever some semblance of an orderly trading arrangement for general advantage looms in Hongkong, it is trampled to bits by rampaging freebooters. Last year's Geneva agreement provided "base" levels on exports of 64 agreed categories in Hongkong's annual $80 million textile trade with the United States; within four months, reckless Hongkong exporters had already exceeded the base level for the year on the most rewarding goods. There was no pretence at self-discipline. There was no central body with sufficient authority to enforce discipline or even, it seems, to counsel caution. (By contrast, the Japanese, with stern controls and punitive power, wisely volunteered ceilings on their textile exports to the United States as far back as 1957.)

Hongkong's defence is based on 18th-century standards of free trade and freer enterprise; unhappily, the gunboat methods of the Opium War, which once served Hongkong so well, cannot be resurrected to force ten-shilling shirts on even a willing American public. And, in today's harsh and complicated world, it is not good enough to discourse highmindedly on the moral rights of refugees and the need to maintain a show-window of capitalism on a colonial off-shore island.

To do so is to confuse trade with aid; two different departments, alas, handle those two different operations in Washington, under the pressure of two different lobbies and two different classes of voters. Such are the contradictions of American democracy that an Administration may prefer to donate foreign aid rather than to buy foreign goods, and may help to build costly industrial plants in backward countries and then reject the bargain products of that investment. By ironic coincidence, a benevolent Washington committee's recommendation that the Administration should make Hongkong "self-supporting" with cash and food handouts was reported here just when Hongkong workers were exploding firecrackers in fulmination against the Administration's brake on self-supporting labour in the textile mills.

Nobody knows for certain how deeply the short-term cutback, under the terms of the Geneva agreement, has already wounded Hongkong's textile industry. Some of the medium plants have ended Sunday work and are running only six days a week. The

All Snarled up

operation of piece-work cottage-mills has contracted. Estimates of actual unemployment range from 2,000 to 10,000. One reliable authority forecasts that perhaps 5,000 hands will have been shed from the industry's labour force of 70,000 by the end of the short-term agreement in September, and perhaps half a dozen medium-sized plants will have shut down. (Of the colony's 3,000,000 population and 1,200,000 workers, 300,000 are engaged in industry. Only government employees surpass in numbers the textile labour force.)

The hurt at the moment, therefore, is chiefly shock. There is well-justified apprehension, even though the Americans have now agreed to arrangements that will make it possible to enforce the base levels next year more smoothly than this year. There is a strong anti-American reaction; the Yankee Pew has tipped the black spot to the poor refugees. Above all, in this mood of alarm and despondency, there is very real anxiety about employment prospects for the flood of youths who will emerge from the schools next year. Dismissed women can find their old jobs as *amahs* (now in short supply), and dismissed men can be absorbed on public works; but the absence of work for the new generation leaving school could mean the beginning of disaster.

On a long view the shock, despondency, recrimination and loss of business for the next six months will have been more than worthwhile if the buccaneering elements in Hongkong industry accept the protection and restraint of effective controls, and if, in a colony not heavily oppressed by democratic processes, the government adopts a tougher policy, with a corrective touch of the rattan for the recalcitrant. It is clear that the governor, Sir Robert Black, an astute and strong administrator, is planning to roll with the shock until the revision of the textile agreement. Realistically, the date of that technical revision is probably not as important as the approach of the American congressional elections next November, and the compromise-ridden fate of President Kennedy's trade expansion bill.

Exit the Lotus-Eaters

FROM A CORRESPONDENT LATELY IN GOA

THE airlift of Portuguese prisoners from Goa to Karachi, which was due to begin this week, is the first essential step toward normality in India's newest territory. Once they have gone, to be trans-shipped home in the liners which the Portuguese were too proud to send direct, the few thousand remaining Indian troops can go home too, and the military administration will give way to civil rule.

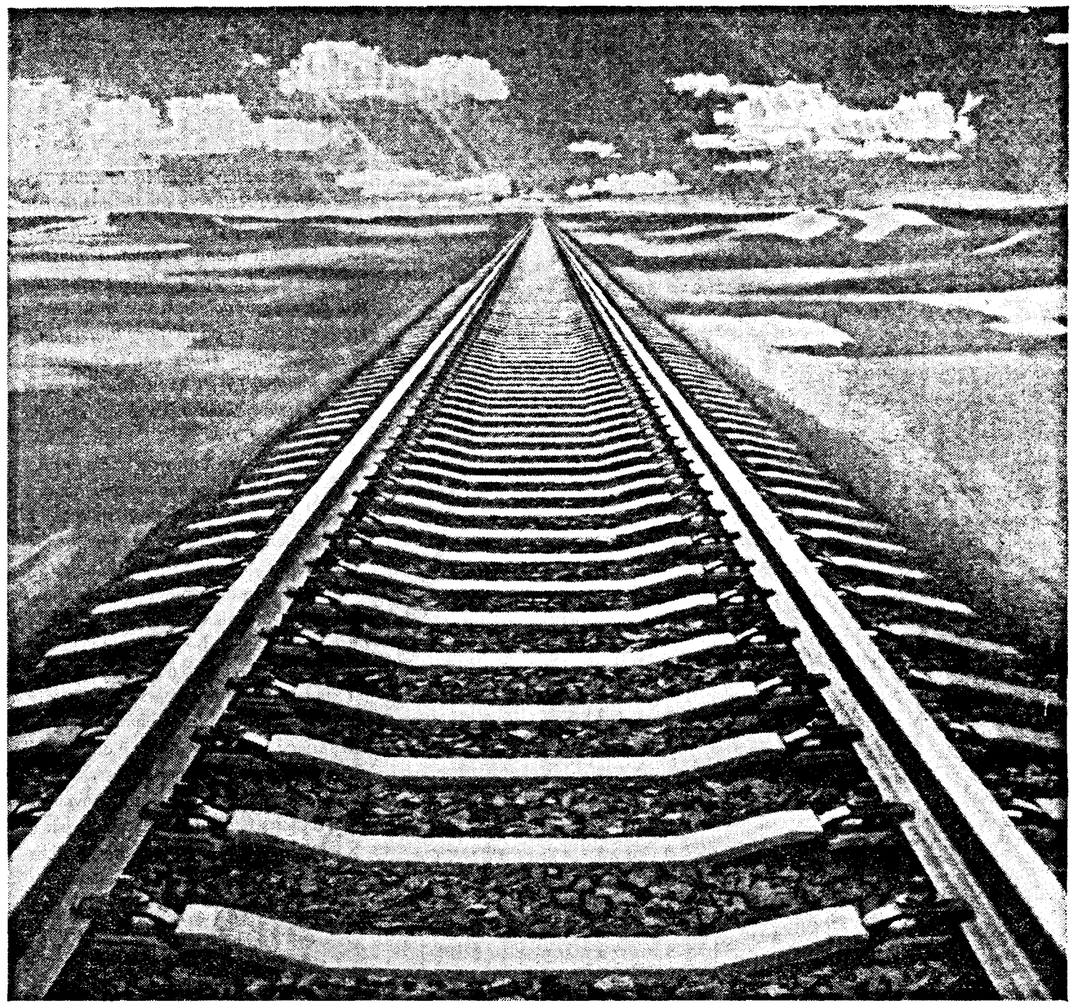
The months since last December when India took over Goa have not been altogether happy. Undoubtedly a majority of Goans welcomed and still welcome the change of regime ; but the minority who were inclined to waver, mainly middle class Christians, have not been reassured. The first shock was the collapse of law and order immediately after the Indian action. Thefts and crimes of violence increased sharply in January, and some members of the liberation army were directly involved. Officers of a rank to know better made free with the refrigerators and radios left with Goan friends by the departing Portuguese. Two soldiers threw a grenade into the house of a shopkeeper with whom they had quarrelled, killing his young daughter ; four others committed a particularly

Portuguese troops: waiting to go.

brutal rape. The incidents were shocking enough, but the military government, showing the catastrophic lack of a sense of public relations that marked the entire liberation, made them worse. It tried to hush up what had happened—which may have helped India in, say, the United States, but not in Goa—and instead of dispensing stern and immediate justice gave every appearance of dragging its feet. Justice is, in fact, being done ; law, order and discipline have been restored. But the effect remains.

The other, and more difficult, problems of adjustment are economic. Goa under the Portuguese had an extraordinarily distorted economy, as unlike that of India as could be imagined. The last few years had brought ostentatious prosperity ; as an Indian journalist recorded, the men he saw in loinclothes in 1954 were now wearing a fine bush shirt and Dacron trousers. The sole cause was the extremely rapid growth of iron and manganese ore exports, principally to Japan. They amounted last year to some £15 million, and financed enormous imports of consumer goods, liquor (empty bottles worth £7,000 were re-exported) and, thanks to India's economic blockade, even food. Potatoes came from Holland, rice from Brazil. Mercedes are in common use as taxis. Where the Indian's wife wears gold bangles, the Goan's may carry a Swiss watch. A large part of these consumer imports, worth altogether over £1 million a year, were intended solely for smuggling into India.

Although food prices were high, the fields were being abandoned for still more lucrative work in the mines. Apart from a shipyard, however, there was little other capital investment or industrialisation. But the economy was further inflated by the way in which over the last two years the Portuguese had for political reasons expanded the bureaucracy and boosted pay scales to three or four times the levels in India. The liberation has changed all this. Food (in this context, producers') prices have slumped. Imports of non-essentials have already been cut by half, and that is only a start. The merchants and the smugglers (who are apt to be the same people) have been hard hit. The custom of three thousand Portuguese troops has vanished. The bloated official salariat has been pruned, and those retained are finding themselves on Indian rates of pay. Altogether some two thousand government employees have lost their jobs, though some are being reabsorbed.



This has naturally led to discontent, largely among the former privileged class. Some 2,500 families have applied for passports to leave for Portugal or Brazil, though it seems unlikely that as many will actually go. Much the same class will, or certainly should, be discontented when the new administration begins to reform land tenure. The old system of communal land ownership has by now degenerated to the point where the communities are virtually joint stock companies of the well-off, often leasing out their holdings to middlemen.

There are other more widespread fears. The Christians, roughly one third of the population of 700,000, have always enjoyed the edge in official favour, although they have lived in perfect amity with their Hindu and Moslem neighbours ; but they are now just a little uneasy. Language disputes are already beginning. Local chauvinists in both the neighbouring states are claiming Goa for their own, a claim that might not be unwelcome in the hinterland but is violently repudiated in the "Old Conquests" which the Portuguese have held since the sixteenth century. The majority there are Christians, but all communities seem to want to be left on their own.

Not all these difficulties could have been avoided. Within the limits of inadequate policy directives and election time unwillingness to take decisions in New Delhi, the administration seems to have made a fair attempt to ease the pangs of change. Its shortcomings have been freely discussed in the Indian press, and even in Goa itself ; it is worth remembering that this *was* an authoritarian colony over-run by political police. "Now we can open our mouths" is a common expression even among those who do so to criticise. Political activity is in full swing—in the case of the communists, rather too full for official comfort.

On the credit side, the Indian administration is planning seriously for Goa's economic development: hydro-electric power, small industries, modern mining methods, tourism, transport. The roads round Panjim are better than they would be elsewhere in India, but in the interior they are atrocious. Marmugao, one of the finest natural harbours in Asia, is connected only by a single metre-gauge track to the far wider hinterland that it should properly serve. This will change with the building of the new west coast highway, whose course is being diverted through Goa. Goa is no longer a land of lotus-eaters, but in the long run its people will probably be better off. No one, mercifully, has yet demanded that it should go "dry." That really would provoke an SOS to Salazar.

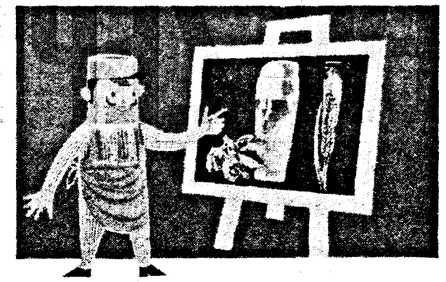
THE SHORTEST DISTANCE BETWEEN YOUR FACTORY AND THE DOCKS IS 2 STRAIGHT LINES

London Midland offers an important priority service to British exporters: *Export Express*. *Export Express* links selected docks by rail overnight to factories in major industrial centres of the London Midland network between London, the Midlands, North and North West. **For full wagons and container loads the assurance to exporters is: at your factory today, at ship's side tomorrow.** Safe. Sure. In all weathers. No extra cost. No red tape. No anxiety. Priority for export goods on trains running to timetable. Today, tomorrow, all through the working week. If you are concerned with shipping goods abroad, *Export Express* can take a great load of freight problems off your mind. Ask your nearest London Midland Station Master or Goods Agent for the latest details of the service. London enquiries ring AVEnue 7535.

LONDON MIDLAND RAILWAY'S EXPORT EXPRESS

Eureka!
—it's come to me...five years ahead of time!

Funny, this ability of mine to think five years ahead. Rather a lonely position to be in, really—except that Halex have it too. So that when I have a plastics problem—or hit on a brilliant idea like this double sproggletacket—I know Halex are the people to go to. They understand. There's nothing Halex can't cope with in plastics. They'll know how to mould the two-headed hookspoke so that it'll meet the gannet halfway. The facilities and knowhow of Halex plus my brains—what a combination! Can't wait for 1967 so that I'll know what's going to happen in the plastics field in 1972 . . .



If you've a problem—*any* problem—involving plastics, then Halex can do a great deal to help you with it. The size of the problem doesn't matter a bit. The bigger the better. Halex are in business to offer a *total* plastics service—a service which begins with one of the most effective consultancy services in the plastics industry through to development and final production. As a division of the British Xylonite Company Limited, Halex can offer you the most *comprehensive* plastics service in the country—perhaps in Europe. If you need *any* help on *any* problem involving plastics, all it takes to secure the facilities Halex command is a phone call to LARKSWOOD 2345

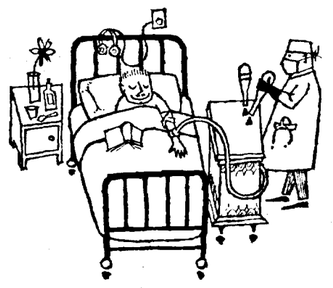
Halex—a quality service in plastics

Bier, Glorious Bier

FROM OUR BONN CORRESPONDENT



DETERMINED efforts to persuade people to drink more beer are to be expected in a country that has 2,218 registered commercial breweries, between them the source of some 55 million hectolitres a year (57 million in 1960). This is a tenth of the world's total production, and roughly three-quarters of the common market's. The west Germans manage to dispose of the bulk of it by drinking themselves an average of 100 litres a head a year. The Bavarians down 181 litres a head a year; which implies some prodigious individual performances. Most of what is left—some 975,000 hectolitres—is exported, half of it by a single Bremen firm.

For centuries the German brewers have made a very comfortable living. Those who have kept their businesses in the family—and they are many—are reluctant to go into details about profits. Most of the big joint stock companies, such as Dortmunder Union and Schultheiss, are paying dividends between 14 and 18 per cent. But there have been signs recently that the German brewers are disturbed at the prospect of common market competition, especially from the Netherlands. Not that they doubt the superiority of the German product. The dangers they see are in the field of costs and prices, and in the increasing consumption not only of wine, tea and coffee (11, 24 and 94 litres a head respectively in Germany in 1960), but also of soft drinks, which rose to 37 litres a head in Germany in 1960—roughly four times as much as before the war.

A hot summer and natural thirst are, of course, the brewer's best friends; but too often they are unreliable and, unaided, they do not suffice in the long run. Additional arguments for satisfying thirst with beer are a help. And, in a valetudinarian society, what could be more effective than reasons of health? The latest annual report of the Federation of German Brewers discusses some of the ways in which the public are being systematically instructed that beer is good for them. All derive from the basic fact that the sole ingredients of beer permitted by German law are malt, yeast, hops and water.

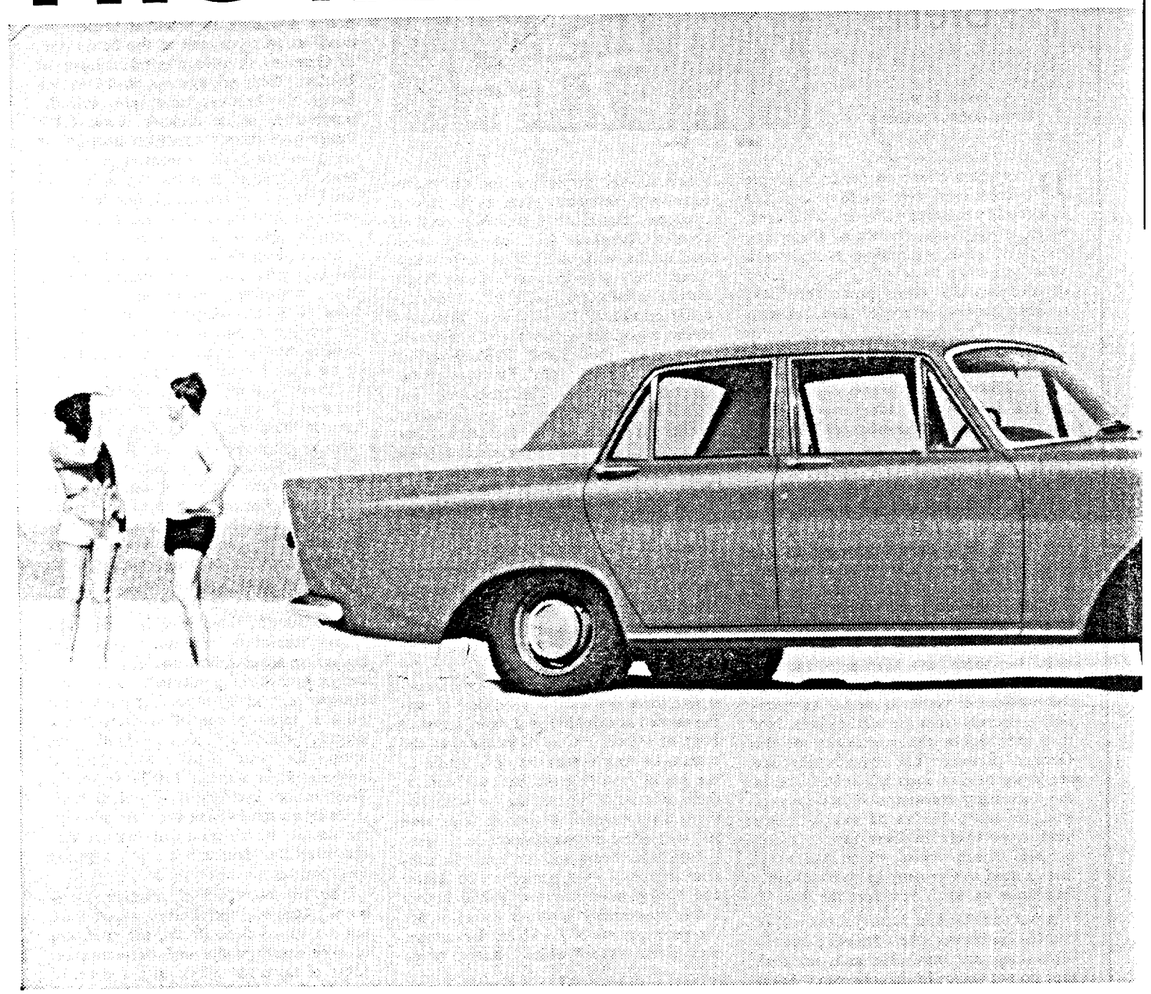
Thus the singular "purity" of beer is being sedulously projected at a time when a new federal law obliges food manufacturers and restaurant keepers to inform customers that the fish and meat on their evening *Kaltplatte* has been kept fresh and bright with the aid of hexamethylentetramin or some such forbiddingly named admixture. The good work is being reinforced by a team of doctors—among them, the report proudly discloses, "Prof. Dr. phil. habil. Felix Just," of Berlin, "Prof. Dr. phil. Dr. med. habil. Caspar Tropp," of Wolfenbüttel, and "Dr. rer. hat. Horst Drews," also of Berlin. The titles of their learned lectures, pamphlets, and newspaper articles range from "Concerning the Ingredients of Beer," through "Is Beer of Dietetic Importance?" to "Beer is Medicine," "Beer at the Sickbed," and "Beer in the Hospital."

The various possibilities of increasing the intake of those who turn to beer unabashedly because they like it are also being diligently exploited. Many brewers have granted generous loans since the war to hotel and restaurant keepers for the purpose of refurbishing their premises—where there is usually a good deal of eating as well as drinking, and many a thirsty bout of skittles. Care is taken that the tenants of tied houses are duly versed in the art of handling the various beers at their disposal. These are mainly *Pils* (with a pronounced flavour of hops) and *Export* (with a greater proportion of malt)—both lager beers with an alcoholic content of from 3 to 4 per cent. In winter and spring most German public houses stock appreciably stronger beers under the generic name of *Bockbier*. In summer they often serve "white" beers, which

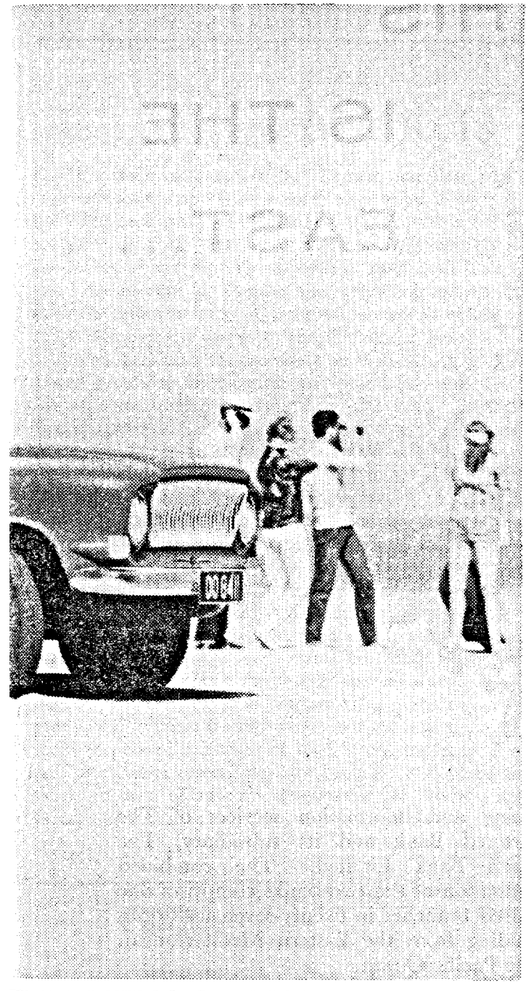
are made with wheat instead of barley malt, and whose asperity is sometimes tempered with a shot of raspberry syrup—a German approximation to England's shandy.

Yet, as is the fashion among other westerners, more and more Germans prefer nowadays to drink at home. As much as 69.2 per cent of the beer drunk in Germany in 1960 was taken home in bottles. With an eye on stocks in the larder, the brewers have sponsored the publication of a cookery book—"It's Better with Beer"—in which instructions are given for braising mutton or beef in beer, basting chicken on the spit alternately with beer and butter, and introducing beer into marinades and other concoctions. Every little counts.

So far, beer drinking in west Germany has kept pace with rising incomes. That is to say that over recent years there has been an annual increase in consumption of between 7 and 8 per cent. Yet the smaller brewing firms are not at all happy about their future. There are too many of them. Only some 80 of the 2,218 breweries have an output of more than 120,000 litres yearly. Indeed, ninety per cent of the breweries in the Federal Republic produce only nine per cent of the total brew. It is not uncommon to find three breweries competing in one small Bavarian town (there are 1,700 in Bavaria alone), and there are scores of village breweries of long standing with exclusively local sales.



SURPRISINGLY, there have been virtually no take-overs hitherto. The small businesses are contriving to hold their own chiefly by installing modern labour-saving equipment, and by arranging guaranteed sales at lower prices, often through the grocers' voluntary chains. Until this spring the price of beer had remained unchanged since 1952. But lately several Westphalian brewers have raised their price by six marks (just over ten shillings) the barrel; which means in practice that the restaurant drinker must pay a penny more for his glass.



The big breweries of Munich, Dortmund, Bremen, and Berlin, which have not yet raised their prices, are confident of continuing profits and pre-eminence. Most of them nowadays have a stake, of one kind or another, in the competitive soft drink trade, and all are represented in current common market negotiations for laying down the future rules of the game (how much deposit on a bottle, for example). Others are going into the business of selling "know-how." Thus, German technicians have been called in to advise Guinness on the production of a lager beer; and Schultheiss of Berlin and Holsten of Hamburg are building a brewery in Togoland, in which they will together hold a 51 per cent controlling interest.

TWO NEW ZEPHYRS!

EPHYR 4 TAKES VER FROM AMOUS CONSUL 375!

ZEPHYR 6 - CRISPEST STATEMENT EVER OF THE ZEPHYR FORMULA!

ONLY THE PRICE IS POCKET-SIZE
Economy never looked better! Nor felt so comfortable! Nor accelerated, cornered, climbed, braked with such relish. Why? Because in the new Zephyr 4 Ford set out to give you the very best of two motoring worlds . . . on the one hand quiet power, elegant looks, de luxe comfort for 6 . . . on the other, family-size economy, and complete ease of handling in traffic, in parking and at speed.

NEW 4-SPEED GEARBOX—30 MPG
The new Zephyr 4 has the lithe look of a champion. But with stretching room for six full grown human beings. Its newly-developed 1703 cc. engine (synchromesh on all four forward gears) delivers 68 bhp. *And* 30 touring miles to the gallon.

DISC BRAKES STANDARD
Initial price is a happy surprise. Yet power disc brakes on front wheels are standard. And the famous Ford all-steel integral construction to guarantee great strength and durability throughout.

NEW NO-MAINTENANCE AUTOMATIC TRANSMISSION
More in your favour. Uncluttered all-round vision. 21¼ cu. ft. boot. Variable-speed electric wipers. Zero-torque "non-slam" door locks. You can have fully-reclining adjustable-rake separate front seats, twin-layer ventilation system, overdrive, or a revolutionary automatic transmission that never needs maintenance. Plus Ford's low insurance, hp rates, and fixed-cost service.

ZEPHYR 4 from **£846.12.9** (£615 + £231.12.9 p.t.)

EVEN MORE POWER TO YOUR RIGHT FOOT!
The new zesty Zephyr 6 has all the space, the lithe good looks and even more of the comfort of the new Zephyr 4—and it's powered by a newly-developed 2553 cc. OHV unit developing 98 bhp. So it performs with the zest of a racer half its size and twice its cost. Extra pull. Extra speed. Extra prestige. See your dealer today.

ZEPHYR 6 from **£929.2.9** (£675 + £254.2.9 p.t.)

THE NEW 6-SEATER

ZEPHYR 4&6

Value never looked so good... Comfort never had such power! Ford

THIS IS THE EAST...

Economic development in Asia is bringing higher living standards to these young people and to the vast population of that continent. Demand for an ever increasing range of merchandise is steadily rising. If you are interested in trade with these expanding markets, you are invited to avail yourself of the banking and information services of The Chartered Bank and its subsidiary, The Eastern Bank Limited. The combined organisation of the two banks comprises one hundred branches in twenty-seven territories extending from the Eastern Mediterranean to the Pacific Ocean.

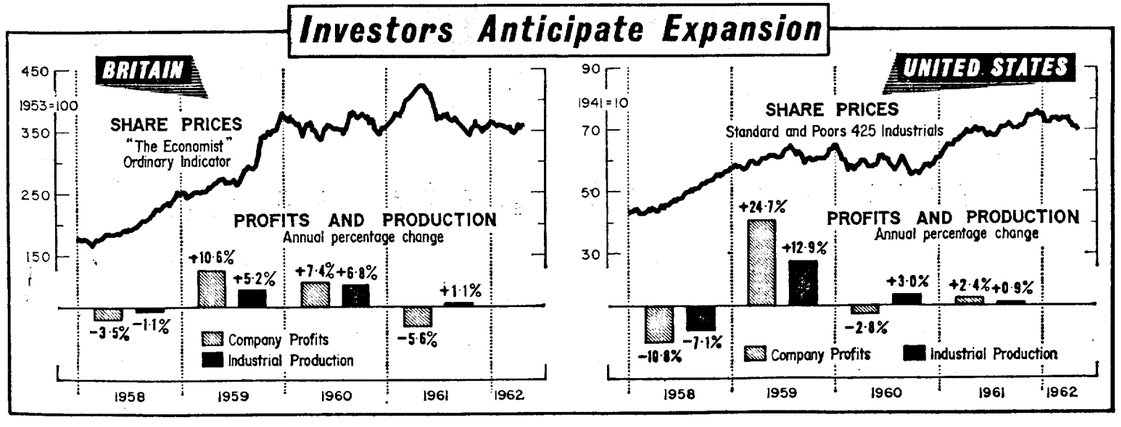
THE BUSINESS WORLD



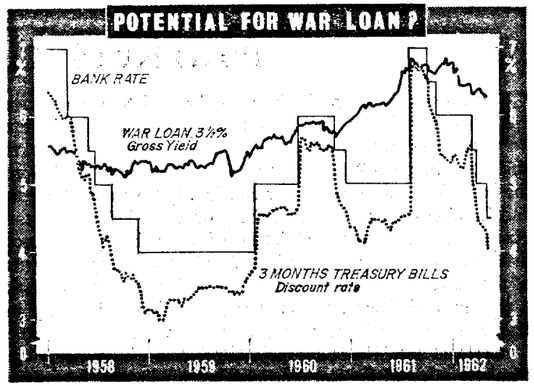
Markets Hand in Hand

THE stock exchanges both in London and New York have a pretty impressive record of sensing a turn in the business cycle well ahead of the economic or market analysts. In 1960 Wall Street was heralding recovery before the recession had properly started; in 1958 both Wall Street and London were far ahead of the production indices and the business commentators. Quickened interest in equity shares in London over the past fortnight, despite the disappointments of the budget and a sharp setback on Wall Street, could mark a well grounded anticipation that production and profits in Britain should again be rising later this year. By then the "occasional halt" in economic expansion to which the Prime Minister referred in New York last week will have lasted for the regulation three years, and 1963 might resemble 1959. The stock markets will undoubtedly recall the excesses of that exuberant year, and investors will no doubt avoid the discredited gimmick of "buying the index" indiscriminately. The market is taking a cyclical view—the pause in both the economy and in share prices has been long enough; but it is not crediting all companies with the same recovery possibilities.

Tighter profit margins have been an important influence in the markets in the past two years; but these have not been associated entirely with the recent business standstill. Profit margins must increase as output turns upward, and total profits will increase by still more: but by how much? The recent depressed behaviour of Wall Street, particularly in this past week, is of direct relevance here, for it is based not so much on fears of an early deterioration of business activity as on the market's spelling out of a new fear of profitless prosperity. Corporate profits in the United States are considerably higher than in the weak first quarter of 1961—leading companies report increases that average about one-third—but the rise in profits appears to have been checked in this first quarter. President Kennedy's success in holding down the price of steel is seen to have wide ranging implications, not limited to business in the United States. Prices both in Britain and in Continental countries themselves are coming under growing constraint from increased competition, domestic and international; prices in export markets are lower, and often immediately unprofitable, while margins at home are threatened by lower tariffs and competitive imports.

INVESTORS now accept this new investment climate, so different from what was predicted for the golden sixties. A defensive note has modified growth appeal; the popular favourites, some at fancy prices, have been banks and insurance companies—they have been bought for growth, but also with an eye on the cushion that great reserves afford against dividend cuts. To the extent that investors are keen to secure at least their present yield, the equity market is bound to be more than usually sensitive to movements in the gilt-edged market. And one most important element in the London market scene is that the prospect for gilt-edged looks decidedly good.

This contention calls for proper humility from those who have called the gilt-edged turn too early in the past. Even after the useful rise in gilt-edged prices since the all time lows of last August, the market is still a little lower than it



was a year ago—when prospects were also brightened by a tough budget from Mr Lloyd, and then blotted out by the summer exchange crisis. Today, sterling is unquestionably in better stead. The Chancellor this week displayed a buoyant mood at a Cutlers' Feast in Sheffield: he suggested, indeed, that the current account will improve as much this year as last, yielding a surplus of £150 million, and a slight surplus in the current and long-term capital account combined—all this apparently without counting anything for unrecorded receipts. For a year in which stockbuilding is assumed to remain unusually light, this performance still represents less than lasting balance and one cannot dismiss sterling's troubles as over. But external influences on gilt-edged are more favourable ; and if serious trouble for sterling were to recur—say around the time of Britain's entry into the common market—the authorities might feel obliged to take new and more direct remedial measures, which, if successful, might have only a transient influence on gilt-edged. Meanwhile, overseas purchases to take advantage of the relatively high yields remain an important bull point for gilt-edged.

IT is becoming clear, indeed, that the authorities at both ends of the town are now contemplating a relaxation of monetary restraints. Lord Cromer shares entirely his predecessor's view that excessive burdens have been placed on monetary policy. And Mr Selwyn Lloyd at Sheffield might have been speaking for them both: ". . . a strong budgetary policy is an essential basis for an easing up on the monetary side." The Chancellor went so far as to refer specifically to "special deposits and the other credit restrictions," with his tax regulator among the means of stimulating home demand.*

One must still remain guarded about the gilt-edged prospect, in view of the external uncertainties and the lack of rationale in official policy. But as things stand, there should be scope for some further reduction in yields. At 6¼ per cent the yield on War Loan is already over ½ per cent lower than last August. But it is nearly a full 1 per cent more than it was in January, 1960, when Bank rate was last below 5 per cent, and it is 1½ per cent higher than in early 1956, when Bank rate last stood at 4½ per cent.

A fall in the yield on fixed interest securities could have a direct impact on equity prices. If the yield on old Consols were 5½ per cent, and if investors were still prepared to accept an average yield on leading equities of 1 per cent less, then, if dividends were unchanged, *The Economist* indicator could rise from its present level of 362 to around 400 and the *Financial Times* ordinary index from 306 to around 350, without significantly altering the relation between gilt-edged and equity yields. With equities possibly poised on a threshold of a further selective advance, it is useful for investors to have some such horizon in mind. This makes no allowance for any rise in equity dividends ; not much rise is likely this summer, for the company results which will then be published will refer largely to a year ending on March 31st and may not make exciting reading, even if the danger of big reductions in dividends is passing. But investors will be looking, not to these figures, but to the recovery in production and the likely effect on profits and dividends in a year's time.

Expanding production would probably not begin to push

company profits up until late in the year. But once established, a rise in production could have a sharp effect on margins and profits, since the economy could expand a fair way before the pressure on costs from the prices of raw materials and intermediate goods and from wage claims began seriously to build up again. Capital investment over the last two years has left many industries with surplus capacity on their hands and once this capacity is brought into production, reductions in costs per unit of sales ought to be significant. The existence of this capacity makes it unlikely that industry will press forward with a fresh bout of capital investment and any future increase in its working capital commitments should be accommodated by some increase in bank credit, financed conceivably from released special deposits. Thus, as the Bank of England has suggested, the weight of new issues on the market is likely to be reduced.

The prospect for economic expansion establishes a base for some rise in equity prices, but not a runaway boom. If the speculative gains tax prompts investors to cast their thinking six months or more ahead, this could be the moment for action. The rise may gather momentum slowly, but it would be helped if the life offices were to revise their cautious attitude towards equity investment and add their buying power to that

* Mr Henry Brooke, speaking on the same evening in nearby Nottingham, cited three reductions in Bank rate within seven weeks as evidence of the Chancellor's readiness to help exporters. Yet under the new fixed rate facilities for medium-term credits exporters are the one category of borrowers who have not enjoyed a reduction in their borrowing rates. A false argument is going about on Europe ; the fact is that closer ties will make it the more necessary for London interest rates to be relatively high rather than low, for what miracle can produce the additional payments surplus necessary to finance the extra lending that the City is only too anxious to do?

Nor, *pace* the Radcliffe report, is there any indication of a more purposive use of interest rates domestically, through more active debt management. The authorities maintain their long run aim of lengthening the debt, so that the process of funding goes on even when, as this year, no new borrowing is needed. But it remains an essentially negative process ; sales are not pressed on the market ; and they tend therefore to be highest when, for the purposes of monetary control, they are least needed. Thus interest rates, and therefore monetary policy as a whole, are playing a subordinate, and not as the authorities maintain a predominant, part in economic control. True, the market is held back to some extent by the government broker. Thus the stock that he is at present selling "through the tap," Funding 5½ per cent, 1982-84, has been allowed to rise by only half a point since the beginning of January—whereas Treasury 5½ per cent, 2008-12, has risen by almost six points. But taps do not last for ever, and the tactic of holding the price down is deliberately designed to make the stock relatively attractive. The 2008-12 stock, which has enjoyed the best rise of the market this year, was the previous tap stock.

of the pension funds and trustees. It will certainly be uneven, and investors are likely to remain highly selective. Some will feel, for example, that the prices of bank and insurance shares already discount a lot of growth and now represent a costly means of defence. Searching for more speculative excitements, buyers have turned with fervour after the budget to property shares. Here developments in hand often suggest a quicker and more certain rise in income, and hence in capital values, than many industrial equities ; but it is easy to confuse the physical fact of buildings actually rising from the ground with the economic fact of the rents they may command. Has enough discrimination been shown in buying property shares ? If not, a shadow will be cast over their performance in coming months. Property values coupled with the possibility of further take-over bids have also attracted investors to brewing shares. These have made the biggest rises of all equities in the last six months. The "take-over" possibles now command prices that would make any bidder hesitate while the share prices of the established national and regional brewers more than discount any immediate rise in consumption and any of the immediate economies emerging from rationalisation. The industry has shaken up its ideas and many of the big groups are conspicuously well managed ; but the facts remain that Scottish and Newcastle yields 2.2 per cent and Bass, Mitchell and Butlers yields 3.2 per cent.

A renewed rise in production could be expected to switch attention from such sectors of the market towards those industries and companies whose fortunes follow a more cyclical pattern. But there is an important reservation—there is no evidence of any fresh resurgence in private investment. This qualifies the attractions of heavy engineering companies and the capital goods sector of the iron and steel industry (over which, in any case, the political shadow falls more darkly as time passes). This leaves a choice between companies whose profits are likely to respond quite sharply to a recovery in industrial production and to an expansion in bank and hire purchase credit—the motor industry, the durable consumer industries and the engineering concerns that supply them. The shares of the hire purchase finance companies themselves might also offer a speculative opportunity if only investors could be certain of the wisdom of managements in learning obvious lessons from past excesses. Elsewhere, the advance that has already taken place in textile shares appears to discount the expected rise in personal consumption ; on the other hand, the reaction that has taken place in ICI and other chemical shares could prove to have been overdone.

Any buying of equities in anticipation of a recovery in production and profits ought to be cautious and the investor would be wise to watch for any danger signs—such as a more pronounced fall in equity yields than in gilt-edged yields. If that occurred it would be a signal that equity investors were taking a more optimistic view about the economy at home than investors in the gilt-edged market were taking about sterling and the balance of payments. These international factors establish limits within which the Government can frame policies designed to stimulate the economy ; but so long as the outlook for gilt-edged remains fair, buying of equities, within moderation, must be justified.

The French Government and Steel Prices

FROM AN INDUSTRIAL CORRESPONDENT IN PARIS

MR KENNEDY'S excursion into informal control of steel prices last month came at a time when the British government was considering the obligation to abandon formal price control for steel that is supposed to go with membership of the European Coal and Steel Community. Across the Channel, however, it was being demonstrated that this obligation itself was also something of a formality. M. Giscard d'Estaing, France's minister of finance, was reacting just as sharply as Mr Kennedy to rises in steel prices decided on by the French industry. His response to an increase of 2.8 per cent in prices of certain steel products was to threaten first to ban companies that put up their prices from access to the French capital market, and secondly to announce the intention of revising the balance of such companies' investments under the national plan. The minister and the companies are about to discuss the whole issue. Once again, it has been made obvious that the French government, ECSC or no ECSC, has not abandoned its effective right to set French steel prices.

Theoretically, it has no such right at all. Article 60 of the ECSC agreement lays it down that steel firms are free to fix their own ex-works prices, and alter them as they wish ; all they have to do is to publish their maximum prices, and communicate the range of price to Luxemburg before it becomes effective. Steelmakers can, in addition, sell below their published schedules, where this becomes necessary to meet the delivered prices (ex-works prices plus transport charges) quoted by other manufacturers into their own market areas. These are the ECSC's prized elements of "price transparency" and flexibility in "price alignment."

In practice, no European government has been able to remain indifferent to its country's ruling level of steel prices ; and in France, in particular, the government has kept them under strict surveillance. Prices rose, in accordance with rising costs, between 1954 and 1958 ; but the government dictated the amounts by which they should rise and the times when they were allowed to rise. In autumn, 1956, indeed, relations between the French government and industry were regularised under an agreement between M. Jacques Ferry, of the French Siderurgie, and M Paul Ramadier, then minister of finance and economics, which governed their joint responsibilities in carrying through the national investment plan. Steel prices, it was agreed, should include a certain special margin over costs for the self-financing of this re-equipment and expansion, in order to guarantee achievement of the plan and to keep loans to the industry within specific limits. The arrangement did not formally cut across the ECSC rules ; but it re-emphasised the powers of the

French government, at a time when Luxemburg was failing to make its own power felt in European steel.

Devaluation in the winter of 1958 kept French steel prices stable in terms of the franc, but cut them by 17 per cent in the rest of the common market. And slight signs of slackening in home demand caused some French steelmakers to turn the whole of their export effort on to south Germany, which tended to throw the German steel market into confusion. During 1959, with the steel market throughout Europe in temporary decline, and again last year, French steel prices have been the leaders of the Continental market. The practice of "alignment downward," intended in the spirit of the ECSC agreement to be exceptional, has in fact become the rule over the last year or so. Germany has lost heavily to France in terms of comparative output, and France to Belgium. But this price-cutting under ECSC rules has meant a loss of income of perhaps 9-12 per cent for steelmakers. The steelmakers of the Ruhr probably dislike any other country becoming the price leader in Western European steel; what they dislike even more is that the leading prices should be so low.

Nor do the French makers enjoy it. "Cheap Lorraine ore, properly concentrated," some of them will say, "plus our technical efforts and investment over the last decade, ought certainly to have made us competitive. But these factors alone are not enough to make a difference of 15 per cent between France and the Ruhr. Our prices are too low because our government is not allowing enough self-financing from them to finance the capacity of 25 million ingot tons that the private sector of French steel is supposed to achieve under the fourth Plan." (The present capacity is 19 million metric tons.)

The Germans have a different explanation why French prices are lower. Their explanation for official consumption is that the French turnover tax, based on value added, gives French steel-makers an "outrageous advantage" over the Germans. Remission of this turnover tax on steel exported, the German argue, means a reduction of 20 per cent in the export price of French steel. This remission is three times as large, in their view, as the turnover tax which affects transactions after French steel arrives in the German market. This seems a fairly weak argument. The same taxes, on each side of the border, affect other manufactured goods. But the price disparity has only appeared in steel.

The High Authority in Luxemburg seems merely a spectator of this argument between the steel industries, formally under its supra-national supervision, and their national governments. The Germans have asked Dr Erhard to increase import duties on French steel; the French makers are asking M. d'Estaing to be allowed to increase their prices (at home as well as abroad). It is being argued that he should relax his anti-inflationary restraint on prices not merely to enable the companies to do more self-financing, but also in view of the confusion in the rest of the European communities' steel market that low French prices are causing.

In order not to appear to disregard the need for countering inflation, the steel-makers have been adopting more flexible pricing policies, putting some prices down as well as others up. Tinplate prices have gone down; prices of structural steel and reinforcing rods up. Special structural sections had a larger increase; the extras charged on other types were altered, and finally a small increase was introduced for bars. This last one was the price increase that aroused opposition from the finance minister.

Inside the French economy, the pricing of steel has reached an impasse. Nor does it seem too likely that German arguments for an increase in import duties, and the reactions this might cause in France, need necessarily persuade the French government to alter its opposition to an increase. Is Dr Erhard, fresh from threatening steel-using industries such as motors with cuts in duties to increase competition from imports, likely to go into reverse for the benefit of German steel?

THERE is only one consideration that might to some degree revise French government thinking on this issue. It has been part of the de Gaulle's government's policy to speed up economic integration of one economic sector where the British position is strong, coal and steel, and to confront Britain with a firm, unalterable set of arrangements. This was one reason why in Rome, last month, the Six achieved some decisive progress towards preparing a common energy policy. Would confusion in the European steel market, in the eyes of France's negotiators, represent a weakness in ECSC that might favour the presumed demands of British steel?

This question has two aspects. France is aware that by 1965, under current steel planning, Britain may have a capacity of 32-34 million metric tons of crude steel, substantially greater than that planned for France. But one factor delaying French expansion now, quite apart from any accelerated expansion the government might like, is the current state of French steel prices, which cuts the industry's internal cash flow. M. d'Estaing, when met with this argument from the steelmasters, answers, "If you are short of funds, borrow from outside." But this solution could mean a further year's delay in carrying out the fourth Plan. And people who have to follow the ECSC negotiations reckon that conditions of financing steel investment are already more favourable in Britain than in Europe, and wonder whether Britain's competitive strength will permit the French industry such a delay.

The second aspect of this French steel problem arises from the fundamental difference between the steel pricing systems of Britain and the Coal and Steel Community. How are the obligations arising from Article 60 of the ECSC treaty—basing-point price schedules, alignment, and publication of transport rates—to be imposed upon these British industries at a time when the Europeans themselves are not applying this article according to the letter or the spirit of the treaty? It would be annoying for the Germans to give a precedent for increasing import duties to the British (who have no turnover tax). It would be still more annoying to prolong a system where the published price schedules have become a formality and all the actual deals are taking place as "aligned prices"—i.e. prices cut to meet competition from imports. In discussing this, the French are thinking more of the potential competition of power station smalls from the British coal industry than of cold-rolled sheets. But in Europe the markets for coal and steel are hardly separable.

Has M. d'Estaing any measure to suggest to these political counsellors, who are preoccupied with the application of Britain to join ECSC, and who want to reinforce the European Six before they become seven? Today, nobody knows. But this is the only chance of any solution to the problem of French steel prices other than continued anti-inflationary rigour.

A Pause for Europe?

FROM A CONTINENTAL CORRESPONDENT

Western Europe's rate of economic growth is still slowing down—almost to the pace of a British boom.

ECONOMIC expansion in the common market still shows signs of slowing down. It is also becoming markedly less evenly spread in the different countries and different industries; and it is becoming more dependent on domestic demand, which is far from ebullient. But the countries which show the most dynamic progress are those which at the same time are boosting their exports; and recent trends in the foreign exchanges reveal significant changes in international competitiveness in favour of Britain, Italy and Belgium and to the disadvantage of France, Germany and Holland.

The common market commission foresees a 4½-5 per cent expansion in gross national output for 1962 for the Six as a whole. For Western Europe as a whole a 4 per cent rate of expansion for 1962 is forecast by the Economic Commission for Europe in Geneva. These forecasts are based in particular on two uncertain assumptions: that agricultural production for the year fulfils expectations—agriculture constitutes a much more important part of national income for Continental countries than for Britain—and that some sort of stimulus will be felt from the American economy.

American expansion remains limited for the present and its effect on the Continental economies is not very pronounced. At the same time, the export drives mounted by both the United States and Britain are threatening to have a restrictive effect on European sales in third markets, where prospects are in any case scarcely improving. It is therefore primarily within its own market that Europe must look for new forces of expansion.

Yet the main economic indices give little indication of a speeding up of the various elements of home demand. *Household consumption*, the dominant element, is expected to rise by 5 per cent for the Six, and this increase continues to rest mainly on the rise in wage incomes. But this in turn cannot be expected to maintain the rapid rate of increase shown in 1961. It is to be expected, as a result, that personal expenditure in the private sector will gradually slow down.

Investment is expanding less slowly than last year—and at markedly different rates in different countries. In Italy the expected rate of expansion is 11 per cent. In France it is 8 per cent, which indicates a slight falling off, as does the 6 per cent expected in the Benelux countries. In Germany it is expected that the rate may be about halved, to around 4 per cent. The slackening of foreign demand has induced a feeling of prudence among many enterprises and accentuates the tendency for consolidation following the investment boom of 1959-61.

The *building* industry remains buoyant. But activity in 1962 may not exceed to any great extent that of 1961, which was an excellent year. Industrial and commercial building continues to thrive, but new orders are tending to fall off for private dwellings. In the second six months of 1961 building licences for private dwellings recovered, but they remained below the 1960 maximum levels.

Budgetary estimates suggest a more significant increase in current spending by public authorities. Generally, deficits are getting larger, mainly because of higher spending on defence, education and administration. But investment spending by public authorities is not increasing significantly, and will not compensate the slowing down in private investment. In total, the governmental impact on the European economy will remain broadly neutral.

EXPANSION of industrial *output* has lagged behind that of total demand. For the common market as a whole, the general index of production has shown an improvement since October, 1961, which compares favourably with American industrial expansion and with the standstill in output in Britain.

Expansion has been most rapid in Italy. In France the rate is about 7 per cent. Belgian industrial production is increasing at the regular rate of about 4 per cent. A slight improvement is visible in Germany, after a year of standstill. In the Netherlands, industrial output has exceeded the low point reached in mid-1961, but the index figures have not yet attained the previous peak of March, 1961—when the guilder was revalued.

By industry, the most rapid rate of expansion is shown by chemicals. In the engineering industries, expansion is less even. While the motor industry has regained new stamina, activity in electrical construction is slowing down. Iron and steel output remains rather rusty, at a slightly lower level than that reached in 1961. The same is true of the textile industry as a whole. Foodstuffs are more active. In the extractive industries the decline in output is broadly at an end, but a further fall in coal output is expected to result from rationalisation programmes.

For *order-books*, both available statistics and answers to enquiries from the heads of business firms indicate a falling off in orders in the capital goods industries. In Germany orders from abroad in February were 8 per cent lower than a year before. Meanwhile a halt in the growth of domestic orders has been noted.

This gap between the expansion in the rate of demand and in industrial output in Europe indicates a reduction in *stock-building*, both at the production and selling stages. It also reflects a shift in demand towards *services*.

The low rate of expansion in industrial output in Europe clearly does not favour an increase in *imports* of raw materials. A rise does seem possible for agricultural products, but the progressive slowing down of home demand is likely to bring with it a reduction in the rate of growth of imports of manufactured goods.

The brake on output is largely on the side of supply. *Unemployment* and unfilled vacancies indicate that there is still persistent pressure in the labour markets. There seems to be no possibility of any easing here during the year. Social claims continue to exert an influence on both wage increases and the reduction of the official working week.

Pressure towards higher *wages* continues. Between the last quarter of 1960 and 1961 wages in Germany rose by 8.6 per cent and in France by 7.6 per cent. The Netherlands—a stronghold of incomes policy—recorded a rise of 5.6 per cent, Italy 5.2 per cent, but Belgium only 3 per cent. In Britain wages rose by 4.2 per cent. Comparison of total wage costs (hourly increase plus employers' expenses) shows that between the middle of 1959 and the end of 1961 the greatest rise was registered in Germany and in the Netherlands. France occupies a middle position, whereas the increase was smallest in Belgium, Italy and in Britain. These countries have evidently improved their competitive position—as the expansion in exports by Italy and Belgium seems to confirm.

COMPARISON OF HOURLY WAGE COSTS IN MANUFACTURING INDUSTRY

Based on the calculations of the French National Institute of Statistics, March, 1960, and on the investigations of the EEC 1959.

	WAGE COSTS			
	Average, 1959		Fourth quarter 1961	
	New francs	Britain = 100	New francs	Britain = 100
Britain	4·25	100	4·75	100
Germany	4·00	94	5·03	106
France	3·95	93	4·65	98
Belgium	3·93	93	4·30	91
Italy	3·42	81	3·82	80
Netherlands	3·21	76	3·94	83

European *wage* pressures are having marked effects on prices. Between March, 1961, and March, 1962, retail prices rose by 5 per cent in France; by 4.6 per cent in Britain; 3.8 per cent in Germany, and 3.3 per cent in both Italy and Holland. In Belgium alone retail prices remained relatively stable, with a rise of 1 per cent.

The *money markets* of common market countries possess sufficient, if not excessive, liquidity. The capital markets remain depressed. At the end of April Paris alone among the common market bourses remained buoyant. The Brussels bourse showed a slight improvement. The Italian and Dutch stock exchanges are marking time. In Germany shares continue to weaken. The cessation of foreign purchases has left a painful gap and has exposed the earlier speculative position. This setback has worked in favour of fixed interest securities.

BUSINESS NOTES

CANADIAN DOLLAR

End of an Experiment

As Europe's markets opened on Thursday morning it became known that the Canadian authorities had established a fixed parity for their currency at 92½ US cents and notified it to the International Monetary Fund. There will be a spread of 1 per cent either side—the maximum under IMF rules, but no more than the maximum. In first dealings on Thursday the Canadian dollar was quoted at 93-93.20 against the US dollar, that is close to its upper limit and about two cents below its recent quotation under the regime of floating rates. Later on Thursday the rate moved to 92.85-95, and against sterling to 3.02½-3.03¼.

While the depreciation involved in this latest move is therefore small, it follows a much larger decline over the past two years; in April 1960 the Canadian dollar was at a premium of five cents. The fall below parity came as a result of deliberate official policy, proclaimed by Mr Fleming, the Finance Minister, in his budget of last June. The Canadian authorities subsequently bought US dollars to keep the value of the Canadian dollar down; but soon they were deeming it necessary to operate in reverse, and they pumped large quantities of US dollars back into the market to stop the rate falling below 95 cents. By the end of April Canada's official reserves were down to $1,595 million, $469 million below their level at end-1961.

Plainly the hybrid system of a floating rate influenced now in one direction and now in the other by the official control made little sense; and now the Canadian authorities have proved responsive to the pressure of the International Monetary Fund for a return to a fixed parity—after some eleven and a half years without one. The move was widely expected in the market, and Europeans have been withdrawing a good deal of money from Canada (the British authorities themselves repaid $20 million in Canadian dollars to IMF on Monday). But the change was widely expected after the election rather than before. The depreciation has caused no wider upset in the markets, as did Mr Fleming's move last June. The exchanges generally are calmer now, and this is after all a move to a fixed base, rather than into the unknown. Meanwhile the Canadian authorities have, fumblingly, achieved something like the 10 per cent depreciation that some European observers guessed they were after.

THE EXCHANGES

Revolving Fund

The unusual ebullience displayed by the Chancellor this week in his references to sterling and the balance of payments was mirrored in the exchange market, where sterling threw off the temporary setback caused by the Bank rate reduction the previous week—and appeared untroubled by the dock strike threat. The spot rate rebounded to $2.8130, and there was a still sharper recovery in the forward rate, so that the discount shrank to the annual equivalent of 1¼ per cent, compared with 1⅞ per cent at the beginnng of last week, an adjustment of more than the ½ per cent cut in Bank rate. Paradoxically, therefore, the margin on covered arbitrage has actually moved in London's favour. On the Treasury bill comparison with New York the forward margin is just about at parity, but some transfers of funds from the Continent are now worth while on a covered basis. This week's demand for sterling is attributed mainly to commercial buying, including commercial buying of forward sterling, and to purchases of stock exchange securities—the London market in recent weeks has been noticeably brighter than both Wall Street and the Continental bourses. And the resultant cheapening of the forward swap has in turn attracted more short-term investment. Once again, it seems, a reduction in Bank rate has failed in its primary purpose of checking an inflow of funds.

The inflow has certainly been slowing down in recent weeks, but that is to be expected from the time of year. In April the accrual of funds was £32 million, of which £25 million was used for a further repayment to the International Monetary Fund—in marks, Canadian dollars and Belgian francs. This denotes an inflow of perhaps half that of March, when the reserves rose by £10 million after financing the great bulk of Australia's repayment to IMF of £62 million.

Wisely, Britain has used the funds that have returned since July to repay its short term debts and reconstitute its international credit facilities rather than add to the central reserves. At £1,240 million the reserves are indeed £172 million lower than immediately after the August drawing of £536 million from the Fund. Meanwhile £300 million has been repaid to European central banks and £250 million has been repaid to IMF. Allowing for drawings of £30 million of sterling by other countries from IMF, the amount that Britain must still repurchase to restore its IMF position to neutral is £256 million.

Britain's repurchases have made a notable contribution to transforming IMF into a revolving Fund; some of the most significant adjustments in international payments in 1961-62 have been settled not through gold or currency transfers but by international credit. In the IMF's year to April 30th total drawings were easily a record, at $2.2 billion—they in fact were half as large as all drawings in the fourteen previous years of operation. But in 1961-62 repayments, too, were at a record level, of $1.2 billion. Britain's repurchases have put IMF back in funds—its holdings of marks, for example, are back to 29 per cent of the German quota, compared with 8 per cent at one time; and the repayments have also had a useful cushioning effect on Germany itself, reducing the outflow of its own reserves as a result of the turning of the exchange tide.

The Chancellor's Forecasts

The net improvement of £378 million in Britain's disclosed monetary position since the crisis—that is the repayment of debts less the net fall in reserves—does not, of course, reflect a corresponding improvement in its basic balance. There has certainly been a large increase in short-term sterling balances, as a result of both the inflow of foreign funds and the improved position of sterling area countries. But the Chancellor at Sheffield forecast a continued slight surplus in the basic (current plus long term capital) account, despite the loss of the special capital inflows of 1961. His tentative forecast for the current account alone, of an improvement "comparable with that of 1961," or £220 million, is really implicit in the government's confident hopes for exports. A steady rise in exports by 10 per cent from the end of 1961 and 1962 would involve an average increase for the year as a whole of around 5 per cent, as exports through 1961 were broadly stable; and this alone would yield £180 million.

Imports, which in the first quarter were almost exactly the same as their average for 1961, are presumably expected to remain stable, for the Chancellor specifically hedged his forecast against "an unexpected build-up of stocks, leading to increased imports." And the invisible account should benefit

from the German contribution to the costs of the Rhine Army, as well as from lower interest rates on sterling balances. But the most important factor in determining how close the Chancellor's estimate comes to the final result is likely to be none of these real influences on money flows but the success that Treasury statisticians happen to have in tracing any more of the flows that have been coming into Britain unidentified.

ENERGY POLICY

Coal, Steel and Oil

Unlike the Ministry of Power, the British steel industry is in no doubt that so far as fuel is concerned it is a consumer. Over the last eighteen months, it has been criticising the prices that the National Coal Board has charged it for coal, on the reasonable grounds that this could be imported much more cheaply—particularly coking coal from America. The Ministry has returned soft answers to these criticisms, but has quietly refused to grant licences for consumers such as coastal steelworks to bring any coal in. Perhaps because it does not want to appear to be fastening upon the coal industry alone—with which its relations are intimate, prickly, but not entirely bitter—the steel industry is now arguing also that fuel oil is pretty expensive in Britain, too.

The British Iron and Steel Federation, last week, even dared suggest that fuel oil is cheaper in markets that are prepared to buy from what it delicately called "non-traditional sources"—which Sir Julian Pode might not be afraid to translate as Russia. This will be considered distinctly bad form in the Ministry, which works broadly on the principle that to offer oil cheaper than the major companies do is subversive, and to try to get it cheaper un-British. The ministry is having some trying months manœuvring the two most awkward industries for which it is responsible into Europe (past Dr Beeching's and Mr Marples's uncomfortably live bodies). Further acrimonious argument about an energy policy for Britain, when even Europe has not yet produced one for Britain to argue about, will irritate it no end.

The federation, in its current *Steel Review*, says that in a calculation last year it took the landed costs of American coking coals, and loaded these with up to 10s. a ton for extra handling charges. From a sample of fuel costs at coastal works, the federation then excluded all where a switch to imports appeared to offer less than 15s. a ton advantage. Ten companies might still have been reckoned to import some of their coal: the calculation suggested that about 2¼ million tons of British coal might have been replaced by imports, at a total saving of £3,125,000—an average of 27s. a ton, or 8s. a ton on the crude steel produced by these works.

The National Coal Board has argued that the low landed prices of American coal arise simply from exceptionally low levels of Atlantic freights which simply must be exceptional. The present slump in freights will no doubt indeed pass eventually; but coal is today transported almost entirely in what by modern standards are very small ships. One might not need to build a very sizeable collier—or do more than convert some of the "handy-sized tankers" that are now in such extreme surplus—to get considerable and durable economies of scale in the ocean transport of coal. The federation relates our fuel oil prices, which it considers generally higher than in Europe, basically to this protection of coal: "British oil companies have done no more than take advantage of a flabby market discipline which stems directly from the broad shape of the Government's energy policy."

BANK CREDIT

Why Have Advances Stuck?

The clearing banks' April figures seem to confirm that the upturn in advances at the beginning of the year was attributable entirely to temporary needs to finance tax payments. In the four weeks to mid-April net advances actually declined, by £6½ million, against the seasonal trend. The decline was more than accounted for by reduced borrowing by nationalised industries, and movements were uneven among the individual banks. Also, the Scottish banks as a whole increased their advances by a further £7 million. But evidently there is no underlying increase in advances; and the bankers are beginning to wonder, a little uneasily, whether this reflects their own rationing—or customers' surfeit.

While the Bank of England was plainly not disturbed by the mild re-expansion of advances in the new year, and bank head offices have not been applying the axe quite so forcefully as they did last autumn, the banks have made no formal relaxation in their lending scrutiny. There has been no formal withdrawal of the official request for restraint—but then there rarely is. More important is the banks' own liquidity position. It is true that the very sharp reduction achieved in advances in the second half of last year has enabled the banks to get through the difficult tax quarter without strain, and even make small additions to their depleted gilt-edged portfolios (in the latest month the Westminster bought £15 million). But the two and a half points of liquidity that the banks have in hand is not considered sufficient to form the base for any sustained re-expansion of lending.

For the Chancellor's tough budgeting leaves little scope for any "natural" increase in bank liquidity or bank deposits; and bankers take the view that if the authorities desire a re-expansion of bank credit they must provide the banks with the resources to finance it—by releasing special deposits. The view is held in some quarters that bank advances will not rise in any case this year, given the reduction in stock-building and the turn in manufacturing investment. Against this, however, is the latent demand from personal borrowers, not to say property developers, which is still being held back by the banks' special restrictions. While bank credit remains, as it still does, so much cheaper than credit granted by most other institutions, potential demand is always likely to be under-estimated—as it was in 1958.

HIRE PURCHASE

Half Way Agreement

The recent peace manœuvres in hire purchase reached a successful conclusion on Thursday when a meeting of the Finance Houses Association reached agreement on both dealers' commissions and charges to customers. Commissions were set at a maximum of 15 per cent—midway between the old maximum of 10 per cent and the 20 per cent maximum that has been disruptively introduced by United Dominions Trust. Presumably UDT, as a member of the FHA, will now amend its scheme appropriately. At the same time, the finance houses are also reducing their maximum charges to the public by 1 per cent. Bank rate has helped them, but it is a relief that lower money costs are being passed on in this way rather than dissipated in dealers' commissions.

Sales of new cars on hire purchase rose more than 11 per cent between March and April; if cash sales rise in the same proportion, the total should be well over 80,000 for April. After a rush of buyers immediately after the budget, the market quietened down in the latter part of the month. Now the industry is anxiously waiting to see what happens in May. Second-hand car sales in April were five per cent below those in March—for which the weather gets the blame from the trade. This suggests that the second-hand market was hardly as healthy as that in new cars, and might therefore prove a brake on its expansion. But prices have fallen little since new cars

became cheaper, and if waiting lists for new cars become at all general they may even rise. So the trade can feel reasonably optimistic about its prospects for the summer.

The business that remains obstinately depressed is motor cycles: hire purchase sales of new machines in April were about 20 per cent lower than in March and half those of April last year. More than 50 per cent of new motor cycles are sold on hire purchase, so this is a better guide to total sales for them than it is for cars. Motor cycles seem to have become, perhaps all too literally, a dying industry.

GERMANY

Interest on Foreign Deposits

A Frankfurt correspondent writes:

FOREIGN residents can again earn interest on their short term holdings in Germany. The Bundesbank, not unexpectedly, has lifted its two-year ban, though interest allowances must still be approved by the regional central banking offices. This relaxation marks a further positive response by the Bundesbank to the recent adjustments in Germany's balance of payments; it follows the modest raising, early in April, of rates on money market paper. The commercial banks, which were previously being actively encouraged to place more money abroad, are now offered slightly more attractive conditions at home.

Neither of these measures has so far had any significant practical result. The German banks in the last few days report no spate of enquiries from abroad, nor is any marked inflow expected, for deposit rates in Germany are far from attractive to foreign operators. Thus three months' deposits yield 2¼ per cent to ordinary depositors and 3 per cent when placed by banks. Foreigners can indeed secure a rather higher total return by covering the forward swap back into, say, dollars, since the mark is still at a premium in the forward market here. But this premium would certainly disappear as soon as such swaps were undertaken on a considerable scale. In other words, there is no longer any real speculative ingredient in favour of the mark. The slightly higher rates on the Germany money market paper (2¼ per cent on three months' bills) are also far below the international level, and German banks have continued to place money abroad. Big transfers have been made to London, mainly in Euro-dollar deposits.

The Bundesbank's change of tack is predominantly to be explained by external considerations. The external reserves are clearly past their peak and in recent months the balance of trade itself has weakened considerably. The Bundesbank has decided that the era of large exchange surpluses is over and that the same steps need no longer be taken to offset such surpluses. Domestic considerations have played a subsidiary part in its action. It is indeed worried by the strong pressures on wages and prices, but the chosen weapon here is a kind of psychological war: and this is in the hands of Dr Erhard.

COAL

Home Truths for Scotland

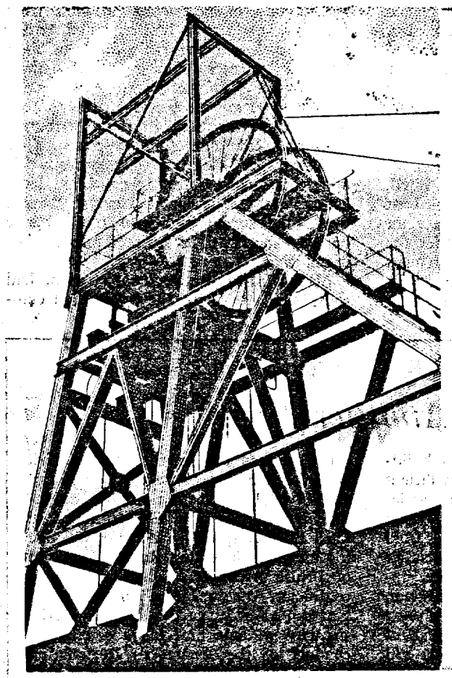
To say that Lord Robens is running one successful coalmining enterprise, two that are pretty weak, and a fourth that is nearly hopeless, slightly over-simplifies his task and the structure of the British coal industry, but not by very much. In 1961, he said in the course of telling Scotland a few home truths this week, the Midlands divisions of the National Coal Board made a surplus after paying interest of £26 million; Lancashire showed a deficit of £12 million and South Wales one of £7 million; and Scottish coal showed a deficit of £19 million. Even after the selective price increases decided on during the winter, it appears doubtful whether the Scottish division will be able to balance its books even before paying interest. Broadly, the Board's current commercial strategy seems to be to tilt prices to a level where the deficit divisions may possibly be able to wash their faces—and to pay the whole burden of interest on the industry out of the profits of the Midlands.

The further closures that the Board is therefore now considering have naturally raised a considerable outcry in Scotland, as did the selective price increases. The only thing that can objectively be criticised about these moves is that they were not decided upon years ago. It is possible, in the bookkeeping of this industry's nationalised history, to show that larger losses have been incurred over the years in Scotland than the industry's total accumulated deficit (to say nothing of the losses the Board incurred on importing expensive foreign coal to sell to domestic consumers at its own artificially low prices).

It is certainly fair for Scottish spokesmen to ask how this new realism upon the part of the coal industry and the railways can be tied in with the government's policies towards regarding the location of industry. A partial answer at least is that subsidy of unemployment places is a matter for the government, and nothing to do with the directors of nationalised industries. If the government wants an uneconomic amount of coal mining in Scotland, or railways, these boards indeed could claim that it should pay them too specific subsidies for the purpose. The government, which a few years ago had a burst of enthusiasm for locating industry in the wrong parts in these islands, seems now lack-lustre towards its own policies. Certainly it has not achieved any consistency in them. But it is also fair to say that few people in Scotland until coal and transport began to be charged for properly, have quite appreciated how far its basic industrial costs are out of line.

VOLKSWAGEN'S PRICES

Exhortation is not Enough



FOR so articulate an advocate of the market economy, Dr Erhard's efforts to make the government the arbiter of the price at which Volkswagen can sell its cars must occasion some embarrassment. His failure to make the company bow to his will looks like causing him even more: and points the moral that governments have a better chance of influencing price policies where they can put direct financial pressure on a firm—as President Kennedy did on the steel companies with defence contracts—than where they appeal to public opinion. If a company considers that it is necessary to raise its prices, accepting the competitive disadvantage that this implies, in order to maintain its profits, it will normally require something that changes its financial situation to make it alter its mind. Certainly Volkswagen, conscious though it is of its public image, seems to consider that the government's efforts can harm its profits less than reverting to its old prices would.

The price leadership that Volkswagen proved to possess when all the other big German car makers—except Opel—followed it in raising prices, plus its still partially public ownership, made it the obvious target for government action; but the company must wonder why its rivals are not receiving similar attention. Now the government has to decide whether it is worth asking the Bundestag to reduce the import duty on cars from other common market countries—already only 10 per cent—in the hope that this will put some genuine financial pressure on German manufacturers. Laudable though such a measure is as a matter of general policy, it may not have enough effect to secure Dr Erhard's objectives. Rising costs are the bane of car manufacturers everywhere in Europe, so the German makers may prove only to have maintained the status quo. Dr Erhard will have to attempt to control the economy by fiscal and monetary policy: exhortation is not enough. Mr Lloyd to note.

ATOMIC ENERGY

Inherited Headaches

PARLIAMENTARY criticism can penetrate the thickest hides; after sharp words from the Public Accounts Committee, the Atomic Energy Authority's current balance

PLANNING BUSINESS DOWN UNDER?

The Bank of New South Wales
will put you in the picture

The Bank of New South Wales can't exactly draw everything out of the hat for you, but if you're planning business Down Under you couldn't gain a clearer picture of current Australian and New Zealand situations than from us.
We've been in Australasia since 1817. We were the first bank there; we still are. Today we have over 1,150 offices throughout Australia, New Zealand, Fiji, Papua and New Guinea all providing key services, many of which are special to the Bank of New South Wales.
We find customers take their hats off to our initiative and sense of judgment. We doff ours to them too, of course. There's mutual interest and respect between the Wales' and our customers.

MAIN LONDON OFFICES: 29 THREADNEEDLE STREET, E.C.2

ALL OVER AUSTRALIA & NEW ZEALAND

sheet for March 31st is marginally more informative than it used to be. It shows some but by no means all of the loss that the AEA is taking on its fuel business. The first fuel charges for the Bradwell and Berkeley power stations and the graphite for the reactor, about 900 tons of fuel and 3,000 tons of graphite, were delivered last year and cost the AEA nearly £5 million. A further £5 million has been provided for future losses of this kind. This reflects merely the difference to the Authority between cost of obtaining fuel and graphite and the price wrung from a reluctant Central Electricity Generating Board. The Authority told the comptroller and Auditor-General, Sir Edmund Compton, that it had abandoned at least for the time being any idea of trying to recoup research and development costs on nuclear fuels.

This is a headache that the Authority has inherited from the expansion and then contraction imposed a few years ago on the British nuclear power programme. The Authority bought uranium and graphite to back up the enlarged programme at high prices, because this was the only way it could obtain them. If it insists on passing on these charges plus interest to customers, the nuclear power programme might cease altogether. Wherever the AEA turns, it must face losses running to many millions on what was intended to be a commercial trading activity. What can be salvaged? At present the AEA has concentrated on minimising losses, extracting as high a price as it can from reluctant customers at home and abroad. It might be better advised to cut its losses now, and start quoting prices for fuel that reflect the true market price of uranium, which is somewhere between $3 and $5 per pound against the $11 to $12 that the AEA paid for its stocks. This could have the dual effect of discouraging countries abroad from starting up their own fuel manufacturing businesses, which they certainly will do if the AEA drives them too hard, and giving adequate work to the Authority's huge and at present underemployed fuel manufacturing plant. It might also be more sensible to adopt permanently the policy of selling fuel more cheaply without offering any "buy-back" price for spent fuel and its residual plutonium as the AEA has done at Latina in Italy.

OIL

The Shortest Way In

COMPULSORY acquisition of 107 petrol stations in Ceylon is not quite the first implementation of the controversial new petroleum law passed there last year; nor will it be the last. But it is the main move by which the Ceylon government is furnishing its new state petroleum marketing corporation with a ready-made network of outlets developed by other people—indeed, by the very oil companies with which the state corporation is now about to compete. There are 680-700 service stations in Ceylon, so in numbers the state corporation has picked itself only 15 per cent of the outlets. But these stations, all within 60 miles of Colombo, are among the high-volume ones: they handle probably 30 per cent of the total retail sales of gasoline. And under the law, the new corporation may take over 175; so the companies are likely to lose nearly 70 more.

Three international companies, Shell, Caltex and Stanvac, operate in Ceylon. Last year the state corporation acquired certain tankage from Shell and Caltex, under the same process of compulsory purchase, which provides for compensation, but with valuation by a local tribunal, against whose decisions there will be no appeal. It did not get imports of petroleum products from Russia as early as it had expected, so for a time it leased the tanks back to their "former" owners; now it has taken them over again. The acquisition of service stations does not seem so far to have been matched farther back in the distribution network; only one depot appears to be included, and the state company is apparently using road tankers hired from contractors. Whether it has yet "taken over" the supply rights to 100 kerosine outlets—another of its declared intentions—is not clear.

Mr Silva, of the new corporation, had some kind words for the established com-

BUILDING

Yet Another View

WHETHER the organisation of the building industry is efficient or inefficient seems a question for an unending series of official studies. The latest study, made for the Minister of Works by Sir Harold Emmerson, recommends that yet another government committee should be appointed, with an independent chairman, "to make a thorough study of the placing and management of contracts in the light of modern conditions." But he does add that it should be smaller than the Simon committee of 1944, which had 41 members, though it should cover the same ground in studying "the whole procedure of building operations, including the method of financing."

Sir Harold considers that the traditional means of placing contracts leave much scope for improvement. Firm-price tendering is not being generally practised, though it has been successful as used for government work—the failure of private building owners to follow this lead suggests that they have oddly little concern for their own advantage. But Sir Harold also suggests that new methods of placing contracts, such as the "package deal" under which the contractor designs a building to the customer's needs, have advantages. He is also attracted by the "serial contract," where tenders are invited for one job on the understanding that the chosen contractor will be given further work in a building programme. Such methods allow the contractor some say in the design of a building, where his experience of structural techniques may be valuable, while still giving the client the advantages of competitive tendering. There would, however, seem to be some danger that the price of the first contract will be cut below cost if other jobs can thus be bought.

Existing regulations on the conduct of architects and surveyors are another limitation on technical co-operation between designers and builders. A working party pointed out in 1950 that a civil engineer can engage in the contractual side of civil engineering without resigning his membership of the Institution of Civil Engineers, but an architect will lose his membership of the Royal Institution of British Architects if he works for a contractor, except on a salaried basis. Nor can an architect act in a managerial capacity without breaking the code of conduct of the Architect's Registration Council. Surveyors are even more stringently controlled in their activities. Nothing has been done to weaken these restrictions in the past twelve years, and this is one reform not suggested in the RIBA's survey of the profession. But there does not seem to be much hope of radical improvement in an industry where the manufacturers and designers regard one another at worst with "mutual distrust and recrimination," and at best their relations "are affected by an aloofness that cannot make for efficiency," as Sir Harold puts it. What seems to be needed is the sort of close personal relationship that exists between civil engineers and contractors.

The government, Sir Harold points out, has a direct interest in the efficiency of the building industry, now that nearly half the capital investment of the country is on public account. It should therefore try to make the knowledge possessed by the works directorates of government departments available to local authorities. He also suggests that practices found successful in the school building programme, such as the CLASP system—which allowed large-scale buying of prefabricated components, while still giving flexibility in design—could be extended to other large programmes. "A bold initiative is needed and that initiative cannot be left to manufacturers. It must come from central government and local authorities." The industry also, Sir Harold says, needs a move to end professional restrictive practices.

Markets to touch down on

The quickest route to commercial success in the Latin American market is through our International Department Representatives. They will guide you safely over the many export or import formalities to markets of ever-increasing promise. South America today is opening up to trade as never before, especially as a market for capital goods.

Our branches and those of our associates – the Bank of London & Montreal and Balfour, Williamson & Co. – cover the whole of South and Central America. Through them, accurate market information reaches our International Department.
The help and information which we are thus able to supply to business and industry includes the following:

Individual market reports · Details of free zones and ports · Import and export regulations, including licensing and prior deposits · Financing · Name of agents Tariffs and payments · Status reports Transfer of funds

BANK OF LONDON & SOUTH AMERICA LIMITED

panies at its official inauguration—particularly for Shell. He had, indeed, more to thank Shell for; the 58 of its stations that have been taken over for him represent a considerably larger proportion of this group's gallonage than the 29 Caltex and 20 Esso stations do of theirs. However, this process of plucking the fairest flowers is not over yet.

PROFITS AND DIVIDENDS

No Spring in Profits

APRIL was a cold month for shareholders too. The accounts of 226 companies analysed in this office included a number of the giants of British industry, so giving a representative picture of the trend in profits and relating in most cases to the past calendar year. Once again the influence of a handful of companies is particularly striking. Thus the sharp fall in profits reported by the chemical group, dominated by ICI, and by the motor group, largely reflecting the experience of the American subsidiaries Ford and Vauxhall, more than account for the fall of almost 7 per cent in the trading profits of the 226 companies as a whole. The decline in profits is 6¼ per cent if the profits of the oil group, dominated by Esso and Shell Transport, are excluded. Net equity earnings of all the groups excluding oil fell by 12½ per cent and as the net dividends of these groups hardly changed there was a sharp fall in the earnings cover.

PROFITS AND DIVIDENDS
(£ million)

Companies reporting in April	TOTAL (226) Previous Year	TOTAL (226) Latest Year	EXCLUDING OIL (221) Previous Year	EXCLUDING OIL (221) Latest Year
Trading profit	572·6	533·5	537·1	501·5
Gross profit	431·6	383·5	385·9	340·0
Net equity earnings	223·9	202·3	185·1	162·0
Net dividends	104·8	111·9	77·7	77·3
Times covered	*2·1*	*1·8*	*2·4*	*2·1*
Net equity assets	2,877·6	3,118·7	1,886·7	2,060·9
	%	%	%	%
Gross profit/net assets	*15·0*	*12·3*	*20·5*	*16·5*
Net earnings/net assets	*7·8*	*6·5*	*9·8*	*7·9*

Among other groups of statistical importance in last month's reckoning the profits of the food group (including Unilever), a widely spread engineering group, and the electrical manufacturing group (including AEI) revealed little change in trading profits. But higher charges for interest and depreciation brought about a sharp fall in gross and net profits, notably in the electrical manufacturing group. The one big group to report a good rise in profits last month was the miscellaneous manufacturing group, but here one company, Dunlop Rubber, whose trading profits rose by over 7 per cent, accounted for over half of the group's profits.

WALL STREET

Future Uncertainties

A correspondent cables:

SELLING appears to have risen to a climax on Wall Street this week. Prices dropped sharply in heavy trading, with IBM losing 55 points in two days' trading before staging a rally. Prices rebounded with almost equal vigour and by Wednesday's close the Dow Jones industrial average stood at 670, roughly ten per cent below its high point in December. Once the shake-out was over, however, the same questions that have troubled the stock market all the year—about the squeeze on profits, the probable strength of the business recovery and the attitude of the administration to business—were still left unanswered. Brokers who feel that equities are in for a sharp and substantial rally are few and far between. The most prevalent view is that the market will revert to a lack-lustre pattern, with prices being gradually eroded more as a result of the absence of buying than of aggressive selling. But drastic selling is thought to be most improbable, as the short term prospects for business are bright and profits so far this year have come up to expectations. Admittedly, a number of big institutional investors have been sellers of stocks on balance, and their sales have helped to depress the market this year; but the vast bulk of the $75 billion held in common stocks by the institutions is not likely to be seriously disturbed. Professional investors, moreover, will be the first to jump back into the market when bargains appear.

Perhaps the most important factor affecting the market is the marked change that has taken place in the psychology of investors over the last few months. The attenuation of fears about inflation has made investors extremely reluctant to bid prices up on the promise of future growth. IBM is only the latest of the "super-growth" stocks to have a rough passage; Addressograph Multigraph, Minneapolis Honeywell and Texas Instruments, for example, have fallen by between 25 per cent to 60 per cent from their 1961-62 high points. Stocks with a strong asset backing, which have an indifferent earnings record but an impressive assets backing, have attracted increased attention. This cautious attitude of investors raises the question whether an improvement in earnings will be eventually translated into higher equity prices. There is a growing body of opinion in Wall Street which holds that, even in an expanding economy, the market will be lucky to stay even. These pessimists, in fact, are saying that lower price/earnings ratios are in store for Wall Street, which until recently had been happy to pay over 20 times earnings for the 30 stocks in the Dow Jones average, despite the fact that as a group they have shown no growth in earnings since 1950.

Fishing for Diamonds

UNDERWATER MINING

OCEANS are storehouses of treasures to which man will not easily find the key. Underwater mining may open some of them and it has been given a sharp jerk forward by the almost unbelievable luck attending exploratory shots at digging diamonds from the depths of the sea by the Collins group of companies. This group specialises in marine pipelaying and has been investigating techniques for underwater mining for 13 years; the difficulty is that minerals valuable enough to repay the cost of exploitation are seldom found in convenient locations. The group turned to marine diamond mining a short while ago, with the coastal strip of South West Africa and the adjacent part of South Africa in mind—not least because the stones in this region contain an exceptionally high proportion of valuable gems. Playing no more than a hunch that if the next farmer finds oil you must have a fair chance of doing the same, Collins decided to sink a considerable sum in a practical test of their underwater techniques in these rough seas.

Collins obtained the offshore concession from its owner, who had an absorbing tug of war through the courts with the De Beers group over a disputed coastal strip of South West Africa between the high and low water marks. After an early victory, De Beers finally won back the land down to the low water mark, so ensuring that the Collins exploration would be, physically speaking, all at sea. Collins bought an Admiralty tug and began tests with improvised equipment which it thought would not long survive these conditions; this withstood the battering and within the first month diamonds were sighted.

A dozen further diamond producing sites were located within the first six months and a seagoing mining unit has now been despatched to the new mining area. De Beers which had assisted the pioneers in their investigations did not take a direct interest in the project, though it will sell any diamonds it produces. De Beers believed that sea mining costs would be heavy and was swayed by its experts' adverse reports on the possibility of diamond strikes in the off-shore concession. However, General Mining and Anglo-Transvaal are providing technical help and jointly have a half share with Collins in the venture.

The sand which covers the diamond gravels is heaped up on the shore (De Beers' territory) leaving diamondiferous gravels near the surface in the Collins off-shore concession. The method is to drop a 125 ft. hose overboard and to blow air in near the bottom of it by powerful compressors, making the water and sediment in the pipe so light that underwater pressure can lift even 10-inch material to the surface through the 10-inch pipe. New location equipment is being used and a line of markers is spaced out at 5-mile intervals along the coast adjacent to its 450-mile long concession, which runs out to the international three-mile limit.

So far, the project has cost £1½ million. The mining unit cost about £400,000 with its equipment and carries 40 men, half of them European. More units could obviously be employed in the mining area if their results justify them. Some fast patrol boats are also being ordered for the expedition. Russian fishing ships, it is grimly muttered, have been seen off the coast. No-one has caught them fishing, but equipment looking strangely like that used by Collins has been sighted over the side of the Russian boats. So the Americans might have a rival in the application of sea mining techniques—another Russian "first," even? The greater the depth, the greater the efficiency of this mining method, which theoretically could be carried on outside territorial waters.

SPACE

Ariel

THE pint-sized British satellite launched last weekend by American rocket has been extravagantly praised and extravagantly ridiculed. Both attitudes are unfair to an experiment imaginatively conceived and efficiently carried out. This is the scale on which scientists, as distinct from rocketeers, would like to conduct research into space. The effort is not so great that it drains resources from other branches of science; yet the results are more valuable than anything that can be learned by peering at space from the ground. Careful planning is important, much of the value of the early American and Russian satellites was thrown away because the experiments in them were badly designed, and sometimes the instruments, too. Ariel appears to have learnt from these mistakes.

Scientists in Europe of the calibre of Sir Harrie Massey, in charge of the Royal Society's space experiments, have been noticeably cool towards the idea of going into space on anything as big as Blue Streak, which is larger than they need (the exceptions being astronomers, who would like to mount a telescope in space) and they fear the cost of a single launching could cripple their research budgets. Nor, being sensible men, do they honestly feel the geophysical results, intriguing as they are, justify an effort on this scale. But if the experiments continue to grow, in size and weight, Blue Streak may not be too big by the date it is ready. Ariel outstripped its original rocket

EIU Quarterly Economic Reviews

57 issues covering individual countries or groups of countries

This service is specially designed to interpret current economic developments, to draw attention to emerging trends, to give essential information on trade and financial agreements, changes in regulations governing foreign trade, government economic plans and policy, major investment projects, etc. The bearing of political developments on the economic scene is also analysed. The reviews are used by businessmen alive to the importance of such questions, by banks, by governmental and international institutions.

The Life of a Nuclear Power Station

ATOMIC power costs depend partly on the accounting period over which its very high capital costs are written off. For the first stations, this is 20 years, and the depreciation and interest charges involved make up two-thirds of the estimated generating costs of 1d. a unit for Britain's first nuclear power stations. Were the stations written off over 30 years, their total costs would be a third lower—and contrariwise. The physical limits to the station's life are fixed in the last resort by the effect of years of intense radioactivity on the materials out of which they are built, and one of the least glamorous and most essential services provided by the Atomic Energy Authority is the testing of reactor materials to see how they stand up to this radiation. The economic limits to station life will depend partly on these physical factors, but largely also upon the rate at which innovation continues in nuclear power. The shift to a group of stations with very low running costs should ensure these first nuclear plants an exceptional period of their working lives on "peak load." But obsolescence rather than durability tends to set practicable amortisation lives in modern highly-capitalised industry.

Most urgent among the tests for the CEGB's present stations is to know how long the vast steel pressure vessels will endure: a failure here could be catastrophic. Steel which is normally ductile becomes brittle as glass at low temperatures, and will shatter with a blow. Expose a normally ductile steel to radiation long enough, and the temperatures at which brittleness sets in will become steadily higher with time—so high indeed that reactor owners will have to take active precautions to stop their veteran reactors from cooling below the prescribed safety levels for their age. Some of the early American reactors have been scrapped because in their case the safe levels had soared to impossible heights on the thermometer. The AEA has recently become the owner of the biggest machine in the world for testing this kind of brittle fracture, and the results will be written into the working manuals of reactors wherever steel is used. Other potential weaknesses, like the tendency of steel to creep or stretch over the years, have to be counteracted at the design stage either by using special steels with high resistance to creep—which also has its drawbacks—or doing what the General Electric Company has tried at Hunterston, a double-walled construction where the inner wall contains the high temperature, and the outer, cooler wall contains the pressure.

Much more important to the Atomic Energy Authority itself is the work just completed by the Culcheth laboratories on that apparently innocuous material, graphite. Graphite has already shown its nasty side by destroying one of the AEA's two big reactors at Windscale. The vice of storing and unexpectedly releasing dangerous quantities of energy without warning has been curbed only to find that under different circumstances graphite can crumble like biscuit. In the advanced gas cooled reactors now under development, hotter and at higher pressures than the present type, atoms of graphite that form the structure of the reactor simply turn into gas by reacting with the carbon dioxide coolant (which breaks up, under radiation, into carbon monoxide and free oxygen that then attaches itself to the graphite). This disastrous reaction could destroy a commercial power station in less than a year, and for the past three years something approaching a crash programme has been in hand to combat it, with industrial laboratories co-opted to help.

The AEA believes that the corner has been turned as recently as six weeks ago. Then laboratory evidence began to show that slight changes to the cooling gas (adding 7 per cent carbon monoxide) would check the reaction 10-fold. This, if true, would still not reassure Sir Christopher Hinton that commercial advanced gas-cooled reactors were worth building, but combined with measures to block up some of the pores in the graphite, it might do the trick. But it may be a year or more before the Authority can give practical as distinct from laboratory proof of this.

and was eventually put into orbit by something much bigger. And although it is demonstrably more sensible to use American launchers and American facilities already in existence, there is a limit even to Cape Canaveral's capacity and the rocket queue at the launching pads is lengthening.

TAXING CONFECTIONERY

Penny Plain, Twopence Coloured

With eleventh hour conferences still disgorging the new sweet and ice-cream price-lists necessitated by the imposition of purchase tax next Tuesday, the general pattern of tax and price has become fairly plain. It is a more uneven pattern than before. Some manufacturers have taken the advantage of the inevitable "rounding upwards" to increase their own margins and/or those of retailers whose sales may fall in volume as the result of the price increases. Mackintoshes, the toffee manufacturers, are probably going to increase their retailers' slice; Lyons, on the other hand, though a good many of their retail ice-cream prices have gone up slightly more than Walls, are not allowing for a retail profit on the 15 per cent tax. The company's view is that ice-cream prices have remained firm for so long in spite of rising labour costs that this is a good opportunity to recover some of the lost margins which they cannot hope to make up by increased sales.

The tax on soft ice-cream is to be calculated after an extra 20 per cent has been added to the wholesale price of the mix, or on certain fixed values, whichever is the greater. This is to allow for the air, water, flavouring and refrigeration contributed by the retailer. But the agreed level of taxability seems to assume a degree of aeration considerably lower than the 60 to 80 per cent put in by the modern continuous soft ice-cream freezers. The retail price of ice-cream made in this way may in fact have an effective tax content of only 5 per cent, compared with 11 per cent in the case of factory-made wrapped ice-cream.

The soft drink makers have none of these headaches; they are generally simply adding 15 per cent to wholesale prices per dozen, with a recommended resale price to which shopkeepers may or may not stick. The breakdown of fixed prices in this business at least means that manufacturers have to worry less about exactly how many extra pennies are spent by the public.

TYRES

Using the New Rubbers

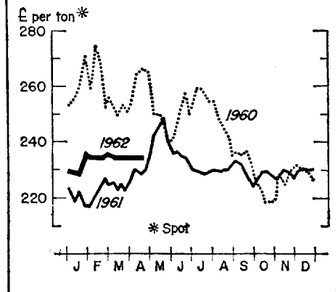
Tyre manufacturers are in unusually combative mood: as soon as Dunlop announced its new tyre with high-hysteresis rubber tread, Goodyear replied with a polybutadiene tyre. This is the first tyre made from one of the new polydiene synthetic rubbers to be marketed in Britain; in this case the polybutadiene is mixed with styrene-butadiene rubber, the present norm for car tyres. What is surprising about Goodyear's move—and a sign of competitive pressures in the tyre industry—is that it is using the new rubber compound, called "Tufsyn," in all its tyres at no extra cost, though polybutadiene now costs 27½ cents a lb in the United States compared with 23 cents for SBR. And as polybutadiene is not made in Britain, Goodyear will have to import all its requirements, paying a 10 per cent duty.

The higher cost of polybutadiene had led to the assumption that a premium would be charged for car tyres using it, though lorry tyres—which are mostly made from natural rubber, costing as much as polybutadiene—would sell at the same price and so prove the biggest outlet for the new rubbers. Their technical appeal is that they are highly flexible, like natural rubber, and so run cool—an essential quality for lorry tyres which SBR lacks—while polybutadiene is claimed to give a longer tread life than natural. But, as a corollary of their flexibility they are generally believed to give a less good grip even than ordinary SBR. (The more bouncy a rubber, the less well will it cling to the road; high hysteresis rubber is a type that is not bouncy.) Goodyear, while making long tread life the basis for its advertising, also claims better grip for "Tufsyn" in cold weather, because it remains flexible.

The pressure of surplus capacity amongst the makers of the new rubbers in the United States may be another factor pushing Goodyear to accept lower margins in the hope of higher sales. Production there is estimated to be only half capacity, with 60 to 70 per cent of production being sold, and the price was cut 2½ cents a lb only last week: it is now the same as that of low-grade natural rubber. Goodyear started production in its own polybutadiene plant at the end of last year. Certainly this behaviour is a sign of the growing competition in the rubber market that the lavish capacity for polydiene rubbers was always expected to bring. It also appears to give motorists a choice between better tyre grip and greater durability.

FROZEN FOODS

Jumbo Package



The new holding company, Findus International, four-fifths owned by Nestlé, is to spend £20 to £25 million in the next three years on expansion, particularly of Findus's frozen foods. If sales expand in any like proportion, this must mean that Findus either expects to work wonders in the non-Scandinavian countries of Europe, hitherto little attracted by the frozen products of their northern neighbours, or count on taking some extra business from their main rivals—which in this country and in Holland, though to no great extent elsewhere, means Unilever.

A quarter of Findus's present annual turnover of £20 million is done in this country, equal to a tenth of the UK market—a poor second to the two-thirds share held by Unilever's Birds Eye. For some time Findus's trouble here has been reliance entirely on wholesalers who are unable to cope with a much greater volume of business. The company has denied any intention of changing its distribution system, but it is as plain as quick-frozen cod fillet that great advantages could be gained from using, like Birdseye, a direct delivery system—which one would think that Nestlé could provide through Crosse and Blackwell.

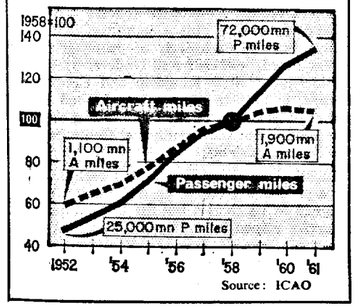
On the Continent, too, Nestlé distribution machinery plus, in time, the capital for more widespread production facilities could provide Findus with the opportunity they need. At present Findus has one factory in each of the Scandinavian countries and a fish plant at Grimsby, though its beans are grown in Italy and its sprouts in Holland. Birdseye vegetables, however, are grown in Britain, usually near their factories, and in Holland Unilever's frozen food company Iglo, which is about to open its second plant, also grows on the spot. Germany, where refrigerator retailing of poultry and fresh vegetables is common but sales of quick frozen foods per head are well under half the British and Swedish levels, probably offers the most immediately promising market on the continent to anyone who can tackle the sticky distribution system. Both Findus and Unilever (through their Solo Feinfrost subsidiary) have a footing in Germany, and it is possible that if Findus decides to push strongly there a three-corner fight could develop between them and Unilever and the groups of German manufacturers.

At present Iglo has not gone far with expansion outside Holland, and exports are only a very minor part of Birdseye sales. In most of Europe, promotion must play a major part in selling the very idea of frozen food. Unilever may be content to let others do the initial spadework in the all-too-frosty soil of France and Italy.

STABILITY IN COPPER

Producers have been increasingly successful in stabilising the price of copper in recent years. Following the curtailment of supplies in 1958, the fluctuation in prices was reduced to about £60 a ton in 1959 and 1960, the smallest range of fluctuations since the London Metal Exchange resumed dealings in copper in 1953. In 1961, fluctuations were reduced to just over £30 by production curbs introduced towards the end of 1960. This year intervention in the market has produced an almost stable price for spot copper since the end of January. Recently, speculative pressure has been building up against this producer-dominated price causing forward supplies to fall to a discount of nearly £3 a ton. The producers' agents were forced to support forward copper, but the outbreak of a strike by African mineworkers in Northern Rhodesia has lessened the pressure, though a forward discount of £1 remains.

AIRCRAFT INDUSTRY



The Little Jets

Competition is hotting up among the little jets. There is more activity now in small aircraft design, military and civil, than in big. The £10 million American contribution to Hawker Siddeley's vertical take-off work is a drop in the bucket but apart from its bearing on military tactics, this interest could also mark a swing from quality back to quantity. Recent military machines have been so expensive and complicated that production orders were tiny and caused the industry more headaches than they were worth. In civil aviation, manufacturers have also begun to think they might sell more small jets than big, meaning perhaps smaller profit but longer production runs. The first company to build an 8-seat jet airliner for business flying was Lockheed with the Jetstar but at nearly £500,000, the Jetstar appears to have priced itself out of the market judging by sales. Today there are at least a dozen other executive jet aircraft to choose from, ranging in size from one to eight passengers and all of them conspicuously cheaper than the Jetstar.

In this country, de Havilland has a batch of 30 executive jets under construction holding 8 comfortable or 12 cramped passengers and costing about £140,000; the first will fly this year. Physically bigger, but still small by airline standards are the feeder-line jet aircraft being offered to the airlines. The commuters' jet was pioneered by the British Aircraft Corporation a year ago, now Fokker in Holland has announced a 60-seat jet replacement for its successful Friendship and Douglas in the United States is testing the market. These little jets, made possible by engine developments, offer a lifeline to manufacturers and everyone is trying to get in on the act.

AIR TRAFFIC

These figures give a clue to the source of the airlines' troubles last year. Although traffic was rising, the introduction of bigger aircraft meant that for the first time in aviation history the mileage flown showed a drop and average loads of 58 per cent of capacity were the lowest for a decade. On international routes loads were only 53.3 per cent, too low for any but the most efficient to break even.

COLOUR FILMS

Rank Insider

It seems to be generally agreed that colour photography will succeed—how can it fail? People have more leisure in which to spend more money than ever before; each year more go abroad for expensive holidays and the urge to record them (in colour) is becoming nearly irresistible. The competitiveness of the market reflects these prospects; Ilford has recently made a strong bid for a larger share of the film end of the market, hitherto dominated in this country by Kodak. But there are other ways of getting into the act. The Rank Organisation has formed a company, Top Rank Laboratories, for developing and printing amateur colour films; a specialist service for commercial colour work is also available.

The choice is a shrewd one even if it is, to some extent, involuntary. Most colour film sold is "reversal" stock, from which transparencies are made, and it is usually processed at the manufacturers' laboratories. Thus anyone wanting to break into the colour film processing business usually pins his hopes on colour prints. Although they lack the brilliance of transparencies, these are convenient and, at the right price, may be the key to the mass market. But they are expensive too: the final cost per print is more than twice that of transparencies and many times that of black and white prints. This has been the main obstacle to faster growth. It seems likely that the film manufacturers will follow Ilford's example by reducing their prices and placing more emphasis on colour prints than in the past. Top Rank Laboratories should be as well placed as any to take advantage of an increase in the market.

It is, in fact, new only in name. In 1959 Ranks bought Tempo Laboratories, a small, sad film processing company whose activities were complementary, on a midget scale, to the huge Rank laboratories at Denham. Investment over the last two years has placed it in a position to process any of six makes of negative colour film—a convenience that may be appreciated by the retailers, although it will probably pass unnoticed by the public in general. Like its other new ventures of recent years, the importance of this move to the Rank Organisation can only lie in the far future. The film interests dominate the organisation and will continue to do so. In 1961 they produced three quarters of the company's profit before tax.

SHORTER NOTES

The United Nations' own investigation into the air crash that killed Mr Hammarskjöld at Ndola last September only confirms what has already been published by the Rhodesian government about the accident. The Rhodesian report, which was described in *The Economist* on March 24th, found no evidence of sabotage or of direct attack and neither did the Swiss experts of the United Nations. Both reports are sharply critical of rescue arrangements after the aircraft disappeared; the United Nations report also criticised security arrangements at the Leopoldville end of the flight. Neither can suggest any reason why what was in every respect other than its secrecy a normal flight should end at the last minute in disaster. It must be supposed for want of better evidence that the pilot made a mistake.

★

Holders of gilt-edged securities now have an association to defend their interests. The association, called The Association of Gilt Edged Security Holders Ltd., was formed and registered last week by Mr Percy Browne, Conservative MP for Torrington. Subscriptions will be one guinea a year. Now that gilt-edged are rising will Mr Browne find his association priced out of the market?

UNILEVER

MANAGEMENT AND STRUCTURE OF A DIVERSE AND WIDESPREAD ORGANISATION EXPLAINED

MACHINERY OF CONTROL AND LINES OF COMMUNICATION DESCRIBED

ESSENTIALS TO MEET CHALLENGE OF PRESENT-DAY CONDITIONS

The Annual General Meetings of Unilever Limited and Unilever N.V. were held on Wednesday, May 2nd, in London and Rotterdam. **Mr George Cole** presided at the Meeting of Unilever Limited and **Mr F. J. Tempel** at the Meeting of Unilever N.V.

Addressing the Meetings the Chairmen said:

This morning I want to try to answer for you one of the questions that we are most often asked about Unilever. It is this:

How do you run an organisation that is so big, so diverse in its range of activities and so widespread across the world?

To explain how we tackle this problem, one must start with the structure of Unilever. This was last described thirteen years ago in an address given to the Institute of Public Administration by Lord Heyworth, who was then the Chairman of Unilever Limited. It was, as he said, a snapshot of the organisation as it existed at a given moment of time, and that organisation has to be constantly adapting itself to new needs and new pressures. And so it seems timely that it should now be again reviewed.

PERIOD OF GROWTH

Look first at some of the milestones in Unilever's history since that speech was made. In 1949 the capital employed in the business was £281 million. In 1961 it was £642 million. Turnover, which in 1949 was £801 million, had last year risen to £1,890 million. Trading profit has moved from £32 million to over £100 million. In 1949 we paid out a little over £2 million in ordinary dividends, in 1961 over £15 million. In 1949 taxation took about £18½ million, in 1961 over £52 million. The number of people employed in Unilever has risen too, but not, I am glad to say, to the full extent laid down by Parkinson's Law nor in anything like the same proportions as the other figures I have mentioned. Where in 1949 we employed 221,000 people, today there are all but 300,000. And throughout this period of growth, the world has seen many and rapid developments which have had their impact upon Unilever. Of these, the most important is that nearly everywhere the standards of living have risen markedly and will go on rising. Then again, communications everywhere have speeded up. In 1949 it still took 4½ days to fly to Australia, and today the journey takes 33 hours. Today one contemplates visits all over Continental Europe and to the United States as everyday events. And the last few years have seen the movement towards a closer integration of the countries of Western Europe.

One result of all these exciting, rapid and sometimes uncomfortable changes is that many other large companies throughout the world, whose interest before was mainly centred on their own domestic markets, are reaching out into every corner and we are being faced with steadily growing and hotter competition on practically all fronts.

THE KERNEL OF THE PROBLEM

Yet amid all these stresses which a world of change creates, the kernel of our problem is always to maintain an effective management structure for a business which is large, diversified and spread across the face of the world; which operates in markets that range from the highly sophisticated to the primitive; and which, above all, in every part and particle needs to be adaptable, ebullient with vigour and filled with a lively sense of purpose if it is successfully to meet the challenge of these times.

THE PARENT BOARD

Now, when you examine the problem of managing a business such as this, you need to begin with the picture of several hundred subsidiary companies engaged in their work in more than fifty different countries, each of them ultimately answering to the parent companies, Unilever Limited and Unilever N.V. As you know, these two companies are linked together by a number of agreements. One equalises the dividends on ordinary capital, another provides that each company gives the other free use of its patents, trade-marks and secret processes. In short, for the practical purposes of management Unilever is a single entity. At the head of affairs, and responsible to the shareholders, stands the Parent Board, and I deliberately use the singular because, as part of this unifying process, the Boards of the British and Dutch companies are identical. There are at present 24 members of the Board, all of whom are full-time working Directors and in addition Limited at present has two Advisory Directors and N.V. five. This is too large a body for quick and effective action day to day and you come at once to the first instance of delegation, on which we so strongly rely.

THE SPECIAL COMMITTEE

While the majority of the Directors have specific responsibilities for different sections of the business, either functional or regional, there are a few whom the Board annually appoints as a small committee, called the Special Committee, which it arms with considerable powers to co-ordinate the whole. This Committee at present consists of the Chairmen of the two Parent Companies and the Vice-Chairman of Limited. It holds frequent and regular conferences with the Directors and others responsible for separate parts of the business, and is constantly available to participate in deciding all those matters that have to be settled at the top. But it would indeed serve only as a dead hand if it were to confine itself to negative criticism of the proposals of others. So its aim must be to provide constructive counsel and a stimulus to new thought. It is responsible too for getting the broad policies of Unilever properly defined and for sign-posting the general direction in which the business is to move. The Special Committee maintains its link with the Board as a whole by its reports to the Conference of Directors at the weekly Board Meeting, when explanations can be given and matters of policy and general interest discussed. The working out of detailed plans, and the methods by which they are carried into effect, are the affair of the other echelons of management, which we shall now go on to explore.

ECHELONS OF MANAGEMENT

These fall into three main categories. There are the Groups responsible for operations in areas that are defined geographically. There is the management responsible for co-ordinating, on a world basis, the policies that govern particular commodities and brands. And there are the Central Services. The first of these categories works within a regional framework, the second within one defined by reference to particular types of product. The hallmark of the third is functional, in other words, the specialised skills and knowledge that these Central Services provide for any part of the business that needs them.

THE REGIONAL GROUPS

In our first category, the Regional Groups, there are five main management committees, a United Kingdom Committee, a Continental Committee, an Overseas Committee, the United Africa Group and the Plantations Group.

The United Kingdom Committee consists, at present, of three Directors of the Parent Board. Reporting to them are all those companies whose operations are confined to the United Kingdom. There are the companies that make and market soap and other detergents, toilet preparations, margarine and other foods; there are companies engaged in oil milling and the manufacture and sale of animal feeding stuffs; there are companies producing and selling chemicals; there are companies whose function is the transport and warehousing of Unilever products.

The Continental Committee, at present consisting of six Directors of the Parent Board, is responsible for our business in Continental Europe and, unlike the United Kingdom Committee, its responsibilities are spread over a number of countries. So in each of these countries we have a small body known as the National Management, and this National Management answers to the Continental Committee for all Unilever operations in its country. The head of the National Management in the Netherlands is a Director of the Parent Board who is also a member of the Continental Committee.

The Overseas Committee follows the same general pattern. This Committee, composed mainly but not exclusively of members of the Parent Board, answers for all Unilever operations outside the United Kingdom and Continental Europe, other than those of the United Africa and the Plantations Groups, and is also responsible jointly with the Continental Committee for our exports business.

In all these three Committees each member has a particular group of countries or companies assigned to his charge, but the Committee takes collective responsibility for the whole.

The fourth of our Regional Groups is that of United Africa. This Group has been undergoing more radical changes than most parts of

the business in recent years, reducing its commitments in the produce and merchandise trades in tropical Africa and switching the emphasis to more specialised and technical activities and to manufacture. In each territory where the Group is established you may find a number of specialised units, each answering for its operations direct to the appropriate section of the United Africa Head Office. But you will also find in each territory a single territorial Chairman whose job it is to supervise the activities of these individual units with the object of ensuring uniformity of policy throughout the territory. Three Directors of the Parent Board serve on the Board of The United Africa Company as its Chairman and Managing Directors.

The last Group is that of the Plantations. These are established in Africa, Malaya, North Borneo and the Solomon Islands, and their top management, located in London, works in closely with the United Africa Group and the Overseas Committee.

PRODUCT CO-ORDINATION

And there, for the moment, I must leave our regional structure and turn to the second main category, which, for the sake of convenience, I will call "product co-ordination."

With the developments of our business that I mentioned at the outset, and with increasing competition in markets, many of which are becoming more and more alike as trade flows more freely across national frontiers and consumers' tastes converge upon a common pattern, it became clear that control on a geographical basis, while essential for ensuring uniformity of policy within any one country, would not alone suffice. It is not enough to concentrate on the markets within a particular territory; everyone, both at the centre and on the periphery, must be alert to spot the openings where the developments arising from our research, production and marketing throughout the world can be applied. To this end, policy must be broadly conceived with worldwide problems and worldwide opportunities in mind.

Some time ago we appointed co-ordinators for our activities in foods and toilet preparations on a worldwide basis, while for some years the Continental Committee, largely with their eye on the possible developments of the Common Market, have had in being teams to co-ordinate activities in particular product fields within the countries of Western Europe. This principle of product co-ordination has recently been extended so that we now have co-ordinating teams for soap and other detergents, for toilet preparations, for margarine and other edible fats, and for various other groups of foods, particularly quick-frozen foods, ice-cream and meat. And there will probably be others.

Each of these co-ordinating teams is headed by a Director of the Parent Board or by one of our most senior managers and each has the Unilever world for its parish. It is their task to help to formulate the policies that will stimulate expansion wherever opportunity offers and to provide a focal point for consideration of all aspects of production and marketing for each of these product groups. But the co-ordinators are not operators, and so they have to get their policies accepted by, and implemented through, the various Regional groups that I have already described.

THE CENTRAL SERVICE AND ADVISORY DEPARTMENTS

The third main category consists of the Central Service and Advisory Departments. Their responsibilities, you will remember, and their spheres of operation are functional. They comprise such essential services as Finance and Accounting, Research, Audit, Personnel, Marketing, Buying, Economics and Statistics, Technical (including Civil, Electrical and Mechanical Engineering and a Packaging Advisory service) and Organisation. Other Central Services include Patents, Pensions, Legal, Insurance, Taxation, Transport and the Information Division. The object of these Central Services is to provide knowledge and experience of a quality that the individual units could not afford on their own. They initiate policies on matters that fall within their fields and, having got them agreed, assist in their implementation. They make their specialised advice and help available at whatever level these are requested, whether it be a Regional group, a Co-Ordinator, an operating company, or for that matter, the Special Committee.

HOW IT IS OPERATED

This sketch of the management structure of your business has had to be brief, because the story would be incomplete unless I leave myself time to say something about how it is operated. The world of business is a fast moving one and in general speed of decision and action is essential to success. But clearly there can be no speed if everything has to be laboriously referred up the rungs of the ladder to the top, there to be mulled over and debated before judgment is given and transmitted down again to those who have to act. A brake of this kind would not only delay decision but, worse, would stifle the development of management talent and initiative throughout the business and kill all sense of lively purpose and momentum. The upshot is that we can only work effectively by applying to the fullest possible extent the principle of delegation. That is why, so far as possible, we leave each unit free to carry on its own operations, within the framework of agreed policy, with a minimum of supervision and controls. But some controls there must be; or what is sometimes called the Unilever Diarchy would become the Unilever Anarchy. The nature of these controls is of prime importance and basically they are three: the unit's Annual Operating Plan; Capital Expenditure; and the selection and remuneration of top management.

UNIT'S ANNUAL OPERATING PLAN

A unit's annual operating plan covers not only the year immediately ahead but also a projection for a further year beyond that, and most companies also have in some detail a plan for many years ahead. For instance the companies of the Plantations Group often have to plan for a minimum of fifteen years. In its annual plan each company makes a careful estimate of its prospective sales, margins, advertising and other expenses and thus arrives at an estimate of the following year's profit or loss. The plan will be discussed in detail with the regional group, with the appropriate product co-ordinators and with such advisory and service departments as may be concerned, before being brought forward for consideration by the Special Committee and the Board. The sum total of these plans provides the basis on which we estimate the profit that Unilever as a whole will earn in the following twelve months; the individual plans provide the yardsticks by which, throughout the year, the performance of each unit can be measured.

But planning is not something that units indulge in only once a year, when the calendar reminds them that it is time to start putting the Annual Plan on paper. Planning is a continuous process, going on all the year round, year in and year out. The Annual Plan simply draws the threads together and gets everything into focus, providing in a convenient form evidence of the unit's liveliness of thought and the vigour with which opportunities are being probed and pursued.

CAPITAL EXPENDITURE

The second control is on capital expenditure. The importance of capital expenditure is that much of it is medium or long term in character and, therefore, it determines the directions in which the business is going to move for some time to come. You can compare it to laying down the permanent way of a railway. Once the track is laid, those in immediate charge of operating the line may, within reason, experiment with different types of rolling stock and, if they guess wrong, their mistakes can be corrected without much difficulty. But if the track has been laid in the wrong direction to start with, the venture will never pay and it is a terribly expensive matter to have to pull it up and start all over again. We try to prevent this kind of thing happening in Unilever by controlling capital expenditure throughout the business both by means of annual budgets and by requiring individual items above certain limits to be submitted for approval.

The annual capital expenditure budget prepared by each unit covers the ensuing twelve months in some detail and gives a projection for a year or more beyond that. It will specify the amounts that the unit expects to have to spend on renewals of existing plant, on additional plant or new factories or offices. You will see plenty of examples in the list of major items published each year in the Review of Operations. When the budget is ready it is submitted by the unit through its regional group to the Special Committee. They in turn, if they are satisfied that it is in order, and in line with the general Unilever interests, will bring it forward to be noted by the Board.

Throughout the year individual items of expenditure, whether or not they have already been included in a budget, are sent forward through the same channels. But at every level in the organisation, starting with the unit, there are people with authority to approve capital expenditure within given limits and so it is only items of major importance, that is, those that are really large or that involve an important point of principle, that have to come right to the top. And it is only sensible that really major projects, such as the building of a completely new factory, should be brought up for discussion and acceptance in principle without waiting for the budget. In much the same way, a proposal for the acquisition of an existing business would be brought forward for consideration at the earliest opportunity.

Our weekly Board Meeting affords an opportunity for dealing with items of capital expenditure that for one reason or another have not been covered by a budget. They may be matters that have arisen unexpectedly and that no one could have foreseen. But if failure to include them in the budget is the result simply of inaccurate forecasting, a little fur may fly. Because the accurate forecasting of capital expenditure, and the accurate implementation of the forecasts, are important tools of management. The sum total of the capital expenditure budgets is a major factor in calculating whether our financial resources are likely to be sufficient to meet requirements in the year ahead.

SELECTION OF TOP MANAGEMENT

Our third control lies in the selection of the top management throughout the business. This

is a matter for recommendation by the appropriate management group, assisted by the Personnel Division, and for discussion with the Special Committee, when a choice will be made. In the same way, the Special Committee and its advisers review once a year the salaries of the top men. This process of selection and review provides an opportunity of planning the careers of those who give promise of rising high in the business.

Now you heard me say, a few minutes ago, how independent we like our companies to be. By now, having listened to this account of the machinery of control and the lines of communication through which Unilever is managed, you may be beginning to wonder wherein the independence lies. You may even be murmuring to yourselves the little verse—of American origin—about the control organisation of another large company:

"Along these lines, from toe to crown,
Ideas flow up and vetoes down."

Well, we make a conscious effort to avoid that sort of reproach. We really do mean our companies to enjoy independence, though the degree of that independence will naturally vary from one to another. A powerful and experienced business can get along with much less help from the centre—I refuse to say interference—than might be needed by one less fortunately placed. More than that, the stronger units, by feeding their experience into the centre for sifting and dissemination, can make a positive contribution to the benefit of the rest.

In the last analysis delegation can only be put fully into practice when people recognise the questions that involve a point of principle and refer them for decision. So we come back to the selection of the top men, the most important factor of them all. If these men are well chosen, then policy-making should be a co-operative process rather than a matter for veto and dictation. There may well be occasional disagreements—in any gathering of strong-minded individuals there are bound to be—but they do no harm if the men concerned respect one another and are in general agreement as to the aims of the business. And there may even be ready acceptance, rather than forced acquiescence, for those ideas which from time to time, in defiance of the rhyme, flow downwards from the top.

THE IMPORTANCE OF COMMUNICATIONS

Much of the smooth functioning of the business depends on good communications and the passing-on of information. Communication would be a subject for a speech in itself. Suffice it here to emphasise that it is a two-way process, the flow of information from the periphery to the centre being as vital as the stream that runs the other way. It means, among other things, a deal of travelling, with members of the Board, the Regional Committees, the Product Co-ordination Teams and the Central Services visiting the units, men from the units coming to London and Rotterdam and visits being exchanged between one unit and another. Mutual confidence depends upon personal contact and getting to know each other as people. Nothing would be more dispiriting or infuriating to the men of the units than to have to deal with faceless chair-borne pundits recognisable only as signatures at the bottom of letters.

A special responsibility rests upon those who pass on information or transmit decisions to those in lower echelons. They must make a conscious effort to picture the scene as it appears to the recipients. It is all too easy to repeat the historic blunder of Lord Raglan, who despatched the Light Brigade to its doom at Balaclava because, when he sent the order from his exalted position on a hill-top, he failed to realise how much less of the battlefield would be visible to his cavalry commander on the plain below. We should do well to heed this lesson, and to order our affairs so that our managers know enough about the business in general to make sure that they run their own particular part of it with, rather than against, the tide of policy.

In this time of change, communications matter more than ever. If we do not keep you, the shareholders, and others of the general public, well informed, then we have only ourselves to blame if your ideas of what we are and what we do get out-of-date. This is one reason why we keep trying to improve the content of the story that we present to you in the Annual Report. Similarly, if we do not keep our own managers and staff informed, we ought not to be surprised if they become anxious when the operations of a factory are drastically altered or when they hear talk of some of the possible consequences of the British application to join the Common Market. Good communications do not always make change palatable, but they make it intelligible and they kill the wilder rumours.

Finally, if the business is to thrive, we must keep not just abreast of change but ahead of it. Complacency and the rigid outlook could prove fatal to the health of the enterprise. Unilever must always be responsive to the need for change, sensitive everywhere to the stimulus of opportunity and alive to the possibilities of growth.

The only question to be asked was from Col. A. E. P. Bridge, who said: I think I should declare my interest in that I am a farmer. I see from the report that for the first time it is disclosed that Unilever owns R. Silcock & Sons. Can you tell us whether there is any other similar concern in this country which Unilever owns and which we have not been told about.

The Chairman, in reply, said: I am really very glad that you asked that question because I take it that you mean to ask if we have any hidden or secret companies which have not been disclosed. I am very glad to be able to say, quite categorically, that there are none. In the report and accounts, of course, we do not mention every company that we own; that would obviously be quite impossible, but in the field about which you are speaking, the Oil Milling Group, this does include two small agricultural businesses which are quite small and, in relation to total operations, quite insignificant. Obviously, for that reason they have not been mentioned. I may add that there has never been any secret at all that they belong to us.

The Report and Accounts for 1961 were adopted.

The proposed final Ordinary dividends, calculated in accordance with the Equalisation Agreement between the two companies, were approved, the dividend in the case of Unilever Limited being 9.19 pence (15.32 per cent) per 5s. Ordinary share and in the case of Unilever N.V. Fl 2.60 (13 per cent) per Fl. 20 nominal amount of Ordinary capital.

The Directors and Auditors of both companies were re-appointed.

A warm vote of thanks to the Chairman, Directors and Staff of the whole Unilever family was proposed by Mr. Frederick Snow and seconded by Mrs Eleanor Nicholson.

Copies of the speech are available on application to Information Division, Unilever House, Blackfriars, London, E.C.4.

THE HALIFAX BUILDING SOCIETY

ONE HUNDRED AND NINTH ANNUAL MEETING

Statement by THE PRESIDENT IAN A. D. MACLEAN, ESQ.

The one hundred and ninth Annual General Meeting of the Halifax Building Society will be held on May 14th, the President, **Mr Ian A. D. Maclean**, presiding. The following are extracts from his statement:

From the point of view of building societies, perhaps the outstanding event of 1961 was what has come to be known as the "July Budget." Two of the measures taken by the Chancellor had a direct effect on societies. First, Bank Rate was raised to 7 per cent, and secondly the Government suspended the arrangement whereby, under the House Purchase and Housing Act, 1959, societies were able to borrow money from the Government to advance on the security of properties built before 1919.

The need for strong remedies to deal with the crisis of last summer is, of course, appreciated. But building societies were not alone in their sense of disappointment that the initial steps took the familiar form of a rise in Bank Rate and a credit squeeze. The series of alternating restrictions and relaxations of credit and the variations in the level of interest rates which have been such a feature of recent years have imposed particular burdens on building societies and on their millions of borrowers. It is therefore to be hoped that the National Economic Development Council, in whose hands so much of our planning is apparently to rest, will not overlook the position of the home owner in their review of the economy and that, in particular, some means will be found whereby the use of interest rates as an instrument of Government policy may be avoided, or at least the scope of their impact restricted.

During the year changes took place in the Society's interest rates. The Board announced at the end of June an increase of ¼ per cent in the rate paid to investors, to operate from December 1, 1961, and of ½ per cent in that charged to borrowers, with immediate effect to new borrowers but with effect from February 1, 1962, to existing borrowers. In taking this decision the Board had in mind the frequent increases in mortgage rates to which existing borrowers had been subjected in recent years and thought it fair to postpone the implementation of a further increase for seven months rather than for the three months which is required under the Society's mortgage deed.

On the investment side, if we take the year as a whole our experience is by no means to be regarded as unsatisfactory. Gross receipts reached the record sum of £122,000,000 or £9,500,000 higher than in the previous year, and although withdrawals increased by £10,000,000 the net result enabled us to increase our assets by 10.8 per cent, a rate of progress with which the Board are quite content, especially as we have been able to achieve it without loss of strength in our reserves.

On the mortgage side, our lending, at £87,900,000, was some £14½ millions less than in the previous year. In that year, however, our liquidity was allowed to fall from 18.6 per cent to 15.2 per cent, a policy which made some £17 millions available for lending on mortgage over and above the amount available from our normal flow of business.

The Society's reserves now stand at £19,354,612, or 3.56 per cent of total assets compared with 3.51 per cent in the preceding year. In welcoming this trend, the Board are of the view that further improvements should be made. But rising costs, and in particular increased taxation, make it more and more difficult to improve reserves on the basis of the present margin between investors' and borrowers' rates. Our liability for Profits Tax alone is now £663,000, and I am only sorry that in his Budget this year, the Chancellor once again did not feel able to grant building societies long-overdue relief from the payment of this tax.

SLOUGH ESTATES, LIMITED

ANOTHER SUCCESSFUL YEAR

LT.-COL. W. H. KINGSMILL'S STATEMENT

The Forty-first Annual General Meeting of Slough Estates, Limited, will be held on May 23, 1962, at Slough Estates House, 16, Berkeley Street, London, W.1.

The following is the Statement by the Chairman, **Lieut.-Colonel W. H. Kingsmill, DSO, MC,** circulated with the report and accounts for the year ended December 31, 1961:

FINANCE

As you will see from the Directors' Report, our Company has again enjoyed a successful year, the Group Profits before taxation having increased from £933,588 in 1960 to £1,076,225 in 1961. This is the fifteenth successive year in which the profits of the Company have exceeded those of the previous year.

However, due partly to the increase in the rate of the Profits Tax, Provision for Taxation has risen from £474,217 to £572,313 this year.

Appropriations for Preference Dividends, the Interim Dividend of 5% on the Ordinary Shares, Redemption of Preference Stock and Redemption of the Debenture Stocks have required £167,259, leaving for disposal £336,653 to which is added the previous year's carry-forward of £270,311, making available a total of £606,964.

Your Board recommend the payment of a Final Ordinary Dividend of 10%, less tax, which with the Interim Ordinary Dividend of 5% already paid brings the year's total dividend on the Ordinary Capital to 15% against the equivalent of 13⅓% less tax for 1960.

This Final Dividend on the Ordinary Capital takes £245,000, leaving to be carried forward £361,964, an increase over 1960 of £91,653.

Your Board would certainly have recommended the payment of a higher Final Dividend but for the Chancellor of the Exchequer's request for restraint, with which they consider they ought to comply.

Perhaps it might be appropriate here to emphasise the Board's policy in regard to the Redemption of the Debenture Stock. The annual cost of redemption is charged to the Profit and Loss Appropriation Account and credited to the Debenture Stock Redemption Reserve; although this is not a Revenue Reserve distributable as dividend, it nevertheless adds to the strength of the Company and would, in ordinary circumstances, enable the Board to take regard of this fact when making their dividend recommendation.

SLOUGH

Leases have continued to fall in for renewal at current market rents and Industrial Development Certificates have been granted to existing Manufacturers for additional premises.

The Company erected a range of small factories, each of approximately 5,000 square feet to meet the demand of smaller manufacturers.

In respect of the Power Station, the 100,000 lb. Babcock & Wilcox High Pressure Oil Fired Boiler was put into commission in May and the 12,000 kW Parsons Turbine, although not completed in the year, reached the stage of final testing.

These developments have necessarily employed a large proportion of the cash resources of the Company and are reflected in the Balance Sheet by a reduction of the liquid assets.

BIRMINGHAM AND GREENFORD

Rentals have continued to increase on both these Estates, which have played their part in adding to the increased profits of the Group.

CANADA

Our Canadian Subsidiary has again had a successful year, the rent roll being maintained and the revenue from export sales of merchandise having expanded.

AUSTRALIA

Last year your Board considered that the development of our Australian Estate at Altona, Melbourne, could be commenced late in 1961 or early 1962.

While services of gas, water and electricity are now available on the borders of the Estate, the drainage facilities are not yet adequate. Our own arrangements in this respect have to be integrated with a District Scheme, over which there has been some delay.

The construction of the first factories, as a result, may be delayed some months.

FUTURE OUTLOOK

In the present uncertain state of British Industry and with the still unknown outcome of the British application to join the Common Market, it is difficult to forecast progress over the next year or so.

The demand for factory space continues unabated. A considerable number of factories are under construction and are now nearing completion, all of which are reserved for specific manufacturers. A number of extensions are also in hand. The demand for electricity and steam continues to grow.

Several leases have been renewed in 1961, the full benefit of which will be felt in the present year.

Plans are now in hand for the sinking of a new artesian Well 1,200 feet into the Lower Greensand, and for the provision of a second 3 million gallon reservoir in order to double our above-ground storage capacity.

Due to the general economic situation our Canadian Board do not expect much expansion in 1962 in the construction of new factories but anticipate an increase in our Export Division's profitability.

Your Board look forward to the future with optimism and in the absence of any unforeseen circumstances expect a further increase in the Group's profits for 1962.

STAFF

Once again your Board welcomes the opportunity of thanking the Staff and all employees of the Group of Companies, for their contribution towards the satisfactory results of the year under review.

We are constantly alive to the importance of maintaining a good staff relationship and recently have materially improved the Company's Pension and Life Assurance Schemes.

BRISTOL AND WEST BUILDING SOCIETY

ANNUAL GENERAL MEETING, 1962

The one hundred and eleventh Annual General Meeting of the Bristol and West Building Society was held at the Grand Hotel, Bristol, on April 25, 1962.

The Chairman, **Mr A. Anthony Scull, JP,** reported that total assets had increased by 12 per cent to £32,191,636. Advances totalled £5,125,742 in respect of 2,922 securities, 99 per cent being advanced to owner-occupiers. At the year end, mortgage assets totalled £25,474,430, representing an average debt of £1,320. Share receipts totalled £5,566,537, and there was a net increase of £176,456 in deposits. The special deposit made by H.M. Government in respect of advances on pre-1919 properties increased by a net £518,660. Income was a record, and after management expenses, taxation, investors' interest, etc., there was a balance of £126,234, increasing the Reserves and unappropriated profit to £1,301,234. Liquid assets amounted to £5,976,514, or 18.6 per cent of total assets. £867,561 was in cash or withdrawable at par within 6 months, and the maturity value of the quoted securities exceeded the book value by £673,747.

Credit conditions and heavy mortgage demand had necessitated increases in interest rates. Although Bank Rate later fell to 6 per cent, demand for mortgages was still excessive, and in these circumstances, to reduce mortgage rates, and thereby investors' rates, would be unwise. Mr Scull hoped that the House Purchase Scheme, suspended in the "Little Budget" of July 1961, might one day be reintroduced.

The transfer of engagements of the St Marylebone and Suburban Building Society had been concluded, and new offices opened in Plymouth, Yeovil, Swindon and Regent Street, London.

The Report and Accounts for the year ended December 31, 1961, were adopted unanimously, and the retiring Directors were re-elected

THE FINANCIAL NEWS

PROGRESS DURING THE PAST YEAR

LORD ROBBINS REVIEWS THE COMPANY'S INTERESTS

The sixty-fourth Annual General Meeting of The Financial News Limited will be held on the company's premises, Bracken House, Cannon Street, London, EC, on May 22nd.

The following is the statement of **Lord Robbins, CB,** the chairman, circulated with the report and accounts for the year ended December 31, 1961:

Before I deal with the business of the past year, I have with much regret to record the death in November last year of A. E. Knock, who had been secretary of your company and its subsidiaries for 24 years. He gave loyally and unstintingly of his services and his death at the age of 55 was a great loss. To succeed him we have appointed Mr A. L. Emerick.

The Financial News group had another good year in 1961. The profits for the group for the year ended December 31, 1961, before charging taxation, amounted to £1,253,344 against £1,046,724 in the previous year.

These profits include a contribution from twenty-one months trading of E. & S. Livingstone from the date of acquisition, whose accounting year has now been altered to conform with the rest of the group. After taxation, deducting the profit attributable to outside shareholders in The Financial Times Limited and its subsidiary company the profit attributable to The Financial News is £351,575 compared with £327,497 in the previous year. Your directors recommend a Final Dividend of 30 per cent, less tax, which with the interim dividend of 15 per cent, less tax, already paid, makes a total of 45 per cent, less tax, for the year.

The Balance Sheet reflects the scrip issue made by The Financial Times Ltd. during the year. This has been shown by writing-up the cost of the shares by the nominal value of the scrip issue (£250,151) and transferring this amount to capital reserve.

I will now give some account of the activities of the companies in the group during the past year.

The Financial Times Limited had a successful year and as a copy of my statement reviewing its progress and developments is being sent to all shareholders in The Financial News Limited I need not go over the ground again.

INVESTORS CHRONICLE

The year 1961 was a more difficult one for the Investors Chronicle than 1960. In 1960, we had the benefit of the increase in the price of the paper instituted towards the end of 1959; at the beginning of the year, some of the advertising rates were raised; it was, at least in the first half of the period, a time of rising prices and great activity on the Stock Exchange; and finally, revenue was increased by the very successful supplement published in June to celebrate our centenary. Although the Investors Chronicle earned lower profits last year, for the reasons I have given we were not surprised that this has proved to be the case. In the current year to date, however, the Investors Chronicle is doing better than in the corresponding period of 1960, a state of affairs which reflects great credit on all concerned.

The Investors Chronicle remains the only publication of its kind to publish an audited figure of its circulation, and its average sale in 1961 was only very slightly below that of 1960, in the first half of which year, of course, the Stock Exchange was very active. We are satisfied the Investors Chronicle retains the commanding position established over so many years.

SOUTHERN AFRICA FINANCIAL MAIL

Just over three years ago, the Investors Chronicle took an equal participation with South African Associated Newspapers, Limited, in a new financial periodical centred on Johannesburg, the Southern Africa Financial Mail. I am pleased to report that the Financial Mail is now firmly established and has achieved the highest possible reputation in Southern African financial, industrial and economic circles for the authoritative and lively work it does in these spheres, and for its complete integrity. It is also, I am gratified to add, now earning satisfactory profits.

I would like to pay tribute to our partners in this venture; their conviction that the Financial Mail would ultimately prove to be the success it now is has never wavered. I would also like to pay tribute to Mr John Marvin, Editor of the paper. Mr Marvin was seconded to the Financial Mail from the staff of The Economist, and has done brilliantly in establishing the paper in so short a period.

THE BANKER

The Banker had a profitable year, achieving increases in revenues both from advertisements and from sales, which more than offset a further rise in costs. During the course of the year the editorial coverage continued to expand and broaden in its appeal. Special opportunities for informed comment and for articles from distinguished contributors were provided by the storms in the exchange market, the plans for strengthening the structure of world finance, the decision to apply for membership of the Common Market and the suggestions for decimalising Britain's currency.

On these and other topics of the day The Banker's lively and considered views have been well received by its readership throughout the world.

THE PRACTITIONER

The profits of The Practitioner have been well maintained: the circulation continues to increase in all parts of the world and is at an all time record.

E. & S. LIVINGSTONE

Last year I informed you of the purchase by the Practitioner of the whole of the capital of the well-known company of medical publishers, E. & S. Livingstone Limited. Our association with this new member of the group has been a most happy one and under the direction of Mr Charles Macmillan, the Chairman, and his colleagues the company has made gratifying progress during the past year. The worldwide demand for their publications continues to increase and some of the special journals that they publish go to as many as 66 different countries. One significant feature is that export sales amount to over 60 per cent of the total turnover. A number of important publications are in active preparation and the prospects for 1962 appear good.

THE ECONOMIST

During the past year the circulation of The Economist has risen to a record level of over 70,000. Plans for a fine new building in St James's Street are well advanced. Profits of The Economist Newspaper Limited have shown some reduction, but we have every confidence in the company's future.

BRITISH TELEMETER HOME VIEWING

Last year I reported that the Financial News Limited in company with the Financial Times Limited had acquired a small interest in British Telemeter Home Viewing Limited. At the end of last year we exercised an option to take up further shares in this Company. We now have, in partnership with the Financial Times, a 7½ per cent interest in the equity. While future developments depend upon the report of the Pilkington Committee and subsequent Government decisions your Board continues to believe that "pay television" has an important part to play in the future of entertainment. We also remain satisfied that in Telemeter we have a system of "pay television" which, because of its many unique characteristics, must play a leading part in this revolution. We now have associated with us in the Company, in addition to those mentioned last year, a Welsh group headed by Sir David Llewellyn.

J. & A. CHURCHILL

Since the close of the financial year, your Company made an offer of 52s. 6d. for each 10s. Ordinary Share and 20s. for each £1 Preference Share in J. & A. Churchill. The directors of J. & A. Churchill accepted the offer in respect of the shares they owned or controlled and unhesitatingly recommended acceptance on the part of the shareholders in the Company. Our offer has been accepted by holders of 99.08 per cent of the Ordinary Shares and 97.84 per cent of the Preference.

J. & A. Churchill are publishers of a wide range of medical and scientific books, including the Medical Directory, which first appeared in 1845. We have given an undertaking that the business of the company will continue to be conducted as a separate entity under its own name and management and that the rights and interests of the staff will be fully protected. We are happy to be able to say that Sir Adrian Jarvis and his colleagues have agreed to remain on the Board and we look forward to a cordial and profitable association with them and with this new member of our group.

CURRENT YEAR

I would like in conclusion to thank the members of our various staffs for their efforts during the past year. With regard to the current year, conditions are not easy, but I hope I have said enough to indicate that we have every confidence in the future of the growing interests of your Company.

THE FINANCIAL TIMES

YEAR OF PROGRESS: EFFECT OF RISING COSTS

LORD ROBBINS ON THE ECONOMIC SITUATION

The thirty-fourth Annual General Meeting of The Financial Times Limited will be held on the company's premises, Bracken House, Cannon Street, London, EC, on May 22nd.

The following is the statement of **Lord Robbins, CB,** the chairman, circulated with the report and accounts for the year ended December 31, 1961:

Before dealing with the Accounts, I have to record with very great regret the death during the year of A. E. Knock who had been Secretary of your Company for the past fifteen years, and Secretary of the parent Company for much longer. During all that time he gave unrelenting and loyal service to your Company. In his place, we have appointed Mr. A. L. Emerick.

The accounts presented to you show that your Company had a successful year in 1961. The group profit for the year was £1,005,560 compared with £873,088 last year, an increase of £132,472. Taxation takes £522,204 compared with £437,424 leaving £483,356 compared with the 1960 figure of £435,664. After making the adjustments set out in the accounts there is left £493,635 compared with £497,202.

An interim dividend of 7½ per cent less tax on the Ordinary shares was paid in November and your Directors now propose a final dividend of 15 per cent less tax making a total of 22½ per cent less tax for the year. This is equivalent to the 45 per cent paid in respect of 1960 before the bonus issue in June and is in accordance with the indications given at that time. The balance sheet reflects the capitalisation of reserves and other changes approved last June, and, apart from pointing to the further improvement in our financial position, does not call for comment.

BURDEN OF COSTS

The Financial Times made further progress last year but, with regard to the profit, I should point out that the increase was wholly earned in the first half of the year. We traded successfully throughout the year and our revenue continued to rise. During the second half of the year, however, the increase in costs more than offset the increase in revenue. I must emphasise that I am speaking of *increases* and that our actual profit in the second half of the year was satisfactory, although, naturally, we would have liked to have seen the rate of increase of the first six months continued. Up to date this year, our revenue has been fully maintained—a highly creditable performance on the part of our business departments and a tribute to the standing of the paper—but costs have continued to rise at a higher rate than income, and we anticipate a fall in gross profit for the year as a whole.

In a substantial part, the increase in the cost of producing and distributing your paper arises from the expansion of the paper itself. For many years now we have pursued a policy of improving the quality, size and editorial content of the paper. We have no doubt of the correctness of this policy and it has brought its rewards in larger circulation, higher prestige and enhanced advertising revenues. The best advertisement of *The Financial Times* is the paper itself. If I had to extol its merits I can think of no more effective way than to put a copy into the hands of any uncommitted reader. It is a well-written, well-produced product of a lively, well-informed editorial staff, most capably directed from the top. The expenditure of extra costs in achieving these ends has been, we are convinced, the best possible use of our resources and has laid a solid foundation for your continued stability and progress. A less palatable part of the increase in costs that we have had to bear is that which has brought no direct increase in output or improved services.

OPPORTUNITIES IN EUROPE

If this country enters the Common Market, the new economic future opening for ourselves and Europe should present a daily newspaper such as *The Financial Times* with a new challenge and great opportunities. You may be assured that we will do our utmost to meet that challenge and seize those opportunities. The more we and the countries of Europe know about one another's economic and business affairs the better it must be for our mutual welfare and I have every confidence that *The Financial Times* is well equipped to take its place in the forefront of any such new developments.

Editorially, the policy of expanding our service of overseas news and intelligence has been carried still further. News from Europe has been enlarged in scope and has now been grouped together on one page with overseas news from the rest of the world on another. North America has for many years had a section to itself.

On the business side, it is interesting to note that during 1961 advertisements appeared in the columns of *The Financial Times* from no fewer than 38 countries outside the Commonwealth and, on the distribution side, the paper is on sale in every important business centre on the Continent. During 1961, Surveys distributed with the paper were published dealing with Europe, Italy, Russia and Japan, in addition to insets of special pages ranging up to twelve in number devoted to New Zealand, provinces of Canada and other countries. We are, therefore, well based for further expansion overseas.

INDUSTRIAL NEWS

It is, of course, in what we can tell business men abroad about the changing aspects of industry in this country, as much as in the information we can present those at home about what is happening elsewhere, that we aim to be of use to the business community. I need not recount the wide range of industrial news that *The Financial Times* carries every day, or the vast amount of statistical and other material that makes the paper an invaluable source of record. Having mentioned Surveys and special pages dealing with overseas activities, I should, however, complete the picture by saying that last year, in addition to the 128-page Annual Survey on British Industry, some of the other home subjects dealt with included Electronics, Building, Packaging, the Motor and Aviation industries, and Banking.

The net sales continued to expand during 1961, the figure for the first six months being 131,631 and, for the second, 132,928. In 1960, the corresponding figures were 122,164 and 122,505. The volume of advertising was a record at 17,243 columns, compared with 16,355 columns in 1960. More than half our revenue from this source comes today from industrial display advertising covering every branch of industry. That *The Financial Times*, as you would expect, also remains pre-eminent in financial advertising is shown by the fact that in 1961 over 2,600 companies inserted reports of their company meetings, occupying 3,363 columns during the year.

ST. CLEMENTS PRESS

The Accounts of St. Clements Press Ltd., our printing subsidiary, showed a modest profit for 1961. During the year the larger of the freehold premises vacated by the former Speaights division of the Company, and the remainder of its plant, were sold and realised a substantial surplus on book value. Only a small section of the Speaight premises now remains to be sold.

While we continue to find the London labour costs a serious factor in the profitable printing of periodicals and magazines, St. Clements Press has succeeded during the past year in expanding its financial and company printing activities, and in developing its service to advertisers. It is especially in these latter directions, therefore, that the Company looks for useful expansion in the future.

HISTORY TODAY

History Today, in addition to its sales in this country, is now distributed in more than a hundred countries abroad and has a substantial and faithful readership in the USA. The average monthly sale continued to increase and during 1961 rose to 25,092 copies per issue. The readers of History Today clearly appreciate the attractiveness of its presentation, the distinction of its contributors and the quality of its highly varied articles.

INDUSTRIAL & TRADE FAIRS

Industrial & Trade Fairs Limited, our associated company of exhibition organisers, had a successful and interesting year. Its biggest enterprise, the British Trade Fair in Moscow, was an outstanding achievement and, as I can testify from personal observation, reflected the highest credit on its organisers. Its opening was attended by Mr Khrushchev and, apart from the valuable stimulus to Anglo-Russian trade that it afforded, it enabled over one million Russian citizens to see for the first time the achievements of British industry. The Company—in which we are partners with the George Newnes Group—was actively concerned in the reciprocal Soviet exhibition in London, the first of its kind to be held and marked by the visit, as the guest of the Company, of Major Gagarin, the Soviet space man. Over half a million visitors saw the exhibition. The Company, directly and through its subsidiary, Bridges Exhibitions, was also responsible in 1961 for

organising the Construction Equipment Exhibition at the exhibition grounds, made available by the LCC at the Crystal Palace, the Factory Equipment Exhibition, The Engineering Materials and Design Exhibition and the Engineering and Marine Exhibition.

APOLLO

Since the close of the financial year, The Financial Times has purchased the entire share capital of Apollo. This is an old-established monthly magazine devoted to the Arts and, under the editorship of Mr Denys Sutton and with new business management, we have every hope of reviving its fortunes. The first issue under the new direction appeared in March.

ECONOMIC SITUATION

The past year has been a period of some economic difficulty for the economy in general. The pressure on sterling, already a cause of anxiety earlier in the year, developed into a severe drain by mid-summer; and a supplementary budget combined with various restrictions on credit was introduced in July. These measures produced at once an alleviation of the external pressure, some slowing up of the pace of internal activity and, over the months that have elapsed, a gradual improvement in the balance of payments.

I cannot help thinking that these events have been the subject of considerable misapprehension. There have been many protests at the application of the brakes and many complaints that they were not doing what was intended of them. Neither of these attitudes seems to me to be justified. There can be no doubt that the pressure on sterling has been relieved and equally no doubt that the balance of payments position has improved.

It is true that the improvement has not yet gone nearly far enough for safety; but this is in the nature of things. The belief that an increase of exports must immediately follow domestic restrictions is based upon a complete misapprehension of the speed at which the economic system can be expected to adapt itself. If we wish to have a really strong position on balance of payments account we must not expect to get all we want in only a few months.

GOVERNMENT POLICY

As for the instruments involved—increased taxation and credit restriction—there is, of course, always room for argument concerning the expediency of particular measures: I think myself that, on this occasion, it would have been preferable to place more emphasis upon the restraint of consumption *via* taxation and less on monetary policy, valuable as monetary policy can be. But assuming that the rate of exchange was not to be altered—and it was certainly not demonstrated that we had yet reach a position of fundamental disequilibrium necessitating such a drastic step—there seems no reason to doubt the necessity of some restriction of the increase of income and expenditure.

The critics of the Government in this respect have to show that with no such restraint and with a continuation of local expenditure rising more rapidly than productivity, the pressure on the exchanges would nevertheless have eased and the balance of payments would have come into equilibrium. And that, I submit, is something which, with all the grumbling, no one has succeeded in doing yet awhile. The idea, which has sometimes been put forward, that on the eve of our entry into the common market negotiations we should have clapped on arbitrary import restrictions and continued to inflate, has never seemed to me either very practical or very sensible.

NEED FOR EARLIER ACTION

In saying all this I do not wish to be understood to be defending our general economic policy in the last few years; I am far from thinking that this has been particularly well conceived. But the vulnerable point, I suggest, is not in the application of the brakes as we approached the chasm—that was an action which only the village idiot would have neglected—but rather the failure at an earlier date to prevent the general levels of income and expenditure rising more rapidly than our productivity at home and the conditions of markets abroad made appropriate.

Needless to say, it would be wrong to argue that all our troubles arose from mistakes on the home front. The falling off of the invisible items in our international business was in part at least the consequence of policies elsewhere, especially in relation to shipping, which must be regarded as pure misfortune. The fact remains, however, that such conditions indicated, at a fixed rate of exchange, a smaller entitlement to an increase of incomes than would otherwise have been the case. But little account was taken of this; and at the same time the pressure of expenditure was allowed to increase so that during the eighteen months or so before the crisis there was at once a tendency to rising prices at home and to further un-balance in the trading account with abroad. What followed seems to have surprised some people. But it is what always happens when developments of this kind are allowed.

BASIC ERROR

It is a valid cause for concern that what has been done for the time being has impaired the rate of economic growth. I think it is possible to entertain exaggerated fears in this connection—most of the tables of comparative growth rates beg all sorts of questions, and the idea that there has been virtually no material growth recently will not bear inspection either of the side-walks or the skyline. But we can all agree that a stoppage of growth is intrinsically a bad thing; and in so far as there has been a stoppage or at least a slackening that is certainly to be regretted. But again the villain of the piece is *not* the measures which were taken to prevent all sorts of further upsets, conspicuously a sterling crisis of the first order of magnitude, but rather the lack of control which allowed the upswing of 1959 and after to get out of hand.

If there had been just a little more restraint at that time, there would have been need for much less later on. The belief that to secure a desirable rate of growth it is necessary to resort to financial policies which lead to internal inflation and external crisis seems to me to lack foundation either in theory or experience. At any rate it would be a pity to act on it until we have given the alternative policies a much better chance than they have had hitherto.

THE FUTURE

As to the future I think perhaps we could allow ourselves some mild degree of optimism, if only we could assume that the tendency for income and expenditure to rise unduly is not to be allowed to be resumed. The pressure on sterling is relaxed and there is some prospect of continuing improvement in the trade balance; conditions abroad, especially in Germany, suggest that if we do not let our costs get out of hand our competitive position may become easier.

But the proviso is all-important. It would be all too easy, once the feeling of crisis is relaxed, for the let-up to be exaggerated and once more to set in motion the evil cycle of recovery, over-expansion, inflation and balance of payments crisis, which has happened so often in the past. If that happens one prediction can be made with confidence, namely, that there will be no lack of experts trotting forth all sorts of esoteric explanations, anything indeed but the obvious one—that again we have accelerated too fast. It would be comforting to think that at last we had learnt our lesson; for there does not seem to be anything in the situation which is intrinsically unmanageable. But on that, perhaps, in the present confused state of public opinion, suspended judgment is the wiser attitude.

THANKS TO STAFF

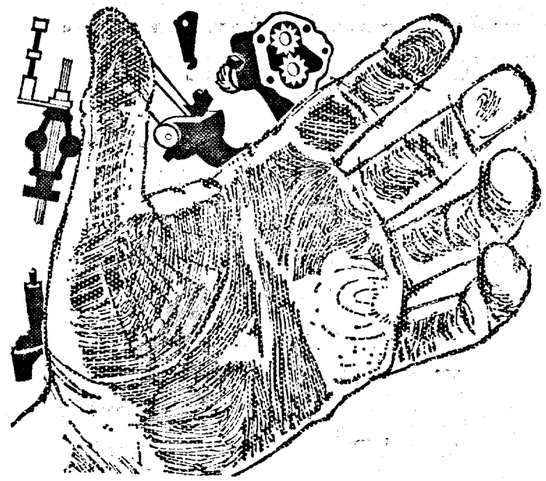
In conclusion I would like, on behalf of the Directors, to express our thanks to all members of the Staff for their efforts on behalf of the Company during the past year. Our Company's prospects during the coming year are much dependent on general economic conditions and, as I have already indicated, these conditions have hardened since I last addressed you. Some fall in profits is therefore probably to be anticipated. But we have great confidence in the long-term development of the Company and in the efforts of the management and staff to promote it.

ENGINEERING COMPONENTS LIMITED

The twenty-seventh annual general meeting of Engineering Components Limited was held on May 2nd in London, **Mr C. C. Griffiths, OBE, MC** (the chairman), presiding.

The following is an extract from his circulated statement:

The past year has been difficult, following one of intense activity.



In my half yearly Statement I referred to the earlier months of the year and I am glad to report that we continued with a reasonable level of output during the last six months, which is reflected in the financial results. These, I hope, you will not think are entirely unsatisfactory.

With difficult trading conditions during the year throughout the automobile industry, we endeavoured to play our part, geared as our costs were to the previous year's record output. In addition, competition over this period, in many products has become ludicrous and if it had not been for constant attention to improving efficiency throughout the organisation, these results could not have been achieved.

Group profits were £666,035 against £829,471 in the previous year, showing a decrease of £163,436.

Our fortunes are largely dependent on the automobile industry, but we have every confidence that our relationship is such that we shall participate in its progress, both at Home and Overseas.

The report was adopted and a total dividend of 17½ per cent, less tax, approved.

FORD INVESTS IN PEOPLE

BY SIR PATRICK HENNESSY

This is a summary of the Chairman's statement to the 33rd Annual General Meeting held on 2 May.

For Ford of Britain, as for industry in general, 1961 was a year of disappointment with wide fluctuations in sales and shrinking profit margins.

In spite of this, it was another year of expansion for our Company and one of planning and preparation.

As confirmation of a continuing faith in the future and on the assumption of further reductions in purchase tax and removal of restrictions on trade, our expansion plan is moving ahead undiminished in speed and scale.

Our record capital expenditure in 1961 exceeded £34 million. For 1962 we have planned an even higher figure and in every four weeks we shall be investing more than we did in the whole of 1952.

The aim of this massive programme is two-fold: to take advantage of the intensively competitive opportunities if, as now seems likely, the UK joins the Common Market and to improve employees' working conditions.

In 1955 our investment in fixed assets was equivalent to £650 per employee: it is now £2,000 and will increase.

This growing investment in more efficient means of production will improve our ability to compete in export markets provided that its effect is not nullified by rising costs of wages and materials or by industrial disputes whether in our own or our suppliers' factories or in essential services.

The first cars are expected off the line this year at the new £30 million manufacturing plant at Halewood near Liverpool; a new head office is being built at Warley near Brentwood. Other major projects include the £10 million tractor plant at Basildon in Essex, a £7½ million addition to the Thames Foundry and extensive rearrangement and modernisation of the original Dagenham factory.

Expenditure on product engineering and styling has been increased and is running at a yearly rate of £5 million.

It is our policy to retain a well-tried design until a new development is proved beneficial to the customer from the functional, cost and reliability points of view. The Anglia is a typical example of this approach. The specification and performance of this rugged but stylish car is as good as any other car of its size and class in the world and we plan to retain it in our range.

It has continued to set the pace in car exports.

During 1961 four new models were introduced—the Consul Classic, the Capri, and the Estate Car and Van versions of the Anglia. All had an encouraging reception.

In April 1962 we have introduced the Zephyr/Zodiac Mark III, the Zodiac in particular offering a new standard of performance and luxury, and the normal control version of the Trader truck with a new chassis layout and an easy-access cab.

A very significant decision was made in January 1962 when Mr. H. H. Jeffries, a member of the Board and previously Director of Manufacture, was appointed as our first Director of Industrial Relations.

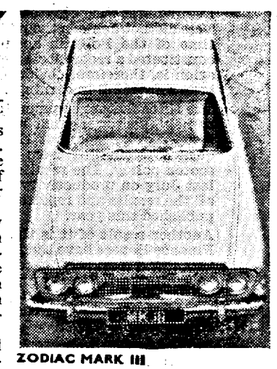
I appreciate the joint responsibility of management and employees in establishing sound industrial relations and it is our wish to improve our communications to assist in creating an atmosphere in which problems can be examined impartially.

I wish to express my personal appreciation of the continued support we have received from our dealers at home, from Ford companies and dealers overseas and from our suppliers during the disappointing trading conditions in 1961. In the past our employees have risen to the occasion in difficult times, and with the new competitive situation at home and abroad, I feel we can rely on our team to face this new challenge.

Although total sales (including parts, industrial engines and other sales) fell by only 4%, income before taxation declined by 34%. Rising costs were the main factor responsible for this large decline.

In the past the benefits of rising volume and increasing investment in modern plant and equipment have offset and masked the effect of higher wages, rising material prices and the cost of industrial disputes and disruptions. Volume decreased in 1961 and rising costs had a severe impact.

Difficulties on the domestic market arose almost entirely as the result of Government action. Violent and artificial changes in demand brought about by hire purchase restrictions and a purchase tax increase made it impossible to plan production in the most efficient way.



The British motor industry must have a large stable home market if it is to compete effectively in the export markets of the world.

We trust that the recent reduction in purchase tax on cars from 55% to 45% indicates that the Government has a full realisation of this axiom and that all future changes in purchase tax will be downwards.

In the export market, total sales fell largely as the result of reduced shipments to the U.S. and increased local manufacture in Commonwealth countries. Sales to Europe, however, increased and Ford of Britain maintained its position as the largest exporter of British cars to Europe.

I am pleased to be able to report that our sales to the Common Market countries increased by 78% over the previous year. The contribution by Ford of Britain to the U.K.'s exports in 1961 was over £100 million and in 1962 this figure is expected to be significantly higher.

I end this statement by referring again to the severe reduction in profit in 1961 and report that there has been an even more serious deterioration in the first three months of 1962.

ZODIAC MARK III

1961 RESULTS: 34% DECLINE IN INCOME

Summary of Sales and Income

	1960	1961
UNIT SALES Domestic	294,366	308,310
Export	252,403	204,502
Total	546,769	504,812
Sales value	£268.7m.	£259.0m.
Income before taxation	£33.7m.	£22.2m.
Taxation	£14.9m.	£7.9m.
Income after taxation	£18.8m.	£14.3m.
Dividend per share	3s.9d. (less tax)	3s.9d. (less tax)

FORWARD WITH Ford

CLAYTON DEWANDRE HOLDINGS LIMITED

Extracts from Mr A V Perry's Review

The Thirty-third Annual General Meeting of the Company will be held on the 24th May 1962 at the Company's London Office, 156–157 New Bond Street, London W1.

The following are extracts from the Chairman's Review which has been circulated to Stockholders with the Directors' Report and Statement of Accounts for the year ended 31st December 1961:

As this is the first year in which I address my comments to you on the Company as a pure holding company, I propose to go into some detail of the constituent units of the Group.

The holding company has acquired the entire issued capital of Follsain Limited. What informed your Board in this acquisition was our policy of diversification: but we did not want diversification for diversification's sake only. What we wanted was other businesses not wholly concerned with the motor vehicle industry but in which our own experience, skill and techniques could be utilised.

CLAYTON DEWANDRE COMPANY LIMITED
THE BRIDGE FOUNDRY COMPANY LIMITED
POWER BRAKES LIMITED

Dealing first with Clayton Dewandre Company Limited itself. This did not achieve the profit your Directors forecast at the time of the Follsain acquisition by some £21,000. Output constituted a record, being some 7½% up on 1960. Some explanation is, therefore, obviously necessary as to why there has been a shortfall in earnings.

The three factors common to almost all industries are there, namely, narrower profit margins, increased labour costs and steeper overheads, but the prime factor is the dire consequences stemming from the Government's economic hop-scotch policy. The results of "the great leap backwards" of last July on productivity have been apparent in pretty well all the results and reports of manufacturing companies so far published this year.

Another result of it is the erratic policy the Hire Purchase Finance Houses have been forced to adopt. Admittedly part of this stems from their excess enthusiasm in the years 1959 and 1960, resulting in heavy repossessions in the latter part of 1961, with consequently a glut of secondhand vehicles making it extremely difficult for the Trade to sell new vehicles during the past six months.

In our case we were working full stretch up to October, but then the heavy commercial vehicle manufacturers found they were manufacturing more vehicles than they could sell, and this resulted in their cutting back their demands on us, substantially in November and drastically in December.

I am not crying before we are hurt because this position has carried on into 1962. In the first three months of this year we have been working way below capacity at our Lincoln Works, and whilst the Government and the Heavy Vehicle Industry predict a fairly early up-surge it is only right to say that so far we have yet to see tangible evidence of this in the shape of increased schedules, rather than pious hopes. This must necessarily result in poor figures for the first half of 1962, and whilst we are not perturbed on the long view, it is disappointing. What makes it all the more infuriating is that we have spent vast sums on creating this up-to-date competitive capacity; we have good skilled labour, and have our fair share of the market, but yet in the result we find our outlet temporarily stopped up.

You will gather that we view the future with confidence, provided that we are allowed to do our job without sporadic and perplexed interference with the economy as a whole.

THE BRIDGE FOUNDRY COMPANY LIMITED

The same general remarks apply here as I have made in relation to Clayton Dewandre Company Limited. Sales were down 5½% and profit was down by 25%.

POWER BRAKES LIMITED

In the early part of the year under review these Works became fully operative, and without them it would have been impossible to achieve the high output from Lincoln for the first 10 months of the year. The venture has fully justified itself, but in common with the other manufacturing units it is finding itself working below capacity at the moment.

CLAYTON DEWANDRE (SOUTH AFRICA) (PTY) LTD

We are pleased with the progress of this Company. Despite its recent origin, it has made a small trading profit this year, and when there is added to this the revenue of sales to it from our Home Works the venture is paying off. We are satisfied with its prospects.

UNITS FORMERLY OWNED BY FOLLSAIN LIMITED

These units turned in better trading results and larger profits than their Directors forecast at the time of the merger (£127,851 against £84,327 in the previous year). These results reflect great credit on all those concerned in this branch of our enterprise.

FOLLSAIN-WYCLIFFE FOUNDRIES LIMITED

The weight of castings sold and the profit were again a record. Having regard to the fact that this unit serves a wide range of industries with specialised products, it is therefore in a position to take advantage of any general up-surge of demand if a reasonable level of activity is seen throughout the country.

VARATIO-STRATELINE GEARS LIMITED

There is a steady demand for the well established products of this Company, and with the greater capacity now available in the new Works they also can take advantage of any increased demand.

CAMPBELL GEARS LIMITED

This Company are specialised Gear Cutters. The first full year's trading under Follsain ownership resulted in a satisfactory volume of sales and trading profit. A wide range of the engineering industry makes increasing demands on the specialist gear cutter, and there seems good grounds for expecting expansion.

JOHN TANN LIMITED

This Company is the well known safe and strongroom Engineers. The new Works at Billericay, of which a lease has been taken, should be ready for occupation about the middle of this year, and manufacturing will be gradually moved there over the latter part of this year and early in 1963. The larger capacity of the new Works is urgently needed, as it has become impossible at the present Works to deal with the large volume of orders on hand.

The trading profits for 1961 were substantial and satisfactory.

Having regard to the heavy nature of the product, and that we are moving from premises we have occupied for some 80 years into new premises with a change over to modern productive methods, the disruption is bound to have an effect on profits in the current year.

The high quality of this Company's products is universally acknowledged, and when the new Works are in full production and we are getting nearer to meeting the existing demand, we think we can envisage further expansion and we see every reason for confidence in the long term future of this unit.

INDIA

A Company has been formed known as Sundaram-Clayton (Private) Limited, of which we own 49% and our Indian Partners own 51%. The Government licence for manufacture has been granted.

A factory is in course of erection at Madras, and the necessary plant and equipment is being ordered. It is anticipated that the Company will be in production in the second quarter of 1933.

That surveys all the activities of your Group.

Taking a broad view, despite the inevitable temporary setback in the first half of this year the Clayton Dewandre unit should view the future with confidence, and is in a position immediately to take advantage of any increase in demand. All the other units are efficient, with well established products and a good demand.

Our gratitude is due to the personnel of all the operating units, management, technicians and operatives, for the fine work they have put in during the year under review.

PROVINCIAL INSURANCE COMPANY LIMITED

MR PETER F. SCOTT'S STATEMENT

The Annual General Meeting of the Provincial Insurance Company Limited will take place at Kendal at 11.0 a.m. on May 21, 1962. The following is an extract from the statement of the Chairman, **Mr Peter F. Scott:**

There are two changes in the main Board which I would like to mention. Mr Roger S. Falk, O.B.E., having assumed wider responsibilities elsewhere, relinquished his deputy chairmanship but remains a director. Mr W. H. Gee, our General Manager, joined the Board in November.

It is with regret that I record the death during the year of Mr J. B. Black of Ayr, a member of our Scottish Board and an old friend of the Company. I am glad to welcome his partner, Mr Alex. Hay, to the vacant directorship.

Premium income increased by £359,625 and now exceeds £10 million. There was a reduction, for which we were prepared, in our overseas income: the account should be the healthier for this. The slight falling away in our marine income, which has advanced quickly in recent years, reflects a wish to restrict our commitments in certain classes. In the circumstances I consider the over-all increase satisfactory.

Underwriting profits of £524,715 in the fire and accident departments are a record for the Company. Three factors have contributed to this gratifying result. Our underwriting of the predominant home accounts has maintained its usual high standard: for the third successive year, and one in which we have absorbed the cost of higher salary scales, our ratio of costs to income shows a reduction: and, most welcome, our overseas operations after several lean years have produced a small profit, thus confirming the belief I expressed last year that our prospects in this field were brightening. Canada, in very competitive conditions, produced a modest profit; there was a useful surplus from Southern Africa on a reduced income; both the 'West African Provincial' and our branch in the Far East had an excellent year; and progress was maintained in East Africa and Ghana. Australia is another matter: costs there are intractable and competition for worthwhile business is intense. But these conditions are not peculiar to any particular market, and we have every confidence in management's ability to overcome them in Australia as elsewhere.

FIRE DEPARTMENT

	Premiums	Underwriting profit	Percentage of premiums
1961	£1,658,667	£64,908	3·9
1960	£1,600,514	£78,426	4·9

Despite the widespread publicity given to the danger and the cost of fires, the amount of direct damage caused by fire at home during 1961 was estimated at £39 million, which is still more than 50 per cent above the average for many years up to 1958. Unfortunately, there is no consistent pattern in the incidence of fires to explain this threat to the profitability of a section of our business which we have always regarded as one of the most stable. Freak windstorms and severe frosts during the year led to a steep rise in the number of claims for damage by these natural perils which are increasingly included in the protection given by fire policies.

The intensity of competition for fire business both at home and overseas showed little sign of diminishing, and especially at home the relentless pressure for rate reductions at each renewal slowed down our rate of growth, which was also inhibited by our policy of reducing our commitments on insurances which we consider are uneconomically rated.

ACCIDENT DEPARTMENT (INCLUDING MOTOR)

	Premiums	Underwriting profit	Percentage of premiums
1961	£6,978,596	£459,807	6·6
1960	£6,653,273	£60,467	0·9

In the home motor section the annual increase in the cost per claim, to which I referred last year, occurred once more. The rise was in fact even sharper, but increases in the rates for some types of goods vehicle and motor-cycle helped to offset it. Revisions in private-car rates beginning in September amounted to little more than a redistribution of charges designed to achieve a higher degree of equity as between different districts and a still greater discrimination in favour of motorists with five or more years free of claims.

However, I am glad to say that both at home and in nearly all territories overseas the motor account and most sections of other accident business, once again produced a profit. Our valuable home goods-in-transit business, while not yet fully restored to its former healthy state, showed much better results than in 1960 when claims for stolen goods were more serious than ever before: unhappily, however, our home burglary account suffered heavily from the crimes of 1961 and showed a loss. It has become necessary both to increase rates and to insist upon stricter standards of protection for business premises.

MARINE DEPARTMENT (INCLUDING AVIATION)

	Premiums	Marine Fund	Percentage of premiums
1961	£1,555,260	£2,246,933	144
1960	£1,579,111	£1,910,856	121

The casualty record, especially of fires and explosions, was heavier than average in 1961. If this trend continues and we are faced with the possibility of a rise in world-wide repair costs, the outlook for hull business will be less encouraging than it has been in the immediate past years. Cargo underwriting too continues to cause anxiety, mainly owing to severe competition, both at home and abroad.

In our aviation account there is a welcome improvement, and there are indications that the market rating during the past two years has been more soundly based than previously.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The book value of our investments and property increased by over £1,900,000 during the year and there was a substantial appreciation in market value. Interest earnings and rents in 1961 at £880,000 showed an increase of £89,000 over the previous year. This increase is somewhat less than the record figure reported for 1960, and it appears probable that the rate of increase in 1962 will again be a little lower owing to the less favourable short-term prospects for dividends receivable on our ordinary share holdings.

The total credits to profit and loss account were £1,405,000. The disproportionate size of the tax charge of £693,000 is accounted for in part by an improvement of the marine results prior to 1960 after a series of unprofitable years.

DIVIDEND

Following such satisfactory trading results and a substantial increase in investment revenue, the directors would have felt justified in recommending an increase in dividend. Having regard, however, to the Chancellor's request for restraint, they recommend an unchanged dividend of 2s. 4½d. and a transfer of £250,000 to the general reserve. After giving effect to these recommendations the amount carried forward on the profit and loss appropriation account is increased by £21,000.

STAFF

The 'Provincial' has always provided pensions for the widows of men who die whilst in the Company's service. We have decided that the time has now come to vest in the staff a right to predetermined pensions for widows and we are accordingly creating a fund to which the Company and the employee will contribute.

During the year we have broadened the base of our employee shareholding scheme under which 67,870 ordinary shares of the Company are now held by members of the staff.

Our residential training college at Ycaland Manor was employed to capacity in 1961, and has played an important part in the dissemination of fresh thinking and new methods in the Company.

Once again I wish to thank our agents everywhere for their continued support and I also have much pleasure in expressing thanks on your behalf to our management and staff at home and abroad for the enthusiasm, effort and resource which have culminated in such a satisfactory year's trading.

ROSS GROUP LIMITED

ANOTHER YEAR OF PROGRESS

The following are salient features of the Accounts for the year ended 30th September, 1961, and the report by the Chairman, Mr. J. Carl Ross, to the Annual General Meeting on 27th April, 1962

" By a planned diversification of interests, Ross Group has now become an association of more than one hundred and thirty Companies."

PROFITS

The Group Net Profit before taxation is £1,066,418 (£600,677) after expenses of £1,204,497 (£775,745). These expenses include Depreciation £815,000 (£512,500) and Interest Charges £333,391 (£215,950). The Net Profit, after taxation, pre-acquisition profits and amounts attributable to outside shareholders and crediting exceptional items (net) £25,781 (£17,183), is £730,243 (£494,213).

Preference Dividends £9,188 (£9,188) and Ordinary Dividends £473,334 (£294,587) together absorb £482,422 (£303,775) leaving an amount retained in the Group of £247,721 (£190,438).

DIVERSIFICATION OF INTERESTS

This year, for the first time, the turnover given is for all Subsidiaries for a full year's trading :—

	1960	1961
Value of fish landed from our vessels	4,000,000	4,200,000
Fish Merchanting and Distribution	9,500,000	11,200,000
Frozen and other Foods : Production and Distribution	11,000,000	15,400,000
Day-Old Chicks and Broilers : Production and Sales	—	6,000,000
Shipbuilding, Engineering, Transport and Motor Distribution and Other Activities	3,500,000	5,200,000
	£28,000,000	£42,000,000

The true measure of our diversification is clearly apparent. With the exception of two small specialist Companies engaged in Fish Merchanting, none of the Companies acquired since 1st October, 1960 has been engaged in the Fishing Industry.

Apart from our investment in the Chicken Industry, which features in the breakdown of turnover for the first time, we have extended our interests in Frozen Food Distribution, Transport, Printing, Motor Distribution and Fresh Vegetable Merchanting. This spread of interests has proved invaluable to us.

In our Chicken Division, it is clear that we will not, during the current year, earn the Profits we had anticipated. We have every confidence that the position is under control and that the results from this Division for next year will be very much improved.

Another factor is that our Frozen Food Division is incurring heavy Capital Expenditure which cannot, in the initial stages, produce the Revenue required to maintain profitability. The growth potential of this section of our activities is, however, undeniable.

DIVIDEND FORECAST

Despite these disappointments in Current Trading, it is hoped by your Directors, as forecast in the circular to Shareholders of 5th September, 1961, to be able to recommend in respect of the current year Dividends totalling not less than 22%, less tax, on the Ordinary Share Capital which at present stands at approximately £4,600,000.

After commenting on the continued modernisation of the Trawling Fleet, the Chairman's Statement continued :—

ROSS FROZEN FOODS

The continuing expansion has resulted in a rise in sales of 40% over those of 1960. It is increasingly difficult, however, to maintain this rate of expansion whilst adhering to our high quality standards.

During the past year, production has been steadily increasing as the extensions to our Factories have been completed. The sales of portion packs to the Catering Trade are becoming an extremely important outlet for our production. It is our intention to maintain the highest quality standards in the Frozen Food Industry.

THE YOUNG GROUP OF COMPANIES

In placing on record my congratulations to the Management, I must mention that under the outstanding direction of the Young family, they have continued to increase their Sales and Profits.

STERLING GROUP OF COMPANIES

In May, 1961, your Company acquired the whole of the Share Capital of Sterling Poultry Products Limited. This was a major development in the history of Ross Group, and it represents by a considerable margin our largest single investment outside the Fishing Industry.

With its long experience and its National coverage, Sterling looks to the future with confidence.

STAFF

It is now, once again, my privilege, on behalf of my co-directors and the Shareholders, to thank the Executives, Staff and Employees at all levels for their contribution to the success of the Group during 1961.

BABCOCK & WILCOX, LIMITED

SIR KENNETH HAGUE'S REVIEW

FUTURE PROSPECTS VIEWED WITH CAUTIOUS OPTIMISM

HEAVY ENGINEERING INDUSTRY'S UNPRECEDENTED FINANCIAL BURDEN FROM PIONEERING WORK IN NUCLEAR POWER

The sixty-third Annual General Meeting of Babcock & Wilcox, Limited, will be held on May 24th at Federation of British Industries, 21, Tothill Street, London, S.W.1.

The following is an extract from the Statement of the Chairman, **Sir Kenneth Hague,** circulated with the Report and Accounts for the year ended December 31, 1961:

FINANCIAL COMMENTS

It is satisfactory to report, after a period of considerable anxiety, that the Company results are much more favourable than at one time seemed probable. Last October, after very careful consideration, your Board regretfully decided to omit the payment of an Interim Dividend on the Ordinary Stock. At that time the net earnings for the first six months were insufficient to cover any dividend, a number of important claims still remained to be settled and the Works' output was below budget. Although there was a prospect of recovery by the end of the year, your Board thought it wise to delay any dividend decision until the complete year's results were available.

In the event, some of the outstanding claims have been settled, Works' output improved considerably in the last quarter of the year, and the out-turn of various contracts completed during the year showed a small but distinct improvement. These developments, coupled with improved income from several overseas subsidiaries, have enabled the Board to recommend a dividend for the year of 9 per cent.

LOSSES ON NUCLEAR POWER STATION CONTRACTS

Last year, we transferred from Contingencies Reserve the sum of £700,000 as a further provision for excess expenditure on the Hinkley Point and Trawsfynydd Nuclear Power Station contracts: even this large sum has since proved to be insufficient and additional expenditure of £150,000 is expected and has been charged in the accounts. The net balance of the provision for possible future losses on nuclear contracts now stands at £288,731, which your Board consider to be sufficient to cover all remaining expenditure required to complete these contracts.

I do not believe it was the intention of H.M. Government that, by undertaking the pioneering work of the development and building of the first group of nuclear power stations in the country, the heavy engineering industry should have been burdened with unprecedented financial losses which, in my judgment, must now amount to at least £25,000,000. Our share of this burden has occurred at a time when profit margins on conventional contracts have been smaller than at any time in the past 30 years and quite inadequate to offset the excessive costs experienced on the nuclear work. We are submitting to the Central Electricity Generating Board claims arising out of the special character and conditions of the contracts; if these can be settled on a satisfactory basis, we will be able to restore at least some of the strength of our reserves—reserves which are so essential to this Company in the pursuit of its international trading.

ORDER BOOK

I am pleased to say that, since October when you were advised that the Order Book stood at a higher figure than for some years past, we have been awarded further important contracts at home and abroad. These include four radiant re-heat boilers for the burning of pulverised fuel at Cockenzie and two radiant bi-drum boilers for Methil, both these stations being operated by the South of Scotland Electricity Board; in addition, an order for the Trinidad and Tobago Electricity Commission for two radiant boilers and three boilers for the Government of India. Another important overseas order was that of our Australian Company for the Hazelwood Station of the State Electricity Commission of Victoria.

The introduction at the Dalmuir Works of new products—which are not related to boilers and are independent of their ordering cycles—will, we hope, make an important additional contribution to the volume of work in hand. One of the most notable of these new products is the Babcock-Marion excavator and crane.

However, as was explained to stockholders in the Annual Statement for the year 1958, the main reason for taking over the Dalmuir Works from the Ministry of Supply was the prospect of fabricating large vessels and equipment for nuclear power stations. Since that decision was made the national programme for nuclear power has been reduced, with the consequent slowing up of the award of orders for such power stations, and recent specifications are calling for containment vessels of concrete instead of steel. If this major change in design becomes an established fact, the reduction in requirements for steel vessels will again create a serious problem in respect of the loading of the unique manufacturing facilities which are available at Dalmuir Works.

Stockholders may be interested to know that the Sizewell nuclear contract, which was awarded last year to the English Electric, Babcock & Wilcox and Taylor Woodrow consortium, has made good progress, both in relation to shop manufacture and erection and is well up to schedule.

RESEARCH AND DEVELOPMENT

Profit margins on our supply contracts have not provided funds on the scale we regard as essential for our research and development activities. As a result, we have drawn on the Research and Development reserve, reducing it during the year from £185,431 to a nominal figure of £34,745 in order to maintain our research programme at a reasonable level having regard to the long-term interest of the Company. It is very much to be hoped that we shall soon be in a position to strengthen this reserve again to meet future requirements.

ACC-VICKERS-BABCOCK LTD., INDIA

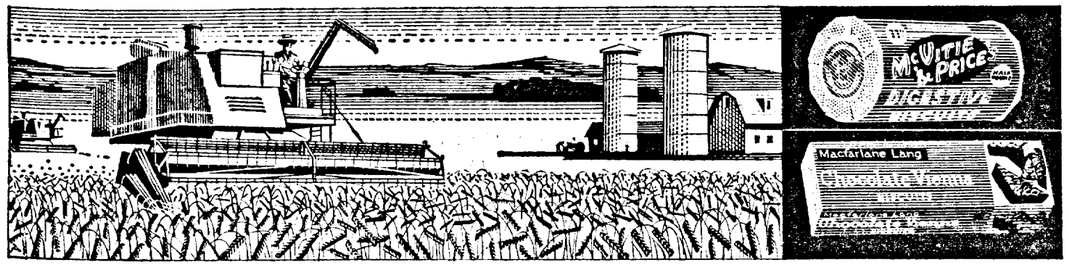
The heavy engineering Works at Durgapur in Bengal, built by A-V-B (Associated Cement Companies of India, Ltd., Vickers Ltd., and Babcock & Wilcox Ltd.), was completed on schedule and is now in operation.

This Company has started its operations with a satisfactory order book and on behalf of Babcock & Wilcox Ltd. I should like to pay tribute to the Government of India for the help and encouragement they have given to this project.

BABCOCK & WILCOX OF AUSTRALIA PTY. LTD.

I was able to pay a short visit to Australia in February of this year and am able to report that your Australian Company is in a very sound position. The trading results of the Company did not reach the high total of the previous year but, nevertheless, satisfactory figures were attained.

After reviewing the activities of subsidiaries at Home and Overseas the Chairman continued:



GENERAL REVIEW

For the past few years we have advised stockholders of the difficult conditions obtaining in the heavy plant industry in general, and in our section of the industry in particular. These difficulties have been accentuated by the rapid increase in the size of steam generating units required, resulting in large, but very few, contracts being placed annually by the chief buyers; and also by the advent of nuclear power plants to which we have already referred.

Whilst the general trading conditions are still difficult and profit margins inadequate, I consider there are reasons for cautious optimism regarding the future prospects of the Company. First, the steps which, as I reported last year, had been taken for reshaping the productive capacity to meet the present-day demands are already showing results. Full provision has now been made for the heavy losses on the nuclear power station contracts to cover all remaining expenditure, and we do not anticipate that similar problems will occur on the Sizewell contract.

I have already advised you that the present order book can be regarded as satisfactory. The Central Electricity Generating Board stated in their last annual report that during the next ten years more new generating capacity must be provided than is at present installed in all existing power stations in England and Wales, and it is reasonable to expect that your Company will receive its fair share of the contracts available.

Apart from the home market, we can expect to receive considerable business from overseas, in spite of the foreign competition which will undoubtedly be encountered. You are aware that much of the Company's overseas business is fulfilled in association with the Group Companies and I am confident that they will be able to maintain and expand the business in their respective territories. Thus the long term policy which your Board has pursued for very many years in establishing manufacturing plants in different parts of the world will prove to be fully justified.

STATEMENT BY THE CHAIRMAN **MR. P. G. MACDONALD**, J.P., W.S.

to be presented at the Annual General Meeting of United Biscuits Limited, to be held on May 31st, 1962, at the Caledonian Hotel, Edinburgh

UNITED BISCUITS LIMITED

AND SUBSIDIARY COMPANIES

McVitie & Price Ltd · Macfarlane, Lang & Co. Ltd · McVitie & Price (Canada) Ltd · S. Henderson & Sons Ltd

I AM AGAIN in the happy position of being able to report group sales for the past year which break all our records at a figure of over £21,600,000, an increase of £1,400,000 over the previous year. The trading profit figure is also again the highest recorded and this is particularly gratifying in a year when, despite increased costs, we reduced the price of two of our major selling lines, the ½lb. packets of McVitie & Price's Digestive and of Macfarlane Lang's Granola Digestive.

The Chancellor in his Budget has seen fit to levy a 15% Purchase Tax on chocolate biscuits along with sweets. I personally feel that he and his advisers would be better employed looking for ways and means, and they would not have far to look, to cut down drastically unnecessary Government expenditure and waste by nationalised industries. He could thus reduce taxes instead of looking for new impositions which, in this case, must affect the housewife and her daily purchases. Our industry, like all others which have pulled their weight for so long, has every right to demand now from the Government a much overdue reduction in the present overwhelming burden of taxation, our company's share of which for 1955 amounted to over £1,000,000 and for 1961 to over £1,500,000. The Chancellor asks us to produce and export more. We have done both and in return we again ask him to produce from all Government departments specific reductions in expenditure.

CAPITALISATION ISSUE In November 1961 we carried through a capitalisation issue of two ordinary shares of 10/- each for every three ordinary shares of £1 each then held, thereby increasing the ordinary capital from £4,500,000 to £6,000,000. Shareholders will recall that similar capitalisation issues were effected in May 1955 and November 1958 so that, as a result of these operations, the original ordinary share capital of £2,000,000 has been trebled. At the same time we took the opportunity of altering the nominal value of our ordinary shares by issuing two 10/- shares for every £1 share formerly held. This, your Directors believe, will increase the attractiveness of the shares. I take this opportunity of acknowledging the co-operation of the ordinary shareholders in sending in their certificates for exchange and I would remind any who may not yet have done so to send their old certificates as soon as possible to the Secretaries' office to be exchanged.

GROUP ACCOUNTS The group profit for the past year after charging depreciation, directors' remuneration, provision for pensions and auditors' fees amounted to £2,941,939 as against £2,877,023 in 1960, an increase of £64,916. Income tax and profits tax absorbed £1,520,754 (1960 £1,439,198), leaving after taxation a balance of £1,421,185 (1960 £1,437,825). The preference dividend for the year, less tax, absorbed £36,750.

An interim dividend of 6%, less tax, paid in October 1961 on the then issued ordinary share capital of £4,500,000 required £165,375 and your Directors recommend that a final dividend on the increased ordinary share capital of £6,000,000 be paid at the rate of 10%, less tax at 7/9d. in the £, requiring £367,500.

The total dividend for the year on the ordinary shares is equivalent to a rate of 14½% on the ordinary share capital of £6,000,000 now in issue and compares with an equivalent effective rate of 13½% for 1960 on the increased capital. After meeting the expenses of the increase in share capital, the balance of unappropriated profit of £828,162 (1960 £904,950) has been transferred to revenue reserve.

The group's capital expenditure amounted in 1961 to over £1,000,000 and as will be seen from the accounts our capital commitments at 31st December 1961 amounted to £560,000. From this it will be realised that we are continuing our policy of maintaining our factories and plant in a high degree of modernisation and efficiency.

EXPORT Our export trade continued to advance. Sales in Canada, our largest export market, increased by 6.8%.

THE FUTURE I am again in a position to report that for the first quarter of the current year the group sales show an increase on the corresponding period of the previous year.

MANAGEMENT AND STAFF Once more on behalf of the shareholders I would congratulate and thank everyone in our group for the combined effort which alone has made another successful and record year possible. We look forward with confidence to the challenging times which lie ahead.

TRADING SUMMARY

FRIED. KRUPP

ESSEN, GERMANY

(Coal, Iron, Steel, Engineering, etc.)

INCREASED COMPETITION BUT TURNOVER MAINTAINED

INTERNATIONAL CONSORTIA FOR DEVELOPMENT PROJECTS RECOMMENDED

The following are details of the address given by HERR ALFRIED KRUPP VON BOHLEN UND HALBACH, owner of the KRUPP concern, on the occasion of the ceremony celebrating the long-service anniversaries of members of the Company's labour force, on March 31, 1962:

ANNIVERSARY

"I am particularly pleased to greet you here today, because I am able to count myself among those celebrating their long-service anniversary in 1961. On October 1st twenty-five years ago, I entered the firm of Krupp on completion of my studies in Aachen.

A few months ago, we also celebrated the 150th anniversary of our Company. This was only possible because you and thousands of your colleagues had worked so hard to rebuild our organisation after the war.

These occasions always provide a welcome opportunity to review our organisation's progress and I should, therefore, like to comment on developments during 1961. In the course of that year the economic picture underwent a marked change. The strong expansion slackened considerably, a trend which concerned the Federal German Republic as much as the other countries of Europe.

It is true that the economy of the United States has again recovered, so that generally speaking the western industrialised nations were spared a steep recession. However, although the economic situation has become more stable, it contains tensions which seriously menace industrial activity at least in some major sectors.

The period of economic expansion that lies behind us gave the far-seeing industrialist the opportunity to consolidate his business. It put us in a position where we were able to draw level with our competitors who had started their reconstruction years earlier. We have never noticed anything of a so-called excessive boom. On the other hand, we are today suffering from the consequences of this incomprehensible slogan.

REVIEW

In the course of 1961, demand on domestic markets declined and foreign orders also fell in the second half of the year. This was a result of the considerable stiffening of competition throughout the world. The German exporter has to struggle for his markets. Travelling abroad, I have increasingly come to the conclusion that we can no longer rely on the proverbial reputation for high quality which German products used to enjoy. Other industrial countries have caught up with us. The competitive pressure has moved into the field of pricing policy. Occasionally we are faced with quotations such as from eastern bloc countries with which we cannot compete. Pitiless competition prevails in the emergent countries. Finally, the position of the German exporter has also been aggravated by the revaluation of the D-Mark.

Generally speaking, the end of the year showed a decline in orders on hand, with the decrease in demand particularly marked in raw materials and capital goods. Steel production had to be curtailed towards the end of the year. Furthermore, the pricing situation has become untenable for German steel producers, as a result of the differences in taxation applied in the countries of the European Coal and Steel Community. In the light of these distortions, it is essential that equal competitive conditions should be created for steel within all countries of the E.C.S.C.

We continue to be greatly concerned about our mining operations. Our mines were involved in losses in the past year, and there is no sign of a general stabilisation in the competitive position in the mining field. The inevitable conclusion is that production has to be adapted to demand by rationalisation measures. An overall plan will be needed to make this field of operation structurally sound in the foreseeable future.

TURNOVER

As regards our results for 1961, we have been able to maintain our position at the previous year's levels, but business did not develop uniformly in the different sectors of our activities.

In 1961, FRIED. KRUPP and its associated companies reached a total turnover of DM 3,042m. Compared with the previous year this was an increase of 6.9 per cent. In 1960, however, the rate of growth exceeded 12 per cent. Exports accounted for DM 594m. in the year under review, a decline of DM 26m. compared with 1960.

Hütten- und Bergwerke Rheinhausen AG., including *Bochumer Verein*, had a turnover of DM 2,142m. This was DM 76m. or 3.4 per cent less than in the previous year; in comparison, in 1960 our raw materials sector showed an increase in turnover by over 20 per cent. Exports in 1961 were slightly up at DM 213m., compared with DM 203m. in the previous year.

Group turnover accordingly rose in 1961 to DM 5.184m. The rate of increase amounted to only 2.4 per cent, while in the previous year it came to 16 per cent. Allowing for internal deliveries, our external turnover totalled DM 4,215m., or only 2.2 per cent more than in 1960. Of this total exports accounted for DM 807m. or DM 15m. less than in the previous year, resulting in the share of exports in turnover declining from 20 per cent in 1960 to 19 per cent in 1961.

On December 31, 1961, FRIED. KRUPP and its associated companies had a labour force of 60,582 compared with 58,390 at the end of 1960. *Hütten- und Bergwerke Rheinhausen AG.* employed at the same time 53,293, compared with 53,947 at the end of the previous year. Accordingly the Group's total labour force at the end of the year under review came to 113,875, or 1,538 more than in the previous year.

I should prefer not to make predictions about the future. Briefly, our task is to achieve long-term security for our work. Despite our current level of operations, it will require the greatest efforts to maintain it.

ECONOMIC PROSPECTS

The speeding up of economic integration in Europe offers us rather fewer opportunities but more risks. This development will be underlined by the prospective entry into the E.E.C. of Great Britain and other countries. In the Federal Republic, as a low-tariff country, foreign competition has intensified considerably in the last few years and rising costs are rendering our competitive position vis-à-vis our partner countries more difficult. Nonetheless, we maintain our favourable attitude towards the European communities in the interests of international collaboration.

The emergent countries are facing us with increasing problems. In part, they are industrialising so fast that we ourselves have to offer technical standards jumping several stages in the industrialisation process. In constructing a technically excellent plant in Brazil, employing 1,750 people, we have also proved our readiness to take commercial risks, but in view of the multitude of the large projects to be carried out, the initiative of a single company is not enough. Projects of this kind call for international partnership. Through the formation of private international supply and financing consortia of a kind that we suggested some time ago, the commercial risks and technical tasks can become more bearable for each partner. But this alone would not be enough. We are again calling on the Government to provide legal protection for private property in the emergent countries

against unilateral State measures, and to guarantee proper yield on capital and capital repayment.

The management of our organisation is constantly endeavouring to secure orders, and rationalisation measures are more necessary than ever. Our main objective must be to raise the overall level of our work. Intensified measures will be taken to improve the qualifications of our staff at all levels, starting with apprentices.

SOCIAL CONTRIBUTIONS

Industry is seriously concerned with the absenteeism owing to illness prevailing for the past few months. There can be no doubt that the new law providing for the continuation of wages payments to workers in case of illness has been partly misused.

Our Company has provided social security contributions for the past 150 years. In part they pointed the way for subsequent legislation. In 1961, our total expenditure on staff for the Group's domestic undertakings, including *Hütten- und Bergwerke* and *Bochumer Verein* exceeded for the first time the DM 1,000m. mark: the amount was DM 1,157m. compared with DM 998m. in 1960. Despite this increase by DM 159m. the labour force of our domestic undertakings rose by only 1,814.

Wages and salaries amounted in 1961 to DM 901m. Compulsory social contributions came to DM 138m. or 15.3 per cent of the amount spent on wages and salaries during the year. In addition, we provided voluntary social contributions totalling DM 118m. or 13.1 per cent of the total wages and salaries bill. This figure does not include expenditure on staff housing. We have accepted these burdens, but in view of the tasks facing us we must reject unjust demands from whatever quarter they may come. It is precisely the increase in costs in the most recent past that causes us the greatest concern. Profit margins are constantly shrinking as a result of extraordinarily stiff competition.

I should like to point out that in 1961 we paid DM 272m. in taxes and other charges on behalf of the whole Group, including the sector of basic industry. In view of this burden, we must ask ourselves how we are going to raise in future the finance necessary for the increased rationalisation of our production programme. In the year under review we made capital investments in the Group's domestic undertakings, including the sector of basic industry, totalling about DM 290m., depreciations amounting to DM 202m.

Faced with these problems, we fail to have any sympathy with talk about 'excessive concentration.' The uncertain economic situation requires all our strength to secure work for our plants and our staff. We are not motivated by so-called desire for power, but by the responsibility for many human beings and their families. Furthermore, without large concerns and their private initiative, there can be no successful development aid. The magnitude of the tasks involved in this field can only be mastered jointly by large organisations.

You realise the responsibility we are carrying. It cannot be shouldered by the management of your Company alone, and I would ask you to help by your example to carry out our task for the welfare of all."

Statement by the Chairman of The Cape Asbestos Company Limited

CONTINUED STRENGTH IN DIFFICULT YEAR

Mr Giles Newton's Confidence in Company's Future Prosperity

The sixty-ninth annual general meeting of The Cape Asbestos Company Limited will be held on May 25th in London.

The following is an extract from the circulated statement of the Chairman, Mr Giles Newton, MBE:

The net profit of the Group, after deducting all charges except taxation, amounted to £1,702,619, which was approximately 8 per cent less than the all-time record of the year 1960 – a result which under the generally adverse circumstances can be regarded as creditable.

In my Statement last year, when expressing my continued confidence in the future of your Company, I pointed out that we could not expect to be untouched by the economic and political hazards which might befall industrial undertakings.

Our trading during the first six months of the year still maintained a slight upward trend, but after the credit squeeze imposed by the Government in July there was a serious fall in demand, especially from those industries – domestic refrigeration is a good example – which depend for their prosperity on active hire purchase conditions. In addition we met with a number of fortuitous hindrances to our mining production programme in South Africa during November and December; these have since been overcome, but they were responsible for a moderate decline in our total earnings from this source.

The net profit of the Group resulting from the year's operations, after taxation and all charges, amounts to £899,965 compared with £1,004,534 in 1960. Your Directors recommend the payment of a final dividend of 17½ per cent which, together with the interim dividend of 5 per cent already paid, brings the total for the year to 22½ per cent which is the same as that paid in the previous twelve months.

SALES

I have already referred to the fact that we experienced a setback in demand during the closing months of the year, an experience which was, I think, common to most firms engaged in kindred industries. Owing mainly to the inclusion of a full year's turnover by our new subsidiaries, of which the lion's share came from Small & Parkes, turnover throughout the Group increased by no less than 16 per cent.

The volume of sales of crude asbestos fibres was well maintained. Not only has 1961's entire output of Blue and Amosite fibre been sold, but contracts have already been signed for 1962's estimated production in full.

Including the very large shipments of asbestos fibres from South Africa to all countries other than the United Kingdom, the volume of our exports was no less than 30 per cent of the total sales turnover; an improvement of some 3 per cent on our previous figures. In the effort to stimulate our effectiveness in this vital field, visits have been paid by Directors and senior executives not only to customers in Western Europe, the United States, Japan, Australia, New Zealand, etc., but also to countries behind the Iron Curtain – Russia, Bulgaria, Czechoslovakia, Poland and Hungary, from certain of which satisfactory orders have already been received.

After referring to the Group's divisional activities, the statement concluded:

OUTLOOK

In our own sphere there has not, during the early months of 1962, been any recovery from the slight recession in the latter part of the preceding year.

While we shall use every endeavour to secure as great a share as possible of such business as is available, our overall results must inevitably be related to the general level of industrial activity. We have, however, a wide variety of products, and there are here and there encouraging signs of improvement. Our order book for asbestos fibre is complete, and increased productive capacity at many of our plants ensures our readiness to satisfy any growth in demand that can reasonably be anticipated at this stage. We have a number of new products which we believe will make an effective contribution to Group turnover. So far as South Africa is concerned, the inherent soundness of the Republic's economy is being increasingly demonstrated and the possibility of racial unrest appears to be less critical than in other parts of the Continent.

While short-term prospects are difficult to determine, in long term my confidence in the growing strength and further prosperity of your Company is undiminished.

THE CAPE GROUP, 1958-1961

	1961	1960	1959	1958

PEARL

ASSURANCE COMPANY LIMITED

Chairman: **GEOFFREY KITCHEN, T.D., M.A.**

YEAR ENDING 31st DECEMBER, 1961

TOTAL ASSETS £331,156,587 **GROSS INCOME £69,563,514**

INVESTMENTS

The Assets show an increase of £20,407,885. The valuation of the investments, taking Stock Exchange securities at middle market prices, showed a substantial margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £117,871,640 compared with £107,517,629 for 1960 and the total sums assured and bonuses in force amounted to over £841 millions (an increase for the year of over £65 millions). The total new annuities of all kinds amounted to £908,316 per annum.

FIRE AND ACCIDENT

In this Branch the premium income was £8,459,146.

REVERSIONARY BONUSES

ORDINARY BRANCH.—A reversionary bonus on United Kingdom participating policies has been declared at the rate of £2 16s. 0d. per £100 sum assured. The rate for "self-employed" participating deferred annuities is £3 per £100 annuity.

INDUSTRIAL BRANCH.—The sum of £5,666,607 has been allocated to provide bonuses in the Industrial Branch.

CHIEF OFFICES: HIGH HOLBORN, LONDON, W.C.1.

HUDSON'S BAY OIL & GAS CO. LTD.

At the Annual Meeting of shareholders of Hudson's Bay Oil & Gas Company Limited held in Calgary on Wednesday, April 25, 1962, all directors of the Company were re-elected. The directors are Ira H. Cram from New York, M. J. Foley from Quebec, Herbert H. Lank from Montreal, L. F. McCollum and Charles A. Perlitz, Jr. from Houston, J. R. Murray, James A. Richardson and J. E. Woods from Winnipeg, and G. T. Pearson and L. J. Richards from Calgary. The owners of 16,851,000 shares or 95 per cent of the total shares outstanding were represented at the meeting in person or by proxy. About 48 per cent of the company's employees own stock through participation in its thrift plan. At the organisational meeting of directors immediately following the Annual Meeting of shareholders the following directors were re-elected officers of the Company: Chas. E. Perlitz, Jr., Chairman of the Board, J. R. Murray, Vice-chairman of the Board, G. T. Pearson, President, and L. J. Richards, Senior, Vice-President. Other officers of the Company whose appointments continue are H. W. Blauvelt, Senior Vice-President, K. H. Burgis, Financial Vice-President and Treasurer, D. C. Jones, Vice-President of Production, M. B. Morris, Vice-President of Exploration, and F. J. Mair, Controller. John H. Currie was appointed Secretary to replace Ronald Suttill, a chartered accountant, who is returning to the accounting field to manage the company's production and pipe-line accounting. Subsequent to the election of Directors and Officers, G. T. Pearson resigned as President and a director of the Company effective June 1, 1962. Effective with his resignation it is contemplated that Mr Pearson will assume the position of a Senior Vice-President of Continental Oil Company. Wayne E. Glenn, a Vice-President of Continental Oil Company, was elected President and a Director of Hudson's Bay Oil & Gas Company Limited to succeed Mr Pearson, it was announced by Chas. A. Perlitz, Jr. Mr Glenn, who is a graduate in Petroleum Engineering from the University of Oklahoma, became associated with Continental in 1940. He held various positions in the production phase of Continental's business until 1954, when he was made Assistant Regional Manager of Production for the Rocky Mountain region. From 1958 until 1961 he was manager of the Production Department. Since 1961 Mr Glenn has served in an executive capacity in Continental's Administrative Department. In his new position Mr Pearson will be responsible for administration of Continental's operations in the United States and Canada. In this capacity he will have a continuing interest in the affairs of Hudson's Bay Oil & Gas Company Limited.

VENESTA LIMITED

LARGER SALES BUT REDUCED MARGINS

The Annual General Meeting of Venesta, Limited, will be held on May 28th in London.

The following is an extract from the statement by the chairman, **Mr S. A. Field**, which has been circulated with the report and accounts for the year ended December 31, 1961.

My statement with the Annual Accounts a year ago stressed that 1961, and probably the greater part of 1962, would be a period of consolidation, during which the integration of the many operations acquired with Winterbottom Industries would be a major task and that in the face of shrinking margins management would be fully stretched to maintain profits, which in 1960 were of the order of £1,700,000.

In the event, profits before tax at £1,623,000 were 4.6 per cent down, whereas sales, at £19.2m, were 3.6 per cent up. The pressure on profit margins was felt in varying degrees by all Divisions. This was especially true during the second half of the year, when the rate of increase in sales was slowing down in concert with the generally lower level of economic activity and the full effect was felt of cost increases that had been building up during the preceding eighteen months.

1961 was a strenuous year throughout the group and I would like to pay the warmest tribute to the many loyal and enthusiastic men and women at all levels for their hard work and cheerful acceptance of the many changes arising from the merger.

SHAREHOLDERS

The number of shareholders in Venesta is now 6,195, an increase of 1,013 over the past year, and it is our wish to provide them with full information concerning the group. With this object in view, a table has been included showing the breakdown of assets and profits between the Divisions, on the assumed basis that the present operating companies had all been part of the group for the past four years. At this stage some of the figures for the earlier years have had to be estimated and it will be possible to improve and extend this type of analysis as time goes on.

MANAGEMENT

Considerable progress was made during the year in strengthening organisation and management. This involved many promotions of existing staff and a considerable recruitment from outside. On the whole the group has settled down well in the face of so many changes and real progress has been made towards establishing the quality of management that is necessary for the tough, competitive conditions that now rule and the even tougher conditions that undoubtedly lie ahead.

As part of the programme for developing potential managers among existing staff, the first Venesta Spring School was held at Trinity Hall, Cambridge, during last month. It is hoped that, in addition to the more obvious benefits, the School will help to foster a corporate spirit and bring a sense of common purpose to the many operating companies at home and abroad.

RESOURCES

At the end of 1960, firm capital commitments existed for £503,000. During 1961 further commitments were sanctioned, amounting to £1,236,000. £1,107,000 was spent during the year against these commitments, leaving a balance outstanding at December 31st of £632,000. To complete the major programmes at home and abroad further expenditure of approximately £1,210,000 will be required, and of the total of approximately £1,840,000 some £1,040,000 will be provided from resources in the United Kingdom. The remainder will be financed by overseas subsidiaries from their own and other local sources. Payments will be spread over 1962 and 1963 and it is considered that the group's strong liquid position will enable these to be met without having to raise additional capital.

The money expended during 1961 produced no benefit in terms of that year's profits. On the contrary, start-up losses, costs of a major factory move and some disruption of current production adversely affected profits in the Plywood and Packaging Divisions. This tendency will continue in 1962, certainly during the first half. The latter half of the year should bring a better balance but it will be well into 1963 before any material benefit is derived from the heavy capital spending of 1961 and 1962.

THE OUTLOOK

There can be little doubt that the Government's special measures of last July, which were intended to act as a brake on an unhealthy growth in home demand, in fact served to accelerate a downward trend that had already set in. By the turn of the year, the general level of economic activity was probably lower than official estimates suggest. If the growth in demand which the Government expects to take place later in the year fails to materialise, it is to be hoped that positive steps will be taken to re-expand the economy.

Venesta in its present form is still a comparatively new group and the future will depend on the soundness of the foundations that are laid during its formative years. In all the circumstances, 1961 may be considered a satisfactory start, with progress in a number of important directions, and during 1962 the process should be carried a major stage forward.

It is more difficult to forecast the result in terms of profits. The external and internal factors that affected results adversely during the latter months of 1961 continued into 1962 and sales and profits in the first half of the year will be below those for the corresponding period of 1961. During the second half these adverse factors should bear less heavily on profits and, provided the Government's forecast of increased economic activity is realised, any shortfall against the results for 1961 is unlikely to be serious.

Looking further ahead, shareholders are entitled to expect an appreciable growth.

Copies of the Report and Accounts may be obtained from the Secretary, Venesta Limited, Vintry House, Queen Street Place, London, E.C.4.

DICTAPHONE COMPANY LIMITED

RECORD PRODUCTION ACHIEVED

MR LLOYD M. POWELL REVIEWS IMPROVED RESULTS

The Annual General Meeting of Dictaphone Company Limited was held recently in London, **Mr Lloyd M. Powell**, the chairman, presided, and in his address to shareholders recorded his pleasure in being able to report an all-over improvement in the results of the year's trading dealt with in the accounts. These reflected a greater turnover and corresponding profit, not only in Dictaphone Company but in the trading results of Dictaphone Corporation, which embraces all countries not included in the British activity.

He continued: Last year I referred to our intention to lay a firmer foundation for growth as well as continuing our efforts to improve sales and profits, and I am pleased to report that considerable progress has been made. Consolidated sales of the Corporation in 1961 were £13,523,816, compared with £13,193,360 in 1960. Total net profits in 1961 were £618,721, as compared with £543,337 in 1960. Our overall production has been the highest ever, limited only by the availability of skilled labour and materials.

This was particularly gratifying having regard to the difficult political and economical situation which had manifested a world-wide unsettlement during the period under review. It must be remembered that while the suppliers of materials raise their prices with monotonous regularity with each increase in wages, we are faced with the fact that our competition is not only with other British manufacturers but also with Continental companies. Our price margins of profit must therefore tend to decrease rather than increase.

In the rapidly expanding market for office dictation systems we retain our position of leadership. Improvements in our internal operations, progress with products of diversification, and renewed emphasis on research and development have contributed to the year's record. Your directors feel that the progressive policy of purchasing the most up-to-date high precision plant and equipment has been fully justified and will prove to be so in the future.

The stronger management installed in this, our British subsidiary company, was followed by a successful corporate change in our Canadian subsidiary, Dictaphone Corporation Ltd. New responsibilities have been given to the Canadian executives who now report to a seven-member board of directors, three of whom are Canadians. Market opportunities for office dictation machines are growing significantly. Office workers are increasing faster than any other major group in the nation's work force. In the United States alone there are 24,300,000 office workers now (31 per cent more than in 1950). It is expected that there will be 31,200,000 or about 37½ per cent of the nation's workers in offices by 1970.

Increased competitive activity has stimulated extra interest in dictation machine systems. We have full confidence in the quality of our products, in our sales force of more than 400 professional salesmen, and nearly 900 well-trained servicemen to further strengthen our position.

In January of this year a new product, the Dictaphone "Travel-Master" was introduced. This new machine is made at our British factory at Acton, and it is already selling well in the United States. In a few months' time it will be available in this market. This versatile portable machine, weighing only 5 lb, uses our standard Dictabelt record. It is powered by built-in rechargeable batteries, is attractively priced and should contribute substantially to sales and profits. It completes the most comprehensive line of dictation machine systems offered to business, professions, government and institutions.

With their strong well-balanced organisations, our companies are well prepared to profit by present and future opportunities. The prospect of wider sales is not confined to the Common Market, to which I referred in some detail in my speech last year. We are also very conscious of increased interests in the dominions and colonies. To review this ever increasing opportunity our managing director, Mr Clement Shread, has, during the last three months, made an extensive tour of 35,000 miles and reports that in Australia, where we have an organisation enjoying a wide coverage in what is rapidly becoming a very prosperous new world, our sales are running at 100 per cent increase on those for the previous year. In New Zealand and South Africa, where Government restrictions hinder our progress, our products are well received and our representatives are making great efforts to overcome political handicaps.

Undoubtedly one of the most impressive facts that emerged from Mr Shread's long tour was the performance of the Travel-Master Portable Dictaphone machine, which he carried throughout his journey. The machine travelled many, many thousand miles, in extreme climatic conditions—by air, road, and sea—in the heat of the outback of Australia, in the high altitudes, and in the big game country of Kenya, and in the humidity of Singapore. It was used daily for many demonstrations, without failure, over a period of two months—truly a Travel-Master!

It is, of course, difficult at present to forecast the trading pattern for the current year. Whilst under present conditions, there is no doubt that with hard work, backed by knowledge and experience, we should continue to get increasing recognition for our products.

I now beg to move the adoption of the accounts and the directors' report which have been in your hands for some time.

I shall ask Mr C. Harold Vernon to second this proposal. This was put to the meeting and carried unanimously. The retiring directors were re-elected, and Mr F. Graham Maw proposed a vote of thanks to the chairman for presiding. This terminated the proceedings.

HUDSON'S BAY OIL & GAS CO. LTD.

Net income of Hudson's Bay Oil & Gas Company Limited and its subsidiaries was $1,591,000 or 9 cents per share for the first quarter of 1962, an increase of 21.3 per cent over the net income of $1,312,000 or seven cents per share earned in the first quarter of last year. In his address to shareholders at the Annual Meeting in Calgary, G. T. Pearson, President of the Company, said that during the first quarter of this year net income was higher than comparable earnings for any previous first quarter in the Company's history. Mr Pearson said gross income was $7,645,000, an increase of $1,232,000 or 19.2 per cent over last year. With all categories of operating revenue showing improvement, sales of crude oil and natural gas liquids increased by $1,025,000 or 20.2 per cent, and sales of natural gas increased by $116,000 or 18.1 per cent. These figures do not reflect an increase in royalty rates put into effect by the Province of Alberta on April 8th, 1962. For the remainder of the year the resulting increase in royalties is estimated at $300,000. Total expenses for the period were $6,054,000, an increase of $953,000 or 18.7 per cent. Approximately two-thirds of the increase was attributable to an enlargement of the Company's exploration programme with the balance due primarily to operation of a larger number of wells and plants. Operating volumes reached new highs for a quarterly period. Production of crude oil and natural gas liquids averaged 29,588 barrels per day, an increase of 3,861 barrels per day, or 15.0 per cent over the first quarter of 1961. Sales of natural gas averaged 71.3 million cubic feet per day, an increase of 7.2 million cubic feet per day, or 11.2 per cent. During the first quarter of this year 42 gross or 24.7 net wells were completed, an increase of 19 gross or 10.9 net wells over the first quarter of 1961. This year's completions comprised 19 gross or 8.1 net exploratory wells and 23 gross or 16.6 net development wells. The exploratory drilling programme was highlighted by a one mile south-westerly extension to the Clark Lake Natural Gas Field in North-Eastern British Columbia. The extension well which was drilled on a 231,700-acre permit in which the Company owns a 30 per cent interest, has a calculated open flow potential of 21 million cubic feet of natural gas per day. The development programme was featured by successes in the Milligan Creek Crude Oil Field, also in North-Eastern British Columbia. The productive area of this field was enlarged by approximately 50 per cent with a consequent substantial addition to the Company's proven reserves of crude oil. In the field, Hudson's Bay Oil & Gas Company's largest natural gas project is in the West Whitecourt area of Central Alberta. The West Whitecourt Natural Gas Plant and related production facilities in which the Company owns a 41¼ per cent interest were recently brought into production and are undergoing final acceptance tests. The output from these facilities will add materially to the Company's sales of natural gas and natural gas liquids, said Mr Pearson.

MOTOR ACCESSORIES MANUFACTURERS ASSOCIATION LIMITED

THE PRESIDENT'S STATEMENT

The following was submitted to the Sixth Annual General Meeting of Members of the Association held on Monday, April 30, 1962, by the President, **Mr J. A. Middleton Joy, MC** (Edward Joy and Sons Limited):

In my last report to you I was able to announce that the President of the Board of Trade had decided to refer the question of the solus site system of retail sale of petrol in the United Kingdom to the Monopolies Commission. During the past year your Association has been actively engaged in relation to this important inquiry, and has made a formal submission to the Commission. A number of Members have also made individual submissions and given oral evidence before the Commission.

The Association has continued to give advice and assistance to solicitors and members of the retail trade on many aspects of petrol company agreements.

Last year, I mentioned that several petrol distributing companies were successfully entering the retail market in this country. During the last twelve months more companies have commenced or have announced their intention to commence retail operations here, and many of them are or will be selling petrol to the public at prices below those of the established brands. It is pleasing to your Association to find that these newcomers are adopting a non-restrictive attitude towards the independent lubricating oil manufacturers, in that their agreements (where such exist) appear to be concerned with petrol only, leaving the trader entirely free in the matter of the display and sale of lubricating oils and accessories.

As Members will have seen from the December, 1961, issue of the *Bulletin*, the Report of a Joint Committee of both Houses of Parliament in Tasmania has condemned the petrol companies' one-brand marketing policy in the following terms:

"The Committee is of the opinion that the present control of the industry by the oil companies is not achieving results for the good of the community. The weight of evidence demonstrated clearly that the companies have been exercising an unhealthy control of resellers through the operations of one-brand marketing, whilst the tremendous growth in the number of service stations has resulted in marked instability in the retail section of the trade."

The establishment of a marketing and licensing authority is recommended "to stabilise the marketing and distribution of petroleum products, the authority to be known as the Petroleum Marketing and Licensing Authority."

In Canada, the Restrictive Trade Practices Commission in September, 1961, held a four-day inquiry into the retail distribution of lubricants, tyres, batteries, and accessories. The Canadian press gave wide coverage to the evidence given before the Commission decrying the tactics of the major petroleum companies.

The Report of the Republic of Ireland Fair Trade Commission was published last December. The following is an extract from that Report:

"Having examined the facts and the arguments, the Commission are of the opinion that any arrangement is unfair which makes the supply of motor spirit to a dealer under a solus agreement conditional on the acceptance by him of restrictions in relation to lubricating oil."

I am pleased to be able to tell you that, following the Fair Trade Commission's report, the text of an Order has been published which, it is hoped, will soon become law. By the terms of the Order the solus agreements may in the future be for a period not exceeding five years. There is similar limitation in relation to Loan, Mortgage, and Hire Purchase Agreements which have the effect of binding the retailer to purchase his petrol exclusively from a particular wholesaler. A petrol supply agreement must not, as from the date of the coming into force of the Order, contain any restrictions in relation to the sale, advertising, or display of lubricating oils and any such provisions in existing agreements will become null and void. The Commission express the view that the policies adopted by the major petrol companies "tend in practice to limit the public in its choice of lubricating oils as they restrict the dealer's freedom to stock a range of lubricating oils and in the Commission's opinion, they are contrary to the public interest."

We are encouraged by the evidence of world-wide activity against the evils of the solus sites system in the retail petrol industry. With the continued support of our Members and our many good friends, I am certain that we can face the future with every confidence that freedom will prevail.

PRINCIPAL OBJECT OF THE ASSOCIATION

"To promote, by exchange of information and by concerted action, the unrestricted sale and display of accessories, tyres, batteries, oils and other products distributed by Members of the Association to the motor and allied trades."

CRUSADER INSURANCE CO. LTD.

CHAIRMAN'S STATEMENT

Mr Harvey Bowring, Chairman, Crusader Insurance Co. Ltd., draws attention in his annual statement to:

Record new business figures and a reduction in the overall expense ratio . . . the streamlining of office procedures made possible by the transfer of more routine work to the computer . . . the following table which illustrates progress made in the Life Branch:

	1960	1961	Percentage increase
	£	£	%
New Sums Assured ..	17,258,314	21,307,011	23·46
Life Premium Income	1,704,110	2,048,762	20·22
Life and Annuity Fund	9,546,077	11,141,661	16·71

The interest yield on the Fund rose by 5/- per cent to £6 0s. 1d. per cent.

In 1961 Group business accounted for £10,024,102 of the new sums assured while £3,234,585 came from Overseas . . . bonus rates on 'With Profit' Life Assurance policies which had again been improved . . . a 15 per cent increase in the Fire premium income, bringing it to £308,566—the Company's tradition of service which enabled it to keep abreast of opportunities and to meet competition successfully.

NATIONAL BANK OF PAKISTAN

1961, A YEAR OF UNPARALLELED PROGRESS

PROFIT OF Rs. 17,400,000

In his Report on the Bank's operations during the year 1961 which its President, **Mr Hoshang N. E. Dinshaw**, presented at the thirteenth Annual General Meeting held at Karachi on April 20, 1962, he revealed a record of unparalleled progress and an ever-increasing contribution to the economic development of Pakistan.

Thirty-eight NEW OFFICES were opened during the year bringing the total number of offices to 194, including 5 abroad. The Bank has a large number of new centres on its expansion programme during 1962. Already 14 new offices have been opened since January, bringing the total number to 208.

DEPOSITS touched the peak at Rs. 1,127,600,000 in November last. Total deposits at the end of the year stood at Rs. 1,046,000,000 as against Rs. 885,100,000 in 1960—an increase of 18.18 per cent. Bank's deposits in Pakistan registered an increase of 14.40 per cent over the year as against an increase of 11.83 per cent in the case of other scheduled banks. The Bank's share in the total scheduled bank's deposits in the country increasing steadily from year to year rose from 28.5 per cent at the close of 1960 to 29.0 per cent this year.

ADVANCES which totalled Rs. 664,100,000 on December 31, 1960, rose by 44.84 per cent to Rs. 961,900,000 at the end of 1961. Advances in Pakistan rose by 46.64 per cent to Rs. 956,400,000 over the year as against a corresponding increase of 23.43 per cent in the case of other scheduled banks. This phenomenal rise more than shares the national trend in credit expansion and has been contributed to substantially both by increased assistance to the Government in the implementation of their food-grains procurement scheme and the Bank's enlarged credit facilities to the private sector. Finances to the Government exercised no pressure on the Bank's resources as they were counter-financed by the State Bank of Pakistan.

INVESTMENT portfolio expanded from Rs. 378,900,000 on December 31, 1960, to Rs. 410,900,000 on the same date this year. Investments in Pakistan at Rs. 395,600,000 showed an increase of 8.89 per cent over the year, which is very significant in view of the fact that investments of other scheduled banks declined by 11.83 per cent during the same period. The Bank's contribution to the total scheduled bank's investments in the country rose from 27.13 per cent at the end of 1960 to 31.50 per cent at the end of 1961.

FOREIGN EXCHANGE business showed a sizeable expansion. The Bank's offices in Pakistan handled imports amounting to Rs. 985,300,000 as compared with Rs. 936,100,000 in 1960. Exports handled totalled Rs. 338,400,000 as against Rs. 268,600,000 last year. Foreign offices transacted import business aggregating Rs. 265,200,000 as against Rs. 212,800,000 and export business Rs. 181,800,000 as against Rs. 126,000,000 in 1960.

PROFIT earned in 1961 amounted to Rs. 17,400,000 which showed an increase of 46 per cent over the 1960 record figure of Rs. 11,900,000. The ratio of Establishment expenses to gross income registered a sizeable decrease from 31.10 per cent in 1960 to 24.55 per cent this year which is an all-time low. This record profit has been made possible by an all-round expansion of our business and more discreet check over the purse.

With an allocation of Rs. 7,000,000 this year, the RESERVE FUND stands at Rs. 28,000,000. This includes Rs. 3,000,000 to be transferred to the Bank's Share Capital Account which will raise the paid-up value of each share from Rs. 25.00 to Rs. 30.00.

Another welcome feature of the allocation is the increase in the rate of DIVIDEND from Rs. 2.25 per share last year to Rs. 2.50 per share this year.

BONUS to staff has been liberalised to include dearness allowance right up to officers and an additional bonus to employees in category II in line with the employees in categories III and IV.

In his review, the President paid tribute to the services of Mr Abdul Qadir, the former Managing Director, who relinquished charge in January last to join the Presidential Cabinet as Finance Minister. Under his guidance said the President, the Bank attained the record height of success and prosperity.

Welcoming the new Managing Director, Mr Mumtaz Hasan, Mr Dinshaw observed that he commanded not only vast experience in the field of finance both on national and international levels but also practical training in banking. The President especially referred to Mr Mumtaz Hasan's long and close association with the National Bank of Pakistan as its first chairman, in which capacity he guided it in tiding over the crisis in jute trade in 1949 and his significant contribution to its growth during the 10 years when he was its director as a government nominee.

THE DELTA METAL COMPANY LIMITED

RECORD OF SOLID ACHIEVEMENTS

The seventy-fourth annual general meeting of The Delta Metal Company Limited was held on April 30th in London, **Mr W. E. Ogden, MC, FCA** (the Chairman), presiding.

The following is an extract from his circulated review:

1961 has been a year of further consolidation and progress. Profits have for the first time exceeded the £4 million mark, and it is perhaps an appropriate occasion therefore to look back over the last few years and review the progress of the Company since the inception of its expansion programme in 1953.

During that time profits have increased from £988,000 to £4,457,000 and the rate of Ordinary dividend (allowing for scrip issues) has been raised from the equivalent of 12.1 per cent to 20 per cent. We have earned over the period total profits of nearly £20 million, of which £10 million has been paid to the Government in taxes, just under £5 million to our shareholders in net dividends, and the balance has been ploughed back into the business. These are solid achievements, and it is only right that in commenting on them, I should express my appreciation of the loyalty and enthusiasm of workers at all levels who have made them possible, and who have justly shared in the benefits they have brought, through the Company's profit-sharing schemes.

That, however, is only one side of the picture. What is more important is to examine the real purpose underlying this policy of expansion, to see how far its objects have been achieved, and to try and assess its effects on the future prospects of the Company.

THE CHALLENGE OF FOREIGN COMPETITION

Four years ago I warned shareholders that the advent of the European Common Market—then beginning to loom up on the horizon—would be a testing time for us as well as for many others, and that whilst I had no doubt that we should eventually win through, it might well entail temporary sacrifices on the part of workers and shareholders alike. This was not the first time that my colleagues and I had given serious thought to the situation which could arise in the non-ferrous metals industry, if and when its protecting tariffs were removed. We had in fact decided some years before that the most effective way to prepare for this contingency and at the same time safeguard our position as the principal extruder of brass rod in the Country was to extend our activities into a wider field, to rationalise production, cut our unnecessary duplication of effort, and build up a strong, broadly-based Group in our own particular section of the industry. That has been the guiding principle behind our policy of recent years, for we were firmly convinced that by linking up with those of a like mind to our own, we should be able not only to give more efficient and profitable service to consumers in this country but at the same time equip ourselves to meet competition from abroad when it came. The figures quoted above afford evidence. I think, that we have succeeded in the first of these objectives; the test of the second has yet to come. When it does, I am confident that we shall be in a far stronger position to meet the challenge than if we had remained on the comparatively narrow basis on which we were working in 1953—better able to defend our home markets and better able to go out and meet the foreigner on his own ground and give a good account of ourselves.

The report was adopted.

APPOINTMENTS

AUSTRALIA
THE UNIVERSITY OF NEW SOUTH WALES

Applications are invited for appointment as SENIOR LECTURERS OR LECTURERS IN THE SCHOOL OF ECONOMICS.

Salary: Senior Lecturer, £A2,594 range £A3,044 per annum. Lecturer, £A1,774 range £A2,479 per annum.

Commencing salary according to qualifications and experience.

Applicants must have an honours degree or equivalent qualifications. The University is seeking applications in the fields of:

Economics.
Economic History.
The History of Economic Thought.

Successful applicants will be eligible, subject to passing a medical examination, to contribute to the State Superannuation Fund.

First class air fares to Sydney *at appointees* and their families will be paid.

Four copies of applications, including the names of two referees, should be lodged with the Agent General for New South Wales, 56-57 Strand, London, W.C.2, and a copy forwarded to the Appointments Section, The University of New South Wales, Box 1, Post Office, Kensington, N.S.W., by airmail, to reach there before 18th MAY, 1962.

MONASH UNIVERSITY
CLAYTON, VICTORIA, AUSTRALIA

SENIOR LECTURESHIPS AND LECTURESHIPS IN ECONOMICS

Applications are invited for *appointment* to Senior Lectureships and *Lectureships in* Economics. Applications will be welcomed from applicants interested in any of the fields of *Economics, Economic Statistics and Economic* History.

Applicants should possess at least a degree *with honours or an equivalent qualification.* Every encouragement will be given to the successful applicants to pursue their individual research interests.

Salary scales: Senior Lecturer £A2,480-£A3,080; Lecturer £A1,660-£A2,450, with provision for superannuation on the F.S.S.U. basis.

Detailed conditions of appointment may be had from the Registrar of the University or from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on 23rd *May, 1962.*

AGRICULTURAL RESEARCH COUNCIL

STATISTICS GROUP

Graduate Mathematician required; previous statistical experience not essential. Starting salary £508 p.a. at age 21 to £901 p.a. at age 28 or more according to qualifications and experience. Write giving age, qualifications and names of two persons to whom reference may be made should be sent to the Secretary, School of Agriculture, Cambridge, not later than May 26, 1962.

MAKERERE UNIVERSITY COLLEGE—EAST AFRICA

Applications are invited for Resident Tutorship in Department of Extra-Mural Studies. Appointee will work in first instance in Northern Uganda, based on Gulu. Salary scale £1,350-£2,151 p.a., entry point determined by qualifications and experience. F.S.S.U. Child allowance £50 p.a. per child (maximum £150 p.a.). Passages for appointee and family *on to the adult passages on* appointment, termination and leave (three months every 21 months). Part-furnished quarters at low controlled rental or housing allowance in lieu. Detailed applications (6 copies) naming three referees by June 4, 1962, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

For further appointments and other classified advertisements see pages 511 and 512

London County Council

ARCHITECTS' DEPARTMENT PLANNING DIVISION

Applications invited from Statisticians or Economists interested in statistics for Town Planning research work. Information from 1961 *Census, landuse* and floor space surveys and other surveys will be processed by an I.B.M.1401 computer and person appointed would prepare requirements and work for programming by computer organisation, deal with queries and interpret results for Town Planning staff.

£930-£1,250 according to qualifications and experience.

Computer experience an advantage but not essential.

Application Form, returnable by May 11, from Homer Bennett, F.R.I.B.A., I.R.I. 955 53, County Hall, S.E.1.

CROYDON

THE COUNTY BOROUGH OF CROYDON EDUCATION COMMITTEE invite applications from suitably qualified teachers for the following vacancies available in September:

CROYDON TECHNICAL COLLEGE, FAIRFIELD, CROYDON

Principal: D. N. Argyll, M.B.E., B.Sc., M.Ed.

DEPARTMENT OF BUSINESS STUDIES

Lecturers to teach law and Legal Subjects for advanced professional and business courses. Candidates should be graduates and preferably members of a professional institute with some legal and/or business experience.

Salary in accordance with the Burnham Technical Scale, i.e. £1,080 x 30 to £1,500 plus London Area Allowance of either £45 or £60 according to qualifications.

Further particulars and forms of application may be obtained from the Chief Education Officer, Education Offices, Katharine Street, Croydon, and should be returned to the Principal at the College not later than fourteen days from the appearance of this advertisement.

SECOND year students L.S.E., required, part-time work, social-marketing study. Six weeks beginning third week May, London area. —Miss Berlein, CROydon 5749.

MONASH UNIVERSITY
CLAYTON, VICTORIA, AUSTRALIA

SENIOR LECTURESHIPS AND LECTURESHIPS IN POLITICS

Applications are invited for appointment to Senior Lectureships and Lectureships in Politics.

While applications will be welcomed from applicants interested in any field of politics, the Department of Politics is especially concerned to attract applicants interested in the fields of Political Theory, Political Sociology, Asian Politics and International Relations.

The successful applicants will be encouraged to pursue their individual research interests, and teaching duties will, as far as possible, be allotted with these in mind.

Salary scales: Senior Lecturer £A2,480-£A3,080; Lecturer £A1,660-£A2,450, with provision for superannuation on the F.S.S.U. basis.

Detailed conditions of appointment may be had from the Registrar of the University, or from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London S.W.1.

Applications close in Australia and London on 4th *June, 1962.*

CENTRAL ELECTRICITY GENERATING BOARD
NORTH EASTERN REGION

REGIONAL OPERATIONAL RESEARCH ENGINEER

Applications are invited for the appointment of Regional Operational Research Engineer, with headquarters at Leeds.

The work involves the application of appropriate techniques to problems arising within the generating stations, transmission systems and the Divisional and Regional organisations, in order that the most effective use can be made of plant and man-power.

Qualities essential for the post are a critical approach to problems, a capacity for analysis of results and a keen interest in all aspects of Industrial Management.

The work calls for tact and persistence in achieving the acceptance of recommendations and the ability of inspiring the confidence of staff at all levels is essential.

Candidates should be suitably trained in either Mathematics, Engineering or a branch of the Sciences and previous experience of operational research is desirable.

The salary for this appointment will be in accordance with the National Joint Board Agreement, Grade Chief Scientific Officer, £1,880-£2,250 per annum. Age limit will commence at a point commensurate with qualifications and experience.

Forms of application may be obtained from the Regional Personnel Officer, Central Electricity Generating Board, North Eastern Region, 15 Whitehall Road, Leeds, 1, to whom they should be returned not later than 16th May, 1962.

CITY OF PORTSMOUTH COLLEGE OF TECHNOLOGY

Principal: W. Davey, B.Sc., Ph.D., F.R.I.C.

Applications are invited for a new full-time appointment of Lecturer in the Department of Commerce.

Applicants should hold an Honours Degree in Economics or Economics and have a special interest in marketing and current marketing problems. The appointment is partly likely suitable for and offers good prospects to a man who has had some Post-Graduate Experience in business and is prepared to carry out research for which facilities will be provided.

Further particulars and forms of application may be obtained from the Registrar, College of Technology, to whom application should be made as early as possible.

COMPANY AFFAIRS

In the London stock market equities lost some of their recent buoyancy but gains immediately after the further cut in Bank rate left The Economist *indicator 3 points higher over the week at 362.4. After the recent sharp gains particularly in brewery and property shares investors were more eager to take their profits despite the new capital gains tax. The prospect of a national dock strike was one factor in keeping buyers away from the market. Gilt-edged have been helped by the Chancellor's statement on sterling and gains have been most marked among the medium-dated issues.*

Ford Motor

THE drop of 34 per cent in Ford's trading profit from £33.6 million to £22.2 million in 1961, when sales fell by only four per cent, from £268.7 million to £259 million, confirms what the interim report from the British Motor Corporation had already revealed about the decline in margins in the British motor industry. Sir Patrick Hennessy, chairman of Ford, says that "there has been an even more serious deterioration [in profits] in the first three months of 1962"—even though the prices of Ford cars were raised in December. Ford's share of the home market has been falling (unlike that of BMC) and as home sales are much more profitable than exports, this will have added to the effect of rising costs on Ford's margins. Moreover, the low prices at which Ford is selling its cars in the common market countries suggests that it is earning little, if any, profits from these export sales. With no new small car in prospect this year, Ford can only hope to add significantly to its present 23 per cent or so of the market if waiting lists for BMC's Minis re-appear this summer—as they may well do. Ford however is the car maker best placed to profit from the cut in purchase tax; but for this fact its prospects this year would have been gloomy indeed. The new Zephyr-Zodiac models will help in the bigger car range, though Ford was already quite well placed here.

Ford has not allowed the gloomy present to affect its expansion schemes: it spent £34 million last year—BMC only spent £20 million, though it does rely on Pressed Steel for much of its new body plant—and Sir Patrick says that even more will be spent this year. The biggest item seems to be the new body-building and assembly plant at Halewood, near Liverpool, costing about £30 million and adding some 200,000 cars to the company's capacity; it is due to start production by the end of this year. But Ford is also spending heavily at Dagenham on modernisation and extensions; its capacity for all vehicles in 1960 was about 12,500 a week and now may be 15,000, it looks like exceeding 20,000 by 1964-65. Ford must be hoping for better margins by then.

Babcock and Wilcox

THE ordinary dividend from Babcock and Wilcox was short earned both in 1959 and 1960 and as late as last October the directors passed the interim dividend. Hence the preliminary statement a fortnight ago, announcing an increase of 38 per cent in gross profits from £641,000 to £886,000 and a maintained total dividend of 9 per cent, now covered 1.4 times, came as a pleasant surprise. The chairman, Sir Kenneth Hague, gives four reasons why the directors were able to recommend this dividend. First, some of the outstanding claims on contracts have been settled; secondly, output improved considerably in the last quarter of the year; thirdly there was a "small but distinct improvement" in the profits on various contracts completed during the year; and, finally, income from some of the overseas subsidiaries rose.

The first sign of brighter prospects came in October when the directors said that the order book was higher than it had been for four years. Sir Kenneth gives details of further orders received since then and says that "the steps for re-shaping productive capacity to meet present day demands are already showing results." A provision, which it is hoped will be final, of £150,000 against losses on nuclear power station contracts was made in the 1961 accounts; Sir Kenneth does not expect the Sizewell contract to pose problems similar to those associated with the earlier contracts and says the net balance of nearly £290,000 available to meet any further losses on them should be sufficient. End-year capital commitments of £793,000 should be covered by the cash flow, which last year amounted to £1,853,000 and which in the current year should not be burdened by the need to provide for losses on nuclear contracts. There was, however, a sharp increase in overdrafts in 1961, from £2¼ million to nearly £5 million. Trading conditions remain difficult and profit margins inadequate but Sir Kenneth regards future prospects with "cautious optimism." He expects the group to benefit from the bigger demand for new generating capacity in this country in the next ten years, and to expand its business abroad. In all this was one of the most cheering reports to come from the heavy engineering industry for many months. There is obviously a good chance that Babcock and Wilcox's profits will again be higher this year. Thus the rise in the price of its £1 shares from 18s. 9d. in October to 30s. 6d. xd does not appear to have been too steep, for the yield at the current price is still 6 per cent.

Vickers

AN interim statement in September from the directors of Vickers suggested higher profits for the second half of 1961 than in the first six months and net profits for the full year about equal to those of 1960. In contrasting ways neither of these estimates proves to be accurate. The table shows that trading profits in the six months to end December were in fact slightly below those for the first six months of 1961 so that gross profits for 1961 are down from £11.6 million to £9.4 million even though the latest result bears no charge for aircraft development expenditure; in 1960 this provision reduced profits by £2.5 million. An unspecified amount has been deducted from profits for "aircraft special expenditure" but as Vickers has transferred most of its aircraft assets to the British Aircraft Company this sum seems certain to have been smaller than the sums written off aircraft development in earlier years. Thus the actual fall in the trading surplus is likely to have been greater than the fall of £2¼ million in gross profits revealed in the preliminary statement.

SALES AND PROFITS

(£ million)

Six months ended	June 30 1960	Dec. 31 1960	June 30 1961	Dec. 31 1961
Sales	75·67	93·56	84·81	84·33
Trading profit	6·17	7·96	4·71	4·66
Aircraft development	1·50	1·00	...	...
Gross profit	4·67	6·96	4·71	4·66
Orders on hand	286·0	307·0	299·0	286·6
Net assets	115·10	114·77	119·83	120·41
	%	%	%	%
Gross profit/sales	6·2	8·3	5·6	5·5
Gross profit/net assets	4·1	6·1	3·9	3·9

By contrast the group's net profits rose from £6.3 million to £7.4 million for the tax charge was more than halved from £5.4 million to under £2 million. This reflected the incidence of investment allowances, particularly in the English Steel subsidiary, and of allowances "in respect of substantial expenditure on aircraft research and development in 1961 and prior years." The directors say that capital expenditure is continuing at a high level and that allowances should provide "considerable relief" from tax on profits earned in 1962. The reduction in taxation in 1961 raised equity earnings from 18.7 to 23.6 per cent, which provides the best cover for the unchanged dividend of 10 per cent since 1956 when it was covered almost three times.

On these results the £1 shares gained 1s. 4½d. to 27s. 7½d. to yield 7¼ per cent; a further recovery will depend on the contents of the full report and more particularly on the valedictory statement of Lord Knollys who retires from the chair next month. Meanwhile it appears that shipbuilding earned almost record profits; engineering profits which hit a record in 1960 were affected by provisions made against uncompleted contracts; Vickers (Aviation) made only a small profit. The experience of English Steel, in which Vickers has a 75 per cent interest, was similar to that of the other major steel companies—a smaller demand for its products, higher costs and lower margins. The fall in English Steel's gross profits from £4.9 million to £4.1 million was cushioned by an exceptional credit of £367,000 and an abnormally low tax charge left its net profits slightly higher at £2.7 million, against £2.5 million.

United Drapery Stores

THE interim report from United Drapery Stores indicated that the group was making more modest progress last year than in the two preceding ones. This is confirmed by the preliminary results for the year to January 31st which show a rise of only 3¼ per cent in trading profits from £10,103,000 to £10,431,000; this compares with increases of 12 and 22 per cent in 1959-60 and 1960-61. Even though the increase in profits is small the directors hint that but for the Chancellor's policy of restraint they would have paid a bigger dividend than the effectively maintained distribution of 30 per cent. This dividend is paid from earnings which have risen slightly from 54½ to 56¾ per cent.

	Six months ending July, 30, 1960	Jan., 31, 1961	July, 30, 1961	Jan., 31, 1962
Trading profit	4,484	5,619	4,628	5,803
Profit before tax	4,013	5,243	4,489	5,309
Taxation	2,030	2,463	2,340	2,530
Available for ord. capital	1,915	2,706	2,095	2,719

As the table shows the growth in trading profits showed little change over the two half years—3.2 per cent in the first period and 3.3 per cent in the second. But at pre-tax and net levels the increase was much smaller in the six months to end January. This is largely explained by an apparent recovery in the group's hire purchase business. Thus in the first half of the year profits were credited with £180,000 from provisions for unearned profits on hire purchase debts; for the full year, however, this credit amounted to only £37,000 which means that in the last six months £143,000 has been added back to this provision. This points to a growth in hire purchase sales in the last half of the financial year and is an encouraging sign since hire purchase and credit trading plays an important part for the group. UDS also owns a number of department stores (of which its latest acquisition, Whiteley, could not have made much contribution to the past year's profits), a big tailoring group and an expanding chain of fashion shops. On the results the 5s. shares fell 1s. to 50s. 10½d. and yield 3 per cent. This low return reflects an impressive trading record over the past decade; but the latest results show that the pace of expansion has slackened.

Associated Portland Cement

AFTER reporting no more than a modest improvement in profits in 1960, Associated Portland Cement, benefiting no doubt from its extensive development programme, achieved a rise of over 12 per cent in trading profits from £15,940,000 to £17,819,000 last year and a rise of over 13 per cent in net profits from £11,432,000 to £12,981,000. Equity earnings rose from 22¾ to just under 24 per cent and the ordinary dividend has been raised from the equivalent of 8½ to 9½ per cent. The stock market, duly impressed, marked the ordinary shares up by 4s. 10½d. to 58s. 3d., offering a dividend yield of 3¼ per cent and an earnings yield of 8¼ per cent.

Several factors have clearly contributed to APC's bigger profits. There was a buoyant demand for cement in the domestic market last year and output rose by 6½ per cent. It is therefore virtually certain that APC, which dominates the market, with over 60 per cent of total home sales, secured a substantial increase in turnover. The rise in turnover may have been accompanied by an improvement in margins: prices were raised in January, 1961, and again in May after the increase in the fuel oil duty. There may have been some improvements in the picture overseas; the new Nigerian plant, for example, is contributing its first full year's earnings. APC's export markets have gradually been eroded by the growth of local cement manufacturing. The resulting pressure on margins hit APC more than most other British cement companies, as it accounted for about 80 per cent of total exports; indeed, the profits it earned on exports must have been meagre. In this context, last year's increase in the duty on fuel oil may have been a blessing in disguise, for the British companies were forced to cut exports by a third; this must have helped APC to the extent that it switched production from exports to the more profitable markets at home.

In the past the stock market has seen APC as the giant of the cement industry, growing, but not so quickly as its smaller competitors. But its results for 1961 bear comparison with those of, say, Rugby Portland and thus suggest that the acceleration of APC's expansion scheme is beginning to pay off.

Burmah Oil

AS the governments of Burmah and India have acquired bigger stakes in Burma Oil Co. (1954) and Oil India respectively these companies now figure in the accounts of Burmah Oil as trade investments. This helps to explain why Burmah Oil's profit on trading in 1961 fell from £4,973,000 to £4,457,000; but since these companies are no longer trading subsidiaries, a much reduced depreciation charge follows, so that Burmah Oil's gross profits before tax are only slightly lower at £3,737,000, against £3,775,000. Dividends from Burma Oil and Oil India presumably account for the sharp rise in the dividends from trade investments from £2,889,000 to £4,060,000. A further rise in "other dividends and interest" from £11,782,000 to £12,386,000, reflects the bigger final paid by British Petroleum for 1960. On its holding in "Shell" Transport, Burmah Oil in 1961 received slightly less than in 1960 although the total dividends declared by Shell were higher; it will be recalled that in 1960 Shell doubled its interim dividend to reduce the disparity between the two payments and this was reflected in Burmah's dividend income in 1960.

In all Burmah's net income rose by almost 11 per cent from £9,997,000 to £11,087,000, to cover the tax free dividend which is raised from 9.38 to 10.43 per cent about 1¼ times. In deciding upon this fourth successive increase in the dividend the directors have no doubt taken into account the higher final payment from "Shell" Transport which will be brought into the current year's accounts as well as the prospect that following the slight increase in BP's final for 1961 declared last week, the interim payment will be fractionally raised to round up the total payment after the scrip issue. Such an issue from Burmah has been on the cards for some years but disappointment at the absence of any announcement was offset by the unexpectedly good results and the £1 ordinary shares gained 2s. 10½d. to 35s. 3d. xd. On the higher dividend they yield 9¾ per cent, and even 6 per cent to a gross fund after taking account of a net UK tax rate of 5d.

Schweppes

IN the first six and a half months of 1961 Schweppes was operating at lower margins of profits and only "an appreciable increase in sales" enabled it to maintain its profits. The pressure on margins remained high throughout the remainder of the year and at the time of the one for twelve rights issue in October the directors said that while trading continued to be satisfactory they did not expect any material change in the level of profits. Their prediction was not far wrong, for in the event Schweppes's trading profits rose by only two per cent from £5,038,000 to £5,134,000 last year. Investment income fell, the tax charge remained unchanged but there was a bigger provision for depreciation; as a result net profits fell by almost 10 per cent from £2,050,000 to £1,847,000. The ordinary dividend is left unchanged at 24 per cent, but because of the rights issue the cost rose slightly and the cover fell to just under 1½ times.

The tax on soft drinks introduced in the budget has had no great effect on the price of Schweppes shares. Schweppes is predominantly concerned with the "mixer" and public house trades of the soft drink market, and its sales seem less likely to be affected than those of soft drinks taken with water rather than with spirits; but it has

Continued from page 505

had in recent years to offer bigger discounts to bulk customers and it will be interesting to see how much of the tax it will have to absorb itself and how much it will be able to pass on. Clearly a good summer could give its profits a fillip; but the long-term growth in profits would appear to be tied more to overseas sales and the rationalisation and development of its interests in jam than to a pronounced further expansion in the domestic market in soft drinks. Thus though the stock market retains its high regard for the shares, which at 34s. yield 3½ per cent, Schweppes may find it difficult to maintain its rate of expansion of the last five years.

Gallaher

A YEAR ago the 10s. shares of Gallaher stood at 48s. to yield less than 4¼ per cent. Now at 29s. 6d. they yield on a maintained dividend of 20 per cent 6¼ per cent. This suggests a complete revision in ideas about the rate of growth to be expected from this tobacco manufacturing group. It is still too early to judge how far consumption will be affected by the latest report on Smoking and Health but Mr C. W. Mason, the chairman of Gallaher, says that it has had a "material effect" on sales. These had already been hit by the surcharge on tobacco duty imposed in July. The surcharge is now consolidated in the excise duty and together with the increase in prices of some brands was largely responsible for the increase in the value of Gallaher's sales from £320 million to £349 million. But Gallaher apparently continued to add to its share of the cigarette market, and this will certainly be bigger this year as it now controls Wix; in all the group should be responsible for about 40 per cent of total cigarette sales in this country. Pre-tax profits of J. Wix in 1961 amounted to £2,361,000 but they were not consolidated into Gallaher's accounts as the acquisition took place late in the year. They were equivalent, however, to over one-sixth of Gallaher's gross profit of £13,661,000 against £11,743,000; but against the contribution they will make to the group's earnings this year has to be set the increase of about 14 per cent in Gallaher's issued capital arising from its issue of 7.2 million shares to American Tobacco in exchange for Wix.

Thus in 1962 Gallaher will have a full year's benefit from the price increases for various brands announced last year and a full year's profits from its new acquisition. But the results will also reflect a full year's trading with duty at the higher rate and presumably some months of lower tobacco consumption. The further rise in leaf tobacco prices may add to Gallaher's problems. In volume stocks at the end of 1961 were only fractionally higher but largely as a result of the 10 per cent surcharge their value was £2½ million higher at £68 million. But last year Gallaher spent less on factory extensions and new plant and its cash flow was bigger so that its bank overdraft was reduced from £6½ million to under £5¼ million. This trend suggests that calls for new funds are unlikely to be as heavy as in the past; this factor, the notable success of "Nelson" in the tipped cigarette market and the prospect of expansion overseas, suggests that the many uncertainties about Gallaher's future prospects may be fairly discounted in the current price of the shares.

Pearl Assurance

LIKE most of the life offices, the Pearl adopted a more cautious attitude to equity investment in 1961. Its total assets rose last year by £20½ million to £311 million but only £2 million of this increase went into equities, which can hardly have covered subscriptions to rights issues. But the Pearl did not think more highly of gilt-edged stocks as a haven for new funds, though it engaged in a substantial amount of switching to improve redemption yields at some cost in running yields. About half its new funds went into debentures, which rose from £58½ million to £68½ million. Of the remainder about £6 million was invested in mortgages, mostly for house purchase, and £3½ million in property.

The fruits of Pearl's investment policy in the past decade is reflected in the further sharp increases in the yields of both Pearl's life funds—of 8s. 7d. to £7 4s. 5d. per cent in the ordinary branch and of 8s. 9d. to £7 4s. 8d. per cent in the industrial branch. The chairman, Mr Geoffrey Kitchen, warns shareholders that the growth in equity dividends which has been a major factor in boosting these yields "now appears to have come almost to a halt." At £12⅝ the 5s. shares yield 2.9 per cent on the unchanged dividend of 90 per cent; but for the Chancellor the directors would have paid 100 per cent, which payment would raise the yield to 3.2 per cent.

Royal Mail Lines

THE latest addition to the list of shipping companies reporting lower profits is Royal Mail Lines. Last year its two tankers were on charter, one for the whole year and the other for six months, compared with only one for six months in 1960. The rise in tanker income helps to explain why the operating surplus of the group has risen from £893,000 to £1,103,000. But interest charges have risen from £181,000 to £576,000 and have completely swallowed up the increase in the operating surplus and a net profit after tax of £166,000 has been replaced by a net loss of £234,000; the ordinary dividend, which was cut from 8 to 5 per cent in 1960, has now been passed.

New liners were mainly responsible for the sharp rise in overdrafts, from £905,000 to £7,400,000, in 1960, and thus for the rise in interest charges in 1961 and it does not look from the preliminary statement as if these liners made much, if any, contribution to profits last year. Interest rates will be lower this year but the group will still be confronted with the problems associated with flag discrimination and political uncertainties in the South American and Caribbean trades in addition to those posed by lower freight rates and the decline in passenger traffic. The £1 ordinary shares have fallen in the past twelve months from just over par to 8s. 9d.—less than one-fifth of their asset value—and in the near future there seems little likelihood of any recovery.

Thomson Organisation

IN 1961 the trading profits of the Thomson Organisation rose from £4,041,000 to £4,714,000 and the ordinary dividend has been set at 24 per cent. This payment was forecast at the time of the capital reorganisation last July when the directors indicated that profits before tax in 1961 should "substantially exceed" those of 1960. In December however the formal offer for Illustrated Newspapers revised this forecast in the light of the less buoyant advertising experience following the little budget and the directors said that profits would be lower than had been expected, though "still be in excess" of those for 1960. Part of the increase may arise from the decision to stop publishing the *Empire News* and the *Sunday Graphic*, on which losses were being made before they were closed down late in 1960.

Earnings on the basis of the capital in issue at the end of December cover the dividend only 1½ times and this reflects the present high gearing of the equity. At 20s. 9d. the 5s. shares (of which over 80 per cent are held by Thomson Scottish Organisation) yield 5¾ per cent. Such a return might be thought interesting for a group headed by so dynamic a personality as Mr Roy Thomson but it should not be forgotten that the group has a sizeable interest in commercial television in Scottish Television, whose profits after 1964 are as uncertain as those of the other contractors. Moreover the new colour supplement to the *Sunday Times* is likely to cost a substantial loss this year.

THE MONEY MARKET

AT last Friday's Treasury Bill tender following the cut in Bank rate to 4½ per cent the discount market caused something of a surprise by raising its agreed bid by only 9d. to £98 19s. 5d.—a fall in the annual rate of 3s. As outside competitors clearly anticipated a sharper fall, the average rate of discount fell by 4s. 3·77d. to £4 1s. 0·54d. Although £10 million fewer bills were on offer applications were only slightly down at £386 million, and the market's allotment of 26 per cent was its lowest for two months. The market appears to feel that after three reductions in Bank rate in seven weeks there is likely to be a pause to test the impact of the lower rates; and the current bill rate offers scope for further reductions in the future.

Credit has been fairly tight in the past week but help from the authorities, which was large on both Monday and Tuesday, was sufficient to prevent the market from borrowing at Bank rate. By Wednesday most houses were better placed and late balances were taken at rates as low as 2⅞ per cent. July maturities changed hands at 4 3/32 per cent.

In New York the three months bill rate rose slightly from 2.740 to 2.748 per cent.

APPOINTMENTS

FORD OF BRITAIN

FINANCIAL PLANNING AND CONTROL

Finance work can be a dull recording function or it can be a live constructive force in assisting management to plan and control a company's affairs. In Ford of Britain the finance activity makes a positive and vital contribution to policy and operations. This work is increasing with the growing size and complexity of the Company and additional high calibre staff are required to meet the needs of expansion and new model programmes.

A number of vacancies are immediately available at both junior and senior levels for men up to the age of 40. The following headings illustrate the range covered by these vacancies—profit budgets, design cost control, price analysis, internal audit, operations analysis, capital expenditure programmes and control, parts and accessories analysis, management reporting, financial systems and procedures, competitive analysis and industrial economics. Although a good honours degree or professional qualification is a minimum requirement, a broad understanding of management problems and a keen analytical mind are more important than training in a particular technique.

Prospects will not be limited to the finance field as the Company management development policy ensures that men of high general ability are detected and advanced as rapidly as their capacity can sustain. Salary and promotion therefore depend entirely on ability.

Applicants are invited to send personal details including age, qualifications, experience and approximate salary required (marking envelopes "Ref. A6") to:—

MR H. G. PEARMAN,
TRAINING AND RECRUITMENT OFFICE,
FORD MOTOR COMPANY, LIMITED,
DAGENHAM, ESSEX.

RESEARCH ASSISTANTS

One post for either graduate or person with research or statistical experience to work in team investigating certain aspects of ECONOMIC PLANNING, STATISTICS & COMPUTERS. One post for a person holding Registered Statistical Assistant qualifications or with experience in analysis of research data. Salaries according to qualifications and experience rising to £640 plus savings scheme. Holiday arrangements honoured.—Apply National Foundation for Educational Research, 79 Wimpole Street, London, W.1.

BRISTOL COLLEGE OF SCIENCE AND TECHNOLOGY

Department of Social and General Studies

Head of Department:
C. T. Sandford, M.A.(Econ.)

The Governors invite applications for the post of

LECTURER IN ECONOMICS

Applicants must possess a good honours degree in Economics/teaching and/or industrial experience would be an advantage. Candidates should have wide general interests, with an enthusiasm for teaching General Studies to students of science and technology.

Salary scale: £1,600 x £40—£1,800. Application forms and further details from the Registrar, Bristol College of Science and Technology, Ashley Down, Bristol, 7. Please quote CST 62/17 when replying.

ASSISTANT RESEARCH OFFICER required for The Royal Institution of Chartered Surveyors' Cost Research Panel and Building Cost Information Service. Age 21/30. Applicants should have had practical experience of cost analysis and cost planning, preferably in a Chartered Quantity Surveyor's Office. Commencing salary £1,000-£1,250, according to qualifications and experience. Two weeks' leave. Luncheon Vouchers, 3s. per day.—Applications, giving full information on education, experience and availability, to Appointments Secretary, Royal Institution of Chartered Surveyors, 12 Great George Street, Westminster, S.W.1.

AUSTRALIAN NATIONAL UNIVERSITY

INSTITUTE OF ADVANCED STUDIES

POSTS IN PACIFIC HISTORY

Applications are invited for the posts of SENIOR FELLOW or FELLOW in the DEPARTMENT OF PACIFIC HISTORY of the Research School of Pacific Studies.

The Department undertakes studies in both history and government, geographically, its field of interest includes both the Pacific and South-East Asia.

On this occasion it is desired to appoint a person with research experience relating to the government and politics of dependent territories of newly independent states. Other things being equal preference will be given to a candidate who has already worked in the Pacific or South-East Asia.

The salaries and ranges of Senior Fellows and Fellows are determined within the limits of £A3,000-£A3,850 and £A2,120-£A3,000 per annum respectively. Appointment to age 65, with the option of retirement after age 60, is normally confirmed before expiry of the initial appointment, which is for five years. Senior Fellows and Fellows are entitled to one year's study leave on full pay, plus a contribution towards travel and other expenses, in every six and seven years respectively.

Superannuation is on the F.S.S.U. pattern. Reasonable travel expenses are paid and assistance with housing is provided.

Further particulars should be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1. Applications close in Australia and London on *15th June, 1962*.

CENTRAL ELECTRICITY GENERATING BOARD NORTH EASTERN REGION

ASSISTANT REGIONAL SECRETARY (PURCHASING, CONTRACTS & STORES)

Applications are invited from suitably qualified persons for the appointment of Assistant Regional Secretary (Purchasing, Contracts and Stores) at the North Eastern Regional Headquarters in Leeds, which will shortly become vacant.

The successful candidate will be responsible to the Regional Secretary for the implementation of the Board's buying policy within the Region in accordance with the established procedure and for carrying out specific functions in relation to that procedure. He will be required to undertake commercial negotiations on contracts, to advise upon stock control and the organisation of stores, to collaborate with the Standards Engineer in the application of the Board's standards, and generally to function as the Regional Officer in charge of all matters in the field of Purchasing, Contracts and Stores.

The salary for this appointment will be in accordance with the National Joint Managerial Agreement, Class "D," Grade 3 (£1,965-£2,170 per annum).

Forms of application may be obtained from the Regional Personnel Officer, Central Electricity Generating Board, North Eastern Region, 1 Whitehall Road, Leeds, 1, to whom they should be returned to arrive not later than 28th May, 1962.

THE DISTILLERS COMPANY LIMITED

OPERATIONAL RESEARCH SPECIALIST

The Chemical Division of The Distillers Company Limited, large-scale manufacturers of organic chemicals for industry, wish to appoint an Operational Research Specialist to join a small, recently formed unit at the London divisional headquarters. This unit applies operational research methods to the practical solution of a wide variety of short-range and long-term problems arising in the planning of the Division's expanding manufacturing activities and in the distribution of its products. Computer facilities are available within the Company.

Candidates for this appointment, preferably in the late twenties, should hold an honours degree in mathematics; knowledge of statistical methods is desirable. Although some important theoretical work is involved, candidates should be of a practical rather than a theoretical turn of mind; they should possess both the persistence to elucidate facts, figures and information from many and diverse sources, and the imagination to use the mathematical interpretation of these data as a powerful tool of management.

Write: STAFF MANAGER, THE DISTILLERS COMPANY LIMITED, 21/22 BOLTON STREET, LONDON, W.1.

Quote Reference: 248 E.C.

GOVERNMENT SOCIAL SURVEY

The SOCIAL SURVEY DIVISION of the CENTRAL OFFICE OF INFORMATION invites applications for post of SENIOR RESEARCH OFFICER. The Research Unit is responsible for official sample survey inquiries covering a wide field of social and economic problems with a variety of research methods and maintaining high technical standards. Specialist sections are available for sampling, interviewing, coding and mechanical tabulation, but research officers have full responsibility for the design and reporting of survey work, much of which is published, and are expected to conduct such methodological research as may be required. All applicants should be qualified in one of the Social Sciences, Mathematics or Statistics, and have had research experience. Applicants must be able to produce reports of previous research for which they have had responsibility. The post is graded SENIOR INFORMATION OFFICER and is unestablished, but there are regular opportunities for establishment. Salary £1,573 to £1,937.—Write, giving age, full details of experience and qualifications, to Manager (PE.3677), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

For further appointments and other classified advertisements see pages 503 and 512

UNIVERSITY OF HONG KONG

LECTURESHIP IN ECONOMICS

Applications are invited for the above-mentioned post. Applicants should have suitable qualifications, including teaching experience, in (a) Economic History and (b) the History of Economic Thought; preferably with special reference to Eastern Asia. The successful candidate will be required to take up duties in September, 1962.

Annual salary (superannuable) is: £2,150 x £75—£2,825 (man) or £1,600 x £60—£2,140 (woman). The equivalent of income tax in the Colony is comparatively low.

Tourist air passages or first class sea passages of equivalent cost are provided for expatriate staff on first appointment and leaves. Accommodation at reasonable rental is provided for those recruited from abroad.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Hong Kong and London on *15th June, 1962*.

NIGERIA INSTITUTE OF INTERNATIONAL AFFAIRS

APPOINTMENT OF DIRECTOR-GENERAL AND SECRETARY

The Nigeria Institute of International Affairs, Lagos—an independent, non-political and non-official body having as its purpose the creation of an informed opinion regarding international affairs by advancing the study of these affairs through research and discussions, issuing publications on these researches, and building up a research and reference Library—invites applications from Nigerians for the position of Director-General and Secretary to the Institute's Council.

Applicants should be honours graduates and, preferably, should have had post-graduate research experience.

Salary will be between £2,000 and £3,000 per annum, depending upon qualifications and experience.

The successful applicant will be expected to enter upon his duties as soon as possible. He will be eligible, subject to passing a medical examination, to contribute to a provident fund.

Six copies of applications, with the names of three referees, should be lodged with the Secretary, Nigeria Institute of International Affairs, c/o Federal Supreme Court, Lagos, Nigeria, to reach there by the 31st May, 1962.

UNIVERSITY COLLEGE, LONDON Gower Street, W.C.1) requires RESEARCH ASSISTANT in Department of POLITICAL ECONOMY mainly to assist with research into the history of monetary thought. Duties to commence October 1, 1962. Salary £800 p.a., plus £60 p.a. London Allowance.—Applications, to be received by May 31, 1962, should be sent to the Secretary, from whom further particulars may be obtained.

UNIVERSITY OF GHANA

DEPARTMENT OF ECONOMICS

Applications are invited for the posts of:
(1) SENIOR LECTURER in Political Science (considerable teaching or research experience essential), and
(2) LECTURER OR ASSISTANT LECTURER in Political Science.

Salaries: Senior Lecturer, £G1,750 x £G75—£G2,200; Lecturer, £G1,050 x £G50—£G1,400 x £G75—£G1,850, £G1,900; Assistant Lecturer, £G900, £G950 p.a. 20 per cent. addition for non-Ghanaians. Entry at appropriate point. Appointment normally five years in the first instance.

Outfit allowance £G60. Car allowance £G150 p.a. Family allowance for non-Ghanaian for each child in West Africa £G350 p.a. or, if under age 21 and being educated outside West Africa, £G100 p.a. (maximum five children). Part-furnished accommodation at charge not exceeding 7.5 per cent. of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.

Passages for appointee and family on appointment and normal termination. Annual leave with three overseas return passages in every four years for non-Ghanaian and one every three years for Ghanaian.

Applications (six copies) with full details of qualifications, experience, etc., and naming three referees, to be sent before 4th June, 1962, to the Registrar, University of Ghana, P.O. Box 25, Legon, Ghana, or to the Assistant Registrar (London), University of Ghana, 15 Gordon Square, London, W.C.1, from either of whom further information may be obtained.

MARKETING RESEARCH

A major British manufacturer of consumer and industrial products requires a Market Research Specialist at its Head Office in London. Applicants, preferably graduates, in the age group 27-33, should have had several years practical experience in a market research organisation and be familiar with all the relevant statistical techniques. The person appointed will be expected to organise a wide variety of marketing and consumer surveys and supervise the research undertaken by outside firms.

This is a new appointment which offers considerable scope for a person with experience, initiative and imagination.

Salary according to age, qualifications and experience, but is likely to be in the range £1,450-£1,750.

Box No. 1619.

MARKET RESEARCH

The Export Sales Department of a Company manufacturing Mechanical Handling Equipment wish to appoint a Market Research Specialist.

Applicants should be experienced in recording all forms of factual information, statistical analysis. Press and trade returns. It is important that they should have an appreciation of the importance of correctly interpreting their researches as an aid to Sales Management.

Applications, giving a brief outline of education, training and experience, should be addressed in confidence to the **Personnel Director, K. & L. Steelfounders and Engineers Limited, Letchworth, Herts.** (One of the 600 Group of Companies.)

For other appointments see pages 503 and 511

ARE YOU INTERESTED IN A.D.P.?

If you are under 35, have a degree in Economics or Mathematics (though any arts degree might suit), know about Electronic Computers and their application, have a genuine interest in Business and in Management methods, can learn quickly and work under pressure, then we may have a *stimulating* job for you. We require an Executive Editor for our Management Journal AUTOMATIC DATA PROCESSING of the calibre to succeed to the Editorship of the Journal within a short period. Applications, stating age, salary required and experience to date, should be addressed to:

The Group Personnel Manager,
BUSINESS PUBLICATIONS Ltd.,
Mercury House, 109-113 Waterloo Road, London, S.E.1.

ASSISTANT ECONOMIST

The **British Wool Marketing Board** invites applications for an Assistant Economist in the **London Headquarters.**

Candidates should have a good degree in economics, some *training in descriptive and* mathematical statistics and in the economics of agriculture.

Interest in work study and costing will be an advantage and the successful candidate may be required to take further training in these techniques.

Salary will be in the range £600 to £1,100. Applications, giving age and full details of education and experience, should be sent to the Economist, British Wool Marketing Board, 81-87 High Holborn, London, W.C.1.

MARKET ANALYST

required by

HOBSON, BATES & PARTNERS LIMITED

The Market Analysis Department of this advertising agency requires an executive aged about twenty-five to undertake the investigation of the markets concerning a large group of accounts.

The successful applicant will have had some years' experience in sales planning or marketing in the consumer product field, or will have worked on analysis with another agency.

He must be familiar with Nielsen and other audits, know how to use market research, and have the ability to evaluate statistics.

A good degree in economics is desirable, together with the ability to communicate his findings concisely and lucidly.

Write giving full details to:—
C. D. Credland, Esq.
Hobson, Bates & Partners Ltd.,
Hobson House,
155 Gower Street
London, W.C.1

COST RESEARCH OFFICER required by The Royal Institution of Chartered Surveyors to be responsible for the work and development of the Cost Research Panel and the Building Cost Information Service. Age 30-38. Applicants should possess a University degree in economics and/or Statistics. Preference may be given to applicant with experience in the building industry. Commencing salary £1,500-£1,800, according to qualifications and experience. Three weeks' leave in the first instance. Contributory Superannuation Scheme. Applications, giving full information on education, experience and ayailability, to Appointments Secretary, Royal Institution of Chartered Surveyors, 12 Great George Street, Westminster, S.W.1.

SUBSCRIPTIONS TO THE ECONOMIST

Annual Postal Subscription by ordinary mail, UK and Canada £4 . 10 ; elsewhere overseas £5

By air see below

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight

CITY OF HALIFAX NOVA SCOTIA, CANADA

Call for Development Proposals Central Redevelopment Area

Halifax, the Capital City of Nova Scotia, together with its fast-growing Metropolitan area, has a population of approximately 200,000. It is an important administrative, cultural, commercial, and industrial centre and one of Canada's major ports open the year round.

The City Corporation, with the assistance of the Government of Canada represented by Central Mortgage and Housing Corporation, has acquired and cleared 13.9 acres of land in the Central Business area of the City as a first step in a Phased Redevelopment Programme.

The City is offering the cleared area for residential and commercial development by private enterprise. Plans, development conditions, and proposal forms may be obtained on application to the undersigned on payment of a certified cheque or Bank Draft for $50 (Canadian funds) payable to the City of Halifax to be refunded on submission of proposals.

Development Proposals will be received by the undersigned at the City Hall, Halifax, Nova Scotia, Canada, up to 3 p.m. Atlantic Standard Time, October 31, 1962.

P. F. C. BYARS, City Manager,
City Hall, Halifax,
Nova Scotia, Canada.

THE POWER PETROLEUM COMPANY POWER

Bridge engineers did fortnight's work in minutes

The Hammersmith Flyover existed on the drawing board—but difficult structural problems still remained. Building could not begin till Maunsell & Partners, the consulting engineers, had solved them. Maunsells had to discover the effects of the loads imposed during construction, and by traffic on the 16 span flyover. These would have taken many men at least two weeks to work out—if Maunsells had not decided to seek computer guidance.

A few minutes' hired computer time at the Ferranti Computing Centre solved all Maunsells' engineering problems with complete accuracy, and at low cost.

Computer guidance pays

The case above is only one of many where slashed costs and greater efficiency have resulted from computer guidance. Computers can perform an immense range of tasks with equally immense rapidity. Once properly programmed, they can cut through apparent jungles of information to reach relevant and practical conclusions. And because computers consider every aspect of a problem, every combination of variable factors, decisions based on their guidance are happily free from bias or over-simplification. Computers don't play hunches, but they *can* test them.

However large or small your problem, hired computer time might be able to solve it. There is no need to own a computer—and no need to worry about the technicalities of computing—you can hand your problem to Ferranti and they will do the rest, or they can teach you, in a few hours, a simple "do-it-yourself" programming technique. Why not get in touch with the Computing Service? They will be glad to advise you whether or not you could profit by computer guidance. *The Ferranti Computing Service, 68, Newman Street, London, W.1. Tel: MUSeum 5040.*

HOW A NATION GROWS

Building new land where oceans once were

A land construction project is in full swing on the coast of Chiba Prefecture, across the bay from Tokyo. Here is a tangible symbol of confidence in Japan's economic future. It is only one of many such projects that will provide acres of new land salvaged from the sea for the construction of new factories to support Japan's industrial growth.

The growth rate of Japan's economy in the recent past has already attracted the attention of astute investors in countries around the world. In spite of recent setbacks in the securities market and some clouds over the economic horizon, the long-term outlook is favorable. But to make the best investments in today's highly selective market you need accurate data, careful analyses, and the kind of expert advice that Yamaichi has the experience and know-how to give. Our 110 offices throughout Japan and our staff of 50 trained research specialists are in constant touch with every segment of the economy. Our wide range of publications on various aspects of investing in Japanese securities is available on request, and our experienced staff will be happy to serve you, all without obligation.

The Dry Fly palate

Styles of sherry vary considerably, but Dry Fly, a finely blended medium sherry, is designed to cover the widest possible range of tastes. It is delicious as an aperitif before a meal, served mid-morning with biscuits, or as an evening refresher. 18/6 a bottle.

Those who prefer a dry sherry should try CECILIA, a delicate Amontillado; and for sweet tastes—GOLDEN CHANCE, a rich Oloroso Cream. Both at 20/6 a bottle.

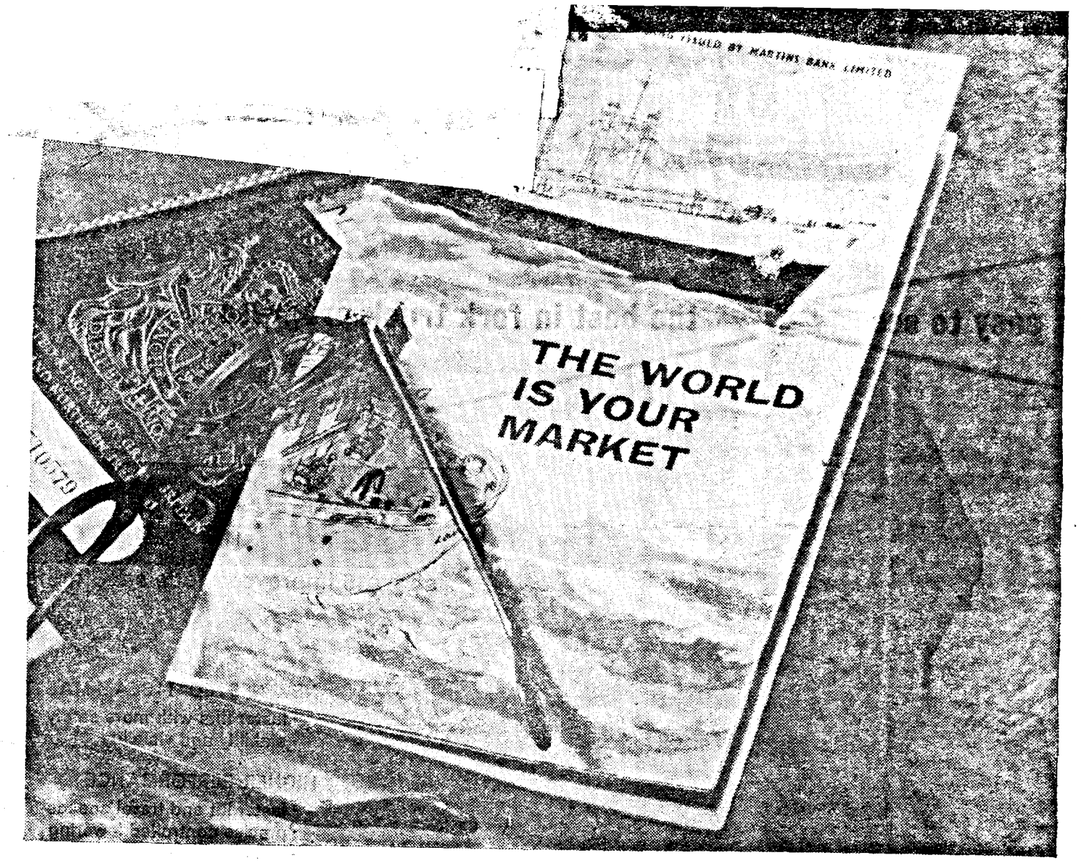
Lloyds & Scottish Finance helps manufacturers and merchants to sell...helps firms and individuals to buy

A comprehensive hire purchase service backed by two great banks

Through its integration of two long-established finance houses—Scottish Midland Guarantee Trust and Olds Discount—Lloyds & Scottish Finance Ltd. represents an unusual concentration of specialized skill and experience in financing the purchase of: ● *Cars, commercial vehicles, and motor-cycles* ● *Industrial and agricultural plant and equipment* ● *Domestic electrical appliances and household goods.*

To traders in motor vehicles, radio, television, and domestic appliances and furniture, Lloyds & Scottish Finance offers both direct collection and block discounting facilities. The manufacturing and building industries, and other users of capital equipment and machinery, including agriculture, are employing its financial resources on an increasing scale. And convenient time payments are arranged for individuals for central heating installations, marine craft, garages and garage extensions, school fees and other such personal requirements.

Lloyds & Scottish Finance Ltd. is a subsidiary of Lloyds & Scottish Ltd., a holding company with a capital of £15,000,000 jointly owned by Lloyds Bank and National Commercial Bank of Scotland. With assets now exceeding £100,000,000, Lloyds & Scottish Finance is well placed for further expansion. Through its country-wide network of branch offices it has established a reputation for efficient, courteous and understanding service to all its customers.



Enquiries are welcomed at any branch, or may be sent to the address below.

Britain's Five-Year Plan

The L.C.C.'s Trinity School, Southwark. Architects: Messrs. Chamberlin, Powell & Bon. General Contractor: Messrs. J. M. Hill & Sons Ltd.

"NOW STEEL GIVES US FREEDOM OF SHAPE"

A leading consulting engineer talks about exciting steel-age developments that are making possible the buildings of the future.

"Steel is enabling us to break right away from the conventional in building," says a leading consulting engineer. The pictures which line his office walls show the exciting shapes of tomorrow's skyline, born of new developments in steel products, and new thinking in architecture.

CLEAN, LIGHT AND SLENDER "Only recently," he says, "**have we really gone to town with steel and taken advantage of its potential as a tensile material.**"

The traditional building materials – masonry, brickwork, concrete – offer strength in *compression*. But steel provides strength in *tension* as well. The results show in clean lines, lighter structures and slender forms.

FREEDOM OF SHAPE The new steels have excellent welding properties – and by welding together pre-shaped steel plates, you can create almost any shape you want.

The consulting engineer comments, "**You eliminate non-essential parts and produce a structure which is fused together. I call it 'freedom of shape'. We're getting back to the freedom of shape which our predecessors had when they used cast iron in those wonderful old railway stations.**"

Roofs like that at Trinity School, Southwark, shown above, point his remarks.

STRONGER AND CHEAPER The new high tensile steels, now standard materials for sections, offer a yield stress of 23 tons per square inch, as against the 16 tons per square inch of the mild steel previously used. And since this big increase in strength comes with very little extra on the price, building costs are cut.

Architects also owe much to the very wide range of beams and columns now being rolled by the new Universal Mills, with webs and flanges whose thickness – or rather, thinness – can be made exactly right for the job they have to do.

AND THE FUTURE? The alliance of the new beams and sections with the new high tensile steels has already led progressive architects and civil engineers to change direction.

Meanwhile in their laboratories, steel scientists are ensuring that still newer steels will be ready to meet the challenges which will be presented by the engineers, motor manufacturers, industrial designers, and all others who are shaping tomorrow.

HOME

Calling the tune

Ned has exceeded all hopes for him: in a tactful way, the National Economic Development Council has set Britain **a target for expansion** which could be a salutary shock to deflationary thinking in high places, and may even leave a mark on the inflationary instincts of other people (p. 537).

American attempts to interfere with **international shipping** have had a cool reception in most countries, and the cold shoulder from Britain (p. 585).

Paying the piper

Mr Cousins, with devastating skill, has put his oar into the **dockworkers'** negotiations and stirred up the prospect of a strike (p. 541).

The **nurses,** riding on the crest of a wave of public sympathy, would do well to accept arbitration (p. 542).

Two great British **airlines** are standing up manfully to what they consider the bullying tactics of some of their employees (p. 543).

Leading the band

Mr Gaitskell seemed, in a broadcast on the **common market,** to have slightly more than half of himself on the European side of the fence (p. 543) : and he is quite clearly on the opposite side of the fence from the more fanatical elements in the campaign for **nuclear disarmament** (p. 570).

Keeping the score

The Pipelines Bill is rousing political passions—departmental rather than party (p. 575): many **pipelines** have already been laid without its benefit (p. 576).

The week's **local council elections** are well-designed as a test of the three parties' strength in the country (p. 569).

In Montgomery the by-election caused by Mr Clement Davies's death defeats psephology (p. 543).

Mr Powell has attacked the inadequacy and inaccuracy of **hospital statistics** (p. 549).

Once more, with feeling

Believers in the repetitive habits of history will find many extraordinary parallels between this year of grace and 1958 (p. 541).

Attention is being directed again to Britain's need for **sporting facilities:** the Chancellor has made a modest gesture (p. 546).

Jersey, in the Channel Islands, lives a life of ease on its fair-weather friends (p. 539).

INTERNATIONAL

Personality Problems

In their different positions, both the British and the French have got to get used to the idea of **living with gaullism.** The British may not find it so impossible as it looks, for General de Gaulle is more flexible and realistic than he sometimes seems (p. 535); the French still do not know what it will mean for them (p. 556).

Dr Adenauer has annoyed and disappointed Washington over Berlin (p. 562); the **Berliners** are far from sure where they stand (p. 555), but know they will have to go on standing there for a long time yet; the harmony of **Nato's** Athens meeting was nice while it lasted, though (p. 542); harmony of any kind has hardly been helped by the American proposal to set off **a bomb in space** (p. 542).

President Segni is well suited to his high Italian office: he needs to be, if he is to play his part in healing the wounds caused by the manner of his election (p. 558).

General Franco and **Dr Salazar** have both been assailed by riots (p. 544).

Little Local Difficulties

China is well and truly on the hook in Kashmir, and probably, in the face of increasing **Indian** pugnacity, wishes that it could get off (p. 538).

Laos continues to baffle the best intentions of the peacemakers (p. 543).

Lebanon will probably show its usual tolerance in dealing with the troublemakers of January (p. 558).

Little Logical Difficulties

Persia's programme of **land reform** is supposed to be completed within two years: how, is open to question (p. 557).

The meatless **Czechs** have yet to experience the promised benefits of **collectivisation** (p. 546).

The problem of dividing up £27½ million among expropriated victims of the **Suez affair** who have lost more than £65 million continues to exercise the Government (p. 546).

Mr Butler and his vacuum-cleaner are going to try to tidy up in **Rhodesia** (p. 543); there is a lot of dust to raise. **Dr Verwoerd** sees well enough the logic of events in Rhodesia: he is not so clear-sighted about the consequences of his own policies (p. 548).

Transatlantic Topics

After floating for twelve years, **Canada's rate of exchange** has been fixed in an attempt to recapture the confidence of overseas investors (p. 573).

The United States Supreme Court's recent decision on **legislative redistricting** is producing political results with unexpected speed (p. 561); but on **voting rights for Negroes** the Administration has suffered a serious defeat in Congress (p. 562). In Louisiana a battle is looming on **Negroes in schools.**

The English Canadians must wake up to the reality of French Canadians' grievances (p. 559).

In Texas there is a scandal over a **stockpile of tanks,** but in Washington no serious revelations are expected from the enquiry into **the stockpile of strategic supplies** (p. 567).

The **1962 American elections** are getting under way (p. 563).

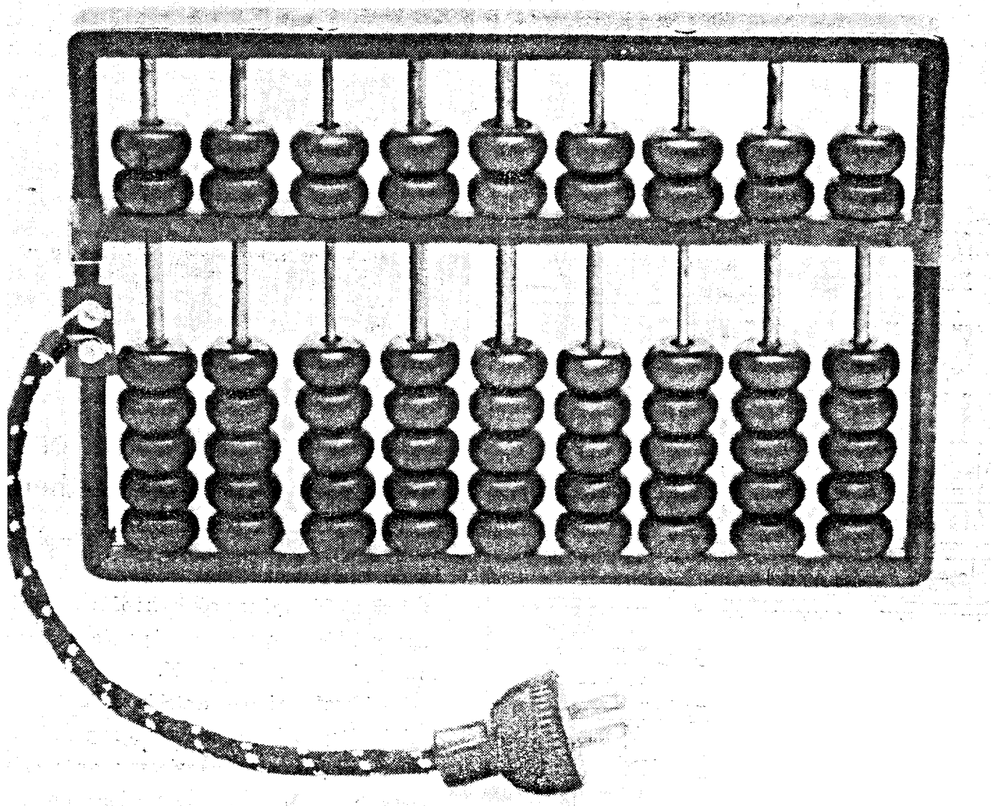
Mallory 'sound power'



is changing your world

The amazing 'Sound Power' generated by Mallory batteries has triggered off a host of modern miracles. Instance the many types of 'invisible' hearing aids, some so tiny they can be contained in spectacle frames; transistor radios small enough to slip into a pocket or purse; paging receivers which will fit into a buttonhole.
All benefit from Mallory size which permits truly miniature design and Mallory 'Sound Power' which ensures a steady flow of energy—a constant volume of sound. Fade-proof in store and in use, Mallory batteries are giving designers the power to reshape the world around us in so many different ways. The greatest battery design development for more than eighty years, they can be of great help to all manufacturers who wish to make their own products smaller and retain full power.

Mallory Batteries Ltd. Crawley Sussex
Sales Office: 33 Duke Street, London W1

In Canada, Mallory Battery Co of Canada Ltd, Toronto 4

How not to make an electric adding machine.

Just in case you'd like to be an electric adding machine manufacturer, we have a little friendly advice.

Don't just take an old-fashioned hand adding machine and hook it up to an electric motor.

A lot of people have done it (and are still doing it).

But it doesn't work too well.

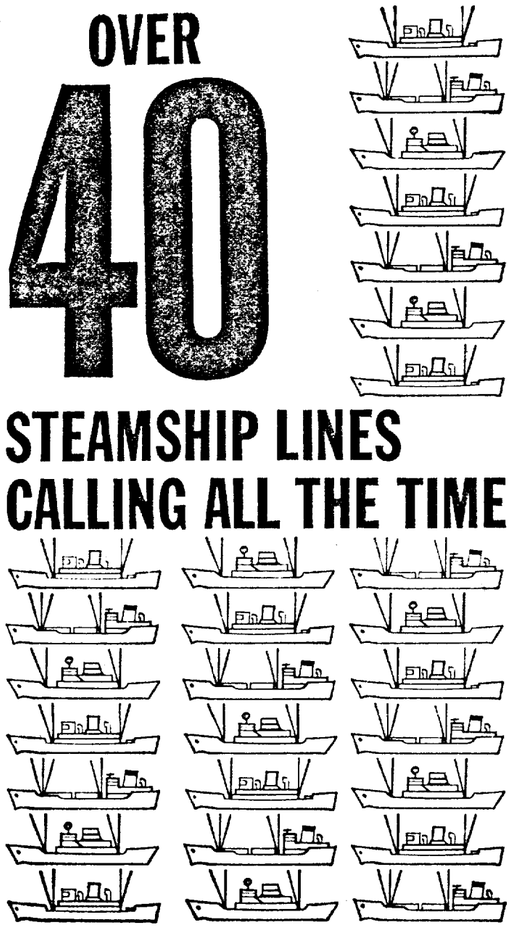
You do much better designing a machine that is completely electric to begin with.

Our Remington adding machine, for example, has far fewer working parts than most others.

So there are fewer things to go wrong.

As a result, the Remington is fast. And accurate. And delivers long years of trouble-free service.

If you *don't* want to go into the adding machine business, buy a Remington.



If you *do* want to, buy one anyway.

It's a very good one to copy.

Remington Rand

REMINGTON ADDERS AND CALCULATORS ARE AVAILABLE IN A WIDE RANGE OF STYLES, SIZES AND PRICES—MANUAL AND ELECTRIC. FOR FURTHER INFORMATION, CONTACT YOUR LOCAL REMINGTON RAND OFFICE.

Alleys full of customers
and a trader who knows them all

Bowling passed from a genteel pastime to big business long before automatic pin-spotters were invented. But modern machinery has made it one of America's happiest exports. This year, millions of people are expected to scatter pins all over the world.

C. Itoh has been instrumental in establishing the sport in Asia. A special company was set up with AMF and staffed with bowling, and business, experts. This expert approach to any business problem—importing, exporting or cooperative ventures—has made C. Itoh one of the world's leading trading companies with offices in every commercial centre. Why not ask your local C. Itoh trader to call today? Your business is probably right up his alley.

Clearly, no one in his senses would use chewing gum at a time and place such as this.

However there are times and places where the use of chewing gum can be most beneficial; in fact its discreet use is a mark of tact and consideration for others as it is a definite aid to oral hygiene.

Doublemint chewing gum is especially made for such people. Its ingredients are carefully selected throughout, even its flavour has been double distilled; in fact, as its name implies, Doublemint is double good and gives you double benefits in many ways.

Try some at the right time and in the right place and see for yourself.

End of a day's business on the Stock Exchange—the great market where stocks and shares are bought and sold for investors in Britain and all over the world.

Night...and a nation's crumpled shopping list

Business is ended in the Stock Exchange. On the floor lie the crumpled remnants of the day's work; dealers' notes, brokers' and jobbers' calculations; the discarded shopping list of a nation.

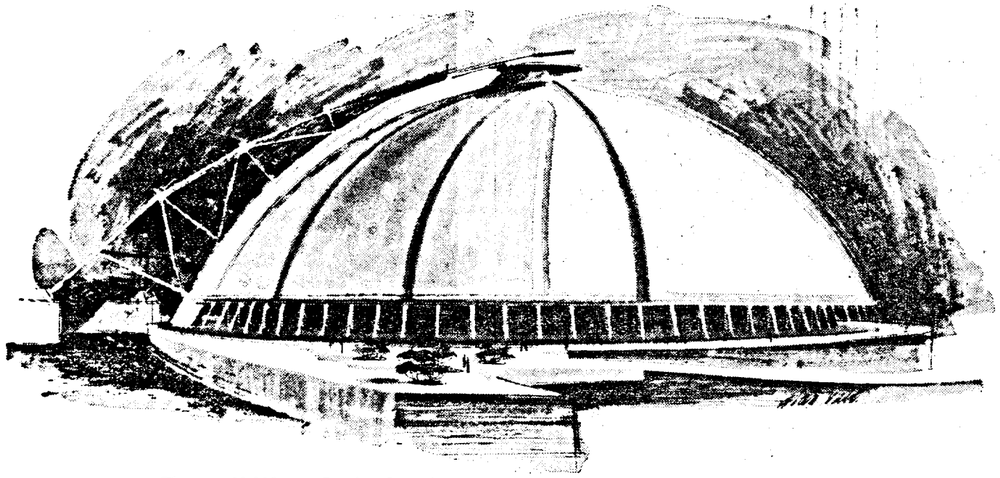
Here, in one of the world's greatest markets, Britain has done her daily shopping. The things that were bought and sold, though, were little pieces of business, of industry, of our Government itself.

Without investment British commerce would just cease to exist. And without the Stock Exchange, investment would be next to impossible.

For the Stock Exchange is a free market which makes it possible for industries, Government and public authorities to raise hundreds of millions of pounds every year on the best terms by the issue of shares and loans; a market which is vital to investors so that they may sell as well as buy such securities.

It is a market which affects us all. So many of us have jobs with companies that could not have been formed without it. So many of us have money invested through it directly, in stocks and shares. So many of us have money invested indirectly, for the institutions that invest their funds—*our* money—through the Stock Exchange include banks, insurance companies, trade unions, pension funds.

This is a great *international* market, attracting business and money from all over the world, helping to keep the country's standard of living high.



But it is also part of the lives of us all, affecting our work, affecting our play; helping us all to live as we want to.

THE STOCK EXCHANGE
LONDON

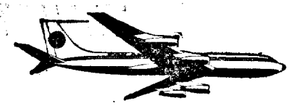
"My word is my bond"

LIKE TO KNOW MORE? For more information, or a list of stockbrokers, please write to The Secretary, Room B13, The Stock Exchange, London E.C.2. Or you can watch the Exchange at work from the Visitors' Gallery and see a film about it. Open from 10.30 to 3.0, Monday to Friday, entrance at 8 Throgmorton Street.

In addition to but independent of the London Stock Exchange are the Council of Associated Stock Exchanges, with separate exchanges in 21 of the larger cities and towns, and the Provincial Brokers Stock Exchange, with members in about 110 other centres throughout the British Isles

The new 13,000 seat Pittsburgh Auditorium with retractable roof in nickel-containing stainless steel.

More projects



More projects and fresh ideas take shape in industry making more exacting demands on metals. Visionary designs are transformed into practical realities —often due to the unique qualities that nickel confers. More projects demand more nickel. Inco-Mond meets the challenge with its new annual production capacity in excess of 400 million lb. of nickel and the metal will be available in ever increasing quantities in future years.

Behind this certainty of ample supply are the outstanding technical and market development services freely provided by Inco-Mond to industry throughout the world.

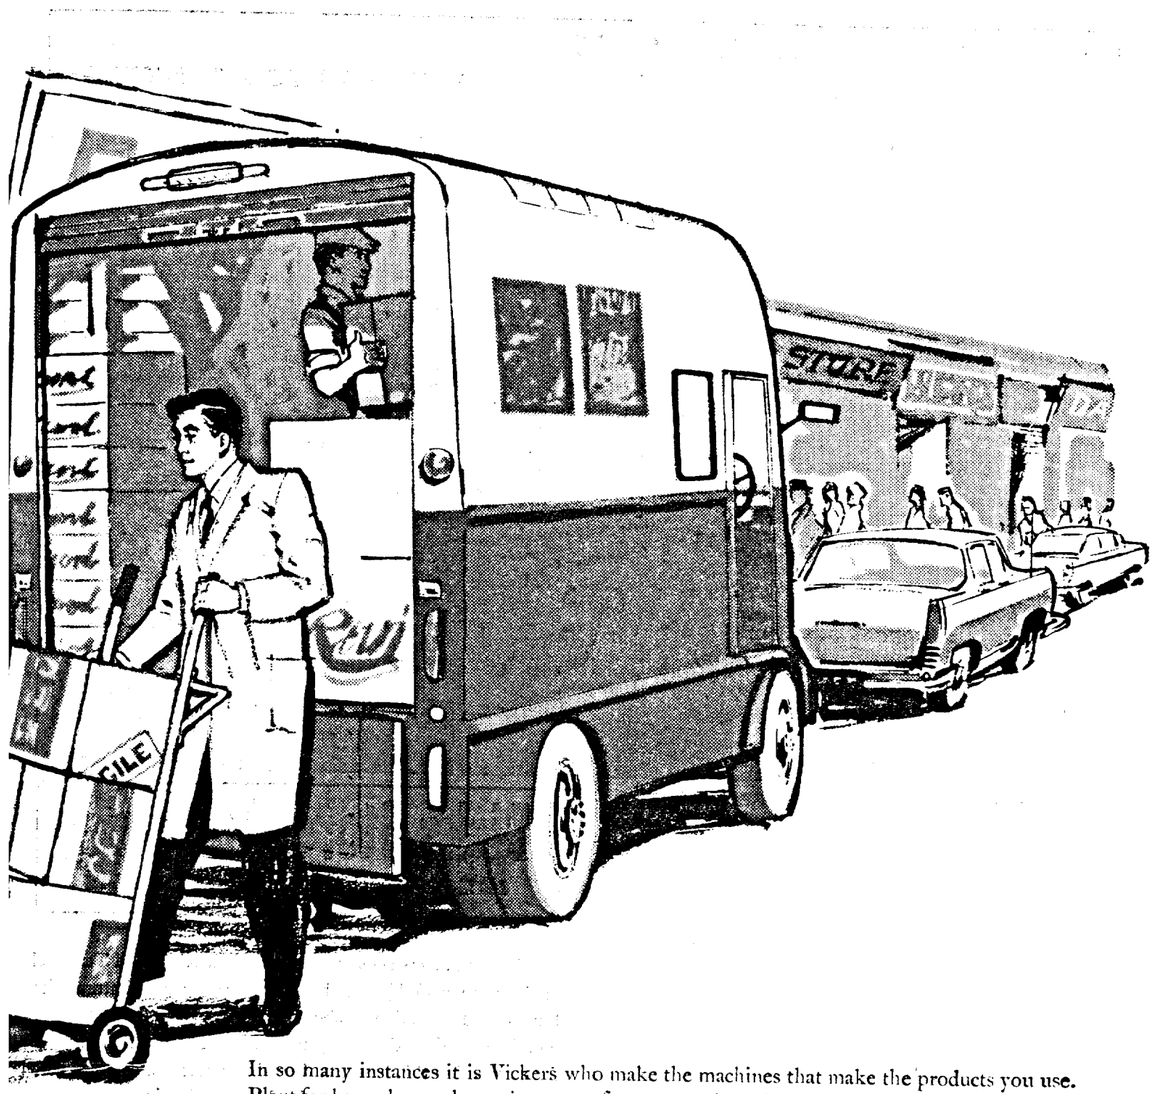
A rubber automobile?

Without rubber, today's automobile just couldn't be built. All the automobile parts you see illustrated are made from one of the many types of Polysar* rubber—from tires to upholstery, from weather stripping to the interlining of the spring leaves. Because of Polysar rubbers, your car gives you better performance, greater comfort—and lasts longer.

If you are planning a new process, a new product, or improvements to an old one, success can depend on your finding a new raw material. A most promising source may lie among the 40 different types of Polysar synthetic rubbers, produced by the Polymer Corporation Limited.

Within the world-wide Polymer organization there is a representative nearby, ready to advise you. A letter to the Marketing Division, Polymer Corporation Limited, Sarnia, Canada, will put him in touch with you.



POLYMER CORPORATION LIMITED *Trade Mark Reg'd.
POLYSAR
SARNIA CANADA

ONE OF THE WORLD'S MAJOR SOURCES OF RUBBER

Curiosity gets the better of me—

whenever my eye lights on consignments of tagged this or labelled that boasting of CARRIAGE PAID or beggared by C.O.D, so that I cannot rest until I discover whence they came or whither bound, and when it comes to identifying the manufacturers of cases and cartons, it is almost as impossible as finding out who builds the ingenious machines used in making and filling such a variety of containers.

In so many instances it is Vickers who make the machines that make the products you use. Plant for heavy box and container manufacture together with filling and weighing machinery, for instance. Often, Vickers make the machines that make the machines that make the products you use. For in a whole world of engineering, Vickers are Engineers to Industry.
