"DIVIDEND retailers" from the Co-operative Wholesale Society recently sent a mission to America to examine the success of another kind of cut-price trading, the discount houses: the team has come back impressed mainly by another kind of trade, the "perimeter-location" shopping centres. These, unknown as yet in Britain, are suburban or ex-urban sites of up to a hundred acres, in which vast parking spaces serve a great variety of shops grouped under one roof, the largest example having over a million square feet of store space. Nearly a quarter of American retail turnover is now said to take place in these, which with their emphasis on store grouping and glamour are the opposites of "cheap-jack" discount houses on backstreet sites in mid-town. The CWS delegation noted that shopping centres (often developed by and round a large department store) have come to accept discount houses in their midst; this usually results in the smartening up—and pricing up—of the discounters. This more elegant type of discount stores in America, says the CWS report, in fact equal or surpass in appearance most low/medium class department stores in Britain (hardly a difficult achievement). Many even offer credit, HP, delivery, and servicing—all the extras, in fact, whose absence is supposed to help discount prices. The report's conclusion was that the cheapest type of discount store was on the way out in America, after a period of great success, and might never even achieve widespread popularity over here.

The CWS seems to have made these discoveries with some relief. Only last November the Development Committee of the Co-operative Union was urging the movement not to miss its chances in the discount selling of dry goods. But, as the CWS report implies, some people felt the movement could not afford to patronise a kind of trading that often made an asset of the scruffiness which the Co-op movement is trying to overcome.

The CWS is undoubtedly right to insist that retail planning for the future must take into account likely changes in transport habit and communications. The two, of course, go together: "motorised shopping" will only become widespread in Britain if there is somewhere to put your car near the shop. The alliance of car parks and shops is the essence of the shopping centre, though it seems unlikely that the shorter distances and more general high land values in this country would ever produce developments on the largest American scale. The CWS talks of the possibility of perimeter shopping centres serving several community areas, of the kind that Allied Land and Investment said this week they were planning in the west of England; this seems the antithesis of integrated community planning and it seems far more likely that, as in the new towns, the smaller "neighbourhood centres" which already flourish in the States will become the common pattern here. There is still room in the larger cities, too, for more Birmingham-style redevelopment of central urban areas rather than the rush to the outskirts—providing the motorised shopper is prepared to pay an economic rent for parking space in the centre.

FILMS

Money to Risk

THE National Film Finance Corporation, one of the three buttresses of an industry that long ago gave up hope of being self supporting, exists to take the strain in the weakest places. It lends most of the "end money" for the production of a film after a distributor's guarantee has made it possible to raise the greater part of the finance on the market. Though big distributors now work closely with independent producers, the NFFC still bridges an important gap, even if the sums it lends —£1,034,396 in the last financial year—are not so great as they used to be.

The NFFC's managing director, Mr John Terry, made the point this week that once an independent producer has become successfully established with the Corporation's help, he may be lost as a source of profit when he comes to make another film, if enough help is forthcoming from elsewhere. This, of course, is as it should be, for the NFFC is not primarily an impresario. But it does make it harder for NFFC to recover its loans. Most British films still lose money; but it can be taken as a sign of improvement, and of several big successes, that the Corporation has made a profit for the second year running totalling £323,952, which is the highest it has ever achieved. Second features are the least profitable of all: Mr Terry would like to see them replaced with shorts.

CAPITAL GOODS

Try Something Else

WHETHER a venture into making steel plant is at present likely to open up for Richardson Westgarth a much more promising market than it has recently been experiencing for its other heavy equipment is very doubtful. The group has made an agreement with the Krupp organisation of Essen to co-operate in the manufacture of hot metal mixers and convertors for oxygen steel processes, such as the Kaldo process.

Oxygen steelmaking, certainly, is one of the processes in the steel industry where a good deal of capacity might in the next few years be earmarked for early replacement, owing to the economies it offers in melting shop costs, even if total steel expansion should slow down.

A few years ago, some steelmakers used to complain about the lack of capacity for making steel plant in Britain, and also of the problem of having only one supplier of certain kinds of equipment. They are not complaining about the first today (though it should be noted that at the peak of the industry's latest wave of investment there was still a good deal of American design and equipment being bought). They might still argue about the other point; the plant-making industry has become more rather than less concentrated. On the other hand, concentrated or diverse in ownership, a lot of this British capacity is idle today: in much the same circumstances as boiler-makers or marine engineers, with sizeable orders still being completed, but little new business coming into bolster up the order book.

SHORTER NOTES

Canada has agreed to accept $5.03 a lb for uranium delivered to UK Atomic Energy Authority under the "hidden contract" contained in an exchange of letters in 1957. A premium will be paid for deferring deliveries and the price will be adjusted if basic costs rise. First deliveries of this 12,000 short tons of uranium concentrates (24 million lb) can be made only after a producing company has completed its deliveries under previous contracts. All earlier contracts will be filled by 1967. The new contract allows deliveries to be stretched to early 1970. It has been shared among Canadian producers according to their contractual rates of delivery on July 1, 1961.

★

Rio Algom Mines, controlled by Rio Tinto-Zinc Corporation, is making a bid for Atlas Steels of Canada. Rio Algom will offer about Canadian $45 million and 680,000 of its shares standing at $9.50 in Toronto. Rio Algom holds a minority interest in Atlas, which has a large development programme in hand.

THE GRÄNGESBERG COMPANY,
STOCKHOLM

TRAFIKAKTIEBOLAGET GRÄNGESBERG-OXELÖSUND

Continued growth in broadened field

This statement is a review of the Annual Report adopted by the Annual General Meeting held on May 18, 1962. Copies available from the Secretary at the Head Office, Gustaf Adolfs torg 18, Stockholm, Sweden.

A Review of 1961

Investments Begin to Bear Fruit

GRÄNGESBERG's activities during the past few years have been dominated by a far-reaching investment and expansion programme, with unusual capital expenditure, aimed foremost at adding steel to the Company's traditional ore and shipping businesses and increasing productivity and capacity in all its fields of activity.

A major part of the financing required for this programme has been based on capital released through the purchase of the Company's LKAB shares by the Swedish State for SKr. 919.5 million. The final part-payment was received in 1961. The Company emerging in 1962 differs in character from GRÄNGESBERG of pre-1957 and most of the investment projects have now reached the fruit-bearing stage. This should place GRÄNGESBERG in a strong position to hold its own despite the prevailing market conditions in its three main fields: iron ore, steel and shipping.

In 1961, production and turnover again showed considerable increases, while profits not only maintained the level reached by their leap forward in 1960, but also continued to rise. These results were achieved in the face of easing demand and rising wages. The year's profit growth can be attributed chiefly to the increased shipping tonnage, together with the improved productivity and the larger turnover.

ORE BUSINESS

Four-fifths Exported of which 62 per cent to Britain

The iron ore mines at Grängesberg and Strássa, the latter re-opened in 1959, reached a new production record, with Grängesberg passing the 2 million metric ton mark for the first time. One-fifth of the ore extracted went to the Company's mills at Oxelösund and Guldsmedshytte Bruk. The larger part was exported, going chiefly to Great Britain (62 per cent) and West Germany (26 per cent). The trading profit on the ore business rose but slightly to SKr. 48.1 million, prices being unchanged and costs rising. The ore contracts for 1962 should enable deliveries to be kept on approximately the same level as during 1961, and the inevitable price drop due to increasing supplies in the world market amounted to five per cent on the average.

Among the many investment projects now under way at the Company's mines is the erection of a 200,000 metric ton pelletizing plant at Strássa.

SHIPPING

Tonnage Doubled Since 1955

While GRÄNGESBERG's shipping operations are based chiefly on ore transport from Sweden, ore from other sources and such bulk cargoes as coal, oil, grains, etc., made up no less than about one-fourth of the cargo carried in 1961. These categories accounted for nearly half of the fleet's operating time in 1961.

The increase in shipping tonnage that affected the 1961 trading profit totalled (apart from the m/v "Matarengi" of 37,530 d.w.t. received in November 1960) 34,700 d.w.t., comprising the bulk-carrier m/v "Aurivaara" and reinforcements on existing combined carriers. After the delivery of two bulk carriers, the total tonnage in operation at mid 1961 amounted to just over 600,000 d.w.t. Of the fleet's present 33 ships, no less than 16 have been built since 1957, totalling over 360,000 d.w.t. Two ships of together about 70,000 d.w.t. are on order for delivery by 1964.

IRON AND STEEL

Oxelösund Officially Opened

A highlight of the year was the official opening of the Oxelösund Iron and Steel Works in the presence of H.M. Gustaf Adolf of Sweden. The primary features of the Works are the two Kaldo (oxygen-steel) furnaces, with a charge capacity of 100 tons each. The intended full capacity of 25,000 tons of plate per month should be achieved, after the present running-in operations of the steelworks, during the second half of 1962.

The plate produced during the starting and trimming phase of operations has been well received on the Swedish market. During the year it was decided to make the necessary investments for increasing the annual production capacity to 400,000 tons of rolled products by 1964, through the addition of a second open-hearth furnace and various mechanical equipment, etc.

OTHER BUSINESS

Grängesberg Self-Sufficient in Power

Virtually all of the power for GRÄNGESBERG's Swedish operations is generated by wholly or partly owned hydro-electric plants; and these resources are being expanded in step with the Company's growing requirements. The port facilities at Oxelösund will be thoroughly modernized and fitted to receive the very largest tonnage entering into the Baltic.

LAMCO

Initial Capacity Increased

In its capacity as Manager of the Lamco Joint Venture in Liberia, GRÄNGESBERG during the year carried on construction work, by its own organization as well as through several contractors, at the Nimba mine and on the railway to the ore port at Buchanan, and the port itself. Production is scheduled to start during 1963. In its additional capacity as Agent for Lamco's ore sales, the Company concluded further ore contracts—with Italian and Belgian buyers—and by the turn of the year it was decided to increase the initial ore extraction capacity of the Lamco Joint Venture to the annual volume of 7.5 m. metric tons by late 1964.

In November 1961, additional shares in the Swedish Lamco Syndicate were acquired, bringing the Company's holding to 15/28 (53.8 per cent), compared with 12/28 previously.

HIGHLIGHTS OF 1961

(Figures in 1,000 metric tons unless otherwise indicated.)

	1961	1960
PRODUCTION		
Ore from Grängesberg	2,001	1,874
Ore from Strässa (Concentrates)	385	370
Power (incl. shared resources) million kWh	289	180
Explosives	5.2	4.4
Steel Plate	125	25
Pig-iron	323	181
Sponge Iron	32	33
Window glass 1,000 ½-cases	386	401
TRANSPORT		
Port of Oxelösund:		
Total shipments	2,327	2,204
Total discharged	649	346
Shipping tonnage 1,000 tons d.w. (31.12.1961)	580.7	546
TURNOVER (in m. SKr.)		
Parent Company (external sales only)	446.9	363.2
Incl. subsids. (Sweden) (external sales only)	512.8	415.5
PERSONNEL		
Company & subsidiaries (Sweden)	8,550	7,307
Liberian Operations	2,410	1,740
PROFIT AND LOSS ACCOUNT (in SKr. 1,000)		
Trading Profit		
Ore Business	48,051	47,178
Shipping Business	51,769	42,242
Other Business	16,220	12,147
	116,040	101,567
Dividends		
From Subsidiaries	5,070	4,093
Other	7,308	7,938
	12,378	12,031
Interest		
From Subsidiaries	2,087	3,141
Misc. Interest	21,574	30,420
	23,661	33,561
Misc. Revenues	14,345	11,416
	166,424	158,575
Depreciations	91,516	89,525
NET PROFIT	41,239	38,787
FROM THE BALANCE SHEET (in m. SKr.)		
Current Assets	419.6	403.7
Fixed Assets*	1,044.1	1,270.6
Current Liabilities	118.9	132.1
Long-term Liabilities	71.5	74.3
Capital and Reserves*	1,273.4	1,468.0
Share Capital†	495.8	297.5
Dividend (for the previous year)	35.7	35.7

Dividend for 1961: **SKr. 39.7 million.**

* Extra depreciations on fixed assets of SKr. 200 m. out of capital surplus were decided by the 1961 Annual Meeting and effectuated during the year.

† In 1962, the share capital has been increased to: **SKr. 500,000,000.**

COX AND WYMAN LIMITED

SATISFACTORY RESULTS IN DIFFICULT YEAR

The annual general meeting of Cox and Wyman Limited was held on July 31st in London, **Sir Christopher Bullock, KCB, CBE** (the chairman), presiding.

The following is an extract from his circulated statement:

Last year I stressed the serious upward trend in costs. The year under review was unfortunately marked by a continuation of that trend. The renewed measures of credit restriction also had a temporarily adverse effect. The Reports of other companies in the Printing Industry published in recent months show that reduced profit margins have been the general experience. In these circumstances, although our profit shows a decrease, I consider that the results may be regarded as satisfactory—particularly when it is borne in mind that the record figures for 1960/61 benefited from an overlap into that year of the accumulation of orders resulting from the printing stoppage of 1959.

There was a further modest rise in our Sales for 1961/62, and in particular we produced even more 'Paper Backs.'

The consolidated Profit and Loss Account of the Parent Company and its subsidiary shows a Group Trading Profit, before Debenture Interest and Taxation, of £105,133 as compared with £112,084 in 1960/61, a decrease of £6,951. Debenture Interest takes £18,600; and £41,612 is required for Income Tax and Profits Tax.

After deducting these charges, the Net Profit for the year comes out at £44,921, as against £50,525. We paid an interim dividend of 3 per cent in January, and now recommend a final dividend of 6 per cent, which makes a total distribution of 9 per cent. We shall thus be maintaining the same dividend rate as was paid last year when our capital was smaller. That issue increased the Company's capital from £280,000 to £350,000; and in consequence the total cost of the 9 per cent dividend on this occasion will be £19,294 net, as compared with £15,435 net a year ago.

I have in previous Statements emphasised the need for our Company to conserve its finances for the present and to strengthen the Balance Sheet by building up adequate Reserves. It is satisfactory that, after the appropriations above proposed, the Consolidated Balance Sheet shows, in addition to the Share Premium Account (Capital Reserve) of £13,381, Revenue Reserves which, including unappropriated profit, will now total £74,647.

We have spent substantial sums in recent years on the re-equipment of our Works; but this process must continue, if we are to maintain our competitive position. This year commitments in respect of capital expenditure are estimated at £61,000 as against £27,500 twelve months ago, an increase of £33,500.

As to prospects for 1962/63, it is difficult under present conditions to make any firm forecast. In the latter half of 1961/62 there was some temporary slackening-off in Orders, which I ascribe primarily to the credit restrictions; but I am glad to be able to report that there has recently been a marked improvement. Our present Order Books should ensure that our Works are well occupied for some months to come. The report was adopted.

S.A. DES AUTOMOBILES PEUGEOT

The Ordinary General Meeting, held on June 26th under the Chairmanship of **Mr Jean-Pierre Peugeot,** unanimously approved the reports of the Board of Management and Auditors, and also the distribution of profits proposed by the Board. After the allocation to legal reserve and a total allocation of NF. 20.500.000 to the statutory reserves, the total allocated to shareholders amounted to NF. 16.776.000, an increase of 4.85 per cent compared with that for the previous year. Taking into account the free distribution made in 1961, each of the 1.800.000 shares of the share capital will receive a gross dividend of NF. 9.32. The net dividend of NF. 7.15 will be payable on July 6th (coupon No. 5).

The appointments of the Directors, Messrs Francois Peugeot and Roland Peugeot, were renewed for six years.

In his address to the meeting the Chairman pointed out that the net assers of the Company could reasonably be assessed at NF. 1.350 millions. The profit after tax of NF. 50 millions, left by the turnover, of about NF. 2 milliards, thus gives a yield of 2.5 per cent. These results, obtained by using the maximum production potential, are in excess of the average recorded in the French automobile industry as a whole, but very much below those of foreign car manufacturers. This means that, in the face of ever-increasing international competition, the Board are making every effort to maintain the present rate of production and sale.

During the first five months of this year there was an increase of 6.3 per cent in the number of cars sold, there being also a slight increase in turnover and an improvement in export sales.

All of these Bonds having been sold, this announcement appears as a matter of record only.

July 25, 1962.

WILLIAM HANCOCK AND COMPANY

FURTHER PROGRESS

The seventy-fifth annual general meeting of William Hancock and Company Limited was held on July 26th in Cardiff, **Mr Joseph Gaskell, TD** (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

I am sure all Shareholders will agree that the group profits of £621,609 (£503,113) before charging taxation of £346,649 (£269,957), giving a net profit of £274,960 (£233,156) are satisfactory.

The tendency for sales of draught beers to increase and bottled beers to decrease has continued during the year but a net increase in total beer sales of 4 per cent is satisfactory. It would seem that the increasing popularity of keg beers is having an effect on bottled beers and in this connection sales of our Barleybrite have been outstanding.

Your Directors feel justified in recommending an increase in the total dividend on the Ordinary Stock from 17½ per cent to 20 per cent.

The consolidation of the duty Surcharge in the 1962 Finance Act gives little hope of a reduction in beer duty in the near future and the effect of the Purchase Tax charge of 15 per cent on soft drinks and cider has to be awaited. Fortunately, most of the areas in which the Company trades are reasonably prosperous at the present time and, provided conditions do not change, I see no reason why progress should not continue.

The report was adopted.

GROSVENOR HOUSE (PARK LANE)

ANOTHER SUCCESSFUL YEAR

The thirty-fourth annual general meeting of Grosvenor House (Park Lane) Limited was held on July 26th in London, **Sir Charles Taylor, TD, DL, MP,** the chairman, presiding.

The following is an extract from his circulated statement:

In spite of the fact that 1961 was a year bedevilled by international affairs which made tourists think twice before leaving their own shores for England, the profit for the Group before taxation shows a further increase over the last year. The net profit after taxation shows only a slight decrease on last year which is entirely due to increased Profits Tax.

Of course, turnover targets were helped by the modernisation which has been completed during 1961. The former Grill Room, which is now proudly renamed The Burghley Room, after the distinguished title which Lord Exeter bore when he joined the Board, captured people's imagination from the start and its customers continue to grow in number.

In the same way the Great Room, which I should remind you is the largest ballroom in any hotel in Europe and one of the few really large hotel ballrooms in the world, has been transformed with glittering success.

One of our small banqueting rooms, known as the Westminster Suite, has, in contrast to the Dubarry Suite, been redecorated in modern style. We can boast that Grosvenor House can provide a private dining-room for numbers ranging from 2 to 1,500 persons.

I believe that world travel will continue to expand, particularly if a solution can be found to some international problems. The wind of competition in the form of a number of new hotels now being built may be felt for a time, but I have always taken the view that we can face with confidence competition of new hotels with comparatively small rooms built at heavy cost, but that the greater problem in the next few years will be a shortage of trained staff. Your directors have been preparing both by improvement of existing facilities and by modernisation, against any competition we may have to face.

We are very satisfied with the investment we made just over a year ago when we bought the Polygon Hotel at Southampton. The turnover and profits have shown a marked increase during the first year of our ownership and operation and contributed to this year's increase in gross profits.

I have been asked on numerous occasions how the Common Market will affect Grosvenor House. I think the real answer is that if we can make sensible arrangements with the Commonwealth and with Europe and promote greater trade with the Common Market countries, there will be a consequent increase in travel by business men and increased tourist travel will follow.

I look forward to the future with confidence because I believe that world tourism and business travel will expand and also because I believe in Grosvenor House. We give the finest service in any hotel in the world; our rooms are comfortable; the food is excellent, and, above all, we have a loyal management and staff who work together as a proud and highly trained team.

The report was adopted and a total dividend of 1s. 4½d. per 5s. Ordinary Stock Unit (2½ per cent up on last year) was approved.

MOUNTSTUART DRY DOCKS LIMITED

IMPROVED RESULTS

The Sixtieth Annual General Meeting of Mouatstuart Dry Docks Limited was held on July 31st at Cardiff, **The Lord Leighton of St Mellons,** Chairman, presiding.

The following is an extract from his circulated statement:

In presenting the Accounts for the year ended March 31, 1962, I am conscious of the note of optimism I ventured to express a year ago. At that time there appeared to be a slight improvement in Shipping and our own position as regards repair work was quite good. Unfortunately, the improvement was not maintained and in fact dockings and repairs dealt with by the Group fell short of our previous year's total. In my Statement I told you of our decision, taken with great reluctance, to close our old established Barry Graving Docks for the time being, and it is only because of the economies effected at Barry, and in other directions, that we are able to show an improvement in our results as compared with the previous year.

It is impossible to make any forecast as to our future prospects because the position in the Shiprepairing Industry, which is entirely dependent on shipping, changes so quickly. The current year started off with all our Docks occupied and working to capacity, but since the beginning of June work has fallen off, and with the exception of Channel and Bute, our other Docks have been very quiet.

The Board have decided to recommend a dividend of 6 per cent, the same as last year.

The report and accounts were adopted.

KULIM RUBBER PLANTATIONS, LIMITED

MR P. B. L. COGHLAN'S REVIEW

The Twenty-eighth Annual General Meeting of Kulim Rubber Plantations, Limited, will be held on August 8th in the Council Chamber of The Rubber Growers' Association (Inc.), Plantation House, Mincing Lane, London, E.C.3.

In his circulated Review, the Chairman (**Mr P. B. L. Coghlan**) describes the further substantial progress achieved by the Company during 1961. Despite the lower price of rubber, good headway had been made with the Company's rubber replanting programme and, through the medium of a Subsidiary Company, first steps had been taken to promote an oil palms scheme. Also, iron ore mining had begun on one of the Company's properties and this additional source of revenue was particularly helpful at a time when receipts from rubber production were at a lower level.

Mr Coghlan then gives the following assessment of the outlook for natural rubber. Generally speaking, the future prospects for natural rubber produced on high yielding estates are perfectly sound. As the years go by, however, the new synthetic rubbers being produced come more and more into the picture and it is fairly obvious that in a few years' time, as their prices are reduced and quality improved, they will become even more competitive. I still consider that the two groups are complementary to each other and if the best qualities of each could be combined, even better materials would be made available.

In the meantime, the main field of competition and the fight for survival is not so much between natural and synthetic, but rather within their own fields of production. In other words, high yielding natural rubber produced at a low cost with a high standard of cleanliness and quality and in accordance with manufacturers' specifications, will have the best chance of survival. Similarly, the new stereo rubbers with their improved qualities and, in due course, reduced costs, will replace largely the present conventional synthetic rubbers.

At present we have the added complication of the problem of disposal of stockpile rubber accumulated by the United States of America. I feel sure that all concerned are doing their utmost to solve this problem with the least possible dislocation to the world market, but I must say that the various rumours and counter-rumours of plans and methods of disposal have created from time to time unsettled and uncertain market conditions. Surely it would be better for the American Government to state categorically that it intends to sell a definite and reasonable quantity per year. In other words, it would become just another rubber "producer" and the market would then know exactly where it stood and could adjust itself accordingly.

However, whatever scheme is adopted, it is most important that there should not be sudden variations and that there should be certainty of action over a period of years.

In the meantime, our own efforts will be directed to improving our efficiency so that we can continue to make a reasonable return to shareholders on their investment even at the lower prices for rubber which we may have to face in the future.

THE GENERAL ELECTRIC COMPANY LIMITED

G.E.C.

SALES AT NEW RECORD OF £135 MILLION

MANY CHANGES IN ORGANISATION

DIRECTORS' REPORT

The sixty-second Annual General Meeting of The General Electric Company Limited will be held on September 6th at the Connaught Rooms, Great Queen Street, London, W.C.2.

The following is the Report of the Directors which has been circulated with the Accounts for the year ended March 31, 1962:

The Directors present their Report and the Consolidated Statement of Accounts as at March 31, 1962. They also present the Balance Sheet of The General Electric Company Limited at that date.

The consolidated profit of the Group after taxation amounted to	£2,131,622
from which is deducted the interest of minority shareholders in Subsidiary Companies in the profit of the year	292,202
	1,839,420
to which is added adjustments relating to previous years	321,877
	£2,161,297
Of this amount the following has been dealt with in the accounts of The General Electric Company Limited:	
Profit for the year	£1,597,971
Adjustments relating to previous years	213,472
	£1,811,443
The Directors have appropriated the following:	
Preference dividends for the year to March 31, 1962, *less* income tax	£206,413
Interim dividend of 3 per cent on the Ordinary Stock, *less* income tax, paid April 7, 1962	422,625
and recommend	
Final dividend of 7 per cent on the Ordinary Stock, *less* income tax, payable September 13, 1962 ...	986,125
leaving balance to be transferred to Revenue Reserve	196,280
	£1,811,443

REPORT OF THE DIRECTORS

Sales for the year, including those of Radio & Allied (Holdings) Limited, which was acquired during the year, amounted to £135,174,000. Direct exports of the Group from the United Kingdom amounted to £16,143,000 against £18,405,000 in 1960/61. Sales by the Overseas Subsidiaries totalled £30,400,000 as against £31,500,000 last year.

The benefits of the programme of reorganisation are now being felt. Non-recurring losses and expenses associated therewith amounted to £679,413 after allowing tax relief (£1,469,000 gross) which has been charged against Revenue Reserve. On the other hand, capital profits amounting to £1,300,000 have been realised on sale of investments and properties arising directly or indirectly out of the reorganisation and have been credited to Capital Reserve.

While trading conditions have remained difficult and competition severe, a concentrated attack on costs has led to improved margins in some areas.

In the light of the results for the year and the prospects for the future, your Directors recommend a Final ordinary dividend of 7 per cent, making 10 per cent for the year on the increased ordinary capital, the same rate as for the previous year.

The Consolidated Balance Sheet shows some improvement in the liquid position as compared with that at March 31, 1961. The very large contracts on which the Company is engaged involve substantial short term fluctuations, but in the long term further improvement is expected.

Before arriving at the profit for the year your Directors have had particular regard to the long term contracts for manufacture and supply at present in progress. Provisions against possible losses have been made on the same prudent basis as in previous years. The usual method of presentation has been adopted by excluding from the provisions shown in the Notes to the Profit & Loss Account those deducted from the appropriate assets. This necessitates changes in the comparative figures for the previous year.

During the year, a number of important changes have occurred in the Company's organisation and management. The transfer of trading activities to the operating Product Groups has been completed and, in furtherance of the policy of decentralisation, certain Subsidiary Companies have been formed.

A conditional contract has been entered into for the sale of Magnet House, Kingsway, previously the headquarters of the Company. Most of the Branch premises throughout the country have either been sold or are in the process of disposal.

In the rearrangement of the shareholdings in Pirelli-General Cable Works Ltd., the greater part of the G.E.C. investment in that Company has been sold to Pirelli International at a satisfactory price. The Company has also sold its 50 per cent interest in Columbian-General Blacks Ltd.

In the early part of 1962, arrangements were finalised with Mullard Limited for the formation of a joint Company, called Associated Semiconductor Manufacturers Limited, to take over the development and manufacture of semiconductors. In this competitive field, the pooling of resources will be of considerable benefit to both Companies.

The Board. Of your Directors, Lord Aldington, Lord Catto, Mr D. G. W. Acworth and Mr W. J. Bird retire by rotation under the Articles of Association, and being eligible offer themselves for re-election.

Mr A. J. Scamp joined the Board during the year and offers himself for re-election under the Articles of Association. Mr Scamp was appointed Personnel Director on January 1, 1962.

It is a pleasure to record that in the 1962 New Year's Honours list a barony was conferred upon Sir Toby Low, who is now Lord Aldington.

BANQUE DE L'INDOCHINE

PARIS

The Annual General Meeting of Banque de L'Indochine was held in Paris on June 27th and the following are details of the report presented by the Board of Directors.

Amongst the branches of the Bank, those in Indochina, Japan, Malaya, Siam, and the French Pacific Islands have shown good results. The work of the London branch is now easier owing to its more spacious and modern premises.

Banking activity in France increased once more, especially in the sphere of discounting. As previously, the Bank took part in important foreign trade operations especially in Brazil and the Far East. The establishment directed or assisted in increases in capital for many French companies.

Shareholdings were taken or increased in many companies in France, in finance, research, distribution, transport, paper, construction. Various associated banking and finance institutions continued to increase the scale and the scope of their activities. Companies financing construction of buildings raised their capital and BANQUE DE L'INDOCHINE was amongst the founder members of *SINVIM* and *UNIF*. Information given in the annual report of the bank about the numerous financial, industrial and commercial undertakings in which the bank holds interests, shows that satisfactory results were achieved, in particular by investment companies, manufacturers of automation equipment, paper and cardboard, cement, alcoholic drinks, glass, chemicals, public works, non-ferrous metals, and by air-lines. The Bank continued to assist in regional development.

Net profit for the year amounted to NF.11,275,510.50 as against NF.10,217,302.27 for 1960 and it is proposed to distribute NF.9,146,787 compared to NF.7,593,602.95 in 1960, in the form of a net dividend of NF.10.7 per share as against NF.10 in 1960.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

F. H. LLOYD & CO. LIMITED

HIGHEST RECORDED PROFIT

MR F. N. LLOYD ON THE OUTLOOK

The seventy-fifth annual general meeting of F. H. Lloyd & Co., Limited, was held on July 27th at the registered office, James Bridge Steel Works, near Wednesbury, **Mr F. N. Lloyd,** chairman and joint managing director, presiding.

The following is taken from the chairman's statement, circulated with the report and accounts for the 52 weeks ended March 31, 1962:

Ladies and Gentlemen, last year's profit is the highest recorded in the history of the Company and the available profit after tax at £561,126, in spite of the increased rate of profits tax, is also a record. These results have been achieved during a year of increasingly keen competition and are the outcome of a further increase in turnover, improved utilisation of man-power and materials and benefits derived from capital investment in recent years.

DIVIDEND OF 15 PER CENT

This year's balance sheet reflects the outcome of the offer of 450,000 Ordinary Shares which was announced in our accounts last year and I would like to thank shareholders for the confidence they then showed in the Company's future by taking up 96 per cent of these shares. Although capital expenditures during last year have been running at a lower level, it is expected that we shall need to utilise the whole of these additional funds in modernising our plant and extending the range of our products. The Board has decided to recommend a final dividend of 12½ per cent, making 15 per cent for the year on the increased capital.

In September, 1961, Mr R. A. G. Duff ceased to be an executive director although he remains with us in a non-executive capacity. He has left us to take up an executive position with N. Hingley & Sons, Limited as Managing Director of one of their subsidiary companies. Four of your directors are now also serving as directors of N. Hingley & Sons, Limited and this arrangement is advantageous to both companies, whose interests are complementary, rather than competitive.

IMPROVED RESULTS MAINTAINED

The steel foundries and machine shops at our Wednesbury Works have been fully employed throughout the year and the improved results reported on last year have been maintained. Important additions have been made to our range of machine tools and additions to our steel foundries are in hand to increase the weight and size of the work which they can handle. Owing to the increasing importance attached to quality control, we are installing this year Betatron radiographic equipment, which will be capable of giving accurate and well-defined pictures through cast steel sections up to 18 inches thick.

At Lloyds (Burton) Limited there has been a further increase in the production of the specialised products which we are making under the agreements made some years ago with the American Brake Shoe Company. There was, however, some falling off in demand for this company's normal range of products and as a result profits here have run at a slightly lower level than at a year ago.

Parker Foundry (1929) Limited at Derby has been able to make a further small improvement in its trading results. This company has brought into operation a mechanised plant which enables the full economies of mechanised methods to be achieved on comparatively short production runs.

E. C. & J. Keay Limited has managed to make a small profit in the year, in spite of the severely competitive conditions which have prevailed in the structural engineering industry. We have had the benefit of economies achieved by concentrating all the staff at the main Works at Darlaston and by closing down the office at Henley-in-Arden, from which all designing and selling activities were hitherto conducted. A start has also been made on renovations in the Works and this will be carried on energetically during the current year.

NEW PLANT ACQUIRED

Since the close of our financial year we have acquired the buildings, plant and equipment used by Curran Steels, Limited for the manufacture of steel castings. An opportunity to acquire this plant arose just before the end of March and we have negotiated the transaction on terms which it is believed will prove advantageous to your Company. We have acquired only the steel foundry plant of Curran Steels, Limited and the engineering part of that organisation is still owned and operated by Messrs. Curran. The steel foundry has substantial capacity for the manufacture of small castings in repetitive quantities especially in manganese steel and given a suitable order book is probably capable of manufacturing at cheaper cost than any of our own plants. Unfortunately, under present conditions it is unlikely that we shall be able to obtain sufficient orders to enable it to make an appreciable addition to our profits during the current year. We feel certain, however, that it is an advantage to us to have this foundry under our own control and that as and when trading conditions improve our selling organisation will be able to find suitable outlets for its products.

Profits for the year to date are running at a lower level because we are having to accept keener prices to keep an economic level of production in our shops. This year's results will depend on our ability to maintain a satisfactory order book and under present conditions in the engineering industry it is difficult to see how we shall be able to do this. At the same time, we are in a good position to take advantage of any improvement that may transpire later on in the year.

TRIBUTE TO EMPLOYEES

Last year's results would not have been possible without the keenness and enthusiasm with which our employees have tackled the tasks allotted to them. In all our factories we operate joint consultative committees or Works Councils which we have kept going since the early days of the last war. These bodies consist of representatives of management and of employees who are elected by secret ballot. They meet at regular intervals to discuss all aspects of the Company's business.

The report was adopted.

'COALITE'

AND CHEMICAL PRODUCTS LTD.

CHESTERFIELD

The following points are taken from the Statement by the Chairman, **Commander Colin Buist,** *to the 45th Annual General Meeting of the Company:—*

★ The previous rate of steady progress has been restored. The record figures of two years ago were exceeded during the year ended March 31, 1962.

★ The profit of the Group, after depreciation and before taxation, totalled £1,017,558 compared with £852,133 for the previous year. Net profits were £531,411 (with an increased total dividend of £212,642) compared with £449,083 in 1961. £300,000 has been transferred to General Reserve.

★ Expenditure of a capital nature totalling £564,000 was the highest for many years. Capital expenditure authorised and outstanding at March 31, 1962, amounted to £1,390,000. It is expected that it will be possible to finance this from our own resources.

★ The work of mechanising retort operations is proceeding satisfactorily. The heating of all our retorts is now automatically controlled. Benefit is already being derived from improving efficiency and better productivity.

★ Entry into the Common Market should not affect the sale of "Coalite" in this country. There seems to be no solid smokeless fuel currently available on the Continent of Europe, or likely to become available, that will match the suitability of "Coalite" for the open fire. Competition in Oils and Chemicals may become more severe.

★ The new Research Centre at Bolsover was occupied in February.

★ Good progress is being made with the major scheme of expansion at the Askern Works. The new output should be available in 1964.

★ The new year has started well.

METAL INDUSTRIES LIMITED

GROUP

Summary of results for the year ended 31st March 1962

Turnover	£34,205,590
Consolidated profit before tax	£2,545,805
Taxation	£1,344,659
Ordinary dividends	£689,533
Cash flow (retained profits plus depreciation)	£1,159,132
Earnings per £1 ordinary stock (after tax)	3/0d
Dividends per £1 ordinary stock (after tax)	1/10d
Cash flow per £1 ordinary stock	3/1d

Copies of the Accounts and Chairman's Statement can be obtained from Metal Industries Limited, Brook House, Park Lane, London W.1.

S.A. Des Anciens Etablissements
CH. BERTHIEZ
PARIS, FRANCE
(Machine Tools)

The Annual General Meeting of S.A. Ch. Berthiez was held in Paris on June 27th under the chairmanship of **M. Aicard**, and the following are extracts from the Report presented by the Board:

REVIEW

Orders received during 1961 rose by 23 per cent compared to the previous year and reached a record level. Various prototypes of machines were built and a new automatic manufacturing process was designed. New machines and buildings were completed in the Company's works. Remarkable success was achieved at the European Machine Tool Exhibition in Brussels and at the Moscow, Bucharest and Brno Exhibitions. A new agreement was made with the Company's Japanese licensees, *Shibaura Machine Works*. A new group, *Toshiba Machine Company Ltd.*, was formed with another company, and the joint undertaking is amongst the most important machine tool manufacturers in the world. A sale distribution agreement was put into operation with the *Schiess Company* in Germany. Two agreements were made, one with the *Wickman Company Ltd.* in Great Britain, the other with *Lapointe Machine Company* in the United States of America.

PROFIT AND DIVIDEND

Net profit for the year 1961 amounted to NF.21,556 and it is proposed to carry forward the whole of the balance. It is expected that the results for 1962 will be very satisfactory.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted unanimously.

ST. MARTINS PROPERTY CORPORATION LIMITED

formerly

ST. MARTIN'S LE GRAND PROPERTY CO. LIMITED

	1962	1961
	£	£
Share Capital	3,336,000	2,503,009
Loan Capital	8,796,959	6,772,221
Reserves	7,982,240	4,308,946
Property Assets	20,048,494	15,841,161
Group Profit (before tax)	665,621	434,053
Net Profit (after tax)	373,518	242,393
Dividends (net)	305,011	214,633

The following is a summary of **Mr. J. B. Andrews'** *Statement circulated with the Accounts to 31st March,* 1962:

Capitalisation Issue. It is proposed to distribute 1,725,000 new shares, one new share for every eight shares held on the 27th July, 1962.

Prospects. In the absence of conditions beyond their control, the Directors are of the opinion that a dividend of not less than 15 per cent. on the new increased capital can certainly be maintained.

Development Programme includes: (a) **Winchester House and 1-8 Great Winchester Street**—Freehold. (b) **Euston Road**—Freehold Offices and Showrooms. (c) **Foster Lane, Cheapside**—Leasehold Offices and Shops. (d) **Finchley High Road**—Freehold Office Block. (e) **Carter Lane, E.C.4.**—Mainly Freehold Office Block. (f) **Southport, Lancs.**—Freehold Shops, Offices and Flats. (g) **Southsea**—Freehold Flats. (h) **Brighton.**—Freehold Office Block.

Further development schemes under active negotiation. Shareholders may look for a further steady improvement in profits which will benefit increasingly as developments become revenue producing.

SMITH'S POTATO CRISPS

HIGH POTATO COSTS AFFECT PROFITS

The Thirty-third Ordinary General Meeting of Smith's Potato Crisps Limited was held on August 1st in London, **Mr F. Le Neve Foster** (Chairman) presiding.

The following are extracts from his circulated Statement:

The Net Group Profit after taxation is £565,798 compared with £876,158.

The Board recommends a Final Dividend of 30 per cent plus a Cash Bonus of 10 per cent which makes, with the Interim Dividend of 15 per cent, a total distribution of 55 per cent for the year, which is the same as for the previous year.

Last year I referred to the exceptionally difficult period for production owing to the very poor quality of potatoes from the 1960 crop. As the Board explained in its Interim Statement the aftermath of these conditions carried over to the first part of the year now under review and resulted in excessive potato costs during that period. We then had reason to hope, from the official estimates available, that the 1961 potato crop would prove to be more favourable and that for the remainder of the year we might get some relief on prices. In this we were sadly disappointed. The short-fall in the potato crop, contrary to the official estimates, has developed since early February leading to near famine conditions and record high prices. Potato costs of the Parent Company alone exceeded those of the previous year by a figure approximating £421,000 (31 per cent increase). These conditions will also continue to affect the results in the early months of the current year.

Dealing with the huge quantities of potatoes—over 80,000 tons per annum—which we consume, fundamentally, these are matters which are outside our control.

Group sales show an increase of the order of 6 per cent on the total figure for the previous year; in the case of the Parent Company in spite of greater competition, and the poor weather during the summer period.

The present retail price of our standard bag is 4d.; this compares with a price of 2d. before the War. In the Board's view, it is not practicable to make a temporary price increase to meet what we believe to be a passing phase.

The Board has decided, for the present at any rate, to maintain the present retail price of 4d. a bag and to continue its traditional policy of taking the rough with the smooth and thus serving the customer; on this policy the success of our business has been built.

In view of the trend of general cost increases which it seems will inevitably continue, the situation will continue to be closely watched by the Board, but, in the meantime, it is hoped that shareholders will be understanding and that customers will give Smith's the credit for taking a notable stand in resisting price increases.

QUALITY THE KEYNOTE

Quality is the keynote of our policy and we pay the greatest attention to all matters which are necessary to maintain it, using the finest products available and methods of processing to impart just that difference in flavour and keeping qualities for which Smith's are famous.

The report was adopted.

HOUSE OF FRASER LIMITED

TURNOVER REACHES NEW PEAK

SIR HUGH FRASER ON SUBSTANTIAL PROGRESS OF MODERNISATION PROGRAMME

The twenty-first annual general meeting of House of Fraser Limited was held on July 27th in Glasgow, **Sir Hugh Fraser, Bt, DL** (chairman and managing director), presiding.

The following is his circulated statement:

The Directors' Report and Statement of Accounts now issued, cover a period in which the emphasis has again been on the improvement of existing assets rather than the acquisition of new undertakings, and later in this Statement I shall refer to a number of projects which have been successfully completed and others which have been commenced.

The Contracts of Sale and Lease mentioned in my previous Statements, and others concluded during the year under review, have had the effect of altering the incidence of certain charges appearing in the Consolidated Profit and Loss Account. Thus the fall in Trading Profit as compared with last year is chiefly due to the increased amount of rents payable under these Leases, and is to a large extent offset by the fall in Interest Charges and the increase in Interest and Dividends received.

Once again no Profit has been brought into the Group Accounts from William Henderson & Sons Ltd. Final settlement of the Consequential Loss Claims, resulting from the fire, falls to be made with the Insurance Companies concerned during the current year, and it is hoped that the financial results, on both Capital and Revenue Account, will be reflected in the next published Accounts.

The past year has been a difficult one due among other things to unfavourable weather conditions at the peak periods of our trade. Notwithstanding this, we have been able to surpass the previous record level of turnover. Expenses, however, are constantly rising, so I am particularly pleased to report that the net profit of the Group shows a small increase from £2,663,466 to £2,692,106 after providing £2,468,291 (£2,742,613) for taxation, the profit for the year applicable to members being £2,461,603 (£2,432,963).

The dividends, less income tax, paid and recommended for payment amount to £1,887,322 (£1,887,322) and after transferring a sum of £250,000 (nil) to Stores Maintenance Equalisation Reserve, and bringing in an adjustment of taxation provisions for previous years amounting to £205,545 (£21,968), the balance of unappropriated profits to be carried forward amounts to £2,907,326 (£2,377,500).

In the Consolidated Balance Sheet the Net Assets have increased by £1,448,177 to £32,445,385 (£30,997,208), while the extremely liquid position is reflected in a surplus of Current Assets over Current Liabilities exceeding £15,000,000. The financial position of the Group has never been stronger, and this satisfactory state has been achieved entirely as a result of the successful utilisation of its own resources.

BUILDING PROGRAMME

The extensions to Hourstons of Ayr, Benzies of Elgin and McDonalds of Harrogate have been completed, and these stores should benefit from the increased accommodation made available and the improvements which have been effected. In addition, considerable alterations have been carried out at Fraser Sons of Glasgow, the headquarters of your Company, which have made it one of the finest and best appointed fashion houses in the country.

The second phase in the rebuilding of Arnott Simpsons in Glasgow was held up temporarily when demolition work disclosed that the adjoining building was in a dangerous state of repair. Work is now proceeding satisfactorily, however, and it is hoped the building will be completed next year according to schedule.

The new premises in Fawcett Street, Sunderland, are nearing completion, and should soon prove a valuable addition to the existing store, one of the main advantages being the concentration once more in one building of a number of departments which are at present dispersed over various sites in the city.

Extensive alterations, including the installation of an escalator, have also been carried out at our Carlisle store.

The new Liverpool store of William Henderson & Sons Limited is now nearing completion and it is hoped will be open for business in the autumn. A leasehold interest in the property has been granted by the Company and part of the premium therefor has been received. The balance amounting to £648,000, in satisfaction of a conditional contract exchanged on January 9, 1962, is shown under the heading of Premium Receivable in the Consolidated Balance Sheet.

The office block, forming part of the development of the site of Rackhams Limited in Birmingham, was completed during the year and is now fully let.

In addition to the above, Harrods more than maintains its exclusive reputation, and, together with its various subsidiaries, is actively continuing the existing programme of modernisation to premises and trading methods, still further to improve both customer service and operating efficiency.

FUTURE OUTLOOK

Some form of trade integration, or at least closer trade association with Europe seems probable in the near future. For those with imagination and industry, this could provide an opportunity for acquiring new markets, but no one should conclude that expansion of our trade will accrue automatically without thought or hard work. The general improvement in our standard of living, and that of our neighbours across the Channel carries with it an increasing demand for higher quality goods, but they must be reasonably priced and conform to the requirements of design and style of our customers.

Your Board of Directors is acutely aware of the significance of these trends, and the whole purpose of our comprehensive programme of alteration and extension is to ensure that we are properly equipped to meet the keen competition we may expect in the challenging period confronting us.

So far as your Company is concerned, turnover for the first few months of the current year has been fully maintained and, subject to any unforeseen circumstances, I look forward to another satisfactory year.

STAFF

Your Company has always been fortunate in its Staff relations, and on your behalf and on behalf of the Board, I am happy to thank all executives and employees for their excellent efforts to achieve and maintain the success and reputation of the Group during a year which has been both exacting and demanding of their best efforts.

The report and accounts were adopted.

BY APPOINTMENT TO HER MAJESTY THE QUEEN BREWERS

BRICKWOODS LIMITED

The seventy-first annual ordinary general meeting of Brickwoods Limited will be held on August 10th at Portsmouth.

The following are extracts from the Director's General Report:

The summer weather of 1961 was not good, although it was an improvement on 1960. Nevertheless, the overall trade was buoyant and the net profit after tax has increased by £109,185, including a non-recurring profit of approximately £25,000 net.

On January 1, 1962, it was announced that the company had been appointed by Royal Warrant into the place and quality of Brewers to Her Majesty the Queen.

The profit of the Group before Taxation amounted to £1,045,796, an increase of £144,376 over the preceding year. Taxation takes £476,675 against £441,484 the previous year, leaving £569,121 (1961 £459,936). The Directors propose a final dividend of 15 per cent making 20 per cent for the year (1961 15 per cent plus a bonus of 2 per cent).

Despite the long winter of 1961-62, trade has been up to now good, particularly in the sphere of cask beer and "Sunshine Keg," a new canister bitter beer introduced into our licensed houses last year. The sales of the new "Brickwood I.P.A." just brought out in bottle, to replace the old Brickwood "Sunshine" and United "Pompey Royal" are showing great promise.

Wines and Spirits and Mineral Water sales are satisfactory and providing they, and beer sales, continue that way, it is hoped that together they will offset the ever-rising costs of production and administration, which are our perpetual headache.

LA RINASCENTE

MILAN (ITALY)

Development which characterised Italian economy until the end of 1961, produced positive results for Italy's biggest chain store business, La Rinascente-Upim.

In 1961 the national Italian income increased by 9.9 per cent in terms of currency thanks to the contribution of agriculture (+10.9 per cent), of industry (+10.5 per cent) and tertiary activities (+9.0 per cent).

In front of this conspicuous increase of the income, there has been an increase of 7.8 per cent in private expenditures in terms of currency and of 6.8 per cent in terms of quantity. This signifies that the income increase has not determined an equivalent increase in families' spendings, as it has materialised in an intensification of the productive investments and has therefore improved the relation between productive investments and the amount of income. The results obtained by La Rinascente-Upim have to be considered therefore within that particular situation, which has become more difficult because of stronger competition among the operators in this field. Also the 9-9.5 per cent increase in costs, must be taken into account.

Sales of the seven Rinascente branches and the 91 Uniprice stores to January 31, 1962, amounted to about Lit. 92,000 million against Lit. 81,000 million, in the last financial year. The increase in sales has been about Lit. 11,000 million showing a 13.5 per cent improvement compared with the previous year's figure.

It can be stated that in a year, which had such difficulties, La Rinascente-Upim maintained a high rate of progress. This demonstrates also that the outstanding sales offers by the seven big Rinascente Department stores and by the 91 Uniprice stores Upim, correspond to the needs of a vast mass of consumers, among which all social classes are represented, and which include foreign tourists visiting Italy.

The net profit made for 1961-62, on a capital which had been increased a short time ago, from Lit. 6,000 million to Lit. 9,000 million, amounted to Lit. 1,260 million against Lit. 840 million in the last financial year; this amount represents 14 per cent of the Company's Capital of Lit. 9,000 million. It should be stressed that a dividend of Lit. 7 per each share has been distributed both on the ordinary shares totalling 180 million and on the preference shares, totalling 40 million.

To these brilliant results of the financial year must be added the continuation of an expansion programme. In fact the development of the business activities proceed systematically and gradually and are in full swing. During 1961-1962 to the six big Rinascente branches existing already—i.e. in Milan, Rome (Piazza Colonna), Naples, Cagliari, Genova and Catania—a second Rinascente branch has been opened in Rome, Piazza Fiume, which provides a very noticeable example of a big department store which has been conceived according to functional and up-to-date requirements.

To the chain of the Uniprice stores "Upim" another nine units have been added, they are: Milan-Giambellino, Milan-S. Gottardo, Cagliari-Petrarca, Bologna-Mazzini, Florence-Gioberti, Prato, Salerno, Potenza and Lodi.

Thus at the end of the financial year 1961-1962, all over Italy, 98 stores were operating.

For the immediate future, another six Uniprice stores are foreseen and will certainly start operations during the current year. In this way more than 100 stores will be in full activity.

A considerable development is foreseen in the field of super-markets, in which La Rinascente-Upim operates through the affiliated "Supermercato S.p.A. (SMA)," that operates 30 stores. The same is to be said for the production field of ready-made clothes in which La Rinascente-Upim has operated for a long time through the affiliated Company APEM, an industrial combine of high efficiency and of an ever-increasing productive capacity.

THE ATTOCK OIL COMPANY

PRODUCTION, SALES AND PROFITS INCREASED

The fiftieth annual general meeting of The Attock Oil Company Limited was held on July 27th in London, **Mr A. McGilvray**, the chairman, presiding.

The following is an extract from his circulated statement:

The Profit and Loss Account shows that profits have improved from £1,204,721 in 1960 to £1,301,922 an increase of £97,201.

Current assets were £3,300,331 against current liabilities, excluding the 1961 dividends, of £1,663,262 giving a surplus of £1,637,069, a decrease of £11,999 compared with the similar figure at December 31, 1960.

Capital expenditure in 1961 amounted to £599,734 of which £368,968 was in respect of the duplication of the Oil Pipe Line from Dhulian to Rawalpindi as referred to in my Statement last year.

Out of the profit of £1,301,922 for the year ended December 31, 1961, £228,411 has been set aside for depreciation and £491,690 for taxation leaving a balance available of £581,821.

Your Board have appropriated £145,000 to General Reserve and recommended a final dividend of 1s. 8d., free of United Kingdom Income Tax, per £1 unit of Stock. This dividend together with the interim dividend of 1s. 0d. will absorb £386,667 and leave a balance unappropriated of £50,154 which, added to the amount of £50,588 brought forward from last year, results in a balance carried forward to 1962 of £100,742.

The consumption of petroleum products in West Pakistan continues to increase, being some 4½ per cent higher overall in 1961 than the previous year. Prices obtained, however, showed no improvement. In fact, the return on your Company's products suffered a further contraction when the first stage in the elimination of the freight protection became operative on August 1st last.

Fortunately because of favourable Fields developments we were able again to increase crude production and consequently sales of petroleum products which resulted in an overhead increase in our revenue. This, coupled with savings in exploration costs, has resulted in the improved Profit and Loss Account for 1961.

FIELD OPERATIONS

Crude oil production for the year was 2,024,735 barrels compared with 1,859,867 barrels for the previous year.

Dhulian: This Field now extends into concessions held by our Subsidiary, Pakistan Oilfields Limited. Altogether results of operations over the past year have been encouraging as to potentialities and have justified the increases in production made towards the end of 1961 and again this year. Including the oil being produced on POL account, Dhulian production is now double that of three years ago.

The discovery of oil at Dhulian on behalf of Pakistan Oilfields Limited is very gratifying and it is hoped will set a reasonable limit to the years of patience which its Shareholders, included in whom are the Government of Pakistan and Pakistani Nationals, have had to exercise during the prospecting phase of that Company's history.

After reviewing the activities at the various other fields, the chairman concluded:

Our crude oil position is better than it has been in the history of the Company and barring something unforeseen I look forward to another satisfactory year in 1962.

The report and accounts were adopted.

SINGLETON & COLE LTD.

A RECORD YEAR

The sixty-fifth annual general meeting of Singleton & Cole Ltd. was held on July 31st, at the Chamber of Commerce, 75 Harborne Road, Edgbaston, Birmingham 15, **Mr J. C. Singleton**, (chairman and managing director) presiding.

The following is an extract from his circulated address:

The year under review is one of 53 weeks, as compared with 52 last year. My colleagues and I are pleased to report on the outcome of a year which provided many records including sales, profits and reserves.

Last July the Duty on Tobacco and the rate of Purchase Tax were both increased by 10 per cent. In addition, there had already been a manufacturers' increase in the prices of certain tobacco goods. Both of these factors disrupted the pattern of consumer purchasing, resulting in a change from the upper and medium price ranges of cigarettes to cheaper categories, adversely affecting sterling sales, though not quantities to a like extent.

Last September your company was appointed sole importer in the United Kingdom for the brands of Messrs. R. J. Reynolds Tobacco Co., Inc., of Winston Salem, North Carolina. This company is the largest manufacturer of cigarettes in the world, and among their important brands are Camel, Reyno, Cavalier, etc.

Last October, in company with Mr J. D. Skelsey, I flew to South Africa to visit our subsidiary in Johannesburg. We spent a fortnight with our selling agents and snuff manufacturer. We found all in "good heart" and enthusiastic in the interests of our Super Menthol Snuff.

ACCOUNTS

Firstly, it is very pleasing to be able to report a recovery from the temporary set-back of last year; and secondly, that the net profit of £69,441 constitutes a record for the company, and is £13,883 greater than the similar figure for last year. In addition, there has been a net fortuitous profit made on stocks in hand, as a result of the duty increase on tobacco announced last July. The net sum after deduction of all tax, amounts to £20,220, and this has been transferred direct to the duty fluctuation reserve, which now stands at £103,924.

Your directors recommend a final dividend of 10 per cent, which, with the interim dividend of 5 per cent already paid, makes a total for the year of 15 per cent.

I would draw your attention to the considerable increase of £74,160 that has taken place in the company's reserves during the year, and that our commitments for capital expenditure are but £5,500, as compared with £95,000 a year ago.

The tobacco trade, at the moment, is operating under an unusual degree of uncertainty, which makes it more difficult than ever to forecast trends but, basing calculations on reactions and conditions to date I know of no reason why we should not be in a position twelve months hence to present you with a satisfactory account.

Of our total gross profit from wholesaling, 56.16 per cent is derived from tobacco goods, and from confectionery, fancy goods and own snuff 43.84 per cent.

The report and accounts were adopted.

ALLIED IRONFOUNDERS LIMITED

DEVELOPMENT OF NEW PRODUCTS CONTINUED

MR G. S. STEVEN ON CURRENT PROSPECTS

The thirty-third annual general meeting of Allied Ironfounders Limited was held on July 26th in London, **Mr G. S. Steven** (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement:

The trading profit of the Group is £2,426,446 compared with £2,779,698 last year, and it will be noted that the charge for depreciation has again increased from £604,788 to £622,906 and reflects heavy capital expenditure, which this year amounted to over one million pounds.

The Directors recommend that a final Ordinary Dividend should be paid, making 15 per cent for the year.

Last year I referred to the development of pipes and fittings of plastic material to supplement our very comprehensive range in cast iron. In January we introduced, under the name "Metrex," the most complete range of soil pipes and fittings available in plastic, which I am glad to say have had a most satisfactory reception by users, including many Local Authorities. With the Export Market in mind, we have adopted metric dimensions.

During the year we introduced a new range of kitchen cabinets of improved design and up-to-date appearance to which we have given the name "Leisure Line," to supplement our already well known "Leisure Luxe" kitchens.

We are now ready to market a newly designed series of electric oil-filled and conventional water radiators in pressed steel, to be sold under our "Aga" trade mark. We are also developing new designs of solid fuel, oil-fired and gas-fired boilers for both domestic central heating and for industrial use. The sales of solid fuel heating stoves showed a disappointing tendency to decline over the year now past, and in an endeavour to arrest this decline we have in preparation new designs which will be available for the coming heating season.

SALES AND FUTURE PROSPECTS

Group sales showed little change in total from that reached in the previous year, but there were quite significant variations in certain of our main Product Divisions. Since the volume of domestic building shows little change compared with that of last year, there would seem to be no reason to anticipate any great variation in demand in the year ahead, and consequently no noticeable change in the volume of our sales can be expected

Recently, both in the press and on the radio, the subject of the conversion of old and substandard property has again received publicity. This, you will recall, is a matter in which your company took the lead by bringing it to the notice of the press, the public and Local Authorities; on the part of the latter, there has been a disappointing lack of enthusiasm to tackle this problem, which indeed is hard to understand when one considers that in some thickly populated areas, of all houses, including those erected by the Local Councils, under twenty per cent have fixed baths. If, however, Council housing is excluded from the calculation, in certain areas less than 5 per cent of the houses are so equipped, and therefore we may perhaps be forgiven for appearing critical of the reluctance of certain Local Authorities to operate the Government's improvement grant scheme.

Although our business still depends mainly on the building industry, we are expanding our sales of industrial boilers and catering equipment for hospitals, hotels and canteens, where there appears to be a growing market and where our "Ganymede" system, incorporating a central tray service, has been very successful both in this country and on the Continent, where we have in the past year equipped several hospitals.

Amongst other large contracts for hotel equipment which we have received are included those for the London Hilton in Park Lane and the Teheran Hilton. In this field competition is keen, particularly on export contracts, and with this in mind we are reorganising our Falkirk Works to increase capacity and to reduce costs.

It is unusual in these days to announce a reduction in price to the consumer, but I am pleased to say that this year we have been able, as a result of improving efficiency, to lower the prices of our "Leisure" kitchen equipment.

The report and accounts were adopted.

UGINE

(Manufacturers of Electro-chemical, Electro-Metallurgical and Electric Steel Products)

PARIS

The Annual General Meeting of UGINE was held in Paris on June 27th with **Monsieur Rene Perrin** in the Chair. The following are details of the report presented by the Board of Directors and of the address by the Chairman:

In the course of a general review, the Chairman was glad to be able to point out that, during the first five months of 1962, the Company had effected a notable recovery from the recession which influenced the market for stainless steels towards the end of the previous year. Sales of stainless steel plate had shown particularly encouraging growth. Average monthly turnover since the beginning of the year had been equal to that for the whole of 1961. It was to be expected that the value of sales for the year would be higher than for 1961. He also announced that an agreement had been reached with the *PROGIL* company for a general pooling of common interests in the field of plastics. One result will be to set up a new company to take over the *Société Résines et Vernis Artificiels (R.V.A.)*, which was a subsidiary of *PROGIL*, and also an UGINE works at Villers making butadiene co-polymers.

Results for the year under review showed a net profit of NF. 29,753,459 compared to NF. 28,193,673 in 1960. The Board proposed to allocate NF. 82.8 m. for depreciation in 1961, compared to a figure of NF. 81.7 m. in 1960. Including the sum of NF. 1,994,206, which was carried forward from the 1961 accounts, the total to be carried forward for the year under review amounted to NF. 6,050,149. It was accordingly proposed to distribute a gross dividend of NF. 6.3248 per share of NF. 75 face value, corresponding to a net dividend of NF. 5.1.

The report, the accounts and the proposals put forward by the Board were approved.

THE REINSURANCE CORPORATION

SUBSTANTIALLY IMPROVED RESULTS

The forty-third annual general meeting of The Reinsurance Corporation Limited was held on July 27th in London, **The Rt Hon Lord Derwent** (the chairman) presiding.

The following is an extract from his circulated statement:

Already nine months have elapsed since I informed Shareholders of the approach made by the respective Chairmen of three Companies interested in bidding for the Share Capital of The Reinsurance Corporation. It was pleasing to observe after the negotiations were discontinued that the majority of Shareholders had remained Members of the Company.

As I told Shareholders at that time, there were grounds for hoping there would be a substantial improvement in the results for the year ending December 31, 1961, and indeed the Accounts now presented to you reflect this position. In addition to the allocation of £40,000 to the Marine Fund, the opportunity has been taken to strengthen the underwriting Reserves.

It is not always appreciated that the Income from Interest and Dividends—other than that earned on the Shareholders' Capital and the free Reserves—is an essential part of the Trading Revenue of Insurance and Reinsurance Companies.

In our own case, the Insurance Funds and the Provision for Outstanding Claims together exceed £7,000,000, which sum is available to us for investment solely because of our actual insurance transactions.

I would not wish you to think, however, that we are content to operate our affairs at an underwriting loss; on the contrary, our viewpoint is that we provide to our Ceding Companies a valuable service involving comparatively low overhead charges, for which we are entitled to a reasonable overall profit as our remuneration.

It may be thought that the prospects of Reinsurance Companies will be adversely affected by the Group formations of some direct-writing Companies in various countries. This could be disturbing but we believe the need will long continue for the specialised cover which our Company makes available in respect of all classes of Reinsurance (excepting Life) to Companies in so many parts of the World, with the exception of the United States of America. This seems to be proved by the steady expansion of our business either directly with Companies or through the Intermediary of Brokers.

Gross Interest and Dividends amount to £363,795, which records an increase of £30,603 on the previous year.

After providing for United Kingdom and Overseas Taxation, and transferring £76,478 to the Fire, Accident & General Account the balance of £132,469, being the profit for the year, is carried to the Appropriation Account.

The Directors have recommended the payment of a Dividend of 3s. 0d. per Share, free of Income Tax, which is an increase of 50 per cent on the rate of distribution in recent years.

The Issued Share Capital, together with the Capital and Revenue Reserves, totals £953,6[illegible]. The Insurance Funds have increased by £270,874 to a figure of £2,909,157.

The Investments at cost, less Reserve, have increased by £373,934 to £5,681,297, and I am able to report that the Market Value at December 31, 1961, was considerably in excess of the Book Value.

The report was adopted and at a subsequent extraordinary general meeting the proposed changes in the Company's capital structure outlined in the Chairman's letter of July 4th last were approved.

DERBYSHIRE STONE LIMITED

MR JOHN HADFIELD ON A PROGRESSIVE ORGANISATION

The twenty-sixth Annual General Meeting of Derbyshire Stone Limited was held on July 27th in London, **Mr John Hadfield, MSc, FRIC,** the Executive Chairman, presiding.

The following is an extract from his circulated statement for the year ended March 31, 1962:

The year under review was a period of outstanding development within the Company. There was great activity in the consolidation and expansion of our established industries and considerable progress was made. In addition your Directors have kept fully in mind the possibility of further expansion by the acquisition of suitable outside interests.

The Group trading profit for the year amounted to £848,599. This figure, however, includes £27,677 profit in excess of one year's profit. The Group net profit before taxation was £506,721. For the previous year the Group trading profit was £807,791 and the net profit before taxation was £498,934.

An analysis of the Group net profit before taxation shows that 65.1 per cent was earned by the Quarrying Group, 29.6 per cent by the Baird & Tatlock Group, and 5.3 per cent represented income from trade and other investments.

An interim dividend of 7½ per cent on the ordinary stock was paid in January and a final dividend of 15 per cent is now recommended on the issued ordinary stock as increased by the one-for-four Rights Issue in January last.

EXPANSION POLICY AND PROSPECTS

Techniques in the quarrying industry are continually changing to meet new specifications and customers' requirements. Throughout the past year we have sought continually and successfully to improve our performance by the introduction of some of the most modern machinery and methods. We intend to pursue this policy throughout 1962-63 by the progressive expansion and modernisation of most of our established units.

It is proposed to increase the authorised Share Capital of the Company from £1,800,000 to £2,050,000 by the creation of 1,000,000 additional Ordinary Shares of 5s. each.

The Quarrying Group has started the year well and our current order book is larger than it has ever been. We are enjoying for the first time some direct benefits from the motorway programme and we are already committed to supply large tonnages of road materials for the motorway construction in Staffordshire, Cheshire and Lancashire.

In 1962/63 the Baird & Tatlock Group should have a much better year than it had in 1961/62. The credit squeeze appears to be easing and whereas in the Laboratory Fittings Division the sales in the year ended March 31, 1962, were £148,273 against £323,060 in the previous year orders on the books at March 31, 1962 amounted to £502,136. Most of these were received in the closing months of the year and the benefit from them and from further substantial orders will be reflected in the current year's profits.

Always contingent on there being no abnormal disturbances nationally or otherwise, the 1962/63 profits of the whole Group should substantially exceed those of 1961/62 and in succeeding years we should have the benefits of developments which are now in train.

The report and accounts were adopted and the proposed increase of capital approved.

APPOINTMENTS

THE FEDERATION OF RHODESIA AND NYASALAND

MINISTRY OF AGRICULTURE; AGRICULTURAL ECONOMISTS

Applications for appointment as Economists are invited from persons holding an Agricultural Economics, Economics, Commerce or similar Degree with experience in agricultural economics and preferably including experience of field work on cost of production or Farm Management surveys.

DUTIES. Initially the officers appointed will be engaged on a cost of production survey of Virginia Flue-cured tobacco, the Federation's principal crop, and this will entail extensive travelling.

SALARY. Depending on qualifications and experience, commencing salary in the range of £752 10s. and £1,397 10s. rising in a scale to £1,773 15s. per annum.

GENEROUS leave conditions.

FARES paid for successful applicants and their families to assume duty.

The Federation offers a healthy, sunny climate with many sporting facilities, a low income tax rate and sound education with free tuition.

Application forms and further particulars from the Secretary (R), Rhodesia House, 429 Strand, London, W.C.2.

Closing date: August 31, 1962.

WELSH HOSPITAL BOARD

ORGANISATION AND METHOD—WORK-STUDY APPOINTMENTS

Applications are invited for the undermentioned posts. The successful candidates will assist the Secretary of the Board in O. & M. and Work-Study activities which will include assignments within the Board's area on all aspects of hospital work:

(A) WORK-STUDY OFFICER (Assistant Secretary Grade).
Salary: £1,560 x 52(3) x 78(2)—£1,872.
Required to supervise this section and to work in association with the Officers of Hospital Management Committee in the Area.

(B) ASSISTANT WORK-STUDY OFFICER. (Principal Administrative Assistant Grade).
Salary: £1,217 x 41(1) x 42(1) x 52(3)—£1,456.
Required to assist the Work-Study Officer over the whole range of his duties.

Applications will be considered from officers within the Service who are suitably qualified and from others who have had previous Work Study experience in Public Service or Industry. Additional training will be arranged where appropriate.

The Whitley Councils for the Health Service conditions of service, superannuation, and a five-day week apply.

Applications, stating age, education, qualifications, details of present and previous appointments and names of three referees, should be sent to the Secretary of the Board, Temple of Peace and Health, Cathays Park, Cardiff, by August 15, 1962.

ECONOMIST/STATISTICIAN. The Joint Iron Council wishes to appoint an assistant in the Economics and Statistics Department. This post gives wide opportunity of experience in applied economics and is suitable for a graduate of one or two years' experience. The Council would, however, be prepared to consider applications from those graduating this year. A wide salary range is offered and the level of remuneration will depend upon qualifications and experience.—Applicants should write to Mr. P. Moore, Economics and Statistics Officer, The Joint Iron Council, 14 Pall Mall, London, S.W.1.

For other appointments see pages 489 and 490

MAKERERE UNIVERSITY COLLEGE—EAST AFRICA

Applications are invited for Lectureship in Sociology or Social Anthropology. Salary scale £1,350-£2,151 per annum. Entry point determined by qualifications and experience. F.S.S.U. Child allowance £50 per child per annum (maximum £150). Passages for appointee and family (up to five adult passages) on appointment, termination and leave (three months every twenty-one months). Rent according to quarters provided £45-£84 per annum (including basic furniture). Detailed applications (6 copies) naming three referees by September 15, 1962, to Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD. have an opening for a Research Assistant (male) in their Market Research Unit in London. Duties will involve the planning of special marketing studies dealing mainly with electronic and light electrical engineering products and the analysis and interpretation of surveys carried out by specialist agencies. Preferred age 25/32.—Applications to the Personnel Officer, A.E.I., Ltd., 33, Grosvenor Place, S.W.1.

EXPERIENCED young writer required, London, full-time qualified to deal with commercial aspects of engineering and chemical developments. Languages desirable. Pensionable appointment.—Please write to Box 1643.

APPLICATIONS are invited for a two-year Post-Graduate Research Studentship to study the economics of the poultry industry, with emphasis on size of unit and inter-regional competition. Qualifications: degree in economics or agriculture with some experience in research. Value £800 to £1,250 per year. Further details obtainable from the Secretary, School of Agriculture, Cambridge.

ORDERS for advertisements in The Economist are accepted on condition that they are liable to rejection at the discretion of the Editor; that while every effort will be made to publish an advertisement on a specified date, no guarantee is given; and that white on coloured reverse blocks or large sizes of black-faced type may be stopped or lined at the Editor's discretion.

COMPANY AFFAIRS

Business has been very quiet in the London Stock Market this week—even quieter than is usual for the week preceding the August Bank holiday. Prices fell at the end of last week on disappointment with the Prime Minister's speech in the economic debate and declined still further on Monday when the growing uncertainty as to the outcome of the common market negotiations in Brussels added to the doubts. Later prices steadied, reflecting the recovery on Wall Street (until Wednesday) and better company news. Over the week to Wednesday The Economist indicator gained 1.9 points to 312.8. Gilt-edged stocks remained firm and the new Warwickshire loan, heavily oversubscribed, opened at 4 ¼ premium. Among equities heavy electricals moved up following the GEC report.

General Electric

THE art of pruning is mastered fully by only a few gardeners and by still fewer industrial companies but when it is done sufficiently ruthlessly it brings its rewards in improved profits. In the past two years the pruners led by Mr Arnold Lindley have been busy in General Electric; a vigorous attack has been made on costs and the reorganisation of the group is now showing tangible results in higher profits and slightly better margins. The pruning has included sales of numerous investments and properties, which have helped to ease the group's financial problem. Bank overdrafts and acceptance credits amounted to £134 million at the end of March, 1961 (against cash balances of £2 million). During the year they rose to £16½ million but by the end of last March they had been reduced to £11¼ million (against a cash balance of £1½ million). This is a formidable figure but the sale of Magnet House should help to reduce it further in the current year, and with the fall in interest rates there should be some relief for profits.

March 31	1958	1959	1960	1961	1962
	£ mil.	£ mil.	£ mil.	£ mil.	£ mil.

Dividend yield: 5·97%		equal to 14·4 years' earnings			

For a report on current trends in profits shareholders have to wait five weeks for the chairman's statement. But the review of operations suggests at least mild optimism. There is plenty of competition in various sectors of GEC's business, described as "increasingly severe," "intense," "increasing" and "very keen," though improved" and "growth" occur quite often as well.

In heavy engineering, profits should be better in 1962-63 as earlier contracts are worked off, but orders have fallen and as the time lag between ordering and completion averages about 2½ years profits on this side after the current year are likely to be lean. There may be an offset from an improvement in orders for mining equipment which usually takes 6 to 9 months to make and the heavy engineering division should benefit from the installation of more up-to-date manufacturing and testing equipment and by the licensing agreement with Westinghouse Electric. There is still overcapacity but GEC believes this will resolve itself within about five years. Last year about a quarter of GEC's trade was in engineering with a slightly greater proportion in telecommunications; the latter is one field where business is expected to continue to grow. Better things are also expected from the complete reorganisation of the domestic appliance side; here the refrigerator factories are now working to capacity. The stock market is taking a more optimistic view of the company's prospects and GEC shares have risen this year from 26s. to 34s., to yield just under 6 per cent. The shares of both AEI and English Electric, despite their better showing this week, are still much closer to their 1962 lows to yield in the case of AEI over a full point more. GEC might have lessons for them.

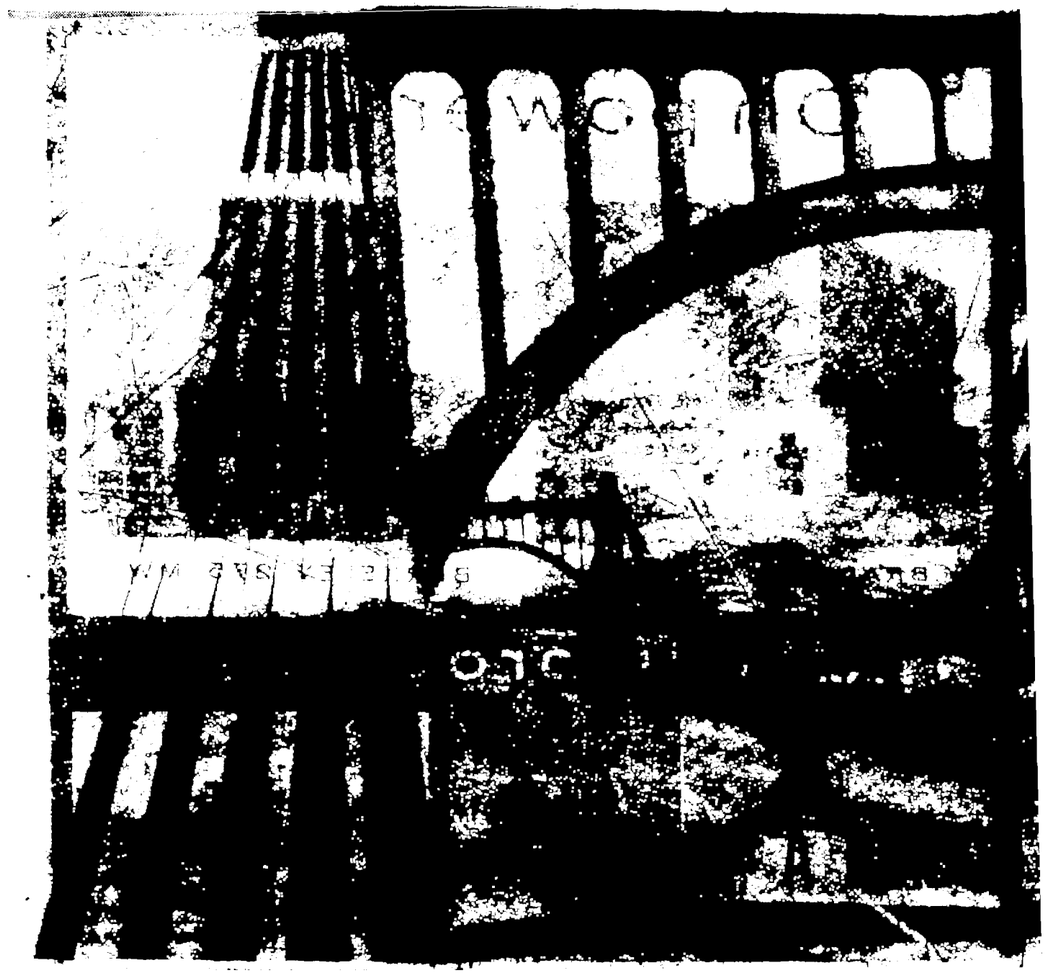
Decline and Growth in Engineering

WITH shipbuilding depressed, an increasing proportion of **John Brown's** profits has come from its machine tool interests: in the year to March 31st as much as 60 per cent of its net attributable profits came from its two machine tool subsidiaries, Wickman and Fitzh Brown Tools. That this proportion is likely to rise still further seems all the more likely because of the sharply contrasting results of Doxford and Sunderland in the shipbuilding industry and of Alfred Herbert in the machine tool industry.

In May, 1961, shareholders of the newly merged **Doxford and Sunderland** shipbuilding companies were warned that a further fall in profits was likely in 1961-62. In the event, profits before tax for the nine months to end-March amounted to £723,000, compared with a combined total of £1,615,000 in the previous year. On an annual basis, therefore, profits have fallen by 40 per cent. The cut in the dividend is equally sharp—Doxford shareholders will receive 10 per cent for the nine months, against the previous year's payment of 30 per cent. Then Sunderland shareholders received only a final payment of 10 per cent. On the dismal results the shares slumped 3s. 6d. to a new low of 30s. 7½d. but they recovered to 34s. to yield just under 8 per cent.

By contrast the tax free interim dividend of **Alfred Herbert** has been raised from 2½ to 3 per cent. The directors say that this does not necessarily indicate a total payment higher than the previous year's 8½ per cent which was kept down in deference to the Chancellor. It reflects however their confidence in "the sound trading position of the company" after an examination of the first eight months' results. Recently there has been some falling off in orders at home but the export market is responding satisfactorily to the efforts of the overseas organisation. The directors report a substantial backlog of orders for home and export markets but increased manufacturing facilities have enabled the group to offer earlier delivery dates. The shares were marked up to 59s. 9d. on this statement to yield 4.6 per cent on a 8½ per cent dividend.

John Brown shareholders also had had their dividend pegged back in deference to the Chancellor but they were promised a higher payment when the one for four scrip issue was made in February, with the forecast of a maintained final dividend of 7 per cent on the bigger capital. This promise has been kept so that in effect the total payment has been raised from 8.8 to 10.2 per cent to put the £1 shares at 33s. on a yield of 6½ per cent. The group's profits before tax fell by 1½ per cent from £4,488,000 to £4,416,000 but the bigger dividend is still covered 2.2 times by net earnings. The trading results of the two machine tool subsidiaries have again been published separately and they present a mixed picture. While the pre-tax profits of Wickman rose sharply from £1,542,000 to £2,008,000, an increase that presumably owes something to a full year's contribution from its Coventry Machine Tool acquisition, those of Firth Brown Tools, excluding an exceptional credit of £50,000, fell from £694,000 to £577,000. A year ago Lord Aberconway said that far-reaching scheme of reorganisation were in hand at Firth Brown Tools. The results suggest that it profits suffered from the dislocation caused by the reorganisation. Presumably there is scope for recovery here; this is just a well, as the chairman has already said that shipbuilding profits will fall in the current financial year.



THIS year more than 36,000 secondary school children are visiting cities as far afield as Amsterdam and Athens, Lisbon and Leningrad aboard two former troopships, the *Devonia* and *Dunera*. The ships become the children's floating classrooms for anything up to 21 days. Such cruises seem likely to remain a permanent part of both the educational and shipping scene. They represent an important straw that has been clutched by owners wondering what to do with old boats ill-suited for conversion into luxury cruising liners ; for the children the voyages give a form of foreign travel distinct from run-of-the-mill holidays organised by schools or travel agencies, which have a very limited educational value.

ALL this adds up to education, which, if not profound, is certainly stimulating to the secondary modern children who make up the majority of the passengers. The whole cruise is, in effect, a comprehensive visual aid interpreted and amplified by the teachers and the ship's staff. The children have to face and solve problems of currency and language ; there are obvious links between geography, history and modern languages to be found in the cities and countries visited. Living as a community afloat and meeting foreigners ashore advances the children's social education in

The brave new world of Borgo a Mozza

THE record of the drug, thalidomide—perhaps 1,200 babies born in this country with missing limbs and internal malformations—is going to accelerate changes in the drug laws that have been discussed on and off for the better part of ten years. The danger now is that the nation's collective feeling of guilt towards these children and their parents will cause the kind of precipitate, conscience-salving legislation that will not necessarily prevent the reappearance of another thalidomide. This is a situation that requires cool heads to rule warm hearts: more and better testing of drugs is not the complete answer and it is cruel to encourage drug makers and drug takers alike to think that it is. This particular horse bolts in open country, and no amount of locks on stable doors will stop him.

The basic weakness in the way that doctors prescribe and patients swallow drugs is this: doctors depend almost exclusively on manufacturers for their information about new drugs, dogs, monkeys and the occasional pig, but on nothing like the same scale. These big animals are simply not available in the same quantity as rats and mice; and even if they were, public opinion and the Home Office would not allow them to be used for laboratory experiments in the numbers required for a proper statistical sample. Manufacturers must hope that a check using perhaps half-a-dozen dogs will throw up any marked difference between the behaviour of the drug in large and small mammals; and more than once these last safety checks have shown that it was wiser to put the drug down the sink than on the market. But the gap between man and animal remains. No one can predict that a drug, tested by the industry's highest standards, is 100 per cent safe when it leaves the laboratory; makers can only claim that it is as safe as modern science can make it, which is a vastly different order of certainty.

The Economist this Week August 11, 1962

INTERNATIONAL

UNTIL AUTUMN

Kept on tenterhooks until October, British public opinion—and world opinion, too—ought to realise how much progress the European common market negotiations have made—and refuse to be panicked into giving up (p. 506).

■ For all the difficulties at Brussels there were indications of the serious desire of the Six to avoid a failure of the British entry into Europe (p. 507).

■ However, **General de Gaulle,** with the French farmer to think about, and his design for a closely knit Europe, is not disturbed by the slow pace at Brussels (p. 509).

■ Bonn talks reassuringly (p. 510).

The refusal by the **trade unions** to co-operate with the new **National Incomes Commission**

UNDER HUMAN MANAGEMENT

Mr Ben Bella has a month to show that he can run **Algeria** (p. 512).

Prince Souvanna Phouma must hope natural political talent to, can make Laotian fiefs into the State of world

Without the right political nothing like **Tshombe,** is losing friends. to talk the prospect of American aid, his intransigence (p. 514).

The kindly people of **Rwanda** and **Burundi,** no longer joined by their hyphen, go their separate ways; and the Belgian troops are going, too. Will their tempers remain equable when the cash runs low? (p. 540).

The **British Motor Corporation,** on its tenth anniversary, is making increasingly unconventional products, but is still run on traditional lines (p. 545).

Anglican, Roman and Muscovite **church leaders** are displaying a willingness to talk

The Finns have a judicious respect for Russia, but Mr Khrushchev's expectation that they would be perfect hosts to the World Festival of Youth was too much (p. 513).

Jamaica is unusually pro-American for a newly independent state; and hopes that this un-Castro gesture will not go unrewarded (p. 519).

PRODUCING PROBLEMS

Superabundance, as the keynote of world commodities, can no longer be considered a temporary affair (p. 547).

A new canal through Bavaria opens up a **waterway from the North Sea to the Black Sea** (p. 541).

German banks may soon be allowed more latitude in fixing interest rates (p. 558), and the Canadian **dollar** is staging a spectacular

DEFENCE

The occasional : **policy** is being subjected
But the gap strain at home as well as

President Kennedy is now unlikely to ask for an **emergency tax cut** this year (p. 524). **Corporate profits** are one of the more encouraging factors in the economic outlook (p. 525) and the **motor manufacturers** are particularly optimistic (p. 526).

Minneapolis has learnt much from nearly four months **without newspapers** (p. 525).

Last week **the death penalty** posed problems for two State Governors who are against it (p. 525).

Women are not as prominent in the American system of government as might be expected (p. 526).

HOME

ROUGH STUFF

Violence in Britain's streets cannot be stamped out merely by setting new limits to the freedom of speech: the full remedy, after stamping hard on all sorts of violence, lies much more deeply within ourselves and our society (p. 505).

The **press,** this week, has done its bit to spread the infection (p. 514).

Two **immigrants,** one undesirable and the other unwanted, have been making life difficult for the Home Secretary (p. 514).

Violence and death strike even at peaceful citizens on their holiday trips: has the time come to make drivers' licences harder to get? (p. 520).

Delinquent generation? (p. 519).

PHONEY WAR

The refusal by the **trade unions** to co-operate with the new **National Incomes Commission** is not a disaster—and the arrival of Nick ought to push the unions into tackling their own problems (p. 511).

Ned's **growth** target of 4 per cent may be imperilled if **investment** is cut any further; but where can the government inject **stimulants?** (p. 549).

Consumer spending is still proving obstinately sluggish (p. 550).

Compensation offered to **redundant miners and railwaymen** is welcome, but still looks mean (p. 516).

South Wales is standing up surprisingly well to the decline of its traditional industries (p. 520).

PEACEFUL COEXISTENCE

The **British Motor Corporation,** on its tenth anniversary, is making increasingly unconventional products, but is still run on traditional lines (p. 545).

Big government departments make a poor job of being **monopoly traders:** the Public Accounts Committee asks why? (p. 550).

In a black year for **airline profits**—£50 million lost—there are some shining and surprising exceptions (p. 555).

In East Anglia **commercial television** provides a local service that the BBC seems unwilling to spend the money to provide (p. 534).

Irish televiewers, with a choice of three programmes, are enjoying the competition (p. 535).

Anglican, Roman and Muscovite **church leaders** are displaying a willingness to talk (p. 520).

Secret of the first shoe that's as comfortable as a bare foot

Whether you're planning a new process, a new product, or improvements to an old one, success can depend on your finding a new raw material. A most promising source may lie among the different types of Polysar* synthetic rubbers, produced by the Polymer Corporation Limited.

For instance, there's never been a shoe that could really compete in comfort with walking barefoot—not until a newly developed process using Polysar SS-250 Flake made it possible. It produces a shoe with a microcellular sole moulded directly to the shoe upper. It's light. It's cool because it breathes. It's more flexible, more resilient. It's soft and at the same time tough. The result—a shoe that's as cosy as an extra skin.

Polysar SS-250 Flake is just one of the 40 types of synthetic rubber produced by the Polymer Corporation Limited. Within the world-wide Polymer organization there is a representative nearby, ready to advise you. A letter to the Marketing Division, Polymer Corporation Limited, Sarnia, Canada, will put him in touch with you.

Shaming the Devil

NO decent man (or minister) likes to be counted on the devil's side. The pressure upon the new Home Secretary, Mr Henry Brooke, to proscribe Britain's new Nazis and old Mosleyites does not come only from politicians who contend, most of them very sincerely but some of them more disingenuously, that these detestable race doctrines ought to be outlawed. It comes also from conscience and history: from remembering with a sense almost of vicarious guilt the merciless, monstrous slaughter of Europe's Jews by the German Nazis. Over all the argument about the banning of opinions preaching racial intolerance broods the ghost of Eichmann (and the blurred print, too, of Sharpeville's bloody field). The desire is painfully strong to prove that "it can't happen here."

The first point for Mr Brooke to cling to is that, still only in shabbiest miniature, it is already happening here. The second is that it is not happening just as the consequence of the poisonous preachings of these handfuls of stupid or malevolent men. It is happening because, in the margins of quick social change, violence and intolerance are coming to be British habits. Neither the rootless youngsters nor the resentful elders of Dudley now or of Notting Dale four years ago needed Mr Jordan or Sir Oswald Mosley to egg them on to the hue and cry for scapegoats for their discontents. The poisonous (or simply silly) preachers are themselves symptoms, too; so also are those who beat the preachers up.

This does not mean that actual provocation to violence, of any sort, does not have to be put down with the law's heaviest hand. What it does mean is that all violence, however directed, has to be put down without discrimination; and that, in fortifying freedom of opinion and argument in Britain, any defence which abridges that freedom is itself a surrender to the enemy from within. It is being argued, honestly enough, that this freedom is already abridged by the penalties against sedition, obscenity and blasphemy; to add racialism to these offences, it is said, will be a logical reinforcement, not a diminution of free opinion. But, in fact, if the law's safeguards against seditious, obscene or blasphemous opinion were still, as they once were, the arbitrary frontiers set by the views of an establishment, freedom of opinion and argument would be vastly less than it now is. These reservations survive in a free society because they have ceased to be a system of censorship; there is freedom of discussion because, in effect, most things go—except when public order itself is threatened. A new rule now that would deliberately silence Mr Jordan or Sir Oswald Mosley beforehand in their indictment of coloured men or Jews—and heaven knows that such an indictment is, in itself, a flat denial of what British freedom should mean—could equally be used by policemen or magistrates to stop Dr Banda indicting Sir Roy Welensky in Trafalgar Square, Sir Roy's friends or the South Africans indicting Dr Banda, the motley men from campaigning against the German troops training in Wales, or the well- or ill-meaning disarmers from [illegible] their charges against Polaris in the Holy Loch.

This, no doubt, will be called the usual unrealism of liberals clinging on to their conventional freedom—even if only the freedom to say good or bad things from a plinth or platform in a public square. Why, it will be asked, have democrats got to give hostages to ill-fortune in this fashion? Why should we accept this "double standard," when the enemies of freedom, whether Nazis or

communists, get the best of the argument always to their evil advantage? The answer is a very simple one: the cold war, whether against right or left, is precisely about the so-called double standard. Men, to be free, have to pay the price of being free. The price that must never be paid, if possible, is the price of giving men in authority fresh power to determine what shall be said, or not be said, in speech or in print.

The problem of public order remains. The danger to British freedom is violent deeds, not, first of all, violent words of whatever colour. The law has to clamp down hard on all violence and incitement. At the same time, those who run a free society have to look to the roots of the canker of violence and intolerance: to the reasons why some of our young people in an enriching society are now rootless and rebellious: to the reasons why ordinary decent elder folk are resentful of strangers in their midst. It is a problem not only for the politician of any party but for the educator as well, both faced with the social and technical changes transforming our society overnight and bringing with them the urgent need for better and broader education and for a great national programme of urban renewal.

There is no gimmick, whether by shutting out immigrants (this Act in fact has fomented intolerance by giving it a justification) or by proscribing detested opinions, which will give a short cut to the resolution of Britain's basic social tensions. Those who cry that the analogy of Hitler's rise to power, helped by the "connivance" of the German people, now demands the massing of both law and force against our own neo-Nazis miss the lesson even of that history. Hitler came to power not only because men of substance aided him for their own ends, but also because, in a time of social and economic frustration, violence in the German streets was allowed to be the arbiter in a struggle which he and his thugs first fought and then won. The street battle was his way to power: the Horst Wessel song, commemorating just such a seamy struggle in the streets, became his anthem.

We will not, if we can help it, surrender what we seek to preserve; we will not give to politicians or policemen or magistrates the power to specify what shall or shall not be said. That is one slippery slope. The other is the resolution of our differences by force not argument; we will not give this power to the mob either. The remedy for the infection is threefold. It is, first, within the law as it stands, not only to call a halt to provocations that deliberately invite breaches of the peace but also to punish every resort to fist or foot or bludgeon by the most swingeing penalties; this is what Mr Brooke should now be making up his mind to see done. The second remedy is the business of all politicians, whatever their party; instead of sheltering behind Mr Brooke they themselves should be out in every market place not only countering the cult of the new Nazism but also every sort of violence as well. And, thirdly, these shameful skirmishes are just one more reminder of the responsibility that we all share to root out the causes that breed them. The fault is in ourselves.

Europe's Dog Days

in or out?

The four articles that follow describe, from viewpoints in London, Brussels, Paris and Bonn, the position in which Britain's negotiations with the common market are left between the interruption in Brussels last Sunday and the resumption in the autumn

It is not unknown for lifts to get stuck between floors; when they do, those inside are advised to keep calm, resist the suspicion that someone is cutting the cable, and suppress the wish that they had never got on. So far as one can tell, the unscheduled halt in Britain's negotiations with the common market at 7 a.m. on August 5th was not caused by a permanent failure of the mechanism. On the main point at issue—the need to protect the farmers of New Zealand, Australia and Canada—the two sides appeared to have got almost within hand's reach of each other, and of a settlement that an impartial umpire might regard as fair and reasonable. Sheer exhaustion, and the running out of the allotted time, then called a halt. The original British deadline having thus slipped past, it would have been pointless (and tactically stupid) to have tried to cram another deadline into the brief time left before the Commonwealth prime ministers meet on September 10th. And so one waits for autumn; the deputies are to meet next in late September and the ministers in early October.

Thus the sudden stoppage on Sunday need not be regarded as the prelude to a sickening drop to failure. There does exist a threat to British hopes of joining Europe; it comes, however, [illegible] what has been happening in Brussels in the last fortnight than from the danger that public opinion in Britain may now want to scramble out of the negotiations before they have a chance to be pushed through to success. To understand this—and to diminish the possibility that such an uncalled-for scramble will in fact take place—it is necessary to grasp two things about what took place in Brussels before the negotiators came wearily home. The first is how close the talks finally got to a tolerable compromise about food imports from the old dominions; the second is how difficult life became for the French when they tried to push resistance to Britain beyond limits acceptable to the other members of the Six.

On the crucial Commonwealth farm issue, argument flowed around four different points; two of these have now been settled, and the other two are much nearer to being settled than seemed likely ten days ago. In last week's session Britain and the common market came to terms on the ground to be covered by the world-wide agreements which (as everyone admits) are the best long-run hope of reconciling the interests of the Commonwealth and of western Europe after the transitional period ends in 1970. They had already come to terms in the week before on the need for special arrangements to fill the gap if, as may very well be, satisfactory world-wide

agreements have not materialised by 1970. The coming together on these two points was not achieved without some concessions on Britain's part. In particular, the British seem to have given up the hope of specifically mentioning access for the dominions among the aims of the post-1970 agreements.

But these concessions have to be seen in the context of the matching concessions offered by the common market. In the pre-1970 transitional period, as Mr Heath acknowledged in his report on Tuesday night, there is still an argument about how much of the common market's internal preference system (or *abattement forfaitaire*) is to be extended to the dominions' exports of food to Britain: in simpler language, about how much of a disadvantage, if any, these exports are to suffer compared with similar produce coming to Britain from inside the common market. But the gap has narrowed slightly; what is more, no matter how the *abattement forfaitaire* is sliced in the end, it is agreed that it will not be permitted to lead to "sudden and considerable alterations" in the flow of trade. This is one substantial gain. Another is the offer of the Six to fix their food prices—the most important question of all—in such a way as to allow the dominions "reasonable possibilities" of selling their produce to Europe. Until last week the common market's negotiators had not been willing to spell this out in writing, or to mention the Commonwealth specifically. Now they have done both.

Quite possibly this is still not enough; not even when one adds the Six's further promise to make special provision for New Zealand—a promise apparently extracted, be it noted, over the dead body of French objections. It may be tempting for the British negotiators, winded by their exertions, to call well enough and resist exhortations to plunge into the breach once more. If so, the temptation should be suppressed, even at the possible cost of some English dead. There is still a case for trying to get for Australia and Canada a little more of what New Zealand has got: to be specific, some further improvement, even if only a slight one, in both the pre-1970 transitional arrangements and the long-term understanding about the common market's policy on prices. On the evidence of the last fortnight's work in Brussels, this last extra effort stands enough chance of success to be worth making.

Provided, that is, the French are not bent on keeping Britain out at all costs. There was a moment, at three o'clock last Sunday morning, when it seemed they might be; that moment, when they suddenly asked Mr Heath to sign their document on the financial transactions arising out of the common farm policy of the Six, and made it a condition of the whole agreement on Commonwealth agriculture, is described by our Brussels correspondent in the following article. But the second cheering point about the happenings in Brussels is the vigour of the opposition this aroused from their German, Belgian and Dutch colleagues. The French can command a majority inside the Six for making the British pay a stiff price to enter Europe. It may turn out that they can even command a majority for getting on with Europe's political union without Britain, while Britain's entry is still held up. But it is now plain that they run out of support when they raise obstacles that amount to a "Keep out" sign. Complaisant though the other five tend to be towards French wishes, their will to make the negotiation with Britain succeed has been demonstrated emphatically. Suppose that, come October, an agreement on food is reached acceptable to the United Kingdom, to the Commonwealth, and to the other five of the Six. Can M. Couve de Murville, surrounded by a whole colonnade of raised eyebrows, continue to "reserve his approval"?

Thus the chief remaining danger to Britain may not come from Brussels, or from continental Europe at all; it may come from Britain itself. It is to be expected that the convinced opponents of the Europeanisation of Britain, from Lord Beaverbrook all the way through the spectrum to Mr Michael Foot, will use the two months' delay before the negotiations are resumed to speak their pieces louder than ever. One's fear is that some of the present fence-sitters—the people whose worries range (in order of seriousness) from the common market's effects on eastern Europe to its effects on the Queen—may get so badly rattled by the prolonged strain on their nerves that they will fall off the wrong side of the fence. Monday's speech at Louth by the Labour deputy leader, Mr George Brown (not so long ago a convinced European), sounded suspiciously like a preliminary wobble on his part. It is unfortunate that Mr Macmillan probably cannot take a completed negotiating position to the Conservative party conference in October with the aim of rallying his party behind him; still more unfortunate, perhaps, that the party's recent by-election agonies may have diminished its capacity to be rallied by anyone for anything.

And yet there is some gain, as well as loss, in the two-month delay before the talks in Brussels begin again. The delay means that the moment when Britain finally has to make up its mind about the terms offered to the Commonwealth will more nearly coincide with the moment when Britain's friends in the European Free Trade Association discover what terms the common market is going to offer them. Thus the two great tests of Britain's fidelity—its willingness to stand by its promises to the old dominions, and to the Scandinavians, Switzerland and Austria—will march towards a decision more or less in step. The result will not be clear until well into the autumn, perhaps even the winter. All that can be said in the meantime by those who want to see Britain get into Europe, by almost any means short of breaking its word, is that the visible facts of the matter—as distinct from the vague swirl of fears and suspicions—are still pointing to the bright outcome. It would be absurd, after so much patient progress, to give up now.

in or out?

Night of the Pound of Flesh

Our Brussels correspondent describes how the negotiations went, what was settled, and what was left to the autumn

The Brussels negotiations have not been helped in their latest stages by the amount of publicity they have had. Too delicate for "open" diplomacy, they are too momentous to be conducted wholly in secret; but half-secrets have a way of turning into half-truths. As a matter of fact there was nearly a rupture last week, but not between the Six

and the British ; it nearly happened during a heated session among the Six themselves. They came nearer to an open breach on August 3rd than at any time since they formed their club. That they weathered their own 12-hour storm and followed it by a 16-hour session with Mr Heath is some indication of the seriousness of their desire to avoid a failure in the British application for membership.

The talks had been prolonged for a week beyond their originally scheduled time ; and at the beginning of last week nobody acquainted with the number of problems still to be solved, with the Six's habitual snail pace, and with the general fatigue resulting from a previous series of late nights, still expected to get the complete general view that had been hoped for by the end of July. As it was, much of this view had emerged by the time the delegates separated to the sound of early church bells last Sunday morning.

BY THEN solutions had been found for the problems of manufactures from Canada, Australia and New Zealand. Agreement had been reached on the eligibility for association of African and Caribbean countries and for almost all the Commonwealth dependencies. The Six had promised to remove their 18 per cent tariff on tea, and to conclude comprehensive trade agreements with India, Pakistan and Ceylon by 1966. A joint formula had been agreed on the question of agricultural annual reviews and long-term assurances for farmers. The main lines of solutions, subject to two chief reservations, had been achieved for cereals from Australia, Canada and New Zealand, with an offer from the Six to work out special terms for New Zealand, which is particularly dependent on the British market. The principal subjects remaining for solution —apart from completing the paper on temperate foodstuffs—are now British horticulture, eggs, pig-meat, processed foodstuffs, zero duties and a number of special commodities including bananas and jute.

Two reservations—one British, one French—were put on the draft agreement for Commonwealth cereals. Conciliatory Belgian and Dutch drafts were boycotted by the French during last week's first meeting, when Britain was asked to produce its own suggested amendments to the joint paper of the Six, the basic document for this phase of the negotiations. This consists of three main chapters. The first, covering the period of full operation of the Rome Treaty, calls for world-wide agreements to stabilise agricultural commodity markets and to iron out the distortions of competition, taking also into account the needs of developing countries. It adds an assurance of the willingness of the Six to follow a " reasonable " price policy, bearing in mind both the needs of Community farmers and the aim to develop world trade harmoniously up to a satisfactory level (M. Couve de Murville's gloss on this envisages a decrease in the sales to the Community of non-member producers, who, he suggests, might be compensated by higher prices).

The second chapter of the proposals concerns transitional arrangements to taper off Commonwealth privileges in commodities where there is a preference in the British market (maize and barley), and the similar tapering off of free entry into Britain for non-preferential products such as wheat. The proposals take for granted that in the definitive period, members of the common market will enjoy a Community preference by virtue of their membership ; during the transitional period, this preference is to be assured by allowing Community countries to pay less of the internal levy when selling to their partners, so that their prices get an automatic advantage (the *abattement forfaitaire*) on the market concerned. For " preferential " products some of this advantage is offered to Commonwealth suppliers, tapering off by or before 1970 ; for non-preferential products the Six undertook, if a sudden and considerable disturbance of trade should occur, to consult with Commonwealth countries with a view to revising the conditions of Community preference.

The third chapter proposes that if world-wide agreements cannot be reached, the enlarged Community should consult with those countries, willing to reach them, and particularly with Commonwealth countries, to make special arrangements.

Although the British had already agreed in the previous week to this third chapter, their proposed amendments when they came threw the Six into a state bordering on crisis. In the eyes of the French, Britain was paying no more than lip-service to the idea of world agreements, while really planning to preserve Commonwealth preference under a different name. To the Commission the British plan seemed to jeopardise the Community's future freedom of action. The Dutch and the Belgians accused M. Couve de Murville of being completely negative in his attitude and of obstructing British entry in the way they had long feared.

However, after the Six's own long session, and then during the long night of Saturday to Sunday, agreement was reached on compromises which safeguarded many of the British interests involved. On world agreements Mr Heath was able to make the text of the Six's paper more explicit and palatable to the Commonwealth. On transitional measures, he secured that the whole of the price advantage enjoyed by the Community countries should initially be accorded to Commonwealth preferential products, and that the consultation clause should apply to these products as well as to wheat. On the Community's future price policy, Mr Heath was able to secure a commitment to offer " reasonable opportunities "—an advance on the Six's initial offer.

For the time being Mr Heath maintained his reserves on price policy, partly because of a similar reservation on the whole subject by the French, who demanded that it should be conditional on an agreement about agricultural finance—an insistence that amounted to the rattling of a skeleton which the Six locked in the cupboard in the small hours of January 14th, the night when they struggled through to a compromise on their own common agricultural policy.

Under that policy, the product of the frontier levies is to go to an agricultural fund to be spent by the Community as a whole. At the insistence of Germany, a large traditional importer of food from non-member countries, provisional ceilings were placed on national contributions to this fund for the first three years. This runs counter to the general philosophy of the Six (enthusiastically championed by France, which is a relatively small importer of food) that the Community's external frontier should gradually come to represent that of a single economic unit, and that no country within that unit can lay claim to special terms either in paying what is a joint levy, or in enjoying its proceeds.

The raising of this issue was no surprise to the Six, who had known of French pressure to include statements on this subject

(and on the European Free Trade Association countries). What took Mr Heath aback was the demand by the French for his agreement on a new detailed document at 3.10 a.m., and their proviso that without such agreement the rest of the package must remain provisional. This action would be consistent with a determination on the part of General de Gaulle to keep Britain out of the Community ; but, more probably, it is just one more example—with others to be expected in the future—of the French technique of driving the hardest possible bargain. Among the Six France has the reputation of a Shylock, inflexible about the pound of flesh. What this costs the French in the accumulating resentment of their partners is France's business. For Britain, the concern must be to let all the Six know when the price threatens to become too high.

in or out? Paris in No Hurry

Domestic pressures and foreign policy ambitions that help the French government to contemplate delays with calm are described by our Paris correspondent

NEITHER surprise nor sorrow in Paris greeted the news that the marathon runners in Brussels had fallen out, exhausted, without reaching their appointed destination. Official French commentators have been stressing the progress made on many subjects, and minimising the importance of the failure to complete the negotiations. It is, they claim, unfair to put the blame for that failure on French shoulders alone. They quote examples—such as the agreement to treat New Zealand as a special case—to show that obstruction was not the French purpose. All the same, less hurried than their colleagues, the French had never really believed that the temperate agriculture problem could be solved on this occasion. They were not perturbed when this August 4th produced nothing for the history books.

That France, with its growing agricultural surpluses, should oppose concessions to Commonwealth farmers, ought to surprise nobody. The hope of bigger agricultural markets was one of the main inducements that got the French into the common market at a time when they were still nervous about their industrial ability to compete. About a fifth of the French labour force is still employed in farming ; as it declines, productivity increases and the economic importance of agriculture is sustained. The numerous decrees passed by the French parliament last week, known collectively as the *loi Pisani* (after the present minister of agriculture) are designed to encourage the development of efficient medium-sized farms, largely through regrouping and the elimination of the smallest ones. They also try to slow down the process of concentration at the top and to limit the financial penetration of the countryside by wealthy people from the towns. Arguing that such measures are needed to prevent social explosions, the policy-makers rely on outlets in the European community to provide the extra income necessary to ensure a gradual transition, without a major upheaval.

With such pressures at home, French negotiators were bound to look carefully at any provision favouring, say, Australian wheat farmers. Still, if they had been interested in a quick compromise, they could have switched the debate from " comparable outlets " to a practical discussion of " reasonable prices." As efficient producers, they could perfectly well have accepted a lower level of food prices than, say, the Germans easily could ; they could have sought a compromise with the British on such a basis. Evidently they had more than the basic economic reasons for hanging back. One reason advanced here is that it would have been tactically unwise to reach a compromise agreement before the meeting of the Commonwealth ministers. The British negotiators, runs the argument, would have returned from that meeting asking for new concessions to satisfy their partners. More important than this tactical calculation is the belief prevailing in Paris that the longer the negotiations last—and the more intransigent the Six are—the more Britain will give away. To convince doubters, the proponents of this thesis point out how striking has been the evolution in the British position from Mr Maudling as advocate of the industrial free trade area (Paris, 1958) to Mr Heath as European statesman in Brussels. This theory may ignore the limits of the British position and neglect the importance of British home politics. But it is widely held here, and when strategies are being weighed up it must be taken into account.

Behind the technicalities and polyglot disputations at Brussels, major economic and political issues are at stake. French ministers may be bothered by the prospect of peasant unrest. General de Gaulle never loses sight of his grand European design, in which Britain was not intended to have a place. He may well think that if the negotiations drag on for long, other continental partners besides Dr Adenauer will become insistent that he should proceed with his Union of European States without delay. On a more elevated level it is calculated that if Britain has to be admitted, the impact of its entry will largely depend on the terms that are made. If Britain manages to give the community an outward-looking character, one thing will lead to another. Special arrangements for the Commonwealth will be followed by agreements with American producers. Western Europe will be set on the road—through " partnership " or " interdependence "—to an Atlantic community. Many Europeans want to tread that road, but not General de Gaulle. If such terms could be imposed on the United Kingdom that it would have to turn its back to the ocean, Britain would then fit better into his own conception of a closely-knit western European coalition.

If London refused terms of that kind, Paris would get on happily enough with its present smaller club. But the French cannot stand alone. The latest round of negotiations has merely increased their awareness that they can carry their partners along only when they stand pat on the Rome treaty (and then only just). (Their insistence on total application of the treaty was reaffirmed at the Cabinet meeting on Wednesday.) M. Couve de Murville derived part of his strength from the support of Mr Mansholt, the Dutch vice-president and principal agricultural policy-maker at the European Commission. Odd though it looks, this alliance between the gaullist opponents of supranationality and the Brussels commission is not new. The French have proved skilful negotiators throughout the building of Europe, and they would not miss the chance of a tactical alliance or a possible bargain. Incidentally, when at three o'clock last Sunday morning M. Couve de Murville produced his document about the financial

provisions of the common agricultural policy, his move was aimed at his German and Dutch partners as well as at Mr Heath. The move was not unexpected. French papers had said in advance that the government might seize this occasion to get an explicit interpretation (in its favour) of a document which had been purposely left so vague as to be described as "an agreement on a conscious misunderstanding."

"Marry in haste, repent at leisure" would be an appropriate slogan to hang on the walls of the French delegation. The French negotiators will not be unduly perturbed if October sees yet another postponement of the plighting of troth. Even if the obstacle of temperate agriculture is cleared, the European Free Trade Association may then appear as a major hurdle ahead. According to stories circulating here, the difficulties about Efta are not going to be confined to the association of its neutral members. The accession of others to full membership is likely to raise problems; Denmark is mentioned. It is being murmured that too many new members would prove a strain for the European institutions. Generally, Britain's road to Europe is seen in Paris as leading through patient and lengthy negotiations, without spectacular short cuts. To say that the French have blocked the way would not be right. But they do have their own economic and political reasons for not making the British journey any easier. So they are in no hurry. Once again, rightly or wrongly, General de Gaulle seems to think that time is, if not his servant, at least his ally.

in or out? Drang nach Europa

In west Germany, our Bonn Correspondent reports, the first alarm at what looked like a Brussels breakdown is giving way to reassurance.

For several months all west German government officials concerned in one way or another with the growth of the common market have been doggedly sanguine—at least in public—about the final outcome of the negotiations with Britain. So have most Dutch, Belgian and Italian diplomatists serving in Bonn. Their common plea for optimism is that the obstacles to British entry will be overcome simply because they must be, if western Europe, including the British Isles, is to preserve and improve its standard of living along with its modest but precious heritage of political freedom. Indeed, they hold that there is no alternative—not even for Britain—between national decay and renewal through surrender of much of the old trappings of national sovereignty.

Weary of the doghouse, yearning to play a far, far better part in history, the Germans like to see themselves as the principal begetters of a new enlightened European era. This is, of course, a role playable not wholly without self-interest. As the Free Democratic deputy, Herr Robert Margulies, has put it this week.

> The *Drang nach Europa* is highly developed in the federal republic. That part of Germany that is declared provisional in the Basic Law is not felt to be sufficiently a fatherland. The citizen . . . pins his hopes for the future on a united Europe strong enough to afford him the protection and security that he expects from his state.

Such expectations are given extra significance by this summer's rumours of impending Soviet moves to bolster still more firmly—probably with the long-feared separate peace treaty—the militantly communist east German regime. The stronger the base of the European community, economic and political, the more the exposed German federal republic is reassured. In the circumstances it is not surprising to find east Germany's *Neues Deutschland* these days gratefully supporting its denunciation of the common market with long quotations from the British *Daily Express*.

The west Germans are proud of their steady effort to help bridge British and French differences about the common market, and they intend to keep it up. That the west German foreign minister did not attend the latest tough bout of bargaining in Brussels has not the sinister significance that some have attached to it. An economical worker, Herr Schröder knew that Bonn was quite adequately represented at Brussels by state secretaries Lahr of the foreign ministry and Müller-Armack of the ministry of economics. As a conscientious parent, he also reckoned that the family's annual summer holiday on the island of Sylt must be taken now or never in view of the preparations that have to be made for President de Gaulle's visit to Germany from September 4th to 9th. The foreign ministry is still having to cope with the misgivings which Dr Adenauer shares with President de Gaulle concerning the consequences, and especially the political implications, of British entry.

As elsewhere, the gloom engendered in Germany by what seemed at first to be a grievous breakdown in the Brussels negotiations last weekend has been largely dissipated by subsequent statements on the actual achievement. Herr Müller-Armack has declared that the result was "quite satisfactory" and the adjournment "quite natural." France, he insinuated, had been reluctant to agree to any concessions to Britain, but had recognised the necessity of preventing western Europe from splitting into two rival economic groups. In the give and take at Brussels, he went on, Britain had done 75 per cent of the giving. He paid tribute to the Lord Privy Seal and his team for the tenacity they had shown "without regard to their health."

These courtesies spoken, Herr Müller-Armack voiced his and his country's misgivings in remarking that what mattered now was the "psychological reception of the Brussels results in England." It is appreciated in Germany, and regretted, that Mr Macmillan is bound by an awkward domestic and Commonwealth political timetable. And that the inconclusiveness of the Brussels negotiations will give the common market's opponents time to muster reinforcements. But it is hoped that the British Government, now that it can point to the readiness of the Six to make special provision for India, Ceylon and Pakistan, will be able to convince home and Commonwealth doubters over the next few weeks of the Six's genuine and practical goodwill towards Australia, Canada and New Zealand. There is no reason for doubting Germany's sincerity in this matter. Figures published this week by the Institute of Germany Industry show that west German imports from Britain and the Commonwealth increased from DM4.234 million in 1957 to DM5,184 million in 1961; while exports to Britain and the Commonwealth rose from DM4.449 million in 1957 to DM5,180 million in 1961.

NIC and TUC

If the TUC were to think better of planning, would it ever be obeyed?

By going seriously into the planning business, and by inviting the Trades Union Congress to join with it in making planning work, the Government has put the unions on the spot. Nor can they get off it by refusing, as Mr George Woodcock and the TUC's economic committee formally did on Wednesday, to have anything to do with the National Incomes Commission. For years and years the unions have declared—and not unreasonably in view of most Tory talk—that planning would be initiated only by a Labour government; and they have dodged the awkward problem of the part they might play in it. This summer the Left's planning clothes have been abruptly stolen: one TUC reaction has been to suggest that it had never seen this particular suit before anyway, that "Tory" planning and "socialist" planning are from entirely different cloth. This evident rubbish can only be explained by the familiar split-mindedness of the TUC. Once more its political and industrial faces are looking in opposite directions.

The contemptuous vehemence of Mr Woodcock's initial reaction to the Prime Minister's first airing for Nick could conceivably have been prompted (and excused) by Mr Macmillan's own highly political presentation of this motion in a censure debate. The unions' more fundamental objection—disguised behind the demagogic claim that the Government wants to control wages but not other incomes—seems to be summed up in the phrase: "You can't plan wages without planning the rest of the economy." But they know perfectly well that the converse is just as true. By this week Mr Woodcock was expressing a slightly more sophisticated opposition to the Chancellor: the idea of planning incomes, he said, was all very well, but this was not the way to do it. (The Government had given the commission a task "far beyond its powers.") But it is a foregone conclusion that, from now on, the TUC will be talking about how to plan wages, whatever happens to Nick.

Far more important is the question whether the TUC can do more than talk. Once upon a time, the optimists insist, the TUC was able to blunt the hungry edge of its members' desire for more pay. But that was under the most special of circumstances, and with Sir Stafford Cripps as Chancellor of the Exchequer. Even then the effort did not last two years. With the best will in the world towards a Tory Chancellor there is nothing that could be done to curb the desire of a recalcitrant union leader to put in a wage claim; there are plenty of recalcitrants, with strong tactical positions in sensitive industries (and without the calming influence of big jobs on the TUC general council), who would not be averse to putting in a claim simply to embarrass their colleagues. Even if the senior union worthies, never happier than when hob-nobbing with cabinet ministers, were willing to moderate their wage claims, the under-paid and often under-estimated officials who have to get their ideas across to the rank-and-file are unlikely to be enthusiastic about anything that makes it look as though they are not squeezing out as much as possible all round.

What is more, if the top union leaders are to be kept happy in their work on the top planning committees, presumably some bits of the advice they offer will have to be taken (and a Labour Chancellor would be under far greater pressure to accept such advice than Mr Maudling). But it so happens that the bits of advice they are likely to be keenest on at present are precisely those that the planners should be swiftest in rejecting. Mr Gaitskell proved in the Commons last month that Labour leaders do not always have to ignore the facts of economic life, even on so touchy a political question to Labour voters as directing industry into central Scotland and other declining areas. But such realism is far harder to achieve for a union leader who wants to keep his popularity. The spirit of Mr John L. Lewis, ruthlessly promoting the closure of coal mines, or Mr Harry Bridges, squeezing vast sums from the west coast shippers in exchange for a total reorganisation of the dock labour force, is beyond the reach of a more easy-going, amiable and unimaginative union movement.

The power structure of the TUC itself, as represented by the general council, is vastly overweighted in favour of the old-established and declining industries, whose spokesmen are bound to be economic conservatives. Thirty-three of the general councillors represent the various "trade groups" of unions (the other three general councillors are the general secretary and two representatives of female unionists). The non-railway transport trade group (consisting mainly of the Transport and General Workers' Union, and thus spreading into almost every modern industry) last year covered 1,419,000 affiliated members, and has three general councillors; the mining and railways groups, with 1,103,000 affiliated members, have six; the textiles, clothes and shoe manufacture groups cover 477,000 members, and have no fewer than five.

The structure is glaringly anachronistic. The best hope that it will be changed comes from the possibility that the National and Local Government Officers' Association may join the TUC, bringing with it perhaps some other white-collar groups: Nalgo alone has 285,000 members, and more than just some minor tinkering would be needed to secure adequate white-collar representation on the general council. But the result of Nalgo's ballot on affiliation will not be known before mid-October, and even if it is favourable it will be some time before a new structure can be evolved.

The TUC's refusal to co-operate with the incomes commission must by no means be regarded as a disaster. The unions now have to think fast about a problem that they have too often ignored; and they must face up at last both to the issue of their own formal organisation, and to whether any decisions reached by that organisation stand any chance of being carried out. Many top trade unionists seem to believe that they can afford to behave pretty cavalierly towards a Government that, in their view, could fairly soon be replaced by one more favourable to their arguments. But the first to benefit from a sorting out of the TUC's muddle over wage-planning would be a future Labour government, committed as it is to co-operation with a body that, unreformed, could only be indecisive and ineffectual.

Ben Bella's Trial Month

A QUESTIONNAIRE

Q. If it isn't too much to ask, what precisely was arranged between Mr ben Bella and his rivals when they patched up their quarrels last week?

A. Mr ben Bella and his politbureau were put in charge of Algeria—on a month's approval.

What happens after that month?

The revolutionary council, as the source of authority, will re-examine the bureau at a meeting on September 9th.

But surely there are going to be elections for a constituent assembly? Won't that rather baffling old council, that has had to make do as a parliament, be a back number by then?

Very nearly, perhaps. But a month is judged to be the time limit that the country will allow to ben Bella to prove he can do the job.

What will ben Bella do?

He will try to become Algeria's first elected prime minister. The elections you mentioned are planned for September 2nd. Assuming this plan holds, the politbureau, which is five to two pro-ben Bella, will approve the candidates for election—on a single party list. The elected assembly in its turn should appoint a ben Bella government.

It sounds like a walkover; is it?

No; it will be quite hard going. There are other odds and ends to attend to. For damage done by quarrelling Mr ben Bella has a heavy account to pay. Take a few items: One sound and united country collapsed into feudal anarchy. Flight of 500,000 Europeans (provoked by their own Secret Army but reanimated by Moslem kidnappings); these include all the teachers, their return having not been arranged for, nine-tenths of the doctors and hundreds of French civil servants, vital cogs in the administration wheel. Flight of capital. Loss of trade. Loss of thirty per cent of the harvests. Total financial loss valued at about two years' revenue. But the biggest problem for the politbureau is to restore some central authority and wrench control of the country from the regional army chiefs' hands.

Has ben Bella a hope of doing this?

There are powerful supports on his side. The Algerian people generally are so shocked by the chaos that has come to them that they will back any leader who is genuinely tidying up. France can influence matters by giving or withholding money. Its present inclination is to use this lever to see that elections are held and the army is brought under control.

What does the army want?

The forces of the interior, the maquis, that is, who bore the brunt of the fighting, seem willing to be converted into a national army under civilian government. The forces from the exterior, from Tunisia and Morocco, have fancied a military dictatorship. Whether their Colonel Boumedienne has been seeing himself as the dictator or as ben Bella's praetorian prefect is hard to say. Each has been exploiting the other. Hence most of the trouble and muddle. Mr ben Khedda, Mr Boudiaf and Mr Belkacem Krim have ranged themselves from the start against any such dictatorship.

Would ben Bella agree to be an army-controlled dictator?

Not if he could avoid it. But he has been so thick with Boumedienne and the two other general staff officers whom Mr ben Khedda dismissed that it is hard now to head them off. He is trying to get disentangled, did not obtain their reinstatement from ben Khedda's provisional government, although he vowed to do so, and when on August 3rd he entered Algiers in triumph, he left Boumedienne behind.

Was this not a moral victory for Mr ben Khedda?

Up to a point, yes. It meant that ben Bella had recognised that he had got to mind his step. But he is probably free to reinstate the three colonels now that ben Khedda's government has formally handed over power to his politbureau—as it did on Tuesday.

Is Boumedienne a "mad colonel"?

Yes, politically you could call him a bit dotty. He has little or no idea of the economic facts of life. He tried to wreck the Evian talks, and he would gladly have seen Algiers and Oran devastated rather than come to terms with the Secret Army. He has not much time for townsfolk, puts his money on the noble peasant. But he is an inspiring leader and has filled the forces under him with revolutionary zeal.

What do those forces do with this zeal?

In the districts they control they fraternise with the people and point to the poverty of most of them, contrasting it with the privileges of the politicians, intellectuals and above all the Europeans. They say these privileges must go.

Does ben Bella agree?

Theoretically, yes; but he says that he hopes to channel some of this revolutionary energy into reconstruction: repairing war damage, road building.

Can you see Colonel Boumedienne blowing the whistle for a road gang?

Frankly, no.

All right. Go back to ben Bella's politbureau. Why did it cause so much hand-wringing?

Because it was a sick choice. Just look at the members. Four of them prisoners with ben Bella. A colonel who had been even longer in prison. And an almost inactive member of ben Khedda's government. Anyone who had accomplished anything during ben Bella's six-year detention was pointedly left out.

Is this why Belkacem Krim could not be included?

Clearly. As soldier, statesman and peacemaker he achieved all the things that ben Bella would have liked to do. But on top of this it was he who first clashed with the general staff officers when, exactly a year ago, they refused to obey his orders as chief of the inner war council. Since then he has been in the van of the crusade against the colonels. So of course he was ruled out.

But is it not a calamity that ben Bella has antagonised the Kabyles?

It is not yet as bad as that. Ben Bella cannot challenge the Kabyles in their mountains. They are the driving force of the country. They paid for the revolution, not only with the lives of their maquis, but as its principal money raisers through their workers abroad in the powerful "federation of France." Ben Bella, it seems, was obliged to concede last week that Krim, and not the politbureau, should select Kabylia's candidates for election. So they and their formidable master can exert an independent influence.

Does the make-up of the politbureau imply that ben Bella condemns everything that has been done in the last five or six years?

Only in a whimsy sense. He has a Sleeping Beauty complex. Everything must stop if he stops. The last six years must not count. But this should not be judged too harshly. He missed his own date with destiny. When the French so crazily arrested him in 1956 he was already two-thirds of the way to making his own peace terms with France.

Then was it really necessary for him to get so embroiled with the colonels and so tarred by their violent ideas?

No; but when he was in prison he feared he was losing ground and believed he must use the army to bulldoze his way back to power. Also, to do him justice, one must say that his cossetting of the colonels may still be the one card he holds to persuade them to come into line. But he did not in any sense "need" them. Though hidden away in France, he remained for most Algerians the symbol of the revolution, their pin-up leader. Had he come out of prison as a conciliator instead of a trouble-shooter he would have been the obvious choice as Algeria's first prime minister. As it is, he now assumes power with a tarnished reputation and on conditional terms of service—a month's trial.

NOTES OF THE WEEK

FINLAND

Ah, Youth

"WITH the Dutch courage of drunks, the hired riff-raff, bought with dollars and western marks, disgrace the good name of the city of Helsinki." This is how it struck a writer in *Komsomolskaya Pravda*, the Russian newspaper for communist youth. The cause of the indignation was the series of demonstrations by crowds in Helsinki against the communist-organised eighth World Festival of Youth, which came to an end on Monday after ten turbulent days. Mr Evgeny Evtushenko, the so-called angry young man of Russian literature who recently visited Britain, got so angry that he told Russian television audiences all about it in poetry. The demonstrators in Helsinki were mainly young people who may or may not have had a shot of aquavit, but certainly did not have to be bought with dollars to express the widespread Finnish hostility to the festival. They were undoubtedly impolite, and probably impolitic as well; but one forgives a good deal to the Finns, who have a not inexplicable dislike of communism and have had to bottle it up for twenty years. The disturbances got the Helsinki police chief, who was unwisely mixing with the crowds out of uniform, cracked over the head by one of his own policemen; and brought an apology by President Kekkonen to the festival.

The Finnish government never wanted the festival to be held in Finland; but they had to accept it, when the communists insisted, since an occasional bowing to the Russian will is the price of Finnish independence. The communist organisers must now be wondering whether they were wise to insist. This is the second World Youth Festival to have been held outside the assured tranquillity of communist territory, and it was even less of a success than the first one in Vienna three years ago. Several delegations from African and Asian countries failed to turn up when they realised that the occasion would be largely a propaganda exercise. Some non-communists who did turn up protested about the way the festival was conducted, and a number went indignantly home, to Ceylon, Nigeria, Uganda and elsewhere, before it ended. Forty or so out of the total east German delegation of 500 appear to have slipped quietly away and sought asylum when no one was looking. On the face of it, the indignities suffered by the festival ought to be an embarrassment to President Kekkonen's policy of staying on friendly terms with Russia. In fact, they may not; they may simply have made Mr Khrushchev realise (what Mr Kekkonen cannot very well say in so many words) that it can be inadvisable to foist things on the Finns.

BERLIN

Anniversary Blues

AUGUST 13TH last year saw the erection of the communist wall—then a makeshift, now a massive and fearsome structure—between the two parts of Berlin. Monday sees the anniversary, which President Lübke and other prominent west Germans are going to Berlin to mark by an act of presence. Perhaps irrationally, the approach of this anniversary has seen a wave of nervousness in west Germany about what may happen next.

The sagging of the west German stock exchanges, at a time when exchanges in other countries were mildly picking up, is only one symptom of this unease. On August 3rd, when the common market negotiations in Brussels were lumbering towards their crisis, Dr Adenauer was receiving the acting head of the west Berlin government, Herr Amrehn, to discuss the dangers to west Berlin and the possibilities of action against them. One easily forgets that east-west policy and the threat of a separate Soviet peace treaty with east Germany have been more of a preoccupation to west German politicians, during these days, than Britain's relations with the Six.

Herr Ulbricht added his mite to the fund of apprehension by slipping off on August 1st to Russia, accompanied by his acting prime minister, Herr Stoph. To suppose, as some did, that he was on his way to sign the separate treaty does not seem necessary;

the communists are well aware that, to be anything better than a farce, the treaty will need to be signed more or less under the public gaze, with the participation of whatever independent governments can be got to join in. A treaty furtively concluded would not be much better, from the Soviet and the east German point of view, than none at all. Herr Ulbricht and Herr Stoph soon turned up in Kiev, and when it was remembered that Mr Khrushchev, too, was in the Ukraine, it seemed safe to assume that consultations were in train about something. Quite likely, the east Germans are pressing for their peace treaty, though they have other, notably economic, wants as well.

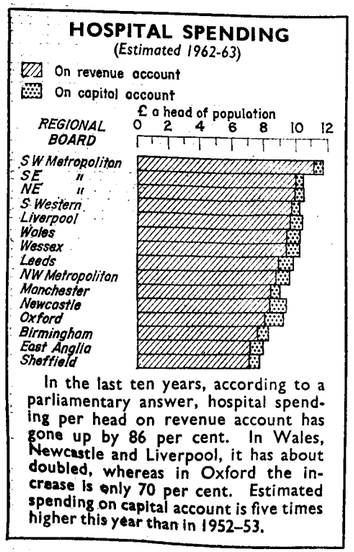
The atmosphere of doubt, speculation, and taut nerves is a commentary on the West's own failure to profit by the interlude that has been allowed it on Berlin by backing up the efforts of Mr Kennedy's Administration to come to some understanding with the Russians that might allow Berlin a period of stability. There has been an increase in Soviet hint-dropping to the effect that Mr Khrushchev is not prepared to wait for ever. An interesting variant on these hints is provided by the suggestions that he may turn up—demanding what?—at the United Nations Assembly when it opens in New York on September 18th.

NEO-NAZIS

Helping Hands

WHEN will the great British press, the BBC, Gloucestershire villagers and champions of democracy everywhere bring themselves to realise that they have fallen for the oldest publicity stunt in the business? By Thursday morning the heroic efforts of all and sundry had secured the detention and deportation of Mr Lincoln Rockwell, a silly and highly unimportant American whose political opinions are to the right of the lunatic right. For five days before that the British public had been titillated with variously excitable accounts of Mr Colin Jordan's "secret" fascist camp in Gloucestershire, the wounding of an intrepid press photographer there, Mr Rockwell's perilous entry into Britain through the Irish Republic, his portentous comings and goings at the camp, the villagers' righteous attack on the fascists, and the nerve-racking closing of the police and press net round Mr Rockwell in central London. The *Daily Mirror* gave Mr Rockwell all its front page (with an exclusive, posed photograph) on Tuesday : it was thus no surprise that Mr Rockwell chose to surrender himself to the *Mirror* in good time for another front-page splash on Thursday. Ever willing, the *Mirror's* rivals splashed him too.

By this assiduous attention to the peril in the country's midst, the press has done as much as the Trafalgar Square punch-up boys to elevate Mr Jordan and a couple of dozen strutting adolescents into something resembling a political entity which simple people (to Mr Jordan's enormous gratification) now take seriously. As a direct result the number of self-appointed nitwit fuehrers will go up; Messrs Jordan and Rockwell will get more bemused recruits ; there will be more publicity, more peddling of photographs and information to the press, and more inspired punch-ups. While helping hands energetically raise Mr Jordan and his breed to fame on the front pages, the leader writers and columnists inside bray for action to stop the propagation of neo-Nazi views. Piffle, Mr King, piffle.



In the last ten years, according to a parliamentary answer, hospital spending per head on revenue account has gone up by 86 per cent. In Wales, Newcastle and Liverpool, it has about doubled, whereas in Oxford the increase is only 70 per cent. Estimated spending on capital account is five times higher this year than in 1952–53.

DR SOBLEN

No Escape?

THE case of Dr Robert Soblen, convicted as a spy in the United States, has added to Mr Henry Brooke's current worries, but for Dr Soblen's actual plight in Britain the Home Office is not primarily to blame. Probably most responsibility must rest on the United States police and emigration officials who allowed him to jump bail and escape to Israel in June after being sentenced to life imprisonment. Israel refused to grant him asylum and he was then deported on an Israeli plane flying to the United States via London. Just before the plane landed in London Dr Soblen cut his wrists, not to commit suicide, but to avoid being taken back to New York. After hospital treatment he was transferred to prison, and from there he applied for a writ of *habeas corpus*. Dr Soblen's plea was to be freed, either to stay in England or to depart to the country of his choice, but this was dismissed by the Divisional Court of the Queen's Bench and also by the Court of Appeal, who held that he had never been given official permission to enter Britain ; technically he was still in transit.

The Home Office then served an order on El Al, the Israeli airline, to fly him on to New York. But on instructions from Israel the airline refused to do so. The Israeli government apparently did not want Dr Soblen in Israel, but had become unwilling to incur the odium of sending him back to the United States. As if to give itself more time to think, the Home Office extended until midnight on Friday the time limit within which it wanted El Al to remove its embarrassing passenger. There could be no question of outright extradition, since spying is not an extraditable offence.

Dr Soblen's case has been complicated by the pressure brought to bear on the British Government by the United States to return him to America, as well as by internal politics in Israel. In addition, doubts have been raised about the fairness of his trial in the United States and the value of the evidence brought against him there. The American Civil Liberties Union has been campaigning for a new trial. There is the further non-legal but human factor that he is a dying man suffering from leukaemia and with very little time to live. Mr Henry Brooke's officials, too inefficient to prevent Mr Rockwell from walking in the back door, are probably not inefficient enough to let Dr Soblen quietly escape from the front one.

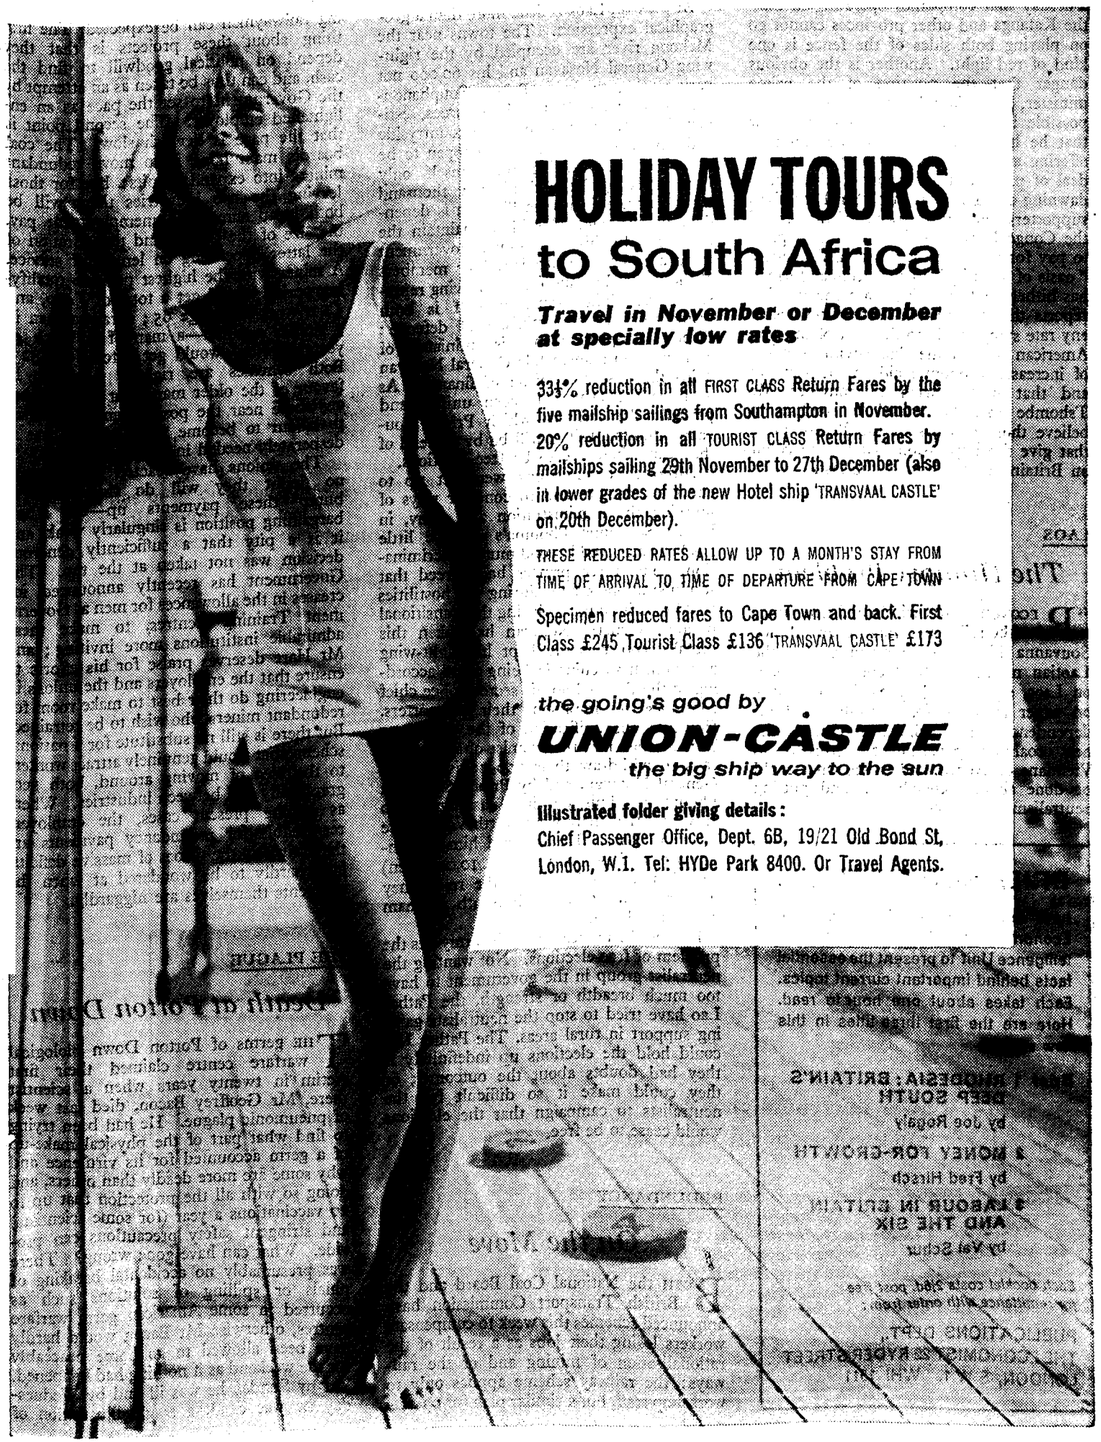
CONGO

Squeeze Play

THE United Nations, at the request of the Congo government, is turning back from Elisabethville aircraft that do not have the government's clearance. The Belgian government has turned back Mr Tshombe, who had intended to pay what he called a "private visit" to Brussels ; a fortnight earlier it had had a painful experience with Mr Kimba, Mr Tshombe's "foreign minister" and deputy, who failed to keep his promise to refrain from political activity on a similar visit. (Was he asked for the same kind of undertaking when he visited London last month? If so, he did not observe it.)

The Belgian government now seems prepared to defy the powerful forces that have hitherto backed Mr Tshombe in Brussels. Reports from Washington indicate that the Belgian attitude, in last week's talks there, about a new programme for ending the Tshombist secession, has been a good deal closer to the American than the British. The *Union Minière* has volubly rejected the United Nations' offer to protect its installations against the reprisals that Mr Munongo threatens if it were to abandon "its constant policy of non-interference in political affairs"—that is, if it were to start paying some of the taxes it owes to the Congo government. But Belgium, like Britain, has substantial interests not only in the Katanga but elsewhere in the Congo too. And Belgium has no Rhodesia.

The Congo government's warning on



Tuesday that companies operating in both the Katanga and other provinces cannot go on playing both sides of the fence is one kind of red light. Another is the obvious danger that the position of the prime minister, Mr Adoula, will become impossible if there are no rapid results now that he has gone to the perilous limit in offering a revised constitution with a great deal of provincial autonomy. Perhaps it is dawning on some at least of Mr Tshombe's supporters that the throwing of the rest of the Congo back into chaos is a high price to pay for the preservation of a Katangese "oasis of stability" in the peculiar form it has hitherto taken. There are encouraging reports that the British Government is at any rate sympathetic to the part of the new American programme that envisages offers of increased economic aid to the Congo; and that it has tried to convince Mr Tshombe that he would be foolish to believe those sections of the British press that give the impression that he can count on Britain to back him to the last.

LAOS

The Humpty Problem

"RECONCILIATION within and neutralism without" has long been Prince Souvanna Phouma's prescription for the Laotian malady. The Geneva agreement on Laos, signed on July 23rd, provided—on paper at least—for neutrality and independence. The prince, who heads the new coalition government, returned to Vientiane on August 3rd to see what could be done about reconciliation and putting neutralism into effect.

BRIEF BOOKLETS . . .

have been produced jointly by The Economist and The Economist Intelligence Unit to present the essential facts behind important current topics. Each takes about one hour to read. Here are the first three titles in this new series:

Brief 1 RHODESIA: BRITAIN'S DEEP SOUTH
by Joe Rogaly

2 MONEY FOR GROWTH
by Fred Hirsch

3 LABOUR IN BRITAIN AND THE SIX
by Val Schur

Each booklet costs 2/6d. post free for remittance with order from:

PUBLICATIONS DEPT.,
THE ECONOMIST 22 RYDER STREET
LONDON, S.W.1. WHI 1511

At present, Laos is little more than a geographical expression. The towns near the Mekong river are occupied by the right-wing General Nosavan and his 60,000 not very warlike troops. Prince Souphanouvong's left-wing Pathet Lao forces, estimated at 20,000 men, roam the countryside and have control where they happen to be at the time. Having for himself only Captain Kong Le and his few thousand troops, Prince Souvanna Phouma is dependent on his political skill to maintain the balance. In his provisional government there are eleven neutralists, four members of the Pathet Lao and four right-wing representatives. The prince himself is both prime minister and minister of defence; Prince Souphanouvong is minister of economy and plans, while General Nosavan holds the post of minister of finance. As soon as the army has been unified and partially demobilised—which Prince Souvanna Phouma thinks will be by the end of the year—there are to be free elections.

Although commissions were set up to effect a cease-fire and to consider ways of unifying the administration and army, in Prince Souvanna Phouma's absence little has been achieved beyond mutual recrimination. The three princes had agreed that administrations set up during the hostilities could remain in being during the transitional period. General Nosavan has taken this literally and virtually kept his right-wing government machine in being; and according to the Pathet Lao his secret police chief continues to imprison their supporters. However, the unification of the army may be made easier by the promise of the Americans to withdraw their 700 advisers from General Nosavan, and by Prince Souvanna Phouma's admission in Washington on July 30th that there were North Vietnamese forces in Laos. He declared himself confident that these (estimated at 10,000 men) would now withdraw, and the route they have been using to reach South Vietnam would be closed.

Beyond the unification of the army lies the problem of free elections. Not wanting the neutralist group in the government to have too much breadth or strength, the Pathet Lao have tried to stop the neutralists gaining support in rural areas. The Pathet Lao could hold the elections up indefinitely if they had doubts about the outcome; or they could make it so difficult for the neutralists to campaign that the elections would cease to be free.

REDUNDANCY

On the Move

BOTH the National Coal Board and the British Transport Commission have announced schemes this week to compensate workers losing their jobs as a result of the rationalisation of mining and of the railways: the railway scheme applies only to workshop staff, but a similar plan for operating railwaymen can be expected. The first thing about these projects is that they depend on political goodwill to find the cash, and can thus be taken as an attempt by the Government to set the pace as an enlightened employer. The second point is that the pace is devilish slow. The coal board's main hope is to move redundant miners into expanding pits: but for those leaving the two industries there will be both lump sums and unemployment pay, the size of the former and the duration of the latter depending on length of service. A miner with the highest possible qualifying period would get a total of £430, and £1 a week from age 65; a railwayman in a similar position—a man of 60 with 45 years' service—would get a total of £523. Both schemes are rightly weighted in favour of the older man; but neither goes anywhere near the positive encouragement to labour to become more mobile that is desperately needed in Britain.

The unions have reacted angrily, and no doubt they will do their best to bump these payments up—but their bargaining position is singularly weak, and it is a pity that a sufficiently generous decision was not taken at the top. The Government has recently announced increases in the allowances for men at Government Training Centres, to make these admirable institutions more inviting; and Mr Hare deserves praise for his efforts to ensure that the employers and the unions in engineering do their best to make room for redundant miners who wish to be retrained. But there is still no substitute for a national scheme that would genuinely attract workers to the idea of moving around, both geographically and between industries. When, as in the present cases, the employers responsible for redundancy payments are themselves in the throes of massive deficits, it is hardly to be wondered at when the payments themselves are niggardly.

THE PLAGUE

Death at Porton Down

THE germs of Porton Down biological warfare centre claimed their first victim in twenty years when a scientist there, Mr Geoffrey Bacon, died last week of pneumonic plague. He had been trying to find what part of the physical make-up of a germ accounted for its virulence and why some are more deadly than others, and doing so with all the protection that up to 20 vaccinations a year (for some scientists) and stringent safety precautions can provide. What can have gone wrong? There was presumably no accidental breaking of phials or spilling of solutions such as occurred in some American germ warfare centres, otherwise Mr Bacon would hardly have been allowed to go home peaceably for the weekend as if nothing had happened. Yet by Sunday he was ill and by Wednesday he was dead, a tragic illustration of

STRENGTH SECURITY

what the Middle Ages must have endured from plague as well as a frightening example of the potentialities of germs in war. The War Office has adjourned until Monday, waiting on the results of laboratory tests, its inquiry into how Mr Bacon could conceivably have put back the clock six hundred years.

A method of vaccination against the two forms of plague had been developed at Porton Down, but scientists were only partly satisfied with it because it gave protection for a bare six months; they are unlikely to have given up their search for a longer lasting vaccine. As epilogue to their earlier development of a highly successful vaccine giving several years' protection against anthrax (which is no longer kept on the station) the station doctor has been taking yearly blood tests from his colleagues to measure precisely how long their blood continues to carry a respectable population of antibodies. The results show surprising variation, with protection disappearing within three years in some individuals and lasting for more than seven in others. Did Mr Bacon lose his resistance to pneumonic plague more rapidly than expected or did he, in the course of his studies of germ genetics, come across plague germs of a type resistant to Porton Down vaccines? In a matter of such importance to public health, it is to be hoped that the War Office—which has behaved so far in a markedly sensible manner—will publish the inquiry's findings.

JAMAICA

Free to Go Where?

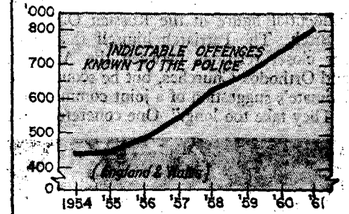
GOLD, green and black are the colours of the flag that Jamaica ran up at midnight last Sunday, when it ended 307 years of British rule. The green and the black represent the realities of a still mainly rural, mainly African community; the gold, an aspiration. Not that Jamaica is stagnating; on the contrary, in the past decade it has tripled both its exports and its total national product. The value of its manufacturing output has quadrupled, and now exceeds that of agricultural production. Since the first Jamaican bauxite was shipped in 1952, not only has the island become the world's largest producer of the ore; the processing of it in Jamaica has reached a point at which the value of exports of alumina greatly exceeds that of ore exports. Postwar diversification of manufacturing and processing has been impressive, owing much to American investment and British aid. Tourists are now spending more than £13 million a year in Jamaica, five times as much as a decade ago. Yet the massive unemployment, the poverty of many hill smallholders, and the pressure of an annual population growth now exceeding three per cent, that accompany Jamaica as it moves out into the world on its own are sombre portents.

As well as becoming the Commonwealth's fourteenth sovereign member (in three weeks' time, Trinidad and Tobago will make it fifteen), Jamaica becomes the twenty-third sovereign state in the western hemisphere—the first new one since Panama in 1903. It has indicated that it will apply to join the Organisation of American States; which incidentally already includes three members with populations smaller than Jamaica's 1,650,000. It has also indicated that it will not establish direct diplomatic relations with the nearest of its neighbours: Cuba, less than a hundred miles to the north. Sir Alexander Bustamante has shown a characteristic lack of reserve in his gestures of friendship and trust toward the United States, inviting the establishment of a military base, among other things.

His cousin and rival, Mr Norman Manley, would no doubt have been less outspoken in this direction if it had fallen to him to lead Jamaica across the threshold of independence; yet it was largely during Mr Manley's seven years in power, from 1955 to last April, that the flood tide of American investment rolled in. British-minded as Jamaicans are, there is no alternative for them, now that Britain cannot even cope with their migration, but to develop a close attachment to the United States. Cuba's loss, in sugar sales and tourist traffic, has already been their gain. None of this has prevented the arrival of messages of warm congratulation on Jamaica's independence

YOUNG CRIMINALS

The latest criminal statistics (Cmnd. 1779) show that the younger age groups continue to account for the bulk of crime. Since 1954, when postwar crime was at its lowest, the percentage increase, as the lower chart shows, has been greatest in the 17-21 and 21-30 age-groups. This agrees with the Home Office findings that children born between 1935 and 1942 had an exceptionally high delinquency rate, presumably because of the disturbing effects of the war on young children.



% increase in crime rate of males between 1954 and 1961

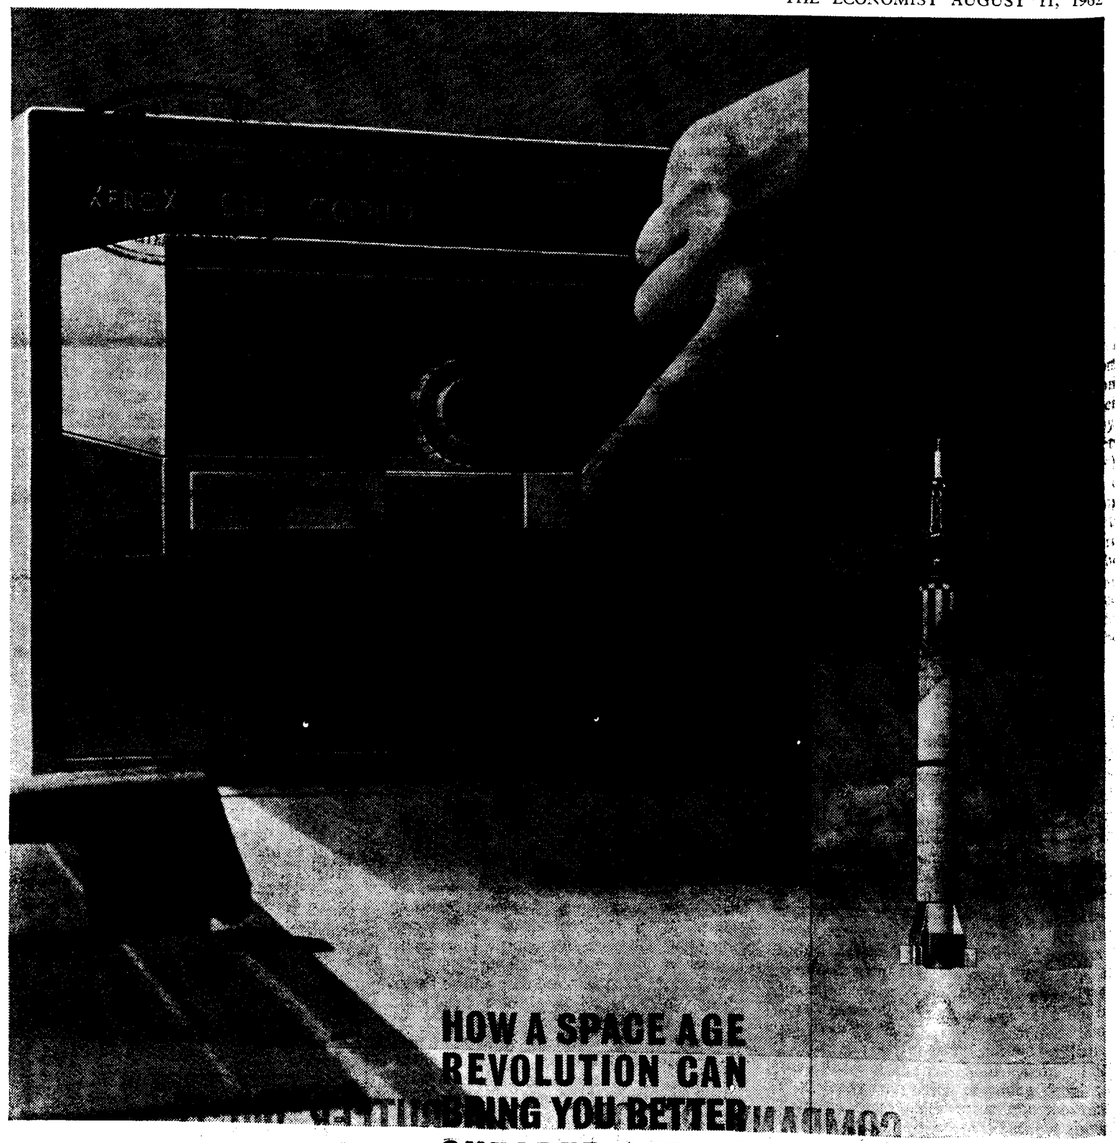
AUGUST 9, 1862

THE PREMIER ON PROFITEERING

LORD Palmerston is never so little happy as when he ventures upon topics involving questions of economic science or practical and productive industry. He has never mastered either the principles of the one or the facts of the other. . . . Nor is he a whit more familiar with the real state of matters in the great centres of manufacturing life, or with the character of the men who reside there and have made them what they are. . . . His ignorance in reference to them is great, and his sympathies are more astray than they should be in the leader of the Liberal party. . . . An instance in point was his attack a few nights ago upon certain manufacturers of whose alleged selfishness he had heard. . . . The charge brought forward by Lord Palmerston was this:—that certain manufacturers, having on hand a large stock of cotton laid in at low prices, preferred realising the profit they could obtain by selling it for export to employing their operatives in working it up into yarn or calico—and were guilty of criminal selfishness in so doing. Now, we will not pause to enumerate the many cotton-spinners who, at heavy loss to themselves, have forgone this natural, obvious and very gainful transactions;—we will accept the fact as Lord Palmerston has stated it, and we ask distinctly in what way and on what principles was the alleged transaction blameable, and by what rule can the Premier's denunciation of it be justified? . . . In the first place, the obvious question occurs, why should the *manufacturer* be singled out for animadversion and not the *merchant*? The Liverpool merchant, who has his warehouse full of cotton, sells it to the foreigner every day in the week, if the foreigner offers him a farthing per lb more than he can obtain from the home consumer; and no one ever dreams of blaming him for selling his wares to the highest bidder. Even Lord Palmerston would scarcely venture so to fly in the face of all the recognised rules of correct and sagacious and proper commercial practice. If, then, such sale is right and perfectly irreprehensible on the part of *merchant*, how can it be wrong on the part of the *manufacturer* who has shortly before purchased his own cotton —the very cotton in question—from the very same merchant? . . . Surely, men in high places should be warned to pause before they cast their thunderbolts abroad so recklessly on guiltless heads.



CHEAPER OFFICE COPIES

The revolution is Xerography – a completely new method of copying and printing by static electricity. It's photography without sensitised material, without developers, without negatives. Scientists foresee its use in space travel, communications and medicine. But right now it is bringing a revolution in office copying. Already 1 in 4 of all office copies in America are made by Xerography. Now it is spreading fast in Britain.

Automation in office copying. The machine using this revolutionary new principle is the Xerox 914. It copies everything – pert, print, pencil, sketches. Copies are colour, even three dimensional objects, all in clearest black and white. It makes copies on ordinary paper, bone dry, 6 copies a minute, completely automatically. You just set a dial to the number of copies you want and the machine delivers. Every copy is perfect. There's never any scrap.

Have one without buying it. We lend the 914 copier to you. You pay only for the copies you use. You get the most advanced copier in the world without tying up your capital and you cash in too on the many thousands of pounds spent in developing this highly efficient copier.

The 914 office copier is not a toy – it weighs just short of 6 cwts. So we cannot bring it to you. But there's one working at any of the branches shown on right. A visit will pay you over and over.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

Defence Under Fire

WASHINGTON, DC

STIFFENING breezes are blowing about the Department of Defence. Some Americans, like some Europeans, seem to fear that the strategy enunciated recently by the Secretary of Defence, Mr McNamara, and intended to lead away from nuclear war, may tend towards appeasement. Other Americans criticise, however, the concept of a three-gear war—cold, limited and total—as provocation for an accelerated arms race. The highly conservative Senator Goldwater has suggested accusingly that Mr McNamara is trying to "substitute" conventional weapons for nuclear ones and complains that the art of warfare is being carried back not just to the second but to the first world war. It is probably quite true that Mr McNamara, who wants more integration in military planning, would also like stricter *apartheid* among weapons, nuclear and conventional. And though it is reported that every army corporal wants to have an atomic howitzer, Mr McNamara does not wish nuclear weapons, including the so-called tactical ones, to become military status symbols. However, very few people would agree with Senator Goldwater that Mr McNamara is living in 1914. It is estimated that the United States possesses 40,000 nuclear warheads, varying vastly in size, and it is still spending $15 billion a year on nuclear weapons.

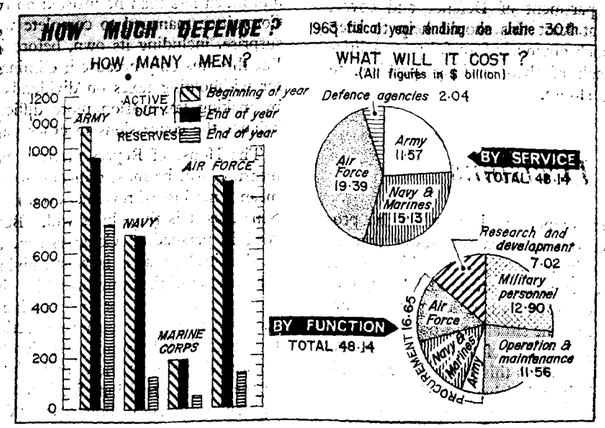
It is this which makes Mr McNamara's other critics argue that, by piling conventional weapons on top of nuclear ones, which is undoubtedly what is in fact happening, Mr McNamara will force the Russians into a still dizzier arms race. These critics find little credibility in his talk about confining nuclear attacks to military targets. Mr McNamara himself said earlier this year that he did not expect the Russians to try to spare American cities. Above all, the critics contend that Mr McNamara or anyone else is gravely wrong to imply that nuclear war can be waged in a limited way, sparing cities or using only "tactical" nuclear weapons, and to suggest that such "limited" war would be tolerable as well as feasible.

But though his strategy has thus come under fire, Mr McNamara seems unlikely to withdraw. Some Europeans may be distinctly alarmed at the idea of nuclear weapons not being used from the outset of a war for Europe. But he appears to be cautiously confident that Americans and Russians share the view that nuclear war is too awful to be indulged in, even though neither country will go quite so far as to say so publicly. The American opinion has been, and probably is still, that the Berlin situation will stay much as it is now with only minor modifications possible, because neither side wants a war but neither will, or can, back down. A nuclear attack by Russia in Europe is regarded as altogether unlikely, while the 175 Soviet divisions which were once supposed to theaten Europe are suspected now to have had much in common with the celebrated missile gap.

Mr McNamara's strategy owes a great deal to General Maxwell Taylor, who was to appear this week before the Senate Armed Services Committee to seek approval of his nomination as Chairman of the Joint Chiefs of Staff. As Chief of Staff of the Army at the height of inter-service strife four years ago, General Taylor was a prime target of the sniping that went on in the corridors of the Department of Defence. He was treated as a heretic because he criticised the doctrine of massive retaliation and deplored the heavy stress on nuclear weapons as opposed to conventional ones. President Eisenhower took the unusual step of failing to renew his term as Chief of Staff of the Army. In retirement General Taylor wrote a book in which he described how, metaphorically speaking, he had been shot as full of arrows as Saint Sebastian for his allegedly harmful opinions. A little over a year ago he was taken out of retirement to be President Kennedy's military adviser at the White House. His return to the Department of Defence, as Chairman of the Joint Chiefs, is rather as if Charles I had not only escaped beheading but had finally won the English Civil War.

But General Taylor's triumphal return may also add to Mr McNamara's problems. The Joint Chiefs, who already feel that their influence has been diminished, may resent General Taylor or may try to enlist him on their side in a tug of war with the civilian Secretary of Defence. Mr McNamara succeeded in halting the feuds among the armed services and for this and other feats he was for a while Congress's and the country's blue-eyed boy, able to do no wrong. But Congress now suspects that dictatorial tendencies are astir in Mr McNamara's breast and so do the Joint Chiefs of Staff. The Secretary of Defence rules with a strong hand and the formerly warring Joint Chiefs feel it.

Much of American strategy and choice of weapons is based on war games, played nowadays with computers. But the Army, the Navy and the Air Force have all long been inclined to disregard the results of war games which fail to fit their own predilections. This form of cheating at patience was partly responsible for there being brought into existence, within the Department of Defence, a group of civilians whose job is to evaluate new weapons. In carrying out their delicate duties they try hard to be tactful and claim that some of their best friends wear uniforms. Nevertheless, it is to the civilian Secretary of Defence rather than to the military Joint Chiefs that they owe allegiance and Mr



McNamara has certainly not attempted to reverse this.

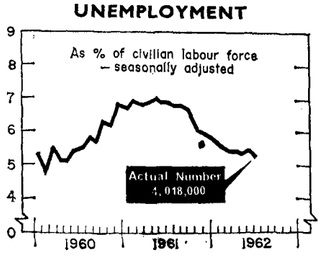
What he has done, moreover, is to install in the Department of Defence, in addition to this older group for evaluating weapons, a number of bright younger men with a background that is a cross-fertilisation of Oxford University and the civilian research organisations, such as the Rand Corporation, which work for defence agencies. The professional military men view the newcomers with a nervousness that is shared by Congress, which likes brass hats and brass tacks, but tends to distrust eggheads, especially ones who show off their higher mathematics. Some of the newcomers, called "McNamara's whiz-kids," are regarded dubiously even by the other civilian experts who also seem to feel that brass is preferable to brashness. For their part the "whiz-kids" are said to consider uniformed officers as dispensable or expendable or both. The Air Force blames them for having condemned the projected big bomber, the RS (reconnaissance strike) 70, as almost sure to be obsolete before it gets into production. The RS-70 is still cherished, however, by Congress as well as by the Air Force. Congress has defied the computers by making available lavish funds for the big bomber, which President Kennedy did not ask for, while refusing his request for half a billion more dollars for shelters against radioactive fall-out.

The professional military men cannot but recall that General Taylor once said that the Joint Chiefs were not the best judges of problems involving science and engineering and that therefore these should be left to the civilian experts. Mr McNamara obviously shares this opinion and acts on it. He seems to have paid careful heed to General Taylor on other matters also. The United States strike command (Stricom), which brings together under one head both the Army's ground forces and the tactical elements of the Air Force which support the ground forces in combat, is in line with General Taylor's ideas. The defence budget is now prepared in accordance with General Taylor's recipe for horizontal rather than vertical "menu-making." Even a proposal that, to save dollars, American troops in Europe ought to commute by jet aircraft every six months, instead of staying two or three years and having their families in Europe with them, fits in with General Taylor's desire to strengthen the Army's air lift support.

When he succeeds General Lemnitzer as Chairman of the Joint Chiefs an Army man will be replacing an Army man though it was the Navy's turn to have the post. Moreover, General Taylor is a retired Army man, which means that ambitious serving Army officers, as well as the Navy and Air Force, may feel chagrined. All this may well revive the cold war among the services and result in both the Secretary of Defence and the new Chairman of the Joint Chiefs being on the receiving end of a good deal of criticism, even if it is veiled in the Department of Defence and covert in Congress. Cynics say that at least this should help to keep them in step. Otherwise, two such obviously forceful personalities might soon pull apart with each of them seeking, perhaps, to enlist the support of the White House.

Cutting Decisions

THE unexpected fall in unemployment in July, when the proportion of the labour force out of work was lower than at any time since President Kennedy took office, is a bitter-sweet statistic for the Administration. It is not substantial enough to suggest that the rate of economic growth is beginning to pick up, but it is quite enough to suggest that the situation is not sufficiently serious to require the emergency stimulus of a cut in taxes. As the President tries to make up his mind on this point this weekend, he will be faced with other similarly indecisive statistics for July; for example, spending on construction, very strong recently, declined in the month but sales improved in department stores and the output of steel is going up at last. It is being rumoured that Mr Kennedy may postpone his decision until the August figures are available, but that will not be until mid-September. By then it will have become impossible to keep Congressmen in Washington and away from their election campaigns; only a real economic crisis, of which there is no likelihood, could induce them to find time then for cutting taxes.



In fact it is already clear that they have no intention of finding that time even if the request is put to them next week, and it is therefore now being presumed in Washington that Mr Kennedy will not lay himself open to another rebuff from Congress by making such a request. However strong the economic arguments for a tax cut this year may seem to him, the political ones are all against it. The expert evidence presented in private to the House Ways and Means Committee during the past two weeks on whether taxes should be reduced now has apparently been as inconclusive as the statistics and the same will probably be true of the evidence which the Joint Economic Committee is now hearing in public—at the insistence of its Republican members who wanted the voters to know the true state of the economy under the Kennedy Administration. Whatever the voters hear, it seems that few of them are going to think that lower taxes would be the best remedy—at least, not if the reduction forced the federal government to go further into debt, as it inevitably would. A recent Gallup poll backed up Congress's lack of enthusiasm for a tax cut by finding 72 per cent of those interviewed against it in such circumstances—although, as Mr Kennedy pointed out, the results might have differed if the question had offered tax reduction as a preventive for recession.

HE also pointed out that the present situation justified his request at the beginning of the year for stand-by power to lower taxes in an emergency without asking Congress. But this is a power which Congress will not even consider giving him. He will probably, however, get one tax measure this year, now that he is apparently prepared to acquiesce in a tax revision Bill which gives him much less than he insisted on originally. The Senate Finance Committee managed to complete work on this Bill, to everyone's surprise, including its own, before it got involved in tariff policy. But this was only because it eliminated the controversial provision for withholding taxes on dividends and interest at source which, by making tax evasion more difficult, was relied on to counterbalance the concessions in other parts of the Bill.

The House of Representatives, which has already acted on the measure, will be most reluctant to accept this change, since it will mean a net loss of revenue, even if the Bill gets through the whole Senate as it is thought it will. But the Administration may succeed in persuading Congressmen, as it is reported to have persuaded itself, that it is worth giving up the withholding scheme for the sake of the stimulus which the economy would receive from the tax deductions for encouraging capital investment; these are the most important remaining section of the measure. The Senate Committee's Bill is not as satisfactory in this respect, from the to the Senate provisions for increasing taxes on overseas earnings, tightening expense allowances and closing other loopholes.

Profits—How Extraordinary?

AT his press conference nearly three weeks ago President Kennedy remarked that the profit figures for some industries in the first half of the year were extraordinary. Businessmen were quick to suggest that this was only true, in general terms, at least, if the comparison was with the same period in 1961, when the recession was at its lowest. While profits as a whole have been running this year about 20 per cent above the first half of last year, the first quarter of this year, with profits at an annual rate of $50.4 billion before taxes, was well below the fourth quarter of 1961 and results for the second quarter, not yet complete, show little improvement over the January-March period. If the recovery were proceeding according to pattern, profits should now be reaching new peaks; in fact they are still, it seems, below 1959's record.

The latest estimates put the 1962 total at a maximum of $52 billion before taxes are paid, and probably less, particularly if corporations make as much use as the Administration hopes they will of the new depreciation allowances. These enable them to write off the cost of capital equipment more quickly than in the past, and one firm which has already taken advantage of the new rules is said to have shown a drop of 5.4 per cent in profits compared with a year ago in consequence, instead of the gain of 1.9 per cent which would have appeared from the old method of calculation. There is practically no prospect now of corporate profits reaching the total of $56.5 billion this year on which the Administration based its January estimates of tax receipts. Nevertheless, when the figures for individual industries are studied, the details of the picture are much more encouraging than is the general effect, with improvements being shown by many companies. While there are as usual complaints of rising costs which cannot be offset by higher prices in the present poor state of demand, in fact many firms, driven by last year's recession to look for economies, have been extremely successful in holding down costs during the recovery (which has not after all been sufficiently ebullient to foster extravagance) and have benefited from what has been a very satisfactory volume of consumer demand.

This is particularly true of automobile manufacturers, whose excellent sales have also meant good business for all their suppliers, but other makers of consumers' goods, such as household appliances and clothing, have also been doing well. Activity in the steel industry was completely distorted by the threat of a strike in the early part of the year with the result that steel made a very poor profit showing in the April-June quarter. It should do better from now on, even though the industry insists that its profits are being squeezed between rising labour costs, which went up again in July, and the President's refusal to allow an increase in steel prices. There is, however, little sign of a real squeeze on profits anywhere and it is quite possible that many corporations may show better results for the year as a whole than are now expected.

Quality of Mercy

LAST week two Governors, both of whom personally oppose capital punishment, had to decide whether to extend clemency to condemned murderers. In California the spotlight was on Governor Brown, now in a neck-and-neck race for re-election against Mr Richard Nixon; Mr Brown's agonies of damaging indecision two years ago over the Chessman case are still not forgotten, thanks in part to Mr Nixon's willingness to jog the public's memory. Chessman's execution, after legal battles lasting many years, split the state. This time Governor Brown decided, without any apparent hesitation, that there were no grounds for intervening to save Mrs Elizabeth Duncan and the two Mexican-Americans whom she hired to murder her pregnant daughter-in-law. She is the first woman to be executed during Mr Brown's Governorship and only the fourth to suffer the death penalty in California. At one time it seemed possible that another Chessman case might be brewing—and in an election year; whatever the Governor did was bound to offend some group. But, perhaps because the crime was so revolting, Mrs Duncan's fate has aroused little interest. In all, Governor Brown, who has tried, and failed, to persuade the Legislature to make California the tenth state to abolish the death penalty, has now permitted 32 executions to be carried out and has commuted the death penalty to life imprisonment in 13 cases.

His decision would have been more agonising this time, and his election campaign might have been affected, if he had been faced with the problem of Mr Paul Crump, the Illinois murderer whom Governor Kerner has just saved from the electric chair. Like Mrs Duncan, Mr Crump protested his innocence but what told in his case was the testimony of fifty people, including the warden of the prison where he has spent the past nine years, that he is a changed man. In 1953, everyone agrees, he was an illiterate, animalistic criminal, but under the care of a warden who has a reputation for rehabilitating prisoners Mr Crump, a Negro, has educated himself sufficiently to write a book which is about to be published, has saved a guard's life and has devoted himself to helping other inmates of the gaol. Under these circumstances Governor Kerner, who is not standing for any office this year, decided that it would serve no purpose to take Mr Crump's life. The decision may be a sign that opinion in Illinois is turning against the death penalty; certainly such a dramatic rehabilitation is a strong argument against capital punishment.

No Substitute for News

IN Minneapolis, a town of 500,000 people, readers of the *Tribune*, a distinguished morning newspaper owned by the Cowles family, and its evening companion, the *Star*, have had 116 days—longer than any other modern Americans—to discover what life is like without daily newspapers. The strike which shut them down began at Easter and ended only last weekend. It was the teamsters, a particularly unruly local branch of an unruly trade union, who started the strike by calling out the van-drivers and it was the teamsters who were the last to go back, but four other unions were actively involved. The hard core of the dispute, like that which recently silenced Detroit's newspapers, concerned work rules and automation in the mailing and distribution department, long a source of friction. Here the management, with an unexpected toughness born of a feeling that it was now or never, held out for a substantial victory, although all the trade unions won increases in wages and other benefits to the tune of about $1 million over the life of the two-year contract. Jobs of some kind are guaranteed for all the 125 individual mailers now employed, but restrictive work rules have been narrowed; the company will be able to send out 70 per cent, instead of only 50 per cent, of its 535,000 copies of the two daily papers without having them specially counted and addressed in the plant.

While this trial of strength was going on, Minneapolis had to exist on a sparse diet of news on radio and television (including a nightly half-hour provided by the newspapers), out-of-town papers for which as much as $1 each was charged and, since May 1st, on a new daily, the *Herald*, started by a man of extreme right-wing Republican views. This was devoted chiefly to advertising but now proposes to subscribe to a news service in an effort to stay alive. At least it will not be undercut in price by the Cowles papers, which have raised their news-stand prices from seven to ten cents.

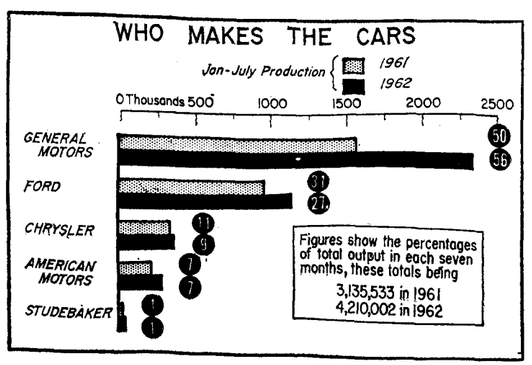
Retail traders can put a price tag on the losses they suffered because the strike blacked-out newspaper advertising: there was a fall of about $10 million in the value of sales which could not be ascribed to anything else. Cinema attendances dropped and houses went unsold. Readers cannot measure their loss but there is no doubt that they missed the detailed reporting of local and national news which radio and television could not give as well as announcements of births, deaths, marriages, prices of stocks and shares and the comic strips—though on their return the newspapers thoughtfully provided an account of what had been happening in this serial world. Even a local television station proclaimed publicly the lesson that was learned: there is no substitute for the daily press.

Detroit's Good Harvest

THE last of the 1962 model cars are now travelling down the assembly lines and the motor capital of the world is waiting for the new models. Detroit has cause for satisfaction this year; it has done well for itself and well for the national economy. At more than the half-way mark 1962 is certain to be second only to the legendary year of 1955, when 7.9 million automobiles were built and 7.2 million sold; this year the comparable figures are likely to be 6.6 million and 6.8 million, including imports. Last year production was more than a million lower. The happiest makers are the General Motors Corporation, the largest, and the second smallest, the American Motors Corporation, which produces only Ramblers, the original compact cars. GM, romping away with more of the market than ever before, may even have done too well to avoid catching the eye of the anti-trust experts. In the first half of the year its sales and profits reached new records and its Chevrolet, leading the field, seems to be headed for a 2-million-car year. GM's gain was at the expense of both Ford's and Chrysler's shares of the market; the latter is struggling desperately to remain one of the "big three."

Perhaps the greatest cause for satisfaction, both in Detroit and Washington, is that big sales have been achieved this year without the excesses which in 1955 had to be paid for in subsequent years. Credit has been used in moderation; production has kept in step with sales so that stocks in dealers' hands have not been swollen. In 1955 6 per cent of all consumer purchases were of motor cars; this year the figure is only 4½ per cent. Forecasters peering anxiously into the future of the 1963 models note with satisfaction that the prices of used cars are high, while those of new cars are slightly lower than they were in the late nineteen-fifties—this gives people an incentive to trade in their old cars for new ones—and that the proportion of multi-car families is continuing to rise.

The new models, on which so much depends, will not be unveiled until the latter part of September, but it is generally agreed that they will be slightly bigger, brassier and more luxurious. It is the medium-priced and medium-sized cars, not the small ones, which have been doing notably well; for the first time in the five years that compacts have been on the market they have not increased their share of it and no new compact models are to be introduced this year. Even those who prefer a small car seem to want it decked out with expensive accessories such as a hi-fi radio. Detroit has been burned before by exaggerating the demand of Americans for ostentation. But this year, if it is wrong, at least it also has plenty of austerity models on tap.



Equal Is As Equal Earns

MATRIARCHS or not, American women are still fighting for equal rights with men even though their country is widely regarded abroad as the land of the Amazons. Sometimes their battle, as in the case of the dozen women who have demanded of a congressional subcommittee the opportunity to become practising astronauts, seems to spring from an envy which Freudians would be quick to name. But more often it is a legitimate protest against the continued existence of outmoded customs of discrimination against the female sex. President Kennedy recognised the rightness of women's struggle, particularly against unfair treatment in matters of wages and career advancement, when he appointed his Commission on the Status of Women last December; with Mrs Roosevelt at its head, the commission will report on what should be done to demolish the prejudices which deny women equal opportunities for achievement. However, many women felt that Mr Kennedy could have supported their cause more vigorously by appointing a woman to his Cabinet, as his recent predecessors had done.

• A practical, although decidedly tentative, step towards raising the feminine status was the recent approval by the House of Representatives of a Bill guaranteeing equal pay for equal work, regardless of sex. While the cautious legislation would apply only to workers in companies which employ more than 25 people and which are engaged in inter-state commerce, it resembles many which have failed to pass the House in the past; its fate in the Senate is still extremely uncertain. The committee considering it discovered that the "equal pay" laws which exist already in 22 of the states are sporadically enforced at best. When the Civil Service Commission, at the President's behest, looked into its own hiring policies for traces of discrimination, it found that of the 15 grades into which government jobs are ranked, women were thought most suitable in only the lowest four; in the top three, men were preferred to fill 94 per cent of the appointments. And while women entered such masculine domains as state governorships and the Senate very shortly after they received the right to vote in 1920, they have not advanced significantly since the Administration of President Roosevelt, who appointed the first female head of a United States mission abroad and the first female member of the Cabinet.

In Congress itself, only two out of 100 Senators and 17 out of 437 Representatives are women; Mrs Green, a Congresswoman from Oregon, recalls that on a trip to Russia she was questioned more often about the discrimination against women in America than about that against Negroes. Geography must bear some of the blame for the dearth of women politicians in Washington; few women could keep homes in both the capital and a constituency hundreds of miles away or shuttle husband and children between the two. Perhaps this explains why more than half of the Congresswomen are widows and why the two able women Senators, Mrs Smith of Maine and Mrs Neuberger of Oregon—last week the first feminine filibusterer (or filibusteress?), sought their office only when seats were left vacant by the deaths of their husbands.

Unionising Wall Street

FROM A CORRESPONDENT IN NEW YORK

THERE are nearly a quarter of a million people in the business of selling securities and they are just beginning to feel the after effects of the precipitous decline on Wall Street. At least two firms have gone into voluntary bankruptcy and in a recent week eight members of the New York Stock Exchange closed branch offices. Others have cut back their staffs, some by as much as 10 per cent. Small brokerage houses, along with concerns which underwrite new issues, have been dealt a particularly severe blow; underwriting has fallen off to a mere trickle. The hardest hit have been the workers in the "back offices," the clerks and bookkeepers who sort out and keep records of the mountains of paper upon which Wall Street depends for its existence. There are upwards of 50,000 such people in the financial district, some of whom receive only about $60 a week for their tedious labour. In better times the low salaries are bolstered by working overtime, by annual bonuses and by the giddy sensation of just being on "The Street" and of being called by one's first name by one's employer.

The latest round of firing has spurred the Office Employees' International Union to send fifteen organisers into New York's financial district and others to Chicago, in a renewed drive to enlist book-keepers, clerks, secretaries and other salaried staff. The union accuses securities firms of "ruthless dismissals" and of working employees during the big selling rush without adequate compensation. It is also worried that the increasing use of computer centres may reduce clerical jobs at brokerage houses by more than half.

The union says that it represents more than 65,000 workers in the shipping, paper, film and insurance industries. Its New York branch, United Financial Employees Local 205, claims 1,000 members, but until recently its fortunes have been at a low ebb. Wall Street's sentiment, as one broker put it, is definitely anti-union. In 1948 the branch called a disastrous strike at the New York Stock Exchange. The Exchange immediately brought people from upstairs offices and from brokerage houses to work on the floor and after 32 days it wrote its own terms. It has taken a long time to forget that strike, but now the president of the parent union claims that the branch is represented in a hundred firms, with sufficient numbers in at least ten concerns to justify it in asking to be allowed to hold an election in an attempt to become the recognised bargaining agent for its employees; it already has contracts with the New York and the American Stock Exchanges and with the New York Cotton Exchange.

Nation Dispossessed

WHERE the Allegheny River crosses from New York State into Pennsylvania yet another dam is going up to control the flow of the water down to the industrial centres round Pittsburgh, to prevent flooding when the river is high and noisome pollution when it is low. As usual the lake which will build up behind the dam will drown good farm land and much-loved homes in south-western New York for which Congress must provide compensation. But this Kinzua dam raises moral as well as economic problems. For the land to be flooded is the most useful 10,000 acres of the 30,000 acres guaranteed in perpetuity to the Seneca Indians by the treaty made with George Washington in 1794.

The Seneca Nation, now with about 1,200 members on this reservation, has carried its fight against the project up to the Supreme Court but there seems no doubt that Congress has power to alienate the land for the purpose of building the dam. It is questioned, however, whether the benefits are sufficient or the dam essential enough to justify the United States in breaking its promise to this small, conquered people. Two-thirds of them live on the land to be flooded; the rest of the reservation is steep hillside or is the site of the non-Indian town of Salamanca. The Senecas have a mystical attachment to their land, fostered by their personal religious cult, which holds the tribe together. Most of the Senecas prefer to spend their lives on the reservation even if they do not farm, as few of them do, and must make daily journeys to their work on construction projects or in the steel mills in neighbouring towns. The land to be flooded is not only the most fertile part of the reservation but also the hunting grounds which are especially precious to the Senecas. No new homesteads, however well chosen, will ever be the same; no compensation, however generous, will make up for the sentimental loss.

The Quaker community in Pennsylvania has befriended the Senecas and is still fighting to prevent what it believes is inexcusable suffering. The contention is that there was, and still is, an alternative and, indeed, more effective method of controlling the Allegheny River which would not touch the Senecas and which would be cheaper. To this the Army Engineers, who have been planning the Kinzua dam since 1928 although Congress was first asked to approve it only during the Eisenhower Administration, reply that the alternative would in fact be more expensive in itself and would flood a larger area of more developed farm land in New York State, so that more people would have to be moved and more compensation paid; the Army also claims that the alternative would not provide the boating and other recreational facilities which are an important part of the Kinzua scheme and that it would be less efficient in other ways. The Quakers are not convinced, although the Senecas themselves seem resigned, and the controversy may be of some importance in this autumn's election campaign in Pennsylvania where Senator Clark, who was largely responsible for getting the Kinzua dam started at last, is defending his seat.

SHORTER NOTES

Tennessee's Democratic primary last week was notable for the nomination, by a substantial margin, of Mr Frank Clement for Governor and for the defeat of two elderly and conservative members of the House of Representatives by young challengers who are pledged to support President Kennedy. In this state the Democratic nomination is usually tantamount to election. Medicare—the President's programme to provide health benefits for the aged under the social security system—was a prime issue in the two congressional races. Both were close and Mr Loser, one of the incumbents, may yet become the winner when absentee ballots are counted.

* * *

The Treasury's effort to tap long-term funds last week had a disappointing reception although investors provided $1.3 billion in new cash, mainly for shorter-term securities, as well as refinancing $7.5 billion of maturing debt. Subscriptions to the 4¼ per cent 30-year bond totalled only $316 million; up to $750 million would have been accepted. The Treasury is now convinced that there is simply not much long-term money available for investment in government securities.

LETTERS

Convertibility

SIR—In reading the interesting report in *The Economist* for July 28th, on the confrontation of your correspondent with "Bankers of Moscow," I found myself quoted by Professor N. N. Lyubimov as having stated that western Europe's own convertibility is "fragile." He seems not to have mentioned when and where I would have said this so I am at a loss to know what he referred to. It could be that in arguing last year in favour of the Fund's borrowing arrangement and the taking of other measures to defend convertibility I warned people that if such measures were *not* taken the system of convertible currencies might be impaired by possible large movements of funds from one country to another.

As you know by now, a whole series of measures have been taken which in my opinion will prove very effective as a means of maintaining the strength of our monetary structure. I believe I was for several years one of the most persistent proponents of a return to convertibility; and I think that we have been building, and are continuing to build in the western world, a monetary system capable of meeting well the needs of our time.—Yours faithfully,

PER JACOBSSON
Managing Director,
International Monetary Fund

Washington, DC

Aid for Whom?

SIR—The claim made by the western world, and by the United States in particular, that all financial aid is given without any strings but solely for the benefit of the underdeveloped countries, crumbles down with the American withdrawal of previously-promised aid to Peru.

One would have applauded this action of opposing military dictatorship to democratic rule but for the fact that the Americans have given huge financial and military aid to many dictatorships for years—I should say decades. Among these are Portugal and Spain (the oldest dictatorships thriving on the support of the western world), Turkey, Pakistan, South Korea, South Vietnam, etc., all of which at one time or other have had military dictatorships, and have been thriving on huge endowments from the democratic countries of the West.

The question that now arises in the minds of the non-committed world is: On what criterion or principles does the US grant aid? Does it ask for democratic institutions, as it practices and preaches, in the aid-receiving nations; or is aid given or withdrawn at the pleasure of every administration, each of which looks differently at political upheavals in those countries?

And talking about democracy, the US, which claims to be an example of true democracy, has some very odd irregularities in its political set-up which require a whitewash soon. A few very notable examples are: (a) Millions of Negroes are deprived of their voting rights, just because by law they are unable to exert their rights. (b) The number of voters represented by each Congressman varies from a few hundreds to a few millions; and those few hundreds can easily stop legislation that is desired by the millions.

What a mockery of democracy?—Yours faithfully,

J. U. DOSHI

Nairobi

Zanzibar and India

SIR—Because of soil, climate and location, Zanzibar's economy depends almost entirely on a single export crop—cloves. On a visit there earlier this year, it was apparent that the recent restrictions by India on clove imports were gravely affecting the economy and well-being of the entire population. India for many years was the second largest market for cloves, taking an average of 3,000 tons a year. Import restrictions and duty have reduced this figure to 700 tons. In effect, cloves are now a luxury in India; the import duty stands at the astronomical level of 341 per cent.

While India continues to treat a small undeveloped territory in this manner, its finance minister, Mr Morarji Desai, is at the same time raising objections to Britain's entry into the common market; he has been reported as saying that British proposals for safeguarding Indian exports (after Britain joins the common market) are quite inadequate.

There are no restrictions whatever on the import of Indian goods into Zanzibar, and it is not unreasonable for Zanzibar to expect the same trading facilities with India. The arguments put forward by the government of India completely fail to justify such a prohibitive rate of import duty.

I would like to see India's interests safeguarded if Britain enters the common market, but it is also my hope that India will treat Zanzibar in the same way as India itself asks to be treated by the more industrialised countries. This could be given effect immediately by removing the restrictions on the import of Zanzibar's export crop and by reducing import duty to a level which will enable consumer demand to return to normal.—Yours faithfully,

London, W1 ALICE MOORHOUSE

Rail and Road

SIR—If you consider all that you have written on the subject of making the railways pay you will, I think, have to admit that it is conditioned far too much by the Londoner's point of view. The Londoner is provided with a reasonable train service to almost anywhere in the country; not so someone who lives in a benighted spot like Cambridge. To do a day's work in almost anywhere except London means taking a car, and wasting not merely imported petrol but that even more valuable commodity time, which must be spent in driving instead of in working peacefully, undisturbed by telephones, in the train.

Although you perpetually call for reality in railway expenditure, when snow and ice disrupted London transport for a few days last winter you promptly demanded that British Railways should spend large capital sums to avoid this sort of thing, which happens only occasionally. This is not logical.

What are the real economics of an efficiently run railway service when account is taken of the £500,000,000 a year which it is estimated that road casualties cost the country; when the estimate made by a well known firm of management experts is taken into account that the railways are overstaffed to the extent of 150,000 men; when the question is raised as to why tickets must be sold at stations, and then checked on the train (this does not happen on buses); when. . . .?

I use the transport which seems best for the job; a car for probably 8,000 miles a year, railways for about the same distance, 2,000 miles by bicycle and perhaps a thousand by bus; and then of course a few thousand by aeroplane most years. I am certain that given a reliable and reasonably fast cross-country network of trains my car mileage would drop sharply and my rail mileage would increase by the same amount to the financial benefit of the country. Sir, let us have some straight calculations and not emotional statements about making the railways pay.—Yours faithfully,

D. B. WELBOURN

Selwyn College, Cambridge

* * *

SIR—Mr John S. Flemming, in your issue of August 4th, conjures out of the blue vast concealed subsidies to the motorist.

In the present financial year road users in total will be paying £752 million in taxes levied specially on them. The amount voted to be spent on roads this year is £152 million, so that the Exchequer will be receiving about £600 million more than it will be paying out. Private motorists will be paying about £400 million of the taxes, thus they alone will be paying more than 2½ times what will be spent on the roads.

Your correspondent also refers to the "colossal waste" of land he alleges road building involves. Professor Colin Clark, director of the University of Oxford Agricultural Economics Research Institute, has criticised on several occasions the reluctance attached to the use of land for road development, since it provides a high economic return when used for this purpose.—Yours faithfully,

M. FRANCIS

London, W1 British Road Federation

BOOKS

Under Human Management

World Order and New States
By Peter Calvocoressi.
Chatto & Windus for the Institute for Strategic Studies. 121 pages. 12s. 6d.

Independence and After
By Richard Harris.
Oxford University Press for the Institute of Race Relations. 69 pages. 7s. 6d.

GREAT changes in world affairs, swift and cataclysmic though they may be, take time to sink in. A lot of unfamiliar detail appears on the world map and is taken in with words of goodwill or philosophic resignation, but when some predictable, possibly minor happening touches us in a sensitive spot we glare about us indignantly, demanding to know who has shifted the furniture while we were out at dinner. Attempts to chart the process of change while it is still happening are necessarily unscientific, and indeed inconclusive, but they can help us not to be taken unawares so much; they can even prepare us to cope better with what will come next. Each of these two studies is of great value in that way.

The east-west conflict looms so large in the foreground of strategic thinking that an effort is needed to look behind it at the problems of international security that arise in and among the (now almost innumerable) minor states. Mr Calvocoressi, assisted by a study group of the Institute for Strategic Studies, looks at the security vacuum which now prevails over large areas of the world and which the vast armouries of the great powers are prevented, by a trend of world feeling as well as by the great powers' own dissensions, from filling. The leaders of the new, liberated, under-developed, or uncommitted states would probably deny with vehemence that any vacuum existed at all. But it does—and not, as it used to be assumed in the West not so long ago, because there are too many neutrals. One of the points made in Mr Calvocoressi's book is that if there were more neutrals—politically stable neutrals, that is, with useful armies and some capacity for helping others, like, say, India or Sweden—it would be easier to mount a collective policing operation when it was needed. Peace, as he points out, is not a beautiful abstraction like virtue, but a state of affairs, "subject to human management."

If the great powers, or the old imperial powers, can no longer police the world, they can still do something to limit the instability and disorder that go with the emergence of so many new states which are weak, poor, often not very cohesive, and almost inevitably discontented with their lot. They cannot line the new states up at their side in their own mighty conflict. They cannot prevent revolution. But they can, by giving economic and technical aid, save the new states from hopelessness and help them to evolve, with or without revolution, to something better than the almost intolerable state of affairs most of them confront when they first snatch independence or get it thrust into their hands. Mr Calvocoressi's book is a political study, not a military one, but he does look briefly at the need of most of the new states for technical aid in military and police matters; subjects not as attractive as hydro-electric stations or irrigation schemes, and less thought about, but not less important to the new state's chances of not becoming a nuisance.

If the great powers are to turn to peaceful forms of help, there is a need for something else to discharge their police function, which has become more necessary than ever just when they have had to drop it. Chapter 4 of "World Order and New States" is a useful analysis of the conditions in which the United Nations has to work, and of its record in the various types of intervention it has gone in for from Greece, 1946, to the Congo, 1960. It is the more useful because it is done coolly, without the waves of emotion that come over many of us when we see the United Nations putting its oar in in places where the once imperial powers can act no longer. A case emerges for preparing the United Nations better to intervene on the occasions when it can and must —occasions which are obviously going to recur. Mr Calvocoressi concludes that a permanent United Nations force is still, at this time, neither desirable nor practicable; but a good deal could be done short of that, perhaps in codifying the rules of intervention, and certainly in preparing the administrative basis. A valuable book, this would have benefited by an index and by more thorough proof-correcting.

Mr Harris's brilliant short book covers the political part of this ground—what actually happens in the new states, and what can reasonably be expected to happen—with quite remarkable lucidity and penetration. Western countries—even, and in a way especially, those with a long history of experience and involvement in the countries that are newly independent—are handicapped by many preconceptions in their efforts to discern what goes on. Some of the preconceptions are wrong, and quite basic; thus we talk and think in regional categories (like south-east Asia, and the Middle East) which were invented by wartime strategists for military convenience, but are unfortunately quite imaginary as geographical or geopolitical unities.

Not unnaturally we fear change, and when change in one country or another takes forms defiant of or hostile to the West, we are too ready to identify the hostility with communist influence. Revolution of some kind is, in many of these countries, unavoidable sooner or later, from causes inherent in the country itself. It does not follow that these indigenous revolutions will lead on to communism. But we fog our judgment with theories of subversion from outside, which lead us to panicky conclusions, like the "ninepin theory" which holds that a communist success in Laos or Vietnam will necessarily be followed by a chain of communist successes stretching down to the Timor Sea, or that to tolerate Dr Castro in Cuba makes Brazil a dead duck. Mr Harris has packed so much fresh thought into a small space that it cannot easily be summarised; this is a necessary piece of reading, and unfortunately an elegant and enjoyable one.

Novelist and Penologist

Dickens and Crime
By Philip Collins.
Macmillan, for Institute of Criminology, Cambridge University. 384 pages. 35s.

THE purpose of this book, written by the warden of a college at Leicester, is to introduce Dickensians to criminologists and criminologists to Dickensians, with an incidental hope that some general readers will join the party. It is clearly the product of enormous industry and very wide reading. It is crammed with quotations, and the acknowledgments (808 in number) run to 36 pages of small print. We are told what Dr Acton, "the acknowledged authority of his age on prostitution," thought about seduction. We learn what Mr Clay said about what Dickens had previously said about Mr Clay; and we are told that it is doubtful whether Dickens was or was not laughing at Mr Clay when he said it. This important point cannot be cleared up, because Dickens's letters to Mr Clay have unfortunately been lost.

With other letter writers we have more luck, and we know what Kingsley, in a letter to Sir Henry Taylor, said about Dickens; and what "the immortal Adshead" said in 1845 about what Dickens had said about American prisons in 1842.

It is natural that Dickens, whose stock-in-trade was melodrama, should be interested in crime, but the treatment of crimes in his novels is often fantastic. For example: when Bill Sikes, after the murder of Nancy, is on the run, he is attacked violently by Charley Bates. Sikes gets the boy down, kneels on his throat and shouts to the others in the room: "Open the door of some place where I can lock this screeching hell-babe." One would think that no one who made a burglar-homicide talk like that could have known anything about the real article. But Dickens, in fact, knew a great deal both about crime and about prisons,

and his opinions were usually sound. He was a leading opponent of the "separate" system under which men were kept in solitary confinement with no companion but a copy of the Holy Bible. He supported the useful "ragged schools" and with the help of Miss Burdett-Coutts (who also put the Cancer Hospital on to its feet) he virtually ran a home for fallen women and delinquent girls. All thoroughly practical and creditable work.

But sometimes even in his cooler moments, even when the novelist had given way to the penologist, Dickens could, despite all his knowledge and experience, be extraordinarily wild. In a private letter he described a solitary confinement cell in Pittsburg which he had just visited:—

> A horrible thought occurred to me. What if ghosts be one of the terrors of the gaols? . . . Imagine a prisoner covering up his head in the bedclothes and looking out with a ghastly dread of some inexplicable silent figure that always sits upon his bed. . . . The more I think of it the more certain I feel that not a few of these men . . . are nightly visited by spectres. I did ask one man if he dreamed much. He gave me a most extraordinary look, and said—under his breath—No.

As evidence in favour of prison ghosts that does not seem conclusive.

The real interest of this book is, in fact, the character of Dickens, and it may be doubted whether its contribution to criminology, past or present, will be material. Dr Radzinowicz blesses the book in his introduction. But is Dickens, the penologist, important enough to justify all the work that has gone to the making of it?

And how one would have welcomed a little light relief.

Italy's Depressed Area

The Men at the Gate
By Ottiero Ottieri.
Gollancz. 173 pages. 21s.

The Awakening of Southern Italy
By Margaret Carlyle.
Oxford University Press. 155 pages. 21s.

MOST of the northerners responsible for uniting Italy a hundred years ago were appallingly ignorant of conditions in the south. Few of them ever went there and they tended to assume it was as rich and fertile as it was beautiful. If they had realised the truth they might have felt differently about a united Italy. Today there is no longer ignorance, and no illusions either. And as the north forges ahead, the contrast between its growing material prosperity and the painfully slow improvement in the south is bound to prick the educated northern conscience with increasing sharpness and persistence.

Few Italians are likely to contribute to this conscience-pricking with more devastating effect than Dr Ottiero Ottieri. He is an industrial psychologist, who was sent to the new factory opened by Olivetti near Naples as personnel officer. In this book he describes his experiences, disguising only the names of places and people. The story is presented in a deceptively casual diary form. But Dr Ottieri is a novelist as well as an industrial psychologist. He marshals and presents the many complicated strands of his experience with great skill; he uses words with economy, without rhetoric, without any easy superficial appeals to one's emotions; the impact he achieves is anything but casual.

There are some 40,000 applicants for the jobs that may fall vacant and the new ones that will be created if and when the factory expands. Only a few hundreds of the applicants can be accepted. To choose this tiny proportion Dr Ottieri makes use of all the latest intelligence tests, of personal interviews, of his own intuition. He is faced all the time with an overwhelming and desperate desire for work—any work, even, as so many plead, cleaning out the lavatories. "The men at the gate" are the really desperate ones who because of their own nature, or their past history, or their family circumstances, simply cannot become reconciled to not getting a job. They hang about the factory gates, try to throw themselves under the manager's or Dr Ottieri's car, and even on one occasion set off a home-made bomb.

One is almost tempted to feel that the factory has created more misery than employment. This would be unfair. The factory is a worthwhile pioneering contribution to an immense problem; and it has demonstrated conclusively that the southerner, given a fair chance, can hold his own with any northerner at the workbench or the production line.

Miss Carlyle's book is on a different scale. Instead of pinpointing the plight of some southerners in one small area, she gives a broad survey of the whole of southern Italy including Sicily and Sardinia. Her first three chapters discuss the economic and social problems of the whole area in general terms and describe the development policies that successive Italian governments have followed since the war. The following chapters deal in more detail with the local problems of each region.

The book is the fruit of wide reading and extensive travelling. It makes a fair and judicious appraisal of what has been achieved, which is considerable, and what still remains to be done, which is immense. It would be better if written in a more sophisticated style and if it did not sometimes indulge in rather tiresome exhortations to the authorities to do this or that. But it is a serious, sympathetic and welcome attempt to provide for English readers some account of an aspect of Italy of which most of them know very little.

choice of writers is made with a view to throwing light on his character. In the collection now published by Lawrence's brother, twenty-three of the thirty-eight correspondents are themselves well-known authors or artists, and most are writing (always with enthusiasm and often with the pained enthusiasm Lawrence sought to stir) about "The Seven Pillars" and "The Mint." The collection is therefore illuminating chiefly to those interested in Lawrence's contribution to English literature. Yet the illumination is scanty because the beam is usually thrown backwards; for instance, a wonderful piece of criticism of style by E. M. Forster (who tackles the over-richness that "imparts not colour but gumminess" when Lawrence stops portraying action and starts communicating thought) reveals far more about how Forster puts words to work than about the Lawrence enigma.

Something is added, however, to the portrait already drawn by contemporaries in "T. E. Lawrence by his Friends," published in 1937. For those many superimposed sketches were obituary notices, whereas these letters (some of them by the same writers) are part of the give and take of friendship, written while there was a chance of riposte, or of causing a change of course. The newest lines etched into the likeness are those added when writers start upbraiding Lawrence for scotching his genius. "Why should you be broken twice on the wheel? Surely not because you were broken once." (H. M. Tomlinson.) "Nor can I imagine that your great endowments of mind derive any benefit from such occupation? unless it be a case of 'lying fallow' after excessive cropping." (Lord Stamfordham.) "All I want to make clear to you is that you are less lonely than you think . . ." and so on. The portrait gains in depth when to such comments are added the letters which show the trouble Lawrence caused to busy departments by playing hide and seek as Ross and Shaw instead of tidying himself away in some Vaslima or on Mount Athos. For these fragments re-emphasize the contrariness, the inverted showmanship and the disregard for embarrassment to others that are part of Lawrence's character. Yet, say these letters from men of substance, all these drawbacks are overlaid by the joy, veneration and love that Lawrence evoked in people he thought worth while. "Since you're doing nothing, why not come to Spain with me tomorrow?" (Augustus John.) "You and I are worse than characters. We are character-actors." (Bernard Shaw.)

Only at two points does the collection contribute to the history of British policy in the Middle East. One letter from Gertrude Bell, written in 1920, gives Ibn Saud a rating that later events justified, and a series of letters about the incident at a private audience with George V, when Lawrence refused a decoration, clears up a number of garbled stories; it also links the incident with the best piece of service that Lawrence ever did his country—acceptance of the call to the Colonial Office in 1921, and the influence he there exercised on Winston Churchill.

The book is an indispensable addition to any library that contains the volume of Lawrence's outgoing letters edited by David Garnett in 1938; Professor Lawrence's excellent editing mates the two. But the new collection does not provide evidence enough to correct, as Professor Lawrence would like to correct, oversimplifications and misrepresentations of his brother's character by publicists. This drawback started with Lowell Thomas's romantic lectures on the desert campaign, given in 1919; from that monster piece of pandering to a public sickened by trenches and mud, and starved of tales of glory, the Lawrence-image has not recovered yet, and probably never will.

As It Is Written

Roget's Thesaurus of English Words and Phrases *New edition revised and modernised by Robert A. Dutch.*

Longmans. 1,362 pages. 30s.

Current English Usage: *A concise dictionary.*

By Frederick T. Wood.

Macmillan. 280 pages. 15s.

Unscramble

By John Usborne.

Hutchinson Educational (1961). 111 pages. 4s. 6d.

HUNDREDS of examiners will now be lamenting the present state of national literacy, as revealed by scripts in the GCE examinations. Two of these books are specifically directed at improving it. Mr Usborne, who teaches at St Paul's School, has provided a set of ingenious exercises to help people to write clearly and, thereby, to think clearly. He begins with the structure of the sentence; then he reproduces a series of passages from various authors and journals with the lines transposed, which the reader has to unscramble; lastly, he sets some quite difficult exercises of S-level "Use of English" standard, designed to test the reader's ability to write a composition from given facts and figures, and so on.

Mr Wood describes the aim of his book as "to provide an easy work of reference for those who wish to write good English." He covers tricky points of syntax, explains the difference between defining and non-defining clauses (hence, when "that" should be used instead of "which" and when a relative clause should be preceded by a comma), and draws attention to misuses and abuses of expressions and words and to mis-spellings, mispronunciations and to "vogue words." The right use of "due to," the difference between "practicable" and "practical" and a guide to hyphens are examples of the points covered. In the true tradition of writers on English usage, Mr Wood allows sentences to end with prepositions and, equally sensibly, infinitives to be split when the sense or shape of the sentence demands it.

Mr Wood's book is called a dictionary because it is arranged alphabetically. A thesaurus, says Mr Dutch in his preface to the new edition of Roget (first published a hundred and ten years ago) is complementary to a dictionary:

> it generalises, where a dictionary particularises. Both a dictionary and a thesaurus take a census of the word-population. The dictionary . . . corresponds to the enumeration. A thesaurus more nearly resembles the final reports, where the population is massed in groups . . . and general conclusions are drawn regarding the state of the nation.

Although this new edition has 50,000 new entries, mainly old words in new places—"our ideas outrun our stock of words, and to express them we must turn over our vocabulary again and again"—Mr Dutch has not had to alter Roget's original groups, based on the philosophical categories popular in his time (abstract relations, space, matter, intellect, volition, affections). The biggest change in the arrangement of this edition is that words under contrasted heads (e.g. cause, effect) are no longer set in opposite columns, but follow each other, partly to save space.

Inflation, naturally enough, appears in this edition in several contexts, including the one with which readers of *The Economist* are familiar (though unfortunately the index reference to this head is wrongly numbered), and is then followed by disinflation and deflation, but not reflation. Had this concept entirely fallen into disuse when Mr Dutch and his helpers were making their compilation? Or did he think the word would have fallen under Roget's own ban:

> Some modern writers . . . have indulged in a habit of arbitrarily fabricating new words and a new-fangled phraseology without any necessity, and with manifest injury to the purity of the language. This vicious practice . . . implies an ignorance or neglect of the riches in which the English language already abounds, and which would have supplied them with words of recognised legitimacy, conveying precisely the same meaning as those they so recklessly coin in the illegal mint of their own fancy.

Roget's introduction, from which this quotation comes, is itself a thesaurus of wise saws on the use of language, and the publishers deserve thanks for bringing his great work up to date and at such a reasonable price.

Prewar Lincoln

Prelude to Greatness: Lincoln in the 1850's

By Don E. Fehrenbacher.

Stanford University Press. London: *Oxford University Press.* 306 pages. 38s.

EVEN before the centenary of the Civil War casts its shadowless glare across the conflict, the disposition was strong among historians of the great American divide to write about it in "revisionist" terms—to argue that it was all a tragic mistake for which both sides were to blame. One embarrassing consequence of this "with malice toward none; with charity toward all" approach was that while it endorsed the Lincoln of the Second Inaugural it implicitly criticised the Lincoln of Gettysburg, explicitly blamed the Lincoln of Fort Sumter and reduced the Lincoln who won the Presidency in 1860 to the level of a "mere" politician. It questioned the whole wisdom of his anti-slavery stand, made him conservative in social and economic as well as in constitutional terms, and attributed his rise to a blend of political opportunism and happy accident.

It is against this interpretation of Lincoln that Mr Fehrenbacher has directed his extremely well aimed book. In half a dozen commendably economical chapters of analysis and reassessment he has gone over the familiar story of Lincoln's rise from Illinois attorney to national President and shown that his progress was consistent with his own professions and the needs and forces of the age. He peels off the layers of legend and misinterpretation from Herndon down to Luthin and presents a Lincoln who is intelligible and commendable, a figure who, if not yet great, has all the seeds of greatness in him. There is not a word of rhetoric; there is an equally welcome absence of cynical smart-aleckism.

Mr Fehrenbacher's book is written against the background of a long tradition of Lincoln scholarship and, for its full appreciation, requires some previous acquaintance with the major interpretations that have been advanced by scholars like Beveridge, Randall and Nevins. Nevertheless his own assessment is so clearly set out, the points of conflict and contrast so fairly and simply delineated that even the non-specialist could read this account with profit. Anyone who does so will feel bound to recognise in Mr Fehrenbacher a Lincoln scholar of real eminence—and may also discover with surprise how much that is fresh and important can still be unearthed in this heavily worked field by a scholar of learning and acumen.

Critics' Anthology

The Poets and Their Critics: *From Blake to Browning. Vol. II.*

Edited by Hugh Sykes Davies.

Hutchinson. 351 pages. 21s.

IT was Alfred de Musset who said that all critics ought to be crucified. The same sentiment must have animated many poets. But what would undergraduates and sixthformers do without commentators on literature? Appreciation, evaluation—these are expected by pedagogues, sometimes at too early a stage; for the light of nature, however bright, is unreliable unless reinforced by quite extensive reading. Mr Sykes Davies is an experienced pedagogue and a witty one, who introduces with a few comments of his own each selection of critical comments on individual Romantic and Victorian poets. This volume is a sequel to one covering the field from Chaucer to Collins, and it is primarily a handbook. In its present form it is too expensive for students, who would be its chief beneficiaries; but as an anthology it will certainly afford pleasure to anyone who enjoys comparing his own impressions with what other people have said about yet other people. It is salutary, too, to be reminded how difficult it has always been to assess the worth of contemporary poetry, and how strongly personal prejudices underlie literary judgments.

Local Democracy

Who Governs?

By Robert A. Dahl.

Yale University Press. 367 pages. 60s.

THE wary reader, at the first sight of this 300-page tome, will appreciate that there is no simple answer to the question: who governs New Haven? This elaborate and cautious study by the chairman of the Political Science Department at Yale University finds that political power is widely, if unevenly, diffused. The city is not in the pocket of the Olin Mathieson Company, or the banks, or the trade unions. On some issues, such as the urban redevelopment for which New Haven is famous, businessmen are particularly interested and influential; where the schools are concerned other groups call the tune. One after another is picked up, shaken, and turned inside out: social and economic notables, ethnic groups such as the Italians, Irish and Negroes, political leaders and sub-leaders and so on. There are chapters on the influence of money, of the press, and on patronage.

The microscopic study of the sources and exercise of political power in cities is becoming extremely fashionable at American universities where graduate students are available—and encouraged—to add their bricks to the projects; some of the most interesting vignettes in Professor Dahl's book come from unpublished student papers. A long list of such studies has been undertaken at the Harvard Centre for Urban Studies and there is no doubt that they constitute very valuable case studies of democracy in action. New Haven, it might be thought, would be an exceptionally interesting guinea-pig with its brilliant Mayor, Mr Lee, its polyglot population, its built-in conflict between town and gown and its striking redevelopment programme. In fact, whether because New Haven is not really very exciting compared with, say, Boston, or because of Professor Dahl's determination to leave no stone unturned and his understandable reluctance not to deal too sharply with living people, the result is not very incisive or very stirring. But it represents a monumental amount of investigation into the workings of democracy among people who are by and large not interested in local politics, and for political scientists it is probably required reading.

North American Monument

The St Lawrence Waterway

By William R. Willoughby.

The University of Wisconsin Press. 396 pages. $6.00.

IT is well known that fantastic engineering difficulties had to be overcome in the construction of the St Lawrence Seaway. That even more baffling political and diplomatic difficulties were involved is not so generally recognised. The history of these less palpable but socially even more significant problems is of great interest to anyone concerned not only with the United States and Canada but also with international relations in general or with problems of river basin development. Professor Willoughby's admirable and comprehensive study combines thorough and wide-ranging scholarship with a most readable style. He gives his complicated and controversial subject lucid and well-balanced treatment, with due attention to the point of view and policy of both the nations concerned and of the many conflicting interests whose rivalries provide a classic example of pressure politics.

The story reaches back nearly three hundred years to the first projects for man-made improvements on the great river. It concerns the whole scope of geopolitics of North American development: the struggle of the rival gateways to the continent; the significance of the St Lawrence waterway in relation to the total transportation problem; the clash of waterway with waterway; of railroad and harbour with lake carrier and ocean shipping; of coal with hydro-electric power; of private utilities with public power projects; and of the mid-western heartland with seaboard communities. Developing the waterway involved competing and complementary uses for the waters of the Great Lakes-St Lawrence system. The demands of navigation, power development, sewage disposal, scenery (especially at Niagara Falls) and recreation have been interlocked with the political, economic and engineering strategy of piecemeal, as contrasted with comprehensive, development of the waters of the Great Lakes and the St Lawrence, and with the maintenance of lake water levels and diversion of water from the Great Lakes to the Mississippi and to the Great Lakes from Canadian rivers that flow "down north" to Hudson Bay.

The deep waterway required high policy decisions by two national governments, two provincial governments and a state government, to say nothing of a number of governmental agencies on both sides of the border, as well as the pioneering International Joint Commission set up under the Boundary Waters Treaty of 1909. This important book gives perspective and coherence to a

mass of diverse detail. It throws new light on the significance of an achievement which, astonishingly, emerged after the long-drawn embittered struggle as a great feat of international co-operation—a monument to the friendship of Canada and the United States.

Naval Epilogue

The History of United States Naval Operations in World War II: *Vol. XV, Supplement and General Index.*

By Samuel Eliot Morison.
Oxford University Press. 393 pages. 52s. 6d.

PROFESSOR MORISON now sets his final seal on the great work which he undertook with President Roosevelt's warm support almost exactly twenty years ago. In the first part of this volume the historian deals with the surrender of the large Japanese garrisons which had been cut off and reduced to impotence by Allied sea power, with the occupation of Japan, and with the repatriation of the thousands of prisoners who had been languishing in appalling conditions for more than three years. If these pages would, perhaps, have been better placed at the end of the preceding volume, they do provide the necessary epilogue to the story which Professor Morison has told with such force and brilliance. Then comes a large and copiously illustrated section in which American warships of all types that took part in the conflict are catalogued with their principal characteristics. Since the reference books on the Allied fleets issued during and soon after the war were very incomplete, this section will be welcome to students. The third part consists of 27 pages of "all important errata that so far have been detected" in the earlier volumes, and in the final part the reader is provided with a general index to the whole series. If the book is therefore more useful for reference purposes than it is distinguished as a work of literature, it is a valuable addition to a remarkable history. Professor Morison can now lay down his pen in the knowledge that he has left nothing undone to give his work enduring value.

OTHER BOOKS

PREDICHE INUTILI. By Luigi Einaudi. *Einaudi.* 431 pages. 3,000 lire.

This latest volume of the collected works of the late Luigi Einaudi gathers together a series of essays originally published between 1955 and 1959. Ranging widely over educational as well as political and economic topics, they are characteristic not only of the author's involvement in current Italian issues but also of his deep attachment to liberal values. His comments on the Vanoni Plan, for instance, remain of permanent interest both as an acute study of the plan itself and of the general problem of planning in a free society.

THE CITIES OF BABYLONIA. By C. J. Gadd. Vol. I., chapter xiii. 60 pages. 6s. $1.25. CHRONOLOGY: Egypt; Western Asia; Aegean Bronze Age. By W. C. Hayes, M. B. Rowton and F. H. Stubbings. Vol. I., chapter vi. 85 pages. 10s. 6d. $2.25. ANATOLIA, c. 4000-2300 BC. By J. Mellaart. Vol. I, chapter xvii, 53 pages. 6s. $1.25. *Cambridge University Press.* Three fascicles of the revised edition of Volumes I and II of the Cambridge Ancient History.

DIPLOMACY IN EVOLUTION: 30th Conchiching Conference. Edited by D. L. B. Hamlin. *Toronto University Press.* London: *Oxford University Press.* 136 pages. 16s.

A LETTER TO A YOUNG PAINTER. By Herbert Read. *Thames and Hudson.* 279 pages. 18s.

In the first, hitherto unpublished, essay in this book, which gives it its title, Sir Herbert Read assembles some of his theories about painting and sculpture. Works of art, he believes, must be sensuous—if not they are mere illustrations. The image made by an artist must have more power than the thing it represents and to accomplish this an artist should, before he starts his work, first perfect his alphabet of signs and work out his formal elements; in short, the form should not grow on the canvas, but in the mind.

Other essays in this book are drawn from Sir Herbert Read's various writings and lectures.

MACRO-ECONOMICS. By F. S. Brooman. *Allen and Unwin.* 256 pages. 35s. clothbound. 21s. paperbound.

A competent orthodox textbook for second-year students. The references to the literature are up to date and some empirical material is brought in here and there. Since most competing textbooks are American, this one qualifies as an "import saving" innovation.

Correction: In our review of "Advertising in Action," by R. Harris and A. Selden, which appeared in our issue of July 21st, it was stated that the number of case studies given in a previous book "Advertising in a Free Society" by the same authors was 60. This should have been 16.

Anglia's Joice

HOME REPORT

Members of the editorial staff and local correspondents report on life and happenings in and around Britain

The Regional Screen

FROM A CORRESPONDENT IN NORWICH

"WE note," the Pilkington committee said of Independent Television, "that the decentralised structure has not resulted in an essentially regional or local service." Few East Anglian viewers would claim to have read the Pilkington report right through. But fewer still would admit to not knowing Dick Joice, who has risen to be something of a local Cliff Michelmore in the *About Anglia* magazine programme that follows the six o'clock news. According to its TAM ratings, this is just about the most popular daily news magazine in British television. Dick Joice is a west Norfolk farmer who was originally engaged to run a weekly farming programme, and had never seen the inside of a studio before Anglia TV came on the scene. Now he is pretty much the face of commercial television for the 2 million viewers in the Anglia region.

Anglia's scattered franchise might be better described as a licence to mint half-crowns than one to print fivers; the company has to cover 10,000 square miles, chiefly of farming country (there is no large conurbation at all), which puts up operating costs for a service that tries harder than most (Pilkingtonians may retort that very few do try at all) to be truly regional and not just a transmitting station for the network. Anglia began in 1959 by spending £500,000 on converting the former Agricultural Hall in Norwich into a studio, surrounded by a honeycomb of administrative and technical offices. But as the service has developed Anglia has laid increasingly greater emphasis on taking its cameras outside, where it believes the greatest potentialities of television lie. To cover the enthronement of a new Bishop of Norwich in his Norman cathedral Anglia pretty well emptied its studios of equipment and transferred itself to the cathedral to follow the whole service.

The Anglia image is not exactly that of unregenerate commercialism. The *Guardian* is the biggest shareholder, but 55 per cent of the capital is local. Five of the ten directors, including the chairman, are local men with landed, commercial or newspaper interests in East Anglia—and two of the others are representatives of Cambridge University. The directors set out from the start to provide a distinctively regional service; generally, although Pilkington ignored their record, they have been prepared to play up and not down to the East Anglian audience.

The result of this policy is that in less than three years Anglia can claim to have persuaded plenty of viewers to turn to their local television service as habitually as to their evening papers for the day's news—which may mean seaside beauty queens or champions at agricultural shows. In their not infrequent local controversies East Anglian towns and districts have come to accept it as a matter of course (even of right) that the parties to the dispute should be brought in front of the cameras to argue it out in public. Anglia televises Cambridge Union debates and it has its string of dons. The dons, for instance, will play an important part in a forthcoming series called "Once a Kingdom," designed to put the provincial pride of East Anglia on a basis of historical and geographical fact.

By and large, Anglia originates between eight and nine hours' television a week. It has also succeeded (where some other regional companies have either failed or not tried sufficiently hard) to make a significant contribution to the national network. Thus, 14 of the 16 plays it has produced for the "Play of the Week" series have been placed by TAM in the magic circle of the Top Ten programmes. But its biggest impact on national and, indeed, international audiences has been made with the *Survival* programmes. It was appreciated from the beginning that the nature reserves of East Anglia could be a rich televisual field if properly used; Anglia's success has given it wider ambitions—including filming the rescue of the white rhinoceros from extinction.

IN October, 1959, the BBC won, by a short head, the race with Anglia to be the first to get a local television service into operation in East Anglia. This is based on a small studio which makes ingenious use of film, and gets occasional help from outside television units from Birmingham. It has been broadcasting daily news programmes, weekly farming programmes and fortnightly or monthly feature programmes, all of which have set themselves high standards of quality; now it is about to expand into twenty minutes daily of news and views.

But, as a competitor in local television, the BBC seems rather painfully handicapped by lack of means. Some of its people would have been just as grateful as Anglia if the Pilkington report had spoken more highly and more urgently of regional broadcasting: for the BBC in East Anglia may be a favoured outpost, but it is still only a colony of the great Midland region that extends to the border of Wales. The local BBC staff would be remarkably out of touch with their viewers if they did not, indeed, feel very vigorously that the technical and administrative link between Norwich and Birmingham is somehow less than natural.

BBC outpost

Financially, however, Anglia TV itself has troubles on the horizon. In 1960 its profit (before taxation and reserves) was 24 per cent of its gross trading income, and in 1961 it was 25 per cent. But the estimate for this year is 16 per cent, and the forecast for next year is 11 per cent. This is not because advertising revenue is falling off, but because the service is expanding and the cost of producing programmes is rising—and the forecast does not take account of the formidable prospective expense of 625-line and colour transmission or of more competition from a second commercial channel.

A company of Anglia's size has most to fear from swingeing action against profits. The rumour of a 10 per cent tax on revenue has led to forebodings that the work that would be maimed would be the most valuable—the original and local work. Your correspondent asked Mr Aubrey Buxton, the director responsible for *Survival*, what would be the first to go. "*Survival*," he said. "would not survive. Neither would our plays. We should hardly contribute to the network. Nor should we be able to expand our local service. If the worst came to the worst we should have to cut it down, and reduce ourselves to people giving little talks in the studio. That would be economical, but it would not be regional television."

Irish Ether

FROM A CORRESPONDENT IN BELFAST

BEFORE the opening of Telefis Eireann (Irish Television) in Dublin last January viewers in the eastern parts of the Republic of Ireland were enjoying both BBC and Ulster Television programmes free of charge. ITV programmes from Belfast were received with remarkable clarity as far south as Greystones in County Wicklow, thirty miles below Dublin. Dublin viewers found it easy to get BBC programmes from across the Irish Sea. Some of the more conscientious Irish viewers even wanted to pay a licence fee to the BBC (or so the story goes) but this generous offer was refused.

Now, with Telefis Eireann in full operation, programmes are being beamed the other way—from Dublin into Belfast and other parts of the Six Counties. Telefis Eireann can be received quite clearly without any special fitments in places like South Down and parts of Armagh. People who live on the hillsides around Belfast, especially if they have taken the trouble to put up special high aerials, now get excellent pictures from Dublin. This means, of course, that viewers within a belt stretching along the east coast from Belfast to Greystones and as far inland as Monaghan, Mullingar, and Navan have the choice of three television stations. Certainly in places like Newry, Dundalk, and Drogheda all three stations are received with equal clarity.

The political significance of this three-line traffic in entertainment and instruction should be obvious. Television is bringing the people in both parts of Ireland closer together. As they get to know each other better old barriers may be broken down. The commercial significance of three stations operating within this area certainly cannot be overlooked. Competition, it is generally agreed, is in a much healthier state than in Britain.

The BBC, of course, is strictly non-commercial; Ulster Television is completely commercial; but Telefis Eireann is a mixture of both. Its income is derived from advertising revenue and from yearly licence fees but it remains a state enterprise. At the same time, to quote Mr Jack White, Head of

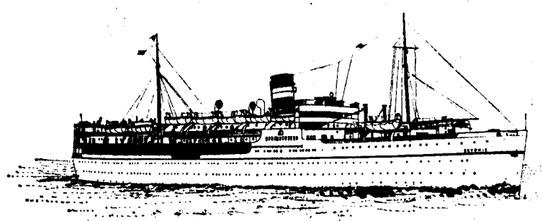
Public Programmes in Telefis Eireann, Irish television must pay its way like the commercial stations while maintaining the standard of programmes expected of a national programme. It passes the Irish comprehension that so few people in Britain are prepared to see any merit in this kind of marriage. Would it not solve the BBC's financial troubles?

SINCE its inception three years ago Ulster Television has run a daily magazine programme, *Roundabout*, which is Belfast's equivalent of the BBC's *Tonight*—and does, according to the TAM rating, appreciably better in Ulster. Telefis Eireann has an identical programme in *Broadsheet* which comes on during the same 6 p.m.-7 p.m. viewing hour. *Broadsheet* has the bigger staff and goes out for material in all parts of Ireland; *Roundabout* is rather more stay-at-home. At long last the BBC in Belfast is responding. Starting next month, it will change its weekly programme *Talk of the Town* into a daily one. To meet this challenge Ulster Television is planning to start a new local news service, which will be linked with the *Belfast Newsletter*, within the next two months. Pilkingtonians, of course, will lament the absence of viewers' choice that these activities must inflict on the public.

Telefis Eireann, the newcomer in this struggle, has met with plenty of home criticism. Some say it does not pay enough attention to the revival of the Gaelic language, that it neglects Gaelic sports, that it does not give enough time to Irish literature, theatre and art, and that too high a proportion of the programmes are imported from the United States and Britain. Both Britain and the United States, on the other hand, have provided Telefis Eireann with some of its best technicians. The BBC, in particular, played an important part in getting it on the air at all.

Within the next year—or maybe less—the battle will move to the west of Ireland. Telefis Eireann is putting up a powerful booster on Ben Bulben, a high escarpment near the town of Sligo, and from there will send out signals that will cover most of County Donegal, which is now a deprived region, Mayo, Connemara, the Western Islands and (incidentally) a large part of western Ulster. The BBC will have a similar booster in the Sperrin Mountains in County Derry, while Ulster Television is building a station at the town of Strabane, on the Donegal-Derry border. It looks as if all Ulster plus at least half the territory of the Republic are going to know the meaning of real competition.

Seaborne Seminars



THIS year more than 36,000 secondary school children are visiting cities as far afield as Amsterdam and Athens, Lisbon and Leningrad aboard two former troopships, the *Devonia* and *Dunera*. The ships become the children's floating classrooms for anything up to 21 days. Such cruises seem likely to remain a permanent part of both the educational and shipping scene. They represent an important straw that has been clutched by owners wondering what to do with old boats ill-suited for conversion into luxury cruising liners; for the children the voyages give a form of foreign travel distinct from run-of-the-mill holidays organised by schools or travel agencies, which have a very limited educational value.

The cruising scheme is run by the British India Steam Navigation Company. It began in April, 1961, after the termination of the *Dunera's* trooping charter, when there seemed little hope of emigrant traffic. The low cost of conversion has enabled fares to be kept at a realistic level, so much so that the popularity of the cruises has kept the ships employed for 10½ months each year. This, the company claims, "brings in a modest return"—which is more than other companies can say of their old ships.

The *Dunera* (12,620 tons) and the *Devonia* (12,800 tons) have each accommodation for up to 830 children in dormitories (old troop-decks) and for 200 party leaders, usually teachers, who are "cabin-class" passengers. The crews are mostly Indian. Each ship has nine or ten classrooms equipped with visual-aids, an assembly hall, swimming pool and sports areas in lieu of gymnasia. There is a cafeteria dining system which eases catering problems and is no stranger to children who have school dinners.

Most of the teaching is actually done aboard. A small permanent staff paid by the company lecture on the educational aspects of the cruise and on the places to be visited. But each group also spends two 45-minute periods daily with their own teachers and has another period of physical education. Visits are also arranged to various departments of the ship. Navigation classes are voluntary, but popular, in spite of the mathematics involved. Ashore, excursions lasting several hours are arranged by the company. The children are then allowed to explore for themselves. Even football and cricket matches are arranged with local sides.

ALL this adds up to education, which, if not profound, is certainly stimulating to the secondary modern children who make up the majority of the passengers. The whole cruise is, in effect, a comprehensive visual aid interpreted and amplified by the teachers and the ship's staff. The children have to face and solve problems of currency and language; there are obvious links between geography, history and modern languages to be found in the cities and countries visited. Living as a community afloat and meeting foreigners ashore advances the children's social education in a way that could not be reproduced in the conventional classroom.

The prices vary between £30 and £55 per child, depending on the length and destinations of the cruise. A group leader travels free if he has more than 15 children with him. Otherwise the cost of cabin class travel is between £40 and £85. The children's fares seem to set few problems to parents. The difficulty is more often to find the teachers prepared to go with the children.

Some local education authorities only allow children to go on cruises in their normal holidays, others allow term time cruises, while a few subsidise the cost of the voyages. Paying for such children's trips as well as for their education has caused controversy in some council chambers; at the other extreme one authority recently took over a whole ship for its pupils—and also in the complement were five education officers and members of the education committee (plus wives).

The scheme has grown rapidly since its inception last year, when 10,000 children from 350 schools travelled on the *Dunera*. With the *Devonia* in service this year, the company intends that more than three times that number will be carried. With the contracts for the government's two remaining troopers under review because of the increasing use of air-lifts, it is possible that more ships may be converted into floating boarding schools. And if profits continue to be made, this seems very likely. Indeed, under the aegis of the Netherlands Office for Foreign Student Relations (NBBS), three ex-liners/emigrant ships, the *Waterman*, *Groote Beer* and *Zuiderkruis*, have been saved from the breakers' yards to bring American students on European tours. The NBBS hopes to make these visits reciprocal in future. Could it all turn into a shipping boom?

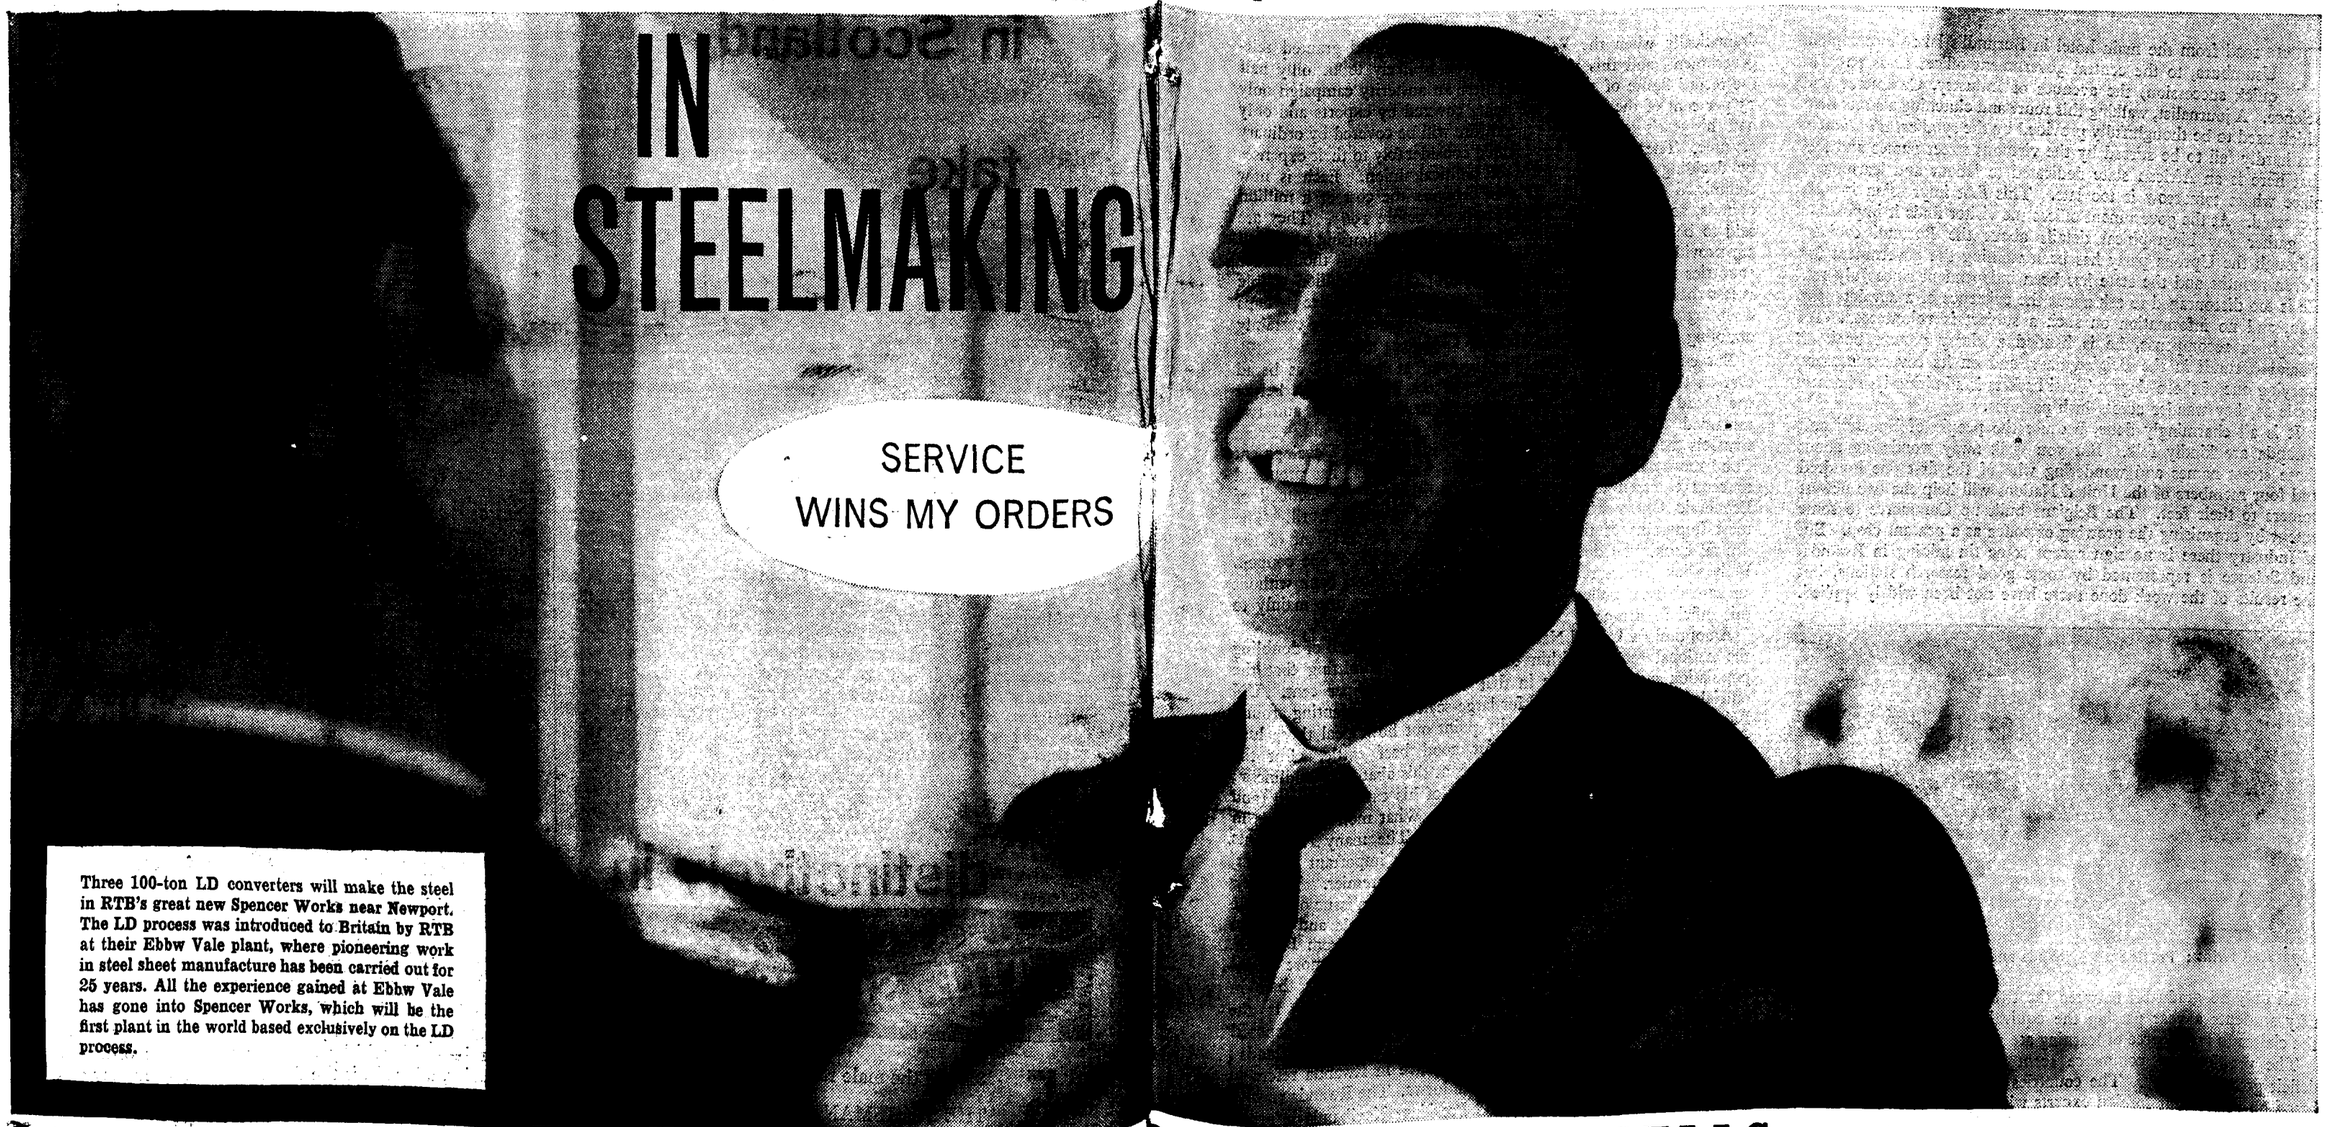
BEAUTIFUL PERRIER

RTB LEAD THE WAY IN STEELMAKING

Of course the steel buyer wants to know about service. And it is because of RTB's constant development of their service and the quality of their steel sheet and tinplate that they have consistently led the way in introducing new processes and techniques to British steelmaking.

RTB



Three 100-ton LD converters will make the steel in RTB's great new Spencer Works near Newport. The LD process was introduced to Britain by RTB at their Ebbw Vale plant, where pioneering work in steel sheet manufacture has been carried out for 25 years. All the experience gained at Ebbw Vale has gone into Spencer Works, which will be the first plant in the world based exclusively on the LD process.

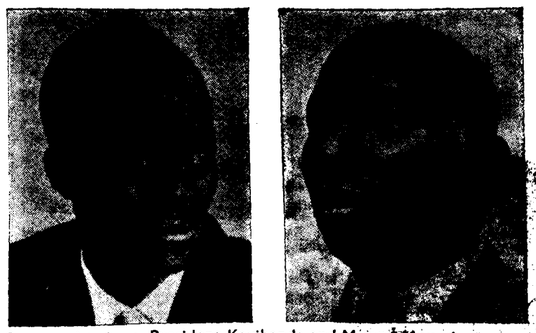
THE WORLD OVERSEAS

Hyphenless in Darkest Africa

FROM A SPECIAL CORRESPONDENT IN BURUNDI

THE road from the main hotel in Burundi's lake-shore capital, Usumbura, to the central government offices leads past (in quick succession) the avenues of Industry, Commerce and Science. A journalist, walking this route and clutching a street map which used to be thoughtfully provided by the *syndicat d'initiative*, can hardly fail to be stirred by the virtuous street names and feel that here is an African state dedicated to labour and learning, a place where tomorrow is too late. This first impression is soon corrected. At the government offices the visitor finds it impossible to gather any biographical details about the Burundi cabinet, although the Uprona party has been running the government for eleven months and the state has been independent since July 1st. He is too discouraged to ask about the existence of a development plan, and no information on such a subject is volunteered. As though in recompense, he is handed a glossy picture book of Ruanda-Urundi in the Belgian days, and on its cover a peasant carrying one of those elegant Tutsi baskets is admiring lyre-horned cattle as they wander across lush pastures.

It is all charmingly done, because the people of Burundi and Rwanda are kindly folk. But you walk away wondering about those street names and wondering who of the first one hundred and four members of the United Nations will help the two newest comers to their feet. The Belgians built up Commerce to some extent by organising the growing of coffee as a peasant crop. But of Industry there is no sign except some tin mining in Rwanda, and Science is represented by some good research stations, but the results of the work done there have not been widely applied.



Separated twins: President Kayibanda and Mwami Mwambutsa

With only 26 graduates between the two countries, and less than fifty students a year passing the equivalent of school certificate, the claims to any degree of learning are more wistful than truthful.

The problems of commerce seem enormous, with the trade deficit growing yearly. The countries have a one-crop economy, based on coffee, but foreign experts will explain that the Belgians achieved high production figures only by threatening the peasants with the horrors of prison. Certainly coffee production dropped dramatically when the Belgians held elections and granted self-government, and this year's production is likely to be only half the record figure of 1959. Even after an austerity campaign only 75 per cent of the imports are being covered by exports and only half this year's government expenditure will be covered by ordinary revenue. The two states have added considerably to their expenses by deciding against any form of political union. Each is now committed to building up its own army at the cost of a million pounds, and replacing its Belgian officers before 1965. They are said to be the only armies in the world where housing and food are provided for the families of all ranks, a generous thought for countries where the *per capita* income of the five million people is less than £15 a year. In addition, the two countries are perhaps doubling the costs of government by their separation, and certainly doubling the expense of maintaining embassies abroad.

But embassies the Burundi government at least sees as bread cast on the waters, and it hopes it will not be many days before the bread returns from Washington, Brussels, Moscow and two unnamed African capitals in the form of foreign aid. From Brussels the two countries should get more Overseas Development Fund money from the Six, and the United Nations has promised to send eighteen technical advisers to help run the Council of Economic Union which the states agreed upon in April. The most important of these advisers will serve as president of the central bank, who doubles up as secretary-general of the council. If the shaky structure of economic union—a central bank without an agreed fiscal policy—holds together, it will be due mainly to this official's firmness.

An optimistic United Nations survey team has talked of doubling the national income within ten years, while admitting that the population would increase in that time by forty per cent. UN officials are pressing the case for large-scale cotton planting around Lake Tanganyika, and they sadly point out how ideal those lush pastures among the hills are for good beef cattle. But the aesthetic mind of the herdsman rebels at this abattoir worldliness; his pride is in the massive curved horns of his cattle (a worth (and certainly costs him) millions of pounds. What money there is in Burundi is easily and frivolously spent. The many restaurants of Usumbura are the scenes of most of the important business, even including the assassination of the first premier. The new Roman Catholic cathedral has to be financed by an issue of postage stamps. But, economics apart, there are intelligible and perhaps even sound reasons for the separation of Rwanda from Burundi. In the kingdom of Burundi political stability depends more on the reverence of the people for their Mwami Mwambutsa than on the good sense of his son-in-law, the prime minister. In the republic of Rwanda those Tutsis who supported the deposed Mwami Kigri are mostly now refugees in neighbouring lands; in true Jacobin style official correspondence in Rwanda refers to the ex-Mwami as Citizen J. B. Ndahindurwa. The Rwanda revolutionaries are social democrats, and President Kayibanda is proud that his wife still works in the fields. Burundi politicians want enough of a constitutional *cordon sanitaire* to allow their country to evolve peacefully from baronial feudalism without it being necessary for the Tutsi overlords to pay the price of exile.

Both states have rid themselves of Belgian paratroopers, Burundi the more gracefully, to everyone's surprise. Many doubt whether the local Rwanda forces, despite their Belgian officers, can always subdue Tutsi invaders from the Congo as easily as they have recently done. But the government hopes the militant exiles will soon lose heart, and the more adaptable ones return to join the Tutsis who stayed and have accepted the Hutu government for the reward of two ministries. The emergency conditions in Rwanda—a night curfew and frequent roadblocks—are an unhappy background to the early days of independence. But nationalist leaders in East Africa have now generally accepted President Kayibanda as a kindred spirit after years of believing him a Belgian stooge.

The first pitfalls of independence have been safely passed by each state and the departure of Belgian troops will almost certainly decrease tension, as the last UN commission argued it would. But along their road are several more deep ditches. What will happen, for instance, when the peasants have spent their small coffee earnings by Christmas and find *uhuru* has brought no bonus? Can Burundi really reach the avenues of Industry, Commerce and Science without some sort of revolution? Perhaps the pipe-sucking peasants do not intend to march along that road at all, and are only concerned to keep gazing enraptured at their lyre-horned beauties.

Opening up Bavaria

FROM OUR BONN CORRESPONDENT

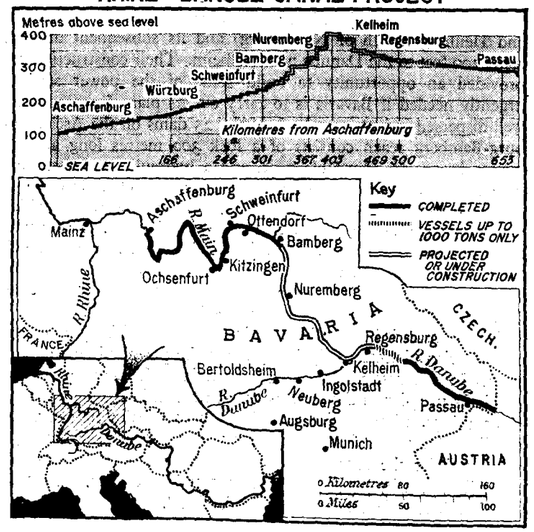
THE hopes and fears aroused by the European common market have given a new impulse to several long-pending projects for extending the ways of continental trade. Of these one of the more ambitious is a navigable waterway between the rivers Rhine and Danube. "A gigantic undertaking," Goethe observed, doubting its completion yet remarking in the same breath, "it would be well worth the trouble to live another fifty years" to see it achieved, along with canals through the isthmuses of Panama and Suez.

That was in 1827. This summer of 1962, final touches are being put to the 180-mile stretch of the Rhine-Main-Danube canal between the red sandstone cities of Aschaffenburg and Bamberg. It is to be opened next month with Bavarian ceremonial at Bamberg's new municipal port. To the south of the canalised river Main, work is in progress at a number of stages on the artificial waterway that will link Bamberg with Nuremberg (by, it is hoped, some time between 1967 and 1969) and eventually with Regensburg and Passau on the Danube. It will then be possible, at least in theory, for ships and barges of up to 1,500 tons to pass from the North Sea to the Black Sea by way of Rotterdam, Mainz, Frankfurt, Passau, Vienna, Bratislava, Budapest, Belgrade, and the Iron Gates through the Carpathians. This fair prospect is stimulating interested parties in France to kindle fresh enthusiasm for a Rhine-Rhone canal that would link Rotterdam with Marseilles. But for the time being the Bavarians are looking temperately northwards. Their canal, they are reflecting with pleasurable anticipation, will bring cheaply the raw materials required from the north for their increasingly industrialised state, and carry away the finished products to the densest markets of western Europe.

Bavaria has more ground than any other state of the Federal Republic for being anxious about the consequences of competition within the common market. Organically, Bavaria is indeed not only "out on a limb" from the main body of trade, but also under duress of the laws of survival to adapt its economic functions to the main body's requirements. The state is cut off today from its former lucrative markets to the east and north-east by 450 miles of forbidding frontier with Czechoslovakia and the German Democratic Republic. Its trading is fettered further by 480 miles of frontier with Austria, another common market outsider (though a substantially friendlier one, co-operating closely in such vital matters as organising a smooth flow of mutually beneficial tourists and electricity). To ensure their traditional creature comforts, the Bavarians must look much farther afield than they used to have to do, and mainly northward and westward. There they descry a future much more promising for industrial wares than for the products of farm and forest that supported close on 30 per cent of the population before the war.

"What does people live on?" is engagingly asked in the English edition of a brochure put out by the Bavarian Statistical Office. The answer for the nine and a half million inhabitants of Bavaria—more than two million of them post-war settlers from the east—is "increasingly from industrial output." Not that, according to the planners, agriculture will cease to keep well over a million persons. But these are already half a million fewer than in 1950; and some 38,000 smallholdings have closed down in the course of the last eight years, the majority near spreading towns in western Bavaria. New industrial and commercial undertakings are opening all over the state (which in area is the largest in western Germany, and in population second after North Rhine-Westphalia). The most important branches of Bavarian industry nowadays are

RHINE – DANUBE CANAL PROJECT



mechanical and electrical engineering, textiles, brewing, and a rich variety of handicrafts. Along with this development an attempt is being made to preserve as far as possible the "Bavarian character" and the "Bavarian way of life" (is that why one of the chief state planners is a Berliner?) by injecting modern methods into what is left of agriculture and by fostering modest, as well as ambitious, industrial and commercial enterprise. Town and country alike, in these circumstances, still have two pressing needs in common—access to cheap power and to a wider network of communications with low freight charges. It is to help meet these needs that there has been a marked quickening this summer of the digging, dredging and damming along the circuitous, up-hill-and-down-dale route of the Rhine-Main-Danube canal.

The construction and working of the canal is the responsibility

of the *Rhein-Main-Donau Aktiensgesellschaft*, the validity of whose contract with the Reich, signed in 1921, was reaffirmed by the newly established Federal Republic in 1949. Of the company's capital stock of DM59.6 million, 64.6 per cent is owned by the Federal Republic and 34.8 per cent by the Bavarian state. The remaining shares are held largely by the *Preussische-Elektrizitäts-AG* and a few towns served by the canal. Further money has been found through loans obtained from the state and the capital market. When the whole of the 405-mile-long waterway from Aschaffenburg to Passau is completed (the Main was already navigable as far as Aschaffenburg for vessels up to 1,500 tons), it will have a theoretical annual capacity of 32 million tons, allowing for two-way traffic moving fourteen hours a day on 300 days in the year; or of 55 million tons, allowing for 24-hour traffic moving on 300 days. At the company's headquarters in Munich they like to point out to visitors that, politicians willing, the finished canal will in practice provide another 2,040 miles of continuous inland waterway linking Holland, Belgium, France, Switzerland, Germany, Austria, Czechoslovakia, Jugoslavia, Hungary, Bulgaria and the Soviet Union. But for the present it is more or less Bavaria alone that is the beneficiary, particularly the cities of Bamberg, Schweinfurt, Würzburg, and Aschaffenburg. Even the smaller towns along the Main are already recording notable increases in the turnover of their sprouting ports. Ochsenfurt, for example, handled 301,000 tons last year (81,000 in 1953), and Kitzingen 567,000 tons (90,000 in 1953).

Altogether 47 locks and three lifts have been, or are being, built to master the canal's rise of some 1,200 feet between Aschaffenburg and Heuberg (south of Nuremberg) and its subsequent drop of some 200 feet to the Danube near Kelheim. Their construction has provided an opportunity to build some of the power stations urgently needed if Bavaria is to carry out its plans for promoting well-dispersed industries. Each of the 25 dams on the Aschaffenburg-Bamberg reach consists of a lock 300 metres long and 12 metres broad, an adjustable weir, and a hydraulic power station. The largest of these Main power stations is that at Ottendorf, whose turbine-driven generators can develop 6,300 kilowatts, and which has an average annual output of 33 million kilowatts. Those who know and love the Main valley will be relieved to hear that much thought has been given to preserving its beauty, and that the old bridge at Würzburg has been scarcely affected by the discreet building operations in its neighbourhood.

Prodigious as it is, the Rhine-Main-Danube canal is by no means the Bavarian planners' only joy. When the promised commission arrives from Brussels before long to investigate the common market problems peculiar to Bavaria, its members will hear much, among other things, of plans for extending the autobahn network, for building Germany's first big nuclear power station near Bertoldsheim, and for the four oil refineries at Ingolstadt and Augsburg that will be fed by pipeline from Genoa and Marseilles. There is just that little matter now of paying for it all.

Ceylon's Straits

FROM OUR CORRESPONDENT IN COLOMBO

THE gravest crisis since its inception now faces Mrs Bandaranaike's government. All the opposition parties have declared war on the budget presented by Mr Felix Dias Bandaranaike, the finance minister and "strong man" of the Freedom party. Restive government backbenchers have also threatened to vote against his budget. The ruling party's old guard may see in the present situation an ideal opportunity to cut him down to size. They have already tasted his blood over the Press Bill issue (the Speech from the Throne in July no longer talked of a take-over of the press, but of preventing monopolies). For two years he had deliberately avoided placing new economic burdens on the peasants, who form the Freedom party's political backbone; now foreign exchange difficulties have forced him to take the politically perilous step of reducing the rice ration by a quarter.

On Tuesday opposition protests forced the postponement, until August 16th, of the budget debate that was to have opened that day. The opposition leaders asked whether they were to debate the original budget as presented at the end of July, or the alterations Mr Felix Dias Bandaranaike had since made to pacify his own party, including a promise to limit the rice cut to not more than six months—a compromise that has not wholly satisfied the backbenchers. The postponement gives the hard-pressed government a chance to tackle its internal differences. Mr Dias Bandaranaike has meanwhile given the petroleum companies—Shell, Esso and Caltex—a week to consider his three alternative proposals for reducing foreign exchange costs.

CEYLONESE governments have a habit of running out of steam halfway through their parliamentary life. In sticking to her late husband's "middle path policies," Mrs Bandaranaike may have shown a sound instinct. The Freedom party is still the nearest acceptable approximation to a popular ideal that rejects both Left and Right. Its statement of policy in the Speech from the Throne indicated that, from now on, it will play by ear—and with caution; the Communists, who usually treat the government gently, described it as yesterday's cold cunjee without salt or spice.

The most interesting announcement in the speech was the reference to the coming talks with Mr Nehru in October about the future of the one million persons of Indian Tamil origin now living on Ceylon's tea estates. Disowned by India and disfranchised by Ceylon, they constitute a disputed category called "stateless citizens." In 1954 both governments agreed to facilitate their registration as citizens, as a prelude to negotiations about the remainder. But the undertaking was not honoured by either party. By administrative means, Ceylon reduced its own intake to the barest minimum; the Indian High Commission retaliated with a deliberate go-slow policy.

Though history, geography and cultural ties cast a warm emotional glow on official Indo-Ceylon relations, the average Ceylonese, who enjoys a much higher standard of living than his big brother across the Palk straits, secretly thanks his household gods for that narrow strip of water. But the Palk straits have not affected the brisk traffic of illegal immigrants from south India who find an easy refuge in self-contained communities on the tea estates where there are good pay, free housing, schools, dispensaries and subsidised rice. In an island whose history is crammed with Indian invasions, the thought of a million Indians living in the heart of the country and boasting a stranglehold on the national economy arouses deep fears in the popular mind.

Recent developments have made matters worse. An overflow of people from the estates has aggravated the already acute unemployment problem. Political propaganda has also increased the friction between the estate population and the Sinhalese peasants of the surrounding villages whose living conditions present a stark contrast to life on the rich, well-run estates. In addition, the Federal party, which leads the Ceylon Tamils of the north and eastern provinces, has reached a dead end in its policy of agitation. Having failed to extract concessions from the government on the language issue, the Federalists are keen on finding new sources of strength. Thus party leaders have been busy on the estates, looking not for tea but for sympathy. Their strategy is quite simple. They agitate for a common platform of Tamil-speaking peoples (Indian and Ceylonese) on the twin issues of language and citizenship. The frustrations of the estate population recently led to the emergence of two new organisations bearing the name of the militant south Indian Tamil party, *Dravida Munethra Kazagham*. The moment the Federalists stepped in, the government got alarmed and banned the Indian organisations under the emergency laws.

To placate Ceylonese opinion, the government has also prepared two Bills which have caused grave anxiety on the estates. One Bill requires all estate labourers to enrol on the national register. The other obliges estate employers to give priority to Ceylonese in filling future vacancies. These actions have disturbed Delhi, which argues that opting for Indian citizenship by Ceylon residents of Indian origin must be voluntary. India concedes that Ceylon may "induce" them to opt by means of monetary rewards, but it is against any "coercion." Ceylon's recent actions are considered coercive; this may account for the report from Delhi that Mr Nehru will not after all engage in political negotiations on his visit in October. Sceptical though it is of Mr Nehru's Himalayan humanism, Ceylon is aware that it must rely entirely on Indian goodwill for a solution.

Heirs of Genghiz Khan

LEGEND has it that Genghiz Khan and his brothers "decided one day to conquer the world" and history records more definitely how they built an empire from Shanghai to the gates of Budapest. Now, eight hundred years later and after forty years of communist defamation for what might be called his "incorrect attitude to proletarian internationalism," Mongolia's greatest son has had his name cleared by the Mongolian Academy of Sciences. He is now accepted as, for all his faults, the founder of that now recognised international entity, the Mongolian People's Republic.

By a stroke of luck, the dust of history had left it uncertain whether Genghiz Khan was born in 1155 or 1162. The Mongolian authorities in 1955 opted for the earlier date; but, with Stalinist legacies at home and a natural reluctance to offend the Russians, whose scalps tingle at the mention of Genghiz Khan, they let the anniversary slip by. But their new prosperity and entry into the United Nations made an exciting brew. So, despite the nasty things the Soviet Encyclopedia said, they went ahead and recognised Genghiz on the 800th anniversary of that now more authoritative date —1162. For all this, the world need have little fear that these 937,000 Mongols, and their 23 million domestic animals, will take up their imperial heritage again; but outside interest in the country has brought about some unexpected developments.

Mongolia has been ruled for forty years by a Communist party taught and supervised from Moscow; but although the party's leaders have been loyal pupils throughout this period, they have worked hard to keep a little independence.

While the Chinese have been concerned to expand their influence to the extremities of their former empire and to win an adherent to their view of communism, the Russians have tried to impose limits. Mongolia, the Russians feel, not only makes a useful buffer state; it provides a welcome Asian supporter for the Soviet way of doing things. This difference has provided the Mongolians with a small degree of independence and a larger degree of prosperity. Contrary to popular belief, the Mongolians have remained close to the Russian view, while trying not to antagonise the Chinese. Before the Sino-Soviet dispute reached its recent peak their attitude was well summed up by the Mongolian diplomat who said, "We don't want to get mixed up in what we don't understand. Anyway, both sides give us aid." But when the dispute became acute they opted for Russia, denounced the Albanians and their sympathisers, and were handsomely rewarded.

At the price of staying close to Moscow, the Mongolians managed to prevent large numbers of Russians or Chinese entering the country and taking things over from the inside. This, with the development of industry, which is now credited with about 50 per cent of the national product, has fortified their sense of nationality. Industrial development was important to them for national as well as doctrinal reasons. When the current five-year plan was being drawn up in 1960 a group within the party suggested that, as Mongolia was short of manpower, the Russians or the Chinese should not only build, but also run, the proposed steel plant. This was violently opposed, on the ground that to have one's vital industries in foreign hands was the essence of colonialism.

RUSSIAN and Chinese interest, not Mongol diligence, is responsible for the air of affluence that now pervades this mainly nomadic people, who have the happy distinction of receiving more aid per person than those of any other country. Until lately their gross national product was less than £20 a head; this left little surplus for development. But in 1956 the Chinese courtship brought them an offer of a Chinese loan of £14 million. The Russians thereupon added another £17 million to the £83 million they had advanced in the past ten years. Undeterred, the Chinese offered another £17 million in 1960 to help with the plan for 1961-5. The Russians, as if to prove once and for all who was Khan of Ulan Bator, replied in 1960 and 1961 with two loans totalling £97 million. With such backing, the Mongolians have been able to advance one of the most startling five-year plans ever. It will cost about £100 million, the equivalent of a reinvestment year by year of the entire national product. But, with aid to a total of £114 million on offer, the Mongolians can bear this burden. Even if a lot of money is spent on military projects and a portion of the aid fails to materialise, it seems that they can expect a high rate of growth for some time at least.

Even more stimulating to the national sense has been the republic's entry into the United Nations in 1961. Tucked away in the centre of Asia, they have longed for global diplomatic contacts; the United Nations is their opportunity. What with the struggle they have had to keep the Chinese from controlling their affairs, they find it rather difficult to accept that the Americans are the great threat to world peace. However, for the record, they denounce American imperialism at the United Nations, while the home government signs tourist agreements with an American agency and expresses its hope that Mongolian poetry and novels will be published in New York. It has hurt them that more non-communist states have not recognised their new international status; but there have been compensations. Since 1961, when Mr Suslov said that "Mongolian experience in building socialism acquires particularly great importance at the present time, when the face of Asia and Africa is changing," the Russians have given them every encouragement to become active in Afro-Asian affairs and spread the good word of Soviet ways of development. In June, Mongolia even became a member of the Council for Mutual Economic Aid, a body which China has not been invited to join.

Top states, like top people, have to keep up. The present fashion for top states is to give foreign aid. No Mongolian would wish to be left out. So, on entering the United Nations, Mongolia announced its aid programme to the Laotians "fighting a just struggle against American imperialism"—11,000 yards of cloth and 300 tons of rice.

THIS IS THE EAST...

Economic development in Asia is bringing higher living standards to these young people and to the vast population of that continent. Demand for an ever increasing range of merchandise is steadily rising. If you are interested in trade with these expanding markets, you are invited to avail yourself of the banking and information services of The Chartered Bank and its subsidiary, The Eastern Bank Limited. The combined organisation of the two banks comprises one hundred branches in twenty-seven territories extending from the Eastern Mediterranean to the Pacific Ocean.

THE BUSINESS WORLD

Ten Years of BMC

TEN years ago, when Austin and Nuffield came together to form the British Motor Corporation, nobody suggested that technical innovation would prove to be the new company's forte: despite the Morris Minor, neither firm had a reputation for providing much more than rather solid worth in its products. Yet it is with novel designs that the combined group has had its greatest success—largely as a result of its good sense in bringing back Mr Alec Issigonis to be its chief designer, then leaving him an unusually free hand to design cars as he thought best, and backing the result, unconventional though it might be. So one finds that BMC may soon be the largest producer of front-wheel drive cars in the world and will eventually build almost nothing else. No major British maker had seriously considered them at the time this merger was made. BMC is the only big manufacturer to use rubber springs, and it will be the first to fit hydraulic suspension on a cheap car. And it is the first firm to put a car with a transversely mounted engine into really large scale production. For the largest British motor company, such signs of original thought are a refreshing change; and they have helped to stimulate some of its smaller rivals into thought and action.

Commercially, BMC has enjoyed less success. Though it has managed to raise its share of the home market from about 38 per cent in 1955-56 to 43 per cent last winter, the past two years have been a period of declining profits: though production more than doubled, from 279,000 to 601,000 vehicles, profits were lower in 1961 than in 1953. Like other firms, BMC has been feeling the effects of stiffer competition in home and export markets, which came when it was in the middle of an ambitious and expensive expansion plan. But the switch in emphasis to the smaller and cheaper car that followed the introduction of the Minis and their great success, especially at home, has been a special factor reducing BMC's margins. Rivals who wonder how the car can be made for its price caustically suggest that BMC must be planning to get its profits from selling spares for Minis, rather than from selling the car itself. Technical innovation can in fact add to costs in the short run even while adding to sales, for it means using parts that are unique to one model and so more costly than parts used over a range: the front wheel drive shafts of the Mini are an example, with their special universal joints. But as more models use them, higher output should bring lower costs. And BMC intends adopting front wheel drive for all but its biggest cars over the next two years or so, with the first of the new models to be announced next week, so it should soon be beginning to feel the benefits of higher output of these special parts. Pioneering may not pay; established practice should pay.

Its present range of cars, though all but the Minor 1000 were introduced after the merger, still divides into Austin and Nuffield: the A40, the 1.6 litre Farina-style saloons and the 3-litre sixes are Austin designs, even if they bear all the marque names that the company possesses; the Minor and its relatives, the Wolseley 1500 and Riley 1.5, are essentially Nuffield. Only the Minis are BMC designs. Engines and gearboxes, however, are rationalised, with two basic designs—the 850-1,100 cc A and the 1,500-1,622 cc B—covering most BMC cars. Both are basically Austin designs. Extension of true rationalisation throughout the model range is something that will come when the bigger front wheel drive cars are introduced. They will be designed for production in the several variants necessary to meet the character expected of a Wolseley, Riley, or MG as well as the basic Austin and Morris, and because they are designed for differentiation the changes will add less to production costs than would be the case if they were added after the design had been prepared. Engines, for example, can be designed to be tuned for extra power, and bodies for such styling features—thought to add distinction to a car—as four headlamps. And though diversity adds to the problem of the production engineer, it does not add significantly to production costs: BMC already has several models coming down one assembly line without slowing things down, and variations on one model are no problem. Eventually, three front-wheel drive models may form the basis of the BMC range, and two of them would share many mechanical parts. But for the immediate future, the existing conventional models will be retained in production alongside the new ones, to meet the continuing demand for old favourites like the Minor 1000, thus earning the fullest benefit from the investment in tooling.

THE commercial policy of multiplying models by sticking a replica of a famous radiator on a basic BMC design has come in for its share of criticism: blinkered engineers sometimes describe it as the penalty for inheriting a large and diffuse network, all of which has to be kept supplied with cars. But BMC, which has to plan for sales in order to make production worthwhile, sees method in such apparent madness. It wants as many dealers as it can get, so that it can tap the maximum amount of the working capital that is the motor trade's scarcest asset. And it can obtain more dealers if it is offering separate franchises than if all its dealers sold all its cars. A Morris and an Austin dealer will tend to cater for separate markets only so long as the old marque loyalties continue—and they are proving surprisingly resilient—but a

Wolseley dealer is offering something rather different, and so can be sited on the territory of a Morris or Austin agent. His dealership will in fact be additional; and BMC is endeavouring to build up Wolseley dealers as a chain distinct from Austin and Morris. Riley and MG are when possible sold as the more expensive line by Austin and Morris respectively, though each retains its own network of distributors with their stocking facilities.

Sales of these "luxury" BMC models are rising, and by now are much higher than they were when the cars possessed a real character of their own. Whatever purists may think, there is a large sector of the car-buying public which wants something "better," or at least obviously more expensive, than the standard models.

Production facilities have been more or less integrated by now; full rationalisation awaits the completion of the expansion plan, postponed from October of this year until October, 1963. The Nuffield organisation had been little more than assemblers, so the Cowley works has been turned into an assembly shop to which bodies come from Pressed Steel or Fisher and Ludlow, awaiting only the final coats of paint, and the mechanical parts from Longbridge or the other Midland factories of the group. The extent of specialisation is now increasing; the factories that produce body sub-assemblies to be "blown up" into complete cars at Longbridge, such as the new factory just finished at Llanelly, will each make only one sub-assembly of a body—doors, for example, or wings. They will thus be better able to apply automation techniques, which should allow them to produce to closer tolerances as well as more cheaply; this becomes increasingly important when the sub-assemblies have to be shipped abroad as well as to the home factories for assembly, and put together by foreign labour without the same experience of the work as at Longbridge or Cowley. BMC thus sees itself as a collection of manufacturing units, each supplying one or two parts for assembly into the whole car.

The management structure of BMC disperses authority with the geographical scattering of its factories. Each of the specialised producers constitutes a self-contained unit, independent for day-to-day management and indeed, apart from purchasing—which is done for BMC as a whole—fully independent in all matters but long-term policy. Where the factory was a separate company before being taken over by BMC, it retains its own board of directors—as do, for example, Fisher and Ludlow, SU, and Austin and Nuffield themselves; where they were parts of a company, they are run by managers. Sales as well as production are run by separate companies in the same way, divided between Austin and Nuffield as the two basic groupings of cars and dealers: export as well as home sales are divided in this way, though where dealer networks were weak or still need strengthening, as in Australia and the United States, a BMC network has been established, and similar arrangements are being made in Sweden, South Africa and Rhodesia.

Whatever the form of their activities or organisation, these companies are the operating units of BMC. They carry on its routine functions, leaving—at least in theory—long-term policy alone to the BMC directors and their small staff. Its core is the directors in charge of the basic functions of the company; design—one that can be, and has been, fully centralised under Mr Issigonis; purchasing, production and finance, which come under the three deputy managing directors; and home and export sales, service and personnel. Apart from the deputy managing directors, who were appointed last year by Mr Harriman when he became chairman to provide an extra layer of policy-makers directly beneath him, the directors of functions are not members of the BMC board. But they meet once a month to discuss policy.

BMC is thus essentially a federation of companies, with much independence for its members. Inheriting an organisation of so many independent concerns meant that it was easier to build on this foundation than to try to start from scratch. Since a loose, decentralised form of organisation might in any case have been chosen—as experience of other big concerns now suggests is best—the result might not have been very different, though the names would have changed. As it is, disruption and anguish have been avoided, if at the expense of preserving some old rivalries and therefore some friction within the organisation. The chief problem, as in other dispersed concerns, is lateral communication between the different companies, and the interchange of staff to give all the best chance of promotion. Labour relations may have suffered from this decentralisation, too; the recent appointment of directors of personnel and welfare seems to be recognition of the need to standardise—and improve—policy on this most important subject, where failures have cost BMC dearly.

On recruiting policy, BMC has stayed right out of fashion, by virtually ignoring the arts graduate—and, indeed, the engineering graduate as well. It has stuck firmly to the motor industry's tradition that managers and engineers should work their way up, preferably from apprentice. Though this adherence to the tradition of loyalty has spared BMC the troubles and wastes of under-employed and frustrated graduates that have been the common experience of those companies that have recruited graduates *en masse*, it has cut itself off from the mainstream of able young men—something which no large company can afford to do. Compared with Ford, it lacks the set of bright young graduates in their thirties which now forms the nucleus of that company's middle—and sometimes its top—management. Sometime, no doubt, BMC will manage to overcome the prejudices of some of those at the top of its administrative and engineering sides, and when it does it may well benefit from the lessons learnt by others. But a company of its size has too much need of able men to persist in such a policy without risking its future efficiency.

To train its future managers, BMC relies heavily on its own staff college. Picked apprentices, foremen and supervisors go there for residential courses lasting several weeks, while others get shorter courses in the works. But this organisation has as much to try to remedy the deficiencies of the men's basic education as to train them in managerial skills—a dual task that must tax the ability of its staff and the time available for each student to study. Apprentices, aided by such schemes and the chance to get degrees through sandwich courses or by scholarships to universities, are likely to provide the basis for managerial and engineering staff for some time to come.

BMC is a company that relies on a few able men for its efficient operation; and a further growth in the central staff seems desirable. The company's scepticism about modern fashions like market research may be healthier than its doubts about graduates, but its management is in consequence less well informed of the facts on which to base policy than, for example, is Ford's. (Ford gets returns from its dealers showing retail sales every ten days, as American companies do; BMC apparently does not.) This ignorance is bound to be a handicap in the tough battle for sales between the two companies, for management cannot respond as quickly to changing circumstances. Changes are beginning to appear in such departments—one dealing with market research for the home market was founded recently—but more still remains to do before BMC's management is as well informed as it could be.

After ten years, for nine of which its founder, Sir Leonard Lord (now Lord Lambury) was chairman, BMC is still run on traditional lines though it is making increasingly unconventional products. Mr Harriman, while continuing the tradition that BMC is run by production men, has shown his desire to change, and rivals claim already to have detected a sharpening of commercial tactics. But if the remarkable designs that the company is putting into production are to be exploited as well as they can, some modernisation of the group's management will be needed to match that of its designs. For a company of midland individualists like BMC, however, fashion will have little influence.

Hardship in Commodities

THESE years of plenty are bringing no blessings for primary producers. For consumers with means there is no shortage, present or prospective, of any important food or material. One can rarely generalise with accuracy about prices and supplies of the hundreds of major and minor primary products that enter world trade, but the middle of 1962 is certainly one such occasion. Every index of commodity prices, based on its particular basketful of goods, is depressed and there are, indeed, few significant exceptions to this miserable level of prices. Silver, it is true, has launched itself as a mainly industrial commodity at prices unequalled since the early twenties. Having been pegged by sales by the United States Treasury up to the end of last November, silver has stolen much of the limelight this year; even so, its gain since then of 9½d. to 89½d. a fine ounce does not make its post-war rise exceptional compared with the rise in other commodities.

Of many other commodities, from expensive and specialised materials like uranium concentrates, valued at $5 a pound under the recent Anglo-Canadian agreement (an enormous drop compared with $8 a pound under discussion in 1957), to commonplace lead which now commands only £52 a ton, there is a superabundance of supplies and capacity to produce far in excess of current needs. The most strenuous attempts to isolate the commodity markets from the facts of bulging plenty have come to nothing. Consumers can get all they want and are not too certain about their prospects. The profound change in the last five years or so is that consumers have allowed their holdings of raw materials to slip back relatively to their turnover and they have worked off excessive stocks.

They no longer need to pay a premium for over-insurance against a stoppage of work through shortage of materials. Their slimmer profit margins have increased the pressures on them to avoid stock losses and to buy competitively. Complacency and laxity, which are always encouraged by rising prices, have gone; lower prices bring out the buyer's pruning knife.

His extra caution is reflected in the course of commodity prices this year. In earlier years, particularly 1960 and 1961, a sharp rise occurred in commodity prices on the expectation that rising industrial activity would lead to a recovery in commodities. When these hopes were dashed, prices were pitched down to lower levels. But this year commodity prices have been low and flat, and when individual commodities have displayed any inkling of recovery, buyers have not chased them higher. Even when tin had its brief moment of glory, consumers were not tempted into buying

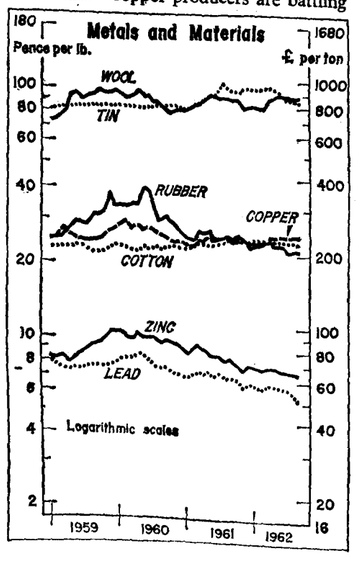
Where Prices Stand

METALS AND RUBBER

IT is upon metals that the main impact of projected disposals of surplus materials from the United States' strategic stockpile has naturally fallen. For **tin**, the peril is real and immediate; for metals like lead and zinc with a powerful home lobby behind them the danger is much less pressing. Faced with substantial disposals, tin has buckled under. This week it had to be supported again at the upper buying limit of £850 a ton by the International Tin Council's buffer stock manager. If American officials were not opposed to the new price ranges contained in the international tin agreement, tin could now be reckoned safe from much further distress. But only last year £850 a ton was about the middle of the top range of the stabilisation scheme within which the buffer manager was expected to sell tin in order to curb excessive price rises.

This year's renewed attempt to support **lead**—this time by cutting back production of refined metal—has misfired. Lead slipped to a low point of £62 a ton in 1960, then to £57½ in 1961 and is now £51½. The then to £57½ in 1961 and is now £51. The margin of surplus in lead production is quite small and consumption is slowly but steadily rising over the years. But it seems quite likely that price after all will prove the only effective corrective for the persistent imbalance, and it is also possible that the current level of prices might be sufficient to achieve that objective. **Zinc** has fallen from £77½ to £65 a ton this year in step with lead. The potential expansion in demand for zinc is much greater than for lead, but so far zinc seems unable to avoid similar difficulties to those that beset lead. **Copper** producers are battling tenaciously to keep the spot price at £234 a ton, though the forward price has sagged to £229½ despite production cuts of up to 15 per cent. Producer controlled prices of aluminium and nickel have had to be trimmed back to £180 and £642 a ton respectively this year and the threat of future surpluses of these metals appears to have increased. For all these potentially fast expanding metals, the end of destocking by consumers, which might not be far off, and a recovery in consumption, which cannot be postponed for ever, will be needed if producers are not to be dislodged from their defensive positions.

Other casualties of the setback in consumption, combined with a communist selling offensive, have been **wolfram** down from a peak last year of 150s. a long ton unit to about 62s., and **quicksilver** which has dipped from £69 to £61½ a flask. Much western production of wolfram ore has already been knocked out by these exceptionally low prices. **Rubber** has suffered the inevitable reductions in synthetic rubber prices and accelerated stockpile releases. Helped by heavy communist purchases (for all the propaganda in favour of planned economies, this seems at least as unpredictable as demand from western consumers) a lb for RSS1.



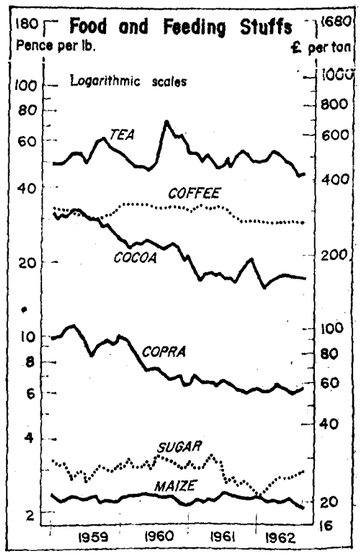
FIBRES

BECAUSE of the continued recovery in **wool** prices, industrial fibres as a whole showed some improvement in the early months of the year. But even in wool, the improvement was largely confined to the more expensive, better grade wools. New Zealand's crosbred wools have drifted lower again though prices of the predominantly merino wools produced by South Africa and Australia have held up well.

The United States' export price policy continues to shield other **cotton** growers of similar types who can undercut American export prices to ensure outlets for their production. But though the price in Liverpool has been maintained at 24.20d. a lb for 1 in. middling spot, there have been persistent fears of an increase in the American export subsidy. **Jute** has dropped back to more normal levels following last season's bigger crop and the prospect of an encouraging new one despite the recent floods. The aftermath of last year's floods in East Africa has been higher prices for **sisal** than a year ago with gains of £10 to £91 a ton in lower grades. But the current price of the best grade—at £95 a ton—is still lower than bottom price for 1960.

FOOD

THE future of foodstuffs and beverages has been thrown into the melting pot by discussion of new world agreements.



For **coffee**, the problem is the familiar one of outrageous excesses in production held off the market by what seems a flimsy fence of producer agreements. Coffee is 2 to 4 cents a lb cheaper on the New York terminal market than a year ago. The future of coffee lies in the shape that the projected international scheme backed by consumers will take. Without this fresh approach prices will surely crumble. The future of **cocoa** is similarly bound up in the influence that the projected international agreement or the newly formed producers' alliance can exert over the market.

The pressure of expanding supplies is unrelenting. Even at £160 a ton, compared with £235 a ton two years earlier, cocoa is not necessarily secure unless producers are prepared to intervene effectively to support prices. With Britain as the only large consumer interested, **tea** stabilisation does not have the international appeal of the other two beverages. The pressure of supplies is building up, as the further drop in prices of plain tea this year shows, but the prospect of a revised international agreement for tea seems remote.

Prices of soft and hard **wheats**, **maize** and **barley** have all slipped back since the turn of the year. Prices of **beef**, but not of **lamb**, have also drifted lower, but most of these products still command slightly better prices than a year ago. Limitation of exports of **butter** to this country have lifted the price of New Zealand butter from £250 to £315 a ton over this period. For all these commodities, the outcome of the common market negotiations is crucial. **Sugar** has recovered strongly from £20 to £26½ a ton because of the poorer beet harvest expected in Europe and the pressure to fill the open quota to the American market. After its turbulent year, sugar now appears to be settling down.

Continued from page 547

much tin at the peak of the squeeze, though the international buffer stock had been emptied.

There has been no pressing need to build stocks of any commodity this year. In consequence, prices have rubbed along mainly without distinction, but with some substantial falls in a few commodities. *The Economist* indicator of commodity prices rose from 92.5 (base 1958=100) at the beginning of the year to 93.3 before sinking to a new low point of 90.8 this week.

Prices in this period might have been some 3 per cent lower than in 1961, itself a poor year for producers. Prices of manufactures have not fallen, and primary producers are therefore not reaping the benefit of their increasing productivity. If this were only a temporary phase it could still be unfortunate. But in fact it has now persisted long enough for influential western nations like Britain and the United States to feel that something ought to be done to check the drift in the terms of trade against primary products. Effective world commodity agreements are also on the cards as a result of Britain's application for entry into the common market, but obviously even at the best these could bring no prompt help for hard pressed primary producers.

These are doleful days for commodities. But a further sharp decline in prices appears less likely; relatively few commodities now seem in danger of falling farther. After the shake-down in prices following the Korean boom, the expected has happened: food prices are weakest because of the slow growth in their consumption; fibres have fared better; and metals have done best. Prices of food, beverages and feeding stuffs have fallen 12½ per cent since 1958; fibres have risen less than 1 per cent; and the four principal metals freely traded in the London market, even after their recent setback, are 10½ per cent up.

BUSINESS NOTES

THE ECONOMY

"Slow Expansion Only"

HOW fast is British engineering eating its way through its export order-books? The machine tool industry, for example, has a longer orderbook than most—nearly ten months' export deliveries at its present rate—but since the beginning of the year the value of its export deliveries has been 40 per cent higher than the total of new orders it has booked, and in May these deliveries were nearly twice the orders that it obtained from abroad. Unless the rate of foreign ordering picks up, this must eventually mean a decline in machine tool exports.

For engineering products as a whole, the same appears to be true. The monthly rate of new orders booked from abroad, the National Institute of Economic and Social Research reckons in its latest *Economic Review*, has now been roughly level for about a year; and for some months export deliveries have exceeded the value of these new orders. Machinery has not contributed as much to the recent upward trend of British exports as a whole as it has to most other rises in exports since the war. Even so, without an increase in foreign orders fairly soon, these export deliveries must slacken off; and "it would be surprising if for any long period of time total exports were to rise when machinery exports were falling."

This happy thought has made the institute rather more cautious than before about the prospects for British exports in 1963. Up to the end of 1962, it has hardly hedged its bets; it is still looking for an increase of nearly 9 per cent in total British exports from the end of 1961 to the end of 1962, which is still roughly in line with the hopes of the Whitehall economists too. The Treasury's economists are now perhaps inclined to agree more than they did with the institute's and other outside commentators about the course of private investment; far from rising enough largely to offset any fall in manufacturing investment, the capital spending of distribution and the service trades seems to have turned downward at much the same time. Public sector investment will have to pick up during the rest of this year, indeed, to hold the end-year figure for total fixed investment to the level of end-1961 (which was 4-5 per cent lower than the average for 1961 as a whole).

Any further cutback in investment next year, as the institute argues, could begin to prejudice Britain's hopes of achieving Ned's target of 4 per cent per year; it is not as sanguine as Professor Paish about the promise now held out by the growing margin of spare capacity across the economy. The institute believes that private investment, already, needs fresh stimulus; but how to stimulate it? No direct encouragement to capital expenditure (even on modernisation) is likely to allay industrialists' current uncertainties; nor, barring devaluation or export subsidies, can the government operate directly upon the trend of exports. The only sectors of demand where official stimulus could effectively bring slack capacity into play and keep unit costs down would be consumer spending, or Government expenditure (capital or current). Politically, the government may still consider it uncomfortable to stimulate any of these.

STEEL

Hard Sell Needed

ALTHOUGH customers seem to have run down their stocks of steel less in the second quarter of this year than in the first, the reduction is still continuing at a sizeable rate. The Iron and Steel Board thinks that in the second quarter stocks may have come down by about 150,000-200,000 tons, against a fall of 230,000 tons of finished steel in the first quarter. The industry expects stocks to go on downward during the third quarter of this year, and even into the fourth.

These incomplete indications of changes in stocks suggest that consumption of steel in the second quarter, allowing for seasonal variations, was at about the same rate as in the first, and 7½ per cent below the level of steel usage twelve months before. In July actual production was 366,900 tons of crude steel, which was 3½ per cent lower than twelve months before.

The British Iron and Steel Federation, in its current *Steel Review*, is however looking forward gloomily to prospects of further decline in fixed investment, and particularly in the private industrial investment that takes the largest tonnages of steel. A decline in re-equipment and expansion (which is now beginning to occur even in the steel industry itself) may be offset in the total investment figures by, say, an increase in constructing motorways and building schools; but these do nothing to balance the demand for steel. Facing the possibility of living with a new system of pricing, accommodated to European rather than settled British habits, the companies certainly need the "new commercial dynamic" that the federation sees signs of everywhere in the industry. A committee of senior steelmakers, it says, has been closely reviewing its own activities as a trade association in order to fit it to the new requirements of a trade association within ECSC and a more competitive market. It is perhaps a pity that someone does not review the utterances of certain senior steelmakers, who on occasion give the impression that they like the idea of going into the common market simply because it will give them a chance to be rid of the Iron and Steel Board and

push up the prices of steel that they cannot sell at present prices.

CONSUMER SPENDING

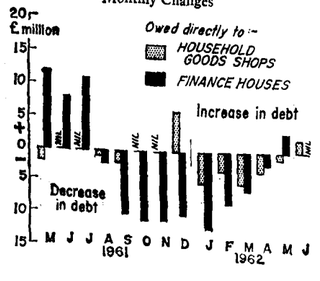
Seasonal Sluggishness?

In June, for the second month running, the total of hire purchase debt outstanding rose by £2 million. This time, however, the small rise was entirely in the debt owed directly to household goods shops, the first increase in this part of the debt since last December. Although there was apparently little underlying change in the new business of the finance houses or of furniture shops, the halving of minimum hire purchase deposits at the beginning of June, not surprisingly, gave a sharp boost to credit sales of household equipment. The Board of Trade's index for the group of hardware, radio and electrical goods shops rose by 18 points, from 98 to 116 (1957 = 100), in a month in which "there has normally been little change or a decrease."

This fillip to credit sales, however, is not reflected in the board's estimates of total retail trade. After moving up sharply in the previous month, the seasonally adjusted index of the value of sales by durable goods shops was only one point higher in June, "an increase that cannot be regarded as significant." With slackness in other trades, final estimates suggest that, after allowing for seasonal factors, the total value of retail business fell by rather more than 1 per cent and, after allowing also for increases in prices, the volume of sales in the second quarter as a whole was some 1 per cent less than in the first quarter.

The quietness of retail trade in the second quarter seems beyond dispute, but it is curious that cash sales of durables from shops fell in June, as seems to be the implication from the latest statistics of retail trade and hire purchase. This would mean that the easing of hire purchase terms did no more than switch some sales from the cash register to the credit account. The divergence appears in the straight statistics and cannot be explained away by any hazards in seasonal adjustment. But on the latter subject the Board of Trade still expresses uneasiness, despite the introduction of a new method last month which, incidentally, has significantly altered the whole official picture of spending on household equipment over the last twelve months.

HIRE PURCHASE DEBT
Monthly Changes



GOVERNMENT SPENDING

PAC and Public Purse

The Committee of Public Accounts has become increasingly exercised in recent years over the problems of big buying departments in the Government—the defence ministries, the Ministry of Health, the Atomic Energy Authority. Here multi-million pound orders are being placed (and in the cases of the AEA, also sought) in industry, and far from giving government negotiators the power of a monopoly trader, the opposite appears to follow. Military equipment exceeds its original estimate by wildly improbable amounts, companies supplying drugs to the National Health Service work to staggering profit margins, the Atomic Energy Authority sells its wares at a heavy loss to the Exchequer and every year the PAC asks why, why, why?

The defence departments have always been able to answer that the unknown is uncostable, and that no price can be put in advance on developments that are pressing on the frontiers of knowledge and may take a decade to realise. To take an example from the PAC's current report, the Blue Steel missile (a poor man's Skybolt to be carried beneath bombers) was ordered, as the Ministry of Aviation frankly admits, "on the basis of a specification which ... merely set out the contractor's proposals in terms of beliefs" which are likely to cost the taxpayer more than £60 million. This excuse has recently begun to wear a bit thin. The Committee of Public Accounts is beginning to ask why a job cannot be broken down into stages—feasibility study, design study and so on—and why a short-term cost estimate cannot be prepared for each stage as it is reached, so that the Ministry of Defence, among others, has some indication as work progresses of whether the bang will be worth the bill. The Ministry of Aviation is increasingly adopting this practice, but not to the extent that the PAC would wish; nor, the PAC suspects, is it doing much to encourage competition in the defence industries.

Here, as the committee recognises, the Ministry is up against the difficulties involved in maintaining an aircraft industry large enough to provide competition; give too much work to one efficient manufacturer, and his only competitor will starve to death. The Ministry's logic is, as usual, unanswerable, but its day-to-day housekeeping remains sufficiently slipshod to infuriate the committee. Why, to quote Blue Steel again, should "inadequacies in the contractors' cost accounting system" ever have been tolerated in the first place? Having placed difficult contracts, it is the Ministry's job to chase and chivy, not to sit back waiting for the goods to be delivered along with the laundry.

Powell's Pills

Aircraft manufacturers present the Government with a bill for the development of new products; the drug industry does not, but attempts to recoup its development costs, of failures as well as successes, in the price charged for its drugs. And this lies at the root of a dispute with the Ministry of Health that is as old as the health service itself. The industry in general reached a reasonably amicable working agreement with the Ministry some years back, though it erupts occasionally, as it appears to have done recently, over prices charged for an anæsthetic on which hospitals are currently spending £500,000 a year. The saga of how Mr Powell brought the few mavericks to heel is now well known; the ethically dubious device of importing drugs from countries that did not recognise American patents has resulted in import prices 60 per cent lower than those charged by British manufacturing subsidiaries of those American companies and in some sharp price cuts by several of these subsidiaries which are expected to save £1½ million a year. But, says the PAC, sniffing suspiciously at a bad smell wafting from across the Atlantic, is the Ministry of Health being led up the garden by this insistence on profit margins? Ought it not to look at costs generally? An industry spending nearly 10 per cent on sales and advertising, £6½ million out of £67 million sales, seems to be carrying a suspicious amount of fat for which the Exchequer pays. The present system of negotiating prices on the basis of profit margins is probably laying the foundations for massive inefficiency and high cost production in the future. Civil servants in the Ministry of Health, exhausted by the long tussle to get as far as they have done, might plead for some respite from the PAC and its constant nagging for quicker results. But then, this is what such committees are for.

What they are not for is the kind of piecemeal criticism of the Atomic Energy Authority which is driving the AEA to even greater timidity in its commercial operations at a time when boldness is all. This is not entirely the PAC's fault. The AEA's accounts are, as the committee properly complains, the biggest farce in bookkeeping; its balance sheet is invariably out of date and a monument of non-information if not near-misinformation, all cunningly scrambled in the interests of security. Among the footnotes one discovers that the AEA lost more than £13½ million on its trading operations in 1960-61 (the balance sheet for 1961-62 has yet to appear). The Treasury seemed satisfied but the PAC thought that "the accounts ... did not make it clear to Parliament that this large sum had been written off to the Exchequer."

The tragedy is that if the AEA wishes to establish itself in the atomic market, it should be writing off not only this but much bigger sums on its high cost uranium stocks. It is not the AEA's fault that it is burdened with these stocks now, any more than it is the authority's fault that it has to take an additional 12,000 unwanted tons from Canada as a political *quid pro quo*. Full trading accounts, presented if necessary by a separate trading company, would show up these facts, and enable the AEA to get a more sympathetic hearing from a watchdog such as the PAC which can wag its tail as well as bite.

IN THE MARKETS

Restraining Influences

Wall Street still appears to be holding the London equity market on a choke-chain. Given the slightest of domestic excuses, London seems prepared to bid equities higher; but time and again a fall on Wall Street has checked the London market before it has got fully into its stride. Wall Street with its fitful rallies still fails to give any firm demonstration of strength, while the German market plunged to a new low before flickering up a little on Wednesday. Doubts about the final outcome of the negotiations in Brussels and about the prospects for the British economy (expressed this week in a round-up of views of businessmen in the Midlands) have chastened hopes; and equities, which were spritely just before the weekend, soon lost their buoyancy. Even so, the earlier gains had been sufficiently strong to leave *The Economist* indicator up by 4.8 points to 317.6 in the week to Wednesday's close. How quickly London responds to Wall Street was shown not only in the earlier failure of equities to continue to rise but in their better showing on Thursday following a slight rally overnight on Wall Street.

The restraints on gilt-edged and other fixed interest stocks are far less severe than those on equities, but the continued procession of local authorities through the new issue turnstile is keeping the rise in fixed interest stocks within moderate bounds. The authorities' aim appears to be to take advantage of the more confident mood in the market and to get the queue moving forward so as to fund part of the immense debt in the mortgage market—but not in such a fashion to destroy hopes that interest rates will continue to fall slowly and gradually. So far they have succeeded, and in pressing new local authority loans on the market their policy avoids the impact on the banks' liquidity that results from outright funding through the sale of gilt-edged stocks. But they cannot have failed to note that the announcement of a £4 million issue from Plymouth and a £5 million issue from Southampton, both of a 6 per cent stock, 1973, at 98, had the immediate effect of wiping out the premiums on the Paisley issue, made on identical terms, and on the Warwickshire loan, where again apart from the slight spread of dates, 1973-74, the terms were the same. Since then, however, both stocks have recovered to a tiny premium. Should the authorities now allow the market a little breathing space? That must depend on one's view of the desirabil-

Growth, the Six, and EEC

How much of the dynamism of the six economies in the European Economic Community, so far, has been due to the fact that they have a common market? Up to 1961, the National Institute of Economic and Social Research thinks, not very much: the growth of EEC output and trade mainly reflected the fact that the community comprises six relatively fast-growing economies. Common market effects will become more important over time; but "it is premature to think of the common market as a single, competing economic block."

The institute, in its latest *Economic Review*, offers a statistical analysis by Mr R. L. Major of growth among the Six during the years before January 1, 1959, when the first reductions in tariffs and other discrimination were made between the common market countries, and the years since. His conclusion is that all that can be attributed to the creation of the common market is "a slight acceleration in the rise of trade between the six countries in 1961." This analysis in no sense writes down the economic success of the Six since 1958; it simply records this success as a continuation of these countries' impressive performance since the early fifties.

Manufacturing production there did rise faster between 1958 and 1961 than in the three years before—though on the same figuring it rose hardly any more between 1958 and 1961 than in other industrial countries of the world, while in the three years before the common market came into being it had been rising three times as fast among the six countries as elsewhere. In fact, however, such "before" and "after" comparisons are vitiated by the fact that 1958 was a year of diminished growth for the Six and of recession elsewhere, from which the other industrial countries recovered more sharply. If one leaves out this odd year, the Six were doing better than other industrial countries before the common market came into being and afterwards, and to almost exactly the same degree better: 9 per cent annual growth in manufacturing output for the Six and about 5 per cent in the other industrial countries. (It goes almost without saying that the United States and Britain were growing somewhat slower than the rest.)

"Intra-trade"—that between the members of the common market—would theoretically be expected to rise most as the result of setting up a common market. It has risen as a share of these countries' total trade in manufactures; but by another measure, it seems to have risen less than the share of the Six in total trade in manufactures of the main industrial countries. And it has been the high tariff countries whose exports have in fact gained most among the Six. Those of the low-tariff countries have gained less; this is the reverse of what might have been expected to result from equivalent percentage cuts in tariffs all round.

Mr Major attributes the increase in "intra-trade" that actually happened largely to the French devaluations, the increase in Italian competitiveness, and, up to 1960 at least, to the decline in Britain's competitiveness in these countries' markets. He does think that the comparatively sharp increase in their "intra-trade" in 1961, however, may have been a "common market effect"—particularly as the tariff cuts taking effect in that year were more discriminatory against other possible suppliers than before.

Britain's trade with these EEC countries—as with the European Free Trade Association of which it is a member—does not seem to have been much affected by either of the two new groupings. Its sales to both groups of markets have been fairly parallel—a slight decline in both up to 1961, with rather a sharp reversal upwards during 1961 itself. But during 1961, "there does seem to have been some improvement in Britain's general competitive power in Europe."

ity of encouraging a fall in long-term interest rates. Since the beginning of the year about £147 million in local and public authority loans have come on to the market, with the result that calls this month will amount to about £34 million with another £24 million next month. As yet there are no signs of indigestion; but they might appear if the institutions were faced with the prospect well into the autumn of putting £1 million a day into new local authority issues alone.

Wall Street's Barrier

A correspondent cables:

WALL STREET continues to find the 600 level for the Dow Jones average a formidable barrier and two rallies have failed to carry stocks up beyond this point. These rallies were based on hopes of a tax cut and now that these are fading a decline should logically ensue. But there is a slow and faltering advance in the economy which has taken some of the steam out of the pressure for tax reductions and this unexpected strength has bolstered investors' hopes. Trading is still light and speculation absent, but there is no selling pressure and averaging by institutional buyers is keeping the market fairly stable. Higher dividends from a number of industrial companies and the decision by United States Steel and Bethlehem Steel to maintain their payments have focused attention on the handsome yields that many stocks now offer. This does not mean that a big buying wave is in prospect; but if the economy does not falter, a retreat is improbable and a fresh assault on the 600 level possible.

Uncertainties about the business outlook are likely, however, to prevent a really aggressive advance and investors will probably remain selective in their purchases. At the moment, for example, they are interested in utilities offering good yields, airline stocks, which are benefiting from increases in fares, trucking companies, which continue to gain at the expense of the railroads, and income stocks, which are now selling at reasonable price/earnings ratios. Some stocks may be sold when it is clear that no immediate tax reduction will be forthcoming but any decline should be moderated by the willingness of investors to buy stocks with attractive yields.

THE EXCHANGES

Network of Dollar Defence

PRIVATE demand for gold reappeared at the end of last week, and the London gold market was again fairly active on Tuesday. It then became very quiet, suggesting that the momentary revival of interest was connected mainly with currency operators' understandable suspicion of long weekends; but activity quickened again on Thursday, and the price edged up to $35.12½ an ounce. The markets had noted the further weekly drop of $60 million in the United States gold stock, bringing the drop since early July to $287 million. The dollar itself has been rather weaker against sterling this week and the British authorities are believed to have taken dollars into their reserves at just over $2.80½. The dollar has also fallen a little in Germany and Switzerland, but the selling appears to have been readily absorbed by the market, so that on the European continent the dollar is still generally free of any need for official support, as it has been since the Telstar impact just over two weeks ago.

Meanwhile the United States authorities have made a further extension to their ring of first line credit defences by another three months swap arrangement, this time with the German Bundesbank. This arrangement, like those with France, Britain, the Netherlands and Belgium, is for mutual credits of $50 million and the local currency equivalent; but in this case the mutual credits are granted on a stand-by basis, so that there will be no effect on published reserves until the credits are actually used. This follows the pattern in the larger swap arrangement with Switzerland (for $200 million, of which $100 million is channelled through the BIS); but whereas half the Swiss credit was immediately drawn (and a further $10 million has been activated this week), no early drawing is expected on the German credit, since the dollar has not been noticeably weak in Germany. The recent flow of speculative funds into Switzerland, which has now been halted, more or less passed Germany by.

If the United States does make any extensive use of these central banking credit facilities it will be expected to consolidate these in a drawing on the International Monetary Fund—much as Britain did in 1961. Completion of the formal ratifications of the Paris club arrangements is not far off; and it happens that Britain's large repayment to the IMF has put the dollar as well as the pound on the parity line in the Fund's accounting. The Fund's holdings of both the key currencies stand at just about the level of the standard currency subscription, of 75 per cent of quotas, so that Britain is no longer a net IMF debtor and the United States—for the first time since the Fund got under way—is no longer a net creditor. Britain's whole transaction with the Fund has indeed contributed to this net easing of the strain on the dollar, as Britain repaid more dollars than it drew—$722 million, compared with the drawing of $450 million, of which one-third was acquired by the Fund by a sale of gold to the United States.

CANADA

Currency Comeback

SINCE the emergency measures taken on June 24th, the reflux of foreign exchange to Canada has reached US $364 million—$58 million in the final week of June and $306 million in July. The reserves, including the $650 million drawn in international credits, now stand at $2,114 million. If this improvement continues Canada may be able to pay off its short-term credits from the Federal Reserve and the Bank of England when they mature (presumably in late September). These total $350 million; in addition Canada has drawn $300 million from the IMF and has an unused credit line of $400 million with the United States Export-Import Bank.

Some $61 million of the July increase in reserves came from an advance repayment of the postwar loan to France. Despite the Bank of Canada's substantial purchases of United States dollars the Canadian dollar has remained between its parity of 92.50 and 92.75 cents to the US dollar throughout July—a sign of the force of its comeback. In the month before the emergency measures were introduced Canada's dollar holdings fell to $600 million; this must have been considered a minimum since in June Canada sold gold from its reserves equivalent to nearly $250 million—providing, incidentally, a useful supplement to the European gold pool.

The new strength of the Canadian dollar is derived from the settling of short positions built up before the emergency measures, the turn-round in the leads and lags of international payments, and to an increasing extent from the return of funds whisked away during the crisis. In the past week or so the Canadian bond market has strengthened slightly, and yields have fallen by an ⅛ to ¼ per cent. The Canadian Treasury bill rate has also eased slightly and is now at 5½ per cent, but there is little scope for arbitrage on a covered basis after allowing for the 15 per cent withholding tax. In the long-term market, many Canadian companies and municipalities are as yet unwilling to return to borrow in New York, despite the 2 per cent advantage in long-term rates. Having borrowed in the past with the Canadian dollar at a 6 per cent premium, they are now servicing that debt with the Canadian dollar at an 8 per cent discount.

BC Boomerang

WHILE Canada's external finances are on the mend, the financial problems of the provincial government of British Columbia seem to be getting worse. The British Columbia government's credit rating took a nasty knock last year when it expropriated British Columbia Power. Now with debts of government agencies totalling $1,342 million, much of which is either maturing or being cashed by holders of parity bonds seeking higher returns elsewhere, the government is finding it next to impossible to raise new money to cover the gap in its finances. In April the province offered for sale $25 million B.C. Hydro and Power Authority bonds. No one has discovered who bought these bonds and many suspect that they were never sold. Press

without air conditioning...

will it soon be obsolete?

Build the advantages of air conditioning into your new building and you make sure it will maintain its 'newness' for years. With the present worldwide trend toward air conditioning, a new building that doesn't include this advantage faces an uncertain future in the property market of the next few decades.

As air conditioning becomes more widespread, your workers, customers, guests will come to demand the quieter, cleaner atmosphere it affords. By adding air conditioning you're protecting a huge investment at small additional cost. It's an outlay you can't afford *not* to make.

Air conditioning provides automatic all-the-year-round control of temperature, humidity, air movement and air cleanliness. And the economical time to install it is now, at planning stage. Ask your architect to show you how much it could add to the value of your property.

CONTROLS BY HONEYWELL—international experts on every aspect of air conditioning—are an important part of the systems in these recently completed buildings:

- **A.E.I. Ltd., Lincoln**
- **B.O.A.C. Air Terminal, London**
- **Commercial Union Assurance Company, Exeter**
- **Imperial Hotel, Torquay**

Japan's imports-exports (in millions of U.S.$)

How to buy and sell in the billion dollar Japanese market

One way is to open your own office in Tokyo staffed with 3,000 experts on Japan's industries, commerce and foreign trade. In effect this is what you get when you deal with Japan's largest general trading company, Mitsubishi Shoji of Tokyo. From its head office with 100 branches and associates throughout the world, Mitsubishi Shoji helped 5,000 overseas firms do $1,100,000,000 worth of import-export business in Japan last year. Mitsubishi Shoji handles everything from consumer goods to heavy industrial equipment. Long association with other Mitsubishi enterprises (30 of Japan's largest corporations) gives you a priceless advantage when either buying or selling in the Japanese market. Put Mitsubishi Shoji's proven ability to work for your firm. For complete information write:

reports in Canada suggest that the government has so far called on three of the chartered banks for aid amounting to between $125 and $150 million, but that the province's banker, the Canadian Imperial Bank of Commerce, has now called for a halt on these drawings and that the Toronto-Dominion Bank and the Bank of Nova Scotia have had to be placated by the transfer of certain government agency accounts to their books. It is also reported that the Royal Bank of Canada and the Bank of Montreal have both refused requests for credit lines of $50 million.

The Prime Minister of British Columbia, Mr Bennett, still scoffs at these suggestions of financial trouble. But his favoured development schemes for the Columbia and the Peace Rivers have been virtually suspended. And there is more trouble ahead. In September some $36 million of Pacific Great Eastern Railway parity bonds mature and the government says that it plans to replace them with a new issue of parity bonds this month. Holders of existing parity bonds, which now yield 5½ per cent, are still reported to be cashing them in order to invest at higher rates elsewhere. Mr Bennett has a crisis of confidence on his hands. To surmount it, he must first make a full disclosure of the province's financial position, secondly offer rates of interest in line with the risks that investors now see in the province's future, and thirdly set about lengthening the maturity of the province's debts.

INDUSTRIAL PRODUCTION

Where is the Growth?

For some time the Central Statistical Office has been putting out two series of seasonally adjusted figures with its index of industrial production—one for all industries, the other for manufacturing as a whole. Last year a more detailed method of seasonal adjustment was made possible by the use of an electronic computer and now, in the current issue of the *Monthly Digest of Statistics*, seasonally adjusted figures are given for the first time for all the main groups of industries. Twenty-nine seasonally adjusted series make an impressive array: all are produced monthly except that for the construction industry which is quarterly.

Seasonal adjustment removes the effects of holidays and regularly recurring movements, but not such irregular occurrences as strikes, extreme weather conditions and 'flu epidemics. Thus, because of disputes, the output of the vehicle industry still looks pretty erratic even after adjustment. The time of year affects some industries much more than others. All industries have reduced output in August and most likewise in July although a noticeable and understandable exception is the drink and tobacco group with comparatively high July output. Consumer trades which are linked

to the Christmas spending spree tend to have fairly big seasonal swings, operating at a low level at the beginning of the year and at a peak in the autumn.

INDUSTRIAL OUTPUT

(Seasonally adjusted; 1958=100).

	Jan. 1961	July 1961	Oct. 1961	Apr. 1962	May 1962
Food	106	107	108	110	...
Drink & tobacco	116	118	116	108	...
Chemicals	125	125	124	126	...
Engineering & elec. goods	115	125	121	123	125
Shipbuilding & marine eng.	84	83	86	89	89
Vehicles	106	110	106	111	116
Iron & steel	120	115	109	109	110
Textiles	105	109	103	102	106
Clothing & footwear	114	131	115	112	110
Bricks, cement, etc.	122	123	122	117	...
Timber & furniture	122	118	116	110	...
Paper, printing & publishing	120	120	117	120	126
Gas, electricity, water	114	116	117	126	127
All industries*	112	116	113	114	116

* Including some not shown separately.

By May, industrial output as a whole had edged back to the level of last July and was 3 to 4 per cent higher than at the start of last year. These new statistics make it possible to see where there has been any growth, although unfortunately for many industries they do not go beyond April. All the main groups of industries, except gas, electricity, and water, got stuck or suffered a setback in the last quarter of 1961. Recovery since then has been in engineering (including shipbuilding and vehicles), food, paper and publishing, and pottery and glass. Textiles gave a spurt in May, but clothing sank to the lowest level recorded (the new statistics start at January, 1961). Another industry for which the latest figure is the lowest is the drink and tobacco group. The chemical industry has been on a long-extended plateau; iron and steel's figure for May was fractionally lower than that for March, although some 8 per cent above the January trough.

AIRLINE RESULTS

Some Make Profits

The world's airlines are tentatively estimated to have lost £50 million last year, and no one need feel proud of the fact that close on a third of this was accounted for by the two British air corporations. But some shining exceptions managed to make a profit and they were by no means all as big or as long-established as Pan American, which recently reported a net profit of about £3.6 million—a small enough margin for a turnover of more than £164 million, but a profit nonetheless. The airline's critics immediately retorted that this was due more to Pan American's international hotel business and its lucrative agency at Cape Canaveral than to its aviation operations, but they can hardly say the same of the small Irish airline, Aer Lingus, of Swissair, of British United Airways, of the Finnish national airline or of some of the domestic giants in the United States. Airlines as far apart as Pakistan and Colombia, indeed, managed to break even, in one of aviation's blackest years—some by a hair's breadth and considerable financial ingenuity, some by margins too small to cover dividends and some with a comfortable surplus.

Aer Lingus, for example, made its eleventh consecutive profit, of £219,000 on a turnover of nearly £10 million, at a specially challenging time, the first full year in which all three of its big jets were operating on the North Atlantic. Even the airline sounds slightly surprised that these "earned a clear operating surplus . . . at a time when other airlines, long established on the North Atlantic, were losing money." In terms of capacity, it is much as if Eire has bought one of Cunard's Queens and made it pay. Students of airline economics might like to speculate what these diverse airlines share in common other than their dexterity in keeping out of the red. A certain absence of fat? A hard-headed approach to the volume of traffic likely to be offered and the capacity needed to carry it? Shrewd bargaining over traffic rights? Good engineering? Quick reactions? Or just a good fairy?

CARS

Selling Season Changes

Hire purchase sales of cars, as registered by Hire Purchase Information, fell by about 5,000 to 84,600 in July, following the fall of 10,000 in June from the May peak. The July fall was actually rather smaller than in 1961, even though the July figures may then have been swollen by buying in advance of the tax surcharge. But the total hire purchase sales of cars last month remained about 7 per cent lower than a year before; indeed in every month except May they have been below the corresponding level in 1961. There seems to have been a significant drop in the proportion of new cars sold on hire purchase during the first half of the year: hire purchase sales were down by about 7½ per cent while total registrations were down by only 2 per cent.

Further falls in car sales during the next few months, both on cash and on credit, would probably be consistent with a continued rise in demand, allowing for seasonal variations; for the pattern of car sales seems to have changed during the last two years. Up to about mid-1960 waiting lists still tended to fit actual car sales to the makers' production schedules; since then, the emergence of space capacity in the industry, if not for every model all the time, has meant that sales follow the consumer's timing. This, the National Institute of Economic and Social Research thinks, seems to be concentrating the selling season more and more into the early months of the year. It makes the institute write down the apparent increase early this year in (seasonally corrected) expenditure on cars—and indeed in total personal consumption expenditure—which the Whitehall statistics suggest took place. But it also means that further falls in actual sales in the re-

maining months of the year need worry the industry a good deal less than on the official figuring they might.

EGYPT

Money In and Out

A FRESH agreement has now been reached between the British and Egyptian Governments on that part of the troublesome 1959 financial agreement involving the property of British subjects sequestered at the time of the Suez crisis. This property was subsequently returned to the owners, as distinct from that property which was "Egyptianised". The 1959 agreement set aside £27½ million to compensate for the nationalised property; and provided guarantees that desequestered property could be realised and repatriated. On this score, the agreement in fact brought very little more than further disagreement.

The main problem has been the transfer of cash and bank balances up to the equivalent of £E5,000 (the Egyptian pound is still nominally at parity with sterling) as provided in the 1959 agreement. The new agreement sets in motion a process that is scheduled to clear up this problem within three years. The first £E1,000 of each approved application will go to the British Embassy in Cairo which will use this money for its current expenditure, thus releasing equivalent sterling funds in London for payment to claimants. To meet the balance of the claims up to £E5,000, Egypt will provide approximately £2½ million, which will be made available in London on specified dates. An immediate payment of £375,000 is being made to settle the outstanding claims of those who have already received the first £E1,000. There is one catch. The British Government is to provide Egypt with a credit of £715,000 to be used to finance transfers in the immediate future.

Another spur to this new agreement was probably a loan of £3,575,000 which Britain has now granted to Egypt under Section III of the Export Guarantees Act. The loan will be repaid over a period of ten years, with a grace period of three years before repayments begin, and will in the usual way be tied to British exports.

AID

Lucky Angola

THE annual "aid review" of the Development Assistance Committee of OECD is issued on the personal responsibility of its American chairman, Mr James W. Ridelberger; but even that is not a sufficient protection against the blue pencils of national bureaucracies. Between the lines, however, a few positive strictures do come across:

> While the factors determining the appropriate size of the development assistance contribution of individual countries are much too complex to permit a simple arithmetic allocation of a desirable share of each DAC country in the common aid effort, it is sufficiently clear that substantial differences in effort persist and require correction.

No names are named, beyond indeed a laudatory mention of Portugal—it apparently contributes 1.4 per cent of its national product in public disbursements to developing countries, compared with the OECD average of 0.8 per cent. The report also emphasises, wisely, the inevitable limitations in these comparative figures of aid contributions which it has painstakingly compiled. The compilation shows that in 1961 Britain had slipped into fourth place as provider of public funds, its $445 million being less than half the French contribution and below the German—and all of these were still only a small fraction of the American total.

A more detailed table shows that the German contribution is swollen by more than $200 million of interest-bearing bonds of the World Bank and other institutions, which really constitute a profitable use of exchange reserves rather than a budgetary burden. The inclusion of private capital, also, puts Britain ahead of Germany. On the other hand, the Development Assistance Committee, like the World Bank, is putting much emphasis on appropriate terms of aid; and the DAC report notes, dead-pan, that Germany and Britain "have raised objections of principle against 'soft' loans." In words that come as close as any to a direct criticism, the authors comment: "It is not clear that the lending policies of some member countries make sufficient allowance for ability of recipients to repay and for the repercussion of their terms on other donors."

TRADE IN ENERGY

Moving Middle East Gas

KUWAIT is the first country that actually produces oil and gas to offer any views on the Meurogas project to pipe natural gas from the Middle East to Western Europe, and its views seem firmly negative. This pipeline project which somewhat resembles one of which the Bechtel consultant firms made a study more than ten years ago, has had a good deal of publicity in the United States, Britain, and in Middle East countries where its promoters have been seeking to interest local capital. It has had some formal approval from the oil transit countries, but no more than reports of discussions with the governments of countries where the gas would actually come from.

In Kuwait there seems to have been some misunderstanding about seeking subscriptions from private investors. Meurogas gathered that formally there was nothing to prevent the offer of shares by any enterprise; but the Kuwait Government has since been at pains to dissociate itself from any degree of approval of the project, and it seems possible, indeed, that one result of the affair will be a regulation prohibiting any offer of shares by a foreign company without specific official sanction.

The industrial and economic department of the Kuwait Ministry of Finance seems to be quite hard-headed towards the whole gas pipeline idea. It doubts whether gas, if moved as Meurogas thinks it could be moved by pipeline, would be competitive in West European markets. If it were competitive, Kuwait thinks the gas would probably take a share of the energy market there mainly at the expense of oil. It believes that the most economic use of natural gas in the Middle East will sooner or later be its conversion into petrochemicals that would be cheaper to move than gas itself. Kuwait is at present studying a project for a local ammonia plant, and indeed has so many plans for gas utilisation that it is

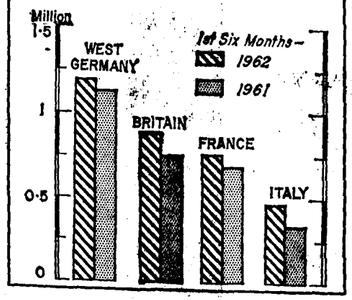
VEHICLE OUTPUT

Car production has generally been higher in the first half of this year than a year before, though the output of commercial vehicles has shown little change. Italy has shown the biggest improvement of any European country, with the output of all vehicles nearly 40 per cent higher; Germany, though still much the largest producer, showed the smallest increase, with car production rising only five per cent and that of commercial vehicles falling slightly —as it did in Britain, too. The size of the recovery in the United States is perhaps the most surprising feature: car production rose 33 per cent to 3,625,832 and that of trucks 12 per cent to 638,335.



asking the Kuwait Oil Company to increase gas production. In principle, too, it believes that the Middle East should make every attempt to promote local industrialisation on this very cheap energy, rather than get involved in any large-scale movement of gas to Europe, which would leave the petroleum producing countries simply in the position of raw material suppliers that they occupy in the oil trade. It remains to be seen, certainly, how soon petrochemical development on this cheap fuel and feedstock could become commercially justified in the Middle East; but this Kuwait view certainly seems a reasonable one for any state possessing little else except oil and gas.

RIO TINTO-ZINC CORPORATION

RTZ Enriched

SHARING out the 12,000 short ton "hidden contract" with the UK Atomic Energy Authority among the Canadian uranium producers on the basis of deliveries being made on July 1, 1961, has given Rio Algom, the Canadian mining subsidiary of the RTZ group, 31 per cent of the total. On that date Rio Algom had cut its rate of deliveries to fit in with the stretch-out scheme arranged to suit the British and American authorities and to prolong the lives of some of the mines. On the basis of production before the stretch-out, Rio Algom reckons it would have been entitled to about 45 per cent of the extra contract.

This extra outlet could carry the last of Rio Algom's mines (only two, Milliken and Nordic are now in production) from the end of existing contracts in December 1966 to January 1970. The projected rate of deliveries is 200,000 lb a month at a price of $5.146 a lb, inclusive of "escalator" payments. Costs in efficient mines such as Rio Algom's are well below $5 a lb and the company's statement that its acceptance of these terms is not automatic needs to be taken with a pinch of salt. Rio Algom says it has to think hard about costs 4½ to 7½ years ahead before it can jump at the new contract. But as a price of about $5 a lb has been expected for over a year it presumably has made up its mind, though it does not expect its share in the master contract will contribute much to Rio Algom's earnings after 1966.

Rio Algom has turned to speciality steels to help fill in the gap, before demand for uranium picks up again, it hopes, around 1970. By buying Atlas Steel for $52½ million, mainly in cash with some shares, it has added steel to the long list of metals in which the RTZ group has an interest. Atlas, reputed to be the largest producer of special steels in the Commonwealth, has a large development in train and appears likely to have a recurring need for capital. It last raised new money only a few months ago. By buying Atlas, Rio Algom should be able to use up some of its substantial tax write-offs at the earliest opportunity.

Atlas is an extremely efficient producer of stainless and other special steels. But the bigger Algoma Steel Corporation on Rio Algom's doorstep is the steel company with the strongest link with uranium. It has been experimenting with uranium steel alloys which it is hoped will one day absorb tonnage quantities of uranium. Algoma is the company in which Hawker Siddeley took an interest some years ago but was forced to sell it to the public in order to consolidate its other interests.

GERMANY

More Flexible Interest Rates?

Frankfurt

BANK interest rates in West Germany, which have hitherto been as rigid as anywhere, may become more flexible—though some formidable obstacles still stand in the way. A decision is due to be taken by the newly created Federal Control Bureau for Credit Transactions (*Bundesaufsichtsamt für das Kreditwesen*). Up to now, in accordance with the federal structure of the west German republic, this supervisory function has been carried out by twelve bodies, each responsible for one of the *Länder*. Although these bodies acted in harmony, it has nevertheless been considered expedient to replace this multiplicity of authorities by a new single one. One of the principal functions of the Federal Control Bureau is to fix rates of interest of banks and savings banks for deposits and for credits, for these charges are not, in Germany, at the discretion of individual banks. In general, interest rates have been revised when the discount rate of the German Bundesbank has been altered. Although the regulation concerns maximum interest rates and transactions are permitted at lower rates, this does not in practice happen; so that every German bank pays the same rate of interest on its clients' deposits (with certain exceptions for small banks which are allowed to pay slightly higher interest) and charges the same rates for credits.

Whereas interest rates for credits are immediately adjusted to any alteration in the discount rate, it is customary for the controlling authority to discuss new interest rates on deposits with the associations of credit institutions and to apply them only after consultation with the banks. These discussions always lead to differences of opinion between the various groups of credit institutions. The savings banks argue that interest rates for savings deposits should be appreciably higher than for time deposits, and the commercial banks take the opposite view.

From the beginning of this year, power over these matters has passed to the Ministry of Economic Affairs, or the Federal Control Bureau for Credit Transactions as its agent. These authorities "may" lay down regulations about the conditions for granting credits and accepting deposits, and, in doing so, "shall" delimit interest rates. From the phrasing of the relevant sections of the law, some observers take this to mean that such regulations need not necessarily be issued and that the authorities could confine themselves to defining the range of interest rates. It is on this interpretation that the savings banks pin their hopes, believing that in future the formation of interest rates for bank and savings deposits will be more flexible. Those who are familiar with the ideas prevalent in the Federal Ministry of Economic Affairs and in the new Federal Control Bureau believe, however, that future treatment of the interest question will not differ essentially from past procedure. The authorities are anxious to avoid any threat to banking stability through excessive competition for deposits; they may be disinclined, also, to discard official influence over market interest rates that is at present provided by the link with the official discount rate.

These arguments concern only interest rates on deposits, and not on credits; but an attack on these has in recent days been mounted from another quarter. The Federal Cartel Bureau, whose task it is to watch over competitive conditions in the economy, has asked the leading credit organisations to define their views on the so-called conditions of business transmitted to associated banks from time to time by these organisations and showing charges for bank credits. The Cartel Bureau objects to this procedure on the ground that the transmission of such "lists of conditions" leads to the alignment of rates by different banks. The Bureau appears to consider that this practice is an obstacle to competition and is evidently trying to introduce a change. The effect of such a change would not be directly on interest rates, but rather on charges and commissions, which are not less important to the level of credit costs than the rate of interest itself.

BUILDING STANDARDISATION

Four Inch Furore

THE Royal Institute of British Architects took a deliberate poke last week at the building industry's biggest hornets' nest—standardisation—when it published the results of its recent conference on industrialised building. Everybody—even the brick manufacturers—agrees on the desirability of some form of dimensional coordination of components; the quarrelling starts over means, not ends. This is why, after 14 years, the British Standards Institute has still found no solution that pleases everybody, though it may now be in the last stages of finding a formula.

Wading right in, the RIBA has recommended, for industrialised building systems "the adoption of a system of modular coordination 4"/10cm as a reference point for a range of preferred dimensions." This is a recommendation that has implications for the whole building industry, since many components or fittings, particularly in housing, are or should be common to all methods of construction. It would be disastrously wasteful if failure to agree on common denominators at this stage produced entirely unnecessary divisions between new and traditional methods and materials.

Thinking about standardisation has travelled along two alternative paths in the past few years. The adoption of a single module, to which all components would have to conform, is the first. The other would be acceptance of a more complicated series of preferred, or recommended, dimensions for each kind of component which make sense when added together but do not necessarily share a common factor. The fact that the RIBA resolutions have been interpreted as being exclusively concerned with a 4 inch module can be taken as a guide to the hold which the modular concept has on many architects.

The reasons are obvious. In the drawing office the simplicity of a single module has overwhelming attractions compared with the necessary juggling and complex calculations which a more deviously related series of dimensions, of the kind experimentally produced by the Building Research Station, would involve. The second method may be more flexible mathematically; whether it would be used to the full is another matter. Its main advantage seems to be that it takes closer account of such matters as thicknesses and small dimensions, and avoids the danger of wastage of materials through over-rationalisation. It is worth remembering that the Building Research Station put its scheme into practice in some houses in Hatfield specifically at the request of the European Productivity Agency, which seems to have regarded the experiment as a necessary part of working out the practicality of 4 inch and (not quite the same thing) 10 cm modules. The makers of building materials are much less frightened of preferred dimensions. It would be a pity if conservatism on their part or rigid rationalism in other directions should hold up a decision here even longer.

PRE-STRESSED CONCRETE

Material Progress

TEN years ago British engineers were still using pre-stressed concrete with a lot of caginess and uncertainty; by 1960 about £40 million worth of the material was being used in this country in a year. A talk given recently to the Institution of Civil Engineers by Mr F. Walley has outlined the main developments in research and practical improvement which have helped this advance and the better engineering techniques which have accompanied it. This country has never been in the forefront of pioneering with pre-stressed concrete, but some useful work on specific problems has been done here, such as the various physical tests carried out by the Cement and Concrete Federation.

The ingredients have changed little in the past ten years apart from the wide substitution of stranded for solid wire: nylon and glass fibres have only been toyed with. The ancillary use of thermosetting plastics to join two segments which are being stressed together on the site has great possibilities, but so far the cost is impracticably high.

Curiously little work appears to have been done, here or elsewhere, on the behaviour of the actual concrete used for stressing, though the wire tendons have come in for close examination. Their relaxation and fatigue has been diagnosed by the Building Research Station—though it has not yet been possible to test the behaviour of stranded wire to the same extent, partly owing to the difficulty of checking individual strands. The Cement and Concrete Association discovered by tests that even straight tendons suffered appreciable frictional losses.

Hundreds of pre-stressed concrete bridges, from footbridges to flyovers, have now been built, helped by fuller knowledge of the now popular combination of pre-stressed with *in situ* concrete. Work such as that done by the National Physical Laboratory on the effect of high temperatures on the material is helping to extend its uses. Special tests have confirmed its value as an alternative to steel for nuclear reactors—the French have been using such vessels and they are now to be built for British power stations.

UNIVERSITY OF CALIFORNIA 31 AUG 1962 PERIODICALS

TRACTORS

Another German Merger

Düsseldorf

THE renowned MAN diesel engineering firm, Maschinenfabrik Augsburg Nürnberg, has made a somewhat surprising agreement on tractor production with Mannesmann of Düsseldorf and its subsidiary Porsche-Diesel-Motorenbau of Friedrichshafen. Only a short time ago MAN was talking about possible mergers, but not bothering to conceal its desire to build up a sizeable tractor combine with other firms elsewhere in the common market. Indeed, Fiat and Renault were mentioned as possible partners. Now MAN seems to have cut its ambitions down to size.

Under the new agreement both the firms, MAN and Porsche-Diesel, will merge their tractor manufacturing programmes; in

reality, however, this means that MAN will only subcontract for Porsche-Diesel in future. Compared to the far-reaching recent expectations of MAN, the result seems rather unimportant, but it may be characteristic of the circumstances facing the tractor industry in the Federal Republic, where sales are declining steadily. Some time ago two well-known firms, Joseph Bautz and Maschinenfabrik Fahr, had to give up tractor production and seek co-operation with stronger competitors such as Rheinstahl-Hanomag AG and Kloeckner-Humboldt-Deutz, which has the largest single [illegible] (about 17 per cent) of the West [illegible] market.

Germany's tractor industry produced 130,500 tractors in 1961, but expects only 120,000 for this year; an output even of this size will probably exceed market demand. Only the more powerful tractors seem to have reasonable prospects. So the process of steady concentration in this part of German engineering, of which the agreement between MAN and Porsche-Diesel is just another demonstration, seems certain to continue.

SHIPPING

Yet More Advisers

THE Ministry of Transport seems to be succumbing to the temptation to surround itself with a hedge of advisers. Mr Marples announced last week that he is setting up a Shipping Advisory Panel to advise him on "commercial and economic matters affecting the future prosperity of British shipping"—a body that is intended to supplement the consultations that already take place with the trade organisations and trade unions. As the only members who do not belong to one or the other of these or to the ministries concerned are Mr Paul Chambers, chairman of Imperial Chemical Industries, and Sir William McFadzean, chairman of British Insulated Callender's Cables, Mr Marples either sets great store by the advice of these two distinguished gentlemen or on getting a representative assembly to discuss problems together under his chairmanship.

One can imagine that the discussions of this panel will be enlightening, both to the minister and to the members; but the relevance of discussion to the problems facing British shipping is much less obvious. These problems are the slump in freight rates and the nationalistic policies of many foreign governments: as they are international, they can only be alleviated by international action—or by the efforts of individual shipowners to improve their efficiency. All one can see the panel doing is giving the minister yet more advice on the attitude he should take in negotiations—which the trade associations are surely only too willing to provide.

One subject that the panel may feel tempted to discuss is the possibility of raising freight rates by restrictive practices; some are now reduced to arguing that this is the only solution, for there is no real surplus of ships. Certainly there are some signs that freight rates may stage at least their usual recovery in the autumn, for the number of tankers competing for grain cargoes is declining now that their natural occupation of carrying oil has become more profitable. A year ago the tonnage of tankers carrying grain was 2,500,000; now it is 1,600,000. With supply thus falling—tramps are being laid up, too—any rise in demand has a better chance of pushing up rates.

A weekly service for business executives covering world economic trends

Highlights Concise analyses of important events in a number of countries
European Integration The latest news from the E.E.C. and of U.K. negotiations
Special Survey This week covers Peru

SHORTER NOTES

The World Bank has now inaugurated its Development Advisory Service. This provides a corps of experts—fifteen have been appointed—available to serve as economic and financial advisers to less developed member countries.

★

India has been granted another credit by the International Development Association, of $17½ million to help finance the Koyna hydro-electric power project. The IDA credit is on the usual 50-year term, interest free.

★

Austria has now declared its currency formally convertible under article VIII of the International Monetary Fund; it is the twenty-second country to do so. This move follows a relaxation of restrictions on purchases of foreign securities and other financial transfers by Austrian residents.

★

Export credits insured under "commercial" policies of the Export Credits Guarantee Department reached £221 million in the second quarter of this year, a rise of 16 per cent over the second quarter of 1962. The department now reports that 26 offers of financial guarantees for the longer credits have been made in principle on contracts still under negotiation, to a total value of £177 million; only one financial guarantee has actually gone through, on a hydro-electric project in Peru.

★

Production of agricultural machinery in the first six months of this year was one per cent below that in the same period of 1961. That of tractors rose three per cent, of combine harvesters fell five per cent and of implements fell 18 per cent. Home sales fell 15 per cent in total, but exports rose 10 per cent; tractor exports were 12 per cent higher.

Mr Geoffrey Rippon, the new Minister of Public Building and Works, returned to an old theme in a speech last Wednesday: he announced that he will appoint a committee to "take a fresh look at present contractual practices."

★

The FBI has published a useful booklet "Restrictive Trade Practices and the European Economic Community" (price ten shillings) which outlines the possible effects on British trade agreements, as far as they can be assessed, of Rome Treaty legislation on the subject. Purely domestic agreements will seldom be affected, but the Treaty would cover export agreements not affected by the Restrictive Trade Practices Act where these concern trade between member countries.

★

New Ministry of Transport regulations introduce stricter controls on the carrying of large or awkward loads by road transport and their lighting at night. Loads more than 20 feet wide or 90 feet long will require special permission from the Ministry before being moved by road.

★

The Stock Exchange Council has agreed that in future dollar securities can be recorded in sterling as well as in the "dummy" London dollars—five to the £.

COMPANY MEETINGS

LONDON TIN CORPORATION

RESULTS CONSTITUTE A NEW RECORD

SIR DOUGLAS WARING'S STATEMENT

The thirty-sixth Annual General Meeting of London Tin Corporation Limited was held on August 7th at The Chartered Insurance Institute, 20, Aldermanbury, London, E.C.

The following is an extract from the statement by **Sir Douglas Waring, CBE,** the Chairman, which has been circulated to shareholders:

In the statement which I made at last year's Annual General Meeting I said that the outlook for tin appeared to be good and that our income for the year to March 31, 1962, would probably show an increase over that recorded in the Accounts then under review. The results this year confirm those expectations and constitute a new record in the history of this Corporation.

THE TIN POSITION

As you are aware, control of exports of tin by the producing countries which are signatories to the International Tin Agreement, was lifted entirely with effect from October 1, 1960. Full-scale mining operations were, therefore, resumed as rapidly as possible and have continued on this basis up to the present time. According to the latest statistics issued by the International Tin Council, mine production for the year 1961 by all countries outside the Sino-Soviet bloc was 137,000 tons expressed in terms of tin metal. Free world consumption is stated at 160,000 tons. This imbalance was to a large extent counteracted by the release of 10,000 tons from the Buffer Stock, and by sales of non-commercial stocks held by certain consuming countries. In the event, a physical shortage of tin which appeared likely in the middle of last year did not materialise although available world stocks of tin metal show a reduction at the end of 1961.

I expressed the opinion last year that the price range agreed by the International Tin Council needed re-examination in the light of conditions existing, and agreement was eventually reached in January last to raise the floor and ceiling prices to £790 and £965 per ton respectively so as to encourage production to meet consumer demand. This has unfortunately been temporarily frustrated by the uncertainty arising in the market as a result of the decision of the United States Administration, approved by the Congress, to release from the US stockpile 50,000 tons of tin, as part of a quantity of some 164,000 tons declared as surplus to strategic needs.

In actual fact the orderly marketing of such quantities as represent the deficit between production and consumption in future years will be of material benefit to the tin industry as a whole, and the producing countries have the assurance of the President of the United States that it is not intended to depress the price of tin through the sales from the stockpile. However, it is likely that this uncertainty in the market will continue until some actual method is devised and put into operation and it is, therefore, of vital importance that this matter should be resolved as soon as possible. I hope that discussions which are taking place at the time of the preparation of this statement may lead to some agreed formula because the whole economy of some of the producing countries is at stake.

THE ACCOUNTS

Our profit for the year under review was £2,872,792 against £1,958,369 in the previous year. After deduction of Taxation our net income was £1,391,292. Dividends amounting to 37½ per cent on the increased capital take £997,276, and a transfer to General Reserve of £323,647 has been made. The carry forward is increased to £404,173, thus restoring it to the balance at the end of March, 1960.

Our total Revenue Reserves will stand at £1,704,173 compared with our issued capital, as increased, of £4,341,883.

THE INVESTMENT PORTFOLIO

The book cost of the Investment Portfolio of the Corporation and its subsidiaries was £5,644,595 at March 31, 1962, as against £5,463,920 at the close of the previous year. The holdings in leading tin mining companies were 76 per cent of the total cost compared with 79 per cent. The market valuation of the quoted investments at March 31st last was £24,659,400, whereas it stood at £20,812,250 at the same date in 1961. This market valuation has varied widely during the year, as evidence of which it is relevant to quote the *Financial Times* Index for tin shares with a high of 480.9 and a low of 332.4 within the financial year of the Accounts.

MANAGEMENT

I visited Malaya in part of February and March of this year and I have recently returned from Nigeria. Such visits are essential in order to consult with the management at the centre of our mining operations and provide the opportunity to meet leading representatives of the Governments concerned. I was impressed with the keenness of all staff of Anglo-Oriental (Malaya) Limited and A. O. Nigeria Limited who are largely responsible by their efforts for the success or otherwise of our undertaking as a whole. Our relationships with Government officials in Malaya, Thailand and Nigeria continue good, and we are fortunate in experiencing a state of political stability in the newly independent countries in which our tin mines are situated, namely the Federation of Malaya and the Federation of Nigeria.

Substantial progress has been made over the past few years by our overseas management organisations in carrying out the policy of promoting Malayans and Nigerians to perform the duties previously undertaken by European staff. The management does, however, find a difficulty in each territory in recruiting local personnel with sufficient qualifications and education to fill the higher posts in the respective organisations, because, as yet, the most promising material is absorbed into Government service for which the individual has a preference on account of its relative security. This position will no doubt change as time goes on, and in the meantime local and overseas scholarships have been offered in order to attract candidates to enter the mining industry. This is a long-term problem because a successful mining career can only be achieved as a result of years of practical experience, but the opportunities are there for those who seek them and are prepared to go through the mill to make the grade for the higher appointments.

RESEARCH

I cannot let this opportunity pass without again acknowledging the excellent work carried out at the Tin Research Institute under the able directorship of Dr Hedges. The cost of this is financed by tin producers including Governments of countries concerned and great credit should be given to the manner in which the money has been economically spent. The results of the investigations undertaken have been most rewarding.

GENERAL

The statistical position of tin is still favourable to the producer although the latest forecasts of consumption in 1962 show a downward trend compared with 1961 owing to the present slowing down in industrial activity both here, in Europe and elsewhere. It seems unlikely that a physical shortage of tin will develop during the second half of this year. Provided that releases from the US stockpile are limited to any shortfall of production which could of course arise in the event of an upsurge in industry, and that they are geared to a reasonable price there is no reason why the long-term stability and prosperity of the tin market should not continue.

The income of your Corporation was exceptional in this past year because the dividends received represented the distribution of profits arising from the sale of minehead stocks accumulated during the period of international control as well as a full year's operations on an unrestricted basis. In addition the share market activity in the middle of 1961 provided an opportunity for profitable trading in investments on a scale which is unlikely to be repeated from year to year.

It is far too early as yet to forecast the dividends which we are likely to receive from our tin investments between now and March 31st next and they are bound to be governed by the price of tin ruling in the meantime. In these unpredictable circumstances I would, however, go so far as to predict that in terms of net profits before tax we are unlikely to repeat our past year's record performance in the current year though the aim of your Board will be to maintain the total dividend at the rate declared in 1961/62, provided that the results come up to our present expectations.

THE NATIONAL BANK OF GREECE IN 1961

Address of Mr D. E. Helmis, Governor of the Bank, to the General Meeting of Shareholders

In his annual report to the shareholders of the National Bank, **Mr D. E. Helmis** underlined the importance of Greece's link-up with E.E.C. This event, the Governor said, constituted a milestone in the evolution of Greek economy. The Bank was fully aware of the changing circumstances and the immense possibilities that were arising for Greece from this association, as well as of the problems the country would have to face in adapting itself to the new conditions.

In order to contribute to the general effort made in this direction, Mr Helmis said, the Bank had started negotiations with foreign concerns to reach agreements of co-operation in many fields of manufacturing activity. The first success of the Bank's endeavours had been the agreement concluded with the big French firm of Saint-Gobain under which this latter had undertaken to help in the reorganisation and modernisation of the Greek chemical industry. The Bank had also initiated talks with banking institutions in the U.S.A., Germany and France and had served as intermediary in the negotiations which led to the participation of I.F.C. in the share capital of the Greek Organic Fertiliser Industry. Mr Helmis also announced that the Bank was setting up an office in Paris with the purpose of establishing contacts with foreign concerns, as well as the local industrial and banking circles.

The accounts and the balance sheet for 1961 show that the Bank was able to expand its business very considerably, thanks to the general upward trend in Greek economy and the better organisation of its banking services. Total assets and liabilities on December 31, 1961, rose to Dr. 18,305 million (15,730), deposits to Dr. 12,707 million (11,160), total loans and advances to Dr. 10.175 million (8,976) and gross earnings to Dr. 777 million (593).

The Board of Directors proposed a 50 per cent increase in the dividend (Dr. 120 per share against Dr. 80 last year), as well as the increase of the Bank's share capital from Dr. 581 million to 872 million.

These proposals, as well as the Report and the Balance Sheet for 1961, were unanimously adopted by the General Meeting. It is understood that the new shares will be issued above par and at a later date as and when the Board will decide.

This advertisement is for informational purposes only and is neither an offer to sell nor a solicitation of an offer to buy any of these Shares.

SCOTTISH & NEWCASTLE BREWERIES LIMITED

SALES SHOW A MOST SATISFACTORY INCREASE

MAJOR DEVELOPMENT PROJECTS IN HAND

MR W. McEWAN YOUNGER ON GROUP'S RAPID GROWTH

The Annual General Meeting of Scottish & Newcastle Breweries Limited will be held in Edinburgh on August 30th.

The following is the Statement by the Chairman, **Mr W. McEwan Younger, DSO,** which has been circulated with the Report and Accounts for the year ended April 30, 1962:

I must first of all refer to the loss we suffered last August on the death of Mr F. C. Eardley. Mr Eardley joined the Newcastle Breweries in 1916. He became a Director in 1953 and Joint Managing Director and Vice-Chairman in 1955. He was also, of course, a Director of Scottish & Newcastle Breweries. He rendered long and distinguished service, and his great experience and ability are much missed by us all.

PROGRESS OF REORGANISATION

During the year under review the process of reorganisation, to which I referred in my Statement with last year's Accounts, proceeded in a satisfactory manner. In the main the assets of the Group are now vested in Scottish & Newcastle Breweries Limited: a scheme for the cancellation of the Debenture Stocks of Newcastle Breweries and the issue in exchange of Debenture Stocks of Scottish & Newcastle Breweries having been put into effect. In North East England the existing organisations of Newcastle Breweries and of Scottish Brewers have been integrated, and all our activities and operations in that area are now controlled by one organisation, under the Board of Newcastle Breweries, subject, of course, to the general direction of the Board of Scottish & Newcastle Breweries. Similarly, as from 1st May, 1962, the whole of the Wine and Spirit side of Scottish & Newcastle Breweries—that is to say of our two Subsidiary Companies John E. McPherson & Sons Limited and Charles Mackinlay & Company Limited, and of Newcastle Breweries—has been combined under a new Subsidiary Company, Mackinlay-McPherson Limited, with Branches throughout the Country. There can be no doubt that these steps will lead, indeed have already led, to more efficient and more economic working.

The extension and expansion of our activities continued during the year. As I mentioned in my Statement last year, we acquired for cash the whole of the Share Capital of Charles Mackinlay & Company Limited, and we also acquired for cash the old established Wine and Spirit business of David Lennox & Sons Limited, Dumfries. During the year the Isle of Jura Distillery Company Limited, in which we hold a controlling interest, became a partly-owned Subsidiary. It is hoped that this Malt Distillery will be in production during the current year. We have continued to spend substantial sums on the acquisition of further Licensed Properties, and on building new and modernising existing Licensed Properties, including Hotels.

TRADING ACHIEVEMENTS

Conditions for our trade, during the year under review, were not particularly favourable. The weather throughout the Summer, and even more so in the Winter and early Spring, was bad. The Chancellor's 10 per cent surcharge involved various price increases, and economic circumstances in general have hardly been helpful to industries such as ours. Nevertheless, our sales, both of Draught and Bottled and Canned Beers, showed a most satisfactory increase. Our home sales of Wines and Spirits, largely as a result of the integration and extension of our organisation in that sphere, continued to increase rapidly, and our export sales of Scotch Whisky, particularly to the U.S.A., showed a remarkable and most satisfactory rise. The development of Harp Lager—with the production and marketing of which we are, as you know, associated—has made satisfactory progress, in spite of unfavourable weather.

I now turn to the Accounts for the year, which, this year show a proper comparison with the figures for the preceding year. You will see that Group Profit before taxation, after charging £1,001,232 for depreciation, against £783,569, increased by £821,657 to £5,855,266: an increase of just over 16 per cent. I think this can be considered a good result, particularly in view of the somewhat unfavourable circumstances to which I have referred. These affected to a greater degree the profit for the second half of the year under review, which, in consequence, did not wholly come up to expectations, though still showing an increase over the corresponding period of last year. Group Net Profit after taxation increased by £262,657 to £2,972,266. The very considerable increase in the taxation provision is accounted for in the main by having to bear a full year's Profits Tax at 15 per cent, as against one month only at that rate last year. In all the circumstances, the Board has felt justified in recommending a total distribution of 10 per cent on the Ordinary Capital as increased by the one-for-one capitalisation issue made during the year. This compares with the equivalent of 8 per cent for the preceding year, and is covered 1.99 times. It still permits the sum of £1,448,853 to be credited to General Reserve.

LARGE-SCALE CAPITAL EXPENDITURE PROGRAMME

From the Consolidated Balance Sheet it will be seen that, once again, there has been very large expenditure indeed on our Breweries and Bottling Halls, and on Licensed Properties: the figure for Fixed Assets showing an increase of no less than £5,864,053. Of this, Breweries and Sundry Properties and Plant account for over £2,890,000, and Licensed and other Properties, Fittings and Furnishings for over £2,880,000. I think I should make some comment on these figures. The continuing increase in our sales over the past years has, for some time, during the peak periods, strained the resources of our Breweries and Bottling Halls. In general, however, at our Breweries and Bottling Halls in Scotland, it has been possible, until recently, to postpone any major reconstructions. This was done quite deliberately in order to enable our resources, which, until not so very long ago, were limited, to be applied to extending our retail outlets. The rapid growth of the Group in recent years has, of course, greatly strengthened our overall financial position. On the other hand, the continually increasing demands on our productive capacity, due to rising sales and the closing of small and relatively uneconomic units, have made it impossible any longer to postpone various major schemes of reconstruction, which, in any event, were called for in the interests of efficient and economic working. In addition, integration, the expansion of our activities, and the desirability of providing better working conditions for our Staff, demanded the provision of additional centralised up-to-date Office accommodation. We have, thus, had to undertake a number of major projects. Our Brewery at Fountainbridge, Edinburgh, has been extended and improved by large additions to the Mash House, Copper House, and Tun Rooms, together with the installation of Malt Bins and various items of modern plant. A large battery of Barley Silos has been completed at our Slateford Road Maltings. There are in process of completion substantial additions to the Tyne Brewery, Newcastle, and the Royal Moss Side Brewery, Manchester. Our Glasgow Branch Office and Store have been almost completely reconstructed, and our Bottling Hall there has been greatly extended. A high proportion of the cost of these schemes was met during the year under review, and is reflected in the figures to which I have referred. The strength and resources of the Group are, nevertheless, now such that we have felt able to undertake all this without in any way restricting the expansion of our business by the purchase, building, and reconstruction of Licensed Properties throughout the Country, but particularly in Scotland and North East England, as is shown by the Balance Sheet figures.

I should, perhaps, add one further comment on the Consolidated Balance Sheet. Shareholders will see that the figure for Stocks has increased by £2,038,288. Approximately half of this increase is accounted for by the inclusion, for the first time, of stocks of Whisky held by Charles Mackinlay & Company. In addition, the very substantial increase in our sales of Whisky at home and abroad, and the need to provide for our anticipated growing sales in the coming years, involves large expenditure on fillings and casks.

FINANCE

I referred earlier in my Statement to our very large-scale capital expenditure incurred during the year. The effect of this has been that, in spite of the issue during the year of a further £4½ million of 6½ per cent Debenture Stock, total Bank Overdrafts at April 30, 1962, amounted to £5,336,603. Further, there can be little doubt that capital expenditure during the current and immediately succeeding years will continue to be on a very substantial scale, though no doubt not on the scale of the year under review. A major extension to our Head Office premises is in process of construction. Plans are being prepared for building and equipping at Fountainbridge a Bottling Hall of the most modern design, utilising the existing cold storage rooms, but otherwise involving, inevitably, a complete reconstruction. The large increase in our sales of Whisky at home and abroad has resulted in our existing blending and bottling facilities in Leith becoming totally inadequate. We have

fortunately been able to buy very suitable premises nearby, but their conversion and equipment on up-to-date lines will involve considerable expense. In Newcastle we have to face, within the next three to five years, the construction of completely new Offices, to replace our present Offices due for demolition under a Compulsory Purchase Order. There can be little doubt, also, that expenditure on the purchase, construction, and reconstruction of Licensed Properties will continue at a high level for many years to come.

PROPOSED RIGHTS ISSUE

In these circumstances, it is obvious that the Board has had to give very serious consideration to the raising of yet further capital. This is not an easy problem in the circumstances prevailing at the present time. As Stockholders well know, the financing of our expansion during the past years has involved the raising of very large sums, in fact over £11 million, by way of Debenture Stock Issues, so that our total Debenture Capital now stands at the figure of £14,750,101. The Board has felt, accordingly, that the time has come when the raising of further capital should take the form of a Rights Issue to Ordinary Stockholders. Conditions for such an Issue are obviously not as favourable as they were some months ago. Nevertheless, as already intimated in the Statement released with the preliminary figures, it is our intention to raise approximately £7 million by this means with the object of repaying Bank Overdrafts, and financing the further capital expenditure to which I have just referred. Subject to the passing of the Resolution increasing the authorised capital of the Company, of which notice is given on page 1 of the Report and Accounts, the terms of the proposed Issue will be announced on August 31st.

I have dwelt at some length on our expansion in recent years, and the heavy capital expenditure involved: sums far in excess of anything which could reasonably be provided out of retained profits. I would, however, like to assure Stockholders that it is our policy only to pursue and develop opportunities for expanding our trade when we are satisfied that an adequate return in increased profits can reasonably be expected to result. Expansion in trade and of fixed assets is otherwise unattractive, and would be a misuse of the resources at our disposal, since, as I said a year ago, there is no particular merit in size as such. I think I can, however, reasonably claim that our record of growth in recent years justifies the policy which we have pursued. By growth, of course, I do not simply mean increase in size, or even in profits. Both of these can occur without any benefit accruing to Stockholders. I mean growth in earnings on Ordinary Capital. I believe that, barring events outwith our control, our policy of selective expansion and investment will continue to yield an appropriate return.

RIGHT TO INCREASED REWARDS

In such circumstances it is only right that Ordinary Stockholders, who would bear the brunt of any failure or serious setback, should profit from our success by way of increased dividends, but success, such as we have achieved in recent years, does not benefit Stockholders alone. It has enabled us to ensure that everyone employed by the Group can benefit by way of increased salaries and wages, and improved pension, canteen, and other benefits. That also is right and proper, and whatever arguments of expediency, or even of necessity, can be marshalled in favour of imposed restrictions on dividends, salaries, and wages, as a temporary expedient, it must never be forgotten that such general restrictions are quite definitely harmful and discouraging to enterprise and growth, since they penalise above all the enterprising and the diligent, who, furthermore, have fairly earned the right to increased rewards.

Perhaps I might also make one further point here. We are a Scottish Company. Our Head Office is in Scotland, and so is the greater part of our production units, though, of course, we also have a large Brewery and Bottling Hall in North East England, in which area we have a very great volume of trade, a Lager Brewery and Bottling Hall in Manchester and Bottling Halls in Kendal and Belfast. In these circumstances, our growth in recent years, and our high level of capital expenditure in Scotland, must benefit the economy of Scotland, about which there is so much anxiety today. Naturally we want to see every encouragement given to the establishment in Scotland of new industries from outside, and every reasonable help given by the Government, more particularly to alleviate the serious human problems which redundancy creates. But sight is sometimes lost of the basic fact that a healthy economy cannot be founded on palliatives or subsidies, necessary though they may perhaps be in the short term. The future of Scotland must primarily depend on our own enterprise and success, and the opportunities we give here in Scotland to young men of ability and drive. To emphasise too much what others should do for us, and too little what we can and should do to help ourselves, presents, I think, an image of Scotland which is not only unfavourable, but also untrue. There will be, I feel sure, more sympathy for our very real difficulties if emphasis is not too exclusively placed on these difficulties.

THE OUTLOOK

I must say something about future prospects. These are not easy to assess, dependent as we are so largely on the prosperity of the Country as a whole, and particularly of Scotland and North East England, where the great bulk of our trade lies. Many costs continue to rise. On the other hand our sales of Draught and Bottled Beer, in general, continue to show a reasonable increase, though, in some areas, the depressed state of the steel and shipbuilding industries inevitably is having an adverse effect. Wine and Spirit sales at home continue to grow, while export sales of Whisky are running far ahead of last year. In these circumstances, and bearing in mind that we anticipate a good return from our large-scale expenditure on Licensed Properties and on our Breweries and Bottling Halls, I think we can look to the future with a reasonable measure of optimism: the more so because we believe that the policies which we have pursued, and are pursuing, are basically sound, even though they differ somewhat from those of other leading Companies in our industry.

Lastly, I would like again to record our appreciation of the work of our Staff at all levels. This has not been an altogether easy year. Reorganisation and reconstruction within our organisation, at a time of rapid expansion, involves many problems and difficulties. I am sure that you will consider it appropriate that during the year we introduced, in place of our contributory Staff Pension Scheme, a non-contributory Scheme on the most generous terms permissible under Inland Revenue rules. We shall continue to give thought to further improvements to benefit those employed by the Company at all levels.

CLIFFORD MOTOR COMPONENTS

TOTAL TURNOVER A RECORD

The 33rd ordinary general meeting of Clifford Motor Components Limited will be held on August 30th in Birmingham.

The following is an extract from the circulated statement of the chairman, **Mr. S. C. Joseph**:

The Trading Profits of the Group after all charges, but before Taxation, together with Income from Trade Investments and Miscellaneous items amount to £933,204, an increase of £81,425 over the previous year.

Having regard to the trading results your Directors recommend a Final Dividend of 20 per cent on the Issued Ordinary Capital.

The Capital Reserve which at March 31, 1961, totalled £628,613 has been reduced by the amount of £29,150 applied in payment of the Capital Dividend declared on August 31, 1961, and, after crediting £359 a Capital Profit, stands at £599,822. Out of this Reserve your Directors recommend the payment of a Dividend of 2½ per cent amounting to £29,150 (not subject to Income Tax) on the Issued Ordinary Stock which would leave the Capital Reserve at £570,672.

Automobile Trade: The Spring improvement mentioned in my Report last year continued during the first six months of the period under review but we suffered from the effects of the recession during the latter part of 1961. I am glad to say however that, as has so often happened in this resilient industry, recovery came with the turn of the year.

Aircraft and General Engineering: The expansion in this Division reported last year has unfortunately slowed down during the year under review and this trend has continued during the current year.

Costs: Raw material and labour costs have continued to rise but in all the companies of the Group the benefit from renewals and modernisation of plant has helped us to absorb these increases. This factor and the quality of our products have been largely responsible for our having achieved in a difficult year a sufficient increase in export sales to give us a record total turnover. Net profits are very little higher for reasons which today are practically axiomatic.

New Subsidiaries: Part of the extensions to the Works at North Bridge Engineering Co. Limited of Leicester mentioned last year have been completed. Group results this year include a full twelve months profit from this subsidiary.

In December, 1961, we acquired the whole of the Share Capital of Rushworth Automobile Components Limited, a small company manufacturing Valve Guides, which is operating as anticipated.

ASSOCIATED COMPANIES

Specialloid Limited: In the latter part of our financial year we acquired equally with Associated Engineering Ltd., the whole of the Ordinary Share Capital of Specialloid Limited. The results of this Company for the year ended March 31, 1962, have reached expectations. Nothing is included in the profits of the trading period under review in respect of this investment.

N. C. Joseph (Canada) Limited: In spite of the difficult conditions presently obtaining in Canada, I am glad to be able to report a gradual improvement in the trading of this Company.

Cold Precision Forgings (D. & C.) Limited: This Company, in which we share equally with the Deritend Stamping Co. Ltd., has been formed to develop the Cold Flow method of forging steel. As yet the operations are experimental and it is not expected that there will be any contribution to the profits of the Group for some time.

Prospects: Turnover for the first quarter of the current year is comparable with that of the year under review.

Our entry into the Common Market is still undetermined but every effort is being made to provide for different conditions and to be ready to meet the challenge of change.

Once again I express my confidence in the future of your Group.

E. ALEC COLMAN INVESTMENTS LIMITED

The second annual general meeting of E. Alec Colman Investments Limited was held on August 3rd in London, **Mr E. Alec Colman** (the chairman) presiding.

The following is an extract from his circulated statement:

I am satisfied that the Company is making excellent progress and the prospects for the future seem very satisfactory.

The general increase in rents has been maintained and will continue to improve, there being very satisfactory lettings since the date of these accounts. Profits on property dealing fluctuate from year to year and you will observe that there is a reduction of £6,096 in these accounts as compared with the previous period. I anticipate that next year the results will be better.

An interim dividend of 5 per cent, less tax, was paid an November 30, 1961, and your directors feel that the final dividend should be maintained at 12½ per cent.

The Company is entering a period of rapid expansion which, together with the increase in rents arising on the expiration of Leases, will be of considerable benefit to the shareholders.

The report and accounts were adopted and resolutions were passed amending the Articles of Association and authorising the issue to Guardian Assurance Company Limited of 105,000 Ordinary Shares of 4s. at a price of 14s. per share and granting them options to purchase not more than a total of 105,000 shares of 4s. each at a price of 26s. per share.

IRISH AIR COMPANIES' OVER ¼ MILLION SURPLUS

REVENUE OF ALMOST TEN MILLIONS

. . . An Increase of Nearly 2½ Millions. Highest European Passenger Load Factor

Against the generally depressing financial picture presented in 1961/62 by the world's airlines, the Irish air companies trading under the title of Aer Lingus – Irish International Airlines returned a combined operating surplus of £256,704. The total revenue figure was £9,850,416—an increase on the previous year of £2,417,162.

In his introduction to the Annual Report and Accounts for the year ended 31st March 1962, Mr. Patrick Lynch, the Chairman of the Boards of Directors of the two operating companies, Aer Lingus and Aerlinte Eireann, writes: "The results for Aerlinte (operating on the North Atlantic route) were strikingly encouraging. It earned a clear operating surplus in its first full year with its own jet aircraft at a time when other airlines, long established on the [route] were losing money. This performance on the world's most competitive route was, indeed, satisfactory; and it was particularly gratifying when regard is had to the competition encountered from the various transatlantic airlines operating between Shannon and Britain and Shannon and continental Europe . . . Of the total revenue Aerlinte contributed 42%, although it carried only 7% of the total passengers (833,599) . . . The average fare per passenger of Aer Lingus (operating east of Dublin) was £6.04, whereas that of Aerlinte was £73.

Dublin Airport ranked fourteenth in terms of passengers in a list of thirty of the principal airports of Europe; only five airports handled more passengers during the peak traffic month of August. Total passengers handled at the airport during the year ended 31st March 1962 was 966,781 and total cargo and mail 18,153 short tons.

"Since 1950, taking one year with another, Aer Lingus, together with building up considerable depreciation reserves, has earned modest operating surpluses . . . .

"The nation's annual income from tourism (now £47 m.) has grown by fifty per cent over the past five years and it can be fairly claimed, I think, that the widespread network of air services and the heavy selling and promotion expenditure of the [airlines] have helped towards that welcome improvement. In the sales and promotion field company expenditure on publicity and advertising outside of Ireland amounts to about £500,000 annually. In addition, considerably more than another £500,000 is spent annually abroad on offices and staff devoted to selling Ireland's tourist attractions in conjunction with the company's air services.

"The company gives permanent employment to over 3,600 people, of whom about 3,200 are employed in Ireland. The total expenditure on salaries, wages and superannuation came to about £3 millions last year . . . The company has built up an international marketing organisation which, as the revenue results have shown, has proved itself more than able to hold its own in world markets with the foremost airlines. While central planning and control are exercised at Dublin, the sales organisation is decentralised to ensure most effective impact. The availability in Ireland of international marketing knowledge and skill of this order is of national importance . . .

TOTAL STAFF—3,600 (of whom 3,200 are based in Ireland)
FLEET—23 aircraft (3 Boeing 720's, 8 Viscount 808's, 7 F.27 Friendships and 5 D.C.3's)

"During the Annual General Meeting of the International Air Transport Association held in Australia in 1961, Mr. J. F. Dempsey, General Manager (and chief executive of Aer Lingus – Irish International Airlines), was designated as President-Elect . . . he will take office as President when the 1962 Annual General Meeting of IATA opens in Dublin on 10th September 1962 . . . . It is fitting that I should congratulate Mr. Dempsey on behalf of Board members, executives and staff on this mark of recognition of his eminent position in the international air transport industry to which he and his colleagues in the management have made such a significant contribution.

"Aer Lingus – Irish International Airlines was a founder member of IATA. Now, after eighteen years and with member airlines from over sixty countries, the association honours Dublin in choosing it for the forthcoming Annual General Meeting. I greet most cordially each member delegate attending the meeting and I wish to acknowledge the spontaneous and enthusiastic welcome that the Government have extended to the event."

AT A GLANCE
Irish International Airlines

AER LINGUS
IRISH INTERNATIONAL AIRLINES

EDGAR ALLEN & CO. LTD.

CONDITIONS AFFECTING PROFITS

The sixty-third annual general meeting of Edgar Allen & Co. Ltd., was held on August 2nd at Sheffield.

The following are extracts from the Statement by **Mr W. H. Higginbotham, FCA, FSS,** the Chairman:

During the year which ended on March 31st last trading conditions throughout the Steel industry and likewise a great part of the Engineering industries of this country were characterised by sub-normal and intermittent demand, by under-employment of productive capacity, by irregular employment of labour, and by increased costs of manufacture and of operation; strong downward pressure on selling prices has continued, and competition has intensified in both home and export markets. The overall effect has been to reduce outputs generally, with a disproportionate shrinkage in profit margins.

As steelmakers, toolmakers and engineers the Company and its Subsidiary Companies (and particularly the "Parent" Company, which as the principal manufacturing unit of the Group is especially vulnerable), have naturally been exposed to and adversely affected by those conditions, whose impact would have been even more severe had the products and activities of the group been less diversified. In the result, the aggregate sales turnover of the group, attributable as to 56.7 per cent to the Parent and 43.3 per cent to the Subsidiary Companies, shows an increase in value of 12½ per cent over that of the previous year.

Whereas the untaxed profits of the Subsidiary Companies have increased by £103,340, those of the Parent Company have fallen by £187,441: after deduction of taxation at the rate of 53.5 per cent (as against 50.7 per cent) the net taxed profits of the Group show a reduction of £63,586 from their level of the previous year.

THE PARENT COMPANY

Although the fall in the value of the turnover of the Parent Company alone over the year is comparatively small (2.4 per cent) it has been accompanied by a reduction in trading profit of the order of 5.5 per cent of that value; of which reduction it is calculated that roughly 2.0 per cent overall is attributable to reduction over the year in employment of available manufacturing facilities and to variation in the nature and volume of demand.

It must be borne in mind that the Company's output is extremely varied in character, comprising products differing widely in nature, unit cost, selling price and profitability: the extent of upward and downward movement in total value of sales gives no indication in itself of the extent of variations which may have occurred in either nature or volume of demand, in selling price, or of their combined effect on ultimate profitability.

As might be expected, the orders currently on hand show a very substantial fall from their level of the previous year: there is an upward trend now visible, but it is generally considered that improvement in this direction will depend to a great extent on the steel and engineering industries.

Reviewing the course of business as a whole, it appears that the favourable upward tendency

of the early part of the year was reversed in the autumn, and the downward trend which followed developed rapidly and acutely in the last four months of 1961/62. In July various measures were taken to stabilise sterling, including the imposition of a 7 per cent bank rate, restrictions placed on the lending capacity of the Joint Stock Banks, a large increase in the number of certain indirect taxes and a limitation of Government expenditure in various directions.

Informed opinion is divided as to the desirability and efficacy of these measures; it is apparent from past experience of "sterling crises" that their effect (particularly in impairment of confidence) while slow to accrue, continues for some time after they are relaxed.

DEVELOPMENT AND EXPANSION

The policy of the Board is definitely one of expansion; and the planned re-organisation which was put into operation at the beginning of April, 1961, and which covers the technological, commercial and marketing operations of the Group is directed to that end.

STRONG FINANCIAL POSITION

The financial position of both the Parent Company and of the Group remains both strong and liquid, and is considered fully adequate to the demands likely to be made upon its resources in the near future; and although the reorganisation of the Company's capital structure, which was mentioned in my statement last year, is still in the mind of the Board, the present is obviously not an opportune time to give effect to it.

Your Directors have recommended payment of a dividend on the Ordinary Share Capital at the rate of 12½ per cent, less tax, for the year, this rate being lower by 1 per cent than in 1960-61.

FUTURE PROSPECTS

The formation and expression of a reliable opinion on these demands prophetic gifts which, unfortunately, I do not possess; I am not pessimistic, however, and I believe that under reasonable conditions the prospects of the Group are good.

With regard to the Common Market, the present delicate state of negotiations, and the stiffening of the attitude of the "Six" suggests that the entry of Great Britain is less a matter of choice than of permission. The habit of decrying ourselves, our institutions, our technical skill, our managerial ability and much else has become too common; it should be curbed. With leadership and self-discipline we need not doubt our capacity to meet what is probably the greatest challenge in our long history as a nation. To this endeavour we of the Edgar Allen Group will contribute to the utmost of our ability; and while we may not be able to command success, we shall at least try to deserve it.

The report and accounts were adopted.

NCHANGA CONSOLIDATED COPPER MINES LIMITED

(Incorporated in Northern Rhodesia)

STEPS TO MAINTAIN STABLE WORLD COPPER PRICES

MR H. F. OPPENHEIMER'S REVIEW

The twenty-fifth annual general meeting of Nchanga Consolidated Copper Mines Limited will be held on August 23rd in Salisbury, Southern Rhodesia.

The following is an extract from the review by **Mr H. F. Oppenheimer,** the chairman, which has been circulated with the annual report and accounts:—

Nchanga's primary production of copper for the year reached 197,948 long tons. The total tonnage of ore milled was 200,000 tons less than in the previous year and the increase in production was due partly to a higher copper grade and partly to improvements in plant efficiencies, in both the leach and the tankhouse sections, to which I have referred in my last two reviews.

The policy announced in October, 1960, of withholding 10 per cent of the total planned production from the market continued in force throughout the year during which 183,052 long tons of blister and electrolytic copper were sold. Over the period October, 1960, to March 31, 1962, our sales of copper were approximately 8,000 tons below 90 per cent of planned production.

COPPER MARKET

Since the end of the financial year the copper companies of the Anglo American Corporation Group, in association with the Rhodesian Selection Trust Group, have decided to increase the 10 per cent mentioned above by 5 per cent, making a total of 15 per cent. Announcements of cuts have also been made by the Union Minière du Haut-Katanga, Noranda Mines Limited, Phelps Dodge Corporation and the Anaconda Company. It is hoped that other copper producers will take similar action in the near future. The total cuts or withheld copper already announced amount to about 200,000 long tons per annum. As in the past, we shall decide from time to time whether to withhold copper from the market or cut production.

I remain optimistic about the future prospects of copper consumption. The steps we have taken are, however, necessary during certain periods in order to correct the imbalance of supply and demand, thereby enabling world copper prices to be maintained at reasonable and stable levels.

The total tonnage sold by Nchanga was higher than in the previous year, and the unit cost of sales was £3 per ton lower; there was however a decrease in the average electro price realised from £237 per ton in 1960-61 to £231, with the result that our revenue from sales was only £1.5m. greater than for last year. The net profit after providing £7.93m. for taxation amounted to £12.89m. compared with £12.4m. for the previous year.

Appropriations of £2.25m. for capital expenditure and £1m. to general reserve absorbed £3.25m. and the board has recommended a final net dividend of 5s. 6d. per stock unit which, together with the interim net dividend of 1s. 6d. paid in February, 1962, will maintain the total net dividend for the year at 7s., as for the previous year.

The appropriation for capital expenditure of £2.25m. was mainly to cover the expenditure of £1.86m. during the year. The balance represents a forward provision of £.39m. against the capital programme for 1962-63.

PLANT EXTENSIONS

A year ago I referred to planned extensions to the surface plant costing about £3.7m., which would improve extraction and enable a greater tonnage of copper to be produced, without increasing the rate of mining. Work continued throughout the year on the first stage of these extensions, the construction of a low grade oxide leach plant which, together with additions and alterations to the existing leach plant, absorbed £1.16m. of the total capital expenditure for the year. The first stage will be completed during the current financial year and work will also start on the second stage, the erection of a roasting plant to deal with low-grade sulphides. It is estimated that when completed the extensions will make it possible to recover an additional 15,000 tons of copper per year from current grades of ore at the present rate of mining. We should thus be in a position either to maintain the current level of production at lower grades or lower mining rates, or to increase output at short notice in order to take advantage of anticipated increases in world demand in future years.

The main issue in the field of labour relations during the past year has been the copper mining companies' proposals in respect of African advancement. Early in 1961 complete agreement was reached with the Northern Rhodesia Mine Officials and Salaried Staff Association and the Northern Rhodesia Mines' African Staff Association on the further advancement of Africans into the staff and supervisory fields within the copper mining industry.

Similar negotiations with the Northern Rhodesia African Mineworkers' Trade Union unfortunately broke down, and after conciliation failed, the Northern Rhodesia Government appointed a Commission, under the chairmanship of Sir Ronald Morison, Q.C., to inquire into the causes and circumstances of the dispute, to examine the terms and conditions of employment applicable to Africans on the copper mines, and, having regard to the interests of all persons employed in the industry and to the well-being of the peoples of Northern Rhodesia, to make recommendations.

On May 2, 1962, twelve days before the Commission began its investigations, the African Union came out on a strike which lasted for three weeks. The Commission completed its investigation on May 24, 1962.

MORISON COMMISSION'S REPORT

The Commission stated in its report that it was generally impressed with the conditions of employment in the industry and paid tribute to the companies not only for their record as employers of labour but especially for the great efforts they have made and the remarkable progress they have achieved in the cause of African advancement. It recommended that a system of joint consultation should be instituted

on the mines and that the negotiating procedure with the African Union should be revised.

On the subject of wages the Commission, while taking note of the companies' submission that Africans in the copper mining industry of Northern Rhodesia are amongst the highest paid workers in this field in Africa, nevertheless recommended that an increase in basic wages was both practicable and desirable. The Commission also made recommendations in relation to leave and to shift differentials.

In accordance with the Commission's recommendations the companies invited the African Union to resume negotiations and several meetings were held in the course of which the companies offered to increase basic wages by 12½ per cent. In addition, the Union was offered a shift differential equivalent to 15 per cent of basic pay and two days extra leave. The companies also agreed to implement the Commission's recommendations in respect of joint consultation and the establishment of a Mining Joint Industrial Council for the discussion of matters affecting the Union and its members.

The Union rejected the offer of 12½ per cent and demanded instead a flat increase of 4s. 6d. per shift. It refused to discuss the companies' other offers until agreement was reached on basic wages. Negotiations broke down and a strike at all mines was called by the Union to start on July 10, 1962, but was cancelled at the last moment on the Union's instructions. The cancellation order was however not obeyed by African ticket-paid employees at the Roan Antelope mine who went on strike for a short period. I very much hope that the current deadlock will be shortlived.

Copies of the Annual Report and Accounts are obtainable from the London office of the company, 40, Holborn Viaduct, E.C.1.

THE HUDSON'S BAY OIL & GAS COMPANY LIMITED

Net income of Hudson's Bay Oil and Gas Company Limited and subsidiary companies for the first half of 1962 was $4,060,000 or 23 cents per share. This was higher than net income for any previous first half in the Company's history. It represented an increase of $970,000 or 31.4 per cent over the $3,090,000 or 17 cents per share earned in the first half of 1961. Wayne E. Glenn, President, said gross income increased by $2,550,000 or 19.3 per cent because of record sales volumes and moderately higher selling prices. Total expenses were up $1,580,000 or 15.6 per cent, of which more than half was attributable to an expansion of the Company's exploration activities. Net income for the second quarter of 1962 was $2,469,000, an increase of $691,000 or 38.9 per cent over the second quarter of 1961. Gross income increased by $1,318,000 or 19.3 per cent while total expenses increased by $627,000 or 12.4 per cent. The factors causing the increases in gross income and total expenses during the second quarter of 1962 were essentially the same as those applicable to the first half of the year. Operating volumes for the second quarter continued well above those for the comparable period of the previous year. *Production of crude oil and natural gas liquids* averaged 28,979 barrels per day, an increase of 2,422 barrels per day or 9.1 per cent. Sales of Natural Gas averaged 77.6 million cubic feet per day, an increase of 20.9 million cubic feet per day or 37.0 per cent. The improvement in production and sales volumes was attributable in large measure to the commencement in April of this year of operations at the West Whitecourt plant in which the Company owns at 41⅔ per cent interest. During the second quarter of 1962 although the new plant was still undergoing performance tests the Company's share of Natural Gas sales averaged 17.3 million cubic feet per day. Net production of Natural Gas liquids averaged 2,679 barrels per day, an increase of 1,633 barrels per day over the output of the pilot cycling plant, which was in operation at this location in the second quarter of 1961. After performance tests have been completed the plant is expected to operate at about 90 per cent of designed capacity. At this operating rate the Company's share of plant output will be 34.4 *million cubic feet per day* of natural gas, 4,188 barrels per day of natural gas liquids and the hydrogen sulphide equivalent of 203 long tons per day of sulphur. The output of the plant is currently being marketed under firm sales contracts. During the second quarter of this year the Company carried on a larger drilling programme than in the comparable period of last year. A total of 33 gross or 23.1 net wells were completed. An increase or 19 gross or 13.6 net wells. The completions comprised two gross or 1.5 net exploratory wells and 31 gross or 21.6 net development wells. Successful completions totalled 27 gross or 18.8 net wells all of which were oil wells.

SALZGITTER A.G.

COMBINED TURNOVER MAINTAINED

NEED FOR ADDITIONAL CAPITAL

The following are extracts from an address by **Dr. Konrad Ende,** Chairman of Salzgitter A.G. at a Press conference held in Berlin on April 27, 1962:

Our dividend again amounts to 7 per cent. This dividend, however, gives only an incomplete picture of our earning position, as this year, also, we have, from the profits at our disposal, primarily effected considerable special write-offs. The true earning position can be seen from the figures covering the commercial results. The commercial results achieved amounted to ca. DM 131 million. These commercial results, to which nearly all the concern's companies contributed, were made up as follows: 19.5 per cent from our coal mines, 7.4 per cent from the iron ore mines, 13.5 per cent from our other basic material plant, 27 per cent from the steel works and their affiliated companies and 32.6 per cent from the plant for further processing.

In this way our companies were in a position to effect extensive special write-offs, i.e. to an amount of DM 37.3 million. As in the past, the emphasis with these special write-offs lay with our mining companies, which accounted for approximately 61 per cent. of the special write-offs in the year under review. The coal mining industry alone accounted for nearly 45 per cent. The share of our companies concerned with further processing amounted to ca. 26 per cent and of our steel works to ca. 13 per cent. On the other hand it cannot be overlooked that the commercial results show a decrease in comparison with the previous year of ca. DM 41 million, or ca. 24 per cent. The main contributors to this decrease were the mines and the Salzgitter steel works, added to by rising costs and higher wages, as well as by decreasing proceeds in the steel-making industry.

TURNOVER

The combined turnover of the concern in the year under review amounted to ca. DM 3,200 million and thus corresponded approximately with the previous year's turnover. The turnover within the concern rose from 23.5 per cent of the combined turnover in the previous year to 24.2 per cent in the year under review, whereas the share of the export turnover fell from 32.2 per cent to 28.2 per cent.

In the year under review our companies invested DM 318.5 million, of which DM 26.6 million went to the building of flats. Investments in the business thereby increased, as compared with the previous year, from ca. DM 179 million to ca. DM 292 million.

As in the previous year, after deduction of expenditure from income, a profit for the concern of ca. DM 29.8 million was available for the distribution of a dividend.

FINANCIAL POSITION

Taken as a whole, our financial position has, in the year under review, taken a turn for the worse. As a result of the large investments in our steel works in Salzgitter it will continue to deteriorate unless an increase in capital is effected. An increase in capital amounting to about DM 120 million cannot indefinitely be avoided. We have, therefore, continued our efforts to achieve an increase in capital and of late we have found complete understanding for our need for an increase in capital with our sole shareholder, the Federal Government. The Federal Government has, to start with, lent us the dividend now paid, and has in this way assisted us quite considerably at least in the matter of liquidity. We were able, without any difficulty, to float the loan brought out a few weeks ago by the Salzgitter steel works. Beyond this, in the last few days we have increased the share capital of the Huettenwerk Salzgitter A.G. from DM 210 million to DM 250 million. We have taken up these shares in full.

PROSPECTS

In the first half of the current year the combined turnover of the concern has been 6.5 per cent less than the turnover in the same period last year. The cost of materials and wages have, in the same period, risen and will continue to rise. They can no longer be absorbed by increased sales and successes in rationalisation. It will probably not be possible this year to achieve the economic results of the trading year under review.

HOLMAN BROTHERS, LIMITED

TURNOVER AGAIN INCREASED

The annual general meeting of Holman Brothers, Ltd., will be held on August 28th, in London.

The following is an extract from the circulated statement of the chairman, **Mr P. M. Holman:**

Once again the turnover of the Group showed an increase over the previous year but the trend of sales away from the more profitable products continued, whilst the pressure of increasing costs on profit margins showed no sign of easing. Certain minor price increases were made during the year but these were not adequate to absorb the whole of the cost increases incurred by us.

Sales in the United Kingdom were slightly better than in the previous year, increased sales of Rotair Portable compressors more than offsetting small reductions in sales of some other products. A wider range of Rotair screw type portable compressors is now in production and has met with a most gratifying response. Rotair stationary compressors in several sizes are also now on sale; and additional types of Rotairs will be made available during the current year.

IMPROVED OVERSEAS SALES

Overseas sales improved somewhat in spite of intense competition and again represented 71 per cent of the total Group turnover. The maintenance of such a high level of exports is a costly matter both as regards capital employed and increased administrative expenses, so that resultant profits are lower than on a similar volume of sales in the Home Market. These factors are frequently overlooked when we are exhorted to increase exports.

A year ago I expressed the view that we should do well to maintain our profit at last year's level but as recently as December 1961 the indications were that this forecast might prove too optimistic. However, as the result of an upturn in sales during the last few months of the year, including a sale to an overseas agent of substantial stocks which were formerly on a consignment basis, I am pleased to be able to report that in fact the group profit before taxation increased from £264,775 to £293,368 and that the net profit after taxation attributable to Holman Brothers, Limited showed an increase of £15,119 to £147,657.

An Interim Dividend of 3 per cent less tax was paid in January of this year and in view of the results for the year being better than at one time seemed likely, your Directors have deemed it reasonable to recommend for your approval a Final Dividend of 5 per cent less tax, making a total of 8 per cent less tax.

THE OUTLOOK

Forecasting the future is always a difficult task in a business such as ours where sales are effected in so many countries, particularly as the political situation in several of them is unsettled. The value of orders on hand at present shows a reduction on the corresponding figure a year ago, although the rate of incoming orders is at a similar level. Recent wage awards will undoubtedly add to our costs. I think that we face another difficult year but nevertheless I expect the results to be much the same as those under review.

On a personal note, since I have now completed fifty-two years' service with the Company, I feel that the time has come for me to relinquish the office of Chairman, and your Board has accepted my resignation which becomes effective at the conclusion of this annual general meeting and the Board has elected Mr J. F. Holman as my successor which action I heartily approve.

FRANCE-OBLIGATIONS

The Annual General Meeting of FRANCE-OBLIGATIONS was held in Paris on May 28 under the chairmanship of M. GEORGES PLESCOFF. FRANCE-OBLIGATIONS buys and sells securities in order to steady the prices for bonds and fixed-interest shares. FRANCE-OBLIGATIONS bought during the year 1961 NF. 145.2 m. worth including: variable interest industrial bonds NF. 132.3 m., tied interest bonds NF. 5.2 m., 5 per cent. 1956 National Loan NF. 7.7 m. Sales amounted to NF. 87.1 m. (which left a credit balance of NF. 10,839,763.11). Refunds totalled NF. 37.1 m. (leaving a net plus-value of NF. 4,585,944.27). On December 31, 1961, the value of the portfolio was NF. 526,580,910.15, and its resale value at the prices then ruling NF. 612,396,909.95, leaving a net plus-value of NF. 85,815,999.80, including dividend coupons issued by December 31, which amounted to NF. 15,070,685.33. The portfolio comprises nearly 300 different securities of which more than half are fixed interest. Dealings have been very active (often NF. 500,000 at one session of the Bourse). The number of holders of bonds of FRANCE-OBLIGATIONS has increased sharply. Thus, the *net credit balance per share* at the end of the first financial year and on introduction to the Paris Stock Exchange (*July 1960*) was *NF. 11.366*, on *December 31, 1960: NF. 11.842*, on *December 31, 1961: NF. 12.361*, on *May 28, 1961* (estimated), *NF. 12.7*. It is proposed to pay a dividend of NF. 571 per share of NF. 10,000. The whole of the profits on sales and refunds in 1961 should be placed to reserves. The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

Comparative statistics	1960 NF	1961
Dividends and interest, less overheads	23,114,632.42	28,558,607.38
Profits on sales of securities	6,008,842.21	10,839,763.11
Plus-values on refunds, less minus-values	1,705,684.04	4,585,944.21
Total credit balance	30,829,158.67	43,984,314.76

COMPANY AFFAIRS

The new Stock Exchange account opened firmly ahead of the holiday, helped by the reappearance of institutional and short term professional support. Gains were widespread, with stores well to the fore, but this week there was little follow-through until Thursday when there was a further general improvement in prices. Over the week THE ECONOMIST *indicator gained 4.8 points to 317.6. The demand for gilt-edged has remained strong, but the announcement of two more corporation issues brought with it the threat of indigestion to this market and the recent Warwickshire loan lost its premium, though the price rallied later.*

Scottish and Newcastle Breweries

IN the past, some investors have overestimated the speed (and even the ability) with which new brewing groups could gather in the fruits of mergers through the rationalisation of production and distribution. They have also underestimated the capital costs that are involved. The froth on brewing shares has now been blown away and investors are left with the beer—good, bad and indifferent. There can be no doubt that Scottish and Newcastle is in the first group but, as a glance at the table will show, it takes time even for the ablest managers to carry their policies through. As the chairman, Mr W. McEwan Younger, says, steps in rationalisation "will lead, indeed have already led, to more efficient and economic working" but much is left to be done. The rate of return on equity capital employed is still not as high as it was before the merger between Newcastle and Scottish Breweries. Yet sales of draught, bottled and canned beers were higher in 1961-62 (and would have been higher still but for the weather) and profits went up. Only a small part of this increase reflects the contribution from recently acquired subsidiaries, for the comparative 1960-61 figures included a full year's trading from Newcastle and not as was stated in these columns on July 28th only nine months'. Hence it is clear that some of the benefits of rationalisation have begun to appear.

	Scottish Breweries			Scottish & Newcastle	
Years to April 30	1958	1959	1960	1961	1962
	£ million			£ million	
Gross income	2·4	2·5	3·0	5·0	5·9
Net equity earnings	1·0	1·2	1·5	2·6	2·9
Net equity assets	9·1	12·1	13·4	29·9	30·1
	%	%	%	%	%
Gross income/net equity assets	26·4	20·7	22·4	16·7	19·6
Net equity earnings/net equity assets	11·0	9·9	11·2	8·7	9·6
Ord. earnings	11·6	12·7	16·2	18·1	20·0
Ord. dividend	3	4¼	6½	8	10

Rationalisation often involves modernisation; Mr Younger says that "the continually increasing demands on productive capacity, due to rising sales and the closing of small and relatively uneconomic units, have made it impossible any longer to postpone various major schemes of reconstruction." These are already reflected in the rise from £9.7 million to £12.6 million in breweries, plant and sundry properties and from £33.4 million to £36.3 million in licensed and other properties. These increases are not reflected in a growth in net equity assets (as set out in the table) because so far they have been financed by bank overdrafts (up from £2.6 million to £5.3 million) and debentures (up from £10.3 million to £14.8 million). But the company will raise £7 million by a rights issue of ordinary shares in the near future to repay the overdrafts and to finance further developments. In the immediate future, capital spending will remain high, though not, Mr Younger says, on the scale of 1961-62. Costs are rising but so are sales and in the future the rationalisation and modernisation programme should increasingly help profits. With the £1 units now standing at 58s. and yielding 3½ per cent, covered twice, investors can share with Mr Younger "a reasonable measure of optimism" and see in the forthcoming rights issue a chance to add to their investment in it on favourable terms; but there is a world of difference between reasonable optimism and wild excitement.

Volvo

VOLVO is a small motor manufacturer that has gained an international reputation by basing its appeal on high quality. In 1961 it made only 80,000 cars and 12,000 commercial vehicles. By concentrating on one basic car design, it has kept its costs down and its prices competitive. As Sweden provides only a small home market—181,000 cars were sold there last year, with Volvo accounting for 25 per cent of them—the company is dependent upon export markets, which take nearly half its output. In the circumstances of 1961, therefore, Volvo did well to maintain its sales at 92,000 vehicles, and to push up turnover from kr 1,079 million to kr 1,137 million. But rising costs cut into trading profits, which fell from 71.6 million kroner to 53.8 million kroner. Like British manufacturers, Volvo had excessive stocks on its hands.

Apart from the cars and lorries made by Volvo itself, the group's interests include tractors, machine tools, transmission units, agricultural machinery and aircraft engines, which together added kr 390 million to net sales. Cars thus remain the group's principal activity; and here Volvo should be able to do rather better this year than last. In the United States, for example, it has maintained its sales in face of a general decline, and car sales in European markets, including Sweden even though the sales tax was raised at the beginning of this year, have been generally better. Having had a hard struggle to establish itself, Volvo is not frightened by the current intensity of competition; but if Sweden does not enter the EEC the company will suffer.

	Gross Sales*		Trading Profit		Net Profit	
	1960	1961	1960	1961	1960	1961

* Including inter-company sales.

Berry's Electric Magicoal

THE open coal fire has lost some of its appeal in the past decade and in the face of a steep rise in fuel prices many people have turned to less dirty and more convenient forms of heating. The growing number of smokeless zones has sometimes made a convenience a necessity. But tradition dies hard and the desire for a visible glow in the hearth lies behind the formidable growth of Berry's and its Magicoal fire, an artificially glowing electric heater which simulates the appearance of a coal type fire.

Over the last five years the group's turnover has more than quadrupled and its profits before tax have risen from under £100,000 to over £700,000. Allowing for two scrip issues the ordinary dividend has been raised from 5 to 45 per cent. The 5s. shares have blazed as well: from the equivalent of 2s. 9d. in 1957 they rose to 78s. 9d. earlier this year. In the last few days they have lost 5s. to 67s. 6d. to yield 3.3 per cent following a warning from the chairman that sales have levelled off at about the same level as in 1961-62. The appreciable increase in exports which had been anticipated has not yet materialised and the listless glow of the economy has affected sales at home. Yet this is far from being a gloomy statement. Mr Raymond Berry points out that in the past year profit margins have been maintained even though in some cases prices have been reduced—a claim that few other companies have been able to make—and he is confident that the company is better placed to counter competition than it has been for many years. Capital spending last year amounted to £230,000 and with the opening of the new

Bletchley factory there is plenty of capacity for further expansion. Capital commitments have fallen from £116,000 to £2,000 and immediate capital expenditures are likely to be only routine in nature. Thus the company could afford to distribute a higher proportion of available earnings: the latest dividend of 45 per cent (against 33⅓ per cent) was covered almost three times. And though the growth in profits is likely to be much less marked than in recent years there still seems scope for an increase in the dividend above the equivalent of 30 per cent after the proposed one-for-two scrip issue.

Michael Nairn and Greenwich

THE hiving off of investments by Courtaulds and Fairey formed part of their plans, ultimately crowned with success, to beat off a take-over bid. But, on the surface at least, there is no indication that similar proposals by the Michael Nairn and Greenwich directors are the result of outside pressure, though they admit that in the past the market price of the shares "has not sufficiently reflected the value of the substantial quoted trade and other investments." Investments with a current market value of £2½ million, consisting of £565,000 of gilt-edged stocks, 210,000 npv shares in Dominion Oilcloth and Linoleum (worth £1,640,000) and 86,724 shares of Congoleum Nairn Inc. (worth £330,000) are to be transferred to a new subsidiary, Michael Nairn Investments.

Nairn and Greenwich shareholders are to receive one 5s. "A" share in the investment company for each £1 share they hold but the parent company will retain control through a holding of ordinary shares which have three votes a share against one vote for each "A" share. This will add to shareholders' income in 1962-63, when the parent company's dividend is again expected to be 8 per cent and when a dividend of 7½ per cent on the 5s. shares is promised from the investment subsidiary. Effectively therefore, shareholders' dividend income will be raised from 8 to 9⅜ per cent. At the current market prices the asset value of the trust's shares will be about 8s. 7d. and dealings in the 5s. units will probably start at about 5s. 6d. later this month.

The directors do not rule out the eventual sale of the whole or part of the trade investments but they do not intend to do so at the moment. This is obviously wise, as both companies after some years of disappointing trading now appear to be doing better. The dividend of Dominion Oilcloth and Linoleum has been cut in two successive years from $2.20 to $1.20, but this Canadian company, in which Nairn and Greenwich has a 27½ per cent stake, is now trading more profitably, while Congoleum Nairn of the United States, where it has a 6 per cent holding, which has not paid a dividend since 1957, made a profit of $800,000 for the first six months of the current year, against a corresponding loss of $175,000.

What of the parent company's shares? Ex the investment company distribution the £1 shares, which have risen in the past four weeks from 14s. 6d. to 20s. 3d., should still be valued at about 15s., to yield 11 per cent on the forecast dividend. Such a return appears to discount many of the uncertainties and the prospect of lower profits in the current year. But the latest proposal is just one part of a plan to simplify and reorganise the group's structure and this general scheme should enhance the company's ability to hold on to its share of trade in the highly competitive floor covering industry.

Central Wagon

FEW companies can have been hit so severely by the cut in orders from the British Transport Commission as Central Wagon, for its business of building and repairing wagons largely depends upon BTC contracts. In the year to September 30, 1961, its turnover was unchanged and although trading profits fell back from £312,000 to £216,000 the ordinary dividend was maintained at 20 per cent. But since then the wagon-building shops have become "increasingly short of work," profits have been "seriously affected" and the directors confess unhappily that "at the present time it is impossible to forecast what the results and total dividend for the year will be." The interim dividend has been halved from 5 to 2½ per cent and it is proposed to reduce the capital of the company by repaying to stockholders 5s. per 10s. unit of stock and writing down the 10s. units to 5s. This will involve a cash payment of £375,000 but at the end of last September the company held enough in 3 per cent Transport stock, 1968-73, to cover such a payment. This repayment shows how difficult it must be for Central Wagon to implement any really profitable scheme for diversifying its activities. The stock market has already revised its ideas about the company's future: the 10s. shares were as high as 19s. earlier this year but they now stand at 12s.

Lobitos Oilfields

THE shares of Lobitos Oilfields have often been swayed by take-over rumours. On the latest of these, a fortnight ago, their price rose from 16s. 6d. to 18s. 7½d. with the market ignoring the indications of political troubles in Peru. The directors of Lobitos have now announced a one-for-one scrip issue and add that they intend to pay a dividend on the increased capital of not less than 20 per cent, against the equivalent of 14 per cent in 1961. The reason that the directors give for the higher payment may be the one which makes Lobitos attractive to a bidder—namely, that the group's policy of broadening its interests and of adding to its investments in Britain has strengthened its stake in the field of specially blended oils.

The directors say that the issue will bring the nominal value of the equity more into line with the capital employed in the business now that the refinery at Ellesmere Port has been completed. But the timing of the issue suggests that they have kept a close eye on the stock market and are willing to confront any bidder with a realistic price for the shares. Their efforts have not gone unnoticed or unrewarded: the shares now stand at 22s. and offer an indicated yield of just over 9 per cent. The price is not unreasonably high: taking a conservative valuation on Anglo-Ecuadorian it is still below the net asset value and earnings should still cover the forecast dividend about twice.

Bluebird Investments

THE second successive decline in the profits of Bluebird Investments, the biggest caravan manufacturer in Europe, suggests that the popularity of caravans is on the wane. The fall of 22 per cent in gross profits from £645,000 to £502,000 in the year to March 31st is much sharper than that in 1960-61. A year ago the directors thought that they might be able to raise the ordinary dividend this time but in fact it has been left effectively unchanged at 32 per cent after the scrip issue. The shares stand at 18s. 9d., compared with a 1962 peak of 25s. 3d., and yield 6¾ per cent, twice covered.

Home sales have presumably been hit by hire purchase restrictions but in an interim statement in December the directors, referring to a "slight" variation in profit margins, said that turnover had been well maintained and implied that a government contract would help to maintain full production. Export sales were also said to be expanding. The sharp setback in profits is therefore something of a mystery, which no doubt the chairman will clear up in his forthcoming statement.

THE MONEY MARKET

THE Treasury bill rate fell by 1s. 3.84d. at last Friday's tender, to £3 16s. 5.05d. per cent, its lowest level since mid-June and nearly ¼ per cent below Bank rate. The syndicate of discount houses raised its bid by 4d., following the previous week's increase of 5d., to £99 0s. 11d. Total applications rose by £15 million to £403 million, but the amount of bills on offer was £20 million higher at £240 million and the market received a very satisfactory quota of 60 per cent.

Credit was comfortable on Thursday and Friday of last week and although the rate for day-to-day money opened at 3¾ per cent it eventually fell to the clearing banks' minimum of 2½ per cent. On Saturday, purchase tax payments to the Exchequer made money tight and the authorities provided a large amount of help by the special purchase of bills. The authorities also provided moderate amounts of help on Tuesday and Wednesday. On each of these three days the market rate for money has remained at 3⅞ per cent, fractionally above the bill rate.

In New York the bill rate fell again this week from 2.874 to 2.829 per cent.

APPOINTMENTS

THE COMMON MARKET

An international professional firm with a large and rapidly expanding practice in Europe has vacancies on their staff in several countries for qualified accountants, whether recently qualified or with several years' experience since qualifying. Men with good experience on large audits and investigations would command a substantial salary and younger men of outstanding ability would be given rapid promotion. The positions offered provide attractive opportunities to accountants who either wish to make a career or to gain extensive experience of business conditions on the Continent of Europe. A knowledge of a foreign language would be an advantage but is not initially essential. Applications, giving full particulars of education and previous experience, should be addressed to Box 1640.

AUSTRALIAN NATIONAL UNIVERSITY INSTITUTE OF ADVANCED STUDIES

RESEARCH SCHOOL OF SOCIAL SCIENCES

Applications are invited for the position of *Research Fellow or Senior Research Fellow* in the *Department of Political Science*, (Acting Head of the Department: Mr. R. S. *Parker.)*

The appointment will be within the salary range £A1,656-£2,450 for a Research Fellow or £A2,620-£3,160 for a Senior Research Fellow.

While appointments in these categories are usually for three years with possible extension to a *maximum* of five years a shorter term may be considered.

Reasonable appointment expenses will be paid for the successful applicant and his family.

The current research interests of the Department include parties, pressure groups and elections in Australian politics; comparative studies of politics in Europe and Asia; studies in European political integration; and studies in the strategic aspects of international politics, including their impact on Australian foreign policy and defence. The Department's work in these fields involves theoretical as well as empirical studies.

Applications will be considered from persons with research experience, preferably but not necessarily in one or more of the above fields. Applicants should indicate their research interests and intentions.

Further details should be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on 1*st October*, 1962.

UNIVERSITY OF LEEDS

APPOINTMENTS BOARD

Applications are invited from graduates for appointment as an Assistant Secretary to the Appointments Board from 1st January, 1963, or thereafter. The salary scale for the post is £1,150 x £50-£1,500 x £75-£1,650 (efficiency bar) x £75-£1,950 a year. The initial salary will be fixed between £1,150 and £1,650 according to qualifications and experience. The person appointed will be mainly concerned with students and graduates either in technology or in science. Candidates should, therefore, have a degree either in a technological subject (preferably engineering) or in science, and experience in a field of work in which graduate scientists and technologists are employed. Applications (three copies) together with the names of three referees, should reach The Registrar, The University, Leeds 2 (from whom further particulars may be obtained) not later than Friday, 7th September, 1962.

UNIVERSITY OF THE WEST INDIES

Applications are invited for (a) Lectureship or (b) Assistant Lectureship in *Department* of Government. Applicants should have a special interest in, or knowledge of, at least two of the following: Political Thought and Theory, Government and Politics in the West Indies, Comparative Politics, International Relations, Public Opinion and Propaganda. Initial appointment *three years*. Duties to be assumed as soon as possible. Salary scales: (a) £1,050 x £50-£1,400 x £75-£1,850 per annum, (b) £800 x £50-£950 per annum plus pensionable supplement of £250 per annum. Child allowance: £150 for first child, £100 for second child, £50 for each subsequent child. F.S.S.U. Unfurnished accommodation at rental of 10 per cent of pensionable salary. Up to five full passages on appointment and normal termination.—Detailed applications (6 copies) naming three referees by September 1 1962, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

MAGEE UNIVERSITY COLLEGE LONDONDERRY

Applications are invited for the post of ASSISTANT LECTURER in ECONOMICS for three years dating from 1st October, 1962. The salary scale is £900 x £50-£1,000, F.S.S.U. and family benefits.

Further particulars may be obtained from the Secretary to the Trustees, with whom applications, naming two referees, should be lodged not later than 15th September, 1962.

STATISTICIAN—HEAD OF MARKET RESEARCH PROCESSING DIVISION

Administrator required for management of processing division in a rapidly growing British and International market research organisation. Responsibilities include sampling and other statistical consultancy, *provision of* basic statistics, tabulation and presentation of survey data, negotiations with outside service organisations and general control of data processing. Candidates should have experience of office administration and data processing in commercial or Government organisation and a good qualification in statistics. Salary, £1,750 to £2,250 with share of profits. Considerable scope would be further elaborated in an interview. Applications with *full details of qualifications* and experience should be addressed to S. J. Orwell, Managing Director Market Investigations Ltd., 1 & 2 Berners Street, London, W.1.

THE EUROPEAN PARLIAMENT IN LUXEMBOURG

invites applications from

TRANSLATORS

to translate administrative and technical texts, official records and reports, parliamentary debates, speeches, etc., into English.

Qualifications required:

1. Nationality: British. Mother tongue: English.
2. Age limit: 40.
3. Education: University degree or equivalent experience.
4. Languages: Candidates must be capable of translating into English from at least *two* of the following languages: German, French, Dutch, Italian.
5. General knowledge: Broad general knowledge and preferably acquaintance with parliamentary *procedure* and style of *language*.

The salary will be between 14.500,—and 23.400,—Belgian francs per month, according to age, qualifications and experience, plus certain benefits and allowances provided for under the Staff Rules and Regulations, less Community income tax.

Applications in writing, with a full statement of qualifications and experience should be made on a Personal History Form obtainable from the European Parliament, 19a, rue Beaumont, Luxembourg, not later than September 15, 1962.

DURHAM COUNTY COUNCIL

PLANNING DEPARTMENT

RESEARCH ASSISTANT.—Salary £1,360-£1,535. Applicants must have a good Honours Degree in Economics, and experience in industrial location work with Industry, a Government department, or a Local Authority.

Housing available—Peterlee 12½ miles, Newton Aycliffe 12 *miles from* Durham.

Forms and particulars from the County Planning Officer, 10 Church Street, Durham. Closing date August 25, 1962.

Personally canvassing members of the Council is prohibited and the Council may declare any candidate infringing this rule to be disqualified for appointment.

J. T. BROCKBANK,
Clerk of the County Council.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of DEPUTY FINANCE OFFICER. *Candidates should* be qualified accountants and should have had wide experience in accountancy; experience of University finance would be an advantage. Initial salary not less than £1,800 per annum, according to qualifications and experience. Six copies of an application, together with the names of *three referees* should be sent not later than 7th September, 1962, to the Registrar, The University, Liverpool 3, from whom further particulars may be obtained. Quoting reference number CV/1448/E.

THE FOREIGN OFFICE offers an appointment to the Academic Staff of Wilton Park, Steyning, Sussex, for discussions on British policy and international relations with leaders of Western public opinion. Practical experience in politics or international relations and/or degree in economics, history or other social sciences required. Language requirements: either bilingual German with working knowledge of French or bilingual French with working knowledge of German. The post is unestablished. Accommodation. Salary: £1,568-£1,947. —Write giving age, full details of qualifications and experience to Manager (PE.5068), Ministry of Labour, Professional & Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Closing date, 20th August, 1962.

THE BRITISH ASSOCIATION OF ACCOUNTANTS AND AUDITORS LIMITED (Incorporated 1929). The next examinations will be held *from* the 20th to 23rd November, 1962. Membership can only be obtained by those who have passed the prescribed examinations. Copies of the Syllabus are obtainable from the Secretary, Stamford House, 2/4 Chiswick High Road, London, W.4.

EDUCATION AND COURSES

EXPERT POSTAL TUITION

for examinations—B.Sc.(Econ.), Law, Accountancy, *Costing* Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4. Established 1910.

TUITION FOR B.Sc. ECONOMICS

Wolsey Hall (Est. 1894) provides Postal Courses in a wide *range* of subjects for the two examinations for London Univ. B.Sc.Econ (three, if entrance is included) at moderate fees. 1,431 Wolsey Hall students passed London University B.Sc. Economics Exams., 1950-60. Tuition also for G.C.E., Law, Statistical, other exams.—Prospectus (mention examination) *from* E. W. Shaw Fletcher, C.B.E., LL.B., Director of Studies, Dept. P.17.

WOLSEY HALL, OXFORD

SECRETARIAL *Training* for Women, especially university graduates and older students, six-month and intensive 14-week courses.—Write Principal, Davies's, 158 Holland Park Avenue W.11. PARK 4654.

APPOINTMENT REQUIRED

DIRECTORS needing able office staff (m. and f.)—Consult Stella Fisher Bureau, 436 Strand, W.C.2. TEMple Bar 6644.

FORECASTING MANAGER

Salary Range £3,200 to £4,000

A national company in the consumer goods field has a vacancy for a Forecasting Manager to head a department which already employs an Economist, a Mathematician with a trained and experienced clerical staff.

The selected man will probably have an honours degree in economics and/or statistics plus at least 5 years' experience in a consumer goods industry where he has been principally concerned in a senior capacity with forecasting future Sales Trends. His duties will include the provision of a statistical service to all Divisions of the Company and involve close contact with top management.

In addition he will be required to liaise closely with the Company's Market Research Department and advise on statistical matters.

Applications should be sent to :—

C.P.O. Box FM 6288, c/o Whites, 72 Fleet Street, London, E.C.4.

GUIDE TO CONTENTS SEE OVER

Already well up among the giants of British industry, the TURNER & NEWALL GROUP has spent £60,000,000 on development and expansion projects since 1947. This includes £9-million on new developments in asbestos textiles . . . £7-million on safer brake and clutch linings . . . £8-million on asbestos-cement building materials . . . £3-million on new forms of insulation . . . £31-million on overseas expansion. And the Group is making a very large investment in plastics developments. What will this remarkable growth mean to Britain and to *you*? Much more than you might imagine. 'T&N' companies between them make some 270,000 different finished products. As basic suppliers to the whole vast range of industry, we also sell to many other companies. The effects of expansion and development on our part ultimately reach out to every factory in the land. *Result—more jobs, more opportunities, more prosperity all round.* And for you, more safety and more comfort in your day-to-day life.

INTERNATIONAL

BETWEEN THE LIGHT AND THE DARKNESS

Nikolayev and Popovich nudged each other happily in space; on earth, the parallel and never-touching lines of Russian and American nuclear programmes lead, at worst, to explosion (p. 589).

The basic rules of spacemanship (p. 590).

One either **side of the Berlin wall,** the rulers and the ruled of both regimes ponder what comes next (p. 602).

Acknowledging only one God **in Ghana** has meant expulsion for two Anglican leaders (p. 597).

Suspended in legal metaphysics, **Dr Soblen** is a persisting embarrassment to both Britain and Israel (p. 595).

BEFORE THE BATTLE

A dark look into the European common market's crystal ball does not suggest that even now a failure between Britain and the Six need be the end; it all depends on who fails (p. 594).

Things might have gone worse at Brussels if it had not been for the Italians (p. 608).

President Kennedy has decided against asking for a tax cut now in the United States, mainly because he could not get Congress to accept it, but also because a recession does not seem imminent enough to justify it (p. 615 and p. 616).

Argentina's generals care little for each other but even less for civilians (p. 596).

Mr Kenyatta issues warning that **Kenya** could become another Congo (p. 598).

AFTER THE BALL

With the celebrations over and the British and American caravans departed, **Jamaica's new leaders** face—or will they?—an arduous and lonely climb (p. 631).

America's liberal Democrats may regret their filibuster against the satellite communications bill, even though there is some justification for it (p. 617).

When, and if, Chiang Kai-shek dies, can **Formosa** be turned into a Tibet? (p. 579).

The Gallic soul lives on in former **French West Africa;** what happens when the African spirit awakes? (p. 603).

IN HOPE

Agreement on **Dutch New Guinea** is welcome; it is not the time to point to possible new entanglements (p. 595).

Exports are playing the star part in **America's international accounts** (p. 617). Labour's remedy for unemployment is to shorten hours of work (p. 619).

Nowadays **American criminals,** like other American workers, prefer white collar jobs (p. 620).

R *seems to be the lucky initial for Republicans who aspire to be President of the United States* (p. 618).

HOME

KEEPING THE BRIDGE

Mr Thorneycroft's aim at the Ministry of Defence must be to push Britain-with-Europe into a realistically close relationship with America (p. 591).

By killing the **Blue Water** missile he has taken a first step to cut Britain's effort down to size (p. 591).

HOUSE IN ORDER

The balance of prosperity in Britain is still slipping towards the south-east; the only effective action to check the slide must be taken by the Government and local authorities together, to renew the physical structure of towns outside the charmed corner (p. 592).

Local authorities who have borrowed too much too short should achieve a better **financial balance** as a result of proposed new rules (p. 634).

In **London,** where approach roads are at last being planned, everyone welcomes them except those whose property is directly affected (p. 610).

In **Leeds,** the corporation's reservoirs can provide both water and a lakeside playground for its citizens (p. 611).

UNDER ONE ROOF

British banks have become too hidebound by official supervision and their own dull conformity—but the merger between the District and the National Provincial shows that there is still room for a deal more **competition** (p. 629).

East meets West in **Burmah Oil's** bid for Lobitos of Peru (p. 635).

The **National Liberal** party still refuses to sink its identity within the Conservative machine (p. 596).

Japan and Britain have made substantial progress towards unshackling trade between the two countries (p. 642).

Durham's schools are to be integrated, offering children a better chance of rising on their merits (p. 612).

RAISING THE ROOF

Sir Winston Churchill, brooding over **Europe,** knows how to deal with military **indiscretions—even when perpetrated by a** field marshal (p. 595).

The **Trades Union Congress** is to look at labour relations abroad, and in **Sweden** it will find that peace is won by the balance of industrial deterrence (p. 596).

The **Potato Marketing Board** is to take a firmer line with indecisive farmers (p. 598).

The new **National Theatre** has been given the best possible director—but will his organisation divert cash from other worthy enterprises? (p. 598).

Money is flooding into the building societies (p. 642).

Morris has brought out a new small car with a difference (p. 638).

. . . for Britain television is an important export, and ATV is foremost among independent television companies selling programmes throughout the world.

While such series as 'Danger Man' (currently being viewed with enthusiasm in Sweden, Poland, Germany and Portugal) and 'William Tell' (followed with equal enjoyment in Japan and Egypt) form an important part of the market, sales are not restricted to entertainment programmes. ATV through its film-producing and distribution companies, ITC London and ITC America, are at present releasing the following documentaries for world distribution: the Sir Kenneth Clark art programmes; an hour-long report on America, 'The State of the Union'; a documentary on South America and many others.

With the filming of three new entertainment series, 'Man of the World', 'The Saint' and 'Fireball XL-5' overseas sales of ATV programmes will exceed £3,750.

ATV ITC

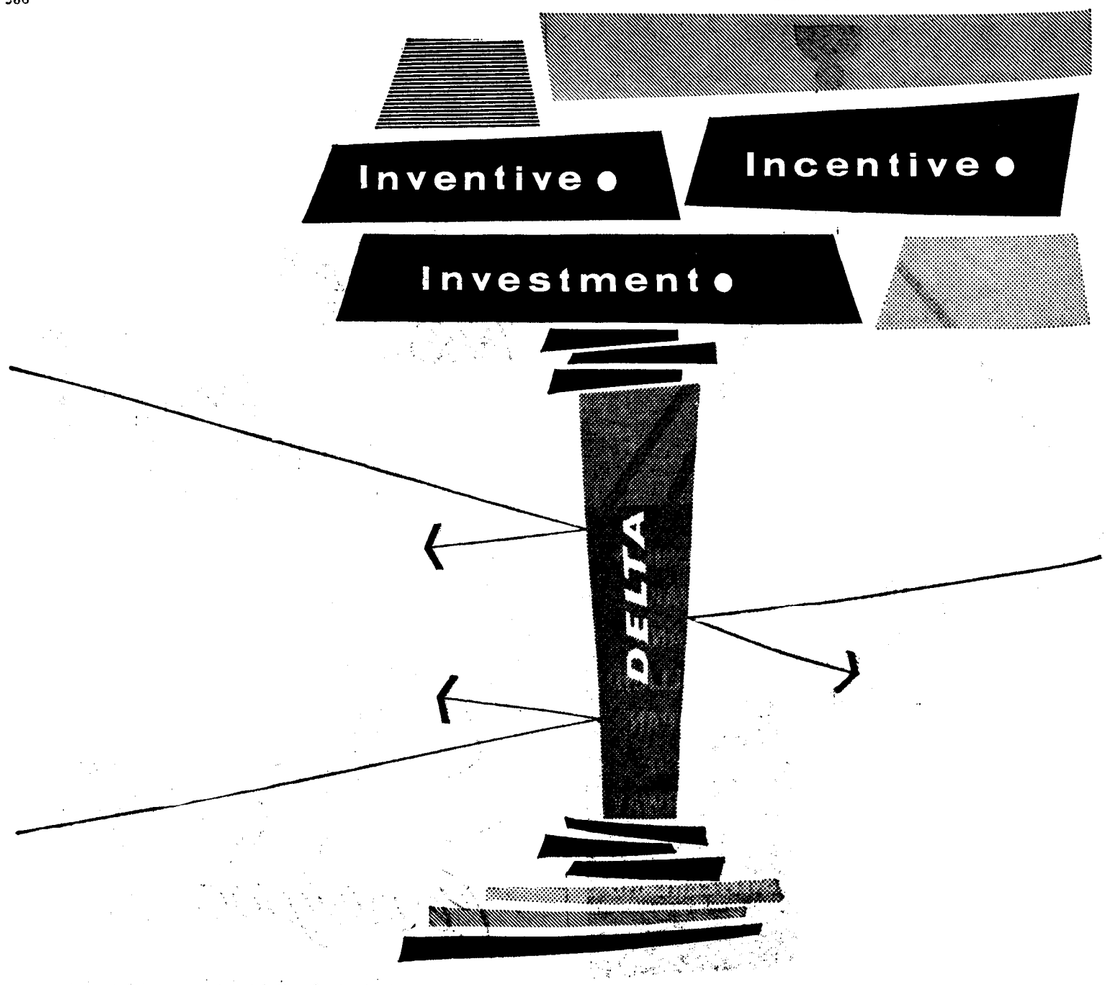
Clearly, no one in his senses would use chewing gum at a time and place such as this.

However there are times and places where the use of chewing gum can be most beneficial; in fact its discreet use is a mark of tact and consideration for others as it is a definite aid to oral hygiene.

Doublemint chewing gum is especially made for such people. Its ingredients are carefully selected throughout, even its flavour has been double distilled; in fact, as its name implies, Doublemint is double good and gives you double benefits in many ways.

Try some at the right time and in the right place and see for yourself.

E391/2



The inventive spirit is a dominating factor in the Delta Group of Companies. It began in 1883 when Alexander Dick founded the Delta Metal Company and invented the brass extrusion process—an achievement which has since provided continuous incentive for all members of the Group to devise new methods of production and to develop new and better materials. Today, the Delta Group is your measure of sound investment. It comprises more than twenty-five companies and is one of Europe's largest manufacturers of non-ferrous metals and alloys in numerous wrought and cast forms.

Products of the companies of the Delta Group include: wrought metals; plumbers' brassfoundry; hot stampings; pressings and forgings; pressure, gravity and sand castings; controls; gas, electrical and sanitary fittings and accessories; brass machined parts; general engineering.

Specialists in non-ferrous metals and alloys.

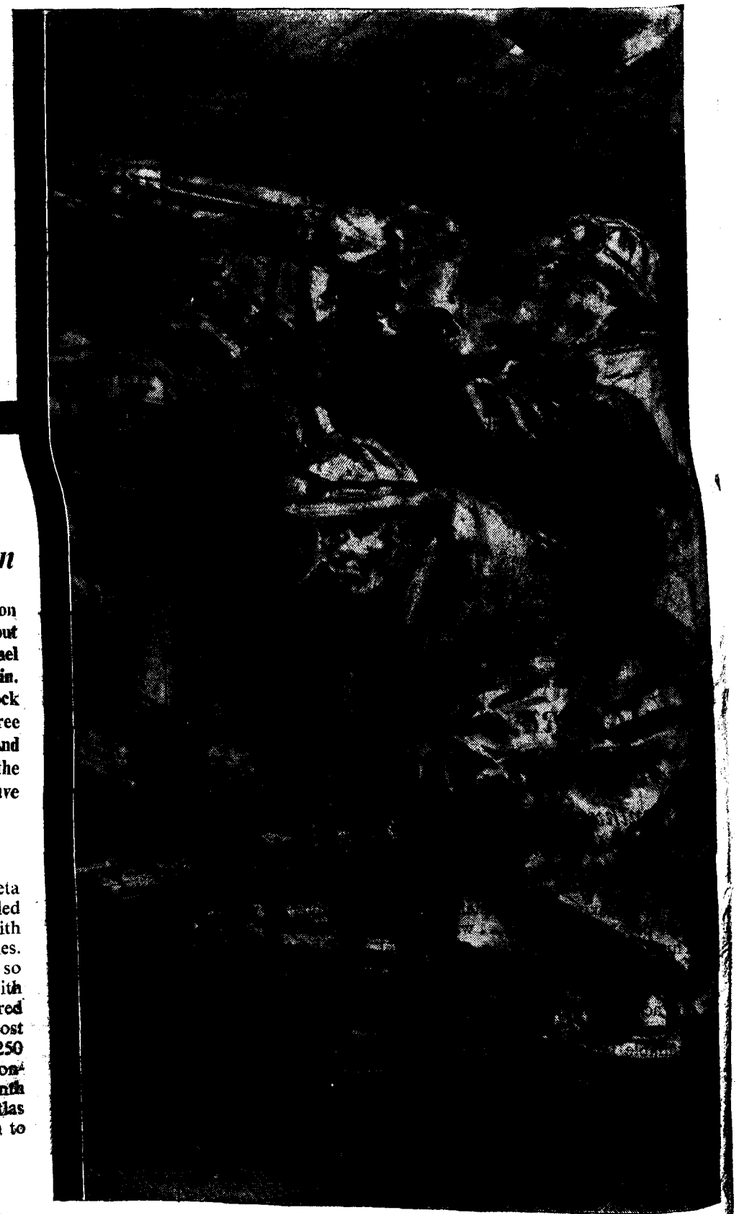
World's longest short cut– through Mont Blanc



Italian tunnel crews and *Swedish steel conquer Europe's highest mountain*

THE DREAM which has fired man's imagination since Hannibal crossed the Alps is now about to become a reality with the seven mile road tunnel through Mont Blanc, Europe's highest mountain. With the break through of the last few feet of rock the Italians can look back after more than three heart-breaking years of rock bursts, roof falls and flood hazards. Working from opposite ends of the mountain, the Italian and French drill crews have brought Paris 194 miles nearer Milan.

A constant fight against nature

The drill teams of the Italian contractors Societa Italiana per Condotti d'Acqua of Rome battled against gigantic natural forces all the way, with rock falls and flooding as everyday obstacles. Several times the rock conditions became so bad that the Italians could only advance with picks and shovels by small heavily-timbered pilot tunnels. Last December, they were almost drowned by a sudden influx of water at 250 gallons a second! Not until February did conditions at last become good. During that month the Italians' skilled handling of their Atlas Copco light-weight rock drills enabled them to achieve a total advance of 807 feet.

The right choice—light-weight rock drills

The only constant factor in the Italian operation was the courage and skill of the tunnel crews and the flexibility of their one-man Atlas Copco rock drills. Throughout the project, whether driving the tunnel full-face for a record advance of 807 feet in one month or drilling a pilot tunnel, knee-deep in water, the Italians used Atlas Copco hand-held rock drills fitted with Sandvik Coromant drill steels.
Ten Atlas Copco AR4 compressors met all the compressed air requirements.

What Goes Up

CHASING each other in vast circles, following virtually the same track, now tantalisingly close together and then drawing far apart, Major Nikolayev and Colonel Popovich have served the world this week as symbols both of man's achievement and of his frustration. Their successful endurance of million-mile journeys has helped to open the road to the moon. But the circumstances of their feat were a painful reminder of the barriers that have yet to be overcome on the divided earth.

This would have been true even if their twin orbiting had not coincided—possibly by intent?—with the first anniversary of the building of Herr Ulbricht's wall across Berlin; even if it had not come as a kind of divertissement in the middle of the series of nuclear explosions that Russia began—surely not by intent—on the anniversary of the destruction of Hiroshima, and which has already included several blasts in the same central Asian area from which the Soviet astronauts were shot into space. For the basic characteristics of Russia's intensively publicised space feats still include, paradoxically, an equally intense military top-secrecy.

The Soviet government is insistent on two themes: first, that its achievements in rocketry and sputnikery "show where supremacy lies," demonstrating not only a lead in these fields but the general superiority of the whole Soviet system; secondly, that its space programme is a wholly peaceful one, unlike that of the United States, which is represented as dominated by military aims. These themes were stressed, for example, in a Moscow broadcast last Sunday by Mr Yuri Zhukov and Mr Nikolai Polyanov, who went on to complain of American failure to co-operate in space research.

It is certainly deplorable that men should be reaching for the moon in a spirit not of co-operation but of suspicious and hostile rivalry. But the Russians are hardly in a position to claim that they have made co-operation easy. Their recognition of American achievements in space has generally been grudging. The United States' first offer of co-operation, made more than five years ago, evoked no response from Moscow until after Colonel Glenn's orbital flight; and the Russians bear at least partial responsibility for the sorry record of inactivity over these same years of the United Nations committees on outer space. When Mr Kennedy, in March, offered Mr Khrushchev a set of direct and specific proposals for joint action and pooling of efforts, the Soviet leader, while agreeing to discuss the possibilities, argued that military considerations were too intimately involved for any pooling activity to be possible before agreement had been reached on disarmament. At the Geneva disarmament talks this year, repeated western proposals for immediate action to prevent the "militarisation of outer space" have met a stubborn Soviet refusal to give priority to this question.

Russia has shown no sign of sharing the West's anxiety to avert the prospect of "orbital bombers"—satellites circling the earth and containing nuclear bombs which could be released at will upon any target. On the contrary, Mr Khrushchev has publicly claimed that Russia could orbit bombs over American territory just as easily as it has sent its spacemen on the same tracks. So long as military secrecy remains the rule of the space road, there is thus cause for concern at the appearance in the sky of any orbiting object whose purpose cannot be identified, and the Americans are already putting a considerable effort into techniques for "scouting" and "neutralising" potentially destructive

satellites. This is one of the things that focus interest on achieving "rendezvous" between two orbiting vehicles.

When Nikolayev and Popovich were reported at one stage to be so close together that one could see the other's craft, it was quickly deduced that the Russians had made sensational progress toward achieving rendezvous. When they swept apart, it seemed there was still some way to go before the problem was licked; no attempt to close the gap by manœuvring one or both of the vehicles was reported. Rendezvous is of great significance for any attempt at manned lunar flight. Rather than launch a whole rocket with the power and payload for a manned moon journey from the earth's surface, it may well prove easier to send it up into orbit in pieces that can be assembled above the atmosphere.

But it is also clear that the rendezvous problem has a significance of a military kind. And the Russians cannot expect the Americans, or indeed the outside world as a whole, to believe that their space programme is strictly non-military while it still lurks behind curtains of secrecy that can be justified only on military grounds. Space rocketry is in fact a field of activity so ideally suited to the Soviet system in its present stage that Mr Khrushchev must give thanks daily to whatever providence he credits with having opened up the lunar road just when he most needs it. It is not only a matter of directing men's eyes to the heavens and away from the nagging "little local difficulties" of meat shortages, Mao Tse-tung and the marshals. Sputniks also offer an unrivalled combination of maximum publicity with minimum revelation. What other device could have such a universal impact on peoples who can never get within a hundred miles of it?

Unfortunately, when one comes down to earth, this passion for secrecy makes it very difficult to achieve any kind of rendezvous at all. At Geneva, Mr Kuznetsov has replaced Mr Zorin, who was apparently exhausted by the steady stonewalling with which Russia continues to resist any idea of international investigation of signs of nuclear test explosions being carried out; but the new Soviet representative at the disarmament talks has quickly demolished the speculation that he might prove more flexible than his predecessor. The latest American concessions, so painfully thrashed out in Washington, would cut the amount of possible intrusion on to Soviet soil by an international inspectorate to the barest minimum. It makes no difference. Even if the inspectors were all from non-aligned countries, were restricted to a few tremor-prone (and militarily unimportant) sectors of Russia's territory, were conducted blindfold across all other sectors, always accompanied by Soviet guides and mentors, and limited to making very few visits anyway, they would apparently still be unacceptable.

On Tuesday Mr Kuznetsov once again rejected the western governments' proposal that the scientific experts should get together and study the Soviet claims that all nuclear blasts can be positively identified at a distance by instrumentation; these claims, it seems, have to be taken on trust. Indiscreetly, perhaps, he revealed what looks like a barrier to all hopes of early progress on any sector of the disarmament problem—whether on nuclear tests, on outer space, or on general disarmament—when he alleged that "preventive war" against Russia had been suggested in America, and asked: "Do you expect the Soviet Union to disarm in such conditions?"

After five months at Geneva, there can be few people who expect the Soviet Union to show a serious interest in disarmament in any present conditions. Yet the head of the American Disarmament Agency, Mr William Foster, has hopefully detected a silver lining in the unbroken clouds this week, suggesting that the successes of Major Nikolayev and Colonel Popovich may increase the Russians' self-confidence and make them readier to get down to real disarmament negotiation. One cannot, presumably, expect such a change to show itself immediately. A good many successors to this week's heavenly twins may shoot up out of the deep obscurity of central Asia, flash across our skies, and return to the same obscurity, before Russia rids itself of its obsession with secretiveness, recognises the waste and the perils that it involves, and bestirs itself to make possible a fruitful rendezvous on earth as well as one in the high sky.

LIVING IN ORBIT

The Russian feat of putting a man into space on Saturday, a second man into orbit on Sunday, and bringing them both safely to earth on the following Wednesday deserves to be saluted on two levels. The first is that of sheer human courage. It is one thing to orbit the earth three, four or five times in succession, and another to resist the combined assault of claustrophobia and agoraphobia for days on end; only those who have endured trial runs on the ground in prototype space capsules can have any conception of what this means in terms of nervous strain and sheer physical discomfort.

TECHNICAL ACHIEVEMENT

It is difficult to coax a big rocket off the launching pad; doubly difficult to get it to put what appears to be the equivalent in size of a double decker bus into orbit; trebly difficult to make two such buses follow one another along an invisible route through space with a regularity and accuracy of timing that London Transport would find it difficult to match. The Americans can match the first, but not the second or third of these feats. Soviet rocketeers seem able to call on their missiles whenever their political masters command, regardless of the state of the rocket, the weather or all those other elements that make life at Cape Canaveral so unpredictable.

But Western Man, instructed by Plato and Aristotle, St Paul and Pythagoras, St Augustine, Descartes and Hume, will throw his hat into the air as he cheers Messrs Nikolayev and Popovich, and murmur under his breath "what for?" as he catches it coming down and puts it back firmly on his square, sensible head.

THE BASIC RULES OF SPACEMANSHIP

It is worth repeating, *sotto voce*, what the rules are:

(1) It is cheaper, easier and more economical of human life to put tiny tough instruments instead of big soft men into space to do whatever work needs doing there, civil or military.

(2) The human brain is many times cleverer, more flexible and—most important of all—more reliable than the electronic brain as at present built, so that wherever reliability is the prime requirement, it is preferable to send men rather than instruments into space.

The Americans, for example, have found that men can control and correct their space capsules where instruments alone would have thrown in the sponge. In the present state of the art, manned satellites might do better than robot satellites in such jobs as reconnaissance, orbital bombing, and the mating up of rockets in space to make moon-ships. Russians and Americans seem to agree that a manned moon rocket fired from the earth's surface in one piece is a technical impossibility in terms of sheer size (say 5,000 tons).

But the question why they should want to do any of these things should be directed to the military and the politicians, not to the scientists, who merely advise how to do it.

Interdependent on Whom?

A new impetus towards Atlantic integration must be Mr Thorneycroft's primary aim

MR THORNEYCROFT is due to visit the United States early next month. Just possibly this could turn out to be something of a portentous occasion. Ministers of defence are all professional proponents of interdependence: Mr Thorneycroft, of necessity, has to mean it. In scrapping Blue Water, the army's prospective tactical missile, last week he provided two explanations: that Blue Water was going to cost too much (i.e. other countries had not been interdependent enough to buy it) and that Nato had a plethora of tactical nuclear weapons in central Europe anyway (i.e. Rhine army, which will be given no new nuclear artillery of its own, is going to be forced to be interdependent with the Americans and Germans). This painful British experience should give any minister of defence something purposeful to say in Washington on the organisation of western resources, but Mr Thorneycroft's immediate troubles are only part of the developing strains within western strategy as a whole.

Seen from London, the successive demises of Blue Streak and Blue Water mean a major, and probably permanent, contraction of independent British efforts in serious rocketry. And when Blue Steel, the V-bombers' stand-off bomb, is replaced by Skybolt the British reliance on American nuclear vehicles, strategic and tactical, will be finally apparent. Seen from Washington, in the light of accepted American military thought at this juncture, this cut-off imposed on a separate, and weak, deterrent can be regarded with complacency. But in continental Europe the implication that the European half of the alliance is to be given a purely conventional part to play is held to be politically and economically intolerable. President de Gaulle has committed France to building its own deterrent; even if this effort eventually founders for the same financial reasons that have ended the Sandys strategy here, the political resentment of a Gaullist Europe at over-dependence on the United States will remain to bedevil the alliance thereafter. Now west Germany, in the past fortnight, has both resisted American hints that it should increase its conventional manpower above the army level of 350,000, which is already the largest national commitment in central Europe, and intimated that to assist its own industry it will manufacture more arms at home than it buys from its allies (chiefly the United States).

The military consequences of the abandonment of Blue Water are largely gratifying to those, like *The Economist*, who have argued for a greater conventional effort in Europe and for a greater flexibility in the tactical doctrines of the British forces there. Mr Thorneycroft has recognised the over-kill capability already at Saceur's disposal; he has decided to speed up the modernisation of conventional equipment, with particular emphasis on increasing Rhine army's mobility; and by entrusting future nuclear support to strike aircraft (initially to the TSR-2, but shortly, it must be hoped, to a vertical take-off plane) there will be a clearer distinction between the forward conventional troops and the big nuclear punch. Instead of Mr Watkinson coming under fire because Rhine army could, allegedly, only fight a nuclear battle, Mr Thorneycroft is already being told from the Tory back benches that the Russians are bound to choose the British sector for any push because there will not be enough nuclear weapons defending it. Saceur, however, is under the impression that he controls modestly integrated forces, and not a congerie of self-supporting national contingents. In these circumstances the nuclear-naked British are hardly a liability.

But there are two more substantial issues that need examination. The first is that, with the abandonment of Blue Water, Britain's permanent contribution to Saceur's forces for the foreseeable future is likely to stick at a maximum of 55,000 men, plus tactical air support. It may be argued, as it was under the Sandys strategy, that a major war in central Europe is still the least likely contingency that Mr Thorneycroft has to plan for: many more unstable situations exist east of Suez. Nevertheless it should be clear that, by comparison with the other major allies, the British contribution to, and influence upon, defence in central Europe have been steadily declining. The Berlin crisis last year revealed the danger of accepting this situation in perpetuity; another Berlin crisis this autumn (after, perhaps, a Russian peace treaty with the east Germans) could again find the British military response lacking in allied, and particularly American, eyes. The second issue is whether the defence policy that now looks likely under Mr Thorneycroft is going to allow of a national use of such advanced weapons capacity as Britain has already acquired.

Blue Water, on most counts, is a superior missile to the American-built Sergeant, which is, in fact, going to provide the backbone of Saceur's capability in this sphere. (Equally, it is conceivable that there may be French or other European missiles that will have claims to be adopted in the future and—if interdependence remains as sketchy as it now is—will run into Blue Water's financial difficulty.) Britain, too, now has a rapidly growing surplus of fissile material (in spite of the partial closure of some production plants) for which there can be little military potential except as a contribution to the alliance as a whole. It has seemed feasible to argue that the best inter-allied use of Britain's total military capability should take account of this kind of effort, rather than, say, require Britain to double its expeditionary force, with its expensive tail, in continental Europe.

It is from the impression that British and European capabilities are being slowly stultified in the development of allied weapons systems that political pressure is liable to grow, not only in Britain but in west Germany, in favour of a separate European military effort. This pressure, together with the sense of growing European unity, is precisely the boost that could eventually end in a European strategetic nuclear force,

even to the extravagant extent of duplicating the American deterrent. To declare roundly (as Mr Thorneycroft must be ready to do) that this would be wasteful, absurd and a negation of everything that Nato has stood for hitherto is not to be "a bad European." The one price that this country must not pay in entering Europe economically and politically is, by that very act, to divide the Atlantic alliance into two self-contained halves. The answer to the dilemma of which Blue Water is the latest illustration is not, therefore, to concentrate on European interdependence, useful as this could be (and as Mr Watkinson tried, unsuccessfully, to make it) in expensive conventional arms like tanks. The nub of interdependence, nuclear and conventional, lies in Washington, in the degree of mutual political control that the United States is prepared to give Europeans over strategic weapons systems (e.g. Polaris submarines) on this side of the Atlantic, and in the degree to which the United States is prepared to share major weapons developments, both nuclear and conventional, with other industrial countries of the alliance.

Europe is palpably in no danger of being reduced to a Turkish cavalry role in American strategy; if, indeed, the European allies are to give their existing conventional ground forces the hitting power and mobility required to parry a Russian conventional thrust, and if they are to contribute as they should to the tactical air and naval forces of the alliance, their budgets are likely to be strained for much of this decade without participating in the nuclear race. For Britain the best military sense of all behind Mr Thorneycroft's cuts is that defence expenditure soaring towards £2,000 million a year would have left precious little for the economic contest with the communist block in Africa and Asia. But the political attitude to alliances, particularly among inferior members, is seldom a matter of entirely logical conduct. As the 1960s advance Europe (we must hope with Britain) will be a visibly rising power in the world and in the alliance. If it is not to succumb to ambitions and resentments, real or imaginary, and attempt to elevate itself into something resembling a self-contained power, the division of responsibility within the western alliance will have to be hammered out in the immediate future. Can, for example, a strategic weapons system of 1970 vintage, and primarily satisfying United States requirements, be partly built and manned by Europeans? Or, failing that, can the United States ever be persuaded to buy conventional European arms in bulk for its own forces? These are old questions, which were easier to ignore when the American military and economic potential was nine-tenths of the whole alliance. It may seem impossible to discuss these matters with President de Gaulle in his mood of nuclear deprivation. It is certainly no time for any public British initiative while the common market negotiation hangs fire. But Mr Thorneycroft, as a potential European, should have a stockpile of pertinent, and awkward, questions to put next month.

The New Cities

Urban redevelopment lies at the heart of the most urgent of Britain's regional problems

EVERY advanced society has its population drift from declining, low-wage, poor amenity regions to booming, high-wage, visibly affluent ones. The Americans have it, the Russians have it, and now people are waking up to the fact that it has been happening in Britain since 1950 with even more vigour than the previous migration to the south-east in the 1930s. Over half a million people have moved from north to south of the Trent in the past decade. New employment is one reason: the social desire to get through the lace-net curtain between the Wash and the Bristol Channel and into the chintzy suburbia of southern England is another. It is now thoroughly fashionable to talk of the two nations: the north-west to be pitied, the south-east to be envied. Or, rather, both to be pitied: the north-west for too much unemployment, too many dingy city centres, too many old schools, too many privies in the back garden; the south-east for too much overcrowding, for over-loaded commuters' trains and jammed roads, for soaring house prices and rentals.

It is not quite so fashionable to declare that the economic forces which have prompted this drift from declining industries to expanding ones are invariably necessary and, in the short-term, wholly desirable ones; that firms need offices in commercial and financial centres like London and Birmingham if they are going to be competitive at all; and that entry into the common market (plus road communication across the Channel) makes it a much better idea to expand on the south coast than, say, at Jarrow or Dundee. At this stage, the most practicable answer to the problems of the two nations is not to implement the kind of programmes, usually involving the direction of industry, that declining localities, their MPs and their trades councils understandably hanker after. Nor is it to impose rigid physical controls on particular aspects of growth, like office employment, that authoritarian planners demand (which does not mean that there should not be fiscal ones). The essence of the matter is twofold: to cater for the growth industries in the growth areas by relieving congestion on a regional scale, including the release of land for building new, planned communities; and equally to reinforce the viable sectors of the declining areas by improving their amenities and encouraging the establishment of new industries in those regional localities where they are most likely to take root. Both these tasks require the acceptance of the regional concept; they also require greater organisational co-ordination between the Government departments concerned: the Board of Trade, the Ministry of Housing and Local Government, and the Ministry of Transport. Scotland, alone of the regions, already possesses some of this co-ordinated infrastructure within the Scottish Office; it is also the region that most badly needs to adopt a purposeful plan of campaign (along Toothill lines) for economic and social renewal.

The redevelopment of the ageing Victorian cities and towns of Britain lies at the heart of any strategy to assist the two nations. In the north-west it means providing the social facilities that now play a major part in the drift to the south: executive or technical skill will not stay in, far less be attracted to, a dingy Bruddersford, whatever the potentiality of its industrial estate and its pool of unemployed. In the south-east it means relieving central congestion and pressure on housing accommodation both by a dramatic overspill operation and by coming to terms with the motor car, which is a menace in city centres but an invaluable and still largely unexploited asset in linking the suburbias, peripheral shopping and entertainment localities and the new towns beyond the conurbation's outer ring. There are three major needs. First, to concentrate the housing effort, particularly in the north-west, on the replacement of obsolete buildings; at present some 60,000 slums are cleared in Britain each year—and another 60,000 old houses slip into slumdom. Second, to redevelop central areas both as attractive foci for recovery in declining areas and to cope with new growth in growing areas. Third, to take proper account of traffic and parking problems in these urban areas in terms of a doubling or trebling of car ownership in the next generation.

THE experience of local authorities is now at the stage where the difficulties are clearly understood, often for the first time, but solutions for general application have never been scarcer. It is a sign of the times that the Ministries of Housing and Transport produced last month a joint bulletin of advice which gave particular emphasis to traffic. About one-third of urban authorities in England and Wales have plans for central area redevelopment already in active being or under consideration. These range from the extensive Newcastle scheme, a major attempt to provide a modern regional centre for a population of 2½ million, to arrangements of more doubtful benefit under which property developers are allowed to exploit the easiest commercial advantage in a town centre, plus a little road-widening, without much relevance to the needs of the town as a whole. In other cases still, planned redevelopment of any kind is held up because the local authorities simply do not possess the trained staff to deal with it. The Ministry of Housing is now sensibly pressing the idea of county planning teams and the preparation of town centre maps, setting out objectives.

But the biggest problem of all does not lie in town centres, which are always likely to attract investment capital. The real backlog of obsolescence and decay is in the "twilight" residential areas of the inner rings of towns, most of the property still rent-controlled, most of it without amenities like bathrooms, and most of it (particularly in the low-wage north-west) occupied by tenants who could not possibly afford economic rents after clearance and reconstruction. The defeatist answer is (as many councils now have to do willy-nilly) to let the rot continue and eventually treat these areas as official slums. If, as now seems to be the case, parity is approaching between numbers of families and numbers of houses, it should be possible to devote a substantially greater proportion of new building to replacing the worn-out housing stock: the Civic Trust has suggested an increase in clearance from 60,000 houses a year to 180,000. How can this, or preferably a better replacement figure, be achieved?

It needs to be tackled at several levels. The obvious marriage is again between the local authorities, who have the necessary powers of acquisition, and private developers, who have the capital and the expertise. There are occasions when commercial pickings (e.g., local shopping precincts) will be sufficient to cover neighbouring housing redevelopment as well. These should be exploited wherever possible, just as in actual overspill there is an equally good case for insisting on the extensive use of private development in the next batch of new towns. The second approach is for local authorities to acquire the land and then sell or lease it to private housing associations. But this is just not going to happen unless Sir Keith Joseph breathes some commercial life into the housing association idea; and it is doubtful, too, whether (outside London) there is a sufficiently large middle class that is prepared to put convenient access to the centre before suburban pleasures. But the attempt is certainly worth making for the sake of the growing number of town dwellers whose new incomes and preferences are steadily raising their sights beyond the ordinary council block.

The third approach, in impossible districts, is to set up special development corporations, drawing on Treasury funds but also with a contribution from local rates, and give them a wide and roving franchise to carry out progressive redevelopment as the opportunity occurs (e.g., when streets are declared beyond repair and where it is not worth trying to instal bathrooms and indoor lavatories). One's preference is to make this as much a local effort as possible. The Civic Trust and others have proposed that these development corporations should be modelled on the new town corporations and be given geographical entities to run on their own. It is difficult, however, to see local authorities subscribing to this loss of sovereignty except in sheer desperation; a better solution may be to tie the corporations in with existing local government—provided the local government areas are sufficiently large to give them proper scope for action.

The Civic Trust has itself retreated from the concept of a Land Finance Corporation which would buy all land proposed by local authorities for redevelopment and then re-sell it to private or public agencies at prices reflecting the profitability of each scheme. Equally, the Labour party's idea of a Land Commission to purchase all development freeholds looks a political non-starter (as well as offering serious disincentives to develop at all). The incentive that is needed to get things moving may well have to be a return to specific grants to local authorities for redevelopment, plus provision for deferred payment of interest on local authority borrowing to acquire clearance sites. This can only involve a large outpouring of Treasury funds. But such external aid should not remove financial responsibility from those local authorities whose housing funds and redevelopment plans are in trouble now partly because of a consistent refusal to charge realistic rents (plus rebate schemes) ever since the war. In getting this vast process of regeneration and planned new development under way Sir Keith Joseph has to undertake a backbreaking but increasingly urgent job. It is something that the political pundits are beginning to think there could be votes in it.

Well, What if We Don't . . .

in or out?

. . . get into the common market? This will not be the end, provided a sincere effort has been made

WHAT with the effort to join, and the exertions of those who would rather we stayed out, there has not been much energy left to think about what will follow if the attempt fails. Since the possibility is there and needs thinking about, it is right to ask ; but probably wrong, so soon, to attempt categorical answers. One would first want to see just what happened, how, and why.

Plainly a situation in which a revulsion in British opinion pushed the British Government into withdrawing would be quite different from one in which General de Gaulle had barred the way. In the first event, Britain would be back in the deplorable situation it was in from 1957 to 1961—handicapped in all its dealings with the six common market governments, with the people of their countries, and, curiously, with the Americans by the fact that when European union was in the air Britain had chosen to stay out. This would not be all. It might not even be the worst ; the truth is—and many British people have grasped this, though the detail and the technicalities of the common market arrangements may escape them—that a self-imposed isolation from its neighbours would be the worst possible thing for the country's domestic health. An enterprise would have been shirked, an adventure left unattempted, a door shut ; there would be feelings of inadequacy and a waste of self-justification.

As French opponents of Britain's entry are the first to see, the British position would be vastly more favourable if it were visibly France that slammed the door. This the French could get away with in 1958 when it was only the Free Trade Area that had to be obstructed, because they were able at all crucial times to convince their common market partners that the British, through their fear of European responsibilities and their lack of a sense of European identity, were denying the way into Europe to themselves. This was never the whole truth, but there was truth in it ; it was not as deep as a well or as wide as a church door, but it served.

This time it is not so. Perceiving how important the difference is, the French have pursued a closely calculated policy of insisting on the last pound of flesh of national interest in every instance where they could hope to carry their partners with them, and always provided that their insistence could be presented as fidelity to the letter and principle of the Treaty of Rome. Even now it is not possible to say what the French would really rather have—a financial killing, or no new member. Thus there is not likely to be a plain case of deliberate, obstinate obstruction. If there were, the French would not carry the other five with them, and it would be the common market that would suffer the crisis of confidence.

On two matters the French knife has cut close to the bone: the definition of future price policy, and the insistence on a French interpretation of the financial regulations, attached to the common agricultural policy, which were agreed in January by the Six—but with the safeguard that the Council of Ministers could control the actual spending of the very large sums of money involved. Without doubt the French attitude is fully consistent with the spirit of the treaty. Equally, the possible cash implications are so large that the governments of the other five, and the British Government, would be at fault in not insisting on safeguards that they will not be committed to transfer entirely unreasonable amounts of cash from the pockets of their consumers to the pockets of the French farmers—and to the loss of Britain's traditional suppliers.

A negotiating position on these lines ought still to succeed. On a scrutiny of the negotiations to date, the outline agreement still looks attainable this autumn. There is no certainty of it ; but we have to do our best, and in a manner that allows no doubt to arise about the British interest in promoting, and the British will to enter into, the European union. If Britain sticks firmly to this course of action, it is probably unrealistic to think of an abrupt, decisive failure. More probable would be a doldrums period, with postponements, fresh starts, and intervals when the countries concerned eyed each other and weighed up each other's intentions. Even a failure, if honestly arrived at in spite of a sincere will to succeed, would leave Britain in a far from hopeless relationship with the other five common market countries, with France, with the United States, and for that matter with itself. The Commonwealth countries would not find that the failure served their interests, but they would have to respect the reasons for it.

None of this would kill the impulse to a large united Europe. The logic that has pushed Britain into the Brussels negotiations, and has obliged the continental partners to listen, would remain obvious and would lose none of its force. Time, tolerance and patience would be needed until the yeast worked again and the moment returned. Unfortunate the loss of time would be ; despondency would not be necessary.

BRIEF BOOKLETS . . .

have been produced jointly by The Economist and The Economist Intelligence Unit to present the essential facts behind important current topics. Each takes about one hour to read. Here are the first three titles in this new series:

Brief 1 **RHODESIA: BRITAIN'S DEEP SOUTH** by Joe Rogaly

2 **MONEY FOR GROWTH** by Fred Hirsch

3 **LABOUR IN BRITAIN AND THE SIX** by Val Schur

Each booklet costs 2/6d. post free for remittance with order from:

22 RYDER STREET, LONDON S.W.1. WHI 1511

NOTES OF THE WEEK

SIR WINSTON AND EUROPE

Who Said That?

SIR WINSTON CHURCHILL'S prompt denial that he had ever said to Lord Montgomery that he was "entirely against the common market" is the sort of reaction that Lord Montgomery, who had ample opportunity in war to learn Sir Winston's ways, had to expect. He can hardly have thought that the old master would let him get away with it ; still, whatever the outcome, they would both be in the headlines again. The incident has importance, not because Sir Winston is now a specially prescient oracle—old men, as has been noted, have a tendency to forget—but because he is regarded as one by the rank and file of the Tory associations where doubts and anxieties about the Government's European policy are most widespread. In those circles Sir Winston's every word has all the force of holy writ. To have created the impression that the grand old man was ranged with Lord Beaverbrook would have hit the Government where it hurts most. Lord Montgomery is not noted for his political gifts but there was shrewdness in this apparently casual stroke.

Lord Montgomery's unchallenged statement would also have deprived Tory speakers of one of their most useful and effective lines of sales talk in persuading local Tories of the rectitude of Government policy. Radical innovation is best sold to a Conservative audience by persuading them that the change is rooted in their past. At the Brighton conference last year the anti-floggers were prompt to conjure up the name of Sir Robert Peel, as being the first Tory Prime Minister and also an ardent penal reformer. In the same way nothing goes down better with a Tory audience than to point out that the whole European movement was set on its way by Sir Winston in his Zürich speech in the autumn of 1946, when he called for "a kind of United States of Europe." In the present mood of the Tory rank and file, not quite abreast of what has happened in Brussels but a prey to Commonwealth doubts and fears, the stamp of Churchillian precedent could never have been more valuable than at next month's conference. Now, just possibly, there could be doubts.

Sir Winston's letter to his constituency chairman—written in August, 1961, but now published for the first time—was firm about the Commonwealth: "In my conception of a unified Europe I never contemplate the diminution of the Commonwealth." This is a sentiment to strike a sympathetic chord in Tory (and others) hearts, but too much need not be made of it. Sir Winston's ideas of European union were crystallised at a time when imperial responsibilities were real and vast ; even then, his world had room for both.

DR SOBLEN

Still Pending

MR HENRY BROOKE is now thoroughly in the Soblen toils. After El Al's persevering refusal to remove Dr Soblen to the United States, the Home Office has now issued an order for deportation under article 20 of the Aliens Order, 1953. This authorises the making of a deportation order against an alien "if the Secretary of State deems it to be conducive to the public good." Dr Soblen's lawyers at once challenged this move by applying for a second writ of *habeas corpus ;* the first one was applied for in the earlier wrangle last month. The writ has now been issued and Mr Justice Stephenson will hear full argument on August 22nd. This will not end the matter, however, since either side can go to the Court of Appeal and from there to the Lords. The Court of Appeal hearing is likely to be in the week beginning August 26th and the Lords hearing in a special vacation sitting beginning on September 6th, if, in the words of Dr Soblen's consel, "the assembly of their Lordships from divers beaches" can be made in time.

Four principal arguments are being put forward on Dr Soblen's behalf. The first is that under article 20 of the Aliens Order the Home Secretary has no express power to deport to a specified country. The second is that by making a deportation order in this form, the Home Secretary is making a non-extraditable offence extraditable. The Extradition Act of 1870 provides that "a fugitive criminal shall not be surrendered . . . if the offence is of a political character." Had Dr Soblen landed lawfully the British Government would have been obliged to refuse any request for extradition from the United States.

The third argument is that a deportation order is a quasi-judicial process and an order cannot be validly made if the deportee is given no opportunity to state his case. Dr Soblen was never given such an opportunity and has been loudly demanding one. It is normal Home Office practice to refer cases of deportation to a Bow Street magistrate for hearing, but this is a matter of grace, not of right. Finally, the defence argues that Dr Soblen cannot be deported because he was never here, having been refused permission to land. Since two courts have upheld Mr Brooke's initial contention that Dr Soblen was not in the country lawfully, this point has legal as well as metaphysical significance. The Home Secretary must by now be bitterly regretting his initial error in specifying a particular destination for Dr Soblen instead of getting him out of the country into another unspecified lap.

Passed to You, Please

ISRAEL'S part in the Soblen affair adds to the unedifying spectacle of buck-passing. As a fugitive from justice, Dr Soblen does not qualify for the Law of Return (which allows all Jews to make their home in Israel), and there has been no serious demand in Israel that he should be so accepted. But after he was expelled on July 1st, the Israeli authorities came under fire for the manner of his expulsion, particularly from members of Achdut Avodah, a left-wing party in the government. There were two main criticisms: first, Dr Soblen was bundled out of the country before his lawyer had a chance to apply for *habeas corpus;* second, an American policeman should never have been given charge of Dr Soblen on the El Al aircraft that brought him to London.

Although most of the opprobrium for the muddle has been officially rubbed off on the heads of junior officials, the fuss was fierce enough to induce the government to change its mind and tactics, if not its heart ; El Al was then instructed to refuse to fly Dr Soblen to the United States. On the other hand, the Israeli government recognises, though without enthusiasm, its obligation to bring him back to Israel should the British Government demand it. Dr Soblen would then have the chance of applying for his immigration visa (which has already been refused once) through the Israeli courts. But with public opinion buzzing, the Israeli government's fervent wish is to wash its hands of this unfortunate wandering Jew.

NEW GUINEA

An End in Sight

WEDNESDAY night's agreement on the transfer to Indonesia of Dutch New Guinea, after seven months' interim administration by the United Nations, must be widely welcomed. For thirteen years the dispute over this territory has bedevilled relations between the two countries. West Irian, as it will generally be known from now on, is three times the size of England, but the population is reckoned at only about 700,000, many of them virtually cut off from

civilisation by tangled mountains and swamps. Its oil and minerals have done little to offset the losses the Dutch suffered when Indonesia, impatient with their delay in handing Irian over, expropriated all their assets on its own soil in 1957 and expelled the Dutch themselves. When, and on what scale, the Dutch can hope for compensation for these losses now that a settlement is in sight, are open questions; but they can at least look forward to resuming business activity with, and in, Indonesia.

The UN now faces the task of finding a temporary policing force of 1,000 soldiers (to be drawn, it is understood, from Asian countries) and up to 150 administrative officials. Fortunately it will not have to pay the bills out of its own strained finances: the Netherlands and Indonesia have agreed to split the cost of the interim administration. But the Irian operation will add to the total load on the UN at a time when there is no immediate prospect of its being able to disengage from the Congo.

Indonesia has agreed to give the Papuan population an opportunity of self-determination not later than the end of 1969. Many Dutchmen have understandable doubts whether this opportunity, after six years of rule from Jakarta, will be a real one. As to that, much will depend on Indonesia's own future political course. Irian has long served it as a national rallying cry; and although President Sukarno's stock should now rise buoyantly for a time, one wonders what substitute goal may soon have to be indicated to keep all his people facing in the same direction. The possibilities are various; it might be tactless to single one out.

ARGENTINA

Martial Democrats

EVEN a wafer-thin constitutional crust is, it seems, more than Argentina's more obstreperous generals can bear. Last week, a group of rebellious military men, led by the fire-eater in chief, General Toranzo Montero, threw two war ministers out of the government in quick succession. The general proclaimed himself commander-in-chief of the army; now, after the flimsiest of patched-up truces with President Guido, he has been named head of the first army corps at Buenos Aires, and one of his faction (known in Argentine army circles as "democrats"), General Cornejo Saravia, has taken over the war ministry.

The brawl was not limited to which general got what top job. Superimposed on innumerable subdivisions, there are two main lines of thought within Argentina's armed forces. One group, nominated by the navy, favours leading the country towards a dehydrated form of parliamentary government. At present, President Guido sits in office, waited on by three military liaison officers and without benefit of parliament or political parties. Some time next year, so ran the plan, carefully vetted elections would be held; all Peronist or "extremist" parties would be excluded. The second military group, led by General Toranzo Montero who claims the support of 85 per cent of the army, has set its mind against even this whiter than white affair. In order thoroughly to disinfect the country from Peronist nostalgia, the generals are pressing for a "democratic military dictatorship" that will rule Argentina for "at least five years."

The most persuasive reason for keeping at least a smack of constitutional legality is the stand taken by the United States. So long as there is a president in his palace and an election in the air, American money will probably continue to come to Argentina; an out-and-out military dictatorship would forfeit aid. This is something that Argentina, bankrupt, seething with social discontent and already in trouble over the misuse of earlier loans, is in no position to do. Dr Alsogaray, the minister of economics, who has been commuting between Washington and Buenos Aires, is not, at the moment, a man to envy.

NATIONAL LIBERALS

Double-Barrelled?

THE National Liberal party may be dying but it obstinately refuses to lie down. The world has now been reminded of its existence by some vigorous kicking in its monthly journal *The New Horizon*, protesting against Mr Macmillan's sacking of some leading National Liberals in his Cabinet reshuffle. The National Liberals, who have 21 members in the Commons, did rather well in the previous government with three members in high office: Mr Maclay, Secretary of State for Scotland, Dr Hill, Minister of Housing, and Mr Renton, Minister of State at the Home Office. In addition Mr W. J. Taylor held junior office at the Air Ministry. Now their leading lights are reduced to Mr Niall Macpherson, Minister of Pensions, and Mr Julian Ridsdale, Under-Secretary for Air. Their protest at this treatment has gained scant sympathy from Conservative members, who resent any attempt to invest the National Liberal group with special political significance.

In fact the National Liberals are an historical rather than a contemporary political phenomenon. They date from the Simonite Liberals of 1931, who anchored themselves to Ramsay Macdonald's "National Government" (as opposed to the Samuelites who left it). Since then they have fought elections as a separate party but always in close concert with the Conservatives. In 1944 and again in 1946 overtures were made to the independent Liberals for a reunion, only to founder on the rock of the Nat Libs' alliance with the Tories. The independent Liberals declined to go for a joyride on the tiger, and in 1947 the Woolton-Teviot agreement firmly tied the Nat Lib-Tory knot. The National Liberals, however, retain their own organisation, council and whips. To confuse outsiders, there is also a club, the National Liberal, founded in 1881 with Mr Gladstone as its first president; except in name this remains a stronghold of the independent Liberals.

Even before the present fraças it was being widely canvassed among Conservatives whether the continuance of a separate group of National Liberals served any useful purpose. The group did provide the government with its numerical majority from 1951-55, but most Conservatives have disliked the additional label of "Liberal" and its use merely infuriates Mr Grimond's followers. The Norfolk Central by-election may now be a test-case for the double-barrelled label. Mr Collard, the previous member, employed it although in reality he was a right-wing Conservative. His predecessor, Sir Frank Medlicott, also used it—and with more reason: he opposed the government over Suez and later resigned his seat. Now Sir Frank has joined the Liberal party and is likely to play a prominent part in the by-election campaign. Whether to call their candidate National Liberal, National Liberal and Conservative, or just plain Conservative, is a nice dilemma for the Norfolk Tories.

TRADE UNIONS

Eyes Overseas

SO the top brass of the Trades Union Congress is going to take some trips around Europe to see how unions in other countries face up to the question of wage planning—and about time too. For a long time now other people in Britain have been looking at European countries' records of industrial peace and smooth bargaining techniques: the Dutch and the Swedes, above all, have been singled out for envious praise. The TUC's leaders are too shrewd to expect to find a ready-made set-up waiting to be copied even in these two countries, but they are likely to find their Swedish experience, at least, rich in ideas. The Dutch have a strongly centralised system of wage-fixing, with a state board at the top and with innumerable technical commissions working away at rates for specific jobs; but when asked why—rather than how—their system works, Dutch trade unionists and employers are apt to confess that they have no idea, except that the big bosses and union leaders all spent the war together in concentration camps, when they fell into habits of co-operation that are impossible to break. The Irish often pass for having copied the Dutch system for their new planning board—but visitors to the Irish Congress of Trades Unions are lucky if they are warned in advance not to mention the word Holland on pain of forcible expulsion.

The Swedish system is less formal, far less tidy, and does not depend on any extraordinary historical experience. A recent study* makes it plain just how fluid the Swedish set-up still is, and how far it can

* Collective Bargaining in Sweden. By T. L. Johnston. *Allen and Unwin.* 458 pages. 40s.

be got round (a recognised technique for introducing wage-drift into piece-rates is known as the *fiffelfactor*). But it is clear that the good behaviour of unions and employers is secured by the constant threat of legislation that would limit their freedom of action. The study also shows how the strong organisation of the manual workers' TUC was brought about in the first place by the exceedingly tough alliance formed by the employers' federation. Even now the employers contribute cash to a fund for compensating members suffering during a strike, and are perfectly ready to call a national lock-out against the unions. So workers and employers face each other from positions of strength, and are each prepared to delegate their affairs to teams of experienced bureaucrats, soundly educated in economic realities. The government, of course, holds the ring, and the courts enforce the carrying out of established labour contracts; but bargaining is carried out with a toughness only limited by fear of the other side's deterrent strength. No doubt the British Employers' Confederation, as well as the TUC, would benefit from a visit to Sweden. Employers get the trade unions they deserve.

GHANA

Vanity, Vanity

GHANAIANS do not yet have the self-confidence to endure with calm or resignation the reproachful finger-wagging of a white man. So, on Monday, Bishop Roseveare, the head of the Anglican church in Ghana, and Archbishop Patterson, the Anglican archbishop of West Africa who had been visiting Accra, were both told abruptly to leave the country. Both clergymen left for Lagos, where they were in any case intending to go that day or the next to take part in a congress of Anglican church leaders. On the same evening, but with even less ceremony, Mrs Mary Dorkenoo, a British correspondent married to a Ghanaian, was bundled off to London.

Bishop Roseveare's transgression was his public criticism of Ghana's national youth organisation, the Young Pioneers. On Sunday, the archbishop, preaching at Accra, threw in his weight on the bishop's side. That the Young Pioneer movement is an unprepossessing, let alone godless, clique for President Nkrumah is a perfectly understandable opinion. All Christian groups must share this view. But Ghanaians, however, are unable to take casually criticism of the sort of organisation which, rightly or wrongly, they believe is the most effective instrument for holding their country together and asserting its image on the international scene. The timing, too, was unfortunate in that the Ghanaian government has not yet fully recovered its self-possession after the unsuccessful attempt on President Nkrumah's life on August 1st. The Anglican sermons fell on jumpy nerves.

It needs more than a bad attack of nerves to explain away the singular pointlessness of the expulsion of Mrs Dorkenoo. Her treatment was harsh: she was put on an aircraft without warning, and cheated of her three children in the process. If the reason may have been inefficiency and not calculated cruelty, the result for her was the same. Mrs Dorkenoo is not only herself a sympathetic reporter of Ghanaian affairs; she has also often helped visiting correspondents to take a kindlier view of the turmoils of a new country. Her comments since she was dismissed show that she has retained both generosity and sense of proportion.

CHINA

The Dealers?

EVEN before 1955, when Mr Chou En-lai (then communist China's foreign minister) said his government would negotiate with responsible emissaries from Formosa, there were rumours of dealings between Taipeh and Peking. The 1955 vintage was an offer by the communists to make General Chiang Kai-shek the governor of Formosa, provided he accepted Peking's suzerainty. The latest report—related by Mr Dennis Bloodworth in last Sunday's *Observer*—is that the Chiang family is trying to preserve its dynasty by negotiating with Peking. According to the agreement said to have been reached, neither side would make a serious attack on the other during General Chiang Kai-shek's lifetime; but after his death Formosa—still expected to be under Nationalist control—might be allowed an autonomous status under Peking "similar to that held by Tibet." During the subsequent decade or so, there would be a referendum to determine whether Formosa would be independent or part of China proper—as both sides, to date, have claimed it to be.

Although the United States restrains General Chiang Kai-shek from trying to fulfil his 13-year-old dream of returning to the mainland, its Seventh Fleet also protects Formosa; and is likely to do so long after Chiang has gone. This protection probably seems more desirable to the inhabitants of Formosa than some vaguely Tibet-like status (which the Tibetans do not seem to like very much). However, Peking might have an interest in putting such a rumour in the pipeline. It realises that all is not well between the seven million Taiwanese and two million or so mainland refugees now living in Formosa. Although Taiwanese discontent is not organised, a reflection of it was seen in 1961 when Chiang Kai-shek imprisoned Lei Chen and others who had not only tried to organise an opposition party, but had dared to doubt the myth of a Kuomintang return to the mainland. Then again, the Nationalist army contains many Taiwanese conscripts, who are unlikely to want to ride with the Kuomintang to a mainland Valhalla. But if the rumoured agreement really exists, and if Chiang Kai-shek's son Ching-kuo wins the struggle for power that is likely to follow his father's death, then the myth of the return to the mainland will be killed stone dead.

Rumours of this kind are liable to arise

The Economist

AUGUST 16, 1862

THE GROWTH OF FRANCE

M. La Guerronière has started a new paper of which a principal object is to magnify the fame of the present Government of France, as well as to direct its policy. Very experienced observers, far shrewder as well as more conscientious than M. La Guerronière, have been singularly impressed with the most marvellous "outward and visible" progress of France since 1852. The evidence, indeed, is written on the very face of the country and in all its public documents. Its trade has enormously increased; its revenue has much augmented independent of any augmentation of taxation: wherever the traveller strays, he sees the reign of growth and prosperity; whatever town he enters, he sees new symptoms of progress and of hope; whatever new district he visits, he finds some trace of the same pervading and omnipresent spirit. In the capital the change is not only considerable, but wonderful. . . . All lovers of liberty, however moderate, tolerant, and constitutional they may be, cannot but ask themselves this question: Are we to judge of the tree by its fruits? Is the despotism—the presiding, interfering, "terrestrial Providence," as its admirers term it—of an Empire the cause of these great improvements? If the system of Louis Napoleon have produced these great benefits, it cannot but be substantially excellent; and if it be so excellent, we must reconsider all our received ideas of liberty and free government, . . . The truth is that the Imperial Government inherited a great inheritance. It commenced soon after the first great construction of railways in France, and in its earlier years it carried forward the production of similar works with great energy and judgment. The effect of the whole creation of railways in France has been wonderful. . . . The whole country has started forward with a vigorous alacrity and an equable celerity to which the previous history of France did not afford any example. . . . Upon the whole, therefore, the great improvement in France under the present Government does not by any means support the deduction which M. La Guerronière and other adulatory writers infer from it.

whenever Washington and Taipeh are at odds; Rapallo complexes, it seems, can flourish in Far Eastern politics as well as in central Europe. But the rumours come from a twilight world where, in Hong Kong, Macao, and Singapore, conspiracies are dreamed up and myth matched with counter-myth; so who knows?

POTATO BOARD

Thinning Out

THE Potato Marketing Board has had a particularly awkward season, what with a revolt among its members and a dire shortage of spuds for everyone. One of the board's main difficulties has been the erratic behaviour of too many farmers who, having told the board that they were going to plant potatoes, have simply not done so. These are mostly small and sometimes less than efficient growers—the big commercial ones know well in advance what they are going to do—and they, having upset the board's plans, have got away scot free while some large and expanding growers have been penalised for over-production. In each of the past four years between 80,000 and 160,000 acres of land on which the board had expected potatoes to be grown have been used for other purposes.

The board has been long-suffering for too long. Next season it is to reshuffle the way in which allocations are shared out among growers, on the basis of the actual acreage they have used for potatoes over the past four years: and it will make inquiries in the autumn, and perhaps again next spring, to find out just how much of their ration has been taken up by the growers. This should give the board a little more flexibility in allowing further plantings before it is too late if the potential crop looks (like last year's) to be falling seriously below expectations. Although the small grower has a continuing part to play, the long-term need is to encourage the large-scale commercial producers who can both use the seasonal labour force most economically and invest in the new techniques and storage facilities that are beyond the means of the small grower. The board has taken a step in the right direction.

NATIONAL THEATRE

Star Boss

SIR LAURENCE OLIVIER was the best possible—perhaps the only possible—choice as director of the National Theatre that is to rise on the south bank of the Thames. He has the theatrical knowledge; he has the public magic; he has the administrative talent—which has had a successful public inauguration at the new Chichester theatre this summer; and he has at his elbow a powerful board under Lord Chandos. No doubt, Sir Laurence would not have taken the job without proper assurances both of continued financial support and of artistic independence.

Two further tests for public policy are, however, looming on the horizon. Both the Theatre Royal, Stratford, and the Bristol Old Vic are looking for money to continue their work; if it is to support them in the manner which they deserve, the Arts Council will need more funds. Stratford has, until this year, received no state grant, but its ambitious new work both in Warwickshire and in London has made it a strong candidate for subvention. The Bristol Old Vic has hitherto received its support as an offshoot of the Old Vic organisation in London, which is now to merge with the National Theatre. Without help both from Bristol corporation and from the Arts Council it could neither keep its noble old theatre nor its permanent company beyond next year.

The Government is giving £1 million towards the building of the National Theatre (£1.3 million is to come from the London County Council), and will guarantee a continuing subsidy of £400,000 a year. To this it is committed. The danger is that somebody in the Treasury may now get cold feet at the thought of this new and substantial subvention, and that the sufferers, for reasons of political prestige, will not be the National Theatre company but the smaller, less pompous, but probably more deserving theatres of the provinces.

SOVIET UNION

Not His Castle

ONE dilemma facing the Soviet planners is how to harness individual initiative without giving too much scope to private enterprise. Farming is one field in which their hesitations on this point are often seen. Housing is another. A decree issued in Moscow on August 6th foreshadows a complete switch from the private construction of individual houses to the co-operative building of multi-storey dwellings. The transition is to be gradual.

Private building has had its ups and downs in the Soviet Union. In recent years, as part of the general housing drive, it has had a good deal of rope. In the last three years, for instance, individual construction, with state subsidies, accounted, on an average, for about 25 million square metres of floor space, or nearly a third of all new urban housing. Things are going to be different; under the new arrangement groups of people, presumably working in the same factory or office, will have to form a building co-operative to get their permit, together with credits of up to three-fifths of total cost.

The primary object of the new move is not to cure workers of the property instinct, or to deprive the privileged of their dachas. It is, rather, economic efficiency. Russia is exerting itself to make up its lag in housing, aggravated by the sustained industrial revolution. Its vast housing drive is still very far from meeting the country's immense needs. The planners' job is to make the most economic, and rapid, use of available resources. To this end they have dropped Stalin's ornamented façades and his skyscrapers; the fashion now is for blocks of flats of three or four storeys. Individual houses fit even less than giant buildings into this new pattern. Co-operatives will be better equipped to fulfil the regulations of the town-planners. Thus economic and ideological considerations happily coincide.

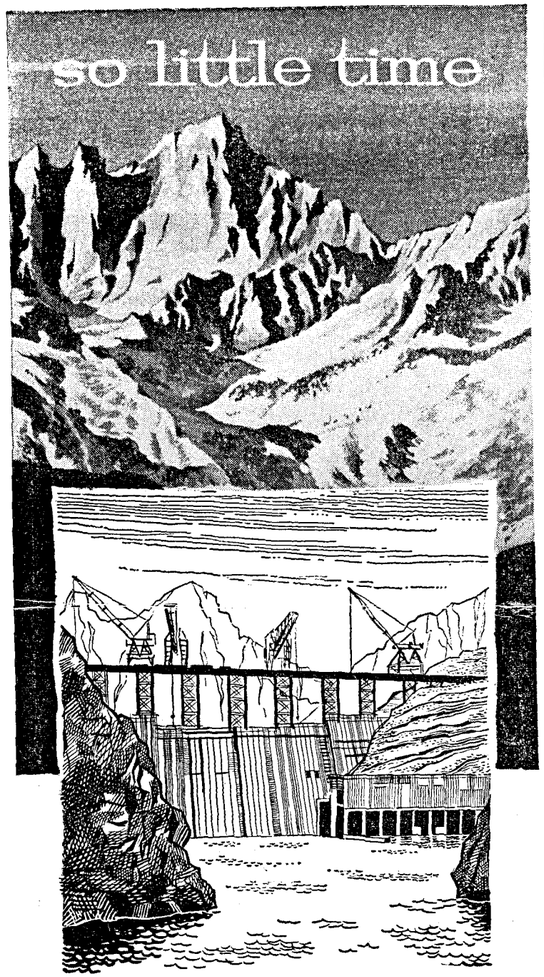
KENYA

Majimbo for All

"THERE are signs of another Congo in Kenya." This warning came (*our special correspondent cables from Nairobi*) from no less an authority than Mr Jomo Kenyatta, last Sunday, before 50,000 of Mr Mboya's supporters in Nairobi stadium. Mr P. M. Koinange, the travelling conciliator for all East African nationalists, followed up with the blunt comment that Kenya's troubles were to be blamed not on the British or on any white men, but on its own internal squabbles.

So they are, indeed. Mr Paul Ngei (himself not lacking in visible tokens of personal prosperity) has attacked his own party's ministers for waxing fat and forgetting the masses. His loud demands for more land, more jobs and money, and fewer white men, and Mr Oginga Odinga's simpler plea just for fewer white men, echo against a background of unemployment and *discontent*. In Mr Odinga's own Central Nyanza area political thuggery is being put down by African riot police; in the councils of the Kenya African National Union, Mr Kenyatta's unitarians are doing their best to put down the heresy of the three Kamba leaders who last week moved towards the Kenya African Democratic Union policy of "Majimbo."

This policy, originally put forward as a sane regionalism designed to check would-be dictators at the centre, has rapidly degenerated. Congoists all, it seems, every Kenyan with a voice, a mother and two friends is jostling for some form of local autonomy before the regional boundaries commission, which embarked on August 9th on its task of demarcating the six regions envisaged under the coming constitution. On Tuesday Mr Kenyatta led a Kanu delegation (not including Mr Mboya) which urged the commission to uphold the existing regional boundaries against all these claims. On Wednesday the unrepentant Kamba leaders told it that their people should not be grouped with the Kikuyu; and some of Kanu's Luo members published an attack on "Kikuyu tribalism." But this is not entirely a struggle between Africans. Unfortunately, many local Europeans, still obsessed with fears of the Kikuyu, tend to support Kadu's Majimbo mania, and welcome every possible split in Kanu.



Fast, forward urgently moves the world today. Never before so much reshaping, rebuilding. Never so much need of Priestman help. Clearing sites, speeding work on dams and drainage schemes. Keeping waterways safe. Moving much-needed bulk material faster. Wherever civilization is speeding peacefully there you will find men relying on Priestman Excavators, Cranes, Dredgers and Grabs to help build a better world.

We move the earth all over the world

PRIESTMAN BROTHERS LIMITED • HULL • ENGLAND

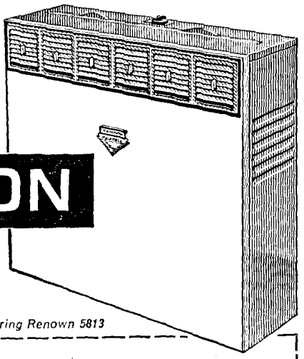
SHUT THAT WINDOW—

—and keep COOL

It's better business to air-condition your boardroom and executive offices. Open windows let in distracting noise, dust, fumes; unventilated rooms grow stuffy, exhausting. But a Temkon *refrigerated* air-conditioner keeps the room cool, calm, fresh—brains alert and businesslike.

The Temkon 'Whispair' floor-standing unit is the world's quietest room air-conditioner. It just *breathes* out clean cool refreshing air, filters out dust, reduces humidity. And it even supplies background warmth between seasons!

One room, a suite or your whole building can be fitted with these elegant, slim-built units for less than half the price of a central installation. Each unit allows for personal control of room conditioning and cuts running costs.



TEMKON

WORLD-WIDE EXPERTS IN REFRIGERATION AND AIR-CONDITIONING

Send the coupon for full details of the Temkon air-conditioner range, or ring Renown 5813

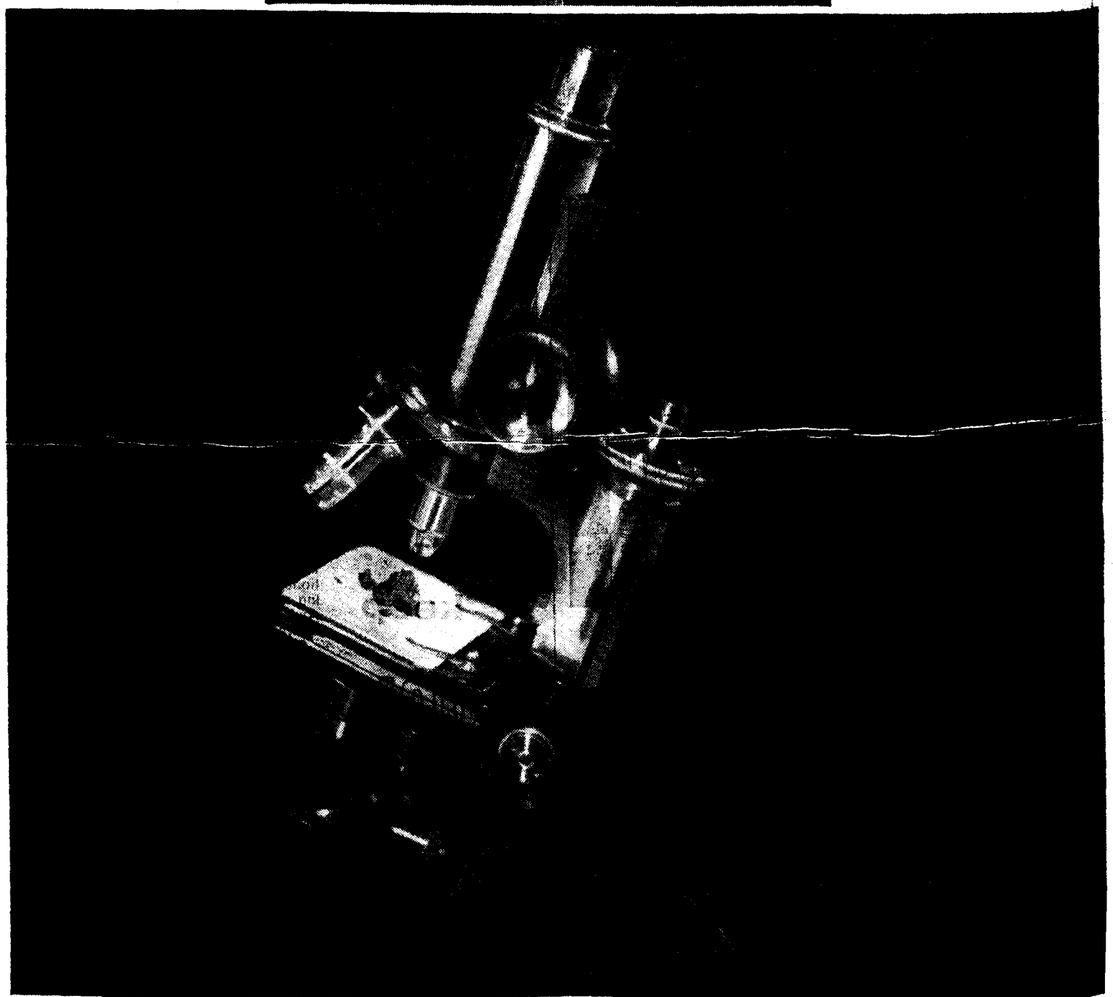
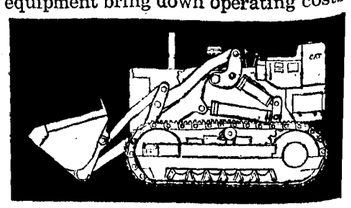
HOW BIG A LOOK DO YOU TAKE AT EARTH?



Caterpillar is used to looking at earth by the million cubic yards, assessing the job of moving it, and then producing the right equipment for the job. Being right for the job, in fact, is what helps Caterpillar equipment bring down operating costs to rock bottom. That is why, no matter how vast the project or how remote the area, it pays to investigate costs alongside the Caterpillar standards of *high* production and *low* per-cubic-yard cost.



CATERPILLAR WORLD'S GREATEST NAME IN EARTHMOVING

THE WORLD OVERSEAS

Waiting for Busta

BY OUR SPECIAL CORRESPONDENT

EXHORTED by the determined heartiness of government admen to "jump-up for independence," Jamaican family parties obediently swayed or hopped their way through the bannered streets on the night of August 6th. The birth of independence was soberly welcomed as timely and proper—although, in Kingston at least, there were also those who gently mourned the interment of federation. Three centuries of British rule have left a rubbing of British decorum, and the string of public holidays that followed independence carried, at times, a whiff of wet English Sundays. To protect their exalted guests from embarrassment or worse, the Jamaican police kept a vigilant eye on security, but, so far as this correspondent could tell, the peace of Kingston's excellently organised celebrations was disturbed only by the occasional outbursts of bellicose patriotism when sailors from the visiting British cruiser collided with sailors from the visiting American aircraft carrier.

These passing brawls between American and British seamen reflected one of the sillier foreign reactions to Jamaica's independence celebrations. Like rival impresarios measuring audience reaction, the American and British press counted the crowds and the cheers as Princess Margaret and Vice President Lyndon Johnson processed on their sometimes separate ways. Not so pretty, so young or so royal, the Vice President started at long odds, but gained steadily as he swung off at a fine Texan tangent. He and Jamaica's prime minister, Sir Alexander Bustamante, understood one another: "I like Americans," said Busta; "We like Jamaicans," thumped back Mr Johnson, and the sugar workers yelled their appreciation—even when Mr Johnson gave them, unsolicited, his high school *motto* on self-help. "The Yanks are taking over the show," came the disconsolate British mutter; the Americans responded with smug symbolism about the difference between our yesterdays and our tomorrows.

Silly and undignified as all this was, it might not have been devoid of point if it had meant that Britain and America were seriously competing to help Jamaica. Few of Jamaica's senior officials hold any such illusions. Britain's legacy to Jamaica was a two-party parliamentary system, a respect for law and order, a faith in freedom and justice. If these bequests had been given the material backing of a serious effort to develop the country's resources or to educate the people to do so themselves, Britain's retreat might seem less of a scuttle. As it is, little was done in the past, and it looks as if less will be done in the future. Jamaica and the other Caribbean territories stand far down on Britain's list of economic and strategic priorities. There is not even a numerous settler class to cry shame. So far, Britain has committed itself to a loan of £1½ million to help out with the budget, and a grant of £1¼ million—most of it already promised, but unspent, while Jamaica was still a colony.

Jamaica is a lush tropical island that could, if a relatively small amount of money were spent on land reclamation, terracing and irrigation, feed itself and have food over to spare. Its economic blessing is diversity: its foreign currency comes from bauxite and alumina (developed by North American capital) sugar and rum, bananas and tourism. But the situation as the British decamp is that the bulk of the people are seriously undernourished in a country that depends on the import of food, consumer goods and talent. Milk and meat are scarce everywhere; a luxury hotel in the north of the island hits a peak of futility by assuring its clientele that its eggs come from New Orleans and some of its fish from the Channel Islands. The number of illiterates (if those who can just scrawl their names for a vote are included) is believed by *some* to be as high as 80 per cent of the population. The official figure for unemployment is 17 per cent; this does not include the disguised unemployment among the peasants.

CAN the Americans, then, do better? The economic interest increases with the flow of private investment; the strategic interest is geographically inescapable (although Mr Johnson's retinue was caught off balance by Busta's heady offer of military bases). Jamaica has applied to join the Organisation of American States (which has gone into a huddle to find out what to do about this unprecedented step) and Jamaicans are thinking about learning Spanish. Apart from the peace corps volunteers working in Jamaica, and the scholarship grant of £27,000 that Mr Johnson brought with him as a gift for independence, the United States is proposing to give Jamaica £2.4 million out of Alliance for Progress funds. The money is to be spent on water development and housing schemes and on agricultural credit; it will become available over the next 2½ years when and if the projects are approved. In the context of all the demands that are being made

Understanding one another: Busta and Sir Lyndon Johnson

on American generosity, this grant is rather more than might have been expected; the sugar workers, with Mr Johnson's evocation of the United States and Jamaica marching hand-in-hand to freedom ringing in their ears, might be excused for asking for more.

Senior men at the ministry of finance are trying to get into the heads of their people that they have to depend largely on themselves. A development plan was prepared while Mr Norman Manley was prime minister; now it has gone under cover while the new ministers find ways of wearing it with a difference. The pattern of light industry and modest agricultural development remains; with luck Sir Alexander, who came in on the peasants' vote, may increase the agricultural emphasis. But with whatever courage Jamaica swallows the idea of self-help, no minister or civil

servant can see a way forward if emigration is blocked. Mr Seaga, the minister of development and welfare, has volunteered the theory that, for the time being, Jamaica needs the safety valve of 16,000 people leaving the country every year. There is little likelihood of this being possible. The outlook for emigration to Britain is clouded by the Commonwealth Immigration Act. The United States allows Jamaica a quota of 100 immigrants a year (apart from the migrant workers' scheme, under which about 5,000 Jamaicans are working temporarily in America). Bolivia, and now Cuba, are the only Latin American republics that will consider West Indian immigrants; neither is a country where a newcomer can hope to strike rich.

The troubling fact for Jamaica, as for all under-developed countries, is that emigration is only an advantage if it is the unskilled and the jobless who leave. A discriminating policy imposed by Britain, the United States or any other advanced country could, at the Jamaican end, do much more harm than good. In any event, it is often the people with uncommon energy and initiative who take the step of looking outside their own country for a future. If on top of this the skilled and educated are siphoned off by a selection process, Jamaica is certain to suffer. It is the unskilled who urgently need the jobs that cannot, at present, be found within their own country.

On a different level, a similar difficulty confounds the group of would-be emigrants called the Rastafarian. They are the mystical, bigoted sect who see a future for themselves only in a "return" to Africa. From time to time their leaders have made, by person or by letter, tentative approaches to the governments of the independent African states, Ethiopia and Ghana in particular. But the African countries, tremulous at the thought of so strange and turbulent an invasion, have prevaricated, insisting on skilled newcomers only. Few of the Rastafarian, living jobless in slums that are as nasty as any in the western hemisphere, boast any skills.

The Rastafarian are usually regarded as the nucleus for any sort of trouble; the police, fearing a protest that never materialised, were in and out of their homes during the celebrations. The guess at their numbers is around 10,000, but this probably excludes a great many Jamaicans who sympathise but will not conform to the external signs of orthodoxy—clay-hardened ringlets sticking out vertically from the head, fierce beards and woolly caps. The more moderate among their leaders argue carefully, with logic, for the law of return to Africa. They reject not only the white man's world, but also Jamaica with its coffee-coloured leaders and the black "lackeys" who support them. They demand that the Jamaican government (whose authority they dispute) should pay for their journey to countries whose governments are clearly reluctant to accept them. However fantastical their demands may seem, the alternative, insists even a moderate, is civil war. It would be easier to dismiss their threats as sad nonsense if it were not for their uncomfortable record of past violence.

The black hopes of the Rastafarian are a crude manifestation of racialism. Otherwise racial prejudice seems mercifully absent from Jamaican discontents. All the candidates who campaigned at the last election on a black racial platform lost their deposits. Young Jamaican intellectuals will rail against the influence and wealth of the pale brown bureaucrats, merchants and agents. They are, rightly, keeping their standards high; outsiders, less idealistic and with comparisons in mind, find in Jamaica an easy and untroubled mixture of colours. But the unemployed, the hungry and the slum-dwellers may find other reasons than colour for working up a dangerous bitterness against a government that does not, as yet, seem prepared to give their interests priority. Foreigners—tourists or business men—are insulated from these murmuring troubles. Wait, the visitor is told, wait until the people find out that Busta is not going to fulfil his election promises; wait for the gathering disillusion. But in this surpassingly beautiful island, amid an easy informality in which neither class nor colour are too obtrusive, it is easy to slide into one's own illusions.

The 13th Comes and Goes

FROM OUR SPECIAL CORRESPONDENT IN BERLIN

It is theatrically eerie, in the moonlit dusk, on either side of the Potsdamer Platz. When the watcher climbs one of the stage properties—some wooden steps mount to a platform from which the whole scene can be surveyed—ghosts spring readily into the mind's eye; it may be Hitler and Stalin, gesticulating possessively across the sprawling wire and concrete where once the buses ran. Twelve months of wall ("wall of shame," the visitor nearly catches himself writing after only a brief diet of west Berlin newspaper prose) have aggravated the desolation on the sector boundary. A western version of the day's news is still flashed towards east Berlin unceasingly after sundown—a rippling chain of snippets often overseasoned with meaningless parochial bragging, such as that announcing the arrival in west Berlin of a party of fifty Tunisians or of twenty Ceylonese. A British armoured vehicle steals out of the shadows, and is gone again as soon as one of its young crew, got up to look like an ailing tree, has nodded a greeting to two west Berlin policemen and peeped perfunctorily over the wall.

Apart from an occasionally glimpsed east Berlin Vopo there is obviously no one within range on the other side of the wall to read about the Tunisians or the Ceylonese, no unusual activity for the soldier to report. On the western side the streets and the wrecked buildings seem almost as abandoned. Most of the seedy booths where a brisk sector boundary business used to be transacted before August 13, 1961, have closed down. Just beyond where they stood lie the Tiergarten and the vast area of destruction around the Lützowplatz. On first re-encounter the desolation appeals, as though fresh. Then one reflects how long, in fact, it has been there; how cultivated, in a way, the Berlin no-man's-land is—the freak fruit of seventeen years' unfinished local and international wrangling.

Within a mile or so on either side of the wall, here and there even less, the inhabitants of the two parts of Berlin are living on the whole normally and in tolerable, if sometimes invidious, comfort, quite ready, should they be given the chance, to get along with each other as practically as do the inhabitants of any other city the world over. But, as we all uncomfortably know, they are not being given the chance; and what is peculiar to the divided Berliners is the transcending anxiety about their political future that every one of them has in common—the rulers and the ruled of both regimes alike. "Things can't stay like this for ever. What is going to happen in the long run? And how will the inevitable changes affect me?" Those are the nagging questions.

In fearing that the political jockeying in and around Berlin may precipitate an international nuclear war the Berliners are, of course, one with the rest of us. Materially, the west Berliners are living rather more comfortably this summer than they were a year ago, thanks largely to intelligent help from their compatriots and allies in the West. Even old-age pensioners concede that they are a shade better off than they used to be. The embarrassment caused by the sudden withdrawal of some 60,000 east Berlin commuters from the west Berlin working scene has been mainly overcome, though the jobs advertised in shop and restaurant windows, along with the strain and stress sometimes encountered within, tell of continuing difficulties.

The 7,000 or so workers who have been coaxed into Berlin from west Germany are helping mostly in the factories, and the Senate hopes presently to be able to bring in reinforcements at

the rate of a thousand a month. For Berlin, it is repeatedly affirmed, is west Germany's "biggest industrial city," with 6,000 concerns employing more than a million persons. The value of their sales to west Germany rose by 5 per cent during the first half of 1962. Industrial output as a whole went up by 4.4 per cent, that of iron and steel products by as much as 18 per cent and consumer goods by 7 per cent. An anonymous genius has calculated that west Berlin is at present producing every second electric light bulb in use in west Germany, every third film running in its cinemas, every third dress worn and every third cigarette smoked; and that the output of the west Berlin electrical industry is more than that of Switzerland and Austria together.

At present. But what is going to happen should the east German regime, left wholly alone to control the ways to Berlin, decide to obstruct the western sector's vital commercial traffic with the Federal Republic? As far as the west Berliners alone are concerned they would, in the event, doubtless continue to live by doing a deal with the devil. But that would be a very costly deal politically; and its avoidance has been the chief meaning of the dour struggle of the last seventeen years. It seems, consequently, to be the opinion of most Berliners—hard as many find the enforced family separations—that the best they can hope for is that the situation shall stay as it is, with the western garrisons present, until the responsible powers are actuated by mellower policies. Those of them who read *Die Welt* are being reminded by its current serial just how much worse their present uneasy lot could be. Published under the title "A chronicle of our hardest years," this is the frank and moving diary kept by Ursula von Kardorff in Berlin from 1942 to 1945—from the fall of Stalingrad, through the allied bombing, to the arrival of the Russians.

Unhappily for everybody's peace of mind, there is no sign that Herr Ulbricht is satisfied with his appreciable attainments in Berlin. Indeed, there is every sign that he is dangerously disappointed. For, whatever his publicists may claim to the contrary, the wall has done the party cause as much harm as good. It was set up, Herr Ulbricht admitted, not so much to dam the Fascist tide as to save the east German economy from collapse through the steady falling out of its workers. Yet the promised better times have not materialised. Herr Leuschner, an east German deputy prime minister, reported recently that between January 1st and May 31st this year 34,200 fewer tons of meat had been produced than during the first four months of 1961, 237,000 tons less of butter and 210 million fewer eggs. Production is behind schedule in several important branches of industry. There has been a return to the rationing of meat and potatoes.

Still more damaging to the regime's pretensions has been the scale on which still resentful citizens have surmounted or dodged the wall in order to get away from it all. It has now been established that 51,056 of the east Germans who were abroad when the wall went up decided eventually not to return home. Since then another 12,316, including some 1,000 service men, have contrived at great risk to get out. At least 37 are known to have lost their lives in the attempt, and several hundred to have landed in gaol. Of these defections, presumably the most painful to the regime is that of the 41 hand-picked party members who used the opportunity to quit presented by the World Youth Festival at Helsinki a fortnight ago. It is by no means only their failure to provide more gracious living that so fiercely alienates the east German rulers from the ruled. It is much more the atmosphere they constantly generate of mendacity and hate. *Gehässigkeit* is the word the Germans often use for it. Reports not long ago suggested that the regime's senior propagandists—men like Professor Norden and Herr Eisler, who in their isolation seem to have largely lost touch with reality—were to be replaced by less hysterical operators. But they are still in full blast. Herr Ulbricht cannot, or will not, recognise the significance of this simple human factor in his continuing failure to win sympathy. So long as he does not, his coveted peace treaty with the Russians is not going to earn him any greater respect.

That the regime is still unable to inspire confidence and willing co-operation has encouraged several politically influential west Germans to take a rather less dismal view than the Bonn government takes of the prospect of the long-threatened peace treaty. The chief political commentator of the Hamburg weekly *Die Zeit*, Countess Dönhoff, is not alone in postulating that in the circumstances west Germany could afford openly to recognise the Ulbricht regime *de facto*—as in practice it already tacitly does. For so long as west Berlin is not condemned to the lingering death of a "free city," the working of time and of human nature will, she anticipates, compel Herr Ulbricht and his associates to liberalise their dogma-ridden system. Herr Richard von Weizsäcker, a brother of the physicist and philosopher Carl von Weizsäcker, has also been advising the west Germans that their hope of helping their compatriots in east Germany lies, not in extravagantly ambitious international negotiation, but in co-operating as actively as possible with the current political evolution in both eastern and western Europe. Herr von Weizsäcker sees in the common market a west European organisation with an immense potential authority to conduct mutually profitable business with the East. And he therefore suggests that the European "Hallstein of Brussels" should be allowed to efface the German "Hallstein of Bonn," reputed author of the sterile formula that Bonn cannot have diplomatic relations with any state that formally recognises the German Democratic Republic.

Many west German politicians and government officials would admit in private their broad sympathy with these ideas. But not yet in public. On the eve of the August 13th anniversary observances the federal foreign minister, Herr Schröder, a lawyer by training, repeated the familiar argument that a "peace treaty" with east Germany could have no legality because its regime had none. At the same time he warned neutral states that Bonn would consider it an unfriendly act should any sign such a document, hinting that the price of signature might be the suspension of German economic aid. Herr Mende and other Free Democrats have since reproached Herr Schröder with ineffectual lecturing and tactless flourishing of the big stick. The Free Democrats would like the Berlin question to be reconsidered in a new series of talks covering the whole problem of the future of Germany and European security. They recommend that the powers concerned should take up the proposal of the United States for a standing conference on Germany, composed of deputy foreign ministers, and that in the meantime the danger of disastrous developments in Berlin might be reduced by developing there a large-scale centre of internationally conducted scientific research. At the time of writing Herr Ulbricht and his deputy and probable successor, Herr Stoph, are still somewhere in the Soviet Union; it is yet to be seen just how far their hosts are prepared to go to help them.

France on the Ivory Coast

FROM OUR SPECIAL CORRESPONDENT

A good way to get to the palace of President Houphouët-Boigny of the Ivory Coast in his capital city, Abidjan, is to stroll up the Avenue du Général de Gaulle and across the Place de la République. The president is likely to be out: he is abroad half the year, mostly in France. Perhaps one of his ministers could help? The one required is likely to be on a trip seeking decisions from the absent president. A head of department? Sure, he is here, making decisions. Like the minister of finance, he is white, and French.

If this does not kill belief in the existence of an independent African soul in the Ivory Coast, then turn away from the Palais de la Présidence, walk across the Pont Houphouët-Boigny, and contemplate the beauty of the palm-trees that line the opposite edge of the lagoon. Behind them is the neat African quarter of Treichville (named after a French explorer). Watch carefully, and you might see a tiny canoe, inefficiently paddled by two competing black boatmen. To them the difference between the old government-in-Paris and the new can be no more than a remembrance of the festivities of the day of independence, August 7, 1960. Ask one of them whether he likes the president, and he will reply that the palace is a grand building (like the bridge and the H-B stadium). Ask again, and the reply will be an African giggle.

But ask one of the 15,000 French inhabitants and he will articu-

Everyman's Castle in Spain

FROM OUR CORRESPONDENT IN BARCELONA

A HANDSOMELY illustrated brochure, printed in English, French, and German by a Spanish estate agent, states:

> To acquire now an apartment or dwelling in Playa . . . is not only to assure yourself of an ideal spot for you and your family at a price within reach. It is much more than that. It is to pull off a worthwhile deal. . . . Have you any doubt that one of the best present-day businesses is investment in the Spanish coast?

This (more or less) is the idea that seems to have fired the imagination of many inhabitants of north-west Europe: to have a holiday place, perhaps an eventual home, in Spain, with sun, sea and simple living, and at the same time make a profitable investment. French, Belgians, Dutch, Swiss, Italians and Scandinavians are all coming—English too, but not so many: the average Englishman still prefers to rent. The leaders of the movement are the Germans. The *Volkswirt*, of Frankfurt, estimated last autumn that the value of houses in Spain bought by Germans amounted to between 50 and 80 million marks. The German press is full of advertisements for villas in Spain and sites suitable for development, and a popular radio feature had the following dialogue: "Haven't you yet bought your villa in Spain, with sun, majestic view, etc.?" "All right, I'll buy three and let two of them."

People have been going to live in Spain for many years—to Malaga, the Andalusian coast and above all to Majorca, the haven of retired British officers and colonial servants. But it is only over the past two years that foreigners have developed their present fever to buy property in Spain; it can be traced to the stabilisation of the peseta in 1959. This made conditions more attractive for foreign residents—the peseta became cheaper, the complicated exchange controls largely disappeared, inflation was halted. It also gave a great fillip to the tourist trade. The numbers of visitors to Spain had been rising steadily throughout the nineteen-fifties, but in 1960 they jumped by 46 per cent to 6 million. Last year they reached 8 million. It is, of course, the tourist boom that has made property in Spain so attractive to foreigners, from the small investor, thinking of a plot of land on which to build a few houses to let, or a bar or a small hotel, to the companies with projects for luxury hotels and housing estates.

Moreover, the government is trying to encourage foreign investment. Foreign capital invested and the profits earned on it can now be freely repatriated; and under a decree announced this year, foreigners wishing to buy land for building will no longer need to obtain official permission if the area does not exceed 10 acres of arable land or 50 acres of dry farmland—though it must be admitted that the previous law had been largely ignored and that permission is still needed in military areas, like the Balearics and the coast west of Gibraltar.

Most of the English people who are retiring to live in Spain come out first on a visit, reconnoitre some peaceful, pretty spot, and then buy a Spanish house or make their own arrangements to build. The small entrepreneurs of various nationalities—British among them—who buy a piece of land and build a group of houses for letting, proceed in the same way. But the many Germans who are now buying or building a house for themselves in Spain generally prefer to do so through an estate run by a company. Housing estates and garden cities are now a rapidly developing business here. German companies, generally acting through Spanish subsidiaries, were first in the field and have conducted an efficient publicity campaign in Germany and other countries. One company, Contracta, which has built housing estates on the Catalan coast and the Costa del Sol, aims at a target of 2,500 buildings along the Spanish Mediterranean and is reported to have spent the equivalent of £150,000 last year on advertising in the European press. This company will fly a likely purchaser to Spain at its own expense, lodge him at the Ritz Hotel in Barcelona while he looks at sites on the nearby coast, and, if he wishes, fly him on to Malaga.

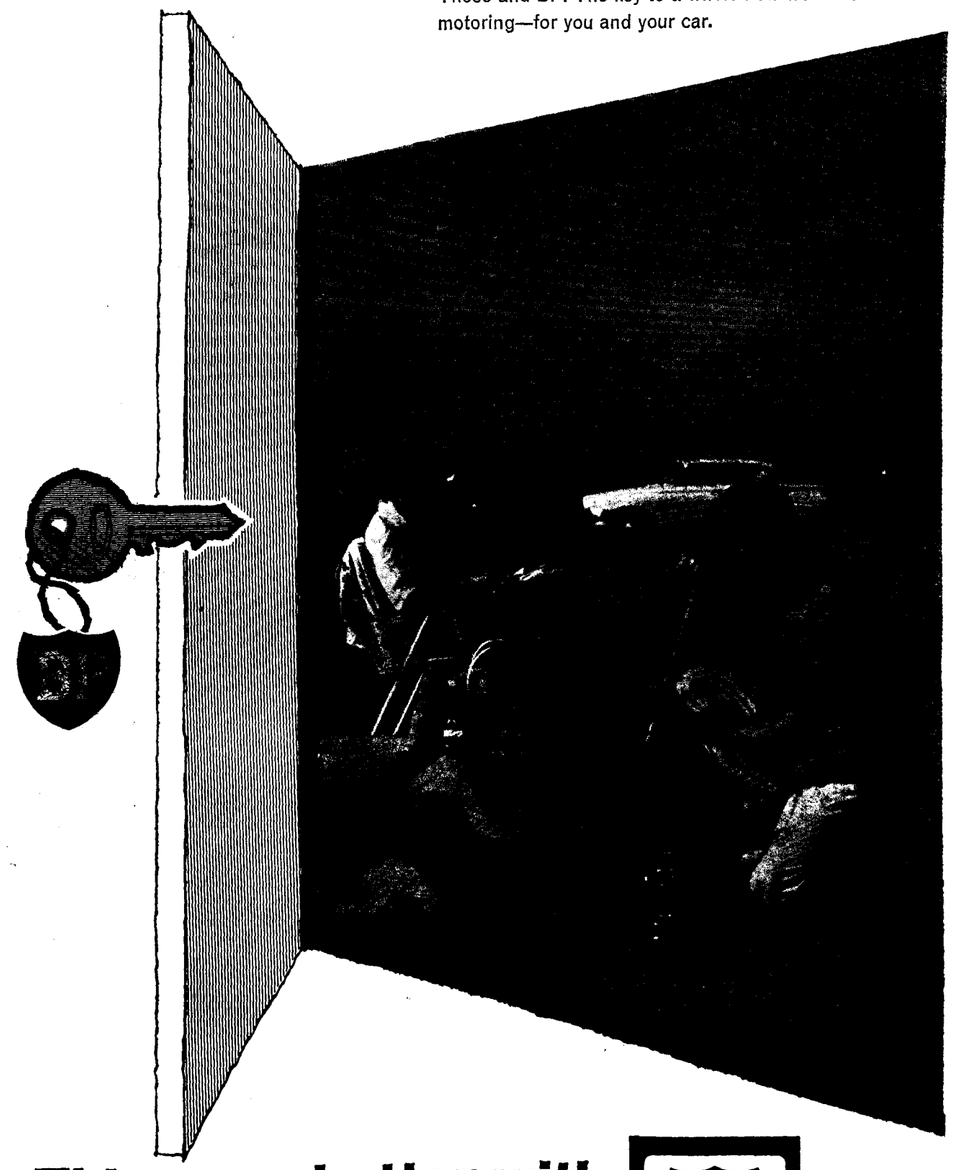
These companies buy land, build a road if necessary (as it often is), lay on water, drainage and electricity, and then build houses to let and for sale. They will also sell a plot on the estate and build a house to the purchaser's design. These estates, known in Spain as *conjuntos*, often include a hotel, restaurant, shops or a supermarket, communal gardens and swimming-pool, and sometimes a cinema. Not surprisingly, many would rather obtain a house in this way than have the worry and trouble of building themselves in an area which, though beautiful, may be primitive; the popularity of *conjuntos* is likely to grow. Some of them are entirely German colonies; this has caused ill-feeling among the Spanish inhabitants, who resent these foreign enclaves in their midst.

This buying and building of houses, and the boom in hotels and restaurants (a British group has been considering a luxury hotel on the Costa del Sol, and Herr Arnold, the German restaurateur, is reported to be opening an establishment on the top floor of a bank building in Barcelona) has so far been practically confined to the Mediterranean coast of Spain, the main tourist zone, and concentrated on the Costa Brava, the Costa del Sol, and Majorca and Ibiza. Foreign capital is now playing a leading part in opening up the less favoured coastal stretches. All the western European nations are represented, including many French and Belgians who have withdrawn their funds from North Africa and the Congo. The Germans are developing the coast between Barcelona and Tarragona; the French Club Mediterranée, with Spanish association, has opened a holiday centre of 400 villas near Cadaqués, on the northern, and quieter, stretch of the Costa Brava; a company headed by a Czech and supported by German capital has started laying out a "tourist residential city" between Algeciras and Cadiz; and foreign interests have put forward a scheme for 3,000 chalets on the Almeria coast, which, although it has the attractions of the sea and an inland lake, the Mar Menor, has not yet shared in the tourist boom. Now the Atlantic coast is being taken up. A German group is reported to have bought a lot of land for villa building near San Sebastian.

Of course, this property boom has sent prices of land rocketing in the favoured areas and in some places, particularly on the Catalan coast, has caused an acute shortage of labour, materials and servants. Every week brings news of further projects.

BP IS THE KEY

At every BP Garage, this you will find. The responsive petrol—BP Super-Plus. The most advanced motor oil in the world—BP 'Visco-static'. These two are the key. These and BP. The key to a whole new world of motoring—for you and your car.



Things go better with SUPER-PLUS

Over 50 years ago, a famous businessman observed:

'I know that half the money that I spend on advertising is wasted. The trouble is, I can never find out which half!

Today, McCann-Erickson says: IT'S ABOUT TIME WE FOUND OUT

Until recently, little attempt was made to measure precisely the effectiveness of advertising. For one very good reason: it was thought to be impossible to measure; because of the very nature of creative work; because of the ephemeral quality of advertising; because of the complexity of the market; because of the subtle psychological factors that affect buying, because . . . you know the arguments. Today, this is no longer true. Many techniques, many tools have been developed in recent years; tools that measure to a nice degree of accuracy one or another aspect of advertising effectiveness. Singly, each is useful. But McCann-Erickson believes that in combination they can add up to an immensely significant whole: to a comprehensive system of measuring the effectiveness of the advertising pound against a clearly defined advertising objective. McCann-Erickson, London, in conjunction with McCann-Erickson offices throughout the world, is pioneering in the development of this new system of objective measurement of its own effectiveness for its clients:

late lengthily on the virtues of M. Houphouët-Boigny (is it that one detects an echo of Belgians in Elisabethville?). The black voters, too, seem to be in favour. Of the 1,641,636 votes cast in the elections of November, 1960, only 190 are recorded as not being for the president. In this lies the sense of security—or is it complacency?—felt in French Abidjan. The French population has increased by some thousands since independence.

The head-waiters in the cafés are French; so are the girls behind the counters in the smarter shops. Their fathers are French administrators; their lovers might be a soldier from the French base, or one of the *petit-blanc* electricians or motor mechanics who do the work of Africans. Like the 800 teachers (French) and the army officers (French), the administrators are paid in large part by the French government; sometimes in French francs in Paris. Like the shopkeepers and the factory-managers, all are making money fast, and sending it home faster. Perhaps this, and the fact that three-quarters of the country's imports come from the franc zone (and mainly from France itself), is some compensation to the French treasury for the cash it must allow to flow towards Abidjan.

The cash flow is considerable; around £18 million a year comes from France in one way or another. Some is in direct aid; some in salaries paid; an important part in support for the price of coffee on the French market. Coffee earns half the Ivory Coast's living. It sells in France at an artificially high price; it is an open question how long the French government will be able to keep up this system against the will of the other common market governments. The world market price of coffee has been falling for some time and, anyway, the coffee grown in the Ivory Coast is of poor quality. (But an instant coffee factory has been opened in Abidjan.)

"The only real problem here is the question of coffee," one Frenchman said, a trifle smugly. But even if the country's only problems were economic (and they are not), the real problems are how to diversify agriculture away from coffee, and, most of all, how to wean the economy from the influence of Paris. The Ivory Coast earns about half as much from cocoa as it does from coffee, but relies equally on the French market. Its third sizeable export, wood, is largely grown by French planters who sell it to French buyers. The country's foreign exchange reserves are held in French francs in Paris; the west African franc that circulates within the Ivory Coast is kept stable by a French-influenced board, whose interest is to maintain the value of the franc, and only incidentally to help develop the Ivory Coast economy along African lines.

THE French hold on Abidjan extends beyond material things—not that anyone in Abidjan can be accused of disinterest in worldly goods. The few educated Africans are well-educated, and well-assimilated. The African in charge while the president is away is the minister of state, M. Auguste Denise, who will proclaim to visitors, "I am a product of French colonialism," which is as accurate and honest as his, "We have political independence but we have not economic independence—we must work for that." Yes indeed, but how fast? one was asked by a bearded student, freshly arrived from Paris, who produced his radical *Fédération des Etudiants d'Afrique Noire (Française)* membership card from a deep pocket, as if it were a filthy postcard.

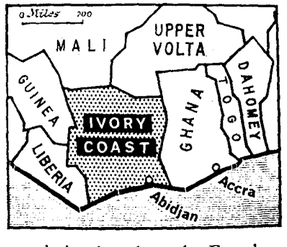
President Houphouët-Boigny, minister in several French governments, would use his favourite quotation from the French colonial administrator, Lyautey, in reply: "*Doucement, doucement, je suis trop pressé.*" The current two-year plan is a mere list of projects. A grander scheme is in the offing; meanwhile there is "austerity" in booming Abidjan. It was spoken of glibly by a round-faced African *chef de cabinet*, fresh back from visiting the president in Paris; he was still in his Paris best, jewelled cuff-links and fat gold ring. House allowances to *fonctionnaires* are being cut this year, car allowances next. A stated proportion of profits and a tithe of each salary-earner's income must be channelled into investment. The Israelis (who run twice as fast as anyone else in Africa) have been called in to build model *kibbutzim* and organise the *service civique*, which puts young men into the army, and to work. Most of this is admirable: the question is, how many Ivoiriens will really be touched by it? The gap between rich and poor is sorely noticeable even in the showplace of Abidjan, and the fruits of a boom in an economy that is largely foreign can hardly be expected to drop into the canoes on the lagoon.

Yet this pattern—the Gallicisation, the dependence on Paris, the backwardness of most Africans—can be found in varying degrees in the other countries of francophonic Africa. Guinea, which was deserted by France in 1958 and now is being made to beg for the right to return to the de Gaulle fold, is the farthest gone, the Ivory Coast perhaps the most securely attached. In colonial days French West Africa was ruled through a governor in Dakar and lieutenant-governors in the other capitals; today the French design seems to be a spread of influence—commercial, financial, "cultural," and political—through M. Houphouët-Boigny of Abidjan and Paris.

PRESIDENT HOUPHOUËT-BOIGNY founder of the *Rassemblement Démocratique Africain,* old and respected west African politician, flexible talker, and demonstrably a success in attracting francs to his country, is expected to help keep his neighbours French. Three of them—Upper Volta, Niger, and Dahomey—depend on the Ivory Coast nearly as much as they do on France: through H-B's Conseil d'Entente. The entente is based on a Common Solidarity Fund which effectively channels Ivory Coast money into the pockets of the other three. Last year roughly £1.5 million (1,105 million CFA francs) was paid out by the Ivory Coast in this way: nearly a third of the estimated cost of the presidential palace in Abidjan.

To a country like, say, Upper Volta, the money from the solidarity fund might amount to a third of the sum jointly made up by the Ivory Coast and France to balance the Upper Volta budget. If the four countries of the entente were federated, the pay-out by the Ivory Coast would be considerably more—but M. Houphouët-Boigny has long been a bitter opponent of federation; he is, in a sense, master of the Katanga that got away.

The Abidjan influence is spreading in other ways. In the mornings, trucks bearing the Mali flag rumble across the Pont Houphouët-Boigny to the docks; goods from Bamako go this way rather than through Dakar because of the break-up of the Senegal-Soudan-Mali federation in 1960. Perhaps even M. Sékou Touré, President of Guinea, may pay a visit to Abidjan before long. The sureness that this might be so has been just a little diminished by the news, announced at the beginning of July, that the Mali government will create its own franc—as Guinea did a long while ago. Mali and Guinea forced M. Houphouët-Boigny to lead his entente into independence; if the franc-zone structure is not now to be threatened, Mali's sudden decision will have to be absorbed by Paris and Abidjan alike. Mali will stay within the franc zone: its revolution is simply to contract out of having a common west African currency controlled (in fact if not on paper) from Paris.



There are other threats to the security of the grand French design, however well it may seem to be working in practice. Since the Algerian war came to an end, even Abidjanians have been wondering how long the French government will continue to feel the need to bolster its security in west Africa. And how long

will the French taxpayer go on financing the policy? These questions are less easy to answer than the immediate political question within the Ivory Coast: are there any young radicals ready for revolution?

The answer is that there are young radicals, but they do not seem ready. Last year Ivoirien students who spoke out in Paris were flown back to Abidjan by the French government at M. Houphouët-Boigny's request; they were gaoled for a while, then sent back to their studies, outwardly chastened. Today it is not hard to find members of the small circle of dissatisfied young intellectuals in Abidjan; the outspoken ones are outside the governing party.

Houphouët-Boigny

Three such—all teachers—are individuals whose main dissatisfaction seems to be with a lack of *la vie intellectuelle* in Abidjan. They listen to Accra highlife records, Accra radio and Accra politics. "Accra is a centre of thought, art and discussion," one of them said and, sighing, his companion added, "Our rulers wear their Frenchness like a coat—deep down they are Africans but they are so unsure of themselves that they adopt a cloak of false self-assurance—French civilisation." The radical teachers' politics seem, on first acquaintance at least, to be less fervent than their desire to reject the French culture that has assimilated them, and to put something African in its place. It is the old cult of negritude all over again, although some intellectual Abidjanians, for all that they had their own spell in Paris, say that cultural revolt is *dépassé*; "What is wanted now is concrete change."

But the men who talk like this are few, and all well known to the authorities. They are not organised and, although some have been detained, they are not dangerous enough to keep permanently out of their jobs or in gaol. And the president is adept at cutting the political ground from beneath the feet of the radical *jeunesse*. He has given them an independent country, a thing he once opposed, and he can now be expected to give them slightly more radical political speeches. But not action. South African oranges are on sale in quantity in Abidjan.

From the French point of view and from the point of view of the president, the system seems to be working well. And the idea seems to be sincere: co-operate with the mother while, ever so slowly, the children grow up. With the sound of many voices proclaiming inter-racial co-operation and moderate good sense, it is hard not to be seduced into believing deeply in it all. But nagging questions still remain: how long will it take the Ivoiriens to begin to treat the French presence as an alien anachronism? It may be some time; there are not so many being brought out into the modern world and those that are are being assimilated. (The favourite medicine for young hotheads is to make them junior ministers.)

Most disturbing, however, is the thought that here Africans have not begun to awaken at all. They are not really running things, nor are they being trained to run things. If all the French departed at once there would be virtually nothing left—the Ivory Coast would be much as the first French explorers found it, with the exception of a few grand, empty buildings and the splendid hollow palace in Abidjan. If this be a nonsense nightmare, it is almost made to come true by the experience of Guinea. But the French community is not preparing to depart from Abidjan. And certainly not all at once. In practice, after all, they still call the Avenue du Général de Gaulle by its old name: Avenue du Commerce.

Colombo the Mediator

FROM OUR ROME CORRESPONDENT

"If both sides had behaved differently we might have reached full agreement." This unofficial comment on what happened in the common market negotiations at Brussels comes from the Italian foreign ministry, and is not quite as tautological as it sounds. Italians who attended the meetings came away with the impression that the British and French ministers were intransigent more about the form than about the substance of the terms. In particular, they felt that Mr Heath was inhibited by too rigid instructions about forms of words. The British desire for precision seemed to the Italian mind at times to degenerate into almost abstract philological argument. In the early hours of the morning Mr Heath could still be heard murmuring *access . . . guarantees . . . comparable outlets.*

As for M. Couve de Murville's conduct of the French side of the negotiations, the Italians refuse to admit that the intent was to sabotage or delay the proceedings. They say the French were defending positions common to the entire European community; what all the Six want is to safeguard the community's momentum and individuality; what all the Six refuse to accept is the principle of a quantitative guarantee for Commonwealth products or the extension of any form of preference after 1970. The common market, Rome emphatically believes, must have full autonomy to

Umbrella for an Emperor

PR187H

Fifteen hundred years ago the Emperor Maximianus Herculius caused a lavish hunting lodge to be built for him in a Sicilian valley. And there he remains to this day, immortalized with gods and goddesses, dancing maidens and all the beasts of the hunt in a spectacular carpet of mosaic. Overhead, to ward off the weather and temper the harsh Sicilian sun, is a 75,000-square-foot translucent canopy of a truly 20th-century material—'Perspex', the acrylic plastic discovered and developed by I.C.I. of England.

Tough, weather-resistant and easily shaped, 'Perspex' appears in one form or another in nearly every country in the world. It provides windshields for Dutch scooter riders and cockpit canopies for French air pilots. It gently diffuses the lighting on German roads, in Swedish petrol stations, Canadian hospitals and Italian trams. Australians mould it into brilliantly coloured lightweight baths and sinks, and it features in many of the world's famous shopping streets in the form of advertising signs. Yet it is only one of a wide range of plastics—the widest in the world—that I.C.I. exports from Britain every year to the value of £18 million.

The influence of I.C.I. research and production is felt today in every corner of the globe

Imperial Chemical Industries Ltd., London, S.W.1

form its own price policy and make world agreements. It cannot accept conditions which would amount to discrimination against countries like the United States or Argentina which also export temperate agricultural products.

Like his British, Belgian and Dutch colleagues, the Italian minister refuses to admit that anything dramatic happened in Brussels. Signor Colombo claims (with Mr Heath and M. Spaak) that the negotiations are adjourned, not interrupted. He argues that, since agreement has been reached on 85 per cent of the points under discussion, it is reasonable to assume that the remaining fifteen per cent can be cleared up. It is fair to add that this will depend very much on Signor Colombo's success in continuing to persuade his French and German partners to change their attitude. Very little has been written here about the Italian minister's part in the negotiations. Signor Colombo, whose future career should be watched, eschews publicity, and few people even in Italy realise that things might have gone much worse in Brussels but for him.

It was he who drew up the plan accepted by the British as the basis of discussion in July. This plan comprised a pledge to call a world conference in 1963 with the aim of concluding world agreements for the products of temperate agriculture; measures to cover the period of transition to 1970, including a form of diminishing community preference for the three Commonwealth countries concerned; and special arrangements if the attempt to reach world agreements breaks down.

At the end of July, the British accepted this plan as the basis of discussion but presented a series of amendments. The French wished to reject these amendments en bloc, but Signor Colombo persuaded them, and the others, to talk about them. His argument was that the Six had made all possible concessions as to substance, but might still make some alterations to the presentation of their terms. In particular, he suggested they should specifically name the three Commonwealth countries in the clause about price policy; and proposed that the Six should allow New Zealand to be treated as a special case.

The Italian view is that the Six have offered Britain something more substantial than a quantitative guarantee which would freeze trade at its present volume. What they offer is a policy of reasonable prices; in the end, say the Italians, it is probable that the European community as a whole will import more from the Commonwealth than Britain does today. The Italians believe that the concessions made by the Six should enable Mr Heath to present a decent case to the Commonwealth prime ministers on September 10th. Officials here are fairly confident that agreement will be reached in the end. Their belief is based partly on their reading of Lord Home's speech in the House of Lords on August 1st, but even more on the conviction that Britain cannot afford to stay out of an organism as dynamic as the new Europe.

This official confidence is not shared by the entire Italian press; the fear is heard that the British negotiators may lose their nerve. The weakness of Mr Macmillan's government is considered a more serious obstacle than the obstructive tactics of the French. As Italians see it, the European community will be a better place for them (and for the Belgians and the Dutch) with Britain in it; but it would be Britain that would lose most by staying out. The desire to have Britain in Europe is strong in Italy; even stronger, however, is the will to maintain harmony among the Six and to go on building what they have started. If it came to a showdown between Britain and France, the Italians would try conciliation first; but in the end they would stand by their partner.

HOME REPORT

Members of the editorial staff and local correspondents report on life and happenings in and around Britain

Traffic Tantrums

LONDON'S planners have still to come to terms with London's traffic—and so have most Londoners. The planners have had their modest successes: the most tangible, the Hammersmith and Chiswick flyovers, have served both to cut the travel time to London airport and given visitors the momentary impression that they were arriving in a modern country. But the basic decisions that will determine the modern face of London and the viability of the city as a place to work and live in have still to be taken.

How many commercial access routes will have to be improved as drastically (and expensively) as the airport road if London is to continue to do its job as an industrial centre and an expanding, and badly congested, port? How much more tidal flow of commuting traffic can be tolerated on the approach roads and Thames bridges, or accommodated in the centre? If more cars are to be allowed in, what is the cost of the engineering involved, and what will be the economic price for central parking? (One suspects that Mr Marples's charges should be doubled tomorrow even to bring home the vastly uneconomic use that parked cars already make of central London roadspace.) If London cannot cope with more traffic without embarking on a sustained Los Angelisation, what is being done to encourage motorists back on to public transport? Are there going to be car parks and electric train services where the motorways end? Is, in fact, the road system of the London region to be given any semblance of integration with the tubes and Southern Region?

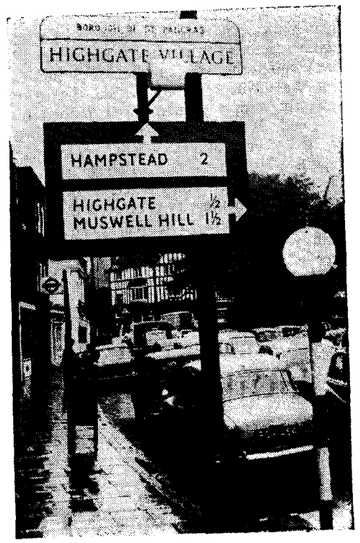
Mr Marples inherited an appalling mess, including a London and suburban public that had hardly begun to think of the consequences of its own actions as road users. It is not surprising that his own attempts to educate road users should have highly irritated them or that some of his, and his experts', temporary and experimental schemes should have been half-baked. It is not surprising, either, that piecemeal reform or experiments should have set up agonising local opposition to any changes that have increased heavy traffic or, worst crime of all in the suburban mind, affected property values. Two current rows in London illustrate the perils of the reformer. The first is at Highgate Village over Mr Marples's lorry freeway to the London docks; the second at Blackheath over a London County Council plan to route the new Dover road through that posh suburb.

Mr Marples's scheme for Highgate Village is to declare a lorry route through the High Street as part of his master (temporary) plan to speed the transit of goods from the north to the London docks. The street, with its shops, schools, hospital and houses, looks patently unsuitable for the task, but it happens to be true that there is no alternative road which alone could carry the volume of traffic envisaged (and already demonstrated). Some little way off is the Archway Road, designed in the early nineteenth century to carry parcels and goods from the north to London; it is designated by Mr Marples as the southbound route for the lorries, and the Village High Street, with its steep rise, as the northbound one.

The villagers, as could be expected, want all traffic to go along Archway Road, which could be widened to take it; Archway people want the minister's plan to go through as it is, countering claims that they merely want to keep their property intact with the charge that the Village merely wants to avoid a fall in its values. This quarrel has occupied the Highgate residents to the exclusion of the real point at issue: is such a lorry route a desirable thing at all?

In the same way, residents of Blackheath have been battering at London County Council, which proposes to run an urban motorway linking M2, the Kentish trunk motorway, with central London along the line of the railway which already cuts alongside their chief pleasance, the heath itself. To all appearance, this extension is expressly designed, not to relieve congestion, but to build it up at the existing bottleneck at the Marquis of Granby. Again the local protest has been directed to shifting the road somewhere else, or its burial under the heath, or its embedding in a deep cutting: everyone seems to accept the motorway as necessary in principle.

The central problem is one of planning and of public relations: and the second follows the first. Unless there is a coherent official argument, based on traffic priorities, and a public comprehension of London's road policy as a purposeful whole, householders are always going to jib, and keep on jibbing, at schemes (particularly "temporary" schemes like the Highgate one that could last indefinitely) that crop up on their own doorsteps. Why shouldn't any scheme be landed on the people in the next street? Piecemeal relief which has proliferated, particularly in London, over the past decade is never likely to win friends; an attempt at regional planning is just about the one sure means (short of establishing a dictator in the Ministry of Transport) to get a traffic policy under way. Since London's outer suburbia has spent most of the past year strenuously resisting the idea that it has anything to do with the city anyway, and trying to opt out of the Greater London Council, it can be grasped how far away regional planning is—in many other places besides Highgate and Blackheath.



Embattled village

The Yorkshire Lakes

FROM A CORRESPONDENT IN LEEDS

LEEDS is trying to solve its water problems with more pronounced tact than Manchester's grab for Ullswater. Leeds' operations are centred in the little Washburn Valley, near Otley, which has been acclaimed by local patriots as the West Riding's lake district. The lakes, however, are actually the reservoirs built by Leeds Corporation and after a dry early summer anxious eyes have been watching their levels.

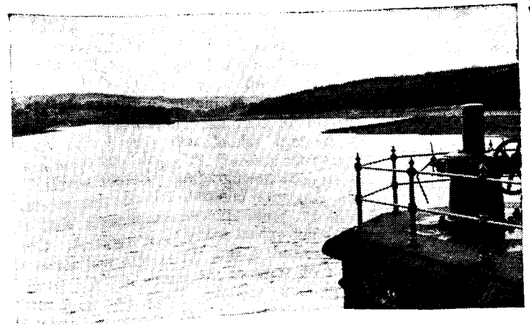
In 1867 the Leeds Waterworks Act authorised the construction of four reservoirs to impound the river Washburn. Lindley Wood (670 million gallons) was completed in 1875, Swinsty (866 million gallons) in 1876 and Fewston (846 million gallons) in 1879. The present Thruscross scheme was not started until last year after Leeds had suffered two acute water shortages. In 1949 the city's water stocks fell almost to rationing level, and for some weeks late in 1959 after a dry summer, no water was available in the city at night.

Dry summers will undoubtedly bring similar problems until 1965. By that time Thruscross (1,727 million gallons) should be in operation. It is being built at a cost of over £1 million. With it, the city's water storage capacity will be increased from the present 148 days' supply to 202 days' supply.

A year ago the site was a peaceful, sylvan one. Now a huge cavity across the valley marks the line of the dam and the river has been temporarily diverted for 140 ft. of its length. High in the air has been slung a 1,200 ft. long electrically-operated cableway to carry loads of concrete for the dam, which will rise more than 200 ft. above the river bed. A few beauty spots will be submerged and a small church which will disappear below the water level is to be replaced on higher ground half a mile away.

At the same time as waters from the new reservoir (the first to be built since 1929 when that at Leighton, near Ripon, was opened) begin to flow from Leeds taps, a second new source of about 4 million gallons a day will become available from the river Derwent abstraction scheme—a joint operation by Sheffield, Leeds, Barnsley and Rotherham. These supplies are expected to keep Leeds going until 1986.

The city's present daily consumption is slightly more than 24 million gallons, of which 13.5 million gallons are for domestic purposes, 8.4 million gallons for industrial requirements and 2.1 million gallons in bulk supplies to other authorities. Modern housing development which has replaced slum property has put a greater strain on the city's water supplies, but the average consumption per head of population has been pegged in recent years by improved methods of detecting waste.



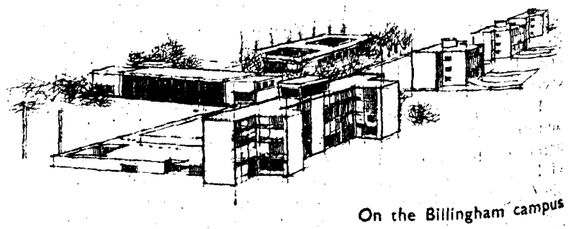
Outlook at Fewston

Leeds' search for water began in 1693, when it was agreed to "designe and lay an engine to convey water from the River of Aire through the streets to the sev'all houses with the towne of Leeds". As the town grew, the supply system was extended by the Leeds Waterworks Company and then by the corporation, which took over responsibility in 1852. Before then a reservoir had been constructed at Eccup, a few miles from the city centre on the edge of Harewood Park. The Washburn Valley itself was already declining before its pastures were first flooded in the 1870s. Its golden age was early in the nineteenth century when it boasted corn and linen mills along the river banks. The advent of steam power was the real killer of the valley's own industries which were driven nearer to the West Riding coal fields.

THERE is little wrong with the valley today. The present scars will heal just as surely as those created 80 years ago. The corporation has planted about 1,200 acres mainly with spruce, Scots pine and larch, but with a proportion of oak, ash, beech and sycamore. Afforestation is the most satisfactory way of utilising spare land around a reservoir. Carpets of pine needles filter the top water and prevent a quick run-off in the gathering grounds. Jays, woodpeckers and magpies abound in the valley, and there are also grouse and plovers. Fishing is allowed in Fewston and Swinsty reservoirs, which hold a good many trout, and among the water fowl are mallard and Canada geese. It seems idyllic beside the stories of the prospective rape of Ullswater —and, of course, there are no Welshmen to complain of the drowning of their valleys either.

Going Multilateral

FROM A CORRESPONDENT IN DURHAM



On the Billingham campus

COUNTY DURHAM, which was faced with a school building problem of huge proportions after the war, is at last beginning to see daylight, not only in its construction programme but in getting rid of some of the bad aspects of the selection system at secondary level. Nearly every district of any size in the county has now got its new modern or grammar-technical school, and by the mid-1960s the county education committee hopes to be in sight of having places in grammar-technical schools for 25 per cent of the school population.

Next month, returning secondary school pupils will find that they are not merely members of a school, but of a multilateral unit of four or five schools, all linked together and grouped with the grammar-technical school for the area. This scheme, which Durham has worked out from its own experience and after watching other authorities' experiments, will retain a selection examination for grammar school places, but without the sense of academic and social finality associated with the unredeemed 11-plus.

The scheme developed from the education committee's plans for Billingham, the town which has grown up amid the vast ICI works on Tees-side. There, like everywhere else in Durham, new schools were needed, but the difference was the existence of a site which would accommodate not one, but five schools and ancillary buildings. Called the Billingham Campus School, the five blocks, when complete, will educate 2,650 children of both sexes (the committee favours co-education—but not comprehensive schools as such). To foster the feeling of integration, each of the five schools is to be called a hall, and the children will all wear similar uniforms and badges, whichever hall they attend.

Bede Hall, the grammar-technical school, will open next month. Stephenson Hall will be used for all streams of pupils in their introductory year, both to let them find their feet on the campus and to check that the selection procedure has been efficient. Davy, Faraday, and Browning Halls will provide different types of modern school education. All the halls will share facilities such as science labs, the domestic science and craft block, the physical education block, and later, it is hoped, a swimming pool and sports hall. These last exotic touches are possible when the cost can be spread over the equivalent of five schools.

Most important, there will be full opportunity to transfer pupils from one hall to another so that they are provided with the type of education best suited to their ability. The campus scheme should have the advantages of the comprehensive school without some of its size disadvantages.

The multilateral unit scheme to be applied to the whole county is a variation of the Billingham campus scheme, although obviously the committee cannot rebuild the existing schools on the campus system. Each grammar-technical school in an area is to become the focal point for the modern schools in the immediate neighbourhood. Each group of schools will have only one board of governors. The 11-plus will be used for the initial grading, but at the end of each year the heads of all the schools will gather in committee to discuss transfers.

PARITY of esteem between the schools in each group is the aim of Mr W. N. Linkleter, the deputy director in charge of secondary education. Mr Linkleter says: "We are not going to talk about transfers up or down, but transfers across. By and large we have found our selection procedure efficient, but we want to make it clear that selection at 11-plus does not shut the gates for any boy or girl."

While all the schools will have the same basic curriculum, it is intended to vary the bias of the courses at each of the modern schools in a unit. One will provide a course leading to the General Certificate of Education for pupils who just failed to get a grammar school place. Another will provide a course with a commercial bias for the boy or girl thinking of clerkships in industry. The third will have a technical bias to produce the skilled craftsmen of the future, and the fourth a course linked to the employment opportunities of the area, agricultural or industrial. Inevitably there will not be the same sharing of general facilities between the grammar-technical and modern schools of a unit as on the Billingham campus itself.

There has been some controversy over the proposals, but not as much as might have been expected in an education-conscious county like Durham. Some of it has centred upon the wholesale jettisoning of school governors: there will be one governing board of 25 members for each multilateral unit. Mr Linkleter says: "It means that a number of people who have served us well and loyally will not have posts on governing boards in future. We regret this, but to have one governing body does seem to be the one big unifying aspect of the scheme."

Another point has been the probable reaction of modern school headmasters who see their best pupils transferred, thus affecting the examination records of their own schools. It is highly unlikely that the parents of grammar school pupils moved to a modern school will regard this as a "transfer across"; they will look upon it as a straight downgrading. Rather wishfully, the education committee hopes that parents will be philosophical, emphasises that it does not expect many such transfers. One likely result is that the system will act as a spur on some of the pupils in "C" forms of grammar schools. Those who think they can rest on their laurels once they have got there will have to think again.

vendetta

A TRAIL OF DESTRUCTION is left in the fashionable wake of woman. One ton of femininity—the average impact weight of a stiletto heel—is the lacerating, splintering, tearing scourge that confronts the floorcoverings industry. In the forefront of this battle is Michael Nairn and on its way to blunt the stiletto is exciting new Armourtile, resistant to indentation, flexible and easily cleaned.

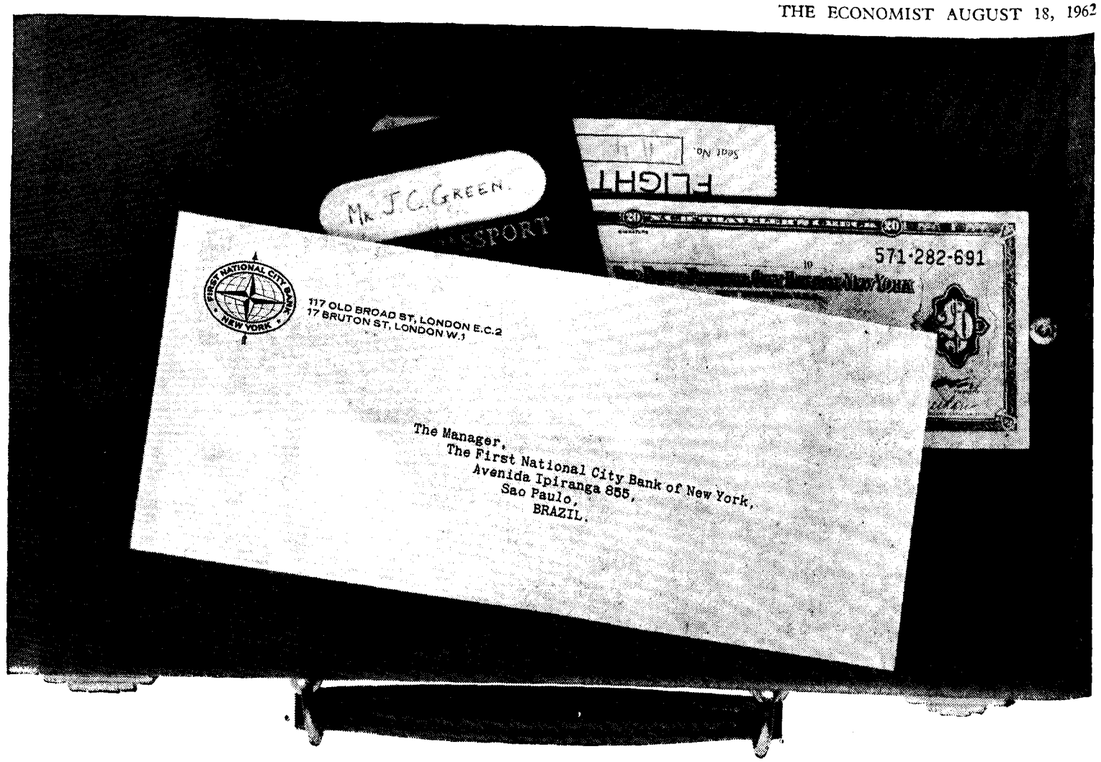
But long-established Nairns are a company of young leaders and new ideas, of enterprise and ambition. Already, the designers and technicians are back at their drawing boards, working towards the ultimate in floorcoverings—soft and warm, yet impervious to even the most brutal fashions of the future.

And converting Nairn's plans into realities of the future is coal. Coal powers the Kirkcaldy works—and the Yorkshire factory, which has rocketed tufted carpet sales by 500 per cent in four years. Nairn chooses coal because coal gives the greatest heat for the lowest cost; because coal, burned in modern equipment, is smokeless; and because there's an inexhaustible supply of coal right here in Britain.

Like so many companies of vision and vigour, Michael Nairn plans its future on coal.

MICHAEL NAIRN PLANS ITS FUTURE ON COAL

ISSUED BY THE NATIONAL COAL BOARD



Your extra passport to local trading conditions

First National City's world-wide network means that there are no important industrial or commercial centres overseas where there isn't a First National City branch or correspondent.

But more is involved in this than merely a first-class global banking service. For instance, every client of First National City can claim what is virtually a passport to local business and local trading conditions anywhere in the world—a letter of introduction to the manager of any overseas branch or correspondent.

These men are valuable allies. They know local customs, local laws, and local commercial practices thoroughly. And they are experts in helping businessmen to increase their export potential.

COMPREHENSIVE SERVICE This is only one of the ways in which First National City can help a businessman. Travelers' checks, up-to-date credit information on any foreign company, a monthly survey of the world's economic and business trends with special reference to the United States—all these are invaluable to the exporter.

Why not call in and find out more about the ways in which First National City can help you? First National City offices are at 117 Old Broad Street, E.C.2 (London Wall 1221), and 17 Bruton Street, W.1 (Mayfair 6600).

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

Timing the Tax Cut

1—To Help the Economy

NEW YORK

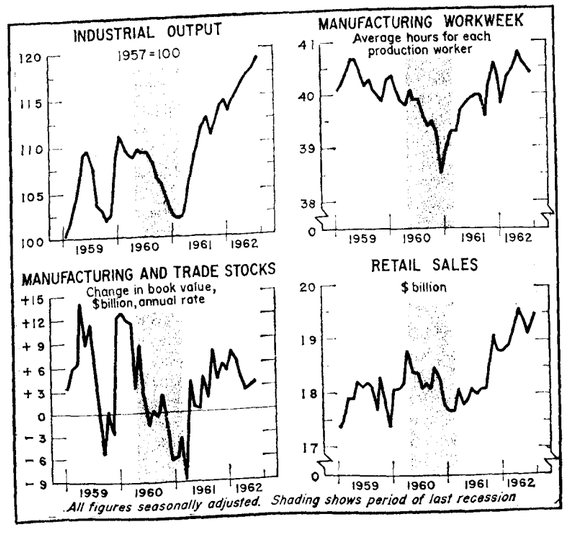
THE latest readings of the economic indicators, showing, as expected, a slight rise from the plateau reached in May and June, could be said to remove any fear that a recession, as President Kennedy put it, was "a clear and present danger." So, after prolonged debate within the White House and copious soundings of congressional sentiment, Mr Kennedy decided against asking for an immediate cut in taxes and settled for a pronouncement in favour of a general speed-up in economic activity. The economy will now have to depend on its own devices, plus whatever help short of a tax cut it can get from the Administration and Congress. This assistance could turn out to be substantial and the private sector is displaying enough basic strength to assure some further advance from current levels. Thus Mr Kennedy has some grounds for arguing confidently that a comprehensive programme of tax reductions accompanied by tax reforms next year may be a more effective cure for what ails the economy than preventive medicine in the form of a tax cut now would be—even if the politicians would have allowed it to happen.

This decision was not a comfortable one for the White House to make, for in a sense it committed the Administration to accepting a sluggish rather than a fast rate of economic growth, at least over the next six months. But the decision was inevitable once the initiative on taxes was granted to Congress and the pause in the economy gave way to a mild upward movement. Mr Kennedy himself acknowledged that the rate of growth had been a disappointment and put the main responsibility for inhibiting and retarding the advance in the economy on the rigidities in the present tax structure. His indictment was so severe that it was plainly hard for him to put off doing something about the situation. But he has been persuaded that the only way to get Congress to go along with the reforms in the system which are essential is to offer tax cuts as part of the package. In contrast to a few weeks ago, when the risk of a recession some time before the end of the year made the Administration give priority to tax cuts, the attitude today is that reform must be pushed because a downturn in the economy can now be avoided.

In fact, the threat of an actual and imminent recession has never been great and most of those, in the Administration and out, who wanted action on taxes were thinking primarily of accelerating and extending the economic expansion, not of cushioning a decline. The series of leading indicators developed by the National Bureau of Economic Research and other statistical methods, which provide what amounts to an early warning system on the economy's prospects, generally suggest that the current slow rise in activity will reach its peak sometime in the next six months. These forecasts are far from infallible, however, and the mixed bag in July, with some of the figures showing an upturn, has made accurate interpretations more difficult. Certainly there is no danger of the current pause giving way to a decline in the immediate future; the outlook is settled for a modest increase in business activity as a whole. During the next few months, at least, industrial production should inch upwards and, with government spending due to increase, there should be a further rise in personal incomes which will aid sales of both durable and non-durable goods.

The paradoxical nature of the leading indicators is illustrated by the rate of increase in manufacturing and trading stocks which has been declining, partly because of the build-up of steel supplies when a strike seemed likely, partly because of cautious estimates by businessmen of the demand for goods. Sales, although far from ebullient, have been ahead of expectations so that the ratio of stocks to sales is at a low point. This means that stocks cannot be regarded as a seriously weak spot; a falling off in sales will mean some further liquidation of stocks but, if the July recovery in retail sales continues, then restocking may take place at an even faster rate and provide a lift for other sectors of the economy.

But, while the immediate economic outlook cannot be classified as ominous, neither the Administration, nor Wall Street, can regard the slowing pace of the advance with anything at all approaching satisfaction. The decline in the average workweek as well as the high level of unemployment are worrying and neither the outlook for corporate profits nor the large amount of excess industrial capacity which is still available suggests that there is likely to be any big increase in capital spending on new plant and equipment. Admittedly, inflation is no longer a threat and the balance of payments is less of a problem than it was, but the general performance of the economy under President Kennedy is falling far short of the rate of growth which was aimed at and which is required to reach full employment and to balance the federal Budget.



Although a sharp improvement in business does not seem likely, the President's decision has some positive aspects. Without the increase in the government's deficit which an immediate tax cut would bring, the pressure for a tighter credit policy and higher interest rates should abate. Officials have been concerned at the recent stiffening in long-term rates and at the money market's anticipation of a further substantial rise ; they are relieved because without a tax cut there is no need for a tightening of monetary policy which might have stifled those areas of the economy which are now showing strength. They had taken this position even before the encouraging improvement in the balance of payments was made public and they feel that credit restraint is no longer required now that the deficit on the international account should be under $1.5 billion for the year.

The improvement in the payments position is greater than appears on the surface, yet this restoration of confidence in the dollar cannot be relied on as long as there is a deficit in the federal Budget ; this was already in the making, even without a tax cut now. With business rising at a slower than expected pace, tax receipts are lower than was estimated earlier and outlays are going up, partly because of the so-called automatic stabilisers, such as unemployment benefits, and partly because of increases, planned and unplanned, in government expenditures. It is still too early to estimate the amount of the deficit, which depends on congressional action, the ultimate size and timing of next year's tax cut and the future level of business, but it could be sizeable, ranging from $4 billion to $10 billion in the 1963 year which ends next June.

Leaving aside a possible tax cut next year, the whole of the 1963 deficit is being incurred in the first half of the fiscal year, which is the last half of the calendar year 1962, so that the downward drag which was exerted by the temporary surplus in the Budget in the April-June quarter is now being reversed. Coupled with a relatively easy credit policy, the existence of this deficit is bound to have some stimulative impact for the rest of this year. But, unless a tax reduction does something to offset the funds which will be drawn out of the economy by tax payments during the first half of 1963, this impact will be short-lived.

The Administration, however, is hoping that the powerful stimulus of a tax cut will be provided early next year at the time when the economy will be most in need of it. But there is no assurance that Congress will do the President's bidding and the Administration's decision that nothing drastic needs to be done now is being criticised on the grounds that it is giving rise to expectations which may not be fulfilled. Certainly, unless Mr Kennedy uses the respite he has asked for to construct a programme aimed at encouraging growth, and then shows aggressive leadership in bringing about its enactment, the Administration cannot hope to shake off the shackles that have been impeding the attainment of full employment. The willingness to risk short-term stagnation in the interests of long-term expansion is justified only if the White House can win over a recalcitrant Congress. Despite Mr Kennedy's show of confidence, there is as much doubt about this prospect as about the outlook for the economy itself.

2—To Win Over Congress

WASHINGTON, DC

THAT Congress is always ready to vote for a reduction in taxes and would fairly jump at the chance in an election year is an old axiom of American politics which is today in a bad state of repair if not entirely exploded. It was congressional reluctance to vote for a tax cut much more than economic considerations which led President Kennedy to announce this week that he would not seek an immediate lowering of income tax rates to stimulate the economy, but would stick instead to his original plan of calling for a general reform of the tax system next year. The mighty House Ways and Means Committee, in which all revenue Bills originate, and its chairman, Mr Mills of Arkansas, are irrevocably opposed to an emergency tax reduction and in this they represent the general opinion on Capitol Hill in both houses and in both parties.

With such a climate prevailing in Congress, Mr Kennedy decided to forgo the quick tax relief which is needed, according to many of his economic advisers, to stimulate the economy rather than risk still another humiliating rebuff from the legislative branch. As might be expected the President did not attribute his decision directly to congressional resistance but declared that economic conditions were not so unfavourable as to warrant an immediate reduction in taxes. However, he hedged by promising to call Congress into special session late this year to cut taxes if the economy deteriorates. But such a special session is considered highly unlikely.

Apart from stifling all hopes of a tax reduction this year, Congress's attitude also casts a shadow over the Administration's long-term plans for tax reform. The Treasury has been planning its strategy on the theory that the assumed irresistibility of lower taxes would force Congress to swallow, as part of the same Bill, some politically unpleasant changes in the structure of taxation, such as limitations on the advantages enjoyed by the oil and gas producing industry. But Congress's lack of enthusiasm this summer for Mr Kennedy's tacit offer to cut taxes without insisting on tough reforms or attaching any other strings suggests that the Treasury's theory may not be valid.

It was to be expected that the Republicans would oppose an emergency tax cut. Not only does the device of reducing taxation when the federal Budget is showing a deficit run counter to the economic orthodoxy still followed by most Republicans, but Republican politicians are also understandably chary about a tax cut whose political benefits, if any, in the forthcoming congressional elections would be reaped by a Democratic Administration and a Democratic-controlled Congress. What has been a shock to the Administration, and to others, has been the nearly equal opposition to an immediate reduction in taxes which has come from Democrats, including a good many liberals who are usually in step with Mr Kennedy.

AT the heart of this opposition is the apprehension of rank-and-file Democrats in Congress about the political repercussions which a tax reduction might have when the Budget is out of balance. Democrats facing difficult battles for re-election on November 6th know that they would have to answer revitalised Republican charges of fiscal irresponsibility. More important, there is a widespread feeling among Democratic politicians that the American voter will accept annual deficits in the Budget if he feels that Congress is really trying to balance it, but that he simply will not tolerate action by Congress which enlarges the deficit deliberately even though professional economists may say that such action is called for when the economy is sluggish.

On the other side of the coin, Democratic Congressmen doubt whether they would benefit politically from an emergency tax plan of the nature contemplated by the Administration: this was for an across-the-board reduction in personal income taxes at all levels accompanied by a similar drop in taxes on corporate incomes. Congressmen reason that tax relief would hardly be enough to impel businessmen and other people who enjoy high incomes to stop voting for Republicans, while the relief granted to Democratic-voting wage earners in the middle and lower income classes would be so miniscule that the average factory worker might not even notice it. Many rank-and-file Democrats are sympathetic to the demands of labour leaders that the benefits of tax reduction should be concentrated in the lower levels, but such a plan was never seriously considered by either Congress or the Administration.

In addition to these sweeping political considerations, the discarded emergency tax cut plan of the Administration was distasteful to certain Democrats for a variety of personal and economic reasons. One faction of liberal Democrats maintains that what the economy needs badly is more spending by the government, not less taxes paid to it. Those Democrats who have inherited the easy money tradition of the Populists see in tax reduction an excuse for the bankers to push up interest rates in order to curb inflation. Still other Democrats simply do not believe that the economy is in a bad enough state to need a tax cut at this time ; this school includes Senator Douglas, the only professional economist in the Senate.

All the haggling and speculation about tax reduction during the past six weeks may push toward passage some of Mr Kennedy's other proposals which might otherwise have fallen by the wayside. The talk about slackness in the economy has greatly improved the outlook for a Bill to increase spending on public works and has revived a Bill, supposedly hopelessly stalled in the Ways and Means Committee, providing federal funds for extending unemployment insurance payments beyond the periods set by state laws. A drastically altered and badly mangled version of the tax revision Bill, first put forward by Mr Kennedy in 1961, which attempts in limited fashion to correct some tax inequities and includes a modicum of tax relief for industrialists who purchase new equipment, is now given a fair chance of passage after having been written off as dead.

On balance, however, Democrats in Congress are disquieted by Mr Kennedy's abortive adventure into tax cutting and wish that he and his Cabinet members had never started to hint that this might be on the way. Nor was the President's reputation as a national leader enhanced when he implied to trade union leaders during a private meeting at the White House last week that congressional hostility prevented him from suggesting tax reductions now. Certainly, the Administration's general handling of the affair has not shown decisiveness or careful planning. It is for this reason that politicians of both parties believe that even though Mr Kennedy avoided an overt defeat from Congress by not calling for an immediate reduction, the President has not escaped entirely unscathed from the great tax cut debate of 1962.

Whose Giveaway?

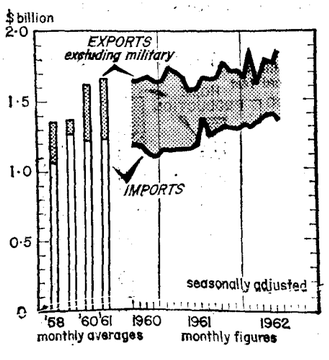
A LITTLE band of Democratic liberals had a taste of their own medicine this week when the Senate, by 63 votes to 27, choked off their filibuster against the Administration's Bill on space communications. All these liberals believe strongly that closure should be made easier to prevent the southern Democrats from talking to death Bills extending Negro rights and, in fact, until this week a motion for closure has not succeeded since 1927 ; in all, debate in the Senate has been limited on only four—now five—occasions. When their tempers cool the liberals may not be altogether happy to have made filibustering semi-respectable and to have shown that closure is in fact possible under Rule 22. This provides that debate can be shut off only by a two-thirds vote of all the Senators present and voting. On Tuesday there were three votes to spare but, if Senator Kefauver is right, the margin of victory was due to pressure put on anti-closure Southerners to stay away. If such pressure was applied it shows that even Senator Mansfield, the gentle and ineffective leader of the Democrats in the Senate, has a turning-point. His failure to deal firmly with a southern filibuster earlier in the session and his inability to control the Senate's powerful conservatives provide some excuse for the liberal revolt.

The thirteen northern and western Democrats who voted against closure had strange bed-fellows: twelve southern Democrats, but of the Republicans only Senators Goldwater and Tower. On this occasion even conservative Republicans who normally vote with the Southerners against closure felt that a vote for limiting debate was a vote for free enterprise. The Administration's Bill, which has already been passed by a large majority in the House of Representatives, provides for a private corporation to own and operate the new system of space communications by satellites with half of the voting shares owned by the communications companies, half by members of the public. Each group would elect six of the fifteen directors ; only three would be appointed by the President. Operations and rates would be regulated by the Federal Communications Commission.

The liberals called this a gigantic giveaway of a great public asset to private interests and particularly to the American Telephone & Telegraph Company ; they proposed government ownership. They also objected that the Bill provided for insufficient public control, particularly of the negotiations which the corporation will conduct with foreign governments and bodies. But the critics got no satisfaction out of the special hearings held for their benefit by the Senate Foreign Relations Committee. Virtually every spokesman for the Administration pronounced the Bill perfect and the need for haste imperative. The measure was returned to the Senate without so much as a comma changed and is now expected to pass promptly. Such steamroller tactics may have relieved a few of the frustrations which this dilatory session has caused. But Senator Humphrey may have been more far-sighted when he suggested that some of the liberals' objections had weight and should be embodied in the Bill.

Trade in the Balance

THE improvement in the balance of America's international payments in the April-June quarter, when the deficit was only $250 million after allowing for seasonal factors, compared with $435 million in the first quarter, was due in large part to the merchandise account. Exports have been running at a record rate all through 1962, between 6 and 7 per cent above the first six months of 1961, and in June they were higher than ever before except in one month during the 1957 Suez crisis. On the other side of the account, imports have not risen as fast as had been expected, since the economic recovery and therefore the demand for foreign goods in the United States has slackened its pace sooner than was forecast ; imports actually went down in June. The value of imports increased by $140 million between the first and second quarters, but exports went up even more and the favourable showing on the trading account was responsible for about two-thirds of the fall in the deficit on the total balance of payments. Details of what caused the rest of this fall are not available but a $60 million repayment of debt by France helped and so did Canada's financial difficulties.



More such repayments of foreign debts will appear in the current quarter's accounts but the remedial action which has now been taken by Canada is likely to have an adverse effect on the flow of Canadian funds to the United States. This action will also presumably bring a fall in American exports to Canada. Exports are

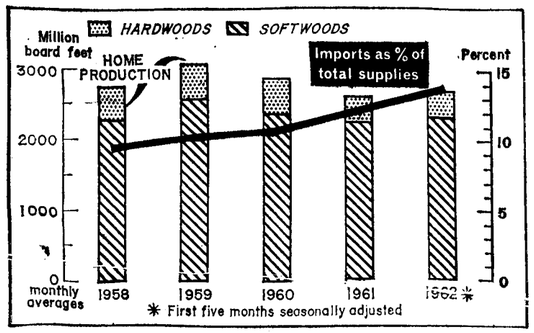
also likely to suffer from the increases in tariffs since July 1st on goods entering the European common market ; certain plastics and chemicals will be especially affected by higher duties imposed in retaliation for the increased protection which the United States is now giving to its own producers of glassware and carpets. Indeed some of the recent rise in American exports may have been in anticipation of the coming restrictions on trade with Canada and Europe. The expansion of exports is therefore likely to fall off during the rest of this year and the annual rate of $21.7 billion reached in the second quarter may even turn out to be the high-water mark.

This is, however, very near the $22 billion which is aimed at for 1962 as a whole by the officials responsible for the American drive to increase exports, now over a year old. Its latest manifestation is the appointment of 30 leading businessmen to head export expansion councils in their respective regions and to advise local companies which are looking for markets abroad ; the hope is that 10 per cent will be added to exports in the coming year. But an earlier spur to exports is looked for from the new insurance programme for goods sold abroad on credit which is a joint enterprise of private insurance companies and the Export-Import Bank. This extends the short-term insurance which has been available since February to cover periods up to five years and should make it much easier for American businessmen to finance exports, particularly of capital goods. They are now, it is said, on an equal footing in this respect with their foreign competitors ; transactions are guaranteed up to 85 per cent of their value against political risks, such as trade restrictions or revolution, as well as against default on the part of the buyer.

Wooden Touch

PROTECTIONIST groups are rallying their forces for a last stand in the Senate against the trade expansion Bill. Among them are the oil companies, the shoe manufacturers and, above all, the textile interests which the Administration thought it had bought off but which are now trying to raise their price. The trade Bill is not thought to be in serious danger but the appetites of all groups have been whetted by concessions made recently, and very quietly, to yet one more candidate for special consideration—the lumber industry.

Western lumbermen have been complaining for months about the inroads which imports are making into their markets, particularly into that on the east coast. Canada, which ten years ago supplied only 7 per cent of this market, now provides nearly three-quarters of the lumber which it takes. One reason why Canada undersells the domestic product in Atlantic ports is that its exporters can use the cheapest shipping available while American goods in intercoastal trade must travel in costly American ships.



American saw-mills also complain that they cannot obtain government timber as freely and cheaply as their Canadian competitors can. On top of this has come the devaluation of the Canadian dollar. A more basic trouble, however, is the competition offered to softwoods by newer building materials.

About a hundred saw-mills in the Northwest have closed in the past two years but in part at least this is due to the long-standing trend to larger units. In Oregon and Washington employment in the industry as a whole is actually higher than it was last year. But members of Congress from the area are determined not to return empty-handed to stand for re-election. Senator Morse, though a liberal Democrat, has been hinting that he will vote against the trade Bill if the "liquidation of the lumber industry" does not cease. Officials have been pointing out in vain that Canada is America's best customer for many other goods. Last month the Administration gave way and announced that it was initiating talks looking toward a voluntary restriction of Canadian exports of lumber to the United States and that domestic lumber would be given preference in government purchases, including those for foreign aid. It also recommended that the shipping laws should be altered to permit American lumber to travel in foreign bottoms.

The advocates of freer trade deplore such steps, which are so contrary to the spirit of the trade expansion Bill. But the lumbermen, who want a quota limiting Canadian imports to about 10 per cent of the domestic consumption of softwoods, are not much happier. They know that Canada, with its balance of payments troubles, will not volunteer very readily or rapidly to limit its exports even though there is a club in the American closet: the Tariff Commission's investigation, under the escape clause, of the lumber industry's complaints. And in Congress the inter-coastal shipping lines, which are themselves a sick industry, will fight hard to retain their monopoly.

Rs for Republicans

THERE was no need for a primary election in Michigan to confirm that Mr George Romney would be the Republican candidate for Governor of that state in next November's election. No one was fighting him for the nomination ; nor was anyone opposing the present Governor, Mr Swainson, for the Democratic nomination. As far as these two were concerned, therefore, last week's election was simply a popularity contest—and in this Mr Romney came out far ahead ; some 450,000 Republicans went to the trouble of voting for him while only about 320,000 Democrats cast ballots for Mr Swainson. The present Governor is a colourless figure who has been constantly frustrated by a Republican Legislature ; but between now and November the automobile workers' union, which dominates the Detroit area where over half the state's voters live, will be doing its powerful best to ensure that the Democrats do not lose a Governorship which they have held since 1948. Mr Romney is not, however, without appeal for trade unionists ; as head of the American Motors Corporation he negotiated the first profit-sharing contract in the industry. His business competitors seem to have stifled the resentment which was aroused by such unorthodox behaviour now that he has a good chance of winning next November's contest provided that he has the full support of his party. Last week's election showed that he is stamping his liberal, progressive pattern on that party—in Michigan, at least. Reactionary, right-wing Republican candidates for other offices in the state, who would have been a constant embarrassment to him, were all defeated.

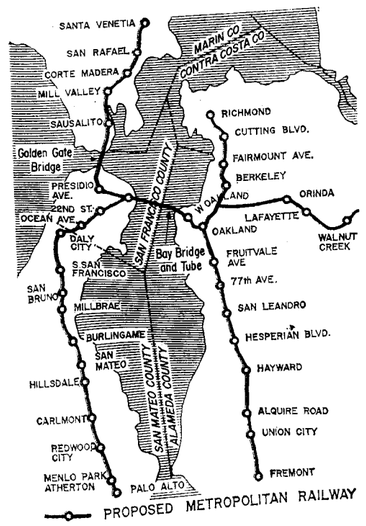
In California Mr Richard Nixon, another Republican who is trying to oust a Democratic Governor, has also now got the party machine in his state under control. But there the ultra-conservatives are much stronger and they may still lose the election for Mr Nixon. If they do he will no longer be a presidential possibility ; if he becomes Governor, he has promised to serve his full four-year term and to stay out of the national race in 1964. This week Mr Romney gave the same promise—almost certainly sincerely, in his case. This leaves Governor Rockefeller of New York, a Republican incumbent whose Democratic opponents have not even been able as yet to find a nominee to run against him next November, with a clear claim to be the next Republican candidate for the White House. It is a claim which suddenly seems worth having, now that President Kennedy is being criticised so widely, and Mr Rockefeller is pressing it to an extent which seems almost irresponsible. In any event it did last week, when he joined the ineffable Senator Dirksen in accusing the Administration of endangering the national security by its latest attempt to get the Russians to accept a ban on nuclear tests.

Rapid Transit Moves

FROM A CORRESPONDENT IN SAN FRANCISCO

THE dream of a seventy-five-mile system of suburban trains, underground, on the surface and up in the air, to link San Francisco with the cities and suburbs eastward across the Bay came one step nearer to reality last month, when the governing bodies of all three counties now concerned gave their consent to putting a $792 million bond issue for the scheme before the voters in November. Despite years of skilful preparatory work by leading advocates of the Bay Area Rapid Transit District, the third and smallest county very nearly brought the whole enterprise to a halt. The Contra Costa County Board of Supervisors finally voted three-to-two in favour but only after its hitherto uncommitted fifth member had been urged on by two telephone calls from the Governor of California and a personal visit from the Mayor of San Francisco.

Both the San Francisco and Alameda (Oakland) County Boards had given their unanimous approval earlier ; Contra Costa hung back because it contains substantial areas that will not be reached by the proposed lines. The episode illustrates the difficulties in the way of any such progressive move towards solving metropolitan problems. Both Governor Brown, a Democrat standing for re-election, and Mayor Christopher of San Francisco, who is the Republican candidate for Lieutenant Governor, regard success for BARTD as crucial in a state with California's fast-growing population and heavy urban concentrations. Yet the wavering Contra Costa Supervisor spoke as though his vote represented a real sacrifice for the sake of progress: he had dared to look beyond the interests of his immediate constituents.



The project still faces the stiff task of winning the approval of 60 per cent of voters, many of whom cling to the American faith in "my automobile, right or wrong." They also fear the increase in local rates, which will amount to about $27 a year for an average householder. Officials of BARTD maintain that the only possible alternative—more roads—would cost twice as much. Originally, as the map shows, the scheme would also have connected San Francisco's northern and southern suburbs with the city. The difficulties in adapting the Golden Gate Bridge to carry trains to Marin County and the refusal of San Mateo County to participate have eleminated these branches. But if the project succeeds, few doubt that these other areas will join in eventually—at far greater cost.

Less Work—More Jobs?

ONE consequence of the failure to speed up economic growth is that the trade union movement is now officially committed to the 35-hour workweek as a cure for unemployment. The executive council of the American Federation of Labour and Council of Industrial Organisations, which met this week in Chicago, has announced a double-pronged drive to spread the work: by individual trade unions in their bargaining with employers and by pressure on Congress to amend the Wages and Hours Act, which covers both union and non-union labour. Since 1940 this has provided that workers in interstate commerce shall be paid overtime, at time and a half of their usual wages, for any hours they work over forty a week. Special committees have been set up by the AFL-CIO to carry on the fight on both fronts. For over four years unemployment has remained above 5 per cent of the labour force and the pressure inside the trade unions for some direct action has become too strong to resist—particularly with the tax-cut, which the trade unions backed, put off at least until next year. Many trade unionists are convinced that another recession, and still higher unemployment, is now inevitable this winter.

On the surface, the AFL-CIO has come to a parting of the ways with President Kennedy. As Mr Goldberg, the Secretary of Labour, seemed sure to argue fruitlessly in Chicago, the Administration is convinced that "sharing the work" would probably increase unemployment rather than cut it, by curbing output and the rate of growth, by raising prices and by making American goods less competitive with foreign ones. If workers were to receive the same wage for 35 hours as for 40 hours, as the trade unions propose, this would be equivalent to a rise of 14 per cent in wages at a time when productivity is rising by only about 3 per cent a year ; faster automation, and fewer jobs might follow. Moreover, many of the jobless lack the skills to do a share of the work and, even if over-time were charged at double rates to encourage the hiring of new staff, employers might choose to pay the surcharge. In industries where short workweeks have been established by collective bargaining, such as construction, over-time is common ; it works out more cheaply than paying fringe benefits—pensions, paid holidays, medical care and so on—for additional workers. Members of trade unions themselves seem more interested in longer holidays than in short hours.

The trade union leaders do not even pretend that a 35-hour week will come overnight. A conservative Congress is not likely to raise businessmen's costs and to win shorter hours through collective bargaining will take years of probably bitter industrial struggle. The 35-hour week is a second-best goal ; the trade unions say frankly that they would much prefer full employment at 40 hours a week. The demand for shorter hours is primarily a warning sign to the Administration, and even more to Congress, that unemployment must be dealt with vigorously—and urgently.

Crime in a White Collar

FROM A CORRESPONDENT IN NEW YORK

WALL STREET, which has been airing its dirty linen in bundles a mile high, was in the midst of new chaos last month when two large and reputable brokerage firms found that they had lost between them $1.4 million in securities. The Federal Bureau of Investigation spread a drag-net all over the country and in no time had rounded up thirteen individuals who were said to be involved in a conspiracy to steal and dispose of some of the missing certificates. They include a clerk employed at Bache & Company, the major victim. This man, who had access to the Bache vaults, possessed a criminal record which the company's investigations had not uncovered. Criminals have had field days in Wall Street before this, but the great expansion in the securities industry has multiplied their opportunities. In the late nineteen-fifties a gang moved quite openly into several lesser known firms, took them over by dint of none too gentle persuasion and made a considerable fortune through the sale of forged share certificates. Reputable brokerage houses have also been somewhat slow, probably because of the hectic atmosphere in the financial district, to protect themselves from theft by their own employees.

Dishonesty of this kind has been increasing, not only in Wall Street but throughout business and industry. Last year fidelity insurance companies paid out three times as much in claims as they had in 1945 and the total stolen by trusted employees, from porters to chairmen of boards, was over $1 billion. This figure does not include the millions of dollars lost in kickbacks, bribes and theft of company secrets. Some of the older detective agencies, such as Pinkerton's, have turned their attention to industrial crime, but they tend to concentrate on the threats from outside. The danger from within demands a new kind of sleuth, who must engage in all the cloak and dagger techniques of the undercover agent and be an expert in the new field of management engineering as well. He must not only find out why a company is losing money, who is taking it and how, but must also devise methods to prevent a repetition of the crime.

One of the largest of these management engineering firms is Norman Jaspan Associates, Inc., which provides industry with straightforward management studies, while its subsidiary, Investigations, Inc., unearths malpractices. The Jaspan companies have 500 employees throughout the country who serve 2,500 clients, among them the giants of American industry. Last year they uncovered $60 million worth of dishonesty and were paid $4 million for their trouble. A caller from the firm may descend upon a company at the behest of its president to make an open survey of shipping methods, incentive programmes and other matters closely related to the work of an industrial engineer. But the problems may prove to be such that Investigations, Inc., will undertake more devious inquiries.

The Jaspan people say that they seldom learn much about a company by talking to the top management directly. It is usually more profitable to send a "junior management engineer"—known in another era as an undercover operative—to apply for a job as secretary to the vice-president or as a porter or operator of a drill press, where he can observe, listen and if need be peek into the files. These individuals differ from the shop-worn image of the private eye in that the young man working as a porter is likely to be a trained efficiency expert; the pretty girl, who is such a good secretary in a drug concern, may be a PhD in chemistry.

In this manner, an operative of Investigations, Inc., innocently washing his hands in the cloakroom, noticed a fellow employee copying a confidential blueprint, one of a series which he was selling to his employer's competitor. Another found a man at a gold mine pouring gold dust into plastic capsules which he proceeded to flush down the lavatory. The capsules were caught in a trap which he had installed previously in a waste pipe. The manager of a supermarket was caught hauling his own cash register to work each morning after lightening the load at home. The head of a meat warehouse was discovered "over-shipping" meat to accomplices at local supermarkets.

Jaspan is handling an increasing number of cases involving the theft of company secrets, some already patented or in the process of being patented. For instance, not long ago an engineer making an open survey of shipping methods in a large chemical company on the east coast noticed a crate marked "Samples" awaiting shipment to the west coast from the director of research. When the crate was opened it turned out to contain the records of developmental work on a new product. The company had spent four years and over $4 million bringing this product to the point at which commercial exploitation was possible. The research director, as is usual, had signed an agreement with his employer to prevent him from making off with the fruit of work done in the company's laboratories with company funds. Nevertheless, he had made arrangements with accomplices on the west coast to ship them the research data needed to give them a head-start in the market. In return they had promised him a job and 10 per cent of the proceeds from the sale of the new product.

VENEZUELA

EIU QUARTERLY ECONOMIC REVIEWS covering 57 countries or groups of countries

There have been two military rebellions this year, but President Betancourt remains in control. The Review describes the background to these events, and analyses the circumstances which led to a partial devaluation of the bolivar in April. Also discussed are the encouraging upward trend in oil production, and the implications for the Venezuelan petroleum industry of the resolutions adopted at Geneva recently by the Organisation of Petroleum Exporting Countries.

SHORTER NOTES

A month-old disagreement between the President and the Joint Atomic Energy Committee of Congress was resolved last week when Mr Kennedy announced that one of the two vacancies on the Atomic Energy Commission is to be filled by Mr James Ramey, the director of the committee's staff. The other goes to Mr John Palfrey of Columbia University. Mr Ramey is not popular with the existing commissioners but the committee refused to consider other names until it was promised a vacancy for one of its own candidates. Unlike the three scientists now on the commission, Mr Palfrey and Mr Ramey were trained as lawyers. Neither may have long in their new jobs; the Administration still plans to ask Congress next year to replace the five-man commission by a single administrator.

BOOKS

From the Tsars to Khrushchev

Russian Foreign Policy: *Essays in Historical Perspective.*

Edited by Ivo J. Lederer.

Yale University Press. 643 pages. 80s.

MAN'S survival, it seems true to say, depends very largely on the Soviet leaders' willingness to face the political implications of the nuclear age, and to turn peaceful co-existence into something more than a slogan. This lends particular urgency to the study of Soviet foreign policy. What are its real objectives and how are they promoted? How relevant is Marxist-Leninist ideology, and to what extent are the Russians of today following in the footsteps of the Tsars?

These problems are complex, but not insoluble. Some light is thrown upon them in this volume of essays by a number of distinguished American scholars, participants in a conference held at Yale to consider Soviet foreign policy in its historical setting. Among the topics discussed are Russia's strategic and economic interests, the role of propaganda and the changes taking place in popular attitudes towards the outside world. Other papers analyse Russia's relations with particular areas of the globe to discover how policy is carried out in practice. Each contributor deals with the pre-revolutionary era as well as the Soviet present. There are some notable gaps, but there is a great deal of useful information and lucid thought in these pages that will interest the general reader as well as the historian.

Imperial Russia emerges as a country neither more nor less moral in its foreign policies than other states of the period. The aim of national aggrandisement was pursued somewhat fitfully, to a large extent prompted by the ambitions of the military —although often the Tsar and his ministers were more deeply involved than they cared to admit to protesting western ambassadors. Much of the trouble stemmed from the fact that the educated Russian public took little interest in foreign affairs and could not exercise any noteworthy restraint on those in authority. But on the whole the problem remained within manageable proportions. Economic backwardness imposed limits on Russian strength, and when international complications threatened the other powers generally intervened to forestall Russia. Still more important was the fact that Russia itself belonged to the European state system. Its diplomats by and large shared the ideas and values of their foreign colleagues. Indeed, so westernised did the Russian élite become that many intellectuals lost faith in their country's future. They accepted the Bolshevik revolution because it enabled them to overcome their deep sense of national humiliation *vis-à-vis* the more advanced West. Communism served them as a means of re-asserting Russia's old claims to moral superiority and catching up on Europe in the sphere of material accomplishments. This pattern of superficial acceptance of western culture, followed by rejection, and then by conscious imitation of certain selected features of it, has since been repeated in China and other Afro-Asian countries.

The Bolsheviks have succeeded in harnessing this latent nationalism to their totalitarian machine. But this does not make them nationalists in the conventional sense. The elements of continuity between their policies and those of Tsarist Russia are only of secondary or incidental importance. No doubt traditional Russian exclusiveness, derived from historical experience, has intensified Soviet fear and suspicion of the West. But the decisive element in the foreign policy of any modern totalitarian state is political: concern for the interests of the ruling party. The party must continually seek to maintain and extend its monopoly of power and justify itself in terms of the official ideology. Marxism-Leninism gives the Soviet system its dynamism, and at the same time provides a framework within which all decisions are taken, including those on foreign policy. Despite its apparent rigidity, the doctrine actually permits great flexibility in the choice of means. Each step is related conceptually to the ultimate goal. But it is taken only after a careful and realistic analysis of the existing power relationship. The sole criterion is tactical advantage to the regime. The result is a curious blend of loyalty to principle and blatant opportunism. But it presents a formidable threat to democratic states, where the diffusion of authority generally prevents national leaders from matching the Communists in the consistent pursuit of purpose.

Can the West meet the challenge? On the whole the contributors to this volume are cautiously optimistic. The Soviet leaders, they point out, are coming to realise that nuclear weapons make direct territorial expansion intolerably dangerous. Aid to the under-developed countries strains Soviet resources and does not always bring tangible political results. Tension arises between Communist countries, seeming to show that Mr Khrushchev is finding it increasingly difficult to reconcile Soviet national interests with those of the world Communist movement. The West has no cause to be complacent, but it has nothing to panic about.

Wool and Protection

The Wool Trade in Tudor and Stuart England.

By Peter J. Bowden.
Macmillan. 260 pages. 35s.

IN the fourteenth century the Ordinance of the Staple called wool "the sovereign merchandise and jewel of this realm of England." Two centuries later wool exports were insignificant, but the sheep remained the mainstay of the economy, since the decline in the export of wool had been offset by the rise in the export of cloth. The expansion of the broadcloth industry between 1450 and 1550 forced up the price of wool, while corn prices lagged behind. The first crisis came with the depression of 1551, and thereafter wool prices rose more slowly than those of grain. The second crisis came in the early seventeenth century: it was met by manufacturers changing from the production of broadcloth to that of fine cloths made from Spanish wool and by a greater concentration upon cheap worsteds and cloth mixtures. Even so the years of the golden fleece were over; large flockmasters prudently contracted their demesnes and let out a growing proportion of their estates.

Mr Bowden's study of this process of economic adjustment and government intervention is careful, realistic and original. In the earlier part of the book he is particularly concerned with the decline of the broadcloth industry in the reign of James I. This has been ordinarily attributed to the collapse of northern European markets, largely as a result of war: compensation was found in the markets of southern Europe, which demanded lighter weaves. Mr Bowden's explanation, originally given in his article in the *Economic History* for 1956, is made in terms of supply and not of demand. The richer grazing made possible by enclosures meant that the fine short wool suitable for broadcloths was replaced by long coarse wool suitable for worsteds. The broadcloth manufacturers had to use inferior raw materials or to experiment with other products. The theory is attractive and cannot be disregarded in future discussions. Yet the depression of foreign markets must remain at least a complementary explanation. And it is unfortunate that while Mr Bowden has here expanded his discussion of the wool supply, he has contracted his main argument.

The second part of the book is concerned with the campaigns fought by industrial and export interests for favoured treatment. Both the wool and the cloth trades were geared to credit, and the "wool-broggers" were indispensable to small farmers and producers. The mid-sixteenth century depression produced the restrictive legislation of 1552 against wool-dealers; and it was not until 1624 that a more serious depression led to the repeal of the 1552 Act. Protection was granted to the clothiers by a prohibition on the export of wool. Mr Bowden questions the contemporary belief that this could handicap continental competitors. However the Leyden clothiers seem to have been justified in their complaints against the export ban. And, since England had a virtual monopoly of long-staple wool, it is odd that Mr Bowden should here lay so little stress on the nature of the wool supply when he has earlier given it such weight. His argument would have been more effective if he had been able to deal explicitly with the doubts and qualifications provoked by his original article. Nevertheless his book will be of great value to historians and of more general interest as a study of, as he puts it,

> the way in which a vociferous section of the community, by dint of sustained and organised propaganda, can obtain general acceptance of its own selfish aims in the name of public necessity.

Civil War Blues—and Greys

Patriotic Gore

By Edmund Wilson.
Deutsch. 848 pages. 55s.

THE Civil War remains the great traumatic experience of American civilisation. Even those who have wanted to forget about it have found, like Mr Justice Holmes, that it would not let them go. A hundred years later, surfeited by the vulgarities and tomfooleries of the centennial commemoration, many an American intellectual has sworn off the subject for the duration. How long will such conscientious objection survive? Here is Mr Wilson, the Grand Cham himself, joining up—and wearing not only the Grey but the Blue also, the Civil War buff to end all buffs.

"Patriotic Gore" is a reminder that a great critic not only can but should address himself to the obvious subjects, to the great focal points of human experience, and that he will find there ample material for the exercise of his illuminating art. In these spacious pages Mr Wilson explores the literature of the war, prewar and postwar, North and South, asking as he always has of any literature, what it can tell us of the values and weaknesses of its society. This means—for the Civil War, a great conflict, produced no really great literature—a careful grading and analyis of novelists, poets, diarists and autobiographers of the second order. Yet the result is, without question, a first-rate piece of criticism.

Mr Wilson's triumph is largely the result of his relentless honesty, of his refusal to exaggerate the merits of his subjects. John de Forest is not inflated into a New Haven Henry James, nor Sidney Lanier into a Southern Keats. But a catholicity of appreciation accompanies this wise discrimination; on both sides of the battle line, in opposite styles of romanticism and realism, Mr Wilson discerns merits which a short-sighted twentieth-century reader would miss, just as he relates shortcomings to intellectual and social climates of which contemporaries were only half aware.

Mr Wilson does not hide—indeed, in an already over-quoted introduction about the "sea slug," he positively parades—the attitude which he himself adopts towards the great conflict. It was, his introduction asserts, merely the grossest manifestation to date of America's recurrent cannibalistic impulses, the North clothing its success in the garments of moralistic superiority. Fortunately the fatal "merely," which makes the introduction so stridently unconvincing, is absent from the pages that follow, and is replaced by a full awareness of the tragic dimension in which his people and their events occur. So Harriet Beecher Stowe can be depicted as comprehensibly as Mrs Chesnut, the diarist of the ruined Southern plantocracy, and Ulysses S. Grant as admiringly as Alexander Stephens. Only one figure in some measure eludes Mr Wilson's grasp (though he has true things to say of him). That is, paradoxically, the leader who most rose above the pharisaism that Mr Wilson deplores. In dealing with Lincoln Mr Wilson's scholarship for once falls short. He still accepts the Herndon gospel, now so widely discredited; he has not fully understood the debates with Douglas; and most surprisingly of all, he still swallows whole the Charles A. Beard thesis of the economic causes of the war. Here indeed, as often elsewhere, Mr Wilson remains "unreconstructed"—an unreconstructed, isolationist, New York City liberal of the 1920s. Fortunately, for most of the time he also remains the most perceptive, informed and literate critic of the 1960s.

Soap Washed Whiter

Competition and Monopoly in the British Soap Industry

By H. R. Edwards.
Oxford University Press. 280 pages. 35s.

MR EDWARDS has really written two books: a restatement and refinement of the theory of imperfect competition under oligopoly; and a history of the British soap industry. Both are good. Mr Edwards is lucid, brief, and relatively free of jargon, equations and diagrams.

He starts by reminding us that the classical description of perfect competition was much more relevant to agriculture than to modern manufacturing. Agriculture has a U-shaped cost curve; its units are kept relatively small by the need for a large number of management decisions; its basic facility, land, is limited; and its products are reasonably standard. Manufacture often has diminishing costs at the margin; its managers are able to control increasingly large units up to a point; its machines can be endlessly duplicated; and its products are infinitely varied.

Classically perfect competition, therefore, Mr Edwards contends, is not normally customary in manufacture. The number of separate firms in an industry is limited; their capacity at a given price is flexible; their customers are more or less tied to them by goodwill, whether it is the goodwill of the large buyer who knows that a particular supplier will provide satisfactory quality and service, or of the ordinary consumer who sticks to a brand because she has tried it and found it good.

When competition is thus imperfect, firms are bound to keep a wary eye on each other's actions. Unrestrained price competition would simply lead them to ruin. Nevertheless, in practice the public is exploited relatively rarely, which Mr Edwards explains by the threat of competition from new entrants, usually established firms in other lines widening their range, and by technological innovation, itself often achieved by new firms.

If these new entrants are to be kept off, prices must be kept below what Mr Edwards calls the 'no-entry ceiling'. If they go above that, new entrants will see a profit, and will be tempted in. Below that, they will see no profit and will keep out. The height of this 'no-entry ceiling' depends on such factors as the goodwill of the existing firms, the minimum optimum scale of production, the level of technique in the industry, and whether the industry is expanding. In practice, the extra price—a rent of oligopoly—this ceiling permits is usually not worth more than 1 or 2 per cent of net sales value, Mr Edwards reckons, though occasionally it may rise as high as 5 per cent.

From his admirably concise history of the soap and detergent industry Mr Edwards draws some very interesting conclusions.

First, there is the importance of innovation. Levers originally burst into a market that was a series of old regional semi-monopolies by providing a better soap (oil instead of tallow based), wrapping it, distributing it at one price nationally, and promoting and advertising it on a large scale to the consumer. They then held their market between the wars by pioneering soap powders. In the fifties when Hedleys jumped to nearly half the market, they too did it by being a little ahead in exploiting a technological breakthrough—the possibility of a soapless detergent made to wash clean with phosphate builders and which did not go lumpy, and, later, fluorescers.

Secondly, there is the old importance in this market of heavy advertising; advertising as a percentage of net sales value was as high in the nineties as in the nineteen-fifties. Thirdly, neither Levers nor Hedleys seem to have exploited their oligopolistic position. Mr Edwards finds little evidence of more than normal profits. Competition seems to have prevented prices from ever going near their new-entry ceiling. Lastly, there is a clear suggestion that the savings of scale, especially in selling expenses, from concentration have been real. Indeed, Mr Edwards's criticism of Unilever is that they remained decentralised into their constituent companies for so long, and so did not get the full benefit of their amalgamations either in costs or policy-making.

Mr Edwards's theory makes imperfect competition a very limited threat to the con-

sumer, even at its most powerful. His example shows that it does not have to be a threat at all.

What is Obscene?

"To Deprave and Corrupt . . ." *A Collection of Original Studies in the nature and definition of "Obscenity".*

Edited by John Chandos.
Souvenir Press. 219 pages. 25s.

WHEN the principle of freedom of expression conflicts with the need to protect society from attacks on its "essential shared values," reasoned argument is avoided and emotion prevails. This is particularly so in the case of obscenity. The present collection of nine studies, which takes its title from Chief Justice Cockburn's test for obscenity in *R. v Hicklin* in 1868, is a serious contribution to the subject. It successfully demonstrates the divergence of standards and inconsistency of judgments which the issue has provoked. But it does not suggest how, short of abolition, the test (which was modified by the Obscene Publications Act, 1959, but still contains the phrase in question) can be made more precise and certain.

Public attention is normally directed to obscenity only when a particular book is challenged before a court. Recently there have been signs that some judges, reflecting an increasing public tolerance, are reluctant to condemn a book on this ground. Mr Justice Stable's enlightened charge to the jury in *R. v Secker & Warburg* ("The Philanderer" case) in 1954 was a straw in the wind, and, recently, the Massachusetts Supreme Court, although by a bare majority, held Henry Miller's "Tropic of Cancer" not to be obscene. It is not surprising, then, that the two articles which concentrate on the legal aspects of the matter, that of Dean Lockhart and Professor McClure of the University of Minnesota from the American side and Lord Birkett's posthumous account of "The Changing Law" in England—a gem of lucidity—are the most pertinent in the collection. Lord Birkett commends Lord Reid's dissenting judgment in the recent *Ladies Directory* case, in which the House of Lords recognised the crime of "conspiring to corrupt public morals," and so shows his disapproval of that decision, which runs counter to the liberal trend. One would have liked to know how the problem is tackled by the legal systems of continental Europe; or is it only English-speaking countries that have an obscenity problem, and if so, why?

Some articles deal not so much with obscenity as with censorship in general: for instance, Mr St. John Stevas's on "The Church and Censorship." Most of the contributors, while disapproving of censorship, decorously distinguish between "writing conceived as art" and "mere pornography." Mr Maurice Girodias, of the Olympia Press in Paris, opens his jolly broadside with the announcement "To deprave and corrupt is my business," and claims that "the final difference between the two categories lies only in the scope of language used."

The editor, Mr John Chandos, a vigorous and well informed writer, is himself the author of two studies. The first adumbrates the main aspects to be discussed later by specialists, and the last is an absorbing account, enriched by discreetly chosen illustrations, of "what censorship can do," by encouraging the production of clandestine obscene writings.

Statistical Concealment

The Statistical System of Communist China

By Choh-Ming Li.
The University of California Press. 180 pages. $4.00.

The National Income of Communist China

By Alexander Eckstein.
Free Press of Glencoe. 215 pages. $6.75.

WHEN Professor Choh-Ming Li wrote his first book on the Chinese economy, an appraisal of the first five years of industrialisation, he could find no evidence of deliberate fabrication of the statistical source material. As his book reached the reader, the Chinese authorities admitted the most massive falsification known in the history of modern statistics. The crop of 1958, the year of the "Great Leap Forward," planned originally at the ambitious figure of 196 million tons, had allegedly yielded as much as 375 million tons. After half of it had been consumed, the Chinese Government, aware of the gross exaggeration, ordered two recounts, which brought the estimate down to 250 million tons. It will probably never become known how the recounts were carried out six months after the harvest. "Ex post checking on output data serves no purpose," Professor Li remarks tartly. Soon the world learned of widespread food shortages; then a novelty, they have meanwhile become an almost regular feature of the Chinese scene. Whilst the revised harvest estimate of 1958 was still overstated by at least a tenth, the one of 1959 was exaggerated by more than one-quarter. Thereafter the Chinese authorities ceased to publish any harvest results.

The position was little better in the industrial sphere. Steel production, planned originally for 1958 at 6½ million tons, was alleged to have jumped by the end of the year to over 11 million tons. This was due largely to a sudden outburst of local party initiative. Thousands of do-it-yourself furnaces were reported to have yielded over 3 million tons of steel. Later the Chinese authorities endorsed the views of western observers: no steel had been produced in the backyards. The iron was of such poor quality that the experiment had to be abandoned.

Professor Li refrains from giving his own estimates of agricultural and industrial achievements. His book is no less important for being an analysis of a vast volume of Chinese literature; from it a picture emerges of the statistical system as it was in operation before it collapsed under the impact of decentralisation and "mass participation" under party leadership. Professor Li has been most restrained in his evaluation, the sparing criticism of which is all the more damning. Instead of being essentially a technical tool for planning, Chinese statistics took on the character of a political weapon. As for any future analysis, adjustments will be necessary, challenging the imagination and ingenuity of students of Chinese economics.

Professor Eckstein's book on China's national income is the fruit of such ingenuity and imagination. Basing himself on partial and fragmentary data he has calculated China's gross national product for 1952 from private and public sector accounts, transfer payments and receipts cancelling each other out. The results Professor Eckstein elicits from his study of farm products, non-farm wage bills, net earnings of private and public enterprises are not very greatly different from those of the few other western scholars who have tried to penetrate behind the maze of concealment, methodological vagueness, shifting definitions and changing coverage that are marks of China's statistical services. What is important in a study of this kind is the composition of the national income as much as its absolute level.

In 1952 China was of course only at the beginning of its drive towards industrialisation. Farming provided more than half the gross national product and private consumption more than two-thirds of the nation's outgoings. Agriculture was still based on the small holdings of private cultivators. The economy was still far from fully socialised. Today the level of the national income and its composition are bound to be very different from what they were on the eve of the first five year plan. In the meantime the importance of the public sector, and that means the share of capital investment in total national income, has grown immeasurably. Personal consumption has lost correspondingly. Even in 1952 China, though greatly behind the Soviet Union on the eve of its plan era, resembled the Soviet pattern with regard to the allocation of resources. In view of the vastly different setting at the time of the Chinese revolution, the similarities between the two experiments are startling.

To judge by a comparison in terms of national income, China in 1952 is shown to have had a slight edge over India in supply per head of farm products and in output per worker in industry. Ten years later the position deserves to be re-examined. It may well be very different. Professor Eckstein's book is the first of a series of studies from which he hopes to derive national income estimates for 1957 and 1962, the last years of the first two five year plans. China's statistical practices have changed sufficiently to require analytical techniques different

from those applied in the first study. This task will require all the tenacity of serious scholarship of which there is so much in this field in the United States and so little elsewhere.

Tocqueville Systematised

The Social and Political Thought of Alexis de Tocqueville.

By Jack Lively.
Oxford University Press. 271 pages. 25s.

A SYSTEMATIC study of the thought of Alexis de Tocqueville has been needed for a long time; and it is no small credit to Mr Lively that the work under review goes far towards supplying the necessity—the first to attempt it, so far as the present reviewer is aware, in any language since the twenties. Of course since then there have been Professor Pierson's great work on Tocqueville and America; a not altogether satisfactory re-editing of his complete works, together with a number of English translations; and a large number of articles in learned journals. But it is indisputable that Tocqueville, a writer whose ideas and whose observations are now constantly drawn on by sociologists, journalists and political scientists, has nevertheless suffered, at worst, from the neglect, and at best, from the somewhat haphazard attentions, of scholarship.

So Mr Lively set himself a worthy enough task; and it must also be said that he has coped with it very capably. He has reintegrated Tocqueville's thought from the hundreds of letters and speeches, essays and (too few) completed works where it lies fragmented, and laid it out in seven chapters, whose titles (Liberty; History and Society; Centralisation, and so on) neatly sum up the main subjects of Tocqueville's reflections. He gives a sound account of Tocquevillism, that special form of liberalism, in all its details. He does not, perhaps, give enough references to back up all his statements, but if he did the book would be horribly over-peppered with footnotes; and on the whole he does not misrepresent Tocqueville's doctrine. In places he even performs much-needed rescue operations from misrepresentation. For example, he emphasises again and again that Tocqueville was no enemy to democracy; and shows that "negative freedom", that fatally limiting ingredient of most liberal thought, by no means limited Tocqueville. Negative freedom was, for him, complementary to that sense of personal responsibility which depends on liberty but on which liberty, in its turn, depends.

Nevertheless, two reservations must be made about this book. The first is that, even for an academic work, it is written with inexcusable stodginess. And the second is a doubt as to whether Tocquevillism is best expounded on quite this plan. It is to be hoped, of course, that many people will read this book as a corrective to the visions of Tocqueville the reactionary, Tocqueville the unrelieved pessimist, Tocqueville the monotonous harper on the single note of equality, that are now current. But in nature such readers are most likely to be academics, not politicians, still less non-academic private citizens. Yet it was above all for these last two classes that Tocqueville wrote. What is needed now is a book to turn them back to "Democracy In America" with fresh minds, there perhaps to revitalise their belief in the virtues of liberal democracy. Mr Lively's work fails, narrowly but decisively, to be such a book.

Diplomacy of Illusion

France and Her Eastern Allies 1919-1925

By Piotr Wandycz.
University of Minnesota Press. London: *Oxford University Press.* 463 pages. 68s.

AT the Paris Peace Conference of 1919, France appeared to be the strongest power in Europe. Twenty years later, its collapse, militarily and diplomatically, was complete. The myth of France's military greatness was shattered, while the apparent strength of its diplomatic position in Europe had been shown to be equally hollow. The intention of French foreign policy in the 1920s is clear enough: to replace the pre-war alliance with Russia by the formation of close ties with the new states of eastern Europe in order to contain Germany within the 1919 frontiers. By 1925 it looked superficially as if this aim had been achieved; and there was a network of treaties and agreements between France, Poland and Czechoslovakia, while Rumania, Jugoslavia and Czechoslovakia had formed the Little Entente, which seemed to promise stability in the area.

Professor Wandycz's careful and scholarly study shows in detail how insecure the French security system in fact was, and on what precarious foundations the eastern alliances rested. He has written a narrative tracing France's attitude to Polish and Czechoslovak claims at the Peace Conference, the brief flirtation (due, it appears, to the influence of Maurice Paléologue) with the idea of supporting a Danubian block based on Hungary, and the development of France's east European policy and of the relations between Poland and Czechoslovakia up to the signature of the Treaty of Locarno. The author sees in Locarno, and the acceptance of a guarantee against German aggression in the west, the failure of France's original intention to link the security of the frontiers of Poland and Czechoslovakia with that of France's own frontiers. "All that remained of a grandiose project," he concludes, "were shaky bilateral French alliances in East Central Europe."

The French sources for the period have been partly destroyed, and most of what survives is not available to historians. Professor Wandycz has largely succeeded in overcoming this difficulty by his use of Czech and, especially, Polish sources, of which he has unearthed a surprising quantity. This leads to the book being more

By James Jay Allen

THE EUROPEAN COMMON MARKET and the GATT

A wealth of well presented detail in a truly expert, unbiased, and intelligent appraisal of the Common Market. It explores, in theory and in practice, the relationship between the European Economic Community and the General Agreement on Tariffs and Trade, the worldwide tendency towards trade-diverting and trade-creating effects, the special position of the United States, and possible future results.

Highly recommended by the *Library Journal, Political Science Quarterly, World Affairs*, and the general press. $6.00 £2.2.10

Ten Per Cent Discount to readers of *The Economist* when this announcement accompanies cheque or money order. Post free.

THE STATESMAN'S YEAR-BOOK 1962

S. H. Steinberg (Editor)

The ninety-ninth annual edition of this famous and indispensable reference book is now ready.

'Compact, accurate, impartial, interesting, and furnished with a wealth of relevant statistics.' —*Financial Times*

Illustrated 45s.

MACMILLAN

of a study of Polish and Czechoslovak foreign policy than of French policy. However, this does less harm to the work's perspective than might appear. It was, in fact, in Czechoslovakia alone that there was any real continuity of policy in this period. Both French and Polish foreign policy was constantly changing under the pressure of internal politics, whereas Czechoslovak policy under Eduard Benes remained remarkably constant. Benes is indeed the hero (if the word is not out of place in writing of so deliberately dry and detached a piece of diplomatic history) of this book. His diplomatic skill, genuine moderation—particularly towards Germany—and real vision of improved international relations in central Europe make the treatment of him by the French and British in 1938 all the more inexcusable.

In addition to exposing the illusions on which France's eastern alliance system rested, Professor Wandycz deals with some other myths; he shows, for example, that the role played by General Weygand in checking the Russian advance into Poland in 1920 has been magnified out of all proportion. He has also some interesting things to say about the influence of economic considerations on French foreign policy. Although this is not an easy book to read—the style is pedestrian and many of the references, particularly to Polish internal politics, need explaining—and although the maps provided to illustrate the complicated territorial disputes are quite inadequate, the author has nevertheless made a real contribution to our knowledge of international relations in the period.

History through Stones

The Mute Stones Speak

By Paul MacKendrick.
Methuen. 382 pages. 35s.

IN this book Professor MacKendrick, who has been professor at the American Academy at Rome, surveys the archaeology of Italy, to show how it illustrates Roman history from the earliest times until the fourth century AD. This reviewer knows of no book that covers the same ground so helpfully; it will be welcomed especially by those readers who have not the time to follow up widely scattered archaeological reports in half a dozen different languages. If in the prehistoric chapter the stones (or sherds) stammer rather than speak, with the Etruscans and early Rome they have found their voices. How good it is to have sites like Marzabotto and Cosa and early Ostia explained and, in the chapter on the later republic, to find an account of the sanctuary of Palestrina. Moving into the imperial age we are shown a succession of major sites, familiar and less familiar. Here, among many other items, are the Nemi galleys; the imperial fora (with, for our entertainment, a photograph of Mussolini inaugurating the Via dell' Impero in 1932); the Golden House; Hadrian's villa; roads, aqueducts and the walls of Aurelian; and, which will give much pleasure, Piazza Aamerina, and the excavations under St Peter's. There are numerous plans and other illustrations; but it is much to be regretted that the reproduction of some of the photographs is so dark and that plans, heavily reduced because of space, are sometimes smudgy.

The reader will emerge with increased respect for the achievements of Italian archaeologists. Their engineering feats in the excavation of the Ara Pacis and of the shrine of St Peter show that the skill of the old Roman engineers still remains with their modern descendants. Besides the Italians, scholars from many other nations have contributed to the work of excavation and survey, and all are given their due credit. But though the author is concerned with the work of others, his book is very individual and has the touch of the scholar who is thoroughly familiar with his subject. All will not see eye to eye with some of his historical asides. He is rather too contemptuous of the Roman emperors, Augustus included, and why bother to give a genealogy of the Julio-Claudian family? There is also perhaps overmuch about the 'involuted' and 'tortured' nature of Hadrian (in the vein of a recent novel) for the taste of provincials brought up in the lee of that great emperor's Wall; but these are merely bypaths in a useful and lively book.

Fabulous Province

The Living Land: *An account of the natural resources of British Columbia*

By Roderick Haig-Brown.
The Macmillan Company of Canada. 269 pages. 50s.

IT is harder to face and balance facts about British Columbia than it is about any part of North America. It is short of nothing but dull scenery, people and level heads. Halve the optimism its government expressed in its evidence to the Gordon Commission in 1955 and one foresees the province by 1975 outdoing Texas and California in "growth." In 1962 the rare observer who has not been outwitted is not easily disposed to recommend the province either to investors who want tangible returns in their own lifetimes or to young immigrants looking for exciting prospects. There is the superficial paradox of serious unemployment and serious labour shortage. Why, with such legendary resources available, is such optimism so damp? What is wrong?

It is greatly to the credit of its otherwise wide-eyed government that, as early as 1948, it encouraged its Director of Conservation in the Department of Lands and Forests to call annual conferences on natural resources to consider and report—scientifically—on the whole picture. And it was, perhaps, more than they deserved that he happened to be Dr D. B. Turner. Under his guidance

> men who were dealing daily with research, administration or operations in the various resources set forth their knowledge and their difficulties, listened to each other with surprising degrees of sympathy and patience, left with broader knowledge and a clearer understanding of the welfare of the province as a whole.

So far over a dozen weighty tomes record these conferences and there is no doubt that a Gordon Commission today would, as a result, get far more sensible evidence. But the general public in and out of the fabulous province are entitled to the fabulous facts in one lucid, un-axegrinding volume. Their appetites were gorgeously whetted in 1956 by the publication of easily the finest Resources Atlas (48 pages of maps in full colour) in the world. To have chosen Mr Haig-Brown for this formidable digesting task was perfectly apt. He is a British Columbian of a rare type. Though he is as much in love with his province as the next man, he knows the stuff his dreams are made of, understands every donaish volume of it and, glory be, can write like a dream.

OTHER BOOKS

THE TRACHTENBERG SPEED SYSTEM OF BASIC MATHEMATICS. *Translated and adapted by Ann* Cutler and Rudolph McShane. *Souvenir Press.* 270 pages. 18s.

Multiplication is really an additive process. Thus, any number in the hundreds range can be written in algebraic terms as $a \times 100 + b \times 10 + c$ and any number in the tens range as $x \times 10 + y$. A simple algebraic equation gives the result of multiplying the two numbers together as:

$$1000ax + 100(ay + bx) + 10(by + cx) + cy.$$

The result, therefore, of multiplying any three-digit number by 11 is found, by making both x and y equal to 1, to be:

$$1000a + 100(a + b) + 10(b + c) + c.$$

Expressed as a rule under the Trachtenberg system of multiplication, this is simply "add the neighbour": that is, after imagining 0 before the number to be multiplied by 11, it is simply a matter of adding each successive number to its neighbour on the right.

It is by such rules that the Trachtenberg system of arithmetic does away with conventional multiplication tables and long division. An institute in Zürich has been teaching the system since 1950 to children in the daytime and adults in the evening with, it is said, considerable success in the attainment of both ease and speed. This book, written for adults, describes the system in some detail. It may exasperate those who are already arithmetically competent, intrigue those who have a mathematical turn of mind and help those who loathe, but have to cope with, simple arithmetic.

BOHEMIA AND MORAVIA: *An Architectural Companion.* By Brian Knox. *Faber.* 168 pages + 64 pages of plates. 63s.

This account of the author's travels throughout the length and breadth of Bohemia and Moravia some five years ago is an ideal travelling companion, especially for those with a car who can follow Mr Knox off the beaten track. It should also prove a delight to the armchair traveller interested in that part of the world. It is erudite, both architecturally and historically, but the erudition is lightly worn, and the writing unusually good for a book of this kind. It has excellent sketches and drawings of ground plans, and above all a profusion of splendid photographs. Its only drawback as a guide is that one might hesitate to submit such a beautifully produced book to the hazards of suitcases and the side pockets of cars. But this of course need not worry the armchair traveller.

LETTERS

Defence Under Fire

SIR—In your article of August 11th you state that the current defence thinking of Mr McNamara, the American Secretary of Defence, is criticised from two sides. Some members of the western alliance fear that the stress that is now being placed on conventional arms development may lean towards appeasement, while others assert that such policy may merely provoke the arms race further.

I fear that there is an even greater danger associated with this policy that no computer-minded "whiz kids" can evaluate. This is that a stress on conventional arms may lead to a feeling, both in East and West, of false security. If the conventional forces of the world are fully developed for limited war a trend of thought may develop that since war would not be total then negotiation is not the ultimate step that can be taken. War, whether defensive or aggressive, again becomes a practical possibility.

I would suggest that this belief may soon develop over the Berlin situation when both East and West see that neither side can, or will, step down. There is then an acute danger—either that the East, on the assumption that nuclear weapons would not be used in Europe, may decide to solve the Berlin problem by force; or, more likely, under provocation, the Western allies may abandon patient negotiation and retaliate with force.

The move towards a build-up of conventional arms heightens, not reduces, the danger of war. While both sides live in fear that provocative acts can lead only to a nuclear holocaust then tough negotiation will be considered to be the ultimate solution to international problems; but if it again appears possible to fight without rendering total destruction to both enemy and ally, then the probability of war is substantially increased.—Yours faithfully,

Cardiff PAUL A. V. ELLIS

Medicare

SIR—Your issue of July 14th contained a report on the difficulties encountered in Saskatchewan, Canada, with respect to their government programme for medical care. In the last sentence a most amazing irrelevancy occurs: "And who knows but that American journalists, crowding into Regina to report on chaos and not finding it, may not end by bringing American opinion round to the need for some such reforms as these?" There is no indication in the reporting what the relationship of matters in the United States might be to those in Saskatchewan, nor is there any indication of what it is in the United States which needs "reform."

We do know that in the United States we have had over the past decade a hospital building programme which has greatly increased the availability of hospital care, and we have chosen to expend tax-obtained funds in this significant manner rather than to dissipate them on what can frequently be inconsequential expenditures under certain types of compulsory government programmes. In the same vein, with public funds we have contributed greatly to medical research which, again, can suffer in nations with compulsory medical programmes. In the United States we do not suffer from an out-migration of doctors. Our doctors do not have to have recourse to extraordinary means such as has happened or been threatened in recent years not only in Saskatchewan but in Italy, Austria, France, Japan, the United Kingdom, and perhaps others. Most of our hospital care is on the semi-private or private room level contrasted with ward care provision under certain government programmes.

Generally, the level of our medical care is conceded to be good and to have improved tremendously over the past fifty years.

Over the past quarter century, we have developed a system of private insurance by which people may be protected against the impact of serious medical care costs and this has found broad public acceptance. No such system of private insurance for these purposes has ever existed in any nation with the breadth of coverages available and the diversity of approaches taken as is found in the United States today.

Your man in North America might well elucidate upon just what it is in the United States which needs "reform." Might he not with equal irrelevance ask the question whether journalists from the United Kingdom may not end by bringing opinion in the United Kingdom round to the need for some "reforms"?—Yours sincerely,

J. F. FOLLMANN, JR.
Health Insurance Association of America
New York

The Regional Screen

SIR—Your very fair article about our company deserves a warm tribute, particularly since the facts about regional television companies have been overlooked in the general hue and cry about profits and violence.

You will forgive an immediate correction, however, to the description of the Anglia Television area as "10,000 sq. miles, chiefly of farming country (there is no large conurbation at all)." This is very misleading, and tends to perpetuate the myth that East Anglia is completely rural in character. East Anglia is, in fact, a thriving area in which agriculture plays only a part; at the end of 1961 it employed 13.9 per cent of the working population.

Manufacturing industry is expanding rapidly and now employs more than 33 per cent of the working population. Considerable industrial development is evident throughout the area, and already over half the total population of more than two million live in the eleven major towns, and the tendency to congregate continues.—Yours faithfully,

MICHAEL NORMAN
Norwich Chief Executive, Anglia TV

West Irian

SIR—It would be interesting to know what the Papuan people think of the "agreement" between three non-Papuan governments to hand them over to Indonesia.—Yours faithfully,

D. BARTON
Stalybridge, Cheshire

Katanga

SIR—Your special correspondent in Elisabethville (August 4th) refers to "gross vilification of U Thant for calling the Katanga ministers 'clowns'." Was it not somewhat "gross" for the world number one civil servant to use the language he did about Katangese ministers? One wonders what would have been the Afro-Asian reaction if the Secretary General had spoken thus about any other African politicians—but then, of course, he would not have dared to do so, even from the safe distance of Helsinki.

Incidentally, your correspondent's statement that "Mr Tshombe is in no mood to leave Katanga for some time" was in contrast with the news of the latter's visit to Geneva.—Yours faithfully,

Paris MARTIN CARMICHAEL

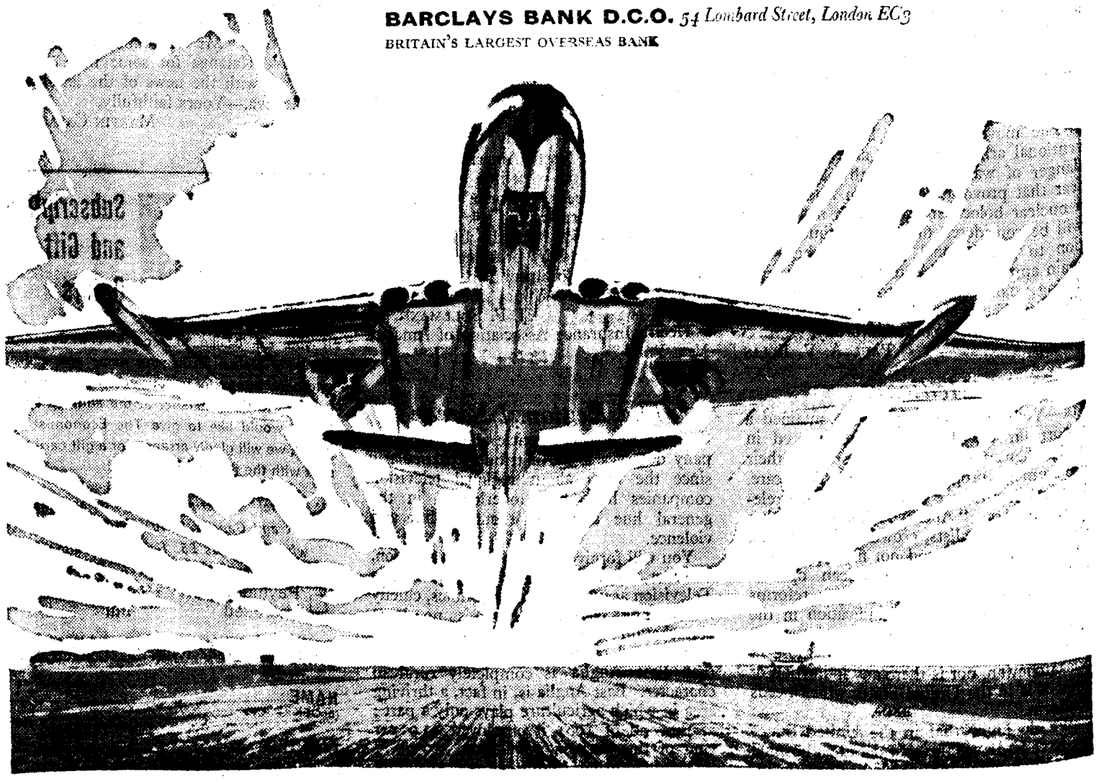
Every 25 minutes... A PLANE LEAVES LONDON FOR A COUNTRY SERVED BY BARCLAYS BANK D.C.O.

To Africa, to the Caribbean, to the Mediterranean fly the planes. Some go direct, some connect with other smaller air lines which carry businessmen, tourists or government officials on to little-known and far-off places.
It will be a small township indeed which does not contain a branch of our bank. From the mines of the Rand to the cocoa trees of Ghana, from the coffee plantations of Kenya to the oil wells of Trinidad the name of 'The D.C.O.' means modern banking service at its best.
All in all we have over 1,250 branches in 41 territories extending over half the width of the world.

BARCLAYS BANK D.C.O. *54 Lombard Street, London EC3*
BRITAIN'S LARGEST OVERSEAS BANK



THE BUSINESS WORLD

Will the Banks Compete?

TUESDAY'S surprise announcement that negotiations are in train for an offer by the National Provincial Bank for the shares of the District Bank heralds England's weightiest bank merger for forty years. Does it also herald a new bout of competitive emulation between the banks in the form they have made peculiarly their own? Just four years ago, also in the midst of the holiday season, the great deposit banks tripped over each other to follow the lead of one of their number into indirect association with hire purchase and to follow the lead of another into more streamlined personal lending. It would be unjust to say that after this momentary stir the banking giants returned to their slumbers; within two years the clearing banks increased their advances by 75 per cent, and the monetary authorities felt impelled to put on the brake again. But one may still feel that the initiatives of 1958 have not been excitingly, or cleverly, followed up.

The banks, indeed, took on their interest in hire purchase; but they pointedly refrained from "interfering" with the "expert" management of their affiliated hire purchase concerns. So they did nothing to avoid the debacle which soon followed. The banks introduced their personal loans and announced intensified efforts for new customers; but they still kept these short of more flexible hours of opening or more competitive rates for deposits. It may be that this built-in inhibition from free experiment and true competition among these institutions, leaving room only for marginal, co-ordinated and sometimes gimmicky innovations, is inextricably linked with the public utility functions which the banks assume they have thrust upon them. If that is the case, then one cannot repeat too often that pressure is bound to increase for the public utility to be taken over formally by the state.

That is a prospect from which bankers, very rightly, still recoil in horror. But it is up to them to give their plainly private and ostensibly competitive form an appropriate substance. This is a challenge both to the commercial bankers themselves and to the Bank of England and it is highlighted in a new form by the prospective merger. Is it designed to bring more competition or less? Since the great banking mergers which culminated at the end of the first world war, the Bank of England and the Treasury have, unofficially, called a halt at the very top, and it has always been assumed that the authorities would step in to prevent a merger among the Big Five themselves—Barclays, the Midland, Lloyds, Westminster and the National Provincial. A merger between the NP and the District (ranking seventh in size) does not directly contravene this unwritten article. It could be regarded, rather, as one of the last moves in completing the nineteenth and early twentieth century consolidation of regional banks in England into large national concentrations. The branch networks of the District and the National Provincial, it is being pointed out, are to a large degree complementary—the National Provincial being weakest in north western England, which is the District's headquarters and main sphere of operation.

There are indeed five other clearing banks below the giant size. But of these the National Bank does most of its business in southern Ireland; Coutts is already a subsidiary of the National Provincial; and Glyn Mills and Williams Deacon's are subsidiaries of the Royal Bank of Scotland. This leaves only Martins, which has its head office in Liverpool and ranks sixth in size at present, as an independent regional entity; and it will now look a distinctly isolated one. Its branch network of 600 offices is still immense by international standards—the largest bank in Germany, the Deutsche Bank, has something over 400 branches—but in England it now looks puny. Even the Westminster, with 1,250 branches, will find itself seriously behind the level of 2,000 or so that all its four rivals will top if the NP-District merger goes through. As the market was quick to notice, both these banks could solve

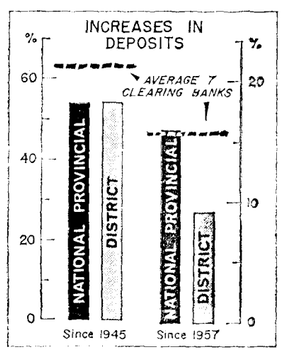
their problem by a merger between themselves ; they already collaborate in their hire purchase holding of 20 per cent each in the equity of Mercantile Credit.

A second merger of this kind is by no means certain. Both the National Provincial and the District have in recent years been more clearly on the defensive than have Westminster and Martins. And just what mergers on this scale can achieve is still far from clear. It is intended at present to leave the District Bank as a separate entity with its own board and head office in Manchester—this was almost the only point of substance to come across in the preliminary announcement, and it may be that some such reassurance is a condition of a "friendly" merger between great banks. But the greater the emphasis on independence, the less must be the scope for meaningful economies of operation—and Scottish experience has shown that these do not come quickly even with a full amalgamation.

The real rationale behind a consolidation of the remaining medium-sized regional banks in England lies in the advantage that can be offered to the customer by the national giant. Those advantages are first, and above all, a national network of branches ; secondly, massive resources sufficient except in rare cases to finance the needs of the largest firms ; thirdly, and increasingly important, an efficient and readily available service of economic information and foreign trade facilities. In the first and the second fields the big clearing banks clearly have the edge over the merchant banks ; in the third, the balance is probably the other way ; and the merchant banks can also offer a more flexible and less bureaucratic service generally. For that reason, they have in recent years made important marginal gains on the clearing banks as a whole. Now the clearing banks' one overriding attraction is size, and to that extent the smaller fry among them are at a clear disadvantage. At the same time, with 500 branches and more, they still constitute a bureaucracy that can never approach the personal merchant banking service. As a result, these middle-sized banks have conspicuously lacked a clear attraction or *raison d'être* of their own.

CONSOLIDATION of the main deposit banking business in England into the hands of the big five and their associates might therefore be justified on the grounds of banking efficiency, and it is unlikely, in itself, to reduce effective competition—it is not, by and large, from the District or Martins that new banking ventures are awaited. The monetary authorities are therefore right to let such mergers through, while remaining watchful lest the giants get an appetite for other giants. Where they are wrong is to let their concern for banking competition stop there. The monetary policeman holds a stern hand against monopoly, but he keeps the rule book for the cartel. The limited extent of competition within the clearing banking system, which has entailed a strictly limited choice for the customer and a consequent transfer of business to institutions such as merchant banks and finance houses, is founded above all on the restrictive agreements on deposits and advances—agreements which the clearing banks could at this stage abandon only with the consent of the Bank of England. Real competition and innovation will come to British banking only when each of the independent giants is and clearly feels free to branch out on its own. While commercial bankers remain frustrated from attempting innovation by the difficulties of getting agreement with other banks, and inhibited by the probable objections from the Bank of England, real competition will be absent—whatever the banking structure.



The other long-term issue in British banking that the new merger highlights is that of the disclosure of profits and asset values. While the banks continue to enjoy their exemption from full disclosure, which the majority of the Jenkins committee indefensibly supported, bank shareholders involved in take-over bids have no objective test, other than that of faith in their directors, on which to judge the terms. In the present case the market is making a broad guess that the share exchange is likely to be one for one, which would give shareholders in the District some 25 per cent of the combined equity, compared with the District's contribution of 22 per cent of published profits. But published profits are a guide only to the direction of movement in profits in any one year, not to their magnitude ; and it is not possible to put great faith in even the most painstaking of estimates of true profits which the outsider can make.

The one influence which would undoubtedly induce the banks to show more of their own true figures themselves would be, of course, a counter-bid. The likelihood of this is not very great, but a number of people in the City this week have been toying happily with the possibilities. The professional bidders, one has long reckoned, are ruled right out of the Bank of England court: whatever the potentialities of the offices of the District Bank as supermarkets it is as banks that they are likely to remain. What of institutions at the fringe of deposit banking, such as Lombard Banking, or, at another end of the scale, Hambros ? However dearly they might like the District, and its inner reserves, the awkward fact is that they would be dwarfed by it.

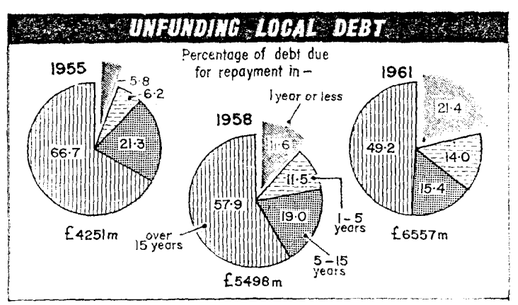
Another possible source of interest, which may become more active in years to come, might be a big bank on the Continent. Probably the only practicable way to establish a direct interest in deposit banking in a foreign country is to purchase an established organisation ; but here again the District is very likely too large—and, as in all these possibilities, the project might never pass the Bank. The London clearing banks are so large and so close to the official sphere that changes of ownership may be possible only within the ken. The only real likelihood of a struggle in the near future would be if a bank other than the Westminster bid for Martins. As it is, the NP-District merger is likely to go through quietly and shareholders will have to take what their boards recommend. But indirectly, competition in banking may be stirred. Is this what the market had in mind when it not only bid up the shares of the District quite sharply but also bid the shares of the prospective bidder, the National Provincial, up and not down, on the news of its intended offer ?

Local Finance—A New Choice

BY the end of September, it is hoped, private discussions between the Treasury and local authority representatives on the shape and future of local authority borrowing should be finished and the recommendations of the committee on their way to the Chancellor of the Exchequer. Tentative agreement seems to have been reached on three basic proposals. First, that the Local Government (Scotland) Act of 1947, which puts a limit on temporary borrowing by Scottish authorities of 15 per cent of total borrowing for capital purposes, should be extended to local authorities in England and Wales, giving them six months in which to conform ; secondly, that the Public Works Loan Board should be re-opened to all borrowers, thus ending the rule set up in 1955 that they must first have tested in the open market their ability to raise money on reasonable terms ; and thirdly, that PWLB rates should be pitched more in line with prevailing gilt-edged rates—in effect, about ¼ per cent below the rate for mortgages of equivalent periods in the London market. The committee could have second thoughts ; and it is for the Chancellor to accept its recommendations. But if the findings follow the forecast, they would provide a sensible solution to the difficult problem, both for the government and for the local authorities, of the remarkably increased dependence of these authorities on short-term debt in the last seven years. Debt maturing in less than one year grew from 5.8 per cent of total debt to 21.4 per cent at March 31, 1961—the latest available figure—and in these percentages temporary borrowing on deposit receipt and bank overdraft increased from 4 per cent to 15.4 per cent.

In 1955 all but the smallest authorities were made to rely on the open market for their funds, and the job of the local treasurer was transformed overnight. Loans from the PWLB were generally tied to the period of the Treasury's loan sanction ; now the treasurers could manœuvre their debt structure in any way they thought fit. And with the rapid rise in interest rates that followed in 1956 and 1957 most treasurers took the view that money rates were more likely to fall than to rise and therefore borrowed short in the hope of funding at a more favourable rate later on. Unfortunately, rates did not fall, and the higher they went the more the treasurers were convinced that they would fall. The result was a rapid increase in short-term debt.

To meet the money demands of the local authorities an existing market, doing a relatively small business in local authority mortgage loans, suddenly blossomed into a large and extremely efficient market. It became a parallel market to the traditional money market of the banks and discount houses, but offered much higher rates of interest with equal security, since the PWLB stood behind the local authorities as lender of last resort, in the same way as the Bank of England had long stood behind the discount market. In temporary money alone this market is currently providing the local authorities with something over £1,000 million and the daily turnover amounts to between £10 million and £20 million, about a fifth of turnover in Lombard Street. But nearly all Lombard Street's money is at call, whereas temporary loans to local authorities range all the way to loans of a year less a day, with perhaps only one-third of them truly short at seven days or less.



The local authorities were pushed into the open market in 1955 because the monetary authorities wanted greater control over bank liquidity. This could be achieved only by close control of the Treasury bill issue, which could be frustrated by the PWLB drawing funds from the Exchequer. The Treasury achieved its control of bank liquidity, but at the expense of a sharp rise in the liquidity of local authority debt. In 1959 the Radcliffe report came out firmly against this policy, pointing out that the "unfunding" of local debt ran "clean contrary" to the funding policy of the monetary authorities. The report recommended that local authorities should have the choice of borrowing either in the open market or at the PWLB "at the current gilt-edged rate." These recommendations are very much in line with those that the present committee looks like making. At the time the monetary authorities did not accept the Radcliffe recommendations, taking the view that the gilt-edged market's appetite was so poor that any return to Exchequer borrowing by the local authorities could only have been financed by an increase in the Treasury bill issue, with a consequent loss of control over the liquidity of the clearing banks.

THE situation is now very different. When the Radcliffe committee examined the temporary borrowing of the local authorities in 1958, it found no more than £488 million outstanding, or 11 per cent of their total debt. By March 31, 1961, temporary borrowing had more than doubled to £1,009 million, and in the nine months to the end of 1961 it probably increased by something like a further £280 million. The size of this debt is a potential threat to any attempts the authorities might make to squeeze spending. And the banks have been quick to point out that when, during the recent credit squeeze, they cut local authority overdrafts, the local treasurers merely replaced this money by turning to the London loan market. Equally there is every indication that the monetary authorities would like to see a further fall in interest rates without necessarily having to rely on Bank rate alone to achieve it. High rates in the local authority money market are tending to keep other rates up. So the dilemma is exposed. Allow competition for money and rates go up ; feed money on demand, and control is endan-

gered. Seven years' experience of the results of competition being unwelcome in its side effects, at least to the authorities, the committee is suggesting that the PWLB should change its role. Since 1955 the PWLB's policy has been to follow the market, fixing its rates at those which a local authority of good standing would have to pay in the market. Many treasurers have argued that on occasions this in itself has tended to keep rates unnecessarily high. It now seems that the PWLB will keep its rates in line with current gilt-edged rates and thereby force down market rates by ¼ per cent or so.

These objectives of limiting the short-term debt of local authorities and reducing rates without upsetting the balance in other sectors of the economy have become possible only because of the current strength of the gilt-edged market. The monetary authorities might be able to finance the increased lending of the PWLB without necessarily increasing the Treasury bill issue, or they could argue that at the moment an increase in bank liquidity through bigger Treasury bill offerings might not be unwelcome. Many local treasurers have been shrewd enough to foresee the possibility that their borrowing activities would come under review and to sense that one likely outcome might be the extension of the 15 per cent rule to all authorities. As a result, 1962 has seen some substantial local funding, gathering pace as the months have passed. The PWLB in fact has already increased its lending. In the four months from the beginning of April this year it lent £13.5 million compared with only £3.9 million in the same period of 1961. Local treasurers have also fallen in with the official wish to put out more stock issues in a receptive market at rates which previously they might have preferred to escape. So far this year, new stock issues by local authorities, apart from refundings, have amounted to £103 millions. Most of these issues have been of around a ten-year life, compared with fifteen to twenty years in earlier issues. The monetary authorities have evidently had to make some concessions on terms to get the queue moving.

Local treasurers have also been carrying out funding operations in the London loan market. Many of them have been stabilising their short-term debt by reducing the amounts held at seven days or less in favour of three, six, and nine months loans. Very big business has also been done in five-year escalator mortgages which give the lender the right of withdrawal at three months' notice, but carry a rate of interest that increases as the loan remains with the authority. The average rate on these mortgages held to maturity works out at 6⅜ per cent, about ⅜ per cent below the rate for an ordinary five-year mortgage. One big lender, thought to be one of the major oil companies, led the way in providing the money for such funding operations, and some smaller industrial companies have followed.

SINCE the temporary debt of all authorities, at the time of the last count in March, 1961, was no more than 15.4 per cent, it might appear that these new measures, if they are introduced, will do little more than check the future growth of short-term borrowing rather than actually reduce it. What happens will partly depend on the reactions of the smaller authorities, which, as Table II shows, have kept their short-term debt well below the 15 per cent mark.

It is the big authorities in England and Wales that would be affected by a 15 per cent limit. On March 31, 1961, their temporary debt exceeded 15 per cent of total debt outstanding by £127 million. In the following year the total undoubtedly rose, but since March this year funding by these authorities has probably reduced their temporary borrowing to about the level of March, 1961. Within these groups, however, there are individual authorities whose temporary borrowing is above 30 per cent; earlier this year Mr. H. R. Page, City Treasurer of Manchester, revealed that he knew of at least two cities whose temporary debt had reached 50 per cent of total debt.

It is not clear on what basis a more receptive PWLB would accept customers, but possibly with only six months for the authorities to put their houses in order, it seems likely that the first customers would be those authorities with temporary debt over the 15 per cent mark. This could mean that those who have been remiss in the past might come off best, enjoying the PWLB's new rates of interest. This, however, would depend on how the PWLB carried out its task; it could force these authorities to borrow for long periods. In fact the number of treasurers who will call on the board will depend on how far it changes its methods of operation. If it continued to tie its loans to the period of loan sanctions, many local treasurers might still decide to stay in the more flexible open market. Although the board may offer lower rates than the mortgage market, treasurers may not feel like paying them for, say, fifteen years or more. Local treasurers have got used to being able to shape their debt and by direct advertising have usefully drawn on new local sources of mortgage finance, which they will presumably keep.

The effect of these proposed measures on the London short loan market will depend on how successful the PWLB is in its lending operations. Certainly the amount of business the market handles is likely to fall; rates of interest may become fractionally lower and a limit on temporary borrowing by local authorities will put an automatic brake on the continued growth of the London market. This, with marginally lower rates, would probably mean that the Euro-dollar market would become less active, and some foreign money might leave London. If the monetary authorities accept these new proposals, they must not allow the PWLB to become so active that it becomes a soft option for local treasurers. But if, as seems probable, the committee has reached a sensible compromise between the PWLB and the open market, the Chancellor will no doubt consider that he has been well advised.

TABLE I

BUSINESS NOTES

IN THE MARKETS

Light in August?

BY the middle of this week the rise in Wall Street, the strong advance in London and a sharp recovery in German share prices were reflected in a better tone in other Continental bourses, though here investors appear to be behaving rather more cautiously than in the major centres. The swing in sentiment in the London equity markets is just as remarkable as that which has occurred in Germany and it is just as hard to pinpoint the reasons for it here as there. The market has remained thin and the jobbers have been quick to mark prices up; but there has been a steady stream of buying orders from institutional and private investors alike. The turn might be dated from the moment that the newly formed Equity Income Trust, whose object is to invest in high-yielding equities, came into the market to buy. But this does not explain why other investors followed suit and in such a way as to push *The Economist* indicator up by 18.9 points to 336.5 and the *Financial Times* ordinary index up by 19 points to 283.6 by the close on Wednesday. These two indicators are now 8¼ per cent and 12¼ per cent respectively above the low points they touched late in June.

Nothing has happened in the domestic economy to trigger off such a strong recovery, though investors might be prepared to rationalise their actions by arguing that the Government cannot delay any attempts to stimulate the economy much longer. Recently reported profits and dividends have been just a little more encouraging than company statements were a few months ago, and some sectors of the market have been affected by take-over bids. But in themselves these factors are not sufficiently strong to account for the change in mood. The key to this appears to lie in the behaviour of Wall Street where equity prices have crossed the 600 barrier. Fears of a recession in the American economy may be fading; but there is still a good deal of uneasiness about the rate of economic growth that can be achieved. Higher profits will still be difficult to earn both in the United States and in this country and it is clear that in both stock markets investors should continue to keep a tight rein on their optimism. The sharpness of the rally itself is a little frightening—even though it may reflect the repercussive effects of the short-term capital gains tax on semi-professional dealings. Sentiment could again reverse itself and a broad, solid advance can be based only on selective and cautious buying. In looking at equities in August, investors would be foolish to ignore the lessons they were so painfully taught in May and June.

Since then gilt-edged prices have risen and interest rates have fallen. This can be said to provide some justification for a fresh look at equities so long as the income comparisons are kept firmly in mind and not ignored in a scramble for growth in earnings (which might not in any case materialise sufficiently strongly to justify the purchase of stocks which already offer very low dividend yields). Plainly some investors are keeping their heads, for the volume of trading in equities has not widened dramatically. The gilt-edged market, where the new issues by Plymouth and Southampton were oversubscribed nearly three times, has risen strongly. The advance was particularly sharp on Thursday morning, when there was fresh evidence that investors were going longer. Thursday noon again passed without any change in Bank rate or special deposits, but the actions of investors in the gilt-edged market show that they are confident about the direction in which monetary policy is being guided.

Breakthrough on Wall Street

A correspondent cables:

ALTHOUGH President Kennedy deferred action on taxes, Wall Street was prepared for the news and greeted his statement with a new rally that carried the Dow Jones industrial average up close to 607 on Wednesday. This is the highest point in this summer's rally. An improvement in business conditions and the promise of a tax cut that will become effective in January are responsible for the brightening of sentiment in the market. For the first time in weeks brokers have reported a renewal of interest in equities. But caution is still in the air and trading has been concentrated upon the bigger and better known companies with good earnings yields and solid finances; stocks of smaller stature have been ignored. The crossing of the 600 barrier is considered to be significant even by those who are not wedded to technical theories, because the market showed no signs of any desire to liquidate holdings at this level.

There is still however a good deal of pessimism about the longer-term outlook for business and this may check any really rapid rise in prices. From now on corporate earnings will be compared with the good company results achieved last year and if they make a comparatively poor showing the rally in prices could be checked and there might even be the danger of a relapse. Republic Steel, which is always regarded as a bellwether in industry because it tends to formulate its dividend policy on future rather than current earnings, is rumoured, for instance, to be contemplating a reduction in its dividend though it may hold off another quarter before it actually does so. There is, in fact, little prospect that the corporations will be as generous in dividends as they were earlier and this will prompt investors to look for safe yields.

GERMANY

Gloom from the Bundesbank

A RALLY in German share markets was to be expected after their extensive recent falls, to not much over half the levels of two years ago, but the rally is oddly timed. It coincides with some particularly gloomy prognostications in the monthly report of the Bundesbank. Economic expansion, the German central bank concedes, is by no means at an end, and indeed has recently accelerated—industrial

production in the second quarter was nearly 5 per cent up on the year, compared with an annual increase of 1¾ per cent in the first quarter. But what worries the Bundesbank is that this recent quickening in activity rests not on new underlying expansionary forces but partly on the after effects of the boom of 1959-61.

Demand in recent months has been particularly fortified by a strong rise in personal consumption, which the Bundesbank does not regard as an independent self-sustaining expansionary force in the long run. And the two such forces that have stood behind the long German boom—exports and investment—have now lost much of their impetus. German competitiveness has been strongly undermined by the relative rise in German costs—the Bundesbank puts the wage level in German industry in February at 25 per cent above February, 1960, compared with corresponding increases of 16 per cent in France, 9 per cent in Britain, and under 5 per cent in the United States. This has led to a loss of ground by German firms not only in export markets but within Germany itself: in the first half of 1962 German imports rose by a further 16½ per cent by volume.

THE MARKET RALLY

	Jan. 3	May 29	May 30	Aug. 7	Aug. 15

Investment, meanwhile, is still rising, as previous projects are completed. But the "introduction of new investments" is falling back, with visible effects on order books in the capital goods industries. In the machine industry domestic orders in the second quarter were 9 per cent down on the year by value and 14 per cent by volume. The Bundesbank sees a clear connection between this setback and the decline in profit margins—and this year in profit totals—which in Germany are mainly the result not of any widespread underutilisation of capacity but of acceptance of orders at very small profit margins or even at a loss. The squeeze on profits not only makes new investment less attractive, it also reduces the internal funds available to finance it—at the same time as the sharp setback in share markets has increased the difficulty of market financing. As a way out of this impasse the Bundesbank has little to offer other than an appeal for restraint in wage demands. It sees the cost-price spiral at the root of the difficulty and, despite its concern about the weakening of the old forces of expansion, it still feels moved to oppose an expansionary fiscal policy.

DEFENCE PRODUCTION

Swings and Roundabouts

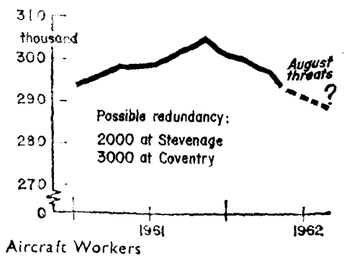
ALTHOUGH the 2,000 men at Stevenage threatened with redundancy can hardly be expected to see it as such, the *coup de grace* that Mr Thorneycroft gave to the British Aircraft Corporation's Blue Water missile last week could be one of the most encouraging developments in the defence industries since Mr Sandys's famous declaration of policy in 1957 that put this country into the missile business. The health of the defence industries here and in the United States has been constantly threatened by the fact that the incredibly intricate armament of the deterrent costs too much to build in quantity. A superhuman effort in research and development results in a ludicrously and unhealthily small production run. Blue Streak would have been such a weapon; so was Blue Water, and so is the TSR 2 aircraft scheduled to replace the Canberra. If the RAF complains five years from now that the unit costs of TSR 2 are so high that it cannot be bought in useful quantities, a lot of people inside the Ministry of Defence will say "I told you so."

But by cancelling Blue Water with £21 million spent and a further sum due in compensation to the makers, Mr Thorneycroft is doing much more than produce a net saving of £50 million in the defence budget. He is taking this country right out of the big rocket business and putting it firmly back into the small. Whatever rocketry has to contribute to the economy in terms of new skills, new materials and new products, can just as well be learnt making these as their big brothers. And the switch to the relatively cheaper arms of conventional warfare brings with it the prospect of a return to more economic production runs, if only because these smaller weapons are of no use unless they are available in large numbers in the field.

Who Gains?

WHEN he announced the death of Blue Water, the Minister of Defence brought forward several new orders that were in the pipeline, three new missiles, two sizeable Army vehicles, more long-range troop transports and another nuclear submarine. Two of the missiles will be built by the British Aircraft Corporation; but as the company was already expecting the orders, they will make little difference to the threatened redundancy in its Stevenage factories. The more elaborate of the two Army vehicles has been designed by Alvis, which has had to contend for several years with the fact that the Army did not have the money to spend on this kind of equipment; the other will be divided between Guest, Keen and Nettlefolds and the Royal Ordnance Factories. BAC and Shorts in Belfast will between them build the six extra VC 10 troop transports ordered for the RAF—but if the Government thinks that this can solve unemployment at Shorts it has underrated the size of the problem. The third rocket, for the Navy, will be built by Hawker Siddeley, which has recently been given firm production orders for its vertical take-off fighter that brought cheer not only to the Hawker factories but also to the engine works of Bristol Siddeley. Other orders, for a short-range and possibly also a long-range freighter, are expected.

In spite of this, and an encouraging lift in civil aircraft business, nearly 5,000 men



Aircraft Workers

are almost certain to lose their jobs in coming months, and in the long term perhaps as many as 50,000 will leave the aircraft industry. This prospect has been before the industry for nearly three years; the forseeable volume of military and civil work cannot support the present labour force which began to decline this year and might be expected to continue to do so at an accelerating rate. The industry says that it would have acted more quickly to cut down staff and disband its design teams if only the Government had given a plain indication of what kind of weapons it intends to buy in the future. Well, the writing is on the wall with a vengeance now.

EXCHANGES

£250 a Trip, and More

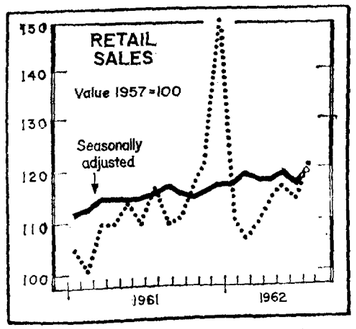
IT is splendid that Britain should continue to dismantle its remaining foreign exchange controls. The process, however, seems to be getting a little lopsided. British tourists may now obtain £250 of foreign exchange or travellers' cheques for each journey, as against the previous limit of £250 a year; and what is more the transaction is no longer being recorded in their passports. Since 1959 any person wishing to take more than £250 out of the country within a year had first to get the Bank of England's permission; if the extra money was needed for genuine travel, permission was more or less automatic. Under the new dispensation, personal currency allocations are still limited to current spending on travel. The law here is unchanged; but the policeman is withdrawn. And without the passport control anyone who wants to buy that villa in Spain need only make a round of banks and travel agents, changing £250 at each to get the money. Yet should the foreign exchange be needed to build a factory in Spain or anywhere else outside the sterling area, it is still necessary to pass the Treasury's stringent scrutiny, imposed in July, 1961, which demands that the investment should clearly be of benefit to Britain's balance of payments in the short-term.

Both the gold market and the exchanges have been very quiet this week. The price of gold on the London market has eased slightly this week from $35.13 to $35.12½ an ounce on a fairly low turnover. The flurry at the close of last week which looked like upsetting the relative calm introduced into the market by President Kennedy's Telstar message proved to be no more than a very minor burst of activity. Sterling has been steady at $2.80½ throughout the week and it is believed that the Exchange Account took in small amounts of dollars at that price. The dollar is still maintaining headway on the Continent and the more conservative bankers appear to have been reassured by the "no tax cut this year" announcement from the White House. Dollars are wanted in Germany, Switzerland, and Holland where the rates against the dollar are DM 3.9958, Sw.fr. 4.320, and 3.6062 guilders respectively, but in France and Italy the dollar is still at its support point.

RETAIL TRADE

Busier July?

RETAIL trade may have improved a little in July. The Board of Trade's provisional estimates put its index of seasonally adjusted sales at 119-120 (1957=100) compared with 118 in June and 119 in



May. The rise may, however, do no more than compensate for the dip in June and put turnover back on its May level, about 1½ per cent above the level in March and April. So far the Board has not produced its estimate of the volume of trade in July: until June, the rise in the prices of goods sold in shops accounted for any increase in the value of sales, and the volume of business in the second quarter of the year was slightly less than twelve months before and only 1 per cent more than in the first quarter of 1960.

Household durables do not seem to have accounted for any of the increase in July. The sharp increase in refrigerator sales in June, when the area electricity boards sold 48 per cent more and makers delivered 11 per cent more to the shops than a year before, seems to have owed more to the weather than to the cut in the hire purchase deposit, and has not, it seems, been maintained in July; and the rise in washing machine sales has not been spectacular, though it is as usual rather more stable. Retailers find that the effect of the cut in the deposit is that more buyers are choosing to take appliances on hire purchase, and more of these are going for long terms, but that total sales are rising little. Television sets, even though Pilkington has settled uncertainty about line standards, remain obstinately difficult to sell, and there seems to have been no increase in sales though more are being taken on hire purchase. As this is the only appliance that can be made obsolete, if the government will help, its future is one of especial interest to the trade; for the other appliances, it can only expect a rather stable level of business, but television sets might, it hoped, prove a recovery stock.

OIL

Pence and Octane

A CUT in the price of regular grade petrol in a market where even the ordinary motorist has been persuaded that a premium grade pays him, and where oil and motor companies have co-operated in raising the compression ratios of family cars to a level where there is some truth in this, may not mean much. But there are numerous commercial users that buy from the pump, such as firms running vans and fleets of travellers, who will benefit from this week's penny a gallon cut in regular grade prices, and from the slight increase in octane ratings that has occurred at the same time. Esso, which initiated the cut that the other major marketers have followed, also sells a mixture grade in between regular grade and the premium grades sold by all the companies; it has cut the price of this by ¼d. a gallon, and says that the quality has been made "comparable with Jet's 93-octane grade." And its cut in prices sliced a little off the dealers' standard profit margin on these grades, while increasing quantity rebates; whatever its estimates of the future of regular grades, it clearly hopes to encourage larger sales of mixture. These sales, if they increase more than the general growth of consumption, could only be at the cost of the majors' more expensive premium grades—including Esso's own Extra.

For Esso is not offering mixture at anything like "a comparable price" to Jet's 93-octane, which sells for 4s. 3d. a gallon against the 4s. 7d. to which the Esso mixture has been cut. It is with the narrowing of the margin between the mixture and the generally available premium grades that the company may hope to gain some sales from motorists who don't want to pink along on regular, but are attracted by the 4½d. a gallon they could save by switching from the main premium grades. Having four grades as against three—which involves it in some extra cost in distribution and means it can get full representation only on sites with tankage for four separate grades—gives Esso a degree of flexibility without actual price-cutting that majors selling only three grades lack. But if mixture should begin to bite into the growth of sales of premium grades, the other majors in their turn could shift their octane ratings; even possibly giving up the lowest-octane grade (which Jet has never bothered to offer) or introducing some new combination of octane rating and price in place of the existing premium grades.

BURMAH OIL—LOBITOS

East and West

IF the actions of the Lobitos directors a fortnight ago were designed to ensure the best price possible from the numerous bidders who were rumoured to be interested in the company they have amply succeeded. Their proposals for a one-for-one scrip issue and their forecast of a substantially higher dividend had helped to establish a more realistic price for the shares, which rose to 22s. 6d. ahead of the bid from Burmah Oil. With Burmah standing at 38s. 3d. the bid of four £1 shares for every five Lobitos 5s. shares values the shares at 30s. 7½d., and in terms of income Lobitos shareholders are offered more than a third above the dividend forecast for this year and double what they received for 1961. It is not surprising that the Lobitos directors have decided to accept this distinctly generous offer themselves and recommend acceptance to other shareholders. But it should be noted that while Lobitos contributes nearly 15 per cent of combined equity earnings, its shareholders will receive 12½ per cent of the combined capital. There are the inevitable reports of counter-bids; none has come and perhaps none will.

The acquisition of Lobitos fits in with Burmah Oil's policy of diversifying its interests outside India, Burmah and Pakistan for Lobitos trades mainly in Peru and has a substantial stake in Anglo-Ecuadorian Oilfields. They both have interests in Canada where Burmah, in association with Murphy Corporation, has been prospecting, while Lobitos has oil and natural gas producing subsidiaries there and owns exploration rights in the Arctic. But it is in the field of specially blended oils that Lobitos has made its mark in this

country, particularly since the acquisition of Manchester Oil Refinery and Dussek Brothers. It has a small refinery at Ellesmere Port specialising in white oils and transformer oils, with a throughput of 200,000 tons a year. With Burmah's trading continually beset by political pressures the acquisition represents not only a further step towards diversification; it also provides a modest opening, over a narrow band of products, in the British market. Its big investments in BP and "Shell" Transport give an assurance to Lobitos shareholders that the price of Burmah Oil shares, which is almost covered by the value of its investments alone, should not fall much below the current level.

Twenty Years On

BURMAH OIL shareholders have shown a realistic disregard for this week's decision in the Scottish Court of Session—sixty million pounds is meaningless before you get it, and although Lord Kilbrandon has found for the company in this claim for compensation for "scorched earth" destruction in Burma in the 1942 retreat, his decision is bound to be taken higher by the Lord Advocate. The Court has declared merely that Burmah Oil's subsidiaries are entitled to compensation (they have, one gathers, received some *ex gratia* payments already) and even if this principle was confirmed by the higher Courts, the argument would then focus on the size of the compensation—on which Lord Kilbrandon observed that one factor could well be the battle of the Sittang River and its consequences—"at the time of the destruction the assets were doomed to fall into enemy hands."

Much has been made in the hearings of a letter written to the company by a Deputy Treasury Solicitor (whose signature was undecipherable) which declared that the claim was wholly unfounded in law and likely to be rejected by the Courts. This was brash enough—direct communication with "the other side" and speaking (as it turned out wrongly) as to the Court's view. But it proceeded:

> Her Majesty's Government are moreover satisfied that the claim made is not in any event one which ought to be met by the British taxpayer. Her Majesty's Government have accordingly decided that, in the unlikely event of your company succeeding, legislation would be introduced to indemnify the Crown and its officers, servants and agents against your company's claim.

This threatened the use of the overriding power of Parliament to defeat an award made by the Courts following from a subject's right to sue the Crown. "The use of the word 'ought' in this context appears to indicate that in the view of Her Majesty's Government there is some moral principle involved in their claim to indemnity which must override the common law of Scotland and the notions of justice of our forebears." Lord Kilbrandon, in studied moderation, made the further point that the Crown, like everyone else, could apply to Parliament for special privileges by way of legislation. A layman can only think that it was bad manners and bad law to suggest that, if this extreme was reached, the outcome would rest with the executive rather than with Parliament.

CIGARETTES

Is it a War?

THE introduction, by Wills, of "Embassy," a cigarette which is to be sold with gift coupons, could mark the beginning of another "coupon war." Up to 1956, one of the few things held sacred in this hotly competitive market was the agreement between manufacturers not to issue gift coupons with their products. In its evidence before the Monopolies Commission, Wills's parent, Imperial Tobacco, expressed its disapproval of gift coupons and its great unwillingness ever again to issue them. Yet only a year later it is abandoning this stand to launch cigarettes whose "quality . . . is matched by the outstanding choice of gifts to be offered."

The new cigarettes are aimed directly at Kensitas, whose success with coupons has, over the last six years, been a painful (for other manufacturers) feature of the market. In 1956, Kensitas was losing about a quarter of a million pounds a year. It introduced its gift coupon scheme when the Tobacco Trades Association, under whose auspices the agreement banning gift coupons was made, was killed by the Restrictive Practices Act. Skilful promotion has made the scheme a success, and the loss has been turned into a £2¼ million profit. Other schemes have not had comparable success: Ardath was offering gifts when it was acquired by Imperial Tobacco but has never been pushed hard; Carreras revived a prewar brand, Black Cat, for a trial but abandoned it. Kensitas, now owned by Gallaher, has taken advantage of this lack of opposition to increase its share of the cigarette market to 5 per cent. But this success is its own greatest threat—it cannot be ignored. At the height of the coupon war in the thirties, manufacturers found themselves selling not cigarettes but pots and pans, and so attractively that several suffered serious losses before the practice was stopped by agreement. Imperial Tobacco will certainly not want those conditions to return, but it is forced to take the risk. Of the other manufacturers, Carreras has no plans for a coupon cigarette, but it too may find itself involved, willy nilly; and Philip Morris is to try a novel variation by giving a 1d. football coupon away with every 10 cigarettes.

Coupon schemes are inherently attractive to manufacturers. Wix, then manufacturers of Kensitas, told the Monopolies Commission that it regarded coupon trading as a form of advertising, with the advantage that costs varied directly with turnover. They encourage brand loyalty which spreads as families and friends join in. However, they are regarded as so dangerous that they may be limited by tacit agreement to tactical, rather than strategic, uses only—to gain a share of the Kensitas 5 per cent, or at any rate to check its further growth.

FRENCH PRICES

Steel Up

Paris

FOLLOWING pressure by producers since the beginning of the year, the French government finally last week agreed to an increase in steel prices. The rise averages 4½ per cent; but in a few weeks steel will go up again to take into account a 3 per cent rise in coke prices which was authorised at the same time, and the final effect will be a rise of nearly 5 per cent. The rises allowed vary greatly from product to product. They are nil for some products (tinplate, castings), and small for car body sheet, but are of the order of 6 to 6½ per cent for heavy sections, and for semis such as rolled bars. Steel producers will now be able to resume the investment programme that they have held up for some months, but they will not be able to make up the time lost in carrying out the plan to re-equip their industry by 1965.

This increase in French prices will bring the cost of Lorraine steel up to the level of local prices in the Ruhr (even a little higher in the case of open hearth steel). So German steel producers will no longer be able to complain about the artificially low level of French prices. This should bring back to normal under the ECSC rules the practice of "alignment down" to the lowest offer, which should only come into play in exceptional cases. This should restore some stability into the steel market of the Six. Large-scale users of French steel such as the manufacturers of cars, domestic electrical equipment, containers, will hardly feel the effect on their production costs and—because of stiff competitive conditions—will be unable to pass anything on in their selling prices.

Oil Down

THE French government's decision on steel prices is a sign that in its view the claims of investment in the steel industry finally outweigh fears of a general price spiral, which might be accentuated by the rise in steel. But the decision to increase steel prices has been accompanied by a reduction in fuel oil prices.

Scheduled prices for fuel oil prices, will indeed, be reduced by 2.3 to 3.5 per cent according to category. Even in France petroleum distributors do not always adhere to their schedules, granting re-

What kind of confection is **that?**

Your young customer from New Zealand is, of course, having a little joke. He's talking about a popular tourist attraction near Alexandra—a place at home we know very well. Still, if it comes to that, we know a great many places in New Zealand very well—and a great deal about each place, too. Not only that, we have an intimate knowledge of our country's past history, present progress—and a shrewd idea of its future hopes and prospects to boot. Indeed, almost anything worth knowing about New Zealand is known to us; for we are the National Bank of New Zealand and such knowledge is our business. So if the time ever comes when you have a question to ask concerning New Zealand, ask us—

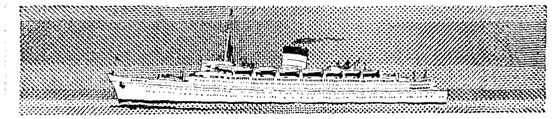
CUNARD

This winter sail South into SUNSHINE in 'Caronia'



BARBADOS, JAMAICA, BAHAMAS, FLORIDA, NEW YORK—
THEN ON ROUND THE WORLD IF YOU LIKE

'Caronia', largest liner built exclusively for cruising, leaves Liverpool on January 5th and sets a sunshine course for New York via Barbados, Jamaica, the Bahamas and Florida. If your time is limited you can return to U.K. from Nassau (Bahamas) or Miami (Florida) by Cunard Eagle Boeing jet. 'Caronia's' cruise through smooth sunlit waters to the West Indies and New York is a brilliant curtain raiser to her annual World Cruise, starting from New York on January 25th.

THE WORLD CRUISE

This is a luxury voyage of 92 days, covering 30,000 miles with calls at 23 of the world's loveliest and most historic ports. You travel in air-conditioned luxury, superbly fed, attentively served and brilliantly entertained. Booking for the World Cruise from Britain or Europe, and disembarking at Naples or Lisbon, entitles you to (1) free transport in 'Caronia' (via the West Indies and Florida) to New York, (2) free accommodation on board in New York until the cruise begins, or (3) free transport to New York by any other convenient Cunard sailing, (4) free travel to your starting point in Britain or Europe by rail or air from Naples or Lisbon.

'CARINTHIA' TO BERMUDA

On January 25th, this fast, modern ship leaves Liverpool and, after a call at Cobh, heads sunwards for Bermuda, then on to New York. Her sister ship 'Sylvania' will operate monthly services in the return direction during February, March and April. Remember, too, that Cunard Eagle Airways operate regular jet services from Bermuda direct to London.

Consult your local travel agent or Cunard Line, Cunard Building, Liverpool, 3 (Liverpool CENtral 9201); 15 Lower Regent Street, London, S.W.1 (Whitehall 7890); 88 Leadenhall Street, London, E.C.3 (AVEnue 3010).

bates for "loyalty," for quantity, or just to get new business. Though discounting has become fairly general, list prices have remained standing; to reduce these would have meant extending the reductions to all customers. For two years, in theory, the government has limited the authorised rebate to 5 per cent; it has now done away with this platonic restriction in exchange for a small reduction in the oil companies' list prices. The only bodies to benefit from this operation will be the nationalised electricity and railway companies, whose status as public undertakings has precluded them (and them alone) from soliciting or accepting rebates of more than 5 per cent.

What about the balance of French prices in general? The index for 179 articles which constitutes one of the barometers of the cost of living in France is approaching a point beyond which it would set off the moving scale of minimum salaries, and the index of industrial production is progressing only slowly and did not rise at all between May and June. However, pressure on the labour market has gone on increasing; thanks to immigration from southern Europe, it has begun to ease and has checked the upward trend of salaries. Moreover, imports and overproduction of consumer goods are exerting a downward pressure on retail prices. Finally, and most important, the price trend of foodstuffs which has been rising dangerously during past months has gone into reverse as the new crops have come on to the market.

NEW CARS

The Big Baby

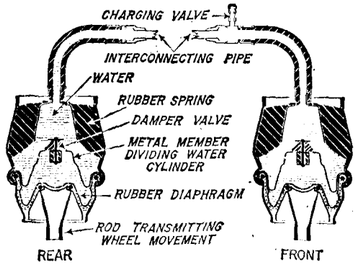
THE Morris 1100 is a small car that competes with medium-sized cars. With body space comparable to that of cars like the Vauxhall Victor, Ford Classic and Hillman Minx and Super Minx, and a performance that is little inferior to any but the Super Minx, its price range of from £661 for the standard two-door model to £695 for the four-door de luxe version should attract many buyers from these bigger cars. For all of them cost more, ranging from £702 for the Hillman Minx and standard Vauxhall Victor to £805 for the Super Minx. The Anglia, Herald, Austin A40 and the veteran Minor—the last two of which are rather closer in price to the new car than one might have expected BMC to leave them—are also likely to feel its competition.

The use of the Mini principle of a transversely mounted engine—in essence the same engine, as well as many other mechanical parts—is what allows the 1100 to offer a more usable car for the money. Though its weight of 16½ cwt is not low for a car 12 ft 2 in long, it is some 2-3 cwt less than that of existing conventional cars with the same body space. And using the same basic engine and transmission unit as the Mini—it is identical to that of the Cooper except for the cylinder bore—means that an engine output of 10,000 a week can be planned. The same volume goes for other common parts, like suspension arms; the only major differences between the mechanical parts of the Mini and the 1100, apart from the actual springs, are that the front drive shafts are longer and disc brakes are used. And, for the moment, the 1100 has a gearbox with baulk-ring synchromesh while the ordinary Mini has not; but one would expect standardisation to spread this improvement through the range. The 1100 costs no less per pound of weight than the Mini; as a bigger car it should be a more profitable proposition—especially with all this standardisation.

The surprise of the 1100 is that it should at first be sold only as a Morris, when it is so obviously a part of the move towards a standardised BMC range. Production facilities may be the answer; the present target is 1,200 a week, rising to 2,500 by January—all assembled at Cowley, with the mechanical parts coming from the Midlands and the bodies from Pressed Steel. By next summer BMC plans to be making 4,000 a week, and a full assortment of grilles is likely to have appeared on the 1100 by then.

Watery Riding

THE "Hydrolastic" suspension is the true novelty of the Morris 1100, and the feature that gives it the most immediately noticeable advantage over competitive cars. The ride is not as soft as that of the Citroen DS19, but it does eliminate the pitching that is the reaction of most cars to the wavy surfaces of British secondary roads and many other countries' main roads.



This gain in comfort is combined with the cornering abilities that so surprised the public when the Mini appeared on the roads; in the wet, it seems to be even more foolproof. In performance the 1100 is little livelier than the Mini in acceleration through the gears up to 50 mph, but in top gear and above this speed the margin of acceleration widens, as the effect of having 48 bhp instead of 34 bhp makes itself felt, and the top speed is about 4 mph higher at 77-78 mph.

The suspension system combines more virtues with simplicity than in previous designs. It combines hydraulic with rubber springing, and should cost little if any more than a conventional system. Each spring consists of a cylinder containing a water/alcohol mixture at a pressure of 210 lb per square inch, divided by a steel disc; at the bottom is a rubber diaphragm coupled to a rod which moves up when the wheel hits a bump. A metal disc divides the chamber *with a two-way valve in its centre*; upward movements of the wheel push fluid through it into the second half of the chamber, and from there down a pipe to a similar unit on the wheel at the other end of the car, trying to raise it with the front—the reaction with normal springing is that it will tend to be pushed down, so producing a pitching movement. If it is a large bump, the fluid will compress the rubber around the top of the cylinder, and this provides a sharp increase in the stiffness of the springing.

This system provides high resistance to roll, for there is no transfer of fluid from front to rear when both springs on one side are equally affected. And the movement of the fluid provides built-in damping, so no separate shock absorbers are needed. Using water instead of oil as the hydraulic fluid obviates trouble with changing viscosity through variations in temperature—and costs less.

UNILEVER

Africa's Claws

LOOKING at the combined results of the Unilever diarchy for the first half of this year, investors need not feel unduly depressed: sales are again higher and profits comparatively stable. But probing deeper they must be concerned about the differing fortunes of Limited (which includes the United Africa Group) and NV (in which the results of Lever Brothers in the United States are consolidated). Over the last three half-yearly periods the gross profits of Limited have run from £29 million through £22.6 million to £25.7 million while those of NV have run from £22.9 million through £28.6 million to £26.4 million. There is a seasonal element in these figures; but the plain fact is that in comparing the first six months of this year with the same period in 1961 the profits of Limited have fallen and those of NV have risen.

Wisely, the directors have broken with past precedent and commented briefly on the half-yearly results. They point out that the third party sales of the United Africa Group fell by £16 million in the first half

At home or abroad, wherever businessmen get together, the Irving is ready to offer professional banking services as the bank for bankers and businessmen.

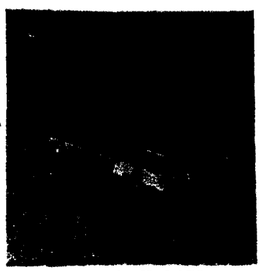
with the new Dictaphone models . . . at new lower prices

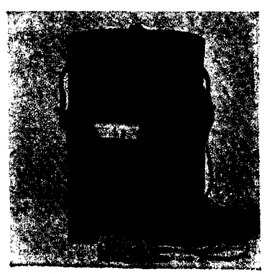


Time-Master Model PC

Just four buttons on the microphone control the complete dictating process with the de luxe model Time-Master. Push a button to start recording; release it to stop. Other buttons control playback, corrections, and letter length. It's so simple, and it uses the unique Dictabelt recording system and costs **£129 10s. 0d.**

Time-Master Model PCB

This combined dictating and transcribing machine does two jobs for almost the price of one. When you have a letter to dictate just pick up the microphone, and when you've finished just pass the machine to your secretary. She doesn't need a special transcriber, because this model does the job of two machines.



Travel-Master Portable

This needs no wires or tapes for recording, nothing but the revolutionary Dictabelts which tell you where you are at a glance. Wherever you are, just slip the Dictabelt into an envelope and send it off for transcription on a standard Time-Master Transcriber. This portable Travel-Master weighs only 5 lb., and costs **£105 0s. 0d.**

Telecord Network System

With the Dictaphone Telecord System, your telephoned dictation is automatically fed on to a vacant Telecord machine, usually located in the typing department. Dictation completed, the Dictabelt is handed to a typist for immediate transcription. This system is ideal for large organisations where it drastically reduces costs.

* Provisional.

June figure, and the rise in exports which had continued since January could not go on indefinitely. The disturbing aspect of the July figures is the further sharp rise in

imports by £22 million to £391 million. With re-exports at £14 million the crude trade gap in Britain's trading account has returned to the £50 million mark and the true visible balance is back in the red.

After this latest increase imports in May-July were 5½ per cent more than in the three months February-April. Exports on the same comparison were 4 per cent higher. However on the longer view exports in the first seven months of this year were 2½ per cent more than the monthly average for 1961, while on the same basis imports increased by no more than 1½ per cent. But imports are now on a rising trend. The detailed trade figures to be published later this month should show whether or not this jump in imports can be accounted for by some special set of circumstances, such as the heavy imports of potatoes which swelled the May figures. At the moment the pointers are that imports of feeding stuffs are still high and that the fall in industrial stocks in the early months of this year may have been checked.

One country that has chalked up a spectacular success in exports is Canada. The figures for May, the month in which Canada formally devalued its dollar to a fixed parity, show an increase in exports of no less than 33 per cent over May, 1961. In the first five months of 1962 together exports were over 13 per cent higher than in the same period of 1961.

AIR LICENCES

The Working Rules

IN fewer than 30 pages, the Air Transport Licensing Board this week served notice on the Minister of Aviation, the airlines, British Railways, the travel industry and the flying public, both gruntled and disgruntled, that it intended to interpret the Act under which it was established in its own way and its own time. And it set out the working rules that it is using as a yardstick in dealing with applications for new air services. "We must interpret the Act as it stands," says the board in its second annual report just published, "and not by reference to statements by Ministers regarding its intention and probable effect. We shall continue to rely upon our own interpretation of the Act unless we are overruled by a Court of Law." This is its only reference to its unhappy experiences under Mr Thorneycroft's administration, but they are fighting words.

The working rules outlined are of considerable importance. The board plainly believes that its brief is to encourage competition wherever the traffic seems able to support more than one air service; it will not, it says, attach much weight to claims by the sitting tenant that plans had already been made and aircraft ordered to carry all foreseeable traffic in the future. (Manufacturers had better watch this one.) But secondly, the board says at some length that airlines wishing to compete with the two corporations must be financially sound, by which it means not only able to pay their bills from day to day, but reasonably capitalised as well. Independent airlines backed by the shipping industry can meet this requirement, but the board is aware that other, truly "independent" airlines cannot. With no capital to speak of (and not much experience of book-keeping either, to judge by the board's comments on their accounts) these airlines rely at best on the credit, and at worst on the charity of their suppliers, mainly the oil and aircraft companies, and the airport authorities. Last year, ten went out of business; others are operating under the supervision of receivers. But they touch only the fringe of the aviation business; the important message of the report is that the board has emerged bloody but unbowed and unrepentant from its clashes with the Ministry of Aviation which, while Mr Thorneycroft was Minister, reversed some of the board's most important decisions and criticised others. Small wonder that the new Minister, Mr Amery, has preferred not to rubber-stamp decisions waiting on his table about British European Airways' appeals against a raft of other new licences for independents. He is not likely to make up his mind on these before mid-September.

BUILDING SOCIETIES

Money to Lend

THE pattern of small savings, as revealed in the figures published by building societies, unit trusts and the National Savings Association, has changed over the last twelve months. A year ago, when the prospect of higher interest rates was in the air, the competition from other savings media, particularly National Savings, was cited as one reason why the Building Societies Association and the Halifax Building Society (which is not a member of the association) decided to raise the net interest rate on shares from 3½ to 3¾ per cent and the mortgage rate from 6 to 6½ per cent. Now that interest rates are falling, money is flooding into the building societies. Yet investment in National Savings has fallen away—from £36 million to £18¾ million, net of withdrawals and interest, so far in

* Represents 77 per cent of all building society assets in Britain.

"stable"—and competitive. But this is no excuse for complacency. They must, for example, note that in the face of the slump in equity prices net investment in unit trusts in the first seven months of this year was fifteen times greater than in the same period last year. In the long term this is a competitor that they must worry about.

Both the member societies of the Building Societies Association and the Halifax are now receiving more funds than at any time in their history and the table shows the sharp jump of over 60 per cent in their net inflow in the first six months of this year. It would have been higher still but for the continuing high rate of withdrawals. Why, when interest rates are falling, withdrawals have remained so high is something of a mystery: not all of them can be withdrawals to meet the down-payments on a house. But no doubt these withdrawals make the association and the Halifax even more reluctant to lower their rates. Compared with a year ago they have plenty of money to lend and for most societies the quotas are now off. So far this has not been reflected in any increase in advances made by members of the association, but this is partly explained by the time lag of two or three months between the promise of a mortgage and its completion. There is little doubt that the figures for the next quarter will show a rise in mortgage lending. A year ago moreover the societies were still lending money under the government house purchase scheme for older houses. The Halifax did not avail itself of this scheme and has always taken pride in its willingness to lend money on older properties. This may explain why, in contrast to other societies, its advances have been higher. Even so its liquidity ratio has remained as high as 17.2 per cent, compared with an average ratio of 15.9 per cent for other leading societies. There is plenty of scope for an increase in advances in the months ahead; but, equally, there seems to be no shortage of prospective borrowers.

BRITAIN'S OPPORTUNITY IN THE MIDDLE WEST

"The American Middle West, covering an area as large as the European Economic Community, is one of Britain's largest potential export markets and probably the most neglected."

The Financial Times, July 27, 1962

THE ECONOMIST INTELLIGENCE UNIT'S NEW YORK OFFICE is available to help British exporters interested in the American Middle West or in any part of the United States.

Enquiries to be addressed to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED, 5 Bury Street, St. James's, London, S.W.1, *or*
Lincoln Building, 60 East 42nd Street, New York 17, N.Y.

COFFEE

Natural Break

FOLLOWING the normal pattern of such assemblies, the United Nations coffee congress in New York was dragging in its fifth week when Brazil staged a walk-out, bored with repetition of its own and its colleagues' well-known cases. This trusted procedure of negotiators lifted the discussions out of the rut which threatened to cause the conference to break up without agreement. African delegates had become increasingly restless at the lack of progress. But Brazil's action spurred the United States into making new proposals to save the conference. On the strength of them, Brazil stepped back into the proceedings, and delegates were so buoyed with new hope that they agreed to extend the conference for a further week until August 24th. If agreement is not then reached, the conference will be reconvened in November or December.

Brazil has the stature in coffee to carry off a diplomatic walk out—50 million bags full in fact—enough surplus coffee to supply the world for a year. African producers have displayed considerable alarm at the possible consequences of failure at the UN conference to produce a satisfactory long-term international coffee agreement. The struggle for shares of the market is said to have become tougher, and African producers appear to be banding even more tightly together for mutual protection.

Export quotas remain the major stumbling block with Brazil asking for them to be based on a two-year period, which does not suit Africans whose latest crop has been smaller than it would have been under normal conditions. They are pressing for a four-year basing period. But the issue on which Brazil stalled the conference was the level of the projected common market tariff, into which has been built a preference for associated African states. This issue might have been the immediate reason for West Germany's decision to become a full member of the conference. It has already been agreed that the common external tariff should be lowered from 16 to 12 per cent, with a further suspension making the duty 9.6 per cent, but no further concessions seemed to be forthcoming. The American proposal asks EEC members to submit within six months of the signing of a long-term coffee agreement, a programme for the reduction of the discriminatory import tariff against Latin American countries over the five-year life of the scheme. The elimination of other taxes and restrictions on Latin American coffee (particularly those levied in West Germany) is also sought.

The faint traces of a new schism in coffee are appearing. The United States is evidently backing the Latin American producers strongly in trying for a new world agreement. The European countries are by no means deaf to the special needs of the African producers. The price of Latin American coffees has recovered a little on reports of severe frost damage to coffee crops in the Parana region of Brazil. At least 6 per cent of these trees will be completely ruined and many more partially affected. It might prove the opportunity to reduce coffee production in this marginal growing area. Crops in Africa are satisfactory; a slight fall from the current level of about £158 a ton for Uganda robustas, delivered in November, seems likely.

TRADE WITH JAPAN

Tokyo Go-Slow

SIX years of talk have not yet produced a signed treaty of commerce between Britain and Japan, though agreement has at last been reached on "an important part of the arrangements to govern future commercial relations" between the two countries. In 1955, the British Government expressed a wish to conclude such a treaty. Meanwhile, trade between the two countries has continued to be governed by stop-gap licensing arrangements in the intervening years, under which trade in both directions has prospered. Exports to Japan from Britain rose to £24.3 million fob in the first half of this year, compared with £20.8 million in 1961 and £12.8 million in 1960; Japanese exports to Britain expanded to £27 million cif, compared with £24.4 million in 1961 and £20 million in 1960. Quotas have been reviewed annually, the last review permitting a substantial increase in trade between the two countries in the year to September. Quotas were fixed retrospectively at the end of 1961 for this period, so another interregnum of provisional quotas after this date will come as no surprise.

But this year it is hoped that a full treaty will be signed in time to dispense with the need to review quotas for a further year. It therefore appears most likely that all thought of annual quotas has gone by the board while a treaty of commerce has been under discussion. There was a hitch in these talks last week, reported to have had "something to do with" the common market. Japan is naturally anxious

E.C.G.D. COVERS YOU AGAINST BUYERS WHO DON'T PAY

When you're going into foreign markets it pays to know whether your customers' credit is good. ECGD can give you the answer. From up-to-the-minute credit reports on 140,000 buyers in 170 markets ECGD agrees the right ceilings for your buyers. It does more: it insures your business against default in payment for goods you have supplied, and a lot of other risks besides.

Are you out to expand overseas sales? ECGD is at hand to help—to back you (more cheaply than ever before) so that you can press ahead with singleminded confidence. Insured business is sound business. ECGD makes helpful bank managers even more helpful. Get in touch with ECGD straight away.

LIL

LAPORTE STANDS FOR PROGRESS IN THE CHEMICAL INDUSTRY

The chemical industry plays an invisible but vital role in the course of our daily life, entering into the making of almost all the things we eat, touch or use. The main products of the Laporte Group are Hydrogen Peroxide, Titanium Oxide Pigments, Aluminium Compounds, Fullers' Earth, Barium Compounds, Catalysts, Inorganic Acids, Phthalic Anhydride, Fluorides, Plasticisers.

LAPORTE INDUSTRIES LIMITED, Hanover House, Hanover Square, London W.1.

DRIVE

to get an agreement before Britain joins the European Economic Community. Japan wishes to achieve most favoured nation status and hence avoid discrimination against its exports under article 35 of the General Agreement on Tariffs and Trade. It has so far been held at arm's length by the European countries and has retaliated by slowing down its own import liberalisation. But the "other important matters" not settled in Tokyo were said to be safeguards against disruption caused by Japanese competition and Japan's methods of subsidising exports as well as the formal abandonment by Britain of protection under article 35 of Gatt.

If Japan does achieve this cherished aim in the British market, quotas will not be completely abolished. Some categories of exports will continue to be controlled, and there will also be the special controls against disruption from Japanese exports in the background. But these proposed safeguards have not allayed the fears of the British wool textile industry. This industry wants quotas for all wool products from the start of the new treaty. It is not possible to judge what concessions have been squeezed out of Japan in return for the coveted mfn rating. But while Japanese commercial practice remains unaltered, British manufacturers of wool textiles will have genuine grounds for complaint with which to embellish their case for protection. It is relevant to the current round of talks about scrapping general quota restrictions that Japan has the highest level of tariffs of all the main industrial countries; Britain boasts the third highest. Loss of quota protection will not, therefore, leave Japanese and British industries without any shield against each other in their home market.

INSURANCE

Lloyd's Good Year

LLOYD'S UNDERWRITERS made a profit of £22.4 million on the 1959 account (closed at the end of last year), the highest since the 1953 account which produced £24.9 million. Premiums of £320 million were received for all classes of insurance and the underwriting margin was 7 per cent, compared with 4¾ per cent from premiums of £302 million in the 1958 account and 3¼ per cent in the 1957 account. These surpluses have to bear further charges—principally the remuneration, including profit commission, of the specialists who underwrite risks for the syndicates: for this and other accounting reasons, Lloyd's figures are not comparable with those of the insurance companies. But Lloyd's results, based on more selective underwriting, have been generally better than those of the insurance companies, many of which nowadays rely on interest earnings to pay dividends and build up free reserves to back an expanding non-life premium income. With two of the three years of the 1960 account completed, it looks as if Lloyd's profits for that account will be within striking distance of those reported for 1959. The first year of the 1961 account shows no exceptional deviations—except in aviation insurance where claims were extremely light, presumably because the big jets are now being rated realistically.

The number of "names" has risen once again. There were 4,645 underwriters of marine and aviation risks last year, grouped in 167 syndicates, compared with 4,506 "names" in 166 syndicates underwriting the 1960 account; in the main non-marine account ("other insurance business"), there were 4,773 names (90 syndicates) last year compared with 4,622 names (92 syndicates) for the 1960 account.

Lloyd's does a world-wide business and the underwriters, in common with the insurance companies, are not likely, therefore, to experience great changes if Britain joins the EEC. It has, however, been suggested by Dr Reimer Schmidt, Professor of Laws at Hamburg University, that the Corporation of Lloyd's might not be held to be a company as it is defined in the Treaty of Rome and accordingly might not be entitled to free establishment within the European Economic Community. Dr Schmidt has suggested, however, that Lloyd's would probably get by as a co-operative holding company, though the supervisory requirements of Continental countries might require some changes of practice by the underwriters. Moreover, agreements between underwriters, mainly in the marine market, that are observed by the British insurance companies as well as by the members of Lloyd's might, he thought, come in conflict with the anti-cartel provisions of the Treaty of Rome.

SHORTER NOTES

Sir William Iliff, vice president of the World Bank since 1956, is to retire at the end of October; many will join Mr Eugene Black in paying tribute to his distinctive achievements, most notably in successfully concluding the delicate Indus Basin negotiations. Sir William is succeeded by another Englishman, Mr Geoffrey Wilson, formerly of the Treasury and the Foreign Office.

★

An attempt by Franco-British Trust to start unofficial dealings in the shares of the Jasper group of companies has been abandoned following the warnings by the chairman of R. E. Jones that the completion of any purchases may not be possible without litigation. Shareholders in that company have been told this week that their shares are likely to be worth about £2 each: of the company's nine hotels six, including the Piccadilly, have already been sold. Lintang's principal asset, the Dolphin Square block of flats, is to be offered for sale and this is likely to raise about £4½ million.

★

Although net new orders for machine tools booked in May were significantly lower than the rate of export deliveries in the month, bringing total new orders for the first five months of this year slightly below total export deliveries during the period, the comparisons quoted in a Business Note in our last issue on this point were incorrect. Reports from within the machine tool industry, moreover, suggest that several large foreign contracts booked during June may since have brought the total orders booked in the first half of this year up to or above the level of export deliveries.

★

The International Tin Council met this week and received a report on discussions with the United States stockpile authorities. The meeting was then adjourned and will be resumed after details of American stockpile releases are made known.

COMPANY MEETINGS

JOHN BROWN AND COMPANY LIMITED

(Engineers and Shipbuilders)

TRADING PROFIT VIRTUALLY MAINTAINED DESPITE DIFFICULTIES IN PERSIA

PROBLEMS FACING CLYDEBANK

LORD ABERCONWAY'S STATEMENT

The ninety-eighth Annual General Meeting of John Brown and Company Limited will be held on September 7th in London.

The following is an extract from **Lord Aberconway's** statement circulated with the Report and Accounts for the year ended March 31, 1962:

The Net Consolidated Profit before tax of the Company and its subsidiaries for the year ended March 31, 1962, was (to the nearest £1,000) £4,416,000, compared with £4,491,000 for the previous year.

The Consolidated Profit this year has been adversely affected to a substantial extent by the experience of Constructors John Brown Ltd. over certain of its Persian contracts. In my statement last year I referred to the many difficulties being encountered by C.J.B. in Persia, expressed anxiety about the eventual financial outcome of these contracts, and stated that provision had been made on what should be a sufficient scale to meet their final outcome.

Extras on contracts in respect of such items as changes in specification, extra work required, delays outside the control of C.J.B., and so on, have now increased to substantially over £1,000,000. In the case of the largest of the contracts, where the client is the Persian government, C.J.B. has had to request the Persian government to submit the matter to arbitration.

C.J.B. expects, and is justified in expecting, to obtain a settlement in due course; nevertheless it has been decided to follow the policy established last year, and accordingly credit for outstanding extras will not be taken until they are settled. By reason of this policy the accounts of C.J.B. show a substantial trading loss for the year.

Despite these difficulties in Persia and despite the conservative way in which they have been dealt with in C.J.B.'s accounts, the profit of the group for the year before tax is only slightly below the record figure of the previous year. Profits Tax, however, is payable this year at sixpence more in the pound, and takes almost £100,000 more than last year, even though it is levied on a slightly smaller profit. After deducting taxation and the interests of outside shareholders in subsidiaries, there remains £1,906,000, compared with £2,056,000 last year.

In March of this year the directors thought it proper to bring the issued capital of the Company more into line with the resources committed in the business of the Company and its subsidiaries. Accordingly, sufficient reserves were capitalised to issue to Ordinary stockholders before the end of the financial year one Ordinary share of £1 (since converted to stock) for every four £1 units of Ordinary stock held.

At that time it was stated that the profits for the year were confidently expected to suffice to pay, upon the larger capital, the same final rate of dividend, namely 7 per cent less tax, as was paid as a final dividend for the previous year. The directors accordingly recommend a final dividend for the year under review of 7 per cent less tax, which, together with the interim dividend of 4 per cent less tax, makes a total for the year of 11 per cent less tax, the same total rate as for the previous year.

During the year all the shares in two companies were bought, Holmes Homalloy Ltd. and Talbot-Ponsonby & Co. Ltd., and the Company's holding in S. N. Bridges & Co. Ltd., comprising some 98 per cent of the capital, was sold. The purchaser was Stanley Works (Great Britain) Ltd., with whose other activities it was thought that the business of Bridges in making and selling portable electric tools would fit better.

Your directors have decided that this year and in the future it would be more helpful to stockholders to show in John Brown's Balance Sheet its interest in subsidiaries at the sum of the values of the net tangible assets of the subsidiaries, as shown by the balance sheets of the subsidiaries. It should however be emphasised that in making this change this year, your directors are in no way re-valuing the assets of the group: no change at all is made in the basis of valuing assets in the books of the subsidiaries. All that is being done is to adopt in the Parent Company's Balance Sheet the asset values shown by the accounts of the subsidiary companies.

SHIPBUILDING AND LAND BOILERS

Clydebank, in common with almost all British shipyards, is seriously under-employed. Enquiries to-day are few and far between, and are the subject of such intense competition that to have any chance of success a tender must usually be on an untremunerative basis. It was in these circumstances that Clydebank put in a very low bid to Cunard for Q.3 and this bid was not the lowest; the decision not to proceed with that ship was small consolation to us and to our workpeople. Clydebank is however determined to preserve what activity and employment it can.

Against this background Clydebank is thankful to have secured, subsequent to the Q.3 decision, orders, even at meagre prices, for a combined passenger and cargo ship for Alfred Holt & Co., for a large assault ship for the Admiralty, and quite recently for the reconditioning and conversion for Cunard Steam-Ship Company of the Clydebank-built ships *Saxonia* and *Ivernia*.

During the year *Transvaal Castle* was completed with many novel features as a "hotel-class" passenger ship of high quality for British & Commonwealth Shipping Company, who have been good enough to express their enthusiastic satisfaction with her. For the same owners the motor cargo vessel *Clan Macnair* was completed. For B.P. Tanker Company *British Hussar*, a 50,000-ton deadweight tanker, was finished soon after the year end.

In present circumstances, difficult times are certain, nevertheless Clydebank is boldly undertaking the final stage of the reconstruction of the West Yard, to handle vessels of up to 100,000 tons: the layout is thought to be the equal of anything in the world for efficient production flow.

John Brown Land Boilers Ltd. commissioned in the United Kingdom during the year two large boilers for central power stations. Again delivery dates were maintained and satisfactory operating results achieved. The Foster Wheeler-John Brown Land Boilers Consortium is working well. It has continued with the design and early manufacturing stages of the four 350 megawatt boilers for the new Tilbury station to be commissioned during 1965 and 1966; it has also secured from the Central Electricity Generating Board for Eggborough the order for four 500 megawatt coal fired boilers for commissioning in 1966/67.

MACHINE TOOLS AND ENGINEERS' TOOLS

Wickman Ltd. had a splendid trading year. A high level of deliveries of machine tools, both of its own and of its various principals' manufacture, has produced an excellent result. Almost half of the deliveries of multi-spindle automatics went to overseas markets, as did a high proportion of the machine tools distributed on behalf of British principals.

Orders, both for automatics and for other types of machine tools, came more slowly as the year progressed. The automobile industry early in the year substantially completed the placing of machine tool orders for its expansion programmes. The manufacturering capacity for automatics at Banner Lane has been substantially increased in recent years, and is in excess of the current rate of intake of orders. The backlog of orders in hand is, however, such that prospects for the current year are good.

In order to benefit from concentrated and specialised management, Wickman's remaining trading activities have been entrusted to subsidiaries formed for the purpose, and Wickman itself has ceased to trade and is now a policy-making holding company.

Webster & Bennett Ltd. has had a satisfactory year and has worked to full capacity. Orders have come in about the same rate as machines have been manufactured, and consequently attractive deliveries can still be offered. Export orders comprised 46 per cent of the total, and 42 per cent of deliveries were for export. Machines of the new 10-foot diameter size have been well received by customers.

Firth Brown Tools Ltd. has again had a busy year; increases in its export sales have more than offset the slight fall in home sales due to the reduction in general industrial activity. The schemes of re-arrangement and expansion referred to last year have proceeded to programme; they will extend into the current year and will affect profits, but on the long term view this plan, leading as it does to increased capacity and efficiency, is fully justified.

OTHER U.K. INTERESTS

Markham & Co. Ltd. has been working to full capacity throughout the year. It has manufactured and installed the mechanical equipment for the radio telescope at Goonhilly for the Post Office, and has completed three new winders and two major winder reconstructions for the National Coal Board. Two large Francis water turbines for Spain, one smaller turbine for installation in North Wales, all to Boving's design, and rolling mill equipment for the universal beam mill at South Durham Steel and Iron Co. to Demag's design, have also been delivered.

The light alloy suburban cars being built by Cravens Ltd. for the London Transport Executive have gone into service with a notable absence of trouble, and the customer is highly satisfied with both design and workmanship.

I referred last year with anxiety to the prospect that British Railways would themselves build substantially all their requirements of rolling stock and thus deprive the private enterprise companies of a home market so essential as a base for their efforts to export. Since then the Transport Bill has been introduced into Parliament. It invests the Minister with power to direct all or any of the proposed railway Boards to discontinue any of certain activities, including the manufacture of rolling stock.

The difficulty in obtaining export orders for rolling stock, consequent upon the present reduction in world requirements, will be critically accentuated if there are no more home orders. Cravens however has faith in the ultimate revival of demand for rolling stock, and is determined to stay in the business. It has recently been encouraged by obtaining against severe international competition two important contracts, one for light alloy coaches for the Eire Railways, the other for insulated wagon bodies to be built in light alloy and fibre-glass for East African Railways.

The shares in Holmes Homalloy Ltd. were acquired during the year. The business of this company is conducted through subsidiary companies, and is to manufacture, frequently to customers' individual requirements, bodies for commercial vehicles. There are factories at Preston, in London, and at Dumfries, the last a joint enterprise with William Alexander of Falkirk. Homalloy (Yorkshire) Ltd., with newly acquired works in Sheffield, has been formed to operate in close collaboration with the Holmes factories.

The organisation of Cravens (Machines) Ltd. has been built up during the year into a well-rounded and self-contained team. A complete range of injection moulding machines using screw plasticisers has been introduced into manufacture alongside models of the well-established plunger type.

Bone Brothers Ltd., at Wembley, achieved the highest turnover in its history, and its order book is heavy. The business is being actively developed, and a new building for use as a research and development centre is being erected.

Talbot-Ponsonby & Co. Ltd., at Petersfield, designers and manufacturers of precision dies and moulds, has been purchased as a business which is complementary to Cravens (Machines) and Bone Brothers.

Sufficient reference has already been made to the difficulties that Constructors John Brown Ltd. has had in Persia. Elsewhere C.J.B. has had an active year. Contracts in progress are proceeding satisfactorily and to time. The order book has been substantially increased and already provides much work to be executed in 1963.

C.J.B.'s pipeline division constructed the majority of the larger pipelines undertaken in the United Kingdom in 1961, including the gas line from Esso, Fawley, to I.C.I. at its new site at Severnside; and has been awarded a contract for £4,500,000 from the Sheffield Water Board.

The Company has an important investment in Westland Aircraft Ltd., a virile company in whose future your directors have great confidence. It was disappointing that the Government could not see its way to continue to support the development of the large Rotodyne helicopter, and this technically quite outstanding machine has had to be abandoned. Westland however retains its leading position in helicopters, and also, with the S.R.N.2, in the new field of hovercraft.

OVERSEAS INTERESTS

In Canada, the operations of Firth Brown Steels Ltd., A. C. Wickman Ltd., and Firth Brown Tools (Canada) Ltd. have been satisfactory despite continued heavy competition and depressed conditions in many industries. The recent devaluation of the Canadian dollar and a new protective tax on imports are likely to prove detrimental to U.K. exports to Canada.

In Australia, the restrictive measures of the Government made business more difficult to get, and less profitable to execute. There are, however, signs of a gradual recovery of activity.

In India, the continuation of financial aid to that country from various sources has enabled Machine Tools (India) Ltd., the Company's principal direct stake there, to play an active part in the importation and distribution of machine tools and other products.

In Brazil, Brasmac-Wickman S.A. finds that the business of importing machine tools grows no easier in the climate of political uncertainty, monetary inflation, and financial restrictions. Brazil undoubtedly has the ingredients of a good industrial future, but, until stable conditions are established, trading will be difficult and attended by risk.

In the Republic of South Africa, there has been a welcome revival of trade and commerce. Wickman (S.A.) (Pty.) Ltd. has had an admirable year; in manufacturing and selling carbide-tipped drill stems of high quality it has given first-class service to the mines. Drury Wickman Ltd. has also operated well as distributors of a diversity of machine tools and other engineering products. John Brown Land Boilers (Africa) (Pty.) Ltd. commissioned in the Union during the year four boilers of a total capacity of 120 megawatts.

In Rhodesia, F. Issels & Son Ltd. has been busy, but business has been difficult to obtain and profit margins have been low. Rhodesian Alloys (Pty.) Ltd. continues to operate well and to full capacity; but a recent severe falling off in world demand has required a proportion of the output to be stocked.

EXPORTS HELPED BY PAY PAUSE

The former Chancellor's policy has, by and large, afforded a welcome slackening in the speed with which costs of all sorts have risen in recent years. The beneficial effect upon exports has been noticeable in more than one of the businesses in which the Company's subsidiaries are engaged. This relative stability of costs, compared with the experience of some overseas competitors, has enabled those businesses to obtain more export orders, and to secure a firmer hold upon their export markets. Thus in those businesses greater employment has been achieved than otherwise would have been the case, and the prospects for future employment have been enhanced. One can only hope that good sense and restraint on all sides will preserve these hard-won benefits, and that they will not be dissipated by a resumption of rapid inflation, to the detriment, among other things, of exports and employment. The moderate wage increase which the engineering and shipbuilding industry has been able to negotiate against the background of the other wage increases made during the last year may perhaps indicate the start of a trend towards the stability that is so much needed.

DIRECTORATE

Two of our most valued colleagues feel that it is time for them to retire. Accordingly, to our great personal regret, Sir Arthur Matthews and Sir James McNeill will be resigning their seats on the Board at the Annual Meeting. Sir Arthur Matthews, a former chairman of the Forgemasters' Federation, was for many years an executive director of Thos. Firth & John Brown Ltd., and retired as Managing Director of that company in 1951. At that time he was also a director of John Brown & Co. Ltd., and he has since then given valuable service in that capacity and as a director of various subsidiary companies. Sir James McNeill, the foremost naval architect and shipbuilder of his time, has spent his working life in the service of Clydebank. He was mainly responsible for the design of the two "Queens" and many other notable John Brown ships. Sir James was the first Managing Director of John Brown & Co. (Clydebank) Ltd., the subsidiary formed in 1953 to take over the activities of the shipyard. He will also be retiring from the Board of that company.

In the recent Birthday Honours List a knighthood was graciously conferred on Mr. Eric Mensforth. His fellow directors, and his colleagues throughout the group, were delighted at this well-deserved tribute to his accomplishments. The barony awarded in the New Year Honours List to Sir Toby Low, now Lord Aldington, also gave great pleasure to his colleagues.

I know that I shall be echoing the thoughts of stockholders who follow our affairs when I say how much the successful results of this year are due to the managements, staffs and workpeople of our various subsidiary companies, and how grateful we are to them all.

UNITED DOMINIONS TRUST LIMITED

RESULTS AFFECTED BY OUTCOME OF POLITICAL AND ECONOMIC CHANGES

MR J. GIBSON JARVIE VIEWS THE FUTURE WITH UNDIMINISHED CONFIDENCE

The fortieth annual general meeting of United Dominions Trust Limited was held on August 16th in London.

The following are extracts from the statement by the Chairman, **Mr J. Gibson Jarvie,** which has been circulated with the Report and Accounts.

Last year your Board had to report the first drop in profit for sixteen years. It is a matter of great regret to your Board that again we have to report a decline in profits for the year and largely from the same, or related, causes.

A year ago I was able to say that "subject to our being permitted to carry on our various activities in a more or less normal manner, the year in which we are entering is full of promise." It was: but the year through which we have passed has been anything but normal.

Although business has fallen the cost of money was actually more than £2,000,000 higher than in the previous year! That, of course, was the effect of the high average Bank Rate here and of higher money rates overseas resulting from violent political and consequent economic changes.

It will be seen that the loss of volume and the high cost of money—remember that money is our merchandise—were important factors in our reduced profits but they were not the only reasons. The credit squeeze, too fiercely imposed and too long continued, as is now admitted, is still with us and it has been followed to a greater or lesser extent I think, in one form or another, in every one of the overseas countries in which we are operating.

The squeeze has brought so much that is unnatural and artificial into the countries where it operates that it is impossible to conduct any kind of business on an even keel. Government regulation and restrictions generally come too late and last too long. Apparently, we are to carry these handicaps with all their inconveniences till the end of the year. It takes a stable, intelligently conceived and realistic economy to provide the conditions for stable and successful business enterprise and prosperity. Inflation is death to a stable economy, yet all the Government regulations, Bank Rate fluctuation and other controls do not touch inflation. Inflation in the United Kingdom stems directly from unproductive Government spending and that still goes on unchecked. Instead of being reduced it is constantly growing.

As you know, in the last two or three years, the U.D.T. Group has gone in wholeheartedly for expansion and for diversification. When we commenced to give effect to this policy the skies were clear. We could not foresee the shattering storms which have followed.

You will also bear in mind that after writing off the goodwill in the acquisition of existing profit-earning concerns, we are still going through the expensive period in the establishment of new companies abroad. In the last three years we have established no less than four companies de novo and we have acquired twelve existing companies.

DIVIDEND MAINTAINED

The Board regards the past year as so much out of character with the Group's history and with its safely expected future as to warrant dealing exceptionally with the year's dividend which, it is recommended, shall be maintained at the total distribution level of last year. There have been times when it has been alleged that the Board leaned too heavily toward retention rather than distribution of profits and this seems an opportune occasion to offer Stockholders benefit out of their forbearance in the past.

The nation's closer ties with the European continent have made it advisable for us to quicken our interest in the means of our entry into Europe. In comparison with establishment in the Commonwealth, there are obvious and quite formidable obstacles to overcome but we have made a most useful beginning in the Amstel Club—to which I referred in my statement last year. This association with banking houses in eleven European countries has been greatly strengthened during the year and the exchange of business is now in millions sterling.

Our companies in Canada, Australia, New Zealand and Trinidad are all working well; and from South Africa, even since it became a Republic and with all that it has passed through in consequence, we continue to receive invaluable support in the Group.

Personally, I have unlimited faith in the future of the U.D.T. Group. It is a powerful and rich association of companies, well buttressed by reserves and by experience. Its ramifications are well spread both geographically and commercially. As time passes, the additions to the Group are integrated and disciplined within the whole. They bring in new, although nearly always related, business activities so that the Group is well and strongly diversified. Again, as time passes, we become less and less dependent on any one line or on any one country. Our field is so wide now that whatever conditions exist or persist, we should be able to make a decent showing. I do not know of any company in this country that has had a more consistent record of successful operation or one any better or as well placed to meet the conditions of this fast changing world.

RUSTON & HORNSBY, LTD.

The Seventy-third Annual Ordinary General Meeting of Ruston & Hornsby, Ltd., was held on August 10th at Lincoln, **Mr W. J. Ruston** (Chairman) presiding.

The following are extracts from his comments on the report and accounts for the year ended March 31st, 1962:

Last year I expressed confidence that we should be able to hold our position provided trading remained as anticipated. In spite of a number of unforeseen events which adversely affected our earnings, the net profit of the Group is fractionally better.

Whilst every endeavour is being made to control costs, these have continued to rise from causes outside our control, although with the acceptance and introduction of work study we should see an increasing efficiency in our factories in Lincoln.

There has been a general improvement in output and the level of the Group's order book has been held. Your Directors recommend a distribution at the same rate as last year, i.e. a dividend on the Ordinary Stock at the rate of 9 per cent less Income Tax.

EXPORTS: We not only increased our percentage of direct exports, but were successful in breaking into new ground. Competition is very severe and this, added to the continual development towards self-sufficiency in some of our traditional markets, aggravated by lack of sterling, speaks well for our products and their acceptance by other countries.

PRODUCTS: Enquiries for our products continue to be active and some useful orders have been received for our larger engines, locomotives, boilers, pressure vessels and for our high speed air cooled ranges.

In the face of strong foreign competition we were successful in obtaining the order for ten 1310 kW sets for power generation from Korea. Our marine business continued active. Our gas turbines are still giving an extremely good account of themselves and the potential for the future is encouraging.

To ensure that we maintain our position, substantial development programmes are in hand covering all of our products.

PROSPECTS: We have been able to maintain the overall level of our order book but trading conditions are continuing to become more competitive and with the high percentage of our output that is exported we are naturally sensitive to the local conditions in these markets.

We are taking such steps as we can at this stage to organise ourselves should the United Kingdom join the European Economic Community, so as to equip ourselves to meet the increased and intensive competition which most assuredly will be there.

The success of our reorganisation and the general acceptance of our products throughout the world, together with the present level of the order book, enables me to view our position for the coming year with sober confidence. Provided further wage and other national increases do not price us out of our export markets, and given reasonable stability, we should be able not only to hold our own, but, I hope, show at least some improvement in the results of the Group.

The report and accounts were adopted.

SHEEPBRIDGE ENGINEERING LIMITED

EXPANDING DIVERSIFICATION OF INTERESTS

LORD ABERCONWAY'S STATEMENT

The Annual General Meeting of Sheepbridge Engineering Ltd., will be held on September 26th in London.

The following is an extract from the statement by the **Rt Hon Lord Aberconway,** the chairman, circulated with the report and accounts:—

Last year I reported that the prospects looked good for the year to March 31st, 1962, and that the overall profit should be maintained. That forecast has been fulfilled. The invoiced sales of the group were again higher than in any previous year, and for the first time in the history of the Company the Consolidated Profit was in excess of £1,200,000.

The Consolidated Trading Profit after all charges is £1,220,128 compared with £1,157,889 for the previous year. After £610,620 has been provided for taxation, where a higher rate of Profits Tax operated, and after £23,740 has been deducted in respect of the minority interest in a subsidiary company, there is left a sum of £585,768 attributable to the parent company. The corresponding figure last year was £562,263.

The overall financial position of the group remains strong, although considerable inroads upon liquid resources have in recent years been made by the deployment of funds, both in renewing and extending our plant and equipment, and in financing an increasing volume and range of business. The effect of continuous inflation upon such a trend is of course to accentuate the absorption of liquid resources. It nevertheless remains the policy of the Company to ensure that its equipment is up-to-date, and to lose no opportunity to expand and develop its established lines of business.

The directors recommend a final dividend of 10 per cent which makes a total distribution for the year of 15 per cent less tax, the same as last year.

SUBSIDIARY COMPANIES

The majority of the subsidiary companies achieved record sales in the year, though the recession in the motor industry had its effect.

Sheepbridge Equipment Ltd. continued to enjoy the benefits derived from increased diversification. Substantial orders were received from the quarrying industry for the new Cuber crushers and ancillary equipment, and three major contracts for oil drilling and hose handling plant for oil terminal installations were completed during the year.

Extensions to the machine shops at Sheepbridge Stokes Ltd. have been made to house special transfer machines which are now in production. These will help to increase manufacturing facilities so as to meet the growing demands of our customers. Increased capacity at British van der Horst Ltd. is being fully used.

The increase in the activities of Sheepbridge Alloy Castings Ltd. reported last year has been maintained, resulting in record sales for the year under review. The demand for the company's products by the petro-chemical and allied industries continues to grow.

The activities of Sintered Products Ltd., continue to expand. New sales outlets are constantly being sought, new manufacturing techniques are being developed and new materials are being tested.

Automotive Engineering Ltd., Light Production Ltd., Harold Andrews Sheepbridge Ltd., and Clews Petersen Ltd., all of whom supply the greater part of their output to the motor industry, were affected by reduced demands for their products. The installation of new and additional plant, however, has made them ready to supply at very competitive prices the increased requirements for which it is hoped the motor industry will soon call. Clews Petersen Ltd. are losing their premises at Hampstead, but negotiations have been concluded for a lease for an appropriate term of a suitable and larger factory being built at Aylesbury, to which their activities will be transferred.

Demand for the products of Twiflex Couplings Ltd. was considerably higher than in any previous year. An agreement has been made with Vulkan Kupplungs und Getriebebau of Dortmund, Germany, under which we can manufacture and sell the Vulkan rubber annulus flexible coupling and the Vulkan air cushion type coupling. These couplings should prove to be suitable and profitable additions to the company's range of products. An agreement has also been made with the German company whereby it will manufacture and sell our newly-designed flexible coupling embodying circlips as the flexible members.

Credit restrictions had an adverse effect on the demand for the products of Bray Construction Equipment Ltd. in the home market and made competition even more intense; but with the easing of restrictions and the organising of a wider sales coverage, we hope for improved sales at home. Export business remains good and long-term prospects are favourable.

The sales of Hardinge Machine Tools Ltd., both at home and overseas, were higher than the record deliveries of the previous year. The new factory at Exeter has been brought into production. The order book is good and the increased manufacturing capacity should ensure higher sales in the future.

The acquisition in 1960 of Perfection Engineering Ltd. has added usefully to the activities of the group in the machine tool field. This company, as well as manufacturing honing machines, is one of the largest manufacturers in this country of spline gauges. The factory is modern, and since the business was acquired its manufacture and sales have satisfactorily increased. Its prospects are good.

RESEARCH AND DEVELOPMENT

Research and development work within the group continues unabated in order to find new products and cheaper methods of manufacturing existing products. Among recent developments are pneumatic pumps for conveying materials in powder form in pipes, conveyors working on the air gravity principle, a new type flexible coupling for power transmission purposes, and a new type of sintered porous stainless steel for aircraft de-icing and for special purpose filters. Our technicians make frequent visits to other European countries and the American continent to investigate new manufacturing techniques which may be useful in our business. We hope thereby to remain in the forefront in the competitive manufacture of our widely diversified products. Although competition is becoming ever more keen we expect to obtain our full share of the available markets.

REVENUE PROPERTIES COMPANY LIMITED

MR ALEX J. RUBIN'S STATEMENT

At the first annual meeting of the Company, held recently in Toronto, Canada, **Alex J. Rubin,** Chairman and President, said in his report to the shareholders: Following the issue of your Company's securities to the public in December 1961, the Company made its first investment consisting of 57 leased industrial properties at a price of $15.0 million and as a result of this acquisition, began operations with a real estate portfolio which provides it with a diversified source of recurring revenue from leases to major companies.

As the 1961 year-end financial statement covers only 17 days, we have, in order to provide a more complete picture, incorporated an audited statement of income for the first quarter of 1962 in the financial section of the report to shareholders. For the three months ending March 31, 1962, your Company had income from rentals and interest totalling $394,549 and net revenue after all charges including depreciation of $73,870. On February 15th last, your Company paid the first quarterly dividend on its preferred shares at the rate of 6½ per cent per annum.

In April, your Company purchased The Rubin Corporation Limited as a wholly-owned subsidiary. Your directors had an independent appraisal of the assets of the corporation from which it was apparent that their present value was substantially greater than their cost on its books and that the equity acquired has a current worth materially in excess of the purchase price.

REAL ESTATE ACTIVITIES

The Rubin Corporation is engaged in the following principal real estate activities; the purchasing, selling, leasing, financing managing and operating of commercial, industrial and residential real estate, the acquisition of land, the planning, development and construction of buildings of all types.

With its acquisition, Revenue Properties Company Limited now stands as the largest Canadian-controlled, publicly-owned real estate development, construction and holding company.

Projects which The Rubin Corporation has under construction or in the advanced planning stage include: six garden homes in the Toronto area which on completion will contain more than 3,300 rental units housing about 15,000 residents; an $8,000,000 14-storey building in which your Company is the major shareholder, consisting of stores, offices and apartments, now under construction; motor hotels and apartment buildings.

INDUSTRIAL PACKAGE DEALS

Activity is also being maintained in the industrial package deal field which involves providing industry with buildings on a lease or contract basis through an all inclusive package which includes land, design, construction and financing.

The report was adopted.

ASSOCIATED BRITISH PICTURE CORPORATION

SIR PHILIP WARTER ON A WELL EQUIPPED ORGANISATION

The thirty-fifth annual general meeting of Associated British Picture Corporation Limited was held on August 10th in London, **Sir Philip Warter** (the Chairman) presiding.

In his statement. which had been circulated to members, Sir Philip said he was pleased to report a satisfactory year's trading with profits, after taxation, only slightly below those of the previous year.

After reviewing the financial results Sir Philip, commenting on Film Production and Distribution, said: At the Corporation's Studios at Elstree, once again the staff and the equipment have been fully employed throughout the period.

In order to enlarge the supply of British films for the cinema the Corporation has, in association with The Grade Organisation Ltd., formed Elstree Distributors Ltd. to promote and finance the production of British films by independent producers.

Shortly after the end of the financial year arrangements were completed for the purchase by the Corporation of a 50 per cent interest in Anglo Amalgamated (Film Distributors) Ltd. and allied Companies. Apart from being a sound business investment this purchase will increase the supply of films by independent producers.

The Corporation is also negotiating with Mr Walter Reade of Continental Film Distributors Inc., of New York, who plans to promote and finance a number of British films which will further strengthen our position in Production, Distribution and Exhibition.

The Production Divisions of Associated British-Pathe Ltd. which produce the Pathe News, Television Advertising films and Documentary films have had a successful year.

The Distribution Division of Associated British-Pathe has maintained its business in the United Kingdom and improved it overseas, despite the relatively high level reached in the previous year.

The Chairman then referred to A.B.C. Cinemas and said that they had, on the whole, had a good year which would have been very much better if there had not been such a dearth of good pictures in the autumn of last year.

The massive reconditioning and modernisation programme of cinemas continues and the investment is already proving to be a good one.

Bowling: This is now beginning to assume an important role in the Company's activities.

Turning to A.B.C. Television Limited, Sir Philip said: The Television Company has continued to make progress.

I do not propose at this stage to comment in detail on the Pilkington Report. I must, however, express regret that the Report, apart from its tribute to our religious programmes, entirely fails to recognise the serious programme contributions that we and other Programme Companies have made to Independent Television.

Whatever the future pattern of television may be from 1964 onwards in this country, I am confident that this Corporation will continue to make a notable and essential contribution for many years to come.

The best can be achieved only by having the finest resources and the most able production staff, backed by generous budgets. This has been A.B.C.'s consistent policy.

Referring to the current year, Sir Philip said: Business is running a little below that of the comparable period of last year but it is much too early to make an accurate forecast of the full year's results.

The Corporation is well equipped in the organisation of its business, the spread of its interests and in its financial strength to take full advantage of whatever developments may emerge in the entertainment field in the future.

COMBINED ELECTRICAL MANUFACTURERS LIMITED

RECORD VALUE OF ORDERS IN HAND

The second annual general meeting of Combined Electrical Manufacturers Limited was held on August 9th in London, **Mr Anthony M. Browne** (chairman and managing director) presiding.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts:

The Consolidated Trading Profit for the year ended March 31, 1962, after all expenses and provisions, but before taxation, amounted to £680,585.

After providing £352,022 for taxation the net profit is £328,563. The Directors have transferred £150,000 to General Reserve and recommend the payment of a final dividend of 8½ per cent making with the 4 per cent interim dividend already paid, a total of 12½ per cent less tax. This leaves £67,425 to be carried forward.

Taking into account the present order book and their plans for the future development of the Group, the Directors are of the opinion that the Company should have additional working capital. They are, therefore, consulting with their advisers as to the best way of providing this, which will probably involve the issue of Loan Capital at the appropriate time.

Greater and improved manufacturing facilities have been and are being provided in order to increase output and productivity.

A great deal of development has been successfully carried out in connection with most of our products.

We are fortunate in having sufficient orders on our books to anticipate being fully engaged in all sections throughout the coming year and have, moreover, a significant amount of heavy transformer work to be manufactured during the following three years. The value of orders in hand is, in fact, a record for the various Companies of the Group. We have again obtained, during the year under review, a very considerable amount of export orders for Transformers, Rectifiers and D.C. Switchgear. One feels justifiably proud of these export achievements which eloquently testify to the good service of the plant supplied and which are so much in the National interest; but it must be recognised that competition is extremely keen, making profit margins on export business negligible.

The report and accounts were adopted.

BANK OF CEYLON

THE NEW CONSTITUTION

The following are extracts from the annual report of the Board of Directors of the Bank of Ceylon:

In terms of the Finance Bill of 1961 which was introduced by the Minister of Finance in Parliament on July 27, 1961, and which received the Governor General's assent on October 12, 1961, the Bank of Ceylon became a fully State-owned institution with effect from the former date.

After dealing with the Bank's inauguration and early achievement, the Report continued:

The Bank which has attained a position of strength will, under its new constitution with the Government as its sole owner, at all times maintain its autonomy and its integrity and ensure its strength and stability which must always remain the foundation on which all its activities are based.

With the Government as sole shareholder a more purposeful pursuit of the objectives of the Bank and a greater versatility in the adoption of means to achieve its ends are now possible, subject only to the controls provided by law.

Dealing with the Accounts for the year ended September 30, 1961, the Report states: Cash, Bullion, Loans at Call, Money at Short Notice and Treasury Bills amounted to Rs. 145.2 million. Our total liquid assets, including Bills discounted, amounted to Rs. 199.9 million. The percentage of liquid assets to total deposits is 38.2.

There has been a slight increase in the Bank's investments from Rs. 166 million to Rs. 167 million; our holdings of Treasury Bills have increased substantially from Rs. 9.9 million to Rs. 47.2 million. Our investment in the shares of the Development Finance Corporation of the face value of Rs. 2.8 million has been written down to its market value of Rs. 1.68 million.

The Bank's advances aggregated Rs. 205 million, a decrease of Rs. 21 million from the figure at the end of the previous financial year. The fall in advances is attributable to the import restrictions of the Government, as well as to the credit restrictions imposed by the Central Bank.

The total deposits of all commercial banks amounted to Rs. 1,038.2 million as at September 30, 1961, as against Rs. 1,019 million as at September 30, 1960, an increase of 1.9 per cent. This Bank increased its total deposits from Rs. 492 million as at September 30, 1960, to Rs. 523 million as at September 30, 1961, an increase of 6.3 per cent.

Of the total deposits within the banking system, the share held by this Bank amounted to 50.4 per cent against 48.3 per cent as at September 30, 1960.

A sum of Rs. 800,000/- has been transferred from inner reserves and a sum of Rs. 350,000/- out of current net profits to Other Free General Reserves. These transfers bring the figure for Other Free General Reserves to Rs. 9 million. The Permanent Reserve Fund stands at Rs. 6 million. The capital and published free reserves of the Bank, therefore, now stand at Rs. 12,500,000/-. In addition, of course, the Bank continues to hold substantial free inner reserves.

There has been a small increase of Rs. 3,000/- in the net profit which amounted to Rs. 775,000/-. The total dividend paid (less tax) to the Deputy Secretary to the Treasury amounted to Rs. 315,000/-.

THE GOLDEN HOPE RUBBER ESTATE, LIMITED

and its Subsidiaries.

ISSUED CAPITAL: £1,281,484 in 2s. shares at 28th February, 1962 (since increased to £2,203,502).

Directors: Sir Eric Macfadyen, J.P. (President elect), F. W. Harper, F.C.A. (Chairman), H. B. E. Hake, C.B.E., R. O. Jenkins, M.C., A. Arbuthnott, M.B.E., C.A.

Secretaries and Agents: Harrisons & Crosfield, Limited.

Summary of Report of Directors and Accounts for year ended 28th February, 1962.

PROFIT AND DIVIDEND		
Profit after tax		£517,732
Replanting expenditure		£146,975
Dividend for year—40 per cent. less tax		£313,963
TOTAL ASSETS (including new planting expenditure 1961/62—£77,652)		£3,774,794
NET CURRENT ASSETS		£293,187
CROPS	1961/62	1962/63 (Estimate)*
Rubber	13,563,330 lb.	19,000,000 lb.
Palm Oil/Kernels	8,035 ton	14,800 ton
Copra	—	8,000 ton
ESTATES		Acres
Planted: Rubber		26,449
Oil Palms		14,352
Coconuts		15,517
		56,318*
Replanted or new planted in 1961/62		1,490
Programme for 1962/63		1,992*

* including recently acquired subsidiaries Prang Besar and Straits Plantations.

A.G.M., 11 a.m. on 5th September, 1962, at The Queen's Room, The Baltic Exchange, St. Mary Axe, London, E.C.3.

WESTON-EVANS (HOLDINGS)

ANOTHER RECORD YEAR

The sixth annual general meeting of Weston-Evans (Holdings) Limited was held on August 9th in Manchester, **Lt.-Col. W. D. Gibbs** (the chairman) presiding. The following is an extract from his circulated statement:

Last year I was able to report record profits amounting to £197,423. This year the Group's profit for the year to March 31, 1962, is further improved at £218,176, an increase of £20,753.

Trading has continued on a satisfactory basis throughout the year for Weston-Evans & Co. Ltd., and W. P. Evans & Son Ltd., who manufacture textile finishing and paper making equipment respectively. Exports, particularly of the 'Rotabelt' Suction Unit, have been maintained at a high level. "Holgates" have made progress and your Directors are confident that this acquisition will continue to provide a useful contribution to the profits of the Group. In the U.S.A., sales of paper making equipment have been maintained and the sales of Nim-Cor Inc. are most promising.

Improved designs and development of new machines in the Group's range of textile finishing machines enables your Directors to look forward to the further expansion of this section of the Group's activities. "Thomas Bradford" has just completed the redesign of its range of laundry machines and from the interest being shown, it is envisaged that this Company will continue as one of the leaders of the Industry.

The report and accounts were adopted and the total dividend of 30 per cent less tax was approved.

This announcement appears as a matter of record only and is not an offer to sell nor a solicitation of an offer to buy any of these securities.

SCHLUMBERGER LIMITED

700,000 shares of Common Stock

August 1, 1962

The undersigned acted as consultants and advisors to the stockholders of the Company who were the sellers of the above-mentioned shares.

Istel, Lepercq & Co., Inc.

63 Wall Street

New York 5, New York

COMPAGNIE FRANÇAISE DES PÉTROLES

The Annual General Meeting of the Compagnie Française des Pétroles was held in Paris on June 28th, **Monsieur Victor de Metz** presiding. The following are extracts from the President's Statement and the report presented by the Board of Directors.

THE PRESIDENT'S STATEMENT

During the first three months of 1962, said Monsieur Victor de Metz, the Company marketed over 5¼ million tons. This represented continued expansion and correspondingly improved financial results.

Among the principal subsidiary companies, La Compagnie Française de Raffinage increased its tonnage by 12 per cent in the first five months compared with the same period in 1961, and the CFP (Algérie) tonnage was correspondingly increased by 11 per cent.

Consumption during the winter months showed varying increases according to product. Prices in many countries, said Monsieur de Metz, "are depressed as a result of surplus quantities available and we are trying, by observing the market very closely, not to upset it by incautious action. But the medium term prospects still remain good."

PARKINSON COWAN LIMITED

MR HUGH P. BARKER'S REVIEW

The Annual General Meeting of Parkinson Cowan Limited was held on August 10th in London.

The following is an extract from the written statement by **Mr Hugh P. Barker,** the Chairman, as supplemented by verbal observations at the meeting:

When I addressed you a year ago the Company was grappling with adversities mostly concerned with our domestic appliance activities. When I wrote to you in February last about the acquisition of the Wild Barfield Company I indicated that 1961-62 would be a very poor year, but that we could expect substantial improvements in 1962-63. So far these forecasts are being realised, and we expect to do moderately well unless there is unforeseen deterioration in trading conditions.

In spite of the net loss the Directors recommend an Ordinary dividend of 5 per cent be paid and feel justified in this step for two reasons. Firstly, because of improvement in the current year's trading, and secondly because we have available £39,000 in our dividend equalisation reserve. This reserve, which we shall hope soon to re-create, was provided for the purpose of paying dividends during bad times.

Our domestic appliance business is now improving quite rapidly, and we have introduced a basically new electrical thermal storage room heater called ConStor.

Our business in gas and liquid meters and associated electrical controls is now developing in a healthy way after a period of difficulty.

Our potentiality in the industrial heating field has been greatly augmented by the acquisition of the Wild Barfield Company. This Company is known throughout the world as a pioneer in the manufacture of electric furnaces. Our industrial gas heating business did very well last year and should do well again this year. Our business in Bastian & Allen electrode boilers is rather quiet, but we have no reason to doubt its future.

Our overseas business taken as a whole is showing a good improvement over last year.

THE LONGER FUTURE PROSPECT

The domestic appliance industry has become a traditional tool of Governments for alternately stimulating and depressing the whole economy. The thing which destroys orderly planning, efficient operation and morale in an industry is this fiscal chopping and changing. I would much prefer to see the present taxes and restrictions maintained at their present level for a long period than we should suffer another cycle of violent expansion and contraction.

As a result of pursuing a declared policy of expansion into industrial fields your Company is now very much concerned with capital goods for industry. This market reflects the degree of optimism which industry feels about its own future. Over the years ahead it is my conclusion that the capital goods industry as a whole must prosper and the state of this industry is a measure of the economic morale of the country. At this moment orders for all industrial equipment are weak and our industrial order books reflect the trend.

Our fortunes are particularly geared to the Gas Industry which we have faithfully served for so long. This industry has passed through the nadir of its fortunes and thanks to new technology is climbing back again.

The Report and Accounts were adopted.

Copies of the Report and Accounts can be obtained on application to the Secretary at Terminal House, Grosvenor Gardens, London, S.W.1.

REPORT OF THE DIRECTORS

The report opened with a general review of the world petroleum situation and outlined the Company's own activities in 1961.

PROFIT AND DIVIDEND: Net profit of the CFP amounted to NF106,899,418.91 and a gross dividend of NF6.50 (NF6 for 1960) per share of NF50 was agreed to be distributed.

SPECIAL NOTES

Total Oil Products (Gt. Britain) Ltd. developed its activities in Great Britain in 1961 by the putting into service of a chain of service stations. Formed in 1955 TOP (Gt. Britain) Ltd. has up till now limited itself to sales to wholesalers in London and Manchester. At the end of 1960 it decided to proceed to direct retail distribution. A hundred TOTAL service stations have therefore been opened in the districts of London and Manchester. TOP (Gt. Britain) Ltd., in the severe competition which characterises the sale of petrol products in Great Britain, can rely on the quality of TOTAL products as well as on the welcome and services extended to its clientele : for example, a huge car park for 500 cars, inaugurated in September, 1961, in the City of London, was equipped with a TOTAL service station.

The Compagnie Française des Pétroles is an associate of the Iraq Petroleum Company on an equal shares basis with British Petroleum, Shell, and the Esso Jersey-Socony Mobil Oil Group. The Iraq Group itself consists of four production companies, the Iraq Petroleum Co., the Mosul Petroleum Co., the Basrah Petroleum Co., and the Qatar Petroleum Co. In addition to a 6 per cent holding in the IOP Consortium the company has a 33.3 per cent holding in ADMA, the balance being held by BP.

Copies of the full Report and Accounts can be obtained from le Secrétariat Général, Compagnie Française des Pétroles, 5 rue Michel-Ange, Paris, 16e. CFP is the third largest oil company in the world outside the U.S.A., after Shell and BP.

APPOINTMENTS

THE SOCIAL SURVEY of the CENTRAL OFFICE OF INFORMATION requires an ASSISTANT INFORMATION OFFICER *(unestablished). Duties include performing the* calculations required in the design of sampling schemes, requiring both a detailed knowledge of the sources of samples and an appreciation of practical sampling problems and using this knowledge in giving clear instructions to the Survey's Field Staff. Applicants must have a mathematical aptitude and experience of sampling procedure and preference will be given to those with a degree in one of the social sciences, statistics or mathematics. Starting *salary will be fixed according* to experience and qualifications and will be on a scale which rises to £1,260 p.a. Write, giving age, full details of experience and qualifications, to Manager (PE/5090/PC), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

EXPERIENCED ACTUARY required by old-established firm of stockbrokers. Please reply in first instance to Box C360, c/o Walter Judd Ltd., 47 Gresham Street, London, E.C.2.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of DEPUTY FINANCE OFFICER. Candidates should be qualified accountants and should have had wide experience in accountancy ; experience of University finance would be an advantage. Initial salary not less than £1,800 per annum, according to qualifications and experience. Six copies of an application, together with the names of three referees should be sent not later than 7th September, 1962, to the Registrar, The University, Liverpool 3, from whom further particulars may be obtained. Quoting reference number CY/1481E.

For other appointments see page 659

THE DURHAM COLLEGES

IN THE UNIVERSITY OF DURHAM

Applications are invited for the post of LECTURER IN POLITICS from January 1, 1963.

Applications (three copies), together with the names of three referees, should be sent not later than September 17, 1962, to the Registrar and Secretary, 38 North Bailey, Durham, from whom further particulars may be obtained.

DURHAM COUNTY COUNCIL

PLANNING DEPARTMENT

RESEARCH ASSISTANT.—Salary £1,360-£1,535. Applicants must have a good Honours Degree in Economics, and experience in industrial location work with Industry, a Government department, or a Local Authority.

Housing available—Peterlee 12½ miles, Newton Aycliffe 12 miles from Durham.

Forms and particulars from the County Planning Officer, 10 Church Street, Durham. Closing date August 25, 1962.

Personally canvassing members of the Council is prohibited and the Council may declare any candidate infringing this rule to be disqualified for appointment.

J. T. BROCKBANK,
Clerk of the County Council.

LEADING STOCK EXCHANGE FIRM requires a SENIOR ASSISTANT for their expanding STATISTICAL DEPARTMENT. He should be aged 22-26 and must have gained a degree, preferably in Economics. Some commercial or financial knowledge would be an advantage. Applicants should write, stating age, qualifications and experience, to Box 1647.

WORLD AGRICULTURAL ECONOMICS AND RURAL SOCIOLOGY ABSTRACTS

ASSISTANT TO EDITOR

Applications are invited for the above-mentioned post, at present in Vienna, from £1,200 per annum. Further particulars from Director, University of Oxford Institute of Agrarian Affairs, 5 Magpie Lane, Oxford.

APPOINTMENTS REQUIRED

EXPORT MANAGER (33), widely travelled, excellent French, Spanish, Portuguese, first-class references, experienced, seeks position, home or abroad.—Box 1646

TOP RANK EXECUTIVE SEEKS BROAD GENERAL MANAGEMENT POST WITH PROSPECTS. Creative Chartered Accountant (33). Exceptionally broad public company boardroom experience. Chief Accountant, Secretarial Administration. At present with large company. First rank record and references.—Box 1645.

COMPANY AFFAIRS

In the London Stock Market this week equities have been firmer than for many months past and this has been reflected in the sharp jump in The Economist *indicator of 18.9 points to 336.5. Gains were widespread and interest in bank and oil shares was stimulated by the NP-District Bank merger and the Burmah Oil bid for Lobitos. Steel shares have also been to the fore and were helped on Thursday by an encouraging statement from John Summers. Gilt-edged have continued to forge ahead and undated stocks which have not shared fully in the earlier advance in this market have been in demand.*

John Brown

THE yield of 6 per cent on John Brown's £1 shares is sustained almost entirely by the group's interests in machine tools, which contributed about 60 per cent of net profits in the year to March 31st. Wickman and Firth Brown Tools must add to their trade and profit in the coming years to counterbalance the decline in shipbuilding earnings. Lord Aberconway, the chairman, has already forecast that shipbuilding profits will fall this year and he now says that competition is so keen that "to have any chance of success a tender must usually be on an unremunerative basis" though apparently John Brown is willing to accept such orders in order to preserve what employment it can at Clydebank. But the directors see no prospect in the next few years of earning a reasonable profit on them.

Years to March 31	1958 £ mil.	1959 £ mil.	1960 £ mil.	1961 £ mil.	1962 £ mil.
Trading profit	4·1	4·2	4·3	5·2	5·2

Dividend yield : 6%.
† Adjusted for scrip issue.

While Wickman enjoyed a "splendid trading year" and earned higher profits, Firth Brown Tools in a "busy year" earned lower profits (largely because it was in the throes of reorganisation). Firth Brown Tools is not yet completely reorganised and this will affect its profits in the current year. At Wickman the backlog of orders should ensure another good trading year ; but the rate of new orders now appears to be slackening and there is the danger that some capacity may be left underemployed. Profits in 1961-62 were adversely affected by the difficulties encountered by Constructors John Brown on its Persian contracts ; the extra costs involved amounted to over £1 million. CJB expects to obtain a settlement of claims on these contracts in due course and if and when it occurs it should benefit the group's trading account. It will be some gain, however, if the accounts of CJB do not show a substantial trading loss this year as they did in 1961-62. If John Brown succeeds in holding profits at the level of the last two financial years shareholders will have no cause to complain ; but equally in these circumstances they can expect nothing more than the rounding up of the dividend to 11 per cent.

Royal Dutch/Shell

OIL shares have stood up well to the stock market slump of the past few months, attracting investors as recovery stocks. The 5s. shares of "Shell" Transport and Trading have moved up this year from 27s. to 34s. 3d. to yield just under 6 per cent. ; they seem unlikely to fall back very far in view of the results of the Royal Dutch/Shell for the second quarter. These were up to best expectations and bear out the encouraging forecast made by the chairman, Mr F. J. Stephens, at the annual meeting when he attributed the sharp improvement in profits in the first quarter of 1962 to a substantial increase in sales and continued control of expenditure. These factors are evident in the results of the second quarter when the volume of sales was 13 per cent greater than twelve months earlier. But oil prices are still under pressure and total income from the sales after excise duties rose by only 7½ per cent. The group's success in reducing unit costs pegged back the increase in selling expenses to 6½ per cent and thus brought about a further improvement in margins. This has however been partly offset by a £2 million increase in depreciation in the second quarter and by a rise of over 25 per cent to £42 million in the tax charge.

Besides keeping a tight grip on its operating costs the group is also holding down its capital and exploration expenditure: for the first half of 1962 expenditure was virtually unchanged at the comparatively low figure of £174 million. This was more than covered by the group's cash flow, and its holdings of cash and short-term securities have risen further to almost £500 million, a level not exceeded since early in 1959. The rate of capital spending is a prime consideration when the "Shell" directors consider what dividends should be paid. They expect a higher level of capital projects in the "not too distant future" but they may well feel able, if the present trend of profits and improved margins continues in the second half of the year, to recommend a slightly higher tax free dividend than the maintained 25 per cent paid for 1961 on the capital as increased by the one for four scrip issue. For the first six months, earnings of the group attributable to "Shell" Transport shareholders amounted to 1s. 8d. a share, compared with 1s. 6d. a share for the first half of 1961.

Rootes Motors

THE announcement that Rootes will pay the dividend on its 5½ per cent preference shares out of reserves, as losses were incurred in the financial year ending on July 31st, confirms the accuracy of the warning given by Lord Rootes last November that the losses from the strike at the company's Acton factory last autumn might not be made good during the year. Though Rootes was in fact able to build up production to a high level by the summer, the costs and delays in doing so added to the loss of production directly attributable to the strike, and output for the year was probably below that for 1960-61.

Apart from the special factor of strike losses, Rootes suffered like other car manufacturers from pressure on margins, especially where sales in common market countries were concerned. Indeed, it may have suffered more than most ; the prices at which it sold the old Minx and Singer Gazelle models in Britain were one of the wonders of the motor trade, and significantly, they were raised slightly after purchase tax was reduced in April. Though at the moment Rootes is doing relatively well, it remains vulnerable to the competition of the two bigger manufacturers, and is heavily dependent on the success of the small car it is introducing next spring. To start this venture from a loss emphasises the speculative nature of its shares. The "A" shares have fallen back by 3d. to 4s. 6d. Last year the dividend on the "A" and the ordinary shares was cut from 12 to 4 per cent ; will the directors also draw on reserves to pay a token dividend again this year and so preserve trustee status for the ordinary shares ?

Richardsons, Westgarth

A YEAR ago the chairman of Richardsons, Westgarth, Mr O. J. Philipson, spoke of a "major and possibly prolonged recession in the shipbuilding industry" and saw "no positive indication of early recovery." Even so the results for the year to March 31st were so bad that Mr Philipson describes them as "extremely disappointing." The swing from a gross profit of £128,000 to a loss of £767,000 was accentuated by bigger provisions for depreciation, development expenditure and loan interest. But the group's plight is of a more fundamental nature. Further heavy provisions were "considered prudent against losses now envisaged on current contracts"; at least one major contract was apparently accepted at a loss in order to cover overheads and sustain the work programme; another contract for new plant brought unexpected problems which resulted in a loss. On the industrial power plant and heavy electrical plant sides, margins remained low.

But there is a strong suggestion in the report that the group's economy measures will bear some fruit this year. Overhead costs have been cut; marine oil engine production is being rationalised; and unremunerative works at Sunderland and Hartlepool are being shut down. It will take more than a year for the full benefit to emerge. Some older and less remunerative contracts have to be worked off. Even so, any loss for 1962-63 is expected to be relatively small in comparison with that sustained in 1961-62. This forecast is based primarily on the assumption of an increased demand for electricity generating plant from the CEGB. This field holds out the brightest prospect that Richardsons, Westgarth shares will ultimately return to the dividend lists after two years' absence. Since the preliminary statement the 10s. shares have gained 1s. 4½d. to 4s. 10½d.

Avana Associated Bakeries

In recent years, food has become increasingly important in Marks and Spencer's business, with particular emphasis on bakery products. Its main supplier is Avana Associated Bakeries. The advantages of this link can be seen from the profits record of Avana. Pre-tax profits have risen from £57,000 in 1957 to £261,000 in the year to March 31st last. Moreover it has been trading at higher margins (which has not been the experience of N. Corah, another major supplier to Marks and Spencer). While Avana added 10 per cent to its sales in 1961-62, its profits before tax rose by over 18 per cent, the wage increase that was granted mid way through the year being more than offset by cost-savings from greater mechanisation. A good deal of the new capital equipment has yet to make its full contribution to profits.

Funds for these capital projects have come from last September's rights issue. Liquid assets at the end of March amounted to £547,000, which covers immediate capital commitments of £106,000 comfortably, but the chairman, Mr I. R. Rees, says that further big sums will have to be spent on the bakery side to meet Marks and Spencer's growing requirements. It is not only in cakes (and particularly slab cake) that Avana has achieved steady growth; its jam-making subsidiary, Ledbury Preserves, has doubled its sales over the past ten years, when consumption generally has been falling. Ledbury has also secured a big contract with Marks and Spencer with the result that its sales rose a third last year. Here too rapid expansion based on the link with Marks and Spencer will mean further capital investment. The directors believe that this can best be achieved by floating Ledbury off as a separate public company, giving preferential treatment to Avana shareholders in the issue. This prospect boosted Avana 1s. shares to 16s. 1½d.; they yield just under 2¾ per cent on the assumption that the current dividend of 40 per cent is maintained on the capital after the one-for-ten scrip issue.

On the board of Avana is Mr Julian Hodge; his Gwent and West of England Enterprises has a sizeable stake in the company and it will presumably handle the public flotation of Ledbury. In an interim report Mr Hodge says that Gwent's profits are expected to be well in excess of those for 1960-61, and he has revised his forecast of the total dividend from 50 to 60 per cent (compared with the 40 per cent paid for the previous year before the rights issue).

Six months to	June 30, 1961 £'000s	Dec. 31, 1961 $000's	June 30, 1962 $000's
Net sales	258,845	258,381	248,691
Costs and expenses	177,693	163,042	155,197
Operating earnings	81,152	95,329	93,494
Total income	81,925	97,687	94,300
Income tax	30,981	29,895	25,361
Net earnings	44,272	51,124	52,344
Net earnings per share	$1·28	$1·74	$1·77

The quarterly figures show however that the improvement in earnings following the rise in nickel prices is being whittled down. The current prospect for nickel, like that for most other metals, is far from buoyant. A possible increase in Cuban output is a threat to prices, and in the longer term there remains the prospect that newly discovered nicket deposits will be exploited. Thus, while earnings per share this year should easily surpass last year's total of $3.02, and perhaps reach the record level of $3.25 attained in 1956, the directors of International Nickel have so far held the quarterly dividend at 40 cents per share. Some increase in future distributions is probably discounted in the yield of only 2½ per cent offered by International Nickel, although the price in London has fallen this year from $151½ to $120.

Canadian Pacific

LAST year's rise in the income of Canadian Pacific came almost entirely from higher net railway earnings. These reflected heavier freight traffic and the pruning of unprofitable routes and also the additional benefit of payments made to Canadian railways by the government pending consideration of the complete report of the MacPherson Royal Commission on Transportation. The interim report for the first half of 1962 presents a very different picture. The railways were distinctly less profitable: their gross revenue fell from $230.4 million to $218.7 million and, though expenses were lower, net railway earnings fell sharply from $17.2 million to $10 million. Other income, derived from the group's steamships, aircraft, investments, hotels and properties, rose from $3 million to $6.7 million but the net income of the group fell from $11.9 million to $8.3 million.

The interim dividend has been maintained at 75 cents per $25 stock; this requires $10¾ million, but net equity earnings amounted to only $6½ million. The decision to maintain the interim dividend by drawing on reserves suggests that the directors may be reluctant to reduce the total payment below last year's $1.50. But the stock market, where Canpacs have fallen to a new low point of London $38⅛, to yield 6½ per cent on the 1961 dividend, seems to reflect the possibility of a reduction.

International Nickel

As expected, International Nickel's results for the first half of this year show a marked improvement over those for the first half of 1961. The disposal of two subsidiaries resulted in lower sales but the group has earned bigger profits. Apart from the benefit of the higher price charged for nickel since June, 1961, the group has also gained from the depreciation of the Canadian dollar and from tax savings on sales from the new Thompson Mine. It also sold less of the "non-profit nickel" which it had earlier acquired from the United States government or its suppliers at market prices.

THE MONEY MARKET

THE discount market was twice forced to borrow from the Bank of England at Bank rate last week, but this did not deter the market from increasing its bid at last Friday's Treasury bill tender by a further 2d. to £99 1s. 1d. The average rate of discount fell closely in line by 8.21d. to 75s. 8.84d. per cent. Total applications for the £230 million of bills on offer fell by £7 million to £396 million and although the market's quota of bills dropped from 60 to 54 per cent, this was still a very satisfactory allotment.

There is no doubt that the official wish is that the bill rate should now either rise or at least remain where it is for the time being. On Tuesday seven or eight houses borrowed a moderate amount at the penal rate, and on Wednesday, the clearing banks' make-up day, one or two houses borrowed a small amount. Credit has been tight throughout the week and the rate for day-to-day loans has rarely fallen below 3⅝ per cent. This has kept the market's average borrowing costs high and the profit margin on bills is now very slim. However the market is at present earning such good margins on its bonds that it can take the squeeze on bill profits in its stride.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Greece is manufacturing only. United Kingdom includes construction. Germany excludes West Berlin and the Saar. Italy includes Trieste. The Saar is included with France before July, 1959, and with Germany after that date. Turkey, beginning September, 1960; 9 liras per U S dollar, previously 2·8. (2) Special trade, excluding re-exports with the exception of Ireland, Denmark, Norway and Sweden, which cover general trade. Belgium includes Luxemburg. (3) Special trade (excluding re-exports) with the exception of Ireland, Denmark, Norway and Sweden, which cover general trade. Belgium includes Luxemburg. (4) Special trade. (5) June, 112. (6) In capital cities only for France, Turkey, for Greece prior to January, 1960, and Austria prior to March, 1959; Denmark, Belgium and Austria (prior to March, 1959) excludes rent; Denmark includes direct taxes; Ireland based on August, 1953=100. (7) Index numbers of unit value which are influenced by changes in the composition of trade as well as price movements. Ireland seasonally adjusted. Turkey index in terms of U S dollars. (8) Holdings of the government and central bank. German figures from 1960 exclude long-term and earmarked assets; Norway and Sweden include foreign investments. Ireland includes some long-term British securities. (9) Average for first quarter. (1) July, 2,915. (2) July 376·1. (3) July 327·8.

APPOINTMENTS

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

STUDENTSHIPS FOR RESEARCH ON SOCIAL, ECONOMIC AND POLITICAL PROBLEMS IN AFRICA, SOUTH ASIA AND EAST AND SOUTH-EAST ASIA

The School offers two or three studentships to men and women with good Honours degrees, for advanced study or research on social, economic and political problems in Africa, South Asia, and East and South-East Asia. They will be available only to graduates of universities in the United Kingdom or to graduates of other universities who are already studying in the United Kingdom.

Each studentship will be of the value of at least £600 a year, and the holder will be required to register at the School as a full-time student and to undertake research in some branch of the studies named above. His programme of work will require the approval of the Director.

Applications must be received by September 6 for studentships tenable from the following October and should be addressed to the Secretary of the Graduate School, the London School of Economics and Political Science, Houghton Street, Aldwych, London, W.C.2.

INTERESTING VACANCY FOR A YOUNG WOMAN GRADUATE

aspire as Executive in the Marketing Intelligence Unit of a large international advertising agency.

Essential qualifications: University degree, preferably in economics, lively mind combined with plenty of common sense, curiosity and persistence, flair for good English, news sense, ability to get on with people, good nerves, sense of humour and a well-developed inclination for hard work at speed. Languages (particularly French, German and Italian) will be an advantage and so will experience of information work, advertising, market research or public relations. Applicants aged under 30 will be preferred.

Initial selection will be made on the quality of letters of application, which should be typed, if possible, and should attempt to do more than list qualifications and ambitions. Applications should be marked confidential and addressed to Miss Christine Hull, McCann-Erickson Advertising Ltd., McCann-Erickson House, New Cater Lane, London, E.C.4.

PIG INDUSTRY DEVELOPMENT AUTHORITY

require an

ASSISTANT to their ECONOMIST

Candidates should be either an economist with agricultural background or agriculturist with good knowledge of economics. Salary dependent upon age and experience. Contributory superannuation scheme. Five-day week.

Details and application form from Establishment Officer, 15 Ridgmount Street, London, W.C.1. Closing date August 29, 1962.

CENTRAL OFFICE OF INFORMATION

requires a JOURNALIST to assist in the Trade and Industries Section. Candidates should have had several years' general experience, be able to write concisely and clearly and be interested in the production of press material. Experience in the trade or technical press an advantage. The post is graded Assistant Information Officer (unestablished). Salary according to experience and qualifications rising to a maximum of £1,299 p.a. Writer, assistant age, full details of experience and qualifications, to Manager (PE.5088/PC), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

BIG opportunity: Assistant Editor needed by large group for brand new monthly in the marketing field. Intelligence and ability more important than experience but knowledge of modern marketing methods would be useful. Good salary.—White Box 1649.

CENTRAL OFFICE OF INFORMATION

requires experienced and knowledgeable industrial JOURNALISTS for the Trade and Industries Section (Overseas Press Services). Previous trade press or daily newspaper, or agency work on industrial beats essential. In some posts preference will be given to candidates with (a) ability to sub-edit a wide range of technical material and rewrite it at a lower technical level, (b) ability to interpret technical subjects to an intelligent non-specialist audience, (c) a wide background in the economics of trade. The posts are graded INFORMATION OFFICER (unestablished). Salary range £1,331 to £1,547 p.a. Write, giving age, full details of experience and qualifications, to Manager (PE.5106/PC), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

HOLLERITH UNIT

Applications are invited for the post of

MANAGER

of the large Hollerith punched card processing unit at the London Headquarters of the National Coal Board.

Considerable experience in the planning and control of mechanical data processing and an appreciation of the potentialities of punched card equipment are essential. Candidates should also have some general experience of the application of modern mechanical techniques to the whole field of operations commonly associated with large commercial offices.

There are attractive conditions of service, including a Superannuation scheme. A salary of up to £1,925 will be offered, depending on qualifications and experience.

Please write, giving full details, to Headquarters Staff Manager (Ref. X.39B) N.C.B., Hobart House, Grosvenor Place, London, S.W.1.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF HISTORY

Applications are invited for appointment as Lecturer or Assistant Lecturer in Asian History at a salary on the scale £1,150 x £50—£1,500 x £75—£1,950 (efficiency bar at £1,650) for a Lecturer, or within the range £900-£1,050 for an Assistant Lecturer, according to age, qualifications and experience. Applications (three copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than 30th September, 1962.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in AGRICULTURAL ECONOMICS. The Salary scale is £900 to £1,050 per annum. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than September 8th, 1962, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

FEDERATION OF RHODESIA AND NYASALAND

VACANCY: SECRETARY AGRICULTURAL MARKETING COUNCIL

MINISTRY OF ECONOMIC AFFAIRS

The Secretary serves a Council which advises the Minister of Economic Affairs on matters connected with prices of agricultural products and investigates marketing conditions. Annually it reviews all aspects of agricultural production and distribution in Northern and Southern Rhodesia and advises on the setting of crop prices to producers.

Applicants should preferably hold a degree in Agriculture or in Agricultural Economics and must have a sound practical and theoretical knowledge of the economics of agricultural production and marketing. Functions include giving the Council advice, detailed information, assessments of all the sometimes conflicting interests in marketing problems, an informed opinion on the issues it faces, services of meetings and executive action where necessary.

The post, initially on a three-year contract, is at a salary of £2,500 p.a. and should be occupied by the 1st November, 1962.

Generous Leave Conditions, Fares Paid for successful applicant and family to assume duty. Sunny climate, excellent recreational and educational facilities.

Application forms and further details from: The Secretary (R), Rhodesia House, 429 Strand, London, W.C.2. Closing date: 7th September, 1962.

INDUSTRIAL MARKET RESEARCH

Major manufacturers of precision components used throughout the engineering, automobile and allied industries are extending the specialisation of their planning operations and wish to appoint a Market Research Officer.

Applicants should be graduates with a good honours degree in economics or commerce, preferably with statistics, and with several years practical experience in industrial market research. Preferred age 28-33 years.

This is a new appointment and offers scope for a person capable of working on his own initiative.

Please apply giving full particulars of experience, qualifications and age to Box 1648.

THE ECONOMIST INTELLIGENCE UNIT

wishes to make further appointments to the staff of its Research Divisions. Candidates for these posts should have at least an upper second class degree preferably, but not necessarily, in economics or statistics, and should have had some experience in industry, finance, commerce or marketing; knowledge of foreign languages is an advantage.

Please send full particulars, including age, qualifications, experience and present salary, to "Research," 5, Bury Street, London, S.W.1.

For other appointments see page 652

UNIVERSITY OF NEW ENGLAND

ARMIDALE, NEW SOUTH WALES

SENIOR LECTURER OR LECTURER IN PUBLIC ADMINISTRATION

Applications are invited for the position of Senior Lecturer or Lecturer in Public Administration within the Faculty of Agricultural Economics. The successful applicant will be required to provide a course for senior undergraduates and should preferably be able to take up duty by March, 1963.

Salary will be within the range of £A2,550 x £A95—£A3,000 for a Senior Lecturer and £A1,730 x £A105—£A2,435 for a Lecturer, with commencing rates determined in accordance with qualifications and experience. In addition, a cost-of-living allowance at present amounting to £A41 per annum is payable. Provision is also made for travel and removal expenses, superannuation benefits, travel grants and full pay for study leave. Under the staff housing scheme an advance of up to 90 per cent or more in special cases may be made towards the cost of purchasing or building a house. Residential Fellowships may be awarded to a single person or a married couple.

Further information may be obtained from the Secretary, Association of Universities of the British Commonwealth (Room 43), Marlborough House, Pall Mall, London, S.W.1.

Applications close, in Australia and London, on 15th September, 1962.

UNIVERSITY OF ST. ANDREWS

Applications are invited for a Lectureship or Assistantship in Psychology in the Department of Psychology, Queen's College, Dundee, commencing 1st October, 1962, or as soon as possible thereafter. Salary scales: Lectureship, £1,150 by £50 to £1,500 (efficiency bar) by £75 to £1,950; Assistantship (three years with possible continuance for fourth year), £900 by £50 to £1,050. F.S.S.U., family allowance and grant towards furniture removal expenses. Applications (six copies, naming three referees) to be lodged not later than 22nd September, 1962, with the Secretary of the University, at Queen's College, Dundee, from whom further particulars may be obtained.

THE BRITISH ASSOCIATION OF ACCOUNTANTS AND AUDITORS LIMITED (Incorporated 1923). The next examinations will be held from the 15th to 23rd November, 1962. Membership can only be obtained by those who have passed the prescribed examinations. Copies of the Syllabus are obtainable from the Secretary, Stamford House, 2/4 Chiswick High Road, London, W.4.

WOLSEY HALL OXFORD

SECRETARIAL Training for Women, especially university graduates and older students, six-month and intensive 14-week courses.—Write Principal, Davies's, 158 Holland Park Avenue, W.11. PARK 4654.

THE FOOD AND AGRICULTURAL ORGANIZATION OF THE UNITED NATIONS

Fisheries Economics Branch seeks ECONOMIST with university degree in Economics or related field and minimum of 5 years' experience in applied economic research and considerable writing and editorial experience.

Initial salary $7,460 per annum, net of taxes, plus family allowance, education grant, pension and medical schemes, etc.

Applications should be sent to

THE CHIEF, RECRUITMENT SECTION,
FAO HEADQUARTERS,
VIALE DELLE TERME DI CARACALLA,
ROMA

under reference VA 591.

THE COMMON MARKET

An international professional firm with a large and rapidly expanding practice in Europe has vacancies on their staff in several countries for qualified accountants, whether recently qualified or with several years' experience since qualifying. Men with good experience on large audits and investigations would command a substantial salary and younger men of outstanding ability would be given rapid promotion. The positions offered provide attractive opportunities to accountants who either wish to make a career or to gain extensive experience of business conditions on the Continent of Europe. A knowledge of a foreign language would be an advantage but is not initially essential. Applications, giving full particulars of education and previous experience, should be addressed to Box 1640.

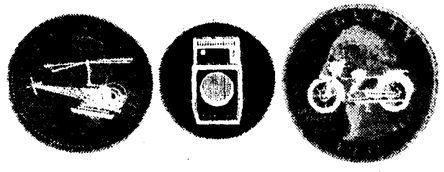
Link up with the bustling Japanese economy



More than 2000 firms in countries all over the world have made technological, manufacturing, marketing, and other types of industrial agreements with Japanese companies. With fewer restrictions nowadays on the flow of capital and technical know-how across national boundaries, more and more companies are discovering the advantages of such tie-ups. The Industrial Bank of Japan has been intimately associated with every major Japanese industry for 60 years and is well qualified to act as go-between in arranging attractive contracts in all lines of business. Inquiries are invited.

IPCORN

can give you all these services!

If you intend starting a new industry in Northern or Southern Rhodesia or Nyasaland, or if you want to expand your existing plant, IPCORN (which exists to stimulate industrial growth and development) can give all these advantages.

***ADVICE** Through its excellent relations with Governments, Municipalities and major industries, IPCORN is in a unique position to give impartial advice to prospective investors (particularly from overseas) on such subjects as sites, markets, labour availability, local finance, etc. IPCORN is also able to give technical advice on production, costing, accountancy, etc.

***FINANCE** Subject to certain broad principles, IPCORN will assist in the financing of approved projects. Proposals involving equity or preference participation, fixed or variable interest loans (convertible or otherwise), the underwriting of public issues or a combination of any or all of these will be considered.

***ON THE SPOT NEGOTIATIONS** IPCORN will negotiate on your behalf with Governments, Municipalities or other parties.

***FACTORY PREMISES** If you intend starting an industry in Rhodesia or Nyasaland, IPCORN's associated property company can buy or finance the building of a factory for you . . . to your own specifications . . . and can rent it to you on a long lease for a fair price. If you already have a factory here it can (a) buy it from you . . . thus giving you more working capital . . . and long lease it to you at a fair rental, and (b) rebuild it for you when you want to expand and modernise.

***CONTACT** A. C. Bartrum, General Manager of IPCORN at Bank Chambers 76 Jameson Avenue, P.O. Box 134, Tel. 60830, Salisbury, Southern Rhodesia.

WHAT CAN THE MATTER BE!

This is the Hitachi Electron Microscope . . . so powerful it probes the very essence of matter. It not only magnifies to an unparalleled 300,000 times, but, through electronic x-ray, actually penetrates surfaces revealing the interior structure of materials and organisms. Already the microscope has proved an indispensable tool for hospitals, natural science and industry. The counterpart of the more advanced HU-11 model illustrated above was awarded the Grand Prix at the Brussels World Fair. This is mistakable quality born out of the advanced research techniques applied at the Hitachi laboratories and facturing plants. Similar quality can be found in the than 10,000 products for industry and the home that the mark of Hitachi. Few firms anywhere can com with the scope of Hitachi, one of the larges elec manufacturers in the world.

SECOND CLASS POSTAGE FOR *THE ECONOMIST* PAID AT NEW YORK, N.Y.
Published weekly every Saturday, fifty-two times a year in London, England.

The Economist this Week August 25, 1962

INTERNATIONAL

RESPONSIBILITIES IN AFRICA

Kenya, hastening towards independence, presents a confused pattern of tribal rivalries and potential disunity. The remaining whites have to resist the temptation to take sides (p. 671).

If lack of support from Britain cripples U Thant's proposals to push the **Congo** towards unity by economic means, the UN could be left with the grim alternatives of quitting the Congo altogether or using force (p. 674).

MOSCOW AND US

The Economist, **in Russian eyes,** is a toady of the City, its radicalism a mere mask for the defence of capitalism and imperialism by more subtle means than usual (p. 675).

In **Hungary,** Stalinists are in disgrace (p. 681); in **Rumania** Mr Gheorgiu-Dej has hung on to power through Stalinism and Krushchevism alike (p. 707).

Economic crisis has reconverted the **Chinese** leaders to birth control (p. 705).

US AND NEIGHBOURS

President Kennedy's endorsement of the **Mexican** revolution of 1910 has helped Washington's relations with its southern neighbour (p. 706); but when **Latin Americans** gather together resentment against the United States is a recurrent theme (p. 707).

The first anniversary of the **Alliance for Progress** was no occasion for celebration (p. 696).

Negroes in the United States are becoming increasingly impatient at the token integration with which southern whites are trying to satisfy them (p. 695).

President Kennedy's non-political trip to the West launched this year's political campaign (p. 696). Contrary to many people's expectations his brother is making an excellent **Attorney General** (p. 699).

The filibuster against the **communications satellite** Bill may not have been entirely inexcusable (p. 698).

Spending on **highways** provides a way of speeding up the economy (p. 698).

THE BERLIN BRINK

The withdrawal of the Russian commandant from **east Berlin** gives the **east Germans** more authority than ever (p. 677).

Refugees who scale the **Berlin wall** should be given medical but not military assistance (p. 677).

An outbreak of **banditry** in southern **France** has been followed by a fourth unsuccessful attempt to **assassinate President de Gaulle** (p. 677).

ARAB ANTAGONISMS

Merging **Aden** with the **Federation** of South Arabia will not shield it from the wind of nationalism (p. 679).

Iraqi bombardment of Kurdish villages in **Turkey has been resisted by the Turks, but the Kurds' itch for autonomy could threaten Turkey too (p. 680).**

In **Saudi Arabia** a princely reformer has lost his passport (p. 679).

TROUBLED WATERS

Sardinian fishermen are tussling with feudal landlords for the right to fish (p. 704).

HOME

CONGENITAL MYOPIA

The TUC, under Mr Woodcock's leadership, has produced some welcome new thinking on matters outside its control: but, in those matters for which it is responsible, no progress has been made. The consequences of this refusal to face reality could be as bad for trade unionism as it is for Britain (p. 673).

The Scots have worked themselves into an excusably worried state over the decline of their country's prosperity, for which **Whitehall** has so far produced no satisfactory answer (p. 691).

Stevenage New Town has been shocked by the loss of 2,000 jobs after **Blue Water's abandonment**—perhaps into a less hostile view of its own expansion (p. 692).

Behind some careful hedging—including its own plan for temperate agriculture—the **National Farmers' Union** has dug a last ditch of restrictionist opposition to the common market: this should cut no ice with the Government; and it may not impress many farmers (p. 678).

This year's radio show is characterised by the pathetic optimism of manufacturers (p. 722).

RESTRICTED DIET

Cartels are unpopular, and that in nitrogen, **Nitrex,** will have to step carefully if it is to avoid EEC's disapproval: it will have its job cut out, in any case, to achieve its aims (p. 712).

The accession of a new **Lord Chamberlain** may just conceivably mean that English playgoers will more often be allowed to be adults in their own right (p. 682).

The best solution to **Malta's** present tribulations may well be the early granting of its professed wish to be independent within the Commonwealth (p. 680).

SELF-INFLICTED WOUNDS

Attempts to prevent a recurrence of the **thalidomide disaster** may not wholly succeed; but such tragedies might be limited by a change in the present system for the approval of drugs—which is no system at all (p. 711).

Little fascist—and **anti-fascist**—sores continue to suppurate on the body politic: the salves so far applied may not be best for its health (p. 679).

Britons may well wonder whether they are as neurotic as a recent doctors' report would have them (p. 692).

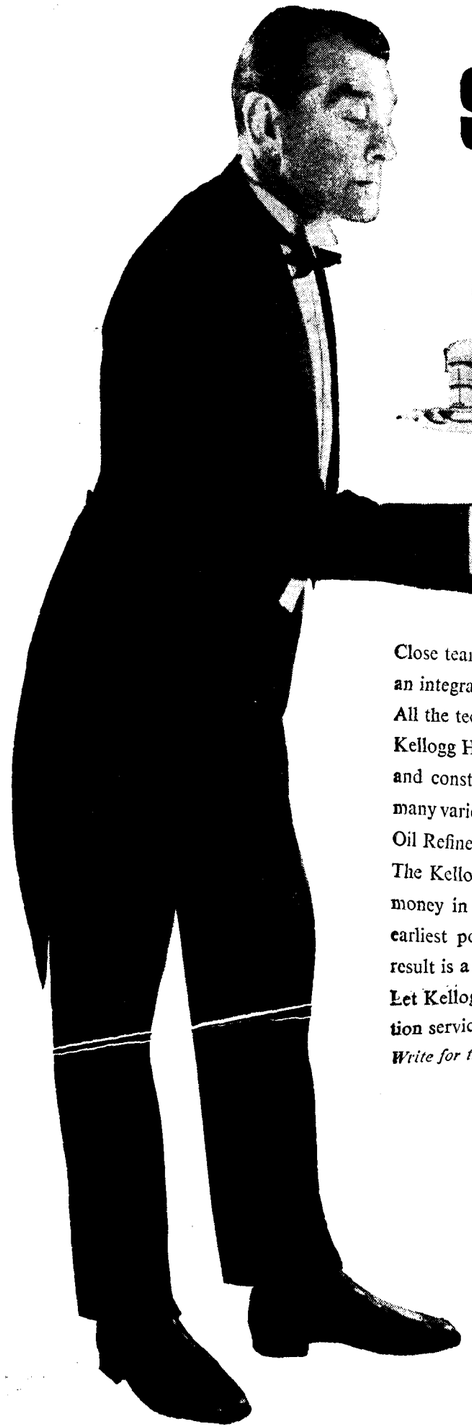
HERD INSTINCT

The Government has got **the army** of 165,000 it predicted for itself: but it is still not large enough, and its growth in better outside economic conditions is not assured (p. 678).

The gross overcrowding of British prisons has its remedies, and its palliatives, which in turn could be good for the penal system; but the problem remains a formidable one (p. 680).

London's newly-authorised Underground line from Victoria will, perhaps, relieve the morning agony of many **Londoners**; but it will not pay its way on the present fare scale (p. 717).

Detailed contents on page 671



SERVICEABILITY

Close teamwork in all operations at home and abroad, and with client staffs, is an integral part of the Kellogg service.

All the technological and scientific knowledge of the engineers and scientists at Kellogg House and at the Kellogg laboratories in America is applied to the design and construction of your plant. This knowledge has been used successfully on many varied projects such as Chemical Plants, Steel and Paper Mills, Copper and Oil Refineries, and other processing plants in all parts of the world.

The Kellogg method has improved process and plant engineering. It has saved money in procuring materials and equipment, expedited erection, achieved the earliest possible on-stream dates and stayed within pre-determined costs. The result is a plant which gives you the best possible service obtainable.

Let Kellogg show you how their coordinated engineering-procurement-construction service can work for you.

Write for the booklet "On The Job With Kellogg International Corporation".

Descending Mount Kenya

CLIMBING a mountain does not make it disappear, but it does become easier to see how big the mountain is; how precipitous its drops; how rocky its slopes. Less than three years ago the British Government, returned to power with a majority large enough for courage, initiated an assault on the Everest of all colonial entanglements—white-settled east and central Africa. The major constitutional peaks have since been conquered, but a safe return to a Britain free of colonial responsibilities is still a hair-raising and immeasurable time away. In Kenya independence is unlikely to mean the immediate and complete disentanglement so earnestly desired by both the Kenya Africans and the British Government. Unlike the west African countries, Kenya will go into independence without financial reserves, without a second generation of educated Africans, without much hope of regularly balancing its budget. It will be controlled (if that is the word) by a highly unstable government charged with the task of keeping the peace between hostile tribes. About 60,000 white people from Britain are likely to be caught in this trap and may need to be rescued.

The sad fact is that this is where the "wind of change" takes us. There is no doubt that the policy known by that name was right. It was, indeed, above all a recognition of the inevitable; and there are some countries (Uganda, Nyasaland, perhaps Tanganyika) where the results may even prove happy. To relinquish power is not, however, to get free of all responsibility. The casualties must be taken care of, and everyone in Kenya, black and white, is in danger of becoming in some way a casualty of the process of historical change. This could hardly have been foreseen by Mr Macleod, who, appointed Colonial Secretary in October, 1959, bravely saw his job as the unpleasant one of dishing the whites and putting his territories on the short road to black political power. There was no other course.

The wise descent, down slopes that inspire just as much fear in spite of being more clearly visible, requires equal boldness. It is true that many of Kenya's present ills could be cured if its African politicians were wiser, less ambitious men. But, whatever the extent of African folly, it would help if white Kenyans no less than expatriate civil servants and Colonial Office officials resisted the temptation to take sides and to keep the Africans divided.

The trouble is that the whites in Kenya, official and unofficial, are a divisive force. The reason is not hard to find. They have not only been forced to submit to the uncertain political authority of their former servants; they have also had to live through the Mau Mau rebellion. If Africans reply that things were hard for them when the whites were on top, this does not make the present situation of white Kenyans any more enviable. The argument is circular: if too many white Kenyans leave Kenya the economy may be so hard hit that life will be made even more harsh for black Kenyans.

Armed with this knowledge, and driven by an almost pathological dislike of the Kikuyu (the Mau Mau tribe), many administrators and white farmers hope (and sometimes work) for the political isolation of the Kikuyu. This is the privately avowed object, too, of the more backward pastoralist tribes that make up the bulk of the support of the Kenya African Democratic Union (Kadu); and it is often the sullen wish of leaders of dissident tribes within the majority Kenya African National Union (Kanu).

The Kikuyu themselves do not help. Many of their most modern and anti-

tribalist-minded men still rub it in that politics in Kenya began with the Kikuyu; that their tribe is the most advanced of them all; and that the largest proportion of Kenya's best African brains are Kikuyu. And the core of Kenya's political problems, as some people see it, is the natural hunger for land that was aroused in the Kikuyu when they first became conscious that they were surrounded in the middle of southern Kenya by a wealthy white settlement.

Yet there is no single core to Kenya's political problems; the divisions are more than simply tribal. In the elections of February, 1961, Kadu's rural tribes gave it little more than 16 per cent of the common roll (mainly African) votes; Kanu won 67 per cent of these votes. Kadu argues that many of its supporters were too isolated in the bush to come and register or vote. But however this may be, the division of interest between these two parties tends to grow into a division of outlook. Kadu represents a gathering of the weaker, more backward clans operating in self-defence under a more or less corporate leadership. Its policy of "majimbo" (regionalism) is an attempt to win entrenched protection from a future central government that it fears may be dominated by authoritarian Kikuyu politicians.

The unfortunate result of this policy, however, has been to spotlight the attractions of locally-based political power before every twopenny leader in Kenya: indeed, Kanu itself is suffering the strains of this attraction. The Luo within Kanu are divided between those who are happy about working with the Kikuyu and those who are not—and white administrators cheerfully point out that the Luo-Kikuyu political alliance always seemed an unnatural thing, in view of long-standing tribal divisions. The Kamba tribe, whose members make up a fifth of Kenya's police force and a third of its three battalions of King's African Rifles, is willing to support Kanu, but some of its members would prefer to be dissociated from the Kikuyu within the party.

OFFICIAL Kanu policy dictates the orthodox pan-African solution of a unitary state designed to crusade against tribalism with the heavy weapons of one strong party and leader. But the actual structure of Kanu is a gathering of local political bosses all surprisingly unwilling to accept the supreme authority of Mr Jomo Kenyatta. This is not only because Mr Kenyatta is old and must one day be replaced; it is also because he himself is finding it difficult to choose between personalities within his party.

The Kenya whites—and the British Government—have no such difficulty. To them Kanu is divided between a "nasty" left wing led by Mr Oginga Odinga and Mr Paul Ngei, and a "nice" right wing led by Mr Tom Mboya and Mr James Gichuru. Yet this is too simple. Mr Mboya, who has made the fateful leap from revolutionary to cautious, constructive minister, is handicapped in African eyes by seeming too tied up with the Americans; Messrs Odinga and Ngei, comfortably free of ministerial responsibility, seem to win more crowd appeal with cries against the whites and for higher wages and more land. It will be dangerous for both the whites and Mr Mboya if their present flirtation continues.

But Mr Mboya is right when he says that the best long-term answer to the present wave of political thuggery in some parts of Kenya is to provide jobs: unemployment is another hard core problem that requires an urgent solution. Hopefully, the present Kanu-Kadu joint cabinet has produced a list of projects designed to alleviate unemployment. These would cost £5½ million; a ministerial delegation returned to Nairobi from London on August 14th bearing promises of £1½ million from the Colonial Development Corporation and an assurance from the Colonial Office that the Treasury would be asked to see what it could do about the rest. But the Kenya ministers, when they visit America next month, will look for some millions there. Again, by undertaking to settle Africans on a million acres of the former White Highlands the Colonial Office has at once made a stride towards assuaging land hunger and rescuing Europeans (whose farms, under the scheme, have to be bought). Even this latest and largest extension of land settlement horizons will soon have to be extended, and the extra cost faced. Thus, for the Treasury, the first truth is that this most expensive of colonies is going to cost much more still: to continue present development plans; to help balance future budgets; to bail out white civil servants (at £10,000 apiece in compensation and other payments); to buy land from small European farmers caught in a mess created for them by the British Government.

For their part, the Colonial Office, and its administrators on the spot, have to recognise that Kenya is fast becoming an African country, not a multi- or non-racial country. (Sir Michael Blundell recognised this, after many years of saying the opposite, when he retired to the back benches in June.) It will mean accepting some run-down in the scope and standards of the future administration; in the economy; and in the number of small European farmers and business men who are likely to want to stay.

Not the least bitter pill to be swallowed is the likelihood that the most attractive politicians to Kenya's people (tribal considerations aside) will be those who are most radical. Where the frustrations of poverty and ignorance persist, this is always likely to be the case. It is better to accept this and work in the knowledge that the Paul Ngeis and the Oginga Odingas are likely to wield great influence in the future, than piously to hope that some Uncle Tom will pull the British and the West through. More success will come from such a recognition than from an anxious following of every political jump within Kanu (or outside it) to see whose faction, at any particular moment, is up.

In any event this sort of question will be answered, for a while at least, in elections that will probably be held next February under a new constitution. The details are still being worked out by the commissions and inquiries that Mr Maudling set up when he was Colonial Secretary. (He now finds himself at the paying end.) In essence there will be a strong central government, but entrenched regional powers over local government, land, education, health, police and other functions. The danger is that, faced with a strongly entrenched regionalism in the constitution, Kanu will feel forced to break it (and blame the whites). Alternatively, if the centre looks strong, Kadu will become the destructive force. After the elections Kenya will have a government and a prime minister responsible to its own parliament; it will be up to this government to set the number of months Britain can stay before leaving a formally independent state behind—and, probably, taking its expensive military base with it. The way down is long, and there is heavy mist at the bottom.

Still in Blinkers

The general council's report and the published agenda for the Trades Union Congress in ten days' time are mostly a disheartening record of opportunities missed

THE annual report of the general council of the Trades Union Congress shows the limits of the progress which that body has made during the two years of Mr George Woodcock's general secretaryship. On all subjects where the TUC's opinion is valuable to have but does not decide the matter—for example, on budgetary policy, on education and on relations with Europe—there has been a clear advance. On all such questions, the general council's pronouncements to the Government and memoranda of evidence to royal commissions are more closely reasoned, more interesting to read and certainly more articulate than ever before. This is the advantage of having as the TUC's chief bureaucrat an intelligent and modern-minded man. But on all matters where the general council might be required to give a lead to its own union colleagues, instead of merely advising outsiders, the picture is much bleaker; the sad truth is that members of the general council are still running away from all the real problems of leadership that could in any way be temporarily embarrassing to them.

This charge of evasion of responsibility does not derive merely, or even mainly, from the general council's attitude towards the proposed National Incomes Commission. The reasons which trade union leaders are adducing for their hostility to Nic are certainly pretty odd. It is hardly a brilliant excuse for boycott to exclaim that one is apprehensive that Nic may become "a device for discrediting the trade union movement before public opinion" (though this will happen if the trade unions go on being an autonomous force pushing the country into cost inflation), or that one is acting out of pique that there was no "prior consultation" before the new policy was announced (which, in plain fact, there was). But, maladroit though some of these protestations are, there was never really any possibility that the TUC would actually welcome Nic; indeed one would be apprehensive about the body Nic might be if, after consultation with Mr Maudling, the TUC had said that it could heartily welcome it.

The most that one could have hoped for—and should have hoped for—was that the labour leaders should adopt an attitude to Nic something like that which business monopolies take up towards investigation by the Monopolies Commission: grudging readiness to argue both before and after specific recommendations have been published, to modify those practices and claims which they know they will not really be able to justify in the final argument, but not to give any prior commitment to accept Nic's judgment as necessarily the last word. In any case, the ultimate word—whether or not to try to call a strike against any award that was deemed to be unsatisfactory—would have to lie with individual trade union leaders. The right position for the general council to have sought would have been on the fence between Nic and any trade union leaders that were congenitally likely to strike. It would then be able to lean its influence now one way (as it did against extension of Mr Cousins's bus strike in 1958), and in other cases (with greater effect) the other way when it felt that the case for battle was made out. By shouting so shrilly against the umpire before he has even appeared at the wicket, Mr Woodcock has cast away an opportunity to exercise prudent future leadership from Congress House.

THIS forfeiture is the more serious because in the two years since his succession as general secretary was formally announced, Mr Woodcock has simultaneously failed to confront the trade union movement with the two big problems that have long lain before it: first, the improvement of its relations with the community as a whole, and secondly, the overhaul of relations between trade union leaders and their own members. At one time, Mr Gaitskell, for one, was plainly hoping that a determined new broom from Mr Woodcock would help to dispel the fusty public odour pervading so many aspects of trade union affairs—one of the Labour party's worst political handicaps. The big need here has been to give the trade union movement an organisation at the centre that looks capable of doing some thinking and showing some feeling about industrial affairs. Sometimes all that has been required has been a readiness by somebody at the centre either to explain or publicly to castigate individual *sottises* committed down the line. Labour leaders should never underestimate the damage that is done to their cause when the newspapers are filled with stories (as has happened this week) of an elderly children's playground attendant in Essex being hounded out of his job because he refuses to sign up for some union, or of other acts of petty persecution, while official trade unionism passes blinkered on the other side, like the Levite. More generally, however, what is needed is a more constant sign that union leaders are at last ready to start thinking about the awkward problems of the new age. At present the motto seems to be: "Don't just stand there talking. Do nothing."

A classic example of the TUC following this bad advice appears in this week's annual report from its general council. By any odds, the most dramatic trade union event of the past year was the fact that 3 million workers in the engineering industry—more than one-third of the TUC's total membership—were asked by their leaders to authorise strike action last winter, and then showed overwhelmingly by secret ballot that they had no wish to do so. This vote provided convincing refutation of the myth that moderate trade union leaders have to fight a constant battle to hold back their militant rank and file. In fact, although most trade union leaders are more moderate than their trade union no'o's, they are more combative and more old-fashioned than most of their ordinary members in modern industries—and it is plain that many recent strikes have been fought with a majority of grudging conscripts rather than by eager and militant volunteers.

One can argue interminably what changes should flow from this realisation; for example, whether or not it should impose

a moral obligation on all unions to require a secret ballot of their members before compelling them into strike action in future ; whether indeed the law should require a secret ballot in this way. Certainly, to write a report on trade union affairs in 1961-62 without discussing the implications of this engineering vote is like writing a history of the Second World War without mentioning the German invasion of Russia.

It may be said that the trade union movement is not the only body in Britain which prefers to shut its eyes to the changing times ; the fact remains that it is by far the worst case. Two years ago there seemed to be hope that the accession of an energetic new general secretary might begin to spark off that reform ; is it already true that Mr Woodcock is not going to provide that main motive force himself ? If so, the medium and long term consequences for British politics and industrial legislation could be profound. If the Tories manage to secure economic recovery before the end of this Parliament, then Labour's connection with this rooted trade union movement will again count heavily against it at the next election. If the Tories do not recover and Labour comes to office, then the next Labour government will find the TUC in its present state a most embarrassing ally for a progressive administration ; indeed the probability is that Labour when next in office will gradually find it necessary to free itself from excessive influence by the big trade unions, in much the same way as Tory governments in the 1950s gradually and successfully shook themselves free from their old sort of influence from big business. Should a Labour government fail to shake free, the Tories while in opposition will almost certainly become such shriller critics of present-day union leadership than they have found it prudent to be while in office ; it seems more than conceivable that any Tory government returning to power in, say, 1968, after having been in opposition since, say, 1964 might bring back with it a policy pledged to submit British trade unionism to legislative reform—at least for the safeguarding of individuals' rights, the examination of restrictive labour practices, and the limitation of the special privileges conferred by the Trade Union Act of 1906 to unions which operate under certain model rules.

In the long term, such legislative reform would be no bad thing. Obviously, however, sensible union leaders today would take action before the country is forced into it. There is one way in which they could make a start at the congress in Blackpool Opera House in ten days' time. The first three motions down for debate at that congress—tabled by the post office workers, public employees and chemical workers—talk of the need for some inquiry into the possibility of changing the " out-dated structure of British trade unionism." It may be doubted whether the sponsoring unions have any really clear idea of what their own notions should mean. But if the general council were wise, it would say that it proposes to set up a committee to study this wide question and to publish a report. The best sort of committee would be one composed not of present-day members of the council, but of major trade union leaders who have recently retired from active duty, plus picked men and women from other branches of the labour movement ; the nearest analogy would be the Gaitskell committee on the Co-operative Movement a few years ago, whose forward-looking report caused grave dissent among the Co-ops but has served to start to revive the Co-ops' desperately drooping fortunes where and when it has been put into effect. Any such report on trade unionism would almost certainly recommend that more power to guide the whole movement should be given to a central and strengthened general council. Is there any hope that the present general council might decide to ask some such committee to start playing Pygmalion in building a new constitution for British trade unionism ? Unfortunately, on current trends, the answer seems to be a quotation from Pygmalion itself.

Katanga Word and Deed

September is the Congo's now traditional time of troubles. Is British policy making trouble less likely, or more?

THE official British reaction to U Thant's latest proposals for a settlement in the Congo has taken a familiar shape. The Government has made known its " warm and full approval " of the proposals, and indicated its disapproval of the idea of putting economic pressure on Mr Tshombe's secessionist regime if it spurns them. The London view is that Mr Tshombe and his backers ought not to be even threatened with pressure ; they should only be reasoned with.

For two years now this barrage of reasoning has been laid upon Elisabethville. Throughout the second year there has existed a Congo government that is recognised by all other nations, and that is as representative as any Congo government we are likely to get. The head of this government, Mr Adoula, has shown remarkable readiness to negotiate at length with the leaders of an armed rebellion that maintains its grip on his country's richest resources only with foreign help and connivance. He has also shown unpredictable staying power ; but it is doubtful how much longer he can hold on if the Katanga secession continues. And there is as yet no sign that it will be ended merely by the reasoning that has been brought to bear on the secessionists by the UN, by some member governments, and even, we are assured, by Sir Roy Welensky.

Mr Tshombe takes more account of deeds than of words. British and Rhodesian ministers and officials tell him he cannot hold out ; but, to put it no higher, nothing they do is calculated to ease him out. Nor are the logistics much help. UN attempts to restrict his external communications cannot close the connection with the Rhodesian frontier. The British-controlled Benguela Railway still carries to the sea most of the mineral exports on which he collects the dues. UN plans for a boycott of Katanga copper would flop if Britain would not join in and might not succeed even if it did. Each time the use of force against Mr Tshombe's regime is mooted, he can count on vigorous British diplomatic moves to discourage it, and probably on the arrival of Rhodesian reinforcements at the frontier.

He is now reported (gratefully trading deeds for deeds ?) to have provided financial aid for political groups working against the African nationalist parties in the Rhodesias and Nyasaland, as well as providing quasi-military training for supporters of one such group. These extra-mural activities illustrate the singular power that the Tshombists' grip on the Katanga revenues gives them ; is it likely that reason, unsupported by the leverage of self-interest, will bring them to relinquish such power and wealth after two habit-forming years ?

U Thant has not yet formally forwarded his new proposals to Mr Tshombe, or revealed just how long he will wait, failing acceptance, before asking for a boycott of Katanga minerals. But already Mr Tshombe has offered a characteristic counter-proposal: an invitation to discuss transferring to the Congo government such of his funds as are " not indispensable to the functioning of our administration and our economy." (Would his private accounts in Geneva, still regularly replenished by the Union Minière, and the funds so lavishly deployed along Madison Avenue be " indispensable " ?) This invitation to a long safari through the jungle of Elisabethville's political account-books has been coolly received in New York. U Thant had already remarked that " the delays and evasive tactics which have been so artfully deployed by Mr Tshombe are dangerous and cannot be indefinitely tolerated either by the UN or by the central government."

The secretary-general's statement on Monday went on to give warning that if the secession were not quickly ended, the UN might soon have to choose between quitting the Congo or authorising " all necessary measures " (that is, force) to deal with the secessionists. That is indeed the looming choice. It may be impossible to reason Mr Tshombe into accepting the fact that he cannot carry on any longer like this ; but it is only too clear to the UN that it cannot. There may be grave doubt whether economic pressures can be made to work against Mr Tshombe. But they are the only means by which the UN may escape the awful choice between using military force and chucking the Congo back into chaos.

As Another Sees Us

In the July 1962 issue of the journal of the Institute of World Economy and International Relations in Moscow, an article of some 3,000 words, with an introductory note, commented on the foreign policy content of *The Economist* in the first four months of this year. Some extracts follow

The Economist (January-April 1962) on England's present foreign policy

BY VIKENTI MATVEYEV, COMMENTATOR OF " IZVESTIA "

Introductory Note

Karl Marx described *The Economist* as the most sensible, reasonable and moderate organ of the English industrial bourgeois. . . . Today, as of old, the journal declares an attachment to radical ideas, but now this serves as a cover for this City mouthpiece's perpetual fear of the present and, still more, of the future. . . .

The Economist very clearly reflects that school of thought in the English ruling class that aims at a more or less painless adjustment to the new times, an adjustment that must enable the English finance bourgeoisie in some changed form to harvest, as before, the rich fruit of power over the peoples at home and abroad. But the emphasis is precisely on the problem of . . . achieving the former imperialist aims by some other means. . . .

Among the direct owners of the journal . . . are the City banking magnates Cadbury, Layton, Rothschild, Schroeder, Brand and others. The representatives of finance capital, understandably, try to hide their leading role in determining the government's policy. . . . Organs like *The Economist* provide a channel . . . invisible to the naked eye. . . . *The Economist* always acts as the Government's " friendly adviser," sometimes addressing criticism to it, indicating that it ought to do " the same thing, but better."

The fate of the last English colonies

. . . The journal criticises the Foreign Secretary's speech of December 28, 1961, in which he posed the question of " reform of the United Nations " and came down heavily on UN members that had condemned colonialism. It comments that Home's yearning for the past, when England ruled the seas, will not ward off what is now occurring, and may further weaken the " non-communist world." . . . The journal thinks it useless to try to defend English privileges in Rhodesia in unchanged forms. . . . At the same time it takes up Home's formula (*sic*) about UN reform—it suggests seeking decisions in the UN that would " secure the peaceful transformation of obviously explosive situations." It indicates that Dag Hammarskjöld's mind worked in that direction. But what it has in mind is not made clear. Hints and half-hints, Aesopian language, circumlocutions—all this is beloved by *The Economist*, *The Times* and their fellows. . . . Clearly, this is one variation on its general line—to win by diplomacy and manœuvre what English imperialism cannot now win by force. . . . *The Economist* is not worried about the interests of " African nationalism," but about those of the white (in this case, English) " masters " . . .

In an article on January 20th, headed " How to Use the UN," the journal, unashamed of its cynicism, urges the Government " not to deny national interests, but to try to harness them for profit." . . . Just in this direction run the thoughts of the strategists of English imperialism. . . .

[The sentence purportedly quoted actually read: " The whole UN experiment makes much more sense as an attempt, not to deny the reality of national interests, but to harness the force of these as much as possible for common ends."]

On January 13th it published an article, " A Message for Sir Roy " (Welensky)—the racist ruler of the Federation of Rhodesia and Nyasaland. . . . It wrote:

" The Government must find the courage to give a liberal constitution to Northern Rhodesia and, as civilly as possible, to make plain to Sir Roy that his assistance in the international sphere is no longer required. It is sad, even tragic, but any other way might be disastrous."

The journal's call for Welensky's resignation (*sic*), dictated, as is quite clear, by a wish to preserve England's imperialist position in Africa under another sign, aroused angry comments

from "ultra"-conservatives . . . in the form of letters from members of the English administration in Rhodesia and from prominent Tories in England itself. How did *The Economist* react? For some time it did not recur to the Rhodesian question, thinking it best not to prolong the polemics. . . .

[Rhodesia was the subject of articles or notes in the issues of January 27th, February 3rd, 10th and 17th, March 3rd, 10th, 17th and 24th, April 7th, 21st and 28th.]

. . . On April 14th, *The Economist* concluded that, even after granting Kenya independence, England could keep it under the invisible boots of its economic domination. . . .

[The article, in fact, pleaded Kenya's right to continued economic aid after independence.]

England and Europe

. . . The journal is one of the loudest mouthpieces in the campaign, conducted in the British Isles by influential finance-capital groups with support from across the ocean, for England's entry into the common market. . . . It soothed its readers even when unmistakable warnings came from across the Channel. . . . After Adenauer's interview with *Le Monde*, in which he made clear that the British Commonwealth could not be maintained in its present form after England entered the market . . . an article on March 31st recommended that no alarm should be shown over this, as the preference system would need to be reconsidered in any case. In other words, *The Economist* showed a spirit of capitulation, resurrecting a tradition of 30 years earlier, when certain British press organs called for agreement at any price with the fascist aggressors. . . .

The Economist

AUGUST 23, 1862

HOW BREAD IS MADE

The journeymen bakers, though little known to the public, comprise as a class a very large and, in many respects, important body of men. In 1851 there were in London 13,762, in Great Britain 50,360 bakers, including the minor class of confectioners. Their number now in London may be estimated as considerably over 14,000, and of these upwards of 2,000 are under the age of eighteen. . . . The work of a London journeyman baker begins, as a rule, when other people go to bed, at about 11 at night. At that hour he makes the dough, a laborious process, which lasts from half to three quarters of an hour, during which time he inhales flour and carbonic acid gas proverbially deleterious to the lungs. He then lies down upon the kneading-board, which is also the covering of the trough in which the dough is "made," and sleeps for two hours. He is then engaged in rapid and continuous labour for about five hours in all the various processes of the baking trade. . . . When the baking business is over, distribution begins, and a considerable proportion of the journeymen in the trade, after working hard in the manner described during the night, are upon their legs for many hours during the day, carrying baskets or wheeling hand-carts, and sometimes again in the bakehouse, leaving off work at various hours between 1 and 6 p.m., according to the existing pressure. . . . Evidence the most various and absolutely conclusive shows that very many bakehouses in London are in a shockingly filthy state, arising from imperfect sewerage and bad ventilation and neglect; and the bread must, during the process of fermentation, get impregnated with the noxious gases surrounding it. . . . It is never desirable for the Legislature to interfere whenever a state of things is in a position likely to remedy itself. . . . But where, as in the baking trade, some of the bakehouses are in a shocking condition, and others are not, and the whole trade is divided between a host of small traders, it is impossible for the journeymen bakers to obtain isolated redress in the absence of a general rule affecting them all alike. Thus we think it fair that bakehouses should be inspected. . . . however chary in principle we must always feel of Government interference in private matters of trade.

In an article headed "Our New Frontiers" (February 24th), the editors reproached Macmillan's government for lack of initiative. . . . It said that: "Generalities that turn away awkward questions, or hide unpalatable facts, do no good, but harm." But the organ of big business itself, in assessing England's situation and its financial-economic difficulties, shows a tendency to turn away "awkward questions" and to "hide facts" . . .

England and Nato

. . . In a note called "Orphan on the Rhine" (March 24th), the journal speaks of the need for increased west German payments to support the English army in the GFR. But even English officials pose this question rather more radically now, giving it out that these forces will have to be reduced if Bonn does not give the necessary financial support. *The Economist* makes no such suggestions. On the contrary, it always stresses the need for England to buttress the North Atlantic block with all its strength. In whose name? . . . The fact is that the City mouthpiece is more concerned about America's interests than England's. . . .

It is known that the USA has long demanded an increase of English land forces in western Europe, while persistently hinting that England should renounce its own nuclear arms. This evidently explains why *The Economist* favours concentrating English forces in western Europe. As to nuclear arms, it expresses itself in extremely rubbery formulations. In the article "Dropping the Bomb" (March 17th), it recognises that the English nuclear arsenal could hardly play any significant role in war. . . . What conclusion does it draw? To keep the English nuclear forces in order to use them as instruments of diplomatic pressure. . . .

[The article in fact suggested that if a British renouncing of nuclear arms were linked with "advocacy of a regional arms control scheme in central Europe" that would "reduce tension along the Elbe" the prospects for such a scheme could be much improved.]

At the same time there appear in its pages little signs of anxiety caused by the USA's programme of military preparations. On March 10th, for instance, *The Economist* mentioned with some disapproval the coming resumption of American nuclear tests in the atmosphere. On February 24th it referred obliquely (*sic*) to the riskiness of American actions in regard to South Vietnam, though it concluded, quite unexpectedly, that a settlement of the question apparently rested on the Soviet Union.

On April 14th it published a very significant article. In it was noted that the English Government was not interested in upsetting the status quo in central Europe . . . but had not worked out a practical programme proceeding from this status quo. "Certainly they would go so far as to accept the Oder-Neisse frontier, if this were not such a sore subject with the west Germans." The article added that England will not recognise the German Democratic Republic, although it trades with it. "Taken together, these attitudes are not particularly coherent with one another" concludes *The Economist*.

What is true is true. On important questions in present international relations, English diplomacy tries to sit between two chairs. . . . Tactics of silence, evasion, manœuvre are characteristic of many of *The Economist's* statements about relations with the Soviet Union, about the solution of looming international problems—almost a mirror image of the present tactics of English diplomacy.

NOTES OF THE WEEK

BERLIN

Muscovy Cat

To say that the removal of the Russian commandant from Berlin does not affect the allies' rights in the city—as President Kennedy said on Wednesday—is true in a sense. But the commandant's departure diminishes, almost to vanishing point, Russian acquiescence in the particular legal foundation on which the allies say their rights are based—that is, the quadripartite status of the city. The only visible survivals of that status, now the commandant has gone, are the four-power air safety centre and the four-power guard on the remaining war criminals in Spandau prison.

It may be argued that the city remains a four-power responsibility whether or not the Russians say it is; but four-legged stools with one leg missing are precarious things to take a defiant stance on. The Russians have now moved one degree closer to saying that the allies must conduct their Berlin business with the east Germans, who have appointed a commandant of their own, or with nobody.

And yet, like the Cheshire cat, Moscow's responsibility for what happens in Berlin has not vanished completely. A last grin remains, in the announcement that the Russian army headquarters in east Germany will "temporarily" deal with matters affecting the allied garrisons. Mr Khrushchev has not yet brought himself to the point of finally handing over control of Berlin to the east Germans. He has simply moved a stage nearer to it. Have the allies made up their minds what they will do if and when the Russians withdraw completely from their admission of responsibility, and the western garrisons are met on the fringes of west Berlin with a bland assertion that there is no one here but us east Germans? The provisioning of the garrisons is not the only problem involved; the allies' rights to enter east Berlin, and the handling of incidents along the wall, are liable to produce difficulties that will have to be talked over with somebody. The events that followed the shooting of a young refugee on August 17th are a case in point. If a fear of "recognising" Herr Ulbricht's regime prevents the allies from discussing such matters with the east Germans, the West may be reduced to a frustrated silence.

First Aid

When east German guards fire on refugees trying to get over the wall in Berlin, the allies could respond in two possible ways. One would be to help the escapers to make the crossing; the other is to make sure that those who are hit before they get across are given first aid. The first course is tempting, but one should be clear where it leads. Nothing short of a decision to give covering fire to refugees—that is, a decision to shoot at the east German guards before they can get the escapers in their sights—is likely to be of much use. In most cases neither tear gas nor smoke screens could be got into action quickly enough to take effect in the vital few seconds when a man is sprinting or crawling for the wall.

But covering fire from one side is almost certain to be answered by covering fire from the other. The west Berlin policemen who now patrol the wall on foot would probably have to be withdrawn into sandbagged look-out posts; and the result would be a kind of miniature Western Front, in which periods of tense watching across no-man's land would alternate with rackety exchanges of fire when something

moved, or was thought to move. The chances of helping wounded men in these circumstances would be almost nil.

But between doing this, and doing absolutely nothing at all, there still lies the possibility of bringing medical aid to refugees who may be wounded on the other side of the wall. On Tuesday evening the United States posted an ambulance at the Friedrichstrasse crossing point, the one place where allied vehicles can enter east Berlin. The ambulance may not be able to reach a casualty very quickly—unless the shooting takes place close to Friedrichstrasse, as Peter Fechter's did on August 17th—but it may prod the east Germans to get their own stretcher-bearers out sooner. Another innovation, likely to have the same effect, is clearly worth thinking about. This would be to inform the east Germans of an intention to station first-aid parties close to the wall in other places, with orders permitting them, where possible and necessary, to get over to save a man from dying for want of attention. These first-aid men would have to be easily distinguishable medical personnel of the allied forces, and it would have to be made clear that their job was to tend a man's wounds, not lift him over the wall. A clear case where effective medical help can be given will not happen often; when it does, the work will be neither safe nor easy. Still, the principle of not intervening in what happens on the communist side of the wall cannot extend to letting a man die when his life might be saved.

FRANCE

Habit of Violence

Once caught, the habit of violence is not easily cured. The epidemic of holdups and banditry in southern France suggests that some of the embittered settlers who have fled from Algeria to France have brought with them their weapons and their lawlessness. On Wednesday the French cabinet approved a series of measures to deal with the gangsters. It was on his way home from this very meeting that President de Gaulle ran into a machine-gun ambush—the fourth unsuccessful attempt on his life in the last year.

To put down gangsterism, there are to be harsher penalties for carrying arms without permission, and the permission enjoyed by some of the immigrants from North Africa is to be withdrawn. At the same time more long-term loans are to be given to help the immigrants to settle down. Compared with some of the other Algerian problems it has had to deal with, this outbreak of banditry may seem small beer to the French government. Yet it is a reminder that France as well as Algeria will have to live with the legacy of violence for years to come.

The discontent of the returned Europeans from Algeria appears at present to be unorganised and leaderless. In June one of the OAS leaders, Colonel Argoud, announced in the Belgian paper *La Dernière Heure* that an executive committee of the Secret Army had been formed including M.

Bidault, as president, and M. Soustelle. The group has since been putting out a clandestine newspaper, Appel de la France, and M. Soustelle has been declaring in its columns that "fascism is installed at the Elysée." There are no signs of a connection between the pamphleteers and the bandits in the Midi; all one can say is that the most promising field for conspiracy is no longer Algeria, but France.

Still Wandering: M. Soustelle

M. Soustelle was picked up by the Italian police outside Milan on Friday, August 17th, and expelled from Italy as an undesirable. M. Soustelle had evidently been in Italy for some weeks; rumour had it that this time he was on the way to a meeting with other malcontents. His false passport gave the Italian police an additional reason for expelling him. The French authorities have not issued a warrant for his arrest, but they evidently encouraged the Italians to remove him and nip any plotting in the bud. The Italians, on their side, embittered by earlier OAS attacks on Italian citizens, were happy enough to comply. M. Soustelle has apparently chosen to move on to Austria, and may by now have gone farther.

AGRICULTURE

Farmers Against Europe

THE National Farmers' Union has flung down the gauntlet to the Government by producing an agricultural plan which is meant "as an alternative to the narrower concept of the agricultural policy of the European Economic Community." At the same time the union has made it clear that it will strongly oppose Britain's entry into the community unless the terms for British agriculture are substantially improved. Since there is hardly any chance of the union's essential requirements being met—indeed they are flatly contradictory to the European agricultural policy so laboriously worked out by the Six—it looks as if the Government must now reckon with the NFU leadership's determined opposition to European union.

Although Mr Heath at Brussels won acceptance for the principle of a European price review, the NFU complains that this review cannot give British farmers anything like the kind of specific price guarantees (save in the case of cereals) which they now regard as their natural right. In addition, the British horticultural tariffs—on which the union, keen to keep horticulturists within its fold, sets great store—would have gradually to go. These being the facts of European agricultural life, the union was particularly keen that Mr Heath should secure what it calls a "*residual assurance*" that the British Government could protect its farmers if their standard of living was seriously threatened. This, it complains, he has achieved only on a very modified basis which requires that any such action should have the approval of a qualified majority in the European Council of Ministers.

The union's own new agricultural plan is a curious but skilful attempt to dress up some old-fashioned restrictionist devices in a modern garb of world commodity agreements. These agreements would in effect "parcel up" markets through a system of import quotas and other devices. The one new idea is that OECD might be used for this purpose and expanded to take in other principal exporters of temperate foodstuffs, e.g. Australia, New Zealand, and Argentina. The countries in this group would be obliged to harmonise their agricultural policies, and the union is prepared to see quantitative controls on British producers so long as the other countries "played the game" by regulating their exports to this country; but should they not do so, Britain would reserve the right to control imports unilaterally. Under this plan the present British system of guaranteed prices, horticultural tariffs and subsidies, and producer marketing boards would of course continue intact. World co-operation, Commonwealth preference, European market-sharing agreements, and cheap food for underdeveloped countries—all these would have a place in the system so long as they did not tread on the roots of the union's present privileges, at which point its international benevolence gives way to a rather waspish autarchy.

How Much Effect?

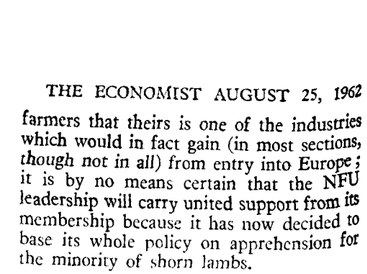
CURIOUS though they are, the National Farmers' Union's new proposals carry an impression of broad horizons and safe (i.e. traditional) alignments, which are obviously likely to have some nuisance value in obstructing the common market negotiations. Just how great a nuisance value will depend on whether Tory MPs feel that the NFU leadership is really speaking on behalf of a sizeable proportion of the electorate, or even on behalf of most British farmers themselves. As regards the first, the total farming vote is about 5 per cent of the British electorate, and the idea that any really large part even of this 5 per cent would turn to Labour because of this issue seems moonshine (even though it may be the sort of moonshine that frightened politicians are apt to believe). As regards the second, poor Mr Heath spent most of last month complaining that Europe looked as if it might be going to featherbed its farmers so much that there might be no room for exports from the farmers of the Commonwealth. The publicity given to this struggle should at last have convinced many British

farmers that theirs is one of the industries which would in fact gain (in most sections, *though not in all*) from entry into Europe; it is by no means certain that the NFU leadership will carry united support from its membership because it has now decided to base its whole policy on apprehension for the minority of shorn lambs.

RECRUITING

First Target

THE Government's professional advisers are entitled to all the credit that is going for the army's achievement of 165,000 regulars five months before the deadline of January, 1963. They said voluntary peacetime recruiting could be expected to reach this figure; many press commentators doubted whether it would be, and began to press the case for compulsory selective service even harder; now the Government's prophecies have proved right. The rise in voluntary recruiting has been particularly marked in the past six months. But the blunt fact remains that 165,000 regulars (including 19,000 officers) are still plainly not enough for British military commitments both in Europe and east of Suez. The true aim is to go on and hit the "ceiling" of 182,000 which the military experts designated as the workable minimum. Mr Profumo's resources are not stretched to the limit this year simply because he has the 15,000 retained national servicemen and no local crisis outside Europe. There can be



no let-up in the drive. In the meanwhile the War Office may be wise to keep its voice down in case Nato really does insist on an immediate active strength of 55,000 men in Germany, and then on a return to the 75,000 which was the basis of the original British commitment in 1954. That would require a much larger army than Mr Profumo has yet got.

The authorities are invariably chary of recognising any sure link between recruitment and the level of economic activity. The argument has too many dangerous ramifications. Thus, the Scottish regiments are said to have recruited well: is this because of unemployment among school leavers in a depressed region or because these are popular regiments (and therefore, Lord Montgomery's tribal chieftains are apt to claim, should not be merged)? The

chart on page 678, based on the quarterly recruiting figures, shows the wide seasonal variations in the past four years, but the worst recruiting performance seems to have been precisely at the point where the boom of 1958-59 was fully under way. The army has done a good deal since then to brush up its image. The television advertisements have shown their pulling power. And certainly the more often Mr Profumo can truthfully say that he is pushing up standards of entry (and thus prestige) the better. But judgment must be reserved until after the "ceiling" is attained—at current rates within the next two years—and then shows whether it can survive an upturn in the economy.

ANTI-FASCISTS

Not in our Stars . . .

MR GEOFFREY RIPPON, the Minister of Public Building and Works, has completed a hat-trick by refusing a third application for the use of Trafalgar Square for a public meeting, on the ground that tourists and holidaymakers might be inconvenienced by fighting which might break out at it. The first two refusals affected Sir Oswald Mosley's followers and the National Socialists; the latest applicant to be turned down is Yellow Star, a movement begun to shame the neo-Nazis into a proper respect for their fellow men. The "silent witness" mounted by the movement on the steps of St Martin-in-the-Fields during the first of Mr Jordan's meetings did not deter either the neo-Nazis or their exuberant opponents; and in the melee that broke out during subsequent meetings it went unnoticed. Now its aspiration to more loquacious methods of protest has been thwarted, and it may dissolve once more into the disparate elements that have briefly come together in the hope of exploiting it.

The movement's founder is the Rev. Bill Sargent, of Dalston, where many immigrants find temporary homes, and where, too, (at Ridley Road) Sir Oswald Mosley once battled and now often campaigns. It was to combat that campaign that Mr Sargent began some time ago to mount counter-meetings in the same street, and it was from those meetings that Yellow Star grew. The idea, of clearly being seen to be pro-Jewish by adopting their star of David, was to remind the unmindful of what it recently meant to be a Jew among militant gentiles. Yellow Star has also thrown its advocacy behind the idea of amending the Public Order Act to make racist propaganda *per se* an offence, and it is mounting a petition of, it hopes, 500,000 signatures to support this.

But the minimal organisation required for this undertaking (and Yellow Star wearers are reluctant to become an organisation as such) has also, unfortunately, offered an opportunity to every kind of bandwaggoner with a left-handed axe to grind; at a conference last Sunday, there was every sign that Yellow Star could soon become a vehicle for left-wingers eager to come into violent collision with their opposites on the right. In so far as Mr Rippon was right, in the interest of public peace, to bar the fascists from the square, he is, therefore, justified in extending his prohibition to their opponents, in the same interest. But where is the present encroachment on the right to make public speeches going to end? This week the neo-Nazis, Messrs Jordan and Tyndall, were sentenced to two months' and six weeks' imprisonment respectively, on the ground that their words and behaviour last July 1st were such that a breach of the peace was likely to be occasioned. The magistrate said that if anybody in Trafalgar Square heard somebody saying that Hitler was right, it would be enough to make him very angry indeed. The sentences are now subject to an appeal, which will be watched with interest by other people who know that they sometimes make their audiences very angry indeed, even if in more respectable causes.

ADEN

Base for Trouble

WITH care and cash Britain is grooming Aden for its future part as the trouble centre of British interests in the Middle East. The Aden constitutional conference, which has been meeting in London, agreed on August 16th that Aden (the port, military base, oil refinery and 220,000 people) should join, not later than March, 1963, the Federation of South Arabia, which at present consists of about half of the protected states of the interior. This agreement has still to be approved by the British parliament, the federal council and Aden's legislative council. To bypass dissent, the life of Aden's council, which was due to end this December, has been extended by a further year. The council was chosen by about a quarter of the electorate (the trade unions boycotted the elections) at a time when there was no thought of federation. If a future council decides that it wants to secede, the British Government may, after six years and if all attempts at conciliation fail, withdraw Aden from the federation. As this indicates, the constitutional advance promised the colony does not include a whisper of independence.

The merger of the port with its hinterland is an obvious economic necessity. Done in this way, at this time, its unhappy political implications are no less inescapable. In Aden, there are the roots of democratic institutions and the muddled beginnings of political thought. The protectorates are run, with the help of British advice and money, by family groups who have made up their own constitutions, some more benign than others. To the most vocal of Aden's opposition groups, the People's Socialist party (the political voice of the powerful Trades Union Congress) the protected rulers are a bunch of primitive reactionaries. Aden will have 24 members in a federal council of 84 members; the federation will control the key functions of government—but not Aden's defence or foreign relations where the British voice will still prevail.

The impetus for the merger is British concern to give political solidarity to the base at Aden. This is now being built into a vital military complex with responsibilities extending from the Persian Gulf to central Africa. Leaving aside the overwhelming question whether a strategy that depends on a territorial base on a part of the Arabian mainland is sensibly conceived, it is doubtful whether the decision to attach Aden to a collection of friendly sheikhdoms will add much ballast, or even buy much time. British policy would make sense only if Aden were insulated from all Arab, or indeed African, streams of thought. As it is, situated at the tip of the Arabian peninsula, Aden is blown by the cross-winds of nationalism. Economically, Aden's migrant workers (three-quarters of them Arab) depend on the base, but the British Government has surely been burnt too often to believe that, in the final analysis, economic interests prevail over nationalist sentiments.

SAUDI ARABIA

Democracy Thrust Upon Him

ONE of the more curious visions of the week was that of Saudi Arabia as a welfare state under a constitutional monarch. The visionary was Prince Talal, one of the many sons of the late King Ibn Saud, whose imaginative powers have helped to lose him his passport (a special one for princes). On August 15th, the prince arrived in Beirut without his passport, having heard that his property in Saudi Arabia had been confiscated and his allowance stopped by order of his half-brother King Saud. (Saudi authorities have since claimed that they are only occupying the prince's houses temporarily while they search for incriminating material.) The ostensible reason for his disgrace was the congratulatory cable he sent to President Nasser when the Egyptian rockets were launched. This was a challenging thing to do at a time when President Nasser and

Saudi seer Prince Talal

King Saud were busy accusing each other of godlessness, but the real reason for his fall, Prince Talal now insists, was his consistent demand for constitutional reform. It is true that when, last September, Prince Talal lost his briefly held job as minister of finance, one of the reported reasons was his mention at a Beirut press conference of plans for a Saudi Arabian national assembly.

On August 19th Prince Talal, accompanied by three other dissident princes, moved on in state to the United Arab Republic, travelling on temporary Egyptian papers. His views, adapting themselves to the heady Egyptian air, shifted leftward. At a press interview in Alexandria he expressed his belief in Arab socialism although, as he said, nationalisation was not fitted for Saudi Arabia since there was nothing there yet to nationalise. His programme was to start up state-owned industries, to distribute the land to the peasants and establish co-operatives for them. He believed that the oil companies would increase their royalties (he mentioned 75 per cent as a fair figure) if the money did not, as now, slip into the pockets of a few. But, above all, he stood for social justice so that the Saudi poor might, at last, be transformed into "human beings." Nobody would dispute with Prince Talal the need for Saudi Arabia to emerge into the light of a more modern world. It is perhaps more doubtful whether the task of renovation in Saudi Arabia will in the end be left to a prince, even a lively and open-minded one like Talal.

MALTA

Why Not?

If Malta really wants its independence within the Commonwealth, as its prime minister, Dr Borg Olivier, said he did after his final brush with Mr Sandys this week, it is becoming increasingly difficult to see any good reason why Britain should stand in its way. After all, Malta has a population twice the size of that other hard-up island and Nato base, independent Iceland. Dr Borg Olivier had been piqued by the size of the financial aid offered to him after his eight weeks in London (some of them spent kicking his heels while the Government was reshuffled and ministers flew off on other business). He had asked for various reliefs adding up to £8¾ million immediately, or £26 per head for Malta's 329,000 people, but in a way which suggested that he might want still more later. Mr Sandys was ready to disburse only £100,000 immediately (or 6s. per head) to meet the recurrent budget deficit, and to make a redeployment of some grant and loan moneys on projects still to be agreed on the capital side. Hence, no doubt, Dr Borg Olivier's sniffy complaint that he had not come "to make a silver collection."

What the Maltese government has gained is permission to seek foreign economic help

Dr Borg Olivier: off with a sniff

and to negotiate Maltese association with the common market. Dr Borg Olivier should certainly try to take advantage of this, but he is likely to discover that neither avenue is more promising than a continued relationship even with a currently unforthcoming Britain. As a flesh creeping rejoinder to Mr Sandys he declared that the door had been opened "to elements which are unfriendly to Nato in Malta." If this was a reference to Mr Mintoff, it is still by no means clear which countries the Maltese Labour party could call on that could see much benefit to themselves in subsidising the island. Communist aid (if it were forthcoming) would not be at all acceptable to the Maltese church, which, in fact, presented Dr Borg Olivier with his last electoral victory over Mr Mintoff.

Malta's economic problem is part of the wider troubles of the poorer southern periphery of Europe, from Portugal below the Tagus to the Greek islands. Now that Malta has lost the strategic importance that made it a relatively better-off Mediterranean community, it has few advantages that would automatically put it higher on the list for common market investment than the Six's own underdeveloped areas. A broader European community (or an integrated Nato one) would certainly have a responsibility towards areas like Malta. In these circumstances Britain's total contribution to an investment fund would and should undoubtedly be more than Mr Sandys offered last week. There is a case for giving an independent Malta a fair dowry to replace the present subsidy. But is it a severance payment that Dr Borg Olivier is asking for?

KURDISTAN

No Help for Highwaymen

General Qasim's unavailing attempts to bomb the life out of the continuing Kurdish revolution in northern Iraq have now entangled him with his Turkish neighbours. Several times in the past two months, Iraqi military aircraft hunting for Kurdish guerrillas in the mountainous frontier region have crossed the line and dropped their

bombs on Kurdish villages in Turkish, instead of Iraqi, territory. The Turkish government, displaying remarkable restraint, was inclined at first to pass these incidents off as regrettable mistakes. But the "mistakes" persisted until, on August 16th, Turkish fighter aircraft patrolling the frontier shot down an Iraqi intruder. Since then, there have been no further violations and the Turkish government, still apparently anxious to believe the best of Baghdad, on Monday called off its patrol flights.

Turkish restraint has not been reflected in Baghdad. In dudgeon, the Iraqis have accused Turkey, in turn, of violating Iraqi air space and have demanded both apologies and compensation. The Turkish government is charged with allowing or perhaps encouraging (in collusion with Britain and the United States) the "mutineers and highwaymen" who use Turkish soil to hatch up aggression against Iraq. This charge is among the wilder of General Qasim's aberrations. However much the Turkish

government may shrink from Baghdad's leftward-leaning policies, it is unlikely to lift a finger to help the Iraqi Kurds in a revolt that is bound to be having repercussions among Turkey's own Kurdish population, known, euphemistically, as "mountain Turks." Mullah Mustafa Barzani, the leader of the year-old revolt, is fighting for autonomy for the Kurds within Iraq; he is reported as saying that the traditional idea of an independent Kurdistan embracing the tribesmen in Turkey, Syria and Persia is "impractical." All the same, the Turkish government's tolerance of the Iraqi intrusions may have had behind it a more solid consideration than diplomatic good manners.

PRISONS

Full House?

If the prison population goes on rising, it will very soon make nonsense of the new prison building programme, which was designed to reduce overcrowding—over 8,000 prisoners now sleep three to a cell—and eventually to replace the antiquated monstrosities of the past. It will also place far too heavy demands on already undermanned staffs. The total population of prisons, borstals and detention centres at the end of last year was over

30,000, and the average daily population for males only has increased within ten years by about 25 per cent. Nor is there any sign of the annual rate of increase slowing down. What can be done about it?

One answer can be found in the prison commissioners' report for 1961 (Cmnd. 1798, 11s. 6.). The prisons are still receiving people unnecessarily. Of the average male population of 28,094 last year, about 1,600 were untried prisoners and 442 were civil prisoners; there should certainly be room for some reduction of numbers here, instead of which the police seem to ask for, and magistrates to grant, remands in custody even more freely than in the past. But the great bulk of the prison population naturally consists of people sentenced to prison without the option of a fine; the number of men and youths in this category in 1961 averaged about 18,000. Of these, over 6,000 were Star prisoners, that is, were over 21 years old and were serving their first sentence. The subsequent record of Stars is notably good; of those discharged in any one year, well over 80 per cent of the older age groups do not return to prison, and about three-quarters even of those in their twenties. Is there not a case for suspending the prison sentence passed on many of these men?

Even so, the problem will remain formidable. The public has its part to play in accepting proposals for open prisons put forward by the prison commissioners instead of resisting them. The prison staffs will have to realise that many of the old rigid rules and some of the unnecessary discipline will have to be waived in the interests of economising in manpower. At a recent conference, a prison officer complained that because of staff shortages a prison was being run on the good will of the inmates. Three cheers—that is just what is wanted. Lastly, it must be more widely realised that in prison a potential labour force is at present largely idle. Last year, the value of the goods and services supplied by prison labour amounted to a paltry £44 a head, compared with nearly £900 outside. This is an appalling waste.

HUNGARY

Rakosi Expelled

In preparation for the Hungarian party congress in the autumn, Mr Kadar is doggedly pursuing his efforts to give a new look to Hungarian communism. A number of decisions by the central committee, announced on August 19th, are clearly designed to emphasise his determination to repudiate the bad old days of Mr Rakosi. The central committee has decided to rehabilitate 190 persons who were illegally imprisoned at that time and who have never since had their rights fully restored. Mr Karoly Kiss, who was particularly ruthless in suppressing those who took part in the 1956 rising, has been turned out of the politburo (but not out of the central committee) for failing to repudiate his part in the illegal trials of communists during the Rakosi regime.

Finally, 25 persons, including Mr Rakosi himself and his former colleague, Mr Ernoe Geroe, have been expelled from the party; most were implicated in varying degrees in the series of staged political trials, mostly of communists like Mr Rajk, between 1949 and 1953. Significantly, in the context of Jugoslavia's present improved relations with its communist neighbours, Mr Rakosi's guilt is said to be all the greater because of his "groundless suspicions" against the leaders of other Communist parties (for example, Marshal Tito?) which "caused immeasurable damage on an international scale." Mr Rakosi is in exile in Russia, and Mr Geroe, who was allowed to return to Budapest early last year, lives in obscurity and is in poor health; their party membership since November, 1956, has anyway been purely nominal. Their expulsion is therefore largely a symbolic gesture; but it is none the less significant for that. After all, Mr Khrushchev has never gone so far as to expel from the Russian party any members of the "anti-party group." Mr Rakosi, for his part, has never been without his sympathisers inside the Hungarian party—which, on being reconstituted just after the rising, naturally got more than its share of diehards.

It is not clear how dangerous these stalinist survivals now are within the top leadership. There is no confirmation of this week's Viennese rumours of an anti-Kadar conspiracy among leading officials. But within the middle and lower ranks of the party there has been considerable opposition to the more liberal policies that Mr Kadar has been trying to pursue since the 22nd Soviet party congress; his policy of putting efficiency first and giving important jobs, especially in industry, to non-communists is particularly resented. This opposition has been openly admitted and openly attacked in the communist press; and last month an article in the official party journal *Partelet* bluntly declared that those who could not co-operate with non-party experts would have to be transferred to other jobs.

Mr Kadar evidently feels strong enough to take a tough line with his communist critics—but perhaps not strong enough to denounce the numerous miscarriages of justice perpetrated against non-communists during the Rakosi regime, or to complete the release of all those imprisoned after the 1956 rising. Or are these points on which he and his communist critics are agreed that nothing should be done?

CHINESE STUDIES

Fiction, Peking Style

"Soviet literature—yes. Chinese literature—no," is a view shared even by those westerners passionately devoted to the cause of Chinese communism. Pasternak and Yevtushenko can be read and enjoyed, but hardly a western soul can stomach the literary output of contemporary Peking. There have been doubts whether the Chinese can take it either. One way and another, Chinese communist litera-

ture has tended to be left unread in the West. In an effort to correct this situation, the *China Quarterly* held a conference at Ditchley Manor, near Oxford, from August 13th to 17th. Mao Tun, head of the Chinese writers' union, had been asked for his thoughts on literature and its relation to communism, but remained silent in Peking. Those Chinese who came did not come from the mainland; but they brought a scholarly detachment and an understanding of China.

China's literary world under Mao Tse-tung contains the sort of paradox one half expects of any human system. Mao has always held that to transform traditional China into a communist society would need not only mass armies, but also mass literature. It would no longer do for literature to be above the heads of the peasants and the workers; it must be something which they could understand and associate themselves with. In this vein the "down on the commune" and "girl loves factory" stories—which seem like Chinese versions of "The Archers" or "Mrs Dale's Diary"—are meant to inspire the Chinese masses with the idea of communism and teach them its ways. But even the doctrinaire Mao Tun has to admit that most of the writers writing in China today desperately need to improve their style. Already it is noticeable that the old patterns of constructing stories and novels are being used, while the denunciation of the old literary ideas goes on. It is amid all this that one prominent nonconformist amateur stands aside from Mao's literary canons. He is none other than Mao Tse-tung himself, whose writings can be accused of classicism, romanticism, individualism and even sentimentalism.

Socialist realism has greatly restricted China's writers, but perhaps not disastrously. When the communists took control of China nearly all the literary talent remained, and Lao She, the author of "Rickshaw Boy," returned. In the past China's writers have managed to produce great works within the narrow margins of freedom which no system of control can entirely remove. Thus it does not do to give up hope for the Chinese intellectual, or for the peasant and his reading.

LORD CHAMBERLAIN

The Regulator

As the new Lord Chamberlain of Her Majesty's Household, Lord Cobbold, the former Governor of the Bank of England, will no doubt prove exemplary in arranging state ceremonies, granting royal warrants and even (should it be necessary) appointing poet laureates. But to nine-tenths of the country any Lord Chamberlain is inevitably the rather pompous ass who cuts the brightest lines out of otherwise unremarkable West End revues. It would be a relief to nearly everyone if, when he takes over from Lord Scarbrough in January, Lord Cobbold were to reduce this branch of his office's activity to a minimum.

That is probably the best that can be done. If the censor's shop were to be shut up altogether, liberal theatre critics say they would be delighted; but closure would gravely inconvenience the declining theatrical industry, by rendering risqué shows liable to direct prosecution for obscenity and by exposing the works of J. M. Barrie to the salacious imaginations of local government watch committees (*vide* Bradford's opinion of Arts Council nudes). The blunt fact is that theatre managers would then be much more timid than they are now. At present the news that the Lord Chamberlain has cut some lines can give bitter young playwrights and knowledgeable theatre managers one of the most effective forms of metropolitan advertising. This is another reason why Lord Cobbold should make cuts very rarely. He should watch the trade cycle at the box office, and recognise that his interventions here, unlike Bank rate, can sometimes inflate what he originally wanted to discourage.

Lord Scarbrough may well quit the Lord Chamberlainship, after a decade of theatrical activity, with relief. It is easier to be a straightforward censor of morals (which the Lord Chamberlain is not) than a judge of public taste. It was not until 1958 that Lord Scarbrough judged the general theatregoing taste to be advanced enough to accept "sincere and serious" plays on homosexuality like *Cat on a Hot Tin Roof*. His more recent brushes with revue authors have been excessively silly. If President Kennedy sees no objection to satirical sketches about himself, it is impossible to see who else can pretend to be offended by any such lampoon on "a friendly head of state." The same point applies to official touchiness about any references to Britain's head of state. Where the royal family is concerned commercial managements are always likely to be much too sensitive to audience reaction to get seriously out of line, and it seems invidious to all concerned that the censor should have to be an official of the household.

PROTECTION OF SKILL

Copyright in Design?

Any industrial design can at present be registered in Britain providing that it is "new and original"—which is interpreted to mean that it has novel features that differ from any previously registered design in more than immaterial details. Provided that the Patents Office accepts it for registration—after a process of search of the designs already on the register, and recent trade periodicals, which is not nearly as rigorous as the search applied to patent applications, but seems fairly effective—the designer gets an absolute monopoly against infringement of this design, even if infringement occurs by chance and not by deliberate copying. But in granting this "design monopoly" the Patent Office excludes "representations of human beings, animals and existing objects," unless these are peculiarly distinguished or stylised in appearance.

A departmental committee of the Board of Trade has now recommended that this system of registration should be supplemented by a system of copyright in design, similar to that applying to original works of art. The essential difference between copyright and the registration system is that copyright would not exclude representations of existing objects, however exactly representational these might be; but in order to prove infringement of copyright, it would have to be shown that the design had in fact been copied, and was not merely a design, however similar, arrived at by chance or by equal precision in representing some actual object.

Original skill and labour may be embodied in even the most slavish reproduction for a model; and the proposed copyright system would protect this skill from anyone who simply mechanically reproduced an exact copy of somebody else's design. One company giving evidence to the committee said that when it sent out an original model of a stove front on a Monday morning, the design might be copied and offered for sale in competition with the original before Saturday night of the same week; and more cheaply because the copyist saved the original cost of the design. Not all industries, however, wanted the extension of this further protection to new designs. Certain fashion industries such as footwear, where the "fair following" of new trends in design is accepted as necessary and useful to the trade as a whole, oppose the idea. The departmental committee thinks that the Board of Trade should have powers to exclude particular industries and classes of product where it was persuaded that exceptions would be desirable.

CHEMICAL COMPANIES · INTERNATIONAL ENTERPRISE ·

Chemicals from Kirkby

... and Mrs Yeoman's washing water

Sensible man, Henry Yeoman. Knows that no matter how efficient his wife's new washing machine, *hard water* could still prevent it doing a thorough job of the weekly wash—especially where his collars and cuffs are concerned. And that's where chemicals from Kirkby come in.

Albright & Wilson (Mfg) Ltd.—one of the companies of the Albright & Wilson Group—produces Calgon Water Softener at Kirkby. Supplied in bulk to industry, or sold to housewives through local shops, Calgon solves the hard water problem outright. Recommended by manufacturers of famous makes of washing machine—English Electric, indeed, include a sample in every new 'Liberator' and 'Tumblewash'—Calgon makes hard water soft every washday in homes like Mrs. Yeoman's.

This is only one of the many ways in which A & W chemicals play a part in the life of Mrs. Yeoman. As one of the biggest organisations in the British chemical industry, the Albright & Wilson Group contributes—but we could go on like this ...

BOOKS

Throwing Up the Innovators

Theories of Economic Growth and Development

By Irma Adelman.

Stanford University Press. London: *Oxford University Press.* 174 pages. 30s.

On the Theory of Social Change

By Everett Hagen.

Dorsey Press, Illinois. 574 pages. $7.50.

MRS ADELMAN has neatly implemented the idea of setting out the growth models of Adam Smith, Ricardo, Marx, Schumpeter and the neo-Keynesians in the same semi-mathematical terms and within a common framework. Viewed as an answer to an examination question of the "compare and contrast" variety, her essay rates an alpha plus for its elegance and brevity. Viewed as an answer to the non-academic question of why country X is growing as fast or as slowly as it is, however, the book is not much help. The policy recommendations which the author attempts to distil are either too vague ("governmental agencies must play an active role in the planning process") or too general ("industries such as metals and investment goods in general ought to be emphasized") as the example of Hongkong will indicate.

These defects are not surprising. Models of this sort presented in skeleton form, however elegantly, simply do not suffice to explain economic development. The evolution of an economy can, of course, be described in terms of a small number of measurable variables, if the necessary statistics are available, but it cannot be understood without reference to a host of factors peculiar to the economy in question. Nor is there any reason to suppose that the same policy recommendations will be right for Albania as well as for Honduras.

The objection raised is, therefore, that models as simple as these are either only very generally right or are particularly wrong. There is, however, a more fundamental point to be made. This is that even an extended and particularised economic model such as is easily conceivable would only explain the speed of growth once it has started, but could not explain the actual start of development. It is all very well paying lip service to the "relationship between technical progress and socio-cultural change", but none of Mrs Adelman's equations says anything about the exact nature of such a relationship. She recognises that entrepreneurial talent is necessary to growth, but her survey contains no discussion of why some societies do and others do not throw up entrepreneurial types.

Professor Hagen, an economist of repute, goes so far as to assert that economics can contribute very little to the understanding of why growth starts. He briskly dismisses various alleged economic barriers to growth, such as the size of markets and inadequate saving, and then gets down to examining the factors that cause a traditional society to become one where economic growth occurs. His basic, obvious and important point is that the personality of innovators is different from that of members of a traditional society. Since a large number of innovators are required for economic growth to start, it follows that a necessary pre-condition is a change in personality on the part of one or more groups in society. Personality, however, is largely formed during childhood, so any explanation of a process of personality change must run in terms of the impact of change upon childhood and the consequences of this, after a few generations, for personality patterns and behaviour.

All this is, or should be, obvious. But so are most important truths in the social sciences, a fact that has not automatically enabled people to see them. It is the great merit of Professor Hagen that he faced the obvious, learned psychology and anthropology and wrote this book. Whatever the experts may think of the details of the exposition, there can be no doubt that in combining several disciplines and attacking the problem as he has, Professor Hagen has made one of the most significant contributions to the literature on economic growth.

The first question tackled is the stability of traditional societies. Why, in other words, do they provide a childhood environment such that adults manifest no desire to change the hierarchical character of society, the rule of custom or existing methods of production? What are the characteristics of the "authoritarian" personality involved and how do they differ from those of creative personalities? The answer takes over a hundred pages and defies summary, but it should be noted that a great deal of it is fairly standard psychology and anthropology.

The second question is when and how social groups will emerge with the "innovational" personalities essential to the initiation of economic growth. Professor Hagen suggests that the basic cause of such a change is that some group realises that its purposes and values in life are not respected by other groups whose esteem is important. Thus in Japan the policies of the Tokugawa had a depressing effect on the samurai; in Russia the religious changes in the 1660s constituted a rejection of the Old Believers. His examples are few, but are mostly discussed in great detail later on. Meanwhile, he goes on to suggest the processes by which the "withdrawal of status respect" ultimately leads to the development of creative personality several generations later. This section of the book is the most speculative and the most difficult. The reader who is not himself a professional psychologist will accept the argument as being plausible while retaining an uneasy feeling that another author might have made an alternative analysis seem equally convincing.

The second half of the book is nearly all taken up with case studies: England, Japan, Colombia, Indonesia, Burma and the Sioux, the last two being examples where development has been hampered by reactions to colonial rule. These case studies are erudite, challenging and interesting. What is more, they include the results of some field work done by the author and his collaborators; thus there is an ingenious attempt to examine the religious affiliation and social background of innovators in the industrial revolution in this country.

After all this it is not surprising that the book took almost six years to write, three of them full time. The Centre for International Studies (at the Massachusetts Institute of Technology) where Professor Hagen wrote it has sponsored an extremely stimulating and valuable piece of interdisciplinary research.

Clio's Many Faces

Approaches to History. *A Symposium,* Edited by *H. P. R. Finberg.*

Routledge. 231 pages. 25s.

THE nine essays contained in this volume have been written by distinguished specialists in some particular branch of historical study—local history, social history, universal history, the history of art, field of learning and to render its fruits more accessible to those outside it. All are well written and interesting; Professor Bindoff on political history, Professor Hall on the history of science, Dr Finberg on local history and the late Dr Wainwright on archæology and place-names have, in particular, achieved a sense of space and depth remarkable in so constricting a form.

All the contributors are, necessarily, out to make a case for their own subjects, but it is instructive to note the differences in the manner of presentation. Professor Hall, for instance, devotes most of his space to a lucid and critical survey of the historiography of his subject. Dr Finberg makes a convincing claim for the insight into national history that only a scrutiny of local history can give. Dr Wainwright, so far from making extravagant claims for the study of place names, explains the methods and the difficulties of the technique with a mastery that inspires more confidence than the resounding tones in which some other scholars champion their less exact and less exacting disciplines.

It is, incidentally, an illuminating commentary on the recent development of historical studies that Dr Perkin should boldly claim for social history the supremacy so long accorded without question to political history; and that Professor Bindoff in his persuasive vindication of the traditional view should adopt a distinctly defensive posture. This book is one that every student of history will find informative and stimulating. And the general reader who opens it out of intellectual curiosity will widen his horizon.

One and a Half Parties

Parties and Politics in Contemporary Japan

By R. A. Scalapino and J. Masumi.

California University Press. London: *Cambridge University Press.* 202 pages. 30s.

THE last occasion on which Japanese politics became colourful enough to attract the attention even of the British press was in 1960. In the warmth of early summer, with the economy booming and the Government party filling two-thirds of the Diet seats, there seemed no obvious reason why the ratification of a security treaty with the United States should set off a crisis of such dimensions that government was paralysed for a month, a goodwill visit by Mr Eisenhower had to be cancelled because of continuous rioting, and in the shock and shame of it all the cabinet was forced to resign. It was stranger still, perhaps, that after an election which changed nothing and the formation of a new cabinet hardly distinguishable from its predecessor, Japanese politics should suddenly have reverted to their normal prosaic unobtrusiveness.

The elucidation of this incident is the peg on which Messrs. Scalapino and Masumi hang their able analysis of the intricacies of Japanese politics. Japan has a two-party system, but it is one which "in an age when the science of power is increasingly being mastered" seems in danger of becoming permanently a one-and-a-half party system. The conservative Liberal-Democrats may well keep their monopoly of power and confine the Socialists to their third share of the Diet seats, no longer, perhaps, because the electorate is content to ratify the authority of "natural" leaders, but increasingly because of the effective distribution of "benevolences" which a ruling party can command. Both parties are single-interest-group parties, the Liberal-Democrats intimately linked with business, the Socialists with the unions. Both are "cadre parties" of professional politicians with little organisational roots among the electorate. Both share certain attitudes deriving from traditional Japanese social organisation—a preference for resolving differences through private negotiation rather than public debate, a preference for unanimous, and a suspicion of majority, decisions. And yet neither is a fully integrated party; both may be best described as a loose federation of factions.

The book's most useful contribution lies in its analysis of the origin and composition of these factions, and the account of the Security Treaty crisis, which concludes the book, demonstrates one part of the authors' thesis: that a stable coalition of a majority of the factions of the Liberal-Democratic Party is a necessary condition of political stability. But they also show how tenuous that stability is bound to be. It is no longer enough for the Liberal-Democrats to be concerned with the nice distribution of power and prestige and the Socialists with the preservation of the purity of their ideology. The crisis of 1960 aroused public feeling to the point where the issue could not be contained within the Parliamentary framework simply because the parties were closed groups inadequately in touch with their electors.

The authors see signs of change, however, in the growth of interest-group organisations, in the attempts of the parties to create constituency branches, and in their increasing tendency to appeal impersonally on policy issues to the floating voter. Perhaps they are right. Luckily Japan is one of the few countries that can afford a gradual political evolution. A booming economy can tolerate a good deal.

An Establishment in Opposition

The Twilight of Federalism: *The Disintegration of the Federalist Party, 1815-1830*

By Shaw Livermore, Jr.

Princeton University Press. London: *Oxford University Press.* 302 pages. 48s.

ONE of the most encouraging aspects of recent American historiography is the fresh study of party history, a development that is only beginning to be visible in this country. Dr Livermore's book is a valuable addition to the corpus of revision of old legends. It is not a blockbuster like Professor Benson's "Concept of Jacksonian Democracy," but it is learned, fair and thoughtful. Dr Livermore is concerned to show that the Federalists did not simply fade away, after the end of "Mr Madison's War"; they existed as an important if disunited and, in great matters, impotent force until the old party system was dissolved in the Jacksonian revolution.

A great deal of the book will interest only the chosen few who enjoy the details of American politics: much of the discussion and intrigue hardly reached the level of parish pump politics. But it has a general, indeed, a topical interest. For it illustrates the failure of a would-be ruling group to adjust to the realities of their situation. The Federalists, "the good, the wise and the rich," had served the republic well in the first decade of the new constitutional epoch. Whether they could have continued to serve it profitably if Hamilton and John Adams had not loathed each other is a matter for speculation. Possibly the group that Professor Manning Dauder has called "the Adams Federalists" might have expanded if there had been no feud and if John Adams had had any managing talents. As it was, they were opposed by a master manager, Jefferson, who, in addition, had the feel of the country. The result was that the Federalists found themselves in the ludicrous position of an Establishment in permanent opposition; they were a group of Old Etonians without an Eton. Dr Livermore glimpses this truth if he does not stress it. "One cannot help but wonder if Federalists looked in the wrong places to account for their many defeats." One cannot indeed.

But Dr Livermore does not deal with an intrinsic weakness in the Federalist position. He ignores the importance of the emigration of the Tories in the revolution. Most of the "best people" had left the United States and never came back. Why should the masses of the people, not to speak of Virginian gentry like Jefferson and Madison, take seriously the aristocratic pretensions of the Federalists? They had genuine blue-bloods like the great Catholic landowner, Charles Carroll of Carrollton. But most of them were new men who had done well out of the Revolution, Balzacian characters like the rising Lowells and Cabots. The Federalists recall, with depressing fidelity, the French *gens bien* after the establishment of the Third Republic. There is the same belief in dodges like a restricted suffrage, the same comforting faith that they represent *le pays réel* as against the mere *pays légal.* There is another parallel. What doomed the Federalists (if indeed they ever had a chance) was the semi-treason of their New England wing. They were not allowed to forget the Hartford Convention where the élite of New England met to liquidate "Mr Madison's War" just as it was ending in peace and in the brilliant, if pointless, victory of New Orleans. The Federalists were like the Vichyites; they despaired too soon of the republic. There were honest and capable men among them like Rufus King; there were odious characters like Timothy Pickering and professional announcers of doom like Timothy Dwight. There were also great politicians destined to great things like Daniel Webster. But the Federalists deserved their fate. Their last years were spent in intrigues no more interesting or dignified than manoeuvres to make "Pop" at Eton or "Skull and Bones" at Yale.

Early Victoriana

The Making of Victorian England

By G. Kitson Clark.

Methuen. 325 pages. 30s.

HUNDREDS of undergraduates heard the Ford lectures for 1960 at Oxford; scores of thousands of people heard a much abbreviated version of them in the Third Programme. They have now appeared in book form, supplemented by the references

scholars delight in and lecturers and broadcasters omit. The book consists of a useful summary of the work that Cambridge historians are doing in some parts of mid-nineteenth century English history, and makes valuable corrections to the accepted doctrines on the subject. For instance, the author discusses briefly whether the phrase "Industrial Revolution" may be used as everybody but the pedant uses it; agrees that it can; and makes the more interesting remark that "It was in fact morally neutral. It was not directed with any certainty to any particular end." He emphasises what most political historians neglect: that many significant activities had no connection with the political stratosphere at all. Other subjects he covers in outline are population growth, religion, higher education, and class. The connection between these two last is brought out neatly:

> It came to be assumed that a gentleman would have had the education of a gentleman, a proposition which might in time carry the convenient converse that someone who had had the education of a gentleman was likely to be a gentleman.

And his sketch of the strengths and weaknesses of the numerous Christian churches and sects in Albert's England provides the best available modern summary.

The other important subject the author covers is government by the civil service, of which he expounds both the origin and the necessity. In the nineteenth century people were in many ways less barbarous in their outlook than they had earlier been; this made the living conditions of the new-built industrial areas socially intolerable. But

> if the power of the community is to intervene effectively in the complicated problems of modern society, it must be guided to its task by experts. . . . The general public must not only surrender its freedom, but surrender it to the control of servants whose actions it cannot understand.

This provides one of the points where one has to remember the title of the book to be sure which century it deals with; the age of civil servants who apply accustomed remedies because they are too sunk in routine to see that the remedies no longer apply is not over yet.

A substantial appendix by Professor W. O. Aydelotte of Iowa State University examines the business interests of the gentry in the parliament of 1841, and indicates that "the heavy involvement of the landed classes in business stands out clearly enough no matter how the figures are arranged."

The main defect of the book is the narrowness of its field. The author discusses industrial expansion in terms of its impact on society, without considering its purposes or the overseas markets much of it was intended to serve; foreign and defence policies are hardly touched on; nor—Ireland apart—does he embark on colonial or imperial questions. As a result the picture of England he presents is lopsided and insular. And his careful scholarship is marred by an occasional absurd statement, such as the one that chattel slavery has long been abolished, or that "manhood suffrage had been achieved" in this country by 1900. These only bear out his point that the recent historical field is becoming too vast for single intellects to master.

How to Co-exist

May Man Prevail?

By Erich Fromm

Allen and Unwin. 263 pages. **21s.**

DR ERICH FROMM'S politico-psychological studies, of which "The Fear of Freedom" is the best known, have generally worked outwards from psychoanalysis to politics. In this book his starting point is his feeling of despair with the theory of nuclear deterrence, which he believes has practically no chance of keeping the peace. He has nothing but contempt for the new book-keepers of nuclear death like Herman Kahn. Let us not dwell too much on the horrors of war, peace is horrible too, Kahn once said.

Hard as it is, the only sane policy, Dr Fromm protests, is multilateral disarmament, Russia being offered doses of inspection increasing with the scale of disarmament, and the West committing itself to total disarmament without mumbling doubts or reservations. The political counterpart must be East-West agreement to respect the status quo. If the West really wants to lighten the burden of Soviet rule in the satellites, it will never do so by threatening "liberation" in which it has already ceased to believe.

As for the uncommitted countries, Dr Fromm sees little point in western efforts to sell them systems of economic individualism that have long been superseded in every western country. The only choice for these countries is between different brands of socialism, and he thinks there is a good chance of Soviet-American acquiescence in democratic forms of moderate socialism in the new states such as would respect personal freedom while providing the economic basis for growth.

East-West agreement, however, is impossible—and this brings us to the core of the book—unless the Soviet Union is recognised for what it is, not a messianic force spreading communism by fire and sword, but a "conservative, totalitarian managerialism" chiefly interested in preserving itself and using ideology as a ritualistic exercise. "The only people who take Communist ideology seriously are we in the United States." Dr Fromm wants Americans to get wise to their habits of projecting their fears on to the Russians, imaging them as doctrinal crusaders when, as half the book shows, revolutionary zeal died in Russia before Stalin came to power.

Much of this is unexceptionable, though the psychology is sometimes given a wrench to make it fit the politics. The trouble is that the puzzle facing statesmen would probably stay the same, though it may be made easier to handle, even if Dr Fromm's "anticipatory rationalism" were adopted. It lies in the simple fact that neither side can be wholly sure that the other, whatever its social system, will keep any disarmament promises it makes. Dr Fromm explains that ordinary people fear many possibilities which never eventuate. Unfortunately governments, especially on matters of national security, tend to work on the gloomiest assumptions. And who can blame them?

Ghana's Early History

Maclean of the Gold Coast

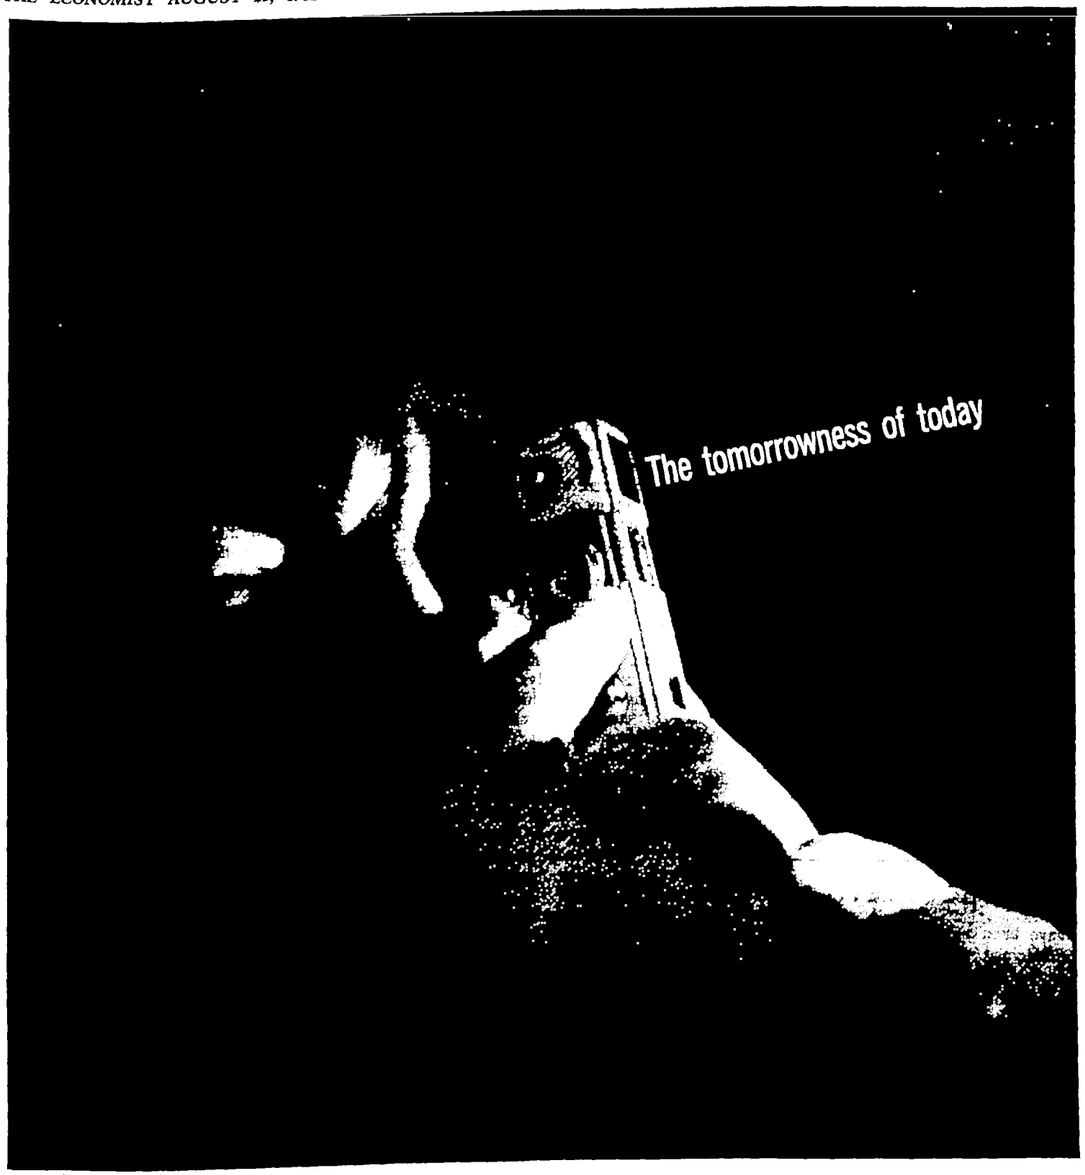
By G. E. Metcalfe.

Oxford University Press. 359 pages. **35s.**

THE more one reads about British imperial history the more one wonders how on earth we ever became a colonial power. Profit and philanthropy, often conveniently hand-in-hand, persistently asked for the assumption by the Crown of responsibilities overseas, but their suggestions were treated for the most part by successive British Governments rather as if they were improper proposals aimed at either the purity or the purse of a spinster. Mr Metcalfe's book, which deals with the history of what is now Ghana between the years 1827 and 1847, illustrates this theme with a meticulous and merciless fairness.

George Maclean was a singularly unsuccessful army officer, who went out to West Africa in 1826 largely because he could not get any other employment. He died there twenty years later, a legendary figure to his contemporaries and, in the vernacular, "the white man in whose time all men slept sound." Soon after he arrived the home government, fed up with its expensive and tiresome responsibilities, handed over the Gold Coast forts to a council of resident merchants. Maclean became president of this council. The council's charter was to administer and protect the coastal settlements "avoiding all interference in the disputes of the natives, except when they have reason to believe that their influence or mediation may be effectual for the preservation of peace or the termination of hostilities." Maclean's interpretation of this proviso led him to embark on policies and practices that were soon to result, with an inevitability which he cheerfully and the Colonial Office gloomily even then foresaw, in a hundred years of British rule.

Maclean was a controversial figure. Mr Metcalfe deals with all the controversial events and policies with which he was involved, whether they were political like the questions of domestic slavery and ritual killing in Ashanti or personal like the circumstances attending the death of Maclean's wife, with the detachment, regard for proven fact and careful judgment of a true historian. The book will bring no comfort either to those who seek to justify everything the British did in West Africa, or for those who seek to condemn it all. Kindness and injustice, honesty and hypocrisy, the good



A camera; compact, precision-built, efficient. ISR; compact, closely integrated, providing industry with versatile grades of synthetic rubber and efficient technical services. deeds and the bad are analysed and judged with scrupulous fairness. Only on the unorthodox, pragmatic Maclean himself does the author fail to pass a final judgment; and perhaps the best comment was made by the perplexed civil servant who said of him that he did much good "but I could never find out by what law he did it."

Critics' Critic

The Literary Critics

By George Watson.

Penguin. 249 pages. 4s. 6d.

THE title is an all-embracing one, but a glance at the cover makes it clear that English literary critics are Mr Watson's subject—though the modish typography, with its run-on lines, appears to include in the list such unfamiliar figures as Thomas Ry, John Dennis Alexan, William Wor and Matthew Ar. Sidney does not figure there, for he was more concerned with principles than with the description and evaluation of actual works of literature; and it is only descriptive criticism that Mr Watson deals with. Consequently Dryden (whose essays he recently edited) is the first on the list, which ends with the American New Critics. The chronological survey results in a kind of literary history, but with all the duller bits left out. There is no attempt to be exhaustive or to follow out the development of doctrines. It is the individual contribution, the characteristic method, the recognisable tone of voice that get full attention, and this makes for a lively book.

Mr Watson knows very well what he is talking about, and he speaks his mind. Several reputations are neatly punctured, and the weaknesses of even the greatest men carefully exposed; but there is such an evident relish for what is good and vital that we are left feeling braced, and inclined to believe that it is not so arid, after all, to read what a critic has to say about critics.

BRIEF BOOKLETS . . .

have been produced jointly by The Economist and The Economist Intelligence Unit to present the essential facts behind important current topics. Each takes about one hour to read. Here are the first three titles in this new series:

Brief 1 RHODESIA: BRITAIN'S DEEP SOUTH
by Joe Rogaly

2 MONEY FOR GROWTH
by Fred Hirsch

3 LABOUR IN BRITAIN AND THE SIX
by Val Schur

Each booklet costs 2/6d. post free for remittance with order from:

Sociology Today

Social Theory and Social Practice

Hans L. Zetterberg.

The Bedminster Press. 190 pages. 30s.

Society: Problems and Methods of Study

Edited by A. T. Welford and others.

Routledge & Kegan Paul. 592 pages. 50s.

IT is, as the American author of the first of these two books points out, easy to say tulip, and hard to make one. In "Social Theory and Social Practice" Mr Zetterberg is concerned to show how practical treatment of social problems can be based on the theoretical knowledge that sociologists already possess. For example, he suggests, if a sociologist wishes to study the difficulties confronting any kind of organised opposition in a trade union, he can immediately draw on accepted theories of motivation, bureaucracy, power, authority and so on. On the basis of these ideas he can give a good analysis of the situation without having to indulge in yet another piece of costly research. We may, the author argues, still have doubts about the theories, but we cannot go on doing research for ever. Mr Zetterberg draws an interesting analogy between sociology today and medicine in the nineteenth century, and points out that if doctors had been similarly inhibited about the soundness of their theories, no one would have been treated at all.

In England this point has simply been ignored. The second book treats sociology as a statistical method for the study and analysis of social problems, and there is virtually no reference to pure theory at all. It consists of a collection of essays by many (though by no means all) of the big names in British sociology, and the sections cover a wide range of topics from road accidents to national intelligence. It is intended as a guide book to the subject for sociologists and laymen alike. Sociologists will certainly find in it a detailed study of Britain today, but laymen will probably find it hard going in places (why must academic sociology always be dull?) and it is not truly comprehensive. Apart from the theoretical gap, certain subjects such as social anthropology have been left out. The total effect is curiously flat, and the fact that there are four editors may account for the lack of a unified viewpoint of directive. If Mr Zetterberg would like some of his fellow-countrymen to borrow some of the English pragmatism, then a little more of the inspiration that lies behind American theoretical thinking would be welcome here. After all, compared with other scientists, sociologists are in a unique position, in that the objects of their study are simply other versions of themselves. Thus they start with a degree of understanding already available. It would be a pity if this understanding were to be buried forever under a pile of statistics, but the English book shows distinct tendencies in that direction.

Psychology and Poetry

Mirror of Minds

By Geoffrey Bullough.

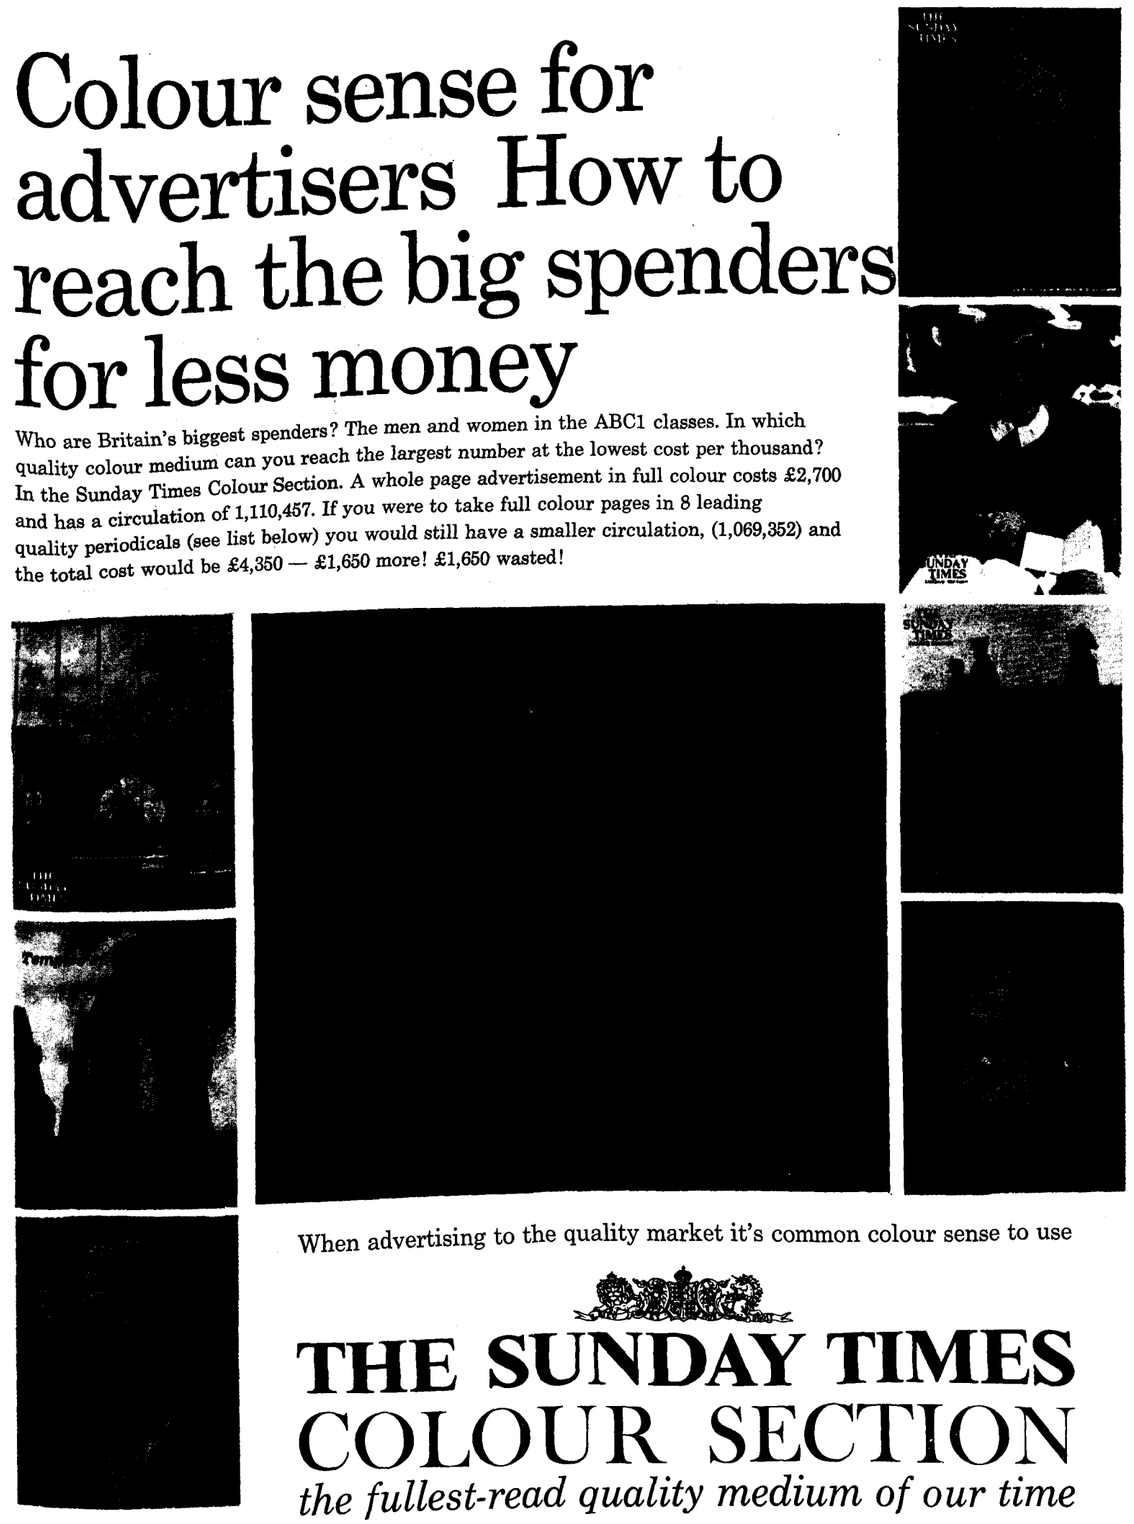
Athlone Press. 279 pages. 35s.

THE trouble with this book is that it attempts to do far too much. It is an expansion of five lectures delivered at Toronto University in 1959, in which Professor Bullough examined changing psychological beliefs as they exhibit themselves in English poetry since the Renaissance. Current assumptions about man's relation with the universe, about the sources of his knowledge, about the various powers of the mind, are bound to affect the more philosophically-minded poets, in whatever age they live, and to consider how they write within the context of such beliefs is very well worth doing. When Professor Bullough writes as a literary historian, conversant with the ideas of the natural philosophers and the psychologists, he is, given a long enough perspective, very illuminating. There is a particularly valuable chapter on reason, the passions and associations from Dryden to Wordsworth. This is a period not much explored by the non-specialist, and there are unexpectedly interesting extracts from Prior's "Alma," Young's "Night Thoughts" and Akenside's "Pleasures of the Imagination." But even here, the wish to leave no stone unturned results in too rapid a survey of too many writers, and some rather banal comments on the better known ones; and when Professor Bullough comes to the twentieth century, it becomes apparent that the historian's feeling for inclusiveness is stronger than the literary critic's concern for intrinsic merit. When he gives himself time to consider a poet in some depth, as he does with T. S. Eliot, he is able to indicate some enlightening connections between philosophical ideas (those of Bradley and Bergson in particular) and the poetic handling of such themes as time and consciousness; but Yeats gets summary treatment, rather more attention being paid to Arthur Symons and Rupert Brooke.

When one considers that Professor Bullough is trying to do within the compass of this single volume something not unlike what Professor Willey has done in a series of quite massive books on the background of thought against which writers worked in the seventeenth, eighteenth and nineteenth centuries, one must admire his temerity and his powers of compression; but it is tantalising to be rushed from one topic to another and from one poet to another at such a breathless rate.

Colour sense for advertisers How to reach the big spenders for less money

Who are Britain's biggest spenders? The men and women in the ABC1 classes. In which quality colour medium can you reach the largest number at the lowest cost per thousand? In the Sunday Times Colour Section. A whole page advertisement in full colour costs £2,700 and has a circulation of 1,110,457. If you were to take full colour pages in 8 leading quality periodicals (see list below) you would still have a smaller circulation, (1,069,352) and the total cost would be £4,350 — £1,650 more! £1,650 wasted!



When advertising to the quality market it's common colour sense to use

THE DRY SHERRY~
~& THE ICE BUCKET

Last year a fable; today a fact

This is the picture that last year launched a thousand conversations. *Chill a sherry? Anything as fine and subtle as Harveys Bristol Dry? It sounded incredible!*

But those who dared were handsomely rewarded. For when a dry sherry has been matured in cask for many years like Bristol Dry, chilling actually reveals its depth of character. The dry, delicate flavour blooms with a glow of hidden warmth.

No sherry drinker who has once tasted Bristol Dry this way would dream of drinking anything else. By the end of last summer, Bristol Dry in its ice bucket had moved into all the very best houses. Now, to drink your summer sherry any other way is nothing short of reactionary. *Harveys Bristol Dry 22/6*

Mr Noble: bitter inheritance

HOME REPORT

Members of the editorial staff and local correspondents report on the life and happenings in and around Britain

Scotland Marks Time

FROM A CORRESPONDENT IN GLASGOW

IT is still not at all clear what the Government means to do about the Toothill report on the Scottish economy, published last November. The new Secretary of State, Mr Noble, announced his considered (and very cagey) reactions on Thursday. They indicated no major innovation in policy on such central issues for Scotland as the distribution of industry in regions of slow, or nil, growth; changes in the Local Employment Act; or the future shape of the transport system. Since these depend on national decisions it is not surprising that Mr Noble refused to commit himself. More observations are promised later on: presumably this means that Mr Noble is still fighting his own battle inside the cabinet for the more fundamental changes that Toothill and others have called for—and in which north-east England and Merseyside are equally interested. But the Scots feel that they have most cause, among all the regions of declining opportunity, to insist on knowing the score as soon as possible. Is there a Government policy or isn't there? There is no doubt that Scottish morale has been sagging increasingly all year and that the Unionists (as the Tories are known north of the border) have never been less loved.

What is to be done about Scotland? Labour MPs and trade unionists are talking themselves almost into the belief that there is no future for it, so often do they preach the harsh facts of economic stagnation. Mr Noble himself, an Argyllshire gentleman farmer so recently elevated to run the Scottish Office and party machine in the north, has come into a bitter inheritance. There are 75,000 unemployed, 3.5 per cent of the working population (or more than double the national average). Emigration rose to 34,000 last year after running at a yearly average of 25,000, mostly drawn from the young and better-skilled, since 1950. Scotland needs 15,000 new jobs a year, but is currently losing existing work faster than new jobs are won. The coal board and the railways have either embarked on policies of massive closure or seem certain to do so. Some 35,000 jobs are said to be in the pipe-line at present, but these will not offset the existing retraction in steel, shipbuilding, engineering, coal, and transport.

While the Labour party demands more financial inducements to attract new industry to Scotland and, on the left, the direction of industry, the Tories complain that all this despondency merely drives potential incoming firms away. They also point out that strikes and go-slows at major projects like the Hunterston power station and the British Motor Corporation plant at Bathgate do not improve the Scottish image. Mr Noble remarks tartly, but with some truth, that Scottish industry has failed to make full use of the research and other facilities that the Government has already provided. But the non-party Scottish Council (Development and Industry) which produced the Toothill report is "pretty desperately concerned" and promises a bit of a battle when it sees Mr Noble and Mr Erroll, the President of the Board of Trade, next week; there are workers' marches; the kirk has voiced its concern, and even the right-wing press is full of anxious leading articles.

It is true that since the British Motor Corporation and Rootes were virtually driven northwards two years ago (to provide up to 20,000 jobs) there has been no sign of an integrated master plan. Six "development sites" have just been designated in the worst black spots, but industries will nonetheless have to be found to occupy the advance factories when they are built.

The most hopeful stirrings have been inside the Scottish Office itself. In June it was reorganised into two key departments, of which the challengingly-styled Scottish Development Department is officially felt to be of enormous significance. Its explicit purpose is to concentrate those economic planning, industrial, and allied functions hitherto somewhat clumsily dispersed around St Andrew's House in Edinburgh and Dover House in Whitehall. In this sense, at least, the Government has not let the Toothill proposals gather too much dust.

IN fact the Unionists have, for them, gone to unprecedented lengths in social and regional planning. Under the previous Secretary of State, Mr Maclay, the basic decision was taken to make 80 square miles of the Lothians (pivoting on Livingston new town and the nearby BMC plant) a focus of new activity to link the Clyde Valley conurbation with the slowly expanding industries of east Scotland. Here the Government is committed to public investment on a major scale. Two distinguished Scots, Professor Sir Robert Matthew, the architect, and Professor D. J. Robertson, the economist, have been engaged as consultants, and there seems to be at least one eye in high places on what the common market Investment Bank could conceivably do for this type of enterprise.

As it is, a substantial infrastructure has been built up in central Scotland generally over the past five years by way of the trunk roads programmes, the Forth and Tay road bridge projects, the Clyde vehicular tunnels, and Glasgow's central redevelopment and overspill. A long-overdue drive to step up technical education and industrial training is beginning to show results. The Unionists are right to point to all this, but it has plainly not produced a self-sustaining regeneration in time to cushion the present (and admittedly overdue) cuts in the older, unprofitable industries.

The Scots have been told repeatedly by their own pundits that the long-term answer lies in industrial virility at home, in economic self-help, and in the will to make Scotland boom without outside aid. But the impression is also growing that all this is less easy to manage when the legislature is 400 miles distant and not particularly sympathetic to a separate rescue operation north of the border. It has always been said that Scottish nationalism would get serious political support only when high and persistent unemployment could be directly related to an economic system that permanently favoured southern England at the expense of the rest of Britain. There have been continuous arguments since 1918 over whether or not Scotland is getting more out of the union than it puts in: the point now is that the visible drift to the south, even before any entry into the common market, has become more painful—and been more resented—than at any time before.

The planners still doggedly predict that the congestion of population in the south and the midlands will eventually produce

its own antidote, in a voluntary return to the relatively empty spaces in the viable regions of the north and west (including central Scotland). But that looks a terribly long time away, particularly if one lives and works in the dying coal and shale mines of West Lothian. Does Scotland have to wait indefinitely for the natural antidote ? If not, how determined will Government action be to start and sustain a counter-drift ? These are the questions that Mr Noble has not answered to local satisfaction.

Grey Skies, Blue Water

FROM OUR SPECIAL CORRESPONDENT

IN the past ten years Stevenage New Town has ceased to be an experiment and become an achievement. Now and again the bright new fabric peters out into wheatfields or heaps of builders' rubble, but most of the citizens can ignore these signs of rawness and settle down to contentment in the neat, orderly houses so conveniently planned within striking distance of shops, amusements and workplaces. The senior residents are noticeably working up their own brand of locally patriotic Conservatism. For many people, complacency and a fascination with such status symbols as a fenced front garden have been the new townsmen's besetting sins. Or so it was until the events of the past few weeks.

First, the Minister of Housing wrote to Stevenage Development Corporation (in company with Harlow) to ask them to undertake a technical study of the possibility of enlarging the planned development of the town beyond its existing target of 80,000 people (the present population is 47,000). Now it is suspected that the Ministry is thinking in terms of an eventual population of 150,000. The suggestion was greeted by a howl of local indignation and an angry protest from the council, despite the warning of one of their number that they might seem to the outside world to be behaving just like those old towners (the indigenous inhabitants) who resisted and successfully delayed the original foundation of the new town.

Stevenage's second bombshell was launched by Mr Thorneycroft, the new broom at the Ministry of Defence, when he decided to stop work on the Blue Water missile. Blue Water was largely designed and made at the vast factory of the English Electric Company at Stevenage which employs 4,500 out of the town's total labour force of 21,000. If nothing turns up to replace Blue Water almost 2,000 of these will have to be sacked. English Electric is one of the two employers in Stevenage not tied to the consumer goods industries. Several local firms, while not avowedly in a state of slump, are chary of hiring new workers at present. What is more, the boffins and the highly-qualified technicians in the missile plant have provided for the new town an elite both in spending power and in education sorely needed by this rootless community.

For just as long as Britain remained in the big missile race the town was thus provided with a star employer at the top of the technological ladder and some justification was given for the familiar jibe that Britain's most peaceful social and industrial experiment rested on the arms race. Much has been made of this by the local trade unions which, in an environment better suited to the cultivation of roses than to old-fashioned working-class solidarity, have come to be dominated by the usual little groups of left wingers. But their protest meetings against the Blue Water decision under the slogan "Boom Town Not Doom Town—No More Missile Contracts" was a fiasco. Most Stevenage workers and shopkeepers want nothing better than peacefully to make weapons of destruction.

•

FOR many individuals who have come into Stevenage to make a new life in highly skilled jobs and a good environment the present position is very serious. For the real specialist there is not a chance of finding a comparable job. For others the idea that all those who live in Stevenage should have jobs there must go by the board, and even the qualified and motor-borne commuter, who can reach within the hour a swarm of booming communities between north London and Bedford and Cambridge, must now compete for jobs with other redundant missilemen from Luton and elsewhere. The shock has come all the harder to a town whose prevailing atmosphere is of earnest self-improvement.

Many Stevenage people whose jobs are not directly affected bitterly resent the prophecies of doom for their town that have appeared in the national press. Even if the number of commuters out of Stevenage does increase, the levelheaded point out that this might have had to come anyway as a new generation grows up. The new towns have amply proved their worth to industrialists: this one, with easy access to markets anywhere in Britain or the world, has actually had to turn away applicants for factory space in the past few years. The English Electric setback, in short, could prove less important for the new town than the question of its optimum planned size.

Over 1,000 new houses a year are still being built and their costs are coming down as new techniques of construction are introduced. Office development is moving in to balance the jobs in factories, to the advantage of the bright young teenagers from Stevenage's excellent schools. In fact the dire effects of this withdrawal by an employer who has become the mainstay of the community may persuade everyone to think again about expansion. The council evidently feels that people can be happier in a medium-sized town, adhering to a good plan, than in a large one that could overstrain the town centre. Against this the idea is beginning to burgeon that a larger and thus more diversified town would also be shielded against even the quirks of British defence policy.

Going to the Doctor

IN 1955-56, about 170 doctors in 106 general practices took part in a survey designed to show the prevalence and incidence of various diseases in England and Wales. Two reports on this survey have already been published, both of them mainly statistical. Now a third has appeared,* summarising the results, in words rather than figures, by groups of illnesses and describing the illnesses of the two age-groups most at risk—children and the over sixty-fives.

A very different picture of national ill-health emerges from this report than is obtained from mortality statistics or from the returns of patients treated in hospital. For instance, over one-quarter of the entire work of a family doctor was taken up with common respiratory disorders — mainly colds, sore throats, pseudo-influenza and bronchitis. These were particularly common among young children ; about a half of the under-fives in all the practices were seen at least once in the survey year for a respiratory illness, and for each illness the child was seen, on an average, three times. At the other end of life, this type of illness, particularly bronchitis, is still the most common, but among the elderly and old a doctor spends more time treating diseases of the circulation—high blood pressure, coronary disease, arteriosclerosis, and so on.

As regards the middle aged, the survey has some interesting things to say about psychiatric disorders. True mental illness (psychosis) is rarely seen in general practice, although it requires nearly a third of all hospital beds. Psychoneurotic illnesses, however, were much more common, with a patient consulting rate of 46 per 1,000 at risk (compared with 264 for respiratory disease), and the most frequent type was an "anxiety reaction." According to the survey, psychoneurosis was about twice as common among women as among men and particularly high in women with families doing a part-time job.

If a woman really wants to avoid psychoneurosis, she had better avoid marriage—or at least motherhood—and sit at home. If a man wants to avoid it, he should not become an administrator or take any post of responsibility, but be a farmer or furnaceman. He should also know that, if he must have a neurosis, it is "U" to show an anxiety reaction, but distinctly "non-U" to show an asthenic one, that is, to complain of tiredness or weakness. He should also not take his wife to live in London or the south-east, but settle in the eastern region or, oddly enough, in the depressed north or Wales.

All this is entertaining reading, but is it a true picture ? Of all disorders psychoneurosis is the most subjective diagnosis that can be made. This is clear from the survey itself: although the average incidence for all psychiatric illness was 50 persons per 1,000 at risk, the extremes varied from 18 to 208 per 1,000 in individual practices. Again, neurotic symptoms become more overt if there is more outlet for them. With more doctors and more hospital and specialist facilities available per head in the prosperous south-east, it may be more worthwhile trotting out your anxieties there than to an overworked harassed doctor in the north. As for the sex difference, may it not be partly explained by a woman's greater opportunities for contact with the doctor, as a result of consulting with her children ? And does not a man tend to drown his worries at the pub? He is certainly three times as likely to have an ulcer.

Racial Intolerance

SIR—Your balanced article Shaming the Devil (August 11th) says ". . . . we will not give to politicians or policemen or magistrates the power to specify what shall or shall not be said." I agree: but that does not mean that a society may not decide what acts run contrary to its sense of right or wrong, and what acts offend against public taste ; nor does it prevent society, if it sees fit, from forbidding its members to commit such acts. It is surely the right of every society, and at times its duty, to legislate in order to maintain its moral standards.

Racial hatred is abhorrent to the majority of Englishmen—at least as abhorrent as, for instance, unnatural sexual practices. Yet the public good does not automatically require either practice to be made illegal. But if either shows signs of becoming widespread, the government, as the mouthpiece of society, should show the general abhorrence of such acts by legislation. This legislation need not aim to prevent the acts themselves: only in very exceptional cases should the liberty of the individual be thus interfered with. It should instead be designed to prevent the corruption of others by those who practise these perversions. A law to make illegal public incitement to racial hatred would do just this.

As John Stuart Mill wrote. . . . "The maxims are first, that an individual is not accountable to society for his actions, in so far as these concern the interest of no person but himself. . . . Secondly, that for such actions as are prejudicial to the interests of others, the individual is accountable, and may be subjected either to social or to legal punishment, if society is of the opinion that the one or the other is requisite for its protection."

Racial intolerance is today increasing in this country. Although, I hope, unintentionally, the Immigration Act has given the appearance of public sanction to racial discrimination. Not only the riots and near-riots of Notting Hill, Trafalgar Square and Dudley, but also the eagerness of magistrates to deport for minor offences, show how close to the surface lies racial feeling. What is profoundly disturbing is that this feeling exists not only among a few ruffians and crackpots, but among people believing themselves to be guided by Christian principles. Surely, therefore, society is now bound to declare by legislation where it stands on this issue. Such action may be called intolerance of the liberty of the individual: but inaction is without doubt tolerance of what, by our ethical standards, is evil. At the same time, this very inaction would be taken by many as, if not tacit approval, at least absence of disapproval by society of such behaviour.—Yours faithfully,

Newton, Cambridge WALSTON

Priorities for Education

SIR—In Priorities for Education (July 21st) you rightly suggest that a policy of salary differentials could be used to help solve problems of recruitment and the distribution of teachers between various types of school. But salary differentials can only influence the distribution of teachers between schools if the teachers recognise their existence ; and the complexity of the present Burnham scales makes this difficult. For example, many primary school non-graduates believe that they are treated less generously than their colleagues in secondary schools. Is this true?

Tables 41 and 42 of Statistics of Education 1961, Part I give information concerning salaries at March 31, 1961. (School teachers have had a salary increase since that date, but these are the most recent statistics available.)

If we consider only men aged 50-54 we find that the average salary for non-graduates in secondary schools was £1,153, whereas that for non-graduates in primary schools was £1,203. Also, whereas 15 per cent of the primary school teachers were earning more than £1,400, only 9 per cent of the secondary school teachers were in this income group.

The average salary for all non-graduate men was £1,040 in primary schools and £953 in secondary schools: 6 per cent of the former and 3 per cent of the latter have salaries of £1,400 or more. Again these statistics suggest that the man teacher will do better in primary than secondary schools.

On the other hand, for the age groups under 35, the average salary for men non-graduates was higher in secondary than primary schools. Also whereas eleven non-graduate men earned more than £2,000 in secondary schools, no non-graduate teacher in a primary school earned more than £1,800. Presumably the discontent among these primary school teachers arises from the fact that they are more conscious of the greater availability of special allowances in secondary schools than they are of the higher proportion of headships in primary schools.

In discussing salary differentials for mathematics and science graduates it is necessary to consider the relationship between the Burnham scales for schools and those for technical colleges. From Table 43 of the same publication, it seems likely that more than half the men graduates in technical colleges were earning more than £1,400 a year compared with 28 per cent for men graduates in secondary schools. Mathematics and science graduates in the schools certainly have better chances of extra allowances than other graduates, but there seems little doubt that salary differentials favour the technical colleges.

The case for salary differentials is generally an economic one: and it would be unrealistic to advocate a salaries policy which took no account of economic considerations. On the other hand, the existence of salary differentials may have an adverse effect on the quality of education provided in the schools. The existence of a high proportion of above-scale posts carrying a variety of allowances may well encourage more mobility among teachers than is good for their pupils. Also the emphasis on posts of special responsibility and advanced work may detract from the status of the class teacher upon whom the quality of education depends.—Yours faithfully,

BANK OF AMERICA

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

Token Progress in the South

WASHINGTON, DC

IT is the devout wish and reasonable expectation of all concerned that a few more young Negroes will be admitted into a few more previously all-white southern schools next month without provoking violence. Last year was the first without trouble since 1954 when the Supreme Court issued its historic decision declaring racial segregation in the tax-supported schools to be unconstitutional. But the mere absence of rioting would not signal the coming of a new order in the South or a widespread acceptance by southern whites that segregation cannot be maintained much longer. On the contrary, the South seems as determined as ever to maintain segregation but to maintain it, as far as possible, without resorting to howling mobs and brickbats. This effective rearguard action against any significant lowering of the colour bar takes two forms. In the states of the deep South there is a solid and unbending opposition to any form of racial integration, not only in the schools but also in eating places, hotels and other facilities open to the general public. Elsewhere in the South, the opposition is more subtle. Dr Martin Luther King, the Negro clergyman who has become the unchallenged leader of the fight against racial discrimination, calls it "planned and institutionalised tokenism"—a compliance with the letter but not the spirit of federal court rulings, under which token desegregation takes place but nothing approaching true racial integration is permitted.

The uncompromising stand of the deep South can be seen in the fact that not a single school district in Alabama, South Carolina or Mississippi has tried even token integration and only one district in Georgia (Atlanta) and one in Louisiana (New Orleans) have hesitantly admitted a few Negro students to previously all-white schools. But at present the dramatic symbol of resistance in the deep South is to be found in Albany, Georgia, a community of some 56,000 persons, including 23,000 Negroes. Albany's dominant white majority refuses resolutely to budge an inch to lessen the segregation of all public facilities, ranging from drinking fountains to courtrooms. Last year this uncompromising attitude brought into existence the militant but non-violent Albany Movement. Its leaders, Dr King and other Negro clergymen, keep asking the all-white City Commission to discuss the Negroes' grievances; when this demand is rejected they sponsor mass demonstrations in the street. More than 1,000 of the demonstrators have been arrested since last December.

What worries civil rights leaders even more than the intransigence of the whites in Albany is the tokenism practised in the supposedly more enlightened areas of the South. The invaluable *Southern School News* reports that 948 Southern school districts have discarded the colour bar, out of 3,047 districts which contain both Negro and white students, and 33 more districts are scheduled for desegregation this autumn. But these encouraging statistics can be misleading. They include states such as Missouri, West Virginia and Oklahoma which are not really southern in culture at all. And in the states of the old Confederacy what integration exists is of the token variety, with only handfuls of Negroes admitted to all-white schools.

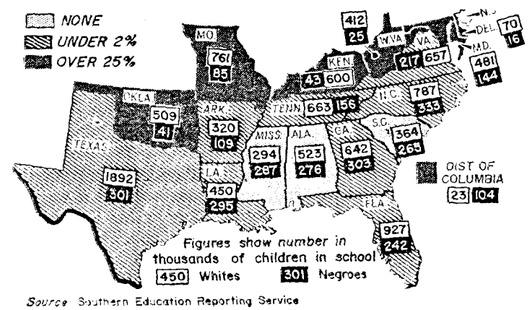
North Carolina, long regarded as the most enlightened of southern states, has become the master of tokenism. During the coming school year there will be racial mingling of some sort in 19 of its 173 school districts, but genuine integration will exist nowhere in the state. Fairly typical is the town of Salisbury, which begins "integration" next month by admitting three Negroes to an all-white school. More subtle are the practices of the charming city of Charlotte, where 414 Negroes will be assigned this year to bi-racial schools, compared with only 27 last year. But of these 414 Negroes 371 will attend the Bethune school and all but 40 white students at Bethune have applied for, and been granted, transfers to all-white schools. Thus the school does not become integrated but merely changes from a predominantly white to a predominantly Negro institution.

Although Dr King demands an immediate end to racial segregation in the South, more moderate Negro leaders and some sympathetic whites believe that the southern Negro will win his demands only when he secures and exercises the right to vote. Then, this theory goes, the southern politician will be forced to cater to the sentiments of his Negro as well as his white constituents. It is true that southern politicians admit in private that the entire political climate of the South will undergo a vast change when the region's immense Negro population begins to vote in significant numbers. One southern Senator with unchallengeable segregationist credentials is secretly building an underground Negro organisation in preparation for that day.

But that day may be too far in the future to have much relevance to existing conditions. It is almost as difficult to break down the barriers, overt and psychological, to Negro voting in the South, and particularly in the deep South, as it is to end discrimination in other fields. Here again, tokenism is at work; a few Negroes may be permitted to go to the polls in one election district after long and involved court struggles, but there is no easy way for Negroes to vote on the same basis as whites.

Furthermore, the right to vote, by itself, will not insure the election of Southerners who will be more responsive to demands for equal rights for Negroes. One veteran southern politician, Senator Olin Johnston of South Carolina, has always depended on Negro support and received nearly unanimous backing from the

SOUTHERN NEGROES IN SCHOOL WITH WHITES



Source Southern Education Reporting Service

Negroes in his recent fight to be renominated by the Democrats. Yet Mr Johnston is an ardent segregationist who has done more than anybody to block the confirmation of Mr Thurgood Marshall, the eminent Negro lawyer whom President Kennedy has appointed to be a federal judge of appeal for New York State. What Negroes find attractive in Mr Johnston is his economic liberalism and his support for spending on social welfare. The Long dynasty in Louisiana has used this same combination of racial segregation and liberal economic policies to attract simultaneous support from both poor whites and Negroes.

The Kennedy Administration has a good deal of justification for claiming that it has promoted civil rights with greater vigour than did the Eisenhower Administration. During the next two years Mr Robert Kennedy, the Attorney General, can be expected to press with particular energy law suits to enable Negroes to vote in the deep South. But the federal government can institute no overnight change in the state of voting rights and possesses pitifully few tools to combat the massive determination of the southern whites to maintain segregation in other areas. There is considerable debate among northern politicians about just how effective new legislation—giving the Attorney General, for example, power to initiate law suits against the colour bar in schools—would be. But the question is largely academic. Truly meaningful civil rights legislation has no real chance of success in Congress for at least another decade, primarily because the southern Senators can filibuster, or talk such measures to death.

Few observers believe that the recent vote by the Senate to choke off a liberal filibuster against President Kennedy's Bill on communications satellites, the first time the Senate has shut off debate on a Bill since 1927, sets any precedent for filibusters over civil rights. Ironically, the vote on closure may even have injured the civil rights cause. Supporters of civil rights in the Senate can no longer argue that it is impossible to secure the necessary two-thirds vote to end debate. Consequently the likelihood of a change in the rules to permit closure by a simple majority vote is all the more remote.

Discouraging as the outlook on racial discrimination may seem, the handful of moderate southern whites counsels patience on the part of Negro leaders, contending that the small doses of desegregation since 1954 are quite remarkable and that it is unreasonable to ask the South to move any faster. Unreasonable it may be, but there are signs that the patience of the Negro is wearing thin. Quite apart from its impact on the international leadership of the United States, racial segregation in the South may be one problem that simply cannot be ignored by an apathetic public. It is inevitable that in the coming years the traditionally docile southern Negro, spurred on by his clergymen, will join militant non-violent efforts similar to the Albany Movement and that the situation in Albany will be duplicated throughout the region. More worrying is the prospect that Negroes, in their discontent, will be attracted increasingly to extremist organisations such as the Black Muslims, with their claims of black supremacy and toleration of violence. If this happens, pacifist Negro clergymen such as Dr King might lose that control of the desegregation movement which has restricted it to non-violent methods.

Nonpolitical Politics

OFFICIALLY nonpolitical as was the President's trip to the western states last weekend, no one doubted that it was the beginning of a sustained and energetic effort by Mr Kennedy to get liberal Democrats, who will support his policies, elected to Congress next November. He went to give his presidential endorsement to three important water development projects. But the general purpose of his visit emphasised how the federal government can help individual parts of the country—provided that the case for that help is put by representatives who can count on a sympathetic hearing in Washington. And the individual projects selected for the President's blessing happened to be in places where there were Democratic candidates in special need of his accolade.

In South Dakota, where the Oahe Dam is situated, Mr George McGovern is trying to oust a Republican Senator. In Colorado two Democrats, Senator Carrol and Governor McNichols, are in danger while the town of Pueblo, which was chosen as the best place for inaugurating the Frying Pan scheme, happened to be in the district of a Republican Congressman who might possibly be beaten this year. Ground-breaking for the San Luis dam in California marked the beginning of the end of California's water shortage; the scheme is the acknowledged achievement of the Democratic Governor Brown's first term of office and he is now being seriously challenged for re-election by the Republican Mr Nixon who has done nothing so far for the state of California. It did no harm at all to Mr Brown that the nonpolitical character of the President's tour and of the water developments he was inspecting meant that all the ceremonies were attended by all the elected local representatives, whatever their party. For California has a nonpartisan tradition of state administration which Governor Brown has maintained; this approach appeals to the voters but it is one which Mr Nixon can hardly adopt.

Similar nonpolitical tours are now being planned for the President in eastern cities, such as Philadelphia and Chicago, with federally-financed urban redevelopment projects being made the ostensible excuse. Here the prestige and publicity of being seen close to the popular President will rub off on such hard-pressed Democrats as Mr Dilworth, running for Governor of Pennsylvania, and Mr Yates, trying to defeat Senator Dirksen of Illinois. Nonpolitical trips have the advantage that they are paid for by the government instead of by party funds. They also give Mr Kennedy a chance to appeal to the vital independent voters instead of to the converted who attend party gatherings. But the President will be making many admittedly political sorties into crucial areas during the next two months, campaigning openly for votes. There is nothing he likes to do better or is better at doing. But if past precedent is any guide the practical impact of his efforts on the make-up of the next Congress is likely to be only slight.

Peruvian Conquest

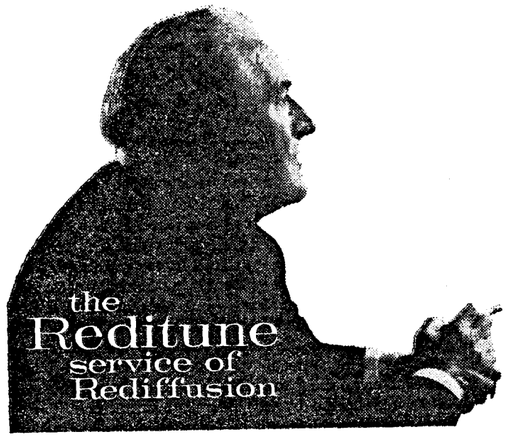
THERE were no celebrations in Washington last week of the first anniversary of the Alliance for Progress, the ten-year plan to stimulate economic growth and the spread of social justice in Latin America. As Mr Moscoso, the American director, said, no celebration was warranted by the results. Investment has been slow to move and the programme has not kindled the imaginations of the ordinary Latin Americans whom it is designed to benefit, partly because they see little concrete evidence of what is being done. According to a congressional committee the plans submitted by the Latin American countries themselves are more like pipe-dreams than blue-prints: meanwhile the rich continue to send their wealth out of the country for safe-keeping. But at least both in Washington and Latin America there is more appreciation of the staggering problems which must be overcome if the programme is to succeed. It may be some consolation that the Russians are having similar troubles in Cuba.

Another reason why no one in Washington was in a mood to celebrate on August 17th was that this was the day the Kennedy Administration swallowed its scruples and fears and recognised the new government of Peru. Economic aid, which was cut off when diplomatic relations were severed abruptly after the military had seized power, is to be resumed. The Administration justifies

♫ MEN WHO MAKE DECISIONS CHOOSE REDITUNE BACKGROUND MUSIC

THE SUCCESSFUL BUSINESS IS ALWAYS MOVING FORWARD—SEEKING BETTER WAYS OF INCREASING EFFICIENCY AND PRODUCTION. REDITUNE IS PLAYING AN IMPORTANT PART IN THIS MOVE FORWARD BY PROVIDING THE RIGHT SORT OF BACKGROUND MUSIC TO SUIT THE INDIVIDUAL NEEDS OF ITS USERS. REDITUNE GIVES LIFE A LIFT FOR 7½ MILLION PEOPLE EVERY DAY. WHAT ABOUT THE PEOPLE YOU HAVE TO DEAL WITH? IF YOU'RE A SUCCESSFUL EXECUTIVE, REDITUNE MUST COME INTO YOUR PLANS FOR THE FUTURE. NOTHING SUCCEEDS LIKE SUCCESS. AND WHEN IT COMES TO IMPROVING RELATIONS WITH EMPLOYEES, RELIEVING TEDIUM AND REDUCING ABSENTEEISM, NOTHING SUCCEEDS LIKE REDITUNE.

♫ REDITUNE GOES WITH SUCCESS



Reditune provides the right sort of music
14 classifications and a wide selection within each. Reproduction is of the highest quality.

How Reditune operates
An automatic tape playback machine feeds any number of speakers. To load the machine or change a tape is as easy as posting a letter.

Reditune costs so little
The inclusive rental of a complete installation can cost you as little as £65 a year.

Reditune is the only all British background music service

this retreat on the grounds that the new regime—perhaps because of the violence of the reaction in Washington—has promised to hold and respect free elections (although not until next June); it has also released its political prisoners, undertaken to respect the country's international commitments and restored civil liberties. To withhold economic aid would have postponed work on Peru's problems and might have looked like Yankee dictation, particularly as most of the main Latin American countries have now recognised the new government which is very popular with the local American business community. But the other side of the coin is that in future American threats to cut off aid if democratic governments are overthrown will not be taken seriously.

Military assistance to Peru is not, however, to be resumed at once. The spectacle of an American-provided Sherman tank controlled by an officer trained in the United States smashing down the gates of the presidential palace in Lima has revived all the old suspicions in Congress of the military aid being given to Latin American countries—$500 million worth since 1952. Originally this was supposed to strengthen hemispheric defence, by standardising equipment and modernising the armed forces, and to prevent the buying of arms elsewhere. Just this week Mr McNamara, the Secretary of Defence, supporting a request for $1.5 billion for military assistance, $63 million of it for Latin America, argued that this aid exercised a "constructive influence" and was needed to put down communist subversion. But the critics both in Latin America and in Congress consider that military aid simply fans an arms race for the sake of national prestige, stimulates wasteful spending of over $1 billion a year and leaves democratic governments more and more at the mercy of their armed forces.

Satellite's First Step

PERHAPS the saddest aspect of the filibuster in the Senate against the communications satellite Bill was that it frustrated its own purpose. The liberal Democrats who tried to prevent the Bill coming to a vote were anxious to bring what they genuinely believed to be its dangers to the notice of the public. However, not only did the publicity generated by the method they used distract attention from the arguments in their prolonged speeches but the filibuster also prevented the Bill being amended in ways which might have improved it. Once the Democratic leaders in the Senate had managed to limit the debate, they were determined not to allow any amendments at all; changes would have had to be reconciled with the Bill already approved by the House of Representatives and the agreed version would then have had to be voted on again in the Senate, giving the liberals an opportunity for another filibuster. They may have this opportunity, nevertheless, for the Bill as originally presented to, and now approved by, the Senate differs from the House version in several respects, notably on the ownership of ground stations for the satellite system.

Basically, however, both versions of the Bill are the same; it is a compromise resulting from lengthy negotiations and hearings and its sponsors claim that it is only a first step which can be altered in the light of experience. It authorises the establishment of a private corporation to develop and run a commercial system of international communications by satellite, of which Telstar is the forerunner. The corporation will be financed through an issue of shares, half to be offered to the existing communications companies and half to the public. Each of these groups will be able to appoint six directors and three will be appointed by the President of the United States. The corporation will be regulated by the Federal Communications Commission but the liberal Democrats contend that, from past experience, this will not be enough to keep the companies and particularly the American Telephone and Telegraph Company, which is responsible for Telstar, from monopolising for private profit a development which has so far been financed mainly by the taxpayers. The argument has many ramifications but the fundamental demand is for outright government control of the satellite system or at least for much stronger control than is provided in the Bill.

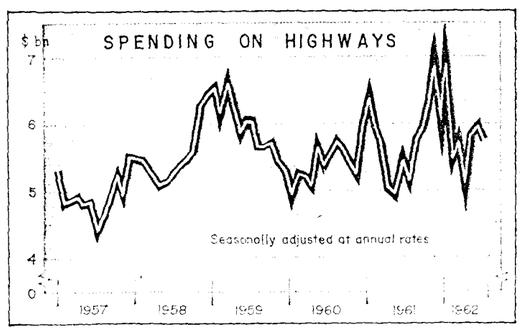
The immediate aim of the filibustering Democrats, however, was merely to postpone a final decision to allow time for further consideration. But this the Administration refused to accept, on the grounds that the new corporation must be in working order before the international conference which in a year's time is to allocate frequencies for use in space communications. There is undoubtedly also the fear that delay might lose the United States its lead in the one space activity in which it is obviously ahead of the Soviet Union.

Speed Up on the Roads

THE Administration has moved quickly to back up the President's plea to Congress, in his address last week, for the enactment of pending measures which would speed economic growth. The Department of Commerce, using powers which it has long had, awarded a $2 billion bonus to the states for building roads during the current fiscal year. They are now authorised to commit nearly $5.8 billion of federal money to subsidise highway construction before next July, instead of the $3.8 billion originally earmarked for the period. Under the Highway Act of 1956 90 per cent of all state outlays on the national system of super-expressways as well as 50 per cent of state expenditures on other primary and secondary roads are reimbursed by the federal government.

The stimulating effect will be virtually immediate in the fifteen or so states which had been waiting to sign contracts for the building of new highways until additional funds became available. They will be able to translate the bonus into actual construction at once; moreover, the whole extra $2 billion is to be released in the current quarter, instead of being parcelled out equally over the full year as has been the usual practice. This will have a direct impact on local economies over a large area of the country, including some states—California and Pennsylvania, for example—which are likely to be crucial in the November elections, and through the normal spilling over of spending the indirect benefits should be even more widespread.

The highway programme's function of helping to sustain a high level of economic activity, underlined this week, will continue for a decade; the full system is not scheduled for completion until 1972. It provides for 41,000 miles of interstate highways, to cost $41 billion and to be capable of handling the volume of civilian traffic expected by 1975 and of meeting the needs of national defence then. Already the project is well advanced, with some



30,000 miles of road in place, under construction, or at various stages of planning. The scheme was threatened earlier this year by the exposure of scandals involving conspiracies to overcharge for rights-of-way and other irregularities and during the 1958-59 recession by a deficit in the Highway Trust Fund, out of which the federal contribution is financed. However, since congressional investigation brought the scandals to light, both the Bureau of Public Roads and state highway departments have tightened up their controls and the fund has been restored to solvency by an increase in the taxes on road users which finance it.

Mr Attorney General

WASHINGTON, DC.

MR ROBERT KENNEDY, a younger brother of the President and at thirty-six the second youngest Attorney General of the United States in American history, detests fraud, hypocrisy and abuses of power. Visiting a well-known law school, he was asked whether a lawyer should ever lie to a judge: Mr Kennedy said in his cool, courteous Boston accent that he thought any six-year-old must know the answer to that sort of moral problem. As Attorney General and head of the Department of Justice, it is his job to give the President legal advice but, as the President's brother and closest associate, he is also consulted on defence, foreign policy and national security. He knows the President's mind and the President relies on him implicitly to report on any situation with complete honesty. His advice is not always followed but it is always wanted.

Mr Kennedy took time off from being Attorney General last February to go round the world speaking for his brother, and in a book* published this week—the profits are to be used for scholarships at universities in Japan, Indonesia and West Berlin—he describes the trip which he made with his wife. He told Japanese and Indonesian students that it was time that they grew up, but he also admitted to Indonesians that Texas's war with Mexico in the last century was unjustified; this offended Texans, who also need to grow up. He claims to have helped to persuade the Indonesians to negotiate with the Dutch about New Guinea. He urged young Japanese to have the courage of their convictions and to be willing to stand up and be counted; he praised the bravery of the Japanese student who argued hotly with him, as well as that of the young Indonesian who faced arrest and punishment by throwing fruit peel in his face. When he left the Orient Mr Kennedy was more convinced than ever that the United States will be only a poor preacher on democracy as long as American Negroes are prevented from voting by threats, intimidation and legal trickery. Writing books seems to be second nature to Kennedys and other members of the New Frontier; Mr Kennedy records his dismay that a Djakarta bookshop had "not one book by the President of the United States."

He was his brother's campaign manager in the 1960 presidential election and he has a fiercely loyal team spirit, so long as the team is on the side of the Kennedys. Tirelessly athletic and happily married, he works with coat off, tie loose and sleeves rolled up, behind a huge desk in an enormous office in the Department of Justice's big building in Washington. He has boyish good looks yet is a shy and highly-strung man, intense and absorbed, with a burning-glass's power of concentration. But his sense of humour, like the President's, is never far away and runs habitually to slight self-mockery. He says the reasons why he became Attorney General are that he worked hard and that his brother was President—but not in that order.

After attending the University of Virginia's Law School, Mr Kennedy served as an assistant counsel on the notorious McCarthy committee but left it because he disliked its methods; later he became chief counsel for the Senate select committee on improper activities in the labour or management field. It was there that he first caught the public eye. Under his dynamic leadership the Department of Justice has gone after corrupt trade union leaders and business monopolies. It has also scourged gamblers and pedlars of dope, exposed crooked policemen and judges and pressed energetically for more civil rights for Negroes.

Mr Robert Kennedy is the Roman Catholic grandson of an Irish immigrant. But it is in the spirit of New England Puritanism that he conducts the affairs of the Department of Justice. He worries about the moral fibre of America. His creed is to reach out with stark, almost naïve honesty to do the things which he feels need doing. The Department of Justice is an instrument of singular power. It can put the squeeze on almost anyone by its ability to investigate almost anything, including income-tax returns. The Attorney General has his brother's ear and like the President himself is continuously on the prod. Gangsters and other public enemies are uneasily aware that little brother is watching them. One man once called him, with deep feeling, the blue-eyed monster. Under previous Democratic Administrations, the Department of Justice suffered from mediocre management by political hacks. President Eisenhower's men were capable but he did not back them up with any conspicuous enthusiasm. With the President's full support Mr Kennedy chose a team of brilliant deputies, one of whom has already gone to the Supreme Court.

The cause of justice, as Mr Kennedy conceives it, is being prosecuted with zeal and skill which have brought him both enemies and respect. Most of those who criticised the President for giving the job to his brother admit now that the Attorney General has done well. But although he appears as a dedicated man, people still ask what he is dedicated to other than President Kennedy. He himself says that businessmen ought to look on him as their friend, because he is on the side of the shrimps against the sharks, but some of them suspect that he regards big business as a form of organised crime. The swiftness with which he moved to investigate the steel industry this spring, dispatching his agents to knock up newspapermen at three o'clock in the morning, did nothing to reassure them.

Modestly he calls himself "an amateur in diplomacy" but there has been talk of him becoming Secretary of State and of him trying to become President in 1968 if his brother serves the two terms which are all that the law allows. But he is reported to be too shrewd to think that a Kennedy can succeed a Kennedy and to have said that "by then, they will be sick of us." Mr Kennedy gives eight-tenths of his furious energies to his present job, in spite of the time he spends at meetings of the National Security Council, and at present it is by his undoubted success as Mr Attorney General that he wishes to be judged.

* Just Friends and Brave Enemies. By Robert F. Kennedy. *Harper and Row*, New York. 211 pages. $3.95.

Match for Symington?

AT his press conference this week, President Kennedy was invited to comment on two charges arising out of the latest and liveliest phase of the investigation by Senator Symington's subcommittee into stockpiling policy under the Eisenhower Administration. The first, developed out of testimony before the subcommittee last week, was that excessive profits had been made out of supplying nickel for this strategic reserve by Mr George

Humphrey, President Eisenhower's Secretary of the Treasury, and the M.A. Hanna Company, of which Mr Humphrey was chairman until he entered the Cabinet and after he left it. The second charge, made by Mr Humphrey himself, was that the whole stockpile investigation was a "stab in the back" aimed at former President Eisenhower.

In his guarded reply, the President said that the Hanna Mining Company, a subsidiary of M.A. Hanna, had made "extremely large profits" out of a contract signed in 1953, four days before Mr Humphrey joined the Cabinet, to supply the government with 125 million pounds of nickel from hitherto undeveloped resources in Oregon. Until then, the United States had been dependent on imports from Canada, Cuba and elsewhere and the nickel was needed urgently for jet aircraft engines during the Korean War. But the President declined to include Mr Humphrey, as a responsible official of the company, in his criticism. Indeed, the Democrats may have cause to regret embroiling the former Secretary of the Treasury in a campaign to make capital for the November election out of accusations that the previous Republican Administration bought too much for the stockpile too expensively.

Mr Humphrey's attitude towards the committee was cavalier. He pooh-poohed as "bunk" and "baloney" the statistics of government auditors purporting to prove that he personally made $8 million out of the nickel contract and that Hanna Mining earned a profit on it of 57.4 per cent before taxes and 457 per cent on invested capital. And he told the subcommittee that it simply did not "understand big business," even though its chairman is a millionaire businessman. This, and Mr Humphrey's generally belligerent approach, tried Senator Symington's patience to breaking point. Smashing down his gavel, he adjourned the hearings abruptly and departed to hospital for a pre-arranged hernia operation. It is not thought that much more will be heard of the investigation before November although this wicked contract could do with further examination.

Slanted Story

To its list of superlatives Texas may be about to add the biggest theft in its history. The state's Attorney General, Mr Wilson, has discovered that at least 109 oil wells in the rich fields of eastern Texas do not, as the state law requires, descend in an almost vertical straight line to the pool of oil upon which they draw; instead they are slanted as sharply as a bent drinking straw in order to syphon oil from underneath neighbouring property. The scandal, with its hints that as much as $10 million worth of oil may be drained away from rightful owners every month and that perhaps half of the 19,000 wells in the celebrated East Texas Field may contain hidden deviations, has pushed the Billie Sol Estes case out of the limelight and left Texas, whose entire economy and emotions revolve around oil, in a state of shock. Already more than 100 independent operators, some of them millionaires, have been implicated and 557 oil wells, including all those on the leaseholds where slanted wells have been found, have been cut off from the pipelines which carry the oil to market. The further penalties for those who may be convicted will be severe: Texas has filed five suits seeking $24 million in fines already, after having completed just a fraction of its planned 1,000 investigations. There will be civil suits from the companies whose oil was stolen and the federal government has already brought 37 charges under the law against transporting illegally produced oil across the state lines.

The practice of slanting has been inspired in large part by dwindling supplies of oil on the western side of the East Texas Field: the still bountiful reserves, estimated at 3.5 billion barrels, on the eastern side have obviously been a temptation to those in a position to draw upon them illegally. There has also been a great incentive to outfox the state's strict regulation of how much oil each well is allowed to produce; the current limit is equivalent to eight days' output a month. But "marginal producers'" wells, said to be incapable of producing as much as 20 barrels a day, are exempt from regulation; thus each such well can lawfully produce 15 barrels or so every day in the month. This fact has led to the ingenious use of one slanted drilling to feel oil to several worn-out wells; this "Granddaddy" system, revealed by the Texas investigations, allows the maximum profit from one deviation.

The wide network of crooked wells—they have been found in three other fields—inspired a rumour that they had been drilled by joint agreement between the major producers and the independent operators in order to dodge the state's restrictions and to share the increased profits. But the independent operators, who have borne the brunt of the scandal so far, have complained that they are being persecuted by the state as a favour to the large companies. Both groups will have a chance to defend themselves at the inquiry which a committee of the State Legislature is to open next week.

Is Washington Typical?

Even the stoutest friends of the under-privileged are having to admit that public assistance has been abused and maladministered, at least in the District of Columbia. Investigations demanded by the congressional committees which control the city's budget have suggested that over half of the families receiving aid under the joint federal and local programme for help to dependent children were not eligible for such relief. In the past the Department of Health, Education and Welfare has insisted that only about 1.5 per cent of public assistance funds went to people who were not entitled to this aid. Critics of these programmes—and particularly of that for dependent children which, they allege, encourages promiscuity and shiftlessness—now feel that their worst suspicions have been justified. The federal government is launching a nation-wide check of the children's programme.

The revelations have probably put paid, for the time being, to hopes that the District might take advantage of the more constructive approach to the problems of welfare embodied in a new Act. Its main aim is to help as many as possible of the recipients of assistance to become independent; it provides funds for nursery schools to enable mothers to go out to work, for retraining the unemployed, and for training and paying more social workers to help families to solve their problems. It also extends for five years the temporary programme of help for the children of the unemployed. In the past they received assistance only if the father had died or deserted his family or if the parents were divorced —a restriction which split up families and encouraged deception. But all these schemes require matching funds from the local community and Congress, exasperated by tales of assistance claimed by people in work, by mothers living with "paramours," of families on assistance with two television sets and of careless overpayments, is in no mood to authorise more spending for welfare in the District.

Instead it is demanding reductions, as well as convincing assurances that assistance will be administered competently in the future. But Congress cannot escape a share of the blame. Its penny-pinching has deprived the District of sufficient social workers. With an average case-load of 186 families, a social worker can devote only about five hours a year to visiting each one; the teams of investigators spent over thirty man-hours on each of the families which they caught out. Moreover the very strictness, in theory, of the rules under which relief is granted tempts both the recipients and social workers to break them. The city's problems have been increased by a tremendous influx of under-privileged and impoverished Negroes from the South. But the capital—and Congress—will be giving the country a wretched example if the sins of the mothers are visited upon hungry children.

THE WORLD OVERSEAS

Feudal Fish in Sardinia

FROM A CORRESPONDENT IN ITALY

THERE is more trouble at Cabras ; fishermen have been arrested, and others have gone into hiding. But this state of affairs is by no means unusual in this Sardinian village on the Gulf of Oristano where the left wing has taken upon itself to challenge the validity of exclusive fishing rights held in private hands for some three hundred years. It is a bitter conflict—feudalism and communism make well matched opponents—but its importance is a good deal greater than a clash of interests exploited by the Left.

At first sight Cabras itself has little to distinguish it from any other backward Sardinian fishing village, with its rows of single-storeyed houses along dusty, unmade roads, many of its men barefoot and its women in traditional dress. But it has two distinctions. Maria Theresa of Austria was sufficiently impressed by the appearance of a Cabras woman to give her an imperial kiss, and thus continued the legend of the beauty of its women. Far more distinctive—since a number of places in Italy make a similar boast—is the lagoon. It is rightly famous for the richness of its fish. Visitors attracted by the first distinction—and perhaps by the Phoenician ruins of Tharros nearby—have recorded how impressed they were by the second ; *très poissonneux* wrote the French consul to Sardinia at beginning of the last century, and of the mullet he remarked that they were *de la plus étonnante grosseur.*

Possession of the lagoon is therefore a valuable property. In its way it probably has no peer in Europe. Whether in the end it will prove so valuable as to justify the struggle for retention conducted by the present feudal lords is less clear. In insisting on what they claim to be their hereditary rights they have managed to humiliate the regional administration, undermine what little confidence there was in the national government, force on the people of Cabras a combative cohesion which they have never known before, and provide the Left with a perfect case for decrying continued injustice cossetted by an ostensibly democratic regime. It is dangerous ground.

The lagoon at Cabras—it is known there as a *stagno*—is in fact a lake divided from the sea by a narrow strip of land cut by canals. Young fish come in from the sea attracted by the warmer temperature, lack of enemies and abundant food. They cannot find their way out again and grow fat on the luxuriant vegetation. It is practically an aquarium, some 22 square kilometres in extent, surrounded by marshes and a misty coast. The effect on the sea of the attraction of the lagoon, and of centuries of coastal overfishing, is that few fish remain to be caught off the shore. That is one reason why the coastal fishermen are now providing the main pressure for throwing open the luscious *stagno* to the whole fishing community. They have organised symbolic occupations of its waters, just as the peasant occupied the land immediately after the war to demand agrarian reform. They fish illicitly. These efforts have at times brought enough *carabinieri* and police to the place almost to give the impression that Cabras was occupied by an alien army. Men are now being arrested on the streets as a result of renewed violence last month.

Ownership is really the point at issue. The existing rights go back to the sixteenth century when Sardinia was ruled by Spain. Philip IV needed money for his Catalan war and raised a loan from the Genoese banker, Gerolamo Vivaldi, offering as a pledge the lagoons, fisheries and dependencies of Cabras and Santa Giusta. In July, 1853, the heirs of Duke Vivaldi Pasqua made over the lagoons to a certain Don Salvatore Carta, a prominent figure in Oristano. The heirs of Don Salvatore, who now possess the rights, are a group of families at the head of which is a lawyer called Corrias ; at one time Signor Corrias led the Sardinian regional administration—in other words he is well connected.

In 1956 the Sardinian regional assembly passed by an overwhelming majority a bill that extinguished exclusive rights to fishing in the inland waterways and lagoons of the island. The bill was tested by the Constitutional Court, found unobjectionable, and some two and a half years later came into force. Its application to the *stagno* of Cabras was immediately challenged ; this challenge has so far not been overcome. The first and principal point raised by the feudal proprietors was that they owned the land, the bed of the *stagno* itself, and not just the fishing rights ; it was a special case untouched by the law. The agitators were soon busy. With what seemed like the law on their side—but with the forces of law and order in the shape of the armed *carabinieri* ranged against them—they organised their demand for a proper application of the measure. They carried out their symbolic occupation. The result was practically nothing ; the sea-fishermen went back to fishing in the the sea—and to brooding.

As the rights to the *stagno* are feudal, so a feudal system has evolved around the exercise of the rights. The scale of subsidiary privileges is exactly defined. At the top of this scale are the *servi*, a small group of some ten people whose title is a complete misnomer. They fish in the well-stocked weirs and see that they are working efficiently. For this work they are empowered to take on extra labour when necessary. They are influential, prosperous and disliked. To be nominated among the *servi*, it is said locally, is like mounting a royal throne.

Beneath them are the four classes of fishermen permitted—on stringent conditions—to enter the lagoon. There are the *sciaigoteris*, called after the fine-meshed net, the *sciabica*, which the proprietors permit them to use ; half of their catch goes to the owners. The next grade, the *poigeris*, also give up half their catch, but do less well because the nets permitted them have a larger mesh. Both classes are allowed to use their boats and fish all the year round. The third stage is that of the *bogheris* who use hand-nets and are allowed in the lagoon only during the autumn and winter, but still hand over half their catch. At the bottom of this structure are the *palamitai ;* they are allowed no boats, no nets and no freedom of movement. The *servi* tell them where they may fish and there they stay. They pay a set sum ; it was 62,000 *lire*, about £35, but after the earlier agitation was reduced to 52,000. They use a line with many hooks. They can go into the lagoon from October 15th to April 30th.

ALONG this chain of decreasing privilege the dissatisfaction naturally grows the farther one is away from the top. It has in the past been effective in keeping the system intact because of the promise of a move up the scale, and the seeming inability of the fishermen until now to co-operate in attacking the whole system. The armed guards employed by the proprietors have done their part in maintaining the system. The change is happening ; among the men who are reported to have gone into hiding are the chairmen of two fishing co-operatives. Outside the chain is the majority of fishermen who are never allowed into the lagoon. They are making up much of the weight of this new solidarity in Cabras. Lawyers are being found to defend the imprisoned men. A delegation has recently been in Rome to put their case to the minister for the merchant marine. The minister is now supposed to be studying a report on how much of the lagoon should technically be considered a part of the demesne ; it appears to turn on the amount of salt water as opposed to fresh, of which there are both in the *stagno*.

At the ministry there is no sign of urgency and indeed little enough sign of interest of any kind in the matter. One of the baffling sides of the whole question is the indifference shown by both the regional and national authorities. For years a genuine grievance has been poisoning the life of a community and, by its example, has shown what value should be put on the democratic workings of society. What will emerge is a deeper civic awareness on the part of the inhabitants and an even deeper contempt for Rome and Cagliari. The owners have managed to maintain their privileges, according to the left wing and according to people who are not so far to the left, by means of money and useful friendships. The price is probably higher than they know.

Family Planning in China

FROM OUR HONGKONG CORRESPONDENT

BACKSLIDING into birth control is one aspect of the general strategic retreat in China. The revival of this marxist heresy has been undertaken guiltily and awkwardly, with a deal of snuffling and eye-rolling. The politburo has shied away from the blunt words and eye-rolling. The politburo has shied away from the blunt words "birth control" as sensitively as any parish priest: "family planning" is the phrase. The gathering campaign was at first directed against early marriages, on the grounds of immaturity, unhappiness, and the need for study and work. The argument has now been shifted against early parenthood, in the interest of the health of young wives, the proper care and education of children, and the rest and relaxation of young husbands between their work and their self-criticism.

The new party line, as promulgated by press and radio and at university and workshop meetings, is that no man should be a father until he is 26 and no woman a mother until 23 and that births should be spaced "according to the mother's capacity for work." This implies dissatisfaction with the existing minimum ages for marriage in China—20 for men and 18 for women. (Before "liberation" the ages were 18 and 16.)

The campaign is coming steadily into the open after its shy and hesitant introduction two or three months ago. Direct and explicit advice on contraception is being given. The old birth control clinics, which had fallen into relative disuse, are hustling for business once more. Letters to the *China Youth Newspaper*, seeking editorial advice on early marriages *versus* party wishes, and on Comrade Cupid *versus* Chairman Mao, are still published, with appropriately paternal footnotes, but one gets the firm impression of a second and more decisive stage in the campaign.

The first—and until now the only—birth control campaign in China was launched as a crash programme in 1957, after prolonged and earnest investigation, and after obvious disputation in the politburo about the need for a population policy. Some distinguished party bosses had to somersault. Thus the prime minister, Mr Chou En-lai, had told Mr Nehru in 1955 that there was absolutely no need for population control in China or any communist state. But in mid-1956 he informed an Indian agricultural mission:

> I personally am strongly in favour of family planning and birth control. Even if there were no problems of producing and distributing adequate quantities of foodstuffs, an increase in the number of children would necessitate that each family should receive a proportionately higher income to maintain the standard of living.

Liu Shao-chi evidently had his reservations also at the outset, but the politburo decision became law in March, 1957, with the edict that "all areas in our country must promote appropriate birth control." Significantly, nowhere at that time can there be found a personal pronouncement by Chairman Mao in approval of the decree, and nowhere at any time a personal pronouncement by him advocating birth control generally.

THIS first official birth control campaign ever undertaken in any communist state blazed with fierce heat for eight months. Then, abruptly in November, 1957, it was snuffed out without the slightest explanation. Chairman Mao made a brief public reference to population—but not to the presumably discredited campaign—at the party congress in May, 1958: "Our fast expanding population is an objective fact and is our asset." Chou En-lai and Liu Shao-chi, agreeably chameleon, cheered "the great flesh-and-blood force of our vast population, by which we can, or soon can, do anything within the realm of human possibility." The *People's Daily*, which had said in July, 1957, "An ideal family should have only three or at most four children in a planned manner," claimed in August, 1958, that "China will always have room for more people because of our rich resources, good natural conditions and wide territory."

Now the politburo is back where it was in the spring of 1957. The heresy has become an article of faith again. Nervous professors, who were ordered to advocate family planning in 1957, and who were denounced as rightists for doing so a year later, are once more preaching the old deviation. It must be remembered that conditions in China in 1956 and 1957 were an ominous if less critical preview of conditions today. There had been a bad harvest. There were industrial difficulties, urban unemployment, rumbles of inflation. Production had fallen. Planning was in flux. The moderate elements in the politburo urged prudence and retrenchment and got a majority decision in favour of a long-range plan for population control.

But evidently there was, at that time, a party revulsion and a shift of voting in the politburo. The admission that there could be too many Chinese people must have looked too like a confession of party failure. The air was electric with recriminations

about the disastrous response to " the hundred flowers " campaign. Mao, on all the evidence, had gone along silently and reluctantly with birth control in 1957. It would seem that, having accepted his celebrated and expedient " one step backward " to birth control, he succeeded in regaining majority endorsement for his more celebrated " two steps forward " to boundless expansion, to the communes and to the catastrophic " great leap forward." When retreat changed to attack, birth control would naturally smack of defeatism.

It is surely reasonable to assume that the cautious mandarins of the party, in the face of today's dark difficulties and darker prospects, have again reimposed their prudent checks and restraints on Chairman Mao. Mr Chen Yun, the deputy prime minister and orthodox planner who had been in disfavour since he opposed the great leap, has made a comeback. The current reversion to birth control must imply therefore that Chairman Mao, composing or yielding to politburo tensions and rivalries, has either changed his mind about China's population problem, or has once more been unable to avoid accepting a policy that he still dislikes. Either way, there is food for thought.

Battle Tremors in the Model State

FROM A CORRESPONDENT IN MEXICO

WHEN he visited Mexico at the end of June, President Kennedy gave his hosts a pleasant surprise by warmly praising the Mexican revolution of 1910. Nothing, not even Mrs Kennedy's looks, has done so much for the atmosphere of Mexican-United States relations. The President went further ; he held Mexico up as a model of progress for Latin America, and publicly aired confidence in his prickly southern neighbour as the best bet for the success of the Alliance for Progress.

Can Mexico justify Mr Kennedy's hopes? To do so, it must maintain the political stability of the past 30 years, the basis upon which much useful work has been done, but it must also quicken the pace of economic and social advance, without which this stability is doomed. The Mexican government wears a confident air. But there are clouds, which President Kennedy's visit did not entirely dispel.

Since the beginning of his six-year mandate in 1958, President Lopez Mateos's expressed concern has been to raise the peasants' living standards and improve social justice within the framework of a rapidly growing economy. A man of the moderate Left, he has skilfully walked a tight-rope over the country's political, historical and demographic pitfalls. But recently he has had to face an increasing polarisation of political forces, largely as a reaction to the Cuban revolution. The Cuban regime's marriage with communism has weakened its appeal to left-wing groups ; it has also sharpened the fears of right-wing factions, who have become extremely suspicious of government measures that they think smack of socialism, as well as of Mexico's firm policy of non-intervention in Cuba. Both Mexican and American investors became alarmed, and withdrew or withheld their capital ; at the same time tourist income, an important factor, fell significantly. Twice last year the freely convertible peso was in danger of devaluation—a possibility which President Lopez Mateos is known to regard with something approaching horror. Indeed, 1961 was a nasty year for the Mexican economy. The national income rose by 3.5 per cent, only just keeping pace with the population increase, which at 3.4 per cent is the third highest in Latin America.

Some concessions had to be made to re-establish confidence, both in the United States and among Mexican investors. While maintaining its opposition to the expulsion of Cuba from the Organisation of American States and refusing to break off diplomatic relations, Mexico conceded at Punta del Este in January that Marxism-Leninism was incompatible with the American system. Soon after this, money started to flow back to Mexico. But something more was needed ; and the occasion for it was President Kennedy's triumphant visit to Mexico. His presence here and his praise for the Mexican government has been a public vote of American confidence, despite the continued disagreement about Cuba. A material sign of this confidence was the fact that in the last few months Mexico has received nearly $200 million in loans from international banks and Alliance for Progress funds. The present prospects for economic recovery are good.

But there are other problems that cannot be solved by investment. The most urgent is on the land, where millions of peasants, after nearly 50 years of agrarian reform, are still living in desperate conditions. Thousands flock every year either into the cities or to the United States, where they get jobs as unskilled labourers ; those who cannot do either sometimes express their frustration in demonstrations or minor insurrections, which are often suppressed with considerable violence by local military commanders. The good intentions of President Lopez Mateos are often brought to nothing by powerful vested interests whose sole aim is to get rich, usually at the peasants' expense.

The most glaring example of this occurred at the end of May when a turbulent peasant leader in the state of Morelos, Sr Ruben Jaramillo, was murdered with a brutality that most people had hoped belonged to Mexico's darker past. The crime aroused nation-wide revulsion and alarm, first for its bestiality—Jaramillo's pregnant wife and three children were shot with him in cold blood ; second for the dismayed realisation that prominent, if unpalatable, popular leaders could still be assassinated in the mid-twentieth century ; above all, because federal army troops were used to murder the family. There have been other, less important, assassinations in the provinces during the past four years, but the murder of Jaramillo was the most serious test of strength for the president. Many people doubt whether Sr Lopez Mateos is strong enough to expose the important people who were responsible. If they are right, it will be a serious blow to his championship of the peasants' interests.

DURING the past two years, the sniping at the president from both right-wing and left-wing extremes has growth into a barrage. Just now there is a welcome lull ; the extreme Left is at loggerheads and in disarray, while the Right has been soothed by President Kennedy's visit. But the lull is likely to be only temporary. Both sides are marshalling their strength to do battle for the choice of the next president. In Mexican political parlance, this is known as " futurismo." The battlefield is the governing Institutional Revolutionary Party (PRI), with outside factions exerting all the pressure they can. The PRI and its predecessors have controlled the country and won presidential elections for more than 30 years, and the new president is effectively chosen in this internal battle. This is not as undemocratic as it sounds, since the PRI is a rambling coalition of social groups and political views, from right-wing Catholic to Marxist socialist, and reflects reasonably accurately the forces and trends in the country.

On this occasion the battle promises to be bitter. A preliminary survey of the forces on either side suggests that on the Left there are ranged: President Lopez Mateos ; General Lazaro Cárdenas, a former president and the great old man of the Mexican Left ; and the many provincial leaders who are loyal to Sr Lopez Mateos's predecessor, Sr Ruiz Cortines. On the Right there are: the Roman Catholic church—or rather, its unofficial representatives, since officially the church is outside politics ; big business interests, closely allied to the church and finding a champion in the former president, Sr Miguel Aleman ; the growing middle class—a new factor in Mexican politics ; and, to a certain extent, the United States. It is certainly not President Kennedy's desire that the United States should be aligned with the Right. But links between Mexican and American economic interests, as well as the exploitation of the President's Catholicism by the right wing, make it almost inevitable. It has always been easy in Mexico to find signs of impending doom, and they should not be exaggerated. There are hopeful developments, such as the growth of a stable middle class and a better understanding of Mexico in Washington. But pressures and strains have been increasing since the Cuban revolution, and it will be even more difficult for the next president to maintain a stable balance.

Latin Americans and Others

FROM A SPECIAL CORRESPONDENT

THE value of calling in the neighbours to quiet a family dispute is sometimes dubious, but in the Conference on Tensions in the Western Hemisphere, held at Salvador, Brazil, in early August, this technique did well. As long as United States policy towards Latin America was being discussed, and in particular the aims and ailments of the Alliance for Progress, voices rasped and nerves tightened. But bipolar argument was tempered with polygonal conversation. When a European indicated that the common market was not a scheme to exclude Latins but might in fact welcome them, or a Nigerian praised the effect of skills brought back from Brazil to Africa by returning slaves in the 17th century, or a Hindu cited Indian experience in creating the psychological conditions for development within a political framework, the tone and temper of the meetings changed. A Brazilian put the point that " we don't want to be loved, but to be respected "; and it became evident that respect was a mutual response assumed to run not up and down the spine of the Americas, but back and forth across the oceans.

Within its chosen theme the conference divided its arguments into three, and considered tensions between nations ; tensions within nations ; and preconditions for economic and social development. The third section, chaired by Mr Paul Hoffman of the United Nations Special Fund, drew more than half the delegates, but failed to provoke much lively debate. But there was plenty of this in the first section, whose subject offered full scope for passions, prejudices and utopian ideas. " Between nations " was immediately construed to mean " between Latin American nations and the United States " ; this interpretation provided rich scope for Latin grievances, but left untouched any consideration of trouble between the Latin American countries themselves.

Out of the week's discussion came some mutual education and a recognition of certain determining attitudes, trends and ideas. The most pronounced of these trends was the persisting Latin irritation against the United States and all its works ; this often disappeared in private conversation, and may have been exaggerated by academic oratory, but at times it seemed so palpable as to constitute a serious barrier to any productive co-operation. It was recognised by the wiser American delegates as a useful form of blowing off steam ; some feared that so much steam might clog the safety valve and explode.

THE second trend was more cheering, and perhaps more useful. There was a warm response to European suggestions that the common market might possibly help to improve Latin American trade, which still depends on the sale of raw materials and the purchase of manufactured goods. The Latin countries are harassed by the fall in their terms of trade, nagged by fear of isolation, and envious of the favoured position enjoyed by African countries in selling their cocoa and coffee. The instinctive approach of most Latin Americans to the common market is a fearful expectation of new difficulties and more favouritism. It was soothing for them to meet the suggestion that adjustments might be made which would allow free entry of all tropical products to industrialised countries. At the same time, the suggestion that the existence of twenty Latin nations with twenty sets of problems was confusing to Europe, and that a federated Latin America might create a better climate for aid and trade, was received with an attention the more surprising since nationhood had been defended with such fervour. The political difficulties of any useful degree of federation are great. Yet in this period of changing alliances all things might, one day, be possible.

The Alliance for Progress, whose first birthday almost coincided with the conference, came in for analysis and criticism but little praise. Its progress was described as slow, and there was scepticism about the genuineness with which some Latin American leaders contemplated the promised reforms. The demand was pressed that the financing of the alliance should be centralised in the popular and successful Inter-American Development Bank. It was suggested that the bank's charter should be changed so as to admit Canada and interested European nations, and that its headquarters, as well as those of the Organisation of American States, should be moved away from Washington to an unspecified Latin American city. It was suggested that the veto power of the United States in the bank's operations should be abolished by eliminating the requirement of a two-thirds vote in approving loans. There was also a more general demand for " an attitude of humility on the part of the United States " when facing Latin problems, and the abolition of the advertising techniques used in propaganda for the alliance.

The conference was the sequel to one held last year at Oxford. Of 33 Latin delegates, 22 were Brazilians. The other 45 delegates included 24 Americans, and delegates from Europe, Canada, Japan, Egypt, Jordan and India. Most held academic posts but there were also business men, diplomats, politicians (including two Latin ex-presidents) and six United Nations officials. All came as private citizens. They managed, between them, to achieve more frankness, and in a more relaxed way, than is usually possible when illusions are being broken and accepted ideas turned inside out.

The Endurance of Gheorgiu-Dej

BY A CORRESPONDENT LATELY IN RUMANIA

THE Rumania that greeted Mr Khrushchev in June with well-organised enthusiasm is a land of striking contrasts. By religion Orthodox, the Rumanians have long been proud of their Latin language and have boasted of their disputable Roman origin. Bucharest, less than a century removed from Turkish rule, has always regarded itself as a kind of Paris of the East. Even today, French is widely spoken by the intellectuals, more so even than Russian. The city centre, with its spacious avenues and huge parks, reminds one of Paris ; it even has a copy of the Arc de Triomphe. But among its striking modern architecture, Bucharest also has its skyscraper in " Stalin wedding-cake Gothic "—the printing establishment of the party journal, *Scinteia*. The capital is a far cry from the primitive villages of Transylvania, and the still more benighted villages of Wallachia and Moldavia, with their thatched mud cottages, or log cabins. The excellent asphalt highways running through these provinces have few cars but plenty of ragged peasants, on horseback or burro, or barefoot, carrying great sacks, or bundles of brush ; some are in white homespun with black vests and hats ; some are driving rickety carts, and some are herding cows, goats, pigs, sheep, even water buffalo, on the road itself.

Unlike the other countries of the Soviet block, Rumania is very mixed ethnically; among its 17,500,000 people, it has more than a million and a half Hungarians and nearly 400,000 Germans, as well as Ukrainians, Russians, Serbs, Tartars, Slovaks, and others. The Hungarians have an autonomous region, with its capital at Tirgu-Mures. The ancient Hungarian cultural and political centre at Cluj is outside the region, although its population is half Hungarian. The once independent Hungarian Babes university was recently merged with the Rumanian Bolyai university, but is still organised in two sections, with five faculties mixed, and two (Law and Economics) purely Rumanian. Hungarian students do most of their work in Hungarian, with separate professors, but are required to learn Rumanian and to take certain general courses given only in Rumanian.

This merging of nationalities is also under way in elementary and middle schools, where mixed schools are replacing Rumanian and Hungarian schools. The ostensible purpose is to eliminate national animosities, and not to assimilate the Hungarian minority. In Cluj there is a Hungarian theatre and opera, and in Tirgu-Mures a theatre and a medical school. The German minority is less fortunate. Much reduced in numbers, but not expelled *en masse* as in Poland and Czechoslovakia, the Germans continue to enjoy education in elementary and middle schools in their own language, but have no university. Brasov, the centre of the Siebenbürgen Saxons before the war, when it was a town of 60,000, with Germans, Hungarians and Rumanians in equal proportions, has now grown to a city of 220,000, with only 6,000 to 8,000 Germans. There is little evidence of the once strongly German character of this ancient community.

Although governed since 1944 by one of the weakest Communist parties in eastern Europe, which lacked either radical political traditions or brilliant leaders, Rumania can now claim to be one of the most stable of the east European communist states. Its present ruler, Mr Gheorgiu-Dej, has been firmly in the saddle since 1945; only Mr Hoxha of Albania can rival him for longevity in power. Mr Gheorgiu-Dej spent the years from 1933 to 1945 in prison and was therefore not closely associated with the Comintern. He was the top party boss in Rumania during the Stalin period; but with the help of some discreet gestures to the new spirit in Moscow he managed to survive the years after Stalin's death.

There was in fact little response in Rumania to the events of 1956; this was partly because of a tradition of anti-Hungarian hostility, and partly because of the lack of a strong liberal intellectual tradition. Certain leaders, notably Chisinevski and Constantinescu, who seem to have urged a reappraisal of policy in the light of Mr Khrushchev's revelations at the 20th Soviet party congress, were removed in 1957. After the 22nd Soviet party congress last year, Mr Gheorgiu-Dej successfully shifted all responsibility for Stalinism on to their shoulders, and those of Ana Pauker and Vasile Luca, who had both been purged in 1952. The 22nd Soviet party congress gave rise to no ferment, political or intellectual, in Rumania, as it did elsewhere in eastern Europe. Mr Gheorgiu-Dej's unchallenged position was still further strengthened last year when he was made head of state, as well as first party secretary.

Soldiering on; Mr Gheorgiu-Dej

Orthodox in its conformity to Stalinist and Khrushchevian policies alike, Rumania has none the less developed its own administrative pattern. Because of the small scale of its industry, it did not suffer so much from rigid centralisation and has not therefore had to copy the "decentralization" carried out in the Soviet Union. *Industry is still run by the ministries. Regional councils formed* in 1961, unlike the Russians' *Sovnarkoms*, are advisory and supervisory. In agriculture, by contrast, the newly created Higher Council of Agriculture, including both specialists and farm managers, has replaced the ministry, and will directly guide and manage collective as well as state farms, through regional and district agricultural councils. A somewhat similar degree of modest decentralisation has just been introduced into cultural affairs by the division of the former ministry of education and culture into a ministry of education and a state committee for culture and arts. The latter, a large collective body of intellectuals and cultural leaders, will also work through regional committees. Needless to say, none of these changes will affect the overriding control of the party at all levels.

In economics the Rumanians can also point to solid achievements which contrast sharply with the difficulties of their neighbours. Collectivisation, after proceeding slowly and cautiously for years, was completed early this year with a great burst of speed. This "victory of socialism" in the countryside will in due course be registered in a new "socialist" constitution. Spokesmen of the regime boast that this was accomplished without the fall in production that accompanied collectivisation elsewhere. Certainly Rumania has so far escaped the serious shortages of major foodstuffs now plaguing other eastern European countries. Industrial production, it is stated, has substantially exceeded the planned annual rate of growth of 13 per cent in the past two years. The regime started with a weak and underdeveloped economy at the end of the war; it can claim to have done something substantial with the country's natural resources and developed a system that is relatively flourishing by comparison with its immediate neighbours. This is not yet very noticeably reflected in living standards. The very high rate of investment, said to be approximately 20 per cent, that has been maintained for some years, has been concentrated more in heavy industry than in light industry or agriculture. All the same there seems to be hope of an improved living standard in both town and country if the development of the economy continues.

Six-Monthly Supplement
EUROPEAN ECONOMIC COMMUNITY
1st issue: 15th September 1962

This report will give essential information on EEC developments. It will facilitate comparison between economic indicators in the EEC and other industrial countries, and provide a continuing analysis of EEC trade. The contents include:

EIU QUARTERLY ECONOMIC REVIEWS

— calendar of events
— timetable of tariff changes
— indicators of economic activity
— statistical analysis of trade

Subscription: annual — £5; single copies — £3; subscribers to Common Market Group QER's — free.

Further details from:

without air conditioning...

will it soon be obsolete?

What's the biggest single change in building construction worldwide in recent years? Many builders agree it's the general trend toward *air conditioning*. The cleaner, quieter, more healthful atmosphere of air-conditioned buildings is now preferred by workers, customers, guests the world over. If you want your new building to retain its desirability in the competitive decades ahead, give it all the advantages of air conditioning. You'll be protecting a huge investment at small additional cost.

Air conditioning means automatic all-the-year-round control of temperature, humidity, air movement and air cleanliness. And the economical time to install it is now, at planning stage. Ask your architect to give you the benefit of his knowledge and experience in this area.

CONTROLS BY HONEYWELL — international experts on every aspect of air conditioning — are an important part of the systems in these recently completed buildings:—

- B.O.A.C. Air Terminal, London
- Commercial Union Assurance Company, Exeter
- A.E.I. Ltd, Lincoln
- Imperial Hotel, Torquay

Business in FRANCE?

Businessmen interested in developing trade with France will find it worth their while to discuss their plans with us. Barclays Bank (France) Limited, the largest British bank in France, has eleven branches there, as well as one in Monaco and two in Algeria; and it is of course an integrated part of the vast network of the Barclays Group. In London Barclays men have studied the possibilities of the Common Market. In France there are Barclays men, for the most part Frenchmen, who know the country well.

The manager of your nearest branch will be glad to explain more fully how our knowledge of France can be of help to you. Alternatively, please get in touch with any of our specialised Foreign branches:—

London: Chief Foreign Branch, 168 Fenchurch Street, EC3
West End Foreign Branch, 1 Pall Mall East, SW1
Birmingham: 61 Colmore Row
Bradford: 25 Kirkgate
Liverpool: 38 Old Hall Street
Manchester: 94 Portland Street

THE BUSINESS WORLD

After Thalidomide

THE record of the drug, thalidomide—perhaps 1,200 babies born in this country with missing limbs and internal malformations—is going to accelerate changes in the drug laws that have been discussed on and off for the better part of ten years. The danger now is that the nation's collective feeling of guilt towards these children and their parents will cause the kind of precipitate, conscience-salving legislation that will not necessarily prevent the reappearance of another thalidomide. This is a situation that requires cool heads to rule warm hearts: more and better testing of drugs is not the complete answer and it is cruel to encourage drug makers and drug takers alike to think that it is. This particular horse bolts in open country, and no amount of locks on stable doors will stop him.

The basic weakness in the way that doctors prescribe and patients swallow drugs is this: doctors depend almost exclusively on manufacturers for their information about new drugs, while manufacturers depend almost exclusively on doctors for their information about how these work. The flow of information is not equal in both directions. The doctor is told much more quickly about the merits of a drug than the manufacturer learns of its defects. One is exposed to the full blast of nearly £7 million worth of salesmanship a year; the other relies on the occasional letter from those doctors who grasp quicker than most the significance of what a drug is doing to their patients. This is why thalidomide has claimed hundreds of victims instead of tens. This is where changes are most urgently needed.

The layman might properly ask why he should be the guinea-pig; how is it that dangerous drugs ever get out of the laboratory and on to the chemists' shelves in the first place? The reason is neither scientific nor medical, but purely statistical. The obvious killers are identifiable in the laboratory. Really serious side-effects show up, if not in the laboratory, then at least when the drug is first tried out in hospitals. But the long odds chance, the disastrous reaction that appears in perhaps only one case in a thousand, will not necessarily be obliging enough to crop up during these controlled trials. Very many mothers who have taken thalidomide have given birth to normal babies.

A scrupulous manufacturer might expect to use as many as 15,000 laboratory animals a month testing the safety of a new drug. These tests give a statistical sample big enough to cover the kind of odds that make a drug a rogue. But the animals are small—rats, mice, rabbits and hamsters—and what they can tolerate could still be bad for man. The risk is somewhat reduced by doing a few tests on bigger animals, dogs, monkeys and the occasional pig, but on nothing like the same scale. These big animals are simply not available in the same quantity as rats and mice; and even if they were, public opinion and the Home Office would not allow them to be used for laboratory experiments in the numbers required for a proper statistical sample. Manufacturers must hope that a check using perhaps half-a-dozen dogs will throw up any marked difference between the behaviour of the drug in large and small mammals; and more than once these last safety checks have shown that it was wiser to put the drug down the sink than on the market. But the gap between man and animal remains. No one can predict that a drug, tested by the industry's highest standards, is 100 per cent safe when it leaves the laboratory; makers can only claim that it is as safe as modern science can make it, which is a vastly different order of certainty.

To many people it seems an anachronism that it should be left to the good faith of manufacturers to decide whether a drug seems safe, or even how extensively it should be tested before it goes on the market. It is legally possible in this country to launch a new drug without any tests at all. The public's only protection is the industry's sense of responsibility and the knowledge that each company can stay in business only as long as it has the respect of the medical profession. This state of affairs is not likely to continue. The emotional reaction to thalidomide makes it almost certain that a drug registration scheme will soon be introduced, with evidence of laboratory trials required as a condition of registration. Some sections of the industry view the prospect with dismay, having their own good reasons for arguing that this would tend to reduce a manufacturer's sense of responsibility. Others welcome the idea, while praying that the actual machine will be somewhat less costive and bureaucratic than the American Food and Drug Administration which it seems likely to resemble. The FDA is at present basking beneath a halo acquired by one staff doctor's refusal to license thalidomide for sale in the United States, but it is not always gifted with such second sight. What it can do is hold up the sale of a drug for 60 days while deciding whether there is any reason why it should not be put on sale, or demand fresh tests from manufacturers. No one is suggesting that British manufacturers are lax in their testing, but there have been cases where, for example, a company assumed that the sum of two harmless products would also be harmless and so did not need trials. A registering authority might have been able to tell the company that this was untrue. But for

the statistical reasons already given, neither the FDA, nor any registration body could necessarily nose out another thalidomide. The American public was only saved this particular tragedy because the drug was marketed first in Europe: some of its—less tragic—drawbacks were already coming to light when it was ready to be launched in the United States.

If such dangers cannot be picked up in the laboratory, can they be identified during hospital trials before doctors start prescribing a new drug in quantity? Again the answer is no. This is not what clinical trials in hospitals are for; they are to see whether the drug has any medical value and, if so, for what conditions and with what dosage. They may incidentally show what price the patient might have to pay for a cure, in terms of side effects that are sometimes more serious than the disease treated, but these will not inevitably show up in such trials. Manufacturers, for their part, may be able during clinical trials to arrange for blood and other samples for analysis; but they cannot ask hospitals to use their patients like laboratory animals, nor can anyone expect the regulations governing the introduction of new drugs to be changed so that hospitals will. Ethics apart, there are not enough patients to provide the statistical sample that would be needed to give the public the 100 per cent guarantee that sentiment naïvely demands.

If the drug proves worthless, it will be withdrawn at this stage; if not, the published results of the clinical trials may spark off interest among other doctors. Letters in the medical journals will begin to describe first, cures and then, as doctors acquire more experience, drawbacks and side-effects—until something analagous to case law has been built up about the drug and the medical profession as a whole has a fairly clear idea when to use it and when not. This can take about five years. In the last resort, the public is the guinea-pig: when the pharmaceutical industry's critics say that drugs are being launched and marketed without proper trial, what they really mean is that the industry's sales machine is working 100 per cent faster than this somewhat Victorian technique of gentlemanly communication and counter-communication. The industry as a whole is spending an average of 10 per cent of turnover on sales and advertising of these "ethical" preparations. Since some of the biggest companies are spending only a fraction of the national average on selling, others must be spending very much above it. Most doctors could name them.

With the incentive to maximise sales during the first three years, while a new drug remains free from Ministry of Health price control, sales promotion techniques are borrowed from the consumer industries (a none-too-happy innovation in itself) and are sometimes used to promote drugs while there is still relatively scanty case history to back them. Consequently, for every wonder drug that ends its first five years with a clean bill of health, there is probably another that has been quietly withdrawn from the market and at least two more whose use has been considerably curtailed because of dangerous, painful, or merely tiresome side effects. But as drugs get more powerful, better able to cure intractable diseases and put patients back on their feet, so their side-effects get more severe, for chemicals that have a sledgehammer effect on disease cannot be expected to leave the rest of the body unaffected. The risk, not necessarily of another thalidomide, but certainly of violent and unexpected repercussions to new drugs, grows rather than diminishes and is the price of medical progress via such preparations. The question exercising the Ministry of Health, its advisers and the industry, is how to keep this risk to a minimum.

The barrier to quicker reporting by doctors is that an individual doctor may have to experience three, five, perhaps a score of cases before he begins to link cause and effect. But if, it is argued, doctors sent details of their cases to a central register, with drugs given and results noted, a score of postcards from different parts of the country all mentioning a common symptom and a common drug, could alert the central office, and indirectly the manufacturer, that something more than coincidence might be at work. Postcards reporting malformed babies born to mothers to whom thalidomide had been prescribed for early-morning sickness would certainly have sounded the alarm earlier; limbless babies were reported in 1960, but the drug was not withdrawn in Britain until late last year. Suggestions for some scheme along these lines are growing more frequent; the stumbling block seems likely to be the attitude of individual practitioners. Doctors, who can be surprisingly reactionary at times, have nevertheless been heard to complain that an office of this kind would forever be sending out false alarms and inhibiting the development and use of new drugs. Oddly enough, this is not how the pharmaceutical industry sees it; but then a drug maker loses more of his customers when one of his drugs turn sour than the doctors lose of theirs.

Nitrex AG

Producers trying to rig the world export market for nitrogen fertilisers may have a huge future surplus to control

EUROPEAN producers of nitrogen fertilisers have banded together to form a nitrogen export cartel, Nitrex, which is to market their products overseas. This has long been expected: for several years intense competition for export business in these fertilisers has been skilfully exploited by a few monopoly buyers in communist China, India and Pakistan to force nitrogen prices down to levels which are said to be uneconomic, and the competitive bidding between European producers has made this all too easy. Members of Nitrex include the leading manufacturers of Europe, with two significant exceptions: ICI and ANIC, the petrochemicals arm of Italy's ENI. Even without these, Nitrex will be the world's largest exporter of nitrogen, with a capacity of 5 million tons a year at its disposal, and some market power to achieve its main objective, of "stabilising" nitrogen prices. The organisation will enable European producers to sell on a scale comparable with Soviet block countries (whose capricious forays into the market have been adding to the excitements of capitalist competition) and the United States. American producers admittedly do not compete for Chinese business; nor has Japan been selling to China of late, though its growing capacity must affect the market there. Nitrex also hopes to rationalise the marketing of nitrogen fertilisers to avoid overlap between the producers, and to arrange barter and long-term credit deals. (The largest customer for this rapidly-consumed product, China, has recently been demanding—and getting—up to 18 months' credit.) Even though the cartel says its activities are to be strictly confined to the export field, as they need be if the agreement is to avoid being banned under the Rome Treaty, it is impossible to avoid comparisons with notorious pre-war cartels.

The circumstances which have led to the formation of Nitrex closely resemble those in which the first European nitrogen cartel was set up, in 1930. During the twenties, synthetic nitrogen capacity considerably increased throughout the world and this, combined with an agricultural depression, led to over-production and a fall in prices. The agreement, which sought to maintain prices, to increase nitrogen consumption and to allocate business by quota, came to an end at the outbreak of war and was not revived. Since the war, world nitrogen production has increased to 14 million tons a year and world capacity exceeds it by 2.5 million tons. Existing plans for new plants, if they all materialise, would increase capacity to 23 million tons a year by 1966; but much of this increase is planned in India, China and Japan, so that Europe's share of world production will drop. Forecasts of demand differ widely, but it looks unlikely to keep up with capacity. If the present rate of growth continues, total demand for nitrogen (including industrial uses) would reach only 16 million tons by 1966; but some manufacturers believe that the total will then be as much as 21 million tons (or 90 per cent of the planned capacity) on the grounds that the present efforts of agricultural missions in various underdeveloped countries might be bearing fruit by then. Certainly, if the base of nitrogen usage could be broadened to include peasant farmers, and if the underdeveloped countries could find the money, there would be a dramatic increase in demand. If not, the surplus capacity could make the attempt by Nitrex to hold prices in the export market very difficult indeed. (All of these figures are expressed as metric tons of nitrogen; the actual tonnages of the various fertilisers are three to six times as much.)

Trade in fertilisers, excluding that within the Communist block, accounts for a quarter of world consumption; a fifth of this is "cyclic movement" (e.g., from the West Coast of the USA to West Canada and East Canada to the Eastern States). In the world market proper, therefore, about 2½ million tons were sold last year, of which European exporters supplied 1.8 million tons. The biggest single buyers in the export market are government agencies in China, India and Pakistan; though these countries buy only 360,000 tons, 180,000 tons, and 70,000 tons respectively, this bulk buying gives them the power to offer very large contracts. The main reason why Nitrex has been formed is to make the European producers into a unit large enough to hold the line against them on prices. None of the producers want to repeat the experience of 1954, when China trailed temptingly large contracts from one country to another and brought export prices crashing.

A third factor in nitrogen supply has been an improvement in the techniques of ammonia manufacture which, although it has helped to ease the smart of slashed prices, has raised another bogey to frighten European producers. It may now be more economic to make ammonia at a source of cheap energy and feedstock (usually natural gas) and ship it to the markets than to ship the feedstock and make the ammonia in a "market-located" plant. Current plans to build plants in Trinidad, Kuwait and other surprising places, have to be taken into account by any European producers with plans to build plants themselves. Contracts for ammonia from these, as yet unbuilt, "source-located" chemical plants have been offered very cheaply in Europe and have contributed to the pressure on export prices, which have fallen by a half in the last ten years. The producers themselves have added to these pressures by competing for some markets as much for political as for business reasons. The formation of Nitrex has been accepted as inevitable since the mid-fifties, and prices have often been slashed to gain a foothold in some market to establish a strong share from which to bargain when quotas came to be allocated.

MEMBERS of Nitrex include Germany's three main producers: Ruhr-Stickstoff, BASF and Hoechst; a selling organisation representing all Italian producers except ANIC; the sole manufacturers of nitrogen fertilisers in Austria, Switzerland and Norway, respectively; and the central selling organisations of Belgium, Holland and France. In many of these, governments have a financial interest and thus find themselves in the position of being, indirectly, parties to a cartel. Of Europe's main producers only ICI—a moving spirit behind the pre-war cartel—and ANIC are not associated. ANIC is a maverick whose arrival in the Italian market with fertilisers based on natural gas precipitated a price war, but it is said not to be entirely unsympathetic to Nitrex and may even consider joining. ICI has said that it has taken no decision; it is certainly considering the matter and has made enquiries at Nitrex into the nature of the association. The two other British producers, Fisons and Shell, are both indirectly involved through interests in Dutch subsidiaries.

If Britain joins the common market, ICI will probably have to join, as a defensive measure. Although any restriction of competition within EEC by associations has been specifically forbidden in the Rome Treaty it seems possible that members will want to avoid the sort of unpleasantness that might arise from competing in each other's home markets. If this became the policy of Nitrex, the association would soon lose whatever acceptance it may now have from EEC. It has therefore had to confine its aims very clearly and completely to export, and if it sticks to them, it may serve the interests of Europe's nitrogen producers effectively. It is too soon to see how the arrangement will work; many administrative details have yet to be agreed, for instance the exact allocation of quotas. The testing time will come when the Chinese come into the market again and for the first time find the European producers united in their determination to stabilise prices. The chemical companies which make nitrogen, the European governments whose capital is invested in most of them and the coal interests for which it is such an important market are determined to lift the market out of its present anarchic conditions. But if they imagine they can stabilise prices against the bulk buyers in the face of vast surplus capacity, they are probably overestimating their power to rig the market.

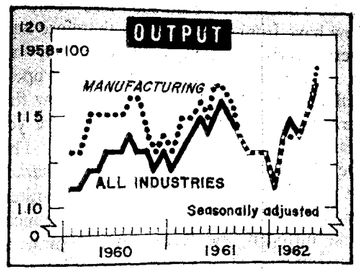
BUSINESS NOTES

THE ECONOMY

Manufacturing Goes Ahead

In the jump upward of industrial production during May and June, manufacturing output rose faster than the rest of industry, after several months of moving no more than in step. This is a return to what has been throughout the postwar years a more customary relationship between the manufacturing index and that for all industries; manufacturing in June, indeed, rose by two points for the second month in succession (which on an index rounded to three digits means at the least more than three points in two months). At 118 (1958=100), it passed the level of July last year and thus became the highest level of output yet recorded; so did the all industries index, which was 117 for June. The Treasury comments, soberly but proudly, that industrial output in the second quarter of the year was two per cent higher, on the average, than in the first quarter. This is not remarkable by European standards, but respectable: West German output rose by 2 per cent during the same two quarters, and French output by only one per cent.

Since there have been few signs of any marked increase in final demand at home during the second quarter of the year, the elements mainly responsible for this increase in production will certainly have been higher exports and probably an end to the rundown in stocks. In some of the industries where home sales recovered in the early part of this year, and particularly among their suppliers, stocks had come down significantly over the previous three to six months. Merely to have checked this minus element in total demand will have been a plus factor for manufacturing. If manufacturers now continue to rebuild



their stocks it will eventually pull in more imports, but for a while at least it will provide a welcome stimulus to output.

Export orders for the engineering industries in June, again, were more encouraging than for some months. New orders from abroad received in the month were much higher than those booked in April or May, and far above the level of June last year; the total of export orders on hand indeed rose during the month. New home orders were rather higher than in June, 1961, but well below deliveries; so home orders on hand fell by 3 per cent during June. There is no sign yet of any upturn in private industrial investment; on the other hand, the engineering industries are making good use of their slack capacity, for the time being, in filling foreign orders more quickly and securing others.

Despite the higher level of industrial activity, unemployment has since continued to rise and the number of jobs on offer has gone on falling. On August 13th, there were 464,191 people out of work in Britain, equivalent to 2.1 per cent of the labour force: this was the first count to go over the 2 per cent mark since January, 1960. Leaving seasonal variations aside, there were nine people registered as wholly unemployed this month for every four vacancies.

EXCHANGES

August Strain

Sterling has come under some selling pressure in the markets this week: on Tuesday the spot rate dropped by 1/16 to $2.80 9/32, its lowest since last September. The Bank of England is believed to have stepped in with some supporting sales of dollars, but the volume was not large. On Wednesday sterling dipped a little further, to below $2.80¼ but it rallied on Thursday. The weakening of the pound in high summer has caused little concern in London. The usual seasonal demand for dollars for purchases of tobacco and other commodities has been decidedly late to develop; indeed, the feeling that the current sterling rate is unnaturally high for the time of year is itself responsible for some of the bear selling that is now under way from New York and Paris. This has been accompanied by repurchases of sterling forward, and this classic scissors movement between spot and forward rates seems a clear indication that operators are moved by short-term technical views rather than by sudden distrust.

Paris was also preparing itself earlier this week for a Bank rate reduction. But in London, Thursday's announcement of no change caused little surprise. While the authorities seem to be preparing themselves for a second release of special deposits and, more effectually, for a downward movement in the indirect tax regulator, they may feel that in the present international context Bank rate can best remain at 4½ per cent. Certainly it would be surprising to see it reduced at a time when foreign money is leaving London, as is now happening on a minor scale.

It has been a quiet week for the dollar. The London gold market has been pretty well balanced between private demand and normal supplies and the gold price, which had shown its now usual rise before the week-end, fell back in mid-week to $35.11½ an ounce. In the exchange markets the dollar remains at its support points against the French franc and the lira, slightly above it against the Swiss franc, and just below parity against not only sterling but also the mark. The mark has in fact held up well this week. It has been little affected by the new Berlin tensions (which may once again have had a greater immediate impact on sterling). Nor has there been any evident reaction in German markets to Dr Erhard's venting, in an open letter to a newspaper, of dire warnings to trade unions and brave reassurances about the currency —a mixture that to British ears is both familiar and a little ominous.

IN THE MARKETS

Sober Hopes

This week the market in industrial equities has behaved more rationally than it did in the exuberance of the earlier rally. The volume of business has not broadened and over the week's trading to Wednesday's close the *Financial Times* ordinary index was practically unchanged at 281.6 and *The Economist* indicator fell slightly, by 1.4 points to 335.1. The caution is understandable; but it is no less significant that a more sober reappraisal of prospects has not produced a fall in prices. Indeed, prices began to move higher on news of the rise in industrial production in June and the increase in engineering orders, and on Thursday the market responded to the resumption of the advance on Wall Street, which had been checked only momentarily by the cut in dividend by Republic Steel. The London market certainly appears to believe that equities are heading upwards and its willingness to contemplate this prospect more calmly and more soberly than it did only a few days ago may enhance the chances that they will do so, slowly and cautiously.

Far-North Finnair

Finnair, one of the first airlines to recognise the potential of the Caravelle, is also one of Europe's aeronautical old-timers. Operating international services since 1924, when they flew a four-seater Junkers F13 from Helsinki to Tallin in Estonia, Finnair today carry half a million passengers yearly to fourteen Finnish centres and twelve European cities. Among the latter is Paris where the modern equipment and highly-trained ground crews of Air BP chop money-saving minutes off turn-round times.

How to make gin

You start with pure spirit. (Burnett's use the very purest.) You test it. You add water; there's a trick even here – ordinary tap water definitely will not be good enough. You test again. Then you distil in, patiently and lovingly, a secret mixture of juniper berries, coriander seed, angelica root and subtle hard-to-get herbs. You test again. There are three snags. One: the excise. Two: the trouble. Three: however hard you try, you won't make a gin that is as clean and smooth and authentically dry as Burnett's.

BURNETT'S

Investors in fixed interest securities seem to have no doubts at all about the immediate future of monetary policy, and gilt-edged prices have continued to rise. A reduction in Bank rate was again canvassed in the market but most dealers came to the responsible conclusion that in view of the seasonal strains on sterling a cut was not imminent and that in any case a reduction in special deposits was likely to come first. The market is still convinced that there will be a controlled and gradual fall in interest rates and this belief has been backed by buying of both short and long dated stocks. The clearing banks were buying the short tap stock, 5 per cent Exchequer, 1967, while other investors continued to buy the 5 per cent Treasury stock, 1986-89—and the market believes that the tap in this long dated stock will soon run dry. The buying is purposive. It is based on realistic assessments and not on wild flights of imagination ; it already acknowledges, for instance, that the series of new issues by local authorities may continue for a few more weeks but that if the Government accepts the recommendations for reform in local government finance the pressure on the stock market should ultimately be reduced.

BANK CREDIT

Advances Turn Downward

ANY doubts about the underlying slackness in demand for bank credit should be dispelled by the latest banking figures. In the four weeks to mid-August net advances by the London clearing banks fell by £3½ million, which seems to confirm that the rise of around £100 million in May-July was predominantly attributable to the special seasonal influence of the debiting of half yearly interest charges. Advances to state boards in August rose by £5½ million, so that net repayments by other borrowers were around £9 million. Advances by Scottish banks moved in line, with a net fall of £5 million. Despite this slackness of lending, the banks did not continue to rebuild their investment portfolios in the month to mid-August, though some significant purchases have been detected in the market in the past week. Liquid assets in the hands of the clearing banks were reduced, and net deposits fell by £36 million. The liquidity ratio was virtually unchanged at 33.15 per cent. It would be surprising, after these figures, if the monetary authorities delayed a further relaxation of credit control much longer—if only to give formal official blessing to freer lending for personal consumption.

RAILWAY WORKSHOPS

Shrinking Pains

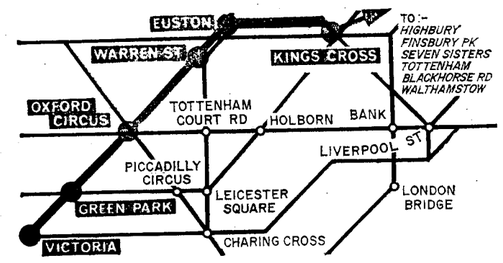
THE threatened second round of redundancies in the railway workshops has come, and the men now know just how sweeping they will be: out of the 56,000 employed in the 25 main workshops, 20,000 will go in the next five years—and nearly half of them by the end of next year. But

LONDON TRAVEL

Some Underground Relief

THREE years after the London Travel Committee recommended that the Victoria line should be built, the Minister of Transport has accepted its opinion and given the London Transport Executive permission to start work. He has thus accepted that more off-street travel facilities have become essential. The spread of parking meters through central London may prevent traffic congestion worsening—unless the reduction in parking space that these bring about is offset by the building of private or public garages and limits the number of private cars that can enter the area with any hope of stopping inside. But the number of people wanting to come in is likely to go on rising with the continued development of office space, and buses are too slow for the medium or long journeys that these commuters mostly make. So the railways and the tubes will have to bear the brunt of the extra traffic: electrification is raising surface railway capacity, and new rolling stock that of existing tubes. When all that is completed in 1968 it would still not be enough, and neither change reduces overcrowding at railway termini. Hence the Victoria line. Even the extra capacity this offers may seem a drop in the mob by then ; some co-ordination of travel facilities and employment in London, perhaps with a tax on employment in the centre, is needed if matters are not to get out of hand. Or would economic charges for all forms of travel into town be enough to check the lemming rush of commuters ?

The somewhat elliptical course of the Victoria line through the less salubrious suburbs of north-east London was chosen to allow it to draw off as much traffic as possible from the suburban railway lines running into Liverpool Street and so to relieve this terminus and the Central Line that now has to carry passengers making their way west from there to Oxford Circus. As the new line gets south to Finsbury Park, it begins to duplicate and relieve other existing tubes.



Most of the traffic on the Victoria line will therefore comes off present services. In 1959 the London Transport Executive estimated that only 30 per cent would be newly generated ; 36 per cent would come from other underground lines, 18½ per cent from its buses and 15½ per cent from the railways. It was then reckoned that though the line should, on the basis of fares then charged, show an operating profit of about £600,000, the receipts lost by the other services would turn this into a net loss of about £200,000 a year—to which interest charges of about £3 million need to be added. So to break even with the new line operating the LTE would have to add more than £3 million to its present revenue of some £30 million from railways—which in itself fails to cover full costs.

But £3 million a year may be a comparatively modest charge in relation to the cost of providing similar carrying capacity by improving roads at London surface values. The delay in deciding to build the Victoria line has had technical advantages, not perhaps fortuitous. The LTE has nearly finished tests on the experimental stretch of tunnel that it has had dug near Finsbury Park to try out a fast new method of rotary digging with a flexible, unbolted tunnel lining, and to decide whether it can use concrete instead of the traditional cast iron for the new route. The half dug by Kinnear, Moodie has a pre-cast concrete lining, and that dug by Edward Nuttall, Sons and Company (London) one of cast iron.

This new tunnelling method should keep the cost down to £56 million, only £1 million more than the 1959 estimate ; if concrete can be used instead of iron, the saving might be more. But tunnelling would account for less than a third of the total of £56 million, with stations expected to cost £22 million and presenting the trickiest jobs—for in many cases the work has to be done while an existing station is used. Oxford Circus station alone will take the full six years to rebuild: a new station booking hall has to be built under the circus itself, which is one of the busiest road junctions in London. The LTE engineers propose putting in a steel platform to carry the roadway, then burrowing beneath to create the new station. All this digging will give civil engineering contractors some rather unfamiliar if relatively straightforward work: apart from the test tunnel for LTE, water tunnels for the Metropolitan Water Board and the tunnels under the Thames have been the only recent local underground projects undertaken in Britain.

LOCAL FINANCE

Easier Money

LAST Saturday the Public Works Loan Board reduced its rates for new loans by a nominal ⅛ per cent to 6⅝ per cent for all maturities. This reduction recognised the easing of rates in the open market for local authority loans; it is not linked to the change in policy expected to be recommended by an official committee, which was discussed in these columns last week. Rates have been moving in the local treasurers' favour since the turn of the half-year, and seven-day money is now available at 4 per cent, compared with rates which were more or less consistently above Bank rate in the first half of the year.

This fall in short-term rates has followed quite substantial repayments of temporary money by local treasurers who have benefited from the increase in stock issues and the inflow of money on two to five year mortgages as a result of press advertising. Many authorities have indeed now temporarily stopped advertising while others have reduced their rates from 6½ to 6¼ per cent. At the same time many treasurers, aware that the monetary authorities may soon limit all temporary borrowing to 15 per cent of total debt, have been funding in the London market. There has been a substantial turnover in two to five year mortgages at 6⅝ per cent and in five-year escalator mortgages at 6¼ per cent. Treasurers have also been lengthening their temporary debt by taking loans up to 364 days and repaying seven-day money.

The figuring on local borrowing in the first quarter of 1962 is published this week in *Financial Statistics*. Net borrowing increased by £202 million, £68 million more than in the same quarter of 1961, and £132 million of the borrowing this year was in temporary deposits. The clearing banks, under official pressure, actually reduced their overdrafts to local authorities by £13 million, but treasurers had no difficulty in finding money elsewhere, and in particular by borrowing a further £86 million from London's merchant banks, overseas banks, and foreign banks. About three quarters of the deposits of these banks is on foreign account; so perhaps over a half of the increase in temporary borrowing of the local authorities in the first quarter of 1962 was of foreign origin.

Total lending to local authorities by these banks, according to the group totals published in the Bank of England's quarterly bulletin, amounted to £278 million on March 31, 1962. The CSO figure lumps lending by the discount market together with these banks, giving a total lent by non-clearing banks and discount houses of £289 million. The difference of £11 million is however attributable partly to foreign banks that have no branches in London and therefore do not appear in the Bank of England figures. Lending by the discount houses in this local authority market is estimated by informed market sources at no more than £3-£4 million. The discount market can lend only its unsecured money in this way, since local authority deposit receipts are not negotiable, and cannot be lodged as security with the banks or the Bank of England. Discount houses now pay only 2½-2¾ per cent for these deposits from the public and can therefore make a good turn in the mortgage market. If they were prepared to break with tradition, risk retaliation from the clearing banks and be more generous with their rates for this money the discount houses might develop this profitable sideline a good deal further.

Spain Takes Advice

LOOKING forward in economics and back in politics, Spain continues to present a baffling scene to watchers from north-west Europe. A milestone in economic practice was passed this month with the lifting of the licensing requirement for internal changes in industrial plants. Thus a fact, not without its symbolism, is recognised: exciting though new factories are, what Spain needs much more urgently is the improvement of the factories it has already. But plant extensions and improvements have been half-stifled by the cumbrous and detailed controls. Licensing requirements remain, in plenty; but the trend is away from state paternalism, at least in economics.

Most notable of recent events in Spain, the moment of presentation to the Spanish government of the report of the World Bank team, headed by Sir Hugh Ellis-Rees, has come and gone with every sign of harmony and concord. This report suggests what should be the general lines of Spanish economic policy for the next five years. The only trouble is to find out what it says. The Spanish government is willing, indeed eager, to make the contents of the report known, and a brief outline of the main points by the able commissioner for the development plan, Señor López Rodó, was published on August 14th. To translate and publish the report itself, some 400 pages, is a big job. But the Spanish government intends to give it "the widest possible circulation" in Spain.

In the meantime we have to rely on the indications of what the report contains given by Sr López Rodó. He made it clear that the general emphasis is on freedom of private commercial and industrial investment, and that the Spanish government accepts this. Controls and forms of direct state intervention devised in more difficult times are to go. The once-dreaded state industrial octopus, INI, which at one time soaked up so much new capital that little was left for the expansion of unprivileged commerce, is invited for the future to limit itself to a "pioneering" role. The government is urged not to try to see to everything itself, but to set the economic goals and pursue policies that will assist the economy to reach them. Its preoccupations with maintaining employment and levelling up the regions are recognised, but the insistence is on mobility of capital and labour, as means towards the economic use of resources and the conditioning of Spanish industry to meet competition in export markets. The World Bank team hopes that an annual rate of growth of national income of 5 per cent a year can be reached and, if these principles are followed, maintained for a long period ahead. It mentions a possible doubling of incomes in industry and services in ten years, and (somewhat more diffidently, to judge by the Spanish report) a commensurate increase in agricultural incomes.

While some will ask whether these increases are going to be sufficient to satisfy Spanish discontents, others will ask how they are going to be attained. Evidently the report gives a good deal of attention to what should not be done, and in particular to ways in which effort should not be dispersed. Thus, it is against ambitious new road schemes: with the one exception of the planned Mediterranean coast motorway, from the French frontier to the Levante provinces, the road effort should be confined, for perhaps four years, to the repair and better maintenance of those existing roads that carry the heaviest traffic. On railways the judgment is much the same: some 4,900 kilometres of track need modernisation, and the locomotive park needs renewal, but neither wholesale electrification, nor the building of new lines, is recommended. Similarly with the ports: in general they are big enough already; what is wanted is more, and regular, dredging. Clearly the World Bank team is convinced that public investment must be limited if industry is not to be kept starved of the capital it needs for expansion. On agricultural policy there is a similar concern to avoid dispersal of resources. Thus, while the value of irrigation schemes is conceded, it is urged that the state should not start simultaneously on so many schemes that their completion is delayed. The central object of agricultural policy, said Sr López Rodó, "should be to get a sufficient volume of production of each crop at the lowest possible cost." An expanded agricultural production is treated as not only desirable, but necessary; but the report urges that efforts should be made to project probable demand, crop by crop, and relate production to it.

ALL this sounds elementary, and indeed Sr López Rodó gave the impression of a report abounding in pertinent platitudes. If heeded, however, these statements of the obvious will imply a modernisation of the Spanish government machine and a spring-cleaning of the process by which policies are made. Some specific suggestions of this kind—a ministry for export promotion, the use of Treasury bills and other credit control instruments made available by this year's bank reform, methods of increasing the volume of new low-cost housing by other means than direct labour—are mentioned.

In general, the report is an attempt to face the problem of combining the orthodox principles of the stabilisation period (1959 to 1961) with a new dynamic element of growth. Stabilisation was a success in that it did what it set out to do, but at the cost of a heavy recession and painful social scars, reflected now in the persistent grumbling on the labour front. As the report points out, Spain now has a foreign exchange situation good enough to allow freedom of manouvre. What is hoped is that if the economy is released, its latent forces of expansion will do the rest.

ANNUITIES

At Death's Door

THE chance of purchasing a Government annuity ends on the last day of this month; ironically this may be the first time that many people realised that such a possibility even existed. Government annuities are to go the same way as Government life insurance went in 1928, when only 12,000 policies were outstanding. Annuity contracts granted in 1954-60 averaged 400 a year; in 1961 this figure fell to 250.

Available through the National Debt Office, the Post Office, and the Trustee Savings Banks the money received in consideration for the annuities was used to cancel part of the National Debt. Recently the scheme has not been worth the trouble, and the Government now feels that there is no demand for the service. In fact the annuities were uncompetitive and cumbersome to acquire and the range of annuities offered was very narrow compared to that offered by the insurance companies. The cost varied with the market value of 2½ per cent Consols and while the proposal forms of the assurance companies are simple, the Government's were lengthy affairs that demanded a declaration to be made before a Justice of the Peace, a magistrate, a Commissioner of Oaths, or an official of the National Debt Office in London. A misstatement could mean imprisonment or a fine or both. Investment was tied to Government securities. If the Trustee Investment Act had widened the investment outlets; if the system had been streamlined; and if it had been advertised, then it might have survived.

A much more successful effort to attract private savings has been made by the Trustee Savings Banks. Deposits with their special investment departments have risen from £119 million ten years ago to £555 million in May, 1962. In that period the rate of interest paid on the bulk of deposits has risen from 2¾ per cent to 5 per cent.

COTTON

No Sale

DESPITE the late boost in cotton exports provided by stepped up disposals under aid programmes and a rise of 750,000 bales in American mill consumption to 9 million bales, the United States wound up the 1961-62 cotton season holding 400,000 bales more cotton than it held a year earlier. Apart from a rise of 150,000 bales in the depressed 1958-59 season, this was the first substantial reversal of the declining trend in American cotton stocks since the peak reached in 1956. The stocks of the rest of the free world are estimated to have declined by nearly 1 million bales in this period. End-season stocks in the United States amounted to about 7.2 million bales in 1961, of which the United States Government through the Commodity Credit Corporation owned only 1½ million bales. This year it has some 4.7 million bales of the total American carry over of 7.6 million bales.

To help move this accumulation into commercial outlets, the existing export arrangements were supplemented by an export sales programme which is meant to begin to operate when the average price of 1-inch middling cotton in American markets reaches 34.22 cents a lb for a full week. Sales by competitive bids can be made at a minimum of 34.82 cents, to which carrying charges will be added from November. Allowing for the export subsidy of 8½ cents, the cotton could be shipped to Britain for 26d. a lb. But American cotton is available

ITALIAN POWER

How Utilities Have Hedged

Milan

ONE article in the current bill for the nationalisation of Italy's electricity industry lays down that the expropriated utility companies will not be dissolved, but encouraged to invest and diversify in other fields of industry. This will leave in existence efficient managerial organisations capable of intensifying or broadening the process of Italy's industrialisation; any attempt to dissolve the expropriated companies, which are already highly diversified, would have struck public opinion as doctrinaire and incidentally posed a thorny technical problem.

When the first rumblings of nationalisation were heard soon after the second world war, Italy's utility companies saw the writing on the wall. Edison of Milan, which accounts for 25 per cent of the total power produced in Italy, embarked as early as 1950 on a vast programme of diversification—"to safeguard the interests of our stockholders." Since then, the company has developed into a chemical, petrochemical and synthetic fibres giant second only to Montecatini group. In the last five years alone, Edison has poured more than £180 million into the seven distinct chemical subsidiaries and affiliates through which it operates a dozen-odd plants from the Alps to Sicily. It is also involved in several other industries and financial activities.

La Centrale, Italy's second largest private utility company, producing 10 per cent of the country's total power, has diversified into six major industrial and financial areas over the past ten years. These include electronics, paper mills, foods, construction, and financing. The company signed an agreement last year with Britain's Reed paper group to build a large paper plant near Cassino, south of Rome. In the construction field, La Centrale has interests in half a dozen functioning and prospected toll highways, and in construction projects in Egypt, Pakistan and Nigeria. In financing, the company has set up several subsidiary holding companies in the fields of underwriting and investment. SADE (Società Adriatica di Elettricità), the third largest private power producer with headquarters in Venice, and with an extensive network covering the north-east corner of Italy, is reportedly moving heavily into tourism, hotels and real estate development.

Italy's utility companies are ready to discuss the new ventures that they have already embarked upon; but so far none of the electric power groups has stated openly yet what they plan to do with the money they receive in repayment for their electricity assets, despite the rumours flying around in Italian business circles. They have two reasons to keep their plans quiet. The nationalisation draft law has to pass both Houses of Parliament; final approval seems unlikely to come until early fall. Secondly, if the bill is passed, future investment of these repayment funds will be subject to approval by a special credit committee of the Bank of Italy, to see whether they fit in with Signor la Malfa's economic plan.

2d. a lb cheaper from non-official sources, and even this price is being undercut by as much as 2d. a lb by rival cotton producing countries.

The first official forecast of the current American crop puts cotton output at 15.1 million bales, the first time production has topped the 15 million mark since 1953-54. The United States Department of Agriculture thinks that the usage of American cotton will again be about 14 million bales, a drop in home consumption being offset by a recovery in exports. This looks an optimistic forecast unless the American authorities are prepared to shade prices to meet foreign competition. American exports are currently lagging badly. Cotton production outside the United States is expected to increase, but unless consumption improves quickly in Japan, Britain and some other European countries, there is unlikely to be any increase in demand for cotton outside the United States. The difficulty with the floor which American export policy places below world cotton prices is that it always seems likely to collapse if overloaded. It is not surprising that the added pressure which the new season seems likely to generate has given rise to renewed rumours about a possible increase in export subsidies.

LOBITOS OIL

Before and After the Bid

THE four for five share exchange offer by Burmah Oil for the shares of Lobitos was quickly recommended to shareholders by the Lobitos directors. They have now decided to defer the proposed one for one scrip issue but they have declared an interim of 16 per cent which accords with their forecast of an 8 per cent interim on the doubled capital. For 1960-61 the interim was 8 per cent, followed by a final of 20 per cent. The bid holds out the prospect to Lobitos shareholders of an income almost double that received last year. The price of their shares has more than doubled this year so that they can have no cause to complain about the terms of Burmah's offer. Nevertheless there has been some speculation whether a rival American bidder was waiting in the wings. A large holding had been built up earlier by Guaranty Nominees, a nominee company of Morgan Guaranty Trust, which is shown in the register as the owner of about 360,000 shares. This may represent the holdings of numerous American investors; indeed in April the register shows this holding at over 410,000 shares, which has been reduced since then by a number of small sales.

One other holding which has aroused comment is that of C. T. Bowring, an insurance firm, whose chairman is Mr F. C. Bowring who is also chairman of Lobitos. The firms have had close links since Lobitos was founded in 1908, but it is only this year that C. T. Bowring has really built up its shareholding; the chairman says that this decision was taken in the light of the injection of new management into Lobitos, which made it an attractive investment prospect. To C. T. Bowring's earlier holding of 34,000 shares, 70,000 shares were added in January, when the price was around 14s., by the purchase of a single block of shares. Then in May, having notified the Lobitos directors, C. T. Bowring decided to buy up to 100,000 shares through the market. In fact however 72,000 shares were purchased (of which about 60,000 so far appear on the register). The last purchase was early in July when the price stood at about 15s. 6d. Mr Bowring has said that at that time the Lobitos directors did not have a scrip issue or a higher dividend in mind and that he had no knowledge of the Burmah bid until August 10th, when the shares in response to the scrip isue and dividend forecast stood at 22s. They now stand at 29s.

RADIO SHOW

Whistling Up the BBC

THE men of the radio industry are not quite the tragic clowns in greasepaint that they were at last year's radio show. They have disposed of their stocks of 17 in. sets and now have the Pilkington Report, even if probably the majority of them would prefer not to be committed to building sets for the ultra high frequency wavebands by 1964. Mr C. O. Stanley of Pye says that the industry hopes for UHF transmission by the end of next year, though the BBC says that it plans to start its new service early in 1964. Once there really is a 625-line UHF service operating, even if it is at first limited to part of the London area, the industry reckons it should be easier to persuade people that they should buy sets that can receive such broadcasts—or can be modified to do so. The set makers are still mostly divided between those who provide "switchable" sets, already adapted to 625-line operation and sometimes even including a UHF tuner as well, which need little or no modification to receive the new service, and those making convertible sets —for which a new unit costing now around £10 will be needed to adapt them for 625-lines and UHF. Some are now hedging by making both.

The end of uncertainty about standards will, set makers hope, mean a new leap forward in sales. After the depressed state of trade in past two years, they could hardly fall any further; but the immediate reaction to the Pilkington Report and the cut in hire purchase deposits was public indifference. It had taken a more optimistic view of prospects than the retailers in the first half of the year, and has built up its stocks of television sets by about 130,000 while the retailers continued to run theirs down. Production was 29 per cent higher than a year before, but home deliveries fell 23 per cent. Exports, though still relatively small, rose 22 per cent. But one may doubt whether the show or even the new BBC service will send buyers rushing for new sets. So it would be unwise for the industry to assume that it can expect much more than the normal replacement demand of around 1¾ million sets a year.

Much of the steam has gone out of the radio boom this year; home sales rose only six per cent, and the proportion of cheap sets rose. So radio still accounts for only about a quarter of set sales in terms of value, with some of the most successful makers of transistor portables, like Perdio, specialists in this field. It is to a revival of television set sales that the industry in general must look for prosperity.

BARLEY

Prodigal's Return

BARLEY has come off its high horse, and prices again bear comparison with maize. Even now it is only new crop homegrown barley that is being bought, at about £21 for November delivery. Trade in imported barley is so slow that the National Farmers' Union has not yet put out its customary price guide to farmers, though the first of the new English barley has already been harvested. The NFU's indicated ex-farm value is based on the landed price of imported barley, of which there was at this time last year an impossible glut that rocked prices before the weight of the home crop was heaped upon the market. This year Canada is probably holding back its reduced stocks of barley against further prospective sales to China. Australian barley, much of which might be earmarked for the same client, will not arrive until around the last two months of the year, and there are no other pressing sellers. The prohibition on barley landed here for less than £20 a ton has been lifted and will probably not be required again this season.

About £25 a ton was wanted for Canadian barley only a month ago and demand was consequently negligible. Maize, which has remained below £20 a ton, has been used as an alternative, filling a large part of the extra demand for feeding stuffs following the unfavourable weather. Stocks of barley on farms, and presumably in compounders' stores, have been largely cleared because of the high prices. But the recent improvement in weather might bring a heavy weight of barley on to the market very soon. The Ministry of Agriculture's forecast of a slight fall in barley production —the first since 1956—was based on estimates made when conditions were less favourable in many areas than now. French and West German crops are also shaping better than expected.

On the Ministry's estimate production is expected to reach 4.3 million tons, compared with 4.4 million tons last season. But wheat production may rise to 3.1 million tons, compared with 2.4 million in 1961. There should be a larger tonnage of animal feeding stuffs available this year—depending on how much of the wheat is millable and how much barley is exportable or malting. Maize is comparatively cheap, but compounders try to ensure that homegrown barley is taken up in preference to imported grain.

To the eloquent tributes that have been paid to Sir Cecil Ellerton this week, *The Economist* would add this: Cecil Ellerton was a master banker and a most human person. He had no arcane professionalism about him, and he wanted ordinary people to understand what banking is and what bankers are. Perhaps his best monument is the wider understanding of these matters that he did so much to foster in his work at Barclays Bank and in his support of Banking Information Service right up to his death.

WOOL

Well Met

THE United States wants a meeting of that almost forgotten body, the international wool study group, in November. Inter-governmental wool gathering is rare. The United States says it has been moved to make this unusual request by the condition of trade in wool textiles and by the stiff competition from synthetic fibres. The management committee of the study group was to meet on Thursday to consider the request. Some years ago a similar motion failed to get through the committee stage, and the last full meeting of the study group was as far back in 1955. It was mainly concerned with statistics; and behind the scenes, the group's statistical agency still functions. If the new conference is held, it will obviously have more flesh on it.

The American suggestion is said to have been favourably received by members. British wool textile manufacturers are anxious to know what might be in it for them, but they are putting on a mystified air about it—when they really know what the November meeting will be about, they will put on official hats to consider what they *must all* be privately turning over in their minds. Last year, quotas were arranged for international trade in cotton textiles. Cynics said then that woollens and worsteds would follow cottons as night follows day, even though agreement in wool textiles might not be so easy to achieve as in cottons.

For Britain's wool textile industry, American proposals could cut either way. Restriction of exports to the United States, for instance, might fence off a bigger slice of the market from British exports than it protects by freezing trade in the prevailing pattern. Base dates for calculating quotas would inevitably give rise to difficulties, as would the distortion of trade that already exists through American attempts to protect its manufacturers and sheep rearers.

Four important exporters of wool textiles, Britain, Belgium, France and Italy, are prospective bedfellows in the common market. Britain is also currently rounding off discussion of a trade treaty with Japan, Britain's powerful competitor in wool, which would relax restrictions on trade between the two countries and perhaps bring about a change in Japan's methods of artificially boosting its exports. With so much going on, if international quotas were discussed, the British industry's brain box would at the moment be taxed to know where its advantage would lie. But in view of its difficulties in the American market Britain seems likely to plump eventually for international regulation if it gets the choice.

Can Poland Run Short of Coal?

FEW coal merchants in western Europe would find it easy to believe that Poland has any prospect of running short of coal: Polish coal has been on offer all round Europe since the war, undercutting other European coal prices and sometimes even cheaper than American imports. Yet, looking forward, the Poles do forecast a fuel shortage and even one of coal. The war cost the country its major crude oil deposits, but gave it Lower Silesian and Upper Silesian coal-mining areas. Immediately after the war the Polish domestic market was simply unable to accept nearly as much coal as these rich fields could produce: so most of this was exported and brought in much of the foreign currency Poland earned. But internal consumption of coal rose from 48 million to 89 million tons (including soft coals), and though coal still contributes 20 per cent of the country's foreign earnings, home demand is soon likely to swallow this up. In spite of continued growth, planned to offer 114½ million tons of hard coal and 27 million tons of lignite a year by 1965, and 135 million and 60 million tons respectively by 1975. Polish planners foresee a total shortage of 10-12 million tons of "coal equivalent" by 1975. This means an end to coal exports: Poland's fuel deficit, it is assumed, will have to be met through the construction of gas pipelines from the USSR, the "Friendship" crude oil pipeline, and imports of refined products.

The new refinery being built at Plock on this Russian pipeline will be ready to treat 2 million tons of crude by 1965; it is planned for extension to 6 million tons a year by 1970. But this refinery is intended to make very little fuel oil; its crude will almost all be converted to petrol and diesel automotive fuels.

Gas consumption in Poland is rising: Silesian coal-gas, natural gas which has been found in good supply in areas just west of the new Polish-Russian frontier, and finally gas imported from the USSR by pipeline have all been linked up with centres of industrial and domestic consumption. Petrol is being obtained from natural gas liquids. Total demand for petrol is expected to reach 2-2½ million tons, and demand for fuel oil and diesel oil 4½ million tons each by 1975, so unless a second new refinery is by then built much of this will have to be imported as products.

POLAND's search for oil and gas has been full of unfulfilled promise. Its proved areas in the south have yielded some small production for more than a century; but they are largely worked out, and are responding very poorly to secondary recovery methods such as water-flooding. The northern lowlands are being surveyed at a slow rate owing to lack of trained men and the right equipment. Oil has been found at Krosno, a town of the same name as the capital of the old "oil country" in the south. The Poles believe that east German fields near the border there extend to the east; they are hoping for as much as 3½ million tons a year from this area by 1975, though these are paper plans indeed. Even so, the country would have to import another 3½ million tons of crude to fill its planned requirements, as well as 1½ million tons of products.

mines making easy profits should accept the method chosen by a leading firm of stockbrokers of evaluating these shares as if they were a gold mine with a limited expectation of life. The authors estimate that by 1964 when the licences expire the total of current equity assets plus the accruing cash flow per share will be close to—and in the case of Associated British Picture will comfortably exceed—the current price of the shares. If so, there should not be much risk of a further substantial fall in share prices, not least because whatever form future legislation takes the companies will presumably be left to make some profits. This will comfort the many who already have considerable book losses on their television investments. But equally

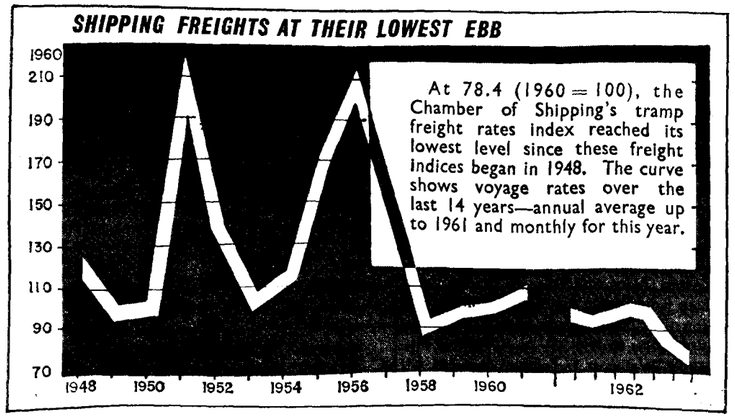
these brokers do not expect any immediate sharp rise in prices. For the moment the best prospects seem to be those of the rental companies, particularly if Pay-TV is to be given a trial, but once the uncertainty about the future of television is resolved, a revival of interest in the shares is possible.

The opening of a new BBC station would however cut into the audiences of the older channels and thus advertising revenue would fall. At the same time there would be greater competition for talent which could force up costs. Accordingly the brokers estimate that even without further action by the government to trim the contractors' profits, these might well be halved by 1965. Nor do they find much promise in the profits that might be earned by a second commercial channel after 1968. If by then advertising revenue had recovered to £120 million, about 20 per cent above its current level—a more pessimistic forecast than some—the new station on projected rates of running costs would still be in the red and a marginal profit would emerge only if the expected rate of growth in TV advertising is achieved.

BUILDING STANDARDISATION

Disputing the Means

PREDICTABLY, the Royal Institute of British Architects has stirred the brickmakers into argument—by recommending the adoption of the 4 in/10 cm module as the basis for industrialised building—as, perhaps, it intended to do. The Brick Development Association reiterates its preference for a system of "preferred dimensions"—different bases for different parts as advocated by the Building Research Station—which, it says, would be more efficient and avoid dislocation of existing production. In saying so, it is assuming that the RIBA intends its recommendations to extend beyond industrialised building to those that use bricks. To press for the adoption of the 4 in/10 cm module for all components used in industrialised building is, it considers, "a serious and premature decision." As the British Standards Institution has spent 14 years trying to get agreement on standardisation, one might question whether it is premature; having both the BRS and BSI studying the subject, each possessing different ideas, has helped make discussions so long-winded. In the meantime many countries have adopted the 4 in/10 cm module. The great virtue of the RIBA's recommendation is that it puts some urgency into discussion—and the BDA has offered to talk the matter over with the RIBA. With industrialised building growing in popularity, standardisation of parts between the various systems used becomes vital if it is to offer all the benefits it can.



SHORTER NOTES

According to a detailed survey of the implications for the cotton textile industry of Britain's entry into the European Economic Community published by the Cotton Board this week, its early effects will be slight. At present only about one half of one per cent of Britain's production of cotton and man-made fibre cloth is exported to the common market. But costs in EEC countries are lower; productivity has been rising much more sharply and utilisation of machinery is more intensive than in Britain. Though there are wide differences in efficiency between firms, in general, producers of quality combed yarns, quality shirtings and some coloured woven goods should benefit. The weavers of man-made filaments and the resin finishers should also be successful. Manufacturers of sewing threads should break even. The rest had better watch out.

★

Brazil has devalued its cruzeiro by slightly over 11 per cent from 350 to 400 cruzeiros to the US dollar. The Chamber of Deputies has passed a bill, which now awaits the President's signature, limiting the remittance of profits to 10 per cent in any one year and of capital to 20 per cent. A section of the Brazilian press has attacked the bill pointing out that not only will it discourage future foreign investment but that it will penalise those foreign firms that regularly reinvest large portions of their profits in Brazil.

★

The International Monetary Fund has agreed to a drawing by Ghana equivalent to $14.25 million. Half will be in dollars and half in sterling. Ghana has intensified import control, reduced government expenditure, and tightened credit control. The drawing is intended to bolster the reserves while these policies take effect.

★

Mr Selwyn Lloyd, who was a director of the Alliance Assurance Company before he joined the government in 1951, is rejoining the board and has also been appointed a director of the parent company, Sun Alliance Insurance.

★

In the succession of price cuts at petrol stations that was initiated last week by Esso, Jet Petroleum and other marketers selling more cheaply than the established major companies have brought down the prices of their own lowest grades, maintaining their price differentials below all the majors' regular grades and Esso's "mixture" grade (which have been somewhat improved in octane rating).

The accounts of Oldham and Son, the battery makers, for the year to March 31st are accompanied by a statement from the chairman, Mr John Oldham, printed in both French and English.

COMPANY MEETINGS

THE DISTILLERS COMPANY LIMITED

SIR GRAHAM HAYMAN'S STATEMENT

The eighty-fifth Annual General Meeting of The Distillers Company Limited will be held in the North British Hotel, Edinburgh, on Friday, the 14th day of September, 1962, at 12.15 p.m. The following is the Statement by the Chairman, **Sir Graham Hayman,** which has been circulated with the Report and Accounts for the year ended March 31, 1962:

I have to report the following changes in the Directorate since my last Statement.

Mr William Reid, who had already retired from executive duties, resigned from the Board on March 31st last. In renewing our thanks to him for his valuable services, we also extend our best wishes for a happy retirement.

Sir Laurence Merriam has been appointed a Director. He is Chairman of The British Xylonite Company Limited, whose acquisition by your Company was reported in my last Statement.

The Earl of Halsbury was also recently appointed a Director. Throughout his career he has been actively identified with scientific research and industrial and engineering problems.

We are glad to welcome both these gentlemen as members of our Board.

Mr G. W. Scott retires from the Board by rotation at the forthcoming Annual General Meeting and does not seek re-election. We desire to express our thanks to him for his services to the Company. Mr H. H. Woolveridge will retire from the Board at that Meeting, having served 37 years with the Company. In recording their appreciation of his services over this long period, his colleagues extend their best wishes to him in his retirement.

GENERAL OBSERVATIONS ON TRADING

The year under review was a very active one and turnover for the Group amounted to £267 million—a slight increase over the previous year although in the main the volume was appreciably higher.

Our Scotch Whisky and Gin Companies earned a moderate increase in profits and their proportion of the Group total is at present 88 per cent.

Our industrial activities had a sharp set-back in earnings due to the generally unsettled state of trade which has adversely affected the Chemical and Plastics industries in the United Kingdom. I shall be making more detailed reference later to those sections where exceptional trading conditions have operated.

Referring now to the Accounts, the trading profit of the year after depreciation was £30,625,818 compared with £31,901,589 in the previous year, a reduction of £1,275,771. We have consolidated for the first time the results of the British Xylonite Group, which was acquired towards the end of the previous financial year. This Group shared in the set-back referred to above and consequently made a smaller contribution to our profits than had been hoped. Further, it will be observed that the charge for depreciation has increased from £2,759,764 last year to £4,223,105. This is largely due to the incorporation for the first time of the charge relating to The British Xylonite Company. However, it also reflects the initial charges for depreciation in respect of our new Acetic Acid Plant, which only came into operation towards the close of the year, and the most recent extension to the PVC plant, which was completed last September. To that extent, therefore, the charge of a full year's depreciation on these two plants has adversely affected the results of our industrial side in the year under review.

Income from trade investments was higher at £2,744,146 (£2,556,571) and interest on loans somewhat lower at £573,055 (£590,432), so that the Group profit before elimination of outside interests was £32,796,909 (£33,867,728). The profit before taxation attributable to The Distillers Company itself was £519,494 less than last year at £32,971,112 (£33,490,606). At the higher rate imposed by the Finance Act of 1961, taxation required £16,476,573, making the net profit attributable to the Company £16,494,539 compared with £17,224,224 last year.

Shareholders may be aware of the complicated taxation situation which has arisen through a number of British Companies selling technical information (commonly called "Know How") to other parties. It has been the practice of your Company to treat receipts of this kind as capital. Recent judicial decisions, however, have indicated the possibility that some part of these receipts might be regarded as taxable. While we consider that the facts upon which these decisions were based are distinguishable from ours in important respects, we have considered it prudent to provide for this possibility. An appropriation to cover the maximum amount of tax which could be involved has been made in the Accounts under consideration.

During the year under review, the Company obtained additional capital by way of a rights issue in the proportion of one new ordinary share for every ten held. The expenses of the issue have been written off.

Your Directors have appropriated £4 million to general reserve and recommended that a final dividend be declared on the Ordinary capital at the rate of 7½ per cent which, with the interim of 6 per cent, makes 13½ per cent for the year, the same rate as last year but of course on the capital as increased by the recent issue.

In the Consolidated Balance Sheet, you will observe that almost £10,000,000 has been expended upon additional buildings and plant. The main items on the Potable side of our business were the construction of additional warehouse accommodation at our Distilleries and part of the cost of the new blending and bottling warehouse at Perth. In the Chemical Division, our principal expenditure was on the construction of the new plant at Hull for the manufacture of acetic acid and, in the Plastics Division, our main project was the extension of the polyvinyl chloride plant at Barry.

Our stocks of Scotch Whisky again rose substantially, broadly accounting for the increase in the stock figure shown in the Balance Sheet.

On the liabilities side of the Consolidated Balance Sheet, the capital is increased by the rights issue to which I have already referred and by the small additional issue required to complete the acquisition of The British Xylonite Company Limited. The premiums involved in these issues totalled £22,123,765 and account for the major portion of the increase in capital reserves. I might at this point observe that the consolidated reserves of the Group have increased by £29,377,039 during the year. In addition to the main item mentioned above, the Group retained for future development £7,253,274.

SCOTCH WHISKY

Our Malt and Grain Distilleries had a successful season and the output and quality of our new whiskies have never been higher.

The reconstruction of Talisker (Isle of Skye) Distillery, which was extensively damaged by fire, is now well advanced and normal operations will be resumed in September next.

It is now proposed to re-equip Linkwood Distillery, Elgin, and this work will be carried out during the coming season.

The new blending and bottling plant and offices of John Dewar & Sons Limited, near Perth, were completed early this year and, on June 15th last, we were privileged to have The Rt Hon Lord Polwarth, TD, Chairman of The Scottish Council (Development and Industry), perform the official opening ceremony. Full reports have already appeared elsewhere on this notable milestone in the history of the House of Dewar and it is gratifying that so much favourable comment has been made on the impressive modern establishment, attractively situated and efficiently designed to meet the increasing demand for Dewar's White Label Scotch Whisky, both at home and abroad. It is fitting that I should record our appreciation of the efforts of our Scottish Engineering Division which, in conjunction with Dewars, was responsible for the design and planning of this project.

Stocks of Scotch Whisky held by the Industry have again increased and, at March 31, 1962, stood at 327.2 million proof gallons. This compares with 296.9 million proof gallons at the same date in 1961. These figures continue to

reflect a high degree of optimism as to the future trend of sales of the Industry. In this connection it will be noted from the figures set out below that although further substantial progress was made in exports during the past year, the Home Trade figures were substantially unchanged.

TOTAL SALES FOR THE INDUSTRY

Year to March 31st	Home Trade Proof gallons	Export Proof gallons	Total Proof gallons
1958	6,075,000	18,108,512	24,183,512
1959	6,224,000	19,561,008	25,785,008
1960	6,636,000	22,381,988	29,017,988
1961	7,587,000	24,235,131	31,822,131
1962	7,662,000	27,507,551	35,169,551

The Home Trade figures have undoubtedly been adversely affected by the 10 per cent surcharge imposed by the Chancellor in July 1961 and subsequently consolidated as part of the Budget proposals in April, 1962.

The consolidation of the surcharge came as a most unwelcome surprise to the Industry, particularly as both the Prime Minister and the Chancellor had been good enough to state that a good case had been made by the Scotch Whisky Industry for a reduction in duty. One might therefore expect that an industry which for so many years has made, and still continues to make, so great a contribution to Britain's balance of payments, should not be given such inequitable treatment by HM Government.

As I pointed out last year, the basic duty on imported heavy wines has been reduced on two occasions in the last four years and consequently the effect of the surcharge, which was imposed on all excisable beverages, weighed less heavily on these imported articles than on Scotch Whisky and Gin. There is no doubt that the punitive rate of duty not only depresses demand at home and diverts consumers to imported products but, by force of example, continually encourages overseas Governments to raise their own duties. The British duty has been raised no less than seven times since 1939 and today the Chancellor is taking 27s. 1d. on a bottle of Scotch Whisky priced to the consumer at 41s. 6d.

The result of the imposition of the surcharge was two-fold. First, by raising the price of a bottle of Scotch Whisky, it not only slowed down any increase in consumption but in addition, because of the alleged temporary nature of the surcharge, it resulted in a running down of stocks by every section of the distributive trades. Unfortunately, the Chancellor has again sought those special powers which will continue this feeling of uncertainty.

So far as our own home sales are concerned, until the full effect of the surcharge became apparent in the early months of 1962, we had a reasonable expectation of a substantial increase. In the event, our Home Trade sales were almost identical with those of last year.

I have already referred to the expansion which has taken place in export shipments by the Industry and I am glad to say that our own export sales showed a satisfactory increase, although I should add that owing to exceptional circumstances in one or two markets, certain substantial shipments were made in the last few months of the financial year which might otherwise have formed part of the current year's trading.

The United States continued to take increased supplies. Although we shared in this additional demand, our proportion of the increase was less than that secured by the rest of the Industry, which may be attributed to two factors: first, the continued exports of Scotch Whisky in bulk for bottling in the USA, in which for policy reasons we are not participating and second, the continued growth of competition from other brands.

These are conditions which must be expected, and met, in an expanding and competitive market but they must also be viewed against the solid progress of our own brands and the eminent position which they hold throughout the world.

The United States recently announced a decrease in the rate of customs duty on Scotch Whisky which, while welcome, is not significant but our efforts are still directed to the more important problem of the removal of tax discrimination against imports in bottle in favour of bulk shipments, to which I referred last year.

Australia continues to be an excellent market and our business there gives us every cause for satisfaction.

In New Zealand, import control is still in operation but I am glad to say that we are obtaining a substantial share of the business which is available.

So far as Canada is concerned, the Scotch Whisky Industry as a whole is apparently doing little more than maintaining its sales. We are hampered by the various conditions to which I have referred previously, namely, differentials of taxation and mark-up as between Scotch Whisky and Canadian Whiskies. The recent emergency increase in tariffs of 15 per cent must inevitably add to the handicaps on our selling efforts in this market.

In Venezuela, following upon the reduction in duties to which I referred last year, there has been a marked improvement but in present circumstances it is difficult to envisage Scotch Whisky sales in this market reaching the high level achieved prior to the increase in the duty towards the end of 1959.

During the year under review, the Common Market countries have again taken greatly increased supplies, the overall growth being approximately 24 per cent over the Industry's shipments during the previous year. As the standard of living in these markets rises, exports may be expected to expand further, whether or not the UK joins the European Economic Community.

In referring to this subject last year, I said that our investigations indicated our position would not be materially affected if and when the United Kingdom should join the Common Market, and we have no reason to alter that view. I should, however, qualify this statement by pointing out that as one of the ultimate objects of forming this European Union is to harmonise the economies of member States, it is conceivable that internal revenue duties (as distinct from Customs duties) may eventually be brought more into line. In that event, the unduly high British Excise duty might be appreciably lowered or, alternatively, other Common Market member States might raise their internal revenue duties, which on average are at present approximately only half the British Excise duty.

We are now in a position where we are just about able to supply all demands both at home and abroad, with the exception of our de luxe brands which are still in short supply. Competition continues to be severe and, in a number of countries, local products consisting of an admixture of domestic spirits and imported Scotch malt whisky provide a type of competition on a very much lower price basis.

However, there are good reasons for believing that Scotch Whisky exports will continue to grow year by year. This applies particularly to industrialised countries where the standard of living is rising and also where trading can be carried on under reasonably normal conditions.

RECORD OF PROFITS AND DIVIDENDS

Year ended March 31st	Group Profit before Taxation	Net earnings attributable to Ordinary Capital	Whereof: Retained	Whereof: Distributed	Rate of dividend on Ordinary Share Capital adjusted for scrip issues subsequent to declaration
1953	£11,059,297	£4,030,122	£1,237,173	£2,792,949	6
1954	17,632,289	7,243,949	4,029,782	3,214,167	6⅔
1955	17,956,109	7,799,159	3,903,769	3,895,390	7½
1956	20,311,430	9,133,969	4,920,267	4,213,702	7⅞
1957	22,452,798	9,741,687	5,222,090	4,519,597	8⅛
1958	23,463,856	10,306,918	5,676,398	4,830,520	8⅜
1959	26,090,103	13,093,720	7,181,913	5,911,807	10⅛
1960	32,143,839	16,785,575	9,549,638	7,235,937	12½
1961	33,867,728	17,143,374	9,134,804	8,008,570	13⅛
1962	32,796,909	16,413,689	7,476,313	8,937,376	13½

GIN

So far as the home market is concerned, the impact of the 10 per cent surcharge applied with equal force to Gin as to Scotch Whisky, with the result that our Home Trade sales showed a slight decline as compared with the previous year.

With regard to the overseas markets, we are continuing the policy to which I have previously referred, namely, the production of one or more of our brands of Gin in those areas where the changing economic conditions and competition from local manufacture—often enjoying a preferential rate of duty—make this desirable. We are today manufacturing Gin in the United States, South Africa, Australia, New Zealand, France, Brazil, Venezuela and the Argentine. In certain of these markets production is being carried out in conjunction with other concerns and capital expenditure by the Group is thereby kept to a minimum.

The continued increase of manufacture overseas is naturally affecting our exports from this country and, in the year under review, these showed a slight decline from the previous year. On the other hand, however, this decline was more than offset by increased sales of Gin manufactured overseas. In the United States in particular, we had a very substantial increase in sales and Gordons is undoubtedly the leading brand of Gin in that market—and indeed in the world—today.

The distillery for the production of spirit for Gin manufacture at Auckland, New Zealand, in which we are shareholders, is now operating and our own gin rectifying plant is also in full operation. The results to date are very satisfactory.

In South Africa, Gordon's Dry Gin Company Limited again showed an increase on the previous year's sales and with the advent of legislation permitting Africans to purchase spirits without restriction from August of this year, we are looking forward to further expansion in this market.

In Brazil, sales of Gordon's Gin showed an increase on the previous year but have not yet reached a satisfactory level.

VODKA

I referred last year to the introduction of a brand of Vodka in the United Kingdom under the trade mark COSSACK. This was launched in September and initial sales have come up to our expectations. We are also developing an export trade in Vodka and propose to make use of our various gin plants throughout the world for its manufacture. Meantime, the sale of Gordon's Vodka in the United States continues to make steady progress.

INDUSTRIAL GROUP

The competitive factors to which I referred last year, together with the recession in the demand for consumer goods, led to unsettled conditions in the heavy organic chemicals and plastics field in which the major part of our industrial activities lies.

The volume of our sales has been well maintained and in certain cases increases have been achieved. The overall position of the British market, however, has not given evidence of any significant growth and selling prices have come under considerable pressure. These abnormal conditions have made the year a difficult one and brought about a sharp contraction in profits. Additionally, certain products have been seriously affected by dumping of foreign materials. It is our hope that the Government will more readily apply the existing anti-dumping legislative machinery to remedy this state of affairs. In a general sense, the keen competitive conditions will continue until such time as there is a more positive increase in demand and less heavy marginal surpluses of production, which are having an adverse influence on many world markets.

It is our view that on balance the British chemical and allied industries will benefit from our entry into the Common Market. There may well be additional competition in some sections but, on the other hand, it would appear that fair trading conditions should be more readily established within the European Community.

Chemical Division.—Sales of our general chemicals held up very well, with the exception of calcium carbide. Our carbide factory at Kenfig (which is rented from the Ministry of Aviation) has been operating at only two-thirds capacity for some months. Calcium carbide is to some extent being replaced by our petroleum derivatives and there seems little prospect of returning to full-scale operations.

Carbon dioxide sales have continued to rise and the fields of application are also expanding. Some additions have been made to our available production capacity and, as the present trend of sales seems likely to continue, it has been decided to establish a large new production unit.

Our new plant for producing acetic acid has been completed and is now in operation.

British Hydrocarbon Chemicals Limited.—British Hydrocarbon Chemicals continued to make progress and production of many chemicals, including such basic products as ethylene and phenol, reached new records. During the year, a large methanol plant was successfully commissioned and I am glad to say that we have been able to sell almost its entire output in home and export markets. The plant for producing Rigidex high density polyethylene is now working to capacity, but present market prices are low.

Substantial progress is being made with the construction of the large petroleum chemicals plant at Baglan Bay, in South Wales, which is expected to start up in the first half of next year.

Plastics Group.—Our Plastics Group has once again increased its output and sales of plastics materials during the year. Owing, however, to markedly lower selling prices, and despite efforts to reduce production costs, trading results were unsatisfactory. This section of our Industrial side has been the worst hit by low-priced imports, particularly in the case of polyvinyl chloride, notwithstanding the installation of lower cost production facilities. The problem of polyethylene dumping having been dealt with by the Board of Trade, it is hoped that a satisfactory solution will also be achieved in respect of polyvinyl chloride.

The long-term trend of consumption continues to rise and, despite the present situation, further expansion in production is under consideration in order to take advantage of the new outlets constantly being found for plastics, and to reduce production costs.

The British Xylonite Company, which your Company acquired last year, is concerned mainly with the conversion of plastics materials into semi-fabricated and fabricated articles and, where it is dependent on the consumer goods and automotive trades, it was adversely affected by the general slowing down and uncertainty of business. In those fields where the Company sells direct to the public, the trading results were very much more satisfactory and considerable progress was made.

The rate of development in methods and machinery in fabricating techniques has never been faster. The Company has an outstanding position in this field and, with a return to more normal trading conditions, this will prove of considerable value.

Biochemical Division.—Conditions in the pharmaceutical industry at home and overseas remained highly competitive. Export prices of basic antibiotics such as penicillin and streptomycin were under pressure and margins contracted, although operating efficiencies improved and the volume of sales increased.

The Division withdrew its Thalidomide products from the market immediately following receipt of the first report from abroad suggesting the association of this drug with certain cases of congenital abnormality. The drug had been subjected to thorough testing in accordance with all recognised procedures, and was highly regarded by the medical profession as being of exceptional value in the treatment of certain conditions.

The utmost sympathy must go to the parents and children who have suffered tragedies which may be associated with this drug.

Food Division.—Home sales of bakers' yeast were slightly below last year's level, due mainly to the national decrease in bread consumption but exports of dried yeast continued to expand satisfactorily and our total production constituted a record. Additional capacity came into operation during the year and further expansion is now being installed.

Sales of other food products marketed by the United Yeast Company also increased.

The Peerless Refining Company (Liverpool) Limited, who are large suppliers of oils and fats, had a very satisfactory year.

OVERSEAS

Australia.—In view of the growth and spread of our manufacturing and marketing interests in Australia, it was arranged that as from September, 1961, one of our Directors, Mr E. G. Gross, should take up permanent residence in that country.

Our subsidiary, United Distillers Pty. Ltd., which produces Australian Whisky and Gin, was successful in increasing its share of the available market, although conditions were generally difficult.

In my last report, I referred to the acquisition of Tolley, Scott and Tolley Ltd., who have been producing high quality Australian Brandy for over a century. I am glad to report that the results of its trading operations to date are satisfactory.

Our associate company, C.S.R. Chemicals Pty, Limited, had a difficult year for reasons similar to, but more acute, than those which operated in the United Kingdom market. This seriously affected the earnings of the chemical industry in that country but the Australian Government has now taken action to restrict the serious effects of competition from imports and there is evidence of some improvement in trading conditions.

South Africa.—Our associate company, National Chemical Products Limited, had a very satisfactory year and made further progress in their general development programme.

India.—A Company is now being formed in India to manufacture a range of chemical products near Bombay. This will be operated in association with Nowrosjee Wadia and Sons, of Bombay, and the Hercules Powder Company of U.S.A. Our holding in the equity of the Company will be about 25 per cent.

During the year, the Indian Yeast Company Limited, in which we have a 40 per cent interest, successfully commissioned its new plant.

TECHNICAL DEVELOPMENT

Our scientific and engineering staffs have been fully occupied on a wide variety of projects ranging from exploratory research to the erection of a number of manufacturing plants. The challenge which British industry faces today gives still greater emphasis to the necessity for maintaining these services at the highest level of efficiency.

PERSONNEL

I should like to record the thanks of the Directors to all ranks of our employees for their sustained efforts during a difficult year.

FUTURE PROSPECTS

It is especially difficult to make a short-term forecast on this occasion. Much will depend upon the Government's economic policy and other issues of major importance which have still to be resolved.

Subject to these reservations, I believe the long-term outlook for Scotch Whisky and Gin is favourable and one of expansion. Our investment programme has had full regard to productive facilities and the building up of substantial stocks of Scotch Whisky and the reputation of our brands in world markets provides the best assurance of further progress.

So far as the Industrial Group is concerned, the conditions to which I have referred have not yet materially changed during the current year, although there are now indications of some slight improvement in prices and demand, which may assume more tangible proportions in the course of the next few months. While competitive conditions will undoubtedly continue, the present phase of surplus production in European and North American countries has had an unduly disturbing effect on markets. Your Company's pattern of activities has been based upon sound economic processes, and a return to more normal trading conditions will undoubtedly enable further progress to be made.

As I shall be retiring at the end of March next, having reached the age of 70 years, I should like to end my report on a somewhat personal note.

It has been a great privilege to serve the Company, whose success over many years provides an encouraging and stimulating background for its future progress.

Your Directors propose to appoint Mr Ronald S. Cumming as my successor and to him I extend my best wishes, as well as the expression of my confidence that his long experience in the service of the Company will well equip him to discharge the responsibilities of his new office to the advantage of the Company and its shareholders.

UNILEVER LIMITED AND UNILEVER N.V.

Interim Announcement of Turnover and Results 1962—First Half-Year

The Boards of Unilever Limited and Unilever N.V. announce the Companies' estimated combined turnover and consolidated results for the first half of the current financial year. The corresponding figures for the first and second half-years of 1961 are given for comparison.

(ALL FIGURES REPRESENT £ MILLIONS)

1962 First Half-year				1961 First Half-year			1961 Second Half-year		
953			TURNOVER	947			943		
740			of which sales to third parties	720			724		
1962 First Half-year			RESULTS	1961 First Half-year			1961 Second Half-year		
COMBINED	LIMITED	N.V.		COMBINED	LIMITED	N.V.	COMBINED	LIMITED	N.V.
52·1	25·7	26·4	Profit before taxation.	51·9	29·0	22·9	51·2	22·6	28·6
26·3	13·6	12·7	Taxation on profit ...	26·5	15·0	11·5	25·6	11·9	13·7
25·8	12·1	13·7	Profit after taxation ..	25·4	14·0	11·4	25·6	10·7	14·9
Minus ·9	Minus ·9	—	Exceptional items	2·5	Minus ·2	2·7	1·4	·9	·5
1·1	·4	·7	Minority interests	1·0	·4	·6	1·0	·4	·6
23·8	10·8	13·0	CONSOLIDATED NET PROFIT.....	26·9	13·4	13·5	26·0	11·2	14·8

The Boards have decided henceforth to comment briefly on the figures published in the half-yearly statements.

Third party sales of the United Africa Group were £16 million lower in January to June, 1962, than in the corresponding period of 1961. A substantial loss was incurred on operations in Nigeria and profits elsewhere in West Africa were lower.

The traditional industrial businesses, particularly in the detergents field in Europe, had a satisfactory half-year; third party sales increased by £36 million or 6% and profits before taxation by 8%.

16th August, 1962.

THE TUNNEL PORTLAND CEMENT COMPANY LIMITED

FUEL OIL TAX MAKES EXPORTS UNPROFITABLE

The fifty-first Annual General Meeting of The Tunnel Portland Cement Co. Ltd. will be held on September 13th.

The following is an extract from the Review by the Chairman, **Mr N. M. Jensen,** which has been circulated with the Accounts:

In spite of a sharp decline in exports, the parent company's total deliveries for the year ended March 31, 1962, were a record. When we include a half share of the Ribblesdale Company's deliveries, our total deliveries have exceeded 2,100,000 tons for the year, an increase of 6 per cent on the previous year's deliveries. It is disappointing, therefore, that the Profit on Trading shows a slight setback on the previous year's. This is mainly due to the imposition of the fuel oil tax in April, 1961, and the 10 per cent surcharge introduced in July. Altogether, this excise tax on fuel oil will have cost us £440,000, of which only a portion has been recovered from the Home consumer by increased prices.

The fuel oil tax is particularly unfortunate in connection with our Export market because, whilst ten years ago more than 50 per cent of our profits were derived from Exports, we can now no longer export cement at a profit. There is, of course, much more competition in Export now, but it is disappointing that, in spite of clear evidence of the effect of this damaging tax, the Chancellor was only prepared to make a token reduction by cancelling the 10 per cent surcharge in his 1962 Budget.

Last year I made it clear that British fuel was sold on the Continent at prices considerably below those in the Home market. If Great Britain enters the Common Market, such absurdities must presumably come to an end. If we do not join the Common Market, I sincerely hope that we shall have a well considered fuel policy. It cannot be right economics to have consumers of fuel oil, which include the Electricity Board and Railways, pay for the inefficiency of a portion of the coal industry. I am happy to say that we have now received more favourable offers for fuel oil, but one of our works, namely, at Padeswood, in Flintshire, is reverting to coal. If the Coal Board were not so inflexible, but a little more up to date in their trading and delivery methods, we might use more coal.

With regard to former Egyptian investments, Mr Jensen says: The total compensation received to date is £787,714, which is only 22½ per cent of our agreed claim of slightly under £3.5 million. Under the present Government scale a large company with a small Egyptian claim receives a higher proportionate distribution than does a smaller company with a large claim. It is to be hoped that this position will be rectified when further distributions are decided upon, and may we also hope that further distributions are made at an early date.

The total capital cost of our programme for expansion and reconstruction at West Thurrock and Pitstone, together with some minor expenditure at other works, is now estimated at about £4,000,000. When completed, our works will be more economical in operation, especially in regard to fuel consumption, and most of our output will be from post-war plant.

HUMPHREYS LIMITED

(Building and Civil Engineering Contractors)

RECORD LEVEL OF TURNOVER

SIR AYNSLEY BRIDGLAND ON SETTLEMENT OF CLAIMS PROBLEM

The seventieth annual general meeting of Humphreys Limited will be held on 20th September, 1962, at Winchester House, Old Broad Street, London, E.C.2.

The following is the statement by the chairman, **Sir Aynsley Bridgland, CBE,** which has been circulated with the report and accounts:

The rise in our trading profit is still continuing but at a lesser rate this year than last, mainly due to large additional contracts having been started which have had very little chance yet to show profits. Compared with last year the increase is £23,508 as against £50,565.

If you look at the Profit and Loss Account you will see that Bank and interest charges have cost us £27,392 more, which is a figure almost identical with the lower rate of increase in the trading profit. Otherwise the other items in our Profit and Loss Account do not call for comment.

Our turnover for the year is a record and is likely to be exceeded this current year. This is reflected in the Works in Progress item of £2,083,698, which is up by £717,068.

Also stocks of material are up by £33,613 and debtors, loans and prepayments are up £134,260.

On the other hand, Bank overdrafts are up by £161,706 and Trade Creditors by £653,865, whilst provision for taxation has called for an additional £9,907.

Other movements in our Balance Sheet items are the creation of a Capital Reserve of £43,702 due to a revaluation of properties, while our investment in associated companies has dropped by £57,034—representing the sale of the whole of the ordinary share capital of R. H. Morris (Pty.) Limited of Cape Town. I will deal with this matter more fully later in this Statement.

SETTLEMENT OF CLAIMS

Last year in my Statement I dealt with contractors' difficulties, notably in the settlement of claims. These remarks are still very pertinent. It seems incredible that a better system of dealing with this problem cannot be effected. Outstanding amounts due to us on claims, adjustments, etc., now reach a formidable figure and the interest charges paid by the Company for Bank accommodation to carry claims which cannot be recovered within a reasonable period can be readily appreciated when one looks at the cost of Bank charges which we must set against our trading profits.

Of course, contractors cannot argue that they are immune from criticism in setting forth their claims but the situation has reached a stage where in order to arrive at a fair settlement of what is due to them, claims must be made at figures that allow for arguments and interest on Bank loans which must be recovered in some way or the other in fairness to our shareholders. Moreover, in a great number of cases it is clear that the final arbiter is the party which has made the claim necessary, and that seems quite indefensible.

DELAYS IN REACHING A DECISION

In some cases two years and over are reached before settlement is obtained and these delays in reaching a decision on claims have reached a point where they are unconscionable. It is only necessary to add that if more prompt attention were given we in this Company would see our Bank charges halved and if 6-12 months only were necessary to get settlements—surely a modest requirement—our cash resources would be increased by several hundred thousand pounds. It is difficult to imagine that any other form of business has to give credit such as this interest free for anything from six months to two years or over.

Of course, your Company is not alone in having to meet this problem. It is not unfair to say that the complaints from contractors are general—in fact, as the situation is today the method of calling for tenders automatically provides the cause of this serious disservice to the building industry. What is not generally understood is that a negotiated contract, if modified and checked in various ways, does produce a much better arrangement for both owner and builder.

We have used such a system with certain of our larger clients over the years and the experience we have had shows that our customers are very happy indeed with the results. But, while it is difficult to persuade the public that the method of tendering does not produce the cheapest or best results, I am firmly of the opinion that new and better arrangements must be evolved in the near future—and the sooner the better.

SALE OF SOUTH AFRICAN INTERESTS

South African conditions have been a serious problem to us ever since the "apartheid" legislation was enacted soon after we went there. This brought with it a cessation of new money entering the country, and later on exchange restrictions were instituted, which prevented the movement of monies out of the country except by permission, which was not easy to obtain.

We were met as well with a sudden exodus of many professional men from South Africa whom we needed badly in our Company there and this added to our troubles. However, we have not lost faith in the future of this very wealthy part of the world, but to carry on would put too heavy a burden on our cash resources.

With our business growing in this country and calling for more and more liquid resources, we came to the conclusion that we should sell our interest in one of the South African companies. Consequently, we sold our ordinary shares in R. H. Morris (Pty.) Limited for their book value to a company formed in the UK in collaboration with other companies with which we are associated, which has considerable interests in this country, but we have agreed to manage R. H. Morris (Pty.) Limited for the new holding company in future.

ELIMINATION OF BANK GUARANTEE SOUGHT

After the sale of these shares we still remained liable under our guarantee to the Bank in South Africa and arrangements are being made to eliminate this guarantee. These arrangements require a cash investment by your Company in the newly formed UK company, to which I have referred above, and, as a result, your Company should eventually have an income-earning investment in this country in lieu of an indeterminate liability under the Bank guarantee in South Africa and by virtue of their management of the South African company and their interest in the new holding company will continue to preserve an interest in contract business in South Africa.

As to the National Quarries, their results speak for themselves. There again the demand for stone and the possibility of even heavier demands will probably bring competition. It behoves us to see that our present quarries as well as the other new ones which we are in process of opening will be able to meet any contingency that may arise.

Finally, as I have already said, last year represented the largest turnover we have ever had and we already know that this year's will be in excess of the year under review. We cannot as yet show the profits from this increased business—rather it helps to lessen the other profits in the business at first but as the work progresses we should show considerable benefit from the enlarged and increasing turnover.

CARTER & CO.

The fifty-fourth Annual General Meeting of Carter & Co., Ltd., was held on August 23rd at Poole, **Mr C. Cyril Carter,** Chairman, presiding.

The following are extracts from his circulated statement for the year to March 31, 1962:

The year we are considering has in general been one of steady progress and consolidation. The pattern of trading as between the units of the Company has been uneven, as it so often is. Group profit before taxation is virtually the same as last year (£100,677 against £101,202); tax takes slightly more this year but this is offset by a provision for tax not now required.

Total production has been increased and the present-day trend calls for ever-increasing Work in Progress and Stocks for early delivery. In spite of the persisting uncertainty, national and international, with the better utilisation of our resources we feel that this year we are justified in recommending the increase in dividend announced.

Our Poole Pottery subsidiary tends to steal the thunder in the public mind but it is important not to lose sight of the fact that our main concern is with the making of floor tiles and of glazed wall tiles, in which fields we probably produce a more varied range than do our competitors. There we depend largely on the general activity of the building industry.

In our Contracting Companies—contracting for the installation of tiles, marble and terrazzo—we have taken steps to bring about a measure of administrative integration which it is hoped will be beneficial.

The report and accounts were adopted.

THE HEPWORTH IRON COMPANY LIMITED

FURTHER EXPANSION AND PROGRESS

The sixty-fifth annual general meeting of The Hepworth Iron Company Limited will be held on September 12th at Hazlehead, Nr. Sheffield.

The following is an extract from the circulated statement of the Chairman, **Mr J. F. Booth :**

In presenting the Accounts for the year ended on March 31, 1962, I am once again able to report that the group had a satisfactory year of trading. The improvements in demand and production to which I referred last year were maintained.

In our main business of Clay Pipe Makers, we continue to invest heavily in new equipment and have increased our fixed assets by the expenditure of over £450,000 on improvements and expansions. In addition you will see also that commitments to capital expenditure at March 31, 1962, amounted to £310,000.

Research and development, both into more efficient methods of production and further uses for our products is being pressed forward vigorously and we continue to invest considerable sums for this purpose.

Towards the end of the year under review, we purchased the whole of the share capital of Oil Recoveries Co. Ltd. This is a small concern engaged in the collection and refining of waste oils for subsequent use as fuel. Companies within the group are its main customers.

Since the end of the financial year, the parent Company has acquired in exchange for shares the whole of the issued share capital of Thomas Knowles, Ltd., of Darwen, who are an old established firm of sanitary pipe manufacturers. The acquisition represents a further step in the expansion of the group's sanitary pipe making capacity.

Your Board of Directors recommend a dividend of 7½ per cent in respect of the year ended March 31, 1962. The policy of the Board remains to finance expansion out of profits and, in fact, once again the profits earned in the year have been re-invested in the form of additions to fixed assets. The Board therefore propose to recognise this by capitalising the sum of £261,412 15s. 0d., to be applied in paying up 1,045,651 new ordinary shares to be issued to the members at the rate of 1 share for every 4 ordinary shares held. Resolutions will also be proposed increasing the Company's authorised share capital to £2,000,000 by the creation of 3,000,000 additional ordinary shares of 5s. each.

So far as the current year is concerned, production and sales continue at a high level and the results of the group up to the present time are considered satisfactory. Subject to any very exceptional circumstances it is the intention of the Board at least to maintain next year the dividend at the rate of 7½ per cent on the capital as increased by the bonus issue.

COLVERN LIMITED

EXCELLENT TRADING RESULTS

The seventh Annual General Meeting of Colvern Limited was held on August 16th in London.

Mr L. A. Redall, FCA, the chairman, presided.

The following is an extract from his statement which had been circulated with the report and accounts for the year ended March 31, 1962 :

Net profits before Tax have been maintained at a very similar level to last year, namely, £260,471 (£264,007).

After Tax, the rates of which increased again this year, the profits remaining amount to £124,150.

On this result your Directors are recommending a Final Dividend of 27½ per cent on the Ordinary Share Capital, making a total for the year of 37½ per cent.

The forecast in my interim statement in January of a successful year is thus borne out. This excellent result has been achieved in an era of falling profit margins due to advancing wage rates and material costs without recourse to price increases, but by expanding sales both at home and overseas, and the devotion of a great deal of thought and energy to organisation and methods to reduce operating costs and improve efficiency.

During the year under review additional expenditure was incurred on (i) Research and Development, and (ii) Overseas Publicity. Shareholders will readily appreciate the vital necessity of the former in the highly technical and rapidly advancing electronics industry. In the case of the latter our exports, particularly to Europe, are already extensive but with the advent of the European Common Market we have participated in Overseas Exhibitions in that area. Whilst such expenditure affects profit margins I do not look on this as a reduction of profits but as a valuable investment for the future.

The major building extension referred to in previous statements was again slightly delayed during the year but I am pleased to report that we should be able to take possession by the end of August.

Our Order Book was never in a healthier position than it is at the present time and whilst we do not anticipate great benefits from our extensions during this year, given stable economic conditions your Directors are confident that your Company will continue to prosper.

The report and accounts were adopted.

COMPANY AFFAIRS

After last week's sharp advance equity prices on the London stock market marked time early this week and The Economist *indicator slipped back by 1.4 points to 335.1. Later in the week, however, more buyers appeared, encouraged by the rise in industrial production in June and the increase in engineering orders and by the resumption of the rally on Wall Street. Steel and engineering shares attracted attention and oil shares recovered most of earlier falls. Gilt-edged have remained firm with investors continuing to buy the short and long dated tap stocks.*

Drag on Distillers

DISTILLERS' investment in chemicals, pharmaceuticals and plastics has never been revealed and it has rarely been possible to judge whether the return has been adequate. For the year to March 31st, however, there can be no doubt. The whisky and gin companies contributed as much as 88 per cent of the group's total profits compared with 82 per cent in 1960-61 and about 80 per cent in 1959-60. Despite a moderate increase in whisky and gin profits and the inclusion of the results of British Xylonite for the first time, total profits fell and the gross rate of return on capital employed came down from 26¾ to 20 per cent. Depreciation has been exceptionally high and the £30 million odd raised by last year's rights issue has not been fully invested in capital developments : the group was holding £20 million in tax reserve certificates at the end of March. But when all allowances are made, the vulnerable nature of Distillers' industrial investments is exposed.

† Adjusted for scrip issues. * At book value

It has indeed been a bad period for chemicals and Sir Graham Hayman draws attention to a string of influences that has become familiar: selling prices under considerable pressure ; dumping of foreign chemicals ; marginal surpluses of capacity ; markedly lower selling prices for plastics ; and lower margins for basic antibiotics. Sir Graham now sees "indications of some slight improvement in prices and demand, which may assume more tangible proportions in the course of the next few months." Distillers, like ICI, has confidence in the longer range prospects, and is devoting almost the whole of the new capital to the industrial side of the business.

In this decision, it must be expecting more to be gained from chemicals and plastics than from potable spirits. Sir Graham again describes the long term outlook for gin and whisky as "favourable." But there are worrying signs on this side of the business as well. The failure to add much to the home trade can be blamed on the 10 per cent surcharge, but there seems to be no strong hope of rapid growth. Exports, unaffected by the surcharge, were again higher, but Distillers failed to secure its proportionate share of the increase in exports to the United States—partly because of the continued growth of competition from other brands and partly because it is refusing (on grounds of commercial policy) to export whisky in bulk for bottling in the United States, so that it has to pay more in duty in the bottle. Elsewhere, too, Scotch is faced with keener competition from local whiskies—particularly where it has to climb over a tariff wall. Total stocks of Scotch whisky held by the industry have risen from 297 million proof gallons to 327 million proof gallons and one wonders whether, to use Sir Graham's phrase, "a high degree of optimism as to the future trend of sales" could turn into over-stocking. The cost of carrying stocks is high and the value of Distillers' total stocks of industrial products as well as whisky and gin have risen from £94.7 million to £102.4 million.

Ultimately stockholders in Distillers may be faced with a slower rate of growth in potable spirits and a faster rate of growth in chemicals and allied products—the reverse of the present situation. Compared with a smaller distillery, Teachers, whose shares yield 2¾ per cent, 2½ times covered, the yield of 4 per cent, 1¾ times covered, offered by Distillers may not look unfavourable. But if investors are thinking three or four years ahead, might not the yield of 5½ per cent offered by ICI, though with a current dividend barely covered by earnings, be thought more attractive ?

National Canning

MR W. V. SMEDLEY, the chairman of National Canning Company, said a year ago that canned garden peas were the group's biggest single item of production, after the glut of canned peas, the group's diversification alone protected gross profits, more than halved from £637,000 to £290,000 in 1960-61, from a bigger slump. In the year to May 31st last some of the leeway was made good. Canned peas were less of a burden and sales of other canned and frozen foods were higher ; so profits recovered to £478,000, though this is still below the 1959-60 level. The tax charge rose sharply from £94,000 to £233,000, but net equity earnings went up from £194,000 to £242,000—exactly the same level as three years ago. The maintained ordinary dividend of 12½ per cent is covered just over 1½ times.

The immediate market reaction was to mark the £1 ordinary shares up by 3s. to a new high of 52s. 9d. but they have since fallen to 49s. 10½d. to yield 5¼ per cent, if the dividend is maintained after the one-for-ten scrip issue. For the future, much depends upon the successful sale of the broader range of products which the group has introduced over the past two years. There are strong competitors in this business and though the scrip issue may be a sign of confidence the earnings record is rather erratic—profits are still below the levels of 1952 and 1953—and it will need a further advance in profits to reassure shareholders that National Canning can trump its competitors.

Lewis's Investment Trust

IN the year to February 1st last, trading profits of the Lewis's Investment Trust group of department stores were virtually unchanged at just over £6 million. Profits were depressed by the bad weather in the peak months of December and January, by government measures to restrain demand and by the addition of £750,000 to the wages bill. They seem unlikely to show much change again this year and in the six months to August 1st they amounted to £2,232,000, against £2,179,000. The weather has been depressing and the retail trade has hardly changed, though the July retail figures at least hold out hope that trade is picking up again. This is just as well for the Lewis's Trust directors appear to be looking to an improvement in the economic climate to offset further increases in wages and other operating costs.

This none too encouraging prospect hardly squares up with the yield of 3¾ per cent offered by the 4s. shares which now stand at 14s. 10½d. But the twofold cover on the 12½ per cent dividend is above the

(*Continued on page 734*)

average for department stores. The earnings yield is thus just over 7 per cent and its only justification lies in the substantial capital programme now being undertaken by the group which owns Selfridges in Oxford Street and stores in many provincial centres.

H. S. Whiteside

PROFITS of H. S. Whiteside, the food manufacturers whose brands include "Sun-Pat" and "Maconochie," have risen for the fourth consecutive year. But the latest rise of 10 per cent from £525,000 to £577,000 in 1961, was little more than half the 1960 advance. This no doubt reflects the "ever-increasing competition and steadily rising costs" to which the chairman, Mr T. A. Barnes, referred a year ago. Bigger provisions for depreciation and tax left net profits less than 1 per cent higher at £216,000, against £212,000. A final dividend of 18 per cent, against a forecast of 16 per cent, is being paid on the capital as increased by the one-for-four scrip issue in December; the interim dividend of 10 per cent was paid on the capital as increased by last year's three-for-four rights issue so that the dividend on the current capital is equivalent to 26 per cent, covered 1.4 times. Now another one-for-four scrip issue is on its way.

Profits could again be higher this year. First, interest charges will be lower as the £900,000 raised by the rights issue in August, 1961, will have funded overdrafts. Secondly, the rationalisation of some of the subsidiaries should bear more fruit: a year ago Mr Barnes said "the benefits of certain major steps taken will obviously not be reflected in earnings until 1962." Thirdly and most importantly, the attitude of Whiteside's management is progressive—a vital quality in the highly competitive food trade: last year, for instance, a new factory was begun in Italy and two Anglo-American projects were started and the day before the latest results were published Whiteside and Marmite, the Bovril subsidiary, announced a joint venture to produce potato crisps and associated foodstuffs. This arose out of an idea of Whiteside to use "Marmite" as flavouring for some of its products, and has resulted in the creation of a separate company, Branded Foods, with an initial capital of £200,000 divided equally between Marmite and Whiteside. Evidently Branded Foods intends to enter the increasingly competitive business of selling potato crisps where flavoured crisps are growing in popularity; but the going will not be easy, with a major sales campaign from Smiths under way and Imperial Tobacco setting up a new Golden Wonder Crisp factory this October. Whiteside's 1s. ordinary shares gained 7½d. to a new high point of 6s. 9d. after the results were announced but later fell back to 6s. 6d. to yield 4d. per cent on a 26 per cent dividend. A maintained dividend on the capital as increased by the scrip issue is well within the bounds of possibility.

Sheepbridge Engineering

A LIST of the customers of Sheepbridge Engineering—public work contractors and nationalised industries, engineering companies, the motor, aircraft, oil and chemical industries—does not at first sight suggest that the group could have expected much better results in the year to March 31st. Indeed, a year ago the chairman, Lord Aberconway, said merely that the "overall profit should be maintained." In fact, gross profits rose by 5½ per cent from £1,158,000 to the record level of £1,220,000 and earnings for the ordinary dividend, maintained at 15 per cent, have risen slightly to nearly 24 per cent.

Lord Aberconway says that "though the recession in the motor industry had its effect" most Sheepbridge subsidiaries achieved record sales. In the current year there should be some improvement in the results of the motor component subsidiaries, which accounted for 21 per cent of the group's turnover last year. Elsewhere, Lord Aberconway points to increases in demand and capacity. A new range of flexible couplings, made under a German licence, "should prove a profitable addition"; and a new factory at Exeter is expected to boost sales of Hardinge Machine Tools, whose order book is good. Competition is keener but Lord Aberconway expects the group to obtain its full share of available business. The 5s. ordinary shares at 11s. 6d. xd are not far below their high point for the year and yield 6½ per cent but the market cannot be far wrong in looking for another rise in profits.

Building Materials

THE second of the big three cement manufacturers in this country, **Tunnel Portland Cement**, again produced rather disappointing results in the year to March 31st, when its gross profits after a bigger provision for depreciation fell by 4 per cent from £2,806,000 to £2,690,000. This is especially disappointing, as the chairman, Mr N. M. Jensen, reveals that Tunnel's total deliveries of cement rose by 6 per cent to establish a new record. He attributes the setback mainly to the fuel oil tax imposed in April, 1961, and the 10 per cent surcharge introduced three months later. The extra cost of these taxes amounted to £440,000, of which the group was able to pass on very little in higher prices to customers. Ironically Tunnel is reverting to coal in one of its plants.

In deference to the recommendations of the Jenkins Committee, the directors have given details about Tunnel Portland's trade investments, which include a 50 per cent stake in Ribblesdale Cement. Compared with a book value of £1,571,000 for equity trade investments, the total market value on March 31st was no less than £4,406,000. The companies concerned have been distributing less than half their profits. This is a source of strength for Tunnel's ordinary shares. On prospects, however, the report is far less cheering. Mr Jensen says that at the beginning of the calendar year, demand for cement fell and though it picked up in the summer it may well fall again by the end of the year. The 10s. ordinary shares gained 6d. on the report and at 38s. 3d. yield 5 per cent on a dividend of 16 per cent and a tax free capital distribution of 2 per cent.

In contrast with those of Tunnel Portland, the results of **Redland Holdings** for the year to March 31st were better than expected. A full year's profits from two acquisitions were included in 1961-62, when gross profits rose by 42 per cent from £1,346,000 to £1,920,000. Equity earnings rose from 33 to 45 per cent and the ordinary dividend was raised from 15 to 20 per cent. The chairman, Mr A. F. F. Young, says that the year brought a "large increase in turnover and profits" and that the prospects for the group's tiles, bricks, pipes and quarrying interests remain favourable. He adds that the ready mixed concrete business, "though highly competitive, can show satisfactory profits." The group's German tile-making subsidiary, Braas and Company, had another successful year and added two new factories to the existing six. The group has disposed of most of its unprofitable interests in rubber and plastics and its turnover and profits were maintained in the first three months of the current year. The 5s. ordinary shares stand at their high point for the year of 29s. 3d., to yield 3.4 per cent, and clearly the market shares Mr Young's "cautious optimism."

The results of **Ready Mixed Concrete** for the year to June 30th are close to the prospectus forecast though they may disappoint extreme optimists. In May, Ready Mixed Concrete's offer for sale of ordinary shares at 24s. each was oversubscribed 61 times and the shares now stand at 34s. 4½d. The company's gross profits amounted to £611,000, compared with the forecast of £600,000, and the dividend of 20 per cent is covered 2.2 times; the shares yield only 2.9 per cent.

EXCHEQUER RETURNS

For the week ended August 18, 1962, there was an "above-line" deficit (after allowing for sinking funds) of £36,990,000 compared with a deficit of £5,077,000 in the previous week and a deficit of £64,956,000 in the corresponding period of last year. There was a net expenditure "below-line" of £8,275,000 leaving a total cumulative deficit to date of £319,977,000 compared with £378,667,000 in 1961-62.

THE MONEY MARKET

VIGOROUS use of Bank rate by the authorities in the days preceding the Treasury bill tender on Friday of last week persuaded the syndicate of discount houses to leave its bid unchanged at £99 1s. 1d. The outsiders raised their bids marginally and the average rate of discount fell by 0.49d. to 7s. 8.35d. per cent. At the same time, however, total applications for the unaltered bill offer of £230 million fell by £28 million to £368 million, and the discount market received a quota of 53 per cent—only one point below the previous week's allotment.

Money was fairly comfortable on Thursday and Friday of last week and although the rate for day-to-day loans opened at 3⅞ per cent it fell to the clearing banks' minimum of 2⅞ per cent by the afternoon on each of these days. Credit became more difficult on Saturday and the authorities helped the market by the special purchase of a fairly large number of bills on either side of the week-end. On Tuesday two or three houses were again forced to borrow a small amount at Bank rate. Credit was again short on Wednesday and the authorities gave a moderate amount of special help.

(7) 25,000 workers had wage cuts in November, 1961, but over the whole of 1961 no worker had a net decrease. (8) Index of building costs. (9) Average for second quarter. (10) Using the revised retail price index based on January, 1962=100: July, 102·5. (11) Average for first quarter. (12) Average for third quarter.

APPOINTMENTS

COMMONWEALTH OF AUSTRALIA

Career Opportunities for

NIVERSITY GRADUATES

Applications are invited for a number of positions in the

BUREAU OF CENSUS AND STATISTICS IN CANBERRA

TYPE OF WORK: A comprehensive range of Australian official economic and social statistics is compiled and published by the Bureau. The following are positions for which applications are invited:

Senior Research Officer £1761-£2101
Investigation into, estimating specific components of statistical series, including National Income and Balance of Payments. Analysis and interpretation of data for official statistics.

Research Officer Grade 2 £1651-£1871
Assistance in the specification, design and operation of statistical collections and analysis of data.

Research Officer Grade 1 £1321-£1651
Investigations concerned with the development of particular statistical series.

QUALIFICATIONS: University degree in Economics, Statistics or Mathematics. Experience in statistical work would be an advantage.

CONDITIONS OF APPOINTMENT: First-class fares paid for successful applicants and their families. Salary determined according to qualifications and experience will be paid from the date of embarkation. A superannuation scheme applies. All salaries quoted in Australian currency.

APPLICATIONS: Should be made on forms obtained from the Recruitment Officer, Personnel Branch, Office of the High Commissioner for Australia, Australia House, Strand, London, W.C.2, and returned by September 14th.

CITY OF LEEDS

LEEDS COLLEGE OF COMMERCE

Required as soonas possible: LECTURER in MANAGEMENT STUDIES. Candidates should possess a good degree; business experience is a recommendation. A special interest in applied economics and/or quantitative methods in the solution of business problems would be an advantage.

Application form and further particulars may be obtained from the Principal, Leeds College of Commerce, 43 Woodhouse Lane, Leeds 2.

GEORGE TAYLOR,
Chief Education Officer.

Education Department,
Calverley Street,
Leeds 1.

UNIVERSITY OF MELBOURNE

HEARN CHAIR OF LAW

Applications are invited for the above Chair. The salary will be A£4,400 per annum, and superannuation similar to F.S.S.U. in Great Britain will be provided.

Further information and conditions of appointment can be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on *October 31, 1962*

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited from graduates for the post of Research Assistant in the Faculty, to assist in the collection of documents for publication, relating to English Economic History and other work in the field of economic history.

The appointment may be full-time or part-time and the salary will be, according to qualifications and experience, on scale £475 x £25 to £750.

Applications, naming not more than two referees, should be sent by 1st September, 1962, to the Clerk to the Faculty of Commerce and Social Science, The University, Edgbaston, Birmingham 15, from whom further particulars may be obtained.

THE ECONOMIST INTELLIGENCE UNIT

wishes to make further appointments to the staff of its Research Divisions. Candidates for these posts should have at least an upper second class degree preferably, but not necessarily, in economics or statistics, and should have had some experience in industry, finance, commerce or marketing; knowledge of foreign languages is an advantage.

Please send full particulars, including age, qualifications, experience and present salary, to "Research," 5 Bury Street, London, S.W.1.

BRITISH CELLOPHANE LIMITED
MARKET RESEARCH DEPARTMENT

Applications are invited from male Economics graduates in their early 20's for the post of Market Research Assistant.

The Company produces "Cellophane," polythene and other plastic films and field surveys are carried out into the existing and potential markets for these products.

The successful candidate (previous experience useful but not essential) should be capable of interviewing at all levels and of preparing concise reports on a wide range of topics.

Candidates must be prepared to live in the London area. A contributory pension scheme is operated and working conditions are excellent. Application forms can be obtained from the Personnel Officer, Bath Road, Bridgwater, Somerset.

LANCHESTER COLLEGE OF TECHNOLOGY, COVENTRY

Principal: A. J. Richmond, B.Sc.(Eng.), Ph.D., M.I.Mech.E.

Applications invited for following post, duties to commence as soon as possible.

DEPARTMENT OF MANAGEMENT AND BUSINESS STUDIES

Head of Department: W. F. Frank, B.Com., LL.B., M.Sc.(Econ.), Dr. jur., M.B.I.M.

ASSISTANT LECTURER GRADE B IN LAW

Candidates should preferably be University Graduates and/or have a professional qualification in Law.

The successful candidate will be expected to teach his subject in part-time courses leading to professional qualifications and in full-time courses leading to awards of Ordinary Degree level.

The Department is housed in new buildings occupied in 1960. There are good general facilities and encouragement is given to undertake research or consulting work. An outstanding feature of all Departments are many well supported post-graduate courses of lectures.

Salary: £770-£1,670 p.a., depending on age, experience, qualifications and training.

Further particulars and application forms (s.a.e. foolscap) from Vice-Principal, Lanchester College, Priory Street, Coventry, to whom applications should be submitted by *September 1st.*

PEP invites applications for the post of RESEARCH ASSISTANT for a study of Attitudes in British Industry. Applicants should be under 30 and have an appropriate degree. The work is likely to involve some background research and some interviewing. Salary according to experience.—Apply The Director, PEP, 16 Queen Anne's Gate, London, S.W.1, in writing.

THE METAL BOX COMPANY LIMITED

require a

NEWLY GRADUATED ECONOMIST OR ARTS MAN

to assist in economic and statistical work and to prepare and examine national and international production and trade statistics.

Apply to
Head of Staff Division
(Quoting Ref. I.S.N.6),
The Metal Box Company Limited
37, Baker Street, W.1.

LEADING firm of stockbrokers requires experienced INVESTMENT STATISTICIAN preferably, but not necessarily, with professional or academic qualifications. Good prospects and working conditions.—Write, giving details of age, qualifications, experience and previous employment, to Box TE. 858, c/o Hanway House, Clark's Place, E.C.2.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in AGRICULTURAL ECONOMICS. The Salary scale is £900 to £1,050 per annum. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than September 8, 1962, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF SOUTHAMPTON

Applications are invited for a Research Fellowship tenable in the Department of Economics for work on a project concerned with British overseas investment. Some research experience is essential and a knowledge of European languages would be an advantage. Salary according to age and experience within range £1,000-£1,250 per annum.

Applications, giving brief curriculum vitae and the names of two referees, should be sent to the Secretary and Registrar, The University, Southampton, before September 14, 1962.

ROTHMANS FELLOWSHIPS

Rothmans of Pall Mall (Australia) Limited have set up the Rothmans University Endowment Fund to encourage higher education and research for the benefit of the Australian national welfare.

The Trustees have agreed to establish Rothmans Fellowships at Senior and Junior levels to enable Fellows to undertake post-graduate work within a University or approved institution. The SENIOR FELLOWSHIP is of annual value of not more than £4,000 (Australian). The JUNIOR FELLOWSHIP is in two grades, the first of an annual value of from £1,000 to £1,250 (Australian), the second of an annual value of not more than £2,300 (Australian). At the discretion of the Trustees, a Fellow may be paid travelling expenses incurred in taking up the Fellowship and returning to his home.

In addition, an amount of £500 (Australian) per annum is available, at the discretion of the Trustees, to the University or institution where the Fellow is working for the payment of fees and expenses including the purchase and maintenance of equipment.

Preference in the award of the Fellowships will be given to those applicants who wish to work in an Australian University or institution and only in exceptional circumstances will an award be made in respect of work to be done elsewhere. Applicants must have had at least one year's post-graduate research experience.

Application forms and further details may be obtained from the Secretary, Rothmans University Endowment Fund, c/o University of Sydney, Sydney, Australia. Applications close on *October 15, 1962.*

H. G. McCREDIE,
Secretary,
Rothmans University Endowment Fund

The
Importance of Good Counselling

The present trend of moderation in the phenomenal growth of the Japanese economy is attributed to the Government's policy of controlled capital investments. In portfolio management, proper counselling is just as important, if not more so, during this period of readjustment. Nikko ... adviser to the U.S. Japan Fund ... offers you complete data on Japanese stocks gained through experience and comprehensive research. Your nearest Nikko office will be pleased to give you up-to-date market information.

NOMURA

THE ECONOMIC MIRROR

What single factor reflects, most completely, the economic picture of Japan? The Japanese stock market. And what is the picture now? After some fluctuation, the market looks good for investors who are interested in growth stocks.

The basic policy of Nomura Securities is that investments are a type of savings. That is why we have always recommended long term growth stock to our clients. We can't say that investing in Japan is the direct road to wealth. And we can't promise certain results from all investments. But we can promise that the data which we give you about investing are complete and factual.

We place research above everything else when we consider the economic situation in Japan. May we help you with your investments?

Write to Nomura Securities for timely information on the Japanese economy which is backed by facts ... through research.

Guide to contents: see o

"Tsuba" a link with old Japan

For over twelve and a half centuries Japanese smiths have been producing masterpieces of the metal worker's art. This sword guard is a striking example. The heritage of craftsmanship has not been lost and these traditional skills have been channelled into new directions. High quality steel, at relatively low cost, now flows from Yawata's furnaces to satisfy a thousand needs, to make things of strength, practical utility, and beauty. Modern technology, well beneficiated raw materials, quality control and careful inspection at all stages of manufacture, assure Yawata's customers of satisfaction.

INTERNATIONAL

CONSIDER JAPAN—1

Japan's extraordinary economic growth has not been by chance alone. In part it is the product of an economic policy which the British have hardly heard of, let alone studied. For how this came about and what relevance it has to Britain's humble attempts at planning, see pages 787 to 823.

POLITICS IN THE SUN

Jamaica and Trinidad and Tobago have their independence; the smaller islands continue to be the problem children of **the Caribbean,** making great demands on any proposed federation but unwilling to concede any of their own authority (p. 753).

Mr **ben Bella's political bureau has proved too narrow a platform from which to lever the deadweight of Algeria** (p. 773).

President Nasser has stolen a march on the Syrians, pressing charges of intervention in their affairs, by his threat to leave the **Arab League.** Jordan and Saudi Arabia have made a gesture of genuine defiance, and hollow unity, in Egypt's face (p. 761).

President Nkrumah's ministers can do no more than guess at his intentions; still less *The Economist* (p. 757).

English-speaking **Africans** are suspicious of the common market because they suspect French motives in Africa (p 758).

Many Australians think the **New Guinea** settlement the worst possible for them (p. 777).

THEN COMES TOMORROW

What sort of Russian rulers will succeed **Mr Khrushchev,** the man of contradictions? The younger generation looks like being more self-possessed, more balanced, more modern and perhaps more formidable (p. 751).

As the mood in **Berlin** has grown explosive, rationality is hard to come by, but it is needed (p. 756).

By trying to separate entry into the common market from entry to a European political union **Dr Adenauer** is trying to put up a last ditch resistance to Britain's entry into the common market; but his ministers think differently (p. 756).

NOT BY BREAD ALONE

French agriculture, the hope and despair of French politicians, has taken to breeding problems for Europe and for the British. Its spontaneous growth has brought not only increased production but a crop of tensions as well (p. 774).

Spain's stagnant society is getting on the move (p. 776).

Macao's pirate tradition lives on (p. 776).

The **Chinese** seem intent on removing America's nuclear monopoly in the western Pacific; "a matter of months" (Washington's phrase) should show how far they have got (p 756).

While President Diem tries to get communist guerrillas out **of South Vietnam,** nationalist exiles plan to get him out of office (p. 762).

"Away with religion" **is Mr Gomulka's** aim; "gradually and without too much noise" his method (p. 761).

USSR HELPS USAF

The Soviet space twins **have done the American Air Force a** good turn (p. 779). While much activity goes on in space, Congress is getting down to business at last (p. 780). This week the Senate has passed two important **Bills, one on drugs** (p. 780), and one on **agriculture** (p. 782). However, controversial **judicial appointments** are still being held up (p. 782).

The national **trade union** organisation is under strain (p. 757).

In the long run nuclear power may provide an answer to the high costs of the American **merchant marine**—but not yet (p. 784).

HOME

HOT WAR

The Conservative party may be facing its toughest internal conflict since 1846—this time about Europe (p. 749).

The **Trades Union Congress** is too busy fighting the Government to sort out its own inner troubles (p. 757).

Some **labour disputes** this week illustrate what the public, rightly, thinks is wrong with the unions (p. 757).

A row is brewing over rents in Dundee's public housing—at 7s. 7d. a week (p. 771).

COLD COMFORT

Counterdrift is the latest jargon word in the debate on how to make Britain's cities habitable (p. 769).

The railways are attracting nostalgists whom speed cannot compensate for the lack of them (p. 754).

The British are spending more on **food**—but are they eating better? (p. 758).

Broilermen are doing a little better out of **cheap chicks** (p. 839).

Scum should be cut by new progress in **detergents** (p. 836).

A puritanical revival is chasing Britain's freelance entertainers from the streets of London (p. 762).

HARD CASH

Thursday's big Government loan of £500 million raises the question whether the Treasury and Bank of England really know where they want to go in monetary policy (p. 825).

Why not devalue like the French, asks a pundit from the anti-Establishment National Institute? (p. 829).

The President of the British Association fears that Britain's spending on international **scientific research** might harm the efforts made at home (p. 829).

Exports have risen, but exporting is still not fun for all (p. 836).

ROUGH LESSONS

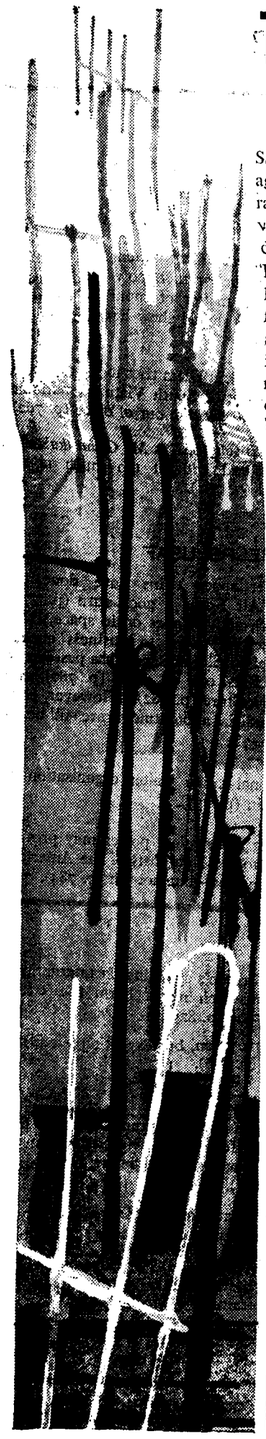
Aircraft manufacturers must take a firm grasp of the few straws offered to them by technical progress and commercial opportunity (p. 827).

A new international school in Wales is the latest in a series of valuable educational experiments (p. 770).

Probation hostels can only fulfil their promise in retraining young offenders if their staffs are properly paid (p. 761).

Who stays on at school? (p. 758).

Detailed contents on page 749



TV: dominant selling medium

Since its inception, only seven years ago, commercial TV has grown rapidly into the most powerful, vigorous advertising medium. Today it is seen in over 70% of all British homes . . . and in those homes it is proven two-to-one favourite channel. Popular coverage on this scale gives TV one of its main advantages over other media, particularly where mass over-the-counter sales are concerned. TV gains complete ascendancy as a selling medium when you consider that, in addition to its vast coverage, it is also *intrinsically vital and convincing*.

There are two main reasons for this. Firstly, TV is more *dynamic*. The selling message comes over with more intensity, more immediacy. You can demonstrate, dramatise, drive your point home. This direct approach is what gives TV commercials their impact and consequent effectiveness.

Secondly, TV advertising reaches the viewer at his most relaxed, his most receptive . . . he is at home, watching a programme he has chosen to watch, *a programme he enjoys*. It is hard to imagine a more favourable setting for putting over a sales argument successfully.

Combine these two elements—the urgency of TV, and the viewer's receptive frame of mind—and you will see why TV achieves much more effective communication than any other medium. And effective communication of product name and product advantages is, without any doubt, of the utmost importance in building mass sales.

The Question of Cost

TV has a reputation for being expensive in comparison with other media. But what are the facts?

Cost of reaching 1000 adults		
National Press	Weekdays	12/4
	Saturdays	
	Sundays	14/8
Cost of reaching 1000 adults

	Saturdays	6/9
	Sundays	7/9

In terms of cost-per-thousand, TV space is just about half the price of national press space. So, measuring cost by concrete returns (i.e. coverage, recall, *and sales*), TV is easily today's best buy.

The TV Contractor

So much for TV in general. Now let's see what a leading television company, ATV, has to offer the potential advertiser in more specific terms.

ATV's coverage

London Area—9,437,000 viewers. Midlands Area—5,575,000 viewers. This coverage accounts for 39.8% of all independent TV viewers.

The London Area

The weekend audience in the London Area, is, from the sales point of view, the most important in the entire UK. Here ATV provides peak *family* viewership with an exceptionally high conversion-to-sales rate.

The Midlands Area

This immensely prosperous, high-density consumer market is served by ATV from Monday to Friday. If a product is on ATV, its name will be on everyone's lips when the vast bulk of buying is done.

Test-marketing

ATV's Midlands Area is ideal for pilot marketing schemes, phased launches etc. Extremely well defined, it provides a watertight national cross-section of age, income, occupational and socio-cultural groups. Such a well defined cross-section is, of course, essential to successful test-marketing.

Ensuring consistently high ratings

ATV's progressive, audience-orientated programming ensures optimum audiences during all time segments. For example, the new London Autumn schedule, which starts September 29th, includes ten exciting new programmes, among them, The Saint, Man of the World, The Bruce Forsyth Show, Scarlett Hill, Broadway Goes Latin and 87th Precinct. In addition to these, proven favourites like Cheyenne and Ghost Squad have been strategically repositioned.

Advertisers get every support

Behind the scenes at ATV is a whole string of specialist departments providing extra services for ATV clients. Ranging from media assessment, through copy testing, to merchandising facilities, these services ensure that ATV clients get full value for every penny of their advertising appropriation and that all campaigns realise their full sales potential.

If you'd like to know more about advertising on TV and on ATV in particular, please contact Patrick Henry, Sales Director, Associated Television Limited, 17 Great Cumberland Place, London W1.

WALPAMUR REGISTERED TRADE MARK

Trial by collision

This is the Walpamur cylinder impact test. Two painted cylinders, each mounted at the end of a long steel pendulum, swing together like trapeze artistes and collide with terrific force. The resulting impact is roughly equivalent to that caused by a domestic washing machine being pushed sharply against a wall. It is testing such as this —ruthless and ceaseless—which conserves the quality of Walpamur Quality Paints. And it is thus that The Walpamur Company, with its overseas factories and multiplicity of branches, maintains its position of pre-eminence in the world of paint.

Not Since the Corn Laws?

IT is not normally in the nature of the Conservative political animal to split sharply and abruptly down the middle. Unkind critics may say that it is generally too soggy a mass to do that. But the approach of the Commonwealth Prime Ministers' Conference on September 10th confronts the party with what could, potentially, be its most explosive internal situation since the repeal of the Corn Laws in 1846. Most Tory MPs are still finding it conventional to say that they will not decide whether Britain should enter the common market until they see what terms will be made available for the Commonwealth. Frankly that, by now, is mainly an excuse by people who do not want to make up their minds. For Commonwealth trade and agriculture, the maximum terms that Mr Heath can secure—and those that he cannot—became pretty clear last month. When the Commonwealth Prime Ministers meet to consider them, there seem to be four possible outcomes.

The first—and probably the very best that Mr Macmillan can hope for—is that the Canadians and Australasians give what can be construed as a grudging acceptance of the broad lines of negotiation that have now emerged. If that happens, one's guess is that Britain will become a fully-fledged member of the market before many more months are out. The second best thing would be if the communiqué and the Prime Ministers' parting speeches after the conference said nothing very clearly at all; there might be no specific acceptance of the emerging terms (not even a grudging one), but also no specific and united opposition to them by the white dominions. In that case, the odds on Britain's entry into Europe would still be pretty high.

The third—and much bleaker—outcome of the conference would be if the white dominions were to say that they could approve the terms only if Mr Heath asked Europe for certain other stated concessions which he will not in fact be able to get. The fourth and worst outcome would be if the Canadians and Australasians decided to call the emerging terms quite inadequate, and proceeded to protest and campaign insistently against them. Between these four possibilities there are any number of gradations, but within the next two weeks observers should be able to point to one of them and say that it is closest to what has occurred. If the worst course, of flat Commonwealth opposition, befell, and if Mr Macmillan still decided to try to press on into Europe, how many Conservative MPs might refuse to follow him? This is the question on which all might depend. Unfortunately it is also a question to which the answer might conceivably depend on the outcome of a complicated game of bluff.

Although nearly all of the Tories' 360-odd MPs have been saying for months that it would be permissible to join Europe if the terms were right, there are between 40 and 50 of them who are privately hoping that it will soon become more respectable to say that the terms are not right. At bottom, they would like to do something—which is very far from saying that they are ready to risk everything—to keep Britain out; they can fairly be called the inverted Micawbers of the present stage of British history, eagerly waiting for something to turn down. The thing that might give inverted Micawberism its cue is an unfavourable reaction by the white dominions at the Commonwealth Prime Ministers' Conference. (What the Asian and African dominions say will have a smaller political effect: not all of the potential Tory rebels will regard it as an additional point against the Brussels negotiations if they learn that Mr Nehru has been disappointed by them.)

The comparison with 1846 must not be pressed too far. This is no case where—to quote Trevelyan on the Corn Laws—a "combustible squirearchy on the back benches" sits ready to be ignited by the hand of some irresponsible genius such as the young Disraeli. Alderman Sir Cyril Black and other Tory MPs of his ilk are not combustible men. The sort of Commonwealth protest most likely to mobilise them would not be a too shrill cry of complaint (the former Canadian Finance Minister, Mr Fleming, tried that at Accra a year ago, and it boomeranged), but a deliberate, dignified, sad, slow shaking of heads by Mr Menzies and Mr Diefenbaker. Even then any Tory revolt would probably be at first a backstairs affair, rather than a loud striking of attitudes on public platforms. What Mr Macmillan has to fear after the Commonwealth conference is probably not assault by Tory backbench philippics, but a steady stream of stately démarches, passed on through the whips, saying that if he tried to press into Europe despite Commonwealth objections some 40 or 50 Tory MPs might deem it their duty to act to check him.

THERE is some danger that determined action by a band even as small as this might succeed. If this meant that Parliament would thereby be expressing its majority will at one of the most awkward stages of British history, there would be no democratic right to complain about it. But the paradox is that by such backstage manoeuvring Parliament would not be expressing its free majority will. While there may be up to 50 Tory MPs who are instinctively opposed to joining the common market, there are certainly more than 50 Labour MPs who are instinctively in favour of going into it. If Mr Macmillan felt that Mr Heath had secured satisfactory terms from the Brussels negotiations, then in a free vote these Labour joiners should theoretically be counted upon to outnumber the Tory separatists. Unfortunately—especially if there is a whiff of Tory revolt in the air—it is unlikely that Mr Gaitskell would encourage anything like a free vote; he would almost certainly strive to table a motion with some form of wording which would enable his pro-European Labour supporters to vote with the rest of the Labour party and the Tory insurgents in a natural but politically-motivated effort to do the Government down.

The danger, in short, is of a threatened alliance between a Labour party seeking a general election and Tory reactionaries seeking disentanglement from Europe. It may be said that, in the last resort, it is singularly unlikely that as many as 50 Tory MPs would join such a strange alliance, since a forced general election is the last thing they want; and, as the Conservatives still have 100 more MPs than Labour, there would need to be just over 50 Tory desertions to destroy the Government's majority on this issue. But the last resort is a ditch which Mr Macmillan, on his side, would equally want to avoid. If he were confronted by a really frightening stream of warnings from the whips, then it is possible to envisage the Cabinet's European aspirations relapsing, not perhaps into open and admitted retreat, but into the spirit of the new decalogue: "Thou shalt not kill, but needst not strive officiously to keep alive." At some period of difficulty in the tiring negotiations at Brussels, when otherwise Mr Heath would have been instructed to make new efforts to resolve a deadlock, the effort to enter Europe might instead be called off, and the whole venture allowed to drop, while ministers explained to the country and to each other that the terms offered had proved less acceptable politically than had been hoped. In that event, a relatively small band of anti-European Tory MPs would have won their game of bluff.

ALL this speculation is based on a very long string of hypotheses. It is fortunately pretty unlikely that they will all come to pass. But it is time to start thinking of a strategy to combat the possibility of their doing so. The first hurdle will be the Commonwealth Prime Ministers' Conference; it is still possible to hope that this will go much better than some of the gloomiest observers have forecast. But if it does not, if the gap between Britain's views and the dominions' views remains wide, then the time will have come for ministers, if they still want to enter Europe, to go barnstorming through the country. As an independent Commonwealth country, with a right of independent decision, it is for Britain to decide whether it is in its interests to go into Europe; if Britain thinks that the safeguards it has secured for the Commonwealth are good enough, then it should say so—even if the Commonwealth countries disagree—and announce loudly and determinedly that it will try to march on ahead.

The Government no doubt fears that there might be some uncomfortable consequences if it did this. Whatever one thinks about the terms which Mr Heath appears to have negotiated for the Commonwealth, there are several other parts of the Brussels negotiations that are still very unclear; they include the Six's future relations with the other EFTA countries, the financial burden that would be assumed by Britain under the system of food import levies, and several other unresolved questions of great political and economic importance. If Britain were to show itself too eager to enter Europe, it is sometimes argued, it would be less likely to secure satisfactory terms on the matters still outstanding; and there might also be a danger of some back-tracking by the Six on matters affecting the Commonwealth that have already been half-agreed. This argument almost certainly underestimates the strategic advantages of showing enthusiasm, and overestimates the tactical advantages of appearing to be an unpassionate wooer. If Britain came out of the Commonwealth conference pleading that it was faced by new political difficulties, and brandishing a whole new shopping list of additional points that it said it wished to reopen, we would not be likely to get better terms on the subjects that remain to be discussed or re-discussed, but might turn the whole tone of future bargaining against us.

The Government's second objection may be that those who are calling on it to be ready to "wage an open campaign after the Commonwealth conference" misunderstand how best the Tory party can be influenced; the Tories are said to be the sort of party that can more easily be converted by stealth than by loud oratory. But the point is that, after the Commonwealth conference and in the circumstances envisaged here, General Stealth might be about to turn traitor. Tory revolts are much more likely to breed in the dark than to flourish in the open; when they are fought against in the open, they can often be beaten by being made to look less respectable. This has especial relevance to the tactics that should be pursued at the Conservative party conference at Llandudno on October 10th. To judge from some past Conservative conferences, there might be a temptation to hold the common market debate at Llandudno on some constituency resolution which appeared fairly innocuous to both sides. This would be a mistake. It would be much better to invite a deliberate vote, as was done last year, on the clearest possible issue between the anti-common market group and the rest. If this were done, then, as also happened last year, it is highly probable that there would be a very large majority in the platform's favour; and that on the next day there would be a healthy thud of heavy bodies falling off fences on to the Government's side.

Looking Beyond Khrushchev

The contradictions of Soviet policy will be left for a new generation to resolve

FRANCE without de Gaulle, Germany without Adenauer, Spain without Franco, the Balkans without Tito, and, for that matter, Britain without Macmillan, are all subjects of speculation; we peer into the crystal for the possible shape of Europe after the elderly rulers have gone. What about Russia after Khrushchev? Doubtless the irrepressible Mr N. S. Khrushchev, now 68, has no thought of retirement; he may see himself organising the celebrations of the fiftieth anniversary of the revolution, in 1967. But he has led a more strenuous life than his western counterparts and—how time is flying—this is his tenth year in or near the centre of the Soviet political stage.

Stalin's death in March, 1953, was quickly followed by a division of his offices, Mr Malenkov—after little more than a week in charge both of the government and of the party secretariat—relinquishing the secretaryship and remaining prime minister. This left Mr Khrushchev as the leading figure in the party secretariat, a position officially confirmed in the following September. When, in February, 1955, Mr Bulganin replaced the disgraced Mr Malenkov as prime minister, Khrushchev took first fiddle in the celebrated, though short-lived, B and K duet. Not till 1957, after the defeat of the "anti-party" coalition headed by Malenkov and Molotov, and the elimination of Marshal Zhukov, did Mr Khrushchev finally reach the top; displacing Mr Bulganin as prime minister in March, 1958, he united the two chief offices once more.

One can imagine a similar see-saw process happening again after he goes. Even now, however, the Soviet pyramid of power is no longer dominated by its apex as it once was by Stalin. What one is most struck by, looking back on Mr Khrushchev's climb to power and on his five years at the top, is the tacking and veering of his policies. Eliminating Mr Malenkov in the name of the sacrosanct priority of heavy industry, he forthwith became the consumer's champion himself. Until this year he contrived to appear as the benefactor of peasants and town-dwellers alike. The sharp increases in meat and butter prices on June 1st have been a blow to his popularity with the urban masses. He has tried and failed to draw resources away from the defence sector. The marshals had helped Mr Khrushchev to power; once in the seat, not only did he start to preach nuclear disarmament, but he actually began to put into practice a reduction of the huge land forces. Announced in January, 1960, this was reversed in July, 1961, though even then he said the reversal was provisional. By now he is landed with an increased bill for both the nuclear and the conventional forces.

Defence leads to foreign policy. At first Mr Khrushchev accused his opponents of exaggerating the damage that the Soviet Union must expect to suffer in war. Next, he himself became the itinerant salesman of peaceful co-existence, the champion of American friendship, the contact man of world politics. This period ended with the failure of the Paris summit meeting in May, 1960. Since then, the Berlin crisis, always in suspense, never entirely quiescent, has been a symbol of Soviet hesitations.

The zigzag course is reproduced in many fields of domestic policy, ranging from literature and education to industrial management, where a drastic decentralisation had to be followed by a certain measure of regrouping. The reasons for this chopping and changing are many. There are external factors, such as western reactions, and Chinese reactions, to Moscow's moves. There are domestic influences: Soviet governments are not made or unmade by the citizens' votes, but the leaders do have to take the public mood into account, and to a growing extent. Pressures from below add to the play of forces, the shifts and realignments within the inner circle of politics. Mr Khrushchev has not inherited Stalin's omnipotence.

Half peasant, half townsman, talking garrulously, with muzhik wisdom, on intricate problems of a complex, modern economy, Mr Khrushchev is a living image of his country in transition, of a Russia with one foot in the last century and one foot in the next. What has enabled him to keep his place at the top has been the fact that he did grasp Russia's need for change after Stalin's death. This has been his strength. At the same time his mental make-up, his upbringing and his self-interest all make him averse to a too rapid pace of change. There is an inner contradiction, which the ambiguities of his attitude towards his dead master illustrate. Nobody has contributed more to the destruction of the Stalin myth than he has, principally through two notable speeches: the "secret" indictment at the 20th party congress in 1956, and the open one at last year's 22nd congress. But each time, after stirring

up the forces of change, Mr Khrushchev has shown an anxiety to damp them down again, as if frightened of what the "thaw" might set in motion.

SINCE Mr Khrushchev is the man of transition, his departure from the scene, when it happens, will not necessarily have the cathartic effect that Stalin's had. It is the end of the Khrushchev era that will be interesting; and there is no certainty that it will coincide with the end of Khrushchev. A look at the composition of the ruling Soviet body, the party presidium, suggests that at least half of its twelve full members are likely to share Mr Khrushchev's complexes and inhibitions. The oldest, the aged Finnish veteran, Otto Kuusinen, was a member of the executive committee of the Comintern at a time when the young Khrushchev is unlikely to have had the faintest idea of international problems. Nikolai Shvernik, now head of the party control commission but former trade-union boss and former Soviet president, has a much longer party past behind him than Khrushchev. Even Anastas Mikoyan, the first deputy prime minister, though a year or two younger than Khrushchev, attained party prominence much earlier. If eminence under Stalin is taken as the criterion, two men must be added to this group. Mikhail Suslov (59), now in charge of ideological and inter-communist matters in the secretariat, was an authority on those subjects before Stalin's death. Alexei Kosygin, the other first deputy prime minister in charge of economic departments, was commissar of the textile industry before the war.

By age alone, Mr Kosygin would be grouped with the other half of the presidium, the men in their fifties, who served their time under Stalin but rose to the top after he died. The leading figure of this generation is Mr Frol Kozlov (54), who made his career within the Leningrad party. Between March, 1958, and May, 1960, he held Kosygin's present job in the government. Since then, he has been second to Khrushchev in the secretariat and as such is well placed for the succession. Men of this generation were relatively minor figures during the bloody purges of the nineteen-thirties; attempts to dig down to the roots of Stalin's crimes do not perturb them unduly. Essentially they are administrators, party overseers of economic life. Still, they were brought up in the Stalinist climate, where the party was monolithic, no discussion was tolerated, and all decisions came from above. The same must be true of the few younger people within the leadership or on its threshold. Dimitri Polyansky, at 44 the Benjamin of the presidium, started his career in the Ukraine but climbed the ladder in the Russian republic. Alexandr Shelepin, his contemporary, reached the secretariat through the chairmanship first of the communist youth organisation, and then of the Committee for State Security.

The shortage of really young men among the leaders remains striking. Gradually, the way opened to young men by the October revolution in 1917 was closed as the Soviet political system became formalised and rigid. Since Stalin died, many grizzled heads have tumbled—but still not enough to bring the younger men to the very top. It is in the middle posts that the reshuffle has been most complete. According to an article by Mr Kozlov in *Kommunist*, discussed on page 1221 of *The Economist* of June 23rd, most of the local and regional party leaders are new men and are in their thirties. No doubt they are also men with more formal schooling than their predecessors had. Soviet citizens now in their thirties, born and bred after the revolution, started their active political life in the post-stalinist period. They are the *nouvelle vague*; when they get to the top, modern Russia will begin.

A little, not very much, is known about this coming generation. They are better educated than their elders, less frightened and, therefore, more demanding. The poet Yevtushenko has put one of their dominant feelings plainly enough:

> The town remembers its black crows.
> It remembers the searches, investigations, and arrests. . . .
> The town does not remember its past in vain. . . .
> It will not let the dark clouds return.

REJECTION of the past implies a quest for ways to prevent its repetition; and indeed there are signs of such a search, as yet timid, for a less arbitrary, less secret and more rational style of government. Sooner or later this pressure must have its effect. The pressure for better living, more and better leisure, and equality runs parallel and will give Russia's next generation of rulers little rest.

In Russia's foreign relations a twofold effect looks likely. The challenge to the West may become more formidable. Those western diplomatists who were accustomed to Stalinist immobility found the greater manœuvrability of his heirs hard to handle. When Mr Khrushchev's place is eventually taken by men who are less flamboyant, but also less inhibited and more coherent, this may be another shock. The new men, when they come, will have the additional advantage that, as time strips Russia of the repellent vestiges of Stalinism, the Soviet Union may present a more attractive image to the outside world.

The Soviet diplomatic challenge of the future, as it becomes more subtle, may also become less alarming. A government that is exerting itself, in a collected and intelligent way, to meet the wishes of a more articulate and exacting public may have a stronger incentive to stop the ruinous arms race. Popular support for "peaceful co-existence" should grow with material prosperity; so, too, should the leaders' self-possession and their confidence that communism really can, as is now asserted with more emphasis than assurance, prevail peacefully.

Probably, then, the real contest between the western and Soviet systems has yet to come; the events of the present Khrushchev interlude simply decide the terms in which it is going to be fought. A transitional regime brings the issues out into the open, but lacks the capacity to provide solutions. Thus the questions that will face the men of the new generation when their turn comes are before them, plainly enough, today. They will have to find the answers; that is, they will have to devise methods of government, and policies, suited to a modern Soviet state.

Islands in the Sun

Two Caribbean colonies are now independent; what happens to the rest?

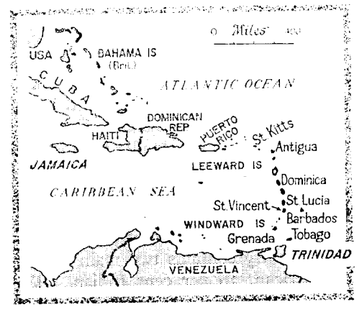
LOOKING back over a desert of memoranda and conferences, West Indians sigh to think of the time and spirit that were wasted on the federation that did not come off. Suspended in a timeless dither between the two conflicting trends—the ambition of dependent territories, however small or weak, to run their own affairs and the self-protective urge of men and nations to draw together in groups—the Caribbean partners failed to breathe life into their enterprise. But in the past year, since federation was knocked on the head by Jamaica's decision to secede, things have moved smartly. At the beginning of August, Jamaica became an independent country within the Commonwealth; Trinidad and Tobago followed suit yesterday. The remaining partners, Barbados and the Windward and Leeward islands, have plans for a new and closer federal union between themselves. But although the larger federation is dead, the economic and social problems that made it seem a good idea in 1958 are still alive. The difference is that outsiders can no longer cushion their concern at Caribbean misfortunes by the cobwebbed myth that adversities, if shared, will disappear.

Federation was supposed to conjure a viable unit out of scattered pieces of the Caribbean. The trick failed, and, in failing, revealed how illusory its prospects were from the start. Now different magic is in the air. The question is whether Trinidad, the wealthiest, most energetic, and most promising of the territories, will be able to provide a workable nucleus for a union of the islands of the eastern Caribbean. This, as one permutation follows another, might eventually lead to some form of all-embracing federation. The warm waters of the Caribbean wash the sands of wishful thinking.

When federation collapsed, Dr Eric Williams, Trinidad's prime minister, offered the smaller islands the chance of latching themselves on to the unitary state of Trinidad and Tobago. The offer still stands but is one that seems to expect a refusal. Grenada (the colony whose constitution was suspended a few months ago on grounds of financial maladministration) has come nearest to accepting, but may be frightened off by the prospect of becoming another Tobago. Described in the official British handbook as an "unspoilt tropical island," Tobago is Trinidad's very poor relation. And none of the island rulers are prepared to step down from their tiny castles. In the words of the *West Indian Economist*:

> Unfortunately, the habit of treating West Indian islands as if they were sovereign states, and of taking them seriously . . . has created the feeling that they have an inalienable right to misgovern themselves . . . the whole policy of the British Government for years has tended to strengthen the position of such local bosses.

One of the reasons for the federation's wearisome travails was the relentlessly grabbing attitude of most of the small islanders. Caught in the familiar quandary of those who are unable to reconcile their appetite for independence with their hunger for security, they bombarded Trinidad and Jamaica with demands, but balked at conceding any significant amount of their own authority. It may now be the turn of Barbados to be pushed into unenviable leadership. The outline for the new "West Indies Federation" contains plans for a central government in Barbados with more power than the centre would have had in the defunct Federation of the West Indies; tax laws and tax collection, for instance, come under federal control. All depends on whether, when it comes to the point, the politicians are prepared to abandon their island charade for federal politics. A string of islands with 700,000 people and eight full-dress parliaments would be absurd. To link them closely together would be tidier, more economical; but, even if it were achieved, it would provide the beginning, not the end, of an answer to their problems.



Trinidad is far less able to detach itself from the worries of the small islands than Jamaica, which, by virtue of distance and tradition, can fairly easily forget about the east Caribbean. Absorbed in their own history and the drift of their own complex society, Jamaicans when they look outside turn to Britain, America or Africa, not to the other islands which few of them have visited and few want to visit. Trinidad, by contrast, has become involved by proximity, immigration and inter-marriage; many of Trinidad's politicians have families living in the smaller islands. British traditions have not flourished in Trinidad as they have in Jamaica; American tourists have not invaded the island; Dr Williams, sour after his squabbles over the American base at Chaguaramas, is not the man to emulate Sir Alexander Bustamante's bubbling flourish of pro-American sentiment. Trinidad's sentimental link with Africa is less strong than Jamaica's, partly because many of the country's negro ancestors did not come straight from Africa but reached Trinidad indirectly by way of other Caribbean territories; and Trinidad, unlike Jamaica, has no history of slave revolts to burn into negro memories. All the islands have different characteristics, but for most of them (Barbados is one exception) Trinidad with its mixture of French, Spanish, British, Indian and Chinese cultures would be far more familiar ground than remote Jamaica.

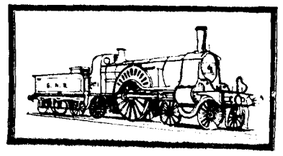
The small islanders come to Trinidad when they can. When inter-island movement was unrestricted between 1958 and 1961, 5,000 immigrants are reported to have come to Trinidad from Grenada alone. Compared with the other islands, and with many countries on the Latin American mainland, Trinidad holds out a splendid promise of prosperity. Its oilfields provide a source of relatively cheap power and the capital for getting on with its agricultural and industrialisation programmes. Communications are uncomplicated. The educational standard is much higher than, for instance, in Jamaica. If the planners and the politicians do their work, Trinidad could benefit much more than it does now from its closeness to Venezuela. Above all perhaps, Trinidad has, in Dr Williams, a capable, honest and forceful leader. But this

glitter, such as it is, appears brilliantly gilded from the dim perspective of the neighbouring islands. Seen in a starker light, a high proportion of Trinidad's 800,000 people are already underworked or out-of-work; an influx of hungry newcomers could not, at present, be happily accommodated.

If, in these circumstances, Dr Williams should decide to make his offer to the smaller islands more inviting, he is much more likely to be influenced by political motives than by economics or sentiment. Unlike Jamaica, where complex social pressures keep the issues cloudy, Trinidad's social tensions are crude, on the surface and cut violently into politics. The country contains two main ethnic groups: 44 per cent are African, 36 per cent Indian. The Indians are, on the whole, better off, and the growing tendency for them to spend rather than to save their money has increased the antagonism between two groups, who rarely mix. Inevitably, voting has been largely along racial lines. However sincerely Dr Williams, who is of African descent, may deplore this trend and try to short-circuit it, the political arguments in favour of bringing more negro voters into Trinidad might, one day, become self-evident.

A Trinidadian with, say, an Antiguan father and a Barbadan mother will feel himself a West Indian. But it is difficult to say how much meaning the concept of a "West Indian personality" has for people who do not illustrate it thus in their own origins. Anti-federalists will say it has very little. Why then should so many Jamaicans, however much their leaders deny it, feel guilty at having acted selfishly in destroying the federation? In fact, if Jamaicans should feel guilt at all, they should probably worry more about their contribution to the long process of attrition and less about the knock-out blow. Before the federation collapsed, the bond between the partners had become artificial and ready for shaking off. The interests of good housekeeping urge a new union of some kind among the smaller islands of the east Caribbean. But the magnetism that might in the end draw West Indians together, and so inject vitality into a larger Caribbean grouping, is still much too feeble a force to counter these lively insular ambitions.

The Steam Romantics



The simple lure of running a railway, the aesthete's satisfaction in the presence of a Gresley streamliner, even the humble spell of an old GNR 4-2-2 add up to a new nostalgia—and a growing cult

THE born conservatism of Anglo-Saxons is everywhere evident: the aged, of whatever description, are revered; change, whatever we may be told, is for the worse. This conservatism finds expression in a passion for the preservation of the *status quo ante*—sometimes very *ante* indeed; or if not mere preservation, which kills the beloved object for exhibition, then restoration, as if by the bringing back of car, ship, windmill to its original grandeur we could bring back, too, something of the legendary goodness of the age in which it flourished.

Since the British environment has been dictated largely by the industrial revolution, it is natural for much of the restorative energy to be directed towards machinery, the golden age of which is, by a law of human nature, never now. On ancient automobiles, traction engines, fairground roundabouts, ships and cotton gins, on machinery in its compulsive infancy, our love is lavished. Psychologists may ponder the rise of this mechanistic shintoism during a period of social change and national resettlement, on the prevalence among its adherents of naval and military men, of die-hard Tories, and of clergymen; and they may theorise on the dressing-up, in nostalgic or outrageous clothes, which so often accompanies the passion.

For the passion itself, there are signs that it is being transferred from old motor cars (which no longer carry much *cachet*) to other artifacts; that, in particular, we may soon see it developing along the lines Dr Beeching is so ruthlessly and necessarily closing down. The train bands have existed for a long time, but simply because of the boom in their hobby (which many a veteran actively resents) none of them is able to give a real estimate of the steam-god's current British devotees. They range from small boys taking engine numbers to stiffish gentlemen with stopwatches riding regularly nonstop to Edinburgh; from Bradshaw manipulators calculating with extreme finesse a day-trip to Cambridge via Manchester (and whose consternation was terrible to see on the death of that publication) to undergraduate societies on a Sunday run in a rare branch-liner.

Their several enthusiasms are catered for, and have long been ministered to, by fellow worshippers at the firebox door, who produce periodicals (there are ten or more, with a combined circulation of well above 300,000), books, postcards, albums, models, manuals and even novels for devoted consumption. The fancy is very wide, its ramifications as complex as those of the railway itself.

Lately, ambition has begun to leap: not content with mere devotion, cultists now aspire to control, even ownership, of the *deus in machina* itself. Every branch-line which is closed under financial pressure produces its band of would-be reopeners, but very few of them get further than inquiring of the British Transport Commission just how much it will cost them to run their railway. The answer is likely to stagger them, and to knock their incipient private line off its feet.

Some have survived the shock; but they have been groups which, from the beginning, have taken a conservative view of what they could expect, and a very liberal one of how much money, time and sheer sweat it would cost them. The first, and best-known, of them is the Bluebell line, which runs summer week-end trains, from Horsted Keynes to Sheffield Park, in Sussex, filled with devotees too passive themselves actually to paint a signal-tower, swab a waiting-room floor or grub up weeds from the permanent way in their spare time; and with tourists, connoisseurs, in a conforming Britain, of the quaint.

The Bluebell line (thus baptised by the press) was first closed early in 1955; but a canny local, a Miss Bessemer, invoked the line's original enabling act and compelled BTC to reopen the service, which finally ended in 1958. The preservation society began its operations almost immediately afterwards, and 18 months later secured, for £11,250, a five-year lease on the five-mile length of track and the option of buying it at £34,000, with its buildings. Now in its third season of operations, it has eight locomotives, ten coaches and a high reputation among both cognoscenti and hoi polloi. Its service is a serious and regular one; and it is better patronised than ever it was under British Railways (92,000 passenger journeys in its first season). It pays its way, to Dr Beeching's acknowledged pleasure, on almost entirely voluntary labour, not all of which can hope to attain the Valhalla of the footplate. In addition, it has brought good (perhaps line-saving) custom to the BR service with which its railway links at Horsted Keynes.

SOME others are, or may soon be, as successful: the Festiniog and Portmadoc, the Tallyllyn, and one or two more. Most of these belong to the Railway Preservation Association, which is strictly on the side of "real" restoration (that is, a full-scale undertaking providing a passenger service) and against both the unwordly romantics who flock briefly to the call of some misguided enthusiast, melting away as if by magic when the work becomes apparent, and those who would buy their well-loved, familiar chuffer to let it rot swiftly away in the children's playground. They are in deadly earnest about what one hesitates to call their hobby, as well they might be: they are spending real money, after all.

The price of land and track may be anything up to £15,000 a mile; locomotives, sold at scrap value (but in as good a condition as BR can manage without being foolishly philanthropic), may cost between £700 (for a small tanker) and £3,000 (which is mentioned among enthusiasts as the price of the famous "Flying Scotsman," now available); restoration may cost any sum the enthusiast can raise—perhaps £150 to £500 for a simple overhaul and livery-painting to £4,000 for a complete overhaul (which BR give their engines every 100,000 miles or so). This sheer spending of money is a separator of mere dilettantism from true devotion. There is only one personally owned standard gauge locomotive (it runs on the Bluebell line) in the country, and the suggestion that this sort of ownership may become more popular is not countenanced any more than another suggestion that locomotive preservation, even by groups, may become what the revival of vintage cars once was. On the face of it, this is plausible: the most lavishly restored engine, left without its customary housing and care, would be worth nothing at the end of a year.

Dr Beeching himself, the arch-fiend of the enthusiasts' demonology, is sympathetic to preservation of the serious sort—to exclusiveness, in fact: he has spoken out against the "overdoing" of enthusiasm to the point at which the market is spoiled—or, perhaps, at which it might be deduced that a concealed denationalisation had restored a profitable, if voluntary, service to too many unremunerative branch lines, when there would be a public outcry. BTC itself has somewhat ambivalent feelings about preservation: it maintains three museums, full of pretty and important things; but, perhaps for the fear that the public might still deprecate the spending of money on preservation while its transport system was cut from under it, the commission will say nothing about how much it spends in this cause. The real reason for this reticence could even be shame: for the sum allotted is said to be so niggardly that, recently, a locomotive scheduled by BR for preservation could not be handled by the Clapham museum, whose cash requirement for this work is now being collected, as a gift, by enthusiasts.

This acceptance of charity is a humiliation to be borne only by dedicated men, on whom BTC may be thought to trade; for it knows, as others with the train bug do, that its staff are enthusiasts first and stokers, drivers, sleeping-car attendants, general managers and porters a poor second. There is something about a steam railway, a spirit, a personality, that gets under the skin and makes one love it. Let nobody think that all who dote on trains are dotards.

The Economist

AUGUST 30, 1862

THE TICKET OF LEAVE

Since the virtual abolition of transportation we have had every three or four years a periodical panic in England on the subject of tickets of leave, and three or four able pens are now engaged in the leading journal in proving that the only way to prevent the garottings and violence which is rendering the London pavements unsafe in quiet streets after or even before sunset, is to abolish the ticket of leave almost if not quite altogether, and to compel the complete exhaustion of the sentence, at least in any case where there has been a second conviction, in prison. The ground on which this is put is that these felons almost always belong to the criminal *profession*, in whom the fascination of crime, or of that indolence and love of excitement which involve crime, is so strong that the hope of reformation for them is puerile,—and, again, that, even if it were otherwise, the reformation of the offender being an object quite subordinate to the protection of the public, the greater security to the latter in the additional years of the offender's imprisonment far more than counterbalances the loss of hope to the former. . . . The outcry against tickets of leave, as they are granted by our present Director of Convict Prisons, is natural and legitimate enough; but to infer thence . . . that the idea of the Irish system should be abandoned, and all the sentences unconditionally enforced without any hope of relaxation to their extreme limit, is really not to secure any new guarantee for the safety of the public, but to sacrifice wastefully one of the most powerful securities which can be taken for the public safety. Even on the strictest principles of probability, it might be shown that, in the case of a sentence for a limited term of years, to venture some portion of the temporarily preventive effect of bolts and bars, in order to gain the permanently preventive effect of a reformed disposition, is but prudent courage. The Irish system has shown how really prudent that courage is;—that the incentive of hope thus infused, does, if properly husbanded and accompanied by *careful* individualised instruction, change many apparently hardened criminals into good citizens. This being so, it is idle petulance to cry out against the ticket of leave in itself,—merely because under Sir Joshua Jebb's incompetent management it has added a fresh abuse to a system already exceedingly faulty.

NOTES OF THE WEEK

EUROPE

Dr Adenauer's Last Ditch

THOUGH the feeling that Dr Adenauer must go is growing steadily stronger in western Germany, there is clearly plenty of kick left in him, which he seems to be directing to a last mulish effort to keep Britain out of Europe. On July 25th the Prime Minister wrote to Dr Adenauer to seek his support for British membership of the common market at the crucial stage of the negotiations. Nine days later Dr Adenauer replied with his by now customary coolness, voicing the hope that the problems raised by Britain's entry would be solved, but emphasising that this must not upset the Treaty of Rome. Fortunately the coolness was not reflected in the behaviour of the German delegation at Brussels, who have been consistently helpful to Mr Heath in the negotiations. And on August 21st, at a meeting of the Christian Democrat parliamentary party executive, the Chancellor was forced, after a heated debate, to accept the virtually unanimous view that Britain should be given all possible help to get into the common market.

Yet in a television interview, recorded on August 24th and broadcast on Tuesday, the Chancellor threw more inflammatory material into the smouldering common market problem. When the upset in Britain over the correspondence was reported in Bonn, Dr Adenauer agreed to an attempt to get the film cut, but the attempt failed.

For a start, the Chancellor accused Mr Macmillan of double talk. The Prime Minister, he said, had told the House of Commons on July 17th that membership of the common market did not imply membership of a political union, but soon afterwards contradicted this in his letter to Dr Adenauer. The slap was a little unfair. Mr Heath and Lord Home have made it publicly clear that the British Government wants to join in political union once it has joined the common market. But the moral —to avoid verbal evasions—is one the Prime Minister might usefully remember.

What is really serious is Dr Adenauer's suggestion that while he would welcome Britain into the common market, there was no reason at all why this need imply British membership of a European political union. For some months now there have been indications that this distinction might be the last-ditch defence of those who want to exclude Britain from the new European system. The Chancellor is evidently digging in, in preparation for President de Gaulle's visit to west Germany next week. A press interview by Herr Schröder, released on Wednesday, is a demonstration that the foreign minister is still determined to do what he can to get Britain in. Dr Adenauer's other party colleagues, who understand perfectly what is afoot, ought now to make themselves heard as Herr Schröder has.

BERLIN

Indignation Not Enough

IF moral indignation could cure the Berlin sore, the last few weeks would have seen it over and done with. Unfortunately, diplomacy is also needed, and that is harder to come by. On August 24th the three western allies sent notes to the Russians voicing the "horror" of the civilised world at the "cold-blooded" killing of many people, including women and children, at the wall. On Tuesday Dr Adenauer followed up with a note, in calmer vein, to Mr Khrushchev, President Kennedy, Mr Macmillan and President de Gaulle, appealing to them to take steps to calm the situation in Berlin so that incidents like the shooting of Peter Fechter could not recur. Obviously these missives were meant to score points. Do they also provide an opening for renewed talks with the Russians?

There are some hopeful signs. The three western notes repeated a western suggestion made in June that there should be a four-power meeting to prevent the Berlin situation from deteriorating further. Dr Adenauer's note apparently avoided casting blame on anyone for the tense Berlin situation, and simply appealed to the four powers to work for a relaxation of tension in the city, meeting at whatever level they chose.

Signs that the mood in Berlin has once more become explosive make some kind of exchanges urgent. When the wall was built just over a year ago, there was a first wave of bitter indignation among the Berliners; then Herr Brandt, the western powers and the west Berlin police together managed to persuade them to be patient. The incidents of the past fortnight have brought a new wave, this time more desperate, with a suggestion of organised nihilism. Herr Brandt evidently feels he cannot hold the tide in check without going some way with it and using strong language himself. The western powers, their note implies, feel the same compulsion. As the tides of feeling flow on, the task of talking rationally with the other side becomes more difficult. But what else can bring an easing of communication between the two halves of the city, or any other form of live and let live?

CHINA

Happy Birthday?

IN Hongkong—the prime source of guesswork about what goes on inside China —the current guess is that the Chinese may explode their first nuclear device on October 1st, the thirteenth birthday of the communist regime in Peking. This is well within the period of "a matter of months" (subsequently defined to mean anything up to a year or more) forecast by an anonymous official of the United States Disarmament Agency on Monday. These nervous predictions probably spring as much from a determination not to let the first Chinese bang come as a surprise, as the first Russian one did, as from any real knowledge of Chinese intentions; but in fact China may well be in a position to let off a primitive device any time now. There has been a research reactor near Peking for the last four years, and perhaps others elsewhere, which could have produced the plutonium required for one or two rudimentary bombs. But it takes time, as the French know, to move on from this stage to the possession of a stock of deliverable weapons big enough to be a factor in foreign policy. In China's case, it will presumably take even longer to acquire modern means of delivery—unless Russia provides them.

The chances that the existing nuclear powers will sign an anti-testing treaty faded still further on Tuesday, when the Russian delegate at the Geneva conference rejected both the latest western proposals. But, even if such a treaty were to be signed, it is highly unlikely that China would subscribe to it. Mr Liao Cheng-chih, vice-chairman of the Chinese Peace Committee, said on Monday that China wanted a ban not merely on testing, but also on the manufacture and use of nuclear weapons; for good measure, he threw in a demand that "all countries in the Asian and Pacific regions, including the USA, turn this area into a zone free of nuclear weapons." The Chinese seem determined to push on until, sooner or later, in one way or another, they remove the current American nuclear monopoly in the western Pacific. When they do, the United States will have to re-examine its policy towards the whole area, not least the Formosa straits. It may be possible to protect Japan, and perhaps Formosa itself, under a two-sided balance of terror; but not, one suspects, Quemoy or the Matsus. The moment at which this reappraisal will have to be made depends on how much help the Russians give China in acquiring genuine nuclear status. In continuing to refuse help to France in its nuclear ambitions, President Kennedy is not being entirely disinterested.

TRADES UNION CONGRESS

Blackpool Prospects

THE Trades Union Congress which opens at Blackpool next week promises to be a pretty dull affair. In one respect this is no bad thing, for the sorts of congress that have done most harm in the past have been those in which delegates have been charging around on high ideological horses. The scene was finally set this week with the publication by the general council of their two supplementary reports, bringing up to the end of the summer political season their views on the two great debates on Europe and on the Government's incomes policy. Predictably, the report on Europe is vague, while that on the National Incomes Commission is utterly stonewalling and therefore really rather silly. It might be optimistic to expect that the debates will be much better.

On Europe, there will certainly be some speeches after Lord Beaverbrook's heart from the floor at Blackpool; and some strong pro-Europeans will no doubt muffle their enthusiasm under pressure from their juniors. The most eagerly awaited speech must be that of Mr Frank Cousins, who has been urging Mr Gaitskell and the Labour party to get down off the fence. He once seemed to be standing on the pro-European side of it himself, until he realised that anti-Europeanism was going to be the orthodox course for the Left. Mr Cousins has a vast talent for obfuscation—most notably exercised in his long refusal to say whether his version of unilateral disarmament did or did not imply a departure from Nato—and it could be intriguing to see how he deploys it to explain his vote this time. At the Confederation of Shipbuilding and Engineering Unions his transport union failed to vote at all on this issue.

The Nic debate, too, is likely to give the wild men the floor. The TUC's political anti-Toryism may prove too strong for the industrial pragmatism of some of its leaders; that is why it seems unlikely that any really top trade unionists will dare to speak up and make spectacular hay with the illogicalities of the general council's views on incomes policy. But, just possibly, there could be some surprises in the speeches, although certainly not in the voting, here: this could be a good test of the increasing self-confidence of the union realists who have come to appreciate, through the events of the past six months, that the movement's ideology, as well as its tactics, needs a stern shake.

One other debate might well deserve attention. Mr Cousins's progressive *alter ego* has tabled a motion drawing attention to the recent progress made by workers in securing fringe benefits, and calling on the general council to make a general inquiry into what can and should be done in this direction. It is precisely along these lines that the union's central organisation could gradually (too gradually) build up the all-embracing influence that it needs to have over its constituents, and that could eventually put it in a position to take over some coherent leadership. Mr Woodcock has himself appeared keen on this approach: with him and Mr Cousins pushing from the same side, the TUC might even make a perceptible advance.

LABOUR TROUBLES

Lightermen's Folly

THE activities of some member-unions of the TUC this week have not been calculated to gain that body sympathy on the eve of its annual meeting. First and worst came the strike in London docks by the 3,000 members of the Watermen, Lightermen, Tugmen and Bargemen's Union. Negotiations over the consequences for these men's overtime earnings of the big rise in wages and cut in working hours at the docks last May were allowed to drag on—perhaps as much by the employers as by the men—until the time arrived for their application this week. This argument about new overtime rates after a wage settlement is quite usual; but everyone, including the watermen's leaders, seems amazed that what had been supposed to be a technical controversy about adjustment has ended up in a blazing row. The other unions in the port have recommended that the dispute should go to arbitration, but the lightermen have stayed on strike.

Behind it all lies the declining position of the union in the docks. Its members' most important function is to handle the lighters or barges that receive cargo directly from a freighter, usually as a supplementary means of unloading it while most of the cargo is going out over the ship's other side which is up against dry land. But the increase in mechanisation ashore, and the use of lorries to shift goods round the docks, have diminished the barges' importance. Although the union has limited entry to the trade, there is often not enough work for all. The men's earnings are kept up to their present pretty high level by the demand for their services for rush jobs when ships want to be particularly quickly unloaded at weekends or in the evening. Hence the importance to lightermen of their overtime rates.

Another old-fashioned and restrictive group in London docks, the tally clerks (not a separate union, but a semi-autonomous section of the Transport and General Workers), caused the last major stoppage in London, helped by the unofficial support of many ordinary dockers. This time the tally clerks' trouble was quickly settled. The Transport and General Workers is stoutly pressing the watermen to return to work, and has accepted a settlement for its own people: its leaders have learned how deeply the trade union movement can be damaged by this kind of stoppage—even when, as now, it disrupts only a part of the normal traffic of the port.

Railwaymen's Error

THE same kind of unpopularity will attach itself to the National Union of Railwaymen soon enough, unless its leaders visibly do something to deter their members from pointless lightning strikes and from gross personal rudeness such as that shown to Dr Beeching this week in Scotland. The railwaymen threatened by closures have the asset of enormous public sympathy: they also have the best possible case for generous compensation and retraining if they do lose their jobs. But, as a practical point, if one wants to protest against the possibility of a line being closed down because of insufficient traffic, it is not very useful to do this by scaring away still more traffic through organising a strike; and, as a means of attracting further sympathy, to stand in front of television news cameras shouting "boo" at Dr Beeching can do no possible good in the world.

The last of the trade union idiocies that needs calling to the attention of delegates Blackpool-bound is a stoppage at a steelworks at Corby in Northamptonshire, where another squabble has broken out between the union of the craftsmen bricklayers who line furnaces with refractories, and the Iron and Steel Trades Confederation which recruits most of the other workers in the plant. Here again the union structure is proving itself not sufficiently flexible to absorb new problems without a period of spasm. The squabble is about who should instal the linings of a new sort of furnace, and the verdict of the ordinary silly-season newspaper-reader is likely to be that if the unions can't sort that one out they had better go back to school.

GHANA

Osagyefo Repentant?

THE deep, black secrets of African politics can never really be probed by outsiders: when they are Accra secrets, even Ghanaians are sometimes puzzled. On Tuesday President Nkrumah relieved his minister of information, Mr Tawia Adamafio, of responsibility for the civil service, and removed two deputy ministers. At the same time the minister of justice, Mr Aaron Ofori-Atta, was attacked by the

Ghanaian Times, which means by fellow-minister or ministers unknown.

On Wednesday Dr Nkrumah apparently decided that he had not gone far enough. Detention orders were issued against Mr Adamafio, against the executive secretary of the Party, Mr Cofie Crabbe, and against the foreign minister, Mr Ako Adjei. The actions against Mr Adamafio and Mr Crabbe seemed explicable to Ghanaians: this was Dr Nkrumah's way of putting the increasingly bumptious left wing in its place. But why then Mr Adjei, a moderate (it is assumed) and a man of very different beliefs from those held by Mr Adamafio and Mr Crabbe?

One explanation—and none can be wholly true—might be that Dr Nkrumah is so determined to curb the recent excesses of the men on his left that he has felt the need of a sacrifice from the Right to cover up his actions. The struggle within Ghana between the churches and the state that led to the expulsion of Bishop Roseveare on August 13th has not abated: the churches are still determined to resist the spread of Dr Nkrumah's totalitarian-minded Young Pioneers movement. Men like Mr Adamafio and Mr Crabbe have proved themselves equally determined to defeat the churches. (It is thought in Accra that these men used to deport first and ask the cabinet for advice afterwards). In such a situation, Dr Nkrumah might have made up his mind to avoid an open clash. Will he now go even further and invite Bishop Roseveare and other deported people back? The answer must lie deep in Accra's darkness.

AFRICA AND EUROPE

Neo-anti-colonialism?

Why, the Nigerian prime minister asked on Monday, does Britain want to drag countries like Nigeria into the European common market? The question might be better turned about: why do countries like Nigeria hesitate about seeking association with the common market, when not to be associated will mean getting on the wrong side of tariff barriers against most of their products?

The answer is that Nigeria, Ghana, and Sierra Leone are against association for political reasons; Ghana most of all. These countries believe that "associated status" is a French device designed to maintain French influence within its former colonies. In this, of course, the English-speaking Africans are quite right; those of them that deign to attend the Commonwealth prime ministers' conference will hammer the point home. Their mistake lies in their inability to make peace with one another long enough to band together (with, say, Tanganyika) and do something about it.

The best thing to do would be to accept associated status (this could hardly result in Accra voting the French way at the United Nations), and set about replacing the ties that bind francophonic Africa to France and Europe with new ties that would bind the African states to each other. The economic and cultural ties to France are not weakening. Guinea and Mali, which tried to break them abruptly, seem to be succumbing to the blandishments of president Houphouet-Boigny of the Ivory coast: it is possible that they will rejoin the group of French client states within Africa.

Nigeria has gone some way towards building up a counter-attraction: it belongs to a wide group of African countries, whose heads have met at Monrovia and Lagos, and which includes francophonic Africa. By working from within—and without real danger to itself—Nigeria could coax the French countries into sturdier independence of France; it might also guide them into diversifying their economies and reducing the degree of their economic (and therefore political) dependence upon Paris. But staying out will help no one.

FOOD CONSUMPTION

Chicken and Pig Fed

Although Britain is much richer than in the so-called hungry 1930s, one of this country's most remarkable perversities is that it does not seem, at first sight, to be eating so very much more richly than it did then. Add in all the juices and canned varieties, and the British still eat, a head, less fruit than before the war. Add in all the frozen beans and peas, salads and canned vegetables, and they eat only 5 per cent more vegetables. Despite the popular steak houses we eat less beef, but about one-sixth or one-seventh more potatoes and sugar. Waistlines still exist because of the fall in bread consumption. The average diet contains less carbohydrate than it did before the war—but, surprisingly, only 3 per cent less. It is still a great deal starchier than the American one and looks like remaining so, for the British seem much more resistant to change.

EATING IN 1961
(Weekly Food Supplies a Head)

	Actual quantity (in ounces*)	As an Index Prewar=100
Meat	36·1	107
Poultry	3·1	286
Fish	6·3	78
Milk (pints)	4·9	150
Eggs (number)	5·1	120
Cheese	3·1	115
Butter	6·1	80
Margarine	3·9	146
Sugar	32·6	114
Tea	2·9	102
Coffee	0·6	300
Flour	50·7	85
Potatoes	68·2	117
Vegetables	38·9	105
Fruit	36·6	96

* Except for milk and eggs which, as stated, are pints and number respectively.

The energy content of the diet has settled down at around 3,250 calories a day (on FAO standards) compared with 3,120 calories before the war, the big change being the extra protein derived from eating or drinking more dairy produce. But this is not a change that has come about in the last few years. Consumption of both milk and cheese has recently been standing pretty steady, well above the prewar level but some 5 per cent less than in 1951. Butter and margarine jostle with each other, but the total consumption of fats has risen only very slightly of late. Meat consumption has gone up by under 1 per cent a year since 1956, although it rose more sharply last year; fish consumption has dropped back to its 1953 level. Twice as much poultry is eaten as five years ago, and three times as much as before the war; but by weight this is still only one-half the amount of fish eaten and less than one-tenth of the total amount of meat. Beside chickens, the foods that have never had it so good include pork, eggs and coffee. No doubt much of the extra money going on food is directed towards better quality and more highly processed foods. Despite the competition from frozen foods, canning, except of fish, seems to be holding its own. Last year more canned fruit and vegetables were eaten than ever before.

SECONDARY SCHOOLS

Who Stays On?

Northerners often say that one reason for their region's industrial and social decline is that schoolchildren are "unfairly" given the chance of a much better education in the south. It is true that the north has a higher proportion of indifferent or downright bad school accommodation, and that the effect of the population drift has been to concentrate much new school building in the southern regions of rapid population growth. But the latest Ministry of Education statistics,* published last week, breaking down secondary education by local authority areas, do not substantiate the idea of a decisive cleavage along the Trent. In England as a whole, 17 per cent of 13-year-olds have grammar school places. Parents who want their children to have an above-average chance of going to grammar schools should think of settling in northern counties like Westmorland (where 27 per cent of 13-year-olds are in grammar schools) or Cheshire (26 per cent); they will not have the same chances in Essex or Kent. While some northern towns have a distinctly bad record (e.g. Bootle's 12.9 per cent), south-east coast towns like Ipswich (14.3) and Brighton (18.9) compare unfavourably with Blackpool (22.9) and Huddersfield (24.6).

The southern advantage shows up more clearly in the percentage of pupils staying on at school to the age of 16. Although industrial apprenticeships account for some of the difference, most of the bad performances (below 15 per cent) are to be found in places like Gateshead, Grimsby, Oldham and Salford; here West Ham (10

V/STOL–330 BC

This early example of vertical or short take-off was conceived by Alexander the Great around 330 BC. Alexander's idea was to tempt four harnessed gryphons into the air by placing food above the passenger cage. The project never passed the paper stage.

Today, the V/STOL aircraft is a reality and Bristol Siddeley engines are playing a major role in its development. The world's first V/STOL strike aircraft, the Hawker P 1127, making its first Farnborough Air Show appearance this year, is powered by the Pegasus vectored thrust turbofan. This type of Bristol Siddeley powerplant has been specified for a range of new aircraft, including future transports. Today, in so many ways, BRISTOL SIDDELEY SUPPLY THE POWER.

The V/STOL P 1127 obtains lift and thrust from the Bristol Siddeley Pegasus

per cent) reveals itself once more as the southern borough that invariably reproduces the worst northern characteristics. An expected variation is for girls to stay on longer than boys in parts of the north, but to fall sadly behind boys in the middle-class and clerically-occupied south. Thus, Croydon has 29 per cent of boys remaining to the age of 16 but only 21 per cent of girls—seemingly a reflection of the demand for junior office staff in central London.

Much the best performance for staying on comes from Wales. In Cardiganshire 30.6 per cent of girls stay until they are 17 (all to become school teachers?) and both Caernarvonshire and Merionethshire claim over 25 per cent, compared with an English average of only 8.8. Despite the growth of comprehensive schools in Wales, over 25 per cent of Welsh children have grammar school places. Wales's trouble, like Scotland's, is that much of this educational investment is lost by emigration.

ARAB LEAGUE

Nasser's Fast One

That President Nasser is not to be beaten at his own game was shown when, on Tuesday, the Egyptian delegation walked out of the Arab League meeting at Shtaura in Lebanon. Cairo's conflicting statements, which left it vague whether or not the United Arab Republic meant to withdraw from the league altogether, sent the less committed members of the league into an aghast hunt for soft words. The meeting had been called by Syria, closely supported by Jordan and Saudi Arabia, in order to try to corner Egypt in the dock on charges first, of hatching and promoting plots against the Syrian government and, second, of selling the rights of the Palestinian refugees for American wheat. But even before the meeting began on August 22nd, an arrogantly provocative gesture from President Nasser showed, once again, why Egyptians are both detested and admired by other Arabs. To answer the Syrian charges, the Egyptian delegation was led by Mr Akram Dayri, a Syrian who was a minister during the union and has opted for Egypt.

The Syrian government had allowed it to be understood that unless it got satisfaction at Shtaura it would consider withdrawing from the league, taking Jordan and Saudi Arabia with it. These three, together with Iraq, might then, so the story went, start up a new league of Asian Arab states. This defiance of Egypt would have raised so many problems that it would probably never have happened. Even so, President Nasser has got in first. By walking out of the meeting and half-threatening to abandon the league, the Egyptians have wrecked the propaganda effect of the Syrian manœuvres.

Although the Egyptians have always been dominant in league affairs, this has not prevented them from treating the institution with a good deal of contempt. The league is a forum of governments, and President Nasser has usually found it more expedient to talk to the "people" over the heads of their governments. All the same, the Egyptian gesture is more likely to be tactical than final. The league has survived the prolonged absences, at different times, of Jordan, Tunisia, and now Iraq. But Egypt's departure would be a mortal wound. It will be better, for all the disappointments that have marked the league's history, to keep it alive.

Monarchs on the March

Without waiting for the confused octopus of a league to sort itself out, King Hussein and King Saud have made their own gesture of unity—and defiance. On Wednesday, after a three-day meeting at the Saudi town of Tayef, the kings announced that they had agreed to merge their armies (whatever that may mean) and establish a joint military high command. Their purpose, they claimed, was to work for the restoration of Arab rights in Palestine—a claim that seems intended to show up President Nasser's alleged defection from the Palestine cause, rather than to frighten the Israelis. Possibly the new merger will last longer than the short-lived joint command of Jordanian, Syrian and Egyptian forces in 1956; for one thing, Saudi and Jordanian troops, most of them bedouin, get along well together. But with Prince Talal planning to set up a Saudi government-in-exile at Cairo, there seems a chance that by getting together the two monarchs will double their troubles rather than double their security.

PROBATION

More Hostels Needed

When a juvenile court wants to remove a delinquent youth (or one who is "beyond control") from his home environment, without subjecting him to the long-term residential training of an approved school, it may recommend that he go to live in a probation hostel. These hostels have been set up over the last fifty years by voluntary bodies, but they now rely almost entirely on public funds, except for the contributions made by the residents themselves towards their keep. The young people remain under the general supervision of the probation officer, but have the additional discipline of living in a hostel, keeping regular hours, eating regular meals and handing over their pay packet to the warden, who takes a contribution for their keep, returns a fixed amount as pocket money and sees that the rest is saved.

According to the second report (Cmnd. 1800) of the departmental committee on the probation service, there are now 20 hostels for youths in England and Wales (with 399 places) and 12 for girls (with 249 places). In Scotland, there are no probation hostels *per se*, but voluntary homes, registered under the Children Act, which are approved as probation hostels but are primarily for children in the care of a local authority. The committee recommends that this Scottish system should cease. It also recommends that one or two additional hostels should be provided for each age group and that these should be set up and managed by probation committees. Sometimes the wardens, who are frequently untrained, have difficulty in co-operating with the probation officers and in understanding that a delinquent youth needs not just to be disciplined but to acquire self-discipline. If a hostel is run by a probation committee, and particularly if —as the Morison committee further recommends—a probation officer himself is occasionally appointed as warden, the hostel regime should be much more valuable.

There is nevertheless bound to be increasing difficulty in finding suitable staff to run the existing hostels, let alone new ones. The Morison committee recommends that wardens should have at least a one-year training. This, of course, means that their salaries should be appropriate for trained staff. At present, the maximum salary for a warden is £780. To name a more realistic figure was outside the scope of the Morison committee's terms of reference, but it recommends that the level of all hostel staffs' salaries should be urgently reviewed. The major mistake made during the Government's pay pause was the uneconomic stinginess shown towards probation officers; it is to be hoped that this will not now be repeated for hostel wardens too.

POLAND

Step by Step

In the running battle of church and state in Poland, the state has scored a notable advance by making up its mind to carry out a law passed last year, and to take over within a year all schools and orphanages run by monks and nuns. The government's intention was formally admitted on August 13th after Cardinal Wyszynski had publicly

Cardinal Wyszynski: "Religious War"

complained of the manner in which some of the takeovers had been carried out. By that time 17 out of 50 schools, and 30 out of 460 orphanages, still remained in the hands of the religious; in a conciliatory statement a government spokesman said that some of these, for special reasons, would be left as they are for more than a year. He denied that any monks or nuns or children had been thrown out on the street. This does not mean that there was no unpleasantness.

Thus all Polish secular education will soon be in the hands of the state. It is of course an anomaly that any of it should have remained so long outside communist control. It is also a tribute to the strength of Catholicism in Poland; Mr Gomulka's regime has seen the wisdom of proceeding slowly and as circumspectly as possible. A year ago religious teaching in schools was banned, and the authorities were given wide powers of control over all educational activities outside schools. Now the communists have taken another step towards whittling away Catholic influence in education.

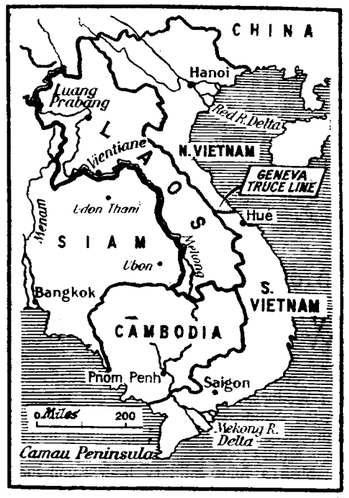
Among Catholic prelates behind the iron curtain, Cardinal Wyszynski enjoys a unique freedom to say what he likes, from the pulpit or by episcopal letter, about relations between church and state. Last Sunday he spoke before a vast concourse of pilgrims at Czestochowa, where in the Jasna Gora monastery the Poles keep their famous and much revered painting of the Black Madonna. Although he referred to the state's "planned atheism" (thinking, perhaps, of the recent takeover of the church schools), his speech seems on the whole to have been less fiery and more conciliatory than many of his previous utterances on the church-state conflict. All the same, his suggestion that progress in Poland was being held back by the "religious war" being waged by the state can hardly have pleased his communist listeners.

VIETNAM

Peninsular War

THE note of cautious optimism that has crept into American official comments on the guerrilla war in south Vietnam finds some justification in the latest news. President Diem's army launched an offensive in mid-August in the Camau peninsula, in the extreme south. Some 4,000 troops are being used, most of them landing by helicopter at selected villages; by the beginning of this week, it was claimed that about 400 communists had been killed and 100 captured.

The Camau peninsula remained a Vietminh stronghold throughout the Indochina war, and the French, whose energies were concentrated on the more important Red River delta in North Vietnam, never got the communists out of it. The South Vietnamese, with massive help from the Americans, have evidently decided to clear the entire area of guerrillas. Tactically, they have a fair chance of success, in that the



peninsula has no common frontier with a neighbouring country and the guerrillas are therefore not able to slip away into Laos or Cambodia, as they can elsewhere when hard pressed.

A few days after the offensive began the North Vietnamese government called for the establishment of a neutral government in South Vietnam as part of a neutral belt that would include Laos and Cambodia. This is a disingenuous proposal if it is not intended —as it clearly is not—to include North Vietnam as well. There was a time when the idea of a neutral, or a demilitarised, zone in Indochina would have made sense. Now, with war in South Vietnam and a settlement in Laos that has yet to prove its value, is not the time.

The North Vietnamese are not the only people calling for a change of government in the south. A group of nationalist exiles met in a junk in "South Vietnam's territorial waters" early in August and did likewise. They included the leaders of the abortive *coup d'état* of November, 1960, and there can be little confidence that they will succeed now where they then failed. No change is likely while the United States continues to support President Diem; and though the Americans have their reservations about his regime, they are unlikely to back his enemies while his army will fight.

BUSKERS

Roundhead Revival

THE old order changeth, aided heartily in its senescence by the Metropolitan Police, patently bent on depriving Londoners of anything which might distract them from their gloomy appraisal of striptease photographs, half-built (or half-demolished) towers, and The Weather. The first to fall beneath what is obviously a recrudescence of Cromwellian prudery were those jolly scrums at Trafalgar Square, in which, of a Sunday, the gaily caparisoned and ecstatically chanting youth of London were wont to pursue the civic sports of punching up, or prostrating themselves before, their political opponents. Yet there has been a more staggering blow at the very heart of British quaintness—at the buskers, or street entertainers.

Infinite of wit (and daring, too: King Farouk was hardly off his throne before they lampooned him—and they do it yet), the busker would set your sorry Londoners on a roar as they stood, mortified and chastised, in dripping line outside the cinemas; and they loved him for it. But the busker has taken his fez and fled away. One day the official popinjays touched his shoulder, muttered "obstruction" in his ear, and fined him many pounds. Broken by the laws, he left his partisans to feed as they might, on no greater pleasures than twice-life-size likenesses of Miss Mansfield, and the great beacon fire of the Chick-o-matic Eatery. Eheu. But a fortnight ago the melancholy rise of censorship suffered an apparent setback: in the name of the people a magistrate bethought him from the bench that to *cause* an obstruction (by gathering a host to crack its sides at the richness of the jests) was not to *obstruct* the free passage of soberside citizens with nothing better than their dim and paltry lives to attend to.

Unhappily that stroke for freedom could not suffice to turn the tide. No sooner had the busker triumphantly returned, plaudits dinning in his ears, success sweet in his false nose, than that killjoy power (powerless, except upon complaint, to curb him otherwise) haled him once more before the bench, and charged him with obstruction as if the words of freedom had never been uttered. This time the prosecution succeeded. The busker, veteran of London Pavilion, British trade pavilion and Leicester Square, is doomed, victim of sectional demands for pavement space and quiet. Speakers' Corner, moved to obscurity already, may be the next to go. Then a long farewell, indeed, to all our quaintness.

EIU Quarterly Economic Reviews.
Covering 57 countries or groups of countries

Mexico

Major external loans have demonstrated continuing foreign confidence in the nation's stability and creditworthiness. The Review describes the government's attempts to instil a matching confidence into investors at home. Despite favourable balance of payments prospects for 1962, Mexico badly needs to export more manufactures in Latin America. Some of the obstacles to this are reviewed, special attention being paid to high freight costs and the ways of reducing them.

Irish Motorists regain

FREEDOM OF CHOICE

▶ It is the policy of the international petrol companies, in most countries in which they operate, to include in their petrol supply agreements conditions which limit the garage proprietor's freedom to offer motorists a choice of lubricating oils.

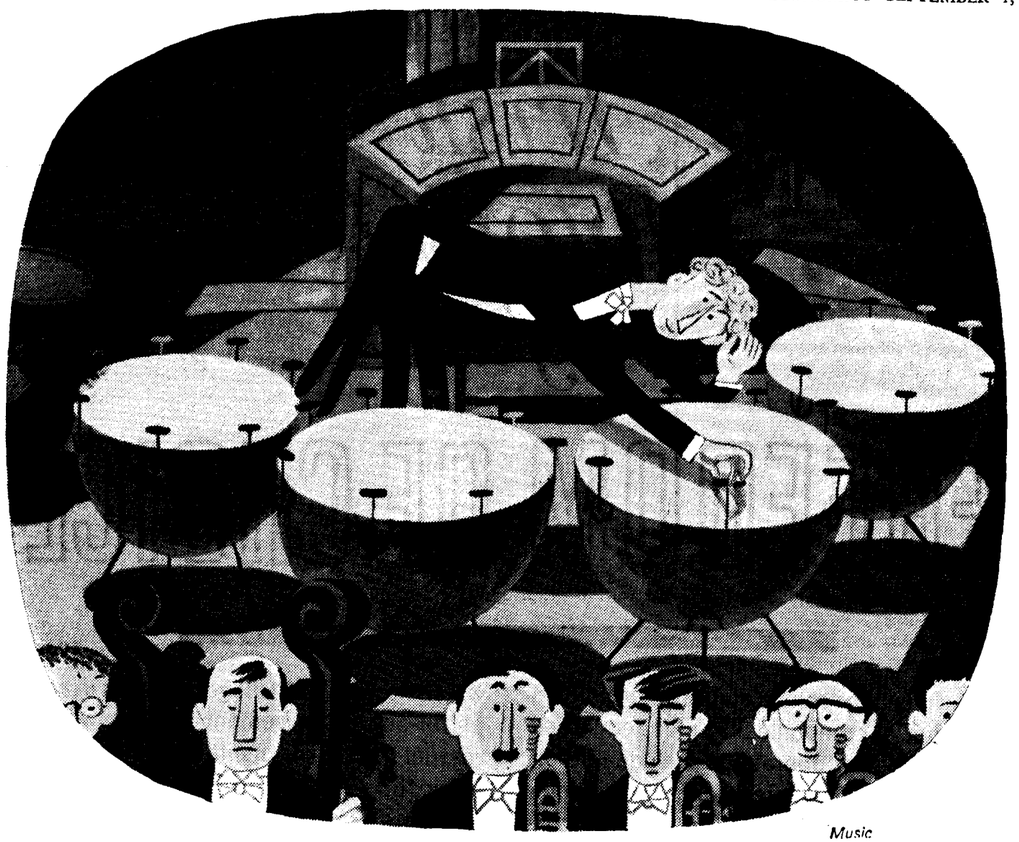
▶ For example, a garage proprietor may be forbidden to display on his forecourt any oils but those of the company supplying him with petrol; only the petrol company's lubricants may be used in his service bay.

▶ The Motor Accessories Manufacturers Association Ltd. accordingly welcomes the Order* issued by the Government of the Republic of Ireland, which now makes it illegal to insert in any petrol supply agreement clauses which restrict the sale or display of competitive lubricating oils. The Irish motorist has therefore regained his right to exercise freedom of choice in relation to lubricating oils.

▶ ** On 18th July 1962 the Irish Parliament confirmed an Order made by the Minister for Industry and Commerce which, among other things, prohibits petrol supply agreements from placing any restrictions on the sale of motor oils. The Order was made following an Inquiry by the Irish Fair Trade Commission into the supply and distribution of motor spirit and motor lubricating oil.*

THE MOTOR ACCESSORIES MANUFACTURERS ASSOCIATION LTD
94 Gloucester Place, London, W.1

has the following principal object: "*To promote, by exchange of information and by concerted action, the unrestricted sale and display of accessories, tyres, batteries, oils and other products distributed by Members of the Association to the motor and allied trades.*"



Music

TV

schweppsicolor

T.V. Schweppsicolor encourages music; but everybody agrees that good music is bad camera. Nevertheless it is our aim to make music acceptable to the eye.

The question of length is important, and our available periods, of thirteen minutes twelve seconds, make a certain manipulation, i.e. shortening, inevitable. Repeats are cut, together with needless echoes of a phrase of the kind which occur somewhat redundantly surely in the first 3 bars of Beethoven's Fifth. Schubert's Unfinished Symphony stops even more prematurely. Variations are limited to two, though for the sake of our backers we make an exception of Variations on a Theme of Purcil.

Choice of soloists with personality is obviously important, but our contralto also has quite a pretty voice. Our conductor not only took second prize in Masterful Batonry, but also won a scholarship in conducting soloists back on to the stage for the second call, a part of his art the grace and gentlemanliness of which comes over well in our concert hall concerts, as can be seen from our frequent close-ups of our appreciative audience, picked for appreciating. By special permission of the conductor, the camera occasionally leaves him and pans (through the perceptiveness of a television producer with an extraordinary knowledge of the musical score) on to that section of the orchestra which is about to come out strongest. To help distinguish them from the second violins, violas have been varnished purple instead of brown. It has been difficult to find double basses with cleft chins, and the appearance of some of our brass is on the inconspicuous side: but our kettle drum, who once had a recording in the top twenty, was Mr. Tymps for 1958.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

BOOKS

The Red Army and its Officers

The Soviet High Command
By John Erickson.
Macmillan. 904 pages. 84s.

IT is a curious thing that the backbones of both cold war alliances should be new armies lacking long organic growth. However, whereas the modern mass American army can claim some tenuous traditional links with the armies of the Civil War, the Frontier and the wars with the British, the Red Army dates only from January 28th, 1918, and had no wish—at least until after 1941—to emphasise continuity with Tsars institutions. Armies are traditionalist and conservative bodies (although they ought to be the opposite); the creation of a force brand-new in every respect is a process therefore of special interest, especially when that force at the age of only thirty-four encountered, stopped and beat the German army at the apogee of its technical ability.

The concomitant of Clausewitz's diagnosis that war is an extension of policy by other means is that armies are extensions of society (or its ruling groups) by other means. In old societies, this process is undeliberate. In the case of the Red Army, founded amid the chaos and crisis of the Revolution and the disintegration of the Imperial Russian forces, it was from the first consciously designed as the military instrument and the military reflection of communism. But how was it to be organised? What should be its doctrines of war? How could it be reliably and efficiently officered?

In this book, Mr Erickson, lecturer in government in the University of Manchester, begins with a detailed and closely documented account of how these problems were tackled while the new communist state was fighting for its life against internal enemies, White armies and foreign interventionists. He shows how the complex techniques of modern war made it impossible to rely for officers on workers and peasants; how therefore the ex-imperial officers (euphemistically dubbed "military specialists") that had to be recruited were politically controlled by the establishment of the commissar system. The role and predominance of the "military specialists" provided the grounds for the first Stalin-Trotsky battles. In defending the use of the "specialists" Trotsky was functionally right but politically wrong: Stalin won.

After the defeat of the Red Army's offensive against Warsaw in 1920, it settled down in peace to digest the lessons of 1918-20. From them it evolved a doctrine of war based on mobility and deep offensive penetration, but also on mass forces; not on the élite panzer groups of Fuller and Liddell Hart. However at this time the Red Army was not only desperately short of every kind of modern equipment; Russia lacked the industrial base to provide them. The Red Army therefore turned to the other pariah of Europe for help: the Reichswehr under von Seeckt, one of the ablest general staff officers who ever twirled a monocle. The Germans provided equipment, technical knowledge and money; the Russians sites and space. Technical experiment was paralleled by intense discussions on tactics and strategy. After 1930 German collaboration diminished, as the five year plans for heavy industry began to give Russia its own technical base. By the mid-1930s the Red Army numbered 90 rifle divisions and between 3,000 and 10,000 tanks. Three rifle divisions were motorised, as were one-third of corps artillery and half the flak. Its doctrine, a result of the interplay of functional needs and Marxist theory, remained offensive, based on forces in great depth—tanks, guns and aircraft opening the way for infantry masses; in fact, as in 1941-45, two armies. With a new General Staff and a talented leader in Tukhachevsky, the Red Army had reached a level of professional competence and independence creditable in so young a force.

However in this growing professionalism Stalin saw great dangers for his regime; the result was the shooting of three out of the first five marshals of the Soviet Union and the purging of officers down to the rank of colonel. Hitler's experiences with his own officer corps suggest that Stalin's judgment may have been politically sound. Mr Erickson calculates that between a third and a half of the Soviet officer corps were affected. To this purge, to the close political control clamped again on all units and to Stalin's rigid bureaucratic methods, Mr Erickson attributes the poor showing of the Red Army in the winter war of 1939-40 against Finland and (together with Stalin's refusal to believe the Germans were about to attack him) the colossal defeats of the summer of 1941. The book ends with a description of the battle for Moscow and the Russian counter-offensive of the winter of 1941-42, when a virtually new army, composed of raw drafts and troops from the Far East, under new generals proved in action, displayed operational ability of a new kind.

The book is not convincing on the effects of the purge, although Stalin's general influence on strategic matters was a bad one. Mr Erickson does not show that the officers lost in the purges were specially able. What the Red Army lacked in the summer battles of 1941 was the most precious of all military assets—operational experience. This the Germans had enjoyed in abundance. There are no conclusive reasons for supposing that an unpurged Red Army led by Tukhachevsky would have avoided terrible defeats at the hands of the veteran Germans.

This thorough history of the Red Army and of its political background, based on the latest sources, is extremely welcome, and it is a pity that the author should have embodied his researches in a narrative that is sometimes clumsily written and hard reading. History is an aspect of literature, as well as a quasi-science.

Elizabethan Tapestry

The Queens and the Hive
By Edith Sitwell.
Macmillan. 550 pages. 42s.

WHEN Mary Tudor came to the English throne in 1553 she was the first woman to do so since the unfortunate Matilda in the twelfth century, and she was succeeded by her sister Elizabeth. At the same time Mary Stuart inherited the throne of Scotland, so the last half of the sixteenth century saw women rulers in both kingdoms, and a new set of problems facing the monarchy. "The Queens and the Hive" is therefore not a full-scale life of Elizabeth as is suggested on the cover, but an impressionistic study of three queens and the issues raised by their rule. Because of this, much of the political and religious background is omitted, and Dame Edith uses her wide erudition and knowledge of contemporary material to recreate the Elizabethan age. Her book is full of information, lists of dances, names of songs and flowers; this cannot fail to give intense pleasure to anyone with the slightest interest in the details of the past, for her quotations are unusual and of great beauty. She adds to this her own gift of imaginative description and with it creates mental pictures not easily forgotten: Mary Stuart turning the pages of a letter to her lover Bothwell at the bedside of her syphilitic husband whose murder she is planning; Elizabeth setting out for her coronation . . . "over the wide roads, a winter firmament of black glass, from which the hooves of a thousand horses splintered great stars, moons, planets, and meteors. . . ."

In style the book follows closely the form set by its predecessor "Fanfare for Elizabeth," but "The Queens and the Hive" is longer, more complex and less perfect, for occasionally the dramatic nature of events leads to banality:

> A terrible shadow drew nearer—a shadow that seemed as if torn from universal Night.
> Then came Horror.

This seems an inadequate introduction to the massacre of St Bartholomew. But in contrast there are few assessments of Lord Burghley more speculative and stimulating than the following:

> In his earlier life there was a darkness in him—a second self, hidden under that discreet,

middle-class respectability, but afterwards banished as the great character of his labours purified him. For, from a cocoon woven about him from the outside by circumstance, from inside, as the silkworm spins silk, from the central fault in his own nature that was the cause of his worldly success, greatness eventually would emerge.

A merit of the book is that Dame Edith remains detached from her characters and includes as evidence both good and evil. She accepts the Casket Letters as genuine, but shows Mary Stuart as a woman capable of greatness, who failed as a queen because of her misguided attempt to apply to Scotland the methods of intrigue and assassination learnt in France. Elizabeth achieved greatness. In the opinion of Lord Burghley she was the wisest of women—" so expert in the knowledge of her own realm and estate, *as no counsellor she had could tell* her what she knew not before "—but both she and Burghley were guilty of cruelty. The torturing of suspects, so long ignored by historians, is now admitted, though not everyone can agree that Catholicism in this period, even in the hands of so saintly a man as Campion, can be divorced from political implications.

The quality of compassion permeates the book. Cruelty was commonplace in the sixteenth century; but Dame Edith makes it a thing to be pitied, a flaw in the great and a sin in a nation. Among the appendices is one on Ireland. It should be read by all who admire the Elizabethans.

" The Queens and the Hive " is an individual interpretation, and it is possible to disagree with some of the views expressed in it. Nevertheless the wealth of information, the splendid descriptions and the imaginative detail make it a book not easily *forgotten.*

Overpraised Poet

Mrs Browning: ***A Poet's Work and its Setting***

By Alethea Hayter.

Faber. 261 pages. 30s.

HAS a writer ever been more extravagantly over-praised than Elizabeth Barrett Browning? Lander thought her the greatest English poet since Milton; Sidney Dobell wrote a sonnet extolling her as a feminine equivalent to Shakespeare; Ruskin proclaimed that *Aurora Leigh* was the greatest poem in the English language, surpassing even Shakespeare's sonnets. Were they all besotted by the spectacle of a woman exhibiting so much creative energy? Needless to say, Miss Hayter does not share their hallucinations. She disarmingly remarks of the ballads and *Lady Geraldine's Courtship,* " it is almost impossible not to dislike these poems very much indeed," and the manifold defects of *Aurora Leigh* are as plain to her as to the most censorious reader. But she does think that Mrs Browning is a poet to be taken seriously, and she has devoted this book to an account of her poetic development. This is a welcome change from the psychological-biographical approach, and Miss Hayter certainly succeeds in impressing on us the amount of sheer hard work that Mrs Browning put into the study of prosody, into translation, into the acquisition of a technique. She was a scholar, and she lived the life of a dedicated poet—an extraordinary thing for a woman to do; she wrote copiously over a long period, and in a good many modes. But does her poetry really deserve exhumation?—for dead and buried nearly all of it is.

Miss Hayter puts up an excellent case for the defence, examining with care Mrs Browning's metrical experiments, focusing attention on her myths and imagery, selecting for praise the better passages from her extremely uneven output. But the sheer profusion tells against her now; the daring topicalities that arrested or shocked her contemporaries, the hysterically strident tone (connected perhaps with opium-taking), the would-be sublimities descending abruptly into bathos—these are not qualities likely to endear Mrs Browning to readers who tend to like their poetry dry upon the palate, ironic, witty, close-textured. Fashions, however, change, and maybe some attention should be paid to the testimony of Browning himself—a prejudiced witness, certainly, but a genuine poet. He was convinced that she possessed the true creative power, superior to his own painstaking, clever, deliberate craftsman's talent. It is conceivable that her eloquence will one day commend itself again to the English public, and Miss Hayter's sympathetic study should bring that day nearer; but it does seem a very hypothetical day indeed, and a very long way off.

Case Creation

The Caseworker's Use of Relationships

By Margaret L. Ferard and Noel K. Hunnybun.

Tavistock Publications. 141 pages, 20s.

SOCIAL work today is in the process of being " professionalised," and the worthy amateur, equipped with no more than good sound common sense, is fast disappearing. Nowhere is this more evident than in the field of psychiatric social work. This book is an attempt to provide a basis for a disciplined approach to such casework, grounded firmly on the principles of psychoanalysis. The ideal caseworker, the authors argue, must be, first, a good listener; second and more important, her knowledge of psychoanalytic principles must enable her to have a good deal of insight, both into herself and into the person she is dealing with.

However, the disadvantage of this approach, as has been argued by Lady Wootton elsewhere, is that it may lead to the creation of a " case " where none previously existed. For example a woman who came for assistance with a genuine housing problem was felt by the caseworker to have a marital problem as well, for which it was presumed she needed treatment. This raises an important point. After all, a great deal of social work involves the provision of some specific service to assist with a specific problem whether it is arranging for a home help for a sick mother or a meal on wheels for an old age pensioner. These people may well have emotional problems, but then so have we all. The authors of this book are undoubtedly sincere in their desire to offer people in need the best possible help, but it would be a pity if the " new style " social worker they envisage did not allow these people to choose for themselves exactly what kind of help they required.

Portent of Dalena

Economic Development and Social Change in South India

By T. Scarlett Epstein.

Manchester University Press. 369 pages. 42s.

DR EPSTEIN'S book is a study of the impact of irrigation in two Mysore villages: Wangala, which was irrigated twenty-five years ago; and Dalena, which remained dry. The results are the opposite of what might have been expected.

Wangala has remained orthodox, wasteful, backward. The villagers spend a great deal on weddings, do not educate their daughters and allow few of their boys to attend school regularly since they are needed in the fields. Except for the sugar cane factory, they have little contact with the outside world. The poor have remained poor—only the rich were able to benefit from irrigation; and they can borrow money from the Government at 6 per cent to lend it at 12 per cent so that all irrigation has done in Wangala is to increase the gap between rich and poor.

In Dalena the whole village has responded to the challenge of irrigation in the region; it has responded by diversification, and this diversification has brought not only relative wealth but also emancipation in its wake. Dalena villagers first made money working for the Public Works Department when irrigation was established in Mandya; then they worked in the sugar cane factory and made money during the war in the black market; that money brought electricity to Dalena and two rural factories. Many of Dalena's villagers work in town; one owns a lorry and carts on contract; the others cart for Wangala villagers. The money thus earned is spent on bicycles, gold watches, houses, private wells, education—two of Dalena's men are clerks and one is a university graduate—and on the purchase of wet land for status reasons. Such diversification can be achieved only at the expense of the old rigidity. Caste relations have become so flexible in Dalena that it has been possible for villagers to improve their status by marrying or taking jobs above their station.

Irrigation, which has petrified Wangala to which it was given, has enabled Dalena, to which it was denied, to take off.

Dr Epstein's book explodes many other preconceptions. It is usually believed that the Mysore administration is efficient and honest; yet she found 2 per cent of the irrigated land entered on the Wangala's records as dry land. It is believed that the sanctity attached to Indian cows makes it impossible for them to be put to the plough; yet in Dalena dry land is ploughed by cows. It is widely believed that villagers keep their bullocks as we do horses; yet in both villages they were traded in as we do cars. Cow dung, one is told, is used in India as fuel; but in Mysore it is used as manure. There is a widespread belief that only aboriginals and untouchables keep hens; yet in Dalena caste villagers keep hens. All this ought to be good news for those who try to improve Indian agriculture. Every government survey shows that expenditure exceeds income, so that indebtedness grows from generation to generation. Dr Epstein found that incomes match expenditure and that indebtedness rises with affluence as the rich become more creditworthy, and thrift has no cachet in India. Everybody has heard of the Indian system of the joint family; only 10 per cent of Dr Epstein's families were joint.

Too much of what has been said about India has depended on out of date generalisations or superficial observations. Dr Epstein is one of a group of scholars like Bailey and Mayer who are at last providing the facts on which a proper policy can be worked out.

Polar Backyard

Australia in the Antarctic

By R. A. Swan.

Melbourne University Press. London: *Cambridge University Press.* 456 pages. 57s. 6d.

ANYONE who looks at one of those maps of Antarctica showing the national territorial claims (now, aptly and happily, frozen by international agreement) will be struck by the fact that the largest slice of the cake is labelled Australian Antarctic Territory. If he wants to know how this came about, and whether it is justified, let him read this book. The Australian attitude towards the Antarctic is rather different from the British, in spite of close collaboration, largely because the Australians are so much nearer. Yet effective interest has only really been aroused in the last fifteen years. Like Canadians, Australians have had more than enough to do at home without bothering much about their polar backyard. And in each case there was one outstanding figure (both, significantly, geologists) who by example and advice persuaded their governments to act.

Mr Swan has written a thorough and painstaking survey. He shows how Australian interest has gradually grown. One can feel that no significant event is left unrecorded, from the meetings of the First Australian Antarctic Committee in 1866 to the field programme for the Australian Antarctic station in 1959. His sifting of a mass of literature is impressive. His final chapters on the territorial claims and the Antarctic Treaty of 1959 will be of interest to many not specially concerned with the Antarctic. And yet, at the risk of appearing ungrateful for a highly commendable service, it must be confessed that the result is not a story one cannot put down. The author has rightly decided that more must be said than just the narrative of the various expeditions, and he has therefore examined the events leading up to them, the motives, the attitudes of governmental, scientific and business circles. Excellent: this is what is needed. Yet something is lacking. All this is what the books and papers say happened. Messages from prime ministers to leaders of expeditions seldom add much to knowledge. The really interesting events are not often publicly reported. Why, for instance, did somebody's backers let him down at the last minute? Polar explorers are notorious prima donnas. Things cannot have been as dull as this. But perhaps one is asking too much. No one is going to write another history of Australia in the Antarctic for many years, and Mr Swan's will answer almost all the questions that the seeker after detailed knowledge may want to put.

Research for Industry 1961

A report on work done by industrial research associations in the Government scheme. It reviews the year's achievements and gives details of the associations serving particular sections of industry. Illustrated and indexed. 10s. (post 7d.)

New Contributions to Economic Statistics

Seventeen articles, which aroused great interest when first published, reprinted from 1959-61 issues of *Economic Trends.* 7s. 6d. (post 7d.)

The Selection and Training of Supervisors

Good supervision can result in better industrial relations, greater efficiency, and increased productivity. This report outlines present day training schemes and gives practical guidance on the problems encountered. 3s. (post 4d.)

LETTERS

Kenya

SIR—I would like to correct the erroneous impression given in the article on Kenya "Majimbo for All" on August 18th. Your correspondent seems to agree with Mr Kenyatta's statement, "there are signs of another Congo in Kenya"; then later in the article he says that the Kadu policy of Majimbo, "originally put forward as a sane regionalism designed to check would-be dictators at the centre, has rapidly degenerated."

The fact of the matter is that the discussions in the council of ministers to finalise the details of the regional constitution have progressed well, with both parties showing a spirit of co-operation, and Kanu tribes, other than the Kikuyu, who hitherto rejected regionalism, are now starting to become its champions. In fact, all four Kamba leaders have declared wholehearted support for their region as it appeared in Kadu's map six months ago. The Luo also, who form nearly half of Kanu, are publicly declaring their dissatisfaction with Mr Kenyatta's constant denial of regionalism.

Both Mr Kenyatta and your correspondent seem to have missed the point over the troubles in the Congo. These arose simply because different peoples within the Congo wished a certain measure of autonomy in their own affairs and were not allowed it. The attempted imposition of policies from the centre failed and caused the chaos that could have been averted through the acceptance of a federal type of constitution. This has at last been seen, and United Nations experts have just started work on such a constitution for the Congo. It is fortunate for Kenya that we are set upon the right constitutional road before gaining independence.—Yours faithfully,

M. MULIRO, Vice-President,
Kenya African Democratic Union

Nairobi

★

SIR—Your conclusion that about 60,000 whites in Kenya may have to be rescued will be welcomed by everyone who has been trying to get our Government to face this fact, ever since the Lancaster House conference of January, 1960. But to blame the whites, as you seem to do, for keeping Africans divided is a dangerous fallacy—dangerous because it carries the corollary that once the whites go, the way will be clear for African unity. This is not so.

Europeans did not invent tribalism and the idea that they are nefariously encouraging it is simply a myth, cultivated—and no doubt sincerely credited—by many African nationalists. It is even less in the interests of the Europeans than of anyone else that Kenya should once again erupt into civil war.

Aside from foreign rule—colonialism—there are only two ways by which tribal war can perhaps be averted. One, the way of Ghana, Guinea and most of the other independent African states, is that of the one-party state and dictatorial rule. The people who will do the dictating are those who get control of the army and possibly police—the majority party. That is why the group of tribes supporting Kadu fear the Kanu majority. They believe that their rights would be swept away and their land taken, and they are almost certainly right.

The other way is federalism. In a country as weak and poor as Kenya, a true federal structure is probably impossible and everyone can see the disadvantages. But as much federalism as possible is the only alternative to the oppression of all minority groups by a strong unitary party on Nkrumah lines.

Now the situation is immensely complicated by the split within Kanu, basically a Luo-Kikuyu split but also one between two types of African leader, the men of the past exemplified by Kenyatta and Odinga, and those who think in modern terms like Mboya. Obviously Kenya will have a better chance of stability if it is governed by men like Mboya than if its armed forces fall under the control of people stuck in the groove of a monkey-skin-and-Mau-Mau mentality.

Meanwhile Kenya's economy is shrivelling and unemployment, resulting from the closing and retraction of European and Asian business, and from the suspension of all development by farmers, is getting out of hand. To attempt to counteract this by creating government jobs financed by overseas grants or loans is to plug holes in the ship's bows while water pours in through holes in the stern.

The sad fact is that the various schemes now proposed, to cost up to £15 million, to settle African small-holders on farms hitherto owned by Europeans, add up economically to a big leap backwards. Such African settlement is designed to marry the Government's obligation to help white farmers, to whom they made promises they cannot now keep, to pull out of Kenya, with the land-hunger of the Africans. As a result, many farms hitherto efficiently run as economic units, producing those export surpluses on which Kenya's economy is based, will be split into subsistence holdings of a kind being liquidated in every other country in the world in a position to do so. This will not create more employment but less, and may well reduce rather than expand Kenya's production of tea, coffee, pyrethrum, dairy produce and other products. In this case even the present standards of administration and social services will topple and *uhuru* will indeed prove to be a god that failed.

Some African politicians have recently been to Israel to see how collective farms can be run. Perhaps a solution will lie somewhere along these lines. The matter is urgent and ought to be studied at the highest levels and with the greatest despatch. The conflict is between political expediency and economic common sense. Before plumping for the first oughtn't we at least to take the blinkers off and see where it is leading Kenya's people—and ourselves, if we have got to go on indefinitely baling out a ship whose seaworthiness is deteriorating fast.

Nothing (as de Maupassant remarked) is ever either as bad or as good as you think it is going to be. So perhaps the ship may, after all, stay afloat; but only if far more attention is paid, and paid now, to the economic consequences of political action. And if leaders who at least begin to understand what economics are about come out on top.—Yours faithfully,

Malmesbury, Wilts ELSPETH HUXLEY

Helping Hands

SIR—You take to task the *Daily Mirror* for combining a photograph of Rockwell on the front page with ban-the-Nazis articles on the middle pages. True, your front page (August 11th) carries a dramatic drawing of Sir Oswald Mosley but, in contrast to the *Daily Mirror*, you support the Government's decision to protect Nazi speakers and you urge Mr Brooke to impose "the most swingeing penalties" on their pugilistic opponents.

Your decision to put Mosley on the cover page simply underlines a fact which you implicitly deny in your note "Helping Hands"—that in modern democracies a tiny minority can draw enormous attention to itself if only it is sufficiently lunatic or criminal. Nudists stripping outside Buckingham Palace could always win banner headlines. Similarly, if somebody declares from the platform in Trafalgar Square that "Hitler was right" in his treatment of the Jews, he will be given publicity and sooner or later will provoke a riot. Given the history of European Jewry over the last eighty years it cannot be otherwise.

Mr Jordan should, therefore, never have been permitted to speak in Trafalgar Square. The fact that his group held one or two peaceful meetings was at first advanced by the Home Secretary as sufficient reason to permit further meetings. Actually, this early calm was due simply to the general ignorance of Mr Jordan's views. It was the *Observer* which, in its issue of July 1st, devoted a lengthy article, complete with sinister photographs, to the Nazi and Fascist movements in Britain.

How long would the police consider it necessary to defend a group which got up in Merthyr and in all seriousness demanded that the miners be shipped to labour camps in Siberia? Of course, the miners might tolerate such views because they seem so absurd. Unfortunately, the Jews can no longer feel this way about fanatical anti-semitism.—Yours faithfully,

New York JONATHAN FRANKEL

After Thalidomide

SIR—Your article puts fairly the real difficulties involved in testing new drugs and the limitations of animal tests. However thorough these tests, the patient must be the final "guinea-pig." It is rational, therefore, that he should know what drug he is taking. At present pharmacists are not allowed to label containers with the name of the drug unless specified. This leads to waste and often to a lack of continuity in treatment. It makes retrospective inquiries about toxicity, as in the case of thalidomide, difficult and incomplete. The increasing incidence of accidental poisoning (now over 5,000 fatal cases annually) has led the Minister of Health to set up a National Poisons Information Centre at Guy's Hospital to give advice on the treatment of poisoning, of which drugs form an increasingly large proportion. Treatment to be effective must be prompt. The work of this centre will be needlessly handicapped unless the name of the preparation is known. It has been suggested that such a centre could also serve as a registry for the untoward side effects of drugs, a kind of "watchdog."

Many think that containers should be labelled with the name of the drug unless otherwise specified. This is mandatory in many countries and in this country in the case of patent medicines. No party seems prepared to act. The ministry would like doctors to give a lead. The various medical professional bodies suggest that the ministry should act. Pharmacists are divided. Until this overdue reform is accepted, patients (who are the final arbiters) should insist that the name of the drug is written on the container if only on the grounds that they will then know what poison they or their children may take.—Yours faithfully,

The Royal Infirmary, Huddersfield W. P. SWEETMAN

Airline Results

SIR—Far be it from me to discourage other students of airline economics from following your invitation to speculate on the common attributes of the diverse airlines which you tell us were shining exceptions in last year's gloomy aviation picture. But I may perhaps be allowed to sound a warning on some of the pitfalls in this speculation; particularly the two into which your article of August 11th appears to have fallen.

One of the five airlines you specifically mention as profitable does not itself claim the profit you credit to it; the airline's report describes this as a "net surplus". And since this net surplus, plus a small amount of loan interest, represents a return of less than 2½ per cent on its capital, a student of airline economics might reasonably conclude that the airline in question would have been far from profitable if, like the British air corporations, it were obliged to pay interest at about 5 per cent on all its capital. Another of the five airlines in your list appears to me to have achieved its small profit by the time-honoured accounting device of providing less for depreciation than it would normally and prudently have done.

I do not wish to suggest that the main characteristic which your estimable group of airlines have in common is flexibility in their methods of presenting their accounts. But I do think it desirable that students of airline economics should examine airline accounts with greater care than you appear to have done.—Yours faithfully,

London, NW11 STEPHEN WHEATCROFT

Seaborne Seminars

SIR—I would like to draw your attention to one unfortunate error in the excellent article on educational cruises in your issue of August 11th. I say unfortunate, as, to date, no profits have accrued to the company as a result of embarking on this venture.—Yours faithfully,

K. M. CAMPBELL
Chairman, British India Steam
London, EC3 Navigation Company

Whose Counterdrift?

HOME REPORT

Members of the editorial staff and local correspondents report on the life and happenings in and around Britain

COUNTERDRIFT is a word that planners are bandying about: an easy bit of shorthand for reversing the population flow from the north-west to the south-east. Strictly speaking, it is not a plan but a concept, and in the mind of Mr D. Rigby Childs, who launched it in the new year issue of the *Architects' Journal*, it is by far the most radical of current ideas for undoing the congestion around London and the west Midlands. It was meant to be controversial, to get people talking, and it has brought its author a steady flow of publicity in planning circles, including an address to the Town Planning Institute in June and now a lengthy reprinting in the columns of the *Local Government Chronicle*.

Briefly, the Rigby Childs idea is to set up a rival to the existing industrial and communications axis London-Birmingham-Liverpool (the basis of what planners call the "coffin"). The new axis would be 700 miles long, "extending from the south-west, past east London and then up to the north of Scotland." It would be the "foundation for a new urban form comprising a series of linked urban and city groups." On the southern leg it would have one new city group (2-3 million people) based on Avonmouth, Bristol, Cardiff and Newport, a regional link-up that is already stirring (see *The Economist*, April 21st); there would also be three urban groups, each of 1½-2 million people, called Moor (Plymouth-Exeter), Wight (Southampton-Portsmouth) and Estuary (Colchester-Ipswich). The northern leg would have three city groups: Humber (Hull-Grimsby), Solway (Carlisle-Dumfries) and Tay (Dundee-Aberdeen). Solway, in particular, would have to start virtually from scratch. (See map on page 770.)

One major object of the Counterdrift idea is to fit in this future development along "Euroway" routes linking this country with Europe by way of a Channel tunnel or bridge. So far, the planners' reaction to the development of closer physical ties with the common market, reinforcing the growth triangle Ruhr-Birmingham-Paris, has been sluggish and conflicting. Some accept the inevitability of a further population shift towards the south coast and the East Anglian ports; Mr Rigby Childs's crystal ball gazing has thus been criticised for failing to site one of the prospective urban groups in the Ashford-Dover area of Kent. Others, already committed to some form of Counterdrift, argue that joining Europe on these terms will merely lead to even worse congestion (and resulting inefficiency, rising land values and decline of suburban environment) throughout the south-east. In the end, they say, this would check the drift anyway as people got fed up with subtopia: so why allow the drift to happen at all?

No one has yet dared publicly to confront the several lobbies (agricultural, green belt and commuting-village snobbery) that stand in the way of fitting people into a planned industrial development spreading over the green spaces of the south-east in a cohesive network of new and expanded towns, linked by motor-

ways and rapid rail communication routes that do not all (as now) run into central London. This kind of plan will probably come sometime. It is partly to nip it in the bud that Counterdrift has been launched.

This kind of "imaginative jump," as its author calls it, is praised by some planners and thought an unmitigated pest by others, partly because it leaps above the hard realities of their own local schemes for development and rehabilitation. Most of the country's serious planning strategy has been talked about on a regional basis (if even that) up to now. Thus, the Town and Country Planning Association, the great and vindicated champion of the new towns, has been concentrating recently on more overspill from London and the south-east Lancashire and Merseyside conurbations within a fairly limited geographical range. To the author of Counterdrift the TCPA's proposals to double town populations in East Anglia in the next 20 years smack of "even more subtopia," with the long-term danger of forming "a contemporary West Riding." Norfolk county council will be advised by its planning committee next month to accept up to 200,000 overspill population in the next 20 years. The Midlands New Towns Society, one of the most energetic of local groups, has envisaged expansion into the foothills of mid-Wales, hardly a contribution to a new axis, although even its modest proposals have not found much favour with Birmingham firms.

OTHER planners are more immediately concerned with the industrial and social rescue of their own decaying areas. These are led by the local development corporations (particularly in Scotland, Wales and the north-east) although their horizons are sometimes cramped by local pressure to grab industry and push it into unemployment blackspots as they crop up. One of the liveliest and most respected of individual planners is Professor Myles Wright of Liverpool University, whose department was responsible for the bulky special issue of the *Town Planning Review* (October, 1961-January, 1962) devoted to Land Use in an Urban Environment. Professor Wright believes in concentrating on making a success of the big northern city-regions, specifically within 15 miles of their present centres, and leaving more outlying areas of poor economic outlook with much more limited aid or none at all. Long-distance overspill, he maintains, will not work in the north. He puts his money on a "planned polynuclear relationship" for the city-region (centre and satellites) depending on an efficient local communications network in keeping with the motor age. His paper at the Town and Country Planning summer school at Nottingham this week called for permanent urban regional development commissions for each northern conurbation.

Professor Wright's stamping ground, at the northern end of the "coffin," is itself providing increasing evidence that even the existing industrial axis is no guarantee of prosperity. The Lancashire and Merseyside Industrial Development Association has reported that between 1951 and 1961 124,000 people left the north-west and that in the past year between 25,000 and 30,000 people lost their jobs as a result of mill and other factory closures. Figures published last week show the north-west to have the largest number of unemployed school-leavers (9,343) in the country. There are now 350 industrial buildings vacant in Lancashire and Merseyside—150 of them former cotton mills.

Government planners, subjected to strong political pressures to encourage new industry to move into existing plant of all kinds (particularly when the buildings formerly housed Government concerns like munitions factories) have begun to realise only slowly that this is a losing game. In central Scotland there has now been a breakaway from the old system in the attempt to start a new, planned region of growth between Glasgow and Edinburgh. An increasing number of local planners maintain that aid should henceforth be concentrated on these areas of prospective growth in the north and west, and that the old city and industrial town environment repels incoming firms despite the preferences that these areas of high unemployment get under the Local Employment Act. A little assistance to stimulate already favourable localities would do more to secure regional regeneration and stop the southern drift than a lot of effort and money spent as it is now.

The Government's own professional advisers know the extent of the problem as well as anyone, even if they are least able to make any dramatic suggestions for relieving it. They are, however, taking almost a delight in building up a mass of frightening evidence for their new minister, Sir Keith Joseph. In his paper to the Nottingham summer school this week Mr J. R. James, chief planner at the Ministry of Housing and Local Government, emphasised not merely the north-south drift but the prospect that, by immigration and natural increase, the population of England and Wales is likely to rise by some 6 million in the next 20 years, "the equivalent of another six Birminghams or, preferably, 60 large new towns." He admitted that the assumptions on which the first post-war development plans were based no longer held good: to deal with a major overspill operation like that in south-east Lancashire, he declared, would need a harnessing of technical, administrative and financial resources that must "stretch the imagination to new planes of thought." This is the measure of the problem confronting Sir Keith and the conflicting heirs of Abercrombie and Geddes.

The Sixth Form College

LAST month General Eisenhower, speaking to the Pilgrims at the Savoy, advocated the foundation of an "international college to promote understanding between nations." In fact, an international public (i.e., private) school is opening this month at St Donat's Castle near Barry, on the Glamorgan coast. The St Donat's "Atlantic College" is a completely new venture in British education. Indeed, its high fees of £500 per annum are one of the few features that it has in common with most other public schools. The one school that it resembles in its educational approach is Gordonstoun.

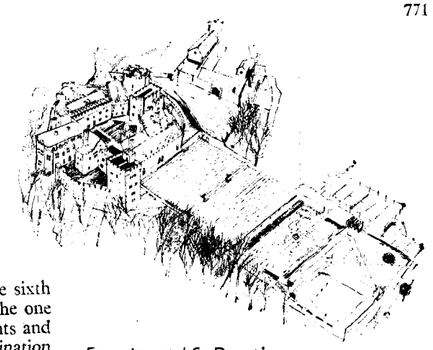
Atlantic College will eventually take 450 boys from Canada, Britain, France, Greece and the United States, the British group being the largest but not in a majority. In time boys will come from a wider range of countries, even from behind the iron curtain (the school has no associations with the North Atlantic Treaty Organisation). Boys will arrive at the age of 16-plus and stay for two years, each year having only two long terms. The old boy net and the old school tie will be no help for British boys going to St Donat's. Pupils will come from grammar and other day schools on the recommendation of headmasters and local education authorities. If successful, the college is intended to become the prototype for others abroad.

Though a distinctive experiment, Atlantic College nonetheless does show two facets that are becoming part of the mainstream of education in this country. The first is the increasing emphasis on corporate activity outside the classroom, but not necessarily on the playing field. Both St Donat's and Gordonstoun offer training in mountain and sea rescue, fire fighting, animal rescue and wild life preservation. But expensive schools such as these are no longer alone in providing such opportunities.

Thus, Outward Bound Schools, founded 21 years ago, train over 4,000 boys and 500 girls annually in seamanship, mountaineering and rescue work. Similar, but broader in scope, is the Duke of Edinburgh's Award Scheme operated by 300 organisations of all kinds, ranging from public schools to nationalised industries. Many other bodies also do valuable work. For example the Brathay Hall Centre in the Lake District takes boys from industry and school on courses and expeditions at home and abroad. The British Schools Exploration Society sponsors ambitious trips to arctic and mountain regions. The Boy Scout Movement, anxious to maintain its momentum, encourages its senior scouts to take part in such activities. At the extreme, the widest range of pursuits is offered by the Central Council for Physical Recreation which co-ordinates activities ranging from ballroom dancing to shark and fly-fishing.

Outdoor courses help sixth-formers to mature before they enter university; many dons feel that with the abolition of national service this is very necessary. An even greater benefit accrues to boys from industry who never make the VIth form. It is significant that this lively sector of education has grown on the initiative of private groups, who are doing a task that the state would find difficult—although some bodies receive direct support from the Government (for example half the cost of Outward Bound's new Aberdovey school is being provided by the Exchequer).

The second distinctive feature of the Atlantic College is that it is solely a "sixth form college," a concept that is grist for the educational mill at the moment. Many members of the Labour party believe that the conversion of the public schools into such colleges would painlessly remove the stigma of privilege while retaining their prestige and high standards. Some educationists rightly think that rural grammar schools with small sixth forms of 40 or 50 are no longer viable. A central sixth form college may provide the answer.



Experimental St Donat's

A few education authorities see the sixth form college as a way to avoid, on the one hand, the distaste felt by many parents and some teachers for the 11-plus examination and, on the other, setting up controversial and expensive comprehensive schools. "Non-selective junior secondary schools" are set up for children at the age of 11. These schools are less cumbersome than their name, their syllabuses being less practical than the secondary moderns', and less academic than the grammar schools'. Later the children transfer to a sixth form college which prepares them for "A" and "S" level examinations and university entrance. Thus grammar school misfits are avoided and late developers get better opportunities. Leicestershire keeps all grades of children in the same schools from 11 to 14 and then transfers all who wish to remain at school for at least another two years to an "upper-school," usually a converted grammar school.

Croydon is now hoping to follow a similar plan. The 11-plus is to be abolished and those children gaining the required number of "O" level passes after 5 years in non-selective schools will go on to Addington Sixth Form College, a converted secondary school. This scheme has been adopted by the education committee, but it has been heavily criticised in some quarters. It is said that staff may not find teaching attractive in the junior secondary schools with no sixth form work available, a factor of importance when good graduate staff are scarce. But this would appear the ideal opening for the growing numbers of graduates with general degrees, who would have the stimulus of teaching some bright children.

A second criticism has been that the scheme destroys what is good (the grammar schools) for the sake of improving what is not so good (the secondary moderns). But the gap between the two has narrowed (GCE "O" level classes are common in secondary moderns nowadays) and this scheme may do much to remove ill-feeling about injustice at 11-plus, about the inequalities of status of different types of school, and would create a sixth form college of high repute to which all could aspire.

Dundee Jam

DUNDEE is the latest Scottish local authority (after Glasgow and Dunbartonshire) against which the Secretary of State has had to deploy his cumbrous legal siege train in order to secure an increase in council house rents. Dundee's 23,000 municipal houses (36 per cent of all dwellings in the town) are now let at an average of 7s. 7d. a week, the lowest council rents in Scotland, except for six houses in Orkney. The Labour-controlled council paid no attention to three warnings from the Scottish Office that action would be taken; it last raised its rents in 1958. Its housing convener, Councillor James Stewart, has now declared his party's intention "to stand firmly by our principles" and "to establish quickly and easily where the fault lies in placing an intolerable financial burden on the housing accounts of Scottish local authorities."

This means that Dundee intends to follow the familiar Dunbartonshire argument, claiming first that housing is a social service for which nominal or nil rents should be charged (an admission that existing rents are nominal) and, second, that the Government's interest rates are too high (although these can hardly be a burden if the town considers itself affluent enough otherwise to charge its householders less for their homes than they pay for renting the telly). The inquiry will duly find against Dundee, add some strictures on the conduct of the town's local government (only 28 per cent of its housing costs are covered by rents; the ratepayers have been providing 38 per cent and Exchequer subsidy the rest), and then one of two things will happen. Either the Secretary of State gives Dundee a bargaining period in which the council slowly raises its bid, or he uses his powers under the new Housing (Scotland) Act to impose a rents scheme he thinks fit. Mr Noble should apply the act promptly.

The average rent of Scottish council houses rose by 1s. 11d. a week in the half-year ended in May—to the sum of 11s. 10d. a week. Russian visitors, Glasgow town council was told last week, think it's all quite mad.

THE WORLD OVERSEAS

Ben Bella on the Horse's Tail

After nearly a month in the saddle Mr ben Bella and his political bureau have discovered no trick for controlling the restive Algerian horse. Their trial run has not gone well. Far from following a straight true course, the riders have gone round in circles and Mr ben Bella has ended up precisely where he was before. He has failed to exploit the truce to conciliate his opponents and provoked a new upsurge of enmity from forces previously neutral. The inscrutable soldiers of the Algiers region (Willaya 4), those units of the interior who opened the gates of Algiers to him to let him get on with the job, have turned on him in a fury. In the violent clash with the military who remain the real power in the capital, he got hoist with his own petard.

The climax came on August 23rd, with rival demonstrations in Algiers. The soldiers, seizing the radio, accused him of overstepping himself in trying to oust them from power before an elected parliament could approve his plans for reconverting the army; they gleefully dubbed the political bureau as right wing and neo-colonialist. That these are the very words with which Mr ben Bella and the armed forces of the exterior, who came in from Tunisia and Morocco, once beat down Mr ben Khedda may appear as a kind of rough justice. But this is a sort of roughness that does not help. When uttering their deadly insults, the officers of Willaya 4 were carping at the lists of candidates that the political bureau had approved for election on September 2nd—and carping for carping's sake.

These lists, thanks to regional influence, were unexpectedly catholic, including such opposites as Mr Abderrahmane Farès of the provisional executive and Colonel Slimane of the general staff (whom Mr ben Khedda dismissed). Mr ben Khedda's government, the provisional executive and the political bureau were all equally well represented. There were sixteen Europeans. The army got seventy candidates in a total of one hundred and ninety-six. Willaya 4 alone boasted sixty-two (both military and civilian). These were not lists to be sneezed at. The bureau in fact had not had all its own way with them and had been unable to impress on them the entirely rubber-stamp character with which it once planned to invest Algeria's first parliament.

Thus the officers of Willaya 4 ill served both themselves and Algeria in decrying the one hopeful product of Mr ben Bella's regime. By doing so they merely played back into Mr ben Bella's hands. On Saturday he declared that because of their interference, his bureau was powerless to discharge its responsibilities. It would therefore postpone the elections, withdraw its approval of candidates, but continue to cling to the power it had not got. So Algeria was thwarted of its prospects of obtaining an acceptable government through the medium of elections, while ben Bella was reduced to clingmanship and to mustering up his supporters—four Willayas out of six, together with Colonel Boumedienne—at a rally on Tuesday at Sétif. He is therefore back where he was with two-thirds of the country behind him, but a new and tense situation in the capital. Shooting took place there on Wednesday between his armed bands and units of the Algiers army; and Mr ben Khedda spoke of a danger of civil war just as he did in July when Boumedienne's forces from Tunisia occupied Constantine. On Thursday troops from Oran loyal to Mr ben Bella were moving into greater Algiers.

It is a sad business, this paralysis of leadership in Algeria. But it is still too soon to cry "Congo." Resistance to the idea of central government is neither seriously secessionary, nor an attempt by one region or another to hog some local source of wealth to the impoverishment of the rest. The economy may be wrecked, but everyone is wrecked together. There is no quarrel over policy. Everybody is agreed about what should be done.

Climax in Algiers

Roughly, the lines of agreement are that the government be centralised; that soldiers be succeeded by civilians in administering the various regions (but soldiers may doff their uniforms to become civilian administrators); that a national army be formed of those who want an army career; that the Evian accords in a broad sense should underpin the economy; that useful Europeans should be wooed back to function in commerce and industry, the professions and civil service; and that everyone should then pull together to make a good socialist state. This is Mr ben Bella's policy, and Mr ben Khedda's and Mr Belkacem Krim's and that of most of the army including Willaya 4. Real divisions between right and left and the various approaches to socialism and international relations may appear at a later stage. They are bound to do so. But the present conflict still revolves round who is to be king of the castle and the bandying of political insults is still kindergarten stuff of the "dirty rascal" kind.

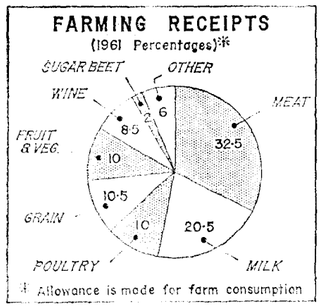
Where the political bureau has failed is not in its words and deeds, but because it is a little clique that jumped on top of the castle upon the lofty assumption that it enjoys a divine right of kings. Mr ben Bella traces this right to the fact that four of the bureau, including himself, the leader, are survivors of the "club of nine" who started the revolution. Only one of these surviving original leaders—Mr Belkacem Krim—was excluded from the bureau, but another, Mr Ait Ahmed, refused to participate in it, and Mr Boudiaf, yet another, has now resigned. The divine right is therefore dissipated. It is, anyhow, all old hat; and only if Mr ben Bella can discard his nostalgia and adapt himself to present-day Algerian conditions will he properly fill out as a leader.

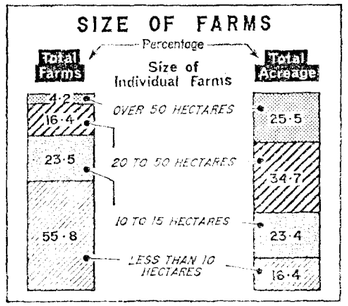
So far he has failed to do so. In those parts of the country, east and west, where he enjoys full support, he has managed well. But the centre—the Algérois and Kabylia—he has not controlled, because his clique is felt to be unrepresentative and commands no confidence. A country, tossing in transition, needs either a single leader, as King Mohammed V was in Morocco and Mr Bourguiba was in Tunisia, or else—the Algerian ideal—a collective leadership that is genuinely a coalition. This is what the political bureau is not. But elections did appear a real hope of obtaining a balanced government. More is the pity that the soldiers of central Algeria, in a fit of understandable anxiety about the political bureau's intentions towards them, should have overplayed their challenge.

FRANCE'S FARMING EXPLOSION

FROM OUR PARIS CORRESPONDENT

Outlets Wanted

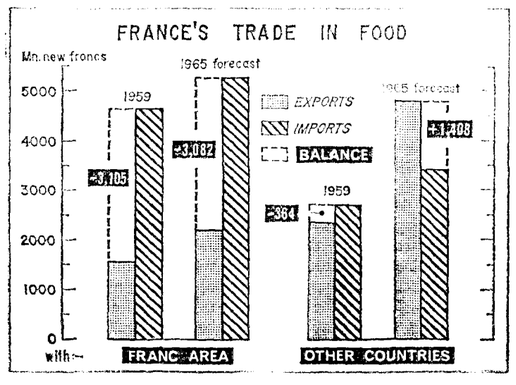




THE common market negotiations brought home that French farming is a factor in European politics, not to be ignored without peril. Tillage and pasturage are no longer *les deux mamelles de la France,* as Sully called them. Still, with more than 21 million hectares of arable land and more than 13 million hectares of pasture (1 hectare = 2.471 acres), France accounts for nearly half of the agricultural area of the whole common market. Its share of the agricultural manpower, by contrast, is less than a third; France, with 3.2 million men employed in farming (statistics of female labour are too inaccurate to allow comparisons), takes second place to Italy. Agricultural employment in France has declined by some 35 per cent since 1921. But in the last ten or fifteen years, a dynamic expansion of farm output has gone on unhindered by the continuing drift from country to town. How to absorb this output has become the common market's problem.

French agriculture, long somnolent behind protective walls designed to preserve the social fabric of the country, was awakened in the postwar period by the massive introduction of modern equipment. The tractor park rose from 35,000 in 1938 and 68,000 in 1948 to more than 800,000 now. For combine harvesters the figures are respectively 260; 1,160; more than 60,000. Fertilizer consumption has roughly trebled since 1938. Naturally, the impact of this transformation has not been the same for the big modern farms and for the bulk of small producers just emerging from subsistence farming. The general trend, however, is upward. Between 1949 and 1961 farm output rose by 2.5 per cent a year on average. If the pause from 1954 to 1958 is excepted, the average rate of increase was 4.5 per cent. The fourth plan, when it assumes that agricultural production in 1965 will be 30 per cent higher than in 1959, anticipates the same rate of growth.

Production forecasts for 1965 are expectations rather than desired objectives. Until the common agricultural policy is in full operation, the French government can influence production by fixing guaranteed prices. Under the French arrangements, the guaranteed price does not necessarily apply to the entire domestic supply of a given commodity; its application may be restricted to a certain volume, called the *quantum*. Beyond the quantum, sellers have to be content with the prevailing (lower) market price. Thus, out of the wheat production expected for 1965, some 8½ million tons should enter the market, but the guaranteed quantum is intended to be only 6¾ million tons. In other words, the government would like to check the expansion of wheat. For milk, too, the desired output is ten per cent lower than the expected one. For meat and eggs, official hopes and expectations coincide.



The government can and does try to influence the pattern of production; but the probability that farm output as a whole will continue to grow, and that exportable surpluses will grow even faster, are facts which it has to face. If food production in 1965 is to be 30 per cent higher than in 1959, home consumption—after account is taken of a population increase of 4.8 per cent—is expected to be 21 per cent higher. Exports of foodstuffs should rise by about two-thirds over the same period. The hope is that in 1965 France will export about six million tons of grain (half of it wheat), 160,000 tons of dried or concentrated milk, 70,000 tons of cheese and 50,000 tons of butter. Some 250,000 tons of beef and 100,000 tons of pork should be shipped abroad in that year. Wine and spirits are scheduled to bring in 1,110 million new francs, but the biggest increase is to come in the export of fruit and vegetables which should reach, respectively, 330 and 148 million new francs. Efforts are to be made to improve storage and distribution and to develop processing industries.

French officials are confident of being able to sell more food to the franc area whatever happens to the French community. Yet it is outside that area, and chiefly within the common market, that the increase in French food exports is to be most striking. Predictions of the course of foreign trade have to be tentative.

FRENCH TRADE IN FOOD WITH EEC
(mn new francs)

	French imports from				French exports to			
	1960	Per cent*	1961	Per cent*	1960	Per cent*	1961	Per cent*

Total EEC	997	10·9	887	8·5	1,484	14·7	1,870	15·6

* Percentage of imports or exports of all goods including industrial products from and to each country.

Much will depend on the size and shape of the European Community, on the character of the common agricultural policy in general, and on price policy in particular. France is, relatively, well poised for the next round of price negotiations in Brussels. Its farm prices for wheat and beef are well below the Community average; for milk, eggs and sugar beet they are just below that arithmetical mean. And indeed, the balance of French trade in food with its common market partners is favourable.

French exports to the other five countries of the common market have been rising fairly fast but France's share in the food imports both of its partners and of other industrialised western states is still very small. Possessing half the Community's effective agricultural land, and having plenty of scope still for modernisation, the French hope to increase that share substantially. In their calculations, the British market figures sometimes as a tantalising prize, sometimes as a hazardous complication. One reason why the French negotiators have been awkward, and are likely to remain so where farming is concerned, is that the awakening of French agriculture has raised major social problems at home.

Struggle for Survival

MODERN farming methods, as they spread, change the social structure of the French countryside. For some 100,000 large-scale farmers, working on 50 hectares of land or more, employing the bulk of hired labour and accustomed to mechanisation, industrial methods of production and accounting were no novelty. For over a million small producers, working on less than ten hectares, on the other hand, the growing cost of the means of production has meant a change from semi-subsistence farming to the full blast of a modern market economy. Such a transition cannot take place without strains and victims. The recurrent peasant demonstrations, with farmers blocking the roads with their tractors, or otherwise plaguing authority, have to do with this social transformation.

The figures given in the chart "Size of Farms" were computed on the basis of the 1955 census. Since then, 100,000 people have been leaving the land every year and this migration has resulted in amalgamations. Among the one and a quarter million farms of less than ten hectares, there were 380,000 of less than two hectares. For the bulk of their occupiers farming was only a part-time activity. The other interesting feature is that even seven years ago, two-fifths of all French farms were being managed by people over 55 years of age. The inadequacy of old age pensions explains the ageing structure of the agricultural population. Many old farmers cling to the land even if they hardly earn their subsistence.

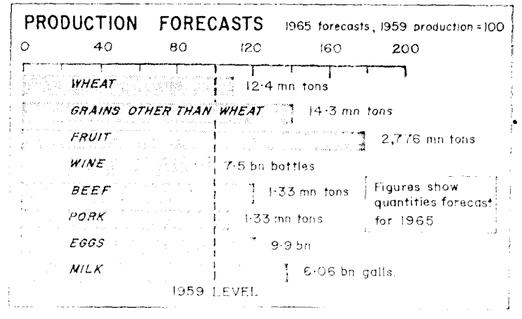
In spite of this peasant resistance, the number of small farms has certainly fallen since 1955. It is not yet clear whether it was more the big farms, or the medium ones, that seized this opportunity to increase their size. In any case, peasants squeezed off their land moved into town in preference to hiring out their labour in the country. In 1954 there were 612,000 full time farm labourers and 413,000 seasonal ones. Wage-earners accounted for less than 30 per cent of agricultural manpower. The proportion has probably declined still further. The modernisation of farming did not involve a greater use of hired labour, but rather a heavier outlay on capital equipment. The use of machinery is no longer limited to big farms. Younger men, who have entered the profession since the war, have sought a chance of survival in mechanisation. Heavily in debt, they are worst hit when the receipts do not come up to expectation. It is no accident that young men on tractors have been the leaders of peasant demonstrations in recent years.

These changes have gradually found reflection in the policy of farmers' unions. In the past, these unions, dominated by big landowners, were merely asking for tariff walls and higher home prices. The latter slogan was a common denominator for the big wheat and sugar-beet growers of the Paris basin or the north, trying to consolidate their advantage (in the Ricardian term, to reinforce their differential rent) and for the mass of smallholders, hoping to survive at the margin. The first sign of transition was the appearance of the new, and rather vague, slogan of "parity with the towns". But in the last couple of years or so, under the growing influence of Young Farmers' Circles, the unions have been making entirely new demands. They have been asking for the shortening of the distributive circuit and for tax privileges for co-operatives. They are demanding a reform of property laws to give security of tenure, and a prohibition of the purchase of land by non-farmers. They want the regrouping of small parcels of land to be speeded up, and demand that efficient small producers should be helped to acquire enough land for economic working. The elimination of the tiny farm seems to be taken for granted. The struggle for the survival of the medium farmer is now on.

These demands have put the government in a dilemma. On one hand, it does not want to interfere with the working of free enterprise and hinder the process of concentration. On the other, French rulers, particularly since Napoleon, view the farming community as the conservative backbone of the nation. Left to themselves the forces of the market tend to reduce entire regions of the centre and the south-west to what has been described as the "French desert". Besides, prosperous medium-sized farmers are less dangerous politically than a growing urban proletariat. If governments have hesitated which road to follow, the agricultural law of 1960 and even more the Pisani decrees, enacted last month, have been largely inspired, at least on paper, by the demands of the young farmers mentioned above. In particular, special official bodies are to be given priority (or the right of pre-emption) in the purchase of land coming up for sale.

It remains to be seen how the laws will be applied. The criteria for both the priority and the subsequent distribution are still to be determined. In any case, other factors, too, are bound to affect land redistribution. The price of agricultural land of a given quality in France is only a third of what it is in Germany, and it is likely to attract purchasers from the other common market countries when the common agricultural policy will be in full operation. The opening of frontiers may also increase the inflow of foreign (particularly Italian) agricultural labour.

On the whole, the common market is bound to accelerate the process of concentration. A table of French farming structure in, say, 1970 is certain to be strikingly different from the one given here. All that is in question is whether large estates or medium farms will have gained most in the meantime. With fair confidence it can be predicted that French agriculture is doomed to larger units of production, to higher output and to growing surpluses. The transition will continue to be painful and politically troublesome. In the circumstances, it is not surprising that French negotiators are bargaining hard for extra income from exports, with which they may hope to soften the impact of their country's agricultural revolution.



New Pirates on the China Coast

FROM OUR CORRESPONDENT LATELY IN MACAO

MACAO'S Portuguese authorities have proudly announced that their colonial garrison of giant blackamoor troops from Mozambique will be replaced by white troops. The announcement coincided with accusations from Peking that the little colony was harbouring Chinese Nationalist saboteurs, who were blamed for mysterious and apparently pointless explosions across the border in China. But in fact the changing of the guard was dictated solely by a Lisbon decision to pay all loyal troops abroad on the same scale, irrespective of colour.

There have been other strange Macao involvements with the international scene during an eventful month, but as usual the involvements prove on examination to be indirect and subject to external influences. Portugal, for example, finally exacted tribute from Macao's Indian nationals, who, after being detained as a reprisal for Mr Nehru's "exhausted patience" in far-off Goa last year, were deported amid tearful farewells from old Portuguese, Chinese and Eurasian friends and neighbours. The 14 men, 10 women and 39 children, still slightly bewildered, all had to go, but civilised Macao officialdom, with a sympathetic eye to the telescope, ensured that they would not lose their humble savings. There is indeed considerable selfish indignation in high places in Macao at the deportation on Lisbon's orders of these Indians. Four old men among them controlled the thriving goats'-milk industry, which, in the absence of reliable dairies, was regarded as vital to the health of the colony. There is little confidence that the Chinese who bought the 300 pampered goats will care for them as tenderly as the Indians did. Most of the deportees will try to make new lives in Hongkong.

Other notable events have confirmed the theory that Peking, despite its forced grumbles about saboteurs, exercises the strongest influence in Macao. To illustrate, the contract for a monopoly of the import of gold into Macao—which means, of course, a monopoly of gold-smuggling out of Macao—was surprisingly renewed for another two years with the old syndicate headed by the redoubtable millionaire member of the Communist party, Comrade Ho Yin. Comrade Ho combines chairmanship of the Macao Chamber of Commerce with membership of the Peking National People's Congress. He pays regular visits to Canton in his shining American limousine (with the status number of 555), bearing to his party superiors transistor radios, cameras and other capitalist tokens of affection and good will. His syndicate's success in renewing the contract—on terms which were, as usual, undisclosed by the Portuguese government—surprised local observers and depressed the new gambling syndicate from Hongkong, headed by Mr Stanley Ho (no relation of Comrade Ho Yin) and Mr Teddy Yip. The Ho-Yip syndicate had had high hopes of winning at least a share of the long-standing Ho Yin gold monopoly because of its pledges of a generous allocation from the profits of its newly won gambling casinos to Macao investment and industry. "Stanley and Teddy had better join the party" is the cynical judgment in Macao.

Peking's influence in Macao affairs was made manifest even more blatantly by the constitution of the official mission which left last week to promote trade between Macao and Portuguese Angola and Mozambique. The Portuguese chief of Macao's economic department went along for the ride, but the other four members were all Chinese nominees of Comrade Ho Yin.

On the cultural front, Macao's debt to Australia was deepened by final agreement that 150 greyhounds would be imported from Sydney kennels to the new dog-racing stadium, to help Macao in its effort to attract tourists. Already 10 Australian-made poker-machines, known to the Chinese as "hungry tigers," are operating profitably in the colony's new casinos. One of these machines last week paid off a 1,500-to-one jackpot to a normally impassive Chinese woman, who immediately had hysterics; a more resounding event, supporters of the gambling industry insist, than any explosions across the border.

Even the operations of these innocent Australian machines by the Ho-Yip gambling syndicate have fallen under the baleful shadow of Comrade Ho Yin. Angered by the intrusion and ambitions of the upstart Hongkong syndicate, he has scheduled the departure of his late-night ferry steamers to Hongkong for 1.30 instead of 3.30 a.m. Mr Ho and Mr Yip are accordingly planning to augment the already extravagant ferry service between Hongkong and Macao with their own vessels and also, it is whispered, to hand out free tickets to foil the Ho Yin syndicate. "It was simpler in the old days," as Mr Stanley Ho observed, "when the pirates on the South China coast had never heard of communism."

Spain's Buoyant Summer

FROM OUR SPECIAL CORRESPONDENT

DESPITE the deflation of "European" hopes caused by their government's reprisals against Spanish participants in the Munich congress last June, most articulate Spaniards are in a buoyant mood. Primarily, no doubt, because of the bracing tang of prosperity that is in the air. Coastal towns report up to 25 per cent more foreign tourists than last year. The Spaniards themselves, foreign tourism and the spring strike wave having fattened many of their pay-packets, are streaming to beach and mountain in greater numbers than ever before. And at times horrifying mushroom growth of hotels, motels and holiday "chalets" is, of course, breaking out on every promising site. But factories and dams are being built, too, and new blocks of flats are reshaping many a skyline.

But the recent government changes and the long-awaited handing-over of the World Bank report have also contributed to the buoyant atmosphere. The new minister of labour, Sr Romero Gorria, has made a favourable impression by dropping the more puerile clichés of *sindicato* (official labour organisation) cant and stressing the "urgent need" to raise the living standards of Spanish workers. During August, to everyone's surprise—and not least to the surprise of the *sindicatos* themselves—he intervened, in the workers' favour, in a wage dispute in the pyrites mines of the Rio Tinto. This method of heading off labour trouble is an innovation; it is expected to be repeated. The new minister of information, Sr Fraga Iribarne, has committed himself to a revision of the press code, and greater freedom of expression, before the end of this year. It is no longer fashionable in official circles to sneer at democracy. What to do instead presents something of a problem. Sr Fraga Iribarne declares that Spain is evolving the kind of democracy best suited to its national character. Last week he allowed his censors (not yet unemployed) to pass for domestic publication a statement by the Spanish ambassador in Washington of the kind that used to be made strictly for foreign consumption; it spoke of Spain as "advancing step by step toward a regime of liberty, economic progress and social justice."

The government's ready acceptance of the World Bank report (discussed in *The Economist* last week, page 720) has strengthened confidence in the country's economic future. Its essential points were approved by the Spanish ministers who handle economic matters before it was handed over, and a development plan incorporating its recommendations is already being drawn up. Satisfaction greeted last week's announcement that the United States government is to subsidise the expansion of scientific research and technical education in Spain.

Even the news of the suspension of the Brussels negotiations between Britain and the European Economic Community—officially deplored because it will delay consideration of Spain's own application for associate membership—failed to cause any real dismay.

Officials covertly, and many liberal Europeans openly, are pleased that Spain has been given a breathing space in which to improve its economic and political standing. The pro-Europeans are still angry at the government's silly attempt to write off the Munich congress in June as a communist-inspired gathering, and at its spiteful treatment of the Spanish participants. They produce photostats of the letter dated June 2nd, witnessed by a notary, in which Sr Gil Robles informed the government that he meant to attend the congress and gave notice of the policy he intended to advocate.

But these same pro-European critics claim to know that at least half the members of General Franco's cabinet would have preferred a more statesmanlike response to the Munich congress: these were, generally, the ministers who had successfully advocated a conciliatory approach to the Asturian and Basque strikers. General Franco appears to have decided in favour of the backwoodsmen on the Munich issue for no better reason than to maintain, as is his custom, the internal balance of forces within his government. For all that, the regime's backwoods element was weakened in the July cabinet changes, and many Europeans expect the measures against Sr Gil Robles, Sr Prados Arrarte and their friends to be rescinded after a fairly short face-saving interval.

In this buoyant atmosphere, there has not been much sympathy with the Asturian miners who suddenly went on strike in mid-August, in one pit after another, for "*la semana inglesa*" (the five-and-a-half-day week). The Communists, while broadcasting, via Prague, praise of the miners' pluck, were embarrassed. They appear now to be opposed to unlimited strikes in single industries which may expose, isolate and exhaust the strikers; their preference is for co-ordinated stoppages of one or two days. Non-communist ind[illegible] grumbled that the Asturians had jumped the gun; having won substantial increases in the spring, they ought now to be content to support other groups of workers in the strike movements that are expected to develop in less favoured areas during the coming winter. [illegible] that a fresh wave of strikes is inevitable, one was hastily assured; the new minister of labour was ready to repeat his Rio Tinto intervention where collective bargaining broke down. Even on the generally sombre labour front, a more hopeful outlook is discernible.

Post Mortem on New Guinea

FROM A CORRESPONDENT IN AUSTRALIA

AUSTRALIANS feel that their country has cut a poor figure in the affair of West New Guinea. Perhaps it would have cut a poor figure whatever it had done. It could hardly, at this late stage, have gone to war as the sole ally of the Dutch, without British or American support, in order to maintain a colonial power that is in haste to get out. Still, the fact remains that Australian policy over the last dozen years has failed to prevent the worst possible result from Australia's point of view, namely the rewarding of Indonesian aggression.

If the outcome was to be the enforced cession of West New Guinea, though with a masquerade of negotiation, and if Australia was to acquiesce, then it would have been better to take a different attitude from the start to the Indonesian claim, and at least press the Dutch to negotiate, and so avoid raising false hopes in The Hague. In that case, too, Australia would have done better not to use its influence to prevent the matter being dealt with in the United Nations; the Dutch capitulation might then have been a less painful one than the present agreement. If it had been made clear to the Dutch years ago that they would get no military support, they would have been spared the wasted expense of their programme of rapid development and the humiliation of having to abandon it after two years. The Papuans whom they were educating to take over the government would not now be faced with the disappointment of their hopes (for what faith can they have in an Indonesian undertaking to allow them self-determination by the end of 1969?) or with the fear of being persecuted by their new masters for having collaborated with the Dutch. The ostentatious build-up of Indonesian force would not have taken place; and Australia would have avoided a sad display of weakness.

Under a Labour government Australia had played some part in promoting the handing-over of the Netherlands East Indies to the Indonesians. But the Menzies government that followed, not being anxious to share a frontier in New Guinea with an unstable power, which might go communist, was very content that West New Guinea had been reserved for further negotiation and was still in Dutch hands. It did not, however, wish to say so, since whereas the Indonesians would be in the area forever, the Dutch clearly would not—though no one at that stage would have dreamed that they could be forced out so quickly. In vain, therefore, did the Dutch press Australia for a promise of military support in the event of attack. The most they could get (in 1957) was an agreement on administrative co-operation which proclaimed it as the aim of both powers eventually to bring their Papuan populations to self-government. In a communiqué after the visit of the Indonesian foreign minister to Australia in 1959, Australia stated its recognition of Dutch sovereignty as a legal fact but added (without any proviso here about Papuan self-government) that if the Netherlands and Indonesia agreed without duress upon a change of sovereignty, Australia would recognise that agreement.

Meanwhile Australian policy was to seek repeated assurances from Indonesia that force would not be used. In the intervals of giving these assurances Indonesian leaders would make warlike speeches, whereupon the Australian ambassador to Indonesia would protest that his government would view with grave concern, or could not regard with indifference. No wonder the Indonesians were not impressed. They were rapidly building up their armaments, while Australia's own meagre defence expenditure was allowed in real terms to slide down. When eventually Indonesia [illegible] a small way use force, Australia became loud in favour of negotiation.

In the upshot, Australia now has to its north a country which has ten times its population and considerable military strength. Indonesia has been taught that force can be made to pay without actually using it. Sir Garfield Barwick has obtained Indonesia's assurance that it has no designs on the Australian half of New Guinea, but that might not be worth very much. There is more comfort in the thought that any attack on Australian territory should qualify for American assistance under the Anzus pact—but the United States might be otherwise engaged; or a new Mr Bunker might appear with a new compromise plan.

Meanwhile the discomforts of sitting on the fence are not yet ended. Eight thousand Papuans from West New Guinea have applied for entry into Australian New Guinea. To accept them would no doubt offend Indonesia and in any case would add greatly to the administrative problems and costs of the Australian territories. To refuse them is to expose them to the danger of Indonesian revenge, and perhaps to increase cynicism and distrust among Australia's Papuans about the promises of advancement and self-government on which they also are being brought up. The Minister for External Affairs has said that applications for entry will be dealt with on their merits and it remains to be seen what this means.

Given another two years or so, the Papuan elite of West New Guinea might have commanded enough respect as politically conscious people to plead their own case before the world. They were overtaken by the speed of events, as Australian policy was also. The lesson is being drawn that a nation cannot hope to persuade its allies to safeguard its interests without taking any active steps itself, nor aspire to be a guardian of the peace without visible strength and an apparent readiness to use it.

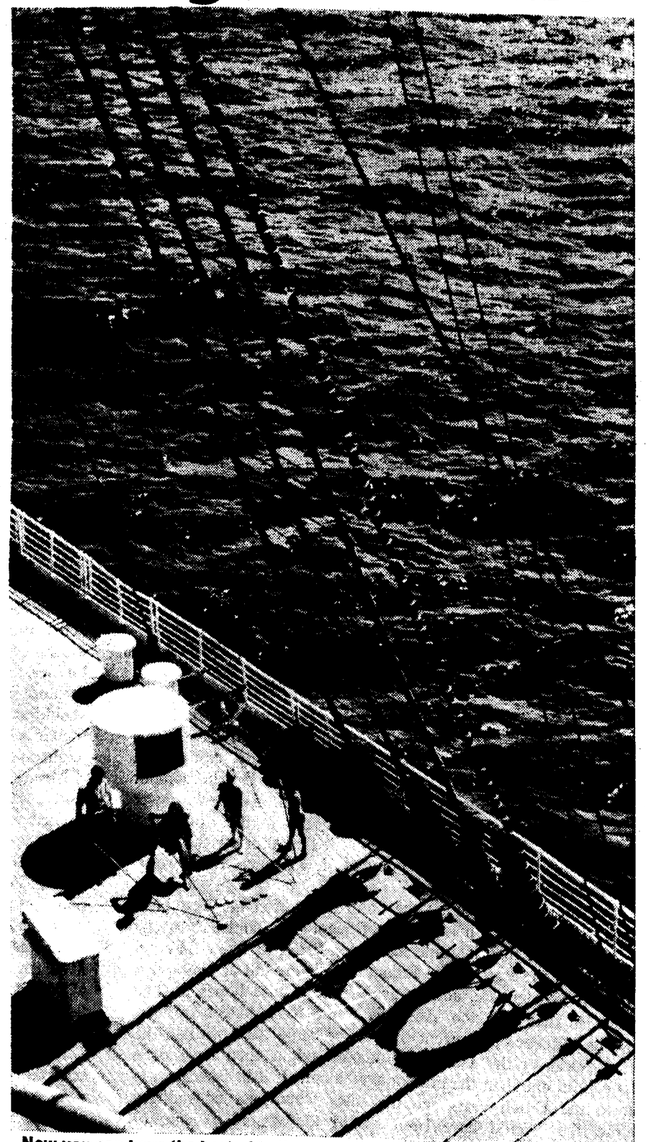
NEW YORK by Queen
in a glorious long weekend!

You go aboard one of the great 'Queens' on a Thursday and are in New York on the following Tuesday. In between you have four carefree, invigorating days... tempted by magnificent menus... royally entertained... splendidly served. Whether you are business or pleasure bound, there is no better start or finish to your visit than this brief but bracing holiday at sea. It costs so little of the working week and pays such splendid dividends in rest and relaxation.

FARES BY 'QUEEN' LINERS
First class from £156.10
Cabin class from £98
Tourist from £80.10

REGULAR SAILINGS FROM SOUTHAMPTON AND LIVERPOOL
Consult your local travel agent or CUNARD LINE, Cunard Building, Liverpool, 3 (Liverpool Central 9201); 15 Lower Regent Street, London, S.W.1. (WHItehall 7890); 88 Leadenhall Street, London, E.C.3. (AVEnue 3010).

CUNARD
TO USA AND CANADA



Now you can have the best of both ways across the Atlantic! The partnership of B.O.A.C. with Cunard and Cunard Eagle Airways provides an unrivalled choice of services and routes by sea and air, and a more comprehensive service from your Travel Agent.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

New Stage in Space

WASHINGTON, DC

A SORT of cyclical rhythm has prevailed in the American space programme, whether the President has been General Eisenhower or Mr Kennedy, ever since the Soviet Union shocked the United States by launching the sputnik which opened the space age in late 1957. That first Soviet feat and the successive Russian accomplishments in space have all been followed by reassuring statements from American officials, politely minimising the extent of the Russian achievements and insisting that space exploration in the United States is proceeding on a satisfactory and orderly basis with no need for acceleration. On each occasion, however, not much time has passed before the American programme has indeed been speeded with additional spending and perhaps with some reorganisation of the general space effort. Then agitation in the United States for more activity in space has settled down again until the next Soviet surprise.

Following the most recent of these surprises, the twin orbiting of the two Soviet cosmonauts, the point has now been reached in this cycle where the Administration is planning to increase still more its now massive spending for space exploration after having intimated not many days ago that no such expansion was in prospect. The difference this time, however, is that the latest Russian success has provoked a basic change in policy: greater emphasis is being put on the military aspects of space. This has long been desired by the Air Force and the precision with which the Russians performed their double orbit gave the Air Force and its partisans in Congress a chance to propagate a nightmarish prospect of the Russians winning dominance in space and developing the ability to bring the United States to its knees by putting into orbit hydrogen bombs that could set the entire North American continent aflame. As President Kennedy pointed out in his press conference last week, it is difficult to see how supremacy in space can change the military balance of power as long as both sides in the cold war are able to annihilate each other with intercontinental ballistic missiles. Nevertheless, at the same press conference the President confirmed, as had already been rumoured, that there was to be a stepping-up of military spending in space.

The most likely immediate effect will be an increase of $500 million in the Air Force's space budget, to a level of $2 billion for the next fiscal year with greater spending likely in succeeding years; at the same time, the $3.7 billion at present allowed for the National Aeronautics and Space Administration, operated by civilians, may climb as high as $5.5 billion next year. This means that the Air Force has been given unwitting help by Major Nikolayev and Colonel Popovich in its five-year struggle for funds to build spacecraft with specific military applications rather than with the mainly scientific purpose of exploring the moon and the planets.

For the past eighteen months, the Air Force has been fighting Mr McNamara, the Secretary of Defence, and his young civilian assistants for a greater role in spacedom. As part of his campaign to resist the insatiable desire for more money of the uniformed services generally, and the Air Force specifically, Mr McNamara has staved off the Air Force's plans for a bigger space programme, but the scare talk generated by the orbiting of the Russian twins is forcing him to relent and to back down on his original statement that the latest Russian feat had no military significance.

The long and more basic struggle, however, has been waged between the Air Force and NASA, an agency created by Congress after the launching of the first sputnik for the precise purpose of preventing the military from controlling the space programme. Until now NASA has had all the best of it in what, apart from the enormous size of the stakes, amounts to a fairly typical Washington inter-agency struggle for power. All attention has been directed on the race to reach the moon and the civilian agency has responsibility for that effort. Moreover, the well-publicised activities of NASA and its glamorous astronauts are better suited to the vital task of enhancing the world prestige of the United States than are the Air Force's hush-hush activities in space.

So the grand designs in space of General Le May, the Air Force Chief of Staff, have been frustrated and he has been limited primarily to the secret launching of the "spy in the sky," unmanned reconnaissance satellites. The Air Force has made no progress so far, for example, in its plan for huge stations in orbit which would test the ability of man to exist in space for long periods of time. NASA once considered the development of such space stations but discarded the idea for fear that this might siphon money away from the primary goal of reaching the moon. Yet, says the Air Force, a space station would have incalculably more military value than a lunar expedition.

Now the Air Force may be able to start soon on such a project and at least it will be able to accelerate its plans for the Dyna-Soar, a winged spaceship far more manœuverable than the bullet-like capsules which carry the astronauts and of military importance because it can be controlled when re-entering the atmosphere and can land on conventional airfields. Opposed by Mr McNamara for reasons of economy and by NASA on the grounds that it duplicates present manned flights in space, Dyna-Soar is now expected to move out of the blue-print stage. Similarly, the Air Force seems likely to get more money for the development of bigger, more powerful rockets.

NONE of this means that NASA's programme is about to be cut back. The civilian agency may even accelerate its schedule enough to pull off a day-long orbit by an astronaut before the end of the year and it will keep to its plans to put a man on the moon before 1970 (and hopefully before the Russians do) and on Mars and Venus after that. Just this week, NASA performed its most impressive launching of an unmanned satellite, successfully firing off a spaceship that should come within 10,000 miles of Venus by December. And if the Air Force has powerful partisans in Congress, so does NASA. Senator Kerr of Oklahoma, one of the great lords of the Senate and chairman of the Senate Space Committee, is a powerful patron for the agency and has placed one of his *protégés*, Mr James Webb, as head of NASA.

What really has happened is that Congress has become increasingly uncritical about requests for funds for space, whether for lunar exploration or for the development of military spaceships. With few members able to appreciate the intricacies of this new world and most of them utterly unaware of the feuding between military and non-military spacemen, Congress tends to rubber-stamp any space proposal sent to it just to be on the safe side. The space budget is, in fact, rapidly approaching the status of a sacred cow which the defence budget already has in the halls of Congress. The scattered taunts of "moondoggle," heard from Republicans last year when Mr Kennedy first outlined his plans for exploring the moon, seem today like memories from another age.

Now and then a few rambunctious souls in Congress question whether the space programme is worth quite so much money at a time when domestic spending is under severe curbs. Senator Proxmire of Wisconsin, a gadfly Democrat with a flair for the unconventional, has been accusing NASA of waste and profligate spending, particularly in the construction of its new space centre at Houston, Texas. Other Congressmen are fearful of the impact on scientific research in general of the huge demand by NASA for scientists and this draining away of scientific talent is likely to be aggravated by the Air Force's greater activity in space. Some even dare to ask just how much a military spacecraft such as the Dyna-Soar adds to total defence preparedness and whether the frightening talk of Russian world conquest through space vehicles is not merely an Air Force ploy to win approval of its long-pending space proposals. But these are mere voices in the wilderness and they will do little to inhibit what may soon be the most expensive single endeavour of the government.

Congressional Record

LEGISLATORS will have earned their rest over the coming Labour Day weekend—in spite of its name it is a national holiday in the United States—if Congress allows itself even this much relaxation in its sudden last-minute rush to do what President Kennedy has asked and leave a record behind it in Washington on which to fight this autumn's election campaign. The record will be impressive in Mr Kennedy's view—obviously he has been forced to modify his ideas about what can be called impressive—if action is taken on the farm Bill, the drug Bill, the trade expansion Bill, the bond issue for the United Nations and the constitutional amendment outlawing the poll tax. This was the list given by Mr Kennedy at his press conference last week but in addition, in his nation-wide economic address a week earlier, he had asked for tax revision, for help for higher education and for unemployed young people, for more public works and for another extension of unemployment benefits for those who have been jobless for so long that they have exhausted their rights under the insurance scheme.

The last measure was turned down unexpectedly this week by the Ways and Means Committee of the House of Representatives, under the influence of the general improvement in the economic indicators during July; these made anti-recession measures seem less urgent. But the House has now approved the public works Bill, already passed by the Senate in a slightly different form; neither version gives the President as much as he wanted in the way of stand-by authority to help depressed areas in the event of a recession, but both provide generous amounts for this purpose for immediate use. The Bill authorising the United States to buy bonds issued by the United Nations to finance its operations in the Congo and the Middle East will not be brought up in the House until next week, in order to give the Administration time to try to undermine the opposition which endangers this measure, and consideration of the Bill appropriating funds for foreign aid has been postponed until September 19th for the same reason. On the other hand this week the House has dealt satisfactorily with the poll tax and has accepted without question the Senate's amendments to the communications satellite Bill; this makes it unnecessary for the Senate to vote on this Bill again and ensures that there will be no opportunity for yet another delaying action by its critics.

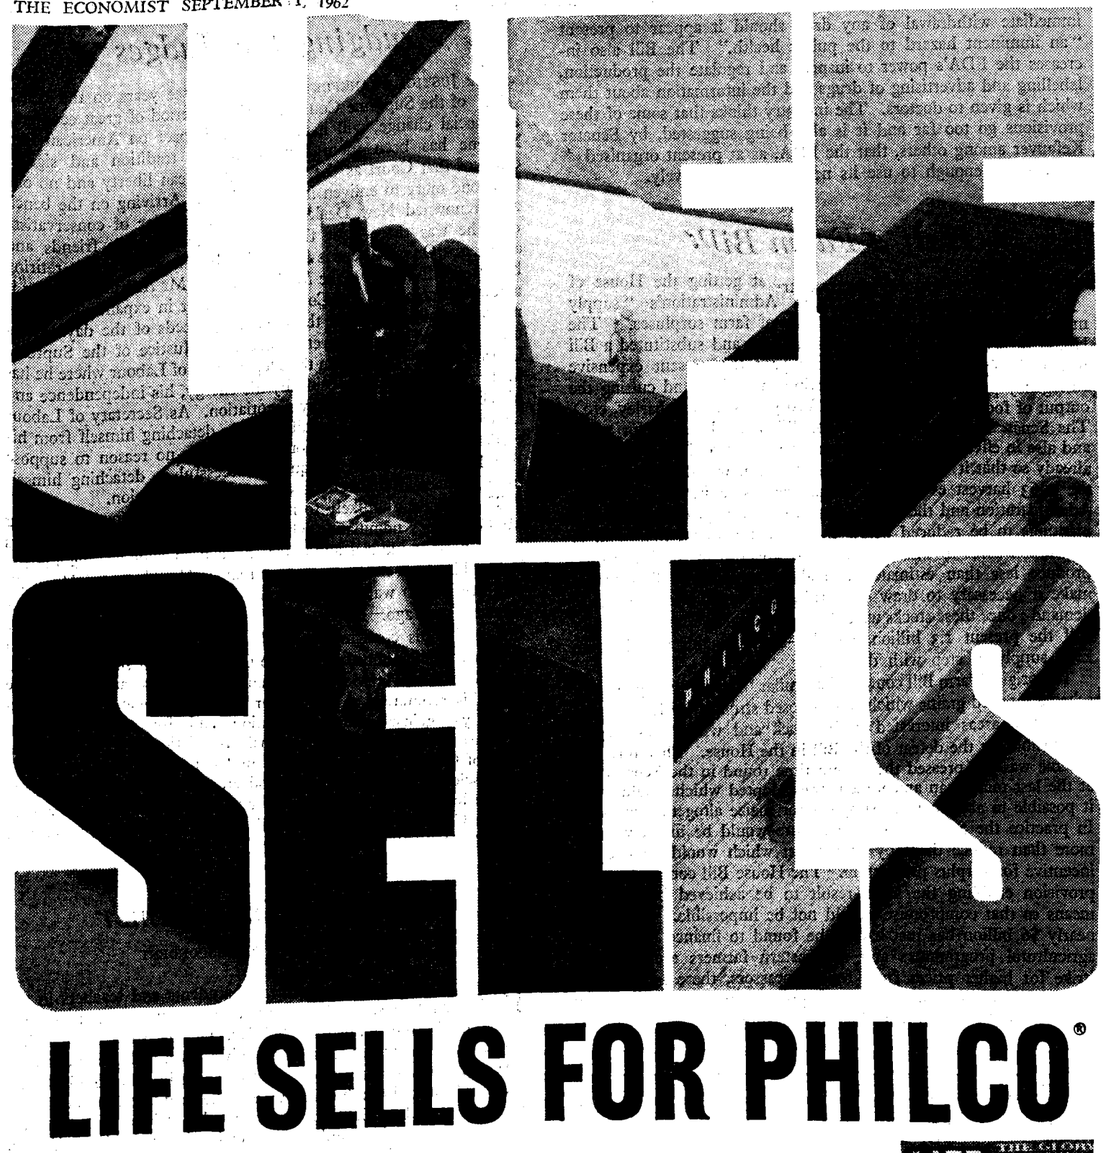
The Senate has been working even harder, as it needed to do. It has passed quite a satisfactory farm Bill, although it is one which may be hard to reconcile with the House's version, and a drug control Bill; the companion measure in the House has not yet come out of committee. The reverse applies to the trade expansion Bill, which has been passed by the House but is still in committee —and apparently in some difficulty—in the Senate. This has, however, made it possible for the Senate to deal this week with the tax revision Bill which might well have been lost in the rush to get home if it had been left to the end of the session. What comes out of the Senate, however, will probably be only a very emaciated version of the tax changes which the President wanted originally, or of those which the House gave him. But at least it will be better than nothing and, if all goes well with the trade Bill, this will provide a triumphant end to this disappointing session.

Kefauver's Justification

THE Drug Industry Bill of 1962 should really be called the Kelsey-Finkbine Bill after the two women who gave substance to what had been until then only a piece of shadow boxing with the drug manufacturers. It was Dr Kelsey and Mrs Finkbine who dramatised in the popular imagination the need for more control of the industry, demonstrated by America's narrow escape from the thalidomide disaster which struck Europe's babies. Suddenly the Bill to tighten the regulations governing the manufacture and sale of drugs, on which Senator Kefauver had held hearings two years ago and which had just been reported to the Senate in a form so weak as to be comparatively useless, in his view, became a piece of "must" legislation in the opinion not only of the President but also of the Senators and Representatives who have to face the voters in November. Even the drug manufacturers, recognising that they must do something to re-establish public confidence in the safety of their wares, withdrew most of their opposition to the original Kefauver proposals. All but one of these were promptly restored to the Bill. It has now been passed by the Senate and is expected to sail through the House of Representatives. The only serious omission now, according to Mr Kefauver, is the absence of any attempt to force manufacturers to release their patents sooner and thus to reduce the present "monopolistic" prices of drugs.

Dr Kelsey became a heroine because, as an official of the Food and Drug Administration she refused to allow the sale of thalidomide in the United States in spite of great pressure from the manufacturer. The new legislation strengthens the agency's power to prevent the commercial marketing of a new product until it has been approved. Mrs Finkbine, who wanted an abortion because she had used the sedative and feared that her child would be deformed, had obtained the thalidomide abroad; but it had in fact been prescribed for nearly 1,600 patients, including about 200 pregnant women, in the United States by doctors who had received experimental samples from the manufacturers. The Bill authorises the FDA, which is already expanding its control over clinical trials of new drugs, to demand reports on tests and to require that these should be made on animals before humans and that the interest of the patient should be considered.

One of the most important provisions of the Bill is that a new drug must be proved effective as well as safe before it is sold commercially. Another allows the government to order the



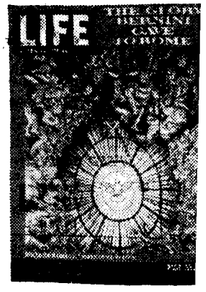
Seven years after their first use of the International Editions of LIFE, Philco Corporation, International Division, comment:

"All the logical reasons for advertising are secondary to its principal objective of increasing sales.

"When ten Latin American Philco distributors heartily agreed to participate with us in the cost of a special two-color ad, they confirmed our confidence in the local, salutary sales effects of LIFE En Español as well as its sister publication, LIFE International."

In 146 countries men and women at the centre of things read LIFE. They start sales moving. These are the readers Philco are already reaching.

LIFE can sell for you, too. For more information about LIFE International, its advertising edition for Europe, as well as LIFE's Spanish language editions for Latin America—write to Robert H. Garey, European Advertising Director, Time & Life Building, New Bond St., London W.1.

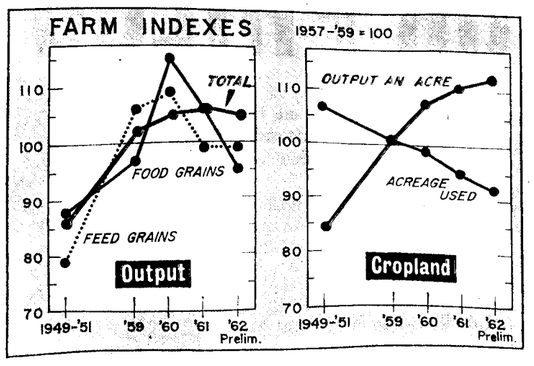


immediate withdrawal of any drug should it appear to present "an imminent hazard to the public health." The Bill also increases the FDA's power to inspect and regulate the production, labelling and advertising of drugs and the information about them which is given to doctors. The industry thinks that some of these provisions go too far and it is also being suggested, by Senator Kefauver among others, that the FDA, as at present organised, is not efficient enough to use its new powers effectively.

Half a Farm Bill

THE Senate is having a second try at getting the House of Representatives to accept the Administration's "supply management" answer for the problem of farm surpluses. The House turned this down early this summer and substituted a Bill which simply extended for another year the present expensive emergency programmes for supporting the prices and cutting the output of food grains (wheat) and feed grains (maize, barley, etc.). The Senate's version of this second Bill does the same for maize and also in effect for wheat, since next year's crop is being planted already so that it will be hard to apply the new scheme until after the 1963 harvest even if the House agrees to it. But then the Administration and the Senate want to make it possible for wheat plantings to be reduced below the present national minimum of 55 million acres to whatever level the government decides would produce less than estimated annual consumption. This would make it necessary to draw on surplus stocks of wheat to satisfy demand; once these stocks were down to a desirable reserve—about half the present 1.3 billion bushels—then the aim would be to keep supply in step with demand.

The original farm Bill contained a similar "supply-management" scheme for feed grains which was opposed strongly by Representatives from areas interested in livestock and which was largely responsible for the defeat of the Bill in the House. Therefore this scheme was not pressed the second time round in the Senate, but at the last minute an amendment was adopted which would make it possible to abolish price supports for maize altogether in 1964. In practice the Secretary of Agriculture would be unlikely to do more than reduce them by an amount which would remove the incentive for surplus production. The House Bill contains a price provision enabling the same result to be achieved by different means so that compromise should not be impossible. And when nearly $6 billion has just had to be found to finance next year's agricultural programmes and midwestern farmers are about to strike for higher prices from food processors, there is plenty of reason why Congressmen should approve some new approach to the farm problem before facing the electorate.



Judging the Judges

MR JUSTICE FRANKFURTER'S twenty-three years on the bench of the Supreme Court, covering a period of great economic and social change, will have a lasting impact on American law. No one has been more devoted to the tradition and significance of that Court as the shield of American liberty and no one has done more to enliven its proceedings. Arriving on the bench as a renowned New Dealer he became a pillar of conservatism once he was there—but the liberals were still his friends and admirers. One of them is succeeding him now that he is retiring because of ill-health. Like Mr Frankfurter Mr Arthur Goldberg is a Jew and comes to the Court as a believer in expanding governmental activities to meet the expanding needs of the day. He is the first trade union lawyer to become a Justice of the Supreme Court. He goes there from the Department of Labour where he has made an excellent impression by his energy, his independence and his ability to settle strikes by negotiation. As Secretary of Labour he appears to have had no difficulty in detaching himself from his earlier trade union connections, so there is no reason to suppose that he will not now be equally successful in detaching himself from his present connections with the Administration.

The Senate is unlikely to make any difficulty about confirming Mr Goldberg's nomination, although some of President Kennedy's less important judicial appointees have been kept waiting far too long. The most notorious case is that of Mr Thurgood Marshall, the Negro who was nominated for the Second Court of Appeals almost a year ago. He has been serving on an interim basis ever since, with his confirmation held up by a subcommittee headed by Senator Olin Johnston of South Carolina. This southern Democrat objects to Mr Marshall because of his race and because he made his reputation as the lawyer who argued—and argued successfully—against racial segregation and for civil rights for Negroes on behalf of the National Association for the Advancement of Coloured People. President Kennedy commented on this unconscionable delay last week and attempts are now being made by the leaders of both parties to bring the nomination to a vote before Congress adjourns. If this can be done it seems certain that Mr Marshall will be confirmed.

To School in Summer

FROM A SPECIAL CORRESPONDENT

FOR an ever-increasing number of students and teachers in the United States, the long summer vacation (eleven to sixteen weeks) has become a busman's holiday. During August a bewildering variety of summer sessions in universities, colleges and secondary schools come to a close, most of them in time to allow staff and students a little holiday before the regular term begins in September. About half the state school districts in the country hold summer sessions and the proportion is much higher if rural areas are excluded. The number of people enrolled for the summer at institutions of higher learning has grown from 132,000 in 1919 to 1,191,000 in 1957, the last year for which official figures are available. The Association of Summer Session Deans and Directors reported a 9 per cent increase at its member institutions in 1961 over the previous year.

The motives behind the growing practice of summer studies are as various as the programmes that serve them. The further education of teachers has always been a leading element; indeed, the summer session traces its descent from the early nineteenth century "teacher institutes," brief gatherings at which were discussed such subtle questions as how to prevent whispering in class or "should the teachers encourage pupils to chew tobacco?". By the last quarter of the century colleges and universities, with Harvard among the leaders, were beginning to provide a few summer courses for teachers. In the twentieth century with higher qualifications being demanded of teachers, with the vast growth of schools of education and, more recently, the provision that expenses incurred in "maintaining or improving skills required by the taxpayer in his employment" are deductible under the federal income tax, the incentives for school teachers to become summer students have increased. A number of philanthropic foundations now help high school teachers to study during the summer. The National Science Foundation, to take a leading example, provides NSF Institutes in many universities, where instructors in mathematics and the sciences from secondary schools can brush up on recent developments in their fields.

But the education of teachers is no longer so clearly the dominant element in summer sessions. A study carried out at the University of Minnesota in 1956 showed that school teachers and administrators accounted for but a third of the summer enrolment, while three-fifths were regular college or university students, working to get their degrees sooner, or simply taking courses which, for one reason or other, they had been unable to take in the ordinary term. At the University of Wisconsin in 1961 regular students accounted for nearly three-quarters of the summer total and school teachers and administrators less than one-quarter. What proportion of the regular students are in effect taking remedial work is a sensitive issue. The impression that summer sessions for non-teachers are primarily a way of catching up with the curriculum or of repairing previous sins of omission is not without foundation; the director of the Harvard Summer School has indicated that perhaps a third of the Harvard undergraduates enrolled at it "have some kind of an academic deficiency."

But it is no longer to be assumed that summer schools are largely hospitals for the academically halt and maimed. There is evidence, in the Minnesota and Wisconsin studies, that summer students do not vary greatly from those at work the rest of the year; this is scarcely surprising, since they are, to an increasing degree, the same people. Whether they get as much done in July as they do in January remains debateable. Summer schools emphasize unabashedly their recreational and general cultural advantages. Most of them are supported wholly or in large part by tuition fees and advertisements such as this, from Humboldt State College, California, are not uncommon: "This summer try the cool, green Redwood Empire. . . . Study six weeks, and then see the [Seattle World's] Fair!". The American University, Washington, DC, wisely says nothing about climate but bills itself as the place "Where World Events and Students Meet" and offers a variety of attractions ranging from an "Institute on Driver Education" to one on "Human Relations and Intergroup Understanding." Summer sessions are usually shorter than regular terms. They therefore give many who teach or study in them a feeling of education by kaleidoscope or just plain intellectual indigestion. Classes often meet five times a week. Examinations, term papers and all the other familiar afflictions of American higher education become even more frequent and distracting than usual.

On the other hand, the very fact that the summer session is something of an adjunct to the main business of a university or school usually gives it flexibility; experiments are made more readily, without objection from tradition-bound staff committees or

Wigs Transformed

FROM A CORRESPONDENT IN NEW YORK

WHEN Mrs Kennedy, who sets the fashion pace on the New Frontier, took a wig with her to Paris last year the women who had hesitated about this new fad immediately joined the rush to buy at least one wig and to boast about it. All the best people in the film world and in New York's "Jet Set" probably have two or three each by now; secretaries save their money to buy wigs; winners of television and other contests demand them as prizes. Down-at-heel poodles have been seen in them and even men, who once went stolidly bald, are awakening to the lure of toupees.

There are five or six quality wig makers in the country and scores of smaller firms which churn out machine-made pieces by the thousands. At last count, between two and five million women owned wigs, some because of "hair problems" but many for the pure joy of it; they have helped to make the wig industry into a $40 million proposition which now advertises its products by their real name, instead of calling them "hair pieces" or "transformations." Wigs are priced at between $2.95 and $750 apiece; the average charge for a good one is $250. The cost depends largely upon the origin of the hair and the delicacy with which it is blended and knotted into the finished article.

Italian women possess the very finest, most lustrous hair, which has been neither "permed" nor dyed, and quality wig makers have been paying prices as high as $250 a kilogram for the rarer colours such as natural white. Brunette hair is the easiest to find and consequently the least expensive, although prices have climbed since last autumn from $5 a pound to $60 a pound. Last year Italy exported over 12,000 pounds of hair to

the United States, which imported 35,000 pounds altogether during the year.

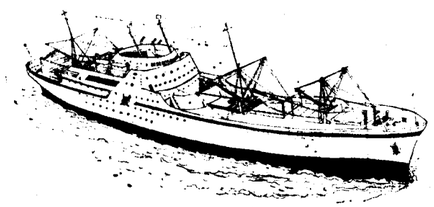
To make a fine wig is an art. The hair is selected and often some 300,000 strands are blended and knotted into a silk and nylon foundation so that the hair actually appears to be growing. The finished piece is easily attached to the head by elastic behind and springs at the side and front. A woman can then brush her own hair up over the front of the wig so that no telltale traces remain. A good wig must not be dyed, for this rots the foundation. Women find it safer and more fun to own two in different colours. Since Italian hair is expensive and hard to come by in large quantities, makers of lower quality wigs have been importing coarser, cheaper hair from the heads of Korean and Japanese women, or sometimes from the backs of goats or yaks, which they sew by machine into cotton foundations for the mass market; synthetic hair may also be used. One way of telling a good wig from a bad one is the weight, which is about three ounces for an expert piece and double that for a cheaper one.

Wigs have emancipated women from the time they used to spend at the hair dressers. Now they begin their daily shopping routine by dropping off the wig at a beauty salon, where it is dressed; they pick it up again at the end of the day. They can swim and engage in other active sports without having to worry about the state of their hair. Some women, in fact, have been able to say goodbye to their psychiatrists because their inner turmoils have been erased by the possession of a wig. Needless to say, wigs have made hats even more *passé* than they were, but they have brought new ancillary products onto the market—stands to keep wigs on, boxes to carry them in and so on. The fear now is that the latest "Marienbad" style, a simple straight bob, replacing the more complicated "semi-bouffant" fashions, may make wigs *passé* in their turn.

boards of education. For some kinds of work, short, intensive summer sessions are advantageous. At Stanford University, for example, a student can, by working full time at it, progress as far in the study of the Chinese language in a summer as he would normally in a whole academic year. The high schools are discovering that summer sessions can help the gifted child just as much as the slow learner. In Clayton, Missouri, a suburb of St Louis, the Mark Twain Summer Institute has been in operation since 1959, using facilities made available by the local Board of Education and money from private foundations. Its aim is to give teachers the chance to try out techniques designed for the unusually able secondary school pupil; the student body in 1960 consisted of 358 boys and girls, selected from 87 different schools. That Clayton is no isolated instance is proven by the presence in many other high school summer programmes of courses obviously aimed at the better students: beginning Russian or pre-university mathematics.

Some observers, reserve at the thought of educational facilities going unused or working at less than capacity during the summer months, have long urged that schooling at all levels be put on an around-the-calendar basis, with the summer term no different from any other. Universities have experimented with the so-called "trimester" system and those that operate on the basis of academic quarters (instead of two semesters a year) find it relatively easy to accommodate themselves, at least partially, to these demands. But such experiments have had indifferent success, partly because the supposedly idle facilities turn out to be quite fully utilised, what with the existing summer sessions and the array of conferences, workshops, clinics, seminars and institutes that generally accompanies them. In California this summer an enthusiast could attend a Conference on Classroom Creativity in San José or a six-weeks Institute on Communism at the University of Southern California (complete with "accompanying workshop," whatever that meant); or he might have escaped just over the border to the Lake Tahoe Music Camp of the University of Nevada. Through such activities there is scarcely a sector of the general public, from amateur sopranos to shop stewards, that is without some access to the groves of academe in summer.

Savannah—All at Sea?



LAST week's maiden voyage of the *NS Savannah*, the world's first nuclear merchant ship, involved even more upsets than ordinarily occur at such times. At one point, it seemed that a strike by the crew against their pay and living conditions might prevent her leaving port at all. Then, when she did put to sea, the nuclear reactor broke down temporarily. Nor are the longer-term prospects for the vessel unclouded, in spite of the official enthusiasm of the Secretary of Commerce. He expanded on the importance of the *Savannah* as a demonstration of the dependability and safety of nuclear ships; as part of the Atoms for Peace programme; and as a prestige symbol for the American merchant marine, much in need of some such stimulus. This last function will be enhanced by the tour which the *Savannah* is making, first of virtually every major American port and then of foreign ones.

On the other hand a sour note was sounded by representatives of the maritime industry itself; they cast doubts on the whole concept of using nuclear energy for merchant shipping. The critics complain that the $54 million spent on the *Savannah* would pay for five Mariner vessels of the type already widely in use, each of which would be faster and would be operated with a smaller crew, at only about half the cost and with about 35 per cent more capacity than the *Savannah's* 9,830 deadweight-tons. Built to carry 60 passengers as well as cargo, at a top speed of 23 knots, the nuclear vessel was no bargain to construct; it was built by the New York Shipbuilding Corporation under the joint sponsorship of the Maritime Administration and the Atomic Energy Commission. Nor, it can be safely predicted, will the States Marine Lines, which is operating the vessel for the government, find it a bargain in this respect either: not only does the *Savannah* carry a larger crew than a conventional vessel of the same size, but bonuses are also paid for the special skills which are required.

But for a prototype, which the *Savannah* is, none of this is either unusual or astonishing. Already the Maritime Administration is taking steps to close the cost differential both in construction and operation. The pressurised water-type reactor which drives the *Savannah's* 20,000 horsepower turbine engines is basically the same unit as was installed five years ago in the nuclear power station at Shippingport, Pennsylvania, and in the early atomic submarine *Nautilus;* it cost about $10 million. The administration aims to reduce this to $5 million in the near future and $3 million by 1966. The key to economy in operation may be the agency's study of the possibilities of using automation in cargo shipping, leading ultimately, it is hoped, to the crew-less vessel. Should these efforts to cut costs succeed, the one great advantage which the *Savannah* has over all other merchant ships afloat would be telling; she can cruise for three-and-a-half years on 130 pounds of uranium-235 fuel. An oil-burning vessel of the same size and horse-power burns that many tons of fuel in a single day.

Fraying Union

FROM A CORRESPONDENT IN CHICAGO

"IN unity there is strength" has always been a favourite catch-phrase of the American labour movement. But the meeting in Chicago a fortnight ago of the executive council of the American Federation of Labour and Congress of Industrial Organisations showed that among the leaders of the movement there is anything but unity today. Outwardly last month's differences appeared petty but they are evidence of deeper differences which may split the merged labour movement back into its old AFL and CIO camps. In 1955 the AFL, whose trade unions are organised mainly by crafts, and the CIO, which had broken away earlier to form industry-wide unions, joined together again. An executive council was established to meet three or four times a year to outline policy. Eighteen of its twenty-eight members are drawn from the conservative AFL and ten from the more liberal CIO. By agreement any vacancy is filled by a representative of the same group.

In 1961 Mr Buckmaster of the rubber workers, a CIO union, retired. The question of who should replace him was the immediate cause of the flare-up at Chicago, though the disagreements between Mr Meany, the former AFL leader who is the president of the merged organisation, and Mr Reuther of the CIO go much deeper than this and have been inflamed in the past by disputes over which unions should have the right to organise which workers. The CIO group unanimously selected Mr Helstein, the president of the packing house workers, to fill the vacancy but Mr Meany's immediate reaction was to veto the appointment because of the history of communist influence in the packing house union.

Could you work with records like these?

Lose vital papers and your business could be ruined. Yet many firms rely on ordinary steel cabinets, or out-of-date fire-resisting safes . . . which become fiery ovens in even a small blaze. In what kind of equipment are *your* vital records housed?

Chubb fire-resisting equipment has proved itself time and again. Saving hundreds of thousands of pounds—and vital records—for our clients all over the world. The latest Chubb equipment includes cabinets for every purpose, all insulated with protecting materials that will not deteriorate with age. It has been stringently tested in simulated conditions of extreme heat and collapsing buildings. And has been certified by distinguished, independent scientists and engineers.

Chubb have produced an invaluable booklet, 'A Matter of Time', that delves deeply into the whys and wherefores of fire resistance. While you think of it, ask your secretary to write for a copy today. There is, of course, no obligation at all.

SHUT THAT WINDOW—

—and keep COOL

It's better business to air-condition your boardroom and executive offices. Open windows let in distracting noise, dust, fumes; unventilated rooms grow stuffy, exhausting. But a Temkon *refrigerated* air-conditioner keeps the room cool, calm, fresh—brains alert and businesslike.

The Temkon 'Waispair' floor-standing unit is the world's quietest room air-conditioner. It just *breathes* out clean cool refreshing air, filters out dust, reduces humidity. And it even supplies background warmth between seasons!

One room, a suite or your whole building can be fitted with these elegant, slim-built units for less than half the price of a central installation. Each unit allows for personal control of room conditioning and cuts running costs.

.....

At the AFL-CIO convention in Miami last December the issue was shelved temporarily but last month, when the executive council convened in Chicago, the CIO unions insisted that Mr Reuther should thrash the whole matter out with Mr Meany. Mr Reuther, who will never agree to meet Mr Meany alone, took along as witnesses Mr Dubinsky of the ladies' garment workers and Mr Hayes of the machinists. At the confrontation Mr Meany charged the CIO with having rigged the Helstein nomination in order to cause him embarrassment; he also accused Mr Reuther of lying.

When these exchanges were reported to the CIO leaders their reaction was that the merger was impossible to administer and that probably there was nothing to be lost by breaking away from it. In the angry atmosphere of the meeting it appeared quite likely that the labour movement, which had struggled so hard for unity, might break apart. It was already known that Mr Reuther himself felt that the merger had produced only "unity in form, not in fact or substance. We merged but we did not unite."

MR HELSTEIN'S election to the executive council was not the only issue to cause serious difficulties. Both Mr Meany and Mr Reuther represent American labour at the meetings of the International Confederation of Free Trade Unions. Mr Reuther's alternates, both from CIO unions, are Mr James Carey, the president of the electrical workers, and the steel worker's president, Mr MacDonald. Recently Mr Meany objected to both of them, saying that Mr MacDonald took no interest in the ICFTU and that Mr Carey was unpredictable. This angered Mr Reuther and the CIO group and Mr Meany apologised to Mr MacDonald and withdrew his objections to him, though not to Mr Carey. Mr Reuther insists that whom he chooses to act for him is none of Mr Meany's business. The president of the AFL-CIO does not agree but the conflicts on both issues promised to be so serious that he himself proposed that they should be postponed until the council meets again in November, when they would be put at the top of the agenda.

By this means the ostensible unity of the labour movement will be preserved for another three months. But the CIO group has come to feel, perhaps for the first time since 1955, that an open rupture would probably not do it much damage. Its attitude is hardening but unfortunately Mr Meany also tends to be uncompromising on many issues. On the other hand he is very proud of having been the architect of the merged labour movement and of his position at its head. He would be reluctant to have it break apart into the bitterly opposed camps which existed before 1955. This may well explain Mr Meany's somewhat unusual willingness to go softly in Chicago last week.

SHORTER NOTES

To the great satisfaction of President Kennedy and of the Philippines, the Senate acted quickly to approve the Bill to pay $73 million as a final instalment on Philippine claims for war damage. The House of Representatives had voted this down in May but reversed itself early in August and decided by 194 votes to 35 to honour what President Kennedy called this "moral obligation." The Bill's provisions were tightened slightly but the offended outcry in the Philippines was the main factor in the switch.

Miss Amy Vanderbilt, the authority on etiquette, has been asked by the New York City Transit Authority to draw up a code of courtesy for the drivers of its buses and their passengers. Last week, before she started four weeks of research in the field—battlefield might be a better description—Miss Vanderbilt held a press conference in the back of a parked bus; the Transit Authority enlivened the proceedings with demonstrations by live actors of the sulky or autocratic driver (whose temper is often soured by having also to dispense tickets and change) and the fretful, overladen, pushing or actively rude passenger. This over, Miss Vanderbilt departed in her chauffeur-driven limousine.

Salt Lake has been shrinking steadily since prehistoric times, when it was as large as one of the Great Lakes. It has shrunk from nearly 4,000 square miles to less than 3,000 since 1896, when Utah was admitted to the union. The state, which claims all the land under its lakes and rivers, contends that it owns the wide strip of land exposed in the last 66 years and wants to lease it to chemical companies which are interested in extracting salt, potash and magnesium from it. But the federal Department of the Interior claims this marginal land as part of the federal domain and suggests that the dividing line should be the present edge of the water.

* * *

Correction:—Editorial handwriting was at fault again last week when it betrayed *The Economist* into giving the appearance of making an unjustified comment on the 1953 contract between the Hanna Mining Company and the United States government which is now being looked into by a Senate subcommittee. The last sentence of the note on this investigation of the stockpile, on page 700 of the issue of August 25th, should have read "this *nickel* contract could do with further examination," not "this wicked contract."

45,000,000 customers and a trader who knows them all

Parisians love to shop for the food and fabrics that have made France famous the world over. And in their midst is a trader from C. Itoh who knows their market as well as or better than most of them. Some of the edibles and many of the wearables in Parisian shops got there via C. Itoh, and some of the machines to make more, came from the factories of France the same way.

C. Itoh traders are stationed all over the world, wherever business is being carried on. These traders are experts in their fields, and a network of instantaneous communications puts one expert in touch with another at the touch of a button.

Whatever your business — importing, exporting or cooperative investment ventures — why not get in touch with your local trader from C. Itoh?

From one of the great industrial complexes of the world—Japan—a myriad of high quality products flow out in ever-increasing volume to all parts of the world. A good many of them proudly bear the SDK mark, especially artificial graphite electrodes for electric steel furnaces and low carbon ferrochrome, an alloy which goes into the making of stainless steel. This means they come from Showa Denko, an integrated chemical and metallurgical manufacturer and a major contributor to Japan's continuing industrial progress. SDK products serve with distinction in numerous and diverse fields, from agriculture to atomic energy. The main lines are electrodes, ferroalloys, aluminium, abrasives, petrochemicals, synthetic resins, organic chemicals, inorganic chemicals, chemical fertilizers and reactor materials. They're manufactured at Showa Denko's eleven plants with advanced technology and strict quality control.

Share in the benefits offered by the high industrial standards of New Japan. Use SDK products.

If you'd like to know more about our products, please write for our general catalogue.

What you should know about the remarkable reliability of KLM before you next fly to any one of 11 capital cities in the Far East, including Tokyo via the Polar Route

Many experienced travellers believe that KLM is pre-eminent in air travel. They know that from the U.K. through to destinations all over the world, they can rely on KLM to give them the service, hospitality and comfort that have made KLM world-famous. KLM links continent with continent: flying you to the Far, Middle and Near East; to North and South America; to Africa and Australasia; to 21 European countries. Read 19 of the facts behind the remarkable KLM record for reliability and top efficiency in air travel.

1. KLM serves sixty-eight countries throughout the world; with a famous reputation for flights that depart on time and arrive on time.

2. KLM flies you fast to the Far East. To Karachi, Delhi, Calcutta, Rangoon, Bangkok, Saigon, Manila; over the Pole to Tokyo; and down to Sydney. All by DC-8 Jets.

3. KLM DC-8 Jet Polar Route flights to Tokyo operate every Wednesday and Saturday.

4. From London, Manchester and Glasgow KLM offers you fast, convenient connections for their Far East Jets every day. Near and Middle East points are served by jet-powered Electra II's.

KLM reliability and maintenance

5. KLM has its own £2,000,000 jet maintenance base in Amsterdam. A remarkable vote of confidence in KLM reliability is that more than 30 per cent of KLM's maintenance work is done for *other* airlines.

6. KLM has had 43 years to perfect its reliability. Founded in 1919, it is literally one of the world's *first* airlines. KLM's London-Amsterdam operation began in 1921.

7. When KLM maintenance crews overhaul a jet engine they strip it down to *two thousand* parts.

8. KLM spends £85,000 to train the flight crew of one DC-8 Jet.

9. KLM training staff teach the crews of other airlines to fly too.

KLM's extra-ordinary service

10. All KLM stewards and stewardesses are multi-lingual, selected for their special flair in making you feel relaxed and at ease the moment you step on a KLM plane. They are always pleased to answer your questions about Customs regulations—or, in general, about the destination you fly to.

11. On board a KLM airliner you are a guest of the Company. During your flight, meals and refreshments are always provided. *Hot* meals—breakfast, lunch or dinner—are served on both First Class and Tourist-Economy flights.

12. At Amsterdam there is a tax-free Shopping Centre—one of the many advantages of flying KLM to anywhere in the world. You will find there a Watch Shop, Photo Shop, Liquor and Tobacco Shop, Perfumery and Luxury Goods Shop.

13. KLM takes a lot of trouble to ensure that you never have the same meal twice on one long flight. This takes a lot of advance planning; you'll appreciate it next time you take a long trip.

14. On KLM's intercontinental First Class flights you get slippers, hot towels, sleeping masks, champagne and other wines on the house.

15. The cabin of a DC-8 is 12 feet wide. This is wide enough to take 6 seats abreast comfortably, KLM's First Class cabins have only 4 seats abreast.

16. The cabin of a KLM DC-8 Jet gets a fresh supply of air every three minutes.

17. KLM takes special care of children. Every KLM stewardess is skilled in child-care.

18. KLM's DC-8 Jets have two pantries (for faster service), five *flush* toilets and several cloakrooms. The cabin is air-conditioned on the ground as well as aloft.

19. Your Travel Agent knows all about the advantages of flying KLM. He will put you right from the start. Or contact your KLM Office in London, Birmingham, Manchester, Glasgow or Dublin.

For further information, see your Travel Agent, contact KLM or post this coupon. To KLM (Dept..LE), Time and Life Building, New Bond Street, London W.1. Telephone MAY 8803.

HITACHI

WHERE ELECTRICITY IS MADE TO DO EVERYTHING

From the vast complex that is Hitachi come more than 10,000 Hitachi-made products: turbines and generators, transformers and trains, electronic computers, home appliances, the miniaturized devices of the space age and just about any item you can mention if it's powered by electricity (and even some that are not).

It takes experience and plenty of know-how to make this infinitely complex equipment. One significant fact about it all is that it is 100% Hitachi – designed, engineered and manufactured under one responsible management. This accounts for the unmistakable quality of any Hitachi product.

CONSIDER JAPAN—1

THE growth of the Japanese economy in the past ten years has been one of the most extraordinary economic stories of all time. Here is a case where the whole way of life and prospects of a people have been transformed within a decade, and with the aid of an economic policy that has been singularly little studied in the west. This summer a member of The Economist's *staff, whose usual job is to write about British economic policy and problems, visited Japan. In the survey below he reports, still a little goggle-eyed, on what he believes to be the lessons of this remarkable Japanese achievement for Britain. A second survey next week will pick up the story of what seem to be the lessons of Japan's experience for underdeveloped countries.*

The Most Exciting Example

At the end of 1951 Mr Joseph M. Dodge, the Detroit banker who had tried (without consistent success) to impose stern policies of demand restraint upon the Japanese government during the dynasty of General MacArthur, shook the dust of a once more independent Tokyo off his feet. His parting message was not designed further to endear him to the Japanese people. "At present," declared Mr Dodge severely, "Japan is suffering from a plague of false legends, which include some dangerous delusions." He then listed fifteen of these delusions, in language which will strike familiar chords for connoisseurs of recent British cabinet ministers' speeches. The delusions included:

> That increased production without a parallel increase in exports represents sound progress. . . . That inflation can easily be offset by increased production. . . . That a nation that must export to live can afford to price itself out of its export markets with a domestic inflation. . . . That granting progressively larger amounts of commercial bank credit for capital purposes can be substituted for the normal processes of capital accumulation. . . .

"The progress and present favourable status of Japan," concluded Mr Dodge, "has been the result of extremely favourable external circumstances, which cannot be expected to be repeated and continued indefinitely." He then returned to the United States (average growth rate since then about 2½ per cent per annum), and sat down in his Detroit bank awaiting Japan's inevitable crash.

In the decade since then Japan, continuing and following almost precisely the policies which Mr Dodge had castigated and opposed, has seen its real national product increase at an average pace of over 9 per cent a year, its industrial production and rate of manufacturing exports more than quadruple, its urban population make the great breakthrough into the first modern consumer-oriented economy in Asia. In the process it has seen the average Japanese's expectation of life (now just over 65 for a man, just over 70 for a woman) rise to ages that are now actually ten years longer than they were only twelve years ago. There are some who will regard this last achievement alone as one of the most exciting and extraordinary sudden forward leaps in the entire economic history of the world.

Moreover, we are talking here not only of a trail-blazing pioneer for Asia; we are dealing with a story that has by now deep implications and parallels for Europe as well. From the welter of remarkable sets of figures about modern Japan, British readers should perhaps first pick out two. First, of the babies who were born in the year after General Doolittle's bombs first fell on Tokyo, so far as one can see from the available educational statistics, only just over 40 per cent left school at the minimum leaving age of 15 in 1958; another 45 per cent or so stayed on at high school until 18; and more than another 10 per cent are currently passing through college or university. The equivalent figures in Britain were over 60 per cent leaving school at 15, around 30 per cent at 16 to 18, and only about 7 per cent going on to college or university. Moreover, the bias of later education in Japan is much more heavily technical, and their big firms train skilled workers more assiduously and deliberately than most of their rivals in Britain. Those Englishmen who think of Japan as a backward country of adaptable but unskilled labour are talking nowadays through their hats as far as Japan's new and younger workers are concerned; this is, in point of fact, a more lengthily educated and technologically skilled generation of young Japanese who are now moving into their modern factories than their contemporaries among young people in Britain.

Secondly, investment in productive capital equipment in Japanese industry last year, on a straight yen-sterling exchange rate basis, seems to have been about one-third larger than equivalent investment in industry in Britain. Admittedly, Japan has a labour force nearly twice as large as Britain; but in the competitive, non-agricultural, big-company, modern sector of industry—into which the majority of both the new Japanese investments and new young Japanese workers are moving—Japan's total labour force is actually still rather smaller than ours. This new generation of more skilled Japanese is moving into factories where entrepreneurs are currently putting behind each one of them in the larger factories a greater force of new and modern capital equipment per head than is being put behind their rather less educated and less well trained contemporaries in Britain; in a few years' time, on present trends, logic would suggest that they could beat us competitively in a much wider field of industry than

most people in Britain at present begin to imagine—even if their wage rates in this modern section of industry do at last go up towards our standards too.

All this has been achieved in a country which seventeen years ago lay in ruins, which even ten years ago had only just re-attained its prewar level of production, and which has suffered far greater disabilities in its traditional export markets (because of the nature of its exports, and the closing of China) than postwar Britain has done. If all this is the result of internal policies which wise men thought would bring about a crash, then, in the name of simple economic common sense, government economists and apostles of conventional economic wisdom from all the world should be coming to Japan to study just how to emulate it.

The trouble is that one is fearful that conventional wisdom may be going to stop the advance instead. One of the done things to say in Japan this year—it was said to your correspondent on more than one occasion—was that the Japanese must now learn respectable economics from the British and slow down their rate of growth (perhaps permanently) in order to push the pressure on their resources down. This seems a very curious view. For consider the contrast between Japan and Britain, two countries with very similar import structures and an astonishingly similar tendency to run into import deficit at one particular stage of the internal trade cycle. Consider it even in terms of the export figures which British spokesmen themselves generally think should be the main criteria. Japan in the last eight years has marked up the biggest rate of growth in both production and exports in the world (217 per cent increase in industrial production from 1953 to 1961, 232 per cent increase in exports). Britain, by following an almost diametrically opposite policy, has marked up one of the slowest rates of increase in both (28 per cent increase in production, 42 per cent increase in exports). Obviously in these circumstances the British economy has lessons to learn from the Japanese, not the other way round. The articles that follow will set out your correspondent's view—both for western and eastern ears—on what those lessons are.

Young Japan at play

Not So Exceptional Case

TV panel game "What's Your Secret?"

ANY transient foreign visitor writing about Japan is immediately faced by a major apparent difficulty. The psychological make-up of the ordinary Japanese, individually as well as en masse, is said to be very different from that of most westerners; all old Japan hands hasten to impress that on the visiting greenhorn, the older and wiser the hands the more forcibly they say it. And in at least one respect which impinges upon economics, the old hands seemed to this transient observer to be transparently and palpably right. Without paying any instinctive credence to Kipling's hoary nonsense about east and west, it is worth devoting two paragraphs to discussing it.

For a variety of historical and sociological reasons there does seem to be a sort of inbred collectivism in the Japanese people, whose outward manifestations (this is a wild oversimplification) bear some caricature-like resemblance to the atmosphere in the heartier English public schools. This atmosphere, disconcertingly for the visiting analyst, can overlay the attitude of the Japanese worker (as well as the Japanese executive) in the more successful industries to his job: up the old firm; Itshibishi Heavy Machinery Plant for ever; act as a fag in your first few years, expect to get greater privileges later; take your hands out of your pockets when passing the headmaster, and expect in return to be treated by him as one of "my people" to whom he has a special responsibility in times of trouble; feel a genuine personal involvement in the factory's production record and other collective achievements; actively prefer to live together cheek by jowl and to spend a lot of your leisure time in group activities (often of a self-improving sort) sponsored by the firm. The song with which workers and executives of the giant and prosperous Matsushita Electrical plants willingly begin their day has already been widely publicised around a slightly incredulous world (see *Time* magazine, February 23rd last):

> For the building of a new Japan,
> Let's put our strength and mind together,
> Doing our best to promote production,
> Sending our goods to the people of the world,
> Endlessly and continuously,
> Like water gushing from a fountain.
> Grow, industry, grow, grow, grow!
> Harmony and sincerity!
> Matsushita Electric!

One cannot quite see the Ford works at Dagenham singing that.

ON the other hand, one cannot see the workers of a declining industry in Japan singing it in willing unison either. On the contrary, Japanese coal miners—to cite the most obvious example of workers in a major but non-expanding industry—have fought some of the bitterest and most violent strikes against their employers in any country since the war; one postwar strike lasted through twenty-two months of the very reverse of peaceful picketing. The Japanese are not nowadays a people who are naturally servile to authority, or who are so silly as actively to enjoy hard work; they just enjoy the group aura arising from success. In consequence, many of them tend to go to extremes in both their group enthusiasms and their group apathies, in both their group likes and their group hates. So long as the policies of a business enterprise or of the government are breeding success, this collective enthusiasm helps to keep success rolling along; if the success story for some reason stuttered abruptly to a stop, nobody can easily tell what would happen, but conceivably the falterers might find that they were holding tigers by the tail.

But the question to be probed in this survey is how and why Japan has achieved an almost consistent success story of economic expansion in the last decade. For that purpose the advantages and disadvantages (for there have been some real disadvantages) arising from Japan's peculiar sociology and habits of group loyalty can justly be regarded as additional accelerators and brakes, rather than as the main motive power. The journalistic method used in this survey will therefore generally be to hive off discussion of these special Japanese sociological factors and employment customs into three-column features (such as that on the next page overleaf). The main body of the text will then be freer to push forward with analysis of what your correspondent believes are the lessons of Japan's experience that are directly applicable for policy-makers in Britain; and, in reverse, of the lessons—all too often warning lessons—of Britain's recent economic experience which could usefully be noted by today's policy-makers in Japan. The only "exceptional" circumstances of Japan's economy which will be noted in this main text itself will be exceptional circumstances of what might be called a conventional economic sort. The main body of our text will be dressed in western clothes; only in the three column matter will we, so to speak, don Japanese factory uniforms and kimonos.

STICKING, therefore, strictly within these terms of reference, one had better admit straightaway that Japan possesses one conventional economic "advantage" which explains why it should indeed be able to expect a faster rate of growth than would easily be possible in present-day Britain. This "advantage" is that Japan is still only part of the way forward to being a wealthy and fully developed industrial economy as yet. All statistics about social and industrial conditions in the Japanese economy must be treated nowadays as evanescent approximations, because the pace of progress is so great as to render them, with each half-year that passes, drastically out of date. But, making the best extrapolation one can from the last industrial censuses, the workers of Japan—whose *per capita* national income in 1961 still averaged only about two-fifths of Britain's—can fairly reasonably be divided into three broad groups.

Perhaps more than a tenth of the total labour force of 45 million (about 27 million men, 18 million women) work in factories and other productive establishments that are as efficient as any of their kind in the world, and they are beginning to enjoy a standard of living which is therefore broadly (even if not yet quite) in line with that level of productivity, at any rate when the extensive fringe benefits offered by all the big Japanese firms are included. To this upper tenth will belong perhaps the upper one-fifth of Japan's 21 million "regular workers" in non-agricultural industries.

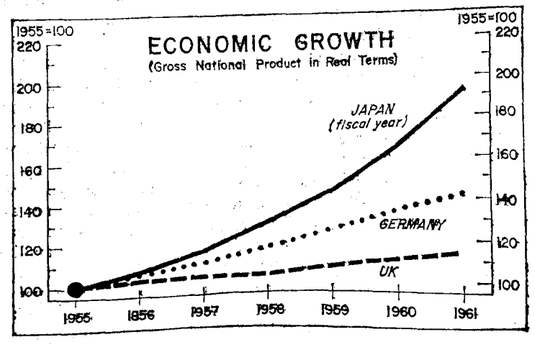
Perhaps over another quarter of the 45 million work at jobs where their productivity and living standards, although below those in the most modern sector, are still definitely of western rather than Asian status. After all, we are talking here of a country where more than 45 per cent of households (over 60 per cent in the towns, over 25 per cent in the countryside) now possess a television set and where over 17 per cent of urban households possess a refrigerator.

But all this must still leave more than half of Japan's 45 million workers in jobs where their level of productivity (and thus of earnings per hour) is less than half of that in the great modern combines. This depressed half must include the majority (though not nowadays all, see feature on "Living Standards" on a later page) of Japan's huge army of 22 million small scale self-employed men and "unpaid family workers." Most of these "family workers" are the country's 15 million farmers and fishermen, and its 1½ million small shopkeepers and petty traders; but other family workers still sweat their whole lives out in Japan's 400,000 "very small" (under 10 workers each) industrial "workshops" which really consist of two or three lathes set up in some family's living room.

WAGE AND PRODUCTIVITY INDICES BY SIZE OF PLANT
(Over 1,000 workers=100)

Number of Workers	Japan (1958)		Britain (1949)	
	Added Value per Worker	Wage per Worker	Added Value per Worker	Wage per Worker
4– 9	27·0	37·9	...	...
10– 50	36·4	43·9	91·4	82·5
50– 99	47·9	50·4	93·8	83·7
100– 499	64·6	61·2	96·4	85·5
500– 999	76·8	75·2	98·1	89·3
Over 1,000	100·0	100·0	100·0	100·0

Note.—The figures for Britain are worked out from the *manufacturing* census of 1949, but relativities between big and small firms are unlikely to have changed much in the meantime. Figures for Japan refer to 1958. In the last few years wages—and particularly starting wages for scarce teenage workers—have risen even more quickly in Japan's small firms than in its big ones, but the gap between total productivity of all workers in big and small firms has plainly remained.



The depressed half of the labour force will also include Japan's most miserable employed industrial class of a million or so ageing day labourers (average cash earnings in 1961, about 12s. a day); and many even of the regular workers in Japan's mass of small but genuine industrial establishments with between 30 and 100 workers each, in which labour productivity per worker—in sharp contradistinction to Britain (see table on the preceding page and footnote)—is still generally less than half of that in the big factories with 1,000 workers or more.

The scope for expansion in an economy of this sort is therefore very large, merely by switching workers from the wildly unproductive sectors into the much more productive ones. The problem is notably different in degree from that in Britain. But it is not entirely different in kind. Even in Britain, as figures now published regularly by the Ministry of Labour make clear, average male workers' earnings in new and modern British industries (ranging from motor car manufacture through machine tools and most other forms of engineering to such things as detergents and synthetic resins) are regularly between 20 and 35 per cent higher than those in older sounding industries like textiles (other than the new man-made fibres) or leather goods or footwear or brushes and brooms. These differences are by no means wholly due to differences in innate levels of skills. One of the advantages for a westerner of studying an economy like Japan's is that it makes it abundantly clear how far modern economic progress depends on switching workers out of the second sort of job into the first.

It also suggests that the pace at which the advance can be effected depends mainly on the answers that can be given to three questions:

(1) Whether the modern sector of industry has an incentive and a mood, and is backed by the kind of government economic policy, that encourage it to play an ever bigger and more expansive part in the national economic life;

(2) Whether the purposeful expansion of marginal domestic demand—which is the only means by which these modern sectors of industry can be spurred on to grow—is then liable to run the country into intermittent balance of payments crises; and if so whether the government can find ways of countering those crises without cutting domestic demand back too grievously and for too long;

(3) Whether the social and economic mechanism for encouraging switches of labour and other resources out of the old-fashioned sector into the modern sector works smoothly and well.

The answers to these questions in Japan are that the Japanese government, either by good fortune or good management, has so far solved the first two problems—that of providing incentives for efficient growth industries to grow, and

Jobs for a Lifetime

Apart from some 22 million self-employed people and "unpaid family workers" on Japanese farms and in small family businesses, there are three main types of employee in Japanese industry.

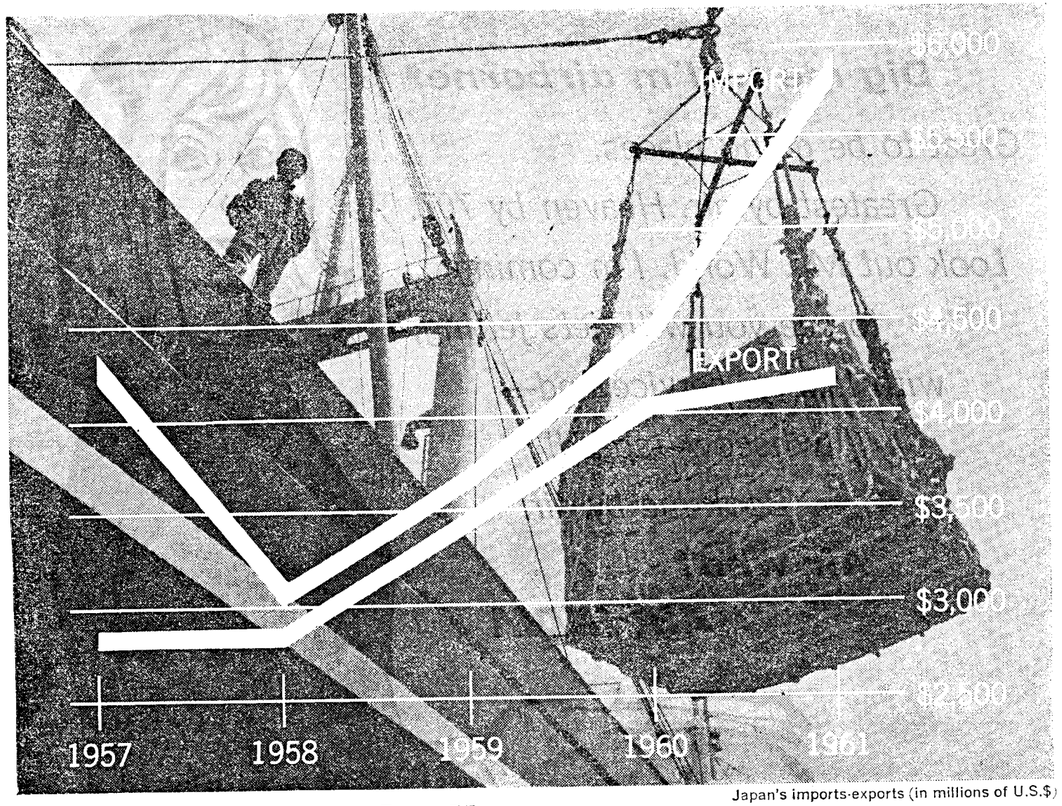
At the end of 1961, there were 15 million male and 6.6 million female "regular employees"; these are the luckiest ones, and their system of employment is described below. There were also 860,000 male (and 660,000 female) "temporary employees"; about half of these are generally temporary workers who go back to the farms in summer, while others are on trial to become regular workers, but it is among these men that sackings occur when business conditions turn awry. Finally, there were three-quarters of a million male (and half a million female) day labourers, who are employed only on days when work is available.

The ambition of every young Japanese is to be taken on as a "regular worker" in a reliable firm straight after leaving full-time education. To become a regular worker in a big firm he is likely to have to pass a written exam and aptitude test set by the firm itself, even for an ordinary job as one of the firm's factory hands. Once taken on, he is safe for life, because the firm will make every effort never to lay him off as redundant, will steadily raise his pay according to his age, will train him and will promote him up the hierarchial ladder of a Japanese factory (often with every minutely different grade even on the shop floor given a different title) according to his length of service. In return he is expected never to leave for a rival firm—at least not after he has reached maturity, although there has recently been some trek of men in their very early twenties from smaller firms to bigger ones. Because of this wage structure and training system, Japanese employers are extraordinarily unwilling to take on new workers over the age of 30. ("The unions would make us pay such workers according to their age," said one industrialist to your correspondent, "but new older workers would not have had ten years' training for the particular jobs we want.") The following figures tell their own story:

(1) School leavers have never had it so good. The 15- and 18-year-olds leaving school last year were faced by between two and three times as many jobs (admittedly not all as "regular workers") on offer as there were applicants. Big firms (those with more than 1,000 employees) managed to fill over 99 per cent of their vacancies for regular plant workers, but small firms (30 to 99 employees) could fill only 77 per cent. In interesting reaction to this, some of the smaller firms (whose total wage rates have hitherto been only about half to three-quarters of those of big firms) have now actually started to pay bigger *initial* wages for school leavers than the big firms. But this is a relatively new development of the past few years.

(2) Despite this scramble for school leavers, in 1960 only about half of the (fortunately relatively few) Japanese who lost their jobs after the age of 30 were reported to be able to find new wage-earning employment at all (and even then, according to one official survey, "old people [over 35 years] . . . are re-employed mainly as watchmen, stockmen, etc."); the rest reverted either to be family workers on the farms or in cottage industries, or to become day labourers. (In Tokyo by 1960, 94 per cent of the unhappy army of casual day labourers were over 30 and 51 per cent were over 50.)

A similar recognition that new jobs are likely to be offered to young people only is shown by the age structure of the half-million or so Japanese who are leaving the farms each year for jobs in industry. Of those who left in the first half of 1961, 58 per cent were under 19, and 92 per cent under 34; among the second and younger sons of farmers (but not necessarily among the elder sons and therefore heirs), the trek into a manufacturing job when one reaches one's teens is now virtually complete.



Japan's imports-exports (in millions of U.S.$)

How to buy and sell in the billion dollar Japanese market

One way is to open your own office in Tokyo staffed with 3,000 experts on Japan's industries, commerce and foreign trade. In effect this is what you get when you deal with Japan's largest general trading company, Mitsubishi Shoji of Tokyo. From its head office with 100 branches and associates throughout the world, Mitsubishi Shoji helped 5,000 overseas firms do $1,100,000,000 worth of import-export business in Japan last year. Mitsubishi Shoji handles everything from consumer goods to heavy industrial equipment. Long association with other Mitsubishi enterprises (30 of Japan's largest corporations) gives you a priceless advantage when either buying or selling in the Japanese market. Put Mitsubishi Shoji's proven ability to work for your firm. For complete information write:

that of riding past its successive balance of payments crises (in 1953-54, 1957 and 1961) without losing its dynamic of growth—with more brilliant success than in any other country in the world.

The answer to the third question is that Japan's social structure and habits could not have been more appallingly devised to make a switch of resources out of the least productive sectors of the economy into the big growth industries more difficult. This is because of the system of lifetime employment and "no new regular jobs for old men" (old meaning anybody over 35) described in a feature on the previous page. This strange employment system explains why Japanese industrialists genuinely claim that they too have been operating in conditions of labour shortage and "over-the-brim-full employment." It makes Japan's achievements in securing an average of over 9 per cent of expansion each year all the more remarkable—and its method of running its economy to achieve this all the more worth studying in the west. It is to these positive lessons of Japan's economic experiment that the next article will turn.

Easy Budgets . . .

JAPAN'S system of managing its economy has been to run what would be regarded in Britain as very expansionary budget policies, with large planned increases in government expenditure and sizeable reductions in personal taxation a regular feature of most recent years (see adjoining table); and to use monetary policy and rises in interest rates as the main restraining weapons, when and if any restraints are needed. This pattern has been widely misunderstood abroad, because of the barriers which economists (particularly government economists) raise in the way of understanding each others' language.

Most Japanese economists will worthily insist—and American economic commentators will generally approvingly report—that Japan has constantly balanced its annual estimates of budget expenditure and revenue ever since Mr Dodge laid down that balanced budget estimates were the right thing to have. But the balancing act is done in a very peculiar way.

Around the turn of every calendar year (and thus three or four months before the fiscal year begins on April 1st) everybody in Japan seems to enter into an annual guessing game to recommend what the target rate for growth in next year's gross national product should be. The ruling Liberal Democratic party, in solemn convention assembled, recommends that gross national product should grow at one rate; the Ministry of Finance recommends that it would be safer to aim to grow at a slightly lower rate; the Economic Planning Agency makes a final calculation, and the Cabinet splits the differences. Thus one reads in the newspapers that the Cabinet after a long session decided that the rate of growth should be 9.2 per cent in fiscal 1961 or 5.4 per cent in fiscal 1962.

This apparently absurd guessing game, expressed to a precise point of decimals, has a genuine economic importance. For every 0.1 per cent of the agreed target rate for growth in national income the Japanese reckon that they can expect a stated amount of extra tax revenue on the basis of existing tax rates. Thus with a target growth rate of 5.4 per cent this fiscal year, they reckoned on nearly £500 million of extra revenue; and by the rules of the budget balancing act precisely that sum —together with the surplus of tax revenue carried over from the previous year—is then assumed to be available for deliberate increases in government expenditure or for new tax reliefs.

The remarkable feature of the game, from the reflationist's point of view, is that the larger the target figure for growth which the planners-cum-bargainers eventually decide upon—and the bigger the growth in production in the preceding year (i.e., the nearer the economy has been running to capacity) —the bigger the tax reliefs and deliberate increases in government expenditure which this system tells them it is orthodox for them to give away.

JAPAN'S DECADE OF TAX RELIEFS
(Billions of Yen, which virtually equal millions of pounds.)

Fiscal Year	Current Balance of Payments Deficit (−) or Surplus (+)*	Value of Tax Relief in That Year's Budget		Growth in Real GNP %
		On Personal Income Tax	On all Taxes	
1951	+118	61	113	+13·5
1952	+112	113	90	+10·5
1953	− 69	77	124	+ 6·7
1954	+ 36	31	17	+ 3·9
1955	+177	53	66	+10·1
1956	+104	23	2	+ 8·2
1957	−137	110	62	+ 7·1
1958	+183	6	37	+ 3·7
1959	+121	23	10	+17·7
1960	+ 39	Nil	− 7	+13·2
1961	−388	56	75	+15·2*
1962		47	116	

* Calendar year.

These reliefs, be it noted, are regarded as "orthodox" even in years when the balance of payments has run into large deficit. Indeed, if the gross national product has been rising particularly swiftly during a year of balance-of-payments crisis—which will usually be the case since Japanese balance of payments troubles are generally of the import *boomu* (Japanese-English for boom) type—it is practically certain that the uncovenanted surplus of tax revenue to be carried over into the next year, and probable that the rise in national income to be counted on for the next year as a whole, will be correspondingly high also. Under the rules of the game, this makes it "orthodox" to make the new year's tax relief or deliberate increase in government expenditure particularly large. Thus in the middle of the balance of payments crisis of 1957 (while Japan's international exchange reserves were dropping sharply) the income tax levied on the average

lower middle class and upper working class salary was literally cut in half. During this last year's balance of payments crisis, Japanese taxes were reduced by about £116 million (at a time when Mr Selwyn Lloyd, in his July and April budgets combined, was raising British taxes by over £200 million); and this Japanese cut of £116 million, reported the *Oriental Economist* truthfully, aroused "general public complaint of a conservative tax relief."

IN these circumstances it may seem a bit odd that the Japanese economy ever slows down at all, at any point short of raging inflation. But—at least until this last year, when living costs in the cities have suddenly bounded by 10 per cent—the policy has not in fact proved very inflationary (the urban consumer price index rose by some 20 per cent in Japan between 1953 and 1961, against a rise of just over 25 per cent in Britain, while Japan's export price index has actually fallen in this period). Moreover—again until last year—Japan has

managed to escape out of its balance of payments crises and periods of "overheating," back on to expansion again, much more quickly than Britain. The weapon used to counter periods of overheating has never been fiscal, but always monetary, policy.

The way in which a restrictive monetary policy is worked in Japan at times of balance of payments difficulty—once again, to the foreigner it seems a very peculiar way—will be discussed in the next article. But it is worth pausing here to consider the rationale of their system. It is customary in Britain to say that monetary policy cannot work as a restrictive device in times of balance of payments crisis if budgetary policy is pulling the opposite way. Experience in Japan goes a long way towards casting doubt on this belief—because their experience is that the two weapons work with quite different time intervals of effectiveness. Monetary policy works much the more quickly and much the more directly upon the balance of payments, both on capital account (by drawing in loanable funds, such as Euro-dollars, from abroad) and on current account (by

Living Standards

FOR the foreign observer who wants to assess living standards in modern Japan there is a constant clash between two apparently contradictory pieces of evidence. On the one hand, the bare income statistics suggest that this is still a very low income and cheap labour country indeed. The average earnings of the 21 million "regular workers" in non-agricultural industry and commerce are only just over £6 a week (which is still less than half of the average for all workers, male and female, in manufacturing industry in Britain).

On the other hand, the standards of consumption are visibly European rather than Asian; the Japanese are now as well-dressed as any people in the world (their figures of textile purchases per head confirm this); they have broken right through into the revolution of consumer durables; and each afternoon their wives throng the world's biggest and most crowded department stores in the large cities, where prices are not all that far below European levels, but where business goes humming along. More surprisingly still to this observer, the farmers in the fields along the main railway tracks, who a few years ago would have manhandled their own barrows to market, can be seen using modern and shiny power-driven equipment. The average farm household's income last year was estimated at £450 a year, admittedly with an average of 5.6 family members per farm, and with nearly half the income coming from earnings of some family member who has taken a job (sometimes wholetime, sometimes only at the farm's slack period) outside farming. Only in two respects—its working hours and its housing standards—does Japan look Asian; the average Japanese works a 48-hour, five and a half day, week even in big industry (in small industry and distribution, considerably longer) before going home to live with his wife and children and probably his parents in two or three rooms. Because of this habit of clustering together, the average household in Tokyo last year had 4½ members (1½ of them earning), and an average cash income of £12 to £13 a week.

The explanations of the apparent paradox between income statistics and high consumption of luxury goods rest partly on the economies secured by this clustering together, and partly on the facts that:

(1) The bare figures of industrial wage and salary levels are misleading because Japan is the country *par excellence* of fringe benefits—and expense accounts. Apart from family allowances and the big cash bonuses at Christmas and midsummer (which are included in the household incomes and average wage figures mentioned above), these fringe benefits include payment of the employees' travel expenses to and from work, and (in the big firms) free accommodation for bachelor and spinster workers, subsidised houses for some married workers, and lavish sporting facilities and holiday rest homes. On average, these non-cash fringe benefits are said to cost employers more than £50 per worker per year; but one's guess is that this is an underestimate, because both sides regard the granting of certain fringe benefits as a matter of course.

(2) The statistics for *average* wages are depressed by the fact that the average woman's wage is only between a third and a half of a man's, and that the average youngster in his early twenties—unless he draws family allowances from a big firm—is entitled to get less than half of the income of a man in his forties or fifties. (Usually his pay will go up by about 5 per cent a year.) This last point is a very important factor in keeping average wages low at the moment, because the average age of the workers in the big and new and highest-paying plants is at present very young indeed (about 25 in some cases). But even on the basis of present wage rates, it is clear that Japanese employers' wage bills are gradually going to be inflated quite considerably as (a) the average age of the working force grows older; as (b) women leave earlier to get married; and as (c) the retirement age for men is pushed beyond the present figure of 55 (which is a hangover from the days, only twelve years ago, when that was also the average age at death; it looks cruelly low, and is bitterly resented, now).

The system of pay-rising-by-seniority has some appalling effects on Japan's employment structure (the way in which it makes Japanese employers eager to recruit their new labour from school leavers only is discussed in "Jobs for a Lifetime," on an earlier page). But it also means that the workers' pay reaches its height just when what ought to be his family responsibilities reach their height too. The relatively low wages for teenagers and high wages for teenagers' fathers, combined with the great importance attached to educational attainments in getting one's first foot on the ladder of what is to be one's lifetime job, help to explain the fact that 60 per cent of Japanese children now stay on at school past the permissible leaving age of 15.

HOW A NATION GROWS

Ocean-spanning bridge creates new industrial complex

The longest suspension bridge in the Far East is being built across Dōkai Bay in Japan's southern island of Kyushu. 680 metres long between suspension towers, it will link directly the twin cities of Wakamatsu and Tobata—and indirectly the three adjacent cities of Moji, Kokura, and Yawata—to create a new industrial metropolis with a population of over a million. Here is a tangible symbol of confidence in Japan's economic future. It is only one of many such major civil engineering projects throughout Japan that will expedite the flow of goods and people between population centres and contribute to Japan's industrial growth.

The growth rate of Japan's economy in the past few years has attracted the attention of astute investors throughout the world. Despite recent setbacks in the securities market, the long-term outlook is favourable. But to make the best investments in today's highly selective market, you need accurate data, careful analyses, and the kind of expert advice that Yamaichi has the skill and experience to give. Our 111 offices throughout Japan are in constant touch with every segment of the economy, and our 50 trained research specialists are continuously analyzing domestic and international economic trends that influence the Japanese market. Our services and a wide range of publications on investing in Japanese securities are available on request, without obligation.

cutting down imports). By contrast, restriction of demand by higher tax rates works on the balance of payments only after a time lag ; and the Japanese say that at times of balance of payments trouble the restriction of demand and imports after a time lag is likely to be the precise reverse of what they want.

Japan's main imports are (like Britain's) raw materials and (less like Britain's) machinery. Both of these forms of imports tend to be highly cyclical (the Japanese recognise, which the British do not always do, that a rush of imports during the period of a restocking or investment boom is likely to be followed by a period of natural slowing down on the reverse arm of the cycle) ; and both are bought almost wholly on business account. The Japanese reckon that a change in interest rates can alter business spending very quickly. No doubt this swift effect is partly due to the peculiar capital composition of Japanese business enterprises (whose loan capital, on which interest has to be paid, constitutes about 70 per cent of aggregate capital). But one suspects that even in countries like Britain a sharp rise in Bank rate can begin to affect businesses' inventory policies within a fairly short period, while changes in tax rates work much more slowly than Bank rate, at least as a restraining device ; when Mr Selwyn Lloyd increases the fuel oil tax, for example, there may be some small initial effect on total spending, but a main effect will be to reduce the number of people who would otherwise be using oil for energy purposes anything from six months to three years hence.

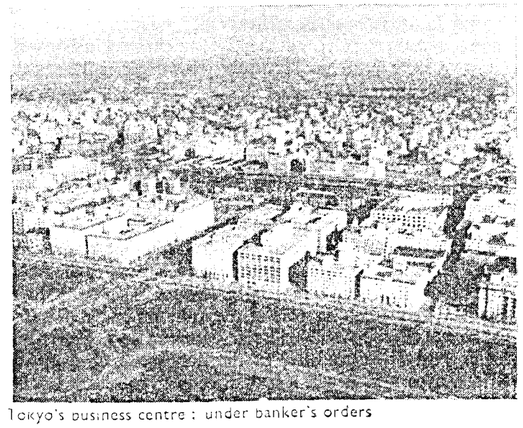
Most British policy-makers would presumably agree that usually they do not really know what they will want demand to be doing more than six months or so ahead. The best Japanese planners, by contrast, will say that they do know what they want demand to be doing in the long term ; they want it, and production, to be rising by 7 or 8 per cent a year (or whatever is the figure consistent with furtherance of their current long-term plan). It therefore seems logical to them to use fiscal policy as an instrument for steadily increasing long-term demand by something approaching the long-term target figure, while using monetary policy as the weapon to control cyclical fluctuations in the balance of payments during that forward march.

Because the system on which the Japanese budget is drawn up seems so very peculiar—because it appears to encourage inflationary budgets when inflation is already in progress, and could theoretically signal that Japan should introduce a deflationary budget when a recession has cut down tax receipts—it takes some time for the visitor to Tokyo to recognise that the Japanese method of organising economic policy is as sophisticated as it is. But by the end of his stay your correspondent was convinced that the degree of sophistication on these matters in Japan—albeit often behind a screen of flummery words designed to show that they were all very simple and conventional chaps with a lot to learn from the West—is really very high indeed. It also happens to have been a sophistication that works.

. . . But Tight Money

THE monetary policy of the Bank of Japan provides a fascinating study for the visiting foreign economist, like almost everything else in this land. It is very difficult to decide whether the policy's undoubted effectiveness has been the result of the Bank's extraordinary success in making the brilliant best of a bad job, or whether the bad job itself (as represented by the highly unorthodox nature of the Japanese commercial banking system) has paradoxically made monetary control very much easier. For various historical reasons (of which the failure of the cheque system to develop quickly under Japanese conditions is one) commercial banking business in Japan is profitable only if the big city banks operate at levels of illiquidity that would drive an English or American banker into a state of permanent neurosis. When window dressing (which is considerable) is removed, the city banks' real cash ratio against deposits is only about 2 or 3 per cent, and they hold virtually no other genuinely liquid assets at all (compare the British commercial banks' conventional liquidity ratio of 30 per cent). The other 97 or 98 per cent of their deposited money is out on loan, without many of the usual conventional bankers' distinctions about lending only for short term requirements ; a very large part of Japan's massive investment boom in fixed capital equipment has been financed by commercial bank loans.

The result of this " overloan position " is that the city banks periodically find themselves in a desperate need to raise liquid funds from somewhere, either in order to meet emergencies or else simply in order to increase their lending further. They can do this in two ways. They can borrow some emergency funds from each other (or from rural and other savings institutions) on the so-called call loan market, interest rates on which can sometimes reach fantastic heights ; at one stage during the last balance of payments crisis and credit squeeze call money was being borrowed by the big city banks at over 20 per cent. The other source, nominally as a lender of last



Tokyo's business centre : under banker's orders

803

resort but really as the main engine of capital creation during a boom, is the Bank of Japan. The Bank's process of credit creation went forward particularly heavily during the early years of Japanese recovery, so that Japanese bankers themselves admitted—and visiting American bankers reported back with horror—that "the commercial banks in the early nineteen-fifties became merely a channel through which the central bank fed industry with investment funds." It was this "overloan" position that Mr Dodge referred to with indignation when he castigated (as mentioned in our first article) the illusion "that granting progressively larger amounts of commercial bank credit for capital purposes can be substituted for the normal processes of capital accumulation."

Nevertheless the fact remains that it was substituted, and that it has worked. Looking round the shining new factories of Japan—a country that actually had the greater part of its previous industrial capacity destroyed in the war of only seventeen years ago—nobody can doubt that. Moreover, paradoxical though this may seem, the consequence of the central bank's unorthodoxy during this period has been its rebirth as one of the most powerful central banking organisations in the world. Because the commercial bankers have to come begging to it when they want new funds to increase their lending further, the entire credit structure of Japan now seems to the visiting foreigner to lie snugly under the Bank of Japan's control.

THE Bank itself would deny this; its position of absolute power, as lender of last resort, over the credit situation does sometimes mean that it cannot use that power to quite the extent that its exasperation with some aspects of the *boom* might make it wish to do. It cannot very well turn away big banks who ask it for funds if the result would be to cause a massive financial crash of Overend Gurney proportions. But in banking, as in international diplomacy, an authority that possesses an unusable thermonuclear deterrent does not necessarily thereby become less able than an unarmed country to make its wishes felt.

The control by the Bank of Japan is exercised in various ways. The one "orthodox" weapon is Bank rate, this summer at 7.3 per cent, which it is certainly able to make effective; most of Japan's other (very high) interest rates are tied to it, and Japanese businesses' heavy dependence on borrowing means that they are very susceptible to changes in borrowing rates. A second and more controversial weapon is the so-called "window operation." The Bank of Japan holds regular consultations with the commercial banks, reviews the likely trend of advances of each bank for perhaps a month ahead, and warns individual banks (or, at times of balance of payments crises, warns all big city banks) that they should please start to restrain their advances; if necessary it will even suggest an "overall loan level" for the big banks as a whole. Finally, although the Bank will not generally in the last resort refuse to lend to any big bank, it does levy penalty rates on what it regards as its ultimate margin of less desirable loans to the commercial banks. As part of the same process the Bank of Japan will offer favourable discount rates on particular types of lending paper—especially, to the annoyance of competing British exporters, it will help indirectly to subsidise Japanese exports in this way.

The commercial banks in turn also have a schedule of penalty rates which they levy on those who borrow from them, according to the status of the borrower concerned. And when they have to cut back lending, they have no hesitation about putting pressure on borrowers whose position they regard as unsound. The small local banks, who lend mostly to smaller local firms, will do the same thing when a credit squeeze makes it more profitable for them to use some of their funds in other ways (perhaps, for example, to lend call money to the big city banks at very high interest rates). The consequence is that tight money during credit squeezes can lead to bankruptcies of small firms in Japan. The figures for dishonoured bills (52,470 in January) are one economic indicator that is regularly watched. So is the number of bankruptcies (firms with debts exceeding £10,000)—which was 202 in January, close to the last peak of July, 1957. But at the same time as reporting this, the Japanese press also reported that the Government seemed to be more intent than in previous crises to temper the wind to the smaller shorn lambs.

The more closely one studies the history of the Japanese economy in the last decade, the more one becomes convinced that success in economic policy nowadays springs from a policy of favouring the forward-looking and most prospering and efficient firms, and beating the less efficient ones into the ground. The fact that control through monetary policy in Japan has—until this last year—generally worked in this direction may not be a sign of great social and humanitarian virtue (see "After the Zaibatsu," overleaf); but it has been of enormous economic utility. Your correspondent became convinced that there are two important lessons for Britain here.

First, the general British method, during the crises of the last decade, of restraining demand by tough budgets and tax regulators has automatically laid its main restraining power on the growth industries, while the opposite Japanese method has worked the other way round. Growth industries, by definition, are those that will be given the biggest impetus to expand their production when the next few hundred million pounds' worth of marginal demand is pumped into the economy; so, of course, they are also those that suffer most severely when the next few hundred million pounds' worth of marginal demand is siphoned out of the economy by means of a restrictive budget. By contrast, the Japanese method of pumping in extra demand through stimulatory budgets, and

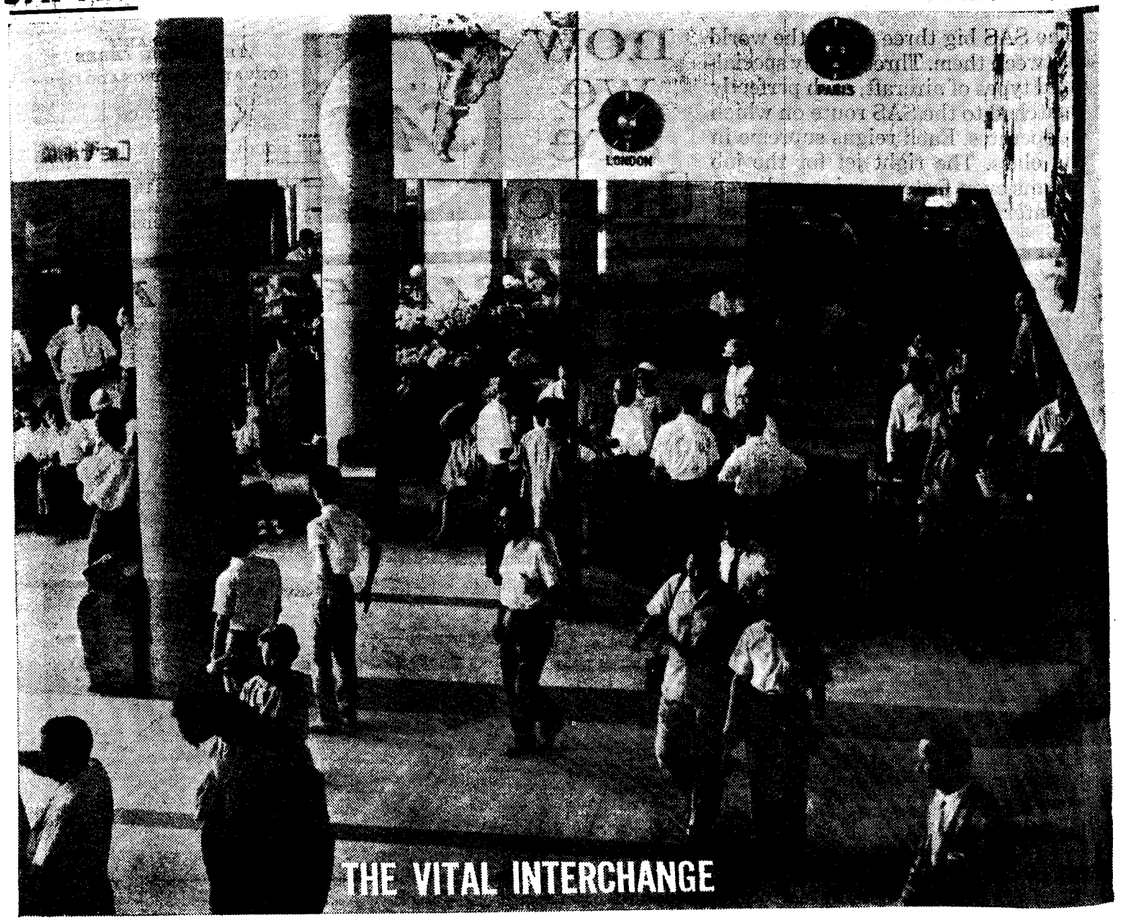
CARAVELLE Silently serves EUROPE and the MIDDLE EAST.

SCANDINAVIAN AIRLINES SYSTEM



Tokyo International Airport is the scene of an exciting international drama. Each day, growing numbers of Japanese businessmen are leaving for Europe, Australia, and the Americas to promote mutual business opportunities in these countries. And, each day, businessmen from all parts of the world are arriving in increasing numbers to see for themselves the amazing growth of Japanese industry and business opportunity. Trade missions arrived in March from Italy, and in April from Britain, Belgium, and Austria — and there are still many more coming.

These men symbolize the widening economic interchange between Japan and other countries of the world, and underline Japan's contribution to the prosperity of the world in such fields of high technology as the steel, optical and electronics industries. And, through careful and farsighted planning, JETRO is laying the groundwork today for the greater economic interchange of tomorrow that will contribute to the mutual economic prosperity of all countries throughout the world.

■ For information on Japanese industry, write to JETRO.

JETRO

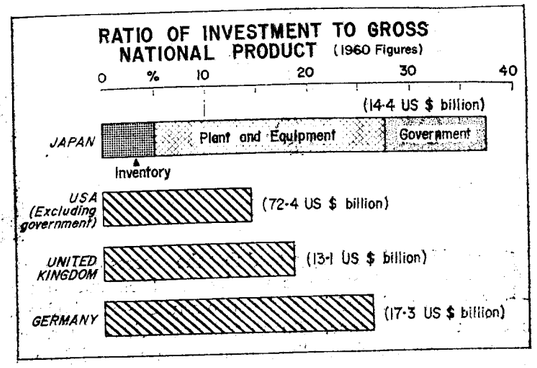
then using monetary policy and high interest rates as a rationing device, has caused restriction to impinge mainly on those whom the banks regard as the worst business risks. The rationed capital has become available only to those who can use it most profitably—except when political considerations intervene and gum the process up.

Secondly, the British have got used to saying that a policy of expansionary budgets and high interest rates will penalise investment at the expense of stimulating consumption. Japanese experience surely proves this to be nonsense. Japan (where industrial borrowing in recent years has cost about 10 per cent) has recently been devoting nearly 40 per cent of its gross national product to total investment. Britain, on the same basis of comparison, has devoted less than 20 per cent. The truth is that it is a spirit of dynamism among thrusting growth industries that nowadays serves to impel an economy along the high road of expanding investment. A policy of stimulatory budgets provides the oats that beckon the horse forward, while a policy of high interest rates provides the reins to guide the horse and also (at least in Japan) helps to provide the high savings (and, sometimes, at appropriate moments of the trade cycle, also the temporary increase of borrowing from abroad) which make the continuance of heavy investment possible. A policy of low interest rates relaxes the reins so that the horse will find it easier to rush forward faster if it wishes, but this is not much use when, because of a lack of expansion of marginal demand, the horse itself is standing still.



After the Zaibatsu

THE Zaibatsu were the rich families of prewar Japan (Mitsui, Mitsubishi, Sumitomo, etc) who owned the great industrial empires, sometimes delegating the job of management to hired managers, but sometimes actively controlling the boards of directors themselves. After the war the Americans, with reforming zeal, split up the firms in these mass empires into individual entities; but this was like grappling with a jellyfish, for the habit of cohesion has remained. It is secured now by interlocking directorships and high-level executive consultation among the firms that used to belong to the old groups; by inter-company shareholdings among group members; and by the fact that one of the big city banks—several of which are successors of the old Zaibatsu banks—is likely to hold a central position in each group. This last point is important because of the major role which the banks still play in financing new fixed investment in Japan—even though direct sales of shares to the public are growing fast (and are helped on their way by security selling departments in the main ordinary shopping streets, which operate in the way that betting shops are not allowed to operate in England, with the latest stock prices shown on television screens, and a commentator jabbering away excitedly as prices change).

When some new sort of industry (say, petrochemicals) becomes the rage in Japan, the group around one bank will set up a firm to take part in it; then the group around another big bank will seek to set up a rival company, almost as a matter of face. This has provided the country with a real, if peculiar, kind of competition in constant modernisation. The big firms will often tell you that this is "excessive competition" and that "the government ought to do something about it" (meaning that the government ought to step in and stop other groups setting up rival firms to themselves). But one suspects that it is, in fact, a kind of competition from which Japan has made great net gains in recent years.

Inevitably, the system means that the big firms which have close connections with the banking groups generally have an advantage in raising funds. The rates which the smaller firms have to pay are often considerably higher even than the 10 per cent or so nominally charged; for example, a bank may say that the borrower must redeposit with it (at an interest rate well below the lending rate) part of the money nominally loaned, thus greatly increasing the effective interest rate really charged. Most of the small firms work mainly as sub-contractors to the big ones. One might therefore suppose that the big firms would hand on considerable credit to them. But surprisingly often things work in the reverse direction. During a credit squeeze the big firms may pass on the effects of a capital shortage by paying their sub-contractors in, say, three-months promissory notes, which then have to be privately discounted (at rates, this year, of up to 25 per cent per annum) by the small firm in the market.

No doubt the big firms are unlikely to allow bankruptcy to overtake any sub-contractor who is really efficient and useful to them. They are more likely to want to see bankruptcy overtake the less efficient sub-contractors, or (this, of course, is the unhealthy part of the system) small firms which compete with them by putting products directly on the market at a cut price. This last sort of squelching of competition, however, is probably more usual in the older trades like textiles than in the newer trades like engineering; in the latter, the small firms cannot generally make completed products anyway, but act as sub-contractors for the big ones.

As has been argued above, your correspondent came to the unorthodox view that this system—by which credit squeezes have tended to fall more harshly on the less efficient firms—has probably been of real if cruel advantage to the Japanese economy as a whole. But it is natural that many ordinary people—and even more small businessmen and politicians who depend on their votes—do not see things that way. In the present (1962) credit squeeze, there have been signs that the authorities have been trying to put more of the strain of the squeeze on the big fellows, and less on the small, compared with what happened in the squeezes of 1954 and 1957; this summer, for example, when the period of tax collections fell due, the government was deliberately pumping out fairly large special loans through the various special institutions which lend directly to smaller businesses. Socially, this is understandable; economically, it might be a mistake.

The Planning of Exports

IT would be absurd to pretend that the success of Japanese governments' economic policies has been due to the formula explained in the last two articles—easy budgets, but tight money—alone. But that almost accidental formula has provided the right elbow room for a part of Japan's dynamic that really has been fundamental; namely, the nation's economic tendency to look constantly ahead in emulation.

In part, of course, this springs from Japan's advantage in not having been historically the front runner in the technological race; in part, it springs from the very useful national urge to be always gaining face. If "advanced countries" abroad have a competitive petrochemical industry—and Japan has not—then everybody in the Japanese government, and everybody in each big business group around each of the big banks, wants Japan (and for that matter his own banking group) to have a successful petrochemical industry too. Every big firm has a planning division which assiduously studies the filing of new patents and the introduction of new industrial techniques abroad; when successful ones appear, Japanese industrialists will immediately enter into negotiations to be allowed to operate the same techniques, under licence—and nowadays often with considerable locally-added improvements—in Japan. This technological élan seems to be far more energetic than in British industry, which has too often seemed to regard the "copying" under licence of American or other foreign techniques as rather infra dig.

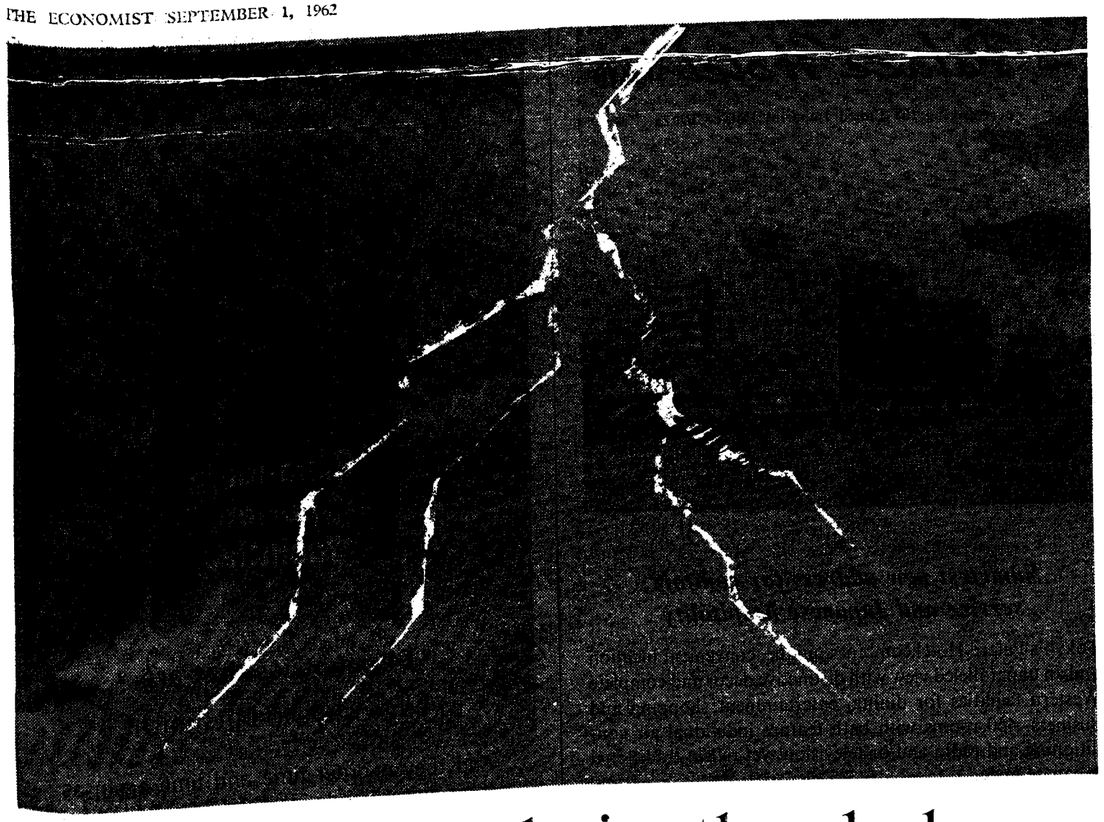
The same tendency for the Japanese to be constantly looking ahead in emulation permeates their government machine. The Japanese will always tell you, especially if they assume you to be an American, that theirs is not a planned economy. In the socialist sense of the term it is not. But Japan, even more than France, is the land of indicative economic planning *à outrance*. One has only to read the annual economic survey published by its Economic Planning Agency—a colossal tome of 500 magazine-size pages—to appreciate that. One has also only to look into the economics and statistics departments of any of its government departments or agencies: huge factory-like rooms, with economic graduates sitting row upon row, all hammering out on their adding machines the indicative economic statistics of the new Japan. Sometimes this estimating goes to what, to a Briton, seems more than slightly comical extremes: it is a bit odd to read in the press that the Economic Planning Agency has set a "target figure" for a rise of 2.8 per cent in the cost of living, or 14.6 per cent in exports, for the year ahead. But the attitude engendered by all this is important, because it is often precisely the opposite of that which rules in Britain. Nowhere can this be seen more startlingly than in Japan's mode of planning its exports, a field in which the Japanese will at first tell one most insistently that they do not do any positive planning at all.

JAPAN knows exactly where it wants to go in its future export drive. It wants to go into what it calls "heavy and chemical industries' products (totals of machinery, metals, metal products and chemical goods)"—hereafter called heavy goods for short. In 1953, when Japan started its present export advance, it had 50.2 per cent of its exports in light industrial goods (of which three-quarters were textiles) and 35.7 per cent in heavy goods; by 1959 it had switched to 47 per cent light (going down) and 42 per cent heavy (going up). Its export structure, Japanese planners will point out, has therefore in this decade been broadly similar to the stage that had been reached by most West European countries in about 1928. Since 1928, every West European country has gradually switched into the more "modern structure" of putting much less emphasis on "light industrial" exports (of which textiles have almost always been the main element) and much greater emphasis on exporting of heavy industrial goods. As witness the table below:

PERCENTAGE OF TOTAL EXPORTS

	Light Industrial		Heavy Industrial	
	1928	1959	1928	1959
Britain	50·7	18·3	30·5	66·1
Switzerland	54·3	25·1	27·6	66·7
Belgium	42·9	26·9	33·2	55·9
France	44·1	21·9	22·6	52·5
Italy	37·5	26·5	16·5	43·0

Most successfully of all Germany had reached 41.6 per cent light and 26.2 per cent heavy even by 1900; by 1959 it had reached 14.7 per cent light and 73.8 per cent heavy, a slightly "more modern proportion" (in terms of industrial exports only) even than the United States.



just a spark in the dark

. . . and a street is lighted, a room is warmed, an ice-box cake is chilled. These are ordinary marvels by now, but the better harnessing of electricity takes another kind of spark, too — the creative spark of an idea. The engineering and design of better electrical appliances is our continuing concern at Sharp. Already Sharp equipment is in use around the globe. New products and processes are being tested every day, from TV sets that are slimmer yet wider than ever, to surgical knives that let surgeons perform operations never before possible.

Sharp also produces radio, refrigerators, fans, electric shavers and air coolers, depth finders and electronic ranges plus dozens of other advanced products for home and industry.

For a brighter future in electric and electronic appliances and equipment, look for the spark from Sharp.

Japan's official Foreign Trade White Paper for last year was quite brutal in drawing attention to the way in which Germany made a quicker and earlier switch into heavy industrial exports than Britain:

> The (different) speed of adjustment of the export structure of these two countries greatly affected later developments . . . in particular it is well known that this became an important factor in leading the British economy into a long-term stagnation. Special attention must be given to this point on the part of Japan, which still depends greatly on textile products.

And one can be quite sure that special attention will be paid to it, for the Japanese are convinced that in the second half of this century the underdeveloped countries will sweep into the export markets for light industrial products, and not only for natural textiles. When your correspondent asked one Japanese which newly developing country he most feared, the answer was unexpected: "In thirty years perhaps all of them, with China of course hanging over all; but in the next few years I think one main challenger may be Spain." Others that were mentioned were Formosa and Hongkong.

THIS idea of encouraging development of to-morrow's export industries, rather than concentrating entirely on today's possibly evanescent ones, is a deliberate feature of Japan's short-term policies, and not just one of its vague long-term aspirations. As one example of the statistical and planning techniques employed: income elasticities of demand for various items in the main markets of the world are studied with loving care, and this trend of world demand is then checked against what is called Japan's "specialisation index." (This term can best be explained by an example: if 5 per cent of total world trade is in chemical goods and 5 per cent of Japan's exports are chemicals too, then Japan's specialisation index for chemical goods would be one.) When world demand is rising especially heavily for some particular item, Japan's industrial planners get very worried if Japan's "specialisation index"—and thus share of world exports—for that item is not concurrently going up too. On the other hand, if Japan's specialisation index is already high for something for which world demand is not rising, the planners are not at all sorry to see that industry—even if it is currently a good exporter, such as (e.g.) tractors are for Britain—gradually dwindle.

Thus Japan's Economic Survey for 1959-60 noted with satisfaction that in a wide range of articles for which world demand was then rising, Japan's specialisation index had increased also. These booming exports included most forms of machinery, other metal goods (as distinct from metals themselves), made-up clothing (as distinct from textile piece goods), vessels, automobiles (where admittedly Japan's specialisation index is still well below unity), and some forms of plywood and wooden products. On the other hand, the survey noted with almost equal satisfaction:

> Among the items on which Japan is beating a retreat with regard to specialisation are those goods which are manufactured through comparatively simple processes and are in poor demand like yarn and cotton fabrics hitherto exported mainly to underdeveloped countries. They also include chemical fertiliser, pottery, glass products and bicycles.

But it added as a warning note:

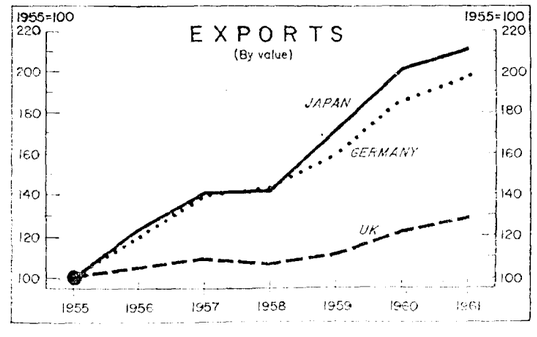
> Declines in specialisation indices are also registered for many chemical products and metals. This is quite noteworthy, for the world's demands for chemical products and metals are on the upgrade.

Following upon this sort of remark, government measures for encouraging greater output of the chemical products indicated as desirable will be stepped up.

In part, these government measures may take the form of winks and nods passed along Japan's extensive "old boy" network. (As Sir Norman Kipping and Mr J. R. M. Whitehorn put it, perhaps with rather polite understatement, in their excellent report on Japan to the Federation of British Industries last year: "The very intimate and manifold connections at all levels between government and industry are a most important factor in the attitudes and policies of both.") But the government also has some powerful positive strings to its bow. They can include the exemption from corporation tax on profits from a new product for an initial period, extraordinary depreciation allowances (which can sometimes be very extraordinary indeed), readier permission to firms in a growth industry to import technological know-how, as well as very tight protection against foreign imports while the infant industry is being built up. And, as a most important point: if domestic demand for these industries' products grows in the meanwhile, thus giving them further encouragement to expand, that will be regarded as the happiest development of all.

THIS last remark leads into another vital difference between official attitudes in Britain and Japan. In Britain the government almost automatically assumes that any "excessive" increase in domestic demand necessarily causes exports to shrink, because the extra demand sucks goods into the home market; British officialdom discounts the argument of some industrialists that increases in home demand help exports by enabling manufacturers to utilise to the full the economies of modern mass production techniques. In Japan—instead of assuming that the industrialists' argument is either always wrong or always right—they set their adding machines to work to find when and whether it has proved true in each particular case. And from this springs calculation of what Japanese planners have called "the export and industrial estrangement coefficient" in various parts of their economy—another term that economists in Britain have never learned to use.

In 1950, for example, machinery accounted for 16.2 per cent of Japan's industrial output but only 10.5 per cent of its industrial exports; so machinery was calculated to have an export estrangement coefficient of 10.5 divided by 16.2,



which equals 0.65. By 1959, by contrast, output and exports of machinery happened to have risen to a level where they accounted (coincidentally) for exactly 28.9 per cent of both Japan's industrial output and its industrial exports, so by then machinery had an estrangement coefficient of one. This, in other words, was one group in which exports had proved to go up more than proportionately as domestic demand had expanded. And the blunt fact is that the same trend has been observed in Japan in most of the "modern" industries on which increases in domestic demand within an expanding economy have recently been most heavily concentrated.

This would not be true in all countries with different schedules of marginal domestic demand; for example, in America marginal demand in an expanding society might well be mainly concentrated on services, which would often use up labour in forms of employment where they could not add to exports at all. But the situation is different when marginal domestic demand is concentrated on industries with a high rate of capital-intensiveness, in which productivity therefore increases sharply with mass production and in which it has been proved (by those adding machines again) that qualitative improvements and investments in modernisation go forward most swiftly in time of high prosperity for the industries concerned (so that a country must be considered to be particularly well placed to follow expansionary policies when marginal domestic demand falls heavily upon industries with great scope for complicated technological advance).

One suspects that Britain, like Japan, has in recent years been in this potentially happy position where re-expansionary policies would have paid off in aiding the export industries of the future to grow to a more efficient size; at any rate it would be nice if the National Economic Development Council or somebody would use its adding machines to try to find out.

IT is easy to dismiss all this talk of estrangement coefficients and specialisation indices as highbrow stuff which only the academic planners (and perhaps even only a small minority of them) understand and make up for the purposes of their absurdly-detailed forward-looking "plans." But the fact is that this sort of economic temperature-testing has insensibly created an attitude towards problems of growth in Japan wholly different from that in Britain.

Your correspondent felt this most keenly at two types of interview during his tour of Japan. The first was when he checked up on the spot what has happened to British exports as a result of British governments' consistent policies of holding down British domestic consumers' (and investors') demand for new things, in order not to draw away resources from traditional export industries. The result has been that, as seen from a market like Japan, Britain's main exports now look very traditional indeed. The main things in which Britain ranked as the principal supplier to the Japanese market last year were whisky, sweets and other confectionery, and woollen fabrics (plus some other textiles). In machinery and other "modern" exports, America and Germany beat us right across the board. As the recent FBI report pointed out this "has perhaps contributed to a quite false picture that we are strong only in consumer goods." To put the matter much more bluntly, the vision of the average Japanese—and of other distant export customers—is that Britain today has become a non-developing country; filled no doubt with whisky stills, children's bon-bons, skilled at making up material from old sheep, and fabricating other quaintly old-fashioned things which the average Japanese probably regards as the products of our cottage industries; but not a dynamic country that it capable of producing anything expansive and new.

The second sort of shock came when one talked to Japanese economists themselves. It was terribly difficult to explain to intelligent Japanese that in Britain the industries for whose products demand rises most swiftly, during hire purchase or other booms, are often precisely the ones that the Government seeks discriminately to hold down; that British Chancellors do not seem to believe in the concept of domestic growth industries, but resolutely maintain that the only sound type of growth is that "based on and led by exports." The answer was apt to be something like:

> That is most interesting. In an early stage of our development we too led our industrialisation by export industries such as textiles. But in the present stage of modernisation of our industrial structure I think the only industries in which we have seen export increases induce a production increment—instead of the other way round—are transistor radios and perhaps cameras. We do not all regard these industries as very soundly based because demand for them, especially transistors, may be saturated too soon. Export increases of all our other products have been induced mainly by expansion for the domestic market. But perhaps in your mature country the indices. . . .

One had then to explain that British policy was not based on such complicated ideas as studies of the likely trends in specialisation indices and estrangement coefficients, but on what British ministers regard as the "commonsense" view that exports can go forward fast only if the domestic market is not too ravenous. The response one elicited by this sort of explanation was apt to be that peculiar Japanese ejaculation which sounds like the word "Ha" emitted from the top of the forehead. It is the world's politest—and in this case just possibly most deserved ?—form of snort.

Can It Last?

THE question to ask now is whether, after Japan's last golden decade, the dynamic is going to last. There are four reasons for fearing that it might not do so. Three of them will be all too familiar to people with experience of Britain's economy in the last fifteen years; the other will be very unfamiliar indeed. The unfamiliar one, which we will deal with first, is that Japan has in the recent past probably been devoting too much of its gross national product to investment instead of consumption.

Fixed investment in private industry has been very much the main growth element in Japan in recent years; last year it was actually four times as large as it had been even in

TOYO RAYON

PLANT CAPACITY FOR 81,000,000 PEOPLE*

As the largest manufacturer of chemical fibres in Japan, Toyo Rayon's (Toray) annual production alone is enough to supply an average market of 81,000,000 people*... and supply them well for the Toray line includes an unsurpassed variety of nylon, polyester, rayon and polypropylene fibres. They're sold under such world-renowned trademarks as Amilan, Nylex, Toray TETRON, Tetrex, Madame Butterfly, Suiko and Toray PYLEN.

Established in 1926, Toyo Rayon today operates seven major manufacturing sites and one central research laboratory, in addition to local laboratories, for the manufacture and continual improvement of its products. Few textile firms anywhere can boast equal facilities or a more promising future. A constant aim of the company is modernization of plant and facilities in order to supply the world with products of the highest quality at the most reasonable prices. With this guiding philosophy you can confidently expect more "miracle" fibres and plastics from the world of Toray.

*Based on 2.71% of the world population which is Toray's share of world production in chemical fibres.

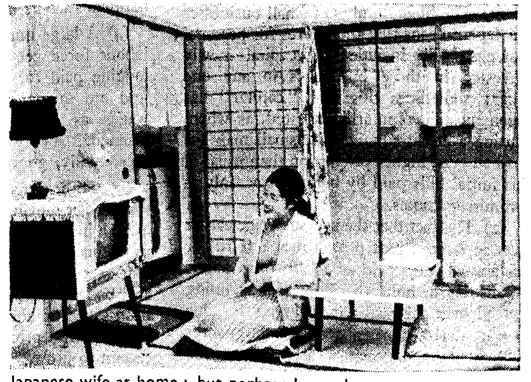
1955. There have been several instabilities in this situation, not the least of which is that the investment boom has been feeding very largely upon itself ; something like half of the investment that was going on in 1961 seemed itself to be investment in the investment goods industries. One cannot really believe that this will last. Some of the equipment installed last year must be beginning to look a bit unprofitable now, especially since total demand and production began to sag in the spring of this year following measures taken to deal with the temporary balance of payments deficit. One's own guess would be that, even after the tight money squeeze is relaxed, the new " natural " rate for total investment (including stocks) might prove to be, say, between 25 and 30 per cent of gross national product (which would still be a very high rate compared with most other countries) rather than the extraordinary 35 to 40 per cent that was being achieved last year.

If so, the questions will be: what is to take up the other 5 to 10 per cent of GNP, and what is to take over as the main dynamic element to lead the next stage of the advance ? There are two main possibilities: an increase in public investment in amenities as private investment in industrial equipment falls off, and an increase in consumption. There should be plenty of scope for increases in both. In the field of public investment, Japan's roads, harbours, housing, and, for example, sewage system (this is still most definitely an effluent as well as an affluent society) cry out for very large new expenditure indeed. Although real spending by the average worker's household in Tokyo has more than doubled since 1951, consumption still takes a ridiculously low proportion of gross national product (only 52 per cent in 1960-61). But there are going to be problems in the way. One rather charming conversation which your correspondent had with a Japanese (not in an official position) is worth quoting. " To change from investment to consumption as you say," said the Japanese, " would mean switching from profits to wages. Politically very difficult." " Not in Britain " said your correspondent. " Ha ! We swop governments, eh ? " Alternatively, a deliberate attempt to take up slack by a still bigger programme of public works, or by introducing more of a welfare state, would mean running the budget into deliberate deficit. And although Japan's peculiar budgetary system has served it well by allowing the Ministry of Finance to introduce expansionary budgets during a period of continuing expansion, it would theoretically not make it easy to use the budget as a re-stimulatory force after a period of slowdown.

MOREOVER, there are some conservative people in Japan who are now advocating a policy of deliberate slowdown in the rate of expansion for other reasons. It will already have become apparent, from the whole tone of this survey, that your correspondent would regard such a policy of a deliberate slowdown as a bitterly disappointing mistake. Before going on to discuss the conservatives' counter arguments, one had better define what one means in saying this. One is not suggesting that Japan should or could aim to keep up annually the extraordinary rate of increase of over 15 per cent in real national product which it achieved last year ; that rate obviously did bring with it some element of undesirable inflation, both in prices and imports. One is not even suggesting that Japan can expect for very long to stick to the average rate of more than 9 per cent of annual growth which it has achieved since 1951 ; if private investment in fixed capital equipment is to account for a rather smaller proportion of GNP in future, productive capacity will no longer go on growing by its recent massive amount. But one is suggesting that Japan should deliberately aim to keep demand rising at the rate which will allow its expanded (and expanding) capacity to be fully used.

The conservative Japanese who deny this put forward three reasons for objection. First, they say that Japan has now run into a shortage of labour " just like England," and they cite the figures for job openings and job applications by school leavers to prove this. The answer to this is that Japan cannot really be called short of labour so long as some even of its new young entrants into industry have to take jobs in firms where their productivity and eventual lifetime wages will still be only between 50 and 60 per cent of those that they would earn if expanding employment opportunities were continuously and progressively made available for them in the larger firms, and especially not so long as the retirement age for older men is at the ludicrously low level of 55. Even in Britain, it has been argued earlier in this survey, the right way to meet the so-called shortage of labour is not to keep on holding back the growth industries by restricting marginal demand, but to shake resources free from the less efficient industries and firms by introducing more competition and by using policies that are more deliberately designed to drive the weakest entities to the wall. In Japan it seems even more obviously desirable that the so-called " excess demand " for young labour should continue up to the point where (a) it gives more young



Japanese wife at home : but perhaps her only room

men the chance to take up jobs in the modern and efficient industries, even if this means that they will go on bidding even more labour away from the much lower paying and less efficient ones ; where (b) it makes more of the established firms feel that they will have to keep existing employees on past the age of 55 ; and where (c) it forces all employers in general to adopt a less restrictive attitude to the new employment of all " old men " over the age of 30.

The conservatives' second objection is that some element of

price inflation will be inevitable so long as policies of "encouraging excess demand for labour" continue. Probably, it will be. Indeed in this respect Japan may well have a heavier cross to bear than Britain. The reason is that prices of some things in Japan (especially services and some things produced by the older and labour-intensive industries) have hitherto been kept very cheap because they have been produced by workers whose wages have been unduly low, and this "advantage" is now about to disappear. The price inflation in Japan in the last two years has been largely due to a rise in labour costs in branches of industry where labour has hitherto been exploited; part (though admittedly not all) of the loud complaints in Tokyo this year that "prices of services have been rising too steeply" turns out to mean that "messenger boys" and other personal servants are more expensive than they used to be (a not unusual phenomenon in an enrichening society) and that those who worked even in the smaller shops were now taking more than one free day off a month. To say this is not to pretend that there have been no evils (particularly for retired people) in the sudden 10 per cent rise in prices which has occurred in Tokyo during the past year; certainly it would be an excellent thing if the big Japanese companies engaged in more of the competitive price cutting which is also badly needed in Britain. But on balance—especially if there were now to be a growth in social services, including pension schemes, for the less well off—some rise in the domestic price of things hitherto turned out by low-wage establishments should not be regarded as an unmitigated misfortune. It would seem to be worth while if it is the requirement for keeping expansion and modernisation of Japan's industrial structure pressing forward at the full stretch of advance.

THE third objection to continuing demand reflation is that it might result in a continuing balance of payments crisis for Japan. Once again, one must define what one means here. If

Savers like the Swiss?

IT is often said that one of Japan's greatest advantages has been that its people are almost unnaturally heavy savers, and there have been many expressions of admiration and wonder that a people with an average personal income of nominally only about two-fifths of Britain's per head apparently voluntarily saves up to 20 per cent of it. But some of the statistics often quoted are rather misleading, or are very heavily affected by circumstances very peculiar to Japan. For example:

(1) The huge number of small businesses in Japan means that the figures for personal savings will include all capital newly invested in those businesses in any one year: sometimes this new "capital" has been most involuntarily invested, as when, during a credit squeeze, the small man has had an even higher proportion than usual of his initial bills paid by bigger firms only in promissory notes.

(2) The fact that the average wage earner gets so large a part (sometimes a third) of his annual wage paid as a Christmas bonus means that he holds that bonus for spending spread over the year; it is largely for this reason that so many even of the poorer households open savings accounts at the banks. No doubt this banking habit in itself leads to an increased habit of genuine saving, but when the bonuses given each Christmas are much bigger than those given the Christmas before—as has happened in every recent year of expansion—it is automatic that the *total* of savings deposits as recorded on each December 31st should be much bigger too.

(3) While employers' fringe benefits in the west often take a form (e.g. pensions schemes) which do some of the worker's saving for him, fringe benefits in Japan often consist of doing or subsidising some of the worker's spending for him (paying his railway fares, cheap company shops) and leaving him to save for his old age himself. Such pensions as the worker gets often consist of terminal pay of his salary in a block sum for a certain period ahead, leaving him to save and spread this block sum over what he guesses will be the remainder of his life. Once again, this increases the nominal figure for "personal savings" in the national income accounts.

(4) A large number of the women in the labour force get most of their board and lodging paid for them by their employers and are saving the greater part of their wages as a dowry for when they get married. (Very few married women, incidentally, go out to work.)

(5) Hire purchase has been relatively slow to get moving in Japan (partly because of high interest rates, partly because of social problems connected with organising it), so that over 50 per cent of consumer durables are bought with money which has first been saved up and is then paid cash down; in future the proportion financed by hp is certain to grow.

WHEN allowance is made for all this, a certain haze of healthy cynicism is perhaps thrown over the theory that Japan has prospered because of "the great natural thriftiness shown by its people." The huge proportion of between 35 and 40 per cent of its gross national product which has been taken up in recent years by total investment (which necessarily equals total savings) is largely explained by another factor: namely the fact that (although, once again, properly comparative figures are desperately difficult to work out) about a tenth of the national income which in Britain would have gone to wages or other personal incomes has in Japan recently been going to company profits instead. To the doctrinaire left-winger, this will seem a shocking proof that the capitalists are too greedy, and the trade unions insufficiently powerful, in Japan. To the more pragmatic economist, the proper observations seem to be:

(1) Because companies have been ploughing back these high profits during a golden age of high investment, the Japanese worker has gained more in this last decade from this greater growth in the national cake than he would have done if he had got a larger share of the national cake immediately.

(2) As a matter of fact, the slower relative growth of wage bills than of profits has not been primarily due to the weakness of trade unions. It has been much more greatly due to the facts that the new and most profitable industries have mostly been built up with new and young labour forces; and it is a custom of the country (which the trade unions themselves appear to support) that young regular employees expect to get a much lower wage than older regular employees in Japan.

As the average age of the labour force in these new industries grows older, more of the national income should go to wages and less to profits; because a smaller proportion of wages than profits is saved, this should mean that consumption will gain somewhat at the expense of investment. We have already suggested that, after its age of high investment, Japan is one of the few countries in the world where such a switch from investment to consumption would now probably be a switch in the right economic direction.

IHI's wharf cranes speed up work at the Port of Calcutta

In recent international bidding IHI won an order from the Port of Calcutta for 25 wharf cranes, which are now being installed. By simple adjustment of a gear mechanism, these versatile work-horses can be changed to handle either 3 or 5 ton loads. Their new "three-legged" construction gives them wider clearance, reduces their total cost and weight, and makes them easier to move. It also makes possible simplification of their operating mechanism.

IHI makes all kinds of cranes, of all sizes and capacities, to meet every materials handling problem. The trademark of IHI is your guarantee of durability and precision. As Japan's leading heavy-industry company, IHI has been designing and manufacturing all kinds of heavy equipment for over 100 years — from ships, engines, and boilers, to heavy machinery for use in the chemical, construction, iron and steel, power generating, and mining industries. Brochures outlining IHI's capabilities and informative "IHI Letter" will be sent on request.

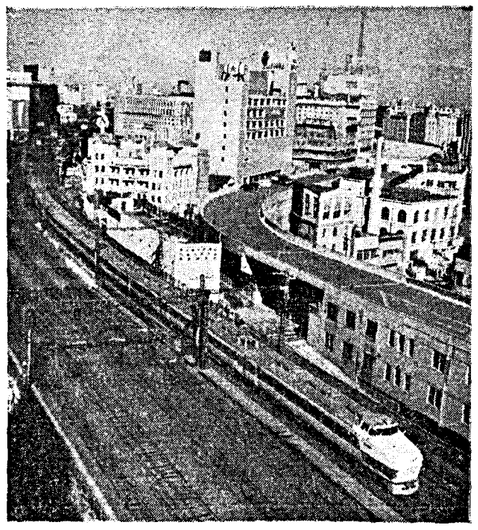
the argument is that the importing structure of Japan cannot easily afford each year the sort of 15 per cent real increase in domestic demand that was experienced in 1961, there may well be some sense in such talk. But if one is calling for a permanent slowdown in Japan's whole recent regular tempo of advance because of balance-of-payments difficulties, then—here the argument must turn back to be addressed again mainly to western, rather than Japanese, ears—one should sit down and think carefully where such an argument leads.

If conventional economics calls for such a slowdown there can surely be no sense left in conventional world economics at all. For everybody knows that Japan's export problems do not arise from the fact that as it has giddily expanded its production of new style goods, those goods have progressively proved to be too uncompetitive and too dear; on the contrary, Japanese products are now being kept out of all manner of western markets by special restrictions, precisely because they have proved so good and so cheap.

IT is easy—and justifiable—to reply that Japan does not throw its frontiers open to foreign goods either. Its attitude to imports will be discussed next week, and the conclusion will be that (despite high flown phrases about its present advance to so-called—misleadingly called—90 per cent import liberalisation) its record is still more than deplorable in one respect: it should do much more to implement the precept spelled out in its present long-range economic plan that while it is reasonable for its tariff and other policy "to give protection to incipient industries which have potentialities for development . . . the government should refrain from giving (similar) relief to declining ones." But really in this it is in the west's own interests—and also should be frankly its responsibility—to set an example. For consider the prospect now before us.

All the goods that Japan could produce more cheaply than the West yesterday and today—including especially the sensitive goods like textiles against which Britain wants to maintain the power to impose sudden import restrictions—are likely to be the goods that other developing countries will be able to produce more cheaply than the West tomorrow or the day after tomorrow. It is most emphatically not in the West's interests to try to keep alive its own doomed industries making these goods; even if Japanese industries are repulsed by special restrictions today, the West will only be left with a mass of declining industries that will have to fight overwhelming competition from a dozen or more new Japans, from Africa, Asia and even southern Europe tomorrow. By contrast the more "modern" goods that Japan itself is now newly becoming able to produce as efficiently as the West cover a much wider range. Probably indeed they will soon be conterminous with nearly the whole field of manufacture. There may be loud protests as this happens. But if the West follows a policy of reasonable liberalism, this does not mean that Japan will capture all our markets.



Full speed ahead: crack express leaving Tokyo

No country can capture all the world's markets and thus run an export surplus for ever. The most that might happen would be a fairly shortlived yen problem, like the D-mark problem of the last decade and the dollar problem of the decade before that, which would eventually be solved (as the D-mark and dollar problems have been) by the rise of living standards and of import freedom in the export surplus country, or (less probably) by an up-valuation of the yen. The problem would in short be solved as, among the comity of rich western countries, this first standard bearer of Asia at last arrived as an equally rich-living partner.

BUT at the moment the West is not following a policy that will encourage this. On the contrary, in answer to pleas for protection from some of Britain's own lowest wage industries and (to cite one actual example while your correspondent was in Japan) from American producers of zip fasteners, imports from Japan are being held down by intermittent special restrictions. And now, in consequence of this, the idea is gaining ground that Japan will have to slow down her exciting rate of advance; that she will have to delay her dramatic surge into tomorrow; that she may have to remain more static in her industrial structure of yesterday and today, a structure into which other developing countries should soon be advancing (although they too will be likely to be slowed, if Japan is left marking time across their route of advance).

And thus a whole absurd cycle of mutual misery could be brought into being. Thus the whole process of advance in Asia and Africa could be blocked, just after one Asian country has shown how breakthrough could be achieved; and the West, sadly pumping out aid funds to spur on the sort of economic development which it will have blocked by the export of its own economic stupidity, will be left wondering why the political consequences of this well-intentioned bungling are so dire. And nobody who has seen the political forces operating among Asian students today—or sensed what will happen if an economic slowdown prevents these young men from getting quite as good jobs as they at present expect—will underestimate for a moment just how dire they could be.

A copper seal used more than 4 centuries ago. This seal was used by Toyotomi Hideyoshi, Japanese military leader (1536 - 1598) during his rule for most important documents. On it are engraved verses from an ancient poem which signify good fortune and longevity, and contain the words Tokai (東海); hence the name of the Tokai Bank

Ever since its establishment this bank has enjoyed continued growth and prosperity. Today it is one of the leading banks in Japan with 176 branch offices strategically located and staffed with more than 9,000 employees — many of them experts of foreign trade. With this nationwide network of branches, Tokai Bank is in a position to offer unrivalled service to whoever trades with Japan.

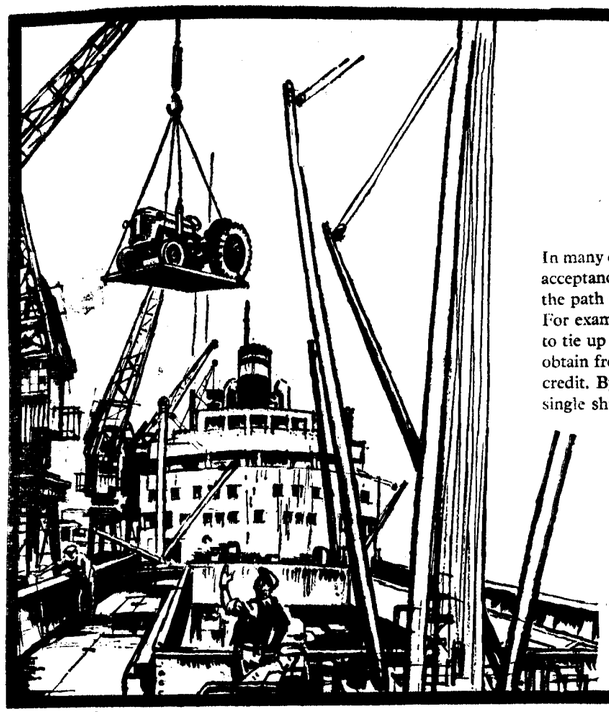
A MERCHANT BANK AT WORK



Acceptance Credits can help to Increase Exports

In many deals which involve the movement of goods between countries, acceptance credits are at work, taking the financial strain and easing the path of buyer and seller alike.

For example, if a United Kingdom exporter of tractors does not wish to tie up his own money by giving credit to the foreign buyer, he may obtain from us the required temporary finance through an acceptance credit. By this means he can draw on us bills of exchange against a single shipment *or under a revolving credit, against a general turnover of export shipments;* the bills, after acceptance by us, can be sold immediately to provide him with the finance he needs.

Acceptance credits, running into many millions of pounds annually, finance much of this country's export and import trade with the rest of the world.

THE BUSINESS WORLD

Should Interest Rates Fall?

A NEW surge of demand for gilt-edged securities in London this week has brought the year-long recovery into new ground. War Loan, rising by nearly 2 points, is now comfortably above 60, and a full ten points above its low after Mr Selwyn Lloyd brought in his emergency measures in July last year. Its yield has thereby been brought to 5.8 per cent, and every government stock in the list is now below 6 per cent; in August last year, yields ranged up to 7 per cent. At the same time, the gilt-edged market has been absorbing unusually large funds. New issues by corporation and Commonwealth borrowers have been let forward in a steady stream; the latest is a loan of £10 million for New Zealand, which with a gross redemption yield of £6 6s. 8d. per cent secured the expected over-subscription on Thursday. In all, these issues have raised over £150 million since the beginning of the year. In addition, investors have by now taken the whole of the £300 million of Treasury 1986-89 stock put out through the tap from the beginning of May. Indeed the expected ending of this tap, which had previously restrained the rest of the gilt-edged market, was one of the immediate factors behind this week's market boom. The authorities have been quick to replenish the tap, reverting to the very long end of the market with a new tranche, of no less than £500 million, of the Treasury 5½ per cent, 2008-12.

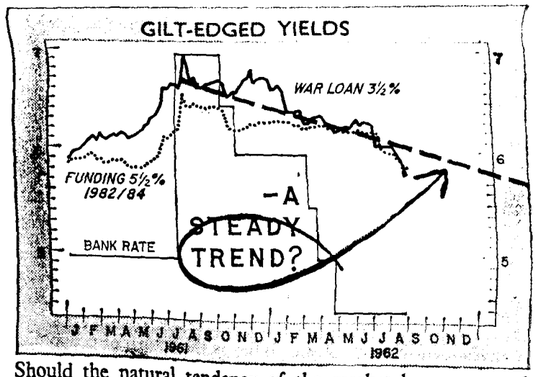
This being issued at 95, ⅛ above the market price—unattractive immediately, but on recent experience perhaps not for very long. The issue contributed to a pause in the very long dated and irredeemable stocks but to a rise in the 1982-84s and the 1986-89s. Faced with a literally overwhelming demand for their wares, the monetary authorities seem to be responding mechanically in the only way they know—making more stock available, keeping short-term "control" but providing little serious resistance to the market rise. Have they really reconsidered, for present conditions, what should be the role of funding sales on the one hand and interest rates on the other?

After a number of years in which, as Professor R. S. Sayers has pointed out in an impressive article,* investors had no clear idea in which direction interest rates were moving, they have recently, with the help of hints from the Bank of England, formed a more positive view. The view is that rates are still unduly high both historically and, more important, in relation to the balance of economic forces. The big new factor in the investment climate of the sixties is the return of economic scepticism to major western economies after the easy post-war boom. Growth no longer looks certain, and to be had for the asking; it follows that a so-called growth stock with a promise of future income is no longer automatically preferred to a staid stock of fixed monetary value and fixed return. This major change in the western economic scene was first discernible in 1960; and it did then look, for a time, as if the long bear market in gilt-edged was already on the turn. The exchange crisis of 1961 intervened; but immediately the rescue operations for sterling had been taken gilt-edged began to rise.

The fall in long-term interest rates so far, of rather more than one percentage point, is already larger than the fall that took place between the previous exchange crisis of 1957 and the time when recovery began to give way to boom in 1959. But in the current cycle long-term rates have started from a notably higher peak, close to 7 per cent. The present level of around 5¾ per cent is still no lower than in the most critical days of 1957; it is significantly higher than at the depths of the Suez crisis; it compares with a long-term level of 5 per cent which seemed shockingly high at the beginning of 1956; with 4 per cent in 1954; and with 3 per cent and less throughout most of the forties. Only four years ago, one may recall, Professor J. R. Hicks was arguing that, given some kind of easing of sterling's international liquidity problem, the traditional rates of 3-3½ per cent on Consols should still be considered the norm; and though most observers would hesitate to go that far, even today, the proposition seems rather less fanciful than it would have done two years ago.

FOR it does seem that at a time when demand inflation or anything like it has disappeared from Britain, from the United States, and from Germany; when cost inflation is under better control in at least the first two countries; when personal savings in all three countries are continuing their extraordinary progression; and when, nonetheless, the British Government still feels bound to supplement these savings through a net budget surplus—in these conditions, certainly, it is not easy to see why interest rates in London should surpass the level that even the supporters of flexible money rates thought appropriate at the height of postwar scarcity and uncontrolled boom. So it happens that voices as disparate as those of Lord Cromer, Professor Sayers and Sir Roy Harrod have been talking interest rates down. Are they right?

* "English Policy on Interest Rates, 1958-62." Banca Nazionale del Lavoro Quarterly Review, June 1962.



Should the natural tendency of the market be encouraged, indulged (as it has been hitherto) or resisted ?

The key question is how to adjust the undoubted misalignment between current interest rates and prevailing fiscal and economic conditions—which side should give, and how much ? The popular vote in the City is undoubtedly for lower interest rates, and this view is shared by the Bank of England, provided that the reduction is gently made and does not risk a psychologically damaging market reversal. The Treasury, which now seems likely to postpone any positive measures to stimulate the economy until after September's meeting of the International Monetary Fund in Washington, seems well pleased with the rising gilt-edged market. Lower interest rates, it is said, are needed to encourage investment and reduce industrial costs. But is there really any prospect that a reduction in long-term rates to five or even four per cent would, by itself, be sufficient to check a declining trend in Britain's industrial investment caused by the disillusionment of industrialists whose existing capacity is markedly under-used ? Interest rates have an important marginal effect on investment decisions, which Professor Sayers himself concedes is likely to be more important in the sixties than it was in the fifties ; but new investment responds more to expectations of profits than to savings in interest. So the first priority for a revival of investment in Britain is a revival of demand, and an easier fiscal policy. Lower interest rates would help, but they are not an indispensable help, whereas an active demand is. And at some point they might need to be dispensed with, as they would certainly add to pressures on the always vulnerable balance of payments. Time and again Britain's balance of payments in recent years has forced a rise in interest rates ; the balance is not so strong now that it can do without the covering fire that relatively high interest rates are now providing for sterling. Relatively high long-term rates—which are still no higher than most rates on the continent—have helped to offset the whole of Britain's large gross outflow on long-term capital account. This is support that might be essential to offset the temporary strain of an industrial revival on the trade balance.

Keeping credit relatively dear need not be in conflict with a policy of expanding the volume of credit by retreating from formally deflationary budgeting and providing an expanding supply of Treasury bills as a base for an expansion in bank deposits. Year by year deposits fall to ever lower proportions of national income (though that is a reflection on banking as much as on official policy). Cheaper but still restricted credit —an outcome which seems all too possible on the basis of current official policy—makes little sense for Britain's present needs, internal or external. The reverse should be the aim. Mechanistically, an increase in credit supply without any significant reduction in interest rates may seem unnatural. But given the role of future expectations, which the authorities can still powerfully influence, it is anything but inconceivable—thus to argue from the extreme case, an obviously extravagant expansion of credit might clearly frighten the market sufficiently to put gilt-edged yields up and not down. The United States authorities in the past year have indeed been trying, with moderate success, to make credit freely available without making it generally cheaper. And in Britain such a policy could be aided by allowing the banks full freedom to lend for whatever purposes they consider appropriate, at whatever rate they consider appropriate—and to pay a competitive rate for time deposits. This could be the ideal time to restore full flexibility and efficiency to Britain's credit market.

All this demands that Threadneedle Street, indeed the world financial community at large, loses its horror of that old villain, the Treasury bill. Hunting down the villains of previous decades is a sadly familiar but not an inexorably permanent characteristic of financial control. After the long inflation of the war and postwar years, the financial authorities had perhaps to show that their power to check as well as to expand the money supply had not vanished. The demonstration has been convincing. No one doubts any longer whether governments will be able to sell, at any price, their fixed interest obligations. Having demonstrated their power of financial control the authorities can, and urgently should, lose their old inhibitions about public financing (" bad ") versus private financing (" good "). They may, indeed, be on the point of starting to do so—the changes projected in local authority finance (more from public sources and less from market sources) imply a willingness to rely more on Treasury financing, short as well as long. But the fear of official paper, still so closely associated with inflationary financing, remains strong, though it is no longer rational. At a time when private savings are tending to exceed private investment, and when there is a lack of growth industries in the private sector, significant room is being made for larger public investment. The attainment of much vaunted growth targets, in Britain and America, may closely depend on getting this extra public investment. And that in turn depends on a willingness to recognise that, in these new circumstances, there may be a need for more credit and monetary demand induced from the public sector and that its suppression by austere financial policy may leave too many resources unemployed. Higher spending from the public purse need not remain permanently in the public sector ; it should act as a primer to the private sector.

In this major question, lower interest rates are a side issue. It is conceivable that the authorities will still pursue them, simply because a marked reduction in interest rates may better suit the politics of Westminster and Threadneedle Street than a marked change in attitudes to public spending and official financing. But if the single choice of lower rates is taken, that will not itself ensure that brave hopes of economic growth are translated into achievement.

Aircraft in Turbulence

The aircraft industry lives by technical change, and its doldrums in recent years have been as much due to the lack of change as to anything else. At the risk of mortally offending every designer in the business, the plain truth is that one aircraft flying at twice the speed of sound is much like another, and one nuclear missile is much like another ; a marginal difference in their performance is not, of itself, enough to create a new market. The industry's most recent setback, the cancellation of the Blue Water army rocket, can be explained very simply in these terms. Blue Water was a good workmanlike design, but it did not do anything that could not be done—slightly less well, it is true—by several other rockets already coming into service. It was this, rather than any subtle conspiracy to reduce the number of tactical nuclear weapons at Nato's disposal, that pulled out the plug from under Blue Water.

Today, change is in the air again. Several big technical innovations are about to be introduced into a number of key markets. The aircraft industry can begin to think in terms of living rather than hibernating, provided that companies can adapt themselves to the unquestionably tough conditions of the sixties. If they cannot, then the industry may not be worth saving at all. These changes, not necessarily in order of importance, are vertical take-off, the introduction of jet airliners on short journeys, the introduction of supersonic airliners on long ones, and the possible need for long-distance freight aircraft.

Vertical take-off that works (helicopters apart) is a British invention. It is a sign of how much the industry has lost confidence in its own achievements that a great deal less fuss is being made of this development than its technical importance deserves. The vertical take-off fighter, as exemplified by Hawker Siddeley's crude little beast, is the only really new weapon since the inter-continental ballistic missile. It is one of the few products of the aircraft industry likely to command an immediate market because it gives an army something that it never had before, a baby bomber capable of giving tactical air support to troops from whatever place and with whatever weapons, nuclear or conventional, are needed. The question is, how much of this market can the British industry expect to capture ? It is, for the moment, the only supplier of vertical take-off engines, with two competing systems on the market. The first to go into production is Bristol Siddeley's dual-purpose engine which provides power for vertical take-off and for forward flight from the same motor. This is backed by the RAF on the simple argument that the more engines there are, the more chances there are that one may go wrong. This is the system which powers Hawker's fighter, for which the machine flying at Farnborough next week is an elementary prototype.

The second system has been developed by Rolls-Royce from the original " flying bedstead " and relies on two sets of engines, each " optimised " for their job. One set consists of normal jets for forward flight, the other of special light-weight, short life engines for the vertical lift required to get off the ground. Rolls-Royce argues that this, for all its apparent complication, is the simplest way of obtaining vertical take-off, since the lifting engines, which fire for seconds only, can be infinitely simpler, lighter (they are half-plastic) and cheaper than a normal jet. There is some indication that Rolls-Royce is beginning to feel uneasy that the only application it has found so far for this system is in a French-designed Dassault fighter due to fly shortly: a determined effort is being made to convince opinion in Britain of its merits.

The situation in which Rolls-Royce unexpectedly finds itself may become the normal pattern for the aircraft industry. Its prosperity in the late 1940s and early 1950s was built on selling large quantities of equipment to other countries, especially in Europe. Europe now has its own aircraft industries in France, Germany, Italy, Holland, Belgium and Sweden, none of whose governments is going to import British-built equipment if it means putting its own factories out of work. Fortunately for both Bristol Siddeley and Rolls-Royce, these factories abroad are, with one or two exceptions, building aircraft rather than engines ; there is also the possibility of their collaborating with British companies in the design and manufacture of the VTO fighters themselves. Hawker Siddeley has arrangements of this kind in Germany and France ; there is a tacit understanding that the Rolls-Royce/Dassault fighter might be built in this country by the British Aircraft Corporation. In these agreements, giving the governments of the separate Nato countries a vested interest in British-inspired designs, lies the British industry's only chance of avoiding another debacle on the lines of the recent wholesale conversion of all Europe's air forces to the American Lockheed F.104 fighter, large numbers of which are being built in Europe under Lockheed's supervision.

The aircraft industry cannot cover its flanks in the same way in the civil aircraft market. Here it has been going through a particularly bad period, coinciding with the petering out of demand for the Viscount and the heavy investment by airlines in the kind of long range jet airliner that Britain has been unable to supply. It has been hard to rouse airline interest in more modest aircraft for shorter ranges, even for such outstanding ones as the Caravelle ; but with their big-jet investment virtually complete, operators are now realising two things. One is that their short-range aircraft, Viscounts, Convairs, and especially Dakotas, are so old that this is obvious to the passenger. The other is that these are flying on routes also served by jets (to take an extreme example, passengers to Manchester can fly from London on a BOAC Boeing 707 or a BEA Viscount or Vanguard).

Hence the revived interest in short- and medium-range jets, which has turned the Comet almost overnight from a heavy liability into a modest profit-earner for both the Government and Hawker Siddeley. Airlines will certainly demand a higher and much more economic performance than the Comet can offer, but for those hard pressed by jet competition, the Comet is available almost off the shelf. Its successor, the Trident, will not find the market so easy in spite of being a much better aircraft. It faces severe competition from a small jet that Boeing has scaled down from the big 707, and less severe

competition from some other jet designs on the market, notably those produced by Convair. The brightest future seems to lie with the British Aircraft Corporation's One-Eleven jet which fits the same niche as the Viscount, and should have all the Viscount's attractions on the shorter routes as well as its short-comings on the longer ones. This particular segment of the short-range market is a big one; how long BAC could keep a lead in it is another matter. For reasons of sheer commercial sense, the American companies may decide to keep out of it as they kept out of the Viscount market. But there is some reason to suppose that the only reason they did that was because they could not get suitable engines for a small turbo-prop in the United States, and not because they had judiciously weighed the evidence and concluded that the market was insufficient to support two competing designs.

The attitude of the American industry gives concern to the Ministry of Aviation. The present cripplingly high level of development costs suggests that the two countries should not duplicate each other's work: the United States, for example, should not develop vertical take-off and Britain should not attempt to go into space. But whatever steps are taken to rationalise production and research with Europe, comparable agreements with American companies seem as far away as ever. So Britain continues laboriously to develop the Blue Streak rocket into a space launcher, not from delusions of grandeur but from a real fear of the price that the United States might charge for space and communications rockets if it became the sole manufacturer in the West.

It is not at all certain that the American industry is equally intransigent about co-operation on a supersonic airliner. Emissaries from American companies who have come to sound British manufacturers on the prospect of collaboration are said to have returned, snubbed, to the West Coast. *The Economist* has not concealed its fears about the course that the development of supersonic airliners is taking in this country—a course that seems aimed at a supersonic Comet rather than a supersonic Boeing 707, which is what the market would seem to require. This is not to say that such a machine should not be attempted at all; to argue this would be to admit that civil aviation has reached the end of the road and can develop no further, which seems unlikely. But whatever design is chosen, a supersonic venture must give tremendous technical stimulus to the aircraft industry, and to all its suppliers. It does not, like vertical take-off or the short-range jet, offer the immediate prospect of work on the factory floor; but it means much to the industry's design side, which has lived for years on the verge of almost total shut-down and which still faces the prospect of unemployment for one man in four. Lack of orders caused by the stagnation of the late 1950s has been felt most severely in the design offices, and accounts for much of the industry's demoralisation.

The significance to the industry of a big freighter, a machine big enough and sufficiently long-range to compensate the army for the disappearance of one staging point after another, lies in the esoteric techniques that would be needed to get this range. None of these techniques is worth developing on its own. But developed as by-products of military freighting, they might contribute much to civil jet design and provide an insurance against the failure of a supersonic transport—there are plenty of obstacles in its way. But the cost of such a freighter compared with the numbers likely to be needed makes it uncertain whether the Ministry of Aviation could go it alone without the collaboration of some or several other countries. In the end, therefore, the industry's future rests less in its own hands than on the impression that it makes abroad; some of its brightest hopes can be realised only with overseas collaboration and finance. For so insular, so fiercely competitive an industry, this is a hard lesson.

BUSINESS NOTES

STERLING

Money Flowing Out?

WHILE the dollar has continued to hold firm in the exchange markets this week, and the mark has had to be supported against it, sterling has continued to be on the defensive. The usual seasonal offerings have been supplemented by some short sales by professionals who expect London interest rates to fall further. But selling has not been on a large scale, and market observers believe that the authorities may not have lost any further significant amount of dollars this week, and that the gold return for August will not show a large loss. The inflow of short-term funds into London was checked some weeks ago, and has been followed by some outflow. But the situation is not clear cut. Falling rates in London have been fully matched by a narrowing in the discount on forward sterling, and on a covered basis arbitrage in Treasury bills now shows an advantage of about ¼ per cent in favour of London over New York. A switch out of Euro-dollar deposits into a deposit with a local authority, however, is no longer worth while: the arbitrage balance here is exactly neutral. The key rates in these arbitrage calculations, including the rate on inter-bank deposits in the Euro-dollar market, are shown on page 849, and will be carried regularly week by week.

Official figures of overseas sterling balances on June 30th show a further fall in holdings by non-sterling countries, by £33 million to £840 million. The reported fall in the first quarter, of £51 million, had been starkly at variance with market experience, since foreign funds were flowing in strongly in the early months of the year. In the second quarter the inflow certainly abated, but an actual fall in these sterling holdings is still a little surprising. Until the authorities make these figures more comprehensive their significance remains uncertain. North American holders are shown to have made good the fall in their balances in the first quarter, restoring them to £94 million. West European countries, on the other hand, show a drop of £22 million, and other non-sterling countries a drop of £37 million. Balances of overseas sterling countries rose strongly by £126 million. This is the favourable season for these countries, but the rise brought their total balances to £2,699 million, the highest June figure since 1957.

WALL STREET

Mutual Funds and the Market

A correspondent cables:

THE rally on Wall Street has been checked and by Wednesday the Dow-Jones industrial average had fallen to 603. This is not surprising as equities made a strong advance earlier this month. It may be that prices will again move higher after the Labour Day holiday. But brokers say that there is a good deal of stock ready to be sold once the Dow-Jones average rises into the 625-650 range. So far the advance has been irregular: many stocks are still close to the lows touched in the spring and buying has been concentrated upon "space" issues and the more solid industrial stocks which offer good yields. The buying of "space" stocks was sparked off by the Russian feat of putting two men into orbit, and though it has since been interrupted by profit-taking, investors are convinced that companies engaged in the space programme will continue to be favoured by increases in government expenditures. In general, the stock market appears to have recovered a good deal of its poise. There are fewer complaints about Washington's attitude towards business and Wall Street at least is still convinced that the administration will make good its promise to make a tax cut in January.

Once the mutual funds had read the study of their activities presented to the Securities and Exchange Commission they, however, were quick to say no real rapprochement between Wall Street and Washington has taken place. The mutual funds now have over $19 billion in assets and this report was critical of some aspects of their operations. It pointed out, for example, that their performance on the average was no better than the stock market's. The mutual funds, whose stock in trade is professional advice and management, have protested at this finding and are saying that the report is undermining public confidence. This suggestion is very much open to question, and the shares of the mutual fund management companies have fallen sharply in the last few days. Some have fallen by as much as 15 or 20 per cent. There is no doubt that the operations of the funds have made the market more volatile. But there seems to be no way of preventing this. No one, however, expects a repetition of the sharp rises that occurred in the bull market nor the sudden falls that occurred in the spring. With the business outlook still uncertain, it looks as if the market will continue to act moderately and cautiously.

SCIENCE POLICY

Home or Away?

SIR JOHN COCKCROFT'S presidential address to this year's British Association meeting sounded a warning, not about more men and more money for science, but about the danger of investing in the wrong kinds of science. Sir John is no Little Englander, yet he felt obliged to say that "in considering our future investment in science, we have to take account of the increasing proportion of our funds for basic research which are going into international organisations. . . . We will need to be very careful that, in periods of financial stringency, these investments do not reduce the funds available for basic research in our universities." This is a serious statement, coming from one who has welcomed the establishment of such international bodies and been a strong exponent of the argument that much of the equipment science requires today is beyond the purse of any single country and must be shared by several. What has caused Sir John's concern? Plans initiated by Mr Thorneycroft while at the Ministry of Aviation for a European space launcher project based on Blue Streak and a supersonic airliner venture with France? Rumours that the international nuclear physics laboratory of CERN in Switzerland wants bigger and better accelerators than the £15 million installations it now owns—plants that cost nearly £8 million a year to run, of which a quarter comes from Britain? At a time when the Government is doing everything to promote interdependence with Western Europe in defence, which indirectly takes a massive slice of the funds available for research, Sir John's implied warning that co-operative enterprises might have some harmful effects on science in Britain needs to be pondered.

THE ECONOMY

The Disestablishment View

We have had an economy devoted to the fetish of the strength of sterling; the Americans have had one devoted to the fetish of the balanced budget. . . .

One of the big objections to devaluation is the damage it does to a country's prestige. France's economic prestige does not seem to have suffered much for long. Other countries are queueing to copy her economic institutions.

IN diagnosis and prognosis of the British economy, the National Institute of Economic and Social Research has become the best-established non-Establishment view—in some sense, indeed, a mirror-image which no respectable Establishment could bear to do without. If there had been any hope or fear that the end of Mr Alan Day's tenure as editor of the institute's *Economic Review* would dilute its heterodoxy, Mr Frank Blackaby, the latest editor, managed at the British Association this week to brush this off, with a provocative paper to its Economic Section on "The recent performance of the British economy."

Technically, the interest of this close look at growth rates is that Mr Blackaby has tested out most of the obvious ways in which economic league tables, with Britain always at the bottom, might be unreliable. He has checked whether over a ten-year period British estimates of the domestic product based on expenditure move in line with those based on output. He has calculated rates of growth for countries that have revised their figuring on the old methods as well as the new. He has excluded certain "non-productive" services from the count—what he calls "the output of nuns and dons"—and simply compared the rest of national output. He has allowed for the greater shift of population into agriculture in other countries; and for the different structure of the different economies. He has asked whether the difference was due to postwar recovery. And his answer is that none of these adjustments makes much difference at all. Britain has grown much slower than the Continent. And hopeful excuses do not hold.

Mr Blackaby puts down the main reason for the different growth rates to the different course and pattern of demand here and on the Continent. Here, he argues, restraint of demand undermined confidence, held private investment low, and encouraged manufacturers to put up prices when wages rose, since they had no confidence that output would rise fast enough to mop up the cost through extra productivity. On the Continent, a sharp rise in export demand at the beginning of the fifties (at a time when Britain was heavily increasing defence expenditure) set off the opposite virtuous circle of strong confidence, high investment, and rapidly rising productivity to offset wage rates.

Britain, he argues, should now set itself a faster growth rate in a particular year: why not 1963? If this should bring the economy up against a balance of payments limitation, he would vote against further long-drawn out restraint on demand: ". . . follow the French in their exchange rate policies as well as in their planning institutions." But the French may have been the last independent devaluation of a major currency; and is an independent devaluation of a reserve currency conceivable?

HOURS OF WORK

Measuring Productivity

IN the United States, the level of weekly hours worked by operatives in manufacturing industries is considered to be an important leading indicator in the general business cycle. A decline in hours, it is thought, may reflect incipient changes in economic activity before the unemployment curve rises. In Britain, up till now, the measure has been available only twice-yearly, alongside the statistics of earnings taken for April and October. Now the Ministry of Labour, in its current *Gazette*, has put out an index number, monthly as from May, 1961, with earlier figures calculated six times a year. The latest figures relate to the week ended June 23rd, when hours in manufacturing as a whole had risen

about 1 per cent since January. Most, if not all, of this rise is likely to be seasonal, and the hours being worked were still 1 per cent lower than in the middle of last year.

The measure of average hours is produced by adding to the standard weekly hours a calculated figure of net overtime per head. This latter calculation leans heavily on the

MEASURES OF PRODUCTIVITY
(1958=100)

PRODUCTION AND EMPLOYMENT*

	Production	Operative hours worked	Operatives on payroll	Employees on payroll
1958	100·0	100·0	100·0	100·0
1959	106·0	100·5	99·6	100·5
1960	114·5	103·5	103·5	104·5
1961	114·7	102·5	104·3	106·0

PRODUCTIVITY*

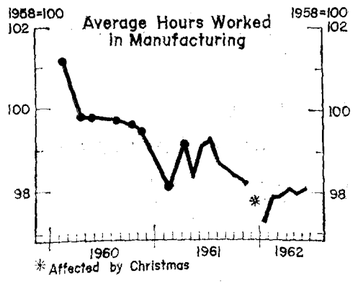
	Output per operative per hour	Output per operative per year	Output per employee per year
1958...	100·0	100·0	100·0
1959...	105·5	106·4	105·5
1960...	110·6	110·6	109·6
1961...	111·9	110·0	108·2

* In manufacturing industry

regular monthly returns from employers—the "L" returns—which makes it, like all employment statistics, subject to revision after the annual count of national insurance cards, although "this adjustment would normally not be substantial."

Another snag in the calculation of average hours is that no allowance is made for part-time workers. This is remedied, however, in the Ministry's second new measure, which is of total weekly hours worked. This is the product of employment and average hours. The total of operative-hours throughout manufacturing in the week ended June 23rd was 2.6 per cent less than in the corresponding period a year before; in the vehicles industry alone, however, the decline was 4.2 per cent.

The new monthly index of operative hours is probably the best guide to effective employment in the factory. On that basis,



the table shows that workbench productivity in manufacturing was still rising last year. But if employment is measured simply by the number of operatives, then productivity per year in the factory declined; and if it is measured by the total number of employeees, including administrative, technical and clerical workers, then productivity in the whole sphere of manufacturing also declined.

SOUTH AFRICA

Feeling the Way

THE South African government has this week announced the second relaxation in the exchange controls imposed in June 1961; it could equally be a harbinger of further relaxation or an excuse for keeping the crutches. Cautiously, the government has taken another step to restore the normal market bridge between London and Johannesburg, and is testing the desire of foreign holders of Kaffirs to unload them once the discount between London and Johannesburg narrows. The Reserve Bank, following the earlier relaxation, already had power to buy South African shares in London for approved institutions and to sell them to the institutions at the ruling Johannesburg price. Now, rather than making the purchases itself, it will make allocations of sterling for purchases directly to the Johannesburg Stock Exchange. The sterling will be divided among the recognised arbitrage dealers by the president of the exchange. It is not known how much sterling the Reserve Bank will make available, but it seems likely that if the discount between London and Johannesburg starts to narrow the amounts will increase; should the South African buying in London be countered by foreign selling of Kaffirs, thus maintaining the discount, the Reserve Bank could retreat and reduce the allocations. The future of South Africa's exchange controls therefore now seems to rest with the London discount. On the news of the relaxation Kaffirs showed gains in London ranging up to 5s. But gains in South Africa have so far kept the discount at about 13 per cent. It is not yet clear what will happen to the "fortuitous profits" from buying in London and selling in Johannesburg. Previously the Reserve Bank paid it into the government's "defence special equipment account." The new scheme is described as being within the framework of this existing scheme, which probably means that the Johannesburg brokers will be asked to hand over at least part of the likely profit on their arbitrage operations.

The other main change in the regulations is that the Reserve Bank will now consider applications for the use of blocked rands for direct investment in the equity or loan capital of South African manufacturing enterprises, provided they are new industries which are not in competition with existing enterprises. Applications for investment in Bantustan border industries will be favourably received—but interest here is distinctly limited. Blocked rands are not transferable, but a businessman whose application is approved can now save money by buying Kaffirs in London and selling them at a profit in Johannesburg to get the blocked rands.

On the surface the South African economy has never looked healthier. Investors were originally led to expect substantial relaxation of exchange controls when the reserves passed the £100 million mark; the reserves are now more than double that figure and are setting new records each week. The balance of payments surplus is officially described as "phenomenal." But still the economy stagnates; consumers have the spending power but they will not use it. The economy is satiated with liquidity and interest rates are once more beginning to crumble. Last week the commercial banks reduced their deposit rates by ½ per cent to 4 per cent on deposits for twelve months, and two of the bigger building societies have reduced interest on savings accounts from 3 to 2 per cent. It seems that South Africa's problem is lack of confidence at home as well as overseas.

BRITISH EUROPEAN AIRWAYS

In the Red

BRITISH EUROPEAN AIRWAYS' first loss for eight years is, says the corporation, the result of excess capacity and excessive competition—a seat and a half for every passenger. The accounts themselves, for 1961-62, tell a slightly different and considerably more complicated story. They show a rate of earning on capital employed that has declined in two years from 12 per cent to a mere 2 per cent last year, producing a net loss after meeting all charges, of close on £1.5 million on a turnover of £46 million (as a correspondent points out on page 769 there is infinite variety in the way airlines compute profits and by some standards this is not too bad a result). But this loss was not made on BEA's international services, where competition is acute and the corporation found to its chagrin that it was losing ground to other airlines for the first time in years. It was made on the domestic services inside the UK, where the corporation faces no competition more severe than that of British Railways. The international routes showed a profit of £1.2 million; the domestic ones a loss of £2.7 million. When domestic traffic was small, BEA could comfortably subsidise it out of international profits; now domestic business accounts for a third of the work done, this is no longer possible, particularly when domestic is growing faster than international traffic.

Two conclusions might be drawn from this. The first and most commendable is that BEA seems well able to meet whatever competition is likely to arise on its international routes, whether from foreign or from independent British airlines. The corporation's costs appear well under control and were shaved during a generally difficult year by a further 1.2 per cent. With loads eight per cent down, and more than two-fifths of its capacity flying empty (well below the Plimsoll line that divides profit from loss), the corporation was still able to show a thoroughly healthy financial return on its international business.

So what went wrong on the domestic routes, where BEA has little competition,

where traffic increased by a fifth, and commuters queue for seats? One difficulty is the cost of introducing a new aircraft like the Vanguard while the machine shakes down in service and the licensing authorities cautiously extend the overhaul life of its components. On international services, an airline can expect to recoup these high costs by attracting extra traffic with new equipment, but on today's domestic routes this hardly applies. Until the Vanguard, and particularly the Vanguard's engines, are through this probationary period, there is little that BEA can do but exert every wile known to salesmen to attract domestic traffic to the level where it can offset these high costs; last year's loads of slightly less than 64 per cent capacity were inadequate. If this surprises regular BEA commuters, the explanation is the same as the railways'—a rush hour morning and evening does not compensate for low loads the rest of the day. Hence the gimmick of no reservation services to be tried next spring at a third off the price of the ticket. The only passengers likely to get on these are people prepared to gamble on someone not turning up to claim his seat—and this is a real gamble—or prepared to travel off-peak. It is in line with BEA's long established policy of shading fares to demand and offering a bewildering variety of rates according to the time of the year, month, week and even day. This makes for a fussy time-table, but can sometimes produce results.

INDUSTRIAL DESIGN

Which Britain on Show?

WHAT image of British industrial design ought trade fairs abroad to project? The kind of traditional designs that, for the present, customers abroad seem to choose, or the kind of contemporary British design that the Council of Industrial Design would choose? The question is not an idle one: it was worrying the council last year, and in its 1961-62 report published last week the council chews over the question again. The reason it worries British exporters as well is that quite often the design of exhibits and the choice of British products to be included in trade fairs overseas is left to the council, and it would naturally choose to show the kinds of product that on the whole the exporters say people abroad do not buy from Britain.

The council does not exclude traditional design in its exhibits: sometimes it puts period pieces alongside contemporary examples, trying to bring out the clear line of descent. Nor does it approve every "exaggeration and aberration in the name of modernity." But its primary purpose is "to improve British design," not to act as an export promotion agency; and it feels that "though fully aware of the immediate commercial problems [it] must take a long view of its work and continue to stress the more modern aspect of British design."

Looking to this primary purpose, the Council is a little sorry that many British manufacturers are copying foreign designs and employing foreign designers. Will this not have arisen in part from its own success in waking them up to consider design at all? And it notes that "in many minds the word 'modern' is associated with Scandinavia or Germany or Italy." This point is perhaps at the core of its difficulty over exports. Generally, would the Council deny that this mental association is a reasonable one?

It thinks it can "demonstrate that good modern British design can stand comparison with its foreign competition." This is a matter of taste. But to assume that the average of British "modern" design stands comparison with the average from Scandinavia, and much from Germany and Italy, would be wishful thinking. Nor do all the "good modern British designs" the council cites (assuming that our tastes coincide) show any strong and modern British flavour. Too many are still derivative from design leaders abroad. And the foreign customer has no reason to buy the flavour watered down if the genuine article is just as cheap; he is not a British buyer imprisoned within our tariff.

GAS

Any Chance for Lurgi?

IT is true that the joint study of Lurgi gasification that is being made for the Gas Council, and the National Coal Board is not yet complete, and that it has not been abandoned. It was never "a £20 million project"; it consists of studies by three gas engineering firms about the economics of a large Lurgi plant on a Midlands site that if ever built would probably cost about £20 million. But it would still be unwise to read too much into the National Coal Board's angry denials of weekend reports that the "project" had been abandoned, which the Gas Council has supported on the facts about the study.

The Gas Council has never made many bones about the fact that it thinks large-scale Lurgi gasification is probably now a non-starter. It could be convinced if the economics of a plant turned out to be strikingly better, from the consultants' reports, than it has always thought they are. But so far it has had nothing striking to make it change its mind. The Coal Board is naturally more enthusiastic about keeping on selling British coal for gasmaking. Lord Robens did indeed offer at one time to take the whole financial responsibility for one full-scale Lurgi plant himself and sell the Gas Council gas rather than material for making gas. But there are signs that he too now thinks he was oversold on the possible economics of the process, against the unremitting opposition of the Gas Council.

It would take some remarkable results from the joint study, therefore, to resuscitate the idea of large-scale Lurgi gasification for Britain. Political not technical problems, admittedly, may now be threatening the Gas Council's scheme to import methane from Algeria, as part of which it has just signed contracts for the building of a 325-mile gas grid across Britain from the import terminal on Thames-side. Anyone who has a contract for future performance with an Algerian government may now be wondering whether Algeria can produce a government—or gas—in time. The Sahara is not the only place from which Britain could get methane.

COFFEE

The New Force

THE 57 varieties of coffee producer and consumer assembled in New York plus the one latecomer who joined in when he saw the way the wind was blowing have sunk most of their differences and provisionally agreed a five-year international scheme for limiting exports. Guatemala said it would not sign the agreement because its quota was too small. Ecuador, Russia, Cuba, Ethiopia and Yemen said mystifyingly that they could not agree with a resolution adopting the text of the articles of the pact. Honduras, Nicaragua and Haiti reserved their positions on the quotas they have been offered. Several African producers, not least Kenya and Tanganyika, expressed dissatisfaction but grudgingly accepted the agreement. Grouses have been heard from other quarters, too; not every Brazilian is happy about that country's 18 million bag quota out of the 45½ million bags provisionally allocated among the 36 producers. From the groundswell of grumbles, it is fair to surmise that rough justice has been done to all, though Kenya for one has a colossal headache in the offing if it has to find an outlet for its greatly expanded future production outside the agreement.

The new agreement will come into force when twenty producers with 85 per cent of the export business and ten importers consuming a similar proportion declare that they intend to ratify. Member countries have until the end of next year to officially deposit the instruments of ratification, but the coffee conference will reassemble just before the start of the coffee crop year on October 1st to approve the draft of the agreement. New markets for coffee will not be covered by the agreement, but consuming members will limit imports from outsiders. Other facets of the agreement have been shrouded in obscurity, compromising the bold new approach that the injection of consumers' realism into the producers' ramshackle skeleton of a scheme promised to bring.

Producers claim that a gradual increase in the price of coffee is embodied in the objectives of the agreement. But it contains no explicit support for prices. On the prickly subject of production controls, the agreement only provides that after a year, production targets can be recommended to get output down into line with outlets. Latin America's basic quota under the agreement is 31.1 million bags of sixty kilos, compared with an estimated exportable production of 38.4 million bags this season. African producers have been allocated exports of 11.4 million bags from an exportable output of 12.9 million bags. Export quotas have been based on performance over the past four years, as the African producers insisted. Quotas will be reviewed after three years.

ELASTIC FIBRES

Very Snappy

FOR fifteen years the big US fibre manufacturers have been developing synthetic elastic fibres (or "snap-backs") and the results of their researches have quickly crossed the Atlantic. In 1961 two "spandex" yarns—which are made from polyurethanes—Lycra and Vyrene, were put on the market by Du Pont and US Rubber respectively; both are now available in Britain, and Monsanto (USA) and Courtaulds have announced plans to make two more within a year. This reflects an uncommon eagerness to get the product to market, but in view of the enthusiasm which they were greeted with in the USA, it may be justified. Remarkable claims for the yarns have been made (including the wild forecast that the synthetics will completely replace rubber elastic in eighteen months), but the market is still in the development stage with sample quantities being offered for testing. However, manufacturers have enough faith in the fibres' future to invest heavily in them.

Spandex fibres are aimed at the market presently held by rubber threads, over which they have many advantages. The main selling point is spandex's greater strength: a lighter fabric can be made which will give as much "support" as the comparatively heavy ones needed when rubber is used. (It is said that one pound of spandex will take the place of 1.8 pounds of rubber.) This is a telling point where fashion goods are concerned. While multifilament spandex yarns can be spun, this is not possible with rubber. Spandex lasts longer than rubber as it is not so affected by body oils or cosmetics or by the atmosphere. This is a useful property in corsets where manufacturers hope that spandex will find its largest market.

Elastic fibres in garments are wrapped in threads of cotton, rayon or nylon and it is an advantage to be able to dye the core and the cover simultaneously. This again is possible with spandex but not with rubber, which is usually coloured white or pink and "grins through" its dyed covering. All these advantages have to be paid for somewhere, and spandex yarns are 2½-3 times more expensive, weight for weight, than rubber yarns. It has also been said, though this is denied in some quarters, that its recovery from stretch (important if the garment is not to sag and, with it, what it supports) is less perfect than rubber's.

The final balance between these yarns and rubber will certainly give spandex a large share of the market (estimated at 5 million pounds of rubber yarn a year in Britain): perhaps 65 per cent of conventional outlets in five years. The cost difference will probably matter less than might appear, because the cost of the elastic is usually only a small part of the final cost of the garment.

Manufacturers are determined to secure their part of the new market in Britain as soon as possible. Plastics Yarn and Lactron Thread, owned by Dunlop and US Rubber, is offering Vyrene; Du Pont imports Lycra; Polythane Fibres, the British subsidiary of the Polythane Corporation of the USA (owned by Chemstrand), plans to put its spandex on the market early next year. Courtaulds, the only British company that has carried out research (ICI has said it is interested, but it has no plans), has plans for manufacture, but these seem dependent on negotiations with Firestone Synthetic Fibres.

ITALY

Dr Carli Reports

ITALY is among the few countries of the western world that is still enjoying rapid industrial expansion, and it maintains its equally impressive financial strength. At the same time the Italian authorities have not been tempted to deploy this financial strength actively in pursuit of national diplomatic ends, as has been known elsewhere in Europe. Italy has been among the more co-operative of the continental surplus countries in developing new facilities to meet the needs of the deficit countries; and Signor Guido Carli, governor of the Bank of Italy, states in his annual report that the conflict between internal and external monetary objectives "calls for the creation of adequate compensatory machinery." For its part, Italy in 1961 began to extend sub-

ELECTRICITY

The Balance of Power

FOREIGN trade in electricity has grown fast during the last ten years in Europe, aided by the work of the Union for the Co-ordination of the Production and Use of Electricity that the OEEC set up in 1951. In a survey of the first ten years of its life, the UCPTE shows that exports of electricity by European countries grew from 4,008 million units in 1951 to 10,553 million in 1960—from 2.5 to 3.6 per cent of production. The biggest scope for such exchanges of power between countries naturally comes where a country with hydro-electric stations adjoins one that lacks them; indeed, Austria was already supplying Germany with electricity before the war. In the winter of 1959-60, Switzerland used night imports to cover 30 to 40 per cent of its load, and in some months west Germany imported more than 10 per cent of its consumption. In the summer of 1960, Switzerland and Austria were exporting 25 to 40 per cent of their output during the day.

Most of the international flow of electricity depends on the virtually constant output potential of a hydro-electric power station as against the variations in the timing of actual demand for power. Where the output of a thermal station can be varied by the amount of fuel burnt, and it can be shut down, reducing the output of a hydro station may mean allowing water to go to waste. Conversely, output cannot be increased to meet peak loads. Thus one finds that at 3 a.m. on December 16, 1959, the main flows were an export of 471 MW from France to Switzerland, while west Germany was sending 177 MW to Switzerland and 150 MW to Austria. At 11 a.m. on July 20, 1960, when demand for power in Switzerland and Austria would be less than their ability to produce, Austria was sending 646 MW to west Germany, and Switzerland 606 MW to Germany and 154 MW to France.

Since last autumn, with an interruption from January to May this year, Britain has been linked to the European electricity system by the Channel cable—which is now running at half its relatively modest capacity of 160 MW because of trouble with one of the transformers at the French end. But at this distance from the Alps, Britain is less well placed than France or Germany to tap hydro power, though these countries are still not taking all the hydro power that could be produced. The real advantages of international trade in current, in terms of saving investment in generating plant, are shown by the contrast between UCPTE countries, where capacity grew less than power production between 1950 and 1958, and the three west European countries whose systems remained autonomous, where capacity had to be increased as much or more than output. Spread the supply net, and one can raise the load factor.

about 1 per cent since ...
not all ...

financial credits through the International Monetary Fund, to a total of $175 million. The Italian authorities went no further however in their earlier action of channelling foreign exchange into the hands of the commercial banks. They were anxious to avoid the banking system becoming a channel for "hot money," and considered that the banks' foreign exchange credits at nearly $1,000 million were large enough to meet genuine trading needs. The authorities continued their policy of keeping the banks domestically liquid; and for this purpose they not only lowered compulsory reserve requirements but also used a new device, buying back some of the foreign exchange previously sold to commercial banks and then redepositing it with them.

Signor Carli expresses his desire to improve the short term money market, and suggests that the present system of issuing Treasury bills by tap might be replaced by a tender system, so that changes in market liquidity, as influenced by the authorities, would be reflected in market rates. In this way the Italian authorities hope to improve the flexibility and responsiveness of the financial market as a whole and to facilitate the transfer of funds from the money market to the capital market. Not that the capital market has been inactive in the recent past: in 1959-61, the ratio of security issues to fixed investment in Italy is given at 26.9 per cent, compared with 14.4 per cent in Germany and 9.6 per cent in Britain. Only Belgium, with 31.9 per cent, had a ratio higher than Italy's.

CHEMICALS DUMPING

I Export: He Dumps

ALTHOUGH dumping is recognised as a part of the chemical industry, there is no sign that the industry is reconciled to being dumped upon. Applications for antidumping duties still thud monotonously onto the Board of Trade's doormat: today, it seems, with more chance of success. Last week, the Board of Trade announced that, having considered the application for antidumping duties against certain imports

BUSINESS NOTES

of styrene monomer, it is satisfied that the imports from the USA are dumped; imports from Canada and Germany were found not to have been dumped. A duty is not going to be imposed as the US exporter concerned (Dow Chemicals) has informed the board that it will suspend shipments to the UK while it considers the board's decision. However the board has given the assurance that it will watch future styrene imports, and will act without waiting for further applications to be made if imported material seems to be dumped.

The demand for styrene in the UK has been increasing steadily from about 60,000 tons in 1960 to an estimated 80,000 tons in 1962. Most of this is made into polystyrene (45,000 tons last year) and styrene-butadiene rubbers (20,000 tons). Shell and Forth are the only UK producers and operate plants of 18,000 tons and 50,000 tons capacities respectively. The Shell plant is thought to be able to produce more than this figure, and Forth has another 50,000 ton plant coming on stream at Baglan Bay toward the end of the year. Prices have dropped 14 per cent in the last two years; 44 per cent since 1955. This fall has been worldwide, but as always, low-priced imports have served as a tap for other countries' surplus production, with a resulting pressure on prices for UK producers—particularly with capacity coming on stream.

To aggravate matters styrene is imported into the UK effectively without duty. Classified as a hydrocarbon oil, it is charged hydrocarbon oil duty, at present representing 35-45 per cent of the fob value of the imports. But this duty is remitted when the styrene is used for chemical production. Shell Chemicals and Forth Chemicals applied for an antidumping duty to get some protection that could not be automatically lifted; they will probably draw small comfort from the board's decision. This is the third application for antidumping duties on imports of chemicals that the board has accepted in whole or in part, and the seventh on chemicals altogether. Pressure for protection against being dumped upon is increasing. The French have recently imposed duties on two petrochemicals, butanol and ethylene glycol, and the recent retaliatory duties imposed by the EEC Council on certain imports from the USA included polythene and polystyrene—two generally dumped petrochemicals. Meanwhile British chemical producers are pressing the Board of Trade for quicker action on antidumping applications.

MOTORS

Holiday Preparations

THE last two weeks before the summer holidays in July are often a good period for car production, with the workers anxious to earn enough to pay for their holidays and the management wanting to build up big enough stocks to tide their dealers over the dead period. This year was no exception, and production reached its highest level for the year. The British Motor Corporation, with its output exceeding 15,000 a week of all vehicles—about 11,000 of them cars—did better than at any time in the last two years, and where production was not affected by future model changes the same seems to have been true for most other manufacturers. With all but Vauxhall—which worked for three weeks—open for only two weeks of the month, the production of 63,000 cars represented a weekly rate of about 29,000, compared with the previous best this year of 27,667 in May.

Home sales have been rather disappointing to the trade after their eruption in May. They remained at about 73,000 in July after dropping to this level in June, more than 10 per cent below sales a year before; but they seem to have recovered in August, and may prove as much as 20 per cent higher than last year. If many other industries followed the motor industry's example in giving its staff their holiday in July instead of partly in August, some buying might have been transferred from one month to the other; with stocks generally adequate, the absence of production would affect sales little. The new models coming onto the market now should help to offset the seasonal decline if they are available in large enough numbers to satisfy demand. There are many disappointed car owners who find that the continued if by now gentle decline in used car prices makes buying a new model too costly for them. The boom that will come when such owners return to the market still remains the gleam of hope in the motor industry's eye. New models are the only means at its disposal to tempt them to do so.

CAR EXPORTS

Losses and Gains

SHIPMENTS of British cars remain about 60 per cent above the 1961 level, and the total for the year should not be very different from the 569,000 exported in 1960. But the recovery has come from higher shipments to Europe—often, it seems, to build up stocks as much as in response to higher sales—and to the Commonwealth markets, now more prosperous than a year ago. The North American market, where the sudden fondness for British cars had accounted for the export boom of 1959-60, has proved less faithful than the industry had hoped. Sales in the United States were, at 28,000, 30 per cent lower in the first half of this year than a year before, though shipments were 44,000, four times the 1961 figure. Stocks have therefore risen, and it is not surprising that by July shipments had dropped below 5,000—roughly to the rate of sales.

Standard-Triumph and Jaguar are the only British manufacturers to have done

Why Ford has had plants in Antwerp for almost 40 years.

Henry Ford decided on Antwerp as location for a plant in 1922 — and the reasons for his decision still apply.

Geography played a big part in causing Mr. Ford to choose Antwerp as the site for an assembly plant nearly four decades ago. Antwerp is ideally situated to reach the whole West European Market. Within a 200-mile radius from Antwerp there are a hundred million well-paid consumers... a market equal to over one half the entire U.S.A. What's more, the unsurpassed port facilities enjoyed in Antwerp greatly simplify the shipment of parts and materials.

An efficient labor supply. Companies like Ford have good reason to consider the intelligent hard-working qualities of the Antwerp labor force when deciding where to locate plants and offices. Productivity and quality, in terms of work done per dollar spent, is better in Belgium than in any other European country.

A friendly business climate. Formalities are few for setting up a business in Antwerp. Foreign firms are treated exactly like local ones. New enterprises may qualify for special tax concessions, low-interest loans, and specially-priced plant locations.

Industrial sites — tailor made. Antwerp is unique in the amount of land it has available for industrial purposes — over 2000 acres. These sites have easy access to inland waterways, highways, railroad spurs, and docks for ocean vessels.

YOUR KEY TO THE EUROPEAN COMMON MARKET

better in North America this year—both sold about 40 per cent more, helped by new models. The sales of other sports cars remained static, but those of small saloons went on falling. The British Motor Corporation is trying hard to sell the Mini-Cooper models, but the Volkswagen remains the only small foreign saloon that Americans will buy. Its sales rose about 15 per cent to exceed 100,000 in the first six months of this year, nearly 60 per cent of all the foreign cars sold in the United States. Whatever faults its design may contain, the VW has managed to create for itself a fund of good will that no comparable British car has been able to acquire. The reasons for this are all too painfully well known to the owners of imported cars in America, and one assumes they are now appreciated by our manufacturers. But as reputations are slowly won and even more slowly lost, attempts to regain sales by British makers are bound to take a long time.

Canada was not expected to be a good market for British cars this year after the increased import duties imposed last year; but a rise of 23 per cent in total sales was a surprise, and when matched by a fall of nearly 10 per cent in the sales of imported cars it makes the fears for the Canadian motor industry expressed by the Royal Commission last year seem rather unnecessary. Again, Volkswagen has increased its sales, but so have some British cars—notably the Minis. This year's export performance might be taken as showing that all markets are unlikely to go sour at the same time, or that the industry has to keep running to stay ahead of its reputation. Certainly it cannot afford to provide the same standard of servicing in Europe as it appears to have done in America.

BRIEF BOOKLETS . . .

have been produced jointly by The Economist and The Economist Intelligence Unit to present the essential facts behind important current topics. Each takes about one hour to read. Here are the first three titles in this new series:

Brief 1 RHODESIA: BRITAIN'S DEEP SOUTH
by Joe Rogaly

2 MONEY FOR GROWTH
by Fred Hirsch

3 LABOUR IN BRITAIN AND THE SIX
by Val Schur

Each booklet costs 2/6d. post free for remittance with order from:

DETERGENTS

New! Miracle-Soft!

WHEN the Technical Standing Committee on Synthetic Detergents recommended last June that soap manufacturers should make as much biologically "soft" material as possible, they were not instructed to do so. The committee did not want to force the industry to increase plant capacity for the existing material because better, softer detergents were on the way. Shell's announcement that it is to build a urea wax plant, to be completed by the middle of 1964, indicates—if obliquely—that at least one sort of softer detergent will be available in Europe in two years. Another manufacturer, Marchon Chemicals (a subsidiary of Albright and Wilson), is completing a plant by the end of 1963 which will provide the "soapers" with primary fatty alcohols from which they can make a different sort of soft detergent. The other British manufacturer of detergent base material, Grange Chemicals, is carrying out research to produce its own soft material and hopes to show some results in a couple of years. The combined efforts of these manufacturers should have put an end to foam on rivers—the outward sign of pollution by detergents—by the end of 1964.

The most important type of detergent is alkyl benzene sulphonate, made by sulphonating (the soapers' job) alkyl benzene, or detergent alkylate. The Jephcott committee found that "hard" detergents, which pass through sewage works unaffected, have branched side-chains (the alkyl part) while detergents with straight chain structures were biologically degraded. Until four years ago, the side-chains in detergents were derived from propylene tetramer, an olefine with a highly-branched structure. Then Shell introduced "Dobane JN" in which the olefines for the side chain came from Shell's wax-cracking process, and contained a high proportion of straight chains. Detergents based on this alkylate were tested on a large scale and as a result the Jephcott committee recommended their use.

Meanwhile, Shell's research (carried out in association with the German firm of Edeleanu) had been directed toward producing an olefine containing straight chains only. This is to be the product of their new plant at Pernis in Holland, where waxes from the oil refinery will be treated with a solution of urea that extracts straight-chain paraffins. The paraffin waxes are thermally cracked, and suitable olefines from the process are sent to Shell Haven where they are reacted with benzene to make alkylate. Detergents made from this alkylate are completely soft; and when the new Pernis plant is completed the production will be sufficient to meet Britain's needs. Marchon's production will be enough to satisfy a large part of the British market as well, but this may be no problem. Several countries on the Continent are considering legislation against hard detergents and the European market should be large enough to absorb any soft detergents that are made.

BRAZIL

How to Deter Investors

WEIGHING the possible profits of inflation against the vagaries of the political climate has long been the lot of the investor in South America. Brazil now seems determined to deter all but the most starry-eyed optimists. At present both the Chamber of Deputies and the Senate are championing separate bills to limit the remittance of foreign profits; with the elections only a month away neither looks like reaching the statute book, but the squabble is bound to have made businessmen wary.

The trouble started last November when the Chamber of Deputies passed a bill limiting the remittance of foreign owned profits and capital. The Senate thought the bill too harsh; it amended the bill and passed it back to the Deputies. The two houses finally agreed to set up a congressional committee on the bill, which eventually produced a draft bill which the Senate then passed. The bill went to the Deputies, who reinserted their original clauses. This was the bill that recently emerged from the Chamber of Deputies ready for the president's signature. The bill limits the remittance of profits to 10 per cent in any one year and repatriation of capital to 20 per cent. So far the president has done nothing, but the Senate has reacted by passing a new bill that contains the more liberal provisions of the original compromise bill. This bill distinguishes between productive and unproductive investment, limiting the latter to an 8 per cent remittance limit and leaving the former free of restrictions. What is and what is not productive would be decided by the National Economic Council. The bill also permits unremitted profits to be added to the capital, so increasing future remittances. Businessmen hope that this bill will provide the president with a good reason for not signing the more extreme measure of the Chamber of Deputies.

OVERSEAS TRADE

Swings and Roundabouts

IN the three months to July, total imports into Britain rose by 5 per cent above the February-April level. Much of the increase has been in fruit, vegetables, cereals and feeding stuffs and should prove temporary; imports of fruit and vegetables already appear to be tailing off. Imports of industrial materials rose by 4 per cent—another indication that the protracted period of stock reductions in industry may have run its course. By contrast, imports of finished manufactures which had risen strongly when demand was high were cut by 2 per cent in May-July, though the level of imports of manufactures in July itself was high.

The further gain in exports, which raised them by 4 per cent in May-July compared

500,000 GALLONS AN HOUR

That is the capacity of each of the two WEIR pumps which will feed the boilers at Thorpe Marsh Power Station. **They are the largest capacity boiler feed pumps in the world.**
As the designed output of power stations increases, the importance of each item of equipment grows accordingly. It was not surprising that WEIR Pumps were chosen for Thorpe Marsh and for many other British power stations. This is one of the fields in which the lead of WEIR is unchallenged.

with the previous three months, was unusually well balanced, though some of the improvement was caused by special factors. But the pattern of exports has altered considerably over the past year. Exports of most foods, beverages and tobaccos contracted in the first seven months of this year, compared with 1961, but barley exports rose by £4.9 million and exports of whisky by £4.3 million, dwarfing the numerous falls. The rise in exports of basic materials was mainly in exports of iron and steel scrap which were recently allowed again, though shipments of our man-made fibre staple and synthetic rubbers also rose. Exports of coal and oil products also rose in the first seven months of the year.

Exports of finished manufactures increased by nearly 2 per cent in the seven months, but between industries export fortunes were mixed, and there were exceptional shipments of copper and silver bullion, which together accounted for a rise

EXPORTS (fob) (£ million) January–July:	1961	1962
Food, Beverages, Tobacco	111·7	117·8
Barley	1·3	6·3
Whisky	37·5	41·8
Basic Materials	79·3	89·3
Wool and tops	43·0	37·0
Iron ore and scrap	...	10·3
Coal and oil products	70·7	81·6
Fuel oil	7·4	9·8
Gas oil	11·1	14·2
Manufactures	1,867·7	1,899·9
Chemicals	193·0	199·7
Cotton goods	35·3	28·6
Man-made fibre yarns and fabrics	18·4	22·8
Iron and steel	130·8	120·0
Metal manufactures	96·7	91·3
Machinery (not electric)	488·8	508·2
Motors	84·1	132·4
Aircraft and parts	40·0	26·8
Ships	45·2	26·3
All exports	2,180·1	2,241·2

of over £8 million. Exports of chemicals did well, rising by £6.7 million; gains in some plastics, fertilisers and the like more than offset ground lost in other sections. Tractor exports increased by £6.8 million, machine tools by £4.5 million, excavating machinery by £3.4 million and telegraph and telephone equipment by £3.3 million.

Motor exports rose by £48.4 million, but exports of ships declined by £18.9 million. Aircraft exports dropped £13.2 million, and aero engine shipments dropped by £7.7 million. Exports of chassis for goods vehicles fell by £9 million and other weak spots were iron and steel (down £10.8 million) and cotton goods (down £6.7 million). However, exports of man-made fibre yarns and fabrics rose by £4.3 million and there was a useful rise in exports of scientific and photographic instruments by £3.9 million, to which lenses and optical elements were the main contributors. Exports of arms and ammunition declined by £6.1 million—significant in relation to the total gain in all exports of £61 million, or nearly 3 per cent, to £2,241 million fob in the first seven months of 1962.

GERMANY

Unwanted Ostmark

Frankfurt

EAST GERMAN currency finds itself friendless one again in the Federal Republic. Officially at parity with the west German mark, the Ostmark has depreciated in the open market from 40 west German marks to the hundred at the end of July to around 32. Some west German banks indeed are willing to buy east German currency only if they already know of a buyer. This movement is the more remarkable as it occurs in advance of the Leipzig autumn fair, which normally produces a demand for east German currency. The absence of such demand at present is explained by the reduced attendance by west German businessmen which is expected this year. But another important influence has been the new tension on the Berlin wall.

Trade in the notes of the DDR (German Democratic Republic) has existed since 1948. Until the erection of the wall a year ago the centre of the market was Berlin, where turnover was large. The supply came from east Germans making personal purchases in west Berlin or other payments not officially authorised by their government. Demand for the Ostmark stemmed mainly from the then still lively personal travel from the Federal Republic to east Germany, and also from private money remittances to relatives and friends in the east. The erection of the wall put an immediate curb on these activities, and sharply contracted the supply—so that the Ostmark at first appreciated. Turnover in the Ostmark was reduced to a small fraction of its former level and the focal point of the dealings moved from west Berlin into west Germany. The remaining buyers of Ostmarks are west Germans and other westerners who can still travel to east Germany. Where the supply now comes from is somewhat mystifying. Part may stem from refugees, but there also appear to be other sources.

BROILER CHICKENS

Pig Cycle for Chicks

THE methods of the factory imported into the farmyard have duly infected chicken rearing, once the peaceable rustic pastime of farmers' wives, with the rabid boom and bust psychology that big business is trying to live down. Symptoms of stock exchange fever became apparent in this field in 1960. Demand for table ready chickens was voracious and profits were plump, at least until towards the end of that year. In 1960, Buxted Chicken came to market. About 250,000 5s. shares were placed by Hambros Bank at 14s. In the following year, Spillers lent the company £500,000 on an unsecured loan stock and took up 250,000 shares at 22s. 6d. with an option to buy a further 150,000 at 27s. 6d. For the year to June 30th, 1962, however, Buxted expects to show a trading loss of up to £20,000; and £40,000 will also have to be written off equipment. No ordinary dividend will be paid. Buxted's shares which had been as high as 35s. in 1961, have now fallen back to 15s. 1½d.; earlier this year they were 12s. 6d. It is a relief that current earnings are described as "satisfactory".

Another broiler victim has been E. F. Fairbairn, which came to market at the very start of the broiler boom in 1953, and gobbled up Chunky Chicks at the beginning of this year. Chunky was then said to be likely to earn roughly the same profit in the year to May 31, 1962 as in the previous year. Fairbairn expected profits in its financial year, which runs to the end of September, to be at least equal to the previous year's figures. But last week's bid by the Ross group for Fairbairn revealed that Fairbairn's and Chunky's combined profits for the year to September 30th would be less than half their 1960-61 level. Delayed action effects of fowl pest contracted over the past two years are blamed for the decline.

But the chief affliction of chickens since 1960 has been too many would-be producers. Big food groups such as Fitch Lovell and many others started intensive production of chickens, and while consumption has increased sharply, total production broke its bounds and prices crashed. Since March, however, chicken prices have recovered steadily though they are not back to 1960 levels. J. B. Eastwood, which was granted a stock exchange quotation in 1959, reported sharply lower profits a fortnight ago, but forecast much higher earnings in the current year. The company is going ahead with a £1 million investment project to be completed by the end of 1963.

Output of chickens is expected to fall this year and some mushroom enterprises have been forced out of the business. The immediate outlook looks brighter, long-term prospects seem sound, and the development of broad-breasted broilers proceeds at an astonishing pace. But there are obviously some of the elements of that familiar phenomenon of agricultural economics, the pig cycle of high prices followed by over-production and slump, in this business.

SUPERMARKETS

Enter Gussies

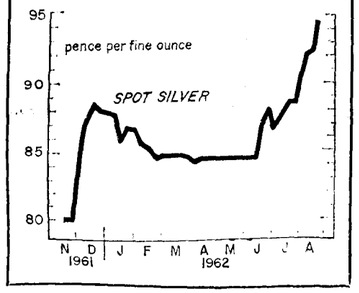
With supermarkets so fashionable, fast growing and still a profitable branch of retailing, it is only a matter of time before the more active existing retail chains decide to spread into them. Great Universal Stores took the plunge last week by buying a 51 per cent interest in William Cussons, a private company that controls 60 food shops —of which 40 are self-service or supermarkets—in the Midlands and Northern England. It has extended its offer to the minority shareholders. So far GUS has chiefly been interested in food as something that its seven mail order companies can sell through the post, a slightly odd way of buying food for a country as small as Britain but one that GUS plans to expand alongside its new supermarket interests. At least it is safe in assuming that the two methods are unlikely to be competing for the same customers.

The management of Cussons is being taken over with the company, and Mr Kenneth Sampson—who succeeds the retiring chairman, Mr Austen Hudson—will take charge of all food retailing in the GUS group. Opening new supermarkets, especially in the midlands and southern England, looks like being his main activity. With the funds of GUS available, only the difficulty of finding good sites is likely to put much of a brake on expansion; about a dozen are said to have been found already. Now that furniture and other durable goods seem long past their days of growth, and clothing can hardly be expected to produce any dramatic changes, entering the supermarket business should give GUS a chance of preserving its reputation as a growth stock.

Competition, however, is going to get stiffer, for GUS is not the only newcomer to the British supermarket trade. Safeways Foods, the American company whose then rather abstract desire to open supermarkets in Britain received much publicity last February, has now revealed that it is negotiating with John Gardner, a catering company which owns eight supermarkets in southern England and is planning to open several more. Entering the market through a company with experience of British conditions would probably be the simplest way for a foreign company; British habits are in many ways different from American. The isolated suburban supermarket, surrounded by its car park, that has proved so successful in America is a rather less attractive venture when a large proportion of shoppers lack a car. The heavy losses reported for the multi-storey car park attached to the Tesco discount store at Leicester rather confirms the belief that the British have yet to become car-borne shoppers.

SILVER SPURTS

An upturn in silver at about this point in the year had been expected in view of the low level of sales by China and the shortfall in supplies of newly mined metal. The rise, however, has been steeper than foreseen. Spot silver has risen 6¾d. to 95¼d. a fine ounce this month, half the rise occurring in the past week. Mexican authorities are believed to have sold some of the silver they bought to support the price when it dipped earlier in the year.



TIN

Market Reassured

Tin from the United States' strategic stockpile is to come on to the market from September 12th at a rate that would take 35 years to clean out the entire stock. When the last of the strategic tin is sold, greybeards might recall that the announcement of the first sales was greeted by a rise in prices. That, indeed, seems to have been the intention of the American officials, who have managed to manœuvre tin buyers into the frame of mind where this could happen. After the protracted discussions and [redacted] in tin prices, the projected releases were passed over by the market, if not by producers, as unexceptional—not the great watershed in the tin market that everyone had earlier believed they would prove. The disposal scheme might now be accepted as a model of restraint and forbearance, though the rate of releases looks uncommonly like the one the United States appeared to have in mind before all the arguing with producers began.

The initial sales programme has been mapped out only for the fifteen weeks from the middle of September to the end of the year. Offers consistent with prevailing market prices will be accepted and if sales have a significant impact on the market the disposal plan will be reconsidered. Two hundred tons of tin a week will be offered; but 40 tons of this will be absorbed by government agencies or foreign aid. About one-third of the tin will be of a quality which should not compete directly with the tin dealt in on the London market. Any part of the 200 tons of tin not disposed of each week will not be carried forward either.

On the evidence of the market's capacity to digest other people's stockpiles in recent years, the burden does not appear unsupportable, though the thought of the immense quantities still to be released might be staggering. Stocks built last year have been brought down to normal levels, though consumption has been lower than producers hoped. The shortfall in tin production has probably been exaggerated, but is still a fact. It should over a reasonable period take care of the quantities which the United States seems likely to release, though a change might be made as frequently in the disposal programme for tin as for rubber. Spot tin has risen to £855 and for the time being the buffer manager is not required to make support purchases at £850.

SHORTER NOTES

Britain's delegation to the meetings of the International Monetary Fund and other institutions which open in Washington on September 17th will as usual be headed by the Chancellor of the Exchequer. Mr Maudling will be accompanied by Mr Edward du Cann, economic secretary to the Treasury, and Captain T. M. O'Neill, minister of finance in Northern Ireland. Both the outgoing and incoming joint permanent Treasury chiefs, Sir Frank Lee and Mr William Armstrong, will attend, and also Sir Denis Rickett, Mr Alec Cairncross, and Mr D. B. Pitblado. They will be joined by Mr Maurice Parsons of the Bank of England.

*

Barley: A note in these columns last week referred to the absence so far this year of the customary price guide put out by the National Farmers' Union for barley producers. The working party responsible for calculating this "indicated value" is however an independent body consisting of representatives of farmers, compounders of feeding stuffs and corn and agricultural merchants. It met again on Wednesday and though still unable to give a price indication in the usual form gave as its opinion that 17s. 6d. a cwt. was a reasonable price.

BRITISH MATCH

RESULTS 1962

Group profit before tax was £3,355,000 compared with £3,344,000 for 1961. This year a change in policy reduced the charge for depreciation. A final dividend of 1s. 4d. per £1 stock is recommended, again making 2s. 0d. for the year.

Overseas profits were well maintained and in Canada Kootenay Forest Products had a much better year. At home profits were lower. Turnover of Airscrew-Weyroc increased in face of keen competition but margins suffered.

THE MATCH INDUSTRY

U.K. sales were hit by the Chancellor's 10% surcharge on revenue duties. The surcharge on matches was removed in April 1962.

The group interest in The Lion Match Co. of South Africa has been increased from 34% to 62%.

DIVERSIFICATION

Airscrew-Weyroc has acquired the wood chipboard factory of the Bartrev Board Co. and is building a fourth plant at Hexham. Bryant & May has acquired Waeco, manufacturers of pyrotechnics and 'Wessex' fireworks.

The group now has 24% of its assets outside the match industry. It is still the board's policy to diversify into selected industries which have an affinity to its main activities. These include wood chipboard, woodpulp mouldings and packaging.

Report and accounts may be obtained from British Match Corporation Ltd., Fairfield Road, London E.3

DONALDSON TEXTILES LIMITED

("Donbros" Ladies' and Men's Knitted Outerwear and "Copley" Hand Knitting Yarns)

RECORD GROUP SALES

The sixteenth annual general meeting of Donaldson Textiles Limited was held on August 28th in London, **Mr Alasdair Donaldson** (the chairman) presiding.

The following is an extract from his circulated statement: Our trading profit again is in excess of the previous year's figure, but due to the incidence of increased taxation and depreciation, the net profit shows a small decrease compared with last year.

The Consolidated Trading Profit amounted to £504,720 compared with £467,469 in the previous year. The net profit is £175,769 against £183,704 in 1960/61.

In the period under review, the sales of your Group again increased to a record level.

We live in an exciting time of major technical development within our industry. New types of knitting machinery are being produced—new types of man-made fibres to use on these machines continually become available. These developments open up a field of research for improving existing products or introducing new ones which a few years ago we could not envisage. We intend to pursue these opportunities by continually endeavouring to develop still further our research, technical and selling skills.

Our sales to overseas countries improved considerably during the period showing an increase of approximately 25 per cent against 1960/61.

The European markets have shown substantial gains but perhaps it is disappointing that the lack of continuity in the importing policies of some of our traditional Commonwealth markets prohibits similar opportunities in these areas

Encouraging as this may be, perhaps it is prudent to again draw attention to the rapid increase of imports of knitted textiles to this country during 1961. An increase from £14.7 million in 1960 to £18 million in 1961 cannot be ignored. We must be sufficiently realistic to accept that it is the declared intention of Government policy to continue a further liberalisation of trade but it would be foolish to shut our eyes to the increased competition which this creates in our domestic market.

Your Directors consider that it would be the wrong policy for your Company, as distributors, to be tied to one home manufacturer.

In February last, we introduced a new range of nylon stockings under our own "Donbros" brand and this range is now being promoted by a strong selling campaign which, to date, has shown encouraging results.

The Future: Undoubtedly there has been a slackening of activity in certain parts of the knitting industry over the last six months. It seems apparent that generally retailers have not had a buoyant Spring selling season which has created a cautious approach to Autumn buying. Nevertheless, the current productive activity of your Group remains high and we look forward to this continuing. We would like to assure you that our policy is to continue to explore all avenues for further expansion.

The report was adopted and a total dividend of 12½ per cent (same) approved.

THE DOXFORD AND SUNDERLAND SHIPBUILDING AND ENGINEERING CO. LIMITED

TRADING CONDITIONS SHOW FURTHER DETERIORATION

The annual general meeting of The Doxford and Sunderland Shipbuilding and Engineering Co. Limited will be held on September 18th in London.

The following is an extract from the circulated statement of the chairman, **Dr J. Ramsay Gebbie, CBE:**

Consequent upon the decision to alter the accounting date, which was announced to members earlier this year, the accounts cover the period of nine months ended March 31st last and include the operations of both former Doxford and Sunderland Groups.

Since my last Statement conditions in the Shipping and Shipbuilding Industries have further deteriorated and the general situation now is worse than at any time since the early 1930's.

As might be expected, the Group has been adversely affected. Group Profit before Taxation for the nine months ended March 31, 1962, amounts to £723,097, compared with the aggregate profit of the former Doxford and Sunderland Groups, for the years ended June 30, 1961, and March 31, 1961, respectively, of £1,615,726.

This reduction in profit was forecast in my last year's Statement and I feel I must warn Stockholders that I can see no possibility of avoiding a further drop in the rate of profit for the current year.

After outlining the reasons for the board's decision to recommend a lower dividend at the rate of 10 per cent, and reviewing the operations of the Subsidiary Companies, the chairman continued:

I have already referred to the present conditions existing in our Industry and I repeat that at the moment I can see no prospect of any immediate improvement in the extremely depressed state of shipbuilding. Trampship freights, instead of improving as many thought they would, have continued to decline, whilst the oil tanker market still remains depressed.

Despite adverse circumstances all of our three shipyards have obtained some new orders, though insufficient to keep them fully occupied during the current year, but the prices at which these orders have been obtained leave little or no margin for profit. Fixed prices are now, of course, the general rule, and any rises in the cost of wages or materials must be borne by us.

The Group has now been in existence for about fifteen months and many of the advantages expected of the merger have materialised, though the full benefits are yet to be reaped.

My co-directors and I feel confident that the competitive ability of the Group, together with efficient and vigorous exploitation of the Group's resources, will ensure its future success.

BOARD RETIREMENTS

I have been with Doxford since 1930 and have been Chairman since 1957. I have passed the three-score years and ten and feel I should now leave the conduct of the Company in younger hands.

We are fortunate in having in our Deputy Chairman, Sir Henry Wilson Smith, KCB, KBE, a most able and experienced industrialist to succeed me as Chairman.

Dr E. P. Andreae has also decided to retire from the Board at the same time as myself, he having reached an even more advanced age than I. Dr Andreae has been a Director of Doxford since 1935 and was Chairman from 1936 until he retired in my favour in 1957. Your Company owes him an immense debt of gratitude for all he has done towards building it up to its present position of eminence in the Industry.

SIR LINDSAY PARKINSON

Mr A. E. Parkinson, the Chairman, presided at the twenty-fifth Annual General Meeting of Sir Lindsay Parkinson & Co. Ltd. held on August 30th in London. After outlining the financial results for the year ended December 31, 1961, Mr Parkinson said "It is pleasing to note that this is the ninth successive year for which I have been able to report higher profits."

Year to December 31st	1958	1959	1960	1961
Group profit before tax	£270,500	£308,146	£356,601	£404,581
Taxation	134,997	159,905	157,643	179,693
Group net profit	135,503	148,241	198,958	224,888
Ordinary dividend (less tax)	27,282	55,125	55,125	60,637
Revenue reserves and unappropriated profit	722,107	801,289	923,438	1,069,247

The following are extracts from his circulated Statement: We are maintaining the diversified nature of the contracts secured. The Building Department continues to execute substantial contracts for Government Departments, Public Authorities, etc. The turnover of our Civil Engineering department has again increased. Very satisfactory progress has been made with the work on all the contracts we have in hand.

WIDE RANGE OF ACTIVITIES

On the M6 Birmingham-Preston Motorway contract, we are confident that we shall complete within the specified time. We are continuing to tender for large projects, both in open competition and upon selected tender lists and, among others, have recently secured a contract for the reconstruction of the South Pier, Great Yarmouth.

Sales in Speculative Housing have been affected by the credit restrictions, but demand for our properties continues at a substantial level. Our Open-cast Coal turnover was also substantial and our long-term contracts continue.

Our Nigerian subsidiary had a year of increasing activity and has secured a number of important contracts. In Ghana, in association with John Howard & Co. Ltd., we have obtained two further Government contracts at Tema, valued at some £8 million.

Our work in hand at present is in excess of £20 million and we are confident of continuing our activities on the same high level.

Sales record for International Stores

Extracts from the Statement of **Mr Frank Hawkins,** the Chairman, for the year ended April 28, 1962:

New records in turnover and profits were achieved despite price-cutting competition which made it necessary to operate on narrow margins. The biggest increases came from shops converted to self-service in the past few years. We plan to open a further 90 self-service shops during the current financial year and the construction of two large supermarkets is well advanced. Our main subsidiary, George J. Mason Limited, is making excellent progress.

	1962	1961
Profit before Tax	£2,142,544	£1,903,416
Tax	£1,090,928	£956,344
Dividends—Ordinary (12½%)	£474,688	£474,688
Preference	£129,097	£129,097
Capital Employed	£15,377,379	£14,766,646
Self-Service Branches	406	322

Annual General Meeting—1st October, 1962

Expenses, especially in respect of increased wages and salaries, have been steadily rising, therefore we must expand our turnover. This we are aiming to do by proceeding with our plans for conversions to self-service and reorganisation of our warehousing and clerical systems to achieve greater efficiency and economies. When our four new warehouses are completed and brought into operation we expect to effect substantial savings. Our factories and bakeries have produced increased tonnage and have made a substantial contribution to Group profits.

I wish to express very real and sincere appreciation of the services rendered by all members of the Staff.

INTERNATIONAL STORES

(The International Tea Company's Stores Limited)

ANOTHER RECORD YEAR

from the Chairman's report to the Shareholders

I have pleasure in presenting to you the Report of the Directors and the Accounts covering yet another successful year in the Company's history. In March 1961 your Directors anticipated that the net profits for the year ending March 31, 1962, would be not less than £250,000. I am pleased to report that this forecast has been exceeded. The net profit for the year to March 31, 1962, was £425,074, an increase of £175,074 over the estimate made last year. Your Directors have decided to recommend a final dividend of 25 per cent making a total for the year of 35 per cent as compared with 30 per cent paid last year.

The actual Capital employed in the Company is now substantially in excess of the Issued Share Capital, and your Directors recommend that there be issued by way of capitalisation of reserves one additional share for every four shares now held.

Resolutions will be proposed as Special Business at the Annual General Meeting increasing the authorised share capital from £280,000 to £500,000 and giving effect to the proposed capitalisation. A further resolution to dispense with signatures on share certificates will have the effect of bringing those used by the Company into line with present day practice.

During the year we increased our manufacturing facilities by the acquisition of two modern radio factories in North West London.

In our new additional premises we have greater facilities for research and design and many new products are being developed. For example, our newly designed record players are now being marketed with great success. The benefits of this research and design will continue to be felt in future years.

We are continuing our policy of increasing our range of products under the trade name of Dansette and at this year's National Radio Exhibition we shall be launching our first tape recorder.

Although it is difficult at this juncture to forecast the final results for this current year, your Directors are satisfied that your investment will continue to prosper and anticipate that they will be able to recommend maintaining the dividend at 35 per cent on the increased issued capital.

Dansette

DANSETTE PRODUCTS LTD.

112-116 Old Street, London, E.C.1.

BRITISH TAR PRODUCTS LIMITED

MR F. WOOLLEY-HART'S REVIEW

The forty-second ordinary general meeting of British Tar Products, Limited was held on August 30th in London, **Mr F. Woolley-Hart, OBE** (the Chairman), presiding.

The following is an extract from his circulated review:

The Trading Profit and other income at £86,279 shows a reduction of some £30,000 as compared with last year, and the reasons for this heavy fall in Profit are given later in this Address.

In view of the results for the year your Board feel that a reduction in the distribution should be made. They recommend a Final Dividend of 5 per cent less Tax, making 7½ per cent less Tax for the year, a transfer of £10,000 to General Reserve Account and an increase in the carry-forward of £5,125.

TRADING REVIEW

Tar and Benzole Products: The demand in many sections has been disappointing with buying resistance naturally bringing about declining profit margins.

COMPANY MEETING REPORTS

Reduced supplies of certain raw materials have in some sections resulted in a position of considerable surplus productive capacity with the inevitable effect of transferring the burden of uncovered overhead charges to more actively employed plants.

This has been particularly conspicuous in the case of Benzole where cheap imported supplies have caused a very serious fall in the demand for home produced material and a further adverse effect on the results of our Benzole Refining has been brought about by the change in the type of the limited supplies of raw materials which have been available to us.

As was foreseen, the world Naphthalene position has now swung to over-production and whilst we concentrate mainly on the manufacture of a very high grade refined product, even here the demand has been irregular.

Hydrogenation Plant: Operations have not been unsatisfactory although not always in the directions which had been anticipated. Special work in the treatment of various chemicals both by distillation and other refining techniques has shown a welcome increase. Our ability to provide the Chemical Industry with these services gains growing recognition.

Bulk Storage Installation: It is regrettable to have to report a substantial reduction in throughput of materials handled compared with the previous year, which is a matter entirely beyond our control. We are hopeful that the trend towards increasing usage of bulk liquids will continue and result in extended use being made of the storage facilities which we are able to provide.

Our Methylating Plant is now operational and we have further new projects coming into fruition but all the adverse conditions to which I alluded in my last year's review remain and to them must be added the uncertainty of the possible impact upon us of the Common Market if the negotiations with the EEC result in the acceptance of the UK's application for entry. We cannot hope to escape the adverse effects of ever rising costs and greatly increased competition experienced by undertakings similar to our own. We may well therefore have to resign ourselves to a further period of lower profits than we have been able to achieve in recent years but your Board continue to have great faith in the virility and growth potential of our business.

The report was adopted.

THE GLOBE TELEGRAPH AND TRUST COMPANY LIMITED

(Investment Trust Company)

Chairman: Sir Edward Wilshaw, K.C.M.G.

CAPITAL (Authorized) £10,000,000*
(Issued) £9,100,000

4% Debenture Stock, 1975/80 ..... £3,542,704

In his address to the Annual General Meeting of Stockowners held at Electra House, Victoria Embankment, London, on Friday, 24th August, 1962, SIR EDWARD WILSHAW reported:

	Year to 30th June 1961	1962
CAPITAL (Issued)	£9,100,000	£9,100,000
EARNINGS (Net)	£832,613	£929,546
DIVIDEND	10%	12½%
RESERVES	£6,548,901	£6,842,437
INVESTMENTS (Book value)	£19,359,627	£19,627,882

FUTURE DIVIDENDS The payment of a 12½% dividend for the year to 30th June, 1963, is anticipated.

Over past years there have been scrip and rights issues.

* The Authorized Capital is now to be increased to £12,500,000 but it is not intended to issue any further shares at the present time.

S. HOFFNUNG & CO.

DIVIDEND MAINTAINED

The sixtieth annual general meeting of **S. Hoffnung and Co., Limited**, will be held on September 20th, in London.

The following are extracts from the circulated Statement of the Chairman, **Mr Pierre J. B. Lachelin:**

Although turnover for the year was only marginally lower, increased costs and increased competition are reflected in a reduction in the profit of the Group, namely from £492,172 to £422,183 before tax. After deduction of taxation and amounts attributable to minority interests, the consolidated profit for the year was £249,446 against £302,346.

In view of the conservative distributions in past years which are reflected in the high level of the reserves and having due regard to current conditions, your Board are recommending a final dividend of 12 per cent., free of tax, which, with the interim of 4 per cent., maintains the annual rate at 16 per cent., free of tax.

Trading conditions in the year under review continued to be difficult. Our sales in Australia are now showing an upward trend. Several import restrictions in New Zealand are likely to impede trade there, but, on current estimates, our overall investment in New Zealand should give us a favourable rate of return.

On balance, I am hopeful that providing conditions in Australia continue to improve, Group figures for the current year will at least be of the same order as those for the year to 31st March last.

Copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Company Meetings Department,
The Economist,
22 Ryder Street, S.W.1.

COMPANY AFFAIRS

For the second week in succession equity prices on the London stock market moved very little. The new account failed to attract buyers and The Economist *indicator gained only 0.7 points to 335.8. The lighterman's strike at London Docks and the setback on Wall Street depressed prices in the middle of the week. After rising soon after the opening of the new account steel share prices fell back later. On Thursday, Bowater Paper fell on the news of the death of the chairman, Sir Eric Bowater. Gold shares rose following relaxations in the South African controls on arbitrage between London and Johannesburg. Gilt-edged stocks moved ahead strongly, with much of the buying concentrated on long and undated stocks.*

Breaking Up Eastwoods

On the score of higher profits and dividends the shareholders of Rugby Portland Cement have no reason to complain of the road on which that ardent and vocal supporter of free enterprise, Sir Halford Reddish, has led them. But occasionally they must feel a little puzzled by the twists and turns that the road has taken. Do they, for example, regard the "A" share scheme as an unqualified success? And what are they to make of the toings and frolings in Eastwoods? Within a few weeks of completing its takeover of Eastwoods, Rugby proposes to split its new subsidiary with Redwood Holdings. When the bid was first made, shareholders must have assumed that Rugby was willing, at a comparatively high cost, to digest the whole of the Eastwoods enterprise—cement, bricks, tiles and all. Eastwoods has three cement plants but primarily it is a brick-maker and it seemed odd for Rugby to seek diversity in bricks, which are growing more slowly than cement.

Now, before they have had time to see what they have in Eastwoods, the Rugby directors have agreed to sell Eastwoods non-cement interests to Redland Holdings (which thus secures an extension of its brick-making interests in the North). The suggestion came "out of the blue" from Redland; but the Rugby directors were quick to accept it, and also to disclose it before the details had been worked out for fear of a "leak" on the stock market (as happened when the original bid for Eastwoods was made). Everyone can have second thoughts; but Rugby paid over £11 million for Eastwoods, including £5¼ million in cash. Its liquid resources, of over £4 million at the end of March were reinforced by a £4½ million rights issue in May. It will get between £6 and £7 million in cash for Eastwoods' non-cement interests from Redland (which in its turn will have a financing problem on its hand). Thus it should have more than enough to cover the £4 million it intends to spend reorganising and modernising Eastwoods' cement works. But, if their ideas were fixed firmly on further expansion in cement, why were they prepared to pay so much only a few months ago for bricks and tiles as well?

Rugby and Redland will both hold a substantial proportion of Eastwoods whose "character and identity" are to be retained; but there will be no financial link between them. The three companies will work in close co-operation and Redland will be responsible for the distribution of cement manufactured in Eastwoods plants. How this will work out in practice remains to be seen; but the industrial logic of the deal points to an integration of Eastwoods' cement plants with Rugby and of its other interests with Redland—in fact, to a more or less complete dismemberment of Eastwoods.

Carreras

Compared with Imperial Tobacco and Gallaher, Carreras, a member of the Rembrandt group, is a lightweight, being responsible for under 5 per cent of the cigarette sales in this country. But the advance in its gross profits from £2,608,000 to £2,939,000 and in net profits from £1,284,000 to £1,509,000 in the year to June 30th shows how remarkably successful it is. The secret lies in concentrating its efforts and advertising expenditures on tipped cigarettes, now about 90 per cent of its production. Tipped cigarettes, on which one pays no duty on unsmoked tobacco and may incur less risk of lung cancer, have grown steadily in this country until they represent a quarter of all sales. But Carreras's own sales rose by as much as a fifth in the latest financial year and it now sells nearly 20 per cent of all tipped cigarettes. Exports were higher and profits again benefited from the agreement to manufacture cigarettes for Rothmans' export trade.

"B" shareholders in Carreras have not been ignored and the dividend, held at 9 per cent in 1960-61 in deference to the request for restraint, has been raised to 11 per cent. At 6s. 4½d. they yield 4¼ per cent, covered just over twice. This is well below the yields on Gallaher and "Imps" and obviously assumes that tipped cigarette sales will continue to grow rapidly in this country, where their 25 per cent share of the market compares, for example, with 55 per cent in the United States and nearly 75 per cent in Australia. But the yield rests on the further assumption that Carreras will not get involved in a slugging match with the heavyweights of the industry. With plain cigarettes in the 4s. 6d. range it pursues evading tactics; but recently in launching a tipped "Piccadilly" brand it began to compete directly with the giants' 3s. 10d. tipped brands such as "Nelson" and "Bachelor." So far the sales of tipped "Piccadilly" have gone well; but the question is whether Carreras can score the same success with this brand as it did earlier with "Guards" in the 3s. 6d. range of tipped cigarettes.

Triplex (Holdings)

In raising the dividend from 12½ to 15 per cent, the directors of Triplex (Holdings) have restored the payment to the 1959-60 level, as the stock market expected. At 34s. 9d. the 10s. shares now yield 4.3 per cent, covered 1¾ times. Profits have recovered, rising from £1,007,000 to £1,245,000 gross and from £460,000 to £504,000 net in the year to June 30th, but they are still below the record level reached in 1959-60. Over the last four half-yearly periods gross profits have run as follows: £348,000; £659,000; £471,000; £774,000. It is clear that Triplex's profits have benefited from the revival in motor sales in this country and in shipments to the United States. These shipments may have an important influence on the latest results, as in 1960-61 the decline in exports reduced the demand for laminated glass and left Triplex's laminating plant working at only a fraction of its capacity. The outlook for the motor industry and its ancillary suppliers is now a little brighter but, understandably, there is no sign that Triplex, which completed its major extensions early in 1961 and which prides itself on always having sufficient capacity to meet peak demand, is investing any big sums in new plant and equipment.

Albright and Wilson

Set against the background of lower margins and surplus capacity in the chemical industry, the half yearly results of Albright and Wilson, summarised in the accompanying table, are reasonably good. Sales were higher and the directors describe trading conditions at home and overseas as "mixed . . . with signs of improvement at some points." They expect profits in the second half of the year to be approximately the same as those in the first half. This is in keeping with an earlier forecast that profits over the full year would not be significantly changed.

These results illustrate that in the

Continued from page 845

chemical industry specialisation pays. Albright and Wilson has kept away from the more fashionable products (notably petrochemicals) in which the giants have invested heavily. But since its acquisition of Marchon it has dominated the market in phosphorus derivatives (other than fertilisers) and through its purchase of W. J. Bush and Boake Roberts it has secured an interest in such specialised products as plasticisers, flavouring essences and perfumes. The

Six months to	June 30, 1961 £'000s	Dec. 31, 1961 £'000s	June 30, 1962 £'000s
Trading profit	4,358	4,074	4,232
Gross income.....	2,762	2,290	2,350
Net income	1,365	1,348	1,245

winds of competition do not blow so coldly round its ears as they do round those of other, bigger producers. The stock market is aware of this; Albright and Wilson's shares at 23s. 9d. yield 4.2 per cent, compared with 5¼ per cent on ICI. The cover on ICI's dividend is thin; but these results make it clear that a total dividend of 20 per cent from Albright and Wilson will again be covered about twice. The interim is unchanged at 6 per cent and there now seems no threat to a maintained final of 14 per cent.

Powell Duffryn and William Cory

ALTHOUGH there are broad similarities between the interests of Powell Duffryn and William Cory in coastal shipping, coal and oil interests, Powell Duffryn is the more broadly based. Its profits come in roughly equal proportions from four main sources: coal, oil, shipping, and heating and engineering and the results for the year to March 31st evoke the comment from the chairman, Sir Henry Wilson Smith, that the group "had cause to bless the widespread nature of its activities."

Two thirds of the increase in trading profits, from £3,472,000 to £3,769,000, came from new acquisitions but Sir Henry describes the broad results as "a very creditable achievement." Although the cold winter aided profits in the fuel business there were offsetting factors—rising costs and the credit squeeze among them. Moreover, the development programme made inroads into the group's liquid balances with the result that investment income fell from £397,000 to £260,000. Thanks however to bigger investment allowances on new capital expenditures, net profits rose from £1,385,000 to £1,447,000 so that the dividend, raised from 16 to 18 per cent, is covered 2½ times. The cost of the dividend was raised by the issue of shares for two new acquisitions: the shares ranked for the 1961-62 dividend but the new subsidiaries contributed little to profits. This year will bring full earnings and some of new developments should earn a higher return.

Even so, Sir Henry does not make any forecast. Two-thirds of total profits are earned in the winter months and thus depend on the weather; investment allowances will be lower; and the group will have a big overdraft to support. Last year net liquid assets of £931,000 gave way to a net overdraft of £903,000 and the current bid for Hamworthy Engineering is likely to require nearly £2 million net in cash, almost as much as last year's cash flow of £2¼ million. Sir Henry does not expect Powell Duffryn to raise any fresh capital this year but the group's borrowing powers have effectively been increased. Eventually, income should benefit from the £4 million in assets which earn little or no profit at the moment. Of these the Purfleet oil terminal should begin to earn profits early in 1963. But when will the three new dry cargo ships earn a satisfactory return? Nothing better than maintained profits seem to be on the cards for 1962-63 and the 10s. shares at 34s. 3d. are only just above their low point for the year and yield 5¼ per cent.

In contrast are the £1 ordinary shares in William Cory at 50s. 4½d., yielding no less than 6.9 per cent. Trading profits fell in the year to March 31st from £2,723,000 to £2,658,000. But an increase in investment income and a lower tax charge led to a slight rise in net profits from £1,799,000 to £1,817,000, and the dividend was raised from 15 to 17½ per cent. The chairman, Lord Leathers, says that the return on capital in the group's two principal investments, coal and shipping, was low. It seems likely to remain low this year with little prospect of improved profits.

Philips NV

STOCKHOLDERS in Philips NV took up their rights in the £72 million issue when the concept of growth was taking a drubbing in Wall Street and other stock exchanges. It was a mammoth issue which, to go by the Royal Dutch/Shell precedent, may inhibit investors from adding to their holdings through further market purchases. The recovery on Wall Street has raised Philips shares from their low point and eventually the company should resume a fast rate of growth, based on further sales of television sets on the Continent and on its ventures in electronics. But the new money has still to be invested and the sheer amount of stock in issue may for the time being at least limit its recovery potential. The shares at £6¼ yield no more than 2½ per cent on dividend and about 6½ per cent on earnings; well-managed though Philips is, it is at the moment adding less to its profits than it is to its sales.

In the first half of this year, sales rose by 13 per cent, from Fl 2,114 million to Fl 2,386 million, slightly higher than the increase secured in the first quarter and the increase expected for the year as a whole. But trading profits rose by only 3½ per cent, from Fl 330 million to Fl 342 million and the profit margin on sales of 14.3 per cent was lower than in the first quarter of 1962, and in the whole of 1961. The net return on capital employed has also fallen (from 11.7 per cent to 9.9 per cent over the two half-yearly periods) though this reflects in part the swelling of liquid assets by the rights issue. And there are signs that stocks are building up more rapidly than sales are being generated. The directors had given stockholders adequate warning about the current slowing down in the rate of growth. This phase will have to pass before the glamour of electronics in Philips can attract the investor.

International Tea

INTERNATIONAL TEA'S self-service stores and super-markets clearly played a key part in pushing up trading profits by 12½ per cent from £2,562,000 to £2,884,000 in the year to April 28th. This increase must mark an expansion in sales by the 322 self-service stores in operation at the beginning of the year and so over the initial disturbance and expense of conversion, and not merely the trade gathered by the 84 self-service stores opened during the year. By the end of April almost a quarter of the group's 1,284 stores were of self-service type; and current plans envisage another 90 self-service stores and two supermarkets.

International Tea may not have the growth potential implied by the low current yields on such specialist supermarket shares as Tesco and London Grocers, but prospects are good enough to justify the yield of 4.1 per cent offered by the 5s. shares at 15s. 3d. on the 12½ per cent dividend. The chairman, Mr F. E. Hawkins, admits that rising costs can be offset only by increasing sales; but as the self-service stores have scored the biggest increase in turnover in recent years the group's policy is in the right direction. Efforts are also being made to cut costs. Clerical systems are being reorganised and the first of four new central warehouses will be in use by the end of the year. Expansion and development will continue to be self-financed.

THE MONEY MARKET

THE average rate of discount fell by 3.85d. to 75s. 4.50d. per cent at the Treasury bill tender on Friday of last week—its lowest point since mid-June. The syndicate of discount houses raised its bid by a 1d. at this tender to £99 1s. 2d. The market's allotment of bills however actually fell to 48 per cent, compared with 53 per cent in the previous week; total applications for the unaltered offer of £230 million bills rose by £22 million to £390 million.

Credit was tight throughout the week to Wednesday with the exception of Monday, when the authorities sold a small number of bills to absorb the surplus credit. On Tuesday one or two houses borrowed a small amount from the Bank of England at Bank rate despite the large amount of help provided by the authorities through the special purchase of bills. On Saturday and Wednesday special help on this scale was sufficient for market needs.

In the local authority loan market, money was fairly tight at the beginning of this week and the seven-day rate rose to 4¼ per cent, but on Wednesday money came on offer and the rate eased to 4⅛ per cent. At the moment there is a good turnover in 364-day money at 5¼ per cent.
