THE ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT (PARIS)
The AGRICULTURAL DIRECTORATE of the OECD is looking for
ECONOMISTS familiar with agricultural questions or GRADUATES IN AGRICULTURE familiar with economic questions
Their work would relate to:
(i) Agricultural policy (price policies, structures and marketing arrangements).
(ii) Projections of supply and demand relating to agricultural products.
Other qualifications required are a very thorough knowledge of one of the official languages of the Organisation (English and French) and ability to draft well in that language ; a sound knowledge of the other language is also required.
Candidates should apply, before September 15, 1962, to the Personnel Division, O.E.C.D., 2 rue André Pascal, PARIS XVIe, enclosing a detailed curriculum vitae.

BCL BRITISH CELLOPHANE LIMITED
MARKET RESEARCH DEPARTMENT
Applications are invited from male Economics graduates in their early 20's for the post of Market Research Assistant.
The Company produces "Cellophane," polythene and other plastic films and field surveys are carried out into the existing and potential markets for these products.
The successful candidate (previous experience useful but not essential) should be capable of interviewing at all levels and of preparing concise reports on a wide range of topics.
Candidates must be prepared to live in the London area. A contributory pension scheme is operated and working conditions are excellent. Application forms can be obtained from the Personnel Officer, Bath Road, Bridgwater, Somerset.

The Economist requires an ASSISTANT STATISTICIAN to help in analysis of economic material, including the construction of index numbers. Age under 30. University degree in statistics or in economics with statistics as a special subject essential. Salary in the range £800-£1,100 according to experience. Five-day week four-weeks' holiday. Bonus, pension and provident schemes in operation.—Apply, in writing, to the Chief Statistician, *The Economist*, 22, Ryder Street, London, S.W.1. (Applicants in response to *advertisement* last month please do not re-apply.)

UNIVERSITY OF AUCKLAND
NEW ZEALAND

CHAIR IN ACCOUNTANCY

Applications are invited for the above-mentioned appointment.

The salary attaching to the position is £2,800 per annum; an allowance is made towards travel and removal expenses.

Further particulars are obtainable from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close, in New Zealand and London, on *October 15, 1962*.

UNIVERSITY COLLEGE OF CAPE COAST
DEPARTMENT OF ARTS

Applications are invited from graduates with good honours degree for the post of

LECTURER IN SOCIOLOGY

Salary scale: £Gf1,030 x £50-£Gf1,400 x £75-£Gf1,850; £Gf1,900 per annum. Non-Ghanaians an additional 20 per cent. Entry at appropriate point. Appointment normally five years in the first instance.

Outfit allowance £Gf60. Car maintenance allowance £Gf150 per annum. Family allowances for non-Ghanaians £150 per annum for each child in West Africa or, if under 21 years of age and being educated outside West Africa £Gf100 per annum. (*Maximum* five children). Part-furnished accommodation at charge not exceeding 7.5 per cent. of salary.

Annual leave with three overseas return passages in every four years for non-Ghanaians and one in every three years for Ghanaians.

Applications to contain giving details of qualifications, etc., and naming three referees, should reach the Assistant Registrar (Overseas), University of Ghana, 15, Gordon Square, London, W.C.1, not later than September 24, 1962.

ECONOMIC AFFAIRS REFERENCE SERVICE

CENTRAL OFFICE OF INFORMATION (ECONOMIC UNIT) requires an information Officer (unestablished) to write reference information papers and provide factual briefing for overseas use on British and international affairs. Desirable qualifications are a university degree in economics or a related subject, research experience and the ability to present factual information concisely and accurately. Familiarity with technological matters would be an asset. Candidates may be asked to produce examples of written work. Salary £1,331-£1,547 p.a. Write, giving age, full details of experience and qualifications, to Manager (PL/1430), Ministry of Labour, Professional and Executive Register, Atlantis House, Farringdon Street, London, E.C.4.

THE UNIVERSITY OF SOUTHAMPTON

Applications are invited for a Research Fellowship tenable in the Department of Economics for work on a project concerned with British overseas investment. Some research experience is essential and a knowledge of European languages would be an advantage. Salary according to age and experience within range £1,000-£1,250 per annum.

Applications, giving brief *curriculum vitae* and the names of two referees, should be sent to the Secretary and Registrar, The University, Southampton, before September 14, 1962.

ROTHMANS FELLOWSHIPS

Rothmans of Pall Mall (Australia) Limited have set up the Rothmans University Endowment Fund to encourage higher education and research for the benefit of the Australian national welfare.

The Trustees have agreed to establish Rothmans Fellowships at Senior and Junior levels to enable Fellows to undertake *post-graduate* work within a University or approved Institution. The SENIOR FELLOWSHIP is of annual value of not more than $4,000 (Australian). The JUNIOR FELLOWSHIP is in two grades, the first of an annual value of from £1,000 to £1,250 (Australian), the second of an annual value of not more than $2,500 (Australian). At the discretion of the Trustees a Fellow may be paid travelling expenses incurred in taking up the Fellowship and returning to his home.

In addition, an amount of £500 (Australian) per annum is available, at the discretion of the Trustees, to the University or institution where the Fellow is working for the payment of fees and expenses including the purchase and maintenance of equipment.

Preference in the award of the Fellowships will be given to those applicants who wish to work in an Australian University or institution and only in exceptional circumstances will an award be made in respect of work to be done elsewhere. Applicants must have had at least one year's post-graduate research experience.

Application forms and further details may be obtained from the Secretary, Rothmans University Endowment Fund, c/o University of Sydney, Sydney, Australia. Applications close on *October 15, 1962*.

H. G. McCREDIE,
Secretary,
Rothmans University Endowment Fund

D.S.I.R.
BUILDING RESEARCH STATION
Garston, Watford, Herts.

ASSISTANT EXPERIMENTAL OFFICERS to join teams working in the field of BUILDING DESIGN AND TOWN PLANNING. The researches are aimed at assessing user satisfaction with various design aspects thus providing the basis for recommendations to designers.

APPLICATION FORMS from Director, above address, quoting B.R.S. 45H.

Closing date September 17, 1962.

MEDIA STATISTICIAN
REQUIRED BY PROGRESSIVE ADVERTISING AGENCY

now increasing Research Staff and Media Research activity. The Agency is of medium size, well-established and has a vacancy for a Statistician age 25-30 with experience of Media Research, with good prospects of increasing responsibility.—Write *age and experience* to Box 1653.

THE UNIVERSITY OF NOTTINGHAM
DEPARTMENT OF INDUSTRIAL ECONOMICS

Applications are invited for a TEMPORARY LECTURESHIP in the above Department, tenable for 2 years from January 1, 1963. Salary within the scale £1,150 to £1,575, plus membership of the Superannuation System for Universities and Children's Allowance. Conditions of appointment and form of application, to be *returned* by Wednesday, September 19, from the Registrar.

THE SOUTH WALES ELECTRICITY BOARD
ASSISTANT STATISTICIAN

Applications are invited for the superannuable position as Assistant Statistician in the Board's Research Group at Head Office, St. Mellons, Cardiff.

The work includes sample surveys, *ad hoc* investigations and the collation of financial and load statistics. The possession of a degree in Statistics or Mathematics would be an advantage.

Salary: NJC grade 7 (£1,298/£1,406 *per annum*).

Applications should be submitted on forms obtainable from the undersigned and returned to him at St. Mellons, Cardiff, not later than September 15, 1962.

Envelopes should be endorsed "Assistant Statistician—126/62."

R. G. Williams, Secretary.

UNIVERSITY OF ADELAIDE
LECTURER IN ECONOMICS

Applications are invited for the above-mentioned appointment.

Salary Scale: £A1,675-100-2,450; with superannuation on the F.S.S.U. basis. The initial salary may be fixed within the appropriate scale in accordance with the successful candidate's qualifications and experience.

Further Information: A potential candidate should also seek from the Registrar of the University or from the Secretary, Association of Universities of the British Commonwealth, Marlborough House, Pall Mall, London, S.W.1, (i) General Conditions of Appointment, which include particulars of tenure, superannuation, removal expenses, invalidity and study leave; (ii) a statement giving further particulars of the post and of the work of the Department of Economics. The University will gladly supply any further information desired on request to the Registrar.

Applications, in duplicate, should give the information listed in the final paragraph of the General Conditions of Appointment, and should reach the Registrar, The University of Adelaide, Adelaide, South Australia, not later than *October 15, 1962*.

QUALIFIED ACCOUNTANTS

QUALIFIED ACCOUNTANTS are required for the financial accounts department of Connaught Food Products Limited, which is one of the Schweppes group of companies.

One man is required for a senior post in the department. He should have had some five years' experience in industry. The second post would suit a younger man, recently qualified. Interviews will be carried out by the Financial Accountant, but please write in the first instance to Personnel Manager, Connaught Food Products, Green Walk, S.E.1.

KING'S COLLEGE, CAMBRIDGE

The Governing Body of King's College will shortly elect to a Fellowship associated with the names of the late Arthur Berry and Frank Ramsey, former Fellows of the College. Candidates must be male members of any University in the British Isles under twenty-eight years of age at Michaelmas 1962 (but any stonal training may be taken into account), lowing group of subjects: Mathematics, Philosophy (including the Philosophy of Religion), Economic Theory.

For further particulars see the "University Reporter," Cambridge, or the "Oxford University Gazette" *first number* of the Michaelmas Term. Or apply by letter to the Bursars' Clerk, King's College, Cambridge.

BRITISH RAILWAYS (EASTERN REGION) require several QUALIFIED ACCOUNTANTS, preferably aged between 25 and 30 years and having some commercial experience in a large organisation employing advanced accounting methods. Candidates, who should have administrative ability and a keen interest in the development of management accountancy, must be *prepared to work* in London or elsewhere in the Eastern Region. Successful applicants will spend an initial period assisting with the introduction of new systems and will have excellent prospects for advancement. Commencing salaries about £1,230 per annum. These are permanent positions with certain free and reduced rate rail travel facilities; there is a contributory Superannuation Scheme. Applications, in confidence, giving full details of age, qualifications and experience should be sent to: Chief Accountant, British Railways (Eastern Region), 21a, John Street, London, W.C.1.

EDUCATION: BUSINESS AND PERSONAL

tions which he so much dislikes are the basis of the new international money market, and give the Euro-dollar market "a long term potential." Moreover, Sir George says:

> It is probable that the supremacy of the official New York and London money markets has now passed and is unlikely to return, unless these two markets were to absorb the newly created international money market.

That, he adds, would be neither easy nor necessarily desirable; he sees this market as providing potential financial resources for Britain that "the sterling system cannot itself generate," and here again one must agree. The Euro-dollar has encouraged a remarkable extension of private financing of international trade, and it has had welcome effects in loosening the hold of local banking monopolies and cartel arrangements. If it complicates the problems of monetary control, national and international, the right solution is not to suppress it but (and here *pace* Sir George) to develop such new official techniques as may be necessary to deal with any adverse side effects of the generally welcome Euro-dollar.

TIN

Quite a Shock

No agreement was reached last week between officials responsible for the United States' stockpile of tin and the representatives of the International Tin Council. The United States had invited the ITC's views on its scheme for getting rid of part of this self-imposed burden, but while the ITC (for a change) was firmly united for this occasion, the United States showed who was master in tin by largely ignoring the ITC's recommendations. The ITC sought to ensure that American releases did not exceed its own estimate of the likely shortfall in tin production and that the United States should work within the new price ranges in the stabilisation scheme.

But there was little chance of complete agreement about "the specific rate and conditions of disposal." The ITC's proposals could have hobbled the United States's plan to peddle out a steady supply of tin from the stockpile, and the United States seems hostile to the price limits in the international agreement. The United States is therefore pursuing its original plan of disposing of a maximum of 300 tons of tin a week for a trial period of six months. As these sales are expected to begin before the end of August, the announcement of a detailed programme for disposals will probably be made before the ITC next meets in the middle of the month.

The maximum rate of disposals is likely to be somewhat less than 300 tons a week and could be softened by disposal through other government agencies, but fairly prompt delivery and acceptable quality should attract reasonable bids for all the tin tendered, partly at the expense of purchases in Malaya and elsewhere. Action is promised if the impact on the market becomes "too severe," though there is no definition of this distressing condition. The tin market registered concern at the United States' bluff treatment of the ITC delegation by dropping the price to £825 a ton, though the ITC's buffer stock manager pushed the price back above his buying limit of £850 a ton without great resistance. The United States is willing to consult at any time with the ITC or "substantially interested" governments. After last week's rebuff, this sounds like a sergeant major asking that any complaints should be addressed to him. The ITC got a better response from Russia in the crisis of 1958.

COMMONWEALTH DEVELOPMENT

A Merger Required

Belatedly, the Government has agreed to keep the Colonial Development Corporation in effective existence. Mr Duncan Sandys announced in the House of Commons on Tuesday that the existing bar on the corporation undertaking new projects in countries that have become independent is to be removed. When the necessary legislation is passed, CDC will again be able to operate freely in all Commonwealth countries that achieved independence after India, Pakistan and Ceylon. At the same time, the corporation's name will be changed to the Commonwealth Development Corporation. As such it is bound to be confused even more widely than it already is with the Commonwealth Development Finance Company—and there is in fact quite a good case for merging the two. Although the CDC is financed almost entirely by the Exchequer while CDFC is financed by Commonwealth central banks and City institutions, the two organisations have for some time been moving closer together in their operations. CDC has deliberately reformed itself to operate on commercial lines, it often works with private capital on a joint basis and it is now in a better position to borrow funds from the market—which could soon be necessary if its extended sphere of operations brings forth a rush of applications. Meanwhile CDFC languishes with impressive backers and good management but a dearth of projects. The two organisations do not lack a mutual respect for each other; a genuine merger into a strong new organisation would be a sensible, and not expensive, contribution to a more effective aid effort.

DIVIDEND REMITTANCES

Local Difficulties

The desperate need of under-developed countries for foreign exchange has tempted several of them to interfere with dividend remittances. Ghana announced in March that foreign companies operating there would have to invest 60 per cent of their net profits after tax in that country. This proposal has not yet been enacted, but officials treated profits earned by Konongo Gold Mines in the year to September 30, 1961, in this way.

Konongo has been forced to pay the final dividend for that year, recommended in February, out of funds previously accumulated in London. But Ashanti, the only other foreign-owned gold mine now operating in Ghana (five others were nationalised last year) has announced an effective increase in its interim dividend for the year to September 30, 1962, and has received money from the Bank of Ghana to pay it. An offer by Ghanaian officials to release part of the funds necessary to pay Konongo's final dividend was accompanied by further conditions which the company found unacceptable, and this presumably accounts for the perplexing difference in the treatment of the two companies. The only encouraging aspect of this clamp down on dividends is that a Ghanaian official has said that the restriction of remittances is not intended to be permanent.

More trouble for tea companies in Ceylon, where taxes already account for three quarters of profits, was contained in last week's Budget. The finance minister is to see Mr Maudling about reducing the level of dividend remittances from Ceylon. A year ago, Mr Lloyd in effect exhorted British companies to do precisely the reverse to aid Britain's balance of payments. At the beginning of last month Carolina Tea passed a dividend on its preference capital because it could not obtain the remittance of funds from Ceylon, and in retrospect that difficulty now seems to have been a harbinger of general restrictions.

Some of the money held back by Ceylon will indirectly help to finance the extension of Ceylon's state-owned plantations. In the same breath as his announcement of the likely curtailment of dividend remittances, Ceylon's finance minister repeated the well-worn assurance that foreign estates would not be nationalised. That promise was little help to Ceylon tea shares, which reacted sharply following their recent slight recovery on improved profits.

PROFIT SHARING

ICI Cuts Its Coat

Since 1954 Imperial Chemical Industries has run a generous profit-sharing scheme, payable in ICI ordinary stock to employees with more than twelve months' service. For 1961 the bonus amounted to nearly £9 million before tax for over 91,000 employees and after tax it will result in the distribution of £2,361,000 nominal of ordinary stock. ICI has now adjusted the scheme for bonuses for 1962 and afterwards. If the new rules had been applied to the 1961 bonus they would have

CONSIDER JAPAN—2 PAGES 907 TO 936

Economist . 22 Ryder Street . St. James's . London . SW1

Guide to contents : see over

It carries ox-carts and ores, food and freight cars, trucks and trade. It spans rivers and gorges . . . even centuries. It brings people together, their aspirations closer.

Bridges must be strong, for they carry the hopes of nations. Bridges must be durable, for they must link today's plans with the realities of tomorrow. Yet, bridges must be light enough not to weigh heavily on the meagre resources of emerging nations.

Fuji Iron & Steel Company makes beams, wire rods, and plates for bridges. In fiscal 1961* Fuji made 1.5 million tons of them. But this still isn't enough. In the next five years, Japan and the other democratic nations of Asia will need over 3,000 bridges using tremendous amounts of steel. They will need countless tons of plates and shapes and other steel construction materials. These needs are urgent; and providing for these needs is a big job.

Fuji Iron & Steel Company, one of the world's largest iron and steel producers, is ready for the job. Its furnaces and mills in fiscal 1961* turned out 4.5 million tons of pig iron, 5 million tons of steel ingots, and some 4 million tons of steel products. In the next ten years production will be more than doubled by the addition of new blast furnaces, LD converters, rolling mills, and coating lines . . . a giant step to catch up with the fast-growing demand.

Bridges bring progress, and where progress requires steel, Fuji Iron & Steel Company spans the world with better products.

PRODUCTS: bars, shapes, sheet pilings, wire rods, rails, hoops, plates, hot rolled sheets and coils, cold rolled sheets and coils, galvanised sheets, zinkotes, tin plates, sectional poles, culvert pipes, light gauge shapes and chemical by-products.

*Fiscal year is from April 1 to March 31 of the following year.

INTERNATIONAL

BRITAIN FREE?

The Commonwealth is a child of change. Can it, looking to Britain and Europe, show the same capacity to adapt itself to a changing world that has marked its record hitherto? Or must Britain assert its own right to act independently? (p. 865).

The British Government is not yet independent of colonial responsibilities, as much as it would like to be. Its field of possible action in **Rhodesia** is particularly restricted (p. 868).

KNCW YOUR EUROPE

It would be merely insular to view this week's visit to **Germany** by **President de Gaulle** as an anti-British get-together (p. 866).

A residue of old **German** distrust of **French** intentions could be felt behind the parade of Adenauer-de Gaulle amity this week (p. 893).

Free to copy anyone's ideas, **Italy's drug manufacturers** have made their fortunes. Now they must bow to common market pressure and the country's first patent law for drugs (p. 950).

The West should discourage, not take part in, nose-thumbing across **the Berlin barrier** (p. 873).

KNCW YOUR COMMONWEALTH

Australia : Following a series of political ups and downs, Australians—and Mr Menzies—are now soberer about Britain's application for entry to the European common market. They may no longer seek to lay down the law to Whitehall (p. 891).

Canada : The double shock of almost losing an election and facing an exchange crisis the day after the results were known has had a damping effect on Mr Diefenbaker (p. 891).

Tanganyika : Mr Nyerere is still doing his energetic best to build a country out of the backward territory he inherited from Britain last December (p. 892).

Ghana : Dr Nkrumah is determined to keep what he inherited (p. 874).

Nyasaland : Mr D. K. Chisiza will be hard to replace (p. 877).

Malaysia : The way now looks clear for the creation of a "greater Malaysia" by the agreed deadline of August 31st next year (p. 878).

Know Your Tshombe : Under arm-twisting, the Katanga leader has capitulated. His arm must not be let free (p. 874).

AMERICA YOU KNOW

The outcome of this **November's elections** in the United States is unusually uncertain (p. 901). The campaign in Massachusetts is a family affair (p. 906).

The **mutual fund industry** has reacted wildly and unwisely to well-substantiated charges that these funds are not living up to their name (p. 903).

A pattern for dealing with **labour difficulties** arising from automation on the railways may result from the telegraphists' strike in Chicago (p. 902).

Satellites and **cows** have both been affected by recent nuclear tests (p. 903).

Steelmen seem to be looking for trouble (p. 904).

At last the end of the poll tax is in sight (p. 904).

NO, THEIR CUBA:

Cuba does not belong to the Russians yet (p. 871).

CONSIDER JAPAN—2

For underdeveloped countries, there is much that is worth knowing about the new Japan. The second of two reports on Japan from our special correspondent appears on pages 907 to 936. It suggests the specific lessons that Japan can offer to backward countries.

HOME

HIGH, HIGH, HIGH

We've high hopes for the world financial meetings in Washington, Mr Maudling, so please get together with the Americans to shake out and share out international reserves, spread the idea of mutual holdings of currencies, and grasp the nettle of guarantees for them (p. 941).

Up go **nurses' wages** by a flat 7½ per cent, but not the industrial court's reputation (p. 874).

Building high has become a matter of pride in **Sheffield**; and the sociable street survives, too, in a new form (p. 937).

Silver is past its 1920 peak price and some coins are getting nearer the melting pot (p. 947).

A clearing house for the end-products of higher education may be on the way, but the **universities' appointments boards** will still have a big job to do (p. 877).

The Ministry of Education is hatching some useful reforms in **selective schooling** which will benefit the top of the class, and those lower down as well (p. 881).

GO, GO, GO

The Trades Union Congress has admitted, without exactly bestirring itself to answer, the major issues that confront it—its own reform, its part in economic planning, and the entry into Europe. Effective action now depends on the estimable Mr George Woodcock and his HQ team, but his own performance at Blackpool has not blazed the trail of reform (p. 869).

The **Liberal party** executive gives a realistic twist to the Llandudno agenda, but a party working group's ideas on industry look both amateurish and undesirable (p. 873).

The proposed Anglo-French **supersonic airliner** is the wrong choice for the future. It leads nowhere; faster speeds will require new aerodynamic ideas, and, above all, new metals (p. 943).

Sir Isaac Wolfson has bought a bank for the family trust—it should add glitter and profit to his interests (p. 950).

Old idea in a new shape : **heating bricks** is the electricity industry's latest idea for spreading its load (p. 950).

LOW, LOW, LOW

Retail trade stayed put in July and the rise in **hire purchase debt** was pretty small. Can the Treasury still count on the forecast rise of 4 per cent in consumers' real expenditure without some new stimulus? (p. 945).

By deciding to deport **Dr Soblen** (even if he still has other ideas) both the Government and the judges have chosen to bury the present law of extradition (p. 872).

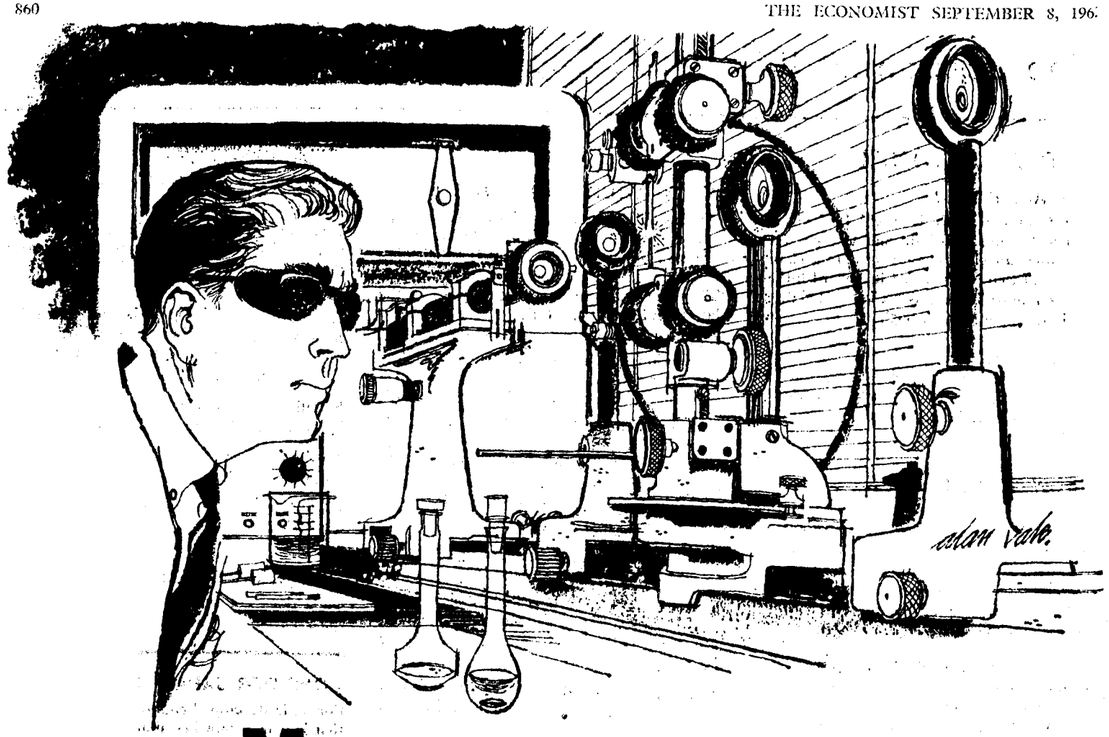
Should Shakespeare's reputed bones be disturbed? More than a Stratford spectre could be upset (p. 881).

What drives **newspapers** into the grave : Manchester offers an acute pre-Shawcross assessment (p. 877).

Glasgow has consigned the last of the big-city **tramways** to the scrapyard (p. 938).

Halifax Building Society has lowered its **mortgage rates**; the pressure will now be on other societies to do the same (p. 944).

Detailed contents on page 865



More research

Research—the exploring arm of industry—creates new demands and develops new applications for materials. Inco-Mond research anticipates demands for metals and uncovers new uses for nickel which confers unique qualities on alloys.
More research creates more demands for nickel. Inco-Mond meets the challenge with its new annual production capacity in excess of 400 million lb. of nickel and the metal will be available in ever increasing quantities in future years.
Behind this certainty of ample supply are the outstanding technical and market development services freely provided by Inco-Mond to industry throughout the world.

Surrounded by members of his Cabinet, Churchill addresses V.E. Day crowd in Whitehall

LORD CHANDOS
ON HIS GREAT CONTEMPORARIES

In the course of a scintillating career (from Oliver Lyttelton, businessman, he became a key member of the War Cabinet, President of the Board of Trade, Minister of Production, Secretary of State for the Colonies), Lord Chandos has met, mixed and worked with some of the biggest names in British politics.
During the next few weeks, the Sunday Telegraph will be printing extracts from his newly-written memoirs, including some remarkably illuminating and witty chapters on Sir Winston Churchill, Lord Attlee and Ernest Bevin. This quite unique series begins with a special article on Lord Chandos himself, in this week's Sunday Telegraph.

COMING SOON. Other features to be published during the next two months include "Renoir, my father" by Jean Renoir, and "To Katanga and back" by Conor Cruise O'Brien.

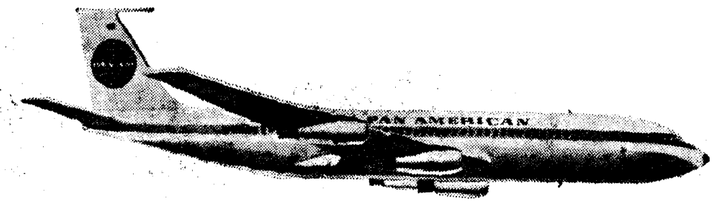
EXPORTERS! IMPORTERS!



Speed your U.S. cargo on any of 228 weekly Pan Am flights!

Never before such frequency, such convenience as you have right now on Pan Am!

ALL THIS SUMMER ON PAN AM: more transatlantic Jets than the next 2 airlines combined! 94 jet flights weekly . . . plus 12 weekly 18-ton-capacity all-cargo flights, plus 8 piston flights. You have 114 opportunities to reach your United States markets every week—114 more to bring in imports.

No matter what you're shipping or importing, your shipment gets extra care on the World's Most Experienced Airline. Pan Am knows much more about cargo handling, because Pan American carries *more cargo* than any other international airline.

Air shipments are lower now too! Up to 63% lower than last year. You also save in other ways. Delivery *in hours* means more sales, smaller inventories, less "tie-up" of your capital. Insurance rates for air shipment are much lower than surface shipment rates. Less packing and crating, too.

Ship by air—ship Pan Am . . . and if you're importing, specify shipment by Pan Am! It's never been easier, or more convenient! For details, call your Cargo Agent, Freight Forwarder, or local Pan Am office. Ask, too, about Pan Am's exclusive World-Wide Marketing Service that can help you get new business in 114 major markets 'round the world.

Clearly, no one in his senses would use chewing gum at a time and place such as this.

However there are times and places where the use of chewing gum can be most beneficial; in fact its discreet use is a mark of tact and consideration for others as it is a definite aid to oral hygiene.

Doublemint chewing gum is especially made for such people. Its ingredients are carefully selected throughout, even its flavour has been double distilled; in fact, as its name implies, Doublemint is double good and gives you double benefits in many ways.

Try some at the right time and in the right place and see for yourself.

E399:2

in a changing world

Imagine carrying the early wireless set round the golf course. Quite a handicap. Compare today's transistor radio.
Why *transistor* radio? Transistors do the work of valves. Not only are they a fraction of the size—they use far less current, so that batteries and other components can be miniaturised. A big step forward from early 'portables'.
Mullard developments in the design and manufacture of transistors helped to put the radio set in our pockets. Today Mullard produce transistors by the million—high performance, precision made devices for an enormous variety of applications. Could you benefit from our transistor know-how?

Mullard products in transistor radio sets include:
TRANSISTORS • GERMANIUM DIODES

Facing the Commonwealth

NO parallel can be found in world history for the phenomenon represented by the conference of Commonwealth heads of government that opens on Monday. In essence, a group of former colonies is complaining of the former ruling power's exercise of the same full freedom of decision that they themselves have won from it. The fact that this is such a strongly "anti-colonial" period of history makes it all the more remarkable to see ex-colonies protesting that the ex-imperial power ought not to weaken the bonds between them that have survived the end of empire.

Without denying the reality of the problems and pains that the conference must face, one may yet point out that it is an instructive spectacle—instructive for all the countries concerned. Whatever impact the British effort to enter the European common market has on the Commonwealth, it ought to put paid to some of the illusory beliefs about the Commonwealth that do it nothing but harm. There are still lingering traces of the old British assumption that other member countries should always follow Mother's lead like dutiful daughters. This notion, however, has never regained the hold it lost during the Suez conflict of 1956. In recent years the same kind of one-way concept—turned round to face the other way—has emerged more clearly in other Commonwealth countries, in the shape of an assumption that, while they should be able to plot their own courses in complete freedom, Britain ought to remain bound. From time to time this belief has led Asian and African member nations to give warning that they might quit the Commonwealth if Britain persisted in some policy that angered or embarrassed them. The idea that Mother might go off on her own never came to mind.

The British could not very well answer such claims as long as they themselves clung to the mother-daughter concept. There is no doubt that this concept has served a valuable psychological purpose. It provided a shock-absorber that eased the transitional pains of disimperialism. But the time has surely arrived when Britain not only can afford to cast aside this psychological prop, but indeed must cast it aside. Constitutionally, the Commonwealth nations have long been not mother and daughters, but a sovereign sisterhood. The reality of this relationship has now to be accepted both because it is a reality, and because Britain cannot otherwise assert the claim to full national independence that the other member countries make.

However the haggling works out, it would be absurd to pretend that British entry into the common market will leave the Commonwealth unchanged. But it would be equally absurd to argue that change must, or can, be avoided. The Commonwealth is a child of change. Beneath the surface continuity that yields so much balm to uneasy minds, yet tends to confuse all minds alike, change—dynamic and decisive change—is its essential characteristic. Only because it has shown itself so capable of adapting its form and substance to a fast changing world has it survived and evolved so astonishingly.

Little more than a generation ago, even the old "white" dominions had not achieved complete institutional self-sufficiency. Since then, the Commonwealth membership has evolved from a small, intimate group to the formidable numbers that will crowd the new council chamber at Marlborough House on Monday. The original "white" membership has become a minority element in a multi-racial one. Four republics, and one separate monarchy (Malaya), have been

dovetailed into the system that formerly knew only one crown. The emergence of a military regime in Pakistan, of a virtual one-party system in Ghana and Tanganyika, has been accommodated. The right of member states to join other associations of their own choosing has been firmly established by usage, and, by the same pragmatic method, has proved to be no bar to continued Commonwealth membership.

Through all these changes, two things have stood out with growing clarity. First, no nation belongs to the Commonwealth except by its own wish. The exit door is always open. Membership is a privilege that has to be granted by the body of other members, not an obligation imposed by Britain on its former dependencies. Secondly, the basic bond is one of practical interest, not sentiment. (A distinction is needed here, between the general historic sentiment in which all Commonwealth countries have at least some share, and the close personal ties of blood that link people of British stock. Blood is thicker than sentiment.)

It is oversimplifying to indentify the practical interest of Commonwealth membership with the system of trade preferences instituted at Ottawa in 1932. In fact these preferences, although usually called Commonwealth preferences, have for years been enjoyed by countries outside the political Commonwealth such as Burma and Ireland, and most African members of the Commonwealth give no preferences at all. The sterling area, which excludes Canada but includes a miscellany of "casuals" ranging from Iceland to Libya, corresponds even less accurately with the political Commonwealth. The Colombo Plan, initiated in 1950 as a framework through which the richer Commonwealth countries would help the Asian ones to help themselves, has already been enlarged to bring in non-Commonwealth countries both as beneficiaries and as contributors. Thus it is amply clear that a country can enjoy the benefits of these various systems without belonging to the political Commonwealth at all.

THE practical advantage that is really to be identified with membership of the political Commonwealth lies mainly in the realm of consultation—both political and economic. This is not a measurable matter: its value can be assessed only by the evidence—impressive evidence—that the member countries prize it highly. And the special value of Commonwealth consultation is that it bridges the gulfs that tend to yawn ever wider between the world's rich white north and its poor brown and black south; between countries allied to America and preoccupied with the perils of a divided Europe, and countries only lately freed from European rule and still in recoil from the west.

The Commonwealth countries have been described, in these columns and elsewhere, as a bunch of keys. Each member nation has its own links with neighbours and like-minded friends; and between them they can open doors into most of the world's regions. Europe is not the least important of those regions; and, even if a stiff price has to be paid for British entry into the common market, that entry will still serve the whole Commonwealth's long-term interest better than would the cutting off of these islands from the continent off whose shores they lie.

It is not only a matter of the need to strengthen Britain's economy so that it can improve on its present very limited ability to meet the Asian and African Commonwealth states' growing needs of capital, technical aid, and export markets, although that is in itself important. What the British entry into the common market ought in the long run to offer the Commonwealth is a firm link with the new Europe that is now being shaped. The vision of this great adventure—for that is what it is—is only too easily lost from sight among the wrangling about immediate and particular interests. But the question that leaders of opinion in Commonwealth countries should really be asking themselves is: do we want a key to the European door, or do we not? If the answer were to prove a negative one, that would—tragically—suggest that the Commonwealth has exhausted its vein of dexterous adaptability to change in the world. Mother would then be well advised to do something shocking: switch off her deaf-aid and go on regardless with the course of action that is necessary.

Will They Have Us?

Is the last obstacle to our European outlook the Commonwealth, or the two old gentlemen of Europe who have been meeting this week?

FROM the homely and animated Commonwealth debate in London, it is a far cry to the Wagnerian reception that west Germany is giving President de Gaulle, as the two grand old men of Europe celebrate the Continental union they have built without the British. Not for the first time Britain's agonising effort to come to terms with Europe seems to be matched, not by a helping hand from across the Channel, but by a demonstration that Europe is getting on quite happily without it. This is not the happiest spectacle for a Conservative government which has staked its future on the European throw, and which now has the task of persuading the Commonwealth to agree. The familiar question echoes again—whether, whatever the British think about the European Community, the other members want them in.

It would be merely insular to see this week's visit to Germany by President de Gaulle as an anti-British get-together. The speeches and the ceremonial have a positive purpose, to deepen the Franco-German partnership which remains the indispensable foundation of the common market and of western Europe's resurgent position in the world. That partnership generally seems less real when one talks to the man in the Hamburg or Marseilles street than it does in Paris or Bonn. But the common market is already creating the powerful common economic interests and the habits of working together which can give Franco-German union lasting strength. Speeches and parades help to ice the cake and give more Frenchmen and more Germans a taste for it. The purpose—to bury the old and world-splitting conflict between two great peoples and create a new spirit of friendship—is noble, and Dr Adenauer, in particular, deserves praise for his long devotion to it.

What is worrying about the vision is not the danger that it may turn against the British, but the fact that it sometimes seems to contain no place for them, or indeed for a good many other Europeans. Is European unity to remain confined to Charlemagne's country, or is it to be enlarged to include

Britain and its European friends whose presence will naturally place Europe in its traditional world setting? In his letter to Mr Macmillan on August 3rd and his television broadcast on August 28th Dr Adenauer's feelings were made disconcertingly clear. He seems to have relinquished his scepticism about, or opposition to, British membership of the common market only to retreat a pace or two and start resisting British membership of the European political union which he hopes will develop inside it. The old Chancellor knows his time is short and wants to complete his life's work soon. He seems more suspicious than ever of the British. Their attitude to the communists strikes him as unreliable; they threaten to lumber into the delicately balanced European construction, knocking it out of shape, just when the Chancellor is about to lower the political roof into place.

FORTUNATELY the response to Dr Adenauer's television gaffe provided healthy confirmation of the fact that German opinion is almost unanimously against him. The west German press has attacked him, emphasising the dangers of playing into the hands of the anti-common marketeers in Britain. "We should make the way easier" for the British, Herr Schröder, the west German foreign minister, emphasised in a press interview, aimed plainly at the Chancellor, and has gone unrebuked. Many thinking Germans who support Dr Adenauer in his reconciliation with France believe that the logical next step is an equally warm relationship with Britain. As they watch France grapple with its Algerian inheritance, and remember their own past, they see that Britain's political stability will be an invaluable addition to the community.

Dr Adenauer's television performance has, if anything, weakened him and made it more difficult for him to suggest any further definite Franco-German moves without the British. When he visited President de Gaulle in Paris in July and the two men agreed to press ahead with the talks on political union before Britain's common market negotiations were over the hump, German opinion acquiesced cheerily and the British were told not to worry. German opinion is more watchful, and more suspicious of Dr Adenauer's intentions, today. This is not to say that there will be no further moves by the Six on political union this autumn. Some of those in Bonn who are most eager for a change at the helm feel that the more quickly Dr Adenauer can be given his last wish—a dose of political union—the more quickly he can be got out of the way and a start made on getting a little more sense into west German government. But men like Herr Schröder are determined that moves of this kind shall be made in close consultation with the British and with the clear intention that the British shall join in fully as soon as they can. The same climate of opinion rules in Rome.

The question remains whether President de Gaulle still hopes to make use of Dr Adenauer's current bout of Anglophobia to keep the British out in the cold, if not outside the common market, at least outside the inner political sanctum. We may as well face it that some Frenchmen think like this. When the talks among the Six broke down formally last April the French wanted to go ahead without the British, and the Dutch and Belgians would not let them. But since that breakdown the French, who do not like to be isolated, have been letting other people make the running in trying to start the talks up again. Paris has shown signs of a growing acquiescence both in British membership of the common market sooner or later, and in the fact that it may not be possible to shape the European political edifice until the British are in and the new shape of western Europe becomes clearer. General de Gaulle is rarely the man to hurry. If the French obviously have no intention of hastening or smoothing Britain's entry to the common market, they also seem to have subdued the urge to hasten the construction of a political union without them.

The reason may be merely practical. Since the talks collapsed in April, the differences between the Benelux countries and the French have never been completely bridged. After his tiff with Mr Gaitskell in July M. Spaak did appear to waver in his determination to wait for Britain and inclined, much to Dr Adenauer's delight, to press for a resumption of the political discussions amongst the Six. But M. Spaak's attempt in August to get the talks going again on a revised basis ran into old differences about the form the political structure is to take. M. Spaak wants to pool the power to make foreign policy decisions in a manner that would not square with President de Gaulle's conception of a "Europe of states."

The odds are that discussions among the Six on political union will be resumed this autumn, but without haste. The suggested summit meeting of heads of government in September has been dropped. If the British handle the question wisely, it will not be difficult for them to be brought gradually into the discussions, so that they can slip easily into the union as members when they enter the common market.

BY the time the political talks get going the outcome of Britain's common market negotiations should be clear. Looking back in tranquillity at the emotions and excitements of last July it still looks remarkable how much of the vast problem of Commonwealth trade has been covered and how near agreement is. There are some hard bits still to come, better defined than they were before the midnight struggles of early August. Mainly they involve either straightforward haggling (like the remaining unsettled tariffs, on aluminium and so on) or simple battles about wording, with the British trying to give more precision to expressions of good intentions by the Six. The French will continue to bargain hard; new snags will make their appearance. But with so much ground covered, and so much achieved for Commonwealth interests, a breakdown now would be unpardonable.

When all is said, the chief danger remains that the Commonwealth, acting as a catalyst on British opinion, might force the Government to send Mr Heath back to Brussels asking for more than he can conceivably hope to get. Commonwealth prime ministers can expect a balanced deal, with each side giving something up, and the elements of such a deal will in fact be on their tables next week. They cannot expect to get everything their way. Britain is half-way into Europe by now; the remaining European opponents of British entry are outnumbered and lack the power to shut the door. Probably only the Commonwealth and the British public, by jumping the wrong way now—and by sapping the nerve and the will of the British Government—could provide them with the means.

Uhuru for Britain

Southern Rhodesian Africans may use some African and Asian prime ministers as their spokesmen at the Commonwealth conference next week. Britain should send back a reply by the same channels

NEXT week the British Government will have more than just the Commonwealth and Europe to worry about: there will also be Rhodesia. When the Commonwealth prime ministers settle down to confer at Marlborough House on Monday, they will be expected to focus on the effects on Commonwealth countries of Britain's application for membership of the European common market. But Sir Roy Welensky will be there with the rest of them, and he will not seem himself if he confines his remarks to the subject of Rhodesian trade with Britain and with Europe. The African and Asian prime ministers will certainly not seem themselves if they forbear to say anything at all about Rhodesia, either privately to one another (and to Mr Macmillan), or publicly to the newspapers and television cameras.

Some of them may feel tempted to call for the exclusion of Sir Roy from the conference on the grounds that he is not head of a sovereign state. Such an argument would lose itself in complexities, however, since the prime ministers of British Guiana, Malta, Singapore and Uganda, the finance minister of Kenya, and an official from Hong Kong will all be present—although none of these countries is yet independent. These representatives will have the status of advisers to the Colonial Office, but they will be able to speak on matters directly affecting their interests. Sir Roy's status is that of associate, allowed to sit in on all discussions except those about constitutional affairs. The presence of a white political leader from Rhodesia has been accepted at Commonwealth prime ministers' conferences since Sir Godfrey Huggins (now Lord Malvern) started coming a quarter of a century ago: it would hardly be possible to make a serious (and successful) challenge now.

But, with South Africa out of the Commonwealth since the last meeting, Rhodesia is now the main target within the Commonwealth of governments that oppose white rule over black men. Last time, a threat from Tanganyika (then a colony) to withdraw from the Commonwealth if South Africa stayed in proved effective. This time, an independent Tanganyika will be represented by a new prime minister, Mr Kawawa, deeply conscious of his ties to his fellow African nationalists. Tanganyika is across the border from the federation of Rhodesia and Nyasaland; Dar-es-Salaam, Tanganyika's capital, is the capital of African nationalist pressure against white rule within the federation. This pressure is sure to be felt in London next week. What kind of report will the British Government be able to make?

Mr Butler, as minister responsible for Central Africa, will be able to say that repeated British assurances (there are many of those to be quoted next week) establish that the future arrangements within the Rhodesian federation depend upon the consent of its inhabitants. Mr Butler's special envoys left London on Tuesday for a second tour of the federation to find out what will be consented to and what will not. They should be able to report next month. It is more than likely that they will tell Mr Butler that the federal government, as a centre of white authority, cannot continue in existence for much longer, since the necessary consent is not to be had.

At the end of October Northern Rhodesia will hold elections, and there is every chance that these will put an end to white control over the government of that territory. All the contesting parties, excepting Sir Roy's United Federal Party, are for the break-up of the federation: Mr Butler will be in no doubt after October what the northern Rhodesian majority wants. Nyasaland, now only nominally in the federation, has virtually been disposed of already; it is an African state, run with increasing sureness by an African government. A conference on its future, to be held in London in mid-November, may set it on the road to independence.

So far, the British Government ought to be able to get sympathetic nods from most of the African and Asian prime ministers, most of whom are reasonable men. It is when it comes to Southern Rhodesia that the difficulty arises. Either Britain is directly responsible for Southern Rhodesia, or it is not: the British Government has to make its mind up. The Africans and Asians (supported by the United Nations and the political left wing in Britain) have all pointed out that, on paper, Britain has the power to put Africans in control in Southern Rhodesia. The British Government's reply is still that Southern Rhodesia's government have been allowed to do as they please since 1923 and that nothing can now be done to change this.

Yet Britain is still held responsible, as next week will show. If the British Government succumbed to the temptation, which at times must be strong, to cast off Southern Rhodesia by granting it, as it is, immediate independence, there would be an outcry against handing over the colony's three million Africans to the (permanent?) control of its 210,000 whites. Yet, except on paper, that is the position already. The only way out of this trap, short of an unthinkable clash of force with the white Rhodesians, is the slow and painful one of putting whatever pressure is available on Sir Edgar Whitehead's Southern Rhodesian government.

For instance, Sir Edgar needs money. In the circumstances, ought it always to be given without extracting a political price? On August 23rd the British Government lent Southern Rhodesia £3½ million, which Sir Edgar will spend on roads, rural development, 4,000 African houses, and quarters for 500 African policemen. On the face of it, this money will be well spent, but it would have been still better spent if Britain had tied to it a strong hint that Sir Edgar's newest repressive legislation is unwelcome. If violence is to be avoided in Southern Rhodesia, Sir Edgar must be persuaded (and not too softly) to open up a short road to political power for his country's Africans. New houses, and desegregation in every aspect of Rhodesian life except voting, will not be enough.

If it is replied that, once in power, Africans will prove to be irresponsible, or dictatorial, then it must be admitted that this may be true. But the longer and the harder their struggle for power the worse they will be when they do get in: the urgent need is to get black men into positions of responsibility in Southern Rhodesia now. The British Government will be expected to carry the can if black frustrations and white stubbornness meet head-on and bloodily in Southern Rhodesia: it ought to do its best to avoid such an eventuality.

Apart from pressing Sir Edgar, the British Government might talk back to Southern Rhodesia's Africans through their own channels. It could be pointed out to the African and Asian prime ministers next week that Southern Rhodesian Africans are in a different situation from any that has been faced by any of the prime ministers at Marlborough House. All the colonial struggles in British territories to date have been directed towards getting Britain to withdraw, and Britain has not generally been reluctant. Southern Rhodesia is different; the struggle there is an internal one, and the black men cannot rely on Britain wresting power from their white rulers and handing it over to them. Neither is the United Nations in a position to do this. Southern Rhodesia's black men will have to do the job themselves. The only parallel is South Africa: the difference between the Republic and Southern Rhodesia is that white Southern Rhodesians are susceptible to constitutional and extra-constitutional black pressures.

If this message were successfully put across (in private conversation) next week, it might filter back, via Dar-es-Salaam and the other places, to Mr Joshua Nkomo's African nationalist party in Southern Rhodesia. (Mr Nkomo hastily flew from Salisbury to Dar-es-Salaam on Wednesday to catch the Tanganyika prime minister before his flight to London.) They might then appreciate that it is up to them to fight Sir Edgar Whitehead and his party in the courts and in the country's own peculiar version of a parliament, and not just by strikes and boycotts. No outside power can turn the black-white tables for Mr Nkomo: the British Government must try to convince him of that. By this slow process—of direct pressure on Sir Edgar and indirect talking to Mr Nkomo—Britain may move towards *uhuru* (or freedom) from its central African problem, a problem that is almost as intractable as its European one.

Blackpool Opera Mouse

Our special correspondent reports from the Trades Union Congress

ALMOST anything not actually dead can give an impression of youthful virility at Blackpool, that monstrous monument to bygone holidays. But the Trades Union Congress, labouring away in the mountainous opera house this week, failed to persuade your listening correspondent that it was about to give birth to anything very impressive. Three inter-connected debates on three successive days could have permitted the congress to discuss its capital problems. Is the present structure of 182 unions affiliated to Congress the most suitable for the modern world? What should be the bargaining objectives of the affiliated unions? Should the unions co-operate with the Government in really planning the economy—and real planning must include wages? With the television cameras beadily watching the whole proceedings, and with an unequalled horde of journalists aching for a nice story, the TUC—despite some of the nice headlines it has received—chose in effect to stuff its skeletons publicly back into the cupboard.

Mr George Woodcock himself set the tone on Monday. A motion from the Union of Post Office Workers called for a revision of the structure of the TUC and of the whole British trade union movement to fit it for modern industrial conditions. Mr Ron Smith presented it in the most moderate of terms, acknowledging that the idea is hedged about with emotional taboos, but urging nevertheless that the general council should prepare a report for next year's Congress that would set the wheels of reform turning. After his speech (which was really rather a good one), his supporters promptly dragged the debate down to the level of a footling and irrelevant squabble about the European common market—from which one had a right to expect that Mr Woodcock, replying on behalf of the general council, would raise it.

Unfortunately, the general secretary, although he declared that this could be the beginning of a "tremendous undertaking," chose to embark on a lengthy quibble. ("Structure is a function of purpose" was how it began.) He said that any report would take a good two years to prepare, and he forecast that the second year would be taken up largely by private negotiations with the many unions whose vested interests could be affected by any reform. That such negotiations would need to be painful to many is of course true—so true that it scarcely needed saying. But that the general secretary decided to lay his main emphasis on this and not on the need for reform seemed defeatist and sad. This gloomy first impression may be an underestimate of what Mr Woodcock will achieve; let us devoutly hope so. But his estimate that trade union leaders will have to take so long in answering his basic question "what are we here for?" is hardly an expression of confidence that they are on top of their job. With members of the general council in such a cautious mood, it would have been better to have entrusted the compilation of the original recommendations to an outside committee (like the Gaitskell report on the Co-operatives) drawn from other segments of the labour movement, instead of from active trade union leaders themselves, and then to have started the watering-down only at the second stage when negotiations began

with individual unions about implementation. But nobody dared to suggest that.

The Tuesday at Blackpool also provided its chance. Mr Frank Cousins in his most sober and cogent vein called upon the general council to set under way an inquiry into ways of securing and co-ordinating claims by different unions for fringe benefits such as health schemes and redundancy pay arrangements. He was followed equally cogently by the (normally even more left-wing) Mr Clive Jenkins of the supervisory staffs, who also emphasised how little co-ordination there is between unions in seeking to winkle non-monetary concessions out of employers. The preparation of this report would throw a new set of responsibilities on the general council, and could in the long term considerably increase its powers to correlate the actions of individual unions. But the motion was approved without further comment from the platform or from the floor.

The private explanation of this was said to be that Mr Cousins and Mr Jenkins, in discussions with the general council, had got everything buttoned up. The TUC is never tired of emphasising that its main job is to educate people: if even during its annual public spree, and when it has a particularly good case, it is going to carry out its business in hugger-mugger what becomes of even this brave claim to credit?

Hope still remained. On Wednesday the Congress was to discuss planning: Neddy was to be blessed, Nicky slammed, and the TUC's own new philosophy of wages unveiled. Mr Woodcock once more set the ball rolling. That he would start with demagoguery was predictable. That he continued in the same vein was appalling. He accused the Government of not having the slightest idea of how to get order into

The Economist

SEPTEMBER 6, 1862

THE CAPTURE OF GARIBALDI

The capture and defeat of Garibaldi have produced a much greater sensation on the Continent than in this country. In England, the thread of vanity and self-will which has marked Garibaldi's political career, and made him seem to us often *assuming* on the strength of his magnificent services to the Italian crown, combined with the want of political sagacity which he has shown whenever tried in administrative or deliberative capacities, has very greatly weakened the force of the admiration with which we regarded his disinterested patriotism and his marvellous genius as a guerrilla chief. The popular impression here has been, we think, that Garibaldi deserved to fail, and that, though we may pity, we cannot regret his failure. But the Liberals of the Continent, accustomed as they have been to a despotism which makes courageous revolutionary self-will seem almost a virtue, when accompanied, as it is in Garibaldi's case, by a most fervent love of country, have felt a very different and far more lively emotion of grief, almost approaching to dismay, at the fall of the one great man whose mere name has long sufficed to inspire with hope and courage the downtrodden nations of the Continent. And probably their feeling in this respect is more nearly just than ours. Garibaldi has had no antecedents that could teach him the terrible danger of the step he was taking. He has learnt only the evils of despotism, and little of the great national risks of a too headstrong and impetuous resistance to legitimate authority. . . . But it is impossible to measure the most Italian of Italians by an English standard, and it seems certain that if Garibaldi has been rash, vain, and self-willed, these are faults which the sad circumstances of his country tend to foster in a courageous and magnanimous mind bent on sacrificing all to the cause of liberty.

wages; but his own notion appeared to be that the best way to keep wages in line with production is to create a mood of general benevolence in which everyone will behave rationally. Even then "no discussions we (the TUC) can enter could lead to anything like the pay pause or the guiding light." He produced a few cheap jibes ("private enterprise has never produced a decent citizen—all it does is to produce the spiv and sometimes the thug"). He harked boldly back to 1944 to prove that the TUC had once been willing to discuss wages rationally with a government. Finally, he observed that the National Economic Development Council was something that the TUC has been asking for for a long time, and sat down, the future ignored, with yet another appeal to inherent British decency.

The next turn was Mr Cousins—again this time advocating a long and complex motion, the result of squeezing together the thoughts of twelve separate unions. This text opposed the pay pause; called for planning, expansionary policies, and the election of a Labour Government, and requested the general council to work out a statement of its own economic objectives and a plan to remodel the trade unions in order to achieve them. Once more the speakers avoided this last and main issue to concentrate on a largely irrelevant squabble over whether or not the TUC should so formally commit itself to supporting Labour. (Unions that want to should vote "yes," those that do not can always vote "no.")

The debate then evolved into an argument between a group of right-wing white collar unions—joined by the new spokesman of the readmitted Electrical Trades Union who to his credit was the only man to plead for a reform of the TUC's structure—and an equally small group of obstructionist little craft unions whose left-wing spokesmen spoke mostly in impenetrably Scottish accents. The debate was memorable only for the fact that Mr Danny McGarvey, Mr Ted Hill's left-hand man and leader of the Clydeside boilermakers, was actually laughed at for his extravagance. Predictably enough the general council won the approval of Congress for its decision to enter Ned by a massive majority.

It is in the size of this welcome majority that the whole pity of the thing lies. Mr Woodcock wants to reform the TUC. Mr Cousins wants to reform the TUC. Practically everyone now says he wants to reform the TUC, save for a few old-fashioned craft union leaders who stand to lose their jobs or at least their privileged positions if it is reformed. Because their small unions are most often both bound by tradition and threatened by economic progress, these people normally stand on the reactionary left that has for so long blocked the more progressive leanings of the TUC. This year they bit the dust. But out of superstitious fear of them the more intelligent and modern-minded trade union leaders funked the main issue of this Congress—the vital question of modernising their own organisation to fit it for today.

The European debate on Thursday also dodged wide around the main issues; by almost 4 million votes the Congress decided, as recommended by the general council, to fail to make up its mind. The most hopeful, but not unambiguous, news for the Labour party was that Mr Cousins, although he did not speak on the motion, sat with his delegation while they voted to join the general council on the fence. What is more the row of small left-wing craft union spokesmen who opposed the general council did so in unwontedly

mild tones; they failed to be made very angry even by Mr Harry Douglass of the Steelworkers who presented the official wait-and-see report. Mr Douglass, in a fervently pro-European speech, denied that he was speaking in favour of Europe. He confused the issue by gnomic statements ("we are not sitting on the fence, we are hoping to open the door to see what is behind it"): and he chose to claim, in conciliatory mood, that "there is not supra-national authority in the European Coal and Steel Community." Prevarication seems to be becoming a habit among top trade unionists.

The one hopeful aspect of this year's meeting has been to throw into the hands of Mr Woodcock and his intelligent bureaucrats the chance of releasing the cat next year among the complacent pigeons. But at Blackpool this week it required a great effort of faith to believe that the pigeons will be made to say more than "coo!"

Snow on Their Boots

Russian troops in Cuba? Maybe, maybe not. It is not this that will decide Dr Castro's fate

Flying Dutchman, wandering Jew: the disembarking Russian, with snow on his army boots, is this century's recruit to the company of spectral travellers. The one thing known for sure about his latest manifestation, in Cuba, is the existence of a tented camp a dozen miles outside Havana containing a sizeable number of healthy-looking young Russians. All else is speculation: that the young men are not technicians, as the Russians and Cubans say they are, but soldiers (Senator Keating); that there is evidence of four Russian intermediate-range missile bases on the island (Senator Thurmond); and that these developments require the United States to invade Cuba instantly (Senator Capehart). Unless the senators possess information denied to their government, there are still no solid grounds for believing that the Red Army has moved into Cuba as a combat force. Healthy-looking young Americans, after all, have been seen disembarking in various countries since President Kennedy took office; no one has yet suggested that the Peace Corps is a branch of the United States Army.

One way of working out what the newcomers could be—soldiers, technicians, or perhaps a bit of both: instructors for the Cuban army—is to ask what they could be used for if they really were fighting men. Not, presumably, for putting down the rebels still apparently operating in the hills of Matanzas and Pinar del Rio; the native *barbudos* can teach the Russians more about guerrilla operations than *vice versa*. And they are certainly not going to be used for keeping the rest of the population in order; if Dr Castro were thinking of having rioters cracked over the head by Russians, he would be madder than anyone has ever suggested. The unlikeliest job of all, although this is what some people seem to think the Russians are meant for, is to conduct subversion in the republics on the mainland. Can anyone really imagine these young Slavs, mumbling heavily Russian Spanish, moving among the local Hispano-Indians "like fish in water" (Mao Tse-tung's phrase)?

In fact, the only plausible employment for the new arrivals, assuming they are not just lathe-operators and tractor-drivers, is to do more or less exactly what the Americans are doing in South Vietnam; that is, to train the local army to fight a more advanced kind of war than it has hitherto been used to and, if necessary and unavoidable, to fire a shot or two themselves. But the only sort of advanced warfare one can imagine the Cuban army getting involved in is the defence of Cuba against another invasion. It does not command the sea and air power required to launch an assault of its own across the Caribbean; President Kennedy conceded as much on Tuesday. Mr Kennedy said on August 29th that he thought it would be a mistake to invade Cuba again. The Cubans, on the other hand, published on September 2nd the names of twelve places in Guatemala, Nicaragua and Panama where they say invaders are being trained by the Central Intelligence Agency. The Cuban fears may be misplaced this time; but it is comprehensible that Dr Castro—once bitten, twice shy—should at least have taken the precaution of putting some Russian polish on his forces.

Let it be, however; suppose that the Russians are real soldiers, not just electronics wizards. So what? Whether they are troops or technicians is at bottom immaterial; not in the sense Senator Capehart means—that American intervention is justified in either case—but in the sense that the Americans cannot very well assert the right to intervene, whatever the Russians are. Doubtless, in a perfectly ordered world, the Monroe doctrine would require the removal of these alien intruders. But in the imperfect real world, where the Americans keep troops along the border of the communist block (in one case, within it; remember Berlin), and claim an unhindered right of access to these outposts, it is going to be awkward, to say the least, to expel or blockade the Russians in Cuba. Mr Khrushchev has made the neatest of moves in the international chess game; take my pawn in Cuba, he says, and you risk your castle in South Vietnam—or your Berlin queen.

In any case, the eventual fate of the Castro regime is not going to be settled by the presence of a few hundred Russians, no matter what their precise job is. If Dr Castro is one day replaced by a democratic government, it will not be as a result of the one threat against which Russian advisers can give his army any real help—a regular invasion, à la D-day, from over the sea. The United States learned its Cuban lesson in April last year. This is that the overthrow of Castro will have to be brought about by disgruntled Cubans, inside Cuba. The United States can perhaps help to organise and supply a rebellion, as the communists do elsewhere; it cannot import a rebellion, prepackaged.

Given enough time, and enough rope, the Cuban regime may yet produce the internal disaffection that will be its downfall. The various elements in the Castro government are still not at ease with one another. Dr Castro's attack on a number of communists in March, and the flight of one of them, Anibal Escalante, to Prague, demonstrated these dissensions. Moreover, Dr Castro has felt obliged to do two things this year that endanger his popularity among poorer Cubans. The stringent rationing imposed on March 12th was one. The other was the announcement on August 18th

that (presumably in order to increase agricultural output) the peasants' prized co-operatives were to be converted into collective farms. Dr Castro has shown that he does not care whether the middle class is with him or against him. If his support in the countryside begins to fade, one of the conditions of a successful revolt against him will have been established.

The Americans doubtless hope that discontent will spread. If it does, the only way in which the Russians could prevent the consequences the Americans are hoping for would be to "do a Hungary": that is, to keep the Cuban government in power by force of arms when, without Russian aid, the government would be blown away by an explosion of popular hostility. But one has only to state this possibility to see how remote and unreal it is. It would require a massive and overt Russian garrison, the process of establishing which would probably cost Dr Castro his remaining popularity. And, if the test ever came, it would be far harder for the Russians to keep an unpopular government in office in Cuba than it is for the Americans to do a similar job in other parts of the world which are better left unnamed. Mr Khrushchev has no Sixth or Seventh Fleet to keep his supply lines open.

If one looks at recent events in Cuba coolly, the only possible conclusion is that there is no cause yet for the Americans to take action. Mr Khrushchev has decided that Dr Castro is worth a little more investment, in the form of steel mills and military assistance. But the military assistance is of a kind not particularly relevant to the main danger facing Dr Castro; and Mr Khrushchev is still carefully not offering an outright alliance. If things go the way the United States hopes—if discontent grows inside Cuba—any further investment in Dr Castro is going to look very risky indeed to Moscow. Patience, not a choleric lunge, is the Americans' best policy.

NOTES OF THE WEEK

PERSIA

Voice from Below

In classical times Greeks and Romans saw in earthquakes the wrath of the gods. Two thousand years later, our attitude is not much changed. Although seismology has been a serious study for nearly two centuries, man has still not discovered a means of effectively predicting earth tremors; we still refer to them, quaintly, as acts of God. This is a strange commentary on our scientific age. Last weekend Persians endured their third major earthquake in the last five years. Affecting an 8,000-square-mile triangle between Kazvin, Hamadan and Saveh in north-western Persia, this latest disaster has taken a toll of probably 10,000 lives, perhaps many more.

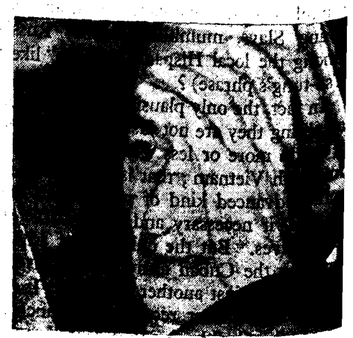
Horrid doubts are caused by the knowledge that the human species has now acquired a certain power to mess about with its environment. There seems no reason to suppose that this new kind of human interference has any seismic effect, and in particular to think that the fairly minor, non-nuclear, explosion set off by the Russians near Tiflis on Saturday night had anything to do with the earthquake. But man's growing capacity for deliberately destroying his fellow-men needs an occasional reminder of the forces he is playing with. We are still as helpless, and almost as clueless, in the face of an earthquake as the ancients described by Aristotle and Pliny. Everyone mourns for Persia, and there are urgent practical ways of showing sorrow in responding to the many appeals to send prompt donations for relief work. But charity, tears and prayers should not be the twentieth century's only thought in the face of such disasters.

DR SOBLEN

Deport When Convenient?

The Court of Appeal has ruled that the Home Secretary has the right to put Dr Soblen, whom the Americans have convicted as a Soviet spy, on an aeroplane to the United States; and Mr Brooke promptly tried to do so, only to be checked again on Thursday by Dr Soblen's infinite capacity for hospitalisation. Friendly Americans should not take it amiss that this decision has caused grave disturbance to liberals in this country. It seems to have obliterated the distinction between deportation and extradition. By common law a man setting foot in Britain is free; under the rule of *habeas corpus* one had supposed he could not be surrendered to a foreign country unless he had committed one of the offences covered by the Extradition Act of 1870 and the treaties made under it. Now the Court of Appeal has held that, whatever the background, the Crown is entitled to send an alien home to his own country under normal deportation procedures. This could make nonsense of the convention that fugitive criminals are not to be extradited for political offences. Obviously the Government must have power to deport aliens whom it considers undesirable (which Dr Soblen no doubt is). But the Government's concern with a deportee is that he should leave this country; it has not hitherto been supposed to be the concern of the British Government where he should go once he has left, so that one had not thought that Dr Soblen could be stopped by British law from disappearing behind the iron curtain.

A second cause of misgiving in the Soblen case concerns the procedure for deciding upon deportations. A principal argument put forward by Dr Soblen's counsel was that an alien should not be deported without being given an opportunity to be heard. This is not a statutory requirement, but one had thought it a principle of natural justice. It was disregarded in the case of *Re Venicoff* (1920 3 K.B. 72) which held that on the wording of the Aliens Order 1919 the Home Secretary need not receive representations before making a deportation order. This was a bad decision which it was open to the Court of Appeal to overrule, but instead of doing so the Court confirmed it on the ground that since the wording of the 1919 Aliens Order had been repeated in its successor of 1953, Parliament must be presumed to have thought *Re Venicoff* good law. Many British liberals think it much more likely that the Members of Parlia-



But not on Thursday

ment concerned had never heard of *Re Venicoff*.

The court's decision is doubtless technically defensible, but it seems to illustrate once again the lengths to which British (as distinct from American) judges will go to accommodate the policies of the executive. If the law of deportation is now to be altered, this can be done only by Parliament. Parliament should do so.

BERLIN

With Knobs On

It has given many people a glow of satisfaction that on Tuesday evening the Russians in Berlin did as they were told, and sent their guard to the Red Army memorial in west Berlin by way of the Sandkrug bridge instead of the usual Friedrichstrasse route. Everything went neatly according to plan. The Russians presented themselves at the Sandkrug bridge as instructed, amiably waited until their British jeep escort turned up, trundled their new guard the half mile to the war memorial, and trundled their old guard out the same way. Of such stuff are the little victories of the cold war made.

If the preservation of the western position in Berlin were simply a matter of scoring points off the other side, this minor knuckling under could be chalked up as a victory, and no more said. In fact, the matter is a great deal more complicated. It may be that the allies, for the sake of demonstrating that they too can give orders, have done something that brings them no visible benefit, and may cause them some embarrassment. The change of route will not safeguard the Russian soldiers against demonstrations by angry Berliners (the ostensible reason for the change). The Berliners, if they are minded to, can gather to throw bricks without much difficulty in the half-mile from the Sandkrug bridge to the war memorial; there was a minor demonstration on Tuesday evening.

The Russians understand perfectly well that the real point of the operation was simply to say: The same to you, with knobs on. The trouble is that the Russians have so many more opportunities in Berlin for saying this than the allies have. By limiting even in this one minor respect the freedom of movement of Russian troops visiting west Berlin, the allies have done nothing to strengthen their claim that Berlin is legally one city, not two; and they have probably pickled a rod for their own backs. For every point at which it is within the physical power of the allies to make things awkward for the Russians, there are twenty where the Russians can make life awkward for us; not least along the supply routes. It is in this that the Berlin problem consists. The allies' interest is to tamp down, not encourage, this contest in petty beastliness.

ALGERIA

In Search of a Government

Rightly Mr ben Bella described the cease-fire announced on Tuesday between the two army factions, for and against his bureau, as a "victory for the Algerian people." If it lasts (already there have been infringements) it will be just that. Rarely has a whole population, dragged by its leaders and soldiers, to the brink of a civil war, expressed with more courage and vigour its corporate will for peace. Last weekend's demonstrations in Algiers, calling for bread and work, elections and a government, drew greater crowds than ever turned out for either Mr ben Bella, or Mr ben Khedda before him.

At various points of the country men and women threw themselves fearlessly between the opposing troops. Mr ben Bella himself, venturing out from Oran (whither he retreated last week) and injudiciously wearing uniform at the head of an armoured unit, was turned back at Tiaret by the same crowd that less than two months ago was excitedly fêting him. Such heroic passive resistance was powerless to avert all armed clashes, but it took the heart out of the fighting. Once Colonel Boumedienne's well-armed troops were marching upon Algiers, at the political bureau's request, the end was not in doubt. (No one except the Kabyles, whose territory was wisely bypassed, could take on their armour.) Mr ben Bella and his bureau would be shakily re-installed, but more than ever in debt to Colonel Boumedienne. This has now come about.

The political bureau, however, appears to be minding its step. Tuesday's truce contained face-saving clauses for the dissident soldiers of central Algeria; and with Mr ben Bella's return to the capital, his deputy, Mr Khider, declared that the bureau would soon hand over to "a legal authority emerging from the elections." One must hope it will. Mr ben Bella has many of the right ideas, not least for reconverting the army, which, he claims, has swollen in the past two months to perhaps 150,000 men. But the bureau is too much dependent on Colonel Boumedienne's forces who came from Tunisia and Morocco for the guerrillas of the interior to feel they would get a square deal if the bureau alone was the agent for carrying out reconversion. Only a government that looks and behaves like a government can steady Algeria.

LIBERALS

The First Llandudno

The season of party conferences will open at Llandudno on September 18th with the largest Liberal assembly of recent years; 1,400 delegates are expected, twice as many Liberals as turned up at Llandudno in 1955. The final agenda, published this week, is in most respects rather heartening. The Liberal executive keeps a watch over this agenda by compositing into multi-point motions the ideas that it wants approved, and by inserting into other people's motions amendments to points with which it disagrees. This year it has acted with some courage. Into a disarmament motion that sounded too unilateralist it has inserted an amendment asking the assembly to recognise "the need for American nuclear testing if necessary to preserve the balance of the deterrent." The motion on consumers' protection wants the Shops Act to "be amended to allow shopkeepers to open when they wish." On town and country planning and land problems, the Liberals (with their policy of encouraging major new "magnet areas" for regional development) are now speaking with more attractive economic expertise than either of the other parties. A motion on trade unions expresses readiness to encourage union membership by excluding non-members from redundancy benefits, but argues that intimidatory industrial action to obtain a closed shop should be considered a breach of contract. Apart from the usual bout of pensioneering ("increase immediately retirement pensions"), this agenda contains less electoral bribery than one has come to expect in a party angling for parliamentary seats, and a much higher batting average of self-confident common sense.

It is therefore a pity that the Liberals have made one tactical mistake. They have adopted Labour's habit in the last parliament of getting party committees, of a rather uneven quality, to issue "policy re-thinking documents" for consideration by their annual assemblies. One of the documents published this week, on local government, is expert and imaginative. It welcomes the recommendations of the royal commission for the reform of local government in Greater London, and urges that a similar solution should be sought for other large urban areas such as Greater Birmingham, Greater Manchester, Merseyside, Tyneside, and the West Riding; it also recommends the application of the parish council system to small communities within large boroughs. But in another pamphlet for the assembly the "Liberal Party Industrial Affairs Committee" has tried to paint over a much wider canvas, and has made a rather unhappy blot of it.

Taming Directors?

In between two fairly familiar ideas—for the establishment of a national redundancy insurance scheme which would provide much more generous treatment for the temporarily unemployed (along lines long advocated by *The Economist*), and for a switch away from national wage bargaining towards more plant-by-plant bargaining (but without really saying how to encourage this switch)—the Liberal report on "Indus-

trial Affairs" submits its proposals for "democratising" boards of directors. It suggests that all the functions performed at companies' annual general meetings, including the election of directors, should eventually be performed instead by an annual meeting composed equally of delegates elected by established employees (say, employees with more than three years' service or other appropriate seniority) and delegates elected by shareholders. In the nationalised industries the shareholders' place would be taken by MPs, chosen broadly in proportion to party strengths in the Commons. This presumably means that a Dr Beeching could generally be appointed or kept in office only if a majority of railwaymen and of Opposition MPs agreed, in which case it is highly unlikely that any new broom would ever be applied to dusty attics at all.

In the much wider field of private industry the results would surely be even more frightening. The "reform" would hamper all the industrial change that is brought about by the infusion of large blocks of new capital into firms that need renovating or expanding (because the men who infused the capital might find the businesses then run by somebody else). In existing companies the system would not be likely to lead to promotion according to merit (a top executive's merit can often be judged only by a narrow range of people) but according to popularity or even demagoguery; directors who tried to introduce methods of work study or other unpopular mechanisms for increasing efficiency would be liable to lose their jobs. Able outsiders would be unlikely to be co-opted by the tightly-enclosed "representative" meetings proposed. And . . .

But why go on? To do the Liberals justice the proposal is put forward only tentatively, with many "ifs" and "buts," and all sorts of proffered escape clauses. But, as Miss Nancy Seear points out in an able minority note of dissent, the real complaint against the many faults (including nepotism) in British industrial direction today is not "the alleged power of directors to use employees as pawns in their private game—a power which is in any case already very considerably limited by unions and the labour market"; the real complaint is that there is often too much inefficiency at the top. This report's proposal, however modified, would quite plainly increase that inefficiency. It is a silly scarecrow to have put up.

NURSES' PAY

Slap for Whom?

The industrial court's award of a flat 7½ per cent wage increase for all nurses will be almost universally interpreted as another one in the eye for the Government. But in cold reality the decision is a prime example of the inability of the industrial court to do its job. Its findings this time make no comment at all on the chief submission of the management side that, in the context of the Government's incomes policy (and the Government is the nurses' actual paymaster, not the management side as the court seems to assume), it could not go above an offer of 2½ per cent at this time. The logical conclusion must be that if an incomes policy is to have any meaning at all, the Government must in future consider itself free to refuse arbitration of this kind, precisely as the unions do when it suits them.

Equally, the court gives no impression of any attempt to relate its award to recruitment in the nursing profession: that is, to discriminate between grades like ward sisters (which might well require more than 7½ per cent to ensure staffing of responsible posts of this kind) and junior entrants, where the case for an increase is much less evident. The court agrees that there is a present case for a thorough-going revision of the whole salary and grading structure, but believes that it should not try to pronounce on this until after the "two sides" (i.e., the nurses and the managements, but not the Government who will have to pay) have had a chance for discussion and negotiation: if the "two sides" have not agreed before the end of next March, the court will determine the matter. But, with all this still to be decided, it is even less possible to justify an indiscriminate hoick-up of 7½ per cent now on the ground that the level of salaries and training allowances, "is, in general, too low." The case for a National Incomes Commission, of a sort that will look at hard economic facts, instead of bowing to popular emotional impulses based on no scrutiny of economic facts whatever, is unconsciously made out in every line of the industrial court's quite incoherent statement.

CONGO

Twist On

It was on August 28th, 1961—almost exactly a year ago—that Mr Tshombe of Katanga said, "We bow to the United Nations" and promised to remove the military gentlemen in his employ referred to by the UN as "foreign mercenaries." The promise was not carried out, and because Mr Tshombe did not in fact bow there was fighting between UN and Katanga forces twice before 1961 was over. What about this year? On September 3rd Mr Tshombe formally accepted the United Nations' plan for reunification of the Congo. He seemed to like the sketch of a federal constitution offered to him, and promised to join his army to the Congolese army, to pay "immediately" half of his mineral revenues to the central government, and to put his foreign currency earnings into the hands of an international organisation.

These promises were made to some considerable extent under duress: the UN had threatened economic sanctions against Katanga unless it gave in. The formal capitulation of Mr Tshombe must now be welcomed, but it ought to be recognised that, on his past performance, the Katanga leader's undertakings are likely to be kept only while he remains under pressure. From now on, it should be made clear to him at every step of the way that he would fare worse by ignoring the instructions of the United Nations than by acceding to them.

He will not feel seriously under pressure if he is led to believe that the British Government would refuse to take part in a plan for economic sanctions against him. Britain might well be followed by Belgium, and the sanctions could then hardly be very effective. For U Thant, the alternative is to use force. What happens between now and the end of the year can therefore be largely affected by the attitude of the British Government. It should be careful not to do or say anything—publicly or privately—that might lead the Katangan government to go back on its newest undertaking.

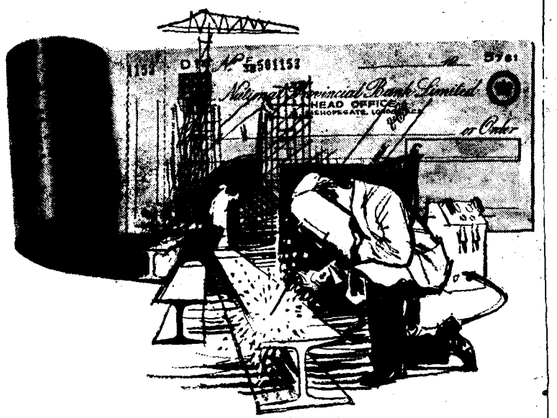
GHANA

No Black Reds

Westerners who anxiously count the pro-communist and the anti-communist heads in African cabinets should be rejoicing this week. After all, on August 29th Dr Nkrumah of Ghana fired two left-wingers and put them, together with a moderate, in prison. The *Ghanaian Times*, a party paper, promptly vilified all three men (Messrs Adjei, Adamafio, and Coffie-Crabbe) and demanded their heads. On September 3rd Mr John K. Tettegah, former secretary of the Ghana Trades Union Congress and now general secretary of the (Nkrumahist) Federation of African Trade Unions, was detained. If ever Ghana had a left-winger in a position of power, Mr Tettegah was he: he was released on Wednesday. Mr Krobo Edusei, once minister of industries (dismissed in April) has been reinstated, this time as Minister of Agriculture. Mr Edusei is a consumer of luxury goods in the best western tradition, and his wife's purchase of a golden bed is still gratefully remembered by the London press.

Yet there might be another explanation for all these Ghanaian comings and goings than a swing away from the Left. The dismissed men have been linked in the Ghana press with last month's attempt on Dr Nkrumah's life; worse, they may have been linked in the Osagyefo's mind with attempts upon his authority. The lesson is that the Ghanaian government means what it says when it proclaims non-alignment: it wants to be run by itself, not by Russians or Americans. And who is "itself" but Dr Nkrumah?

CHECK WITH N·P



Whatever the size of your business, whatever product you sell, you can rely on the friendly and efficient services of National Provincial Bank. With over 1,550 offices in England and Wales and correspondents throughout the world, National Provincial Bank can assist your business in many ways both at home and overseas. The bank's customers include many of the largest companies in the country. Check with National Provincial—and you will see why.

Saturday night in Singapore

People are much the same wherever you go. In foggy London, noisy New York or sweltering Singapore, the Saturday crowds still look for late-night snacks on the way home from theatres, cinemas or bars. Still stand around stalls to eat pies or hamburgers, whelks or fishballs.

And the stalls themselves are the same triumph of personal ingenuity. Often highly decorated, they must still be functional and mobile; and the power they use for lighting and cooking must be as mobile as the stall itself. Almost invariably the answer to this is kerosine—the oldest of the petroleum fuels. Shell sends kerosine all over the world—and not just to homely 'hokkien mee' stalls. For Shell kerosine powers the jets that fly over Singapore, as well as providing fuel for dozens of domestic jobs such as heating and refrigeration. Fortunately, most places are within reach of one of the 500 Shell companies. Shell, in fact, is as world-wide as people.

YOU CAN BE SURE OF SHELL

NYASALAND

Mr Chisiza

An African nationalist leader who argues that pan-Africanism does not make sense while the African people (as opposed to their leaders) are hardly conscious of loyalties beyond the tribe and the new nation is a rarity. He is a greater rarity when he points out, before his own party chief, that "strong-man" government lapses easily into dictatorship, for which the only remedy is assassination; and that "assassination is . . . dangerous . . . because it has a built-in tendency to become habitual." Such a rarity was Mr Dunduzu Chisiza, prospective minister of finance in Nyasaland, who was killed in a car accident on September 3rd. Mr Chisiza is the third central African political leader to have been killed in this way within the past year. (The other two were Dr T. S. Parirenyatwa of Southern Rhodesia and Mr Lawrence Katilungu of Northern Rhodesia.)

Nyasaland has produced several extremely bright African politicians; Mr Chisiza outshone most of them. He was detained for 19 months until September, 1960; he spent the time studying—to good effect—the economics of underdeveloped countries. The ten-day Nyasaland economic symposium held in July was his idea: at little cost it brought 24 economists of world reputation to the country to discuss its problems—and it attracted the attention of possible future sources of aid and investment to Nyasaland. The country's new and realistic three-year economic plan is Mr Chisiza's—"the most exciting thing I have ever done"—he told friends. His death, at 32, is a great loss to his country, and to Africa.

THE DAILY PRESS

Advertising League

There are three divisions in the newspaper league, according to the paper read to the British Association by Mr Laurence Scott of the *Guardian*. The division a paper belongs to depends on the kind of advertising it attracts, which in turn depends on the kind, as well as the number, of its readers. Advertisers of general consumer goods go for "the newspapers with the biggest circulation and the lowest cost per inch per thousand sales": this is the first division, the popular national morning papers with sales up to over 4½ million a day. Other advertisers, with producer goods or services to sell and the prestige or reputation of big companies to build up, want "to reach people in a position of authority and influence, particularly those who influence the spending of corporate money": these go to morning papers like *The Times* with little more than a quarter of a million readers, but many of them the sort of customers that the advertiser is after. The third division is local, supported by the advertisers who want to catch the custom of people living in a particular place or area: the provincial evenings (thinned down mostly to one in each locality) and local weeklies live by this backing, and some can survive with not much more than 20,000 readers, though others go much higher.

The "sandwich" paper in this classification that manages to belong to both the first and second divisions is the *Daily Telegraph*, which "contrives to carry both a large amount of advertising in the consumer goods class and also a fair slice in the prestige and producer goods class," and so is able with a sale much the same, at a million and a quarter, as the circulation that meant death to the *News Chronicle* to be highly successful. It was promotion in this (advertising) league that the *Guardian* sought when it started a year ago to print in London as well as in Manchester: as a provincial morning paper, even with its international reputation editorially, it had no business future; so, as Mr Scott put it, "our best hope of continued existence, with the financial ability to maintain our standards, lay in becoming a national newspaper." The objective was to get the second-division (or "quality") ranking of *The Times* with the advertisers; success depends not just on getting more readers but on getting more readers of the right kind, with "influence and authority."

Who Goes Down?

"Continued existence" is indeed every newspaper's problem, in a high-cost (and cut-price) industry where "the pattern of costs and revenue, and of editorial standards" is set by the front-runners in each division of Mr Scott's league. It has still to be seen whether the *Guardian* will get the 300,000 or more readers of the right sort, and the advertising income, that it needs both to foot its London bill and to meet its Manchester outlays, complicated as they are by the joint running of two evening papers, one successful and the other not. It has still to be seen whether the 260-odd thousand circulation of *The Times*, which the *Guardian* now just matches, will be enough, with the advertising it can attract, to keep even that great paper safely viable in the longer future. It has still to be seen whether even the *Daily Mail*, which is well over the first division's supposed break-even sale of two million (though it may be drifting downwards), is going to be safe with what Mr Scott reckons to be "the minimum viable circulation of any newspaper," which he says is "at least half the sale of its most successful direct competitor." And, on any count, the *Herald* and the *Sketch* have little to look forward to.

Mr Scott does not believe that advertising revenue is all, though it is crucial. Good editing and good management, with good editing first, are still the fundaments of success, even financially. At the *Guardian*, which has given British journalism at least two great editors, this is ABC, and should be the star now to which, in its biggest test, its waggon ought to be hitched. For the British press at large, looking at these life-and-death problems of promotion and, still more, relegation, the Shawcross report will give its doctor's report in only a few days from now. About the impolicy of both newspaper proprietors and trade unions, as well as the inadequacy of the present watching brief of the industry's own press council, the report is likely to be clinically scathing. On the question with which Mr Scott started his paper—"Can competition survive?"—it is likely to be less helpful: it may not be able to go much beyond Mr Scott's own conclusion. This is that

> The newspaper industry is a high-cost industry, and perhaps not very efficiently run, but this is not the main reason why newspapers get into financial difficulties and have to be merged or closed down. The main reason is competition from other newspapers.

JOBS FOR GRADUATES

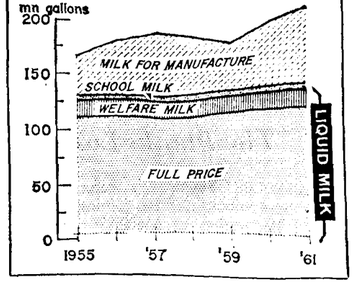
A Clearing House?

The inquiry into the work of university appointments boards, which Nuffield College, Oxford, has just begun, should prompt some serious thinking inside more universities about the eventual destination of their end-products. Appointments boards can sometimes be simply straightforward job agencies, a more or less genteel introduction to industry for arts graduates and an easy source for knowledgeable firms

HA'PENNY ON THE PINTA

British households take, on average, nearly 5 pints of milk a head each week. The extra ½d. a pint from last Monday will mean, therefore, an extra 2½d. a week on average for most adults and older children: welfare milk is not affected.

Including liquid milk consumed outside the home, consumption has risen 4 per cent over the last six years—about in line with the increase in population. Milk manufacture has gone up much more.



to raid for scarce skills. But the better kind at least also set out to advise the individual (the advice may be, initially, to get more training; e.g. for women entering industry or commerce to acquire secretarial skills); and they pay due attention to variations in personality. Probably three-quarters of the student population could benefit greatly from this kind of advice.

The best boards, and they are still too few, also try to exert a positive influence in guiding firms on how to make the best use of graduates; and they are playing an important part in the internal university debate about the right kind of education to provide, particularly for the new type of student. As the (too slow) expansion of university places proceeds there will be an increasing need to think out what form of general education provides the most effective intellectual, as well as pre-vocational, training for bright young people who are not going in for research or an academic life. There is a lot that needs looking into. Can, for example, any appointments officer truthfully say that this country is really making the best use of its women graduates? Is it actively helping them to continue their careers after early marriage, let alone helping them to come back into an appropriate job after their children have grown up? Again, appointments boards will soon have to tackle on a broad basis such new problems as fitting in the increasing number of graduates who have read science by choice but who also want administrative careers.

The demands for a central professional agency have understandably grown as a result of the cheese-paring cuts in the services (particularly the technical and scientific register) hitherto provided by the Ministry of Labour. There is a great deal to be said for a central clearing house, which would be a natural resort for graduates who want to change course into a new job or career. Mobility of this kind should often be encouraged.

The most competitive firms may already know well enough how to get the initial entrants they want under the present system. It is in backward industrial areas that energetic university appointments boards most need to spread the gospel and provide potential executives from graduates already living in the region. And it should be through the appointments boards that backward dons are made aware of what the community requires from its educational investment.

MALAYSIA

The Blanks Lose

ALTHOUGH Singapore's referendum of September 1st, on joining the proposed Federation of Malaysia (Singapore, Malaya and the Borneo territories), did not give the voters a real choice, it did show that most of them do want to join. It is a pity, in retrospect, that Mr Lee Kuan-yew, the prime minister, found it necessary not only to exclude the option of not joining, but to announce that blank ballot papers would be counted as part of the majority answer.

The voters were in fact asked to choose between joining on the terms Mr Lee had decided with Tunku Abdul Rahman, the Malayan prime minister, last November, and two other variations which are now of no interest since nearly 400,000 votes—more than 70 per cent of the total—were cast in favour of the agreed terms. There were about 144,000 blank papers—a high figure, but not as high as the communist-led Barisan Socialis opposition had evidently hoped for. Whether it was high enough to justify Mr Lee's choice of procedure is another matter. Having seen his parliamentary majority whittled down to a minority during the past eighteen months, he must have felt he could not leave a question of such importance to chance.

Now the way looks clear for the creation of "greater Malaysia" by the agreed deadline of August 31st next year. Under the terms the voters approved last Saturday, the citizens of Singapore will become citizens of the new federation while retaining their present citizenship. Defence, foreign affairs and—most of all, in view of communist strength in Singapore—internal security will be in the hands of the federal government, leaving education and labour under Singapore's direct control. This is not the end of Mr Lee's domestic political troubles; but it is a weight off his mind and justifies a sigh of relief in London as well.

CAMBODIA

Uneasy Neighbours

RECENT events have revived Cambodia's ancestral fears of the Siamese and Vietnamese. The civil war in South Vietnam has more than once spilled over into Cambodia, and Cambodian lives have been lost. A frontier dispute with Siam (which seized two Cambodian provinces during the second world war and handed them back only after Japan's defeat) has contributed to Cambodia's feeling of insecurity. This background helps to explain Prince Sihanouk's proposal of August 21st that the fourteen nations which lately met at Geneva to define and guarantee the neutrality of Laos should now meet again and do the same for Cambodia. Mr Macmillan politely turned down the idea on August 31st; General de Gaulle said France would take part in a conference if there was one; President Kennedy is thinking it over; and only the communist powers—Russia, China and North Vietnam—have accepted with any marked enthusiasm.

It is possible to sympathise with the prince's feelings while doubting whether a fourteen-nation conference would be the best way of solving his problems. The Laotian settlement, for what it is worth, was made possible because the two great power blocks were getting involved in the Laotian conflict and wanted to avoid a head-on clash. Cambodia's case is different. There is no civil conflict in Cambodia, and none of the great powers threatens its integrity. The burden of Prince Sihanouk's case is that Siam and South Vietnam, which are allies of the United States, do threaten it, and that the great powers, including the United States, should undertake to protect Cambodia against invasion by either of its neighbours. He has also asked the Americans for arms and threatened to get them from China if they are not forthcoming.

At one stage the prince proposed joint border patrols by Cambodian and South Vietnamese troops, but when President Diem agreed, perhaps unexpectedly, the Cambodian leader seems to have had second thoughts. Mr Macmillan is right to suggest that the Cambodians should try to reach an understanding with their neighbours by diplomatic channels before the great powers are called in.

SOVIET BLOCK

Second Thoughts?

IN the communist world the common market is now being paid the compliment of close attention. The communists seem to be adjusting themselves to the probability that the European Economic Community will expand and flourish; the process of adjustment may be protracted and difficult. At a conference of Marxist economists from more than twenty different countries on "the problems of modern capitalism" which ended in Moscow on Monday, the common market was one of the chief topics discussed. The published "theses" put forward for discussion at the conference say everything that is bad about the common market; it is a new form of colonial exploitation and an instrument of the monopolists, it is incapable of ensuring harmonious economic development, and so on. But it is reported from Moscow that in private many of the economists argued that the common market was a vigorous and going concern, which the communist world must face the necessity of coming to terms with.

Similar divided feelings are reflected in an article by Mr Khrushchev himself, summarised in the latest issue of the *World Marxist Review*, and published in full in the Russian party journal, *Kommunist*. But the summary of the article gives the impression that Mr Khrushchev is primarily concerned, not with running down the common market, but with building up its communist counterpart, the Council for Mutual Economic Aid. Various organisational measures have in fact been taken since last June when this body (Comecon) met in Moscow and decided on steps to

flying 70 miles up, at staggering speeds . . . but headed for its destination with pin-point accuracy. For this is an airliner of tomorrow, non-stop to Tokyo in a smooth 90 minutes. Aircraft on the drawing board today will tomorrow be switchbacking in and out of the earth's atmosphere. For them, conventional navigation methods will not be accurate enough. *For them, tomorrow's answer is Inertial Navigation.* Ferranti are currently working on this project—and already a prototype has been successfully flight-tested. Three ultra-sensitive instruments register movement—sideways, forwards, up or down. They're housed in one small cylinder, with miraculously precise gyroscopes to keep them level with the earth . . . entirely self-contained, unaffected by any outside influence. And a computer translates their signals into exact navigational information . . . even at orbital speeds.

Ferranti, in fact, know exactly where they're going in the air. Airpass, for example, is theirs—the astounding tracking, guiding, hunting, aiming system that squats in the nose cone of R.A.F. fighters. Advanced helicopter instruments are theirs. Apollo, the computer that will control Prestwick Airport's entire transatlantic traffic, is theirs. And these are only a few of Ferranti's contributions to the times we fly in. For Ferranti, tomorrow is very much a matter of the moment.

Here are a few statistics about Durox Aerated Concrete:—Its modulus of elasticity is up to 400,000 p.s.i. • Its cube compressive strength is as high as 850 p.s.i. • It provides 3 times the thermal insulation value of brick, 8 times that of concrete. • It weighs about ½ as much as brick. • Its water absorption is ¼ that of brick. • Its coefficient of expansion at temperatures between 58° and 212° is 0.000004. • Plenty more where these came from.

Durox Aerated Concrete is distributed through the various depots of Hall & Co. Ltd., of Croydon, and other builders' merchants. Details, specifications and performance figures from: Durox Building Units Ltd., Chantrey House, Eccleston Street, London, S.W.1. Sloane 7122. *A member of the Hall & Ham River Group of Companies.*

DUROX

give itself a new look. But that these steps have not yet got very far, at any rate in the public view, was demonstrated by a recent Budapest broadcast, which, declaring that "it has become fashionable to . . . overestimate the undeniable results of the common market and to underrate, perhaps out of ignorance, our own work," went on to argue at length how wrong such an attitude was. If this attitude is at all general among the general public in eastern Europe, it is hardly surprising that the Communists are greatly exercised about their official attitude towards the common market. In his article Mr Khrushchev refers guardedly to the possibility of economic co-operation and peaceful competition not only between individual states with different social systems, but also between their economic associations. Here is a thought indeed.

GRAMMAR SCHOOLS

New Breeze?

One of the most hopeful pronouncements to come from the schools inspectorate was delivered to the British Association last week by Mr Percy Wilson, senior chief inspector at the Ministry of Education. Mr Wilson hit out at sixth form over-specialisation, at the growing hurry and congestion of work in the fourth and fifth forms, and at the antiquated and anti-cultural syllabuses that most pupils have inflicted on them in the name of academic attainment. None of these criticisms is in fact at all radical by now: the capital fact is the demonstration that the much-maligned Lord Eccles succeeded in giving a hefty liberal push from the top in encouraging his inspectors to become much more purposeful engineers of change.

What is Sir Edward Boyle's ministry going to do about it? The curriculum study group which has been at work for the past six months is likely to recommend some drastic reforms. These will not necessarily mean more scope for taking up new "minority time" subjects, but they should certainly mean a broader-based and up-to-date approach to all GCE "A" level subjects: it is really high time, too, that English education as a whole ceases to be weighed down with Euclid, the Anglo-Saxons and Dickens. But over-specialisation and over-cramming are not going to end by fiat in the schools alone; neither are the modest reforms that most university vice-chancellors have accepted for their entrance qualifications going to work out in practice (particularly among the good, honest triers who know they have to fight for their place) unless the physical bottlenecks to higher education are first removed.

To insist on reforms of this order will certainly not deprive British education of those merits which seem to have been deliberately over-stated this week by the American Admiral Rickover in his castigation of his own country's educational standards. There is manifestly little danger that highly intelligent pupils are going to be held back by the changes that the present Ministry of Education is likely to advocate: the "streaming" of these children continues in grammar and comprehensive schools alike, and more "minority time" would, in fact, add to their ability to profit from university life. Where the chief trouble still lies is (a) among the lower grammar school streams which are being pressed by competition into specialisation beyond their immediate intellectual comprehension; and (b) among the (relatively few) 11-plus "failures" who show ability and application but still do not get the chance to transfer later on or to make good at their secondary moderns. Worries over the second, and much-publicised, problem are now far less justified than over the first.

SHAKESPEARE

Old Bones

It is extremely unlikely that Mr Christmas Humphreys QC and others will succeed in their campaign to celebrate the 400th anniversary of Shakespeare's birth by getting somebody to take a peep inside his tomb at what they call the poet's "reputed birthplace" at Stratford-on-Avon. This is not because many people suppose that such "desecration" would really bring down the dire consequences threatened by the famous warning on the gravestone:

GOOD FREND FOR IESVS SAKE FORBEARE,
TO DIGG THE DVST ENCLOASED HEARE.
BLESTE BE Y MAN Y SPARES HES STONES
AND CVRST BE HE Y MOVES MY BONES

It is because the ordinary Englishman still blithely assumes, like Shakespeare or whoever wrote his tomb's inscription, that after death his own body will be allowed to lie on undisturbed for aeons to come. With over 30,000 Britons dying in this crowded island each year, this assumption that each can expect to fill 30 or so square feet of urban land in perpetuity is—be it softly whispered—as absurd as dread of the curse.

Most of us who choose to be buried will be turned over in our graves many times before 350 years are up, as indeed has already happened to the majority of Shakespeare's contemporaries. And among the tombs which have remained intact, virtually all—including Shakespeare's—will certainly have been peeped into at some time or other when adjoining vaults were dug. On religious grounds it has always seemed curious that Christian men have taken over from pagans a tradition of awesome respect for the so-called "resting place" of a dead, entirely spiritless body; one cannot really see why one's crumbled remains some years after interment should be regarded as "oneself" any more than are individual components of one's living body—say an extracted appendix—which most of us are only too glad to know has been deposited in a hospital dustbin.

Nevertheless, the traditional respect for dead bodies goes deep. Most people who might otherwise support Mr Humphreys in braving it will be deterred by the strong probability that, even if any written tributes or other historical evidence were left interred with Shakespeare, they will long since have melted into dust together with his remains. And while they will be afraid of looking foolish if, after all the fuss attendant upon opening it, the cupboard proved bare, there will be an even stronger alliance of scholars who must be secretly afraid of looking even more foolish if, unexpectedly, something rather startling about Shakespeare (or, heavens forbid, Bacon) were to be found.

LETTERS

Kenya

SIR—"Descending Mount Kenya" (your issue of August 25th) requires comment. In the process of disengagement from African dependencies, Britain has been successful only insofar as immediate chaos, such as the Congo suffered, has been averted. With the notable exception of Nigeria, however, democracy has soon vanished and dictatorships have taken, or are taking, its place.

It is all the more paradoxical and tragic, therefore, that when a truly democratic force emerges in an African country and it puts forward a constructive plan designed to avoid the unfortunate things that have happened elsewhere, there is a tendency to dismiss it as a luxury which a young emerging country cannot afford, or references are made to "orthodox patterns" which, though they have resulted in dictatorship, for some obscure reason should nevertheless be adhered to.

How is it—and indeed your article implies this—that unity and one-party systems have an attraction for Britain when dealing with others, while she herself enjoys a two-party system and fundamental differences exist between those parties? I strongly believe that the existence of two or more parties is a major factor in the upholding of individual rights. It automatically means that one or other party will come to the rescue of those who have been wronged.

You say that Kanu policy is to have a

unitary state designed to crusade against tribalism. Superficially, and conveniently for the Kikuyu, this may appear so, but the end result of a "non-tribal and unitary system" would be to place the Kikuyu in complete power, thus giving Kenya almost undiluted tribal domination.

Your article states also that "about 60,000 white people . . . may need to be rescued." If this is the case, what about other Commonwealth citizens, Indians, Pakistanis; what about Goans and Arabs? No, the answer does not lie in "rescue operations" for selected minorities, but in creating the right conditions now, constitutionally and economically, to ensure that disaster does not follow independence, that all Kenya's people, including Europeans, may live in peace. The truth is that race relations are good here, that the divisions are political rather than racial, that far from Europeans or British administrators trying to divide Africans, they are divided in any case, and that luckily we have the basis of a sound constitution, which takes all this into account.

Finally, I would like to say that Kadu does not represent "a gathering of the weaker more backward clans." The Abaluya and Kalenjin are both major tribes; the geographical advantages all lie with Kadu and the country could not possibly run without their concurrence.—Yours faithfully,

R. G. NGALA
President, Kenya African Democratic Union
Nairobi

*

SIR—Your leader of last week was timely and realistic. While contesting, as I must, your view that the policy which has led to the present crisis was right, I hope that the widest publicity can be given to your statement that some 60,000 white people from Britain are likely to be caught in a trap (not, I would add, in any way of their making) and may need to be rescued. Its grave, perhaps tragic, implications deserve urgent and careful study.

Some sixty per cent of the existing British minority in Kenya will in any event leave the country, either before or directly after independence. Of the remaining forty per cent, twenty will stay and try, as best they can, with all the fortitude and skill they possess, to live and work under the new conditions. The other twenty per cent will only stay because they are helpless and penniless, lacking the means to pay their passage. To abandon them would be as dishonourable as callous. Since rescue is now admitted to be necessary, let us openly begin to plan for it.

There are certain steps which must be taken to make it a practical—even if unseemly and saddening—operation. Of first priority is the need for an impartial and efficient land settlement board, to supervise the £15 million purchase of land already proposed by the Kenya government; its chairman, I suggest, should be at least of the status and experience of an English High Court judge, and he ought to be supported by a deputy with a real, expert knowledge of farming, and of agricultural techniques and values. The board, and not the Kenya government, should control the purchase funds; and payments should be prompt and, if vendors so desire, to banks outside Kenya; there must be no opportunity for post-uhuru sequestration.

Second comes the question of resettlement and employment in the United Kingdom or elsewhere. This must be accepted unequivocally as the responsibility of the British Government; and it is surely bare justice that those who return here should be entitled without any niggling to all national insurance benefits, as though they had lived in this country since 1947.

Third is the problem of what are known in Kenya as the compassionate and the security categories. There is a number of elderly people living in isolated farmsteads, who are even now extremely vulnerable to gangster and Youth Army attacks. And there are others, in the countryside and in the towns, whose names, because they took an active part in the defeat of Mau Mau, are on a murder list, the existence of which is perfectly well known to the Governor and the Minister of Defence. The sooner all these are brought out the better.

Your candour is refreshing, and calls for an equal candour in response. The unpleasant job of "dishing the whites," first undertaken by Mr Macleod, is now almost fulfilled. I disagree with your assertion that the casualties could not have been foreseen; I, for one, foresaw them two years ago. Let us, however, leave recrimination, try to put aside bitterness, and get on with the task of rescue and a measure of reparation for this most ill-used of British minorities. If we do not, if in apathy, stinginess and ignorant prejudice we finally betray our brothers in Kenya, there will be no words with which to describe our disgrace and our shame.—Yours faithfully, JOHN CONNELL
London, S.W.1

BRIEF BOOKLETS . . .

have been produced jointly by The Economist and The Economist Intelligence Unit to present the essential facts behind important current topics. Each takes about one hour to read. Here are the first three titles in this new series:

Brief 1 RHODESIA: BRITAIN'S DEEP SOUTH
by Joe Rogaly

2 MONEY FOR GROWTH
by Fred Hirsch

LABOUR IN BRITAIN AND THE SIX
by Val Schur

Each booklet costs 2/6d. post free for remittance with order from:

PUBLICATIONS DEPT.,
THE ECONOMIST 22 RYDER STREET
LONDON, S.W.1. WHI 1511

Parallels

SIR—The parallel behaviour of Sir Alexander Bustamante and Mr Tshombe has, so far as I have noticed, gone unremarked. Both head the economically viable (if Jamaica *is* viable) parts of their area and both have resisted carrying along the less viable parts. Busta has got away with it, even receiving the personal blessing of (*vide* your issue of August 18th) "Sir" Lyndon Johnson. Much of the world is ganging up on Mr Tshombe to force him to drag along the savage tribes that inhabit what was, by happenstance, the Belgian Congo. Busta is permitted to cast off a politically civilised, highly responsible group of people who have profited by years of exposure to British tradition. They are, for the most part, the kind of individuals who make good neighbours.

Katanga has the possibility of becoming a leader in Africa. It is hard to see how Jamaica can get by, except with permanent outside support, especially in view of its population growth. The remainder of the West Indian Federation will almost certainly become a public charge, again in large part because of its birth-rate.

Aid and accolades for Busta; berating and boycott for Tshombe. The behaviour of our government is at least as puzzling to many Americans as it must be to citizens of the UK.—Yours faithfully,

WILLIAM VOGT
Palenville, NY

Counterdrift

SIR—Your article on Counterdrift (September 1st) was most interesting but it did not pay enough attention to the architectural problems involved. In any scheme of the kind suggested the planners should pay more heed to the *Unité* principles of Le Corbusier. Thus the new urban areas could contain their populations within a small area of built-up land and the vast areas of subtopian development could be eliminated.—Yours faithfully, W. N. WATFORD
Sevenoaks, Kent

"Dutch Courage"

SIR—I read with interest the August 11th edition of *The Economist*, in which under the heading "Ah, Youth!" you started a Note of the Week on Finland with the following quotation [from *Komsomolskaya Pravda*]: "With the Dutch courage of drunks, the hired riff-raff, bought with dollars and western marks. . . ."

Being a Dutchman myself, I am very interested to know where the above expression comes from. If you can enlighten me, I should appreciate it very much.—Yours faithfully, J. L. CORBA
Geneva

BOOKS

Crisis of Irresponsibility

Germany and the Diplomacy of the Financial Crisis, 1931

By Edward W. Bennett.
Harvard University Press. London: *Oxford University Press.* 350 pages. 60s.

THE world financial crisis of 1931 was not only a cataclysm in the economic and political affairs of the modern world ; it was a microcosm of the whole interwar tragedy. The economics of depression and the politics of Versailles, each as sterile as the other, now interacted with devastating effect. As Mr Bennett notes: "A thin plaster of international finance and Locarno ambiguities had covered the cracks left by the Great War, but now the plaster flaked off." The world financial system blew up, the slump in the trade cycle was carried to unprecedented depths, and presidential dictatorship was firmly established in Germany.

How did it happen? Mr Bennett is a student of diplomacy, not of economics ; and he has a healthy distaste for armchair theorising. His book, as the title indicates, is concerned with the diplomacy of the crisis, with its unfolding over these critical weeks and days, as it can now be reconstructed from the German and American archives and from the much less complete British papers. Mr Bennett's use of this mass of material is masterly: he sets one document against the other to correct not only the usual inaccuracies in statesmen's memoirs but also some significant inadequacies in the contemporary record—this ambassador was evidently playing to his master's ear, that foreign secretary was leaving his officials in the dark. All this is fascinating to anyone who is interested in the process of decision making on the diplomatic level. But Mr Bennett's narrative goes deeper. At just the right intervals the threads are drawn together, a general conclusion is drawn. And besides being a first rate researcher, Mr Bennett is not short on wisdom ; he is also an elegant writer. So while he does not throw himself up against the cosmic question of whether 1931 was avoidable, he does show how the collapse was rooted in the political failings of the previous decade.

The theme of the story is irresponsibility. Most obviously irresponsible was Germany, which found that the weaker its finances were seen to become, the better were the prospects for its overriding political aim of "revision"—revision of the regime of Versailles and not least of reparations. Only at the last moment did Brüning and his colleagues see the financial crisis as a threat to themselves, and by then it was too late. (Mr Bennett is not hard on Brüning: he "exemplified the same conscientious conservatism and selfless courage—if also the same reliance on intrigue and manipulation at the top—that characterised the best of the July 1944 conspirators.")

Irresponsibility of a different kind was displayed by President Hoover, with his basically sensible but untactfully presented plan for a moratorium on inter-government payments. As Mr Bennett observes:

> Unilateral bombshell proposals like Hoover's have perhaps about the same relation to international politics as a new insecticide or epizootic disease has to the balance of natural life.

Above all, Hoover's sudden initiative ignored the realities, sordid as they may have been, of the Franco-German power struggle that lay behind the reparations argument:

> While the manipulation of American interest in German finance had, as hoped, brought Hoover on to the scene, his arrival as *deus ex machina* was not appropriate to Teutonic drama, and it did not leave much of a role for the German heroes in their struggle with the dragon, Tribute.

But not the least irresponsibility was that of Britain itself. Mr Bennett points to the basic and continuing inconsistency of accepting the provisions of Versailles, the imposed peace, and then shrinking from the entanglements, and the costs, of imposing it. So France felt isolated, and let down ; and after the stabilisation of the franc in 1926 made it the strongest financial power in Europe, it not unnaturally saw this financial strength as a weapon of policy.

France was petulant, France was irritating ; but, in Mr Bennett's view, it was France, in its basic insecurity, that needed help and understanding more than Germany, poverty stricken but also actively revisionist. Henderson, foreign secretary in the second Labour Government, saw the need for a rapprochement with France. But Britain's foreign policy at this time was conducted by others too—by Ramsay Macdonald on the one side and, on the other, by Montagu Norman. Real information on this key figure of the interwar years is still kept largely under the wraps. Mr Bennett's researches produce a few fascinating insights ; and they are not likely to add to the great governor's reputation for foresight, wisdom, or even for the coveted bankers' nous.

Norman, like the Germans, but for essentially different and more respectable reasons, was convinced of the need for "revision," for removal of the drag of reparations and war debts from the financial system. This was sensible enough ; but how could Norman suppose that, in the summer of 1931, revision could be forced on the unwilling French—whose huge balances in London held the key to sterling's own fate? In these circumstances it is quite astonishing to find Norman, of all people, arguing at the height of the German crisis in mid-July that for the French to be brought round the crisis would have to deepen: within ten weeks the crisis had deepened sufficiently to sweep away one British government and one gold standard.

Norman had added to confusion by suggesting cavalierly that the British government should be approached for the loan to Germany that the Bank of England could no longer afford to extend. In Mr Bennett's biting words:

> Irresponsible and inexperienced in diplomacy, Norman promised everything and nothing. It was a basic postulate in this period, especially in London and Washington, that central banks must be independent of government control ; perhaps some thought might have been given to defending the governments against the central banks.

In his conclusion Mr Bennett links the general "lack of perception" to a widespread distrust of politics, of which Norman above all was the apostle—having a deep and unfortunate influence on future central banking disciples. To get reparations out of politics and into the normal stream of commercial life where they would somehow cause no trouble had been the panacea of the twenties ; in 1931 the central bankers found that governments, and politicians, had to bail them out after all. This political distrust, matched by a defeatist negativism in economic policy, was perhaps the ultimate irresponsibility of 1931. The crowning irony of these tragic months is that many men realised what was at stake. When the Hoover agreement was reached in Washington in early July the French ambassador ordered, on his extra-territorial precincts, a bottle of champagne. He proposed a prophetic toast: "To the crisis which we have just avoided and to the catastrophe which will follow."

Far Eastern Common Market?

Australian Diplomacy and Japan 1945-1951

By R. N. Rosecrance.
Melbourne University Press. London: *Cambridge University Press.* 300 pages. 45s.

THE increasingly close relations between Japan and Australia have gone largely unremarked in Britain, but they are bound to become more noticeable if Britain joins the common market. The loss of Australian preferences in Britain will set the Australians free to cancel British preferences in Australia, and replace them, as seems highly probable, with preferences to Japan, who has become too good a customer to disappoint. Although British entry into the common market will certainly stimulate Australian efforts to trade with Europe as a whole, it will also strengthen the existing Australian determination to find better markets in Asia ; Japan, with the most

nor has Japan been selling to China of late, though its growing capacity must affect the market there. Nitrex also hopes to *rationalise* the marketing of nitrogen fertilisers to avoid overlap between the producers, and to arrange barter and long-term credit deals. (The largest customer for this rapidly-consumed product, China, has recently been demanding—and getting—up to 18 months' credit.) Even though the cartel says its activities are to be strictly confined to the export field, as they need be if the agreement is to avoid being banned under the Rome Treaty, it is impossible to avoid comparisons with notorious pre-war cartels.

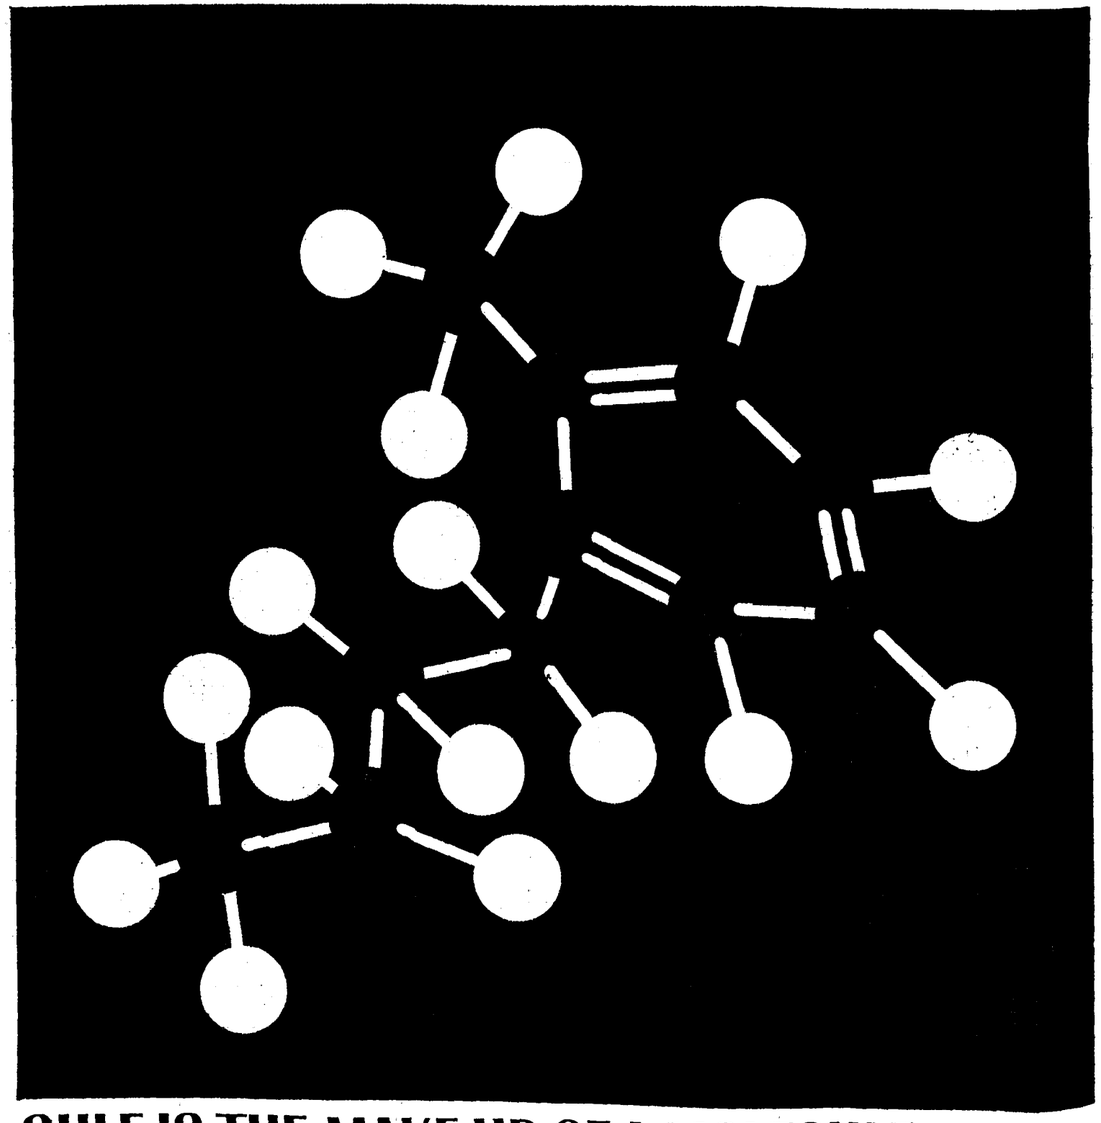
The circumstances which have led to the formation of Nitrex closely resemble those in which the first European nitrogen cartel was set up, in 1930. During the twenties, synthetic nitrogen capacity considerably increased throughout the world and this, combined with an agricultural depression, led to over-production and a fall in prices. The agreement, which sought to maintain prices, to increase nitrogen consumption and to allocate business by quota, came to an end at the outbreak of war and was not revived. Since the war, world nitrogen production has increased to 14 million tons a year and world capacity exceeds it by 2.5 million tons. Existing plans for new plants, if they all materialise, would increase capacity to 23 million tons a year by 1966 ; but much of this increase is planned in India, China and Japan, so that Europe's share of world production will drop. Forecasts of demand differ widely, but it looks unlikely to keep up with capacity. If the present rate of growth continues, total demand for nitrogen (including industrial uses) would reach only 16 million tons by 1966 ; but some manufacturers believe that the total will then be as much as 21 million tons (or 90 per cent of the planned capacity) on the grounds that the present efforts of agricultural missions in various underdeveloped countries might be bearing fruit by then. Certainly, if the base of nitrogen usage could be broadened to include peasant farmers, and if the underdeveloped countries could find the money, there would be a dramatic increase in demand. If not, the surplus capacity could make the attempt by Nitrex to hold prices in the export market very difficult indeed. (All of these figures are expressed as metric tons of nitrogen ; the actual tonnages of the various fertilisers are three to six times as much.)

Trade in fertilisers, excluding that within the Communist block, accounts for a quarter of world consumption ; a fifth of this is "cyclic movement" (e.g., from the West Coast of the USA to West Canada and East Canada to the Eastern States). In the world market proper, therefore, about 2½ million tons were sold last year, of which European exporters supplied 1.8 million tons. The biggest single buyers in the export market are government agencies in China, India and Pakistan ; though these countries buy only 360,000 tons, 180,000 tons, and 70,000 tons respectively, this bulk buying gives them the power to offer very large contracts. The main reason why Nitrex has been formed is to make the European producers into a unit large enough to hold the line against them on prices. None of the producers want to repeat the experience of 1954, when China trailed temptingly large contracts from one country to another and brought export prices crashing.

A third factor in nitrogen supply has been an improvement in the techniques of ammonia manufacture which, although it has helped to ease the smart of slashed prices, has raised another bogey to frighten European producers. It may now be more economic to make ammonia at a source of cheap energy and feedstock (usually natural gas) and ship it to the markets than to ship the feedstock and make the ammonia in a "market-located" plant. Current plans to build plants in Trinidad, Kuwait and other surprising places, have to be taken into account by any European producers with plans to build plants themselves. Contracts for ammonia from these, as yet unbuilt, "source-located" chemical plants have been offered very cheaply in Europe and have contributed to the pressure on export prices, which have fallen by a half in the last ten years. The producers themselves have added to these pressures by competing for some markets as much for political as for business reasons. The formation of Nitrex has been accepted as inevitable since the mid-fifties, and prices have often been slashed to gain a foothold in some market to establish a strong share from which to bargain when quotas came to be allocated.

MEMBERS of Nitrex include Germany's three main producers: Ruhr-Stickstoff, BASF and Hoechst ; a selling organisation representing all Italian producers except ANIC ; the sole manufacturers of nitrogen fertilisers in Austria, Switzerland and Norway, respectively ; and the central selling organisations of Belgium, Holland and France. In many of these, governments have a financial interest and thus find themselves in the position of being, indirectly, parties to a cartel. Of Europe's main producers only ICI—a moving spirit behind the pre-war cartel—and ANIC are not associated. ANIC is a maverick whose arrival in the Italian market with fertilisers based on natural gas precipitated a price war, but it is said not to be entirely unsympathetic to Nitrex and may even consider joining. ICI has said that it has taken no decision ; it is certainly considering the matter and has made enquiries at Nitrex into the nature of the association. The two other British producers, Fisons and Shell, are both indirectly involved through interests in Dutch subsidiaries.

If Britain joins the common market, ICI will probably have to join, as a defensive measure. Although any restriction of competition within EEC by associations has been specifically forbidden in the Rome Treaty it seems possible that members will want to avoid the sort of unpleasantness that might arise from competing in each other's home markets. If this became the policy of Nitrex, the association would soon lose whatever acceptance it may now have from EEC. It has therefore had to confine its aims very clearly and completely to export, and if it sticks to them, it may serve the interests of Europe's nitrogen producers effectively. It is too soon to see how the arrangement will work ; many administrative details have yet to be agreed, for instance the exact allocation of quotas. The testing time will come when the Chinese come into the market again and for the first time find the European producers united in their determination to stabilise prices. The chemical companies which make nitrogen, the European governments whose capital is invested in most of them and the coal interests for which it is such an important market are determined to lift the market out of its present anarchic conditions. But if they imagine they can stabilise prices against the bulk buyers in the face of vast surplus capacity, they are probably overestimating their power to rig the market.

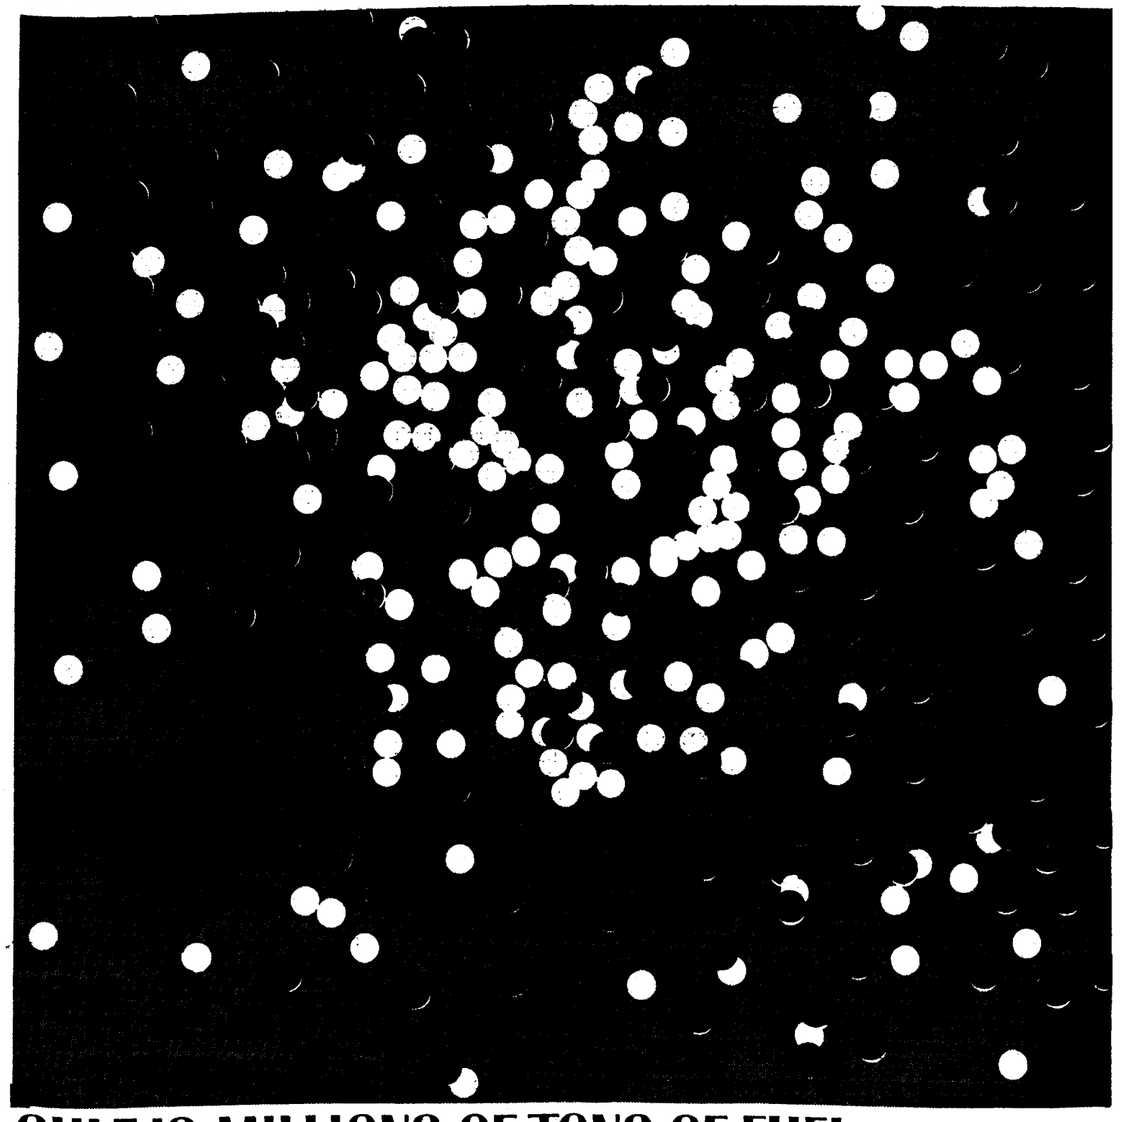


GULF IS THE MAKE-UP OF A MOLECULE

GULF IS OIL Across the world, the great Gulf complex covers every aspect of oil. From the Harmarville laboratories near Pittsburgh, where the smallest petroleum molecule is probed, to well heads in Texas, Kuwait or Venezuela, where output is measured in millions of tons—Gulf *is* oil. Gulf is tens of thousands of people whose combined skills produced 77 million tons of crude oil in 1961 and more than 400 different petroleum products. Motor fuels; lubricating and insulating oils; oils to keep machinery cool; oils to keep houses warm—Gulf supplies all these and many more. Gulf *is* oil at work for you.

GULF—ONE OF THE WORLD'S GREAT OIL ORGANISATIONS
GULF OIL CORPORATION, PITTSBURGH, PA., U.S.A., AND THROUGHOUT THE WORLD

GULF



GULF IS MILLIONS OF TONS OF FUEL

"Hers" private planes, Nieman-Marcus, the Dallas-Fort Worth rivalry, bootleggers, voracious art collectors, "Wop Salad" (mixed green salad), $50,000 poker games, and swimming pools where the water level drops six inches as one steps in, ensuring that there will be no splash. Yet as the book chronicles the Texan pursuit of bigness into every aspect of life, from the oversized souvenir teacup ("Texas Demitasse") to religion (75,000 children and adults go to Sunday School every Sunday in Dallas), it becomes monotonous; the subject was better suited to a series of articles. As it stands, to paraphase James Thurber's favourite review, that of a nine-year-old girl after reading a thorough book on penguins, "This book told me more about Texas than I wanted to know."

As Economists See Us

Main Currents in Modern Economics

By Ben B. Seligman.
Free Press. (*Macmillan*: New York). 896 pages. $11.75.

ANY historian of economic thought writing about a period too recent to possess the charm of antiquity suffers from the inherent disadvantage that his subject matter is to a considerable degree either banal or worthless. Ideas that have been incorporated into the fabric of the subject seem dull, just because we are used to them, while ideas that have been rejected have usually been rejected for very good reasons, so that their rehearsal is rather tedious.

Given this handicap, Mr Seligman, who starts his story in 1870 and carries it on to the present day, has sticceeded in writing a surprisingly lively book. He has done this by expressing his personal opinions fairly freely. Brought up as an institutionalist, he regards economics as part of the general theory of social systems; he wants to know what is the "image of man" provided by an economic theory. This explains his readiness to take seriously what many people would regard as the maunderings of many neo-classical theorists, and it also explains his mistrust of pure model-making. Those who take a pragmatic and workmanlike approach to economics may share this mistrust for quite different reasons.

The most obviously striking feature of the book is its bulk. However, the economists whose work is discussed range from Max Weber to Milton Friedman and from Rosa Luxemburg to Arthur Lewis. Furthermore, the treatment is fairly detailed; as many as eighteen pages, for instance, are devoted to Professor Hicks, all of whose major works are discussed. This explains why there are eight hundred pages in the book, and may tempt the reader to wonder whether one man really was able to write them all. As with Homer, however, stylistic consistency argues against multiple authorship.

Any arrangement of the material in a book of this sort is bound to be arbitrary to a certain extent. Mr Seligman's narrative runs smoothly, which is a tribute to his scheme of classification. The scheme is such that two of the nine chapters are almost wholly devoted to American writers; one on the institutionalists (Veblen to Galbraith) and one on the neo-classical economists (Ely, Taussig, Fisher, etc.). Since some of these writers are no longer well known in this country, these two chapters are probably the most interesting to an English reader.

The main drawback of the book is that many of the summaries of particular theoretical works are too long to interest the reader who knows them anyway, without being sufficiently full and rigorous to satisfy the reader who wants to learn economic theory. On the whole, therefore, this is a book for the more advanced student who is ready to skip here and there. With a book of this size, however, there is plenty of scope for skipping and no other book offers the same encyclopaedic coverage. Mr Seligman's survey is no substitute for a systematic training in modern economics, but it would be a stimulating supplement to such a training.

Exercising Patronage

Aucuparius: *Recollections of a Recruiting Officer*

By Ralph Furse.
Oxford University Press. 345 pages. 35s.

WHEN Harcourt took over the Colonial Office towards the end of 1910, Sir Ralph Furse became one of his private secretaries (at £150 a year unestablished). He owed the job to the recommendation of his predecessor, "an old Balliol friend." The occupant of this post was mainly concerned, not with the ordinary run of "private office" work, but with the exercise of the Colonial Secretary's Patronage—the recruitment of all junior officers in the higher grades of the colonial services (except administrative and police posts in Ceylon, Malaya and Hongkong, which were filled, like their Indian counterparts, by competitive examination). For all the casual way in which he was himself appointed, Furse could claim some qualifications for the job. At Eton, he had won an Empire League prize for an essay on "the ideas expressed in the word Empire." At Oxford, he had joined, with "a number of Rhodes scholars," a Yeomanry regiment, the "King's Colonials." And he had spent a fortnight in Ceylon and so claims that he found himself "one of the very few men" in the Colonial Office "who had ever seen a colony." (It is a recurrent complaint, but, in fact, of the twenty-two men who during his first year in the office held posts of what we should now call principal and above, ten had either served in, or paid official visits to, at least one of the territories for which he was responsible.)

This book, besides giving a delightful vignette of the prewar Colonial Office, describes how the rather haphazard "patronage" of 1910 was transformed into a defensible system of selection (which in many respects foreshadowed the underlying ideas, though not the techniques, later developed for the Foreign and Home Services by the Civil Service Selection Board). In the process, recruitment was enormously improved by imaginative co-operation with the universities; scholarship schemes were evolved in many professional and technical fields, and the foundations laid for academic study of developing countries. Events no doubt overtook the "job analysis" on which Furse based his work: the transfer of power called for men with different qualities than those most needed in the often isolated district officers of Furse's first decade or so. But in the inertia of the inter-war years a radical would almost certainly have achieved much less than this dedicated member of the establishment.

Mancunian Scrap-book

Manchester and its Region

Published for The British Association by the *Manchester University Press.* 283 pages. 30s.

THIS book both gains and suffers from its special purpose which is to commemorate this year's meeting of the British Association in Manchester. It gains from the breadth of the learned contributions which, following the varied instincts of association members, have been brought to bear upon the history and character of Manchester and its surroundings. It suffers from an inevitable electicism which turns the book into a scholarly scrap-book that is curious and wide-ranging but somewhat uneven and disjointed.

The eager dipper for facts about the Manchester region will find them here in abundance. The longest chapter deals, appropriately enough, with climate (not as bad as supposed), and landscape, geography, flora and fauna, history, industry, medicine, education, town planning, and many other subjects (e.g. some social pioneers) are all included. The one thing generally lacking

A weekly service for business executives covering world economic trends

Highlights: Concise analyses of important events in a number of countries.
European Integration: The latest news from the E.E.C. and of U.K. negotiations.
Special Survey: This week covers economic prospects in Turkey.
THE ECONOMIST INTELLIGENCE UNIT LIMITED
5 Bury Street London, SW1 Tel: WHI 0353 Ext 35
60 East 42nd Street, NY 17 Tel: Murray Hill 7-6850

is lightness of touch and one longs for a few pages of Neville Cardus describing cricket at Old Trafford or concert-going in the old days of the middle-class hegemony. In consequence, the history and character of Manchester emerge in very neutral tints. This is the kind of stolid, factual book which would have won the Prince Consort's praise over a century ago; but perhaps that too is an appropriate tribute to the city in question.

China's New Pattern

China

By Victor Purcell.
Benn. 340 pages. 37s. 6d.

PROFESSOR PARKINSON might say that the number of books published about a foreign country is in inverse proportion to the knowledge and understanding of it among those who write books. The present spate of books on China certainly reflects this. Modern China is usually explained according to the theory that the country is run by devils, or, alternatively, by Marxist gods. In such circumstances balanced judgments are welcome. This Mr Purcell provides. For many years he looked after the interests of the Chinese community in Malaya in his official capacity as Protector of Chinese. He has a good first-hand knowledge of China itself. With intelligent sympathy he explains the special Chinese outlook with reference to China's past, and how Chinese discipline and self-sacrifice are characteristic of all mass movements seeking change. Thus, he argues, the Chinese feel free and have actually fared much better under communism than under former regimes, for all that Mr Dulles thought them slaves. The wide scope of the book allows the theory of the Overseas Chinese being a fifth column for communism to be placed in perspective. What Mr Purcell says about Tibet is a refreshing change: far from being an idyllic retreat from the London rush-hour, it was a primitive feudal society with little to commend it.

Dr Joseph Needham is quoted as saying that the lengthy historical introduction is brilliant. As he is the most quoted source in that introduction, and as Mr Purcell does not skilfully bring together the main strands of Chinese pre-communist development, there is little beyond mutual admiration to explain this. Mr Purcell is tedious when he gets down to politics. To be balanced and readable seems too difficult; it is a pity.

Paperback Selection

The latest entrant to paperback publishing is the firm of Duckworth, which has reissued four of its "Great Lives," all at 5s.

Below is a guide to some of the paperbacks received by this journal in recent weeks:—

Biography:

OLIVER CROMWELL. By C. V. Wedgwood. 144 pages.

BACH. By E. Meynell. 140 pages.

NAPOLEON. By H. Butterfield. 143 pages.

DICKENS. By B. Darwin. 135 pages. (Great Lives series.) All 5s. *Duckworth.*

Current Affairs:

WORLD EVENTS 1962. 617 pages 15s. *Penguin.*

POLITICS IN AFRICA: *Prospects South of the Sahara.* By H. J. Spiro. 191 pages. $1.95. Spectrum. *Prentice-Hall.*

DIVIDED GERMANY AND BERLIN. By N. J. G. Pounds. 134 pages.

RUSSO-CHINESE BORDERLANDS. By W. A. D. Jackson. 131 pages.

SPAIN IN THE WORLD. By S. Bradford. 126 pages.

PACIFIC ISLAND BASTIONS OF THE UNITED STATES. By H. Wiens. 131 pages. (Searchlight Books.) All 12s. *van Nostrand.*

History:

CICERO AND THE ROMAN REPUBLIC. By F. R. Cowell. 415 pages. 8s. 6d. Pelican. *Penguin.*

PROTESTANT THOUGHT BEFORE KANT. By A. C. McGiffert. 281 pages. 11s. 6d.

THE MISSION AND EXPANSION OF CHRISTIANITY. By A. Harnack. 548 pages. 17s.

THE MIND OF MODERN RUSSIA. Edited by H. Kohn. 310 pages. 13s. 6d.

REVOLUTION FROM 1789 TO 1906. Edited by R. W. Postgate. 414 pages. 15s. Harper Torchbooks. *Hamish Hamilton.*

Literature and Literary Criticism:

LECTURES IN CRITICISM. Edited by E. Coleman. 217 pages. 11s. Harper Torchbooks. *Hamish Hamilton.*

SELECTED POETRY OF W. B. YEATS. 253 pages. 5s. *Macmillan.*

THE STORY OF THE BIBLE. By H. van Loon. 352 pages. 5s. *Maybuecker.*

THE DEAD SEA SCROLLS IN ENGLISH. By G. Vermes. 255 pages. 4s. 6d. Pelican.

SELECTED POEMS OF YEVTUSHENKO. Translated by R. Milner-Gulland and P. Levi. 92 pages. 2s. 6d.

THE PENGUIN BOOK OF CONTEMPORARY VERSE. Edited and revised by K. Allott. 413 pages. 6s.

ALTONA, MEN WITHOUT SHADOWS, THE FLIES. By Jean-Paul Sartre. 316 pages. 4s. 6d. *Penguin.*

Philosophy and Logic:

THE SPIRIT OF CHINESE PHILOSOPHY. By F. Yu-Lan. 238 pages. 9s.

THE DEVELOPMENT OF MATHEMATICAL LOGIC. By P. H. Nidditch. 96 pages. 7s. 6d.

AXIOMATICS. By R. Blanché. 70 pages. 7s. 6d. *Routledge.*

THE TRAGIC SENSE OF LIFE. By Miguel de Unamuno. 319 pages. 8s. 6d. Fontana. *Collins.*

Politics, Political History and Thought:

THE OPEN SOCIETY AND ITS ENEMIES. Vol. I.: Plato. By K. R. Popper. 362 pages. 10s. Vol. II. Hegel and Marx. By K. R. Popper. 420 pages. 10s.

THE ROAD TO SERFDOM. By F. A. Hayek. 192 pages. 7s. 6d. *Routledge.*

THE LAST EMPIRE. By R. Conquest. 132 pages. 3s. 6d. *Allen and Unwin.*

PLANNING FOR FREEDOM. By L. von Mises. 188 pages. $2.00. *Libertarian Press.*

INTERNATIONAL POLITICS IN THE ATOMIC AGE. By J. H. Herz. 368 pages. 14s. *Columbia University Press.*

Science, Sociology, Psychology:

CHILD TRAINING AND PERSONALITY. By J. W. M. Whiting and I. L. Child. 359 pages. 12s. 6d.

RECEPTORS AND SENSORY PERCEPTION. By R. Granit. 377 pages. 15s. *Yale University Press.*

THE PSYCHOLOGY OF INSANITY. By B. Hart. 138 pages. 6s. 6d.

VIRUSES. By K. M. Smith. 134 pages. 12s. 6d. *Cambridge University Press.*

THE PHYSICS OF MUSIC. By A. Wood. 270 pages. 12s. 6d. *Methuen.*

SCIENCE IN THE MAKING. By J. H. Hildebrand. 116 pages. 9s. *Columbia University Press.*

MALE AND FEMALE. By Margaret Mead. 413 pages. 6s.

ANATOMY OF PRISON. By H. J. Klare. 159 pages. 4s.

HUMAN HEREDITY. By C. O. Carter. 266 pages. 6s.

KNOW YOUR OWN I.Q. By H. J. Eysenck. 191 pages. 3s. 6d.

THE SIMPLICITY OF SCIENCE. By S. D. Beck. 239 pages. 4s. Pelican. *Penguin.*

TIME'S ARROW AND EVOLUTION. 2nd edition revised by H. F. Blum. 234 pages. 12s. 6d.

MODERN THEORIES OF DEVELOPMENT. By L. von Bertalanffy. 218 pages. 11s. 6d. Harper Torchbooks. *Hamish Hamilton.*

SATELLITES AND SCIENTIFIC RESEARCH. By D. King-Hele. 240 pages. 9s.

SELF-ANALYSIS. By K. Horney. 309 pages. 10s. *Routledge.*

Miscellaneous:

COAST TO COAST. By J. Morris. 243 pages. 9s. 6d. *Faber.*

LONDON. (Benn Pocket Guide). 160 pages. 6s. *Benn.*

CHRISTIANITY, DIPLOMACY AND WAR. By H. Butterfield. 128 pages. 2s. 6d. Wyvern. *Epworth.*

THE BOOK OF SNOBS. By W. M. Thackeray. 276 pages. 7s. 6d. Dolphin. *W. H. Allen.*

AN INTRODUCTION TO JEWISH BIBLE COMMENTARY. By B. M. Casper. 134 pages. 7s. 6d. JUDAISM AND ISLAM. By E. I. J. Rosenthal. 170 pages. 7s. 6d. *Yoseloff.*

THE HIGHER LEARNING IN AMERICA. By R. M. Hutchins. 138 pages. 10s. 6d. *Yale University Press.*

THE RAILWAYS OF BRITAIN. By O. S. Nock. 224 pages.

THE RACING CAR. By C. Clutton et al. 247 pages.

SWITZERLAND. By J. Russell. 192 pages. All 5s. *Batsford.*

ELEPHANTS. By R. Carrington. 285 pages. 8s. 6d. Pelican.

SCOOTERING. By J. Stevens. 263 pages. 5s.

BANDOOLA. By J. H. Williams. 207 pages. 4s. NO ROOM IN THE ARK. By Alan Moorehead. 219 pages. 5s. *Penguin.*

THE SURVIVAL OF THE PAGAN GODS. By J. Seznec. 390 pages. 17s. Harper Torchbooks. *Hamish Hamilton.*

PAPERBACKS IN PRINT JUNE 1962. 390 pages. 3s. 6d. *Whitaker.*

without air conditioning...

will it soon be obsolete?

Make sure your new building *stays* new . . . with the advantages of air conditioning. Workers, customers, guests all prefer the quieter, cleaner, more healthful atmosphere of an air conditioned building.
Within a very few years, judging by the present worldwide trend, air conditioning will be essential for the profitable operation of commercial and industrial buildings. You're protecting a huge investment when you add the small additional cost of air conditioning.
Air conditioning ensures automatic all-the-year-round control of temperature, humidity, air movement and air cleanliness. And the economical time to install it is now, at planning stage. Ask your architect to discuss its many advantages with you.

CONTROLS BY HONEYWELL—
international experts on every aspect of air conditioning—are an important part of the systems in these recently completed buildings:

- A.E.I. Ltd, Lincoln
- B.O.A.C. Air Terminal, London
- Commercial Union Assurance Company, Exeter
- Imperial Hotel, Torquay
- Wilton Hotel, London

COMMONWEALTH ATTITUDES—1

Australia Takes a Cooler Look

FROM A CORRESPONDENT IN AUSTRALIA

IN the eight weeks leading up to next week's Commonwealth talks in London Australian opinion about the common market has altered somewhat. It is a vague and fluid opinion, but an extreme sense of grievance seems to be *démodé*. In this connection some interesting shifts of public and parliamentary favour have lately been observed in the snakes and ladders of democratic politics.

The prime minister, Mr Menzies, who had been having snake trouble for a long time, has gone up a ladder. Between his return from London and Washington in July and his departure this week for the Commonwealth prime ministers' discussions about the common market, his utterances on that subject have been notably statesmanlike. There has been none of the emotionalism or exaggeration of Australia's misfortunes which the former minister for air, Mr Bury, castigated in July in the speech that cost him his job. One has the impression that in his recent talks overseas Mr Menzies was impressed, both in London and Washington, by the arguments in favour of Britain's entry. Having stated Australia's interests as forcibly as possible, it seems that he does not want the responsibility for causing Britain to drop the common market project against its better judgment.

There is still room for a clash about political union. Mr Macmillan's exchange with Dr Adenauer has made plain the British Government's intention to join in a European political union—though without making clear just what measure of political union he has in mind. Mr Menzies, for his part, made his position plain in a speech on August 9th when he recorded his unqualified opposition to Britain's membership of a European federation, but his approval of closer political arrangements and co-ordination of policies. His stand appears to have been misinterpreted by some British papers as a shift in the grounds of opposition—as "second thoughts." But it is what Mr Menzies has always said.

As one who has worked for the Commonwealth connection all his political life, he cannot easily contemplate the weakening of its structure that would follow a part-abrogation of sovereignty by one of its members. It is on the economic issues that his opposition appears to have been somewhat modified, and this principally because of the reassuring nature of his conversations with President Kennedy, of whom he said, "I am sure that he is our friend." Mr Menzies appears to feel that in view of the mutual understanding that was achieved, and of the substantial identity of Australian and American trading interests in relation to the common market, American influence will be used to prevent the common market from adopting price and tariff policies that would be too injurious to Australia.

Mr John McEwen, the minister of trade, has slithered down a snake. One reason for this is the impression that, unlike Mr Menzies, he failed to win the sympathy of the Americans, ending by roughly telling them (in a speech made after his return to Australia) that if they would not help they should "get out of our hair." He has also lost support over the Bury affair. Quite apart from the fact that many people agreed with Mr Bury, the parliamentary Liberals have resented Mr McEwen's attack on their colleague, and those who had been thinking that the leader of the Country party would make a better successor to Mr Menzies than anyone in their own ranks seem to have changed their minds. Mr Bury himself, paradoxically, has gone up a ladder with his relegation to the back benches, and many members of the general public, who until then had never heard of him, now remark how nice it was to have a minister with a mind to speak, or that his economic expertise all too briefly filled a long-felt want in the cabinet.

Up a ladder goes Mr Gough Whitlam, the deputy leader of the opposition. He has had a chance to prove his quality during the past month while his leader, Mr Arthur Calwell, has been in hospital. Labour supporters of the traditional type, more accustomed to crude repartee from their leaders than to measured or thoughtful utterances, were stunned into unwonted silence by three important speeches packed with information by their deputy leader. One of these was on the common market, about which Australian policy is bipartisan; Mr Whitlam aimed at the chink in the coalition armour by suggesting that the negotiations might have gone better for Australia if the outlook had been "more global and less selfish." He also remarked that Mr McEwen "could not resist the opportunity to blame Britain's application to join the European common market for the deterioration and deficiencies of Australia's trading pattern."

Nowhere, of course, is there any disposition to undermine the analysis of possible effects that forms Australia's case to the Six. What has changed, with a better understanding of the issues involved, is the emotional atmosphere. This creates a better background for statesmanship at the conference; Australia can now no longer be heard yelling that it has been stabbed in the back by mother.

COMMONWEALTH ATTITUDES—2

The New Diefenbaker

FROM OUR CANADIAN CORRESPONDENT

THE John Diefenbaker who arrived in London yesterday for the Commonwealth prime ministers' conference may not strike his colleagues as a silent or a cautious man. That will depend upon their standards. But by the previous Diefenbaker standards he has appeared to his fellow countrymen as both laconic and prudent ever since the June events which left him and his ministers in a state which one of them frankly described as shellshock. Without doubt Mr Diefenbaker has seen a hard summer. The election campaign revealed a startling change in the public reaction; the contrast to the enthusiasm of 1958 visibly upset him. The results, cutting his House of Commons following from over 200 to 116 and leaving him in a precarious minority against three opposition parties, represented a rebuff which few of the leading Conservatives had been able to contemplate before it happened.

Staggering under this bitter blow, the Diefenbaker cabinet was presented on the very next day with the exchange crisis—a drain of reserves and a run on the Canadian dollar which had been predictable (and had, indeed, been predicted) for weeks before the election, but which they had not allowed themselves to recognise. Within a week they had to introduce emergency measures that contradicted everything they had been saying during the campaign —import surcharges, tight money, higher interest rates, cuts in government expenditure. Mr Diefenbaker's announcement of June 24th on what the public has, with exaggeration, called "the austerity programme" is the last word he has vouchsafed to the public on major policies. Last month he made some changes in his cabinet, in particular removing Mr Donald Fleming from the ministry of finance to the ministry of justice and bringing in by way of the senate a minister without portfolio from the business world, Mr Wallace McCutcheon, former vice-president and managing director of the Argus Corporation. He replaced Mr Fleming with a hardy Nova Scotian, Mr George Nowlan, who had formerly been minister of national revenue.

Slight as these changes may appear, they may portend a more coherent, down-to-earth approach than ever seemed possible in the continual atmosphere of tension between Mr Diefenbaker and Mr Fleming which marked the previous government. But that remains to be seen. Whatever plans the new ministers may make to replace the emergency measures by "a positive and constructive programme" as promised, nothing has been revealed. Regrettably, but perhaps inevitably, consideration of basic policies is hopelessly confused with the political calculations of a government which cannot stay in office without support from one of the three opposition parties. If the Liberal leader, Mr Lester Pearson, with his 100 followers, introduces a short general motion of no confidence at the beginning of the session which starts on September 27th, the Conservatives cannot survive without support either from the 30 Social Crediters or the 19 members of the New Democratic party. The New Democrats are not likely to save Mr Diefenbaker. The maze of contradictory statements from Social Credit leaves their position as uncertain as a poker hand. The nominal leader, Mr Robert Thompson from Alberta, has sounded as though he were prepared to keep the government in. The deputy leader from Quebec, M. Real Caouette, has contradicted himself so often that no one can tell where he may land on the day. But M. Caouette is the apparent leader of the 26 Social Credit members who come from Quebec. Even if Mr Diefenbaker tried to reach an understanding with Social Credit, it looks as though it would be like going into partnership with an eel.

THE silence and caution that have marked Mr Diefenbaker's approach to all these pressing domestic problems seem also to extend to the British proposals for entry into Europe, and again they make a striking contrast to the position Canadian ministers were taking barely a year ago at Accra. For all their earlier fuss, they are now accepting the implications of the Brussels negotiations and the Kennedy trade expansion programme. Both the finance department and the department of trade and commerce are laying repeated stress on the freer trading world to which Canada must adapt itself, and the minister of trade, Mr George Hees, is exhorting Canadian industrialists to make themselves competitive in world markets instead of relying on protection.

Mr Hees has not gone to London with Mr Diefenbaker. The only minister with him is Mr Howard Green, the minister of external affairs, and Mr Green's fervent aim will be to draw a discreet veil over what happened at Accra and demonstrate the fullest possible spirit of Commonwealth co-operation. Neither he nor Mr Diefenbaker is qualified by interest or knowledge to enter into detailed discussion of the trade questions occupying the Brussels negotiators. They are both concerned, by instinct and tradition, with the political future of the Commonwealth. In this, as Mr Diefenbaker showed during the discussions about South Africa, their thinking is nearer to that of the Labour party than to that of many British Conservatives. The Commonwealth link between the old dominions, Africa, India and Asia has a very high value in their minds. Methods for securing continued political co-operation in the Commonwealth are likely to receive far more emphasis from them than any of the knotty trade problems still outstanding at Brussels.

Mr Nyerere's Wheelbarrow

FROM OUR SPECIAL CORRESPONDENT

IT has become a habit for Tanganyika cabinet ministers, when they reach the last item on their agenda, to adjourn to the Dar-es-Salaam suburbs in their work-clothes and toil away through the evening at their "Any Other Business"; this is digging foundations for houses and laying new roads. Not only does this set a good example to their nine million countrymen in the national campaign of self-help schemes; everyone who has sweated alongside them (including one blistered high commissioner) agrees that they enjoy it. Long after the photographers have gone, Mr Rashidi Kawawa, the prime minister, is swinging his hoe and Mr Julius Nyerere is trundling a wheelbarrow. Cynics will say it is simply good mental therapy after facing the less tractable problems of pushing along the government of a poor country. But it is more than that: it is, for instance, an illustration of Mr Nyerere's thesis that Ujamaa (familyhood) is the basis of African socialism; the family is one in which everyone takes a hand with the hoeing.

Nomination day passed this week with one undaunted man challenging Mr Nyerere for the post of president of the new republic in December. But nobody gives Mr Zuberi Ntemvu a ghost of a chance of winning against the Father of the Nation. His Tanganyika African National Congress holds only a few district council seats. Mr Nyerere is thought of as president-designate already, and it seems as though he has never ceased to be chief executive. This is in part because he and Mr Kawawa have worked so harmoniously and closely together since his resignation in January. Mainly it is because the most important matters legislated on during these last eight months have been just those that Mr Nyerere had decided to tackle after he resigned. He has never had a moment to put down his political wheelbarrow.

Mr Nyerere has said that he decided to resign after hearing members of his party's national executive (which includes trade union leaders) refer to the newly independent government as "they." Opinions naturally differ about the degree of success he has had in bridging the gap between the government and the Tanganyika African National Union branches, and between TANU and the Tanganyika Federation of Labour. But most would say that his policies—and the government's subsequent laws—are along the right lines. The appointment of nine TANU stalwarts as regional commissioners was swiftly justified. Civil servants who mistrusted a plan for "political commissars" were soon relieved to have someone else shouldering the responsibility for political decisions. And the regional commissioners quickly became mature leaders, almost sahibs, extolling the worth of the three-year development plan, lecturing councillors about the irresponsibility of drinks before sun-down or giving schoolchildren a pound for singing the national anthem in tune.

Criticism arose only when this system for binding the regions more closely to the central government was extended in May to the appointment of area commissioners to take over the more public powers of the district commissioners. It has been difficult to find 56 party men of reasonable education and calibre, not already highly

placed in government, to take these posts. In addition, local government officers began to be appointed last month to advise—even to instruct—the district councils (all TANU men) how to do their business. They have been mainly drawn from the ranks of the African district officers, while the remaining European district officers have headed for non-political posts such as local courts officer. The African district commissioners, now renamed area secretaries, and the National Assembly members who find area commissioners guiding the district councils and taking all the political decisions in their constituencies, are inclined to question the usefulness of area commissioners, and even to suggest that the whole structure may warp under the weight of too many politicians with executive powers. But the minister for local government, Mr Job Lusinde, is happy about the experiment; he says that the powers of the councils have on the whole been increased rather than circumscribed.

The new republican constitution, which gives the president (in Mr Nyerere's own words) "terrific powers," has been accepted without demur, except by a few non-Africans who regret the absence of any Bill of Rights. More specifically, they worry about the attitude of mind of the leaders who dismissed plans for a Bill of Rights. It is, they say, the attitude of men who argue, "We must not tie our hands in circumstances we cannot foresee." All, however, accept as valid the government's argument that a Bill of Rights could stir racialism by bringing the executive into conflict with the judges on political matters at a time when the judges are all non-African. And the adoption of the Ghanaian method of interlocking the election of the president with that of the majority party is thought a sound means of both making him the popular choice and ensuring that the Assembly is his effective partner, in contrast to the American pattern.

SUCCESS with the trade unions has yet to come. The leaders of the Federation of Labour have sucked through the sugar on the Trades Union Act, which compels all unions to affiliate with the federation and employers to operate a "check-off" system for collecting union dues as well as a provident or pensions scheme. They find the undercoating bitter, since the right to strike is restricted to those rare cases where both sides in a dispute agree not to go to arbitration. The new machinery may run smoothly once it is rolling, but at present union officials dislike being deprived of their steering wheel. When the Tanganyika High Commissioner in London, Mr Christopher Tumbo, resigned ten days ago for "political reasons" it was freely predicted that he might try to build an opposition round the unions and other dissident groups, such as those who resent chiefs losing their administrative powers. But Mr Tumbo, as a railwaymen's leader, watches his signals carefully and will not head down a line where the track is unsure.

In foreign policy Mr Nyerere should return to a happier situation than the one he left in January. On the eve of independence he said, "We will not allow our friends to choose our enemies for us." Since then Tanganyika has set about reconciling one incipient foe, Zanzibar, and has picked two notable new friends, Israel and Guinea. President Sekou Touré had to cancel his visit last month, but promises to come soon. Israel has been making an increasing impact, with 200 short-term bursaries (including one for Mr Nyerere's wife), and offers to train six Tanganyikan pilots, build and help to run a 200-room hotel and run the government's chain stores.

Reconciliation with the Zanzibar Nationalist party began at the Pan-African Freedom Movement for East, Central and Southern Africa conference in May. Suspicions have eased since last year, when the ZNP put most of the blame for the election riots on hooliganism by mainlanders and speeches from a TANU visitor. However, Tanganyika immigrants now face stiff hurdles on entry into Zanzibar, and in reprisal Tanganyika demands a £50 deposit from every Arab landing from the islands. In May PAFMECSA instructed its Kenyan secretary-general, Mr Peter Koinange, to mediate between the ZNP and the Afro-Shirazis, and his work has been frustrated (temporarily, at least) only by the Afro-Shirazi leaders' failure to sell the idea of a political bargain to their followers before the news got out unofficially. Mr Nsilo Swai, Tanganyika's ambassador to the United Nations, was cross-examining the ZNP delegation harshly as late as July, but the avowed aim now is friendship with all (including the Arabs of the ZNP) and encouragement to join an East African federation.

Meanwhile, the rest of East Africa shows some signs of drifting apart, as each territory propounds different views on the position of chiefs, on land tenure, on trade unions and on the structure of the administration. Mr Nyerere, as president-apparent and for two years the leading advocate of an East African federation, has a heavy load of problems dumped in his wheelbarrow.

Put Out Two Flags

FROM OUR BONN CORRESPONDENT

AS befits his more soldierly habit, President de Gaulle seems to have had a conception clearer than Dr Adenauer's of the immediate achievable aim of his visit this week to the German Federal Republic. The general's primary objective has been quite openly to win the hearts of the German public at large for the constructive, reconciliatory work of a very small minority of Frenchmen and Germans. To this end he set out to show himself to the crowds in Bonn, Cologne, the Ruhr, Hamburg, Munich and Stuttgart—a lone, undeniably lofty symbol of the incredible thing that has happened within the space of ten to twelve years.

At the August Thyssen steelworks (one of the bigger fish in the European coal and steel pool), at a Bundeswehr officers' training college at Hamburg, and at a youth rally in the grounds of Ludwigsburg castle, he has chosen to address himself also to significantly representative audiences. The operation has been planned with precision and imagination, the state visitor himself having meticulously vetted the disposal of every minute of his time. The preparatory exchanges between the protocol men in Paris and Bonn, with the president breathing down their necks, have been well in the tradition of the finicking between the Bourbon and the Hapsburg courts concerning the handing over of the bride, Marie Antoinette, in that diplomatic no-man's-land of a tent on the Rhine island near Strasbourg.

At the Bonn end—having a last glorious fling as chief of protocol before he leaves for New York next week to serve as German observer at the United Nations—Herr Sigismund von Braun has sedulously briefed all regional masters of ceremony. The pageantry of the president's entertainment, he enjoined, must put that of all preceding state visits in the shade. And so, this Saturday and Sunday, Munich will be dutifully putting out more flags and doing its cheerful Bavarian best to turn its most embarrassing ghost, the late Adolf Hitler, green with envy.

To Dr Adenauer this is almost certainly not enough. The 86-year-old German is in much more of a hurry than is the 71-year-old Frenchman. By now the chancellor takes the francophile sentiments of his countrymen for granted, and probably regards the hubbub of the state visit largely as a waste of time. He would like to have been able to see more of the president alone, so that the two might have tried to give more shape and substance to their ideas for unifying western Europe politically. In the event, they were allotted only some four hours at the most for private talks in Bonn, and those interrupted by the interpreters. True, they are meeting again, rather publicly, in the provinces, and their foreign ministers are being given a chance from time to time to talk quietly in the background. But it is

cold comfort to Dr Adenauer to see this question of European political unity handled by Herr Schröder, who is so much less inclined than he to put a jealous, or exclusive, interpretation on the rules of admission of the European club.

Some days before his arrival in what the west German radio gamely continues on solemn occasions to call "the provisional federal capital," President de Gaulle let it be known through the German embassy in Paris roughly what he would like to talk about with Dr Adenauer. His agenda had three main headings—European union, Britain's entry into the common market, and Berlin and East-West relations. The president intimated further that he did not wish to discuss on this occasion exclusively Franco-German questions ; and, at any rate up to the last moment, there was no intention on either side of airing the problems arising from French plans for developing an independent nuclear force.

There being little new at this moment to be said about Berlin, the subject of European political union has dominated the talks. President de Gaulle has been talking in moving terms of the need for closer collaboration between France and Germany. But, it seems, more in general than in particular. Excitement aroused by the reports that at Tuesday night's banquet, he had spoken of giving political union "an organic form" has died down now that the translation has been corrected and made vaguer. The president, it seems, is still of the opinion that much time must yet be spent in finding a workable form of union acceptable to all concerned.

In his turn, Dr Adenauer has been tentatively commending, by way of possible collective advance, M. Spaak's proposal that the Six should set up a four-man commission with the task of reconnoitring possible common courses in the fields of policy, defence, culture, and development aid. At the time this report was written, the Bonn foreign ministry was not expecting that before the time comes to part on Sunday the two statesmen would have reached any decision likely to bring about the summit conference that the Six had hoped to hold on this subject either this month or next. As for Britain's entry into the common market, both men's well-known misgivings were probably tempered by uncertainty about the outcome of next week's Commonwealth conference—as well as by the unmistakable verdict of the bulk of opinion in Germany that leaves Dr Adenauer virtually alone in wanting to fend Britain off from Europe's inner councils.

SOME west German political commentators have been soberly assessing the long-term objectives of President de Gaulle's ostentatious cultivation of the Federal Republic. They appreciate that he sees in Germany the last buffer—"the vanguard of the free world" as he himself put it at Cologne airport—between an overmighty Soviet Union and a France weakened by war ; and that he believes France must give the Federal Republic visible support if it wants to avert the danger of a recrudescence of radical nationalism after Dr Adenauer has gone. One commentator has pointed out that President de Gaulle's sympathy is limited to a Federal Republic confined within its present boundaries—a Germany only half the area of France. The president's acceptance of the finality of the Oder-Neisse line is so well known that the refugee organisations in Bonn have kept in their cupboards the clamorous streamers which they contrived to sling over President Eisenhower's route three years ago. The small Silesian and east Prussian flags which they gave to children to wave were probably unidentifiable to the visitor. Up to the time he left Bonn on Thursday morning President de Gaulle had not uttered a word in public concerning the desirability of reunification. Yet the Germans are being encouraged by their leaders to see some hope of its eventual achievement through a politically united Europe's bargaining strength in East-West negotiations.

There are sound international reasons why the president has left Berlin out of his itinerary. Yet there were cries of "Why don't you go to Berlin?" from some of the Bonn sightseers, and the Free Democrats have professed disappointment that the president is not visiting the French garrison in the city. The old distrust of French intentions can still be seen simmering here and there beneath the surface of this week's parade of Franco-German friendship. And that, of course, is one of several reasons why the majority of Germans want Britain to be a partner in the new European dispensation.

A Saint Goes Abroad

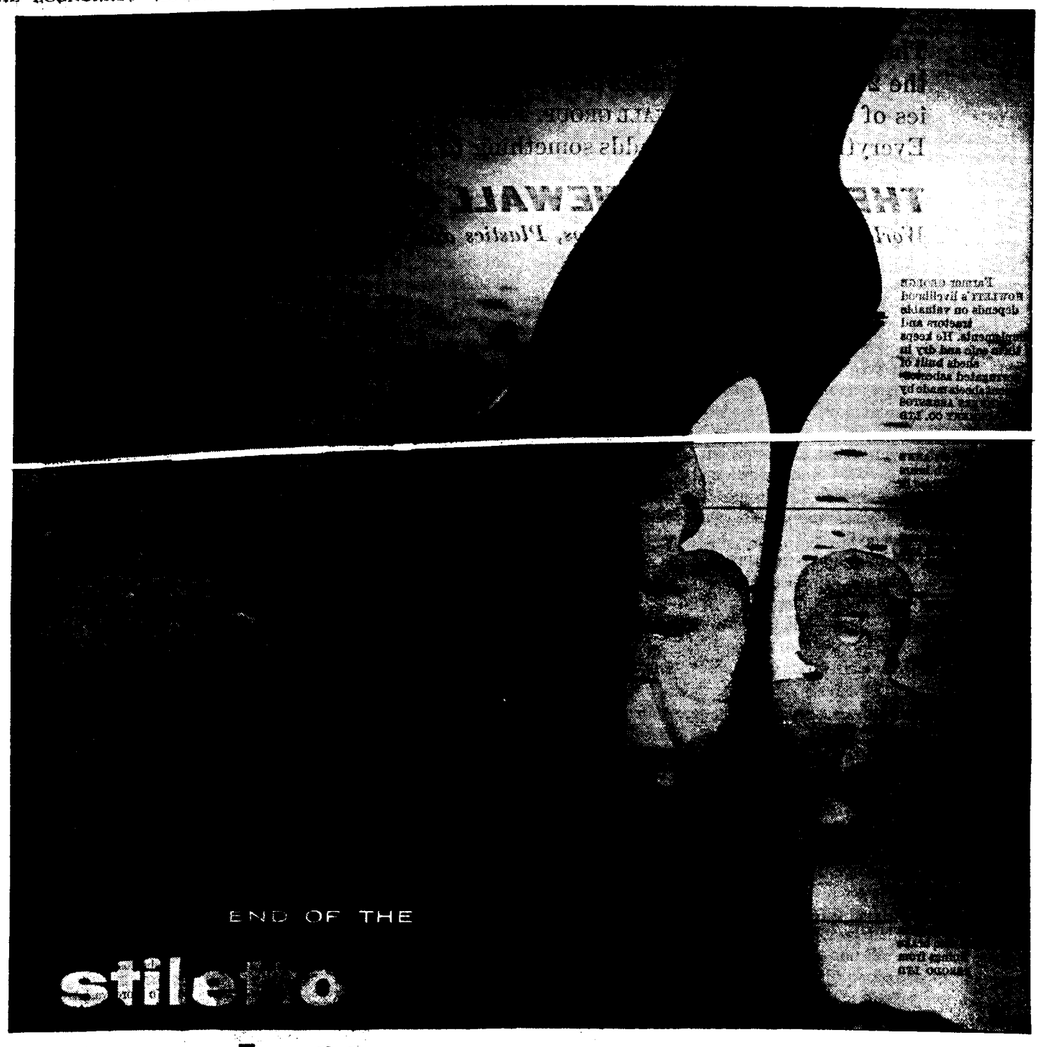
FROM AN INDIAN CORRESPONDENT

PERHAPS in no other country today can one find such a bewildering mixture of hard-headed political realism and soaring idealism as in India. Officials are parleying with the Russians for the purchase of Mig fighters, and bulldozers are opening up military roads in the Himalayan border areas menaced by the Chinese. In the face of secessionist and disruptive movements in both north and south, local "integration committees" are being set up ; a campaign has been launched to get every Indian to sign a pledge on October 2nd, Gandhi's birthday, that "I will not resort to violence to settle any internal dispute" ; and on the morning of September 5th, an elderly Indian walked out of Assam into Pakistani territory with the slogan "I have come to loot you with love."

For eleven years Acharya Vinoba Bhave, whom Gandhi called "a priceless jewel," has walked the length and breadth of India. He has secured "gifts" of 4,177,572 acres from landlords for distribution among landless peasants, in whose misery he, like Gandhi, saw the germs of a violent revolution. He began his *Bhoodan* (land-gift) mission in the once communist-dominated area of Telengana in the former princely state of Hyderabad, where he virtually talked landlords and tenants out of what then seemed an inexorably developing blood-bath. Before reaching Assam in March last year he had walked some 39,000 miles. Among the "gifts" are some 4,700 villages whose inhabitants pledged themselves to renounce individual ownership of their lands, vesting it in the village community. In several states *Bhoodan* has yielded a crop of legislative headaches, and the *Gramdan* (village-gift) scheme has also run into official and psychological troubles ; but the endeavour to demonstrate that Gandhian idealism is still alive and can produce economic results has caught the public's imagination.

In the summer of 1960 Vinoba Bhave decided that, if landlords could respond to his pleas, highway robbers in the Chambal ravines of Rajasthan could also be painlessly tamed. It is estimated that there are some 5,000 big-scale robberies in the area each year. The problem is partly economic. Soon after independence, disgruntled feudal elements joined hands with starving vagabonds to make life a nightmare for the Rajasthani peasantry. It was said that the police fought the bandits by day and consorted with them by night.

Nineteen leading bandits surrendered to the Acharya as he walked unarmed among their rocky hideouts, and for a time public confidence returned. Today there is much less banditry and grudging officials admit that at least some credit for the more vigorous police measures should go to Vinoba Bhave for focusing attention on the problem. Under



vendetta

A TRAIL OF DESTRUCTION is left in the fashionable wake of woman. One ton of femininity—the average impact weight of a stiletto heel—is the lacerating, splintering, tearing scourge that confronts the floorcoverings industry. In the forefront of this battle is Michael Nairn and on its way to blunt the stiletto is exciting new Armourtile, resistant to indentation, flexible and easily cleaned.

But long-established Nairns are a company of young leaders and new ideas, of enterprise and ambition. Already, the designers and technicians are back at their drawing boards, working towards the ultimate in floorcoverings—soft and warm, yet impervious to even the most brutal fashions of the future.

And converting Nairn's plans into realities of the future is *coal*. Coal powers the Kirkcaldy works—and the Yorkshire factory, which has rocketed tufted carpet sales by 500 per cent in four years. Nairn chooses coal because coal gives the greatest heat for the lowest cost; because coal, burned in modern equipment, is smokeless; and because there's an inexhaustible supply of coal right here in Britain.

Like so many companies of vision and vigour, Michael Nairn plans its future on coal.

MICHAEL NAIRN PLANS ITS FUTURE ON COAL

ISSUED BY THE NATIONAL COAL BOARD

These nine people are our way of telling you quickly about some of the 270,000 separate things made by the nine U.K. member companies of the TURNER & NEWALL GROUP. There are 38,000 of us in 'T & N'. Everything we produce adds something to your safety and comfort.

THE TURNER & NEWALL GROUP

World-wide leadership in Asbestos, Plastics and Insulation

T&N

his guidance peace committees have helped to rehabilitate hundreds of families uprooted by bandits. He has not forgotten the wives and children of robbers killed in action, and recently arranged the weddings of three daughters of bandit chiefs.

His present tour in the east has three objectives, besides *Bhoodan*. In Assam he has tried to assuage the linguistic rivalries between the Assamese and the economically dominant Bengali-speaking minority which in the past two years have flared up in violent conflicts. Secondly, the Moslems of East Pakistan have never reconciled themselves to living with the remnants of the Hindu population in their midst, and the volatile Hindu press of Calcutta has not made matters any easier. Bhave himself has emphasised the third objective of his eastern march by pointing out that "I have come to a place so near the frontiers of India, Pakistan, Burma, China, Tibet and Nepal." He described the area as "a place from which either peace or destruction of the world may emanate." He fears that continued unrest in this strategic area may spell ultimate disaster both for India and for Pakistan.

Mr Nehru said in Calcutta on July 29th that he hoped the Acharya's tour would help to ease tension between the two countries. In the present state of Indo-Pakistani relations, any expectation of improvement seems rash. Mutual suspicions have undermined commerce even in bananas and movie films. But the fact that President Ayub Khan permitted the saint to march into Pakistan despite shrill protests from mullahs that he was "Islam's No. 1 Foe" indicates that a desire for reconciliation is not lacking.

The House of Saud

FROM A SPECIAL CORRESPONDENT

PRINCE TALAL'S defection to Egypt, together with two half-brothers and a cousin, last month is the first open breach in the solidarity of the Saudi royal family. There have been disagreements before, notably between the King and Crown Prince Faisal; but their importance has been regularly exaggerated. Prince Faisal has shown no sign of haste to step into his brother's royal shoes, while the King, despite rumours that are spread every silly season, has repeatedly and categorically declared that he has no intention of depriving his brother of the succession in favour of one of his own sons. In fact, the two senior members of the house have been indulging in a Box and Cox act, periods of extravagance under King Saud alternating with bouts of austerity under the premiership of Faisal. At the moment, the two brothers are probably closer than ever before, since Prince Faisal is reported to be bitterly offended by the violence of President Nasser's personal attacks on the house of Saud.

Nevertheless, the spectacular defection of Talal, coming at a time of hopeless confusion in the Arab world, must call for a reappraisal of consciences in the royal family, with results that can only be gloomy. The thirty-five surviving sons of the late King Abdul Aziz are a mixed bunch, as one might expect, and few of them can offer much hope of strong rule. The third, after Saud and Faisal, is Muhammad, who has long been written off as a playboy. The fourth, Khalid, is a dark horse. When tensions between the King and the Crown Prince reach a certain point, his name is usually mentioned as a potential compromise prime minister. But he has no apparent ambition for high office, and seems to take little active interest in public affairs.

After Khalid comes a group of princes in their early forties and late thirties, some of whom have held cabinet rank. Among them, Fahd and Sultan deserve special mention. Fahd was minister of education and deputy prime minister in Faisal's austerity government, but now seems to have dropped out of circulation. Sultan, although capable of exerting some personal influence, enjoyed the distinction, as minister of communications in Faisal's cabinet, of presiding over what must surely be the worst post office in the world. After Fahd and Sultan come the professed liberals, with Talal now indisputably at their head. But not all of them have followed Talal into the wilderness. At least one still holds high position in Riyadh, and is presumably trimming his sails to the prevailing squalls.

There are informed observers of the Saudi scene who consider that Prince Talal has chosen the worst possible moment to depart for Egypt, at a time when Saudi public opinion has been genuinely shocked by the crudities of the Egyptian attack. Whether he will actually choose to set up a government-in-exile, or what effect it will have if he does, remains to be seen. The only possible good that is immediately discernible might be a slight acceleration of the Saudi government's welfare programmes.

By all accounts, Prince Talal is looking at distant horizons, and, in doing so, has overlooked the foreground that has to be crossed first. That foreground is cluttered with a hopelessly archaic administrative machine, the besetting curse of which is the refusal to take responsibility. All decisions have to be taken at the top, with the result that the top levels get clogged. It has been seriously said that Prince Faisal's austerity programme was only in part the fruit of deliberate decision; the rest was due to the Prince's sheer inability to get to the bottom of his in-tray and sanction projects that cried out for implementation.

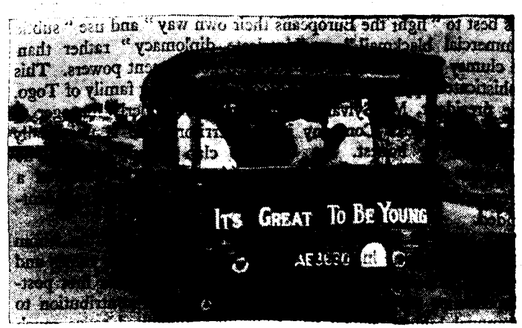
This situation, of course, will change. Standards of education are rapidly improving, and by now many young Saudis know the outside world—Beirut, Cairo, Paris, London and New York—as well as they know their own country, if not better. But, short of revolutionary chaos, the period of waiting for modern progress is bound to be wearisomely long. There are few with the vision to see the application in detail of modern practices, and none at all with the will and power to impose them. Prince Talal's self-chosen sojourn in the wilderness is likely to be a long one. He can console himself with the thought that he will enjoy it much more than the flesh-pots (such as they are) of his own country.

On the Trail of Africa

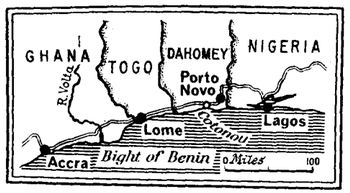
BY OUR SPECIAL CORRESPONDENT

ACCRA and Lagos, are drifting further apart, west Africans say, but they are still linked by a road only a few hundred miles long. It is a lovely road. For a very little money a white traveller will gracefully be offered the seat next to the driver of a mammy-wagon. A modern van with padded seats is a better idea than a doubtful lorry with boards across the back irons: the painted slogans are the same in both cases, and the African passengers are not always likely to be more closely packed in the newer wagon.

Leaving the atmosphere of the Accra market, not too regretfully, for the clear, damp air of the bush road is a good time for slogan-collecting. "Say Yours" (prayers or drinks?) and "Love Is All" seem more cheerful than one's own "The End Is At Hand," but even this beats the delight-phrases sung by the Party men about the Immortal One.



Yet Accra must be admired by those who depart from it: it is an admirable place to leave. There are memories of the grandiose Black Star square and of the big thinking behind rows of modern multi-storey buildings for the farmers, women's, trade unions' and party's organisations. Tema Harbour, soon passed, is brand new and marvellous: its market is as hygienic as the houses of its new town are uniform. But the wealth and dynamism of the black capital gradually fade away. As you enter Togoland it is at once apparent that colonialism has not been gone long. For one thing, the Ewe tribesmen manning the Togo side speak French; their brothers in Ghana speak English. (It is anyone's guess what they tell one another in Ewe, when the official uniforms are put away and the African night comes down.)



In Ghana you keep to the left; in Togo, to the right. The captain of the mammy-wagon sticks to the middle. Like a jet pilot, he slows down as he approaches Lome, the capital, which is right on the border—for he may well overshoot his mark by more than the 31 miles' width of the country and find himself in Dahomey. They are a beautiful 31 miles, stretching back up into Africa (sometimes at twice the width) for 450 miles. The sea front is lined with palms, waving, says the republic's department of information, before "a sugar-sand beach."

A rusty iron pier stretches across the sugar-sand into the sea. Boats, some with outboard motors, bring packing cases from ships at rest offshore. For the moment, this is the national port and the chief means (apart from smuggling across the border, closed by Ghana) of importing anything.

The sensible thing to do might be to build a cheap bridge across the Volta and import through Tema, but Dr Nkrumah is not trusted by the Togolese (they plan not to buy his cheap surplus hydro-electric power either) and so a harbour must be built within the 31 miles of coast. The Germans, who lost Togo as a colony in the first world war, are building and paying for it.

This might do the Togolese more good than its only other finger into the sea, the jetty twenty miles from Lome built to export phosphate. The company is almost entirely French owned, and is enjoying a tax holiday. The phosphate is valuable, but working it will, initially at least, bring Togolese little more benefit than employment for about a thousand workers and some extra foreign exchange.

Nevertheless, there seems little chance that the Togo government will succumb to pressures or temptations to expropriate. "We are a small, poor country," they say in Lome, "and 1½ million people cannot afford the enmity of the whole commercial world." Much later in a conversation, they will point out that it is best to "fight the Europeans their own way" and use "subtle commercial blackmail" or "intricate diplomacy" rather than the clumsy bludgeon of newly acquired government powers. This sophisticated approach is in the blood of the ruling family of Togo. The president, Mr Sylvanus Olympio, was formerly manager of the United Africa Company in the territory: he is universally alleged to be honest. An Olympio clan is appearing. The Olympios are wide awake, western (they carry the blood of a Portuguese slave-trader proudly in their veins) and independent-minded.

The result is a curious relationship with France, from whom independence came in April, 1960. President Olympio values and continues to solicit French (and all other) aid, but his first post-independence move was to renounce the French contribution to his annual budget, which had sometimes amounted to as much as a fifth. He has fully "Africanised" his civil service, retaining some French technicians, but he has watered down the French influence by calling on the services of French-speaking United Nations experts. He has kept aloof from African groupings designed to hold French client-states together, and his voting in the United Nations is highly independent.

But Togo still uses (French) west African francs. "We hope to be ready to produce our own currency within two years and, by starting our own bank, to be completely independent financially within five," the government says. This spirit is, to the dismay of the French, infectious: it is drawing the Dahomey government timidly in the same direction (the Dahomeyans were the first of General de Gaulle's acknowledged clients to allow a communist embassy within their borders).

The infection could spread from Dahomey, and the Togolese acknowledge that this perturbs France, which is, after all, still Togo's main market and source of funds. "But the French dislike the Ghanaians even more than they suspect us," the Togolese argue and this gives both governments something in common. Further, President Olympio is alert enough to placate General de Gaulle in private whenever he does something unwelcome to Paris in public. "We tell them that unless we make a public show of independence we cannot be a useful private influence for the French good among countries that have strayed further than us, or countries that are English."

The contrast is quickly felt in Cotonou, where the mammy-wagon rests awhile for the sake of the bright lights of a town peopled by many more Frenchmen than Lome. Here the government is an uneasy coalition of two, M. Apithy and M. Maga; each seems alternately on top. It listens to the Togolese, but almost invariably follows the French. The pay-off is visible: modern buildings in Cotonou compare with the near-slum that is Lome, yet both countries are much the same size. The new buildings, however, are French: one block of flats, for instance, was designed to profit from the existence of an unhoused diplomatic community.

Crossing into western Nigeria from Dahomey there is a new kind of bustle: people making money. Lagos from a distance is a stunning surprise after a journey through the bush: it has a multi-skyscraper skyline and many miles of busy outlying suburbs. Here are newspapers saying rude things about the government (and about neighbouring governments) and politicians feeling their way towards a "Benin Union" that would join the minute economies of Togo and Dahomey to the giant one of Nigeria. But Ghana is not mentioned as a possible member: Accra, they say, wants the other three countries to join Ghana, not the other way round. Getting down in Lagos market, the mammy-wagon traveller reflects that while the villages and the bush are all the same west Africa, the capital cities still live in separate worlds.

Could you work with records like these?

Lose vital papers and your business could be ruined. Yet many firms rely on ordinary steel cabinets, or out-of-date fire-resisting safes . . . which become fiery ovens in even a small blaze. In what kind of equipment are *your* vital records housed?

Chubb fire-resisting equipment has proved itself time and again. Saving hundreds of thousands of pounds—and vital records—for our clients all over the world. The latest Chubb equipment includes cabinets for every purpose, all insulated with protecting materials that will not deteriorate with age. It has been stringently tested in simulated conditions of extreme heat and collapsing buildings. And has been certified by distinguished, independent scientists and engineers.

Chubb have produced an invaluable booklet, 'A Matter of Time', that delves deeply into the whys and wherefores of fire resistance. While you think of it, ask your secretary to write for a copy today. There is, of course, no obligation at all.

"The United States will not devalue its dollar . . . ."
" . . . the dollar is a good investment and as good as gold."
President John F. Kennedy, Telstar news conference, July 23, 1962

Q—Mr. President, the United States has reportedly invited Japan and other industrialized countries to invest in the building of plants in this country. Would you explain the thinking behind that, sir, and does it imply also that we are discouraging U.S. investment overseas in plants?

THE PRESIDENT: As you know, the United States investment overseas has been very heavy. In fact, it has been one of the matters which, of course, affects our balance of payments. Over the long run it does not, over the immediate run it does. We are anxious to have others invest in the United States, and particularly to invest in those areas where there may be higher unemployment, so this program is being operated through the Department of Commerce.

Presidential news conference, July 5, 1962

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

Election in the Air

WASHINGTON, DC

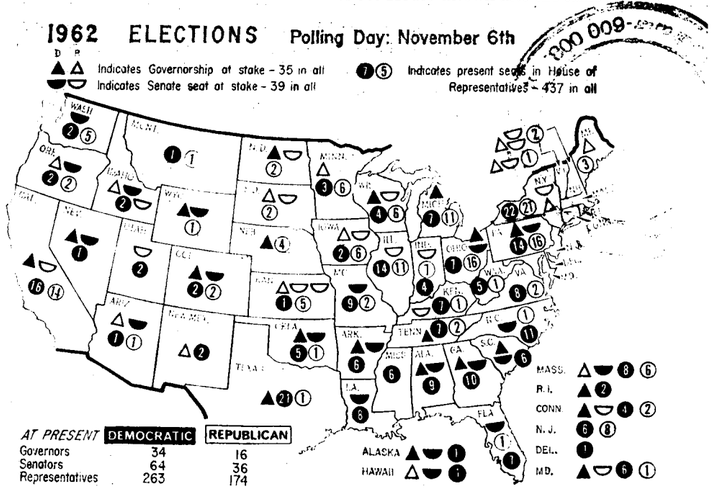
SELDOM has a mid-term election campaign reached Labour Day, its traditional starting point, with so much uncertainty about its probable outcome and even about its general tone. The Democratic landslide in the 1958 general election, the last nation-wide polling when the Presidency was not at stake, was quite predictable. By the beginning of September four years ago it was obvious that the Democrats were going to benefit politically from a severe economic recession and from a suicidal attack on trade union prerogatives by many Republican candidates. But this time it is difficult to say which party will come out on top on November 6th or what issues will be stressed in a campaign which will not become intense until Congress adjourns, about October 1st, after an unusually long and singularly unproductive session.

Not all aspects of the coming campaign are cloaked in uncertainty, by any means. It is a fair bet that Democratic and Republican gains in the Senate will just about balance out so that the Democrats' present majority of two to one in that chamber will not change much. The Republicans are certain to increase substantially the abnormally low number of states which they now govern, but it is difficult to read a great deal of national significance into these contests. All the interest and the uncertainty lie in the battle for the 435 seats in the House of Representatives, all of which must be filled and many of which have revised constituencies as a result of the 1960 national census. Even though only about 100 of these contests will be close, it is nevertheless pure guesswork at this point to forecast how these key races will affect the Democrats' present majority of three to two in the House. It is conceivable, though unlikely, that Republicans could capture control of the House for the first time in a decade by picking up 44 seats. On the other hand, there is a slightly better chance that the Democrats might wind up with a net gain in seats, although this would be the first time since 1934 that the party in control of the national Administration had improved its position in mid-term elections. Dispassionate observers see a modest increase in Republican seats as the most probable outcome but nobody is quite sure.

A major factor in this uncertainty is the absence of any clear-cut campaign issues even at this late date. Republican candidates will accuse the Kennedy Administration of spend-thrift fiscal irresponsibility, of softness towards communism, of anti-business policies that stifle the economy, of attempting to usurp congressional power and—in northern areas where there is a heavy Negro population—of lack of militancy in fighting racial segregation. But with the electorate apparently neither very happy nor unhappy about the state of the country or the world, there is no one issue on which the Republicans can fight. The economy is sluggish but not really slumping; the world situation is troublesome but not in a state of real crisis.

By the same token, Democratic candidates have little to boast about in the way of accomplishments during President Kennedy's first two years in office. Although a late surge of activity by Congress is keeping this year's session from becoming the disaster for Democrats which it once promised to be, a major theme of the Democratic campaign will be that Republicans have obstructed the legislative programme, particularly the Bill to incorporate hospital benefits for old people in the social security system. But the northern urban areas where this Bill and other welfare measures proposed by President Kennedy are most popular are the solidly Democratic districts where Republican candidates do not have a chance anyway.

This unusual lack of national issues probably means that the individual House contests will revolve so much around local controversies and personalities that it will scarcely be possible to regard these mid-term elections as a true national referendum on the way Mr Kennedy has performed as President. Representative Rutherford, a Democratic member from Texas, may lose his seat to a Republican because of his friendship with Mr Billie Sol Estes, the disgraced Texas financier. A contest in the Kansas wheat country between Mr Dole, a Republican, and Mr Breeding, a Democrat—two incumbent members of the House thrown into the same district



* The total number of seats in the House of Representatives to be chosen this autumn reverts to 435 and they have been reapportioned among the states to allow for the changes in population which were revealed by the 1960 census. Nine states gain seats, sixteen lose them, as shown on the list below :—

Alabama	−1	Kansas	−1	Nebraska	−1
Arizona	+1	Kentucky	−1	New Jersey	+1
Arkansas	−2	Maine	−1	New York	−2
California	+8	Maryland	+1	North Carolina	−1
Florida	+4	Massachusetts	−2	Ohio	+1
Hawaii	+1	Michigan	+1	Pennsylvania	−3
Illinois	−1	Minnesota	−1	Texas	+1
Iowa	−1	Mississippi	−1	West Virginia	−1
		Missouri	−1		

because loss of population has lost the state a seat—will hinge almost entirely on the popularity of Mr Kennedy's proposals for tighter controls on the production of wheat. California has gained eight seats and Democrats count on scoring a net gain of at least that many there, not really because there is a high tide in Democratic fortunes in the state, but because the Democratic-controlled State Legislature artfully redrew California's congressional districts so as to keep Republican victories to a minimum.

Nor does Mr Kennedy have any illusions that he can have much influence on individual contests for the House, in spite of his plans for an amount of personal presidential involvement unprecedented in a mid-term election. The more sagacious Republican candidates will try, in fact, to keep their races from becoming tests of the President's strength. The party's paid publicists in Washington will issue broadsides belittling Mr Kennedy but the actual candidates in closely-fought contests will shy away from direct attacks on a President whose national popularity remains consistently high.

Nevertheless, the outcome of the elections for the House will be interpreted widely as a national judgment on the Kennedy Administration and will influence immeasurably the content and success of Mr Kennedy's legislative programme for the next two years. A Republican gain of 10 to 15 seats would give the coalition of Republicans and conservative southern Democrats effective control of the House and almost certainly would force the President to restrain his legislative desires. A larger Republican gain of from 20 to 30 seats would probably mean the abandonment of any hope for health benefits, federal aid to education or tax reform. On the other hand, a slight Democratic gain in the House or even a Republican gain held to less than 10 seats would be viewed as a vote of confidence in the Administration and would improve immensely the prospects for the President's programme next year.

With no great change in the composition of the Senate likely as a result of the voting in November, the major impact on the upper body of the mid-term elections will probably be the psychological effect of the outcome of the House contests. But there will be a significant alteration in the way in which affairs are conducted in the Senate if Mr Sidney Yates, a vigorous Democratic member of the House from Illinois, succeeds in his efforts to unseat Senator Dirksen, the Republican floor leader. While opposing Mr Kennedy's domestic proposals, Mr Dirksen has given the President a helping hand in passing such vital Bills as the foreign aid authorisation and authority to purchase United Nation bonds. Most probably his successor as Republican leader would be far less co-operative.

The influence of the contests for State Governorships will be felt mainly in the struggle for power inside the Republican party. Significant Republican gains in the gubernatorial contests seem inevitable for a variety of reasons: some incumbent Democratic Governors are political freaks who hold their offices solely because of their party's landslide in 1958, many have fared poorly because they had to deal with Republican Legislatures and Republicans have come up with remarkably good candidates for these state offices. These factors point to a strengthening of the influence of the State Governors on the shaping of Republican policy; they are likely once more to become a liberal counterforce to the party's stolidly conservative congressional wing.

The most encouraging prospect of the gubernatorial elections is the rise to prominence in party circles of moderate and enlightened Republicans to offset the party's trend to the right immediately after Mr Kennedy's victory two years ago. One such Republican is Mr Fred Seaton, who was General Eisenhower's Secretary of the Interior and who is now a heavy favourite to be elected Governor of Nebraska. Other important Republican candidates of this nature for Governor are Mr George Romney, former chairman of the American Motors Corporation, in Michigan; Mr William Scranton, a member of the House, in Pennsylvania; and Mr John Alsop, brother of the journalists, in Connecticut. Because of the likelihood that the Governors' influence in party affairs will grow because of the apparent waning of the spell once cast by Senator Goldwater, the leader of the right wing, the Republican nominee for President in 1964 may well be one of the Governors elected in November. If Governor Rockefeller scores an impressive triumph over a weak and divided Democratic party in New York, he will pull into a commanding lead for the presidential nomination. Victories for Mr Romney and Mr Scranton would put them in the category of presidential dark horses. And if Mr Nixon comes from behind to displace Governor Brown in California he cannot be counted out completely.

Blocked Railway Lines

Mr Willard Wirtz, Mr Goldberg's successor as head of the Department of Labour, falls heir to the urgent and unenviable task of settling the strike on the Chicago and North Western Railway. This broke out after the management had refused to accede to the demand of the Order of Railway Telegraphers that it re-employ over 500 members of the union who had been dismissed during the past five years in an economy drive and that it make no further layoffs without consulting the union. Thirty railway companies have been challenged in this way, in an attempt to set a national pattern. One, the Southern Pacific Railroad, gave in last year; but in five other cases, including that of the New York Central Railroad only last week, emergency fact-finding boards have recommended that the telegraphists drop their demands. The Chicago and North Western objected on the grounds that acceptance would be tantamount to giving labour power to veto modernisation. All legal procedures under the Railway Labour Act had been exhausted and the telegraphists walked out; other unions respected their picket lines and the operations of the railway—the third largest in the country, serving nine midwestern states—have been at a standstill for a week, to the inconvenience, if not worse, of industry, farmers and 35,000 commuters who travel to work in Chicago every day by train.

This is a tough assignment even for a man with as much experience in labour negotiations as Mr Wirtz; already this year, as Under Secretary of Labour, he has been given the chief credit for settling the West Coast shipping strike and for staving off a nationwide airline strike. Both these disputes involved much the same issues as the present strike—what to do about job redundancy developing out of technological improvements—and Mr Wirtz will certainly have to spend a great deal more of his time dealing with such questions. Already there is a threat of a national railway strike if five unions, representing the men who actually work on the trains, fail to obtain a permanent injunction against proposed changes in working rules which would eliminate 65,000 jobs but which the employers say are necessary in the interests of efficient and profitable operation. A temporary restraining order is now delaying these changes until the case comes up in the Appeals Court, which should be before the end of the year.

The railway unions also have deep-rooted apprehensions over the effect of mergers on job security. The Interstate Commerce Commission is working on cases involving 38 railways, with 60 per cent of the country's total mileage, but is not likely to reach any broad decision before next year. One of the objectives of such consolidations is economy through the telescoping of jobs—though recently at hearings before the ICC the president of the Pennsylvania Railroad, which wants to combine with the New York Central Railroad, argued that, if a prosperous system resulted from such a merger, employment would be increased while now it is menaced by the economic difficulties arising out of separate operations.

Fall-out—Up and Down

Sir Bernard Lovell and other scientists who objected to high-altitude tests of nuclear devices because they might disrupt later experiments in the upper atmosphere may be forgiven for saying "we told you so" now that the American authorities have announced that their explosion on July 9th did indeed change the belt of radiation around the earth and that the alterations may be relatively permanent. The belt has become more dense, with high energy electrons generated by the test, and deeper, so that it is now nearer to the earth although not near enough to affect flights of manned satellites. But at least three unmanned satellites which were already in orbit, including the British Ariel, were damaged badly. Moreover, the effects seem to be wearing off more slowly than was anticipated, so that some planned launchings may have to be postponed and some satellites redesigned to resist the increased radiation.

Earth-bound Americans are also having to deal with increased radiation and this too is the result of their own tests, not Russian ones. In Utah some pastures were so contaminated by fall-out from the nuclear explosions above ground in Nevada during July that concentration of radio-active iodine in milk went as high as 580 micromicrocuries a litre at one western testing station, although at others the figure was much lower. When it goes above 100 local health authorities are supposed to consider protective measures since this iodine 131 can cause cancer of the thyroid, particularly in children. In Utah about 70,000 gallons of milk a day, at the peak, were taken out of fresh consumption and diverted into manufactured products; the contamination has a short life and will have ceased to be dangerous by the time such products are consumed. In Utah some cows were also taken off fresh grass and fed on dry fodder, old enough to have lost its radio-activity. This practice is also now being followed voluntarily throughout Minnesota, the leading dairy state, as a safeguard in case radio-activity goes up even more as a result of the current Russian tests.

It is being questioned whether these precautions are in fact necessary and they have led to a critical re-examination of the official standards for assessing the danger from fall-out. These are set by the Federal Radiation Council and are not obligatory but only guides for local authorities to follow if they wish, after taking other factors into account. (The FRC thinks that the action taken in both Utah and Minnesota was premature.) Furthermore, in reply to the Joint Congressional Committee on Atomic Energy, which is concerned at the impact of such measures on public opinion and on milk consumption, the FRC said that its guides were intended only for workers in atomic plants and were never meant to apply to fall-out from nuclear explosions. The council admits that it is not able to judge exactly when radio-activity from this source becomes dangerous; it only knows that as yet the health of Americans is not being menaced. It is not surprising that Republicans are accusing the Administration of having no clear policy on fall-out.

Our Mutual Fund?

NEW YORK

The huge industry which has been built up around mutual funds, the American form of what are called unit trusts in Britain, is outraged at the analytical study of its activities made by the University of Pennsylvania's Wharton School of Finance and Commerce on behalf of the Securities and Exchange Commission. Wild and vituperative charges are being hurled at the authors and instead of concentrating on the areas where the study may be at fault the industry is scattering its fire recklessly. Apparently it hopes to discredit the whole operation but in fact it is merely drawing more than ordinary attention to the findings of the study. And once the shouting dies down, the mutual funds will have to answer both the substantial evidence contained in the report that there are glaring deficiencies in their practices and the implication that the interests of shareholders, who number some five million, are inadequately protected. In essence the study alleges that though the funds are mutual in character they are not living up to their name, a charge which is both damning and difficult to refute. Although the study makes no specific recommendations—a task it leaves to the SEC and to Congress—it suggests that changes, many of them major, are in order. The remarkable growth of the assets of mutual funds, from $4 billion in 1952 to $19.5 billion at present (they were over $23 billion before the collapse of the stock market this spring), is their best defence but it is not a foolproof one.

Mutual funds, which are so heavily concentrated in equities and played so big a part in the cult of the common share, have nothing to be ashamed about when their results are compared with those achieved by other types of savings institutions. But much of their growth is due to the net inflow of new money, which has averaged a remarkable 14 per cent a year. The study makes it clear that, while existing shareholders have enjoyed a considerable appreciation as a consequence of increases in market values, they have not profited from the rise in assets which has resulted from sales of new shares in the funds themselves. It is the managers alone who reap that reward and, because costs do not rise nearly as fast as assets, the rewards have been very large indeed. Mutual funds, it has often been said, are sold rather than bought and, while the study does not delve into selling practices (which is the subject of still another study now underway), its findings confirm that there is a great incentive to increase assets through sales.

What is most embarrassing to the funds is the charge that their shares have done no better than the stock market as a whole or than the shareholders could have done independently without professional advice. The industry has been seeking to convince the investing public, with considerable success, that the mutual funds offer the advantage of having expert management. This, the study contends, is a gross exaggeration; it goes on to observe that the diversification of risk offered by the funds is a much more honest and realistic selling point. The funds are challenging the evidence as "misleading" and "inaccurate," insisting that they have produced superior gains. But on this score the study appears to have been conducted with meticulous care, simply because it was recognised that it would be hitting the funds in their most vulnerable spot.

Spokesmen for the industry are not appeased by the finding that the size of mutual funds presents no problems. For the study emphasises that their structure, which has served to promote their rapid growth, has created many potential conflicts of interest. Mutual funds are a hybrid form of financial institution, divided into three parts: one consists of the fund and its management or promoters; another of its investment advisers, who usually charge a fixed fee of one-half of one per cent of the fund's assets; the third is the distributor of shares in the fund, either a broker or a sales organisation working on a commission.

In theory, the three parts are supposed to operate at arm's length, with 40 per cent of the fund's directors being independent. In practice, however, internal control is the rule, with the actual management of all three parts in the hands of the same people. This system, according to the study, works to the detriment of shareholders, who have little or no voice in choosing their advisers and whose rights are not being protected by the independent directors. There has never been a case where the managers of a fund have changed their advisers because of unsatisfactory per-

formances or because they sought the services of a more talented group. Nor have fees ever been lowered except under pressure from shareholders themselves.

But it is doubtful whether the mutual funds could have grown so fast without high commissions on sales of shares in them ; these charges are not competitive and bear no relation to the performance of the investment. The fixed fee paid to investment advisers is much harder to justify, for it is payable even if a fund shows a decline in assets and is more than that asked from other types of client. It is probable that funds will fight harder to maintain their sales charges, which average about eight per cent, than to keep the fixed investment fee ; high commissions generate high sales. But even in this area the funds will find it difficult to defend contractual plans, which are a form of instalment buying of shares ; salesmen get a much higher commission on these than on outright purchases of shares.

As might be expected, the study finds evidence that mutual funds contributed to the rise in share prices and particularly to the fluctuations in individual stocks. On the other hand, they did not use their undoubted power in the market to exert an undue influence on the managements of companies in their portfolios. The study also pays a guarded tribute to the funds in commenting that they have helped to cut the cost of equity capital and have stimulated investment in new ventures. Nevertheless, its conclusions indicate that a slowing down in the growth of funds is definitely called for. It recognises that to transform the industry for the benefit of the shareholders might disrupt it and put a brake on its growth, yet the authors seem to favour such a course as being the only way to extend the mutuality of these funds.

Whether the SEC will follow this course is uncertain. The investigation of mutual funds is merely one phase in its wider look into the securities markets and the SEC will not do much until it has more facts on hand and is able to determine whether the industry will take a more reasonable and constructive attitude than it has to date. The mutual funds are not entirely oblivious to the need for changes. Some have already introduced a sliding scale of fees which decline as assets increase and there is a possibility that the independent directors will begin to play a more active and critical role. It is doubtful, though, whether the industry will initiate any move to alter its traditional trident form. It may be willing to acknowledge that some of the largesse accruing from the rise in assets should be passed on to shareholders in one form or another, but it will resist any attempt to curtail the sales of additional shares since, if fees are reduced, growth will depend even more than it does now on such sales.

Poll Tax—Final Round

CONGRESS has now approved the only piece of civil rights legislation to be expected from the current session. This is the constitutional amendment outlawing the poll tax as a prerequisite of voting in federal elections. This tax was enacted originally by eleven southern states to keep the vote from Negroes, many of whom could not raise the necessary dollar or two. Only five states still have such a law on their statute books and it is generally accepted that the poll tax is on the way out. Even extremist Southerners put up only half-hearted opposition to the measure and that largely for the record. In the view of many, it is a pity that a simple Act was not passed to abolish the tax ; this could not, it is thought, have been challenged successfully in the courts. The method chosen, that of constitutional amendment, is really a delaying action, which explains why the measure went through comparatively easily. The amendment must now be ratified by three-quarters of the State Legislatures—38 out of 50—but they have seven years in which to do it. Negro groups, however, with the help of labour and citizens' organisations, will try to speed ratification.

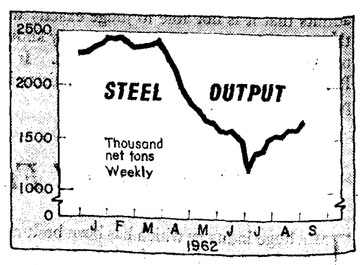
But even if the poll tax were to disappear everywhere right away, this would mean only a limited advance for the civil rights of the southern Negro. In the poll tax states and elsewhere in the south, other, more modern weapons to prevent Negroes from exercising their rights as electors have been forged, such as the Mississippi statutes of last spring. These require—among other things—publication of the name of any applicant for the vote in his local newspaper and the payment by him of the costs of any hearing that results in a successful challenge, which need be based on no more than objection to his "moral character." The federal government has just brought suit against these statutes and against two sections of the State Constitution, to force Mississippi to open its voting booths to Negroes.

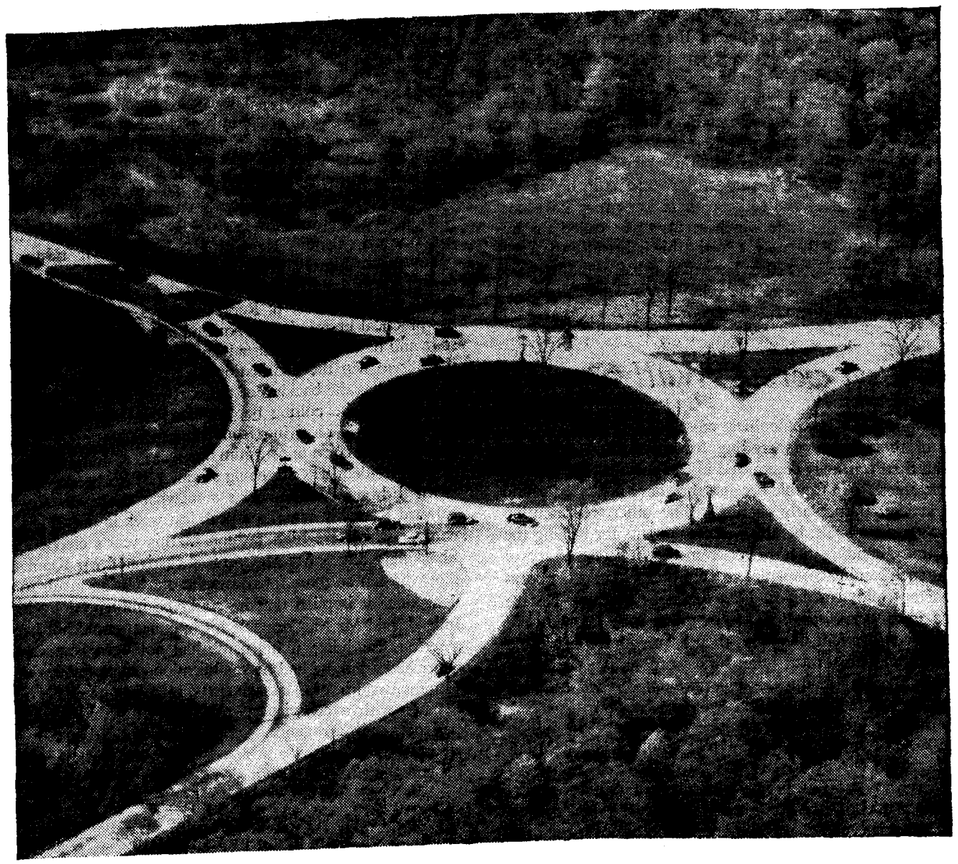
This is in line with the vigorous campaign of the Department of Justice, begun under the Eisenhower Administration, against discrimination and intimidation which prevent the registration of Negro voters in the south ; this campaign has resulted in the filing of 32 suits under the Civil Rights Act. True, progress is slow—too slow for many Negro leaders. At present some 1.3 million Negroes have their names on electoral rolls in the south ; this falls well short of the original target of 3 million by 1960. But headway is being made, with the assistance of the Southern Regional Council's newly-established drive to educate voters, and in the long run the power of the ballot must be on the Negroes' side.

Steel in Trouble

WHETHER or not the steel industry as a whole actually wants a show-down with Congress, four of the leading firms are certainly doing their best to see that it gets one. Last spring Senator Kefauver, long dissatisfied with steel's "monopolistic" pricing policies, lost no time in getting into the Administration's sensational dispute with the companies. He summoned them to provide his anti-trust subcommittee with full details of their costs. After he had arranged that these confidential figures would not be made available to competitors, eight of the companies, including the biggest of all, the United States Steel Corporation, agreed to submit them. But four, led by the Bethlehem Steel Corporation, refused, saying that the only purpose for which these details could be needed was to establish price control and that to demand them was outside the proper scope of any legislative inquiry.

It is doubtful whether this is true and the executives of these companies compounded their defiance by refusing to present themselves before the committee in person to explain their stand, feeling that to do this would jeopardise their legal position. They were in fact challenging the Senate to take them to court. This Senator Kefauver is very ready to do and his subcommittee recommended that the four companies and nine of their officers be cited for contempt of Congress. The vote, which was on strictly party lines, must be upheld by the full Judiciary Committee and there the outcome will depend on the attitude of four conservative southern Democrats. Normally they might be expected to side with the industry and against the liberal Mr Kefauver ; but they are all strict upholders of the traditional prerogatives of the Senate and are likely to feel affronted at the unprecedented refusal of the steel executives even to appear before the subcommittee. Even if the full committee votes to proceed with the citation, the Senate





Do you use a roundabout . . . or a rotary ?

The difference may be slight . . . but even small distinctions in language and in customs can assume importance, when people in Great Britain do business with people in the United States.

The Chase Manhattan Bank, with the largest network of correspondent banks in the U.S., naturally has close familiarity with American trade practices and usages —and with the ways in which they differ *among* the fifty states. And after more than seventy years in London, too, The Chase Manhattan is equally familiar with British ways. This understanding of customs on both sides of the Atlantic can be very useful to you in your dealings with the States.

Indeed, The Chase Manhattan can be of service to you almost anywhere you do business. Its network of more than 51,000 correspondent banks, branches and representatives' offices all over the globe can provide you with every type of modern banking service, promptly, efficiently, and on a personal, *localized* basis.

When you do business anywhere abroad . . . it will help to talk with the people at The Chase Manhattan, in either of the London Branches.

as a whole has to approve it before it is passed to the Department of Justice for implementation. It will be hard to find time for this in the tail-end of the session and if the whole matter lapses the Administration will certainly be relieved; it has no desire to stir up business enmity again just now.

The steel industry itself has other things to worry about. While an increased demand for steel had much to do with the general and encouraging rise in the new orders received by the manufacturers of durable goods in July, there is no buoyancy in the industry. In particular the automobile manufacturers are still trying to reduce their stocks of steel and to keep them low; they have not yet begun to order on the scale which seems to be called for by their plans for the rest of the year. Partly this is because they are changing over to new models rather later than usual. The lateness of this changeover is also one of the reasons why unemployment rose unexpectedly in August.

Cleopatra versus Wall Street

In a Hollywood beset by difficulties, most of them financial, two schools of thought are contending for supremacy. One, the voice of Wall Street, heavily committed in the business, claims that the film companies are in trouble because they have neglected sound business practices, particularly costing. The other, representing the industry's professionals, berates the accountants for lacking the elementary understanding that to make money it is necessary to spend it. At such leading companies as Columbia Pictures Corporation and Metro-Goldwyn-Mayer, Inc., the issue appears to have been settled in favour of the financial men, at least for the time being. But at another famous studio they have suffered a notable setback: the Twentieth Century-Fox Film Corporation, where the new president, Mr Daryl Zanuck, has just presented his first report, forecasting a net loss of $25 million in 1962.

Earlier on, in the face of a cumulative loss of some $66 million in 1958-61, Wall Street interests with large holdings in Twentieth Century-Fox forced Mr Spyros Skouras to resign from the presidency after twenty years; he is now chairman. The purpose was to elect a new president who would carry out their policies. But Mr Zanuck, a former head of the Fox studio and also a substantial shareholder, outmanœuvred the financiers and was elected to fill the vacant post at the end of July. Thereupon, the Wall Street representatives on the board resigned. Thus they put Mr Zanuck on trial and a severe test it is likely to be.

Some of Fox's recent films have disappointed at the box office, as have those of its competitors. And the company seems to have been slower than the rest of the industry to follow the now favourite policy of concentrating on fewer and bigger pictures and exploiting the opportunities offered by making films for television. Now Mr Zanuck is streamlining operations and laying off hundreds of employees. Production at Fox's Hollywood studios is at an indefinite standstill; three scheduled pictures have been postponed, including *Ulysses*, in which Mr Peter Sellers was to star. Meanwhile, to the company's liabilities must be added the loss, by the death of Marilyn Monroe, of one of its most valuable properties. But if Fox's shortcomings are mainly professional, and it looks as if perhaps they are, then it may not be beyond Mr Zanuck's capacity to solve them. The outcome may depend, however, on a factor over which he has no control. Before he became president, Twentieth Century-Fox had committed itself to the making of *Cleopatra*, now complete. The film will provide the supreme test of the spending-to-make-money theory. It cost $30 million to produce, against an original budget of $10 million, and will need to take in $50-60 million merely to break even. If it does so, Mr Zanuck and his supporters may survive as a force in Hollywood. If not, the financiers may become pervasive.

Teddy or Eddie?

President Kennedy may be holding himself absolutely aloof from the senatorial struggle in his home state of Massachusetts but he cannot avoid being linked closely with it. The attention of the whole country is on it because the President's youngest brother is a candidate for the Democratic nomination and the contest gives substance to the suspicions of nepotism and dynastic ambitions which the President's enemies have been sowing ever since he took office. These suspicions are being played upon by Mr Edward (Teddy) Kennedy's opponent, Mr Edward (Eddie) McCormack, himself a member of a family almost as powerful as the Kennedys in Massachusetts and a nephew of the present Speaker of the House of Representatives. Young Mr McCormack has practical knowledge of both politics and administration in the state and he is pressing his advantages ruthlessly, as he needs to do if he is to win the nomination on September 18th. Mr Edward Kennedy has the backing of the party organisation and this counts for more in the polling booths than does the support which Mr McCormack is receiving from Harvard intellectuals; even those who have not come out for him openly are wishing that their loyalty to the President was not being strained by his brother's aspirations.

Mr Edward McCormack's somewhat desperate attack on Mr Edward Kennedy came to a peak last week in one of the television debates which are high fashion in this year's election campaign. Shockingly direct, Mr McCormack castigated Mr Kennedy's claim that "he can do more for Massachusetts" as an insult to the President since it implied that he could be influenced by his brother. Indeed, said Mr McCormack, his opponent could not have become a serious candidate if his name had not been Kennedy; he had never had a job, he had no qualifications whatever to represent the Commonwealth of Massachusetts in Washington: "we need a Senator with a conscience—not with connections . . . with experience—not arrogance." But after witnessing Mr Kennedy's restraint under this assault many people felt not only sympathy for his courage and control but also that he might in fact be able to do the job. He kept his temper, refused to reply in kind and concentrated on real political issues; his understanding and grasp of these was up to his brother's standards.

SHORTER NOTES

Last week the Treasury hastily amended its rules on bidding for government securities after the Morgan Guaranty Trust Company, one of the six major banks in New York City and Chicago which make a market in these securities, as well as buying them for investment, bid for one-half of an offering of $1.3 billion in 13-week bills for its own account. The Treasury reacted to this unaccustomed generosity by granting the bank only one-half of the amount sought and ruling that in future no bidder would be allowed to take up more than one-quarter of any similar offering. The reason given was that, if one purchaser bought heavily, this would reduce the supply of bills for general trading and disrupt the market. Another tendency would be to lower the average yield, which would be counter to the current policy that rates should be kept high, as an inducement to foreign central banks and governments to invest in dollar obligations.

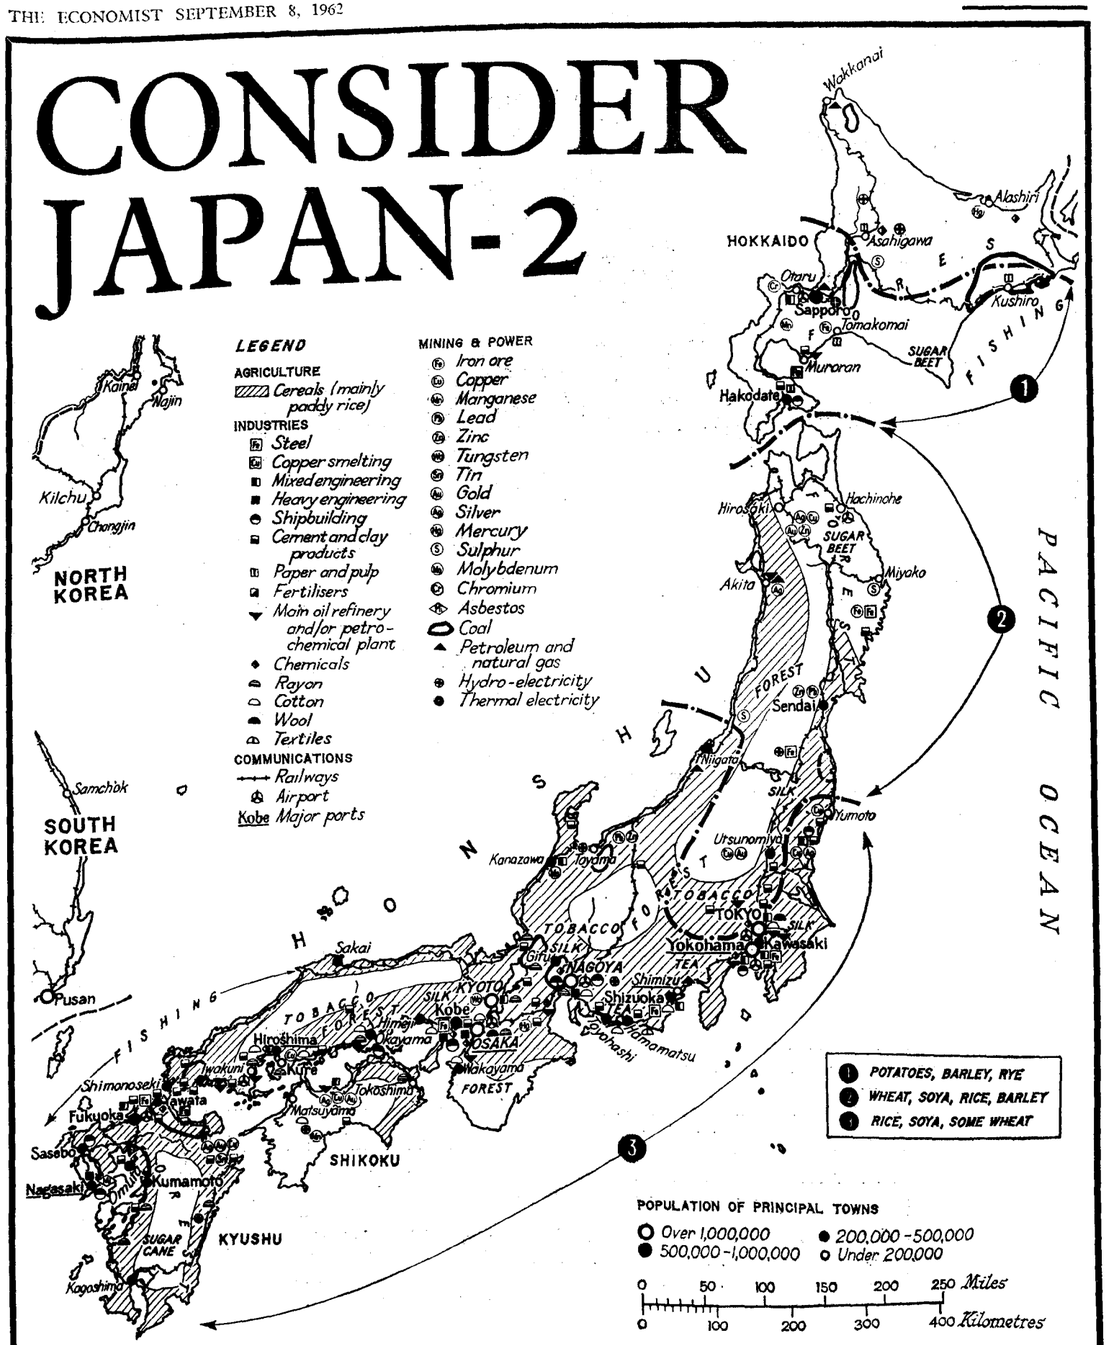
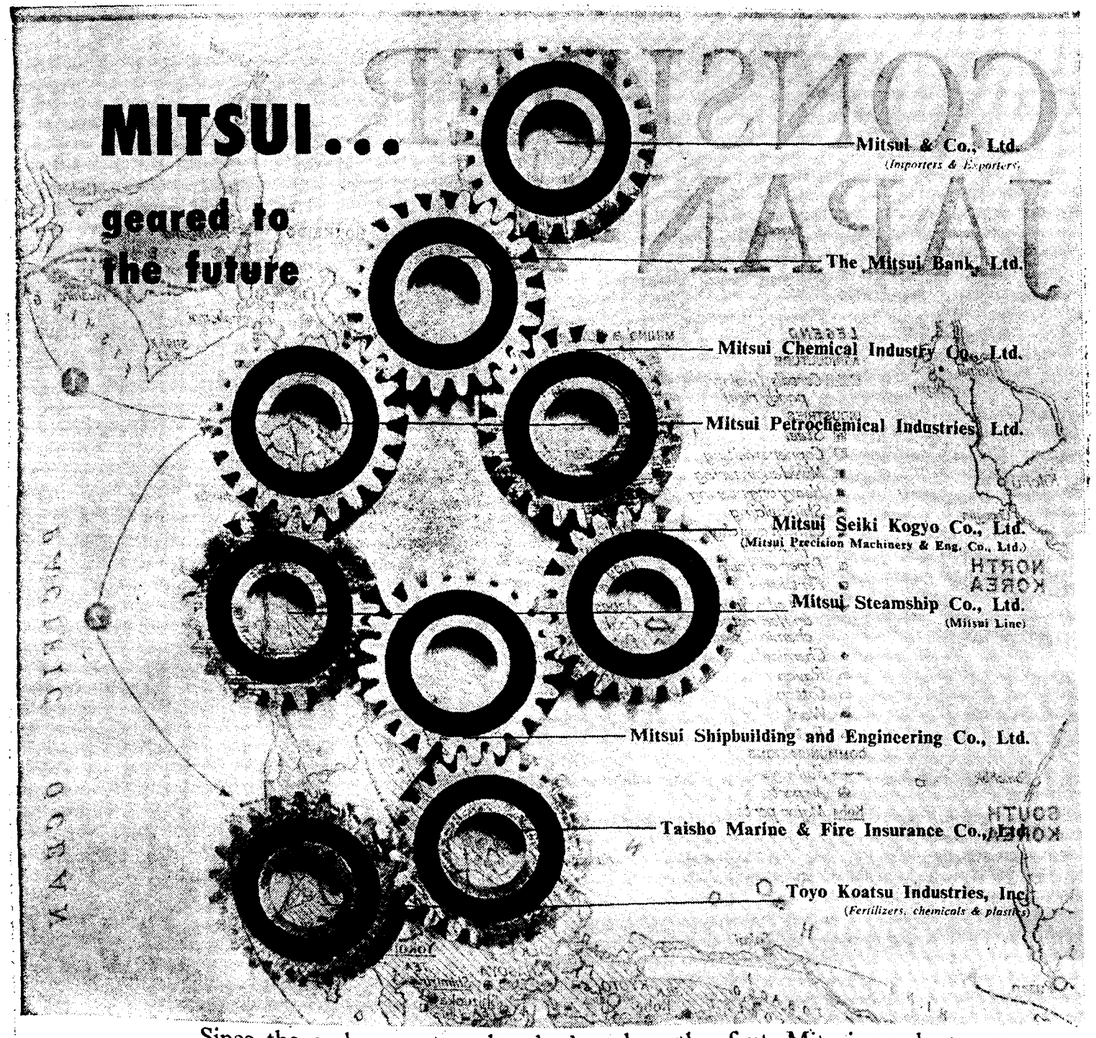
Doctors can now secure information about the use, side-effects and supplies of drugs in a few minutes by ringing up Mediphone, Inc. It costs $20 a year to subscribe to this service; doctors also have to pay $3 each for written reports sent later.





Since the early seventeen hundreds, when the first Mitsui products were shipped to Holland, the name Mitsui has been found wherever progress is being made. By virtue of their abilities and vast experience, the companies comprising the Mitsui group have attained the highest position in their respective fields which range all the way from banking, trade and insurance to the maritime, chemical and mining industries. Today, the products and services of Mitsui firms, working jointly on large complex projects or individually, when it is feasible, can be found in the forefront of economic growth and development the world over.
As it has for three centuries, the future holds an exciting challenge for every member of Mitsui.

For information, contact the members of Mitsui through: Mitsui & Co., Ltd., Second Fl., Bucklersbury House, 83 Cannon St. London E.C.4

Japan and You

Whether you wish to **Invest** in Japan's thriving industries; **Import** or **Export** goods; make **Currency Deposits;** in whatever business you have with Japan you will need expert banking services. We can gladly provide these. Our Offices in every important centre in Japan and throughout the world are waiting to carry out any commission you may entrust to us, efficiently and economically.

NOMURA

THE ECONOMIC MIRROR

What single factor reflects, most completely, the economic picture of Japan? The Japanese stock market. And what is the picture now? After some fluctuation, the market looks good for investors who are interested in growth stocks.

The basic policy of Nomura Securities is that investments are a type of savings. That is why we have always recommended long term growth stock to our clients. We can't say that investing in Japan is the direct road to wealth. And we can't promise certain results from all investments. But we can promise that the data which we give you about investing are complete and factual.

We place research above everything else when we consider the economic situation in Japan. May we help you with your investments?

Write to Nomura Securities for timely information on the Japanese economy which is backed by facts . . . through research.

CONSIDER JAPAN-2

This summer a member of "The Economist's" staff, whose usual job is to write about economic problems in Britain, visited Japan—a country which, in the last decade, has expanded its real income at an average rate of over 9 per cent a year, transformed the whole standard of living of its people, and thereby marked up one of the most astonishing economic success stories of all time. In a survey last week, he discussed the lessons of this Japanese economic miracle which seem to be applicable to Britain. In the first two articles below he takes up the story of what seem to be the lessons of Japan's experience for underdeveloped countries. A third article discusses some of Japan's trade union and organisational problems, as they appeared to a visiting westerner. Finally, the last two articles below—on Japan's educational system, and its trade and aid relations with South East Asia—are contributed by our normal resident correspondent in the Far East.

Lessons for Developers?

LAST week Japan was discussed here as a model (well, more or less a model) of some aspects of economic policy which should be studied by Britain and other countries of the west. Obviously, however, it must also be regarded as a harbinger of future possibilities for the rest of Asia and Africa. We have here a practical case study in that most over-documented but least satisfactorily solved of all economic problems—how a very poor country can at last start to shake grinding poverty off. For Japan has sprung from near-starvation and utter devastation seventeen years ago (in the month after the end of the war its industrial production was 8 per cent of the prewar average, and even by February, 1946, it was only 16 per cent of it) to a position where today in almost every finished modern product it is one of the half-dozen biggest industrial producers in the world. In shipbuilding and motor bicycles it is the world's largest producer; in bearings, cameras, radio and television sets it ranks second; in machine tools, pharmaceuticals and iron and steel it ranks fourth; even in motor cars it ranks fifth. Did it have any special advantages which enabled it to achieve this astonishing growth, or are most of the lessons of its development ones that other countries of Asia and Africa could and should now learn to imbibe and emulate?

The Inherited Advantages

One's own judgment is that Japan inherited three great advantages from prewar days even into the bleakness of 1945. Two of these will be mentioned here only briefly, for it will be convenient to discuss them in more detail in later articles. The first was that even in 1945 90 per cent of Japanese were literate and had been to school; the further massive extension of education since 1945 is discussed in the fourth article of this survey. The second inherited advantage from the 1930s —unmoral though this may appear—was that Japan's efforts to build up a war production economy in its militarist days had enabled it to leap over one particular chasm in industrial development which orthodox economies find it very difficult to cross. The third inherited advantage, however, was that even before 1945 Japan's topography had (perhaps accidentally) impelled it into what now seems to have been exactly the right transport system for the early stages of its development.

The main secret was that Japan's long narrow coastal strips had made it natural that all the main industrial activity should cluster round a few main railway lines, which ran along the coast linking one inlet and natural harbour with the next one. Those main railway lines (although not those harbours) are in superb shape today. The branch lines and some of the commuter services—the sort of railway lines that lose money in Britain—are hived off in the hands of small private railway companies. This has proved to be an excellent system, because it has meant that any necessary (or unnecessary) subsidisation of them or their customers has been done fairly directly, instead of indirectly and by expensive stealth; the cossetings of the sort of people whom Dr Beeching in Britain wants to deprive of railways altogether have not tended, in Japan, to be paid for by holding back development of really profitable national investment in the main arteries of the prosperous and busy main railroads.

By contrast, Japan's road network is in an appalling state; but in the early stage of development (as distinct from the stage it has reached now) this did not enormously matter. It is now fairly clear that coastal shipping, initially, and the railroads were a much more economic main form of transport for Japan to have concentrated upon first. They were much cheaper to build up and run in terms both of capital expenditure (even today surveys show that a new railroad line from Tokyo to Osaka would cost much less to build than a modern high speed highway) and of foreign exchange (using first native coal and then hydroelectricity, instead of imported petrol). These latter advantages of railway communications over roads would not be repeated in every developing country;

but the main lesson—that it is better in the early stages of industrialisation to concentrate on building up industrial complexes around one or two main arteries of communication, rather than trying to spread industrial prosperity "fairly" into every scattered region of the land—almost certainly is of universal application. The "railway basis" of Japan's development was an important factor in bringing about the present regional location pattern of Japanese industry, which all the sociologists will say has led to an undesirable and ugly sprouting of huge conurbations, but which in terms of economic efficiency (in a country still poor enough for every penny's worth of efficiency to matter) has during this development stage probably been very near to just right.

The Americans' Legacies

Japan also gained at least three great, if sometimes cruel, advantages from the American occupation of 1945-52. One was the land reform, which amounted in the end to virtually full-scale expropriation of many of the old landlords; they were paid compensation in paper money during the immediate postwar inflation, and (as each pound in 1945 was worth about a penny by 1948) that paper money soon lost all of its value. The peasants were thereby relieved of the burden of debt, and given greater incentives to cultivate every square yard of their holdings, just when the postwar food shortage (and the postwar black market) made crops from these holdings very profitable indeed. It is often said that a developing country can progress only if a period of relatively greater prosperity for the peasants in some way marches on in advance of a period of greater prosperity for the industrial classes; in postwar Japan that is precisely what happened, although the period when peasants were leading the advance was very short indeed. The expropriation of the old landlords also had important social effects. No doubt in deeply rural Japan some appalling habits of feudalism still exist, but *vis-à-vis* industry at any rate, the power of the country gentlemen in the growth districts to hold up productive progress is now probably smaller than in Britain; if it was regarded as profitable to sink a chalkpit in Japan's equivalent of Essex, this would not nowadays be so likely to be held up because it was deemed to spoil some local squire's view. It has been said that the Japanese have a great sense of beauty but no awareness of ugliness, while the British are exactly the other way round; not to have an awareness of ugliness is a great economic advantage during a period of industrial advance.

But while Japan gained something, paradoxically, from the cruelties of the postwar inflation (by 1948 prices were 250 times higher than prewar)—because it broke up some part of the old restrictive social order—the country also gained immeasurably from the fact that in 1949 this inflation was brought suddenly to a stop. This was the Americans' second boon to Japan, and great credit for it must go to the generally much-criticised Mr Dodge. By late 1949, thanks to the spasm of stern policies that he introduced, money had come to mean something again; the earning of it had become everybody's aim. Moreover an important part of Japan's dynamic was provided by the fact that there were then entrepreneurs up and down the country who were left holding little bits of apparently meaningless paper shares and entitlements to urban land which were soon to become worth many times their real 1949 value—provided the land and other assets were productively used—as prosperity started to boom again. The entrepreneur class was jostling at the starting gate for the great advance.

What Mr Dodge and his fellow experts did not realise—and what indeed no other economists in the world would have realised at that time—was that the spasm of deflation in 1949 should be short-lived. It is now clear that almost immediately after hyper-inflation had been stopped, albeit at a relatively low level of output, it would have been the right policy to swing the tiller right over and start reflating demand again. Fortunately for Japan this swing of the tiller, which the economic experts would have resisted, was almost immediately provided by the outbreak of the Korean war in June, 1950—and the huge orders for supply and behind-the-front soldiers' requirements, all paid for in foreign exchange, which then flooded in upon Japan. This was the third great boon to the country from the period of American occupation. Later the Japanese were to have another stroke of luck from an international misfortune, at a critical time, when the Suez incident in late 1956 temporarily gave it a great advantage over the west in the markets of Asia.

It is awfully difficult to turn the experience recounted in these last few paragraphs into a moral for the development of other countries. One cannot very well say that developing countries would be wise to leap willingly into a 25,000 per cent inflation of prices, merely to reap peculiar sociological advantages—in the switch of power and incentive from old rentiers to new entrepreneurs—when the price inflation has been stopped and demand reflation has immediately thereafter been restarted again. But the lesson of that part of the Japanese recovery which was sparked off by the Korean procurement boom is worth study. Anybody who examines the record in Japan from 1947-50 and then that after 1950 must have grave doubts about the efficacy of the sort of (admittedly very generous) aid policy carried out by the Americans in Japan just before the Korean war started. Instead of pumping in foreign-directed support funds, foreign-directed technical aid, and foreign technicians to tell indigenous governments how they should spend it, the right policy seems to be to concentrate on spotting what in each developing country is the moment of burgeoning dynamic; and then to pump into that country large orders for that country's goods. Preferably the orders should be for goods of a fairly advanced sort which can help to lay the foundations of the modern industries (including service industries) which the developing country will need later as its own people grows richer. This is what the Korean procurement boom did in Japan.

Goodness knows how such a policy could be implemented on a worldwide scale. It would be an immensely difficult diplomatic task to agree on exactly when the moment of burgeoning dynamic in any country had arrived; and the associated idea that the west should be quixotically free-trade-minded towards imports from cheap labour countries that are just on the point of becoming manufacturing competitors would give vested interests in each western country the screaming willies. But the need to move towards some such system of "aid through trade," rather than concentrating solely on the less effective "development fund" sort of aid; may well be one of the most important emerging economic ideas during the second half of this twentieth century. Moreover the point

Toshiba Technology Saves Lives And Property

is that often the manufactured goods which new developing countries have available to sell will initially be uneconomically high cost ones; quite possibly, in a perfect world, developing countries should be allowed by Gatt to subsidise their manufactured exports at this early stage (although this certainly should not apply at the stage of development which Japan itself has reached now).

The Disadvantages that Disappeared

Japan's golden decade and a half of development, therefore, has owed quite a lot to good luck as well as to good management. The surprising thing is that, only a short while ago, all the prophets were saying that Japan was almost bound to be one of the unluckiest countries in the world. Its traditional disadvantages—which at one time sad-faced economists (as well as hard-faced military imperialists) prophesied would condemn an island-bound Japan to perpetual poverty—were supposed to be that it was (a) grossly overpopulated, (b) desperately short of cultivable land, and (c) extremely poor in natural resources.

What has happened to these neo-Malthusian prophecies of doom? The answer is that each of them has proved to be based on completely mistaken premises; indeed in some ways these traditional disadvantages have been actual boons to Japan.

The argument that overpopulation would be Japan's undoing rested partly on the belief that while the advance of medical science would enable infant mortality to be cut and old people to live longer (as it has done), the slightest rise in living standards would also simultaneously send the birth rate up. Unexpectedly, however, the birth rate in Japan has suddenly slowed down in these last few years to or below European levels (17 per 1,000 compared with over 34 per 1,000 in 1947). This has not been solely, or even mainly, due to the much publicised fact that any Japanese woman who can get a doctor to sign a certificate, grantable on very wide grounds, can have a legalised abortion. The major discovery seems to be that there may be a natural cut off point for birth rate increases at a particularly important stage along the path where a developing country starts to grow richer: namely at the stage where ordinary people just become well enough off to buy contraceptives.

The result of this sudden change to a much lower birth rate has been very beneficial to Japan. It has meant that the country has had fewer babies to feed, but a bulge of young workers coming forward on to a labour market which is crying out for new labour to serve in Japan's developing industries. This bulge of teenagers has helped to keep the supply price of labour lower, and thus the margin of profit higher, than it otherwise would have been. This may not seem socially desirable, but economically it has been an important factor in keeping up the huge proportion of gross national product which Japan has devoted to investment in the first stage of its development boom.

Japan's shortage of land and raw material resources has meant that in agriculture and the extractive industries the country has been at a relative disadvantage compared with other countries. This has made it logical for it to concentrate on making and exporting the products of secondary industry, in order to be able to buy its raw materials and some of its food from abroad. This has been very fortunate for it because in the postwar years the terms of trade (i.e. the trend of relative prices) has moved in favour of exporters of manufactured goods and against agricultural and other primary producers.

THE terms of trade have moved against agriculture because governments all over the world have kept too many farmers on the land by politically motivated policies of agricultural protection. Japan has itself made some errors in this respect. Some foreign observers in Tokyo told your correspondent that "Japan's greatest achievement is that it has made itself self-sufficient in rice"; but in fact this has surely been one of its most obvious errors. Its policy of agricultural support has been concentrated on encouraging an expanded cultivation of rice and wheat, just when the Japanese public are starting to eat less of these old staples and move over towards eating more meat and dairy products instead. It would be logical for Japan to buy more of its rice from other Asian countries, particularly if it wants these countries to open their doors to more exports of Japanese manufactured goods. Possibly providentially, however, Japan's upsurge of consumption of meat and dairy products is coming at a time when (because of its past rice-eating habits) it has not itself got an army of dairy farmers to over-protect—and also at a time when its neighbours of Australia and New Zealand (a mere 3,000 miles away) are anxiously looking for markets for their farmers because of Britain's negotiations with Europe. Logically there should be scope for a major increase in trade here, provided the Australasians are wise enough to open their markets even wider to Japan's industrial goods. It would be a great economic advantage for Japan if it could now take over some of Britain's past role as the dumping ground of cheap food surpluses from the most efficient (or the most subsidised) agricultural producers from all over the world.

The turn of the terms of trade against raw material producers has been largely due to technological advance (the fact that raw materials make up a smaller part of the total cost of really modern manufactured products, and the spread of synthetic substitutes). In addition, shipping freight charges, which have always played a big part in the cost of importing raw materials in bulk, have gone down (once again partly because governments, for political reasons, have striven to keep too many shipping services in being). As in agriculture, so also in raw materials Japan made some early postwar mistakes in attempted autarky; for some years after the war it spent vast sums inducing its industries to use Japanese coal, which is of very poor combustible quality and mined hideously and expensively far from the pitheads, instead of switching to more modern and efficient forms of energy (like imported oil). But the government has altered the emphasis of this policy in recent years, albeit at the cost of violent strife and strikes in the coal mining areas; Japan's planners now appear to recognise that coal mining is one of the primary industries that should be run down pretty ruthlessly as resources switch more and more into manufacturing industry.

The next question, however, which is vital for Asia, is: which manufacturing and other secondary industries does Japan's experience suggest are the most profitable ones for a developing country to concentrate upon first? To this question the next article will turn.

The Front Runners

Japan's most astonishing achievement in the past decade is that it has broken through into ultra-modern levels of labour productivity in a whole new range of industries. Which are they, and why?

JAPAN'S industries today can be divided into four groups. First, there are those in which its own planners recognise that Japan is not internationally competitive, and presumably never will be. Among these industries where Japan is "uncompetitive by reason of unfavourable natural resources and social conditions," Japan's Economic Survey for 1959-60 specifically mentioned coal, non-ferrous metals, paper pulp, soda and most agricultural products; in other words most of its primary industries now belong to this "throwaway" group. It is now fairly generally recognised in Japan that the more swiftly resources move out of these industries into other fields, the better.

The second group comprises what may be called Japan's "early stage industrialisation" industries. These, too, are industries which should now gradually decline—although naturally not all the industrialists concerned recognise this. The most obvious items in this "early" list are cotton textiles, the manufacture of sewing machines, bicycles, leather goods, pottery, rubber goods, and (admittedly in a different category as regards potential domestic growth) cement. Many of these goods—to which may be added the special but structurally not dissimilar industries of silk and cultured pearls—formed the main staples of Japan's competitive export trade in the 1930s. In all of them Japan's competitive position is still high; in nearly all, including textiles and cement, its productivity per man month (let alone per wage unit paid) is today higher than most other countries, including Britain's. But nearly all are also industries in which Japan does not expect its productivity per man month to increase very much in future. In most it feels that its limits of technical innovation may pretty well have been reached; in many it feels that its competitive position may in future decline, for two reasons.

ONE of these reasons is that other underdeveloped countries seem likely to enter many of these fields. Most of the products mentioned above are labour-intensive rather than capital-intensive; many are manufacturable in, or partly in, pretty small scale workshops; many are therefore on the list of industries which other Afro-Asian (and West Indian and South American) countries are already setting up. The second reason why Japan might not be sorry to see some of its own productive resources move out of these "early stage industrialisation" industries, however, is that, quite apart from the threat of international overcrowding, the prospects for a voracious increase in world demand for most of these products frankly do not seem very glowing.

Nearly all of them have new competitors appearing over the horizon. Natural textiles are losing some of their markets to synthetic textiles; pedal bicycles lose ground to motor (or motor-assisted) transport; sewing machines suffer from the worldwide switch (which Japan itself is now experiencing in full flood) from the small village dressmaker to ready-made clothing; plastics bite into some of the markets for rubber goods, leather goods and pottery. This is very awkward for the newly developing countries. The list of labour-intensive "early stage industrialisation" goods is narrow enough in all conscience. But if, in addition to being limited in number, the "early stage industrialisation" industries look like losing ground before new-style competitors that require heavier capital investment, the problem becomes knottier still.

THAT is why special interest must be attached to Japan's most astonishing achievement in the decade of the 1950s: the fact that it has broken through into ultra-modern levels of labour productivity no longer just in labour-intensive "early stage industrialisation" industries, but in a whole range of what might be called "second stage industrialisation" or capital-intensive industries as well. The list of capital intensive industries in which it has made this breakthrough is wide, although also specific. By 1959-60 Japan's statisticians could justly claim that Japan's productivity per man month broadly equalled (and indeed sometimes exceeded) west European averages in the manufacture of iron and steel (other than special steels, like those for high grade tools); in building ships, in making lorries and buses (but not yet in making passenger cars); in making television sets and radios (especially, of course, what might be called consumer-style transistors, but interestingly not yet in high grade transistors or other electronic parts for computers); in railway rolling stock and tractors; cameras and optical instruments; in small scale construction machinery (but not yet large scale construction machinery). What is the distinguishing factor between the industries in which this "second stage breakthrough" has been made, and those (like passenger cars and some high grade precision tools) where Japan still lags relatively behind?

The answer is pretty clear when one thinks about it; unfortunately it is also, at first sight, more than a little unmoral. The common base for most of these "second stage" breakthrough industries was laid in the long period in the 1930s and early 1940s when virtually the whole of Japan's industrial effort (and thus a very large part of its very low national income) was devoted to building up or serving its capacity for war. That is when Japan laid its foundation of

Toshiba Technology Harnesses Nature's Resources

technical knowhow, of rough (but initially pretty costly) experience, of trial and initially considerable error, in the making of lorries (but not passenger cars), of ships, tractors, rolling stock, small scale construction machinery (i.e., portable engineering corps stuff), and behind them mass production of iron and steel. Many of the small firms who are engaged today in making parts for transistor radios were originally engaged in making parts for range finders and other optical instruments demanded by the military authorities. The same is true of parts of the camera industry. Indeed it is interesting, looking through the list of these ploughshares made by yesterday's sword manufacturers, to note the similarities of parts of the industrial structure of modern Germany and modern Japan.

This unmoral story does not mean that war *per se,* is an excellent forcing ground for all the most economic and profitable sorts of industrial development. But two of the commonest features of a war-orientated economy probably are a great help in fostering a breakthrough into what we have called "second stage industrialisation."

The first of these is the ruthless drive made in a war economy to get production moving ahead in a number of industries which usually belong to the more modern part of a developing nation's industrial structure.

The second is that a drive for war production tends to concentrate more on volume of output than on fussing about achievement of very high grades of quality of craftsmanship; certainly if a firm makes a botch of one pioneering line of output it does not go bankrupt as a result, but is enabled to push on instead with a Mark 2 model. In the initial stages, at least, the war industries' sole and voracious customer does not worry over-much if costs per unit of output are considerably higher than equivalent costs abroad. Although there were inevitable exceptions, a lot of Japan's equipment during the Pacific war was frankly well below western standards in terms of both quality and man-hour production costs; but instead of being beaten on the open market places of the world (in which case the firms making it would have had to draw in their horns much earlier), it was beaten in much lengthier and bitterer competition in Leyte Gulf, on the jungle trails of New Guinea, and along the Tiddim road. By that time, deep below the surface, the economic infrastructure for new industries had been laid. And the fact that, in these postwar years, Japan has devoted only 2 or 3 per cent of its national income to defence—compared with 10 per cent or so in other big industrial countries—has enabled it to direct the energies of these industries into booming production for the domestic and export markets.

CLEARLY, this analysis has now reached a very awkward point indeed. One's guess is that the other underdeveloped countries may move fairly quickly into the stage where they can efficiently operate "early stage industrialisation" industries—where they can become economic and capable manufacturers of textiles, sports goods and so on. But, once there, they are unlikely to find a rapidly expanding market for their products; and the narrow range of these industries may present some very awkward problems. If nearly the whole initial weight of poor countries' industrialisation is to fall on a limited number of relatively hard-up industries of this sort, established interests in these industries in western countries are going to object to being "utterly swamped"; and, foolish though this may be, are going to persuade western governments to close their markets by import restrictions.

Higher up the scale, one's guess is that Japan itself should find it relatively easy to move from its present "second stage" industries into the "third stage" advanced industries in which it is still a rather high cost producer. One cannot be sure of this. It is a bit surprising that a country, which can already produce lorries so efficiently, is still finding it so difficult to bring its costs of motor car production down; that, although it can now build factories and office blocks more quickly and probably more cheaply than the west, tenders for building new western style houses (e.g. for foreign residents in Japan) still tend to be three or four times as high as they would be in England; and that Japan's few new and modern motor roads look like being so expensive to build. The arguments put forward by Japanese contractors are that "in these things we find ourselves working in media which are foreign to us."

This comes back to the problem of the country's industrial foundations again. One phrase sometimes used in Japan is that while most of Japan's new and successful industries of the last decade were "built from the lower echelons upward" (i.e. the small sub-contracting firms making parts for transistor radios had some background of know-how from making radio or other components in the war), the automobile and other less successful industries have had to build "from the higher echelons down" (i.e., the manufacturers of passenger motor cars had to put out orders for components which the small sub-contracting firms were quite unused to making). Clearly, there is a real gap to be bridged here. But your correspondent's own guess is that in the next few years one or other of Japan's manufacturers of automobiles will break through, perhaps after amalgamations between the different producers, into successfully starting mass production of some standard small size passenger car with Volkswagen-like efficiency.

CERTAINLY, the stride into this "third stage" industrialisation looks like being much easier and shorter than the leap which Japan has already taken into "second stage" industrialisation, apparently during the last decade but in reality (probably) as a post-dated result of its course during past and painful years. The real question therefore remains: how can other developing countries start to prepare themselves for that leap? Apart from Britain, which had the advantage of being first in the field and so had no real competitors, it is arguable that virtually every other country in fact crossed this particular chasm in the first place thanks partly to the accident of running or preparing for a war economy. Even in America, the early industrial structure of the northern United States owed at least some of its initial impetus to the drive for equipping the Union armies in the civil war; in Canada some of the main seeds of industrialisation were planted during the second world war; in western Europe and Russia the part played by war economies has been obvious; nobody else apart from these has really crossed the chasm as yet.

One of the needs in the next few decades will be to consider how international trading policies, international development policies, international aid policies and international subsidy policies can be worked out so as to provide a better godfather than Mars to the infant of development. Not nearly enough thought has been devoted to this subject as yet.

Unions, Management, Competition

Industrial relations and managerial efficiency (in some respects, inefficiency) in Japan contain some surprises for the visiting westerner. And Japan's attitude towards price competition is very different from what Lancashire imagines it to be

So far these surveys have seemed to be quite largely concerned with eulogies of the efficiency of Japan's economy. What of the criticisms to be made? As so often with Japan, one finds oneself at this stage plunged into a discussion of paradoxes. The usual left wing critic's picture of Japan is that of a country where feudal employers beat trade unions into the ground in a ruthless search for labour economies and productive efficiency; but in point of fact an extreme wastefulness in the use of labour, both on the factory floor and at the junior executive desk, is one of Japanese industry's most glaring failings. The usual right wing picture of Japan is as a nation bent on cut-throat competition (particularly, say its rivals crossly and as if this were an unfair action, "in matters of price"); but in fact a social atmosphere which frowns on price competition is one of Japan's worst international handicaps.

The story of the foundation of postwar trade unionism in Japan is one that would be best fitted for a novel by Mr Evelyn Waugh. Between the end of the war and the end of 1946 the number of Japanese trade unionists rose from nought to five million, because the American occupation authorities (this branch of the occupation administration was very largely filled with reforming New Dealers) had proclaimed that voluntary joining of a trade union was the good democratic thing for everybody to do. In some cases it is said, even the manager joined the union—and was respectfully elected to head the shop floor organisation which was supposed to bargain with himself. But in many more cases, as Professor G. C. Allen pointed out in his excellent book on "Japan's Economy Recovery,"* the right man to put in charge of a trade union organisation was deemed to be somebody who had been imprisoned by the Tojo and earlier regimes. This was often an ex-student zealot with pronounced syndicalist views, and with ideas on organisation which he had read up almost solely out of books. The temporary and meteoric rise of these men—who were often near communists of a dottily disorganised kind—went much further than most people in the west realise. In the first two years of utter demoralisation of Japanese industry after the war the left wing trade unions actually seized control over several plants, and quite often became responsible for the employment, dismissal and discipline of the workers. By early 1947 the trade unions were reading up in foreign textbooks how to call a general strike; and the American occupation authorities, horrified at the rather dreamy monster which they had conjured up, began to clamp down.

This has set the pattern for one part of the trade union movement ever since. Even today the main national trade union organisation Sohyo (1960 slogan: "To hell with the US Security Pact and Fatter Share of Improved Productivity for Labour") is decidedly to the left of, say, Mr Cousins in its political views. It has learned from, and formalised, British practice in trying to secure an annual wage rise for its members; each spring it marches into battle against the Japanese employers' federation by proclaiming an annual offensive of strikes. Unfortunately for Sohyo, although there is a real degree of trade union militancy in some branches of government service and in a few industries such as coalmining, workers in the big and prosperous manufacturing industries are singularly unwilling to follow its lead. In these industries the so-called "company unions" are the main forms of organisation; the national bodies that exist are loose federations of unions which are themselves limited to workers in particular firms.

Western trade unionists tend to regard these company unions as the managements' tame poodles. This is an underestimate of at least many of them. They play a real (and sometimes damaging) part in seeing that firms engage most of their workers as "regular" workers (i.e., workers they can practically never sack) instead of as "temporary" employees; and many of them negotiate seriously and hard about the size of the Christmas bonus and family allowances and other fringe benefits. A typical tactic of these enterprise unions, indeed, is to move on from one fringe benefit to another in a constant stream of negotiations that lasts the whole year round. What they do not do, however, is to impose any restrictive or demarcation rules about who will do what job; by British standards they seem virtually to delegate to the management the sole responsibility for deciding upon manning schedules for different types of new machines and for deciding in which types of job women can be employed instead of men.

YET the impression remains that most Japanese firms carry many more workers than the simplest system of time and motion study would suggest they can really need. In the longer-established firms this may be largely the result of the "lifetime" system of employment, and of the fact that pay and promotion are supposed to be determined almost wholly by seniority, with a factory worker in his forties being entitled to get twice as much as a factory worker aged about 21. Many firms are paying older workers more than they are relatively worth (which provides another reason why, as soon as they reach the painfully early retirement age of 55, they so incontinently retire them). In the very large number of new factories which have been opened only in the last ten years this burden from the "pay by seniority" system is lighter; but it will grow as the average age of the workers in the factories grows. Many cost comparisons of the difference between Japanese and British wage levels tend to ignore this point.

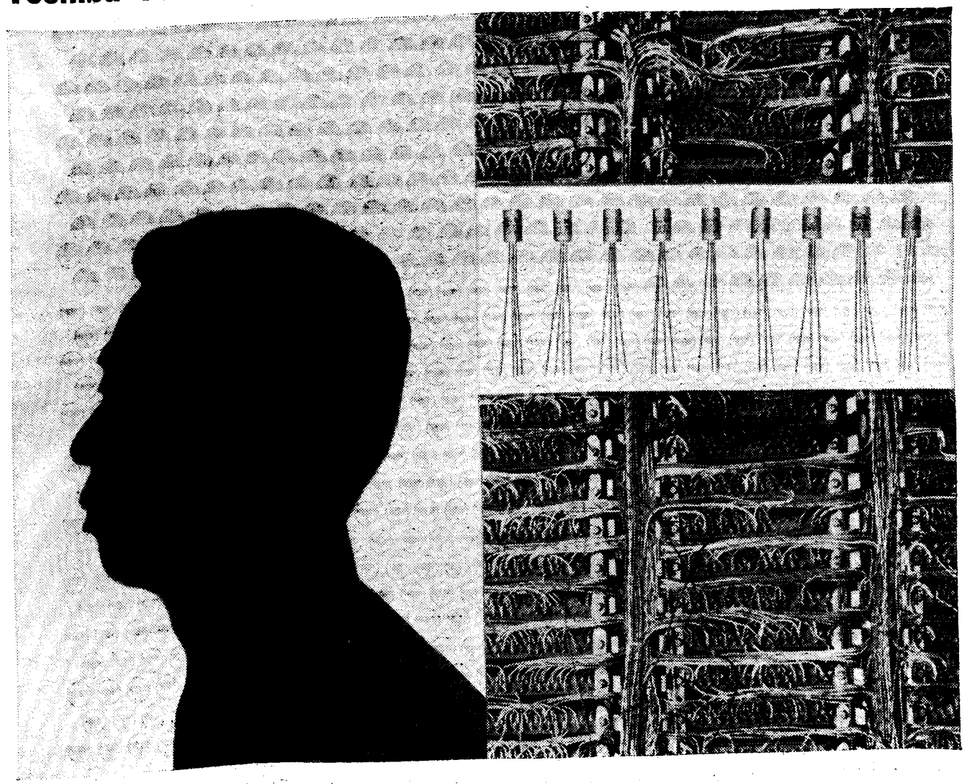
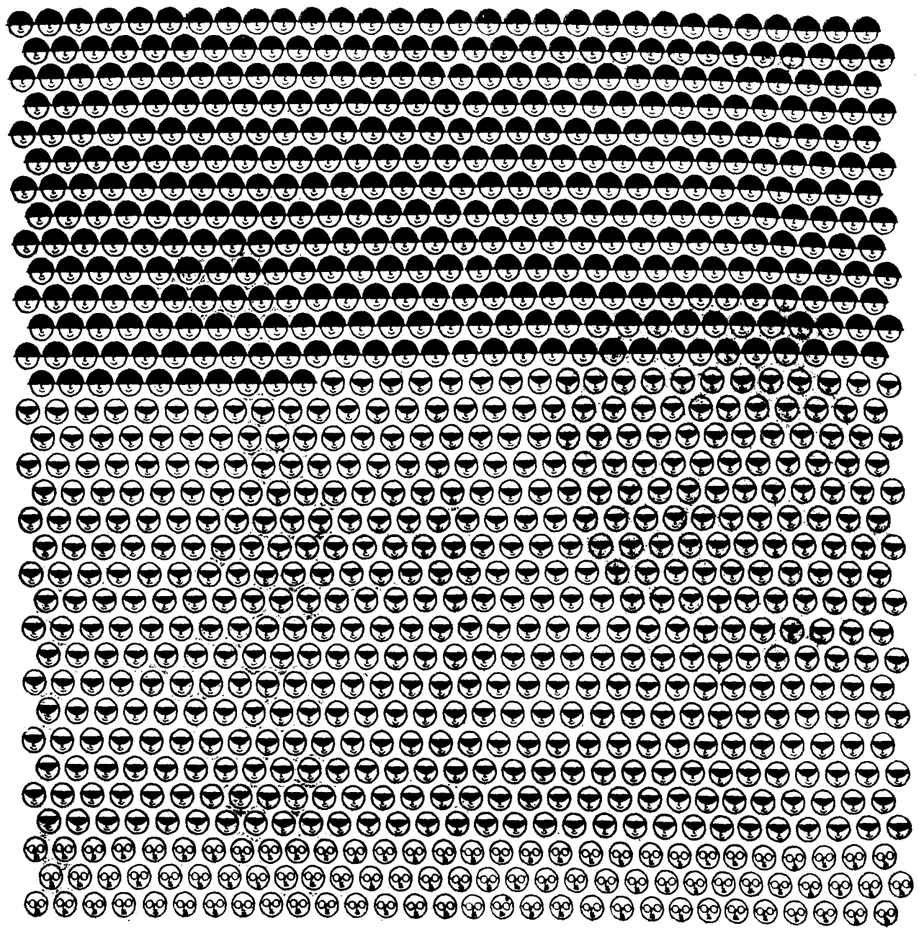
Toshiba Technology Thinks For You



This Toshiba computer takes a big load off the human mind. Its heart is the tiny transistor. At Toshiba the creative minds of more than 50,000 engineers, technicians and specialists are thinking in terms of better living for tomorrow. These are the men who made possible mass-production of Toshiba's now world-famous semiconductors. Toshiba produces a wide range of electrical equipment and appliances. These products represent the technical and manufacturing capabilities of one of the world's most versatile electrical manufacturing firms. Find out how Toshiba technology can help you with your electrical and electronic problems. Write today to Foreign Trade Division, Toshiba, Hibiya Mitsui Bldg., Yurakucho, Tokyo, Japan.

Tokyo Shibaura Electric Co., Ltd. Tokyo, Japan Toshiba Quality Since 1875



SKILL FOR SALE

JGC's 34 years of continuous experience in the planning, design, engineering, and construction of petroleum refining, petrochemical and industrial chemical process plants have made it a leader in the field. For example, over 60% of all petroleum refining facilities in Japan were constructed by JGC. Its skilled staff consists of 400 project engineers, 500 design engineers, and nearly 100 chemists.

JGC does not manufacture equipment or components itself but procures them from the most suitable suppliers. Representing no particular interests, its recommendations are made strictly on the basis of cost, quality, and location. JGC rigidly supervises every stage of the project – from process development to construction and start-up—and fully guarantees its final products with complete after-service. These advantages of quality, economy, and mobility have led to repeat commissions from satisfied clients all over the world. For details and catalogues write to Japan Gasoline Co., Ltd., New Otemachi Bldg., Chiyoda-ku, Tokyo, Japan.

Process engineering from "on paper to on stream"

Moreover wasteful overpadding of junior executive posts seems to be almost universal. In some aspects of management —such as the pre-planning of new operations and meticulous attention to the paper work required for each operation— Japanese industry is first class, largely because so many jobs that in Britain would be done by clerks are done in Japan by university graduates. But whenever any small hitch occurs, the whole machine is apt to catch up in a bureaucratic seizure of immobility. This is partly because under the system of promotion-by-seniority no junior executive has any incentive to show any capacity for making snap decisions on his own; partly because in Japan procrastination in the face of difficult problems is sometimes regarded as a national virtue rather than a maddening vice (after all it was the hero Abe Masahiro who laid down the line for dealing with Commodore Perry: "Our policy shall be to evade any definite answer to their request, while at the same time maintaining a peaceful demeanour"); but largely because it seems to be a tradition in Japan that if any changes in any plans are to be made they must be agreed to by everybody. Even at boardroom level decisions are not taken by majority vote but theoretically only by unanimous agreement.

To prevent this tradition of unanimity from being eternally stultifying, many Japanese organisations seem to have a man whom the outside observer finds himself disrespectfully calling the Emperor-figure. Conversation with and even between different executive grades in Japanese industry can go forward most interestingly and pointedly until this Emperor-figure arrives; then, your correspondent found, everybody falls into a deep and respectful hush. As the Emperor-figure (who may belong to the family owning the firm) does not seem always to be the man best fitted to make big decisions, the system is puzzling at first; but in fact his function is probably often to work merely as a constitutional monarch. When there is a controversy about some line of action to be taken, he lays down what has already emerged as the majority opinion as his own decided view; everybody then agrees that he must be right and so the tradition of unanimity is maintained. The system does not make for speed in operation, but it has some achievements to its credit. After all it was by this method, with the real Emperor, that Japan called off the war in 1945.

THIS tradition of always seeking agreement can have enervating results within industries as well as within individual companies. Because the Japanese in their recent great economic success story have followed some fiscal and economic policies in line with precepts that *The Economist* has long preached, it would be nice to be able to say that they are also keen believers in competing between themselves in a free market. Unfortunately, this would be quite flamboyantly untrue. The American Occupation left behind it an Anti-Monopoly Act and a Fair Trade Commission, on orthodox American trust-busting lines. The commission still exists, but the Japanese will explain that its main bias now is towards regulation of "unfair and unethical trade practices" (which means towards stamping out competition).

This is not to say that some forms of Japanese competition —vis-à-vis customers, if not vis-à-vis competitors—do not deserve to be stamped on. In 1960 the Fair Trade Commission set what the Japanese press called a "historical precedent" by threatening to act to stop the "selling of canned whale or horsemeat under labels designed to give the impression that beef was the content." (The phrase "give the impression" is a fine understatement.) However, this matter was all settled very chummily, in a typically Japanese way. In co-operation with the Fair Trade Commission, the designated packers of whale and horsemeat "launched corrective action by setting up committees on specifications and betterment of trade practices"; once set up, these committees promptly devoted themselves to stopping "excessive price competition" in their industries as well. This sort of thing is very common in Japan; it is constantly a surprise to find how far industries composed even of minuscule firms can continue to keep up prices, often with some form of official support. This applies even—indeed perhaps especially—to goods destined to be sold on export markets. The orthodox British idea, that by toning down demand on the home market one can encourage enterprising small firms to cut their prices and speed up their delivery dates and thus boost exports, is the precise opposite of the policy followed by Japan's Ministry of Trade and Industry. Under the Law on Export Goods Inspection, 1957, many manufacturers have to submit their goods to compulsory pre-export inspections; early this summer, despite the balance of payments crisis, some inspection organisations were grossly understaffed, which resulted in lengthy and officially created delays in some shipments. Moreover, when the Ministry imposes export quotas and official check prices, its object is to keep prices to particular markets up, not down.

WHAT will be interesting, however, will be to see how far import liberalisation serves to introduce some much-needed degree of competition into Japan. This autumn, with a fanfare of trumpets, Japan is due to take a step into what it calls 90 per cent liberalisation of imports. It had better be said straight away that this most certainly does not mean that

Tokyo street scene

Japanese farmer with tractor

Old yields to new

90 per cent of all that might be imported into Japan will be free of restrictions. In the first place, the figure refers only to 90 per cent by value of Japan's spending on imports in 1959; if imports of anything were nought in 1959 (and imports of very many things were) 90 per cent of nought is still nought. Again, imports are still to be authorised only within

the limitations set by an overall foreign exchange budget ; it is pretty clear that liberalisation is being steered into fields where the government hopes that domestic producers would be least hardly hit ; and some tariffs have already gone up to counter the effect of the quota restrictions coming down. Nevertheless the " Long-Range Economic Plan of Japan " was specific about the principles that should be followed :

> While it is advisable to give protection to incipient industries which have potentialities for development . . . the government should refrain from giving relief to declining ones. . . . Such a government attitude . . . would be felt as rather severe on industries and enterprises. But only by going through such a phase will Japan be strong enough to compete in the world market and gain a solid basis for economic growth.

It will be of enormous advantage to the next step forward in Japan if, as a gradual consequence of the removal of the most onerous part of the import controls, this precept comes at last to be gradually put into effect. Japan has advanced massively in the last decade, largely because it has had a steady stream of technologically educated school-leavers coming on to its labour market to take up their first jobs. The government has followed exactly the right budgetary, economic and planning policies to attract these youngsters into modern, expanding and high productivity industries, instead of following the stagnationist policies which could have left them to sink into the traditional and lower productivity industries of a past age. But now Japan has reached the stage where its objects should also be to draw existing and older workers out of inefficient firms into the new industrial structure ; its sociological set-up, its industrial customs, and its innate habits of mind will not make that switch an easy objective at all.

Technicians and Troublemakers

The final two articles in this survey are contributed by our resident correspondent in the Far East. He deals, first, with some of the troubles as well as the achievements of Japan's educational system

OF all the changes which the American occupation imposed or sought to impose on Japan, none dismayed and affronted conservative Japanese more than the reform of the education system. The reaction to these foreign changes provoked a bitter struggle between traditional and " progressive " elements as soon as Japan regained independence in 1952. This conflict has persisted through the ensuing decade, with violent political repercussions, scenes of disorder in universities and high schools and public demonstrations and riots. But generally a steady reversion to Japanese methods and ideas has, logically and successfully, prevailed. Many teachers and radical students, as well as the Japanese Communist party and the extreme left of the muddled and impotent Socialist party, led and lead the still stubborn opposition to the post-occupation trend. The lively paradox is that the conservative political forces and educational authorities which seek to revise the work of the occupation are largely regarded—and always denounced—as " pro-American," while the elements which uphold the old MacArthur education directives include the communist-backed demonstrators who storm the Diet, insult the Emperor, ill-use elderly professors and shout, " Yankees, go home ! "

The paradox derives from the pious occupation conviction that Japan's prewar educational methods, and especially the so-called " course in ethics," had somehow twisted and malformed the Japanese mind. It was assumed that the best teachers for the new Japan would be those who had been opposed to prewar Japanese policy. The result was that a majority of Japanese teachers reverted to the minority Marxist illusions and delusions of the nineteen-thirties. The Japanese teachers' union, 500,000 strong, became a confused stronghold of militant radicalism and political aspiration, which encouraged some strange excesses among a restless generation of Japanese students.

THE campaign for Japanese-style education in Japan began with the transfer of local education from the control of local authorities to the central government, continued with a revision of textbooks and curriculum, introduced a " merit-rating system " to weed out " undesirable " teachers, restored the controversial " ethics course " in the watered-down guise of a " morals course," placed major importance on scientific and technical-training, and prepared the way for vocational schools as well as high schools.

All these revisions, it was said, were aimed at discarding " the American method of education by experience and experiment." They were concentrated on the six years of primary school, the three years of middle school (which constitute the nine years of Japanese compulsory schooling) and the subsequent three years of high school. But naturally they are exerting a profound influence on the four years of university education also. (Formal education in Japan consists of what is known as the 6-3-3-4 system.)

The tragic confusion of politics with education has not, however, prevented a massively ambitious expansion of

MITSUBISHI RAILWAY LOCOMOTIVE AND ROLLING STOCK . . .

Mitsubishi Heavy-Industries, Reorganized, one of Japan's leading manufacturers of railway equipment and rolling stock, enjoys a deservedly high reputation in the transportation industry both in Japan and overseas.

The Company's engineering experience, technical skill, modern facilities, and rigid standards of inspection, have helped to produce a line of passenger and freight units which is attracting world-wide attention.

Other Mitsubishi Heavy-Industries, Reorganized, Limited products, all bearing the famous 'Three Diamonds' trademark, include ships, prime movers, steel structures, industrial machinery of all kinds, automobiles and aircraft, and complete industrial plants.

Illustrated is a 914 mm gauge 725 PS diesel electric locomotive which is part of a shipment being made to the Cuzco-Santa Ana Railways, Peru. It has been specially designed and constructed to negotiate 1 in 21.2 (40%) gradients.

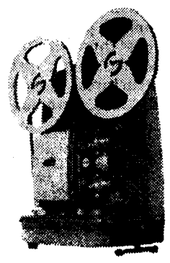
NEW ELMO "ZOOM AUTO-EYE" CINE CAMERAS NOW—with Power assisted exposure control!

And a host of other new features to join with Elmo's present standards of excellence.

New "CdS" meter boosted by a mercury battery assures perfect exposure always.
New Film speed range with 10-320 ASA with any camera speed.
New Filter factor control—built-in automatic control for filters and polarized fader.
New "F" stop reading incorporated in the viewfinder.
New F/1.8, 10-30 mm Zoom lens with the natural action zoom lever.



900% more brilliant!
Elmo 8mm Movie Projector

ELMO FP

- The most brilliant still projection available—900% more brilliant due to special glass heat filters.
- Reverse projection at the press of a button.
- Auto-start for talkie projection with a tape recorder.
- Variable speed control. Fast power rewind and Micropolished film transport mechanism.

("FP means "Fine Projection.")

educational facilities and a corresponding development of technical and high school training in Japan. Emphasis has been placed on education of the 15-17 age group. The rate of enrolment in high schools has increased to 60 per cent of those completing the nine-year period of compulsory education. There is growing pressure to make three years in high school (i.e. education for all children up to the age of 18) compulsory—with concentration on vocational and technical training.

Several bold and far-seeing education ministers have combined Japanese energy with the Japanese talent for skilful adaptation. In a recent survey of Japanese education over the past five years, the claim was made that recommendations contained in the Crowther report in Britain and Dr James Conant's report on American high schools had been incorporated, along with Russian and French practices, in Japanese educational policy. As part of the overhaul of the educational system, a cabinet economic council is drafting long-range training plans for engineers and technicians. The government's plan for again doubling the national income within 10 years will demand constant technological progress and a mounting supply of technicians. Increased enrolments will be encouraged in science and technological faculties at universities. More scholarships will be offered. A new type of high school will be introduced to specialise in industrial techniques. The pace of these developments will, of course, be governed by the availability of instructors, already in short supply, and the continuing replenishment of ordinary technicians who move ahead as they specialise.

TRAINING centres have already been established for technological instruction in nine famous universities. Here high school graduates receive concentrated training for three years, compared with the four-year course of training required for ordinary undergraduates at normal schools. This short-cut is under fire by critics who fear that it may lower teaching standards—and who also argue that it may result in an eventual diversion of young specialists from teaching posts to better-paid positions in Japan's thriving modern factories.

Further recognition of the new industrial age is to be found in the ministry of education's programme for establishing technical high schools, which will offer a five-year term for ordinary technicians, combining the three-year period of normal high school tuition with two years of advanced technical training. This programme has been criticised by traditionalists because it departs from the 6-3-3-4 system and also from accepted long-term educational goals; but the new technological trends in industry are too strong to be ignored.

There are admittedly substantial regional gaps in the rates of enrolment in high schools: a gap between rural areas and urban ones, and a widening rate of migration from country to city after graduation. Part-time schools, night schools and correspondence courses are still needed for remote rural areas in the crowded islands. There are serious accommodation problems, some schools struggling to cope with from 50 to 70 students in a single class. Moreover, despite a steady improvement, the ministry concedes that Japanese teaching standards fall behind western standards.

Since the war, the number of students at Japanese colleges and universities has increased 3.6 times; the number of girl students has increased more than seven times. Japan is ranked second only to west Germany in the number of active classroom hours in universities, but the results of examinations on "academic" subjects are said to be disappointing; only in mathematics did the Japanese hold their own—at about the same level as students' performances in British and Australian universities, and ahead of the level in the United States.

ALL of this change, improvement and conflict in Japanese education is now approaching a climax in the great universities, already reflecting the influence of new types of students, new ideas and new standards. Violence and irresponsibility in student life and manners will always command the headlines, but there can be no doubt that many of the old qualities of the universities of Tokyo and Kyoto have suffered grievously in postwar years. Not only do the mass of students tend to follow sheeplike, violent minorities, but too few professors have the courage to denounce the excesses of hoodlum students. Japanese traditionalists attribute this deterioration to the occupation reforms, which, they say, diminished the stature of the Emperor, the power of the police and old concepts of patriotism and discipline.

Unless the bellicose temper of the university student bodies mellows, and their political agitation is tempered by some forced interest in learning, the pending revisions in Japan's university system will provoke stormier incidents than the prolonged conflict over evolution in other fields of Japanese education. These revisions, "designed to make universities fit the requirements of the modern technical age and to adapt education to the development of human abilities," are in the hands of the Central Education Council, whose past rulings have so outraged the teachers' union and leftist politicians. The council's investigations are concerned with all aspects of university organisation and life, including such touchy problems as "the control and guidance of undergraduates."

The frustrated, but still strong and active, union of teachers from the primary, middle and high schools will certainly not miss the possibilities for trouble-making on this front in retaliation for their retreats and reverses on their own front. The anarchistic Zengakuren students' movement has already declared that it will resist to the last "any interference with the freedom of students' action," which in practice means freedom to detain professors forcibly in classrooms on matters of university discipline, and freedom to storm the Diet building, assault the police and stone the prime minister's residence on matters of political disputation.

It may well be, of course, that the new type of practical, technical-minded student, who will now be entering university from reoriented high schools, will help to remould campus thinking as the authorities seek to remould university methods. The Japanese, it has been well said, are better knowers than they are thinkers. As a rule, and as a race, they pragmatically set more store on knowledge and know-how than on speculation and argument. In the long run, the clearly-seen opportunities for early and rewarding advancement in scientific and technical careers, combined with the government's realistic investment in technological education, may conceivably result in a larger measure of self-imposed discipline by a more responsible student body. Meanwhile the giddy expansion of that student body still looks hugely impressive, however appalling some of its antics may seem.

South Seas Shuffle

Finally, our resident correspondent in the Far East deals with Japan's trade and aid relations with its neighbours in south-east Asia

JAPAN'S postwar plans for the organisation of an expanding and mutually rewarding partnership in economics, trade and development with south-east Asia have somehow never managed to get off the ground. Suspicions of Japan and Japanese motives died hard in the dark memories of the "mutual co-prosperity sphere" of the war years. Nor were the earliest Japanese diplomatic salesmen after the war as prudent or as tactful as they could have been. Only three years ago a former prime Minister, Mr Shigeru Yoshida, Japan's wise old man, reported bluntly after a tour of south-east Asia: "It is useless just now to think of economic co-operation with these people of the South Seas (Japan's name for south-east Asia), because the idea only raises their suspicions, makes them mistrust our intentions and withhold sympathy from our aims."

But sentiment has changed sharply since then. Japan's exports to south-east Asia are now approximately 30 per cent of the national aggregate, or roughly equivalent to its volume of exports to the United States. Japan's leaders fear that the United States may be virtually saturated as a market, and they realise that the south-east Asian markets will need a higher standard of living and increased cash or credit to be able to buy more from Japan. Japan's own continuing prosperity at home is now indeed largely dependent upon prosperity elsewhere. Nor have Tokyo's trade planners forgotten the sudden hot burst of competitive exports from China into south-east Asia in 1958.

At the conference of the Economic Commission for Asia and the Far East in Tokyo in March, Asian delegates, their old fears apparently forgotten, were politely critical of the scope and degree of Japanese aid and investment, but recalled hopefully that the prime minister, Mr Ikeda, after his own tour of the region four months earlier, had promised to promote economic co-operation with south-east Asia "even if we have to borrow money from foreign countries to do so." There is also pressure from Washington: Japan's ambassador there has no doubt transmitted State Department hints that Japan's proportion of foreign aid and investment could, with advantage, be increased to one per cent of the gross national product. The present proportion is just over half of one per cent. (In 1956 it was 0.2 per cent. The total amount of foreign aid extended by Japan between 1956 and 1960 was $1,000 million, on Japan's measurement.)

DRASTIC proposals to change the pattern of triangular trade now existing between the United States, Japan and south-east Asia have just been advanced by Japan's influential Institute of Asian Economic Affairs. The institute's experts, under the direction of Professor Kiyoshi Kojima, complain of contradictions, weaknesses and harmful competition between Japanese and American trade trends with south-east Asia. These they argue, will have to be corrected in concert before the development of the south-east Asian states can be properly planned and expanded. The south-east Asian problem, indeed, is presented primarily as one of long-range agreement and co-ordination between Washington and Tokyo, and secondarily of investment and aid by both governments.

Briefly, Professor Kojima contends that the flow of south-east Asia's exports in primary products to the United States should be large, and of American exports in primary products to Asia small. Actually, the volumes are reversed. Secondly, the professor says, the proportion of American manufactured exports to south-east Asia should be raised as the proportion of primary products drops. Thirdly, while Japan's imports of primary products from south-east Asia are of course high, they should be higher—at the expense of a reduction in the excessive imports of American primary products. Fourthly, Japan should reduce its existing volume of exports of "labour-intensive" light industry goods, in order to increase its exports of "capital-intensive" heavy machines and equipment.

It is pointed out that, to the extent to which Japan imports primary products from the United States—because of superiority in quality and quicker and safer delivery—instead of from south-east Asia, Japan's trade liberalisation policy automatically and increasingly stimulates this undesirable trend. Abolition of the protection which America now gives to its agriculture and textiles is strongly recommended. The United States should shift its industrial structure still further to heavy and chemical industries as well as the service industries; or so the report says. There is ample room for adjustment in the competition between Japan and south-east Asia in textile exports if Japan places greater emphasis on sending out mainly higher quality textiles. Japan should be ready to see a run-down in its exports of lower quality textiles and even begin to accept such textile imports from south-east Asia.

The United States and Japan, it is further argued, must co-ordinate aid and trade policies to increase the production of food, and especially rice, in south-east Asia. Because of poor methods and inadequate use of fertiliser, the south-east Asian countries produce too little food. This low productivity is responsible for the higher south-east Asian prices for primary products, which the United States is able to undercut to the continuing disadvantage of Asian balances of payment. Japan, by scientific methods and proper use of fertiliser, produces four tons or more of rice to the hectare; in Korea and Formosa, the average yield is three tons; in other areas of south-east Asia, it is often one ton or less. Chemical fertiliser must be made available and large-scale irrigation work undertaken to double the production of rice in south-east Asia in the next 20 years—an increase which will just meet the estimated rise in population and rice demand in that time.

Finally, Professor Kojima recommends an agreement between Japan and the United States on capital co-operation and amicable division of the categories of heavy and chemical industry products on which both should concentrate for the

south-east Asian market. Some of these classes of capital goods, he insists, could be manufactured at lower cost in Japan if mass production were possible. "It is clear from our analysis," he submits, "that there remains an ample market for the exports of capital-intensive products from the United States and Japan to a self-prospering south-east Asia, with expanding industry and rising living standards, provided that the United States and Japan improve their pattern of triangular trade and invest aid and capital in the right directions."

IN an imperfect world, the political and international difficulties confronting the recommendations of the Kojima report are only too obvious. But the report coincides with Mr Ikeda's pledges of increased help and with a steadily rising scale of aid by Japan to the South Seas area (which, by Japanese calculation, includes 14 states: Formosa, Hongkong, South Korea, Burma, Ceylon, India, Pakistan, Malaya, South Vietnam, Laos, Cambodia, Indonesia, the Philippines and Siam).

There is certainly an encouraging mood of ripening reasonableness in both government and industry in Tokyo. Perhaps, too, the prospects of long-range planning between Japan and the United States are not as remote as in other days. After all, Washington today is prepared to welcome Japanese investment in factories in areas of the United States, like Kansas, North Carolina, New Jersey and the west coast, to the advantage of both countries.

Japanese aid for south-east Asia takes the shape of loans, technical investment and advice, and more or less generous variations on the prickly theme of Japanese war reparations. Loans, it is true, have not been munificent; for example, only $80 million went to India's third five-year plan and $30 million to Pakistan's second plan. Interest on the Indian loan was 5½ per cent, which can be hardly described as generous. However, close friends of Mr Ikeda say that the prime minister was shaken by his first personal observations of poverty in India; maybe there will be more liberal offerings.

Technical aid has been on a more ambitious scale, and action has been taken to reform and expand this form of co-operation. An Association for Overseas Technical Co-operation, with a capital of 200 million yen, will pool the efforts of the Asia Association, the Latin American Centre, the International Engineering and Technical Association and the Lower Mekong Research Committee. In the past eight years, 35,000 trainees have come to Japan for technical studies, and Japan has sent 600 experts abroad. The latest budget appropriations for technical co-operation with the Colombo plan region total 2,233 million yen, including grants to Cambodia and Laos, and loans and credits to India, Indonesia, Pakistan, the Philippines, Siam and South Vietnam. In the year ended March, 1961, Japanese firms invested £15 million in south-east Asia.

Reparation payments are another method of providing economic stimulus in which Tokyo has done some skilful backing and filling. Burma's exports to Japan are worth only 25 per cent of its imports from Japan, and her leaders now complain that Burma has suffered because of an early agreement to accept $200 million worth of goods in settlement of reparations, while other countries, which were tougher, have since hammered out better terms. There was some fine print in this agreement which provided for later renegotiations, but the Japanese are now being unyielding—and, in any event, no longer require rice imports from Burma because of improved agricultural methods and a growing taste for western bread and butter. So far Japan has paid £41 million in reparations to Burma (of an agreed £72 million), £41 million to the Philippines (of an agreed £198 million to be paid over 20 years), £15 million to India (of £80 million over twelve years), and one million pounds to South Vietnam (of £14 million over five years). A complicated settlement with Siam over Japan's manipulation of the local currency during the occupation of Siam is being completed.

Finally, rationalisation of trade and aid should be simplified by the stirrings of regional integration in south-east Asia. The projected Federation of Malaysia and the alignment of Siam, Malaya and the Philippines in the Association of South-East Asian States (ASA) are helpful contributions to the reshaped pattern of triangular trade advocated by Japan's Institute of Asian Economic Affairs.

JAPAN has rejected all tentative proposals for a Pacific common market, contending with some plausibility that there is far too much diversity in the markets, wage structures and technological capacities of the various countries. But ASA is a welcome exercise in south-east Asian self-reliance; it represents a potential economic-social grouping of 65 million people and could help to stabilise world prices for south-east Asia's rubber, tin, copra and other basic exports. The nervous neutralism of Burma and the expedient neutralism of Indonesia limit the horizons of ASA, a grouping which, even if non-military, is anti-communist. The delicate balance which must be preserved in all plans affecting south-east Asia was properly stressed by the Burmese government: "When emphasis is placed on the positive aspects of common economic interest rather than the negative aspects of anti-communism, the idea of an association of south-east Asian states can become a reality."

Some symbolist has since expressed the prospects for ASA by altering its original title ASAS, which is bold Malayan for "foundation." The new title ASA means simply "hope" in the native languages of the three founding partners. Perhaps this is the right mood, also, for a cautious sniffing of the prospects for freer trade winds in the South Seas.

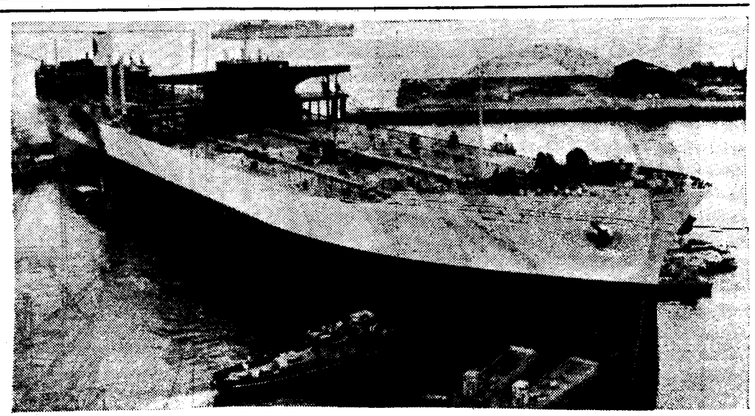
World's Largest Tanker To be completed In Oct. '62



Work on the world's largest tanker will soon be completed and ready for delivery to its owner Idemitsu Kosan Co., Ltd., a Japanese oil refining company, in early October, 1962. This 131,000-dwt vessel measures 954 ft. 9 in. in overall length, 141ft. 1 in. in moulded breadth, 72 ft. 10 in. in moulded depth. It is capable of carrying 930,000 barrels of oil at a service speed of 16 knots. This mammoth tanker was made by Sasebo Heavy Industries Co., Ltd., one of the largest shipbuilders in Japan, which has six dry docks—including Japan's largest—three building berths, and other complete and most modern facilities necessary for building any type of ship and also for manufacturing all kinds of industrial machinery and plants. The record-breaking speed—only 11 months after keel-laying—in building the world's largest tanker is due to Sasebo's superior technology, high-level engineering skill and traditional experience.

Find out how Sasebo can fill your construction needs. Write to Sasebo Publicity Section, Sasebo Heavy Industries Co., Ltd., New Ohtemachi Bldg., Chiyoda-ku, Tokyo.

Sheffield Experiments

FROM OUR SPECIAL CORRESPONDENT

THE new Sheffield is a city of visual excitement. Other industrial towns share the sense of monodic drama which comes with great mills, belching chimneys, and soupy air lying heavy on the frail shoulders of the back-to-backs. Sheffield has, in addition, three steeply-rising hills enclosing and looking down on the dark heart of the town at the confluence of its two rivers ; and on them, stark towers and cliffs of council-built housing enliven the pale murk of the skyline, punctuating and lending point to the new open spaces which lie where not long since were marching armies of slum houses.

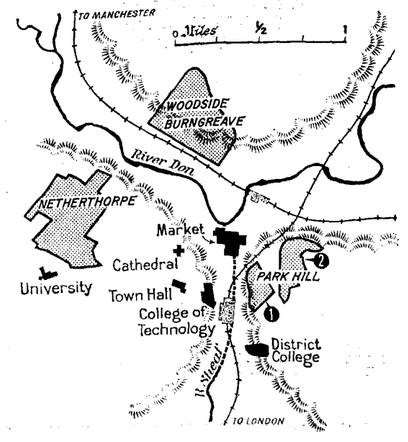
Ten years ago Sheffield, still grossly scarred by war, began to reform the grim mixture of slum and furnace which two centuries of industrial revolution had imposed on its city centre. Its limitations were severe: at 500,000, its population was all but bursting through its boundaries, within which only two-thirds of the available area could be used for development, the rest being within the Peak National Park. There was a substantial waiting list for houses ; about a quarter of the population was living still in slums which urgently needed demolition ; and much of the space occupied by slums intermingled with factories in the Don valley was needed for the expansion of the factories if Sheffield was to maintain its prosperity. But there were some initial advantages, too, not the least of which was council responsibility for much of the later nineteenth-century housing, put up when its own by-laws of the decade after 1860 made the speculative building of working-class houses less profitable than it had been in the back-to-back era.

A start was made immediately after the war with the infilling of space in the city ; but the first major scheme, covering what had been virgin countryside, came in the 1950s, and was built on the then *avant-garde* Radburn plan. In five subsequent projects in the decade since 1953, some such development of new town principles has been incorporated and, apart from the extraordinary densities with which the planners are working (160 or more, net, to the acre), no particular significance attaches to them. They are good of their kind, exceptionally numerous (about 20,000 dwellings have been council-built since the war—but 67,000 more are needed), and low in cost, having been built to plans prepared for the municipality by its own public works department, which tendered lower than anybody else. But nobody could call them original in conception or execution.

The sixth of the seven developments during the decade, Park Hill, is, however, a new departure, representing the first step in a scheme of undoubted vision and scope, which has a social purpose rather than a mere need to package as its impetus. Park Hill stands steeply overlooking the Midland railway station on the south side of Sheffield, close to the city centre and, within fresh memory, the home of over a thousand slum families. Their dwellings had been the subject of some of the earliest of the city's slum clearance orders, and much of the site had been cleared before the war. On this site the first redevelopment scheme proper was begun in 1957.

Dwellers in slum areas are in intimate social contact with their neighbours, and generally have a certain co-operative loyalty to the only meeting-ground available to them—the street. Park Hill, and the scheme which will accompany it, have been designed to perpetuate both neighbourliness and a form of the street while doing away with their more obvious shortcomings. About whether the design has succeeded there may be more than one opinion ; but it is certainly a notable first attempt to break away from the traditional insipidity of council housing.

IN plan, Park Hill 1, the first half of the development housing nearly 1,000 families, is a series of four serpentine blocks, four storeys high at the top of the hill increasing to fourteen as the ground falls away. Every third floor is a "deck," corresponding to the access corridor of the conventional block of flats, but ten feet wide: on to it open all the front doors of the two-storey maisonettes (one above deck-level) and flats (below deck-level) of which the blocks are made up. Each deck is continuous through all four blocks, forming the "street" to which so much sociological importance is attached. Park Hill 2, now called Hyde Park, will rise behind the completed scheme, and link with it through similar decks. In addition, the lowest of the decks will eventually link directly, via a bridge over the Sheaf river valley, with the proposed city centre, bits of which have already been built, partly by the corporation and partly by private developers, to incorporate a first-floor-level gallery which is the continuation of the decks at Park Hill, and which will itself be continuous from one building to the next. By this means it is planned to achieve the complete segregation of pedestrians and road traffic (which is not a pressing problem now, but may become so when Sheffield's comparative isolation is ended by the new London-Yorkshire motorway.



Reactions to Park Hill range from whole-hearted approval to outrage. The accommodation is small ; no amount of convoluting has managed to avoid the appearance of cliff-dwellings in the blocks ; the density, of 192 to the acre net, is perhaps unnecessarily high, even for Sheffield ; the tenants are not unanimous in their liking for the "street" idea, and some of them complain of living in a barracks ; there has been some talk of architectural triumphs at the expense of social improvement. Nor is that the only expense complained of: the average cost

of an apartment is, at £1,950, over £300 more than that of the equivalent council house on an estate—and Sheffield does not operate a differential rent policy (£2 7s. 4d. is the maximum gross rent for a three-bedroomed apartment in the city, 13s. 10d. of that being rates).

The municipal departments concerned remain convinced of the rightness of what they are doing, and point out in support that they are accommodating twice as many people as the area formerly held, in infinitely more salubrious quarters; and although costs are high, the economies implicit in large blocks with central servicing make the whole proposition compare favourably with conventional estates of the same size and capacity. In spite of reservations, primarily about the city's apparent preoccupation with high building as a universal solution to housing needs, it is hard to avoid sharing the excitement of the builders, and their feeling that something significant has been achieved.

And if they have not quite achieved what they planned—the cheapest and best council housing in Britain — they have come close enough to it to attract visitors from many countries to see their work—a welcome development, acknowledged in the publication this year of a progress report in three languages, one of them Russian. Sheffield has much to teach other grim cities (and some not so grim) about urban renewal and vigour in local government; even its severest critics allow that.

On the new "street"

End of the Line

FROM A CORRESPONDENT IN GLASGOW

MORE than a quarter of a million Glaswegians turned out on two separate evenings during the week to line seven miles of the city's streets and bid a sentimental farewell to the last city tramway service in Britain. Most of them firmly believe it was also the greatest and they have facts and figures to prove it. Blackpool may have the last trams of all but now that the Glesca' caurs have lurched into history such heresies as the space age could become acceptable along Clydeside.

Sociologists have still properly to explain why Glasgow should have claimed the tramcars so completely for its own (although it may be allowed to local pride that nobody else managed to operate them so cheaply or successfully). No city but Glasgow invested its trams with such impassioned law and legend or stood faithfully by them for so long. The tramcars' departure may help simultaneously to balance the city's books and ease traffic troubles in the streets, but it will do the civic psyche no good at all. Glasgow used and loved the trams throughout its great days, and over the past decade there are plenty of Clydesiders who see hard times significantly endured by the city and its trams together.

The Number Nine tram (Car 1313, Coronation Murk II model) that ended it all in the wee sma' hours last Sunday morning, September 2nd, had run the final route from Auchenshuggle to Dalmuit West, most of the way in sight of Mother Clyde. Some old men who just remember the municipal tramways' birth and who have lived long enough to witness their death, have been joined this week at the wake by light railway enthusiasts flooding in from Europe and elsewhere. But Glasgow Corporation celebrated the occasion on Tuesday with a shameless piece of Barnum and Bailey and staged a cavalcade of 20 Glasgow cars ancient and modern, the Lord Provost driving one and surviving to boast of it at the valedictory banquet that followed.

Horsedrawn private enterprise trams were eliminated when Glasgow Corporation monopolistically launched its own tramway system in 1894, and it was not until 1955 that the corporation began scrapping it seriously (four years after the Inglis report on the Clyde valley's transport problems had pointed the way). Between 1894 and 1955 there was bred in Glasgow a famous dynasty of tramway managers who created an international reputation for the city's tramways. The services were still expanding up to 1948, but that was a big year when 595 million passengers were carried and 38 million miles run by a fleet of more than 1,100 cars which worked 40 routes over 270 miles of single track.

Up to 1945 the trams were highly profitable. Municipal transport (mainly the cars) paid £1.5 million to the city's Common Good fund, and also provided £5.15 million to the rates and £2.5 million in property tax. For long the big thing about the trams was the cheapness of the fare; for many years it cost only ½d. to travel half a mile. The ½d. fare was so cheap it was sometimes attacked for that very reason, but it had a lot to do with the tramcar taking its place in Clydeside mythology.

The Glasgow trams, mostly by absorption in the 1920s, ultimately served Lowland burghs and hamlets well beyond the city boundaries, from Airdrie and Coatbridge to Paisley, Barrhead and Elderslie, from Rutherglen and Uddingston to Hillfoot, Milngavie and Clydebank. The longest haul was 23¼ miles, from Milngavie to Renfrew Ferry (maximum cost 2d. in the brave days), but these farflung services through rutal areas contained some of the seeds of eventual unprofitability. Finances, in spite of cheap fares, were buoyant for so long that the transport department twice paid off its outstanding capital liabilities, but the postwar period began a financial decline. Operating costs rose steeply as tram track grew expensive to maintain and as buses increasingly served the emerging peripheral housing estates. By the early 1950s municipal transport was well in the red, surplus and loss have fluctuated wildly since, and today there is a capital debt in excess of £6.3 million.

Whether transport undertakings show a temporary profit or a loss tends to depend nowadays on fares either needing to be raised or recently having been. Glasgow's, in fact, has made substantial profits for two years back and only the tramway sentimentalists remain unconvinced that the new profitability has very much to do with the progressive elimination of the tramway system. It was in 1957-58 that the decision was irrevocably taken to convert to buses before 1963, and in spite of last-ditch bids by their fans to save them the end of the line has duly arrived for the trams. The next step ought to be the rationalisation of Glasgow's modernised transport system (discussed in *The Economist* of February 3rd) within a wider Clyde valley road-rail network, fully integrated to speed passenger carrying by public and private means. The first faltering moves towards such a full scale integration are getting under way just as Lilley's toothpicks (a fearsome Glasgow invention for tearing up enormous lengths of tram track) are swiftly removing the last of the granite setts on which so much tramways history was made. Stubborn local enthusiasts remain sure that in time Glasgow will turn again to tramcars, on the American or European model, and thus reap a bitter harvest from its motorbus policy. But meantime the ratepayers like the new profitability of the buses and motorists know well that the traffic flow in the streets is quicker since the last trams went.

THE SHORTEST DISTANCE BETWEEN TWO POINTS IS A CURVE

The swooping curve of steel wire which now leaps across the Firth of Forth looks good to motorists. When the Forth Road Bridge, of which it is part, opens in 1963, the Edinburgh-Dunfermline run will be cut from 40 tedious miles to 7. For key jobs like this, bridge builders depend, of course, on STEEL: 6,000 tons of high-tensile steel plate in the two 500 foot main towers; 30,000 miles of high-tensile steel wire in the 2 ft. thick main cables—each made of 11,618 separate wires, only 1.5" thick but with a breaking point of over 100 tons a square inch. Another 16,000 tons of high-tensile steel will be added in the roadway of the bridge, plus 880 tons in balustrading and railings. In all, some 39,000 tons of steel will span the Firth, its curves set against the more severe lines of the Forth Rail Bridge, which back in 1889 was the world's first great bridge to be built of steel. Today, as then, steel—tremendously strong and versatile is the *modern* metal. STEEL SHAPES TOMORROW

Do's and Don'ts for Washington

What is to be expected from the annual meeting of the International Monetary Fund (and the more cloistered sessions in private rooms) opening in Washington on Monday week? Mr Reginald Maudling has promised new initiatives from Britain; President Kennedy is taking a special personal interest. But this attention itself is not enough to promise success; there seems a clear danger at the moment that brave intentions may yield little result, or may even misfire. A rare mixture of long-term vision and diplomatic tact is necessary to break through the present frustrating deadlock in international finance, and unfortunately the financial authorities in London and Washington have so far shown themselves rather short on both qualities. Some short-hand practical advice may perhaps not be taken amiss. And before coming to the positive things that Mr Maudling and his American counterparts could and should desirably say, one must begin with warnings of what they should definitely not say, lest the best constructive proposals be ruined in advance.

True to God, the Queen and American Treasury Bills?

THE first "don't" needs to be shrieked out loud. *Don't* give yet another plea for the international monetary system to be run on the principles of the Boy Scout movement. *Don't*, Mr President, send round a rallying call that all partners in the western alliance should patriotically do their bit for Nato by holding dollars and not changing them for gold; do, Mr Roosa, persuade Mr Dillon to spread around that the United States has gold in plenty and is only too happy to exchange it for any central bank that is fool enough to lose the interest on the US Treasury bills that it holds. And there is a footnote for Mr Maudling: *Don't* make too much of the unfair burdens that have long rested on sterling through its role as a key currency. Sympathy is not a powerful mover in international diplomacy, least of all in financial diplomacy with the French; and this one has been tried before. People will not change the system because they feel it is tough on you: they will change it if you can show them it is worth their while to change it. For what to offer, see below. Meanwhile, Mr Maudling, don't expect to get anything by offering nothing; Mr Roosa may have some Roman memories about this.

Maudling-Roosa Entente?

BUT perhaps you have already got together? It would be a pity if you had not. You happen to be a British Chancellor of the Exchequer keenly interested in achieving a real transformation of the international monetary system—but perhaps not quite certain how to go about it—at a time when external policy for the dollar is being directed by one of the keenest central banking minds ever to come to grips with the balance of payments. Mr Roosa, necessarily, has paid first attention to short-term pressures; but do not, Mr Chancellor, follow some of your advisers in under-estimating the possible implications of his longer range ideas, notably for mutual holding of currencies. With patient but purposeful shoving, this concept could work out much the same as the elaborate plans of the Keynes or Triffin type which, Mr Chancellor, you have prudently been advised not to resurrect under present circumstances. The start made this year under Mr Roosa's lead in mutual holdings between central banks is a minimal one, totally inadequate by itself. But it is a start; and just what is the Bank of England doing in frowning on the idea to such an extent that the sterling-dollar arrangement has now been allowed to lapse? The Bank, like some other central banks, distrusts the idea of "artificially creating" reserves. Mr Maudling, do you? Or has this not rather struck you as the object of the exercise? If you are really serious about new initiatives, there could be something in Roosa for you. *Don't* under-estimate the value of a co-ordinated Anglo-American approach; don't over-estimate the impact of a few wise words uttered in isolation.

SO much for the don'ts. Now for the positive stuff. *Do*, as an overriding aim, make an impact. Do reinforce your resolve not to produce yet another beautiful comprehensive plan—there are more than enough to choose from already—but to break out of the impasse. Think of it in this way: more urgent even than making available new forms of liquidity is to stop the existing forms of liquidity from freezing up. And freezing up, in effect, they are. America with $16 billion of gold behaves as if it has $4 billion; European finance ministers with billions in dollar balances face hostile questions at press conferences if they begin to draw them down. The first task is thus to restore confidence in the usefulness of existing international money.

Nettle of the Guarantee

HOW? You, Mr Roosa, claim it can all be done by faith. The only real guarantee for the dollar, you say, is its own strength. Well, that's a platform point but not much else. The hard point is this: if foreign monetary authorities

are to be persuaded to hold more dollars than they would otherwise do because you and your President give the most solemn assurances that the dollar will never be worth less than one thirty-fifth of an ounce of gold, who should take the risk of things turning out another way—they or you? Have you not, in all your new arrangements with other central banks, provided a guarantee on the dollars provided—a guarantee, admittedly, not in gold but in the foreign currency concerned? And would you, frankly, hold really large amounts of other people's currencies without guarantee? Do you see any possible prospect—or case—for extending the mutual holding of currencies in the way you have foreshadowed without such guarantees? It is entirely natural that any deliberate, as opposed to automatic, extension of international holding of monetary paper, whether of other people's national currencies or through specifically international credit in the International Monetary Fund or similar institutions, should embrace some form of value guarantee; the most radical reformer does not suggest otherwise. Guarantees are an indispensable element in any step forward in international credit.

All this is for you, Mr Chancellor, too. Your officials at times show signs of being terrified of a guarantee: how can it possibly be assumed by sterling, they say, with its ratio of only one to three of quick assets to liabilities? But this objection shows a fundamental misunderstanding both of the nature of a guarantee and of the function of the cash reserve in banking—international as well as domestic. A gold guarantee assumed by Britain on sterling balances now would not mean, in the event of a devaluation, that Britain was committed to pay out still more gold that it had not got. It has nothing to do with the paying out of gold (which Britain does not officially undertake anyway); it is a value link for sterling balances—which it would protect, not threaten, in the event of a devaluation.

Similar considerations apply in America. Of course, if as responsible financial authorities you both still feel you must guard against the prospect of a rise in the price of gold then you would be foolhardy indeed to offer the guarantee; you have probably said this a number of times to yourselves. But equally, don't you think the private operator (you call him a speculator, while in *your* hedging you count yourselves as responsible authorities) is capable of tracing this logic himself, and drawing appropriate conclusions. Don't you, in short, see the urgency of finally deciding, and committing yourself, on whether you are going to change the gold price or not?

T--ff-n by the Back Door

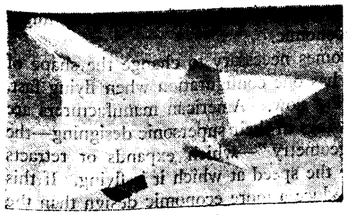
IF a change in the price of gold is ruled out; if, that is to say, sufficient faith is put behind the creation of new forms of international liquidity in paper form; then it will not matter much whether the currency guarantee is expressed in gold or in the currency of the holder. The only element at risk will be the possible relative devaluation of one currency against another—the scope for which is narrowing each year as the major western economies draw closer together and become more sharply competitive. But there would be two advantages in taking the bolder course of the gold guarantee. The first would be its very boldness—one must repeat that a jolt is needed to change the deteriorating course of confidence in international finance, and needed above all is a jolt against the gold fetish.

The second advantage, Mr Maudling, is that a gold guarantee would be the ideal instrument for linking this reassuring support for the old system to a practical beginning for the new. The guarantee could be given, that is to say, to those balances that are transferred as new deposits to the International Monetary Fund. Wouldn't it be nice, oh forward-looking Chancellor, to see central bankers scrambling into the world's new unit of international account rather than having to be dragged into it by the professor we mustn't name? Of course this would be only a beginning. Decisions would soon have to be taken about expanding the volume of IMF deposits. But how else to begin, given that there is no chance of a credit-creating scheme being voted in from scratch? Mr Roosa has shown you the way, Mr Chancellor. Mutual holding of currencies and a wider role for the IMF are essentially part of the same exercise, and can for the immediate future go side by side. You will not sell them to the world outright. You have to give something in return. What you both have to give is the currency guarantee; you will have to give it in the end anyhow; so why not give it now while it still looks good?

MR CHANCELLOR, you are under test. You have chosen, to your credit, to make your first assault on this awful problem of international finance—almost as difficult as getting into Europe in 1958, perhaps? You have some personal stake in your success. To achieve it, you must be willing to court unpopularity in some quarters of London, and to work much more closely, if still not uncritically, with that heaven-sent ally on the other side of the Atlantic. Why not get up with him in Washington and say in chorus:

> Here is our plan; we offer these real concessions to introduce a system that is of clear advantage to you as well as to us; we are both prepared for our part to switch reserves out of gold into interest-bearing guaranteed paper; we rejoice in the recent improvement in our recent balances of payments; we reject the concept of a mystic influence that prevents the reserve currency countries from pushing expansion to the limits that are safe for other countries and safe for us domestically; and we intend to go forward with due, but not undue, caution.

Then you might get somewhere. You would certainly get things moving, which is the first need. Without such gestures, without such alliance, what, Mr Chancellor, can you expect to achieve?



What Kind of Supersonic Airliner?

NOBODY loved Cassandra. To have to play a Cassandra part during the one week when the aircraft industry is *en fête* at Farnborough may seem graceless and ungrateful but there are misgivings about the Anglo-French exercise in building a new supersonic airliner which require airing before final decisions are taken. The British Aircraft Corporation and the nationalised French company, Sud Aviation, have reached agreement on the design and development of a supersonic airliner to fly at 1,400 miles an hour; this means that the design has now been frozen and that the two companies need only the approval of the two governments to go ahead with a prototype. The public ought to know what it will then be asked to pay for.

Just as the monoplane succeeded the biplane and the jet succeeded the propeller aircraft, a supersonic airliner is the logical next step in aviation. But "supersonic" is a disarmingly vague term. Some supersonic aircraft are intended to fly at twice the speed of sound (say, 1,400 to 1,500 miles an hour) and some at three times (more than 2,000 miles an hour). The difference is significant even in words; in engineering terms, it involves departures in technique as radical as those that separate the propeller-turbine Viscount from the pure jet Boeing, whose only resemblance is that they are powered by gas turbine engines. In a supersonic regime, the 1,400 miles an hour Mach 2* aircraft and the 2,000 mph Mach 3 aircraft would fly faster than sound; but that would be the only thing they had in common. In every other respect they would be as different from each other as a Boeing from a Viscount. The question is: Which of the two types should Britain build?

The design that has been evolved by Sud and BAC is a Mach 2 machine. One could describe this not unfairly or cynically as a supersonic equivalent of a Viscount or a Britannia. The intention is that Sud should build a supersonic "Caravelle" suitable for the 1,000 to 2,000 mile range routes that Air France flies to the Middle East, while the British Aircraft Corporation should build a trans-Atlantic version. The two aircraft would be identical, except that the trans-Atlantic version would carry more fuel than the short-range version and so, presumably, fewer passengers.

The Mach 2 aircraft typified by this Anglo-French venture represents the ultimate in aircraft engineering, by today's standards. It offers the fastest aircraft that could be built out of the standard light alloy materials used throughout the aircraft industry. At Mach 2, these materials would reach temperatures of up to 140° centigrade from thermal friction between the airframe and the air. Any marked increase in speed beyond this critical point would heat the structure to an extreme where it began to lose its strength. In much the same way, the Viscount, Britannia and the new Vanguard represent the ultimate speed that can be reached with propeller-driven aircraft. Faster speeds require new engines, new aerodynamic ideas and, above all, new materials. A Mach 2 aircraft is not essentially new; it is rather an intrinsically conservative design, pitched comfortably within the limits of proven aircraft techniques. Jet fighters and a few jet bombers are accumulating hundreds of hours of flying experience at these speeds, so providing experience that can be built into the proposed civil aircraft. With this technical backing, the prototype of a Mach 2 airliner might be flying in five years, with deliveries to the airlines starting in the early 1970s.

THIS sounds an eminently sensible, cautious approach; in fact, it is an approach to an end, not to a beginning. Going supersonic is expensive; at the most conservative estimate, the proposed Mach 2 aircraft might cost £150 million to develop, divided equally between Britain and France. When it comes to laying down a supersonic production line, the first thing an aircraft industry will need to know is that the basic aircraft will stay in production for many years. The airline that buys it, for two to three times the £3 million that it pays for a subsonic jet, will want to be certain that the machine will not become prematurely obsolete.

No such guarantee can be given with a Mach 2 airliner. Judging by trends on the other side of the Atlantic, any Mach 2 aircraft would be replaced sooner rather than later by a new generation of genuinely supersonic aircraft built out of materials like steel and titanium that can withstand the operating temperatures that go with speeds above Mach 2. At Mach 3, about 2,000 miles an hour, skin temperatures might reach 500° centigrade. Mach 3 is out of the question for the time being. Aircraft with a stainless steel skin would be able to withstand this speed and more, but other materials would not, and the fuel would explode. But these present limitations are not necessarily permanent. Manufacturers on the other side of the Atlantic are planning their supersonic programmes in terms of steel aircraft starting at speeds little faster than Mach 2, but hoping to evolve to Mach 3 in good time. Given a steel primary structure, limits on operating speeds imposed by other materials can be removed in turn without altering the basic aircraft structure.

A light alloy Mach 2 aircraft—as opposed to a steel Mach 2 aircraft—is worth building only if it can be expected first, that it would have an outstandingly better economic performance, and secondly, that a steel aircraft would take so long to develop that a light alloy aircraft would have a long working life. The Ministry of Aviation which has consistently supported the light alloy aircraft, would argue that technical developments have been made in light alloy construction to produce a machine conspicuously lighter—and so conspicuously more economic—than a steel one. But the Ministry has to

* The Mach number measures the speed of an aircraft in relation to the speed of sound at a given height. At sea level, sound travels at 760 mph; it falls at higher altitudes. Mach 1 equals the speed of sound, Mach 2 reaches twice the speed of sound and so on.

convince doubters, many with wide scientific knowledge, that this Anglo-French venture is secure, because we have tricks unknown to the Americans. American manufacturers have examined both kinds of supersonic design and rejected the light alloy aircraft because of its apparently short commercial life. It is worth remembering that the long-range Britannia airliner and the short-range Vanguard were examples of propeller-turbine aircraft that represented the ultimate propeller-aircraft design. The airlines pointedly preferred jets, and the two propeller aircraft proved virtually unsaleable. At Farnborough during the past week, the aircraft industry could be seen belatedly attempting to rectify the mistake with the British Aircraft Corporation's giant VC 10 and de Havilland's smooth, smaller Trident.

Its supporters claim that the light alloy Mach 2 aircraft will have a lead of five years at worst, and at best considerably longer, over any steel-built competitor. But one must ask whether the entire United States aircraft industry is composed of ostriches. Has the lesson of the Comet been learnt ? Does the industry still lack a sense of timing ? All the evidence suggests that airlines are in no hurry to go supersonic, will not be panicked into doing so, and will not thank anyone for offering a supersonic airliner before they are ready for it. They also expect an economic performance from any supersonic airliner that they buy. In spite of the popularity of the early Comet before its fatal weakness was discovered, airlines did not buy it because they did not think it the right jet for the job. They waited instead five long years for the big Boeing and Douglas jets ; and they might make just the same decision when offered the choice between two different supersonic systems. Airlines are asking not merely for speed ; they want speed with economy over a variety of routes on which the aircraft have to fly mainly supersonically but in part subsonically. An airliner flying from New York to Europe, stopping at London on the way, might cross the Atlantic at supersonic speed but could not fly supersonically on the short leg between London and Paris. But supersonic flying calls for an aerodynamic shape that is inefficient and expensive at slower speeds and these short, slow flying legs of any journey might prove cripplingly uneconomic.

Accordingly, it becomes necessary to change the shape of the aircraft so that it has one configuration when flying fast, and another when flying slow. American manufacturers are incorporating geared wings in their supersonic designing—the so-called " variable geometry "—which expands or retracts the wing according to the speed at which it is flying. If this trick works, it will produce a more economic design than the Anglo-French light alloy aircraft, but many years will be needed to make it work. Delivery of such an airliner is virtually impossible before 1975, and unlikely much before 1980. But now that they know such ideas are being worked on, airlines are not likely to buy any supersonic airliner without it. It is ironic that the idea originated in this country with Dr Barnes Wallis at Vickers-Armstrongs ; it has taken American effort to try to turn it into a workable mechanism.

THERE are plenty of difficulties in the way of any supersonic airliner, not least the sonic boom that it trails as an explosive shadow wherever it goes. But since the consensus is that such aircraft will be built and flown, it is imperative that whatever Britain builds should have a competitive chance in world markets. When hundreds of millions of pounds are involved, one cannot justify British ideas by saying that American ones will not work. Either they will be made to work or the American aircraft industry goes out of business—which it has no intention of doing. Were this a matter of commercial judgment solely, the industry could be left to make its own mistakes, as Vickers-Armstrongs did with the Vanguard, sadly and expensively. But the bulk of the cost of development in supersonic aircraft will have to be met by the taxpayer ; no group, however big, could raise Britain's £50-£75 million minimum share in the Anglo-French venture. It would be surprising if the companies each invested much more than their usual stake of about £10 million in a privately-developed civil airliner. This is, in truth, a public commitment and the aircraft technicians had better explain it publicly.

BUSINESS NOTES

HALIFAX BUILDING SOCIETY

Taking the Plunge

IN promising to cut its mortgage rate from 6½ to 6 per cent and its net share rate from 3¾ per cent to 3½ per cent next February, the Halifax evidently feels that the trend towards lower interest rates will be maintained. Other societies probably agree with this view but are not likely to rush precipitately after the Halifax, which is not a member of the Building Societies Association and has always been able to pursue its own line, as the biggest society of all. When the Halifax's rates are level with those of the others, as they have been for some time, its inflow of new funds can be embarrassingly high and difficult to match in suitable new mortgage loans. And since it was never in the government's now abandoned house purchase scheme, it cannot use an excess of new money to repay money advanced by the government under the scheme, as other societies can. With its liquidity ratio above 17 per cent by the end of July, the Halifax's decision pays logical regard to its own special circumstances.

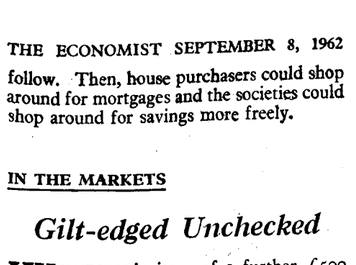
But its decision adds to the pressure on the building society movement, already supported by government spokesmen, to bring mortgage rates down. In the end the other societies will find this difficult to resist and, given a further slight fall in interest rates, a reduction in the association's recommended rate in the new year must be reckoned as a lively possibility. But any such step would be nonsensical if it brought back the rationing of mortgages and the societies must first convince themselves that the inflow of savings will remain high at a lower rate of interest before they move. If the aim, as the movement and the government proclaim it to be, is to encourage home ownership, the societies would not be flint-hearted monsters if they left the rates unchanged. But is there any such thing as a right level for a recommended rate fixed by the Building Societies Association? Why not dispense with it altogether? Not all member societies can afford to observe it anyway. For the rest, more competition and less cartel might be a good principle to

follow. Then, house purchasers could shop around for mortgages and the societies could shop around for savings more freely.

IN THE MARKETS

Gilt-edged Unchecked

WEDNESDAY'S issue of a further £500 million of 5½ per cent of Treasury stock 2008-12 for which " applications from the public were allotted in full," was barely noticed in the market. For those unfamiliar with the devious ways in which the British financial authorities still cloak their basically sensible borrowing arrangements, one must explain that since the issue was deliberately pitched above the price at which the same stock can be bought in the market, applications from the public must have been confined to the misguided few. The great bulk of the issue, in the usual way, has been taken up by the government broker on behalf of official funds, where it will henceforth be available " on tap." Since, if recent tactics are continued, there will be sales from this tap only if the market as a whole rises sufficiently to make the tap price look attractive, the existence of this large new potential supply is not a threat to existing prices. It does, admittedly, act as some check on an immediate rise for this and comparable stocks, and in the past week both the 1999-2004 stock and irredeemable War Loan have risen by only another ¼ point or so. At the same time, the switching of the " long tap " from the late eighties into the twenty-first century has provided a boost



for the twenty-year maturity range, and both the 1982-84s and the 1986-89s (which left the tap a week ago) have risen by 1¼ points. Thus, as was almost certainly intended, the large new issue has not taken the steam out of the gilt-edged market as a whole.

Nor has it checked the flow of non-government gilt-edged issues—which the government broker does not support. Manchester is offering £10 million of 6 per cent stock 1973-74 at 99, giving a gross redemption yield of 6⅛ per cent. These terms, pitched right up to the existing market valuation for comparable corporation issues, denote a saving of ¼ per cent over corporation issues made only a month ago and of ½ per cent over issues made in late spring. Even so, one member of Manchester Finance Committeee has stated publicly that he would have preferred to wait longer for a larger saving. The trouble here is that Manchester would then again have missed its place in the issue queue. Since the borrowing arrangements are due to be remodelled very soon this might not matter too much. But Manchester's Treasurer, Mr H. R. Page, is no novice in management of his debt. In the current issue of the *District Bank Review* he stresses his dislike of being committed to high interest rates for long periods ; and he has evidently decided that just over 6 per cent for eleven years is a reasonable compromise at the moment.

Wall Street's Influence

IN a thin, lifeless market equity prices in London have been drifting down ; over the week to Wednesday's close *The Economist* indicator fell 7.3 points to 328.5 and the *Financial Times* ordinary index 2.2 points to 277.2. The British market has faithfully reflected the lack of drive and purpose on Wall Street, where the Dow Jones average has fallen back below the 600 mark. In both markets intermittent rallies have carried prices well above their low points in the spring. But these rallies have been based on relief that the check to the American economy has not gone further rather than on any expectation that it will expand quickly. Indeed, a strong, broadly-based advance has been constantly frustrated by the fear that, try as the governments may, it will be difficult to get the American or British economies quickly moving forward in top gear. An experienced commentator on the American economic scene, Mr William Biggs, of the Bank of New York, has been looking at the 1963 prospect and offers some conclusions that, though not positively disheartening for equities, quite clearly rule out the possibility of a bull market. Mr Biggs expects business in the United States to hold up well until the early part of next year but that after that there might be a " gently declining plateau of business " perhaps accompanied by a fall in corporate profits to the 1961 level. He also suggests that the prospects for an " important " tax cut in 1963 are not good unless business weakens seriously. Such a forecast is not likely to put steam into American equities and if things work out in this way, they could put a brake on any rise in British equities in response to official attempts to stimulate the British economy.

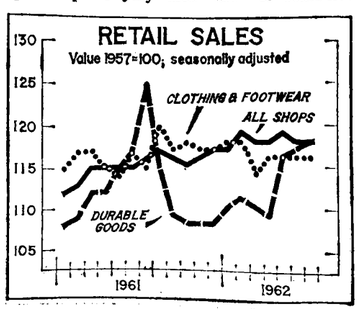
The August rally in Wall Street, which carried the Dow Jones average 40 per cent above the low touched in the spring, has clearly lost its momentum. It was, in any case, an irregular advance in which some stocks made little or no progress. Rises have been most marked in some of the low yielding growth stocks and some of the high yielding blue chips ; and this lopsided appearance reflects the state of the American economy where profits in some companies are very high and in others extremely disappointing. Small investors, who were so active on the way up, have stayed out of the market and a much brighter economic outlook is needed to bring them back into it. Those pension funds, mutual funds and bank-managed trust funds which have remained active investors have been highly selective in their buying. They are still buying growth stocks such as IBM, Polaroid and Air Products which have good earnings prospects, but often as " averaging " purchases balanced by buying of defence, motor and oil stocks which offer good yields. Unless there is a marked change in economic conditions, the analysts are now saying, the Dow Jones average could range between 550 and 650 ; the fact that they went so woefully wrong as recently as last spring does not prevent the wide acceptance of their present assessment on Wall Street. If they are right, could there be a great forward thrust in the British market?

CONSUMER SPENDING

Poor Figures for Poor Trade

THE Board of Trade's first shot at measuring retail trade in July was badly off-course. Its index of seasonally adjusted sales has been lowered from the provisional estimate of 119-120 (1957=100) to a final 118. " Round numbers are always false " said Samuel Johnson ; but not to finish up with one out of a choice of two is a statistical facer. In mitigation, the two other misfires in the last twelve months were not quite as bad: the final index differed by a point from a single provisional figure (the board does not always indulge in a range). The forecasters, therefore, have been much more often right than wrong. Faint praise, however: and this earlier estimate may prove worse than useless if it has to continue to rely heavily on the trade of the smaller shopkeepers who send in their simpler returns more quickly than large retailers. But maybe there is just a hoodoo on the retail trade statistics at present for they are in bad odour on another score—the more serious revisions that have resulted from the overhaul of seasonal adjusters.

Anyway, there it is: retail trade did not pick up in July after all. It remained



in the doldrums, the same, in volume, as in June and in the second quarter of this year, but a point lower than in the first quarter. Shop prices seem to have levelled off and the money coming into the tills in May, June and July was only slightly higher, seasonal factors apart, than during the earlier months of the year. None of the main kinds of business has been showing much life. Trade in food shops has done little more than reflect price changes ; trade in clothing shops has been unchanged since April. Total turnover in durable goods shops was much the same in each of the months May, June and July ; while on the credit side of this business the level reached in June was probably maintained in July. The easing of hire purchase terms three months ago has done no more for the household goods shops than switch some sales from the cash register to the credit account.

The shops take only about a half of all consumer expenditure and statistical evidence about amounts spent on such things as drink, housing, transport and personal services does not go beyond the first quarter. But the hire purchase statistics provide an indication of car sales. The further small increase in July, for the third month running, in the total debt outstanding was almost entirely in the part owed directly to finance houses. New credit extended by these houses went up about 5 per cent compared with "the slight fall normally experienced between these months," and business in used cars did particularly well. In August, according to Hire Purchase Information, the seasonal decline in motor business was less than last year and for the first time appreciably more car contracts were taken out this year than in the corresponding period last year.

PROFITS AND DIVIDENDS

Turning the Corner?

A SINGLE month's profits do not make a trend, but the accompanying charts suggest that the worst of the setback in industrial profits as a whole may have passed. Certainly, there is no great buoyancy in profits and returns on capital employed remain depressed. With the economy in third gear, a big rise in profits reported in coming months is hardly to be expected but a levelling out around the previous year's levels begins to look likely. That, indeed, happened for the 121 companies whose reports were published in August. But the table shows that although trading profits rose by 3¼ per cent, there was no improvement in net equity earnings or in returns on capital employed. Among the industrial groups that had an important influence on the total results, food companies' made higher profits but brewing profits were practically unchanged ; profits were higher in building and electrical manufacturing companies but lower in engineering companies.

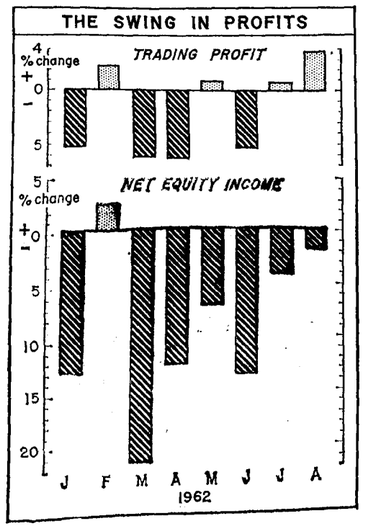
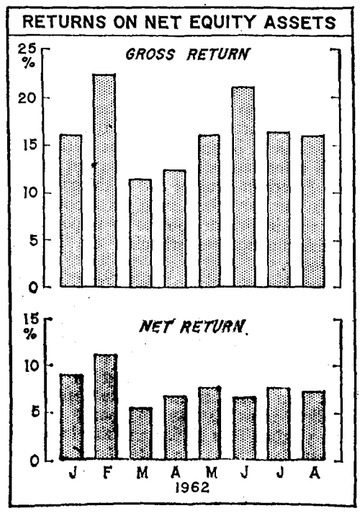
THE SWING IN PROFITS



RETURNS ON NET EQUITY ASSETS



Cars offer the only sign of an expansionary force in this latest batch of statistics. Nevertheless, the official view is that higher incomes and some increase in credit will automatically raise spending in the second half of the year. But, without any new stimulus, can the Treasury foresee the 4 per cent rise in consumers' real expenditure that Mr Selwyn Lloyd forecast over the current fiscal year?

EXCHANGES

No August Drain

STERLING has been generally steady in the exchange markets this week, and some dealers believe that the Bank of England may actually have been taking in dollars again. The market was pleased with the good out-turn for August, showing a net gain of £4 million in the reserves, after special influences, in what is usually the worst month of the year. Indeed Britain's reserves have changed very little, again allowing for special influences, since the summer strain began: there is a net rise of £8 million over the three months June through August. This stability does not necessarily contradict the impression that short term funds have begun to flow out in a small way. But any such outflow has evidently been counterbalanced from other sources—including, without doubt, a continued foreign inflow to the gilt-edged market. This has helped to strengthen Britain's basic balance (current and long term capital account) and at the same time sterling may also have benefited from the recent improvement in overseas sterling countries—though the third quarter is a poor season for them also.

The unfortunate aspect of the August gold return is that the actual reserves fell by £24 million where they need have fallen by only £6 million. For apart from the special payment of £10 million on debts incurred in the former European Payments Union, there was a further special fall of £18 million as a result of the liquidation of the three months swap arrangement (mutual credit) between the Bank of England and the United States Federal Reserve, which had swollen the reserves of both countries by the equivalent of $50 million when it was established in May. The London comment on termination of this agreement is that thanks to the stronger position of the dollar the agreement is no longer necessary—and it could always be resuscitated. But is the position of the dollar—or of sterling—so strong that such supports should be dispensed with at the first opportunity? No doubt the arrangement would have been maintained if the dollar had been actively under pressure ; equally, one guesses that it would have been continued if the London authorities had been less lukewarm about it. One wonders now what will happen to Mr Roosa's network of agreements on the continent.

SILVER

The Rise Goes On

SILVER rose by 3½d. an ounce last week and this week has already jumped a further 3d. to 97¾d. an ounce, comfortably exceeding its 1920 peak. Industrial consumers have been given many unofficial assurances since the price was unpegged last November that there would be silver enough for their needs but they must now be wondering where the rise will end. The cost of silver nitrate to the expanding photographic film industry has jumped about 20 per cent since November in line with the increased price of silver. Silver nitrate accounts for a small proportion of total costs of some film ; for others it may run up to half of the final cost. Manufacturers have been taken aback at the steep rise in silver but they cannot afford to risk not buying well ahead of their requirements. There are many unknowns on the supply side, but a quick alleviation of the pressure through the release of large quantities of silver stored in various forms throughout the world does not seem likely. Manufacturers who have been running through stocks accumulated last year have therefore been competing against speculators to cover their needs from the limited sources of supply.

Last year's tremendous weight of forward buying has not been repeated this year. In the changed circumstances of the silver market, the rise in silver looks well grounded and the market seems in no danger of a sharp reaction. Demand for silver for industrial purposes cannot be met solely from newly mined metal. On top of industrial demand there has apparently been a revival in demand for coining, which might obviously be modified by reducing the silver content of coins if the rise in silver gets out of hand.

Mexico, the largest producer of silver, bought up large quantities earlier this year to support its price after interest in silver flagged following the initial rise. It has recently been selling off part of this stock said to amount to more than 10 million ounces. The United States Treasury was left with 32 million ounces when it suspended sales from its "free" stock last year. This was intended to be released if the rise in silver became excessive. Melting down coins and other silver valuables might produce some more metal for industrial uses. The American silver coin with the greatest intrinsic value prices the silver it contains at $1.29 an ounce, compared with a present market price of $1.13 an ounce, but Latin American coins are nearer the melting pot.

COTTON TEXTILES

Crossing the t's

ADMIRABLE in its way, the Cotton Board's recently published analysis "Implications for the UK Cotton Industry of Britain's Entry into the EEC" stopped

FUEL CONSUMPTION

A Ten-Year Look

WITH output static, fuel consumption was virtually unchanged last year, according to a study made by the Ministry of Power and published in "Economic Trends." But coal's share of the total fell to 71·9 per cent ; in 1960 it was 74·1 per cent, and in 1951 it had been 88·9 per cent. The meteoric rise of oil as an industrial fuel has been one unforeseen feature of the decade ; last year's consumption by industry of 38.6 million "coal equivalent" tons was more than 2½ times what the Ridley Committee forecast for 1959-63 and that of coal 20 per cent less, even though it set its prediction of total energy requirements less than one per cent too high. The reduction of nearly 20 per cent in the amount of coke needed to produce a ton of pig iron is another factor that has upset forecasts, for the steel industry has made 42 per cent more steel with 14 per cent more fuel ; and, because its oil consumption has trebled, its consumption of coal and coal-based fuels is unchanged.

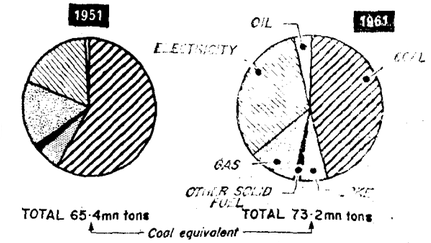
The creation of some sort of a free market in fuels in the last decade after more than a decade of control helps explain the changes in consumption ; once oil had gone from shortage to surplus, the competitive position of coal proved weaker than expected. Indeed one lesson one might draw is that convenience counts for almost as much as cost, for electricity consumption rose by 120 per cent, and it is about the most expensive source of power there is. But this popularity of electricity gives coal, indirectly, its one strong point ; the power stations consumed 3½ million tons more coal in 1961 than in 1960, and they take the sort of coal that can be most efficiently produced. General industry took five per cent less, 29.3 million tons, while using 16 per cent more oil—15.9 million "coal equivalent" tons, nearly 3½ times as much as in 1951. Its consumption of electricity has doubled in the decade, while that of gas has risen by a third.

CONSUMPTION BY TYPE OF FUEL
(million tons of coal equivalent)

	1951	1956	1960	1961
Coal	206·2	214·0	195·5	190·0
Oil	24·8	37·5	65·6	70·9
Other	1·0	1·3	2·9	3·5
Total	232·0	252·8	263·9	264·3
Total used to generate electricity	37·7	49·2	64·7	69·0
Total used to make gas	19·6	20·1	18·8	18·6

Domestic consumers have shown much the same pattern of preferences as industrial ones, though they are still using an insignificant if growing quantity of oil. Coal consumption has fallen by nearly 12 per cent since 1951, while that of electricity has grown 2½ times. Gas, however, has lost ground—though "coal equivalent" figures exaggerate the trend, just as they under-estimate the rise in electricity consumption, for in both cases more is now made from one ton of coal than ten years ago. Gas consumption may now be rising. An odd feature of the domestic market is that the northerner still uses as much coal as in 1951, while sales in southern England have fallen by nearly 40 per cent since then ; in the London area the fall is about 65 per cent. Tradition dies harder in the more rugged and colder areas of Britain. But there is economic sense in burning coal near to the mines, even if this cause of the drop in the amount transported must be one reason for the troubles of British Railways. Most of the oil used in homes is paraffin — consumption of which dropped by six per cent last year—with central heating accounting for only 20 per cent; the oil companies, for all their efforts, are still only selling by drops. The fortunes of electricity must seem indecently comfortable to them.

DOMESTIC FUEL CONSUMPTION
Percentages



short of outspoken criticism of the quality of British management. It touched on the neglect of this and that tool of modern management, on missed chances and the deplorable relations between employers and workers in the British cotton industry. The cotton workers' latest claim for a 10 per cent rise in wages was, incidentally, passed to the Industrial Court last week following a breakdown in negotiations. But the Cotton Board could not bring itself to say of the people it represents that they simply have not got what it takes to make a success of their business.

But Mr Allan Ormerod of Ashton Brothers, the cotton spinners and manufacturers, which this week strengthened its own position in the industry by bidding for Burgess Ledward, used the platform of the British Association, meeting this year in Manchester, to say just that. The lack of ability, pure and simple, was blamed for the emergence of some of the industry's problems and for the persistent failure to find solutions. The dearth was alleged to be evident among all those responsible for the industry's well-being—the Government, trade associations, trade unions and directors and executives. Experience was reckoned a stumbling block in this industry which would do better to forget its past. However, technical graduates are rare and the industry traditionally recruits only from skilled operators to fill its management posts. As a result, good management is said to be too scarce to maintain the industry at its present size.

But if Britain enters the common market and a 17 per cent *ad valorem* duty is eventually applied to exports to this country from Commonwealth countries, the British industry will be effectively sheltered against their competition. Based on prices of sheeting in February, a 17 per cent duty would more than account for the difference of 5d. a yard between the British and the Hongkong product, though to British manufacturers current prices for even British cotton textiles are distressingly low. Wages in Hongkong have risen by 25 to 50 per cent since 1960 and hours have been shortened. Wages are higher in some cases than in countries like Greece and Spain which might get preferential treatment in the common market. It seems Hongkong's turn to worry, though its troubles are not all of its own making.

AMERICAN BANKING

Paying for Time

EIGHTEEN months ago the First National City Bank of New York announced its willingness to provide negotiable certificates of deposit in return for time deposits by corporations. Other banks quickly followed this lead and the New York money market acquired a new short-term instrument and corporate treasurers a new investment outlet for their cash balances. The innovation has attracted a good deal of interest from bankers all over the world, in particular among British bankers faced with the same problem of attracting deposits without offering higher rates across the whole range of existing deposits. A full length study of these negotiable time certificates of deposit has been made by Mr Richard Fieldhouse, now on the staff of the New York Federal Reserve Bank.*

The certificates are issued usually in bearer form and interest is paid to the holder at maturity on the par amount. The original market in the certificates was provided by the Discount Corporation of New York; other government security dealers now trade the certificates for their customers. By July 31, 1962, the certificates issued by the nine New York City banks totalled $1,361 million; by the end of March, 1962, Mr Fieldhouse estimates that the country-wide total was $2.5 billion. This is a long way from the $43.4 billion of Treasury bills outstanding at that date, but it is very close to the $3 billion of finance company paper in the market, and already above the $1.7 billion of commercial paper outstanding.

Previously, American banks discouraged corporate time deposits in the belief that they would lead to wholesale switching from demand deposits. However, businessmen have in recent years been looking on their cash flow as demanding careful husbanding and they tend to keep in their current bank accounts no more than is absolutely necessary for day-to-day operations. This first entailed a drain of bank deposits into Treasury bills, and meant a higher turnover of the remaining corporate balances. By offering corporations an investment that is relatively high yielding and marketable the banks have countered the squeeze on deposits and at the same time have made corporate deposits less volatile. The aim is to compete for funds that would otherwise go into the money market, without inducing the corporations to draw down their demand account balances. For this reason the banks issue the certificates, only in large denominations; among the bigger city banks the minimum may be as high as $1 million.

The certificates provide bankers with a good deal of flexibility. Having lost deposits through the increasing sophistication of corporate treasurers, they are now able to ease liquidity strains and increase loanable funds by operating on that same interest consciousness. The banker can control the flow of these time deposits by varying his rates in relation to the Treasury bill rate and other money market rates. The

GERMAN FINANCE

Germany's Revolving Banker

Düsseldorf

THE Schlieker affair has again switched the limelight on Rudolf Münemann, the 53 year old banker from Munich who has played a particular part in West Germany's postwar economic history. He was called in to help in finding potential investors who might be prepared to invest money in Schlieker's ailing shipyard; but he soon disappeared from the stage when he saw how hopeless this operation was, though he is said to have supported it with quite a considerable personal sum.

Shortly after the Deutschemark was established in 1948, Rudolf Münemann had a strikingly simple idea, though one not in accordance with classical banking rules. In the years of the arduous resurrection of the German economy, long-term investment capital was sought at any price, even by new and risky ways. Münemann introduced the *Schuldscheindarlehen* (debt bond), financed by money collected at banks and savings institutes and provided by him on a long-term basis to industrial investors. He reckoned that enough new money could be counted on to replace debt bonds as they expired, so that the credits would in practice revolve. Although no legal obligation rested on Münemann, as a broker, his personal credit involved the greatest possible care in arranging the money between the small banks and the industrial investor. No major mistake seems to have occurred, and the total turnover of his activities reached DM 1200 million in the most active years.

It was natural that the German banking world recoiled at such unconventional methods. Münemann complained of an attempted collective boycott by some banks; in the Bundestag there was discussion of a special "Lex Münemann" to prohibit this form of banking practice, though the bill was finally abandoned. West Germany's anti-cartel board had to intervene, and finally Münemann achieved a favourable compromise with the banks. Then several other credit institutes introduced *Schuldscheindarlehen*, and the brokers' profits became correspondingly smaller.

In the last few years Herr Münemann therefore turned increasingly to direct financial investment. His main instrument in which he holds the majority of the stock was the *Investitions und Handelsbank* in Frankfurt, which has done business of DM 600 million a year. Bank connections with London and New York consolidated his position. His industrial interests have been extended to the big textile factory of Müller's in Wipperfurth, a big watch factory and Germany's biggest dealers in used cars in Düsseldorf. And a third area where Herr Münemann has recently extended his interests is in development aid.

Markets to touch down on

The quickest route to commercial success in the Latin American market is through our International Department Representatives. They will guide you safely over the many export or import formalities to markets of ever-increasing promise. South America today is opening up to trade as never before, especially as a market for capital goods.

Our branches and those of our associates — the Bank of London & Montreal and Balfour, Williamson & Co. — cover the whole of South and Central America. Through them, accurate market information reaches our International Department. The help and information which we are thus able to supply to business and industry includes the following:

Individual market reports · Details of free zones and ports · Import and export regulations, including licensing and prior deposits · Tariffs and payments Financing Transfer of funds · Name of agents Status reports.

BANK OF LONDON & SOUTH AMERICA LIMITED

HEAD OFFICE: 40-66 Queen Victoria Street London EC4 *City 9822* · BIRMINGHAM 3: 50 Great Charles Street *Central 4058* · BRADFORD: 55 Well Street *Bradford 25693* · GLASGOW C1: 54 West Nile Street *City 5393* · MANCHESTER: 36 Charlotte St *Central 3135* · PARIS: 89-91 Rue du Faubourg St. Honoré NEW YORK: 34 Wall Street · ZURICH: Schifflände 26. Branches & agencies throughout Latin America, West Indies, Portugal & Spain.

Federal Reserve, however, imposes an upper limit on these rates under Regulation Q. In November, 1961, the three months Treasury bill rate rose above the Regulation Q limit of 2½ per cent on deposits of 90 days to six months; and as a result certificates outstanding with nine New York banks declined by $200 million in the ensuing two months. On January 1st maximum rates on deposits from six to twelve months were increased from 3 to 3½ per cent, and with 182-day bills currently yielding 2.9 per cent the banks are in a strong position to compete for six-months' money.

ITALIAN DRUGS

Bonanza Near its End?

Milan

ITALY'S days as a haven for manufacturers of pharmaceuticals may well end, once the country's first drug patent law is passed. Italy has been the only major country in the world without patent protection for drugs. Any pharmaceutical company can obtain information on any registered drug for a modest fee through the Italian Ministry of Health. A producer of pharmaceuticals has described the method: "In Italy, where there are no patent laws governing pharmaceutical products, it is simple and perfectly legal to get copies of pharmaceutical product patents and read the scientific literature on new products. With the data derived from reading this material, any competent pharmaceutical chemist can duplicate the original product. The process used may be a little more or less expensive, but, generally, the desired end result can be attained with comparative ease."

The result has been the mushrooming and prospering (with no need to embark on research) of about a thousand pharmaceutical firms, including two dozen distributors who, with little or no overheads, have created a highly competitive market, and have evoked angry charges of piracy from foreign pharmaceutical firms. The absence of a patent law has been credited with helping the development of Italy's pharmaceutical industry, unburdened by costly investments in research and personnel. This is perhaps true at home, but since Italian pharmaceutical companies have reached international stature, they have had to invest heavily in research to compete on world markets. To protect their interests, they have themselves recently been pressing for a drug patent law. Italy's major drug companies, it has been said, resemble an old man who, having had his fill of fun, starts to moralise.

The fact is that Italy's pharmaceutical industry is now considered one of the best in the world and the lack of drug patent legislation smothers all incentive to do the research needed for its survival and future progress. Moreover, the pressure by the Six on Italy to align its drug patent laws with those of the other member countries has been mounting to the point where measures can no longer be postponed. A Bill protecting pharmaceutical processes and products has been drawn up by Emilio Colombo, Minister of Industry and Commerce. If and when the new law goes into effect—though opposition, it should be noted, appears to be growing—there will be a major shake-up in the Italian pharmaceutical industry, with mass mergers of the smaller concerns and the departure of many other proprietors of so-called "pharmaceutical" companies with the capital they have accumulated during the years of prosperity.

ANGLO-PORTUGUESE BANK

Sir Isaac in Banking

SIR ISAAC WOLFSON seems to have decided, like so many wealthy men before him, that becoming a banker can add just that something to an already successful career, as well as being profitable. Sir Isaac already has a half share in Ralli Brothers (Bankers) through the Wolfson Foundation; now he has purchased the equity capital of the Anglo-Portuguese Bank from the Banco Nacional Ultramarino (the State Bank for the Portuguese overseas provinces, except Angola, which means in effect Mozambique and a few other outposts like Macao scattered around the world).

The purchase is a private transaction—no price given—on behalf of the Wolfson family trust and the shares are held by the trustees, Sir Isaac and Lady Wolfson. The bank will remain the sole representative of the Banco Nacional Ultramarino for at least the next ten years—out of total deposits of just over £15 million on January 31st last, some £4.3 million came from that bank. Disclosed profits last year were £92,000, compared to £75,000 the year before; five year ago they were £55,000. The change in ownership has not entailed any change in the management, although Mr Felix Neubergh has taken over from Viscount Davidson as chairman of the bank.

Negotiations between the Banco Nacional Ultramarino and Sir Isaac took eighteen months. The reason for the sale seems to be the same as for the earlier sale to Brazilian interests of another subsidiary, Banco Ultramarino Brasileiro, namely that the parent bank's monopoly in the Portuguese overseas provinces forbids branches or subsidiaries elsewhere in the world. If this is so, the bank's one remaining subsidiary, Banque Franco-Portugaise d'Outre-Mer, may soon be looking for buyers.

ELECTRIC HEATING

Radiating Bricks

WARMTH is the convenience that Britons now most desire. Their efforts to obtain it in old and chilly houses have relied, to an extent that has embarrassed the electricity industry, on electric fires—which have heightened the demand peaks in the mornings and evenings and have overstrained the distribution systems in the older residential areas. Floor warming helps to spread the load in new buildings, but can hardly be applied to existing houses; so the industry is now launching a big campaign to persuade the public to buy storage heaters that also use off-peak power. These heaters cost much more than electric fires—about £35 for one giving an output of one kilowatt and having no direct control over output, and £60 or so for a more elaborate unit with controllable output—but they are cheaper to run.

The principle of the heaters is simply that of a hot brick enclosed in a metal cabinet: a lump of concrete or fireclay contains an electric element, which heats the block to a temperature of about 400° centigrade. After the current is cut off, this heat is gradually dissipated into the room; on more expensive models, the casing is insulated and the flow of air past the block is controlled by a damper or a fan, so enabling the heat to be more effectively stored until it is wanted. These heaters need to be charged only at night, when electricity costs about ¾d. a unit; the uncontrolled type needs to be "topped up" by an afternoon charge, taking advantage of a dip in the load curve and usually of some reduction in price—so that the average charge works out at 0.80 to 0.85d. a unit.

These heaters are being sold on an advertising slogan "Central heating for £60"—the cost of two heaters with a combined capacity of 1.6 kilowatts, or enough to give background heating in a hall and one room, or full heating in a smallish sitting room. Six heaters, described as "lavish" in a four-bedroomed house, would cost £180 and could provide only background warmth, with the need for supplementary heating in cold weather. In terms of capital outlay for a given output of heat, there seems little to choose between storage heating and central heating by hot water radiators—though the cost of the latter will vary more from one installation to another. Running costs are even more difficult to compare; storage heating should be a little cheaper than underfloor heating, as no heat is lost into the ground, but it is still likely to cost more than solid fuel or oil. But the simplicity of installation and running should attract customers.

WATER POLLUTION

Clean Water

WATER is so essential a part of people's lives that they take it for granted. It is the water engineer's concern that they should be able to do so—rather than have it forced on their attention by smell, colour or a habit of foaming in rivers. The problem of preserving water's neutrality becomes increasingly difficult as the population rises and industry becomes

ALWAYS BUSY–BUT GLAD TO SEE YOU

See the manager? He'll be *glad* to see you—whether you need advice, or information, or perhaps just a second opinion on some project or problem you have in mind. He will always help if he can. And he'll be interested to hear how you're getting on.

It is much easier for the manager to be helpful—often in ways that go beyond mere efficiency—if he knows you and something of your affairs. No-one can do this job well unless he enjoys helping people. Most District Bank managers are able to know practically all their customers because, in general, we like our branches to be of a size where this happens naturally.

But in all our offices, large and small, we aim at providing, through all our staff, an unusually personal banking service for both business and private customers.

HELP FOR EXPORTERS. Through any branch you can call on the full service of our Foreign Department, which has a reputation for sound information on overseas markets and expert handling of foreign transactions. A copy of "Adventurers of Britain" will be sent on request. This booklet outlines in practical terms the ways in which the Bank can serve the firm engaged in foreign trade: arranging to collect payment for goods exported; to remit payment for imports; to buy or sell foreign currencies, on forward contract if required; to furnish currency, credit facilities and introductions for business trips abroad.

DISTRICT BANK LIMITED

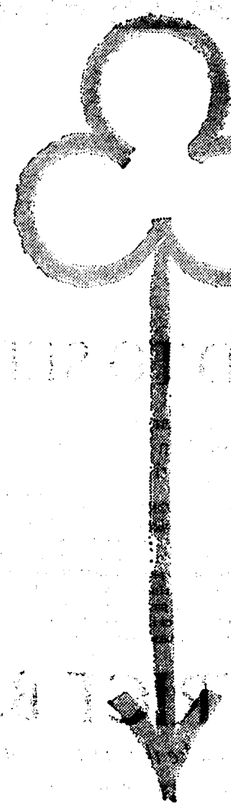
helps you make the most of your money

A complete banking service for business and private customers... over 570 branches

HEAD OFFICE: Spring Gardens, Manchester 2
CITY OFFICE: 75 Cornhill, London E.C.3

IRELAND

—where new exporters pay no tax



NO income tax and NO profits tax for 10 years on the profits of new industries exporting from Ireland, plus 5 more years of reduced taxation. This is one of the overwhelming advantages that are attracting more and more industries to Ireland, others include:

Grants: NON-repayable grants available amounting to a substantial proportion of the cost of the fixed assets.

Capital and profits can be freely repatriated to Great Britain.

Labour: All the workers you need at reasonable wage rates.

At Shannon Free Airport firms interested in the possibilities of air freight can obtain factories for renting, grants for machinery and for worker training, full tax exemption until 1983—and plenty of labour.

Mr. Gerard MacCarthy, representative of the Industrial Development Authority, will be glad to provide information on what Ireland can offer your industry. Contact him through the Irish Embassy, 17 Grosvenor Place, London, S.W.1. (BELgravia 2171)

Or write for two informative booklets to:

THE INDUSTRIAL DEVELOPMENT AUTHORITY OF IRELAND

14 ST. STEPHEN'S GREEN, DUBLIN 2. TEL: DUBLIN 61965

more complex. The study of water pollution and ways of dealing with it is now an established science. This study began in England where pollution of rivers first became an urgent problem and where some of the first answers were found. It was for these reasons that the first International Conference on Water Pollution Research was congratulated on its "rare discretion and warm sense of history" by Professor G. M. Fair of Harvard when it met in London. In his introductory speech, Professor Fair asked: how has the revolution in science and technology placed water supplies under stress? This problem and attempts to solve it were discussed in the conference, which was divided into three sections: pollution of fresh water, treatment of sewage and pollution of the sea.

Biological methods of dealing with sewage are now extremely efficient; the problems remain of making them cheaper and able to deal more quickly with the enormous volumes of sewage generated by modern cities. Under special circumstances sewage treatment can be made profitable—as Bradford Corporation knows, for it extracts lanolin from it. Some research carried out in California now suggests that cultivating algæ in sewage may be an efficient way of producing a nutritious animal feedstuff, and of purifying the water at the same time.

The streams and rivers into which effluents are discharged are all too easily exhausted of their capacity to deal with pollution and its long-term effects on river life are being studied. Even the sea is not free and the temptation to dump things in it is rarely resisted. Oil on beaches is one price we have to pay; so are two recent outbreaks in the USA of hepatitis, traced to polluted oysters and clams.

AUSTRALIAN BANKING

New Price for Banking

In three weeks' time Australians will have to start grappling with a new set of bank charges which the Australian Bankers' Association has just agreed on. The changes will clearly raise charges generally and not insignificantly, as the market has been quick to appreciate. In London the shares of the Australia and New Zealand Bank have risen 4s. 6d. to 46s. 3d. and the Bank of New South Wales £2 to £34½, since the Australian papers first published unofficial reports of the changes on August 20th.

Under the existing system "low activity" accounts using less than one ledger page (forty entries) in a half-year are charged ten Australian shillings and accounts with more than forty entries in a half-year pay £1 per half-year. It is as simple as that: no allowance is made for any credit balance and a person with forty-one entries pays the same as a firm with forty thousand. There is, however, an "inland exchange" charge. The charge here is based on zones within and between the states and varies with the number of zones crossed. Between Victoria and Canberra the charge is 2s. per cent; between Victoria and New South Wales it is 2s. 6d. per cent.

Under the new system, as shown in the table, there will be three sets of charges: a basic quarterly charge of 5s.; an activity charge; and a new collection charge to replace the inland exchange. Someone with 40 entries a half-year at the moment pays 3d. an entry; under the new system the charge will rise to about 7½d. At the same time a firm with 2,800 entries a half-year at present paying only £1 for the whole lot

THE NEW CHARGES
(per quarter: Australian pounds)

Activity Charge (40 entries per page)	
Number of pages	Charge
½	2s. 6d.
½—1	7s. 6d.
1—2	£1
6—7	£7
35	£29
plus 10s. for each page over 35	

Collection Charge	
Number of cheques	Charge
20	Free
21—100	5s.
plus 2s. 6d. for every 10 cheques over 20	
101—500	£1 5s.
plus 12s. 6d. for every 50 cheques over 100	
Over 150,000	£875
plus £30 for each extra 20,000 cheques	

BANK OF CANADA

The Governor's Evidence

Canada is clearing its thinking on economic affairs. Last year's painful conflict between the Minister of Finance and the then Governor of the Bank of Canada, Mr James Coyne, led quickly to the setting up of the Royal Commission on Banking and Finance. The new governor of the bank, Mr Louis Rasminsky, recently submitted written evidence to the Commission; it comes through clear as a bell.

Mr Rasminsky usefully includes in his evidence the statement he made in August, 1961, immediately after his appointment; the present document is essentially a careful development of his views on the bank's job and its position in relation to the government. Monetary policy, fiscal policy, and debt management should, in Mr Rasminsky's view, form a mixture that is "interdependent and to some extent interchangeable," aimed at influencing demand and the level of activity. Just how the ingredients are mixed must depend on the results that are sought and the speed with which they are expected to take effect. One of the bank's responsibilities is to express its views to the government on this blend of policies "on occasions even to the point of nagging." But, says Mr Rasminsky, in the final analysis the bank "must take the government's expenditure, taxation, and debt management as given" and tailor its monetary policy accordingly. If the governor felt that "he could not in good conscience" carry out the appropriate policy, "his duty would be to resign and to make way for someone who took a different view."

Mr Rasminsky sees his job as regulating "credit and currency in the best interests of the economic life of the nation." His method is to operate through the cash reserves of the chartered banks—fixed by statute at 8 per cent of deposits—by buying and selling "a broad range of financial assets." In Canada it is not the volume of Treasury bills that is regarded as the effective base for bank credit but the volume of bank cash reserves. Mr Rasminsky prefers to control credit indirectly through open market operations in short dated paper, believing that "central bank operations should leave as much room as possible for the exercise of private judgment" in determining the term and allocation of credit. But Mr Rasminsky admits that there may be occasions when the central bank might need more powerful weapons. If disorderly conditions arose in the security markets, or "where a change in the interest rate differentials between Canada and the United States was a matter of importance," the bank would be prepared to intervene directly in the medium and long-term security markets. Mr Rasminsky rejects the idea of continually and directly influencing the level and structure of interest rates, on the grounds that the cash reserves held by the banks would become "a by-product rather than a focal point of the central bank's open market operations." Such an approach would require the virtual fusion of debt management and monetary policy.

If the more conventional control produced a too rapid rise in interest rates, Mr Rasminsky would in the last resort prefer "to vary the cash reserve or liquid assets ratio or resort to moral suasion or selective credit controls than to allow inflationary processes to proceed without further resistance." But he has clear hesitations about such sanctions: to impound the banks' liquid assets is of limited use because the unsuccessful applicants for bank credit would turn up "elsewhere in the market to press their demands for credit." There is the further disadvantage, and this objection should find echoes from British bankers, "of being discriminatory if they apply only to the banks." The same arguments, in the governor's view, condemn moral suasion, where there is also the difficulty of "disengagement." The Bank of England gets around this problem by never formally announcing disengagement at all—the suasion is allowed to fade away.

will now pay the full £A29 a quarter or about 5d. an entry. There will, however, be a rebate system for credit balances rising from one free ledger page for a minimum balance of £A300 to five free pages for £A2,500 and an extra page for every £A500 over that amount.

SUGAR

Testing Time

THE price of sugar has never been easy to define as the International Sugar Council has discovered in fixing a representative price for its own guidance while it still possessed some standing in the world sugar trade. Since the new sugar legislation came into force in the United States in July, American prices have flown off at a tangent compared with their London counterparts. The New York world contract has gained more than £3 a ton on the London spot price since then. Prices for October deliveries are slightly higher than spot values in New York, though prices are lower than spot values for deliveries next year. By contrast, prices for deliveries up to the end of this year on the London terminal market are lower than the daily price, though prices for deliveries from March onwards are higher.

The pull of the American market has attracted much of the available cane sugar in the western hemisphere. About 350,000 short tons of sugar for which quotas in the American market had been allocated could not be supplied by the intended producers. Puerto Rico was 250,000 tons short of its allocation. Part of the shortfalls have been redistributed to other suppliers, the Philippines, British West Indies and Dominican Republic being the principal beneficiaries. But American requirements were also raised by 200,000 tons to 9.9 million short tons at the end of last month, of which the greatest part was offered to producers in the western hemisphere on the basis of first come, first served at the American market price less the import fee of 2.4 cents a lb imposed under the new Sugar Act.

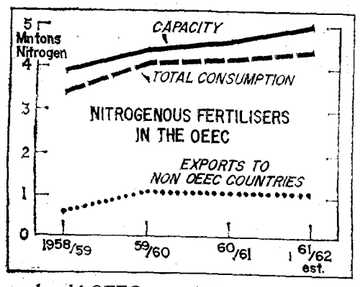
This limited free market for sugar offers around one cent a lb more than the American "world" sugar contract. As American importers are worried by a threatened strike by longshoremen, it is being argued that the import fee should be cut to attract more sugar. Sugar on the global quota would therefore be still farther divorced from the open market. In the straight reallocation of unused quotas to producers who pay only the 10 per cent import fee this year as dictated by the Sugar Act, preference has apparently been given where possible to producers who will take American agricultural produce in return. But the suppliers now seem to be regaining a little of their lost grip on the market, and consumers cannot now dictate terms quite so easily.

World stocks of sugar might have been cut by more than 20 per cent over the past year, and the European beet crop is likely to be smaller than last season's, which excluding Russia, was itself nearly 3 million tons lower than in 1960-61. But the London market has not improved much further since the initial rise which followed details of America's revised sugar importing arrangements. The threat of cut-price sugar from communist countries persists, and there appears to be enough cheap sugar available to satisfy buyers without forcing up its price.

FERTILISERS

Too Much Nitrogen

THE 11th OECD report on fertilisers in Europe, recently issued, makes clearer the background against which the European nitrogen export cartel, Nitrex, was formed. Plant capacity continued to rise, by nine per cent to five million tons a year by the middle of last year, while total demand rose by less than five per cent to 4.4 million tons. Consumption within the OEEC (western Europe plus Greece and Turkey) rose by slightly more, by six per cent; the weak point was exports to countries outside the OEEC which have remained at about 1.1 million tons for three years. (Although the report was issued by the OECD it refers



to the old OEEC group.) Pressure to export is likely to increase as new plants within the OEEC are built: Spain, the largest importer of nitrogen fertilisers (some 165,000 tons 1961-62), should be self-sufficient in a few years; new plants based on natural gas in France have transformed it into an exporter. But plants are also being built outside the OEEC, and although demand for nitrogen will inevitably increase it is hard to see how the new production will be absorbed.

By spreading orders among its members Nitrex may ensure that none is too severely affected by the conditions of surplus. If all were primarily fertiliser manufacturers, plants could be operated below capacity. But it is not possible to cut back manufacture of some fertilisers, namely by-products from other processes, such as steel or gas making. (This comprises the larger part of Belgium's output.) Will Nitrex allow such producers to sell their fertilisers when other members are forced to cut back their production? It will be interesting to see how it copes with the next years of surpluses, and in particular how it solves the problem of by-product nitrogen.

SHIPBUILDING

Rationalising Ship Design

WORK on the design and drawings can absorb as much as 6 or 7 per cent of the total cost of a "tailor-made" cargo liner, although this can be spread over a series if no changes are made in repeat orders. The difficulty, in the past, has been to persuade different owners of cargo liners to avail themselves of the advantages of a good measure of standardisation. The Swan Hunter group of shipbuilders and marine engineers has now produced a basic design for a modern cargo liner of 10,000/12,000 tons deadweight capacity, which it can offer at a price between 10 to 15 per cent less than the normal cost of a tailor-made design. Shipowners have pleased Swan Hunter with their interest, but have yet to convert it into orders. It has also designed a bulk carrier of about 22,000 tons though no details have been announced, and it is also planning a tanker.

Acceptance by the shipbuilders of the original cost of drawings and design accounts for some of this saving; but other savings have been made by the reduction or elimination of features that do not in any way contribute to the efficient operation of the ship, by the use of new materials, and by the introduction of certain new design features and shipbuilding techniques. An important feature of this project is that the designers have deliberately avoided falling into the easy trap of concentrating on producing a ship which is cheap to build, but only at the expense of subsequent operating and maintenance costs. In fact, one of the objects of this design is to enable reductions to be made in the number of crew required, at the same time increasing their standard of accommodation.

On the technical side, an interesting feature is that the hull form is efficien over a range of speeds from 14 to 17 knots and two alternative sets of Sulzer diese engine installations are provided according to the speed required. In addition to the basic design, a number of "standard extras" are offered (at additional prices, of course) in the form either of items tending further to reduce operating or maintenance costs, or of items required for particular service conditions. Altogether this is an imaginative attempt to attract the attention of hesitant cargo liner operators; and it is good news for British shipbuilding that the group proposes to apply the same sort of treatment to other types of merchant ship.

PLASTIC FILM

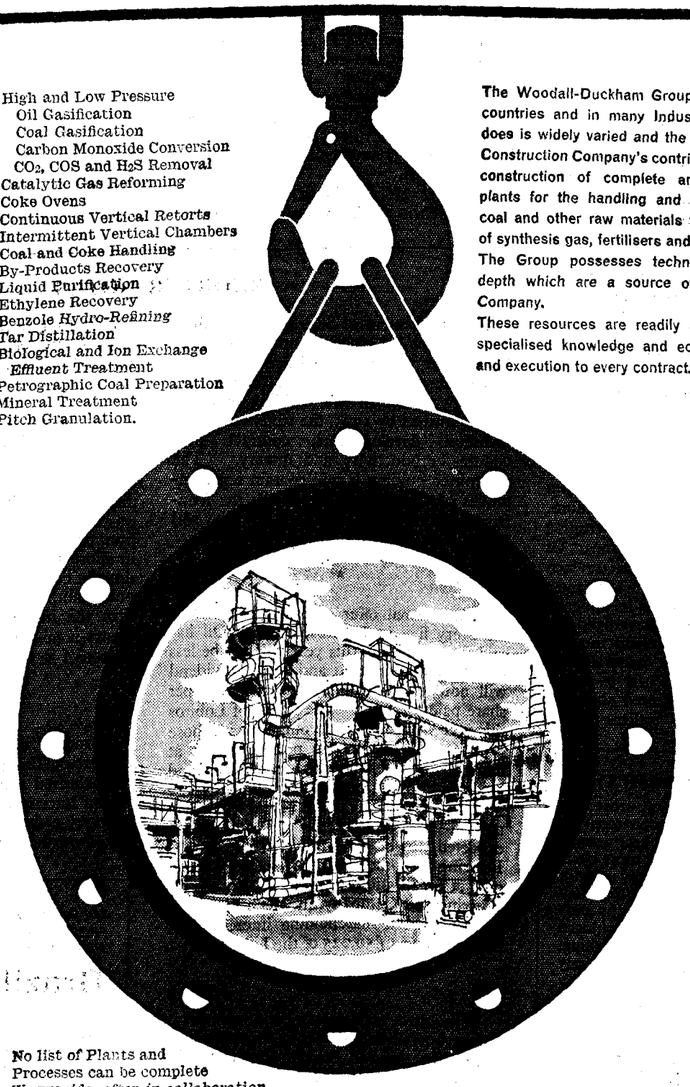
Between the Sheets

HARDLY a week passes without a "new, vital" use of polythene film being announced. And it usually is new and vital—that is the astonishing thing about

the active world of WOODALL-DUCKHAM

PLANTS WE BUILD

High and Low Pressure
Oil Gasification
Coal Gasification
Carbon Monoxide Conversion
CO_2, COS and H_2S Removal
Catalytic Gas Reforming
Coke Ovens
Continuous Vertical Retorts
Intermittent Vertical Chambers
Coal and Coke Handling
By-Products Recovery
Liquid Purification
Ethylene Recovery
Benzole *Hydro-Refining*
Tar Distillation
Biological and Ion Exchange *Effluent* Treatment
Petrographic Coal Preparation
Mineral Treatment
Pitch Granulation.



The Woodall-Duckham Group is active in many countries and in many Industries. The work it does is widely varied and the Woodall-Duckham Construction Company's contribution includes the construction of complete and comprehensive plants for the handling and processing of oil, coal and other raw materials for the production of synthesis gas, fertilisers and chemicals.

The Group possesses technical resources in depth which are a source of strength to the Company.

These resources are readily available to bring specialised knowledge and economy of design and execution to every contract.

No list of Plants and Processes can be complete We provide, often in collaboration with our overseas associates, a complete service in the selection, appraisal and provision of an ever-widening range of processes.

the business. British Cellophane recently announced that a shipping line has been laying sheets of polythene between cargoes to separate them at different levels. It has also used them for wrapping up powdery materials, such as Fullers earth or painters' colours, to prevent them from sifting around. Not surprisingly, the film was found to be more efficient than the conventional materials previously used, such as bituminised sisalcraft and burlap. Not surprisingly, the shipping line will separate all future cargoes in this way.

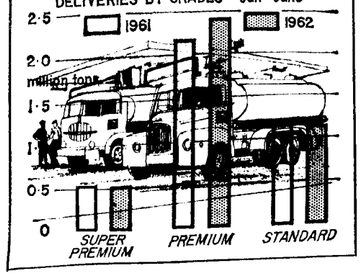
What is surprising is that nobody thought of it before. But this is a standard reaction to many uses for the film, for instance, bags for dry-cleaned clothes. One used to collect them un-bagged; now 500 tons of polythene film a year is sold for the purpose, and this is expected to increase to 2,000 tons by 1970. Gramophone records are invariably in plastic bags; toys, mattresses, kitchen utensils, frozen foods—all appear wrapped these days, where previously they were sold uncovered. This has been the main, and most gentlemanly, characteristic of the growth in polythene film sales so far: it has made its own market.

In this country, sales of flexible films increased from 58,000 tons in 1958 to 73,000 tons last year; sales of polythene film increased by 35 per cent, to 23,000 tons, and of cellulose film, the main packaging film, by 29 per cent to 40,000 tons. Of the polythene film sold, three-quarters was used in packaging and this is where most of the effort to increase sales is directed. New types of film have been developed and new machines designed to extend the uses of old. Among the new materials are films that have been stretched in manufacture and which when heated shrink to their former size, and others which will stand boiling water and are used to make "boil-in-the-bag" packages for frozen foods. Machines have been developed which form, fill and seal bags from flat sheet, previously printed. But the biggest potential is thought to be in heavy gauge sacks, of the sort normally made from paper. It has only recently become possible to make polythene sacks cheap enough to compete. (They now cost 1s. 1d. compared with 10½d. for paper.) Interest in these tough, waterproof sacks is such that British Visqueen, for one, is to instal plant (primarily to produce them) which will make it the largest manufacturer of polythene film in Europe.

New uses are also being found for flat sheet, which in the USA accounts for twice as large a share of the market as in Britain. Used as a weather cover, it is familiar to watchers of building sites; its use in road-making is probably less so. It is laid below the top surface of the road to prevent it from drying out before properly cured; miles of sheet have been used in this way on the Medway motorway. It is also laid under concrete as a damp course. There are many outlets for it on farms: in America, it is used as a mulch, laid on the soil to keep in moisture, but this will not be an important outlet in Britain except in some uses in market-gardening. The inventive film-makers will continue to find uses for their product, and manufacturers of polythene—so sadly over-produced—will continue to be grateful to them.

BRITISH OIL CONSUMPTION

British oil consumption rose by 11.1 per cent (to 25,705,000 tons) in the first six months of this year against last year. Nearly 14 per cent more black oils were consumed; these now account for about 60 per cent of the total. Demand for motor spirit rose by only 4.4 per cent; consumption of standard and super premium grades is falling, and the oil companies have lately reduced the price and raised the quality of the former. The chart breaks down petrol deliveries by grades.



SHORTER NOTES

The Department of Scientific and Industrial Research has placed a contract with the Manchester College of Science and Technology for a study of the structure and economy of the British building industry. To be finished by 1965, the study will cover technical developments, contract procedures, productivity and quality. The committee guiding it will contain representatives of the college, the DSIR, the Ministry of Public Building and Works, and of the professions or industry.

★

In its formal offer of four of its shares for every five in Lobitos, Burmah Oil has said that its profits this year will not be less than they were in 1961 and that its dividend will not be less than 2s. 1d. tax free per share paid for 1961. The profits of Lobitos this year will compare favourably with those in 1961, the decline in profit margins at home being offset by the extensions and modernisation of the Ellesmere Port refinery and by a rise in profits from Canadian natural gas. In Peru, the year's trading is expected to be favourable. Mr. F. T. Bowring and other directors of Lobitos have only a small interest in its stock; C. T. Bowring and Company, in which Mr. F. T. Bowring has a shareholding interest of 2½ per cent, owns £50,025 of the Lobitos stock.

★

Bills drawn on German exporters will in future be rediscountable by Privatdiskontbank, the special discounting institution founded two years ago; hitherto it has accepted only import bills and those drawn for transit dealings.

★

Undercutting by other retailers has persuaded the London Co-operative Society, under Mr John Stonehouse, to change its own price-cutting methods. Direct price-cutting will replace the traditional dividend at self-service stores, and an "instant dividend" of 6d. in the £ will be paid in other shops in the coming financial year, independently of trading results.

★

New commissions for private architects in the second quarter of this year were worth £264 million, four per cent more than they had been a year before. There was a sharp rise in commissions for houses from private developers and a slight increase in those for office building, matched by a drop in commissions for factories and from public authorities. These figures help confirm the impression that the building industry is now in a static state after the hesitations of last summer and autumn.

★

Through its subsidiary, City Centre Properties (Europe), City Centre Properties has acquired a half share of the capital of Union Internationale Immobiliere, a French property company whose shares were introduced on the Paris Bourse in August.

EIU Quarterly Economic Reviews
covering 57 countries or groups of countries

Brazil

The review discusses Brazil's serious balance-of-payments predicament, now aggravated by political uncertainties, and the fumbling attempts by the authorities to shore up the sliding value of the cruzeiro. Meanwhile, it notes that foreign investors are being deterred by more manifestations of economic nationalism as epitomised in the fate of the controversial Profit Remittance Bill.

ASSOCIATED TELEVISION LIMITED

POLICY OF "REAL COMPETITION" ADVOCATED THROUGH ADDITIONAL COMMERCIAL TV CHANNEL

LOWER PROFIT FROM REDUCED REVENUE, GREATLY INCREASED COSTS AND DEVELOPMENT EXPENDITURE ON NEW SUBSIDIARIES

SIR ROBERT RENWICK CRITICISES ATTACK ON ADVERTISING

The seventh annual general meeting of Associated Television Limited will be held on September 26th at ATV House, Great Cumberland Place, London, W1.

The following is the statement of the chairman, **Sir Robert Renwick, Bt, KBE,** circulated with the report and accounts for the year ended April 30, 1962:

You will see from the Consolidated Profit and Loss Account that the profit of the Group before taxation is £5,038,204 as compared with £6,411,899 for the previous year. This profit is after charging all expenses including depreciation. The provision for depreciation of £439,986 shows an increase of £157,463 as compared with the previous year, due to the fact that this is the first year in which is charged a full year's depreciation on new equipment at our Elstree Studios.

After making allowance for taxation of £2,658,935 and the interests of outside shareholders, there is left a profit of £2,387,884 attributable to ATV.

The amount retained in subsidiary companies is £113,708 and the balance brought forward from last year is £1,859,608 making £4,133,784 available for appropriation.

An interim dividend of 20 per cent has already been paid and your Directors now recommend that a final dividend of 40 per cent be paid again this year. If this recommendation is approved, there will be left a balance of £2,424,909 to be carried forward in the Accounts of the Parent Company.

BALANCE SHEET ITEMS

Turning to the Consolidated Balance Sheet it will be noted that under the heading of Fixed Assets there have been increases both in Land and Buildings and in Plant, Equipment and Motor Vehicles. These are attributable to our new studios at Elstree which are now completed and fully equipped. Whereas the total of Trade Investments has not altered materially, it will be noted that Quoted Shares have increased and Debentures and Loan Stock have decreased. This is mainly due to the conversion into shares of the £500,000 Convertible Loan Stock in British Relay Wireless and Television Limited.

We already have in our Balance Sheet an investment reserve of £500,000. Taking our Trade Investments and Investments in Subsidiary Companies together, your Directors are satisfied that the present investment reserve is adequate.

FACTORS AFFECTING PROFIT

The reduction in Group Profit for the year is due to three main causes—greatly increased cost of operations, reduction in advertisement revenue and losses made by subsidiaries in early stages of development.

We believe that in time our subsidiaries will make a very useful contribution to the income of your Company. We have never stated, as I have seen reported, that our Company could maintain its present dividend from sources other than the profit which we make as television programme contractors. Our profit at present comes mainly from our operations as contractors for Saturday and Sunday in London and for the five weekdays in Birmingham and the Midlands. These two broken periods are economically far from ideal.

VALUE OF SEVEN DAY OPERATION

We advocate a policy of real competition in commercial television through an additional commercial channel. If we were to have a seven day operation, not only would there then be real competition, but we would be able to use to the fullest degree, both at home and through our export subsidiaries, the new studios which we have constructed at Elstree, which are the equal of any in the world.

Our purpose is to provide good television, and by ploughing back profits into the studios at Elstree we have supplied concrete evidence that we are making in the field of television production the sort of contribution which the Government must have believed in when we were appointed. Nevertheless it must be appreciated that though we have been able to improve programme standards by bringing into operation the new studios at Elstree with their complex and up-to-date equipment, this has not been achieved without at the same time increasing production costs. Similarly the awards which have been made as a settlement of the Equity strike are also contributing to increased day-to-day costs of putting programmes on the air.

Last year my predecessor in his statement said: "We confirmed to the Pilkington Committee that we accepted the recommendations of the Television Advisory Committee for the adoption of 625 lines as the British standard. In order to give effect to this we offered, on the days we were not broadcasting in London, to put out a new programme on 625 lines in the UHF band which would carry in addition one hour a day of 625 line colour broadcasting—all at our own expense. Surely this would be a great contribution, and something that would give encouragement to the scientists, the technicians, the script writers, the producers and all the many people who will benefit from an expansion of television broadcasting."

CONTRACTORS' PROFITS

There has been a great deal written about the profits which contractors have made. It is surprising to me that, when a contractor offers to divert a large slice of its profit and to plough it back into advancing the art of television broadcasting, as we proposed, this should not have been mentioned in the Pilkington Report. It seems to me that to use profits to expand the art of broadcasting and to make new programmes available is a better alternative than to force companies by penal taxation, to pass money to the Exchequer to spend on providing the public, not necessarily with what the public enjoys, but with what the Pilkington Committee thinks it ought to have.

I am not one to believe that we are called on to make any defence because of the profits we have made in recent years but I think it is a good thing to repeat what the Hankey Committee on Television stated in 1945:—

"It is quite clear that, until the television service is well developed, commercial interests would not be willing to incur large expenditure for this purpose, owing, for example, to the limited audience served. In the early stages, therefore, we could not expect sponsored programmes to provide a substantial contribution towards the cost of the television service. In these circumstances and without prejudicing the matter for the future, we feel it would be premature to come to a conclusion on this question."

I can say that, for several years before and after the war, the people concerned in promoting Commercial Television lost a considerable amount of money in financing the pioneering work and when eventually the Government agreed to set up a Commercial Television service it was far from easy to find sufficient sources of capital. This only confirmed the conclusions of the Hankey Committee.

PROVISION OF RISK CAPITAL

No sooner had the Independent Television operation started than the rate at which money was being lost became so alarming that it was extremely hard to get any new money. In our own company almost the entire original capital was lost in the first year, so that, far from having "a licence to print money," we found that we had a licence to lose money in millions. Yet a substantial number of the people who were original shareholders put their hands back into their pockets and produced further capital. Even so, it proved necessary to go outside the group for still further backing. It is easy to be wise after the event, but when one considers the risk involved in putting up money for what, on the best authority, was a very long-odds chance, I cannot agree that the criticisms of large profits are warranted.

It should not be forgotten that, if risk capital had not been put up six years ago, we would not have had commercial television. We would still have the low standard of television broadcasting which existed at that time. Occasions are bound to arise when it may be necessary to depend on voluntary risk capital if the many projects and services of the future are to be developed. If

the Government undermines the confidence of the investor it will make it impossible to get the financial support which will be required if we are to bring many new inventions to the light of day.

The most important objective in the day-to-day existence of your Company is the creation and production of programmes. In London we have Saturday and Sunday. These are the two days when the great mass of our people have time off from work and look forward to relaxation and pleasure. The daily drudgery of any worker can be lightened considerably if great care is given to filling periods of relaxation during the weekend by presenting the right sort of entertainment for ordinary people. We have tried to achieve this by giving pleasure while at the same time maintaining balance in our programmes.

ADVERTISING AN HONOURABLE PROFESSION

I do not intend in this statement to deal with the Pilkington Report in any detail. I feel that the ordinary people will decide the answer and not the extraordinary people. I would only point out the many references, often of an offensive character, about advertising which have been made in discussions about the Report. Advertising is an honourable profession. Its standards in this country are recognised as high throughout the world. The Government is constantly calling for more and more exports. Now there is no weapon in this job of selling so important and vital to its success as advertising. Is it a crime to advertise?—it cannot be right to do it in one place and wrong to do it somewhere else. It is certainly wrong to attack advertising in the way it has been attacked, and then to say "but it will be all right as long as the advertising is sold and handled by a state enterprise."

Many shareholders have written to me about the effect of the Pilkington Report and I can only say to every one of them "You have made an investment in an undertaking which was permitted and promoted by the Government, and you have all the rights and all the freedom to take any legitimate steps you wish to protect your investment." In the same way, I say to any and all of our viewers—"We are an adult people and each one of us individually has been entrusted with taking political and national decisions of enormous importance, but the Pilkington Committee has made it quite clear that there is one issue we are apparently not mentally capable of deciding, and that is the sort of programmes the majority of people want to see on their television screens."

SUCCESSES ABROAD

One of our more important subsidiaries, Incorporated Television Company Limited, continues to be the biggest producer and exporter of British television programmes. Following the network success in the United States and Canada of the "Danger Man" series, a further series "Sir Francis Drake" is being transmitted this summer on the NBC network. During the year, the "Supercar" series, using new techniques with animated puppets, was completed and has been equally successful both here and on the American Continent.

Four film series, "Man of the World," "The Saint," "Fireball XL5" and "Broadway goes Latin," were about to go into production when

the strike commenced and as a result of this over six months were lost. However, production is now in progress and we can only hope that there will be no interruption during the coming year; but of course the interruption in our production will affect our sales throughout the world during the present year.

Incorporated Television Company distributes the Group's products in the Eastern Hemisphere and supplies these programmes to our American subsidiary, the Independent Television Corporation, for distribution in the Western Hemisphere. To date over 10,000 hours of programmes have been sold to 32 countries in the Eastern Hemisphere, covering Australasia, Scandinavia, Western Europe, Eastern Europe, Middle East, Far East, India and Africa.

Very few British series have achieved a network showing in the United States of America and our American management have to be congratulated on their achievement.

POSITION IN AUSTRALIA AND CANADA

Last year we referred to our investment in Australia where we have holdings in seven commercial radio stations including stations in Sydney, Melbourne, Adelaide and Canberra, and we are partners in the Australia-wide McQuarrie Radio Network. In commercial television we have interests in eight stations, including Sydney, Adelaide and Brisbane, which are firmly established and are now showing satisfactory returns. Of the remaining five stations, one is in Canberra and four are in important country centres but these stations only commenced transmission in 1962. In addition, we operate a radio programme production company which has a large market for its programmes overseas as well as in Australia.

Last year Australia suffered a severe income recession. I am glad to say we now see definite signs of recovery and look forward to much improved results in the future.

We continue to sell a substantial amount of material in Canada through the Independent Television Corporation. In addition, we have a capital investment in two Canadian Television Stations, one in Halifax and one in Vancouver. We were reconciled to the fact that it would take some time before these companies had expanded to the stage of income being able to carry the expenditure. One of the companies has already got into a profit position and the other is now likely to achieve profits at an earlier date than we originally expected.

PLANNED MUSIC LIMITED

Our subsidiary, Planned Music Limited, which promotes the distribution of suitable background music programmes in public buildings, offices, factories, etc, is gradually approaching a period of consolidation. In the last few years the expenses incurred in preparing the groundwork in this particular business were heavier than we had anticipated. During the build-up period the time taken to get GPO lines laid down and contracts completed is a much longer operation than one would expect, and the shortage of certain Post Office lines has, to some degree, continued. A policy of developing in the known profitable areas, with good administration, will, I believe, bring us to a profit making stage within the next two or three years.

Pye Records Limited, in which we have a substantial interest, progresses according to plan and, although large sums of money are required to establish a records business, we have been making profits for the last three years.

BRITISH RELAY WIRELESS AND TELEVISION LIMITED

Shareholders will know that for a considerable time we have had a substantial holding in British Relay Wireless & Television Limited. This is one of the leading line networks for bringing programmes into people's homes and has been in existence for many years. In fact, the original company, Link Sound & Vision Services Ltd., was the first company in this country to operate successfully a system of transmitting television programmes by wire, and consequently doing away with the difficulties of interference and weak signal strength.

Because of the lack of public demand for new television sets, caused by the state of uncertainty while everyone waited for the Pilkington Report, the company has undoubtedly suffered during the last two years. It has nonetheless continued to build and extend its networks, confident that the added complexities of ultra high frequency broadcasting and colour would lead to a greatly increased demand for wire reception. British Relay's networks are worth many millions of pounds, and we know that, if the maximum effect is given to the White Paper recommendations on the number of channels, well over 80 per cent of the company's existing cables will be able to take all these new programmes including colour, with practically no capital cost. The future of British Relay is extremely bright and we will do everything possible to help it to become a great success.

In addition, in the field of Pay Vision, British Relay Wireless & Television Ltd., has a system which in my opinion is technically equal to any other, and certainly from the economic point of view has a great many advantages. I believe that Pay Vision is one of the certainties of things to come and in due course will be available to viewers in this country.

TRIBUTE TO STAFF

I would like to bring a personal note into my concluding remarks. The strike put a great strain on your company. A large number of our employees had to spend some months in comparative idleness; this not only cost a great deal of money but was a soul-destroying period for everyone concerned. Yet, in spite of the frustration caused by enforced inactivity among staff who love their work, our people supported us wonderfully in that difficult time and were a great encouragement to my fellow directors who are responsible for the day-to-day management of the business.

With the strike at last settled, but almost before we could get back into our production stride, the Pilkington Report was published and more unsettlement was created.

Broadcasting depends on creative people—script writers, producers, directors, actors and technicians—and all of these were thrown into a well of doubt and despondency. It is quite clear to your Board that, if we have to go through a long period of uncertainty about the future this will do irreparable harm to British broadcasting.

We can only say to our staff that we appreciate their great loyalty and we shall do everything in our power to restore a sense of sanity and stability into the commercial side of British broadcasting which is recognised as being unequalled throughout the World.

I.B.E. LIMITED

RECORD YEAR

The thirty-fourth Annual General Meeting of I.B.E. Limited was held on August 30th, **Mr Robert Montgomerie,** the chairman, presided. The following is an extract from his statement:

It gives me considerable pleasure to present to you the accounts, because this was, by a substantial margin, the most successful year in our history. Last year, I indicated that our earnings were then near the record established in 1952, when our profits before taxation reached the figure of £122,668. However, the comparable figure for the year under review was £176,190, which represents an increase of nearly 44 per cent over our previous record and an increase of 51 per cent over the figure for 1961.

Our current activities can be broadly divided into three main groups, road-making materials, including ancillary services connected with their use and application, paints and specialised building products, and it is true to say that the section concerned with the production of bitumen emulsions constitutes no more than one half of the total.

Trading operations in all these main spheres of interest this year gave us every reason to be satisfied, although not complacent.

So far as roads were concerned, our companies in that field made excellent progress and there are very real signs that, by sheer determination, hard work and the production of first-class materials, they are steadily overcoming the difficult trading conditions which have persisted since 1957.

The paint trade is still highly competitive but we are proud of the quality of our products, and in the past year our own companies have shown material advancement, both in the volume of business obtained and in their contributions to the Group's results.

Specialised building materials, marketed under the trade mark Plycol, have contributed substantially to the all-round improvement this year. Expanding sales, increasing good will, and the acceptance of our products in a constantly widening field have led to a number of interesting developments, many of which resulted from inquiries by customers anxious to find materials suitable for their particular needs.

The business of our subsidiary company in Pakistan also showed a marked improvement. Owing to currency restrictions, however, it has not yet been possible to arrange for the profits to be remitted.

In South Africa the operations of our associated company have again been most gratifying and the further improvement in their profits is reflected in the increased dividend received from that source.

Current reports from some of the trades with which we are most closely concerned, notably paints and the building industry, suggest that conditions generally in those trades are not very encouraging at this time. Although, in viewing our prospects for the current year, I do not anticipate the expansion we enjoyed during the past two years, I have no reason to feel despondent, and the news from our own companies for the first three months' trading, indicates that our position at this time is being maintained.

The report and accounts were adopted.

THE CEMENTATION CO. LTD.

IMPROVED RESULTS

The forty-second Annual General Meeting of The Cementation Company Limited will be held on September 25th in London. The following are extracts from the circulated statement of the Chairman, **Sir Frederick Pile:**

The consolidated Profit and Loss Account for the year to March 31, 1962, shows a trading profit of £653,635 compared with a loss of £202,274 for the previous year, an improvement of £855,909. After tax, mostly incurred by our Companies and Branches overseas, the profit this year is £317,513 compared with a loss last year of £434,903. During the year the Group's overdraft position improved by over £800,000. We are now in a position to take the fullest possible advantage of new business on offer.

LAST YEAR

Civil engineering here at home continued to be intensely competitive throughout the year and there was little new mining or drilling work on offer. However, there was a good deal of activity in the UK in our other specialist fields.

The group of UK manufacturing and selling subsidiaries had a successful year, though, like our contracting activities, they were running into a period of generally reduced business activity towards the end of the period.

The results of our companies in South Africa were better than expected.

Elsewhere overseas the year turned out much as I envisaged in my last annual statement, though business conditions in New Zealand worsened markedly towards the end of the year (our establishment in that country has consequently been much reduced) and, in the face of its trading record and future prospects, it was decided to close down altogether our contracting operations in Brazil.

THIS YEAR

The Group's order book at the beginning of the financial year was not so satisfactory as it was in March, 1961, and great efforts are being made to reverse this trend. As I have already pointed out, we now have adequate finance to enable us to deal with the situation.

At home, the reduced profitability, to which I referred in my letter to shareholders of May 2nd, continued during the early months of the year as did the intense competition. The level of activity in some of our specialist fields has been reduced, but I am hopeful that this will prove to be a passing phase of short duration, with the exceptions of mining and drilling. In the case of those two activities we must face the fact that the home market will be substantially smaller than hitherto for some years to come.

I expect the level of operations and profits of the South Africa Group of Subsidiaries to be roughly similar to those of 1961-62, but business activity in Rhodesia is at a low ebb.

Work is still scarce in New Zealand. In Australia our subsidiary company is expanding and prospering. I have no doubt that a sound and substantial business will have been built up in Australia by the end of this year where a useful profit should be earned.

In India our business is continuing to expand and should make a reasonable contribution to our profits for the year.

THE PURNELL GROUP

(Printing, Packaging and Publishing)

A YEAR OF PROGRESS

PROVISION OF ADDITIONAL CAPITAL FORESHADOWED

The twenty-eighth Ordinary General Meeting of Purnell & Sons Limited will be held on September 28th in London.

The following is the circulated statement of the Chairman and Managing Director, **Mr W. Harvey:**

In December 1961 your Company was able to add sufficient Ordinary Shares to its holding in British Coated Board & Paper Mills Limited to secure control of that Company, and the profit in respect of the nine months to December 31, 1961, together with the profit of Waterlow & Sons Ltd. for the year to December 31, 1961, are reflected in the Group Trading Profit of £2,126,473, which shows an increase over the previous year of £702,498.

The Net Profit before Tax, but after providing additional Depreciation in respect of Initial and Investment Allowances of £287,920, is £1,177,462, an increase of £414,820 over the previous year. After providing for taxation the balance of Profit for the year is £668,534, an increase over the previous year of £296,914.

SUCCESS OF BOARD'S POLICY

During the past few years your Company has purchased, in the open market, shares in concerns where the business has been complementary to our own, and where it was felt that a merger of interests would be to the advantage of all concerned. The success of this policy is now evident as I am able to report that during the current year offers have been made to acquire the balance of the Deferred Shares in Waterlow & Sons Limited, the balance of the Ordinary Shares in British Coated Board & Paper Mills Limited, and the balance of the Issued Shares in Raphael Tuck & Sons Limited. I am pleased to be able to report that all these offers have been successful and your Company now hold or are in process of acquiring under the provisions of Section 209 of the Companies Act, 1948, the whole of the Deferred Ordinary Shares in Waterlow & Sons Limited, and the whole of the Ordinary Shares in British Coated Board & Paper Mills Limited, and have acquired over 90 per cent of the Preference and Ordinary Shares in Raphael Tuck & Sons Limited. I am confident that the merging of these interests will be to the benefit of your Company and also to the benefit of the former holders of the shares in these Companies who, by accepting Purnell & Sons Limited shares in exchange for their former holding, have acquired an interest in your Company.

The Issued Ordinary Share Capital of your Company after these exchanges have been made will be approximately 8,700,000 5s. Ordinary Shares, and, with the exception of some 500,000 £1 Preference Shares and 200,000 £1 6½ per cent Preferred Ordinary Shares, the whole of the Share Capital of the Subsidiaries and their proportion of Reserves and Surplus applicable thereto standing in the Balance Sheet at £2,710,082 will belong to your Company.

The Investments in the Balance Sheet at £491,710 will, I anticipate, realise, in due course, slightly in excess of £1,000,000.

CAPITAL PROGRAMME

In my last year's Report I stated that your Company was committed to a large capital programme, and the photographs accompanying the Accounts show the progress of some of these extensive projects. When these are completed your Company will be equipped to provide for its own publications and those of its customers one of the most comprehensive and up-to-date printing services in the country.

All our extensions and installations are allied to the printing, paper, packaging and publishing industries with which your Company has been associated since its formation some thirty years ago. The training and recruitment of our personnel have kept pace with the introduction of modern equipment, and our craftsmen are among the most efficient in these industries, with an exceptionally wide range of experience.

Your Directors have continued to pursue a policy of ensuring that the Group's products are such that they can be produced as far as possible from the raw material to the finished goods within the Group. We have, for example, recently completed a most up-to-date ink factory capable of supplying ink to satisfy our own needs and those of our customers.

We have continued to build up our publishing interests with particular emphasis on general education, and during the past few months we have launched another weekly publication, *Understanding Science,* which has been well received by the public both at home and abroad, and we are contemplating further weekly and monthly publications in the very near future.

You will observe from the Accounts that we have Forward Contracts in respect of Capital Expenditure amounting to £2,149,645 which, when completed, will, I am sure, add greatly to the profit of your Company. To finance this expenditure and place your Company in a liquid position we propose at a very early date to raise further Capital either in the form of a Rights Issue or Loan Stock with Conversion Rights; such additional Capital will be offered in the first instance to our Shareholders.

CURRENT TRADING

Before I conclude you will be interested to know about the current year's trading, and I am pleased to state that our turnover is now over £15,000,000 and continues to grow steadily, and our profits for the year, subject to any unforeseen circumstances between now and the end of the year will be at least equal to those of 1961.

Your Directors have recently appointed to the Board Messrs. Bertram Clarke and William J. Harvey, who have been associated with the Company in all its activities for some twenty years or more.

An Extraordinary General Meeting of the Company is being convened on the same date as the Annual General Meeting to seek the authority of the Members to increase the maximum number of Directors to twelve. Should this increase be confirmed it is the intention of the Board to appoint as additional Directors of the Company Messrs. Peter Lavington and A. C. Grant, who have also been associated with the Company for many years.

During the past year your Company has made great progress in all its activities, and I am quite sure that all Members would wish me to convey our sincere thanks to my colleagues and all employees for their devoted services which, at times, have been long and arduous in order to bring to fruition some of the many and varied projects we have on hand.

MOTOR IBERICA S.A.

Avda. Capitán López Varela, 149, BARCELONA (5), SPAIN

Distributors of Ford Products in Spain and Andorra

Manufacturers of Ebro Tractors, Trucks and Engines

The Annual General Meeting of MOTOR IBERICA S.A. was held in Barcelona on May 12th, and the following are details of the report presented by the Board of Directors:

REVIEW

The total sales volume in the year 1961 rose to a far higher figure than that obtained in 1960. The number of tractors sold recorded a 28 per cent increase as compared with that of the previous period whilst the truck sales figure was four times that of 1960.

New types of tractors, farming implements and trucks have been developed. Some of these have already been introduced whilst the launching of others is now going through preliminary stages. The Company's plant is undergoing considerable expansion and alteration, and participation in the capital of other companies within the motor or allied industries was increased during the year.

PROFIT AND DIVIDEND

Profit for the year totalled Ptas. 255,088,770. It was accordingly proposed to distribute this amount as follows: to Income Tax Ptas. 69,500,000; to allocate to the Legal Reserve Ptas. 19,535,660 to confirm the 8 per cent interim Dividend, taxable, against Coupon No. 13, declared in October, 1961, Ptas. 22,386,048; to declare a 10 per cent complementary dividend, taxable, against Coupon No. 14 Ptas. 27,982,560; to distribute, gratis, as additional Dividend, taxable, and against Coupon No. 15, new shares, one for every 22 shares held, Ptas. 12,719,400; to allocate to the "Motor Iberica S.A. Social Welfare Foundation fund" Ptas. 8,000,000; to allocate to the Company's personnel house building scheme Ptas. 2,000,000; to transfer to the "Provision for Capital Investment" (Law 26-12-57) Ptas. 40,000,000; and to transfer the balance to the Reserve Fund Ptas. 52,965,102.

The report, the accounts, and the proposals put forward by the Board were adopted.

Copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Company Meetings Department,
The Economist,
22 Ryder Street, S.W.1.

COMPANY AFFAIRS

Equities have again had a slack week on the London stock market, but whereas in the previous fortnight the low level of business did not lead to lower prices this week prices have fallen. The Economist *indicator lost 7.3 points from 335.8 to 328.5. Any benefit that the gold reserve figures for August brought to prices was limited to gilt-edged stocks ; equity prices were more influenced by the disappointing retail trade figures for July and the dullness on Wall Street. Gilt-edged prices continued to rise. The new £500 million tranche of 5½ per cent Treasury 2008-12 triggered off extensive switching among long dated stocks, but undated stocks tended to ease.*

Steel Dependents

In differing degrees, the fortunes of Davy-Ashmore and Wellman Smith Owen depend upon the pace of investment in the steel industry in this country and overseas, and their results, as the table shows, both point in the same direction. Each has had to work on lower profit margins and each is affected by the end of the steel investment boom in this country. But Davy-Ashmore is much the bigger of the two and appears to be more dependent than Wellman on big-scale developments in the British steel industry such as Newport and Ravenscraig. Both have tried to diversify their activities as capital goods producers ; but since it acquired Incandescent Heat Wellman may have secured a broader range of interests than Davy-Ashmore. Davy-Ashmore's profits will be substantially lower this year and its dividend will be cut, though not by "grievous proportions." Does this mean 25 per cent, against 27½ per cent, or something lower? Wellman, on the other hand, has orders on hand worth £13 million—Davy-Ashmore does not say what its orders are worth but its turnover in 1961-62 amounted to £40 million—and it expects to earn profits close to those in 1961-62. Its dividend, effectively raised through a scrip issue from just under 22 to 25 per cent, does not appear to be in danger.

Year to March 31	Davy-Ashmore 1961	Davy-Ashmore 1962	Wellman 1961	Wellman 1962
Trading profit	5·0	5·3	2·1	2·0
Gross profit	4·1	4·0	1·9	1·7
Net equity earnings	3·0	2·9	0·8	0·8
Retained cash flow	2·7	2·7	1·0	1·0
Net fixed assets	9·3	10·2	2·6	2·6
Net current assets	7·5	7·8	2·6	2·5
Net liquid assets	2·3	Dr 1·0	1·3	0·8
Net equity assets	12·3	13·4	4·4	4·7
Ordinary earnings, per cent	65·3	61·4	48·3	46·3
Ordinary dividend, per cent	27·5	27·5	21·9	25·0
Gross profit/net equity assets	33·3	29·9	43·2	36·2
Net earnings/net equity assets	24·4	21·6	18·2	17·0

In the short term, Wellman's 5s. shares at 20s. 3d. and yielding nearly 6¼ per cent appear a safer investment than Davy-Ashmore's 5s. shares at 18s. 6d. and yielding nobody knows quite what—particularly as there is no guarantee that Davy-Ashmore's steadier earnings record over the last decade (based on the expansion of the British steel industry) will be repeated in the next. But Wellman is not immune from the influences on profits that Mr M. A. Fiennes so fairly puts before Davy-Ashmore shareholders in his statement. Some part of its business, though possibly a smaller part than Davy-Ashmore's, will be affected by the pause in steel investment in this country while other parts are just as dependent as Davy-Ashmore's on higher steel output. As capital goods suppliers, both need economic growth in this country to revitalise their profits. And more than ever both have to look abroad for new orders—ranging beyond steel plant and equipment—and thus are concerned with the flow of aid to the developing countries and upon the provision of export credits. Sir Peter Roberts, the chairman of Wellman, would no doubt agree with Mr Fiennes that the next year or two will be difficult. Both companies will have to live in a tough, competitive world.

Fitch Lovell

The remarkable growth of Fitch Lovell, the wholesale and retail provision merchants, has been based on the acquisition of smaller businesses. It has so captured the imagination of investors that the 2s. 6d. shares at 14s. 3d. are close to their high point for the year. Immediately, this faith is difficult to fault. The group's turnover in 1961-62 amounted to nearly £110 million ; gross profits rose by 32 per cent, though the increase comes down to 16½ per cent if the contribution of new acquisitions is excluded ; the dividend was raised from 15 to 16½ per cent ; and the customary capital bonus of one per cent was repeated. Trading in the first months of the current financial year, the chairman, Sir Ambrose Keevil, says, has shown a "good all-round improvement" and he hopes at least to maintain the dividend at 16½ per cent on the capital as increased by the one-for-ten scrip issue, though the small capital bonus may be dropped. The indicated yield is thus 3.2 per cent, presumably again covered about 2½ times.

But expansion at Fitch Lovell's speed has its cost. This first appears in its bank overdrafts. Admittedly, these are based on

quickly moving stocks and are the equivalent of only slightly more than a normal week's trading. But there is a hint in the revaluation of the group's freehold and long leasehold properties (which, Sir Ambrose says, leaves the company, "well placed for arranging additional finance") that a funding operation may be on its way. It could take the form of a debenture or leasing-back arrangements, and it would thus raise the gearing on an already highly-geared equity. The price of expansion is also revealed in the decline in the return on capital employed. Like other grocers, Fitch Lovell trades on a low profit margin on a big volume of sales. To push up the return on capital employed it must keep its costs down and fight against fierce competition for increased sales. To do this, the admirable objectives of policy laid down by Sir Ambrose have to be translated into hard facts ; they include automation in the factories, mechanical aids in warehouses and offices, the development of supermarkets and self-service stores, a "new and different approach" in retail display and service and a streamlining of the organisation with a view to the "gradual integration" of its various functions. All this costs energy, time and money. And while it is being achieved Fitch Lovell's competitors will not be standing still. Does the current yield make sufficient allowance for the fact that Fitch Lovell has to consolidate the ground it has already won?

Monsanto Chemicals

Monsanto's trading record is poor. In boom years it has not done as well as its competitors and in slack years it has done noticeably worse. In its investments in chemicals and plastics, it has sometimes followed the fashion rather than taking its own line in looking for products and markets which would be less affected by price-cutting and dumping by the international giants when the going got tough. It exports about two-fifths of its output and its dependence upon overseas markets has proved to be a source of weakness in the chemical price war without being a source of great vitality in the boom years. In the end, the blame must rest on the managers, though how far the distant control of the American parent has added to their problems is a matter on which only they could pronounce.

The best that can be said about a profit of £77,000 on sales of £9.9 million in the first half of this year (compared with a profit of £796,000 on sales of £10.7 million in the first half of 1961) is that it is slightly better than the profit earned in the last half of 1961. The figures exclude the results of the Australian subsidiary (which has made an "encouraging recovery," though the company is small) and investment income (which will be lower this year). Like other chemical companies, Monsanto expects some "measure of recovery" in the current half of the year.

But the interim dividend has been cut from 5 to 3¼ per cent and Sir Miles Thomas says that the repetition of last year's dividend of 10 per cent (which compares with 15 per cent in 1960 and 1959) depends upon the degree of recovery which is attained. On a 10 per cent dividend the 5s. shares at 14s. would yield about 3½ per cent and on a 7½ per cent dividend about 2¼ per cent. The only justification for so high a price is that the American parent might decide to buy out the minority shareholders. It would need some considerable confidence in the long run outlook to do so.

Joseph Lucas

Whether or not Britain enters the EEC, it is logical for Joseph Lucas, the biggest manufacturer of motor accessories in this country, to seek some protection against the fluctuations in the British motor industry by investing in plants on the Continent. Its foothold in the Commonwealth is secure ; but its Continental investments are no more than a few months old. They include an association with the French company, Roto-Diesel, which makes distributor-type Diesel pumps ; a newly acquired 40 per cent interest in Ducellier, the biggest manufacturer of electrical accessories for the French motor industry ; and plans for building a factory in Coblenz where Girling brakes for the German motor industry will be made. With its low geared capital structure, Joseph Lucas rightly intends to raise fixed interest finance for these investments—£10 million in a long-term debenture issue in this country before the end of the year and £4.2 million on a medium term loan in Switzerland early in 1963. These loans will more than cover the £3 million outstanding in bank overdrafts in this country and £2 million in bank loans in Switzerland. This is a big operation for Joseph Lucas, which in the last decade has financed developments of nearly £30 million without coming to the market ; but it has to be seen in the perspective of an annual turnover of about £120 million on a net asset base of about £45 million. The operation requires an alteration in the directors' borrowing powers ; these will be raised to £40 million and as compensation for their loss of control over borrowing the holders of the small preference share issue are offered an increase in income.

ATV

Although Associated Television has extended its interests, it remains heavily dependent on commercial television. The fat years, as the table shows, are coming to an end.

The chairman, Sir Robert Renwick, says that the fall in gross profits in the year to April 30th from £6,412,000 to £5,038,000 had three principal causes: greatly increased costs of operations, a fall in advertising revenue, and losses of subsidiaries in the early stages of development, Sir Robert says that these subsidiaries will in time make a "very useful contribution to the income" of the group. But he refutes the suggestion that the group could maintain its dividend from income from sources outside commercial television. This dependence explains the stock market's assessment of ATV: the 5s. ordinary "A" shares now stand at 20s. 6d. and yield nearly 15 per cent. Shareholders are confronted with two major questions. First, how much will television profits shrink? Secondly, what contribution can the other activities of the group make, and how soon? Until the government decides the future of commercial television, the first question cannot be answered. On the second, Sir Robert points to the prospect of higher profits in some of the smaller subsidiary companies, such as a television station in Canada and commercial radio services in Australia ; but Planned Music Limited is not going to earn profits for the next two or three years. Sir Robert says that British Relay Wireless and Television has an extremely bright future ; it must account for a large part of the quoted investments of £3 million shown in the balance sheet. But in all, to buy the shares is to gamble on the readiness of the government to extend commercial television much as it is.

Dowty Group

The report and accounts of the Dowty Group reinforce the pleasing change, shown in the preliminary profit figures, from the rather depressing news which the market has come to expect from firms supplying the British aircraft industry. Dowty's 27 per cent rise in gross profits from £2,527,000 to £3,213,000 owes little to Boulton and Paul, whose gross profits were virtually unchanged at £400,000. Tax relief relating to prior years doubled to £167,000 and net profits rose by 37½ per cent from £1,331,000 to £1,832,000. The tax free ordinary dividend, raised from 9½ to 10½ per cent, is covered almost 2½ times by earnings before tax rebates.

Pleasing as this performance is, the most welcome part of the report lies in Sir George Dowty's statement that nearly all the companies of the group have full order books and that a further improvement in profits is expected for the current year. In large measure this can be attributed to the success of the group's policy of diversification since the war ; although slightly more than half of its sales go to the aircraft industry the group has applied its specialist knowledge of hydraulics to mining equipment (where sales last year reached a new peak), hydraulic controls and marine equipment. It has also done well abroad, where it sells about a third of its aircraft equipment ; most British firms lamented the adoption of the American F-104G as the standard NATO fighter aircraft, but Dowty went out and won contracts for its equipment. Sir George reckons that the group's aviation order book should keep it occupied for about 2½ years. Backed by this kind of enterprise, the 10s. ordinary shares yielding 5 per cent at 35s. 9d. seem reasonably valued.

Rhodesian Selection Trust

The three-week strike on the Copperbelt in May reduced production of the three Rhodesian copper producers in the RST group in the final quarter of the financial year to June 30th. Mufulira's output fell from its peak of 31,000 tons in January-March to 28,000 tons in April-June—only 1,000 tons or so above its level before capacity was raised sharply by the Mufulira West extension. Roan Antelope, which became a subsidiary in March, suffered only a slight fall in output in the June quarter, but the drop in production at Chibuluma was very steep, and costs rose sharply from about £171 to £198 a ton in the final quarter ; over the year Chibuluma's gross profit fell from £1,047,000 to £623,000. Roan's costs continued to go up, reducing the gross profit to £36 a ton in the final quarter of 1961-62. Though the realised price of copper has remained steady at about £231 a ton over the past two years, the 3½ per cent reduction in Roan's output and the increase in costs led to a fall in its operating

Continued from page 963

profits from £3,746,00 to £2,804,000 in the year to June 30th.

Mufulira's production was stepped up by 13,000 tons to 114,000 tons. Though costs were slightly higher in the final quarter, over the year the extension at Mufulira West and other improvements brought down costs by nearly £9 a ton, widening the gross profit margin to £68 a ton. Hence Mufulira's gross profit went up from £6,355,000 to £7,486,000. The parent company, RST, which holds about 65 per cent of Mufulira's and Chibuluma's capital has reported a fall in its net profits from £9,722,000 to £9,167,000 in the year to June 30th.

Mufulira is now capable of producing 150,000 tons of copper a year. But in July the Rhodesian companies agreed to cut back either production or sales by a further 5 per cent. The RST group has elected to cut production, not sales, to achieve this. The copper producers have been heavy purchasers of copper in London this year in order to stabilise its price. Mufulira's bigger capacity should raise the RST group's combined output this year despite the bigger cutback, and the producers' support for copper prices has been impressively resolute. RST has also gone ahead with development of the Chambishi mine in which it holds a 64 per cent stake. The first copper should be available from the new mine in about three years' time. RST's £1 shares at 30s. yield 12 per cent net of Rhodesian taxes on the forecast dividend of 18 per cent after tax.

Murex

This year has disappointed all the metal producers. Fabricators of some of the more specialised metals have recently seen some improvement in business, but the improvement does not yet appear to have been fed back to the refiners and extractors of specialised metals like tungsten, molybdenum, tantalum and niobium. In his review, the chairman of Murex, Mr H. J. Penn, says that turnover has not improved since the early months of the year. The tailing off in demand this year led to a fall of 17 per cent in net profits over the full year to April 30th, compared with 10 per cent in the first six months. The prospect for the current year is therefore none too promising. The dividend for 1961-62 was trimmed from 13 to 12 per cent, resulting in a net saving of £23,000 which presumably owes more to the board's apparent policy of holding the distribution at almost precisely half the available profit than to the contribution it will make to self-generated investment.

In spite of more difficult trading conditions, Murex is still pushing ahead with its development programme. On the average level of capital expenditures over the last five years, this implies a further reduction in its liquid assets (which fell from £544,000 to £201,000 in the year to end-April). The board is prepared to borrow from the banks if the need arises and that need might occur this year. An increase in demand would however quickly alleviate the pressure by adding to profits and reducing stocks. Their growth is unavoidable at the onset of a fall in demand as the intake of raw materials is not cleared through the group's works for many months. This lag partly explains the sharp increase in stocks held by Murex from £2.9 million in 1960 to £3.8 million in 1961 and to £4.5 million by the end of last April.

Sales of the group's metallurgical powders and chemicals were maintained last year, and turnover in welding electrodes rose. But sales of welding plant fell, reflecting the poorer prospects of the metal-using and construction industries. But a revival in demand for metals will eventually occur and Murex will be especially well placed to exploit it. The emphasis in its development schemes is upon semi-finished and complex fabricated products and this could point to more stable profits in the future. The current price of 34s. and the yield of 7.1 per cent, covered twice by earnings, may be a little unflattering in view of the specialised nature of Murex's activities.

Mercury Securities

The thin yields on merchant banking shares reflect the tightness of their market; they also owe something to the belief that the City of London in general, and the merchant bankers with Continental connections in particular, will gain if Britain enters the EEC. But the price of £15⅝ and the yield of 2.3 per cent for Mercury Securities, the holding company of S. G. Warburg and Company, also reflect the energy and ability with which this firm of merchant bankers handles its affairs, and its *causes celèbres,* such as British Aluminium and Fairey. The fees accruing from what Mr S. G. Warburg describes as "special finance transactions" vary appreciably from year to year and the income of other firms within the group is vulnerable to changes in commodity markets. Thus the fall in profits for the second successive year —gross profits down from £2,128,000 to £1,651,000 and net profits from £1,047,000 to £741,000—may not be so upsetting to hopes as a similar report from an industrial company would be. The dividend has been maintained at 35 per cent and is covered about 2¼ *times*; but the yield is looking to growth, not to stability.

Furness, Withy

The full report from Furness, Withy *offers little relief for the bad results* for the year to April 30th announced last month. The combined effect of unsatisfactory trading conditions, rising costs and flag discrimination cut the group's shipping profits from £4,380,000 to £3,430,000, which thus failed to cover depreciation of £3,818,000. Equity earnings were thus entirely dependent upon the income from trade and other investments, which fell from £774,000 to £695,000, and though the ordinary dividend was cut from 10 per cent to 8 per cent, there are no genuine earnings for it.

Nor is there hope of an early recovery. There has been no improvement in the Mediterranean trade, though the group is trying to rationalise its sailings there, and the principal subsidiary, the Shaw Savill Line, is faced with a fall in freight both in and out of Australia and New Zealand; the directors regard any improvement in that trade as "very speculative." Hopes for Air Holdings, through which the group has a minority interest in British United Airways and Silver City Airways, have also been checked. Only half BUA's applications to operate a bigger number of scheduled services have been approved by the Air Licensing Board, and most of these are still subject to appeal by BEA. The £1 ordinary shares at 22s. 3d., stand at only a quarter of their net asset value, and yield 7.2 per cent on the smaller dividend.

Purnell and Sons

The sharp increase in profits for 1961 announced by Purnell and Sons, the printers, was expected; an improvement had been forecast and the latest results included nine months' profits from British Coated Board and Paper Mills, of which Purnell gained control at the end of the year, and much better results from the Waterlow subsidiary, which turned a loss of £8,000 into a profit of £273,000. Consolidated trading profits rose from £1,423,000 *to* £2,126,000 and net profits, after deducting substantial minority interests, rose by nearly a third from £378,000 to £494,000. The ordinary dividend has been maintained at 20 per cent, the minimum forecast on the capital as increased by acquisition issues, and is covered 1.9 times.

The stock market was pleased with the results and marked the 5s. shares up by 6d. to 20s. 3d., close to their high point for the year. The yield of about 5 per cent is not high for a paper share and reflects the group's growth potential. The chairman, Mr W. Harvey, says that the consolidation of the group's interests originally acquired by buying in the open market will benefit the group. Purnell now has complete control of the equities of Waterlow and British Coated Board and Paper and it has acquired over 90 per cent of the preference and ordinary capital of Raphael Tuck and Sons. In the current year therefore minority payments should fall but the tax charge on Waterlow will probably rise. The group's own printing and publishing ventures continue to expand, and capital commitments at the end of last year were as high as £2,150,000. Mr Harvey says that the group will raise fresh capital at a "very early date" and that profits this year will be "at least equal to those of 1961."

Money and Exchanges

EXCHEQUER RETURNS

For the week ended September 1, 1962, there was an "above-line" surplus (after allowing for sinking funds) of £2,405,000 compared with a deficit of £20,924,000 in the previous week and a deficit of £27,299,000 in the corresponding period of last year. There was a net expenditure "below-line" of £41,919,000 leaving a total cumulative deficit to date of £361,085,000 compared with £442,683,000 in 1961-62.

THE MONEY MARKET

At the bill tender on Friday of last week the syndicate of discount houses raised its bid by a further 1d. to £99 1s. 3d. and the average rate of discount fell by 4.08d. to £3 15s. 0.42d. per cent. Total applications rose by £7 million to £397 million and the allotment of bills was cut by £10 million to £230 million, but the market still received the satisfactory quota of 45 per cent, although this was slightly down on the previous week's 48 per cent.

The unchanged Bank rate on Thursday was no surprise to the market—a cut before the IMF meeting is out of the way seemed unlikely and the authorities had reinforced this view on Tuesday by forcing six or seven houses to borrow a moderate amount from the Bank of England at Bank rate. Credit was also tight on Friday and Wednesday, and the authorities helped the market by special bill purchases.

The flow of funds into gilt-edged securities has contributed to tight conditions at the short end of the local authority mortgage market, and the seven-day rate has remained at 4½ per cent. The longer rates have, however, eased this week, and mortgages for any period are quoted at 6½ per cent—which is ½ per cent below the recently reduced PWLB rates.

APPOINTMENTS

Central Electricity Generating Board Headquarters

A SYSTEM ECONOMICS ENGINEER

is required to take charge, under the System Planning Engineer, of the Economics and Mathematics groups of the System Planning Branch of the Planning Department at Headquarters, London, S.E.1.

The work will be principally directed towards forecasting the optimum broad pattern of development of the Board's generation and transmission system in a three-fuel economy and determining the sensitivity of such forecasts to variations in the basic assumptions. It will require the development and application of new or improved mathematical or statistical techniques for estimating the future operating regime and fuel consumption of existing and prospective generating stations of diverse types; for studying factors affecting reliability of supply, including load forecasts, plant margins and strength of interconnection; and for arriving at the relevant economic assessments. Excellent computing facilities are available.

This is a new appointment, essential qualifications for which are logical thinking, management ability, a good understanding of engineering economics and of the operation of a complex electricity supply system, and ability to present clear and concise reports. Experience in the employment of digital computing techniques in the solution of scientific problems would be an advantage.

● **Salary within the range £3,330 to £3,575 per annum.**

Applications stating age, qualifications, experience, present position and salary to the Appointments Officer, 24/30, Holborn, London, E.C.1, by 17th September. **Quote Ref. ECO./441.**

STATISTICIAN

We wish to appoint a chief statistician to our Market Research Department, which is located at our Head Office in the City of London. Responsibilities will include Statistical Control, Design and Testing of Research Techniques, and overall control of Desk Research.

Applicants, who may be male or female, should be in the age range 25 to 40 years, and in possession of a good degree in Mathematics or Statistics, possibly with post graduate qualifications. While previous experience in Market Research would be advantageous, that obtained in other fields would also be acceptable. The person appointed will have an enthusiastic approach to the problem of reviewing and selecting the most advanced techniques to ensure that we constantly employ the best available methods. This appointment is permanent and a first class pension scheme operates.

Please write stating full details in strict confidence to:—

The Personnel Manager,
The Nestlé Company Limited,
St. George's House, Wood Street,
London, E.C.2.

ESSEX

MID-ESSEX TECHNICAL COLLEGE AND SCHOOL OF ART,
Market Road, CHELMSFORD

ASSISTANT LECTURER GRADE "B" IN ECONOMICS required as soon as possible. Applicants should have a degree or professional qualification and have had teaching or professional experience. Ability to teach banking or an allied subject would be an advantage.

Salary: Within scale £770 to £1,350 (further scales apply for approved training and graduate qualifications). Increments above scale minimum for War/National service and previous recognised teaching/professional experience.

Application forms (which should be returned by 20th September) and further particulars from the Clerk to the Governors.

THE UNIVERSITY OF NOTTINGHAM

DEPARTMENT OF INDUSTRIAL ECONOMICS

Applications are invited for a TEMPORARY LECTURESHIP in the above Department, tenable for 2 years from January 1, 1963. Salary within the scale £1,050 to £1,[illegible], plus membership of the Superannuation System for Universities and Children's Allowance. Conditions of Appointment and form of application to be returned by Wednesday, September 19, from the Registrar.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

RESEARCH ASSISTANT. Applications are invited from graduates to work in the field of economics, pure and applied. Some knowledge of statistics or mathematics desirable. The appointment may be full-time or part-time. The full-time salary will be [illegible] qualifications and experience [illegible] £[illegible] 50.

Applications [illegible]

MARKETING RESEARCH MANAGER

A leading food manufacturer, with headquarters in the Home Counties west of London, requires a Manager to start up a new service.

He will be responsible for collating and interpreting to the Marketing Director all information required to develop the Company's marketing policies and to control their execution.

Candidates, aged about 30, should be Honours graduates, with Economics as a major subject. They must have at least 3 years' responsible experience in marketing research for consumer products, preferably in the food industry.

Initial remuneration: dependent on experience, in the range £2,000-£2,500. Pension scheme.

Applications, in confidence, should be sent to Urwick, Orr & Partners Ltd., who are advising the Company on this appointment at 14, Hobart Place, London, S.W.1, quoting reference CJ 1670 on the envelope.

D.S.I.R., Industrial Operations Unit, State House, High Holborn, London, W.C.1, requires ASSISTANT INFORMATION OFFICER to write/edit reports of investigations relating to productivity in industry and commerce. Previous writing experience, preferably in technical or management journals is essential. A background of management or production engineering would be necessary. QUALS.: A good general education with an interest in current affairs and a wide general knowledge is expected. SALARY: £677 (age 21)-£850 (age 25 or over)-£1,200. Application form from Manager (PE/5449), Ministry of Labour, Professional & Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Closing date September 28, 1962.

MINISTRY OF EDUCATION
STATISTICIAN

Applications are invited for a post of Statistician in the Ministry's HQ in London. Applicants must be at least 28 years of age on July 1, 1962. They should have had wide statistical experience and preferably a first or second class honours degree in statistics, or in mathematics, economics or other appropriate main subject combined with statistics. Other graduates with specially suitable statistical experience will be considered.

The Ministry's Statistics Branch comprises a small professional staff and an executive and clerical staff of 45 under the direction of the Chief Statistician. The Branch is responsible for the collection, analysis, publication, and interpretation of the statistics of the education service (including schools and further education). It participates in planning and forecasting work concerned with such subjects as school and technical college populations, and the demand for and supply of teachers and scientists. New sample surveys are in prospect on, for example, the school curriculum and the deployment of teachers in schools. Preparations are being made for the installation of an electronic computer, which will in due course process most of the Ministry's statistics.

Salary scale £1,904-£2,634. The appointment will be on an unestablished basis initially with prospects of establishment to a permanent and pensionable post.

Write to or telephone the Ministry for an application form, which must be returned to the Establishment Officer before September 24th, at Curzon Street House, Curzon Street, London, W.1. (HYDe Park 7070, Extension 514).

UNIVERSITY OF GLASGOW

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH
ASSISTANTSHIP IN APPLIED ECONOMICS

Applications are invited for an Assistantship in Applied Economics. Salary scale: £900-£1,050 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (3 copies), with the names of three referees, should be sent not later than September 25, 1962, to the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

UNIVERSITY OF SYDNEY

SENIOR TUTORSHIP IN GOVERNMENT AND PUBLIC ADMINISTRATION

Applications are invited for the position of Senior Tutor in Government and Public Administration.

The salary for a Senior Tutor is within the range £A1,820 x 105-£A2,360 per annum, plus cost of living adjustments (at present £A42 per annum) and will be subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful applicant.

Under the Staff Members' Housing Scheme, in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on October 29, 1962.

BBC requires Research Assistant in Projects and Developments Section of Audience Research Department. Duties include design and supervision of special surveys and analysis and tabulation of results: preparation of attitude scales, tests and questionnaires and administration of these to experimental groups, writing reports. An Honours degree, preferably in Psychology, and knowledge of statistical methods desirable. Practical experience of social surveys, market research or similar work an advantage. Salary £905 (possibly higher if qualifications exceptional) rising by five annual increments to £1,155 max. p.a. Requests for application forms (enclosing addressed envelope and quoting reference 62.G.347 Ect.) should reach Appointments Officer, Broadcasting House, London, W.1, within five days.

INDUSTRIAL RELATIONS

A vacancy has arisen in the Manpower Survey section of the National Coal Board's Industrial Relations Department at London Headquarters. This section carries out field investigations into current problems of Industrial Relations, particularly those relating to manpower.

The successful candidate will investigate, report and make recommendations on these problems in the coalfields. He must be capable of working quickly and accurately and of expressing himself clearly and concisely. A degree and research experience would be advantages but are not essential.

The appointment is superannuable and the salary, dependent on qualifications and experience, will be between £1,250-£1,600. Please write for application form to Headquarters Staff Manager (N.2608/2D), N.C.B., Hobart House, Grosvenor Place, S.W.1.

A CAREER IN MARKETING

A MARKET RESEARCH OFFICER

A Market Research Officer with a good level of education and capable of clear thinking and concise expression is required by the manufacturers of Bird's Custard Powder and Maxwell House Coffee.

We offer a starting salary of not less than £1,000 (it could be more), pension, life assurance and sickness benefit schemes, canteen [illegible] service. Furthermore, there is the opportunity of developing a rewarding career in the [illegible] marketing department of one of the leading manufacturers of branded food [illegible]. The Company rates the market research function very highly and previous [illegible] in this field is imperative. [illegible] the initiation and interpretation of consumer and standard research services, such as Nielsen, interest you and if you [illegible] to understand and control general statistical and economic information [illegible] write to us.

PERSONNEL MANAGER,
ALFRED BIRD & SONS LIMITED
DERITEND, BIRMINGHAM, 12.

[illegible] education and previous experience [illegible]

BRITISH TECHNICAL ASSISTANCE

AGRICULTURAL ECONOMIST FOR MALAYA

The Department of Technical Co-operation invites applications from AGRICULTURAL ECONOMISTS for a technical assistance appointment in the Federation of Malaya.
DUTIES: To make a detailed survey and analysis of land use among aborigines.
QUALIFICATIONS: Candidates, preferably under 40, must be agricultural economists with experience in tropical agriculture and have a genuine interest in the problems of developing countries.
TERMS: Appointment will be for two years with salary £2,500 p.a. (subject to British tax) and a tax-free overseas allowance of £1,600 (married) or £875 (single). Additional allowances payable in respect of dependent children. Free passages for officer and family. Free furnished accommodation. Free medical and dental treatment.
Applicants should send their full name and brief particulars of their qualifications and experience to Director of Recruitment, Department of Technical Co-operation, Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting RC 213/87/02.

THE Marketing Division of The Economist Intelligence Unit Limited is making additional appointments to its staff because of further expansion. Applicants preferably should have degrees in economics, psychology or statistics and have experience of consumer research, marketing, sales administration or market research. Knowledge of European languages an advantage. There are vacancies at junior and senior levels and applications should be addressed to the Marketing Division, The Economist Intelligence Unit Limited, 5, Bury Street, London, S.W.1.

THE UNIVERSITY OF HULL

CENTRES FOR SOUTH ASIAN STUDIES

Applications are invited for appointment to either a Senior or Junior Research Fellowship tenable for three to five years from January 1, 1963, or as soon as possible thereafter. The fields of research will cover Economics, Geography, Politics, Social Anthropology or History and candidates must hold good qualifications in one of these subjects.
Salary scales: Senior Fellow £1,750 x £75-£2,050; Junior Fellow £1,150 x £50-£1,350 with F.S.S.U. and children's allowances.
Applications (five copies) should be sent to the undersigned not later than October 20, 1962.

W. D. CRAIG,
Registrar.

For other appointments see page 969

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG

LECTURER IN DEPARTMENT OF COMMERCE AND APPLIED ECONOMICS

Applications are invited for appointment to the above post. Duties to be assumed on January 1, 1963, or as soon as possible thereafter.
The salary will be according to the scale R2520 x 120—R3600 (£1,260 x 60—£1,800). A commencing salary above the minimum notch may be paid on the grounds of special qualifications or experience. In addition the University is at present authorised to pay an annual vacation savings bonus of up to R120 in September each year.
Preference will be given to a candidate qualified to lecture in Business Organisation and Technique, Marketing, Industrial Fluctuations and a course in business organisation entitled "Accounting Theory."
Intending applicants are advised to obtain a copy of the information sheet giving full details of the vacancy and other activities of the Department from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1. Applications close in South Africa and London on *October 15, 1962.*

Managing Directors

The choice of a whisky to send to your fellow-directors or clients at Christmas time is often not an easy one. There are many fine whiskies on the market, but specially recommended is a rather more exclusive than average blend, the Grand Macnish. This light de luxe whisky retains the true flavour of the Highland malt whiskies, and has a delicate quality which once tasted is never forgotten. Available from your wine merchant. In decanter bottles packed in presentation boxes.

Quiet please while I'm investing

John is not actually buying stocks and shares. But he is wisely putting aside part of the household budget for insurance protection for his family. Home Service Insurance Offices invest a substantial part of their policyholders' funds in industry and commerce. As these prosper John gets better value for his money. This sensible arrangement is helped by the regular visits of the friendly Home Service insurance man to 10 million families.

Lloyds & Scottish Finance helps manufacturers and merchants to sell...helps firms and individuals to buy

A comprehensive hire purchase service backed by two great banks

Through its integration of two long-established finance houses—Scottish Midland Guarantee Trust and Olds Discount—Lloyds & Scottish Finance Ltd. represents an unusual concentration of specialized skill and experience in financing the purchase of:

● *Cars, commercial vehicles, motor-cycles* ● *Industrial and agricultural plant and equipment* ● *Domestic electrical appliances and household goods.*

To traders in motor vehicles, radio, television, and domestic appliances and furniture, Lloyds & Scottish Finance offers both direct collection and block discounting facilities. The manufacturing and building industries, and other users of capital equipment and machinery, including agriculture, are employing its financial resources on an increasing scale. And convenient time payments are arranged for individuals for central heating installations, marine craft, garages and garage extensions, school fees and other such personal requirements.

Lloyds & Scottish Finance Ltd. is a subsidiary of Lloyds & Scottish Ltd., a holding company with a capital of £15,000,000 jointly owned by Lloyds Bank and National Commercial Bank of Scotland. With assets now exceeding £100,000,000, Lloyds & Scottish Finance is well placed for further expansion. Through its country-wide network of branch offices it has established a reputation for efficient, courteous and understanding service to all its customers.

Some facts worth remembering: 1. The most spectacular feature of the new Forth Road Bridge is the method of suspension: the cables are each made up of 11,618 parallel wires of galvanised high tensile steel only 0.19" thick. The lubricant they are packed in is supplied specially by Shell-Mex and **B.P. Ltd. 2.** Shell-Mex and B.P. Ltd., through their associates, **Scottish Oils and Shell-Mex Ltd., also supply** the Contractors,* The A.C.D. Bridge Company, with all the other lubricants and fuels needed on this project.

* "The bridge is being constructed for the Forth Road Bridge Joint Board." "The Consulting Engineers are Mott, Hay and Anderson with whom are associated Freeman, Fox and Partners." "The Contractor for the superstructure is The A.C.D. Bridge Company, a consortium comprising: Sir William Arrol and Company Limited, The Cleveland Bridge and Engineering Company Limited, The Clevedon Long (Bridge and Engineering) Limited."

EUROPE

Fencing

Mr Gaitskell, having pushed the Labour party off the fence into opposition to the Government's European venture, is now trying to prop it back up again. If he fails, he will condemn his party to the loss of the support of the new radical left (p. 989).

For lack of a leader, the **Tory right** has not yet produced its anti-European insurrection (p. 997).

The **Liberals,** in their quest for a progressive theme at the annual assembly, could not do better than fire off their European guns as loud as possible (p. 997).

What Europe, with Britain included, can reasonably be expected to offer the Commonwealth—and what the **Commonwealth** wants (p. 991).

Campaigning

General de Gaulle has won the hearts of the **German people**—but their heads still seem to be inclined towards bringing Britain in (p. 1017).

After the General, who? (p. 1019).

The **French** attitude to Mr Maudling's proposals at the **International Monetary Fund** meeting in Washington is as well known as the proposals: they see no reason for change (p. 1036). The other Europeans will be milder, but probably not much more helpful (p. 1037).

Trinidad would like to be an associated state, attached to Europe (p. 997).

Investing

The collapse of Herr Schlieker's interests arouses doubts about the future of **German shipbuilding.** What with a revalued mark, rising wages, and the need to re-equip, shipbuilders have little room for competitive manoeuvre (p. 1035).

A report from Germany shows how **German banks'** foreign investments are distributed (p. 1042).

Scoring pointless victories over **the Russians in Berlin** now may mean reaping pointed rebuffs later—on ground of Russian choosing (p. 996).

OFFSHORE ISLAND

Self-improvement

Grouse-shooting, Britain's most patrician sport, is also an important industry in the poorest area in the British Isles (p. 994).

A new brand of tourist comes to Britain to learn the language of world trade: from many private schools they will return disappointed (p. 1013).

Self-interest

A professor at Manchester makes such shocking remarks about **incomes policy** as to fit him for a seat on Nick (p. 1001).

The latest **Bank of England bulletin** tells rich men how to earn a safe 16 per cent on their money (p. 1046).

Those responsible for **hall-marking precious metals** would do well to polish up their decorative traditions (p. 1015).

Self-exposure

Their annual congress over, **trade union leaders** are setting off to see how their brothers abroad set about their problems (p. 1001).

Television cameras at the Blackpool Trades Union Congress made a strong case for their own admission to Parliament (p. 1002).

The Economist, too, faced the cameras this week (p. 1002).

Constituency Labour parties, by the resolutions they present to their annual conference, show themselves to reflect with surprising accuracy the preoccupations of ordinary people (p. 1014).

ELSEWHERE

Hemisphere

The outlook in the **United States** is for a stormy autumn as far as **foreign affairs** are concerned (p. 1025).

President Kennedy is having to settle for much less **tax revision** than he wanted this year (p. 1026) and he may have to settle for less free trade as well (p. 1027).

American capital investment is going up at home, although not enough, but it is falling off abroad (p. 1026).

The summer has ended with the **American economy** doing a balancing act (p. 1028).

American farmers are striking for the same reason as trade unionists do—to get a bigger and more stable return for their work (p. 1027).

New Hampshire's Republican primary was a free-for-all (p. 1028).

How America left Britain (p. 1004).

NEWS: **President Monroe is dead** (p. 996).

Whole World

The future of the **United Nations** depends largely upon what happens in the **Congo** in the next week or two—and for what happens there, Britain has a heavy share of responsibility (p. 993).

The meeting of major **world airlines** in Dublin this week has been a gloomy affair, marked by tears for present losses and mutual recriminations over massive, and illegal, discounts. Before they all put their fares up, they might get rid of some waste and inefficiency (p. 1033).

The Far Elsewhere

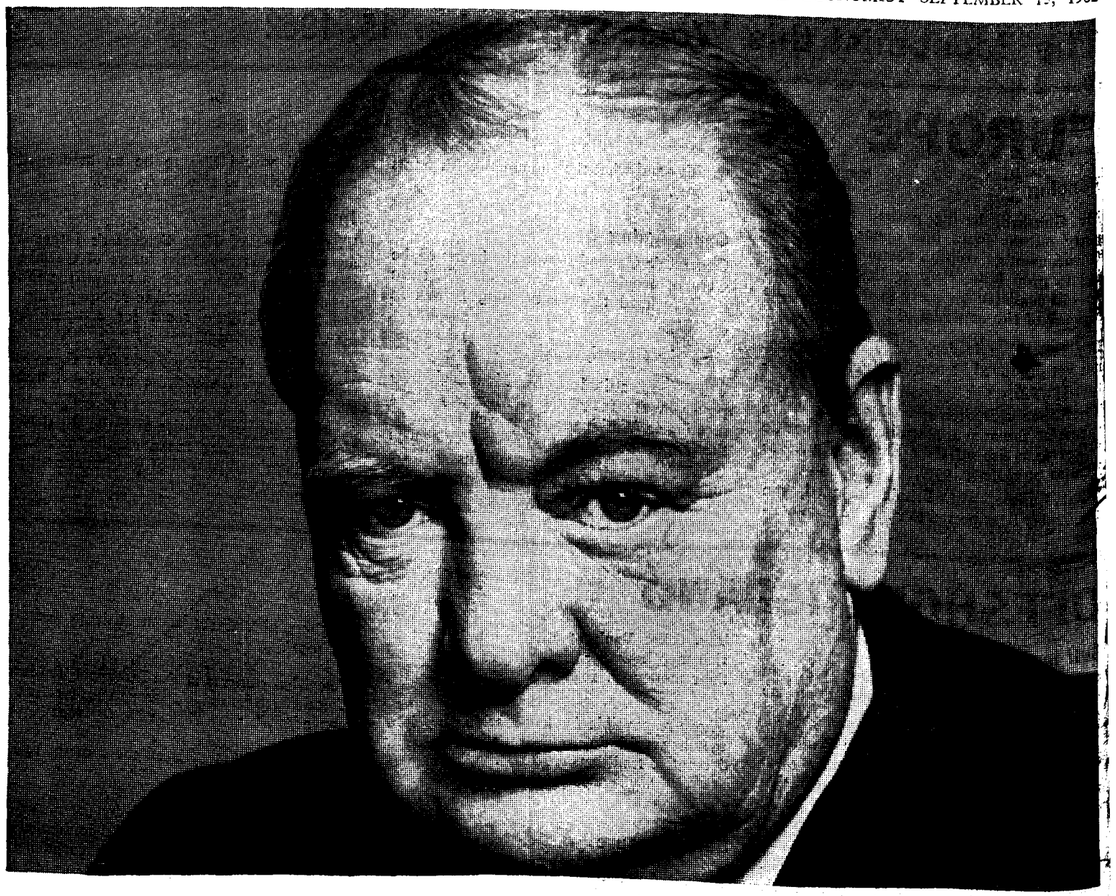
China: The Chinest communist government may be resolved to avoid any further discord with Indonesia, now that the friendship between the two countries has been patched up (p. 1020).

India: The real issue at the trial of Sheikh Abdullah, former prime minister of Kashmir, is whether a Kashmiri leader is to be allowed to put Kashmir's interests before India's (p. 1018).

Morocco is after the Spanish enclaves on its coast (p. 1001).

Ghana: What are the avenues open to dissenters? (p. 998).

Detailed contents on page 989



"WE UNANIMOUSLY ADOPT THE IDIOTIC SUGGESTION OF THE MINISTER OF PRODUCTION"

Who could be angry with such a man? Certainly not the Minister of Production himself—Lord Chandos—even though he found his ideas not always immediately acceptable to the P.M. Indeed, in this week's extract from his memoirs, Lord Chandos tells us that the famous bulldog expression went (sometimes somewhat reluctantly!) hand in hand with a genuinely magnanimous nature.

The portrait of Sir Winston Churchill in the Sunday Telegraph gives us some delightful and unexpected glimpses of the wartime leader—and written as it is by someone who was both a member of the Cabinet *and* a personal friend, it makes the most intriguing reading. Don't let Sunday go by without reading the Sunday Telegraph.

COMING SOON Other features to be published during the next two months include "Renoir, my father" by Jean Renoir, and "To Katanga and back" by Conor Cruise O'Brien.

Stress analysis à la carte

PhotoStress* quickly locates areas of stress in a new die-cast aluminum engine block, for an automobile manufacturer. A builder of radar towers assures structural integrity with MetalFilm strain gages. PhotoStress shows distribution of live strains in actual parts, through meaningful color patterns. MetalFilm strain gages translate strains into electrical impulses for precise measurement and recording. These are but two of many Budd advances in testing and research. Budd's work in quality control is a natural outgrowth of its pioneering skills in engineering . . . metallurgy . . . tooling . . . welding . . . research . . . testing . . . production and development for international industry. These skills place Budd high among the world's 250 largest industrial concerns. For information on stress analysis instruments and methods, write THE BUDD COMPANY, International Division, Philadelphia 32, Pa., U.S.A.

Polymer's new Strasbourg plant goes on stream October 1

At the heart of Europe's network of rail, water and road systems is the new specialty rubber plant of the Polymer Corporation. It provides a new source of rubber for Europe, Africa and Western Asia. Strasbourg's strategic location will mean speedier delivery in these areas.

Production will include specialty rubbers and latices for a host of products... soling, floor tiles, calendered and extruded goods, textile adhesives and many others in rubber's ever increasing fields of application.

If you are planning a new process, a new product, or improvements to an old one, success can depend upon your finding the right materials. A most promising source may lie among the different types of Polysar* synthetic rubbers.

Within the world-wide Polymer organization, there is a representative nearby, ready to advise you. A letter to Polysar International S.A., Prudential House, Wellesley Road, Croydon, Surrey, England will put him in touch with you.

but many thousands of friends

The problem the printer sets the papermaker is the turning of a substance, which at the start of the papermaking process is about 98% water, into a sheet of paper with certain well defined characteristics.

The proper blend has to be made, but the mixing and beating is of equal importance, for the same recipe, beaten differently, can produce both blotting and greaseproof papers.

This beating is not easy and it cannot be fully controlled by instrumentation in spite of modern scientific advances. So the beaterman has to be a craftsman, for without the aid of instruments he must control 430 variables which are enemies to a good paper.

All J. A. Weir's Beatermen are craftsmen. All beat the 430 enemies and produce a consistently good paper welcomed by modern printers.

At the other end of that tail is a set of sharp white teeth. Plant Investors Beware. Original plant costs, start-up date, pay-out time, plant efficiency, operating costs . . . each can make you feel you have a tiger by the tail. That's where Kellogg International Corporation comes in. Kellogg handles the whole project from the ground up: Engineering, Procurement, Construction. This makes cost control easier and more efficient. The result: your plant goes up within its appropriation. Faster too. Produces sooner. Most important, you get the plant you want and the cost comes as no surprise. You and Kellogg set the figure when the plant is still on paper. Be a wise plant investor: Let Kellogg tame the tiger.

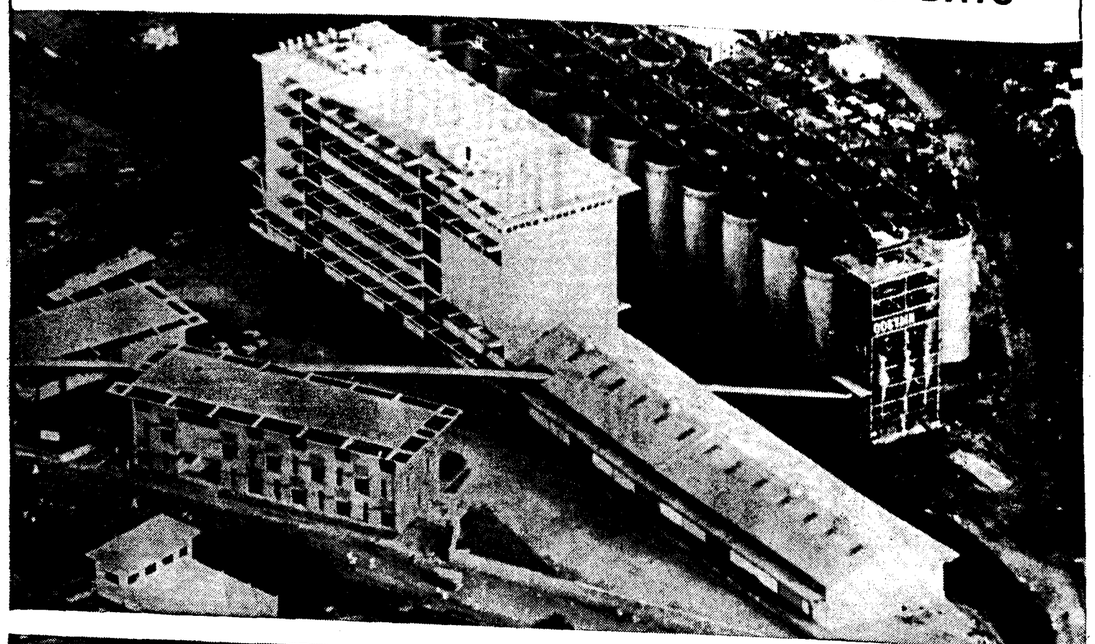
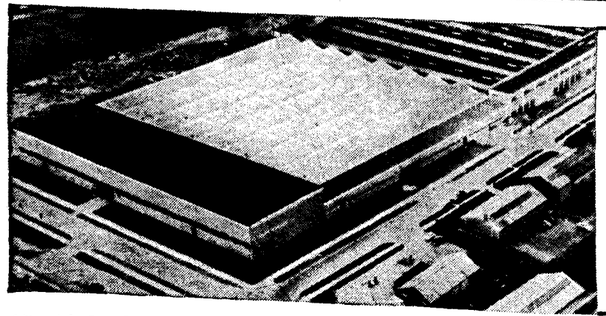
APAPA FLOUR MILLS, NIGERIA CONSTRUCTED IN 197 DAYS





BORG-WARNER

Factory extension, Letchworth

DESIGNED AND BUILT IN 10 MONTHS

Nigeria's first flour mill is now in production. It was constructed by Costain (West Africa) Ltd. for Flour Mills of Nigeria Ltd. in only 197 days, and went into immediate operation. ■ Here at home, Costain designed and built a 140,000 sq. ft. factory extension for Borg-Warner Ltd. in 10 months. In this building, the new fully-automatic transmission systems for medium-sized family cars are being manufactured. ■ These two projects, completely different in every way—size, purpose, location—illustrate the scope of the Costain organisation. ■ *Architect for Borg-Warner factory extension: H. Stanley Smith, A.R.I.B.A.*

For Gaitskell and the Empire?

LAST Saturday Mr Gaitskell brought the Labour party off the fence against the common market ; he has spent the next few days trying nervously to push it back on again. It is almost unbelievable that so experienced a politician should not recognise the clang of finality that necessarily seemed to reverberate through his most publicised first statement ; he said that Britain should not enter the common market unless it secured detailed extra concessions for the Commonwealth which everybody knows that it will not in fact be able to get. Or rather it would have been almost unbelievable if Mr Gaitskell had not been the man he is: a man, that is, who genuinely did not foresee the political boomerang that was bound to swoop back at him when he issued his statement, at the moment calculated to be of maximum mischief to Britain's European aspirations, and after getting into cahoots with leaders of Commonwealth Labour parties—among whom his duty should have been to act as a moderator for Britain instead of as a pure porte-parole for them.

Now that the boomerang has swooped back—with a blunt assault from Labour's most important and vivacious newspaper ally, the *Daily Mirror*, in the fore—Mr Gaitskell is trying to get out from under it. It is possible that he might eventually find an escape route by pretending that any further concessions which Mr Heath secures at Brussels are much bigger than they will in fact be ; in this event last week's statement may still prove to be only about a nine weeks' wonder, and probably no lasting damage to Mr Gaitskell's reputation as a national leader will have been done. But if reasons of face prevent him from reversing course, an entirely new political situation in Britain will have emerged.

In examining why Mr Gaitskell issued his statement last weekend, only rather cursory attention need be paid to the reason which he himself adduced for it: namely, that he considers the terms which Mr Heath has so far secured to be less good than those he had hoped for. Nobody should question Mr Gaitskell's fine personal idealism about the newer parts of the independent Commonwealth, but only his seeming inability to raise himself from the role of counsel for it to that of counsellor to it. For the blunt truth is that the terms offered at Brussels so far are slightly better for the white Commonwealth, and very much better for the coloured Commonwealth, than anybody dared to expect a year ago (which is not to deny that, in Europe's own freer-trading interests, it would be wise for the Six to make the terms for both better still). The paradox that the older dominions have recently been slightly (well, very slightly) moderating their outcry against the common market, while the newer dominions have started to react much more fiercely against it, is simply explained: by the fact that the man in Tanganyika genuinely is less sophisticated in assessing such economic opportunities than the man in Whitehall. Unfortunately, there is a strange emotional streak in Mr Gaitskell's character which would make him regard it as imperialist arrogance to recognise this, and it has helped to still in him the voice of his former economic commonsense. For some reason he always regards it as progressive to speak out for Mr Nehru, even when his economic training may tell him that Mr Nehru is wrong.

A second emotional factor last week was Mr Gaitskell's anger at what he regards as the "unfair" way in which the Government is handling the common market issue. While Labour cannot make up its mind about policy and has

hitherto been saying so, Mr Gaitskell plainly believes that the Government has made up its mind but is still saying that it hasn't. There is increasing evidence that he is right. With three possible exceptions (of whom Mr Sandys is not one), one's guess is that the Cabinet has fairly unitedly decided that it will be in Britain's interests to enter Europe on the terms that now appear to be broadly available—and provided that internal political forces allow. The reason why ministers have not been saying this more openly is that they are afraid that, if they did, it would be impossible for Mr Heath to wring any further concessions at Brussels (and some further concessions, to repeat, are what we all want). Indeed they may fear that, if Britain were to become too open a wooer, the Six might be even more sticky when the time arrives for hammering out the last details than they have so far been in helping to sketch the broad outline.

One can see possible moral and tactical grounds for criticising this Government attitude, but Mr Gaitskell's own criticisms of it have been, to say the least, mixed. On the one hand, perhaps justly, he appears to regard the Government as too devious in thus disguising its real attitude of mind from the British people; on the other, he has publicly criticised the Government for "making it so obvious that they want to go into Europe," with the result that Mr Heath "has been asking for concessions at Brussels on his knees"—in other words, his criticism has been that the Government has not been devious enough.

OVERLAYING Mr Gaitskell's statement last week, however, were two more prosaic political calculations. First, he believes that a new tide of opinion is rising in the country against Britain's integration with Europe; and some of his lieutenants have told him that he has a great opportunity to collect votes for the Labour party from among it. Secondly, and for him most enticingly, some people have been saying that by coming out against the common market now Labour might be able to force the Government into an earlier general election. Both these assumptions require to be looked at in more detail.

It is clear that there has been a movement of opinion against the common market in recent months. In April, National Opinion Polls Ltd. reported in the *Daily Mail* that 47.1 per cent of the Britons they questioned were in favour of joining the market, 25.0 per cent were against, and 27.9 per cent didn't know; now it reports only 37.8 per cent in favour, 52.2 per cent against, and 10.0 per cent don't know. But the poll's breakdown of this opinion is fascinating. There is a definite differentiation as between age groups: a sizeable majority of those aged between 21 and 45 are in favour of entering, and a rather bigger majority of the over 45s are against. There is also a clear distinction between income groups: most white collar workers and a large majority of those earning over £1,250 a year are in favour of joining, and a sizeable majority of unskilled workers are against. Other soundings that have been taken—including some taken by political parties themselves—suggest that the biggest distinction of all may be between educational groups; the majority of those who have enjoyed full-time education past the age of 16 during the last twenty years are in favour of entering the market, while the majority of other people are against.

The sort of internal British opinion that has recently been moving against the common market seems, in short, to be very like one large segment of the opinion that reacted so violently against Mr Gaitskell himself at the time of the Suez crisis: an alliance of the elderly upper classes and the blunt old traditionalist unskilled labourer class—the sort of people who instinctively believe that "wogs begin at Calais." (Moreover, this time they are not supported by many of the brash younger executive class—many of whom, undoubtedly if sadly, were firmly on Sir Anthony Eden's side at the time of Suez.) This is a mad sort of army for Hugh Gaitskell to think of leading into an election, even if he thinks that he might thereby be able to cause the election's date to be advanced.

WOULD a political fight over the common market cause the general election to be held next year instead of in 1964? Perhaps the best argument of those who say that it would springs from consideration of the probable timetable for the negotiations. Even if the Government can introduce the legislation required some time during the coming session of Parliament—say from about February—there will have to be some gap between this legislation and the date when it and any Brussels Treaty come into effect. Many people therefore think that the most probable date for actual entry into Europe will now be some time around January 1, 1964. So far, most commentators have assumed that the most probable date for the general election will be May, 1964. If the date for actual entry into Europe is January 1, 1964, this election would then be only four months after a British Government had taken the most portentous step in peacetime history. An election in October, 1963, on the other hand, might well be fought between the passing of the necessary legislation and the actual entry into force of the assumed treaty.

Some people, including some sincere Tories, would say that, if Labour opposed entry into the common market, to hold an election then—in October, 1963—would be the right thing to do. But—surely Mr Gaitskell's spies have told him this?—one is coming increasingly to believe that the Prime Minister would not. The signs are multiplying that Mr Macmillan regards it as his duty, as the thing that will send his name down into history, to lead Britain into Europe; if and when he gets in, he seems more than likely to want to defer the general election until the first results of the union have begun to appear. In fact, the delay in the Brussels negotiations may well have increased the probability that the election will not take place until the last possible date—in October, two years hence; the political and constitutional arguments against such a delay are less weighty than most commentators assume.

Nothing is certain in politics; that goes for the success of Mr Macmillan's efforts to get Britain into Europe during the present negotiations—and obviously, even more, for the achievement of the tentative target timetables suggested here. But it does now lie in the logic of history that Britain is likely to enter the common market some time during the next decade, and the probability is still pretty strong that it will happen in the next eighteen months. If it does, the party that opposes entry will find itself opposed by a majority of the young people, a majority of the educated people and a majority of the unjingoistic people in the country; it looks as if it will be supported among national daily newspapers only by the *Daily Worker* and the *Daily Express*. When Mr Gaitskell took over the leadership of the Labour party seven years ago, there was much speculation where he would lead it; not many people forecast that he would lead it to this.

Moreover, he must know that many of the strange new allies in the electorate that his stand against the common market might immediately attract to him are likely to melt away very quickly. The softly traditionalist anti-marketeers would melt away as soon as we actually joined Europe, for being pro-market would then become the softly traditionalist thing to be. Most of the brusquely jingoistic standard bearers would not be inclined to carry their banners behind Mr Gaitskell's leadership into an actual general election; one of the nicest things one can think to say of him this week is that he is not immensely beloved by them. Perhaps, when he has realised this, he will wisely, if undignifiedly, hurry back on to his former fence. But what a tragedy it is that the leader of what is supposed to be the radical party of the left has now destroyed all chance that he might ever go right over to the other side of the fence, and start marching just a little ahead of the Tories towards the most progressive and radical challenge of our time.

The Sound and Fury

The Commonwealth prime ministers' protests analysed

AS the smoke disperses after the broadside which the Commonwealth prime ministers fired off at Mr Macmillan on Tuesday—a series of blasts that must have stirred grave doubts about the European common market in many British breasts—it is important to see what the ministers actually said. How many of the shots were fired over the heads of the Government? How many were aimed to kill the whole idea of British membership of the common market altogether? The objections can be divided roughly into three categories. First come some valid demands concerning the untied ends of the negotiation which Mr Heath and his colleagues in the Six meet again in October to tie up; some of these may even be satisfied. Next come the requests to reopen matters already agreed in Brussels; these would be much harder to satisfy without jeopardising the whole negotiations. Finally, there was a streak of root and branch opposition to the whole idea of British membership of the common market; this kind of opposition can and should be brushed aside. The following review of what the different prime ministers said attempts to separate what was reasonable from what was not, and to assess which of their demands deserve attention.

Holyoake: Moderation

As so often in the past year, the one Commonwealth country that could run grave economic risks through British membership—New Zealand—took up a position both calm and rational. Alone of the speakers on the stormy second day of the conference, Mr Holyoake gave proper attention to the useful results that British membership might produce in Europe itself. He had faith that the Commonwealth could survive "even the radically new state of affairs" to which British membership of a European political community would give rise. Just as the best friends of the Commonwealth in Britain are rarely found among those who shout the loudest, so New Zealand's attitude is a reminder that Britain's most loyal friends in the Commonwealth are not the most importunate.

Properly enough, Mr Holyoake also insisted that what had been agreed in Brussels so far about temperate agriculture was too vague for him. New Zealand needs harder guarantees for its main exports, butter, beef and lamb. Fortunately, the outlook here seems relatively fair. The Six agreed in principle last month to special arrangements for New Zealand, in addition to the general agricultural arrangements. Working out the details will be an early point on the autumn agenda in Brussels. Of the three main commodities, mutton and lamb need not cause problems, for there are no serious continental competitors with the New Zealand producers. Beef should benefit from growing consumption in Europe. Butter may be more difficult to settle. But at least the French have already offered New Zealand "comparable earnings" for their butter, if not "comparable outlets." There seems ground for cautious hope that New Zealand's main fears can be allayed.

Diefenbaker: Root and Branch

Canada also has some "untied ends" in the negotiations. Indeed, even Mr Heath would scarcely quarrel with Mr Diefenbaker's detailed trade demands—that tariffs on aluminium, lead and zinc, newsprint and canned fruits should be reduced. The requests, which the British themselves put forward last October, are due to be dealt with when the ministers resume their talks, and some kind of compromise seems inevitable.

But Mr Diefenbaker's main objections were more fundamental and less acceptable. He sees, or seems to see, British membership of the common market as a political threat to the Commonwealth idea and at times his arguments sounded a bit wild. Britain would continue to make its weight felt in the world inside or outside the common market, he said at one point. A moment later he wanted to know whether

Britain, in a European union, might not dwindle to a stature comparable with that of a Canadian province or an American state. He added a veiled threat that, if Britain joined, Canada might be drawn even closer into the magnetic field of the United States.

All this shows little sign of serious thinking about either Canada's future, or Britain's. The pull of the United States on Canada is a many-sided thing, exerted through many channels of life, and not, in the main, by one government upon the other. Who seriously supposes that the fact of it will be conjured away by keeping Britain out of the European Community? On the contrary, one would think that if there is a hopeful path for Canada in its continuing search for a national identity, it can open up only if Britain can first resolve its relationship with Europe. Thus, one would hope, a cause for dissension between communities of British and French origins might be removed; and Europeans and Americans would be given a chance to get their relations, in turn, in better order.

Nor is it surprising that Mr Diefenbaker should have been so reluctant to disclose his loudly hailed (indeed, not unobtrusively announced) "alternative" to British membership of the common market, for it appears to consist of little more than the suggestion that there should be liberal trade agreements, and more tariff negotiations through the General Agreement on Tariffs and Trade. President Kennedy and his advisers are well aware that their trade proposals—which offer the best hope of world-wide tariff cuts—depend in part on British membership of the common market. Nor can tariff talks in Gatt resolve the political problem Britain faces in Europe.

Menzies: A Pinch of Salt

Mr Menzies seems to have taken up position somewhere between Mr Holyoake and Mr Diefenbaker. He recognised that Britain might see a balance of advantage in joining, but he had some cutting things to say about the price Commonwealth countries might have to pay. Were they to pay most of the price, and indeed make out a blank cheque to the British at this meeting? Further meetings of some kind (he did not specify quite what kind) would be needed to weigh up the final terms.

The request for a later meeting is not unreasonable; what is doubtful is whether it will prove either practicable or sensible to have another grand gathering, soon, of all the Commonwealth prime ministers at once. Mr Menzies's plea on behalf of Australia's unfinished business in the negotiation was fair enough. Canned fruit, for what that is worth, still has to be settled; hard guarantees on cereal prices (affecting Australia's soft wheat) are desirable. Whether Australia's economic problem requires the weighty anxiety Mr Menzies is bestowing on it is another question. The moral for the British Government seems to be to press hard for better terms for the Australians, but to take the shouting from down under with a pinch of salt.

Asia asks for more

The most unexpected volume of opposition of all came, not from the old dominions, but from Asia and Africa. In the last analysis it was based less on economic considerations than on a deep suspicion, indeed in some ways a hostility, towards a united Europe. Mr Nehru expressed this in one form when he said that unity in western Europe might increase tension between East and West, instead of reducing it. The argument can be heard on British Labour lips as well. But can it be seriously held, even in Asia, that the reconciliation of France and Germany is a bad thing in the long run, a thing unconducive to peace? Even if it could, the common market exists, the reconciliation is a fact and its consequences will go on unfolding. One would have supposed Mr Nehru aware that British membership of the common market would be more likely to strengthen the party in western Europe that favours policies designed to ease the east-west tension.

Both Mr Nehru and President Ayub Khan of Pakistan (a man sympathetic to the political aims of the European community) also put the familiar argument, often voiced very emphatically by *The Economist* itself, that markets must be provided for their countries' industries, and that without such markets the task of getting the struggling Asian economies on their feet would be made unnecessarily hard. The terms offered in Brussels, they both complained, were not enough.

Is this true? In negotiation Mr Heath has succeeded in obtaining two main guarantees for these countries. The community has promised to maintain, and indeed gradually to expand, its imports of cotton textiles, and to take immediate remedial action if they fall. The Six have also promised to negotiate long-term agreements to promote an expansion of trade. These agreements obviously ought to be negotiated quickly, and the fine principles given practical meaning. European countries, including Britain, are still a great deal less liberal towards the new emulators of Japan than they should be. But at least the terms agreed in Brussels recognise the need in theory and seem unlikely to make things any worse, in practice, than they are today.

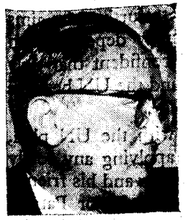
Africa: Anti

Mr Goka, of Ghana, could hardly be expected to speak well of the European community, which he regards as a ganging up of former colonial powers. His reported threat to leave the Commonwealth if Britain joined, later denied, was also hardly a surprise. Whether the common market really has any relevance to Ghana's attitude to the Commonwealth club is another question. Ghana will stay in so long as it finds membership useful, and no longer. Certainly Ghana's hostility to the common market owes more to its own inner compulsion to be rid of all non-African influences than to anything the common market has done, or will do.

More actively a matter for regret is Nigeria's refusal to entertain the idea of association with the common market. The advantages are tangible—free entry to the whole of western Europe, together with the right to put tariffs on European goods at will, and the possibility of some increase in economic aid. They have been turned down, on the ground that links with Europe are neo-colonialist.

The difficulty is that alternatives for African countries are hard to find. Association is not really a political link; in the main it is a device to enable the preferences it embodies to get past the General Agreement on Tariffs and Trade. There is another baffling point. Sensibly, the Nigerians are interested in an African common market as an end of policy. How can they expect to get it, when the ex-French countries of Africa, with which they hope to work, are associated with the European common market, which Nigeria shuns? It has to be said that the apparent Nigerian hope—to get equal economic terms with the present associates, without accepting the status that they have accepted, looks as idle as the similar hopes cherished by the British turned out to be in 1958. A faintly hopeful sign is that the African states did, after all, decide to sit in the sub-committee on association starting work on Thursday.

This week's debate seems to point to the conclusion that if the Commonwealth is to be led to look to the future, and to set about moulding the new pattern of relationships that the common market is bound to precipitate, instead of leaving it all to others, then Britain must go on forcing the pace. The process of regional grouping that is spreading out from Europe is not going to be stopped. The Commonwealth could have played, indeed can still play, a most valuable part in it. But this will happen only if its members wish it. It will not happen if they choose to go on living in 1932.



U Thant

Between Troika and Tshombe

The problems that face the United Nations as its 1962 Assembly meets—finance, the Congo, the secretary-generalship—are inseparable parts of a whole

A YEAR to the day after Mr Hammarskjöld was found dead in the Rhodesian bush, the United Nations Assembly will sit down on Tuesday for its seventeenth regular session. A frieze of question marks hangs over the future of the organisation itself. Its finances are still imperilled by the failure of many members to pay their shares of the costs of its military operations in the Congo and Sinai. This assembly has also to tackle the problem of the secretary-generalship, which is not merely a matter of continuing U Thant in office (his present term will expire next April) but one of resisting the Soviet wish to destroy the office altogether. And there is no sign that the assembly is likely to moderate the pressure on colonial positions in Africa that led the British Foreign Secretary to announce "a crisis of confidence in the United Nations" at the end of 1961.

The seventeenth session no longer looks like having to withstand another personal assault by Mr Khrushchev in the grand manner of 1960; but there can be no question of this assembly proving a quiet one. In duration, it may not in the end match up to the marathon 1961 session, which, twice extended into this year with resumed debates in February and June, lasted altogether for five months. That gruelling experience moved the 1961 president, Mr Mongi Slim, to publish last May some proposals for abbreviating the procedure of debate which now appear as an agenda item, sponsored by Tunisia, on the long list for the coming session. There will be widespread support for this move to restrain the verbosity of a gathering which now numbers 104 delegations, and which will presumably be up to 109 very shortly, with the admission to membership of Rwanda, Burundi, Jamaica, Trinidad and Tobago, and Uganda. To cut the length of debate will in no way reduce its intensity; the effect may be to heighten it.

On the eve of the session, the financial outlook may be eased by the final passage through the United States Congress of the long-delayed bill permitting the Administration to buy United Nations bonds. Since U Thant launched the bond issue in December, 49 other governments have undertaken to buy a total of $73 million worth, of which $27 million have actually been paid for. With the costs of the Congo operation running at their present high level, however, the whole $200 million bond issue is no more than a short-term stopgap. The larger task of getting all members to contribute to special operations such as the Congo and the Middle East remains in question. (Arrears on the basic budget are negligible in scale.) Here, matters have been improved by the advisory opinion that the International Court gave in July, to the effect that the Congo and Unef (Middle East force) costs constitute UN expenses within the meaning of Article 17(2) of the Charter, which means that member states are legally bound to pay the assessments decided by the assembly. But the dissenting votes of the French, Soviet and Latin American judges of the Court were a clear pointer to the inevitability of a further sharp clash when the assembly reaches this item on its agenda.

Is a public clash over the secretary-generalship equally inevitable? At present, that is up to the Russians; and they have been holding their cards close to their chests. At the end of August U Thant rounded off his series of visits to European capitals by going to Moscow and also to Yalta, where Mr Khrushchev, holidaying at his Black Sea residence, took him boating—a ritual entertainment accorded to Mr Hammarskjöld, in similar circumstances, not long before the Soviet leader decided that the late secretary-general was a political criminal, and his concept of a "dynamic" UN a political anathema. The day Mr Thant reached Yalta, his staff issued his personal introduction to his annual report, a characteristically plain-spoken statement in which he directly endorsed Hammarskjöld's "dynamic" approach. Mr Khrushchev, for once anything but plain-spoken, seems to have kept mum, in his private talk with U Thant as in his public utterances, about both the renewal of the acting secretary-general's term and the still theoretically maintained Soviet demand that the single head of the UN secretariat must be replaced, for good and all, by a "troika" team which would give Russia a direct veto on all UN executive action.

The Soviet leader's dilemma is apparent. Unwilling to countenance any more freedom for the UN executive to act without Moscow's approval, he is at the same time reluctant to collide directly with the Asian and African countries' strong

resistance to any cutting back of UN authority. It is logical enough that he should have held his hand as long as possible; hoping, perhaps, that U Thant would prove willing to pay some price for an assurance of Soviet backing; perhaps, that the Burmese secretary-general would take some false step that alienated even his Asian and African friends.

MR THANT has not obliged—in either way. He firmly underlined his insistence on the independence of his office when, invited to record a statement for Moscow radio, he put into it these blunt remarks:

> Let me be candid. When Soviet foreign policy did concern itself with what was happening in the rest of the world—for instance, in the Congo—it did so out of fear and suspicion. . . . I beg to be excused for saying that the Russian people do not fully understand the true character of the Congo problem. . . . If only they have the means of knowing all facets of the problem, they will certainly revise their opinion of the nature of the UN involvement in the Congo, and decide to shoulder their share of the heavy responsibilities now being undertaken by the world organisation. . . . I am not a believer in honeyed words.

Needless to say, although Moscow broadcast this passage in English, it was cut out of the version presented to the Soviet home public. But censorship does not spare Mr Khrushchev and his senior colleagues the painful realisation that they have a painfully honest man on their hands.

It is hardly surprising, then, that the Russians have stepped up their thinly veiled criticism of U Thant's Congo policy, just when its chances of succeeding look greatest. Last week an official Soviet government statement was devoted to attacking an alleged American-British-Belgian-French plan, the aim of which was said to be "to strengthen Tshombe's position, to prevent the reunifying of the Congo." The statement, although couched in the form of a reply to U Thant's appeal for support for his own latest proposals, carefully made no mention of those proposals as such, but sought to mislead its readers into seeing in him, and in the whole United Nations, mere tools of the "colonialists" in the Congo.

Whether this kind of misplaced ingenuity is well-aimed enough to weaken U Thant's position, and improve Russia's chances of trotting out the "troika" again, must largely depend on the course of events in the Congo in the next week or two. It ought to be pretty clear, before the assembly has sat for more than a few days, whether Mr Tshombe's outward acceptance last week of the new UN plan is genuine or merely another instance of the practice, shrewdly summed up by the blunt Thant in his annual report, by which Mr Tshombe and his backers "make gestures of reconciliation, leading to no practical results, whenever the pressure builds up, while at the same time seeking to further the aims of secession." And this in turn is crucially dependent on the extent to which the secessionists feel confident that they can go on defying the Congo government and the UN because they can count on British benevolence.

Officially, Britain has associated itself with the UN plan, but it has openly deprecated all idea of applying any really effective pressures to ensure that Mr Tshombe and his friends accept it; and the eye-catching inclusion of Major Patrick Wall, a prominent parliamentary champion of the Tshombe regime as well as of the Portuguese record in Angola, in the British delegation at the coming assembly, may be widely interpreted as a straw defiantly streaming against the UN wind. It should not be necessary to rehearse here once more the full tale of the consequences of a policy that seems to present Britain to the world as the principal sustainer of the Katanga secessionists. What is directly relevant is that the swift settlement of the Congo problem is now vital to the UN, both because of its financial difficulties and because of its need to develop an effective executive arm—the development which the Soviet "troika" was designed to prevent. British ministers, in shaping their next moves in regard to the Congo, need to be clearly aware that these questions are now of one piece, and that, for the UN, a further setback in the Congo must mean a falling back along the whole line.

No Grouse Grumbles

A look at the industry which covers perhaps one half of the area of Scotland

IT usually seems to be in late July and August that the season for international crises opens: Berlin crises, currency crises, common market crises, cabinet crises. Twice in the last fifty years it was in August that the world moved into or towards a war. This is rough on statesmen who, like everyone else, want to get away for a bit of a summer holiday. But Britain, for as long as the Tories are in power, is lucky. Most top Conservatives do not spend the dog-days lolling about on sunny Mediterranean beaches; they can usually be got hold of not too far from Whitehall, shooting away at small but delicious birds.

The mass execution of grouse driven over a line of concealed gunmen is Britain's favourite patrician sport. Like so many other time-hallowed traditions, it was made fashionable by Queen Victoria herself and has been kept in fashion by her descendants. The sport, like the process of British imperialist expansion, rests solidly on the achievements of Victorian technology—the quick-firing breech-loading gun and the spread

of the railways into the remoter regions. It retains its air of leisured ease, and the Twelfth of August, when the season opens, provides a gossip-columnist's field-day.

Grouse shooting is fated to remain an exclusive sport, for the red grouse is a pretty exclusive bird. Unlike the other game-birds—the pheasant (originally Chinese, reputedly introduced to Britain by the Romans) and the partridge—grouse thrive only in Britain, and in Britain the only country they really like is the desolate moorland and mountain stretching from Derbyshire right up to the north of Scotland. Grouse—again unlike the other game-birds—cannot be artificially reared for shooting; or, if they are so reared, they only wander off to the neighbouring estate. All that can be done is to encourage the young heather which is their natural food by burning off the old growth, and to keep down their natural enemies, foxes and crows. (Their worst foes, eagles, hawks, and gulls, are protected by law: keepers would dearly love to have a go at them, and perhaps they sometimes do on the quiet.)

THE best grouse country is on the moors of Yorkshire and Westmorland (where Mr Macmillan generally goes for the Twelfth): the record bag of all time was made in Yorkshire when eight guns slaughtered 2,929 birds in a day. But that was in 1915, a peak year for powder and shot on all counts. Nowadays birds are scarcer, and the Nature Conservancy is running an inquiry into the causes of the decline. It seems most probable that the burning of heather, while it improves the young growth in the short run, is inclined in the long run to impoverish the soil. A dearth of grouse can be a serious matter for some parts of Scotland, which draw such prosperity as they have from the spending by outsiders (usually from the south of England) on the allied Highland bloodsports of grouse-shooting, deer stalking and salmon fishing. There are horror-stories around in the Highlands of how landlords have had to return the rent to tenants dissatisfied with their poor bags.

A typical Highland grouse-moor, with shooting for eight and a lodge for some of them to stay in, might fetch around £2,500 a year in rent; usually the expense is shared among the members of the syndicate who rent it. A peculiarity of grouse-shooting is that there is no conceivable means of increasing the available acreage devoted to the sport (perhaps already about half the extent of Scotland). In fact, it is feared by some that, as the plantations of the Forestry Commission spread across the Highlands, the shooting area will get smaller. New entrants, ambitious for the glamour and the genuine pleasure of the sport, are constantly trying to get into the act. Prices are shooting upwards. Last year a large estate of 80,000 acres in Ross and Cromarty, including salmon fishing, stalking and grouse country, was sold for £420,000. Money is pouring into the Highlands not only from American sportsmen—or reputedly from American firms established in Europe, seeking a way of not repatriating their profits—but also from entrepreneurs such as the Swiss businessmen who recently bought an estate on Royal Deeside.

The sport itself is a pretty spartan affair. Its devotees spend much of the day crouching in butts—holes in the ground that sinisterly remind any ex-serviceman of fox-holes—hiding partly from being spotted by the driven birds, partly from being ravaged by the tearing wind, and partly from being peppered by reckless neighbouring shooters. The beating in many parts of the Highlands is traditionally a perk of whisky distillery workers during the seasonal lay-off for the dry summer: they will probably ask £2 a day. Elsewhere there are no distilleries, and the job will be done by up to forty schoolchildren, at £1 a day. A sinister recent trend is that children have begun to threaten to strike for the odd five shillings; one can see their point, as they earn their money well by walking for 25 miles or so over steep heathery slopes.

Once on the wing a grouse, with the wind behind it, can reach 60 miles an hour by the time it gets over the guns: plenty of cartridges—at 7d. a bang—are wasted. The wiliest birds refuse to fly over the guns at all, and escape backwards over the line of beaters. Keepers and landlords are quietly delighted when this happens, or when they have a particularly inaccurate group of shooters: it means a good breeding stock for the next year. The whole present trend in the sport, in fact, is to try to think up new rules in favour of the grouse. Landlords are well aware of what has happened in the United States, where over-efficient shooters armed with repeating shot-guns have made it necessary to ban duck-hunting in some areas altogether, for fear that the ducks might be totally exterminated.

There is, however, one day when the incentive to bag as many birds as possible is strong. On the Twelfth of August birds can fetch up to £1 each; they are dispatched by jet to Scots exiles—and gourmets—all over the world. Scotsmen think it absurd that the Savoy or the Waldorf-Astoria should pride themselves on offering grouse to diners on the night of the Twelfth itself, since an old grouse does not really taste very good without being hung for ten days, and a tender young bird is practically tasteless early in the season anyway: but they are not averse to the income they provide (and they are apt to be resentful of the unfair competition from Yorkshire birds, nearer to the southern market). Later in the season birds fetch only around 17s. 6d. a brace: one man in charge of a Highland shoot calculated that he makes just about enough by the sale of birds to pay his beaters for a whole month of sport.

THIS still leaves grouse shooting as a pretty expensive way of spending a holiday. One City man estimated that he spends around £500 a year on taking his family of four to the Highlands for three weeks in August (he shoots: the children spend their time fishing for trout in the lochs, messing around by the sea, and generally enjoying the country). And there are other expenses on top of this: Land-Rovers and weird, warm clothes are absolutely necessary to face the rigours of a windy Scots summer. A good retriever can do marvels for his master's prestige, and is needed for finding birds that may fall beyond a hill. A pair of hand-made guns can cost well over £1,000—but then this can be amortised over a long period. It is not at all unusual for a man to use his grandfather's 60-year-old 12-bore; and those perfectionist craftsmen, the gunsmiths of London and Birmingham, rely more and more on their impeccable reputation abroad.

In all this luxury spending lies the patriotic Scotsman's dilemma. It is obviously annoying to see Sassenachs and other foreigners throwing their money about in the poorest area of the British Isles, suffering at once from depopulation

and unemployment. But then what else can be done with the land devoted to grouse? Sheep are sometimes profitable—but the demand for the coarse wool of the only breeds that can thrive on high ground has a most uncertain future. Cattle-ranching (which is incompatible with grouse-shooting, as it demands the replacement of heather by grass) has succeeded in a few glens, but only in those that have enough lowland to provide grazing during the months of snow. Anyway, unlike grouse-shooting, it has to be subsidised by the Exchequer.

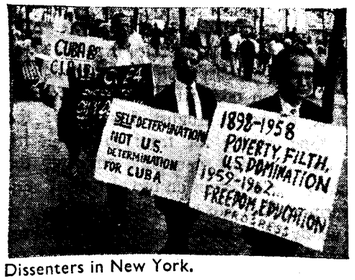
Forestry is spreading as fast as the capital can be made available: most planting is still replacing the timber cut down during the war, and is not yet inimical to grouse. The growing sport of skiing takes place above the height where grouse live, and gives jobs in the winter to some of the men who work for the shooters in the summer. Tourism of a humbler kind sometimes conflicts with shooting—especially when hikers with dogs walk across the moors just before a drive, or in the early summer when the birds are nesting. But the Highlanders are well aware that most tourists never leave their buses, and that those who choose to tour on foot are unlikely to spend a fraction of the money put down by sportsmen. The three months of the shooting season do provide some jobs in the Highlands (ideally, eight workers are needed for each gun): and for the privileged—such as keepers—the tips are high even when the pay is low. And the carting away of the corpses also provides a bare minimum of traffic for Dr Beeching's least profitable railways. All in all, Scotland has no cause to grouse about the grouse.

NOTES OF THE WEEK

MONROE DOCTRINE

Times Change

"OUR policy in regard to Europe . . . is not to interfere in the internal concerns of any of its powers. To consider the government, *de facto*, the legitimate government for us." This, though some Americans may not recognise it, is part of President Monroe's historic doctrine—though not the part currently in favour. Monroe's successor, Mr Kennedy, has been under pressure from sections of American opinion, since the arrival of Russian military instructors in Cuba, to invoke quite another part of the doctrine: the part that forbade the European powers to extend their political system to any portion of North or South America.



Dissenters in New York.

This pressure on Mr Kennedy (discussed more fully on page 1025) should not be underestimated. The demand for enforcement of the Monroe doctrine, or at least the convenient bit of it, comes from part of the Democratic party, as well as from many Republicans. Since it was Mr Kennedy who in the presidential election in 1960 accused his opponent, Mr Nixon, of having "presided over the communisation of Cuba," the demand touches a sensitive spot in this new election year.

And yet—may it be said?—the world has changed somewhat since the Monroe doctrine was formulated 139 years ago. Then the American insistence that the European powers keep out of the western hemisphere had a counterpart: an American determination to keep out of the tangled affairs of Europe. Things are different now. The United States stations its forces, conventional and otherwise, along the boundary of the communist world (in one case, Berlin, inside that boundary: the east Germans, among others, might well wonder about that undertaking "to consider the government *de facto*, the government for us").

Without this American readiness to interfere in its affairs, Europe would be in a bad way. But an awkward question is bound to arise, and seems to be arising now. Can the United States expect successfully to enforce, without any exceptions, one part of the Monroe doctrine, when it has abandoned the attitude to world affairs that underlay the doctrine? The United States government, aware of the hostages it has given to fortune in Berlin and elsewhere, may not need to have this pointed out; but many Americans have not seen it yet. Mr Khrushchev may even say one day (he hinted at it in his statement on Tuesday) that his attitude to the western presence in Berlin depends on the American attitude to the Russian presence in Cuba.

BERLIN

Another Famous Victory?

NOT only in its Cuba policy, but also in Berlin, Mr Kennedy's Administration is much favoured just now with exhortations to firm action. One result is the attempt to stop the Russians using armoured troop-carriers to convey their ceremonial guard across the sector boundary to their war memorial in the Tiergarten—a short walk from the Brandenburg Gate, but a good deal farther from the nearest crossing-point now that the gate is walled up. From the building of the wall until last month, the Russians sent their guard reliefs in ordinary buses. But on three days from August 18th to 20th their buses were attacked with stones by an angry west Berlin crowd.

When the Russians thereupon started to use the armoured carriers, their action was seen in west Berlin as demonstrative, offensive to local feeling, and a danger to west Berlin's morale. After an interval the western commandants insisted that the Russian reliefs should take a shorter route, using a different crossing point which happens to be on the British, instead of the American, sector boundary. On September 4th, the Russians complied. Next came a western demand that buses should once more be used instead of the armoured carriers. On Tuesday the British, apparently not wholly convinced of the advantages of a display of firmness for its own sake, put this demand in the form of a request, to the annoyance of some American press commentators who have been urging a show of force.

Berlin seems to be another topic on which some reflection about the premises of western actions would do no harm. On the face of it, the Russians were justified in using armoured carriers by the series of attacks on their buses. Whether they should be keeping a guard at all on their memorial in the western sector is another question, but it has the sanction of long custom and none of the occupying powers, so far as is known, has questioned it. If they are allowed to send the guard, then the guard would seem to be entitled to protection from stone-throwing.

If, as is likely, the Russians give way to this demand, the result will doubtless be

hailed as a vindication of policies of "firmness." Rightly, or wrongly? The Russians would be foolish to clash head-on with the West on western ground, when they can so richly repay the West on ground of their own choosing: it might be in the air over Berlin, or on the long road from Helmstedt. The West should be seeking workable arrangements in Berlin, not sham victories. And where

A British request.

does this idea come from that the morale of the Berliners depends on their being sheltered from reminders of the Russian military presence all around them? That presence, as well as the history that gave rise to it (of which the ugly Russian war memorial itself is a not unsalutary reminder) are the facts that Berlin has to live with. One would think it more healthy that the facts should be visible than that they should be muffled.

CONSERVATIVES

Still No Revolt

CONSERVATIVE backbenchers must have suffered from some acute anxieties this week, as they read the assiduously-leaked reports of the speeches of the visiting Commonwealth statesmen, and as the implications of Mr Macmillan's new, tougher and more committed tone of voice about the common market began to sink in. But, in so far as one can possibly gauge at a time when the House is not in session, there are no signs of a real backbench revolt.

The potential insurgents are still lacking any true leadership. Lord Salisbury is the only right wing Tory of national status and he, as a good imperialist, is a supporter of Britain's joining Europe. The appeal of Mr Robin Turton, Sir Derek Walker-Smith, and Lord Sandwich is severely limited, to say the least. In the Commons the nucleus of their strength remains the ten or so Tory irreconcilables who have lingered on since Suez. To these might be added, at the outside, a further thirty dissidents, only some of whom are expected ever actually to vote against the Government. In fact the chances of Conservative members going into the No lobby have been much diminished by the hardening of Mr Gaitskell's attitude against the common market. To be found in the same stable as the official Opposition is not a fate which even the most rabid Tory anti-marketeer would welcome. In any case the voting record of the right in Parliament has not been an heroic one. Snarky and undebated motions, saying one thing but meaning another, are the weapons they prefer to use. As the House was not sitting this week, no such motions could go down.

When the Commonwealth conference is over, the Prime Minister—presuming he is still determined to press on into Europe—should now make up his mind to sound a clarion call in the country and at the party conference. His difficulty all along has been to strike an emotionally responsive chord in his followers, but he may now have found one in his emphasis of the need to avoid a third European conflict. By this emphasis he has managed to turn the most appealing of the pro-Commonwealth arguments inside out. Another profitable line of approach for the conference may be to present Britain's entry into the market as part of that return to national greatness which is always near the Tory heart. But thirdly, and most important of all, the Prime Minister should be able to use what Lord Kilmuir once called the Tory party's secret weapon—loyalty. At heart the Conservative party is still a deferential party and likes to follow its leaders. Moreover the Llandudno conference seems likely to take place at just about the time when Mr Heath may be in the middle of another session of sitting up all night, and nobody wants to be beastly to him.

LIBERALS

With Sails Unfurled?

THE Liberals at their conference next week at Llandudno will have their greatest opportunity for many years to capture the imagination of the country. Whether they do so or not will depend largely on themselves. They can either seek to pick up every possible protest vote by whatever means, or they can genuinely attempt to put themselves at the head of the new political currents that are flowing through the country. This is not the moment to try to appear politically clever (which is why some of their tentative new industrial policies should be quietly buried), but to appear wise and courageous about the one overwhelmingly important issue that now lies before the country.

The keynote message which Mr Grimond should send ringing forth is that there will be no, repeat no, trimming of Liberal sails on the common market issue despite the anti-market protests which have been echoing this week round Marlborough House. To trim now would be a fundamental error, since the point that the Liberals were the first party to come out in favour of the market is the one fact about them that really has penetrated the consciousness of the average man. The Liberals can justly claim that if their advice to negotiate had been heeded earlier the conditions for Britain's entry would have been better than Mr Heath can get now; they should certainly make clear their opinion that Europe would be wise to offer better terms than it is doing; but they should also say that, on the terms so far offered, the Liberal party believes that the clear balance of advantage is on the side of going in.

To say this boldly and outspokenly would not only be to say what the Liberal leaders believe, but would also be to take the course best calculated in the long term to pay off in political dividends. Mr Grimond should learn from Mr Gaitskell's mistake. To start wobbling on the common market issue for the sake of picking up a few votes from the farmers of Chippenham or the colonels of South Dorset would shake the whole foundations of the Liberal revival. They are now at the stage where they can afford (indeed should welcome) being attacked for their outspokenness, but cannot afford to be sneered at for any vacillation.

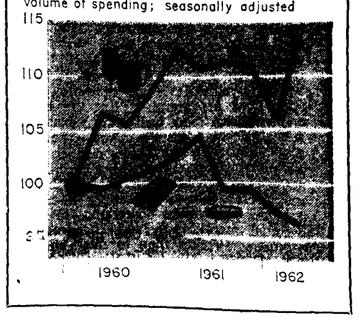
WEST INDIES

Europe in the Caribbean

AS befits the two youngest members of the Commonwealth, Jamaica and Trinidad have, in their very different ways, illuminated the dusk of the prime ministers' conference with flashes of clear-eyed originality. With an old trouper's instinct for timing, Sir Alexander Bustamante, the prime minister of Jamaica, emerged from Tuesday's fervid meeting remarking with limpid fatalism that there was no need for a multiplicity of words since Britain was going into Europe no matter what was said or who was

WORRIED?

Still less spending on tobacco and a leap in spending on alcoholic drink in the second quarter. Has the report of the Royal College of Physicians (March 7, 1962) disturbed the smokers enough to curb their indulgence? Are they turning to drink to soothe their shattered nerves?



hurt. On Wednesday, Dr Eric Williams, Trinidad's leader, carried this argument a long stage further by not only accepting, but welcoming, Britain's step. A weak Britain, he said, was no use to his country; he saw both Trinidad and Britain strengthened by the European connection.

Sir Alexander's eyes are turning towards North America (though those of Mr Sangster, a likely successor, are not). Dr Williams is "European" in his outlook and his hopes. Trinidad, with its economy based on oil, sells to the Six as well as to Britain; some of its best customers in the Caribbean are the non-British territories of Curaçao, Surinam, Guadeloupe and Martinique. But Dr Williams's imagination ranges beyond the immediate effect on his own country: he sees in European unity, including Britain, the inspiration and the instrument that might one day bring order and integration to the scattered mosaic of Caribbean islands.

The malaise that lingers on after the slow death of federation makes it improbable that in the short run any of the smaller British West Indian territories (with the possible exception of Grenada) will accept Dr Williams's invitation to join Trinidad and Tobago in a unitary state. Until these insular passions subside, Trinidad is off on another tack, working its way towards a more extensive, but less binding, form of Caribbean unity. Guadeloupe and Martinique are already associated with the European Economic Community through their dependence on France; Trinidad would come in, it seems, on the heels of the British.

Dr Williams makes the point that these territories, together with Surinam (self-governing, but still effectively attached to Holland) might do better economically, and on more acceptable political terms, if they could present the united front of a Caribbean economic community. A movement in this direction has already started. Economic experts from Trinidad and Surinam have paid visits to each other, and Dr Williams hopes to meet the prime minister of Surinam in Europe. The French government, according to Dr Williams, agrees in principle with the suggestions concerning Guadeloupe and Martinique. If a Caribbean economic community comes off, it will be open to all countries—except those going in for state trading. This effectively excludes Cuba.

At present Trinidad sells much more to the other Caribbean territories than it buys from them, and Dr Williams hopes that any association between the two communities would allow Trinidad a protected market in the Caribbean. There are possibilities for expanded inter-island trade; Surinam, for instance, could sell more aluminium and more rice to Trinidad. But Dr Williams gets his real impulse from the need to bring order to a disordered region. If the European common market is the lever for this, then, he says, thank God for the common market.

The Economist

SEPTEMBER 13, 1862

DISTRESS IN LANCASHIRE

¶ There is scarcely any more baffling problem in practical life than how to distribute charity so as to relieve distress, without doing as much harm as good—especially where the charity is boundless and the distress extensive and unquestionable. The more it is seen and known, the more perplexing does the work become to a conscientious labourer in the field of benevolence. "People are starving: give liberally," cries the bystander or the casual visitor, "and all will go well. It is no time now to be scrupulous or careful." But the humane and inquiring man, well-informed as to the state of his district, and thoroughly acquainted with the habits and characters of the people among whom he lives, is often made aware that to give liberally is in too many cases only to multiply distress, to paralyse individual exertion, to fatten habitual mendicancy, and encourage easy supineness, rather than to meet and mitigate the privations of the really suffering and needy. . . . The fact is, the case [of Lancashire] is one of singular difficulty, and we must proceed with great caution if we do not wish to repeat among a far worthier population all the consummate errors and mischievous follies of the Irish famine. There need be no *starvation*, as in that case; and there will be none, unless the administrators of legal and voluntary charity should be goaded by "sensation" writers to gross mismanagement and recklessness. There is food enough to be had, and to be had at reasonable prices; there is property enough to meet any rate; and there is benevolence enough to provide ample funds for the sustenance of those who ought not to come upon the parish. The essential points to be watched are, that too lavish and too early a distribution of eleemosynary aid do not sap the spring of individual exertion, and that too ignorant and indiscriminate relief do not permit the lazy vagabond and the professional beggar to intercept the stream of bounty designed for the struggling and respectable artisan.

GHANA

Dangerous Insurance

ASSASSINATION is a deplorable way of destooling a chief, or getting rid of a ruler, but, in the absence of elections, it tends to present itself to young revolutionaries as the only way. The Ghanaians have never been given any reason to doubt Dr Nkrumah's intention to remain firmly in charge of his country for as long as he possibly can. To many of them, including the sympathetic crowds outside his palace, this may seem no bad thing. Ghana is, after all, the most go-ahead country in black Africa. More Africans are in positions of responsibility in Ghana than in neighbouring countries; and the whole purpose of the revolution initiated by Dr Nkrumah is to put Africans in charge of affairs all over their continent.

But men in charge, even when black, must expect dissent. Dr Nkrumah has rejected dissenters; he surrounded himself with sycophants. It must be at least partially as a result of this that he is experiencing a series of attempts upon his life, the latest of which was a a bomb explosion outside his official residence on September 9th. In this case at least two innocent bystanders were killed, and several injured. One way to steer dissenters clear of the path of violence is to give them an opportunity to speak at least within the governing party if not outside it. Given no such opportunity, the most responsible men, respecters of peaceful, constitutional methods, might pause before vetoing revolutionary kinds of opposition. What will such men make of the unanimous vote taken in Ghana's parliament on September 7th to keep the Osagyefo as president for life? Or the vote that followed on September 11th, calling, by an overwhelming majority, for the introduction of a one-party system? These measures may be challenged in Ghana's courts as unconstitutional; but Dr Nkrumah might ask himself what he, in his days as a non-violent fighter against the British, would have done if the courts themselves had seemed to be loaded directly against him?

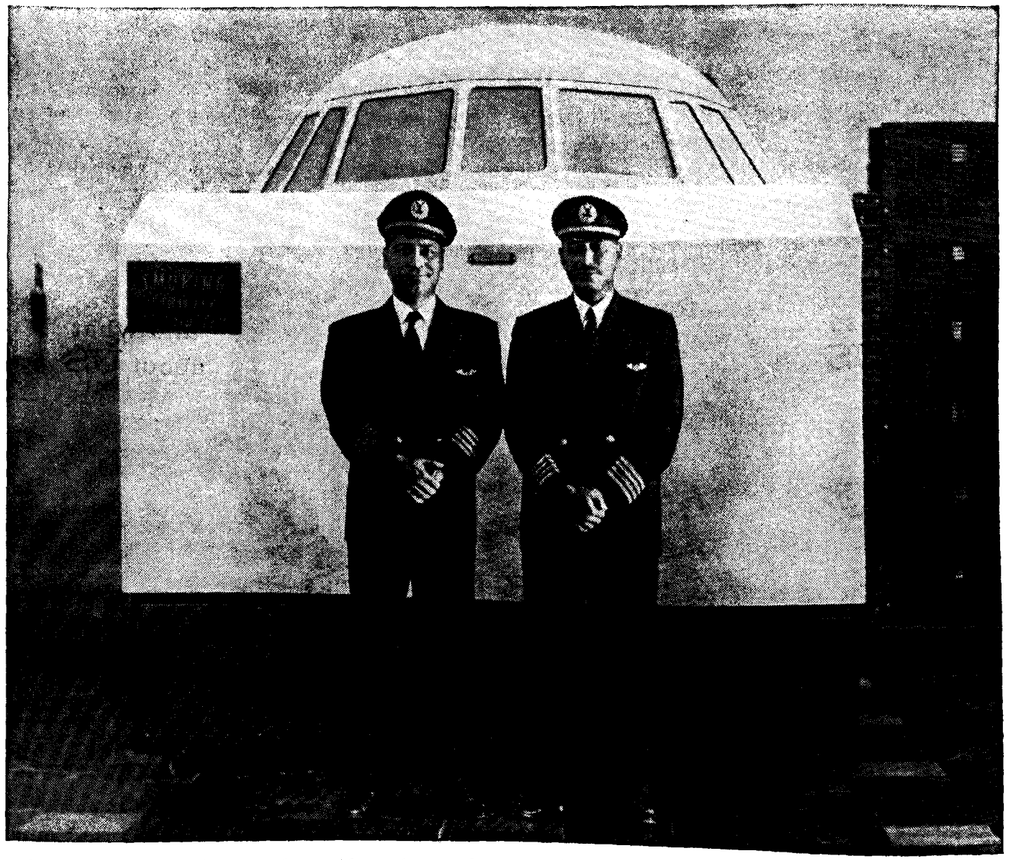
ALGERIA

Before the Elections

THE problem of the Kabyles, said Mr ben Bella at a recent interview with the Tunisian weekly *Jeune Afrique*, will not be hard to settle; their leader, Mr Belkacem Krim, will be offered the job of deputy leader in the new government. It would be fine if all Algeria's problems, including this one, could be solved so airily; as things are, it is still hard to see how Mr Belkacem Krim and Colonel Boumedienne, chief of the regular army, will fit easily into the same picture. Colonel Boumedienne provided another demonstration of his presen ascendancy by refusing to be cheated of hi victory march into Algiers, even though th city had been demilitarized under the term of last week's truce. After a series of urgen consultations between Mr ben Bella and th colonel, a "token" force of 4,000 me entered the city at the weekend.

This arrangement with Colonel Boume dienne has at least given Mr ben Bella chance to turn to his country's frightenin

PIA pilots can perfect an Idlewild touchdown without leaving this room



PIA's plane-without-wings reproduces with complete accuracy any flight route in the world, combined with the most unnerving alerts and emergencies the instructor can think of. That is why a PIA captain, before taking over a new route, can 'fly' over any part of it a number of times. and under some very awkward simulated weather conditions. A pilot new to Idlewild, for instance, probably the world's busiest airport, might have 'landed' there perfectly over and over again before even leaving Karachi. And the trainer has another use, equally important. *All* PIA aircrew take a compulsory refresher-course every six months. Even a senior captain must fly thousands of miles a year on this machine, however many hundreds of thousands he may have logged in the air.

This kind of perfectionism – which puts two full rated captains on every PIA international jet flight – has also given PIA an unmatched record for punctuality. Last year it brought them 63% more passengers and 41% higher profits than ever before. Not many airlines can prove in figures that they're great people to fly with.

See your Travel Agent or consult us: 45 Piccadilly, London W1. Tel: REGent 5344. PIA offices in these UK cities: Birmingham (Midland 1960), Glasgow (City 3733), Leeds (21188), Manchester (Blackfriars 7546). All cables: Pakintair.

economic troubles. The elections for a constituent assembly, now to be held next Thursday, will, in effect, be a vote of confidence in Mr ben Bella ; the electorate has only to accept or refuse a single list of 196 names. The political bureau, which is now reduced to Mr ben Bella and four of his supporters, is to have the task of providing "political orientation" for the new government. In pre-election style, Mr ben Bella has spoken of land reform and new jobs in the towns ; his more immediate problem is to crank up the dying mechanism of administration. Financial help has been coming in from various outside sources, principally from the United States, and the French government has been doing what it can to keep the public utilities working ; it has been uphill going since most of the French civil servants left for France. Mr ben Bella claims that the French are starting to return to Oran and other areas ; he may have encouraged some returns by his threat to confiscate property not claimed within a month. One of the tests will be whether the teachers come back in time for the beginning of the school term on October 1st. After the Bizerta incident last year, the French teachers left the Tunisians in suspense until the very last moment ; nobody knows what they will do this time.

TRADES UNION CONGRESS

Mr Woodcock's Excursion

DIRECTLY the Trades Union Congress ended last week Mr George Woodcock, the general secretary, set about packing his bags for Israel, on the first of his voyages of exploration to see how trade union leaderships abroad manage their affairs. What he sees should certainly confirm him in his presumed objective of trying to reform Britain's straggling trade union structure. It is particularly encouraging that he is to take along with him on the trip to Sweden the strongest possible team of top general councillors. In Sweden they will find a social-democratic trade union federation that is not only unimpeachably anti-bomb and pro-underdeveloped-country but also extremely strong on economic realism—a combination that should have a particular appeal for Mr Frank Cousins, and that could reinforce the alliance between him and Mr Woodcock that some people believe began to burgeon at Blackpool.

But perhaps the TUC will argue that what goes on in Sweden in the way of agreement to limit wage increases is made possible by the fact that successive social democratic governments have seen that increases in national prosperity are fairly shared out among all classes. If so, let them be specific about what features of Sweden's taxation or other policies they consider should be repeated here ; let us have a hard and specific report in terms of such things as what proportions of the national income wages and profits take in Sweden compared with Britain—and why. So far the TUC's mutterings about its willingness to co-operate with some sort of national incomes policy, but not with Mr Maudling's, have been as hard to pin down as Mr Diefenbaker's remarks about alternative possibilities for expanding Commonwealth trade if the common market negotiations fail ; it is not surprising that they have therefore carried just as little conviction.

NATIONAL INCOMES COMMISSION

Waiting for Nick

ONE of the most balanced analyses yet made of "The Uses of Nick and Neddy" appears in an article in the latest issue of the *District Bank Review* by Professor C. F. Carter of Manchester University. Without raising extravagant hopes, he believes that these two bodies "have a logical and potentially useful part to play in changing the institutions and loosening the assumptions which bind the British economy." Neddy's task should be to try to influence the civil service and establishment forces to be more in favour of growth, while Nick's should be to influence wider public opinion to be less in favour of abstract principles of "fairness" (the sort of "fairness" which says that if wages go up in industries that need labour, they must also go up in industries that don't, even though that leads to a rise in prices which is then held to justify everybody else getting another increase to start the spiral moving again).

The experiment of Nick, says Professor Carter bluntly,

> will fail if public opinion accepts the old principles of justice, or devises some new inflationary principles for itself (such as that the conduct of nurses in *Emergency—Ward* 10 is relevant to the fixing of nurses' pay). Therefore the National Incomes Commission must, to succeed, speak with a convincing voice, showing why an unjustified award of 10 per cent is equivalent to robbing one's fellow-citizens. . . . What is needed here is a body acceptable to people in their capacity as consumers. . . . It will be a task of formidable difficulty to create such a body, but the attempt is worth making.

And, says Professor Carter with a touch of left-wing asperity, the present day "assumptions of the owners of capital or property are just as much in need of questioning, and of setting against the general public interest." He would like to see a separate commission (which might, perhaps, impinge into the field of making recommendations about taxation ?) set up to consider them.

Last month some newspapers reported that Nick was being slow to get off the ground because several people who had been asked to be members of it had hastily refused. These stories were quite untrue. Up to a fortnight ago, at any rate, the Government had not seriously approached anybody, perhaps partly because it had not yet made up its mind what sort of a body Nick should be: whether it should be the old tripartite sort of committee in which retired trade unionists and employers politely tone down what each other wants to say, or whether it should be a commission of outsiders picked for qualities of blasphemous candour. The latter is what is needed ; the right sort of choice, on the evidence of this article, might well be Professor Carter himself.

MOROCCO

African Pinpricks

FRICTION about the Spanish enclaves in Morocco is flaring up again, as it has done periodically since 1774, when the Moroccans attacked the *presidios* of Ceuta and Melilla. King Hassan's government, having unilaterally extended Morocco's territorial waters from six miles to twelve, has been sending out patrol boats to exploit the consequent opportunity to harass Ceuta's fishing fleet. Spain has sent half a dozen warships to protect the fishermen, and Spanish spokesmen have been expressing concern at Moroccan imports of Soviet arms.

The current campaign in the Moroccan press, calling for the liberation of these Spanish-held coastal towns, as well as of Ifni and the Spanish Sahara, is strident but not unexpected. In recent months, Mauretania, which the Moroccans also claim, has been consolidating its independence ; among Mauretania's African friends, the Moroccans have found themselves outnumbered. The remaining points of Spanish power in north Africa are a more promising target, in that the African and Asian members of the United Nations could be expected to approve their "liberation," even by force, just as they approved India's seizure of Goa. It is true that the "Spanishness" of the *presidios* is beyond argument ; they have been Spanish cities since the fifteenth century. But ethnic composition and sovereignty do not invariably coincide, as the Europeans of Oran are learning, and as Morocco's irredentist minister for Islamic affairs, Mr Allal el-Fassi,

EIU Quarterly Economic Reviews

Six-monthly Supplement

EUROPEAN ECONOMIC COMMUNITY

Compares economic indicators in E.E.C. and other major industrial countries.

1st issue: 15th September, 1962.

Do you know that—

Italy is the largest exporter of textiles and clothing in W. Europe?

The Six imported $374 million worth of motor vehicles last year?

These and other important facts can be found in the supplement.

well knows. It may be assumed that the American embassies in Madrid and Rabat are busy with soothing advice, which may, for the present, have its effect.

SYRIA

Civilians on the Ladder

SYRIA, the first Arab country at the time of the Suez crisis, in 1956, to break relations with France, is again the leader in restoring the formal link. On September 9th, Syria resumed diplomatic relations with France (economic and cultural relations were fully revived some years back), and Jordan and Saudi Arabia followed suit soon after. Lebanon is the one Arab country that never broke with France in the disasters of 1956. It is tempting to see in the Syrians' decision to mend their breach with France at this time an attempt to project their obsessive quarrel with the United Arab Republic into the international field. But, at least for the time being, they are trying to keep that dispute on home ground. The Arab schisms that are tearing at the weak guts of their own league will, it is hoped, be kept beneath the surface when the United Nations assembly meets again next week.

Criticism of the way in which Syria's leaders have handled relations with Egypt is one of the reasons behind the growing pressure for a change of government. The present cabinet has the army's blessing, and the army's hand on its shoulder, but it is lamentably hamstrung by the fact that it represents no political party or group. Although economically Syria is doing well, its government's lack of confidence has led to a number of muddled and contradictory situations. But the army has made clear its reluctance to imperil the present stability by allowing back the heterogeneous elements of the national assembly it dissolved in March. As a compromise, it is now being suggested that Mr Khaled Azm (probably Syria's most formidable politician) should preside over a new government that would have the double job of preparing for elections and enabling the old assembly to disband itself in a more constitutional fashion.

The plan, with which it is hoped to appease the army, is that the assembly should meet only to reinstate, with certain changes, the 1950 constitution; it would then allow itself to be dissolved. But, when it comes to the point, it is doubtful whether the deputies, who have been missing the salaries they earned in the golden months between December and March, would allow themselves to be liquidated again so quickly or so easily. If they once get back, they may well try to sit it out until elections are held, in perhaps a year. In the meantime, Mr Khaled Azm would try to steer Syria out of its present confusions and firmly to the right. One of his chief aims is to woo back the money that the Syrians themselves have been investing outside the country. But whether Mr Azm will be given the chance to try his hand depends, at the moment, on the army stifling its qualms.

POLITICS ON THE SCREEN

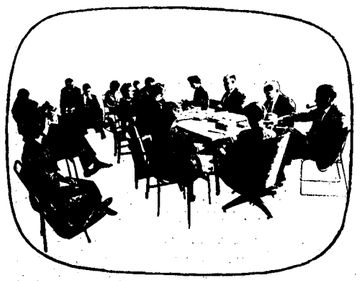
Cathode Ray Conference

THE Trades Union Conference was the scene of an experiment that could be as important as a reform of the union organisation itself; for the first time ever television viewers in the north could watch the whole proceedings, unedited, on their screens, the occasional gaps being filled in by comments from experts (or other observers) and by interviews with the main personalities. Granada Television, who have long been the most enterprising independent television company, will also be televising in full the Liberal and Conservative annual conferences at Llandudno, while Southern TV will televise the Labour conference at Brighton. It is expected that the party conferences will be available to the whole nation outside London, where the local contracting company is apparently unwilling to risk boring its customers for the public good, even during these off-peak daytime hours.

Practically nobody but a masochist would want to watch a party conference all the time, and only a few may want to watch it for some of the time; but it is a breakthrough in education for democracy that people should have the chance. The televising of these conferences should give some clues whether other debates of public importance—from planning inquiries to Parliament—should also be televised live. The first reaction after seeing the TUC under the electronic eye is an enthusiastic Yes.

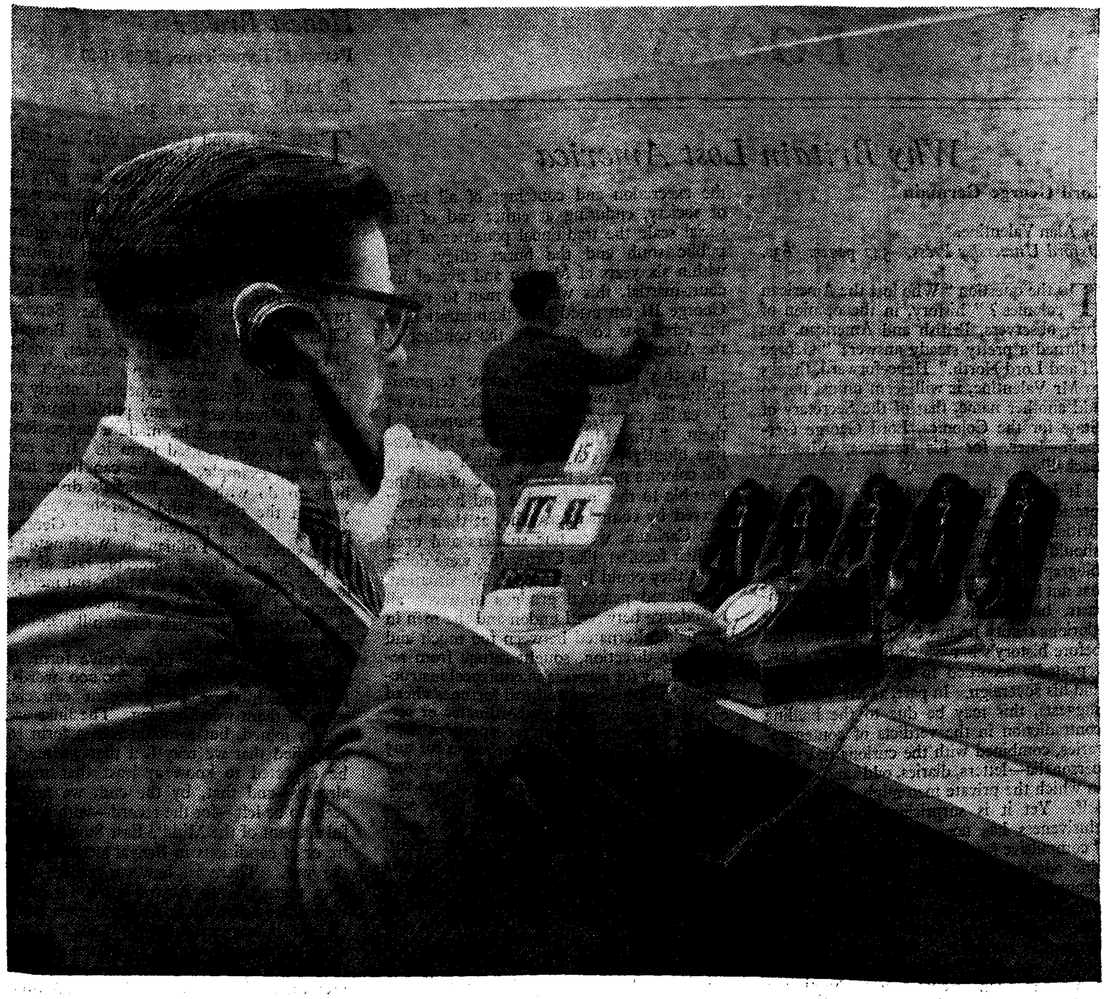
The traditional objection to televising debates has been that the speakers might be distracted, and the proceedings transformed from an exchange of views into a public circus. But at Blackpool the cameras, despite the irritation of arc lamps blinding straight into the chairman's eyes, were soon forgotten. The buffoons and exhibitionists were in no way encouraged to show off, nor were the shy inhibited. (When one speaker made a blue joke some viewers complained to Granada, but delegates took it in their stride.) It has become obvious that many of those who say they fear that the quality of debates will be changed mean that the quality will be raised, and their own performances correspondingly devalued—or alternatively that their absences will be more generally noted. But it must be said that the cameras at Blackpool did not noticeably change the numbers of those snoozing or slipping out for cups of tea at selected dull moments. Parliament will (and should) certainly have to allow the television cameras to come and look at its most important debates before many years are out; hitherto one had supposed that it might only be prepared eventually to allow selectively edited films, but it now seems likely that politicians may be quite quickly conditioned to being televised live.

THE ECONOMIST



THE odd drawing above has an odd origin. It is one of the props used in a BBC television programme by *The Economist* last Monday (the fourth by British weekly journals of opinion) and represents the editorial conference deciding what to put into the week's paper. Deciding what to put into Monday's programme was a novel and nervous exercise. It was easy to decide that the thread should simply be the editorial staff discussing the themes of the week in politics and business, at home and across the world. The difficulty is that conferences are not what is called good television. There is no reason why they should be: the mumbling, the cross-talk and the non-sequiturs and allusive half-sentences that make up conversation are all right among friends and colleagues; journalists, after all, have to be read, not seen or heard. So the truthful portrait of the paper's staff talking things out has to be touched up; it has to be staged without making it stagey (which the BBC did patiently well on Monday), and even then some of the best lines will be lost because that's how the speaker speaks.

The alternative is to fake the portrait: to drop out of the programme all those, however important in the paper's running and thinking, who do not "come over" well and put on only the televisual members of staff and outside contributors; obviously, if the purpose of the programme was not (as on Monday) to present the paper as it is, but simply some of its ideas, this would be the right contrivance. In time, maybe, every paper will have to have a duplicate staff, from editor downwards, just for television; or, less expensively, nobody will be put on the staff unless he passes the screen test. This indeed is now the universal danger of the television age: that nobody in any job over a frighteningly large range of the nation's life and work will be regarded as being any good at his job unless he is good at television, too. All in all, this series of programmes (which were designed to fill the gap while the BBC's own "Panorama" of current affairs was on holiday) has been a thought-provoking experience which put the pen-pushing reputations of all of the journals that took part very much at risk.



He dials O for 3,000 kW

By the simple act of dialling O and asking for the appropriate number, the controller at the South Western Electricity Board in Bristol can operate any one of three Proteus-powered Bristol Siddeley 3,000-kW turbo-generators. These sets are located at Princetown, Porlock and Lynton, in buildings smaller than the average semi-detached house. At times of emergency or during peak-load periods, each set reaches full power within one minute from cold.

This ability to stand inoperative for extended periods, start immediately under any conditions, and run unmanned, is an inherent advantage of the Bristol Siddeley Proteus gas turbine. The Proteus has proved its reliability during 2,500,000 flying hours in the Britannia airliner. This reliability now ensures power for the community served by the robot stations.

A larger turbo-generator, capable of producing between 15,000 and 18,000 kW, is now being built for the Central Electricity Generating Board. This set, powered by the Olympus gas turbine, will commence operation this year as a stand-by unit in the Hams Hall Power Station near Birmingham.

BOOKS

Why Britain Lost America

Lord George Germain

By Alan Valentine.
Oxford University Press. 542 pages. 63s.

To the question "Who lost the American colonies?" history, in the opinion of most observers, British and American, has returned a pretty steady answer: "George III and Lord North." Henceforward, thanks to Mr Valentine, it will seem unjust not to add another name, that of the Secretary of State for the Colonies, Lord George Germain—later, for his services, Viscount Sackville.

It is odd that a figure who so directly presided for so long over the decline of British rule and arms in North America should have had to wait so long for his biographer. Lord George, then and since, has not lacked for critics, or even for encomiasts, but as the Third Man of an inglorious trinity he has evaded that full trial before history's bar which biographers have repeatedly accorded to his prime minister and his sovereign. In part, as Mr Valentine suggests, this may be due to the baffling contradiction in the verdicts of contemporaries, combined with the curious dearth of personalia—letters, diaries, odds and ends—in which the private man might reveal himself. Yet it is surprising that this very elusiveness has not earlier exercised that "compulsive fascination" which Mr Valentine admits finding irresistible. There is about Lord George and his long secretaryship so much that cries out for explanation that one is tempted to say that no one can grasp the quiddity of eighteenth century politics unless he has understood how such a man, in such circumstances, could hold such an office for so long. The explanation owes something to *Namierismus*, but more to an understanding of the eighteenth century English mind and society.

It is Mr Valentine's triumph that, returning to historical scholarship relatively late in life, he has got inside the mind of the age and of his particularly "period" subject so well that the Lord George who takes shape in his pages becomes a credible as well as a fascinating figure. The career he narrates is indeed an extraordinary one. Born a Sackville, rising rapidly through the conventional channels of politics and influence to the position of "Commander-in-Chief of all His Majesty's forces on the lower Rhine," Germain had attained by the age of forty-three to the highest post of active command in the British Army. All this he jettisoned on the battlefield of Minden by an inexplicable and flagrant disobedience of orders, for which he reaped the execration and contempt of all levels of society, enduring at either end of the social scale the traditional penalties of the public snub and the burnt effigy. Yet within six years of Minden and five of his court-martial, this was the man to whom George III entrusted the administration of the rebellious colonies and the conduct of the American war.

In this position of pervasive responsibility, so far from redeeming the errors of his earlier career, he positively compounded them. "Under his direction," as Mr Valentine bluntly puts it, "the British cause in the colonies moved from the decent and the possible to the indefensible and hopeless." Served by commanders who, at their best, like Carleton, were fine soldiers and even at their feeblest, like Cornwallis, were doing what they could in an impossible situation, he allowed personal grudges to wreck all confidence between London and the men in the field, alternated between too much and too little direction, sought refuge from responsibility for reverses in equivocal instruction, placed his own political fortunes ahead either of justice to his subordinates or service to his country, and yet—perhaps most extraordinary of all—did not atone for any of these errors of administration by any triumphs as a parliamentarian; it was seldom that Germain, for all his crass self-assurance, was able to produce even a good debating defence in the House of Commons. Even after Saratoga, when his failure was self-evident, he remained in office, though the King would willingly have been rid of him; persisting beyond Yorktown, he was able to extract from his royal master as the price of an overdue resignation a viscountcy which one of the most stubborn of British monarchs had repeatedly vowed never to confer.

All this, in its intricate and revealing detail, Mr Valentine makes explicable in terms of Lord George's own personality and the attitudes of an oligarchic society and a corrupt political system towards a colonial revolution which was simultaneously feared and despised. The incredible self-confidence in ruin, the untiring persistence in error were in equal degree dominant traits in Lord George's personal make-up and reflections of deep structural flaws in eighteenth century society. The Germain failure-in-success story, as laid bare by Mr Valentine's sharp but fair scalpel, tells one more about why Britain lost the colonies than any study of George III's obstinacy or Lord North's ineptitude. A fascinating biography, this book is also an important key to the understanding of an old but still crucial chapter in Anglo-American history.

Honest Broker

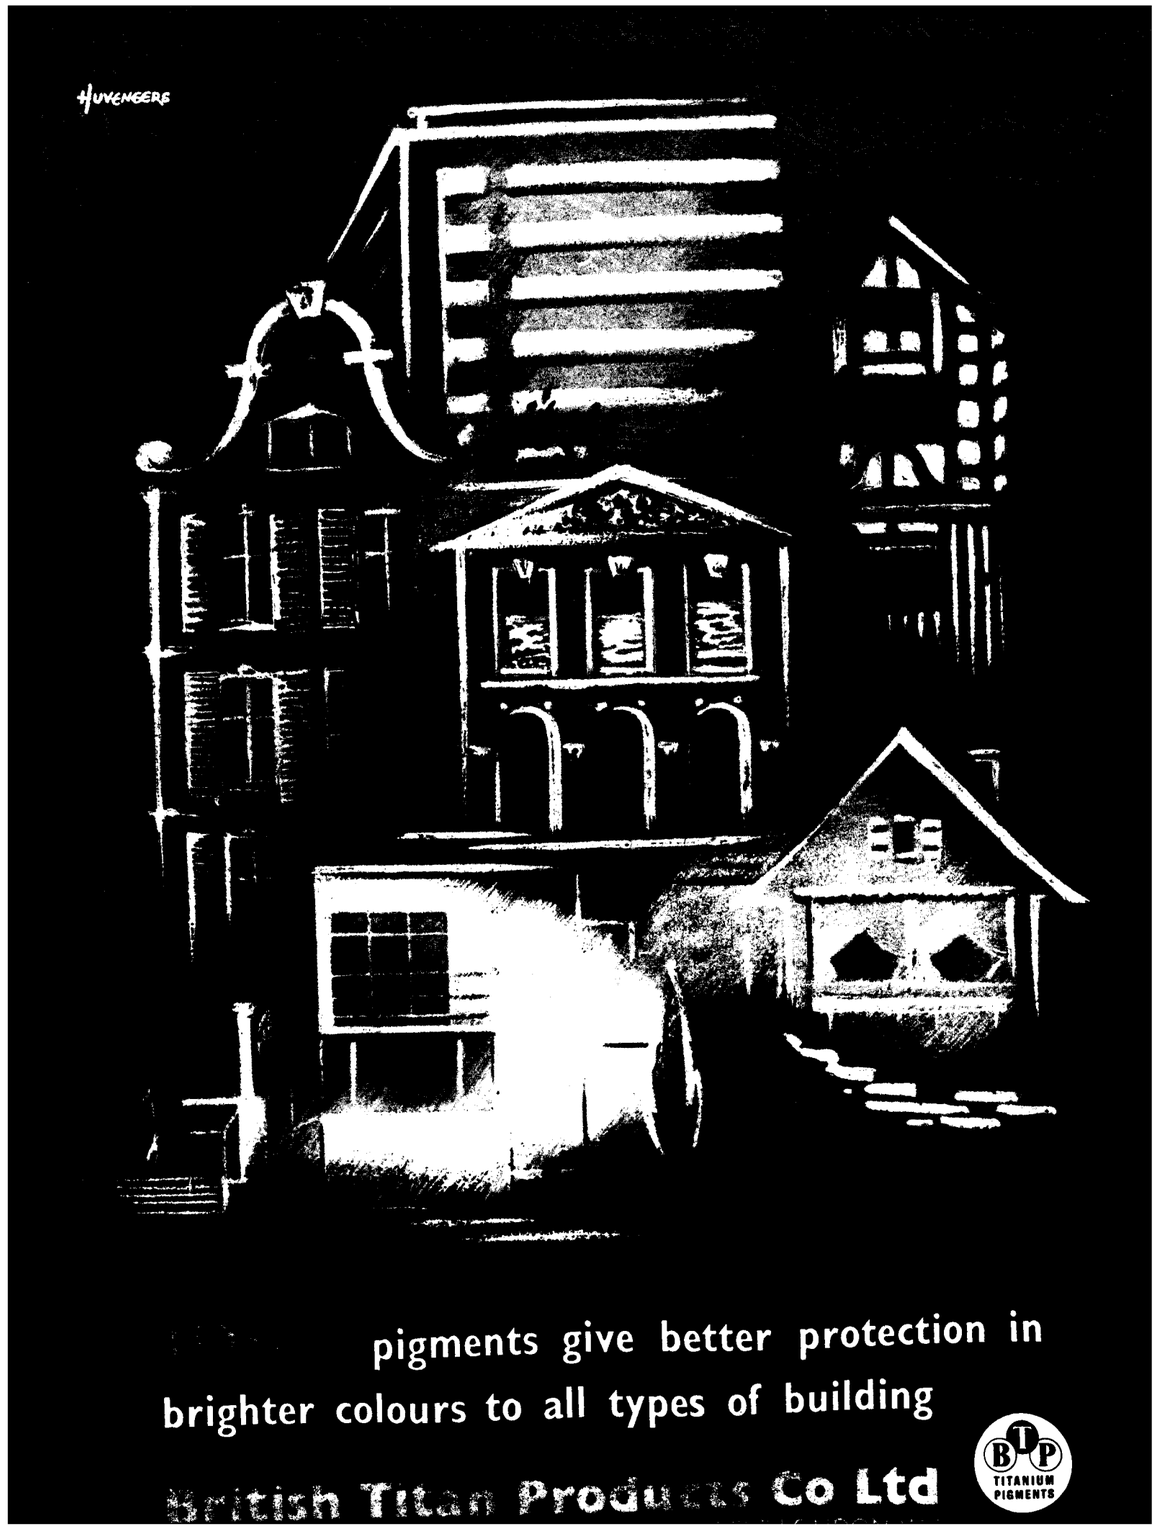
Personal Experience, 1939-1946

By Lord Casey.
Constable. 267 pages. 30s.

This slight and pleasant book is easily read, neatly fulfilling its author's modest intention "to fill in a few gaps in the record." "Wild horses" would not now drag from Casey what he "would have done differently" in his three widely dissimilar wartime appointments: Australian Minister in Washington, 1940-42; British Minister of State in Cairo "in the twilight zone between the politicians and the Service Chiefs"; then, Governor of Bengal, 1944-46. So the book is discreet, unobtrusively in a minor key, although its author may scarcely be expected entirely to avoid the tendency of any public figure to imply that because he made a suggestion, what followed resulted from it. It is evident, for example, that he can have had little to do with Hore-Belisha's dismissal, yet, on the other hand, that he was the positive agent in preventing Lloyd George from succeeding Lothian in Washington; or that he had the disagreeable task of relieving General Dobbie in Malta, but merely concurred in Auchinleck's supersession in the Middle East, which Churchill handled in person.

The book, mainly in narrative form, is based on diaries of over 700,000 words, from which there are frequent extracts, some of them worth having. The links are crisply joined, but sometimes in a form so simplified that we may feel that we might be expected to know at least that much already—and that, by the end, we might seem to be left—for the record—with a useful account of the Middle East Supply Centre or of conditions in Bengal at the end of the war. There is, however, more to it than that. As an Australian, if far from typical (he had been at Cambridge with the Chief Minister in Calcutta), "Dick" Casey saw affairs from a contributive angle, understanding but not always sharing the prejudices of "the abstraction called London", able at the same time to get alongside Americans such as Adolf Berle or Harry Hopkins more easily than those Englishmen about whom they had their preconceptions or who could not give their first thoughts to Pacific matters, anyway. Irritated by their arrogant possessiveness over the word "British" or their infuriating habit of talking of "spring" and "autumn" as if all the world shared their extraordinary climate, he could help explain them to Americans and explain Americans to them, Hopkins and Churchill, for example, most helpfully; or Cordell Hull and Halifax, two shy men.

Lord Casey's quiet noticingness, the breadth of his interest in the unexpected and his eagerness to go see for himself were accompanied, it would seem probable, by considerable administrative gifts which may scarcely be revealed autobiographically. Full of sound advice (though Auchin-



Learning the exquisite art of service

JAL

JET TO JAPAN

In Japan, girls are taught to seek perfection in each small task. Part of their training includes **Ikebana,** *the art of flower arrangement. The kimono-clad hostesses of Japan Air Lines are no exception, and travellers are delighted by their ability to create an atmosphere of serene beauty, courtesy, and charm. This, together with traditional decor and exquisite food, makes every journey a memorable experience. London-Tokyo polar flights* by DC-8 Fan-Jet are twice weekly. The service is direct and there is no change of aircraft en route.* **Unique Service:** *From October 4th you can meet JAL hostesses on JAL's new 'SILK ROAD' to the Orient. Like the silk road of antiquity, JAL's new Southern Route† links London, Frankfurt and Rome with Cairo, Kuwait, Karachi, Calcutta, Bangkok, Hong Kong and Tokyo. Fly these other JAL routes too: Trans-Pacific to Tokyo from the U.S.A. and throughout S.E. Asia. *In conjunction with Air France. †Subject to Government approval.*

JAPAN AIR LINES 8 HANOVER ST., LONDON, W.1. TEL: HYDE PARK 3831

leck can scarcely have appreciated being told how to use his tanks), knowledgeable without being too knowing by half, he was to prove a natural, by nationality, by training, and by temper, for the task of honest broker in the particular stretch of history which he has described with characteristic competence.

Garibaldi Undefined

The Lion of Caprera

By John Parris.
Arthur Barker. 352 pages. 30s.

MR PARRIS'S publishers are wrong in claiming that this new life of Garibaldi could be definitive. In spite of the new material that the author has used, and his patient diligence in checking facts, "The Lion of Caprera" is merely a popular biography that all too often descends to being pop. A brief verdict on it would indicate that Mr Parris has made available to a wider public some of the conclusions arrived at since the second world war by revisionist students of the Risorgimento, but that he has at the same time failed to assimilate all the material and failed therefore to paint a balanced portrait of his sitter.

It is all very sad, because it is possible to see that Mr Parris might well have succeeded, and has, in places, done so. His researches into Garibaldi's youth, into the "marriage" in South America, into the first encounters with Mazzini and the complicated relations with Cavour have all clearly been conducted with sense and care (though he does not quite prove his allegation that Cavour plotted Garibaldi's murder in 1860). In his exposition of Saint-Simonism and its effect on Garibaldi Mr Parris displays real insight. Furthermore, his heart is in the right place. He is not hypnotised by Garibaldi's legend, and is quite ready to puncture the balloon when necessary; but his sense of the absurdity of some of the hero's antics never leads him to forget that Garibaldi was indeed a hero. His genius for action often proved wiser than Cavour's cunning, and, naïve though he was, he understood the needs of Italy and what the Italians could achieve better, perhaps, than any of his contemporaries.

But Mr Parris strains and finally destroys the reader's tolerance by his extraordinary faults. He cannot resist sexual gossip, and the result is that not only does he devote the greater part of a chapter to the amusing but entirely irrelevant activities of the much-bedded Countess of Castiglione (successively the mistress of Victor Emmanuel II and Napoleon III); he also prints almost every letter ever written by Garibaldi to the tiresome and insignificant "Speranza" von Schwarz, one of his mistresses, and devotes more space to this trivial association than to Garibaldi's relationship with Mazzini. Nor is it just a lack of sense of proportion that produces this distortion: Mr Parris has clearly found it easier to use Speranza's memoirs than Mazzini's papers, just as he found Dumas *père* a more manageable source of information on the conquest of Naples than solider authorities. Mr Parris's exaggerated dislike of the Roman church should also be mentioned. Pio Nono was an indifferent pope and a ruler whose unfitness shaded off into wickedness, but it is absurd to call him impertinent for establishing an English hierarchy in 1849; and it was wisdom, not superstition, in Victor Emmanuel to hesitate before taking Rome from the papacy by force. The legacy of suspicion that the 1870 seizure left behind still poisons Italian life.

Why, moreover, did Mr Parris set out to write about Garibaldi without equipping himself to judge the great irregular's military talents? It was, after all, as a commander of men that Garibaldi earned his immortality, and one would like to know how he did it. Lastly it may be observed that, for one who so firmly and often rebukes other historians for slips, Mr Parris is too lavish of small errors. He revives the canard that Napoleon III was not a Bonaparte, although it has been disproved beyond all reasonable doubt. He writes "Venezia" throughout when he means "il Veneto". He has invented an English brewery called Barclays and Perkins. He thinks that Cardinal Wiseman was an ex-Anglican. The proof-reading is execrable throughout the book; and there is only one map—a bad one. Mr Parris's grammar is often faulty.

Secret Practices

The Law of Trade Secrets

By A. Turner.
Sweet and Maxwell. 550 pages. 6 gns.

A GOOD idea can be worth a mint of money. In industry and commerce today, the value of a simple but original selling gimmick, like the development of a cheap but efficient piece of machinery, can be immense. The growth of the mass market and the increasing dependence on gimmicky titillations for selling hardware or entertainment, and the fast pace of technical progress, seem to ensure a vigorous expansion of the free market in know-how, novel themes and even half-baked ideas that can be refined into an exploitable form. These assets are not priceless; they are indeed usually readily assessed and valued by the interested parties. But the rather ill-defined law of trade secrets and confidential disclosure might leave many parties to these transactions unclear about their rights and the commitments into which they might enter as a result of a deal.

The protection of a valuable trade secret is necessarily imprecise. Some potential sources of difficulty are immediately obvious. What part does an individual's skill and experience play in developing a process? What part of that process is a novelty, to whose exclusive benefits the employer is fully entitled? What use can an employee make of useful information carried away in his memory from his previous place of employment? A person, for instance, who was employed in digesting technical papers and making reports on them cannot keep copies of those reports. But he can use what he could remember of them.

British and American practice in these elusive matters has been clearly set out in Mr Turner's book. He assembles all the relevant case law into well chosen compartments, which should enable businessmen as well as lawyers and patent agents to use the book as their source of reference without difficulty. The volume is also well-indexed and contains a table of cases. It discusses remedies and suggests a procedure for the disclosure and receipt of information of this type. Though this book is itself an extremely useful pioneering work, a clear exposition of European practice in the handling of trade secrets might now be of even greater interest to businessmen.

Morphemes without Tears

The Use of English

By Randolph Quirk.
Longmans. 341 pages. 12s. 6d.

PROFESSOR QUIRK has written a stimulating book. He is an expert in the modern science of linguistics; but he is kind to the amateur and lets nothing of his hidden art protrude. What appears on the surface is common sense. The book is based on a series of broadcast talks and shows signs of its origins: it is a collection of essays rather than a coherent whole. Clarity of style, different usages for different purposes (the best passage in the book), the use of dictionaries, poetic language (not so good) and many other topics find their place. Each chapter ends with a well-designed set of exercises. Nine-tenths of the book or more is about the written language; but what most distinguishes it from the spate of intelligent books on the subject that are appearing just now is a long, clear and interesting supplement by Mr A. C. Gimson on the phonetics of contemporary English. This is much to be recommended to all of us Jourdains who do not know what phonemes issue from our mouths. A further short supplement by Mr J. Warburg attacks once again the deathless fallacy that there are absolute standards of language, as distinct from generally accepted usage.

Only at one point do the authors depart from their calm and objective acceptance of the language as it really is spoken. They get hot under the collar at the concept of an upper class idiom. Education, they say, is now widespread—and so it is, partly thanks to Miss Mitford. But when Professor Quirk says that standard English means something different to the educated Scot, and Mr Gimson says that what he prudishly calls "Received Pronunciation" is no longer the exclusive property of any particular social stratum, they are straining the facts to fit their social prejudices. What they say may be true a few decades hence;

but everyone knows that, inside the class of educated men, accent is still a most effective shibboleth, used as such day by day, with no permissible regional variations inside these islands. It has less and less practical significance; more and more educated men speak with what used to be called a vulgar accent and never suffer from it. But the continued existence of this particular standard is a social and linguistic fact of the greatest interest, and should be recorded and analysed, not glossed over or wished away.

Hindu of the West

Rabindranath Tagore

By Krishna Kripalani.
Oxford University Press. 417 pages. 35s.

EVERYBODY knows that Tagore received the Nobel Prize for literature, the first Asian to be thus honoured. But few can have read the whole works of the poet-author-dramatist since only a small percentage of his gargantuan output has been translated; and this has, from all accounts, lost much of its flavour in the process. Mr Kripalani's biography of his grandfather-in-law is a good substitute for reading him. It provides a complete synopsis of Tagore's innumerable works, and shows us Tagore the universal man, as prolific with his pen, his brush and his ideas as he was with his songs. It also places the poet in the background of his own society, at the crossroads of Hinduism and westernisation, a crossroads jammed with contradictions. Tagore campaigned against child marriage and untouchability; but he himself was married off when he was twenty-three to a girl of ten who was poor, ugly and uneducated because she belonged to the same untouchable brahmin sub-caste; and in his turn he married his own daughter off when she was only eleven. In his own educational institution he enforced segregation on untouchable students, to Gandhi's dismay, on the plea that social reform must not anticipate social awakening.

This is the more puzzling in that in many ways Tagore was ahead of the Mahatma. A moderniser within his own tradition he used western experience to create a Hindu rural university; he founded the community project approach to rural development and insisted that culture cannot be acquired but must spring from the soil; and to prove this he created Santiniketan. He entered into open controversy with Gandhi over spinning and self-sufficient villages because he was a man of progress. Tagore, like most forerunners, was doomed to remain all his life an outsider at loggerheads with everybody. His own people did not approve of the fairmindedness with which he was prepared to give the West its due, just as the West was angry at the manner in which he supported Indian independence and allowed himself to be used by totalitarian regimes in Italy, Germany and Russia.

Mr Kripalani tells the truth and makes no excuses; his hero is naive, unworldly, vain—"Praise shames me for I secretly beg for it"—profoundly humble at the same time and always honest with himself. Tagore's childhood was surrounded by a jungle of geniuses; everybody in his large family was so talented that his own genius took a long time to be noticed. He was deeply in love with his brother's wife and she committed suicide when he was married off. Mr Kripalani's description of this period of Tagore's life is the best part of the book, for it evokes an age gone by and makes Bengal come to life, with all its eccentricities and its cultural wealth, more vividly than anything this reviewer has seen. In addition, in his synopsis of Tagore's work one can sense the great Hindu poet-moralist, in the best Mahabharata and Bhagavad Gita tradition. Tagore was a man whose genius like a banyan tree shot out master branches in every direction, but like a banyan tree he always remained firmly grounded in the soil of his native land. This biography should be read by those who want to understand the mind of India in transition.

The Forerunner

Marshal of France: *The Life and Times of Maurice de Saxe.*

By John Manchip White.
Hamish Hamilton. 314 pages. 35s.

JOHN MANCHIP WHITE has left the exotic corruption of his Conradesque story "The Mercenaries" for the cynical sophistication of the eighteenth century in which a mercenary became a marshal of France. This biography should encourage other novelists to cultivate those colourful characters whom our donnish historians seem afraid to meet. But they will need equally good equipment: unflagging interest in research, the selective skill of a painter, the subtlety of a face-to-face interviewer, a style that illuminates and warms; and a publisher who provides first-class paper, print, maps, tables and illustrations.

Maurice, born in 1696, was one of the three hundred and fifty-five illegitimate children of the Elector Augustus of Saxony who was deservedly nicknamed "the strong." His mother was Aurora Countess von Konigsmarck; his maternal great-grandfather "Old Konigsmarck," a Brandenburger who commanded an army for Gustavus Adolphus; one of his uncles loved the wife and was murdered by the mistress of our George I; a genealogy which promised, as Mr White felicitously remarks, unusual potentialities "in bed and battle."

Battle was, however, the natural medium for Maurice's genius. His amorous propensities earned notoriety; but his creative brilliance in the theory and practice of war has given him a place among the great captains. He started as a cadet-musketeer in the Saxon contingent serving under Marlborough at Malplaquet. From Marlborough's school he passed to that of Eugene, under whom he served as a volunteer against the Turks at Belgrade. The reputation he gained for courage and initiative, added to his personal charm (and Aurora's persistent importunity), induced Augustus to include Maurice among the six electoral bastards to whom titles and properties were awarded, and to conscript an heiress for his wife. But by 1720 the young Count de Saxe, having run through her fortune and got rid of her by an easily arranged Lutheran divorce, left Dresden for Paris and service in the army of Louis XV.

After a short spell in a minor appointment he badgered the indulgent Augustus into buying him a regiment—an expensive military investment, but soon to become one of the most efficient in France. Its training inspired many of the theories he tested later on a larger scale. Meanwhile his life had its lighter side: he enjoyed a prolonged affaire with the actress Adrienne Lecouvreur, and a briefer, if more exacting, one with Peter the Great's eccentric niece, Anna, during a serio-comic attempt to win a dukedom in Courland. But by 1732 he was ready; he might have said, like Napoleon seventy years later, "if I always seem to be prepared it is because I have meditated long."

His meditations had generated his "Reveries" perhaps the most influential military textbook ever written. But its effect was postponed till after his death. Publication in Saxe's lifetime would have been suicidal. Throughout his professional life he had to fight two enemies—the commanders on the other side, and the jealousy and obstinacy of court favourites or obstructive veterans on his own. His reputation rose rapidly in the Wars of the Polish and Austrian Successions; but not till two years after Fontenoy was he, as Marshal-General, able to initiate any reforms. His victory at Fontenoy is consequently less impressive than the relentless determination and skill of the feints and thrusts by which he confused, alarmed, unbalanced, and finally separated and defeated the Anglo-Austrian armies between 1745 and 1748.

He was only fifty-four when he died. But considering that dropsy had compelled him to ride in a wicker carriage at Fontenoy, that he shocked his opponents (and his more conservative colleagues) by campaigning in the following winters, and that his life in retirement at Chambord, with his own court and private army, was a fantastic mixture of drill and debauchery, it is surprising that he lasted so long. Three years later, in 1753, his "Reveries" were published. They are used by Mr White as an epilogue and an obituary. In a sense they were a legacy more important than his hero's life—daydreams which became the doctrines preached (and to some extent practised) by the men who taught the young Bonaparte. It is an historical fact, rather than a picturesque metaphor, that Maurice de Saxe was Napoleon's forerunner on the road to glory.

These three Vauxhalls have changed people's ideas

This Victor has changed people's ideas about family saloons. It has set new standards in styling, comfort and easy maintenance. Well over 100,000 people have already chosen it. Join them, and you will find that good design speaks for itself—and for you.

VAUXHALL VICTOR

£702.5.3. Victor Super £736.12.9. Victor de luxe £798.10.3. All-synchro 3 or 4-speed gearbox. 12,000 mile lubrication interval.

The Victor has changed people's attitudes to estate cars, too. Thousands of motorists have bought their first estate car because this Victor is so unusually elegant and practical. The Victor takes all that room at the back in its stride; it really *likes* being an estate car.

VICTOR ESTATE

£812.5.3. 46½ cu. ft. load space with rear seat folded. 21½ cu. ft. with 5 adults. Low axle ratio. Heavy-duty tyres & springs.

All prices include Purchase Tax

The VX4/90 has made motorists think again about 'performance' cars It has shown that real liveliness and real luxury *can* go together in a roomy four-door Saloon — and still give about 30 m.p.g. With extra power matched by extra safety the VX4/90 offers vivid motoring with the velvet touch.

VAUXHALL VX4/90

£927.15.3. 1.5 litres, 4 cyls., 81 b.h.p. Twin carburetters. Power-assisted brakes (disc at front). 4-speed-all synchro, floor-mounted lever.

A bright outlook
on a grey day...

A NEW MOSS BROS OVERCOAT

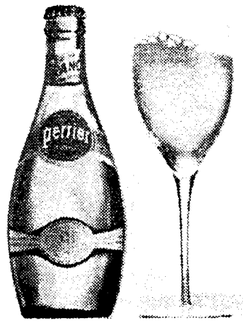
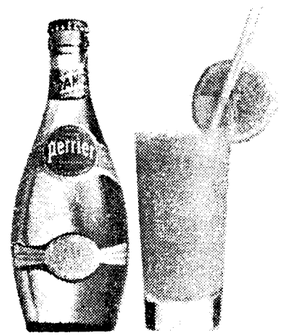
Perrier au naturel



Le Whisky Perrier

Le Citron Perrier



What shall you drink with your Perrier?

Cognac, whisky, blanc ordinaire? The juice of fresh oranges? Or do you prefer to drink Perrier by itself, well chilled, just for the joy of it?

Perrier enlivens your drink and your palate as nothing else can. After all, it's the finest table water money can buy. The purest sparkling water in the world. perrier

BEAT LITTLE PERRIER

Biblical Archaeology

The Crescent and the Bull; *A Survey of Archaeology in the Near East*

By Erich Zehren. (Translated by James Cleugh).
Sidgwick and Jackson. 375 pages. 36s.

READERS with a taste for archaeology now have plenty of books to choose from. For light reading, they can relax in company with Leonard Cottrell; if they prefer to keep the civilisations of the ancient world in watertight compartments, Professor Sabatino Moscati will oblige; those who would rather visit the dig and be present at the unearthing can do so with Leonard Woolley or Seton Lloyd; any who relish decipherment can work stage by stage on cuneiform or Linear B. Given this wealth of approaches, there is now room only for good books on the subject, and Herr Zehren's (translated from the German) is not well enough arranged to rank in that class.

His title in the original German—more illuminating than that in English—was "The Mounds of the Bible", and he aimed only at covering biblical archaeology. But, to simplify this huge subject for the common reader, some form of chronology was required. Herr Zehren has preferred a geographical arrangement, and, as he plods from the Bosphorus to Sinai and beyond, skips back and forth in the history both of the ancient world and of the science of archaeology in a way that supplies too few signposts to the centuries. As he cannot forbear to leave out a single mound (he throws in Troy and the Monastery of St Catherine on Sinai as he passes by) he is apt to overdose with information. The line drawings are adequate at the price of the books, but the whole would have been greatly improved by a table of comparative chronology.

OTHER BOOKS

PLANNING. Papers read at the Business Economists' Conference, April, 1962. *Eyre & Spottiswoode.* 43 pages. 6s.

Two of the four papers in this booklet on economic planning are by active planners—the heads of the planning organisations in France and the Netherlands. The other two represent the academic thinking of Professors Frank Paish and Tom Wilson.

HUNGARY: *A Short History.* By C. A. Macartney. *Edinburgh University Press.* 271 pages. 21s.

This is the sort of "short history" that one would like to see more of. Dr Macartney, the foremost authority writing in English on the history of Hungary, succeeds in describing both the wood and the trees of his subject. His book spans the whole range of Hungarian history from the 9th century AD to 1956. He packs it with information on both Hungary's political and economic development, while standing back from time to time to describe the basic issues and problems, and to give his own assessment of men and policies. The book is attractively produced with pictures and maps; all that it lacks is a short bibliography.

LETTERS

Liberals and Industry

SIR—Your description of the Liberal Industrial Committee Report as "undesirable" can be accepted as unexceptionable though highly subjective comment, but I would caution you against the use of the adjective "amateurish." The group included a director of an international company, a professor of industrial relations, an economist/engineering works manager, a shop steward, and a trade union official. You thoroughly misunderstand this subject.

1. It is quite clear that under our proposals the government of the day would have the power to appoint a "Dr Beeching" to the board of a nationalised industry (see page 42) in an emergency, but it would in effect have to justify the appointment to the House of Commons beforehand. We should therefore be spared the undignified picture of a government leaving one of its paid servants to fight its political battles with his own subordinates.

2. The introduction of new capital, or takeovers, need not be affected, and employees would have no control over the disposition of shares by those who own them. However, employees would be in a position to ensure that their interests were not ignored when major changes in the ownership of the share capital took place.

3. The proposals which we make have nothing to do with the selection of managers, which will, as now, be the duty of the board. The revised annual meeting would be very much more competent than is the present one (if it takes the trouble) to approve or otherwise the proposed board appointments, and, odd though it may seem to you, merit receives recognition even at shop floor level. It might be a little more difficult, say, to replace the late Sir Allen Clark and his colleagues by Lord Kilmuir, Mr Watkinson, and Lord Harding rather than by someone who had a clue about the business, but what do you suppose this sort of appointment does to the promotion prospects which you cherish? Outsiders should need to be justified.

4. Efficiency will be promoted when in a competitive economy directors know that they are vulnerable at the end of the year if profits and earnings do not come up to expectations. It is the self-perpetuating old boy oligarchies, immune from formal attack by unorganised shareholders and employees, which breed inefficiency.—Yours faithfully,

PETER MCGREGOR
Chairman, Liberal Party Committee on Industrial Affairs
London, NW9

Crisis of Irresponsibility

SIR—Your sprightly review, reflecting the emphasis expressed in Mr Bennett's excellent though controversial book on the financial crisis of 1931, levels the charge of irresponsibility at Germany, the United States and Britain in turn but excuses France from the general condemnation. Why? As we are still living with the distant consequences of the Treaty of Versailles and the economic slump of the 1930s the question may not simply be of academic significance. The key passage expressing Mr Bennett's interpretation (which your reviewer seems to share) is as follows:

> France failed to offer Germany any voluntary concession and insisted on her reparations privileges. She tried to use her financial strength to coerce other countries, and displayed a monomania of her own, an almost blind veneration for the Versailles *status quo*. France and Germany seemed to be haunted, in different ways, by the contrast between their respective positions as laid down in the treaties, and their respective economic and military potentials. It appeared that the treaties represented an unrealistic effort to establish an artificial French superiority.
>
> But the peace settlement had been the result of a real victory, even though a close one. It was a victory of the Allies, not France alone, and reflected the preponderance of Allied over Austro-German power. Ultimately the peace as laid down could only be maintained if all the Allies supported it. But some of the Allies, principally Britain and the United States, did not do this, and it was largely their irresponsibility which left France in a state of nervous anxiety and exposed Germany to delusions of potential grandeur.

As the first paragraph implicitly recognises, France was quite as prepared to use Germany's financial weakness to block any move towards revision of the Versailles treaty as Germany was to exploit the financial crisis to push the cause of revision. It was the French who were most insistent on a harsh treaty at Versailles and who dug in their heels about reparations. With her manpower bled white in the Great War, her fear of the rebirth of a strong Germany is understandable. But, sixty years later, there was still something of the spirit of revenge for 1871 in the French attitude. Can the other powers really be described as irresponsible in seeing, as the French would not, that strict adherence to the treaty of Versailles was doing more harm than good? Surely, the French attitude held up the search for a broader solution of the financial crisis through a revision of reparations (or through a customs union) and played at least some part in prolonging and deepening that crisis. France may have deserved "help and understanding" but if she had displayed a more accommodating spirit she might have got them—and might have merited them. In diplomatic history, it is perhaps better to avoid the charge of

irresponsibility, for like guilt it can be a sword with two edges ; but once it is made, I for one cannot see on the evidence presented in Mr Bennett's book why France should be judged blameless.—Yours faithfully,

G. CHARLES

Shoreham, Kent

Nurses' Pay

SIR—Your comment criticising the industrial court's award of an interim 7½ per cent increase for nurses, plus a directive to the Whitley Council to negotiate bigger increases by March 31st, shows little knowledge of the background to the nurses' claim. That claim was for a far-reaching reconstruction of the present outdated and hopelessly inadequate grading structure, combined with a review of differentials between those exercising the highest levels of skill and responsibility and their juniors. It called for increases of 33 per cent overall —and of as much as 60 per cent for some grades.

The claim was supported by an impressive weight of evidence—of inadequate recruitment and widespread wastage, leading to the present shortage of 26,000 nurses (the minister's estimate) ; of a drastic fall in the proportion of qualified to unqualified staff ; of the heavier demands made on nurses by the recent revolutions in treatment of mental, surgical, and medical illness ; of the rising birthrate threatening imminent breakdown of both the hospital and domiciliary midwifery services ; and of the certainty that the nursing force had no hope, in present circumstances, of manning the additional beds required under the hospital rebuilding plans. To this evidence, the ministry's spokesman made no reply. He confined himself to unsupported generalisations that salaries and staffing were adequate, that the shortages were "local," and that Government policy limited the minister to a ceiling of 2½ per cent.

The court did not "bow to popular emotional impulses," since none were displayed. It heard the hard facts—and, having heard them, it agreed that "the level of salaries and training allowances is in general too low and . . . should without delay be increased." In doing that, it was doing what the Whitley Council itself should have done months and years ago—and would have done had the dead hand of the Ministry of Health not prevented it, continuously since 1950.

Nurses have been denied economic justice for many years—and the hospital service (and hospital patients) have suffered in consequence. So far from being "incoherent" and a sign that the court is "unable to do its job" therefore, the award marks at long last a recognition that, sometimes, facts can triumph over ministerial blindness and negation.—Yours faithfully,

W. C. ANDERSON

General Secretary, National and Local Government Officers Association

London, NW1

Twin Towns

SIR—In the article "Perils of Twinning," which appeared in your issue of April 7th, 1962, your correspondent states that: "Soon after Mr Bortman's visit (1955) certain of M. Bressand's Franco-American *jumelages* were lured away fom *Le Monde Bilingue*."

This creates the impression that York, Pennsylvania (the only American city named in the article) has been "lured away." Permit me, therefore, to make our position clear:

(a) Despite M. Bressand's part in the initial stages of our twinning with Arles, and our correspondence with him, we never entered into an affiliation with *Le Monde Bilingue* or its United Towns Organisation. Thus we could have not been enticed to leave *Le Monde Bilingue* since we never joined this organisation.

(b) We decided to stop corresponding with M. Bressand even before we met Mr Bortman, members of the Civic Committee, or any one connected with the People-To-People Program. (The date of our last letter to M. Bressand was March 3rd, 1958 —which was not "soon after Mr Bortman's visit in 1955.")

(c) Never did Mr Bortman (since we met him) or any one of the Civic Committee or of any other committee of the People-To-People Program discuss or even mention to me or any other member of the York-Arles Twinning Committee either M. Bressand or his *Le Monde Bilingue* or its United Towns Organisation.

(d) The reason for our decision to stop corresponding with M. Bressand was the disillusionment we began to face regarding the idealism of *Le Monde Bilingue*. Previously we believed it to exist and therefore eulogised it in our "Story of the Twinning of York, Pennsylvania and Arles, Bouches-du-Rhône, France."

M. Bressand's letter to us, which finally "broke the camel's back" revealed a bitterness against American foundations, who refused to support his organisation financially, and an obnoxious attitude of prejudice and suspicion we could no more tolerate.—Yours faithfully,

MOSES N. FRIEDMAN

York-Arles Twinning Committee, Inc.

York, Pennsylvania

Supersonics

SIR—Your article on the supersonic airliner did not make the point clear that the airlines' reluctance to buy propeller turbine aircraft was to a large extent a question of their operating economy. It was originally intended that these aircraft would have a substantial advantage in operating costs over the jets and would open up new markets in air travel. In the case of the longer haul aircraft, this margin was largely eroded between the time of the go-ahead decision and their entry into service, because the cost of aircraft manufacture and of flight crews grew while the price of fuel fell. This tended to favour the faster jet aircraft which spreads its capital and crew costs over a greater product in seat miles performed than its slower counterpart, though burning more fuel. On shorter routes, on which the cost advantage of the propeller turbine aircraft is greater, operators are often prevented by international agreement from charging lower fares than those for jet aircraft.

Surely the lesson of this is that one can only sell a slower aircraft against a faster one, available concurrently, if the advantage in cost per seat mile is substantial and if the fare differential made possible can be used to attract profitable loads.

I do not consider that your article's suggestion that the airlines may not buy a Mach 2 aircraft in the early seventies because of the prospect of a Mach 3 aircraft in the late seventies really follows from the history of propeller turbine aircraft, or that, whatever the arguments for or against the supersonic airliner may be, one can reach useful conclusions regarding the relative merits of steel or light alloy construction in this way.—Yours faithfully,

P. J. DETMOLD

London, SW1

"Australasia"

SIR—In the first leader of your issue of September 1st when discussing the Common Market problem you refer to "the Canadians and Australasians."

New Zealanders, while conceding that the term "Australasia" may have some vague geographical connotation, are unanimously opposed to its use in a political context. Their view is reinforced by the recent conclusion reached at Brussels that New Zealand's position requires special consideration—a conclusion with which we hope *The Economist* agrees.—Yours faithfully,

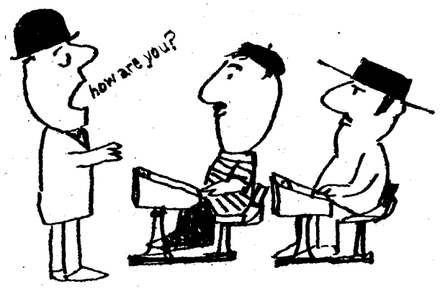
HOME REPORT

Members of the editorial staff and local correspondents report on the life and happenings in and around Britain



As She is Spoke

FROM A CORRESPONDENT

AUGUST and the tourist season end together: but a steady, though diminished trickle continues of Britain's newest type of foreign visitor. According to recent sample surveys undertaken by the British Travel and Holidays Association, about 200,000 visitors from the common market countries and Scandinavia claimed to come to England last year to brush up their business-letters, if not their Shakespeare. If one adds to these another 50,000 foreign workers and 15,000 *au pair* girls for language courses, the total market is well over a quarter of a million. Teaching English to foreigners is an expanding business.

Some people have already recognised this. In the London "classified" directory for 1951, 11 institutions teaching English and other languages were listed. Today, apart from those of the LCC, there are at least 52 other schools in London offering instruction in English. In the country as a whole there are at least 100 private schools of English, about a quarter of which are "recognised" by the Ministry of Education. Almost all these schools are concentrated in London and the south-east, the old university cities and the south coast resort towns being especially popular.

Much of this increase results from the general boom in the travel trade. Since 1951 the number of visitors from France has doubled, and those from Germany have increased by almost 500 per cent. Of these French and German tourists, almost 40 per cent claim to come here to learn English. The increase in the long-term students, however, is more probably explained by the growing popularity of the *au pair* idea (14,912 last year), the increasing employment of Continental workers (1951: 32,632 : 1961: 51,775), and the growing wish of prosperous Continental parents to "finish" their children's education in a pleasant, and useful, manner. Many schools cater for these students by offering sessional courses of about three months. Some schools, in addition to this, offer short summer "vacation" courses, of from two to four weeks, with three or four hours daily tuition and visits to "places of interest." Accommodation is frequently arranged with nearby families, and the inclusive cost varies from about £10 to £14 a week.

In London, where most of the visitors, *au pair* girls and many foreign workers stay, the schools are mainly in four areas; 17 within a half-mile radius of Oxford Circus, another 15 in the Bayswater-Kensington area. A further half-dozen are in Hampstead. The fourth group, less expectedly, are in south-east London, near Herne Hill and Dulwich, a factor largely explained by the prevalence of many-roomed Victorian houses with lower rates and a local population willing to act as hosts whilst at the same time supplementing the family income. Two student visitors might bring in £40 a month.

School premises run the whole gamut of size, suitability, cleanliness and decoration, from the specially-built, 27-classroom block, accepting over 5,000 students a year, to the drab two rooms over a dingy shop, with perhaps 12 students at a time. The average school seems to have from three to eight rooms, frequently occupying the top two or three storeys over a shop or office premises, and might have between 12 and 60 students. During the summer these numbers may expand considerably ; one seaside school was so crowded last month it had to work three 4-hour shifts a day. Another in Kensington overflowed into a neighbouring basement.

FEES on long-term courses range from about 8 to 10 guineas a month for 15 hours weekly tuition in a class of some 10 to 15 students. In the summer this number might jump to 25. The schools probably get teachers of the quality they can pay for ; throughout June and July one school advertised in a national weekly for "Tutors in English for Continental students. 15 hours weekly for £5." The prospectus of this school, the inclusive board and tuition fees of which are almost £11 a week, refers to teaching by "fully qualified English tutors." At another institution where, according to the brochure, "every member of the staff is a qualified specialist in the teaching of English to foreign students," one prospective teacher inquired about teaching vacancies. With no inquiry into his name, qualifications or experience, he was asked to come the same evening to lead a conversation group. The rate was 6s. an hour. "After all," it was explained, "you only have to talk with them." Although some rates are as low as 3s. 6d. per hour, the hourly average for the larger schools seems to be about 10s. to 12s. 6d. The LCC rate for a two-hour session is £2 8s. 6d.

Teachers employed at this price vary. Some are grateful research graduates who, on the whole, probably give good value for money. Others might be returned expatriates with a smattering of languages but no teaching experience. The foreign student, in a strange country and unsure of his case, rarely complains outside his own immediate circle, especially if he is only here for a fortnight.

Caveat emptor might be good advice for the prospective student. But how far can he rely on the prospectus ? That of one school (recently closed), referred to "our fully qualified staff . . . specialists in the teaching of English to foreign students" ; the school was owned, taught and administered by one unqualified person. "Beginners must not be worried," states another prospectus, "if they seem to understand very little in the first few lessons. Even if they seem to understand nothing, they are still learning unconsciously." Another school in a somewhat less than fashionable suburb, accommodating over 200 students with neighbouring landladies, refers to families "chosen for their purity of language and excellent manners."

Whatever happens about the common market, more and more people are going to want to learn English. In particular, American investment in Europe pushes up the demand. Already, many Continental students are sent here at their firm's expense. Some countries give tax concessions for course expenses. In February, 1963, new British Travel publicity is aiming to attract visitors to specific kinds of "Holidays in Britain" and one of these will be the Study Holiday with the accent on learning English. Printed in seven languages, this publicity is aimed at 250,000 readers, and it will probably reach double that number. However many may come, it is important, from all points of view, that they return better satisfied with the tuition they receive than do many students in private schools of English.

Party Militants?

FROM A CORRESPONDENT

ACTIVE members of British political parties are treated with scant respect in most writing about British politics; the general tendency seems to be to suggest that such products of radical ideology should not exist. Party leaders take note of these people rather as they take note of certain groups of MPs—in order to avoid them. Academic students of politics have devoted much time and energy to noting the existence of activists—only to call for their relegation to the most menial of roles. As a result, people who might be thought to be practising a duty of citizenship by upholding party standards in their community often appear in the press as atypical if not unbalanced, psychologically as well as politically. Now at least one academic researcher has sprung up to stigmatise this practice as quite unfair.

The definitive study of local party organisations will probably not be done until the Ford Foundation decides that Britain, like the Afro-Asian nations, is at least potentially a developing country. But while waiting for American largesse and American research techniques to invade this isle, a recent academic article* by Mr Richard Rose of Manchester University has argued that there were broadly four contrasting kinds of attitudes which local parties showed in the resolutions that they submitted for their annual conferences between 1955 and 1960. This article will apply Mr Rose's four classifications to the 441 resolutions that were offered in the agenda for the Labour party conference at Brighton next month.

(1) The first group comprises the constituency parties that are **somnolent,** rather than militant. This year more than one-third of local Labour parties are not offering any advice to party leaders. This is an average showing for Labour, although well below the standards of Conservative conferences, where annually upwards of half the parties do not presume to rise above their station and give advice to Her Majesty's ministers.

(2) The largest single heading in the classification of resolutions for Brighton is—perhaps surprisingly—**non-partisan.** Fifty-five per cent of the resolutions for Brighton express views which appear to be derived from the concerns of pressure groups, or from the sentiments of a cross-section of society, rather than from long meditation upon the eternal principles of socialism; they might appear as much on a Conservative or Liberal agenda as on a Labour one.

This tendency is particularly marked among those concerned with education, local government and pensions, where the cry is for "more money" rather than for "more socialism." For instance, of 26 resolutions dealing with education, none mentions comprehensive schools or the abolition of the public schools. Instead, Scottish parties press for more education for Scotland, South Kensington seeks more university places and Aylesbury asks for better care for the physically and mentally handicapped. Resolutions about local government are primarily concerned with the burden of rates. From places as different as Salisbury and Bradford South come pleas for the Government (not Labour's national executive) to do something to help finance local authorities. About 10 per cent of the resolutions are miscellaneous. Idiosyncrasy, rather than ideology, presumably accounts for the desire of the militants in the Guildford Labour Party for a great Labour crusade to prevent young people from driving motor-cycles of more than 125 cc until they are 18.

MANY of this year's Brighton resolutions against entry into the common market can be called non-partisan, in Mr Rose's sense of the word. Slightly less than half of the 51 resolutions oppose the common market on partisan grounds, as a threat to building socialism. A few propound a left-wing alternative. But more than half make no open reference to Labour's economic doctrines, and some resolutions base their objections on a concern for the Commonwealth. Partisan feelings may explain why the bulk of resolutions are against the common market; after all, a Conservative government has proposed it. But this does not explain why so many resolutions opposing the common market do so in arguments and phrases identical with those of a number of Conservatives.

(3) About one quarter of the resolutions from Labour constituency parties this year can justly be called **partisan** but not extremist. That is to say, they are drawn in terms sufficiently broad to appeal to all Labour Party members and few Conservatives. This is particularly noticeable in fields such as housing and economic affairs. Sometimes, socialism and self-interest are nicely intertwined, as in the resolutions from constituency parties in depressed areas, asking that industry be directed to their doors by the next Labour government. The efforts of the Campaign for Democratic Socialism in constituency parties may account for the production of a number of resolutions on multilateral disarmament so skilfully and selectively drafted as to meet with the approval, even if only grudging, of all wings of the movement.

(4) Finally, the voice of **left-wing** extremists is heard in only 22 per cent of the resolutions for Brighton. According to Mr Rose, the hard core of consistently extremist parties, numbering about 100, are found in all kinds of constituencies; he denies that they are all bunched in hopeless Labour seats like Hampstead and Bath. For instance, there are 15 left-wing resolutions this year complaining that a purge mentality is beginning to show itself in *Transport House*; of these, nine come from parties with Conservative MPs, and six from those with Labour MPs, about the national proportion.

It is in foreign affairs that left-wing views seem disproportionately concentrated in middle-class areas this year. Of 32 CND-type resolutions from Labour parties, 24 come from those with Conservative MPs. Over a six-year period, Labour parties in middle class areas which Labour will never win (the dispensable tonsils, rather than the backbone of the movement) are slightly more extremist than those in safe working-class seats. The difference is statistically significant, but not politically significant; over a period of 12 years it represents the difference between a local party filing four extremist resolutions rather than three.

The resolutions for Brighton suggest that active workers in local Labour parties cannot be glibly type-cast. Some may join because they wish to spread the gospel of socialism, but others may join the party because they are joiners, or because they like the Christmas party, or perhaps because they hope for a headship in a local school. The bulk appear to acquire many opinions outside the Labour party, from pressure group connections, as in the case of the trawlermen of Grimsby, or from sentiments of goodwill common to Englishmen of all parties and none. By containing a section of extremists, as well as partisans and those with few partisan feelings, the local Labour parties, in conjunction with their Conservative counterparts, do not deny British public opinion; they reflect it.

*"The Political Ideas of English Party Activists," *American Political Science Review*, June, 1962.

Jersey Fills the Gap

THE States of Jersey, without a murmur of dissent, in April abolished one of the few statutes remaining to it from the reorganisation of the island's government in 1771 (*The Economist*, May 5th): the limit on interest rates, so long set at 5 per cent (because that was where it was at the end of the Royal Court's authority) was erased from the book in the apprehensive hush which followed Mr Selwyn Lloyd's decision to tax English money tucked away in real property abroad to evade death duties. Of such money, owing to a quirk of nomenclature in its laws, Jersey had had a good deal of the benefit, in spite of the 5 per cent rule. It did not expect to get any more on those terms, and wisely, therefore, decided to try to fill the vacuum in the normal way.

The royal assent to the abolition is expected shortly; and when it is given, the first building society the island has known will begin to fight the prejudices natural among people who have, hitherto, been able to lay hands on as much money as they liked at rates which were seldom higher than half what a sensible lender would consider economic. Nor is that the only disadvantage: the Jersey Savings and Loan Corporation Limited will have an initial fund of £150,000, little more than a hundredth of the money which was freely on offer through agents before April 5th. The corporation will charge 6½ per cent on loans, pay 5 per cent on investments, and pay no dividend for the first five years at least—none of which can look very attractive to island borrowers used to accepting large sums at 2 or 3 per cent and reinvesting them immediately at 6 or 9 per cent on the mainland.

On the other hand, there is certainly a market for even relatively expensive money in Jersey among people whose genuine desire to borrow in order to build houses for themselves, and to settle their debts over periods of years without the continuous risk of a six-month notice of foreclosure, was previously frustrated in the feverish conditions of the island's private finances. The new venture has been backed by one of the Big Five banks and by a solid insurance business.

Farewell to Hallmarks

FROM A CORRESPONDENT

ONE of Britain's most ancient industries received the gentlest possible push towards the twentieth century last month, when the Chester assay office closed down on August 24th. This has so far been the only tangible consequence of the radical report of a departmental committee which in March 1959 proposed a reform of the system for hallmarking—and thus guaranteeing the quality—of gold and silver articles. From the fourteenth and fifteenth centuries the right and duty of certifying articles of precious metal has been entrusted to the guilds of goldsmiths in large cities.

To this day there survive five completely autonomous assay offices, at Birmingham, London, Sheffield, Edinburgh and Glasgow. The Birmingham Assay Office Act, 1824, placed the control of that office, now the largest in Britain, in the hands of a board of 36 guardians. These must live or own property in Birmingham or within 30 miles of it. Not more than nine or fewer than six of them can be goldsmiths or silversmiths. The guardians are appointed for life and choose their own successors. At Sheffield, the guardians number 30 and of these not more than 10 or fewer than six may be silversmiths. They must live or own property in Sheffield or within 20 miles. They are elected for a period of five years and may be re-elected for further periods. The London assay office is controlled by the Goldsmiths Company of London: more than a quarter of its court of assistants is connected with this trade. The Edinburgh assay office is maintained by the Incorporation of Goldsmiths of the City of Edinburgh, which is known to include trade members although its complete membership is not made public. The Glasgow assay office was established by an Act of 1819 and has a board of about 30, all of them gold or silversmiths. These must reside in Glasgow or "within forty miles to the west and south thereof."

Each of these five hallmarking authorities has statutes peculiar to itself and restricted to its own district. Some general hallmarking statutes apply to the whole of Britain, while others apply to England only or to Scotland only. It is no wonder that this statutory hotch-potch caused Lord Justice Denning (in *Westwood v. Cann*, 1952) to remark: "I would observe that in 1856 and 1879 select committees said that the law as to hallmarking was uncertain owing to the number of statutes in which it was found to be: and they expressed the opinion that the consolidation and amendment of the law should be carried out without further delay. Now 73 years later, in 1952, I may, perhaps, be permitted to express the same opinion."

A Board of Trade investigation in 1887 reported in the following expressive terms: "In certain Offices the results are not systematically controlled by 'check assays': the furnaces closely resemble those described and figured by the early metallurgical writer Biringuccio in 1540, and the balances are hardly more delicate than those of which illustrations were given by Lazarus Ercker in 1580, and by the author of *A Touchstone for Gold and Silver Wares* in 1675."

Nowadays general standards of assaying are on a higher level, but with each assay office under independent control, with differing financial resources, without uniform rates of pay or conditions of service or standardised training, it cannot be expected that the efficiency of all the offices should be the same. Another relic of the past is that although the manufacture of gold and silver articles in Britain is virtually confined to England, yet Scotland has two assay offices to handle perhaps 2 per cent of the total British output. As with some other Scottish industries, any suggestion that economy and efficiency demand the closure of even one of the Scottish offices rouses an intimidating sound of clashing claymores.

THE hallmarking system of the future should no longer be fixed immovably to certain towns. The central authority, whether it be a statutory corporation or a department of the Board of Trade, should have power to open an assay office where one is needed and to close it when the need has passed. Even mobile assay offices in vans should be considered. Recently such a one would have proved its worth at Coventry when it was discovered that a 5 cwt silver cross in the new cathedral had not been assayed or hallmarked. Mobility could even provide a nice little export trade: the Swiss have asked Britain to open an assay office at Berne, while the United States possesses no hallmarking system and a number of British assay offices established there would meet a marked American liking for *British hallmarks*.

In modernising the administration, it must not be overlooked that the hallmark itself is in need of modernisation. At present a hallmark consists of no less than four separate marks. There is the mark of the maker; the mark of the assay office; a date-letter altered each year; and the standard mark which indicates the quality of the gold or silver. Of all these, the only essential one is the standard mark which certifies the quality of the precious metal. The others are confusing and irrelevant: when stamped on to small or intricately-worked articles they can easily cause damage. The time-honoured marks of the old corporate bodies will survive as long as the beautiful objects they adorn. But it is really time for this tradition to pass into history.

THE WORLD OVERSEAS

After General de Gaulle's Triumph

FROM OUR BONN CORRESPONDENT

AFTER apotheosis, anticlimax. President de Gaulle is back in France and Dr Adenauer has set off on a three weeks' holiday in Italy; lesser mortals are left to hold the ethereal baby the great men have left behind, and to quieten the neighbours. Still, it would be churlish and crass to belittle what has been achieved. The French President made a brilliant personal appearance—the product in part of the authority of his own prestige and style, and in part of the German people's long abstinence from pageantry and hero-worship. General de Gaulle's success was the reward, too, of attention to detail. Without a trace of condescension, the president adapted himself imaginatively to his varying audiences on the Rhine, the Ruhr, the Elbe, and in the south. Having gone to the trouble to brush up for the occasion the smattering of German he learned while he was a prisoner at Ingolstadt in the first world war, he was able to talk intelligibly to the crowds at each stage of his journey. He told them they were great. And of course they loved it. No American, British or Soviet leader who has visited Germany since the war has wooed the German public so handsomely.

This fascinating performance has set much of the German political world searching the president's every word and gesture for hidden secrets. The publicity-mongers of the various political parties, who have to make do with leaders of lesser stature, are brooding wistfully over the general's conquest in the hope at least of picking up a useful wrinkle or two. It has been spotted that the only member of the cabinet, other than the chancellor, with whom President de Gaulle talked when he arrived at Bonn airport was Herr Krone, the former parliamentary leader of the Christian Democrats and now minister without portfolio. The reason for Herr Krone's being singled out in this way, it is being put about, is that he is the man whom the chancellor would like to see step into his shoes in the autumn of next year, and that President de Gaulle knows it and approves.

IT has been noted further that the president twice took aside Herr Brandt, the governing burgomaster of Berlin, presumably to help keep him in good spirits. The encounter does not seem to have made the burgomaster altogether happy. Forty-eight hours later, in a weekend speech in aid of the Social Democrats' bid for power in the Schleswig-Holstein Landtag elections (polling is on September 23rd), Herr Brandt appealed to France not to forget that there were seventeen million inarticulate Germans east of the Elbe. He deprecated any fostering of a "Little European solution." France and the German federal republic, he observed, were not Europe; "we must now clasp England's hand as warmly as we have clasped the hand of France."

Such reservations as these were drowned at the time in the applause of the Bavarian and Swabian crowds. The cheers were not for the prodigious visitor alone. They were as much for the idea he brandished of a new era of practical and inviolate Franco-German association. In such a context, who could be against it? But precisely what it means has been left largely to others to interpret, and maybe to accomplish. General de Gaulle himself spoke at Hamburg of closer military co-operation, and at Schloss Ludwigsburg of the cultivation of a rich variety of contacts between the young people. The "now quite natural solidarity" of Germany and France, he declared, "must of course be organised. This is a task for the governments." Neither German nor French official spokesmen have since been able to throw more light on what is to happen next. Speaking for the Bonn government, State Secretary von Hase has been falling back this week on such handy evasions as "a new impulse" in Franco-German relations, and "the necessity for practical measures for increased co-operation between the two countries." He has reiterated that no new exclusive "institutions" are to be set up.

The enthusiasm of the German crowds was genuine and understandable, but it could be misleading. The Munich correspondent of *Die Welt* reported that when the president spoke of "the two great nations" together facing the menace from the east, an old man near by was heard to mutter: "Fine; but unluckily we're not all that great any more." One of the streamers flourished beneath the French president's nose ran "Long live de Gaulle. Long live Europe—but with England." There is, in short, no evidence of President de Gaulle having swung a majority of German opinion away from belief in the advantages of a European Community embracing England over a more limited association dominated by Germany and France. An unconfirmed report that President Lübke, with characteristic frankness, put this point of view sharply to his guest, is being approvingly circulated. Simultaneously, the Commonwealth conference is being fully reported in the German press, and Mr Macmillan's difficulties are being sympathetically explained to German readers. Not, of course, that Mr Heath and his team are considered disarmingly modest bargainers. As Herr Krone has put it since President de Gaulle's departure: "When I say we are ready to include England, I must add that one doesn't buy a pig in a poke. The English are cool reckoners. So are we."

Sheikh Abdullah on Trial

FROM OUR CORRESPONDENT IN INDIA

NINE years after he was deposed and arrested, Sheikh Abdullah, former prime minister of Kashmir, with 25 other accused, was on August 31st finally allowed to plead not guilty to the charge of conspiring against the government of Kashmir in order to facilitate its annexation by Pakistan. The prosecution was due to open its case on Thursday, September 13th.

Sheikh Abdullah, a tough, able and arrogant man, once a close confidant of Mr Nehru, was the leading Kashmir nationalist before 1947. He played a large part in securing the state's accession to India when Pakistani tribesmen invaded it after independence, and became its first prime minister. But from 1952 he began to criticise discrimination against Moslems in India and to suggest, once in public, that Kashmir should be independent. In May, 1953, a committee of leading members of his ruling National Conference party—among them Bakshi Ghulam Mohammad, the present prime minister—decided to press for a plebiscite, with independence as a third choice. Bakshi, however, urged the alternative of an autonomous buffer state consisting of the Kashmir valley, leaving the north and west to Pakistan, and Jammu, the largely Hindu southern portion of the state, to join India.

On August 9, 1953, Sheikh Abdullah was abruptly deposed and Bakshi took his place. Abdullah was detained until January, 1958, released and rearrested the same April. He was only committed for trial in January, 1962. If it is allowed to run its full course, the "Kashmir Conspiracy Case" will be a long trial. The committal order fills more than 1,000 typed pages. The prosecution has over 200 witnesses. Mr Dingle Foot, QC, is leading the defence, aided by several Indian lawyers.

ALL the accused are charged with conspiring to overawe the Kashmir government by force, or the show of force. They are alleged to have obtained funds, posters, arms and explosives for this purpose with Pakistani help. At the last moment the prosecution added the charge of conspiracy to "wage war" against India, a technical term for which, with unwitting appropriateness, they quoted precedents in British prosecutions of Indian patriots. A curiosity about the charges is that they relate only to the period between Sheikh Abdullah's first arrest and his second, for nine-tenths of which time he was in prison. He is alleged to have master-minded the whole conspiracy from his jail, where his conditions of detention were not exactly onerous. The earlier actions that supposedly justified his removal from office have been forgotten. In particular, the charge that he was intriguing with the United States to make Kashmir a cold war base has long since passed into limbo, together with the "unimpeachable" evidence that his opponents once claimed to hold for it.

Another curious thing about the charges, which he has pointed out, is that the prosecution evidence shows that the government knew about the conspiracy by 1955. Begum Abdullah at least was deeply involved from the beginning, and, as the prosecution emphasises, she would hardly have been acting without her husband's knowledge, if not orders. Yet he was unconditionally released in January, 1958. Unfortunately, he will not be able to testify to his version of the truth. Kashmir passed a law in 1956 amending the criminal procedure code to allow an accused to give evidence in his own defence; but the amendment was to come into force on a day appointed by the state government. That day has not yet dawned.

Meanwhile, Kashmir is going through a political crisis, directly though not obviously related to the trial. Bakshi stands on one side, with his education minister, Ghulam Mohammad Sadiq, and a substantial part of Indian official opinion on the other. The dispute centres on Kashmir's relationship with India; the corruption of the Bakshi regime and the lack of normal democratic liberties are also under attack. Kashmir is integrated in most respects with India. But it still has its own constitution, flag, prime minister and head of state. Sadiq, a left-winger, wants the Indian constitution amended to put Kashmir on the same footing as any other state. Bakshi, and most of the National Conference, do not. For the time being, Mr Nehru has said, the amendment will not be made. But New Delhi suspects Bakshi of being a little too independent, indeed, of hankering after the ideas that led Sheikh Abdullah to jail. Earlier this summer he was privately urging that Abdullah should be released. He himself has been offered a place upstairs in the Indian cabinet, but has refused it.

Simultaneously, though probably not by coincidence, there has been considerable public criticism in India of Bakshi's government, whose faults till now have been discreetly passed over. According to an impeccably patriotic commentator, his administration is "riddled with corruption" and "blatant nepotism." An anti-corruption act was passed this summer, apparently under direct pressure from Mr Nehru, who visited Kashmir twice within a few weeks. The first victims of any serious clean-up, one is told, would be Bakshi's relatives. Bakshi has continued the tradition of suppressing civil and political liberties that was inaugurated by Sheikh Abdullah. It is not only the pro-Pakistanis or Abdullahites who are repressed, but also the pro-Indian opposition parties, based mostly in Jammu. They allege that their supporters are blackmailed and beaten by the "peace brigade" (National Conference strong-arm squads, another inheritance from Abdullah) and their candidates kidnapped on the way to the nominations.

These charges may be partly discounted as the common coin of frustrated opposition. But Indian observers admit that the atmosphere they describe is substantially correct. As long as Sheikh Abdullah is imprisoned political normality is impossible. He claims to have been several times offered release and the premiership if he would accept Kashmir's status as part of India; he has always refused his freedom on these terms, and if he is released the whole business of Kashmiri independence will start up again.

The real issue at the trial is whether a Kashmiri leader is to be allowed to put Kashmir's interests before India's. Abdullah, who is still widely, though covertly, popular in Kashmir, believes that the Kashmiris are being sacrificed to provide fuel for the cold war between India and Pakistan. As he told the court on August 31st, "This is a political trial. I and my friends have been detained over many years, and we are here today, because of the principle for which we have stood, the right of the people in Jammu and Kashmir state to be masters of their own destiny."

The saddest feature of the trial for those who value Indian democracy is the clamorous silence that surrounds it. Just as there is no serious discussion, in India or Pakistan, of a solution to the Kashmir question, because there is no serious reporting of the real situation, so there is no serious public discussion of even the most elementary principles involved in Sheikh Abdullah's case. Hardly a voice has been raised to suggest that it could be in any way shameful that he should have spent almost as long in prison without trial as, in the course of nine trials, did his former brother in arms, Pandit Jawaharlal Nehru.

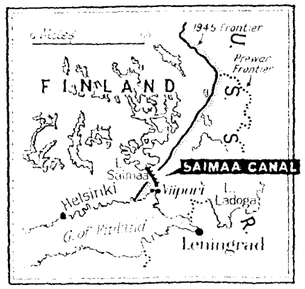
Finland's Controversial Canal

FROM A CORRESPONDENT IN HELSINKI

AN agreement to lease to Finland for fifty years the Soviet section of the Saimaa canal, as well as an island port on Soviet territory, was initialled on August 27th and will be discussed by the Finnish parliament soon after it reassembles next week. The project for the lease was first agreed upon when President Kekkonen went to Moscow in December, 1960. Since then many doubts have been raised in Finland about the cost and the wisdom of the project.

The main pressure behind the agreement has come from the Agrarian party, which dominates the present government coalition. The leading papers of the conservative groups in the coalition have strongly criticised the agreement on the ground that the project will not be profitable, in spite of the government's calculations to the contrary. It will take five years to carry out the extension and repairs that are necessary before the canal can be used for traffic. The statisticians who present figures on the profitability of the canal almost seem to have conjured away the undeniable fact that during this five-year period the waterway will swallow at least 15,000 million marks (about £17 million) before the first ship has paid the first dues. Some of the strongest critics have mentioned a much larger initial expenditure and maintain that it will be decades before the canal shows a profit. They argue that Finland, whose yearly budgets are balanced by high government loans, cannot afford to invest in the canal, especially as the present tense relations between East and West may not encourage the international traffic that the Finns hope for.

In the agreement initialled last month the Russians insist that the passage of any warship and the transport of troops and military equipment on ships of third nations shall be forbidden. This is understandable. But they also insist that Soviet laws should be in force in the canal area leased to Finland, and that the Soviet Union shall have the right to forbid the entrance of third-nation ships should their presence in the Soviet part of the canal be considered incompatible with Soviet security interests. This may affect the Finns' expectations of the extent to which foreign shipping will use the canal. West German and Dutch shipping have been mentioned in the discussion as possible users of the canal. But Nato countries may not care to risk their shipping in the canal (nor may the Russians allow them to do so) when there is tension in the Baltic area. Furthermore, others besides the Finnish Seamen's union may feel that the thirty-metre-wide zone on both sides of the canal (at locks and bridges it goes up to 200 metres) is not enough to guarantee the security of ships' crews, or to protect stranded seamen from the suspicion of undesirable activities.



The Saimaa canal, which, if a number of lakes are included, is about 57 kilometres long (33.8 kilometres of which is through Soviet territory), runs from Finland's south-east lake district to an inlet of the Baltic sea just north of the former Finnish city of Viipuri at the end of the Gulf of Finland. During the war there was little traffic through the canal, and under the 1944 armistice an important part of it was included in Soviet territory. The big companies who had used the canal for shipping their products from the interior of Finland reorganised their transport system and took part in building new harbours. They have shown no great desire to go back to using the canal.

During the five-year period when the canal is going to be enlarged and dredged, locks repaired, bridges built and other constructions carried out (all of which Finland will pay for), Finland will also pay Russia a total of 600 million marks (about £670,000) as compensation for the Soviet-owned canal area and for the lease of the area. Finally, when the canal is ready for use, the annual lease will amount to 64.3 million marks if the goods transported fall below one million tons; the amount of the lease will increase according to a fixed scale and will be 95 million marks when a volume of two million tons or more of goods is carried through the canal. A Finnish commission has estimated that the first year's volume of goods traffic will be one million tons and the income from canal fees will be 230 million marks. The annual cost of running the canal is estimated at about 100 million marks.

The government has argued that the Saimaa project will do much to help to develop the economic life of south-east Finland. But one cannot help wondering whether the large investments in the canal project will not use up a disproportionate amount of the government's capital and lead to economic stagnation elsewhere. A study carried out not many years ago reached the conclusion that the canal was unprofitable. Many critics of the project feel that south-east Finland would benefit more from an extended network of roads and railways and from investment in new industries. This chorus of politicians and financial experts, who doubt the wisdom of reviving the canal after more than twenty years of disuse, will continue to hold forth. But once the agreement is signed there will be nothing else to do but hope that it will not become too heavy an economic or political burden on Finland.

After Me, the Void?

FROM OUR PARIS CORRESPONDENT

IN Gorki's play, "Lower Depths," one character collects complicated words in the hope of finding a magic formula that will save the world. This delusion can be found in more sophisticated versions. There are jurists for whom political harmony is merely a question of a nicely balanced constitutional law. France has many such learned men, despite the fact that so many French constitutions, after being received with enthusiasm, ended in the dustbin. The disputations about the virtues of the constitution of the Fifth Republic are puzzling if one knows with what frequency and ease it has been violated since its introduction in 1958. But the discussion is now more heated than ever. The bullets that missed General de Gaulle by inches, at Petit-Clamart on August 22nd, drew attention to the institutional void that is usually hidden by the president's towering figure. And now the persistent rumours of constitutional change have been confirmed.

In a broadcast next Thursday General de Gaulle will tell the French people that they are going to be called to the polls again towards the end of October; the purpose of the referendum will be to alter the method of electing the president. Hitherto French presidents have been elected by a limited corps of electors consisting largely of parliamentary deputies and local councillors. To increase the power and prestige of the office, it is now proposed that the president should be elected not by 90,000 or so *notables*, but by universal suffrage.

The suggestion that the president should be elected by a popular vote is being supported in some quarters by the argument that

France is moving towards an American system of government. To demonstrate the absurdity of this thesis, and the difference between the two systems, it is enough to imagine the power that President Kennedy would have if he could dissolve a recalcitrant Congress. In the gaullist system, parliament is subordinate to the president. The president, elected for seven years, has all sorts of special powers, including the power to dissolve the National Assembly; but the assembly, elected for five years, cannot touch the president.

True, in the gaullist constitution the president is supposed on paper to be an arbitrator, and the government is supposed to govern, "to determine and conduct the policy of the nation." Yet nobody supposes that President de Gaulle would let his prime minister decide any major issues. The few who suffered from this misapprehension while M. Debré was prime minister have dropped it since M. Pompidou took over.

If a suit is made to measure, its wearer may get it altered if it creases in the wrong places. That the 1958 constitution was made to General de Gaulle's measure is understood by all. The puzzle is what he hopes to gain through the projected change. A popular vote will not increase his prestige. In fact, it is assumed that the new system of election would be applied only after the end of his current mandate (that is, only in 1966). As to the general's successor, the question for him will be one of power rather than prestige; it is not at all certain that the struggle for the succession would be fought in a constitutional framework.

Under the present law, if the presidency becomes vacant its functions are provisionally carried out by the leader of the Senate (at present, M. Monnerville) and a new election must take place within 20 to 50 days. To eliminate this dangerous interregnum, it has been suggested that a vice-president, who would succeed automatically, should be elected. Various names—ranging from the faithful M. Debré to the pretender to the vacant French throne, the Comte de Paris—have been advanced as the general's likely choice. But if the vice-president is to be elected at the same time as the president, there are two difficulties. First, General de Gaulle would have to face the electors once again and run the risk of losing votes, particularly through his association with his deputy; second, a vice-president carried by his chief might lack the independent status to maintain his position once the general has gone. If the vice-president were to be elected separately, on the other hand, General de Gaulle's candidate would risk defeat. In view of all these snags it is not at all certain that this idea will be carried into practice. It may merely turn out to have been a source of jokes about Joan of Arc's troubles with the Dauphin.

THE would-be assassins of Petit-Clamart realised how much the French political system rests on one man. They hoped that in the upheaval after General de Gaulle's death they could repeat the sequence of events in 1958, revive the bogey of a popular front and call the army in to "preserve law and order." Who would be the general in this new performance? What would be the attitude of the army and the reaction of the other political forces? These questions cannot be answered in advance, but the Secret Army Organisation has accurately grasped that its main chance lies in the political vacuum surrounding General de Gaulle. The rubber-stamp assembly elected in 1958 has managed the extraordinary feat of discrediting parliamentary institutions still further. If the new assembly to be elected next year has a majority intent on carrying out its own policy, the conflict between president and parliament, inherent in the make-up of the Fifth Republic, may have to be fought to a finish. This the government wants to avoid.

But the political void seems to be self-perpetuating. General de Gaulle may parley with military officers, or even give ground to trade unions, if their pressure is serious. But he does not want to share power with parties, parliament or other organised bodies; thus he has been led to accumulate enormous powers in his hands. Personal popularity, carefully fostered, has made it unnecessary for him to use these powers to the full as yet. Yet the weapons are there, should the mood change or a less popular successor take over. The gaullist system, so centred on one man, is not designed to produce a successor who can match the general's popularity. His court has room for feudatories and able, obedient technocrats; there is none for men who could catch the public imagination. When the moment of succession comes, whether through natural or other causes, the choice will depend on the balance of political forces in the country rather than on the constitutional changes that are going to be debated with increasing vigour in the coming weeks.

Gold Medal for "Bung Karno"

FROM OUR HONGKONG CORRESPONDENT

THE beautiful friendship between China and Indonesia, so grievously strained two years ago, with unworthy words on both sides, was affectionately consolidated last month on the playing fields of Djakarta. The Asian Games—held in a Russian-built stadium for visitors who stayed in a Japanese-built hotel and who travelled in Australian-aid buses along a highway built with American aid—may not have enhanced Indonesia's reputation for sportsmanship. But the chicanery which resulted in the exclusion of Nationalist China was a ringing reaffirmation of renewed trust and understanding between President Soekarno and Chairman Mao. "Bung Karno" ("Big Brother" Soekarno) certainly earned a gold medal from Peking.

There is no hard evidence here to indicate whether Peking or Indonesia took the initiative in excluding Formosa, whether Peking used strong pressure from the outset, or whether the Indonesians, in their anxiety to please, anticipated Chairman Mao's wishes.

On the record, it was about time for President Soekarno to make a gesture of sorts to Chairman Mao. Since the uproar about overseas Chinese in Java and Peking's subsequent retreat, the Chinese Communists have been both generous and gracious to Indonesia. It requires an effort now to recall that only two years ago relations between Indonesia and China were as bad as relations between India and China today. Dr Soekarno's anti-Chinese directives, mirroring the customary south-east Asian resentment against the local influence and success of hard-working Chinese traders and storekeepers, had caused much hardship and loss to the Chinese in Java. Peking spoke angrily of "vicious discrimination" as the Indonesian army and police banned Chinese from retail trading in rural areas and began forcibly to evict Chinese from their homes. Peking, it is clear in retrospect, overplayed its hand by urging the Chinese in Indonesia to defy and even resist the Indonesian government.

Mr Huang Chen, the Chinese ambassador, and his staff addressed meetings and intervened between evicted Chinese and the Indonesian authorities, who, in a characteristic Indonesian reaction, at once responded with tougher methods, culminating in the Tjimahi incident, in July 1960, when two Chinese women were shot to death. At the same time, Peking recklessly invited all Chinese who were suffering hardship in Indonesia to return to the motherland and "take part in the glorious work of socialist reconstruction." This invitation was an embarrassing success; 40,000 were repatriated in five months, and tens of thousands more applied. Peking, lacking sufficient shipping to carry the repatriates and enough food and accommodation for them on arrival, quietly applied its own discrimination and accepted only skilled technicians or students.

The powerful Indonesian Communist Party (PKI) was in despair. Compelled to go along with Chairman Mao, it found itself compromising its close association with Indonesian nationalist aspirations. Its suspicious and formidable critics, including army leaders, were able to argue that the disloyal communists were conspiring with Chinese aliens and with the Peking government against the Indonesian people and government. The secretary-general of the PKI, Mr D. N. Aidit, made anguished representations to Peking to drop a lost fight and improve relations with Indonesia at all costs.

Peking's flexibility in crisis can be very realistic. Suddenly in 1961, discord was forgotten; the affable foreign minister, Mr Chen Yi (who had been invited in 1959), arrived in Indonesia; the glorious indestructible friendship of the Chinese and Indonesian peoples was joyously affirmed. China, it transpired, was enchanted with President Soekarno's "dual nationality" formula for discrimination against Chinese aliens. A Sino-Indonesian friendship treaty was signed; China pledged economic aid, and Chairman Liu Shao-chi himself was invited to visit Indonesia. Then, in June last year, President Soekarno revisited Peking, where he dismissed the previous unpleasantness as "a small dispute between brothers" and deftly applied the screws to translate aid promises into fact. China is now committed to a $30 million programme of technical aid for Indonesian textiles on the liberal terms of two per cent over 12 years.

It may be assumed that, having managed to extricate themselves from one dangerous contretemps, the Chinese communists are resolved to avoid any further discord with Indonesia, since discord can serve only to benefit Soviet comrades and western enemies. Asia is China's zone of communist influence, and Soviet aid, even if it cannot be matched, can at least be partly offset. According to private diplomatic reports from Peking, China will be expanding its economic aid to Indonesia on the pattern of its current assistance for Indonesian textiles, which, apart from political considerations, does represent a reasonable investment repayable in sterling or other convertible currency.

Mr Liu Shao-chi has yet to fulfil his formal acceptance of the 1961 invitation to visit Indonesia. If he comes, it will not only be his first venture outside the Sino-Soviet block, but also the first visit by a Chinese communist head of state to a non-communist country.

New Paths for Comecon

NEW epoch, new era, new stage—these expressions recur in recent Soviet analyses of the international economic situation. The Russians started taking European integration in earnest roughly when it became obvious that Britain was making a serious bid to join the common market. Since then, their interest has grown considerably. In the last few weeks, an international marxist conference has been held in Moscow, with European integration on its agenda, and Soviet publications have been filled with lengthy articles on the same topic. Naturally, the attitude towards the common market remains hostile, but the analyses have become more complete, better documented and more sophisticated. On August 26th *Pravda* published theses, prepared by the Institute of World Economics and International Relations, which can be taken as the official Soviet view on the common market; they reflect the mixed feelings of the Russian leaders on this subject. Satisfaction at the "contradictions within the imperialist camp" is tempered by the feeling that the tilting of the Atlantic balance in Western Europe's favour is unlikely to work to Russia's advantage.

If the Russians are still pondering how best to react to the complex and changing situation in the western world, they have already drawn one domestic conclusion. They have decided to hasten the long delayed integration of their own block or, rather, of its European part. In this respect, Mr Khrushchev's lengthy essay on "Topical Problems of the Development of the World Socialist System," published in the last issue of *Kommunist*, is a most important and revealing document.

Mr Khrushchev accepts Lenin's conception of a communist "world co-operative" as the ultimate objective. He recognises, however, that the countries of eastern Europe are still very far from it. He puts the blame for the relatively slow progress of their economic collaboration almost exclusively on "capitalist vestiges." The economies of the non-Soviet members of the block were, he argues, entirely geared to exchanges with the West, and they were so backward that it was necessary first to broaden their industrial base. While condemning the search for self-sufficiency, particularly in small states, Mr Khrushchev forgets to add that this creation of a constellation of self-sufficient little Russias was Stalin's idea. In any case, he now proclaims that individual autarkic tendencies are a luxury the communist block cannot afford. The stage has been reached when frontiers should no longer be allowed to distort the location of industry or limit the size of economic enterprises.

Between 1950 and 1961 foreign trade among the countries belonging to the Council for Mutual Economic Aid (Comecon) increased about 3.5 times, roughly as fast as industrial production. Trade in raw materials increased more rapidly than in industrial products. Left to itself, this trend would continue. According to current forecasts, Comecon's output of machinery is intended to rise by 50 per cent between 1960 and 1965, and trade in machinery by 45 per cent. But according to Mr Khrushchev things will not be left alone. Radical measures will be taken to ensure that exchanges between Comecon countries rise much faster than production. Co-ordination of investment is to be the crucial step on the road to combined planning. Each member country is still to decide the proportion of its national product earmarked for investment, but since major investment projects in all key industries are to be thought out on the scale of the block as a whole, investment policies will, in practice, have to be elaborated collectively.

MR KHRUSHCHEV claims that communist planners now have the statistical and theoretical equipment to embark on these collective policies. At the Comecon meeting in June, the organisation's statutes were strengthened; Mr Khrushchev claims that Comecon now has the powers to put the new policy into practice. Two reforms are foreshadowed, the absence of which has always astonished outsiders. In the first place, exchanges within the block are to be shifted from a bilateral to a multilateral level. A clearing bank, a sort of communist European Payments Union, is to be set up. Secondly, the setting up of an international communist bank is envisaged; its primary purpose would be to finance combined projects within Comecon (and, possibly, common ventures outside). To stimulate trade between communist countries, Mr Khrushchev also contemplates the introduction of special export subsidies as a temporary measure until trade channels are sufficiently expanded.

Communist planners can boast that they are already working on several combined projects, the most famous of which are the European electricity grid and the international pipe-line. They can claim as well that they have co-ordinated fuel and power targets for 1965 and are preparing combined objectives for 1980. Mr Khrushchev disclosed that it is planned to increase the combined Comecon output of fuel from 970 million tons (of hard coal equivalent) in 1960 to 3,400 million in 1980. The figures for electric power are, respectively, 407 billion kWh and 3,500 billion kWh; and for steel, 86 million tons and 330 million tons. If the Soviet figures are deducted from this total, the steel output of other members of the block should increase from 21 to 80 million tons and electricity generation from 115 billion kWh to around 650 billion kWh. But what is now foreshadowed is more than a number of combined targets. It is the common elaboration of joint blueprints for entire branches of industry, starting with basic materials, heavy engineering, chemicals, trans-

port and agricultural equipment and spreading to light industry. It is a gradual, but in Mr Khrushchev's view rapid, transition to joint planning, to a *Gosplan* for the whole block.

What will be the reaction of Russia's partners to such a drastic transformation? Once bitten by stalinist practices, are they not twice shy of co-operation with Moscow? Two factors seem to indicate that the moment for action was well chosen. First, the June conference in Moscow, which accelerated the process, was, apparently, held at the demand of Poland, the least orthodox of members. Secondly, worries caused by the prospect of the external tariff of the common market will tend to throw communist countries in Europe together. There remains the problem of China.

Most of Mr Khrushchev's article is taken up with Comecon. Outer Mongolia, admitted to membership in June, is the only Asiatic country in the organisation. In one cryptic passage the Soviet leader suggests that although all countries did not start on the socialist road together, the progress of Comecon should help them to make a collective advance. In another passage, also obviously directed at the Chinese, he attacks the "so-called Marxists" who misunderstand the "Leninist" doctrine of peaceful co-existence and underestimate the chances of communist victory through superior economic growth. Is he suggesting that if the Chinese accepted his doctrine, they would be entitled to greater aid from the European members of the block? In any case, Mr Khrushchev's internal initiatives cannot be dissociated from his assessment of the international situation.

Lee Out-Generals Them

FROM A CORRESPONDENT IN SINGAPORE

UNDER Mr Lee Kuan-yew's leadership, the Singapore government persuaded its electorate to vote for federation with Malaysia on September 1st by a campaign that was politically mature, strategically consistent and tactically resourceful. This success was achieved against the grain of communalist feelings in the Chinese majority of the population, and against the most sustained political campaign ever mounted by the Malayan Communist party. In spite of criticism, the government decided that only a referendum could kill the accusation that it was "selling out" to the Malays of the Malayan federation to the north, and could prevent the opposition from claiming that it wanted, and could get, better terms for Singapore. It was a necessary struggle, not a "pointless poll."

The turning point in the battle came when the Malayan government agreed that the Malaysian citizenship recommended by the Cobbold commission for the three British territories in Borneo could be extended to the population of Singapore. This destroyed the charge that Singaporeans would be "second-class citizens" in Malaysia. It enabled Mr Lee Kuan-yew to mount a powerful campaign in the press and (decisively) on the radio on behalf of alternative "A" on the ballot paper—equal citizenship, plus autonomy for Singapore in education and labour matters. When the Chinese chamber of commerce and the Chinese teachers' union came out in support of alternative "A," the tide had palpably turned.

Nine-tenths of the electorate went to the polls under the system of compulsory voting introduced for the 1959 elections. Of the 561,559 votes cast, 70.8 per cent were for the government's proposals, and three per cent for the other two proposals. The blank votes called for by the opposition in protest against a "sham" referendum accounted for a quarter of the total. Thus the result was clear and decisive, with a majority larger than the two-thirds required for fundamental constitutional changes. One of the most bitterly criticised clauses of the Referendum Bill provided that blank votes should be counted as supporting the majority view. A decision based on these blank votes would have been politically vulnerable; but there has been no need to call on them.

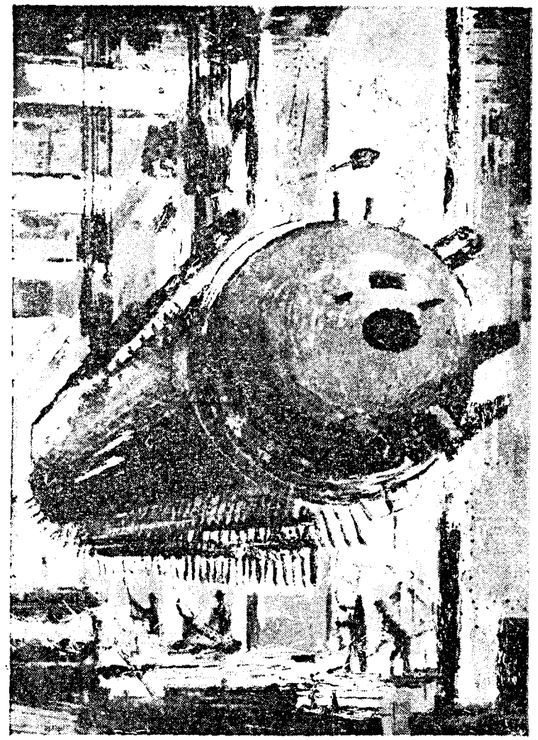
Singapore's present provisional constitution, with its vestigial traces of colonial rule, has thus fulfilled its purpose of giving the people the opportunity to decide the pattern of their independence —whether chauvinistically Chinese, parochially Singaporean or nationally Malaysian. The only state in the world that has both a Chinese majority (78 per cent of the electorate) and a free constitution has voted to submerge its independence in a larger state in which the Chinese will be in a minority, and in which compromise between the various communities is the condition of survival.

Not less important is the fact that most of the Malayan 12 per cent of the electorate—who might have been expected to vote for alternative "B," which provided for a more restrictive form of citizenship and did not give autonomy to Singapore—have in fact voted for the alternative that gives special rights to the Chinese. This, with the welcome which Malays in the rest of the federation have given to the results of the poll, augurs better for the future than the bitterness of the past fifteen months might have led one to predict. Moreover, the Singapore result will make it easier for realistic Chinese in the Borneo territories to resist the communalism preached by the dominant extremists in the Sarawak United People's party.

What of the future of Singapore's internal politics? Mr Lee Kuan-yew's People's Action Party (PAP) has won a famous victory, but this will not necessarily benefit the PAP itself. The 140,000 blank votes represent the half of the PAP poll that it lost through the secession of its left wing in 1959. To the half of the "old PAP" vote that stayed with the government have been added 250,000 votes cast on a national issue. Will these people go on looking to the PAP to fulfil in Malaysia the hopes behind their votes? Or will they look to the group led by Mr Lim Yew-hock, who keeps politically close to the federation government? These two men may just possibly work together in the Malaysian framework. At least both realise that at this stage it is only in co-operation with the ruling party in Malaya that they can maintain the communal harmony achieved in the referendum.

As significant as the cause that has won is the cause that lost. Not all the blank votes were communist. Mr Ong Eng-guan, the former mayor of Singapore who is now in opposition, and Mr David Marshall, a former chief minister, have staked their claims to the blank votes. Nevertheless, the defeat of the communists in their most determined political campaign is almost as significant as their military defeat in the Emergency. The myth of their invincibility has been exposed within their own community. The dominant feature of the banner of the Barisan Socialis group is the red star, and it has stood for a heady brew of Chinese chauvinism laced with communism. Mr Lim Chin-siong, the group's secretary-general and the focus of the turbulence of 1955 and 1956, has talked in terms of a "twenty-year struggle" beginning with the fall of Singapore in 1942. Just as the people had defeated the Japanese and the "Ang Mos" (red-haired devils) of colonialism, so, he said, they would defeat Mr Lee Kuan-yew.

A pattern has been found for the containment of communism as an internal threat, provided that the promise of "honourable" co-operation between the communities is fulfilled, and provided that the unity of the referendum is not splintered later. The external threat remains, both from the Indonesian communist party and from Peking, which regards Malaysia as a bastion of the South-East Asia Treaty Organisation. But as long as the opposition is conspicuously alien, the external threat too can probably be held in check—long enough, that is, for the non-communists to try to prove that the Malaysian dream can yield real benefits.



One of the main steam drums for the boiler plant which Mitchell's have installed at Komati power station, Eastern Transvaal.

Power for Export

Mitchells supply boilers for South Africa's newest Power Station

Mitchells have completed the installation of two 100 MW boiler units at Komati. These boilers are of the pulverised fuel fired type and each is capable of generating 900,000 lb of steam per hour. They are now in operation.

Mitchells have recently been awarded a contract by the Electricity Supply Commission of South Africa through their South African associates, Mitchell Engineering (Proprietary) Limited. This contract is for two further 125 MW boilers at Komati. These boilers, the largest in South Africa, go into operation in 1964.

Mitchells have also supplied boiler units to India, Australia Venezuela, Russia, Borneo, Burma, Malaya, Southern and Northern Rhodesia.

QANTAS

"The United States will not devalue its dollar . . . ."
" . . . the dollar is a good investment and as good as gold."
President **John F. Kennedy, Telstar news conference, July 23, 1962**

Q—Mr. President, the United States has reportedly invited Japan and other industrialized countries to invest in the building of plants in this country. Would you explain the thinking behind that, sir, and does it imply also that we are discouraging U.S. investment overseas in plants?

THE PRESIDENT: As you know, the United States investment overseas has been very heavy. In fact, it has been one of the matters which, of course, affects our balance of payments. Over the long run it does not, over the immediate run it does. We are anxious to have others invest in the United States, and particularly to invest in those areas where there may be higher unemployment, so this program is being operated through the Department of Commerce.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

All This— and Cuba Too

WASHINGTON, DC

IT looks like being a rough autumn for President Kennedy and perhaps for everyone else. When the Russians unveiled their build-up in Cuba, American attention was on Berlin and Americans had begun to give up hope that Mr Khrushchev would have enough sense not to let the East Germans mishandle the situation there into a crisis. Prolonged probing had turned up no evidence of any Soviet ardour for a deal on disarmament or atomic testing or even for one on avoiding a proliferation of nuclear weapons—to which the Administration attaches great and growing importance. In these circumstances the latest developments in Cuba have made Mr Kennedy look like a man with not one, but two, Achilles heels. The Democratic party, whether Mr Khrushchev intended it or not, is impaled on the horns of its old painful dilemma: either it will be accused of being soft towards communism or it will be reproached as the war party.

Mr Khrushchev's probes are seen to be crueller and appear to be more effective than the patient searching of Mr Dean Rusk, the Secretary of State. This week's Russian statement may well constitute a clumsy retreat being carried out under a smokescreen of bluster. But the bluster creates some risk that pressure may be put on the Administration by angry Senators and others to call Mr Khrushchev's bluff. The Soviet Union chose a bad week in which to tell President Kennedy to put up or shut up over Cuba. Americans are suffering from the all too familiar affliction of frustration. They think that they were ineffectual in dealing with the Berlin wall and they fear that the Administration is going to be ineffectual again in dealing with Cuba.

Inevitably these feelings reflect on Mr Kennedy, whose popularity was in any case going through a downturn in the cycle of public opinion. It is recalled that, in the 1960 presidential election campaign, he advocated direct action against Dr Castro (but later stumbled into the Bay of Pigs). If he actually calls up any military reserves there are fairly sure to be cries of anguish. Meanwhile, the President is also criticised for merely reacting to both the Russians and the Republicans instead of showing that he is in possession of the initiative. This makes some people speculate aloud and in print about what is called Mr Kennedy's imbedded vein of indecision. To say that Soviet weapons in Cuba seem to be only for defence but that steps will be taken if they turn out to be for other purposes is regarded as being much the same as saying that there is no real trouble but that bloodshed will ensue if it does not stop.

Perhaps the Republicans would be more than human and much more than politicians if they did not try to make a little hay out of such a situation only two months before the elections. That is how sapient observers view the Republican proposal to give the President authority which he does not need to use troops in an invasion of Cuba which he does not wish to launch. The Republicans are seen as proposing in effect to hand Mr Kennedy a dagger in order to discover whether or not he is as infirm of purpose as they suspect he is.

However, even before he had a chat with the President, General Eisenhower was quick to announce that the Republicans would be wrong to make a campaign issue out of Cuba or out of any other aspect of the country's foreign policy. Senator Dirksen, the Republican leader in the Senate, gave a similar assurance—though he had just been criticising the Administration for not squeezing more propaganda advantage out of the Berlin wall. But for foreign policy to be bipartisan does not, it seems, mean either a halt to heated debate or any sharing of responsibility. Both parties are preparing political moves. Mr Kennedy's request to Congress for standby authority to call up military reserves in case of need trod heavily on the heels of the Republican proposal to authorise his use of troops. It might seem, therefore, like a complementary step but in fact it is regarded almost universally as a political counter-stroke. The Democrats are combing feverishly through the Republican record on Cuba to be ready to prove if they have to that it is the Republicans' fault that there is a Cuban problem at all.

Mr Rusk is not expected to persuade the Latin American foreign ministers to agree to new sanctions against Cuba and the United States is unlikely to go it alone. Unless nuclear weapons were used, the conquest of Cuba would probably take at least a little longer than some of those who urge an immediate attack are prepared to admit. Others acknowledge that an armed invasion of Cuba would mean the deaths of thousands of Cubans and of an untold number of Americans. And yet a danger exists of events taking charge of men. There could be—or there could be thought to have been—a Cuban attack on the Guantanamo naval base. There could be other provocations that might be deemed equally intolerable. Not totally precluded are landings by anti-Castro Cubans, avoidance, this time, of a Bay of Pigs disaster and the start of serious guerrilla warfare. Almost everyone is perfectly aware of the dangers of Cuba becoming the scene of another Spanish civil war, in which Russians as well as Cubans would no doubt kill and be killed.

PERHAPS the chief restraining factor on bitter American impatience is that action by the United States against Cuba, including a naval blockade, might tempt Mr Khrushchev to snap shut the trap in which Berlin finds itself. Senator Dirksen has pointed this out. But another Republican, Senator Keating, suspects the Administration of meditating a "deal" with the Russians about Berlin and Cuba. Others say that, if the United States fails to deal, in a different sense, with Soviet-armed communism only ninety miles from American soil, Mr Khrushchev will be convinced that the United States will not defend Berlin.

Meanwhile, there is some irritation both with the Latin American countries and with the European friends of the United States. The former are held to be laughing up their sleeves at American "weakness" over Cuba, while fiddling their private funds by the billion into Swiss banks and other safe sanctuaries as their own countries totter. Senator Dirksen has declared that Soviet supplies are being taken to Cuba in British, west German, Norwegian and Greek ships and has encountered no resounding denials. There is a growing consciousness in America that it is not just in Cuba that Soviet trade, especially in oil, and Soviet aid are rapidly increasing but in many parts of the free world. American pro-

tectionists who oppose the European common market seize the occasion to cry that the countries in that market compete with the United States, yet let it continue to provide the lion's share of the cost of their defence; thus they contribute, it is alleged, to the continued dribbling away of American gold which adds to the profits of European bankers. Even staunch friends of the common market are afraid that in the present lowering atmosphere the initial American enthusiasm for the market could degenerate into irritated impatience if Europe fails to react quickly and decisively to problems which it shares with the United States.

Yet the Administration's own view of the world remains essentially unaltered. It is still thought that Mr Khrushchev will not in fact risk a third and final world war over Berlin; that, whatever happens there, he still has his own difficulties and that one of them is that his own country is changing, on the whole for the better; and that an eventual easement of tensions through disarmament and bans on nuclear tests is in Russia's interest as well as the West's. Recent events suggest, however, that Mr Khrushchev, having grasped the fact that general war has become impossible, is tempted as a result to be more rather than less provocative.

In Germany the American expectation is that on the whole there will be a continuation of the present Soviet tactics, aimed at a separate peace treaty which, Mr Khrushchev hopes, will merely confirm what will by then have already been achieved. The United States intends to continue resisting this. In Cuba Mr Khrushchev is suspected of having imitated an American bad habit and of having gone out of his way to acquire a weak ally to whom he has now had to give military aid. Both militarily untenable west Berlin and militarily unviable Cuba create serious problems. Nevertheless, it is hoped that, with luck, the current Russian exhibitionism may expend itself in mere flares and shrill whistles of propaganda. But nerves ought to be steeled for the noises may be very loud and they may come as well, this year, out of China—and be not just outraged cries about U-2 reconnaisance aircraft, but the long-anticipated big bang of Chinese atomic fireworks.

Tax Revision Revised

WHEN the Senate approved its greatly watered-down version of the tax revision Bill last week, President Kennedy appeared to be ready to accept what his Secretary of the Treasury called "a significant first step toward the reform of our outmoded tax laws." It is a much shorter step than was asked for originally, but it does offer Mr Kennedy what he considers vital. This is the tax credit of 7 per cent for investment in new plant and equipment which is counted on to give a much-desired stimulus to capital spending by businessmen and to encourage them to create more jobs at home and to compete more successfully abroad.

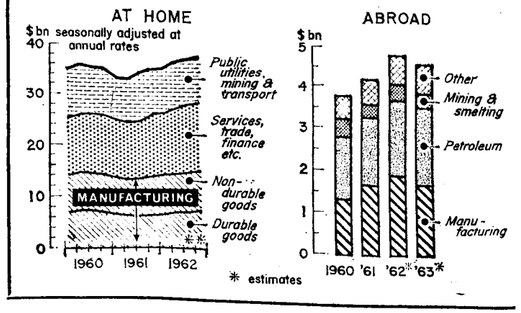
Perhaps in all the circumstances the President had reason to be satisfied. To win his majority of 59-24 Senator Kerr of Oklahoma, the Democrat who piloted the Bill through the Senate, had to beat down the opposition of a curious coalition between liberal Democrats and the usual combination of Republicans and conservative Democrats, led by Senator Byrd of Virginia. Both groups argued that the tax credit provided an unnecessary windfall for businessmen. Mr Byrd and his friends objected to the deficit in the Budget which would result from this loss of an estimated $1.2 billion in revenue. The liberals wanted to make this good, as the Administration had originally planned to do, by restoring the 20 per cent withholding tax on income from dividends and interest which the House of Representatives had approved, but which the Senate replaced with a mere requirement that such income be reported. Estimates of the financial effects of the Bill vary, but all agree that the Senate version adds up to a substantial deficit, even though it does provide for increased taxation of savings and loan associations, mutual savings banks and co-operatives, for new taxes on certain foreign earnings and for the tightening up of deductions for business expenses.

Few of these go as far, however, as the Treasury had urged or as the House had approved. Nevertheless, the Administration offered its liberal supporters in the Senate no encouragement in their efforts to strengthen these provisions. It does not intend apparently to insist that the important withholding clauses be restored to the compromise Bill which will be worked out by a conference between representatives of the House and the Senate. Mr Kennedy dare not risk losing the whole measure and with it the investment credit. One thing which he was not prepared to accept, however, was Senator Dirksen's amendment allowing self-employed persons to deduct from their tax base payments towards their retirement pensions. Senator Kerr removed this last-minute spanner from the works by promising to deal with the matter in a separate Bill. This passed the Senate next day but only in a modified form of the version which the House had already approved.

Capital Spending

The latest survey, made by the Department of Commerce in August, shows that American businessmen need a stimulus of the kind provided by the tax Bill if they are to increase their outlays for new plant and equipment in the United States at the rate which the lagging economy requires. The total amount of spending for this purpose planned for the rest of this year showed no change from earlier surveys made in February and May. While this is encouraging evidence that confidence in the economic outlook has not been shaken by the recent behaviour of the stock market, it is disappointing that plans have not yet been stepped up as a result of the tax concessions for new business investment announced by the Treasury in July.

The final tax Bill, unlike the original version, will have little if any effect on outlays by American businessmen for new plant and equipment abroad, but in fact this is probably about to fall off in any case. On a percentage basis capital investment overseas has been growing much faster in recent years than it has at home, although total spending is much less. A levelling-off in this hectic expansion appears to be coming next year, however, according to a recent survey of business intentions by the Department of Commerce. This shows an actual turndown in 1963 although the McGraw-Hill Department of Economics does not expect this until 1964. American businessmen seem to be consolidating their foreign operations, partly because these are no longer the bargain they once were now that wages are going up, especially in Europe, partly because there is a feeling that the Administration will probably succeed eventually in its aim of stiffening taxation on investment abroad.



Farmers on Strike

FROM A CORRESPONDENT IN IOWA

SINCE September 1st members of the National Farmers Organisation have been withholding their cattle, hogs, sheep, maize and soya beans from market in the hope of forcing food processors to bargain with the organisation for higher, stable prices in the same way as they bargain with trade unions over wages; some processors have had guaranteed contracts of this kind with individual farmers for some years. The decision to start this "all-out holding action" was made a few days earlier at an unprecedentedly large meeting of 20,000 farmers and their wives in Des Moines, Iowa. Mr Oren Lee Staley, the 39-year-old Missouri farmer who is national president of the organisation, told the meeting not to expect results for at least two weeks since it would take that amount of time to exhaust processors' reserves and winnow the withholding farmers down to those determined to make a real test.

The National Farmers Organisation has been working up to this test ever since it was founded in southern Iowa in 1955. Farm strikes were discussed at several early meetings with an organiser from the packinghouse workers' trade union. Memories of how farm "holidays" had failed in the depressed nineteen-thirties caused this strategy to be laid aside for a time in favour of petitioning Washington for high support prices for livestock. Congress has wrangled interminably ever since about agricultural subsidies but has never come close to giving the organisation what it wants. In 1958 it began a new approach, asking farmers to sign agreements designating the NFO as their bargaining agent with the processors. Other farm groups have had some success with such an approach when dealing with fruits and vegetables where the supply is concentrated and with high-quality livestock, but the NFO got nowhere. To back up this bargaining, during the past three years it tried brief, partial 'holding actions" to test its strength, with inconclusive results.

In the first days of the 1962 holding action, smaller quantities of livestock were put on the market than a week or a year before, prices went up, both at the wholesale level and in at least some retail shops, and processors began to lay off workers. There were a number of complaints of violence: stones were thrown at the windscreens of farm lorries bound for market; shots were fired at tyres; NFO men crowded the aisles of livestock auction barns, making bids on the stock themselves and shouting down the bids of others. To begin with, the strike was certainly more effective than expected. But the question is whether, now that prices are up, farmers will continue to keep their produce off the market until the organisation gets its long-term contracts.

THE NFO's tactics seem unlikely to work unless they bring the organisation wider public support than it has at present. Outsiders are mostly hostile and the NFO has not divulged the number of its members since 1958 when it claimed 43,000 (15,000 of them in Iowa, where the NFO was then torn by factional strife). There are thought to be many more now and the NFO claims to be the fourth largest farm organisation in the country after the Farm Bureau with 1.6 million families, the National Grange with 800,000 members and the National Farmers Union with 750,000. The NFO also claims that its members control 25 to 30 per cent of agricultural production; few outsiders believe this. And even if the NFO should succeed in cutting market receipts drastically for some weeks and forcing prices up sharply, the effects are unlikely to be lasting; if they are, non-members will probably reap the benefits too.

But it would be a mistake not to take seriously the zeal and indignation of these farmers. The NFO now includes many large operators and good managers, not just marginal farmers who are in danger of being squeezed out by costs which mount faster than receipts even with bountiful crops and admirable efficiency. And the NFO has just got results from threatening reprisals against the Sears Roebuck Company, the Ford Motor Company and the Standard Oil Company, all large suppliers of farmers' requirements, whose executives had signed the recent report of the private Committee for Economic Development; this recommended lowering agricultural price supports to zero within a few years and taking steps to help another 2,000,000 farmers to move off the land, a proposal which aroused the indignation of the NFO. The Ford Company has now announced that it does not support the report and that its vice-president was acting solely as an individual when he signed it.

The NFO movement contains many skilled organisers; in 1958 it had 45 full-time field men signing bargaining agreements with farmers and in 1959 250 "farmer-reporters" in livestock markets and sales barns were observing the effect of its first small holding action. In the village of Cascade, Iowa, this summer it sent three local teams of farmers down Main Street, asking for contributions to pay for an advertisement to go in the village weekly, headed: "You Bet! We're mighty proud of NFO . . . Here's what Cascade merchants say about NFO . . ." Many of these merchants were unhappy when they saw the statement in print or when anti-NFO customers blamed them for the fulsome praise.

Members of the organisation feel that the normal market mechanisms have failed to assure them of survival as farmers and that, whichever party is in power, both Congress and the Administration have let them down. They see no way out except high-pressure tactics like those of trade unions and oligopolistic business enterprises which manage to set their own prices. Whatever they may think of the NFO's policies Democrats are hoping to channel some of the members' dissatisfaction and some of their organising ability into political channels during this autumn's elections.

Trade in Cotton Wool

WITH the tax Bill out of the way the Senate Finance Committee has returned to work on the trade expansion Bill, which would enable tariffs to be reduced, and there is a danger that the same sad story may be repeated. Once again the House of Representatives has given the President practically everything he wants and once again the Senate looks like wrecking much of the Bill. Delay has allowed the protectionists time to get their second wind and they have been emboldened by the concessions with which Mr Kennedy bought them—or some of them—off earlier. As he was warned that they would, they are now asking for more and there have been hints that they will get it from Senator Kerr, who is managing this Bill too and who is himself linked closely with the protectionist oil interests.

"Just One More—"

Another important protectionist group which President Kennedy tried to appease

earlier was the textile industry and the delay on the Bill has also meant that his efforts to save these manufacturers from foreign competition have come unstuck. This scheme included an appeal to the Tariff Commission for a ruling that the farm programme was being disrupted by cheap cotton textiles coming from abroad and that an import fee of 8½ cents a pound should be put on these in addition to the present duty of 14 cents a pound. This fee was to offset the difference between the price at which manufacturers abroad can buy raw American cotton and that which American manufacturers have to pay because the domestic price is supported at a level far higher than that of the world market. The government subsidises the export of its surplus stocks of cotton and 700,000 bales are said to be coming back this year as imported fabrics. But the Tariff Commission, very sensibly but rather surprisingly, considering its usual protectionist attitude, has now refused to help the American textile industry in this way.

President Kennedy rushed to denounce the "burden" which the inequity of the two-price system imposes on cotton manufacturers and promised to ask Congress to do something about it at the next session. Presumably he hopes that this will keep the Senate from adding the import fee to the trade expansion Bill. But if it does add it, another part of the President's textile scheme may come unstuck. For exporting countries such as Japan might then refuse to ratify the international pact under which the United States sets quotas for imports of various types of cotton goods from various countries; frequent use has been made of these powers recently to curb imports. One importer is now challenging the Administration's authority to do this in the courts and others are fighting the suggestion that a similar pact should be negotiated for wool textiles.

Republican Free-for-all

WITH ten states holding primary elections this week the season was drawing to a close for these contests in which the parties choose their candidates for November's general election. But in New Hampshire, the state which attracted most attention this week, the contest was really for control of the Republican party machine. This had been left without a head by the death of Senator Styles Bridges last November and this summer's fighting to fill the vacancy has been so bitter and disruptive—Tuesday's voting did not settle the matter—that the Democrats hope for some success in what has until now been the most solidly Republican state in the country.

The trouble began when Governor Powell, who owed his political career to Mr Bridges, refused to appoint the Senator's widow to fill the temporary vacancy in Washington. This alienated the influential publisher of the state's leading newspaper, the *Manchester Union-Leader*, and many of Mr Bridges's other sympathisers. Mr Powell added insult to injury by choosing a young *protégé* of his own, a Mr Murphy from a Roman Catholic, Democratic family. No one would have minded if Mr Powell had taken the Senate seat for himself but he had his eye on another place in Washington—the White House. He is the only Republican who has admitted to being a candidate for the Presidency in 1964—but now he is one Republican who will certainly not be chosen. Anxious to prove his superiority and his vote-getting ability, he ran for an unprecedented third term as Governor but, with a recent heart attack as an excuse, he refused to demean himself by campaigning for the Republican nomination. His record in office was not above criticism and as a result of this, of his dictatorial approach and of the way in which he had alienated many of his old supporters, he was roundly defeated on Tuesday by an attractive member of the State Legislature, Mr John Pillsbury.

Mr Pillsbury is nearly, if not quite, as conservative a Republican as Mr Powell but the Senate nomination has been won by a middle-of-the-road Republican and this in New Hampshire is the equivalent of being left-wing. There were four candidates but the battle was between Mrs Bridges, as reactionary as her late husband, and Representative Bass, who won by a narrow margin. He had to give up his seat in the United States Congress to run and so did another of the senatorial candidates—the fourth was Senator Murphy—so that the Republican nominations for both New Hampshire's seats in the House of Representatives in Washington were at stake on Tuesday. There were eleven candidates for these two vacancies, nearly all of them extremely right-wing, and it looks as if correspondents who are suggesting that the Republican party in New Hampshire is moving away from its traditional conservatism may be guilty of wishful thinking.

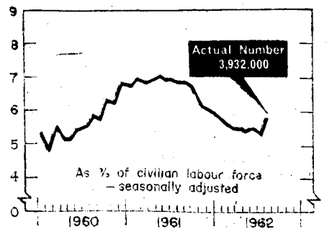
Economy on a See-Saw

AMERICANS came back to work after Labour Day, supposedly followed by an upturn in business activity, to find the economy on a see-saw. This at least is the inconclusive conclusion to be drawn from the latest movements of key economic indicators. Exerting mild upward pressure are personal incomes and corporate profits. The former rose by $1 billion in August, to an annual rate of some $443 billion, while earnings of corporations in the second quarter were slightly higher than in the first. This was a surprise—they were expected to be lower—and so pleased the Secretary of Commerce that he released the total figure of some $50.9 billion at annual rates without waiting for the usual supporting details to be ready.

But swinging lower are certain other indicators of no less significant weight. In August, retail sales were down and unemployment up—in terms of the metaphor a depressing phenomenon. The slight decline in retail trade to a seasonally adjusted rate of some $19.6 billion was caused by a falling off in sales of durable goods—those of non-durable goods were higher—as the demand for new cars dropped below the improved July level; even so this August was one of the best for Detroit in several years. Factory layoffs there for the change-over to new models, and other special features, contributed to a contra-seasonal rise last month in the proportion of the labour force which was out of work. Therefore this is not considered serious; it is of more concern that in August the average working week in factories declined for the fourth month in a row, to 40.2 hours. Employment rose, also contra-seasonally, to an all-time high of 69,800,000—a seeming paradox explained by the fact that the number of jobs is growing, but not as fast as the labour force.

In spite of these contradictory trends, the mild upturn is still expected to continue. To help it on its way, Congress has just authorised an emergency public works programme to promote large scale federal spending on public buildings, hospitals, streets, sewers, in parts of the country where unemployment is chronic. This is an echo of the President's programme of last spring when Mr Kennedy asked for $600 million immediately for public works and stand-by power to spend another $2 billion if a recession seemed imminent. Congress has refused him the stand-by authority but has voted up to $900 million, which is probably more than its Appropriations Committees will actually sanction.

UNEMPLOYMENT



Chicago's Oldest Bank Opens the Newest Bank in London

Address: 58/60 Moorgate, London, E.C. 2

Now in London—just as in Chicago—Continental offers a complete range of commercial and international banking services. The members of our London staff have been selected for their experience in both fields. You'll find them equipped to serve you well.

A QUESTION TO EVERYONE WHO REGULARLY FLIES THE ATLANTIC

Can you make the mileage shorter and sweeter too?

Yes! By Aer Lingus—Irish International Airlines. Catching a transatlantic jet need not mean hours of cross country journeying in the wrong direction. Aer Lingus flies *direct* from the major airport nearest you, to connect at Dublin with the daily Boeing jet to New York and Boston.

Not only is this far more practical, it is also more of a pleasure. *At Dublin* take a breath of fresh air, and enjoy a meal in the most famous airport restaurant in Europe. *At Shannon* stop off at the Duty Free shopping centre. Here the nicest things from Ireland and the rest of the world are all gathered under one roof and sold for a song. *In the air* you will discover that the Golden Shamrock menu and wine list are the finest that ever got off the ground.

Your travel agent will give you full details of all Aer Lingus services from the airports listed here, and of the connecting flights to New York or Boston.

Check your home town against this list of Aer Lingus take-off points in Britain.

Connecting with Addicts

FROM A CORRESPONDENT IN NEW YORK

A WHITE HOUSE conference is to be held later this month on one of the most stubborn, complex and far-reaching social problems in the United States today: that of drug addiction. The exact number of victims is not known. It is generally put at about 60,000, but in California a recent report estimated the number of addicts in that state alone at 20,000 and a report to Mayor Wagner has stated that there are probably 90,000 in New York City. Even the conservative figure of 60,000 is large enough to give the United States the highest rate in the western world.

Drug addiction is responsible for a tremendous amount of petty crime. A capsule of heroin bought on the black market costs about $2 compared with about 2 cents if it is obtained legally for medical purposes. Addicts usually begin by spending $4-$5 a day on drugs. Gradually but inevitably they must increase the dosage to obtain euphoria until they are spending $50, $60, $75 or even $100 a day. In New York City about one-half of all crimes against property are committed to get money for drugs.

In America, unlike Great Britain, addiction to drugs is directly linked with deep-seated social ills and is rife among the economically deprived groups in the big city slums—racial and religious minorities and recent immigrants. Moreover, to an extent not commonly realised, the narcotics trade in the United States is controlled by the criminal underworld. It centres in New York City's East Harlem. There every major importer congregates to pick up the drugs brought in from the docks. These are hidden for a while, then shipped out to "retailers" or pushers, most of whom are addicts themselves. From there the "connection" is made with the addict, in one of the more sleazy chemists' shops, in a deserted park or an amusement arcade.

Illegal imports of drugs are controlled rigidly by a syndicate. These top men, and their lieutenants, reap most of the industry's profits, which are estimated at $180-$350 million a year. (Ironically, whenever there is a big drive against trafficking in drugs, profits shoot up even further while the "junk" is diluted even more than usual.) Members of the syndicate are extraordinarily hard to convict, because they never come near the drugs. Most of them are thought to belong to a Sicilian dynasty whose code of family loyalty effectively prohibits "squealing" on one another. The authorities feel, however, that they are getting closer to the top.

Some experts want to eliminate the criminal element by making it legal, as it is in Britain, for doctors to supply addicts with the drugs which they need. But the federal government believes that this step might reduce crime only at the price of increasing addiction. Instead the government and many states have steadily raised the penalties both on traffickers and on those found in possession of drugs. In 1955 the Narcotics Control Act raised the minimum sentence for "receiving, concealing, buying or selling" drugs to 5-10 years and the maximum penalty for selling drugs to minors became death. In 1956 the Boggs-Daniel Act eliminated probation, suspended sentences and paroles for drug pedlars.

The federal government has rejected emphatically the idea of clinics to treat addicts, as has the American Medical Association. Instead both advocate putting addicts in hospital where their access to drugs can be regulated completely. Unfortunately, there are only two such federal institutions, one in Lexington, Kentucky, and the other at Fort Worth, Texas, with a combined capacity of only 1,450 patients. Often the waiting lists are so long that addicts desperately seeking treatment are forced to steal to get drugs and land in prison instead. In New York City, which has almost half the cases in the country, the situation is proportionately even more acute. The total facilities available to adults for humane withdrawal from drugs amount to 165 hospital beds. For addicts under 21 there is an additional hospital with 181 beds. The rate of relapse among those leaving all hospitals is more than 95 per cent.

THE champions of clinics for addicts cite this recidivism as proof of the utter bankruptcy of confining treatment to hospitals. Others, who are more moderate, argue that both hospitals and clinics are needed. Diagnosis, study and withdrawal of the addict from drugs would take place in hospital. Then the clinic, to be set up first on a strictly limited and experimental basis, would help the patient to deal with his personal and family problems, give him guidance on how to find and keep a job and assist in overcoming his educational shortcomings. The confirmed addict would be supplied with sufficient drugs for his needs so that he would not have to patronise the illicit pedlar.

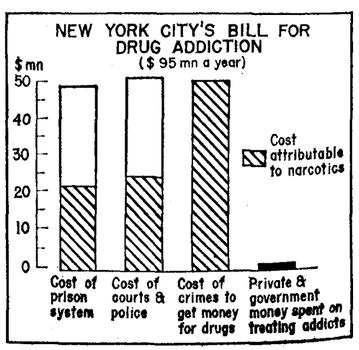
Exactly how clinics would deal with the problem of increasing tolerance and how they would prevent the addict from supplementing his legal dose is not clear. But the experiment might be worth trying, not only because it would help to determine how effective rehabilitation can be outside the walls of an institution, but also because it would go far toward answering the basic question of whether clinics could eliminate the illicit traffic and reduce drug addiction. It would also prove whether or not a confirmed addict, when provided with the drugs he needed, could live a relatively normal and productive life. Several states, notably New York and California, are doing pioneer work in rehabilitating addicts.

One result of the poverty of government facilities has been the emergence of voluntary agencies on the community level. In New York, in both East Harlem and Greenwich Village, clergymen, psychologists, social workers and ordinary citizens have set up informal centres which are often the one place to which the addict, at odds with his family and society, can turn for help. Over a friendly cup of coffee he can discuss his problems and receive guidance.

These centres also serve as the "half-way houses" so desperately needed by the addict newly released from hospital who often has no money, no job, no home and only his old drugged cronies as friends. Furthermore, amid the dearth of research on narcotics, at least one centre is keeping careful records which should prove invaluable. In addition, the Salvation Army's Narcotics Anonymous, following the same quasi-religious approach as Alcoholics Anonymous, is doing a remarkable job in bringing together former addicts and those presently "hooked" so that the one may help the other. Of all the traditional welfare agencies, only the YMCA, YWCA and the Salvation Army have given house-room to the addict.

In spite of the wide range of opinion on drug addiction, there is growing unanimity on several points. Perhaps most important is the agreement on the need for more facilities for treatment. Most authorities also feel that there must be more research into all phases of addiction, including the effect of the present laws. For example, the Supreme Court has taken the position that the legality of doctors' relationships to addicts must be determined case by case, presumably through a trial. This makes doctors unwilling to treat such sufferers. Finally, many experts feel that there should be some kind of campaign to educate the public on the nature of narcotic addiction.

There are other promising signs. New York State has just passed enlightened legislation which permits the addict to choose treatment instead of a prison sentence; if his treatment is successful the charges of illegal possession are dropped. Mr Henry Giordano, the new Commissioner of the federal Bureau of Narcotics, has a less rigid approach than his predecessor, Mr Anslinger. Finally, the White House conference will provide a meeting-ground for the differing viewpoints and, it is to be hoped, a catalyst for government action.



The High Cost of Dying

FROM A SPECIAL CORRESPONDENT

EACH year 1,600,000 Americans die and about $1,500 million is spent on burying them. Simple division suggests that the average cost of a funeral is $940 and other estimates bear this out, although obviously many funerals are much less expensive and some cost a great deal more. In the last decade the average charge for a burial has gone up by over 40 per cent, while living costs have risen by only 15 per cent. By any standard the present cost of a funeral is high, even when it includes such extra charges as clothing, flowers, additional cars, grave-digging, newspaper notices and the clergyman's fee, and by most standards it is excessive. For the price of an average funeral in the United States it is possible to buy a television set, a washing machine, a clothes dryer, a dishwasher and a refrigerator.

Contrary to the teachings of economic theory the number of funeral directors (the title "undertaker" is abjured passionately) has increased as steadily as have the prices charged. The latest official total for the country is 20,767. The explanation is that the market is inelastic and fixed while the social customs attaching to death prevent price competition. The Funeral Directors' Association denies that higher volume would reduce costs; it maintains that expenses at funeral homes increase with volume and that more business does not lower costs except in establishments with very few funerals.

One reason why costs have risen so rapidly is the widespread habit of embalming, a process not commonly used outside of the United States and Canada; it is not required by law in any of the fifty states except when the body must travel a considerable distance before being buried. Embalming has led to other American funeral practices, such as cosmetology, a process designed to give the corpse a life-like appearance by means of various make-up

The works—at $1,200

techniques. From cosmetology came the custom of "viewing the remains" and this in turn required an expensive plush casket so that everyone could pay their respects with due admiration. After that a concrete vault became standard housing for the fine coffin. All of this was a "shot in the arm" for the industry and it looks down contemptuously on the simple, inexpensive funerals common in many other countries.

Acceptance of such costly procedures was accelerated by the fear of social disapproval and there were other reasons why prices became inflated. Industrial insurance was introduced to help the low income groups who suffer most from the high cost of being buried. Part of these benefits was to pay for the deceased's funeral and part to give financial assistance to the widow and children. Very often, however, the full value of the insurance has become the exact cost of the funeral. In 1947 there was a coal mine disaster in Centralia, Illinois—111 miners were killed—and some funeral directors charged the grief-stricken widows as much as $1,178.50 for burial services. This incident shocked the public into action and a Senate Investigating Committee was amazed to learn from the head of the largest undertaking concern in the Washington area that he could embalm an elephant for $1.50.

Attempts have been made with some success by church groups, trade unions and consumer co-operatives to secure a reasonably-priced funeral on an organised basis. In California the East Bay Area Funeral Society reduced burial costs 70 per cent by bargaining collectively with three local morticians. The oldest such organisation is the People's Memorial Association in Seattle, organised in 1939; it now has a membership of more than 7,000 families in Seattle and seventy-eight nearby communities. Similar societies exist in about fifteen American and Canadian cities. When a member joins he chooses a funeral from the many available types; it has a set price and the member pays for it on the instalment plan. In Chicago the average cost of a member's funeral has been about a quarter of the average for all funerals in the area.

Direct control of the funeral industry itself as a means of checking costs has proved almost impossible. The licensing of undertakers and embalmers is done by the individual states and thus restrictions vary widely, in an inverse relationship to the power of the funeral industry's lobby in that state. The industry naturally looks down on cremation; in the whole of the United States there are only 200 crematoria and it usually costs as much as 80 cents a mile to take a body to one. But the co-operative associations usually recommend it and they are growing in size and importance as the American citizen seeks a less expensive way of taking his leave of this earth—even though one mortician is reported to have condemned such societies as "alien to the American way of life."

SHORTER NOTES

The potentiality of the Food-for-Peace programme to win goodwill for America abroad is underlined in the latest semi-annual report on this project from the White House. This shows that some 35 million children in 86 countries are now getting school luncheons under the programme, an increase of ten million, or more than one-third, compared with a year ago. In addition, 14 countries are using commodities provided through this channel to help to pay workers who are building roads, schools, or hospitals and four countries are receiving grain to expand their production of poultry and livestock.

* * *

This month Mr John Henry Faulk is returning to the Columbia Broadcasting System for a series of guest appearances after five years off the air. He is the New York radio and television performer who was recently awarded $3,500,000 for damages from libel—believed to be the largest such compensation in legal history—because his career had declined after he had been labelled pro-communist. The defendants were the publication, *Aware, Inc.*, Mr Vincent Hartnett, one of its vice-presidents, and the late Mr Laurence Johnson, a supermarket owner from Syracuse, New York, who died the day before the jury reached its verdict. The New York State Supreme Court has since upheld the award, declaring that, even were it uncollectable, its magnitude would deter others from similar offences. In 1955 *Aware* accused Mr Faulk of having entertained at "communist front" events. Mr Johnson was said to have distributed the bulletin to advertisers and to have ordered his supermarkets to bar any products sponsored on Mr Faulk's shows.

THE BUSINESS WORLD

Air Fares Going Up

FROM OUR SPECIAL CORRESPONDENT IN DUBLIN

THE world's major airlines have just ended the most critical meeting in the history of the International Air Transport Association in a mood as grey and chill as the Dublin weather. They arrived to a clear warning from this year's president, the general manager of Aer Lingus, that unless the worldwide wave of under-the-counter fare cutting was stopped, IATA might cease to exist and "I may not be talking to you at all next year." They broke up with a feeling that fare increases were inevitable and unavoidable—perhaps up to 15 per cent across world routes as a whole, but as much as 20 to 25 per cent on certain routes. The business of arguing these increases in detail starts in Arizona later this month—against the predictable last-ditch opposition of lines such as Pan American.

Is this the way to fill empty seats? Is it the way to encourage more people to fly, when many previous newcomers to the air have been enjoying discounts of up to 30 per cent on the face value of their tickets? The permanent officials of IATA would probably say it is not. For the second year running, Sir William Hildred, the director-general, reminded airlines that the way to stimulate traffic was by low, low fares. But after the worst financial results on record, entailing a probable total loss of £50 million, airlines are in no mood to take the long view. They are less worried, if one can use such a phrase, by their empty seats than by their empty exchequers. Something, they feel, must be done to increase revenues—and done quickly. The only sure means they can think of is to raise fares. Airlines do not need their critics to remind them that while the phenomenal growth in air traffic since the war has been based on judiciously timed fare cuts at intervals of three to five years, the industry's own abysmal ignorance of its market means that the outcome of any cut in fares is wholly unpredictable. A cut will certainly increase traffic, but will this be big enough to offset the loss in revenue per passenger carried? No one knows, and in their present plight, the airlines are in no mood to take chances.

The mess in which they find themselves is not so very new. Airlines have been accused of buying too many jets as if managements blithely shopped around for aircraft at £3 million apiece without giving the matter a little careful thought beforehand. Aviation is possibly the worst managed of modern industries but it is still not as badly managed as that. But it is suffering from the rapid pace of development in aircraft design. Aircraft costs go down as size goes up and the huge power of the jet's engine has made it possible for manufacturers virtually to double the number of seats in a single machine, with dramatic results. But an indirect consequence is that many a medium-sized airline wanting to maintain, say, a minimum service of one flight a day across the north Atlantic, finds itself obliged to buy a great many more seats than it really needs. Where by happy chance the capacity of the jets happens more or less to match their traffic, the airlines do very well indeed, as the north Atlantic experience of even such small operators as Aer Lingus and El Al will testify. But in far too many cases, airlines find themselves with equipment much too big for them, and this begins to create a pool of surplus capacity that hits not only them but every other airline on the same route.

The cold truth is that many airlines are too small, and will always be too small for the big jet business. The trend was at work long before the jets came, but by doubling the size and cost of equipment overnight, the jets have rocked aviation to its foundations. If the next generation of jet airliners are supersonic, as they well might be, only the biggest airlines will be able to buy them. Hence the long and anguished debates that have taken place in Dublin this week about the economics of supersonic jets—although the delegates were perfectly aware that you cannot really discuss the non-existent economics of a non-existent aircraft.

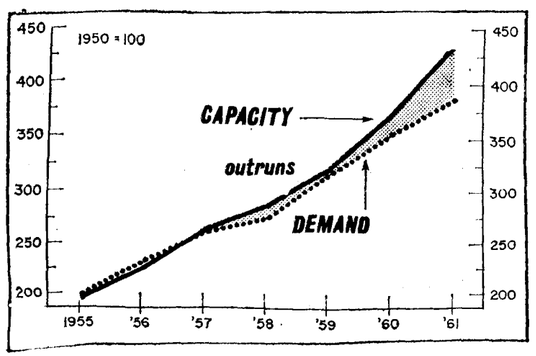
IN his report on the state of aviation, Sir William Hildred tried to re-assure the airlines that the worst was over, but they were in no mood to listen to him. He pointed out that most of the jets on order will have been delivered by the end of this year, so that the number of seats will remain more or less fixed until the next big round of re-equipment. He explained, with considerable eloquence and an impressive array of statistical evidence, that the industry was in nothing like so bad a state as it thought it was. He pointed out that where losses had been made, and where traffic growth had slowed down, was in the domestic traffic and not in international traffic. International traffic was actually growing at close to the ordinary (or extraordinary) rate of 15 per cent a year which has been the average since the war. This means that the brunt of the losses was incurred inside the United States, and it is interesting in this context to note that in this country, British European Airways made a profit on its international services but a £2.7 million loss on its domestic routes, where it has been cutting fares to compete with British

Railways. Will Dr Beeching find one load lifted off his shoulders by sharp future rises in Britain's internal air fares ?

If Sir William thought by this to allay the panic that seems to have gripped some of the big international airlines, he was mistaken. During the past two years, but especially during this last summer, one international airline after another appears to have decided that any revenue, however small, is better than an empty seat. Something amounting to a Dutch auction in air tickets appears to have developed. When governments agree to the establishment of air services between their two countries, it is invariably on the written understanding that both airlines will charge fares agreed by IATA. A scale of penalties, with a maximum fine of $25,000, is laid down for any infringements detected by IATA, and price maintenance had in general been the rule in the air, with the exception of one or two regions where the tradition of bargaining is strong, such as the Middle East and South America. But under the pressure of empty seats and multi-million pound deficits, discipline among the airlines has begun to slip.

AIRCRAFT are flying on average half-empty, but no-one can guess how many of the passengers who occupy the remaining half of the seats have paid the normal fare. The average rate of discount appears to range between 20 and 30 per cent, but there are reports of passengers who fly to New York for the normal one-way fare, plus 10 dollars for the return leg of the trip, of passengers who appear in the returns as children qualifying for half-price tickets. The situation is exacerbated by jockeying for position among the potential member-airlines of Air Union in Europe. If and when Air Union comes into being, the share of the traffic allocated to each member will be decided by its past performance. Some European airlines are therefore sweeping the highways and by-ways for passengers whom they are prepared to carry at almost any price in order to increase their totals in this, the base year for Air Union calculations. (The ordinary innocent aloft may wish he ever felt the swish of their competitive brooms, but there are quite a number of cool customers who know how little they can fly away for.)

Fare-cutting does not appear to have hit London to the same extent as New York and the chairman of British Overseas Airways Corporation, who may find himself in the embarrassing position next month of announcing a loss of nearer £20 million than £15 million, electrified one of the preliminary meetings by producing evidence of cut-price tickets bought by his agents on other airlines. (One airline that expected to be accused by Sir Matthew Slattery, but was not, is said to have had a similar collection of cut-price tickets on BOAC in its delegate's pocket.) Sir Matthew, and his stable companion Lord Douglas, had the meeting's general support only because airlines find that the process of fare-cutting has gone so far that they are laying themselves open to blackmail by passengers and travel agents, and what was begun as a lure to the marginal traveller is in some danger of becoming the standard fare. They are also alert to the Aer Lingus warning that IATA would cease to exist if its main function, the fixing and policing of fares, fell any further into disrepute. They all know that the alternative to IATA is fare fixing by Government negotiation, which would remove from the airlines the control of their own destinies.



But might not the airlines in fact reduce fares by 20 per cent or more, a move that would certainly cut the ground from beneath the discounters ? Some airlines argue that this could and should be done, particularly if it were accompanied by a ban on charter flying which is tapping off an ever-increasing volume of traffic at fares between 50 and 70 per cent of normal. On purely statistical grounds, one would think that a fare cut on long-range jet services was certainly possible, for the big jets start to show profits on loads between 50 and 55 per cent at present fares. Efficient airlines could almost certainly show a profit on fares well below today's levels, provided that their loads could be relied on to improve sufficiently under the stimulus of cheaper tickets. But these are a regrettably small minority, as last year's financial results for the aviation business show. In spite of a world loss of £50 million before allowing for interest, some airlines broke even and a few actually made profits. Bearing in mind what Sir William Hildred said about the state of international, as opposed to domestic, air traffic, rather more should have made a profit than actually did so.

The key to the airlines' bad performance lies in the structure of the aviation business. Perhaps only 20 per cent of an airline's costs are under its own full control. Its product is sold at a fixed price which is agreed in advance for two years at a time (admittedly by the airlines' own cartel). The cost of aircraft, the rate of amortisation, the cost of fuel, and landing fees are beyond most individual lines' power to influence ; and wages, which account for as much as half the total running costs, are set largely by very powerful craft unions. Rates of interest, which are playing a steadily increasing role in airline costs, are beyond the management's day-to-day control, although some succeed in financing new purchases much more cheaply than others. The most that the airline can try to control is the size of its staffs and the cost of administration. Here, European airlines tend on average to carry conspicuously more fat than American airlines.

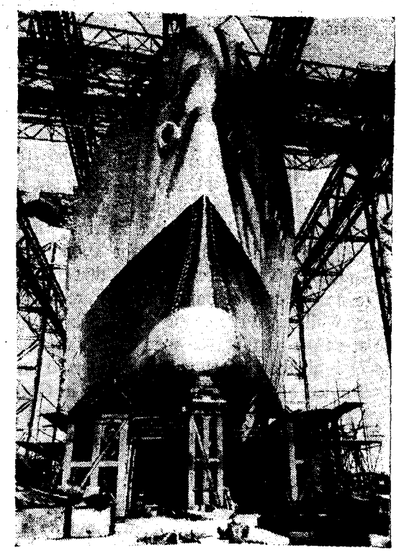
LORD BRABAZON was loudly cheered by the meeting for the most cuttingly unkind and insulting speech made to the airline industry for years—just because he is Lord Brabazon and it amuses the airlines to treat him as a father figure. The same words from a younger and less honoured speaker might have penetrated further beneath the skin, particularly the acid comment that among airlines, " few give the impression of living in the red." Lord Brabazon's tilt at palatial airline offices in expensive sites was followed up by members of the IATA secretariat who attacked the grandiose airports with their gilded knobs and marble staircases which airlines demanded of governments and for which they now object to paying. Carrying the argument nearer home, why does it take nearly three Englishmen to do the work of one American executive or one American pilot ? No one has suggested that American air crews are over-worked.

Unless air passengers are resigned to fares going up rather than down, they should rise now in a body and demand two things. One is an overhaul of airline management and the other an overhaul of the fares structure. Airlines that consistently make a loss are abominably run and there is no reason why the taxpayer here or in any other country should be expected to tolerate this. On rates, Sir William Hildred himself asked if fares for special groups were really the right way to get new travellers into the air. He could have said much more. Is it right, for example, to kill long distance first-class travel by charging twice the fare for 10 per cent more amenities ? Might not lower first-class fares bring in more revenue and offset at least in part any fare cuts at the other end of the scale ? Might not a little more market research and a little less striking of attitudes designed to impress other airlines teach operators something about their customers and their potential customers that they obviously do not know today ? One can only ask.

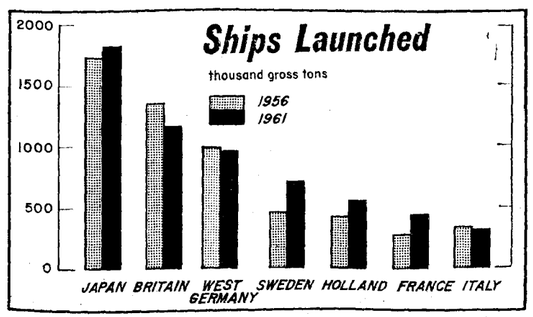
Shadows over German Shipyards

FROM A CORRESPONDENT IN DÜSSELDORF

HERR WILLY SCHLIEKER, the self-made magnate of the German steel trade, steel production and shipbuilding, seems for the moment to have disappeared from German business. In spite of all the efforts of well-meaning business circles in Hamburg and elsewhere, it has been impossible to find new investors willing to invest capital in his big insolvent shipyard. Official bankruptcy had to be declared ; the 3,500 men of his shipyard's labour force have begun to disperse ; construction has practically stopped (all material being requisitioned by his suppliers and creditors) and the neighbouring Blohm & Voss yard will finish the ships which Schlieker was building on American orders. Inevitably, the Schlieker case has revived uncertainties about the general situation of German shipbuilding industry. Was Schlieker only a special case ? Or is his plight a symptom of some underlying crisis awaiting the whole German shipbuilding industry ?



Complaints from German shipbuilders are not new. They began in 1961, when on top of a general slackening of the shipbuilding boom of the fifties came the revaluation of the D-Mark. The effects of this revaluation have been a topic of discussion in German industrial circles ever since, but there is no doubt that shipbuilding and shipping have been the great losers. These were the two branches of German industry in which international competition was sharpest, and their tenders were already based on very small profit margins.



Immediately after revaluation orders from abroad began to slacken, and most foreign customers refused to go on accepting the D-Mark as a basis for calculation. Then the Federal Government intervened and granted the shipbuilders a credit ceiling of DM 400 million (about £35 million) at a cheap interest rate of 5 per cent, 1½ per cent below the normal German rate. This was meant to enable them to accept export orders that were not financed in advance (as had been usual in former years) even if these were not directly profitable. More and more often, orders began to be accepted that were 10 to 20 per cent below the level of the shipyards' own costs. These were accepted to maintain stability of employment and to keep shipbuilders in business.

At the end of 1961, the financial state of the industry was, therefore, somewhat gloomy. Though the total turnover of the whole industry had risen from DM 2,593 million in 1960 to DM 2,705 million in 1961, turnover on ships built for export declined from DM 1,564 million in 1960 to DM 1,275 million in 1961, the lowest point since 1956. The number of ships built for export came down from 116 in 1960 to 101 in 1961 with a total tonnage of 705,000 tons gross, compared with 899,000 tons gross in 1960. Only higher orders on home

account staved off a major crisis. These rose from 93 ships in 1960 to 126 ships in 1961, and from 254,000 to 355,000 tons gross respectively. But the situation was further aggravated at the beginning of this year when wages rose by about 6 per cent and the working week came down to 42½ hours, effectively increasing wages still further. The result was an increase in the wage charges in German yards of 10½ per cent, while in competing countries wages rose mostly in the order of only 3 to 5 per cent.

From the beginning of this year, German orders began to slacken, because depressed freight-rates and the tighter financial situation prevented many shipping companies from replacing or renewing their fleets. In the period from May 1, 1961, to April 30, 1962, new orders were little more than half the rate of deliveries. It was natural that under these circumstances this shipbuilding industry should compare these conditions with the conditions it believes exist abroad; what shipbuilder anywhere does not? German shipbuilders complain that many of their competitors are subsidised in some form or other, directly or indirectly, by their governments.

Though the Rome treaty requires that shipbuilding subsidies be gradually abolished, this principle has been ignored in practice. German shipbuilders argue that in Italy subsidies seem even to have been raised in the past year. In France they appeared in the budget for 1962 at the equivalent of £21 million. The Germans argue that this means that in Italy up to 27 per cent of building costs are borne by the government, while in France the average building subsidy works out at 23 per cent, and in special cases up to 35 per cent. On top of it all the French turnover-tax paid on export business is refunded to the shipbuilders, while in Germany, out of the 7-7½ per cent turnover-tax in the total costs of a new ship only 3 per cent is refunded. Outside the EEC, too, there are a good many indirect aids for shipbuilders. Japan, the world's biggest shipbuilding country, has no turnover-tax, and 80 per cent of the export profit or 5 per cent of export turnover can be deducted from company tax. In addition, the shipbuilding firms can convert 35 per cent of their annual profit tax-free into capital reserves. The Japanese Export-Import Bank gives credits to the shipbuilders at rates of 4-5 per cent, about half of normal interest rates there. Recently in Argentina, German tenders were 37.4 per cent higher than the Japanese. The United States, hampered by exceedingly high wage rates, gives subsidies to American firms placing orders in the American shipyards of up to 50 per cent of the building costs. Great Britain has no turnover-tax, to refund or not, and provides cheaper industrial credits than do the German financial institutions, while its shipowners get a bigger tax relief on investment than the rest of industry; from Hamburg, this looks as much like subsidy as some German practices often have looked from the Clyde. The Scandinavian countries, again, provide cheaper credits for their shipbuilders and generous income-tax allowances.

If one takes the year 1956 as 100, German tonnage launched in 1961 stood at 97 and Italian at 92, while French shipbuilding rose to 150; Britain's output index, on that basis, would be 86. However, if one compares the tonnage of ships under construction, Germany has (at July 1, 1962) maintained its third place with 936,000 tons gross, behind Japan with 1,491,000 tons and Great Britain with 1,292,000 tons. Close behind come Sweden with 773,000, France with 674,000, the Netherlands with 636,000, and Italy with 604,000. The United States has only 445,000 tons of ships building and Poland, the biggest shipbuilding country of the Eastern block, has 346,000 tons.

It is not so much their present circumstances that are worrying German shipbuilders as the general trend. In the years of a seemingly boundless shipping boom all the German yards expanded their capacity; now they are determined at all costs to maintain the national capacity intact. Competition not only in shipbuilding, but also on the shipping market itself, has become stiffer, and the bigger and faster ships are mostly the better placed in the race. This involves the necessity for re-equipment and further aggravates the financial position of shipbuilders in general. And German builders, having lost their room to manœuvre as a result of rising wage costs, and alarmed by the Schlieker failure, feel the pinch of the situation even more sharply than some yards elsewhere—though they naturally claim that Schlieker was a special case in many respects and is not the beginning of a general catastrophe.

BUSINESS NOTES

MAUDLING PLAN

Snub from Paris

Paris

POLITE indifference is all Mr Maudling can expect from the French delegation for the proposals he intends to present at the meeting of the International Monetary Fund next week. "All is for the best in the best of monetary worlds . . . or very nearly"—that will be the approximate position taken up by M. Giscard d'Estaing, France's minister of finance. The position is an inoffensive one only in appearance: the French intend to use it in order to bury quietly the proposals attributed to Mr Maudling for the creation of an eventual pool of reserves. In order to be quite sure of not having to reply in precise terms to British suggestions, the French minister of finance will take the floor on Wednesday before his English colleague—and will then return forthwith to Paris. He will leave in his place M. Calvet, deputy governor of the Bank of France, whose functions do not in any way authorise him to take a position in the name of the French government.

The French attitude is founded on two basic propositions. The first is that, contrary to Mr Maudling, official circles in Paris do not see any problem of international liquidity in the medium term, and perhaps not even in the long term. Secondly, they consider that if such a problem did nevertheless emerge, there would be plenty of time to find a solution. In the meantime, the agreement made last year at Vienna and sealed in Paris provides the means to meet difficulties if they present themselves: the equivalent of $6 billion could theoretically be put at the disposal of

the IMF by the ten signatories of the agreement. The French wish has been throughout that this eventuality will never come about. In this respect, the improvement in the balance of payments in the United States and in Britain has been viewed with much satisfaction in Paris.

Doubtless, French financial circles, through national pride, somewhat exaggerate the virtues of the agreement of last December, in the settlement of which M. Baumgartner (the previous minister of finance) took a prominent part. But in Paris the restrictive clauses placed on the calling up of the famous $6 billion are seen as having a constructive role, despite the criticisms: they offer some remedial virtues to the eventual borrowing governments, preventing them from succumbing to a monetary *laissez-aller*.

Besides displaying this rather hostile reserve, what will the French say in Washington? They will undoubtedly encourage the reference of Mr Maudling's proposals to the experts, for study by the IMF. It is also expected that M. Giscard d'Estaing will show himself favourable to the idea of increasing the resources of the International Development Association, but remain more discreet about the dates and the means that have his preference. Finally, it may be that on this subject the French minister of finance will revive the idea, thrown out in 1955 by one of his predecessors, of an aid plan in which the contributions by western countries would be proportional to their resources. The minimum percentage of one per cent of national income can be put forward the more easily by France since, as computed in Paris, its existing aid for under-developed countries already amounts to 2½ per cent of its national income.

What Support Elsewhere?

REACTIONS of other Continental countries to British proposals for wide ranging reforms are unlikely to be as sharply antagonistic as the French, but, as in Vienna last year, it will probably be on this complacent side of the fence that France's common market partners are likely to come down. Reports from Frankfurt suggest that the German delegation will have little sympathy with arguments predicated on a shortage of international liquidity, and will point rather to the recent lessening of the imbalance between Britain and America on the one hand and Continental Europe as an indication of the adequacy of the existing system. The Americans themselves seem likely to rest on the small piecemeal innovations they have been developing over the past year or so. Mr. Robert Roosa, under-secretary of the US Treasury, this week spoke of these co-operative arrangements as "the most comprehensive restructuring of international liquidity arrangements" since the IMF was founded, and referred to further impressive acts of co-operation yet to be revealed.

The improvement in the balance of payments between the main industrialised countries is also strongly stressed by Dr Per Jacobsson, managing director of the Fund, who has for some months been pointing to the "natural" forces making for equilibrium through a sharp relative upward movement in prices and costs on the Continent in relation to the United States—and is now sensibly advising the United States to be less edgy about its gold losses. But Dr Jacobsson is not given to complacency, and he may be expected to play his part in stirring up the conservative continentals. In an eve of conference address to the Advertising Club of Washington, Mr Jacobsson is reported to have said that deflation may have become as great a danger to the world as inflation was a few years ago; and specifically, that financial policies should now attempt to prevent declines in commodity prices "of a deflationary character." This, Dr Jacobsson intimated, would be one of the main themes of the meetings. The other will be this big question of easing the strains on the reserve currencies, in which Mr Maudling and Mr Roosa have evidently a much more active interest than the audience they are appealing to.

Meanwhile Mr Maudling sets off with a somewhat muffled supporting call from his own central bank. The September issue of the Bank of England *Quarterly Bulletin* notes the present economic contrast between the problem of under-employment in North America and the growing problem of rising costs in Europe. This contrast itself "suggests that the main payments disequilibrium is on the way to solution." At the same time, the Bank recognises that if Europe tries to attack its cost problem by restricting demand, this will make it more difficult for America to end its under-employment; and that the result may be "some approaching restraint upon the growth of world trade, at a peculiarly inopportune time for the United Kingdom." So what is the way out? The tortuous concluding sentence is a rather sorry reflection of the highest common factor of agreement between Threadneedle Street and Whitehall:

> It is the task of international economic co-operation, highly developed as it is, to minimise any adverse change in the growth of world trade; and if this task were made too difficult by doubts about the adequacy of exchange reserves and international credit facilities, it would be for international discussions to resolve them.

Would be—or is?

EXCHANGES

Two Strong Dollars

THE exchange markets have this year maintained their calm until the very eve of the IMF meeting. For a moment on Tuesday it looked as though last-minute nerves might be developing, as there was a sudden increase in demand for gold on the London market and the price rose to $35.13 an ounce. But this seems to have been attributable to a special order, for demand subsequently died down. On Wednesday indeed the dollar staged a notable advance against all currencies. It recovered to 4.3210 against the Swiss franc, rose back to parity against the mark, and nearly reached parity against sterling—the rate of 2.80\frac{1}{16}$, at which the Bank of England is believed to have provided some support, is the lowest rate for sterling for a year. The Bank of England now confirms that the inflow of private funds seems to have stopped "after May"; it shows that the fall in sterling balances of non-sterling countries in the second quarter was entirely attributable to official holdings, which were being drawn down largely for "ordinary trading transactions."

This week's further strengthening of the dollar was attributed in the London market to two main influences—Dr Jacobsson's speech telling the United States administration it could justifiably itself show more confidence in the dollar; and the passing by the House of Representatives of the bill allowing higher interest rates to be paid by banks in the United States on deposits of foreign official institutions—though still not of private holders. This bill must still pass the Senate.

The other strong currency of the moment is the Canadian dollar, which is being held down (at 92.86 US cents, just above the parity of 92½ cents) only by continuing purchases of US dollars by the Bank of Canada. In August these purchases added US $216 million to the reserves, bringing the total to $2,330 million, and the total increase since the June low point to $580 million, net of the large special credits. Canada has thus regained some three-fifths of the earlier drain of over $900 million from the beginning of the year; in fact the true movements of funds in both directions were larger still, being partly disguised by official operations in the forward market. The clear recovery of market confidence encouraged the Bank of Canada to allow a guarded reduction from 6 to 5½ per cent in its Bank rate at the end of last week; but, despite the heavy reflux of exchange, Canadian financial circles still believe that the government has made arrangements for a loan in New York, of perhaps $250 million, to repay part of the short term credits extended by the IMF, the Federal Reserve and the Bank of England. The rationale of such an operation is not easy to follow—and one wonders how it would be received by Mr Dillon.

OVERSEAS INVESTMENT

Quicker Returns

LAST July, Mr Lloyd added to the already great complexity of considerations that govern the size of remittances from profits earned overseas a call for consideration towards Britain's balance of payments. The overseas territories in which

these profits are earned have their own methods, formal and informal, of putting pressure on firms to reinvest a large part of these profits within their own borders. From figures for British subsidiaries operating overseas—excluding oil and insurance—published by the Board of Trade this week, it seems fairly clear that Mr Lloyd gained the ascendancy in the ensuing tug-of-war. Because of the economic setback in many areas, profits earned by these overseas subsidiaries declined by £6 million to £151 million. But dividends remitted to Britain increased by £5 million to £77 million, so that for the first time since a record of these transactions began to be compiled in 1958 the proportion of remittances exceeded 50 per cent of earnings.

The whole of the improvement in overseas earnings by subsidiaries of British companies since 1958 has been remitted in dividends. Unremitted earnings in 1961 were £74 million—precisely their level in 1958—while dividends to parent companies have expanded from £50 million to £77 million. Although it is impossible to generalise about the causes of this shift in the balance between earnings and remittances, profits have been getting harder to earn in most countries, prospects for primary producers have been dimmed by the fall in commodity prices and investment throughout the free world is not being pursued with the vigour of earlier years. Direct investment by British firms overseas, including retained profits, contracted sharply last year from £239 million to £168 million, mainly because of a fall of £57 million in investment in the overseas sterling area.

Remittances from profits of overseas subsidiaries operating in the United Kingdom show the same trend towards repatriation of a greater proportion of profits. The earnings of foreign subsidiaries in Britain fell marginally last year, but remittances increased sharply. The reduced liquidity of many parent companies caused by the squeeze on profits has presumably increased the incentive to remit. This year overseas earnings by British companies have improved, but the continued depression in industrial profits in Britain reduced profits and dividends earned by foreign companies.

REMITTANCES BY BRITISH SUBSIDIARIES OVERSEAS*

NEW FORD

The Cardinal Disrobed

NEWS of the Ford Cardinal has been leaking out over the months and years more extensively even than is now usual in this decade of sales strip-tease; now it is revealed, under the lay title of Taunus 12M, as an unusually original design for an American company—even if it is to be made in Germany. The main features had become familiar enough—a V-four engine driving the front wheels of a car slightly bigger and a good deal more powerful than the Volkswagen, but otherwise intended to share that car's appeal—with its price of £476 only £31 above that of the VW de luxe in Germany and £23 above the Opel Kadet. The engine is almost the same capacity—1,183 cc to 1,192—and it also has a low enough compression ratio to allow it to run on commercial grade petrol; but it develops 50 bhp compared with 40 bhp for the VW. As the extra body space of the 12M means 200 lbs more weight (1,863 lb), the gain in acceleration is slight; but Ford claims a maximum speed of 78 mph, six mph faster than the VW. Again like the VW, the 12M is so high geared that its top speed can also be its cruising speed.

The advantages that the 12M has over the VW are no more than one would expect from a new design intended to match the unique appeal of a 25-year old; but they also bring it into the market at which the new generation of bigger British and French small cars is aimed—the Morris 1100 and the awaited Ford equivalent (which is not related to the 12M); the Renault R8 and the Simca 1000; to say nothing of the Opel Kadet. In export markets the Cardinal will be a formidable competitor and yet another factor pushing the export prices of British cars down to unprofitable levels. Having originally intended that the car should be sold in the United States as well as Europe but that some parts should be made only in Europe, Ford has tooled up for production on a massive scale in its new factory at Cologne, with the most modern production techniques, and it can only be on the expectation that output will be higher than that of any British small car that Ford can have set its price competitive with that of the VW.

But it is not only by tooling for high output that Ford has kept down costs; the design of the 12M shows many marks of ingenious simplicity. No engine fan is fitted, for example; but an interior heater is a standard fitting, and its electric fan is brought into use—exhausting on to the road on such occasions, not over the feet of the passengers—if the engine should overheat. This simplification saves the power needed to drive a fan and the noise it produces. Where most cars now have their clutch operated hydraulically, the Taunus uses a cable in a plastic sleeve; and the flywheel housing forms part of the final drive unit. The springs are the simple leaf type, transverse for the independently sprung front wheels and half-elliptic with a rigid axle at the back. But weight saving has not been so rigorously followed as on some new models, perhaps because robustness was sought more than performance—and the designers may have thought that simplicity of line and structure would save more than attempts to reduce the amount of metal needed by employing complex structural forms. Now the Americans are in the European small car market, the 12M shows how hard the locals will have to try if they are to keep up—and locals include Volkswagen.

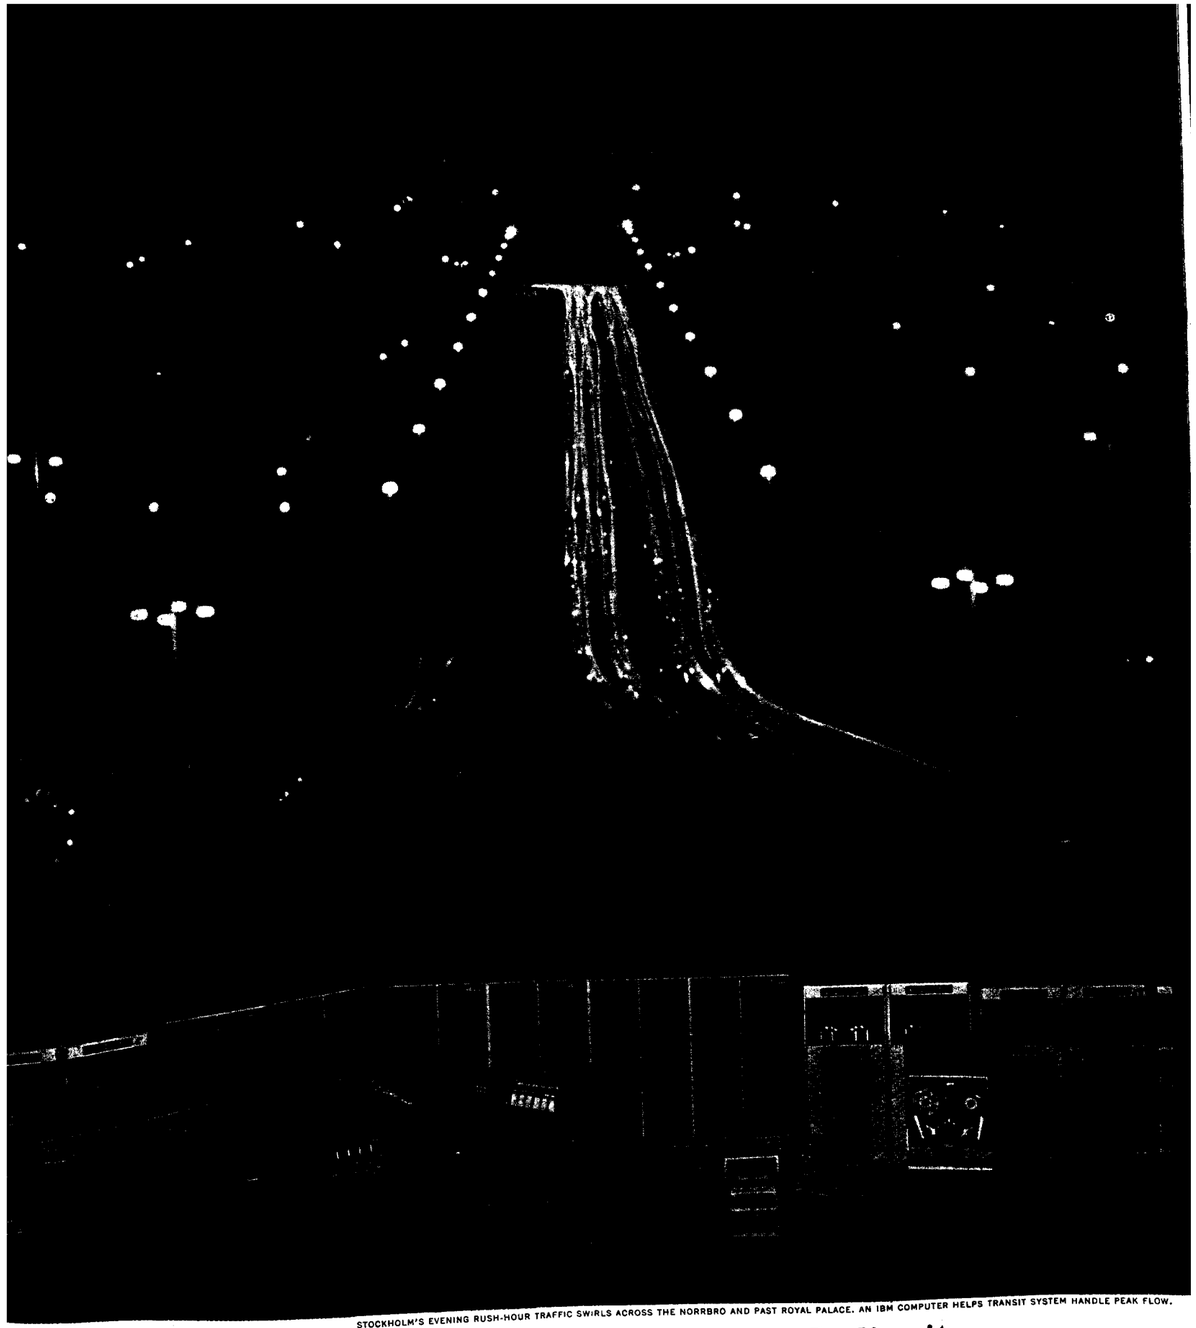
COTTON TEXTILES

Haven in the South

MILL closures in Lancashire are nothing out of the ordinary, though after the cotton industry's Government-assisted contraction, the rash of additional closures this year has been particularly dispiriting. Each closure is a tragedy of its own, but together they are just crosses along the hard trail that the industry has been forced to follow. Opening up mills abroad is no new departure for British cotton manufacturers either. English Sewing Cotton, Calico Printers, David Whitehead, and, less happily, Smith and Nephew among others have participated in what seems an inevitable drive towards self-sufficiency in textiles in many overseas markets. But this week, Cyril Lord, the carpet and textile manufacturing group, has linked its participation in a new mill in South Africa with the shutting down of two of its cotton mills in Lancashire—one of which is already out of production—and appears to have invited publicity for the move, which could not in any event have failed to cause a stir.

The threat of switching production to low cost areas abroad has already been used in the propaganda campaign waged by the industry against cheap imports. But the intended irony of the Cyril Lord move is that the company plans to pack up part of its British plant and to trek with some of its workers to the hospitable, protectionist climes of South Africa. State aid is said to be lavish and it must be a comforting thought that South Africa appears dedicated to the elimination of imports of textiles, in happy contrast with the lack of sympathy shown to the protectionist cause in Britain.

In partnership with the state sponsored Industrial Development Corporation, Cyril Lord intends to establish a £750,000 integrated plant for producing fine cotton fabrics at East London on the borders of the Bantustan African reserves, thus qualifying for special Government assistance. It is planned to have the new plant in production at the beginning of 1964 and to increase output eventually to 20 million yards of cloth and 800,000 lbs of yarn. South African imports of cotton piece goods amounted to about 180 million yards last year and imports of yarn to 6 million lbs



STOCKHOLM'S EVENING RUSH-HOUR TRAFFIC SWIRLS ACROSS THE NORRBRO AND PAST ROYAL PALACE. AN IBM COMPUTER HELPS TRANSIT SYSTEM HANDLE PEAK FLOW.

To work and home again in Birger Jarl's city

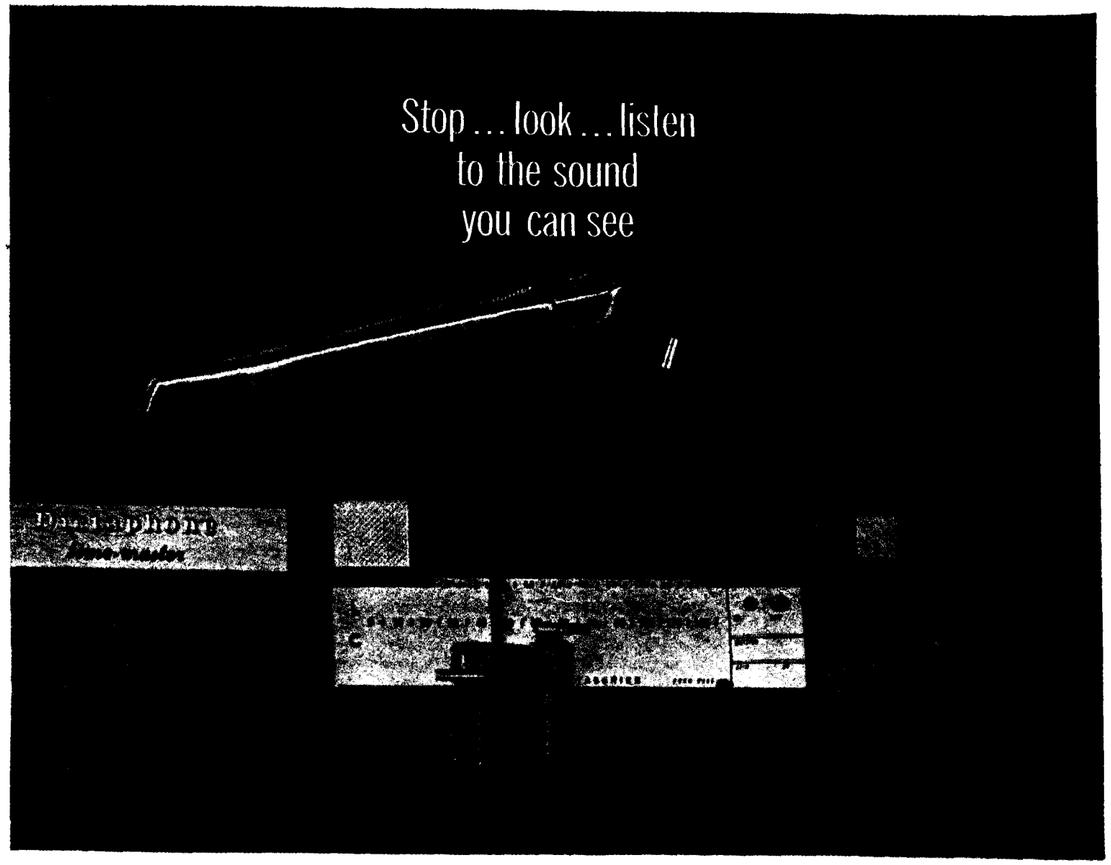
You might say that pirates are at the root of Stockholm's traffic problems. To block sea raiders seven centuries ago, old Birger Jarl founded his city on an island between lake and sea. As it has grown, the Swedish capital has leaped from island to island to mainland until its traffic patterns are everywhere fragmented by gleaming waterways.

To get island-hopping commuters to work on time and home again requires a precise yet flexible transit system. Daily passenger and vehicle mileage, periodical tallies of 1,500,000 passengers, travel habits of 10,000 families are tabulated and studied.

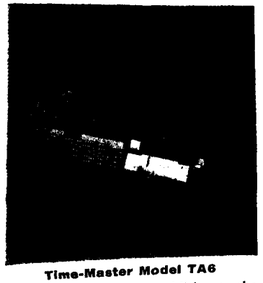
To translate this unwieldy information into timetables, an IBM data processing system analyses millions of facts and prints out reports that help schedule bus, tram, and tube traffic. In its spare time, the computer keeps the books, makes job assignments, figures salaries and pensions, and even sends vehicles to overhaul.

Such use of advanced technology has helped Sweden build a dynamic economy on limited resources. Two other factors, Swedes will tell you, are *effektivitet* and *kvalitet*. Efficiency and quality are IBM watchwords, too. We feel right at home in Stockholm.

IBM

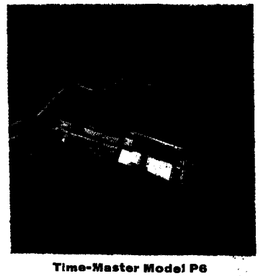


...with the new Dictaphone models at new lower prices



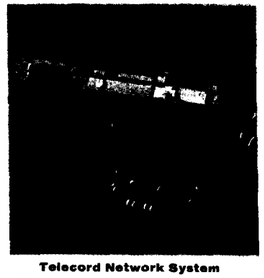
Time-Master Model TA6

This is an entirely new addition to the Dictaphone range. The Time-Master TA6 has been specially designed to incorporate the basic advantages of the Dictaphone system at the lowest possible cost. It uses the unique Dictabelt which records permanently and visibly to ensure against accidental erasures and mistakes. Price: **£95 0s. 0d.**



Time-Master Model P6

Just four buttons on the microphone control the complete dictating process with the de luxe model Time-Master. Push a button to start recording; release it to stop. Other buttons control playback, corrections, and letter length. It's so simple, and it uses the unique Dictabelt recording system and costs **£129 10s. 0d.**



Telecord Network System

With the Dictaphone Telecord System, your telephoned dictation is automatically fed on to a vacant Telecord machine, usually located in the typing department. Dictation completed, the Dictabelt is handed to a typist for immediate transcription. This system is ideal for large organisations where it drastically reduces costs.

Travel-Master Portable

This needs no wires or tapes for recording, nothing but the revolutionary Dictabelts which tell you where you are at a glance. Wherever you are, just slip the Dictabelt into an envelope and send it off for transcription on a standard Time-Master Transcriber. This portable Travel-Master weighs only 5 lb., and costs **£105 0s. 0d.**

DICTAPHONE
REGD. TRADE MARK

Dictaphone Company Ltd., 17-19 Stratford Place, London W.1. Tel: HYDe Park 9461
The words DICTAPHONE, TIME-MASTER and DICTABELT are registered trade marks.
The Dictaphone Time-Master has been accepted for the Design Index of the Council of Industrial Design.

IN THE MARKETS

Autumnal Tints

THERE was a hint of autumn, a touch of frost in the air, in the references that Mr Per Jacobsson and the quarterly bulletin of the Bank of England made about the course of world trade. Mr S. G. Warburg, the chairman of Mercury Securities, was even more explicit when he referred to a "salutary" downward trend of the trade cycle. But having evoked a spectre, he made it less frightening by defining it as "a period of squeezed profit margins in industry and trade with consequent repercussions on banking." The London market, though Wall Street was steadier, took the hint and, made increasingly cautious and anxious about the outcome of Britain's negotiations with the EEC by the Commonwealth Prime Ministers' conference, saw no reason to buy equities. *The Economist* indicator slipped back by 1.9 points to 326.6 and the *Financial Times* index by 2.3 points to 274.1 over the week to Wednesday's close.

These are not big movements but they are symptomatic of a lack of faith in equities in a market where buyers appear to be interested only in gilt-edged and other fixed interest securities. After some initial hesitancy, reflecting doubts about the speed at which interest rates would be allowed to fall, fresh buying pushed up gilt-edged prices, especially in the medium and short dated range, even though the market expects no change in monetary policy until after the end of the IMF meeting. Inevitably, this movement found its echo in higher premiums on recently issued corporation stocks. The Bank of England bulletin does not comment directly on the present state of the gilt-edged market; but the parallels which can be drawn between now and the experience of the market in the April-June quarter, when £187 million net of stocks was sold by the authorities (including £67 million to private investors, who were switching out of Treasury bills) are clear for all to see. Then, the issue of a new tranche of the 1986-89 stock slightly above the market price "could be, and was regarded as an indication that some continuing fall in long term rates would not be opposed." Does the Bank want investors to interpret the recent issue of a tranche of the 2008-12 stock, again above the market price and coming on top of a quarter of almost certainly bigger sales of stock than took place in April-June, in the same way?

STEEL

Restful August

STEEL production fell more than usual in August, as the industry made the most of the holiday season: with little sign of a recovery in demand, most plants shut down for a prolonged period of relaxation. Output was therefore 13 per cent less than in July and eight per cent lower than in August last year; and the effect of this long holiday makes it difficult to reach any very precise conclusions about the industry's position from the production figures. Use of the seasonal adjustment calculated by *The Economist* on the experience of past years suggests a sharp fall in production in August following an increase in July; but if the two months are taken together, one gets a weekly rate of 401,000 tons, little less than the adjusted figure for May and June. So the conclusion seems to be "little change."

The Iron and Steel Board estimates that output this year should be 20¼ million tons, 1¼ million tons less than last year; so far this year output has been at an annual rate of 20,338,000 tons, but the last quarter is usually a good period for demand. This rate represents, the Board states, the use of only 76 per cent of existing capacity; it adds: "This figure would of course be higher if the older and less efficient capacity, which, in the Board's view, it is no longer essential to retain had been eliminated more quickly." To have done so would no doubt have provided a more agreeable figure for the utilisation of capacity, but it is rather doubtful whether it would have improved the financial position of the companies. The saving on maintenance when plant is scrapped rather than just left idle is hardly big enough to make much difference; and when capital charges are taken into account, the old plant may often prove little more costly than the new. Where the biggest losses lie is in the new and costly plants that are ready for use but under-utilised.

The Board confirms its provisional estimate that steel consumption in the second quarter was 7½ per cent less than a year earlier, and reiterates the industry's view that a "firm recovery" in steel production next year depends on further measures to stimulate the economy.

CONSUMER PROTECTION

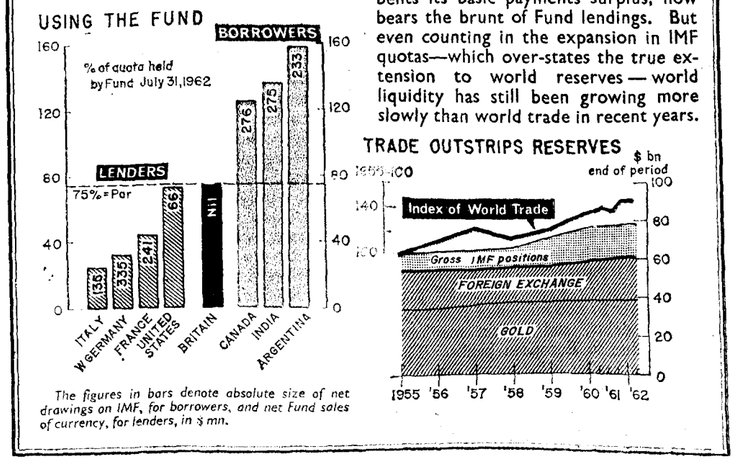
Whose?

"A STRUGGLING orphan . . ." was the verdict of the Moloney Committee on Consumer Protection on the British Standards Institution's "Shoppers' Guide." The committee saw no way of helping it nor a better home to consign it to; no alternative, in fact, to leaving it where it was. The sickly child seemed certain to waste away but, in true Dickensian fashion, kindly foster-fathers have been found at the last minute. Mr Labowitch and Mr Heseltine, owners of the Cornmarket Press which publishes the magazines "About Town" and "Topic," have reached an advanced stage of negotiations with the BSI for taking over "Shoppers' Guide" and injecting new life into it.

They say they hope to form a non-profit-making organisation, perhaps called Consumers' Advisory Trust Ltd, which would take over the running of the magazine. Editorial policy would be supervised by an editorial board consisting of 12 people: eight supplied from the BSI's Consumer Advisory Council, which presently runs the magazine, and four nominated by Mr Labowitch and Mr Heseltine, although subject to the BSI's approval. The present editor has been asked to continue in the job.

Washington Backcloth

Britain is back exactly to parity in its transactions with the International Monetary Fund, and continental Europe, as befits its basic payments surplus, now bears the brunt of Fund lendings. But even counting in the expansion in IMF quotas—which over-states the true extension to world reserves — world liquidity has still been growing more slowly than world trade in recent years.



The figures in bars denote absolute size of net drawings on IMF, for borrowers, and net Fund sales of currency, for lenders, in $ mn.

Cornmarket Press would provide publishing services (including, presumably, push) for which it would receive a management fee. Just how its new owners would hope to widen the appeal and increase the subscriptions of the magazine is not said, but judging from the success the group has had with its own publications their ideas may be arresting.

The puzzle is, why? Mr Labowitch and Mr Heseltine have been extremely successful in enlisting the advertisers' support upon which their publications are mainly dependent. It is hard to see where a magazine from which they would draw no profits and whose *raison d'être* is primarily to cast a sceptical eye on the kind of claim that most advertisements make could fit into their scheme. A new "Shoppers' Guide" would presumably hope to offer the same sort of comparative testing as "Which?" does, but these are expensive: "Which?" spends £150,000 a year on testing alone. Do "Shoppers' Guide's" prospective backers intend to foot the bill for enlarging such activities, until readership can be built up sufficiently to wipe out the "Guide's" present deficit? Half a million pounds a year from the 320,000 subscribers of "Which?" points to quite a sizeable source of circulation revenue that might be tapped eventually, but to whose benefit?

ARGENTINA

Refinancing the Debt

PARIS now has two "clubs." The older and lesser known of the pair, which concerns itself with the financial problems of Argentina, has this week been meeting Senor Alsogaray, the Argentine Minister of Economy, in Paris to consider a further request for the rephasing of Argentina's debts to European creditors. After the main meeting on Wednesday Senor Alsogaray seemed optimistic on two counts. First that it would take Argentina only a year to eighteen months to solve its present financial problems—reserves are now down to $170 million, equal to about six weeks' imports. And secondly, that Argentina was practically certain to get the co-operation for which it was asking, namely a debt moratorium covering a year to eighteen months. There are unconfirmed reports, however, that Senor Alsogaray originally asked for three years' relief.

This "Paris club" comprises the main west European countries and Japan; observers from the United States, Finland and the IMF also attended the meeting. The size of the amounts involved is, as always, uncertain, but reports from Paris suggest the discussions concern $270 million of pre-1956 debts over $1,000 million of post-1956 stabilisation debts, and certain medium-term debts due to European banks. The United States has let it be known that it is no longer prepared to put money into Latin America that is then used to repay European creditors. In future American policy will be to offer the Argentinians the same terms as to the Europeans. Argentina's total official foreign debt now amounts to $2,620 million; of this $384 million falls due in 1963, and $460 million in 1964. Some $545 million is owed to the United States and perhaps three times as much to West European countries. On top of this are large private debts. Recently the central bank announced that there were also $284 million of private foreign debts due for repayment before June 30, 1963—$85 million to the United States and $172 million to Western Europe.

BUILDING SOCIETIES

How Revolutionary an Idea?

HAVING said that building society interest rates must come down and that his own society was giving serious consideration to a reduction in its own, Mr Lewis Cohen, the chairman of the Alliance Building Society, gave support this week to the idea, discussed in these columns last week, that the societies should in place of the "recommended" rate of the Building Societies Association be left more free to fix their own rates. He thought that the bigger societies should pay less to their depositors and charge less to their borrowers. The "recommended" rate of the association is not mandatory and not all member societies follow it. To dispense with it therefore might not even be so "revolutionary" an idea as Mr Cohen seems to think it is.

To try to counter the suggestion that societies should have greater freedom to compete in interest rates by the argument, put up by some commentators this week, that the demise of the "recommended" rate would destroy one of the prime purposes of the association, raises more questions than it answers. Is the association simply a cosily protective trade alliance?

GERMANY

Where Euro-Dollars Are Held

Frankfurt

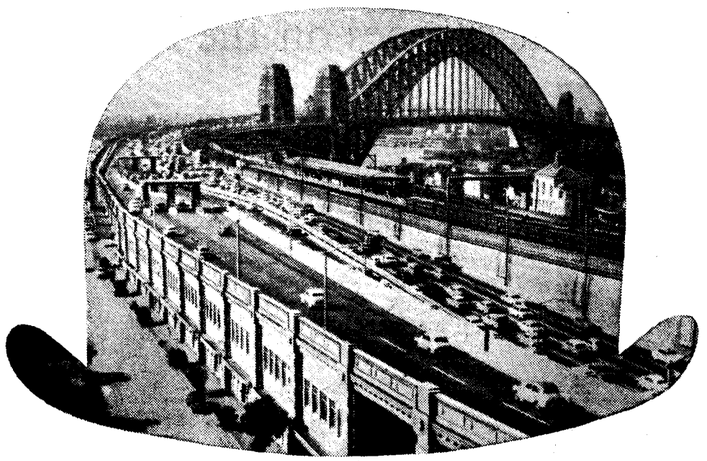
JUST at the time that the German financial authorities are becoming less anxious to encourage their commercial banks to put large funds in foreign short-term investments, they have released a mass of information about those investments—information that throws new light on the international money markets. At the end of 1958 the German banks, after an interval of more than 25 years, began once again to play a part on foreign money markets. This move was instigated by the Bundesbank which provided facilities for forward exchange cover. The aim was to neutralise the large exchange surpluses. Under the impetus of these measures, short-term foreign investments by German banks (assets with foreign banks, foreign money market paper and short-term credits granted to foreigners) rose to 7.3 billion D-marks by the end of February last.

At this point, in view of the trend which had meantime set in towards a return to balance in the Federal Republic's external finances, the Bundesbank changed tack. It no longer actively encouraged the outflow of short-term funds, and increased the cost of forward cover. At the same time it raised interest rates on the internal money market. This induced the banks to reduce their short-term foreign investments to DM 5.5 billion by the end of June, 1962. A detailed survey carried out by the Bundesbank and published in its August report now shows that some 865 million marks, that is 16 per cent of the total, was invested in Britain. Of this, 103 million marks was in the form of sterling, a similar sum in marks, and a small amount in Swiss francs. But the major share of the investments maintained in London was in Euro-dollars, at 650 million marks. This accounted for nearly half the entire amount of German Euro-dollar investments of some 1.4 billion marks. The other half was distributed mainly between France (267 million marks), Italy (238 million) and Belgium (91 million).

The short-term commitments of German banks in Britain, mainly in the form of short-term credits, amounted altogether to DM 774 million in mid-1962, somewhat below the corresponding figure for London assets. Of the liabilities, the equivalent of 27 million marks was in the form of sterling, 356 million in dollars, and 365 million in D-marks. Since the mid-year, short-term investments abroad have declined further: at present they are estimated to be no higher than 4 billion marks. A further decrease is expected, since the return flow of deposit money has not yet ceased but rather, since the beginning of August, has accelerated.

In the meantime the Bundesbank has made further adjustments to the altered circumstances of the German foreign exchange balance: it has decided to admit bills of German exporters for private discount as first class bank acceptances at Privatdiskont. This special institution, established a few years ago, has hitherto taken bills only for finance of import and transit transactions. Since interest rates on prime acceptances are lower than on bank credit, this in effect reduces the cost of short-term export finance. The German authorities, at least in the central bank, have for years been seeking to strengthen the passive rather than the active side of their balance of payments. Their latest step seems to signal the inception of an era of active encouragement to exports. Corresponding measures in the field of long-term export financing might well follow.

PLANNING BUSINESS DOWN UNDER?



The Bank of New South Wales
will put you in the picture

The Bank of New South Wales can't exactly draw everything out of the hat for you, but if you're planning business Down Under you couldn't gain a clearer picture of current Australian and New Zealand situations than from us.

We've been in Australasia since 1817. We were the first bank there; we still are. Today we have over 1,150 offices throughout Australia, New Zealand, Fiji, Papua and New Guinea all providing key services, many of which are special to the Bank of New South Wales.

We find customers take their hats off to our initiative and sense of judgment. We doff ours to them too, of course. There's mutual interest and respect between the 'Wales' and our customers.

English cargoes on the Rhine

PRIBSH

Up and down the Rhine goes the inland shipping of half Europe, as it has for centuries, fetching and carrying a hundred different kinds of cargo between Basle and the open sea. Swelling this familiar traffic is a growing new element — tankers carrying petrochemicals. These are the exciting new materials out of which ingenious chemical engineers will produce polyester fibres for glamorous clothes, hard-wearing synthetic rubbers for shoe-soles, supple plastics for car upholstery.

Here and there among the flags at the mastheads is one bearing a symbol that is becoming more and more familiar to European industry—the I.C.I. trade mark. From I.C.I.'s petrochemical plants—the largest in Europe—cargoes are now finding their way across the North Sea and deep into the heart of Europe. In the years ahead these cargoes will be augmented by the products of new I.C.I. plants to be built near Rotterdam, at the mouth of the Rhine itself. In the petrochemicals sphere, as in so many others, from colour chemistry to crop-protection, the name I.C.I. has come to mean quality, service, experience.

The influence of I.C.I. research and production is felt today in every corner of the globe

ICI

Imperial Chemical Industries Ltd., London, S.W.1

Or is it there to create mutual trust and confidence between the societies and their members? The association, in protecting the good name of building societies and putting the principles and methods of their operations before the public, has done much good work and there is still much for it to do. But in the end it could do more harm than good to itself and its members if it argues that its *raison d'être* is the "recommended" rate. How revolutionary would it be for the movement to brush the cobwebs away and let some fresh air blow in through the windows?

POLISH BACON

Fifty Years On

POLISH pigs first came to market in Britain fifty years ago, and last year bacon accounted for about 30 per cent of Poland's exports to this country. But the value of bacon exports has been contracting while Poland's total exports to Britain have risen steeply. In 1958, bacon accounted for over 40 per cent of trade with Poland, while in the first half of this year bacon's share has been cut to 25 per cent: Poland's quota for bacon exports to this country has been held at 48,500 tons for several years, and the decline in bacon prices has eroded its value. The price of bacon dropped to an extremely low level in the third quarter of 1961, recovered, then slumped again. In line with the general market movement, Polish bacon fell 12 per cent in price in the first half of the year and is now 220s. a cwt, precisely the same as the depressed price of a year earlier.

It must be irksome to Polish producers to know that if larger imports of Polish bacon were allowed, they would find a ready market in Britain. They were once the second biggest suppliers to this market and they are now the fourth. British pig producers would, in fact, like to see imports cut, though their pressure has been resisted. British farmers were warned in July by the Minister of Agriculture that they must either check the growth in the British pig population or accept cuts in pig subsidies. But, as happened with butter before all imports were subjected to quotas, exporters of bacon have become dissatisfied with the prices they obtain in the British market. But they have no alternative outlet; their production has been designed to satisfy British tastes. The Wiltshire cure has been adopted by these suppliers and the bacon industry in many countries, including Poland, was originally developed from British stock. But unlike butter, where British production is still relatively small, home produced bacon now accounts for more than one-third of total supplies. Home production in the first seven months of the year rose by 8 per cent. At the same time heavier shipments from Denmark raised imports by 5 per cent.

RUBBER

Softly, Softly

RUBBER has recently acquired another useful property that should help it resist pressure from the synthetic substitute—imperviousness to political shock. President Kennedy's request for powers to recall reservists to the colours made only a fleeting impression on rubber prices, as did the repeated crises over Berlin which preceded it. Spot supplies of RSS1. momentarily regained a level of 22d. a lb in London, but immediately slipped back a fraction of a penny to about the lowest point for this year. The price of rubber has now been low and stable for about a year; manufacturers who have in the past been disconcerted by the elasticity in rubber prices could hardly ask more.

This becalmed rubber market, however, understates the strength of recent demand for rubber. Although shipments of rubber from Malaya to Western Europe have lagged so far this year, exports to the United States, where production of tyres expanded by more than a fifth in the first half of the year compared with a year earlier, have helped to balance the decline. A further increase in exports to Russia raised total shipments in the first half of 1962 to a higher rate than in 1961. But a large part of American purchases bypasses the ordinary market and is forwarded direct from the packing stations of the big American manufacturers. Russia has also been buying more rubber in the East rather than through London.

This tilt in the pattern of purchases has helped to rob rubber markets of some of their customary bustle and vitality, but the persistent drag of stockpile releases that fill in gaps between production and consumption appear to have have had a still more dispiriting effect. Consumers have let their stocks dwindle and cannot be persuaded by slight changes in the balance of the market to rush to rebuild them. Rubber fell below 23½d. a lb in May, and this price, under the revised rules for stockpile sales, has turned off the tap for ordinary releases. But physically deteriorating rubber has continued to be sold at a rate only 300 tons a month below the 1,000 tons level for British releases which is meant to apply in the price range 23½d. to 27d. a lb. The United States augmented its scheduled sales of stockpile rubber by earmarking extra supplies of rubber for foreign aid programmes from the beginning of July. In both July and August American disposals exceeded 5,000 tons.

But rubber has not weakened as sharply as might have been expected earlier this year. Stocks in producing countries have risen, but are not particularly high. The low level of exports from Malaya in August might be offset by the larger carryover of shipments into this month. Heavy rain in Malaya has hindered production, though the leeway will be made up later. So while rubber is depressed in price the tone of the market is steady and forward supplies command a reasonable premium.

FORTE'S

Catering for the Public

FROM the moment that merger negotiations between Mecca and the catering organisation of Mr Charles Forte were broken off at the end of last year, the stock market reckoned that a public quotation for Forte's was a lively possibility. Now a public issue of preference and ordinary shares in the company is on its way. Two major obstacles stood in the way of a Mecca-Forte merger. The first was the difficulty in valuing the shares in Forte's, which is one of the biggest private companies in this country, and the second was the difficulty in reconciling the interests of major and controlling shareholders in the two companies. Having built up his empire from tiny beginnings by his own energy, Mr Charles Forte will naturally be reluctant to give up control, and this he can retain by offering only a minority of the ordinary shares for public subscription. But the public quotation of these shares will make it easier for him to raise new capital for any developments he has in mind and will provide a firm value for the shares either for estate duty purposes or for any future merger negotiations. If Mr Forte is so minded, the quotation will make it easier for him to consider the possibility of merging with another company of equal stature such as Mecca or of taking-over other, smaller concerns.

But as Mr Forte is believed to have plans for further expansion of his empire in mind, notably in motels, the primary object of this issue appears to be to secure greater access to the capital market. The prospectus will be studied with care, for though the names of the companies in which Forte's is interested are well known—Fullers, Slaters and Bodega, Café Royal, the Waldorf Hotel, Quality Inns, the "Talk

of the Town" theatre-restaurant and so on—the size of the organisation and its record of growth in assets and profits are as much a matter of speculation as Mr Forte's own private fortune. The sponsors, Ocean Trust, can plan the issue in the knowledge that the general public is curious about the organisation and that investors are likely to be attracted by the magic of success which surrounds the man and the company. Forte's, in fact, has all the makings of a "glamour" stock—which is not always an unmixed blessing.

IDLE MONEY

From Mattress to Deposit

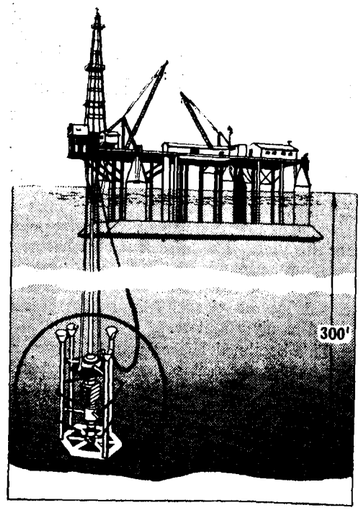
A SPECIAL article in the Bank of England bulletin discusses the withdrawal of the old (fatter) £1 note from circulation this year. When the announcement of withdrawal was made last February there were 253 million old £1 notes outstanding, and by mid-June some £210 million had been handed in. But of this total only £120 million were actually changed for the new notes; of the balance the Bank thinks that some £50 million went into the deposits of the clearing banks and £40 million was invested in various other ways, in particular in National Savings. So it has not taken much to bring cash hoards into bank tills. The clearing banks, having had their deposits boosted so effortlessly, must be eagerly awaiting the end of its partner the old 10s. note. The upshot of this was that the note issue actually fell by £20 million between mid-March and mid-June, against the expected seasonal increase of £50 million.

OIL DRILLING

In the Depths

OFFSHORE drilling has become an increasingly popular exercise among the oil companies as all the more likely oilfields on land get thoroughly perforated; but the limitation of the conventional drilling platform is that it rests on legs on the seabed, with the drilling equipment mounted upon it, and so cannot operate in more than about 200 feet of water. Now, by placing the actual well head and much of its equipment on the seabed and controlling it remotely from a floating platform, Shell Oil and the Blue Water Drilling Corporation of New Orleans claim that they can drill wells in up to 600 feet of water and later perhaps 1,000 feet—with greater ability to withstand rough seas. So the open sea now becomes an oilfield. Four wells have been drilled in the Gulf of Mexico this year; the deepest was in 300 feet of water. During the winter the platform operated in waves up to 28 feet high.

The platform gains seaworthiness from having its buoyancy chamber 40 feet below the surface, where wave action is slight, while the platform itself rides high enough above water level to be well above the waves. The "bottles" at each corner can contain air or water in different proportions, automatically varied to maintain the



trim of the platform as loads change. But it is the underwater drilling equipment and its control apparatus that is most intriguing and must have taken most of the $7 million that Shell has spent on development. The drilling derrick is mounted on the platform, with the pipe on which the bit is mounted running down to the well head on the sea floor: the flexibility of a long steel pipe takes up any movement of the platform. The well head carries two blow-out preventer units, hydraulically operated through a flexible hose from the platform, and there are two television cameras to let the operators see what is happening.

Setting up the equipment on the seabed without using divers is the most improbable part of the operation, and it is slower than starting a well from a conventional offshore platform. A single tube is first driven into the bed, and then a large hexagonal base plate carrying five vertical columns is locked on to it: the columns each carry a line that is used to guide a part of the control equipment to its place on the bottom. Meanwhile more holes are drilled and cement is poured down pipes to secure the base structure rigidly to the seabed. Then the blow-out preventers and the drill bit itself can be lowered, and once all is connected, drilling can start. Then the operators sit back and watch their television screens.

UNIT TRUSTS

A Good Summer

ALTHOUGH the holiday period usually coincides with a falling away in most forms of saving and investment and the behaviour of the stock markets has been uncertain, net sales by the unit trusts for the June-August period have reached the good figure of £4,780,000 comparing with £672,000 and £1,148,000 for the corresponding periods in 1961 and 1960. Moreover, there were no block offers in the 1962 period, compared with three in each of the same periods in 1960 and 1961. There were, however, a number of block offers earlier in the year which helped to stimulate sales so that for the first eight months of 1962 the movement has attracted net saving of £19.7 million, against only £1.6 million in the same period last year.

This steady growth seems likely to be maintained, for the favourable response of investors is now encouraging trusts to come out with further block offers. The Unicorn Trust has, for example, offered 1 million units at 6s. 9d. each to offer a yield of just under 4 per cent. The newest recruit to the Association of Unit Trust Managers, New Issue Unit Trust, is expected to make an initial offer of units later this month and there are several others in the pipeline. One of the most encouraging factors in the present growth of the movement has been the very sharp increase in the number of regular savers, who now number over 50,000 compared with just over 35,000 at the end of 1961. But savings by these investors still represent no more than about 7 per cent of the total inflow of funds to the movement. And perhaps a more important factor in the sharp rise in sales this year has paradoxically been the prevailing uncertainty in the stock market. This has made investors more aware of the advantages of expert management and the spreading of risks.

RECORD OF GROWTH

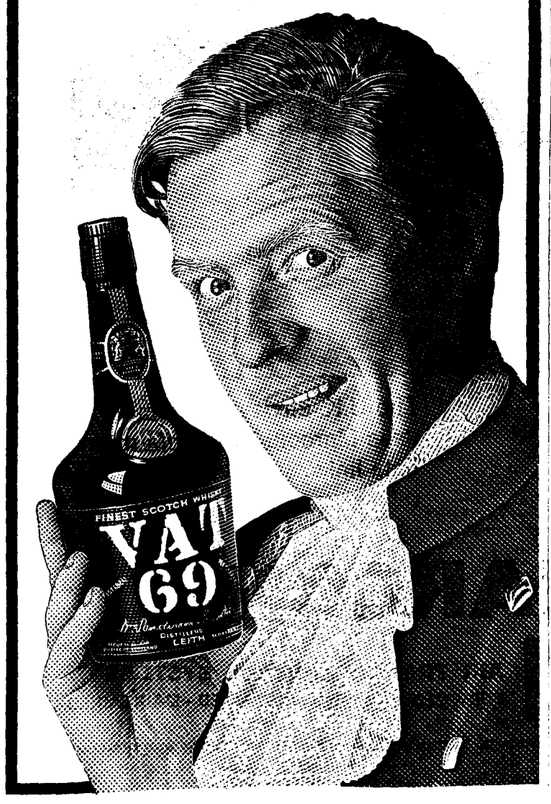
LOMBARD BANKING

Sea of Troubles

LOMBARD BANKING'S "smaller fleet of better ships"—the phrase used by Mr E. G. Spater last April to describe the reorganisation of the group—does not seem to have improved the company's performance. The interim dividend of this banking and hire purchase finance group has again been pruned, this time to 2½ per cent, following last year's cut in the interim from 9½ per cent to 5 per cent. The board makes little effort to explain from which quarter the rough weather continues to come, while the veiled forecast that the interim "should not be taken as any indication of the total for the year" leaves the poor shareholder facing both ways at once. Does this mean

ONE SCOTCH STANDS OUT
VAT 69



SHUT THAT WINDOW—

—and keep COOL

It's better business to air-condition your boardroom and executive offices. Open windows let in distracting noise, dust, fumes; unventilated rooms grow stuffy, exhausting. But a Temkon *refrigerated* air-conditioner keeps the room cool, calm, fresh—brains alert and businesslike.

The Temkon 'Whispair' floor-standing unit is the world's quietest room air-conditioner. It just *breathes* out clean cool refreshing air, filters out dust, reduces humidity. And it even supplies background warmth between seasons!

One room, a suite or your whole building can be fitted with these elegant, slim-built units for less than half the price of a central installation. Each unit allows for personal control of room conditioning and cuts running costs.

that the final will be maintained or cut?

A company that has cut its dividend ought in fairness to shareholders give some indication of the trend in its affairs and the outlook for the future. The Lombard directors say that "the group is currently operating profitably." That at least is some relief, but "profitably" can mean anything from just beating the break-even point to the best year ever. Finally, "the board consider additional provisions are necessary in certain companies." This could mean the final winding-up of old bad debts or it could mean a batch of new ones. The board does not say which. The stock market had its own view, marking the shares down by 2s. to 10s. on Thursday.

POTATO CRISPS

Waiting for the Crunch

THE British are said to munch their way through £20 million-worth of potato crisps in a year (equal to 1,200,000,000 4d. packets), some two-thirds of which are consumed at the time of purchase at pub, pier or street corner. Believers in the further potentiality of this market, who are many, pin their faith on the forecast that crisp eating, like so many other social habits, will become increasingly based on the home—preferably as part of a meal, on the American pattern. This view has now encouraged Oxo to enter a market in which other recent challengers to the dominating Smiths' share (still believed to be more than half) include Imperial Tobacco, who last year acquired the Golden Wonder Crisp Company; the Sunpat-Marmite subsidiary Branded Foods launched in August; and the American Fryto-Ley, who sell $160 million of crisps a year and last April bought a controlling share in the British firm Crimpy Crisp. Mars, too, now sell their own crisps in the north of England.

Smiths' sales went up by only 3 per cent last year but are still continuing to rise, with the help of £95,000 worth of television advertising in the first six months of this year and—so the company feels—a share of the helpful publicity attendant on the launching of rival brands. A fair slice of the market is, however, taken by unbranded crisps sold by chain stores: Meredith and Drew, for example, make them for Marks and Spencer. A Garfield Weston subsidiary, Walters Biscuits, makes potato puffs out of potato flour.

Two occupational headaches trouble crisp-makers—the perishability of their product and the fluctuating price of potatoes. Both are felt most acutely in July and August, the time of peak demand and of peak potato prices. Strange as it may seem, however, last year's record potato prices of up to £80 a ton may have had something to do with encouraging new manufacturers, for when potatoes are at their most expensive in the shops crisps are more likely to be used as a mealtime alternative.

Smiths' elaborate and costly distribution system—still virtually the only nationwide one in the business—is geared to the fact that packets of crisps, even if stored in tins in the shop, only keep their quality for about a month. Packaging can improve this only partly, though Oxo makes a great point of the fact that its 6d. plastic coated packet can be displayed in the open without harm for about 6 weeks which should help the firm's heavy point-of-sale publicity and facilitate self-service. In flavouring the product with Oxo the newcomer to the market is following Cristo, and other manufacturers who use their own flavours. Smiths, from the height of its 40 years' experience, prefers to regard flavoured crisps as a passing fashion, but does not mind admitting that its own cheese and onion variety is doing well.

MANAGEMENT COURSES

Aim in the Fog

UNCRITICAL acceptance is the worst service that can be done to the cause of management training in this country. Nevertheless, to judge from a report published today by the Acton Society Trust*, it is too often the attitude of those who should be most exacting in their demands on it—namely, the firms who pay large fees to send members of their staff on management courses. Though in the United States several courses have closed through lack of support, in this country it seems that "any course whatever, no matter how extraordinary or expensive, will attract enough takers to keep it going." It is suggested, too, that the organisers of these courses are often insufficiently particular about whom they take, for fear of losing custom.

The report criticises industry for being far too vague about what it expects to gain from having its managers trained: firms talk in the general terms that are in fact the clichés of the management text books, about qualities like leadership and organising ability which, as the authors remark, could apply equally well to a bishop or a general. Many of the courses have only the most tenuous connections with industry (those run by management consultants being the notable exceptions) though in some fields the university courses benefit from their access to research. But only one course (presumably that of the Glacier Institute) is closely connected with research into management problems. The result is a great variation in the type of syllabus offered, with academic courses concentrating on subjects like economics and psychology and the consultants' syllabuses more on "tool" subjects such as work study and operational research. There is a shortage of properly qualified teachers in this type of technical subject, and this often leads to group discussions being preferred to lectures. The most original and distinctive feature of management courses is their development of group techniques—though, as this study points out, in actual practice many more decisions are made by individuals than groups.

"What does a manager do that he can be trained to do better" is the $64,000 question asked by the authors, though they do not go further towards a reply than to summarise the answers—mostly far too abstract to be of practical use—given by the standard pundits. They feel doubtful whether the answer, if given precisely, would be sufficiently the same for different types and sizes of firms to justify the existence of a general management course intended to suit everybody.

Yet another question is whether the improvement in efficiency when a polished-up manager returns from a course is sufficient and immediate enough to justify the expense. No follow-up from a fee-paying training course in this country has been published, but the evidence from abroad and from firms who run their own schemes is that there are proven results, such as a more analytical approach to problems and a better appreciation, at least for a time, of the effect of decisions on other people. Whether such transformations are worth 30 or 300 guineas is a managerial problem that some course might try to solve.

* *Training Managers*, by Michael Argyle and Trevor Smith. 87 pp., price 10s. 6d.

SHORTER NOTES

All bids were rejected for the first 200 tons of tin offered under the new disposal programme from the United States stockpile. All bids submitted were below prevailing market prices. Rejection of the bids caused a recovery in tin in world markets. The Singapore price rose £5¾ a ton, and the London spot price gained £2¼ to £855¼ a ton.

★

The international cotton textile committee, which is responsible for the five-year scheme to regulate world trade in cotton manufactures due to come into force next month, has adjourned until September 26th without agreeing the size of the increase in import quotas for EEC countries.

★

The Board of Trade is considering an application for anti-dumping duties on the import of lithium hydroxide and lithium carbonate from the United States and west Germany.

The Annual General Meeting of MANNESMANN AG was held in Düsseldorf on July 4, and the following are details of the report presented by the Board of Directors:

TURNOVER

During the year under review production continued to rise, although at a slower pace than during the preceding year. During the last quarter the downward trend in the economic cycle led to falling turnover figures for the year as a whole in some of the Company's sectors of activity, particularly in the steelworks and rolling mills. The situation in the mining sector deteriorated as well, while the tube mills maintained their position. The remaining processing works continued to develop favourably. Once again the Company's diversification proved an asset.

Total turnover of the MANNESMANN Group, including foreign subsidiaries, amounted to DM 4,619m. External sales rose by 1.7 per cent to DM 3,596m.

Total sales of the consolidated German MANNESMANN companies reached DM 4,113m., while sales to outside customers amounted to DM 3,225m. as against DM 3,174m. in 1960.

Export turnover fell by 0.9 per cent to DM 875m. as a result of lower prices. At the end of the first quarter export prices had to be cut by app. 5 per cent as a result of the revaluation of the D-Mark, and since May cheaper imports of thin sheet, electric sheet, zinc and lead-coated sheet, strip steel, wide strip and semi-finished goods had an adverse effect on the Company's prices of these products.

These price reductions could not be offset on the cost side. The drop in price for foreign orders of app. 5 per cent as a result of the currency revaluation was more than absorbed by higher prices demanded by the Company's suppliers. Moreover, wage increases led to a considerable rise in personnel expenditure.

Lower prices and higher costs could only partly be offset by the Company's long-term rationalisation measures. Despite the slightly higher turnover figures the earned profit for 1961 was therefore slightly below that for 1960.

DIVISIONS

The following are details of developments in the various sectors of the MANNESMANN Group:

A. Mining

Coal output at *Essener Steinkohlenbergwerke AG* was up by 2.1 per cent and reached 6,508,000 metric tons despite a fall in labour employed in the pits. In view of falling sales figures, coke production at the company's carbonisation plants including the central coking plant at Huckingen was reduced by 2.6 per cent and output amounted to 2,180,000 metric tons.

Pit-head stocks of coal and coke increased from 372,000 metric tons to 501,000 metric tons.

Output in the German MANNESMANN ore mines at 379,000 metric tons was slightly higher than in 1960. Eighty-five per cent of domestic production went to Huckingen steel works and the remaining 15 per cent were sold to steelworks outside the Group.

B. Steelworks and Rolling Mills

Crude steel output in the Federal Republic fell by 1.9 per cent during the period under review. Production at the German MANNESMANN works fell by as little as 0.6 per cent and amounted to 2,354,000 metric tons. The Company's share of crude steel production in the Federal Republic rose from 6.9 per cent to 7 per cent. Output of open-hearth steel dropped by 7.7 per cent to 1,514,885 metric tons, while production of basic Bessemer steel rose by 2.9 per cent to 633,230 metric tons. Output of basic oxygen steel rose by 109 per cent to 97,046 metric tons and that of electric steel by 63.9 per cent to 108,344 metric tons. Production of rolled steel at 1,412,000 metric tons was 7.6 per cent lower than in the previous year.

No decisive changes occurred in the raw materials situation. Iron ore supplies again totalled 2,7m metric tons with a share of home-produced ore of 900,000 metric tons. The Company's own mines in Brazil produced 6.5 per cent of foreign ores. In order to safeguard continued supplies of iron ore, the Company acquired a 2 per cent interest in Wabush Mines, an international joint venture to exploit iron ore deposits in Labrador. First deliveries are expected in 1965/66.

C. Tube Plants

Production of steel tubes in the Federal Republic rose slightly to 2,349,000 metric tons during the year under review.

Tube production of the German MANNESMANN companies, i.e. of the plants of the Parent Company itself and of those of its German subsidiaries, including *Röhrenwerke Bous/Saar GmbH*, fell by 2.2 per cent to 952,000 metric tons. Output of seamless tubes dropped by 3 per cent to 631,000 metric tons and that of welded tubes of up to 318 mm diameter by 5.5 per cent to 157,000 metric tons. By contrast, production of welded large-diameter tubes rose by 4.9 per cent to 164,000 metric tons.

Including the MANNESMANN foreign subsidiaries in Canada, Brazil and Turkey, which produced altogether 136,000 metric tons of tubes, the overall Group total amounted to 1,088,000 metric tons against 1,110,000 metric tons during 1960.

Incoming orders for tubes and tubular products—excluding large-diameter tubes—at the Company's German subsidiaries at 770,000 metric tons were 11.3 per cent lower than during the previous year. The position in oilfield tubes continued to be unsatisfactory. The high order volume for precision steel tubes and alloyed tubes, production of which was further increased, dropped in the course of the year by about one third.

SUBSIDIARIES

A. Steel Processing

Röhrenwerke Bous/Saar GmbH, Bous/Saar.

Output of seamless tubes remained at the level of last year. The new electric steelworks was taken into service in February, 1961, and its monthly output at present amounts to 4,500 metric tons.

Kronprinz AG, Solingen-Ohligs.

Output of seamless precision tubes, which had already increased considerably during 1960, once again rose by 10 per cent. By contrast, production of welded tubes dropped by 5 per cent. In the wheel sector the high production figures of the previous year were maintained. Production of hot strip, which had gone up considerably during 1960, fell to the level of 1959, mainly on account of reduced strip deliveries to the Company's tube plant in Turkey. The turnover level of the previous year was again reached. At the end of the year under review a 2,500-ton hydraulic tube extrusion press for the production of tube blanks for high alloy steel tubes was taken into service at the Immigrath works. A fully automatic continuous extrusion mill for passenger vehicle wheels came into service at the Ohligs works in the spring of 1962.

Kammerich-Werke AG, Brackwede.

Tube output was up by 32 per cent compared with the previous year, after capacities had been considerably expanded at the end of 1960. The company's turnover increased by 15 per cent. The volume of orders on hand, which had risen steeply as a result of insufficient capacities during the previous year, dropped but still guarantees adequate employment.

Grossrohrwerk Mannesmann-Hoesch GmbH, Duisburg.

Production and turnover in 1961 were still slightly above the previous year's figures, but the employment situation, particularly during the second half of the year, was unsatisfactory. As a result of new orders received, the year 1962 promises to be considerably more successful.

Mecano-Bundy GmbH, Heidelberg.

At 52m. metres tube production almost reached last year's level. By contrast, production of thermostats and vibration dampers, which had risen by 40 per cent during the previous year, fell by 25 per cent. The company's turnover, which had increased by 35 per cent in 1960, therefore dropped by 7 per cent.

Mannesmann-Stahlblechbau GmbH, Düsseldorf.

As a result of large-scale deliveries of oil tanks and transport containers for liquified gases turnover rose by 18 per cent. In August, 1961, production of oil tanks was taken up in the newly built Wolnzach works in Bavaria.

Mannesmann-Rohrleitungsbau GmbH, Düsseldorf.

Turnover rose by app. 11 per cent compared with 1960. The first section of the 720-mile pipeline in Assam (India) in the laying of which the company is participating with a share of 50 per cent was finished in the spring of 1962. At the same time the water conduit from Derna to Tobruk in Libya was taken into service. The order book increased by 10 per cent and employment for a full year is guaranteed.

Tube and Boiler Head Mill of Hüttenwerk Huckingen.

The delivery in 1959 of a pressure vessel for the atomic power station at Kahl resulted in another substantial order for a reactor vessel. The British Atomic Energy Authority ordered a pressure vessel for the high-temperature reactor "Dragon" at Winfrith which is to be built by EURATOM and the British Atomic Energy Commission in co-operation with a number of other

European countries. The very complex vessel, which is 60 feet long and weighs 65 tons, was delivered at the beginning of the year.

Mannesmann-Meer AG, Mönchengladbach.

Turnover, which had risen by 44 per cent in 1960 as a result of the completion of the large-diameter tube plant in Rourkela (India), dropped by 14 per cent in 1961. Production performance corresponded to that of the previous year so that capacities were again fully utilised. Orders on hand, half of them originating from abroad, have risen by 7 per cent and guarantee full employment for a year.

Porsche-Diesel-Motorenbau GmbH, Friedrichshafen/Lake Constance.

Production of tractors increased from 13,000 units in 1960 to 17,000 units in 1961. As a result of good sales figures of the newly developed tractor types *Standard Star* and *Standard T* the company's turnover increased by 42 per cent. The export ratio amounted to 29 per cent.

B. Coal Chemistry and Plastics

Ruhrchemie AG, Oberhausen-Holten.

The situation continued to improve in 1961 as a result of rigorous rationalisation measures, taking up new lines and full utilisation of capacities. While turnover for nitrogen and refinery products was slightly lower than during the previous year, that for oxo-alcohols and polyethylene was considerably higher. The plant for the production of polyethylene and the oxo works were further expanded.

Süd-West-Chemie GmbH, Neu-Ulm, Donau.

Turnover was slightly higher than in 1960. Good progress was made in the development of new moulding compounds and resins.

Mannesmann-Plastic GmbH, Düsseldorf.

The general slackening of sales of plastic tubes, in connection with considerable price losses, led to a downward development of production and turnover. While deliveries dropped only negligibly, turnover by value fell by 22 per cent after increasing by 64 per cent during the previous year.

C. Trade and Shipping

Turnover of the MANNESMANN tube and steel selling companies in Berlin, Düsseldorf, Frankfurt, Hamburg, Hanover, Munich and Nuremburg rose by 3.6 per cent during the year under review.

Mannesmann-Export GmbH, Düsseldorf.

Turnover remained 9 per cent below the record figures reached in 1960. The tube business remained at the level of 1960 seen on an average for the whole year, but turnover figures fell towards the end of the year. Despite the general weakness of the market, turnover in rolled steel rose considerably. By contrast, in the case of steel sheet, last year's turnover figures were not reached, partly on account of the downward price trend. The company's order book was slightly down.

D. Foreign Activities

Mannesmann Tube Co. Ltd., Sault Ste. Marie/Ontario (Canada).

Production rose during the second half of 1961 and amounted to 75,400 short tons, a slightly higher figure than last year. As a result of increased demand the entire production could be sold and moreover stocks reduced to a normal level. The company's balance sheet for the year shows a profit.

Companhia Siderúrgica Mannesmann, Belo Horizonte (Brazil).

Crude steel production increased by 9 per cent to 122,300 metric tons during 1961, rolled steel output was up by 5 per cent to 111,000 metric tons and tubes advanced by 22 per cent to 54,300 metric tons. In the spring of 1961 the second tube press and in the autumn of that year the third electric steel furnace were taken into service.

Companhia Siderúrgica São Caetano, São Paulo (Brazil).

Total output of the company's mill for rolling small sections of structural and high quality steel rose by 46 per cent to 23,000 metric tons after last year's increase of 50 per cent. Further modernisation of the works is under way.

Mannesmann Mineração S.A., Nova Lima (Brazil).

Apart from ore deliveries to the steelworks of *Companhia Siderúrgica Mannesmann*, 100,000 metric tons were shipped to the Huckingen steelworks during 1961. With a view to further increasing output, production is being further automated. In the spring of 1961 the company acquired a further ore deposit of 100 million metric tons.

Construçoes Tubulares Mannesmann S.A.; São Paulo (Brazil).

The company's production programme was further expanded by the inclusion of supporting frameworks and building-site hoists. Turnover remained unchanged compared with last year.

Mannesmann-Sümerbank Boru Endüstrisi TAS, Izmit (Turkey).

After the Turkish elections in October, 1961, the country's economy experienced a revival in the course of which the company was able to reduce its stocks to a desirable level. Annual production, which had amounted to 25,000 metric tons in 1960, only reached 13,000 metric tons and corresponded to the figure achieved in 1959. Sales reached a figure of 16,000 metric tons. The result was satisfactory.

During 1961 MANNESMANN AG acquired a 26 per cent holding in the share capital of 60m. Austrian Schillings of *Jenbacher Werke AG*, Jenbach, Tyrol, Austria. The company produces diesel compressors, diesel locomotives of all sizes and other diesel units from 10 to 3,000 HP.

PERSONNEL

The number of employees of MANNESMANN AG and its German subsidiaries increased to 77,415 during 1961. This increase is mainly due to shorter working hours and the resulting need to recruit more labour in the Company's steelworks and tube mills. By contrast, employment figures in the mining sector continued to fall. Foreign labour increased to 3,940 which represents 5.1 per cent of MANNESMANN'S German employees. Employees abroad rose to 6,279.

PROFIT AND DIVIDEND

Net profit for the year amounted to DM 81,554,745.55 which, added to the balance of DM 928,029.43 brought forward from the previous year, produced a total of DM 82,482,774.98 available for distribution. It is accordingly proposed to distribute a dividend of 14 per cent, equivalent to DM 81,112,101.35, and to carry forward the resulting balance of DM 1,370,673.63.

The report, the accounts, and the proposals put forward by the Board were adopted.

Copies of the Annual Report are now available in English and can be obtained from Mannex (London) Ltd., Universal House, 60 Buckingham Palace Road, London, S.W.1.

The following table gives details of turnover and labour at MANNESMANN'S foreign subsidiaries during 1961:—

	North America	South America	Other foreign countries	Total
Total turnover (in DM '000)	157,376	107,681	83,549	348,606
External sales (in DM '000)	83,749	89,610	41,016	214,375
Labour force	543	4,710	1,026	6,279

SUPERVISORY BOARD

(*Aufsichtsrat*)

Dr Wilhelm Zangen, Chairman; Professor Dr Karl Hax, Deputy Chairman; Walter Arendt; Franz Berensdorf; Ferry von Berghes; Dr Hans Constantin Boden; Professor Helmut Duvernell; Dr Dr Friedrich Haas; Rudolf Hahn; Dr Rolf Hanschmann; Dr Paul-Ferdinand Hast; Rudolf Nungesser; Heinz Pohl; Bernhard Potthast; Dr Hans Reuter; Professor Dr Carlo Schmid; Dr Eduard von Schwartzkoppen; Dr Hermann von Siemens; Heinrich Sträter; Franz Heinrich Ulrich; Franz Westhoff.

BOARD OF DIRECTORS (*Vorstand*)

ALITALIA

Italian Airlines S.p.A.—Rome

CAPITAL LIT. 25,000,000,000

ANNUAL GENERAL MEETING

The Annual General Meeting of ALITALIA was held on June 26, 1962, at the Company's headquarters at 92 Viale Maresciallo Pilsudsky, Rome, **Count Dr Nicolò Carandini** taking the chair. The balance sheet at December 31, 1961, was adopted.

The Annual Report of the Board of Directors points out that for the international air transport industry as a whole, 1961 was a difficult year. This was due to the large increase in capacity offered which was not matched by a proportionate increase in the volume of traffic. It is against the background of this critical situation that the results achieved by ALITALIA assume an encouraging significance.

During 1961 the process of standardising the Company's fleet continued, and delivery was taken of three new DC-8 as well as six Caravelle jet aircraft. A further stage will be completed in 1962, and in fact, during the first few months of the current year, the remaining three DC-8s and the last four Caravelles were delivered on schedule. At the same time, steps have been taken to dispose of six DC-6Bs and six Convairs.

The following are details of the composition of the Company's fleet at December 31, 1960 and 1961, and as envisaged at December 31, 1962:

Type of Aircraft	1960	1961	1962
DC-8	4	7	10
Caravelle	4	10	14
Viscount	14	14	14
DC-7C	3	3	3
DC-7F	2	2	2
DC-6B—DC-6	11	5	—
DC-3	4	4	4
Convair	6	—	—
Total	48	45	47

This fleet enabled the Company to achieve the following output during the year under review:

The table also shows the 48 per cent increase in the number of seats offered, and the 39 per cent rise in the number of passengers carried. The volume of freight reflected an outstanding growth of 52.2 per cent, but the increase in ton/kilometres of freight carried at 82 per cent was even more substantial.

Table II covers increases in production and sales and demonstrates in figures the notable productive effort made by ALITALIA during the year.

TABLE II.—INCREASE IN PRODUCTION AND SALES OVER PRECEDING YEARS

	Production (ton/km. offered)	Increase over preceding year %	Sales (ton/km. flown)	Increase over preceding year %
1956	45,917,954	22·5	25,542,164	23·7
1957	71,295,108	55·4	40,712,120	59·4
1958	157,306,037	121·4	82,332,759	102·2
1959	210,051,218	33·3	114,718,788	39·3
1960	267,389,880	27·2	148,575,063	29·5
1961	413,193,618	54·5	211,066,343	42·1

New routes were opened during 1961 to Dakar (new stage on the South American routes), Accra (Ghana), Lagos (Nigeria), Bangkok (Thailand), Darwin and Sydney (Australia). During the first few months of the current year the African routes were strengthened by a new service to Johannesburg via Leopoldville; services to the Far East were augmented by a new stop at Singapore and a new route which extends beyond Bangkok to Hong Kong and Tokyo; services to South America were increased by an extension to Santiago de Chile; and finally the North American route was supplemented by the extension to Chicago via Canada.

* * *

The Report thus reviews the efforts made in every sector of the Company's activities in order to achieve the results obtained. It also outlines the obstacles encountered, which were overcome by the united efforts of the staff, numbering 6,409 people at the end of the year, and records the Board's appreciation of these efforts.

In the engineering sector the organisational problems resulting from the transfer of the Company's services to Fiumicino airport, where the maintenance workshops have been installed, have been solved. Work has also begun at Fiumicino on two additional large hangars and on workshops to house the inspection services that are still at Ciampino.

In the operational sector attention was mainly paid to the training of flying personnel. The ALITALIA Training Centre inaugurated on June 7, 1961, and equipped with flight simulators for DC-8, Caravelle and Viscount aircraft, has completed its training programme for flying personnel, and as many as 932 people have already attended 96 different courses. The building for the Catering Services is also about to be completed at Fiumicino; it will be one of the best equipped establishments of its kind.

The problems of over-capacity, as well as keener international competition and the growing difficulties involved in obtaining traffic rights, had to be faced in the commercial sector during the year. The Company's network of agencies abroad was considerably strengthened by the opening of new offices (Accra, Alexandria, Bangkok, Colombo, Dakar, Lagos, Lima, Madras, Melbourne, Sydney) and improved working arrangements in others.

A number of co-operation and pooling agreements was concluded during the year, and ALITALIA also pursued its negotiations with Air France, Lufthansa, and Sabena on setting up the Air Union organisation.

The Company's administrative services stood up to the growing pressure on them thanks also to the use of the IBM-7070 electronic computer. The organisation and individual fields of responsibility were further decentralised during the year, partly by the efficient application of the "control and balance" system.

The Safety Committee, set up to study and investigate the problems inherent in flight safety, continued to function during the year, and another committee was established recently to look into the health problems of flight and ground personnel.

* * *

June 8, 1961, marked the expiry date of the agreement concluded in 1946 between the Italian Government and the British BEA company. As from that date the latter terminated its holding in ALITALIA, and Lord Douglas of Kirtleside resigned as the Company's Deputy Chairman and member of the Board.

* * *

The Report, after outlining the extensive activities of S.A.M. (Società Aerea Mediterranea) and Elivie (Società Italiana Esercizio Elicotteri), its associated companies, goes on to illustrate the Company's economic progress.

Results on intercontinental routes were encouraging, and progress on international routes was even more satisfactory.

The operation of internal routes once again registered a particularly substantial loss, owing to excessively low fares, uneconomic working on certain routes, and the increases in airport charges.

TABLE I.—SUMMARY OF OPERATIONS IN 1960 AND 1961

	1960	1961	Increase %
Kilometres flown	37,629,333	43,390,646	+15·3
Flight hours	93,507	88,288	− 5·6
Passengers	1,099,668	1,528,175	+39·0
Passengers pass./km.	1,338,812,912	1,864,467,890	+39·3
Seat/km. offered	2,321,710,546	3,436,358,305	+48·0
Mail carried kg.	3,984,889	4,311,568	+ 8·2
Mail carried ton/km.	6,645,322	7,107,625	+ 6·9
Freight carried kg.	12,062,241	18,360,615	+52·2
Freight carried ton/km.	19,864,761	36,156,116	+82·0
Total ton/km. carried	148,575,063	211,066,343	+42·1
Total km. offered on scheduled flights	267,389,880	413,193,618	+54·5
Total km. offered including charter flights	271,593,434	417,769,703	+53·8
Passenger load factor %	57·7	54·3	− 5·9
Overall load factor %	55·6	51·1	− 8·1
Growth of network at Dec. 31, 1961 km.	110,533	144,879	+31·1

Traffic returns, made up of foreign currency to the extent of 73.17 per cent, increased over the preceding years as shown in the following table:

GROSS TRAFFIC RETURNS

	1956	1957	1958	1959	1960	1961
In Lit. m.	8,134	12,986	26,138	35,033	44,481	59,275
Increase %	29·6	59·6	101·2	34·0	26·9	33·2

Expenses increased in proportion. Altogether the business results achieved in 1961 can be considered satisfactory, as operating results substantially balanced expenditure.

As a result of the very conservative policy previously followed by the Company in the field of fleet depreciation, and owing to favourable market conditions, the sale of DC-6B and Convair piston aircraft produced a surplus sufficient to cover the losses suffered in previous years.

The Report summarises the Profit & Loss Account for 1961 as follows:

Traffic returns	Lit.	59 275 253,361
Miscellaneous returns	„	3,324,317,863
Total returns	Lit.	62,599,571,224
Management and general expenses	„	54,178,270,413
Balance	Lit.	8,421,300,811
Depreciation	„	6,770,302,744
Profit	Lit.	1,650,998,067
which at the Annual General Meeting it has been resolved to allocate as follows:		
—to cover the losses of previous years	„	1,644,246,730
Balance	Lit.	6,751,337
—to transfer to reserve	„	337,567
—to be carried forward	Lit.	6,413,770

Investments rose to approximately Lit. 33,000m. during the year. The "Fleet" account increased as a result of the purchase of the three DC-8s and six Caravelles previously mentioned, and decreased on the other hand by the appropriate amounts following the disposal of six DC-6Bs and six Convairs. "Depreciation" accordingly registered the decrease resulting from the reduction in investments effected during the year as well as the increase represented by the annual percentage in respect of the present fleet and other fixed assets.

The Report concludes by expressing its sincere appreciation of the help given to the Company during the year by the Ministries of Defence, Foreign Affairs, and State Holdings, as well as by other Public Authorities—and both administrative and financial bodies. Thanks are due especially to IRI which was as always generous with its help, advice and support.

After the adoption of the balance sheet the Annual General Meeting proceeded to nominate the new Board of Directors and the Auditors for the three-year period of 1962-1964.

At its meeting after the conclusion of the Annual General Meeting, the Board of Directors approved:

as Chairman: Count Dr Nicolò Carandini;
as Deputy Chairman: Gen. S. A. Aldo Urbani;
as members of the Executive Committee: Dr Ercole Agosta; Count Dr Nicolò Carandini; Dr Franco Giazotto; Ing. Bruno Velani.

KENTAN GOLD AREAS LIMITED

The Annual General Meeting of Kentan Gold Areas Limited was held on September 11, 1962, at The Chartered Insurance Institute, EC2, **Mr E. F. O. Gascoigne** (Chairman) presiding.

Mr Gascoigne referred to the Board's intention to recommend to shareholders proposals for a merger with Rhodesia-Katanga Company Limited, subject to the capital reconstruction of that company becoming effective. Details of the proposals, which the Board considered to be greatly in the interests of shareholders, would be posted in due course.

He emphasised the dependence of the company on its interest in Tanganyika Concessions Limited and hence in the establishment of a satisfactory solution to the problem of Katanga and the Congo. In this connection the acceptance by Mr Adoula and President Tshombe of the United Nations plan for the reintegration of Katanga into the Congo was encouraging, but in the meantime it was impossible to hazard any forecast of the company's future earnings.

The consolidated accounts at March 31, 1962, showed a profit for the year of £136,778 and after bringing forward the previous year's balance, and allowing for adjustment of taxation of the previous year, a balance of £761,752 remained available for distribution. An interim dividend of 1s. 6d. per share (7½ per cent) had been paid on March 16, 1962, and it was proposed to recommend a final dividend of 1s. 0d. per share (5 per cent), making a total dividend for the year of 2s. 6d. (12½ per cent), as compared with 3s. 0d. (15 per cent) for the previous year.

The Report and Accounts were adopted.

AMALGAMATED ANTHRACITE HOLDINGS

MR P. E. HOLDEN'S STATEMENT

The thirty-eighth Annual General Meeting of Amalgamated Anthracite Holdings Limited was held on September 11th in London, **Mr P. E. Holden, FCA,** chairman, presiding.

The following are extracts from his circulated statement for the year ended December 31, 1961:

The trading profit totalled £1,171,000 compared with £1,025,000 in the previous year. The net profits available come out at £349,000 compared with £384,000 in 1960, and there is a taxation windfall of £73,000 which raises the available figure to £422,000 for 1961. The board are recommending a final dividend of 12 per cent, making a total of 18 per cent for the year.

1961 as a calendar year, was difficult for retail coal, but the overall results of the coal and transport sections of our business were slightly above those of the previous year, and hold out promise for 1962.

Our engineering companies, which are versatile, covering general engineering, chemical, electrical, and electronics, have produced overall a useful contribution.

Our substantial building supply interests had quite an active year and improved their results.

I hesitate to forecast a result for 1962 because of the width of our activities and the imponderables of the weather, and the Government's rather erratic economic policies. All I can say is that for the first six months of 1962 we are ahead of the same period in 1961 and unless we suffer some serious reversals which are not yet apparent, I feel 1962 will be a satisfactory year.

The report was adopted.

This announcement appears only as a matter of record.

THE UDDEHOLM GROUP

UDDEHOLMS AKTIEBOLAG, UDDEHOLM, SWEDEN

Extracts from a survey of the Company's activities as presented by the Board at the Annual General Meeting June 2nd, 1962

MAIN ACTIVITIES

UDDEHOLM is situated in the west of Sweden and its main activities are based on the natural resources of the region – iron ore, timber and water power. The business includes the production of iron and steel, hot-rolled and forged, cold-rolled and drawn; sponge iron; ferro-alloys; and tungsten carbides. Its finished metal products include hot-rolled, cold-rolled and drawn tubes; carriage springs and other springs; wire ropes, etc. Among its forestry products are sawn and planed timber; sulphate and sulphite pulps and by-products; paper and board. Electro-chemical products also feature in the Group's output.

The Company's main activities are centred on its own mines in Värmland; the steel works at Hagfors, Nykroppa and Degerfors; the cold rolling mills at Munkfors; the tube mills at Storfors; the wire rope plant at Blombacka; the saw mills, pulp mills, paper mill and chemical plants at Skoghall. UDDEHOLM also holds a majority interest in the Tuolluvaara mines in Lapland.

The sales organisation of UDDEHOLM comprises offices and service plants in leading cities of Europe and America; London, Birmingham, Paris, Brussels, Dusseldorf, Solingen, Stuttgart, Nuremberg, Copenhagen, New York, Cleveland, Los Angeles, Toronto, São Paulo and Rio de Janeiro. UDDEHOLM is also represented by agents in almost every country in the world.

REVIEW

There was a good demand throughout the year for the Company's products, but in view of increasing competition and the resulting price decrease, the future should be regarded with caution.

Output of iron and steel products increased by about 10 per cent. A slackening off in the pulp industry was evident throughout Sweden with decreased exports and price reductions. Following an agreement between the Scandinavian pulp manufacturers to reduce production, the sulphite factory at Skoghall was closed down in December.

On the other hand, production of sulphate pulp rose and paper production remained stable.

Capacity was fully utilised at the chemical plant at Skoghall, but prices dropped slightly. As in 1960, ample rain during the year was favourable for power supply.

IRON AND STEEL

Demand for UDDEHOLM steel products was very good in late 1960/early 1961, but during the year under review a slight decrease was noticeable, particularly towards the end of the year. This was first noticed on the markets for tubes, sheet and plate iron. Sales of stainless material, especially stainless steel sheets, also declined towards the end of the year following strong foreign competition, including Japan's entry into the European markets. On the other hand, the market for tool steel, cold-rolled drawn steel and cold-drawn material has remained more stable and the number of orders received was virtually unchanged.

The Company expanded its production of steel products quite considerably during 1961 and output increased, in both quantity and value, by over 10 per cent. A new electro-steel furnace at the iron works at Hagfors came into production at the beginning of 1962 and production of tool steel and stainless steel rose as did production of semi-finished materials, intended for further treatment at the Concern's other mills. Production of stainless and acid resisting steel castings also increased. Output of cold-rolled strip and various kinds of drawn steel wire at the Munkfors steelworks increased by 15 per cent., and at Storfors, where production reached a record level despite personnel difficulties, the tube mills operated at full capacity throughout the year. Following rationalisation measures, production at the Persberg sponge iron works rose by 30 per cent.

FORESTRY AND FOREST INDUSTRIES

Deliveries to industry remained practically unchanged during the year under review, but deliveries from the Company's own forests decreased by about 2,118,900 cubic feet. Transport conditions were favourable during the first part of the felling season but deteriorated later, following long thaw periods starting early in the year. Rationalisation of forestry activities continued to include the construction of new forest roads. Favourable weather conditions facilitated the planting of ten million saplings during the year under review.

The Company was able to sell the planned quantity of wood products (sawn and planed goods) which exceeded last year's figure by 2,000 standards.

The equilibrium between production and demand for market pulp which characterized 1960 did not prevail during 1961. In order to stabilize the market pulp industry the Scandinavian manufacturers late in 1961 agreed to restrict production by about one million tons in the 12 month period following 1st December 1961. The total deliveries were increased by over 4,000 tons to almost 102,000 tons.

The market for kraft paper was firm in the beginning of the year but later gradually weakened partly due to the deteriorating prices for market pulp. The paper sales rose by about 2% in both value and quantity.

Timber production rose to the record level of 27,000 standards.

Sulphate pulp production rose by more than 11,000 tons to 113,000 tons.

Output of paper remained unaltered but production of paper sacks, which are only sold on the Swedish market, increased considerably.

The Company's chemical plants have been run to capacity.

Continuous production was introduced at the CMC plant late in the year.

The investments in plant and machinery at the Skoghall works which have been made lately have resulted in increased production with a decreasing number of workers.

HYDRO-ELECTRIC POWER

Rainfall in Värmland was above average in 1961, but still below that of 1960. Following these favourable conditions, the Company's power requirements could be met almost completely by water power alone. Total energy available amounted to 1,140 m. kWh, of which 80 per cent. was consumed by the UDDEHOLM Group.

PRODUCTION FIGURES

	1961	*1960*
Electric power (1,000 kWh)	986,000	1,040,000
Timber from Company forests (cu. ft.)	24,297,779	26,403,083
Iron ore (tons)	76,793	84,623
Dolomite (tons)	17,766	19,160
Steel ingots (tons)	338,196	338,834
Sawn timber (stds.)	27,099	24,863
Sulphate pulp (tons)	113,246	101,785
Sulphite pulp (tons)	65,898	68,965
Paper (tons)	70,482	71,058
Chemical products (tons)	112,053	110,204

GROUP SALES

	Kr.m.	Kr.m.
Iron and steel products	353.6	319.1
Timber products	212.7	203.6
Other products (incl. chemicals)	31.9	29.3
Total	598.2	552.0

PERSONNEL

The average number of people employed by the Parent Company and its wholly-owned Swedish subsidiaries in 1961 was 15,167. Wages paid to workers and other employees amounted to Kr. 211.4 m., an increase of 11 per cent.

ALLOCATION OF PROFITS

The Board and the Managing Director propose that the profit for the year of Kr. 18.0 m., and the balance of profits remaining from previous years of Kr.14.7 m., should be allocated as follows:

—to shareholders a dividend of Kr.8 per share against Coupon No. 69: Kr.16,500,000;
—to balance carried forward: Kr. 16,200,000.

The report, the accounts, and the proposals put forward by the Board were adopted.

BOARD OF DIRECTORS

Alf Lindahl; Sven Schwartz; Erik Lundh; Age Lundström; K-G Ljungdahl; Carl A. Jacobsson; Oskar Akerman; Wilhelm Ekman (Managing).

SOME OF THE WAYS IN WHICH UDDEHOLM PRODUCTS ARE USED IN BRITAIN:

***Cold rolled strip steel** for—Razor blades, band saws, springs of every type, printers' rules, camera shutters.*

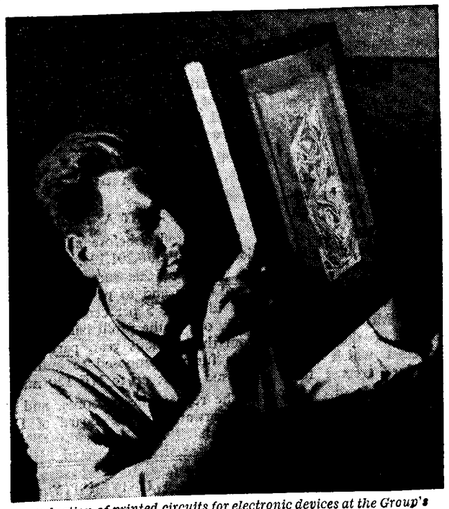
***Hot rolled and hammered steel** for—Press tools, die-casting tools, plastic moulds, drop forging dies. Also for—Piano wire, valve springs, needles, wire ropes.*

***Stainless steels** In sheets, bars, tubes or rods for—Food processing equipment, chemical apparatus.*

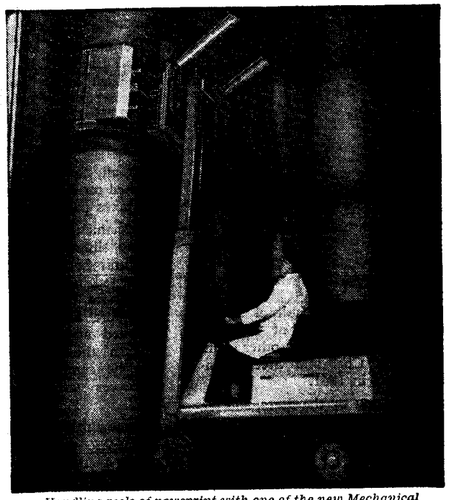
***Seamless tubes** for—Condensers, heat exchangers, cooler tubes. Lighting masts. Steam boilers, oil cracking and refining equipment.*

***Welded constructions** for—Atomic energy equipment, high pressure tanks, distillation columns.*

***Drill steels** and other equipment for mining.*



Production of printed circuits for electronic devices at the Group's factory in Douai



Handling reels of newsprint with one of the new Mechanical Handling attachments

Oldham Group's steady progress

'Company shaping and adapting its resources to take full advantage of future opportunities'

—MR. JOHN OLDHAM, O.B.E.

The Annual General Meeting of Oldham & Son Ltd., the Denton (Manchester) battery, electrical, mining and mechanical handling engineers was held on September 12th.

THE Group profit before Taxation was £584,070, an increase of £68,019 over the previous year. The turnover of the Group as a whole shows a gratifying increase. Final dividend was the same as last year.

In his statement, the Chairman—Mr. John Oldham, O.B.E., made the following comments:

COMMON MARKET. Shareholders will no doubt expect me to enlarge upon long-term tendencies, and particularly on the possible effects of Britain's entry into the Common Market, which in view of our geographical distribution is a matter of direct concern to the Group. I have frequently expressed my strong belief in the continued existence and welfare of the Commonwealth, and in the world's need for Britain's moral and technical leadership in this age of rapid change and development. To this I have also added my conviction that Britain's advent into the Common Market is essential if she is to continue strong and stable enough to remain the centre of a powerful Commonwealth and community of nations. The two systems are not in my view necessarily competitive, or mutually incompatible. The design and development of your Company's present trading pattern is well adapted to such circumstances through the present operations of its Subsidiary Companies in both the Commonwealth and the Common Market.

AUTOMOBILE BATTERIES. The Company's trading in the automobile and commercial vehicle battery sections increased during the period under review.

MECHANICAL HANDLING. In the field of mechanical handling, as represented by the supply of batteries and electric chargers for shop and fork-lift trucks, the Company has continued to make further steady progress.

ATTACHMENTS. A new line of mechanical handling attachments has recently been added to the productions of your Company, which offers the prospect of further increasing the diversification and use of this Division's productions.

This development has a significance greater than the mere addition of another set of equipment to the Company's range of products. It is a fundamental break-through from our previous policy of concentrating on the battery and electrical side of the industry, into what our American associates would describe as part of the "hardware" of the Mechanical Handling equipment.

MINING. The period to which I am referring has been marked by increasing competition at home and overseas. Notwithstanding these conditions, I am pleased to report that the volume of business in the Mining Division has been well maintained.

EXPORT. On the Export side, the challenge to maintaining your Company's high export levels has been very severe. I am gratified, however, to be able to say that the Company has in fact maintained that level.

OVERSEAS COMPANIES. Speaking of the Group's overseas subsidiaries, Mr. Oldham reported that "the Australian Subsidiary has more than held its own, whilst its sister company Dunlop-Oldham has now established itself on a profit making basis".

During the year the Indian Company has continued to expand and develop its sales and service concerned with the supply of miners' lamps, and the prospect is now offered for the overseas diversification of the Company's activities!

The affairs of the South African Subsidiary continue to develop satisfactorily and a further expansion of its business is to be reported. Important development concerns the introduction by the South African Subsidiary Company of its automobile batteries to the South African Market.

The production of the French Company has now been extended into the manufacture of batteries for commercial vehicles and mechanical handling equipment. Another interesting development concerns the manufacture at Douai of safety equipment, involving the production of electronic equipment, printed circuits, etc., the first time such work has been undertaken anywhere in the Group.

THE FUTURE. Looking to the future, and the challenge which it offers, I feel that shareholders can have confidence that the Company is shaping and adapting its resources to meet that challenge, and to take full advantage of the opportunities offered.

Over the years, your Company has been successful in taking a variety of such eventualities in its stride. I am confident that as it approaches its centenary in three years' time, events will show that it is properly equipped to continue its development in the rapidly changing circumstances of this latter half of the twentieth century.

OLDHAM & SON LIMITED

Denton, Manchester; France; Africa; India; Australia

DE WENDEL ET CIE

SOCIÉTÉ ANONYME

(Iron & Steel)

Paris

The Annual General Meeting of DE WENDEL ET CIE S.A. was held on May 26, 1962 under the chairmanship of Comte Emmanuel de Mitry. The following is a summary of the report published by the Board of Directors:

REVIEW

The report notes that as a result of slower economic expansion, the activity of the iron and steel industry in France and the other countries of the European Coal and Steel Community fell considerably in 1961.

Following on destocking by the users, shorter delivery periods, and increased imports, steel production was adjusted to the new levels of demand.

Despite these less favourable conditions, DE WENDEL ET CIE S.A. maintained production at a high level. In particular, 7,502,223 tons of ore were extracted, 2,361,264 tons of pig iron and 2,759,625 tons of steel were produced, including the Company's share in the output of *SOLLAC*.

In all, 2,156,175 tons of semi-finished and finished products were sold and turnover, including taxes paid, amounted to NF 1,670,460,249.

Investments increased to NF 183,260,521. A second sintered products line was built. The first unit in a new blast furnace division was completed, and a second is under construction. A mill for broad-flanged beams was installed. The port installations on the Moselle were extended and adapted in view of the work to turn the river into a canal which will soon be completed. Houses were erected for employees and an apprentices' school was built.

Those subsidiaries of DE WENDEL ET CIE whose operations are connected with the Company itself achieved satisfactory results on the whole in 1961, especially in the case of *Société Lorraine de Laminage Continu SOLLAC* which produced 1,785,000 tons of steel and 2,093,000 tons of hot-rolled strip. This Company continued to build a new cold-rolled strip mill and a new electrolytic galvanising production line.

DE WENDEL ET CIE invested NF 10,268,835 in new share issues by subsidiaries.

PROFIT AND DIVIDEND

Gross profits, before allowance for depreciation, are NF 170,201,124. It is proposed to set the whole of this sum against depreciation of fixed assets, and to pay, as from June 7, 1962, a dividend of 5 per cent or NF 2.5 per share, partly out of the profit balance brought forward from the previous year, partly out of reserves. It is further proposed to authorise the Board to issue bonds up to NF 120 million.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

EDUCATION AND COURSES

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

A series of ten lectures on THE COMMON MARKET will be given fortnightly during the Michaelmas and Lent Terms, 1962-63, on Tuesdays at 5 p.m. beginning on October 9. So far the following have accepted invitations to speak:—

Europe in the Making. M. P. O. Lapie.
Machinery of Government. Professor Max Beloff.
Legal Aspects. Professor O. Kahn-Freund.
Labour Problems and Social Policy. Mr. Robert Cox.
Problems of the Association of Oversea Countries. Dr. J. J. Van der Lee.
Tariffs and Trade. M. J. Royer.
Industrial Repercussions, especially the problems of particular industries in individual countries. Lecturer to be announced.
Agriculture. Mr. H-B. Krohn.
Decartelization: The Rules of Competition in the E.E.C. Treaty and in the participating countries. Dr. L. Günther.
Money and Finance. Professor S. Posthuma.
Admission free without ticket.

TUITION FOR B.Sc. ECONOMICS

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for London Univ. B.Sc.Econ. (three, if entrance is included) at moderate fees. 1,431 Wolsey Hall students passed London University B.Sc. Economics Exams., 1950-60. Tuition also for G.C.E., Law, Statistical, other exams.—Prospectus, (education examination) from E. W. Shaw Fletcher, C.B.E., LL.B., Director of Studies, Dept. P.17.

WOLSEY HALL, OXFORD

SECRETARIAL Training for Women, especially graduates and older students, six-month and intensive 14-week courses.—Write Principal, Davies's, 158 Holland Park Avenue, W.11. PARK 4654.

Employers are invited to write to:

The Director,
City of London College,
Moorgate, E.C.2

for details of an

ADVANCED COURSE
IN
BUSINESS STUDIES

which will commence in January, 1963

This is a **Three-Year 'Sandwich' Course** suitable for well-educated entrants to commerce and leading to a **Higher National Diploma in Business Studies.**

NORTHAMPTON COLLEGE OF ADVANCED TECHNOLOGY

ST. JOHN STREET, LONDON, E.C.1.

DEPARTMENT OF MANAGEMENT AND SOCIAL SCIENCES
Lecture and Discussion Series 1962-1963

14 lectures, fortnightly on Wednesdays (10 a.m. to 5.0 p.m.) from 17th October, 1962, to 8th May, 1963, entitled DIRECTION AND LEADERSHIP OF SCIENTIFIC & ENGINEERING PERSONNEL. Fee 50 gns.

10 lectures, weekly on Mondays (2.30 to 5.0 p.m.) from 8th October, 1962, entitled THE MANAGEMENT OF MEN AND RESOURCES. Fee 5 gns.

8 lectures, weekly on Thursdays (2.30 to 5.0 p.m.) from 27th September, 1962, entitled MARKETING MANAGEMENT. Fee 5 gns.

10 lectures, weekly on Tuesdays (2.30 to 5.0 p.m.) from 9th October, 1962, entitled CHANGING INDUSTRIAL RELATIONS. Fee 5 gns.

4 lectures, weekly on Thursdays (2.15 to 5.0 p.m.) from 15th November, 1962, entitled RAPID AND INTENSIVE READING. Fee 3 gns.

15 lectures, weekly on Thursdays (6.30 to 8.30 p.m.) from 25th October, 1962, entitled PATENT LAW AND ADMINISTRATION. Fee 10 gns.

12 lectures, weekly on Tuesdays (7.0 to 8.45 p.m.) from 25th September, 1962, entitled COMMUNICATION IN MANAGEMENT. Fee 3 gns.

10 lectures, weekly on Fridays (7.0 to 8.30 p.m.) from 28th September, 1962, entitled EFFECTIVE SPEAKING. Fee 3 gns.

12 lectures, weekly (6.0 to Tuesdays 7.30 p.m.) from 25th September, 1962, entitled EFFICIENT READING. Fee 3 gns.

Further particulars on request.

NORTHAMPTON COLLEGE OF ADVANCED TECHNOLOGY

LONDON, E.C.1.

DEPARTMENT OF MANAGEMENT AND SOCIAL SCIENCES
Diploma in Management Studies
(Approved by the Joint Committee and the Ministry of Education)

A course for this Diploma will begin on the 5th November, 1962. Students attend College on one day a week for three years. There is a period of two weeks in residence at the beginning of the course and two weeks each year thereafter. Students can specialise in Production, Marketing, Finance or Industrial Relations. Applications should be made before 12th October. Further particulars on request to Head of Department, at St. John Street, London, E.C.1.

B.Sc. (ECON.)

LONDON UNIVERSITY

U.C.C., founded in 1887, successfully prepares students for this Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts.—Prospectus, giving details of Courses for other London Degrees, G.C.E., Law Exams., etc., from Registrar, University Correspondence College, 60 Burlington House, Cambridge.

EXPERT POSTAL TUITION

for examinations—B.Sc.(Econ.), Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (S9/2),

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4. Established 1910.

BRUNEL COLLEGE

WOODLANDS AVENUE, ACTON, W.3

The Department of Management and Production Engineering will include the following course in the programme for the academic year from September, 1962.

ORGANISATION AND METHODS FOR MANAGEMENT

A course in O. & M. Techniques which comprises:—
Report Writing.
Work Study and Office Procedure.
Ergonomics and Psychology in Industry.
Computer Programming.
Punched Card Techniques.
Operational Research Techniques.
One day (Wednesdays) each week during term from September 26 to November 28, 1962.
Fee: £21.
Reservations and enquiries on this course should be made to the Department at the College. Telephone ACOrn 6601.

BUSINESS AND PERSONAL

A FOREIGN LANGUAGE in a few months for yourself or your staff, with the easy ASSIMIL way. You assimilate the language and acquire the accent naturally by listening to the living language on gramophone records with an illustrated book to guide you. Preliminary and Complete Courses in French, German, Italian, Russian and Spanish. A Pitman follow on course available for technical and commercial expressions. Details from ASSIMIL, 79, Farncombe, Godalming, Surrey.

WANTED: "The Times"; "Palmer's" and "Official Index to The Times"; early "Economist"; Trans. and Procs. of the Royal Society; Journal of the Roy. Statistical Soc.; "Annual Register"; "English Catalogue of Books"; "British National Bibliography,"; "New Statesman"—runs; "Economist" runs; "Illustrated London News"; and almost any learned and scientific periodicals.—H. Pordes, 138 New Cavendish Street, London, W.1. MUSeum 5250.

APPOINTMENT REQUIRED

PUBLIC SCHOOL MAN, mid-forties, commercial manager, requires progressive post Far East. Sixteen years' trading experience West Africa, present resident Sierra Leone. Good knowledge French and German.—Box 1655.

ECONOMICS Graduate, consultancy experience in Work Study, Stock Control and Production Scheduling, seeks position in small firm.—Box 1656.

APPOINTMENTS

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of LECTURER or ASSISTANT LECTURER in MATHEMATICAL ECONOMICS, to begin duties on January 1, 1963, or such earlier date as may be arranged. Initial salary according to qualifications and experience on the scales: Lecturer, £1,150 x £50-£1,500 x £75-£1,950; Assistant Lecturer, £900 x £50-£1,050, with F.S.S.U. provision and family allowance. A grant towards removal expenses will be made. Further particulars may be obtained from the Registrar, to whom applications (4 copies) including the names and addresses of three referees should be sent by October 1, 1962.

THE ECONOMIST INTELLIGENCE UNIT requires a sub-editor/writer for its Press and Publications department. Experience of publishing is desirable, knowledge of economics an advantage, ability to put over facts clearly is essential. Write, giving qualifications, experience, age and salary, to: Press, E.I.U., 5 Bury Street, London, S.W.1.

STAFF ENGAGER. Griffin & Spalding Ltd., Nottingham, have a vacancy for a Staff Engager and Manager. Will women with suitable qualifications please send details of their career to the Managing Director, Lone Row.

UNIVERSITY OF GHANA

INSTITUTE OF PUBLIC EDUCATION

Applications are invited for
(a) SENIOR RESIDENT TUTOR/PRINCIPAL in the Institute of Public Education for Sekondi-Takoradi Workers' College,
(b) RESIDENT TUTORSHIPS or
(c) ASSISTANT RESIDENT TUTORSHIPS in the Institute of Public Education.

Candidates for Senior Resident Tutor/Principal must hold a good honours degree and have considerable administrative experience, preferably, in an educational institution. Experience in Adult Education an advantage. Candidates for Resident Tutorships or Assistant Resident Tutorships must be honours graduates with qualifications in Mathematics, Geography and Trade Union Studies.

Salary Scales: (a) Senior Resident Tutor/Principal, £G1,750 x £G75—£G2,200 per annum. (b) Resident Tutor, £G1,050 x £G30—£G1,400 x £G75—£G1,850; £G1,900 per annum. (c) Assistant Resident Tutor, £G900; £G950 per annum. In each case 20 per cent. addition for non-Ghanaian. Entry at appropriate point. Appointment normally five years in the first instance.

Outfit allowance £G60. Car allowance £G150 per annum. Family allowance for non-Ghanaians for each child in West Africa, £G50 per annum or, if under 21 and being educated outside West Africa, £G100 per annum (maximum five children). Part-furnished accommodation at charge not exceeding 7.5 per cent. of salary. F.S.S.U. policies maintained if already held, or superannuation on similar basis.

Passages for appointee and family on appointment and normal termination. Annual leave with three overseas return passages in every four years for non-Ghanaians and one every three years for Ghanaians.

Applications (six copies) with full details of qualifications, experience, etc., and naming three referees, to be sent before October 15, 1962, to the Registrar, University of Ghana, Legon, Accra, or to the Assistant Registrar (Overseas), University of Ghana, 15 Gordon Square, London, W.C.1, from either of whom further particulars may be obtained.

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the following posts:—
(i) LECTURER IN SOVIET POLITICAL INSTITUTIONS.
(ii) LECTURER IN RUSSIAN HISTORY.
Salary Scale: £1,150-£1,950.
Commencing salaries will be according to the age, qualifications and experience of the successful candidates.
F.S.S.U. Benefits and Family Allowances.
Further particulars may be obtained from the Registrar, University College of Swansea, Singleton Park, Swansea, to whom applications (six copies) must be sent not later than *Saturday, October 13, 1962.*

For other appointments see page 1063

THE UNIVERSITY OF HULL

CENTRE FOR SOUTH-EAST ASIAN STUDIES

Applications are invited for appointment to either a Senior or Junior Research Fellowship tenable for three to five years from January 1, 1963, or as soon as possible thereafter. The fields of research will cover Economics, Geography, Politics, Social Anthropology or History and candidates must hold good qualifications in one of these subjects.

Salary scales: Senior Fellow £1,750 x £75-£2,050; Junior Fellow £1,150 x £50-£1,350 with F.S.S.U. and children's allowances.

Applications (five copies) should be sent to the undersigned not later than October 20, 1962.

W. D. CRAIG
Registrar.

COMPANY AFFAIRS

In the London stock market equities have again been dull this week and there has been no follow through to last Friday's rally. This was based on hopes of early moves by the government to stimulate the economy, but this week sentiment has been affected by the tone of the Bank of England's economic review and by statements by Mr S. G. Warburg here and by Mr Per Jacobsson in Washington. Uncertainty over the common market was a further factor restraining buyers and over the week The Economist *indicator fell by 1.9 points to 326.6. Once again interest has centred on gilt-edged, particularly among the short and medium dated stocks. The new Manchester loan got off to a good start and rose to a premium of 1⅜.*

Bowater Paper

THE new chairman of Bowater Paper Corporation, Sir Christopher Chancellor, and his fellow directors have many problems to face in the months ahead. Not the least of these will be to decide what final dividend they should declare for 1962. The interim dividend has been maintained at 5 per cent and in his statement accompanying the results for the first six months which was prepared shortly before his death, Sir Eric Bowater wrote that he did not believe it possible now to express an opinion about the rate of the final dividend but when the time came the directors would take into account not only past results but also future prospects.

This would seem to hold out some hope that the total dividend will be maintained at 13¾ per cent even though there is the possibility that this payment will not be fully covered by earnings. For the first half of 1962 earnings were running at an annual rate of just under 11 per cent. A further decline in profits has taken place but sales, though lower than in the first six months of 1961, were £2 million higher than in the second half of 1961. The home market has remained weak and as yet there is no sign of any material improvement in the demand for newsprint and magazine papers. But there has been some recovery in packaging papers, which presumably in part reflects some revival in the demand for consumer durables. This is one favourable pointer to the current half-year's results as is the bringing into production of new plant for coated printed papers. Moreover, higher earnings from North America will once again cushion the fall in profits in the home market to some extent. But the overriding problem of over capacity in the paper industry still remains and Bowater like other paper manufacturers will have to accept slim profit margins for some time to come. It has been estimated that the gap between demand and capacity will not narrow much in the next two or three years. If this is the case can the directors risk paying a dividend not completely covered by earnings? The other factor which will no doubt have some influence on the directors' decision is whether or not Britain joins the EEC. If she does, the British paper manufacturers may be less exposed to Scandinavian competition. But whatever happens it is clear that the dividend is in the balance and this is reflected in the 8.2 per cent yield offered by the £1 shares at 33s. 7½d.

General Electric

AT the end of last week the £1 shares of General Electric touched a new high for the year of 37s., which compares with a low point of 26s. and which brought the dividend yield down to 5¼ per cent. The latest rise in price was sparked off by the speech that Mr Arnold Lindley, the chairman, made at the annual meeting. Mr Lindley expects a further advance in profits in the current year. This forecast is based partly on the "significant economies" that should result from the reorganisation of the group and the introduction of new trading policies. The difficulties in the group's domestic equipment and radio and television businesses have now apparently been overcome and the telecommunications business holds out substantial prospects of growth in the years ahead.

This cannot be said, however, of the heavy electrical engineering division, where profit margins are low and which still remains the prime "area of difficulty." Another serious problem still facing GEC is its short-term debts, which including acceptance credits amounted to £11½ million at the end of March even though numerous investments and properties had been sold. Since then the overdraft has risen again, though this in part reflects the higher level of business activity within the group. If the chairman's forecast of a rising trend in profits is realised the capital problem will be eased, while the sale of Magnet House should bring in some much-needed cash. But Mr Lindley says that the group "must continue to seek suitable opportunities to expand business" and clearly in several directions it will have to spend heavily on development and research. Thus while GEC's trading prospects are brighter than for some time past the group is unlikely to be able in the immediate future to pass on to shareholders much of the benefit that may arise from reorganisation. But shareholders will recognise that without the reorganisation a regular dividend of 10 per cent would have been impossible. The shares have fallen back to 35s. this week and yield 5.6 per cent.

Rank Organisation

WITH the profits and the dividend for the year to June 30th last already forecast, both at the time of the issue of £5¾ million convertible debentures and of the acquisition of Murphy Radio by Bush Radio, the preliminary report of the Rank Organisation was not expected to produce any surprises. As forecast, a dividend of 25 per cent, against 22½ per cent, has been declared, but in fact profits are much better than had been indicated. Before tax and interest charges profits at £6,617,000 compare with £6,451,000 in 1960-61 and with a forecast of approximately £6 million. Reflecting the highly geared capital structure, net profits at £1,906,000 are about 20 per cent more than the forecast of £1,550,000. No reason is given in the preliminary statement why the Rank Organisation did so much better than it had been expected but it seems that the chairman, Lord Rank, who retires from that office after next month's annual meeting, will be able to sign off on an optimistic note by holding out the prospect of further increase in profits in the current year.

Where will this improvement come from? There seems little sign that the group's cinema interests, which still account for nearly three-quarters of total profits, will again do little more than hold their own. The directors may look for better results from manufacturing interests, whose profits have fallen from £1,532,000 in 1959-60 through £1,148,000 in 1960-61 to £728,000 in 1961-62. In their earlier forecasts the directors had not expected bigger profits from Rank's miscellaneous and much publicised activities such as bowling alleys, ballrooms, television relay and rental companies and Bingo to offset the fall in manufacturing profits. But this is what happened, for miscellaneous profits rose from £325,000 to £972,000. The directors may be counting on some further growth in profits from these sources.

(*Continued from page* 1057)

The group's policy of keeping in step with the changes of fashion in entertainment has been amply justified but it would be unwise to expect miscellaneous profits to rise as rapidly in the future as they did in 1961-62. The 5s. Ordinary and the 5s. "A" shares yield 4.3 and 4.5 per cent respectively and further benefits arising from the redeployment of assets appear to be well discounted.

Television Rentals

The television rental companies have enjoyed boom conditions for several years past but there are signs that their growth is not likely to be so rapid in the future. Nevertheless they are likely to find a steady source of new subscribers among those who bought sets in the early and middle fifties and now when they are thinking of acquiring a new set are somewhat bewildered by the welter of confusion surrounding the proposed change over to 625 line transmission and the introduction of colour television. This is the view of the latest of the rental companies to come to the stock market—**Robinson Rentals,** which is ranked about fifth or sixth in size in this country. It again brings into prominence Mr E. K. Cole whose company (of the same name) merged with Pye late in 1960 to form British Electronic Industries from which he resigned as a director a year later. He has recently been appointed chairman of Robinson Rentals, but the founder and main shareholder of the business is Mr David Robinson, who with his family will hold about 70 per cent of the 4s. ordinary shares after the offer for sale. Hambros Bank is offering to the public 825,000 shares at 30s. each, to yield 4 per cent on the forecast dividend of 30 per cent. This is nearly a full point more than the current return on Radio Rentals and the offer is likely to go well. By the end of August Robinson's branches numbered 92, widely spread throughout England ; of these more than 40 had been opened in the last two years. Profits before depreciation, which amounted to £397,000 in 1958-59, are estimated at about £1,550,000 for the year to end-September; this represents almost a fourfold increase in the past three years. For almost all this period Robinson Rentals has had an agreement with Thorn Electrical to purchase from it the television and radio sets it rents out. As with all other rental companies depreciation is an important factor for an investor to take into account. Robinson is now changing its depreciation policy so that its sets will be written off over five years with 75 per cent of the cost written off in the first three. Thus of the estimated profit of £1,550,000 no less than £1,014,000 will be absorbed in depreciation ; this substantial cash flow should help to finance further expansion, for at the end of August bank overdrafts amounted to £703,000, while loans from finance companies, mostly secured on batches of rental agreements, amounted to £1,900,000.

If rental companies are to experience some falling away in business then paradoxically shareholders are likely to see higher earnings and possibly bigger dividends. This is evident from the figures given by Robinson Rentals which show the highly inflated depreciation charge in the early years of a set's life. But if business falls off the depreciation charge will be much less and will be set against a relatively unaffected gross income. A slowing down in new business seems to be implied in the estimate of **Radio Rentals'** profit given in the formal offer for Dawes Radio, for depreciation in the year to August 31st last is only £189,000 higher at £4,310,000. Gross profits before depreciation are estimated at £6,810,000, against £6,497,000. The dividend is forecast at "not less than" the previous year's 22½ per cent and shareholders will have to wait until December to discover whether the company will in fact continue its unbroken record of dividend increases since 1950-51. This in itself is no bad recommendation for a new share in a similar type of company.

Dimplex

Householders in Britain are well aware of the various type of heating available to them. In some areas change has been forced upon them by the introduction of smokeless zones but more often than not it has been the steep rise in the price of coal which has attracted them to less dirty and more convenient forms of heating. A more modern approach to housebuilding has also played its part in this fireside revolution. All this has produced good business for the manufacturers of different types of heaters, and their success in achieving a rapid growth in sales and profits is reflected in the high rating given to their shares by the stock market. The 5s. shares of Dimplex have, for example, been yielding less than 2 per cent for many months and this week's results did nothing to alter the market's high opinion.

Dimplex's profits before tax, which in 1960-61 had risen by 75 per cent, rose in the year to June 30th last by 27 per cent from £555,000 to £706,000. The dividend of 40 per cent compares with an equivalent of 21 per cent after last year's two-for-three scrip issue. Now there is to be a two-for-five scrip issue and the shares are to be split into 1s. units. Dimplex is best known for its oil filled radiators but recently it has introduced a range of coal and log effect infra red fires, which bring it into close competition with Berry's Electric Magicoal. Dimplex's sales in 1961-62 were much higher but profit margins were reduced slightly by higher overhead costs. By contrast Berry's profit margins were unchanged even though it had reduced some selling prices. But while the directors of Berry's have said that sales have now levelled off the Dimplex directors report that orders received so far in the current year materially exceed those for the corresponding period in 1961-62 and that production was stepped-up in the summer in anticipation of a further increase in demand. This statement, coming on the back of excellent trading results, pushed the shares up by 8s. 7½d. to 82s. 4½d., to yield just under 2½ per cent, covered 2¼ times. This is discounting a good deal of future growth, though the strong earnings cover enhances the prospect that the 40 per cent dividend will be maintained after the scrip issue. Happy as they must be with Dimplex's record, investors must watch out to see whether greater competition will flaw the circuit.

Camp Bird

Next month's meeting of shareholders in Camp Bird should be a well attended and a lively affair and in their account of stewardship to shareholders the directors will have a lot of explaining to do. At the formal annual meeting in April, the chairman, Mr John Dalgleish, who now has only Mr C. Maxwell Norman as a fellow director, forecast "not unsatisfactory" results for the 22 month accounting period to February 22nd last. In fact a loss before tax of £888,000 was recorded, compared with a loss of £136,000 for the previous twelve months. The trading loss amounted to £533,000, of which Camp Bird Mine contributed £247,000, Cold Forging Process £23,000 and other trading interests (which have now been largely sold) £262,000. But this is struck before administration expenses of £227,000 and bank and debenture interest of £101,000.

The balance sheet also makes depressing reading, with the ordinary capital of £2.4 million only partially covered by net equity assets down from £3 million to £2.8 million. But even this figure is open to question, for the auditors, Price Waterhouse & Company, in their report say that they are unable to express an opinion about the values of "development expenditure" shown in the balance sheet at £637,000, and "rights and licences" at £373,000, which both relate to the cold forging business, or about the value of "pre-production costs" of £675,000 at Camp Bird Mine. Not surprisingly the 10s. shares have fallen to a new low of 2s. 6d.

THE MONEY MARKET

The discount market continues to press down the bill rate against the apparent wishes of the authorities. At the Treasury bill tender on Friday of last week the market raised its agreed bid by a further 2d. to £99 1s. 5d., and the average rate of discount fell by 7.87d. to 74s. 4.55d. per cent. The bill rate is now virtually back to its low-point in mid-June, when the market was expecting an early cut in Bank rate to 4 per cent. Total applications last week rose by £42 million to £439 million—their highest this year—but the discount houses received a quota of 48 per cent compared with the previous week's 45 per cent.

The authorities eased the tight credit conditions on Thursday and Friday of last week by special bill purchases, but on Tuesday, when six or seven houses were due to repay a moderate amount, further borrowing was necessary at Bank rate.

In the local authority loan market the rate for 7-day money has eased slightly to 4⅛ per cent, but the general tightness in the discount market, where call money has gone as high as 4 per cent on occasions, has prevented any further fall. With the end of the quarter approaching mortgage rates are now expected to harden.

APPOINTMENTS

STATISTICIAN

A Statistical Assistant is required for extracting and recording statistical data and economic facts for Market Research and Sales Forecasting.

The position offers ample scope for imaginative presentation of data. Some writing ability would be an advantage.

Candidates, under 30, must possess an appropriate University degree or professional qualification. Some industrial experience is required, preferably in the engineering industry.

Excellent prospects for advancement.

Applications should be addressed to the Chief Personnel Superintendent.

DAVID BROWN INDUSTRIES LTD
PARK WORKS HUDDERSFIELD

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT LECTURER in ECONOMIC HISTORY to begin duties on January 1, 1963, or as soon as possible thereafter. Applicants should have special interests in either Medieval or Early Modern Economic History. Initial salary according to qualifications and experience on the scale £900 x £50–£1,050, with F.S.S.U. provision and family allowance. A grant towards removal expenses will be made. Further particulars may be obtained from the Registrar, to whom applications (4 copies) should be sent by October 1, 1962.

THE ECONOMIST INTELLIGENCE UNIT
TRANSPORT ECONOMICS

The Economist Intelligence Unit invites applications for a new post for an economist to work primarily on studies of Transport Economics, these including surveys of the development implications of specific transport projects. Applicants should have a good degree including economics, and should have had experience in transport or industry or any other relevant fields. Salary according to qualifications and experience. Applications, including detailed curriculum vitae, to "Research," 5 Bury Street, St. James's, S.W.1.

BRITISH IRON AND STEEL FEDERATION
Technical and Development Department

A vacancy exists in the Technical and Development Department of the British Iron and Steel Federation for an Assistant to deal with the work of assessing technical and economic efficiency within the Steel Industry. Applicants should be graduates or hold equivalent qualifications, be aged about 27 to 30 and have had some experience of development planning and associated economics and costs within the industry, and accustomed to preparing reports for the guidance of management. A salary in keeping with qualifications and experience will be offered.

Applications should be submitted in writing, giving full details of age, qualifications and experience, to the Staff and Establishment Section, British Iron and Steel Federation, Steel House, Tothill Street, Westminster, London, S.W.1. T.D.4.

BBC REQUIRES General Programme Producer in Glasgow. Duties include production of varying types of programme, plays and features, dramatic readings, short stories and talks for Scottish Home Service and contributions to other Sound Services. Qualifications: candidates should have a good education, organising ability and a thorough knowledge of Scotland, Scottish literature, traditions and activities. Production experience desirable. Salary £1,380 (possibly higher if qualifications exceptional) rising by five annual increments to £1,780 max. p.a. Requests for application forms (enclosing addressed envelope and quoting reference 62/G.352 Ext.) should reach Appointments Officer, Broadcasting House, London, W.1, within five days.

JOINT ORGANISATION IN PARIS OF LEADING EUROPEAN AND AMERICAN BANKS SEEKS:

ECONOMIST ASSISTANT ECONOMIST

Candidates should have a first or good second class Honours degree in Economics, familiarity with European statistical sources, a complete command of spoken and written English or French with very good command of the other language), and preferably a reading knowledge of German. Some familiarity with stock exchange matters would be an advantage. The work involves observation of the current economic scene in the principal European countries, the preparation of studies on various industries and the forecasting of broad economic aggregates.

The post of Economist carries an initial salary of 30,000 NF p.a.; and that of Assistant Economist 18,000–24,000 NF p.a. according to qualifications and experience, with prospects of advancement. Applications, preferably accompanied by samples of the candidate's work, should be sent to Box 1654.

COMMONWEALTH ECONOMIC COMMITTEE invite applications from economists with wide experience for appointment as Section Officer. Salary according to approved experience in scale £1,850–£2,580. Compulsory contributory superannuation scheme (F.S.S.U.). Five-day week. Duties include preparation of regular and occasional reports on trade, production, etc., of Commonwealth commodities or on specific economic questions; supervision of professional staff in section. Experience in dealing with economic aspects of trade in grains would be an advantage. Applications, giving curricula vitae, qualifications, names of referees, etc., to Executive Secretary, Commonwealth Economic Committee, Marlborough House, Pall Mall, London, S.W.1.

For further appointments and other classified advertisements see page 1056

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for a RESEARCH FELLOWSHIP IN SOCIAL STUDIES tenable at the University College of Swansea for a period of two years.

The person appointed to the Fellowship will be expected to base his research on the area in and around Swansea.

Salary will be within the scale £1,150–£1,500, the starting point dependent upon the successful candidate's age, qualifications and experience. F.S.S.U. benefits and Family Allowances.

Further particulars may be obtained from the Registrar, University College of Swansea, Singleton Park, Swansea, to whom applications (six copies) should be sent not later than Saturday, October 13, 1962.

STATISTICIAN

TAM require an assistant to its Chief Statistician. The successful applicant will have a degree in statistics or a subject associated with statistics and some practical experience (not necessarily a great deal) in research of some kind. Age probably 25-35.

The work will be based in London. It will cover the whole range of statistical work done by the Company, from basic survey problems in liaison with the statistical unit at Berkhamsted, through special enquiries to client problems and research into techniques and future operations.

Opportunities will be given to take over work of increasing responsibility, and success in this post will form the basis of a career in market research. The salary will be in the region of £1,500–£2,000, depending on the applicant. Favourable terms of employment including generous pension scheme.

Write, stating full details of qualifications and experience, to :—

N. L. Webb, Esq.,
Television Audience Measurement Limited,
Chantrey House, Eccleston Street, London, S.W.1.

FORMICA LIMITED,
a member of the De La Rue Group,
require an
ECONOMIST
for the Commercial Development Department. Necessary qualifications are a good Degree in Economics, plus at least two years' experience in sales, marketing, or market research in industrial products. In addition, candidates must have the ability to plan research, carry out field work and write up the results lucidly with the minimum of supervision. The Department is concerned with business forecasting, and the investigation, development and marketing of new products and applications.

Write (quoting ref. No. R.7213) stating age, education, experience and salary, to
Assistant Personnel Officer,
FORMICA LIMITED,
De La Rue House, 84 Regent Street, London, W.1.

Computer plots varied menus

EASTERN Counties Farmers are a large go-ahead organisation owned by farmers, with headquarters in Ipswich. They have recently been tackling a routine problem in an exciting new way—by hiring time at a Ferranti Computer Centre to find the most economic methods of keeping their members' livestock well-fed. The technique of linear programming is used to produce answers from a welter of data such as the cost of various foodstuffs, calorific values, and Ministry of Agriculture requirements. The total cost of the three calculations needed, one for poultry, one for pigs and one for cattle, is only £30, a very small fraction of the savings they make possible.

Computer guidance pays

The case above is only one of many where slashed costs and greater efficiency have resulted from computer guidance. Computers can perform an immense range of tasks with equally immense rapidity. Once properly programmed, they can cut through apparent jungles of information to reach relevant and practical conclusions. And because computers consider every aspect of a problem, every combination of variable factors, decisions based on their guidance are happily free from bias or over-simplification. Computers don't play hunches, but they *can* test them.

However large or small your problem, hired computer time might be able to solve it. There is no need to own a computer—and no need to worry about the technicalities of computing—you can hand your problem to Ferranti and they will do the rest, or they can teach you, in a few hours, a simple "do-it-yourself" programming technique. Why not get in touch with the Computing Service? They will be glad to advise you whether or not you could profit by computer guidance.

Call:—Ferranti Computing Service; LONDON: Museum 5040. Telex 23830. MANCHESTER: East 1301. Telex 66111, or EDINBURGH: Davidson's Mains 2231. Telex 72141.

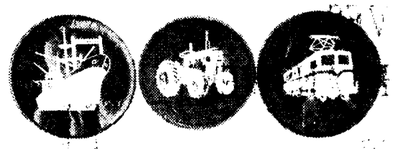
Link up with the bustling Japanese economy



More than 2000 firms in countries all over the world have made technological, manufacturing, marketing, and other types of industrial agreements with Japanese companies. With fewer restrictions nowadays on the flow of capital and technical know-how across national boundaries, more and more companies are discovering the advantages of such tie-ups. The Industrial Bank of Japan has been intimately associated with every major Japanese industry for 60 years and is well qualified to act as go-between in arranging attractive contracts in all lines of business. Inquiries are invited.

Watchdog for 4 nations

This is the Bristol/Ferranti Bloodhound surface-to-air guided missile, adopted by the United Kingdom, Australia, Sweden and Switzerland as an integral part of their defence systems. Bloodhound is powered by two Bristol Siddeley Thor ramjets which have proved their reliability during hundreds of test firings in the missile's development programme. Bristol Siddeley have more than twelve years experience in the design and development of ramjets and are the only European company to have a large ramjet engine in quantity production.

HOME

FAIR OF FACE

The Conservative par has lifted Mr Macmillan over his polital European hurdle: Mr Gaitskell's carelly planted electoral time-bomb could alblow up in his own face (p. 113).

But even their Europan enthusiasms could not make the Torie assembled at **Llandudno, anything butull (p. 147).**

Sir Roy Harrod agait the common market (p. 146).

FULL OF GRAC

The **Trades Union Cgress** has had an unrivalled opportunitythrust upon it—and seems to be graspii it with both hands (p. 128).

But the **railwaymen** :d the London **busmen** are both teetering ı the brink of hasty strikes (p. 121).

FULL OF WOE

Sir Matthew Slatterhas correctly assessed the condition of **BAC's** financial set-up; the next step is to put his crazy house in order (p. 161).

Britain's balance of payments might have reached a high-water-mark in the first half of 1962 (p. 165).

The Government may be going to legislate on **the care of children:** proper attention should be paid to preventing as well as curing the family ills afflicting the young (p. 122).

FAR TO GO

The new Minister of **Defence** must pick up the pieces of his predecessors' half-policies: in the long term he must sternly choose whom to be interdependent on; in the short term he can make the forces contribute to the technical progress of the nation (p. 118).

The gas **industry** is treading the long road towards its financial objectives (p. 173).

More development is needed before **hovercraft** can provide a practical service (p. 174).

On the latest taking of industry's pulse there is no sign of a quickening tempo (p. 169).

LOVING AND GIVING

Bankers are ready to lend more freely—and the authorities are ready to let them do so; but a big expansion in **advances** will not necessarily follow (p. 163).

The release of some **post-war credits** is certainly a way of pumping cash into the economy—but are there not some better, and more socially welcome, methods in this funny world? (p. 125).

HARD FOR A LIVING

Tough bargaining lies ahead before the **National Coal Board's** position within an enlarged **European Coal and Steel Community** is finally settled (p. 170).

New provisions to help **the disabled** back to active life would not be pure philanthropy—they could usefully add to the labour force (p. 126).

The grim cities of the English north-east are working to develop a cultural gloss as well as an economic structure (p. 148).

INTERNATONAL

GREAT WHITE ATHERS

Charles the Tall: eneral de Gaulle may be doing his best tout an end to his reign. But his opponents ve still to wait on what he may do next (p.14).

• The constitution crisis in **France** adds a new touch of uncerinty to **Britain's** negotiations with the comon market (p. 120).

Francisco the Fat General Franco has the opportunity of guidg Spain into the modern era of western-styl prosperity (p. 116).

Mac Coeur de Lyn: Mr Macmillan has grasped at the opptunity of guiding Britain into a prosperous urope (p. 120).

Tito Through the Tulips: The **Jugoslavs** are tiptoeing throh the difficulties of surviving in a Euro that contains both the common market and its communist counterpart (p. 133).

Dief the Deft: Th shaky **Canadian government** headed b Mr Diefenbaker has collected curious, but indefinitely useful, support from the Social Credit party (p. 129).

FARTHER OFF

Ugandanisation: Mr Obote, prime minister of the **newly-independent** Uganda, is faced with the task of welding a nation out of the state born on Tuesday (p. 131).

Congo: Britain is faced with a clear responsibility (p. 122).

India: Has determined on a test of **China's** intentions in the Himalayas (p. 125).

Mr Nehru can do little, however, for the million stateless **Tamils** in **Ceylon** (p. 125).

But his Congress party has been able to fix things in **Kerala** (p. 132).

United Nations: The party is hotting up, and the night is still young (p. 122).

Yemen: Our special correspondent describes the cautious demeanour of the revolutionary leaders (p. 130).

FOUNDING FATHERS

The current state of the union:

There is a close link between **slum clearance** and **racial desegregation** in the United States (p. 137).

President Kennedy dived into the election **campaign** this week (p. 141).

Cuba is becoming a perilously important campaign issue (p. 138) but the Republicans are also making grist out of the **crisis in Mississippi** (p. 141).

In **Idaho** it's all a gamble (p. 142).

Congress is in no hurry to free the Treasury from its obligation to support **the price of silver** (p. 145).

Civil servants have received two last-minute presents from Congress and letter-writers will have to pay for one of them (p. 141).

Budd progress rides the rails

Budd has pioneered railway progress for over 25 years. Today, Budd-built passenger cars of all types—mainline, multiple units, self-propelled rail diesel cars (RDC) and subway cars—are in use on six continents. Railways around the world prefer cars built by Budd and its licensees because of the advantages of sound stainless steel construction: lightness, dependability, economy and low maintenance. They also like such extra features as unique Budd-designed trucks and efficient disc brakes. Budd continually seeks new ways to improve rail service, lessen maintenance and reduce operating costs. Unique skills in engineering . . . metallurgy . . . tooling . . . welding . . . research . . . testing and production have helped place Budd high among the world's 250 largest industrial concerns. For information about our railway activities, write THE BUDD COMPANY, INTERNATIONAL DIVISION, Philadelphia 32, Pa., U.S.A.

Giants' feet have rubber soles

Many of today's construction colossi stand on mats made from one of the various types of Polysar* rubber. Polysar shock absorbers insulate the footings from the building proper, dampen the vibrations caused by road and rail traffic. You'll find Polysar rubber in floor tiling, in stair treads and rails, stripping for windows and doors, in cable and wiring, caulking compounds and sealers, escalator steps and platforms. In fact from sub-surface rock to weather-bombarded roofing, Polysar rubber is vital to the construction industry.

If you are planning a new process, a new product, or improvements to an old one, success can depend on your finding a new raw material. A most promising source may lie among the 40 different types of Polysar synthetic rubbers, produced by the Polymer Corporation Limited.

Within the world-wide Polymer organization there is a representative nearby, ready to advise you. A letter to the Marketing Division, Polymer Corporation Limited, Sarnia, Canada, will put him in touch with you.

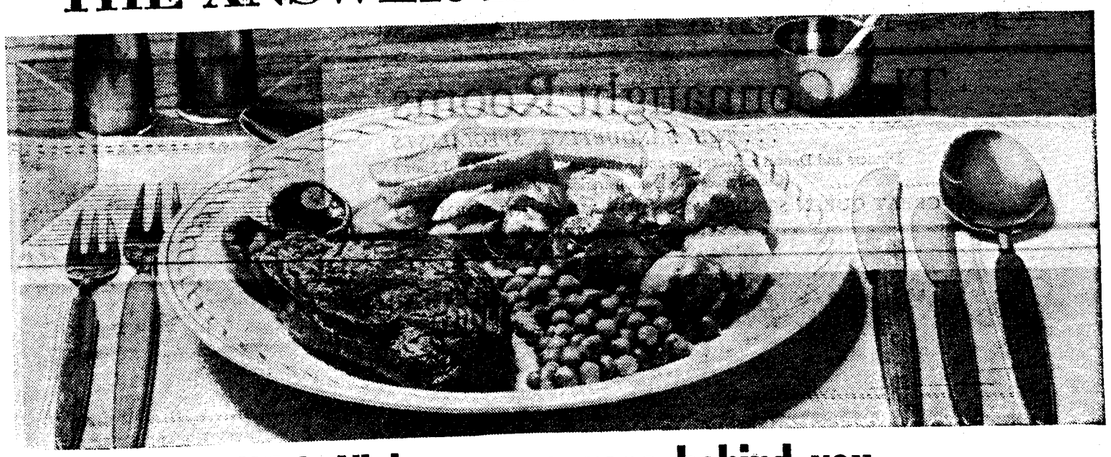
THE ANSWER IS CUT AND DRIED!



With Vickers resources behind you, A.F.D. food production is now an economic proposition.

To compete successfully in the race to market Accelerated Freeze Dried food your company needs time, money and specialised equipment. Vickers will lighten the load for you by holding trials to determine whether your products are suited to Accelerated Freeze Drying. These tests embrace everything from the initial economics of A.F.D. to the final packaging of the food, and involve no expenditure by your company.

If, like many other leading food processors, you find the results impressive, Vickers can provide low-cost pilot plant for you to continue your own product tests until you are familiar with the technique and ready to install a full production line.

Vickers offers you a complete range of Accelerated Freeze Drying equipment—in fact the choice of pilot, batch or continuous A.F.D. system—as well as supporting food research and laboratory services.

IMMENSE POSSIBILITIES Each facet of Accelerated Freeze Drying has been carefully studied and considered by economists, engineers, physicists and bio-chemists on Vickers staff. Their work and knowledge provide a solid base on which to build your own A.F.D. experience.

Accelerated Freeze Dried foods will soon be no strangers to the larder shelf; in another few years they will be as much a part of everyday eating as the knife and fork. Knowing this, can your company really afford to ignore the potentialities of A.F.D? If not, then invite Vickers engineers to examine the application of A.F.D. to your own business.

HERE'S HOW TO MAKE A
SUCCESS
OF YOUR
NEXT LUNCHEON

Let's assume that you are an efficient man, accustomed to getting value for money. As a specialist in your own field, you expect equal expertise in others. How, then, would you ensure the success of your next luncheon? You would do well to choose the Connaught Rooms, which is not an hotel but an establishment which specialises in banqueting, and is situated in the very heart of London. There you have the choice of several rooms, separately or in suites, for the entertainment of any number of guests—from 8 to 800. Whatever you ask for . . . soup with snow eggs . . . closed circuit TV . . . you get, quickly and with pleasure. And the reasonable cost will surprise you.

Connaught Rooms will arrange and organise everything exactly as you want it. A word from you will bring immediate action. Helpful suggestions, advice and estimates are equally forthcoming.

Please remember that luncheons are only one aspect of the service available. Contact Connaught Rooms regarding your next function —whatever it may be.

VOLUME CCV - NUMBER 6216

Over Llandudno's Hurdle

THE first political hurdle into Europe has been cleared, with almost derisory ease. The Conservative party conference at Llandudno on Thursday made it clear that the party's stalwarts were not going to block the road forward which the Government has now so plainly determined to take. It may be that the force which swayed many of the most conservative hearts in England this week was political calculation rather than visionary love for a European brotherhood. Not to follow their leader now, the older Conservatives told each other, would land their party in the electoral soup. But political calculation has been at least as strong a factor in causing many in the Labour party to follow Mr Gaitskell on to the backwater side of the fence, as it has now been in impelling their counterparts in the Conservative party to follow Mr Macmillan on to the side of welcoming change. And the spectacle offered at Llandudno this week—of a supposedly tired and worn out Government, eleven toiling years old, flexing itself for such a bravely historic venture as this—rightly carried a real sense of exhilaration with it. At Brighton last week exhilaration was a difficult emotion to feel.

The vote at Llandudno is important because of the effect it is likely to have on any eventual vote in Parliament. The number of Conservative MPs who will refuse to follow Mr Macmillan in voting for the market now looks as if it may actually be less than the number of Labour MPs who may refuse to follow Mr Gaitskell in voting against it; even if it is not, the Prime Minister's parliamentary majority on this issue seems secure. That being so, there now seems to be only one internal political event that could still keep Britain out of the common market: namely, if Labour succeeds in forcing and winning a general election before Britain's signature of the Treaty of Rome comes into effect. Whether there are any circumstances in which Labour will be able to force such an early general election is doubtful; but obviously discussion is now going to centre more and more on the one way in which some Labour sympathisers think it might be done. This is if Mr Gaitskell drops what has been called his H-bomb: namely, if he announces that a future Labour Government would feel itself free to repudiate a Conservative Government's signature on the treaty.

It is becoming increasingly clear that this is what the hidden struggle at the Labour conference at Brighton last week was really about. The evidence is mounting that at the beginning of last week Mr Gaitskell was starting the preliminary count-down for his nuclear explosion: the button was not to be pressed until the final terms became known—in several months' time—but in the meanwhile Mr Gaitskell was hoping to get certain impediments out of the way. Specifically among those impediments—there is no point in being mealy-mouthed about this—was Mr George Brown; Mr Gaitskell's expectation was that, thanks to what he himself had said in the opening speech of Labour's common market debate, Mr Brown's closing speech to that debate would be booed. The most significant feature of this year's Labour conference was that Mr Brown's speech was not booed; and following it a number of big trade union leaders, realising what was being prepared, have rallied strongly to Mr Brown's side.

The need now is not to preach more moral sermons at Mr Gaitskell; it is to appeal to his sense of political calculation. If he did set off the weapon of threatened repudiation, and if Mr Macmillan still pressed on with the negotiations, one of three things could happen. First—and this is what the Tories

themselves expect to happen—the Government and the other countries of Europe might simply ignore the threat. Mr Macmillan might sign his treaty, and carry on governing until October, 1964; by that time Britain would be so far integrated into Europe that many people believe that Mr Gaitskell, even if he returned to power, would not in fact be able to revoke.

Secondly, the threat might cause such a split in the Labour party (and, possibly but not at all surely, such spontaneous revulsion throughout the country) that the public opinion polls might swing violently against Labour; in that event Mr Macmillan would no doubt be only too eager to call an election, probably between the treaty's signature and its coming into effect—say, a poll in October, 1963. But it would then be Mr Gaitskell's own party that would have been blown up by his H-bomb.

Thirdly—as those around Mr Gaitskell are insistently telling him—the Six themselves might conceivably insist on a general election in Britain before any new Treaty of Brussels came into effect; so that the Tories might have to go to the country while the polls were still in Labour's favour, and Mr Gaitskell might come to power. But he would do so in circumstances where his election campaign would have caused cold fury in the Kennedy administration as well as deliberate insult to the Six; he would rule over a British government initially divorced from all its allies, deplored, distrusted, written off by those allies as a weak deserter (but an increasingly unimportant one) from the cause of free world union, bickered at, suspected, outcast and alone. This would be the worst possible result for Britain; it would also be the unhappiest possible personal result for Hugh Gaitskell himself.

It may seem unfair to anti-marketeers to point out these alternatives; they are in effect being told that their stout fight for Britain's independence is gravely hampered because *Britain is already not really independent. But the political* difficulties originally lay wholly against those who advocated this huge change of Britain's entry into Europe. If the difficulties have now moved against the other side, this may be partly because members of that other side have been clumsy and tardy in their political manoeuvring; but it is mainly because they are by now fighting against the reality of a historical trend. The truth about this year's two main party conferences seems to be that Mr Macmillan has got himself over a hurdle, and Mr Gaitskell has got himself over a barrel. The next few months will show how far he really intends to go on trying to pull the country down on to that barrel with him; he must not think that other spokesmen in the country are being unjust if they shout at him that he shouldn't.

(A report from our special correspondent at Llandudno appears on page 147).

Gaullism versus Politics

General de Gaulle has gone out of his way to unite his opponents. Can they unite themselves?

LITTLE need to recapitulate in how many ways France has bettered its position in the world in the four and a half years since it submitted itself, with a sigh of relief, to General de Gaulle's authority. He has sufficiently reminded the French nation of them himself, most recently in his radio and television address on October 4th, the day Parliament and Presidency in the French state went openly to war. A France in "the full flight of prosperity and social progress"; a solid franc, a balanced budget, a favourable balance of trade; the last big stage of colonial withdrawal accomplished; it is all true.

Even General de Gaulle's assertion (to quote his broadcast again) that France's "weight and radiance are recognised throughout the world" keeps safely this side of absurdity. Whether all the credit goes to the institutions of the Fifth Republic, as he will have it, is a question that can be argued about. The parliamentarians will be arguing it out during the referendum campaign and the election campaign that will occupy them between now and the last week of November. Here it is not necessary to carp. Another question is more germane and more pressing: how is it that the brilliant achievements registered under the Fifth Republic have been accompanied by no reform, no realignment, no revival, no consolidation of France's political life? For this is the deadly fact brought home by the present political and constitutional crisis. As M. Fauvet put it in *Le Monde*:

> It is not right to say that we are going back to the Fourth Republic. We are there already—and by the fault of the Fifth. By his analysis, which is hard to refute, French political life has derived no sort of renewal from the Gaullist experiment. It has merely enjoyed a moratorium, and now that the chief occasion of the moratorium—Algeria—has been sloughed off, the old structure is stirring into life and the old laws are working again. The bitterest enemy of those laws and that structure is General de Gaulle. Serenely operating, as he still does, the levers of power, he has done nothing to change what he hates for the better; nor has he considered coming to terms with it. Watching the constitutional crisis unfold has been like watching a Greek tragedy. General de Gaulle has courted the conflict with the parliamentary parties, and in courting it has spared no contemptuous word or gesture that could sting them, indeed force them, to unite and resist him effectively. As it would seem, he has not been counting consequences but simply obeying, with pride, the laws of his nature that have made him what he is. To tell the general,

as many old admirers have been telling him, that such a course must end badly seems not only embarrassingly banal, but, in a ludicrous way, impertinent; he can hardly not know.

It was as such admirers, one by one, from M. Paul Reynaud and ex-president Coty to the MRP (Christian Democrat) leaders who withdrew only in May from the Pompidou government, came out against General de Gaulle's latest referendum that it became clear, in the course of last week, that the moment of collision had come. The Senate made its feeling plain by the demonstrative manner of its re-election on October 2nd of M. Gaston Monnerville, a root-and-branch opponent of General de Gaulle's constitutional ideas, as its president. In the Assembly, all five groups (six, if the handful of Communists is included) other than the Gaullist union (UNR) itself united behind a motion to censure not the president directly, but the government of M. Pompidou which shared the responsibility for the president's referendum.

EVEN so, not a few members in the alliance of opponents would have been prepared to give General de Gaulle the substance of what he wanted, the election of future Presidents of the Republic by direct popular vote, provided he had been prepared to seek it in a constitutional way, consulting Parliament. What they could not stomach was the recourse to a plebiscite to change the constitution without any reference to Parliament at all. It was the unconstitutional procedure, and not the substance of the change, that united an opposition vote of 280 deputies (39 more than the quorum) behind the motion of censure at 4.40 a.m. on October 5th.

What followed was full of the irony of contrast between the institutional working of the Fourth and Fifth Republics. General de Gaulle had sensibly gone to bed, leaving orders not to be disturbed. He got up early and set out for a day in the Champagne, watching the army manœuvres; M. Pompidou could not get to see him till Saturday, and then well on in the morning. Accepting M. Pompidou's resignation, the President asked him to carry on the government until the next National Assembly had met; he had decided to dissolve the existing one.

Thus, under the Fifth Republic, a parliamentary vote of censure produces not a new government, but a new Parliament. The referendum, fixed for October 28th, will go ahead, and the constitution will presumably be changed *de facto* against the juridical protests, as well as the political objections, of both chambers, leaving a rich field of constitutional dispute and uncertainty for some future time. By and large the French electorate is not expected to resist the flattering invitation to take over from the present electoral college the job of electing future heads of state. All the same, the voting figures will be anxiously watched, since this referendum will be treated as yet another personal vote of confidence in General de Gaulle; he has intimated that that is how he will regard it.

Next, in the latter half of November, will come the general elections to the new National Assembly. If he had wanted a working majority in the Assembly for the government that functions under his wing, General de Gaulle might have done better to order these elections last April, after the Algerian settlement. Many people at that time expected that he would, but instead he chose to install M. Pompidou and to make his life impossible. This time, for all that General de Gaulle may win his referendum, his chance of a working majority in the next Assembly looks thin. Suppose the next government is censured like M. Pompidou's: then it, too, has to resign, but the Assembly cannot, in its first year of existence, be dissolved. Thus the president must either find a government acceptable to the Assembly (which, one has to suppose, would be a government unacceptable to him), or he must invoke Article 16 and govern without parliament, through emergency powers (which can hardly be what he wants); if he will do neither, the only way open seems to be the road back to Colombey-les-Deux-Eglises.

NO WONDER the word is going round in Paris that the reign of Charles the Tall has virtually come to its end. The word is premature. Referenda have been so frequent, and so unnecessary, under the Fifth Republic that one can only conclude them to be in some way a psychological necessity for its towering president. A big enough majority in this one, on October 28th, may give him reassurance, and if he determines to go on governing he still has many a shot left in his locker. As for the opposition, its locker is full of shot but its rigging is bare of sail. The republican parties, as one must once again call them, are united in opposition to General de Gaulle's insufferable contempt of Parliament. Are they united in anything else? The issues of the recent past—Algeria, economic and social policy, the schools—divided them just as under the Fourth Republic; so that although a majority could always be said to exist, it was a different majority on each subject. Even now they are not wholly united in opposing General de Gaulle's plan for the Presidency, only in opposing his indefensible way of putting it through.

Just conceivably, it might be possible to piece a working anti-gaullist majority together on a programme of European integration, coupled with a new policy of co-operation with the United States and support for the Atlantic alliance: an attempt to hold the real gains of gaullist foreign policy while dropping its more overweening pretensions. If this were to happen, it would have interesting implications for the British, who would then have every inducement to make haste into Europe, but who would no longer be able to deceive themselves that European political union was a chimera, rejected by General de Gaulle and therefore not to be worried about. But it is a shape on the horizon, no more.

One further vast uncertainty remains, and General de Gaulle may yet see a way to use it to hold his opposition in check. The Fourth Republic was overthrown in 1958 not by force, but by the fact that when the soldiers withdrew their obedience from it, its leaders allowed power to drop from their hands. General de Gaulle has, to put it bluntly, cheated the soldiers of what they stood out for in 1958. Their last overseas position gone, they are now virtually thrown back on metropolitan France as the last field in which to discharge what sense of national mission they still feel. General de Gaulle has worn them down and outmanœuvred them, using as his one weapon the singular presumption that he alone incorporates France.

His personal "assumption" of power (his own word) has, by a narrow margin, been triumphantly effective. But, with this one man taken away, where will power in France rest? The political parties may hope that it will revert to them. But

can they be sure? If they are not sure, they can still be outmanœuvred. This is not to deny the genuineness of the change of feeling among the parties that makes last week's parliamentary debates a landmark. The parliamentary correspondent of the *Berry Républicain*, M. Rouanet, commented last week on the note of sincerity in the utterances of their leaders on the constitutional question—"a note one had not heard for four years." This is accurate. A sense of political responsibility is in the air; France's normal political leaders once more feel themselves to be representative men. The weakness of the gaullist system is that it has never quite allowed for this development.

The Next Economic Miracle?

The next country to break through into a massive economic advance may well be General Franco's (or his successors') Spain

ALL the signs suggest that the next "economic miracle" in Europe ought logically to be a rapid and massive advance in the economy of Spain. The infrastructure for such an advance exists. At present 42 per cent of Spain's labour force is still scraping a bare living in agriculture (where it supplies only 27 per cent of a gross national product which is still less than £100 a year per head); but when Spaniards have emigrated as modern industrial workers to other countries, such as Germany, they have proved to be both industrious and easily trained. The scope for domestic industrial change in an underemployed European society of this sort ought now to be very large indeed. Besides this underutilised labour force, the country has an able and ambitious managerial class, a settled financial community and a most fortunate geographical position on the periphery of western Europe's booming market. What has so far held Spain back is that the Spanish government seems to have repeated in the 1950s all the errors of economic policy which the rest of Europe perpetrated in the late 1940s; now in the 1960s, unless new economic errors intervene, it might well start to do something of what much of the rest of continental western Europe did in the 1950s.

If one remembers that it marched through the cycle of economic clumsiness a decade late, the parallels between the Spain of the 1950s and the Europe (or for that matter the Japan) of the late 1940s look almost spookily exact. After having remained isolated from its neighbours, largely for political reasons, during the first five postwar years (so that by 1950 its national income per head seems still to have been below the depressed pre-civil-war level of 1935) Spain started in the early 1950s to reflate internal demand. In this new policy it had some statistical success (between 1951 and 1958 industrial production increased by about 75 per cent), but it made the same errors as many more left-wing European governments had made between 1946 and 1950; it pumped in the fresh demand against a dam of inflexible physical controls that seemed almost designed to divert the country's productive effort into all the wrong places.

The Spanish government's economic policy in this period was one of Daltonism and Crippsism plus. Throughout the 1950s, price controls prevented any growth of a healthy market economy. Rigid import restrictions and allocation controls on raw materials protected the inefficient, making it impossible for firms to grow according to their profitability, but only according to what ration of raw materials or other scarce resources they were permitted to have. A featherbedding labour law made it impossible for overstaffed concerns to dismiss any of their redundant workers for "economic" (as distinct from "disciplinary") reasons without prior permission from the Ministry of Labour. The tax system discriminated between different enterprises, not according to efficiency but according to status in official favour.

An extensive system of subsidies, which took the form partly of specially favourable prices between state enterprises and partly of concessionary interest rates, piled further distortion upon further distortion. Rigid controls were maintained on any enterprise that wanted to undertake new investment. Throughout the 1950s about half of the nation's fixed investment was undertaken by a gaggle of 1,600 autonomous organisations within the public (i.e., government) sector of the Spanish economy; many of these operated on no known grounds of economic principle, but largely on principles of bureaucratic prestige or pull, with a persistent tendency towards approving projects that were showy rather than those that were profitable. (There are still groups of the underpaid Spanish civil service whose earnings depend on the volume of investment projects that their departments start, because of the professional fees and other special charges that are then allowed.) Even when investment patterns were not determined by distortions as grossly personal as this, autarky was one of the aims of the whole system of "controlled" investment, so that particular concessions were granted towards (e.g.) those electric power projects that were based on the mining of expensive and inefficient Spanish coal.

The result was that the newly created monetary demand did not lead merely (or even mainly) to an upsurge of production in the most efficient growth industries; instead it poured itself out into a series of raging inflationary whirlpools in narrow favoured sections, while everywhere else the growth of which the economy was by now capable was held back by physical controls. There was therefore—as in Britain during Daltonian days—an inevitable excess of demand over this absurdly strangled supply; and with this came the usual concomitants of a rapid inflation of prices and a large deficit in the balance of payments. In 1959 Spain reached its 1949; the peseta was devalued and the Spanish government set afoot a period of "economic stabilisation" and moderate deflation. The questions then were whether

(a) the devaluation would swiftly put the balance of payments to rights; whether

(b) the disinflationary stabilisation programme would cause money—and thus economic efforts to earn it—to mean something again; and whether

(c) Spain would thereafter proceed not merely to reflate demand again, but simultaneously to make a dash for freedom from controls and from bureaucratic distortions.

If Spain achieved all these things, it could lay much the same foundation for an economic miracle as Germany, Japan and Italy did in the early 1950s; most of the other pre-requisites for such a big economic advance seem to be in place, including even—and this is important for so Roman Catholic a country—a fall in the birth rate compared with prewar days.

So far the signs of burgeoning reform in the last three years are very hopeful. Questions (a) and (b) have already been satisfactorily answered; the balance of payments is back in surplus and price inflation has been largely checked. Admittedly, this has been achieved only at the expense of a standstill in production from 1958 to late 1961, but the check to production seems at last to have been permitted to impinge most sharply on the most inefficient sectors. (That, indeed, is largely why Spain has run into labour troubles in some of its least efficient industries, troubles which have caught its government politically on the hop.) Since late 1961, the government has started to re-expand demand again. Most important of all, during and since the "stabilisation period" bureaucracy has begun to remove some of its most crippling physical and other controls. The still too stately Spanish equivalent of a dash for freedom is on; and last week saw the publication of the document that might do most of all to hurry the process up. It was in March of last year that a team of seventeen experts from the International Bank for Reconstruction and Development, under the leadership of Sir Hugh Ellis-Rees, arrived in Spain at the invitation of the Spanish government. Their report, which has been in the hands of General Franco's government for some time, has now been published to the world.*

THE report is a fascinating document, not merely for the future history of Spain, but in the history of the advice given by international bodies of this kind as well. Unfortunately, a large part of it is written in world bankers' English, which is hardly a pellucid literary style. But the main recommendation is clearly stated, again and again. "The principal measure that the Government can take to establish an environment that is conducive to rapid industrial growth," declares the mission, "is to remove the controls which continue to hamper the free working of the economy." The mission runs its eye over the history of Spain's internal investment controls, of its allocation and rationing systems for industrial materials and of its price controls; all of these controls have been considerably whittled down in the last three years, but too many (price controls, in particular) still exist. "We are persuaded," declares the mission flatly, "that general economic conditions are now such that these controls can be removed." The same medicine is recommended, although a bit more guardedly and with some temporary exceptions, for import controls and export controls. The mission then plunges into a survey of the jungle of state subsidies which take the form of special prices between state enterprises and concessionary interest rates; always it recommends that these distortions should be whittled down, and usually that they should be virtually swept away.

This recipe of free market liberalism from the bank was to be expected, although it is good news that the Spanish government seems more than half-inclined to swallow it. What was less certain was whether the mission would also be progressive in its attitude towards the re-expansion of demand. The answer comes out happily. "It is only by a policy of stimulating the growth of the economy as a whole," declares the World Bank mission, "that a general solution can be found to the problems caused by disequilibrium in employment, income and regional development." It is true that the mission rears a bit awkwardly when it realises that this advice might logically lead it into the still unspeakable sin (to world bankers) of recommending that Spain develop on the basis of unbalanced budgets. But it recovers its equilibrium admirably. Spain, it thinks, should be able to plan its policies on the basis of expecting "an annual growth rate of 5 per cent per capita . . . over an extended period." "Taking the rate of growth of national income proposed above and assuming the same relation between the growth of income and of fiscal receipts that has existed in the past," says the mission, "the increase in public revenues that can be forecast would make it possible . . . to carry out over the next five years . . . development proposals. . . ."

In other words, by assuming that it will have an increase in tax revenue as a result of assuming that it will have an increase in national income, the Spanish government is told to engage in the reflationary policies from which a more strictly orthodox system of budget estimating would have held it back. This system of reflating demand while pretending that it isn't happening is the one that has worked so enormously successfully in Japan and Germany and other expansionist economies in the past ten years.

This article may have been too optimistic in its assumption that the sauce that has proved so successful for other golden geese may now be about to be applied equally successfully to the Spanish gander; it is a bit odd to base optimism for the future of the Spanish economy so largely on the fact that the recent mismanagement of that economy has seemed to be so unrepeatably ghastly. But, as the mission says, the foundations for growth appear to be there; Spain already has a wide range of industries, even such modern ones as consumer durable industries, although necessarily most of them are still working on a tiny scale. The dynamic could now well be set alight by the opening up of the economy to freer market forces, a process in which Spain's application to be associated in some way with the European common market could play a big subsidiary part. And if this happens none should welcome it more than those who so rightly deplore the unhealthy and undemocratic features of Spain's present political system.

If Spain does now go forward economically into something more like a west European standard of life, this will surely bring new attitudes and new sorts of men into positions of influence which will ensure that its governing classes cannot go on looking backward politically for ever. There is, after all, a proud past history on which this country can build. "Methinks I see in my mind a noble and puissant nation rousing herself like a strong man after sleep, and shaking her . . . locks. Methinks I see her as an eagle mewing her mighty youth, and kindling her undazzled eyes at the full midday beam. Methinks . . . ." Well, it is rather fun to find oneself moved to quote Milton after reading a report from the International Bank for Reconstruction and Development.

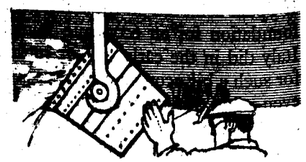
Steelmen Unstuck



The Trades Union Congress must follow up its victory for common sense in South Wales

THE dispute between two trade unions that, until Tuesday afternoon, was threatening to bring a large part of the British steel industry to a halt, has followed a too-familiar pattern. The intervention of the Trades Union Congress, leading to a truce and to agreement by both unions to submit to arbitration, could set a new and infinitely more sensible standard for the future. This time the squabble over who-does-what has been between the Amalgamated Union of Building Trade Workers (83,030 members, several hundred in steelworks) and the Iron and Steel Trades Confederation (112,321 members): the bone of contention is the right to the job of lining with heat-resisting material the converters in which molten metal is transformed into steel. This has traditionally been done by ISTC members, but when the steel companies decided, instead of a lining of tar-like composition rammed into place, to use 90-lb prefabricated blocks of a similar substance, the AUBTW chose to claim that these blocks are bricks and should be laid by its own men.

In August the bricklayers stopped work at Corby in Northamptonshire, where the work has since been carried on by non-union volunteers from the company's staff; last week, having endangered the commissioning of the new integrated steelworks of Richard Thomas and Baldwins at Llanwern (and threatened other works on its way westwards) the dispute reached RTB's older plant at Ebbw Vale. There the management promptly (and not entirely convincingly) threatened to close the whole plant down—which would have meant catastrophe for the valley, 10,000 of whose men work there. Urged on by the local Member of Parliament, Mr Michael Foot himself, and by the local council, the TUC stepped in. After a 4½-hour meeting the bricklayers' union agreed to order its members back to work (many of them had been vocally reluctant to come out anyway in a strike that seemed to involve their union's prestige rather than their own jobs). The carve-up of work is still not resolved, but the AUBTW was persuaded to accept the verdict of an arbitrator —the ISTC having accepted arbitration from the start.

Of course there is more to this quarrel than meets the eye. The bricklayers fear that their jobs in the steelworks could fade away as new processes take the place of open-hearth operations: the open hearth, as big as a house, reconstructed every three months and built entirely of brick, has always been put up by craftsmen bricklayers. And the ISTC has for long been suspected by the craft unions whose members do specialist jobs in steel—electricians and engineers as well as building workers—of wanting to squeeze them out. The steelworkers' leader, Mr Harry Douglass, is a tough-minded right-winger who gets results for his members, in the form of high pay, sensible redundancy payments and so on, without too much truck with verbal militancy or formal delegate conferences; he does not lack critics to say that he is undemocratic, dictatorial and what you will (but not to his face). The latent conflict between the craft unions and Mr Douglass's quasi-industrial union has been simmering for a long time; just a year ago it came to the boil during another thoroughly avoidable strike, also of bricklayers, at Port Talbot, also in South Wales.

But whatever the underlying reasons for the obduracy of the bricklayers' union—and, however much one may be surprised to find Mr Lowthian, the AUBTW's level-headed general secretary, mixed up in so stupid a business—there must be a warm welcome for the outcome. The great disappointment of this year's Trades Union Congress at Blackpool was the lack of a sense of urgency about union reform, even in the speeches of those who most clearly see the need for it. This week, however, Mr George Woodcock was faced with an inter-union dispute that clearly cried out for TUC intervention, and the publicity that the dispute got (and that union leaders and the local Labour council saw that it got) forced the building workers into a position where they had to accept arbitration, however poorly it may turn out for them. A couple of decisive TUC actions could do more to reinforce its prestige with its own constituents, and with the public, than any number of speeches.

Key in the Door?

British defence policy has to be adapted to the needs of a new western alliance — and to the new British society

DEFENCE planning always looks a mess: if it looks even more of a mess this year, at the time when decisions on next year's estimates begin to loom large, this need not be an unmitigated disaster. Mr Thorneycroft has inherited the almost concurrent collapse of two policies: of Mr Sandys's strategic bias toward going-it-alone (the Blue Streak philosophy which still has its carry-over in the irrelevant claims of political independence for the V-bomber-Blue Steel-Skybolt force); and of Mr Watkinson's worthy but ill-rewarded trust in the interdependence of the *Otan des patries* (from which the tactical missile, Blue Water, has been the chief, but not the only, sufferer). Now Mr Thorneycroft has got to pick up the pieces.

There are three jobs to be done. The first is to integrate the existing British forces into a more cohesive structure of western strategy. Primarily this means using the remaining bargaining power that the V-bomber force represents in allied councils to encourage the marriage of American and European

interests in the joint control of the nuclear deterrent: there are several British options here. The second job is to gear future defence production (which means the British participation in the next generation of weapons systems) to the degree of economic and technological integration that can be expected both in Europe and in the North Atlantic area as a whole. In the absence of any political infrastructure on which to base a co-ordinated western pattern of defence production, how far dare an economy like Britain's now go in developing the weapons that will be needed after 1970? And Mr Thorneycroft's third job is to make the most efficient use of the armed forces he has got: to see that they have the capability to fulfil their Nato role, and their continuing role east of Suez; that they have the right equipment; and that they have the right kind of men. Here, too, there are decisions piling up.

Western nuclear strategy is enmeshed in two issues. Immediately, there is the American (and British) desire to get President de Gaulle's *force de frappe* into the harness traces of the alliance as a whole. There is a timetable here. The French deterrent does not exist now; if President de Gaulle has his way it will exist as a weak, dangerous and expensive force from 1964 onwards; if the pace of American and Russian technology keeps up, the French force, like the British, will cease to count at all after 1970. The French factor is therefore likely to be a more transient one than most people have recognised. It cannot now be discouraged from emerging by scrapping the British force; but its owner may (and only may) be more amenable to accepting the kind of joint target system that the V-bombers already share with the American Strategic Air Command if the French nuclear ambition is accepted in the United States as an objective fact. It is the Kennedy administration's responsibility to interpret the degree of French nuclear knowledge according to the revised terms of the McMahon act permitting co-operation with advanced nuclear allies. There are signs that Mr Thorneycroft encouraged his hosts to look at France in this light during his visit to Washington last month.

Atlantic symbol: Fylingdales missile radar.

But the major problem is to integrate western Europe as a whole in an effective share of political control over the western deterrent. The perennial European fear that American policy on this side of the Atlantic may become dependent on Chicago's willingness to accept a Russian nuclear bombardment has not been wholly assuaged by the reality of the present American commitment to the alliance. Britain and France have expressed their fears by building, for good or bad reasons, their own attempts at a deterrent; west Germany is still at the stage of words. There is a military choice now for Mr Thorneycroft to make. He could still, conceivably, do no more than keep the V-bombers, armed with Skybolt, in being up to 1970 as a small fraction of the American effort, and plan to contract out of any subsequent major weapons system altogether. This would be at odds with the political attempt to enter Europe. Or he could disperse his V-bombers throughout western Europe with the French Mirage bombers and fall in with the Europeans in calling this deterrent politically independent of Washington. The logical next step, if the governmental infrastructure existed, would then be for the Europeans to join in producing their own post-1970 deterrent-of-a-kind. If this were a local version of the Polaris or Minuteman systems (both relatively cheap, inter-generation weapons) Europe might be able to afford it. But this would be a wasteful duplication of American weapons that are already in existence; and the European deterrent would still be likely to have as little credibility, compared with the next generation of Russian defences, as the V-bombers possess now.

OR there is a third option. Mr Thorneycroft can try to get into Europe, call the resultant Anglo-French force as independent as he thinks convenient, but then use this key to unlock the door to a joint Atlantic system. The balance of military and economic, as of political, advantage is overwhelmingly behind this course. Up to 1970 Europe will thus have a deterrent (and a say in deterrent policy) that depends on the American Skybolt for the V-bombers and on the American refuelling aircraft that are needed to get the Mirage bombers beyond Brest-Litovsk. This is not independence, although it might pass as such politically. But in this period the need is to develop the Nato nuclear committee from an educatory into an advisory and then into an authoritative body. At the same time a separate international force, directly under the Supreme Allied Commander, Europe, can be built up to supply tactical nuclear firepower. The existence of such a force, by itself, implies a political authority to decide on whether or not to extend a battlefield as far east as the Polish border. Within an established context of this kind Europe could then expect (and North Atlantic military and economic necessity could well dictate) a European share in the development, construction and manning of a sophisticated strategic, probably orbital and certainly post-Polaris and post-Fylingdales, weapons system. This is the reverse of the third force concept. On no account should Mr Thorneycroft's entry into Europe be in pursuit of that already obsolescent military idea.

Immediately, therefore, Mr Thorneycroft should stamp heavily on those defence planners who (simply because this is what they are paid to do) are now pressing for Britain to develop the semi-obsolescent strategic weapons that the British economy, or the European economy, could just about hope to sustain. This includes Polaris, either the true underwater (i.e. European-financed) Polaris or the cut-price (i.e. independent British) variety that would be stuck into surface ships. This is, in fact, the year of all years when political and military uncertainties make it impossible for anyone in London to lay his hand on his heart and say that British expenditure on such-and-such a prospective post-1970 weapon would be justified. The lead-times for such weapons are already becom-

ing a problem, but only after Mr Thorneycroft has got into Europe and can begin his second job of co-ordinating defence production can concrete decisions of this magnitude be risked. This reality should show up in next year's estimates.

THE third job, of making the best of what exists, is one that occupies all defence ministers but is one which Mr Thorneycroft, arriving in office with the actual achievement of all-regular forces, should consider of exceptional importance. By ploughing the savings on Blue Water into conventional arms the minister has shown that he has grasped at least one of the glaring weaknesses in the British defence posture in Europe and outside it. But in the very success of the army's recruiting drive in the past year there lurk two dangers—which add up to a major opportunity. There is the danger that professional armies grow apart from the societies that produce them: this can be particularly serious in relation to the prestige, and the efficiency, of the technical and supply services on which modern forces are utterly dependent. There is the second danger that any upturn in the economy, and a belated increase in the civilian technical training facilities for school-leavers, may in the future deprive the services of the kind of recruit they most badly need.

The Economist has argued in the past that the services should be given funds specifically to turn themselves into model educators and employers of technical personnel; even if they lose 80 per cent of their trainees to civilian employment after an initial period of service, this would still be all gain to the economy at large. This argument did not find favour with the Admiralty (which has had little or no recruiting problem, partly because it does provide good technical training and has given its technical grades, up to wardroom level, a proper status); nor did it find favour with the army which, desperately short as it was, could not afford to release skilled personnel as instructors and preferred to try to get half its tradesmen in from outside. The success of recruiting in making up sheer numbers may help to reduce some of the army's objections. For this is, in fact, the time for all the services to look ahead towards the type of educationally-superior entrant that they, like everyone else, will need in the later 1960s. It may be the last chance to capitalise on the failure of the educational system as a whole to cope with 16-year-olds of good potential.

The services ought to be expanding their own training facilities dramatically; they should be encouraged to play a part, with their own sandwich courses, in new technical colleges; and they could, by demonstrating the practicality of vocational training well above existing apprenticeship standards, become unexpected catalysts in overhauling ordinary industrial practice. The services have got to gear themselves to the new society in every way they can. This is one central role that Mr Thorneycroft, among his other preoccupations, should insist that they play.

NOTES OF THE WEEK

EUROPE

MacMarket

AT last the Government's long-awaited campaign in favour of British membership of the common market has begun. Following up his firm speeches at the Commonwealth conference and on the television, the Prime Minister has now committed himself in print to wholehearted advocacy of British membership of the common market. His pamphlet "Britain, the Commonwealth and Europe," published by the Conservative Central Office on October 7th, wastes no words on the terms of an agreement or the possibility of failure to agree. The case for joining is put without qualification.

Conservative morale should be stiffened, too, by the loud support ministers have been giving to the Prime Minister. In the fortnight before the party conference Mr Thorneycroft, Mr Macleod and Mr Maudling all put the European case forcibly. Thus the rumour, sometimes heard in the constituencies, that Mr Macmillan is riding a private hobby-horse into Europe without cabinet support has been firmly squashed. Mr Maudling's voice should carry a special message for waverers. The man who had the misfortune to be responsible for both the luckless free trade area and the European Free Trade Association has spoken with convincing moderation of the economic advantages of joining the common market.

The Prime Minister's own pamphlet covers ground familiar enough to readers of *The Economist*. It is wrong to suggest there is a choice between Europe and the Commonwealth, he stresses. Rather, if Britain is to serve the Commonwealth as it should, it must have a place in the new centre of power, Europe. The idea that sovereignty will be "sacrificed" is also false, he suggests, in an age when not even the giant powers, Russia and America, are fully independent in defence and foreign policy.

The Prime Minister's tract is not an inspired, crusading document. But its solid style and argument should be persuasive within his party. Perhaps the most intriguing passages are at the end, when the Prime Minister permits himself a flash of idealism:

> We want to see Britain . . . working towards the unity of the world which is the ultimate vision of mankind. The European Community is a signpost to that future and we must play our part.

This follows a plea for speed in the Brussels negotiations. The Government has realised that uncertainty about the outcome of the negotiations has done as much damage in the country as the arguments of the anti-marketeers.

Waiting for France

DO the other Europeans share the British Government's wish for speed? There have been signs, since the Commonwealth conference and Mr Gaitskell's efforts at Brighton, that most of them do. Any doubt Mr Gaitskell may have sown about Britain's reliability as a future partner seem to be matched by a new awareness on the Continent of the Prime Minister's determination to get Britain into Europe, and by an enhanced sympathy with his difficulties. As Mr Heath learnt during his European mil round last month, five governments, at any rate, feel that from the community's point of view, as well as Britain's, the sooner uncertainties are resolved, the better.

But what of the sixth? The French have never shared their partners' anxiety for speed as far as getting the British in is concerned. M. Couve de Murville was in New York this week for the United Nations Assembly, and Mr Heath was not able to see him in Brussels as he had hoped. The French representatives at the ministerial meeting in Brussels (described on page 131) argued that it would not be wise to arrange meetings of ministers this autumn in close succession. Officials, they suggested, would not have enough time to work out technical details in between.

The French constitutional crisis adds a new element of doubt. It is true that M. Pompidou's government has temporarily recovered from the bite; it was the National Assembly that died. Still, a period of uncertainty has opened and is not likely to end before December. It all means that concern for the French political future is likely, for a time, to take precedence of the British negotiation in French minds. For this reason few French observers now expect Mr Heath's hope of agreement by Christmas to be realised.

What of the further prospect, if the French Parliament asserts itself and a government of parliamentarians takes over? Such a government could hardly fail to be more interested in European integration than any chosen by General de Gaulle. It might, at the same time, be more tender towards French vested interests, and the difficulties for Britain of reaching agreement with it, though they would be different from those of negotiating with M. Couve de Murville, would not be negligible. Most probably such a government would want to get on with the negotiation with Britain. But this would not be all it wanted. A new French government based on a parliamentary coalition would almost inevitably be committed to an effort to get European political union moving, a matter the British Government has found it convenient so far to leave vague. The British might have to make up their minds more quickly than was comfortable; or they might get left behind again.

STRIKES AHEAD?

Railing at Fate

THE National Union of Railwaymen's post mortem on the one-day strike on October 3rd has cleared the air, even if it has not given the hoped-for prospect of peace. Mr Greene, the general secretary, has at last made it perfectly clear that the union's protest is not so much against the way in which the British Transport Commission is carrying out the process of cutting down on unprofitable bits of the railway system, as against the Government's whole transport policy. The rail strike, then, must be seen as a political act—and like all such political strikes in British history, its objectives, and still more its possible consequences, have clearly not been visualised by the strikers. The NUR's executive reflected this inconclusiveness by declaring its intention to call a further stoppage, but passing on the decision of when it would be and what form it would take to a special sub-committee; thus leaving itself at once in a militant posture but with a large freedom of manœuvre.

The other conclusion to be drawn from the NUR's behaviour is that Mr Marples was right to appeal to the union to have a further word with Dr Beeching (although wrong to imagine that this was the way to stop last week's strike). The union has greatly weakened its own case by appearing to be absolutely opposed to even such obviously necessary measures of rationalisation as the closure of carriage-works designed for the repair of obsolete wooden vehicles; but nevertheless it has some legitimate points to make in protection of its own members—not just to secure less stingy severance payments, but also to see about future employment prospects in that minority of areas where other industries are not eagerly awaiting the chance to snap up railway workers once they are freed (broadly speaking—and this ties up with altogether larger economic issues—things are all right in the south but not in the north). It is also in Dr Beeching's interest that the BTC should appear to have the interests of its staff at heart. If the NUR's subcommittee can manage to dither usefully over its tactical decision about the strike, the two sensible adversaries could yet find themselves making a concerted approach to the Government over a social problem that concerns them both.

The case of the craft unions with members in railway workshops is a tougher one. They have this week been urging rough tactics—a one-week strike—on the railwaymen, thus strengthening the hand of the wilder men with whom Mr Greene has to contend in his own union. It may be fortunate that the craft unions chose to put so much weight on piffling questions of procedure—their main cause for anger seemed to be that Dr Beeching had specified whom he wanted to meet, and not left the choice of his interlocutors to the unions—which might ensure that they do not get as much public sympathy as the railway staffs themselves have, and in some cases deserve.

Go for Broke

THE long-standing struggle by the London Transport Executive to persuade its bus drivers and conductors to change their ways is at a crucial, but still indecisive, stage. While the LTE complains that it cannot get men to operate its services, the men themselves seem determined to obstruct any attempt to save labour. On Monday a delegate conference of busmen refused to accept a package deal offered by London Transport: this included the introduction of larger buses, of one-man buses on some uneconomic suburban routes, and of a new kind of continental-type bus with more standing passengers on some short-trip routes, plus a speed-up on country routes with 40 mph speed limits instead of the old 30 mph limit. (The delegates were also angry at the LTE's intention to suspend for the winter some under-used weekend services on which the men had been making regular extra overtime money.) In exchange, the busmen were offered a share of the extra profit. The men, however, claimed both that their share should be larger and that it should be given more in the form of time off (meaning, perhaps, extra overtime at higher rates of pay) than in cash. They refused to consider the "standee" buses. In the face of this opposition the LTE once again postponed the introduction of its new large buses on routes that were due to get them.

London Transport, in fact, is in the throes of one of its fairly regular barneys with the tight group of bus workers who have persistently made difficulties for everyone who has to deal with them—even, on occasion, for Mr Frank Cousins himself. It is wholly certain that the public would have no sympathy at all with them if they did try to strike or go slow in opposition to the LTE's reasonable measures of modernisation: and the unofficial strikes planned for some routes this weekend, in protest against the cutting of services for the winter on some busmen's "favourite" routes, should be negligible. It is hard, too, to be entirely convinced that the majority of drivers and conductors—many of them immigrants and women—are really the doctrinaire, militant bunch that they are painted by their delegates to conferences like last Monday's. This is an occasion when the employers should get, and stay, tough.

TURKEY

Mr Inönü's Respite

MR INÖNÜ, it seems, has been given a respite from his mounting political troubles. In recent weeks the Turkish prime minister has again been faced with an ugly crisis over the question of an amnesty for some or all of those imprisoned after the Yassiada trials. It was this same question that precipitated the protracted government crisis early this summer, and when Mr Inönü formed his new coalition in June he undertook to introduce a partial amnesty by October 29th.

Since then the opposition Justice party has been ceaselessly and insidiously agitating for a complete amnesty; it has even tried to create the impression among the uneducated voters that an amnesty would somehow have a magical effect on the country's economic troubles. The army and the students, on the other hand, are hostile to any amnesty at all. On two occasions last week there were violent student demonstrations in Ankara, directed principally against the Justice party and its newspapers; the demonstrators appear to have enjoyed the tacit acquiescence of the army.

On Tuesday the government at last announced its amnesty terms; these would have the effect of releasing at once all those

with sentences up to six and a half years, and reducing all other sentences by four years. Unlikely to satisfy the opposition, the amnesty nevertheless provoked angry student demonstrations in Istanbul. In Ankara, however, the Justice party, suddenly and most surprisingly, turned right round and on Wednesday announced their fervent support for Mr Inönü. Presumably, at the secret session of parliament earlier this week, someone must have told them pretty forcibly where they got off. How long the lesson will stick is very doubtful; the Justice party's obsession with the past will not be easily overcome. But if there really is a lull on the political front in the feuding over the fate of Mr Menderes's supporters, one hopes that the government will seize the chance of pressing on with its economic and social reforms; at present the new five-year plan is jeopardised by a disagreement between the government and the planners over how to finance it.

IN PURSUIT OF LEISURE

Since 1955 the combined amount spent on public entertainments and reading matter (when adjusted to remove the effect of price changes) has remained almost constant and as a proportion of total consumer spending it has fallen from 3.6 per cent to 3 per cent. Within these groups, however, there have been considerable changes. Cinemas, which in 1955 took nearly half the spending on public entertainment, in 1961 attracted only one-fifth. In reading matter, books have gained at the expense, particularly, of magazines.

UNITED NATIONS

Warming Up

After a quiet start, the United Nations Assembly reached a livelier stage this week with a personal appearance by Mr ben Bella, a committee vote on Southern Rhodesia, and a rowdy reaction in the public galleries to a two-hour anti-American diatribe by President Dorticos of Cuba. About twenty Cuban refugees had to be forcibly ejected from the Assembly hall on Monday before Dr Dorticos could go on with a speech which departed altogether from the usual conventions about visits to the UN by heads of state, and which, it was noted, drew diminishing applause from the delegates (except for the loyal Soviet block).

The admission of Algeria to UN membership on the same day evoked a series of welcoming speeches which were remarkable for the many expressions of admiration and goodwill for France that came from unexpected quarters. Of all people, Mr Shukairy of Saudi Arabia was heard by a startled Assembly raising his voice in praise of President de Gaulle. Meanwhile M. Couve de Murville had taken the opportunity to be the first French minister to engage in private talk with Mr ben Bella; and on Tuesday the Algerian prime minister made a forceful speech in which he pledged his country to fulfil the Evian agreements with France.

Against this background of lively and sometimes surprising events, there was something rather flatly predictable about the fourth committee's vote, 68 to two (Portugal and South Africa), for a resolution that called on Britain to act to secure the release of Mr Joshua Nkomo and the lifting of the ban on his Zapu party. The British delegation, sticking to the argument that London cannot interfere in Southern Rhodesia's politics, did not take part in this vote; and 25 other delegations found reasons for not being present in the committee room at the time.

Over the head of an Assembly which is still only warming up there now hang three question marks. One is Katanga. Another is the widely canvassed possibility of the arrival of Mr Khrushchev around the middle of November. The third is the question of the secretary-generalship, which is not formally before the Assembly as yet. If agreement can be reached to invite U Thant to accept a full term of office, this recommendation will come to the Assembly from the Security Council with the battle already fought and won. At the beginning of this session, however, Mr Gromyko, assisted by *Pravda*, wheeled out the "troika" again, for the first time this year. If the Russians cannot be induced to push it back into its shed, the UN may have to face a full-scale showdown on the whole question whether there is to be a secretary-general at all. U Thant's firm public adhesion to the Hammarskjöld doctrine of an expanding executive role for the UN has not fired the Russians with enthusiasm; but it has enlarged his stature in the eyes of the great majority of member countries.

CONGO

Britain to Move

Mr Tshombe, of Katanga, is still waiting to see which way the lion jumps. The British Government is in a special, perhaps a key, position to influence the course of events in the Congo: if it says it will support action against Mr Tshombe, the threat of that support will probably be enough to keep him in line. But he will remain obdurate so long as he believes that economic sanctions against him would not work (because the British Government would not make them work) or that force would not be used (because the British Government would not allow it). The British attitude needs to be reconsidered now that the situation in Katanga seems to be hotting up once again.

The familiar signs are all there. Mr Tshombe is stalling, in an attempt to nullify his acceptance on September 3rd of the United Nations plan to reintegrate his province with the rest of the Congo. The acting secretary-general of the United Nations, U Thant, was to meet his Congo advisory committee on October 12th; on Tuesday, October 9th, United Nations troops encircled two buildings in Elisabethville, and Mr Robert Gardiner, UN chief of operations, reported evidence of increased Katangese air strength. Mr Tshombe's hired white soldiers, Mr Gardiner said, were still there in strength.

There is, therefore, some danger of renewed fighting between the United Nations troops and Mr Tshombe's; there is a worse danger that he will keep talking for so long that a bankrupt United Nations will have to withdraw from the Congo, leaving its work unfinished. Such a victory for Mr Tshombe would be a defeat for almost everyone else: the world would be back where it started when, in June, 1960, the United Nations went into the Congo, and all the dangers that the United Nations has succeeded in staving off would come crowding in again.

This can still be avoided if the British Government brings itself to help put Mr Tshombe in his place as provincial prime minister in a united Congo. (America's active concern for a settlement has been shown in the talks that the Under-Secretary of State, Mr McGhee, has held in Katanga and Leopoldville this month.) Two explanations for Britain's unwillingness are white Rhodesian pressure and anxiety about British financial interests in Katanga. But if there is an African nationalist victory at the polls in Northern Rhodesia (across the Katanga border) on October 30th, succumbing to white Rhodesian pressure will make even less sense than it does now.

NEGLECTED CHILDREN

New Powers for Prevention

When the Home Secretary first announced that a departmental committee on children and young persons was to be set up (in 1956), the original intention was apparently to confine its terms of reference to juvenile courts, approved schools, etc., and to the existing statutory provisions under which parents could be prosecuted for cruelty to children or for exposing them to moral and physical danger. These terms of reference were immediately recognised

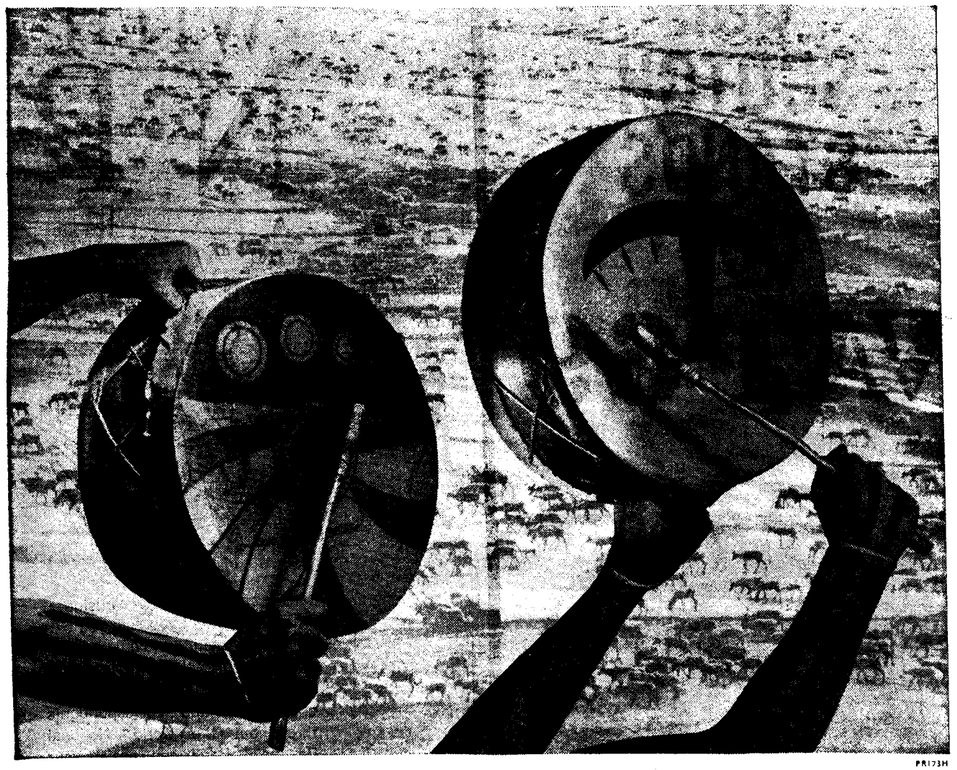
Drums *(non-returnable)* along the Athabaska



PR173H

Under the midnight sun of Canada's far North-West, a line of barges creeps into Yellowknife—a gold-mining settlement on the desolate shore of a great lake. Their load—cyanide in drums—is prosaic, perhaps; but it has completed an adventurous journey that started 10,000 miles away at an I.C.I. factory in England: by sea across the Atlantic and through the Panama Canal to Canada's Pacific coast; down-river by barge, overland again for many a rugged mile, down-river once more to the waters of the lake itself.

Such odysseys are not uncommon for I.C.I. chemicals, and least of all for I.C.I. cyanide. Known for 50 years as the key for unlocking gold and silver from their ores, it is used almost everywhere these precious metals are mined—in the Australian deserts, in the rolling hills of Southern India, in the mountains of Colombia and the uplands of Fiji. And, like so many I.C.I. chemicals, it is no stranger to the world's engineering industries. Cyanide case-hardening salts from I.C.I., as well as degreasing solvents and metal pre-treatments, play a part in the production of everything from hypodermic needles to agricultural machinery.

The influence of I.C.I. research and production is felt today in every corner of the globe

by people interested in child care as far too restricted. Was it not better, it was urged, to see if more could not be done to help families with problems, and "problem families," in order to prevent children from appearing before the courts at all, whether as delinquents or in need of care and protection?

In the end the terms of reference of the Ingleby Committee were widened to take in this aspect of the child and his family, and it is now reported that the Queen's Speech will contain a reference to legislation on the lines of the committee's recommendations on prevention. The committee pointed out that a multiplicity of official and voluntary agencies may be concerned with families in trouble, but that, so far as local authorities are concerned, their powers are derived from legislation like the National Health Service Act and the Education Acts, which are not primarily concerned with neglected children. Even under the Children Act of 1948 the statutory powers of local authorities as regards prevention are limited.

The result has been a lot of services concerned with the child, and a lot of people running about, once things have gone wrong, but nobody with a statutory obligation and powers to prevent them from going wrong; and, in spite of governmental exhortations to co-ordinate and confer, the Ingleby Committee decided that there was, nevertheless, a great deal of inter-service rivalry. It thus recommended that a general duty should be laid on local authorities to prevent or forestall the suffering of children through neglect in their own homes, that they should have powers to do preventive casework and to provide material needs that cannot be met elsewhere, and that no committee should be specified to carry out these powers. Further, there should be a statutory obligation to submit schemes for detecting families needing help; for investigating what sort of help is needed—the investigating centre should be in charge of an officer responsible to the clerk of the authority, not to a committee; for providing the appropriate help; and for making the services known to the public. In 1960-61 there was an average of 61,000 children in the care of local authorities because of some sort of family breakdown, at an average cost in local authority homes and hostels of nearly £9 a week. Many of these cases could have been prevented by timely assistance, and it will presumably be the purpose of the new bill to ensure that it can be given.

POSTWAR CREDITS

Strangely, No Outcry

It is surprising that Mr Maudling's releases of postwar credits have not been more violently attacked from the left. The people who have accumulated the biggest credits necessarily tend to be those who paid most income tax, because they were earning most money, between 1941 and 1946. At first sight, it is not easy to say that these are the people who most obviously deserve to be given more purchasing power now.

When the credits were first introduced—in the great budget speech which Sir Kingsley Wood delivered (and Maynard Keynes wrote) in 1941—they arose out of Keynes's fear that the Treasury might still be too orthodox to unbalance the budget during any postwar slump; they therefore pumped these £765 million of permitted tax repayments into the fiscal system, with the idea that any slumptime releases from these "funds" below the line might prove to be administratively less controversial than unbalancing the budget. In the event, the device proved an unnecessary one. Still, once the Government had accepted the obligation of the postwar credits, they had to be honoured. The aim should have been to move towards a scheme which would marry these obligations to some socially useful object. The best compromise scheme seemed to be the one towards which the authorities were moving just before 1959; it envisaged releases to creditors when they reached retirement age (so that the credits became a sort of retirement bounty, for which there is some social case) and earlier releases in case of hardship (for example, to any creditor who became unemployed for more than 26 consecutive weeks).

The two further releases in 1959 and 1962, which now allow women to cash the credits at the age of 55 and men at the age of 60, have no such social justification behind them; the recipients now get them at a time when they are still earning, sometimes indeed at the height of their professional earning power, and often just after their family obligations have run down because their children are now earning too. These measures have been decided upon almost solely because they are a convenient "once-for-all" release of purchasing power; women between 55 and 58 and men between 60 and 63 will draw an extra £42 million this year, but thereafter releases from the credits will relapse to £18 million a year or so as before. Alternative measures could have been to make £42 million a year of tax reliefs now, but with a plain warning that the taxes might well have to be put back up again later; or even to give out £42 million as a once-for-all Christmas bounty in 1962 to, say, old age pensioners or those on national assistance. The objection to these latter suggestions is that, if ever the poor had been given a special Christmas bounty, there might have been immense political and moral pressure to repeat the bounty each year. Probably there would have been. But what a very unmoral story this has become. One dare not give a bounty to poorer people now, for fear of having to give another one to them later; so the new release of purchasing power goes instead in the form of an earlier-than-expected-hand-back to those who paid most taxes 20 years ago.

INDIA AND CHINA

Marching as to War?

The clash of arms reported this week between Indians and Chinese at the eastern end of the border looks like a natural outcome of the latest verbal hostilities between Peking and Delhi. On October 3rd, a Chinese note proposed border talks in Peking ten days later, but observed that India's stipulation that Chinese troops should first be withdrawn from the area was "absolutely unacceptable". Three days later, India repeated its pre-condition and added, for clarity's sake, that until the Chinese withdrew across the McMahon Line—the rightful eastern border, in Indian eyes—there could be no question of discussions about the western section of the frontier in Ladakh.

The latest clash has a more ominous ring than previous ones. Each side has been complaining of a military build-up on the opposite side. According to reports from Tibet, which are evidently taken seriously in New Delhi, the Chinese have been building airfields capable of servicing jet aircraft within 60 miles of the newly disputed area. It is doubtful whether the Chinese have aircraft that compare in quality with the half-squadron of Russian Mig fighters, equipped with the Soviet version of the American "Sidewinder" homing missile, that India is now to receive. But these are not expected until next month.

The Indians seem, however, to have decided to put Chinese intentions to the test, especially in the McMahon Line region. This is probably the significance of the transfer of Lieutenant-General B. N. Kaul from his post of chief of staff to take over the Eastern Command, together with a new corps to be formed there. What nobody knows yet is whether the Indians will prove an irresistible force, or the Chinese an immovable object.

INDIA AND CEYLON

Floating Non-Voters

Trouble is brewing again over the million "stateless citizens" who make up ten per cent of Ceylon's population. They are Tamils of south Indian origin, but born in Ceylon, whither their fathers and forefathers migrated to work on the tea estates. They have remained a self-contained community in the tea-growing uplands, quite distinct from the other million Tamils who populate the north and east of the island and represent a much earlier wave of migration. Years of haggling between Ceylon and India have left the stateless million still stateless. Their relative job security and good living conditions on the tea plantations have aroused envy among the Sinhalese, and now Mrs Bandaranaike's government has started to insist that priority

must be given to Ceylon citizens when the plantations have vacancies for employment. Voteless and thus politically voiceless, the estate Tamils now foresee a steady worsening of their already shaky position.

Mr Nehru, who is due in Ceylon on October 13th for an outwardly non-political visit, may not be able to offer them much more than sympathy. India is certainly in no position to provide the whole community with an equivalent livelihood if it returned to Madras, and any pleas from Delhi to Colombo on behalf of the stateless Tamils have to be phrased cautiously, lest the hapless million should suffer at the hands of Sinhalese enraged by signs of interference from India. Some of the plantation Tamils are now being wooed by envoys from the Federal party, which represents the Ceylon Tamils of the north and east. The tea workers' more cautious leaders have warned their people against getting involved with the Federalists, who have their own bitter quarrel with the Bandaranaike government. Similar warnings have come from Madras. But it will ultimately depend on the Ceylon government itself whether the stateless community is driven into the ranks of its declared opponents. It cannot be simply relegated to a kind of political limbo.

REHABILITATION

Steps against Steps

SOME of the thought which is being given to proper housing for the disabled is apparent from an admirable exhibition currently running in London, sponsored jointly by the Central Council for the Care of Cripples and the Royal Society of Health. But even if homes can be adapted, the inaccessibility of large numbers of public buildings and public transport remains a problem. A lot of trouble is taken by the health and rehabilitation services to get a person back to working capacity, but often all this is frustrated because of sheer physical obstacles. Can anything, sensibly, be done about this? Professor Nugent of Illinois University told a London audience this week that the answer was most definitely yes; he showed pictures of conveniently designed doors, lavatories, desks, cafeterias, telephones and, above all, ramps —short, long, straight and zig-zagged—as a result of which over two hundred severely, permanently, physically disabled students took full part last year in university life at Illinois. Old buildings have been modified, new ones built; all provide facilities designed to deviate as little as possible from what is normally accepted so that they can be used by everybody. There is no segregation of the halt and the blind—and none of the amendments, it is claimed, involved significant extra cost.

On the basis of research carried out under Professor Nugent's direction, approval has been given in the United States to standard specifications for buildings and facilities with the disabled in mind, and already five states have made them compulsory for new buildings financed out of state funds. There are no such standards in Britain, which is still far behind the United States—and Scandinavia—in its outlook on this matter. According to Professor Nugent, about one out of every seven persons has a permanent physical disability. Many disablements, however, must be only a manifestation of old age and, to look at the problem with hard economic eyes, the elimination of architectural barriers could probably do no more than add a half or, at most, one per cent to the numbers employed. Nevertheless, this possible addition is not to be sneezed at: after all, the growth forecast for Britain's working population over the next ten years is no more than 4 per cent.

COMMUNIST WORLD

A Setback for Peking

IN their joint communiqué issued in Belgrade on October 4th at the end of Mr Brezhnev's visit, the Soviet and Jugoslav presidents gave a remarkable demonstration of turning the other cheek when they declared it to be "intolerable" that communist China should still have no seat at the United Nations. They can, however, hardly have expected any thanks from Peking. Forced by their economic difficulties to back-pedal on the domestic front, the Chinese seem determined to assert themselves and their views in the rest of the communist world. Moscow's cordiality towards that arch-revisionist, Marshal Tito —who is to visit Russia before the end of the year—is likely to make them even more assertive. Relations between Peking and Belgrade have reached a new low, after the particularly violent attack on Jugoslavia by Marshal Chen Yi, the Chinese foreign minister, at the National Day parade in Peking on October 1st.

To Peking, the Soviet-Jugoslav rapprochement must be an irritation. The Jugoslavs may have been disappointed that they did not get a more hearty slap on the back from their Soviet guest than a reaffirmation of the joint Soviet-Jugoslav declaration of June, 1955, in which Mr Khrushchev acknowledged the Jugoslav road to socialism; but, for the Chinese, this reaffirmation was a definite snub. Moreover, it may lead to a greater diffusion of Jugoslav revisionist ideas throughout eastern Europe; a high-level Jugoslav delegation, led by Mr Bakaric, is now in Poland, while the Bulgarians, who have been noticeably wobbly in their attitude to the Jugoslavs, have sent a delegation to Belgrade to discuss closer economic co-operation.

When others have fled, the Albanians remain staunchly on the Chinese side. Their latest gimmick was to launch last Sunday, after some understandable delay, an Albanian-Soviet friendship month. The chief speaker at the opening ceremony declared that the friendship of the two peoples would not be broken by the "unprecedented outbursts and anti-Marxist activities of N. Khrushchev and his followers." Even worse, he dragged in repeated, complimentary references to Stalin. Moscow has not deigned either to send a delegation, or take any notice of this curious celebration.

ACCIDENT PREVENTION

Value for Money

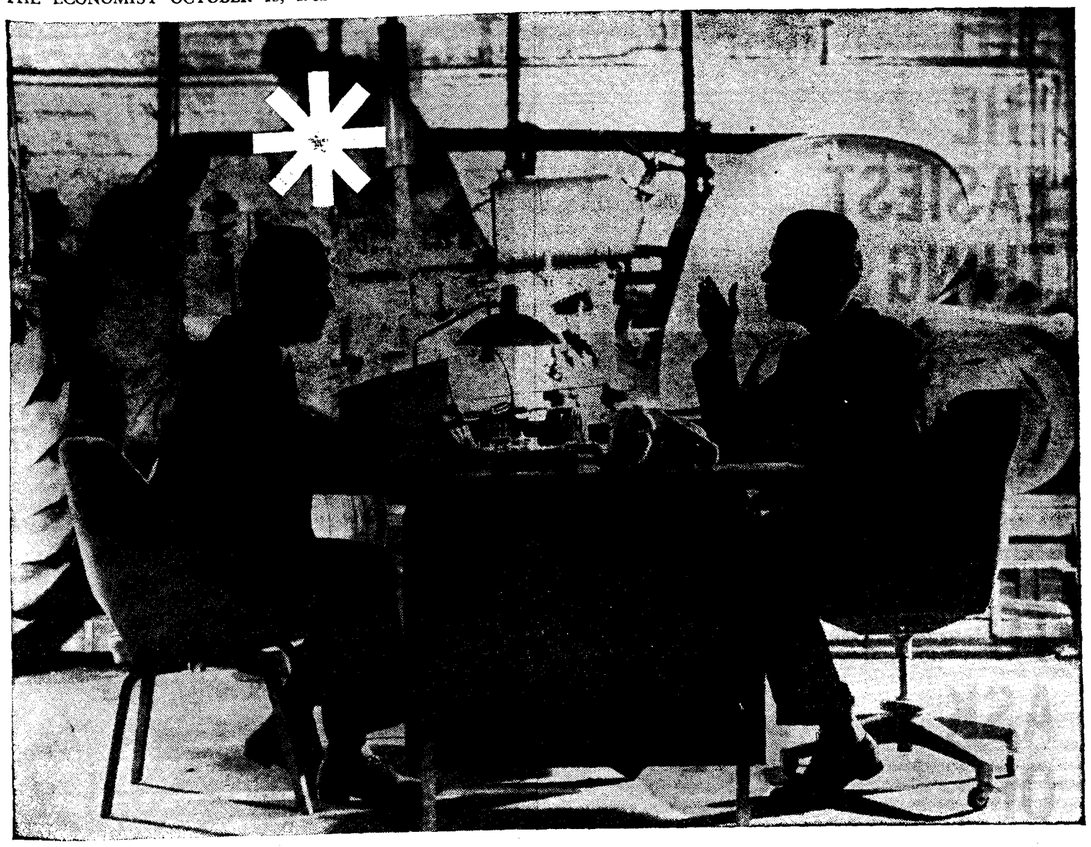
FOR the first time in its history, the Royal Society for the Prevention of Accidents has found itself with less money at the end of the year than it had at the beginning: its schemes of instruction and propaganda last financial year consumed all the £257,000 it secured by grant, subscription, the sale of posters and publications—and £23,000 from its reserves besides. (It spent another £119,000 in work for various central government agencies, but for this it was reimbursed directly.)

Has its work been effective? There is no doubt that matters have improved somewhat on the roads of Britain: road traffic has increased steadily at about 5 per cent a year, yet there was a fall of 3 per cent in the total of road casualties in the first seven months of this year from the already improved level of January to July, 1961; and there were 6 per cent fewer deaths. Several things have contributed to the improvement (notably a decrease in motor and pedal cycle traffic of about 16 per cent, and a consequent reduction of casualties among these classes of road user—13 per cent in total, and nearly 30 per cent in motor cycle deaths): RoSPA modestly hopes that its propaganda has been one of those things. Since a rough computation of the annual cost of road accidents to Britain produces the extraordinary answer that they probably cost £230 million a year in financial terms alone, everybody must share that hope—and hope, too, that the Ministry of Transport might try to test its validity by offering RoSPA more money in the motoring field (it now gives £10,000 a year).

Pious exhortation, however, is obviously not enough; perhaps RoSPA's best hope of success is in its practical training of the young, particularly the very young (25 per cent more children under five were killed in 1961 than in 1960). And with Government backing similar schemes to those designed for road training in schools might be developed for use in industry, for instance, where the accident rate among young people was 17 per cent up in 1961.

CORRECTION

The National Gallery was founded in 1824, not 1924, as misstated on page 30 of *The Economist* of October 6th.



EXPORT FINANCE? This *man has £1,000,000,000 to offer

Time was when the manufacturer who wished to export his products had to give credit himself—either borrowing for the purpose or using his own sometimes limited capital. But not any more. Today, he calls in the *man from the Amstel Club who arranges the credits his customer requires. He himself keeps his capital and receives immediate payment in full, allowing his exports to flow. The Amstel Club is a consortium of 13 leading financial institutions, with combined capital resources of £1,000,000,000 which provides specialised services in the field of export finance. There's a member in every country of 'The Six,' 'The Seven' and in the USA.

How the Amstel Club works. It's simplicity itself. If you want to sell capital goods abroad, you simply contact your national Amstel Club member. He immediately gets in touch with his fellow member in the country to which you wish to export and the credit required by your customer *is arranged in his own country.*

It costs you nothing. It is simple and quick. You are informed as soon as your customer's credit needs have been met, and you are free to ship your goods.

In the case of products normally sold on instalment credit terms—such as cars and consumer durables—the Amstel Club will work out a comprehensive stocking and retail instalment plan for your distributors or concessionaires.

Your Amstel Club member will be happy to discuss with you the various ways in which he can help. He has behind him the resources and experience of every member of the club. You will find his name below.

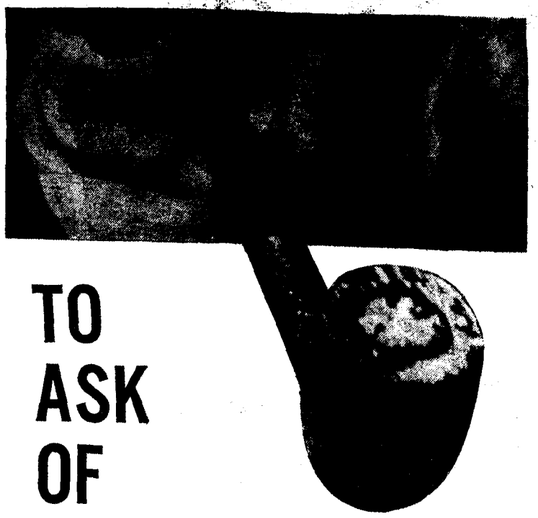
NOT THE EASIEST THING



TO ASK OF A MAN

Asking him to change his tobacco, that is. Take yourself. Probably smoked the same tobacco for years. Why change?
Well, Exmoor Hunt is one reason. A true mixture of great tobaccos. Impossible to describe. But a great pleasure to smoke.
You know, there aren't that many pleasures around these days. It seems a pity to miss one like this.

THE WORLD OVERSEAS

Beginners in Parliament

FROM OUR CANADIAN CORRESPONDENT

MR DIEFENBAKER'S government has survived four votes of confidence in the first ten days of the 25th Parliament, and most observers now expect it to last at least until next spring. Its survival depends on the votes of 26 parliamentary novices from Quebec and four from Alberta bearing the label of Social Credit. Why the Social Crediters are supporting the government so doggedly no one quite understands—least of all the Social Crediters, if one may judge by the contradictory statements of their spokesmen. In the opening debate on the address on October 1st, in reply to the Speech from the Throne, Mr Pearson, as leader of the major opposition party (with 100 Liberal seats against the government's 114) had the right of moving the first major amendment. He deliberately adopted the traditional form, regretting that " your excellency's advisers no longer command the confidence of this house," without specifying particular grievances which might have alienated either the 30 Social Credit members or the 18 members of the New Democratic Party. It fell to Social Credit, as the second largest party, to move the first sub-amendment ; and when the Social Credit leader, Mr Robert Thompson, announced its terms, the whole House dissolved into gales of laughter, led by Mr Diefenbaker himself. The Social Credit sub-amendment was bold enough to declare that the government lacked the confidence of the House because " it had failed to pursue economic and financial policies based on Social Credit principles." Having thus established a position which no other party could support, the Social Crediters registered their votes against the combined forces of the Conservative, Liberal and New Democratic parties, and then proceeded to support the government against an NDP sub-amendment which the Liberals supported, and against a Liberal amendment which the NDP supported.

As to why they did this, their spokesmen disagree. Their leader, Mr Thompson, acknowledged that their sub-amendment had been devised to make the Liberals support the government. Their number two man from Quebec, Dr Guy Marcoux, in the absence of M. Real Caouette, took the opposite view. He said the words " Social Credit " should have been taken out of the sub-amendment so that the Liberals could have supported it. It was all a mistake, he declared in the House, because the Social Credit members were still green.

In spite of these contradictions, or perhaps because of them, all the other parties now feel convinced that the Social Credit party will go on supporting the government simply because its wily leaders do not want an early election for which they have no funds. Mr Pearson, who carries increasing conviction in his expressed determination to beat the government as soon as possible, may yet trap the Social Credit vote with a motion involving their fundamental opposition to tight money. But the impression persists that they will wriggle out if they can.

Meanwhile, the sense of moral indignation, which has obviously been growing in Mr Pearson for several years past, has focused on Mr Diefenbaker's pre-election speeches up to and including his last telecast on June 14th, just four days before polling day and ten days before the announcement of emergency measures to save the fixed exchange rate of 92½ cents established on May 3rd. On June 14th Mr Diefenbaker assured Canadians that all was well with their economy and that devaluation would bring them a host of additional blessings. He gave no hint that the exchange rate was insecure, although most of the financial community and some newspapers were already openly discussing the crisis ahead. Mr Pearson's charge that this represented a deliberate fraud on the Canadian people evidently stung both Mr Diefenbaker and Mr Fleming, who was finance minister until his replacement in mid-August by Mr George Nowlan. They say that the run on the dollar was still unforeseen as late as the crucial day of June 14th, when Mr Diefenbaker made his last rosy telecast, and that it started to develop only on Friday, June 15th, and to reach crisis proportions in the following week. In support of this thesis, Mr Diefenbaker revealed partial details of exchange fund operations in June which are normally under statutory secrecy. He chose the date of his telecast, a Thursday, as a dividing line and revealed that exchange losses from June 1st to June 14th were $128 million. From June 15th until June 22nd (when emergency measures had already been promised) he said they came to $270 million.

These partial figures have already led to a Liberal demand for the complete disclosure of exchange losses day by day. This is unlikely to be granted, nor is it really necessary to the debate. The argument is essentially between the sophisticated, who well knew what would happen as soon as the election was over, and the unsophisticated, who may be impressed by Mr Diefenbaker's claim that the loss of confidence resulted from Liberal predictions of doom and would have been erased by a clear Conservative victory on June 18th. Mr Pearson now seems unlikely to let go of this promising election issue, though this week he switched the Liberal attack to import surcharges and the doubtful legal basis ingeniously devised by officials to replace the more normal Order-in-Council powers which Mr Diefenbaker had repealed in a grand political gesture.

THE debate about the past is unquestionably lively and may be useful. But it does not help to expedite the " positive and constructive programme " which Mr Diefenbaker has promised and has left Mr George Nowlan to define. Present signs suggest that Mr Nowlan, with influential backing from Senator Wallace McCutcheon and the business-orientated trade minister, Mr George Hees, may have a new budget policy which deserves to be called constructive. But he is obviously in no hurry to produce it in the midst of these turbulent political arguments. He appears to be reserving his fire until both his friends and his enemies have tired of their sharpshooting and he may have some chance of putting in a shot where it can do most good.

For the next six months or so, Canada's credit rating should not depend primarily on parliamentary skirmishing. Far more important will be Mr Nowlan's failure or success in winning cabinet support for comprehensive fiscal and economic policies which may transcend the vote-getting proclivities of some of his most influential colleagues. Mr Nowlan, unlike his predecessor, is a man who can compromise without capitulating. He knows where he wants to go and, unlike Mr Fleming, is ingenious in finding ways around any obstacle. If the Diefenbaker government survives the winter, as now seems likely, Canada's foreign credit rating will largely depend on what Mr Nowlan can do with his colleagues.

Yemeni Outlook

FROM OUR SPECIAL CORRESPONDENT LATELY IN YEMEN

THE fighting on the borders of Yemen, now admitted by Brigadier Abdulla Sallal, the Yemeni prime minister, may or may not be important. According to refugee royalist sources, it is concentrated in the Marib area facing the British protectorate of Baihan and in the region vaguely called "the north." Marib is the ancient capital of the Sabaan rulers and the site of the famous

Meeting the press: Brig Sallal (right) and Dr Baidhani.

dam which fell into disrepair in the pre-Muslim era ; Baihan is the domain of Sharif Husain, minister of the interior in the government of the South Arabian federation and a strong supporter of the royalist cause. Husain has said he has no doubt that Prince Hassan will succeed in asserting his rights, or possibly those of Imam Muhammad Badr in the event of the latter emerging from the predicament in which he now finds himself.

The frontier district between Yemen and Baihan is part mountainous, part desert, suitable only for operations by mobile, lightly armed tribesmen—and, of course, aircraft of which the Sanaa government has the monopoly. The northern frontier with Saudi Arabia is equally, if not more, difficult. No one should know this better than King Saud, who led the Saudi forces in this area when his father attacked Yemen in 1934. While his younger brother, Faisal, swept all before him in his drive along the coastal plain and seized Hodeida, Saud's offensive stalled in the mountains. The royalist cause, therefore, is likely to make little progress unless the Yemeni tribesmen in the area rise in force, while the absence of movement in the coastal plain suggests that King Saud has not yet decided on full-scale intervention.

The coastal plain of Tihama is, indeed, the only region in which a major offensive is feasible. It is inhabited by Sunni Muslims of the Shafei sect who are traditionally hostile to the Shia Zaidis of the highlands, co-religionists of the Imam. They welcomed the Saudi forces when they attacked the Zaidi Imam, but are unlikely to do so now that a revolutionary regime has replaced the imamate. Another factor that might deter King Saud from overt hostilities is the spectacular defection of two Saudi aircraft to the United Arab Republic while on a mission to deliver arms to the royalists in Yemen, and of a few Saudi officers stationed in Asir, the Saudi province on Yemen's northwest border.

All the Arab republics, except Iraq, have recognised the new government in Sanaa. According to both Abdulla Sallal and Abdul Rahman Baidhani, the deputy prime minister, minister of economy and senior civilian in the cabinet (he obtained a doctorate in economics at Bonn University on the side while serving five years as Yemeni minister to west Germany), General Qasim is waiting to see what attitude the Sanaa government will take on the Kuwait issue. Both the prime minister and his deputy are emphatic that the Yemen is in no shape to take sides in inter-Arab disputes and is prepared to let matters take their course. Their standpoint, they say, is comparable to that of Algeria, which in its concentrated struggle for independence refused to dissipate its energies in Arab feuds.

The same caution is discernible in Sanaa's approach to the problem of Aden and the protectorates. Baidhani, while appreciating the eagerness of the Yemenis in Aden to rejoin their homeland, is firmly opposed for the time being to foreign adventure. He hopes that friendly negotiation with the British will be possible when the revolutionary government has established itself and obliterated all traces of the imamate. "Why fight when we can negotiate ?" The more sophisticated Yemeni nationalists in Aden accept this situation, though their rank and file may not take an equally philosophical attitude.

In Sanaa's view, Jordan and Saudi Arabia are committed to a hostile attitude, but the leading figures in the Yemeni government believe that the kingdoms of Morocco and Libya will accord recognition after a decent interval to mark their disapproval in principle of regicide. They suspect that the opposition to the regime in the south is nourished from across the border. So far as the British colonial authorities are concerned, this suspicion is groundless, though the same cannot be said of the ultra-conservative rulers of some protectorates. Although they nominally take British advice in all matters affecting foreign policy, there is nothing to prevent them from slipping arms and men across the open frontier. For this reason alone, the revolutionary government is anxious to secure western, and specifically British, recognition. Failing that recognition, the Sanaa government must rely heavily on Cairo and, to a lesser extent, on communist support. Egyptian officers and men in smart fatigue dress have arrived in Sanaa ; their number is obviously kept secret, but Saudi allegations that "thousands" are already in Yemen can be safely dismissed.

Brigadier Sallal insists that they are instructors and technicians only, but some carry heavy kit which suggests that their duties are more directly connected with the defence of the revolution. That is not all. The Sanaa government has asked Egypt for 52 experienced civil servants to help Yemen to create an administration—a modern invention virtually unknown in the imamate. It has also asked for, oddly enough, exactly the same number of Egyptian school-teachers and eight high school experts to study university problems in the Yemen.

After the revolution.

Whatever the situation in outlying areas may be, the two capitals of Sanaa and Taiz appear to support the revolution by an overwhelming majority. Within hours of the proclamation of the republic, a new flag appeared on buildings, vehicles and camels with a horizontal green band replacing the dreaded sword of the imamate. Portraits of Brigadier Sallal and President Nasser side by side are seen everywhere both in the Yemen and Aden (the Aden government is one of the few in the Middle East which permits the free display of President Nasser's smiling features, and people take full advantage of it). The flag was hastily improvised, like everything else in Yemen, and has now been replaced by an official one with horizontal bands of red, white and black and a green star. It is identical with the Egyptian and Syrian flags, except that Egypt has two stars and Syria three. Thus Yemen has chosen the emblem that is proudly symbolic of the country's alignment with modern trends of Arab nationalism. But Brigadier Sallal is well aware that he has far to go before aspiration becomes reality.

Back in the Market Place

FROM OUR CORRESPONDENT IN BRUSSELS

MR HEATH'S report on the Commonwealth conference was the chief feature of last Monday's meeting in Brussels when the common market negotiations were resumed with the ministers of the Six—more accurately, with some of them. The French foreign minister, M. Couve de Murville, was paying one of his rare visits to the UN General Assembly ; Dr Luns, the Dutch foreign minister and present chairman of the negotiations, was in the same place. Without Dr Luns's forceful presence, the session got off to a quiet start, very unlike the excitements and alarums of the last meeting before the summer recess.

If the Six had wondered whether Mr Heath might now feel the presence of critics, such as Mr Gaitskell, peering over his shoulder, they must have had their answer within the first hour. Mr Heath, by all accounts, has never appeared more master of himself, of his brief or of his audience, seen or unseen, since his epoch-making initial speech in Paris just a year ago. Two points stood out ; one was Mr Heath's desire not to shut the door of association, or of some alternative to association, on those African countries which *prima facie* have rejected it—Ghana, Nigeria and Tanganyika. The other was his request that the misgivings of India and Pakistan about the solution provisionally agreed in the summer should be sympathetically considered.

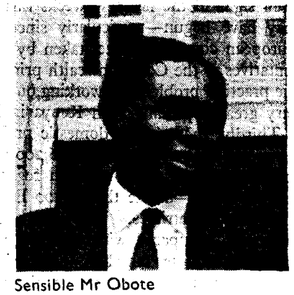
In July and August it was proposed that comprehensive trade agreements should be reached by 1967 between the enlarged European Economic Community and these Asian countries, and that from the date of its entry Britain should begin edging gently towards the common external tariff. India and Pakistan, said Mr Heath, were impressed by the offer of trade agreements but wanted negotiations for them to begin as soon as Britain joined. This should raise no great problems. The Six, however, may have more hesitation about the second Indian and Pakistani request, that Britain should make no move towards the Community tariff before the trade agreements are concluded. Mr Heath did not formally ask for a reopening of negotiations on this point, but merely for a declaration by the Community that tariffs should be suspended for a reasonable period while comprehensive agreements were being worked out.

Mr Heath stressed that the desire of the developing countries of the Commonwealth to benefit from an expansion of world trade was shared by Australia, New Zealand and Canada, which also feared that the common market might grow more self-sufficient with its own success. In his reply, the Dutch chairman made it clear that the Community aimed at an expansion of world trade. He also pointed out that the EEC tariff had been lowered and that Community trade with the outside world had increased. Among themselves, the Six feel confident that given a little time they can resolve the dilemma of liberalising their trade without losing the cohesiveness that is essential to their enterprise—a dilemma that Britain's application has forced them to face very early in their joint history.

The requests of the Asian countries, with the question of zero duties and the outstanding problems of British agriculture, will be discussed at the next ministerial meeting fixed for October 25th. Further three-day sessions are planned for November and December with the possibility of two additional ones before the end of the year. The Six, like Britain, seem to want to push on and get the long uncertainties resolved. Inevitably, there will be storms ahead—for instance, over agriculture and over the European Free Trade Association. But as warm autumn weather welcomed the delegates back to Brussels this week it looked as if there might be an Indian summer after all.

Looking for Uganda

FROM OUR CORRESPONDENT IN KAMPALA



Sensible Mr Obote

A NATIONAL balance-sheet for Uganda, which became independent on Tuesday, shows credits outweighing debits—but only just. After sixty-eight years of British rule, independence has been achieved painlessly: no Uganda leader is a prison graduate, though some have gone through exile, either abroad or in the remoter parts of the country. Lack of a convincing enemy has made it difficult for Uganda to achieve the necessary minimum of national unity. The grip of local loyalties is still strong ; only five weeks before independence day yet another minor secession movement sprang up, when Bamba and Bakonjo tribesmen living on the slopes of the Ruwenzori Mountains in western Uganda demanded their own district, separate from the kingdom of Toro in which they are now included.

Uganda's constitution has already had to provide scope for the fiercely individualistic ambitions of four tribal kingdoms and twelve districts. The solution adopted is for Buganda and the other three kingdoms, plus the territory of Busoga, to have a federal relationship with the central government—"federal" being rather narrowly interpreted so that the powers devolved from the central government are not very extensive. The positions of the traditional rulers and their governments in the federal areas are guaranteed, but sufficient power remains with the central government, which controls the security forces and most revenue, to run the country.

Political stability has been achieved by means of an alliance between the Uganda People's Congress (originally an anti-Buganda party) and Kabaka Yekka (an almost all-inclusive Baganda movement). In April this year these two parties won Uganda's second general election and Mr A. M. Obote became prime minister at the head of a coalition government. The present party strengths in Parliament are: UPC, 44 and KY, 23 ; and the opposition Democratic party, 24. The coalition has held together remarkably well, and it is even possible that if a split should now develop inside the Kabaka Yekka—as it might, between nationalists and neo-traditionalists—Mr Obote could draw a good number of Baganda MPs into the UPC, and so preserve the association of Buganda with his government. The prime minister has also managed to stifle the "lost counties" dispute between the kingdoms of Buganda and Bunyoro, which six months ago appeared to threaten a Congo-situation in Uganda. Yet one wonders whether, in the excitement of winning these tactical victories, Mr Obote has had time to plan his long-term strategy.

Three diverse examples indicate the importance of unresolved problems. The explosive issue of Uganda's head of state has been shelved. The Queen is Queen of Uganda still and the last British

Governor, Sir Walter Coutts, has become Governor-General. This is presumably a temporary expedient, and rumour strongly suggests that Mr Obote contemplates the appointment of the Kabaka of Buganda as governor-general, or even head of state. This would please the Baganda, but it would have to be very skilfully put across to the rest of the country, and there would need to be a careful separation of the roles of Kabaka of Buganda and head of Uganda.

Another long-term problem is that of Uganda's attitude towards East African federation and towards the wider world. There have been signs in the last few weeks that progress towards federation may have begun—particularly since the joint stand against the European common market taken by the three East African representatives at the Commonwealth prime ministers' conference. But the practical problems of working out a federal arrangement remain very great, especially with Kenya in its present condition.

Thirdly, there is the domestic problem presented by Uganda's Asian population. There are 76,200 Indians, Pakistanis and Goans in Uganda, and many of them regard the country as their permanent home—unlike the 11,700 Europeans, who think of themselves as expatriates. The Asian community is not all that numerous, compared with 6½ million Africans, but it occupies a key position—its members predominate in commerce and are conspicuous in the professions, the middle ranks of government service and the skilled artisan class. Remembering the anti-Asian trade boycott in Buganda in 1959-60, and observing what treatment the Asians in Tanganyika have received, Uganda's Asians are afraid for their future. They have been partially reassured by a fairly liberal citizenship law, and by the government's recent adoption of the term "Ugandanisation" in place of "Africanisation." But Uganda's African politicians have not yet faced up to the prospect of integrating the Asians into an African country, nor have they decided just how much political power this economically important community can be allowed to enjoy.

MANY big economic problems lie ahead of independent Uganda. Economic expansion in recent years has been offset by unfavourable world prices for cotton and coffee, and by the insidious growth of population at a rate of 2.5 per cent a year. As a result, per capita income remains lower than £23. The World Bank Report on Uganda in 1961 emphasised the need to increase and diversify agricultural production; and a more recent survey suggests that Uganda has an industrial future too—if it concentrates on processing local raw materials and sells its goods in the big African market surrounding Lake Victoria, thus overcoming the disadvantage of being so far from the sea.

Development prospects depend, of course, upon elusive finance. Uganda has received from Britain a going-away present of loans and gifts totalling over £6.5 million in the period to mid-1964, together with substantial aid for paying civil service compensation, pensions and expatriate allowances up to 1966. But when this and all other sources of finance have been taken into account, there is still a gap of about £22 million to be bridged before the finance for the World Bank's £54 million development plan is found. Nor is the problem simply that of financing development—it is also that of galvanising the population into profitable economic activity. Too many peasant farmers are still content with a standard of living a little above subsistence level. It will obviously take time to change social patterns that inhibit economic progress. In this connection it is worth mentioning that though Uganda spends 27 per cent of its budget on education, only seven children in every 1,000 of secondary school age are actually at school.

Altogether, Uganda's economic targets look harder to attain even than continued political stability. Mr Obote is a notably sensible politician, but he will have an almost superhuman task if he is to achieve the welfare state that he has promised the people of Uganda, and he may not have counted its political cost.

Break-up in Kerala

FROM OUR CORRESPONDENT IN INDIA

THE resignation last Sunday of the two remaining Praja Socialist ministers from the Kerala cabinet marked the final collapse of the anti-communist front in India's south-western state. The coalition had limped along since the surprise resignation on September 25th of the Praja Socialist chief minister, Pattom Thanu Pillai. Now the Congress party is on its own, several members short of an absolute majority in the state assembly, though in little danger of defeat.

The chief minister's removal was a stunning, if not particularly creditable, piece of political fixing by Congress. The 77-year-old Praja Socialist had been chief minister of Kerala since the 1960 state elections, when the Communists were defeated by a joint front of Congress, Praja Socialists, and the Muslim League. The previous Communist government, elected in 1957, had been dismissed in the wake of a civil disobedience agitation, partly popular, partly stage-managed, in 1959. Presidential rule was imposed, and at the ensuing elections, the Communists won less than a quarter of the assembly seats.

The first break in the three-party coalition came last autumn, when the Muslim League was pushed out by Congress as being a communal party. That left some fifteen Praja Socialists allied with 62 Congressmen in an assembly totalling 127. By midsummer these two parties were already at loggerheads, notably over refusal of permission to open private, that is, church managed, primary schools. (The Praja Socialists are dominated by the Nair community of Hindus.) Mr Pattom's Congress colleagues hotly resented his autocratic ways, and understandably began to feel that the tail was wagging the dog.

The home minister, Mr Lal Bahadur Shastri, was sent from Delhi to unravel the Kerala tangle. Declaring that the coalition would stand, he set out to undermine it. The first price Mr Pattom asked for his own resignation was a place in the national cabinet. Reluctantly convinced that there was no place there for an elderly Praja Socialist, even under a new party label, he settled for the governorship of the Punjab. A central cabinet minister who had already been named for this post conveniently discovered an unwillingness to quit active politics. Without a by-your-leave to the Kerala Praja Socialists or the national leadership of his party, Mr Pattom was appointed.

The deal stunned and infuriated the Praja Socialists. Their leader, Mr Asoka Mehta, spoke of a breach of faith. Their national executive, meeting last Sunday, denounced the abuse of the presidential power of appointment and "facile disregard of healthy democratic practices". "Denuded of its consent and trust, the coalition in Kerala has ceased to be a reality," they said, and pulled their men out.

The new Congress ministry, strengthened by the hasty return of nine members who were being morally rearmed at Caux in Switzerland when the crisis broke, can probably survive. Some independents and Praja Socialist members are expected to defect to it. The Praja Socialist party has promised "responsive co-operation," and did not support a Communist no-confidence motion on Wednesday.

But the deal raises two issues. First, just how far can Congress decently go in using presidential patronage to nobble its opponents? Second, and more important, what about communism in Kerala? The failure of the coalition marks also the failure of the attempt to defeat the Communists by groupings formed solely for that purpose. The Communists' strength in the assembly was slashed in the 1960 elections, but their share of the popular vote actually rose, to almost 40 per cent. The national parliamentary elections this year suggested a further increase of support in Kerala for Communist or Communist-supported candidates. Assuming it can last its full term, the Congress government has only two and a half years to prove itself a better choice.

Between Brezhnev and the Six

FROM OUR SPECIAL CORRESPONDENT

AN uninformed tourist arriving last week in Belgrade might have been surprised to find himself greeted by red flags with the hammer and sickle all the way from the modern airport, past the tall buildings of the new city, right up to the centre of the old town. But the Russian flags were not in celebration of any startling realignment between Jugoslavia and the Soviet Union, but simply in honour of the Soviet president, Mr Brezhnev, who was returning the visit that Marshal Tito had made to the Soviet Union in 1955. This long-delayed return visit has in the end been paid at an interesting time, when Belgrade is perturbed by the prospect of the growing economic division of Europe. And on September 26th, two days after his arrival, the United States Congress amended the foreign trade bill in such a way as to deprive Jugoslavia (as well as Poland) of most favoured nation treatment. Indignant Jugoslav officials were quick to point out that the United States was thus unilaterally abrogating one of its oldest treaties (it had been signed with Serbia in 1881). Privately, they added that from Mr Brezhnev's point of view, Washington could not have invented a better send-off for his Jugoslav journey.

President Brezhnev went back to Russia on October 4th, and the red flags were taken down. The final communique spoke of the "major contribution" that had been made to Soviet-Jugoslav relations, but one suspects all the same that both sides may have been a little disappointed. Mr Brezhnev did not push the Jugoslavs into any closer alignment on international issues; the Jugoslavs did not extract any warmer blessing for their form of socialism. In short, the visit produced no startling change in Jugoslavia's position.

That position is less likely to be affected in a spectacular way by the speeches of important visitors than by the slower and more prosaic working of economic forces. With internal economic difficulties and three bad harvests in succession, with heavy foreign debts and an unfavourable balance of payments, with ambitious plans for the expansion of exports in order to wipe out trade deficits, the Jugoslavs are naturally perturbed by Europe's dual economic integration. They would like to solve their problem by increased trade with the uncommitted world, but realise that this is not a practical solution for quite a time to come. Last year nearly 46 per cent of Jugoslavia's exports went to Western Europe, and more than 30 per cent to the Soviet block. With the United States accounting for nearly 8 per cent, the share of the rest of the world was limited to a mere 16 per cent. In imports, the western share was even bigger (western Europe together with the United States accounted for more than 70 per cent of total shipments to Jugoslavia). No wonder that the question of how an uncommitted economy can survive in Europe between the common market and the Council for Mutual Economic Aid (Comecon) is hotly, if rather vaguely, debated in Belgrade.

The main preoccupation is with the common market. Just how big is it going to be? How quickly, and with what strictness, will the Rome Treaty be implemented? The Jugoslav equation depends on answers to these and similar questions. When outlining their foreign trade programme for 1965, the planners are anticipating losses and difficulties in west European markets not only for their foodstuffs (mainly meat and canned foods) but also for such industrial goods as furniture, textiles and the products of the electrical and metal processing industries. Their tactics will be changed according to the course of events. For the moment, it is hoped to overcome some difficulties by bilateral deals with important trade partners like Italy. An approach to Brussels is also envisaged at some stage, not to seek membership or association, but to see whether some awkward provisions cannot be altered. The hopes are not too sanguine, since it is generally believed that an exclusive club involves privileges for members only.

Blunders in Brussels, or in Washington, may provide Mr Khrushchev with an opportunity. In Belgrade one hears two complaints about trade with Russia. One is that Jugoslavia is given only second-rate treatment, priority being reserved for Comecon members and hard-currency western countries. The second is that the Russians sometimes "tie" their exports, selling scarce commodities only if other items are included in the bargain. But the Jugoslavs do not seem worried by the prospect of increased economic difficulties with the Soviet block. In the past they have made unsuccessful soundings with the object of getting observers admitted to Comecon meetings. Now there is apparently a possibility that they may be allowed seats on some of the Comecon committees. This, if it proved true, would be specially significant just now when the Soviet block is speeding up its economic integration. Increased sales resistance in western Europe might thus eventually lead to a shift in the balance of Jugoslav trade.

But the situation should not be over-dramatised. The numerous little Fiat 600s—which are produced under Italian licence and are the dream of every Jugoslav with a little money saved up—are a reminder of the extent to which the Jugoslav economy is geared to the western markets and dependent on western supplies of equipment. Besides, it cannot seriously be argued that the country's current difficulties are the result of European integration. The succession of bad harvests has made the problem of food imports a more urgent matter than the problem of putting more life into the export trade. The deflationary measures and the export drive are apparently yielding results in industry. This year's exports are expected to be 17 per cent higher than in 1961. Though the biggest increase is in exports to under-developed countries, shipments to western Europe have been rising faster than to the Soviet block. It is only when they are contemplating the more distant future that the Jugoslav planners foresee, short of an accommodation with the common market, a substantial shift in their country's pattern of trade. And they need not be Marxists to assume that such an economic change might have political consequences. Jugoslavia reminds the newcomer now of Poland, now of Italy. A country can be both Slav and Mediterranean. But can it also stay uncommitted in an increasingly divided Europe? This is harder.

Clash Over Latin in Italy

FROM A CORRESPONDENT IN ITALY

OF any language, dead or alive, Latin is probably the most liable to be judged on its associations rather than its own exact qualities. One of its associations is certainly class—the power to set apart a man who knows it—and just how strong the feeling of class remains in Italy was shown during the final stages in the Senate last month of the conflict between the Christian Democrats and their Socialist allies on whether Latin should be taught in the new secondary schools. The inevitable compromise ended a clash of principles which was beginning to look embarrassingly like a political argument, conducted in one ancient and one modern language with neither side able to grasp what the other meant.

The controversy arose out of the government's bill to introduce the new type of state secondary school which children will be obliged to attend until they are fourteen. Since 1947 the Constitution has enshrined the principle of compulsory education up to

the age of 14 for all children, but no law has yet come into force applying this aspiration in practice. The existing system for providing compulsory education ends when a child finishes the fifth class of the elementary school, as a rule at the age of eleven. There is no need for him to continue—or, indeed, as far as sanctions go, even to arrive at that stage. If he goes on to post-elementary schooling he either enters an ordinary secondary school or goes to another form of state school where the training is more technical. In the education bill the two types of institution are amalgamated in general post-elementary schools at which children will be obliged to remain until they are fourteen. Those who mean to go on to higher education will need Latin, and the quarrel in the Senate was at what point the teaching of Latin should begin. The Socialists maintained that no Latin of any kind, compulsory or optional, should be taught during the three obligatory years of secondary schooling; they were backed by the lay Left and the Communists. The Christian Democrats—particularly their right-wing—wanted Latin to be compulsory, or at least optional. They were backed by the Right, including the neo-fascists.

The Socialists claimed to detect a danger of discrimination. A working-class child would have little chance of higher education because its parents could not afford it. If Latin were obligatory it would waste much of the working-class child's time which could better be spent on more useful subjects. If optional, the children from prosperous homes would choose to start it at once because they expected to go on to a university and a career. Latin, in other words, would stamp the class-rooms with the mark of class differences. It could easily be regarded as the language of the rulers—not for the first time in its history but just when the experimental left-of-centre government is attempting to show a break with the old ways. Latin is also the language of the priests. The Socialists made quite clear that they suspected clerical pressure on the Christian Democrats. In fact even left-wing Christian Democrats could be heard to say that their more conservative colleagues were pressing for the retention of Latin because they thought it would please the Pope.

THEY also knew that it would embarrass their Socialist allies, another attractive prospect for the right-wing of the Christian Democrats who are far from being convinced that the present centre-left government experiment should be allowed to continue. Some obviously sincere arguments were also put forward that Latin was a help in the formation of character and that all that was really necessary was a reform of the way in which it was taught. The right wing also alleged that the Socialists' fears showed that Marxists and Roman Catholics can never effectively unite. The Socialists claimed that their real object was to let some fresh air into the ancient—and admittedly failing—system. They also pointed out that the country suffered from having far too many people seeking to enter the professions and far too few technicians and scientists. They were in favour of introducing another course, which could lead to a university degree and would be based entirely on modern studies. As far as the government's bill was concerned they threatened to vote against the whole measure if the article retaining Latin was left as it stood.

The importance of not knowing Latin had passed beyond an academic difference of opinion to a revelation of the wide difference in approach over a broader field between the two coalition partners. Those who supported the bill appeared, in the eyes of their opponents, to be rapidly reassuming their clerical and hopelessly reactionary qualities; those who opposed the bill were, in the view of their opponents, no better than Communists. It gave the measure of the uneasiness of the coalition. It also showed that in a country where society is swiftly changing and ordinary life adopting more modern aspects, the strength of tradition and of conservatism at the political level is remarkably resilient. Both sides were inclined to expand their factual objections into statements of full metaphysical systems, but on the whole it is difficult not to allow a good deal of weight to the Socialist view.

Left-wing and much independent opinion urged that the government should courageously sweep away Latin until the three years of obligatory post-elementary schooling were over. The conservatives and extreme right remained firm. Surprisingly, a compromise was found. For the first year there would be no Latin. Some elements of Latin would be introduced into Italian lessons during the second year in order to give the pupil "a first idea of the affinities and the differences between the two languages." In the third year it would be a fully fledged but optional subject.

The Right was disgusted; "the language of civilisation," observed the neo-fascist press, had been "repudiated." Some of the government's customary supporters struck shocked attitudes; the Rome newspaper *Il Messaggero* suspected a "grievous lack of principles" in educational policy. The Communists shrugged off the compromise as confused and complicated; better rather to have left the original proposal which, if nothing else, had the virtue of clarity. A Liberal senator lamented, in the final meeting of the commission before the compromise went to the Senate, that "no one would now be able to decline *rosa, rosae,* etc" an observation which no doubt will turn out to be quite accurate. At least the Christian Democrats and Socialists had agreed. But the quarrel had shown that without much difficulty they could behave as though they were worlds apart. Of the two, the Socialists possessed rather more of the Latin virtue of clarity; they certainly made certain that the size of the real problem—the fact that more than 800,000 children between the ages of 6 and 14 attend no school at all—was brought to the public eye.

SUBSCRIPTIONS TO THE ECONOMIST

Annual Postal Subscription by ordinary mail, UK and Canada £4 . 10; elsewhere overseas £5

By air see below

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either no available or not recommended.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

New Slums for Old?

WASHINGTON, DC

In the elections to be held in November, it will be more than ever necessary for political candidates outside the South to take some sort of public stand on the question of racial segregation and to propose methods of combating it. The increasing importance of the Negro vote cannot be ignored. But because of what has happened in Mississippi, President Kennedy may put off until after the elections the fulfilment of the promise he made as a candidate in 1960. This was to issue an executive order that by a stroke of the pen would bring the end of racial discrimination in all federal housing programmes, including private housing which receives federal assistance. The President has been chided frequently for his delay in fulfilling this promise. But some nervous Democratic candidates are said to be begging for a further postponement, to give the South time to cool off.

Earlier this year the National Association of Home Builders warned the White House that an official ban on racial discrimination in housing which received federal aid would cut $6 billion a year off the private funds going into construction. This attempt to play the fat boy and make the President's flesh creep might have been more effective but for his knowledge that thirteen states and thirty-four municipalities already prohibit racial discrimination in urban renewal projects and publicly-assisted housing developments. Nine of those states also prohibit it in private housing that is not assisted.

The extremely rapid growth of suburbs after the war was stimulated immensely by federal loans and guarantees but few if any of the fifteen million suburban homes built since 1945 are available for Negro occupation. The *Washington Post* recently accused the federal government of being the indispensable partner of residential segregation. Washington, DC, with its environs poses the dilemma in its most extreme form. The plight of Negroes in the area round the capital is underscored by the steps taken by the Department of State on behalf of African and Asian diplomats. Such diplomats find it difficult to obtain accommodation because of their colour; the State Department recently said that only nine out of over two hundred blocks of flats would accept them. One excuse given is that if coloured diplomats were accepted, American Negroes would seek to get a foot in the door. Some Africans and Asians have been requested to "wear native costume," so as not to be mistaken for Americans.

About half of the two million people in subsidised public housing in the United States are Negroes. But neither Negroes nor other Americans look on public housing as the main solution of the country's housing problem. In the land of opportunity, there is marked reluctance to remain longer than is absolutely unavoidable in housing that is stamped as "low-income." The programme for the provision of subsidised public housing began twenty-five years ago. There are now about half a million subsidised dwelling units, mostly flats, and there are plans for another 160,000 such units. Meanwhile, however, fourteen or fifteen million Americans are still living in dilapidated "sub-standard" private housing. The hope is that in time they will be shifted to improved private housing.

There is a close and growing connection between urban renewal —which in practice often amounts to no more than slum clearance —and racial integration. Full-blown segregation exists only in the South, but Negroes in northern cities live for the most part in what are virtually ghettoes. The massive migration of Negroes from South to North has swollen these ghettoes and has also speeded up the flight of whites from the cities into the suburbs. This flight has several roots, but its most striking fruit has been the determined founding of new communities of homogeneous "all-right"—and all-white—residents.

Flight from old to new environments is nothing new in America. On the contrary, it has been the prevalent pattern. Americans are natural nomads. And what has frequently precipitated flight has been a strong desire to get away from new and unwelcome neighbours. The clearest case, perhaps, is Boston, where the Protestants fled from the Irish immigrants, the Irish from the Italians and the Italians from the Greeks and Poles. Hitherto, however, the middle-class vacuum caused by the departure of one group has been filled quickly by the latest arrivals simply becoming a new home-owning class themselves. But residential segregation is preventing the most recent newcomers to the cities from becoming the latest home-owning middle-class because they are Negroes.

Urban renewal also confronts other problems. Land that has been cleared of slums, usually at vast expense, is sold to private developers who may build luxury flats and office buildings; these please city governments by yielding higher rates but they do not help the ejected slum-dwellers. Moreover, as a well-informed trio* has just pointed out, some local agencies obtain federal funds for one urban renewal project, then move on towards the same objective in a second, third and fourth project, meantime setting the first one aside because of lack of staff—or will—to carry it out. A third problem is the need for some control over the dispersal which has occurred and which continues to do so. The successive flights of the middle-class from Boston, for example, led to the creation of forty incorporated municipalities—with

Can you make the mileage shorter and sweeter too?

Yes! By Aer Lingus—Irish International Airlines. Catching a transatlantic jet need not mean hours of cross country journeying in the wrong direction. Aer Lingus flies *direct* from the major airport nearest you, to connect at Dublin with the daily Boeing jet to New York and Boston.

Not only is this far more practical, it is also more of a pleasure. *At Dublin* take a breath of fresh air, and enjoy a meal in the most famous airport restaurant in Europe. *At Shannon* stop off at the Duty Free shopping centre. Here the nicest things from Ireland and the rest of the world are all gathered under one roof and sold for a song. *In the air* you will discover that the Golden Shamrock menu and wine list are the finest that ever got off the ground.

Your travel agent will give you full details of all Aer Lingus services from the airports listed here, and of the connecting flights to New York or Boston.

Check your home town against this list of Aer Lingus take-off points in Britain.

A decision to do business abroad

President on the Stump

CONGRESS has not stayed in Washington so long in an election year since 1942, though what was holding up adjournment this week was not any matter of national concern but a peanut laboratory for Georgia, a dam somewhere else—in short the "pork barrel" out of which come the tidbits that members like to bring home to their constituents. Democratic members, moreover, had the consolation that the President was already hard at work on their behalf and that he means to spend every weekend until the election on the campaign trail. No other President has ever made so strenuous an effort to reach the voters in an off-year election (when he himself is not standing).

The obvious reason for Mr Kennedy's weekend forays is that he needs more Democrats in Congress—more progressive Kennedy Democrats—if his domestic programme is not to be ham-strung for two more years. Normally the party in power in Washington loses seats at the mid-term election and this is particularly true of the Democrats. They are in the majority throughout the country but they fall into apathy more easily than the more highly disciplined, better educated and richer Republicans. It was no mere coincidence that brought Mr Kennedy to Michigan for the last days of the Democrats' drive to get their members to register. To convince the voters that even in a non-presidential year a great deal is at stake the President has been attacking the Republicans as the party which says "no" to progress; as the party which is obstructing faster economic growth; and as the party which countenanced stagnation and do-nothingism for eight years. This has touched General Eisenhower to the quick, as it was, perhaps, meant to do; his attacks on the President's "callow youth" have provided the campaign with its first real drama.

The states where Mr Kennedy is campaigning show, however, that he has the presidential election of 1964 in mind as well as next month's congressional races. On his visiting list are the three where his possible rivals two years from now are standing for Governor: Mr Romney in Michigan, Mr Rockefeller in New York, Mr Nixon in California. But the President is also campaigning in most of the other big states where a Governorship is at stake, such as Pennsylvania, Ohio and Minnesota. Massachusetts is an exception but there there may already be a surfeit of Kennedys. Evidently the Administration fears that Mr Kennedy's re-election in 1964 may be imperilled if the Republicans seize control this year of the machinery and patronage in the populous states where presidential elections are often decided.

Mississippi's Price

IN Mississippi this has been a week of waiting; on Friday, after *The Economist* has gone to press, the federal court of appeals at New Orleans is to decide whether Governor Barnett has purged his contempt of the court's orders. In Washington, meanwhile, minds are turning to the price which the Democrats may have to pay for enforcing respect for the Constitution in the most "southern" state of the once solidly Democratic South. The Republicans, who were already mounting their most ambitious drive below the Mason-Dixon line, hope that southern resentment will find expression at the polls next month.

There are no Republicans standing in Mississippi but in the ten other states of the Confederacy, plus Kentucky, there are two-party races for 62 of the 113 congressional seats, compared with only 35 in the last non-presidential year, 1958, and 53 in 1960. Republicans are also contesting, though more feebly, all of the seven Senate seats at stake and three of the six Governorships. Behind this impressive effort stand revitalised Republican organisations run by aggressive young businessmen interested in winning votes; the traditional southern Republican cared only for the patronage he could obtain when a Republican President was elected by the votes of the North and West. (In North Carolina one of these new men was so successful that his picture was published in *Time* magazine—to his undoing, for it led to the revelation that he had a second family in Virginia.)

Most of this new breed of southern Republicans are even more conservative than the Democrats they seek to replace and, except in Georgia, most of them are fiery segregationists ready, in spite of their party's traditions and the present winds of change, to exploit the bitterness left by events in Mississippi. In South Carolina, one of the two states where the colour bar is still unbroken, Mr William Workman, who is given an outside chance to defeat Senator Olin Johnston, is as much of a segregationist as the incumbent and much more right-wing. South Carolina may also send a Republican to the House of Representatives, the first in this century, but the party's main hopes of adding to its nine southern Congressmen lie in Florida and Texas.

No one imagines, however, that even with federal troops occupying Oxford, Mississippi, the Republicans will make more than marginal gains in the South this year. And on the other side of the equation, the President's stand will pick up votes for his party in the North and West—chiefly among the 8 million Negroes who live in the electorally important big cities there and, unlike the 10 million in the South, vote in large numbers. Most of them, however, vote Democratic already. But will such support be enough two years hence if the South gives its presidential vote either to a Republican or to some regional candidate? Mr Kennedy could not have won in 1960 without the help of the South.

Incentives for Civil Servants

PRESIDENT KENNEDY'S legislative programme scored more last-minute pluses last week when Congress pushed through two measures designed to strengthen the attractiveness and efficiency of government service. One Bill brought to success a movement begun in 1960 to replace with a single consistent set of rules America's makeshift and antiquated conflict-of-interest laws. Loopholes opened by the changing role of government over recent decades have been closed. Prohibitions against former civil servants representing private interests in "claims" against the government have been broadened to include any matter of public interest—such as applications for licences, approval of sites for hydro-electric projects and the like. At the same time, the new Bill very sensibly relaxes these restrictions in cases where the employee, while in service, has had no direct concern with the matter. The Bill goes even further in removing what President Kennedy termed the "wholly unnecessary obstacles" to the recruitment of part-time advisers and experts, allowing these men the greatest possible latitude to carry on their private businesses.

Another of Mr Kennedy's long-standing programmes implemented by Congress last week—if in a characteristically watered-down form—was a major reform of the government's pay policies. The so-called Johnston Bill provides substantial increases for 1.6 million federal employees and more generous pensions for retired civil servants. It embodies two fundamental principles: that government salaries should be competitive with those paid in private enterprise and that the various federal pay schedules should be inter-related, with differences in pay reflecting differences in responsibility and performance. Unfortunately, the specific provisions of the Bill tend to dilute these principles. True, it abolishes pay increases based solely on length of service and permits greater flexibility in awarding achievement and in bidding for scarce skills. However, Congress proved less than sympathetic to the President's aim of upgrading high-level executives, whose salaries have suffered from the greatest lag, although it invited him to repeat this request next year, when increases for civil servants, Cabinet officers and "those under other federal schedules" (i.e., members of Congress) could be considered all "at one time."

The pay reform got through even though tied to the controversial scheme for raising postal rates in order to combat the Post Office's chronic deficit—a priority item on Mr Kennedy's list of must legislation for this Congress. Despite some toning down of the Administration's proposals, higher postal charges, mainly for letters, are expected eventually to bring in $603 million a year, only slightly less than requested.

New Instrument

THE Trade Expansion Act of 1962 is certainly a great success for President Kennedy and for Congress but it is only a beginning. It does not itself reduce tariffs; it merely gives the President power to negotiate with other countries for such reductions, to be introduced in five equal annual instalments, in exchange for reciprocal concessions. Under the most-favoured-nation treatment all non-communist countries will share in these concessions but Jugoslavia and Poland will no longer be regarded as non-communist for this purpose. The Act's authority for lowering duties will not necessarily be used to the full and the President has power to raise tariffs in retaliation against any country which puts "unreasonable" or "unjustifiable" restrictions on imports from the United States. Certain classes of goods are reserved from negotiation—those which have already been given special protection or which are the subject of an international marketing agreement, cotton textiles, for example.

Nevertheless the legislation gives a welcome stability to American tariff policy. It does not have to be renewed for five years. Negotiations can now cover broad categories of goods instead of having to deal with individual items separately. When a domestic industry suffers as a result of increased imports under the Act, it should not now be necessary to restore the tariff since an alternative method of dealing with this situation is provided: adjustment assistance taking the form of advisory services, loans and tax relief for firms which have been injured and of special unemployment, retraining and removal allowances for workers in such firms.

The Act also broadens greatly the President's power to reduce tariffs. Any duty may be cut by 50 per cent from present levels and those that are now at a rate of less than 5 per cent may be eliminated altogether. So may duties on articles in which 80 per cent of world trade is accounted for jointly by the United States and the European Economic Community; this clause only becomes important if Britain joins the common market. Tariffs on various agricultural commodities may also be reduced or eliminated under certain conditions. Before bargaining begins the Tariff Commission must hold hearings and advise the President on the economic effects of any proposed reductions. This replaces the old "peril point" procedure which set a limit below which duties could not be cut. For this and other reasons it will be about a year before the United States opens formal negotiations with other countries under the new Act.

State of the Betting

FROM A CORRESPONDENT RECENTLY IN BOISE

IDAHO will probably not become a gambler's paradise but punters with luck or judgment should be able to clean up on the results of the various political races now being run. So much seems clear about the current election campaign in this state but all else is obscure. One of the most important reasons for this is that four of the ten major candidates are still detained in Washington by congressional duties so that the campaign has not jelled yet. The candidates on the spot are unable to feel out and attack their opponents' weak points and the two Senators and two Representatives are unable to counter-attack effectively. But one factor above all explains the uncertain shape of the struggle in Idaho: the emergence as the dominant issue of a proposal to make gambling legal as it is next door in Nevada and thus to give Idaho a share in the prosperity generated by this activity.

The churches are strong (especially that of the Mormons, to which more than a third of the people belong) and they have launched an all-out attack on the proposal and on its author, Mr Verdon Smith, the Democratic candidate for Governor. As a result the able Republican incumbent, Governor Smylie, is heavily favoured to win a third four-year term and all other local issues and campaigns are eclipsed. National issues are nowhere, as both parties discovered when testing reactions on such things as Cuba and medical care for the aged. It is not felt that the promised intervention of such luminaries as General Eisenhower and Vice President Johnson will change this. Idahoans go their own way. This is not to say that such visits are necessarily without effect. Mr Truman paid a visit to Idaho Falls in September during which, while declaring that he wanted to help all Democrats, he nearly scuppered Mr Smith.

> Legalised gambling is the worst thing in the world. . . . If you want to be like Nevada that's your business. Nevada is the one black spot on the United States government, so go ahead and do what you damn well please.

The Republicans have since tried to oblige by linking Senator Church, a Democrat running for re-election, and Representative Harding, who is in the same position, with the party platform that includes the gambling proposal. How much success they will have is not known. Senator Church carried 42 of the 44 counties in 1956; he is young and handsome, "with a corncob full of teeth when he smiles," and he has a good record as a hardworking Senator. But his record is also a conspicuously liberal one: he fathered the Wilderness Bill, which would have carved three million acres out of Idaho to make a national park, and supported the Trade Expansion Bill, which may damage Idaho's already semi-depressed lumber and mining industries (they suffer from Canadian competition).

The Republicans are doing the best they can to rouse the public against him for this and for his support of a proposal to extend the operations of the federal Bonneville Power Administration into southern Idaho. They do not have the same openings with the Democratic candidate for the other Senate seat, Representative Pfost, although she also advocates electricity undertakings handled by the government. It was she who, as chairman of the House Subcommittee on Public Lands, emasculated the Wilderness Bill and she has always fought for the interests of Idaho. To beat her the Republicans rely on their traditional strength in the popu-

A world-wide network of branches

Travel anywhere in the world, you would be hard put to it to find any important industrial or commercial centre where there isn't a branch or a correspondent of the First National City Bank.

In all, there are eighty-four branches in twenty-nine countries, and seven thousand resident National City bankers, helping to finance international trade.

COMPREHENSIVE BANKING SERVICE. But there is much more to First National City's service than its normal day-to-day routine of banking, extensive and efficient as that may be.

Up-to-date credit information on any foreign company, a monthly survey of the world's economic trends, and letters of introduction to the managers of any overseas branch or correspondent are but a few examples of the service the First National City Bank can provide in expanding your overseas business.

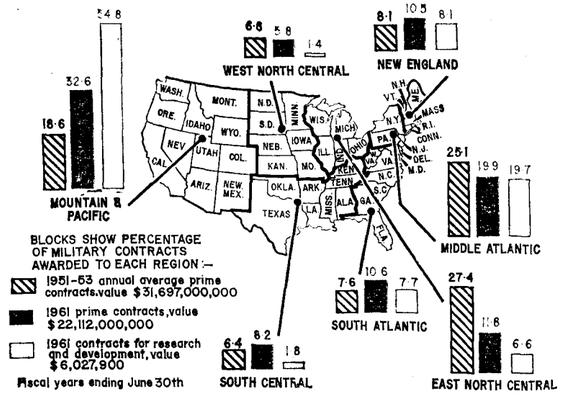
Why not put these services to work for *you*? Contact First National City now, either at 117 Old Broad Street, E.C.1 (LONdon Wall 1221) or 17 Bruton Street, W.1 (MAYfair 6600).

FIRST NATIONAL CITY BANK
NEW YORK
Incorporated with limited liability under the National Bank Act of the U.S.A.

Regions at War

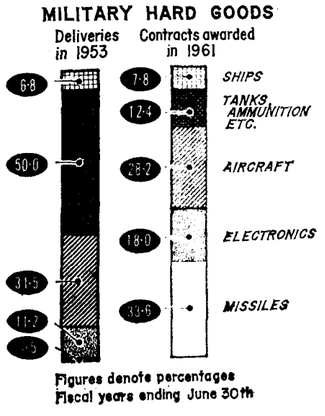
To the numerous chores which members of Congress have traditionally performed for their constituents, the cold war has added a new one: seeing that their states get a fair share of the $50 billion a year which the United States spends on defence. Last summer the worst suspicions of the Middle West were confirmed when the Department of Defence issued a survey on "The Changing Pattern of Defence Procurement." This showed that in the ten years since the Korean War the middle-western states have lost their predominance in defence business, which now goes primarily to the states on the eastern and western coasts. But the spokesmen for California and the other states which are doing well out of such contracts insist, as might be expected, that their good fortune is due, not to favouritism or politics, but to sheer merit.

Not subject to debate is the fact, illustrated by the accompanying charts, that in the decade since Korea, Michigan, Indiana, Ohio and other states of the Middle West have ceased to be the main arsenal of America and that this title has passed to California, with other nearby states profiting as well. The shift reflects a radical change in technology dictated by the new importance of missiles and space developments and the trend is continuing, although in the current fiscal year its impact is being mitigated by increased buying of equipment for the Army.



At the time of the Korean War military purchases were weighted heavily in favour of tanks, lorries and conventional weapons and the tools to fabricate them—all things which mass production factories in the Middle West could turn out easily. Now that the first line of defence has shifted to the upper atmosphere, the emphasis is on the products of the aircraft industry and its aerospace derivatives, including those of the all-important and continually expanding electronics business. The heart of this sophisticated industry is in California and New England is also a major centre. The expanding part played by the mountain states is due to such developments as the concentration of testing and tracking facilities for missiles and rockets in their desert areas.

The figures showing the geographical distribution of prime contracts do not include the huge volume of supporting subcontracts for assemblies, systems and components, of which the Defence Department does not and cannot attempt to keep track. Undoubtedly, a great many subcontractors are in the Middle West, both because of the area's skills and resources and because of the national policy of dispersing defence work as widely as is possible provided this is consistent with efficiency and economy. Moreover, the region may do better in the future if more pressure is put on to the Department of Defence to give priority, as it is supposed to do when allocating contracts, to areas with a chronic surplus of labour.



The real bone of contention seems to be the RDT and E (Research, Developmental, Testing and Evaluation) contracts, which are concentrated in the two coastal regions to an even greater extent than prime production contracts. California and the eastern seaboard states from Massachusetts to Maryland have about 75 per cent of the research and development contracts between them, while 38 of the 50 states share a mere 10 per cent. The two coasts have also been awarded the bulk of all basic research for defence, which is done primarily by universities and non-profit organisations. In the past, the importance of these trends has gone far beyond the actual sums involved since a company which has assembled, or had access to, the experience and talent needed to carry out research and development work on a new system of weapons has been admirably placed to compete for the follow-on production contracts and for new developmental contracts. A recent ruling by the Defence Department tries to prohibit this sequence, to avoid conflicts of interest, but regions already endowed with facilities, talent and experience have an inescapable advantage.

Senator Lausche of Ohio has charged Mr McNamara, the Secretary of Defence, with maligning the Middle West by saying that the coastal regions were getting the lion's share of all research and developmental work because the brains were there. If this is true—and the Middle West does not admit it—Senator Lausche and other spokesmen for the area think that the explanation is that California has "pirated" the scientists trained at middle-western universities. But the Defence Department is quite uncompromising. The survey which stirred up the hornet's nest declared it to be "self-evident" that certain institutions, communities and companies had been the most alert, active and effective in their quest for research contracts and that, unless the others changed their ways, they would go on being left out.

Unquestionably the record of the fortunate states owes much to the existence and enterprise of their research institutions and the industrial complexes that have grown up around them. Massachusetts, with its famed Institute of Technology, Harvard University and the research and industrial facilities along Route 128, which encircles Boston, received not far short of 30 per cent of the total of $431 million awarded to all universities and other non-profit institutions for research and development work during fiscal 1961, considerably more than any other state. Ranking second and third respectively were California, which besides an outstanding Institute of Technology possesses Stanford University, the Rand Corporation and the Aerospace Corporation, and Maryland, the home of Johns Hopkins University. The process seems to be cumulative; brainpower attracts more brains. Moreover, in California, at any rate, the climate and living conditions are an added attraction.

What can the middle-western states do? Political pressure might accomplish something—the influence of Vice President Johnson is credited with having brought the new Space Centre to Houston, Texas—but this is a game which all can play and California's political power is formidable and growing. Since the Defence Department is not likely to depart from its policy of placing research and development contracts where it knows there are the brains to tackle them, the best hope for the "have not" states would seem to be to bestir themselves to publicise their undoubtedly impressive and possibly neglected capabilities; to improve their universities and research facilities; and to go more aggressively after the business. It might be better, too, if they worked together, as Missouri's Commerce and Industrial Development Commission has proposed, instead of competing against each other. All this was presumably pointed out when Defence Department officials met mid-western leaders this week to discuss their complaints, one of a series of such briefings.

Continued from page 142

lous Second Congressional District (Mrs Pfost is conceded to be invincible in the First, northern, district, which she has represented for ten years) and on the fact that their candidate, Senator Jordan, was Governor from 1950 to 1954. He is thus known all over the state and has had time to outlive any enmities he incurred while in office. He also has the advantage, for what it is worth, of having been appointed by Governor Smylie to fill the seat of Senator Dworshak, whose death in July explains the occurrence of two simultaneous Senate elections.

Old Ties to Silver

NEW YORK

ALTHOUGH speculative activity in silver has been intense, there is no doubt that the metal has lost its old political glitter. Congress is adjourning without giving any consideration whatsoever to the Administration's requests for changes in the laws affecting silver. The fact is that the metal is no longer an issue, politically or economically, even though its price has soared since President Kennedy directed the Treasury, late last year, to suspend its sales of "free" silver—the stock not needed for the coinage or as backing for currency. In less than a year and at a time when the price of most other commodities was falling, silver rose from below 93 cents an ounce to over $1.21. Recently, the price has dropped, partly because of speculative profit-taking, partly because of fears that the Treasury would re-enter the market and sell silver in order to maintain orderly conditions. The Treasury will remain an important factor in the market until its special relationship with silver is finally severed once and for all by Congress. This may happen next year but it is far from certain.

Last November, when the President suspended sales of silver because the heavy demand, largely for growing industrial uses, threatened to deplete the Treasury's stocks, he requested Congress to repeal the silver purchase laws; these require the Treasury to buy all newly mined domestic silver offered to it at a price of 90.5 cents an ounce. He also requested power to withdraw from circulation all Treasury $1 silver certificates and to replace them with Federal Reserve notes, something he had already ordered to be done for all $5 and $10 silver certificates. These moves would end the official floor under the price of the metal, something which has usually been opposed by the silver mining interests in the western states. But their traditional noisy opposition was not forthcoming because silver is fetching such a high price in the market. The real complaints about the price of silver are beginning to come from industrial users in the East, who feel that they are being victimised. The Treasury has said nothing but it is anxious for early action.

If the Administration gets its way the Treasury would continue to issue coin and would buy the necessary amounts of silver at the prevailing market price, but the Federal Reserve System would be responsible for issuing all paper money. This would simplify a somewhat confusing monetary arrangement in which two agencies, the Treasury and the central bank, are jointly responsible for issuing paper money. In addition, the change would save money by making available for coinage the bullion which must now be held as backing for silver certificates.

Substituting Federal Reserve notes for silver would have an adverse effect on the country's "free" gold supply. Federal Reserve notes must be backed by a 25 per cent reserve of gold certificates. The substitution would thus require a substantial increase in gold certificates to back the existing supply of currency. But there has been no suggestion that worries about further drains on the declining stock of gold had any part in persuading Congress to hold its hand. On the contrary, while it is recognised that silver has had its day, there is a certain reluctance to celebrate the last rites, particularly when the matter does not seem urgent.

The present silver laws reflect the economic concepts of a bygone era. They go all the way back to the period after the Civil War, when deflation-plagued debtors linked arms with the hard-hit silver miners in an attempt to force Congress to reinstitute free and unlimited coinage of silver. Nevertheless, prices of commodities continued to fall until nearly the end of the century; farmers had to pay off mortgages which had been incurred when maize was selling for $2 a bushel with receipts from maize selling at 77 cents a bushel. The hardships created were abominable and a cry went up for reflation—for raising commodity prices—by increasing the supply of money relative to the supply of goods. If gold was insufficient to provide the needed monetary expansion, the argument ran, then supplement gold with silver. There had always been a silver tradition in the United States and in the late eighteen-nineties it had the emotional appeal of a panacea for the economic ailments of the day.

But the debtor and silver interests were never able to persuade Congress to allow free coinage of silver, although between 1878 and 1893 various laws were passed calling for the purchase of silver in varying prescribed amounts. In 1900 the United States went on a pure gold standard, silver being purchased only for subsidiary coins. Silver did not go down without a fight. In the nineteen-thirties Congress, under pressure, adopted the Silver Purchase Act of 1934 as part of its programme to mitigate the depression. Once again the Treasury was required to buy silver at fixed prices, even though it had no use for the metal. This requirement is still on the books, although it is generally recognised that the purchase of silver would be of infinitesimal value in fighting a recession. But it will take more effort than the Administration has yet applied to overcome the passive resistance to breaking the tie to silver.

SHORTER NOTES

Last week the *New York Times* became in fact what it has long been in practice, a national newspaper, when it began publishing a western edition. Printed in Los Angeles from type set by a machine fed by a perforated tape which is the duplicate of one coded in New York and transmitted across the continent by electronic impulses at the rate of 1,000 words a minute, the west coast edition, like the present European one, will be virtually the same as the New York paper; it will be distributed, mainly by post, in thirteen states, on six days a week but not on Sundays.

* * *

A strike which began over eight years ago and which cost the trade union involved over $10 million has been settled at last by a one-year contract with the Kohler Company, which made plumbing fixtures—and continued to make them with non-union labour.

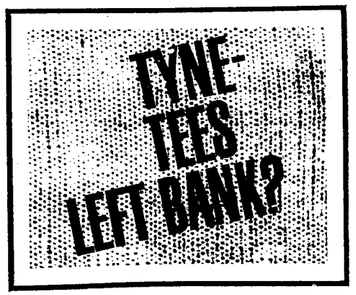
marketeers might have mobilised their forces with a hitherto unsuspected degree of behind-the-scenes efficiency. With the country said to be split about fifty-fifty on the virtues of the common market, it might, some people began to say, be too much to hope that Tory delegates would vote really overwhelmingly in its favour. The conference organisers were accused by some of having been quixotically generous in allowing the most eloquent anti-marketeers a special dispensation of time in which to speak. Moreover, it was whispered at a lower level, *sotto voce*, Mr. Butler was to speak for the Government in the middle of the debate. If he felt the mood of the conference running more strongly than expected against the market, he might not be the strongest prop on whom Mr Heath could lean.

As it turned out the fears disappeared in the first twenty minutes. Of the two relatively small claques in the hall, the anti-marketeers were scattered and isolated and made to look absurd. The pro-marketeers were larger, noisier and in their early heckling of their opponents quite often unfair. By the time Mr Butler rose, the applause even from the more silent centre rolled out at phrases like " this great adventure." By the time Sir Derek Walker-Smith summed up for the anti-marketeers in a speech much more eloquent than last year's, he was heard largely in embarrassed silence. So, it must be admitted, was Mr Heath's dully technocratic dissertation which ground on above his audience's head, desperately eager though the conference was to cheer him. But the Conservative party knew where it was going all right. As the thin trickle of hands went up against the Government, followed by the great forest of voting in the Government's support, the noise in the conference hall suddenly hushed some way below the level of historic events. Not with a bang, but with a reedy giggle of sympathy for the crushed minority, Tory opposition to the European venture died its death on Llandudno pier.



FROM A CORRESPONDENT IN DURHAM

WHILE the North-East Development Council is trying to dispel the impression that the region consists largely of slag heaps and grime in order to attract new people and industries, the year-old North-Eastern Association for the Arts is trying to crack that other image of the region which has hearty barbarians, rolling their " r's " and blowing crude pipes, as its main constituents. It is intended to prove that culture has not died in the north-east, both by propaganda and, more sensibly, by giving financial encouragement to new activity in music, opera, ballet, drama, painting, sculpture, and writing.

Apart from its intrinsic ambition and possible wider effects (there has been no genius of the " New Wave "—yet—from the north-east) the association is interesting because its organisational shape is one favoured by the Arts Council and so could become a pattern for similar regional associations elsewhere. Its membership includes industries, trade unions, university art societies, and ordinary people: but it is principally an association of local authorities able to raise its funds through regional effort —and to do this before asking for grant aid, which is the feature that endears it to the Arts Council, on whom the burden of supporting provincial ventures weighs heavily. The association has high hopes therefore for the success of its application for backing, to the extent of £1 grant for each £1 raised regionally.

So far, 38 local authorities in the north-east have signed up as members of the association, and most are to devote a farthing rate to the project. If all 88 local councils signed up, £43,000 a year would come in from this source alone, but Mr Arthur Blenkinsop, the acting secretary of the association, agrees that it is most unlikely that every rural district council in the region will be sufficiently keen on self-improvement to pay good money for it. But he does expect the number of local authority members to rise to 50 next year, and from these and other sources to raise £40,000 compared with this initial year's £26,000: even if the Arts Council does not feel able to double that, it is likely to make a significant grant.

In addition, the Gulbenkian Foundation has given £9,000 over three years, to pay the salary of an "arts officer." Actually the foundation will probably get some of its money back, because the association will offer an annual salary of only about £2,000, which is what it will be able to afford itself when the " Gulbenkian years " are over.

THE first task of the arts officer will be to survey the virgin territory of the region's existing cultural activity, and then to submit detailed proposals for the future. The function of the association will be largely that of a grant-aiding body, and one of the knottier problems still to be worked out in detail is how its income should be divided between the various artistic activities. It is already clear that music will receive a lion's share: the Northern Sinfonia, for instance, has 25 permanent professional musicians touring the north-east, and it is not a money-making venture. If, as is likely, the association takes over as its financial support, it hopes that the contributions from local authorities and the private donations, which at present keep the orchestra in being, will be diverted to the association's funds.

Most money will be spent on encouraging native talent; but some will go in introducing established talent from outside as well. Famous performers rarely include the area on their visiting lists at present, and it is not on the usual circuits of national exhibitions. Efforts will be made to extend exhibitions of painting and sculpture, including work by local artists, throughout the region; a half-yearly magazine on the arts in the north-east will be published, and an annual literary award may be offered for the best published and unpublished work by north-east writers.

All this activity will be within the region, and, apparently, aimed primarily at people within the region, but it is significant that the association has been given office space by the North-East Development Council and that, when published, the half-yearly magazine will be sent out by the council together with its own publicity material aimed at industrial prospects.

They Came to Britain

Over the last ten years the number of visitors to Britain (excluding those from the Irish Republic) has more than doubled, according to the latest report of the British Travel and Holiday Association. In 1961, around 25 per cent of the total number of visitors from most foreign countries were on business trips. Two notable exceptions were the United States (13 per cent) and the Netherlands (38 per cent).

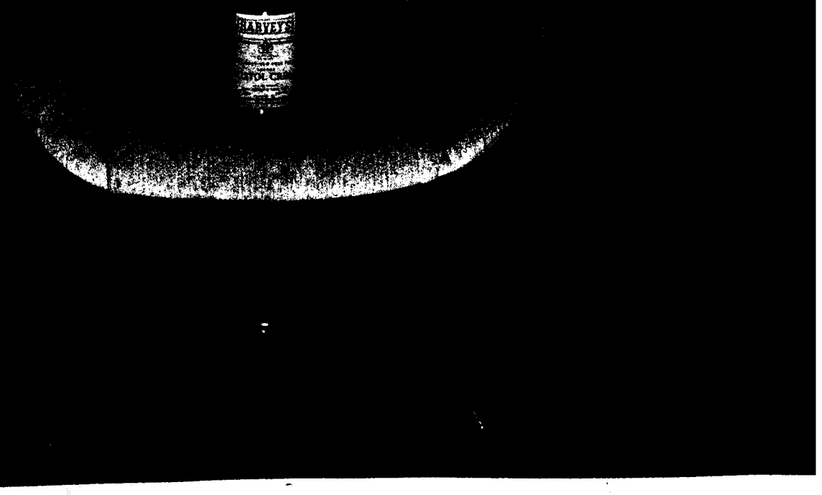
Why do you see
this familiar bottle in
houses where
everything else is rare?



The mark of the real connoisseur (and what sets him apart from his imitators) is the unexpected. In his house, and on his table, nothing is run of the mill. Why, then, in such houses do you see Harveys Bristol Cream—the world's best-known and best-liked sherry?

Simply because, no matter how far you search, you will never find the equal of Harveys Bristol Cream. No other sherry is so soft-voiced and pleasing, and no one to whom wine is important would choose a second best simply to be different.

There is really no paradox here. For, though the bottle is a familiar sight, the sherry inside is rare indeed. It is blended by Harveys, who alone understand its secrets. It is composed of ancient, mellow olorosos which Harveys have earmarked. So, among a collection of rare and priceless objects gathered from the most unexpected corners of the earth, Harveys Bristol Cream is perfectly at home. It costs 25/6 a bottle.

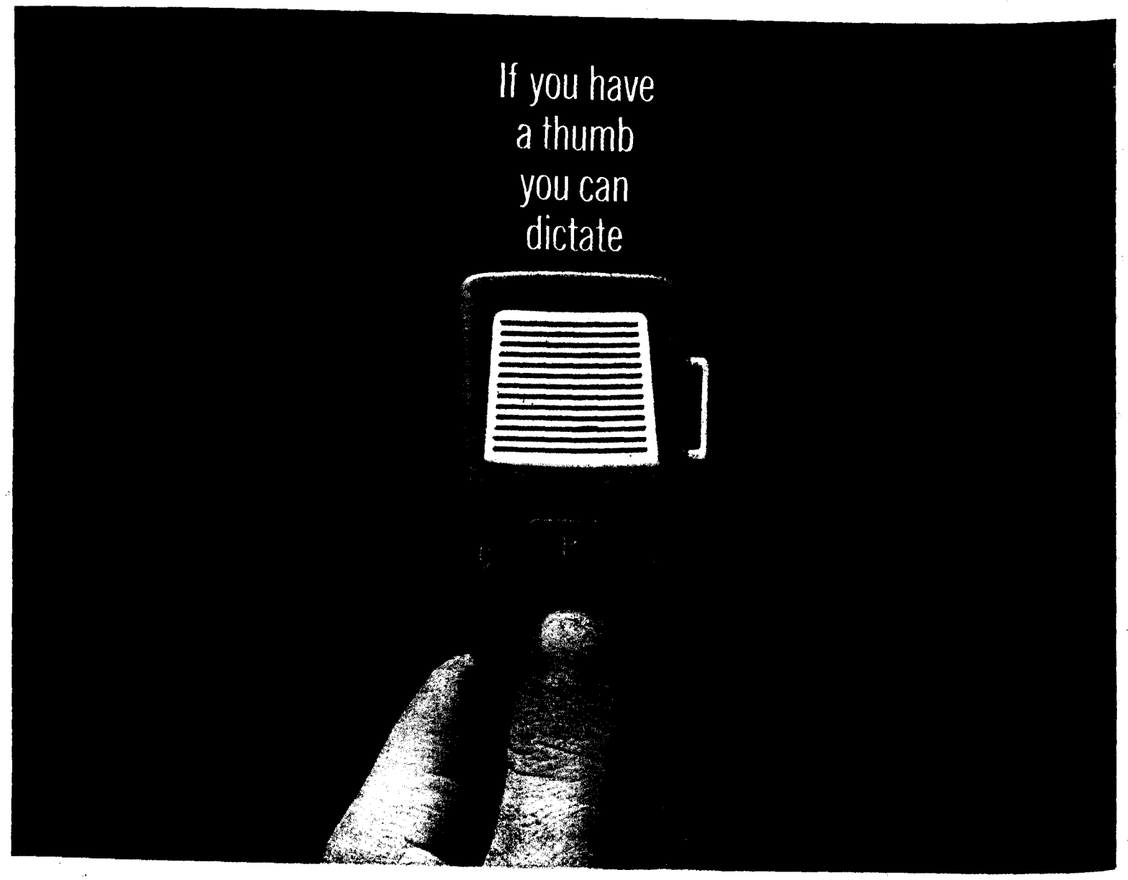
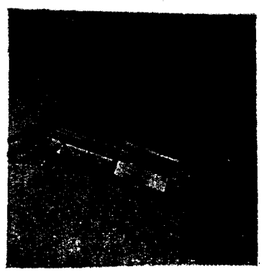
100 YEARS BEFORE THE ASTRONAUT

The Standard Bank was in Africa all but a hundred years before the astronaut had his first view of it. With so much experience to guide us, we look to the Africa of the next 100 years. This is our concern, the Africa of tomorrow.

THE STANDARD BANK LIMITED
100 YEARS IN AFRICA

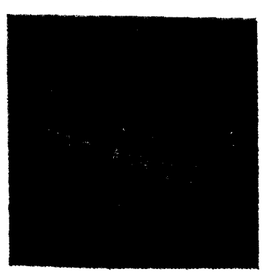


with the new Dictaphone models . . . at new lower prices



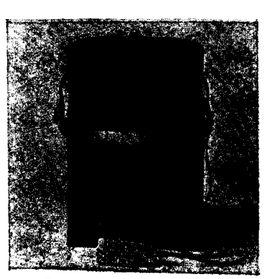
Time-Master Model P6

Just four buttons on the microphone control the complete dictating process with the de luxe model Time-Master. Push a button to start recording; release it to stop. Other buttons control playback, corrections, and letter length. It's so simple, and it uses the unique Dictabelt recording system and costs **£129 10s. 0d.**



Time-Master Model PC6

This combined dictating and transcribing machine does two jobs for almost the price of one. When you have a letter to dictate just pick up the microphone, and when you've finished just pass the machine to your secretary. She doesn't need a special transcriber, because this model does the job of two machines.



Travel-Master Portable

This needs no wires or tapes for recording, nothing but the revolutionary Dictabelts which tell you where you are at a glance. Wherever you are, just slip the Dictabelt into an envelope and send it off for transcription on a standard Time-Master Transcriber. This portable Travel-Master weighs only 5 lb., and costs **£105 0s. 0d.**

Telecord Network System

With the Dictaphone Telecord System, your telephoned dictation is automatically fed on to a vacant Telecord machine, usually located in the typing department. Dictation completed, the Dictabelt is handed to a typist for immediate transcription. This system is ideal for large organisations where it drastically reduces costs.

BOOKS

Full and Empty Purses

Income Distribution and Social Change
By Richard M. Titmuss.
Allen and Unwin. 240 pages. 25s.

ANARCHARSIS the Scythian observed that laws were like cobwebs, where the small flies were caught and the great broke through. After 2,500 years, the fiscal laws, at least, are still partial. The difference is that now it is unnecessary for the wealthy to break the law; the benevolence of the courts and the ingenuity of tax consultants make it easy for them to avoid taxation legally. The principal technique, used increasingly in recent years, is for the individual to arrange his spending power so that less of it is recognised and recorded by the Inland Revenue as a single income. The wage or salary earner, taxed on PAYE, has less incentive and no opportunity to manipulate his resources in this way. The theme of Professor Titmuss's latest book is that largely as a result of the spread of tax avoidance among the rich, the official statistics of income distribution, which make no allowance for this development, have become progressively more unrealistic as measures of the actual spending power of different sections of the community.

There have been many studies of income distribution in Britain published in the last decade. All the previous authors relied, more or less uncritically, on data from the reports of the Inland Revenue and not surprisingly they all came to the same conclusion—that there had been a substantial levelling up in incomes since the late 1930s. Professor Titmuss ends the unanimity. The main part of his book is a careful examination of the reliability of the official statistics of personal income before tax and, in effect, his only conclusion on changes in the income distribution is that the figures are too shaky to support any conclusion. He does imply, however, that the apparent levelling up in incomes could be partly, or even wholly, explained by the bias in the Inland Revenue's figures.

The bias arises mainly from the increase in tax avoidance and many pages are devoted to an anatomy of this devious and fascinating subject. It is shown how through covenants, trusts and other arrangements an individual can split up his income among his family or spread it over his retirement. Alternatively, he can turn income into capital through the formation of a private company or take remuneration in the form of fringe benefits or income in kind and so escape taxation that way.

It has long been recognised that death duties are largely optional taxes. Professor Titmuss has now indicated the degree to which the payment of taxes on large incomes is also voluntary. Surprisingly, he does not discuss at any length tax dodging among the lower income groups; and yet it could plausibly be argued that the gulf between those who cannot avoid taxation and those who can lies not so much between the rich and the poor as between those who pay tax on Schedule E and those who pay, or avoid paying, on Schedule D. Small traders in aggregate may be responsible for quite as much avoidance and evasion of tax as the wealthy subjects of the professor's exposure.

This book is not easy to read. The meandering argument is difficult to follow. It is further slowed down by too many examples, the effect of which is sometimes to overwhelm, rather than to support, the points made. Too often the sentences are clogged with figures. On page 112, for example, there are 26 numbers (five with seven or more digits) and 18 dates. But any book which makes many earlier studies redundant and requires many more to be rewritten is important. This one will be useful as a work of reference as well. It brings together a mass of information on income distribution and tax avoidance previously scattered among specialist journals from many subjects. But perhaps the book's greatest contribution will be its effect on policy discussions. It demonstrates the need to obtain much more information on the dispersal of income and wealth. It suggests that tax avoidance may be more extensive, and therefore require more urgent attention, than was thought. Above all, the book challenges the assumption that there is a trend towards a more equal distribution of income which justifies a move towards regression in Government taxation policies (i.e. towards levying less taxes on the rich) whatever the arguments for such policies on other grounds.

The Clash of Interests

The Nature of Politics
By J. D. B. Miller.
Duckworth. 296 pages. 30s.

PROFESSOR MILLER has written an interesting, stimulating and eminently readable analysis of the nature of politics, which is mercifully free from the jargon (although there are some blemishes) that so often disfigures this type of book. He is an unrepentant follower of Heraclitus. For Professor Miller politics is in a perpetual state of flux and there are few fixed points, only a constantly changing spectrum of interests. In making interests the basis of his political approach Professor Miller is writing in the tradition of Bagehot, to whom politics was first of all a species of business. The perpetual clash of these interests is the very stuff of politics, and it is this tendency to disagreement, says the author, which is natural to man, not a drive towards an ideal agreement, as Rousseau would have us believe. Conflict, says Professor Miller, lies at the very heart of politics:

> Politics, then, is about disagreement or conflict; and political activity is that which is intended to bring about or resist change, in the face of possible resistance. It is not necessary to suggest that people engaged in politics never agree, or that open and flagrant disagreement is necessary before we can see politics going on; what is important is that we should recognise that conflict lies at the heart of politics. In a world of universal agreement, there would be no room for it.

In other words (which Professor Miller would certainly not use) politics, like literature, is one of the more agreeable consequences of original sin.

This picture of politics as a perpetual clash and struggle is true up to a point, but perhaps Professor Miller carries it too far. At times he is painting with the brush of Hobbes when the lighter strokes of Locke would seem more appropriate. He comes near to rejecting the proposition that there is any general interest in politics at all either in the Thomist sense of a general direction of government by reason, or the Platonic notion of the need to subordinate the parts to the whole, or even a general interest arising from the mere fact of living together in society. While his insistence on the connection of politics with the social structure of a community is welcome, it is surely going too far to say that a common concern is no necessary part of society and will sometimes be found and sometimes not. It is true that the common concern will alter. It is not the same in a society of national states as it was in the Roman Empire, or is likely to be in the more united world of the future, but the fact that it changes does not mean it does not exist.

Nor does Professor Miller give nearly enough weight to the continuity of moral ideas and their influence in politics. One misses in his reflections the synthesising mind of Burke. Yet in English politics, to take a parochial example, there is a direct moral connection between the medieval idea of the essentially limited power of the state and the modern political system we enjoy today. It is the same on the continent of Europe, although there violent breaks and oscillations between different moral traditions have obscured the norm. In his chapter on "The Effect of Ideas", the author does not of course deny that ideas have political effects, but he maintains that for the most part they are heavily national in character and subordinate to actual interests. This is too narrow a view of European political development and Professor Miller may be somewhat myopic here because he is an Australian and Australian politics are very much the flux of interests.

These criticisms, which are based on a rather different view of politics from that of the author, should not however be allowed to obscure the undoubted merits of this well written and thoughtful book.

Swinging on Hanging

Capital Punishment and British Politics

By James B. Christoph.

Allen and Unwin. 202 pages. 25s.

FLOGGING has dropped out of the picture at this year's Conservative conference. Does this mean that the Tory rank and file has been converted to the view that brutality should have no place in penal policy? And does it therefore also indicate a possible weakening in the traditional Tory support of capital punishment?

In this careful and well-written analysis of the abolitionist campaign, culminating in the Homicide Act of 1957, Professor Christoph, of Ohio State University, shows that there has definitely been a weakening of the retentionist position. Capital punishment is still supported by a majority in the country as a whole; but the majority is significantly smaller than it was in 1948. More important, there has been a real change in the attitude of the two groups, abolitionists and retentionists. In 1948, when the latest abolitionist campaign began, with the attempt to add the suspension of capital punishment to the Criminal Justice Bill, its supporters were on the defensive: they were expected to prove that abolition would not lead to more murders. In the fifties they had moved over to the attack, and it is the retentionists now who feel the need to justify their point of view. Although the Homicide Act is an unsatisfactory compromise, which produces border line cases that rouse strong public emotion, the fact that it was passed, when another Government compromise had been laughed out by the House of Lords in 1948, is a tribute to the increased strength of the abolitionist cause.

Professor Christoph discusses the reasons for this partial success. He describes the respective parts played by the Howard League for Penal Reform and the two organisations that attempted to influence public opinion directly—the National Council for the Abolition of the Death Penalty, which in 1948 merged with the Howard League, and then the National Campaign for the Abolition of Capital Punishment. He points out the difference between pressure groups of this sort, which attempt to change attitudes, and the sectional groups, like trade unions, which can apply sanctions. Essential factors in the swing in opinion, he emphasises, were beyond the power of the organisations to bring about: a series of murders, followed by executions, that pricked people's consciences—the Bentley case, the Evans/Christie case and the Ellis case.

The author also raises the point whether the issue of capital punishment should be left to a free vote of the House of Commons. To do so means that a government that is responsible for maintaining law and order and for penal policy may find, as in 1948 and 1956, that an important part of its responsibility has passed beyond its control, and it then has to backpedal and negative a free vote. So far when this anomaly has arisen governments, of whichever party, have always as a body been retentionists. If a government wished to abolish the death penalty, and allowed a free vote but was defeated, what would it do then? What indeed will a Labour government do if it is returned to office with only a small majority at the next election?

Confidence Trick

Ouvrard: *Speculator of Genius 1770-1846*

By Otto Wolff. Translated by Stewart Thomson, with an introduction and notes by T. A. B. Corley.

Barrie and Rockliff. 253 pages. 30s.

"THE only treasure which is never exhausted, which grows and multiplies, is credit." Gabriel Julien Ouvrard practised what he preached: his credit was astonishingly resilient. His buoyant eloquence inspired confidence; his intuitive weather-sense kept him afloat—even when his passengers went overboard. The son of a paper-manufacturer, he gambled on the French Revolution's appetite for proclamations, pamphlets, songs and lists of suspects; and at nineteen made his first pile by cornering paper in Nantes, whose civic slogan in 1789 was 'business even more lucratively than usual'—till the arrival in 1793 of Carrier, sent from Paris to turn war-profiteers into patriots or corpses. Whereupon Ouvrard prudently enlisted as a clerk in the local military HQ, maintained his commercial contacts by mislaying lists of the proscribed, and then evaded the *noyades* by drafting himself to the western army. In the months before Thermidor his bold impudence secured him substantial compensation for war damage to the family paper mill, and a marriage to the daughter of a rich merchant whose release from prison he claimed to have arranged. She subscribed liberally to his speculations and submissively tolerated his liaisons.

One of these was with Therézia Cabarrus, Tallien's ex-mistress, popularly canonised as "Our Lady of Thermidor" for her part in Robespierre's downfall. She introduced him to Barras and the crowd of adventurers, political, military, and financial, who formed Directory 'society.' The author believes that Ouvrard tried to stabilise France's collapsing economy; but most contemporaries (and historians) emphasise his success in expanding his own. Between 1794 and 1799 he amassed a huge fortune. The events of Brumaire did not worry him. Whether he ostentatiously supported the deserted Barras by breakfasting with him, or backed Bonaparte by buying bonds, is immaterial. Probably both—he knew when to hedge.

The author seems shocked by Napoleon's indifference to Ouvrard's over-prompt offers of advice and money; he wonders if it was due to fear of the financier's friendships with ex-Terrorists and of his attentions to Josephine. But it was not the bogus-revolutionary or the lady-killer whom Napoleon mistrusted, but the richest of the contractors whose operations in the Italian campaign had been far more dangerous than those of the Austrians. This mistrust justified Napoleon's relentless exaction of loans and his lack of enthusiasm for the fantastic complications of Ouvrard's attempts to smuggle Spanish-Mexican treasure through the British blockade. It explains, too, why Napoleon arrested him in 1810 for his collaboration with Fouché in secret discussions with enemy bankers. The author's regret that Ouvrard was not released to organise the commissariat of the Moscow campaign seems odd. It is as if a biographer of Horatio Bottomley were to complain that he was not made Minister of Munitions.

On Napoleon's abdication in 1814 Ouvrard rushed with offers of help to Louis XVIII; reinvested in the Emperor during the Hundred Days; but sold Bonapartes and bought Bourbons after Waterloo; and in 1816 operated as a contact-man in the raising of foreign loans to pay the indemnity due to the Allies. In 1823 he reappeared in his old role—as chief contractor for Louis XVIII's military promenade into Spain. He bought lavishly on a cost-plus basis for a long campaign, but was in trouble over his accounts when it became a short one. An official investigation, which lasted three years (followed by three years' imprisonment for refusing to pay one of his creditors), did not finish him; for in 1830 he fought an unprofitable stock market battle with the Rothschilds. But from then till his death in 1846 he lived in a prosperous placidity only once disturbed—by an unsuccessful legal action against a swindler who was sharp enough to get the better of him.

This biography, though historically sketchy, is an entertaining study of the age as well as of the man. But it takes Ouvrard's pretensions too seriously. His favourite aphorism—that credit increases a man's resources, adds to his wealth, and so benefits the state—is quoted as portentously as if it were an axiom of Keynesian economics; and not, as it was in Ouvrard's career, a useful formula for a life-long confidence trick.

Victory and Splendid Defeat

The Battle of Arnhem

By Christopher Hibbert.

El Alamein

By Michael Carver.

Batsford. 224 and 216 pages. Both 25s.

ON Sunday, September 17th, 1944, the leading brigades of the British 1st Airborne Division landed on Dutch soil a few miles west of Arnhem; by midnight, about 500 parachutists were at the north end of the bridge over the lower Rhine that

SHUT THAT WINDOW—

—and keep COOL

It's better business to air-condition your boardroom and executive offices. Open windows let in distracting noise, dust, fumes; unventilated rooms grow stuffy, exhausting. But a Temkon *refrigerated* air-conditioner keeps the room cool, calm, fresh—brains alert and businesslike.

The Temkon 'Whispair' floor-standing unit is the world's quietest room air-conditioner. It just *breathes* out clean cool refreshing air, filters out dust, reduces humidity. And it even supplies background warmth between seasons!

One room, a suite or your whole building can be fitted with these elegant, slim-built units for less than half the price of a central installation. Each unit allows for personal control of room conditioning and cuts running costs.

Why Remy Martin has no stars on its label

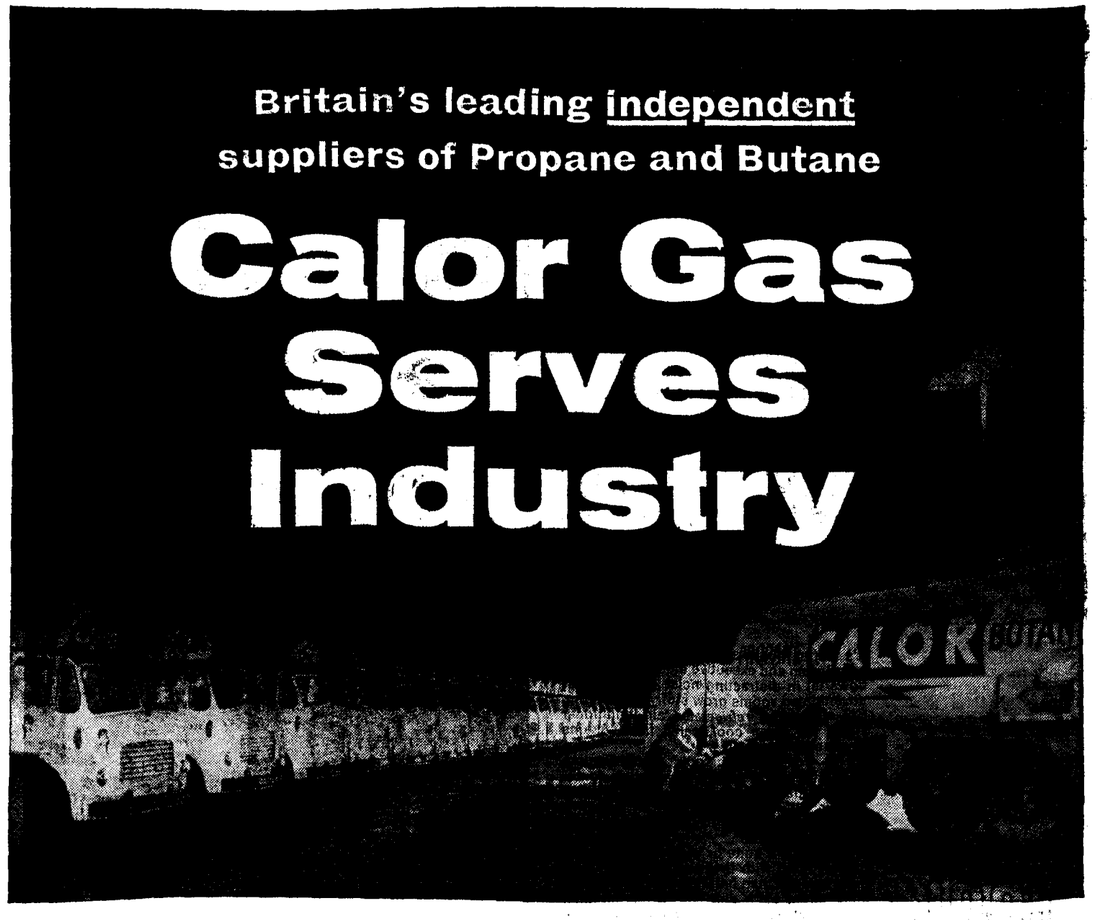
No brandy of lesser quality than Fine Champagne V.S.O.P. Cognac is permitted to bear the Remy Martin label. Hence no grading by stars. The question does not arise. All you need remember is to ask for Remy Martin. In return you enjoy a superior cognac of liqueur quality. For Remy Martin *make nothing less good.* In a word, Remy Martin cater for the one man in a hundred who prefers to compliment his palate—and his guests—with brandy as good as Fine Champagne V.S.O.P. Just ask for Remy Martin.

PRIDE OF COGNAC

REMY MARTIN

Britain's leading independent suppliers of Propane and Butane

Calor Gas Serves Industry



Calor Gas has the largest L.P. Gas Road-Tanker Fleet in the world and the widest research and service facilities in Europe!

NO MATTER WHERE YOU ARE, You can depend on Calor Gas to serve you on the spot. Seven modern filling stations, and transport depots sited near major oil refineries throughout the country, ensure that the full, specialist facilities of Calor Gas Service are never more than a short, speedy journey from Calor customers. Calor Propane and Calor Butane are the modern, mobile, clean-burning industrial gases that fuel every kind of industrial process with new efficiency and economy. Calor Gas supplies them to you in cylinders or to bulk storage tanks on site. Calor Gas Storage Tank Hire Purchase Plan enables customers to own their own storage tanks and qualify for the lower customer-storage buying rates.

ENQUIRIES TO: **CALOR INDUSTRIAL GAS SERVICE**

Calor Gas (Distributing) Company Limited, 178-202 Great Portland Street, London, W.1. Telephone: LANGHAM 0351

the division was confidently expecting to seize. The one intelligence officer with the intelligence to predict the presence of much German armour in the neighbourhood had been told he was overwrought and sent home. As it turned out there were the better part of two German SS armoured divisions close by; and the Germans were on top from the start in everything but fighting enthusiasm. Bad weather, bad signals, and bad luck combined to deprive the British of air support to reinforce their light artillery, and to condemn the airborne troops to watch pilots of impeccable gallantry dropping the food and ammunition they depended on straight into enemy hands through a holocaust of anti-aircraft fire. They had expected relief in two days and prepared to hold on for four. After eight—eight days' fighting, with little to eat, less to drink, and practically no sleep at all—the survivors were still hanging on to about a square kilometre of Holland, and still fending off heavy tanks with hand-held weapons and untameable skill. The last of them were withdrawn across the river that night.

Mr Hibbert has written a short, clear, and moving account of this astonishing feat of arms. He has seen many participants, and quotes freely from narratives written down nearer the time. He conveys sensitively the feel of the battle, and the relentless pressure that drove hitherto brave men into screaming surrender, while it turned hitherto quiet men into heroes. At this distance in time from the event, he can be compassionate about the causes of the failure, of which the principal one was that these élite troops were frantic to get into battle again before the war was over. Three-quarters of them became casualties that week.

★

BRIGADIER CARVER'S informed, detailed and unimpassioned picture of the battle of El Alamein provides in a most valuable form the evidence necessary to answer the query: how far did Field Marshal Montgomery bungle the battle? Brigadier Carver, who served at Alamein, on the whole comes out solidly in favour of the Field Marshal. Despite all the complications and setbacks, Montgomery achieved successfully his main objective. This was to draw the enemy's tanks into a fight of attrition in which our superior artillery and airpower could grind them down. This, says Carver, "may have been expensive and unromantic, but it made certain of victory, and the certainty of victory at that time was all important."

He also disposes effectively of the argument that Montgomery's success in the earlier action at Alam Halfa was due to a plan he took over from Auchinleck. Whether Montgomery took such a plan over or not, he certainly modified it in its most important aspect, by bringing forward 44 Division from Cairo. And, though brand new to the desert, he fought the defensive phase of the battle most skilfully.

Brigadier Carver also makes one very important point which has escaped the notice of Montgomery's detractors—the degree to which he improved the quality of the 8th Army by intensive training between Alam Halfa and the main battle in October. In retrospect, this may emerge as one of Montgomery's greatest strengths—as the neglect of training in the past may prove to have been the real weakness of his predecessors.

But Brigadier Carver finds the case generally proven against the Field Marshal for having bungled the pursuit, and also for having claimed in his Memoirs that the battle went according to plan, when it certainly did not. Indeed Montgomery, by claiming too much, has helped to diminish the credit due to him for what was unquestionably a great victory. What is needed now is to judge him by what he did, rather than what he said he did. It is the merit of Brigadier Carver's book that it enables us to make just this judgment. Though marred in places by military jargon, it is an honest, informed, thoroughly professional study of what was above all a professional soldier's battle.

Wilson and Mexico

The United States and Pancho Villa: *A Study in Unconventional Diplomacy*

By Clarence C. Clendenen.

Cornell University Press, for the American Historical Association. London: *Oxford University Press*. 366 pages. 46s.

THE decade 1912-1922 was marked by the high tide of those appearances by United States marines in the Central American and Caribbean republics, the memory of which affects relations between the United States and Latin America to this day. Into Cuba they went in 1912 and again in 1917. Elsewhere they went in without benefit of the Platt Amendment—into Nicaragua in 1912, into Haiti in 1914 and 1915 and into the Dominican Republic in 1916.

Superficially these moves seemed to represent only a further stage in United States expansionism towards Latin America, of which the Mexican War of 1846, United States ambitions to possess Cuba and Theodore Roosevelt's midwifery at the birth of Panama had been previous and prominent features. In fact they were mainly tokens of the failure of a new policy in Washington; for they mostly took place only after Woodrow Wilson, who had firmly repudiated dollar diplomacy, had failed in his attempts to bring stability to his southern neighbours by advice rather than by military or other pressure. Nowhere did Wilson make such an attempt more patiently and more carefully than in Mexico between 1913 and 1915, and it is with this largely forgotten but significant chapter in the story of the United States and Latin America that Colonel Clendenen is concerned in this excellent book.

At Wilson's inauguration the situation in Mexico contained all the usual ingredients for armed intervention by the United States in defence of its interests. Taft had first been sympathetic to Madero, but had soon found that he intended no favours for United States capital. His ambassador, Henry Lane Wilson, thereupon advised Washington to station 100,000 troops on the Rio Grande on the ground that Madero could not maintain order, supported the seizure of power by Huerta and reported that "a wicked despotism has fallen."

Despite pressure from United States and European interests, Woodrow Wilson refused to recognise Huerta. Failing to persuade him to withdraw, he lifted the embargo on the supply of arms from the United States in favour of the Constitutionalists led by Carranza, a *hacendado*, and Villa, a former bandit. This book is the record of the relationship thus established between Washington and Villa, and of its subsequent collapse.

Villa (his real name was Doroteo Arango) was impelled by a robust if cloudy faith in reform and had early joined the revolutionary forces, in which he first became Carranza's chief commander, with an army of 40,000 men. His establishment of relatively well-ordered government over a large area of northern Mexico contiguous to the United States convinced Wilson that he was "a factor to be reckoned with in the determination of major policies." Regular and frequent contacts were therefore established with Villa through special agents in Mexico and Villa's own men in Washington. But the course of the revolution was to lead to Villa's decline and Carranza's consequent

12th INTERNATIONAL CLOTHING & FURNISHING FABRICS TRADE MARKET

TEXTILE PALACE—
PIAZZA 6 FEBBRAIO-
MILAN (ITALY)
Monday, 12th November to
Saturday, 17th November 1962

MITAM IS THE RECOGNIZED CENTRE OF INTERNATIONAL TEXTILE TRADE AND HAS BEEN CREATED ESPECIALLY FOR TRADE BUYERS

The 12th **MITAM** will feature
Presentation of new Autumn/Winter 1963
Fabric Collections
Furnishing fabrics and domestic textiles
Over 250 exhibits by leading Italian International textile Firms
Daily fashion shows to illustrate fabric uses
Every service and assistance for visiting buyers

A FULL PROGRAMME OF HOSPITALITY AND ENTERTAINMENT IS PLANNED FOR OUR VISITORS

For admission tickets and further information, please apply to:
Mrs. **RUTH STEWART** — U.K. and Commonwealth Agent for MITAM, Milano (Italy) — BUSINESS REPRESENTATIVES LTD., 19, Hanover Square, London, W.1 (England). Phone: Hyde Park 1911.

MITAM: The textile world brought to you in samples. The textile business brought to you on a world-wide scale.
A SPECIAL WARM WELCOME WILL BE RESERVED TO VISITORS. TO THOSE WHO WILL ADVISE THE DATE OF THEIR VISIT IN DUE TIME, THE MITAM WILL FACILITATE BOOKING AND ATTENDANCE TO A NIGHT PERFORMANCE AT THE SCALA THEATRE ON THE OCCASION OF THE CONCERT-SESSION THAT WILL BE HELD THIS AUTUMN.

ascendancy, and thus the latter was recognised by Wilson after the most careful consideration and inquiry. This development, the resultant re-imposition of an embargo on his supplies, and United States support of Carranza against him, infuriated the hapless Villa. He regarded these actions by Wilson as a poor return for his success in preventing the union of all Mexican factions against the United States when, in 1914, Wilson had sent marines to Vera Cruz to teach Huerta a lesson. In their wrath Villa and his followers first killed 17 Americans and then raided the border town of Columbus. Only then did Wilson agree to intervention—in the form of a punitive expedition under Pershing, whose object of capturing Villa was largely frustrated by Carranza.

The basis of Wilson's Mexican policy was his concern for the common people. Unmoved by considerations of the material interests of the United States, he sought only for a government that would bring law and order, and social and economic justice. That his patient idealism was largely disappointed does not argue against the possibility that relations between the United States and Latin America might be more healthy today if some of his successors in the White House had been inspired by his example.

The Young Swift

Swift: *The Man, His Works, and the Age.* By Irvin Ehrenpreis. *Methuen.* 305 pages. 35s.

In this, the first instalment of a projected full-length biography in three volumes, Professor Ehrenpreis deals with Swift's childhood and youth, and the years in the household of Sir William Temple at Moor Park, both before and after his ordination. As the title indicates, this is not purely a biographical study, though it is based on primary sources and includes some new or little known material on Swift's family and social background. The sub-title, "Mr Swift and his contemporaries", further illustrates the author's intention of placing him firmly in the settings and among the people that had a formative influence on him; the angle of investigation is historical rather than psychological. But there is literary appreciation too: two chapters are devoted to the early poems—more space, perhaps, than they warrant; three to an interesting assessment of "A Tale of a Tub," and one to "The Battle of the Books".

Whether he is narrating events, describing characters or elucidating texts, Professor Ehrenpreis writes soberly and judiciously. His previous book, "The Personality of Jonathan Swift," was an attempt to look coolly at that extraordinary man, around whom so many speculations have been woven. During the years covered by the present study, Swift displayed an unusually acute intelligence (though not in his university work), in other respects behaving like a normal enough young man. His latest biographer is certainly at pains to make him appear so. He makes out a good case for the strong and lasting impression which Temple, as a retired statesman of high integrity and culture, made upon his young Irish secretary, pointing out that Swift not only knew the man as he was in his retirement but, through editing his papers, became acquainted with him as he had been in his hey-day too.

Reinforcing the chapter on Trinity College, Dublin, is a fascinating account of some of the transactions of the Dublin Philosophical Society. Their experiments in astronomy, meteorology and physiology find echoes in the third book of "Gulliver's Travels," and an episode in the Story of Lilliput is foreshadowed by the demonstration of Sir William Petty's toy navy:

> He has a fleet of ships in little models of about one and a half and two feet long, more than the King of France, and with these in a great broad trough of water he performs wonders.

Professor Ehrenpreis comments that someone as order-loving as Swift would have little use for such "miscellaneous enthusiasms of half-baked experimenters"—not that Petty was half-baked; he was a true virtuoso—and he makes it clear how great the attractions of Moor Park were for the undistinguished young man who was to become so powerful and enigmatic a figure in English letters.

OTHER BOOKS

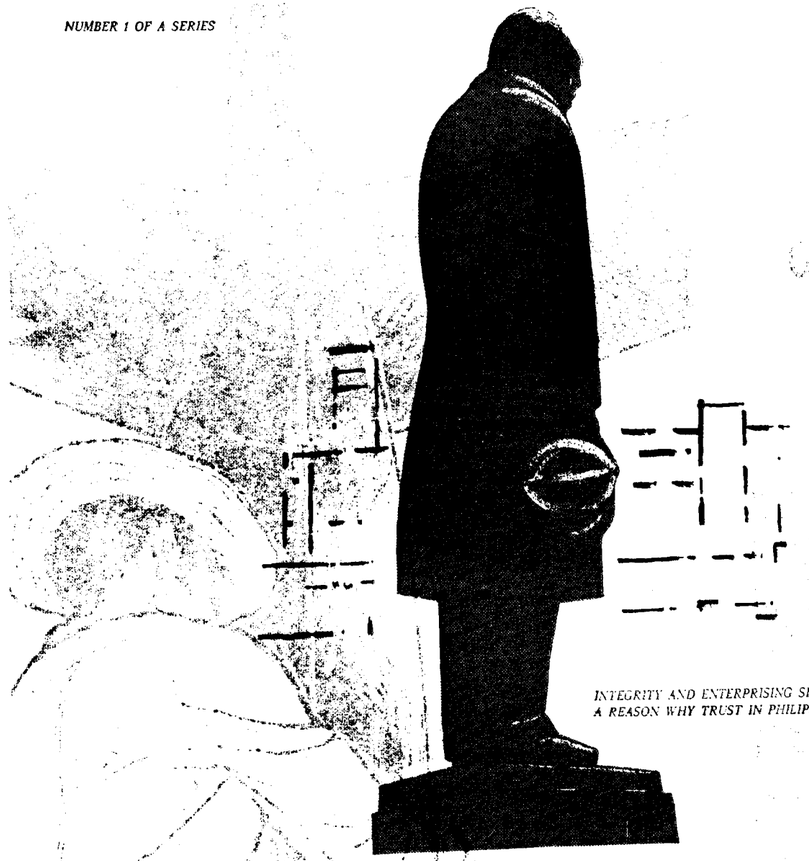
HITLER: A STUDY IN TYRANNY. By Alan Bullock. *Penguin.* 848 pages. 8s. 6d.

For the Pelican edition of what was recognised from the first moment of publication ten years ago as an outstanding contribution to the history of the Third Reich and to the art of biography, Mr Alan Bullock has thoroughly revised his text. The passage of time has not only permitted him to incorporate new material (he now, for instance, makes much use of Hitler's "table talk" to expose the workings of an extraordinary, warped and evil mind) but also to set the biography, notably where it is concerned with the events leading up to the outbreak of war, in a longer perspective. But there has been no substantive change in Mr Bullock's view; indeed time has enhanced rather than diminished it, just as it has the virtues of the book itself. There can be no better bargain in publishing today than this volume.

THE PROVINCE OF EAST NEW JERSEY, 1609-1702. By John E. Pomfret. *Princeton University Press.* London: *Oxford University Press.* 421 pages. 80s.

With this companion volume to his "Province of West New Jersey, 1609-1702," the director of the Huntington Library completes his history of New Jersey during the seventeenth century. Beginning life as part of New Netherland, the present state was presented by its royal proprietor, James, Duke of York, to Carteret and Berkeley. This volume mainly concentrates on the period after 1674 when Berkeley sold his portion and East New Jersey began twenty-six years of separate existence. Scholarly, detached, lucid and full, the author's treatment sticks close to contemporary records, and, while paying most attention to government and politics, also contains much valuable information on social and cultural developments.

NUMBER 1 OF A SERIES



INTEGRITY AND ENTERPRISING SPIRIT·
A REASON WHY TRUST IN PHILIPS IS WORLD-WIDE

WHY TRUST IN PHILIPS IS WORLD-WIDE

Seventy years ago, two brothers Philips headed a small company bearing their name. Today, the Philips World Federation of Industries employs 250,000 people, is financially strong, and stable in its international spread. The organization grew by planning imaginatively; by researching and developing. And through manufacturing and selling a *wide variety of high quality products in many countries*, the Philips organization is protected against market fluctuation. The same enterprising spirit of Philips endures today - this is why there is confidence in Philips.

Markets to touch down on

The quickest route to commercial success in the Latin American market is through our International Department Representatives. They will guide you safely over the many export or import formalities to markets of ever-increasing promise. South America today is opening up to trade as never before, especially as a market for capital goods.

Our branches and those of our associates — the Bank of London & Montreal and Balfour, Williamson & Co. — cover the whole of South and Central America. Through them, accurate market information reaches our International Department. The help and information which we are thus able to supply to business and industry includes the following:

Individual market reports · Details of free zones and ports · Import and export regulations, including licensing and prior deposits · Tariffs and payments Financing Transfer of funds · Name of agents Status reports.

THE BUSINESS WORLD

BOAC: Profit Must Come First

SIR MATTHEW SLATTERY, chairman of the British Overseas Airways Corporation, has described his airline's financial structure as "crazy." Few would wish to contradict him. Last year, 1961-62, BOAC lost £14 million on its revenue account, or roughly £14 on every ticket sold. This is quite probably the biggest loss incurred by any one airline in the history of aviation but it was, as it turned out, only the tip of the iceberg. Below the waterline and out of sight lurked the fact that for many years the corporation has persistently and optimistically overvalued its assets, mainly its fleet of 68 aircraft. In the accounts published this week, the rose-tinted spectacles were laid aside and many of these aircraft were seen for what they really are—hunks of metal that no other airline would be prepared to buy and fly. Their value has now been written down by £33 million more than had been set aside in the corporation's normal provision for depreciation.

There appears to have been some argument about how to treat this once-for-all adjustment of balance sheet values to the actual saleable worth of assets. Some £5½ million of it has been charged to the operating account for 1961-62, which was already £5 million in the red. In its total accounting, BOAC showed a deficit last year of £21 million after paying interest. The remainder of the special obsolescence has been loaded on the deficit accumulated from previous years. However the account is struck, the inescapable fact remains that this, a vigorous growth industry, has accumulated a deficit for the ten years since subsidies ceased of £67 million, £50 million of it in 12 months. If the subsidies of previous years are added, BOAC can be said to have cost the taxpayer £93 million making a profit in only four out of its years of existence. Is there another Dr Beeching in the house?

Sir Matthew wants permission to wipe off the whole of the accumulated deficit and with it the burden of interest payments that have to be found out of current earnings; and to start again with a clean slate—a kind of British Railways operation for an industry a century younger. Then, he suggested on Monday, BOAC could show a profit in two years!

This might be true only, one would think, on the basis of assumptions that Sir Matthew does not appear prepared to make. BOAC's troubles fall into two groups. The swinging capital loss taken this year on its aircraft fleet may be, as Sir Matthew argues, the result of yielding to government and other pressure to buy British airliners that are too expensive to fly and that no-one wants to buy. But it belongs to history. It cannot be undone and regrets or recriminations are so much waste of time—though many other enterprises, public and private, have to go on paying debts incurred in early mistakes. There is something to be said for allowing BOAC to close the door on the past and write off the accumulated deficit as a dead loss (which it is) and make a fresh start—but on one condition only. This is the absolutely clear understanding that the board of the corporation is expected to be master in its own house; if, at some future date, the government wants the corporation to help the British aircraft industry by placing orders for new aircraft that BOAC neither likes nor wants—which might easily arise in the case of the projected supersonic airliner—then the minister should issue a written directive to the corporation to do so. Then everyone will know where he stands.

At present nobody knows where the corporation stands. Does BOAC really want the 35 VC-10s on order? Or was it, as BOAC's report provocatively suggests "necessary initially to order no less than 35 aircraft before the manufacturer would undertake production"? Does this phrase mean that four or five years from now, the chairman of BOAC will be once again explaining excess capacity and a heavy fleet write-off by saying that the government pushed the corporation into ordering the VC-10? It would be better to cancel unwanted aircraft on order, and pay compensation, than to allow skilled men to break their hearts on building unwanted aircraft. BOAC cannot expect that excuses about government pressure will be accepted in future.

When Sir Matthew's suggestion is stripped to its essentials, it emerges as a book-keeping transaction that does nothing to attract one single extra passenger into the corporation's half-empty aircraft. A quite separate set of troubles turn on BOAC's appalling operating results, which are more serious, in terms of its continuing future, than these once-for-all capital losses. In the previous year, 1960-61, BOAC made a profit of £4 million on its flying operations (before charging interest). Last year it made a £5 million loss, despite nearly £5 million more revenue. There is nothing to suggest that this current year's results will be significantly better.

The corporation's plan for meeting this crisis is a simple one and runs as follows: aviation is a growth industry; last

year's bad results were caused by a temporary check to the rate of growth which has persisted into this year. It happened to coincide with the big heave of a five-year expansion plan in which BOAC aimed at more than doubling capacity, so the set-back hit the corporation worse than most. In two years' time, however, traffic should have caught up with the capacity that BOAC has on offer. If the line can again fill 55 per cent of its aircraft, instead of the 45 per cent it has filled in the past eighteen months, the corporation will be out of the red. It is only a question of waiting for the traffic tide to rise sufficiently to float leviathan off the beach.

The country has a right to expect a more dynamic policy than this. It is not at all certain that other airlines are going to let the tide flow BOAC's way. This week's report, a sweet-sour mixture of realism and wishful thinking, draws attention to a permanent change in the pattern of traffic that bodes ill for BOAC. London, it points out, has ceased to be the gateway for Europe now that jets have the range to fly between North America and the major European cities non-stop. The result last year was a levelling-off in air traffic between Britain and the United States, although air traffic across the North Atlantic as a whole rose nearly 8 per cent in the same period. Did the corporation's planners foresee this when they put 60 per cent of BOAC's considerable capacity on to the Atlantic? If not, why not? More important, what are they going to do about it?

According to Sir Matthew, nothing at all. He concludes his report in remarkable words:

> This is not the moment to turn back. To do so would mean not only a drastic reduction in the size and world-wide image of the corporation and in the contribution it can make to the nation's overseas earnings; it would mean abandoning many routes . . . cancelling many British aircraft now on order . . . dismissing very large numbers of staff. These immense penalties, with their grave economic and social implications, would produce no compensating financial advantages for many years and indeed, the short-term position would be immensely worsened by the large capital losses that would inevitably be entailed.

Someone should tell Sir Matthew that the "economic and social implications" of losing £21 million in 12 months with no prospect of improvement are also grave. The economy of this country cannot afford the luxury of an airline whose financial performance is so outstandingly worse than that of its competitors. Pan American, with a route network that compares closely with that of BOAC, has as many faults as a colander has holes; yet PAA made a profit, after tax, of more than £3 million last year—admittedly a ludicrously low rate of about 2 per cent on turnover, but a profit nevertheless. Other airlines as different as Swissair and Qantas, Aer Lingus and the Colombian Avianca managed to keep out of the red, sometimes by a hair's breadth. But more relevant perhaps to BOAC's case is what has been happening to other airlines that also recorded multi-million pound losses in 1961. Trans-World Airlines, for example, found itself in a plight that has many parallels with that of BOAC: with a staff demoralised by rapid management changes, aggressive competitors taking traffic on all sides, and a large fleet of obsolete, over-valued aircraft. In 1961, TWA showed a loss of very nearly £14 million, £8¼ million of which represented the drastic writing-down of propellor aircraft. There followed an administrative shake-up and a sales drive that was big even by American standards. TWA is now showing a profit on its international services—where it most closely resembles BOAC. It may, with luck, break even this current year and should certainly do so in 1963. In Scandinavia, where new management was brought in to cure an SAS loss of more than £6 million in two successive years, the airline is on the road to recovery and is expected to break even by next year. In Holland, the Dutch airline, KLM, is going through the same treatment. Why does BOAC think it should be any exception? Why, when every other airline meets losses by attempts to re-organise for greater efficiency, does BOAC alone believe that its administrative and management structure is beyond any significant improvement?

This is not a carping question. Administrative costs are the only ones directly under an airline's own control; the prices of all its other expenses, aircraft, fuel, engineering and landing fees, are fixed for it by other agencies. If some airlines make a profit and others in the same year, under similar conditions, make a loss, the inference is that the former group have tighter control over their administrative costs than others. The perceptive and experienced men who guide BOAC's destinies must be aware of this. How then can they argue that it is essential to keep a staff of about 20,000 to do half the work that TWA does with precisely the same numbers?

Can it be that BOAC's management is caught in a trap of its own making, where relations between management and unions have deteriorated to a stage where unions lead management by the nose, where every minor reorganisation has to be preceded by a strike costing perhaps £3 million and where pilots' rotas, laid down in the dim past, mean that BOAC pilots do approximately one-third the work—in terms of miles flown—as those of Pan American? Ironically, the men who work at airports are among the most intelligent, rational and responsible of tradesmen. Will time show that ultimately the sickness that besets BOAC—and not, one must note, other British airlines—is fundamentally one of human relations? This could and should be one of the biggest and finest airlines in the world, in the vanguard of traffic expansion and not, as today, begging for a further 10 per cent rise in fares at the air fares conference now in progress in Arizona (and prepared, if its public statements are any guide, to settle for 5 per cent). If BOAC alone and unaided cannot set its house in order, what is the Government doing to goad or assist it?

£400 Million More Bank Loans?

The unknown quantity in Mr Maudling's otherwise unexciting reflationary package is the effect of allowing the banks and insurance companies to lend exactly as they wish. It is widely said, and certainly true, that there can be no second expansion on the scale of 1958-60. But in 1958 itself most leading bankers and monetary analysts poured scorn on the possibility of a dramatic upsurge. What they forgot was the size of the pent-up demand for bank facilities by borrowers for whom a bank overdraft is cheaper by a very wide margin, perhaps as much as one-half, than their next available source. To this extent a rise in bank borrowing may represent no more than a switch from borrowing elsewhere; but it may also represent a net increase in borrowing by people who are disinclined, logically or not, to pay what they regard as extortionate rates elsewhere.

Where can advances now be expected to rise? Little, plainly, is to be expected from industry at large, in the old "priority" sectors. The banks have been receptive to borrowers in this category at least since May, when the first release of special deposits was made and when liquidity was clearly more comfortable. In a number of cases these borrowers have arranged larger overdraft limits, involving the banks in larger contingent provisions, but in general such credit has not been drawn. Advances in this category are almost bound to follow the trend of business confidence and of business investment—which both look just about as stagnant now as they did in mid-1958.

The direct impact of last week's official freeing of bank lending falls on the sectors previously under special restraint. This was sharpest on property and speculation but also covered in a residual way personal borrowing for "consumption." The property business is not booming quite so indiscriminately as it was, and some observers believe that the banks will therefore not be faced with many very large projects which they can acceptably finance. But there is other evidence showing that a number of big projects are waiting at the gates; and it is worth remembering that, properly arranged and with the right backers, a property proposition can fall much more satisfactorily within a bank's traditional preference for self-liquidating finance than can most "national interest" advances for heavy capital goods.

A still bigger question mark hangs over the course of bank borrowing by individuals. It seems likely that all the big banks have informed their managers that they can now resume the expansion of lending which they so reluctantly halted in 1960-61; at the same time, head offices have stressed that the size of bank resources will not permit the expansion to go forward too fast. Just what effect this saver will have on local managers bursting to press forward remains to be seen. Memories of the bad risks picked up in the earlier drive will no doubt have some restraining effect, but bad debts have been nowhere near so significant for the banks as in the hire purchase trade. The banks' troubles were often confined to a handful of branches, and could accordingly be put right without great difficulty. Having learned from mistakes, the banks are in a better position to go selectively ahead now than they were four years ago.

On Wednesday, at any rate, the Midland again made the first opening move. It cut its rate on personal loans from 6 per cent flat (implying a true rate of almost double that on the diminishing balance) to 5 per cent, the rate at which the scheme was launched by this bank in 1958. The Midland had already resumed lending under this scheme in a quiet way after May, so that repayments have no longer been running above new lending. Now net lending under this scheme should expand a good deal more, with perhaps a larger emphasis on household improvements such as central heating. Other banks are making no immediate reduction. They prefer not to make any public move that could attract the wrong kind of custom; and the Midland itself is likely to give preference to existing customers. But no bank will want to be left behind in personal lending, and those that still abjure the supposedly usurious "personal loan" proper are in practice likely to subsidise their personal borrowers at the expense of their large business accounts.

Demand for bank lending may not, therefore, be so insignificant after all. What scope is their for meeting it? With an average ratio at the London clearing banks of 33.7 per cent last month, liquidity is comfortable without leaving too much in hand at this time of year. The recent build-up of investment portfolios provides some leeway. At 16.3 per cent of deposits the average ratio here compares with a minimum of 13.9 per cent in July, 1961—to which it had been reduced from 23 per cent in 1958. The advances ratio is now just under 47 per cent, two points under the July peak last year and comparing with a mere 30 per cent in 1958 and less before. Scope for switching from investments to advances now may be perhaps three points on the ratios, which would bring advances to hard on 50 per cent, and investments a shade below their mid-1961 low point. Many bankers would resist going beyond that. A switch of this order would release some £225 million in advances. But if, as would be likely, the authorities again helped the banks in making this switch, by buying their investments from them, the scope for advances would be increased by an additional factor—the extra Treasury bills pumped into the system to finance the authorities' purchases of gilt-edged from the banks. The bill issue is also likely to be increased by next year's expected revival of the Public Works Loan Board. And there is, finally, the remaining £75 million or so in special deposits, which the authorities would probably think it right to release before they started buying the banks' gilt-edged. In sum, there could be scope for an expansion in advances of perhaps £400 million. One can easily think of numbers—this or some other. But there are signs that the authorities would accept an expansion on this scale as a reasonable one—which is not to say that they are yet certain that it will materialise.

BUSINESS NOTES

BALANCE OF PAYMENTS

High Interest Rates or High Surplus?

THE first half of 1962, a period in which buoyant world markets were receptive to Britain's exports while a running down of stocks at home was keeping down imports, almost certainly marked the zenith of the improvement in the balance of payments which has gathered pace since 1960, when almost precisely the opposite conditions at home and overseas temporarily produced a large basic deficit. This year's further improvement in visible trade—the gap between exports and imports on a true payments basis narrowed from £115 million to £16 million between the first half of 1961 and 1962—was not continued in July and August; the trade returns due next week will help to show whether this was a momentary pause or a change of trend. But the improvement in the current balance as a whole, from a deficit of £60 million in the first half of 1961 to a surplus of £96 million a year later, also reflected a strong recovery of invisible income. These broad trends were shown in the quarterly figures discussed in these columns three weeks ago. Now the detailed semi annual white paper on the balance of payments* shows that the most important contribution here came from a long awaited recovery in overseas earnings of oil companies—these being far the most important constituent of "other credits" in investment income, which rose from £149 million to £196 million between the two half years.

* Excluding oil and insurance.

On the capital account, the white paper also shows that despite the falling off in inward portfolio investment in the first half of this year, the balance of private investment was still only just on the debit side—actually a little better than in the first half of 1961 when the net debit of £16 million was kept down by the special inflow of £131 million for Ford. But in the second quarter of this year the inflow of portfolio investment had already stopped and the capital account was back in the red. The Treasury seems to see this as restoring the pattern to which it was accustomed before high interest rates began to pull in long term as well as short term funds in mid-1960. In fact the big swing in the balance of long term capital under the influence of high interest rates provides one of the few really successful examples of Britain's balance of payments responding to official policy; and if this support were now to be dropped the Treasury would logically be bound to fall back on hopes of a current payments surplus of a size that proved impossible to reach in the past and will certainly be no easier in Britain's first years inside the common market.

There are some signs that the responsible officials in the Treasury may now be coming round to a recognition of this constructive role for interest rates as an offset for Britain's gross capital exports; but other elements in Whitehall, which some say include the National Economic Development Council, maintain their natural predilection for low interest rates as a stimulant to investment. If Ned does prove to have come down on this side—its first global assessment is to be considered by the Council next Wednesday—then it will be interesting to see how it squares the external problem.

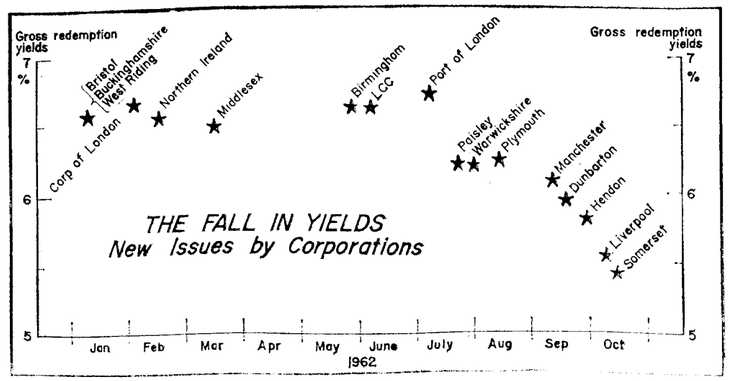
IN THE MARKETS

New Tactics in Gilt-edged?

THE long rise in the gilt-edged market was checked and partly reversed at the beginning of this week; but the market's new found resilience was quickly reflected in a recovery on Wednesday and Thursday, which in many cases made good the earlier losses. This week's new issue of £7 million for Somerset, with a coupon reduced by a second ½ per cent within a month to 5 per cent, was nevertheless oversubscribed, by about a half. The check to gilt-edged seems to have had little to do with either the general economic outlook (which has not changed) or the effect of the capital gains tax now that six months have passed since the first operative day, enabling profits to be taken tax free: for how many people are supposed to have chosen to buy on that first day? The check can be explained much more easily, first by the very rapid pace of the earlier advance, especially in the medium dates, which had carried with it some open bull speculation and had reduced yields sufficiently to have a marginal effect on income comparisons with equities (or the yield gap).

Secondly, one must not overlook the huge scale at which the authorities have been feeding the gilt-edged market. Apart from the now regular weekly corporation loan, the market last week genuinely subscribed £100 million to the government issue of 4 per cent Treasury 1965s. The setback in prices at the beginning of this week therefore reflects first an element of sheer exhaustion and secondly a correction of some over-extended positions. The medium dated stocks were affected also by a slight change in the government broker's tactics. The authorities have taken advantage of the lull in the market to push up the price of the long tap stock (2008-12), by ⅝ on Wednesday and again by ¼ on Thursday.

By doing this at a time that the market as a whole is pausing, they have succeeded in narrowing the gap between gross redemption yields on this stock and the rest—at under 5¼ per cent this is now 6s. rather



than 8s. above the yield on 1982-84s. But the truly medium dates, in the early seventies, remain the strongest section of the market, buoyed up by the support not only from the banks but also from other institutional and private investors who, despite the sacrifice in yield and despite the new investment climate, still prefer to hedge their bet with a ten-year bond rather than an irredeemable or a forty year eternity.

Equity Mirror

THE advance in equity prices which took place before Mr Maudling spoke at the Mansion House ten days ago was based on nothing more than hope and though it was maintained for a couple of days after the Chancellor spoke, it petered out, since the measures he put forward were not radical enough. There are too many unknowns about—the future strength or otherwise of the American and British economies and the outcome of the common market negotiations among them—for investors to formulate any confident short term view of the market. Those interested in the long term can still pin their faith on high quality management, picking their way through the good, bad and indifferent in the now well-mixed bag of company results; but they are not willing to pay fancy prices for the popular stocks of yesterday (where the yields are still thin) and are looking for dividend yields of between 4½ and 5½ per cent. Thus, when the gilt-edged market was shaken by a temporary spasm of nerves, it was not surprising that the nervousness communicated itself to equities, which took a tumble at the beginning of the week. Some shares were also affected by anticipation of tax selling to establish losses (which can be carried forward to set against capital gains) before the end of the six months' period. Equities did not steady themselves until the gilt-edged market had recovered its poise. The end-result of these movements was that over the week to Wednesday's close *The Economist* indicator was practically unchanged at 334.2 and the *Financial Times* index, having dipped to 275.8 on Tuesday, was slightly down on the week at 278.0.

There has been no movement in Wall Street or on the Continental bourses sufficiently strong either to give heart to the British market or to explain the rise in the premium on investment dollars, to 4¼ per cent. Here, the explanation seems to be that the pool has been drained slightly by the use of investment dollars for direct, as opposed to portfolio, investment and fresh demands for them have pushed up their price.

One significant aspect of this year's markets is the success with which unit trust sales have stood up to all the doubts and uncertainties. Helped by two block offers, net investment in new units in September amounted to £3.5 million, against £1.5 million in August. Net investment in the year to end-September amounted to an impressive £28.6 million, against £3.2 million in the previous twelve months. Over these periods, purchases by unit holders rose from £18.3 million to £39.0 million while sales by them fell from £15.1 to £10.4 million. Clearly a fall in the markets and hence the possibility of a capital loss has made unit holders more reluctant to sell; but the figures also suggest that they see some advantages in risk diversification and in equity averaging through regular purchases of units.

GERMANY

Dr A and the Budget

Düsseldorf

THE measures of stabilisation for the German economy that Dr Adenauer announced this week are largely promises of future action: only restraint on the building boom is being exerted immediately. The specially generous write-off provisions for speculative builders are to be suspended (though houses built for owner-occupiers will not be affected); and government subsidies for building local authority housing are to be reduced, for a time, by 20 per cent. The other measures are only vaguely outlined. Anti-cartel legislation is to be "tightened up"; since the Federal Republic already has what could in theory be the most stringent laws of this kind in Europe but does not enforce them very strongly, this could be a matter of administration rather than legislation. Retail price maintenance might be partially abolished; and state backing is to be given to consumer product testing. If the unions and employers do not reach "sensible" wage agreements rather than inflationary ones, the German government will think (again) of "new patterns of negotiating wages and conditions." These are vague; but the suggestion that the German turnover tax might be revised, where it seems to be penalising export industries such as steel, shipbuilding and motors, could be more important.

In the budget itself, the draft of which has now emerged from the Cabinet, there is to be no rigid anti-cyclical financial policy and no rigorous credit restriction. But at any rate Dr Starke, the minister of finance, who secured the support of Dr Erhard and Herr Blessing, president of the Bundesbank, in the famous meeting on the Tegernsee, has succeeded in establishing the principle that currency stability is a political object of primary importance and that the government, before all, has to give an example of restraint.

However, the new budget is to balance at the record sum of DM 56,800 million (about £5,000 million)—which is DM 2,800 million more than the budget for 1962. This is a rise of about 5 per cent compared with an increase in the national product of 3½ to 4 per cent; nor is it much compared with increased demands in such fields as defence, development aid, social adjustments, and coal subsidies—DM 5,400 million in all. So DM 2,600 million has to be spared in other fields, and in view of the slow depreciation of the D-Mark this was certainly no easy performance.

On the income side, there are several uncertain factors, above all the DM 2,000 million that is to come in through an increase of the Federal Government's share in the revenue of income tax and company tax. So far, the *Land* governments have stubbornly resisted all demands to go beyond the modest concessions they made this year. Another uncertain factor is the DM 1,800 million that Dr Starke hopes to borrow from the capital market. This sum is too modest to put a real squeeze on the private capital market. A 6 per cent loan announced on Tuesday was for only DM 250 million. The government's popularity on the German capital market has never been very high, and it does not possess any legal means to gain precedence over private loan issues which in the course of this year have closely followed each other. Whether Dr Starke can keep his promise of no tax increases is therefore still uncertain. What is certain, however, is that he does not want to use the instrument of taxation to damp a prosperity which has in any case shown signs of flagging.

A Warning Signal

THE apprehension about lagging prosperity has again been expressed in the monthly review of the Bundesbank, published a few days ago. According to the Bundesbank the growth in the national product slowed down in the first half of 1962: the increase at current prices was 8 per cent, compared with 9.3 per cent in the second half of 1961, but allowing for price rises the increase was only 3.5 per cent compared with 5.3 per cent in the second half of 1961. This slower rate of growth was due to a reduction in actual working hours by 2.8 per cent. The further increase in the numbers of the working population, mostly provided by foreign labour, was more than offset by the steady reduction in working time.

Even more serious is the changing pattern of demand. A greater share has gone into consumption, a smaller share into investment and into export. The absolute growth of investment has been smaller, and the surplus of visible and invisible exports over imports was smaller also. In contrast, private incomes have risen by 9.5 per cent compared with 1961, but private savings have diminished.

FLEXIBLE PACKAGING MATERIALS

Continued from page 166

Bundesbank review can give little comfort to the triumvirate Erhard-Starke-Blessing. It shows that in Germany as well as elsewhere the tendency to live better, to work less and to save less has increasingly been asserting itself, with all its uncertain consequences for the maintenance of capital investment and, in the long run, for the chances of maintaining prosperity at the present high level.

THE ECONOMY

Sentiments Unchanged

NOTHING in the latest survey of business opinion taken by the Federation of British Industries smacks of expansion. As the federation itself puts it: "the overall situation emerging from these results is little different from that reported in June." Out of the 697 firms responding to the questionnaire, exactly the same proportion as before, 19 per cent, felt more optimistic about the general business situation than they did four months ago. Practically as many reported a fall in output as reported a rise, and 66 per cent of them said they are now working below capacity compared with the 64 per cent who gave the same answer four months ago. Only one in ten, however, now mentions shortage of skilled labour as a limiting factor compared with one in seven in June.

In some respects this latest sounding of business opinion is less cheerful. Despite optimism in June about the future rate of new orders, a majority of firms (and a slightly bigger majority) has again reported a downward trend. On the export side, the general upward movement appears to be slackening a little, the upward balance of opinion being less with regard to both the level of deliveries and the rate of new orders. Prospects in both the Common Market and EFTA countries seem to be still improving. But the balance of business opinion that thinks so is smaller than last time; and for the first time since June, 1960, when the federation introduced the export part of its inquiry, a balance of firms report declining prospects in Latin America.

These returns were made before Mr Maudling announced his further dose of weak stimulants. The moves on postwar credits and public investment, however, will not remove the federation's concern about "the further indications of a continuing decline in manufacturing industry." About 45 per cent of firms expect to authorise less expenditure on buildings and plant and machinery in the next twelve months, against the 15 to 20 per cent who expect to authorise more.

BALANCE OF UPS AND DOWNS*

Passing on Costs

SINCE 1954 wage rates in Britain have increased by 38 per cent (and earnings by 50 per cent), while the prices of materials, after a surge in 1955-57, have come back almost to 1954 levels. The Purchasing Officers Association, looking at these figures and considering their own professional activity, which is to buy things economically for industry, recently constructed from the statistics an "estimated price curve." This was based on the assumption that of the cost of a manufactured article 40 per cent represents labour cost, 40 per cent material, and the rest overheads and profits; and that the effects of changes in wages and materials prices were passed on to the consumer direct without any change in profit or overheads. The association thus came up with a notional curve of how prices, in such circumstances, would have behaved. On comparing this with the actual curve of prices of manufactured goods, it found that the two coincided very closely. How prices would have behaved by passing changes in direct costs straight on to the consumer, that is to say, was just about how the prices had behaved.

"What happened to productivity?" asked Mr J. M. Grammer of the National Coal Board, president of the association, talking about this to purchasing officers this week. Output and employment figures suggested that during the years since 1954, productivity in British manufacturing had gone up by 15 per cent. Some of this will have gone to profits, some to overheads, and labour has had improvements in conditions over and above increases in wage rates. "But one thing is certain: this average increase in productivity for the country does not seem to have gone to help the price position for the eventual customer."

Mr Grammer was convinced that before long prices of materials used in manufacturing would rise again—and not convinced that there was any cushion in present profit margins by which this further increase could be absorbed. His own professional concern was not with detailed ways of cutting costs, but with the purchasing officers' job of preventing rises in costs from being passed on, simply by harder bargaining over the price of the manufactured product. Buyers as well as manufacturers, he said, should be getting together with their opposite numbers inside Europe. Expert industrial buyers spend perhaps £10,000 million a year, he said; they ought to be in a position to insist that some of the cost savings being achieved are "shared with the customer." The question here, however, is "Who whom?" Do all the enterprises on whose behalf he and his colleagues buy, in their turn, pass on savings in these intermediate prices to the ultimate customer?

AIR FARES

Up

Chandler, Arizona

THE international airlines closeted in Arizona since late September have now tentatively agreed the level of air fares for the next two years, although they are still haggling over points of detail. They have settled in principle for a five per cent rise in fares across the world as a whole, with the possibility of much bigger increases still to be agreed in certain parts of it, notably Europe. Few things in aviation are as simple as they sound; the way the airlines intend to get their increase is not by a flat rise across the board but by halving the present 10 per cent discount on return tickets. Thus a return ticket across the North Atlantic which has stood for the past three years at £173 13s for a jet flight, economy class, will go up by nearly £10. The one-way single fare, however, will stay at £96 6s.

Many airlines went to Arizona wanting a much bigger increase than this; BOAC originally asked for a 10 per cent increase although its public utterances suggested that the corporation was ready to settle for five, and Air France would have liked a rise of 20 per cent. Only the Dutch and the Germans actually suggested fare reductions; the majority were in favour of holding the line. As a sweetener for the low fare lobby, the airlines seem likely to extend the present tremendously popular 17-day £125 North Atlantic winter excursion ticket in two ways. One is to extend the period when it can be sold. This now runs from October to March and the period may well be stretched by another four weeks to the end of April. The other is to extend the ticket's period of validity from 17 days to three weeks. But there is a strong suggestion that the price of this concession should be a new ruling making the ticket ineffective for stays of less than 14 days. This, presumably is aimed at discouraging what is virtually a mass switch of business traffic during the winter from the normal fares to these special rates, since few business visitors want to spend longer than 17 days away from base. It is doubtful how many of them want to spend as long as 14 days; will the airlines never learn that these footling restrictions are no way to encourage mass travel in the air, without which they will be out of business?

Some even more fiddling changes seem likely in first class fares, a moribund form of air travel, with a strong move towards ending the serving of free drinks (except on services to Portugal, a civilised country where the law requires free wine for diners). The most important issue now is not over

passenger but over freight rates. Air freight has rocketed in the past year under the stimulus of a new, low, and simple scale of charges which gave considerable and steadily rising discounts for really big loads of one ton and upwards. There are signs that some airlines regret this, and are fighting strongly to end these concessions for the biggest loads and to re-design a scale of charges that will encourage much smaller ones, more suitable for the cargo holds of passenger jets (which need at least a ton of freight on every flight to break even).

EUROPEAN ENERGY

Room for the Coal Board?

PRESUMING that Britain joins the European Coal-Steel Community in Luxembourg, some of the powers of the Iron and Steel Board here will have to be abandoned, whether or not the Government decides to keep on the board itself. (Its last indication was that it may.) What about the powers and responsibilities of the National Coal Board? When questioned on such points in the Commons, Government spokesmen have always replied with absolute assurance that entry into the European club would make no difference whatever to the way Britain runs its nationalised industries. When appearing as a candidate for entry before the club committee, however, this was one of the questions that Mr Heath himself asked the Council of Ministers of ECSC; and one of the issues on which last week they gave Britain their preliminary answers.

Under Article 83 of the Treaty of Paris which governs ECSC, the Council of Ministers agreed, the system of ownership of any country's mining industry was not to be prejudiced; Britain's, after all, would not be the only nationalised coalmines in the community. But the treaty also opposes the use of a dominant position to ends contrary to the objectives of ECSC, and the number and size of mines grouped under the Coal Board do, the ministers feel, raise problems of a special nature. (A similar question has been raised in the European parliament, by a German deputy, about the nationalisation of Italian electricity.) Other ECSC producers, understandably, are uneasy about an industry that would constitute a single management and joint selling organisation for by far the largest coal industry in the enlarged community. They are uncertain whether the system of price lists for individual mines, and publication of transport charges, could be applied fairly within so large an organisation—though the National Coal Board is confident that it can fit their rules.

On the question of publishing transport charges, about which Mr Heath affected to feel satisfied on his return to London, he sounds to have got little change out of the ECSC countries. British suggestions that [illegible] transport policy to which British Railways should adhere for coal and steel transport might be the one that the Common Market Commission is trying to devise for European transport as a whole were firmly turned down. Moreover, ECSC wants maritime freight rates, which would affect all coal and steel trade between Britain and the other countries concerned, to be brought into the same system of published pricing.

There thus remain a certain number of issues on joining ECSC about which some knotty argument may still have to come; but neither side is in doubt that these are negotiable. The Council mentioned that the Treaty of Paris itself might be in process of revision during these negotiations with the British, and that possible changes in it would have to be taken into account. But the subsequent confused argument over energy policy for Europe suggested that on this account, at least, revision of the Treaty will be in no hurry.

PROFITS AND DIVIDENDS

What Sort of Corner?

ABOUT four-fifths of the 480 companies reporting in the September quarter made up their accounts on or after March 31st. Their results, analysed in detail on pages 190 and 191, might be said to be encouraging were it not for the unpleasant awareness of unused capacity in the capital goods industries which will be reflected, for instance, in the profits of the steelmakers when they appear later this year. The rise of nearly 3 per cent in the trading profits of the 480 companies as a whole reflects higher profits in such statistically weighty groups as engineering and electrical manufacturing.

This compares favourably with the fall in profits recorded in the three preceding quarters. But joy based on blithe forecasts that profits are turning the corner should be confined. First, the advance in electrical manufacturing profits owes a great deal to the inclusion of the results of General Electric and other nuclear power contractors, which are just tottering back on their feet after a number of shaky years, and also of those of such companies as Dimplex and Berry's Electric Magicoal, which after several years of remarkable growth may find the going harder in the future. Secondly, the rise in engineering profits owes a good deal to companies which benefited from the last dying phase of the steel investment programme. Thirdly, these advances have to be set against lower profits in such industries as iron and steel and textiles and practically stationary profits in miscellaneous manufacturing; indeed, the real crumb of comfort for investors in these results is that the profits of industries closely in touch with consumers continue to hold up well. Finally, the rise in trading profits has not been reflected in equity earnings or in an improvement in rates of return on capital employed. Higher depreciation charges and the increase in profits tax have reduced net equity earnings; these now cover slightly bigger dividends 1.8 times, against twice. These companies, moreover, have been investing more in fixed and working capital—net fixed assets have risen by over £160 million and stocks and debtors by over £90 million—so that the gross return on capital employed has fallen from 15.4 to 14.1 per cent. Such results and gloomy outlook for future profits do not wholly support the sentiment that equities in London are undervalued. It seems more likely that earnings prospects are in some cases still overvalued.

Uncommon Policy

JUST how completely or finally the same Council of Ministers, having answered the British in one morning, then proceeded in a two-hour afternoon session to come out against the proposed common energy policy for Europe, is now a matter of argument in hindsight. In Paris, the next morning, the press perhaps expressed the mood of the French government in describing the policy on which MM. Lapie and Marjolin, of ECSC and EEC, had spent so much ingenuity, as "in the wastepaper basket." By this week, the civil servants in Luxembourg and Brussels were composed enough to argue that at most the policy was on the shelf. But certainly all the hopes about rapid progress towards agreement on a common energy policy (or a common market in energy) for Europe, which have been high since the spring, were down in the dumps again.

The reactions to the Lapie-Marjolin policy of "cheap energy from secure sources" which ministers of the individual countries expressed at last week's meeting, were not that much more sour than one might have expected; France's was the sourest, as was to be expected. But the lack of voices in support of the energy policy—save Italy's, whose definition of cheap energy goes to the logical extreme of Soviet oil—was surprising. The High Authority of ECSC, which had gone as far as preparing a draft revision of the Treaty of Paris to accommodate certain proposals such as the subsidies for coal contained in the energy policy memorandum, may then have made a mistake in tactics. Its president, Signor Malvestiti, intervened to ask the ministers to make a decision quickly about this revision, adding that anyway the High Authority could not go on operating some present relaxations of Treaty rules without it.

The ministers reacted vehemently to being put in their place by a supra-national official, and finally the meeting broke up in confusion, with some vague instructions to the inter-executive commission that put up the draft policy to look again with government officials at various elements of energy policy before putting it up to the Ministers again. This policy is clearly not going to be adopted as it is, though even on the shelf it will exert some influence on further discussions, as indeed has M. Lapie's earlier proposal of a "guidance price." But any early progress towards the elements of a common energy policy seems likely to be achieved at best piecemeal—and perhaps for a time by the different communities in their own fields rather than together?

STEEL

More Confidence?

STEELMAKERS resumed output after the holidays at about the same rate, allowing for seasonal fluctuations, as in June; not quite up to the May level, that is, but better than throughout the twelve months before then. The actual level in September, 421,800 ingot tons a week, was 5 per cent more than a year before, but 12 per cent lower than in September 1960. In spite of the rise in output, the utilisation of capacity was about the same as a year before, at 76½ per cent: capacity has risen as much as production. And actual consumption of steel is unlikely to have changed nearly as much as output figures would suggest. There was heavy de-stocking about this time last year; today consumers are still probably running down stocks, but by much less.

Britain has managed to hold its steel exports up fairly well this year, in spite of sharp price competition abroad. Indeed, British exports into Europe have caused some producers in the common market to complain about price-cutting in answer to which the ECSC High Authority reasonably pointed out that they use double-pricing themselves to get exports. Total exports this year have been only slightly below the record levels of 1961. Britain is exporting just about as much steel (some 240,000 tons of finished steel a month) as in 1960; but our imports, at 52,000 tons a month, have been cut to half what they were then.

GAS

Outlook Sanguine

IN common with the other nationalised industries, the gas industry has been set certain financial objectives by the Government: over a five year period starting with the current year, it has to earn an average gross return on net assets of 10 per cent and a total surplus after paying for the five years of £54 million. The report for the year ending March 31st shows how far the industry will have to improve itself if it is to meet them; last year the surplus was £3.3 million, only about a third of the target figure. Even so, it represents an advance over past years: £1.3 million more than the year before with depreciation provisions £1.3 million up too. Every area gas board, moreover, showed a surplus, where the year before four showed deficits—one for nearly half a million pounds.

These advances are the result of a process of streamlining: more attempts are being made to sell gas; production is being concentrated in fewer, larger, more efficient plants; and administration costs are being cut wherever possible. The industry hopes to be entirely self-financing within a few years—perhaps by 1966, if Ned's 4 per cent rate of growth is achieved. (The proportion of capital provided internally has risen from half to more than 80 per cent in four years.) Sir Henry Jones, chairman of the Gas Council, said that the extra revenue would come from reduced costs and the benefits, not yet apparent, of increased tariffs. He did not think that gas prices will be further increased for some years.

Sales of gas rose by nearly 3 per cent over the previous year to 2.7 billion therms. Most of the increase, however, came from domestic users (up by 4 per cent), driven to their fires by colder weather. Industrial users took only 0.6 per cent more than in the year before. Expansion of the market for gas is now looked for mainly in the domestic field—in contrast to ideas a few years ago. Newly-designed gas fires have sold well; sales of gas-fired central heating plants increased by a half; and it is unlikely that the convenience of cooking with gas will be surpassed. But in the end, this market may be the industry's chief limitation.

ICE CREAM

Triple Cornet

THE merger of Lyons' ice cream interests with Neilson and Eldorado makes sense in an industry with high distribution costs and more slack factory capacity this year than it cares to talk about. Big manufacturers with expensive plant and fleets of refrigerated vans have more to lose by a bad summer: this year's sales may be 10 per

cent lower than the £70 million estimated for 1961. The new combine is thought to represent nearly a third of total sales, putting it in the same bracket as Walls.

Rationalisation of resources is the reason given for the merger; details of the arrangements and the price paid by Lyons are still undisclosed. Brand names will remain unaltered but this is not inconsistent with reorganising the location of production and the distribution of different categories of ice cream. Some cutting down of varieties can be expected, since the new Lyons subsidiary will have over 50 main lines under its wing.

The Eldorado link will reinforce Lyons' dominance of the cinema trade, and add to its catering outlets a contract with Butlin's holiday camps. The new group has its factories mainly situated in and around London, with two at Liverpool and one in Cornwall, evidence of the concentration of sales to holidaymakers. If, as the industry hopes, more and more ice cream will be sold for consumption in the home, some resiting of production may prove necessary. Walls's largest factory, opened earlier this year, is at Gloucester.

ATOMIC ENERGY

The AEA Opens Shop

THE Atomic Energy Authority's decision to close roughly two thirds of its Capenhurst diffusion plant because of falling military demand for uranium warheads—for this in effect is what the dismissal of a further 1,500 workers in addition to the 500 already under the axe will mean—coincides with the start of its first-ever advertising campaign to get work for its production plants, including Capenhurst, where capacity was put in for combined military and nuclear power crash programmes that never materialised. The AEA is moving a great deal more slowly and timidly in this direction than some of its members—and its critics—would like, but it is moving. There are signs that the authority has faced up to the impossibility of disposing of its uranium stocks at anything approaching the price paid for them, and has mentally written them down from their original price of $12 a pound to the price agreed recently with the Canadians for a further 12,000 tons, namely $5 a pound. This means that in its fight for foreign business, the authority's production group is able to quote prices of about £14,000 a ton for manufactured, natural uranium fuel for power stations, a price that won them a contract in Italy in the face of strong competition from other countries. So far, Sir Christopher Hinton has failed to wring the same concession from the authority for fuel supplied to the Central Electricity Generating Board, but he must be trying hard. For the uranium content at present accounts for roughly half the price he pays for manufactured fuel, around £17,500 a ton.

The authority is also beginning to pay considerable attention to the way its production plants are planned and costed. In order to get long production runs, and an ultimate price, some day, of £10,000 a ton for fuel, discounts of £1,000 a ton are offered to customers who order "standard" fuel elements—which in effect are the same as those used in the Bradwell power station, rather than specifying their own special design. Industry does not like being forced into this strait jacket, since fuel design is one of the ways of improving a reactor's performance, but a discount of this size spread over a fuel charge of several hundred tons is too big to ignore. The authority has in past years received more kicks than carrots, but this is one field where it is showing a most commendable enterprise that can yield dividends not only to the AEA itself, but to nuclear power in general, since the services that it is now advertising make up a significant part of its costs.

HOVERCRAFT

Rough Summer

HOVERCRAFT did not find everything smooth going during their experimental—publicity-seeking is the ruder description—services this summer but the result has been the learning of some salutary lessons. The weather was no kinder to them than to anyone else, preventing the service run by British United Airways with the Vickers VA-3 from operating on 14 of the 57 days for which it was scheduled to make the crossing from Hoylake to Rhyl. More serious as indication of the need for further development before hovercraft can be put into commercial service is that 18 days were lost because of mechanical trouble, so that the service actually operated on fewer than half the days that it should have done. Sensitivity to weather is something to be expected with a small machine like the VA-3, which can be overcome once bigger machines are developed; but the troubles with its engines raise doubts about the suitability of aircraft units for use in what is virtually a speedboat.

The VA-3 uses four Blackburn Turbo 603 engines, a small and simple gas turbine that should be reliable, if not particularly economical of fuel. The chief reason for using such an engine is that it is light; and perhaps the fact that the designers of hovercraft are aircraft men has given them a leaning towards aero engines. But these engines are themselves relatively new to regular service in Britain, so the operators were gaining experience of them as well as hovercraft—and under particularly arduous conditions. The Denny sidewall type hovercraft uses diesel engines, appropriate to a machine that more closely resembles a boat in concept, and this might be a more suitable unit for the bigger machines to come.

The Saunders-Roe hovercraft that operated a limited service across the Solent seems to have suffered much the same troubles as the Vickers machine, though the less ambitious nature of the service it was offering made the results less embarrassing. Though these lessons from the first regular operations of hovercraft may seem disappointing, and must postpone the day when orders will appear, they were only to have been expected from a novel means of transport. More development, with more emphasis on marine experience, seems to be the next stage.

INTERNATIONAL BANKING

Schroders in Paris

CITY people will still argue generally that the best way to do more financial business in Europe is to make friends there rather than to branch out on one's own—which is more likely to make enemies. But direct representation is not being universally rejected. Perhaps half a dozen leading stockbrokers are now seriously considering taking advantage of their new freedom to open branches abroad. And this week J. Henry Schroder Wagg has opened a representative office in Paris, jointly with J. Henry Schroder Banking Corporation. The office will be in the charge of Mr V. Lada Mocarski, who has been closely involved in the bank's European affairs. The Schroder group already has offices in Frankfurt and Zurich, and it will be no stranger to Paris, as it had an office there between the wars. But, understandably enough in view of the cool reception which is generally given to foreign banks in continental centres, the Schroder group is confining itself to a representative office, which will not itself conduct banking business.

At the same time another London merchant bank, M. Samuel, has improved the London market in the shares of Banque de Paris et des Pays-Bas, by issuing deposit receipts for its shares. These consist of units of one twentieth of the bearer shares of a nominal 100 new francs, or 37s. at the current price compared with £37. Dealings started on Thursday. The shares were introduced to London in June, 1961 at a price of £44½; the fall of 15 per cent compares with a net rise in British bank shares in this period, but it is a good deal less extensive than the fall in the French bourse as a whole.

DOCUMENTARY CREDITS

Uniform Practice

A NEW and almost universal code for dealing with documentary credits, which are used extensively in financing international trade, has been successfully drawn up by an international committee of bankers. Banks in about 50 countries

Chemicals for Anywhere

... and Susan Yeoman's questions

CHEMICAL COMPANIES · INTERNATIONAL ENTERPRISE ·

Helpful father, Henry Yeoman. When Susan asks what they make in Italy, he doesn't just say 'spaghetti'. Yet Henry himself could learn more about what is made where—particularly where the Albright & Wilson Group is concerned. In Italy, for instance, a company of the Group makes chemicals for the shampoo and detergent industries; in India, other companies make flavouring materials and perfumery compounds.

Italy, India . . . in many places throughout the world, in fact, there are companies of the Group, supplying some hundred countries with thousands of different chemicals. Phosphoric acid, phosphates, oil additives, sulphuric acid . . . plasticizers, silicones, cement . . . essential oils, flavours, perfumery compounds . . . chemicals for agriculture, metal treatment, textile finishing . . . the variety is impressive.

Impressive, too, are the ways in which the companies of the Albright & Wilson Group are playing a part in the everyday lives of so many peoples, giving a helping hand to the Henry Yeomen of the world . . .

throughout the world, including the United States, have in the past decade handled documentary credits according to a code laid down by the International Chamber of Commerce in 1951. But London banks and banks in the Commonwealth which follow British banking practice closely have never adopted this code. Until last year British banks have been merely observers at the meetings of committees responsible for the ICC code. In their view, which was respected by foreign bankers, the flexible British practice gave the customer a better opportunity of obtaining the particular service he needed, and the practice was so well understood that it did not cause confusion. It was also claimed that the international code was too imprecise.

Last autumn, however, the British banks agreed to play a full part in the revision of the international code decided upon in 1958. English, Scottish and Irish banks, the eastern exchange banks and banks operating in other parts of the Commonwealth have joined the discussions, so that if a satisfactory code could be negotiated, it was likely to be accepted in most countries of the free world. The principal reason for the change in the British attitude is the emergence of new banks in developing countries which need a published code for guidance. The revised code, which will be submitted to the Council of the ICC for approval, meets the demand by British bankers for greater precision. Uniform practice for dealing with documentary credits is therefore likely to be adopted soon.

TRAINING ARCHITECTS

Call for Realism

THE architectural profession is taking its self-criticism seriously. Among the shortcomings revealed by the RIBA enquiry into architects' offices, published in April, was a serious lack of practical skill, or even interest, among young school-trained architects. Now the RIBA has adopted in principle the proposals made by Mrs Elizabeth Layton for the improvement of the practical training which, from this year, is to total two years instead of only one in addition to the five years of school training.

With this extra margin—which some may think is still too small when compared for

Appointments, Business and Personal notices and other Classified Advertisements pages 183 and 192

instance with a young doctor's curriculum—there is scope for varying the content as well as the timing of the practical training. Mrs Layton's most important suggestions are that this should include work inside some other branches of the building industry—such as manufacturers, contractors and quantity surveyors, rather than simply in an architect's office, and that a useful part of this should take place before the final examination. Students should keep a logbook of their practical experience which would help examiners to make really certain that candidates have a reasonable grasp of working conditions, in place of the largely theoretical yet unrealistically complete ability to cope which a pass is at present supposed to imply. The schools should make much more effort to relate academic and practical training and could themselves pay more attention to teaching essential "tool" subjects such as cost control. Architects are notoriously bad organisers of their own work, and training in basic office techniques should not be despised.

Mrs Layton also points out that even after the full seven years, including practical training, required for qualification, a young architect can hardly be fit to practise entirely on his own though at present he can and sometimes does. Some further period before qualification for individual practice would bring us more in line with other countries, such as the United States and Germany. These are not simply the household reforms of a single profession, but an important step towards breaking down some of the curtain walls between the different sections of the building industry. New techniques and materials must influence but not necessarily set the pace for changes in design; to make the most of all three designers must be able nowadays to talk to technicians in their own language.

CHURCH COMMISSIONERS

Mites and Millions

BY shrewd investment policy, the Church Commissioners, who provide over three-quarters of the clergy's total income, have added substantially to stipends in the last decade. An analysis made in November, 1961, showed that only one-third of all clergy now received from all sources less than £800 a year, net of rates and mortgage repayments; and, as a result of further allocations made by the Commissioners, stipends have been further increased by £100 per annum from April this year. The Commissioners do not intend to make any general additions to stipends in the coming year; instead they are concentrating on permanent improvement of the pensions of clergy widows. They are to pay £165,000 annually to increase the clergy widow's pension right from one-third to one-half of her husband's pension; and in addition they are allocating £550,000 from general reserve so that the Church of England Pensions Board can provide a minimum income for every widow from all sources of not less than £350 a year.

These decisions follow a further increase in the Commissioners' income—though less sharp than in recent years—of £623,000 to £16,388,000 in the year to end-March. Just under £9 million was earned on stock exchange securities. The relatively small increase of £220,000 in portfolio income reflects reduced dividends on 33 of the 277 industrial holdings; higher dividends were paid on 95 industrial holdings and on 70 of the 125 investments trust, bank and property holdings. Falling stock market prices are reflected in the decline of £17 million to £187 million in the market value of the portfolio and the Commissioners kept their new purchases down to £1.2 million last year, divided between fixed interest stocks and equities. Rights issues absorbed more than the available money involving some sales of existing holdings (but not of Courtaulds). The Commissioners turned to Treasury bills and short-term local authority loans and invested £27½ million in bills and loans over the year to produce £438,000.

The spread of the Commissioners' assets is likely to change substantially in the next year or two for they are now extending in a new growth field—property development—

which, it is hoped, will prove as rewarding as their earlier switch from gilt-edged stocks to equities. The vehicle for the bulk of these property developments is the Church Estates Development and Improvement Company; this has 27 subsidiary companies, in which the Commissioners have total commitments of about £24 million, which are jointly controlled with leading property developers and builders. Some new blocks of flats and houses are being undertaken in London, but the main emphasis is still on developing commercial properties, which already yield about three-quarters of the Church's income from real estate. The Commissioners confined their earlier development to their own estates; now they are investing in outside developments.

With assets of over £300 million (and most of their property carried in the books at 1957 values) the Commissioners have a wide field of choice in raising £24 million over the next two years, without affecting the fund's income. To raise part of the sum they are stepping up their sales of properties let on long leases at fixed rents; they have sold 44 properties in London and the provinces this year for £3 million and 40 more properties with a much higher rent roll will come under the auctioneer's hammer in the next few months. The Commissioners also plan to sell about 65,000 acres of agricultural land which will still leave them with over 140,000 acres. After these sales about £10 million will still be needed for the property commitments and this will come from the sale of securities, posing the question whether the Commissioners will reduce their gilt-edged holdings further or undertake a more vigorous pruning of their equities.

FISONS

End of a Policy?

FISONS recently opened new extensions in Loughborough at the plant of its chemical subsidiary, Whiffens, including new laboratories and pilot plant facilities that will be available to other Fisons' subsidiaries. They also include a plant for making a new range of chemicals based on cyanuric acid. This marks the end of improvements to Whiffens, which have cost £500,000 over three years. Its range of chemical products has been drastically revised, allowing concentration on a few specialist lines. Setbacks in the chemical industry over the last two years have shown the wisdom of this approach.

The completion of these extensions marks the beginning of a new existence for Whiffens; it also marks the end of Fisons' old policy of diversification. Even before the war Fisons recognised the dangers of dependence on agricultural chemicals. After the war the company attempted to build up a side to its business at least comparable in size to its fertiliser interests. The most recent manifestations of that policy were the attempts to add to its food interests (Genatosan) by buying Crosse and Blackwell, and to its drug interests (Bengers) by buying British Drug Houses. Both attempts failed, and the recently-acquired food firm, Pickering and West, far from compensating for the abortive take-overs, has lost money. No moves outside agricultural chemicals have been made since last year, and it is clear that Fisons has now accepted the overwhelming predominance in the future of its agricultural side.

Although no plans have been announced, it is hard to see what alternative there is for Fisons to expanding its interests abroad. (It cannot expand in Britain indefinitely.) Even expansion abroad will require new initiatives since the present disposition of its foreign interests is not the best possible. Fisons has gone abroad where the tariffs led it, to what are now politically unstable Commonwealth countries and poor markets for fertilisers. It has no stake in the best markets: Western Europe, the USA and Japan, which together account for 80 per cent of the world market. It is therefore fair to assume that Fisons' next moves can be expected to correct this imbalance, certainly abroad; probably into Europe.

AIR ACCIDENTS

What Compensation?

THE compensation paid, under international agreement, by airlines to the families of those who die in air accidents is likely to be doubled soon from the ludicrously low figure of £3,000 to the ungenerous one of £6,000. Twenty-six countries, including Britain, have now ratified the change and only another four signatures are needed before it takes effect: these are expected any day. The United States is not, however, one of the signatories, nor is it expected to be for the sensible and compassionate reason that a level of compensation which strikes airlines from undeveloped countries as placing an extravagantly high value on human life is wholly inadequate in American eyes (as indeed it is in British, for it seems to bear no relation to the probable earning capacity of many air passengers).

Nevertheless, it would be deeply embarrassing for the United States, not to say awkward for American airlines, to withdraw altogether from the Warsaw Convention under which these levels of compensation are agreed—as well as other important questions of an airline's legal liabilities towards its passengers (and their lost or damaged baggage) and towards other airlines. A correspondent in the United States writes that the State Department is likely to introduce a bill next year which will require all US international airlines to take out insurance cover to the tune of £18,000 per passenger, after which the United States could ratify the amended Warsaw convention with a clear conscience. This legislation would mark another step forward by obliging the airlines to tell passengers the maximum compensation they can expect—most of them fly today in blissful ignorance of the true meaning of the small type on their tickets. But American airlines are expected to fight the plan, since insurance already bulks high in their costs.

SHORTER NOTES

Final figures put out by the Board of Trade show that the rise in the volume of manufacturers' stocks and work in progress in the second quarter of the year was rather more significant than the provisional estimate had suggested. Allowing for seasonal factors, the increase was 0.2 per cent; this followed a fall of 1 per cent in the previous quarter. Final estimation puts the fall in the volume of manufacturing capital expenditure in the second quarter at 1 per cent.

*

A further cut in lending rates by the Public Works Loan Board from 6½ to 6¼ per cent at the end of last week still leaves them on the high side in relation to the market. On Wednesday the Agricultural Mortgage Corporation reduced its lending rate from 7 to 6½ per cent.

*

According to the Central Statistical Office's revised figures the decline last year in consumer expenditure at constant prices, seasonally adjusted, was a little less than had been thought. By the first quarter of this year total spending had recovered most of the drop of the previous three months. It rose again in the second quarter, this time by over 1 per cent to a record level: this was the result of increased purchases of drink, durables and miscellaneous services.

EIU QUARTERLY ECONOMIC REVIEWS
COVERING 57 COUNTRIES
OR GROUPS OF COUNTRIES

MIDDLE EAST OIL The leaders and the laggards in expanding crude production are indentified, prospects are analysed, exploration described. The latest review is set in the context of the recent OPEC resolutions. The consequences of these and the shifts in the Arabian Peninsula's political foundations are analysed.

COMPANY MEETINGS

JAMES HOWDEN & COMPANY

(Specialists in design and manufacture of Air and Gas Handling Plant)

GROUP SALES AGAIN INCREASED

CONTINUING HIGH LEVEL OF ACTIVITY

The fifty-sixth annual general meeting of James Howden & Company Limited was held on October 10th in Glasgow, **Mr Crawford W. Hume, MRINA** (the chairman), presiding.

The following is his circulated statement:

It is with deep regret that I have to record the death last July of Mr P. H. N. Ulander, Technical Director for many years. He joined us 38 years ago from Swedish associates when he was a young man, but he was then already an experienced and highly trained engineer. Great engineering and administrative ability together with an outstanding personality quickly earned him a directorship of our Subsidiary, James Howden & Co. (Land) Limited, followed three years later, in 1934, by a seat on the main Board. He will be very much missed by his many friends.

Mr John D. Young, who joined the Company in 1937 and became a Director in 1957, has intimated his intention to retire. I should like to pay a special tribute to his valued services. We will all greatly miss his kindly manner and wise counsel. We wish him health and happiness in his retirement.

The accounts of the Parent Company and the Group are presented in the usual form for the year which ended on April 30, 1962.

The total sales of the Group, which are once more an increase on the previous year, amounted to £9,534,421, of which the Parent Company effected £7,276,401 and the Subsidiaries £2,258,020. The trading profit of the Group at £943,382 compares with £989,165 for the previous year. These figures in all the circumstances, and particularly in a year of restriction, are not unsatisfactory, but the profit before taxation of £661,972 compared with £802,642 is disappointing, although this is partly explained by the increase of about £22,000 in depreciation and about £64,000 in interest.

The group profit of £661,972 has been hard hit by taxation this year amounting to £382,535 because a loss by the Canadian Company has had to be carried by the taxed profits of the other Companies of the Group.

SUBSIDIARIES' ACTIVITIES

The Subsidiaries have done well, with the exception of the Canadian Company which has been a great disappointment. Last year the immediate and long-term prospects in Canada appeared to be bright. After careful consideration it was decided to increase the manufacturing facilities of the Canadian Company—a decision which we think was right and will bear fruit in the future. Thus, a new bay was added last winter at a cost of $500,000 to provide an additional 30,000 square feet of floor space. However, because of the changed economic situation in Canada, industrial orders did not materialise and electricity power station extensions were postponed, with the result that our operations in that country have shown a loss of £120,467.

I still believe that the long-term prospects of the Canadian Subsidiary are good, but I find it difficult to give you any hope that this Subsidiary will show a profit during the current year. Everything possible is being done by our Canadian Management to improve the situation.

The necessary finance was found in Canada by the issue of $1,500,000 6¼ per cent First Mortgage Bonds. The balance of $1 million has been used to reduce indebtedness to the Parent Company and to the Canadian Bank. The Parent Company has guaranteed the Bonds.

Our other overseas Subsidiaries in South Africa, Australia and Holland earned a total profit before taxation of £278,040.

In South Africa, business has continued to be very good and the two operating Subsidiaries made a profit of £153,980.

In Australia we have had a good year, the profit being £60,192. The current year's trading may be slightly reduced due to a fluctuation in demand, but the immediately following years should be very good.

In Holland our new Subsidiary has had a satisfactory result, earning a profit of £63,868.

In France our Subsidiary has only recently been formed. It should afford advantages which will increase the substantial business we have enjoyed there during the past few years.

In the Parent Company's accounts, the profit before U.K. tax, taking into account the Australian taxed dividend received from our Australian Subsidiary, amounts to £539,633. After deducting taxation of £297,821 and adding the balance carried forward from last year there remains a balance of £435,387 for allocation and appropriation. £30,000 has been transferred to General Reserve, bringing this to £1,900,000. The Group General Reserve will now be £2,589,604.

If the recommended dividend of 20 per cent is approved, there will be a balance to be carried forward of £196,371 in the Parent Company's accounts. The Group balance to be carried forward will then be £88,330.

£14M ORDER BOOK

I hope and believe that the present period of restraint may not require to continue much longer and subject to this and no unforeseen circumstances arising, I feel that, with a substantial order book amounting to some £14 million and taking into account the current rate of orders, we should be assured of a high level of activity for some years to come.

The reduction in the profit of the Parent Company as compared with the last year is disappointing as the total sales value was again higher than in any previous year. The reduced profit margin resulted mainly from increased costs of production not being matched by increased prices and by our flow of production being put out of balance by sales of certain products being lower than expected.

In our ordinary way of business our uneven flow of production of large units on long delivery is balanced by the receipt of many small orders for quick manufacture and delivery. The steps taken by the Chancellor of the Exchequer last year to correct the economic instability of the country had an immediate effect on these orders and many projects were postponed. At the same time, the running down of marine business, which fortunately for us was a small proportion of the total, has nevertheless been noticeable and has contributed to the lack of balance. Measures have been taken to minimise the effect wherever possible.

The orders booked during the year under review were substantial and in excess of the output, but a large proportion is for long delivery and we are missing the quick turnover industrial work as a result of the postponement of development plans in industry to which I have just referred.

CAPACITY GEARED TO MEET INCREASED DEMANDS

It would appear that the Central Electricity Generating Board and South of Scotland Electricity Board requirements for conventional coal or oil burning power plant have been increased, and these may be of great benefit to us. Our capacity is geared to meet such increased demands.

A recovery in industrial spending on capital goods should also be of great value to us.

General export business is good, but often made difficult in the case of our heavy capital goods by dollar or other foreign loans made on condition that the plant is bought complete in the lending country.

I have pleasure in thanking the Boards of the Subsidiary Companies and all the employees at home and abroad for their loyalty and service.

The report and accounts were adopted.

IN his Statement for the 53 weeks ended 30th June, 1962, The Lord Rank said that the past year had been one of the most significant in the Group's history. The complete financial merger of The Rank Organisation Ltd. with Gaumont British Ltd. had taken place, which had greatly simplified the administration and financing of the Group.

THE FINANCIAL RESULTS

Group trading profits before charging interest and taxation amount to £6,617,026, as compared with £6,450,805 for the previous year. The estimate of 1962 Group profits given at the time of the Convertible Loan Stock Issue had been £6,000,000.

After providing for interest payable, taxation and outside shareholders' interests, the net profit had been estimated at £1,550,000. The actual net profit was £1,906,132.

THE DIRECTORATE

As previously announced, Lord Rank was retiring as Chairman and was being succeeded by the Deputy Chairman and Chief Executive, Mr. John Davis. Lord Rank would continue as a Director with the title of President. Mr. Kenneth Winckles had been appointed Managing Director.

THE FUTURE

In company with many other businesses, the Group experienced difficult trading conditions last year, not only in the traditional cinema business, but in connection with its manufacturing activities. Taking this into account, the Organisation had done well to increase its profits as compared with last year. The Board was recommending an increased Ordinary dividend of 25% as forecast, which was adequately covered by profits.

During the year the Organisation had been strengthened in several directions, including the simplification of the financial structure, the provision of essential finance for development, and the complete re-organisation of the management structure on Divisional lines.

Further shrinkage in theatre attendances might lead to some reduction in profits, but this should be fully compensated by increased profits from the 'Miscellaneous Activities'.

Under current economic conditions few Chairmen found it possible to make any firm forecast for the future. However, said Lord Rank, I am hopeful that the Group will increase its profits in 1962/63 in the absence of unforeseen circumstances.

FILM ACTIVITIES

Exhibition. We believe that our Theatre interests, as now rationalised, will continue to be an important contributor to our overall profits provided that there are sufficient films available, particularly from America. Flexible booking policies, covering 70mm. presentations, extended runs, mass releases, etc. will play an increasing part in the "new look" of film exhibition. The theatres playing the Rank Release have by and large held their own. By flexibility of approach we hope to keep the 40/50 theatres of the so-called "Third Release"—for which the supply of product has largely disappeared—in operation.

While rationalising our activities, we have been spending substantially over £1,000,000 a year on major modernisation schemes.

Film Distribution. Despite the rate of national theatre closures, the U.K. operation continues to secure contracts on individual films which are only 10% less than in the peak period of 1957. Overseas, the operation is highly efficient.

Film Production. The challenge of changing public taste has been met with fair success, despite the alarming rise in costs. Earnings overseas account for 41% of the total.

The Film Processing Division has more than held its own. Colour film printing facilities have been extended to all types of film sold to amateurs.

The Rank Film Library, the most important in this country, had a successful year.

LEISURE SERVICE ACTIVITIES

The greatest potential in this area is **Tenpin Bowling** and our experience has satisfied us that this is a potential profit earner in our overall activities.

The Group operates 25 **Ballrooms.** We have laid down an expansion programme which will take five years to mature, by which time we anticipate that we shall be one of the leading operators.

Dance Studios are being developed and turnover is increasing.

We have secured contracts for **Service Areas** on the M.2 and M.6 and now run our first **Motor Hotel**, near Dublin.

The **Relay Activities** have been integrated with the **Retail Shops** under common management and now trade under the name of **Top Rank Home and Leisure Service.** It is our aim to expand into the major shopping centres throughout this country.

Southern Television. The future of this Company, in which we hold a 37½% interest, is bound up with the decisions of Parliament. Considerable thought will have to be given when new contracts are being negotiated as to the possibility of making a reasonable profit in what must always be a speculative business.

The Pilkington Committee recommended against Pay-TV but the Government has reserved its decision. We hope our Associated Company, **Choiceview,** may be permitted a field trial.

MANUFACTURING AND MARKETING ACTIVITIES

We concluded that **Bush** would find increasingly competitive disadvantages unless it could increase its manufacturing capacity, and in June we acquired Murphy Radio. Rationalisation will take time. We look for some benefit in the current year, and greater benefit subsequently. Colour research and development is moving much faster than we anticipated. We have secured substantial contracts from the B.B.C. and G.P.O. for equipment.

Rank Cintel, our highly specialised electronic Division, has been materially re-organised.

Rank Precision Industries Ltd. has been faced with problems in areas where it manufactured for the film industry. Also, difficult conditions developed when open import licences were granted to Japanese cine and photographic products.

The **Cine and Photographic Division** successfully launched the new 16mm. Bell and Howell sound projector. The amateur market, however, has been dislocated through heavy competition.

50% of the **Rank Taylor Hobson Division's** output was sold overseas, which represents 50% of Britain's exports in this field. The expansion of the measuring instrumentation lines has been increased. We are still expanding in Europe, and have set up a direct operation in Germany.

The long-term project of the Xeronic Computer Printer has been helped by two successful installations during the year.

Rank XeroX Limited, in which we are proud to be in partnership with the Xerox Corporation of America, is one of our most important growth activities. Turnover has increased by 425% in three years. The output of the 914 Office Copier in 1961 was 1,750 machines and in 1962/63 will be of the order of 4,000. Demand for the Copyflo machine has also developed well. I hope that in 1962/63 we shall receive a dividend from Rank XeroX for the first time.

AMALGAMATED TIN MINES OF NIGERIA

LARGE CAPITAL EXPENDITURE PROGRAMME

PROBLEM OF RISING COSTS

SIR DOUGLAS WARING ON CURRENT YEAR'S PROSPECTS

The twenty-third Annual General Meeting of Amalgamated Tin Mines of Nigeria Limited will be held on November 2nd at 55-61, Moorgate, London, E.C.2.

The following is the Statement by **Sir Douglas Waring, CBE,** the Chairman, which has been circulated with the Report and Accounts for the year ended March 31, 1962:

Before dealing with the results for the year I would like to welcome the appointment to the Board in December last of Mr W. T. Dunne. Mr Dunne is well known in Malaya where he practised as a consulting mining engineer for many years before taking up residence in this country. His experience in opencast mining and exploratory work should prove especially beneficial to an undertaking such as ours and I am pleased to say that he has already visited the properties and consulted with the management in Nigeria.

THE YEAR'S OPERATIONS

The output of tin concentrate for the year was 4,645 tons. This is 163 tons less than the previous year but was achieved in spite of serious rationing of electric power. At the beginning of November an average ceiling of 4,200,000 units per month was imposed by the Nigerian Electricity Supply Corporation Limited, representing a drop of approximately 20 per cent. Power was also restricted in April and May, 1961.

Our sales of tin concentrate for the year totalled 4,730 tons compared with 4,788 tons in 1960-61, but the average price of metal covering these sales was £952 as against £814.

We have not been so fortunate in our sales of columbite, though I did give an indication in my Statement last year that this was to be expected. Our output increased to 884 tons concentrate against 722 tons, but sales were lower at 545 tons compared with 1,371 tons. Development of pyrochlore projects elsewhere in the world appears to be responsible for the present lack of demand for Nigerian columbite but with the assistance of the British Metal Corporation we are doing everything possible to stimulate further interest.

The profit for the year was £721,162 which is after charging a substantially higher depreciation charge than previously as I warned shareholders last year. Taxation amounting to £289,000 has to be deducted and the sum of £100,000 has been placed to General Reserve. The interim dividend of 10 per cent paid in March took £119,437 and the final dividend of 17½ per cent now recommended will absorb £209,016 leaving £3,709 to be added to our carry forward.

The Company's contribution to the Nigerian Government's proportion of the second Buffer Stock has been assessed at £375,156 and this amount has been set off against £422,703 being the refund of contributions and surplus arising on the first Buffer Stock. The Company's share of the surplus was £72,557 and this has been shown in the Balance Sheet as a deduction from our contribution to the second Buffer Stock.

CAPITAL EXPENDITURE

Capital expenditure on the new earth-moving equipment programme, as part of our overall estimate of £1,000,000 spread over five years, was £445,000 (of which about £326,000 was in respect of a new dragline) and this approximates to the estimate I gave last year. In addition to this we spent some £150,000 for usual replacements on other capital items.

Capital expenditure for the two years to March 31, 1964, is currently estimated at around £600,000 of which some £200,000 will be in respect of our earth-moving equipment programme and which will see us through three years of our five-year plan. It will thus be evident that although the liquid position is strong, our cash balances will be needed to meet future capital commitments. Our stores show at an increased figure but this is largely due to spares for our new earth-moving plant and items of capital equipment received but not installed at the date of the Balance Sheet. I hope that by making use of local purchasing facilities, which show some improvement compared with the past, we may be able to effect a reduction in the current year.

The erection on site of the new dragline is now nearing completion and when this is finally ready in a month or two it is the intention to mark the occasion with an opening ceremony at which the Premier of the Northern Region, Alhaji Sir Ahmadu Bello, KBE, has kindly agreed to officiate.

PARTICIPATION IN LOCAL ENTERPRISE

During the year we acquired a Trade Investment of £12,500. This represents a participation in the capital of the new Makeri Smelting Company near Jos to which our tin concentrate has been delivered since December 1, 1961. The smelter, which is functioning well, represents a contribution towards Nigeria's aims in economic advancement and your Board felt that it was important to participate in this local industrial enterprise.

INCREASE IN COSTS

I visited Nigeria in June for the purpose of discussing problems with Mr Farrington, the General Manager of A. O. Nigeria Limited, and his staff. Since the commencement of the current financial year there has been a considerable increase in costs, consisting largely of items outside the control of the management. As from April 1st last, the price of electricity has been put up by no less than 28 per cent of our previous charge, taken on average, which will mean an increase of approximately £72,000 on our annual bill, based on the previous year's consumption. In addition, the special diesel fuel rebate for industrial consumers hitherto granted by the Northern Region Government has been cancelled. Therefore, both our sources of power have become more expensive simultaneously. The Nigerian Government budgets this year also involve increases in duties on oil, petrol, and in fact most imports.

In an effort to offset this general rise in costs, the management has revised the operating programmes and instituted economies in various directions, all of which were discussed on the spot at the time of my visit.

It is appropriate that I should record that there has been the fullest co-operation by all concerned to adapt the organisation to meet existing circumstances, but it is not possible to go all the way to offset the general increases in mine charges which have all occurred at the same time.

NIGERIANISATION

There is a growing desire to accelerate Nigerianisation throughout the supervisory staff of the minesfield generally. This is understandable in the case of all newly independent countries, but our efforts to speed up the process are largely frustrated through lack of basic education of aspiring candidates to qualify for entry to technical institutions and mining schools, in spite of sponsorships which the Company has granted. For the moment it is necessary to go further down the line and try to assist in primary and secondary education and to ask that patience be exercised during this transition stage. The management on its part gladly welcomes the entry of Nigerians to fill the senior posts at present held by Europeans on an equal status and remuneration, on the understanding that this basis of equality applies in the same manner to the qualifications and capability of those Africans appointed to assume the very responsible positions attached to mining in particular. On the administrative side, progress has already been more rapid and, in conformity with the policy adopted by the larger commercial and trading organisations in Nigeria, the opportunity is being given to enable selected African staff to gain experience in the United Kingdom, by means of a visit to this country, involving a short-term course in subjects relating to their duties on the minesfield.

LABOUR AND WELFARE

In regard to Labour, we have always enjoyed a reputation, second to none on the Plateau, for our attention to Housing and Welfare. The obligations represent a considerable item in our Capital and Revenue budgets but I am sure that it is essential to pay particular attention to such matters at the present time and I made it a point to cover this subject very fully on my recent visit. I am quite satisfied that the enlightened attitude of the management towards this important feature is the right one and that if political agitation seeks to exploit isolated cases where conditions are not what they might be, we for our part are co-operating fully with the Nigerian Government in setting a high standard in this direction.

CURRENT YEAR'S PROSPECTS

It is always difficult to forecast prospects for a mining company owing to the variable factors and the uncertain elements in any undertakings of this nature. By comparison with conditions

prevailing in the year under review I have to point out that the price of tin is now relatively static at around the £850 mark as against an average price for the year 1961-62 of £952 per ton as reflected in our sales. Furthermore, the price for the remainder of the current year is no longer subject to the usual economic influences of supply and demand because of the anticipated releases of the U.S. stockpile which produce an entirely artificial element whereby the policy and attitude of the American authorities is the deciding factor. Taking account of the fact that costs have risen for reasons which I have already dealt with it must be apparent that, unless there is a revival of interest in columbite, our results for the current year will not measure up to the profits for the year to March 31, 1962, and that we shall have to trim our sails in distributions to shareholders accordingly. Nevertheless, at this stage we are half-way through our new financial year, and the results so far should permit us to give a reasonable return to our members, even if conditions are less favourable than last year.

In conclusion may I record that M. Mohamed Tukur, OBE, The Emir of Yauri, has joined the Board of A. O. Nigeria Limited in place of the Hon. P. S. Achimugu who resigned on his appointment as a Provincial Court Judge. I also have to point out that arrangements have been made during the year so that all residents in Nigeria can more easily participate in the profits accruing from our mining undertaking on the Plateau through the purchase in Nigeria of Security Deposit receipts covering shares in our Company. A quotation in the Company's shares has also been obtained on the Lagos Stock Exchange.

Finally, on behalf of the Board I would wish to pay particular tribute to all our managerial staff in Nigeria and to our labour force, for their loyalty and attention to duty during the past year. Their lives are largely concerned with the prosperity of the Company for which they are working, and I have the fullest personal knowledge of the impact which this has upon them and to what extent favourable or adverse conditions influence their happiness and wellbeing.

CITY CENTRE PROPERTIES

LIMITED

The Annual General Meeting will be held on 7th November, 1962, and the Report and Accounts for the NINE MONTHS ended 25th March, 1962, shows :—

Issued Capital : 21,189,832 Ordinary Shares of 5/- each	£5,297,458
Capital Reserves	£7,172,469
Gross Income of the Group	£6,016,404
Net Income for the period (after taxation)	£726,022

Dividends of 22½ per cent. for the nine months are equivalent to a rate of 30 per cent. per annum.

THE UPPER ASSAM TEA COMPANY

RECORD OUTTURN IN CENTENARY YEAR

The one hundredth annual general meeting of The Upper Assam Tea Company, Limited, was held on October 9th in London.

Mr H. C. Bannerman (the chairman) presided and, in the course of his speech, said:

In common with the general experience of other producers in 1961, the average sale prices realised for the Company's crop failed to reach the levels obtained in the previous year, either in London or Calcutta, although auction prices during the latter part of the selling season proved better than seemed likely earlier on. The overall selling price works out at 4/3.79d. per lb. compared with 4/7.29d. in 1960. I am pleased to say, however, that the Company's outturn established a record, exceeding five million pounds for the first time, and representing an increase of 13 per cent over 1960. The cost of producing the crop fell from 3/8.65d. to 3/6.27d. per lb. so that despite a reduction of 1d. per lb. in the gross margin to 9½d., the Company was able to earn a crop profit some £2,000 higher at £198,848.

The final dividend of 15 per cent, free of tax, now recommended, together with the interim dividend of 2½ per cent, also free of tax, paid in January last, maintains once again a total of 17½ per cent for the year. In addition, your Directors recommend the payment of a special dividend of 2½ per cent, free of tax, to mark the important occasion of the Company's centenary.

With regard to prospects for the current season, the outturn to date has not quite reached last year's record figures to the same date. The crop at the end of September amounted to 3,519,040 lbs. compared with 3,609,600 lbs. a year earlier. Given satisfactory weather conditions for the remainder of the season, I am not without optimism that a reasonably good crop may be achieved. Sale prices so far for quality teas of the type produced by your Company compare favourably with those realised up to the same time last year.

Turning to the figures of world supply and absorption prepared by the International Tea Committee, which is the only authoritative source, these show that the 1961 world supply exceeded world demand by about 30 million lbs. This was much more favourable than it was at one time anticipated and was undoubtedly due in large measure to the considerable increase in India's internal consumption which rose from about 274 million to about 305 million lbs.

The latest figures for the current year show that outturn from the major producing countries is slightly less than the 1961 figure and it may well be that India's internal consumption will again progressively increase.

We must, however, view with some anxiety the desire of governments of all the producing countries vastly to increase both production and exports. In the case of India alone, under the target which they have set of 900 million lbs. per annum at the end of the current five-year plan, the desired figure of exports is about 170 million lbs. above the present-day figure. With increased production from what might be termed the newcomers, that is to say Africa and other new sources of supply, it is apparent that if oversupply is to be avoided, world consumption must be steadily increased. With intensification of propaganda this may be possible but unless equilibrium between supply and demand is maintained, we may well face difficulty in coming years. On the other hand a measure of optimism may be based on the fact that in the past 10 years world demand has increased from approximately 1,200 million to over 1,600 million lbs. annually and production within the same period rose approximately from 1,160 million to 1,650 million lbs. Let us hope therefore that consumption and production figures will continue in reasonable balance.

The report was adopted.

BEKOH CONSOLIDATED RUBBER ESTATES

SATISFACTORY CROP

The forty-second annual general meeting of Bekoh Consolidated Rubber Estates Limited was held on October 10th in London, **Mr A. A. Estall** (Chairman) presiding.

The following is an extract from his circulated Review:

The Accounts for the year ended March 31, 1962, show a profit of £67,785 before taxation and provision for replanting and upkeep of immature areas. This is £3,567 greater than that for the preceding year and, bearing in mind the much lower prices realised for the crop, is most satisfactory. It will be noticed that cost of production is also less than for the previous year despite the larger crop harvested. Taxation is provided for in the sum of £18,749 as compared with £17,865 last year.

An interim dividend of 2½ per cent less Income Tax was declared and paid on May 21, 1962, and your Board now recommend a final dividend of 7½ per cent less Income Tax, making a total distribution for the year of 10 per cent, absorbing £21,384, and to carry forward to Profit & Loss Account the balance of £35,554.

During the year a crop of 2,689,500 lbs. was harvested, against an estimate of 2,592,000 lbs. which is indeed satisfactory. For the current year, to March 31, 1963, we have estimated for a total of 2,743,000 lbs., and to the end of August 1,018,500 lbs. have been harvested. It is confidently expected that our estimate will be attained.

The report and accounts were adopted.

THE KETTON PORTLAND CEMENT CO. LTD.

The thirty-fourth Annual General Meeting of The Ketton Portland Cement Co. Ltd., was held on October 11th at Albion Works, Sheffield. The Chairman, **Mr H. W. Secker, OBE,** presided and in his report, already circulated, said:

Mr Erik Elmquist, a member of the Board since its inception, decided to retire at the end of the financial year. It would be difficult to give adequate expression to the great assistance and benefits received from his good counsel. I am sure you will join in wishing him good health and happiness in his retirement.

Your Directors appointed **Mr J. A. Eadon** to succeed Mr Elmquist. He is well known to your Company and is Group Consulting Engineer for Thos. W. Ward Ltd.

INCREASED PROFITS

Despatches were 331,278 tons, compared with 326,506 tons in the previous year, and this is the second highest tonnage obtained by the Company. Profit, before tax, is £487,926, compared with £440,090 last year, an increase largely contributed to by an increased return on investment in Ribblesdale Cement Ltd., and a slightly higher profit margin on our own cement sales.

Charge for depreciation at £118,065, is £15,902 more than for the previous year and a full year's charge on new equipment in next year's accounts will considerably increase the total charge.

Taxation at £101,000 is £95,000 less than for the previous year owing to the influence of investment and initial allowances. The profit after tax is £386,926, compared with £244,090. In addition, we have brought back £5,000 in respect of tax previously over-provided.

Your Directors feel justified in proposing a final dividend of 17½ per cent on the ordinary shares making, with the interim dividend of 5 per cent already paid, a total of 22½ per cent less tax—an increase of 2½ per cent. Holders of 7½ per cent Participating Preference Shares will be entitled to the half-year's dividend of 3¾ per cent and an additional participation of £7 8s. 0d. per cent in accordance with the terms of issue.

It is considered prudent to allocate £200,000 to General Reserve (compared with £150,000 last year) bringing the total to £700,000. Additions to fixed assets amounted to £1,105,810, the bulk of which relates to the new unit.

The heavy capital expenditure is reflected in the Company's liquid position. At the end of the last financial year current assets exceeded current liabilities by £956,000; the excess is now £152,000. When the outstanding capital commitments have been extinguished the liquid position will, of course, gradually improve.

NEW PLANT IN OPERATION

Your Company's busy and rewarding year was concluded by bringing into operation the 5th unit which it is hoped will add 150,000 tons per annum to the works' capacity.

Buildings, plant and machinery have been maintained in good order, and we are constructing additional cement storage accommodation to give increased facilities for the despatch of bulk cement. Our road transport fleet has been further extended.

Ribblesdale Cement Ltd., jointly owned by The Tunnel Portland Cement Co. Ltd., has continued to operate at full pressure, and its subsidiary, The Horrocksford Lime Co. Ltd., has also been fully employed.

The report and accounts were adopted. Mr J. A. Eadon retired in accordance with the Articles of Association, and was re-elected. The retiring director, Mr D. F. Walton, was also re-elected.

APPOINTMENTS

LANCASHIRE COUNTY COUNCIL

RESEARCH ASSISTANT required in the Planning Department at PRESTON. Commencing and maximum salary according to qualifications and experience within range £670-£1,360 per annum.

Applicants should possess a good honours degree in economics, geography, sociology or related subjects and should be interested in problems of industry, population and housing.

Disturbance allowances and removal expenses to a maximum of £125 will be granted in approved cases.

Applications giving age, qualifications, present appointment, experience and two referees to the County Planning Officer (G), East Cliff County Offices, Preston, by the 30th October, 1962.

NIGERIAN INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH

UNIVERSITY COLLEGE, IBADAN, NIGERIA

Applications are invited from Economists for appointment as RESEARCH FELLOW. Appointment on contract for three years. Salary scale: £1,200 x £75-£1,650 (bar); £1,725 x £75-£2,175 per annum. Entry according to qualifications and experience. Passages paid on appointment, approved overseas leave and termination, where applicable, for member of staff, wife and up to five children under 21 years. Children's and car allowances. Part-furnished accommodation at rent not exceeding 5 per cent of Salary. F.S.S.U. Detailed applications (6 copies) naming three referees by November 15, 1962, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

UNIVERSITY OF EDINBURGH

CHAIR OF ECONOMIC HISTORY

The University Court invites applications for the Chair of Economic History, which has become vacant in consequence of the appointment of Professor A. J. Youngson to the George Watson's and Daniel Stewart's Chair of Economic Science.

The salary of the Chair will be not less than £5,000 per annum. The terms and conditions of appointment may be obtained from the undersigned, with whom applications (TEN copies) should be lodged not later than 31st October, 1962. A candidate from overseas may submit one copy of application.

CHARLES H. STEWART,
Secretary to the University.

September, 1962.

UNIVERSITY OF NEW ENGLAND

Armidale, New South Wales

ASSOCIATE PROFESSOR OR SENIOR LECTURER IN ECONOMIC HISTORY

Applications are invited for the above-mentioned position. The successful applicant will be expected to accept responsibility for work in Economic History at the University and for its extension and development.

The salaries for an Associate Professor is £A3,300 and for a Senior Lecturer £A2,550 x 95-£A3,000. Cost of living allowances are payable in each case amounting to £A42 at present. Provision is made for superannuation, travel and removal expenses and assistance in buying or building a house. Grants are made for sabbatical leave and for research.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in Australia and London on *1st November, 1962.*

NOTTINGHAM & DISTRICT TECHNICAL COLLEGE

BURTON STREET, NOTTINGHAM

Principal: D. A. R. Clark, M.Sc.Tech., M.I.Mech.E.

Applications are invited for the post of SENIOR LECTURER IN ECONOMICS.

Staff are expected to conduct research work. Consultancy work is allowed.

Salary in accordance with the Burnham Technical Scale as follows: £1,800 x £50—£2,000 per annum. A salary above the minimum may be paid in approved cases.

Further particulars and form of application may be obtained from the Principal to whom completed forms should be returned not later than October 21, 1962.

UNIVERSITY OF QUEENSLAND

SENIOR LECTURER IN ECONOMICS

The University invites applications for the above-mentioned position. Applicants should have high academic qualifications in Economics and some years experience in teaching at University level and/or economic research. The successful applicant will be required to teach in either Pure or Applied Economics, according to his qualifications.

The salary range for Senior Lecturer is £A2,520-£A 1,600, I x £80-£A3,000. The successful applicant will be entitled to F.S.S.U. type superannuation, Housing Assistance, Study Leave and Travel Grants.

Additional information on the conditions of appointment, staffing and activities of the Department, together with application forms will be supplied upon request to the Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S.W.1.

Applications close in London and Brisbane on *17th November, 1962.*

UNIVERSITY OF KHARTOUM

Applications are invited for the PROFESSORSHIP OF GEOGRAPHY.

Salary scale: Professor—£52,760 per annum. Generous allowances payable. Passages for self and family on appointment, termination and annual leave. Inclusive superannuation scheme, and arrangements can be made to maintain F.S.S.U. policies. Direct appointment on contract normally for 5 years with possibility of renewal (secondment welcomed if possible). Unfurnished accommodation provided at rent (excluding rates) up to 7½ per cent of Salary.

Applications (10 copies) detailing qualifications and experience and naming three referees by November 15, 1962, to Recruitment Secretary, University of Khartoum, c/o Inter-University Council for Higher Education Overseas, 29, Woburn Square, London, W.C.1.

For further appointments and other classified advertisements see page 192

UNIVERSITY OF EXETER

LECTURER IN AGRICULTURAL ECONOMICS

Applications are invited for the post of Lecturer in the Department of Economics, tenable at the Provincial Agricultural Economics Centre at Newton Abbot, Devon. Applicants should possess good honours or higher degrees in Economics and/or Agriculture with Economics, and should have some experience in research in the field of agricultural economics. The successful applicant will be required to undertake advisory work and should be familiar with the use of all farm management advisory methods.

Salary scale £1,150 x £50-£1,500 x £75 (efficiency Bar) x £75-£1,650.

Starting salary according to qualifications and experience.

Further particulars may be obtained from the Secretary of the University, Northcote House, The Queen's Drive, Exeter, to whom applications (6 copies—overseas candidates—1 only) should be sent by October 31, 1962.

COMPANY AFFAIRS

Prices of both gilt-edged and equities went into reverse in the London stock market early this week with investors uncertain as to the effect on prices now that the first six month period of the capital gains tax is up. But by Wednesday fears of heavy selling on that score had diminished and buyers returned to the market. Gilt-edged on Wednesday and Thursday met a strong demand and prices recovered most of their earlier falls. In equities, too, prices made good headway and THE ECONOMIST *indicator was slightly up over the week to Wednesday's close at* 334.2.

Leisure Steps Out

THE sun has shone brilliantly for Mr Charles Forte. Even before the details of the package offer of one £1 preference share and one 5s. ordinary share at 20s. each in **Forte's (Holdings)** were issued, the magic of his name pointed to a massive oversubscription. Then, on the eve of the prospectus, another catering and entertainment group, Mecca, published excellent results. The man who has built up the business retains firm control of it through his ownership of 71 per cent of the ordinary votes, but this has not damped the enthusiasm of investors.

The prospectus is one of the biggest on record and contains details not only of Mr Forte's present empire but of the companies which he is now acquiring. Present activities include: popular catering, mainly in the London area, under such names as Forte's, Fuller's, Quality Inns, Pronto and Stewarts (though there is no connection with the seaside Fortes cafes); hotels and restaurants, including the Waldorf, the Criterion and the Cafe Royal; airport catering; fourteen licensed houses; bakery, chocolate, confectionery, ice cream and other foods; bulk catering; and such miscellaneous investments as a majority stake in the "Talk of the Town" theatre restaurant and a half-interest in the Newport Pagnell service area on the M1. Companies which will join the group this year include the "Mr Whippy" soft ice cream business and the Belle Vue (Manchester) amusement and catering centre. The consolidation of the profits of these acquisitions into the accounts for the year to January 27th next should, the prospectus forecasts, produce a gross profit for the group as a whole of just over £1 million and net equity earnings of just over £475,000. On that basis, the forecast dividend of 18½ per cent. will be covered 2¾ times; the dividend on the "B" ordinary shares is waived until January, 1966, but a payment of 18½ per cent on these shares would bring the cover down to 1⅞ times. The ordinary shares are being issued on a prospective dividend yield of 4⅝ per cent.

The issue proceeds of just under £3 million will be used to repay accumulated bank overdrafts of nearly £2.8 million. This will leave about £1.2 million outstanding in loans, debentures and mortgages over and above the £1.5 million in preference shares. This and the market quotation for the ordinary shares leaves Mr Forte with plenty of financial room for further expansion, on which his heart seems set. The only danger with this issue is that Forte's will be a "glamour" stock, which is not an unmixed blessing, and that once dealings begin the market in its enthusiasm will run the price up too quickly.

The **Mecca** statement includes only one profit figure—an increase of £337,000 to an unspecified figure in net trading profits. This is vague, but it does indicate that the growth in leisure spending and in profits made from it is not flagging. But satisfying the public's tastes can be a costly business and Mecca is to raise £4 million by a rights issue in order to expand its dance halls and the growing chain of Silver Blades ice rinks. The new shares being offered are non-voting "A" shares. This may deter some institutions but the terms are attractive—one-for-two at 16s.—and the rights issue is to be accompanied by a one-for-ten scrip issue in "A" shares. The interim dividend has been raised from 8 to 11 per cent in order to equalise the interim and final payments (which together amounted to 22 per cent for 1961). On 22 per cent, the "A" shares at 39s. 6d. offer a prospective yield of 3.7 per cent on an ex all price of 29s. 9d. For the ordinary shares the yield on an ex all price of 48s. 3d. is still only 2.2 per cent. The returns are low but they reflect a good showing in the past and the growth potential of a group which seems to be in tune with the leisure needs of affluent teenagers.

Debenhams

ON the maintained dividend of 19½ per cent, Debenhams 10s. shares at 48s. 6d. yield 4 per cent, covered 1½ times. The fall in the price this week was justified. Against the competition of the multiples and the chain stores, the department stores have difficulty in pushing up sales while their traditional organisation, based on a wide range of goods under one roof, does not lend itself readily to the more modern forms of retailing. The edge once given to Debenhams, the biggest group of department stores in this country, by centralised, bulk buying has been blunted and its record over the last decade has not been exciting. The year to July 31st was not an easy one for retailers, and trade, particularly in the fashion field, was difficult in the first half of this year. The trading results, though no worse than expected after an interim statement had reported a fall of 4¼ per cent in gross profits in the first half of the financial year, are not impressive: trading profits in the full year have fallen by 2 per cent, from £8,599,000 to £8,433,000; gross profits by 3¼ per cent, from £7,219,000 to £6,945,000; and net profits by 5 per cent, from £3,564,000 to £3,387,000. Expenses, the directors say, are still rising but turnover since August has shown signs of improving.

The food division has been reorganised and the directors propose to expand in the "variety chain field." The 4 per cent yield still anticipates some tangible benefits from such policies of re-organisation and integration and could be expecting too much from the economies that can be secured. It also seems to expect a lot of the group's property potentialities. The directors are exploring these, but so far the results are limited to the sale of two small properties, apparently at a good profit. They have, however, opened discussions with a big property company about the re-development of two of Debenhams' bigger sites though these schemes cannot be "productive" for between three to five years.

Redland Holdings

DETAILS of the division of Eastwoods between Redland Holdings and Rugby Portland Cement have now been augmented by the issue plans of Redland Holdings which is paying just under £7 million in cash to Rugby for Eastwoods' non-cement interests, consisting of eleven brickworks and some sand and ballast pits, largely in the Midlands and the South, and 22 depots spread throughout England. These interests have accounted for a growing proportion of Eastwoods' profits, contributing about 70 per cent of its total attributable profits in 1961-62. Their acquisition will add about 50 per cent to Redland's profits and will be financed by a £4 million rights issue and a £3 million debenture (of which the details will be announced later).

One new 5s. share at 7s. each for every one already held is offered to Redland's ordinary shareholders. The directors forecast a dividend of 14 per cent on the bigger capital. With the existing shares standing at 28s. 6d. this will produce an effective increase in the yield from 3.6 to 4 per cent. This return compares favourably with the yields offered by other leading companies in the building industry, particularly as the deal will make Redland one of the biggest manufacturers of bricks in this country. Redland's profits were well maintained in the first five months of the current year and Eastwoods' turnover is higher.

Capital and Counties

LIKE most other property companies, Capital and Counties is still in the early stages of its development programme and its chairman, Mr L. Marler, says that precise dividend calculations from year to year are virtually impossible. For the current year, however, a dividend of 20 per cent (against 18 per cent) has already been forecast on the capital as increased by the one-for-seven rights issue. This raised £3.4 million, which practically covered the net increase of £3½ million in the group's holdings of freehold and leasehold properties in the year to April 30th. Bank overdrafts were cleared off and the group is well placed to add to its reserve of sites for future development. The directors' policy is to build up such a reserve of "developable areas" rather than pay inflated prices for "immediately developable" sites which in their view leave little or no room for profit. The immediate increase in profits from recently acquired properties will not, therefore, be large.

In the longer term much is expected from the Knightsbridge Green development project, on which a decision from the Minister of Housing is expected soon. Finance for this and certain other developments has already been arranged with the Norwich Union and the Prudential. In all this amounts to £18.3 million, of which £3¼ million had already been advanced by April 30th. The insurance companies will have the right to convert 20 per cent of this loan into the ordinary shares of Capital and Counties in such a way as to produce for them a gross yield of 6 per cent. At the moment the 5s. shares at 44s. 9d. offer an indicated yield of only 2½ per cent on a forecast 20 per cent, but the arrangements with the insurance offices look six or seven years ahead, when the dividend will have to be around 50 per cent to meet the stipulated yield on conversion.

Interims Up to Scratch

APART from Mecca the latest batch of interim reports and results from various sides of industry have done little to excite the market, for they mainly fulfil forecasts made earlier in the year.

Thus it was hardly surprising that **Dunlop Rubber's** profits fell in the six months to end June following the chairman's warning last May that certain factors were adversely affecting the group at home and abroad. The directors now say that although there was some improvement in trading in this country in the latter part of the period, trading overseas became more difficult. The volume of sales has been maintained but lower selling prices together with higher wage costs have more than offset the benefits of increased efficiency and

DUNLOP'S SALES AND PROFITS
(£ million)

Six months to	Dec. 31, 1960	June 30, 1961	Dec. 31, 1961	June 30, 1962
Sales	139·0	133·0	132·0	131·0
Gross profit	12·05	11·88	12·92	10·45
Net profit	3·37	3·24	3·84	2·26
Gross profit/sales	% 8·7	% 8·9	% 9·8	% 8·0

lower raw material prices so that profit margins are lower. Shareholders' disappointment with these results may be alleviated by the forecast of better results for the second half of 1962 but the directors do not expect profits to reach the record level achieved in the second half of 1961. This did not impress the market and the 10s. shares fell 2s. 4½d. to 28s. 9d.

As expected, the interim results from **British Insulated Callender's Cables** show a welcome improvement in profit margins but the chairman, Sir William McFadzean still regards the margins as inadequate in view of the group's heavy capital requirements. He attributes the improvement primarily to the benefits of the group's reorganisation programme over the last few years, rather than to bigger sales. Apart from those sections supplying the radio, television and consumer durables trades, profits from all BICC's operations at home and overseas have improved and Sir William expects profits in the second half to be about the same as those in the first half. This points to a bigger profit for the whole of the year than in 1961 while investment income, the bulk of which accrues in the second half, is likely to be unchanged.

A year ago **Babcock and Wilcox** gave the stock market a shock by passing its interim dividend and then surprised it pleasantly in April by keeping the full year's payment at 9 per cent with a final of that amount. Profits too were much better than seemed possible at the time of the interim statement and the chairman in his statement took a cautiously optimistic view of future prospects, pointing out that full provision had been made for losses on nuclear power contracts and that the expansion programme of the CEGB was expected to produce its fair share of orders for the group. The resumption of a 4½ per cent interim, the same rate as that paid two years ago, suggests that this view still holds.

With Bowater Paper's final dividend still in the balance shareholders of **E, S, & A. Robinson (Holdings)**, the makers of paper and containers, will be relieved by the directors' assurance that profits for the year to end-February should justify the same total dividend as the 17½ per cent paid for 1961-62. Profits of the home companies are lower but this has been partly offset by higher profits overseas.

Venesta also has a big interest in the container field and its directors hope to maintain the total dividend for 1962 at 17½ per cent. But they warn shareholders that profits will show a "marked reduction," and say that the chairman's forecast that less adverse factors would bear less heavily on profits in the second half of 1962 is not yet being realised. In the glass container industry trading is also difficult and **Rockware Glass** shocked the market by cutting its interim from 5 to 4 per cent; for 1961 it paid 14 per cent, covered almost twice. **United Glass** is holding its interim at 5 per cent,

but the directors say that profits, which this year will include those from Key Glass, will be below those for 1961. Both companies say that sales have fallen away.

There is better news, however, from **Sunday Pictorial**, which is raising its interim from the equivalent of 6¾ per cent to 7½ per cent. In June the chairman, Mr Cecil H. King, forecast that the record profits of 1961-62 were unlikely to be repeated, but while trading profits in the six months to end August fell by 4½ per cent there was a sharp increase in dividends from trade investments so that profits before tax at £1,005,000 were almost 11 per cent higher.

In the office equipment field, **Gestetner** has maintained its interim dividend at 7½ per cent after the one for three scrip issue—an effective increase of 1⅞ per cent. But this is in sharp contrast to the full year's results from **Ronco, which** bear out the chairman's warning of six months ago. Its ordinary dividend for the year to June 30th has been cut from 17½ to 14 per cent and trading profits have fallen by just over 25 per cent to £641,000.

If industrial profits are hard to earn at the moment the reverse is true for the discount houses, where the steady fall in interest rates has meant that the houses are earning such favourable margins on their holdings of short bonds that they can take the recent squeeze in bill profits well in their stride. This is reflected in the increase of the interim dividend of **Smith St Aubyn** from 7½ to 10 per cent; last year the total was 17½ per cent. The shares, which now stand at their 1962 peak, are to be split into 5s. shares, making them less "weighty." The biggest discount house, **Union Discount,** also forecasts an effectively higher dividend for with the announcement of a one-for-eight scrip issue the directors forecast an unchanged final dividend of 6¼ per cent on the bigger capital.

Hallmark Securities

HALLMARK SECURITIES is linked with Sun Life Assurance and as a result it has recently concentrated its developments on commercial and shop property. The chairman, Mr Sydney Bloch, says that the fruits of this association are now being harvested. This, however, was not the case in the year to end April when gross profits rose from £721,000 to £873,000. This increase was largely offset by sharply higher interest charges so that net profits rose by only £25,000 to £313,000. Earlier this year the 1s. shares fell back to 18s. on reports of some slowing down in house sales along the South Coast. But now the shares are back to 23s. 4½d., for if the trading results were none too impressive there is plenty of compensation in a dividend of 67½ per cent (against the equivalent of 49.6 per cent). Moreover, this is supplemented by a special payment of 7½ per cent as compensation for dividend restraint in 1960-61. The ordinary capital is to be doubled by a one-for-one issue to over £1 million, one necessary qualification for trustee status. On the doubled capital Mr Bloch forecasts a dividend of not less than 33¾ per cent, but with the shares currently yielding only 2.9 per cent, covered 1.7 times, there will be disappointment if this forecast is not surpassed. Hallmark may well achieve better results in the current year. Apart from any benefits arising from the Sun Life link, interest charges should not be so heavy and with mortgages easier to obtain Mr Bloch sees signs of an upturn in demand for houses.

Copper Dividends

THE highlight of the Rhodesian copper company results for the year to June 30th is the unexpected increase to 7s., before Rhodesian taxes, in the dividend of **Rhodesian Selection Trust.** A dividend of 6s. had been forecast at the time of the merger with Roan Antelope. After falling early in the year, copper shares are now about 13 per cent above the low point touched in June. Even so, RST gained a further 1s. 6d. to 31s. 3d. following the dividend announcement and now yield 13.4 per cent, net of Rhodesian tax. Including £2,970,000 from Roan, RST's gross profit has risen from £7,742,000 to £12,352,000. The net profit of **Mufulira,** reflecting expanded production at lower cost, rose from £4,194,000 to £4,969,000 and its dividend has been raised from 6s. to 8s. 6d. a share. RST holds about 65 per cent of **Mufulira's** capital.

In the Anglo American group **Rhokana** has maintained its dividend at 7s., net of Rhodesian taxes. Its gross profits were practically unchanged at £9,617,000, against £9,507,000, but its investment income fell because Mufulira and Bancroft reduced their 1960-61 payments. Rhokana's net income was therefore slightly lower at £10,767,000 against £10,956,000. The agreed curtailment in Rhokana's sales affects profits in the same way as a straightforward cut in output, as stocks are brought into the accounts at cost and it looks as if expanded capacity has offset this restriction of sales. At 47s. 9d., Rhokana yields 14¾ per cent.

Bancroft produced the shock of the dividend season by halving its payment to 4½d., net of Rhodesian tax. The mine pays no tax and therefore the sharp drop in operating profits, from £2,745,000 to £2,122,000, is fully reflected in equity earnings. The capital expenditure appropriation has been maintained so that the cut in earnings is borne entirely by ordinary and participating preference shareholders. Bancroft's units dropped to a new low point of 7s. 9d. after the results.

Rhodesian Anglo American, whose income will be affected in the current year by the cut in Bancroft's payment, reported an increase in net profits from £9,356,000 to £9,514,000 and has maintained its payment at 8s. a share, net of Rhodesian tax. The net yield at the current price of 58s. 3d. is 13¾ per cent. Because of the hitch in the payment of dividends by Union Minière, the net profit of **Tanganyika Concessions** in the year to July 31st slumped from £3,296,000 to £875,000 and its dividend has been cut from 3s. 3d. to 9d. per share.

Wright's Biscuits

THE name of Wright's Biscuits is now something of a misnomer for while the company owns two modern biscuit factories its real strength lies in its retail grocery interests. The group had 750 shops at the end of June; in addition, it has a 36 per cent holding in Moores Stores, which following its merger with Thrift Stores and the earlier acquisition of 102 Mence Smith stores from Timothy Whites now owns about 1,100 stores. Mr W. P. Webster, the chairman, says that the integration of Thrift Stores into the Moores group should bring considerable advantages for Wright's. The stake in Moores is worth about 20s. per Wright's share, now standing at 32s. 6d.

This puts only a modest value on Wright's trading prospects. In the year to June 30th Wright's trading profits after depreciation rose from £508,000 to £663,000 and the chairman expects continuing progress in the current year though not at such a rapid rate as in 1961-62. In the longer term the improvements now being made to manufacturing plant and to retail shops should add to profits. These will include the conversion of stores to self-service as well as three supermarkets. But in view of the capital expenditure involved and of evidence in some parts of the country that supermarkets are running ahead of customers Wright's penetration into this branch of retailing is likely to be cautious. Only 31 of its stores had been converted to self-service by June this year. The company's profit record and the market's assessment of the shares, which puts them on a yield of 3¾ per cent, suggest that the right balance between adventure and caution has been attained.

Greenall Whitley

BREWERY take-over prospects are much fewer than they were two years ago, before Mr E. P. Taylor's brewery group, Charrington United, swallowed so many of them. Greenall Whitley would fit Charrington United's quest for new outlets for it trades largely in Lancashire and Cheshire, where Charrington United is weak. Rumours of a possible bid gained fresh currency last week on the resignation of Mr Edward Greenall from the board. The Greenall and Whitley families together could block any unwelcome take-over attempt, for they hold the bulk of the £300,000 of "A" ordinary capital carrying some 24 million votes, compared with 14.2 million votes controlled by £3.6 million of ordinary capital. The possibility of a bid has brought the 5s. ordinary shares up this year from 24s. 1½d. to 39s., which includes the 2s. 3d. gained this week on the preliminary results of a property revaluation.

Early publication of these results may reflect the wish of the directors to justify the high price of the shares and possibly to deter any would-be bidder. The surveyor's report values the 1,800 public houses at £25½ million, compared with a written down value of £10 million. The surplus is equivalent to about 20s. per ordinary share and brings their break-up value up to 35s. But it is a surplus that can only be effectively released by a bid. And the yield of 2¼ per cent is not justified unless Mr Taylor or someone else is prepared to pay what looks like a high price for further trading outlets. Mr Taylor has paid high prices before.

EXCHEQUER RETURNS

For the week ended October 6, 1962, there was an "above-line" deficit (after allowing for sinking funds) of £7,463,000 compared with a deficit of £45,729,000 in the previous 8 days and a surplus of £7,900,000 in the corresponding period of last year. There was a net expenditure "below-line" of £9,924,000 leaving a total cumulative deficit to date of £526,700,000 compared with £644,242,000 in 1961-62.

THE MONEY MARKET

IN anticipation of a higher demand for bills from the banks following Monday's release of special deposits the discount market was clearly anxious not to run down its portfolio, and at last Friday's Treasury bill tender it again raised its bid—by 1d. to £99 1s. 11d. The average rate of discount fell a further 4.29d. to £3 12s. 4.13d. The market's allotment, however, fell from 51 to 37 per cent and only £220 million of the £250 million of bills on offer were allotted. The reduced allotment reflected the full market subscription of the 4 per cent Treasury Stock 1965. Total applications for bills rose by £8 million to £415 million.

Credit continued tight in Lombard Street at the end of last week with heavy calling from the banks as a result partly of the delayed effects of the rail strike and partly of the subscriptions to the Treasury and Liverpool issues. But the authorities were prepared to give a very large amount of help both on Thursday and Saturday. On Monday the release of the first half of special deposits helped the market and credit was in ample supply. The authorities sold back a small amount of bills to absorb surplus funds. Since then houses have continued to be comfortably placed.

APPOINTMENTS

PA APPOINTMENTS DIVISION

ECONOMIST — **Group Development**

In order to intensify its recent good growth rate, a group with a multi-million turnover has recently given one of its directors the full-time responsibility of recommending ways of expansion and diversification. An economist is to be appointed *to join this director's* small high-powered "business" team to carry out appropriate surveys, collate and analyse statistics, recommend lines of investigation, study economic trends and generally assist in future planning. A good economics degree and *sound statistical training* are essential; knowledge of finance and familiarity with a *process-type industry* are desirable. The group wishes to avoid appointing a backroom specialist, hence personal qualities and ambitions should be appropriate to potential line management. A salary of around £2,500 will be available, plus bonus and good side benefits. The location will be pleasantly within 20 miles of London. (Ref. AA5/927/TE).

The identities of candidates will not be revealed to our clients without prior permission. Applicants should forward brief details, quoting the reference number, to:—

Personnel Administration Limited, Appointments Division, 2, Albert Gate, London, S.W.1.

GLASGOW · MANCHESTER · BRISTOL · BIRMINGHAM
DUBLIN · LEEDS · PARIS · FRANKFURT · MILAN

HASTINGS COLLEGE OF FURTHER EDUCATION

ARCHERY ROAD, ST. LEONARDS-ON-SEA

Required, as soon as possible, Assistant Lecturer (Grade A) to teach Commerce and Arithmetic to full-time students, with opportunity to teach Economics to G.C.E. "A" level from September, 1963.

Salary scale £570 to £1,170, with *graduate* addition up to £200. Increments for approved service in commerce.

Application *forms*, obtainable from the Principal, to be returned by 22nd October. Suitably qualified registered disabled persons will be considered.

TRANSPORT ECONOMICS

The Economist Intelligence Unit invites applications for a new post in connection with studies of development and transport economics. Applicants should have a good degree including economics, and should have had experience in transport or industry, or in other relevant fields. Salary according to qualifications and experience. *Applications*, including detailed curriculum vitae, to "Research," 5 Bury Street, St. James's, S.W.1.

RESEARCH ASSISTANTS

required by the International Co-operative Alliance's London Secretariat. A good degree in economics or related subjects, together with a knowledge of European languages is needed. The work is varied, ranging over economic information, management questions and international problems. Candidates for these posts must be able to express complex ideas in a good English style. Further details from the Director, 11 Upper Grosvenor Street, London, W.1.

ECONOMIST OR STATISTICIAN

The Economics and Statistics Department of the Cotton Board requires a *young graduate (male)* with good qualifications in Economics and/or Statistics. Post-graduate experience would be an advantage but is not essential. The work includes economic intelligence and research on a wide variety of matters concerning the textile industry and involves contact with top management. The starting salary will be commensurate with age, qualifications and experience. The post provides good prospects and excellent experience. Applications, giving full details, should be addressed to Director of Statistics, The Cotton Board, 3, Alberton Street, Manchester 3.

ECONOMIST

for industrial *market research*. Candidates should have a good degree and not less than two years' experience of marketing or market *research* in industrial products, and should be capable of planning and carrying out research with a minimum of supervision. *Age range* 25-30. Permanent well-paid position with good prospects available for suitable applicant. Applications giving full *details* should be sent to the Chief Personnel Manager, Turner Brothers Asbestos Co. Ltd., Rochdale.

THE G.E.C. PENSION FUND

ASSISTANT INVESTMENT MANAGER

This vacancy offers considerable opportunity to a person aged 23-26 with some investment knowledge who wishes to widen his *investment experience*. All aspects of investment from policy formulation to day-to-day business will *be involved*. The fund exceeds £20,000,000.

The applicant should have obtained, or be studying for, a recognised *qualification and a salary of* approximately £1,200 per annum is envisaged.

Apply in writing, giving details of experience and qualifications to:

The Staff Manager,
THE GENERAL ELECTRIC COMPANY LTD.,
Greycoat House, Greycoat Place, S.W.1.

For other appointments *see page 183*

BP has a vacancy for a STATISTICIAN in its expanding team of Mathematicians and Statisticians at the Research Centre at Sunbury-on-Thames. Candidates should have an honours degree in Statistics *or in Mathematics* with a diploma in Statistics. They should also have a good basic knowledge of Physics and Chemistry. Work will include the design and analysis of experiments connected with research at the small scale and pilot plant levels and *investigations* on refinery plants. Other aspects of the Company's operations will also be involved, and there will be opportunity for original work. A modern electronic computer is available. Salary according to age, qualifications and experience. Non-contributory Pension Fund. Housing Scheme. Removal expenses and settling-in allowance payable in certain cases. Luncheon Club. *Write giving* full details, quoting reference H.5916A, to Box 7138 c/o Hanway House, Clark's Place, E.C.2.

APPOINTMENT REQUIRED

ECONOMICS GRADUATE, 35, good general knowledge, can write well on any subject, given the material, seeks free-lance work. "Ghosting," technical writing, etc. Box 1661.

GKN COMMERCIAL INTELLIGENCE

The **G.K.N. GROUP RESEARCH LABORATORY** has established a unit to assist a Group advisory committee in the consideration of new products. The unit investigates both economic and technical trends over a wide range of industrial markets and products.

Applications are invited for a vacancy in this unit. The person appointed will *preferably* be not over 35 years of age *and will have had experience in* **Industrial Market Research or Commercial Intelligence**, and probably (but not necessarily), be a graduate in Economics or Commerce.

Applicants should have wide interests in economic and industrial affairs, ability to work without close supervision, and be capable of writing objective and literate reports on their studies.

Staff conditions are good and the Laboratory is situated on the western edge of the Midlands conurbation not far from pleasant countryside.

Please write giving details of age, experience, qualifications and present salary to the:

Personnel Officer, G.K.N. Group Research Laboratory, Birmingham New Road, Lanesfield, Wolverhampton.

BUSINESS AND PERSONAL

CONSULTANT STATISTICIAN, extending his private practice, invites inquiries from firms. Box 1660.

John is not actually buying stocks and shares. But he is wisely putting aside part of the household budget for insurance protection for his family. Home Service Insurance Offices invest a substantial part of their policyholders' funds in industry and commerce. As these prosper John gets better value for his money. This sensible arrangement is helped by the regular visits of the friendly Home Service insurance man to 10 million families.

With a bottle or two of Dry Fly Sherry you will be fully prepare for anyone. For Dry Fly—a *medium* dry sherry—is special blended to cover the widest possible range of tastes. 18/6 a bottl

Those who prefer a dry sherry should try CECILIA, *a delicate Amontillado; and for sweet tastes—*
GOLDEN CHANCE, *a rich Oloroso Cream, both at 20/6 a bottle.*

GREET YOUR GUESTS WITH
FINDLATER'S SHERRIES

A copper seal used more than 4 centuries ago. This seal was used by Toyotomi Hideyoshi, Japanese military leader (1536-1598) during his rule for most important documents. On it are engraved verses from an ancient poem which signify good fortune and longevity and contain the word Tokai (東海); hence the name of the Tokai Bank.

Ever since its establishment this bank has enjoyed continued growth and prosperity. Today it is one of the leading banks in Japan with 176 branch offices strategically located and staffed with more than 9,000 employees—many of them experts in the field of foreign trade. With this nation-wide network of branches, Tokai Bank is in a position to offer unrivalled service to whoever trades with Japan.

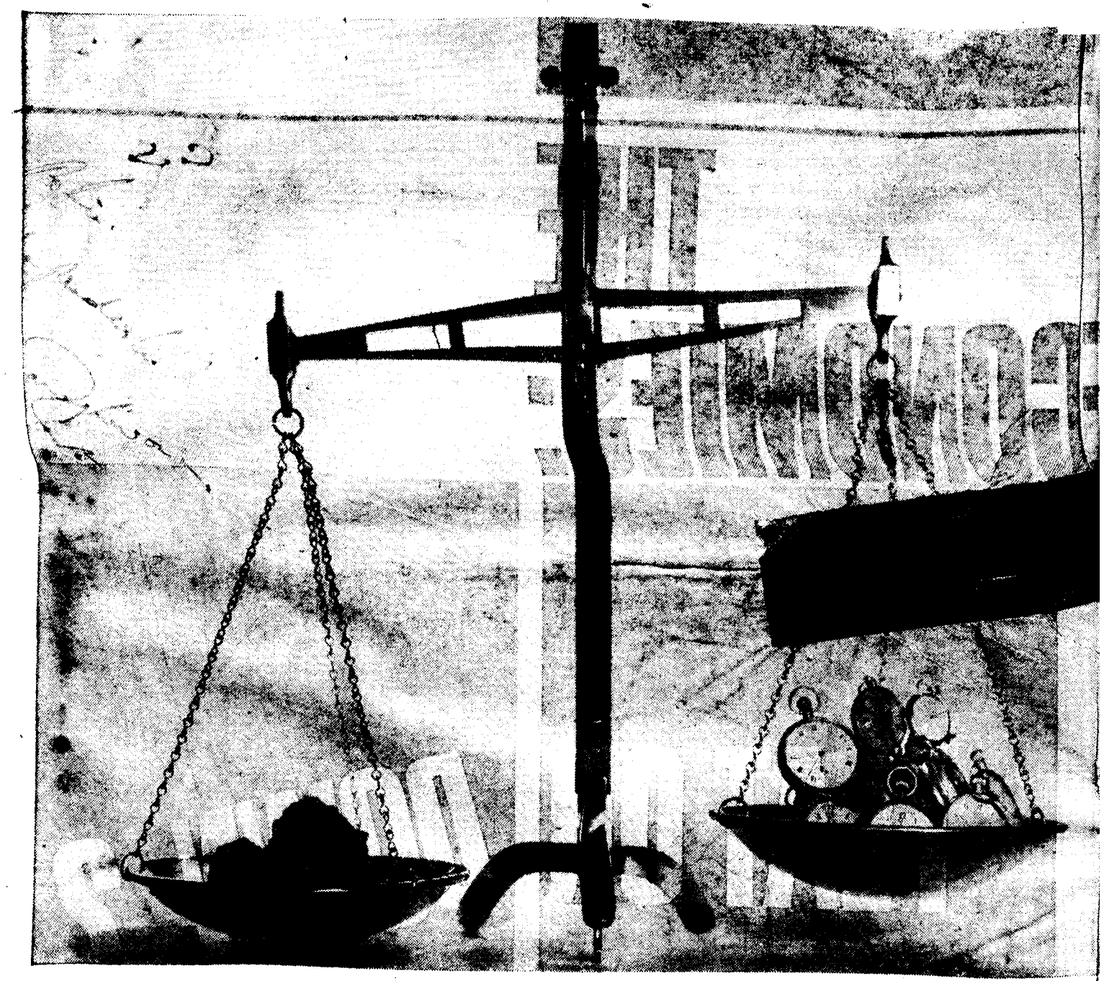
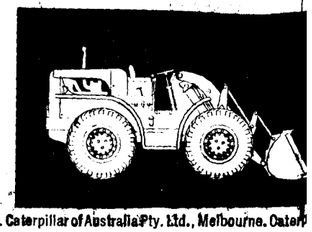
WHICH COSTS YOU MORE EARTH OR TIME?



In any earthmoving problem the race is between time and production: this is what produces the operating cost. No company on earth knows as much about the principles of low-cost earthmoving as Caterpillar. For decades Caterpillar's experience and research have continued to produce the best machine for the job, and a world-wide spare parts service stands behind every piece of equipment. Which costs you less? It is a question Caterpillar can answer best.



CATERPILLAR WORLD'S GREATEST NAME IN EARTHMOVING

HOME

MONEY TALKS . . .

World deflation is an unpleasant possibility. Will the western economic managers recognise it as soon as it appears; and will they dislike it enough to stop it? (p. 283).

- The **National Economic Development Council's** first published thoughts are hopeful, but may not mean much yet in real terms (pp. 216 and 284).
- **Exports** are no longer rising, but **imports** now are (p. 290).

The reform of **local authority finance** will centre on Exchequer borrowings: a correspondent suggests an alternative approach (p. 285).

Tourism is Britain's **seventh largest** export earner, and no mean spinner of native cash, either: with a little self-improvement, it could do better still (p. 214).

Choosing the decimal unit: first round to the pound (p. 299).

PEOPLE SAY . . .

The demands now being made in Britain for *the mounting* of a **referendum**—or a **general election**—on the issue of the entry into Europe should be treated seriously—and then rejected (p. 211).

Public opinion on the **party conferences** has been less favourable than the parties hoped—and perhaps expected—it would be (p. 216).

All three parties are hanging on the results of the *five pending* **by-elections**, which may be a better pointer than usual to the outcome of any imminent general election—and one particular result may make all the difference to its imminence (p. 216).

More readers' thinking on the common market (p. 224).

MAN PROPOSES . . .

Dr Beeching may be planning to sap the **railwaymen's** wrath with pay rises, instead of using the extra money to ease the lot of the redundant men they are angry about (p. 218).

Mr Gaitskell's new posture on the common market fence has led him to press for more on behalf of the **Commonwealth** than the Commonwealth needs—or perhaps wants (p. 223).

An advisory council has turned down a scheme for training **young offenders** without locking them up (p. 223).

Matchmakers play the numbers game (p. 299).

WHO DISPOSES?

There is a **pressing need** for some overall regional control in the wastelands of the **Liverpool-Manchester** complex: both authorities are trying hard (p. 255).

The task set to Selwyn Lloyd—to report on the **Conservative Party's** organisation—may be less harmless to the party than the party thinks (p. 220).

The arts were better cared for in Britain this year: but the provinces have done less well than London (p. 260).

CITIES NEED RELIEF

The Economist Motor Survey, 1962

pages 261—280

INTERNATIONAL

AFRO-ASIAN DISUNITY

At the United Nations:

The **Afro-Asian** block is often pictured as a massive *monolith*, single-mindedly bent on attacking European interests. On closer look, this image falls apart (p. 209).

On Home Ground:

Ripples from **Yemen's** revolution wash against Arabia's ramshackle edifice of kingdoms, sheikhdoms and British proconsuls (p. 212).

Under a banner of anti-Nasserism, Syria's leaders are trying out their own version of democracy (p. 243).

Mr Nehru is responding to Chinese infiltration across India's frontier with Churchillian talk and disclaimers of Churchillian action (p. 237).

China, meanwhile, is working to isolate India from its Himalayan neighbours (p. 217).

Sir Hugh Foot's resignation brings home the British Government's dilemma in **Southern Rhodesia** (p. 218).

Mr Tshombe goes on stalling (p. 218).

Was it wise of Britain to sell Buccaneer aircraft to South Africa? (p. 217).

EUROPE'S BATTLEFIELDS

General de Gaulle's political campaign has the professional gloss of a military training (p. 238).

Dr Adenauer's journey to Washington is a chance for the dogged Chancellor to show that anything his juniors can do, he can do too (p. 237).

Mr Khrushchev still procrastinates over his peace treaty with east Germany, but his terms do not get any better for the West (p. 217).

Flemings and Walloons in **Belgium** persist in finding it hard to coexist (p. 220).

The floods in **Catalonia** took a greater toll in human lives than in human property (p. 241).

AMERICA'S CAMPAIGN

This year's gubernatorial contest in **New York** may be a dress rehearsal for the presidential election in 1964 (p. 245).

In **Illinois**, President Kennedy has to campaign against a Republican Senator who has been helpful to him (p. 246).

Unemployment shows no sign of ceasing to be a long-term problem (p. 248).

Mr Khrushchev is taking part in this year's election (p. 246).

PREVENTING THE WAR

Two new books on the nuclear arms race suggest a proposition that might, just might, help to keep the peace (p. 229).

Detailed contents on page 209

Detecting the drag

This is the Walpamur brushability test. A sensitive mechanism,
which records the exact amount of pressure exerted when a coat of paint is applied,
shows at once if the brush drags. The purpose is to ensure that every
Walpamur Paint spreads smoothly, evenly and is therefore easy to apply.
It is testing such as this — ruthless and ceaseless — which conserves the quality of Walpamur Paints.
And it is thus that The Walpamur Company, with its overseas factories and multiplicity
of branches, maintains its position of pre-eminence in the world of paint.

CALL FOR STEEL Looking like a giant hair-dryer, this new phone booth at Stavanger houses telephone equipment manufactured by Standard Telefon A/S. This company also makes deep-freezers and refrigerators and uses sheet steel from The Steel Company of Wales.

THE CITY OF STEEL SELLS TO NORWAY

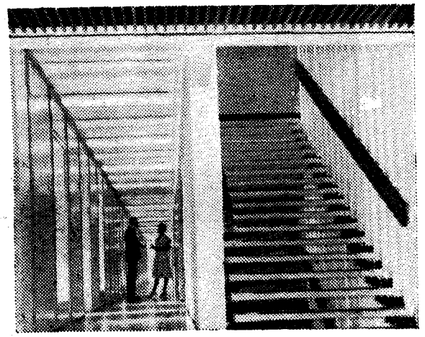
Norway, in area the fifth largest country in Europe, has a population of 3,601,000 almost equally divided between urban and rural areas. At least 4/5ths of the country is more than 500 ft. above sea level. The economic development of the country is rapidly progressing. Living standards are among the highest in the world and in the last four years wages have increased by 20%.

There is full employment in Norway and by far the largest groups are those working in industry and mining (25%), agriculture (17.2%) and commerce (10.8%).

In order to maintain her living standard Norway needs to participate in foreign trade. In 1959 her total imports and exports amounted to approximately £212 per inhabitant. Only eight other countries in the world were ahead.

The Steel Company of Wales exports sheet steel and tinplate to Norway for her industries. Last year the total *world* exports from 'The City of Steel,' the Company's vast steelworks at Port Talbot, amounted to £34 million. This included 54.7% of Britain's sheet steel and 72.8% of her tinplate exports, and these figures were achieved in the face of heavy competition.

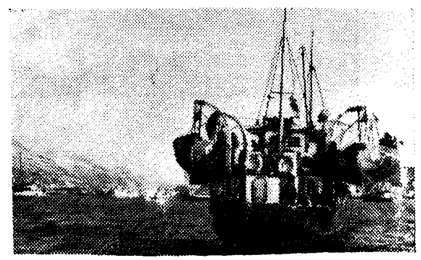
Visitors gaze at the Henrik Sørenson theme-mural in Oslo City Hall.



BRIGHTER OFFICES—WITH STEEL The steel partition walls in this building of the firm of Gustaf Aspelin Co. at Alnabru were supplied by Høvik Verk, a customer of The Steel Company of Wales.

OSLO GOES UNDER ▶

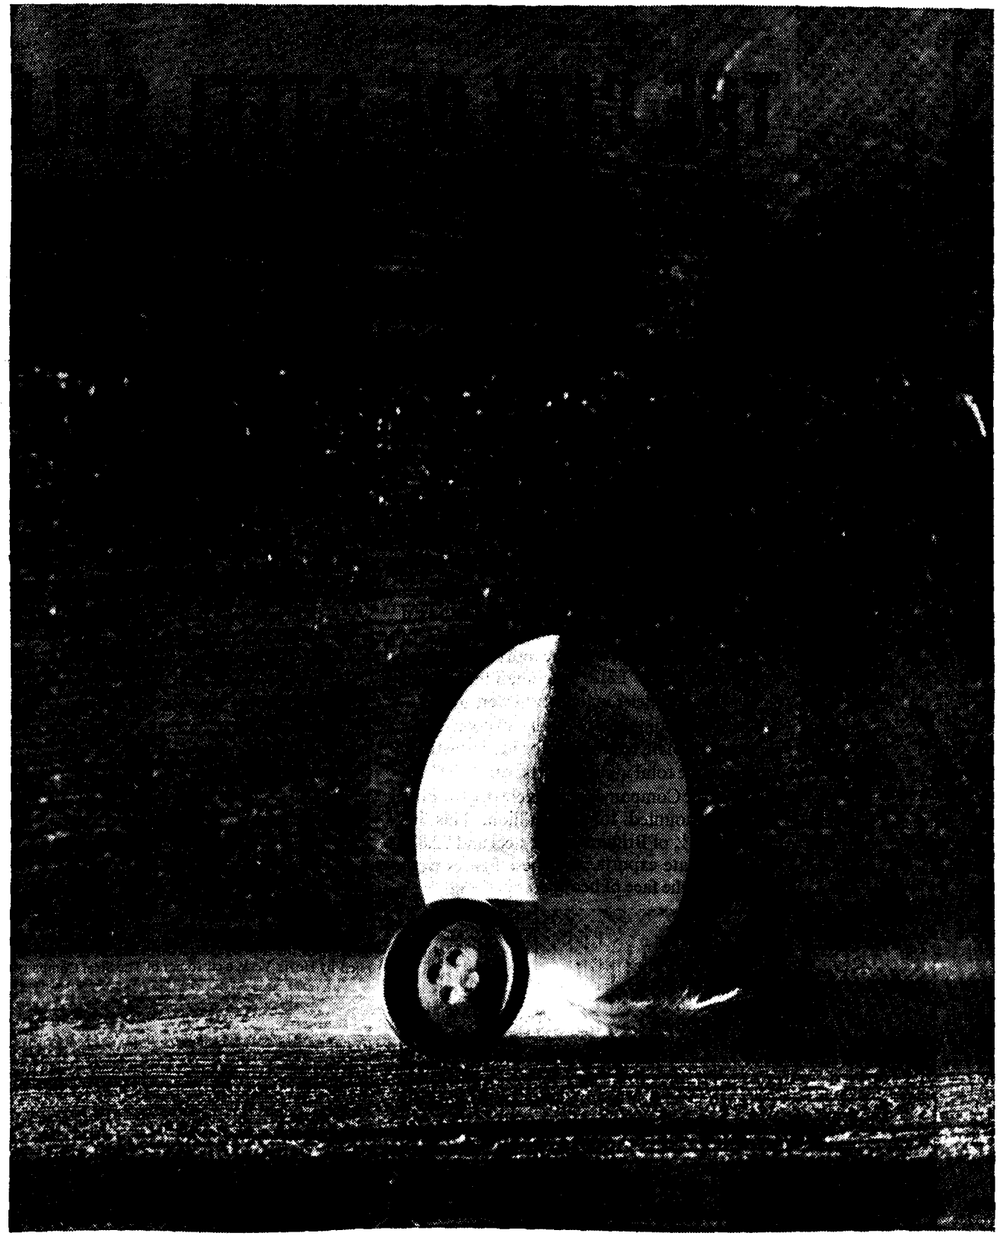
Like most world capitals Oslo has traffic problems. Here is Karl Johans Gt. in the city centre. By 1964 a new underground railway will be in operation, relieving the city's congestion. Passenger coaches are now being made by Strømens Verkstad, using sheet steel imported from The Steel Company of Wales.



NORWAY'S MARITIME WEALTH The catch from these fishing vessels will go to one of the Norwegian fish canners, many of whom are users of tinplate from The Steel Company of Wales.

Steel for the World from Wales

THE STEEL COMPANY OF WALES LIMITED



Everyday AMF solves fascinating problems with unique products

Two very ordinary unrelated items. And yet when you put AMF in the picture they have much in common. Both have benefited from AMF's versatility in the field of research, engineering and manufacturing. Take the egg. Hens lay eggs when it's light. So the longer it's light the more eggs will be laid. AMF Paragon makes time switches for industry. They even make time switches that control poultry house lighting! With these automatic timers chickens get up earlier, have longer 'daytime' to lay more eggs and the poultryman can stay in bed a little later. Everybody's happier. And the button? AMF makes an automatic button stitching machine that duplicates the most skilled hand stitching — only better, more economically — and almost three times faster: Stepping up production is every day work for AMF machinery. In many lands, in many fields, problems are being solved with unique products—thanks to AMF International.

THE HILTONS AROUND THE WORLD

Clearly, no one in his senses would use chewing gum at a time and place such as this.

However there are times and places where the use of chewing gum can be most beneficial; in fact its discreet use is a mark of tact and consideration for others as it is a definite aid to oral hygiene.

Doublemint chewing gum is especially made for such people. Its ingredients are carefully selected throughout, even its flavour has been double distilled; in fact, as its name implies, Doublemint is double good and gives you double benefits in many ways.

Try some at the right time and in the right place and see for yourself.

Why Kofi Asare moved house

Kofi Asare grew up in the quiet Ghanaian fishing village of Tema; going out in the boat every day with his father and brothers. Until two years ago he lived in a reed hut—like the rest of the villagers. But today, Kofi is a man with a promising future! With the building of the new £27,000,000 harbour at Tema (Africa's largest man-made port) his whole way of life has changed. Kofi now lives in a house in the new township of 40,000 people, and works as a leading hand on one of the modern fishing vessels operating out of Tema. His children attend a new primary school and his wife shops in modern surroundings. Ghana's Tema harbour has brought a new standard of living to Kofi and to thousands of others like him.

Atlas Copco compressed air equipment and Sandvik Coromant drill steels and bits were used extensively in the construction of the harbour and its connecting roadways. Tema harbour is only one of the many large engineering projects in which Atlas Copco and Sandvik Coromant equipment have played an important role. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

VOLUME CCV - NUMBER 6217

No Afro-Asians

WHEN newly independent Uganda is admitted to membership of the United Nations, as it is expected to be next week, the total membership will rise to 110 states. Exactly half of them, 55, will be Asian and African states. The change that has affected the United Nations since it was set up in 1945 with only twelve Asian and African members out of a total of 51 founders is sweeping. A visitor to this year's Assembly session in New York has only to glance up at the presidential podium to see what looks like a neat bit of symbolism. In 1960 it was Mr Boland of Ireland who sat high above the ranks of delegates, and he was flanked by Mr Hammarskjöld and Mr Andrew Cordier of the secretariat: two Europeans and an American. Today, it is Zafrulla Khan who presides, flanked by U Thant and Mr Narasimhan: a Pakistani, a Burmese and an Indian. And the only other serious contender for the presidency this year was a Ceylonese.

Asia and Africa have not attained a representation in the UN Assembly to match their predominant share, about two-thirds, in the world's total population. There is no possibility of the Assembly's Afro-Asian members ramming through a decision in the teeth of other members' solid opposition; for an Assembly resolution on any matter of substance requires a two-to-one vote in favour. The west European and American countries command forty votes, and could block any move that made them feel they must close ranks, even if it was being pushed by the Soviet block as well as by the entire Afro-Asian membership. Theoretically, the admission to the UN of another dozen emerging African states could bring it within sight of an automatic two-thirds majority in favour of any resolution solidly backed by the Asians and Africans and by the Russians. But in practice there has never been a line-up on such a sharply defined basis, and there is not likely to be. This is the significant point, and one too often overlooked by everybody.

It is, in fact, rare to find all the Asian and African states taking up the same attitude to a contended issue, either in the United Nations or outside. When they do, they are not alone. For instance, the plenary resolution on Southern Rhodesia on October 12th, which asked Britain to secure the release of Mr Nkomo and the lifting of the ban on his Zapu party, was carried by 84 votes to 2 (Portugal and South Africa). Twenty west European and American countries voted for it. In the last Assembly a series of resolutions on African issues were carried by majorities of between 90 and 99; some of them had the support of almost all the European members.

The notion, reflected in some recent utterances by British ministers, that in these matters the Afro-Asians are often led by the nose by the Russians, is not borne out at all by the record. On the contrary, a recurring pattern in the Assembly in the last few years has been the firm rejection by the Afro-Asians of Soviet proposals which Moscow had taken some pains to tailor to provide the maximum appeal to anti-colonial feeling. Considering that it is one of Russia's persistent aims to appear as the true champion of all struggles for national liberation, it is remarkable how often it has seen its supposed protégés set its drafts aside in favour of their own. It is equally noteworthy how consistently the Afro-Asians have tailored their own texts with an eye to attracting support among the western countries, instead of seeking a head-on collision with them.

Even to speak thus of "the Afro-Asians" is liable to mean putting misleading

emphasis on their unity. Faced with a question like that of Portugal's African colonies, it is natural and easy for them to unite. It is the common experience of European domination that binds together peoples as diverse and remote from each other as Indonesians and West Africans. But Afro-Asian solidarity, being so largely a European creation, can thrive only in soil fertilised by European efforts to hold on to positions of domination and privilege. The diehards of southern Africa are now the main prop and stay of that solidarity; where would it be without them?

Platform symbols: U Thant, Zafrullah Khan, Mr Narasimhan

The common struggle for economic development might be assumed to give all Asia and Africa a basic unity, regardless of political orientations. In practice, brotherhood in poverty is a fragile bond. Naturally Asians and Africans, with Latin Americans and others, are joined in pressing at the United Nations and other diplomatic centres for more generous economic aid from the advanced countries, for stabler commodity prices, for better terms for their own exports. But they are rivals as much as comrades in these struggles. It is perhaps here that their achievements of solidarity in the UN are most artificial in character, for the Assembly and the UN's economic organs are well suited to the airing of common grievances, while the silent in-fighting about the distribution of such concessions and aid as are available goes on elsewhere. According to each underdeveloped country's individual circumstances, its needs and hopes of succour from advanced nations may lead it to adopt a political posture best calculated to bring it economic advantages. The common urge can have strongly divisive effects.

There is much else that divides. It is too often assumed that the Asian and African countries can be simply classified according to their military links. At one extreme, the West's allies and associates in defence agreements: Turkey, Persia, Pakistan, Siam, the Philippines, Formosa-China, Japan, South Korea; at the other, communist Mongolia, China, North Korea, North Vietnam; between the two, the great mass of the "non-aligned," some of them shading penumbrally toward one extreme or the other according to their degree of dependence on supplies of arms from Soviet or western sources, their readiness to provide bases on their soil, or their recourse to one great power or another for training missions or places at staff colleges. Another, and just as over-simple, approach has been to classify the Afro-Asians by their acceptance of economic aid from Russia, the West, or both. Neither formula does any justice to the kaleidoscopic variety of these countries' political positions.

One has only to look at the UN voting records to see how divided the Asian and African countries show themselves on issues that range from the Congo to the Chinese seat and the financing of the organisation itself; how the lines of division change in each case, and sometimes change with time too. Similar divisions, less formalised but just as telling, emerge when Asian and African leaders forgather outside the UN—for example, at last year's Belgrade conference. They underlie and explain the fact that the first Afro-Asian "summit" meeting, held at Bandung in 1955, has never been repeated, although Indonesia has long been canvassing a repetition.

The supposed Afro-Asian "block," so often pictured as a vast and menacing monolith, is in fact criss-crossed with rifts. As the number of new independent states has increased, the rifts have multiplied. Old leaderships have been challenged; new feuds have broken out. Quarrels among the Arab states have long been famous. The African estrangement between the "Casablanca" radicals and the "Monrovia" moderates is already familiar. Less commented upon, as yet, have been the simmering ill-will between India and Indonesia, and the ripples of speculation spreading through the African and Arab worlds as the appearance on stage of a newly sovereign and tough-minded Algeria portends the remaking of established patterns of influence.

A NUMBER of these alignments among the non-aligned have, in the past few days, revealed their interplay in an embarrassingly open fight for the seat on the UN Security Council that Egypt will vacate at the New Year. Precedent allots this seat to an Arab or Middle Eastern country, and Morocco was an early candidate for it, backed by the Casablanca group. As the only other Afro-Asian on the Council is Ghana, another Casablanca state, the Monrovia group would not accept Morocco; and, after a confused interlude during which Ethiopia and Mauretania offered their services, the Monrovia states found a more formidable candidate in Nigeria. The elections, which had been fixed for October 11th, had to be postponed to give time for private parleying.

But this delay, far from enabling the disputing factions to reach a compromise, yielded a third candidature, that of Persia. After two ballots, Morocco won the seat on Wednesday. These votes are secret, but the shifting line-ups clearly reflected not only the unhealed breach between Casablancans and Monrovians, but also divisions of opinion about how to meet emergent Africa's claims to more representation, about the proper balance between Africa and Asia, and about the changed status of the Arab group, which was the original nucleus of the greater Afro-Asian group in the UN. A further complicating factor was the established convention that the Council should always have one Commonwealth member, but not more than one: to put Nigeria in alongside Ghana would have breached this rule. Particularly significant was the fact that Persia's last-minute intervention showed that there was no simple rallying of "pro-western" ranks in order to keep Morocco out; when Persia was eliminated, most of its backers swung to Morocco.

Such an episode is worth noting for the light it sheds on the real nature and workings of the Afro-Asian group. The lesson that needs to be drawn is that Asia and Africa neither constitute a solid "anti-western" block nor do they, even in the private fights which show how little of a block they are, divide up neatly into pro-westerners and others. It is all a great deal more complicated than that—for them as well as for us.

Consult the People?

How cogent is the case for a referendum or a general election before Britain enters the European common market?

ANYBODY who joins in intelligent political discussion nowadays soon finds that there are many people who still feel in their bones that before Britain enters the European common market there ought to be some form of plebiscite, either by a general election or (as at least one of the country's leading political scientists has now flatly recommended) by a straight national referendum. Those who (like *The Economist*) are in favour of joining the market have a duty to engage in honest debate on this matter.

Honest debate can fairly begin by stating what most people will recognise as a constitutional fact, however undemocratic it may at first sound. Major political decisions in this country are generally taken when there is a balance of agreement among a majority of establishment opinion, of civil service opinion and of other informed opinion that it is time to move in a certain direction; and, indispensably, when the government of the day manages to persuade its own party supporters and Members of Parliament that the move is desirable. An intellectual oligarchy of this sort is very often resistant to change. That is why, in cases when establishment forces are standing fast against popular opinion in defence of the *status quo* (say, in supporting the continuance of public schools or of an economic policy based upon maintaining inequalities of income), radicals should constantly query whether "informed opinion" is really being mainly influenced by force of argument instead of by mere traditional prejudice. But when informed opinion has swung round to supporting so huge a change as British entry into the common market, the balance of prejudice can fairly be the other way round; there is then more ground for presuming that only a very strong force of argument can have pushed the staidest minds in the country into this remarkable new position.

This does not mean—fortunately it could not mean—that everybody should then abdicate from all opposition on the matter. But it does make it reasonable that governments should generally carry through the reforms which they and the balance of informed opinion believe to be advisable, and then go to the country only when the new policies carry with them the advantage of being already part of the new *status quo*. Many (perhaps most) progressive reforms in this country, from the abolition of hanging for sheep stealing to the adoption of the Keynesian economic policies of unbalanced budgets, have been made possible only because a majority of official opinion has led on just a little ahead of a majority of ballot-box opinion in this way.

Those who say that this analysis should not apply in the case of the common market usually base themselves on two arguments. First, they argue that joining the market would be a peculiarly irrevocable step; this does not seem to be a particularly strong argument, since everybody knows that Mr Gaitskell is at present deciding whether he thinks it will be to his party's and the country's advantage to state specifically that a Labour government would in fact revoke it. Secondly, the critics say that while the Government and establishment opinion may seem to have been converted to support of the common market by a gale of change, it is plainly standing fast against the novel device of a referendum mainly because of prejudice and tradition. With the spread of education, the critics may claim, informed opinion should now be regarded as being much more nearly nation-wide; and in these new circumstances referenda may have become a respectable instrument of national policy-making. There is, frankly, a certain attraction for modern radicals in this argument, But it is necessary to consider how far the argument is real, and how far specious.

GENERALLY, four arguments are advanced against referenda. First, it is said that they are not a traditional part of the British constitution; this is a very poor argument indeed, since in constitutional as in other matters change should often be welcome and innovation acclaimed. Secondly, it is sometimes said that the result of a referendum could depend on the exact way in which the question at issue was phrased. This is not a strong argument in the present case, since everybody would know in his heart what he was really voting about.

Thirdly, there is the argument—stated, among others, by Dicey—that a referendum is a device for transferring "the government of the country from the rule of intelligence to the rule of ignorance"; this is, largely, the argument that has just been discussed above. It may have lost some of its force in modern conditions, but radicals should note that referenda are still generally devices which support reaction (witness the Swiss, who rule themselves largely by referenda, and still refuse women the vote). Again, left wingers should note that Labour governments who ruled over a Britain where referenda had become fashionable might conceivably never be allowed to nationalise anything again.

This leads, fourthly, to the most cogent argument of all against referenda. A referendum is, in essence, a device for keeping a government in power but not allowing its members to follow the policy which they feel convinced is right. It would be as absurd in present circumstances to keep Conservative ministers in office and tell them that they must not go into Europe, as it would be to put a Gaitskell government into office and tell it by referendum that it must go into Europe. Rule by referenda would be a device for ensuring that the government of Britain would have to be undertaken by time-servers, instead of by men who will resolutely express their opinions and try to put them into effect.

The Economist, for one, feels his fourth argument against a referendum to be overwhelming. One is left, then, with a general election as the only logical way in which a national vote can be taken. Since an election is bound to be held within two years anyway, the real question now is whether it should be morally obligatory for it to be held before ratification of the Treaty of Rome, as the Opposition demands, or whether it could take place after ratification if the Government so desires. There are two arguments against dictating to the Government on this matter. One of them has already been

mentioned already: as part of the normal political process, as part of the normal mechanism for ensuring that governments can sometimes implement policies of change which they believe will be more popular in the long term than in the short, it should normally be the right of a Prime Minister to decide when in any five-year period a general election should be held. A Government in office is inevitably more likely to pile up resentments against itself than an Opposition which is basking in a pleasant lack of responsibility ; the right to decide the timing of an election is a legitimate right to redress this imbalance, and to give governments the elbow room in which to govern instead of constantly to electioneer.

Secondly, any early general election, even if nominally fought on the issue of the common market, would not really be fought on that issue alone. Until recently, at least, it seemed most likely that in any early general election Labour might win something close to the 44 per cent of the popular vote which it marked up last time ; the other 56 per cent or so would presumably go overwhelmingly to the two parties who are in favour of the common market, the Conservatives and the Liberals. But, as the Liberals might well take around 15 per cent of the vote, a Labour government might then be returned to power—although it had nominally lost the plebiscite on the market issue by over five to four. The fact that many of those who had voted for the two pro-market parties might in their hearts be against the market, while many who had voted for Labour might in their hearts be in favour of it, would not make this sort of election-plebiscite more democratic ; it would merely make it more absurd.

The right course, therefore, is surely to abide by the normal British constitutional practice, interpreted and swayed—as it inevitably and properly tends to be—by the wiles of leading politicians and by the pressure of events upon them. Once again the present indications suggest that those who say that this traditional system usually works in the end may be going to have the last laugh over those who reject it. One way in which Mr Gaitskell might force an early general election might be by saying that a Labour government would repudiate any Conservative signature on the Treaty of Rome. He is hesitating to do this at the moment, because he fears that it might cause a split in his own party. But that is a recognition of the obvious fact that a large number of people in the Labour party believe that the Government's policy on this issue is right ; it is a perfectly proper democratic check. The Government, for its part, has always believed that there would in the end be a major swing in favour of the common market both by some of its own former rebels and by the country at large. It has been proved right in the first forecast, and there are increasing signs it may be going to be proved right in the second ; if so, it may be able to hold and win an election earlier than it had previously dared to hope. In that event, it will deserve its victory. If this does not happen, if at no time before the end of this Parliament can the Government persuade the electorate that it has served it well, by its common market policies or by the sum of its other policies, then it will in due course be thrown from power. That is how democracy works ; one cannot see why the historic issue of the common market should necessarily change its ground rules.

Arabia Felix

With the Yemeni revolution, all Arabia may have come to the end of a long sleep

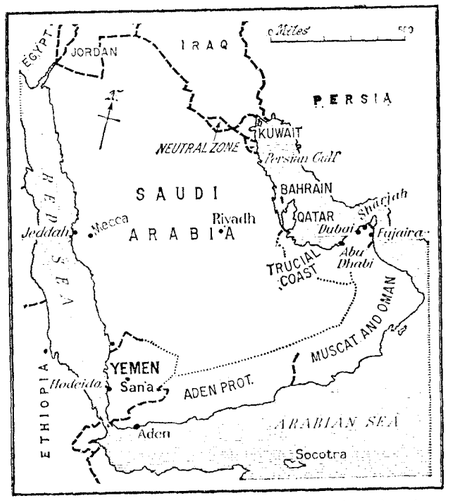
UNTIL something is done about the lacework of British protected states that festoon the eastern and southern coasts of the Arabian peninsula, the Arab portrait of Britain is indelibly adorned with the horn and tails of an old-fashioned proconsul. The 11 sheikhdoms and sultanates on the Persian Gulf ; the 25 states of the Aden Protectorate (11 of which have now formed the South Arabian Federation) share a feudal outlook and the benefit of British "advice." The states blessed with oil (Kuwait, Qatar, Bahrain, Abu Dhabi and, maybe, the Qaiti sultanate in the Eastern Aden protectorate) are much too rich, in fact or in prospect, for their own safety ; those without oil scrape the sand and British subsidies for an exiguous living. Tidy-minded people who groped towards a more contemporary, and permanent, decor for this messy frieze of principalities found their visions bumped down to earth by the uninviting and uninspiring gloom of the setting. Dreams of federation, union or any sort of general tidying-up were cut short by the thunderous pre-condition: major changes in the Arab peninsula, and, in particular, Britain's own retirement, had to wait upon the emergence of more enlightened and, in a modern context, more durable forms of government in Saudi Arabia and Yemen.

Unexpectedly, it is Yemen that has opened the first crack in what seemed a blind alley. Shrouded behind the heavily beaded curtains of its feudalism, Yemen had become to outsiders a joke kingdom of mediæval curiosities, seeming to offer little except a plunge into some of the nastier habits of the past. Now the new foreign minister, Mr Mohsin al Aini, has reminded a New York audience that Yemen was known to the ancients as "Arabia Felix." In antique days it was respected as the only part of the huge Arabian peninsula that was not a desert ; he judged it necessary to tell his audience that his country was still largely green and fertile, sustaining six million people. Arabs still refer to it as "happy Yemen"; the revolutionaries have set out to strip the phrase of its irony.

How severe the hazards, how effective the counter-revolution itself, how material the aid or opposition coming from outside are still altogether speculative. Fighting goes on in the north and east of the country ; the Zeidi tribes may still regard the Imam (but which one ? The "dead" Imam now seems to have been on the wireless) as their ruling monarch as well as the spiritual head of their sect. The revolutionary government, under the prime minister, Brigadier Abdullah Sallal, has tended to play down the fighting as "skirmishes," although he accuses the counter-revolutionaries of getting help from King Saud in the north and from the Sharif of Beihan in the east. A louder war goes on over the Arab radios where Jordan and Egypt charge each other freely with supplying massive aid to, respectively, the revolution and the counter-revolution. But the notable fact is that this revolutionary

government, against the noisy background of shooting and transmitter battles, has, with resounding confidence, declared its intent to plunge into the modern whirlpool of planning and progress.

Whether these brave aspirations succeed or run into the sand, their echo is sure to rebound throughout Arabia. King Saud's decision, on Wednesday, to change his government, may have been precipitated by anxiety about Yemen. In Aden the repercussions have been loud and clear. Even when Yemen was still the dark imamate, there was a movement in Aden colony urging federation, and its supporters were not confined to the 80,000 Yemenis who work in Aden. The British decision to latch Aden on to the South Arabian



Federation gave the movement a lively shot in the arm. Moderate men turned disillusioned from what they sincerely believe to be British fast practice to look wanly at the possible alternatives offered by Yemen. Those alternatives have been made immensely more real and inviting by the revolution.

WITHIN three days of the revolution, photographs of Brigadier Sallal and of Dr Abdurahman Baidhani, his deputy, appeared miraculously all over Aden colony. They were peddled by small boys in the streets, used by cab-drivers on their windshields as stickers, produced from the pockets of waiters and lift-boys. Pictures claimed to be "exclusive" were offered at premium prices. The People's Socialist party (the political body of the Aden Trades Union Congress) which had been the mouthpiece for co-operation with Yemen, felt itself gloriously vindicated. Mr Abdullah Asnag, the president of the TUC, adopted the Yemeni revolution as his own. With the imamate out of the way, his aim is now clear-cut: the union of Aden colony and the Aden protectorates with Yemen, under the Yemeni flag.

The boisterous camaraderie with which the Yemeni revolution has been welcomed by Aden workers has not been echoed at San'a, the Yemeni capital. The Imams, whose foreign policies were uncomplicated and whose chief worries at home were self-survival, would steamily reiterate their claims to Aden. Brigadier Sallal, who is concerned with transforming his country as well as with surviving himself, has spoken much more discreetly. When asked about his policy towards Aden by a British correspondent, he gave a meticulously correct reply:

> We have to realise the fact that we have designed our revolution here within this area governed by the late Imam. Our intention for the time being is to develop this area and get it to stand up. . . . The aspirations of the people there in Aden are decisive.

Brigadier Sallal can afford to pitch his voice low. His revolutionary message will not be quarantined, even if he does not trumpet it. In Arabia, where tribal families wander back and forth across the largely undefined frontiers, no movement is isolated for long. The agitation that has been aroused in Saudi Arabia and in some of the Aden protectorates is intensified by the fear of regicidal ideas seeping through the tribes that live on both sides of the disputed frontiers with Yemen. The danger for King Saud is that this interaction at tribal level could, in time, work its way into his army, whose loyalty, like that of most arab armies, is split between country and tribe.

But this is not how revolutions start, though it may be what helps them to succeed. Gusts of revolutionary infection will be bellowed out over Arabia not by the discreet brigadier but by Egypt, his less scrupulous, and less vulnerable, patron. Yemen's infant revolution has been lustily and joyously taken up by the old hands in Cairo. Certainly, Jordanian and Saudi Arabian propagandists have grossly exaggerated the amount of military aid that Egypt has already given the new government ; on the other hand, there can be no doubt that Egypt will do what it can to ensure that the revolution survives in Yemen—and spreads throughout Arabia. Cairo has unearthed a pact signed by Egypt, Yemen and Saudi Arabia in April, 1956, at Jeddah which set up a joint command and committed the signatories to come to the aid of any one of them that was attacked. Saudi Arabia's part in this bond is being conveniently forgotten.

Whether or not Egypt finds it necessary to fulfil its carefully selected obligations under the Jeddah pact, Egyptian goods and technicians are arriving in Yemen as fast as Dakotas and frigates can carry them. There has been talk in Cairo of re-establishing the short and little blessed union between the two countries that was dissolved in 1961. Probably both parties would prefer to wait a time: Egypt in order to calculate the strength of the new regime ; Brigadier Sallal, perhaps, to see whether he can manage without so much help—and interference. The Yemeni government has gratefully accepted the United Arab Republic's quick and unquestioning support ; but there is no evidence that the young men at San'a want to abdicate any of their control over the exciting momentum of a new revolution.

Egypt's speed and vigour in taking up the Yemeni cause manœuvred the other Arab republics into a quandary. Syria and Iraq, deeply involved in their own campaigns against President Nasser, recognised the new government only after considerable delay, and even then hedged their commitment with pious expressions of distaste for interference of any kind. Iraq, in particular, hesitated for ten days, during which pro-Yemeni demonstrations in Baghdad showed how awkward it was for any Arab republic to be caught lurking on the side of the "reactionary" kings.

Syrian, Jordanian, Saudi and other spokesmen persistently claim that President Nasser's influence in the Arab world has sunk to a nadir. The inevitability with which the young Yemeni revolutionaries recognised Nasser as their patron, though not their sponsor, shows how fallible this judgment is. Syria's experience has undoubtedly made all Arab politicians think twice about linking their countries tightly with Egypt; it has not prevented the rebels and potential rebels in all Arab countries from looking to Egypt for inspiration and succour. It was as natural for the dissident Saudi Arabian princes to set up their exile group in Cairo as it was for Mr Mohsin al Aini to make Cairo his first call after his sudden appointment as foreign minister.

If the light of a more modern world spreads over Arabia, it will be all to the good. But the flashes of light, especially if Cairo controls the lamp, will show up the anomalies, the anachronisms and the patchy attempts to bring them up to date. Brigadier Sallal has spoken civilly of Britain, although he naturally looks for recognition of his government and, more important, for a restraining hand on the agitated protectorates. But the flaws in the British Government's attempt to give security to the base at Aden by forcing through a federation that the majority of Adenis do not want are bound to be floodlit by the new ideas from Yemen. This need not be unhelpful; it was the calm which seemed to prevail before all this that was deceptive.

Holidayland

Tourism in Britain pays off well for the national economy; but it could pay still better

THE tourist industry is Britain's seventh largest export earner, taking in £205 million last year; if the £93 million paid by foreign visitors in fares to British ships and aircraft is added on, tourism rises to fourth in the export league table below only machinery, vehicles and chemicals. In fact this country, according to the latest figures from the Organisation for Economic Co-operation and Development, earns more from its visitors than any other European country except Italy. For a small and damp island it is a pretty staggering success.

Is it likely to last? So far this year, the latest figures show that visitors from the United States have risen by 9 per cent (after a fall of 1 per cent in 1961) and those from Europe by 7 per cent. But the number of British holidaymakers going abroad is now rising faster still; their spending abroad exceeded foreign tourists' spending here by £21 million in 1961, and by £17 million in 1960. Even so, this deficit on tourism is little enough beside, say, the west German deficit of £140 million. Although Englishmen have always regarded themselves as lordly travellers, waited upon as of right by menial continentals, it is just as well for the Chancellor of the Exchequer that most Britons are home-bodies at heart. Of the 30 million who do actually take a holiday beyond their own back gardens each year, 26 million still scorn to set foot on foreign soil. A Channel bridge for the growing car ownership (nearly 50 per cent of British holidaymakers now travel by car) could, of course, change all that. Or could it?

Britain's hotels and boarding houses are still catering predominantly for a large and not particularly well-off home market, with an average holiday expenditure of £16 a head. By and large, except in London, the holiday trade contrives to segregate this market from that of the 1.8 million comparatively big spenders who come here annually from overseas. The Americans, who contribute a quarter (£48.4 million) of British tourism's foreign earnings, generally stick to a familiar, largely antiquarian and generally profitable round: they sleep in London, Edinburgh, Stratford, Glasgow and Oxford. The younger west Europeans who arrive here are distinctly poorer, and seldom show much inclination to penetrate north of the Thames valley. The bulk of the trade still comes from the Commonwealth (£89 million last year), chiefly families from the white dominions, Canadians predominating, often set on staying 3-4 months to look up relatives, with short trips to the continent increasingly *de rigueur*.

The biggest question facing the industry is how rapidly it can jack up its standards of service (the major complaint that foreigners lodge with their travel agents) and accommodation, and thus equip itself to meet increasing competition. More and more British people can be expected to go to Europe for at least part of their holidays; the North American globe-trotting trade (or at least the more lucrative parts of it) may be lured increasingly towards the exotic Far East. So far the economics of a local industry geared to two peak months (July and August) have left little scope for investment in the kind of improvements that Britain needs to hold its own.

The Board of Trade now subsidises the industry directly to the extent of £1.4 million a year. There is no financial help for hotel construction, except in Northern Ireland; and also no equivalent of the Swiss *kurtaxe* on visitors (although some people in Scotland would like one to raise capital for local improvement schemes, saying that at 6d. a night on each visitor to Scotland the levy would bring in £500,000 a year). The Government's money goes instead to meeting the greater part of the annual budget of the British Travel and Holidays Association. The BTHA itself is principally an overseas publicity organisation; and, despite the critics who say its sales line damages the image of British manufacturing industry, it knows perfectly well that the main assets it has to plug are history and scenery. Americans still flock to Britain's "prettiest village" but not to Basildon new town. Antiquities are what many of Britain's new car families are after, too, so that with Stonehenge and the Tower already showing maximum throughput what is needed is more ancient monuments, not less emphasis on them by official publicity. (Thus the Ministry of Works believes that there are potentialities, if the right roads and hotels existed, in the monument-cluttered zone between York and Edinburgh.)

In its other job, that of trying to set British producers to rights, the BTHA has gone distinctly warily. Its predicament is obvious enough: if it really were, with much justification, to lambast British hotel service, menus and catering hours, it would get all its publicity where it least wants it. Its main hopes now seem to lie in encouraging the development of purposeful local associations to cajole the 1930s-oriented sectors of the industry into new life.

AT long last the motel (variously defined) is beginning to sprout: there are now over 30 in Britain and the BTHA expects to see 20 more opened shortly. But the British motel is not on the classic, and cheap, early-American lines. For some time to come it looks as if the country hotel, with extra garage and parking space, will remain the most practicable arrangement for the new carriage trade; in many areas it is the only place where one can get anything to eat after 6 p.m. So far the boom in motorised holidays in the home market has chiefly helped the licensed hotel and the very primitive caravan site. It may be that as holiday spending goes up there will be a growing demand for better accommodation than the trailer camp: motels, particularly in the heavily-motorised West Country, should then come into their own. For the present, however, the best bet for new investment may be the motor hotel in good country within easy driving distance of the big urban centres, which has a chance to draw regular custom from the dowdy Victorian establishments in city centres, where trade already falls off ruinously at weekends. The pattern that one group is aiming at is to attract both the mid-week commercial trade and the better-off family weekenders.

The west end of London apart, the return on new hotel construction in British cities is still too small to attract developers. Britons without expense accounts (and often even more with them) are not yet prepared to pay for the room-with-bath accommodation that North American visitors take for granted: year-round home trade is thus not great enough to justify expanding peak-period export capacity. If there were more first-class hotel rooms at the height of summer, travel agents say, there might be a hope of filling more of those BOAC seats. In the countryside, too, the very short season is a major handicap; winter closure can make ends meet, but it means starting again each spring with a scratch staff—not the way to improve the quality of cooking or service. Small owners have too little capital to risk improvements like extra bathrooms. If the bottom ever fell out of coach tours (which has not happened yet, although a decline is visible) a number of smaller country hotels in the remoter districts would be in trouble. They need to spread ordinary bookings at each end of the summer, but here again some owners are unwilling to pay commission to travel agents who have the power to steer traffic their way. The result is that the agents stick to the established, and increasingly crowded, circuit.

The need for greater year-round occupancy of all rooms is a hoary problem. Until it is tackled, development like the Coventry venture (which went through sticky years subsidised by shop rents) is bound to stay stifled. American visitors, predominantly middle-aged, are now being attracted by off-season fares, but the home market of family holidays is still jammed into two months. Moving the August bank holiday from the beginning to the end of August is one only slightly plausible suggestion; the growing trend towards taking spring and autumn weeks off—as a supplement to the normal two-week summer holiday—should help; but the real solution depends on arranging a school year that takes rational account of the months when the sun actually shines.

In stark truth, Britain generally has too little sun and too little snow to make tourism an easy business. One small gleam in the north, however, is the emergence of the winter ski-ing trade in the Cairngorms, where investment in such aids as ski-lifts and a new road is bringing in a significant addition to the normal summer takings. Elsewhere, however, there is little enough to tempt the native, let alone the overseas, visitor. It may, however, become increasingly profitable to keep holiday camps (with indoor entertainments) open at Christmas-time, if only for the publicity this earns.

THE adaptation of the British tourist industry to modern society still has a long way to go. But, slowly, things are beginning to move. Multi-purpose holiday investment, as at Towyn on the Welsh coast, is starting up, on the principle that the people who are beginning to buy or rent their holiday chalets are going to want swimming pools, restaurants and children's playgrounds right on their doorstep. Local councils like Brighton's have grasped that the family car is upon them and will impose a new structure on the holiday trade. The most antiquated licensing laws (including Sunday observance in Scotland and Wales) are being improved. Even the casino-bingo movement may help to keep Britons contentedly on their own island when the Channel is bridged. But there are still other trends that need to be exploited. The growth of fully international spectator sports like football or motor racing could help some provincial centres (as arts festivals have helped others). New York actually imports European soccer teams for a summer tournament—why not Manchester or Sheffield? The small-boat craze is catching on: the next stage may be a rash of "boatels" in the warmer estuaries. But the family car will predominate. Catering for it will entail the designation and construction of scenic drives, particularly along the coast and in the north-west, with the appropriate camping sites and perhaps cheap, timber-built summer accommodation on the motel pattern. Local authorities and, better still, regional authorities should be thinking in terms of dividing the countryside between the car and the more sedentary holiday maker. The era of the seaside landlady is dying slowly; to replace her only a specialised and highly efficient holiday industry will do.

NOTES OF THE WEEK

AFTER LLANDUDNO

By Europe Alone?

Both the Liberal and Labour party conferences this year made a less favourable impact on outside public opinion than those who attended them originally expected. It may be that this will prove to be true of the Conservative conference as well. For the second year running the Conservative rank and file shone on the Thursday with a genuinely progressive glow; one has still not got over the strange exhilaration of seeing all those young Tory men (and an astonishing number of older Tory women) marching into the common market debate flaunting the one word "Yes" from their buttonholes. But this was the single pearl in Llandudno's oyster. In all other fields except Europe, minister after minister, from Mr Maudling downwards, sounded as if he was allowing himself to be much more impressed by the difficulties of his job than by its opportunities. Aside from the European adventure, there was no obvious sense of dynamism about this Government at Llandudno. One's main and most significant thought while watching Mr Macmillan on Saturday was how noticeably older he now is than any other member of the cabinet ranged alongside him.

All three parties will be hanging breathlessly on the trend shown in the by-elections immediately ahead. The Tories feel confident that they have begun to recapture votes as a result of the common market issue, and certainly Labour is terrified that it has begun to lose them; that is why Mr Gunter and other Labour pro-marketeers have begun another brave effort to pull Mr Gaitskell back away from his instinctive anti-Europeanism towards the depopulated fence. But the Government is in danger of forgetting that the by-elections will not be fought on the common market issue alone. They may also be fought in an atmosphere of mounting uneasiness about the possibility of world recession, and of complacency about Mr Maudling's apparent disinclination to start Britain re-expanding more quickly. And they will take place shortly after the announcement of a legislative programme in the Queen's Speech which—for all the promises about contracts of service and compulsory severance pay (reconfirmed by Mr Macmillan on Saturday)—looks like being quite ghastly dull.

BY-ELECTIONS

Bogeys for By-Elections

It is now generally expected that the by-elections for the five vacant Conservative seats will all be fought on one day next month, possibly November 15th or November 22nd. Labour's near-marginal seat of Colne Valley—which has become vacant through the death of Mr Glenvil Hall last weekend—will presumably be fought over later. The net swings which Labour would need to win the five Tory seats at issue would be: Glasgow Woodside 3.1 per cent, South Northants (which is especially vulnerable, because it is the only seat of the five which had no Liberal candidate in 1959) 7 per cent, South Dorset 7.6 per cent, Central Norfolk 7.8 per cent, and Chippenham 10.6. It follows that all the seats would in fact be captured by Labour if it marked up the sort of 12.3 per cent swing which it secured at Middlesbrough West last June. Indeed, with an exact repeat of the Middlesbrough swing, the Conservatives would be thrown into third place in three or four seats out of the five, with Labour and the Liberals fighting the main battles for first place.

Up to a few weeks ago one suspected that the Conservatives might be going to lose the whole nap hand. Now, however, there are signs that Mr Gaitskell may have scared some Tories back to their former fold. The Conservatives therefore exude a new-found confidence that the Government should hold all except Glasgow Woodside, and some Tories even assume that they might hold it. They may well be being too optimistic (they often are); but it is worth pointing out that if they are not—if by any chance the Tories should hold all five seats, including Woodside—then this cluster of by-elections could conceivably become really historic.

In order to win the next general election Labour must secure an average swing of 3.5 per cent across the country; it follows that Glasgow Woodside (swing needed 3.1 per cent) is one of the seats which Labour would normally expect to win on its way to even the narrowest of national majorities. The statisticians will say that an average Labour swing of 3.5 per cent would usually be compounded of below-average swings in seats (like Woodside) where Liberals fought last time, and of above-average swings where there were new Liberal appearances; but this is probably cancelled out by the belief that Scotland should be a better-than-average area for Labour just now. In very general terms, therefore, as Woodside goes next month, so might the country be expected to go in any immediate general election. If the Tories should manage to hold it, together with the rest of the famous five, then—and probably only then—Mr Macmillan might conceivably wave away the chocks, take a quick look at some economists' forecasts of a world recession before the end of 1963, and roar off down the runway for an early "common market" general election.

THE ECONOMY

Don't Let Poor Neddy Starve

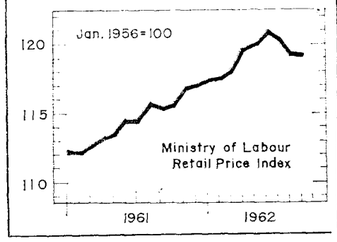
It is still quite unclear how far the National Economic Development Council is going to succeed in making itself into a really effective national force. On Wednesday it tabled a paper setting out its guesses about how much might reasonably be expected to go respectively to consumption, investment, exports and government expenditure if Britain manages to increase its gross domestic product by 4 per cent a year between 1961 and 1966. The figures are discussed on page 284. They are fairly conventional guesses, not obviously different from those which many other economists might have suggested, impromptu, long ago. They are not necessarily any the worse for that.

So far—and quite rightly—all the work has been done by the "office" of full-time experts under Sir Robert Shone and Sir Donald MacDougall; the trade unionists and industrial leaders and other dignitaries on the council itself seem to have done little more than give a nod of approval to them. The "office" will now proceed to draw up recommendations for inclusion in Ned's end-year report about various new policies which it would favour on such matters as training more skilled workers, improving redundancy schemes, providing more incentives for exports and investment, and so on. At that stage, the trade union leaders and others on the council will presumably have more to say, probably often in the form of the one word "No". The danger is that Ned's proposals may then become no more than an interesting series of economic essays, with any ideas that are regarded as too contentious edited out of them.

But the real question underlying all this is whether those parts of Ned's plan that are agreed by the council, including the statistical paper published this week, are going to exert a real influence on the Government. Ned's programme for 4 per cent growth envisages that Britain's gross domestic product ought to increase by £1,150 million each year, in real terms, between 1961 and 1966. In the first year of the plan, between 1961 and 1962, it is already clear that gross domestic product will have risen by no more than about £400 million, if by that. The idea should therefore presumably be being burned into the Chancellor's consciousness that, if he is to make up this leeway and get back on target next year, the total of demand exerted upon British production ought to be some £1,900 million higher next year, during calendar 1963, than it has been during calendar 1962. So far, there is no sign that such an idea has even occurred to Mr Maudling in the policies which he has put in train.

INFLATION HELD?

In the first half of this year food prices rose by nearly 7 per cent, but two-thirds of this increase was accounted for by seasonal increases, particularly exaggerated this year in the case of potatoes by shortage. Potato and vegetable prices have since come down and the general level of all retail prices (see chart) was lower in August than in any month since March.



BERLIN

Str-e-t-c-hing

Once again, for the umpteenth time in the four-year-old Berlin crisis, Mr Khrushchev has stretched yet another inch or two of elasticity out of his promise to sign a separate peace treaty with east Germany. It is quite true that, when he recently offered to put off his next move on Berlin until after the American elections on November 6th, he did not say that this next move would be the signing of the treaty. But that is how most people in Washington read his meaning; and the sheer cumulative force of all the repeated Russian talk of signing it "in the very near future" gave solidity to their fears. On Tuesday, however, he told Mr Kohler, the American ambassador in Moscow, that what he had in mind was more negotiations—which might include a meeting with Mr Kennedy (it might be at the United Nations Assembly in New York). The slogans adopted for next month's celebrations of the Russian revolution do not specify this year that action on the peace treaty must be "speedy." And, to rub home the point, the Polish leader, Mr Gomulka, touring east Germany, talked on Tuesday about the communist powers' patience on the subject. East Berlin papers, please copy.

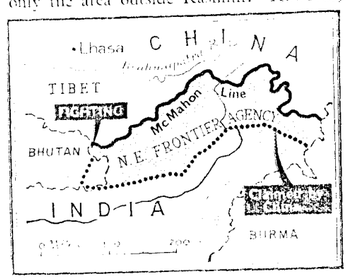
If Mr Khrushchev is extending yet again the deadline he originally set for 1959, it may be a reflection of the failure of Russian diplomacy to persuade any non-communist states to agree to attend a "peace" congress and sign such a treaty. But it must also mean that he sees the signing of the peace treaty as a very serious step indeed. For there is no evidence that the next round of negotiations is likely to get any nearer a solution than the last. The talk between Mr Gromyko and Mr Rusk in New York on October 6th confirmed that the Russians will not extend their blessings to the western garrison in Berlin in return for the creation of an international body to control the access routes to the city (the point of this international body being that it would give some measure of western recognition to the east German government). But the allies cannot raise the price they might offer, in terms of acknowledgment of the existence of east Germany, because west Germany will not let them. And the presence of the western garrison is quite simply and rightly not negotiable.

That Mr Khrushchev is now ready to plunge into this tangle again shows that the separate peace treaty with east Germany—if and when it ever comes—is likely to be no mere formality. One's guess is that it will not simply mean east Germans politely waving allied convoys down the road, instead of Russians. Herr Ulbricht is probably insisting that he must be allowed to rub home his sovereignty over the access routes on, and above, east German soil. If this is what a peace treaty means, the western powers, and west Germany in particular, ought to be prepared to go a bit further in negotiating before that elastic snaps in Moscow.

CHINA AND INDIA

Himalayan Isolation

Peking's diplomacy, rarely brilliant, is currently attempting a flourish in the Himalayas. As the border dispute with India (discussed in an article on page 237) flares up into mountain warfare, the Chinese are trying to isolate India diplomatically from its Himalaya neighbours. The latest move came at the end of last week when a Pakistani delegation arrived in Peking to settle "the boundary between Sinkiang (China, that is) and the areas where defence is under Pakistan's control." Pakistan at first suggested that the talks should cover only the area outside Kashmir. However,



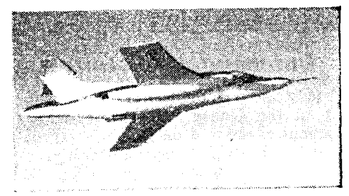
it seems that the fear of further Chinese intrusions into north-eastern Kashmir, together with the Pakistanis' hope of getting Chinese recognition for their claim to the whole of Kashmir (and the hope of scoring points off India) have led Pakistan to discuss the whole of the border, Kashmir and all.

At the other end of the mountains, China and Burma were in dispute about their border for many years after the Chinese communists came to power and Burma became independent. This was quite natural; administration on the ground never entirely coincided with the lines on the maps. But by 1960 Peking had reduced its more inflated claims, recognised Burma's "traditional boundary"—a continuation of the McMahon Line, which China will not accept in the case of India—and agreed to minor exchanges of territory. The *People's Daily* made China's point when it said that the 1960 agreement "was a good example of how other Asian countries could reach a reasonable settlement."

To complete the attempted isolation of India, Peking has put to its own good use the King of Nepal's resentment of India's traditional meddling in his country's affairs. The king especially dislikes India's support for Nepalese rebels who are trying to remove him. In a well-timed speech on October 4th, Marshal Chen Yi, the Chinese foreign minister, promised Chinese support if Nepal were ever attacked. When Mr Nehru offered similar support two years ago he was told that it was neither needed or wanted.

SOUTH AFRICA

Taking Sides?



The Government has agreed that a British firm may sell thirty Buccaneer naval aircraft to South Africa. The contract is reported to be worth about £30 million. The Buccaneer was designed for use from aircraft carriers; South Africa has no carriers, but it is indicated that it will use these aircraft for shore patrol operations. From the point of view of the British aircraft industry, which has found few likely takers for this expensive type of aircraft despite its acknowledged qualities, the deal is a good one. But it has inevitably prompted some questions, and may prompt some more when Parliament reassembles.

It is contended that the South African government would have plumped for some cheaper and perhaps slower type if its real intention was to strengthen its arm still further against the violent internal upheaval

which many people regard as inevitably lying in wait for Dr Verwoerd's republic, and which its armed forces have already been drastically reshaped to meet. On the other hand, there is no doubt that the Buccaneers would be an effective, if needlessly over-elaborate, weapon in any such struggle; and there has already been some speculation about the possibility that they may have been chosen because South Africa found Britain reluctant to sell it aircraft more obviously suited to the repressing of rebellion.

To many South Africans there now seems no alternative to an eventual violent conflict between the government and the majority of its subjects. The tale of repressive acts continues to mount. Mrs Helen Joseph, a white liberal and believer in non-violence, has just been put under house arrest. Mr Nelson Mandela, a moderate African leader, is now on trial on charges of incitement and illegally leaving South Africa; his defence lawyer could not appear at his trial in Pretoria on Monday because the lawyer was himself confined to Johannesburg by a restrictive order. In London a radical African leader, Mr Porlako Leballo, has given warning that South Africa will soon face a violent uprising; and on Monday night members of the "Sword of the Nation" organisation had another amateur go at the use of explosives, and two transformers in an electric sub-station near Johannesburg were severely damaged. To picture British arms being used against a subject people that has been driven to violence by the closing of all other channels of redress is a dark thought. Is it wise even to act—with whatever motives—in such a way that this kind of picture can take shape in men's minds?

SOUTHERN RHODESIA

Independent Colony?

SIR HUGH FOOT, the British representative on the *United Nations Trusteeship* Committee, resigned on October 11th because he felt unable to defend British policy in Southern Rhodesia. By making the reasons for his resignation clear (although he declined to go into the substance of them in public), Sir Hugh acted in an indelicate manner for a civil servant. But this was an indelicate situation. The point of view Sir Hugh could not continue to defend was that Britain could do nothing about Southern Rhodesia. To a certain extent this is true. The white Southern Rhodesians on the spot possess the military and administrative power; Britain is deterred from attempting to use its reserved powers by the expectation that the attempt would be resisted, and by a repugnance to consider force.

But, of course, Britain can do something about Southern Rhodesia. It can put considerable political and financial pressure upon Sir Edgar Whitehead to speed up the pace of reform and give Africans more than a token say in the government of the country. There may be a case for not doing this right now, when a general election is expected by the end of the year and Sir Edgar's right-wing opposition is growing. But over the past year Sir Edgar's arm might well, and profitably, have been twisted. For that matter, so might that of the African leader, Mr Joshua Nkomo.

Let there be no mistake about Southern Rhodesia, however. Unlike South Africa (where there are three million whites)

Sir Hugh: bringing it home

Southern Rhodesia can hardly claim to be a white man's country, or even a multi-racial country. It has only 220,000 whites, many of them immigrants from South Africa and many of the rest Britons who have gone out since the war. There are three million blacks. It is, by mathematics, their country; if their representatives, when they have some, govern it badly, the remedy will lie in their hands. Meanwhile, right is overwhelmingly on their side; even Sir Edgar's lowering of the colour bar in social matters has not spread much beyond showplaces in Bulawayo and Salisbury. Putting blacks in power in southern Africa will certainly not bring the millenium, but that does not make it defensible for Britain to support the whites in an attempt to maintain their power indefinitely. Sir Hugh's resignation may have the effect of bringing this home to the British Government.

CONGO

Throwing the Bones

THE ruler of the Congo's breakaway province of Katanga, Mr Tshombe, is adept at offering crumbs of hope to those who want to reunite the Congo. In hopes that excessive delicacy on the part of the British Government and others will allow him a victory by default, he is stringing things along by making a series of minor concessions. On September 3rd he accepted a United Nations plan for reunifying the country. Since then he has offered $2 million to the central government in Leopoldville (last year he received $42 million, legally due to Leopoldville, from the Union Minière company). He has accepted the reopening of telephone and telex communications and the rebuilding of an essential bridge on the copper-route railway line to Leopoldville. If a cease-fire agreement comes into force between the central government forces and the Katangese gendarmerie, some of his senior officers may swear oaths of allegiance to the President of the Congo, Mr Kasavubu.

But how much does this mean? According to a United Nations report published on October 8th, the air power of Mr Tshombe's forces has been considerably strengthened. The UN has photographed "at least" five new Piper aircraft, three Klemm aircraft, and seven Harvards; it strongly suspects that twelve Harvards armed with rockets and guns, four hundred 120 mm. rockets, and an unspecified number of P-51 Mustangs have been bought. In addition there are unconfirmed reports that aircraft are being assembled at the Union Minière factories at Kolwezi.

It seems plain that Mr Tshombe will go on stalling so long as he thinks that the British Government would veto economic or military action against him. The testing time will be the coming weeks, when the new constitution prepared in Leopoldville by Mr Adoula (with American advice and support) is presented to the provinces. This constitution is federal, but keeps strong powers (including power over the armed forces and police) in central government hands; it also divides Katanga into two separate provinces. Mr Tshombe's good faith may now be judged by how far he goes towards accepting the gist of this constitution, and, in the long run, divesting himself of his newly acquired arms—and the foreign soldiers who will presumably operate them.

STRIKES

Rough and Smooth

WHEN *The Economist* went to press on Thursday, the executive of the National Union of Railwaymen had not yet decided whether to accept Dr Beeching's new "peace proposals" as a basis for negotiation. This note is therefore having to be written when it is still uncertain whether Mr Greene will succeed in persuading his executive not to call another strike; and when the details of Dr Beeching's proposals on Thursday morning are still unknown.

ALGERIA
MOROCCO
TUNISIA

EIU Quarterly Economic Reviews covering 57 countries or groups of countries.

The Review examines the political evolution of Algeria and seeks to measure the extent of the economic collapse. The new Moroccan agreement with France is one of the factors pointing to a higher level of activity there. Signs of Tunisia's economic recovery are reinforced by large-scale U.S. aid.

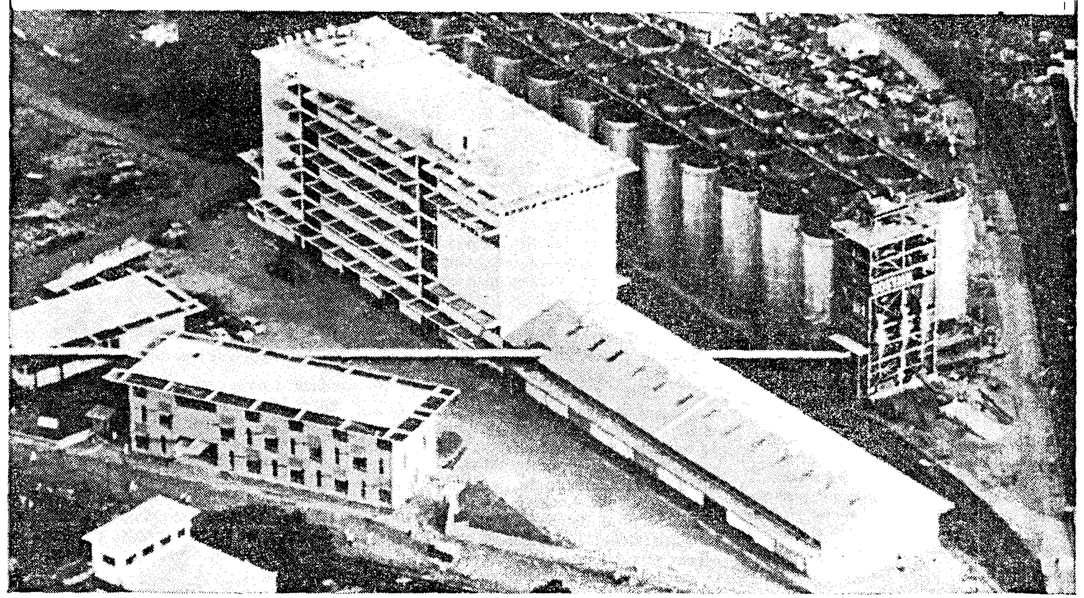
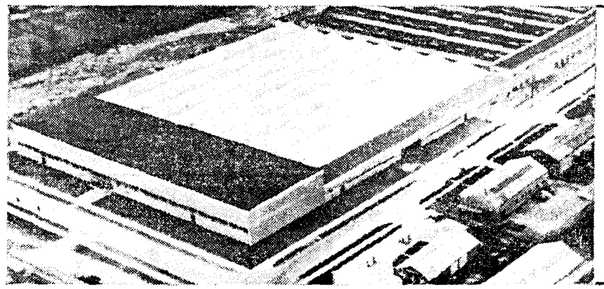
APAPA FLOUR MILLS, NIGERIA CONSTRUCTED IN 197 DAYS





BORG-WARNER
Factory extension, Letchworth
DESIGNED AND BUILT IN 10 MONTHS

Nigeria's first flour mill is now in production. It was constructed by Costain (West Africa) Ltd. for Flour Mills of Nigeria Ltd. in only 197 days, and went into immediate operation. ■ Here at home, Costain designed and built a 140,000 sq. ft. factory extension for Borg-Warner Ltd. in 10 months. In this building, the new fully-automatic transmission systems for medium-sized family cars are being manufactured. ■ These two projects, completely different in every way—size, purpose, location—illustrate the scope of the Costain organisation. ■ *Architect for Borg-Warner factory extension: H. Stanley Smith, A.R.I.B.A.*

FOR CONSTRUCTION AT HOME AND ABROAD

It's never too soon to call in COSTAIN

But one widespread report was that the transport commission may now offer to give sympathetic consideration to a new pay rise (which, incidentally, it more or less promised for the autumn when the railwaymen got their last rise in the spring) in exchange for a more pliable attitude over redundancy. Dr Beeching is thought to be a high-wage man, believing that the way to get results is with a small but contented labour force—and in the long term he is certainly right. But the question here is one of priorities. If the railwaymen get, say, another 5 per cent wage rise, this one concession would cost around £20 million a year, or £60 million spread over the next three years; the cost would actually be the same as giving a once-for-all severance payment of £13,300 to each of the 18,000 railway shopmen who in these three years are due to be sacked, and whom the present crisis is meant to be about. Nobody is suggesting that there should be a complete wage freeze on the railways during the period while they are run down, but the contrast between the cost of wage rises and of decent redundancy provisions is obvious. In these next few years, it would be wiser and juster to give generous treatment to the men who have to be sacked, even at the expense of at last keeping in check pay rises for those who stay on. It would be a mistake for Dr Beeching to play for popularity with the unions by pitching his offers the other way round. The miners agreed in principle on Thursday to redundancy payments based on the earnings of the man affected.

Meanwhile London Transport has suffered a few tiny strikes in some bus garages, has dropped part of the package deal on modernisation that it was presenting to the unions, but is to go ahead next Wednesday with the introduction of the new Routemaster buses on selected routes. There are already cries of protest from some militant busmen's "delegates"—but there are also signs that the militancy of those whom they claim to lead is diminishing, if indeed it has ever been high. It is a pity that London Transport did not decide to fight its battle outright over a complete set of modernising measures.

MR SELWYN LLOYD

Appeasement by Hot Potato

THERE are several obvious advantages in Mr Selwyn Lloyd's appointment by the Prime Minister to conduct the Conservative party's inquiry into its own organisation. It will help to assuage bruised feelings. It can provide a stepping stone for Mr Lloyd's eventual return to some departmental office (like that other ex-Chancellor, Mr Thorneycroft) if Mr Lloyd wants it, although almost certainly not back to really top leadership. It is a job which Mr Lloyd will do as competently as anyone else could. But has anybody paused to ponder what sort of things he should eventually say?

This inquiry sprang originally from a complaint by constituency Conservatives that their views on policy were not "getting through" to the party's leaders. So long as the Tories remain in office, any idea of giving the Tory conference more say in the planning of policy is not likely to be effective; ministers will run their own bailiwicks. If the Tories went into opposition, the idea could become more effective—and singularly unfortunate. If the Tories had to rebuild their policies in the wilderness between, say, 1964-1967, one would much prefer the job to be entrusted to Mr Macleod (following Mr Butler's brilliant example in 1946-50) rather than to some new machinery for collating pressure groups' policies handed in from lower down.

In the more prosaic field of purely organisational efficiency—in improving canvassing techniques, propaganda, etc.—every British political party has a lot to learn, although the Tories less so than the others. It would be easy to think up several ways in which they could draw in still more money from business interests who support them. In putting over their image, they (and all other political parties) would certainly gain from relying still more on professional public relations consultants. The main sort of advice given by Messrs Colman, Prentis and Varley to the Conservatives just before the 1959 election is shown by the fact (quoted in the last Nuffield study on "The British General Election of 1959") that Tory propagandists:

> never used the slogan frequently attributed to them, "You've never had it so good," because it was negative and because it was looking backwards. Instead . . . an election poster . . . read "You're having it good. Have it better. Vote Conservative."

This latter slogan was "forward-looking," and the whole burden of the p.r. men's advice was that everything the party's spokesmen said must "emphasise the party's interest in the future." Mr Gaitskell might do well to take note of such counsel. But, even if the Tories' most efficient course now would be to rely on still more professional methods of both fund-raising and p.r, one is not entirely sure that it would be good public relations to publish a Selwyn Lloyd report openly saying so. It looks as if the balm now applied to the ex-Chancellor may have consisted of handing him a peculiarly hot potato.

BELGIUM

Tribal Troubles

A CURRENT Brussels joke about the quarrel between Flemings and Walloons has one Congolese saying to another: "A nice country, Belgium, but the Dutch and French gave it independence a little too soon." The perennial strife between the two linguistic groups in Belgium is at best undignified; at its worst, it calls the existence of a Belgian nation in question. The demonstrations last Sunday, when some 60,000 Flemings marched on Brussels to demand wider use of their language and larger parliamentary representation, went off relatively peacefully. Police intervened whenever clashes with the local French-speaking people threatened to get out of hand. All the same, the signs of growing embitterment are alarming. This is the second mass Flemish march on Brussels in just over a year.

The demonstrators had four main demands. They want the "linguistic frontier,"

On the linguistic frontier

which determines whether the official language in a given area is French or Flemish, to be adjusted in their favour. They want the heads of firms employing Flemings to be obliged to speak their language, and the Flemish element in Brussels to play a greater part in the life of the city. Above all, they want representation in the national assembly to reflect, exactly, the linguistic balance in the country (55 per cent Flemish).

Reasonable as it may look at a glance, this last demand would be fraught with risks in application. A rigid, arithmetic, division in the Belgian parliament would sharpen and exacerbate a division which most non-committed people would rather see blurred. What Belgium needs is an effort of reconciliation of the tribes and a concentration on other tasks, national and European, which will put the language difference in

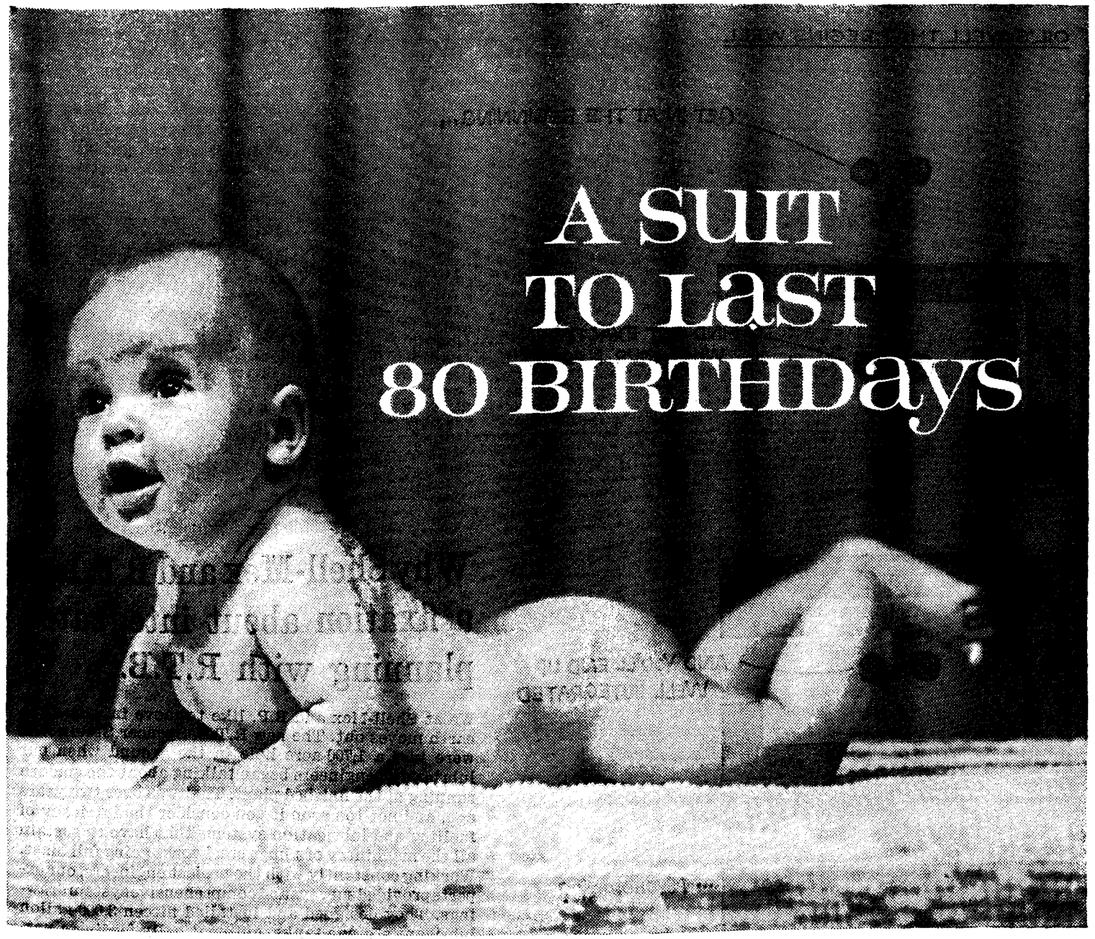
ADDRESS .....



We call it skin. It comes in a range of colours—and for most people it's a well-tailored, washable, hard wearing, trouble-free suit that lasts a lifetime—60, 80, maybe a 100 years! But for 1 in 10 of the population, this suit is not perfect.

Last year in Great Britain alone, some 5,600,000 people consulted doctors nearly 14,700,000 times about skin disorders. Sometimes these were just pimples—sometimes more serious skin conditions that are disfiguring and embarrassing, even crippling and psychologically distressing to the sufferer. And until recently, doctors were limited in the treatment they could prescribe for these more serious skin diseases.

Then came the great breakthrough, the discovery and development of the cortisone family of drugs. The Pharmaceutical Industry, including Cyanamid's Lederle Laboratories, spent many years and millions of pounds on research to find these wonder drugs. Now the skin no longer has to fight its enemies alone. For these new drugs are as effective in the treatment of skin disorders as broad-spectrum antibiotics are in the treatment of infections.

But helping to make your suit last a lifetime is just one problem Cyanamid has worked to solve. Research goes on. Cyanamid will invest over £11 million this year in research of all kinds: research to find drugs that will conquer human ills; to find new and better ways to produce more food; to find better ways to make life happier and more abundant.

In this and in a thousand other ways

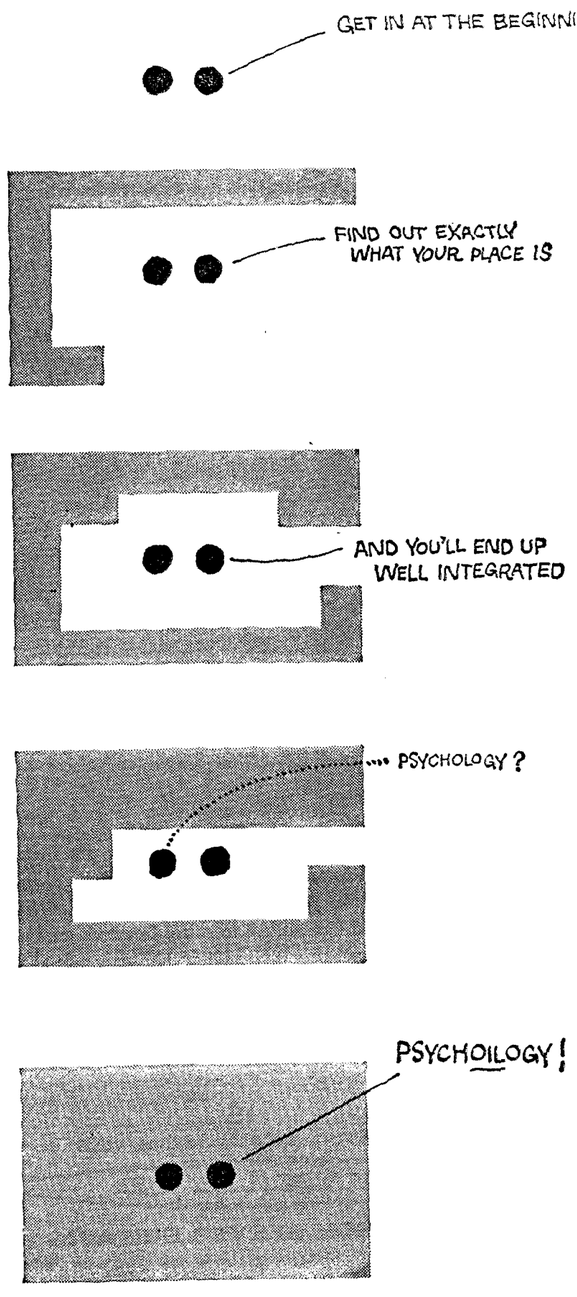
OIL'S WELL THAT BEGINS WELL



Why Shell-Mex and B.P. had a fixation about integrated planning with R.T.B.

We at Shell-Mex and B.P. like to move in where the earth moves out. The new R.T.B. Spencer Steelworks were just a 1,700-acre hole in the ground when our lubrication engineers began talking about the smooth running of the finished plant. That was over two years ago, and not too soon if you consider the intricacy of fuelling and lubrication systems that have to sustain all the machinery of a huge steelworks going full blast. Working constantly with the project engineers, our experts provided surveys and comprehensive system drawings. They designed and installed fifteen 3,000-gallon lubricant storage tanks, automatically feeding a network of oil lines to the machinery. They made complex replenishing arrangements and planned bulk deliveries. They helped plan the integration of lubrication maintenance and recording procedures. We are leaving one engineer behind permanently to keep an eye on it. Besides the 100,000 gallons of Shell lubricants in the system at any one moment of time at full operation, we are also supplying the total fuel oil requirements covering all the furnace and boiler applications, which will amount to an annual consumption of up to 200,000 tons. And the Works receive the constantly efficient attention of our delivery services.
All of which shows that there's more to lubrication than reaching for the oil-can when you hear a squeak. And more to fuelling a steelworks than filling it up when it's empty. Shell-Mex and B.P. like to get it *organised*.

proper perspective. In parliament, where the minister of the interior, M. Gilson, has recently introduced three bills for the regulation of the "language frontier," there has been some cooling of tempers lately: in consequence the Flemish socialist and liberal organisations did not take part in the weekend march. But in the country, as the demonstration showed, hotheads are still plentiful.

COMMON MARKET

More Commonwealth than Commonwealth

MR ROY JENKINS'S warning at the Labour party conference that the Labour party was in danger of becoming more pernickety about certain Commonwealth interests than the Commonwealth itself is already coming true—over the first Commonwealth issue to be raised by Mr Heath in Brussels.

With the good wishes, no doubt, of all the British political parties, Mr Heath and his team have been pressing for improvements in the terms for India and Pakistan. On October 8th he asked that negotiations on their proposed trade agreements with the community should be begun as soon as Britain has joined and not left until later, and he resurrected the Asians' request that the common tariff should not be imposed on their exports until the trade agreements are complete. There are no European objections to the first idea (an early negotiation) but the second (putting off the common tariff) raises big problems, and officials who have been discussing the matter in the past fortnight have referred it back to the ministers for a political decision.

One main difficulty is the familiar problem of the "bridge." If the common tariff is not to be introduced until after the trade agreements are sewn up, India and Pakistan, the Six point out, might simply drag out the talks and put off the common tariff indefinitely. One answer might be to fix a definite period of grace for the negotiation of the trade agreements, at the end of which the new tariff would be applied whatever happened.

Mr Gaitskell goes further. In his television broadcast on September 22nd he suggested that the trade agreements should be negotiated now, before Britain joined. It is here that he differs from the Indians and Pakistanis. They want the trade talks to be held after Britain is in the community, so that Britain can influence the agreements in a liberal direction from inside. Some Indians even feel it might be wiser to postpone the completion of the agreements until the opening of the third and last phase of the transition period of the common market. In that phase, majority voting would ensure that one protectionist country could not stand in the way of the (presumably liberal) majority. Thus the need, which Mr Gaitskell would deny, to get Britain into the community so that it can help shape it from within, has begun to make its impact in the Commonwealth.

YOUNG OFFENDERS

No Training Centres

WHEN the last Criminal Justice Bill was passing through Parliament two years ago, an attempt was made to insert amendments in it to establish "training centres" for young delinquents in Britain, on the lines of the Citizen Training Group experiment in Boston in the United States. The Government resisted these amendments (which had been sponsored, outside Parliament, by the late Sir Basil Henriques). But it agreed to ask the Home Office's advisory council on offenders to consider the scope for "new methods of non-residential treatment for offenders under 21."

The essence of the Boston scheme is that boys between 12 and 17 may, as a condition of probation, be required to attend the group for two hours on five afternoons (3.30 to 5.30 p.m.) a week for twelve weeks. The week's programme consists of crafts, physical training, group discussion and visual education; and the boys are medically examined, psychologically tested and referred for psychiatric treatment where necessary. The attendance is followed by six months' supervision by a probation officer. In Britain, the only provision at all comparable is the attendance centre. At such a centre, which is usually in the charge of a police officer, a boy generally attends for two hours every other Saturday afternoon, and is made to do physical training, some sort of craftwork and listen to a talk on some form of citizenship. The minimum age for attendance has recently been lowered to ten, and the maximum number of hours of attendance is twenty-four.

The purpose of the attendance centre is "punishment by deprivation of leisure." There is no after-care, and the boys who are sentenced to attendance are not at the stage of delinquency that would justify treatment at a Boston-type training centre. The training centre, in fact, would be an alternative to detention centres, approved schools or borstals. But in its report (HMSO, 1s. 9d.) the advisory council turns the idea down. It declares that only about 5 to 10 per cent of offenders under 21 now committed to residential training could be left at home were new methods of non-residential training available, and that it would be difficult for a court to identify them at the time of sentencing. Thus the provision of training centres would not relieve the overcrowded approved schools and borstals; they might well divert the services of skilled staff from schools, youth clubs and other forms of social service among the young. Even more important, they might encourage delinquency, because young offenders would be herded together in a group but without the constant supervision of a residential institution. The last argument sounds convincing; but it leaves the advisory council with nothing new to propose save worthy recommendations that the existing youth services should be strengthened, and that more should be done to get delinquent youths to join clubs or evening classes, preferably voluntarily but if necessary as a condition of probation.

OCTOBER 18, 1862

RELIEF IN LANCASHIRE

Sir,—I have for some time past been a good deal engaged, in connection with a Local Relief Committee, in the work of investigating and relieving the distress unhappily now prevalent in most districts of manufacturing Lancashire. I regret to say that my experience in this work has driven me to the very unwelcome conclusion, that the organisation of Relief Committees, independent of the regular parochial authorities, has been a great and lamentable mistake. . . . The most serious evil is the encouragement of the idea that it is less degrading to receive aid from charitable funds than from those upon which those out of employ have a legal claim, and towards which they themselves have been regular contributors. . . . Now the poor's rate is in some sense a Mutual Insurance fund in the case of that deserving class who have always contributed to it, and who never will touch a penny of it except under circumstances of unavoidable emergency like the present; and it is precisely these people who are now genuinely thankful, willing in all simplicity to receive aid from the parish if need be, and who in many instances have stipulated in receiving it that they shall be allowed to consider it as a loan to be repaid in full on the return of better times. I am now quite convinced that the independence and right feeling of the operatives would have been much less subjected to injury had we left the whole matter to be dealt with by the regularly constituted authorities, whilst many other serious evils would have been avoided. To meet the pressure, Committees of influential ratepayers, such as those who now act independently, might have been appointed to aid the Guardians, without creating that division of responsibility which now exists. And as regards funds,—any general subscription that might have been raised would have been applied to prevent the poor rate in any township rising beyond the fixed limit. It would not in that case have gone one whit more directly to save the pockets of ratepayers than it is now doing, whilst the rate of relief in various districts, and the point at which public charity came in aid of the ratepayers, would have been infinitely more uniform. No one can appreciate more highly than I do the generous outburst of sympathy which has provided so liberally for the mitigation of this distress. But I am bound to add that I think it ought never to have been called for in this shape. . . . I am, Sir, your obedient servant, L.C.M.

LETTERS

Airline Profits

SIR—Your headline last week—" BOAC: Profit must come first "—expressed an opinion to which, of course, you are entitled. The white paper on the " Financial and Economic Obligations of the Nationalised Industries " lays some stress on the desirability of all nationalised industries having a strong profit motive but makes some reservations in its concluding paragraphs. It is for the Government, not the corporation, to decide this fundamental issue—an issue that will no doubt be decided in the coming months.

I was somewhat disappointed to find that in writing on such an important issue a publication of your standing should have spoilt an otherwise good contribution to thought by including statements which may well be open to question. In particular, you state that BOAC pilots do approximately one-third of the work, in terms of miles flown, as those of Pan American. You do not indicate in any way the basis of this calculation and it would indeed be interesting to know how you arrive at such a conclusion.

The article also referred to the size of BOAC staff and compared it with that of TWA. A comparison of this kind can be highly misleading, which is why, in my annual report, I pointed out that no satisfactory criterion has yet been established for the measurement of productivity in our industry, so that output per employee is an index of very limited validity. BOAC has some 5,000 employees overseas, mostly local nationals. At 29 stations we handle aircraft for other operators, including the RAF, and for reasons often explained the practice of airlines at overseas places differs widely, not least in the use of agents or sub-contractors instead of staff. Thus it is clear that any comparison of output per man employed is not necessarily a sure index and a much more reliable guide is the cost per capacity ton mile. On that basis BOAC does not appear to be out of line.

You refer in your article, coupled with some gratuitous insults, to the results of our good friends Pan American and to the fact that they made a profit last year. This is true—but if you examine their accounts you will find that their operating revenue contained an item, " non-transport incidental revenues—*net* $7,435,000 ", which is slightly more than half the airline's net income before taxes. Their dividend was $5,311,000 and they increased their retained earnings by about $2,000,000. It is plain that this " non-transport activity " went a long way towards paying their dividend. In short, our friends made a profit but not, it would seem, wholly out of operating an airline.

With regard to the other airlines you mention, I would also ask you whether an organisation that does not have to service its capital either by way of dividends or interest on loans can be said strictly to be keeping itself out of the red? Perhaps the hair's breadth to which you refer is a split hair's breadth.

By what right do you infer that " BOAC alone believes that its administrative and management structure is beyond any significant improvement "? We certainly do not think so, and it is for this reason that we have made considerable use of management consultants. There are currently two teams at work. Moreover, it is nonsense and mischievous to suggest that relations between our management and trade unions have deteriorated to a stage " where unions lead management by the nose ". Relations between management and the unions are by no means unsatisfactory.

BOAC's prime need is to have its aims and purpose clearly defined by the nation and, when this has been done, for its financial structure to be put on an appropriate basis.—Yours faithfully, M. S. SLATTERY, Chairman,

British Overseas Airways Corporation
Hounslow, Middlesex

Common Market

SIR—May I add a little to Sir Roy Harrod's comments in your columns last week on your article of the previous week entitled " Much More than Fifty-Fifty "? I am delighted that after eighteen months you have unfolded your economic argument for the UK joining the common market, but am not surprised, having read it, that you were so coy about it.

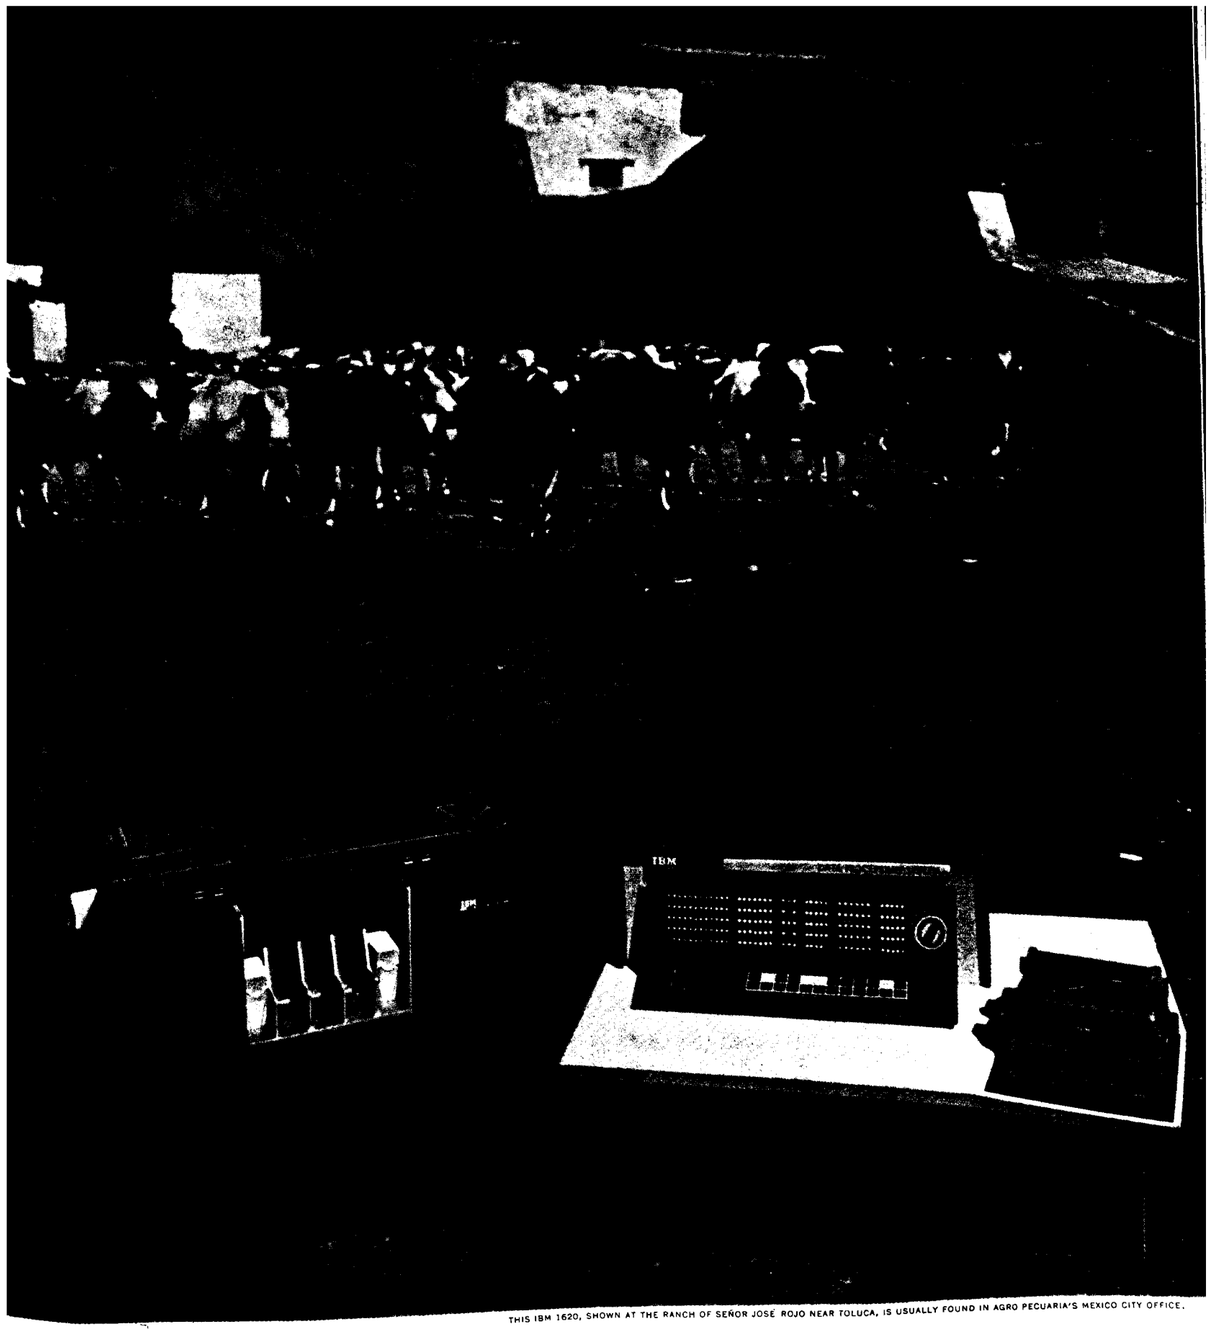
You admit that joining on the proposed terms might add £300 million to our import bill and cost of living. You then virtually admit, and certainly do not try to answer, the contention that little, if any, rise in exports on balance can be expected from joining. We now know that, for two years, UK exports to the Six have been rising as fast as the Six's exports to one another without our signing the Rome Treaty (a crucial fact you constantly ignore). Taking this into account, and the loss of other exports, and the chance offered by the US Trade Expansion Bill, I do not see how anyone can seriously argue that we should gain exports materially on balance. I think we should lose. But, on your own argument so far, imports are dearer; exports not materially higher; and imports from Europe have increased.

Then you suggest that all these arguments (not to mention damage to the new Commonwealth) are offset by the prospective economies of large scale. But you astonishingly fail to see a glaring gap in your own logic. If we do not materially increase our exports, as a result of joining the Six, we do not reap material advantages of scale. The evidence that we should not gain exports weakens not merely the " great expanding market " claim but the argument about scale. Economies are achieved by increasing the scale of output, not by merely hoping to.

But let us ignore this, and examine your thesis that a " market of over 50 million " (of course we have a world market anyway) is vital to modern industry. Here the expert evidence is against you. To mention the more serious studies, L. Rostas (" Comparative Productivity in British and American Industry," National Institute of Economic and Social Research, 1948) concludes that the size of the market theory is much exaggerated since, outside a few industries, " there does not appear to be a close inter-relationship . . . between productivity and the size of the market." Comparing productivity in the UK to Sweden and Holland, he finds that " relative productivity is in no way relative to the size of the market. This points to the fact that the optimum plant (or firm) and specialisation can be achieved within the limits of a smaller market."

This study has been brought up to date by M. Frankel in his paper " Anglo-American Productivity Differences; their Magnitude and Causes " (American Economic Review 1955, Papers and Proceedings, pages 103-7). In a wide survey he finds " no regular relationship between differences in market size and differences in productivity." He recalls E. Rothbarth's finding that in 1870 the US market as a whole was probably smaller than the UK market. Yet it appears that US productivity in some industries was even then significantly greater. Frankel concludes that " 50-60 million potential consumers should offer as great or almost as great an opportunity for gains from specialisation and mass production as one of 150-160 million."

Of course there are important economies of large-scale organisation; but the issue is whether these can mainly be won by a market of over 50 million. Clearly the expert evidence is against this. At the very best it is unproven. You try to argue that the potential gains are particularly large in the case of modern sophisticated products. Is there any evidence that (apart from aircraft) this is widely true? You also completely ignore one crucial point. Most of these economies are from large-scale *organisation*, not manufacture. Few would say that our plants are too small. Mr Paul Chambers last winter argued that it was large-scale research and management which would work wonders (but Courtaulds did not agree even with this). But these economies can already be gained by the technique



THIS IBM 1620, SHOWN AT THE RANCH OF SEÑOR JOSÉ ROJO NEAR TOLUCA, IS USUALLY FOUND IN AGRO PECUARIA'S MEXICO CITY OFFICE.

Writing the menu for Señor Rojo's cows

Romantic old Mexico. Placid cows, red tiled roofs, and white walls that reflect a way of life unchanged for centuries . . .
Don't let that background in the picture fool you. Only the architecture is traditional. This is the new Mexico where vigour, ideas, and technology are changing almost everything—even the cows.
These Holsteins, for example. Once they lived rather simply on grass alone. Now their menu is fortified with feed carefully formulated by an IBM computer to meet strict nutritional needs, including ample portions of minerals, protein, and vitamins.
Agro Pecuaria, one of Mexico's leading cattle-feed producers, uses an IBM computer to work out menus from millions of possible combinations of ingredients which change constantly in price and availability. The result: improved feed—as well as a saving of 16% in cost.
Robust cows are only one instance of how IBM systems help in today's Mexico. A famous fresco there shows Quetzalcoatl, the Aztec god, returning on a raft with examples of new learning to blend with Mexico's rich heritage. If he landed today, there just might be an IBM computer stowed away on the raft somewhere.

of a parent holding company and subsidiaries manufacturing within tariff areas, which is now normal in British industry.

Whatever the exact truth on economies of scale, therefore, it cannot really be seriously argued that they are so clear and large as to justify the UK in damaging the Commonwealth, our Parliamentary institutions, and our balance of payments.

Incidentally, on a lower level, you argue that "all the overseas Commonwealth countries . . . are building up new secondary industries which Britain already has," and you imply that we should therefore sell instead to Germany and France which already have them too!—Yours faithfully,

DOUGLAS JAY

House of Commons, SW1

Britain and Europe

SIR—Sir Roy Harrod's argument last week against entry into the European Common Market, so far as it applies to strictly British economic self-interest, rests on two counts. Entry will do us no good, he says, because international specialisation in what he calls "science-based industries" will work in our favour whether Europe has a tariff up against us or not. On the other hand, it will harm us by causing some of our imported food to cost more.

On the second point the question is clearly one of quantity: how much of our existing cheap supplies of food from the Commonwealth (but also deriving from such places as Denmark and Holland) will have to be given up to make way for more expensive consignments from the common market? We do not know the full answer yet. But we do know that the Government has got the outline of an arrangement which will permit continuing imports on a large scale from New Zealand; and that it has also extracted a promise from Brussels that the community will pursue a policy in fixing internal prices which will provide "reasonable opportunities" for other Commonwealth exporters of temperate foods in Europe. I suggest that what this means is that an enlarged European community (with Britain inside it exercising its influence directly in the fixing of target prices) will not readily be able to push up domestic prices to the point where high-cost European producers flood the British market with grain and dairy produce, at the expense of the Commonwealth. Other EEC members, notably France and Holland, have a common interest with us in keeping prices low enough to encourage the Germans to produce less. That indeed is precisely what some British farmers fear.

But even if the extra cost of food does not turn out to be very onerous, it will still be a net loss against which Sir Roy is unable to see any offsetting gain. His point about the increasing division of labour among the advanced industrial countries is a crucial one, and it was of course the purpose of securing the maximum advantage from this division and specialisation in a period of unusually rapid technological advance which supplied the main economic argument for European integration. We see again and again that it is not just a matter of achieving economies of scale in the simple traditional sense. A market of fifty million certainly seems large enough for that. It is the *time-scale* which is all important, when international trade in advanced manufactured goods consists increasingly of the exchange of new products with a short life and early technical obsolescence. In such a world the speed of innovation is decisive. Unless a nation is equipped to carry out research and development in industry on something approaching the scale of the United States—currently of the order of ten times the British total—it must either lag behind or specialise.

That means that it must deliberately set out to import more from other specialists; otherwise it will be slower than its competitors in achieving the latest advance in industrial quality or productive power. My contention is that the issue of the speed of innovation affects a very wide range of economic activity—including, e.g., railways and electric power—not just "certain sectors of highly science-based industries," as Sir Roy suggests. If that is so, then the greatly increased bill for industrial imports which I am proposing can only be faced if there is the clear assurance of a free run for the sale of British exports on a scale much larger than exists now or is in prospect. That is the economic justification for joining the common market. It is wrong to concentrate exclusively on the tariff issue; there are subtler and often more effective forms of discrimination against foreign goods. What the common market set out to do is to guarantee that within the area the imports from its members will, for all time, receive the same treatment as domestically produced goods. Such a guarantee provides a quite different basis from anything available at present for the planning of long-term investment in new products with a large potential market abroad.—Yours faithfully,

London, SW3 ANDREW SHONFIELD

Cuba and America

SIR—Viewed from here, the leading editorial in your issue of October 6th on Cuba looks eerie indeed. I feel I must comment upon it, expressing an entirely personal opinion, since it seems to outline a view widely held in the United Kingdom. Its prevalence does not make it more valid to me as an Englishman living and working in the United States.

I came away from my last visit to Cuba a month ago—the tenth of a series in which I have seen Dr Castro's revolution bloom, wither, and finally be given artificial resuscitation by an alien, self-seeking gardener—convinced of several facts. The predominant one is that Mr Khrushchev will now go as fast and as far in Cuba as the United States will allow. He is on one of the most venturesome "dares" of his career and I feel sure that if he can be faced with no alternative but to abandon Cuba he will do so without resorting to nuclear war, despite his bluster. The Americans will certainly not start an atomic war over Cuba and Mr Khrushchev will not start one until he is certain he will win it, which is not yet.

I do not by any means advocate direct American intervention to oust him and I have no precise formula for outmanœuvring him there. One might suggest that the present policy of containment be pursued to its limit; that every possible help be given to Cubans seeking to liberate their country; that some kind of international anti-communist brigade be set up within the hemisphere; that the United States offer to Cuba the terms of a new relationship which will wipe out memories of exploitation in the past and give real attraction to a Cuban-American future; and that every political and diplomatic device, anything short of war, be used against Castro and Khrushchev.

Too much nervousness is being shown in and out of the United States, in my opinion, about the effects upon Latin American feelings of any American action about Cuba. Fairly regular acquaintance with events in Central and South America over the past ten years leads me to think that the United States will be much more respected there in the long run if she disposes of Mr Khrushchev in Cuba than if she lets him go on defying and goading her there. Even as I write, the *New York Times* announces that Radio Havana has begun to broadcast a "Radio Free Dixie" programme beamed at the negro population in southern states. . . .

One final word. I ask Britons who support the recommendation of passive containment of communism within Cuba if they would take the same calm and detached line if circumstances were to work to make it possible for Mr Khrushchev to set up a handy base for himself in Eire?—Yours faithfully,

EDWIN TETLOW

New York

Not So Angry

SIR—Reading your admirable review of Sir John Wheeler-Bennett's life of Lord Waverley in your issue of October 6th, it occurs to me that the answer to the enigma it raises as to "what made the man tick" may be answered by reference to two old adages; familiar enough to us older ones, and certainly to Lord Waverley, but less so, maybe, to the "angry young men" mentioned at the end of your review. Namely that great affairs are best conducted in the light both of Spinoza's "sub specie æternitatis," and of the old Greek philosopher's μήδεν ἄγαν.—Yours faithfully,

The Athenæum, London, SW1 A. H. T. CHISHOLM

↓ choose IRELAND

FOR YOUR NEW EXPORT FACTORY

For many years Philips, world-famous for their electrical products, have been manufacturing in Dublin. Now they are embarking on a new export programme from Ireland, and a second large factory for the mass production of components is nearing completion.

Mr. A. J. W. van Agt, Managing Director of the Philips Group of Companies in Ireland, is enthusiastic about Ireland's advantages for industry: "Our already well-established Irish organisation, employing some 500 persons, has given us much favourable experience of collaboration with the country at all levels. Our relations with our personnel are excellent and the co-operation of the authorities first-class. The Government's incentives to exporting industries obviously complete the attraction of operating here".

Some of the advantages that are bringing industries of all sizes to Ireland:

PLENTIFUL LABOUR. There is an ample supply of keen, adaptable workers.

NON-REPAYABLE CASH GRANTS are available, amounting to a substantial proportion of the cost of fixed assets.

NO INCOME TAX, no profits tax, for ten years on new industrial exports—and for the following five years taxation is at reduced rates.

NO DIFFICULTIES about repatriation of capital and profits to Great Britain.

AIR FREIGHT FACILITIES. To exporters interested in air freight, Shannon Free Airport's industrial estate offers premises for rental and 21 year tax exemption.

Ask Mr. Gerard MacCarthy, representative of the Industrial Development Authority, for full information on what Ireland can offer *your* industry. You can reach him through the Irish Embassy, 17 Grosvenor Place, London, S.W.1 (BELgravia 2171).

Or write for two informative booklets to:

BOOKS

The Case for Hoping

On the Prevention of War
By John Strachey.
Macmillan. 334 pages. 40s.

The Spread of Nuclear Weapons
By Leonard Beaton and John Maddox.
Chatto & Windus (for the Institute of Strategic Studies). 227 pages. 18s.

In the last two or three years the literature of the nuclear arms race has become so fragmented and specialised that it is a rare pleasure to find two books, published within a week of one another, which not only see at least one part of the problem whole, but also complement each other. Different though these two books are in purpose—Mr Strachey's aim is to build up a thesis, Messrs Beaton's and Maddox's to knock down a misconception—their effect, taken together, is to leave a coherent proposition about our nuclear future in the reader's mind; and a faintly hopeful—no more—proposition at that.

The proposition is as follows. So long as the rival blocks of power continue to possess nuclear weapons, it is unlikely that war can be staved off for ever by what Mr Albert Wohlstetter called "the delicate balance of terror"; sooner or later the balance is likely to break down (when one side discovers a defence against missiles, for instance) or a political miscalculation will set off the nuclear exchange. But experience suggests that there is no hope of getting rid of nuclear weapons as long as the world remains divided into sovereign nations—since disarmament appears to require a world authority, superior to mere sovereignties, to make sure that nations really disarm. The only hope, then, until and unless such a world authority comes into being, is for the powers that possess nuclear arms to come to a working arrangement (a) not to let other countries get possession of these weapons and (b) to keep their own quarrels this side of an atomic conflict. Such a working arrangement might itself be the first step towards a world authority.

So far the argument is Mr Strachey's; now the Beaton-Maddox book takes up the thread. The United States and the Soviet Union seem to be beginning to understand their common interest in imposing a *pax Russo-Americana* on the rest of the world; but one's fear is that before they have finally groped their way through to an understanding, the chance will have been lost because the proliferation of nuclear weapons will have passed the point of no return. In fact, Mr Beaton and Mr Maddox present a powerfully argued case for thinking that the number of countries likely to acquire a nuclear armoury is neither so large, nor so rapidly expanding, as most of us have tended to assume. The practical difficulty of building bombs and (even more) delivery vehicles is such, they suggest, that, together with moral scruples, it may prevent the nuclear club from expanding significantly for several years to come. In other words, we may have more time than we thought to work out ways of keeping the nuclear beast under restraint.

One reservation has to be entered about this second half of the argument. Hitherto a number of countries capable of making atomic arms have refrained from doing so because (among other reasons) they have felt themselves protected in one degree or another by one of the super-powers; this applies to Canada, and to a lesser extent to Sweden and Switzerland. But suppose China gets a nuclear armoury. This might crack several countries' inhibitions. India would very probably feel obliged to follow suit (which would cause some interesting reactions in Pakistan); so might even Japan. The crack having been opened, the other technically qualified powers might well conclude that restraint was no longer sensible. Mr Beaton and Mr Maddox suggest that in fact China may be farther away from nuclear status than the pessimists have feared. (The argument is that the irradiated fuel from the famous Peking reactor probably has to be returned to the Soviet Union, and is thus not available to make bombs.) The fact remains that, when China does go nuclear, as one day it undoubtedly will, the atomic club is liable to suffer a sudden expansion as others rush in too.

This reservation apart, it is hard to fault the Beaton-Maddox work; tightly argued, and full of facts, it is a remarkably useful eighteen bobs' worth. One's judgment on Mr Strachey's book is more complex. It has its flaws. There is one passage near the middle, dealing with communist attitudes towards the cold war, which amounts to little more than generalisations of the "by and large it is true to say" sort. Mr Strachey also appears to underestimate the case for keeping tactical nuclear arms in the Nato front line in central Europe. (The case is that forward deployment of these weapons, by making any fighting almost automatically nuclear, enables the West to wring the last few drops of credibility out of the doctrine of massive retaliation.)

But in the end this is not important. Neither of these passages is central to Mr Strachey's main theme; and on the question of tactical nuclear arms he is probably right in his conclusion, even if he does not give the other side full credit for the strength of its case. It is for its main theme—as set out above—that Mr Strachey's book deserves to be greeted as one of the most sensible and stimulating contributions to the nuclear debate in the last few years. It has already been pointed out that one of his virtues is to have digested recent American and Russian works bearing upon the likelihood of a nuclear war, and the probable consequences of one, and then to have presented their arguments in a more readily understandable form than the originals. An even greater achievement, in fact, is to have set this discussion in its proper diplomatic context—that is, in the context of the present (very tentative) Russian and American attempts to keep their antagonisms within tolerable bounds.

The relative moderation of Mr Kennedy and Mr Khrushchev—against the opposition of more militant people in their own countries, and among their allies—is probably going to be pointless in the long run if its only object is to avoid war on a day-by-day, crisis-by-crisis, basis. To make peace reasonably stable, it is necessary for the nuclear super-powers to work towards a mutual understanding—no matter how rough and ready—to use their unrivalled strength to keep the rest of the world in order. The moderates in both camps are starting to grasp this; others are not. Mr Strachey, lucidly, helps to spread the word.

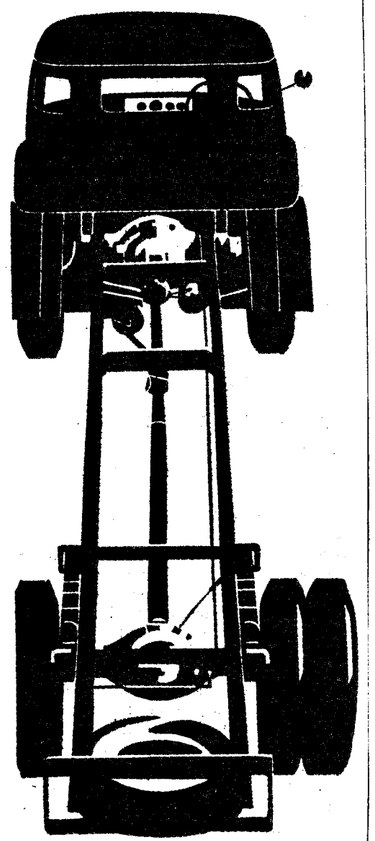
Cassandra

My Yesterday, Your Tomorrow
By Lord Boothby.
Hutchinson. 279 pages. 25s.

Lord Boothby has gathered together a number of speeches, lectures and articles written since the war on politics, economics, people and literature. There are two themes to the book. One, which is recurrent and fascinating, but needs no further mention, is Scotland. The other, more contentious, is that he was always ahead of his time, and warned the nation in vain of dangers which later befell us. The record is astonishing: appeasement, prewar deflation, the American settlement, the need for economic expansion, European union, the need for organised international liquidity, Suez; everything is there, and Cassandra's warnings always turned out right (did he also warn us against dangers which came to nothing? It is ungenerous to ask, and admittedly such speeches would not be worth reprinting). What is more, there was nothing of Cassandra's sibylline words; Lord Boothby is a model of clarity and his style is delightful.

Why was he not heard? Why did they not make him Chancellor of the Exchequer? It is a question which he often asks, and the obduracy of the establishment still astonishes him—most of all the obduracy

Steel
IS TOUGH



of Sir Winston Churchill as soon as he became Prime Minister. Yet the answer is clear, and he gives it himself in an introduction: Lord Boothby is a prophet by nature, not a member of the Sanhedrin. He hates power, but will not accept subordination; and he is a radical. He has never descended to the field of daily compromise; he sees the shape of the wood clear, but he has not battled through the trees, half-blinded by undergrowth and the back-lash of unruly boughs. He has kept a clear view at the cost of renouncing the responsibility and corruption of power. Nor is it certain that his remedies would have worked as well as he thinks, particularly when their sharp edge had been blunted by practical application. The man who has held power must be judged by his fruits; the man to whom it was denied does not run this risk. Lord Boothby is a little too resentful of his own exclusion from power to be generous to the smudged record of those who held it.

Long may we continue to have such prophets as Lord Boothby; may the world's slow stain never touch him; and may he put his regrets on one side. It is a delight to read again some of his political speeches; yet, at least between hard covers and after the event, one rather prefers the pieces untinged with regret and resentment, which means, in effect, his non-polemical writings. Best of all is his Rectorial Address at St Andrews, a noble and passionate speech in favour of reason and tolerance.

The Spy

The Secret War

By Sanché de Gramont.

Deutsch. 515 pages. 30s.

STUDENTS of history have long recognised the validity of Clausewitz's famous doctrine that war is the continuation of political relations by other means. The same, and this is Mr de Gramont's message to us, is true, *mutatis mutandis*, of espionage, which in his very last sentence he neatly describes as "an organic branch of foreign relations and foreign policy." Indeed, this role is given formal recognition by the major participants in the cold war—therein, for instance, lies the true import of the 1960 U2 incident. All this is a far cry from the day in 1928 when a celebrated American Secretary of State, Henry L. Stimson, could close down his department's cryptographic bureau, saying, in pious outrage, "Gentlemen don't read other people's mail."

Today, just as the political leaders of a democracy are accountable for failures in foreign policy, so too they are made answerable for the often inevitable and all too much publicised mishaps to intelligence operations—an obligation which, if they had the option, they would unquestionably renounce. Their diffidence is understandable. The secrecy of intelligence operations and the open character of democratic politics are hard to reconcile. Intelligence operations are often likened to the iceberg: the public only sees the smaller, visible part (and the failures at that). How can we be sure that the largest, invisible, part is any more successful?

Mr de Gramont tries to take us some, if only a little, of the way behind the scenes. Between thoughtful first and last chapters on the implications of espionage today, he sandwiches a substantial meaty filling on the doings of the American and Russian intelligence services (not forgetting the syllabus of the Moscow School of Seduction), adds some savouries about Britain and Germany, and garnishes the whole with titbits, probably from official sources. But at the end of the feast there is a feeling of anti-climax; really, we have learned precious little that an intelligent reader of the press could not have gleaned anyway. There may be some fresh disclosure to the British reader on Gordon Lonsdale or George Blake, but even this, like news about royalty, will probably not be news to readers of continental or American papers. Though we are told that Colonel Abel was "the master Soviet spy of the 20th century," and there is a fascinating account of his character and personality, of his actual achievements and his real value to his masters, we learn little. Quite the reverse: Mr de Gramont, almost in contradiction to what has gone before, states emphatically in his summing-up that Colonel Abel and George Lonsdale "did not send any sensational revelations to the center in Moscow." For, as he explains, the problem of communications for agents is an age-old one, and it is easy mistakenly to equate a successful communications system—the best that Phillips Oppenheim can offer—with a commensurately good intelligence end-product. Nor does a successful cover-story, in which the Russians specialise, necessarily make a good spy. Thus, Boris Morros (Hollywood and the Federal Bureau of Investigation) is quoted as saying of the late Dr Soblen's brother, Jack Soble, whose cover was a flourishing bristle-business, that he was more interested "in milking Moscow of its espionage funds . . ." than anything else.

None of this is to suggest that in this golden age of ideological treason and master professional spies, espionage can be laughed off. Mr de Gramont shows that it is not only the West that has its problems. Democracy's most serious source of defection has been among scientists, but to the Russians it is in their own intelligence services that defections are continuous and among the most eminent. Of the two, this may be the more critical problem. As scientific instruments, for instance satellites, take over on all sides from the human observer, this golden age may become the last age of intelligence services. But defections from the Soviet intelligence network strike at something else: at the vitals of Soviet society. Mr. de Gramont can therefore finish on an optimistic note; if the Central Intelligence Agency is by nature a "freak in a democratic society," the Soviet intelligence system is the "core of the régime, and its disappearance could lead to the end of Communist dictatorship . . . as we have known it."

Anglo-Saxon Attitudes

Anglo-Saxon England and the Norman Conquest

By H. R. Loyn.

Longmans. 430 pages. 30s.

THIS is the first volume of a new series, which is to cover the social and economic history of England in nine volumes. As the general editor, Professor Briggs, explains in an introductory note, the series seeks to avoid narrow specialisation. The various volumes will make a point of dealing with social as well as economic developments, and will draw on demography and sociology as well as historical geography. They are also designed to avoid what the editor regards as the dangers of this *genre* of history—the tendency to write in impersonal terms and to concentrate on categories rather than on flesh and blood human beings. To fulfil these admirably liberal intentions Professor Briggs has gathered a very strong team, a judicious mixture of "old hands" like W. G. Hoskins and Charles Wilson, and of younger scholars like the author of the present volume. If Dr Loyn's book is a representative sample, the series will be highly successful.

The period covered by the volume—from the withdrawal of the Roman garrisons to the aftermath of the Norman Conquest—provides unusual opportunities for the writer of a general survey. In a real sense these centuries saw the making of England; they have also attracted the energies of some of the finest scholars, from Maitland and Vinogradoff to Chadwick, Stenton and Lennard; and since the surviving evidence provides little scope for the indulgence of the historian's appetite for the minutiæ of political manœuvre, a large amount of attention has been concentrated on the economic and social history of the period. And knowledge of the main developments is still being extended, for example by the study of river-names and by numismatics. On the other hand the period is still a minefield of explosive controversies, on the course and nature of the Anglo-Saxon settlements, the extent of Roman survivals, the origin of the manor and on many other issues. Dr Loyn handles these complicated matters in a judicious and well-balanced way, though never with such an excess of scholarly caution as to disguise his own views on where the weight of the evidence points. He places the early English economy in a European setting and he deals not only with the mundane details of land-tenure, agricultural techniques and trade, but also with kingship and the nobility, and with the Church, learning and literature. The argument is at times necessarily technical, but it is invariably lucid, and the layman will not feel, as he is apt to do when reading works on so remote a period, that he has strayed into a colloquium of experts discussing obscure and unimportant problems in the secret language of their guild. This is not only a book for the student, but also for anyone who is curious about the origins of England and wants an expert and intelligible account of current views in this field.

A "Natural Oligopoly"

The Price of Middle East Oil

By Wayne A. Leeman.

Cornell University Press. London: *Oxford University Press.* 292 pages. 40s.

THE early story of Middle East oil is beginning to attract the attention of economists. The more distant it becomes the more clearly recognisable are its contours; though, with time marching on and so much having changed already, what set out to be a fighting analysis tends to become nothing but a postmortem. Professor Leeman's book is only the first of the studies of the subject that are to be published in the near future, and one of its merits lies in the fact that its content goes well beyond the scope of the title. The book is in fact a very readable account of some of the economic aspects of what happened; writing it must have been as difficult as it was necessary, for there are so many elements of straight power politics involved (to say nothing of the legal and taxation aspects) that the economics of the case have so far failed to be noticed in their proper context.

Another positive feature of the book is its general approach: analytical in his methods and critical of some features of the industry, the author is not an apologist for the oil companies; on the other hand, he is not (as were some others) patently allergic to the oil companies as they happen to have developed.

Professor Leeman deals with the legal wrangle between the United States Government and some American oil companies whether the latter had overcharged the Marshall Plan (ECA) agency—the Queen's Necklace affair of international oil—and also with the so-called "Cartel Case." He describes how and why the oil companies came out almost unscathed from these ordeals, and then gets down to first principles: he establishes that the oil companies are not monopolists, that they have not since the war had any explicit cartel-like agreements, but that they have lived up to the fact that Middle East oil is—or at least was for some time—a "natural oligopoly." Since the entry into that sphere was originally open only to the biggest international operators, their behaviour was almost inevitably determined by the motives of oligopolists. They would compete vigorously in some spheres, such as research, products quality, service, sales outlets and advertising, but would shy away from straight price

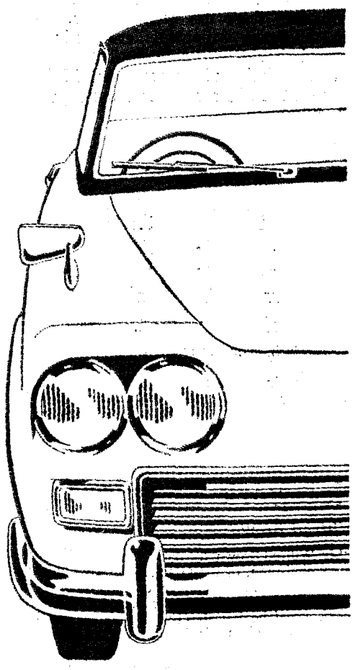
Steel
IS TRIM

Steel gets things moving. It bears the heavy burdens of industry and commerce, and the lighter ones of pleasure motoring. In cars and lorries it bears them on rugged frameworks. Moves them with powerful parts. For modern motor vehicles are essentially steel, used with ingenuity in hundreds of different forms.

Steel transmits the power. It takes the roughness out of the ride with springs, torsion bars, bearings. It buffers the shocks with bumpers and over-riders. It radiates heat and keeps the engine cool.

Steel is highly attractive too. Sheet steel for elegant bodywork. Steel for fittings. Stainless steel for a satiny finish, or plated steel for hard brilliance, laminates of plastic and steel for colourful décor.

Steel in exciting new forms provides the basis for continuous advances in the design of British cars and commercial vehicles.



You know where you are with
Steel
BRITISH IRON AND STEEL FEDERATION

competition, partly because of its self-defeating character in the circumstances. But such a situation tends to lead to a certain sluggishness, and thence to a rigidity; following American doctrines, Professor Leeman asks whether some obvious advantages of this kind of "stability" are not outweighed by its drawbacks. He traces the trend of Middle East oil prices since the war, and agrees on the whole with Mr W. J. Levy's noteworthy analysis of the range of prices within which Middle East oil is likely to move in the course of its co-existence with other sources of supply. Like Mr Levy, however, Professor Leeman considers "Middle East oil" or "Caribbean oil" as one competitive unit, without querying how competition among operators in each area might affect the picture. Some close attention to this problem would have given more strength to his misgivings that Middle East prices have been, on the whole, too high.

Professor Leeman goes on to trace the positions of the several parties interested in Middle East oil—producer countries, oil companies and consumer countries—and sees some divergence of interests which he would like to see tackled in a more business-like manner, and with more open competition than there has been hitherto. But his conclusion is hopeful: everybody concerned should have sufficient interest in a rational solution of the problems of Middle East oil to make a common sense approach possible.

Industrialism and Industrial Man

Clark Kerr · J. T. Dunlop
F. H. Harbison · C. A. Myers

A highly informative report on six years' study of economic development, labour and industrial relations in various parts of the world, with particular reference to new societies.

Piecework Abandoned

Wilfred Brown

"Mr. Wilfred Brown, formerly managing director, now chairman, of the Glacier Metal Company, has conducted a number of experiments in industrial sociology since the war. In *Piecework Abandoned*, he describes two of the most notable —one that gives his book its title, and the scrapping of "clocking in" throughout all Glacier Metal's factories. Both have been abundantly successful, and the reasons that Mr. Brown suggests for their success merit study by all managements"—*Guardian* leader.

HEINEMANN

Polar Explorer

Sir Hubert Wilkins: *His world of adventure.*

By Lowell Thomas.
Arthur Barker. 284 pages. 25s.

SIR HUBERT WILKINS was one of the most remarkable men in a profession that attracts few who are not in some way remarkable. Explorers can hardly fail to have adventures, and Wilkins, a quiet, rather retiring man, had more than most. His explorations are fully recorded in his own writings and the narratives of his various expeditions. A biography in such a case can do two useful things: link-up and re-tell the adventures, and, more important, explain the motive.

This biography is the second to come out in as many years. The earlier one was by Mr John Grierson, a polar flier like his subject. That did the first job very well, but left us not much the wiser on the second count. Mr Lowell Thomas does not, unfortunately, provide the complement. His book reads very easily, and he tells the story well, but he debars himself from telling us anything really interesting by his chosen method of presentation. His book is written as if it were by his subject —it is apparently based on an unfinished autobiography of Wilkins's—so that no comment on his subject is possible. Furthermore, since there is no indication which parts of the book come from the original manuscript and which have been added by Mr Thomas, the reader must not draw any conclusions from what he may think are self-revelatory remarks. The worst of both worlds is thus ensured.

When Mr Thomas does, very occasionally, risk a footnote, it is not always specially helpful. The story of the air exploration of Graham Land in 1928, for instance, draws an explanatory comment that a feature on the ground is now named after Wilkins—and another after Lowell Thomas. It would have been more useful to call attention to the fact that the major discovery of the flight, that Graham Land was an island and not a peninsula, was later found to be wrong.

Important areas of Wilkins's life are not touched at all. His profoundly religious nature is not mentioned, nor is his great interest in thought-transference. Furthermore, a book largely about geographical matters can be hard to get the hang of if it is totally without maps. In short, this is a good book for a nephew's birthday, but it does not add much to our knowledge of a fascinating and complex character.

Essays on Novels

Scholars of the Heart

By S. Gorley Putt.
Faber. 239 pages. 30s.

MR GORLEY PUTT is the Penn of literary journalism. When he was at Cambridge he was converted by Dr Leavis, and he remains openly faithful to his principles. But years of writing for the *Times Literary Supplement*, coupled to a generous temperament, have taught him courtly manners. The essays in this book are based on articles which he has written for many journals. They are all smooth and pleasant reading; and behind the smoothness lie both sense and sensibility. A few of them are a little light; admirable when the book which inspired them had just appeared, still readable, but hardly worth putting between stiff covers. However, most of them are worth preserving.

Much the best of the essays is one on Mr Gerhardi—witty, amusing and just. It was Mr Gorley Putt who not long ago reminded the reading public that one of the cleverest and oddest of English novelists is still in our midst, strangely neglected. Bringing back the half-forgotten is rather his forte: there are essays on Forrest Reid, on Anthony Hope (a most valuable guide which takes one through all his works and tells one which to avoid as well as which to read), and a rather dispiriting one on Maria Edgeworth, which does not give enough weight to her wit and knowledge of the world.

The book ends with a long section of musings on Henry James, in that curiously ruminant style which the master imposes on his admirers: little use to those who do not already read him, but stimulating to those who do.

A Planned Economy

Central Planning in Poland

By J. M. Montias.
Yale University Press. 425 pages. 60s.

POLAND is a country of special interest for those wanting to understand the nature of Soviet-style economies, and indeed to obtain an insight into planning problems in general. Polish economists include some very eminent and courageous individuals, with experience of the West, capable of expressing the special problems and difficulties of their country in a language which their western *confrères* can (or should) understand. Moreover, since 1956 these economists, and others, have been able to express their views with a degree of freedom hardly known elsewhere in the communist world. This freer atmosphere has also facilitated research by western scholars into the Polish economy, which sufficiently resembles that of other communist countries for any lessons to be of more than purely Polish relevance.

Dr Montias knows Poland, has met and talked with Polish economists and planners. He has also studied Soviet Russia and the economies of several other communist countries. He is therefore well qualified for his task, and he has written a most informative and stimulating book. It should be read by anyone interested in Poland, or in planning. After a most useful and subtle discussion of "planning in theory and practice", the author launches into a detailed survey of the development of the system down to 1956, with chapters on the political background, output planning and the allocation of in-

The Economist Diary

A happy mixture of all the ingredients necessary to ensure the smooth running of a busy man's day.

A week's appointments at an opening; a book that lies open flat on the desk

puts, incomes policy, long-term planning and investment; he deals also with the socialist enterprises and prices. Dr Montias says much of interest on each of these inter-related themes, the more so as he presents us with a most judicious mixture of the institutional pattern and reality, of model and practice. For example, in discussing "efficient" solutions to planners' problems, he loses sight neither of the theoretical difficulty of defining what is to be maximised nor of the practical snags of ensuring the required collection and processing of information. There is a valuable survey of the place of foreign trade in the planning process, of vital importance to a country so dependent on imports. Events since 1956 are analysed in one of his best chapters, in which an account is given of the fascinating discussions on the "Polish model"; these dealt with the theoretical basis of pricing, the role of market forces, possible relationships between the central plan and local and enterprise autonomy, and other issues of fundamental importance. We are also told about the practical reforms that followed the events of 1956, and their consequences. This chapter has unfortunately to be followed by one entitled "counter-reforms", because there has been a trend towards renewed centralisation, for reasons that receive careful and dispassionate analysis.

It is a pity that Dr Montias did not devote more space to the relationship between the state sector and the still predominantly individual peasantry. As he points out, the government is unwilling either to allow the emergence of large private farms, or to impose collectivisation, and cannot effectively tax the peasants or persuade them to increase off-farm sales. His arrangement of his material is open to the criticism that 1956 and its aftermath is dealt with in detail in chapter 9, although the consequences of the 1956 reforms are also discussed under various heads in several earlier chapters. But these are minor criticisms of a book which, beyond any doubt, significantly enlarges our understanding of planned economies.

Blue Funnel

A Merchant Fleet in War: ***1939-1945***

By S. W. Roskill.

Collins. 352 pages. 25s.

THE merchant fleet described in this book is the Alfred Holt organisation, in which the principal company, the Ocean Steam Ship Company, is generally known as the Blue Funnel line, though the ships of another subsidiary are distinguished by their red funnels. When the control of the fleet was taken over by the Admiralty and the Ministry of Transport a week before war was declared, 87 ships were involved, of which 52 were lost during the next five years. Some, such as the fast modern ships of the Glen Line, which performed such admirable service in the Mediterranean, served under the white ensign; the rest suffered the same hazards of war as did the 9,400 ships sailing under the red ensign at that date.

The company is fortunate in securing the services of a distinguished naval historian to record its war efforts. By collating company records, the testimonies of survivors and British and German official documents, Captain Roskill has described the activities of a particular shipping line in the context of the whole war at sea. Such a book is, of course, primarily of interest to the company concerned, but it is also of value in providing a convincing justification for the strategy of convoy, which is now accepted as having provided the key to victory. This was far from the case before the war, and convoy continued to be disliked by members of both the Royal Navy and the Merchant Navy for a long time after hostilities had begun. Convoys are difficult to organise, and before 1942 they were far from efficient on account of the shortage of escort craft and weapons. If more books like the present one had been written about shipping experiences in the first war, such shortages might never have existed, because the protection of trade would have had a higher priority in naval thinking. As Captain Roskill points out, the Japanese never learned the lesson, and because they squandered their merchant marine by refusing to provide adequate protection, they lost the war.

When the heroic endurance of those engaged in the Battle of the Atlantic is recalled, as it is here, and when the holocaust of shipping in the China and Indian oceans during the first period of the Japanese war is faithfully recorded, who can blame the masters of cargo ships for so frequently asking: what is the Navy doing? Kept in ignorance of the demands of grand strategy, they found themselves re-routed or deserted by their exiguous escorts to face the constant danger of torpedo and mine. What this book really does is to justify the ways of naval officers to their comrades in the merchant service, and to pay well-deserved tribute to the stoutness of the ships and the staunchness of spirit and sound seamanship of the men of the Holt line.

OTHER BOOKS

METTERNICH AND HIS TIMES. By G. de Bertier de Sauvigny. *Darton, Longman and Todd.* 315 pages. 32s.

This book is the fruit of much browsing through the vast mass of documents that Metternich left behind him, principally in the state archives in Vienna. It is not a biography or study of Metternich, but rather an anthology of his writings, assembled under different subject headings and linked together by explanatory comments. The first part of the book discusses Metternich's character, as revealed by himself, his ideas and his diplomatic methods. The second part describes his attitude and policies towards different countries and their rulers; in this English edition of the book the chapter on Britain has been considerably enlarged. This is not a book to be read in isolation; but for anyone interested in the period it is a useful, stimulating and often amusing source.

WHO OWNS WHOM (UK EDITION) 1962. *O. W. Roskill, Ltd.* 631 pages. £7.

This is the fifth edition of this invaluable reference book of parent, associate and subsidiary companies. The number of subsidiary and associate companies listed has risen from 19,000 to 22,000, and there is a new section showing subsidiaries and associates of British companies in the Commonwealth and South Africa.

A NAME

When you place a building contract, do you give the right importance to a good name? A name which is valued because it stands for absolute reliability, the highest standards of work and a strictly observed schedule.
There is no short-cut to the acquisition of a good name. It has to be earned: by years of hard work, proved ability, willing service and by readiness to adopt new methods without abandoning the best traditions of the old.

TO REMEMBER

The name of Laing has behind it over one hundred years of progressive experience, gained in a wide range of building and civil engineering works; a tradition of long service and team work among employees; a respect for craftsmanship; a pioneering spirit in mechanisation, research and development, in planning and methods of operation; an appreciation of human values. The name of Laing is, in fact, the best assurance to new building owners that their project will be carried out speedily, efficiently and economically. For behind the name is a good reputation which the company intends to keep.

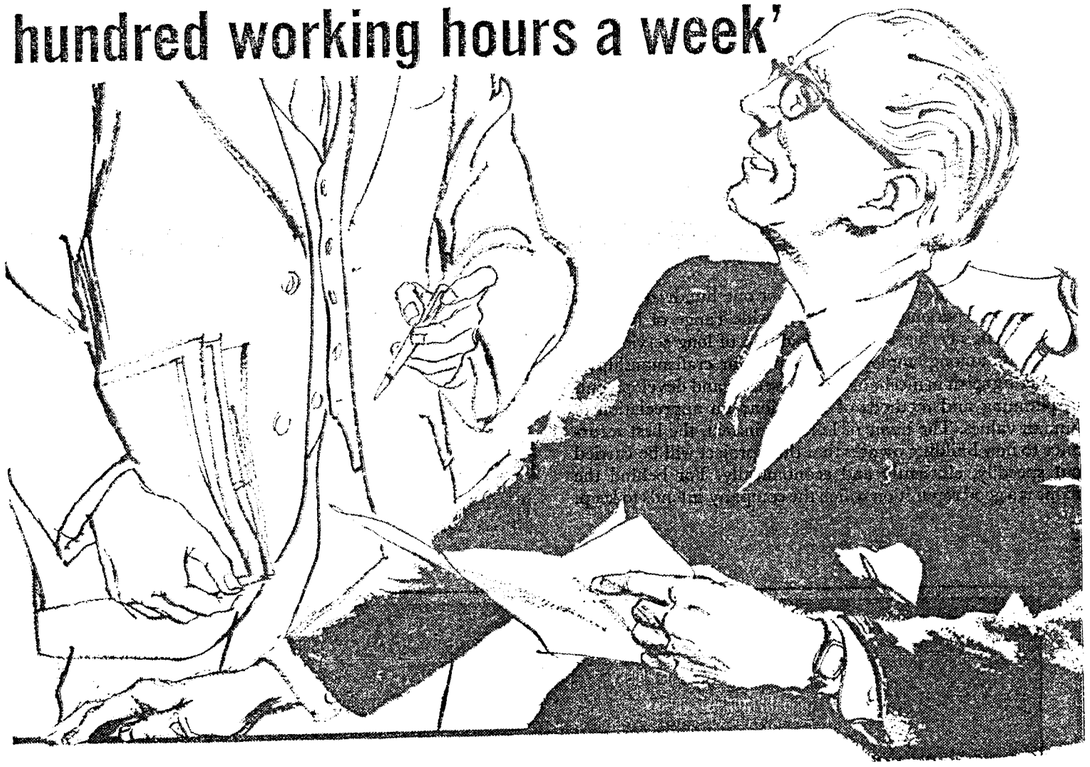
'So CREDIT TRANSFERS have gained us a hundred working hours a week'



This is the kind of economy now being achieved by many companies sending out Credit Transfers with their invoices. Not only is time saved, but Credit Transfers simplify the handling of accounts, eliminate the time-absorbing work of scrutinising, entering and paying in cheques, and enable valuable personnel to be directed to more productive duties. To make use of the Credit Transfer service, you (as the Creditor Company) include with each invoice you send out a Credit Transfer slip bearing, in addition to the name of your company, the name and branch of your bank. The customer completes and lists all the slips he receives, makes out one cheque for the total amount of all the accounts he is paying at any one time, and sends the cheque with the relevant slips to his bank. If the customer does not have a bank account he pays in cash at any branch of any of the banks named below. The money due to you is then transferred to your company's bank account; a complete record is sent by your bank to you; and the operation is over. You have saved time, trouble and money; so has your customer.

Himalayan Mists

FROM OUR CORRESPONDENT IN INDIA

For the first time since the Sino-Indian border dispute began the Indian people knows where it stands. After months in which New Delhi has blown hot and cold in successive breaths, one could almost feel the relief that greeted Mr Nehru's flat statement on October 12th that the army had been ordered to push the Chinese out of their latest foothold in the North East Frontier Agency. He followed it next day with an appeal to the people to back the troops in the front line "with discipline and increased production." No ifs, no buts. It was as if Chamberlain had given way to Churchill.

More sophisticated observers are not so sure. The "appeal to the people," at least, was largely the work of reporters demanding a message before Mr Nehru left for Ceylon, and of the sub-editors who played it up. The army has its orders—which is a good deal—and the government is committed not to negotiate unless "this particular aggression" is vacated, which is more. But if the job proves difficult, how long will the government retain the courage of the people's convictions?

The job may well be difficult. So far as one can tell through the fog of New Delhi's habitual half-truths and, till now, indecision (which, rather than ill intent, is the reason for most of the half-truths), the position is this. The Indians mean what they say about pushing the Chinese out; in the North East Frontier Agency, unlike Ladakh, terrain and logistics, though difficult, are relatively favourable to the Indians; they have at least 50,000 men deployed under a new and energetic, but not battle-tried, corps commander, General B. M. Kaul, who was moved two weeks ago from leadership of the army staff to take charge in the North East Frontier Agency, which till then had been combined with Nagaland and the East Pakistan frontier. Though Delhi denies it, the creation of a new corps for the agency was the logical accompaniment of heavy troop reinforcements for that area.

It is at the tactical level that the difficulties appear. The present fighting seems to be confined to the frontier just east of the tri-junction of Bhutan, the North East Frontier Agency and Tibet. The Chinese have come over the Thagla (Tang La) ridge, which according to the Indians marks the MacMahon line, and are dug in on the southern (Indian) side at a level of 13,000 to 14,000 feet, higher than India's Dhola post. Winter is coming on. The Chinese have ostentatiously proclaimed that their forces include veterans of Korea. They have substantial reinforcements at their main base, only twelve miles behind the ridge, and two airstrips within fifty miles. The Chinese have reacted very sharply to Mr Nehru's statements. A Note last Sunday accused India of making "preparations for war," and gave a warning that "Indian aggressors must bear full responsibility for the consequences of their crimes." Chinese troops are ready to strike "resolute counterblows."

What, precisely, is happening today? Here the fog descends in earnest. Official spokesmen remain convinced that the best news is no news, and uncertain whether their job is to love India more, or peace. Hence all movement and all firing must be initiated by the other side. One day perhaps they will face the fact that a sitting aggressor can only be removed by shooting at him, and begin to call things by their names.

It seems pretty certain that the initial incursion in early September was by the Chinese. But the first serious incident, near the Dhola post on September 20th, offers an example of the difficulties facing the unbriefed and distant interpreter. The Indian version was that two Chinese soldiers crept up and threw grenades at an Indian post. The Indians fired Verey lights, and saw a substantial force of Chinese a few hundred yards away, on whom they fired. Why, asks the armchair tactician, would a large and presumably attacking force obligingly announce its arrival with grenades while still several hundred yards away? Perhaps it was the two Chinese who were stationary and the Indians who were on the move? Maybe, answers the soldier, but in this kind of war, is not this just the kind of muddle that happens? It is on such slender threads that any detailed speculation hangs.

In general, though, it is certain that the Indians are starting to hit back. The reported casualties of the latest incident (100 Chinese and 17 Indians, according to both Peking and New Delhi) hardly suggest an Indian attack uphill against dug-in troops. But they do suggest at least a pitched battle, in which, it appears, neither side gained ground. Did the Chinese attack, and get a bloody nose? Last Sunday's Note, which among other things suggests that the Indians have been dropping paratroops—a remarkable achievement in this kind of country—bears every sign of real alarm in Peking.

The most intriguing uncertainty is whether the area really is south of the MacMahon line at all. The Chinese do not recognise the line, but they allege that in any case the Indians are north of it. Having originally charged the Indians with attacking "Chedong," whose co-ordinates, undoubtedly north of the line, appear to have been those of an unrelated place called Le, they then decided that "Chedong" was where the Indians say Dhola is, i.e., latitude 27° 46.5′ north. In this area, they say, the original 1914 Simla Convention map shows the line at 27° 44.5′ north—two minutes of arc, slightly more than two miles, south of "Chedong." Further, they say, correctly, that the Indian officials who discussed the border question with the Chinese in 1960 said the line ran east from a point thirteen miles south of the Mela Pass at 27° 57′ north: which would make the line run at 27° 45.5′ roughly—still south of Chedong. The Indians say, equally correctly, that their officials later expanded their statement to indicate that the line was running east from a point at 27° 48′ north—a mile and half north of Chedong. They explain the discrepancy with their original statement by saying that the thirteen miles were intended to be measured along the international frontier. Presumably a look at the original Simla map, which was on a scale of one inch to eight miles, could settle the question—if anyone cared to produce it.

Dr Adenauer Stops the Clock

FROM OUR BONN CORRESPONDENT

It will be no great hardship to Dr Adenauer to fly to Washington for his third conference with President Kennedy on November 7th. In the Chancellor's calculations the trip will provide him with a timely opportunity to demonstrate that when it comes to hopping the Atlantic he is just as nimble as the vice-chancellor, Herr Erhard, the foreign minister, Herr Schröder, the defence

minister, Herr Strauss, the development aid minister, Herr Scheel, the governing burgomaster of West Berlin, Herr Brandt, and all the rest who these last few weeks have made the fashionable pilgrimage. Nobody here doubts that Dr Adenauer is hoping against hope to convince the country of his unflagging powers and continuing indispensability. If the political promises of yesteryear are more enduring than the snows, the Chancellor has just twelve months left before he is due to make way for a successor—who, as envisaged in the by now dog-eared coalition agreement of 1961.

Many west Germans, probably the majority, think it would be better for all concerned were Dr Adenauer to go now. Yet this autumn sees him exerting himself to persuade parliament and public that his active influence on state affairs should be prolonged. Encouraged by a few blindly faithful disciples, Dr Adenauer has disclosed that he is toying with the idea of remaining at the head of the government until 1964 and then standing for the office of federal president—a consummation that would keep him at the head of the state for the following five years, by the end of which he would be 93.

With the object of confounding the critics who observe that the old man is gradually, and in the course of nature, losing his grip, the Chancellor made some theatre at last week's reassembling of the Bundestag out of a long exposition of the government's domestic and foreign policy, solicitously devoting, for once, the greater part of his attention to home affairs, particularly the nagging worry of persistently rising wages and prices. If on this occasion his light did not shine as brightly as he had hoped it would, it was partly because he had chosen a moment when there was little new for him to say. He was disappointed by his reception. But next month's sortie to Washington, he may well reckon, will help to polish up the tarnishing image of energy and usefulness.

OTHERS might suppose the journey to be superfluous. The west German foreign minister, Dr Schröder, has been in Washington this week; what further business is there that could not be settled by telegraph, telephone and ambassadors? The paramount purpose of the present German-American exchanges is clear, even though it is not easy to accomplish. This is, first, to reach as close agreement as possible about the limits to which the West could go to accommodate Mr Khrushchev should he bring the Berlin issue to a head after the Congressional elections on November 6th; and second, to reach a similar accord about the joint action the western powers should take against this or that possible trespass on their rights in or around Berlin. An increased financial contribution by Germany to Nato, and Britain's entry into the common market, are less urgent subjects of discussion.

But there are other considerations on each side. For Dr Adenauer, in addition to the chance, as he must hope, of bolstering his prestige at home, the visit will give him an opportunity once again to pronounce his anathema on any concessions to the Russians, and to correct any impression Herr Schröder may have been giving of the federal government's willingness to take a more conciliatory line. For President Kennedy the meeting will be an occasion to allay the Chancellor's immense suspicion of United States policy, and to explore the meaning of one of Dr Adenauer's more hopeful remarks about west Germany's relations with the east German regime. This was in the "government declaration" which Dr Adenauer read to the Bundestag on October 9th. As had to be expected, he first restated the familiar thesis that the signing of a peace treaty between the Soviet Union and east Germany would be a brutal act of power politics. The Hallstein doctrine, he reiterated, remained valid; the Federal Republic would regard diplomatic recognition of the east German regime as an unfriendly act, tantamount to blessing the permanent partition of Germany. Yet, although Dr Adenauer wholly ignored recent talk of the possibility of establishing west German trade missions in the east European communist states, he went on to make the following remark:

> I declare again that the government is ready to discuss many things if our brothers in the zone can organise their lives as they would like to. Here human considerations play on even bigger part than national ones.

Such a course has been advocated before; but what would it mean? What would he be ready to discuss? The long-term credits for which the hard-pressed east German regime has been asking? Recognition of the Oder-Neisse line? Presumably Mr Kennedy would like to know.

In the meantime, the Bonn government keeps up an unyielding appearance. The German ambassador to the Vatican, Herr van Scherpenberg, lost no time on Monday in seeking confirmation or denial of Polish newspaper reports that the Pope, in an address to the Polish bishops now assembled in Rome for the Vatican Council, had spoken of "the Polish western territories" that had been "recovered after centuries." (Herr van Scherpenberg was told that there had been no change in Vatican policy.)

An unedifying feature of Dr Adenauer's saddening efforts to hold back the clock in the Palais Schaumburg is his disparagement, direct and indirect, of the man who is waiting to step into his shoes. While addressing the Bundestag on the present perils of the German economy, the Chancellor made no mention of Herr Erhard, who had been the first to raise the alarm and to advocate the policies Dr Adenauer is now recommending. But Herr Erhard's popularity with parliament and the public has so far survived the Chancellor's petty crabbing. At a meeting of the Christian Social Union in Nuremberg last Sunday, Herr Erhard was demonstratively hailed—among others by the defence minister, Herr Strauss—as the Chancellor's heir.

Herr Erhard is respected on all sides for his constant decency and honesty amid the political hurly-burly. He does not shrink from saying unpalatable things when he believes they should be said. Thus he told his admirers at Nuremberg that if every worker put in only two more hours a week, some 800,000 persons would be released for industries in urgent need of their help. At the same time he deplored the flamboyant and pretentious way of living of many west German business men. Having reminded the Bundestag that hourly wages in industry had risen by 36 per cent since 1959, while production had increased by only 12 per cent, Herr Erhard recommended that the June 17th holiday, celebrating the anniversary of the east German rising of 1953, should be abolished and everybody devote his earnings on that day to a national fund.

There can be little doubt that, were the seat to fall empty now, Herr Erhard would be elected Chancellor. But while he is waiting a rival of increasing stature is emerging. In Washington this week Herr Schröder has been quietly adding to his already growing prestige at home and abroad.

General versus Parties

FROM OUR PARIS CORRESPONDENT

GENERAL DE GAULLE'S dogged attendance at army and navy manœuvres during the French government crisis is not without its bearing on the political outlook. His new political campaign appears to be based on rules of military strategy. It is now possible to piece together this *Kriegsspiel* that is designed to crush the existing political parties. One golden rule of the game is not to fight your main battle on the ground most favourable to your opponent. Since the political parties feel at their best during a general election, and since one was to be held before next spring, it was tactically advisable to defeat the political parties beforehand. If the parties

are knocked out in the referendum (on October 28th) they will still be groggy by election time (the two ballots are on November 18th and 25th). In any case this second electoral round will lack the importance of the first.

Such considerations explain the general's sudden passion for the electoral system by which his successor is to be chosen. Indeed, as the campaign gathers momentum, the problem of the succession is almost entirely forgotten by the gaullists. The chief slogan of the official propagandists is that if you don't give General de Gaulle your vote, he will turn his back and go, and you will be left to your dreadful fate.

General de Gaulle's preventive coup makes strategic sense. When the frightened leaders of the Fourth Republic surrendered in May, 1958, and fetched the general back from Colombey they secretly hoped that he would be an absolute ruler only for the duration of the crisis, and would then accept the mantle of a constitutional monarch. But their exception was to be the general's rule. The compromise lasted until the Algerian war was ended. The bogey of the Secret Army could have kept the parties quiet for still longer, but—short of an officers' coup a year—the deputies were bound at some stage to claim a share of power. In this context it is irrelevant whether the parliamentary leaders were actually preparing an offensive on more favourable ground. Logic demanded that they should rebel sooner or later. The general decided to strike first in order to establish that the president is the undisputed master, and to get his version of the situation endorsed by a massive popular vote. What present could be more flattering for the electors than a constitutional change requiring that the president be directly elected by the people?

Most commentators here maintain that the plan was more ... than he ... parliament altogether, the general spurred the ... into action. Revealing only too clearly his anti-parliamentary purpose, he pushed all parties into opposition—all, that is, with the obvious exception of the disciplined troops of the gaullist UNR. Yet what has happened is not necessarily the outcome of a miscalculation. If the purpose of the whole operation is to emphasise the vanity of parliament and the impotence of the parties, it may have seemed clever to show that the general could beat them all single-handed.

General de Gaulle, who brought the Algerian war to an end, has plenty of assets. The first electoral largesse is being distributed ; on Wednesday, the government decided to increase minimum wages and family allowances. The state apparatus of propaganda is getting into its stride. The bias of the French radio is almost too notorious to be mentioned. The television screen ("les étranges lucarnes" as they are called here in Saint-Simonian language) provide a prince president with a weapon that Louis Napoleon could hardly have dreamed of. But the general's principal asset is the weakness of the patchwork opposition which has failed to use the four years in the wilderness to renew its men and produce an alternative programme.

From Pinay's conservatives to Mollet's Socialists, the very names of the anti-gaullist coalition remind French people of the vagaries of the past. It is easy for official spokesmen to argue, with sarcasm, that the gravediggers of the Fourth Republic are hardly qualified to expound the virtues of parliamentary democracy. The opposition weakens its position still further by refusing to make a frontal attack on the general. With the qualified exception of the Communists—who are anyway outside the block—no party in the coalition says plainly what it would do in case of a parliamentary victory and the general's departure. The situation has reached the farcical stage at which the followers of the general proclaim that he will go if the constitutional project is rejected, while his opponents plead that it is his democratic duty to stay in office. (His broadcast on Thursday suggested that he would go if not supported by at least half the nation.) An unsophisticated voter may, in these circumstances, be forgiven if he concludes that if the general is so precious, it is better to vote for him.

This does not necessarily mean that General de Gaulle is assured of a resounding triumph in the referendum. For years observers have been writing about the political apathy of the French people and the diminishing audience vouchsafed to the parties. Now comes the moment for testing how deep is the apathy and just how reduced the audience. In 1958, after the humiliating collapse of the Fourth Republic and with threats of civil war in the air, the triumphant general obtained 80 per cent of a high poll. But at that time, of all the big parties, only the Communists dared to oppose him. Now the situation is reversed with only the UNR standing faithfully behind General de Gaulle. How much will this shift be reflected in the referendum figures ?

It is generally assumed that the Communists, and to a lesser extent the Socialists, will carry the bulk of their followers with them. The extreme Right—as was seen in the last referendum—has little electoral following. The big question is whether the parties of the centre and the traditional Right (the Radicals, the wavering MRP and the Independents) can bring many of their followers to vote against the President. If General de Gaulle once again polls more than 70 per cent of a fairly high vote, the *Cartel des Non*, which in any case will find it difficult to translate its pact into electoral alliances, will collapse under the shock. The general will either get a docile Assembly or, strengthened by his popular success, will treat any recalcitrant with contempt. If he polls between 60 and 70 per cent of a fairly high vote, both sides will claim a victory and the next round will be more complex. But should he get less than 60 per cent of those voting, which, it is calculated, would mean in practice less than half the total electorate, the anti-parliamentary operation will have failed. Unlike a player in the *Kriegsspiel*, he will not be able to put the pawns back in their starting positions. He would then have to revise his strategy and produce his secret weapons. The future course of the struggle between the general and the parties will thus be determined by the referendum.

Catalonia Counts the Damage

FROM OUR CORRESPONDENT IN BARCELONA

THE damage done by the floods of September 26th in the Barcelona region was heavier in human suffering than in property destroyed. The human tragedy was very great: over a thousand dead or unaccounted for (and local people say this is an underestimate). Many have lost relatives, their homes and all they possessed. The material damage, so far as can yet be assessed, was not remarkable by the standard of other floods in Spain. An estimate based on provisional figures collected from the local authorities a few days after the disaster put industrial and com-

mercial losses at 2,250 million pesetas and agricultural losses at 136 million ; but insurance circles put the figure a good deal lower —about 1,000 million for industry (the main loser) and 100 million for agriculture (168 ptas = £1).

But the essence of the economic damage is the crisis produced in the Spanish wool textile industry by the destruction of dyeing and finishing plants. Some 80 per cent of the wool textile industry of Spain is concentrated in the two Catalan towns of Sabadell and Tarrasa, which received the first impact of the storm and floods. The dyeing and finishing plants stood close to the rivers from which they drew their water supplies. Three-quarters of those in Sabadell and many of those in Tarrasa were swept away and wrecked (Rubí, the other town that suffered the worst casualties and damage, was an industrial dependent of these two). All this happened just when woollen manufacturers were about to deliver cloth for the winter season, and large stocks of highly priced goods awaiting despatch were destroyed or buried in the mud. The immediate problem is how to get the existing goods, let alone future production, finished and delivered to wholesalers before winter buying starts. Manufacturers may be forced to have some finished abroad.

The cotton industry was not hit in the same way, although considerable damage was done to cotton mills, particularly at Ripollet, south of Sabadell, where three large mills were flooded. The cotton weavers send their goods for finishing to Barcelona, which suffered relatively little from the storm.

There remains the problem of rebuilding and repairing the factories and replacing the machinery. The damage to factory buildings, equipment and machinery in Sabadell alone is estimated at 500 million pesetas. Measures announced by the government include the declaration of the losses as a "disaster risk," to be met by the funds created for this purpose by the consortium of insurance companies ; exemption from taxation for a year ; the waiving of customs duties on imported machinery ; and the granting of a long-term credit of 1,000 million pesetas through the Bank of Spain, 300 million of which has already been handed over. Manufacturers believe that, with this assistance, the industry will be working normally again in a year's time. The government has also taken steps to ensure that the workers thrown out of employment receive adequate unemployment relief, and expects them to be re-absorbed into industry within six or eight months. Some are being kept on the payroll of their former employers and are helping to repair the factories ; others are being offered work by rival firms, as there is a shortage of labour nowadays in Catalonia.

Congress in Cordoba

FROM A CORRESPONDENT

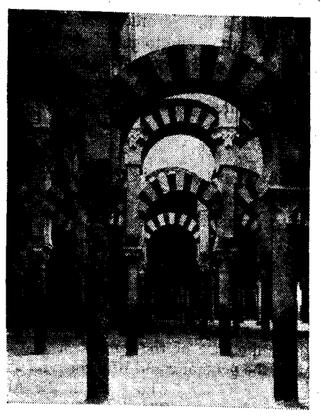
In Madrid today it is officially held that Spain is proud of its Arab past. But if you talk to a Basque or an Asturian you will probably quickly learn that this sentiment is not universal. Whoever you are talking to has very likely never been to Andalusia ; he dislikes both Arabs and the *cante flamenco,* which is rather doubtfully claimed as part of the Arab heritage of modern Spain ; and prefers to go for his holidays to any Nordic land rather than the southern half of his own country. A great many other Spaniards, however, do feel a sentimental attachment to the Arab past of their country. Manuel Machado, for instance, a poet with a wide popular appeal, began one of his poems by emphasising his kinship with the people "who coming to my country first won and then lost everything" and then went on to affirm that his "soul was impregnated with the fragrance of the Spanish Arab."

During the last hundred years interest in Spain's Arab past has been spread by the creation of a great school of Arabic studies. Founded by Francisco Codera, it was nourished by Julian Ribera and Asin Palacios, carried on by Gonzalez Palencia, who unhappily died prematurely in a motor accident, and is now represented at its best by Emilio García Gomez, the scholar and litterateur (Señor García has recently—it is to be hoped only temporarily—forsaken his professorial duties to become his country's ambassador, first in Baghdad and then in Beirut).

In the critical years between the end of the second world war and the beginning of the cold war, when Spain was semi-blockaded by the victorious powers and badly needed allies, the possible political uses of the Arab connection became clear to the Spanish foreign ministry. The way had been prepared at the end of the civil war when the government introduced in the Spanish zone of Morocco a distinctly more liberal policy than that followed in the French zone. Teaching in Arabic was allowed and the links between the Spanish zone and the Arab world in the east were encouraged.

Some five years ago a further step was taken when an Hispano-Arab Institute for the encouragement of cultural relations between Spain and the Arab countries was started under the ægis of the foreign ministry ; it was put under the direction of García Gomez with another distinguished Arabist, Father F. M. Pareja, as his second. The Spanish government hopes that these connections will help to smooth away the difficulties caused by the Spanish enclaves in Morocco.

Meanwhile, at the Moscow meeting of the International Orientalist congress in 1960 the unwieldiness of these congresses, which now cover the whole of Africa as well as the whole of Asia, led a number of eminent Arabic scholars to form a separate, perhaps two-yearly, international congress devoted entirely to Arabic studies. The Spanish government was glad to act as host to a congress of this kind, and in the middle of last month the First International Congress of Arabic Studies assembled in Córdoba. Señor García was, unfortunately, absent and a



number of other Spanish professors of Arabic also stayed away. Even so, the attendance, which it was originally hoped to limit to some 60-100 experts on Muslim Spain, rose to nearly 150, including observers. Scholars from western Europe and the United States were present, but there were very few Arab professors, probably because Arabic was not made one of the official languages of the congress.

The setting and the hospitality could hardly have been better. The Alcalde of Córdoba and the director of the Real Academia proved themselves fully aware of the traditions of their Muslim predecessors. The excursions, the parade of thoroughbred Arab horses, the display of flamenco dances, and the final banquet in the Alcazar of the Christian kings were not unworthy of the entertainment which in the 10th century the great Abderrahman III provided for his visitors from the barbaric north.

The rehousing of the homeless will probably be accomplished with reasonable speed in view of the priority given to it. A large proportion of the sufferers were poorly housed labourers—many of them had built their own dwellings, often by the river bank—who can be rehoused quickly, and a good deal better than before, in cheaply built blocks of flats. But many small farmers had their fruit and vegetable crops ruined and their plots rendered unusable by the flooding of the rivers Llobregat and Besós. The government is to provide credits and to undertake the cleaning of the land.

The effect of the disaster on public opinion has not been too adverse to the government. People are not inclined to blame the authorities, central or local. It is true that human fecklessness does much to make these natural disasters worse in their effects than they need be. These riparian industrial settlements had been allowed to grow up without much precaution against a rush of water from the mountain streams, or even against the fairly frequent flooding of the Llobregat and the Besós. The devastated towns were mushroom growths along the river beds ; foresight in the siting of industry and of housing could have made them less appallingly vulnerable. But the negligence belongs to the past, and criticism is stilled by the fact that the storm was quite exceptional. General Franco's prompt visit to the stricken areas, and the holding of an emergency cabinet meeting in Barcelona, have made an impression on Spanish opinion. But the outstanding effect has been the revelation to the Catalans themselves of the strength of their solidarity. The response of the people of Barcelona and other towns to the news of the disaster was remarkable. It was shown not only in the rush to subscribe to relief funds and deliver blankets, clothes and anything else for the homeless, but in the numbers of volunteers who went out to recover bodies and clear up the devastation.

Syria's Fashion Show

FROM A CORRESPONDENT LATELY IN DAMASCUS

Syria, who first set the fashion for military regimes in 1949, now has the chance to encourage a general movement towards representative government. The free play of political forces in Damascus, and the formation, on September 17th, of Mr Khaled el-Azm's coalition cabinet are of more than local interest. If some form of democracy, however imperfect, can be seen to work in Syria, it cannot fail to influence, by example, the monolithic regimes of Cairo and Baghdad.

But there are flaws in the present Syrian model. Such is the weakness of party organisation and the strength of local factors that Syrian elections are a poor guide to the political forces confronting each other in the capital. Non-party men, whether landowners, businessmen, tribal and minority leaders or the heads of the largest and most powerful families, are regularly returned in great numbers, swamping the small groups who actually make policy and set the pace.

Only the exigencies of the current struggle with the United Arab Republic have allowed Syrian political leaders to step clear of the trammels of a traditional parliament and arrive at a working agreement that more closely reflects the active political trends. Three days after he formed his cabinet Mr Azm dissolved the assembly and secured special powers to rule by degree until new elections are held within a year. Despite its claim to legitimacy, the government is less a parliamentary coalition than an *ad hoc* alliance of the principal political forces and pressure groups in the country—both parliamentary and extra-parliamentary.

One of these forces is the army: the commander-in-chief, General Zahreddin, sits in the cabinet as minister of defence, and a former general is minister of the interior. To have sought to exclude the army altogether would have been to invite its more direct intervention. In view of the history of the last twelve years, the Syrian army cannot be expected to return overnight to its barracks ; it must be recognised as one force among several on the Syrian political scene, domesticated only by being intimately associated with the political process.

How then does the situation differ from the ungovernable nineteen-fifties ? And what chance has Mr Azm's coalition of being both durable and effective ? For one thing, Syria is no longer a cold war battlefield as in the immediate pre-union years: the Right no longer looks to the West for support against a Left in league with the Soviet Union. With the great powers out of the ring, domestic differences seem less irreconcilable.

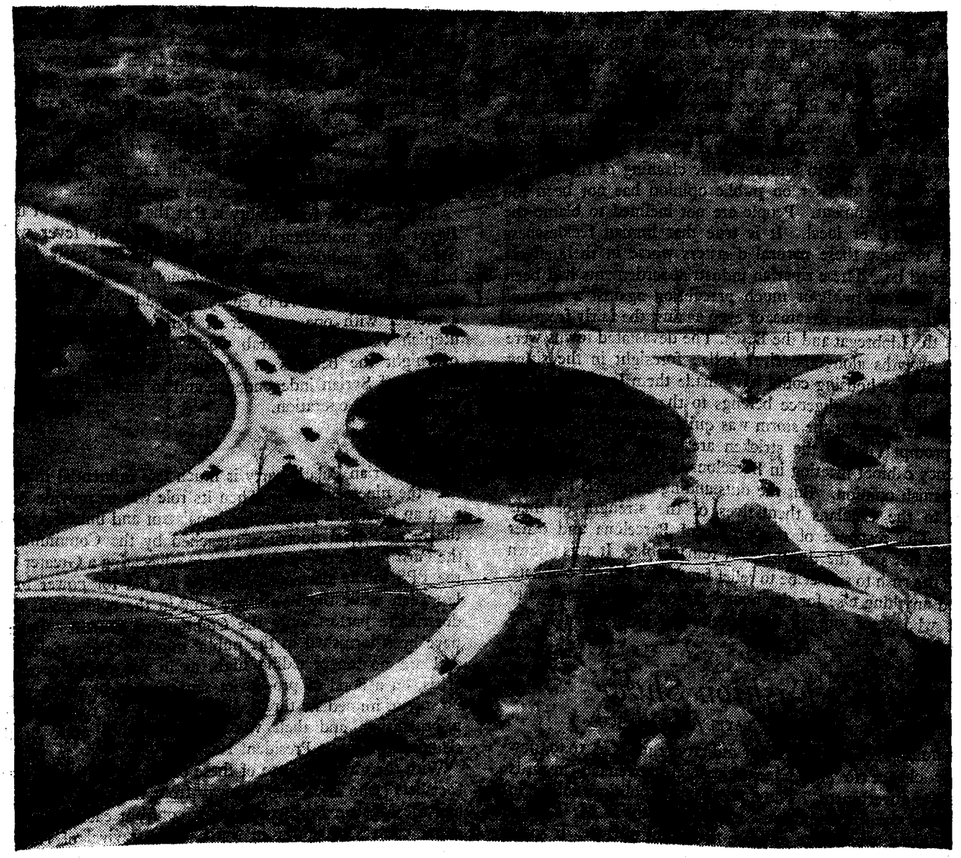
Another factor for stability is that the three years of union with Egypt have momentarily stilled the pan-Arab fever with which Syria was traditionally consumed. In the past, few Syrians believed in the future of their country as an independent unit outside some larger Arab entity. Salvation was thought to lie in a merger with one or other of Syria's neighbours. Today, the utopian vision of an Arab world miraculously united, enjoying overnight the benefits of socialism, has given way to a fierce defence of Syrian independence and to more modest objectives of inter-Arab co-operation.

The Syrian Ba'ath party is much less influential than it was in the nineteen-fifties. Then its role was to provide Arab youth with an ideal of a progressive, renaissant and united Arab world in the face of rival doctrines preached by the Communists and by the *Parti populaire syrien,* the party advocating a Greater Syria. But the PPS finally destroyed itself by its bid for power in Lebanon last year, while the Ba'ath are now in the wilderness. Of all the doctrinaire parties, only the Communists remain. But they too, have been tarnished in the public mind by their violence in Iraq, and are no longer riding high, as in the period after the Suez crisis, on a flood of pro-Soviet sentiment. As yet they constitute no sort of immediate threat, although they are thought to be busily re-organising, and their voice is heard once more in the press clamouring against President Nasser.

With the virtual eclipse of these old rivals, Mr Akram Haurani's socialists (who have broken away from the main Ba'athist group) and the Moslem Brotherhood now confront each other as the two major centres of power in Syria. The revival of Haurani's fortunes in the last year has been remarkable. He realised that if Syrian independence was to be assured, President Nasser's legend must be destroyed, and that if his own reputation was to recover from his responsibility for union in 1958, he must lead the attack in person. He has thus broadened the base of his support, formerly limited to peasantry in the Hama area and to his socialist henchmen ; he has won the somewhat incredulous admiration of many.

But of all the changes, the resurgence of the Moslem Brotherhood is perhaps the most striking. It is a reminder that the Arab masses, particularly in Damascus, can still be rallied in the name of religion. Islam, contrary to what many young Arab intellectuals would have one believe, is not yet a spent force. The present revival is, in part, a mass return to familiar roots in a moment of crisis ; in part, a regrouping of traditional forces to fill the vacuum caused by the disintegration of the old conservative National and People's parties. It is also a personal triumph for the Brotherhood's spirited supreme guide, Issam al-Attar, at 35 the only newcomer to hold his own among the veterans.

Opposition to President Nasser is the cement that binds Syria's coalition government together. At its head, Mr Khaled Azm, subtle and authoritarian, faces the greatest challenge of his career. He is perhaps the only Syrian leader acceptable to all factions and strong enough to mould them into a working team. The right wing are reassured by his *grand bourgeois* background, the left wing recognise in him a former ally, while to the general public he is known as a champion of Syrian autarky and an early opponent of union with Egypt.



Do you use a roundabout . . . or a rotary?

The difference may be slight . . . but even small distinctions in language and in customs can assume importance, when people in Great Britain do business with people in the United States.

The Chase Manhattan Bank, with the largest network of correspondent banks in the U.S., naturally has close familiarity with American trade practices and usages —and with the ways in which they differ *among* the fifty states. And after more than seventy years in London, too, The Chase Manhattan is equally familiar with British ways. This understanding of customs on both sides of the Atlantic can be very useful to you in your dealings with the States.

Indeed, The Chase Manhattan can be of service to you almost anywhere you do business. Its network of more than 51,000 correspondent banks, branches and representatives' offices all over the globe can provide you with every type of modern banking service, promptly, efficiently, and on a personal, *localized* basis.

When you do business anywhere abroad . . . it will help to talk with the people at The Chase Manhattan, in either of the London Branches.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect, all others are the work of the editorial staff in London.

New York's a Stage

FROM A CORRESPONDENT IN NEW YORK

THIS year's election in New York State ought on its merits to be a quiet and one-sided affair, but it has taken on unique importance as a dress rehearsal for the 1964 presidential campaign. The Republican Governor, Mr Nelson Rockefeller, is a heavy favourite to gain a second four-year term; he is also generally expected to be his party's candidate against President Kennedy two years from now. Therefore he wants not only to win but also to increase his majority in order to show the Republican professionals in other parts of the country that he is, indeed, the right man for the presidential nomination. This means that he must improve on the quite handsome majority of 573,000 votes which he obtained over the politically inept Mr Averell Harriman in 1958. Last summer the task seemed easier than it has done since the Democrats chose as their nominee Mr Robert Morgenthau, a political unknown who has proved to be an unorthodox but surprisingly attractive candidate.

President Kennedy and his brother, the Attorney General, who is the Administration's chief political strategist, are in their characteristically long-headed and alert way doing everything within their power to reduce Mr Rockefeller's majority and—hopefully—to defeat him. They hand-picked Mr Morgenthau on the advice of Mr Louis Harris, a public opinion pollster upon whose assessments of political sentiment they rely greatly. Local party leaders, having no candidate of their own of star quality once Mr Wagner, the Mayor of New York City, refused to run, assented to the President's choice but the party convention ratified this decision only after angry protests from some of the rank-and-file.

The Harris analysis of past voting statistics and present sentiment spotlighted middle-class Jewish voters in the city and its suburbs as the critical floating group in the electorate. In 1958 Mr Rockefeller ran only slightly better than routine Republican candidates in his party's upstate strongholds but he made a personal impact in the city, particularly on Jewish voters who are traditionally liberal and independent. This analysis resulted in the prescription that what the Democratic party needed was "a Herbert Lehman-type candidate," referring to the former Governor and United States Senator who is the revered elder statesman of New York Democrats. The political witch-doctors succeeded remarkably well in filling this prescription.

Mr Morgenthau, aged forty-three, is a great nephew of Mr Lehman, the son of Franklin Roosevelt's Secretary of the Treasury and the grandson of Woodrow Wilson's Ambassador to Turkey; he exemplifies the tradition of the old German Jewish families which have played a prominent part in New York's business and civic life. A successful lawyer and a loyal Democrat, he entered active politics in 1960 when he served as one of the local chairmen of the Citizens for Kennedy organisation and was rewarded by being appointed United States Attorney, a major patronage plum. As the chief prosecutor in all cases involving violation of federal law in metropolitan New York, he gained a reputation for vigour and high professional competence. Like his father, whom Roosevelt used to call "Henry the Morgue," the Democratic candidate for the Governorship is reserved and diffident and a mediocre public speaker. The attempt of the press to popularise him as "Morgy" adds a diverting footnote to the campaign.

To strengthen Mr Morgenthau in his difficult assignment, the Democrats nominated their customary "balanced ticket" of candidates designed to appeal to all elements in their complex racial and religious coalition. Those chosen to run for the other offices which are voted on by the electorate of the whole state include three Roman Catholics, two of Irish and one of Italian ancestry, a Jew and a Negro, thereby excluding no one except the newest minority, the Puerto Ricans, and the oldest, the white Protestants. Mr Edward Dudley, the Negro Borough President of Manhattan who was nominated for State Attorney General, is the first of his race to be designated for an important state office in New York by one of the major parties. He is accustomed to breaking fresh ground since he was the country's first Negro Ambassador to Liberia in 1948. The selection of Mr Dudley represents an attempt to increase political activity among the Negroes, who usually vote 3 to 1 for the Democrats when they bother to vote at all, which barely half of them do.

At first glance Mr Morgenthau would seem to pose no challenge to the fluent, self-confident Governor who has taken to politics with remarkable gusto and flair. The Democratic strategy is for Mr Morgenthau to point a contrast between himself and Mr Rockefeller rather than to attempt to compete with him in his own style. Unlike Mr Harriman, who tried four years ago to outdo Mr Rockefeller in marathon bouts of hand shaking and eating blintzes and frankfurters, Mr Morgenthau hopes to win support from voters with a taste for understatement.

THERE are virtually no issues in the campaign. Mr Morgenthau accused Mr Rockefeller of intending to ask for increased taxes, a charge which the latter has vehemently denied and which seems improbable on its face if the Democrats' other charge that the Governor has his eyes only on 1964 is true. Governors who hope to move to the White House do not normally begin their forward march by increasing the electorate's tax bill. Mr Morgenthau has also complained that Mr Rockefeller has failed to attract new industry to areas of chronic unemployment, has provided insufficient aid for education and has enlarged the loopholes in New York City's programme of rent-control. But these are fairly mouldy bricks which the outs have been throwing at the ins for several elections.

Mr Morgenthau's only chance of winning, which is slight but exists, is to convert the election into a plebiscite in support of President Kennedy and his policies. In New York as elsewhere the great imponderable of the election is how much of Mr Kennedy's personal popularity, which is very high, can be translated into votes for his party's candidates. Mr Rockefeller is not only the President's putative opponent in 1964 but he has also, in the past, made searching criticisms of Mr Kennedy's handling of foreign affairs, notably in the nuclear disarmament negotiations; here Mr Rockefeller argues that the United States has gone too

far in yielding to the Russian point of view. Mr Morgenthau stresses his own support of Mr Kennedy. The President has made two appearances in the state on his behalf and is to make a third before the campaign ends.

Recently the Governor has tried to minimise the plebiscitary quality of the election by speaking exclusively on state issues. He has refused to debate with his opponent on the sound premise that such encounters would only serve to make Mr Morgenthau better known. Democrats have twitted Mr Rockefeller for this calculated avoidance of his opponent as well as for what appeared to be an uncharacteristic lack of graciousness in refusing even to pose for photographs with Mr Morgenthau when they attend the same function.

One "issue" which is never mentioned in public but which is behind much of the political interest in this contest is how much the Governor's unexpected divorce last year after thirty-one years of marriage hurt him with the voters. There is no doubt that it damaged his image somewhat; previously this had been of rock-like moral solidity. New Yorkers as a group are urbane about matters of this kind but politicians will have their antennae out to detect even small shifts in the voting pattern of urban Catholics and conservative, small-town Protestants.

The election will provide a test of strength for the politically resurgent right-wingers who in New York have organised themselves as the Conservative party and are running their own candidates. The Republican party has finally abandoned the strenuous efforts to get the Conservatives ruled off the ballot on various legal technicalities; it is now reconciled to the view that they will not do the Governor serious harm. Although the Conservatives have criticised Mr Rockefeller occasionally for his social welfare programmes, the real target of their wrath is Mr Jacob Javits, the most liberal of the Senate's small block of progressive Republicans. But Senator Javits is so far ahead of his Democratic opponent, Mr James Donovan, the lawyer who is negotiating the release of the anti-Castro invaders held prisoner in Cuba, that nothing the Conservatives do is likely to impede Mr Javits's triumphant re-election.

At one time Mr Rockefeller had hoped to make up for any losses among the Republican party's right wing by an electoral alliance with the Liberals, New York City's durable third party, which is financed by the trade unions in the garment industry. But the Liberals, as is their custom, put their interest in the Democrats' national programme ahead of their admiration for the Governor and renewed their traditional alliance with the Democrats. Mr Rockefeller has, however, obtained endorsements from several other influential trade unionists who normally support Democrats. He is likely to do equally well with the rank-and-file of the Liberal party, a development which would not greatly surprise or distress that party's leaders despite its official protestations on behalf of Mr Morgenthau.

Visit Washington Week

LAST week's "Visit USA" campaign seems to have had a more striking impact on Bonn and Moscow than it did on London. This week the Russian Foreign Minister is calling on President Kennedy in Washington to tell him, so it is thought, that Mr Khrushchev will be coming to the United Nations in New York during November. In any case Dr Adenauer has ensured that he will get in first, by announcing that he will be in Washington on the day after the congressional elections; the German Foreign Minister is already there. For the Administration all this is welcome reinforcement for its present rather ostentatious insistence on the need to be ready for another serious crisis in Berlin before Christmas. This insistence is designed partly to convince Mr Khrushchev that the United States is determined to resist any further encroachment in Berlin, partly to stiffen the western allies and to recapture the interest which has been concentrated on the bargaining over the common market and partly to give the American public something to worry about beside Cuba.

President Kennedy argues that the Russians are interfering in Cuba in order to divert attention from their much more dangerous plans for Berlin. But it is difficult not to feel that he himself is building up a sense of imminent emergency in Berlin in order to distract American voters from the Republican allegations that he has failed to cope with Dr Castro and that his foreign policy has been a constant backing down in the face of threats. The present stream of visitors to Washington certainly gives Mr Kennedy an answer to the charge that he has not provided leadership. Nevertheless his efforts may rebound against the Democrats since a growing number of Americans seems to agree with the officials in other countries who think that the Berlin crisis is being exaggerated and that Mr Khrushchev has no intention of bringing it to a head this year. His reported readiness to meet Mr Kennedy and to open a third round of negotiations over Berlin will strengthen this view. In Washington the chief fear is that Mr Khrushchev will again organise some unanticipated shock, if not along the lines of last year's Berlin Wall, then in another form.

Illinois Accent

CHICAGO, ILLINOIS

PRESIDENT KENNEDY is visiting Chicago and Springfield this week to support a man with an almost perfect pro-Kennedy voting record in Congress. Mr Sidney Yates, whose actual score is 97.6 per cent, is leaving the safe seat in the United States House of Representatives which he has held for fourteen years, in an attempt to replace Senator Dirksen, the Republican leader with a voice like tarnished silver whose throaty oratory is familiar to millions of television viewers. Mr Yates needs all the help he can get. People are saying already that he is more likely to find himself appointed to the judicial bench, as a reward for faithful service, than elected to the Senate and that Mr Kennedy may succeed only in stirring Republican voters out of the apathy which is Senator Dirksen's only real problem.

For a long time it was whispered that Mr Kennedy would not campaign for a Democrat in Illinois because he wanted Mr Dirksen to continue in the Senate so that, as minority leader, he could go on being helpful about foreign policy; it is now said that by campaigning against Senator Dirksen the President is endangering bipartisan unity. But whatever Mr Dirksen may have thought it desirable to do in Washington, he is now telling the voters in Illinois that Mr Kennedy is to blame for the mess in Cuba and that in the talks at Geneva with the Russians about a ban on atomic tests his mistaken policy has been "retreat, retreat, retreat." Mr Yates has preferred to attack Senator Dirksen on his domestic flank, saying that the Senator tried to "sabotage" the legislation for stricter control of the distribution of medicines which was passed after the sensation about thalidomide and also that he has always opposed hospital insurance for the elderly—there are a million people in Illinois over 65. But "medicare" does not seem to be quite the burning issue in Illinois, or elsewhere, that the Democrats persist in supposing it to be.

Mr Yates is a Congressman from Chicago and in the rural areas of the state he carries two handicaps. One is that he is a leading member of Americans for Democratic Action, which the farmers suspect of being a very left-wing organisation that wants to manacle them all on collective farms. The other handicap, one of quite

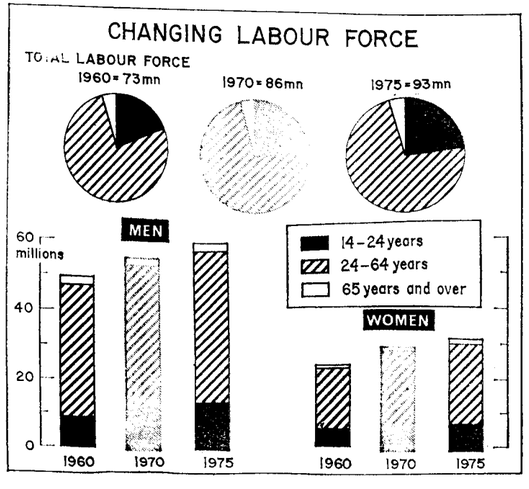
a different sort but no less serious, is that Mr Yates is widely regarded as having been hand-picked by, and of being helplessly dependent on, the Democratic "machine" of Cook County, of which Mr Richard Daley, the Mayor of Chicago, is boss. Illinois already has one Senator from Chicago and in the opinion of many rural voters one is quite enough.

This lakeside metropolis is expected to continue stoutly Democratic, because of the votes of organised labour and of its racial minorities, particularly the Negroes, who are said to control nine of the city's fifty wards and to be pressing hard for more equality. And Chicago continues inexorably to be itself in other ways. Beer barons still appear in court, charged with evading income tax, and are still slain in gang wars. The city is dynamic yet decays as fast as it rebuilds itself and, despite its art treasures and blocks of flats built like lighthouses, resembles its famous Loop which makes an immense roaring noise and goes round in a circle.

Well Off but Workless

THE September employment figures showed what the industrial production index for the month has now confirmed, that the economy is stuck in its groove of prosperity, "hanging high" as one official says of the number out of work. This was again 5.8 per cent of the labour force and unemployment is not likely to go below 5.5 per cent during the winter. With the seasonal stepping up of activity in the motor factories and the opening of the school year there were 400,000 fewer people actually without jobs than in August; long-term unemployment, lasting for more than six months, and the number of areas of "substantial unemployment" both went down to the lowest level for over two years. But the number of people at work declined more than usual for the time of year and the proportion of Negroes, women, young people and other unskilled workers who were jobless continued to be far above the average for the labour force as a whole. Therefore it is good news that the new programme for retraining unemployed workers has made a fast beginning. But it is bad news that Congress refused to approve an extension of unemployment benefits for those who have exhausted their rights under the existing scheme.

Another supposedly good sign, that in September the work week in factories had gone up for the first time since April, was disturbing because it suggested that manufacturers were so uncertain about future demand that they preferred to pay extra wages rather than hire new workers; this process is potentially costly as a result of the pensions, supplementary benefits and so on to which employers are committed. The generosity of such schemes is the main reason why older people are retiring earlier than they used to do. This explains why the latest projection of the labour force (shown in the chart) forecasts rather smaller increases than were estimated a few years ago. In addition there is a growing and welcome tendency among young people to stay longer in school or to go to college instead of entering the labour market. This may mitigate the coming impact of the flood of post-war babies who are now reaching working age. Nevertheless by 1970 there will probably be 10 million more people wanting jobs which can only be provided in sufficient quantity if economic growth is speeded up in the United States.



Every Man His Own Borgia?

NEW YORK

THE American manufacturers of agricultural chemicals do not yet know whether they have been injured or merely insulted by Miss Rachel Carson. But in private they are bemoaning the formidable literary powers which have been turned against their insecticides and pesticides, a $300 million a year industry, and the enthusiasm with which the public has embraced Miss Carson's new book,* a diatribe against the poisoning of man's environment by "substances nature never invented." In their counter-attack the chemical companies and their associations are mustering battalions of public relations officers to explain how the new industry, which has not looked back since DDT was released for public sale at the end of the war and since methods were discovered of making agricultural chemicals from oil, has helped each American farmer to produce enough food for twenty-six people. In pre-pesticide 1940 he could feed only ten.

The industry does not expect to suffer serious financial loss as a result of the attack by Miss Carson, a biologist highly respected for an earlier book, "The Sea Around Us," although her gloomy prophecies are destined for wide distribution through the book clubs, paper-bound editions and magazine serials (one of which alarmed readers of *The New Yorker* magazine in the summer). Agricultural chemicals account for only one per cent of the annual $30 billion worth of sales by the chemical industry as a whole. Moreover, those who may now decide to forswear Miss Carson's "elixirs of death" are householders and amateur gardeners, who provide only one-sixth of the market for weed and pest controls. Professional farmers—on whom both the industry and the Department of Agriculture work constantly to eradicate the conviction that if one dose of insecticide is good, two are better—are not likely to become converts to Miss Carson's belief in "natural" control of unwanted forms of life.

Nonetheless, the manufacturers, who include many reputable firms such as the Monsanto Chemical Company and the du Pont Company, which pride themselves on public spiritedness, feel that they have been unfairly accused of ignoring the safety of the people out of a desire for profits. They believe that in reality they have been more than vigilant in pointing out the risks of accident and in teaching proper methods of applying their products, whose enormous benefits they had felt patently to outweigh the dangers. One of their real fears is that public anxiety may force Congress to pass regulations concerning the use of pesticides on food crops even stricter than those which have been observed since the pesticide amendment was added to the federal Food and Drug Act in 1954.

Certainly Miss Carson presents a frightening case. Traces of

the chlorinated hydrocarbons, such as DDT, and of the even more toxic organic phosphates, such as parathion, manage to find their way into the body ; some tend to accumulate in fatty tissues. Since these substances are new, no one can know what they may do to humans over a long period (although an experiment conducted in Atlanta, Georgia, by the US Public Health Service found that convicts who volunteered to eat for over a year 200 times the amount of DDT absorbed by the average person suffered no ill effects). If the two groups of insecticides kill insects by damaging the central nervous system, though in different ways, will they not harm people similarly ? Miss Carson also makes propaganda play with the fact that 11 per cent more Americans died of cancer in 1959 than in 1900. Moreover, apart from the danger to human life, she can foresee a kind of chemical devastation of the soil and wildlife such as has been described until now only by the most pessimistic Cassandras of nuclear holocaust. There could be a " silent spring," she says, in which the only living creatures might be those strains of cockroaches, mosquitoes and flies which had adapted themselves to the omnipresent poison.

THE Department of Agriculture, the journal of the American Medical Association and a committee of the National Academy of Sciences have recently reminded the public that pest control is necessary to maintain the food supply, and that there is still no clear evidence that insecticides, used properly, have caused illness or death. Officials of the Food and Drug Administration are taking the attack stoically, although it discounts to a large extent their work in guarding the public's safety. The FDA is constantly testing pesticides for toxicity ; it establishes upper limits—tolerances—for the amount of pesticide which may remain on food transported across state lines. There is no tolerance for DDT in milk, for example ; on unlinted cotton seed, a food for dairy cows, the limit for the insecticide chlordane at the time when the crop is sold is only .2 parts a million.

The FDA is also on guard in farm areas ; when a heavy rain brought an infestation of red spider mites to lettuce fields in California just before the harvest, the FDA heard that a desperate farmer had illegally sprayed his crop with dieldrin (similar to but 40 times more toxic than DDT). Samples of the lettuce were taken and analysed and the entire crop was seized when it reached its market in New York. The great cranberry scare of 1959 cost the growers $40 million worth of their crop because they had sprayed the bushes before, rather than after, harvest with aminotriazole, a weedkiller which had produced cancers in rats. The threat of such losses is felt to stay the farmer's hand. FDA methods are not foolproof ; there are only 600 inspectors for the whole country, enough to sample only a minute fraction of the food reaching markets. Moreover, although most states adopt the FDA's limits of tolerance for pesticides, there are some in which the Legislatures, heavily weighted by representatives from rural areas, many of them farmers, soften the intra-state restrictions to favour growers.

From her crusade Miss Carson may have achieved a pyrrhic victory. She has frightened the public, whose delight in insect bombs and spray guns has made it the most dangerous user of pesticides. Her epitaph for dead robins, meadowlarks and wildflowers will undoubtedly give pause to communities which have unthinkingly ordered large spraying campaigns against mosquitoes or elm disease, for example. But with her extravagant language, " we are in little better position than the guests of the Borgias," her unscientific use of italicised innuendo (" *Today, more American school children die of cancer than from any other disease* "), her pantheism (" Nature fights back ") and her disregard for the studies of the problem by her fellow-scientists in industry, the universities and government service, Miss Carson may have damaged seriously her professional reputation as a reliable scientific journalist.

Give and Take

IN the most comprehensive survey of foreign direct investment in the United States since 1941, the Department of Commerce has revealed that the stake of foreigners in American business has more than trebled to reach a book value of $7.4 billion at the end of 1961. This total is still dwarfed by foreign holdings of United States shares and other portfolio investments, which have grown even more rapidly to exceed $14 billion. Four-fifths of the increase in direct investments—mainly reinvested earnings of $2 billion and capital inflows of $1.6 billion—has taken place during the last decade. Europeans have contributed a predominant and rising share of this investment ; reasserting their prewar eminence, they now account for 70 per cent of the book value of all foreign direct investment in America. Keeping pace, British investors have retained the lead. Indeed, United Kingdom holdings alone account for one-third of the total. Not surprisingly British investment in the United States remains particularly important in insurance and petroleum. The United Kingdom's holdings in finance and insurance are second to none and represent almost half of all foreign investments in this field. Its holdings in petroleum are outdistanced only by those of the Netherlands and still account for almost one-third of the total. The remaining British investments are widely spread. Altogether, at the end of 1961 their total book value was nearly equal to the value of direct investments which American companies have made in their turn in Britain.

Although the British and American stakes in each other's economies are roughly comparable, the Americans have continued to earn far more than their British counterparts. Figures published by the Board of Trade in Britain, which exclude data on oil and insurance, indicate that the annual earnings of United States investments in this country have averaged some $270 million during recent years. In contrast, earnings of British investments in the United States (excluding an estimated $1.4 billion in oil and insurance) have averaged only some $50 million a year. This is not by any means a phenomenon confined to the British case. Total foreign earnings on direct investments in the United States have risen very little during the past decade and in 1960 were equivalent to not much more than one-tenth of the earnings of American companies on a total of investment abroad just five times higher. The Department of Commerce advances no reason for this discrepancy. However, one aspect of the nature of foreign invest-

ment in the United States highlighted by the survey suggests a partial answer. Almost 80 per cent of the value of this investment is still accounted for today by firms acquired or established by 1941. Presumably American investment abroad, which has grown far more rapidly during the postwar years, has been directed to a larger extent towards newer and more dynamic industries. Despite the relative sluggishness of the earnings of foreign-owned companies in the United States, however, the income remitted to foreign countries has on average exceeded the flow of new capital to American from these sources by $50 million a year.

Over the Pork Barrel

In most election years members of Congress are panting to leave Washington. But last week, although many individuals had slipped away, making the finding of a quorum difficult, Congress seemed almost to have lost the trick of adjourning. One reason for hanging on was a Bill, disliked by the Administration, which authorised tax deductions for doctors, lawyers and other self-employed people who are outside the social security system and wish to make private provision for their old age. If Congress had gone home, the President could have administered a pocket veto; in fact, finally he signed the Bill. But for three more days Congress lingered, unable to extricate itself from disputes between the Senate and the House of Representatives over "pork."

Pork is the generic name for the tasty morsels of federal spending—usually on rivers, harbours and flood control—which a member of Congress likes to bring back to his constituents. But last week, in each case, it was the House—all of whose members must stand for re-election this year—which dug in its toes against last-minute additions to spending proposed by the carefree Senate. Even so, Congress appropriated in all at this session about $101 billion, a record for peacetime. About $94 billion of this is for the present financial year which began in July. Revenues are put at about $87 billion, pointing to a deficit of some $6 billion.

The growing bitterness between the House and the Senate over money matters is a question of prestige as well as economic principle. When the Senate added millions of dollars worth of politically useful spending to the agricultural appropriations Bill, the House pointed out in a chilly note that under the Constitution only the House can originate revenue Bills; over the years this has come to include appropriations. In the Senate Mr Russell of Georgia threatened to keep Congress in session till Christmas to prove that the Senate is the equal of the House but in the end—consoled by a handful of agricultural research laboratories strategically placed to help needy Senators—he had to give in. So did the mighty Senator Kerr when conferees from the House flatly refused to accept the addition by the Senate of $1.7 billion to the authorisation of $2 billion for work on rivers and harbours. By Saturday even the House was fed up and out-manœuvred its high priest of economy, Mr Cannon, to clear the way to adjournment. But the quarrel, which held up the whole appropriation process for weeks earlier in the session, seems certain to flare up again when Congress comes back in January.

The Big Fight

FROM A CORRESPONDENT IN NEW YORK

With a detective on one side and a prison chaplain on the other, Mr "Sonny" Liston, the new world heavyweight champion, has sworn that he has also won a moral fight and is a new man. His past includes convictions for armed robbery and the mauling of an unfortunate policeman in St Louis; he has also been associated with Mr Frankie Carbo, the underworld boss of boxing, who is now in Alcatraz serving a 25-year prison sentence, and with Mr Frank "Blinky" Palermo, another gambler and racketeer, who is at large on bail of $100,000 while he appeals against a 15-year sentence for conspiracy and extortion. These associations are the concern of the New York State Joint Legislative Committee on Boxing which has been investigating the influence of the underworld over the sport and which is considering whether or not it should be banned. The State Boxing Commission has belatedly recognised Mr Liston as the champion but neither New York nor California will give him a licence to fight.

The promoters may suffer if Mr Liston cannot get a licence to box in New York, a city with large stadia and the home of wildly enthusiastic fans who will pay anything to attend a big fight—though they usually expect more for their money than the two minutes of spectacle which they got last month. But the takings at the ringside are becoming less and less important and the sale of ancillary rights, particularly closed-circuit television for showing in cinemas, looms larger all the time. Of the $2 million involved last month, a tidy sum though less than the $5 million expected, under $700,000 was paid at the gate. These sums do not include the huge gambling business which flourishes under the counter.

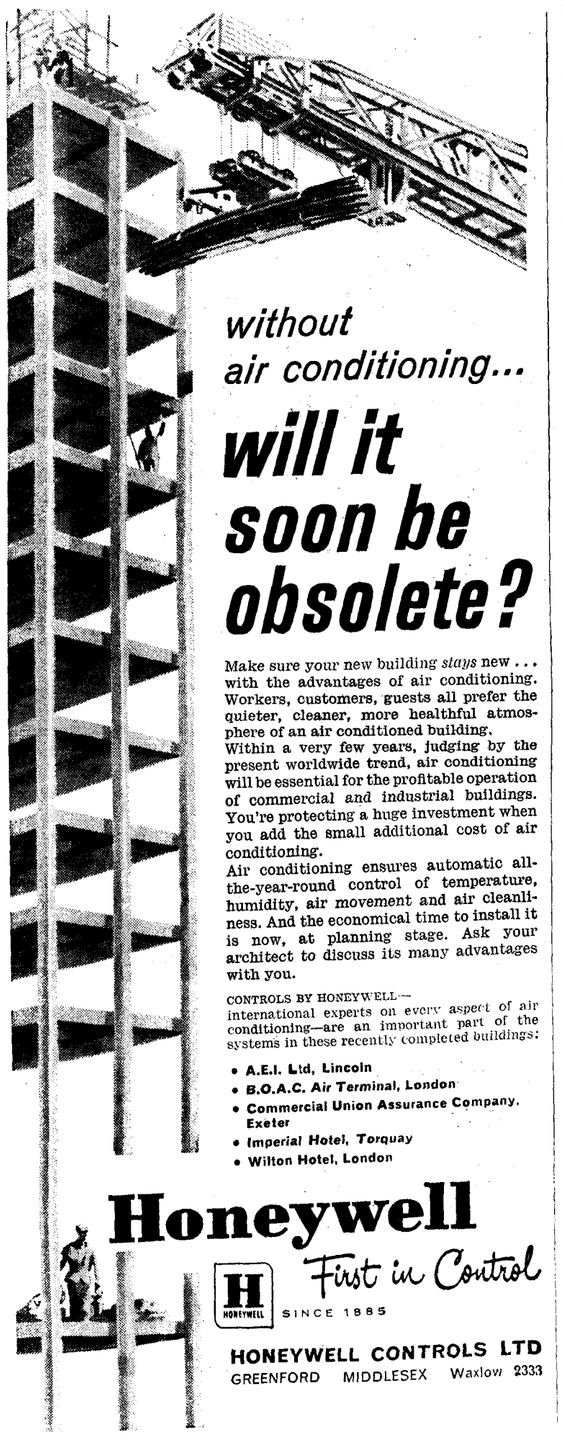
Foreign Aid Warned

The substantial cut in funds for foreign aid is proof—were any needed—that far-reaching changes are required if Congress is to agree to the United States continuing to carry the heavy burden of these programmes. It is true that the Senate, with a marked lack of enthusiasm, performed its usual rescue operation but, most unusually, the House was the victor in the final conferences over the amount to be appropriated. Last year the money for Latin America was dealt with in a separate Bill. If it is included in last year's totals for foreign aid—as it is in the table—about $600 million less was appropriated this year than last year, over half of the cuts falling on the category of economic aid. The harshest blow is the failure of Congress to live up to its promise last year that it would honour its authorisation of up to $1.5 billion a year for four years for the development loan fund. By comparison supporting assistance, for countries carrying too great a military burden, has come off comparatively well in spite of its supposed unpopularity. The appropriations for the various programmes are as follows:

($ million)

	Approp. 1961–62	Requested 1962–63	Approp. 1962–63
Economic Aid :—			
Development Loans	1,112·5	1,250	975
Development Grants	296·6	335	225
Alliance for Progress	600	600	525
International Organisations	153·5	148·9	148·9
Contingency Fund	275	400	250
Supporting Assistance	425	481·5	395
Admin. and Other	52	245·9	85
Total	2,914·6	3,461·3	2,603·9
Military Aid	1,600	1,500	1,325
Total Aid	4,514·6	4,961·3	3,928·9

President Kennedy himself appeared to lose heart at the last moment, although he may have acquiesced in certain cuts to obtain some flexibility over aid to Poland, Jugoslavia and countries trading with Cuba. The final version of the measure prohibits assistance of any kind to countries which furnish military supplies to Cuba or allow these to be carried in their ships but, if the supplies provided or transported to Dr Castro are non-warlike, the President has discretion to waive the ban on economic aid. Military aid to countries conducting ordinary trade with Cuba is not affected but none is allowed to any communist country. Mr Kennedy may, however, permit economic assistance for Poland and Jugoslavia if he considers that this is in the interest of the United States.



without air conditioning...

will it soon be obsolete?

Make sure your new building *stays* new ... with the advantages of air conditioning. Workers, customers, guests all prefer the quieter, cleaner, more healthful atmosphere of an air conditioned building.
Within a very few years, judging by the present worldwide trend, air conditioning will be essential for the profitable operation of commercial and industrial buildings. You're protecting a huge investment when you add the small additional cost of air conditioning.
Air conditioning ensures automatic all-the-year-round control of temperature, humidity, air movement and air cleanliness. And the economical time to install it is now, at planning stage. Ask your architect to discuss its many advantages with you.

CONTROLS BY HONEYWELL—international experts on every aspect of air conditioning—are an important part of the systems in these recently completed buildings:

- A.E.I. Ltd, Lincoln
- B.O.A.C. Air Terminal, London
- Commercial Union Assurance Company, Exeter
- Imperial Hotel, Torquay
- Wilton Hotel, London

Le Whisky Perrier

Whisky and Perrier are natural partners. One, glowing with the still fires of the North; the other brisk and lively, with a Gallic zest. Together, the virtues of both are set off to perfection.

With whisky or cognac, with a white wine or just by itself, Perrier enlivens your drink and your palate as nothing else can. After all, it is the purest *naturally* sparkling water in the world.

Perrier
BEAUTIFUL PERRIER

ten digits to unravel the universe

NUMBERS RULE OUR LIVES. The incredibly intricate calculations of the master mathematicians lead us ever further towards control of the universe. But man unaided has a limit to the speed of his counting. So he builds extensions of his mental powers, fantastically complex machines to tot up his mountainous sums, at speeds near to the velocity of light.

The Atlas computer, developed by Ferranti Ltd. in conjunction with Manchester University, is the most powerful in the world, able to cope with a million calculations a second. Atlas, latest development in the Ferranti range of computers, will handle with stupendous ability advanced problems of thermo-nuclear research, astrophysics, cosmology, fluid dynamics, molecular-structure, meteorology—and whatever else in the way of superhuman tasks that the scientists can work up for it.

One calculation—shrewdly human—which didn't need an electronic brain was the choice of fuel. Ferranti chose *coal*, and go on choosing coal, because coal gives the greatest heat for the lowest cost; because coal, burned in modern equipment, is smokeless; and because there's an inexhaustible supply of coal right here in Britain.

For the best of computable reasons, Ferranti—like so many companies of vision and vigour—plans its future on coal.

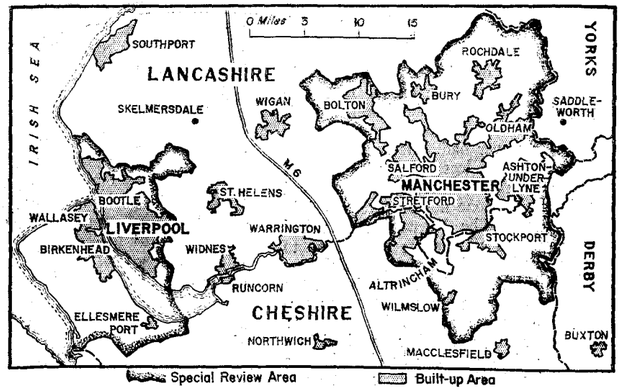
Lancastrian Imperialists

FROM OUR SPECIAL CORRESPONDENT



THE case for redrawing the local authority boundaries in the two vast conurbations of south Lancashire is obvious to everyone who does not live there. The need is quite simply to give some authority the power to replan the endless square miles of decrepit housing, inadequate roads and (despite some recent progress) obsolescent factories that sprawl out around the two central cities of Liverpool and Manchester. The present situation in local government is a ludicrous and inefficient mess, inherited from a day when separate towns really were separate. Now the islands of brick have merged, so that no outsider can tell when he steps from the realm of one town hall to that of another. Even where the towns have not, in all but name, merged, their regeneration depends for its success on the use of land outside the formal city limits—in new developments or, ideally, in real new towns.

Industrial decline—in cotton and textiles, but not only in these old staple activities—is the spectre that haunts the region: but government subsidies to Merseyside (including money for a new crossing of the estuary) far greater than are already being granted can only, in the long run, go to waste in the absence of a coherent plan for the regeneration of the whole complex that surrounds and depends on Liverpool. Manchester, far better off, still shows the scars and gaps of war and of neglect. But Lancastrians obstinately —and in a curious way admirably—insist that they are citizens of St Helens or of Salford rather than of the conurbations of which these boroughs form part.

From the centres, however—from Manchester and Liverpool themselves—things look rather different. Any formal conurbation formed around the cities would obviously take the name, and contribute to the glory, of the centre. And, more important, they would contribute financially to the regional services that the cities already provide. The Local Government Commission, which has now got round to the job of considering what is to be done in its two special review areas around Liverpool and Manchester (shown shaded on the map), is likely to find the burgesses of the two cities its best allies in the attempt to impose logic on the region. Both city councils have been considering reports from their sub-committees this week that go even further towards ruthless elimination of the traditional borders than was suggested by the commission's terms of reference.

Not content with the limits of the review area, Manchester corporation is considering a plan from a sub-committee embracing fifty small local authorities on top of the fifty-three within the special review area. A suitable local government structure for the region, said the committee, would consist of nine new boroughs based on existing units (Bolton, Oldham, Ashton-under-Lyne, Bury, Rochdale, Salford, Stockport and Stretford as well as Manchester itself). The minimum population for these boroughs would be 200,000 (twice the size of the minimum English county borough, although in line with the Herbert commission's proposals for London). The area they would cover contains 2½ million people, and stretches out into Cheshire, Derbyshire and Yorkshire beyond the Lancashire border, as far as Buxton and Saddleworth; and a new county authority with overall responsibility for this area—possibly something like the Greater London Council or the "continuous county" concept on Tyneside, whose planning, transport and overspill housing responsibilities will interlock with those of the individual boroughs—would be created from scratch.

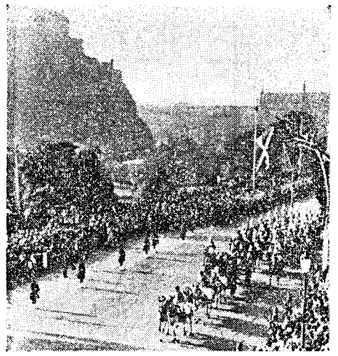
LIVERPOOL corporation approved on Thursday an equally bold proposal from its finance committee: once more the idea is for a two-tier system of government, with 2 million people and an area stretching from the Ribble estuary in the north—almost up to the boundary of Preston—down to take in Southport, Skelmersdale new town, St Helens, Widnes, Runcorn (together with its rural district) and finally embracing the whole of the Wirral peninsula, Hoylake golf course and all.

Both these projects rest on the same commonsensical assumption—that the fate of the towns and of their peripheral countryside is bound up together; and that it is possible to combine the traditional "intimate" structure of local government with the existence of a strong overall planning authority in close contact with that traditional structure. Both have been received with howls of rage and indignation from local conservatives (with a small c: such temperamentally Tory bodies as the Liverpool Chamber of Commerce have come out in strong approval of the idea of regional government, without necessarily committing themselves to these ambitious ideas). A representative view is that attributed to the chairman of Bootle's finance committee: "These are ridiculous proposals. They really have a gargantuan municipal appetite."

It has long been apparent that to get a rational local authority structure the Local Government Commission will have to ride roughshod over objectors of all kinds—industrialists wanting to hold on to locally prestigious jobs, farmers wanting to maintain their stock of subsidised cows, suburbanites wanting to retain their fancied social exclusiveness. This is the context within which the imperial ambitions of the two great cities (for no one can doubt that Liverpool and Manchester would dominate any regional organisation within which they are placed) are so welcome. It is uncertain to what extent the commission would in fact be able to adopt a plan stretching so ambitiously outside its terms of reference (and the example of the London County Council raises all sorts of questions such as the possible need to pay people for doing jobs as important and as time-consuming as membership of the proposed authorities would need to be): but even if the two committees have set their opening bids too high, they deserve the encouragement that should greet properly radical initiatives.

Too Parochial?

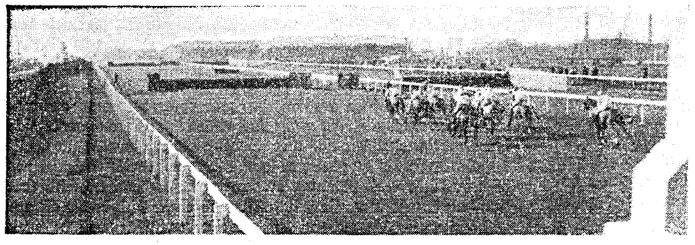
KING OLAV of Norway has been in Scotland this week on the first state visit of the kind that Edinburgh (which produced a crowd of 100,000 on Tuesday morning) has ever had. Its success makes the previous neglect of an unrivalled backdrop even harder to understand—and why should someone not be entertained in Cardiff, too? The Norwegian idea had been to give an affectionate recognition to the part Scotland played as the chief base for the exiled Norwegian forces during the war. In the event the visit took on unexpected overtones of Nordic solidarity: monarchs returning, after a judicious interval, to old dominions are invariably a hit. Edinburgh citizens, whose first parochial thought had been for the extra charge on the rates, visibly began to enjoy themselves and even to mutter about "the Norwegian example": not all of them, however, were inclined to recall that the Highland Panel, in a report published last July, reserved most praise for Norway's persistent readiness to subsidise rural industries.



But the visit also contrived to touch some exposed nerves. On Wednesday the *Guardian* took the opportunity to emphasise that for Britain to join the common market without Norway and Denmark would be "hard to swallow." There have certainly been signs of a growing political reluctance in some circles in Europe to accept too many small (and, incidentally, liberal and Protestant) countries into the community. But the Norwegian government (a Labour one) is insisting that it will negotiate only on full membership, and it is still outwardly confident that it can solve the much more important economic problems involved, particularly those surrounding a common fisheries policy (which the Six have not yet worked out for themselves) and its effect on Norway's desire to uphold its 12-mile fisheries limit. Whether Norway and Denmark will enter the community at the same time as Britain now looks doubtful but there is no cause to write them off.

King Olav's arrival was nothing if not written off in the London papers (a touch of chagrin, perhaps?). Tuesday's *Evening Standard* gave his drive through Edinburgh two column inches on an inside page; the *Evening News*, in its late extra edition, refused to admit that he was in the country at all. No insult was intended, of course: the late King Haakon paid a state visit to London in 1951 which was suitably reported, but Norwegians may need to be reminded that there's nowhere more parochial than the capital of Britain.

Houses for Courses



FROM OUR SPECIAL CORRESPONDENT

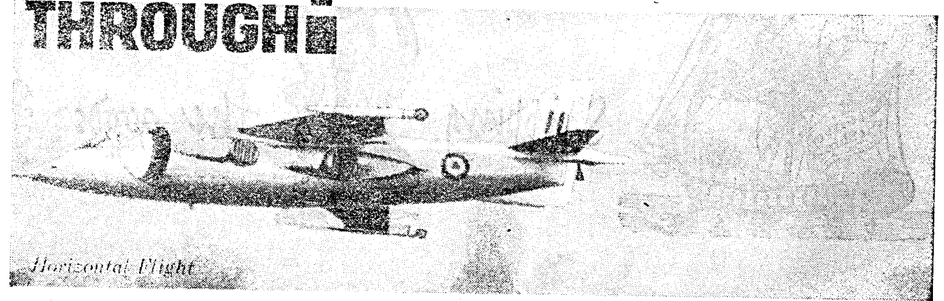
A WREATH was left at Hurst Park racecourse last week. It did not mark the passing of an unfortunate punter but the closing of the course itself: a housing estate is to be built on 54 of Hurst Park's 120 acres—although those jockeys and mounts who found the turf to their liking can take consolation from the fact that some of it is being transplanted at Ascot. Hurst Park is only the second major course to be shut down since the war (Gatwick was the other) but it seems likely that it will now be followed by others: two bids have already been made for Manchester racecourse, which customarily closes the flat racing calendar with the November handicap, while its directors also plan to develop the course.

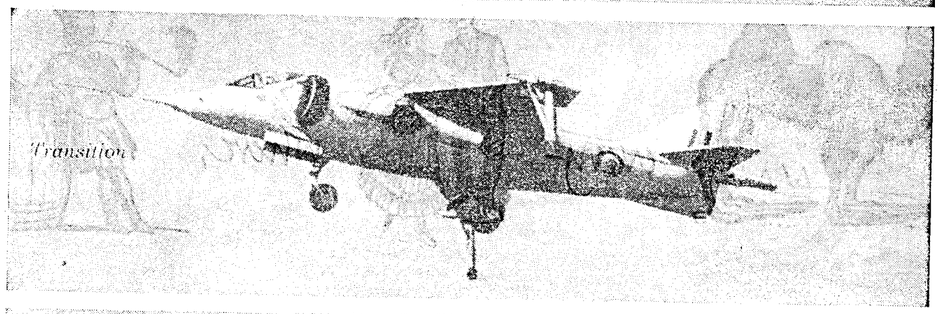
There is precious little cause for anyone to shed tears. There are still some 70 courses left in this country, usually holding at the most four or five meetings each so that racing probably takes place on no more than 20 days in the year. This is hardly enough to make it an efficient operation and many courses have had to be heavily subsidised, first by the Tote and now by the Levy Board which will have upwards of £3 million to spend from its levy on bookmakers. The board (set up under the Betting Levy Act of 1961) has announced its intention to bolster the prize money of British races by £1½ million a year, but it seems clear that a major part of its funds will be used to improve the amenities of racecourses, thus making them slightly less vulnerable to the attention of developers. But before it sinks too much capital the board should take a hard commercial look at courses like Hurst Park which could be used for housing development (particularly those courses close to towns) or even, as unintentionally suggested by the Hurst Park racegoers, as cemeteries—if this released sites nearer the city centre.

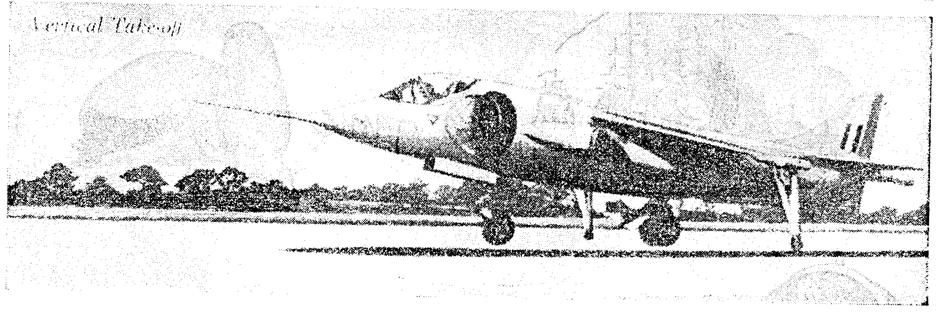
Paradoxically the injection of new funds into horse racing stems partly from the decline in attendances which has resulted from the growing popularity of betting shops (whose annual turnover is now put at around £100 million) and the widespread coverage of races by television. The racing authorities are drawing a useful income from the television companies and would hope to increase it still further if a third channel were opened. Clearly the board should use its funds to promote more and better meetings at popular courses rather than keep alive a number of smaller tracks as has been done in the past. Racing, like football, badly needs to adapt itself to the new society. Plenty of courses will remain: many are privately owned by horsey enthusiasts; Ascot itself is on royal property; others are in green belts.

Some courses are now investigating the possibility of making a fuller use of their sites and this is one of the proposals put up to the Manchester racecourse for a joint participation in an "all the year round amusement and entertainment centre" with the race course remaining an integral feature. This is on similar lines to the plans of several greyhound racing groups, which have seen a steady and persistent fall in attendances since the postwar boom years, accentuated by the advent of betting shops, from about 25 million annually to what looks like being little more than 12 million this year. Gambling casinos and bowling alleys are among the attractions planned and their sponsors no doubt look wistfully to the sharply rising profits of the major leisure groups, Butlins, Mecca and Forte. It has yet to be proved, however, that diversification will pay off in this field.

BREAK-THROUGH







The Hawker P.1127—"A British project of imagination and originality!"

(Mr. Robert McNamara, U.S. Defence Secretary)

Perhaps once or twice in a generation there comes a great leap forward in any branch of knowledge—an advance so marked as to justify the name 'breakthrough'. The jet engine was just such a breakthrough in aviation. And so, more recently, is the Hawker P.1127—the world's first operational V/S.T.O.L. jet aircraft powered by a single engine giving both lift and thrust. The first tethered hovering flights of the P.1127 were made in October 1960. Since then development aircraft have repeatedly made transitions from vertical to forward flight and vice versa. On several occasions the aircraft has flown faster than sound. The P.1127 provides a fighting aircraft that adds new flexibility and striking power in military operations. It combines helicopter versatility with high-speed jet flight, making long airstrips unnecessary. The aircraft also represents a vital stepping stone into the future of aviation, and gives the Hawker Siddeley Group and Britain a substantial lead over the rest of the world in the field of vertical and short take-off and landing.

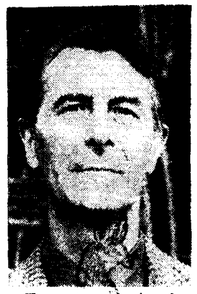
One-Tenth of a Pennyworth

"We are much indebted to Mr Selwyn Lloyd," writes Sir William Emrys Williams in his introduction to the Arts Council's seventeenth report,* in tribute to the extra £445,000 obtained from the Treasury this year. A third of this additional money has gone to hard-pressed repertory companies and this beneficence has apparently already persuaded many local authorities to follow suit. In addition, old theatres continue to be bought up by local authorities, as in Hull, Darlington and Sunderland, and new ones opened, as in Torquay, Chichester and (next month) Croydon.



Treasury preacher?

The spreading of municipal support for the theatre owes much to the hard work put in by Sir William himself, whose last report this is. When he retires shortly, the twelve years in which he has been secretary-general of the Arts Council will go on record, by many measures, as successful ones for the arts in Britain. The Treasury grant to the Arts Council has increased fourfold and the subsidy to the largest recipient, Covent Garden, is now based on a proportion of receipts without imposing any upper limit. The green light has been given to the National Theatre project and the South Bank developments. Outside the concern of the Arts Council, the National Gallery and the Tate have purchase grants which are no longer hopelessly inadequate in size and extensions are planned for the housing of the two major art collections. Altogether, the outlook in London seems fairly bright.

But in the provinces, despite all the improvements, there is still a good deal to be done for the arts; only in a few places, notably in the north-east, is the problem being tackled in a balanced way. Throughout the country, large numbers of Victorian buildings need, at the very least, an interior reconstruction. Some new concert halls and much increased local support are essential if permanent orchestras are to be maintained outside London. In national and civic expenditure on theatres and opera houses, Britain comes tenth in a list of fourteen European countries, three places lower than Bulgaria, according to a recent investigation carried out by the International Theatre Institute. In the end, it comes down to money. And money leads on to the fact that between them ratepayers sustain the arts only to the extent of one-eighth of what taxpayers do through the Arts Council; the burden amounts to less than one-tenth of a penny rate. Sir William has given a splendid start to the job of stirring up local councils; it is left to his successor, Mr Nigel Abercrombie, to devise an acceptable formula for sharing the costs of the arts between central and local funds.

Some critics suggest it may prove to be a handicap that Mr Abercrombie is a civil servant. It seems much more likely, however, that his knowledge of how the wheels turn at the Treasury should be no bad thing. The only doubt may be whether Whitehall equips somebody to get out and about to preach the gospel. For Mr Abercrombie's prime task must be to make a personal assessment of the needs of the arts in different parts of the country and, by personal contacts, stimulate the civic pride of local dignitaries.

* "A Brighter Prospect." 2s. 6d.

WHO PAYS FOR THE ARTS?

(1961-62 provision for Arts Council beneficiaries)

Box office receipts.....Over £3½ million
Local authorities subsidies.....£250,000
Independent Television, Gulbenkian Foundation and Pilgrim Trust.....Over £80,000
Arts Council expenditure £1,745,000

Distributed as follows—

	to London	to rest of Great Britain
Opera	£448,000	£292,000
Ballet	£164,000	£66,000
Music	£27,000	£220,000
Drama	£92,000	£164,000
Visual art	£32,000	£49,000
Festivals, poetry, arts centres and clubs	£1,500	£47,500
Administration	£50,000	£93,000
Totals	£814,000	£931,000

Nitrogen Farm

The Aesopian view of anybody who thinks the grass is greener on the other side of the fence is one of greyly smug wisdom; but heard on a small farm at Crewkerne in Somerset it is merely the expression of the formidable agricultural expertise which ICI has employed to confute the grey, smug wisdom of the ancients of British dairy-farming. On two farmlets, each of 51 productive acres, the firm has set out an elegant five-year experiment to prove, in figures and hard cash, what most laymen have always believed to be true—that cows can thrive and produce milk on grass, helped along by good management and liberal dressings of fertiliser.

The two farms are as identical as nature allows—the same size, on the same soil, under the same crop (grass) supporting the same animals (cows): they differ only in that one is dressed with potash and phosphate and the other with both of these and nitrogenous fertilisers as well. Each was run, during the experiment (which ended in April this year), by one man, neither having any advantage in equipment or buildings. Yet one of them carried more than half as many cows again as the other, produced more than twice as much profit and nearly three times the return on capital to the tenant after the landlord had taken his cut of 6 per cent on his capital. This profitable farm was fed on nitrogen.

The experiment was designed so as to keep each cow's milk yield, and the feed additional to grass given in the winter, as near as possible equal on the two farms; and to use the extra growth on the nitrogen farm to carry more animals (between 32 and 39, compared with 22 on the no-nitrogen farm). This has been done with a remarkable degree of accuracy, leaving one figure for comparison as an index of the performance of the nitrogenous fertiliser—the acreage required to support one cow: it was 1.4 on the nitrogen farm, 2.3 on the other. This difference was bought at the price of doubling, on the nitrogen farm, the feed and fertiliser bill on the other (£24 an acre—some on extra feed for the extra cows, most on the fertiliser—as opposed to £12); a price justified in the lower cost of a gallon of milk from the nitrogen cows (under 2s.) and the higher price it fetched (because there was more of it in winter), of 3s.

On both farms the main feed was grass, either grazed direct or taken as a particularly evil-smelling molasses-enriched silage, of which there was sometimes not enough on the no-nitrogen farm to allow the cows to feed themselves. On the nitrogen farm there was always enough: the annual number of crops off a single enriched field was seven or eight, but only four or five from the fields without nitrogen. Even this reflects a tremendous degree of management skill, confirmed in the profit of £15 an acre from the deliberately "impoverished" farm, which is above the national average. It reflects, too, an interesting light on the ability of dairy-farmers everywhere to cut their costs and raise their production—and to do it without (as food-faddists may like to assert) the impoverishment of the soil or "unnatural" treatment of the animals. Fertility on ICI's farm has actually improved over the experimental period and the cows (to the tune of 1,100 gallons of milk and a calf every thirteen months) are in the best of contented health.

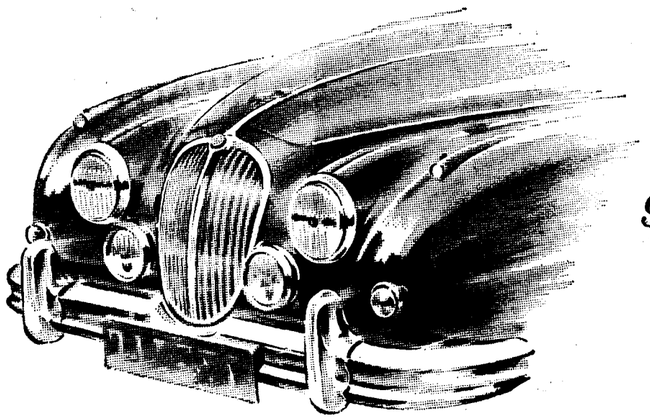
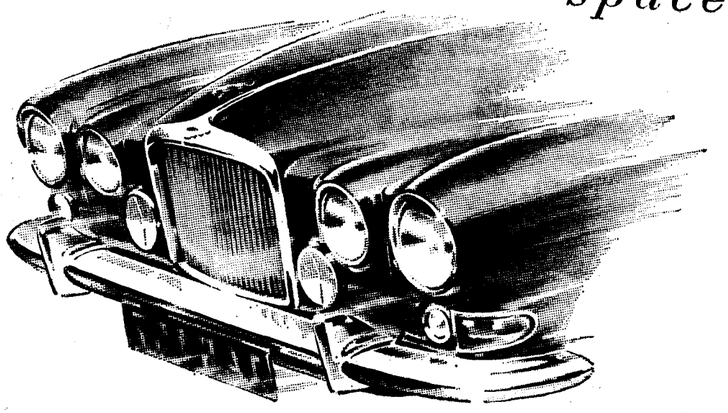
THE ECONOMIST MOTOR SURVEY 1962



grace...

space...



pace

Three basic models constitute the Jaguar range; the Mark 2, the Mark 10 and the "E" Type. Each is endowed with its own individuality, each is outstanding in its performance and, together, they satisfy every requirement of those motorists who, however diverse their needs, have a common aspiration—to enjoy a special kind of motoring which no other car in the world can offer.

The Cars in Our Lives

MAKING the motor car part of your ordinary life cannot leave the other parts just as they were. For the individual, the balance of plus and minus is almost entirely net gain; for the community, the adjustments are more complex, and it is not so easy to hold on to the net plus. As car ownership has grown, with this personal transport accepted (and afforded) as a right of every family, so the physical pattern of every Western community has to be stretched or pierced to make room for the motor car. And this is a means of transport that needs a lot of room—both for manœuvre and at a standstill.

No community has yet managed this adjustment to the motor car to its complete satisfaction—partly because the multiplication of motoring is nowhere yet complete. In the United States, farthest along the road to motorised living, the postwar euphoria with swirling freeways and coiling cloverleaves as a panacea for all traffic problems seems generally to have dimmed. Traffic authorities cannot cease their multiplication of traffic lanes, as construction tries to keep pace with the demand for motor circulation; but any confidence that this is a sufficient solution seems generally to be ebbing. The return to public transport systems for motorised American cities is so far largely a matter of traffic engineers' despairing suggestions, rather than of physical construction or even of city authorities' firm decisions. But the widespread discussion of this course reflects a feeling that perhaps cities cannot, after all, hope to make room for all the personal transport that their citizens and visitors choose to use and leave about there.

One cannot assume, at least from any statistical evidence, that even the United States has yet reached any saturation point of cars to population. In Western Europe, where "car density" is as yet far short of the American—and where, perhaps as important, most countries have never anyway had anything like the sheer space per person that American communities still have—the pressure of mass motor ownership within cities, where most Europeans are tending to live, is only now being faced. It will inevitably build up—or seize up—faster from now on.

Fitting cars into cities requires more forethought than the other adjustment to the motor car upon which the Western European countries have already begun—fast motor roads between cities. Constructing a motorway calls basically for readiness to take firm decisions about investment; though economic criteria for estimating priorities for and return on such projects are now being worked out, the decisions can still be taken fairly arbitrarily with a good chance of achieving a worthwhile investment. But sheer energy, and a readiness to spend money, are simply not enough for motor movement inside cities; they can sometimes result in intensifying the problems they set out to solve. Moreover, there is a shifting frontier of convenience between motor transport and the other activities that go on in cities. Even when traffic measures or the rerouteing of roads does achieve a net improvement in traffic convenience inside and on the edges of the city, they may make inroads upon the convenience of business and shopping and the comfort of residence in cities. Yet motor transport, by common consent, is also essential to all of these. Could the modern city work without it?

ONE thing is certain: the Western citizen is not going to give up the right to own and use his car. (Mr Khrushchev thinks the Soviet citizen can, as well as should, be deprived of personal motoring; but how long will that doctrine stand if Russia should ever come within a mile of American standards of living?) The European motorist can be influenced to make do with a smaller and more manœuvrable car (though not a slower one); he will accept the logic of paying for street parking and taking elaborate and roundabout one-way approaches to his destination; there are degrees of inner city congestion that may deter him from car commuting into big cities. But solutions that ask the motorist to forgo any large part of the convenience and flexibility of motor transport, however technically, ingeniously, æsthetically pleasing, or economically neat, are probably just not on. The sheer expression of individuality involved in driving one's car wherever one wishes is an extension of consumers' choice; public transport systems, however efficient for the mass delivery of bodies, are necessarily standardised. As the property-owning democracies prosper, more and more people gain such opportunities for self-expression, and one of the main justifications for free capitalism would be gone if they could not.

Making room for our motor cars would not be simple if the town planners and traffic engineers were simply building new towns. In fact, they are seeking to improve flow through and access to every part of huge aggregates of city capital. But this does not indefinitely block the planning task: these aggregates of business building, in any case, are in process of constant renewal. For both the planners and the engineers, the exercise is twofold, making the best use of what for the present cannot be changed in city layout and ensuring that change, as and when it comes, conforms to the margins of mobility that one can at least roughly outline. Master plans of city development for traffic would attract more confidence if the outsider were sure that these different kinds of experts could agree on what principles ought to be followed for cities. But there is no reason to assume that ways through the traffic maze cannot, inherently, be found for society; there may even be some short cuts. Motorists, travel hopefully. . . .

Planning for Traffic

IF you could rebuild all Britain's cities, or on the other hand change all the British people's habits of motoring, the country's traffic problems might be a straightforward —though still a prodigious—job. You cannot. So the problems attract two classes of specialist: the traffic engineer who seeks to get the traffic moving as fast as possible through the existing streets, and the planner who wonders how or whether this traffic can be accommodated in a town without destroying its character as a place for civilised life—and what sort of an ideal city might make this possible. The two approaches are not exactly opposed, but they are separate and can conflict. Speculation about dream towns, either car-happy or carless, has become a hunting-ground for architects and sociologists, but the results are still pretty fragmentary and decidedly contradictory. Little is really known in detail about the purposes for which most motor vehicles are in fact being used in towns; for example, lorries obviously carry goods, but from where to where? So the extent to which traffic could be reduced, even theoretically, by making it still more difficult or expensive to drive into the centre of a town is virtually unknown: what is the average car in a city worth, in use, to its owner? Operating in a vacuum of ignorance, planners spin their theories and present a utopia of the city made peaceful for pedestrians or utterly free for speed as their inclinations lead them.

But the need to do something about both aspects of the problems has led Britain's Ministry of Transport to equip itself with two types of adviser, one for the short-term and the other for the long-term. The first derives from the (relatively) old-established Road Research Laboratory and the engineers already at the Ministry, which provided the staff for the London Traffic Management Unit; the other is the Urban Road Planning Group under Mr Colin Buchanan, which is preparing a report for the Minister on the planning of towns for traffic. While the former is sending the buses pouring down Gower Street and Pall Mall in a successful attempt to keep the traffic from coming to a halt, the latter is thinking how to keep traffic away from just that sort of district. So the Minister may find himself faced with conflicting advice.

The difference in the approach of the two types of adviser comes out in two papers recently published by Dr Smeed,* deputy director of the Road Research Laboratory, and by Mr Buchanan†—both looking, as it happens, at the long-term. Dr Smeed, a traffic engineer, looks at the effect of changes in the sort of road system used in a town on the number of commuters who can travel in by car. Mr Buchanan, an architect, considers how a town can be laid out to keep traffic away from where people live, work or shop, and how the amount of traffic that is compatible with pleasant town life can be estimated.

Dr Smeed's most interesting conclusion is that the amount

* "The Effects of Some Kinds of Routeing System on the Amount of Traffic in Central Areas." Read to the Institution of Highway Engineers, September, 1962.

† "Towns and Traffic." Read at the Annual Conference of the Royal Institute of British Architects, July, 1962.

of traffic that can come into a town centre is greatly increased if it follows a ring road around the circumference of a central area until it reaches a road leading in to its destination. Using certain standardising assumptions, he suggests that in a town where 20 per cent of the central area is devoted to roads or parking space (14 per cent of central London is so used), in the form of six-storey garages, about a million people could travel in to work by car (assuming an average of 1½ persons per car) if they followed a ring road, 100,000 if they followed a direct route, but only 50,000 if they drove first into the centre of the town and then out again to their destination. The great gain in capacity provided by the ring route comes from the reduction in traffic at the centre if this is only being approached and not driven through—though it also assumes that the ring road itself can be of a huge traffic capacity, able at any point to carry a quarter of the traffic entering the central area in an hour.

The problem, as Dr Smeed admits, would be to make people use the ring road. The difference between speeds on it and in the town would determine the extent to which it was used voluntarily, and if traffic could keep moving three times as fast on it as inside the city, perhaps half the traffic might use it—which should encourage those who unsuccessfully advocated a ring road for Oxford with such arguments.

So in practice, unless traffic was forced to use such a ring road, the gain in capacity from building one would be less than the simplified figuring would suggest. Dr Smeed has deliberately limited his analysis to commuter traffic, leaving out of account the local and goods traffic that forms a large though not yet precisely measured proportion of the total. For this reason, again, the effect of a ring road on traffic at the centre could not be as dramatic as a superficial reading of Dr Smeed's figures might suggest. He shows that with commuter traffic following a ring road, traffic near the centre would not be more than a fifth of that produced when it followed a direct route. But given the inevitable simplifications in a mathematical study, Dr Smeed has shown that ring roads are the most efficient means of reducing congestion in the centre of a town, to the extent that this is caused simply by traffic entering it; and the best way of increasing the number of vehicles that can enter any town.

MR BUCHANAN might not be interested in allowing more commuters to travel by car, but he would be attracted by any means of reducing traffic in the town centre. For some time he has been developing ideas on how to separate traffic from living and working areas in town. In this recent paper he suggests that a town could be divided into "precincts" separated by roads carrying through traffic—which would only be able to enter the "precincts" at a few points, and thus could not travel through them in the way that traffic now takes short cuts through residential streets, or is diverted along them by traffic engineers. Within each such self-contained area, therefore, traffic would be limited to vehicles going to or coming from the buildings in that district. And, Mr Buchanan argues, this traffic ought to be kept down to the amount that is compatible with maintaining reasonable living standards, just as the number of people living in a house is limited by health regulations.

He comes to this conclusion by analysing traffic at any place and time as a combination of vehicles passing the area on their

THE NEW
HUMBER SUPER SNIPE
a magnificent car still further improved

A policy of continuous, logical development has brought the Humber Super Snipe to its present eminence. In its balance of quality, comfort and economy, it is unrivalled by any other car approaching the price. Here is an elegant and distinguished car. A fast car. And a safe, reliable car. A car that offers every up-to-date refinement. Extremely easy exit and entrance . . . ample headroom . . . good road clearance. *A car you will be proud to own.*

See what the Super Snipe gives you:

✱ More power (the 6-cylinder, 3-litre engine now develops 132·5 b.h.p.) ✱ Improved suspension and steering ✱ New diaphragm clutch for improved gear change ✱ New elegance and comfort ✱ Front disc brakes ✱ Generous luggage space and carpeted boot ✱ Built-in ventilation, with four swivelling ventilating windows ✱ Richly upholstered seating ✱ Walnut fold-away tables ✱ Reading lights ✱ Larger petrol tank for increased range ✱ Overdrive or fully-automatic transmission, individual front seats, power-assisted steering and whitewall tyres available as extras.

THE NEW HUMBER SUPER SNIPE
Unrivalled at its price
£1120 plus p.t. £421.0.3.

ALSO THE NEW HUMBER HAWK
with extra refinements. Humber luxury at
£875 plus p.t. £329.2.9.

Limousine and Estate Car versions of both models also available.

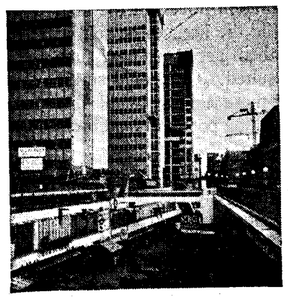
way from one place to another, even if only a mile or so apart, and of vehicles seeking to stop at their destination in this vicinity. The first, he suggests, should travel on roads designed only for traffic and giving no access to buildings. But cars should stop, and their drivers reach the buildings, only after entering the "precincts." The capacity of the network of through roads should be related mainly to the demand for travel created by the activities in the "precincts," and this would mean creating a new pattern of motor roads through existing town centres.

One attraction of Mr Buchanan's suggested layout is that it could be applied to existing towns without complete rebuilding, so long as the traffic capacity sought was not too high. Some of the through routes in London could be transformed into the sort of motor road Mr Buchanan visualises, for the main traffic streets already divide the town into the sort of areas Mr Buchanan visualises as "precincts." But many of the existing through roads, such as Oxford Street, Regent Street and Piccadilly—which form the boundaries, with Park Lane, of what might become a Mayfair "precinct"—are now a combination of through routes and shopping streets. To become what Mr Buchanan wants, traffic would have to be separated from the shoppers, and in so congested an area this might mean putting the roads and the pedestrian on different levels. "Vertical segregation" is already being applied in the centre of Cumbernauld new town in Scotland, and it was also a feature of the plan for the abortive new town at Hook in Hampshire.

The application of Mr Buchanan's principles would therefore also be expensive, and involve the reconstruction of existing town centres. And in the meantime much of the road work carried out or planned—such as the Hyde Park underpass and the rebuilding of Piccadilly Circus—will increase the amount of traffic feeding into the shopping streets of Piccadilly, Regent Street and Knightsbridge. So while the Minister of Transport is awaiting Mr Buchanan's report, he may be taking decisions that could prove incompatible with carrying out the policy Mr Buchanan seems likely to recommend.

TRAFFIC capacity can thus be related to investment. But how is the traffic flow to be related to capacity, as Mr Buchanan suggests it must be if amenities are to be preserved? Some economists concerned with the study of transport, notably Mr G. J. Roth, Dr M. E. Beesley and Mr M. Foster, have suggested that various means might be employed to charge drivers directly for the use of roads in central areas. They think electronic apparatus could detect cars as they pass the entry points of the central area, each car being fitted with a device that gave off a call sign of its own, so that the owner could be presented with a bill every month for the time his car had spent in the central area. An alternative and more elaborate system advocated by Mr Foster calls for cables to be laid beneath all the streets, so that the charge for using any road at any time could be directly related to the degree of congestion. And there already exists the simpler mechanical-cum-economic regulator of the parking meter, which is gradually reducing the number of cars that can be parked in central London.



One thing is certain: if owners were made to pay the full social cost of using vehicles in cities, motoring would become an expensive means of transport once again. But electronics seem a rather unnecessary complication when it is so simple to charge for parking; how often do cars enter the centre of a town unless they want to stop there? The present meter system, however, is far from ideal. It is based on the comfortable but probably quite retrograde assumption that off-street parking spaces should be built with the profits of the meters to provide for long-term parking, while the meters serve only the vehicle that wants to stop for a short time. In practice the meters provide far more parking space than short-term parkers want, and the new garages that are planned are not related to the capacity of the streets for traffic.

So the long-term effect of carrying on from installing meters to building new car parks might be to nullify the benefits that meters have recently brought. And the assumption that meters will and should only be used for short-term parking seems rather unrealistic—unless one decides that for aesthetic reasons, cars ought not to be there on the streets. As Mr Roth has suggested, the limit of two hours on parking at a meter has no more than nuisance value (indeed it worsens traffic congestion in meter districts by sending parkers off every two hours in search of a new meter). Varying the charges is a more effective means of controlling the demand for parking space. While it is cheaper to park at a meter than in a garage, cars will not go off the streets. And the time limit makes the position of residents pretty impossible.

In the long term, however, meters hardly seem the thing to fit into the more beautiful towns that Mr Buchanan would like to see; if the effect they produce had been generally appreciated before they were installed, one wonders if people would have accepted them so readily. The alternative of paying for a licence to park, or to use a car in the town centre, just as one pays for a licence to use the roads, is a system that has to be considered. The main difficulty is perhaps that once a motorist had paid it, possession of this (expensive?) licence might become an incentive to make use of the special privilege it offered, just as having paid the price of a car one does not reckon depreciation on every mile run but feels that driving does give some value out of owning it. Should one limit the number of such licences to the number of vehicles one felt the city could accommodate parked and moving, multiplied by some factor of probability (the chance that X decides to go to London?)—and then put the licences up to auction?

Entry to one city, or to all cities ; different prices for the first, second, and third leagues? Or should the licences be sold at first *ad lib*, for a short term, and then jacked up next time according to the congestion that resulted? One could surely achieve the same economic result more simply by flexible charging for the available space and telling potential road users when this is full.

The amount of parking space provided inside a city, on or off the street, ought to be related to the flow capacity of however much of the city area one plans eventually to devote to carriageway for moving vehicles—and also to the capacity of approach roads. And providing parking room for more cars than the roads can handle would be a worse error than providing less. Relating the city's room for vehicles at a standstill to its room for vehicles on the move, and the speed and number of stops that drivers want to achieve, is an exercise that still requires the far greater information Mr Buchanan would like about what traffic is actually doing inside a city. But in the meantime, there might be an advantage in keeping possible motoring entrants to the city continuously informed, by broadcasting, about the extent to which parking room is filled up and the degree of congestion at major intersections.

But more traffic than most of us realise—though how much nobody has ever steadily measured—originates and has its destination within cities, from residents and businesses inside or on the fringe of the outer ring. Ought all the motor vehicles that are regularly kept inside towns to be garaged? Aesthetically the answer is yes, but the cost is so high and the scale of rebuilding needed to provide garage space so great that it may be impracticable, certainly in the short run. Would it be feasible to insist that every such house or flat should have its garage or car-park when to provide one adds substantially to the cost? But the provision of garages for residents in a city is unlikely to increase the amount of traffic in nearly the same proportion as providing them for commuters, where the chance of getting into a garage could have a direct effect on the number of vehicles entering a town in the rush hour. So from the traffic control aspect, it is a much more desirable activity to build garages for residents than for commuters.

The lack of plans to make cities compatible with traffic is the worst condemnation of the present town planning system. The opportunity presented by bomb damage has by now largely been lost, so that future rebuilding will have to start mostly on established sites. And the cost of road building and of rebuilding between roads will therefore be frightening, quite probably frightening enough to cause yet more postponement of decisions. But if one wants life in city centres to become more mobile and yet not more unpleasant, money will have to be spent, in proportion to the desire to segregate traffic and to allow it into town centres. As Birmingham's experience shows, relatively small units like the Bull Ring can be redeveloped one at a time, each producing a miniature "precinct" that may eventually be linked with others to provide larger traffic-free areas in the centre of a town. In this example the building of a new inner ring road provided the stimulus for redevelopment by private capital. Perhaps this shows how public authorities can best stimulate the process—but they must decide first on what kind of city they want.

Cars for Cities

The more crowded roads get, the smaller the car it is logical to drive. But people don't get any smaller—indeed, they keep on growing bigger. So inner pressures push cars out, and external pressures force them in: designers have to try to balance these forces as one part of the compromise of design. This year they have produced a whole new variety of answers, trying to offer more space and performance within the price range and usually within the external dimensions of the normal small car—not really an unexpected development, though a little surprising in its simultaneity. But it does give the chance to compare the answers of British, French, American and German engineers to the same problems, for they are expecting to compete in a common market.

The Morris 1100 and Ford Cortina in Britain, the Ford Taunus 12M and Opel Kadett in Germany are the best examples of small cars with "internal expansion," roughly in this order of spaciousness ; the Renault R8 has a narrower body but a higher performance. The Renault offers the sort of performance that could only be obtained in a 1½-litre car a year ago, while Morris, Ford and Opel provide as much—or nearly as much—internal space. How have they managed to do it?

The Morris and the Taunus have used some unconventional methods, the Cortina and Opel conventional ones ; and Renault has stuck to what is normal to it. What the Morris gains by putting the engine across the frame is smaller external dimensions (though this could mean lower weight, it does not). The Taunus shares its front-wheel drive and uses a V-four engine to save space, though locating the gearbox conventionally behind the engine makes the unit in fact little shorter than one with four cylinders in line. The toeboard comes no farther forward than it does on the Cortina, on which it is placed about six inches farther back than that of the Morris ; to compensate, the Cortina has five inches and the Taunus six inches more on the wheelbase. But the Morris still has 1½ inches more leg room than the Cortina, which has almost exactly the same dimensions as the Taunus. The Kadett is fractionally shorter on "lounge room" than the Cortina, but the R8 is about the same. Thus the Morris has 67 inches of usable seating space, from the pedals to the rear seat backrest, the Cortina and 12M have 65½ inches, the Kadett 64¾ inches

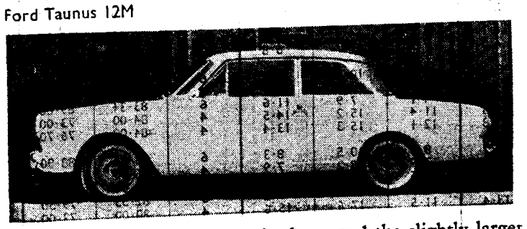
A MEMBER OF THE COURTAULDS GROUP

and the R8 66 inches. The Kadett gets this amount of space despite seven inches less wheelbase than the Cortina by pushing the toeboard farther forward and the rear seat squab farther back. The Morris comes only half an inch behind so much bigger cars as the Austin A60/Morris Oxford in "lounge room," though lower seats make the real difference rather more than this, while the next three new cars mentioned above are comparable with the Hillman Super Minx and rather roomier than the old Minx. Compared with the Anglia and Minis, they have 2-3 inches more "lounge room." The Cortina is slightly wider than the Morris or the Taunus, but all the cars will really seat only four people.

Where the Fords and Kadett gain over the Morris is in luggage space; the Fords have boots each of 21 cubic feet in capacity, while that of the Morris is only 9½ cubic feet. To obtain this, they have about eighteen inches more overhang at the rear than the Morris, making them two feet longer. They are thus much less the true compact traffic car than the Morris, with 17 per cent more length to fit into parking spaces—though the uniform 18 feet provided by meters does mean that where these have come into operation, drivers gain virtually nothing where parking is concerned from owning a shorter car. And the greater impression of size that the Fords present may well prove to be one of their best selling points; there are still many buyers who like the car that looks biggest for their money. The Opel, 12 ft. 10 in. long, and the slightly larger Renault are the standard size for 1,000 cc cars.

Ford Taunus 12M



WHILE the Morris weighs rather more than one would expect of a car twelve feet long (its most English feature) and the Taunus and R8 are about average for cars of their external dimensions, the Cortina and Kadett are decidedly light. As there are no obvious signs of weight-saving in their construction, such as the use of thinner steel than is normal, one can only assume that the careful study that Ford and General Motors have made of the stresses on a car's body has shown that one can save on the amount of metal normally used to reinforce the structure, now that no separate chassis is used.

The engine is the other possible source of increased efficiency; and all these cars but the Taunus 12M have units giving rather more power for their size than has been normal practice with small economy cars. With the Morris and the Cortina, this reflects the scope for development in the Mini and Anglia engines, already exploited in the Mini-Cooper and Ford Classic: the 1100 engine is nearly as highly tuned as the Cooper, having "hotter" camshafts and bigger valves than the Mini though retaining a single carburettor. The Cortina has the same camshafts as the Classic, to give slightly more power than the increase in engine size alone would provide. The R8's engine is virtually a new design, though having a close family resemblance to the Dauphine's power unit and using the same gearbox and final drive unit. It is the only one of these cars to have a five-bearing crankshaft, which ensures smoothness at high engine speeds, and it develops about as much power in relation to its capacity as the Morris 1100 unit. Its most unorthodox feature is that, like other Renault engines, it has no oil filter.

The new cars have contrasting engines: the Kadett's unit is conventionally modern, with a family resemblance to other General Motors designs—four cylinders in line, where they are mostly V-eights, moderately over-square dimensions, overhead valves with a high-mounted camshaft and no rocker shaft. But it has a lower compression ratio than American engines, allowing it to run on commercial-grade petrol, and its output of 40 bhp is moderate for 1,000 cc. The Taunus 12M has an even less highly stressed engine, for it also develops 40 bhp but from 1,200 cc. But it has adopted a V-four layout with the cylinders at an angle of 60 degrees, when existing engines, like the Lancia, place them at an angle of less than 20 degrees.

The big attraction of the V-four is shortness; the disadvantage, increased by using a wide angle layout, is poor engine balance. With the 12M, the only benefit that Ford gains from the V-four is that the engine protrudes less beyond the front wheels, so that the overhang at the front can be kept to normal proportions. An in-line engine would add about nine inches to the car's length. But to secure this, Ford has had to go to considerable trouble; offsetting the poor balance of the engine involves using a shaft driven by the crankshaft but rotating in the opposite direction, and one wonders whether the extra design effort is worth this small advantage. Mounting the gearbox in line with the engine, behind the wheel centres, means that the bonnet is as long as that of a conventional car, so the benefit of front-wheel drive to the passengers is only a flat floor. As with the Kadett, the compression ratio is low enough to make the use of commercial-grade petrol possible, and the low specific power output gives scope for future development—as well as helping to give longer life, a characteristic of the Volkswagen that Ford is anxious to reproduce.

Suspension is the feature on which the designers have the most varied ideas, ranging from the "Hydrolastic" system of the Morris to the leaf springs of the Fords and Opel. But the profound difference in design between the Morris and the others does not produce an equally great difference in riding comfort. BMC is at the beginning of the development of rubber-hydraulic springing while the other companies are at

Opel Kadett

the end of centuries of experience with leaf springs. The Morris is more comfortable than the Cortina, but its comfort is still far from absolute.

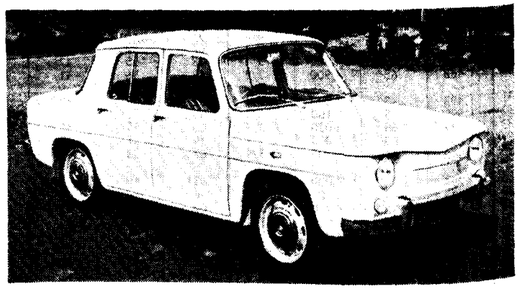
For all the apparent conventionality of their suspension, too, the Fords and the Opel have some innovations in detail. The Cortina has its rear suspension designed to minimise the amount of longitudinal movement on the propeller shaft, for the friction this produces can provide an unplanned stiffening of the rear suspension, and the front suspension, while basically similar to that of other Fords, is also designed to minimise friction. The Kadett has its rear axle located by a short torque tube, pivoting beneath the rear seat, so that the springs do not have to take brake or engine torque—and the transmission tunnel is kept low. The Kadett and the Taunus have a transverse leaf spring with conventional wishbone-type front suspension, though the spring forms the upper suspension arm on the Taunus—which also has the lower arms mounted on the engine, perhaps to simplify assembly, but making stiff engine mountings a rather embarrassing necessity. Its rear suspension follows other front-wheel drive cars like the Lancia Flavia in retaining a rigid axle and leaf springs: as there is no transmission unit for it to carry, the axle can be light, so that the advantages of independent rear suspension are less than they are for a rear-wheel drive car. BMC, however, believes these are worth having, especially as it is more simple to devise an independent rear suspension system when there is no transmission to worry about—so the balance between the two systems is much the same as it is for rear-wheel drive cars. Renault is the only other maker in this group to use independent rear suspension, but this is almost an essential with a rear engine. The swing-axle system used, with coil springs, is basically the same as that of the 750 that began the present Renault family some 20 years ago, only altered in having longitudinal arms to take the engine torque—desirable now that engine power has been doubled—while the front suspension remains virtually unchanged.

Renault is the only maker to have adopted disc brakes on all wheels, though the Morris has them at the front. When they carry 60 per cent of the car's weight, they do nearly all the braking, but on the Renault the front wheels carry only 38 per cent of the weight, so that braking effort is more evenly divided between front and rear wheels. The American-owned companies stick to drum brakes, like their parents—a more justifiable decision; for on cars of this weight a disc brake will only have obvious advantages when the car is driven fast. But it then provides an extra margin of safety that is worth the small addition to the car's cost.

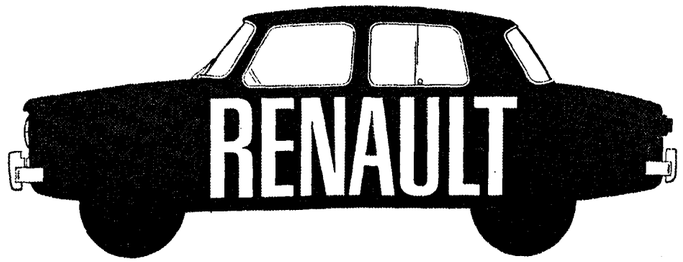
The performance of the Fords and the Morris is similar so far as top speed is concerned: they do 78 mph, but the Renault reaches 82 mph—and the Kadett has not been tested. There is much difference concealed within this similarity, more in top gear acceleration than in acceleration through the gears; the 12M with its high top gear is sluggish compared with the Morris, which can match the R8 in this respect. Indeed these two cars are little slower in top gear than the Vauxhall Victor and Hillman Minx, and all are comparable in maximum speed. Fuel consumption again shows a remarkable similarity: the Morris and Renault both returned a "touring fuel consumption" of 37 mpg in *The Motor's* road tests, and though the Cortina gave only 32 mpg it had apparently been somehow maladjusted—personal experience suggests its consumption is the same as that of the Morris. The 12M, as one might expect, is more economical to match its lower performance and gave 40 mpg. The Kadett remains an unknown quantity, but it should not differ much from the Morris and Cortina in acceleration and top speed; indeed, its low weight might give it better acceleration through the gears to 50-60 mph.

THIS batch of cars is now being released onto the European markets at prices that are often comparable—though the Morris tends to come above the others—and can match the price of that so far unbeatable best seller, the Volkswagen. Which will the public choose, and will the VW go under? Does the European buyer like the unknown or the known evils? The continental makers seem to lean pretty heavily to the view that the known is preferred, so the British Motor

Renault R8



Corporation is up against a tough commercial test if it is to show them that they are wrong. And it is again showing much courage in basing body design on logic, and keeping its dimensions to the minimum needed to contain the accommodation and mechanical parts. Size as they see it is still the criterion that many buyers adopt in choosing their car. Will congestion hand BMC the eventual victory? Renault will gain from the use of parts proved in the Dauphine, though lose from having less space to offer inside; Ford of Britain has the same advantage but not this disadvantage. Ford Germany can offer space inside and size outside, but a novel engine that is rough at tickover speeds; while Opel can provide conventional size, nearly as much interior space, and conventional if new mechanical parts. Backed by General Motors, it may well prove the short-term winner—pursued by the two Fords. The Morris may yet overtake them, though, if its price can come down to their level.



No need to wait for import duty cuts!

"We have decided to anticipate at once all the import duty reductions that may take place until the rate of duty is cut to half its present level. Keeping our advertising, temporarily, to a minimum, we present now, for the whole of the Renault range, a price list that would otherwise become practicable only after a long series of customs adjustments.

This means that, from the time of its introduction, the new Renault R8 will sell at a price based on this policy and that most existing models will have either lower prices or improved specifications. Above all, it means that prices for Renault vehicles in general will not be further reduced in the near future on account of import duty reductions. However, we must reserve the right to increase these prices, without notice, if the anticipated duty reductions do not materialise or for any other reason affecting our costs."

Since people started making cars—in a sense. For Consett has always been one of the largest suppliers of steel to the motor industry. Consett steel goes into wheel rims, bumpers, gearbox layshafts, rainwater channels, axle-casings and all kinds of accessories. Consett steel is both supplied direct to the major motor manufacturers and used by component makers like Dunlop, Rubery Owen and Wilmot Breeden who each supply many of the parts the industry depends on. In these ways Consett steel is playing an all important part in an industry that's at the very heart of the nation's prosperity. CONSETT IRON COMPANY LIMITED, CONSETT, COUNTY DURHAM

Americans Seek Distinction

DETROIT

IF the sales figures that were piled up in the first nine months of 1962 can be believed, the US consumer has deviated from the bent for economy in his automobile, a leaning that prompted the introduction of so-called compact cars into the United States in 1960. Instead, this year's auto buyer is looking for something a lot more luxurious. That doesn't mean he is looking for a bigger car. In many cases, he is satisfied with one the size of the Rambler Classic, the Ford Falcon, or the Chevrolet Corvair. But he is ordering his car with bucket seats (for which he pays about $75 extra), power steering, power brakes, automatic transmission, and often air conditioning. Putting such an energy demand on the power plant—before the auto is even in motion—has forced the auto companies to fit bigger engines.

So far in 1962, Detroit's automakers are enjoying their second best year in history. If sales continue at the same pace for the last three months, the industry should sell 6.4 million cars. With sales of about 350,000 imported cars, US customers will buy a total of 6.75 million autos this year. The best year in history was 1955, when the industry delivered 7.2 million cars. It looks as if 1962 will rank second.

During the 1962 model year, which runs from the first of October to the end of September, the most striking feature was the surprising strength of General Motors divisions, which increased their share of the US market to 55 per cent, after having enjoyed a steady share around 47 per cent. Among themselves, automen agree that GM's success can be attributed mainly to its divisions' sensing the trend to sportier cars and more luxurious trappings. One Ford executive said bluntly, "GM was closer to the market than we were. Their divisions offered a lot of the fancier, sportier cars that buyers wanted."

A good part of GM's gain apparently came out of the Ford Motor Company's traditional share. Ford's share dropped from around 30 per cent to 24 per cent. Looking back, Ford officials admit there were several reasons why Ford sales have been a little disappointing. Ford's total sales—Ford Division and Lincoln Mercury—ran about 10 per cent ahead of 1961, a reasonable showing until you realise that the industry average was 25 per cent ahead and GM ran over 40 per cent ahead of last year.

Last year, Ford introduced two so-called in-between models, the Fairlane in the Ford line and the Meteor in the Mercury line. These were to have the roominess of a standard-sized car inside and the low price tag and economy of operation of the compacts. In size, they were in between the compacts and the standard-sized cars. Unfortunately buyers didn't appreciate this or understand it. Instead of bringing in new customers to Ford and Mercury dealers, these in-between cars pulled Ford customers away from other Ford cars. A lot of people who would have bought Falcons or Comets bought the in-betweens; and a lot more who normally would have bought big standardised Galaxies or Montereys also bought the in-betweens. As a result, although the new lines reached the marketing goals set by Ford—about 7 per cent of the market—it was at the expense of Ford's own compacts and standard-sized cars, whose shares of the market fell sharply.

At Chevrolet, Ford's traditional rival, the situation was quite different. It too introduced a new car last year, the Chevy II, but the newcomer was so different from Chevrolet's rear-engined Corvair or standard-sized cars—it is really a compact car in the style of the conventional and economical Ford Falcon—that it brought in new customers for Chevrolet. Another reason why Ford sales were not on a par with those of GM divisions was that Ford lacked some speciality models that were big sellers in 1962, like compact convertibles, low-priced hard tops, and a stripped down big car. For 1963, Ford has remedied these shortcomings with many additions to both the Ford and Mercury lines.

For 1963, Detroit companies will offer something for everybody, from stripped down compacts to luxurious pseudo-sports cars. The trend to more luxurious transportation is illustrated clearly by the large number of speciality vehicles that were introduced last month to compete in the distinctive market characterised by the Ford Thunderbird. These are cars that sell for from $4,000 to $5,700 each, and offer outstanding performance and luxurious interiors.

THIS demand for distinctive transportation has surprised many automen. For example, when the Thunderbird was first introduced as a luxurious two-seater sports coupe in 1954, Ford hoped to sell 12,000 a year. The company reached that number within two years and when Ford made the T-Bird a four-seater, sales mushroomed. Last year, 85,000 T-Birds were sold in the United States. In 1963, the most spectacular competition for the T-Bird is the new Buick Riviera, a low-slung luxurious four-seater auto

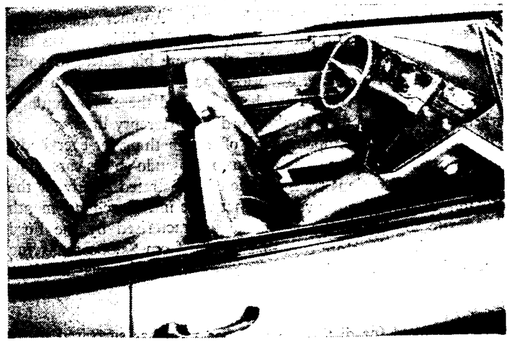
Chrysler New Yorker

whose price starts about $4,500 with state and Federal taxes. The Riviera was responsible for much of the new competition. It had started as a new corporation compact at General Motors. Pontiac, Oldsmobile and Chevrolet all wanted it for their own lines. When Buick won the Riviera, because of the excellence of the division's engineering plans, the other divisions decided to introduce their own entries into this market.

Pontiac, which last year marketed its most expensive car with a special interior as a Grand Prix, now has styled a speciality car under the same name. Oldsmobile did the same thing with its Starfire model. Last year, the Starfire was just a souped-up Oldsmobile 98 with bucket seats; this year it has its own distinctive exterior styling with a concave rear window as its most individualistic mark. Chevrolet came up with the most devastating competition: a completely restyled and redesigned Corvette. To compete more exactly with the Riviera, Chevrolet added a fastback hard top to the Corvette series (which used to be available only as a soft top though it was possible to buy a detachable hard top). And some of the biggest changes have been mechanical ones. Steel reinforces the plastic body so that more of the car's weight is over the rear wheels for better traction; a new suspension system (the rear wheels have independent suspension) gives better adhesion, necessary with up to 360 bhp available. The Corvette drives easily and smoothly at 125 mph.

On top of all this General Motors competition, Studebaker last April introduced a plastic-bodied sports car called the Avanti. It was styled by Raymond Loewy and offered at a price around

Individualised interiors



$4,500. After its introduction, Studebaker was swamped with orders for the new car and raised its production goal from 10,000 to 15,000 a year. But the company ran into serious production difficulties which have only been solved recently. Studebaker is having the plastic body, complete to seats and instruments, built by Molded Plastic Products in Ashtabula, Ohio; the body is dropped on a Studebaker chassis in South Bend. When production started, Studebaker found the body did not fit the chassis, and the plastic-reinforced-with-glass-fibre could not be hammered to fit. Finally, new dies had to be made. All this caused almost a four-month delay in getting cars into dealers' hands.

Edward O. Rollert, General Manager of Buick and a Vice-President of General Motors, estimates that there is a market for about 150,000 of these high priced sporty vehicles per year in the United States.

MORE proof of the move to more luxurious cars comes from the upgrading that is taking place in Studebaker's and Dodge's 1963 line. Studebaker has placed its economy compact Lark in the class that Detroit calls the luxury compact. The new Lark will have fancier interiors and a higher price than did the 1962 model. Dodge is doing the same thing. It has killed its Lancer economy compact and replaced it with a Dart compact which is six inches longer.

Styling changes in 1963 US cars are minor, except at American Motors, which has made its first major change since the Rambler appeared. AMC is offering a new unit side construction which, it claims, is stronger than a conventional side. With the new construction, 30 per cent fewer stampings are required to build a side, since it uses larger pieces. The new side construction is curved, bulging outward, and the glass in the side windows is also curved. This rounding has a pleasing effect on style, since it ties the roof line and belt line together neatly. Detroit rumours say that all General Motors Divisions are going to this same curved side construction in 1964 models. One fact is clear in styling for 1963. The roof line that was introduced on Ford's Thunderbird has now been adopted by every US automaker. This is a low roof line with the rear vertical sharp and slanting outward at the angle identified with the Thunderbird.

Engineering changes are slight, for the most part. Both Ford and Pontiac are offering transistorised ignition systems as options for the first time. In these, the traditional points of the distributor are eliminated. Contact is made magnetically, so there is no wear. The biggest advantage of the electronic system, however, is that it will not get out of adjustment. Once the timing is set, it will stay for the life of the engine. The transistorised ignition produces a stronger spark at high speed, a feature that appears desirable in engines whose horsepower is over 350. The

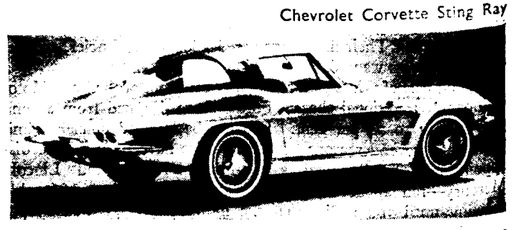
option costs about $75. All General Motors Divisions, except Chevrolet, are offering a steering wheel that tilts to seven positions to fit any driver (Cadillac's tilts to only six) as an extra cost option. Price: about $45. GM expects to equip 400,000 cars with the new accessory this year—further proof that the US consumer is splurging on his car. For 1963, all American models will have built-in crankcase air pollution devices which recirculate fumes from the crankcase back through the carburettor.

Warranties are longer for 1963 models, too. In these guarantees the auto company actually warrants through the dealer and it is the individual dealer who extends the warranty to a buyer. Chrysler is offering a standard 12-month or 12,000-mile warranty on all parts (except tyres and tubes) and a bonus warranty of five years or 50,000 miles on the components of the power train—the engine, drive shaft, transmission and rear axle. All other companies have extended their standard warranties to 24 months, or 24,000 miles. Last year, only Lincoln had such a long warranty; the rest had 12 months or 12,000-mile guarantees.

As the 1963 models go on sale, auto men will be watching two companies closely: Chrysler and American Motors. Chrysler, with new styling that is no longer out of the mainstream of US auto design, is expected to make a strong comeback. The company has had a falling share of the market almost for the past 12 years. Its 1962 sales were barely even with 1961, which was a disappointing year for the company. But Chrysler has more than new styling for 1963. Its new president has been in office long enough to have made some drastic changes in organisation and philosophy. Chrysler today is a lean operation, after having laid off 7,000 salaried employees to save almost $5 million a month and having closed four plants.

Chrysler's young president, Lynn A. Townsend, brought in a new Vice-President, Virgil Boyd, who had done an outstanding job at American Motors, to solve the company's most pressing

Chevrolet Corvette Sting Ray



problem: rebuilding its distribution net. Since February, Boyd has been signing up new dealers, realigning dealerships where too many dealers have been serving too small a marketing area, and listening to the real and imagined grievances of dealers. Chrysler's dealer organisation went into the 1963 model year with enthusiasm and loyalty rare for that organisation.

American Motors is having problems as a result of its sales success. The 1962 model year was the best in history for AMC, with sales of over 440,000 units. For 1963, AMC is shooting for US sales of 550,000. But the company is learning that an organisation that sells 550,000 cars a year has to be a different organisation than when it sold 250,000. Briefly, AMC's profit has not kept pace with its sales. In fact, earnings have slid so that during the record year of 1962, profit ran only about three per cent on sales (while companies like General Motors and Ford were running seven to ten per cent). For one thing, the company is more an assembler of automobiles than any other US company. Since it buys most of its components from outside suppliers, it hasn't reaped all the advantages of increased volume. Too much of the

profits have gone into the hands of suppliers. And AMC's three plants are old and not as efficient as engineers would like. Its main plant, where all 440,000 Ramblers were assembled last year, is bulging with activity and had to work much overtime during 1962. With production running at full capacity, AMC lacks the flexibility to switch quickly to models that sell better.

Probably the biggest question in Detroiters' minds these days is whether the industry can put two over-six-million years back to back. The industry has never been able to do it before.

One factor automen watch closely is the reserve of retail credit. Since over 80 per cent of the cars purchased by US consumers are bought on instalments, the amount of credit available is a critical factor. During the somewhat dismal sales year of 1961, a great reserve of retail auto credit was built up as more consumers paid off their loans than started new ones. Despite the good sales of 1962, there still seems to be plenty of retail credit left in the reserve. Used car prices are a leading indicator that predicts how new car sales will go. Surveys show used car values are running almost at record highs. The scrap rate of autos is working in automakers' favour, too. It has been running at a rate of about four million a year. Now statisticians say it is increasing as cars sold during the big sales years immediately after World War II are going to the scrap heap. Most industry statisticians are predicting that five million cars will be scrapped in the US in 1963, a substantial base on which the industry can build sales.

On top of all this, US suburban living continues to increase the number of two- and even three-car families. In 1955, auto salesmen spoke respectfully of the million or so two-car families in the United States. Today, they reserve that tone for three-car families; there are over 10 million two-car families.

The one factor automen have the least control over is consumer confidence. Today it is strong. Surveys show that consumers are in a buying mood. But estimates for auto sales in the United States next year range from General Motors' optimistic seven million (for 1962, GM estimated 7.25 million, well over the 6.75 million expected) to Ford Motor Company's more realistic 6.4 million (for last year Ford predicted 6.8 million). Detroiters are expecting 6.5 million, including about 375,000 imports.

Motor Racing in 1962

NINETEEN-SIXTY-ONE saw the 1½-litre formula well established, with these new Grand Prix cars that the pessimists thought would be underpowered for their weight and dangerously unresponsive breaking lap records and winning the leading road races at higher average speeds than the 2½-litre cars they superseded. Britain, however, was hampered by having unsuitable engines, and its new V-eight Coventry-Climax and BRM racing power units came along too late for her to stop the Italian Ferrari from taking the Manufacturers' Championship and the American driver Phil Hill from winning the Drivers' World Championship, driving these cars.

This season Britain has been on top all the way. The new engines have proved successful in providing just that little extra power and torque that was required. The BRM, after some internal staff changes in Sir Alfred Owen's racing division, has proved reliable after years of dubious racing, and Colin Chapman of Lotus, after building ever smaller and lighter space-frame cars, introduced an entirely new conception of lightweight racing-car chassis design with his monocoque Lotus 25.

All this has given Britain almost unchallenged supremacy in the highest field of motor racing. Writing before the South African Grand Prix has been held, it seems obvious that the next World Champion driver must be Graham Hill of the BRM team or Jim Clark of Team Lotus. Ferrari, after the departure of several of his key engineering staff, which caused the uninitiated to forecast the end of motor racing for the little Modena firm, ran what were virtually last year's cars and never brought out its promised new models. Stronger opposition for British BRM, Cooper and Lotus cars came from the German Porsche Company, which was relying on a new air-cooled flat-eight cylinder engine.

Although British cars were superior to their Italian and German rivals, it is extremely satisfactory to find that no one make dominated the Grand Prix scene and that the new make of Lola, with motor cycle champion John Surtees at the wheel, was in the picture. In every case the successes gained by the British cars were won with Coventry-Climax or BRM V-eight cylinder engines; last year's four cylinder power units were quite outclassed. Ferrari continued to use a V-six cylinder engine and Porsche only made any mark after getting teething troubles out of its new flat-eight cylinder power unit. BRM employed fuel injection.

If Ferrari was outpaced in racing-car contests, his sports cars won Le Mans, the Nurburgring 1,000 kilometres, the Targa Florio and the TT at Goodwood.

Drivers who handle Grand Prix cars command good pay; and so Formula Junior contests are hard fought, because drivers who put up good performances in these second-string cars are well placed to step into the cockpit of a Grand Prix team car next season. Lotus have tended to dominate this class of racing with typically low, light and compact cars. As in Grand Prix racing, so in this FJ field, no one make is supreme; but for the most part Ford engines prevail.

One of the disasters of the 1962 season has been the accident to Stirling Moss. In the absence of Moss, Graham Hill has become the most successful British driver.

IHI's wharf cranes speed up stevedoring at Calcutta Port

In recent international bidding IHI won an order for 25 wharf cranes from the Port of Calcutta. These versatile work-horses, which are now being installed, can be changed by simple adjustment of a gear mechanism to handle either 3-ton loads at higher speeds or 5-ton loads at lower speeds. Their new "three-legged" construction provides ample clearance and greater mobility and reduces total cost and weight.

As Japan's leading heavy industry company IHI has been designing and manufacturing all kinds of heavy equipment for over 100 years – from ships, engines, and boilers to heavy machinery for use in the chemical, construction, iron and steel, power generating, and mining industries. The trademark of IHI is your guarantee of durability and precision. Brochures outlining IHI's capabilities and informative "IHI Letter" will be sent on request.

THE BUSINESS WORLD

The Economies: Flat or Down?

Since the war there has been a great increase in the productive capacity of the industrialised countries. The problem now is to prevent this development from leading to deflation—declining employment, production and profits. The Western nations should act quickly to meet the threat of world-wide deflation. By the beginning of next year at the latest, more pronounced expansionary policies will be needed in the budgets and monetary controls of these countries.

Dr Per Jacobsson.

For a classical economist, faithful to the theory of cycles, it would seem that we are at the end of a boom. This is possible; but it seems to the Commission that one can actually envisage the future difficulties and examine here and now the remedies that it will be necessary to apply.... We are certainly moving into a less exuberant economic development; but after a period of relative stability, we could quite well have another phase of expansion without having to pass through a recession at all.

M. Robert Marjolin.

WARNINGS from the IMF, caution from EEC; against this new sobriety about recession, NED's first sketch of what faster growth might bring Britain may look a little oddly timed, even ingenuous. Has Britain woken up to how nice growth would be just about the time, across the world, that the springs of growth are running down? This has been a private uneasiness for some ever since Mr Selwyn Lloyd took to the idea of planning fifteen months ago; now the uneasiness is gathering and becoming public.

Dr Per Jacobsson would never be classed as an expansionist at any price; but he called the turn accurately on inflation two years ago, and of late his main concern has been with the danger of world deflation. This concern, incidentally, was shared much more generally in private discussion among the sound bankers gathered for the World Bank and Fund meetings in Washington last month than was obvious from some of their formal public utterances. Dr Jacobsson is clearly uneasy about the possible conjuncture of renewed recession in the United States, of the continued droop of commodity prices for the primary producing nations and—the new element—of a slowdown and perhaps a dip in the proud recent curve of West European growth. Developing simultaneously towards the back end of 1963, these could present the free world with a more real danger of recession than any that pessimists have sniffed at several times since the war, only to be confounded by renewed inflation.

M. Marjolin, perhaps the most distinguished official economist of a common market that has outrun the rest of the industrialised West for growth during recent years, sees the Western economies as having reached a stage where "one can hardly foresee whether what comes next is further ascent or a decline." The factors that he listed as signs of the end of a boom are:

- the continued fall in commodity prices, limiting the buying power of the industrialised countries' traditional overseas customers;
- difficulties in some industrial sectors—chemicals, non-ferrous metals, and steel;
- the fact that recovery in the United States has been less marked than one had hoped;
- reductions in profit margins in some industries, implying recourse to other sources of finance;
- the slowdown in investment demand;
- falls on the stock exchanges, which if they got worse could have economic effects; and

the fact that almost the only driving force behind European expansion is " internal consumption " (plus building, much of which " is a factor of investment in name only ").

But against these factors he sets the fact that the European economy is becoming autonomous, which is one reason why the classical method of cyclical analysis may not apply. Another reason is the competence of the " management " of the Western economies today—governments, and regional planning bodies such as the European Economic Commission—to take action with a good chance of forestalling world recession before it happens.

THESE managers have some time—not much—in hand. Looking at the world from a vantage point inside America, Dr Jacobsson wants more expansionary policies by the beginning of next year at latest. From Brussels, M. Marjolin's consideration of the possible need for stimulus soon has to take account of a continued rate of growth within the common market that is still very respectable, and in one or two countries still quite rapid. The comparisons with last year, average to average, which the commission cites for individual countries in its latest quarterly report are rosier than the more recent run on seasonally corrected output during this year noted in the table on page 283 ; but certainly there is some, declining, momentum left in the common market boom.

There is some growth too in Britain. With the trade figures for September putting a possibly healthier complexion on the trade balance, and the industrial production index for August picking up a point of the two that it dropped in July, Mr Maudling has a plausible reason still for caution in stimulating home demand further. It is true that industrialists, as reflected in last week's survey from the Federation of British Industries and this week's from the National Union of Manufacturers, feel that production remains no more than stable, and show little optimism about any marked improvement in the near future. In the very short run, one would expect here some continued modest growth in personal consumption, public consumption ; and re-stocking ; some little rise left, perhaps, in exports, but private investment dipping enough, probably, to offset the continued rise in public investment. Confidence is lacking throughout the economy, and perhaps affecting consumption as well as business readiness to invest: the failure of hire purchase sales of cars and consumer durables to rise as much as might be expected from the completion of earlier contracts may not be unconnected with the growing uneasiness about redundancy that is beginning to percolate into many layers of British employment.

It is possible to assume, therefore, that the managers of the Western economies still have the time to forestall incipient deflation—providing they also have the inclination and the foresight. It is in this respect that the very existence of NED, figuring away at how happy it would be possible for us all to be if we could only be virtuous, is a good mark for the managers of the British economy. Mr Maudling has had borne in upon him, as all Chancellors soon have, the still pitiable margins of room for manœuvre that make it hard for Britain to say " Go " when sound opinion in the rest of the world is still only prepared to hear the word " Stop." But the existence of a state-appointed pressure group for faster growth, at a time when the danger is that growth will be getting slower, has at least the advantage of making acceleration respectable whenever it can be afforded.

Mr Maudling's experience in Washington—among the same bankers who were privately prepared to sound worried about a slowdown in world trade—was not encouraging for British initiative, or as an index of general readiness among Western nations to engage in the " more pronounced expansionary policies " that Dr Jacobsson is now counselling. Complacency at many levels in the United States, though perhaps not at the highest, is more than matched inside the European Economic Community, as witness the German budget proposals. Dr Blessing, this week, put most effectively the arguments of those who are still fighting the last war against inflation:

> I would think it wrong, in the interests of price stability, if measures were already to be taken now with a view to averting any cooling-off in economic activity. If, as some pessimists think, developments should really lead to a recession and not to a healthy toning-down, there would still then be time to take the appropriate measures. There still exist tendencies of price inflation, even though they may be less strong, and there is still an excessive demand on the labour market, with all the consequences this brings for internal stability. So long as this state of affairs continues I shall refuse to listen to those who demand measures to stimulate the economy.

The argument is well put, and entirely tenable. It is the attitude of mind behind it that gives cause for uneasiness. Will all the economic managers of the Western world recognise—and really dislike—deflation as soon as it may come?

Sketch for A Plan

GROWING at 4 per cent a year, where would Britain get to by 1966? The table, which roughs out the main aggregates of demand and supply as they might be after five years of such a rate of growth from 1961 onwards, summarises the NED office's first exercise with a statistical " model " of the economy. It presented this exercise—75 pages of it—to the NED council two weeks ago ; and this table, with a few notes, but no indication as to its methodology, to the public after the council met this week.

The figures that matter here are the rates of change of the components of demand and supply, and how they compare with the general assumption of 4 per cent growth. Imports are reckoned to rise somewhat more than the gross domestic product, so that the total resources available would grow by about 4.1 per cent. Personal consumption expenditure is assumed to grow less ; current consumption by public authorities (including defence) by less than the basic 4 per cent, though somewhat more than consumption. Investment as a whole would, according to this reasoning, need to grow much more than the economy as a whole ; and exports a good deal more.

This wisdom sounds conventional: accent on investment, export or die. It is in fact much less so than it chooses to appear.

This growth rate of 6.2 per cent a year in investment, for example, is a good deal lower than the planners would have come up with had they simply assumed that the relationships between investment and total output that have been operative in the British economy in recent years would have to continue. According to such ratios, investment might have had to grow by nearly 9 per cent a year, and constitute 24 per cent of GDP by 1966. That would have reduced the resources available for growth in other sectors of demand—notably consumption—to a level that Sir Robert Shone and his economists considered that people would simply not put up with.

1966—AFTER FIVE YEARS OF 4 PER CENT GROWTH PER YEAR

	1961 £ million	1966 Provisional £ million (at constant 1961 prices)	Increase per year 1961-66 per cent
Supply :			
Gross Domestic Product* at market prices	26,486	32,225	4·0
Imports of goods	3,998	4,990	4·5
Net imports of services	83	95	—
Total	30,567	37,310	4·1
Demand :			
Consumers' expenditure	17,336	20,280	3·2
Public consumption	4,570	5,460	3·6
Investment	4,798	6,470	6·2
Exports of goods	3,863	5,100	5·7
Total	30,567	37,310	4·1

* GDP, excluding net income from abroad, is here taken as total domestic factor incomes plus indirect taxes less subsidies (as distinct from the National Income Blue Book definition, which excludes indirect taxes on imports).

Bringing the investment figure down to a bearable level that they could still consider consistent with the total growth assumption (getting consistency in such figuring is the main intellectual technique of this economic model-making) made it necessary to assume a considerably better utilisation of—or return on—investment than we have had of late.

Within the 6.2 per cent growth figure for total investment, moreover, it is worth noting that the growth of stocks (even, once again, assuming slightly more economical management of these) is quite significant: and most people would assume that public investment, over the next five years, would be growing faster than private. So the emphasis on private industrial investment in this plan is probably much less than many expansionists would ordinarily assume.

The growth rate assumed for exports, again, which is nearly double the rate achieved in recent years, is postulated on the assumption that the balance of payments on current account improves to a surplus of £300 million by 1966 (some increase in net invisible earnings is also assumed). This means an improvement of say £50 million a year on the balance of trade over the current five years. So the growth assumption here allows for some increase in aid, in net investment of private capital overseas, and an addition to the reserves that should " help to remove the need for stop and go policies." (No benefit from continued improvement in the terms of trade is allowed for).

That last assumption, necessary but austere, has incidentally a significant effect upon the final result of this sketch for a plan upon personal consumption expenditure per head—which is, after all, the end in which all the other figures are met. This sketch of 4 per cent growth offers an increase of 2¼ per cent per year in consumption per head (allowing for population increase) ; in recent years, with much less distinguished performance, we have managed 2.1 per cent a year per head, partly through favourable terms of trade.

The first five years of four per cent growth, therefore, would fall somewhat short of Mr Butler's famous doubling of the standard of living in 25 years, which required 2.8 per cent a year. But there would be a good deal of " once for all " acceleration in this first five-year burst. Stocks, once the 4 per cent rate was achieved, should not need to rise more than in line with output as a whole, perhaps less. Investment probably would ; but would the current surplus, once attained, need to rise even as much as total output? So 4 per cent, eventually, should yield more jam tomorrow . . .

An Alternative to PWLB

Reform is coming to local authority finance. Will it be of the right kind? A correspondent thinks not—and suggests an alternative.

" I DO, however, recognise," said Mr Maudling on October 3rd at the Mansion House on the subject of local authority capital finance, " that if temporary debt is to be kept within reasonable bounds, we must make it easier for the authorities to meet part of their capital needs by borrowing from the Exchequer."

Why from the Exchequer? Is there no other way of making it easier for local authorities to borrow than to cause them to borrow from the Exchequer? Is it, indeed, desirable that local government—in addition to the public corporations—should become dependent on the Government for capital finance? Mr Butler thought not in 1955 when he withdrew from local authorities their hitherto unrestricted access to the Public Works Loan Board. Mr Heathcoat Amory thought not in 1959 when he rejected the Radcliffe committee's recommendation that PWLB loans at prevailing gilt-edged rates should again be made freely available to local authorities. And if Mr Selwyn Lloyd thought otherwise during his term of office he never said so. It is Government policy, often reiterated, that local government should be strengthened, not weakened. How is it then that in this matter of capital finance, local government cannot stand on its own feet? Perhaps with a little encouragement it could—to the benefit of taxpayer and ratepayer alike.

One of the weaknesses of local authority capital borrowing is that there are too many authorities competing for the available resources. One of its strengths is an ability to tap sources of supply of capital moneys which may not be available to the central government ; the local authority mortgage and temporary money market is an efficient organisation performing a useful function in this connection. And there does seem to be a way of keeping the virtues of direct access to the market without cluttering it up with an unmanageable number of individual borrowers.

The proposal is that the number of authorities charged with raising capital funds for local government should be considerably reduced ; that capital finance, in fact, should be raised on a regional basis. For example, in the proposed Greater London reorganisation the Greater London Council could be made responsible ; and the rest of England and Wales could be divided, for purposes of capital finance, into convenient regions, perhaps five or six in number, perhaps even fewer, each served by an *ad hoc* body comprising a panel of members appointed from among the elected representatives, and maybe senior officers, of the constituent authorities. Legislation would be required, of course ; but legislation is required in any case for the comprehensive rationalisation of local government, and local government areas, which is already in train. Indeed, a major opportunity for imaginative reform of local government capital finance now presents itself.

Public finance, national economic planning and local government are interdependent. It is accepted that the scarce capital resources of the country must be assessed, husbanded and allocated sensibly and methodically. Capital control, to be effective, must be national. But local government, to be effective, must be local. In the local government sphere, therefore, control of the expenditure of capital should rest with the individual local authority, subject, of course, to general

economic and planning control; while the raising of capital, though remaining unequivocally a local government responsibility, resting on local government credit, should yet be as sensitive to the essential national control, without leaning on Government credit, as is practicable. To raise and to manage local government capital finance regionally would conduce to this.

WHAT is suggested, shorn of technical detail, is that each regional body, responsible for the raising of the capital requirements of all local authorities within its area, should set up an all-embracing consolidated loans fund; a fund into which would be paid all loans raised, and from which would be paid all advances made to the participating local authorities; a fund which would be responsible for the ultimate repayment, and continuing replacement, of all capital debt including existing capital debt, and into which would be paid from time to time the loan charges and relevant expenses attaching to the advances made to the local authorities and to the capital commitments taken over from them. It would be convenient, and highly economical, for all capital accounts of the participating authorities to be kept centrally by the regional authority. The use of modern computer techniques in this process would achieve significant economies of time, of money and of expert staff—currently three scarce commodities.

Each regional authority, in raising capital finance, should be able to pledge the whole of the area's credit. It should, therefore, be empowered to issue a precept on the counties, boroughs and districts within its area for the loan charges and related expenses which would become due to it. This would both facilitate orderly finance and provide legal sanction in a manner less cumbersome, and less expensive, than the exchange of mortgages. The regional authorities' credit in the capital markets, so founded, would rank second only to that of the Government. The marketability of local authority stocks, so rationalised, would be enhanced: the yield differential relative to Government stocks would accordingly be reduced. Competition among individual local authorities for capital finance would be eliminated. Expertise in the management of capital finance would be concentrated and so strengthened. Control by the Treasury would be simplified. And the orderliness of the capital market, beloved of the Bank of England, would approach the ultimate. The benefits of the PWLB type of financing would be available to local government without, to repeat, local government leaning on Government credit and losing its sense of responsibility and self-reliance.

At the same time, additional flexibility should be accorded to local government's new capital finances by permitting the regional authorities to borrow, as local authorities did in the past, by the issue of Local Government bills. The regional authorities together might be empowered to issue a maximum of, say, £400 million of one- to six-month bills with characteristics otherwise similar to those of Treasury bills, marketed either direct by the regional authorities to the London money market or, if preferred by the authorities, by the Bank of England, following existing arrangements for Treasury bills. This would relieve the banking system of undue strain on advances, while providing it—and the money market generally—with an augmented bill market. And it would enable local authorities to be more flexible in their funding arrangements, ensuring adequate short-term finance at times when they preferred (as astute treasurers periodically should and will) to postpone incurring debt at long term. The Treasury, no doubt, will object to a loss of control over the liquid assets base. But the PWLB arrangements themselves involve an increase in Treasury bills—and why should the Treasury not adapt its arrangements to the interests of the local authorities?

The local authorities comprising each capital finance region should also be enabled to lend temporarily surplus revenue and other fund balances to the regional body, freely and at market rates. Conversely, the regional bodies should be empowered to lend to their constituent authorities against the receipt of revenues; and the regional bodies should be able to lend to, and borrow from, each other.

There will, no doubt, be objections from local government itself: there always are. This stems partly from the doctrine of *ultra vires* which inhibits innovation; and partly from the structure of local government, with its league table of authorities and its attendant promotion rivalries and jealousies. It will be objected that such a scheme as is here proposed would involve loss of "sovereignty" by the authorities which would lose their current responsibility for raising capital finance. But the control of expenditure is what really matters and that would still be theirs. Local authorities are already sharing in the use of organisation and methods teams and co-operating in the development of common building techniques. Why not in capital finance? They are combining and co-operating voluntarily in the use of computers, and that must surely involve agreement upon techniques and accounting procedures. In any case, is not the adoption of standardised accounting, long preached within local government, overdue?

It is not claimed that regional local government borrowing would be better in every respect for every authority than PWLB borrowing. But it should be for the ultimate health of local government generally to be self-reliant in capital finance rather than to be dependent on Government credit.

FUNDING HAS BEGUN

Figures published on Thursday of local authority borrowing in the second quarter of the year show that funding of temporary debt had then begun. Total temporary borrowing was reduced from its peak of £1,190 million by £15 million; and a larger portion of the temporary borrowing itself was at more than three months' term. Bank overdrafts were down by £19 million, but other advances by banks and discount houses rose by £7 million; other temporary borrowing fell by £7 million. The local authorities repaid £13 million to the PWLB but at the same time took £28 million from the new issue market—which has provided even more since then—and £120 million in other loans and mortgages. These were mainly in the one to five year period, with gross borrowings of £131 million.

LOCAL FUNDING BEGINS
NEW BORROWING BY LOCAL AUTHORITIES
(£ million)

* Up to 364 days.

It is no doubt administratively easier, just now, to loosen the PWLB purse strings than to undertake the legislation and planning that would be required for a change to regional borrowing by local authorities. But administrative expediency is a siren that has lured many a good principle to its doom. If, nevertheless, the prospect of reorganising the capital financing of the whole of England and Wales in one operation is too daunting, an opportunity is at hand to try out such a scheme in London. A Greater London, comprising thirty or so London boroughs and an elected Greater London Council, is about to be created. Within a vast homogeneous area local government, inherently unresponsive to change, is to be excitingly rationalised. Could not capital finance be part of the master plan?

BUSINESS NOTES

STOCK MARKETS

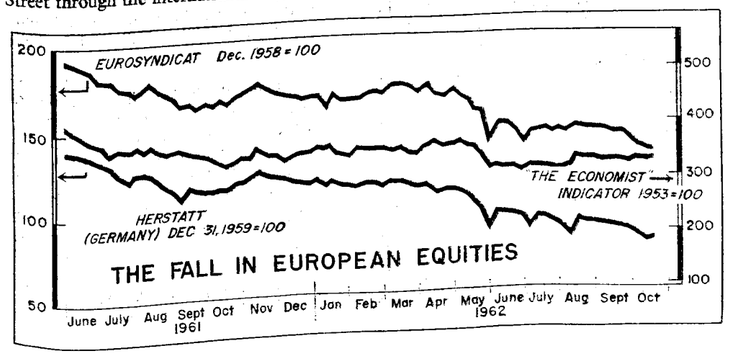
Caution the Watchword

THERE is too much evidence of slackening in economic activity in Europe and North America and too much talk of the possibility of recession in these areas late next year for any investor to have much confidence in the immediate future of equity prices. Prices in many of the European stock exchanges, notably in Britain, Germany and Italy, had begun their long fall before the collapse on Wall Street in the late spring and early summer. As Dr Abs, the chairman of the Deutsche Bank has said, the fall was an acknowledgement of the exaggerated height that prices reached in the feverish search for "growth" when buying was often based on the scantiest of statistical evidence. But it took the sharp fall on Wall Street to drive the lesson right home to investors that the behaviour of the American and European economies would not sustain the concept of automatic growth in equity values. Then it was realised this was a competitive world where profits would be hard to earn and that the immediate flow of dividends would be insufficient to justify the prices paid at the top of the boom.

But while British and American equities have rallied from their low points, prices on the Continental bourses have continued to fall. Except in Belgium (where the Congo has prevented any boom in equities) and in Holland (where prices tend to follow Wall Street through the international list), all the major Continental bourses touched new lows this month, with declines particularly marked in Germany and Italy. Prices have rallied a little this week, especially in Germany on hopes of an easing of tension in Berlin. Special factors are at work in these markets: in Italy, where the economy is still expanding, the bourse is worried about the attitude of the government towards business; in France the decline has not been particularly severe because the economy still appears to be healthy. But everywhere investors are openly acknowledging that the European boom is slowing down and are apprehensive about 1963.

Equities in London and Wall Street have in the meanwhile continued to mark time—around 275 on the *Financial Times* index and around 585-590 on the Dow Jones average. In London, almost all the buying has been concentrated upon gilt-edged stocks and the authorities have been encouraging investors to go longer. They have had almost an embarrassing success. Within six weeks the £500 million tap in the 2008-12's has run dry. A good part of the demand—perhaps as much as two-thirds—has represented switching out of other stocks, notably the 1982-84's and the 1986-89's but as soon as the tap ran dry on Thursday (when the 2008-12's rose by ⅝ to 97 5/16) dealers in the market began to wonder whether the authorities could possibly control the market through the stock they had taken in from the switches or whether they will issue a new stock in the long-medium or long range.

In neither London nor Wall Street are equities absolutely friendless and there has been some selective buying of "cheap" stocks. The massive oversubscription of Forte's in the British market (where the ordinary shares rose to a premium of 8s. 6d. on the issue price of 20s.) and the buying of the so-called "dull blue chips" with stable earnings records and good dividend yields on Wall Street are examples of this. But a quip is going round Wall Street that while there is considerable debate whether the American economy is suffering from "high level stagnation" there can be no doubt that the stock market, where the trading volume is less than three million shares a day, is afflicted with "low level stagnation." The last part of the sentence holds true for the British market and so, probably, does the Wall Street forecast that equity prices will continue to move sluggishly within a narrow range. It may be that the adjustment of ideas and prices in the Continental bourses has gone far enough to allow this prediction to be extended to them. M. Marjolin has already uttered the warning that if stock prices continue to fall there may be repercussive effects on business confidence and with so many warning lights flickering it is difficult to believe that the governments of the heavily industrialised countries will ignore Dr Jacobsson's plea for more expansionary fiscal and monetary policies.



FLAT STEEL

Capacity in Britain

DEMAND for flat steel is at present healthier than for any other group of steel products; at a time when the industry in general is producing to only about 76 per cent of capacity, the strip mills have been operating at 90 per cent or more. The Spencer Works at Llanwern near Newport will add only gradually to that capacity; it will be the end of next year before it is counted in for its whole initial 1.4 million ingot tons (of crude steel; some of its slabs will go to Ebbw Vale for rolling). Ravenscraig's cold reduction mill will be running

up during next year, too ; but at present the steel planners are happier about keeping this developing capacity well occupied than they are about almost any other types of steel capacity. They are accepting the motor industry's estimates that car output may go ahead 10 per cent or so next year, and feel that there may be some recovery in durables, too. Moreover, demand for tinplate remains very strong, and the use of flat steel in other products (sometimes at the expense of other kinds of steel) seems to be growing steadily.

For this kind of steel, therefore, there is little hedging of the estimates of demand in

Spencer Works, Newport

1965 made a few years ago (though for steel as a whole there certainly is). Some uncertainty arises over tonnage demand for tinplate ; here customers buy area and not weight, and there is an increasing shift towards lighter qualities. This can make a sizeable difference to the tonnage in a few years: against 108 lb per basis box of the thickness of tinplate still considered normal, the lightest, about six thousandths of an inch thick, can go down to about 50 lb, and increasing quantities of thicknesses weighing say 80 or 90 lb are being used. Thinning down the tinplate somewhat alters the pattern of work at the mills ; one needs more coating per ton of throughput, and the thinnest gauges of plate have to be rolled on a five-stand and not a four-stand mill.

At present, strip mill capacity in Britain amounts to nearly 3½ million tons of sheet and about 1,350,000 tons of tinplate. By 1965, sheet capacity is expected to reach 4½ million tons ; tinplate capacity hardly rises at all on present plans, being put at 1,400,000 tons for 1965. The industry's planners, on present showing, think the sheet capacity will be well utilised and the tinplate capacity could indeed be overstrained.

—and in the Six

By 1965, however, the steelmakers expect to be within Europe, and on the way to conforming fully with the competitive rules of the European Coal-Steel Community. And within the Six there is already no doubt that there will be quite a margin of surplus strip mill capacity.

The High Authority of ECSC reckons capacity for all flat steel products together, on the grounds that these mills can shift fairly flexibly between different products. Its present capacity for "sheet (including hot rolled coil for tinplate)" is about 13.7 million metric tons, and this is at present over 90 per cent employed. But its forward estimates of demand for flat steel indicate a "trend" figure of about 12.7 million metric tons, with a higher limit to their range of estimates of some 14 million tonnes by 1965. The capacity that it expects to have in being by then is about 16.7 million tonnes. For 1965, that indicates operations at only about 75-85 per cent of capacity.

Assuming that competition between Britain and these countries will be virtually open, with tariffs declining, by then, should one assume that the sharper competition certain on the Continent will make inroads into the sheet market that British strip mills are counting on? For the moment the British industry is prepared to concede that this may tend to depress or at any rate curb growth in prices of flat steel ; but they are expecting to gain at least as much in this freer trade as they need concede here and there. At one or two points, Continental

ITALIAN LABOUR

Recruiting in Reverse

Milan

Italy still has close to one million unemployed: yet the country is faced with a serious shortage of skilled labour. In the north, it is not rare for firms to tempt skilled labourers away from another firm by offering higher wages, or even expensive gifts. Nor do they stick to labour skilled in their own field. Motor companies, for example, are trying to hire pharmaceutical plant workers, arguing that it is easier to retrain any worker who is already skilled. The latest classification of labour statistics put out by Confindustria, Italy's confederation of trade associations, suggests that only 16.5 per cent of Italy's five million industrial workers are skilled and 40 per cent are semi-skilled.

One sign of the acuteness of the problem is ENI's attempt to persuade Italian skilled labour now in other countries to come back home. The state-owned gas and oil corporation agency is putting advertisements in Swiss and German newspapers with such slogans as: "Come back, your country needs you." Approximately 400,000 Italians work in Switzerland, and over 200,000 in Western Germany. Most of this Italian labour working elsewhere in Europe, however, had no craft or skill when they emigrated. Industry abroad trained them.

Unlike other common market countries, Italy has a chance of solving its skilled labour shortage problem, being the only EEC country with a surplus of total manpower. What was considered a serious Italian problem has now become an asset for the country. Italy can continue her industrial expansion without worrying about the manpower shortages that plague the other countries of Western Europe. Most of this pool of labour is in the rural areas of the south. From 1951 to 1961, Italy's industrial north absorbed over 600,000 new recruits, 60 per cent of them coming from the south. Nor does the flow of southern labour migrating to the prosperous Genoa-Milan-Turin industrial triangle show any sign of slowing down. The number arriving in 1961 was 50 per cent more than in 1960 ; the increase may be even higher in 1962.

The problem, therefore, is training this rich source of manpower to fit into Italy's rapidly developing industrial economy. Private industry, through on-the-job training programmes ; the government, through increased investment in public trade schools and special training courses set up by the Ministry of Labour ; and to some extent the labour unions are taking some action here. Specialised training courses offered in 1961-62 were organised in Italy for 471,353 trainees.

But under the Treaty of Rome, labour will be free to move across Europe ; and its partners in EEC are still recruiting, in spite of ENI's counter-propaganda. Among others, this year, Volkswagen and Regie Renault have hired respectively 4,000 and 1,000 southern Italians for their Wolfsburg and Paris plants. Between 1956 and 1961 more than 2 million Italians left their country to work abroad, and over 1½ million emigrated to European countries. According to the Italian ministry of labour, emigration from Italy to other countries reached 400,000 people by 1956-57, dropped to 275,000 people in 1959, and rose again to level off at about 350,000 a year in 1960 and 1961. Whether the Italian government and Italian industry can stem the tide of unskilled workers flowing to other countries depends simply on whether training can make a job to keep them at home more attractive than elsewhere in Europe.

?

THE POOR KNIGHTS!

What kind of fairy tale is that?

No fairy tale at all, but much more exciting. It's a group of islands off the Whangarei coast of New Zealand. And with their natural bridges, tunnels and large caves, these Poor Knights could provide more adventure than any fairy tale. We know about the place because New Zealand's our part of the world—and *that's* a place we know quite a lot about. Through the collective efforts of more than 160 branches and agencies covering the North and South Islands, we have amassed information on almost every subject of national interest—a great deal of which is often of interest to others, as well. So if you want all the answers concerning New Zealand, ask us—

common problem

Few people in Britain embark on European ventures without the help of their Bank. From the bread and butter of travel arrangements to the more complex matters of foreign trade, we in Barclays can look after quite a lot of your European money problems. We have many tried and trusted friends amongst the bankers of the Continent; we have our own European representative, Mr. R. G. W. Lambert, in Zurich. Barclays Bank D.C.O. has an office in Hamburg; we have a close association with the Banque de Commerce, in Belgium, and Barclays Bank (France) Limited has eleven branches in metropolitan France. One way and another we can make your venture into Europe certainly easier and possibly more profitable.

The Manager of your nearest branch will be glad to discuss your European problems with you. Alternatively, please get in touch with any of our specialised Foreign branches.

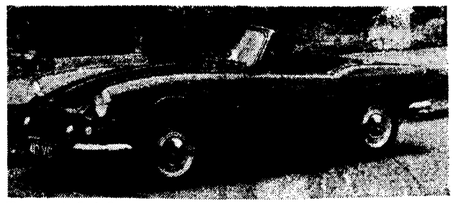
Money is our business throughout the world

works may actually be closer to big customers for flat steel than British works (even Newport and certainly Ravenscraig) are; on the other hand, the British industry contains much less obsolete capacity, such as handmills, than some of the Continental industries.

There is no doubt that within ECSC there has been some extravagant investment in strip mills (though much of the money spent in recent years has been to balance up finishing capacity constructed in the immediate postwar years). The British industry is not looking to much further growth in direct exports (its exports of tinplate into the Six have recently drawn complaints about dumping from within ECSC). But it is reckoning on some extra growth in indirect exports of flat steel, from larger sales of British vehicles—and possibly of British durable consumer goods as well—when we enter Europe.

MOTOR SHOW

New Wine



Triumph Spitfire

NEW engines for old cars have been the main surprise of the Motor Show: the British Motor Corporation has put the 1100 cc version of its A series engine, with the improved gearbox, into the Minor 1000, Austin A40, Austin-Healey Sprite and MG Midget, while Ford offers the 1200 cc engine of the Cortina as an option for buyers of the Anglia de luxe. So these old models are all brought into the performance class of their makers' newer cars—indeed, as they are lighter, they should have an even livelier performance. BMC has added £10 to the price of the Minor and of the A40 basic model, but £20 to that of the A40 de luxe; the 1200 engine costs £27 10s. extra on the Anglia, while the Super model, fitted with the bigger engine and with de luxe equipment, costs as much as the A40 de luxe. But the Minor two-door model is about £35 cheaper than the 1200 cc Anglia, so this veteran again becomes a strong competitor in its class. The Minis are also being fitted with the improved gearbox, and now have seats that should not sag; their price rises by £10.

The only new car on show is the Triumph Spitfire, Standard-Triumph's entry in the small sports car market. Using the Herald chassis, the third model to do so, it has the 1200 cc engine tuned to develop 63 bhp and sells for £730 in Britain. This makes it £63 more expensive than the Sprite, but it has 8 bhp more than this model and a more comfortable body—with winding windows, a desirable fitting for a car that is aimed mostly at the United States market. Standard-Triumph International has now completed the range of cars planned before Mr Alick Dick left the company, giving it a spread over the speciality and sports car markets from two basic models; any more new models will reflect the opinions of the Leyland directors.

Rootes and Rolls-Royce are the other two makers showing the most significant changes to their existing models. Rootes has made rather more drastic alterations to the Super Minx and Vogue than one might expect after only one year of production; the engine is modified to improve fuel consumption, a higher axle ratio is fitted, disc brakes replace drums, greasing points are eliminated, the fuel tank repositioned to increase luggage space and different seats fitted—all of which are said to add more to the cost than the £30 put on the price. Rolls-Royce has also incorporated mechanical refinements in its range, such as a higher compression ratio to give seven per cent more power, while a concession to modern styling has been added in the form of four headlamps. And prices have again been raised—by £265.

Old Sentiments

THE Motor Show is becoming a rather gloomy occasion, timed as it is when car sales take their seasonal fall; this year it has followed hard on the news of the first short-time working, and some makers believe that it will become more widespread this winter than last. Stocks of new cars at the end of the summer were perhaps half as big again as they were last year, leaving less scope to increase them during the winter; and though sales in August and September were about 17 per cent higher than a year before, they were still 30 per cent below the average for May, June and July—with sales in September, unusually, slightly lower than in August. When exports are liable to fall as well, makers are almost bound to reduce output.

Ford is probably best placed, for the Cortina accounts for around 40 per cent of its car output while the 1100 forms barely a tenth of BMC's. And the way in which new cars attract the buyers makes the state of the makers relying on older models even less happy. The short time at Rootes, Pressed Steel and in some parts of BMC seems to reflect this problem: Rootes is probably worst placed of all makers, for its old Minx, which still accounts for the bulk of this Group's home sales, is most likely to be hit by the Cortina and 1100, as well as sales of the old-type Classic at a reduced price. Vauxhall has its new sixes to stimulate sales, and needs to build up stocks of them; it also found that sales of the Victor in September were higher than expected, despite the competition of new models. BMC, with its dispersed range, might be expected to have a similarly mixed experience, and much will depend on the extent to which mechanical modifications add to the appeal of its old models.

The widespread price increases, only eschewed by Vauxhall and S-TI, may often be partly justified by improvements, and probably all too necessary to make production profitable, though they are oddly timed: last spring or next spring would have been more appropriate. The makers may have hoped that the Chancellor would by now have reduced purchase tax, so that they could raise prices without the public paying more; and they remain hopeful, and anxious, for such relief. The decline in home sales over the last two years becomes of increasing concern to them as their expansion schemes get nearer completion.

OVERSEAS TRADE

Trend Still Adverse?

SEPTEMBER's overseas trade returns confirm that the sudden fall in Britain's exports in the previous month was temporary and non-recurring, possibly even the result of inadequate seasonal adjustment. But it appears also that exports are no longer on a noticeably rising trend, while imports now are. True, the monthly total of imports fell for the second time running. But at £378 million in September the total is still notably above the general level since the peak of late 1960—and this apparently before any large restocking movement has begun. Exports in September recovered from £309 million to £325 million season-

BRITAIN'S TRADE

Besides the Standard and De Luxe Anglia (illustrated) and the Anglia Estate, there is a new sporty ANGLIA SUPER which offers a 1200 cc engine for extra performance, plus greater passenger comfort.

New Height of Luxury! The new ZODIAC MARK III offers over 100 mph with acceleration to match—plus comfort and fittings never before found on a car in this class. From £1,070.15.3 (tax paid).

New Statements of the Zephyr Formula! The surging ZEPHYR 6 gives sports-car performance plus big saloon-car roominess. Its sister, ZEPHYR 4, replacing the Consul 375, carries six in comfort—yet with real economy from its 4-cylinder engine. Zephyr 6 from £929.2.9. Zeyhyr 4 from £856.5.3 (tax paid).

New Heart for the Pacemakers! Make the pace as never before in the CONSUL CLASSIC 1¼ LITRE and CAPRI 1¼ LITRE—both now have a new 1500 cc engine for extra power, with 5-bearing crankshaft for extra smoothness. All this—with no increase in price! Classic still from £722.17.9. Capri from £863.2.9 (tax paid).

Big News for all New Ford Owners! Besides their individual virtues, most new Ford models offer major improvements for better, safer, easier motoring:—(1) FULL SYNCHROMESH 4-SPEED GEARBOXES. (2) 12 MONTHS/12,000 MILES WARRANTY. (3) 5,000 MILES OR "TWICE-A-YEAR" SERVICING. Add these to the existing merits of buying Ford and you have a range which offers the finest value in family cars.

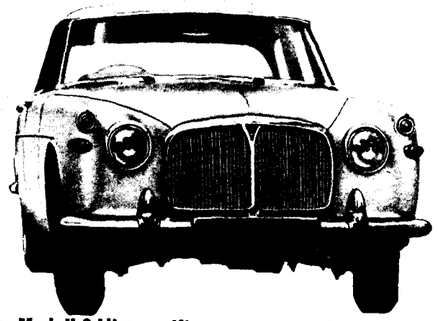
Ford

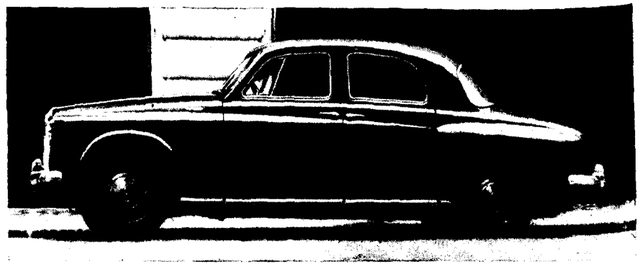


NEW — the sleek and stylish 3-Litre high-performance Coupé.
The Mark II 3-Litre Saloon: swifter version of a widely acclaimed car.
The 110: faster, more powerful replacement for the 100.
The 95: luxury six-cylinder motoring for the family.

One of the world's best engineered cars. In every Rover ever built there is a nicely calculated balance between performance and comfort, between power and handling qualities—a balance that is never upset. The new engine modification for 1963 is an example. Rover engineers have developed the two 3-Litre models and the 110 to give 17% more brake horse-power. And because of careful Rover planning this extra performance is achieved well within the cars' road-holding capacity. Balanced developments like this confirm the Rover claim to be one of the world's best engineered cars.

The Mark II 3-Litre—swifter version of an elegant car. For 1963, the famed Rover 3-Litre becomes a faster, even more luxurious car . . . the Mark II 3-Litre. Points to note: 17% more power; new stub gear lever; new sumptuous interior trim, immaculate new line. *Manual model £1,325 plus P.T. £497.17.9. Total £1,822.17.9. Automatic model £1,375 plus P.T. £516.12.9. Total £1,891.12.9.*

New Rover 3-Litre Coupé. The low and elegant shape is quite new. The controls and interior layout, with four deep bucket seats, are planned specifically for motorway driving. Under the bonnet, the new high output engine has been further developed to make this the fastest Rover in the range. And note the new stub gear lever. *Manual model £1,499 plus P.T. £563.2.9. Total £2,062.2.9. Automatic model £1,549 plus P.T. £581.17.9. Total £2,130.17.9.*



ROVER 1963
new coupé leads new more powerful range of swift and silent cars

The new 110—faster replacement for the 100. This new Rover has a performance that belies its deceptively quiet looks. The familiar Rover 100 six-cylinder engine has been given more power, so that the new 110 will quietly attain—and surpass—the magic 100 m.p.h. *Basic price £1,115 plus P.T. £419.2.9. Total £1,534.2.9.*

The new 95—luxury six-cylinder family motoring. The new 95 offers you six-cylinder Rover luxury, replacing the four-cylinder 80 for very little extra cost. Its advanced engine produces an abundance of silk-smooth power and there are front wheel disc brakes (as on all Rover models) to curb it effortlessly. Altogether the 95 is the ideal introduction for the family to swift, silent, and comfortable Rover motoring. *Basic price £998 plus P.T. £375.5.3. Total £1,373.5.3.*

The Rover Company Ltd Solihull Warwickshire · London Offices and Showrooms Devonshire House Piccadilly · MAKERS OF FINE CARS AND THE WORLD-FAMOUS LAND-ROVER

showed a seasonally adjusted deficit of £41 million last month; allowing for the built-in distortion this reflects broad balance on a payments basis. In the third quarter as a whole, however, there seems to have been a clear trade deficit, with an average crude gap of £53 million a month. For the second quarter, the balance of payments figures showed a small surplus, of £17 million over the three months together. But these payments figures, which are more meaningful in other ways, have so far not been seasonally adjusted; the Treasury hopes soon to issue an adjusted series, which will be more comparable with the monthly trade returns.

EXCHANGES

Euro-Dollars Will Survive

FOREIGN exchange markets continue to be reasonably stable, reflecting the better underlying balance that has been achieved in world trade and payments this year. Sterling has been in fairly good demand this week and the rate has remained at around $2.80¼. Demand for gold has reached moderate proportions at the daily fixing, but subsequent dealings have not been large and market activity is still well below speculative proportions. The dollar has weakened a little in the exchange markets, falling below 4.32 against the Swiss franc on Tuesday; but on Wednesday the decline was checked and the dollar was generally stronger on the continent. It remains at its support point in Paris, where the French franc was jolted only momentarily by the new political uncertainty. Almost unnoticed in the market has been approval by Congress of United States participation in the IMF Borrowing Scheme (the Paris lenders' club), which formally brings the scheme into being.

The most active topic of verbal speculation in the exchange markets is the effect on the Euro-dollar market of the new American law freeing banks in the United States from any restriction on the interest they pay on balances of foreign official holders. President Kennedy signed the bill this week, and New York banks are expected to raise their rates within a few days. In London the general view is that there will be no great drain from the Euro-dollar market. In the first place, the higher rates can be paid only to a restricted group of lenders—official bodies and those international institutions of which the United States is a member. This excludes a good number of international institutions which have large liquid funds to place, such as the Bank for International Settlements, the Coal-Steel High Authority and Euratom. And the weight of central banks in the Euro-dollar market is not nowadays very large. Some central banks may no doubt channel funds into the market indirectly, through commercial banks—but such funds are not eligible for the higher rates that may now be paid in New York. And some central banks, notably those behind the iron curtain, have special reasons for wanting to keep dollar deposits outside the United States whatever the terms.

The new rates to be offered in New York, moreover, are even now expected to be perceptibly below those available in Europe. Thus three months deposits are expected to be at 3½ per cent, compared with the current rate of 3⅝ per cent available in London. The big American banks are in fact not particularly anxious to attract funds at the moment. They are liquid enough, and can in any case acquire funds at the Federal Reserve at the re-discount rate of 3 per cent. Their participation in the Euro-dollar market, hitherto through their overseas offices, has sometimes been motivated by a desire to keep their hand in international banking rather than by any real need of additional funds. But other big American banks have begun to use the Euro-dollar market systematically as a supplementary source of funds. This limited modification of Regulation Q is unlikely to take much dollar business out of Europe: nor, *pace* Sir Charles Hambro, is it certain what effect a complete freeing would have. London bankers attending the Washington meeting of IMF last month were highly taken with a remark made privately by the most respected of international officials: "At last the most widely used currency in the world is in the hands of people who know how to use it."

WORLD BANK

The New President

CORRIDOR gossip in the Sheraton Park Hotel in Washington four weeks ago was rife about Mr Eugene Black's successor as President of the World Bank, but not a clue was vouchsafed, except that the announcement might have to wait until Congress had risen. So it has proved, and conceivably because the new president, Mr George D. Woods, was the subject of some Congressional controversy when he was proposed by the White House as head of the Agency for International Development a year ago. It is not that the World Bank appointment needs Congressional confirmation—as one American newspaper report has it, the Administration decided on Mr Woods as the US nominee (though only "after a long search and some internal tussling") thereby "assuring his selection by the bank's board of Governors."

If this is a somewhat stark way of describing the realities of Mr Woods's nomination, it would be equally relevant to add that this is not the boldest appointment among the *on dits* that were to be heard in Washington. Mr Woods has the needed banking background from his long connection with the First Boston Corporation, of which he is chairman. He has had an active role, too, in special missions on behalf of Mr Black, including the Anglo-Egyptian settlement after Suez. His appointment evidently assures continuity of policy, with little departure from the strict but necessary standards that Mr Black has laid down for the bank's business. But the bank is a youngster that has reached maturity already, as Mr Black showed so clearly in his leave-taking speech last month; his main text then was to find new resources for the International Development Association to take care of technically sound but "unbankable" projects in the developing countries.

To get this money in volume and to break individual donors of their addiction to bilateral aid will be a prodigious task for Mr Black's successors. It is unlikely that Mr Woods can do more than start it, notwithstanding his undoubted energy, for he is 61 and is bound to go in four years under the bank's rules. This explains why many observers had hoped for the appointment of a younger man with ten or fifteen years to give, as Mr Black has given, and of no less liberal outlook and banking equipment. It is naturally being suggested that Mr Woods is to act as a seat-warmer, perhaps for Mr Dillon. If this sort of thinking should gain currency among the bank's staff, it will not be for the good. The momentum that Mr Black gave to the bank now needs to be given to IDA. Mr Black's legacy is to have satisfied a series of investment risks by converting them into an impeccable bank portfolio. IDA's wide-open risks and the means of meeting them are bound to present an even greater challenge.

AIR FARES

The Last Hurdles?

Chandler, Arizona

IT seems that the conference on air fares here is likely to end next week. There are only two matters holding up agreement on passenger fares on the lines outlined on page 169 of last week's issue of *The Economist*. First Pan American and Scandinavian Airlines are still insisting on the need for a cut-rate fare for piston engined airliners to counter competition from Icelandic Airlines, with the object either of making life intolerable for Icelandic or forcing it into the IATA cartel. Although first reactions to this attitude were favourable, some European airlines have since had reservations, on the ground that the same weapon might later be used against them.

The second stumbling block is a proposal by several airlines to permit any three members of IATA to sell at a discount when necessary to meet competitive cutting of IATA rates by other operators. This idea is supported by the two British corporations, Pan American, Trans Canada and TWA. But it is opposed by a small group of airlines, led by Qantas, which fears the open rate competition that might result. Some compromise on both these issues seems likely, and the expectation is that the

intended fare increases will be approved and become effective next April.

There is, however, no hope of agreement on cargo rates, on which a second conference is expected later this year or early in 1963. There is a division between carriers who favour lower rates to attract new business and those who favour increased rates to squeeze more revenue from present customers. Seaboard wants to hold the line or to lower rates for larger shipments, particularly of 1,000 kilos and over. Pan American wants to lower the top weight dividing line to 500 kilos and to raise the rates for higher weight consignments. The object is to divert mores mall shipments from the consolidators, and into the belly compartments of jet airliners.

Much time has been taken up with airline malpractices and enforcement of IATA rules. Sir William Hildred lectured all the delegates in a long speech on this subject. Sir William has stayed aloof from discussion on fares and rates, but he has made it clear that the new czar to be appointed to replace the three-man commission that has hitherto dealt with breaches of the rules will sit in continuous session and have power to exact full penalties up to $25,000 and even to order expulsion from IATA. He also declared that the uses of airline "slush funds" have been rising as well as discount selling—the latter having reached "dreadful proportions in some parts of the world." Passengers and agents were being bribed and enforcement officers intimidated. It was notable that when Sir William finished his speech, some of the worst offenders were first on their feet to cheer.

HIRE PURCHASE

Financing the Financiers

The statistical fruits of the Radcliffe report of three years ago are still coming forth; the latest offering, included in the new and compendious monthly *Financial Statistics*, is an analysis of the financial structure of hire purchase companies, which also forms the basis of an article in this week's *Board of Trade Journal*. The new figures show that while the total of instalment credit itself was falling in the first half of 1962, the finance houses' other loans and advances rose slightly—from £108 million to £114 million. These advances are, probably mainly to finance dealers' stocks; but they also include loans for house purchase.

The finance companies' most important source of finance is deposits, which provide more than two-fifths of the total on average —and over three-fifths for the large companies. Future inquiries are to delve into the sources of these deposits. The biggest change in financing sources since the time of the Radcliffe inquiry has been the increased importance of discounted bills, which rose from £17 million in 1958 to £80 million at the end of 1961, but then dropped to £61 million in the next six months.

Another analysis shows the preponderant weight of the larger companies in hire purchase. This investigation covered 440 companies (and there are many more besides).

HIRE PURCHASE FINANCE
(£ million)

	End Dec., 1961	End Mar., 1962	End June, 1962
Certain assets:			
Instalment credit	674	652	652
Other advances	108	113	114
Trade investments	36	37	37
Other securities	5	4	8
Assets with other financial intermediaries	10	5	7
Total	833	811	818
Certain liabilities:			
Deposits	337	351	377
Bills discounted	80	72	61
Other (mainly bank) borrowing, net	179	165	152
Issued capital and reserves	148	148	148
Total	744	736	738

Of these, 236 had less than £50,000 of instalment credit outstanding in mid-1962, and they accounted for less than 1 per cent of the total debt. At the other end thirteen companies with assets of £10 million or more accounted for 76 per cent of the selected assets.

CHARITIES

Investment Pool

From the beginning of next year a common investment pool for charities, the Charities Official Investment Fund, will be established. It will work much like a unit trust. Participating charities will be allotted a number of "shares" in the fund proportionate to the value of the investments or cash they contribute to it. The fund has absolutely unrestricted powers of investment and a "growing future income" will be its aim. This implies that some switch out of fixed interest stocks contributed by the charities into equities (or real property) will be made and at the outset the charities may therefore experience a small reduction in income. How many will join is anyone's guess, but the Charity Commissioners expect an initial contribution of at least £5 million in investments and the fund may easily grow to £15 million in a short time. All charities can join the scheme but they can do so only by making their contributions through the Official Custodian for Charities. Charity trustees can put the whole of their trust funds into this pool (where they can, if they wish, arrange for any income to be reinvested) or they can put in part of them. In the latter case, the part so invested will be regarded as "special range" property for purposes of the Trustees Act; this will leave the charity trustees free to split the rest of their trust funds fifty-fifty between the "wider" and "narrower" range of trustee investments.

The fund will be run by those who already manage the funds of the Central Board of Finance of the Church of England and the Local Authorities Mutual Investment Trust. The charities fund is closely akin to the Central Board fund, which also has unrestricted powers of investments. It differs from LAMIT in two respects. First, LAMIT does not have completely unrestricted powers of investment. Secondly, the growth of LAMIT largely depends upon the flow of accumulating contributions to the local authorities' pension funds; the growth of the charities fund will largely depend upon the readiness of trustees to transfer investments to it and upon any future bequests to the participating charities.

WOLFRAM

Two-Pronged Pressure

In the case of wolfram, the bite of communist competition has proved worse than even its bark. Production in the West has been crippled almost before producers have been able to mount an effective campaign to persuade consumers of the alleged perils of relying on communist suppliers. The German and Austrian markets, for example, are said to have been lost almost entirely to Western producers without causing the protective reaction one would expect even for metals of far less strategic importance than wolfram, which is used in the manufacture of tungsten steels for armour plating and space missiles. But wolfram producers have no international mouthpiece through which to voice their warnings, and wolfram is a relatively small earner of foreign exchange for most producing countries.

UK IMPORTS OF TUNGSTEN†
(tons)

	1960	1961	1962*
Western suppliers	5,719	5,479	2,923
Communist sources	1,078	1,148	1,107
Communist sources (per cent of total)	15·9	17·3	27·5

* January–August. † Ores and concentrates.

Government representatives from many Western producing countries recently met in London to discuss their problems, and this meeting could be the forerunner of a permanent international committee to watch over producers' interests. The slump in prices has cut Western mine production sharply, including that of Beralt Tin and Wolfram, which announced this week that one of the company's mines is to be closed and its whole mining output drastically curtailed. The slump is partly the result of recession in steel output, but though prices have fallen no further than in 1958, the relatively low prices throughout 1961 caused by communist competition have weakened Western producers and have removed the prospect of a swift recovery to a highly profitable level, though some mines are benefiting, and others hope to benefit, from reductions in export taxes.

E.C.G.D. COVERS
YOU AGAINST EXCHANGE DELAYS

What do you do if sterling shortages block your payments from abroad? Answer: you relax—if you've got ECGD behind you. Under normal cover ECGD pays 95% of each instalment four months after it falls due. No need to wait years (yes, perhaps ten years or more) for your money, assuming you do get it in the end. To be without your money can run you into heavy expense. And remember, the same ECGD policy covers you against troublesome buyers and a lot more besides. Are you out to expand overseas sales? ECGD is at hand to help—to back you (more cheaply than ever before) so that you can press ahead with singleminded confidence. Insured business is sound business. ECGD makes helpful bank managers even more helpful. Get in touch with ECGD straight away.

French Refrigerators Boil Over

Paris

THE discriminating customer for a refrigerator in France is in great danger of ending up with brain-fever.

Pleased with his Conord or Vedette washing machine, he decides on a refrigerator of the same brand . . . and becomes the owner of an Italian appliance sold under a French trade mark. More conservatively, does he settle for a Satan, an old-established French make, rejecting Frigeco of whose links with Thomson-Houston he is aware? A few details apart, he gets the same refrigerator. Is he a faithful customer of the department stores, with more confidence in their goods than in those shops specialising in household appliances? If he buys Frigal from Galeries Lafayette he is, without knowing it, buying the Pontiac refrigerator of Royal Corporation that he disdained elsewhere. There is a lower price on the label in the department store, but he can get a discount off the list price at the specialised shop; so the price, regardless of labels, works out the same.

The French refrigerator industry has developed in a curious manner in recent years: centralised at the production stage, diffuse at the distribution end. This diffusion is such, and the links between the actual manufacturers and the brands on the market are so numerous and fluctuating, that it is difficult to find one's way around. One thing, however, is certain: there are only three manufacturers of compressor units, the essential (and the only complicated) component of any compression refrigerator, and absorption refrigerators are disappearing in France. These three manufacturers are General Motors, Thomson-Houston and Claret-l'Unité Hermetique (Claret-Compressor Units). The first two, branches of big American companies, manufacture under their own licence. The third is an enterprise of modest origins, manufacturing the American Tecumseh design under licence. A fourth manufacturer, Kelvinator, whose components were previously manufactured in France, has now stopped production and will henceforth import compressors either from the United States or from Italy.

For a long time, General Motors and Thomson-Houston produced units for none but their own makes (Frigidaire and Frigeco respectively), while Claret supplied the rest of the market. But this has altered over the last six years. Before 1955, refrigerators were a luxury article, bought by people who set more store by a reputation for quality than by price. Since then, refrigerators have rapidly conquered the mass market and sales have enormously increased. French production since 1955 has soared in rapid development: 260,000 refrigerators in 1955, 375,000 in 1956, 575,000 in 1958 and 975,000 in 1961.

IT has not been the makes which have been longest established in France that have made this running, but rather the newcomers, playing for sales at any price. In the supply of compressors it is almost exclusively Claret which has benefited from this expansion: it now supplies three quarters of the French market. Not until two years ago did General Motors and Thomson Houston depart from manufacturing simply for their own use and decide to sell units for other brands of refrigerators. But their decision may have come too late.
