WHILE POINTING out the various difficulties pertaining to the Titaghur Paper Mills at a recent meeting of the company, Sir Walter Michelmore, the chairman, delved deep into various aspects like marketing, shortage of raw materials and the working of the mills. The case put forward by Sir Michelmore was that the price increase granted was not sufficient and that there was a need for a subsidy or an increase in paper prices. He underlined that the cost of production was rising. The inadequacy of the increase will be apparent when it is taken into account that coal has increased in price and so has the freight on it—the Calcutta Electricity Supply Corporation rates have been increased — every single chemical whether caustic soda, lime or sodium sulphate, to mention only a few, are more expensive than in 1958 and the same applies to basic raw materials, whether bamboo or waste paper. In March 1962 it was estimated that total increase in cost since 1958 was Rs. 160 per metric tonne or 16 nP. per kilo. The 1962-63 Budget and the Railway Budget added a further Rs. 20 per tonne to the industry's costs—an additional 2 nP. per kilo.

It may also be noted that the price increase has been virtually absorbed by having to transport 50 per cent of the coal requirements by road—a cost factor which has not been even taken into account in the determining of the recent price increase. Needless to say that this raw material has been a continuous headache throughout the year. For Mill No. 1 and Mill No. 2 which were supplied coal mostly by road transport an additional bill to the tune of Rs. 18 lakhs was added. Since paper industry with its high coal consumption has to take 50 per cent of its requirements by road, the case for increase in paper prices becomes all the more stronger.

Dealing with the capital reorganisation, Sir Michelmore hinted that the paid-up capital was unduly small in relation to the scale of its operation and the value of its assets. To rectify the situation and to provide funds for the modernisation and expansion programme which is very essential, the chairman pointed out that the application has been made to the Controller of Capital Issues for a bonus and rights issue.

(Continued from page 473)

tion suggest continued appreciation in the price until such time as additional supplies can be pulled in and some demand choked off.

Before the equilibrium price is reached another all important factor may come into play: it is the large stock of silver, about 1800 million ounces, equal to about 7 years' production, which is held by the U.S. Treasury as a reserve against silver certificates now circulating in the United States. This vast reserve is a relic of the silver legislation that was passed by Congress between 1933 and 1939 and which required the United States to build up their silver reserve to a figure equal to 25 per cent of the gold reserve. The objective has now been abandoned but the legislation has left in its trail this enormous holding of silver which is used to back paper currency on the basis of a monetary price of $1.29 per ounce of silver.

The present free market price of silver is $1.13 per ounce and the time may not be far distant when the free market price will catch up with the official monetary price. What will the U.S. authorities then do? By withdrawing silver certificates from circulation they could free an equivalent amount of silver and sell it in the market. They would do so at a very substantial profit since most of that silver has been bought at around 91 cents per ounce from domestic producers in the United States.

This, however, is an issue in which politics will play an important and perhaps dominant part. The Senators representing the silver producing States in the U.S.A. exercise an influence in Congress out of all proportion to their numbers. The silver legislation of the 1930's was largely their work. They would oppose the complete unwinding of that legislation with ferocity. $1.29 may not therefore be a ceiling to the free market price of silver.

Cryolite

A NEW VENTURE

THE EAST INDIA TRADING CO., OF CALCUTTA has plans to set up a project for the manufacture of cryolite and flourite at an estimated cost of Rs. 50 lakhs. Efforts, it is stated, are being made to secure technical collaboration from a prominent Italian firm.

The company has already secured a licence to produce 12,600 tons of cryolite and 3,600 tons of fluorite per annum. Its plant is to be locoted at Raipur.

The estimated annual requirements of India for cryolite and fluorite at the end of the Third Five-Year Plan are placed in the neighbourhood of 20,000 tons. Of this, about 14,000 tons are said to be required for use by the aluminium industry. Most of these requirements would be met from the indigenous sources when the East India Trading Company's plant and the project of Gagalbhai Jute Mills (Calcutta), which has also been licensed to produce annually 3,000 tons of synthetic cryolite, 1,200 tons of aluminium fluorite and 400 tons of sodium chloride, go into production.

4¾% MADRAS STATE ELECTRICITY BOARD BONDS 1972
FOR Rs. 300 LAKHS

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS)

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE Rs. 99.75 PER CENT

REDEEMABLE AT PAR ON THE 24TH SEPTEMBER, 1972.

Subscriptions will be received in cash or cheques from the 24th September 1962. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 300 lakhs and in any case not later than the close of business on the 29th September 1962.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board.

FROM THE CAPITAL'S CORRIDORS

FOREIGN TRADE

PROBLEMS of India's external trade were to the fore last week, not only because the joint meeting of the Import and Export Promotion Advisory Councils was to be held on September 8, but also because the Prime Minister, along with the Union Finance Minister, Mr. Morarji Desai, was embarking on a mission to London where Commonwealth Prime Ministers' Conference opened on September 10, to impress upon the United Kingdom the adverse effects which her joining the European Common Market would have on the foreign trade of under-developed countries like India.

The Prime Minister, both before his departure in New Delhi and on his arrival in London, raised the fundamental issue that if India's exports to Britian went down as a sequel to the latter's becoming a member of the European Economic Community, this would have similar effects on Britain's exports to India. Speaking in the same vein, Mr. Nehru pointed out that the imbalance in the trade between India and West Germany on the present scale could not continue any longer. The Prime Minister made another significant observation concerning the political aspect of Britain's entry into the Common Market and stated if the Common Market were an extension of the NATO alliance, "it becomes a party to the world conflict."

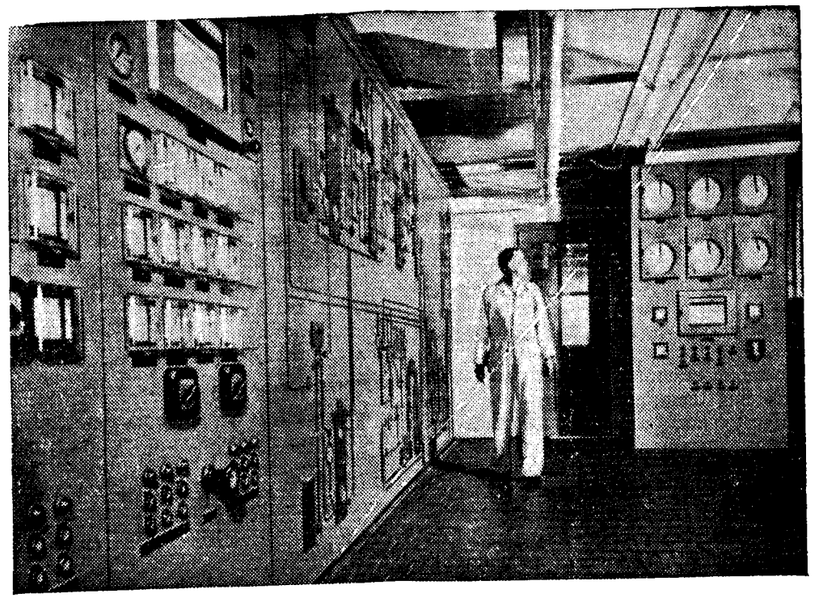
The Prime Minister's remarks about the effects of Britain's joining the Common Market on India's trade were eloquently echoed by the Union Commerce and Industry Minister, Mr. K. C. Reddy, while inaugurating the one-day joint meeting of the Import and Export Promotion Advisory Councils. Mr. Reddy declared that the policies of the West European countries particularly towards imports of manufactured articles from developing countries still remained highly restrictive. It was a sad commentary, he said, on the declared policies of the advanced countries that they should insist on protecting or subsidising simpler forms of manufactures in the production of which the less industrialised countries had a comparative advantage. As a background to his these remarks, Mr. Reddy pointed out that India's exports to the United Kingdom and the ECM countries during the first seven months of the current year declined by Rs. 6 crores and Rs. 7 crores, respectively, from the levels during the corresponding period last year.

Regarding the negotiations between the United Kingdom and the EEC, Mr. Reddy stated that the U.K. and the Six had reached agreement on some points of interest to India. Tea, an important item of India's export, would get duty-free treatment throughout the enlarged Community. He further hoped that the benefit of free entry would not be nullified by increased internal taxes or duties within the Community. Other items like cashewnuts, ginger, cardamom and sandalwood oil, Mr. Reddy observed, would also get similar treatment by suspension of duty. In regard to many items of vital interest to India, Mr. Reddy stated, no solution had yet been found. He expressed dissatisfaction at the treatment meted out by the Community to cotton textiles exports from India.

IMPORT RESTRICTIONS

An important point made by the Union Commerce and Industry Minister at this meeting was that during the second half of the current financial year, foreign exchange available for maintenance imports would be appreciably less than was available during the first half. He, therefore, envisaged that further import tightening up may have to be resorted to. At the same time, however, he assured the business community that the recent 50 per cent blanket cut on imports would be reviewed to mitigate the hardships in deserving cases to the extent possible. While Mr. Reddy's this gloomy observation can be stated to have come at a very inopportune time when the Union Government and the Planning Commission are very much concerned about the recent rise in prices, Mr. Reddy would have done well to have clarified the position further. Presumably, Mr. Reddy had in mind the fact that since bilateral negotiations with the members of the Aid-India Consortium have not yet come to an end, it is difficult to say how much of the aid promised by them would be available for maintenance imports. Further, there still remains a gap of Rs. 130 crores between the aid that was expected from the members of the Aid-India Club, other than the World Bank and its affiliate, the International Development Association, and the aid promised by them. The Government would obviously be looking forward to the outcome of the efforts of the Union Finance Minister who, during his forthcoming visit to the United States to attend the Fund-Bank meeting, would be utilising the the opportunity to secure some more aid from the Aid-India Club members for the current year of the Third Plan so as at least to bridge partially the gap that remains in the expectations and commitments regarding assistance from this source.

Mr. Reddy characterised the task of export promotion as a national crusade. While the Government, he said, had decided to give export promotion the highest priority and was determined to spare no efforts, there was a limit to what Government alone could achieve by its efforts. He added that the current foreign exchange crisis would have served a useful purpose if it evoked a spirit of determination on the part of the business community to meet the challenge and to so organise production and trade as to achieve a steady increase in the country's foreign exchange earnings. The main handicap in the way of India's stepping up of exports, Mr. Reddy opined, were high cost of production here and the keen competition that was faced in the world markets.



Mr. Manubhai Shah, intervening in the deliberations of the joint meeting of the Import and Export Promotion Advisory Councils, pointed out that nearly Rs. 50 crores had been saved in the first half of this year as a result of import cuts and this did not involve any damage to the economy. Referring to exports, Mr. Shah disclosed that the Government was working out the details of the proposed Import-Export Stabilisation Fund to finance additional import of components and raw materials for export industries. Certain discussions in this regard, he added, were taking place already in Bombay. As soon as the scheme was ready, the trade would be consulted.

EXPORTS LIBERALISED

The Government of India has decided to remove licensing restrictions on exports of most of the items over which, at present, there is export control. As compared to the old list of banned items numbering as many as 185, there will now be export ban only on 78 items.

Two lists have been drawn up, one showing the items the export of which will be banned and the other listing the commodities for which there will be free licensing within quotas which will be announced on an annual basis.

The lists include only those items where export control is inescapable because of their connection with such national schemes as the Preservation of Wild Life or because of their use in the country's defence. Minerals and components connected with Atomic Energy

Look what you get with
HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

etc. and items required for domestic consumption are the other items which figure in the list of banned items.

In respect of some 45 items, which were hitherto allowed to be exported after considering the merits of each case, the formalities of obtaining licences have now been removed.

BANNED ITEMS

The following are the commodities whose exports are totally banned :

A. Animals, Food and Drink. Wild life (dead or alive or part thereof or produce therefrom), the following: Asiatic Lion; Black Buck (White Variety), Brow-antlered deer, Clouded Leopard, Crocodiles, Eastern Pangolin, Great Indian Bustard, Hunting Leopard, Indian Rhinoceros, Jerdon's Courser, Kashmir Stag, Mountain Quail, Pigmy hog, Pink-headed Duck, Snow Leopard, White-winged wood Duck, White tiger, Butterflies, Moths larger than 75 mm., Marbled Cat, Four-horned antelope, Golden Cat, Golden Langur, Indian Gazelle, Indian Swamp deer, Lesser Panda, Spotted Lisang, Tragopans, Urial, Markhor; (2) Wheat and wheat flour.

B. Minerals, Ores and Concentrates, Metals and their Compounds: Beryl, Radium ores and concentrates, Thorium ores and concentrates, Uranium ores and concentrates, Uranium bearing tailings left over from ores after extraction of copper or gold, Zircon ores and concentrates including semi-precious variety of zircon stones; Some other minerals, containing the above substances as accessory ingredients including, (a) Uraniferous allanite, (b) Columbite, (c) Monazite, Samarskite; Selenium and compounds including Selenium, Beryllium compounds, Deutorium compounds, Lithium compounds, Neptunium compounds, Plutenium compounds, Radium compounds, Thorium compounds, Uraniam compounds, Zirconium compounds.

Metals: Iridium, iridosmine and osmiridium, Beryllium, Lithium, Neptunium, Plutonium, Radium, Thorium, Uranium, Zirconium.

Seeds, other than Oilseeds: Green manure seeds, Jute seeds, Mesta seed, Lemon grass seed and roots, Pepper cuttings or rooted cuttings of pepper, Potato seed (export to Pakistan is, however, covered by O.G.L. No. 4), Seeds, steams and green roots of Rauwolfia Serpentina and other species of Rauwolfia, Sun hemp seed, Russa grass seeds and tufts.

Oilseeds (non-essential) : Castor seed, Copra, Cotton seed, Ordinary groundnuts, Linseed, Mustard seed, Rape seed.

LICENSABLE FREELY WITHIN CEILINGS

The following are commodities exports of which are licenseable freely within ceilings to be announced on an annual basis.

Wheat bran (from the ports of Bombay, Calcutta, Madras and Gujarat); Rice bran (from the ports of Bombay, Calcutta, Madras, Andhra Pradesh and Gujarat); Sugar costed, salted and unsalted groundnuts roasted or fried; Tinned butter (on 'first come first served' basis on production of valid firm sale contracts); Sugar (by the Indian Sugar Mills Association, Calcutta and the S.T.C. only); Onions (to destinations other than Pakistan). (Export to Pakistan is on O.G.L. No. 4); Potatoes (to destinations other than Pakistan (Export to Pakistan is on O.G.L. No. 4); H. P. S. groundnut kernels (against registration of contracts); Linseed cake; Coconut oilcake; Controlled varieties of raw cotton (on 'first come first served' basis to those exporters who exported raw cotton prior to 31-8-1958); Indigenous wool (on 'first come first served') basis on production of certificates of Agmark grading); Cotton rags, hosiery cuttings and linen cuttings; Gurjan wood from Tripura and Lungleh Sub-Division of Lushai Hills District in Assam (to East Pakistan only against transit passes issued by the Assam and Tripura Forest Officers concerned; Indian teak including Kayal (Tectona Grandis) (at Bombay and Ernakulam only against firm contracts subject to a maximum of 50 cubic tons per shipper per day.); Benteak (Lagerstrecmia Lanccolate) (at Ernakulam against firm contracts subject to a maximum of 100 cubic tons per shipper per day); Haldu wood scantlings (Adina Cordifolia) (at Bombay against firm contracts subject to a maximum of 100 C. tons per shipper per day); Rose wood (Dalbergra Latifolia) (against firm contracts subject to a maximum of 100 C. tons per shipper per day). Shisham (Dalbergis Sissoo) (at Headquarters against firm contracts); Kokoo, black siris, white siris, etc. (Albizzia supp.) (at Ernakulam against firm contracts subject to maximum of 50C. tons per shipper per day provided the sizes of timber exported are smaller than those required by the Indian Railways); H.P.S. groundnut in-shell (against evidence of firm sale contracts.); Bauxite; Guar Gum; Raw goat skins excluding pickled goat skin; Manganese Ores and concentrates other than low grade; Manganese dioxide peroxide; Bananas (to destinations other than Pakistan); Bone sinews; Chrome leather shavings, picker waste and dry piece in hair, dry limed hide bellies, splites, hide cuttings or trimmings, hide fleshing; Nux Vomica seeds; Sizlimanite.

The above two lists are provisional and are subject to review from time to time. All the other commodities are freely exportable without any limit.

TRADE WITH EUROPE

The first meeting of the Council for Trade with Europe was held here during the week. The meeting took note of the declining trend in India's exports to Western Europe and decided that detailed commodity-wise studies should be undertaken so that concrete steps for promoting exports to West European countries might be evolved.

During the discussions, several members pointed out that quantitative restrictions and high tariff rates were imposed by most of the countries of Wesern Europe on numerous Indian commodities on completely wrong impressions about the low-wage structure and low cost of production of Indian goods offering unfair competition to the products of European industries. The Council, therefore, felt that commodity-wise studies should be made and West European countries should be informed about the facts which clearly point out that India is not a low-wage country by any description and, therefore, such high tariffs or quantitative restrictions on Indian products are totally uncalled for.

It was, however, not disclosed that India had not utilized the quotas allotted to her primarily because Indian goods were not competitive enough either in quality or price.

JUTE EXPORTS

A three-member committee has been set up to examine all the sale contracts and invoices relating to shipments of jute goods. After the contracts have been scrutinised by this committee and considered to be in order, the exports of the goods will be allowed without further check by the customs at the time of actual shipment. In order to facilitate the scrutiny, it has been decided that all contracts for the export of jute manufactures should be first registered as soon as they are finalised.

IMPORT OF COAL - TAR DYES

The Government has decided to ban the import of coal-tar dyes other than dyes intermediates with effect from October 1, 1962. The revised policy will be applicable to the supplementary licences covering the next half-yearly entitlement which may be granted to established importers after October 1.

Under the Cotton Textiles Export Incentives Scheme, against the import entitlements for dyestuffs and chemicals, not less than 35 per cent of the value of import entitlements was to be utilised for the import of dyes-intermediates, the balance being utilised for import of coal-tar dyes and/or textile chemicals. On a review of the position, it has been decided that against the entitlements for dyestuffs and chemicals under the Cotton Textiles Export Incentives Scheme, not less than 75 per cent of the value of the import entitlement shall be now utilised for the import of dyes-intermediates, the balance of not more than 25 per cent of the value being used for coal-tar dyes and/or textile chemicals. The revised percentages will, however, apply in respect of the import entitlements on exports of cotton textile fabrics etc. made after September 5, 1962, under the Cotton Textiles Export Incentives scheme.

No further imports of coal-tar dyes other than dyes-intermediates will be made under the rupee payment arrangements by the State Trading Corporation.

IMPORT OF COPRA AGAINST VANASPATI EXPORTS

Import licences for copra will be issued to the manufacturers-cum-exporters of vanaspati and hydrogenated oil up to 75 per cent of the f.o.b. value realised from exports of vanaspati and hydrogenated oil, according to an Import Trade Control Public Notice issued here.

Manufacturers-cum-exporters will have the option to utilise 10 per cent of this entitlement for such items as chemicals, spares and machinery as approved by the Directorate of Sugar and Vanaspati and the Development Wing in the Ministry of Commerce and Industry.

The Public Notice has clarified that the import entitlement for chemicals, spares and machinery as well as copra should be within the maximum limit of 75 per cent of the f.o.b. value realised.

STEEL RETENTION PRICES

The long-awaited announcement on steel retention prices for the two-year period to March 31, 1962, was made by the Government of India last week. The average retention price of steel produced by the main producers, whether in the private or in the public sector, has been fixed at a uniform rate of Rs. 522.50 per tonne. This means an increase of Rs. 10.50 per tonne over the provisional price fixed earlier for this period.

The increase allowed by the Government falls considerably short of the Rs. 38 per tonne raise recommended by the Tariff Commission. The Commission, after going into the claims of the steel interests in the country, had recommended that retention price of saleable steel should be increased from an average of about Rs. 512 per tonne — this price had been provisionally fixed by the Government under the Escalator clause after a preliminary cost examination of the Tata Iron and Steel Company Ltd., and the Indian Iron and Steel Company Ltd., undertaken by the Cost Accounts Branch of the Ministry of Finance and allowed for increase in railway freights, changes in statutory price of coal and other fuel and labour costs — to Rs. 550 per tonne. The Commission's recommendations were as follows:

(i) The average fair retention price of saleable steel (inclusive of the special element for payment of interest on and repayment of special advances) for 1960-62 should be Rs. 550 per tonne. This recommendation was based on an assessment of a fair or standard block on the basis of a comparative study of the capital blocks of the existing units. The Tariff Commission recommended that for the price period 1960-62, a capital block of Rs. 1,300 per tonne of saleable steel should be reasonably representative;

(ii) A return at 8 per cent on the representative block of Rs. 1,300 per tonne of saleable steel and interest on an estimated working capital at six months works cost equivalent at 5 per cent should be allowed;

(iii) Based on an equated payment spread over a period of 20 years, the special element allowed in the retention price for payment of interest on and repayment of the special advances should be Rs. 8 per tonne of saleable steel (this element is included in the price of Rs. 550 per tonne);

(iv) The fair retention price of steel ingots for 1960-61 should be Rs. 344 per tonne, inclusive of the special element of Rs. 8 per tonne for payment of interest on and repayment of the special advances; and

(v) The price of pig iron recommended by the Commission means roughly an increase of Rs. 3 per tonne over the existing prices.

The Government's decision has varied from the recommendations of the Tariff Commission in various respects. Firstly, the Government has differed from the Tariff Commission's recommendation in regard to the block of Rs. 1,300 per tonne. In Government's opinion, there was insufficient justification for accepting this amount of block which was calculated by the Tariff Commission on the basis of 90 per working of the plants' capacities. The Government has decided to base the retention prices on a block of Rs. 1,176 per tonne. This figure it has arrived at on the basis that the plants should be worked at 100 per cent of capacity and after excluding from the capital block the special advances paid to the companies by the Government. Secondly, the Government has viewed the working capital provision allowed by the Tariff Commission as rather too hign. Instead of this provision being allowed at the rate of six months of the works cost, the Government feels that a provision on the basis of four months works cost should be adequate. Thirdly, the Government has not considered it necessary to provide an element in the retention price for the payment of interest on and the repayment of special advances. The agreements with the companies according to the Government, provide for an alternative method of repayment of a part of the special advances with interest, namely an issue of share capital by the companies at such a time or times as the Government may, in agreement with the companies, decide. This would be considered by the Government further. The Government has, therefore, decided to exclude the element of Rs. 8 per tonne recommended by the Tariff Commission on this account from the retention price fixed.

As a corollary to the fixation of a lower retention price than the one recommended by the Tariff Commission, the Government has scaled down suitably the retention prices recommended by the Commission for different categories of steel. The retention price of steel ingots has been fixed at Rs. 326 per tonne, as against Rs. 344 per tonne recommended by the Tariff Commission. The retention price of pig iron, similarly, has been scaled down by Re. 1 per tonne from the price recommended by the Commission.

A detailed gazette notification on the new retention prices fixed for various categories of steel, as also pig iron, is being issued.

The increased retention prices do not imply any increase in the controlled prices of various categories of steel for sale to the public.

The other general recommendation of the Tariff Commission regarding regular supply of raw materials (particularly coal), improvement of sintering and ore handling facilities, more regular transport arrangements for both raw materials and finished products, adoption of the latest technological advances etc., have been accepted by the Government. These will be commended to the steel plants for implementation.

The new retention prices have been made applicable provisionally beyond April 1, 1962, subject to certain changes which are necessary on account of (a) the recent increase in the statutory price of coal and (b) the increase in the railway freight from July 1, 1962. The effect of these changes will be announced

talking about banks

There is more in banking with the STATE BANK OF INDIA than the mere possession of a bank account—first class service, security and safety and ability to obtain friendly and helpful advice and information when required.

The wide experience of the State Bank is at the disposal of the customers whether their accounts be large or small. The State Bank can be of assistance to your business and its problems. If the business covers a small-scale industry, you will find special attitudes aimed at earnest desire to help. In the co-operative sector too, the Bank has similar attitudes with schemes offering special facilities. Every kind of foreign exchange business is transacted. Why not contact the nearest office?

You will always find a friend at

THE STATE BANK OF INDIA

India's Leading Bank

SISTAS SB-56-A

shortly. The final prices to be fixed for the period after April 1, 1962, will be decided after further consideration.

DURGAPUR ALLOY AND SPECIAL STEELS PLANT

Hindustan Steel Limited has entered into an agreement with Messrs. Atlas Steels Ltd., Canada, for providing production know-how and training services in connection with the erection and operation of the alloy and special steels plant at Durgapur. The services to be provided by the Canadian firm cover exclusive use of all inventions, patents, secret knowledge and know-how which the Canadian firm possesses or owns, advice on specifications and plans, or production and operation matters and training of personnel abroad and in India.

The total fee payable is Rs. 23.75 million (5 million Canadian dollars) in instalments. The agreement is for a period of 12 years or six years after the date of commercial production in the proposed plant, which ever is earlier. The tenders invited for the plant give a perfect latitude to the tenderers to quote for the plant in accordance with the Dastur Project Report, or in modification of this report or for an entirely new design of the plant.

MYSORE ALUMINIUM

The Mysore Aluminium Company, as reported last week, is meeting heavy weather. Early this year, the Indian licencees and the American collaborators had reached an agreement to their mutual satisfaction. According to this agreement, the shares of the Governments of Mysore and Maharashtra and those of Mr. Murarji Vaidya and his other Indian partners and of Reynolds in the equity capital was determined. Since then, Mr. Murarji Vaidya has raised some further objections. As reported last week, efforts are being made to eliminate the Government of Maharashtra Another meeting of the Indian licencees with the Government was held here last week, when efforts were made to explain to them the repercussions of revoking the licence or of hold-up in the progress of the project. These attempts, according to reports, were not very successful.

As reported last week, the Government has issued a "letter of interest" to the Hindustan Aluminium Corporation to raise its capacity to 50,000 tons a year. Whether this expansion will take place during the Third or the Fourth Plan period will depend on the implementation of the already licensed units, including one in Mysore. The Government will be compelled to sanction the expansion scheme of Hindustan Aluminium Corporation during the Third Plan itself, if Mr. Murarji Vaidya and his colleagues do not find their way to implement their licensed scheme. This would also be serving as a warning to the American industrialists.

CREDIT FACILITIES FOR SMALL EXPORTERS

The Exports Risk Insurance Corporation has decided to issue a new insurance cover to help the small exporters who often find difficulty in getting a line of credit from banks.

Normally, credit insurers the world over do not cover risks of "non-acceptance" by the overseas buyers. In view of the peculiar difficulties of small exporters in India and the imperative necessity to augment the country's exports, a new insurance policy will be issued by E.R.I.C. which will take care of this risk, subject to proof of the credit-worthiness of the exporter and the quality of goods.

The "non-acceptance" risk policy will serve as an important collateral security for banks and will considerably ease the position in regard to credit availability for small exporters.

MANUFACTURE OF PRINTING MACHINERY

The Union Government has approved five schemes for the manufacture of various items of printing machinery. Three of these will be implemented with foreign collaboration. The particulars of the approved schemes are as given in table below.

Only Britannia Engineering Co. Ltd., has so far gone into production. Its output during the year 1961 was of the value of Rs. 6.74 lakhs.

It is explained that in cases where the firms do not show any progress within a reasonable time, steps would be taken to withdraw the Government approval to the scheme.

Name of the Firm	Particulars of Foreign Collaborator	Item of Manufacture and Capacity (Annual)
(1) Britannia Engineering Co. Ltd., Titaghur, West Bengal. (2) Printers House (P) Ltd., New Delhi.	Dawson Payon and Elliot Ltd., UK. Nederlandsche Shelpersew fabrick Bercedes, Holland.	Flat Bed Machines, Stop Cylinder Types 240 Nos. (i) Stop Cylinder Machines .. .. 24 Nos. (ii) Paper Cutting Machines .. .. 60 Nos. (iii) Proof Presses .. .. 48 Nos.
(3) Oriental Electric & Engg. Co. Ltd., Calcutta.	—	(i) Victoria Type Printing Press .. .. 100 Nos. (ii) Cylinder Printing Press .. .. 120 Nos.
(4) Ramakrishna Machinery Corporation Ltd., Coimbatore.	—	(i) Treadle Machines .. .. .. 240 Nos. (ii) Cylinder Machines .. .. .. 96 Nos. (iii) Cutting Machines .. .. .. 300 Nos.
(5) Sahu Jain Ltd. (to be set up in Bihar).	Hamada Printing Mfg. Co. Ltd., Japan	(i) Printing Press. (ii) Stereotype Equipment. (iii) Corrugated Board Making Machines, Printing and Slotted.

SEA FREIGHT CONCESSION ON PUBLIC SECTOR CARGOES

An agreement has been signed in London between the Government of India and the UK/Continent—India/Pakistan Conferences, giving an additional rebate of five per cent in freight on all imports carried by the vessels of the Conferences from the UK and the Continent to India on account of the Central Government and State Governments as well as public sector undertakings fully owned or controlled by Government. The Conferences have been allowing so far either immediate rebate of 9½ per cent or a deferred rebate of 10 per cent except in case of shipments arranged through the India Stores Department, London, for defence, railways, posts and telegraph and ports, where a 15 per cent rebate had been made available.

The concession now secured will apply mainly in respect of general cargoes, machinerys etc., shipped in parcels under both f.o.b. and C&F contracts.

CZECH ASSISTANCE

The gift of Rs. 60 lakhs offered by the Government of Czechoslovakia for setting up the Central Machine Tools Institute at Bangalore is being utilised towards payment of (1) the salary of the Czechoslovak experts to be deputed to India, (2) the training expenses of Indian engineers in Czechoslovakia, and (3) the cost of plant and equipment, training aids and tools etc., to be obtained from Czechoslovakia.

The Institute will impart training in the de_igning of machine tools and will carry out research in the methods of calculations in the design of machine tools, behaviour of machine tools and elements and on hydraulic, electrical and electronic control system in relation to machine tools, metal cutting, production processes of machine tools and study of machinability etc. In addition, the Institute will also be engaged in collecting information on tool literature and documenting it.

Pioneers in Plantations

One of the largest groups of planting companies in South India today lies within the Peirce Leslie & Company Limited fold. Resources, experience and skill have combined in P.L.& Co. to command wide confidence. The diversification of interests from fertilisers to estate stationery has firmly emphasised that P.L.& Co. are now part of the planter's life. Tea, rubber and coffee interests are blended in the P. L.& Co. group.

The Rupee companies that Peirce Leslie & Co. Ltd., look after as Managing Agents are:

The Periakaramalai Tea & Produce Company Limited; The Ouchterlony Valley Estates (1938) Limited; The Kil Kotagiri Tea and Coffee Estates Company Limited; Chembra Peak Estates Limited; The Cochin Malabar Estates Limited; Kumergode Estates Limited; The Kalasa Tea & Produce Company Limited.

Peirce Leslie & Co. Ltd., are also Secretaries and Treasurers of: The Savamalai Estates Limited; The Thirumbadi Rubber Company Limited; Cowcoody Estates Limited and Lingapur Estates Limited.

Peirce Leslie & Company Limited

PL.III

COMPANY AFFAIRS

IMPERIAL TOBACCO

There has been substantial reduction in the net profit of Imperial Tobacco Company Limited for the year ended March 31, 1962, partly as a result of the retrospective increases in company tax. But the Board of Directors has recommended that the total distribution would remain unchanged at 9 per cent subject to tax. In making this recommendation the Board has taken into account the results of the last four months' trading and the good prospects for the current year (1962-63) and are confident that they will be able to maintain a 9 per cent distribution for the current year though at the same time appropriating an adequate sum to reserves. The net profit for the year under review after deduction of charges and expenses and providing for taxation amounts to Rs. 146.33 lakhs. A sum of Rs. 3.74 lakhs has been transferred to Development Rebate Reserve and Rs. 8 lakhs for the fixed and stock replacement reserve. Interim dividends on ordinary shares were paid at the rate of 2½ per cent on September 28, 1961 and subsequently on April 11, 1962 also at the rate of 2½ per cent. Now the Directors have proposed the distribution of a final dividend on ordinary shares at the rate of 4 per cent making 9 per cent in all.

To protect the Company's interest in paper and board required to wrap its products, the compony made an initial investment of Rs. 1.13 lakhs in Assam Pulp Mills Limited. Certain difficulties in arranging for the required loan capital could not be resolved and the project had to be abandoned. Ahsam Pulp Mills Limited is now in liquidation and that investment has been written off. The Company has no further liability in this connection.

TITAGHUR PAPER

The overall results of the Tataghur Paper Mills Company Ltd., for the year to March 31, 1962, are quite disappointing. The Profit and Loss Account shows a loss of R. 11.38 lakhh after providing for all charges and making a provision of Rs. 34.31 crores for depreciation. A sum of Rs. 3.84 lakhs has been refunded from excess profit tax and a sum of Rs. 2.5 lakhs has been transferred from Reserve for dividend equalisation, Rs. 11 lakhs have been transferred from reserve for revaluation of stocks and stores and Rs. 7 lakhs from general reserve. This leaves the company for the year with a credit balance of Rs. 14.44 lakhs. Dividend on preferred ordinary shares is now to be paid at 13 per cent and on 'A' and 'B' ordinary shares of Rs. 10 each at the rate of Rs. 1 per share or 10 per cent per annum.

The unsatisfactory results were partly due to the disappointing performance of the mills at Kankinara in West Bengal and Choudwar in Orissa. The mill at Titaghur in West Bengal, however, worked satisfactorily. The total output has been slightly lower than the previous year. This was due to the time lost in dismantling and transit of paper making machinery and the erection of new machines at Kankinara and Choudwar and this took away about six months. The machines did not go into production till September 1961. The Directors have also recorded that the costs of chemicals as well as repairs and maintenance have been high. An electrolytic Bleach plant with four banks of cells has now been installed at Kankinara which is likely to reduce the costs. An application has been made to the Government of India for permission to increase the capacity of plant to the extent of 6 banks of cells. Difficulties in the procurement of railway wagons still remain a problem, having adverse effects on the transport of raw materials and despatches of finished products. It is, therefore, necessary to continue to supplement bamboo as material with bagasse, jute sticks and paddy straws.

The company holds an industrial licence for an increase in the installed capacity of their mill at Choudwar by 6,000 tons per annum and the Directors feel that this should be implemented. Besides, there is scope for effecting modernisation and substantial improvement by way of productive efficiency and economies in operation at Titaghur and Kankinara Mills. For both these purposes substantial capital expenditure is necessary and it is the opinion of the Directors that a further issue of Ordinary Shares should be made. With this in view, the company has applied to the Controller of Capital Issues for permission to capitalise a sum of Rs. 56 lakhs from the General Reserve of the Company by making a bonus issue of new 'A' equity shares in the proportion of one bonus share for every two shares held to the holders of 'A' and 'B' Ordinary Shares and after the bonus issue to make a "rights" issue of new 'A' equity shares in the proportion of two shares for every three shares held to the holders of 'A' and 'B' Ordinary shares at a premium of Rs. 5 per share. The services of the Adamson Engineering Company have been secured as consultants to examine and give detailed recommendations regarding the scheme for expansion of Choudwar Mill and renovations at Titaghur and Kankinera Mills. Negotiations and formalities for the cash credit facility of Rs. 50 lakhs with the State Bank of India have now been completed and it is expected that the company shall be able to utilise this facility from September 1962.

ELGIN MILLS

The working of the Elgin Mills for the year ended September 30, 1961, is considered satisfactory. A programme of renovation and modernisation was carried through and naturally a better efficiency was achieved. The Directors report that the total expenditure on buildings and plant and machinery during the next five years is estimated at Rs. 135 lakhs and for that the Company has arranged a long-term credit with their bankers. Commitments for capital expansion subsequent to the close of the financial year amount to nearly Rs. 26.5 lakhs. With the installation of new plant and machinery, the company would be able to manufacture products of even better quality.

The sales for the year at Rs. 5.82 crores was a record figure and naturally the profit was also satisfactory at Rs. 88.6 lakhs. After the provision for depreciation, development rebate reserve and taxation, the Directors recommend the transfer of Rs. 10 lakhs towards rehabilitation reserve and Rs. 20 lakhs to its general reserve. The dividend was recommended to be paid on ordinary and vendor shares at the rate of Rs. 1.75 per share of Rs. 10 each.

As a result of quota restriction in the U.K., which is principal export market for the company's textile goods, and keen competition from Japan, Hong Kong and Pakistan, the exports received a set-back. The company has plans for setting up a new spinning unit and has applied consequently. The company has also been recommended an allotment of 10,348 spindles for balancing purposes.

Company Meetings

CAMPHOR & ALLIED PRODUCTS LTD.

133, MAHATMA GANDHI ROAD, BOMBAY - 1.

Speech of the Chairman, Shri N. K. Petigara, at the First Annual General Meeting held on Wednesday, the 12th September, 1962.

Ladies and Gentlemen;

I take great pleasure in welcoming you this afternoon to the First Annual General Meeting of the Company. The Directors' Report and the Statement of Accounts for th period 29th March, 1961 to 31st March, 1962 have been circulated and have been in your hands for some time. I will, therefore, with your permission, take them as read.

2. You will naturally want to know the progress that the Company has made during the period under review.

3. The total land requirement for the project is about 22 acres. Land admeasuring 9.97 acres has been purchased from the Indian Bobbin Co. Ltd., Clutterbuckganj, which is four miles from Bareilly. The Company has paid a deposit and already taken possession of the adjoining land admeasuring about 12 acres from the Forest Department of the Government of Uttar Pradesh. The purchase deed is now under finalisation. The total cost of the land is expected to be approximately Rs. 3.05 lakhs.

4. The construction of buildings for the various factory units is proceeding at a satisfactory rate. The power requirement not only for the Camphor Plant but also for future expansion, rising, in stages, up to 2000 K.V.A., has been sanctioned by the authorities and will be drawn from Harduaganj Extension Hydel Scheme. Two tube wells are being sunk and pumps and auxiliary equipment are being installed to ensure adequate water supply for the entire project.

5. Arrangements are being made for the construction of suitable sidings between the metre gauge and broad gauge railway tracks which are adjoining the plant-site to facilitate the receipt of plant equipment, raw materials and the despatch of finished goods.

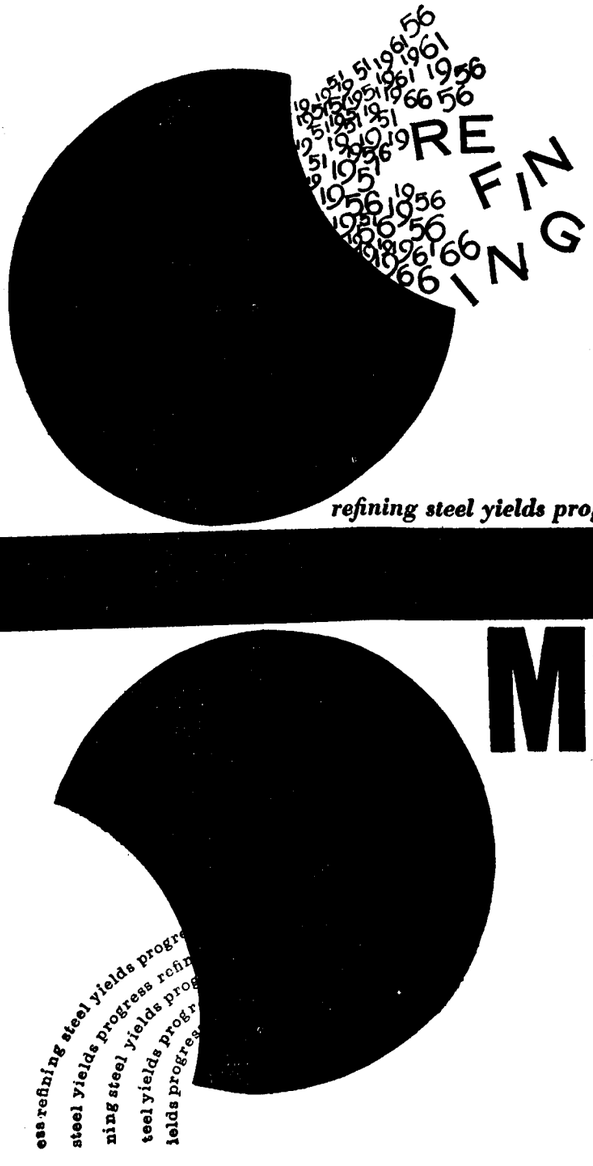
6. As stated in the Directors' Report, the super structure of the Plant Building is expected to be completed by November 1962. As regards the supply of Machinery, I am very happy to state that since the printing of the Directors' Report, the first consignment has already been shipped from the U.S.A., and, the first consignment of indigenous machinery has been received at site. Most of the equipment, both foreign and indigenous, is expected to reach the site by the end of the year. The erection work is expected to be completed by March or April 1963, and thereafter, the trials, for which we have obtained performance guarantee jointly from M/s. American Hydrotherm Overseas Corporation and M/s. R. L. Dalal & Co., will be undertaken. The Plant should go into production, barring accidents and unforeseen delays, by April or May 1963.

7. On the above basis, the plant can be in production for only eight months of 1963, and it may be expected to produce about 500 to 600 tons of Synthetic Camphor. It is believed that the annual demand for the Camphor in India is about 1,000 tons. Officially, imports through the State Trading Corporation of India Ltd., are to the extent of approximately 300 tons. There are grounds to believe that a major portion of the residual demand is met by illegal imports and/or by spurious products said to contain Camphor. The present market price of powder camphor is about Rs. 30 per kilogram, while the wholesale price of the State Trading Corporation for the same powder is about Rs. 11.50 nP. per kilogram. In view of the demand which should increase, and the prevailing prices, there should not be any particular difficulty in the sale of the Company's production at reasonable profit.

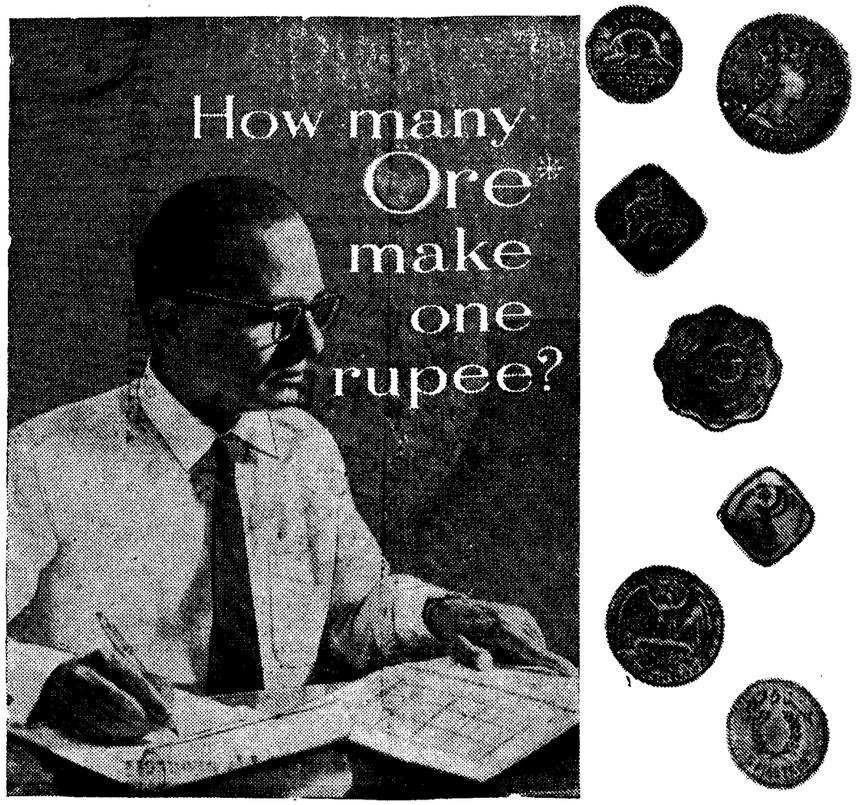
8. It was anticipated that the factory would be set up and the production would be commenced by about December 1962. The original schedule for putting the plant into operation has had to be modified due to two factors over which the Company had no control. First, there was delay in the matter of the land for our factory site. Second, although, the Industrial Credit & Investment Corporation of India Ltd. had asked the World Bank to open the Letter of Credit in favour of the Company, as early as May 1962, owing to the technical requirements arising out of the agreement between the Industrial Credit & Investment Corporation of India Ltd. and the World Bank, the Letter of Credit could not be confirmed till last month. These delays were unavoidable.

9. On behalf of the Company, I would like to express our gratitude to the Industrial Credit & Investment Corporation of India Ltd. for the foreign exchange loan, and, to the Industrial Finance Corporation of India, for the Rupee loan. I would also like to express on your behalf our deep appreciation of the helpful attitude of the Government of Uttar Pradesh. In particular, our Managing Agents have informed us of the excellent cooperation extended to the Company by the Officers of the Indian Turpentine & Rosin Factory at Clutterbuckganj, Uttar Pradesh, and of the Forest Department of the Government of Uttar Pradesh.

10. It may interest shareholders to learn that your Directors are not remaining content only with the setting up of the Company's Plant for the manufacture of Camphor. Your Directors are looking far ahead towards the possible exploitation of various intermediate and by-products resulting out of the main process.



11. Your Company will not only be a pioneer in the large-scale manufacture of Synthetic Camphor in the country but it will also be an organisation well equipped to exploit gainfully various intermediate and by-products. I would like, with your permission, to indicate briefly the potential of your Company.



12. The basic raw materials for major organic chemical industries, such as, Synthetic Rubber, Plastics and Resins, Synthetic Fibres, Dyes, Drugs and Industrial Perfumes, are derived from :

i) Petroleum and Natural Gas,
ii) Coal and Coke,
iii) Industrial Alcohol, and
iv) Gum Turpentine.

The resources of the first three in the country are certainly not unlimited, and, therefore, your Company's pioneering effort, namely, the utilisation of Turpentine

refining steel yields progress

110, says our accountant who has the exchange rates of Sweden and many other countries at his finger-tips. Quotations for BINNY fabrics are called for by discerning buyers in over 50 countries overseas — countries where good quality and efficient service are appreciated — countries where the name 'BINNY' is known and trusted.

Quality Control

BINNY'S reputation for the excellence of their fabrics is in no small part due to their system of rigid quality control—a system of laboratory testing designed to eliminate defects at every stage of production — a system of control that guarantees the strength and durability of all BINNY fabrics.

Every year BINNY manufactures over 82 million metres of **Shirtings • Khaki Drills • Bleached and Dyed Drills • Towels • Crease-resistant Suitings • Tussores • Union Fabrics • Silk Sarees**

BINNY —a great name in textiles

JL
Xm 2, [illegible] 164818

as a base not only for the production of Camphor but also of a wide range of intermediate chemicals for use in various industries, acquires particular significance.

13. The fractional distillation of turpentine yields Alpha Pinene, used for Camphor manufacture, Beta Pinene, leading to Polyterpene Resins, and, Residual Turpentine, containing mainly Carenes. The presence of a high proportion of Carenes is peculiar to Indian Turpentine. Although, at first sight, Carenes may appear to be a waste by-product, they can be put to a multitude of uses which would convert them into an asset of great market value.

14. Your Board has decided to encourage thorough research for the conversion of Carenes into Cymenes, Synthetic Pine Oil, Aromatic Chemicals, Dibasic Acids and Synthetic Resins, which would be of far greater value, unit by unit, as compared with that of an Industrial Solvent. The production of Cymenes will open up further fields such as the manufacture of Terephthalic Acid, which is used in Synthetic Fibres such as Terylene, as well as Acetone and Metacresol.

15. The other by-products of considerable importance are Terpenes B, D and G. Terpene B can be used for making technical grade Dipentene which is utilised in Rubber Processing, Ore Dressing and Paints. It appears feasible to use Terpene D in the manufacture of Synthetic Resins used in the Paint Industry. Terpene G can, with slight processing, be marketed as an Industrial Perfume.

16. Apart from the above, intermediate products in the Camphor process, such as Alpha Pinene, Camphene and Isoborneol, offer immediate possibilities of promoting the manufacture of Toxaphene (used in Insecticides), Alpha Terpeneol, Terpenyl Acetate and Isobornyl Acetate (used for Industrial Perfumes).

17. The Company has decided to take the initiative and to explore the possibility and profitability of these processes. A short-term project relating to the conversion of Residual Turpentine into an Industrial Solvent, for the Paint, Varnish and Insecticides Industries, and, the manufacture of Polyterpene Resins from Beta Piene has been planned. The long-term project visualised is concerned with the conversion of Carenes into various useful and saleable products of high commercial value.

18. Another matter which has received the attention of your Directors, is, ensuring the continued availability of Formic Acid which is one of the major chemicals involved in the Camphor process. In order to minimise, and, if possible, to obviate, dependence on imports and other sources, your Directors have applied to the Government for a Licence to set up a Formic Acid Plant.

19. In order to prepare for all the development plans, to which I have referred above, suitable Research and Pilot Plant facilities are being provided to our personnel. You will be happy to know that our Technical personnel are at the plant site and our Technical Director has already commenced acquainting our personnel with the technicalities involved in the various processes.

20. To implement the above, the Company has obtained the services of Dr. Gasto Etzel who has specialised knowledge of this field. The Board is satisfied that Dr. Etzel, formerly of 'Du Pont' and who is now your Technical Director, will be able to help the Company achieve both its immediate as well as long-term objects. Dr. Etzel is a highly qualified Research Chemist with an experience of thirty four years in the field of Terpene Chemistry and its Industrial application. He has come here not only to set up the Camphor Plant but also to implement other projects for the fullest industrial utilisation of Residual Turpentine, which I have outlined above. We expect that Dr. Etzel's tenure with us will give us the added advantage of being able to provide thorough, up-to-date and on-the-spot training and guidance to our team of technical personnel connected with the Plant as well as the Research Schemes. You are aware that Dr. Etzel was one of the senior Chemists with M/s. E.I. Du Pont De Nemours & Co., better known as "Du Pont", for several years. Incidentally, it may be added that ours is the only Indian concern so far to obtain technical 'know-how' from this internationally known firm.

21. I should like to mention one or two other matters which I consider of importance. The Licence for the Camphor Plant was issued originally for the State of Assam. Owing to several factors, particularly, the problem of transportation, it was decided to investigate the possibilities of setting up the factory at a suitable place in what was formerly the State of Bombay. The project at that stage was being viewed in terms of the possibility of utilising Turpentine from Pinus Excelsa (Jammu & Kashmir, East Punjab, Himachal Pradesh and Uttar Pradesh) and Pinus Khasya (Assam) trees, which has a very high Alpha Pinene content. While the preliminary survey and laboratory tests were being conducted, it was decided to acquire land as near the city of Bombay as possible. Accordingly, a piece of land was negotiated at Udhna. By the time the land purchase was finalised, it became apparent that Turpentine from Pinus Excelsa or Pinus Khasya was not available in a quantity required for an industrial unit of our size. Expert opinion indicated that commercial-scale tapping of these trees would involve the lapse of a considerable period of time, and, in consequence, the possibility of a unit of our size being based on these sources was ruled out. The original land at Udhna is still in the possession of your Company and your Board proposes to dispose of this land at Udhna at the current price.

22. In the result, it was decided to shift the site to the State of Uttar Pradesh, where the largest number of tappable Pinus Longifolia trees grow. The largest Turpentine factory in the country is also situated in that State. The advantages of setting up our Plant near that Factory at Clutterbuckganj in Uttar Pradesh are thus obvious.

23. Apart from being assured of the supply of a large quantity of Turpentine from the State of Uttar Pradesh, steps have been taken to procure sufficient quantities from other States, and, as such, your Company does not anticipate any raw material problem in the foreseeable future. Indicative of the reasonable adequacy of raw material for your industry is the fact that the Government of India have decided not to permit the import of Alpha Pinene.

24. I have no doubt that you would like me to express our thanks to the Managing Agents for their efficiency in handling all the major problems inherent in the setting up of what is a pioneer industry in the country. I would also like to refer to and to pay tribute to the untiring and loyal services rendered by the Company's staff both in Bombay and at Clutterbuckganj.

25. With this, I now move :

"That the Directors' Report and the Audited Profit & Loss Account of the Company for the period 29th March, 1961 to 31st March, 1962 and the Audited Balance Sheet as at 31st March, 1962 submitted to this meeting be and they are hereby approved and adopted."

NOTE : This does not purport to be a record of the proceedings of the annual general meeting.

THE METTUR CHEMICAL & INDUSTRIAL CORPORATION LIMITED

Registered Office: METTUR DAM R.S.

Addressing the 25th Annual General Meeting of the Company held at the Registered Office of the Company at Mettur Dam R.S. on Saturday, the 1st September, 1962, Dr P. S. Lokanathan, Chairman, said–

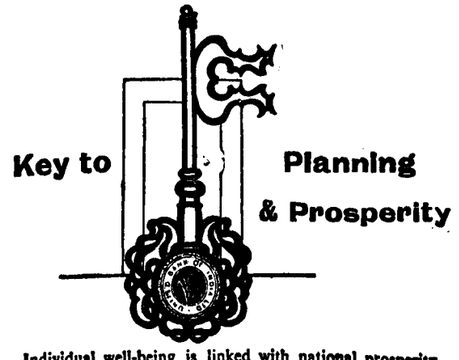
Ladies & Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Twentyfifth Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and Profit & Loss Account for the period from 1st April, 1961 to 31st March, 1962 have been in your hands for some time now and with your permission, I shall take them as read.

The Company celebrated its Silver Jubilee in the last week of December 1961 and it is a matter for gratification to us that production capacity for caustic soda has increased from the original 5 tons per day to 40 tons per day—8 times the original installed capacity. Considering the vicissitudes through which the Company has had to pass, particularly during the initial years when it was no easy task to find the comparatively smaller capital involved and in the early 1950s when an unfavourable import policy and pegging of prices at uneconomic levels rendered our operations extremely difficult, I believe we may look back on our past achievements with pardonable pride.

Sales at just over Rs. 1.5 crores were the highest recorded so far, in spite of the fact that in March 1962 only a part of the expansion plant units was commissioned. Divisible profit would have been slightly better but for the increase in the Corporation tax from 45 per cent to 50 per cent. Shareholders will recall that we had stated in the Directors' report that the Company had approached the Income-tax Officer for a certificate in respect of the balance of relief under Section 15C of the Income Tax Act so that they may pass on the same to the shareholders. The Income Tax Officer, Salem, has since determined the appropriate proportion of the dividend at about 45.95 per cent on which tax is not payable by the recipients.



I am very glad to be able to report that we have already reached production of our full installed capacity of 40 tons caustic soda per day, thus marking the completion of a significant stage in our expansion programme.

Production however was again adversely affected during June-July this year on account of electricity cuts following the low water conditions in the hydro-electric reservoirs. Fortunately, however, the cuts did not last long as the hydro-electric reservoirs are again full. Also the first 50 M.W. Neyveli thermal unit based on lignite was commissioned early in August. The second unit is likely to be commissioned by November next and the other 3 units later at intervals of 5 to 6 months. There have also been proposals to expand the capacity of the plant to 400 M.W. against the present 250 M.W. during the Third Plan period with further Soviet technical and financial aid. I earnestly hope that these and other hydro-electric schemes in Madras State will materialise as programmed and that power shortages will be a matter of the past.

Progress in the matter of the further expansion from 40 to 100 tons caustic soda per day has been satisfactory. The entire additional 60 tons caustic soda will be of the Rayon grade quality. The recent initial issue of 6 lakhs equity shares of Rs. 10 each with a premium of 50 nP. per share was oversubscribed by the existing shareholders. In view of our 40 Ton expansion having gone into commission, we expect to be able to maintain the usual dividend level for the current year also despite the increased capital. We expect to make the further issue of 6 lakhs equity shares and 3 lakhs preference shares early in 1963. I am also glad to state that the Industrial Finance Corporation of India have advised us that the loan of Rs. 140 lakhs for financing the further expansion scheme including the foreign exchange part of it has been sanctioned by them subject to certain conditions. We have received the fullest co-operation and assistance from the Industrial Finance Corporation of India in all our expansion schemes and I take this opportunity of expressing our gratefulness to them for the assistance they have agreed to extend to us for the further expansion scheme.

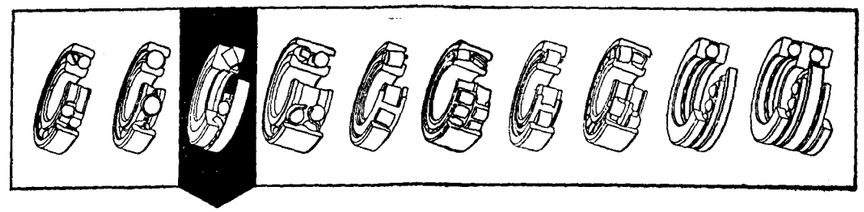
With the foreign exchange allotment already made to us by Government we have placed orders for part of the plant and machinery from Switzerland. The balance of the equipment for the expansion scheme will be ordered from the United States of America under D.L.F. loan allotments.

The chlorine from the further expansion plant will be fully utilised, partly by converting into organic chlorine chemicals, for which there is a good demand in the country and partly by sale to a neighbouring factory

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.



United Bank of India Limited

offers complete banking service

SKF *offer the widest selection of bearings*

Illustrated here is the **SKF** SPHERICAL ROLLER THRUST BEARING which has one row of obliquely disposed rollers guided by a high flange on the shaft washer and running on a sphered track on the housing washer. It combines very high carrying capacity with complete self-alignment. The surface of the roller end next to the guiding flange is so formed that the rollers are always separated from the flange by an oil film when under load. The bearing can therefore be used at relatively high speeds, even if the load is very heavy. Unlike other thrust bearings, it can also carry radial loads.

for the production of polyvinyl chloride plastics. Such diversification of production, I am confident, will lead to better operating results and more satisfactory return to our shareholders in the years to come.

During the year, fresh excise duties were imposed on liquid chlorine and hydrochloric acid at 10 per cent of the tariff value of Rs. 425 per metric ton and Rs. 180 per metric ton respectively. These Central Excise duties are charged not only in respect of sales of these products but also on internal consumption thus adding to our cost of production. An electricity surcharge, which, in the case of energy intensive industries like ours, has been fixed at 5 per cent of the cost of power, was also imposed by the State Government. A duty was also imposed on steel packing sheets used for packing of our products. A higher rate of depreciation has to be provided in respect of plant & machinery coming in contact with corrosive chemicals in chemical works like ours. These and other factors have served to considerably increase our production cost. As however exworks ceiling prices have been fixed by Government in respect of caustic soda, liquid chlorine, hydrochloric acid and bleaching powder, we have had to seek Government's permission for increased selling prices.

We do hope that Government will see the reasonableness of the industry's request and grant the increase in selling prices without delay. Incidentally, I wish to suggest that Government must establish a body which can promptly consider and decide on manufacturers' representations in regard to increased selling prices wherever Government have already fixed ceiling prices. The capacity of the industry to absorb increased costs is very limited having regard to the factors which the Tariff Commission takes into consideration in recommending the fixation of ceiling prices to Government and it will cause avoidable hardship to industry if reasonable requests for price increases are not promptly met.

We have derived some benefit from the decision of the Railways to charge only half the freight on consignments of furnace oil booked in wagon loads which is leviable in accordance with the normal Tariff Rates in force at the time of booking with effect from 1st July, 1962. This reduction has been proposed in order to facilitate the use of furnace oil by industries located at some distance from the ports, having regard to the unsatisfactory coal supply position.

I understand that having regard to the deteriorating foreign exchange situation, the Government of India, who have already cut down established importers' quotas, have under consideration a proposal to cut down the maintenance import quotas as well. Maintenance import quotas have already been fixed at a bare minimum and any reduction in maintenance import quotas will directly result in reduced production in industries like ours. The supply position in regard to chemicals like caustic soda and bleaching powder is already not very satisfactory and the need to maintain indigenous production at the maximum possible level is therefore paramount. I therefore hope that nothing will be done by Government which would cause loss of industrial production for lack of maintenance imports.

In closing I wish to convey my cordial appreciation of the valuable services rendered by the Managing Agents, the General Superintendent and all ranks of staff and workers.

NOTE: This does not purport to be a report of the proceedings of the Annual General Meeting.

THE TITAGHUR PAPER MILLS COMPANY LIMITED

Statement by the Chairman, Sir Walter Michelmore.

When, in 1960, the Tariff Commission gave its award on paper prices based on 1958 costs, those most closely concerned with the industry predicted a difficult time ahead, and this has certainly proved to be the case. In the first place the 12 per cent return on capital employed covering as it does taxation, provision for rehabilitation, managing agents' remuneration, bonuses to labour and preference dividends, does not leave a sufficient balance to provide an adequate return by way of ordinary dividends on the capital employed. In the second place the cost of virtually every raw material and service used by the paper industry has increased sharply, often as a result of Governmental action. Coal has increased in price and so has the freight on it — the Calcutta Electric Supply Corporation rates for power have been increased — every single chemical whether caustic soda, lime or sodium sulphate, to mention only a few, are more expensive than in 1958 — and the same applies to the basic raw materials, whether bamboo or waste paper. In March 1962 it was estimated that the total increase in cost since 1958 was Rs. 160 per metric ton or 16 nP. per kilo. The 1962-63 Budget and the Railway Budget added a further Rs. 20 per ton to the industry's costs — or an additional 2 nP. per kilo.

The recent increase in paper prices of 6 nP. per kilo was granted with commendable promptitude and it does not do to look a gift horse in the month. The inadequacy of the increase will however be apparent from the figures quoted above, and it is sincerely to be hoped that Government will, before long, turn a sympathetic ear to the industry's case and agree to a further price increase of a substantial nature. To illustrate the difficulties of, at any rate, certain units in the industry, in the case of your No. 2 Mill the price increase has been virtually entirely absorbed by having to transport 50 per cent of the mill's coal requirements by road — a cost factor that was not even taken into account in determining the recent price increase.

COAL:

This raw material has been a continuous headache throughout the year. In the first place coal stocks have been down to below one day's consumption on several occasions. Secondly, the mills now receive — and cannot expect anything better — Grade I coal which has to be burnt in boilers, many of which were designed for Selected A rubble. Finally, as mentioned above, 50 per cent of the coal has to be transported by road. In the case of industrial units consuming under 1,000 tons of coal per month, road transport of 50 per cent of consumption is expensive and inconvenient. In the case of your No. 1 and 2 mills which consume 16,000 tons per month, road transport is ruinous — spelt out in rupees, an additional Rs. 18 lakhs is added to the annual coal bill. Having spent considerable sums to strengthen the mill sidings to take full rakes of BOX wagons, it would seem only reasonable that concerns such as yours, should be permitted to take their full coal requirements in this manner. This procedure was in force for a limited period and it is believed suited the railways as well as your company — why it should have been terminated is difficult to understand. If however the paper industry with its high coal consumption has to take 50 per cent of its requirements by road, it would appear to have just as good a case for a subsidy or an increase in paper prices as industries in the country who are compelled to take their coal by sea.

BAMBOO:

Gregarious flowering of bamboos in Assam and Orissa has created difficulties, but by stepping up cutting in the company's own forest areas to 60,000 tons, adequate supplies have been made available at despatching points. Wagon supplies have, however, been totally inadequate — a situation not peculiar to your company — with the result that 50,000 tons of bamboo are awaiting despatch at the time of writing, and as with coal, stocks at the mills have on occasion fallen below one day's consumption.

Longer term, one of the difficulties your company is faced with, is that with new paper mills going up in the states adjoining West Bengal, they tend to be given preference over your company in respect of bamboo leases, even in respect of areas from which supplies have been drawn continuously for many years. It is evident that the paper industry as a whole will have to rely to an increasing extent on alternative raw materials such as bagasse and jute sticks, and this is receiving careful attention as far as your company is concerned.

MARKET:

The market has remained firm throughout the year and it would appear that demand will remain in excess of supply until some time in 1963. With additional mills coming into production, it is quite possible that there may be a surplus of paper in 1964 or 1965, but it is hoped that on a longer term basis, with the increase in literacy, this will be only a temporary feature.

In the reorganisation of your company's affairs, to which reference is made later in this statement, particular attention is being paid to the improvement of quality in all the various types of paper produced. Even allowing for the difficulties with which the paper industry as a whole has been faced, shareholders will naturally wish to know why your company's results compare so unfavourably with those of other units in the industry of comparable size. I will therefore deal with this matter in some detail and at the same time outline the remedial measures that either have been taken already or are in process of implementation.

BAMBOO FOREST AREAS:

It will be noted that some Rs. 23 lakhs has had to be written off bamboo stocks. Your company's policy was to value bamboo stocks in the forest areas at a figure well below cost. A few years ago this method of valuation was objected to and stocks were valued on the basis of average cost irrespective of location. A very poor cutting year resulted in an extremely high cost figure, and it was regrettably not realised until the current year that this resulted in an overvaluation of bamboo stocks lying at points distant from the despatching points to the mills. The revaluation in this year's account provides for the cost of moving forest stocks to railhead and in addition strict budgetary control has been introduced throughout the bamboo forest areas.

NO. 3 MILL — CHOUDWAR:

It was always realised that this mill would not be a fully economic unit until output reached the level of 18,000 tons per annum as provided by the original industrial licence — 12,000 tons per annum plus an expansion licence of 6,000 tons per annum. The mill was however planned in 1955 on the basis of bamboo at Rs. 71 per ton delivered, other chemicals at ruling rates, and paper at the prices that prevailed before the reduction imposed by the Tariff Commission. On this basis it was expected that, as a one machine mill, it would nearly break square and that on a two machine or 12,000 tons per annum basis, a small profit would be made. Unfortunately many factors have combined to make this projection of profit very wide off the mark.

With the increase in the cost of bamboo, chemicals and all other raw materials, and the reduction in the price of paper, it is now evident that No. 3 Mill will not break square under 30 tons of paper per day.

For part of the year only one machine was operating with a rated capacity of 15 tons per day. The second machine was installed in the course of the year, increasing the rated capacity to 35 tons per day. In practice the average daily output in the year under review did not exceed 23 tons per day. The financial result of this most unsatisfactory state of affairs has been a gross loss of Rs. 39.41 lakhs to which must be added depreciation of Rs. 11.49 lakhs.

Many factors have been responsible for the low production and the high loss, and in fact there is practically no misfortune this mill has not experienced. A go-slow movement in the crusher house and roaster section — wagon shortages leading to chlorine and lime running out so that unbleached paper had to be made on many occasions — power cuts as often as twelve times in a week, some probably due to sabotage. These are only a few of the unexpected problems that have had to be faced up to in the past year.

NO. 2 MILL:

This mill has made practically no contribution to the company's profits during the past year. The two main causes have been labour problems, particularly in the receiving section, and poor management. The former is being dealt with and the latter has been dealt with, as will be explained later.

The recovery side at this mill has been giving very poor results, and as always this is a most expensive weakness in any paper mill. While improved results are expected, a modern recovery boiler is essential at this mill — partly because the existing obsolete recovery plant will never give a recovery percentage above 55 per cent, however efficiently operated, and partly because it is vital to provide additional steam from this source, thus enabling a reduction in the very high ratio of coal per ton of paper. Mention has been made earlier of the high cost of moving coal by road, and No. 2 Mill suffers badly from the other factor of having to burn low grade coal in boilers designed for the best coal India can produce.

NO. 1 MILL:

This mill has worked with reasonable efficiency during the year and has contributed all the company's profits.

REORGANISATION:

The Directors of your company, and the Managing Agents, have been acutely conscious of the decline in management efficiency in the recent past. This can often occur, and not only in India, after a long period of prosperity when the going has been too easy. A severe shock is often the best cure and this has certainly been administered by the current year's results, assisted by the Tariff Commission. I would therefore now like to touch on what remedial action has and is being taken and the results that have been achieved so far.

As already intimated to you in a previous statement, Messrs. Urwick, Orr & Partners Limited were commissioned to do both a survey of the company's mills and bamboo forest organisation and to undertake the preliminary implementation of their reports. I should like to take this occasion of congratulating them on the excellent job they have done. It is therefore most unfortunate that, when there are not yet available in this country management consultants of this calibre, Government should have refused sanction to remit them their dues, with the result that the company has not yet been able to pay them for the greater part of their work — which for this reason had to be brought to a premature end.

Quite considerable savings in costs have already been achieved as a result of their reports and there are more to come now that Work Study Engineers have been engaged at all three mills.

Apart from cost savings, the whole senior management structure has been recast and there are new faces in virtually every senior post. A Superintendent of Mills has been appointed, there are three new Mill Managers, a new Superintendent of Engineering Services, and a new Cost Accountant. In my opinion the company now has a most excellent team of senior executives. Almost equally radical changes have been and are being made in the lower staff levels.

Many other changes are also being made, such as a complete overhaul of the Labour Relation organisation, the introduction of a modern Training Scheme, a new Cost Accounts system — to mention only a few.

While it will be appreciated that a major reorganisation of this nature cannot achieve a complete cure overnight, shareholders will no doubt be interested to know what results have been achieved so far.

NO. 1 MILL:

This mill is now earning satisfactory profits. The output in July at 2,330 tons was the highest in its history and in August 98 tons was manufactured in one day which again is the highest figure ever achieved. In my view, even further improvements can be expected in certain directions such as the recovery percentage, quality control — and even output.

NO. 2 MILL:

This mill reverted to a profit making basis — albeit small — in June. A progressive improvement is now expected and it is hoped that by the end of 1962 satisfactory profits will be being earned. A reduction in the percentage of broke and an increase in the recovery percentage are the two main technical problems but getting a full day's work out of a percentage of the labour force is equally important.

NO. 3 MILL:

This mill is still making a substantial loss, although on a lower scale than last year. However, in August over 30 tons was reached as daily output on several occasions and given co-operation by the labour — there have been several recent instances of sabotage — it is hoped to get on to a break square or small profit basis towards the end of 1962. As at the other two mills, the new management deserves congratulations at the extremely good job being done, often under difficulties — as recently as July, six wagons of lime were lost on

the railways, forcing the mill to make wrappers only for 7 days.

From the above brief survey it will be seen that substantial progress has been made in recent months. It is therefore expected that the 1962-63 result will show a substantial improvement, but it may be 1963-64 before the company can claim that its results bear favourable comparison with those of other companies of equivalent size.

CAPITAL REORGANISATION:

The company's paid up capital is unduly small in relation to the scale of its operation and the value of its assets. On the other hand its borrowings from the I.C.I.C.I. and the bank are on the high side in relation to its paid up capital. To rectify this situation and to provide funds for the modernisation and expansion programme that is completely essential, application has been made to the Controller of Capital Issues for a bonus and rights issue. It is hoped that sanction will be obtained in the near future, although details of the capital expenditure proposed will still have to be cleared with the Development Wing of the Commerce and Industry Ministry.

MODERNISATION AND EXPANSION:

The Adamson Engineering Corporation were appointed Technical Consultants to the Company in June 1962. Mr. George Adamson and Mr. Mac Coston have paid two visits to India in the course of their survey of the three mills and their report has been received and is being studied. Mr. Adamson has been responsible for erecting and commissioning the new bamboo pulp and paper mill at Bataan in the Philippines and thus is the rare combination of a technical expert with knowledge of the latest techniques in the world's paper industries plus a special knowledge of the problem involved in bamboo based paper manufacture.

Until the Consultants' report has been carefully studied it is impossible to say with exactitude how the funds to be raised by the rights issue will be spent. There are, however, certain general observations that can usefully be made. While it is expected to increase output at No. 1 and 2 Mills by increased efficiency, the expansion licence for 6,000 tons is specifically for No. 3 Mill and the greater part of the capital expenditure will therefore be concentrated on that mill. Apart from this consideration it is quite essential to make No. 3 Mill a contributor to the company's profits instead of a liability as hitherto, and this postulates increasing the output to 18,000 tons per annum which is today the minimum economic size, bearing in mind the competition to be faced from large and modern mills shortly coming into production.

In retrospect it is evident that No. 3 Mill was planned on too small a scale, and with the desire to save foreign exchange and the company's funds undue reliance was placed on reconditioned plant — undoubtedly a false economy. Both these errors of judgment must be rectified.

Apart from No. 3 Mill a modern recovery unit at No. 2 Mill is essential — there are in fact many other directions in which capital expenditure can improve efficiency and cut costs — one example in installing chippers for bamboo at despatching point to save freight and wagon capacity — but the governing factor will be the availability of funds until the company resumes making profits on a scale that permits a generous plough back.

LABOUR

Since the close of the year agreement has been reached with the representatives of labour on a long outstanding dispute. An increase in dearness allowance has been grantad and an improvement in the clerical grade scales. On the other hand a retiring age has been accepted coupled with a gratuity scheme. It is also hoped that by the time shareholders read this speech, gate control will have been introduced at Nos. 1 and 2 Mills. Urwick Orr's investigations have shown up what a large surplus of labour exists at all mills, but with give and take on both sides it should be possible over a period to resolve this problem with the minimum of hardship, if any.

In conclusion, I would say that I well appreciate the concern shareholders will feel at the extremely poor results shown in the accounts now in their hands. Nevertheless, I feel confident that this year is a turning point — that the mistakes of the past are being corrected, and that the increased efficiency now evident at the three mills plus the modernisation programme being planned, and I hope sympathetic treatment by Government of the problems of increased costs, will restore your company to the high standing it has so long enjoyed.

N.B.: The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on the 27th September, 1962.

SEPTEMBER 21, 1962

After the Conference

THE Captains, in the form of the Prime Ministers of the Commonwealth, have now departed. Their parting gift to the world is a voluminous communique of 2,500 words, which is claimed to be a "factual" account of Britain's negotiations as well as a selected summary of the minutes of dissent. It is doubtful if this somewhat confusing document is reward enough for the labours which have shaken the Commonwealth over the last seven days. Indian opinion in Delhi, which is happy because the communique places on record the apprehensions expressed by the Prime Minister about the terms already negotiated for Indian exports, and also the proposal that our treaty with the enlarged Common Market should be negotiated at once, is, to say the least, easily pleased. As far as one can determine at this distance, Britain's decision to go it alone still stands. Only British diplomacy has sugar-coated its pill sufficiently to deceive superficial observers.

The truth is that the Commonwealth Prime Ministers in this matter were not, in fact, acting as an instrument of history; they were observers. They were observers, firstly, because the major decision on the Treaty of Rome is completely outside their hands. Secondly, because history has decreed, as has already been explained in *The Eastern Economist*, that the Commonwealth should be a declining factor in world trade and, therefore, increasingly become incapable of sustaining itself by a process of mutual exchange, preferential or otherwise. In retrospect, the expectations from this conference were clearly excessive. The results must be considered, from the Prime Ministers' own point of view, severely disappointing.

So far as India is concerned, interest has moved to the Prime Minister's trip to Paris, following President Ayub Khan's apparently infructuous visit, to see President de Gaulle. There is something curiously anomalous in the President of Pakistan and the Prime Minister of India first openly criticising the Six as reverters to a new form of colonialism by the denying of markets to the developing countries, and then proceeding more or less in the guise of statesmen with a purpose to argue a much more friendly case before General de Gaulle. If the President of Pakistan and the Prime Minister of India were really anxious to set up a base of friendship with the Six, their utterances revealed to the Press in London were certainly not the best diplomatic preparation for this purpose. In the result, we have only hardened opinion significantly in Paris and, indeed, somewhat in Bonn. It is probably a mistake to assume that the Paris-Bonn axis is decisive so far as the Treaty of Rome is concerned. But if, as the leaders of India and Pakistan seem to consider, this is a political move of France and Germany above the other countries, surely they might have been a little more moderate in the expression of opinion when they intended to make submissions in areas in which goodwill was necessary even above argument.

The Eastern Economist believes that the Indian delegation has erred in its assumption that outspoken criticism in London will help our case in the European Continent. It is possible it will make the British Government more ready and anxious to negotiate on some points; it is not likely, as Professor Hallstein has made clear, that it will change the opinion of the Six. Can it be that the Ministry of External Affairs has misjudged the environment as well as the timing of the present *demarche* against the European Common Market?

This is not the only event which has caused comment in New Delhi. What is even more disturbing is that the Ministry of External Affairs has made a huge error at the same time at the United Nations. It seems incredible in retrospect that India should have been so misguided as to back Prof. Malalasekara of Ceylon for the candidacy of the U.N. General Assembly's Presidentship, against Mr. Zafarullah Khan. Seeing that Mr. Zafarullah has won by 72 to 27 votes and only the Communist Bloc has solidly voted for Prof. Malalasekara, one wonders how the Ministry of External Affairs committed this country to so ignominious a defeat. It is now openly said at the United Nations that the defeat was as much for India as for Ceylon. There is no justification whatever for our having allowed ourselves to be placed in this ignominious position. The indications are fairly clear that we are inadequately briefed on the structure of opinion inside the Afro-Asian group and are, therefore, unable to estimate the consequences of going out on a limb with the non-neutral areas. It would seem that both for London and New York, Indian information on the structure of opinion which would prevail is, to say the least, incomplete.

Only a postscript needs to be added to this statement of events after what might well be, at least in terms of the Commonwealth, a historic conference. Its importance arises not because it can change the substance of the European Com-

mon Market's conditions of entry, but because it exhibited, under the tremendous pressure for survival, the remarkable capacity that the British people have of facing severe criticism and maintaining a position of reason with dignity and good sense. This is something when the ability to shape history departs from a Great Power. Nobody really believes that either Britain or the British Commonwealth can today be decisive in the most momentous decisions of the world. This does not imply that the Commonwealth has not a major contribution to make. There was enough in this Conference to suggest that the moderation and good sense shown by Britain in dealing with somewhat hasty and ill-considered criticism from the Commonwealth will be used to good advantage after Britain has entered the European Community to temper the somewhat rigid apparatus of dogma which surrounds the Treaty of Rome. It may well be that the leavening of the lump will be the greatest contribution that Britain can now make to the history of the world.

Postscript to Steel Prices

A POSTSCRIPT is required to the controversial issue of steel retention prices because of the explanation given by the Minister of Steel, Mr. C. Subramaniam, as late as Wednesday the 19th September. There is no doubt that some of the criticism would have been averted had this clarification been available at the time of his statement in the Lok Sabha. The essential point that the cost structure suggested by the Tariff Commission has been accepted in full would have itself allayed much of the resentment felt in the business circles at the suggestion which was contained in the Minister's own remarks that the Tariff Commission was out-of-date. It now transpires that the Tariff Commission was out-of-date in only two respects that it assumed 90 per cent working as an optimum for the assessment of the cost of production and, secondly, that it made full provision for working capital not all of which was, in fact, being raised by the steel companies, and, furthermore, they actually used large amounts payable to the Equalsation Fund due to the element of time-lag. Also the sums due by the companies to the Government towards interest and repayment of the special advances are, in fact, available as working capital since the date of repayment has not matured. In the light of these explanations the general public might tend to be more tolerant, even though distress signals have been hoisted by the stock exchanges all over the country.

The issue that is involved in the steel retention prices is two-fold. One is an issue of public policy in which India is certainly not unique. The fixing by the Government of the price of steel in the United States by a Presidential directive is certainly a precedent which cannot fail to have been noticed in other countries. Its meaning was that the price of steel, entering, indeed, in a wide variety of industries, essential for a nation's life, might be regulated not with reference to the general principles of free enterprise or fairness of return, but by strategic elements not all of which can be fully explained. In that sense there is a political component in steel prices which takes them outside the routine processes, like that of the stock exchange. The stock exchanges in India, no less than in the United States, have responded fully to the bearishness of this factor in the economy, but in the circumstances, such as they prevail at the present time, one wonders whether the bearishness of the stock exchanges is itself a decisive factor for the making of public policy. It would not be in the highest interests of the country as a whole that a somewhat mercurial behaviour of the stock exchanges should, in fact, be a good touchstone of public policy.

On the other hand, the psychological elements which invest the situation with uncertainty cannot be conducive to the fulfilment of India's Plans particularly in the private sector. It is undoubtedly true that the disturbance which has now been communicated to the private sector climate for expansion has been grave. This is largely because it is believed that the Government of India is likely to be arbitrary not only in respect of steel but in respect of a large range of products, where heavy investment is taking place, based on the belief that free selling prices will prevail. This was a reasonable calculation of many of the entrepreneurs who had sought licences and it would be a misfortune if the impression were created that the policy followed in respect of steel is capable of application everywhere. It would be necessary for the Government of India to make clear that this is not the case, if it is desired that the incentives for expansion under the Third Five-Year Plan should not be eroded so considerably as to lead to a shortfall in the private sector expansion. There is no current indication too that the public sector can fill the gap.

The essence of this postscript, therefore, is two-fold. It is, firstly, to argue that the case of steel does, in some respects, permit of exceptional treatment, even if this is somewhat adverse to the interests of the shareholders and in the long-run denies capital to the steel-making industries from private sources. This only means that the public sector will have to accept its full obligations for setting up of steel plants in future with the consequent difficulties posed by the challenge of good management. The second and more important postscript is that the Government of India should clear the air and make it patent that the private sector's right to earn fair profits on its investments is not jeopardized by its ruling in the steel case. There are grounds for believing that this clarification is overdue and optimism will not be restored until the Government sees its way to removing psychological disincentives which have loomed large over the last several days.

U.P.: Crisis Over the Land Tax

THE crisis in UP over the Agricultural Land Holdings Tax Bill, which is rapidly heading towards the peak, is unique in its character as well as magnitude. While this is purely an issue of taxation, it has been distorted by unscrupulous manoeuvring by the Opposition parties as well as by the anti-Chief Minister faction inside the Congress Legislature Party into a major political controversy. Altogether, a grave situation has been created in the State which threatens to undermine the strength and cohesion of the State Ministry. The tension over the Bill is being queered to a new pitch and it now transpires that it is not the State alone which will be affected by the ramifications of this controversy. In denouncing the incidence of the tax on the land-holder, a new twist has been given to the agitation. This strategy aims at assailing the very principle of enhancing the land revenue and tax. As a corollary, it also assails the principle of a rational allocation of responsibility, as between the Centre and the State Government, for providing financial resources for the State plan with the apparent object of shifting a substantial part of the burden of the State to the Centre.

In principle the Bill is quite unexceptionable and for this fundamental reason the State's Chief Minister, Mr. C. B. Gupta, deserves the support and backing of the Central Government as well as the Planning Commission since they have now come in the picture. He has taken courage in both hands and at the risk of unpopularity come forward with a bold measure to tax the land property, which is a vital source of direct taxation for the State Governments. It is also one of the major sources of tax-revenue in predominantly agricultural States of which UP is a typical illustration. But if the Bill is based on a rational principle, it suffers from drawbacks which must be regarded as serious. The limit of exemption from the tax has been adjudged to be low by the consensus of opinion. A uniform limit is hardly sustainable in a large-sized State like UP, where the disparities of land fertility and capacity to bear the tax are as gross as they actually are between the prosperous western districts and the indigent eastern districts. A broad-based scientific definition of an economic holding, taking cognizance of regional variations, ought to have been framed and prescribed by the Cabinet as the basis for determining the limit of exemption. The grievous omission to take this preliminary precaution has made the demand for raising the limit of exemption irresistible. There are other clauses in the Bill which relate to the assessment of the value of the holdings on which the capital tax is based. Still other complicated features of the Bill include the filing of very intricate returns by a class of illiterate tax-payers. The high cost of collection is easily another impediment, arising from the complex procedure of the assessment, which reduces the net revenue by a substantial margin.

By an ironical coincidence, which it was not difficult to foresee, an extraneous circumstance has strengthened the opposition to the Bill and placed the Chief Minister in an unenviable predicament. The Bill was introduced in the State Legislative Assembly immediately in the wake of devastating floods, which have wrought abnormal destruction, particularly in the eastern districts. Why this impolitic course was adopted by the Chief Minister is beyond comprehension. In this situation Opposition slogans against the Government's attitude in seeking to tax the flood-stricken peasant, when relief should have been provided first, have found a ready emotional appeal. The Opposition may be pardoned if it is exploiting this blunder. But a substantial section of the Congress Legislature Party, which is also conducting an open campaign against the Bill, ought to have preserved a reasonable balance before jumping in the fray, by flouting Party discipline, to condemn the Bill outright on this particular count. Statutory relief can surely be provided by way of suspension or remission of the tax on the score of natural calamities. But the ill-fated timing has made the task too difficult for the Chief Minister to remove the misunderstandings and prejudices of the people.

There cannot be the least doubt that the Bill ought to be watered down sufficiently to take away the sting of the high incidence of the tax. The extraordinary course of bringing in the intervention of the Planning Commission at the belated legislative stage has been adopted in the case of the UP Bill. But the available reports of the recent talks between the Planning Commission and the Ministers unhappily disclose that this intervention has borne little fruit. What is to be regretted most is that there are sharp differences still existing between the Chief Minister and two high-powered Ministers, one of whom, strangely enough, is the Finance Minister himself. If, as Mr. C. B. Gupta has been protesting aloud, there are no serious differences inside the Cabinet over the Bill, the best way for him to silence his critics is to evolve a compromise formula for the modification of the Bill before the intra-party situation deteriorates and the rift inside the Cabinet as well as the Legislature Party goes deeper.

The dissenting Ministers, according to reports, have been making repeated statements (in private, of course,) that they have a substitute in mind. If so, they ought to offer it to the Chief Minister without any delay in this critical situation, consistently with their joint Cabinet responsibility. But rumours are afloat that the substitute means substitute taxes different from the land tax incorporated in the Bill. Actually, not only the Opposition parties, but the rebel elements inside the Congress Legislature Party are campaigning vigorously for the declaration of a policy of no enhanced taxation of the peasant. This is a dangerous move. The argument need not be elaborated that land revenue or land tax ought to share the increasing burden of tax-revenue, like other sources of taxation, for developmental outlay from which the peasant derives positive benefits.

There is still another angle to this agitation. Along with the propaganda against any enhancement in land taxation is being carried a propaganda for lightening the burden of developmental taxation on the State Government. This latter propaganda is now openly and feverishly being carried out and the claim is being pressed hard that the deficiency in the States' share of tax-revenue should be made good by Central aid. This principle, fraught with potential consequences, ought to be discouraged at this initial stage. Rajasthan has adopted the wise course of voluntarily offering a cut in its Plan on account of its inability to raise its agreed share of tax in the Third Plan. If UP finds itself unable to meet its accepted commitment of Rs. 110 crores, the best it could do is to ask for more Central aid along with a fair pruning of its Plan. If the principle of Central aid equitably correlated to self-help is diluted by a policy of drift, it will impose a serious strain on the Centre and indirectly promote laxity on the part of the State Governments in shirking their basic responsibility.

(This is an Announcement and not a Prospectus)

INDUSTRIAL FINANCE CORPORATION OF INDIA

Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948)

ISSUE OF 4½% BONDS, 1974

(Guaranteed by the Central Government under Section 21(2) of the IFC Act, 1948)

REPAYABLE AT PAR ON THE 28TH SEPTEMBER, 1974.

Amount of Issue: Rs. 6,00,00,000|-

Issue price: Rs. 99.50 for every Rs. 100|-

1. The bonds are being issued for augmenting the resources of the Corporation to meet the demands of industries for financial assistance.

2. The bonds are approved securities under the Indian Trusts Act, the Insurance Act and the Banking Companies Act and are also eligible for grant of advances to scheduled banks by the Reserve Bank of India. They are on the approved list of securities of the State Bank of India.

3. Applications will be received at the branches of the Reserve Bank of India at Bombay, Calcutta, Madras, New Delhi, Nagpur and Bangalore **from the 28th September, 1962 to the 5th October, 1962**, both days inclusive, unless the subscription list is closed earlier. Copies of the prospectus and application forms can be had from the above offices of the Reserve Bank of India as also from the Head Office of the Corporation at Reserve Bank Building, 6-Parliament Street, New Delhi and branches at Liberty Building, 8-Marine Lines, Bombay-1, P-11, Mission Row Extension, Calcutta-1, and 38, Whites Road, Royapettah, Madras-14.

4. Interest will be paid half yearly by the Head Office and the above branches of the Corporation.

5. The Corporation reserves the right to retain subscriptions received up to 10% in excess of the sum of Rs. 6 crores.

6. Arrangements will be made for listing of these Bonds at the Calcutta, Bombay and Madras Stock Exchanges.

7. Brokerage will be paid at the rate of 6 nP. per Rs. 100/- to recognized banks and brokers on allotments made in respect of applications for the Bonds bearing their stamp.

NEW DELHI,
Dated: 14th September, 1962.
DA-1036 (5)/62.

K. P. MATHRANI.
Chairman.

THE WEEK'S NOTES

The U.N.

TWO PROBLEMS

THE SEVENTEENTH SESSION of the General Assembly which started early this week will be significant since the Assembly will be called upon to face and tackle at least two issues of major importance. The first is the appointment of a permanent Secretary-General. U Thant, the Acting Secretary-General, has, by the general consensus of opinion in both the power blocs, conducted himself not only with competence and impartiality but with a remarkable degree of statesmanship, making himself acceptable to all the nation-members. There are several concrete successes to his credit during this brief tenure and among them may be mentioned two. The agreement on West Irian owes much to his persevering and tactful good offices. At long last this thorny problem has been resolved after fifteen years. In the Congo he has been successful in preventing a bad situation from getting worse and internecine strife causing ruin in that country. It was he who tried to induce with initial success the Central Government at Leopoldville and Katanga to examine the scheme of a federal union. It is another matter if Mr. Tshombe, with his characteristic evasive strategy, is attempting to indulge in a more wearisome war of attrition with a view to smothering the idea of the federation and having his way with his cherished goal of secession. But the Acting Secretary-General has undoubtedly acted with impartiality and determination to promote the cause of peace in that tormented area. While there is everything to be said for the election of U Thant as Secretary-General, one cannot be too sure that it would follow automatically in due course. Russia may again raise her "troika" proposal. U Thant's latest visit to Moscow has not been able to shed light on how Mr. Khrushchev's mind works. But U Thant has made one thing clear and it is that he will not accept any further offer of an officiating position.

The finances of the UN are in a chaotic condition and this result has been precipitated by the heavy expenditure it had to incur in the Congo. Only a shrewd device conceived by U Thant prevented the prospect of near-bankruptcy. The bonds floated by the UN are somehow helping the Organisation to live a hand-to-mouth existence. If the military position in the Congo were to be reversed in the future, nothing short of defeat may have to be admitted by the UN in continuing its presence and handling the situation. The only solution to the problem is to recover the contributions of the members to the extraordinary expenditure in the Congo as also the arrears of the normal contributions into which several small countries have fallen and to raise the quantum on a normal footing. The former problem poses the real and substantial difficulty. Russia has refused to recognise her obligation to pay towards the Congo expenditure on the ground that she does not approve the policy applied by the UN. It is significant that Britain also has her important reservation about the Congo policy, but she is willing to bear the expenditure which is the result of the majority decision. If Russia's reasoning were to be accepted, it would create serious difficulties in the future. Once the principle is accepted that a dissenting country is free from the obligation to abide by the responsibilities involved in a resolution or policy adopted by the UN, only unanimous decisions will qualify for financial and other support from the members. This will make the democratic process difficult to function particularly because unanimity in the UN will be scarcely obtainable.

Kashmir

GRATUITOUS CONTROVERSIES

IT IS astonishing that political organisations as well as high-placed responsible Ministers should gratuitously raise issues of controversy in relation to Kashmir and give a handle to interested quarters in the State as well as abroad to sow the seeds of confusion—the former by habit as it were, and the latter through sheer inadvertance or lack of appreciation of the course advocated. The Praja Parishad has raised its voice against the continuance of the special constitutional status conferred on the Jammu and Kashmir State by Article 370 of the Constitution and demanded its abrogation forthwith. Article 370 makes the provisions of Article 238 of the Constitution, which deals with the powers etc. of the former Part B States, inapplicable to Jammu and Kashmir and it also contains provisions which places certain limitations on the applicability of the laws passed by Parliament to that State. This Article is by no means irrevocable, but by Clause (3) the President may declare it to be inoperative, or operative with certain modifications, only with the concurrence of the State Legislature. The major point involved in the demand of the Praja Parishad is whether the time is ripe for abrogation. Mr. Lal Bahadur Shastri, making a statement in the Lok Sabha on September 6, explained why the continuance of the special status was essential and expedient. Among the major causes he assigned were two — that a part of Kashmir is still occupied by Pakistan and the Chinese intrusion in Ladakh has created a continuing situation of emergency in which it would be unwise to make the constitutional change. This statement of the Home Minister has set the matter at rest for the time being and it was fully endorsed by the Jammu provincial branch of the National Conference at its last week's session. The termination of the status must come at the appropriate time by consultation and agreement between the Central and the State Governments.

Mr. Pratap Singh Kairon, Chief Minister of Punjab, was hardly aware how his proposal for the merger of Punjab, Rajasthan, Himachal Pradesh and Jammu and Kashmir into one state would be misinterpreted and abused for vicious propaganda, particularly by Pakistan. The sole idea which seems to have primarily predominated Mr. Kairon's proposal was to remove the canker of communalism from the politics of his State by a broad-based and more comprehensive reorganisation of the regions into one unit. But precisely by the same line of thinking, it was taken to be a clandestine attempt at nullifying the fact of a Muslim majority in the life and politics of Kashmir and propaganda was rivetted on this particular emotional point. Mr. Kairon's proposal, however, has gone unheeded. But its lesson should not be lost.

Cuba

PRESSURES VERSUS RESTRAINT

NO DOUBT need be entertained about the fact that a the present time the gravity of the situation in Cub is being magnified out of its due proportion in th United States. Pressures are being exerted on Presiden Kennedy to take snap action before the danger fron Cuba assumes big proportions. This is nothing but plain advocacy of another invasion. The America healthy tradition of a bi-partisan foreign policy is bein overlooked, albeit for a temporary period, in view c the gains to be scored in the forthcoming mid-terr elections. Reports are being strongly circulated abou

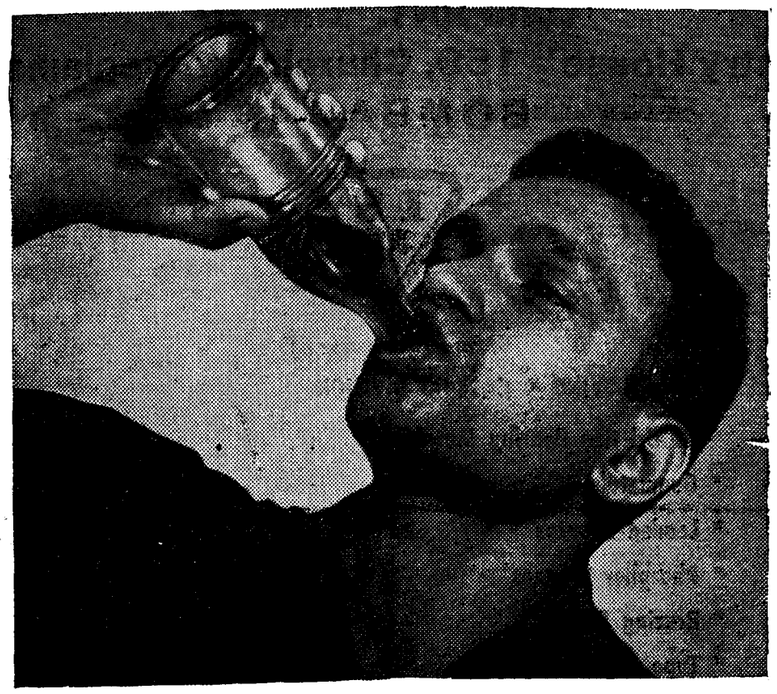
the setting up of some four or five Russian military bases in Cuba which may involve the danger of a surprise action at any moment. There is no possibility of enlisting any sympathy or support from the other Latin American countries in an overt military invasion of Cuba and the viewpoint is argued by a minority section that America should proceed headlong. All these pressure tactics apparently fail to assess the deeper consequences of the action that is being advocated. Mr. Eisenhower has rightly intervened at the correct moment and asserted after his interview with the President that Cuba must not be made an election issue. This is expected to have a salutary effect on the pressure wave.

Between the unsuccessful invasion of the Bay of Pigs and now the political and military scene has undergone a substantial change in Cuba. Even so, things happen sporadically without official responsibility or knowledge of the Department of State. The shelling of the Havana water front certainly took the Administration by surprise. It is not fully understandable why President Kennedy asked for the authorisation of the House for calling up of 150,000 reservists at his discretion. This, coupled with the unauthorised misadventure of Havana, has given a handle to Russia and Mr. Khrushchev has come forward with a warning that Cuba would be protected in case of aggression from anywhere. He made it plain that there was no need for Russia to construct any military bases in Cuba for the simple reason that protection could be provided promptly to Dr. Castro's regime from the Russian territory itself. This is but a veiled threat that nuclear missiles would be launched from Russia in defence of Cuba, if necessary. President Kennedy did well to come out with a prompt statement that the Monroe Doctrine would be observed and that there was no question of American aggression in Cuba. The fact, however, remains that large-scale military help in the form of equipment and technicians is being poured from Russia into Cuba. In retrospect, it would appear that the misconceived adventure in the Bay of Pigs and the trade boycott of Cuba have pushed this tiny country into Russian arms more vigorously than Dr. Castro himself would have thought it advisable to do. There is no danger to American security from Cuba and, furthermore, there is the important consideration that any overt move against it may provoke a retaliatory move by Russia in Berlin. Restraint under this provocative situation is of the utmost importance and the President has shown determination to stick to this farsighted policy.

Management Pool

STAGNATION AND FAILURE

WHY IS it that the Industrial Management Pool, so ably conceived and planned, has failed to make any impact whatsoever on the quality of the management of the public sector undertakings, it is stagnating at its strength of 200 without any expansion during its life of five years and a feeling of frustration has seized the managers and technical experts who constitute this sorely-needed cadre? By and large, the stagnation and failure in this crucial sphere can be blamed squarely on bureaucratic rigidity and lack of imagination on the part of those who had excellent opportunities offered to them to put it to the best use. Dr. Paranjpe of the Indian School of Public Administration, New Delhi, has thrown revealing light on the failure of the pool in his evaluation, but only some scanty facts and findings recorded in his report are available in the published reports at the moment. They underscore the lesson how a valuable plan can be rendered unfructuous by bad implementation. This is one glaring instance which demonstrates the lack of tact and skill on the part of the public sector to carry out managerial policies, even where they are very seriously lacking.



The insistence on following all the rituals prescribed by red tape are responsible for the loss of talents with long experience to the pool. By the time actual recruitment was made, many of the aspirants to senior grades declined the offers as they were comfortably established in good positions elsewhere. But the time and dilatory procedure of recruitment took its winding course and several of the posts of responsibility in the public undertakings for which they were intended were already filled. Presumably, a good part of them was appropriated by the officials in various Government Departments and it is likely that urgency to fill the posts was pressed as a ground to provide placements in many cases. Worse than that, it is only ironical that many of the members of the pool, selected after careful scrutiny of their qualifications and experience, were found to be misfits for no fault of their own. They were appointed to positions for which they claimed no expertise, while posts where their qualifications would be suited were offered to others, swelling the number of misfits. Complaints are heard of this callous policy of appointments and the consequent waste, of managerial and technical talents. To abolish the pool may perhaps amount to too radical a course. But if it is to be forced, there should be a determined bid for another serious experiment to make it a success. The ever-growing appetite of the public sector for technical experts surely requires the pool. But if a pool cannot be managed by the Government on sound principles, the last resort will be to allow each undertaking to make direct recruitments of men with practical experience and not of officials approaching retirement or by granting superannuation.

Maharashtra

PROHIBITION MINUS PURISM

IT IS heartening to learn that Maharashtra, which, as part of the former Bombay State, was in the vanguard of total prohibition, along with Madras, is having second and sober thoughts on the policy for prohibition. Reports, whose authenticity can hardly be questioned, indicate that a modification of the present rigid policy of prohibition in the State is in the offing. The State's Prohibition Minister, Mr. Salebhoy Abdul Kader, specially studied the problems of prohibition in Madras and Andhra in an effort to understand what precisely is needed to rationalise prohibition, but not to scrap it. The rationalisation of the present inflexible policy of prohibition in the State is to proceed on two major, among other, principles. Liquor permits will be issued on a liberal basis to remove the existing difficulties of those who genuinely need them and certain types of liquors or medicinal preparations with a nominal alcoholic content will be exempted from the law of prohibition. It will be news to many in several parts of India that in this State a licence or special permit is required to buy a bottle of methylated spirit. Examples of a long range of medicinal preparations can be added to it.

Prohibition has given a boost to a highly remunerative illicit traffic in liquor in this State as well as in Gujarat. Illicit distillation of liquor and its sale are conducted with impunity on such an extensive and State-wide scale that in several areas criminals have taken to this lucrative trade to avoid the risk of jail-going. The traffic has taken a deep root and how far it will be eradicated by the proposed rationalisation is a matter only for experience. It is also problematic how far corruption in the excise staff will be eliminated. To achieve success in these two spheres, enforcement of the liberalised and rational policy of prohibition will need to be very strict. This should not necessarily prove an insurmountable task since the availability of liquor in the open market will be liberalised.

You can't postpone thirst!

DURING THE HOT DRY MONTHS, Metal Box manufactures crown corks for bottled 'cold drinks' at a rate almost three times the annual average. Similarly, fruits, vegetables and fish have a short canning season dependent on the harvest. Cans and closures, therefore, have to be manufactured and delivered quickly at short notice, to satisfy seasonal expansion in demand, to catch crops before they spoil and to meet strict export shipping deadlines.

This is why manufacturing capacity in the packaging industry must be flexible enough to react almost instantly to calls for increased production. It is also the reason why packaging is a technically complex, mass production industry requiring large investments in men, machinery and raw materials.

Metal Box, pioneer and leader of the packaging industry, can match seasonal fluctuations in demand because it relies on a high degree of mechanisation, sound technology and resourceful engineering.

The World Abroad

RURAL PUBLIC WORKS

By ODYSSEUS

ARGUING IN FAVOUR OF utilising India's vast labour potential to build rural roads, new wells, and improvements to irrigation works, in order to tap resources which do not involve strains on foreign exchange for the import of capital equipment, Mr. W. B. Reddaway, in his recent address to the British Association, added some words of caution. He said that one of the difficulties in launching such schemes on any big scale lay in their organisation, the inadequate numbers of skilled administrators, and also the problem of allocating the costs and benefits from these schemes among the people involved. Once these are overcome and the construction work is started, a further problem is an additional demand for consumer goods, mainly for food. The extra demand is liable to fall on the balance of payments, whether through increased imports, or diversion from exports, or, if this is prevented by import controls, it pushes prices up. There are, of course, some beneficial effects from the increase in demand, where this falls on an industry in which output can be readily expanded, notably the service and distributive industries, and possibly textiles. In the main, however, the counterpart in the national income account to the extra investment is not additional saving in India, but an increase in the balance of payments deficit.

Mr. Reddaway emphasises that this does not mean that rural public works could not be usefully increased. If increased expenditure of this kind is matched by increased taxation, then the primary addition to the national income is secured, and the stock of useful assets is increased, with a counterpart in the national account of saving through taxation. Mr. Reddaway urges administrative efforts to overcome the organisational problems involved in simple construction schemes and the difficulties in collecting the revenues needed to cover the expenditure. Additional foreign aid of gifts of food grains would also help this rural development. All that he is saying is that you cannot adopt the superficially attractive Keynesian method of printing money to do the investment, and relying on the multiplier to generate the necessary savings. Incidentally, more and more people are coming to wonder if Keynes's diagnosis was correct even for the UK at the time of its publication. In arguing that the depression was caused by over saving and under consumption, Keynes forgot that several leading UK industries, such as coal, textiles, and railways, were powerful centres of depression because they were obsolescent. Public works and credit expansion could do little to revive these industries and to the extent that they might have been revived, they would not have promoted health in the UK economy, which needed to boost expanding industries, not bolster declining ones.

INFLATION DANGERS

Mr. Reddaway makes a novel point about the difference between inflation in a Western economy and the type of inflation which could be expected in a developing country if it insisted on large capital expenditures with created money, and were to use import controls to prevent large deficits in the balance of payments. In a Western economy, one of the factors which slows the pace of inflation is the tendency of profits to rise disproportionately, and for a substantial proportion of these additional profits to be saved or paid in taxes. Additional profits do not immediately raise demand for consumer goods, because typically they accrue to a company, and no additional dividends will be paid for some months to come. Even on a longer view, a substantial part of the additional profits will be retained by the company, or paid to the government, and even the part paid in dividends will accrue to shareholders, who are usually people with a low propensity to consume.

In a developing country, however, if rising prices lead to higher profits they do not typically accrue to a company at all, but to working farmers, traders, and managers of small-scale business. There is no time lag between receipt of profits and payment of dividends, and little tendency to retain profits in the business. Moreover, most Indian entrepreneurs who receive the profits are not rich but are struggling people with low incomes and a real need to spend more on consumption. In such circumstances, the built-in brakes on the pace of inflation which exist in the West are replaced by built-in accelerators, because the new distribution of income favours potential spenders rather than savers. The only qualification is that Indian entrepreneurs are frequently in debt to money-lenders, who may ensure that a good slice of increased incomes goes in debt repayment rather than in consumption. Has anyone done any research on this point? According to the First National City Bank of New York, India, between 1951 and 1961, was inflating at the rate of 1.8 per cent a year, and between 1956 and 1961 this average doubled to 3.6 per cent. The purchasing power of the rupee fell from 100 in 1951 to 83 in 1961. Does anyone know anything about the volume of small-scale indebtedness in these years?

Mr. Reddaway stresses that the process of transforming a developing country into one with higher productivity and real incomes involves creating a much more complex economy, in which productive units are much more dependent on each other, and so on the existence of a mechanism to ensure a proper inflow of materials, power, and other imports, and a proper outflow of their products to market. In turn, this requires not only adequate public utilities—notably power and transport—but also efficiency in the apparatus of government. Development is unlikely to flourish, however much foreign capital is provided, amidst political instability, corruption, riots, and so on. "In countries where poverty is as rampant as it is in India," says Mr. Reddaway, "there might easily develop a disregard for any system of property rights, which would make orderly development impossible."

DIFFICULTIES OF CULTIVATORS

One of the difficulties in securing an increase in the output of Indian agriculture is that so many of the people actually doing the cultivation have no incentive to improve their methods, because they know that they will not enjoy any appreciable part of the extra output: either they are hopelessly in debt, so that any extra income will go to the money lender, or the terms on which they hold their land will be revised so that the landlord gets the main benefit.

It has been argued that the introduction of better credit systems and minor irrigation works are of little value without a reform of the structure of the village,

because the benefits will go to the more powerful members of the village, leaving the poor as poor as before. The new measures will have to be administered by these more powerful people because nobody else is capable of the job: hence the hopelessness of trying to make progress by measures which would weaken the position of the very people who would have to administer them. Mr. Reddaway's views tie up with Mr. Colin Clark's criticisms in "The Eastern Economist" of August 10, in the course of which he quoted Mr. and Mrs. Thorn as saying in their new book "Land and Labour in India" (Asia Publishing House) that the administrators of the Sardar canal in the Punjab are never able to supply enough water when needed, that the available water goes to "the strong, the powerful, and the well-connected," and that much of the great change in land ownership supposed to have taken place in India since 1947 can be dismissed as "Agrarian Revolution by Census Redefinition." These are grave charges. They should be refuted if they cannot be sustained. But up to the moment of writing, no one has challenged Mr. Clark's article.

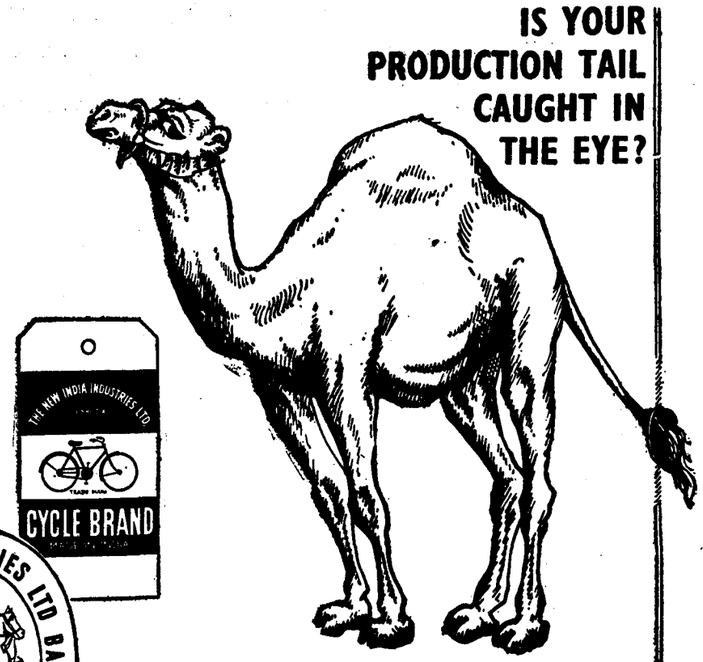
If, however, we admit the truth of these allegations, Mr. Reddaway urges that this should not lead to fatalistic inaction. Many measures, such as the production of artificial fertilisers, on a scale adequate to meet the market demand at an unsubsidised price, would secure a valuable increase in output, which would speed the over-all process of development. That the fertilisers will largely be bought by the richer farmers, and that their incomes will be raised rather than those of the poor, is a reason for imposing suitable taxation on them ("suitable" seems to me the operative word—if it is too harsh, there will be no incentive to increase output), and for pressing ahead with reforms of land tenure and debt. It would be absurd to refrain from supplying fertilisers on the grounds that the resulting increased food production will not solve the village's social problems at the same time: they are, in fact, likely to bring some benefits through more employment for the poor on the lands of the richer farmers to spread the fertilisers and harvest the larger crops. As against this, that some increase in output can be secured without structural reforms is no reason for refraining from striving after reforms, which may often be arranged in a way that will also increase output, by improving incentives to the actual cultivators.

Mr. Reddaway notes that foreign aid covers about 40 per cent of India's imports, and asks whether this is a sign of extravagance, mismanagement, or over-ambitious plans. He replies that while no nation has a right to demand foreign aid, the broad strategy of India's planning makes sense and the objectives are modest in relation to the size of India's problems. He therefore hopes that the developed countries—not all of which are in the West!—will aid India, and he stresses that trade facilities are as important as aid. Admission of cheap Asian textiles do create difficulties for Western producers—though, as Asian spokesmen seem to me slow to point out, they benefit Western consumers, and so in the longer run will benefit Western economies. These difficulties are, however, trifling when compared with the problems which the exclusion of Asian exports—often in defiance of GATT obligations—causes to the whole development of poverty stricken Asia. And, I would add, the peaceful development and political stability of Asia are important to the free world.

4¾% MADRAS STATE ELECTRICITY BOARD BONDS 1972
FOR Rs. 300 LAKHS

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS)

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.



ISSUE PRICE Rs. 99.75 PER CENT

REDEEMABLE AT PAR ON THE 24TH SEPTEMBER, 1972.

Subscriptions will be received in cash or cheques from the 24th September 1962. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 300 lakhs and in any case not later than the close of business on the 29th September 1962.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board.

THE
THERMOSCOPE
CIRCA 200 BC

THE ORIGINAL THINKING OF AN ANCIENT GREEK PAVED THE WAY FOR THE MODERN THERMOMETER

The modern thermometer owes much to the pioneering of an ancient Greek. Physicist and philosopher, Philo of Byzantium invented the thermoscope about 200 B. C. It was a simple apparatus consisting of a lead globe and a flask filled with water. A tube connected the two. When the globe was heated, the air within expanded, flowed through the tube and produced air bubbles in the flask of water. Philo proved that a temperature rise causes air to expand. He did not calibrate his thermoscope and could not therefore measure temperature. But his basic experiment was invaluable : it paved the way for the modern thermometer.

Negretti & Zambra too, have pioneered in the field of temperature. Over a century's experience lies behind their range of mercury-in-steel indicating, recording and controlling instruments. To industry world-wide, the name Negretti & Zambra means instrumentation of faultless workmanship and trusted reliability.

Whatever your requirement—single thermometer or complete installation—contact the manufacturers.

The European Scene

FRENCH TRADE IN 1965

From Our Special West European Correspondent

PARIS, September 15.

AFTER its approval by Parliament, the weighty official document entitled "Fourth Plan for Economic and Social Development" has just been published in Paris, almost nine months after the 1962-1965 plan has begun to run its course. This tardiness, though deplorable and apt in itself to raise doubts about the efficiency of planners, is not grave since the economic agents, who collaborated in writing it, already knew what was expected of them; by its nature, a French plan can contain no surprises, for it consists not of orders from above but of agreements reached during discussion. In any event, the outside commentator has in hand for the first time a complete and detailed picture of the programme thought feasible for the coming three or four years. The main lines of this programme are known and have been discussed here before: a 24 per cent increase in gross domestic product in four years, which means an annual growth of about 5.5 per cent. The spirit of the plan remains, as with its three predecessors, the effort "to conciliate the imperative of development with an attachment to liberty", but the context of the fourth plan differs because of radical changes in France's international situation. The main changes, says the introduction, are: the beginning of the crucial phase of the Common Market, the opening up of the French economy on to a freer-trading world, the transformation of the imperial connection with the African peoples to a new style of co-operation, the intense scientific and technical competition within the industrialised world, and finally the appearance in France of a more numerous youth.

Publication of the plan documents enables us to go beyond these generalities to detailed figures. This would perhaps be instructive only to those familiar with the orders of magnitude that appear in the Indian Five-Year Plan, and who remember that France's population is slightly more than one-tenth of India's. However, there is one important table in the plan that is of general interest ,and of which one would like to have the equivalent for all the industrialised countries: an analytical forecast of French imports and exports in 1965. This can give foreign traders concerned with exporting to, or in competition with, France an inkling of the evolution of their markets. Thus when one reads the forecasts of substantial increases in French imports of textiles and non-ferrous metals, piecegoods, leather and wood, one can draw conclusions of evident business relevance.

This evolution of foreign trade will be governed not only by the development of French industry but by changing trade conditions. For example, tariffs on goods traded inside the Common Market will have fallen by the end of the plan period to 20 per cent of their 1957 level, and this naturally affects estimates of exchanges. The sharp rise in imports of motor cars and bikes, for example, has this for sole cause. The common agricultural policy of the Six will be coming into effect in this period, and this is the reason for the sharp increase in exports of the first two entries, which together make up agricultural produce: their total value will more than double at fixed prices, from 2,300 million NF in 1959 to 4,800 million NF in 1965. This supposes that new markets are indeed found for the output of French farms in the territories of the Six.

The Common Market is not the only factor responsible for the transformation of French foreign commerce. Tariffs on goods imported from outside the region will, in general, also fall as the common external tariff comes into effect. Moreover, the growing economic independence of the franc zone—former French colonies, in Africa principally—will deprive French exports of their predominance in those markets. That is why the plan foresees that the traditional surplus in trade with the franc zone will fall from 2,700 million NF to 1,600 million NF, since exports to that region will grow more, slowly than imports. The main developments due to the growth of French resources, as distinct from transformed trade terms, are the fall in imports of oil and of food and farm produce. The former is due, of course, to the expansion of franc oil supplies, from the Sahara in the main, but it will be noticed that this gain will be annulled by heavier imports of coal as uneconomic domestic mines are closed down; in sum the fuel bill will stabilise. Smaller imports of food will be due to the vast increase in productivity in French agriculture that is expected in the next few years.

In contrast, imports of mechanical and electrical apparatus are expected to rise by 128 per cent, as industry is expanded and farming mechanised more rapidly than the domestic capital-goods industries can follow. Yet on the export side, those same industries are counted

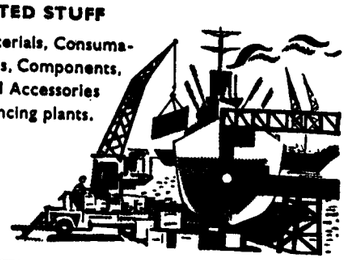
upon to increase their foreign sales by 86 per cent; different machines are involved in each case, as the division of labour progresses within the Common Market. In general it can be said that the planners look for a dual change in French export catalogues: big increases in sales of food, and considerable progress in sales of highly technical goods, notably machines and tools. This reflects the hopes placed in the Common Market, which will allow France to become the granary of West Europe, while yet continuing her industrialisation in those fields where she enjoys special advantages.

The admission of Britain to the Common Market, at least on the terms so far envisaged in Brussels, would not greatly affect these prospects within the period here envisaged, for a gradual transition will be allowed that will not be far advanced by 1965. Thereafter, the trends indicated would be hastened without being revolutionised; French farm produce would gain wider markets in the United Kingdom, while the division of labour in highly technical industry would have to be pushed a stage further as British specialities found easier access to the Continent. Perhaps the imports of textiles, already predicted to be notable, would grow more quickly if the facilities tentatively offered India and Pakistan are confirmed in the final settlement. It will be noticed that trade in textiles was approximately in balance in 1959, but is expected to be in deficit in 1965; most of the increase in exports concerns synthetic fibres. So the plan seems to take account of the necessary, relative restriction of the national textiles industry as increased opportunities are offered to non-European countries that rely on textiles largely for their export earnings.

It can be calculated that the plan foresees that imports will increase in value annually (at stable prices) by 6 per cent, and exports by 6.2 per cent yearly. The year of reference, 1959, was already a period of favourable trade for France, following on the end-1958 devaluation and monetary reform, so the planners are taking an optimistic view of trading prospects. The trade surplus including services is expected to increase (for trade with the franc zone and foreign countries together) from 6,600 million NF in 1959 to 7,200 million NF in 1965. This surplus will amply compensate from the expected fall in receipts from tourism and capital revenues, so that the balance of payments on current account will show a surplus of $810 million, against $620 million in the earlier year.



Foreign trade predictions are no doubt the least certain part of forward programming because external commerce depends on so many factors beyond the ken of national planners. In the present case, however, the risks of error are reduced by the existence of the Common Market's schedule of tariff cuts and its common farm policy; since almost one-half of French trade is conducted with her Common Market partners (rather more if Britain and one or two other European countries accept that schedule and that policy), the evolution of trade can be fairly safely foreseen. Whatever the uncertainties, it is the forecast of future imports and exports that most interests traders abroad in any national plan, and if tables similar to the above were to hand for other Western economies, the developing nations would know better where they stood.

GAS COMING UP

When a successful well has been completed the oil that has entered the bottom of the hole has to be brought to the surface. Sometimes the oil will flow to the top of the well of its own accord, rather in the way that a bottle of warm soda-water will empty itself when the cap is taken off—the gas bubbles out strongly and carries the liquid with it. Sometimes the oil has not enough gas associated with it to flow in this way, but it can be encouraged to do so if extra gas is forced down the well. Sometimes again the oil has so little gas that the easiest way to get it out is by pumping it up with a special type of pump.

In all these methods the oil is brought to the surface through a string of narrow pipe, called tubing, suspended in the well.

The specially compounded wear-resistant tread and strongly reinforced cord body ensure more trouble-free mileage—means more kilometres per rupee invested.

Your Mark of Quality

Economic Report from the U.S.

GOVERNMENTAL FINANCES

By GUY SIMS FITCH

WASHINGTON, Sept. 11.

EVEN the most prosaic of economic reports may reveal exciting and significant developments. Such a report has recently been issued by the US Department of Commerce, in the form of a detailed summary of governmental finances for the 1961 fiscal year that ended last June 30. From it, one can gain renewed appreciation of the magnitude and variety of public services in the United States and of the vital and often interrelated roles of national, state and local governments in the US Federal system. In this context, the fact that governmental outlays have been rising is not nearly as important for itself as for the light it sheds on the continuing US effort to meet responsibilities abroad and to supply a growing population with more and better services at home. While the former burden, with all that it implies for the economic advancement and the defence of free nations, is largely that of the Federal government, the latter tends to fall more heavily on state and local units.

The much publicized Federal budget, which does not include state and local outlays, thus embraces only one of the three main governmental levels in the United States. Hence, it understates by many thousands of millions of dollars the full scope of the nation's public activity. All told, government spending in the United States came to no less than $164,200 million in fiscal 1961. A more pertinent figure, however, one that excludes capital outlays and trust fund operations, is the $138,800 million spent for such general purposes as defence, education, highways, health, housing and transportation. This represents a fiscal 1961 outlay of $758 for every man, woman and child in the country, compared with $644 back in fiscal 1957, when general spending totalled $109,800 million. Significantly, the big spending increases have come not so much in the areas of Federal activity, as in those which traditionally have been reserved for state and local action in the US socio-political system. Thus, national defence and such related international activities as foreign aid, constituting the largest single statistical element in both Federal and total government spending, came to $49,400 million in fiscal 1961, up from $45,000 million in fiscal 1957. On a per capita basis, however, the rise was negligible—from $269 to $270. A notable contrast is in the field of education, the second largest area of total government spending and the largest area of state and local expenditure. Here, total outlays rose from $15,100 million or $88 per capita in 1957, to $21,000 million or $115 per capita in 1961. The predominance of state and local responsibility in this field is seen in the fact that of the $21,000 million spent in 1961, the Federal government put out only $1,600 million, of which $1,000 million represented aid to state and local educational programmes. Inter-governmental payments of this kind are typical of the US Federal structure. For instance, state and local governments also are primarily responsible for such varied programmes as highways, health and hospitals, public welfare, housing and urban renewal. In each of these, as in education, the Federal government provides varying degrees of financial aid to the state and local units, in addition to its own relatively minor direct spending.

This principle also extends to relations between state and local units. As an example, states provided local governments, which are the principal operators of the nation's schools, with some $6,000 million for educational support in fiscal 1961. This was about 36 per cent of the total sum spent for education by the local governments. In many cases Federal aid reaches local communities via state administration and distribution. There are some domestic activities, of course, which are principally or entirely the responsibility of the Federal government. By and large, like national defence and the conduct of foreign affairs, these are clearly national in scope, inter-state in character and beyond the effective capacity of state and local bodies. Among them are the postal service, air transportation, and the conservation and development of natural resources—agricultural, forest, mineral and water.

A Letter to the Editor

HAFIZ MOHAMMAD IBRAHIM

Sir,

Your main editorial in your issue of 17th August in making a frontal attack on the Minister for Irrigation and Power, Shri Hafiz Mohammad Ibrahim, has done less than justice to the Minister. It is not generally realised that as far as Constitutional or other responsibilities are concerned the Ministry of Irrigation and Power is in no way responsible about the working of the Delhi Electric Supply Undertaking. One has only to refer to the provisions of the Delhi Municipal Corporation Act, to uphold the truism of this stand.

A correspondent in a local Paper in discussing the debate in the Lok Sabha about the Delhi power failure very jocularly reported the Minister having said in chaste Hindi "If the Transformer at the Rohtak Road Power Station fails what would the Supreme Court do!" Joke apart this is a real fact.

There is of course something wrong with the working of the Delhi Undertaking and if one were to ascribe responsibility to the present situation one has to go right back to the year 1957 when the then Delhi State Electricity Board was dissolved and the Undertaking handed over to the Delhi Municipal Corporation as part of a political deal.

It may perhaps be appropriate here to dilate upon some of the other legal aspects arising out of the Delhi Municipal Corporation Act whereby the Delhi Electric Supply Undertaking was vested with the Municipality. Under the law the General Manager (Electricity) is subjected to "all the obligations of a Licence under the Indian Electricity Act 1910 or any other law for the time being in force relating to generation or supply of electricity". In this context, if therefore any direction on matters of policy were to have been given they should have been done by the Home Ministry and consequently the responsibility on the part of the Ministry of Irrigation and Power could only be to the extent advice is sought by the Home Ministry.

To sum up, the malady lies in the sudden reversal of policy in 1957 in relation to the electric supply organisation in the Union Territory of Delhi and consequently the responsibility for the present impasse must be fully borne by the framers of the Delhi Municipal Corporation Act and not by the Ministry of Irrigation and Power.

Yours faithfully,

1st September, 1962. R. P. Aiyer

THE CRISIS IN COTTON TEXTILE EXPORTS

ADDRESSING the joint meeting of the Import and Export Promotion Advisory Councils in New Delhi early this month, Mr. Neville Wadia, who speaks as one having authority, painted a dismal picture on the export of our cotton textiles. He implied that, if drastic action were not taken, exports were unlikely to exceed 300 million yards next year. Our present expectation is less than 500 million yards for this year as against the target of 800 million yards. This reduced figure will earn even less in ratio because of the drop in international prices and may fall in between Rs. 20 and 25 crores in 1963, as compared to Rs. 40 crores for 1962 and Rs. 46 crores for 1961. One may characterise this picture of our textile export outlook in the near-term as alarming, but there is no denying the fact there exists at present a near-crisis in the export trade of Indian cotton textiles. How far these exports would go up as a sequel to the institution of the Obligatory Export Scheme by the industry about 2½ months ago, it is difficult to say, although the indications are said to be encouraging.

That India's cotton piecegoods exports have been in a bad shape, particularly since 1960, should be evident from the fact that in 1961, in terms of yardage, exports touched the lowest level since 1956. During the first quarter of the current year, these exports declined further to 133.55 million yards from 152.32 million yards during the corresponding period last year. The provisional estimate of exports during the second half, April - June, 1962, is put at about 110 million yards, as against actual exports of 138.82 million yards during this period in 1961.

This decline in our cotton textiles exports during the past one-and-a-half years may be partly attributed to the expansion in the indigenous industry in some of our traditional importing countries and to the tight raw material position, but that this setback has been due much more to the severe competition that India faces today in the world market is a fact that hardly requires elaborate data to prove. The competition is from a number of sources, both old and new. In our traditional South-East Asian, West Asian and African markets, the competition is stated to be particularly keen from Japan and China. But there are signs of stiffer competition being faced from such new suppliers as France, West Germany, East European countries, Turkey and Egypt. The overall effect of this on our textile exports has been that despite the fact that the international trade in this commodity had expanded in 1960 by about 11 per cent over the preceding year, our exports in that year dropped by about 14.7 per cent. In 1961, while exports from the major Communist countries declined by about 6.3 per cent as compared to 1960, exports of Indian textiles declined by about 17.4 per cent. This is an unmistakable evidence of Indian cotton goods being priced out in the world markets.

If our textiles exports are to improve to any great extent, it is obvious that our cost of production should be made more competitive. But how this is to be achieved is the crucial question.

The important point, namely that India's exports have been ruled very largely by the price of cotton has uncomfortable implications both for the Indian agriculturist and for the textile manufacturer. Mr. R. G. Saraiya made the point well in response to Mr. Neville Wadia's remarks that when India's exports were at their peak in 1951, this was almost entirely because Indian cotton was 21 per cent below world prices.

It seems true today that we are losing cotton textile market because Indian cotton is nearly 25 per cent above world prices (vide Table I, page 536). Thus the point that manufacturing costs are almost secondary, whilst the price of cotton is the dominant element, would suggest that not too much stress should be laid on the rationalisation argument by itself. Rationalisation can reduce costs, but it cannot eliminate the disadvantages of price of cotton so largely out of parity with international levels.

A historical study of Indian exports in relation to the average prices of cotton inside the country is presented in the table below (Table II). This particular point, namely, that the price of cotton and not India's efficiency in manufacture has been the dominant element emerges from this table. It does look as though, if markets are to be recovered, something radical will need to be done on the price of cotton. The current floors and ceilings are too high. At the same time, there must be a ceiling on manufacturing costs. This does not imply that they are always fair any more than the price of cotton has been fair to the Indian agriculturist. A policy for cotton textiles today is not a policy for equity, but a policy for exports. For these purposes, Mr. Neville Wadia's suggestion acquires importance, which has little to do with historical injustices in the past or necessities of distribution at present. The country must make up its mind whether it wants exports or fair wages or fair prices, irrespective of the shortages in foreign exchange. It should not be difficult for the Planning Commission at least to make up its mind.

Handloom Board—A Decade's Work in Retrospect

By CROESUS

SAVE for the absence of Mr. W. R. Natu, who died prematurely a few weeks ago, the 18th meeting of the All-India Handloom Board (A.I.H.B.), which was held in Bombay, last week, must be regarded as an important landmark in the history of the handloom industry in this country. It is important, because it marked the completion of the first decade of the Board. Fortunately for the industry, the Board has, in the new Chairman, Mr. R. Doraiswamy, a no less sympathetic guide than the late Mr. Natu. He may be depended upon to tackle the problems of the industry with the same degree of sympathy and single-minded devotion as his distinguished predecessor. But, in the final analysis, more depends upon what the industry itself does, or is prepared to do.

If after the past ten years of the A.I.H.B.'s working, one were to ask whether what the industry has achieved during the decade is at all commensurate with the generous measure of assistance accorded to it, I feel, one should be excused. For, even whilst inaugurating the 18th meeting of the Board, Mr. Manubhai Shah, the Union Minister for International Trade, was still referring to the several schemes "being initiated to assist the industry" and not to any spectacular achievement as such in any specific sphere. If there is some achievement that the Handloom Board can take credit for, it is undoubtedly the organisation of the industry on co-operative lines, although, even here, not to the extent it originally bargained for. But, then, one must concede, there are several inherent difficulties in organising all those engaged in the handloom industry on co-operative lines. Nor does this seem desirable, and this perhaps explains the concern of Mr. Shah more for consolidating the gains of organisation already achieved than for enlarging the number of looms within the co-operative field. Of course, from the point of view of production, — assuming that the official statistics are wholly dependable — the progress made, in absolute terms, that is from 950 million yards to 2,000 million yards, is sufficiently spectacular, and the handloom interests might even gleefully compare this rise with that in the organised mill sector from 4,076 million yards to 5,142 million yards over the same period. But the public, one hopes, is not unaware of the fact that, whereas the handloom sector is actively encouraged to augment production, the mill sector is deliberately discouraged from increasing its output. Also, one must not overlook the fact that the progress of handloom industry has been achieved at enormous cost to the country's exchequer. According to Mr. Shah himself, the Government has so far provided financial assistance to the tune of very nearly to Rs. 45 crores, while, under the Third Plan, the revised target of expenditure, including the expenditure of Rs. 3 crores for the Central schemes, is Rs. 34 crores. And all these for just 28 lakhs of handlooms said to be working in all parts of the country.

After spending such a huge amount, how has the industry fared on the export front? Miserably! The value of handloom cotton fabrics exported has steadily come down from Rs. 10 crores in 1953 to Rs. 8.7 crores in 1956 and to Rs. 4.8 crores in 1961. Even after making allowance for the keen competition in foreign markets, one cannot explain away this shrinkage in exports, especially when we are repeatedly told that there is cosiderable scope for expansion, except by frankly admitting the failure on the part of the industry to improve quality. The industry has not been denied incentives to export either. In fact, it has been enjoying export incentives in the shape of licences (15 per cent import entitlement) for the import of scarce dyes and chemicals ever since 1959 and a cash incentive by way of a part of cotton entitlement of 5 per cent (this has since been raised to 8.4 per cent) on the f.o.b. value of export. It is significant that these incentives apply both to manufacturer-exporters and to merchant-exporters. Perhaps the only thing that the industry has been clamouring for, but has not got, is a separate Export Promotion Council. Although the Government had earlier conceded this demand, it was withdrawn subsequently — at the instance of Mr. Shah, of all people, I am told — and the industry has been asked to content itself with an Export Promotion Committee of twelve people to advise the two existing all-India organisations which are already there to develop markets for hand-woven fabrics — namely the Handloom Export Organisation — a subsidiary of the S.T.C. (for non-traditional markets) and the All-India Handloom Fabrics Marketing Society (for traditional Markets). Although denying a seperate Export Promotion Council to the handloom interests, the Union Minister for International Trade assured them that the Central Government would accord the highest priority and provide all assistance to development schemes oriented towards the production of export goods. As it is, whether by way of finance (as witness the pilot schemes of the Reserve Bank of India to ensure the working capital needs of the industry) or by way of quality control as in the case of "Bleeding Madras" and Etawah bed spreads (by fixing either ceiling or floor prices or both), the industry has been helped sufficiently, and it can depend on the powers-that-be to pamper it furthermore. Even so, it remains to be seen if the export target of Rs. 14 crores worth of handloom fabrics would be achieved during the Third Plan period.

Even as regards the contemplated Third Plan production target, one cannot be absolutely certain that the handloom industry would be able to raise its production from an estimated 1,930 million yards in 1960-61 to 2,800 million in 1965-66. For this would mean an overall increase of as much as 870 million yards, or an average annual increase of 174 million yards. Moreover, the realisation of the target is based, among others, on the assumption that the per loom production in 1965-66 would go up to 800 yards, which is contingent on adequate technical improvements proposed to be effected during the Plan period. There is no doubt that some useful work in designing and quality improvement has been achieved by the various units of the Weaver's Service Centres organised by the Handloom Board, but a good deal more remains to be done in the matter of effecting improvements, both in the techni-

ques of production and in the production of attractive fabrics, so as to make these fabrics readily saleable. Even on the admission of Mr. Shah himself, although a substantial portion of development funds has been utilised for the encouragement of the consumption of hand-woven fabrics, such has been done without specifically linking it to the improvement in quality or the utility of cloth. He was, therefore, eminently in the right when he pointed out that, in the final analysis, a decentralised industry, such as the handloom industry, can hope to stand on its own feet only by effecting technological improvements to enable the industry to produce quality material capable of being marketed anywhere at competitive enough prices.

Business Notes

Drugs

DESTROYING THE RACKET

THOUGH OF recent origin, like so many other industries, the Indian Pharamaceutical Industry also has registered a notable progress in recent years. The total value of its production has gone up from about Rs. 10/12 crores in 1948 to as much as Rs. 80 crores in 1961, and this is shared by as many as 120 manufacturers in the organised sector and about 2,600 in the medium and the small-scale sectors. All this is to the good, but, lately, there has developed a disturbing trend in the pharamaceutical world, namely the growing predominance of spurious drugs which has begun to cause both concern and consternation—concern for the future of the healthy section of the industry and consternation at the probable damage to human health.

It is in the fitness of things, therefore, that the Indian Pharamaceutical Association (I.P.A.) should have arranged a symposium, in Bombay, last week, to take stock of the present situation and also to review the problems of the industry as a whole—on its manufacturing, distributing and control aspects. The Chairman of the I.P.A. did well to emphasise the urgent need first to dispel the loss of faith in the drugs made in the country and the consequent sense of panic in the public mind caused by such revelations as recent detection which showed that spurious distilled water had been used for injections! Calling forth for adequate and effective measures, Dr. Rohatgi suggested that all pharamaceutical products offered for sale be brought under effective control and proposed three methods for the purpose.

First, he said, there should be control over the conditions under which manufacture of drugs is carried out, leading to the licensing of firms, and the continued check of their performance under supervision at various stages. Dr. Rohatgi observed that the Government should make an effective use of the powers accorded to it under the Drugs Act to ensure that the Drug Control does operate at various stages. In view of the fact that there is considerable inter-State movement of drugs, the I.P.A. Chairman felt that there was need for appointing an expert committee.

Secondly, Dr. Rohatgi suggested the control of each batch of drug so as to guard against mistakes and ommissions and also to ensure that each packing conformed to the prescribed standards. The responsibility of maintaining the quality and standard of a given drug rested solely on the manufacturer, who should spare no efforts in maintaining them. As Dr. Rohatgi rightly remarked, "no amount of precaution taken by the manufacturer can be considered as excessive".

And, finally, the control at the different stages of distribution, that is wholesale and retail trade, and dispensing, should be such as to ensure that the drugs are stored under proper conditions and that deteriorated drugs as well as those of doubtful quality are promptly eliminated. The snag here, however, is, according to the I.P.A. Chairman, that the problem of distribution has not received the attention that it deserves. The spurious drugs racket, in his opinion, could not possibly have thriven but for the support of sections of the trade and the medical profession, as also some buyers of such products. In this connection, he further said that, in spite of all the precautions taken in regard to manufacture and analysis and the control exercised by the Drug Control Administration, faulty storage could cause considerable deterioration and render a given drug ineffective and even harmful. Inasmuch as this function mainly rests on the dispensing pharmacists, who represent the last link in the chain of distribution, it is imperative that adequate facilities for the training of pharamacists should be provided, added Dr. Rohatgi.

Dr. Sushila Nayar, the Union Health Minister, inaugurating the symposium, said that the twin problems of keeping the prices of drugs at a reasonable level and bringing in stringent measures against the spurious drug trade, had become more urgent today than at any time before. She, accordingly, hinted that the Government would play a very important role in the future in this connection. Dr. J. N. Banerjee, Honorary Secretary of the I.P.A., however, suggested that what needed investigation was the effective enforcement of the machinery already constituted under the Drug Act. He felt sure that such would not in any way hit the reputable manufacturer even on technical grounds.

World Bank

AID WITHOUT STRINGS

WHILE IT is true that economic assistance to the underdeveloped countries from industrially advanced countries has become a recognised factor in the process of economic growth, Mr. Eugene Black, President of the World Bank, in his address at the Annual Meeting of the World Bank and other international financial institutions this week has made it clear that it is not the same thing as economic assistance that flows through certain international institutions. The bilateral aids however justified, can lead to confused economic objectives when influenced by political ends. This nevertheless may not be always so. The experience in India has been that bilateral aid has by and large been received without any political strings. It has to be stressed that assistance in whatever form from the World Bank and International Monetary Fund has been based purely on economic grounds. Naturally, therefore, Mr. Eugene Black urged that while bilateral aid should be continued, more and more aid should pass through the international development institutions. In this context it has to be recorded here that the assistance received by India from the Aid-India Consortium was definitely substantiated by the World Bank authorities. It goes to their credit that apart from the aid offered by other countries like the United States, Germany and Great Britain, the World Bank contributed a substantial share.

The annual report of the Bank outlines that during the last decade there has been a shift in the source of funds that were made available to the World Bank. During the immediate post-war period, the Bank was obliged to depend on the U.S. for virtually all its

funds. By 1962 the capital contributions made available by members other than the US had risen to over $1,000 million. Other countries have obtained their capital markets to Bank Bond and Note issues so that by the end of the fiscal year 1961-62 about 56 per cent of the Banks' outstanding funded debt of $2,521 million was held by non-US investors.

New bank loans of the year came to $882 million, the highest annual figure so far attained. Electric power was the largest single purpose of bank lending at $493 million which was followed by loans for transport facilities at $241 million. The Bank also extended its activities and had increased its expenditure in the less developed countries on studies both of specific projects and all factors of the economy. Assistance of this type of undertakings included study for a new bridge over the Hooghly River in Calcutta. Thus it is clear that the Bank is gradually increasing its activities both in terms of quantity and sphere.

I.F.C.

A NEW ROLE IN DEVELOPMENT

PERHAPS ONE of the most important developments of the year for the International Finance Corporation was the approval by the Board of Governors of an amendment to the Articles of Agreement enabling the Corporation to make its investments in equity form. As a result of this, IFC was also able to participate for the first time, in under-writing the issue of common shares by one of its borrowers, a steel corporation in Mexico. This move is a positive step forward and it gives a new role to IFC in the field of economic development. The annual report reveals that during the year 1961-62 IFC made nine investment commitments totalling $18.4 million and one underwriting commitment of $2.9 million, in seven countries. The Corporation made its first investment in Spain assisting a manufacturer of electrical components for automobiles to expand operations. IFC's $3 million investment was partly in loan form and partly in equity form and was the first in which capital stock was purchased directly as part of IFC's original investment commitment. Other investments included $4 million in a new cement plant in Pakistan; $2.4 million in the expansion of a cement plant in Peru; $3.05 million in petro-chemical plant in Argentina; $600,000 in a new fertilizer plant in Greece and small supplementary investment in a fertilizer plant in Peru.

By and large it is true that IFC, like many other bodies associated with the World Bank, is assisting the Development projects in various countries, where finance is not readily available, but it appears that the institution has its own limitations because funds at its disposal are not sufficient. This has to be seen in the context of huge demands that exist in most of the developing countries. It seems, however, that the number of institutions that are prepared to associate the IFC in its lending programme is increasing. For instance, IFC formed a syndicate with Credito Bursatil, a Mexican investment house, to under-write the issue of capital shares of the largest private steel company in Mexico. Three private investment banks, two U.S. and one European, joined IFC as participants taking up about one-third of the IFC's under-written commitments. It may be added that five private financial institutions in the United States, Germany and Switzerland agreed to participate for a total of approximately one million dollars in four IFC investments this year. Thus, there has been a broadening of its activities, but it seems that there still is scope for performance on a much larger scale.

I.D.A.

AID FOR DEVELOPMENT

AS THE annual report of International Development Association for 1961-62 recalls, the primary purpose underlying the establishment of this institution is to provide a supplementary source of development capital for countries whose balance of payment prospects would not justify their incurring or continuing to incur external debt on conventional terms. Consequently in each of the credits so far made by the IDA the credits are repayable over a longer period and with considerably lower rate of interest as compared to the World Bank Funds. The rate of commitments of IDA funds is accelerating and it appears that the entire $757 million of freely convertible resources available to this institution designed to cover its first five years of operation might well be committed by mid-1963. The annual report, therefore, records that steps have been taken to place the question of replenishment of IDA sources on the agenda of the annual meeting of its Board of Governors.

The report outlines that agricultural improvement received largest amount of IDA finance in 1961-62 — to the extent of $66 million. The development credits were principally for irrigation and drainage in farming areas in India and Pakistan where greater agricultural output is vitally needed to keep pace with growing population. Second in importance were the credits given for transportation. In most of the cases these were also of direct benefit to agriculture by opening up of new areas for farming and providing efficient farm-to-market roads. Another important credit made was for electrical power ($18.5 million), which was for India. Credits were also given to finance municipal water supply system and only one credit was given for industry, which went to assist the China Development Corporation.

Of the six credits that India received, four were for irrigation. Uttar Pradesh received $6 million which will assist in financing the drilling and equipping of 800 tubewells for the irrigation of 320,000 acres of land in Uttar Pradesh. The wells will be built and operated by the State's Irrigation Department and this project will naturally improve agricultural output substantially. The second important credit was for Salandi project, which will irrigate about 225,000 acres in the State of Orissa. The area is now under dry farming and produces only one crop a year. The crop failures in the area are frequent and with proper irrigation double cropping would be possible on almost 40 per cent of the land which naturally would lead to higher yield. The third project to get the credit is Shetrunji project which will receive $4.5 million. This credit will help to finance completion of Shetranji Project for the irrigation of 86,000 acres in an arid, but fertile, area of Gujarat. Work has already started on the project and it will involve the building of about 94 miles of main and distribution canal, houses, workshops, buildings and service roads. The State of Gujarat is going to provide technical sources to farmers to bring about prompt utilisation of the available water.

The fourth credit is to finance Punjab project for irrigation and drainage. The high water table has aggravated the problem of flooding which occurs in areas when the monsoons are heavy. The State is now constructing a system of adequate service drainage and building embankments to keep rivers in their channels. The project includes the construction of 17 miles of such embankments, the enlargement of 300 miles of existing drains and excavation of 2,000 miles of new drains. The fifth credit is for Sone Project being carried out by the State of Bihar to improve and expand the Sone irrigation system making possible the irrigation of about one million crop acres annually. The new diversion barage is to be built on the Sone river, a tributary of the Ganges, and the canal system now comprising about 427 miles of canals on one side of the river and 1,235 miles on the other, is being remodeled and extended. The last credit of the year was for Damodar Valley Project to assist in financing an expansion of the electrical power system of the DVC. The IDA credit will help to finance the addition of 140,000 kilowatts generating unit at the existing 165,000 kilowatts Durgapur Power Station and the expansion of transmission facilities.

Industrial Finance

IFC'S NEW LOAN

THE INDUSTRIAL FINANCE CORPORATION of India is floating a Rs. 6 crores loan on September 28. This will be the fifth loan that this Corporation is going in for during its short tenure of less than a decade and a half. The new series of bonds which the IFC is issuing with the approval of the Central Government and the Reserve Bank of India, will have a maturity period of 12 years and will carry interest at the rate of 4½ per cent per annum. The issue price will be Rs. 99.50 for Rs. 100 bonds, thus giving a running yield of 4.54 per cent per annum. The list closes on October 5, or earlier as soon as the issue is fully subscribed. Since these bonds are eligible securities for the purposes of advances to scheduled banks by the Reserve Bank under Section 17 (4)(a) of the Reserve Bank of India Act, and are included in the list of approved securities of the State Bank of India, they should prove an attractive avenue of investment for institutional investors like the Life Insurance Corporation, Provident Fund Accounts, Scheduled Banks etc., as also the general public. Arrangements are being made by the Corporation for getting these bonds listed with the Bombay, Calcutta, and Madras stock exchanges to ensure their easy marketability.

This new issue by the I.F.C. is obviously an indication of its growng activities. During the 14 years of its existence, the Corporation has sanctioned loans to the industry to the tune of Rs 130 crores and disbursed loans to the extent of Rs. 69 crores on the security of fixed assets stated to be valued at much more than twice this amount. The Corporation has also been approving underwriting proposals for the issue of shares and debentures; it has done so to the extent of Rs. 5 crores. Besides, it has agreed to guarantee deferred payments to foreign machinery suppliers to the tune of nearly Rs. 26 crores. The working results of Corporation during the last five years have been very satisfactory. During this period, it has not only paid the dividends out of its own profits, but, has also repaid the subvention received by it from the Government in its early years of operations, to the extent of nearly 66 per cent. The remaining about 34 per cent of the subvention amounting to Rs. 18 lakhs, it proposes to pay out of its profits during the year ending June 30, 1962. The Reserve Fund of the Corporation now stands at over Rs. 2.3 crores.

Electricity

TWO BOARDS TO FLOAT LOANS

TWO ELECTRICITY BOARDS—the Gujerat Electricity Board and the Madras State Electricity Board—have also decided to float loans, of the nominal value of Rs. 300 lakhs each, with a view to provide part of the finance required for their expansion programmes during the current Plan period. Both the loans carry interest at the rate of 4¾ per cent per annum. The Gujarat Electricity Board's loan is to be issued at par and has a maturity period of 12 years. The Madras State Electricity Board's loan is redeemable after 10 years and is to be issued at a discount of 25 nP per Rs. 100. The subscription list of the latter opens on September 24 and closes on September 29, or earlier as soon as the total subscriptions amount to the sum called for. Gujarat Board's list opens on October 3 and closes on October 6.

Both the loans are fully guaranteed by the respective State Governments in regard to the payment of interest and the repayment of principal. Both will be trustee securities under the Indian Trusts Act and approved securities for the purposes of the Insurance Act and the Banking Companies Act. They will also be eligible for the purposes of advances under the Reserve Bank of India Act.

During the current Plan period, the generating capacity of the installations owned by the Gujarat Electricity Board is proposed to be increased by about 3,00,000 KW, excluding the 1,50,000 KW to be obtained from the Tarapore nuclear power station. The total funds required by the Board for implementing this expansion programme is estimated at Rs. 47 crores. A major portion of this is to be advanced by the State Government and the balance is to be found by the Board from its own resources, including public loans.

The Third Plan allocation for power to be fed into the Madras grid — its present installation capacity of 5,60,000 KW is envisaged to be doubled — is Rs. 100 crores, nearly one-third of the total outlay of the State Plan. During the first year of the Plan, the Madras State Electricity Board spent Rs. 17.93 crores. The capital programme for the current year is of the order of Rs. 20 crores.

Co-operatives

LOAN TARGETS CROSSED

THE LATEST review of the co-operative movement in India, that for 1958-60—the ninth in the series to be released by the Reserve Bank of India—is notable for its disclosure that the village credit society became the base for the structure of the credit movement, as suggested by the National Development Council—a clear departure from the idea of the large-sized society as the base, as was enunciated by the Rural Credit Survey Committee. Of course, it also includes the customary assessment of the progress of the movement during the two-year period covered. The emphasis on small-sized societies, according to the Report, has resulted in revitalizing the existing small-sized societies, on the one hand, and checking the further formation of larger societies, on the other. Surely, no one will accept as yet that this is the last word on the subject, in view of the heat that this controversy generated at one time.

A noteworthy feature of the co-operative movement during the two years under review would appear to be the credit structure of the movement. The targets in respect of short-term and long-erm loans to agriculturists to be achieved at the end of the Second Five-Year Plan were fulfilled a year in advance, that is, in 1959-60 itself. Thus, as against the target of Rs. 150 crores to be reached in 1960-61 the short-term loans issued by agricultural credit societies during 1959-60 alone amounted to Rs. 154 crores; in the case of long-term loans, the outstanding loans of the Central Land Mortgage Banks were Rs. 28.05 crores in June, 1960, as against the target of Rs. 25 crores scheduled to be achieved in 1960-61. With regard to medium-term loans, however, the amount advanced during 1959-60 remained at only

Rs. 15 crores, as against the set target of Rs. 50 crores. The phenomenal increase in loan operations thus was due mainly to the liberal loans and advances from the Reserve Bank of India, as the Report claims. For, out of the total short and medium-term advances of the order of Rs. 169 crores, as much as Rs. 104 crores (or 65 per cent) were obtained from the Reserve Bank.

During the period under review, the number of primary agricultural credit societies (including grain banks) rose from 1.76 lakhs to 2.13 lakhs, thus registering an increase of 21 per cent. Their membership also showed an increase of 41 per cent from 10.2 millions to 14.4 millions. In the result, the population covered by all types of primary societies too rose to 30 per cent on June 30, 1960, from 27 per cent on June 30, 1958.

With the process of rationalisation of the Central Co-operative Banks attempted to be achieved by amalgamating the weak units with the stronger ones and strengthening their share capital base, the number of Central Co-operative Banks came down from 418 to 400 during the period under review. Their share capital, on the other hand, amounted to Rs. 31 crores, that is an increase of 80 per cent over the position as on June 30, 1958. The review points out that this was brought about by the steps taken effectively to link borrowings of societies with their shareholdings in Central Banks and also by substantial contributions by the State Governments to the share capital of co-operatives.

Kerala

SPEEDING UP INDUSTRIALISATION

AT THE first annual general meeting of the Kerala State Industrial Development Corporation Limited, Mr. K. R. K. Menon, Chairman, underlined that Kerala State be accorded a special treatment for the promotion and development of industries even if it be for a limited period. The special treatment is asked for the reason that there is lack of indigenous risk capital on the one hand and long-distance from the larger capital markets of the country on the other. A reasonable solution to Kerala's large-scale industrial development problem must therefore, necessarily be looked for, Mr. Menon feels, in the direction of positive intervention by the Central Government. Since an adequate number of applications for locating industries in Kerala has not been forthcoming, it becomes important to ensure that out of large number of licences granted throughout the country, an adequate number is diverted to Kerala till such time as this backward State attains a minimum level of industrialisation suited to the requirements of its large population. There is no doubt that a start has been made in this direction by the allocation made recently to Kerala of one lakh spindles out of the total spindles sanctioned by the Central Government for the country as a whole, this, however, needs to be followed up in many more fields.

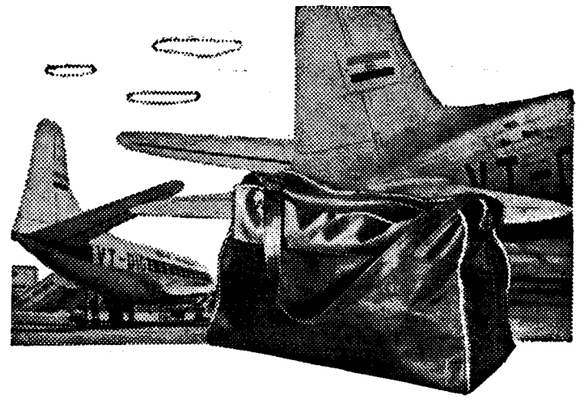
Another important suggestion that Mr. Menon made at the annual general meeting relates to the appointment of a suitable Liaison Officer in New Delhi, who will, among other things function as a close and effective link between the Government of Kerala and the Central Government. The importance of appointing a Liaison Officer needs to be highlighted on the score that it would help to process things quickly. The need to have a reliable data relating to our industrial raw materials is also important as that would help the outside business men to assess things in their proper perspective.

So far as providing financial resources by the KIDC is concerned, Mr. Menon was hopeful that it would be possible to tap the general money market successfully. So there would not be any difficulty in raising additional funds.

Foreign Trade

TRADE WITH EAST EUROPEAN COUNTRIES

IN VIEW of the possibility of U.K. joining the European Common Market, the issue of bringing about a change in the direction of trade has again come to the lime-light. While FICCI formerly seemed to be hesitant to bring about an expansion of trade with the East European countries, it seems of late to be giving second thoughts on it. A review of the whole thing is likely to take place shortly. A certain section is of the opinion so lang as the increase in trade offsets the decline in trade with West European countries, it should be welcomed. The main objection in expanding trade with the Eastern European countries has been because of the fact that our traditional exports are being re-exported. It is now encouraging to learn that steps are being taken to offset this tendency. The latest analysis has revealed that the volume of re-exports to West European markets is very little and should be ignored. Now the customs does not give clearance to the goods meant for the Eastern European area unless the destination is clearly mentioned. This has been done because goods sometimes were exported without any specified destination and later diverted from ports like Aden to West European countries. To tighten the measures Indian missions abroad have also been asked to keep a check on the goods imported by East European countries to see that these are not diverted to Western Europe. The State Trading Corporation has advised all firms dealing with East European area to include in their contracts the specific terms that the goods covered under the contract are not re-exportable.



A factor to bear in mind is that traditional goods exported to the East European countries are very nominal. It may for instance be noted that in the case of tea while total exports amounted to 430 million lbs., Exports to East Europe amounted only to 60 million lbs. So far as jute goods are concerned exports to these countries amounted to only 13 per cent of our total exports, iron ore only 30 per cent, cashew kernel 12 per cent, coffee 30 per cent, mica 10 per cent, tobacco 15 per cent, raw wool 25 per cent and vegetable oils 14 per cent. So this should offset the fear that the traditional trade might only get diverted without any real expansion. The heartening factor in the latest developments is that there has been a gradual increase in the export of non-traditional items. The East European countries are also now aware that India is interested in exporting non-traditional goods to their area.

The total trade between India and East European area was to the tune of Rs. 65 crores in 1958. It jumped to Rs. 130 crores in 1961 and this year's total is expected to touch Rs. 160 crores. The State Trading Corporation has plans to increase the trade target with East European countries to Rs. 200 crores by the end of the Third Five-Year Plan. While the expansion in trade with East European countries is to be welcomed, it needs to be recorded that the expansion with East Europe can be beneficial only if the imports contemplated are predominantly of capital goods or essential raw materials with quality and price comparing favourably with goods available from other areas.

Camphor

MANUFACTURE OF SYNTHETIC CAMPHOR

AT THE first annual general meeting of Camphor and Allied Products Ltd., Mr. N. K. Petigara, revealed that the camphor plant would probably go into production

BANK OF BARODA

TRAVELLERS CHEQUES!

are safe to carry,
convenient to use!

When you travel, travel safely—with Bank of Baroda Travellers Cheques! They can be cashed only if you have counter-signed them!

Bank of Baroda Travellers Cheques are very convenient too! They are available in denominations of Rs 25, Rs 50 and Rs 100, at any of the branches of The Bank of Baroda Limited. Can be cashed at any branch of the Bank of Baroda, State Bank of India, Bank of Rajasthan, and some branches of the Punjab National Bank.

So before you plan a trip, make sure you get Bank of Baroda Travellers Cheques!

THE BANK OF BARODA LTD.

(Estd: 1908) Head Office: Baroda

Branches: Over 135 branches in India and also in East Pakistan, London, British East Africa and Fiji Islands.

JENSON & NICHOLSON

1962

J & N has been producing India's leading paints since 1922. With a pioneering history of forty years, the name Jenson & Nicholson is synonymous with the finest decorative finishes and industrial coatings. The paints featured in this advertisement—leaders in their fields—are only three in a vast range of J & N brands.

ROBBIALAC PLASTIC EMULSION

is excitingly different. It applies easily—brush marks vanish as you paint—and dries in an hour. It leaves a smooth, lustrous, extremely durable finish that will stand repeated washing and scrubbing. Robbialac Plastic Emulsion is especially suitable for decorating walls, ceilings and woodwork.
When planning your new colour scheme, consider Robbialac Plastic Emulsion—choose from 120 delightful shades.

JENSOLAC STOVING ENAMEL

is the perfect coating for metal. It provides a clear, attractive, hard-wearing gloss, and is widely used for refrigerators, typewriters, filing cabinets and other domestic and office equipment.
Industry has clearly demonstrated its confidence in Jensolac Stoving Enamel. As with all J & N's industrial coatings, Jensolac is backed by a Technical Advisory Service second to none ! Staffed with qualified chemists, this service offers expert advice and practical assistance to Industry on any problem involving paint.

ROBBIALAC SUPERGLOSS ENAMEL

is the last word in quality finishes. It represents the most advanced thinking in its field. It combines rich, brilliant tones with a superb gloss. The most versatile coating in the J & N range, Robbialac Enamel can be used, with equally superlative results, for interior and exterior painting. Robbialac Enamel comes in a very wide range of colours. It is recommended for use in homes, offices, shops, showrooms, theatres...anywhere, in fact, where only the finest paint is good enough.

QUALITY SELLS J & N COATINGS

either in April or May, 1963. Originally, the date fixed was December 1962, but the delay, Mr. Petigara explained, was brought in on account of the delay in the purchase of land and also due to the delay in getting the letter of credit from the World Bank. So far as shifting of the factory to Uttar Pradesh from Udhana near Bombay was concerned, Mr. Petigara explained that the decision had to be taken in favour of Uttar Pradesh because of the consideration of the availability of raw materials which were adequate in the State.

The construction of buildings for the various factory units is proceeding at a satisfactory rate. The power requirement not only for the camphor plant but also for future expansion, rising in stages upto 2,000 KVA has been sanctioned by the authorities and will be drawn from Harduaganj Extension Hydel Scheme. It was also revealed that two tubewells were being sunk and pump and auxiliary equipment were being installed to ensure water supply for the entire project. Arrangements were being made for the construction of suitable sidings between the metre gauge and broad gauge railway tracks adjoining the plant-site to facilitate the receipt of plant equipment, raw materials and the despatch of financial goods.

The plant is expected to produce about 500 to 600 tons of synthetic camphor while annual demand for the camphor in India is about 1,000 tons. At present imports through the STC are to the extent of approximately 300 tons. On the completion of the project Camphor and Allied Products Ltd. would not only be a pioneer in the large scale manufacture of synthetic camphor in the country but would also be an organisation well equipped to exploit gainfully various intermediates and bye-products.

Stainless Steel

FIRST PROJECT APPROVED

WITH THE demand for stainless steel continuously rising in the country, it is something heartening to learn that a new public limited company under the management of Messrs. Lallubhai Amichand Private Limited, with an authorised capital of Rs. 5 crores has been promoted for the first time in the country to manufacture stainless steel sheets for industrial and commercial uses. An industrial licence for the first phase of the proposed project has already been issued. The proposed plant, to be located at Vatva near Ahmedabad in Gujarat, will have capacity progressively rising from 15,000 tons to 20,000 tons per annum in stages, thereby effecting considerable saving in foreign exchange. The sheets will be manufactured according to international standard specifications. The manufacturing programme will be undertaken with foreign technical collaboration in production method. Raw materials like steel ingots, low carbon steel ingots, process rejects and ferro-chrome are all available in the country except nickel which is imported. Since most of the raw materials are obtained locally, the price of the product will be slightly lower than prevailing international rates.

The demand for stainless steel is expected to be 50,000 tons by 1965 and 68,000 tons by 1970. At present, the entire requirement is imported and the present import figures are a mere 4,000 tons. Stainless steel sheets are, therefore, scarce and attempts to manufacture them locally must attract wide support.

Rubber

THE PROBLEM OF REPLANTING

THE PLANTING COMMITTEE of the Rubber Board decided recently to recommend to the Government of India to issue new planting licenses only to holdings using high-yielding planting seedlings. This decision was necessitated as a measure to meet the criticism of the Estimates Committee of the Lok Sabha. The Planting Committee has decided to discourage rubber plantations situated 1500 feet above sea level as plants at this allevation are more vulnerable to disease and as such uneconomical. These decisions are likely to be enforced from 1963. The rubber industry as such is facing the crisis of production. During the last decade countries producing raw rubber have recorded spectacular increases in the yield but in comparison improvement in India has been quite meagre. During the 10 years—1950-60—the area under raw rubber increased from 149,600 acres to 173,600 acres and output increased from 17,148 to 24,795 tons. This represented an increase in the average from 263 lbs. an acre to 320 lbs. an acre. As indicated earlier, yield improvements in other rubber producing countries have been much more. It may be pointed out that the Government of India was not mindful of this fact until 1957 when a proper scheme for the replanting of old areas was evolved. It was provided that 70,000 acres of plantation would be replanted in 10 years and for that a subsidy from Rs. 250 to Rs. 400 per acre was provided. It was observed in 1960 that the progress was not satisfactory and in that year the rate of subsidy was raised to Rs. 1,000 per acre. Now it is estimated that during the next few years—by 1965—the replanted area would be more than 50,000 acres.

One very significant problem of replanting is that large portion of the rubber estates have been planted with ordinary seedlings instead of higher yielding special seedlings. Taking this into consideration the Tariff Commission recommended in 1960 that no licence should be given in future for the planting of rubber with ordinary seedlings and the same was the view held by the Estimates Committee. This decision has to be welcomed. This naturally will lead to higher productivity in the rubber estates. It is only through higher productivity that natural rubber will ultimately be able to compete in terms of prices with synthetic rubber which soon will be produced in the country in large quantities. Unless the quality of output through higher yielding special seedlings is improved, the returns of rubber estates cannot be sufficiently competitive.

CENTRAL REVENUE COLLECTIONS IN JULY

THE REVENUE realised from items on which duties are levied and collected by the Central Government in the first four months of the financial year 1962-63 amounted to Rs. 305.63 crores. Of this, Rs. 75.42 crores were collected during July last. The corresponding figures for the first four months of the financial year 1961-62 and for the month of July, 1961, were Rs. 269.48 crores and Rs. 67.24 crores, respectively.

The following are the details of the revenue realised under various heads :

(In Rs. lakhs)

Revenue Head	July		April to July	
	1962	1961	1962-63	1961-62
1. Customs	17,69	15,52	76,60	61,24
2. Union Excise Duties excluding cesses on Salt, Coal & Iron Ore	46,35	38,50	177,60	152,10
3. Corporation Tax ..	2,75	3,76	21,64	23,56
4. Income Tax	7,91	8,36	26,84	29,09
5. Estate Duty	36	28	82	81
6. Taxes on Wealth ..	23	23	79	82
7. Expenditure Tax ..	1	3	2	8
8. Gift Tax	3	3	14	14
9. Opium	9	53	1,18	1,64
TOTAL	**75,42**	**67,24**	**305,63**	**269,48**

FROM THE CAPITAL'S CORRIDORS

PRICE POLICY

THE difference of opinion between the Union Minister for Economic Co-ordination, Mr. T. T. Krishnamachari, and some of his colleagues in the Union Cabinet on the genesis of the price problem of India threatens to erupt into a full-fledged showdown in another few days, soon after Prime Minister Nehru returns to the capital from his tour abroad. The Union Cabinet which considered the price policy for the Third Plan period at its meeting about a fortnight ago, according a knowledgeable sources, preferred to follow a line of drift on the assertions made by some Ministers concerned with economic matters to the effect that there had been no abnormal rise in the prices of commodities and that some rise in prices was inescapable in a developing economy. Mr. T. T. Krishnamachari is understood to be not subscribing to this view and is reported to have submitted his thesis on this problem to the Prime Minister some time ago. The matter, according to the indications available, would be thrashed out on Prime Minister's return to New Delhi.

Meanwhile, a preliminary statement on the price policy to be followed by the Government was issued last week. It stated:

"The Government have recently considered a preliminary report from the Planning Commission on the subject of price policy. It has been decided that larger quantities of wheat should be released from stocks for fair-price shops so as to bring about a decline in prices to about the level of last year in areas in which there has been a tendency for prices to rise. Action along these lines is being taken by the Ministry of Food and Agriculture. It has also been decided that releases of sugar should be so arranged as to maintain prices at the level of the control prices prior to decontrol and, if possible, a little below this level. With this object, the Ministry of Food and Agriculture have made a special release for areas in which there have been indications of rise in sugar prices. The Ministry are also arranging for releases from stocks on a larger scale to cover the requirements of the next two or three months, during which consumption is likely to rise on account of the Diwali and Puja holidays.

"With a view to working out detailed proposals in respect of rice, millets and oilseeds and of industrial commodities which enter into common consumption, the Planning Commission is constituting two separate study groups including representatives from the Ministries of Food and Agriculture, Commerce and Industry, Finance, Community Development and Co-operation, Labour and Employment and Railways. One study group will consider the prices of food and agricultural products and the second those of other essential consumer goods such as cloth, salt, soap etc. Both groups are expected to submit their first reports early in October.

"Since there has been a marked rise in the prices of fruits, vegetables, eggs and milk, the Ministry of Food and Agriculture are working out proposals for intensifying the present production efforts in respect of these commodities, particularly in the neighbourhood of large towns. The Ministry are also preparing special projects for securing a substantial increase in fish production.

"In implementing various measures, co-operative and other consumer stores have an important part to play, specially in urban areas. The Department of Co-operation has been asked to work out the necessary proposals. It is also proposed that consumer stores should be set up for the benefit of their employees by organisations such as public and private industrial enterprises, representative associations and Departments, Corporations and other offices. Among other measures for maintaining prices of essential commodities at reasonable levels are the display of prices by all dealers, widespread publicity, association of local consumer organisations and steps to harness public support, including voluntary organisations, municipal bodies, Panchayats and Panchayat Samities.

"Government are attaching the utmost importance to measures for ensuring stable and reasonable prices for all commodities which enter into general consumption. In seeking this objective, it is an essential aspect of Government's price policy that the agricultural producer must be assured a reasonable return and his interests fully protected. For the success of any policies that may be adopted, it is important that hoarding, profiteering and speculation should be dealt with as antisocial activities and that the distribution machinery, both wholesale and retail, should be enabled to function in the best interest of the community. For securing the objectives of price policy and active support and participation of trade, industry and labour, of consumer associations and voluntary organisations throughout the country, and of the Press are vital and necessary conditions. Government, therefore, seek their fullest co-operation in working out the details of proposals and solving the practical problems involved and in implementing the measures which are decided upon."

Following this statement, the monthly release of sugar has been stepped up by the Union Ministry of Food and Agriculture from 2.25 lakh tons to 2.50 lakh tons. Greater supplies are also stated to have been effected in the last few days of imported wheat to the fair-price shops. The two working groups mentioned in the above statement have also been constituted and they are understood to be engaged in their fields of study.

RESOLVING FOREIGN EXCHANGE CRISIS

With export trade not picking up to any appreciable degree and the foreign exchange reserves of the country continuing at a critical level, some hard thinking is understood to be going on in the Union Ministry of Commerce and Industry for import substitution and devising of measures to step up exports to the extent possible.

The Union Ministry of Heavy Industries last week had a meeting with the representatives of the automobile industry at which the stepping up of the indigenous component in automobile manufacture came under discussion. The automobile industry is stated to have assured the Govednment that the industry would endeavour to step up the indigenous content in its products to 90 per cent of the components by 1963-64. The automobile manufacturing units, it is learnt, mould be shortly applying for the import of capital goods with a view to undertake the manufacture of various components hitherto imported.

Another important meeting in this connection was held by the Union Ministry of Heavy Industries with the representatives of ancilliary industry to work out details for standardisation of components. Similar talks were held with the cement plant manufacturers. According to the present thinking in the Planning Commission, an analysis of heavy plants into their various components is favoured with a view to standardise

Tower Bridge, London one of the 43 cities in Europe served by KLM

What you should know about the remarkable reliability of KLM before your next flight to Rome, Frankfurt, Zurich, Amsterdam, Paris London, or any of 37 other cities in Europe

KLM carries an average of 3830 passengers every day—about twice the capacity of a big ocean liner. More than 30 per cent of KLM's maintenance work is done for other airlines. A remarkable vote of confidence in KLM reliability. Read 20 other facts about KLM.

1. A KLM plane takes off or lands every four minutes somewhere in the world.

2. KLM flies to 43 cities in Europe alone—and to every continent on earth.

3. A KLM DC-8 jet leaves for Europe every Tuesday from Calcutta, every Saturday from Delhi and on Mondays, Wednesdays, Thursdays, Saturdays and Sundays from Karachi.

4. KLM was the first airline to carry freight to the Far East. Today it is one of the leading air-cargo carriers to operate worldwide.

Experienced crew

5. A KLM pilot achieves rank by hard work. After twelve years of flying, he may become a Pilot First Class.

6. Every KLM stewardess takes a special course in baby care during training and loves to look after children during the flight. KLM provides many special services for young travellers.

7. Two senior KLM stewardesses fly KLM's world-wide routes constantly to check that standards of service are being maintained.

DC-8 jet—never out of radio contact

8. KLM's DC-8 jets are never out of direct radio contact with a ground station. When they leave the area of the airport they have just left, they immediately tune into the next airport. The captain himself does most of the talking.

9. A DC-8 jet is an intercontinental jet. It has a hundred subtle refinements. KLM engineers installed what years of experience have taught them are the most reliable, navigational, radar and communications equipment.

10. Every KLM DC-8 jet carries about two hours more fuel than it needs—enough to fly an extra 1,100 miles. An expensive precaution. The extra fuel load is equivalent to 12,000 kgs. (26,460 lbs.) of paying freight.

Service on board

11. KLM chefs cater for special diets. Specify your diet when you book your seat. Meatless meals are usually available on Fridays on European runs and between the US and Amsterdam. Oriental food and vegetarian food are available, too.

12. KLM loves babies. It supplies cots that hook firmly to the racks, leaving mother's lap uncluttered. Your stewardess helps prepare your baby's food.

13. For older children, KLM carries a mysterious bag of tricks filled with toys and games and picture books that keep children quiet for hours on end.

Via attractive Amsterdam

14. KLM's westbound DC-8 jet flights from Calcutta and Delhi depart at a very convenient time (on Tuesdays at 20.20 hours from Calcutta and on Saturdays at 22.00 hours from Delhi.) The arrival times in Rome, Zurich, Frankfurt and Amsterdam are convenient too—next morning.

15. Both these services offer same day connections at Amsterdam to London, Glasgow, Paris, Hamburg, Copenhagen, Stockholm, Oslo, Stuttgart and many other cities in Europe.

16. KLM also offers you a choice of five DC-8 jet flights a week to Europe from Karachi, providing same day connections at Amsterdam to many major cities in Europe. Convenient connecting flights to Karachi available from Bombay and Madras as well as from Calcutta and Delhi.

17. Holland Minitours may be varied to suit individual tourist taste. They usually include a visit to Diamond-cutters' workshops, a flower auction, a museum and a boat tour on Amsterdam canals.

18. Amsterdam's central location makes it the natural hub for your European tour. It offers excellent opportunities for travel by boat, road, rail, or air to all of Europe.

19. Make a point of routing your European trips through Amsterdam for the Tax-Free Shopping bargains.

20. Ask your KLM travel agent about the many stopover opportunities available on the KLM Multi-Stopover Plan. In many cases you may be able to fly to several extra cities, not necessarily on the direct route, at no extra air fare!

How ISI Helps the Manufacturer

BY PROVIDING THE SEAL OF INTEGRITY

The ISI Certification Mark may be given to any manufacturer whose products are made to the relevant Indian Standards. It is a recognition of his business integrity and trustworthiness.

Modern methods of quality control, an essential part of any scheme of certification, bring about many economies in production through elimination of defectives, increase in productivity, and securing of uniform quality of output. These benefits far outweigh any additional cost involved in instituting continuous inspection and testing.

Periodical check-up by ISI of manufacturers' own quality control systems constitutes an invaluable service to ensure top management of the high efficiency of production and maintenance of quality.

Consumer satisfaction and competitive marketing position are the obvious advantages enjoyed by all ISI Mark users.

Enquire for details NOW how you too can join the distinguished company of manufacturers who already hold the ISI Certification Mark Licence.

INDIAN STANDARDS INSTITUTION

NEW DELHI • BOMBAY • CALCUTTA • MADRAS • KANPUR

them. This, it is claimed, would help in mobilising the general engineering capacity in the country to a greater extent. This school of thought does not favour specialisation, that is one unit manufacturing only say sugar plants and another one only cement plants.

In regard to the manufacture of cement plants, it is pointed out that foreign exchange at the flat rate of Rs. 8 lakhs per unit would no longer be allocated "as a matter of course". Allocations of foreign exchange for the manufacture of these plants, as also for the machinery and equipment to be manufactured for various other industries, is envisaged to be progressively reduced.

With a view to step up export earnings, opinion seems to be veering around the fact that to compensate for the shortfall in exports to Western Europe, more and more diversification of trade to the Communist bloc may have to be resorted to. The State Trading Corporation is understood to be negotiating with the Czechoslovak Government opening of an office in Prague which would look after its trade interests in the eastern bloc.

OIL MATTERS

The Nunmati Refinery is understood to have again run into difficulties. Refining of crude here, it is learnt, came to a standstill a few days ago. But this time the difficulties of the refinery have nothing to do with any operational defect in it or crude supplies. In fact, the refinery stopped entertaining crude supplies from Oil India's Nahorkatiya oilfields nearly three weeks ago. Knowledgeable circles reveal that the current difficulties of the refinery are attributable to lack of moving the end-products due to railways not being in a position to supply adequate number of tank-wagons. This has led to piling up of stocks in the refinery storage and until and unless these stocks are moved from there and the storage capacity released, the refinery will not be able to pick up production to its normal level.

The cost of laying the second stage of Oil India's crude pipeline, connecting Nunmati with Barauni, it is learnt, is likely to go up as a result of quite a number of bursts having been located during the hydraulic tests on the sections of the pipeline where pipes supplied by Hindustan Steel Limited were made use of. All the operations, excepting a few discontinuities, on this section of the pipeline are stated to have been completed. Out of the 66 river crossings, as many as 59 have already been finished. In regard to the remaining seven, work is stated to be progressing satisfactorily. Four out of the five pumping stations are stated to be in operational readiness. The mechanical and electrical installations in regard to the fifth one are at an advanced stage. The work of laying the pipeline across the Brahmputra over the rail-bridge is also stated to be at an advanced stage of execution. As many as 124 roller hangers, out of a total of 170 required to take the pipeline across the Brahmputra bridge, have already been fixed. The hydraulic testing of the completed sections of the pipeline is in progress and the project is expected to be completed by the end of February, 1963, unless the number of leaks discovered during hydraulic testing does not go up abnormally. The present rate of discovery of leaks in the pipes is, however, considered to be rather on the high side.

The drilling operations of Oil India in its Naharkatiya-Moran oilfields are stated to be going on well. Upto August-end, 135 wells had been drilled. Out of these, 102 wells were established as commercial producers of oil and gas, 17 wells remained to be tested and only 16 had proved dry. The deliveries of crude to the Nunmati Refinery through the pipeline since May 31, 1962, when the refinery started receiving regular supplies of crude oil through the pipeline, totalled 77,385 tonnes, which gives an average off-take by the refining of 1,450 tonnes of crude a day. Deliveries of crude in August amounted to 26,546 tonnes.

The Board of Directors of Oil India held its 35th meeting at Shillong for the first time where the progress of its drilling and pipe laying operations was reviewed.

NAPHTHA CRACKER UNIT

The Government of India, it is understood, has approved the proposal of ESSO Standard to set up a 2,00,000 tons naphtha cracker unit near its refinery at Trombay, provided it goes into partnership with Union Carbide or the Mafatlal Group of Industries. The Government is stated to be now awaiting ESSO Standard's reactions to this partnership proposal.

ESSO authorities, it is learnt, however, have received no official intimation in this regard so far and as such consider that the question of giving their reactions to the proposal does not arise.

ESSO Standard, then the Standard-Vacuum Oil Company, had applied some two years ago for the grant of a licence to set up a naptha cracker unit of 1,00,000 tons capacity. But after about three or four months' time it submitted a fresh application for the grant of a licence for a 2,00,000 tons units. The increased capacity was asked for by the company for it considered, after taking into consideration the marketability of its products, that the 1,00,000 tons capacity unit would not be an economic proposition. Recently, the Union Government got the requirements of lubricating oils — the end-products of the naphtha cracker unit — in the region where supplies by ESSO Standard were to be effected, estimated by a French oil expert who opined that the anticipated requirements warranted the setting up of a 2,00,000 tons capacity unit. The Government's proposal to ESSO Standard to go into partnership with Union Carbide has its genesis in the fact that Union Carbide holds a licence to set up a 60,000 tons capacity naphtha cracker unit. Details about the proposed partnership with the Mafatlal Group are not yet known.

THE COAL STORY

The triumph of ideology over planning in the case of oil industry was reported in these columns a few days ago. Something similar is happening in the coal industry. It may be recalled that in March 1960, the National Coal Development Corporation had asked for assistance from the French Government to help it with the problem of deeply inclined seams so as to maximise their output during the Third Plan. In July 1960, a top-level French expert, Mr. Signard visited India and submitted his report which outlined that (1) obsolete methods left unexploited greater part of the coal, so that output per man was 1/5th of output in France; (2) mining policy was bureaucratic, overcautious, often guided by rule of thumb and above all as unrealistic; and (3) wage-policy gave no incentive to productivity.

In August 1961, a mission of two French mining engineers, specialists in "depillaring", "stoving" and "sub level caving" visited India. One of their findings was that for Burkunda mine (Karampura basin) the best method was sub-level caving, to be first demonstrated by a large-scale trial carried out by a French team composed of 1 engineer, 3 foremen and 18 skilled workers.

In March 1962, the Ministry of Mines and Fuel and the National Coal Development Corporation are believed to have accepted these recommendations. Consequently, on March 27, 1962, the French Embassy proposed a joint programme, along the following lines: (a) foreign exchange cost to be covered by the French Government, ex-

cept for equipment left over after use by French teams, (b) cost in rupees to be borne by National Coal Development Corporation, allowance and accommodations being provided for engineers, foremen and workers from France; (c) cost of equipment to be paid by National Coal Development Corporation, except for depreciation during use by French teams; due to quick rate of depreciation chosen (2½ years), half of the cost remains with the French. In all this the cost to the French side would have been roughly 4 to 5 lakhs. This was followed by a three-week visit to France of the Chief Inspector of Mines and Mr. Chari to show them actual working of sub-level caving, in similar conditions.

Now it has been indicated that the Chief Inspector of Mines, in his reports, is believed to have refused everything connected with sub-level caving in deeply inclined seams on the ground that the method was too complicated for Indians to operate safely. He has recommended sand stowing, even if sand were not available closeby. As matters stand now, a new expert mission with sand stowing in view may be necessary. It may be added, in this connection that the Charbonnages de France, which is the operator of all coal mines in France and a state-owned undertaking, had pledged its full support to the programme and had committed its success, provided its basic recommendations were followed up.

FERTILIZER MANUFACTURE

The Union Government has approved the collaboration agreement between Andhra Sugar Limited and Allied Chemical Corporation of the U.S.A. for setting up a fertilizer plant at Kothagudum, in Andhra Pradesh. The project will cost Rs. 16 crores, including Rs. 9.5 crores in foreign exchange. Allied Chemicals will be allotted 40 per cent share in the equity capital, 30 per cent will go to Andhra Sugar Limited and its nominees, and the remaining 30 per cent is to offered to the public for subscription.

Allied Chemicals will invest Rs. 2 crores. A World Bank Mission is expected to visit the site by the end of September or early in October in order to appraise the soundness of the project. This study is to be made by the World Bank for an approach has been made to it to provide a loan to finance the gap in the foreign exchange requirements.

If all goes well, production at this factory is expected to start by 1964.

ANOTHER IDA LOAN

The International Development Association (IDA), an affiliate of the World Bank, has extended to India another development credit equivalent to $42 million (Rs. 19.99 crores. The funds will be utilized by the Posts and Telegraphs Department for the purchase abroad, during the next two years, of the equipment to expand and improve telephone and telegraph services.

The allocation for investment in telecommunications during the Third Five-Year Plan has been set at Rs. 134.5 crores. Of this, about $100 million (Rs. 47.6 crores) will be in foreign exchange. The programme will be carried out by the Telecommunication Branch of the Posts and Telegraphs Department. The Branch has substantial earnings. In addition to covering its own operating expenses and depreciation charges, it expects to provide from its own funds the equivalent of $120 million (Rs. 57.12 crores) towards the expansion programme. The remaining funds required, including the proceeds of the $42 million IDA credit, will be made available by the Central Government in accordance with the normal practice as a permanent investment on which the Posts and Telegraphs will pay the Central Exchequer an annual charge of 4½ per cent.

JAPANESE COMPETITION TO AIR-INDIA

Air-India will shortly have another competitor on its Toyko-London route. According to Japanese sources, the Japan Airlines is planning to open on October 4, its Tokyo-London service via Hongkong, Bangkok, Calcutta, Karachi, Kuwait, Cairo, Rome and Frankfurt. In London, the new service will connect Japan Airlines' other Tokyo-London service via North Pole. B.O.A.C. has pooling arrangements with Air-India. With the exception of the Belgian Airline, Sabena, all the international air carriers operate through India. Thanks to the Ministry of Finance, the revenue of Air-India has been seriously affected by the recent curbs on foreign travel. A much more effective weapon to impress the world, knowledgeable circles opine, would have been to ban participation in International Conferences, pending the foreign exchange crisis. This would have saved much more foreign exchange than the ban on foreign travel would.

IMPORT POLICY OF GOA

The import policy in respect of three former Portuguese enclaves on Indian soil—Goa, Daman and Diu—for the period commencing from October 1, 1962, is understood to be under active consideration of the Government. During January - March, 1962, imports into Goa were limited to ⅛th of the imports effected through the Marmagao port during the calendar year 1961. For the six months period to September-end, the policy was revised keeping in view the necessity of bringing the pattern of import trade of Goa in line with that of the rest of the country, but, at the same time, not upsetting the arrangements in regard to certain items of special economic significance to the former Portuguese enclaves so as to allow the established traders there to adjust themselves to the changed conditions. According to this policy, imports into Goa were divided into three categories. Imports of 102 items were banned, imports of 21 items were allowed liberally for actual users and the import of another 23 items was restricted to 10 per cent quota of the imports in 1961.

The following is the list of the items allowed to be imported into Goa on the quota basis by established importers:

(1) Milk (powdered and condensed); (2) Butter; (3) Cutlery, excepting safety razors and blades; (4) Fishing nets and yarn; (5) Perfumery, lotions, powders etc. (toilet); (6) Spices; (7) Watches, and time-pieces (below Rs. 100); (8) Celluloid and gelatine material; (9) Meat (tinned); (10) Whisky; (11) Cognac (Brandy); (12) Wines (common red); (13) Wines (common white); (14) Wines, foaming like Champagne; (15) Wines (port); (16) Liquors; (17) Paper (printing); (18) Paper (wrapping); (19) Textiles such as twill and satein Italians, super mulls, umbrella cloth, fine lawns and muslins, organdies, poplins, fashion prints, namely, prints with permanent synthetic resin finishes designed to give properties like crease resistance, abrasion resistance, permanent glaze voils, lappets, satin drills and jeens, satin drills; (20) Cheese (tins and balls); (21) Foodstuffs (sundry); (22) Tinned foodstuff; and (23) Paper and cigarettes.

TEXTILE EXPORTS TO USSR

The details of the recently announced deal regarding export of 1.8 million metres of printed cotton textiles, valued at Rs. 25 lakhs, are understood to be under discussions with the buying organisation of the Soviet

The Third Five Year Plan
Bird-Heilgers' part in it...

MADE IN INDIA

A SIMPLE PHRASE...
...VITALLY IMPORTANT!

"...special emphasis is being placed on... steel and machine-building and the manufacture of producer goods". The Third Plan very rightly stresses the need for rapid industrial development. Every new project for domestic production creates employment, saves foreign exchange, adds to the national striving for economic independence. The expansion of indigenous manufacture is critically important, and Bird-Heilgers is deeply committed to this decisive aspect of the Plan.

Steel for a solid industrial base

Steel is the very life-blood of an economy. Industries, utilities, homes, all depend on steel. Steady steel production depends, in turn, on the uninterrupted supply of minerals to the nation's blast furnaces. Bird-Heilgers supplies these minerals. Between 1957 and 1961, the group's output of minerals—coal, dolomite, iron and manganese ore and limestone—shot up almost 100% to well over 6,000,000 tons. The group will continue to help meet demand...to feed the blast furnaces with the minerals they must have

"Made in India"—by Bird-Heilgers

A vast range of products, hitherto imported, are now manufactured in India by Bird-Heilgers. The group produces jute goods, paper and board, water treatment equipment, air compressors and springs, castings and fabricated steel. The refractory manufacturing plant is the largest single unit in the East. A factory for the production of coal washeries was the first in India.

The group's engineering units are extremely flexible. They contribute, with equal facility, to projects as far removed as blast furnaces and ceramic plants. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. The agency department handles everything from heavy capital equipment to light consumer goods.

Towards a self-generating economy

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group is alive to the problems of a growing economy. It deploys the full potential of a century's resources, technical knowledge and executive skill to broaden its activities...increase domestic production...join in the national drive to economic independence.

BIRD & CO., (PRIVATE) LTD., F. W. HEILGERS & CO., (PRIVATE) LTD.,
Chartered Bank Buildings, Calcutta-1

Union. The USSR is stated to be interested in placing another order for approximately 7 lakh metres of bleached sheeting, valued at approximately Rs. 10 lakhs, with this country. This new order, it is learnt, is under negotiation at present.

JAYANTI SHIPPING

According to a London report, Court Line is negotiating to sell to the Jayanti Shipping Company half of its fleet. Finalisation of this deal rests on the Government of India's approval which is being sought.

TEA PLANTING RULES

In the context of the production target of 900 million lbs. for the end of the Third Plan period for the tea industry, the Tea Planting Rules, governing grant of permission for extension of tea cultivation, are to be further liberalised so as to bring about an increase in production of tea. The provision under the Rules as obtaining today and as proposed to be amended is as follows:

Permissible acreage of estates at the commencement of each five year period.	Present ceiling for extensions.	Proposed ceiling for extensions.
Upto 10 hectares	40% of the area	10 hectares.
Above 10 but not exceeding 60 hectares	40% of the area	100 per cent.
Above 60 but not exceeding 200 hectares	25% upto 120 hectares 15% of the area above 120 but not exceeding 200 hectares.	60 hectares
Above 200 hectares	15 per cent	30% of the permissible.

CENTRAL SHEEP AND WOOL RESEARCH INSTITUTE

Two Australian experts are arriving in India shortly to help establish the Central Sheep and Wool Research Institute at Malpura, near Jaipur, in Rajasthan, it is learnt here. One is an expert in sheep husbandry and the other in shearing and grading of wool. Their services have been secured by the Government of India under the Colombo Plan. Later, some experts will also be supplied by the U.N. Special Fund, which has agreed to meet a part of the expenditure on the Institute by providing equipment and technical personnel.

The Institute will have two sub-stations, one in Kulu Valley in Punjab and the other near Kodaikanal in Madras State. The total outlay on the project is estimated at about Rs. 75 lakhs during the Third Plan period.

These research institutions will, among other things, help develop improved sheep breeding and sheep husbandry techniques. Trials in acclimatisation of imported breeds and supply of high-grade rams for breeding purposes will also be one of their main functions. Besides, they will undertake special studies on wool technology in relation to sheep production and on basic aspects of sheep health.

IN BRIEF....

According to an Import Trade Control public notice issued here, applications for import licences under the Export Promotion Scheme will be entertained even during the month in which the exports are effected and payments received, provided the necessary documents regarding the export of goods and earnings of foreign exchange are produced by the applicants. Hitherto, the applications for import licences under this scheme were being entertained on quarterly on monthly basis.

•

The Indian delegation to the seventh session of the Metal Trade Committee of the ILO, currently being held in Geneva, is being led by Mr. S. W. Zaman, Economic Counsellor in the Indian Consulate-General in Geneva. The other members of the delegation are Mr. Madhu Sudan S. Cashish, of Jagadhari Metal Mazdoor Sabha, Mr. Trilochan Karmarkar, of Tata Workers' Union (Workers' Representatives), Mr. D. P. Mukherjee, of Philips India Ltd., and Mr. Brij Krishna Gupta, of Victor Cable Corporation (Employers' Representatives). "Acceleration of technological progress and its influence on the effective utilisation of manpower and the improvement of workers' income" and "the working conditions and safety in ship building and ship repairing" are among the items to be discussed at this meeting.

•

Applications from established importers, who have imported exposed cinematograph films in the basic period up to and including 1956-57, for importing from Pakistan exposed films (in Indian and Pakistani languages) during the current financial year will be considered on an ad hoc basis by the Deputy Chief Controller of Imports (CLA), New Delhi. Import of such films will be permitted only on the basis of outright sale and subject to the condition that payment for imports will be made in non-convertible Indian rupees through Account "A" maintained by the National Bank of Pakistan with the State Bank of India as provided for in Protocol No. I to the Trade Agreement between the Government of India and Pakistan signed on March 21, 1960.

•

The National Coal Development Corporation recently signed a contract with Messrs. Tjazhpromexport, Soviet Trade Organisation, for the supply of equipment for the Central Workshop to be set up at Korba, in Madhya Pradesh. The supplies are to be financed out of the first credit of 500 million roubles made available by the Soviet Union to the Government of India in November, 1957. In addition to equipment, the U.S.S.R. will depute two specialists in mechanical and electrical engineering each to assist in the erection and commissioning of the workshop.

•

The Government of India has decided to purchase the Alnavar-Dandeli metre gauge railway line, (length 19.12 miles) from the Mysore Government. This line is already being worked by the Southern Railways. The purchase deal will be effected on October 1, 1962.

•

The All-India Handicrafts Board is convening a marketing conference here from September 20 to 22, 1962, which will be attended by the Marketing Officers from States and representatives of various emporia all over the country. The conference is being convened with a view to analyse and study the raw materials and the marketing problems of handicrafts in India and to take suitable steps to promote and increase the sales of handicrafts.

NEWS IN BRIEF

INDIA

General Tyres Ltd., Calcutta, is setting up a tyre manufacturing factory near Calcutta, with Czech co-operation. The factory is expected to go into production this December and will provide employment to about 1,000 persons.

*

The National Coal Development Corporation will build its second Central Workshop at Korba, Madhya Pradesh, with Soviet financial and technical collaboration. The workshops will be equipped to manufacture spare parts, carry out major repairs to mining machinery, and construct steel structurals for mining projects. The project is expected to cost about Rs. 2 crores.

*

The Indian Council of Agricultural Research will hold an All-India Banana Show in Calcutta on September 29 and 30, 1962.

*

Vummidiars (Mfrs.) Private Ltd., Madras, has been granted a licence to set up a factory to produce 7,000 tons of stainless steel per annum at an estimated cost of Rs. 5 crores. The machinery will be imported from Japan under the Yen Credit Agreement. Arrangements are being made for technical co-operation with two British firms.

*

Plans are afoot to set up stock exchanges in Bangalore and Patna.

*

The Union Government intends to double the railway lines between Calcutta and Madras during the Fourth Plan period in an effort to solve the chronic transport difficulties on this system. This project would involve the construction of additional bridges and rail lines.

*

The Union Minister for Food and Agriculture, Mr. S. K. Patil, laid the foundation stone of the Vizhinjam fishing harbour, near Trivandrum, Kerala State, on September 12. This Rs. 4 crore project is expected to be completed within five years, and would contribute substantially to the fish output of the State.

*

The State Trading Corporation has concluded arrangements for the export of 1,80,000 metres of woollen textiles to the Soviet Union and Hungary this year.

*

Preliminary work on the Rs. 200 crore Beas Dam project is expected to be started shortly.

*

Meters and Instruments Private Ltd., has obtained a licence to manufacture 48,000 polyphase meters and 18,000 current transformers per annum in its factory at Chandigarh.

*

The Federation of Insurance Institutes plans to establish a training college in Bombay for General Insurance executives.

*

The World Trade Department of the Indian Chamber of Commerce is organising a Foreign Trade Seminar at Calcutta in October 1962.

FOREIGN

The International Development Association has provided a credit of $3 million to Nicaragua to finance the expansion and improvement of the water supply system in the capital city of Managua.

*

The Government of Cyprus and the International Monetary Fund have agreed to establish an initial par value for the Cyprus pound at 0.357143 Cyprus pound per US dollar.

*

The plastics division of the ICI has developed a new type of glass-filled nylon, coded "Maranyl A 190", which is claimed to be suitable for the replacement of metal parts and has mechanical and thermal properties much superior to those of existing nylons.

*

The Singapore Government is floating a $ M60 million loan to finance its 4-Year Development Plan projects.

*

A Soviet IL-18 airliner has begun the first weekly service on the new international line Moscow-Belgrade-Rabat-Conakry-Accra.

*

The Japanese Economic Planning Agency's report claims that the Japanese economy is growing at a nominal growth rate of 18.9 per cent, and in real terms at about 13 per cent.

*

The Egyptian Five-Year Plan Organisation has signed a contract with a British firm for the supply of a worsted combing mill valued at £1 million.

*

A Unesco-sponsored conference on the development of public libraries in Africa will be held in Enugu, capital of Eastern Nigeria, from September 10 to 22.

*

The first off-shore oil test of the Kuwait Oil Company was recently started at a location in Kuwait Bay, half a mile north of Kuwait City.

*

The "flying bike"—the pedal aircraft built by a group of de Havilland employees will shortly attempt a mile-long experimental flight.

*

The United Nations Economic Commission for Africa has decided to undertake a thorough study of African trade, in the light of the perspectives of the European Common Market.

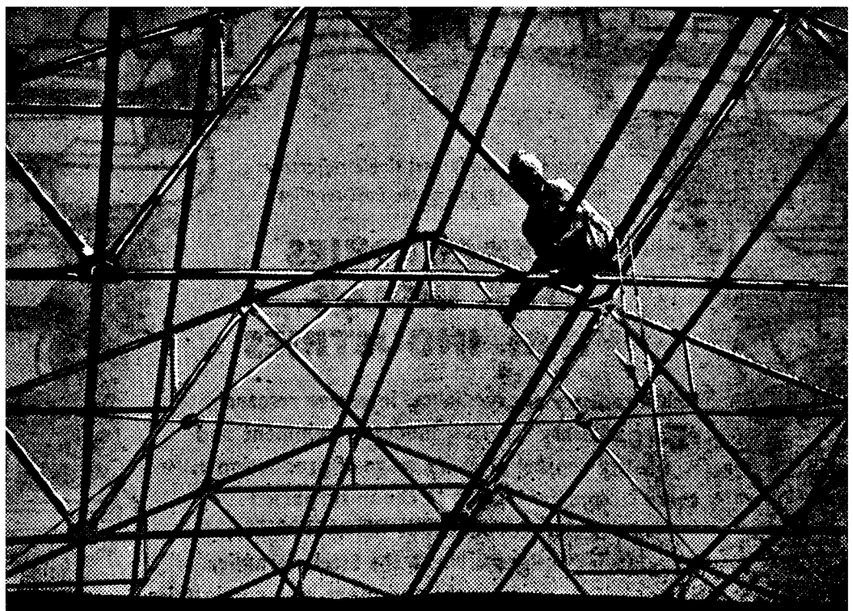
*

The 20 million dollar mile-long high level bridge over the Panama canal on the authorised portion of the Inter-American highway, between the Texas border and the canal, will be opened to traffic on October 12.

*

Soviet Union's foreign trade has risen in value from $1,400 million in 1946 to $11,200 million in 1960, according to a recent estimate of the United States Commerce Department.

*



The Singapore Government plans to start a shipbuilding and repairing yard at an estimated cost of £2.6 million with Japanese collaboration. The yard will build mostly small vessels for coastal trade in South-East Asia.

*

Czechoslovakia, with one television set per 11.8 inhabitants, has surpassed such European countries as Austria, France and Italy in the matter of television.

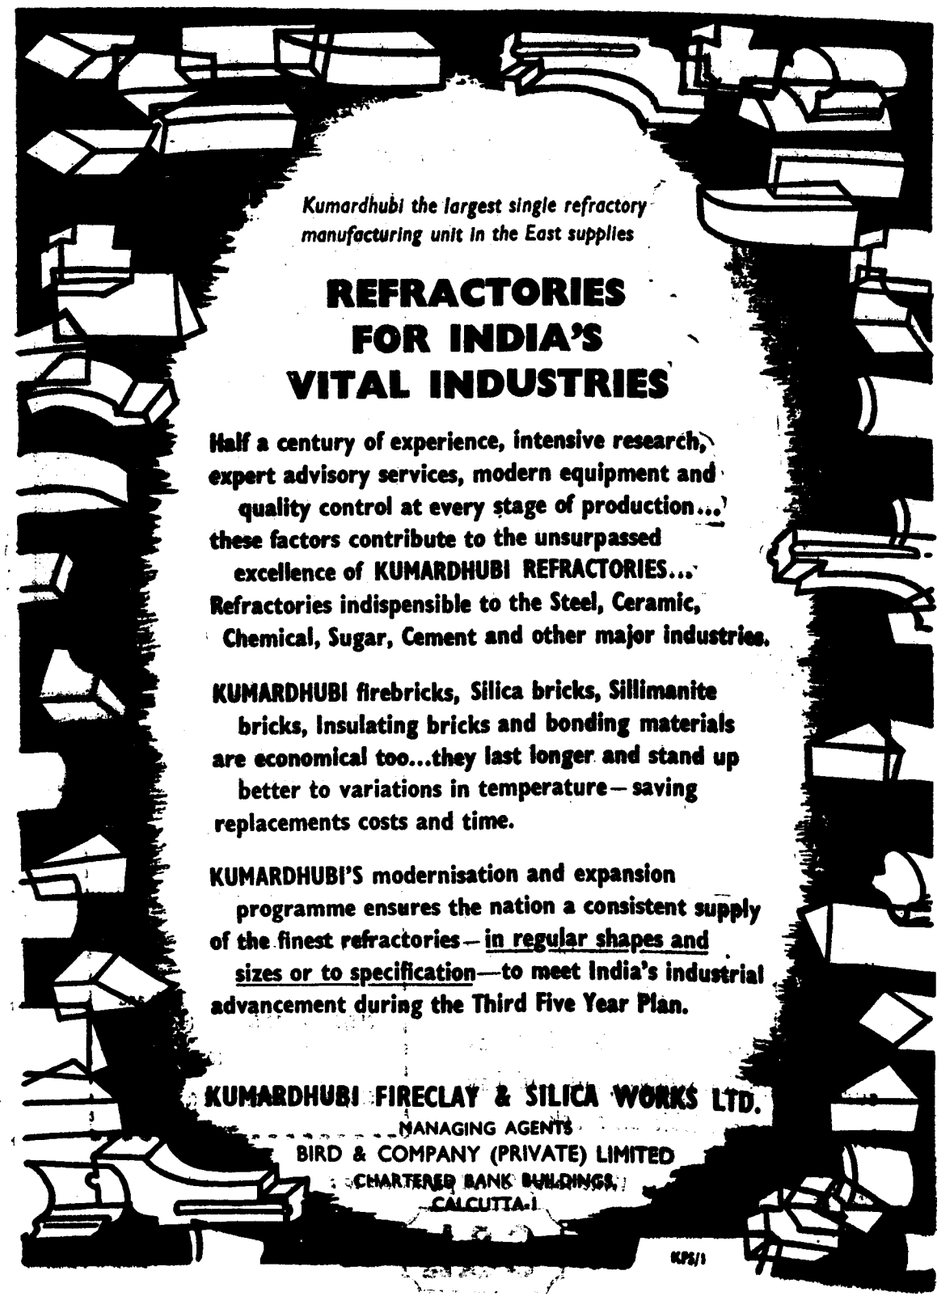
*

A new cargo ship with remote and automatic control devices designed to reduce running costs, will leave Britain on September 17 on her maiden voyage to India and Pakistan.

PREFABRICATED
TUBULAR ROOFING STRUCTURES

All S & L Prefabricated Tubular Roofing structures are designed to the requirement of I.S. 806 : 1957 code of practice for the use of steel tubes in general building constructions.

Entirely self-supporting S & L structures of the following spans and bay lengths are available ex-stock.



Type	Nom. Single Span	Bay Lengths
SLS/20	20 ft.	10 ft.
SLS/30	30 ft.	10 ft and 13 ft. 4 in.
SLS/44	44 ft.	10 ft. 1/8 in. and 13 ft. 4 1/8 in.

COMPANY AFFAIRS

JAY ENGINEERING

The Directors of Jay Engineering Limited in their annual report reveal that the sales of the Company kept pace with production which has been increasing gradually during the year 1961-62. The overall sales were recorded at Rs. 9.43 crores against Rs. 8.89 crores in the previous year. The break-up of the sales from sewing machines and electric fans was as under :

(Rs. lakhs)

	1960-61	1961-62
Sewing Machines	384.03	386.38
Electric Fans	501.71	552.25
Miscellaneous	3.61	4.60
TOTAL	889.34	943.23

The Company has stepped up the number of Usha Training Schools to nearly 900 against 800 a year before. The profit during the year was higher at Rs. 30.79 lakhs against Rs. 26.14 lakhs a year before. This profit was after providing for taxes and depreciation etc. The Directors proposed the distribution of a dividend at the rate of 15 per cent on equity shares of Rs. 10 each, which will absorb Rs. 22.77 lakhs. After the payment of Rs. 5 lakhs towards preference shares, the Directors proposed that a sum of Rs. 2 lakhs be separated out towards Development Rebate Reserve and another sum of Rs. 3 lakhs be put towards general reserve.

The Company continued its intensive efforts towards exports. The value of exports during the year under review was Rs. 91 lakhs as compared to Rs. 113 lakhs a year before. The fall was due to import restrictions imposed by the Government authorities in Yugoslavia, Burma, Ceylon and Egypt, where products of the Company were exported to the extent of Rs. 52 lakhs as compared to Rs. 19 lakhs this year. The Company has made arrangements to produce new designs of 16" and 12" table fans suitable for export market. During the year building construction work of Hyderabad factory progressed well according to the report. Production of parts for zig-zag machines has been started from April this year. The Directors also indicate that a new company under the name of Usha Industries Limited has been formed in Ceylon in which the Company will be holdiny 51 per cent shares. The assembly with the components sent from Calcutta factory has already started there from the month of April. It is expected that this factory would help the Company to increase its exports as well as add to the profits of the Company. The Company is progressing with expansion schemes and, therefore, an application has been made to the ICICI for a loan of Rs. 60 lakhs.

INDIAN CABLE COMPANY

During the year to March 31, 1962, the Indian Cable Company Limited recorded a sale of Rs. 10.04 crores, which is a figure nearly 5 per cent more than that recorded last year. The profits of the Company, however, declined to Rs. 68.26 lakhs against Rs. 85.22 lakhs a year before. The Directors have pointed out that this decline in the profits was due to increased costs resulting from combination of factors, including increased manufacturing expenses and substantial increases in distribution expenses, specially freight costs necessitated by the large-scale use of road transport. The Company, however, did not increase its selling prices.

The annual report indicates that capital expenditure during the year amounted to Rs. 15.37 lakhs. Of this figure Rs. 13 lakhs were mainly accounted for modifications and renewals and Rs. 2.37 lakhs in connection with the expansion and modernisation plans. The Company plans to go in for substantial expansion of paper insulated power cables, thermoplastic insulated cables and flexibles, copper wires and cotton and paper covered wires and strips. These plans have been finalised and negotiations have been completed to secure loans to cover the foreign exchange element. Import licences for the necessary plant have also been received and the project is likely to be completed in a period of two years.

The profit for the year after making provision for taxation and depreciation comes to Rs. 68.26 lakhs. After taking into account a balance of Rs. 48.73 lakhs brought forward from the previous year, and other adjustments, there is an amount of Rs. 124.78 lakhs at the disposal of the Directors. A sum of Rs. 3.18 lakhs is transferred to Development Redemption Sinking Fund, Rs. 5 lakhs to reserve for replacement of fixed assets and Rs. 10 lakhs towards general reserve. The Directors have recommended the payment of a dividend at a rate of Rs. 2.25 per share of Rs. 10 each subject to deduction of tax which will absorb Rs. 55.45 lakhs. A sum of Rs. 50.15 lakhs is carried forward.

ASHOKA CEMENT

The output and despatches of cement produced by Ashoka Cement Limited during the year to March 31, 1962, was lower as compared to the previous year. Output of cement was recorded at 1.37 lakh tonnes against 1.74 lakh tonnes a year before. This decline was due to stoppage of Kiln in the installation of electro-static precipitator by about a month and on account of inadequate and interrupted supply of power. The Chairman, Mr. S. P. Jain, has indicated that the power supply from D.V.C. was interrupted frequently due to tripping of their equipment. Production of steel foundry was also effected due to power difficulty. This naturally had an impact on the year's working results. The net profit for the year, after providing for depreciation and taxes was recorded at Rs. 7.17 lakhs against Rs. 7.70 lakhs a year before. A sum of Rs. 1.52 lakhs was separated out towards Development Rebate Reserve, Rs. 1.12 lakhs towards reserve for rehabilitation, development and research. The Directors recommended the payment of a dividend at the rate of 7 per cent (same as last year) which will absorb Rs. 4.20 lakhs.

Installation of electro-static precipitator involving an expenditure of nearly 28 lakhs was completed in November, 1961. Its operation has eliminated the dust problem. During the year the Company received a long awaited announcement of cement prices by the Government of India on the recommendations of the Tariff Commission. The Chairman regrets, however, that increase in prices was given effect from November 1, 1961, instead of July 1, 1961 as recommended by the Tariff Commission. Then the Government put a price of Rs. 69.50 per tonne inclusive of Rs. 2 per tonne earmarked as special reserve for rehabilitation, development, research etc. against Rs. 72.75 per tonne recommended by the Tariff Commission. Against an average increase of Rs. 10 per tonne for the industry as a whole, the increase in respect of the company's cement worked out to only Rs. 2 per tonne. The Chairman, expressed his dissatisfaction that this price fixation by the Government was unsatisfactory.

Company Meeting

KERALA STATE INDUSTRIAL DEVELOPMENT CORPORATION LIMITED

Speech delivered by Shri K. R. K. Menon, Chairman, at the First Annual General Meeting on 18th September, 1962.

Gentlemen,

I have great pleasure in placing before you the accounts of the Kerala State Industrial Development Corporation Ltd., for the year ending 31st March, 1962 and the report of the Board of Directors of the Corporation on the working of the Corporation during that period. With your permission I shall take the report as read.

2. As stated in the report, the Kerala State Government was one of the pioneers in setting up Government-sponsored Industrial Development Corporations for assisting in the promotion and development of large-scale industries in the private sector. Despite whatever differences of opinion may exist on the political front on many subjects it is fortunately common ground between all political parties and all schools of economic thought in Kerala that by far the most emergent need of the State at present is industrial expansion at a very rapid pace. Unanimity of opinion on this objective has indeed been an encouraging factor.

3. So far as large-scale industries are concerned, the main obstacle in the path of expansion at even a moderate pace has been, and continues to be, the non-availability, within the State, of an adequate amount of risk capital. This is attributable in my opinion, partly to a deficiency in total savings, but more than all, to the lack of a spirit of venturesomeness among those who have the capital. Entrepreneurs of the right type who are prepared to risk their capital in putting up large-scale industrial units and to shoulder the responsibility of running them efficiently are unfortunately very scarce in Kerala. That this should be so in spite of the undoubted advantages that our State has in the matter of raw material, power, transport facilities and above all, labour supply, is certainly most deplorable, and perhaps even un-understandable. Whatever be the reason for this, the result is that Kerala is obliged to turn to parties outside the State for bringing in risk capital and managerial skill on the requisite scale in order that large-scale industrial units could be set up within the State in large enough numbers. It is indeed fortunate that parties outside the State are beginning to realise that our State is in a position to offer them special attractions such as plenty of raw material, cheap electric power and excellent rail, road and sea transport facilities, all relatively superior to those obtaining in many other States, combined with the inestimable advantage of an almost inexhaustible supply of intelligent and skilled labour. Even so, the task of attracting outside risk capital in sufficient volume to the State has been found to be an extremely difficult one, largely because of what I surmise is essentially a psychological factor, namely, the doubts and uncertainties that assail the minds of outside businessmen on account of the distance that separates their place of business from our State. Distance is a factor which definitely does 'not' lend very much enchantment to the view of the prospective investor in Kerala.

4. I trust it is not necessary that I should dilate on this occasion on the importance of establishing 'large-scale' industrial units in Kerala, as distinct from small-scale and cottage industries. Kerala's case in this regard is not exceptional at all, and the pattern of industrialisation in our State need be no different from the one adopted for India as a whole, namely, the one based on a rational and equitable distribution of industrial units among all these three categories, viz. cottage, small-scale and large-scale industries. Each category has its own place in our economy and, however tempting the thought is, we must not succumb to the facile but defeatist assumption that the salvation of Kerala alone lies in concentrating on small-scale and cottage industries, to the exclusion of large scale ones. On the contrary, I believe it will be more correct to assume that once a sufficiently large number of large-scale industrial units are set up in Kerala small-scale and cottage industrial units will follow almost automatically in the role of feeders and subsidiaries. If, therefore, more emphasis is laid in the present initial stages, as I feel it must be, on large-scale industrial units, it will only be in accordance with the well-known maxim that first things must come first.

5. What then is the solution to this large-scale industries problem faced by a backward State like Kerala which labours under the double disadvantage of lack of indigenous risk capital on the one hand and long distance from the larger capital markets of the country on the other? I do not think I can offer a simple solution to this problem today, but before I even attempt it I feel I must point out that this is a problem which obviously cannot be left to be solved by the normal operation of economic forces. To do so, particularly in this socialistic-pattern welfare-state of India, would be as illogical as it would be unfair, and, may I add in all humility, it would also be suicidal to the body politic of the country as a whole. It is not only that we are a welfare-State, but we also function under a highly controlled economy; and, to let the principle of the survival of the fittest guide the economic destiny of even the smallest State in India would do grave violence to our socialistic objective. A solution to Kerala's large-scale industrial development problem must therefore necessarily be looked for in the direction of positive intervention by the one all-powerful authority in our controlled economy of today, namely the Central Government. The Central Government's duty in this regard is, to my mind, as clear as any layman's understanding of the manner in which the human body marshalls all its fighting strength to despatch its forces to even the most distant diseased organ, be it ever so small, in order to save it from the onset of gangrene. As in the human body, so in the body politic, the safety and well-being of the smallest and most distant entity must be the subject of the most anxious concern and solicitude to the seat of power at the Centre. This duty may be ignored only at the peril of fatal consequences to the entire body politic.

6. Effective assistance from the Central Government in the matter of industrial expansion in Kerala must in the very nature of things, relate closely to the pattern of the grant by the Centre of industrial and import licences. But in the matter of industrial licences and import permits it will 'not' suffice if the special assistance that will be rendered by the Central Government is confined to those applicants who themselves voluntarily apply for locating their industrial units in Kerala. As I have already said, the crux of the Kerala problem is that, for various reasons, an adequate number of applications from the right parties for locating industries in Kerala has not been coming forward, and there seems no prospect of any appreciable improvement in the position in the near future. Therefore, the urgent need today is to ensure that out of the large number of licences granted throughout the country an adequate number is diverted to Kerala till such time as this backward State attains a minimum level of industrialisation suited to the requirements of its large population. This is by no means a revolutionary proposition, being quite consisteant with the well-known principle of co-operative endeavour, namely, one for all and all for one, and needs no special pleading on my part for its justification. In fact, the Central Government have made a start already in implementing this principle by the allocation they made recently to Kerala of one lakh spindles out of the total spindlage santioned by them for the country as a whole. Kerala, which cannot claim to be a cotton-growing area, and has therefore had very few spinning mills till now, has reason to be grateful to the Centre for this gesture, and we may well hope that this will soon be followed by many more examples of this kind in other industries besides textiles.

7. Any preferential treatment of this kind must of course be treated as an altogether special one, and must obviously be of limited duration only. It will be for the entrepreneurs who set up industrial units in Kerala to ensure that the maximum production targets are achieved as speedily as possible; the State Government has also an important role to play in assisting the industrial units to achieve this. For example they could help considerably by speeding up land acquisition proceedings, supply of electric power, and the institution of civic amenities in industrial areas. The State Government must also take steps to provide technical training institutes for ensuring a regular supply of trained personnel to fill supervisory posts in the factories, particularly in the lower and middle grades. Kerala has no doubt the highest percentage of literacy, but literacy alone, as is well known, will not suffice to produce the necessary number of trained supervisory staff to man the posts in the factories once we get going briskly with our industrialisation programme.

8. An economic survey of the State, with special reference to the availability of raw material of various kinds, is another matter of great importance and urgency which must claim the attention of the Kerala State Government. The K.I.D.C. has had, on many occasion during the last few months, to cut a sorry figure in their conversations with outside businessmen due to the lack of adequate and reliable data relating to our industrial raw material. This is therefore a matter which I would commend for immediate attention by the State Government.

9. Another important suggestion which I have already made to the State Government, and which I take the liberty of repeating again, in order to enable more industrial licences being procured for the setting up of industries in Kerala, is the appointment of a suitable Liaison Officer in New Delhi who will, among other things, function as a close and effective link between the Government of Kerala and the Central Government. I understand this suggestion is currently under considera-

tion of Government; I hope that a decision will be taken without further delay.

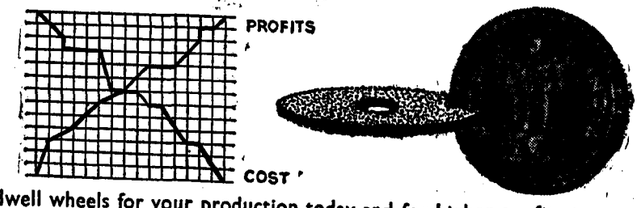
10. As and when the pace at which industrial licences and import permits are issued for the setting up of industrial units in Kerala is accelerated, institutions like the K.I.D.C. would be called upon to take adequate steps to ensure that the necessary finances are forthcoming for the use of these units, in the shape of share capital, long-term loans and working capital. The financial resources of the K.I.D.C. will then have to be considerably augmented in order to enable it to cope with the demand, and it is my hope that, when the time comes for raising additional funds for the K.I.D.C., we shall be able to tap the general money market also, besides relying on Governmental finances. The success of our direct approach to the money market for augmenting our funds will naturally depend on the reputation that we shall have built up as a dynamic and virile institution. I should like to assure the Government of Kerala that we shall dedicate ourselves to this task with all the earnestness and enthusiasm at our command.

11. In closing, I take this opportunity to express my grateful thanks to all my colleagues on the Board of Directors, and particularly to the Managing Director. Shri Abdussalam, for their very cordial and enthusiastic co-operation, and to our two honorary Public Relations Officers and to all the members of the staff for their loyal and devoted application to their work during the period under report.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, *libraries and students, if a single order exceeds* Rs. 50|-.



1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50

Note: Owing to the adoption of different definitions in the 1961 census for urban areas, the number of urban areas in the census is different from that in force in the 1951 census. The figures for 1951 and 1961, therefore, are not strictly comparable.

* Excludes Goa, Daman and Diu.

** Excludes Jammu and Kashmir, Goa, Daman and Diu and Pondicherry.

† The population of Pondicherry for 1951 has been assumed to be the same in 1948 when a census was taken by the French Government.

SEPTEMBER 28, 1962.

The Crisis in NEFA

AFTER Ladakh, NEFA. Only NEFA, from existing reports, appears to be more serious in military terms than Ladakh. For one thing Ladakh is closed by acts of Providence for half the year; NEFA is likely to be open for a good deal of the winter as well as over the rest of the year, except when the rains happily intervene. Secondly, the NEFA action, by diverting India's attention and disturbing the disposition of her forces, places greater strain on our transport as well as on our economy than do the limited Ladakh operations. India is, therefore, now faced with an exacting strain on her economy as well as a threat to her national integrity. It is right that the Prime Minister is abroad, all the Ministers at home should make it quite clear that this time at least the invaders are to be repelled at once. In this decision the country will be wholeheartedly behind the Government.

It is right that democratic comment should proceed and one particular comment, namely, that somehow or another the Government of India is much more determined in NEFA than in Ladakh is probably true as a question of fact. But this must also be seen in perspective. It has taken some time for the Government of India to take a true measure of the Chinese and, unfortunately, Ladakh was invaded under cover of a continuous shadow of doubt as to real Chinese intentions. They have now been unmasked, not least in the Prime Minister's mind, and thus the hesitation in the External Affairs Ministry, often overshadowed with the cast of doubt, has been, it seems, finally abandoned. It is hoped ambiguity has gone for ever. Indian soldiers whose bravery on our outposts needs no description require that behind the fighting lines the country should with one voice support their arduous and dangerous labours. They have already inflicted casualties on the enemy which have been numbered at over a dozen, although the figures are by no means firm. Our own losses have not been disclosed. Meanwhile, there have been reports of fresh concentration of Chinese troops near Longju, though this lacks official confirmation, and Chinese troops have been sighted at other fronts of the border. There is certainly worse to come.

The time has, therefore, come for the Indian people, taking their place somewhat ahead of the Government, to make their position clear in respect of relations with the People's Republic of China. A state of war currently exists at the very moment that a meeting is proposed to be held for lessening tensions. As though to sound the knell of these negotiations, the Chinese have discharged their guns as well as their aggressive intentions across our border, at distances well within the McMahon Line.

The Government of India must refuse absolutely to discuss any matters with the People's Republic of China while they are in our territory in NEFA. Whatever doubts there might be on the demarcation of the Ladakh border there are none in NEFA. The McMahon Line here has been clearly demarcated. The Indian outposts are well within Indian territory. Therefore, an attack on our outposts is clearly an act of aggression amounting to invasion. The country will demand on the Prime Minister's return not merely an unambiguous statement, such as he has made in his Press Conferences both in Europe and in Nigeria, but also firm action to throw the invaders out. This was not the time for the Defence Minister also to have been absent from the scene. The country should demand that, if Mr. Krishna Menon continues to be the Defence Minister, somebody else should lead our delegation to the United Nations.

No one need deny that, against the strains engendered by the Plan, this new and disturbing event will add fresh pressures to the economy and distract attention from the making of policy on the economic front. This is a serious blow at a time when economic problems continue to build up. In particular, this is likely to lead to a rise in prices in the areas most intimately concerned with supplying forward areas in NEFA. One must take these reverses with a philosophy not of resignation, but of renewed dedication to the national effort.

If the Chinese feel that the Indian people, long wedded with traditions of non-violence are crumbling before their assault, they have already had through the warm reception they have received from our soldiers an illuminating lesson. But it is the will of the Indian people alone which can sustain us over the period of hostilities on our border as well as on the domestic front, striving against enormous obstacles to raise standards of living of the poorest in the country. This is the time for a new determination in the country to stand behind the Government in every measure that it might take to discipline this nation in the face of crisis. It is believed that India will emerge stronger as a result of these measures for, in the last analysis, the strength of a nation is the determination of the minds of its people to face with courage, hard work and imagination these problems which are cast before it both as a challenge and a glorious opportunity.

Transport and Power

TRANSPORT and power loomed large in the public discussion once again last week. But this time the debate was maintained at the appropriate level of objective and constructive criticism. The conference convened for this purpose by the Federation of Indian Chambers of Commerce and Industry has undoubtedly produced substantial results, particularly in the sphere of exhaustive discussions on technical papers specially produced for the occasion. It is the work done at this level which is expected to produce at least some impact on the inevitable modifications of the plans for transport and power. This alone and no other can be the import of the Planning Minister's assurance that the deliberations at the conference would receive the due consideration they would undoubtedly merit. But an immediate assessment of the responsiveness of the Government to some at least of the proposals put forth is certainly possible, from the reactions of the Minister to certain definite claims and demands made by the Federation's President during the inauguration of the confe-

rence. The significance of these reactions lies in the fact that they pertain to qeustions of broad-policy.

It is not for the first time that the public is reminded that the acute shortages of transport and power, which were felt in first eighteen months of the current Plan, were the legacy of the ruthless and drastic cuts made in 1958 in these two sectors —particularly in power—when the Second Plan was pruned to the core under the stress of the dearth of foreign exchange. The question remains to be answered why power generation and distribution in particular were not put on a footing of top urgency right from the beginning of the current Plan, if the wide gap was too obvious to escape notice.

It is here that Mr. Shriyans Prasad Jain, the Federation's Presidest, made specific suggestions to ensure that expanding power generating capacity was quickly done. His earnest plea for granting licences to private investors to set up thermal power generating capacity met with the cold response that power expansion fell within the jurisdiction of the public sector in pursuance of the Industrial Policy Resolution. It is true that a modest amount of Rs. 50 crores has been earmarked for power development in the private sector and recently a fractional addition has been made to it; but the overriding necessity of expediting generation of power cannot brook any ideological considerations. Thermal power has assumed particular importance in the light of this year's failure of hydel power due to the shortage of rainfall, making industry dependent on the vagaries of the monsoons, like agriculture, though on nothing like the latter's stupendous scale. The plea for a fair return on investment in electricity comes as a corollary to the demand for expansion of private capacity. But this plea was turned down by Mr. Nanda on the specious plea that no such major policy change can be envisaged to promote power generation.

Still another strategic direction in which the private sector's participation in accelerating the development of power made by Mr. Jain related specifically to the manufacture of power equipment and machinery in private plants. Mr. Nanda could not overcome his ideological proclivities and he elaborated how the programmes of manufacture of generators and electrical quipment were planned in the three public sector projects at Bhopal, Hardwar and Hyderabad. The plain truth is that the last two projects are not relevant to the crying needs of the Third Plan period. Nothing could be lost by welcoming the collaboration of private enterprise in this badly needed sphere and any likely emergence of excess capacity could be avoided by readjusting the expansion plans which are inevitable in the Fourth Plan period.

The impediments in surmounting the present hardships caused by the shortages of transport capacity can be hardly removed in the short run inasmuch as a fundamental blunder was committed in the Third Plan in equating transport development almost wholly with railway development, resulting in a very raw deal being meted out to roads and shipping. Even in the railway sector, the planned expansion of capacity has been found to be acutely short of the requirements in the movement of strategic traffic like coal. Amends are now being made for this error and Rs. 120 crores out of the additional allocation of Rs. 145 crores for the railways are being earmarked for the movement of coal. But it is worth recalling that the three-fold division of consumers of coal from the Bengal-Bihar fields into the washeries, steel and other consumers has brought all the inconveniences and hardships of low priority to the last residuary class. The target of additional supply of 242 wagons per day in the first year of the present Plan will not be achieved even by the end of the second year and the general consumers of coal are asked to rest content with the assurance that the backlog would be cleared during the remaining Plan period.

Road transport is now recognised, at least in theory, as the emerging and dominant mode of transport of the future. Its immediate potential to minimise the shortages of transport capacity disclosed by the railways is indisputably quite substantial. If only the restrictive regulations on inter-State truck transport are removed, a good deal of relief would be offered to the hard-pressed railways. Mr. Jain specifically pointed out the artificial barriers, created against inter-State truck movements, by the short periods and mileage lengths for which permits were granted, as well as by the awkward situations created by variations in the permissible loads from State to State. The utmost that Mr. Nanda chose to do was to take the conference into confidence by making the "disclosure" that the Neogy Committee was applying its mind to all these problems. Certainly there is no need to wait for the Committee's final report; the crisis is with us already. Some immediate decisions are required. When are they to be taken?

Guest Editorial

Reactions to Commonwealth Conference

COMMON Market reactions to the proceedings at the Commonwealth premiers' conference will no doubt influence the course of the negotiations between Britain and the Six when they resume next month. The Six have not yet put their heads together about this, and they do not know whether Mr. Heath will come over to Brussels with a request to re-open dossiers regarded as closed, or with the intention to secure large concessions on subjects that remain to be tackled. Nevertheless, general Continental reactions are already evident. The first is certainly astonishment at the passionate tone (from the outsiders' point of view, the frankly irrational tone) the discussions at Marlborough House took this week and last. More exactly, competent people here privately expressed surprise at the dearth of economic arguments presented by Mr. Macmillan's compeers and, in some cases, their unwillingness to listen to economic argument that came not only from the British Government but from economists in their own, Commonwealth, countries. Brushing aside, as it seemed to the Continentals, the economic facts of the case, the Commonwealth premiers situated the debate on the political level. Unwilling or unable to follow them (because the political elements in question were often almost parochial and related to forthcoming elections at home), Continentals feel that nothing useful emerged in London that will have any practical relevance to the Brussels negotiations.

In meeting this barrage of politico-sentimental criticism, Mr. Macmillan earned some admiration in Europe, and suspicions that he is playing a double game in seeking entry to the Common Market have been abated. In the pathetic note

he struck when he told Commonwealth premiers that there was nothing else for Britain to do but join the Six, many Continentals recognised the mood in which they themselves accepted economic unification five years ago. For the feeling of optimism and self-confidence about the Common Market is in reality a very recent thing in Europe, and dates from the initial success of the venture, notably after the French economic reform of 1958. Before that, most Europeans felt that they were being pushed into economic union by inexorable necessity; there was just no other way to make their economies viable. The pomp with which the reconciliation of the Continental nations has lately been celebrated should not lead us to forget that the Six did not fall into each other's arms lovingly, nor did they tally up the commercial profits their association would bring; they piled rather sadly into the same boat, the way unfriendly shipwrecked passengers would do when there was no other hope of salvation. The fraternity and the economic rewards came later.

The British Government, on the contrary, first announced its intention to join Europe as though this were a brilliant commercial stratagem, a way of having the best of both worlds, something that Britain did not necessarily have to do but which it would be profitable and politic for her to do. This was definitely not the mood in which the Common Market was founded, and this discrepancy of sentiment was the reason that British and Continental negotiators were often on different wave-lengths. That British attitude was dropped in London this months, and is interpreted retrospectively here as creditable pride, putting a brave face on the inevitable. A Britain that admits forlornly, as Mr. Macmillan did to the Commonwealth premiers, that there is no alternative but union with Europe, to which economic necessity obliges her regardless of sentiment, is a different negotiating partner, one who has, as it were, consented to come down to the level of her Continental neighbours. As a confession of weakness, one might think that this saps Britain's bargaining position, and certainly there is nothing here to encourage Paris to make concessions hitherto refused. But it is perhaps more important that it means that British suggestions are no longer seen as sinister and hypocritical stratagems. There is some distance from the arrogance of Lord Attlee decrying union with "our defeated enemies and the people we saved" (sic), to the confession of Mr. Macmillan under attack that Britain is in the European boat, like it or not.

Thus, for being largely politico-sentimental the Marlborough House encounter was not uninstructive. Still, the vigour of Commonwealth criticism caused surprise. It would be too easy to take the case of certain African states rejecting as neo-colonialism advantages that it would cost Europe dear to offer and which the West Germans, for one, are only too glad not to have to extend to more "associates". This unreasonableness seemed simply comical to those who assisted as the Brussels negotiations and know how hard Mr. Heath had to fight to secure Commonwealth Africa these concessions; for him to be accused of having "given" Africa to the Six in payment for Britain's admission was so accurately the reverse of the truth that it was concluded here that not everybody in Marlborough House knew what he was talking about. A more suitable case is that of Mr. Menzies who without apparently giving way to passionate nonsense of that order, was nevertheless oblivious of economic realities that seem obvious from here.

Due note had been taken in Brussels of reports that reached Europe on the eve of the conference that the weight of informed Australian opinion was coming round to a cooler estimate of the results of British entry into the Common Market. Mr. Leslie Bury had indeed been sacked from the Menzies Cabinet for deploring the excessive pessimism of his premier, but his voice had not been smothered and his arguments had made an impression. This was reinforced by Sir John Crawford, a former Secretary of Trade and now a director of research at the Canberra University, who had declared, "I do not know—nor can anyone else know — whether we will lose £10 million or £100 million of our trade. Some loss sems inevitable. It will not be immediate... A loss of £100 million would be very large but by expressing it as 10 per cent of our total exports it may sound easier to swallow". Stressing that no one could know, either, the shape the Common Market would take after Britain's integration and that therefore the apocalyptic tone of Mr. Menzies was misplaced, Sir John added, "We will need to make the running more for ourselves than we have been accustomed. I do not regard this as a bad thing at all". Just as the conference in London opened, the 'Australian Financial Times' was quoted here writing, "Sir Crawford, likewise Mr. Leslie Bury, have not spoken in vain... Our own representatives are now adopting a more moderate and less admonitory tone. The overexcited period of oratory and wholly partisan advocacy has led into a sharp and close examination of detailed issues, as Mr. Bury maintained it must". Judge, then, the shock provoked by the emotional onslaught of Mr. Menzies against Britain's entry into Europe.

The shock was no doubt as great in London, and possibly in Australia. The realities were more brutally recalled here: negotiators at Brussels said publicly what had been murmured during the talks with Mr. Heath, that Australia's famous wheat exports, which were giving so much trouble, went to Britain only as to 18 per cent, and as much more went (and would continue to go, whether or not Britain joined the Six) to Communist China and elsewhere outside the Western world. Canberra was seeking export outlets for her wheat, wool and other produce wherever she could find them, and was offering to secure those new markets by reducing tariffs against the exports of the countries concerned, i.e. to mitigate the effects of imperial preference. Continentals, too, were franker about the economic implications of ANZUS, which means that Australia will look more to the USA whatever Britain does in Europe.

Australia's economic actions, however much at variance with Mr. Menzies' London proclamations, accorded with necessity so well that Britain before long would be doing the same, said Common Market experts. Given the state of her balance of trade, Britain would be seeking export markets outside the Commonwealth and she would secure them by accepting cheap farm produce from the countries concerned: French wheat, Polish eggs, Irish butter would all be admitted to open the way to British exports. The famous "alternative solution" promised but never exhibited by Mr. Diefenbaker would amount, said Common Market observers, to just that: Britain would suppress the imperial preference for Commonwealth foodstuffs, in favour of fresh markets for British manufactures, in an attempt to encourage competitive

A DELHI DIARY

TO BE OR NOT TO BE

TO be or not to be, that has been, for a long time, the question! Only, unlike Hamlet, I was able to make up my mind some years ago. Not, indeed, that I had his great dilemma which was either to face the 'slings and arrows of outrageous fortune' to end them in with a "bare bodkin"! My problem was whether or not to continue working week by week as an observer in the economic field instead of plunging into the hurly-burly and becoming a portion of what I wrote about! I have already, I felt, been an observer for too long and the time is ripe (before I take my final departure!) for an active role in economic affairs. Quite simply, I am reducing the element of journalism in my constitution by the addition of a noted poison or opiate in the form of economic research in the field! No doubt, there will emerge, in the fullness of time, an article here or there and, finally, in the greater fullness of time, a book. But the future is not to be prescribed for individuals in five-year plans. I intend to enjoy the lovely uncertainty which arises only when one has made up one's mind to go where the spirit listeth. Quite simply, while the hurly-burly beckons below, the ivory tower beckons from above, and, in the eternal conflict between the world of intellect and that (far from intellectual) world of the market-place, one's intentions get strangely diverted and plans not a little revised. I shall, therefore, promise nothing except to announce that from next week I shall not appear regularly in the columns of 'The Eastern Economist'. This is thus merely a bow and a withdrawal.

AFTER FOURTEEN YEARS

After fourteen years (when I have appeared with various large absences due to the fickleness of my nature and the exigencies of [illegible], not to say the ravages of old age) I naturally have [illegible] regrets as well as personal attachments. My larg[illegible] debt, during this period, has been to my readers w[illegible] have extended to me almost incredible generosity, often asking repeatedly when I am to reappear after long lapses of unexplained silence. No one who has received this generosity can fail to be touched by the kindness of people who have borne stoically the wicked fickleness of a columnist who has never promised responsibility of any kind. Basically, I was a cork pushed up and down on the crest of a tremendous wave. That wave is nothing less than the passionate current of India's new history thrown against what might be described as the shores of Delhi. From time to time things look different elsewhere and, indeed, from this very shore, one can get other views. I believe I have presented, as honestly as I have been able, the view of one who is no respecter of persons. Much of the generosity of my readers is connected with the fact that they have often been subjects of attack if not personally, through the familiar journalistic devise of setting up their types and knocking them down unceremoniously like ninepins. For one so naughty I can say no journalist in the Indian Union could possibly have received such generous appreciation from those whom he has so inadequately served. Therefore, after fourteen years I offer to them impersonally, but nonetheless individually, my deepest thanks for a hospitality which, in the Indian journalistic world, I am arrogant enough to say, has never been surpassed.

There is always a personal equation about generosity, and I cannot feel that generosity such as I have enjoyed can be summarily ended by the mere fact that I shall, while working on three or four other pressing assignments, not be engaged on a hard journalistic routine. I am, therefore, giving to those readers who might wish to know my whereabouts my address for correspondence. It is Post Box 288, New Delhi. I promise, wherever possible, to keep in touch with any reader who feels that a comment here or there might be helpful in the absence of a direct printed page. Thus it seems the tenuous bonds which a journalist creates over the years with that fickle, but substantial, universe of readers can be maintained. It is wholly wrong that journalism should be a profession involving only the sale of services. For those of us, who have lived in its inside world, it is a world opening out on another, much larger world. The inner world will cease in some sense when the printed word ceases to be the vehicle of communication connecting the journalist with the outer world, but the bonds of that communication can endure. I hope that I shall be able to repay in some small measure by individual correspondence what I have been unable to fulfil by way of a printed reply to the numerous comments one receives in the course of what — again arrogantly — I have chosen to describe as my 'fan mail'.

FREEDOM OF SPEECH

There is no greater satisfaction for a journalist in the Indian Union than the use of a column in which he enjoys complete and absolute freedom of speech. The "absolute" is, indeed, unattainable, but the freedom that Argus has enjoyed over fourteen years to say what he likes (notwithstanding contrary Editorial opinion elsewhere!) is as great a demonstration of the fundamental character of the freedom of speech clause in the Indian Constitution as anywhere else. The great have come under criticism which is stronger (and more unbalanced) than anything which has appeared in the Editorial pages and I would be doing less than justice to a valued association if I do not mention that I have employed cartoons which are as near slander as the difficult law of libel permits. In spite of all these extreme angularities and, indeed, acromonies, Argus has emerged unscathed and can remember only two occasions on which he received a legal notice to withdraw. In both cases, he reflects happily, he refused to withdraw and nothing happened! all of which seems to show that in this journalistic world one should have the courage to stick to one's guns, however old and foolish they are!

Attractive as freedom is, and important as freedom of speech is as a fundamental right in a democratic society, it carries a converse which is not nearly so good. This sounds like tautology, but I shall say it. One cannot exercise one's freedom of speech or of writing unless one at the same time does the speech or the writing wherewith one exercises that freedom. It is the constant routine of speaking and writing which in itself destroys some of the individual freedom which we prize above all. And thus—paradoxical as it may sound—I am seeking freedom from freedom of speech largely because I recognise that the freedom not to be so confined is the greatest freedom of all. How long this freedom from freedom is to be enjoyed is a nice, but unanswerable, question!

If it cannot be endured, as some of my generous readers have hinted to me, then obviously I must return, but for the moment, I am seeking freedom from the time-table which for fourteen years has been too rigid a pattern for a mind not disciplined enough to recognise that we have in our bad, bad world our appointed times as we have our appointed places. Thus, at least for the present, I say Goodbye. Again, with the feelings of one who has known through these pages both friendship and understanding, my heart wells up because of thousands of kindnesses which have come upon me quite undeserved. One day I trust we shall all meet face to face; I'll try to stammer some of the thanks I have now been so feeble in putting into words!

ARGUS.

THE WEEK'S NOTES

Nepal

THE WIDENING GULF

IN REMOVING Mr. Rishikesh Shah from the office of Foreign Minister and reinstating Dr. Tulsi Giri in that post, King Mahendra has left not a shadow of doubt about his dissatisfaction with the outcome of Mr. Shah's mission of reconciliation and better understanding with India. The official communique announcing the reshuffle in the Cabinet came close on the heels — in a matter of only two days — of the Cabinet discussion on Mr. Shah's report on his mission to India. The main, rather sole, purpose of the mission was to resolve the differences between the two countries arising from Nepal's grievance against the asylum given by India to the rebel leaders and their use of this facility to direct subversive activity against the King's authority. The communique repeats the charge when it states in open words that rebel armed raids are organised with help from inside India. Mr. Shah, known for his foresight and equilibrium was scheduled to visit India again in a few days to resume discussion on the border raids at the high official level. But the reshuffle was made, as the communique points out, in the interest of preserving the uniformity and solidarity of the Cabinet. Dr. Tulsi Giri, now takes over the foreign affairs portfolio, presumably to consummate the solidarity. His avowed attitudes to India and China cannot be without due relevance and significance to this solidarity.

Whatever India's stand on the correctness of extending asylum to the Nepalese leaders in exile and her sincere demand for at least prima facie proof that arms are provided to the leaders and their followers in India and whatever the merit of her contention that the joint investigations into the rebel activities to arrive at the factual situation (and Nepal's hesitation to issue joint reports with agreed findings as well as clarifications of dissent), India as a big neighbour ought to be more appreciative of the suspicion complex of her neighbour and remove any impression that she is taking a legalistic view of the root of the trouble. The larger stake of maintaining cordial relations with strategically situated Nepal requires that India would lose little in making understandable concessions to her. The propriety of extending asylum to the leaders who have chosen the path of exile may have its own justification as an issue of principle. But a pragmatic approach is sorely needed in this delicate issue. The change in the complexion of the Nepalese Cabinet, with the pronounced sympathy of Dr. Giri for China, comes ill at a time when China has started her aggressive intrusion in Indian territory, in the vicinity of the trijunction between India, Nepal and Tibet. The initial difficulty now posed is about the initiative to be taken to resume the talks. In the first instance, the Government should prevail upon Mr. Subrana Shumshere to refrain from indulging in any propaganda against King Mahendra.

U.P. Land Tax

THE COMPROMISE BILL

THERE WAS no iota of doubt that the UP Land Holdings Tax Bill could not be carried through the legislature in its original form in view of the storm of opposition which it raised not only from the opposition parties but even from inside the Congress Legislature Party and particularly when two of the influential Ministers did not endorse it fully. The principle of levying an additional tax on land to enable the State Government to raise tax resources to finance the five-year plans remains vindicated. But the Bill has been modified much beyond ordinary expectations and this is the measure of the pressure before which Mr. C. B. Gupta had to bow. One fundamental defect in the Bill was that the limit for exemption of holdings from the tax was placed too low — one acre throughout the State — thereby entailing undoubted hardship on the owners of uneconomic holdings. The size of uneconomic holdings naturally depends upon varied factors, but broadly speaking, it ought to be fixed high in the sterile eastern districts and comparatively low in the fertile western districts. The limit of exemption is now raised to 8 acres, but a higher limit will have to be allowed in the case of poorer grades of land. This makes a substantial difference to the revenue expected to be earned from the tax. There is no readily available basis to make any accurate estimate in the case of such a complex levy as this, but it is surmised that the revenue would be reduced from Rs. 8.5 crores to a little above Rs. 4 crores.

A major target of attack was the very principle of taxing the peasant. Substantial sections inside the Congress Legislature Party itself advocated the policy of no additional taxation of the peasant ostensibly with an eye on the ballot box. For the time being at least this clamour has been resisted. The passage of the Bill is now assured. But if by an implied understanding it is assumed that this will be the only dose of taxation of land, it would amount to nullifying the principle courageously accepted by the Congress Party. A good deal of outspoken and convincing propaganda will need to be carried out to bring home the the reasonableness of the principle of levying this tax to the peasants as well as to those who profess this new-found solicitude for them.

Education Medium

RIGHT TO EXCLUDE

THE SUPREME COURT'S judgment dismissing the appeals of the Gujarat University and the State of Gujarat in the matter of prescribing specified languages as the exclusive media of instruction settles an issue of fundamental importance. The facts of the case are simple, but typically representative of an attitude which threatens to inject intolerance and severity in the system of education at the higher level. The Gujarat University framed certain statutes in pursuance of the powers conferred on it by the provisions of the Gujarat University Act, whereby it prescribed Gujarati or Hindi as the compulsory media of instruction at all the levels, to the exclusion of English. The exclusion of Enylish as a medium of instruction was challenged in the Gujarat High Court on two grounds — that the power of exclusion was not vested in the University and that such exclusion offended against the fundamental right of the minorities to safeguard their language and culture and to establish educational institutions of their choice as guaranteed by Articles 29 and 30 of the Constitution. The Gujarat High Court upheld the contentions of the aggrieved party on both the counts and gave the ruling in favour of the petitioner, rendering the statutes on the exclusion of a particular language void.

In the appeals preferred separately by the University and the State Government against the High Court's decision, the Supreme Court gave its ruling on the issue of exclusion of a particular language as a permissible medium of instruction, but not on the question whether the fundamental right raised was infringed. This does not, however, amount to a decision that the right is not violated. The Supreme Court's action

was based on a technical ground. This particular plea was not raised by the aggrieved party in his pleadings and, unlike criminal proceedings, where any plea not specifically raised can be taken up even at the final stage of argument, in civil suits, appeals etc., if a plea is not taken up, the party's case on that score goes by default. In the reference on the Kerala Education Bill, introduced by the Communist regime, the Supreme Court gave its advisory opinion that the minorities were vested with the fundamental right to be educated in their language and to order their educational institutions to that end. A regular and formal judgment in the Gujarat case by the Supreme Court would have given finality to this view. In the result, the position on this basic question remains that there is no judicial ruling of the Suprm Court, but an advisory opinion.

It is on the issue of the right to exclude a particular language as a medium of instruction that the Supreme Court's decision is of great value to determine the educational policy on this controversial point. The statutes whose validity was challenged by the party were impugned by the Gujarat High Court (and this ruling was upheld by the Supreme Court) on the ground that the provisions of the Gujarat University Act, under which the statutes were made, conferred the right on the University to promote the use of Gujarati or Hindi, but by no stretch of reasoning could they be construed to include the right to exclude and demote English. An immediate issue was raised whether the State legislature is competent to legislate for such exclusion, in which case the disability of the University could be removed by an amendment of the University Act. The Supreme Court expressed itself very strongly — and here lies the great merit of the decision — that, while the State legislature can legislate on matters pertaining to education in general, this power is not unrestricted.. The State legislature may indicate in certain cases the medium of instruction, but this power, like some other powers, is subordinate to the power of the Union Parliament. Ultimately it vests in the Union Government as part of its responsibility to maintain educational standards on a basis of co-ordination. Parliament, of course, will show supreme good sense to uphold quality standards in education, of which the medium of instruction is an integral part. But the State Governments on their part ought to abide by the Supreme Court's ruling in its genuine spirit and resist the temptation to circumvent it by erecting administrative barriers against the maintenance of English as a medium.

Consulates in China

DESPARATE MOOD

IN THROWING to the winds all diplomatic courtesies, especially in the case of a mighty neighbour, which, in the final analysis is her inseparable ally, China has given the latest ugly proof of her capacity for desparate action. She has peremptorily called upon Russia to close down all her consulates in China. The reason may be not plausible but sound. As it is, the number of Russians resident in Chinese towns is now (after the summary elimination of the technicians) too nominal to warrant the continuance of these consulates. Probably no answer can be given to the straight poser: What are these consulates supposed to do? But the least that is expected of the host country, which welcomed their establishment, is to observe the minimum decorum in asking for their disestablishment. To issue what smacks of an ultimatum is bad enough to make muddy relations more so. It could not have been done by accident or sheer inadvertence. And China certainly cannot be accused of ignorance in these matters.

That this was a calculated thrust at the Big Brother cannot be doubted. The trouble with touchy China is that she is not prepared to admit such an existing fact as the bigness of the brother, whatever her own ambition to snatch bigness in the ideological realm may be. There are, however, some standing grievances against the Big Brother and some new ones. Russia's veering towards competitive co-existence and her overtures of disarmament to America — the imperialist aggressor militatarily propping up the Kuomintang bandits in Taiwan—is an unpardonable sin. This is now an old grouse. China resents Russia's intrusion in her zone of influence in S-E Asia. And she has advanced new claims in Africa from which Russia cannot be expected to stay aloof. The offer of the MIG's to India, the intransigent contender against China's border claims, (in contradistinction to Russia's neutrality so far in tne India-China dispute) is a stab in the back. But tne timing of this peremptory order for closure of the Russian consulates to follow the shooting of U-2 and with the claim that China has perfected her atom bomb mastery gives a sinister import to this exhibition of the desparate mood. This is something which India needs to ponder over in tightening her defence in the North.

Congress Reform

AN UNFRUCTUOUS CONFERENCE

THE CONFERENCE of the Pradesh Congress Presidents and Secretaries which was convened at Trivandrum to consider the problems of the organisation's reform dispersed without achieving hardly anything. Two questions which figured prominently in the conference discussions ought to be mentioned. The more important of them related to a radical suggestion that the Prime Minister and the Chief Ministers of the States should be elected jointly by the Parliamentary or Legislature parties as well as by the members of the A-ICC and the Pradesh Congress Committees respectively. The precedent of the Conservative Party in Britain was quoted in support. But it was totally overlooked that the precedent was quoted only half way. The Conservative Prime Minister has a complete control over the organisational wing in the sense that he nominates the incumbents of the key posts. How many of the Pradesh Congress Committees would countenance this super-imposition, as it were? The leader of the British Labour Party in Parliament, like the leader of the Congress Party in the legislatures, is chosen by the Parliamentary Party and there the spectacle of friction in important matters between the parliamentary and organisational components of this party is witnessed. But it is not of the same variety as in India. In India, the strife between the legislative wing and the organisational wing has assumed ugly dimensions in some of the States. The correct remedy to bring harmony and a reasonable degree of consultation between the two wings lies in the hands of the leaders of the party and they can apply it successfully if only they shed the lust for power.

The question of bogus membership was debated at some length and it seemed as if raising the membership subscription for the primary membership of the Congress organisation above 25 nP. would do most of the trick. Bluntly speaking, few at the conference would have taken this proposition at face value. Bogus members are enrolled not for their own sake but to strengthen the electoral prospects of the aspirants to positions of power in the organisation. Even if the subscription is raised from 25 nP. to Rs. 5, funds for the enrollment of bogus members will continue so long as corrupt practices are freely indulged in. The figure of 25 nP. was symbolic of the fact that the doors of the Congress were open even to the poorest. But much more than 25 nP., what lay at the root of the membership was the moral allegiance of the members to this august organisation. It is this moral allegiance which needs to be resuscitated.

The World Abroad

"PROFITS" OR "THE NATIONAL INTEREST"?

By ODYSSEUS

THE GREAT PROBLEMS in the industrialised West are inflation and over full employment, which impede growth. Up to the present, efforts to solve them have largely concentrated on raising bank rates and imposing purchase taxes or other fiscal controls, which halt growth, and so we have had the constant alterations of Stop and Go. Britain, Germany and the USA are but three outstanding countries which at the moment are in one or other, or in between, these phases.

The repercussions of this Stop and Go are not confined to the industrialised West but affect the developing countries' ability both to sell their exports and to borrow capital. So East and West each have motives for trying to find the way out.

In the past few years, British economists have successfully devoted much time and energy to clarifying the issues and have advanced a long way towards a solution. The difficulty, as Keynes said, "lies not in new ideas but in escaping from old ones." And it is ironical that the consensus of opinion is that some of the old ideas which are forcing us into the rut of Stop and Go are those of Keynes himself. As Colin Clark says in his "Growthmanship" (Institute of Economic Affairs. 66A Eaton Sq., London. SW-1. 2nd ed:. May 1962. Price 6sh.), nearly all economic theory of the last twenty years has been influenced by Keynes, but what was overlooked was that Keynes was pre-occupied with unemployment and depression — the exact opposite of our present ills. The world has sought to expiate the fault of not having listened to Keynes in the 1930's by applying his cures, with the deepest respect, to wholly different ills.

All this is a preliminary to investigating a problem of current importance which, to judge from Mr. G. L. Mehta's interesting article, "The Managerial Revolution in India" ("The Eastern Economist," July 20, 1962), is beginning to pre-occupy India as much as it does the West. How do you promote more rapid growth, mobilise savings, ensure that they are channelled into the most productive uses, and that management is efficient and on its toes? Is growth secured better by private enterprise or state action? The quarrel between private and state enterprise is the alleged contradiction between private profit and the "the national interest" — the shareholder versus the public.

PROFITS — SOCIAL AND ANTI-SOCIAL

Profits are respectable if they are "reasonable" and if they are ploughed back. To go all out to make the highest possible profits is "anti-social", and to pay them out in dividends is, indefensibly, to distribute "unearned" income.

The connection between these views and the U.K.'s showing in the international "growth league" is direct. The U.K. trails behind Germany, France, and even Italy, (a) in technological advance and (b) in the percentage of gross national product invested at market prices (cf. 25 per cent in Germany; 17 per cent in the U.K.). Growth is linked to technological advance, because real explosive growth, like that of mid-19th century Britain, or of Germany, France, and Italy in the 1950's, does not spring from increasing investment in established industries, but from investment in new products, and new techniques, which boost productivity, particularly in exportable goods and services.

To plough profits back slows growth from innovation because it normally expands the capacity of existing plants or equipment. Thus, plus restrictive practices by trade unions, may divert investment away from technological innovation and new labour saving devices into surplus capacity. This, in turn intensifies labour shortages and wasteful use of labour.

Although the U.K. has the lowest rate of capital formation in Europe, (2.6 per cent per annum compared with 7.7 in Germany), capital per worker has risen since 1937 by 70 per cent (30 per cent in Germany), which means that it has been wastefully allocated between alternative uses. That output per man hour (1935 = 100) is 110 in the U.K. compared with 133 in Germany suggests that the capital allocated is also less efficiently used. The U.K. depends more than any other country on exports, so the U.K. ought to be ahead of her competitors in scrapping old plants, investing in labour-saving devices, and, above all, in encouraging the development of new technologies.

It follows that tax policies should encourage companies to pay out maximum dividends, compatible with the maintenance of normal business reserves. Shareholders and their advisers, stock brokers, investment analysts, the financial press, and others, take a more objective view of the comparative merits of alternative allocations of savings than directors, understandably biased in favour of their own company and industry. Obviously proposals to raise money by a new issue, which will be subject to expert vetting by outsiders,

AUSTRALIA'S LARGEST COMMERCIAL BANK
CAN HELP YOU TO PROMOTE TWO-WAY
TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The international Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.
The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

will be more carefully thought out than proposals to use retained profits.

To pay out maximum dividends should appeal to egalitarians because:

(1) They dislike the growth of monopoly, take-overs, and amalgamations at the expense of small or medium sized enterprises. Ploughing back reduces the availability of capital to small and new firms, which might otherwise become competitors.

(2) They seek the widest possible distribution of wealth. Ploughing back concentrates wealth in fewer hands. Paying out diffuses it.

Note, too, that a firm which, as a matter of policy, finances itself from its profits, tends to keep its selling prices up accordingly.

Historically, specialisation of persons, plants, and firms has speeded progress. Proposals for "diversification", to expand into an entirely new field should therefore be examined to ensure that they are economically justified, and not a device to secure a more comfortable life for an individual firm. Proposals to "diversify", to launch out in unrelated fields often arise when an established firm finds its existing business contracting. But it is, in principle, preferable that capital withdrawn from a failing line of business should be repaid to shareholders, since this enables them to re-invest it in growing rather than contracting enterprises. In his "Structure of Industry in Britain", Professor G. C. Allen asks pertinently whether a cotton firm, which closes following the industry's contraction, should invest compensation received in new enterprises which require expertise of a different kind? Should estate companies, after selling out to Malayans, start anew in, say, plastics? The answer depends on the technical and commercial equipment of the individual firm, but it is certain that some boards have, by ploughing back, retained control of capital that they could not have obtained from the market.

512 LARGEST FIRMS IN THE U.K.

The U.K. Labour party's pamphlet "Industry and Society", discussing the 512 large U.K. companies which (it is said) account for half the total profits earned by private industry, and which plough back a high level of these profits, observes that they "are the main centres of growth in the economy." This suggests that the Labour party, so allergic to the social "establishment", is unaware that these 512 large firms, together with organisations like the F.B.I. and the T.U.C., constitute a formidable economic "establishment". Historically, the giants of industry have not been the main centres of that technological advance which constitutes true growth: on the contrary, they tend to delay rather than to advance it. This is natural, because governments, the press, business, and trade union leaders, associate national prosperity with established industries. If one of these is declining, the economic "establishment", far from hailing its elimination as evidence of progress, is deeply concerned; and whereas pressure groups against change were comparatively feeble in the 19th century, today they are powerful in press and parliament. Who, in 1900, when cotton textiles towered over all other U.K. exports, could predict that a then embryonic product — road vehicles — would, fifty years later, be selling abroad five times the value of cotton textiles? Who, in 1900, could prophesy that the net output of two wholly unknown industries — radio and telecommunications — would today be substantially greater than that of the U.K.'s historic shipbuilding industry, or aircraft worth more than wool textiles? The transformation is obvious as one looks back, but at the time when new products first appeared, innovators needed vision, and capital, to struggle against disbelief. The transformation was initiated not by the economic "establishment", but by the enterprise of innumerable small or medium entrepreneurs, like Rolls, Morris, Marconi, Ferranti, de Havilland, or Mullard — men whose criterion for investment was a matter of fact: "How much profit is there in it?"

Next week, we will look more closely at the role of the shareholder.

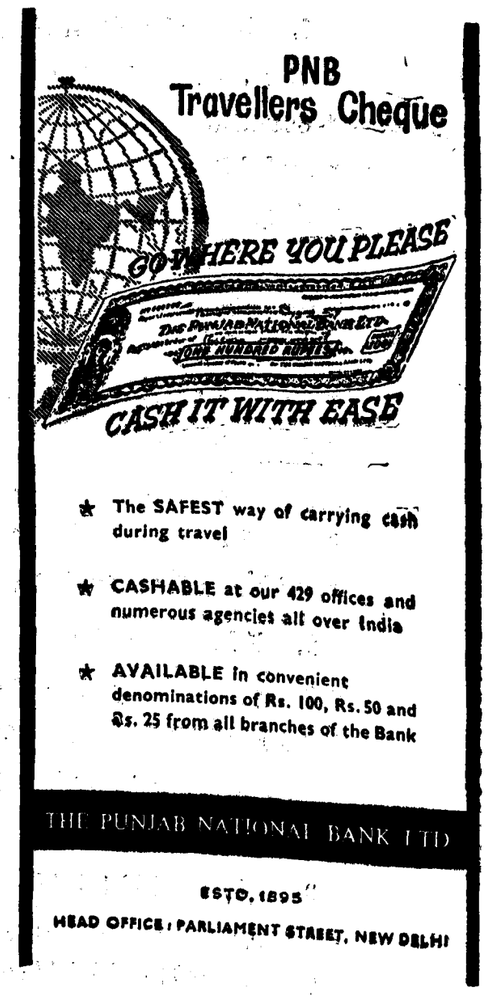
Economic Report from the U.S.

MANPOWER TRAINING



By GUY SIMS FITCH

WASHINGTON, September 18.

THE growing awareness of the major role manpower training plays in national development will be reflected in Puerto Rico next month when representatives of 40 nations gather for a conference on "Human Skills in the Decade of Development." The conference was proposed by the United States, which recommended that it be at the cabinet level. Responding nations, which now number 36, agreed. To show the importance the United States attaches to the matter, it has designated Vice-President Lyndon Johnson to head its delegation, which will include Cabinet members, Congressmen and heads of major Government agencies.

In a sense, the conference is the result of a change in the direction of developmental thinking in the past few years. For some time, all the emphasis was on the provision and creation of capital. But actual post-war experience has shown that capital accounts for less than half the actual development — about 40 per cent in fact. Furthermore, it has been determined that maintenance of a given growth rate requires a manpower training rate from three to six times larger. What this means is that, if a developing nation plans a growth rate of 10 per cent annually, it must plan simultaneously to increase its manpower training rate by 30 to 60 per cent annually. If it does not, all the capital development it can muster will do it little good, because it will not have the human skills needed to put the capital to work.

The sub-heading of the conference title, "The Middle Manpower Level Approach," accurately describes the direction it will take. There is usually no shortage of unskilled labour in countries embarking on development programme, and it has been found, to the surprise, of many, that there usually is a fairly good corps of highly skilled persons. It is in the broad area in between that the crippling shortages occur. Such countries usually do not, for example, have the laboratory technicians that the skilled research scientist needs to support his work, the nurses to back up the doctors, and the construction foremen to translate the plans of the engineers into reality. Where such manpower exists, as in Japan, for instance, with its ratio of 230 skilled workers to each 1,000 population, the rate of sustained economic development is high. The general principle involved in this relationship between capital manpower as factors in development was stated a year ago by Amb. Adlai Stevenson, the U.S. delegate to the U.N. Addressing an audience of Latin American Journalists, he said the U.S. learned, in its post-war history of assisting in development projects, that "it was impossible to build a modern economy on the foundations of massive poverty, illiteracy, feudalism, tax avoidance and social injustice. The middle level manpower approach is designed to strike directly at some of those age-old evils. It has three general purposes; to increase awareness of the importance of the manpower training approach; to arrange ways by which individual nations can assess their manpower training needs; to provide them information on the techniques of training within the country. The third point is the working culmination of the factors of awareness and assessment. Specially, it involves application of relatively new methods of adapting existing educational systems to training needs, and creating specialized training programmes outside the normal educational process. The U.S. regards this conference as one of the most important to be held in the post-war period — particularly in that it is a co-operative effort by both the highly developed and the newly developing nations to solve some of the major problems of the latter.

THE BUSINESS WORLD

Stock Exchanges and Speculation

By CROESUS

STOCK exchanges have been in the news throughout this month. They have been both condemned and given a good chit. The condemnation came from our ebullient Union Minister for Steel and Heavy Industries, Mr. C. Subramaniam, when he was in Bombay early this month. In an understandable effort to defend the Government of India's decision to fix the average steel retention prices at a level lower than that recommended by the Tariff Commission, he told the Indian Merchants' Chamber that the Government's decision should not be judged by any stock exchange reactions, because those were the outcome of speculative deals. This, one hopes, is his individual opinion. In any case, the Minister need not have questioned the wisdom of those people who are concerned with the reactions of stock exchanges. For not all stock exchange reactions are the outcome of undiluted speculation, and certainly not always. Even in the worst speculative market, there is present another important constituent called the investor, and when the stock exchanges reflect the reactions of the genuine investor, as happens at least at times, no one can afford not to take note of them.

Let us take, for example, the reactions over a period of, say, the Madras Stock Exchange, which has just completed its Silver Jubilee. It is well known that this body is a relatively conservative institution. It has on its lists still only 268 companies; in fact, the official list quotes only 262 companies, the total paid-up value of the shares of which is Rs. 118.78 crores (their market value, of course, is much higher at Rs. 203.53 crores). It is a revealing commentary on the cautious attitude of the operators of this exchange that, out of the 262 companies quoted, only 17 companies happen to be those that have not paid dividends for the past three years. Until 1958, there was no Clearing House for the Madras Stock Exchange and even today the total number of scrips included in the Clearing List has not gone above 15, although the volume of business is stated to have increased substantially. And there are no jobbers to speak of yet. Against this background, it is a matter for calm consideration whether, one could brand the Madras Stock Exchange as a speculators' market and belittle the importance of its reactions. Be that as it may, it is indicative of the robust realism of the stock-broking community that it has not been demoralised by the deliberate debunking of stock market operations even by some highly placed persons. On the other hand, as though to demonstrate that the stock exchanges are a really useful institution and that stock-broking is a respectable enough occupation, the Madras Stock Exchange has moved the University authorities to creat a special chair and to institute university courses to train persons for a career in stock-broking.

I do not know why the bearish reactions of the stock markets to the announcement of seel retention prices has been made the occasion to damn stock exchanges, unless the thesis is accepted that "there is a political component in steel prices which has taken them outside the routine processes like that of the stock exchange". But then, if this thesis is accepted, it cannot lie in the mouth of the Union Finance Minister, as has happened in the past, to justify his budget propo.als, in particular the increases in the incidence of tax burdens, with reference to price movements on the stock exchanges in the country. True, these movements are at times inexplicable, which has perhaps provoked the expression "a somewhat mercurial behaviour" of the stock exchanges, but, since it is not impossible to indentify such behaviour and seperate the chaff from the grain, as it were, it should not be difficult correctly to gauge the right type of reaction. This is not to say, however, that the bearishness or the bullishness of the stock exchanges at a given time should always be taken as a decisive factor for the formulation of public policy. But it may be helpful, even as it would be useful, in effecting some suitable modifications.

All may not agree that the stock exchanges are a barometer of the economic health of a country, but there are quite a few who even dispute the usefulness of the role of stock exchanges in canalising savings, especially in an era of inflation. It is now more or less universally acknowledged that equities provide an excellent hedge against inflation and the erosion in the real value of the currency of a country. One would have thought that, when the trend of thinking in international banking circles is definitely veering round to the view that gold holdings should be owned only by governments and not by individuals, the growing importance of equities as a hedge against inflation would be unquestionably accepted. One is also at a loss to find the persistence of an impression about the stock exchanges that prevailed a decade ago, even after the enactment of the Securities Contracts (Regulation) Act. All the stock exchanges in India today are governed by this Act and, in the past two or three years, there have also been a number of voluntary moves on the part of several stock exchange authorities in the country to place their business on a really sound basis. Evidently, this explains the recent complimentary remark of the former Governor of the Reserve Bank, Mr. H. V. R. Iengar, when he inaugurated the Silver Jubilee Celebrations of the Madras Stock Exchange, that the performance of the Indian stock exchanges had been good, compared with the performance of the stock exchanges in other countries. He, of course, claimed that this record would not have been achieved by the Indian stock exchanges but for the considerable degree of Government regulation. He also added that, if they (Indian stock exchanges) had been allowed to have their own way, there would have been violent fluctuations and oscillations with very deleterious consequences to the psychology of the investor. In other words, if one may draw an inference from this, the Indian stock exchanges, as they are constituted today, are sound and sober enough. And, if this is so, it would be a pity if the stock exchange reactions to any given policy announcement or decision are not taken seriously. It is no use merely paying tributes to the stock exchanges on the role played by them in the industrial and economic development of the country on occasions like a silver jubilee and ignore them altogeth-

er at other times. Merely because there is an element of speculation in the stock market, it should not be condemned, as was the habit in the past when any stock exchange business was equated with gambling. Speculation is undoubtedly an element of the stock markets even today—as it must needs be—but it has ceased to be the only or even the predominant element. Also it has come to be fairly well recognised that, in order to ensure liquidity, there must perforce be a degree of speculation. Speculation is like a shot in the arm to an unwarrantedly hesitant market, a phenomenon not known to us.

Those who complain about our stock exchanges today are apparently unaware of not only the healthy regulatory aspect, as already outlined, but also the refreshingly welcome change that has come in the wake of the entry of fresh blood—the young and educated men who have taken the place of their fathers or other seniors — into the profession. With the advent of this new class of stock-brokers, I make bold to say, the profession has assumed both respectability and responsibility. Stock market prices are no longer determined solely by speculative considerations but by a thorough understanding of the working of a given company in particular and the concerned industry in general and this, be it noted, against the setting of the entire economy. More interest is being evinced today than at any time before in the operations of the Reserve Bank, the Life Insurance Corporation, the Industrial Credit and Investment Corporation of India and other financial institutions, as also in the progress of our five-year economic development plans, with particular reference to foreign aid. Quite often, the "mercurial behaviour" of our stock markets is determined by what happens in the US Senate or at the meetings of the World Bank or the International Monetary Fund or their affiliates. In short, inasmuch as it is possible today sensibly to correlate the behaviour of the stock exchanges to some important economic development or other, either within the country or outside, the degree of importance that one need attach to the speculative factor in the functioning of our stock exchanges has necessarily narrowed down.

Business Notes

Scrap

TRADE CIRCLES DISAPPOINTED

SCRAP TRADE interests have been thoroughly disappointed with the Report of the Scrap Committee, submitted recently to the Government. Stating this, Mr. S. A. Nathani, President, Scrap Traders' and Exporters' Association (S.T.E.A.), declared at a press conference, the other day, that the Committee, as also its recommendations, proved to be precisely what was apprehended by the scrap interests. What was worse, Mr. Nathani said, the Committee had served rather as a committee of secondary steel producers than as a Scrap Committee as such.

Highlighting these reactions of the scrap trade, the S.T.E.A. President expressed the view that the Committee had erred at the very outset by expressing itself about the impossibility of ascertaining the arisings of different grades of scrap in the various regions of the country. The scrap estimate made by such a committee could not be expected to project realities, he added. As he pointed out, the Committee has estimated the process scrap consumption at 10 per cent of finished steel consumption in the country and capital scrap at 66.6 per cent of steel consumed some 30 years ago! Even this very low estimate, the S.T.E.A. President said, was found to be much more than what was being collected at present. Not content with underestimating the position thus, the Commitee had reduced it still further by 20 per cent on the score that the availability should be placed at 80 per cent of the arisings. Thus, for the year 1961-62, the Committee has placed the arisings at 7,62,000 tons (internal demand 3,71,000 tons and available for export 3,91,000 tons, which is less than the actual export of approximately 4 lakh tons.) In this connection, Mr. Nathani referred to the scrap arisings in the UK and the United States which, he said, represented 20 per cent and 15 per cent, respectively, of the finished steel consumption in those countries. The National Council of Applied Economic Research had earlier placed the process scrap arising at 20 per cent, while the scrap interests had placed it at only 15 per cent. On the other hand, the Steel Furnace Owners' Association had placed it still lower at 12½ per cent; earlier still, the Kapur Committee had placed this estimate even lower at 11.5 per cent. But, to the great consternation of the scrap interests, the latest (official) Committee has arrived at the inconceivably lowest of the low estimate of 10 per cent! Actually the estimated arisings, according to the S.T.E.A. Chief, were over 2 million tons in 1961, whereas the Scrap Furnace Owners' Association has placed it at 14 million. The Scrap Committee estimates, however, place the figure at no more than 7,62,000. The contention of the S.T.E.A. President is that the Committee has neither taken the trouble of sufficiently examining scrap arisings, nor has it taken the trade into confidence, but has arrived at its own untenable conclusions for reasons best known to itself.

In estimating domestic consumption, on the other hand, Mr. Nathani complained, the Committee had taken a very optimistic view, in that the consumption had been placed by it at 3,71,000 tons in 1961-62, gradually rising to 12,562,000 tons in 1965-66! For the current year, it has placed the consumption at 4,50,000 tons, including the demand of 2,75,000 tons of main producers. According to Mr. Nathani, these figures are highly exaggerated. Instancing the arisings of scrap of nearly 1,50,000 tons out of the total annual sheet consumption, he pointed out, there was only one solitary consumer in the country, namely the Mysore Iron and Steel Works, which consumed not more than 2,000 tons during the last five-year period; the rest of the arisings had no market whatsoever in the country. The S.T.E.A. President, accordingly, regretted that the net result of the recommendations of the Committee would be further limiting of the outlets for scrap from this country. If the facts are as Mr. Nathani has indicated, the least that the authorities can do, especially when they need to muster everything exportable to augment our exports, is promptly to appoint a wider and more representative committee to determine the exportable surplus and release it without much ado.

Food

WHY THESE HIGH PRICES?

THE PERCEPTIBLE rise in the wholesale prices of foodgrains in the country, witnessed lately, has once again brought to the fore the controversial question of introduction of controls. More than the known divergent views on the subject among some Union Ministers, what has caused concern among the wholesale foodgrain traders is the persistent rumours about the proposed introduction of strategic controls by the Planning Commission. According to these interests, the so-called strategic controls would affect only the wholesale trade (which constitutes hardly three per cent of the entire foodgrain trade in the country), while leaving out the primary producers and the retail traders untouched.

Besides, they argue, any hasty introduction of controls would not serve the purpose the authorities have in view. As such, they suggest that a thorough investigation be made into the inherent causes that have contributed to the recent upward trend.

The President of the Federation of the All-India Foodgrains Dealers' Association (FAIFDA), Mr. M. H. Hasham Premji, declared, at a press conference in Bombay last week, that the present price spiral was due to reasons other than any shortcoming on the part of the foodgrain dealers. Substantiating this, he said that the rise of over eight per cent in the price index of food articles during the first six months of the current year had been brought about more by other sub-groups in the price index than by wheat and pulses. During this period, the price increases under different heads were: fruit and vegetables, nine points; milk, 22 points; ghee, 7 points; gur, 21 points; and sugar, 9 points. The price of wheat had actually declined by ten points, but a corresponding rise had been witnessed in rice, and, even so, on the whole, the prices of agricultural commodities had risen by only 1.7 per cent during the said period.

Yet another contributory factor to the present upward trend, according to Mr. Premji, was the considerable rise in the cost of production brought about by the extensive use, made by the farmers, of better seeds and fertilisers, as also the execution of several farm-improvement schemes, the introduction of better farming methods, etc. Further, the FAIFDA President also alluded to the increased incidence of various new taxes, such as the water cess, the development cess, especially in case of the vast area of newly irrigated lands, and so on. In addition, notice had to be taken too of the important shift that has taken place in the commodities of consumption by the people in the country, due to urbanisation and rise in living standards of the people, Mr. Premji added. It seemed to him, therefore, that there was a very strong case, in the changed circumstances, for granting the farmer some compensation, by way of a slight increase in the prices of foodgrains, to cover a part of these higher costs, as also to provide him with some incentive to make use of better and more effective farm production practices and to keep his interest alive in higher and higher production. However, as he pointed out, though this policy is supposed to have been followed by the Government, it has only been put into selective use as in the case of the prices of jute, cotton, sugarcane, tea and oilseeds, all of which, by the way, have been allowed to be raised.

Recalling the doubts raised by the Parliamentary Congress Committee for prices at its meeting during the first week of this month (September, 1962) whether all the items included in the Index Numbers reflected the correct rise in the wholesale foodgrain prices, Mr. Premji said that a change in the group had to be brought about and that the sooner it was done, the better it would be.

Sugar

EAST U.P. SUGAR MILLS' TRAVAILS

THE EAST U.P. mills are indeed the Achilles' tendon of the Indian sugar industry, for the working of most of them is uneconomic. But at the same time this is the only industry worth the name in this poverty-stricken and backward area of the country. In the recent past, with a view to help them to bring down their cost of production, some of the East U.P. mills have been allowed to be shifted to places where there are better facilities available in respect of essential raw material (i.e. sugarcane) supplies and marketability of the end-product. Shutting down of the whole of this industry in this region, however, is obviously neither necessary nor desirable. Efforts, therefore, need to be made to make their working more economic to the extent possible.

The travails of the East U.P. sugar industry emanate primarily from two factors, namely, the uneconomic size of majority of them and the poor quality of their cane supplies. According to Mr. V. D. Jhunjhunwala, President of the Indian Sugar Mills' Association, East U.P. Branch, there exist in this region a number of factories having a capacity of only 700/800 tons, as against an economical capacity, in the opinion of the Planning Commission, of 2,000 tons. The quality of cane in this area, which at one time was considered to be the sugarcane belt of the country, has also not shown much improvement over the past decade or so—in some places it has not shown any improvement at all or has even gone down. The causes for this are not far to seek. Lack of adequate irrigation facilities, frequent recurrence of drought and the poverty of the peasantry in general have tired the soil over the ages with the result that the fertility of the soil has reached a stage from where it can recover only through concerted measures over a long period.

To rectify the position and to restore the health of the East U.P. sugar mills, the eminent pleas made by Mr. Jhunjhunwala, while delivering his presidential address to the East U.P. branch of the ISMA at Gorakhpur, last week, need to be acted upon. The number of sugar factories in the area has to be reduced gradually from 33 working factories at present to say 10/15 units, through merger of the small capacity units either amongst themselves or with the bigger ones to make them viable and economic. Their modernisation is also urgently called for. With a view to improve the quality of cane, the State Government has to bestow more attention on matters pertaining to cane research so that improved varieties suitable for cultivation in this area are evolved. With this end in view, the State Government obviously will have to earmark a greater portion of the cane purchase tax (cane cess which it was called before its levy in that form was nullified by the Supreme Court recently) for development of cane instead of its diversion towards the general revenue.

Some relief to the East U.P. sugar industry can also be afforded by undertaking construction of new roads and improving the existing ones so as to enable the movemet of stores, particularly coal, and the end-products less costly and expeditious. Provision of irrigation facilities through undertaking of minor irrgation projects would also be a step in the right direction to increase the yield of cane in the area. To minimise the havoc played by floods to the cane crop in years of heavy monsoons in the catchment area of the rivers flowing through this region, which is a fairly recurring phenomenon, the State Government would do well to act upon Mr. Jhunjhunwala's advice in respect of dredging of river beds. This, incidentally, would result in an other benefit to the area, namely easing of the transport bottlenecks.

New Issues

GAJRAJ PANNALAL LIMITED

MESSRS. GAJRAJ PANNALAL LIMITED, who own Shree Mahalaxmi Cotton Mills, have plans to raise Rs. 12.5 lakhs capital, all in equity shares of Rs. 100 each. Of this, 1,450 shares are reserved for allotment to the directors, their relatives, friends and the existing shareholders. The remaining 11,050 shares were offered for public subscription, at par, on September 21, 1962. The list closes on October 1, 1962, or later at the discretion

of the directors. The issue, if fully subscribed, will raise the issued and subscribed capital of the company to Rs. 22.5 lakhs, out of an authorised capital of Rs. 25 lakhs.

The proceeds are to be utilised for financing the modernisation and the expansion scheme of Shree Mahalaxmi Cotton Mills. The expansion plan envisages an addition of 6,676 spindles, 129 looms and some more equipment for dyeing, bleaching, printing and processing of yarn and cloth. After the expansion programme is completed, the mills will be having a total of 12,800 spindles and 390 looms with their complete back and front processes.

The expansion programme is estimated to cost Rs. 37.5 lakhs. As the present issue will be making available only Rs. 12.5 lakhs, the company has entered into an arrangement for a loan of Rs. 25 lakhs from the Industrial Finance Corporation of India.

HIND AUTO INDUSTRIES

HIND AUTO INDUSTRIES LTD., Lucknow, a new company sponsored recently by Premier Motors Private Ltd., with a view to undertake the manufacture of automobile components, is expected to enter the capital, market some time later this year. The authorised capital, all in equity shares of Rs. 10 each, is proposed to be issued in the first instance. Part of it will be subscribed by the directors, their friends and associates, and the remainder will be offered for public subscription. The exact details of this, however, are yet to be disclosed.

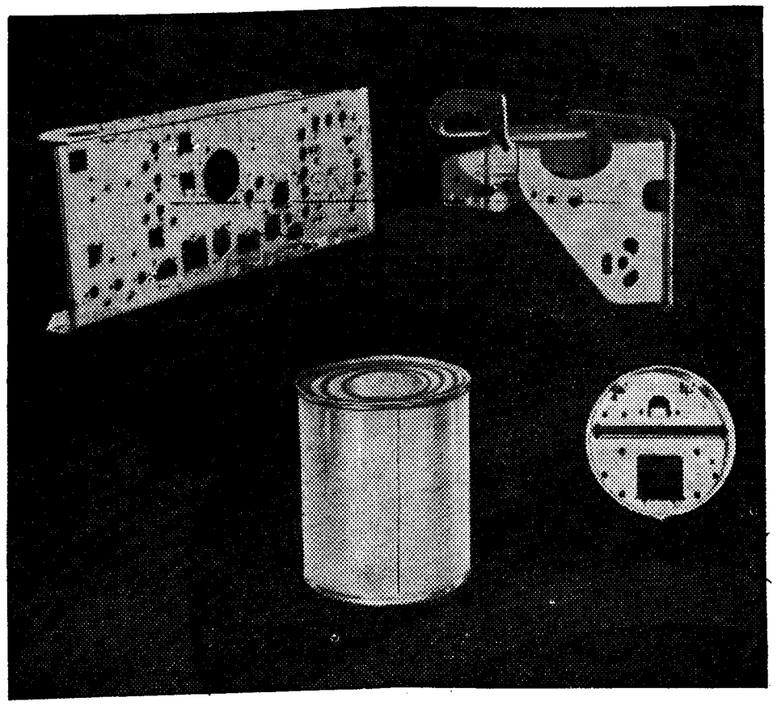
The plant of the company will be located at Lucknow. The components which are envisaged to be produced are tie rod ends, spring shackle boards and pins and king bolts. The manufacturing licence for these is at present owned by Messrs. Premier Motors Private Ltd. The Government of India has been approached for the transfer of this licence to the new company. At a later stage, the manufacture of universal joint couplings, water pumping repairing kits, tail crown wheels and tail pinions is also proposed to be undertaken.

Technical collaboration has been arranged with the West German firm Alfred Sell Autoteilefabrik. The necessary foreign exchange required for the import of machinery and equipment is reported to have already been sanctioned by the Government.

Shipping

UNSATISFACTORY RESULTS

AT THE annual general meeting of the shareholders of India Steamship Company Ltd., Sir A. Ramaswamy Mudaliar, Chairman, referred to the financial results of the company as an unsatisfactory development in the year 1961. Although the freight earnings during the year was Rs. 8,97,26,920 as against Rs. 8,63,00,835 in the previous year, Sir Mudaliar regretted that the year ended in a loss. The loss may be lower than the previous year, but it does not make the position satisfactory in any way. Two factors seem to be responsible for this state of affairs. The first one being the lower rate of freight which continued for goods carried from East to West throughout the year and for goods from West to East during most of the year. The second factor was that he volume of high freigh cargo had fallen to some extent and the vessels had to carry low freight cargo like oil cakes, ore and fertilisers which swelled the volume of freight tons carried without substantial benefit to the companies concerned. The increase in items of expenditure was mostly due to incrmental increases of salary, revision of scales in some cases, and repair and maintenance charges.



It may be noticed that the depreciation charges have also gone up and the insurance charges has also gone up on account of unfortunate loss sustained by the company last years. The costs on the whole have been increasing. The strikes at ports and delays both in official and non-official circles in no way can be justified and sooner an end is put to all this the better it will be. Under this state of affairs, Sir Ramaswamy Mudaliar, pointed out that the increased rate of dock levies cannot at all be thoroughly justified. In February of this year, the levy amounted to 90 per cent over the normal rate and from 1st April, it is 100 per cent. The remedy, Sir Ramaswamy Mudaliar feels lies in either providing adequate freight rates or by decreasing the costs. The situation as described by, Sir Ramaswamy Mudaliar, appears to be quite convincing and one would agree with the Chairman of the Company that the cost must be brought down or adequate freight rates be provided otherwise the shipping industry which is so vital for the economy of the country will not be able to make the necessary headway.

Efficient management could also reduce the financial gulf between receipts and expenditure and the manage-met must see to it that this is brought about. At the same time it needs to be reiterated that the essential economic factors affecting all interesss must be carefully viewed and freight policies evolved then as a result of these considerations. Attention must at the same time be devoted to replacement of old ships and new ships must be built in our shipyards and in foreign yards where necessary. So far as repayment of the loan is concerned, the National Shipping Board has suggested that the same principle may be applied, that is, payment over a longer period for those instalments on the previous loans which have yet to be paid by shipping companies. It is to be hoped that this principle would be accepted.

Finances

STATE OF THE U.S. DOLLAR

PRESIDENT KENNEDY, while addressing the annual meeting of the International Monetary Fund and the World Bank, revealed confidence of his Government that is pledged to keep the dollar fully convertible into gold and to honour that pledge with all the resources of gold and credit. The U.S., he added, had not impaired the value of the dollar by imposing restrictions on its use nor had it restricted the amount of dollar an American might wish to take or send abroad. It had followed a liberal policy on trade and it continued to supply its friends and allies with dollars and gold to rebuild their economies and to defend their freedom. He rightly was of the opinion that other countries did not expect the U.S. to bear indefinitely both the responsibilities of maintaining an international currency and in addition a disproportionate cost of defending the Free World and fostering social and economic progress in the less developed parts of the world. This has to be read in the context of the last decade when the World War II in Europe had crushed various advanced economies. Naturally America had to come forward with considerable assistance to European countries to help them regain their economic health. Moreover newly gained freedom in the underdeveloped countries made it necessary for the advanced nations, especially the United

What have components to do with a can?

What has a radio or bicycle component to do with a can?

Plenty! It has to do with what engineers term "press tool know-how". Engineering experience in precision drawing and forming of sheet metal for packaging has been extended by Metal Box to the production of vital industrial components.

From clutch-covers to extruded transformer cans, Metal Box serves the radio, automotive and electrical industries with a wide range of precision-made components, all of which were previously imported. These—and the essential can-closing and bottle-sealing machinery manufactured in India by Metal Box—help save over Rs 60 lakhs of valuable foreign exchange every year. And Metal Box machines are exported too.

The BINNY Group of Mills manufactures over 50,000 miles of cloth every year—enough to encircle the world twice at the equator!

From their inception the Madras and Bangalore Mills have unfailingly concentrated on the production of high grade materials so that the name 'BINNY'—synonymous with superior quality and durability—has been carried to the remotest corners of the country. The volume of their production bears ample testimony to the popularity of BINNY fabrics, the fine quality of which has not only created a large and growing following in India but has also succeeded in winning the goodwill of buyers in many countries overseas—sure proof that BINNY fabrics are equal to the best in the world.

Buy your requirements of BINNY fabrics at controlled rates from authorised BINNY Stockists who display this sign board.

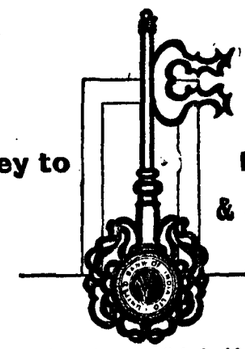
States, to lend them a helping hand in their economic progress.

President Kennedy also referred to the deficit of the order of $1,500 million this year which is likely to appear in the U.S. foreign trade balances. This deficit, he said, was a considerable improvement over the last year when it was $2,500 million which was even higher in the preceding years. Against this deficit, it may be observed that the total gross military expenditure of the U.S. abroad is around $3,000 million and other aid expenditure comes to nearly $1,300 million. Thus if America were to look after its narrow self-interest, it could easily do without this huge expenditure and bring about a proper balance of trade. President Kennedy, therefore, was quite reasonable when he pointed out that the problem of the U.S. imbalance of payments was not their concern alone. The security of the dollar was and ought to be of major concern to every nation. This is so true because balance of payment deficit is not the result of any monetary or economic mismanagement in the U.S. Instead it is the result of expenditure in whole of Free World. This President Kennedy in a way confirmed that the basic strength of the dollar was unchanged and there would be no reversal of the present U.S. policy of assistance to underdeveloped countries.

Pig Iron

A PLANT FOR GOA

IF NOT in the public sector, at least in the private sector a pig iron plant is likely to be set up in Goa shortly. The reasons for going slow by the Government in regard to this matter appear to be that no proper survey has so far been made of the iron ore resources in the territory. The N.C. Srivastava Committee of the Planning Commission which visited Goa recently gave an overall suggestion for industrialisation and economic development of the area and the specific issue of setting up of pig iron plants to utilise, the locally available iron ore was not gone through by it. Besides, the Ministry of Steel and Heavy Industries does not seem to be in a clear mind whether large-scale production unit will be a profitable ore proposition. In other words, it implies whether the iron ore would be sufficient and of the right quality for running a pig iron plant. The other reasons appear to be that mine owners have entered already into contracts with Japan and Germany for supply of ores. This obviously restricts the scope for establishment of several plants to produce pig iron immediately. So if pig iron plant is set up, it would obviously have to depend on increased production of ore beyond the committed limit for exports to foreign countries. It is estimated that Germany was importing 2.2 million tons of iron ore from Goa every year, approximating to 39 per cent of the total iron ore output of the territory. Japan was taking 2.6 million tons per year, approximating to 46 per cent of the total iron ore output. Other overseas countries together imported the rest.



There is another difficulty and that is in regard to operating the iron ore mines as the mines are not mechanized. So under the circumstances, availability of iron ore is likely to be limited. The mines which are mechanized seem to be only three such as those of Messrs. Dempo & Co., Chowgule & Co., Salgoankar & Co. While on the face of it all this may seem reasonable for not setting up a big pig iron plant in the territory till a proper survey is carried out of the iron ore resources, it is heartening indication that the plant may be set up in the private sector. The private sector in every field has delivered the goods well and there is no reason why it should not be able to deliver the goods in future. So it should not only be given a chance in setting up the pig iron plant, but it should be encouraged to establish many more vital industries the need for which is greater at the moment to develop the territory.

(Continued from page 577)

dumping of farm produce by all the surplus countries. Thus, European taxpayers would all be subsidising the British housewife, while the British Government passed on a part of the gains in subsidies to British farmers. This is just the state of affairs the Six want to avoid, and they are astonished that Australia and Canada cannot see that they must avoid it too. Precisely similar prospects exist, it is claimed here, for many tropical products such as India exports. Britain would be forced before long to buy them where they were cheapest (which is not necessarily in India) or where such purchases opened the way for more British exports. The Commonwealth preference that the overseas premiers were defending was a luxury that Britain could no longer afford if she were to live next to a renascent Europe.

Mr. Nehru's criticism was no more favourably judged on the Continent. The success of India's Five-Year Plan depends, it was pointed out, on the USA and West Europe; much less on Britain if she remains isolated and a stagnant economy. The arguments of the Six and of Mr. Heath to the effect that India will make gains in trade with the enlarged Common Market are perhaps disputable, but Mr. Nehru did not dispute them. He merely passed on to political points that were shrugged off here; the Six did not lead Britain into the anti-Communist alliance, so reflections on the danger of power blocs were irrelevant. In sum, the case put forward by the visiting premiers in London was assessed on the Continent as weak or beside the point, and commentators were in agreement in concluding that the Commonwealth was a sentimental reality but an economic non-entity. (Australia, one Parisian paper claimed to calculate, exports to neighbouring New Zealand only one-tenth of what she exports to Britain, while she exports to India only half what she exports to New Zealand.) That was why the Commonwealth conference produced no useful economic discussion and will have no influence on the course of the Brussels negotiations, except to the extent that it gave Mr. Macmillan the opportunity to affirm his European faith under trying circumstances.

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

FROM THE CAPITAL'S CORRIDORS

OIL MATTERS

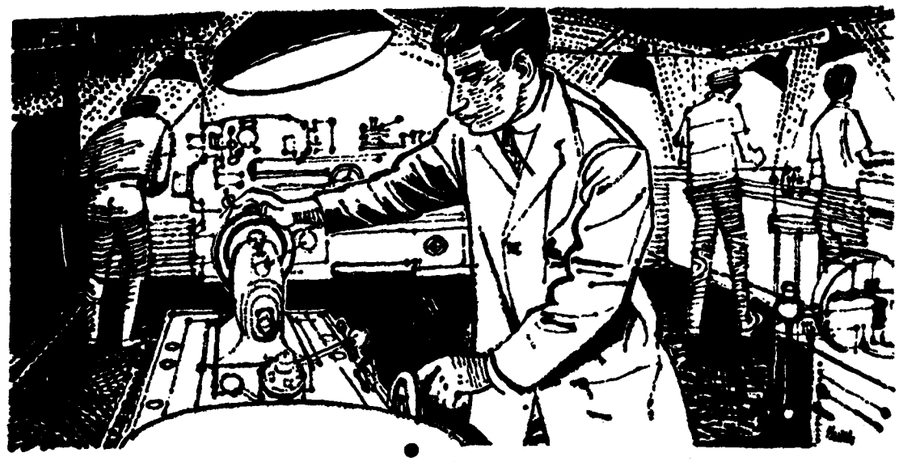
THE finalisation of the petroleum products demand estimate for 1966 has again been postponed at least by three months. The Oil Advisory Committee, which met here this Monday to consider the recommendation of the Steering Committee to the effect that total demand for petroleum products in India by the end of the current Plan period would go up to slightly over 17 million tons, decided to set up a Sub-committee to report within a period of three months on the likely pattern of demand for furnace oil. The increase in the 1966 requirements estimate from 14 million tons to slightly over 17 million tons, envisaged by the Steering Committee, as indicated in a leading article in this journal a fortnight ago, had mainly resulted from an upward revision in demand for kerosene by 7 lakh tons and for furnace oil by 1.8 million tons.

The Union Minister for Oil, Mr. K. D, Malaviya, who presided over the Oil Advisory Committee's meeting, is understood to have expressed the belief that the 17 million tons demand estimate was an unrealistic one; the expansion in the demand for furnace oil envisaged by the Steering Committee, according to Mr. Malaviya, did not take into consideration a number of facts such as expansion in coal output and availability of natural gas as a source of energy in the Gujarat State. The estimated increase in the demand for kerosene also, the Minister is understood to have stated, could be met to some extent by converting coal into gas. The Sub-committee that is being set up would be asked to examine the issues raised by the Minister for Oil so as to reach a more realistic estimate for demand for petroleum products by the end of the Third Plan. It would not be out of place to mention here that ENI has estimated India's demand for petroleum products in 1966 at 18 million tons and has visualised a rapid growth in this demand thereafter. According to some usually reliable sources, the Oil Minister is prepared to accept the 1966 demand estimate somewhere in the neighbourhood of 16 million tons.

The question of further expansion of the private sector oil refineries is also believed to have come up before the Oil Advisory Committee. But in view of setting up of the Sub-committee to report on the likely pattern of future demand for furnace oil, it was naturally put off. Mr. Malaviya, however, is stated to have indicated that the question of expansion of the private sector refineries had nothing to do with the revision of the existing refinery agreements. Any expansion of the private sector refineries, he asserted, could only be considered after first deciding on the expansion of the existing/proposed State-owned refineries and setting up of new refineries in the public sector and after assessing the progress of finding other economic substitutes for oil. Further, Mr. Malaviya is reported to have stated that the three private sector refineries now functioning in India could be allowed to expand their capacities only if they were willing to import crude oil at much cheaper rates than they are doing at present and accept payment for it in non-convertible rupees. The three western oil companies, it may be recalled, had offered to voluntarily relinquish their special privileges under their existing refinery agreements on understanding being reached on some points included in which was the role that they would be envisaged to play in the future development of the oil industry in India. This obviously made their offer to abrogate the refinery agreements and their substitution by industrial licences to be drawn under the Industries (Regulation and Development) Act, 1952, conditional on allowing them to expand their capacity without incurring much foreign exchange expenditure and that too without drawing upon the foreign exchange resources of this country.

Mr. K. D. Malaviya is leaving New Delhi next month on a tour of the Soviet Union, Rumania, Poland and Italy to enlist fresh assistance from these countries for the public sector oil and coal enterprises. With the foreign exchange situation of the country becoming increasingly critical, Mr. Malaviya is stated to be anxious to obtain larger supplies of deficit petroleum products from the East European countries which accept payment for their exports in non-convertible Indian rupees. How far the Oil Minister would be able to ensure adequate and regular supplies of petroleum products in India this way, however, depends on how rapidly the State-owned Indian Oil Company can spread its network of distribution.

In Italy, it is learnt, Mr. Malaviya would discuss with the ENI authorities the question of setting up the fourth public sector refinery in South India. ENI is now reported to be willing to participate in the construction of this refinery on the basis of participation in its share capital rather than on the basis of a long-term loan to it.



In Poland, Mr. Malaviya's concern would be coal. Efforts are being made to secure some additional Polish assistance for the development of coal industry in this country. The Polish Government also is reported to be inclined to provide some more aid.

Meanwhile, the Government of India is understood to have started negotiations with ENI for the supply of 1,00,000 tons of furnace oil and 40,000 tons of HSD in exchange for motor spirit. India has also signed another agreement recently with the Soviet Union for larger imports of petroleum products from that country.

MANUFACTURE OF AUTOMOBILES

The Union Ministry of Heavy Industries is understood to have done some plain-speaking with the representatives of Premier Motors, manufacturers of Fiat cars in India, who, following the recent cut in the foreign exchange allotment to them, had sought the permission of the Government to raise prices of their cars, which they pointed out was a necessary follow-up of a reduction in their output. The reduced foreign exchange allotment, the Fiat manufacturers intimated to the Government, would compel them to curtail their production due to difficulties of importing some essential components. This, they stressed, would naturally result in a certain amount of retrenchment of labour. The Government officials who discussed the matter with the Premier Motors' representatives, however, are understood to have plainly told them that any curtailment in their motor cars' output would call for further reduction in their allotment of foreign exchange, reiterating that the Government shall not increase foreign exchange allotment even in the face of threats of retrenchment of labour. They have advised Premier Motors that they should make larger use of indigenous components in the manufacture of their cars and also increase their production of trucks. In reply to the plea by Premier Motors that their trucks were not popular, the Government is reported to have suggested to the company that it should reduce the prices of its trucks.

Coming close on the heels of Mr. T. T. Krishnamachari's threat to scooter manufacturers that if they did not bring down their cost of production and conse-

In Factories, Hospitals, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In factories sudden darkness can cause injury and damage to machinery. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actual mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for factories, hospitals, schools, banks and public places.

quently their sale prices, they would face nationalisation, the meeting of the Premier Motors' representatives with the Government officials in the Ministry of Heavy Industries should show that the Government has said good-bye to its policy of appeasement to the automobile industry and is going to insist on greater use of indigenous components in their manufactures. To step up the output of indigenous components for the automobile industry, as already reported in this column, the Government has agreed to grant the necessary foreign exchange for import of capital goods required for the manufacture of components.

Failure of the automobile industry to come up to Government's expectations, knowledgeable circles opine, may lead to the revival of the proposal to manufacture people's car in the near future.

MANUFACTURE OF ALUMINIUM

The trouble about Mr. Murarji Vaidya's aluminium project, to be set up in Mysore, has already been referred to in this column. Similar is stated to be the story of the 20,000 tons Koyna aluminium plant for the setting up of which licence has been granted to Tendulkar Industries, first in collaboration with an American firm and then with a German firm, the United Aluminium Works Collaboration. The unsatisfactory progress registered by these two aluminium projects so far, especially by the latter in view of the fact that the Maharashra Government has earmarked power supply for it from the Koyna project which is now nearing completion, has created an unhappy position for the Union Government and has also disturbed the programme of aluminium manufacture during the Third Plan period. Although Mr. Tendulkar has not yet disclosed his mind, Mr. Murarji Vaidya is stated to be looking for a new foreign collaborator. If the unsatisfactory progress of Mr. Tendulkar's Koyna plant also is an outcome of a similar reason, the Union Government has reasons to be very much perturbed, for the breaking off of collaboration arrangements by the private sector, especially with two of the leading industrial houses of the United States and West Germany, may have adverse effect on economic assistance which these two friendly countries are offering for India's development plans. The Government, it is believed, is satisfied that both the foreign collaborators in question are competent and willing to carry out their undertakings. The Government is also anxious, and even determined, that these two aluminium projects should be successfully carried through.

These two instances and the surrender of their licence to set up a fertilizer plant in Madhya Pradesh by Khandelwals is feared in knowledgeable circles to be creating unnecessary prejudice in the mind of the Government against the private sector in this country.

STEEL RETENTION PRICES

Speaking to pressmen last week, the Union Minister for Steel, Mr. C. Subramaniam, made a stout defence of the Government's decision in regard to fixation of steel retention prices. The Government, he pointed out, had accepted all the basic recommendations of the Tariff Commission and stressed that the deviation was only in regard to the basis for the computation of the capital block and working capital.

The only suggestion which was not accepted was the allowance in the price of Rs. 8 per ton recommended by the Tariff Commission to enable the two steel companies, TISCO and IISCO, to return the principal and interest on the Rs. 10 crore loans taken by them from the Government. Although the Tariff Commission had recommended payment of an interest of 5 per cent by the two companies from July, 1958, on these loans, the Government had not so far demanded any payment. The understanding with the companies was that they could issue equity capital after April, 1963, and discharge their loan obligations to the Government.

Mr. Subramaniam said the Government had accepted the Tariff Commission's figure of Rs. 357 per ton as the average works cost for 1960-62. He claimed that this had taken into account the quality of raw materials, the increase in coal prices and the upward revision of railway freight.

The Government, he further said, had also accepted the recommendation of the Tariff Commission for a return of 8 per cent on capital and 5 per cent depreciation.

Explaining the calculation of the capital block, the Minister said that on the basis of the full-rated capacity, the capital block worked out at Rs. 1,241 per ton in the case of TISCO and Rs. 942 per ton for IISCO. At 90 per cent capacity, it worked out at Rs. 1,379 per ton for TISCO and Rs. 1,047 for IISCO. Whereas the Tariff Commission had suggested an average capital block of Rs. 1,300 per ton, the Government arrived at a figure of Rs. 1,176 per ton.

Mr. Subramaniam also pointed out that the proportion of the equity capital in the total block of the private sector steel plants had considerably declined in recent years. In 1955-56, he stressed, the equity capital of TISCO amounted to Rs. 17 crores out of total block of Rs. 69 crores. In the case of the IISCO, it amounted to Rs. 3 crores in a total block of Rs. 22 crores. As against this, TISCO's equity capital was only Rs. 39 crores in a total block of Rs. 189 crores at the end of March, 1962, which was less than 20 per cent. Similarly, it was about Rs. 16 crores, out of a total of Rs. 85 crores, in the case of IISCO. This, the Minister opined, went in favour of equity shareholders and provided justification for calculating block capital per ton at the full-rated capacity.

Mr. Subramaniam conceded that the Government's calculation of the working capital was at variance with the recommendation of the Tariff Commission. While accepting the Commission's suggestion of a return of 5 per cent, the Government assumed a working capital equivalent to the value of four months' production, whereas the Commission had recommended a figure equivalent to six months' production. In justification of this lower working capital, the Minister said that the companies would not in any way be affected by it because they were collecting from every purchaser of their products a deposit of 25 per cent of the sale value which they retained for an average period of one year without paying any interest. Further they utilised for some duration of time large amounts of money they owed to the Government.

PLANNING AND DISTRIBUTION OF IRON AND STEEL

The Government of India has decided to constitute a Committee to examine the entire system of planning and distribution of iron and steel. The Committee will consist of: Dr. K. N. Raj, Director, Delhi School of Economics, Delhi University (Chairman); Dr. Raj Krishna, Institute of Economic Growth, Delhi (Member); Dr. K. S. Krishnaswamy, Chief (Economic Growth), Planning Commission (Member); and Mr. C. A. Nair, Union Department of Iron and Steel (Secretary).

The terms of reference of the Committee are: (i) to examine the existing system of planning of production and control over distribution of iron and steel materials exercised by the Iron and Steel Control Organisation; (ii) to recommend measures to streamline and revise the procedure for ensuring equitable and speedy distribution; (iii) to examine the functions of stockists, both controlled and registered, and to make recommendations about their future role; and (iv) to examine the system of control and distribution for pig iron.

COTTON PIECEGOODS EXPORTS

Some more light is now available on the tough competition that Indian cotton piecegoods exports are meeting in the world markets. Spain, without any preferential tariff, is reported to have been able to push up its cotton textile exports to Britain by about 40 per cent in the last one year and Japan is emerging as the biggest competitor to India in South-East Asia, Europe and the United States. A trade protocol was signed between Japan and West Germany in Tokyo last week, under which Japan's export quotas in regard to cloth have been fixed by West Germany at DM. 20 million for cotton textiles and DM 22 million for other piece goods. The Japanese trade circles are reported to hold the belief that the signing of this protocol will bring about 20 per cent increase in their exports of cottongoods to West Germany. The Germans, it is stated, would be increasing their imports of cotton goods from Japan by about 60 per cent. As against this, the performance of India in the West German market is obviously deplorable. West Germany had allocated to India in 1960 a quota of DM 2.6 million, but against this goods worth only DM 9.4 lakhs were exported. During the current year, India has been given by West Germany a quota of DM 4.1 million worth of cotton piecegoods, but goods worth only DM 3.31 lakhs were exported during the three months ending March 31, 1962.

The acuteness of the Japanese competition in the United States is already well-known owing to the preferential position Japan enjoys in that market; it need not be elaborated here. But apart from Japan, India's cotton textiles today are also facing a keen competition in both the traditional and the non-traditional markets from new suppliers like France, West Germany, East European countries, Turkey and Egypt.

As against exports of cotton piecegoods to the tune of Rs. 49 crores a year, the maintenance imports on account of the Indian textile industry are stated to be of the order of Rs. 102 crores—cotton imports Rs. 70 crores, art silk yarn imports Rs. 12 crores, dyes imports Rs. 15 crores and machinery imports Rs. 5 crores. This should show that the performance of the Indian textile industry as a foreign exchange earner is on the debit side.

IMPORT OF CARDING ENGINES AND RING FRAMES

The position in respect of import of carding engines and ring frames by the Indian textile industry, allowed recently after a period of about four years, has been clarified by the Government in the statement issued last week. The statement says: "For the last four years or so import of carding engines and ring frames (spindles) was not allowed. Urgent and heavy requirements of these machines to attain the Third Plan targets of cloth production, however, have necessitated a change in this policy. Since indigenous production was not likely to be adequate to meet these requirements, it was found necessary to meet a part of the requirements by import. Thus a Public Notice No. 87|ITC|(PN)|62 dated 16-7-1962 was issued by the Chief Controller of Imports and Exports says that licences for the import of carding engines and ring frames will be granted to actual users in consultation with the Textile Commissioner.

"It has been brought to the notice of the Government of India that this has created an erroneous impression that import would be allowed freely. This is reported to have led to a decline in orders on the indigenous manufacturers for carding engines and ring frames or even cancellation of such orders already placed. It is clarified that it is not the intention to allow import of these two items freely. Import will be considered on a restricted scale only in special cases having due regard to the indigenous availability and the requirements of units which have undertaken special export obligations. Actual users should, therefore, make the maximum use of the indigenous production of carding engines and ring frames."

MANUFACTURE OF FERTILIZERS

The Union Ministry of Heavy Industries is understood to have examined last week the applications of the Governments of Uttar Pradesh and Kerala for setting up two fertilizer plants. According to authoritative sources, the two State Governments are understood to have been explained that since the Third Plan target capacity for fertilizer manufacture had already been fully licensed, their applications could be considered only in the context of the Fourth Plan programme. Both the Governments, it is learnt, have been advised to bring up their applications with greater details in 1963. More details have been asked for in view of the fact that the off-take of fertilizers, especially in the State of Uttar Pradesh which has already been allotted a fertilizer plant (to be set up at Gorakhpur) during the current Plan period, is not so very encouraging.

INDUSTRIAL LICENSING: PRIORITY LIST

The Union Government is according the following priority to capital goods imports:

1. Alloy and special tool steels.
2. Steel castings.
3. Steel forgings.
4. Heavy structurals including cranes.
5. Railway wagons and other railway equipment.
6. Industrial machinery for textiles, jute, tea, mining, washeries, cement making and paper making.
7. Machine tools, on a selective basis.
8. Pig iron.
9. Shovels and earth-moving equipment.
10. Fertilizers.
11. Rayon grade pulp.
12. Special refractories.
13. Industrial explosives.
14. Ferro-chrome, ferro-molybdenum and ferro-silicon.
15. Modernizing steel re-rolling plants to enable them to manufacture wires rods and special steel sections.
16. Cotton textile machinery particularly for use of short and medium staple cotton.
17. Trucks and ancillaries.
18. Ball Bearings.
19. Cast iron spun pipes from domestic pig iron and scrap.

MARKETING OF HANDICRAFTS

The fifth Handicrafts Marketing Conference, organised by the All-India Handicrafts Board, which concluded its session here last week, has recommended that steps should be taken to introduce measures like the compulsory quality control and preshipment inspection of handicrafts. Till the time the preshipment inspection was made compulsory, the Conference felt that goods carrying quality mark of various States alone should be encouraged for export purposes. In the absence of quality marked goods, the goods meant for export should at least carry a preshipment inspection certificate from some recognised agency. Certain State Governments, like U.P., West Bengal, Maharashtra, Kerala and Punjab, the Conference noted, already operated the ISI certification marking scheme in conjuction with their own quality marking schemes for some of the handicrafts. The Conference suggested that the remaining State Governments should be approached to evolve similar arrangements in consultation with the Indian Standards Institution.

Regarding the difficulties experienced by the handicrafts industry in the availability of raw materials, the Conference recommended that the Handicrafts Board should organise a system of allocating quotas of raw materials to the State Governments for utilisation only by the handicrafts sector. The Conference requested the Handicrafts Board to organise technical training for carrying out inspection and testing of goods and also to conduct regular training programmes for salesmen and impart training in display art.

The meeting also urged that in Delhi and other important export centres, training should be given in the packing techniques.

The Conference recommended that the design centres of the Handicrafts Board should conduct research and give proper help to crafts where necessary. Assistance should be given to craftsmen in improving their own designs.

It was recommended that an institute for training of designers and craftsmen should be started immediately. National awards, the meeting suggested, should be given to Master Craftsmen in recognition of their merits and scholarships instituted for the children of these craftsmen, so as to encourage the continuation of the craft tradition in the families.

In regard to the supply of raw materials for the craftsmen, the Conference felt that for the exporters who earned foreign exchange and were desirous of importing zinc and copper direct, the Indian Handicrafts and Handlooms Export Corporation should make arrangements for converting the metals into brass billets or sheets at a reasonable charge. The State Governments should also earmark some quantities of zinc and copper or brass and make them available to the craftsmen directly.

The meeting suggested that the Handicrafts Board should start depots in areas where there was a large concentration of workmen for storing raw materials, so that these could be supplied to craftsmen conveniently. The National Small Industries Corporation, the Conference urged, should give maximum help in procurring essential tools from foreign countries.

INCREASING MILK SUPPLY TO CITIES

By the end of 1962-63, 10 more dairies are expected to be commissioned in the country under projects to increase milk supply in cities. The new dairies will be in Aarey (Bombay), Calcutta, Madras, Patna, Cuttack, Lucknow, Jaipur, Srinagar, Nellore and Visakhapatnam. Together, they will have a daily handling capacity of about 400,000 litres (11,000 maunds) of milk. During 1961-62, the first year of the Third Plan, seven dairies were started with a total handling capacity of about 315,000 litres (8,500 maunds) of milk per day. New pilot schemes were also started at seven centres in Maharashtra.

Under the Third Plan, there is provision for 55 new milk schemes in cities and growing industrial townships. Thirty-five of these will be Government dairy plants, associated with village co-operatives for supply of milk, while the others will be run by producers' co-operative milk unions. These schemes will be supported by rural dairy extension services, plants for cattle feeds and dairy training. The entire programme is estimated to cost about Rs. 36 crores.

During the current financial year, the milk powder factories at Amritsar and Rajkot are also expected to go into operation. These plants are designed to produce about 2,500 metric tons of skimmed milk powder a year, besides marketing about 20,000 litres (over 500 maunds) of milk a day.

Rapid progress is also being made in the manufacture of dairy products in the private sector. Thirteen firms have so far been licensed in this field and their capital outlay is estimated at Rs. 4 crores. The annual production capacities licensed are (a) 8,500 tons of condensed milk, (b) 3,000 tons of malted milk, (c) 5,500 tons of infant milk foods, (d) 250 tons of processed cheese and (e) 7,500 tons of milk powder.

POULTRY DEVELOPMENT

A "Package Programme" for poultry development is among the main projects now under way to increase the annual output of eggs in the country to about 6,000 million at the end of the Third Plan period, it is learnt here. The level of egg production at the end of the Second Plan period was 2,880 million per annum.

Under the "Package Programme", there will be 50 intensive poultry development blocks spread all over the country, where all the facilities necessary for rapid increase of poultry and egg production will be provided simultaneously. These cover requirements of breeding stock, balanced poultry feeds and better poultry houses; technical guidance in rearing the birds and control of diseases. Besides, there will be a proper set-up for the collection, grading and marketing of the produce.

The total poultry population in the country increased by 60 per cent in the decade 1951 to 1961 — from 73 million to 117 million. During the Second Plan, five Regional Poultry Farms were set up in Bombay, Delhi Mysore, Orissa and Simla for the production of superior birds for breeding purposes and 269 extension centres were started in the rural areas to demonstrate modern methods of poultry-keeping.

During the current Plan period, three of the five Regional Poultry Farms are being expanded, for the production of over 7 lakh superior chicks per annum for supply to State farms and private breeders as foundation stock.

The hatching capacity is also to be increased to four million eggs per month against the present availability of only half a million. Foreign exchange worth Rs. 7 lakhs has recently been released for the import of 167 incubators.

Another project provides for streamlining the organisation for the collection, grading and distribution of eggs and poultry to consumers in 10 large cities. This has the twin object of supplying quality products to people in major urban areas at reasonable prices and providing an incentive to producers in the shape of a big and ready market.

A pilot egg powder factory is also being set up in Kerala to utilise the surplus egg production in the

State. Initially, 30,000 eggs per day will be utilised for powder making.

SHIPPING FREIGHTS

The India-Pakistan|U.K.-Continent Conference Lines used to charge, prior to unification, freight rates on shrimps and prawns from various Indian ports to U.K.-Continent as under: (i) From Bombay — sh. 198-6 per cubic metre. (ii) From Malabar and Tuticorin — sh. 158 per cubic metre.

The Conference Lines have fixed the unified freight rate effective from March 1, 1962, at sh. 172-6 per cubic metre. This has resulted in an increase in the freight rate from ports of Malabar, which is the major exporting area for this commodity, by sh. 14-6 per cubic metre.

On receipt of a representation from the Marine Products Export Promotion Council to the effect that this increase of sh. 14-6 per cubic metre would adversely affect the potential export possibilities of this new industry, the Freight Investigation Bureau took up the matter with the Conference. The latter, however, have not agreed to restore the rate to its original level.

The freight rates on rice bran prior to the introduction of unified tariff from various Indian ports were as under:

(i) From Calcutta — sh. 184-6 per 100 Kilos.
(ii) From Visakhapatnam and Madras Coast — sh. 168-6 per 1,000 Kilos.

The Conference have unified the freight rate at sh. 172-6 per 1,000 Kilos. The freight rate for this commodity was already high as compared to the freight rate on the same commodity from Burma to U.K.-Continent which is about sh. 115 per 1,000 Kilos. The matter was taken up with the Conference concerned pointing out that this commodity moved in considerable quantities from Visakhapatnam, Kakinada and Madras and comparatively small quantities moved from Calcutta and that it is, therefore, more appropriate and reasonable to fix the unified freight rate at the level of the rate prevailing from the major exporting area, namely, at sh. 168-6 per 1,000 Kilos.

The shippers are already findinp the rate of sh. 168-6 as quite high and prohibitive taking into account the rate on this commodity from Burma to U.K.

PROVIDENT FUND EXTENSION

The Union Government has extended the Employees' Provident Funds Act, 1952, to some more establishments employing twenty or more persons.

The Act will apply to saw mills, wood seasoning kilns, wood preservation plants, wood workshops and to establishments engaged in the processing or treatment of wood with effect from October 31, 1962. The latter would include establishments manufacturing hard-board or chip board, jute or textile, wooden accessories, cork products, wooden furniture, wooden sports goods, cane or bamboo products and wooden battery separators.

IN BRIEF ....

According to an Import Trade Control Public Notice issued here last week, the Union Government has decided that exporters of cut and polished diamonds, precious stones, diamond manufactures and jewellery set with diamonds and precious stones, will be permitted to utilise their import entitlements up to 5 per cent of the f.o.b. value of exports for import of machinery, tools and implements required for their respective industries.

*

Sale to tourists of jewellery (manufactures of diamonds, cut and polished, precious stones, jewellery set with precious stones, imitation jewellery, pearls and synthetic stones) against payments in foreign exchange will henceforth be treated as export for the purposes of incentives under the Export Promotion Scheme. Evidence, however, will have to be produced that the articles sold had actually been taken out of India and not disposed of in the country itself.

*

With a view to safeguard the health of the domestic consumers from use of aluminium utensils manufactured out of sub-standard material, the Union Government has assumed the requisite powers under the provisions of the Essential Commodities Act to control the quality of aluminium utensils produced for internal consumption. As a preliminary step, the Government issued an order on September 18, 1962, under Section 2 of the Essential Commodities Act, declaring inter-alia aluminium utensils an Essential Commodity. The order which prima facie declares manufactures and semi-manufactures of non-ferrous metals to be Essential Commodities is intended to cover aluminium utensils only at this stage.

*

A revised scheme for making available imported raw materials such as sisal yarn and dyes to manufacturer-exporters and merchant-exporters of coir yarn and coir mats will come into force from October 1, 1962. Under it sisal yarn and sisal fibre and permissible varieties of dyes and chemicals, actually needed by the coir industry, will be allowed to be imported up to 2 per cent of the f.o.b. value of coir mats and mattings actually exported. Up to one per cent of the f.o.b. value of these products exported can be used for importing essential items of machinery like ledger blades and shearing blades. Against the export of coir yarn, permissible types of dyes and chemicals which are actually needed by the coir industry will be allowed to be imported up to ½ per cent of the f.o.b. value of exports. Essential items of machinery such as ledger and shearing blades can be imported up to one per cent of the f.o.b. value of exports. All import entitlements under the scheme will be worked out by the Chairman of the Coir Board for each quarter.

*

In order to maintain the traditional pattern of trade between India and Afghanistan, and in terms of the arrangements recently agreed to between the two countries, it has been decided to permit for the Trade Agreement period, October 1, 1962, to November 30, 1963, imports of fruits (dried and fresh), asafoetida cumin seeds, and medicinal herbs from Afghanistan, on an ad hoc basis through approved importers. Those who had participated in the Indo-Afghan trade in these commodities during the four years ending June 30, 1956, and who had already been registered as "approved importers" can apply for licences. Those approved importers whose names have been de-registered will not be eligible for any permits. Imports will be allowed within a limited monetary ceiling and, in no case imports in excess of the ceiling will be allowed.

*

The Minister of State for Shipping, Mr. Raj Bahadur, is visiting Japan in the first week of October to explore the possibility of securing Japanese collaboration for setting up of the second shipyard at Cochin. Mr. Raj Bahadur will reach Tokyo on October 1. Besides conducting negotiations about the shipyard, he will also visit some ports and shipyards in Japan to study their working and also visit some tourist resorts.

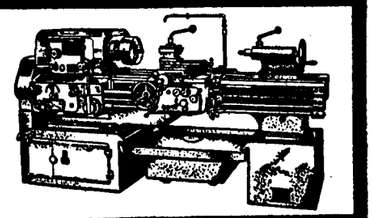
*

Ad hoc licences for the import of seven items from Iran during the period, August 1962 — January 1963, will be granted to established Importers who had imported those items from Iran within the basic period, according to an Import Trade Control public notice issued here. The items are: dry fruits, dates, medicinal herbs (crude drugs), asafoetida, red oxide, dyeing and tanning substances, and gums. The Trade Agreement between the Government of India and the Imperial Government of Iran, concluded recently, provided for import of these commodities from Iran.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

NOTICE is hereby given that the Board of Directors of this Company have decided to recommend to stockholders at the forthcoming Annual General Meeting that a Final Dividend for the year ended 31st March, 1962 on the Company's Ordinary Stock at the rate of £4 per cent net (Tax applicable at 7s. 9d. in the £) be paid on the 5th November, 1962 to those stockholders whose names are registered in the Company's Stock Register on the 16th October, 1962.



Applications for transfers received in this office before 12 O'clock noon on Tuesday, the 16th October, 1962 will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above Dividend.

BY ORDER OF THE BOARD,

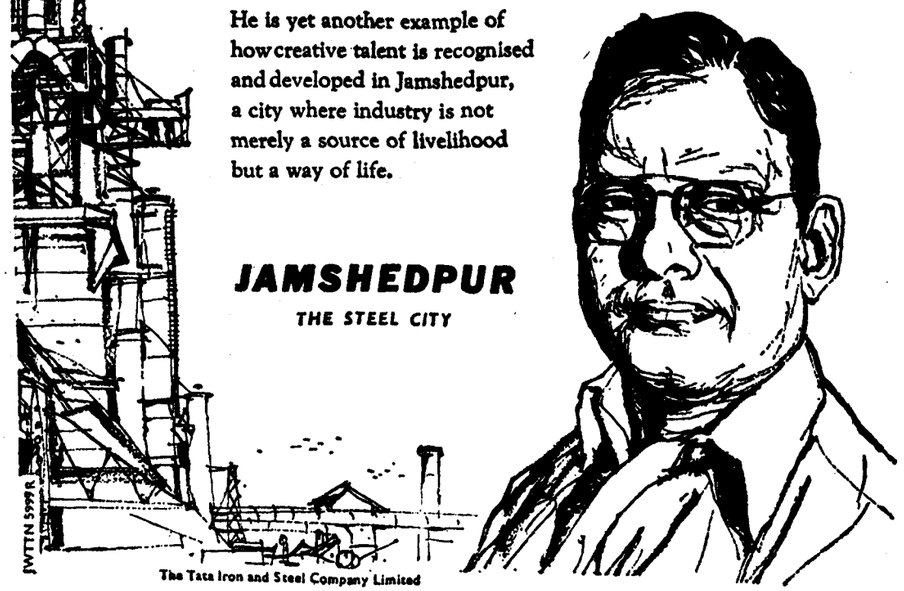
He never looked back...



In 1920, P. K. Chatterjee, a young man just out of school, joined Tata Steel as an apprentice draughtsman.

Full of ambition and zeal to learn, he entered the Company's Technical School which afforded the opportunity to study during leisure. Young Chatterjee was among the first to complete a three-year course in engineering.

Over the years, Chatterjee has worked his way up in the Engineering Department, and blast furnaces have been his enduring interest. He has helped to rebuild the blast furnaces in the Jamshedpur Works, including a 1,000-ton-a-day blast furnace which was rebuilt to his design—the first such attempt in India.

Now an Assistant Chief Engineer in charge of special projects, Chatterjee is widely travelled and highly esteemed by blast furnace designers all the world over.

He is yet another example of how creative talent is recognised and developed in Jamshedpur, a city where industry is not merely a source of livelihood but a way of life.

An agreement for the import of $180 million worth of Japanese industrial goods was recently signed in Moscow by the USSR and Japan.

BOOK REVIEWS

RITCHIE CALDER ON THE CONGO

Agony of the Congo: By Ritchie Calder: Gollancz. 1961: Price 16sh.

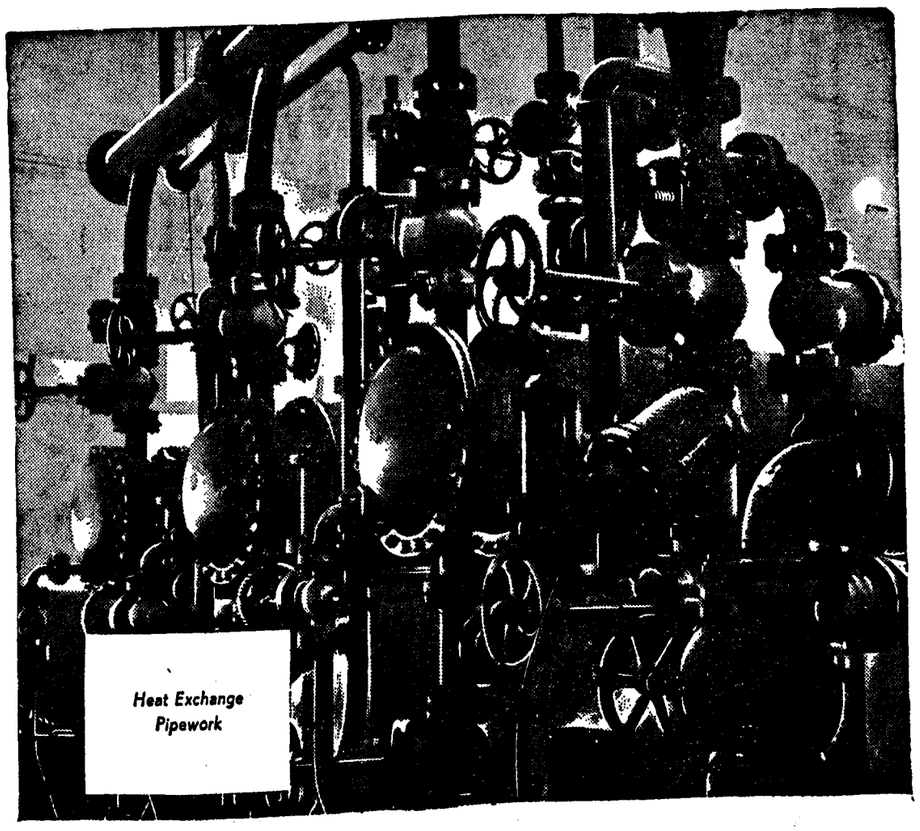
THE classical definition of tragedy is of an action which evokes the emotions of pity and terror. In this sense, the recent history of the Congo is undoubtedly a tragedy. A glance at the newspapers has been enough to reveal some aspects of this tragedy — the bewilderingly rapid and incomprehensible political changes, murders, arrests and fugitive flights, tribal warfare and massacre, the dramatic intervention of the U.N., and the death of Dag Hammerskjold. Behind these surface upheavels, which have all too often made headline news, like the deeper, more difficult, and in the long run, more dangerous problems only the solution of which can lead to the emergence of the Congo as a truly free and independent nation. This is the problem of a potentially rich nation left, perhaps deliberately, with a shattered economy, and a people left, again perhaps deliberately, quite unprepared to cope with the situation. It was to deal with these aspects of the problem that the United Nations Civil Operations was started. Its task was to help salvage, rebuild, perhaps create anew a viable State out of chaos, and it has been working quietly, heroically but undramatically, behind the scenes. On the success or failure of this international experiment will depend the future of the Congo. And it is with the early stages of this experiment that this book is concerned.

Ritchie Calder was sent by the U.N. on a fact-finding mission to the Congo, to report the U.N. Civil Operations, and this book is the record of his impressions of his travels through the six provinces of the Congo. For a fact-finding report, the book is perhaps short on sheer fact, and long on personalities and illustrative anecdotes. Yet a clear enough and frequently horrifying picture, emerges of the confused situation. Under Belgian rule, all the key posts were manned by Belgians, most of whom fled the country. At Independence, there were only 17 Congolese graduates and not a single Congolese doctor. The U.N. was faced with a variety of tasks, ranging from the relief of famine and prevention of pestilence to the reorganisation of agriculture, banking, education, the judiciary, public health services, communications and transport. Calder has described both the magnitude of the task and the quiet, dedicated efforts of the men and women of the UNOC, often working in extremely difficult conditions. In a sense, the book is, and justifiably, a paean of praise for the UNOC.

Yet the UNOC has not been without its shortcomings and has had to face quite a lot of hostile criticism. One of the most interesting points he makes is the reason for the delays and procedural difficulties which the UNOC was accused of creating. Yet this was the inevitable result of U.N. policy. The U.N. experts had no mandate to take over, politically or functionally, any aspect of the administration. The U.N. did not intend to replace Belgian colonialism by international colonialism. U.N. experts were advisers to the relevant departments of a legally constituted government and only in emergencies such as famine relief, did they act on their own. But whom were they to advise in a country where governments changed overnight, and where to decide who constituted the executive of the day, was itself a delicate question. Hence matters had often to come to a standstill while vital orders lay unsigned on ministerial desks, because ministers were in hiding or under arrest!

There is enough evidence to show that when the Belgians left the Congo in 1960, their intention was to make the Congo an object lesson to the world — to demonstrate that an African people were incapable of running their own country even efficiently, leave alone wisely or democratically. Yet, today the Congo has become an object lesson to the world in quite another sense. It is showing the possibilities of international co-operation in nation-building, and the value of this book lies in drawing attention to precisely this. Continued disorder in the Congo is a challenge to the U.N., and its success in this experiment of "State-making and State-management", as Calder puts it, will be a glorious justification of its very existence. It is the most concrete step the U.N. has ever taken to show that international goodwill and co-operation can do, a miniature model of world management. We must hope for its complete success, which will bring us all closer to international harmony and peace.

Mrs. Mina Swaminathan



SEMINAR ON LOW COST HOUSING

Low Cost Housing: Published by H. Volken, Indian Social Institute, Poona-1: ' Price Rs. 2.

With the increasing population, the problem of housing is becoming acute day by day in this country. It is estimated that in the Third Five-Year Plan the urban population would need about five-million houses, not to speak of the housing shortages in the country's seven lakh villages. And with a view to overcome this shortage an overall outlay of 200 crores of rupees has been provided in the Third Five-Year Plan in the public sector and Rs. 1,125 crores in the private sector. Of course, all these are in the fulfilment of the concept of formation of welfare state which this country has accepted.

To bring to light this problem a seminar was held on low cost housing last year encouraged by the success of a Seminar on rural co-operatives held under the sponsorship of Indian Social Institute, Poona. The primary purpose of the Seminar was to provide persons involved in housing schemes in the lower income groups an opportunity to meet Indian and foreign experts as well as higher representatives of the Government entrusted with housing to discuss the various problems. Many eminent experts like R.F. Eyheralde, Consultant in Rural Housing of the Ford Foundation, Mr. S. Adaviyappa, Executive Engineer of the Government of Rajasthan in Development Department and Mr. J. C. Ryan, Chief Officer, Agricultural Credit Department of the Reserve Bank of India, took part in the proceedings.

The book though only a collection of addresses and papers delivered at the Goregaon Seminar on low cost housing provides useful information and material for persons connected with housing schemes and co-operatives. Here are analysed the various problems connected with housing and what is being done by the Government to solve these problems. The issues have been thrashed out carefully and the entire picture is presented in a lucid form. Most of the credit should go to Mr H. Volken, who was the moving spirit behind the Seminar. This book is a must for all those who are connected with housing problems.

S&L

make it

This is an S & L pipework installation—a part and parcel of the rapidly growing Indian Industry.

S & L undertake fabrication and installation of the pipework, as well as the design work entailed in the engineering of piping systems. Our years of experience gained on projects so far completed in India, plus the extra attention that has made S & L so well-known for quality and dependability, assures you of complete satisfaction.

Whatever your project—a Steel plant, Power Station, Paper Mill, Chemical plant, a single item or a complete installation—call for S & L.

COMPANY AFFAIRS

ALUMINIUM INDUSTRIES

It appears from the annual report of the Aluminium Industries Ltd. that during 1961-62 financial year demand for aluminium conductor and accessories produced by the Company was considerably favourable. The sales of the Company during the year under review touched a record figure of Rs. 6.17 crores. The directors indicate that the restricted availability of aluminium metal did not permit the full utilisation of the Company's rolling capacity. During the year about 62,000 kilometres of bare conductor were manufactured. Aluminium conductor production touched a peak of 9.86 million core metres. Aluminium rod and accessories manufactures also reached higher levels. The highlight of the year as far as this Company is concerned was the commissioning of the high tensile galvanized steel wire plant at Kundara. The Government of India have granted licences for the import of machinery for establishing the manufacture of a special type of low voltage solid aluminium underground cable at Kundara. Work on this project has started and the directors expected to bring this new plant into production towards he end of 1963.

During the year under review there was a net profit of Rs. 23.17 lakhs after making adequate provisions for depreciation and taxes etc. The directors recommended the payment of final dividend of 90 nP. per share of Rs. 10 each subject to deduction of income-tax which together with the interim dividend of 90 nP. per share distributed in March 1962 absorbs Rs. 18 lakhs. The dividend proposed to be distributed comes to 18 per cent. A sum of Rs. 4.91 lakhs is separated towards development rebate reserve and the remaining sum of Rs. 3.27 lakhs is carried forward. It may be added that the Company is availing in full the benefit of development rebate mainly on the steel wire plant and machinery and some other miscellaneous equipment commissioned during the year. The directors indicate that it was possible to provide for the income-tax liability at the enhanced rate of 50 per cent, and that a significant addition has been made to the development rebate reserve. In spite of these appropriations the entire amount acquired for dividend payment on the increased capital of Rs. 100 lakhs has been made out of the year's profits.

JOST'S ENGINEERING

There has been an increase of 20 per cent in the sale proceeds of Jost's Engineering Company Ltd. during the year to March 31, 1962. The directors, however, indicate that in view of the very severe import restrictions imposed recently the Company is not likely to maintain this trend. The Company which now manufactures a range of air-compressors has nearly the same position as it was last year in respect of its order books. After making provisions for taxation depreciation etc. the Company recorded a profit of Rs. 90,234. The directors have recommended the payment of a dividend at the rate of 10 per cent subject to income-tax. The first phase of the factory building has been completed. Power has not been made available as scheduled and the factory is now expected to go into production shortly as soon as the power supply is received. Plans for the second phase of construction have also been prepared and the work is expected to commence by the end of this year.

During the year the Company received sanction from the Central Government for the manufacture of auto trucks. The first Jumbo truck and trailers and stillages to go with it have been produced. The Company has negotiated an agreement with Kerry's (Great Britain) Ltd. for the manufacture of drilling machine in a new Company and industrial licence for the manufacture of 1,200 drilling machines per annum has been received. Arrangements are now being made to complete the formalities for forming the new Company. In view of the increased manufacturing activities of the Company a loan of Rs. 4 lakhs is being negotiated with the Bombay State Financial Corporation. An opportunity is also being taken to increase the authorised capital of the Company to Rs. 25 lakhs. This is being done to enable the Company to invest in the new company and to expand its manufacturing activities.

SAYAJI MILLS

During the year to March 31, 1962, Sayaji Mills Ltd. recorded a profit of Rs. 38.30 lakhs after making provision for depreciation (Rs. 14.56 lakhs) and taxation (Rs. 45.50 lakhs). The directors have recommended the payment of a dividend at the rate of Rs. 33 per ordinary share of Rs. 100 each which will absorb Rs. 16.50 lakhs. A sum of Rs. 14.25 lakhs has been transferred to general reserve.

The Company had sold Sayaji Mills No. 2 situated at Bombay to Rajesh Textile Mills and this task was through from September 1, 1961. The working results of Sayaji Mills No. 2 for the five months ending August 31, 1961, have been incorporated in the current year's account. The Company has also purchased all the 21,000 fully paid shares in Shri Shubhlakshmi Mills Ltd. and therefore Shri Shubhlaxmi Ltd. becomes a subsidiary company to Sayaji Mills. The gross profits of Shri Shubhlaxmi Mills Ltd. for the year 1961 were of the order of Rs. 4.6 lakhs. A programme of substantial rennovation of the plant and machinery as well as improvement in working efficiency has been initiated after the Company acquired possession of the said mills.

Company Meetings

THE ALUMINIUM INDUSTRIES LTD.

Address delivered by Sri S. Narayanaswamy, Chairman, at the 16th Annual General Meeting of the Company held at the Registered Office, Kundara, on September 27, 1962.

The year 1961-62 has, in several ways, been a memorable year in Alind's history. It has been a year of record turnover, our sales having reached a peak of Rs. 6.17 crores in money value, our production being 62,000 kilometers in bare conductors and 9.86 million core yards of covered conductors. It is perhaps inevitable that such a turnover should produce profits of the order of Rs. 23.16 lakhs enabling the Company, despite higher tax commitments to distribute without much effort, the now familiar 18 per cent dividend on its paid-up capital of Rs. 1 crore, after making appropriate provisions. You will have observed that despite a quantum of development rebate, of which the company was able to avail on its high-tensile steelwire plant, tax provisions have had to be of the order of Rs. 18.20 lakhs. The total tax the company will be paying on its own behalf and on behalf of shareholders by deduction from dividend packets will be of the order of Rs. 23.60 lakhs, which gives you some idea of the suction effect of direct Central taxation on the profits of the Company — distributed and undistributed.

TAX IMPACT

It is interesting to observe that over a three-year period, changes in the pattern of corporate taxation have been such as to add considerably to the burdens of industry. Companies which made reasonable profits exercised prudence in distribution of dividends and ploughed back chunks of residual profits for development in the past, felt that in so fashioning the disposition of their finances, they were achieving a golden mean between distribution on the one hand and the build-up of enhanced earning capacity on the other. I am happy to say that this latter feature has been as welcome to shareholders as the dividend packet itself.

With the stepping up of the Company Tax to 50 per cent and the reduction in development rebate allowance to 20 per cent, the residual profit available for ploughing back has shrunk to levels, that are bound to cause concern to all those interested in expansion of industry. The element of internal capital formation involved in ploughed-back profits enabled companies in the past to restrict their additional share issues to a minimum, and apart from this, provided a cushion against the inflationary impact of high-priced plant and machinery involved in latter-day expansion. The increased corporate levy has the effect of dislocating all medium or long-term managerial programmes of investing retained profits, apart from imposing on the corporate sector as a whole, stresses and strains that will lead to both curtailment of inventories and creation of liquidity problems, compelling the corporate sector to lean more heavily on the banking system — at a time when the banking system itself is not particularly equipped to take on such additional burden. All told the pattern of corporate taxation today is not such as to provide incentives for companies taking on the added responsibilities and burdens of expansion. Curiously, the Third Plan contemplated enhanced installed capacity and diversification of activity by existing industrial units.

EXCISE DUTY

The Finance Act of 1962 has imposed an Excise duty of 5 per cent on finished conductors. As I observed on a previous occasion, the customer pattern in bare conductors being what is is — comprising in the main, Electricity Boards, Project Bodies and State Governments, such Excise duty will only swell projects' bill of costs. All new taxes are meant to augment Plan resources. In this instance, the duty will augment Plan expenditure. In other words, such imposts have financially only a cancelling - out effect, with Excise collection costs thrown in as an addition to the Civil Administration budget.

POWER TARIFF

Some time ago, we made representations to the Orissa Government that the rates of power supply to our Hirakud Unit rendered the operations of our Rod Mill uneconomic. We were hoping for some relief in power rates, but far from affording such relief, the Orissa Government have imposed a 15 per cent duty on electric power consumed and this is bound to add to our rod production costs at Hirakud. Your Directors feel that in the circumstances expansion of activities at Hirakud would be far from purposeful.

ALUMINIUM METAL

I now come to the more crucial problem of raw material. Allocation of raw material to the Company during the current year has been far from satisfactory. In a cycle of stepped-up demand for conductors, any shortfall in aluminium metal supplies, would result in curtailed production of conductors, with which to transmit electricity from hydel or thermal centres of generation in this country of distances — and thus have far-reaching consequences on the pace of electrification. Meagre and perfunctory allocation of aluminium metal, at a time when copper conductor producers have been asked to accept reduced supplies of copper and switch over to aluminium conductor production, is likely to have an unwholesome effect on the morale of the cable industry in India. Until such time as indigenous sources of aluminium supply are able to ensure a free and adequate flow of metal to the cable industry, it would be advisable for Central Government to programme for adequate imports and prompt allocations of such imports to the Conductor industry, in order that the latter may be freed from hesitancies in booking orders. Uncertain deliveries of metal will inhibit production programmes.

EXPANSION SCHEMES

As you are aware, the company has a programme of expanding its Covered Conductor capacity at Kundara and to establish a Covered Conductor unit at Hyderabad. The Company will be trebling its current Covered Conductor capacity before the end of the financial year. Alind Covered Conductors have proved their worth in consuming markets and our increased capacity will help us to meet the increased consumer demand. In respect of the underground cable manufacturing programme known as the "Solidal" project, we have now obtained clearances from Central Government for importing the necessary equipment. We expect to establish the "Solidal" unit before the end of 1963.

ROD ROLLING

Alind has had the privilege of establishing the first Properzi rod-rolling mill in India and of following it up by a modern Properzi unit in Hirakud. The Company has now full command of the technique of rolling rods by the Properzi process, which is now established as the most economic method of producing rod for conductor manufacture. The Company has applied for a licence to enhance rod-rolling capacity from 250 to 600 tons per month. With the paid-up of primary metal production within the country, it appears essential that the country should be concurrently equipped to manufacture rod out of ingots, by the economic Properzi process and free the country from dependence on external sources for rod supplies. It is our hope that the small quantum of foreign exchange involved in our programme to augment rod rolling capacity will be weighed by Government against the vastly larger foreign exchange saved by non-import of rod — which is what will be secured by an increase in our rolling capacity. It is hoped that Government will afford us facilities to import the necessary Properzi rod mill unit and ensure larger production of rod by the cheapest and most efficient process.

STEEL PLANT

The performance of our high-tensile steelwire plant commissioned in November 1961 has been fully up to expectations, though we have been battling against inadequate availability of zinc at economic prices. The Japanese technicians who helped us with the erection and smooth commissioning of the plant left Kundara a few weeks ago after satisfying themselves about the efficient operation of the unit.

SWITCH-OVER FROM COPPER

Consequent on slender indigenous supply of copper and our limited foreign exchange resources, Government have decided on asking copper-using cable manufacturers to switch-over to aluminium. In view of the large and well-spread bauxite resources of India and the licensing of several primary metal producing units, the production of aluminium is bound to be stepped up substantially in the next three to five years, making available to the conductor industry its full requirements of raw material. There is little doubt that this phased programme of displacing copper by aluminium cables will be implemented satisfactorily. This phased programme of achieving total self-sufficiency in the matter of raw material and finished cables is a realistic one and should be implemented in a five-year period from now.

CABLE STUDY TEAM

Having regard to the spectacular strides taken by the cable industry in India and the increasing importance of maintaining the highest standards of production in the industry, it was very appropriate that the National Productivity Council should have sponsored a tour of U.S.A. and Japan by a Team of Indian Experts, who will visit cable factories in these countries that have made so notable an advance in cable-making techniques on the basis of research carried out over the years. I am happy to say that the National Productivity Council Study Team has paid Aluminium Industries the compliment of appointing the Company's General Manager, Sri V. G. G. Nayar, its accredited leader. This, I believe, implies a recognition of the significant role Alind plays in the cable economy of India. The report of this team, when made available, will undoubtedly constitute a valuable addition to the none-too-voluminous literature and know-how on the subject of cable manufacture in India and help the Indian industry as a whole to improve and refine its techniques.

EXPORT

I should not omit to refer to Alind's part in helping export promotion. A few export orders for bare and covered conductors and accessories were received from South-East Asian Countries and are in the process of being executed, the first bare conductor reel to be exported having been kindly released by the Kerala Chief Minister earlier this year. I am glad to say these exports are not uneconomic nor are they subsidised, while margins of profit are no doubt modest.

CAPITAL ISSUE

The Company has received Government sanction for a further issue of capital — namely, 3,50,000 shares at a premium of Rs. 3.50 per share. This issue when made will bring our paid-up capital to Rs. 1.35 crores, while adding Rs. 12.25 lakhs to our Share Premium Reserve. Such an issue will relieve the company of pressure on ways-and-means, caused by continuous plough-back of funds into expansions — a process which will become more and more difficult under the new tax dispensation. The company expects to make the capital issue early in 1963, when our expansion projects will get under way.

That about sums up our doing during the years and our plans for the future which I hope will be implemented with the same smoothness and promptitude as our earlier projects. Notwithstanding difficulties I have catalogued already, there is reason to look forward with confidence to a period of augmented and gainful activity for Alind.

N.B.: This does not purport to be a record of the proceedings of the Annual General Meeting.

INDIA STEAMSHIP CO., LTD.

Address of Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon.), Chairman, delivered at the Annual General Meeting of the Shareholders of the Company, on the 25th September, 1962.

GENTLEMEN,

The Audited Accounts and Directors' Report for the period ending March 1962 have been in your possession for some time and, with your permission, I shall take them as read.

I have to refer to the great loss that the Company sustained in the demise of my esteemed friend and colleague, Sir Bijoy Prosad Singh Roy. The place that he had in the public life of India and of Bengal in particular can hardly be filled and your Company has lost a most valued and devoted champion of Indian shipping. May I request you to pass a resolution conveying the deep sense of sorrow of the share-holders of the Company at this great loss and offering our condolences to the members of the bereaved family.

The Directors' Report shows that the freight earned during the year was Rs. 8,97,26,920 as against Rs.

8,63,00,835 in the previous year. The total number of Liner voyages during the year was however, 54 as compared with 49 voyages in 1961 and the number of ports called at was 947 as against 942 in the previous year. In spite of the larger earnings of freight, it is regretted that the year has ended in a loss. It was hoped that when the pooling system was introduced, the Company would show much better results. Though the loss is somewhat less than in the previous year, various factors have combined to make the position less satisfactory than was expected. The number of freight tons carried during the year was 9,56,332 as compared with 8,80,070 in the previous year.

The earnings reflect two factors. The first is the low rate of freight which continued for goods carried from east to west throughout the year and for goods from west to east during most of the year. The second factor was that the volume of high freighted cargo had fallen to some extent and the vessels had to carry low-freighted cargo like oil cakes, ore and fertilisers which swelled the volume of freight tons carried without substantial benefit to the Companies concerned. The increases in items of expenditure are due to incremental increases of salary, revision of scales in some cases, and repair and maintenance charges. The insurance charge has also gone up on account of the unfortunate loss sustained by the Company last year of the Indian Navigator. The depreciation charges have also gone up as the latest steamer, Indian Trust, was throughout the year in service and the full depreciation amount had to be provided for. The picture is admittedly a gloomy one but I venture to express the belief that it is not unrelieved gloom, as there are factors which have recently come into existence which redeems the situation to some extent. These factors will be referred to at the end of my speech.

The financial results of the working of your Company are not satisfactory, though perhaps slightly less unsatisfactory than those of the previous year. The fact that almost all the shipping companies, both Indian and foreign, have shown either losses or considerably less profit than in the previous year may be noted but does not afford any consolation to your Company. This is particularly so in regard to companies whose fleets are mainly engaged in the India|U.K.|Continent trade.

In my last year's Report to you, I referred to the fact that the freight rates have not been revised since 1957. During part of the financial year under review, the freight rates eastward remained the same and were increased only from 1st October, 1961, the consequence being that the result of such increase is recorded only in the voyages of three months of the year. The freight westwards remains the same virtually as in 1957.

The costs have, however, been increasing, a state of affairs which cannot long be maintained. The difficulties and delays at ports, the strikes — official and unofficial — in no case justified, have all aggravated to bring about a serious financial situation for all companies. The drafts in the river Hooghly during the year under review have caused a great deal of anxiety to shipping companies. There are only a few days in the month when a ship can carry a load of more than 5,000 tons either to the port or down the river.

In this state of affairs, the increased rate of dock levies seem to be thoroughly unjustified, particularly when they are meant for providing special amenities to the dock labour staff. In February of this year, the levy amounted to 90 per cent over the normal rate and from 1st April, it is 100 per cent. These matters require careful reconsideration. The remedy lies in either providing for adequate freight rates or for decreasing the costs. It may be stated that more efficient management may also reduce the financial gulf between receipts and expenditure. But the outcry against what has been termed rationalisation of sailings by shipping companies and the demands of shippers of small quantities of freight from almost every port in the country which was hardly ever served by an ocean-going vessel a few years back poses a problem which is not easily soluble, consistent with the principles of efficient management. I place these facts before you and the public not with a view to minimising any shortfall on the part of the management of this or any other company, but to present the picture clearly and unambiguously both to the authorities and the public.

INDIAN LINES SHARE

Last year, I referred to the pooling arrangement that was arrived at which gave some sort of security to the share of the trade to the Indian flag, and I based my optimistic hope of better results in freight earnings on the fact that undue and unfair competition will be less and perhaps completely eliminated. I must candidly state that the results of the short period prove that some of the most serious abuses have been eliminated in the particular sector that I have referred to. The result would have been far better if the quantity of freight moving, particularly high value freight, had not fallen during the year.

I also referred to the fact that the Western Shipping Corporation, a public sector company, has been admitted as a member of the Conference with the agreement and approval of the two Indian Lines on the India|U.K.|Continent route. I emphasized then that this would be the beginning of a harmonious working of the two sectors and that there would be a growing appreciation of the difficulties of shipping in all quarters. A further step has been taken in this direction and negotiations have been carried on by all the three shipping lines, the India Steamship Company, the Scindia Steam Navigation Company and the Shipping Corporation of India, with the United Kingdom Lines, with a view to increasing the pool percentage allotment to the Indian Lines as a whole and with a view also eventually to bring about an absolute parity in the India|U.K. trade between the Indian Lines and the British Lines. I hope that the negotiations, which have come to an advanced stage, will shortly result in definite agreements and that all chances of rivalry, as between the Indian Lines and the British Lines, will cease and that this will be fortified by an agreement among the Indian Lines themselves, allotting certain percentages to each of the three companies concerned. These matters have occupied a great deal of the attention and time of your Directors who were resolved to seek a lasting solution for the problems, international and internal, in regard to shipping.

FREIGHT INCREASES

I must emphasize that the future of shipping depends largely on a far-sighted policy that the shipping companies and the shippers of any importance take in regard to the freight rates of commodities. Whether it is a general increase demanded by the rising costs of shipping companies or an increase in the freight rates of individual commodities, there has recently been a tendency on the part of Governments not merely in India, to limit the freedom that once existed of shipping companies to increase such rates after full discussion at Conference meetings. It cannot be denied that the earning of foreign exchange has become a very serious preoccupation of most Governments, particularly Governments of developing countries. It is also a matter of serious concern for those countries which depend on invisible earnings from shipping for securing a balance of payments position for their countries. Export promotion is an acute problem for many Governments and the Government of India is no exception to it. It is making every effort to increase its exports, to diversify the destinations of such exports, to find new markets and

to give incentives or rather to remove disincentives which stand in the way of exports by reasonably efficient units of production in the country. It is a well-known fact that the first obstacle to exports which a shipper feels he has to encounter is the rate of freight he has to pay for movement of his goods by road, rail or sea. If only what he produces can, by a miracle, be transported to its ultimate destination without any charge, some at least of the shippers will be most happy. But this is obviously impossible. And if shipping services have to be maintained for the transport of goods, they have also to work certainly without loss and indeed with a little profit. The shipping companies cannot on the one hand afford to fix such rates as will preclude the transport of goods which is their only function, or on the other, carry freight at uneconomic rates. It is therefore necessary to set up agencies which will really find whether the shipper can afford the freight charged or not and whether in fact the export of goods has been prevented or their quantity unduly diminished by freight rates. The profit which the shipper is making has also therefore to be very carefully considered by the Government and by the shipping companies before any conclusion can be drawn as to the unreasonableness of a freight rate. It is my hope that these essential economic factors affecting all interests concerned will be given due consideration and freight policies evolved as a result of these considerations.

I shall not refer to the port delays that have occurred from time to time and I do not wish to refer to the strike in the Calcutta port which over a period of time seriously affected shipping companies. Nod do I wish to comment on the present rate of development rebate which requires that 75 per cent of the allowances has to be provided from the profits before any dividend can be declared. The National Shipping Board, which is the body responsible for advising the Government in matters of policy, has recently reiterated its recommendation that the development rebate may be spread over a period of years — five or six — a reasonable proposal in my opinion, and I hope the Government will give further consideration to it and give effect to the proposal.

Apart from expansion of shipping, replacement of old shipping has to be undertaken seriously. New ships have to be built in our shipyards and in foreign yards where necessary, and the development rebate requirements are proving a serious handicap according to the Shipping Board itself.

There is another matter on which the National Shipping Board has made its recommendations. Recently, the Government have been pleased to order that the instalments on loan received from the Government may be repaid over a longer period than was fixed for loans taken between 1953 and 1960. The National Shipping Board has suggested that the same principle may be applied, that is, payment over a longer period for those instalments on the previous loans which have yet to be paid by shipping companies. I hope that in fairness to the older applicants, this principle may be accepted.

There has recently been a change in the Cabinet Minister in charge of Transport. Shri Jagjivan Ram has replaced Dr. P. Subbarayan as Minister of Transport and Shri Raj Bahadur continues to be the Minister of Shipping. Both of them are enthusiastic and eager for the promotion of Indian shipping and have helped with support and advice all reasonable demands of shipping. I only hope that their voice will prevail and their recommendations accepted in the ultimate decisions that may be arrived at by the Cabinet of the Union Government. The Secretary to the Ministry of Transport, the Director-General of Shipping, who has since been promoted as an additional secretary, the deputy and assistants of the Director-General of Shipping, have all shown a real interest in helping Indian shipping and we have been greatly profited by their advice and assistance. It is not a formal record of thanks that I wish to place before you.

TRIBUTE

It would have been noted that the freight earnings of the year are the largest on record, though for reasons already stated the net results are not what we may expect from such earnings. The gross freight earning is an indication of the zealous and devoted services of all your staff, both afloat and ashore. I am personally aware of the exceedingly ardous duties that fell upon them both in consequence of the first year of the working of the pool and as a result of falling freights and low frieght rates, and I should like to express the appreciation of the Board for their services. I should also like to convey the thanks of the Company to the Shippers, who have extended their continued and firm support to us, and to the brokers and forwarding agents who have shown confidence in us and in the quality of our shipping services.

Since the above paragraphs were written, I would like to refer to some redeeming factors of recent date which would go to relieve the situation in the current year. The coastal freight has, after prolonged investigation and thorough study, been increased by 15 per cent for general cargo and about 10 per cent for coal carryings. This will benefit all Companies including yours which do some amount of coastal trade. A second factor, which has been publicised widely, is the fact that the three Indian Companies have come to an agreement with the British Companies to raise with immediate effect, from September 1st, the pool quota from 30.5 per cent to 39 per cent and to increase that percentage every year by an escalation of 1 per cent. Though the bulk of the advantage of increased percentage would go to the Shipping Corporation of India, the other two Indian Lines engaged in this trade, your Company and the Scindia Steam Navigation Company, will have a fair advantage in freight earnings.

The last and most important factor which enables me to feel optimistic, is the agreement that has been come to between the three Indian Lines engaged in the India U.K.|Continent trade both ways, the Shipping Corporation, the Scindia Steam Navigation Company and your Company. The agreement provides on a pooled basis equal carriage of freight and equal earnings for the three Lines in the Indo-Polish trade, the Indo-German trade, the Indo-Soviet and Indo-Rumanian trade in the Black Sea, and in the trade to the Egyptian and Levantine ports, and Indo-Adriatic trade. This agreement has great possibilities, both because of the friendly and co-operative atmosphere it has created and of the fact that there is no rivalry and no clash of interests between the three Companies.

I have tried to be severely practical in my estimate of the position but I would like to state that the Government of India must realise that Indian Shipping Companies play an important part in foreign exchange earnings and they should have — as I have reason to believe they have — an interest in promoting Indian Shipping and enabling them to earn reasonable profits on their ventures. It has to be emphasized that as against the small voice of Indian Shipping Companies, the loud and uncontrolled, menacing voice of shippers of small exports sometimes prevails. I hope that shareholders of shipping companies will join with the managements to impress on the Government and the public the need for fair-play as between Indian Shipping Companies and Indian exports and importers.

N.B.: This does not purport to be a record of the proceedings of the above Annual General Meeting which was held on the 25th September, 1962, in Calcutta.

OCTOBER 5, 1962.

Guest Editorial

The End of a Chapter

By ERIC P. W. DA COSTA

CHANGE is a law of nature; if it were not, it would have been desirable to introduce it as a human discovery, in much the same way as it was once said that, if God did not exist, it would be necessary for men to invent Him. Descending from the sublime to journalism, one might venture to say that there has been in recent years too much addiction to personalities in the highest reaches of Indian journalism. It is essential for the vitality of journals and newspapers that there should be traffic right to the top. *The Eastern Economist*, in its five earliest years, had two Editors and may claim to have started well as an instrument of restless change. In the fourteen years, thereafter, however it fell prey to a strong personal equation. I have to admit that I was responsible for this return to the Indian journalistic type. I believe this was an error. While long years are generally rewarding to an Editor, particularly when he receives the abundant kindness that I have received, they are not, on balance, good for the institution. A decade at one post should be long enough for any man; for those of us who have large interests elsewhere, it is too much. If there are no important issues of policy at stake, and replacements are available, Editors, after a decade, should generally retire to plant, if they are vital, their stepping stones on higher things.

I will not, I feel sure, be misunderstood by my readers if, on this occasion, I take a backward look over fourteen years which for India have been critical, although for Indian journalism, curiously, they have often been inert. If Indian journalism was not a creature of the Indian Revolution, it might, perhaps, have had in these same fourteen years a more glorious record to show. As it is, it became, after Independence, a camp - follower. Much of its thinking, even in economic affairs, was prompted by Government policies such as the socialist pattern of society, the dispersion of industry, and, all together, in the pedestrian, but nonetheless often original, quality of our Plans. There have been deep defects in the creative or research element in Indian journalism; far too little has been done to break new ground or create the climate for journalists to participate actively and, at an early stage, in the creation of policies.

If *The Eastern Economist* can claim any credit over the last fourteen years, it was in the attempt —only partially successful—to throw something of itself into the creative pool. For those with generous memories there is some record left in three new indices, 'The Eastern Economist Index of Agricultural Production', 'The Eastern Economist Index of Industrial Production' and 'The Eastern Economist Index of Indian Business Activity', all published in 1948, which paved the way for the official indices which, prompted by non-official initiative, came after 1951. Except for purposes of comparison, *The Eastern Economist* indices have ceased to be used. Their task was that of the Socratic midwife to bring official research agencies to life; they were not intended to be set up in private competition with official recording. Only our readers can judge whether the task that has been accomplished, both in creation and then in wanton destruction of our indices, was a contribution to economic understanding in the Indian Union.

The Annual Numbers of which 1948 was the prelude stand on a different footing. Here our readers (and equally happily our advertisers) have left us in no doubt that they wish us to stay in the field. Here the purpose was to stimulate, to provoke, to explain, to persuade and, indeed, in the last analysis to stand fast with our convictions against all comers. Over fourteen years, the philosophy of *The Eastern Economist* on large themes —Asia, South-East Asia, the Middle East, Europe, the North American Continent and, above all, Indian political and economic policies—has been set out in these Annual Numbers for all to see in a single comprehensive piece. Some prophecies made—such as the basic conflict between India and China presented in the Annual Number of 1957—have been triumphantly fulfilled. We can be expected to be less forthcoming on areas where Time has shown, sometimes rudely, where we were in error.

It is right, however, that, on this occasion, I should explain where I erred and where I would now add post scripts to qualify my errors. I came to *The Eastern Economist* steeped in the rectitude of the free enterprise way of life. I came to this view from a belief in human diginity, not from a conviction of the efficiency of commercial free enterprise. I distrusted the public sector unduly, and underestimated the evils of concentration of economic power in Big Business, where management was not impersonal and quickly responsive to social needs and even political imperatives. Over the last five years, largely by public sector initiative in the Second Plan, I have come to place much more faith in the well-mixed economy, with the public sector forcing the pace. Where human freedom comes out in the mixture is still an issue of some doubt in my mind. But I am much more willing to recognise that freedom is a matter not of economics but of a cultural way of life. The Government of India—witness the genuine freedom which I have enjoyed—may not like criticism, but it is tolerant and, generally, freedom-minded. For the present at least, Indian liberty is in safe hands. I am still desperately in earnest on the freedom of individuals to act on their own; but I see that this must never put a brake on public enterprise where it serves needs which the private sector is unwilling, or unable, to undertake promptly.

This nation, irrespective of its agencies of production, has, under God, a destiny quite outside the narrow limits of discussion set in economic journals. The great majority of its people still live so desperately close to the poverty line, and are so encumbered by the terrible burdens that poverty engenders, that it may well be that religion, education, the arts, and vast areas of, "non-productive" expenditure as with Community Development and Panchayati Raj are, in the long haul, more important than industrialisation. Perhaps one of the most difficult lessons we have to

learn is that our own callings are marginal to the country's true progress. This is also the greatest of all lessons, in much the same way as the fear of the Lord is the beginning of wisdom.

One must always leave office, as one should leave life itself, with a feeling not only of humility, but of genuine recognition that almost all one has done has been due to the help and generosity of others. In my case this is not a matter of words. I have drunk too deeply of the milk of human kindness not to know how wonderfully it sustains us through every age. And there is no formality in my thanks to my colleagues, to my readers, to all my friends at home and abroad. The period of fourteen years has been a partnership with them; no one could have received more in return for so little.

This is not a farewell to arms. I still edit the publications of The Indian Institute of Public Opinion and am adding a research publication on exports to numerous studies in the public opinion, marketing research, and economic research fields. But who that has tasted the joys of lively controversy, with the power to thrust as well as to parry, will not regret the end of this chapter in his life? And thus as I withdraw from active journalism, I cast over my shoulders a last longing look. The past always has, through the mistaken, but magic, mirrors in the mind, a glow of glory. Happily all glows, as well as glories, get dimmed in time. Only the friendships endure for they are made of imperishable stuff. With this merciful dispensation of Providence we should all be happy. I, for one, would never wish for more.

Caste in Education

THE ugly exhibition of intransigence, which the Mysore Government has gone on making in the past four years, in the matter of injecting the virus of casteism in the system of education at the university level, particularly at the technical level, has hardly any parallel in the history of India since we became the absolute masters of our own affairs. For the fifth time judicial authority declared in solemn terms the State Government's policy of determining eligibility for admissions to the higher educational institutions on the criterion of caste, by prescribing a high proportion for the reservation pool, as unconstitutional and invalid. The earlier four writ petitions were decided by the Mysore High Court and the fifth one was decided last week-end by the Supreme Court. This makes no difference to the binding nature of the judicial decisions on the State Government. The mask under which it managed to flout the Mysore High Court's four decisions is significant as betraying an attitude of evading obedience to the rule of law in the genuine spirit.

There can be no doubt of how grave a view the Supreme Court takes of this policy of reservation of admissions on the basis of caste. The judges of this highest tribunal in the land err usually on the side of moderation in expressing their views. But when they feel constrained to use a strong condemnatory expression, it is a measure of the danger implicit in the policy that is denounced. Mr. Justice Gajendragadkar, who delivered the judgment of the Supreme Court, has branded it as a fraud on the constitution.

The latest impunged order makes a reservation of 68 per cent of the admissions to the engineering and medical colleges for the specific castes enumerated in it. The reservation of 15 per cent out of these for the Scheduled Castes and 3 per cent for the Scheduled Tribes is not in issue at all. These percentages of reservation have been maintained for them throughout in all the five orders. The constitution makes a specific mention of these two classes and there are apparent reasons for it. The Scheduled Castes were subjected to centuries of supression and the Scheduled Tribes have lived in isolation from the rest of the society. Social justice demands that their welfare and progress should be promoted by special safeguards.

The distribution of the remaining 50 per cent in the reservation pool was made on the basis of a maddening multiplicity of castes and sub-castes —28 per cent for 81 backward communities and 22 per cent for the 135 more backward communities, identified virtually with castes or sub-castes. An analysis of the background to the fifth reservation made by the Supreme Court reveals how dynamic is the concept of the Mysore Government about the definition of backward classes. The reservation for the communities, other than the Scheduled Castes and Scheduled Tribes, fluctuated during July 1958 and July 1962 between 40 per cent and 50 per cent. One wonders whether it is the case of the Mysore Government that these fluctuations are correlated to the fluctuations in the population. But an embarrassing difficulty that emerges in this theory is that the lowest percentage of 40 was prescribed in the mid-year 1960.

The constitutional position on the question of providing safeguards for the protection and promotion of the educational interests of the backward classes is clear. Howsoever the interpretation of the relevant Articles may be stretched, the basic principle remains unaltered that safeguards in the nature of reservation cannot be made on the sole test of caste. Caste may enter as one of the elements in the determination of backwardness in the case of some classes. The Supreme Court poses a forthright question: How about the religious communities which do not recognize the institution of caste? Buddhists, Christians, Jains, Muslims and Parsis fall within this category. The special provisions incorporated in the constitution take scrupulous care to use the word classes. Classes cannot be equated with castes, nor can the two terms be used as synonyms.

The fundamental rights enshrined in the constitution do not allow any discrimination of any description whatsoever on the ground, among others, of caste. Article 15(1) declares that the State shall not discriminate against any citizen on the ground only of caste etc., while Article 29(2), ordains that no citizen shall be denied admission into any educational institution maintained by the State or receiving aid out of the State funds on grounds only of caste etc. The Mysore Government's order, which bases the rule of reservation on the test of caste, militates against both these mandatory provisions.

The question of special provisions for the betterment of the backward sections in the realm of education cropped up in 1951 in a set of cases from Madras and on the strength of Article 46 the constitution was amended by the insertion of an additional clause — Article 15(4). Article 46 contains a directive principle of policy and stipulates that "The State shall promote with special care the educational and economic interests of the *weaker sections* of the population," etc. Article 15(4) introduced by an amendment authorises any provision "for the advancement of any *socially and educationally backward classes*" etc. Coment on the interpretation of these two Articles as excluding the test of caste is hardly called for. The rational criteria of backwardness ought to be the economic condition of the class of citizens and the deviation of the ratio of their student population to their total population from the average ratio for the State's overall population.

To put merit at a discount by restricting the proportion of its pool for admission within severe limits is bad enough — bad for the classes from which the students come and, what is more important, bad for the nation's economy, coming under increasing pressures of the unsatisfied demand for technical and professional skills. But in the public discussion of the Supreme Court's decision an issue of policy of fundamental significance has not received the anxious attention it urgently needs.

The fact that it is a Congress Government which has systematically flouted judicial authority in spirit on four prior occasions in Mysore is as distressing as it is portentious of nationally harmful trends in larger issues of policy. The top leadership of the Congress Party will find no easy, much less convincing, answer to the charge, virtually endorsed by all, that it is conniving at this injection, with a vengeance, of the virus of casteism in the various segments of the nation's life on considerations of expediency. Selection of candidates for elections and the choice of ministers in some States are influenced by caste considerations. There can be no worse technique of perpetuating caste distinctions and centrifugal forces, raising barriers against secularism and national integration. There is yet another vital angle to this question. In a federal constitution, with different political parties ruling at the Centre and in the Units, the risks of the Units pursuing parochial and nationally objectionable policies are real and grave. We can make a fetish of autonomy at the Unit level in strategic or vulnerable points at a high cost. Would it not be advisable to make an appropriate amendment to the constitution vesting the power under Article 15(4) in the Union Government alone?

A Faltering Reappraisal

THERE is much more than meets the eye in Mr. K. C. Reddy's inaugural speech at last week's meeting of the Central Advisory Council for Industries. Since the Monsoon Session of Parliament there has been a policy of hush-hush, as evinced by Mr. G. L. Nanda's defence of the progress of the projects in the Third Plan, to keep away from the public gaze the inevitability of pruning the Plan in parts for the obvious reason of the shortage of foreign exchange and the inadequacy of some of the basic domestic resources. Reading between the lines, it is clear that Mr. K. C. Reddy has now come out with a more frank reappraisal of the Third Plan than his colleagues were prepared to do. But even so, there is positive evidence in his speech which indicates that his appraisal, too, is still faltering.

It would not serve much purpose at this stage to rake up the developments of the recent past involving errors in planning and in rearranging priorities. Amends seem to be in the offing for some of them. Nevertheless, Mr. Reddy has made confusion worse confounded in material respects and, for this result, respect for dogma, to which the Congress Party has been committed, appears to be responsible. On the one hand, licensing for fresh industrial capacity is sought to be brought under stricter control and, on the other, the slogan of concentration of economic power and the consequent necessity of issuing licences to new comers have been advocated. Politically, the Party may find it expedient to raise this slogan from time to time; but at a critical stage, when the expansion of industry is being slowed down, the weight of economic argument must prevail. The policy of allocating licences to new comers has met with very limited inspiring response. As it is, concentration of economic power is more a presumption than a fact. On whatever scale it may appear to exist, its magnitude is grossly exaggerated. A rapid and continuous process of the diffusion of shareholding, particularly among the middle-classes, is going on. It is in the urgent interest of the economy that enterprise and initiative to invest for industrial expansion should not be depressed by a repetitive emphasis on this slogan.

Dispersal of industries may have theoretical as well as practical justifications. Where location of the industry and reasonable availability of resources entitle dispersal in sparsely industrialised areas, the policy should undoubtedly be stimulated. But as has actually happened in the past few years, dispersal of industry, of heavy industry in particular, has taken place under political pressures emanating from the State Governments, regardless of the considerations of economic costs. In the long run, this variety of dispersal of industries is bound to operate as a drag on the economy. Mr. Reddy did not throw full light on the principles which would guide the policy for the dispersal of industries.

There should be agreement with Mr. Reddy in his stress on the full utilisation of the present installed capacity before new licences in the same industries are issued. But it appears from his speech that he is not convinced about the extent of under-utilisation of capacity. The kind of scientific and elaborate statistical probe, for which he is waiting, might even see the passage of much of the valuable period of the Third Five-Year Plan. There is no reason why under-utilisation should not be assessed on pragmatic grounds. The list of the 21 priority industries is on the whole justified in the circumstances. But the determination of the exact number of industries eligible for priorities should be made with less haste and greater thoroughness. This is the lesson to be drawn from the enlargement of the original list of 19 priority industries to 21 in a matter of a mere week.

Licences already issued are being revoked on the ground of failure to take positive measures to implement them. Inherently, this new trend in policy seems sound. But there is a great and real risk that lack of full and proper appreciation of the difficulties in the way of taking action on the licences will result in revocation in very vital and deserving cases. The Minister's assurance about proper inquiry into the causes of non-implementation does not go far enough and it is not fully corroborated by recent experience. Pruning is implicit in the flexible nature of planning. But there must be no surrender to the mood of defeatism and the progress that is feasible must not be allowed to be undermined by pet themes.

THE WEEK'S NOTES

Kerala

AFTER MR. PILLAI'S EXIT

THE WILLINGNESS of Mr. Pattom Thanu Pillai, until recently Chief Minister of Kerala, to resign from that high office and to accept the offer of the Governorship of the Punjab literally came as a bolt from the blue to all, including the public and the politicians of the State itself. This outcome is no doubt an additional feather in the cap of Mr. Lal Bahadur Shastri. Mr. Pillai's individual decision and surprise action have given not a little shock to the leadership of the PSP itself, apart from the loss of reputation they have caused. The discussion in the Press about the objects behind Mr. Pillai's acceptance of Governorship — whether it is love of authority or any similar force — has now ceased to be of importance.

With Mr. Pillai's position in the politics of Kerala powerfully entrenched during the last two decades, the PSP enjoyed a weightage in the cabinet totally out of proportion to its strength in the legislature. The Congress, which had to reconcile itself with a subordinate status, in spite of its higher strength, now gets its due share of effective power in the Government. This is a moment of real opportunity offered to the Congress Party and it will fail not only the State but the nation too, if it does not make a determined and honest effort to run the administration efficiently and thereby make a convincing appeal to the electorate in the forthcoming election. This alone is the way it can fight the Communist challenge. In the recent local elections it won a majority in half the number of districts in the State and the unholy alliance between the Communist Party and the Muslim League failed to dislodge it, as the alliance vociferously threatened to do during the election campaign.

But the task before the Congress is by no means easy. Not only the acute communal differences which have crept deep into the politics of Kerala but the differences between the legislative and organizational wings of the Congress Party pose a difficult challenge to it. The talk of Congress going it alone is premature. There is every need to carry on with the coalition if only because further complications are to be warded off before the elections are due. The PSP now finds its own policies and affairs in a complete mess. But one thing which its National Executive should decide at its meeting, due to start tomorrow, is to view the political scene in Kerala in its correct perspective. That perspective demands a guarded policy not to do anything that would offer gratuitous opportunities to the opposition parties.

Emotional Integration

ROLE OF EDUCATION

ALTHOUGH THE principal purpose of the Sampurnanand Committee on Emotional Integration was to examine the role of education in the difficult task of integration, the dominant impression cannot be missed that the Committee has produced yet another marathon report on the subject of education as such. This is not to minimize the significance of education, which definitely moulds the character and outlook on life of the student community, as one of the powerful instruments of emotional integration. If anything, the Committee's report raises a very important, but controversial, point. It analyses the confusion and chaos that have been created in some respects in the educational policy of some of the States and the deleterious effects of the parachoial pulls. It wants education to be lifted from this state of affairs and to that end it urges a common pattern of education to be adopted by all States. The present drift and State autonomy with some vengeance are to be blamed on the lack of the pursuit of any firm and positive policy for education after Independence. All this analysis raises the controversial point as to whether the States will be prepared to surrender a significant part of their autonomy in matters pertaining to education. The answer to the basic suggestions of the Committee will depend upon the attitude of the States in this behalf.

Inevitably, the question of the media of instruction has been examined at length by the Committee. In this respect what it has done is to consolidate and reinforce the argument for the three-language formula and the maintenance of English as a medium of instruction which follows as a corollary to the official policy of its continuance after 1965 with the status of an associate language alongside Hindi. There is much force in what the Committee has said about the media of instruction. In the course of time, Hindi will, and must, be assimilated on a nation-wide scale as the national language and not merely the official language as the Constitution formally characterises it. The adoption either of Hindi or the regional language as a medium of instruction will narrow down the gap between the highly educated middle class and the less educated masses. Nevertheless, every precaution needs to be taken that the States should not lapse into a situation of intellectual isolation from each other. It is here that English (and Hindi over time) will serve as a great cementing force to prevent that isolation and, furthermore, the retention of English will perform the valuable service of throwing open the windows to the latest currents of thought in literature, science and technology, blowing from abroad. All said the practical difficulties in introducing the three-language formula (with the addition of the regional language as a medium of instruction) are real both in terms of the availability of teachers of the necessary calibre and the outlay that will be involved. The report, in short, restates the problem with a greater sense of conviction.

Desegregation

NOW MISSISSIPPI

MANY OF the Southern States unhappily continue to be the bulwarks of the retrograde philosophy of segregation in the realm of education on racial considerations. But if this blemish mars the reputation of America as a State in the vanguard of the progressive forces in the world, it speaks volumes for the courage of the President to compel obedience to the rule of law and respect to the voice of reason. The segregationists in the Mississippi State, incited by the reprehensible lead given by Governor Barnett, staged many ugly scenes of violence in which two lives were lost. The Supreme Court's order had in any event to be enforced and it was as clear as broad day light that Mr. James Meredith, the negro student who has emerged as the hero in this battle of principle, had to be admitted to the University of Mississippi. In flouting the Supreme Court's order and inviting the charge of contempt, Governor Barnett has necessarily created embarrassment for himself. President Kennedy's personal appeals to him have gone in vain and in the result the President had the only course left open to him to do his duty by the Constitution. He has federalized the National Guards of Mississippi and issued orders to the Secretary of Defence to produce the recalcitrant Governor before the Supreme Court, if even at this final stage he declines to appear voluntarily. How he clears himself of the charge of contempt is a matter for him to decide, but his legal embarrassment is certainly very grave.

Mississippi recalls the previous parallel of Little Rock which made history five years back. President Eisenhower at that time did not flinch from his primary obligation to uphold the Constitution and the rule of law. The technique that had to be applied to enforce the Supreme Court's order was the same as now adopted by President Kennedy. The National Guards were federalized and Governor Faubus' compliance was obtained under the reluctant threat of the use of armed force. Whether it is the Republican Government, as in the case of Little Rock, or the Democratic Government, as now in the case of Mississippi, no extreme action can be grudged to promote the principle of desegregation. The strength behind the segregationists need not be underestimated, but it is obvious that their fight for a lost cause cannot survive long.

U.A.R.

REMARKABLE REFORM

PRESIDENT NASSER has taken a bold and courageous step in introducing a radical reform in all the sectors of the nation's life. This was apparently the result as much of his own relalization as of the public murmurs of criticism that there was too much of over-centralization of authority at all levels. The spate of reforms which he announced aims basically at liberalizing the authoritarian rule in some measure and introducing centralization and delegation of powers. Among the three Councils which have been set up, two are most important, namely, the President's Advisory Council, vested with powers to formulate policies, and the Council of Ministers. The appointment of Mr. Aly Sabry as Prime Minister or Chairman of the Council of Ministers has been hailed throughout the country as an appropriate choice. Mr. Aly Sabry has earned the confidence and respect of the people by his able discharge of the functions of his former office as Minister of Presidential Affairs. Another appointment which has been welcomed is that of Dr. Hekmat Abou Zeid as Minister of Social Affairs. She has already made a mark on the public mind as a sound administrator.

Since the middle of 1961 a number of reforms have been introduced and it is possible to argue that the haste with which they were enforced could very well have been tempered by moderation. In the result, mistakes have occurred, resulting in creating obstacles to the progress of the intended reforms. It is reckoned that about four-fifths of the production in the industrial and other sectors is now socialised. But how far the structure of the new set-up is strong will remain to be tested over time. Land distribution has proceeded fairly satisfactorily. But unemployment has not been curbed effectively, partly because the high rate of accretion to the working force has made the task more difficult to tackle. In his speech announcing the significance of the reforms, President Nasser laid repeated stress on the need for augmenting opportunities for jobs.

The emphasis in the new reform is on collective leadership, one of the reasons being to minimize the possibilities of corruption against which there is no doubt a good deal of cogent criticism. It has come as a source of great relief to the Egyptian people that the President has openly and warmly invited criticism of the errors and defects in the working of the administration. Ten years of the Revolution seem to have brought, on his part, a deeper objective insight into the problems of the State. President Nasser was careful and cautious to remind the nation that during the current decade spectacular results may not be expected as the progress of the economic, social and political reforms was, in the very nature of things, bound to be hard and slow.

A CORRECTION

In the last week's issue the caption of the last Week's Note was inadvertently printed as "An Unfructuous Conference". The correct caption is "An Infructuous Conference". The error is regretted.—Ed.

HOW TO ENCOURAGE SAVING

By

ODYSSEUS

"HOW MUCH PROFIT can I make out of this?" It is disconcerting to reflect that today a minority of UK enterprises ask this question, because the public authorities, central and local, decide, directly or indirectly, over half the UK's annual gross investment — in the nationalised industries, in supervising investment in steel, in their role as leading customer for many products, such as drugs and aircraft, in financing research and development, in long-term policies that condition major private industries like agriculture, and in financing the contraction, expansion, reorganisation, or location of industries. What is more, as firms become giants they become "socially responsible", amenable to the "national interest". Increasingly they take major decisions not in order to maximise profits but to comply with the wishes of officials or ministers.

The "national interest" is not, however, a matter of fact but of shifting opinion, as contradictorily expressed by political parties, organised groups of electors, industries, employers, or workers.

I do not suggest that giant firms are unjustifiable — they have advantages in economies of scale, and so on — but their expansion should be based on the objective assessment of prospects by investors and their professional advisers, not on ploughed back profits.

PROFITS — "NORMAL" AND "ABNORMAL"

Are maximised profits "anti-social"? For answer, compare the sources of "normal" and "abnormal" profits. "Normal" profits are made from the existing plants of already established firms. If they are content to jog along with such profits, they will, as tastes change and products becomes obsolescent, slip into the ranks of dying industries. "Abnormal" profits are made (a) by keen businessmen, who think up new possibilities of making money: build new plant, introduce labour saving devices, increase the scale of output, or (b) by new enterprises, running high risks by pushing untried products or techniques.

Not the prospect of "normal" but of "abnormal" profits induces the inventiveness, the change, and growth, which are the aims of a dynamic society. And free enterprise ensures that "abnormal" profits, having achieved their innovatory function, do not survive indefinitely. Other entrepreneurs will seek to cash in on the high profits obtainable in a new field; wages and costs will rise, selling prices be forced down. The free enterprise system, if it is not distorted by interventions "in the national interest," has a built-in trend towards change and growth because, on the one hand, it rewards innovators generously, and, on the other, it is continuously reducing profits from "abnormal" to "normal", and then eliminating them altogether. There are always profits to be made, but never from the same goods and services for long, as can be seen by comparing today's prevalent goods and services, and the identities of today's firms, with those of 1945, 1935, 1900, 1850, or 1800.

These facts answer the argument of the Labour party's pamphlet, "Industry and Society" that shareholders need no compensation for taking risks because, with full employment and government measures to avoid slumps, the prosperity of the 512 large companies "is now substantially underwritten by the state" and the risk taken out of risk capital. But precisely to the extent that the state underwrites these particular companies, it is impeding change and growth, and so ensuring long term loss of capital, and precisely to the extent that the state encourages competition, it is ensuring change, and the risks that go with it.

The proposition that growth depends on "abnormal" profits clashes with the suggestion that if the workers will not put wages up by more than output, the government will ensure that profits will also be held down. Now, the share of wages in the UK national cake has risen from 64.7 per cent in 1950 to 67.7 per cent in 1960, but in a remarkable statistical analysis in the "Westminster Bank Review," which I reviewed here on August 10, Mr. A. E. Jasay showed that the workers could have a larger slice if they were less concerned to keep profits down and readier to go all out to increase the size of the cake by raising production and productivity. It is only possible to secure a faster growth rate if profits are allowed to benefit. Mr. Jasay's calculations show that with a small growth rate of, say, 2.5 per cent, real wages may rise faster than profits, which, indeed, might well fall — with perhaps disastrous longer term consequences. But with a faster growth rate of, say, 4.5 per cent, profits would probably rise thrice as fast as wages. Yet the rise in real wages would still be much greater than if the growth rate were only 2.5 per cent. Mr. Jasay put the choice to the unions: "Wages may go up faster than profits, but still too slowly for your liking: or else fast, but still more slowly than profits. A loss in labour's relative share could be traded for more rapid progress towards affluence — or conversely. Both relative and absolute gains may be worthwhile but to have more of one you must accept less of the other."

Let's face it: shareholders are suspect. Why? Keynes is largely to blame. Seeking to cure chronic unemployment, he diagnosed that wealth was concentrated among too few people, whose incomes, in so far as their capital was inherited, were "unearned". When savings exceeded investment opportunities, unemployment followed, but the wealthy few went on saving, thus aggravating under consumption. The cure was for the state to prevent, by taxation, the narrow accumulation of wealth and to avoid slumps by public expenditure and investment.

Whether or not this diaongsis was wholly true of the UK in the 1930's (it ignored a major cause of the depression: the changes and growth that were rendering obsolete old established industries, like coal, textiles, shipping), it does not apply today, when death duties erode the inheritance of "unearned" incomes and high taxation levels the "rich". Far from saving too much, the continuous rise in prices since the war shows that the U.K. is saving too little, consuming too much.

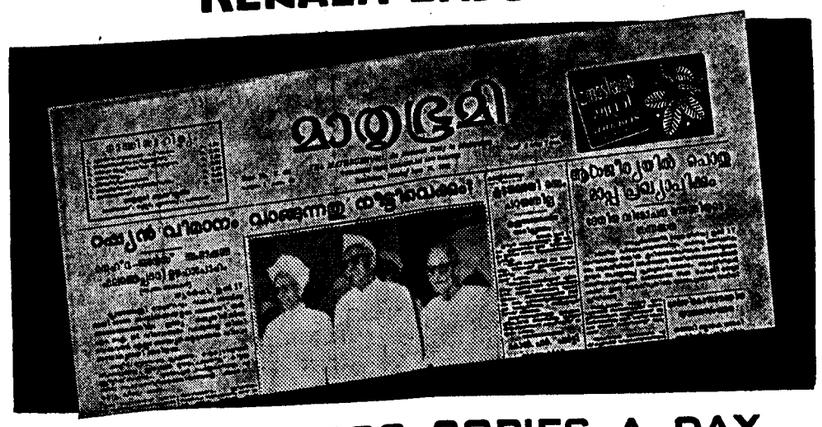
There is, today, a shortage of savings.

The more that the UK applies Keynes's out of date diagnosis, the more we rely on the state to save and invest by taxation, the wider the economic "establishment" imposes its subjective definitions of the "national interest", slowing down change and growth, and the narrower the area in which maximisation of profits — the only objective criterion of efficiency — prevails.

SMALL SAVERS IN THE U.K.

But if the UK restrains state investment, and if there are none of Keynes's rich savers left, where are the savings to come from? A new class of wage-earning and salaried savers has, in fact, emerged. In 1960, out of UK gross personal incomes £21, 108 million, £1,494 million, or 8.3 per cent, was saved.

Most of these savings are accumulated in fixed interest outlets. 4.5 million people have £3,000 million in building societies. 31 millions have savings banks accounts worth £3,100 million (average £100 per head). 17 million have £2,700 million in National Savings Certificates. These institutions have cultivated the habit of saving — but at the expense of the savers, because the purchasing power of the £ has fallen by 44 per cent since 1945. Nor do these fixed interest savings directly promote the growth of the economy as does investment in industry. That the number of shareholders is estimated to have risen since the war from 1.5 to 3.4 millions today reinforces the evidence that new classes have emerged as savers, but the savings statistics quoted above nevertheless show that many more could afford to invest in shares. Of those who do, the percentage of share owners is highest in the upper middle class, because that class is the smallest, but the Wider Share Ownership Committee's Report found that numerically there are as many share owners in the lower middle class. The Acton Society discovered that the typical UK small investor is a lower middle class man, earning £17 a week, who has invested nearly £1,000 since the war, and expects to continue to invest £100 a year.



No one suggests that the small man should put all his savings into shares, but there are three reasons why he should put much more in them: (1) shares are a hedge against inflation — an important fact in this age over full employment; (2) a personal stake in the prosperity of one or more industrial enterprises would be widening understanding of economic processes, help to create a climate of better informed opinion favourable to economic growth; (3) ordinary shares are risk capital, which enables new enterprises to get going, and thus helps to further prosperity.

The UK's big insurance companies, pensions, and trade union funds, are no substitute for the individual shareholder, because they seek the type of share that they can buy or sell in thousands at a time without turning the price against them, i.e., shares in the bigger and better known companies. They thus favour the economic "establishment" — the big companies in steel, motor cars, chemicals, breweries, etc. — at the expense of new and unfamiliar enterprises, which must have money if they are to develop.

What prevents increased saving for investment in shares is (1) the widespread feeling that share ownership is "anti-social", (2) tax, and other, policies, which encourage divided restriction rather than the maximation of dividends, and (3) policies which actually penalise shareholders. As Richard Kellet says in "Ordinary Shares for Ordinary Severs" (Institute of Economic Affairs. 1962), the small UK investor in shares suffers tax handicaps which he escapes in War Loan or Trustee Savings Banks. He loses £2 in stamp duty for every £100 invested. He pays higher brokerage than for gilts. On dividend income, the company deducts tax at the full rate, which he has all the trouble of reclaiming if he pays a lower rate. Although today's small shareholders buys his shares out of savings from his income, he gets no tax relief on dividend income — because it is "unearned"! A typical saver paying tax at the standard rate, or above, earns a ridiculous 3¾ per cent, i.e. reward of £1-17-6 a year for not buying a £50 TV set.

The UK spends 65 per cent of her GNP on personal consumption (cf. 57 per cent in Germany). The statistics show that British wage-paid and salaried workers have money to save. If they would (a) save a little more — if 10 million more people save £5 a week, there would be an extra £125 million of new savings every year — and (b) invest more in shares, fears that the UK's new National Economic Development Council may not attain its target growth rate of 4½ per cent per annum without inflation would vanish, and the target itself could even be raised.

NOT GOOD FOR GENERAL MOTORS

From Our Special West European Correspondent

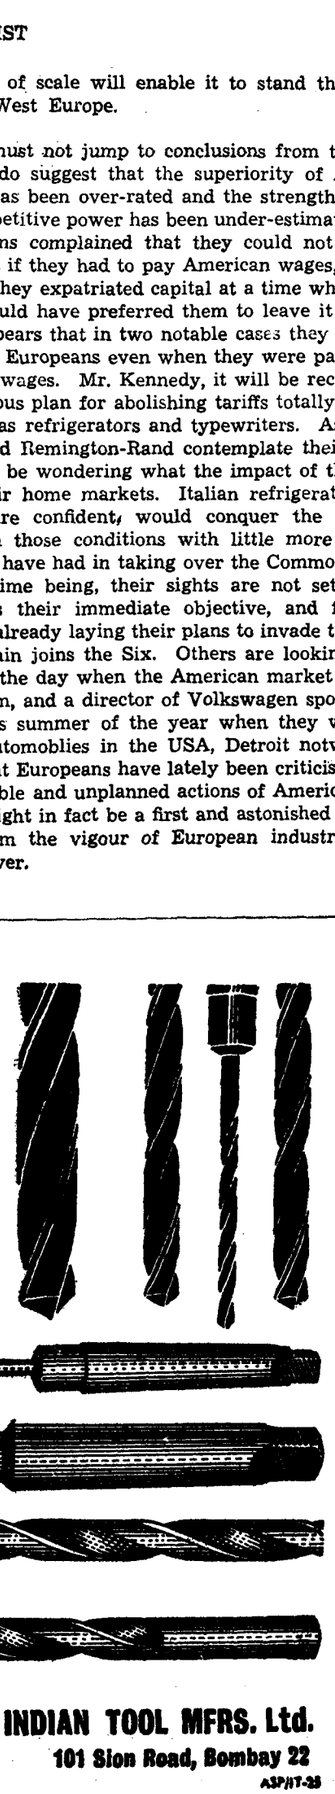
PARIS, September 29.

TWO major U.S. corporations, the Frigidaire division of General Motors, and Remington-Rand, have been in the dock this month in France, providing the occasion for some minor but significant outbursts of anti-American economic nationalism. Fascinated by the prospects of the Common Market, both these American giants made ambitious investments in France as well as elsewhere in the six-nation region. But they bit the dust. Finding that business in this country was not as good as they hoped, they promptly retrenched in ruthless American style. Trade unions who are not particularly fond of American capital exlaimed that these were un-French activities. The Industries Minister supported them to the extent of declaring, "I will not allow certain isolated industries to practise an irresponsible policy that ignores the social contract that binds a financially powerful firm to the labour it hires. To stop such sins, I am giving instructions for a most careful examination of new foreign investments, particularly American." Denying that there was any intention to restrict such investments, his department added, "Our aim is simply to invite French subsidiaries of foreign companies to take quite seriously the imperative obligation that lies on them in France to respect the production objectives of the Plan and its social objectives too."

The fuss created by the labour unions soon died down and perhaps should never have been taken seriously. Once the U.S. firms found themselves in the limelight, they dealt more generously with their dismissed workers, who, moreover, will not have the least difficulty in finding other jobs. The General Motors plant is in the Parisian suburbs and the Remington factory near Lyons, and in both these regions there is an acute shortage of trained industrial labour. French firms in similar lines have closed down lately, firing many more men in some cases; the unions protested then too, but made much less capital out of the affair. Both capital and labour should (and do privately) count themselves lucky that the economy is in a state of full employment and uninterrupted expansion, so that the inevitable adjustments required by the division of labour in the Common Market can be made painlessly, and mistakes in the sense of over-investment can be quickly repaired. The fact stands that there was a slight but noticeable difference in manner between the U.S. firms and their European compeers.

Local firms still have a paternalist style, and if obliged to retrench they handle the unions with velvet gloves, taking good care to get the Government, in the shape of the ministers for labour or industry, on their side first. The Americans are rather more abrupt and businesslike. Apart from different labour practices on the two sides of the Atlantic, this is to be expected because the American subsidiaries represent gypsy capital: they sent money out of the United States to West Europe because they saw that the cost of labour was lower over here, and if they make a mistake they lose no time in pulling up their tent and moving on. How else can European nations, which are not undeveloped or economically immature, expect U.S. capital to behave? It will always be more volatile than domestic capital. When they gloat over the figures for rising American investment in the Common Market, Europeans have to remember that if the profit rate declines this money will promptly be redistributed or even sent home again. Some municipalities succeeded in attracting American investment with special concessions and other baits, but they had not, for all that, managed to anchor it. Remington, for example, had accepted a loan and a tax exemption for its plant near Lyons, but this does not prevent it moving on when business dictates. The prosperous European economies are big enough to stand this sort of fair-weather treatment. Between equally industrialised nations, capital will skip about according to the prospects for profit and however welcome foreign investment is it will always be less stable than local funds. It is welcome for all that: on the same day as the U.S. firms were denounced by anti-American trade unions for throwing men out, West German capital moved in to take over a steel enterprise on the Atlantic coast that various French groups had despaired of resuscitating, thus providing employment where local capital could not.

In the period of unrestricted capital movements that began a few years ago, and especially in the phase of re-assessing comparative advantage as Common Market tariffs fall, fluctuations of this kind have to be accepted. As long as governments maintain full employment and yet prevent the level of wages rising above the average in competing economies, the Europeans have nothing to fear and much to gain from this increase in mobility. Incidentally, I learn from private sources that the French Communists were given lessons on this point lately in Moscow, at the Communists economists' gathering. Earlier this year a State-owned colliery in the centre of France had to be shut down because it was uneconomic, given th shift from coal to liquid fuels and the common market in coal. The miners, though offered facilities for reconversion refused to quit and staged a stay-down strike, and even a hunger-strike at the bottom of the pit. The French Communists, scenting an opportunity for demagogic intervention, espoused the absurd cause of the miners, holding them up as martyrs to the monopoly trends of the Common Market. The State stood its ground, despite the sympathy such displays inevitably arouse, and the miners eventually quit after gaining some extra benefits. In Moscow the French Communists were taken to task for their role in this affair, notably it appears by the Italian C.P., and criticised for their readiness to take up any anti-progressive economic lunacy. The workers' interests, they were admonished, were not to be protected by blind opposition to the increased mobility and concentration required by the Common Market. The presidents of General Motors and Remington-Rand could not have put it more plainly, it seems.



While accepting most of the above, the French Government nevertheless claims to have a just complaint against the American firms, in that their sudden decisions tend to upset the operation of the national plan. Domestic capital takes part in the discussion of the plan, sets its programmes in accordance with what it learns in plan commissions and is less likely to make the sort of mistake that some over-optimistic U.S. corporations have made; if they do err, the French firms find it normal to consult back with the officials of the plan before they take brutal measures to rectify the situation. The Americans on the other hand, allege governmental critics, make no secret of the fact that they come to France because of the security offered by the existence of the plan (France's industrial growth may not be the world's highest but it is the most consistent), yet they remember that planning is "socialism" when it comes to consulting officials about writing off mistaken investments. The closer watch that Paris proposes to institute for American capital over here will consist in reminding U.S. corporations that their decisions have an echo throughout the plan, and are thus not to be taken in New York or Detroit without advising Paris.

The planners may have a point here, but the real moral of the General Motors and Remington affairs surely lies elsewhere. These companies came to Europe imagining that the application of tried and tested American methods in the Common Market would yield profits, yet they have discovered that they could not stand the competition. For all the resources that were behind the General Motors venture, it has been annihilated just like a dozen other French and German refrigerator firms by the overwhelming force of Italian competition. The Italians, and particularly the one firm Ignis which manufactures 500,000 refrigerators yearly, are undercutting other Common Market makers by as much as 33 per cent, and nothing can stand in their way (though duties on this product have not yet fallen to zero), not even a major American house that combined the advantages of a great name, U.S. patents, research and backing—and French labour that is cheap in comparison with American. Remington's experience, while more complex, is not very different. The firm admits that it cannot find cheaper trained labour anywhere than in Lyons, but the going has been so rough that it must concentrate its output in Holland, in the hope that economies of scale will enable it to stand the competition in West Europe.

One must not jump to conclusions from two cases, but they do suggest that the superiority of American methods has been over-rated and the strength of European competitive power has been under-estimated. U.S. corporations complained that they could not beat the Europeans if they had to pay American wages, and that was why they expatriated capital at a time when Washington would have preferred them to leave it at home; it now appears that in two notable cases they could not beat some Europeans even when they were paying only European wages. Mr. Kennedy, it will be recalled, has an ambitious plan for abolishing tariffs totally on goods just such as refrigerators and typewriters. As General Motors and Remington-Rand contemplate their bruises, they must be wondering what the impact of this would be in their home markets. Italian refrigerators, their makers are confident, would conquer the American market in those conditions with little more difficulty than they have had in taking over the Common Market. For the time being, their sights are not set so high; Britain is their immediate objective, and firms like Ignis are already laying their plans to invade the islands once Britain joins the Six. Others are looking further ahead, to the day when the American market is opened up to them, and a director of Volkswagen spoke calmly to me this summer of the year when they would sell 600,000 automoblies in the USA, Detroit notwithstanding. What Europeans have lately been criticising as the irresponsible and unplanned actions of American corporations might in fact be a first and astonished American recoil from the vigour of European industry's competitive power.

IT DAGGER BRAND DRILLS FOR LASTING PRECISION PERFORMANCE

BACKED BY 25 YEARS OF TRADITION and rigid control at every stage of production
DAGGER BRAND DRILLS
(available in metric and inch sizes)
assure precision performance.
They are made of superior quality steel, specially heat-treated to ensure long life and manufactured in India's biggest and most modern factory for Small Tools.

Economic Report from the U.S.

IBRD—IMF SESSION

By GUY SIMS FITCH

WASHINGTON, September 25.

BEHIND the general calm which pervaded this year's joint meeting of the World Bank (IBRD) and the International Monetary Fund (IMF) lies one of the truly exciting developments of our time. The stresses and strains that affected the international monetary system in earlier years clearly are giving way to a new and welcome equilibrium. With this has come a new confidence among the Free World's economic and financial leaders in that system and in the value and stability of its major reserve currency, the U.S. dollar. This confidence could be felt on every hand, and it was openly expressed by many of the delegates from the 80 countries which make up the Bank and Fund membership. This tone was set at the opening session by IMF Managing Director Per Jacobson, who insisted that the dollar is strong and that the Free World is approaching the kind of monetary balance that has long been its goal. Few experts dare speak with the authority of this respected elder statesman of world finance, whose views have proved so correct so often.

This dramatic progress also represents a vindication of sorts for U.S. policy. It appears to have swept away any lingering concern over the U.S. determination to maintain the value of its dollar, and to eliminate its balance of payments deficit — with the consequent outflow of gold — without retreating from long-accepted responsibilities at home and abroad. It was evident at last week's meeting that dollar devaluation — the possibility that the United States might have to raise the price of gold — is a dead issue now. And there was a general agreement that the United States is in a good position to bring its international payments into balance by the end of next year, in keeping with U.S. treasury objectives. Other elements of U.S. policy which appear to have won approval relate to what U.S. Under-Secretary of the Treasury Robert Roosa has termed the "restructuring" of the international monetary system. Significantly, Mr. Roosa used his term in an article published only a few days before the opening of the Bank and Fund meeting, in which he called attention to steps the United States has taken in concert with other nations to strengthen the world's financial mechanism.

There are, for instance, the exchange arrangements under which the United States acquire other currencies for dollars, and vice-versa, plus the outright purchase of other currencies to be held for long periods of time if necessary. Also, there is the $6,000 million in special stand-by credits to bolster IMF resources being set up by 10 leading industrial countries, including the United States. And, of course, there is the IMF itself, with the drawing privileges available to each member country. No one can be absolutely sure what other responses future developments may require, and one should guard against an overweening complacency in these matters. But there apears to be substantial agreement with the observation of U.S. Treasury Secretary Douglas Dillon that there is plenty of liquidity under these arrangements and others like them to finance world trade and payments for the immediate future, without resorting to revolutionary and untried approaches that could upset the progress being made.

With the world's monetary structure so obviously improved and with many countries in better financial shape, last week's meeting was able to turn its attention to another pressing international problem. Widespread support, at least in principle, was produced for the proposition that more aid should go to the developing lands. Both U.S. President John F. Kennedy and retiring IBRD President Eugene Black expressed themselves eloquently on this subject. Mr. Black, whose imaginative and vigorous leadership has contributed greatly to the success of the IBRD for the past 13 years, called particular attention to the needs of the International Development Association (IDA), World Bank affiliate which specializes in long-term, low-interest loans to the less-developed nations. IDA presumably would offer one highly useful vehicle through which nations now in position to do so could expand their economic assistance efforts. President Kennedy reaffirmed U.S. determination to maintain its long-standing assistance programmes which have done so much to reinforce the security and the economic advancement of free nations. But he noted that the United States has spent some $85,000 million for these purposes in the past 15 years, and suggested again, as he has in the past, that the time has come for other prosperous countries to carry a more equitable share of this load. It would be unfair to suggest that other countries have not been contributing to the joint economic and defence effort. But the feeling here is that many of them can do more. From the attitudes apparent at the IBRD - IMF Session, it is possible to look forward hopefully to such a result.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50|-.

1.	India & the World and India in 1950	Rs. 5|-
2.	A Social History of the Indian People & India in 1951	Rs. 5|-
3.	India & the Free World and India in 1952	Rs. 5|-
4.	India in Asia & India in 1953	Rs. 5|-
5.	India in South East Asia and India in 1954	Rs. 5|-
6.	India & the Communist World and India in 1955	Rs. 5|-
7.	India in 1975, A Study of the next Twenty Years & India in 1956	Rs. 7.50
8.	India & the Middle East and India in 1958	Rs. 7.50
9.	India and Europe & India in 1959	Rs. 10|-
10.	India & North America and India in 1960	Rs. 10|-
11.	India and Europe Divided	Rs. 10|-

Please take advantage of this offer and mail your enquiries to :

INDIAN IMAGE AND WESTERN REFLEX

By PEGGY HOLROYDE

IT is an uncreative cliche to say that an Indian's skin is several layers thinner than most others — but it still seems to be true, and in a day and age when, unfortunately, it would appear very necessary to cultivate a mutation of genes in order to produce a thicker one. This thought came to mind the other day when four Nagas arrived at London Airport and were eventually allowed to remain. One can foresee one more barb in the Indian body politic and further ammunition for a bad press in the West. In a flash the perennials clattered into the daylight of my mind, so many skeletons rattling out of their respective cup-boards. Kashmir, Goa, Mr. Menon and MIGs, Congo troops and Naga freedom fighters—they are the bony remnants of old antipathies. Only recently the London Times in dealing with the MIG issue ran the headline "Western critics rebuked by Mr. Nehru." His regret that Britain and America were almost invariably against India on subjects like Goa and Kashmir was quoted, as well as the fact that speeches conditioned by these Western reflexes to India's actions "hurt us, annoyed us, irritated us, angered us." This hurt, annoyance, irritation, anger suppurates like a malignant tissue in our total relationship and one sometimes gets the impression that Mr. Nehru nowadays is tired in an infinitely sad way with the perpetual effort of having to suffer gladly with the foolish opinions so often born out of Western ignorance.

Knowing India and feeling sympathy with her aspirations one understands the underlying anger, the fierce desire to be independent, the need to shake off the damage done by Western arrogance in the past. Nevertheless India surely has to come to terms with contemporary life in the brutal arena of politics. None of us is in it for altruism, at least not yet, not until we have won our painful way to a world government, so that as things are all national motives are suspect. Secondly, if anyone treads on our corns, as India has done in the past (again, quite rightly so), we are not as yet sufficiently imbued with the Christian or Gandhian spirit to stick out the other foot. We are far more likely to give a kick in the pants. And when Mr. Nehru went on to comment in relation to the UN debate on Goa that it was based on certain assumptions and, he regretted to say, on some dislike for India and all she stood for, both British and American readers are inclined to say "so what?" We get broadsides after all from every quarter. Sometimes the rarified atmosphere of politics tends to make politicians forget that people are human, reacting in a very unsaintly way. We learnt long ago to be thick-skinned; the Americans after years of wanting to be loved have learnt the hard way that there is no room for affection in politics; and Indians, no matter how righteous their cause, will have to discover that no one believes that right is entirely on their side. Historical perspective teaches that most issues are washed in a dreary grey, so unlike the deceptive blacks and whites of the original presentation. This is where the image of India suffers, discoloured by the corrosion of time. In the West we live in an Age of Disillusionment. Not even the most idealistic can escape the breath of scepticism which now pervades our Western world.

With this background in mind Indians must not be surprised then if we scrutinise her unsullied image with the same scepticism that we bring to that of our own or the American. James Morris, that sensitive and peripatetic commentator, has just incensed a great many Australians with his recent articles in 'The Guardian', To an outsider they seemed fair-minded, to many Australians who live outside their country they did also. But to native Australians they appeared grossly misrepresentative. This is an inevitability of life. The view from outside is never the same as from within. Not only Indians have to suffer this.

When people read of Press restrictions in Naga territory suspicion of any argument readily grows. The point that the Press might complicate delicate negotiations or even try to interfere and influence is not accepted. These are the hazards of democracy as Mr. Kennedy discovered over Cuba. Even India's best friends cannot accept the totality of her arguments nor the hurt self-righteousness, conditioned as we are to be wary of the official statement. We are only just recovering from the ricocheting effect declarations by American scientists (who deplored Sir Bernard Lovell's reservations on the rainbow bomb) and who stated that any deleterious effect would only last a few weeks. Now we are told that in fact the artificial radiation belt outside the Van Allen one will probably last five years if not more!

The disillusions pile up like twentieth century filing cabinets. I was surprised to find on a recent visit to Jersey to lecture on India to a group of students how even among teenagers the mental reservations have percolated into their uncynical minds. Intelligently well-informed though they are on Asian problems and often willing to give India the benefit of the doubt, they are entirely hostile to any "official" answers to their questions. They sense instinctively that there is more to any problem than meets the eye; they have been conditioned to this by the harsh realities of the world in which they live.

It is at this point that India's relationship with the West falls down. There is a real need for emphasis on public relations and sensing the psychology of people than in futile attempts to present lengthy political arguments. The MIG issue is an example. Much sympathy was lost here because the Indian case was not put properly before the case broke in the full passion of cold war polemics. Stereotyped Government hand-outs lie heavy on the mind like badly cooked 'idlis' do on a Malayalee stomach. I defy anyone to enjoy reading the official India News. No matter how much one personally cares for India, to read two pages of solid type on India's case for Goa is a real labour of love. It does indeed stretch even love to a finality of boredom. Some concession simply has to be made to human interest stories and the format of our press, if even the young imagination is to be fired with enthusiasm. Here a lesson could be learned from the coverage of the Kariba dam project in Africa. It was presented with a real panache and though one can say the British are unbalanced on the subject of animals, (their preservation having been given the full press treatment), nevertheless many more people now know about Kariba than the far more worthwhile and challenging project at Bhakra. There were human stories at Bhakra too—not just mountains of statistics. Although there have been enlightened and educative Press supplements in the West on the Indian experiment they only reach a minority of the already well-informed of the population so that there

seems to be a real need to get through to the average reader, and students, everywhere.

One of the problems at the present in sustaining a comprehensive image of India in the West is that one has to deal with two levels of thinking—the over-forties who in some instances still retain a Mother India image or worse still suffer from the boredom of long association through relatives, army or civil service connections—and the under-forties who are free of threadbare concepts.

Here India is her own worst enemy, and her case often goes by default. Indians, and Indian officials especially, sometimes give the impression that they just do not care if they get a bad press, and quite frankly very little thought is given to educating the outside world on India's problems. India's population is more than the combined populations of Russia, The United States of America and the United Kingdom put together, but often this immensity in the task of development is not seen in these terms in the West. Our minds need to be shaken out of the normalities of our living into the realities of 'yours'. Indians may not be a proselytising people but there is an undoubted change of mentality in our younger generation which does need encouragement. All the effort cannot come from them. One day they will be in the positions of influence and the temper of the West could be changed for the better. There are signs in the enriching effect Indian immigration is having on the insularity of provincial life in this country; neutralism is no longer suspect; Tibet diluted the hostility towards the Panch Sila ethos; Indian students on the whole give a remarkably good account of themselves.

For all the dislike Mr. Nehru thinks there is in the West, there is this growing generation who are free from the old antipathies that grew out of Christian-Hindu incompatabilities. Little is ever written about this but it has a great deal to do with the Mother India image which does occasionally raise its atrophied totems. Humanity is swept far more into irrational sentiments by these profound emotional currents than by the surface winds of politics.

Political opinions are assessed in too shallow a manner these days with very little regard for the intangibles that create the psychology of changing attitudes. Increasing secularisation in the West has led many younger people to explore Indian thought, music and dance. But very little expertise comes from India itself which is curious because India seems to be aware of the intangibles more than most nations. The Indian Government appears to look upon cultural delegations to the West as a luxury, yet ironically it is here, rather than in Japan and Russia, that the needs are greatest. Our familiarity in the past except for some remarkable scholars was always superficial and laden with political and religious overtones. Now is a chance to break free of this. It is salutary to see how the Japanese Government wholeheartedly supported the Kabuki theatre venture in the West. The Kabuki theatre is remembered. Yevtushenko came with official blessing, the new image of the new young Russian. The poet is remembered. The moral is plain. Yet Indian artists, musicians and dancers are often treated by their own officials as the poor relations of the Five-Year Plans despite the fact that they feel a passion and a fire in projecting the rich quality of Indian life. In the long run they are remembered when all the politicians have faded, and their image blurred.

One wonders in fact how much is appreciated in India of Western lack of comprehension even on the part of the most intelligent because of lack of personal experience of India. Our ignorance of the vastness of the problem can be forgiven because intellectual understanding is very different from emotional involvement. We are for example a homogenous nation, small in size so that to think on a continental scale of all the Indian complexity in diversity, the telescoping of centuries of development into one anxious threshold leap where we had the leisurely development of centuries, comes with difficulty. And in America where even the luxuries of living are considered necessities the problem of understanding is even greater, although in certain quarters Americans appear more willing to try than the British. Much is at fault with our press reportage but much depends on an imaginative approach from India too if we are to be re-educated. In fact I often think that an Indian Rockefeller is the only answer to enable many more Westerners to experience India on her own terms, to train her students in their own environment, and to bring the technological know-how of the West into direct contact with Indian conditions.

Obviously the image of India in some measure affects the reluctance or willingness to give aid. The taxpayer faces astronomical sums in foreign aid which barn-storming senators, thinking only of their own re-election, do not exactly help to place in proper perspective. But in recent months with the maturing of the Third Five-Year Plan and the crisis in the I.M.F. there have been signs of a shift in opinion as though the deep-rooted antipathies which threatened aid in the past are mellowing into a more realistic assessment of Indian needs, and an awareness that the problem of foreign aid can no longer be tackled piecemeal.

It is obviously unfair to India to be forced into the invidious position of coming regularly, cap in hand, to the West. It is on the conscience of the richer nations that constructive aid with continuity and far-reaching dimensions has to come. But with democracy our electorates have to be educated toward this. They in the end foot the bill and it is interesting to note that West Germany has gone over to the practice of tying aid to specific projects in India.

This may well be the trend, for underneath the uneasiness and the irritation felt about economic aid to Asia is the doubt about what happens to it at the grass roots level. The integrity of India's planners is never questioned and in fact India's continuing stability in the face of the disruptions in Pakistan, Burma, Ceylon, Ghana and the Sudan is duly appreciated. But the fears and prejudices of some who feel they are passive into a bottomless pit come back again to failure in communication. Little is really known of what happens to that aid and the impression is still held that open debate in India is in its infancy.

Sentiment about aid is deeply involved with knowledge of what happens in India. Recently bitterness was expressed here by Indians over an article carried in a national newspaper about the "silly season" in Delhi. Reports of beetles in the milk were taken much to heart. Of course this is no prerogative of India. A London dairy was fined heavily for a mouse in a pint of milk. I myself have discovered a rusty nail in a can of peaches. The point is not that these things happen but that something is done about them. This is where Westerners, used to a vociferous Press and the accumulative effect of public opinion on members of Parliament, wonder occasionally if misuse of aid can ever have the same public accounting in India when they are still haunted by the vision of three monkeys, symbolic of India. Hear no evil, speak no evil, see no evil.

THE BUSINESS WORLD

I.F.C.: Steady Progress

DURING the last 14 years the Industrial Finance Corporation has made a praiseworthy "contribution towards the successful implementation of the objectives of the Plan". The financial loans made by the Corporation for the expansion of the old industries and the setting up of new ones have gone a long way in enhancing both production and industrial employment. At the 14th annual general meeting of the Corporation held at New Delhi last week, Mr. K. P. Mathrani, Chairman, Industrial Finance Corporation of India, detailed the performance of the Corporation since its inception highlighting particularly the new records set up for disbursement of loans as well as for the steady financial results. In the last few years the Corporation has taken new strides in its onward march to assist Indian industry and the dynamic personality of Mr. Mathrani has without doubt made a great impression on its working.

Till the middle of the current year total loans and advances approved by the Corporation to the various industries were placed at Rs. 130.27 crores. The total utilisation of funds offered, however, stood at Rs. 68.14 crores. This shortfall in the utilisation of the sanctioned loans has been primarily because of the failure of the loanees to comply with the regulations of the Corporation.

The industry-wise distribution of the loans and advances is set out in the table below. It will be seen that the sugar industry stands at the head of the list with the highest contribution at Rs. 37.79 crores. It might be argued as to why the Corporation has been so liberal to the sugar industry particularly when production of sugar in the country has been steadily rising and during the last two years the stocks have not been absorbed either by enhanced domestic consumption or by increase in exports. At the press conference specially convened to explain the working of the Corporation Mr. Mathrani took pains to elaborate that the Corporation was not favourably inclined to the sugar industry without reason. The bulk of the advances made to the sugar industry went to the co-operative societies. This was, according to Mr. Mathrani, in keeping with the spirit of the Second Five-Year Plan which advocated special encouragement to industrial co-operatives. It is not known if the Corporation has made any critical analysis of the co-operative sugar societies which have gone into production to see if their working results justified the patronage extended to them by the Finance Corporation. It is known however that in one particular State, that is Maharashtra, the co-operatives have done well. The experience elsewhere however is not known to be uniform.

The gross profit of the Corporation for the year ended June 30, 1962 stood at Rs. 130.71 lakhs as against Rs. 139.35 lakhs for the preceding year. Excluding the profit accruing from the sale of investments the profit for the current year was higher by about Rs. 13.98 lakhs than for the last year. This is due to the fact that the financial operations of the Corporation have been steadily rising from year to year.

Particular mention needs to be made of the new channels into which the Industrial Finance Corporation has started its operations. The coal industry also has come within the purview of its patronage and so far three loans totalling for a sum of Rs. 82 lakhs have been sanctioned. Again, for the first time in the history of the Corporation, a loan of Rs. 35 lakhs has been extended to a unit in Mahe (in Pondicherry) for the establishment of a textile mill. The Corporation had also agreed to provide a guarantee for deferred payments to this unit to the extent of Rs. 5.62 lakhs. Once again "industrial and medical gases" have been brought within the approved list of industries of the Corporation and a loan of Rs. 1.09 crores has been sanctioned during the current year. This shows that the Corporation is alive to the needs of the new industries.

A notable achievement of the Corporation has been the increase in the foreign exchange resources available to it for disbursement to Indian industries. West Germany for example has provided foreign exchange to the extent of 15 million DM (Rs. 1.79 crores). This sum has been provided from the German Bank for Reconstruction. The Government of India also has taken the wise decision to make allocation of yen credit equivalent to a sum $2 million for facilitating the operations of the Corporation. Again, the Corporation is anticipating another loan of equipment credit in French currency, though the terms with the French Commercial Bank have not yet been finally decided. All this goes to prove that the IFC has made in the recent past a successful bid in procuring the necessary foreign exchange as well for the industries. Another major event of great importance is the interest that the International Finance Corporation has evinced in co-operating with the IFC. The activities of the Corporation are also proposed to be extended to Goa—the former Portuguese colony which became a part of India in December last. Goa in fact offers virgin soil for the IFC where the industrialists are looking out for opportunities in expanding their activities and are not able to do so because of paucity of financial resources and foreign exchange. In helping Goa in extending its industrial pace the IFC has taken

LOANS AND ADVANCES APPROVED BY IFC
(Upto June 30, 1962)

	Type of Industry	Amount approved upto June 30, 1962 (Rs. crores)	Percentage to total loans and advances
1.	Sugar Industry	37.79	29.01
2.	Chemicals	17.35	13.32
3.	Cotton Textiles	13.70	10.52
4.	Paper industry	13.39	10.28
5.	Cement	7.62	5.85
6.	Electrical Engineering	5.65	4.34
7.	Ceramics and glass	5.42	4.16
8.	Rayon industry	4.80	3.68
9.	Mechanical engineering	4.80	3.68
10.	Iron & Steel (Light Engineernig)	4.47	3.43
11.	Hotel Industry	1.89	1.45
12.	Automobile & Tractor Industry	1.88	1.44
13.	Metallurgical Industry (Non-ferrous metals)	1.52	1.17
14.	Aluminium	1.60	1.23
15.	Plywood	1.11	0.85
	Total (including others)	130.27	100.00

a very wise decision. The Chairman of the Corporation is likely to visit Goa in the next few weeks and the industrialists in Goa are well advised to get in touch with him and chalk out plans of co-operation.

The decision by the Corporation which is likely to have a great impact on the working results of the units seeking loans from the IFC is to raise the rate of interest from 7 per cent to 7½ per cent per annum with the usual rebate of ½ per cent for punctual payments. It is patent that this move, though in keeping with the trends in interest rates in the country, is likely to raise industrial costs and add to the inflationery pressures which are being generated in the Indian economy. Whatever the compulsion of the market situation, it should not be forgotten that this will result in raising the cost structure.

Business Notes

Plastics

PHENOMENAL PROGRESS, BUT COSTS HIGH

THE ACHIEVEMENTS of the plastics industry since it inception fifteen years ago are indeed gratifying. Over this period, the industry has not only reduced its dependence on imported raw materials and come to rely more and more on domestic raw materials, but has also turned out to be an earner of foreign exchange. Besides, the industry has made such remarkable strides that plastics, which once served as only substitutes during the last world war, have now become important enough base for a variety of applications in construction, industrial and domestic fields. The lightness of weight, the resistance to corrosion and wear, the controllable thermal and electrical resistance and the easy pliability have made plastics an all-purpose material. Accordingly—and more so in the context of the industrialisation of the country—the industry has assumed a place of considerable importance.

Thanks to the protection accorded to it, as also to the initiative of those concerned in the manufacture of the plastics, the industry has successfully recorded increases in production as also in exports. That the production of various essential raw materials has already been undertaken in the country in a big way, is evident from the fact that the five units engaged in the manufacture of phenol formaldehyde moulding powder in the country accounted for an output of 2,111 tons in 1961, as against 1,310 tons in 1954. The production of urea formaldehyde moulding powder amounted to 433 tons in 1961 the rated capacity is about 1,000 tons per annum, while the production of polystyrene moulding powder was over 3,500 tons; with the erection of the monomer plant, the industry expects to utilise the rated capacity of 5,400 tons by the end of this year. Production of polyethylene during the current year is expected to be over 6,200 tons.

Presiding over the fifteenth All-India Plastics Manufacturers' Conference, (AIPMC), in Bombay recently, Mr. Lalchand Hirachand complimented the industry on its performance and said how this performance would have been even better, had there been no shortfalls in supplies of raw materials in the country. Notwithstanding this handicap, the industry, the total investments in which today exceed Rs. 25 crores, was able to produce goods worth Rs. 22 crores last year, against only Rs. 3 crores a decade ago, and Mr. Lalchand was, therefore, confident that, by the end of Third Plan, this figure would even go up to Rs. 100 crores ayear. The only snag is the high cost of production, but this is attributed to the high prices the industry has been called upon to pay for the indigenous materials. According to the industry, the indigenous raw materials cost 2½ to 4 times more than the imported raw materials. In view of this, as the AIPMC President noted, the excise duty of 20 per cent levied on this nascent industry would appear to be too heavy. This is evident from the fact that the levy which was expected to yield only Rs. 40 lakhs has acually fetched the Government nearly Rs. 150 lakhs! The imperative need at present for the industry is to produce more and more and also export more. But this could only be done, as Mr. Lalchand observed, when these burdens are lessened, if not removed. The industry has been able to export nearly Rs. 83 lakhs worth of goods last year as against only Rs. 7 lakhs worth four years ago, which is an indication of the export potentialities of the industry. It is, therefore, gratifying that Mr. S. K. Wankhede, Maharastra's Minister for Industries should have held out the assurance that "the Government would help the industry in other ways", such as by facilitating imports of raw materials and machinery from the DLF grants and so on. But the Minister also cautioned—and this cannot be objected to either—that even after 10 years of planning, if we keep on crying for imports of raw materials or procurement of machinery, there can be no end to imports.

Tourism

DEVELOPMENT COUNCIL'S RECOMMENDATIONS

IT WAS noted with certain concern at the recently held Tourist Development Council's meeting at Ootacommund that the rapid growth of tourist traffic to India had slowed down during the last two or three years. This attitude was quite natural because it is only now that we need to encourage tourism: it brings foreign exchange. It must look rather prosaic if seen from this angle alone. But that is not really so. We have to encourage tourism because it ultimately leads to a better understanding of the Indian attitudes in the foreign countries. In a way enhanced tourism projects the most appropriate and changing image of the Indian mind. At the moment it could be considered a source of relief to our terribly strained foreign exchange situation. Participants in the meeting, which included the Minister for Transport and Communications as well as the Minister for Information and Broadcasting, naturally, stressed the need for promoting tourist traffic.

One single factor that helps tourism is the amenities that could be made available for all classes of foreign tourists, and it was considered that hotel accommodation of different categories in large cities and small towns was perhaps most significant. The hotel industry was already being provided certain incentives by way of tax holidays which could help to stimulate the creation of more hotel accommodation. If at certain places the creation of hotel accommodation at the moment was not considered very profitable by the private entreprenurs, it was decided at the meeting, that the State Governments should consider participation financially in the setting up of new hotels. This measure could certainly invite the interest of various hotliers who at the moment were rather shy. The Minister for Transport and Communication gave a very wise suggestion to the State Governments to earmark suitable plots for hotels and make them available at nominal rates to prospective hotliers. This was in response, perhaps, to the generally expressed feeling that suitable sites for building hotels in large cities were not easily available. This measure would definitely make the coming up of hotels comparatively certain.

Another significant proposal was for an integrated development of a few selected tourist centres. For this the Council endorsed the decision to set up a technical working group to prepare model schemes during the next six months in consultation with the State Governments. It was also decided that there should be an annual review of the execution of schemes for the development of tourism in order to see that no State lagged behind. Such concerted effort in terms of integrated development would certainly bring fruits and would help in the elimination of various minor hinderances which stand in the way of proper popularisation of tourism.

The Council also discussed means for promoting tourist traffic to the hill stations and for this it was recommended that by mutual agreement the neighbouring States should stagger school and university vacation so as to lengthen the tourist season at the hill stations. Similarly, the desirability of developing seaside resorts was accepted and it was agreed that a technical study of the problem should be made in consultation with the States concerned.

The point raised by the Minister for Information and Broadcasting, Dr. B. Gopala Reddy, was fairly interesting. He pointed out that the foreign tourists, while wanting to go around seeing natural scenery and places of art, were also interested in person-to-person contacts to see the way people lived and practised religion and participated in community life. They were essentially interested in the new picture of India that was emerging after Independence. He suggested that arrangements should be made to bring them in contact with the Indian people through organization of regular entertainments at reasonable rates. These should be typically Indian and should suit the tastes of all the tourists. Thus the need was of creating an overall tourist bias in the country so that all those who come in contact with foreign tourists should be polite, considerate and courteous.

Foreign Trade

STEPPING UP EXPORTS

DESPITE GREATER awareness and conscientious efforts made since the creation of the Department of International Trade in the Union Ministry of Commerce and Industry and the establishment of the Board of Trade, the country's exports during the first five months of the current financial year, indicate none-too-happy a position. For, as the review made by the Board of Trade, which met in Bombay recently, indicated, during this period while exports to East European countries, Canada and the U.S.A. remained steady, exports to West European countries and the U.K. — the major market for our exports — witnessed a shortfall of about Rs. 12 crores. That this ominous trend has attracted attention of the Board is evident from the emphasis placed by it on the need for strengthening international trade by appointment of Regional Directors of Foreign Trade to streamline and intensify exports in a given group of countries.

It is interesting to note that the Board dwelt at length on the question of exporting important agricultural products like sugar, vegetable oils and oil products and sea foods for which there are greater opportunities for exports today. In respect of sugar, the Board was of the view that exports of sugar should form a very important part of the country's future export programme because, it felt, "through proper crop planning, undertaking maximum advantage of economies of scale, by modernisation and expanding the existing units, in preference to creation of more units, costs could be reduced contributing to larger exports". The Board appears to be convinced that increasing the productivity of sugarcane cultivation and by various rationalisation of the management practices in the sugar industry, exports of sugar could both be expanded as well as the losses suffered on these exports could be reduced. The Board thought export of nearly 500,000 tons of sugar annually as a feasible proposition.

As regards the question of increasing exports of vegetable oils, oil cakes, vanaspati and other allied products, the Board felt, that this objective could be achieved only by taking necessary steps towards increasing the production of oilseeds and oils in the country. In this connection the Board desired that the Government should give further facilities to the oils and oilcakes industry for future development, for it is to form a important export sector of our economy.

Considering briefly the question of industrial goods exports, the Board pointed out that, in principle, such industrial units which were working for exports should be given further assistance to enable them to increase their contribution towards export earnings. It also took note of several other industries which have great export potential such as pig iron, castings, forgings, oilcake extractions, specialised varieties of cotton textiles, woollen and jute carpets and several engineering and pharmaceutical items. Referring to the question of including industries in the export sector, the Board stated that "no unit can be entirely for exports and it will be sufficient if the units or industries in the export sector contribute substantially — say 50 to 60 per cent of their production for exports."

Engineering

JAY ENGINEERING'S EXPORT EFFORTS

PERHAPS THE most significant aspect of Mr. Charat Ram's speech at the annual general meeting of the Jay Engineering Works Ltd. was in respect of the company's export efforts. Exports have been, the Chairman believed, a matter of social and business philosophy for the company. Their efforts have been continuing for an expanding organisation to meet the targets of higher export figures. From this angle the setting up of a foreign subsidiary as a part of the export promotion drive was mentioned as a possible means by the Chairman. The company has started the manufacture of sewing machines in Ceylon in collaboration with the people of that country. Authorisation has been obtained for starting a manufacturing unit in Burma too. These efforts are likely to enhance possible foreign exchange earnings during the years to come. It may be added, however, that during the year under review — year ended March 31, 1962 — there has been an unfortunate decline in export earnings from Rs. 113 lakhs to Rs. 90 lakhs. The fall is accounted for by the import restrictions imposed by the Governments of Yugoslavia, Burma, Ceylon and Egypt, resulting in a decline of Rs. 33 lakhs — from Rs. 52 lakhs to Rs. 19 lakhs. The company's exports to industrially developed countries such as the U.S.A., Germany, the U.K. and other similar countries are increasing. This, in a way, is an indicator of the company's solid efforts.

During the course of his speech Mr. Charat Ram expressed gratification over the fact that the Government of India had for reasons of the necessity of furthering exports trade left the portfolio of International Trade in the very energetic hands of Mr. Manubhai Shah. He added, however, that in the field of exports all the countries followed an aggressive policy so that selling prices in export markets bore little relationship to the costs of manufacture so that exports were often conducted at prices below costs. Almost all the countries follow a dual price policy. Normally the incidence of all export losses have to be borne by the consumer through increases in domestic prices. But apart from such patriotism the Chairman added there was a need for good marketing organisation. It is interesting to observe that all the sales of the company are now being handled through a separate marketing company set up a few years ago. This step taken

initially with some apprehension has ultimately been justified fully by subsequent results.

The Chairman referred to the question of rising cost of manufacturing which was causing alround concern. These rising costs ultimately led to higher selling prices which were being resented everywhere. Even the Government authorities he added wish to keep prices down but the industry in general was quite helpless because the cost of transport, materials, power etc. kept on going up. He, however, was of the opinion that the management personnel in industry as well as operations personnel in plants and offices should apply their maximum efforts so as to keep unit costs down which also is an important factor in the field of exports. It is a significant fact that the company had refrained from any increases in the selling prices of its sewing machines and fans. Thus it seems that the problems of exports and costs both have engaged the Chairman's mind mostly. In a way the two are inter-related. It would be in the interest of the officials concerned in both the fields to help the industry in keeping the costs to the minimum and exports as high as possible.

Confectionery

EXPORT EFFORTS

MR. H. V. R. IENGAR, Chairman of Parrys Confectionery Limited, revealed at the annual general meeting of the company that the sale proceeds touched a new record of Rs. 1.34 crores, a figure as much as 14 per cent higher than that in the previous year. This, he believed, was partly the effect of a steadily rising level of living of the people in general, but partly it was a reflection of discriminative buying on the part of the consumers who attach importance to hygienic packing and quality. An important aspect of the company's rising sales was its effort to export to raise its selling abroad. The Chairman agreed that the Government had taken certain effective steps to provide incentives for export promotion by way of rebates of excise and customs duty. But he was of the opinion that even with these incentives the net price which could be realised from the exports was so low that the resultant loss was still too high a burden for the industry to bear. The industry was aware, he indicated, that the Government have been considering supply of sugar at the international price for manufacture of confectionery for exports. Naturally, he was anxious that an early decision on the question could be taken which would be welcomed by the industry.

While the industry deserved such incentives from the Government, he was not unmindful of the fact that the industry had its responsibility in terms of producing goods which retained quality that could stand comparison with those offered by other exporting countries. For this naturally the industry has to utilise and carry forward the latest refinements in use in various other countries. For this the units that concentrate on exports could be given facilities such as provision of certain quantity of foreign exchange to import machinery which was not available in the country.

The Chairman expressed his satisfaction over the fact that sugar supply continued to be easier and was available at lower prices than in certain previous years. The costs of other materials, he added, were, however, increasing. The company had to increase the prices of its products since other raw materials were being made available to the company at higher prices; even sugar prices are likely to move up. Moreover, new tax levies have added to the cost of tin containers and packing materials. The industry definitely needs attention especially because it could be helped to find its way in the foreign market.

Electrical Goods

BAJAJ ELECTRICALS RECORD PROGRESS

MR. KAMALNAIN BAJAJ, Chairman of the Bajaj Electricals Ltd., in his annual report of the company reveals that it was his insistent effort which convinced the Planning Commission to revise the target of electric lamps upwards. He had asserted that the annual demand for lamps would not be less than 90 million by 1965-66. The Development Council for Light Electrical Industries consequently recommended a revision of the production targets for lamps as well as for fluoroscent tubes from 75 million and 6 million per annum to 90 million and 8 million respectively. It was quite in line with the performance of industry in general that Bajaj Electricals improved their output which was reflected in their sale proceeds during the year under review—the year ended March 31, 1962. The sale proceeds of lamps and lighting equipment, fans, transformers etc. were Rs. 28.3 lakhs, a figure considerably higher than the last year's figure of Rs. 23.9 lakhs. Gross profit for the year was recorded at Rs. 16.74 lakhs out of which depreciation taxation and various reserves were provided so that a sum of Rs. 4.15 lakhs remained with the directors for distribution. The directors recommended the payment of dividend of Rs. 9 per ordinary share and Rs. 7.87 for every new ordinary share of Rs. one hundred each.

In December 1961 the company made a rights issue of ten thousand equity shares of Rs. 100 each. The issue was fully subscribed. The Chairman pointed out that Hind Lamps Ltd., half of whose production of general lighting service and miniature lamps and fluorosecent tubes is supplied to this company, have submitted applications to the Government of India for expansion of production in lamp, fluoroscent tubes and components during the Third Plan. This will involve an increase in the capital of that unit and consequently of this company. The Chairman further added that with the growth of industrialisation there will be tremendous increase in demand for precision instruments—both industrial and scientific. The company is busy on a comprehensive scheme to expand the production of instruments and to undertake the manufacture of various types of industrial control equipment. The new instrument factory and a development Centre in the field of instrumentation and industrial controls are proposed to be located in Poona. The company has also been taking interest in the development and marketing other products like fans, accessories, heating appliances etc. and the company continues to sell all these products in larger quantities.

Imperial Tobacco

SATISFACTORY WORKING

AT THE 51st annual general meeting of the Imperial Tobacco Company of India Ltd., Mr. F. A. Collett, Chairman of the Company surveyed in general the various problems facing the company. Mr. Collett underlined that in deciding price policy, it was necessary to strike a balance between the reasonable profitability of the business on the one hand and the rights and purchasing power of the consumer on the other. Although on account of increased customs and excise duties and the increase in corporation tax, the profit of the company has been affected, there is nothing much to despair as the dividend has been maintained. It was because of these duties that price increase had to be effected of the company's leading brands.

So far as production and productivity is concerned, the Chairman pointed out that the company had to work under certain particular difficulties. It has, however, been able to achieve a fair degree of streamlining and modernisation. Progress has been achieved but there is still room for progress as and when the opportunity arises to acquire fully up-to-date machines. The most important thing, is to see that the quality of the product does not suffer. Then again it is Leortening to note that the company has been constantly revising its manufacturing processes in the light of modern developments either evolved by company's own experimentation or borrowed from overseas sources. The company's research department has also been functioning effectively and has played no small a part in the development and improvement of indigenous raw materials required in the industry. Labour-management relations have been quite satisfactory and this has helped the company a good deal in evolving a sound policy for its staff. Productivity payment scheme adopted in the factory is now causing increasing awareness. On the whole the working of the company can be said to be quite satisfactory and one can look forward to still better results in the years ahead.

Aluminium

ALIND'S RECORD PROGRESS

FROM THE address of the Chairman of the Aluminium Industries Ltd., delivered at sixteenth annual general meeting of the company, it is evident that the company has made a record progress for the year 1961-62. So far as turnover is concerned, this has undoubtedly been a record year, sales having reached a peak of Rs. 6.17 crores in money value; production being 62,000 km. in bare conductors and 9.86 million core yards of covered conductors. On the face of it such a turnover should produce profits of the order of Rs. 23.16 lakhs enabling the company, despite higher tax commitments to distribute 18 per cent dividend on its paid up capital of Rs. 1 crore.

So far as expansion schemes of the company are concerned, the Chairman made it clear that the company has a programme of expanding its covered conductors capacity at Kundara and operate covered conductors unit at Hyderabad. The credit goes to Alind in establishing the first Properzi rod rolling mill in India and of following it up by a modern Properzi unit in Hirakud. As a considerable quantity of rods is still imported, the Chairman made the plea that the Government should afford facilities to import the necessary Properzi rod mill unit and thereby ensure larger production of rod by the most efficient and the cheapest process. He assured that the amount of the foreign exchange that is spent on imports would be saved to a considerable extent.

Referring to the exports, the Chairman also revealed that Alind has been trying its best by helping export promotion drive and pertaining to the capital issue, he hinted that the company has received the Government's sanction for the further issue of capital — namely 3,50,000 shares at a premium of Rs. 3.50 per share. This issue, when made, will bring company's paid-up capital to Rs. 1.53 crores, while adding Rs. 12.25 lakhs to company's Share Premium Reserve.

Mysore Paper Mills

PLEA FOR PRICE INCREASE

AT THE twenty-seventh ordinary general meeting of the Mysore Paper Mills Ltd., Mr. M. D. Shivananjappa, Chairman and Managing Director, made a strong plea for increase in the price of paper. He pointed out that the price increase sanctioned by the Government of India of 6 nP. per kg. on all qualities of paper and boards for both Government and Civil Supplies effective from 21st June, 1962, was not sufficient. The production costs were going up and it was, therefore, essential that there should take place a periodical revision of prices so as to absorb this increase in costs over which the industry has no control.

So far as the balance-sheet of the company is concerned, it would be noticed that the performance has not been too bad. The Directors, after a careful consideration of all relevant factors, have recommended declaration of dividend at 15 per cent or Rs. 1.50 nP. subject to deduction of tax on every share of Rs. 10 each fully paid-up for the year and proportionate dividend on partly paid-up shares of Rs. 2.50 each for the proportionate period subject to deduction of tax.

So far as the expansion schemes are concerned, the Chairman revealed that satisfactory negotiations have taken place with the firms in the UK and Germany and it is hoped that the work of erection and installation will be completed by the end of 1963 and operations commenced. The value of the orders placed in UK was to the tune of Rs. 58 lakhs and in Germany to the tune of Rs. 66 lakhs. The two loans from CDFC and ICICI would provide the necessary funds for these purchases.

The labour-management relations have been quite cordial and a bonus of four months' salary or wages to the employees of the Mysore Paper Mills for the year ended March 1962 has been disbursed. On the whole the state of affairs have been quite satisfactory except for the sale realisations which were a little lower as compared to the previous year. It is, however, expected that things would be put in their proper shape and the company would achieve strength and would march forward with confidence in the years ahead.

ENGEL INDIA

A COLLABORATION has formally been approved by the Ministry of Steel and Heavy Industry for the manufacture of Injection Moulding Machines and Moulds. The collaborators are the House of Mayurbhanj represented by the Maharaj Kumar P. C. Bhanj Deo and Mr. C. S. Loganathan, an industrialist of Madras from the Indian side and Messrs. Maschinenfabrik Ludwig Engel KG of Austria. In accordance with the collaboration terms the Austrian company will subscribe shares worth Rs. 7.5 lakhs in the Indian company. The Directors and their friends will subscribe shares worth Rs. 12.5 lakhs. The remaining shares worth Rs. 30 lakhs out of the present issue of Rs. 50 lakhs will be offered to the public in the near future.

Injection Moulding Machines and Moulds for the Plastic Industry in India are entirely imported at present. This is the first time that these machines will be manufactured outside Europe. This Commpany will, therefore, save considerable volume of foreign exchange. Moreover, certain territories have been set aside by the Austrian collaborators for exclusive export from the Indian factory and, therefore, this company will be able to earn valuable foreign exchange by exporting its products to those territories. In order to save foreign exchange the collaborators have arranged to supply the entire plant and machinery from Czechoslovakia, Poland and Hungry against rupee payment. It has also been planned that this company will have about 85 per cent indigenous content in their products from the initial stages. Preliminary work for the construction of the factory at Taratalla Road, Calcutta, has already commenced.

FROM THE CAPITAL'S CORRIDORS

MORE RESTRICTIVE LICENSING POLICY!

ADDRESSING the fourteenth meeting of the Central Advisory Council for Industries, the Union Minister for Commerce and Industry, Mr. K. C. Reddy, stated that in the present-day situation of the country when there were acute foreign exchange difficulties along with shortages of power and transport, it was necessary to follow a restrictive policy in licensing under the Industries (Development and Regulation) Act. He indicated that the Government proposed to enlarge substantially the list of industries with regard to which applications under the Industries Act were as a rule rejected. No purpose, he said, would be served by issuing licences for setting up new industries or for expansion of the existing ones if there was no reasonable prospect of foreign exchange being made available when required for the import of components.

Mr. Reddy urged industrialists to carry out further the process of improvisation in the use of indigenous materials to replace imports. The Planning Commission, he said, had already set up a Committee under the Chairmanship of Mr. G. L. Mehta, to study the matter of import substitution. But even during the intervening period between now and the submission of this Committee's report, he added, efforts should be made to exploit fully the possibility of dispensing with imports in the industrial undertakings. Future releases of foreign exchange for the import of capital goods and imports against external assistance, Mr. Reddy said would be made on a priority basis for 21 industries, which are as follows:

1. Alloy and special tool steels.
2. Steel castings.
3. Steel forgings.
4. Heavy structurals, including cranes.
5. Railway wagons and other railway equipment.
6. Industrial machinery for textiles, jute, tea, mining, washeries, cement making and paper making.
7. Machine tools, on a selective basis.
8. Pig iron.
9. Shovels and earth-moving equipment.
10. Fertilizers.
11. Rayon grade pulp.
12. Special refractories.
13. Industrial explosives.
14. Ferro-chrome, ferro-molybdenum and ferro-silicon.
15. Modernizing steel re-rolling plants to enable them to manufacture wire rods and special steel sections.
16. Cotton textile machinery, particularly for use of short and medium staple cotton.
17. Trucks and ancillaries.
18. Ball bearings.
19. Cast iron spun pipes from domestic pig iron and scrap.
20. Tin-plates.
21. Steel wires.

This list, however, would be subject to revision from time to time. Industries from this list would be deleted when foreign exchange has been released to them to reach the Third Plan targets and additions to it will be made whenever appropriate.

Dwelling on the problem of under-utilisation in certain industries and grant of additional licences for setting up more units in such industries, Mr. Reddy stated that the Boothalingam Committee which has been recently set up to review the working of the Development Wing, had been asked to indicate the basis on which capacity statistics should be collected so that under-utilisation of the capacity in various industries could be known on a realistic basis. As a matter of general policy, further licensing of capacity in various industries in the private sector, Mr. Reddy observed, would be allowed only when the production required could not be secured from full utilisation of the capacity of the existing units. Consideration in this regard, however, would be given to economies of scale, keeping in view also the need for regional dispersal of industries. Due to the stringent foreign exchange situation, the Minister added, "in certain fields of low-priority it may be preferable, under present circumstances, to put up with some degree of under-utilised capacity rather than to import components and raw materials". The range of industries for which future licensing may have to be done will, however, be somewhat wider than the priority list drawn up for import of capital goods.

Mr. Reddy recalled that for some time past the licences issued under the Industries Act had been under review of the Government with the purpose of revoking infructuous licences so that the unnecessarily committed foreign exchange for these projects could be released for use in a more judicious manner. A quick survey, he said, had been made by the Development Wing of the progress of implementation of the industrial licences issued so far and letters had been sent to some 461 licensees to indicate reasons for lack of progress in the implementation of their licences. Upto August 22, 1962, the Government, after a careful consideration of the replies sent by the licensees, had revoked as many as 129 licences and extended the time limit for implementation in the case of 62 licences. In the remaining cases, the replies of the licensees had either not been received or were under the consideration of the Government.

Dwelling on the regional considerations to be taken into account in licensing of private units under the Industries Act, Mr. Reddy pointed out that regional dispersal was not inconsistent with establishment of new units with adequate capacity to operate on an economic basis.

About the private sector industrial units being allowed to set up their own power generating sets, Mr. Reddy stated: "The generation of power must, as a rule, be undertaken by public authorities. Generation on a small scale by individual industrial units might result in higher costs. However, there is no bar to the consideration of individual applications from private parties on merits."

The import allocations for the half-year October, 1962, to March, 1963, Mr. Reddy said would be determined after careful review of the overall foreign exchange position of the country. This implies that any adjustments in the current import policy would be decided upon only towards the end of this month or in the beginning of November.

Mr. Reddy pointedly drew the attention of the industry to the imperativeness of holding the price-line and warned that if the industry did not itself take steps to reduce prices of industrial products, the Government

The Third Five Year Plan
Bird-Heilgers' part in it...

FOURTEEN MILLION NEW JOBS

Employment. A word that translates into a meaningful future for millions of people without jobs. India's Five Year Plans are aimed at the concept of full employment. The intensified drives of the Third Plan are estimated to create 14,000,000 new job opportunities—more jobs for more people than ever before in the economy's history! To achieve the employment target calls for a single-minded national effort. It must be co-ordinated, dedicated, complete...

75,000 jobs—and more in the offing

Bird-Heilgers is convinced that the quickening tempo of industrial activity must be accelerated if unemployment is to be checked and full employment brought about. Wedded to this concept, the group provides well-paid employment for approximately 75,000 people. They are concerned with iron ore and insurance policies, bridges and writing paper, gunny sacks and laboratory tests—a complex of goods and services which involves the group heavily in the industrial insurgence of India.

Towards a self-generating economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...provide employment for many more thousands...join the national drive to economic independence.

would have no option but to resort to imposition of controls, strategic or general.

INDIAN SHIPPING

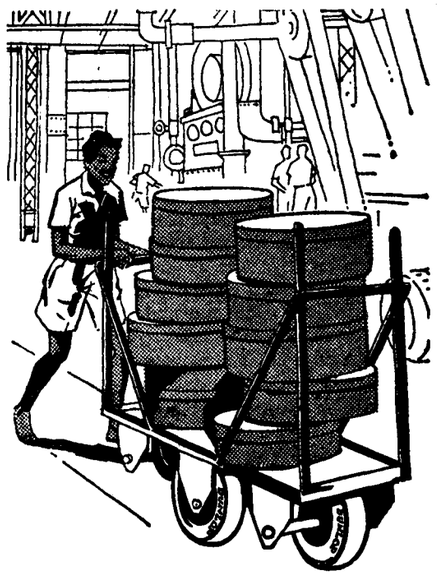
The share of Indian shipping lines in the trade between India and the U.K. has been raised from 30.25 per cent to 39.475 per cent from September 1, 1962, under an agreement signed recently between the representatives of shipping lines of the two countries. According to the agreement Indian lines will achieve parity with British lines on January 1, 1971.

The agreement provides that the share of Indian shipping in the trade will be increased from 39.475 per cent to 40.475 per cent on January 1, 1963. Thereafter, on January 1 every year the share of Indian lines will increase by 1 per cent till it reaches 48.475 per cent on January 1, 1971. The share of British lines, which today stands at 57.035 per cent, will be reduced to 56.085 per cent on January 1, 1963. This share will be reduced every year till it comes down to 48.475 per cent on January 1, 1971, which will be the share of Indian lines in the trade on that day.

The new agreement lays down that 6 months' notice will be given of any desire on the part of shipping companies to increase the over-all tariff rates of freight, so that discussions might take place between the shipping companies and trade organisations. In case there is no agreement within three months of such a notice, the matter will be referred for discussion and consultation between the Government of India and the shipping companies.

The agreement provides that over-all increases in tariff rates of freights will not be made at intervals of less than two years, and not before June 30, 1963, though rates of freight on individual commodities may be increased at more frequent intervals. In case the shipping companies intend to increase the freight on individual commodities, three months' notice would be necessary, so that negotiations may be held between shipping companies and trade organisations, and if necessary, with the Government of India. The shipping companies will have the option as before to apply surcharge in freight to meet special and exceptional conditions, but the surcharge will be removed as soon as the special conditions disappear.

On the assumption that trade between India and the U.K. would be the same in 1961, the gain to Indian shipping lines and to the country's foreign exchange resources is assessed at £1,291,500 (Rs. 1,72,20,000) on account of the increase of India's share from 30.25 per cent to 30.475 per cent on September 1. The additional increase of one per cent with effect from January 1, 1963, would result in a further gain of £140,000 (Rs. 18,76,000). The total gain by January, 1963, will thus be £1,431,500 (Rs. 1,90,87,000). Since the trade between India and the U.K. is fast expanding, the actual benefits in 1962 and in successive years may be much larger.



THE SECOND SHIPYARD

The annual report of Hindustan Shipyard, published here last week, perhaps is of vital importance in connection with the question of setting up the second shipyard at Cochin. The report points out that despite all-round reduction in ship-building activity in the world, the supply position continues to be far in excess of demand. It says that shipyards all over the world are competing with one another for quoting low prices. Large amounts are being spent on modernisation and research in order to increase productivity and reduce costs. It was because of this severe competition that Hindustan Shipyard had to accept orders for nine Mitsubishi type vessels at fixed prices, which are all below cost of production.

In a recent announcement, the British ship-builders stated that they were finding their strenuous efforts to win export work frustrated by ruthless subsidisation — direct and indirect — in overseas countries.

According to a recent study, taking the year 1956 as base (100), German tonnage launched in 1961 stood at 97, Italian 92, French 150 and British 86.

According to same study, in Italy upto 27 per cent of the ship-building costs are borne by the Government, and in France upto 35 per cent. Japan, the world's biggest ship-building country, has no turnover tax and 80 per cent of the export profits or 5 per cent of export turnover can be deducted from the company tax. In addition, the ship-building firms can convert 35 per cent

DSTC-4

of their annual profit, tax-free, into capital reserves. The Japanese Export-Import Bank gives credit to the ship-builders at the rate of 4-5 per cent, about half of normal interest rates. Recently, in Argentina, German tenders were 37.4 per cent higher than those of Japan. The Scandinavian countries provided cheaper credit for their ship-builders and generous income-tax allowances.

It is, therefore, not understandable why should India launch in the second shipyard project when there is a glut of shipping all over the world. The Chairman of the Hindustan Shipyard told his shareholders that the yard needed more orders to provide adequate work from middle of 1964.

The report shows that the profit of Rs. 43,000 earned during the year was mainly from the construction of small vessels, which were outside the purview of subsidy arrangement. This profit was worked out after claiming a subsidy of Rs. 89,58,887 from the Government. In the era of acute foreign exchange crisis, will it not be better to lay off the scheme to have a second shipyard say for the Fifth Five-Year Plan?

STATES' HOUSING SCHEMES: NEARLY RS. 24 CRORES ALLOCATED BY UNION GOVERNMENT

The Union Ministry of Works, Housing and Supply has allocated Rs. 23.90 crores to State Governments during the year 1962-63 for different housing schemes.

Under the Subsidised Industrial Housing Scheme, the State Governments have been allocated Rs. 417.11 lakhs, out of which Rs. 209.19 lakhs will be given as loan and Rs. 207.92 lakhs as grant. Under the Low-Income Group Housing Scheme, the States have been allocated Rs. 479.61 lakhs and under Plantation Labour Housing Scheme, Rs. 13.75 lakhs. For Village Housing Project Scheme, the States have been allocated Rs. 136.08 lakhs. The Central assistance for State planned schemes will be Rs. 1,046.55 lakhs.

Under the Slum Clearance Scheme, the State Governments have been allocated Rs. 297.09 lakhs. Under these schemes, Andhra Pradesh will have Rs. 128.34 lakhs, Assam Rs. 50.80 lakhs, Bihar Rs. 174.40 lakhs, Gujarat Rs. 235.90 lakhs, Jammu and Kashmir Rs. 45.69 lakhs, Kerala Rs. 75.23 lakhs, Madhya Pradesh Rs. 161.80 lakhs, Madras Rs. 1,255.86 lakhs, Maharashtra Rs. 506.60 lakhs, Mysore Rs. 161.90 lakhs, Orissa Rs. 62.49 lakhs, Punjab Rs. 82.89 lakhs, Rajasthan Rs. 158.90 lakhs and West Bengal Rs. 289.39 lakhs.

INSTITUTE OF INTERNATIONAL TRADE

The Committee set up by the Board of Trade at its Calcutta meeting on July 6, 1962, to prepare the scheme for the establishment of the Institute of International Trade has submitted its report. The salient features of the scheme recommended in this report are:

"The Institute of International Trade will be a corporate body registered under the Societies Registration Act XXI of 1860, in the functioning of which the Government, the trade and industry and educational and research institutions will participate. It will have training and research wings and will also develop facilities for providing information on India's international trade. Its objectives will be broadly to undertake training and research in all aspects affecting India's international trade and disseminate information on international trade with special emphasis on export promotion problems and a strong practical bias in favour of assisting the Government and the trade and industry in finding solutions to these problems.

"Apart from normal training courses, which will be of one year's duration for persons about the age group 25 to 35, there is a provision for a re-orientation course of three months' duration as a part of refresher course and in service training for Commercial Counsellors and Secretaries working in Government of India's trade establishments abroad and representatives of trading, industrial and financial organisations assigned for work abroad. A rapid conversational and working knowledge of foreign languages is also to be part of re-orientation course as well as of the training programme. To begin with Arabic, French and Spanish will be taught and additional languages will be taught as the facilities at the Institute increase.

BRITISH INVESTMENTS ABROAD

The British Board of Trade has issued some interesting figures about British private investments overseas and the income earned on them. In 1961, these investments amounted to £218 million (excluding investments in oil and insurance)—about the average rate for the last three years. Total return on them in this year was of the order of £151 million.

The direction of British private investments abroad shows the following countries as the six most important (in order) in each year since 1958:

BRITISH PRIVATE DIRECT INVESTMENTS OVERSEAS (EXCLUDING OIL AND INSURANCE)

	1958	1959	1960	1961
(1)	Canada	Canada	Australia	Australia
(2)	S. Africa	Australia	Canada	Rhodesia
(3)	Australia	U.S.	U.S.	Canada
(4)	U.S.A.	Rhodesia	S. Africa	U.S.A.
(5)	W. Germany	India	India	Nigeria
(6)	India	S. Africa	Rhodesia	W. Germany

In 1961, India dropped to seventh place in importance.

The most profitable countries for British investments during these four yeare were:

	1958	1959	1960	1961
(1)	Australia	Australia	Australia	S. Africa
(2)	Canada	S. Africa	S. Africa	Australia
(3)	S. Africa	Canada	India	U.S.A.
(4)	U.S.A.	U.S.A.	Malaya	Canada
(5)	India	India	Canada	India
(6)	Malaya	Malaya	U.S.A.	Malaya

NEW LICENCES AND COMPANY REGISTRATIONS

Ninety-four licences were issued by the Government in August this year for setting up new industrial undertakings and for expansion programmes in the existing industries. Of these, 36 licences were for the setting up new units. Maharashtra State was given 13 licences, Punjab 4, Assam and Mysore 3 each and U.P., West Bengal and Jammu & Kashmir 2 each. Andhra Pradesh, Gujarat, Kerala, Madras, Rajasthan, Pondicherry and Andaman and Nicobar islands were given licences for the establishment of one new undertaking each.

As many as 158 companies were registered during his month in the various States of the Indian Union, with a total authorised capital of Rs. 23,20 lakhs. These included 11 giant-sized companies having an authorised capital of Rs. 1 crore and above. Four of these giant-sized companies were registered in the State of West Bengal, two in the State of Punjab and one company each in the State of Madras, Mysore, Orissa, Uttar Pradesh and Delhi.

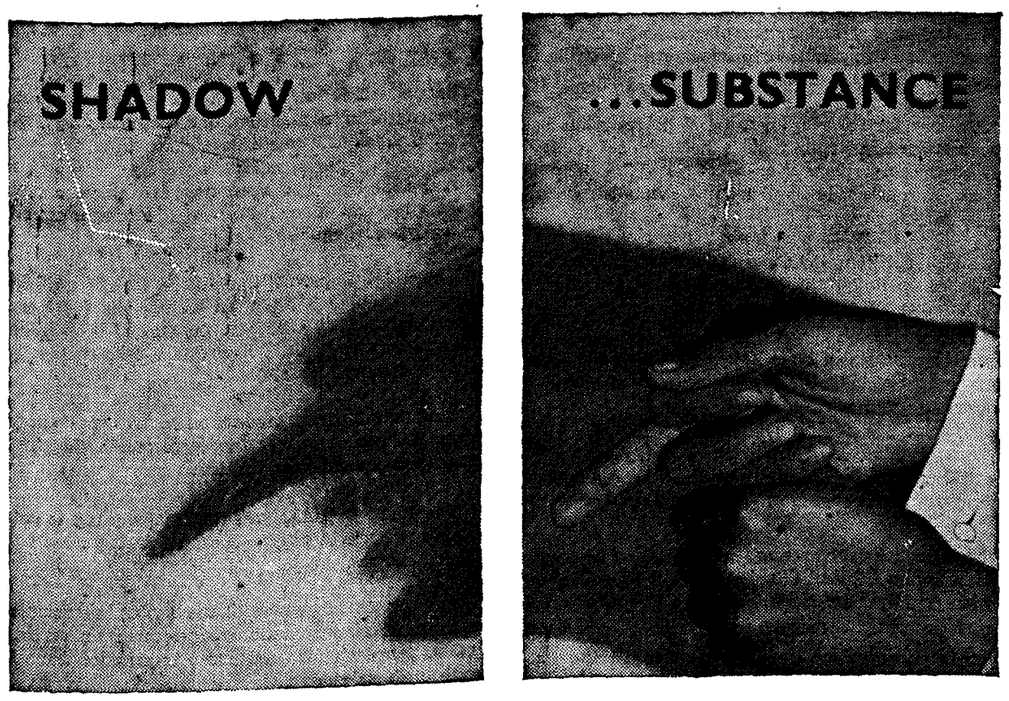
The largest number of companies (34) was registered in the State of West Bengal. The State of Maharashtra came second with 32 new registrations. Twenty-six and 24 new companies were registered in the State of Madras and Delhi respectively. The remaining 42 companies were registered in the other States.

SIMCO METERS

Signing of an agreement to subscribe the equivalent of £50,000 for ordinary shares of Simco Meters Ltd., Tiruchirapalli, Madras State, has been announced in London by the Commonwealth Development Finance Co. Ltd. (CDFC).

The announcement says that as further assistance towards the total cost, estimated at Rs. 70,00,000 (£525,000), CDFC has agreed to make a sterling loan of £137,500.

Simco Meters will manufacture domestic and industrial electricity meters. Sponsors of the project are Seshasayee Brothers (Private) Ltd., in technical collaboration with Denis Ferranti Meters Ltd., of Bangor, Wales. It will be managed by South Madras Industries Development Co. (Private) Ltd. Production is expected to start in mid-1963.



IN BRIEF...

BOAC has introduced, with effect from October 1, 1962, Boeings on its London-Sydney service via New Delhi. With effect from April 1, 1963, it also expects to increase Boeing frequencies on its London-Sydney and London-Hong Kong routes. Some of these services will pass through Calcutta.

Messrs. Kamani Industries, who manufacture transmission towers and have applied for a licence to set up their own rolling mill, have been advised by the Government to procure their supplies from the existing rolling mills in view of the foreign exchange difficulties the country faces today.

The project report for the High Pressure Boiler Plant, prepared by Czechoslovak experts, has been received by the Government and is stated to be under examination. The plant is envisaged to manufacture annually 12 boilers of 125 to 300 tons steam per hour capacity.

The Fertilizer Corporation of India has been asked by the Government to take up the installation of a Fertilizer manufacturing plant at a convenient location in Madhya Pradesh on a high priority basis. The plant is to be coal-based and is to have a capacity to produce annually one lakh tons of nitrogen in the form of urea. The preliminary investigations by the Fertilizer Corporation in respect of choosing a convenient site for the plant have already been initiated. The Corporation expects to launch this project in about six months' time. This plant was originally to be set up by Khandelwals.

Many things cast deceptive shadows.

Your files, for instance. Your notes, ledgers, lists and journals—your records. If you are connected with any kind of operations Control—running a business an office, an army—you have probably been worried by the shadow cast by your records—worried about what they added up to. You probably have to assess situations everyday by leafing through masses of paper—charts, reports, data.

Try Remington Systems. They can be tailored to your business, so that your records and information are not only arranged for easy reference—they provide an automatic *Control* of your operations. They can tell you when to act, even how to act.

And they are simple to use.

MAKE YOUR RECORDS WORK FOR YOU

NEWS IN BRIEF

INDIAN

The UNESCO will finance a research project in India on human relations between Europeans and Indians.

•

An estimated 30,000 acres of virgin land in the Ganganagar Dist. Rajasthan, will come under irrigation this October through water released from the Rajasthan canal feeder into three branches of the canal. The completion of the Rajasthan canal system is, however, expected to take at least 15 years.

•

The National Metallurgical Laboratory at Jamshedpur claims to have developed a process to use aluminium instead of zinc in galvanising steel sheets and other ferrous products.

•

I. N. S. Kistna, a frigate of the Indian Navy will participate in the forthcoming exploration of the Indian Ocean, organised by the Special Committee on Oceanic Research of the International Council of Scientific Unions.

•

The construction of the fully automatic light house near the Visakhapatnam port, Andhra Pradesh, is nearing completion and is expected to function very shortly.

•

The Defence Ministry has placed an order with Sweden for a rolling mill to produce special steels in Ishapore.

•

A factory for the manufacture of hearing aids has has been started in Bombay with the technical collaboration of the American Danish Orticon Company of Denmark, Europe's oldest and leading specialists in this field.

•

A high-level Planning Committee for Transport will soon be set up under the chairmanship of Mr. Tarlok Singh, Member, Planning Commission.

•

The Government of India have constituted an expert committee to examine the present system of planning and distribution of iron and steel.

•

The Government of India have issued an order under Section 2 of the Essential Commodities Act declaring aluminium utensils as an Essential Commodity.

•

The Rajasthan Government is conducting a sample survey of living standards in 384 villages in collaboration with the National Sample Survey Organisation.

•

The Government of India have extended the Employee's Provident Fund Act to saw mills, wood seasoning kilns, wood preservation plants and wood workshops employing twenty or more persons.

•

The Government of Maharashtra has announced comprehensive plans for the development of deep-sea fishing centres, which would increase the present annual income of fishermen from Rs. 300 — 700 to Rs. 1,000 or more in the near future.

•

Preliminary work for the expansion of the Bhilai Steel Plant has been started; its completion should ensure the increase of the annual capacity from one million to two and a half million tons of ingot steel.

•

The Government of Maharashtra has constituted an expert committee to advise her on the establishment of co-operative spinning mills in the State.

FOREIGN

The L. M. Eircsson Telephone Company of Sweden plans to build a tele-communications plant in Australia.

•

The Soviet Union is building 21 power stations including three 2.4 million kilowatt stations, claimed to be the biggest of their kind in the world. It is estimated that by 1970 the annual commissioning of new capacities will be about 25 million kilowatts.

•

The average American family now spends only 20 per cent of its total income on food compared with 66 per cent a hundred years ago.

•

The number of shareholders in the USA has risen from 6.49 million in 1952 to 17.01 million in 1962, according to the New York Stock Exchange.

•

The German Democratic Republic will shortly conclude trade agreements with Nigeria, Somalia, Rhodesia and Ethiopia.

•

A UNESCO report states that in tropical Africa only two persons per thousand are enrolled in institutions of higher education.

•

The UAR is to become a member of the GATT, and will participate officially in 1963.

•

Between 1959 and 1960 the percentage of population engaged in non-agricultural activities in Poland has risen from 52.9 to 61.7.

•

A Polish firm has been awarded the contract to build the new commercial harbour of Famagusta, capital of the Cyprus Republic.

•

The UAR Supreme Committee for Electrification will send about 300 Egyptian technicians for training in the USSR. They will form the core of the personnel to run Aswan High Dam now under construction with Soviet assistance.

•

Finnish industrial production in 1960 was approximately 200 per cent over the corresponding figure for the pre-war record year of 1938.

•

The Rank Organisation, U.K. is planning to set up Britain's first chain of coin-operated do-it-yourself dry-cleaning centres.

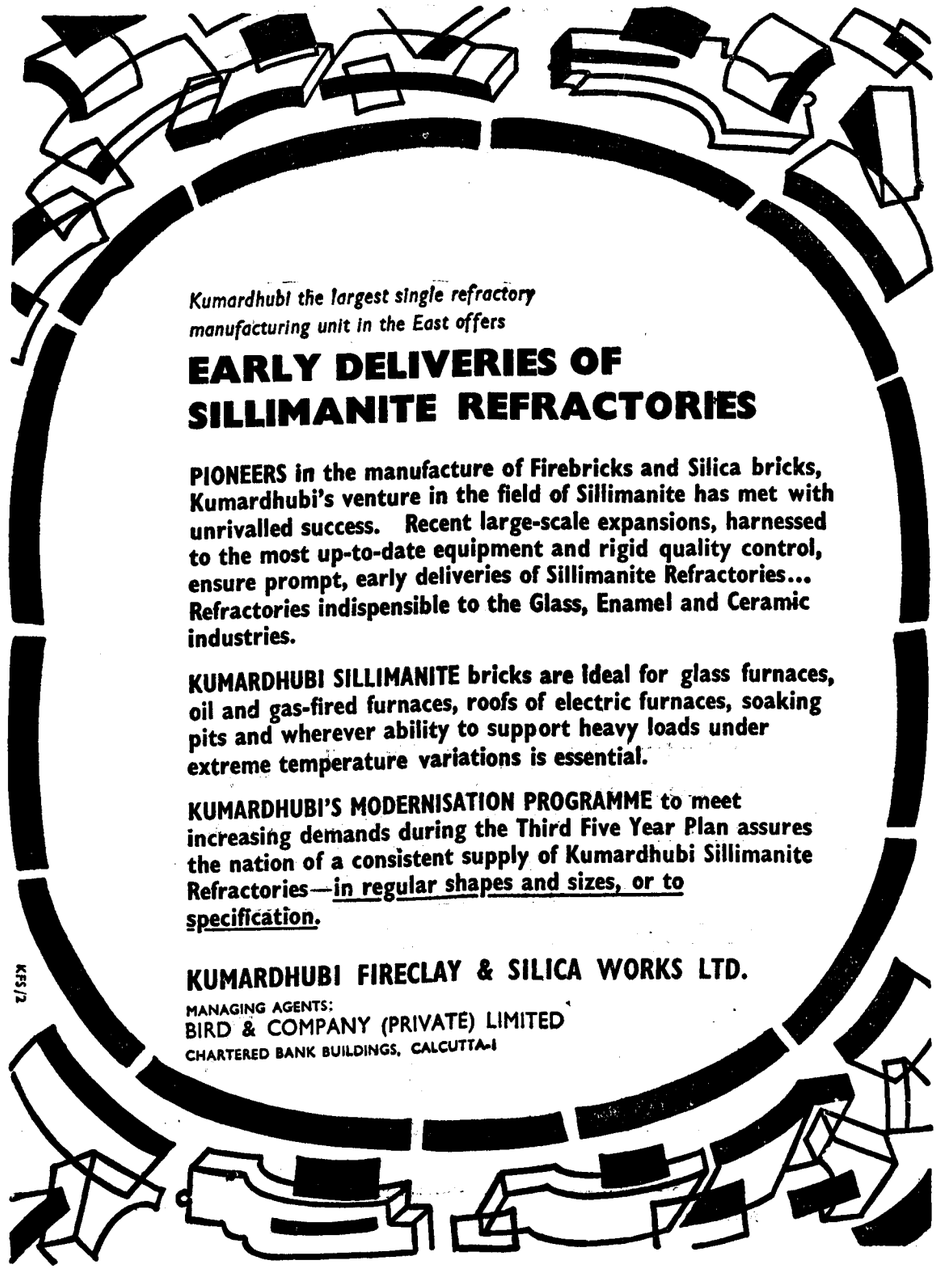
•

The cocoa study group of the F.A.O. has completed the draft of an international agreement on cocoa. It contains proposals for a system of international marketing through sales quotas.

•

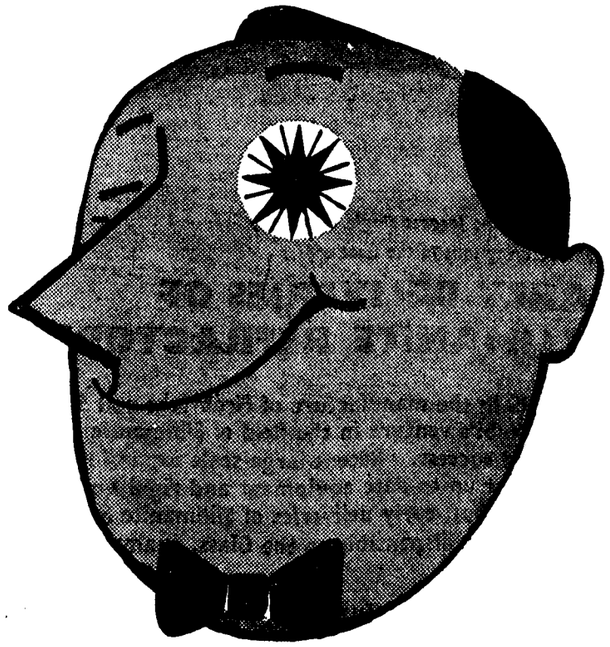
Favre-Leuba Watch Company, Geneva, claims to have developed a revolutionary mechanism involving twin springs, for the manufacture of extra-flat precision wrist watches at extremely low costs on a mass scale.

•



An American firm, Union Oil of California, has signed a contract with the Thai Government for an oil survey in North-East Thailand.

•



An agreement recently signed by the Soviet Union and Ceylon provides for Soviet Technical Assistance in clearing and planting 2,000 acres of cotton in the Hambantota district of Ceylon at an estimated cost of Rs. 1.89 lakhs.

•

The Honda Company of Japan will establish a plant for assembling their motor-cycles in Belgium.

BRIGHT OUTLOOK

A dirty door knob, a grubby paper-weight, a dull name-plate or tarnished brass rails may be taken by prospective clients as signs of dull business.

Keep your office attractive always...give the brass articles and fittings in it a bright look with Brasso.

COMPANY AFFAIRS

BIRD GROUP JUTE MILLS

All the five companies for which the annual reports have now been made available for the period of financial year 1961-62, give plain indication that the year for the jute industry was rather bleak. As the Directors of Kinnison Jute say, "the year ended March 1962, will long be remembered as one of the most difficult in the long history of the Indian Jute Mill Industry. The reason for this has been the inadequate supply of fibre consequent on two successive short crops which in turn resulted in a period of heavy financial losses due to the disparity in prices between raw jute and manufactured goods. The short crop of 1959-60 due to inadequate sowing was followed by a poor harvest in 1960-61 caused by drought and mills found themselves with insufficient fibre to carry them through the season until the new crop arrived in August1September. Prices for fibre advanced rapidly and with overseas markets resisting the rise in prices for manufactured goods, the disparity widened to such an extent that at one period for every ton of goods produced the mills suffered a loss of Rs. 300 on simultaneous business."

As these reports level, the IJMA introduced maximum quota schemes which remained in force until August 1961. The object of this was to regulate purchases and avoid a scramble for fibre which would have forced prices to even more uneconomic levels. In conjunction with this quota system a price agreement which laid down maximum price for the mills' purchases had the effect of minimising the losses created by the disparity between raw jute and manufactured goods. It was only in September when raw jute arrived in increasing volume that mills stepped up weekly working hours to 45 and soon by the middle of October the working hours were raised to 48. This was followed by bringing more looms into commission and by December 31, 1961 the industry had reduced its sealed loomage to just 7 per cent.

The reports further reveal that the trade estimates for 1961-62 raw jute crop were in the region of 84 lakhs of bales and with prospects of a similar sized crop in Pakistan there was considerable apprehension among growers as to how this huge crop could be marketed at economic prices. With the rapid drop in raw jute prices during July and August it was feared that unless steps were taken to arrest the fall, ryots would switch a greater acreage to the cultivation of paddy in the ensuing season. The IJMA therefore introduced its price support scheme which included purchase quotas at a minimum price level of Rs. 30 per maund basis for Assam Bottoms. Early in January, 1962, the Agricultural Department of the West Bengal Government issued a report that the total outturn of raw jute (excluding Mesta) in West Bengal would be 167 lakh maunds in the 1961-62 season against the previous season's figure of 95 lakh maunds. This announcement started off a wave of selling pressure and the IJMA with its price support scheme increased Mills's quotas to restore confidence in the market. In January, 1962, the jute Buffer Stock Association was registered under the Indian Trade Unions Act and its first purchases were made early in April, 1962. Till the middle of August, 1962 the total quantity purchased amounted to 11.25 lakh maunds.

The prospects of exports in respect of hessian and sacking were rather unattractive in terms of quantity although in terms of price earned was comparatively better. This earning through higher prices can ultimately be harmful because there is every possibility of ultimate users turning to substitutes. In this context the severe competition from Pakistan has to be reckoned with.

Of the five companies, two—Landsdown Jute and Kinnison Jute—reported actual losses. Loss in the case of **Kinnison Jute** was to the extent of Rs. 14.20 lakhs. Taking into account the depreciation provided to the extent of Rs. 8.32 lakhs, the actual deficit balance is Rs. 22.52 lakhs. A sum of Rs. 1.37 lakhs was transferred from General Reserve and nearly the same amount was paid as dividend on cumulative preference shares at the rate of 9.10 per cent per annum subject to deduction of tax. No dividend was declared on ordinary shares.

Landsdown Jute Company recorded a loss of Rs. 11.54 lakhs after separating Rs. 3.98 lakhs towards depreciation. Taking into account an amount brought forward from the previous year of Rs. 3.54 lakhs deficit balance was of the order of Rs. 19.13 lakhs. A sum of Rs. 9.57 lakhs was transferred from General Reserve, Rs. 1 lakh from Debenture Redemption Reserve and some more money from Statutory Development Rebate Reserve. The net result was that the debit balance was Rs. 6.84 lakhs which was carried forward to the next year.

Dalhousie Jute Company, in spite of these adverse conditions, recorded a profit of Rs. 5.89 lakhs. Taking into account depreciation of Rs. 6.49 lakhs, and Debenture Redemption Reserve of Rs. 1 lakh, the Directors have proposed to transfer Rs. 1.37 lakhs from General Reserve and Rs. 86,740 from Statutory Development Rebate Reserve. After the payment of a dividend on Cumulative Preference Shares at the rate of 9.10 per cent per annum subject to deduction of tax, there was debit balance of Rs. 62,456 which was carried forward.

Northbrook Jute Company, recorded a profit of Rs. 16.53 lakhs out of which a sum of Rs. 6.29 lakhs was separated towards depreciation and Rs. 6.18 lakhs towards taxation. A sum of Rs. 1 lakh was transferred from taxation contingencies reserve. The Directors have proposed the payment of a dividend on Cumulative Preference Shares at the rate of 7.15 per cent per annum and on ordinary shares at the rate of Rs. 2 per share.

Union Jute Company Limited recorded a profit of Rs. 6.43 lakhs. After taking out Rs. 4.71 lakhs for depreciation and Rs. 1.17 lakhs for taxation, a sum of Rs. 40,751 was transferred to Statutory Development Rebate Reserve. A sum of Rs. 50,000 was transferred from General Reserve. A dividend on Cumulative Preference Shares was paid at the rate of 9.10 per cent per annum which absorbed Rs. 54,600. A sum of Rs. 18,317 was carried forward to the next year.

It may be added that power cut from the month of February 1961 upset the working of all these mills and this continued till the end of May, 1961. As a consequence all the mills declared Monday as their weekly non-working day. These companies also are waiting for the Wage Board decision which has not yet completed its investigation into the wage structure for jute mills workers. An interim relief amounting Rs. 3.42 per month continues to be paid to the workers.

Company Meetings

THE IMPERIAL TOBACCO COMPANY OF INDIA LTD.

Speech by the Chairman, Mr. F. A. Collett, at the Fifty-first Annual General Meeting of the Company on 25th September 1962.

BOARD OF DIRECTORS

Mr. E. G. Willis retired from the Board on 31st March this year. He originally came to India in 1934 and has been on the Board since 1956, bringing a particular knowledge of the leaf tobacco growing side of the business. He leaves behind many friends both inside and outside the Company, and we wish him a long and happy well-earned retirement in England.

Mr. W. K. Foster was appointed to the Board on 1st October, 1961 with particular responsibility for our marketing problems. Mr. Foster has been in the tobacco business all his working life, most of it in Asia. He came to India in 1959 and we have already begun to derive benefit from his experience.

ACCOUNTS

When I addressed you a year ago I told you that your Board did not feel justified in increasing selling prices to cover the additional duties imposed by the Finance Act of 1961.

In deciding price policy, it is necessary to strike a balance between the reasonable profitability of the business on the one hand, and the rights and purchasing power of the consumer on the other. Ours is essentially an industry depending on volume, and it is usually sound business to accept a relatively small unit profit for the sake of maintaining a large and increasing volume of sales. The cigarette consumer, particularly in the middle and lower economic ranges, has always shown considerable reluctance to increase his outlay per unit of cigarettes; and in the face of frequent tax increases over the years he has seemed often willing to do without rather than pay more, or at least to have recourse to even cheaper forms of smoking.

The policy of restraint I referred to last year would itself have involved some decrease in the Company's nett profits but we did not at that time envisage that the Finance Minister in his 1962-63 Budget would retroactively increase corporate taxation to 50 per cent. This has reduced the Company's profits by a further Rs. 18 lakhs.

The overall effect of the increase in Customs and Excise Duties and the increase in Corporation Tax has been to reduce the Company's nett profit after tax from last year's figure of Rs. 188 lakhs to Rs. 146 lakhs. In the 1962-63 Budget the Finance Minister imposed still further increases in Excise Duties on tobacco products, estimated to yield him a further Rs. 5 crores per annum. These factors, combined with the normal increases in costs, have swung the balance strongly in favour of a price increase and in April this year your Board felt compelled to increase the selling prices of a number of its leading brands.

You will have seen from the Directors' Report that despite the reduction in nett profits by Rs. 42 lakhs, they recommend maintaining the total dividend at last year's level. This will involve reducing the appropriation to reserves to a figure below that which we normally consider prudent. We feel justified in making this recommendation because the increased prices are expected to restore profits to a more reasonable level. Although there was an initial drop in consumption immediately after the price increase, there are already some signs of recovery in total demand, and we are confident that, unless unforeseen circumstances arise, profits in the current year will be sufficient to enable the Board to maintain the dividend at the same rate and to appropriate an adequate sum to reserves.

PRODUCTION AND PRODUCTIVITY

It has been my practice in previous years to enlarge on a particular aspect of your Company's business, and this year, in which the cigarette factories and the printing factory in Madras have achieved record outputs, it seems appropriate to give special mention to our Production Department.

This department works under certain particular difficulties. Your Company was one of the first to embark on large-scale manufacture in this country, and consequently most of the factories were designed and built a good many years ago. The cigarette industry is at present on the list of those for which major expansion is not allowed. For some years foreign exchange difficulties have restricted the importation of modern machinery, and partly in consequence of this and partly due to the employment situation in India at large, the labour density in our factories in unduly high by international standards.

Nevertheless, over the years we have been able to achieve a fair degree of streamlining and modernisation, one aspect of which is depicted in the photograph in the Annual Report of the Bangalore factory as it is today. In consequence of this our factories are all, without exception, producing more cigarettes today than their original designers could have deemed possible. There is still room for further progress as and when the opportunity arises to acquire fully up-to-date machines.

When the pressure on factories is for maximum volume it is necessary to pay particular attention to ensuring that the quality of the product does not suffer. This is partly a matter of technique, and we are constantly revising our manufacturing processes in the light of modern developments, either evolved by our own experimentation or borrowed from overseas sources (and in this connection I might mention the valuable technical assistance which we continue to receive from our associates in the United Kingdom). Our own Research Department has played no small part in the development and improvement of indigenous raw materials required in the industry.

New ideas need to be widely understood if they are to be efficiently implemented and to this end we run a regular series of courses and conferences for all levels of management. These courses are complemented by frequent visits by senior members of the Head Office management to the branches. We also send selected members of management overseas for training, when availability of foreign exchange permits, to enable them to widen their knowledge and measure their performance against world standards.

At the same time we have been able to intensify the training of the clerical and factory workers themselves, on whose efforts the quality of our products ultimately depends. This training not only makes the day-to-day jobs more interesting to those who do them but is increasingly making it possible for us to bridge the gap between ordinary workers and management and to fill at least junior management posts from the clerk's desk or the factory floor.

I think it is widely recognised that our working conditions and labour amenities are second to none and I can report another year of generally cordial relations with our unions. I should, however, perhaps mention one rather disturbing tendency. This is the trend to a multiplicity of unions within a single factory, based usually on political affiliations, with consequent internal rivalry between them. I do not wish to question the right of workers to belong to the union of their choice, but there is no doubt that this disharmony on the union side can complicate negotiations between the Company and the workers and cause unfortunate delays in the settlement of outstanding differences of opinion.

I am glad to be able to report that our Productivity Payment scheme, now adopted in all our factories, is causing increasing awareness among labour that better work, and improved productivity, are reflected in the pay packet and are ultimately to the advantage of the Worker, the Manager and the shareholder alike.

I indicated earlier that the Production Department was hampered to some extent, in its task of extracting the optimum output from its existing establishments, by inability at the present time to acquire all the machines it would like to install. It is not always fully understood that it is in the interest, not only of all concerned in our industry, but also of all concerned in the prosperity of the country at large, that existing assets should be utilised to the maximum and kept up-to-date and that resources of manpower should also be so utilised. As consumption in India grows, so must productivity per man-hour increase also, and this calls both for progressive management and for a progressive attitude of mind on the part of the men who work the machines.

PROSPECTS

I said last year that I considered that, provided the various items of increased cost did not outstrip the gains from increased productivity, we might look forward to the future with moderate optimism. I think you will agree that, insofar as the commercial operation of your Company is concerned, that somewhat cautious prophecy has been justified. Our volume of sales has increased considerably, but so has taxation and the cost of many materials which we use. The tobacco trade in India is increasingly competitive but on the whole we are holding our own. I have already discussed the reasons which led us to increase prices, and these price increases have, of course, militated against the steady increase in sales volume to which we look to counteract the ever-growing pressures on profit margins provided by rising costs on the one hand and vigorous competition on the other.

Nevertheless, as I have already indicated, I am confident that, taking all foreseeable factors into account, we shall be able to maintain our present rate of dividend during the current year after making adequate appropriations to reserves.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

THE MYSORE PAPER MILLS, LIMITED

Speech delivered by Sri M. D. Shivananjappa, I.A.S., Chairman and Managing Director, at the Twenty-seventh Ordinary General Meeting of the Company held at Bangalore on Wednesday the 26th September, 1962.

Ladies and Gentlemen,

I have very great pleasure to welcome you all to this 27th Ordinary General Meeting of the Shareholders and particularly those who have become members for the first time by acquisition of new Equity Shares issued recently. As usual the Report of the Directors and the Audited Balance Sheet for the year ended 31-3-1962 have been circulated already and with your permission I shall take them as read and before requesting your approval to them I would like to review the main features of the year's operations.

In exercise of the right to appoint a Director on our Board as provided in their Agreement with us, the I.F.C.I. have appointed Padmabhushan Sri V. Narahari Rao, C.S.I., C.I.E., Retd. Comptroller and Auditor General of India, as a Director on our Board. I welcome him and I am sure his wide knowledge and administrative experience will be of great advantage to the Company.

I am glad to inform you that production of paper during the year under review was higher than last year by 172 tonnes. However, sales realisation was Rs. 119,30,299 as against Rs. 123,21,728 last year. As indicated in your Directors' Report, the slight fall in turnover was due to the manufacturing of large quantities of lower priced paper owing to inadequate supply of wood pulp due to import restrictions. In this connection, I wish to point out that with the installation of the Recausticising Unit there has been much improvement in the working conditions of the Soda Recovery Plant resulting in smooth operations in the Bamboo Pulp Plant and this has contributed to increased production and higer efficiency reducing production costs. It is this increased production and higher efficiency that has helped to maintain financial result about the same level as that of last year. Last year while telling you that the efforts of the Paper Industry to move the Government of India for a suitable revision of prices had not borne fruit, I expressed, the hope that the Government of India would view this question with sympathy. The Indian Paper Industry as a whole and more particularly the smaller and unfavourably situated Mills like ours which are working on progressively diminishing margins attach very great importance to the question of increase in the selling prices of paper to correspond with increased costs of labour, materials, chemicals and spare parts which have all risen steeply and continue to rise. I am glad to say that the Government of India have sanctioned an ad hoc increase of 6 nP. per kg. on all qualities of paper and boards for both Government and Civil supplies effective from 21st June, 1962 and have also discontinued the rebate of 4 nP. on reels. I should state this this small increase is not adequate in view of the mounting manufacturing costs. However, this slight enhancement will increase our turnover during the running year to some extent. I am grateful to Go-

vernment of India for their awareness to Industry's needs and I take this opportunity to impress on them the necessity for periodical revisions of prices so as to absorb such increases in costs over which the Industry has no control.

In regard to Balance-Sheet, I have to mention that provision has been made for depreciation on fixed assets calculated in accordance with the rates allowed for normal depreciation and extra shift allowances as per Income-tax Act, amounting to Rs. 6,67,750, Rs. 50,200; towards Development Rebate and a further sum of Rs. 50,000 towards Retirement Gratuity. A provision of Rs. 6,00,000 has been made towards taxation.

In regard to disposal of surplus, namely Rs. 672,432 including carry over of last year which stood at Rs. 36,664 your Directors have decided to transfer Rs. 87,500 to Dividend Equalisation Reserve, which fund now stands at Rs. 3,12,500. Further, your Directors, after a careful consideration of all relevant factors and having regard to the satisfactory working result, have recommended declaration of dividend at 15 per cent or Rs. 1-50 nP. subject to deduction of tax, on every Share of Rs. 10 each fully paid up for the year and proportionate dividend on partly paid up Shares of Rs. 2-50 each for the proportionate period subject to deduction of tax, absorbing Rs. 5,46,500, the balance being carried forward and I am confident these proposals will meet with your approval.

The Industrial Finance Corporation of India have communicated their approval to our declaration of 15 per cent dividend subject to tax in terms of the Agreement for which I am grateful to them.

I am very happy to inform you that the Labour-Management relations continue to be cordial. Your Directors have been pleased to sanction a bonus of four months' salary or wages to the Employees of the Mysore Paper Mills for the year ended 31-3-1962 and the same has been disbursed. Further, your Directors in accordance with their policy to provide all necessary amenities to our employees have taken steps to start a High School of our own to meet the growing needs of our Paper Town.

You will certainly be interested to hear the progress made since we met last in the implementation of the Expansion Scheme. It is a matter of gratification to me and to my colleagues on the Board and I have no doubt it will be to you also, that I am able to report that all agreements and arrangements with the Lending Institutions for financing the expansion scheme have been completed. In terms of the Agreement with the Commonwealth Development Finance Co., Ltd., London and the Industrial Credit and Investment Corporation of India Ltd., Bombay and the Industrial Finance Corporation of India, a Debenture Trust Deed has been executed and registered and the State Bank of Mysore have been appointed Trustees who will look after the interests of the three Lending Institutions.

Arrangements have been made to secure a complete range of equipments necessary to step up production to 18,000 tons. Contracts have been concluded with M/s. J. M. Voith, West Germany, original Suppliers of our Plant and Machinery for the supply of Pulp Plant with a capacity to produce 10,800 tons of Bamboo Pulp which together with the present capacity will be sufficient to feed all the three Paper Machines. Besides, contracts have been concluded with Messrs. Escher Wyss Ravensburg, Germany, a firm of International repute for supply of Paper Machine and Stock and Chemical Preparation Plant with a capacity to manufacture 35/40 tonnes of paper per day of 24 hours. Likewise, contracts have been entered into with the well known firms of Messrs. Millspaugh, Sheffield, England, for supply of Modern Stock-Makers, with Messrs. Babcock & Wilcox, London, for supply of Boiler and Black Liquor Recovery Unit, with Messrs. Ernest Scott and Co., Laven-Fife, Scotland, for supply of Standard Vacuum Evaporators, with Messrs. Masson Scott and Co., Ltd., London, for supply of Duplex Super Cutter and with Messrs. Dorr Oliver Co. Ltd., Surrey, for Save-all Filter. The value of the orders placed in U.K. is to the tune of Rs. 58 lakhs and in Germany to the tune of Rs. 66 lakhs and the two loans from CDFC and ICICI would provide the necessary funds for these purchases. Of the equipments ordered, the first shipment of Coal Fired Boiler has already reached the Mills' site and part of Soda Recovery Plant and Oil Fired Boiler are on their way from Madras Harbour to Bhadravati. The bulk of the remaining equipments is scheduled to reach the Mills at Bhadravati by about June-July 1963. The Civil Engineering works at the Mills are making satisfactory progress.

It is hoped that the work of erection and installation would be completed by the end of 1963 and operations commenced. In August this year I and our General Manager, Sri B. K. Swamy visited U.K. and Germany for purposes of clarifying and settling certain outstanding matters with CDFC arranging advance delivery of certain equipment from Germany and to check up drawings and designs of the Plant and Machinery with a view to ensure that they answered our local requirements. I am happy to say that all outstanding matters have been settled with he CDFC. Messrs. J. M. Voiths of Germany have agreed to advance the date of delivery of Pulp Plant. We visited several of the Workshops in U.K. and Germany, where our Plant and Machinery are being manufactured and were happy to see that the work was progressing satisfactorily.

As you are aware, last year with the consent of the Controller of Capital issues, Government of India New Delhi, 10 lakhs Equity Shares of Rs. 10 each attaching a premium of Rs. 2 per share were offered to the existing shareholders and I am glad to acknowledge that the response was good. At the time of seeking your Approval to the increase of authorised capital to Rs. 1 crore and 50 lakhs, I informed you that the amount would be collected as and when necessity for funds arose. In October last, we have collected a sum of Rs. 3 (being the application and allotment money and part of premium) and further calls will be made in the next few months, having regard to the expenditure to be incurred in the implementation of the expansion scheme I have proposed to fix the dates of the next calls well ahead and publish the same to enable shareholders to arrange for payment as and when the calls fall due. I hope you will agree with me that ample time is being given to the shareholders to make payments without undue strain or stress.

A sum of Rs. 1,500 has been contributed towards the Chief Minister's Flood Relief Fund and I hope you will appreciate and approve the same.

On behalf of the Company, I should express my grateful thanks to the Government of India and the Government of Mysore for their abiding interest in the progress of the Company. On behalf of the Company, I should also express my grateful thanks to the Board of Directors of the CDFC, London, ICICI, Bombay and IFCI, New Delhi, the State Bank of Mysore, and the Canara Banking Corporation Limited, for having rendered valuable aid and assistance in making satisfactory arrangements for financing the scheme of expansion.

I am grateful to my colleagues on the Board for the uniform courtesy, consideration and valuable guidance I have been receiving. I wish also to express on behalf of the Directors and myself our warm appreciation of the willing and efficient co-operation of our employees.

Last, but not the least, it is my pleasant duty to thank you all for your support and encouragement in the implementation of the Scheme of Expansion, and I look forward with confidence for a full measure of support in the years to come.

Ladies and Gentlemen, I now move that the Director's Report and the Audited Balance Sheet and the Profit and Loss Account for the year ended 31-3-1962 be APPROVED AND ADOPTED.

N.B.: This does not purport to be a Report of the Proceedings of the Shareholders' Meeting, a copy of which will be sent to the shareholders separately.

PARRYS CONFECTIONERY LIMITED

Eighth Annual General Meeting

MR. H. V. R. IENGAR'S REVIEW

Presiding over the Eighth Annual General Meeting of the Shareholders of the Company held on the 29th September 1962, Mr H. V. R. Iengar, Chairman, said:

I am this year taking the step of having the speech from the Chair printed and sent with the Accounts. I hope shareholders will agree that this is a useful innovation.

My first duty is to record my profound regret that this, the First Annual General Meeting of the Company over which I shall preside, should be without the presence of the previous Chairman, Mr. C. R. Srinivasan, B.A., who passed away on 29th January, 1962.

It is also my unfortunate duty to record the death on 24th November, 1961, of Mr. H. I. Wonfor, C.B.E., F.C.A., who was a Director of this Company since its inception.

Both Mr. C. R. Srinivasan and Mr. H. I. Wonfor played a vital part in the development of the Company and in pioneering many new ideas introduced over the years.

As some of you may be aware, Mr. P. Hadfield retired from active service in India earlier this year for permanent residence in the U.K. following upon which he requested the Board to accept his resignation as Director of the Company from such date as may be convenient to the Board.

Your Directors have accepted Mr. P. Hadfield's resignation from the Board with effect from the 15th September, 1962, and I am sure you will join me in recording our thanks to Mr. P. Hadfield for the valuable service which he rendered to the Company during his tenure of office as a Director from 9th July, 1959.

In connection with the Accounts, the points of greatest interest to shareholders are probably the Rights Issue during the year and the very recent bonus issue. The result of the Rights Issue was to increase the Issued Share Capital to Rs. 15 lakhs, and, in addition, the premium on the Rights Shares brought in a further Rs. 5 lakhs which has been shown as a reserve under the heading of Share Premium Account. At the Directors' Meeting held on 17th August, 1962 it was decided that the Share Premium Account should be utilised for issuing bonus shares in the ratio of the bonus share for every existing three shares held.

The interim dividend paid for the year was at the rate of 10 per cent on the Share Capital of Rs. 15 lakhs while the final dividend, which will be proposed later at this Meeting, will be payable on the increased share capital of Rs. 20 lakhs. You will see that the total quantum of dividend proposed for the year is larger than in the previous year.

The net profit after taxation, which includes the provision of Rs. 62,500 for Super Tax on the bonus shares, stands at Rs. 5.25 lakhs as compared with last year's figure of Rs. 5.80 lakhs. From this profit and the "brought forward" of Rs. 1,81,361, appropriations have been made or are proposed totalling Rs. 5.50 lakhs. This figure includes an amount of Rs. 50,000 placed to General Reserve and Rs. 30,000 transferred to the Development Rebate Reserve. The carry forward to next year stands at Rs. 1,56,302.

The operations of the Company during the year under review were satisfactory. You will have noted from the Report of the Directors that the sales turnover of Rs. 1.34 crores constituted a new record, the increase over the previous year being 14 per cent in value as well as volume. A noteworthy feature is that approximately 50 per cent of the increase in sales occurred in North India. Considering that this is an area away from what has been traditionally considered to be our normal area of operations, this is an encouraging sign and augurs well for the future.

Yet another encouraging feature of the sales in the year under review is the increased volume achieved from sales of wrapped varieties. In consonance with the steady rise in the living standards of the people, there is undoubtedly more discriminative buying on the part of consumers who attach increasing importance to hygienic packing and quality, and our progress is in keeping with this development.

During the year, supply of sugar continued to be easier and it was available at lower prices than previously. However, costs of other raw materials, notably items for which we still depend on imports have been rising with the consequence that we have been forced to make some price increases. I see no prospect in the near future of prices of raw materials coming down. On the other hand, the position has since worsened as, from the beginning of the current financial year, the price of sugar has substantially moved up and new tax levies have added to the cost of tin containers and packing materials. Owing to the rise in price of sugar alone, our costs of production this year will increase by over Rs. 1 lakh. Due to the additional tax levies on tin and aluminium foil, our packing costs will go up by approximately Rs. 0.5 lakhs. In addition, our wage bill will raise by Rs. 0.5 lakhs. Against this background of rising costs, it becomes specially important that we achieve, higher turnover and, whenever possible, operating economies.

In response to the Government's call to step up exports to augment the country's foreign exchange earnings, your Company is intensifying its efforts in this direction and will naturally do everything possible to co-operate with Government.

While the Industry is grateful to Government for the incentives afforded for export promotion by way of rebates of Excise and Customs duties, it is pertinent to observe that even with these incentives the net prices

which can be realised from exports are so low that the resultant loss is still too heavy a burden for the Industry to bear. It is therefore necessary to ask for further measures of assistance. The Industry is aware that Government have been considering supply of sugar at the international price for manufacture of confectionery for exports, and an early decision on this question will be welcome. Apart from the question of price, the quality of sweets offered for export must stand comparison with those offered by other exporting countries and we have therefore to keep pace with refinements in manufacture, using up-to-date machinery. Owing to the difficult foreign exchange situation obtaining over the last few years, the Industry has been facing difficulties in importing machinery required for replacement and rehabilitation. I would urge the authorities to view this problem with sympathy and, if necessary, link the import of machinery, with exports, fixing a reasonable ratio between the two.

During the year under review our relations with staff and labour have been most cordial and I take this opportunity to record our sincere appreciation of the excellent work done by them.

The Report and Accounts for the year ended 31st March, 1962, were unanimously adopted and a final dividend for that year at the rate of 16 per cent, subject to deduction of tax, on the Company's Ordinary Share Capital (as increased by the Bonus Issue made on 17th August, 1962), was declared payable on the 29th September, 1962.

The retiring Directors, Messrs. H. V. R. Iengar, M. J. Edwards and G. N. Noel-Tod, were re-elected and the retiring Auditors, Messrs. Lovelock & Lewes, were re-appointed.

N.B.: This does not purport to be a report of the proceedings of the General Meeting.

THE JAY ENGINEERING WORKS LIMITED

SELLING PRICE POLICY MAINTAINED

SUBSIDIARY MANUFACTURING UNITS ABROAD

MR. CHARAT RAM STRESSES EXPORT NEEDS

Speech delivered by Lala Charat Ram, Chairman, at the 25th Annual General Meeting of Shareholders on 27th September, 1962

Gentlemen,

I have great pleasure in welcoming you to the Twenty-Fifth Annual General Meeting of the Company.

At the last meeting I had deputized for my father, Sir Shri Ram ji, on account of his indisposition. Sir Shri Ram Ji has continued to guide the affairs of the Company so far inspite of keeping indifferent health for sometime now, and he has now requested the Board to relieve him of the responsibilities of the Chairman's position; he has however assured us all, if an assurance were at all needed, that he will continue to be a part of us all, remain on the Board of the Company and guide our steps as heretofore. It is a solemn occasion for me, and one of no little apprehension at stepping into shoes that had hereto been filled by such an eminent personage. In all humility I pray for being able to serve this Company well, which is so near to Sir Shri Ramji's heart.

During the year, your Company—as indeed the whole of India—lost its great friend, Dr. B. C. Roy. Dr. Roy's services to West Bengal and particularly to its Industry—need no repetition. Your Company had the privilege of his special patronage and we feel his loss greatly.

The Annual Report of the Company for the year ended March 1962 has been with you for some time now; with your permission I shall take it as read. As usual, there have been some areas of gains, and some other areas which must cause us all concern. I would like to highlight some of these here.

HIGHER PROFITS

The gross profit has been marginally higher at Rs. 91 lakhs as against 88 lakhs last year. This profit however is on increased capital and reflects a lower capital productivity i.e. return on the capital employed. The decline is explainable somewhat by increasing investments in our Hyderabad factory, which will necessarily take some more time before it begins to contribute to the profits of the Company. The profits were also affected by frequent power shedding in Calcutta, increased excise levies on copper, winding wires and special steels, considerably higher transport charges on coke on account of rail transport not being available, and very much higher price paid for America silicon sheets due to restricted import licensing from other countries. The incidence of actual cost due to these causes has been considerable. Your Company however has refrained from increasing the prices of its finished products, in keeping with its traditional policy of avoiding increases in selling prices so far as is at all possible.

The equity dividend proposed to be disbursed this year amounts to Rs. 22.8 lakhs against Rs. 18.4 lakhs last year, being 15 per cent this year on enlarged share capital as against 17.15 per cent last year on smaller capital. In the face of continuous increase in costs, which are beyond the management's scope of control, it is requiring all the management effort in keeping down costs by expansion of production and reduction of expenditure. We launching this year on a plan of economies in all directions, and it is hoped that with this effort, and the contribution which the Hyderabad unit might make, profitability will show improvement.

Increases in production have been less this year than previously. Whereas the rate of expansion necessarily slows down as higher levels of output are achieved, nonetheless the production would certainly have been better, but for the dislocation caused by frequent power shedding in Calcutta.

EXPORTS: A BUSINESS PHILOSOPHY

Exports have been for your Company a matter of social and business philosophy and our efforts have been continuing for an expanding organisation to meet the targets of higher export figures. I referred last year to the proposal for the setting up of foreign subsidiaries as a part of our export promotion drive. Your Company has now started the manufacture of sewing machines in Ceylon in collaboration with the people of that country. Authorisation has also been obtained for starting a manufacturing unit in Burma. There has been an unfortunate decline in exports from Rs. 113 lakhs to Rs. 91 lakhs in the preceding year; the fall is accounted for by the import restrictions imposed by the Governments of Yugoslavia, Burma, Ceylon and Egypt, resulting in a decline of Rs. 33 lakhs, from Rs. 52 lakhs to Rs. 19 lakhs. On the other hand, our exports to industrially developed countries such as USA, Germany, UK and others are increasing.

The matter of rising cost of manufacture is one of great alarm. Criticism is voiced, and rightly too, against increase in selling prices of goods, and the steady inching up of living costs. But if manufacturing costs continue to mount up, they must sooner or later be reflected in increased selling prices. It would appear however that those people who represent against this trend, pay only lip sympathy to the cause. Organised labour which represents an important mass of consumer group, ceaselessly strives in the factory for higher remuneration in one form or the other, while agitating in the market place for lower prices—a contradiction in terms. Governmental authorities wish to keep prices down, as any good Government must, and yet as a consequence of one or the other imposts, costs of transport,materials, power etc. keep on going up. Management personnel have an important role to play in this area; without implying that the material efficiency in Indian industry is not capable of improvement, the fact needs to be faced that tirading against industry as distinct from trade may meet political objectives, but will not provide solutions to the problem. To the extent that the ratio of return on capital in an industry shows a decline in the face of increasing production, it is a demonstration of the fact that the management has not increased its selling prices to match rising costs. The matter however is much too serious to permit of mutual mud-slinging; it is a matter of joint responsibility of the management personnel in industry, its operating personnel in plants and offices, and of the Government. Each of these groups needs to work whole-heartedly in their own areas of responsibility for keeping unit costs down. This matter of keeping unit costs low is of vital importance for our export trade, for it is on our export earnings that our very future hangs. I am glad to be able to report to you, as I have said earlier, that in the face of rising costs, your Company has refrained from any increases in the selling prices of its sewing machines and fans.

TRADE IN SAFE HANDS

It is heartening to note that the Prime Minister has thought it fit to give the portfolio of International Trade in the Union Government in the very energetic hands of Shri Manubhai Shah. However, apart from some assistance in the shape of elimination of bottle-necks, which the Government might render, I consider that it is in the enlightened self-interest of Indian industry itself that it realises the absolute importance of self-reliance and maximum individual export effort. Every one must be aware of the country's very difficult foreign exchange situation and its impact on the country's economic plans. If the retardation in the growth of our economy continues to take place, as has been evident from several recent studies, this would necessarily have an impact on employment opportunities. In this context I may briefly state here what may be termed as "the economics of export", in the light I understand it. It is only a truism that the cost structure for most of our country's products is higher than in other countries. It is also correct that management personnel and operating personnel owe a duty towards a constant reduction in cost, and I hope that we are all attempting to work towards this objective. However it would be unrealistic to wait for working aggresively for exports till such time as our costs become comparable to those of other countries. The selling prices in export markets bear little relationship to the costs of manufacture, even as they do not in the domestic market, and exports will need to be done only at competitive prices ,and very often at prices below costs. Almost all countries follow a dual price policy, there being a much lower price for the export market than for the domestic market, the former being subsidised by the consumer in the domestic market. The incidence of all export loss has to be borne by the home consumer through increases in domestic prices; there is no escape from this situation. However, the incidence of loss on exports is not as frightening as it is made out to be very often. For the loss of every rupee in export, about half is contributed by the Government by way of loss in taxes, partly it is borne by the workers in the shape of reduction in bonus; partly by the management in the shape of reduced remuneration; and partly by the shareholders in the shape of reduced dividends. The consumer shares his bit by marginal increases in the domestic selling prices: If we also consider the reduction in costs, which higher output on account of export leads to, the loss to any Company in its net retained profits would be negligible indeed. Let me repeat that export effort is necessary now as a patriotic effort for national development, irrespective of short term, real or imaginary self interest.

But export sales need, not only patriotism, but a good marketing organisation. As one of the major exporters in the engineering group of industries, it might be of some interest, if I was to give a brief account of the export marketing experience of your Company. All sales of your Company are now handled through a separate marketing company which was set up a few years ago. This was done with the conscious knowledge that the manufacturing activities had grown to such large proportions, that for the satisfactory marketing of these goods, an independent organisation, free from the problems of factory and production, was needed. This step, taken initially with some apprehension, has been fully justified by subsequent results. In fact it will be correct to state that the high rates of output being achieved by the factory might not have been possible without a distinct marketing organisation, planned for selling all the output. This marketing Company makes a constant study of the market potential in India and abroad, and keeps a constant watch on the designs, quality and prices of our competititors' products in the foreign markets. Every year, export targets are set for each country, and the achievement of these targets becomes the responsibility of the sales organisation personnel as a whole. More often than not, we have been able to meet and even surpass these goals. The proper location and expansion of distribution channels is extremely important for any marketing activity. We have distributors located strategically in various parts of the world. The Annual Report which is in your hands gives a list of the 40 odd countries, where the products of your Company are distributed. Basically there are two alternatives available for the development of distribution in the foreign markets, i.e. either to establish a foreign branch of the Company or to appoint local distributors; the choice ultimately depends partly upon the extent of the market and partly the extent to which we have resources for running a departmental distribution system in a foreign country. However, there is no doubt that a branch of the Company is in almost all cases far more effective than local distributionship. The combination of these two exists however in the sense that while work of physical distribution is the responsibility of local people, the sales promotion effort is largely planned and directed by our own representatives.

STRESS ON QUALITY

The development of distribution channels is only a part of the big effort needed for the promotion of exports. Unflagging heed to quality maintenance is a must for any exporter of engineering goods. Traditionally the Indian producer has not been as quality-minded as is needed. Japan has made a remarkable recovery in

this matter in the post-war era. Its exports have increased in the last 10 years by 300 per cent to the staggering figure of over Rs. 2,500 crores per year, as against our annual rate of only Rs. 650 crores. This increase is largely due to the comparable if not better quality goods that Japan now offers at highly competitive prices. These handicaps however are bound to wear off as we gain experience and your Company is meeting the challenge of quality and design constantly in a fast changing world market.

Yet another matter which an exporter has now to pay increasing attention to, is one of credit extension. This involves the raising of funds, and of covering the inherent risks involved in bad debts. Unfortunately refinancing facilities for exporters are still inadequate in India. In this connection the however in the sense that while work of physical distribution is the responsibility of local people, the sales promotion effort is largely planned and directed by our own representatives.

The development of distribution channels is only a part of the big effort needed for the promotion of exports. Unflagging heed to quality maintenance is a must for any exporter of engineering goods. Traditionally the Indian producer has not been as quality-minded as is needed. Japan has made a remarkable recovery in this matter in the post-war era. Its exports have increased in the last 10 years by 300 per cent to the staggering figure of over Rs. 2,500 crores per year, as against our annual rate of only Rs. 650 crores. This increase is largely due to the comparable if not better quality goods that Japan now offers at highly competitive prcies. These handicaps however are bound to wear off as we gain experience and your Company is meeting the challenge of quality and design constantly in a fast changing world market.

CREDIT EXTENSION

Yet another matter which an exporter has now to pay increasing attention to , is one of credit extension. This involves the raising of funds, and of covering the inherent risks involved in bad debts. Unfortunately refinancing facilities for exporters are still inadequate in India. In this connection the Mathrani Study Group recommendation for the establishment of an Indian Export-Import Bank is most welcome. The risk of bad debts is now somewhat covered by the Export Risks Insurance Corporation. It is however necessary to liberalise the terms of insurance on the basis that a little more than reasonable risk is worth taking if the real objective of export insurance is to be attained.

The provision of "technical service-after-sales" is of imperative importance in the marketing of engineering goods. This applies not only to industrial products, but also to consumer products such as Sewing Machines and Facts. Unless adequate servicing arrangements go hand in hand with sales arrangements, the export venture is likely to end in distress. We have always assigned the highest importance to this aspect and the success that we have had in exports is attributable in no small measure to emphasis on this matter.

Finally I would refer to an aspect of export sales which is abstract rather than tangible, but none the less significant. It is the "image" that the exporter creates in the foreign market. Business has always to be responsive to community needs in any area; it becomes much more important when doing business in a foreign country. The newcomer is always suspect, and a natural impression is created that he is there for his own ends, at the expense of the receiving country. The exporter has to create confidence, to generate a feeling of community of interest and to establish himself not as a self-seeker but as one who is there to contribute to the welfare of the society in which he is operating. This aspect can present considerable difficulties and much unintended offence can be caused. We have attempted always to pay great attention to local susceptibilities, and to create an image of "USHA" which evokes respect and comaraderie. This has helped us a great deal.

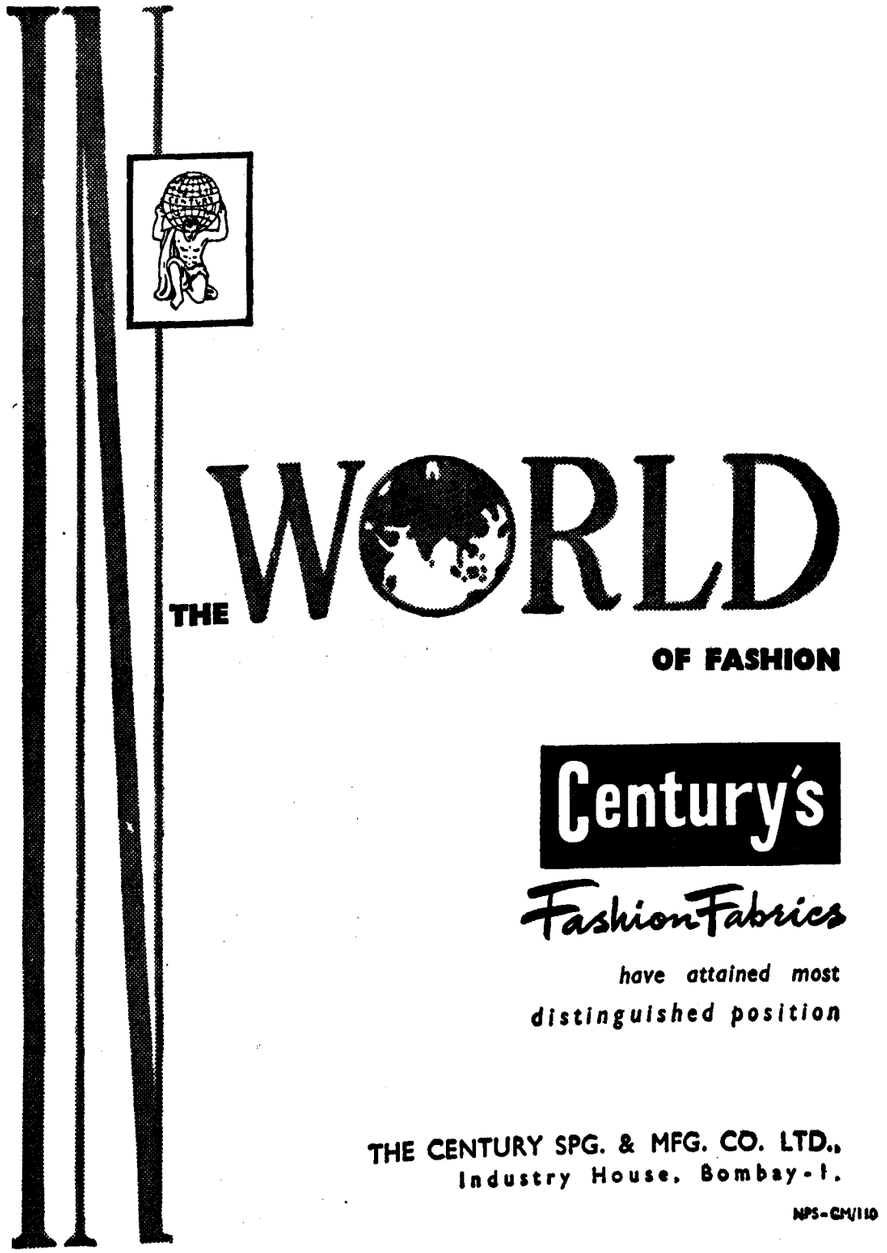
I am sorry that I have taken so much of your time in attempting to place before you some of the points that our Company emphasizes in developing the export business; basically there is nothing new in any of these points yet this has been done in the hope that it may possibly provide some guidance to the willing and young exporter of this country. I believe that such pooling of experience will be of great advantage to the country's export trade.

In closing, I wish to briefly say a few words on my understanding of the real difficulty in the way of exports and what is needed to be done about it. I believe that in the existing economic situation in our country, there is scarcely any alternative to a programme of mandatory exports. Incentives and persuasion have been tried for many years now, but with disappointing results. The vast increase in volume and spread of purchasing power makes this country of 400 million people a fabulous market for any producer. It would be a foolish producer who would seek out difficult markets and at a loss. Banking on patriotism is in my opinion banking on a weak staff. Many arguments are placed against mandatory exports; however the opponents of this scheme are not able to place any positive alternative scheme of expansion of exports. There is no objection in trying for some more time the instrument of persuasion, but I hope that ideological opposition will not be permitted to come in the way of expansion of export earnings for much longer; our country cannot afford the time. This, however, is my own personal view and I would be very happy to see myself proved wrong.

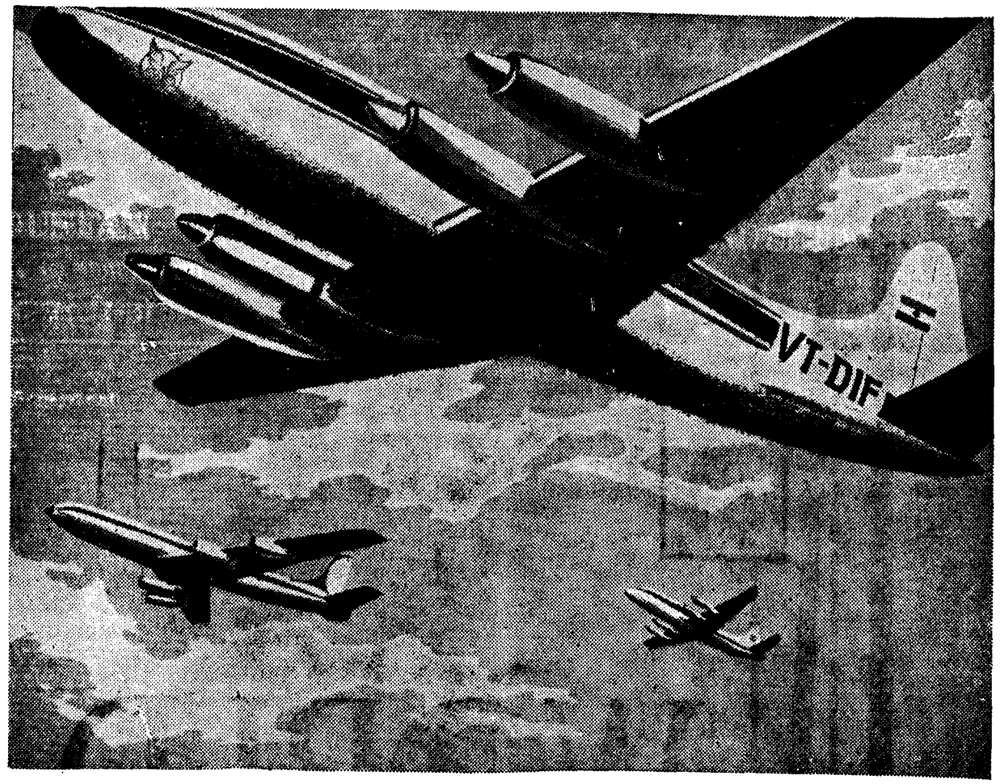
I thank you for the patience with which you have heard me. I am very proud of this opportunity of addressing you today, and I hope that the operations of the Company in the year have been a matter of general satisfaction to you.

Thank you.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.



INDUSTRIAL FINANCE CORPORATION OF INDIA



Speech delivered by Shri K. P. Mathrani, I.C.S., Chairman, at the Fourteenth Annual General Meeting of the Corporat ion held on 28th September, 1962

Gentlemen,

I have great pleasure in welcoming you and placing before you the Fourteenth Annual Report of the Board of Directors and the Accounts for the year ended the 30th June, 1962. The printed copies of the report have been circulated to all the shareholders and I shall, with your permission, take them as read.

2. The year under report almost coincides with the first year of the third Five-Year Plan. As the lending policies of your Corporation are closely integrated with the country's Five-Year Plans, we have, as in the past, made during the year under review, a useful contribution towards the successful implementation of the objectives of the Plan viz. to create conditions for the maximum production and employment and the develop-

IAC-1445-B

ment of human resources. Your Corporation has, during the year, sanctioned loans of the order of Rs. 24.45 crores and has disbursed loans of the value of Rs. 10.78 crores. These are the highest figures for loans sanctioned as also disbursed in any single year of the working of the Corporation and thus constitute fresh landmarks in the history of the Corporation.

3. The year under review has been another successful year in the life of the Corporation. Our gross income during the year was Rs. 3.04 crores which is the highest figure reached so far and shows an increase of Rs. 5.32 lakhs over that of the previous year. This has been achieved in spite of the fact that the income of the preceding year included a profit of Rs. 22.62 lakhs realised by the Corporation on the sale of its investments, a factor which did not operate during the current year as no investment were sold by us during the year. Our gross profit, subject to provision for taxation, was Rs. 130.71 lakhs as against Rs. 139.35 lakhs for the previous year. If the profit on the sale of investments is excluded, the profit for the year under review is higher by Rs. 13.98 lakhs than that for the preceding year. The Corporation has also had to make a larger provision for taxation as a result of the increase in the rate of income-tax from 45 per cent to 50 per cent in the current year.

4. As the shareholders are no doubt aware the Government of India had, during the first eight years of the career of the Corporation, to make subvention of the order of Rs. 53.45 lakhs to enable the Corporation to pay the minimum guaranteed dividend of 2¾ per cent per annum on its share capital of Rs. 5.00 crores. With the progressive improvements in our working results, we have repaid so far a sum of Rs. 35.45 lakhs during the last four years and the balance of subvention outstanding at present is Rs. 18 lakhs. We have decided to repay this amount from the profits of the year under review and thus liquidate finally the Corporation's liability in this behalf—a step which I have no doubt will receive the whole-hearted support of the shareholders. With the discharge of this statutory liability, the Corporation may now claim to have come of age—as an institution depending more and more on its own strength in its task of promoting the industrial development of the Country.

5. I had mentioned in my speech at the last Annual General Meeting that in the Finance Act, 1961, the Government of India had made an amendment to the Income-tax Act, which gave a relief to the financial corporations approved by Government by enabling them to claim a rebate in income-tax in respect of the amounts, not exceeding 10 per cent of the total income of each year, transferred by them to a Special Reserve Fund. I am glad to say that the Central Government have approved the Corporation for the purpose of availing itself of the benefit of this rebate from the year ended the 30th June, 1960. As required under Section 36(1) (viii) of the Income-tax Act, 1961, we have created a Special Reserve Fund and have transferred a sum of Rs. 24.82 lakhs to this account in respect of the accounting years ended the 30th June, 1960 and 1961 from our General Reserve Fund. Out of the current year's profits, we have transferred a sum of Rs. 13.21 lakhs to this Fund in order to qualify for the maximum admissible rebate in income-tax. The total amount thus transferred to this Special Reserve Fund amounts to Rs. 38.03 lakhs. As a result of these transfers, we have secured a relief to the extent of Rs. 11.84 lakhs in our income-tax assessments for the accounting years 1959-60 and 1960-61. We expect to get a rebate of Rs. 6.60 lakhs in respect of the year under report.

6. A review of our loan accounts has shown a further improvement in the position regarding bad and doubtful debts. It is a matter of gratification that not only have there been no accretions to bad debts but on the other hand some of our loan accounts, in regard to which we were anticipating shortfalls, have been fully liquidated and the rest are in the process of being cleared. No additional provision was, therefore, considered necessary by your directors towards the Reserve for Bad and Doubtful debts, the balance in which now stands at Rs. 14.47 lakhs.

7. As a result of our underwriting operations both in respect of preference and equity shares, our investment portfolio has been slowly enlarging and we held, at the end of the year, investments of the paid-up value of Rs. 106.44 lakhs. A majority of the shares held by the Corporation are redeemable cumulative preference shares carrying fixed rates of dividend. The share issues have been underwritten by the Corporation as a part of its promotional activities and the role of the Corporation has been that of a catalytic agent rather than as an investor. We have, however, as a measure of caution, transferred a sum of Rs. 2.00 lakhs to the Reserve for Depreciation on Investments.

8. We have transferred a sum of Rs. 26 lakhs out of the net profits for the year under review to the General Reserve Fund which now stands at Rs. 134.08 lakhs. Our Special Reserve Fund under Section 32-A, to which are credited all the dividends on the shares of the Corporation held by the Central Government and the Reserve Bank of India, now stands at Rs. 41.05 lakhs. The total of the balances now standing in General Reserve, the Special Reserve Funds and other Reserves comes to Rs. 230.63 lakhs, which may be regarded as a creditable performance.

9. I had mentioned at the last Annual General Meeting that the Board of Directors of the Corporation had under their consideration the issue of further share capital to the extent of Rs. 2 crores carrying a minimum guaranteed dividend of 4 per cent per annum, for which the approval of the Central Government had been obtained. We entered the market in March this year and I am glad to say that the issue was a success and in fact the quota reserved for the institutional investors, including the co-operative banks, was over-subscribed. On behalf of the Board of Directors and myself I should like to thank you all for your response to this issue and to welcome to our fold those investors who have subscribed to our shares for the first time. The dividend on our shares has, in view of the restriction contained in Section 31(2) of the I.F.C. Act, to be limited to the minimum guaranteed by the Central Government viz. 4 per cent per annum in respect of the recent issue of Rs. 2 crores and 2¾ per cent per annum in respect of the original issue of Rs. 5 crores. I am aware of the feeling of our shareholders in regard to the dividend in respect of our first issue. An alteration of this position, however, requires an amendment to the I.F.C. Act which is under the active consideration of the Government of India. We have set aside a sum of Rs. 13.68 lacs for the payment of the guaranteed dividend to our shareholders for the year under report. The dividend in respect of the second issue is, in accordance with the terms of the issue, payable from the 12th March, 1962, i.e. the date when the issue was launched on the market.

10. The Corporation received during the year 59 loan applications for an aggregate amount of Rs. 31.40 crores as against 76 applications for an aggregate amount of Rs. 36.86 crores received in the preceding year. The fall in the number of applications could be attributed partly to the restrictions on the import of plant and machinery on deferred payment terms and also the curtailment of the grant of industrial licences, for the establishment of new sugar factories. Moreover, during the recent months we have been advising the parties coming to us for assistance to obtain, as far as practicable, the various statutory permits and clearances such as those relating the grant of industrial licences, the permission of the Capital Goods Committee and the

Foreign Agreements Committee and the consent of the Controller of Capital Issues before making a formal application to us. This may also partially responsible for a fall in the number of applications. But you will appreciate that the revised procedure saves a good deal of infructuous or avoidable labour on the part of our beneficiaries and substantially shortens the period during which applications have to be kept pending. It would, therefore, be of advantage all round in the long run. However, during the intervening period we continue to have informal discussions with them in order to enable them to submit to us their applications in as complete a form as practicable.

11. Out of the total loans of Rs. 130.27 crores approved by the Corporation during the last 14 years, loans aggregating Rs. 24.09 crores were either declined by the applicant concerns or were not made available to them for various reasons, and loans amounting to Rs. 7.86 crores were pending approval of the Government of India or the AID. The firm commitments of the Corporation for the grant of loans thus aggregate Rs. 98.32 crores, out of which a sum of Rs. 68.14 crores i.e. about 70 per cent of the commitments, was disbursed. These results may be regarded as satisfactory and have been achieved as a result of the various measures which the Corporation has taken from time to time to expedite the attendant formalities on the part of the Corporation prior to the disbursement of the loans. In order to meet the immediate requirements of our borrower concerns, we also continue to grant interim loans in cases where a prima facie valid title to their properties has been established, and during the year, we disbursed interim loans to the tune of Rs. 5.73 crores.

12. While the loans in rupee will constitute the bulk of our lending operations, the Corporation has also, since last year, been sanctioning sub-loans in foreign currencies. The first dollar loan of 10 million dollars (Rs. 4.76 crores) obtained from the D.L.F. (now merged in A.I.D.) was completely committed early this year. I am glad to say that we have received a second loan of 20 million dollars (Rs. 9.52 crores) from the A.I.D. and a formal agreement in this behalf was executed in June 1962. A sum of 4.8 million dollars (Rs. 2.29 crores) has already been committed from the second loan and I believe that the balance of the loan will be put to fruitful use in not too distant future. As the first dollar loan was largely and the second dollar loan is completely tied to purchases in the United States it has been our endeavour to obtain in addition lines of credit from other countries. These efforts have now borne some fruit and we have been sanctioned a line of credit in the West German Currency to the extent of 15 million D.M. (Rs. 1.79 crores) from Kreditanstalt ful Wiederaufbau Frankfurt | Main (German Bank for Reconstruction) out of which a sum of 1.92 million D.M. (Rs. 22.86 lacs) has already been committed in the form of sub-loans. I may add that there are indications that an additional loan in the same currency will be available to the Corporation in the near future. The Government of India have also further decided to make an allocation to the Corporation of the Yen equivalent of a sum of 2 million U.S. dollars from the Yen available with them. Lastly we have recently been informed of the sanction to I.F.C. of a line of equipment credit in French currency to the extent of 50 million new francs (Rs. 5 crores) through a French commercial bank and the terms and conditions of the credit are now in the process of negotiation. These you will agree, are welcome developments as they will go to meet, though to a limited extent, the needs of our borrower concerns in respect of foreign currencies. In view, however, of the fact that except for the West German loan, these credits are tied to purchases in those countries, the need for a more substantial line of credit in convertible currency for meeting the foreign exchange requirements of industries in the private sector is obvious.

13. Coming to our loan operations the sugar industry continues to lead the list of loans approved by the Corporation. During the year, we sanctioned loans of the order of Rs. 7.52 crores to 13 sugar mills of which there were 12 sugar co-operatives. This brings the total amount of loans approved to Rs. 30.4 crores to sugar co-operatives numbering 45 which are distributed all over the country. Besides, the Corporation has sanctioned loans of the order of Rs. 1.02 crores to three co-operative spinning units and one co-operative unit for the manufacture of vegetable oils. The loans approved by the Corporation to co-operative units represent 24.1 per cent of the total loans approved, and is indicative of the high priority given by the Corporation to the development of the co-operative sector. These co-operatives, I am glad to say, have, by and large, shown satisfactory working results.

14. Chemical industry to whom loans aggregating Rs. 6.28 crores were sanctioned during the year has, for the first time, occupied the second place while the third place is taken by the electric machinery manufacturing industry to whom loans of the value of Rs. 3.14 crores were sanctioned. For the first time, the Corporation has sanctioned to a concern in Mahe in Pondicherry for setting up a textile mill a loan of Rs. 35 lacs in addition to a guarantee for deferred payments to the extent of Rs. 5.62 lacs. The Corporation has also for the first time sanctioned a loan of Rs. 1.09 crores to a concern engaged in the production of industrial and medical gases.

15. For sometime past the problem of modernisation and expansion of the coal mining industry in the private sector has been engaging the attention of the Central Government which has been sanctioned a loan of 35 million dollars by the World Bank for the import of coal mining equipment and spares in order to achieve this purpose. The coal mining projects to be financed out of this credit have been examined by high level screening committees set up by the Government of India, with which our Corporation has been associated. While the foreign exchange requirements of these projects would be met out of the World Bank credit, the rupee finance has to be arranged by the undertakings concerned either from their own resources or through the various institutional channels. In view of the vital nature of this industry in the present context, the Corporation has agreed to assist in this direction and has so far sanctioned loans to 3 such concerns of an aggregate amount of Rs. 82 lacs.

16. Although our approach to underwriting has been somewhat cautious, we are continuing to enlarge our activity in this field in order to meet the increasing requests of our clients. In view, however, of the fact that in most of these cases Corporation has sanctioned loans for substantial amounts, the underwriting commitments of the Corporation in respect of such concerns are generally of a token nature. During the year, we had approved 11 proposals for underwriting facilities to the extent of Rs. 62 lacs in equity shares and Rs. 10.5 lacs in preference shares. The applications approved cover a wide range of industries such as pottery, china and earthen-ware, basic industrial chemicals and fertilisers, textiles, metal products, electrical and other machinery, paper and mining. Since December, 1956 when the Corporation started underwriting business, we have underwritten 18 issues of capital for an aggregate amount of Rs. 4.92 crores. As a result of amendments to the I.F.C. Act in December, 1960, the Corporation has also been authorised to subscribe directly to the stocks and shares of industrial concerns. Having regard to the experience gained by the Corporation in the field of underwriting in the past few years, it is expected that the Corporation will be able to make a fruitful contribution in this direction.

17. There was a reduction in the requests for guarantees of deferred payment arrangements owing to the restrictive policy of Government in this behalf. We approved three applications for such guarantees of the value of Rs. 43.61 lacs during the year, bringing the total value of guarantees approved by the Corporation to Rs. 27.6 crores.

18. The periodical inspections carried out by us and the progress reports received from our borrower concerns have shown that many of them earned sizable profits and 37 such concerns have, during the year, declared, with our prior approval, dividend in excess of 8 per cent. There has been a further reduction in defaults in the payment of interest by our loanee concerns. The percentage of defaults in the repayment of principal has declined from 2.34 in 1960-61 to 1.24 in 1961-62 while in regard to interest it has come down from 0.25 to 0.18.

19. The resources position of the Corporation continued to be comfortable during the year. The capital outgoings in rupees amounted to Rs. 10.78 crores (inclusive of investments in shares to the extent of Rs. 26 lacs). We met these commitments from the proceeds of the further issue of share capital of Rs. 2 crores and borrowings from the Government of India to the extent of Rs. 4½ crores in addition to our own internal resources of the order of Rs. 4.28 crores inclusive of the repayments of loans due to the Corporation. We did not therefore enter the market for a fresh issue of bonds during the year. We have, however, decided to go in for a fresh issue of bonds to the extent of Rs. 6 crores to enable us to strengthen our resources further in order to meet the likely demands of industry during the year. These bonds which are for a period of 12 years will carry rate of interest @ 4½ per cent per annum the issue price being Rs. 99.5. The terms are similar to those on which the State Governments recently floated their loans and are, I believe, sufficiently attractive for the investors. I am sure I can count upon your generous support, as in the previous year, to make the issue a success. It is a matter of coincidence that the issue has been opened to public for subscription from today.

20. The rate of interest charged by the Corporation from its borrower concerns had remained constant at 6½ per cent per annum net for the last five years. Our lending rate is, however, dependent on our borrowing rate as also the general monetary and economic conditions. During the last year there was a gradual increase in the rates of interest charged by the scheduled banks and we had reached an anomalous position where our rate for medium and long-term loans was lower than that charged by many commercial banks for their short-term loans. Further, the Government of India and the State Governments offered higher yields in respect of their recent issues of public loans as compared to their market floatations in the previous year. This has had its repercussion on the rate at which the Corporation is able to borrow from the market and we have had to offer a rate of 4½ per cent on our bonds as against 4 per cent in 1959. Having regard to these circumstances as also the general economic conditions, the Corporation after careful consideration, came to the conclusion that an increase of ½ per cent in the rate of interest would be appropriate. According, the Corporation, with the approval of the Central Government raised, with effect from the 19th July, 1962, its rate of interest from 7 per cent per annum to 7½ per cent per annum with the usual rebate of ½ per cent for punctual payments i.e. a net rate of 7 per cent per annum. The Corporation has not, however, made this rate applicable to the concerns which had fully or partially availed themselves of the loans sanctioned to them prior to this date.

21. The Corporation's efforts to promote joint financing of large projects in collaboration with other credit institutions and banks gathered further momentum during the year. In pursuance of this policy, the Corporation convened at Bombay in January 1962 a conference of the representatives of institutional investors like the Life Insurance Corporation of India, the Industrial Credit and Investment Corporation of India, Ltd., the State Bank of India and other leading commercial banks, with a view to formulating common approach in regard to joint participation. The proposal received wide support. It was appreciated that such joint participation by different financial institutions would help in establishing healthy practices regarding the scrutiny of applications, coverage of loans and the follow-up operations. Requests in respect of large projects are being processed in the light of these deliberations. In this context, I might mention that international institutions such as the International Finance Corporation, Washington, have also expressed their interest in co-operating with I.F.C. and other Indian institutions in this manner.

22. A conference of Development Banks in Asia was held in Bombay towards the end of March 1962 under the auspices of the Industrial Credit and Investment Corporation of India Ltd. to discuss the various problems of development banks. The General Manager and a senior Manager represented the Corporation at the deliberations and I also participated in some of the sessions which, by and large, proved useful and instructive.

23. Our relations with the various Chambers of Commerce and with out loanee concerns continue to be cordial. We have nominated more non-officials on the Boards of our loanee concerns and I take this opportunity to thank them on behalf of the Board of Directors for the keen interest they have taken in the work.

24. During the year, we have reconstituted our Advisory Committees and have enlarged them by nominating some additional members having considerable experience in their respective fields of activity. I should also like to convey on behalf of the Board of Directors our sincere thanks to the members of our Advisory Committees for the able and effective assistance they have given to the Corporation.

25. Before concluding I should like to express the thanks of the Corporation for the assistance and co-operation accorded to us by the United States of America Agency for International Development, with whom our relations have been very cordial and who have recently sanctioned to us a further line of credit of 20 million dollars. Our appreciation is also due to Kreditanstalt fur Wiederaufbau, and also to the French authorities for their agreeing to sanction loans in foreign currencies and we look forward to a period of useful association with them. I should also like to convey my heartfelt thanks to my colleagues on the Board for their valuable co-operation and wise counsels. In particular, I should like to make a reference to Prof. S. K. Basu and Shri G. D. Ambekar who ceased to be Directors of the Corporation from the 19th February, 1962, and the 12th April, 1962, respectively. The Corporation benefited much by their active participation and sound advice during their association with it. Finally, I have great pleasure in conveying the thanks of the Board of Directors as well as my own to the General Manager and the entire staff of the Corporation for their loyal and devoted service to the Corporation during the year.

OCTOBER 12, 1962.

No Compromise on NEFA

SPECULATION about the ulterior purpose of China in opening the second front of aggressive penetration in the eastern sector of the border is pointless. It is also likely to be positively misleading as the evidence of the interpretation of the Chinese move in certain responsible quarters indicates. This interpretation purports to advance the theory that China's latest intrusion in NEFA is intended to be no more than pressure tactics to impress upon India the urgency of settling the border dispute in the western sector inasmuch as China's primary, and probably sole, objective is to acquire the territory she claims as her own to link and strengthen her line of communications between Sinkiang and Tibet. This theory completly ignores China's designs on Bhutan as well as her ambition to tighten her military grip over the Himalayan border in the eastern half. Her latest overtures of assistance to Nepal against aggression, which amount to an offer of a defence pact, are part of this ambitious scheme.

It is a matter of reassurance that the Government of India has taken a determined attitude not to give quarter to China's aggressive actions in the eastern sector. For the first time, the morale of the people—which is as indispensable for total defence as the morale of the army—has been raised since the Chinese penetration in the northern border started about five years back. China's note of October 3 reiterates her crafty proposals made earlier, but India has rightly rejected them out of hand. She now insists on negotiations for the settlement and delimitation of the entire border running from west to east. She does not accept any conditions precedent attached to the negotiations and specifically asserts that the talks should be held unconditionally and forthwith. Her proposal calling upon both the sides to withdraw their armed forces 20 kilometres behind the positions occupied by them sounds like a gesture of conciliation, but in reality its object is quite sinister. That object is to seek to perpetuate the gains of aggression which China has made in Ladakh and now in the eastern sector to the south of the McMahon Line.

While the Government of India has restated in its note of October 6 its intention to stick firmly to its proposals for the reduction of the tensions recently generated to create a climate of confidence as a preliminary to the holding of the regular negotiations, it has made it clear beyond the shadow of any doubt that the talks for the settlement of the border must be restricted exclusively to the western sector. Even in this sector the restoration of the *status quo* before China grabbed Indian territory in Ladakh remains an absolute pre-condition. But under no circumstances is the Government of India agreeable to treat the border in the eastern sector as a matter in dispute and therefore an issue for negotiation. China's latest incursion into the Indian territory in this sector near the Thagla Ridge must be vacated first, since India does not recognise the existence of any dispute in this region and she cannot enter into any talks regarding the western sector under duress which is what this incursion aims at.

China's case regarding the McMahon Line has been condemned by her own action. To outward appearances she has been insisting that the McMahon Line is an arbitrary demarcation drawn at will by the British to which she is not a party and which she does not recognise. But in her settlement of her border with Burma this self-same line has been finally sanctified. Certainly it cannot be China's dual case that the McMahon Line is a recognised line redefining the traditional border in part so far as it relates to Burma and it is arbitrary and unrecognizable in so far as it relates to India. In any event, at least the evidence of conduct on the part of the Government of China clearly shows, as India's note of October 6 highlights this fact, that in its communications addressed to the Government of India, the Chinese Government has repeatedly stated that it has all along refrained from disturbing the *status quo* on the eastern sector of the boundary along the McMahon Line, though it did not formally admit its existence. No argument is necessary to restate the recognition in practice over the decades of the McMahon Line as demarcating the traditional watershed boundary between India and Tibet. It cannot now be made a matter for barter to readjust the boundary in the western sector at points where ambiguity may be discovered.

The stage has now passed when any cogent proof is required to vindicate India's stand. China's aggressive intrusion across the Thagla Ridge constitutes a danger signal. The time has been long since reached, when no relaxation of defensive action in the eastern sector can be tolerated, while proposals for talks on the western sector may be entertained. The Government of India has given sufficient indication of its determination not to compromise on the question of the eastern sector. In this determination it has the fullest support of the entire nation. At this juncture, appropriately enough, no time is being lost to take concrete measures to reinforce the defence of the frontier. The bifurcation of the armed forces in the Eastern Command — one for the eastern region and the other for NEFA—may have been conceived some time back. But the reorganisation of the corps under two GOC's at this crucial time gives the much-needed reorientation to the defensive strategy. The challenge which China has thrown in this sector need not be under-rated, but, at the same time, India's determination to fight it back cannot be held in doubt.

As we go to Press, heavy fighting — the severest so far — is reported in the Dhola area of NEFA. The casualities on the Chinese side are reported to be far greater than Indian casualties, but the indications are that our armed forces will have to keep themselves in readiness to face Chinese incursions on a bigger scale. This fighting breaks the lull which lasted for nearly the past two weeks. The meeting of the officials of the two Governments at Peking scheduled for October 15 to resume the talks is now ruled out — in fact, the tenor of India's reply to the Chinese Note had virtually ruled it out. In pursuing a calculated policy of intruding into the Indian territory, holding it by armed occupation and making overtures of negotiations for "peaceful settlement",

China means to enforce her aggressive claims by military action. It is precisely this strategy of a double deal which has exposed the true design behind her policy and stiffened India's attitude that there can be no negotiations unless aggression is vacated. It is immaterial whether China is adopting this militant posture to save face. The situation is assuming greater gravity, but there can be no compromise where the frontier is well defined and traditionally recognised.

The Outlook at Brussels

THE Ministerial meeting of the EEC, convened on Monday this week, was the first after the conclusion of the Commonwealth Prime Ministers' Conference. Considering the united voice with which the Prime Ministers spoke on the consequences of Britain's entry into the Community and the unusually strong tone of their speeches, it was only to be expected that Mr. Heath should appraise the Ministers of the Six with the outcome of the Conference at some length. A vital issue which he had to bring home to the European Ministers was the depth of the fears entertained by the Commonwealth countries in regard to the impact of Britain's entry on their exports to her in the short run. It would, however, appear from the reports in the Press that high hopes were entertained in this country about a favourable response from the Six to the suggestion made by Mr. Heath about the application of the common outer tariffs to exports from India and Pakistan. It seemed as if the readiness of the Six to accommodate the viewpoint of the two countries could be taken for granted. Much of the disappointment which is now seen is attributable to wishful expectation.

Adverting to the problems of India and Pakistan, Mr. Heath made two specific points. In the first place, he urged with a good deal of passion that the negotiations for the separate trade treaties between each of the two countries (as well as Ceylon) and the enlarged Community ought not to be deferred as long as the end of 1966. They should be commenced in earnest immediately on Britain's accession to the Community, if only because the transition between the imposition of the outer tariffs of the Community and the operation of the treaties would be minimized and the adverse effects of the transitional upsets would be reduced.

In the second place, Mr. Heath conveyed to the Six the demand of India and Pakistan for the suspension of the levy of the outer tariffs on their exports to Britain until the agreements were concluded. This was a delicate point to press. It created an embarrassing situation since no direct appeal could be made to reopen the issues settled between Britain and the Six in the agreement of July last. Mr. Heath put the suggestion in the form of a proposal for an additional declaration to be appended to the agreement. But the net effect of this declaration would have been to reopen the question to which the Six are so averse. Nevertheless, the impolitic course of brushing aside the plea summarily could not be taken.

The matter was transmitted to the deputies for a fuller examination before it could be considered at the next Ministerial session scheduled to take place from October 25 to 27. Hardly had two days passed after the reference was made, when the deputies unexpectedly announced that it was essential to refer back the issue to the Ministers themselves, implying that it needed to be tackled at the higher level, involving, as it did, considerations of practical policy. The attitude of the deputies is probably explained by the genuine apprehension that an additional declaration amounting to a variation from the terms of the agreement would set up a precedent of a special treatment on which the other Commonwealth countries with similar stakes would rely. Pressures to follow the precedent could hardly be resisted.

In particular, the undecided issues about the exports from the three temperate zone Commonwealth countries have posed difficult problems for which solutions are not within sight. The temperate zone agricultural products raise serious problems which impinge on the agricultural policy of the Community, still in the process of formulation. This is a vulnerable part of the Rome Treaty on which strong individualistic positions have been taken by the signatories. Once modifications are made in the form of an additional declaration in the provisional agreement, even if to mitigate the difficulties of the two Asian countries, a policy of non-discrimination will need to be adopted by the Six in fairness to the other Commonwealth countries. Here, it would appear, is the rub.

The negotiations for Britain's admission to the EEC may not be expected to run a smooth course, but the climate at Brussels has now improved. Mr. Macmillan's recent pamphlet, "Britain, the Commonwealth and Europe", makes the central point that the choice lies between dynamic participation and economic isolation, or between a new vigour for the economy and stagnation or at best tardy growth. The economic case for entry has been cogently argued in this pamphlet not only in relation to Britain but the rest of the Commonwealth. While, therefore, Britain's entry is a matter of time, depending on the course of the negotiations and, in particular, the attitude which France would choose to adopt, it should be clear that no pre-conditions can be attached to her participation. The issues involved in the export trade of the individual Commonwealth countries will have to be negotiated on an independent basis.

The Ministers meeting again at Brussels on October 25 are unlikely to accept the suggestion for the additional declaration which Mr. Heath has pressed and to reverse, in a real sense, the earlier decision. In plain terms, the prospect is that the levy of 20 per cent on the textile exports of India and Pakistan and of 15 per cent on the exports of their other manufactures to the enlarged Community and the phased imposition of the common tariffs at progressive rates will stay. This is for the reason that none of the Six is willing to take kindly to a revision of the settled issues.

Nevertheless, the other equally vital demand put forward by Mr. Heath in the interest of India, Pakistan and Ceylon seems assured of a helpful response from the Six. Negotiations for the trade agreements with the three will very likely be taken up soon after the outer tariffs are applied as a consequence of Britain's entry. This is some saving grace inasmuch as the strenuous phase of transition in our exports will not be prolonged until the end of the Third Plan, but it will be terminated earlier with the introduction of the agreement to be negotiated with the enlarged Community. The terms of the agreement will put to test the professions of the Community to liberalise its external trade.

The Pause in China's Economy

SUFFICIENT reliable information, inevitably of a circumstantial nature, in the absence of published official statistics, is now available about the stultified growth of the Chinese economy since the Great Leap Forward was proclaimed by the Peking regime in 1958 with all the fanfare. The latest issue of the State of Food and Agriculture, issued by the FAO, is studded with references to the setbacks experienced by Chinese agriculture during the past three years, and the slogans of consolidation, improving the quality of Chinese manufactures and development of light industries is indicative of the fact that in at least some crucial fields of industrial activity, the progress has slowed down conspicuously. The newly propagated consciousness in China about family planning is another unmistakable straw in the wind.

The years 1959 to 1961 have witnessed only poor crops in China and this has not only resulted in her rice exports falling rapidly but necessitated a resort to massive imports of wheat from Australia and Canada to feed the teeming population, traditionally accustomed to the rice diet, even to very low nutritional standards. In 1961 alone, wheat and barely imports by China amounted to over 5 million metric tons, while her rice exports to destinations other than the USSR fell to 0.35 million metric tons from 1 million metric tons in 1959. Exports of Chinese rice to the Soviet Union too have progressively gone down. From a net exporter of foodgrains, China today has become a net importer.

But there is politics in food which can deceive only the gullible. A major part of the rice exports that are currently effected by China apparently are being sustained for political considerations, and certainly not on account of any real surplus. That this is just not a presumption is evident from the fact that on the eve of Prime Minister Nehru's visit to Colombo, China has entered into a trade agreement with Ceylon involving exchange of 33,000 tons of Ceylonese rubber for 200,000 tons of Chinese rice. During the current year some improvement in Chinese agriculture is stated to have been brought about. But that it is hardly commensurate is clear from the foodgrains imports of about 3.1 million metric tons having already been contracted for. In all probability, China will be importing foodgrains during the current year approximately to the same level as in 1961.

One need not dwell upon the adverse effects that the setbacks in agriculture have produced on China's agriculture-based industries. To camouflage the issue, Peking has very cleverly contrived the slogan that improvement in quality is now more important than quantity. Crude steel output at about 21 million metric tons is also not very much higher than was claimed to be nearly three years ago. This slow growth in steel production is ostensibly due to the liquidation of the uneconomic backyard furnaces which were attempted to be established in the effervescence that marked the years 1957 and 1958. Similar is said to be the case with coal and cement; there are stated to be developing shortages of these two essential commodities.

The effect of all this and two other factors, namely, sending back home of Russian technicians and transfer of Chinese experts as well as labour from industries to rural areas with a view to strengthen the agrarian economy, can obviously be nothing but an application of brakes to industrial progress. The new stress placed on the development of light industries has probably come not only to suppress the growing discontent among the masses but also to attempt to maintain the rate of industrial growth at a respectable level. Some basic industries, helpful for agricultural development, have, of course, made progress in the last two years.

The ten-point programme of economic development during the current year, enunciated by Mr. Chou En-lai, the Chinese Prime Minister, recently, should be a clear enough manifestation of the fact that although the Chinese economy is stated to have turned the corner, all is not yet well with it. The primary objectives of this programme are to step up agricultural production and to bring about a rational correlation between the light and heavy industries. Agriculture has naturally been made the focus of all developmental activity; most of the industrial programmes of China are now geared to the needs of her agrarian economy. This is a marked deviation from the Communist pattern of development with its ruthless emphasis one heavy industries at any cost. The loss of Russian technical and economic collaboration is responsible for it.

There is a lesson that the South-East Asian countries and the new independent nations of Africa have to learn from the Chinese economic development during the past three years. So far as agriculture is concerned, the failure of Chinese food crops for the third year in succession, though primarily attributed to the vagaries of weather, is a pointer to the fact that the agrarian policies pursued by the Mao Tse Tung regime, since it seized power twelve years ago, have various inherent weaknesses, the most important of which are unbreakable regimentation and centralisation. Further, there is a limit to the capacity even of a totalitarian state to force the pace of growth.

That even Peking has come to realise this should be clear from the decentralisation effected in the system of the communes since 1959 and the economic incentives, though of a limited character, granted to induce the peasant to put in his best in his present half-famished state of health. This process of readjustment in the commune system in China has been carried a step further this year and still more authority is being vested in the village level production teams. These squads (groups of about 10 workers) have now been authorised to make their own decisions on production, rather than to follow the directions from the commune headquarters or from the brigades, as was the case previously. The revival of "free markets" in 1959 also evinces that wholesale socialisation of agriculture has not proved a success as the Chinese Communists claimed in the early years of their regime. The moral of all this is obvious: the peasants in any country can be anticipated or made to fulfil the task of raising increasingly larger outputs only through a provision of adequate economic incentives. Idealogical slogans and Party vigilence cannot sustain the tempo for all time.

So far as industrial development is concerned, the obvious lesson to be learnt from the Chinese experience is that an overwhelming emphasis on the development of heavy industries at the expense of light and consumption industries is a folly. There has to be a rational correlation between the two if undue jerks to the economy are to be avoided. This is all the more essential in the developing countries encumbered with large populations.

THE WEEK'S NOTES

Kerala

DISSOLUTION OF THE COALITION

THE DECISION of the National Executive of the Praja Socialist Party to call upon its Kerala Unit to withdraw from the Coalition Government in that State has not necessarily come as a surprise. This decision is a product as much of the resentment felt by the Party at the part of the Congress Party in inducing Mr. Pattom Thanu Pillai to quit the Kerala political scene as of the frustration which has obviously overcome it. With the loss of Mr. Pillai in the Coalition, the PSP had no alternative but to play a subordinate role, but such a role would have caused a rapid diminution of its political prestige, let alone any influence it could exercise. The rout of the Party in the municipal elections in the State was another proximate development which brought home to it the realization of the futility of holding on to office. What the Party has to do is to rehabilitate itself immediately if it has to make any impression on the electorate in the next election. For this reason, if not for any other, it is in its own interest to do nothing that would hasten the holding of the elections. This is one assurance to the Congress Ministry that it will not be embarrassed by the PSP in case its continuance is challenged. Already it has opposed the Communist sponsored no-confidence motion against the Congress Ministry. But credit must certainly be given to the PSP for holding fast to the basic political faith by which it is as much bound as the Congress Party. The resolution gives an unequivocal assurance to the people of Kerala that the PSP would do nothing which would jeopardize the principles of democracy and socialism in the State.

Mr. R. Sankar's confidence about the ability of the Congress Ministry to command a stable government apparently sounds convincing. But stability is not the only purpose for which the Government exists. It must be in a position to function effectively and on this score one cannot be quite sure. In a House of 127 members (excluding 3 vacant seats) the Congress Party commands less than 50 per cent of the strength. This fact in itself makes it dependent on the support of the PSP and some at least of the independent members in matters of crucial policy. It is in vain to pretend that it is in the same position to push through its policies as a party enjoying an absolute majority. Inside the Congress Party communal forces have grown too powerful to leave any Chief Minister free to handle the administrative affairs with an absolute measure of independence. The diverse pulls within the Party and the need to derive support from outside the Party are handicaps which can hardly be denied. The Congress Government has to make the best of the situation, giving the State a clean and efficient administration, if it is to succeed in its appeal to the electorate for a clear mandate for the next tenure.

France

FIFTH REPUBLIC: CRISIS

BY AN ironical coincidence, it was on the 5th October that the Fifth Republic was involved in its first crisis after a very arduous and strenuous lease of four years. The censure motion carried out by the National Assembly brought the end of the Pompidou Ministry. The forthright constitutional course left open for President de Gaulle was to order a fresh general election to choose the successor government. But before an open appeal could be allowed to be made to the electorate, he has taken the decision to hold on October 28 a referendum to approve his proposal for the election of the President of France by universal suffrage. Theoretically the constitutional propriety of this course has been seriously challenged, since it amounts to a subtraction from the sovereignty of Parliament to amend the constitution for this specific proposal. But President de Gaulle is too practical and farsighted a statesman to take this risk, if only for the sake of conforming to the formalities of the constitution. The repeated attempts made on his life have made it urgent that firm arrangements should be made for the election of a President who would not be subject to the fluctuations of power politics in a country where the multiplicity of parties is the bane of its political life.

President de Gaulle certainly cannot be accused of any ambitions to snatch the powers of a dictator and four years have proved that he is far from being one, although his personality and influence have naturally been quite overpowering. What influenced his decision to make the proposed referendum is to install in office a President who would derive his mandate from the people and at the same time be free from the vagaries of the shifting policies of the numerous political parties. It seems most likely that the referendum will give what the President desires. The debate may still be carried on as to what guarantee there is that the successor President will not turn to be a dictator. That depends upon the political faith or ambition of the individual concerned. But a strong President would be in a position to give a far more stable government and stronger administration to France than what the political parties have demonstrated during the life of the Fourth Republic. Stability and strength are the supreme virtues necessary for any government in France which has to play an increasingly responsible role in world politics and it is very unlikely that authoritarianism will take root in the French soil.

S.G.P.C.

THE SANT'S TRIUMPH

THE DETERMINATION with which Sant Fateh Singh defied Master Tara Singh's authority left no doubt that the fight for the capture of the control of the Shiromani Gurudwara Prabandhak Committee would be as bitter as it would be bold. Both the groups strained every nerve to bring the maximum number of voters for the ballot and, in the result, a true picture of the relative support to the two groups has now become available. Mr. Kirpal Singh Chaksherewala, President of the SGPC, a staunch supporter of Master Tara Singh, has been ousted and the majority has installed in his place Sant Fateh Singh's candidate, Mr. Channan Singh. The election settles the struggle between the two groups, but it will be an error to suppose that the rivalry for leadership has been settled once and for all. The very fact that the maximum effort went into taking practically every single voter for the vote proves that there may be many waverers who would have chosen to remain neutral. Their defections from the groups for which they have voted cannot be ruled out. There is thus the likelihood of a disturbance in the balance of power as between the two groups.

There is a tendency to exaggerate and misinterpret the implication of the result of the election. Mr. Darbara Singh, President of the Punjab Pradesh Congress Committee, for instance, has gone into wild enthusiasm declaring the ouster of Master Tara Singh as a defeat for communalism, sectarianism and separatism. In truth, this is a wishful image of what should emerge. There cannot be any doubt about certain wholesome trends that are bound to emerge from the triumph of Sant Fateh Singh. The control of the SGPC give a tremendous control over financial resources of the order of half a crore of rupees per annum. It was Sant Fateh Singh's principal grievance that the funds and the authority of the SGPC were abused and corruption had crept deep into the organization. His integrity is above suspicion and one thing that is certain is that a clean administration of the funds and the SGPC's affairs will be under way during his stewardship. But how far this reform will last will be conditioned by the inevitable attempts to assail the power of the Sant Group by all manner of tactics adopted by Master Tara Singh's followers. In so far as the demand for the Punjabi Suba is concerned, the result of the election does not make any change in this Akali claim, for Sant Fateh Singh is its ardent advocate.

Pakistan

DILEMMA OF PARTIES

President Ayub Khan could hardly have believed, when he inaugurated the new Constitution, that he would have to allow the return of the political parties in the legislatures much sooner than he would have liked. Of course, he would have liked the revival of the parties to be postponed indefinitely for the simple reason that the entire set-up of the Presidential system which, as he conceived it, was intended to give a longer lease to his authoritarian rule in a liberalized form.

But once the concession had to be made to form the parties the directions in which the alignments of the leaderships tended to proceed could not be controlled. The attempt to revive the old Muslim League has practically ended in a fiasco and if the League is revived, it will be of a much different variety from the original organisation. President Ayub Khan is being pressed to accept the leadership of the League, but his silence is indicative of the grave doubts he entertains about the final pattern of the League and the certainty of its continued support to him. Mr. Surahwardy had great success to his credit in canvassing the cause of the National Front beyond expectations. The violence and rowdyism used to break the meetings convened to popularize the National Front in West Pakistan speak for the diffidence of the supporters of the Muslim League. Mr. Surahwardy has raised the demand for the restoration of the abrogated Constitution of 1956, which, in effect, is a demand for the abolition of the Presidential system to which President Ayub Khan will not agree. But this demand is gathering rapid support not only in East Pakistan but also in West Pakistan, although in a somewhat less forceful form. Student riots are no longer confined to the Eastern Wing, but they are rearing their head in Karachi itself. Altogether, the revival of political parties holds a prospect of renewed struggle for power and this trend, considering the past performance of the parties, may end up in a rigorous type of exercise of Presidential powers.

China

PRIDE THAT PREVENTS

THE CELEBRATION of the thirteenth anniversary of the Republic was an appropriate occasion for the leaders of the Chinese Communist Party to take stock of the situation and to make an appraisal of achievements and failures. They may no doubt dismiss the association of 13 with bad luck as a bourgeois bogey. But the appraisal is bound to bear out that on this occasion the association does vindicate that ominous import. There are some indications from the communique issued after the meeting of the Central Committee of the Chinese Communist Party about set-backs and failures in diverse directions. There is no longer any proud talk of the big leap forward and, on the other hand, there is a deep consciousness that what can be attempted is a steady march intermingled with intervals of limping. The transition from capitalism to communism, it is now openly admitted, will inevitably take several decades. There is a tone of diffidence about the Party's popularity, its command over the allegiance of the people and confidence in internal unity and cohesion. This is not to suggest that any widespread movement for subversion or overthrow is taking the initial shape. But there are definite indications of dissatisfaction with the grand promises unfulfilled, in spite of the heavy toll of sacrifice and hard labour from the people.

The leadership of the Party admits the existence of opposition, but attributes it squarely to the enemies of Marxism. This is to evade a forthright appraisal of the situation as it has emerged after thirteen years of rigorous discipline. Nowhere is there any indication that the mistakes committed are owned and assurance given of making amends. To this the only exception is the setback received in the over-ambitious and fanatic programme of converting the entire countryside into a network of communes. There is a marked go-slow with the communes, which cannot be concealed. While there are no overt admissions of failures, there are also no tactful hints of any changes or modifications in policy. It is pride that prevents such a straightforward course which would easily win conviction with the people. And pride is perhaps the most outstanding trait in the Chinese character.

Whether or not honest pronouncements of change in policy are forthcoming from the rulers of the country, the fact is too real to be masked that three years of failure of crops have given a great setback to the second development plan. How far it has been axed will probably never be told in the telling figures of the shortfalls in the targets, but the fact of serious shortfalls is too glaring to be concealed. It is not without significance that China now realizes the compelling necessity to restrict the growing number of mouths to be fed. Perhaps one explanation of China's aggressive intrusions in the Indian territory lies in the necessity for the rulers to divert the attention of the people from excessive preoccupation with their own hardships and sufferings resulting from shortages of food. A likely motive of these aggressive designs may be to involve India in defensive expenditure to put spokes in her programmes of economic expansion.

Obituary

DR. SUBBAROYAN

IN THE sudden demise of Dr. Subbaroyan, India loses a statesman of a very high order in more respects than one. He was one among the few leaders who retained a deep interest in politics as well as sports—a rare combination in this country. It was his love of both which explains his liberal and catholic outlook on life. As a politician, like most of the elder statesmen in this country, he had the special benefit of a solid legal background which stood him in good stead. He rose to be the Chief Minister of Madras soon after the Mont-ford reforms were introduced and again in the Congress Ministry formed in 1937 by Mr. C. Rajagopalachari, he was invited to accept the portfolio of Law. His entry in the State Cabinet a decade after did not see a long tenure because of vital differences with the Chief Minister.

The rest of his life, when he was allowed freedom from the burdens of ministerial office, was devoted to the cause of sports to which he made a solid contribution that will be long remembered. After his reappearance on the political scene as India's Ambassador to Indonesia immediately after the dawn of 'merdeka' in that country, he found himself invited to join the Central Cabinet with the onerous responsibilities of Transport and Communications. Age and health decided his choice to retire from active politics, but there could be no full escape from the call of public life. As Governor of Maharashtra, he won the affection and veneration of the people in quite a short time. The passing away of Dr. Subbaroyan comes as a painful reminder that the generation of stalwart statesmen who guide the destiny of this nation is fast fading out.

The World Abroad

THE FUTURE OF INDIA'S TRADE WITH EUROPE

By

ODYSSEUS

THE INDIAN Chamber of Commerce in the UK (3 Laurence Pountney Hill, London. EC 4.) has issued a 60-page report, written by Mrs. Anila Graham (some time lecturer in economics in Calcutta), entitled "British Membership of the Common Market: What Will It Mean To India's Trade?" (Price 5sh).

In assembling under one cover the facts of India's trade with the UK and with the Six, the present tariffs which India encounters and the tariffs which she may expect if the EEC's common external tariff is applied to her exports by the UK as well as the Six, Mrs. Graham has done a fine job. She outlines the economics of the Treaty of Rome, records the Government of India's attitude as explained by various official spokesmen, sketches in the outcome of the negotiations between the UK and the EEC up to date, lists the key problems that would follow from UK membership, assesses the impact on India's exports to the EEC of competing tropical products from the African Associated Territories, and analyses the prospects for tea, coffee, fats and oils, tobacco, cotton textiles, jute goods, and other manufactures.

Indian diplomats, exporters, industrialists, economists, editorial writers, and all concerned to follow the negotiations, will find in Mrs. Graham's report useful expositions of all the technical proposals to which constant reference is made in the news, for example, duty-free quotas for Commonwealth goods, the Evian pact between France and Algeria, long-term contracts, comparable outlets, the new agreements to be worked out between the Six and the Associated Overseas Territories and their potential importance to India. She answers the questions: What additional aids does the EEC envisage for its Associated Overseas Territories? What are the possibilities of increased production induced in the Territories by the EEC's protective tariff? What steps are being taken to protect tropical producers outside the Common Market? What hopes are there of reductions in the EEC's tariffs? What will be the impact on Indian exports if certain Commonwealth members accept Associated status?

GLOOMY PROSPECTS

Mrs. Graham is gloomy about the prospects of all India's exports to Europe, with the possible exception of tea. Referring to manufactured goods, she provides a reasoned case for the view frequently upheld in this column that if Europe is sincere in its desire to aid the developing countries, it must open its markets to their manufactures. The prospects for India's manufactures, particularly cotton textiles and jute manufactures, look bleak. This is unfortunate since these are important foreign exchange earners. In 1958-59, together with tea, these items accounted for 54 per cent of India's exports. Mrs. Graham castigates the Six for sheltering behind he argument that the import of cheap Asian manufactures will "disrupt" their industries. This makes nonsense of the EEC's claim to be sympathetic to the developing countries' needs. The same discrimination occurs in the higher tariffs imposed on processed goods. To abolish duties which prevent the developing countries from expanding their processing industries would do much to convince the developing countries of the EEC's sincereity. I am driven to agree with Mrs. Graham that the EEC's idea of helping the developing countries is to lend them money, which has to be repaid, rather than buy their exports.

Mrs. Graham cites India's Third Plan target for export earnings as Rs. 850 crores per annum by 1965-66. Export earnings were Rs. 660 crores in 1961, which means that an annual increase of Rs. 190 crores is needed. This shows how urgent it is that India should not merely maintain, but improve, her existing exports. In these circumstances, it is clear, argues Mrs. Graham, that although India must now make an all-out effort to find new export outlets, particularly for the new type of industrial goods that she will be producing in increasing quantities, India cannot afford to give up any of her traditional export outlets, above all in the UK, and any new markets that she finds must be additional to, not a substitute for, the UK. If the UK's entry into the EEC reduces Indian exports, the entire calculations regarding foreign exchange availability for the Third Five-Year Plan will be upset.

I will not summarise Mrs. Graham's analysis of the effects of the EEC's tariff proposals on all the Indian exports that she examines, but I urge the Government of India to see that a translation into French and German is made of her report for circulation in Brussels, Paris, Bonn, and Rome.

THE UK—INSIDE OR OUTSIDE THE EEC.

Before such a translation is made, however, there is one all-important modification which Mrs. Graham would be well advised to make. Her case is based on the implication that grave harm will be done to India's economy if the UK market for India's exports is reduced. Although she never actually says so, she seems to imply that India's future will be safer if the UK stays out of the EEC.

I suggest, however, that this implication undermines her whole case.

Mrs. Graham's own statistics reveal that the UK is not merely a stagnant market for India's exports, but a declining one. The value of India's exports to the UK as a percentage of her exports to all countries fell from 28.8 per cent in 1958 to 24.7 per cent in 1961. (In the same period, India's exports to the EEC rose from 6.8 per cent to 8.3 per cent).

The UK's growth rate is, Belgium apart, the lowest in Europe. Among the causes of this are too many cosily protected industries, uneconomic allocation of capital and labour, and extremely wasteful use of labour. Entry into the EEC will provide healthy blasts of competition. The UK's economy will benefit by (a) the transition period before all tariffs are eliminated and (b) being able to co-ordinate her policies with those of the EEC. Together these two facts should ease the process of adaptation. Merely to join the EEC is no guarantee whatever that the UK's economic difficulties will be solved, but the transformation of her domestic market from 52,000,000 to one of some 220,000,000, containing the world's most dynamic economies, will be an exciting challenge, well within her powers of response. Above all—and this is even more important—the UK inside the EEC will be a member of one of the world's three great powers. Moreover, that the UK will be influential in formulating the policies of the Six seems probable from the obvious anxiety of five of the Six to have her in.

With the UK inside the EEC, the chances that Mrs. Graham's cogent case for liberal policies towards Asia will be considered as it deserves will be enhanced. If the EEC's policies towards outside imports were unduly protectionist, this could start a chain reaction of national economic crises round the world. In the political repercussions with the USA, the USSR, and the countries of Asia, Africa, and South America that would follow, the EEC itself might founder. But the EEC leaders are not fools and there is no reason to assume that such catastrophes are inevitable. Moreover, the UK's connection with the Commonwealth, and her experience as a world banker and trader, will be an additional reassurance that they will be avoided—if the UK is inside.

If the UK does not achieve EEC membership, it is nonsense to believe that she can continue to afford to import Commonwealth products on the existing scale. Without the exciting challenge of EEC membership, the UK's high cost economy would find it increasingly difficult to maintain exports, balance of payments crises might be two a penny, and tensions between employers and workers, and Right and Left would be intensified by bitter recriminations over economic policies. Whereas inside the EEC, the UK would face its economic challenges under political leaders, supported by a united party, buoyant after a great victory, and industrial leaders spurred by great opportunities, outside the EEC, the UK would face the same challenges amidst internal disunity, sharpened by the bitter consciousness of political eclipse in the counsels of the world.

The opponents of entry into the EEC argue that the UK would still play her role as leader of the Commonwealth. But does anyone really see the Commonwealth looking to leadership from a UK politically powerless and economically floundering?

The September Premiers' conference in London suggested that most of the Commonwealth agreed with Mrs. Graham in hoping that the UK would not join the EEC, but no Commonwealth country offered any alternative. While all Commonwealth premiers wanted the UK to keep its markets open to their exports, not one offered to open his domestic markets freely to UK manufactures and to re-launch the sterling area currency pool of the war years. They were right not to do so. The experiment of the closed sterling system was continued in the early postwar years and gradually broke up because the UK could neither (a) absorb total Commonwealth exports, nor (b) provide either all the finance or all the capital exports that the Commonwealth wanted. Mrs. Graham rightly says that it is not enough for India to maintain her exports to the UK—she needs to expand them in new markets. I agree. The EEC has a unique opportunity to use its vast economic strength to raise world prosperity to new levels by liberalising world trade in collaboration with the USA and the Commonwealth. Inside the EEC, the UK can further this cause. Outside she is as much a suppliant as any developing country.

If Mrs. Graham omits the passages in her report which imply that the UK should not join the EEC, what remains is a closely documented presentation of the case for EEC liberality towards not only India, but all countries outside the EEC, and I am confident that a French and German translation would compel attention in Brussels, because her case is irrefutable.

The European Scene

INDO-FRENCH TRADE

From Our Special West European Correspondent

PARIS, October 9.

THE reader of Indian newspapers has become rather blase about those "industrial supplements" which, on a variety of pretexts, recurrently swell the volume of his morning daily: a mass of editorial material of unequal value and of interested origins interlarded with specialised advertising. The phenomenon is much rare here, and almost unknown in quality papers. So the 11-page supplement on India that appeared in **Le Monde** this week made an impression, as the first thing of its kind to be seen in that country. The official contributions, such as Mr. Nehru's message to the French people, struck a pathetic note that distinguished them from the customary aridity of solicited articles, and the advertisements from Tata Industries, Birla Brothers, the IJMA and various State corporations benefitted from an exotic charm. This should not be so, of course; these should be well known names in France if India were making the export-promotion efforts required of her, and the facts about Franco-Indian trade recalled by Messrs. Manubhai Shah and K. B. Lall should be familiar to French traders. They are not, and the curiosity-success scored by this first effort will be without enduring consequence unless it is followed up by persistent campaigns.

For the fact is that Franco-Indian trade is in a very unsatisfactory state, unsatisfactory from both countries' point of view: it represents too small a percentage of their foreign commerce, and even that small volume is at the mercy of technological and political developments. India, of course, feels the inadequacy of this state of affairs more, because she runs a notable deficit. But the French can see, when they reflect on the figures, that their advantage is precarious and not due to any virtue of their own trading policy: they are contenting themselves with the inglorious surplus that any industrial country today can score in its exchanges with a less developed economy, whereas their industrial rivals are planning for the future.

The facts first: the following statistics, in millions of new francs, come from the French customs and the surplus they show is in France's favour:

FRANCO - INDIAN TRADE

	1956	1957	1958	1959	1960	1961
French imports	88.2	140.3	91.4	110.8	121.5	117
French exports	170.7	197.9	242.6	203.7	203.6	192.2
Surplus	82.5	57.6	151.2	92.9	82.1	75.2

What India sells to France is mainly raw materials: 80 per cent of the total represents manganese ore, raw hides and skins notably goatskins from South India, raw cotton, Malabar pearls, precious and semi-precious stones, camel and goat hairs, essential oils and spices. (Tea is imported from Britain, in blends to which the Indian contribution cannot be reckoned.) M. Jean Bernard, economic and commercial counsellor at the Delhi embassy, suggests that this list could be lengthened without too much difficulty to include iron ore and chrome, oilseeds, tobacco, coffee, etc. "provided Indian exporters improve the conditions of sale, as to price, quality and delivery delays, and provided they succeed in modifying French buying habits to their own advantage." Indian textiles, which are one-quarter of total exports, were till very lately quite unknown to the French consumer; brocades and first quality sarees fabrics were sold in a few fashionable shops on the central boulevards of Paris, but Bombay cottons and Calcutta sacks never reached the French market. It is only a year since the first modest quotas were granted for handloom cloth and jute and cotton fabrics.

Whenever a visiting mission or an Indian official stationed here discusses with French authorities or business men the development of this nascent trade in textiles, there is a ritual exchange of arguments. The French say, we have made a first gesture of liberalism, now it is for you Indians to use these quotas to the full, make your products known and create a demand for more; our own textile people, both employers and workers, are too apprehensive about Indian competition for us to throw the door open all at once, so you must get another section of French people on your side by acquiring a clientele of users and consumers who can shout as loud as the local mills. Besides, if in the process you demonstrate that Indian cloth is not the menace it has been made out, you will disarm opposition to further concessions. To which the Indians reply, the door is not yet far enough open for us to start kicking effectively the quotas represent too small a volume of business to support the commercial campaign you are urging us to underatke. No one in Bombay is going to spend time and money on a market that totals a few tons of cloth yearly; France must make larger concessions before trade can be developed.

The weakness of both arguments is evident. Paris (as usual, for this is a constant feature of French democracy and extends well beyond the commercial sphere) is afraid to offend one lobby until another lobby pushes it; French politicians seldom do anything until they are shoved and shrink from affronting vested interests in the name of reasonable policy. On the other side, there is the tendency to use other people's alleged protectionism as an alibi for not making the necessary commercial effort; markets are conceived as something to be served up on a platter rather than won. These reflections apply to various Indian goods other than textiles, for example to sporting equipment; small quotas will not become big quotas until they are used to the full, until local importers know the range and quality of goods available. Till then, the demand for bigger quotas has to rely on general appeals to generosity and fair dealing, which are much less effective than pressure from local consumers for more imports of a known type. Granted that action on both sides is needful, one can say that the French trend to freer imports is evident in the facts (and written into agreements such as the Geneva convention on textiles commerce and the Brussels arrangements with Britain), whereas the Indian effort to promote sales in France is to date less visible.

French exports to India consist of 43 per cent producer goods, 26 per cent steel and 11.4 per cent chemicals and fertilisers. Their total volume, after growing rapidly to 1958, has declined as India has been obliged to

stint on imports. Even apart from this exchange crisis, the French could not have expected their sales of steel and chemicals to continue to increase, because, to the extent that the Indian plan succeeds, local supplies will replace these imports. Given that India can earn or borrow the exchange, French sales will increase provided they are concentrated on capital equipment. It happens that French capacity in this field is today better known than just after independence, and on certain points Indian needs coincide with French specialities; electrical railway equipment, special steels, hydro-electric material and electronic apparatus. From here on, expansion of the market or these goods depends entirely on the financial conditions that France can offer Indian importers.

For a time the required financial effort was not made because of the dogma of preference for Africa. From June last year, however, French attitudes began to evolve: at that time Paris put up $30 million by way of entry fee into the Aid India Club, and to this has since been added another $20 million and bank credits totalling $10 million. This still only comes to 2.8 per cent of total Western aid to India, and it assumes the cumbersome form of export credit insurance, yet it marks a turning point in the two counries' relations — and for that matter in French attitudes to development aid in favour of countries not previously part of their empire. A common assumption here, both official and private, was that in the matter of development aid France would serve in preference her former colonies, Britain would do the same (as in the Colombo Plan) while the USA looked after the rest of the developing world. This was partly because of that sympathetic, paternalist solicitude for ex-colonies that is today decried as *neo-colonialism by those* who imagine that Colonel Nasser's relations with Moscow and Washington are a model for connections between civilised nations; but it was also founded on plausible views about the efficiency of aid within areas sharing a common culture.

Whatever its origins, this policy had to be revised when it was seen that the African states were developing much less quickly than had been hoped, while French exporters were scoring all their successes inside the Common Market. Neighbours, like West Germany, replaced ex-colonies, like Algeria, at the head of France's list of customers; almost half of French exports were going to Europe, while her clients made impressive inroads into those overseas developing-economy markets that France had agreed to leave to others. The French realised that in the Common Market that was taking shape, the job of external relations was being taken over by the Germans, while they were working solely for the European market. This division of labour was never intended, and it promised to be a very bad bargain: Europe's expansion could not continue at the present pace indefinitely, while the markets of South Asia, where the Germans and Italians were gaining a foothold, offer the long-term prospect of vast development. Besides, the increasing difficulties encountered by India showed that no one country, nor even Britain and the USA together, could carry the burden alone; India's immediate needs are so considerable that all the Western nations must co-operate, as the Americans argued in drumming up recruits for the Aid India Club.

These are facts that are only slowly penetrating French official and industrial circles, and it is obvious that they feel some apprehension about attacking the huge Indian market (less, often, because it is so Indian than because it is so British). The emulation introduced by the Common Market will be helpful stimulant; the German and Italian ventures in India in recent years have attracted more attention here than all the British did in a century before.

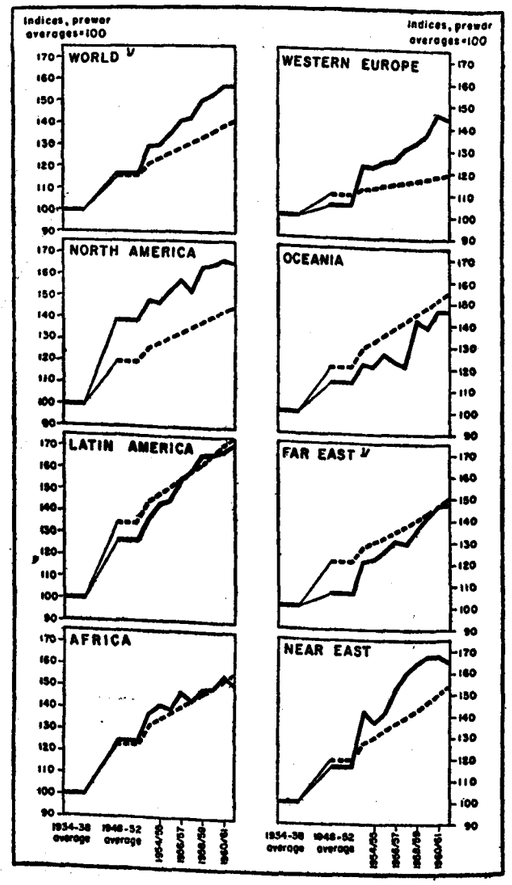
Special Article

THE RACE BETWEEN FOOD AND POPULATION

THE most disquieting feature revealed in the FAO annual review "The State of Food and Agriculture, 1962" is not that 1961-62 recorded little increase in production but that hunger still stalks vast areas spread mostly over the less developed regions of the world. Since the pre-war days, pressure of population has outstripped the output of food in Oceania, Latin America, the Far-East and Africa, resulting in declining production of food on per capita basis. The imported food in these regions has not been sufficient to fill the gap. The trends in population and food production for the last two decades have been highlighted in the graph and the table given below. The table shows that in the case of Oceania, total food production in the period since the commencement of World War II was 44 per cent while population rose by 52 per cent establishing a fall of 5 per cent in per capita food production. Again, in Latin America, the Far East (excluding Mainland China) and Africa per capita fall in output since the pre-war period was computed at one per cent each. Thus, there is an unmistakable trend of falling per capita availability of food in these areas. The graph shows that the total world production (excluding mainland China) has been rising faster than the increase in population. The surplus in the developed regions has however not been sufficient to satisfy the needs of the deficient regions. Dr. P. V. Sukhatme, Director of the Statistical Division, FAO has estimated that in the Far East alone supply of food—in terms of calories—has fallen short of the requirements by 11 per cent. As against the average need of 2,300 calories per day, the supply is of the order of 2,050 calories. The impact of this shortfall in nourishment assumes a much more alarming turn when it is known that nearly half of the total world population lives in this region. Rough estimates indicate that "between 300 and 500 million people go hungry for part of their lives even in normal times".

How can this global malady be remedied? There is no single solution to this highly complex problem. Of the various methods suggested to draw the less fortunate nations out of their poverty the most important are restriction of population, wide use of insecticides, training of peasants in the art of using new tools and fertilizers so as to raise productivity and to bring new lands under the plough. While the long-term solution of raising productivity is to be commended, the efforts of the Food and Agriculture Organisation to initiate a new programme under the title "freedom from hunger" needs special mention here. The short term problems of the less developed countries can only be solved by the increased efforts on the part of the developed nations to make available material aid, especially in the shape of surplus foodstuffs. Later this year the United Nations and FAO are launching a new programme to "explore methods of using the surplus food production of the more developed countries to aid economic-development in less developed countries and to combat hunger and malnutrition". The significance of this programme lies in the fact that this is a step in the right direction to mitigate the miseries of the starving millions in the less developed countries in the short period. While the long-term programmes enunciated above will have their natural course, this short-term programme of relieving the hunger of the starving people in these lands will be a humanitarian task of vast proportions for which both the FAO and the United Nations deserve special thanks of the developing countries.

More than one study undertaken by the United Nations and the FAO in recent years has focussed attention on the perils of un-controlled population increase. Unless all the developing nations chalk out aggressive plans of population containment, the problem will remain as illusory as ever. No one believes that the birthrate in the developing countries can be brought down by any sudden manoeuvres. Natural calamaties apart, the current trend shows that population will continue to rise, thrusting a greater pressure on the food supplies of the world. This naturally lands one in the delicate task of estimating the needs of the developing world in terms of funds. The UN Development Decade proposals estimated that even one per cent of the national income of the developed countries could go a long way in assisting the developing countries. Even if this order of aid were made available, the belief prevails that the population problem will be tackled only by restraining the indefinite multiplication of people. In the ECAFE region, in particular, the present estimates show that population might double in the next 30 years. The estimates made by Coale and Hoover in regard to India's population show that the continued increase in population is likely to be a "major barrier to an economic breakthrough". The lesson of all these international exercises in demographic research is that the food problem can be tackled if the race between food and population can be kept at the pace of food output and not at the pace of the population rise.



CHANGES IN FOOD PRODUCTION AND POPULATION

WEST BENGAL STATE ELECTRICITY BOARD BONDS. 1972

(Second Series)

For Rs. 150 Lakhs

(Payment of Interest and Repayment of Principal Guaranteed by the Government of West Bengal)

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE RS. 99.75 PER CENT
REDEEMABLE AT PAR
ON THE
27TH OCTOBER, 1972

SUBSCRIPTIONS will be received in cash or cheques. Applications will be received at the head offices of State Bank of India at Calcutta, Bombay, New Delhi and Madras from 22 October, 1962 to 26th October, 1962 both days inclusive. But the list may be closed earlier without notice if the total subscription is reached.

Copies of loan prospectus and application forms are available at all the offices mentioned above and at the Head Office of the State Electricity Board, 1, Hastings Street (7th floor), Calcutta-1.

For you...in the CALTEX "STOP-LOSS" Programme

Out of the Caltex Sales Engineer's briefcase comes a sheaf of ideas for cost control through organised lubrication—the Caltex "Stop-loss" Programme.

Start on the programme immediately. You will find that organised lubrication reduces losses in three important directions: production, maintenance and purchasing. The savings will go directly into profits —an average gain of upto 4% safely in the bag.

Ask your Caltex Sales Engineer for information

Company executives can obtain a free copy of this booklet by writing on their official letter-head to their nearest Caltex office.

THE BUSINESS WORLD

How Housing Co-operatives are Cribbed

By CROESUS

BETTER late than never, the Planning Commission has at last bestirred itself to look into the question of housing and, what is more significant, to harness the co-operative agency to the great task. One should feel grateful to Providence that, at least in the second half of the first year of the Third Plan, it has dawned on the Planning Commission that, even as food and clothing, shelter is not one of those amenities the provision of which will brook any delay. These three are, indeed, the elementary amenities of any people, and it is a sad commentary on our Planners that, even after two Five-Year Plans, we are nowhere near a satisfactory solution of the problem of providing any one of the three amenities. As regards food, considering that we are still struggling to reach 80 million tons of foodgrains in the 1962-63 season, one cannot but entertain doubts about reaching even the 100 million-ton (low) target by the end of the Third Plan. In the matter of cloth too, although, at one time, there was tall talk of ensuring over 20 yards of cloth per capita, there is today a distinct tendency to feel satisfied if the per capita availability of cloth does not fall below the level in 1950-51, when we first embarked on the planned economic development of this country. To come to the third amenity—shelter or housing—one has only to indicate what, according to the Planners themselves, is the position. They estimate that, by the end of the Third Plan period, the country would need some 13 million urban housing units and about 50 million rural units (to be rebuilt or repaired), entailing an investment of about Rs. 13,000 crores, that is something more than the total investment outlay on the entire Third Plan! A major problem like this needs to be tackled in a really bold and imaginative way, and it is natural, therefore, for everyone to look forward with interest to the findings of the Working Group on Housing Co-operatives just set up by the Union Ministry of Works, Housing and Supply. Inasmuch as the Working Group is asked only to recommend specific programmes and physical targets for co-operative housing during the Third Plan, it may not go into the question of housing that falls outside the co-operative sector. In other words, even after the new Working Group has gone into the question and made its recommendations—and assuming, further, that these recommendations are implemented in full—the overall problem of housing cannot be said to have been tackled wholly or fully.

As the problem of housing is going to be entrusted to housing co-operatives, one would want to know what progress this agency has achieved so far. The progress of housing co-operatives since 1913-14 and until recently, it would appear, had been very slow. This is understandable, since the concept of co-operation itself has been of recent import, while the development of housing co-operatives is a still more recent phenomenon. Lately, thanks to the active assistance of the authorities, co-operative housing has received considerable fillip. It is stated that, at present, six societies at the State level and 5,568 societies at the primary level are functioning. In 1958-59, it is estimated, 44,000 houses or tenements were built at a cost of Rs. 33.17 crores, while, in 1959-60, nearly 45,000 houses or tenements were constructed at a cost of Rs. 38.41 crores. Needless to say, these figures pale into insignificance when placed alongside the country's requirements mentioned earlier. The authorities themselves admit that the progress made is far from adequate in the context of the overall requirements of housing. It is worthwhile looking into the causes for this admittedly unimpressive progress.

Now, between the registration of a co-operative housing society and the completion of houses for its members by the Society, there are so many stages of bureaucratic procedure to pass through, and, with a handful of honourable exceptions, if at all, bureaucracy in our country seems to know more about how to put a spoke in the wheel than to be positively helpful. Many of the officials have to be told that, whereas they are doing a work for which they receive payment, the honorary workers of a co-operative society do their work without any payment and, often times, at the sacrifice of their regular office work. There is first the question of land procurement either by outright purchase from any owner or by acquisition through the Government, after a given society has located some piece of land that it considers suitable. True, outright purchase does not entail much time, but the question of establishing marketable title to the land so purchased is a laborious and patience-wearing process in all conscience. Even where the State Government acquires the land and puts a given society in possession of that land, the solicitors, with whom the co-operative housing societies have necessarily to deal before getting financial accommodation from the concerned financing agencies—Housing Finance Co-operatives or the Life Insurance Corporation—will insist on the title being 100 per cent marketable. It takes several months for a society to have this done. But, between the time a given society is put in possession of a land by the Collector and the time that buildings come up, there may be encroachments by neighbours, especially if the society happens to be located near a village. And, in such an event, the organisers of the society concerned are verily in a soup. For it gives rise to an annoyingly anomalous situation in which the Collector says he cannot interfere—his work is over once the possession is given—and the police say they are helpless—they are supposed to intervene only when there is a breach of peace. In one instance that I know of, a day light and daring encroachment on the Government — acquired lands of a housing society by the residents of a village near Bombay city in the enlightened State of Maharashtra has persisted for well over three years, despite appeals to the police, the revenue and the co-operative authorities, not excluding Ministers. The organisers of the Society are now told by the police, who have slept all these years, that the society should seek redress in a Court of Law. The Society was not averse to doing even this, but found itself helpless, as it did not know against which of the fifty or so villagers it had to proceed.

Be this as it may, as this may be a stray case. And let it be assumed that the marketing title has been established to the satisfaction of the Solicitors and the loan also has been sanctioned by the concerned Housing Finance Society. There is no guarantee that the loan can be fully drawn upon within the stipulated period, thanks to the scarcity of cement or steel or some other essential building material. The position of tenant-ownership co-operative housing societies is really unenviable, especially because of the prevailing quota system. In the case of tenant-co-partnership societies, whatever the quota—it ranges from 5 tons and upwards — could be used, without inviting the charge of favouri-

ism, as there is only one building but a number of tenents, but not so in the case of tenant-ownership societies, where each member has a cottage of his own. If, say, five tons of cement are released—and this has happened—it becomes extremely difficult to allocate it to any one.

Again, when a Housing Finance Society grants a loan, it may be 40 per cent, 50 per cent or 60 per cent of the initially estimated total cost of land and building, there is a stipulation that this may not be supplemented if costs go up. As a matter of fact, because of the inordinate delay in establishing the marketable title, in drawing the loan, and in getting quotas of cement and steel, the initial cost estimates invariably go awry and the member concerned will be required to find the additional finance. Normally, office-goers, Government or private, resort, in such cases, to a loan on the security of their pension or provident fund, but the authorities pose a fresh problem by saying that, unless they have the first charge on the property, they will not make any advance. This is clearly impossible, because the Housing Finance Society, which has advanced the bulk of the loan, cannot be asked to relegate its first charge in favour of the Government or the Regional Provident Fund Commissioner. The net result is that quite a few members, finding themselves caught in this predicament, resort to loans from other sources at fantastic rates of interest and thereby add to the capital cost of their houses.

Generally speaking, a middle class person joins a co-operative housing society to become the eventual owner of a building when he retires from service, so that he may be saved from the obligation of paying rent every month to his erstwhile landlord. But disillusionment awaits him when his co-operative cottage is completed and he has to face the Municipal Assessor. This supremely indifferent official assesses a house (even if it be a co-operative society's) on the basis of what he calls the ruling rateable value which, nearly in every case, far exceeds the rent that the member of the society has been paying, so much so that many of them have since become firm believers in the improvised adage: "Fools build houses and wise men live in them". This is a dangerous form of complacency and may strike at the very root of co-operative housing in future.

I have deliberately detailed here at some length the trials and tribulations to which a votary of co-operative housing is subjected to, wittingly or unwittingly, by the several public bodies whose blessings he has to court. My purpose in doing so is to bring all these to the notice of the Working Group in the hope that it would devote some time and thought to these irksome pinpricks, many of which, in my opinion, are avoidable. I feel convinced, therefore, that if co-operative housing must succeed in this country, there should be a thorough reorientation in the attitude of every one of the public officials concerned.

Gilding the Gold

By PAUL BAREAU

BRITAIN is living up to its historic reputation as an initiator of monetary theory and practice. It has done so recently by introducing into the sphere of international discussion a new proposal for improving the system of international payments and enlarging the volume of international reserves — in fact for gilding the gold.

This was done by the Chancellor of the Exchequer, Mr. Maulding, in the speech he made as leader of the British delegation at the annual meeting of the International Monetary Fund in Washington. He had promised some such initiative many weeks ago and it should be said that the unveiling of his plan was anticipated by part at least of his audience with a certain amount of trepidation. The Americans, in particular, were nervous about the possible implications of his speech on the state of confidence in the dollar. For some weeks past the authorities of the United States have been intoning the refrain that "the dollar is as good as gold". If, therefore, Mr. Maudling found it necessary to produce a scheme to remove the blemishes of the present system of international payments, based as it is on gold and the two reserve currencies, the dollar and sterling, this by implication must be deemed as a glancing derogation of the dollar. In fact, the Maudling plan has received a cool, not to say frigid, reception; but this does not in any way detract from the need to give it the attention which it undoubtedly deserves and which it will receive in the months and years to come.

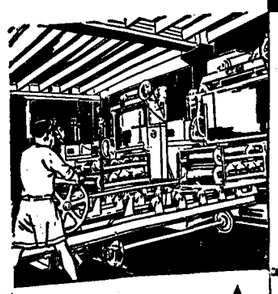
The plan is based on an acknowledgment of the limitations and shortcomings of the system by which international liquidity is at present maintained. At the basis of the system for creating international reserves is gold itself. Within the last few years there has been a healthy and altogether desirable redistribution of monetary gold reserves; but the total of these monetary stocks has failed by a very substantial margin to keep pace with the growth in international trade and the work which international reserves have to do. The main reason for this is not far to seek: the price of gold in terms of dollars has remained unchanged since 1933 and as the costs of mining gold have gone up it is not surprising that the production of new gold has failed to keep pace with the need for increasing reserves.

That need has in fact been supplied by two internationally used currencies, U.S. dollars and sterling. To an increasing extent other countries have maintained their reserves, not in gold, but in these two key currencies on the understanding that whenever other currencies, or even gold, was needed they could be obtained by free conversion from the two key currencies. The world in fact has been operating a gold exchange standard.

The basic defect of this system is that these two currencies have been subjected to fluctuations of confidence. In fact, the better they performed their function as key currencies and provided the world with increased dollar and sterling balances, the more they invited distrust and conversion into gold. One country's exchange reserve is the liability of the country in whose currency that reserve is maintained. There is a point, therefore, at which expansion of these reserves becomes tantamount to the invitation of a run on the reserve currency in question.

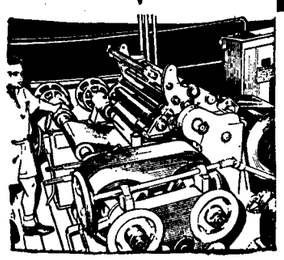
All kinds of devices have recently been used to veil these defects and to underpin the gold exchange standard system. One of these was the scheme agreed a year ago at the I.M.F. meeting, then held in Vienna, to give the Fund powers to borrow up to $6 billion in order to provide resources with which to defend the key currencies. This, however, had the grave defect that when used it would merely be an acknowledgment of weakness for the currency in whose help the borrowing scheme was being invoked. It might, therefore, make matters worse.

The next device was a series of bilateral arrangements by which central banks took in one another's currencies. That, however, had the grave defect that if it tended to work in a one way direction — say loading up other central banks with dollars, as it has recently done, it must weaken confidence in the currency that is currently abundant. This could be met by giving banks holding such currencies gold or even an exchange guarantee, but any such suggestion has been received



The first step in foil manufacture is the cold-rolling of .45 mm gauge aluminium foil stock. Each pass reduces the gauge of the foil by approximately fifty percent.

ROLLING OF FOIL



The making and shaping of aluminium foil is an extremely skilled process. It calls for rigid control in rolling to gauge. Special techniques in applying scientifically formulated coatings. Skill and know-how when mounting foil on carefully selected substrates. Machine techniques, and material and production quality control demand the highest order of technical knowledge and experience—the kind of experience that India Foils have acquired in 60 years.

India Foils Limited
(Incorporated in Great Britain)

The Birthday Gift

Mother stitched a pair of trousers for his birthday and sent them to the laundry so that they would look fresh, crisp, new. But they shrunk—she had forgotten to look for the label 'Sanforized'!

If only she'd taken a little more care in the selection of the fabric, these trousers would have retained their immaculate fit even after many, many washings.

Make certain you get the full measure of value of the material you buy—

Look for ·SANFORIZED· REGD TD MK

on the label

and your clothes will never shrink out of fit.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark SANFORIZED, or permit the said trademark to be used by registered users authorized to use the trademark, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95 Marine Drive, Bombay 2

The trademark 'SANFORIZED'—registered and trusted in 129 countries of the world—is a vital force for the export of Indian textiles.

mas. SAN. 246

with horror by the U.S. authorities on the reasoning already noted that "the dollar is as good as gold" and, therefore, asking for a gold guarantee is disparaging the dollar.

This is where the new Maudling plan comes in. It suggests that countries which in the normal course of their international transactions accumulate other currencies, whether they be dollars, sterling, D-marks or other members of a select group often, should be entitled within limits to hand these in to the International Monetary Fund and require in exchange a credit in a "mutual currency account". The units in which that account is to be expressed would have the usual exchange or gold guarantee which attaches to all operations of the I.M.F. A similar guarantee would apply to the currencies handed in to the Fund. If, for example, sterling were deposited with the Fund by France in exchange for a mutual currency account credit, and sterling were subsequently devalued, France's credit would be unaffected but Britain would have to make up to the Fund the amount by which its holding of sterling had been depreciated. This illustration emphasises one essential feature of the scheme, namely, that no such depositing of currencies with the Fund would be allowed, except as a result of specific negotiation between the two countries directly concerned — in this case France and Britain — and even then only within limits that would have to be laid down by the Fund.

The advantage of the scheme is that the creditors would be able to use their balances to meet their deficits if and when they ran into balance of payments difficulties, and moreover that they could do so within a truly multilateral context, withdrawing from the Fund not merely the currency they had originally paid in but whatever currency they needed in order to meet their temporary balance of payments difficulties. Here, therefore, is a faint but promising echo of the Keynes scheme which visualised what was ultimately to become the International Monetary Fund, as a clearing union, operating international accounts dominated in bancors and usable as international reserves and also as an international currency that could be made to keep pace with the genuine needs of internaional commerce and finance.

Business Notes

Power

SHARAVATI'S SLOW START

FROM THE point of view of economy, hydel (hydro-electric) power generation undoubtedly scores over coal, oil, natural gas, or even nuclear fuel. But even after taming all the rivers and harnessing all the potential hydel power, there would still be left a wide gap as between the total supply and the potential demand for power. Ironically enough, however, the present power shortage has come even prior to the maximum utilisation of hydel power has been achieved. While ambitious targets have no doubt been set for constructing power projects in the country, the execution of those Plans have continued to suffer either for want of efficient administration or capital, or from natural calamities or due, at times, to unhealthy political pressures.

The Government of Mysore naturally came under strong criticism recently, from all the opposition parties, in the Mysore Legislative Assembly, for its rather unsatisfactory handling of the Sharavati Valley Project. Mysore — the poineer state in the utilisation of hydro-electric power as early as in 1902 — will have in the Sharavati Valley Project the country's biggest hydel project, which is estimated to produce 12,000 megawatt power or six times the States' present installed capacity. It is further pointed out that this project bids fair to harness about one-third of the State's power potential.

Under the Sharavati Valley Project, it may be noted, it is proposed to dam the river Sharavathi at a place called Linganamakki in the Western Ghats. The resulting 198-feet high dam is estimated to store 156,000 mc feet of water and the water thus stored in the reservior will be diverted through a hill into another balancing reservior by walling up a tributary of the Sharavati Talakalale. From there the water will be rushed through twin hill-top tunnels in two open tanks at Voddenbyle and then downhill to the penstocks to turn the ten turbines at Anebyle or the Plain of Elephants — so called as it was once known to be the habitat of elephants — before joining the river. At the end of the bend, a further dam — the third — also is being built to use the tail water by installing a separate generator of 150,000 kw capacity at Gerusoppa.

The inordinate delay in the construction of the project has been due, the State authorities say, to the unusually heavy and prolonged monsoon rains in the ghats and the labour strike in 1959, as also to the absence of rock-base at Linganamakki. Additional measures for laying the needed foundation because of this is progressing only at the rate of six inches every day. But, according to versions strongly current in knowledgeable quarters, whilest these factors also have constituted to some extent, the delay is mainly the result of the time taken to finalise the contracts, even after unmistakable expert opinion on the tenders was available, presumably because of some political wire-pulling. The opposition parties in the State rightly sought, therefore, to focus public attention on the project through a censure motion, a few days ago, on charges of alleged mis-handling of funds and thereby causing avoidable delay in the construction of an important national power project so urgently needed for industrial production in power-starved Mysore. Originally — that is in 1953 — estimated to cost Rs. 270 million, the project, according to this year's revised estimates, is expected to cost well over Rs. 800 million or even Rs. 1,000 million by the time it is finally completed! And this has been disclosed by no one else other than the Chief Minister himself. Be that as it may, it is something that, at least by the end of 1966 this biggest hydel station in the country is scheduled to be completed A notable feature of this project, which is jointly financed by the United States Loans and by the Central and State Government is that it will produce the cheapest power in the country at, say, about Rs. 700 per kilo watt.

Engineering

NO MORE LICENCES FOR TYPEWRITER MANUFACTURE

IT IS an established fact that, under the protectionist policy of the Government, many an indigenous industry has recorded considerable progress. This progress would have been even more marked, had it no been for the fact of non-availability of raw materials in adequate quantities in the country, on the one hand, and the growing import restrictions on imported raw materials, on the other. The typewriter industry is a typical example of this. Inspite of the fact that the indigenous industry was sufficiently licensed to meet the demand, imports of typewriter—standard and portable—parts, and accessories have continued (the import bill for these in 1961-62 amounted to nearly Rs. 1.5 crores), and this is the outcome of the extremely low production recorded in recent years. While the total licensed capacity so far, for both the types of machines, is 78,400 per annum, the actual production amounted to only 31,101 in 1961! On the other hand, the demand for standard as well as portable typewriters, at the end of the Third Plan, has been estimated to go up to 100,000 per annum. There is thus a gap between licensed capacity and actual need

as well as between actual production and the estimated demand.

The Planning Commission would appear to have expressed its unwillingness to license additional capacities in view of the huge unutilised capacity still existing in the industry. At present, three companies are in actual production of standard typewriters, while one more is yet to go into production. In the case of portable typewriters, one company is already in production and another unit is expected to be commissioned soon. The respective licensed capacities of the four companies for the manufacture of standard type writers are: Remington-Rand of India, Calcutta: 24,000; Godrej and Boyce, Bombay: 12,000; Rayala Corporation, Madras: 14,400, and Rai and Sons, Chandighar, 10,000 (yet to go into production). The existing firms have a total installed capacity of about 48,000 typewriters per annum on a single-shift basis, but they would be able to turn out 60,000 to 70,000 per annum if they were to operate on a double-shift basis, against the present actual production of about 20,000 machines per annum. The Planning Commission has stated that the units already in the field should be helped to increase their production upto their installed capacity and thus meet the increasing demand, rather than license fresh units. It has suggested, for instance, that a double—shift operation could easily be resorted to by the Remington-Rand, which is at present operating up to its full capacity. The Commission has further pointed out that, if the existing units were allowed to expand their production as and when the demand increases, they would not only be meeting the increasing demand but would also be able to achieve greater reduction in production costs. This is in line with the latest trend of thinking of the Planning Commission on industrial licensing policy. The fuller utilisation of the installed capacity could, however, be achieved only when the country is able to manufacture all the components needed for the typewriters, or sufficient imports are permitted, at least till such time that the country need no longer depend on such imports.

RAISING INDIGENOUS STANDARDS

MR. K. C. MAHINDRA, Chairman of Machinery Manufacturers' Corporation Limited, at the annual general meeting of the Company, made it clear that the Indian industry is doing its maximum to improve the standards of finish of their products. Referring to his own company, he said that renovation has received sufficient attention so that the plant originally designed for a rated capacity of 50 carding engines per month is now producing on an average 85 units every month.

In addition to renovation he stressed that enough care is being taken to bring in diversification. The company has introduced the Speed Frame of their own design which still is in the protype stage because the equipment and tooling required for the purpose have not yet been procured which has happened because relative import licences have not been forthcoming. The company has, however, received a quota of such licences for import from East European countries and is likely to proceed further very soon. Similarly, he added that detailed work on the engineering of the Turret Lathe has been completed and the company is waiting for the import licences for one or two specialised machine tools which are necessary for the job. This policy of diversification is being followed by the company and will be helpful in the sense that it will provide a sort of cushion to the fluctuations which have characterised the Indian textile industry particularly in respect of demand for machinery, either for replacement or for expansion purposes.

Referring to the swings in demand for the textile machinery he pointed out that it is influenced by the vagaries of textile industry itself. In this connection the Chairman pointed out that new mills with as small a capacity as 12,000 spindles are being encouraged to be set up with the proviso that the products must be exclusively reserved for export purposes. The Government has granted them licences for the import of carding engines and ring frames in consultation with the Textile Commissioner. This seems to be a rather unhealthy trend because textile machinery industry in our country has now been established on fairly firm grounds and has proven itself in the matter of the quality of its products. Under these conditions any import of textile machinery is plainly unfair both for reasons of the wastage of the foreign exchange as well as positive disincentive to the indigenous machinery producers. The Chairman pointed out that during the last five years the foreign exchange outlay on the import of texile machinery alone has come to about Rs. 83.6 crores which is hardly justified. It is time that the manufacturers of textile machinery looked more carefully in to the demands of the textile producers and the Government discouraged the import of such machinery which is available within the country.

National Income

DISQUIETING PERFORMANCE

DURING THE first year of the Third Five-Year Plan, India's national income has gone up by only 2.2 per cent. This result for 1961-62 is based on a quick estimate prepared by the Central Statistical Organization. Against a figure of Rs. 126,90 crores in 1960-61, the national income for the year under review—1961-62—is placed at Rs. 129,70 crores. Although this figure may undergo revision by the time the final report is published early next year, it is positively a disturbing factor when seen in the context that growth expected to secure an increase in national of over five per cent per year. This result seems even more discouraging when viewed against the principal objective of the Plan which is to secure an increase in the per capita income. The Central Statistical Organisation study reveals that the per capita income during 1961-62 is not likely to show any increase at all over the previous year. The increase in national income has been offset by an equal increase in population. The provisional figure for per capita income for the year remains at Rs. 292.5 which is the same as was in 1960-61.

The reasons for this slow increase in the national income are not very difficult to analyse. The principal factor, it may be observed, is the shortfall in the agricultural production. The total output of foodgrains during 1961-62 is now taken to be 78.6 million tons as compared with earlier estimate of 80 million tons. Thus a clear shortfall is there of the order of 1.4 million tons. It may, however, be added that these figures are not final still.

Another factor is a comparatively reduced rate of industrial output which has not progressed as fast as was expected. The rate of increase for 1961-62 has recently been revised downwards to 6.7 per cent. It was estimated early that the rate of increase would be of the order of 8.3 per cent. Then the tertiary sector, which ultimately depends upon agricultural and industrial output to a large extent, naturally had certain handicaps and therefore income from commerce and transport was not up to the expected levels. Although this increase in national income does not, in any way, indicate the final results of the Third Five-Year Plan, it is a fair reminder that all is not well with the Plan.

New Issues

WELLMAN INCANDESCENT INDIA LIMITED

FIVE NEW issues are expected in the capital market in the near future.

Wellman Incandescent India Ltd., a new company recently promoted and got incorporated in Calcutta by The Wellman Smith Owen Engineering Corporation Ltd., of London, is expected to raise capital to the tune of Rs. 24.99 lakhs, all in equity shares of Rs. 10 each. The authorised capital of the company is Rs. 50 lakhs. Of the issued capital, shares worth Rs. 12.50 lakhs have been agreed to be taken up by the parent company (these include 39,885 shares to be issued for consideration other than cash). The directors and their friends have agreed to subscribe to another 14,930 shares. The balance 1,10,000 shares are to be offered for public subscription at par.

One of the main objects of the company will be to establish, as soon as possible, a well-equipped design office staffed mainly by Indian engineers under the supervision of foreign technical specialists. The manufacturing programme includes production and sale of all types of furnace ovens and allied equipment, including charging and discharging gears, electric overhead travelling cranes, gas producers, coke-oven machines, foundry plants and handling equipment for steelworks. Part of these fabrications and manufactures will be undertaken by the company at its existing factory at the Howrah Industrial Estate. A major portion of the work, however, will be sub-contracted to other manufacturers in India.

MAHARASHTRA SHEET GLASS CO.

THE SECOND company envisaged to raise capital from the public in the near future is the Maharashtra Sheet Glass Company Ltd., which is being formed to undertake the manufacture of plate glass. Its promoters are Messrs. Rajan & Sons, Bombay. This is the second plate glass manufacturing unit approved so far by the Government.

The authorised capital of the company will be Rs. 2.5 crores. Capital worth Rs. 2 crores is proposed to be issued in the first instance. Exact details of the issue are stated to be being finalised.

The capacity of the factory, to be set up in Maharashtra State, will be about 10 million sq. ft. of plate glass in various thickness per annum. The total demand for this type of glass in the country is estimated to go up to about 30 million sq. ft. by 1965-66. This new Maharashtra unit will begin meeting part of this demand, from safety glass and automobile industries and others, after mid-1964. Technical collaboration is being negotiated with a leading plate glass machinery fabricator on the Continent.

CENTURY FLOUR MILLS LIMITED

THE THIRD company which intends to approach the public in the near future for subscriptions to its share capital is the Century Flour Mills Ltd., Madras, which proposes to establish a new and modern biscuit factory as its anciliary unit near Madras. The factory will have a capacity to produce 3,000 tons of biscuits per annum. At a later stage, it is also proposed to set up cattle-feed and poultry-feed manufacturing units.

The biscuit manufacturing project is estimated to cost Rs. 50 lakhs. A sum of Rs. 23 lakhs is proposed to be secured through issue of capital—Rs. 18 lakhs in equity shares of Rs. 100 each and Rs. 5 lakhs in preference shares, also of Rs. 100 each—and the remaining Rs. 27 lakhs through borrowings from financial institutions.

This will be the first organised buscuit manufacturing unit in Southern India whose estimated consumption is placed at nearly 10,000 tons per annum, worth about Rs. 5 crores. Technical collaboration is being negotiated with a reputed foreign firm. This, of course, is subject to Government sanction. Machinery and equipment is proposed to be purchased from Baker Perkins (Exports) Ltd., United Kingdom, who will also make available some technicians for setting up the machinery and for supervising its working in the early stages.

SUN PAPER

THE FOURTH company which is expected to enter the capital market shortly is another South Indian concern —Sun Paper Mill Ltd., Madras. The authorised capital of this company is Rs. 1 crores, of which capital worth Rs. 20 lakhs, all in equity shares of Rs. 10 each, is proposed to be issued in the first instance.

The company has obtained a licence for manufacturing annually 3,000 tons of writing and printing paper and an equal quantity of paper pulp. The factory is proposed to be set up at Ariyanayagipuram, in Tirunelveli District of Madras State. Part of the machinery has already been received and the erection work is in progress. Production is expected to start early next year.

MAHARASHTRA STATE ELECTRICITY BOARD

THE FIFTH new issue that is being floated is a Rs. 3 crore-debenture issue of the Maharashtra State Electricity Board. The debentures will carry interest at the rate of 4½ per cent per annum and will be issued at par. They will be redeemable at the end of 12 years. The list opens on October 15 and closes on October 20, or earlier as soon as the total subscriptions amount approximately to the sum called for.

The debentures will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act They will also be eligible for the purposes of advances under Section 17(4)(a) of the Reserve Bank of India Act.

The proceeds are to be utilised for financing partly the expansion programme of Electricity Board, which is estimated to cost Rs. 52 crores and envisages augmenting of the installed capacity of the Board's plant from 1,37,160 KW to 9,03,000 KW by the end of the current Plan period and laying of an extensive transmission line-network in the State with a view to carrying grid power to the hitherto power-starved areas.

Foreign Aid

MR. MORARJI DESAI IN TOKYO

MR. MORARJI DESAI'S visit to Tokyo marked the culmination of his mission abroad. Having gone round the UK and the US where he very ably expounded the foreign exchange needs of Indian planning, Mr. Desai made it very clear to the Japanese Government and the commercial circles there that India attached great significance to the Japanese assistance. Speaking at a joint meeting of the Federation of Economic Organisations and the Japan Chamber of Commerce on India's Third Plan, Mr. Desai said that India had a great deal to learn from Japan as the latter had the experience of facing such problems now confronting India. Mr. Desai agreed that Japan was playing a significant role in extending a helping hand to India by providing credits for the planned development.

Mr. Desai was asked a very significant question as to whether India preferred technical co-operation or joint ventures from Japan. He did not conceal the fact that ventures were preferable as they would bring better results. But he added that private joint enterprises were treated without discrimination in India against the State projects. The flow of investments is, therefore, increasing though not on a scale commensurate with India's requirements. He very rightly allayed the fears of the foreign investors by indicating that much of State development expenditure was in the fields in which foreign private capital could not be expected to play a significant part. It was mostly concentrated in railway transportation, power generation, measures to help promote health and education, agricultural products including irrigation projects, big and small. Thus even though the public sector was expanding, it really did not en-

croach upon the private sector sphere in most of the cases. Mr. Desai, therefore, very rightly explained the process of expanding public sector within the Indian economy where field for foreign investors was also increasing rapidly. This fact has to be brought to the notice of the foreign investors in this light.

FOUR CATEGORIES

IT MAY be recalled that Mr. Andrew Shonfield in a lively study dealing with assistance to the developing countries, had outlined the fact that more than the nature and the volume of aid, it was the economic structure of the recepient country that really could take advantage of foreign aid. In that study he had given a clean chit to the Indian planners and private entrepreneurs who were in a position to utilise foreign assistance in the most appropriate manner. Now it is Mr. Chester Bowles, at one time American Ambassador to India and presently a Special Advisor to President Kennedy on the world's developing countries, who has confirmed that India is one of those countries that received assistance to make best of it. In this connection he also outlined four categories of countries that claimed the right to receive American assistance.

The first category is of the countries that "lack the competence, organisation and will" to use aid effectively which, he believes, should be limited to receiving assistance from the US Peace Corps, the US Food for Peace Programme and the technical and advisory services of the United Nations Agencies. He, however, refrained from naming the countries that could be listed in this category. The second category is of the countries with a gross national product of more than $350 million and whose current problems are sufficiently acute to require aid from the US, but whose difficulties result mainly from "misuse and maldistribution" of their wealth. In this category are the countries like Argentina, Chile, Cyprus, Greece, Jamaica, Lebanon, Panama, Singapore, Trinidad, Uruguay and Venezuela. These nations, he add, are capable of "putting their financial houses in order, and the US should suggest to them corrective measures and provide advice on how to introduce tax and land reforms and a more effective control of their foreign exchanges."

Then the third category, in which he groups India, is of the countries which are "demonstrating competence and courage in mustering their own resources". In this category Mr. Bowles listed apart from India, countries like Pakistan, Columbia, Nigeria and Tunisia. In aiding these countries, he indicated that US should integrate its efforts with those of international lending agencies and other capital exporting countries and should simplify administrative functions and assign the ablest people. It was thus in these countries that the US could demonstrate what outstanding performance by a recepient nation backed by generous assistance could accomplish. Mr. Bowles categorised in a separate group countries that stood in between the second and third category — the countries which have an adequate gross national product and are doing well in some areas of self-help but badly in others.

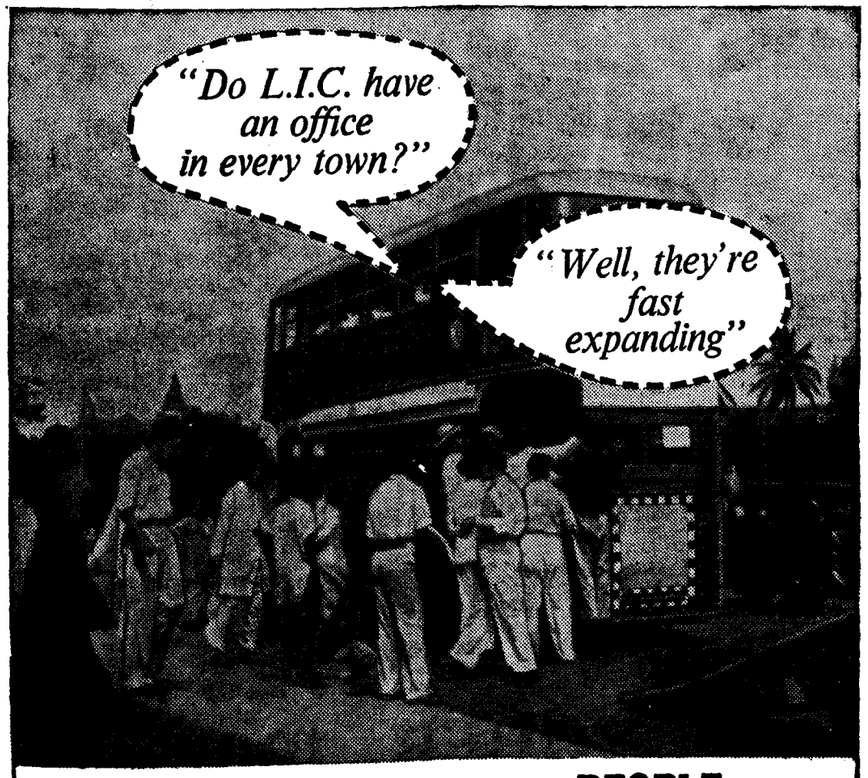
Mr. Bowles outlined that economic aid should flow to the countries on the basis of their legitimate economic needs and this flow should be kept as far as possible aloof from the cold war and other political considerations. This could also be seen in another light. Mr. Bowles indicated that more than half of the countries receiving American aid have authoritarian governments of some kind. He nevertheless was hopeful that even a military regime could be seeking to accomplish certain reforms. He, however, did not hesitate to say that the US had her differences with those Governments which persistently stuck to outmoded concepts designed to protect the status quo. Even mild pressure in this direction could be expected to bring about some change sooner or later.

Madras

PAUCITY OF SKILLED PERSONNEL

A QUARTERLY study made by the National Employment Service for the period ending March 1962 discloses severe bottleneck of skilled personnel such as turners, automobile mechanics and electricians, professional and technical workers such as civil engineers, electrical engineers, town planners, pharmacists and laboratory assistants in Madras. That the character of our unemployment is more quantitative than qualitative needs no saying. When the Third Plan programmes are facing frequent bottlenecks in transport, coal and power and as such are in the likelihood of being pruned, the disclosure of NES indicates that the reality is still worse. The study which covers both the public and the private sectors discloses that a little over 10,000 vacancies remained unfilled during he period due to dearth of skilled personnel of which 31.3 per cent was in the case of skilled craftsmen closely followed by farmers and miners who formed 29.9 per cent of the unfilled vacancies. Vacancies of professional and technical personnel, however, represented 20.8 per cent of the total unfilled vacancies.

The private sector appears to have suffered more from the shortage of skilled personnel than the public sector in that the unfilled vacancies in the private sector during the period were more in the case of skilled craftsmen and professional and technical workers.



The study points out that a lasting solution to the problem of occupational shortages could be sought only when the forces of demand and supply in the employment market for these occupations are in equilibrium. Planning in an under-developed economy starts with some amount of unskilled labour and as the economic activity expands on all fronts the demand for occupational labour rises much faster than the supply and hence the stage of equilibrium takes a long time to reach. The problem is therefore of training people within as little a time as possible to keep pace with the rising demand. Since skilled personnel is one of the factors contributing to the rate of economic growth, it is time that the Planning Commission took due cognizance of this shortage in its true perspective.

Forestry

LONG-TERM PLANNING NEEDED

IN HIS convocation address to the Forest College, Dehradun, Dr. Ram Subhag Singh, the Union Minister for Agriculture, emphasised the need for a long-term planning in respect of forestry. In view of the rising tempo of industrial development in the country, more particularly in the expansion of wood-based industries like drugs, paper and pulp, Dr. Singh's plea, though nothing new, deserves mention. It is true, as he says, that our forests are unable to meet the growing demands of our industries and the heavy pressure on forest resources would leave us with a wide gap of shortage by the end of 1975, when our requirements of industrial wood would rise to 9 million tons from the present level of 4.5 million tons.

It has been already estimated, the Minister says, that by 1975 the deficit in industrial wood is likely to be about 215 million cubic feet and to meet this shortage plantations are to be raised on five lakh acres. This apart, there is a special project for raising plantations of rapidly-growing species on 1,37,000 acres the cost of which is to be borne by the Government. Intensive development schemes are essential for a sustained increase in production and since forests are among the few renewable resources in nature, they can be inexhaustible, if properly managed. With such a conspicuously low consumption of industrial wood as 0.6 cubic feet, India is far behind other countries in the production of basic raw materials like wood and other forest products so essential for industrial activity.

In 1956, the LIC had 97 offices in the country. Today they have 344*. And more are being opened. It is all part of LIC's drive to get to the people where they are, to offer them security, service them at their door-step and promptly satisfy local needs.

PEOPLE ARE TALKING ABOUT L.I.C.

This expansion was promised. This expansion is taking place.

PAUSE IN WORLD AGRICULTURAL PRODUCTION

THE Food and Agriculture Organization of the U.N., on the basis of its preliminary estimates for 1961-62, states that there was little or no increase in world agricultural producing during this year. While there was a "pause" in the expansion of production, world population was estimated to be rising at the rate of 1.8 per cent annually.

In its latest annual report on "The State of Food and Agriculture, 1962", FAO says: "The pause in the expansion of production, which if confirmed by later figures, would be the first since 1957-58, was caused mainly by widespread bad weather, and there is every indication that the rise will be resumed in 1962-63." The main crops affected were grains and sugar. The production of livestock products and of most other crops was the same or higher.

With the little or no increase in production, as indicated by the preliminary estimates, there was clearly some reduction in the output on a per-person basis. In fact, the FAO index of per caput agricultural production (1952-53 to 1956-57 equals 100) showed a fall from 106 in 1960-61 to 105 in 1961-62. The per-caput index for the production of food (as against the broader category of agricultural products as a whole) fell further—from 107 in 1960-61 to 105 in 1961-62.

The report is based on statistical material available to FAO up to June 30, 1962. As in the past years, no official figures of agricultural production have been published for Mainland China, which is not included in the index of world production. But "floods, droughts and pests are reported to have curtailed production for the third consecutive year, and there have been further large imports of grains", the report says.

Among other regions, the report says, the only substantial increase in agricultural production in 1961-62 was in Latin America where it had fallen in 1960-61. This increase in 1961-62 is estimated to be about four per cent, although production of food alone rose only by two per cent.

In Eastern Europe and the Union of Soviet Socialist Republics, both total agricultural production and food production are estimated to have "increased by two per cent after failing to rise in 1960-61". "Smaller increases of approximately one per cent are estimated for Oceania and for the Far East (excluding Mainland China)" for total agricultural production, with hardly any increase in food production.

In Western Europe there was a decrease of about one per cent in both agricultural and food production after a large increase of six per cent in 1960-61. In North America too there was a decline of nearly one per cent.

In the Near East both total agricultural and food production fell by two to three per cent. In Africa, the estimates show a decline of three per cent in both agricultural and food production.

Aside from a world and regional review of the situation and the outlook for agricultural production (including forestry and fisheries), "The State of Food and Agriculture" contains reviews of changes in stocks, economic activity and the demand for agricultural products, food supplies and consumption, international trade in agricultural products, farm prices and incomes, consumer prices and a review of agricultural policies and development plans in various regions and countries. It includes estimates of production and trade for East European countries and the USSR, and contains available information on Mainland China. Supplementing the text are several diagrams ad statistical tables.

The report emphasizes the preliminary nature of production estimates for 1961-62. For instance, revised data for 1960-61 showed that world agricultural production rose by about two per cent instead of the one per cent in the first estimate reported in SOFA 1961. This was so mainly because Western Europe produced more milk and vegetables than originally estimated, and data for Africa indicated an increase of four per cent, instead of one per cent, due mainly to sharp revisions in the estimates for grains production.

In his foreword to the report, the Director-General, Mr. B. R. Sen, says, "the year 1961-62 could be considered as one of promise rather than achievement" in regard to the key problems of food and agriculture. In the less-developed countries the key problems were first under-production, hunger and malnutrition, and second the continuing decline of agricultural prices on world markets. In contrast the key problems in the developed countries were more often excess production in relation to commercial outlets, leading to accumulation of stocks and, closely related to it, the lower incomes of farmers compared with persons in other occupations. Rural poverty however was "still more acute, if less articulate" in less-developed countries.

Referring to developments in agricultural production, Mr. Sen said, "The most disquieting trend is that per-caput food production in Latin America, Africa and the Near East, which increased appreciably during the 1950s, has tended to fall in the last few years as production has lagged behind the growth of population. In the Far East, however, the region where food problems are most acute of all, recent developments have been somewhat more favourable".

The report says that while the prewar level of per-caput food production has been exceeded in each of the less-developed regions at some time during the post-war period, but the gain had so far been only temporary, in all regions except the Near East, and elsewhere per-caput production had subsequently tended to slip back. However, actual per-caput supplies and food consumption levels in these regions appeared to be slowly rising to levels higher than before the Second World War. This had been possible because of larger imports and often smaller exports of food from these regions.

The increase in per-caput food production in the world had come from the more-developed parts of the world, instead of the less-developed regions "where such improvements are urgently needed to raise levels of living". The report points out, however, that rapid population increase, rather than a failure on the part of their agricultural production, had over the longer-term checked the growth of per-caput production in the less-developed regions.

WORLD TRADE IN AGRICULTURAL COMMODITIES

Mainly because of large shipments of grains to Mainland China to make up domestic shortages, and of sugar to both USSR and Mainland China, there was a four-per cent increase in the volume of world agricultural trade. But the ample supplies of most products in the world markets tended to depress prices, and the average

(unit) value of all exported farm products fell by four per cent. There was thus little or no increase in the value of world agricultural trade.

At the same time the average price level of exported manufactured goods rose by two per cent. The "terms of trade" of agricultural exports—that is, their capacity to purchase manufactured goods in world markets—therefore fell by more than six per cent. This was the seventh successive year of deteriorating terms of trade for agricultural exports, and they stood in 1961 merely one-fourth below their average level in 195-53.

In keeping with the trend over the past decade, however, the exports of the developed regions of North America and West Europe were less seriously affected than the trade of the less-developed regions. In 1961, the value of exports of both these regions, as well as Oceania, increased mainly because of a larger volume of exports and higher prices for wheat. By contrast the value of exports of each of the less-developed regions fell. The figures for North America in particular, however, include shipments of surplus foods under special terms.

Owing mainly to the check in the expansion of world agricultural production, the level of world agricultural stocks was reduced in 1960-61. The drop was the first since 1957-58, when production suffered a similar setback. Wheat stocks of the United States, Canada, Argentina and Australia—the four major exporters—are estimated to have fallen by 15 per cent. North American coarse-grain stocks fell by 12 per cent, partly because of the drive to curtail excess production. Stocks of coffee, soybeans, butter and cheese increased.

Generally speaking the consumer paid higher prices for his food in 1961 than in 1960. During the eight years 1953 to 1961, the report says, the cumulative effect of the continuing rise in food prices and in the cost of living has been considerable. In 37 of the 87 countries for which figures are available, the cost of living rose by 25 per cent or more. In 19 of these it rose by more than 50 per cent.

The report says there were several developments in agricultural policies in 1961-62 "which are likely to influence the course of world agricultural developments for many years to come". More determined efforts than ever before were made in the US to reduce the costly burden of agricultural surpluses—although progress so far was limited. The European Economic Community adopted a common agricultural policy to achieve in seven and one-half years a community-wide market for agricultural products protected from outside. This would change production and trade pattern within EEC, and is sought to be achieved mainly through raising or lowering prices.

In USSR "production policies have already been drastically modified" to bring about a more intensive pattern of cropping with the help of fertilizers. The autonomy of the collective farms has been reduced, and the prices of meat and butter have been raised sharply.

In 1961-62, Mr. Sen says in his foreword, "There were encouraging signs of an increased world recognition of the importance of agricultural development, both in itself and as a key component of general economic growth. There were signs, too, of a greater determination to tackle the problems of agriculture before they became still more acute. On the other hand, the year's developments in production and in international trade contributed little to their long-term solution".

Mr. Sen referred to the efforts of the less-developed countries to achieve a planned development of their agriculture, geared to plans for general economic growth. At the same time in the more-developed countries, "under the impact of the world-wide Freedom from hunger Campaign and related programmes, there were increased efforts among governments and the general public to step up the flow of material aid to less-developed countries, especially in the food and agricultural sector, including aid from surplus foodstuffs".

A NOTABLE DEVELOPMENT—WORLD FOOD PROGRAMME

A notable new development, Mr. Sen said, "is the experimental World Food Programme, jointly sponsored by the United Nations and FAO, and expected to come into operation late in 1962". The programme is designed to explore methods of using surplus food production of the more-developed countries to aid economic development in less-developed countries and to combat hunger and malnutrition, "Though small in relation to some bilateral programmes, it is potentially of great significance", Mr. Sen said.

He also referred to the efforts being made to mitigate the effects of the continuing fall in agricultural prices, which hampered the growth of the capacity of these regions to earn foreign exchange and lessened the potentialities for their economic development. Among the possibilities widely discused in internatonal forums were schemes for compensatory financng and more comprehensive forms of world commodity agreements.

Mr. Sen said that such arrangements do not as a rule come quickly to fruition, "but the fact that such questions are now being discussed internationally is in itself a hopeful sign".

Mr. Sen said, "Although the basic problems of agriculture are likely to remain substantially the same for some years or even decades, it is encouraging to note that the world food and agricultural situation is no longer esssentially static. Both the level and pattern of the demand for agricultural products are in constant flux as a result of changes in population, consumer incomes and prices, and these changes in demand in turn impose changes on agricultural production. At the same time, it must be noted that not all the changes or activities are in the right direction and of the right emphasis".

Mr. Sen referred to a study (Agricultural Commodities: Projections for 1970) analysing the probable trends to 1970 of demand, production and trade in agricultural products, which was published by FAO in April this year. In no sense a forecast, the study presented the likely outcome if present policies remained unchanged.

He said the study was "disquieting in that it brings out the danger that, unless drastic action is taken to increase production in the less-developed countries, the food supply may fall increasingly behind domestic demand. At the same time, surplus production of export commodities may become even more wide-spread, while the demand for farm products in world trade may grow only slowly, or in some cases even decline. Nevertheless, with rising populations and incomes a rapid increase may be expected in the demand for some commodities, notably forest products and (especially in less-developed countries) livestock products".

As in last year's issue of SOFA, there are two special chapters in the issue this year. One is on the role of forest industries in the attack on the economic underdevelopment. It analyses the growth of demand in developed and less-developed countries alike for forest products, such as wood, pulp and paper, and also the important

hoarded wealth in ancient india

From early Buddhist literature one learns that wealth was hoarded underground in brass jars or buried under a river bank. The nature and amount of the wealth thus hoarded was registered on gold or copper plates.

The tendency to hoard wealth doubtless arose from the lack of opportunities for investment. The *Dharmasastras* for instance allowed only men of the Vaishya community to lend money on interest. Frequent invasions by neighbouring kings and the resultant fear of the future made people believe that there was nothing safer than burying their gold or silver.

Times have changed. Today the saving habit has many incentives—savings help not only the individual but also the nation. And many opportunities exist for profitable investment with reliable and streamlined institutions like the Union Bank of India.

The Union Bank prides itself on its unique *personalised service*, under which every depositor is treated as a Very Important Person.

The Union Bank Helps People

SERVICES OFFERED: Current, Savings Bank and Cumulative Deposit Accounts; Fixed Deposits and Three-year Cash Certificates; Inland Bills, Demand Drafts and Telegraphic Transfers; Letters of Credit and Guarantees; Foreign Bills and Remittances; Loans, Overdrafts and Cash Credits; Sale and Purchase of Government Securities and Shares and Safe Custody; Standing Instructions accepted; Credit Reports and Trade Information; Safe Deposit Vaults; TELEX contact with countries all over the world.

THE UNION BANK OF INDIA LIMITED
Registered Office: Apollo Street, Fort, Bombay 1. 61 branches all over India

ASP/UBI-

contribution which forest industries could make to economic development. Forestry contributed largely to the economic development of some European countries and could do the same for quite a few less-developed countries.

The other special chapter is on livestock industries in less-developed countries. Livestock products, the chapter says, are of importance to less-developed countries to provide them with more balanced and healthy diet. The chapter analyses the problems of expanding livestock production in the less-developed countries and gives some indications of developments which may be foreseen in the next decade.

BOKARO STEEL PLANT

The biggest hurdle in the way of the United States extending assistance and collaboration for setting up India's fourth public sector steel plant at Bokaro appears to have been overcome. Although the 9-member US Techno-economic Team, which has been here to study the technical feasibility of this plant, has yet to finalise and submit its report, it is undertood to have been greatly impressed by the site chosen and the availability of iron ore and other raw materials in the vicinity. The Team, it is further learnt, has also judged the feasibility of this project from the point of view of the expanding demand for steel in this country and the inevitability of setting up another steelwork. The report of the Team is expected to be submitted by the end of current financial year.

On the receipt of this report, the US Administration will be in a position to consider making available a credit of about Rs. 100 crores which, it is presumed, will be the foreign exchange component of this Rs. 200-crore project.

Meanwhile, the preliminary work on the project is stated to be progressing satisfactorily. The Bihar Government is said to have acquired 44,000 acres of land for setting up this plant. The Indian consultants, Messrs. Dastoor and Co. have been authorised to go ahead with the preparation of the detailed project report. This task is expected to be completed by the end of next year.

The initial capacity of the plant is envisaged to be 0.36 million tonnes of saleable pig iron and one million tonnes of flat products.

BHILAI EXPANSION SCHEDULE

Under its expansion programme for raising production to 2.5 million tons, the Bhilai Steel Works will have three more coke oven batteries of 65 ovens each in addition to the existing three batteries (total six), two more blast furnaces of 1,719 cubic meres each in addition to the three existing 1,033 cubic metre furnaces (total five), four more open hearth furnaces of 500-ton capacity each and conversion of an existing 250-ton furnace to 500-ton capacity (total 10), and a new wire rod mill (total mills five). Bhilai will produce 2.5 million tons of ingot steel per annum, which will be rolled into 1,965,000 tons of finished and semi-finished products. The existing mills will be enlarged and renovated. The new wire rod mill will produce 400,000 tons of wire rods annually.

The expansion of the Bhilai Steel Plant is to be carried out within four years. According to the present schedule, two more coke oven batteries, one more blast furnace of bigger size and two more open hearth furnaces of double the size of existing ones will be erected and commissioned during the first two years. Some additional soaking pits will also be put up in the blooming mill besides installation of additional machinery and equipment in the rail and structural mill and merchant mill.

The construction of the sixth and last coke oven battery, fifth and last blast furnace and one more open hearth furnace will be carried out during the third year, besides effecting some modifications in the billet mill.

The construction of a new wire rod mill in the rolling mill, tenth open hearth furnace and doubling of one of the existing open hearth furnaces, last group of soaking pits in the blooming mills as also erection of the third machine in the sintering plant will be carried out in the fourth year.

After expansion, Bhilai Steel Works will be the biggest steel plant in India.

STEPPING UP OIL REFINING CAPACITY

The NPC Productivity Team on Oil Industry, which recently toured the Soviet Union, Czechoslovakia and Rumania, to study at first hand the new techniques practised in these countries in oil refining, has stressed the imperativeness of achieving self-sufficiency in the refining capacity in this country by the end of the current Plan period. This self-sufficiency, it has pointed out, may even be attained on the basis of imported crude.

In its report, released here last week, the Team observes that to meet the 17 million tonnes demand for petroleum products by 1965-66, an additional capacity of 2 million tonnes shall have to be established every year. The Team has expressed the belief that after providing for the output in the existing and the new refineries being proposed to be set up in the public sector, an extra capacity of 3 to 5 million tonnes will have to be created by 1965.

Another important recommendation made by the Team is that in future, as far as possible, refineries should be set up near the consumption centres. This, it has pointed out, is the policy pursued by the Soviet Union. A significant advantage resulting from following this policy would be minimising of the transport costs.

The Team has also called for considerable intensification of the quest for oil. In this connection it has stated that only a fringe of the country's 4,00,000 sq. miles of oil-bearing areas has been touched as yet. The current pace of development, it has emphasised, needs to be augmented by all possible means.

In view of the rapidly increasing demand and the necessity of keeping the import bill on account of petroleum products at the minimum, the Team has recommended the manufacture of the drilling, refining, distribution and marketing equipment within the country.

HOLDING THE PRICE-LINE

The first meeting of the Planning Commission's Advisory Committee on Economic Policies, held here last week, has failed to clear up thoughts in respect of even holding the price-line in regard to the essential commodities consumed by the lower middle-class people. Apart from a broad general agreement that the prices of these essential commodities should be held, the top economists included in this Committee neither agreed among themselves nor with the Planning Commission officials on the methods to be adopted to hold the price-line and the machinery to be entrusted with this task. The discussions mostly were of academic nature on the theory of prices and the inevitability of costs rising in a rapidly expanding economy. The general view expressed was that with the existing machinery for implementing measures to hold the price-line, no large-scale or drastic immediate action could be contemplated.

FOODGRAIN PRICES RECEDE

Meanwhile, foodgrain prices have, in recent weeks, shown a healthy downward trend. Without making claims that a general recession has begun, reliable sources interpret the latest price graphs in a favourable light. They add that there is absolutely no cause for alarm, particularly as the traditionally "lean" period is coming to an end.

A comparison of weekly index numbers (base: 1952-53 = 100) shows that rice prices fell by 1.3 points from 115.8 during the week ended September 8 to 114.5 at the end of the month. The decline in rice prices has been noticed in several States. Compared with last year, the current prices of rice are generally lower except in the eastern States of West Bengal, Bihar, Orissa and Assam, where production suffered a setback of nearly 9 lakh tons in 1961-62 due to heavy diversion of land from paddy to jute.

The general picture in regard to wheat also is one of declining prices, except at a few places in Bihar, Maharashtra and the Punjab. The index number for wheat fell from 92.7 in the last week of August to 90.1 at the close of September.

Prices of other cereals have also begun to display a declining trend. For instance, the index for bajra has declined from 138.1 in the third week of August to 134.5; barley has fallen from 97.8 in August to 93; maize from 114.8 in the second week of August to 103.3 and gram from 96.0 to 92.8.

Although the production of pulses fell by 9.7 lakh tons in 1961-62 as compared with the previous year, their prices too are coming down. The index number in the second week of August was 114; in the third week of September it had fallen to 110.7.

The prices of all food articles taken together — these include cereals, pulses, fish, eggs, milk, fruits, etc. — also are showing more favourable trends. Their index in August was 131.6, while in the third week of September it came down to 129.9.

LIFE INSURANCE BUSINESS OVERSEAS

The Federation of Indian Chambers of Commerce and Industry in a communication to the Union Finance Ministry, has urged upon the Government to permit Indian insurance companies having branches abroad to undertake life insurance business there. Specifically, the Federation has asked for this permission for the countries in Africa and the Far East.

The FICCI has pointed out that time is an important factor and if the present opportunity, when there is goodwill for India in these countries, is not taken advantage of, it may not be possible to enter the field at a later date when insurers from other countries get themselves established firmly in this business. Another reason given by the Federation for allowing the private insurers in these countries, now doing only general insurance business, to undertake life insurance business abroad is that this would enable the country to earn a good amount of foreign exchange so direly needed for the implementation of the current Plan. Any short-sighted policy on the part of the Government in this regard would only prove disastrous in the larger interests of the country.

The Federation has drawn the attention of the Government to the assurance given by the Finance Minister at the time of passing the Life Insurance Corporation Act in 1956 that the Government would consider individual applications for undertaking life insurance business abroad on their merits.

SHIPPING AND FORWARDING AGENTS IN LONDON

An annual saving of Rs. 6.75 lakhs (£50,000) in foreign exchange will be made as a result of the implementation of the recommendations made by Mr. T. Sivasankar, former Secretary, Union Ministry of Works, Housing and Supply, for streamlining the overseas purchase organisations at London.

The Director-General, India Stores Department, London, has now appointed a suitable firm of Shipping and Forwarding Agents for handling transport and other formalities for goods to be sent to India. The agents will undertake the work without any cost to the Government of India. They will finance themselves from the commission on freight charges from the shipping lines on goods booked by them from North Europe. The strength of the Shipping Directorate in the I.S.D. London will be reduced to a few officials required for liasion with the Shipping and Forwarding Agents.

Mr. Sivasankar, who made a detailed examination of India's overseas purchase organisations at London and Washington, had suggested the appointment of Shipping and Forwarding Agents to whom the entire work of the Shipping Directorate in the ISD London could be transferred.

TEXTILE AND CEMENT MACHINERY MANUFACTURE

Meeting were held here and at Bombay last week to plan the manufacturing programmes of the textile machinery and cement-making machinery, respectively. Meanwhile, the Department of Heavy Industries in the Union Ministry of Steel and Heavy Industries has been busy in giving shape and issuing instructions in regard to its policy to maximise the production and utilisation of Indian-made components and ancillaries in the automobile industry so that the indigenous component could be raised to 90 per cent by 1966.

IN BRIEF ....

Mysore sugars has been permitted by the Government to undertake the manufacture of triacetode, diacetate and moulding powders. These products are required by the Government of India's raw film manufacturing units proposed to be set up Ooty.

*

M|s. Indian Pipes of Madras, have been allowed to manufacture annually 25,000 tons seamless pipes. The company has entered into collaboration arrangements with an Italian firm. Machinery and equipment for the project is to be imported from Hungary.

*

An Indian delegation is shortly leaving for Poland to discuss the import of capital goods required for the deep coal-mining machinery project/ coal washeries, fertilizer plants and general purposes machinery and machine tools. Polish credit of about $40 million is available for these imports.

*

The Government, it is learnt, has decided to undertake the manufacture of methenol in the public sector.

Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

NEWS IN BRIEF

INDIAN

The Geological Survey of India has discovered in Singrauli, Madhya Pradesh, a 244-ft. thick coal seam which is stated to be the thickest one in the country.

•

The Union Government has agreed to the proposal of the Oil and Natural Gas Commission to install a central workshop near the ONGC headquarters. The workshop will initially undertake repairs of drilling machinery, but is designed to undertake eventually its production as well.

•

The Union Government is considering a proposal to vest the responsibility of fertilizer distribution with private commercial agencies.

•

Mr. K. D. Malaviya, Union Minister for Mines, Oil and Fuel, announced recently that South India will have an oil refinery and that work on this project will start in about 2 years.

•

The Engineering Export Promotion Council is examining the possibilities of exporting Indian-made refrigerators, room air-conditioners and water coolers to West Asia and West Europe.

•

Two Indian engineers from India's Overseas Communications Service have gone to Britain to study space communications.

•

An international symposium on "Protein Structure and Crystallography" will be held at Madras in January, 1963, under the auspices of the University of Madras.

•

A batch of Indian technicians will shortly proceed to Czechoslovakia for specialised training in connection with the setting up of the High Pressure Boiler Plant near Tiruchi, Madras State.

•

The Government of India has decided to manufacture certain types of contraceptives in the public sector with a view to bringing down their present prohibitive prices.

•

The Pondicherry pier will be commissioned on November 1, by Mr. S. K. Datta, Chief Commissioner.

•

A second rosin and turpentine factory in Himachal Pradesh will be set up at Manwa during the current financial year at an estimated cost of Rs. 12 lakhs. It is expected to provide employment to about 700 persons.

•

The Geological Survey of India proposes to hold a Seminar on "Ground Water Resources of the Country" January next in Calcutta.

•

U.S. Business Corporations are leading British and others as the largest current investors in India, according to a spokesman of Indian Investment Centre.

•

The Union Government is likely to license soon some additional capacity for the manufacture of bicycle tyres and tubes.

•

The Chief Minister of Madras inaugurated on October 2 the Aliyar reservoir project at the Aliyar dam site, the first in the series of eight constructions planned under the Parambikulam Aliyar Project. The entire project is expected to cost Rs. 35.8 crores.

•

Soviet Engineering have completed the blueprint for the new Bhakra Power Project on the right bank of the Sutlej. The project, when completed, will have a total installed capacity of 600,000 KW.

FOREIGN

The OECD has published a new edition of its "Catalogue of Courses on Nuclear Energy" for the benefit of science and engineering students.

•

Czechoslovakia has recently entered into agreements with Ethiopia for the construction of a rubber footwear plant, with Afghanistan for the development of coal mines, and with Egypt for the construction of a water-purifying station.

•

The Co-operative League of the U.S.A. is backing a drive to raise $1 million for sponsoring a programme of pilot projects in Indian villages.

•

Soviet engineers are to design the 500,000 volt electric transmission lines, 850 kilometres long, which will link Cairo with the Aswan Power Dam which is being built with Soviet assistance.

•

The UAR has promised to donate one million dollars worth of foodgrains, mostly beans, to the World Food Programme of the FAO.

•

Preliminary construction work has started on the 30-acre site of Ceylon's new rubber-tyre factory to be built with Soviet assistance. The factory is expected to go into production by the middle of 1965 and will have an annual capacity of 600,000 tyres and an equal number of inner tubes.

•

The Grassland Research Institute of Britain has developed a new chemical method of soil treatment which will do away with ploughing and will produce higher yields.

•

The number of students at all levels in Iraq has increased by 102 per cent between 1957-58 and 1961-62, according to Iraq's Central Statistics Bureau.

•

The North Eastern Gas Board, Britain, is constructing a network of automatic gas stations operated by remote-push-button control. The project is expected to be completed within five years.

•

Soviet engineers will design a 60-metre arch dam on the Kasseb river in Tunisia. This project when completed is expected to irrigate vast areas and generate about five million KWH. of electricity.

•

President Nkrumah of Ghana has announced that Ghana's budget estimates for the coming financial year had been slashed from £170 million to £128 million in an effort to eliminate unnecessary expenditure.

•

The UAR Ministry of Industry has drawn up a list of industries described as "basic". The industries thus described will not be allowed to reduce or stop production without the permission of the Government.

•

President Kennedy signed the Bill authorising the United States Government to lend upto $100 million to the U.N. to help the latter to tide over its present financial crisis.

•

Poland's share in world ship-building has increased from 0.4 per cent in 1950 to 3.7 in 1962, according to the Lloyds Register.

•

The Tass News Agency reports that a Russian twin-jet 44-seater TU 124 airliner designed by Tupolev made its first passenger fight of 621 miles in 90 minutes. This aircraft is claimed to be capable of flying 600 miles per hour.

COMPANY AFFAIRS

ELECTRICITY COMPANIES OF MARTIN BURN GROUP

Seven electricity companies belonging to Martin Burn Group for which the annual reports are now available for the year ended March 31, 1962, show increased revenue almost uniformly during the last two years. This increase in revenue is naturally a reflection of larger number of units sold by all these companies. In most of the cases their generation stations are fully loaded and it is not the lack of demand but the lack of electricity supply that holds back their further progress.

The working results of **Jubbulpore Electricity Supply Company Limited** reveal that profit for the year, after providing for taxation, depreciation and other charges, amounts to Rs. 4.35 lakhs. A sum of Rs. 1.55 lakhs has been separated towards reserve allocations such as contingency reserve and development reserve. Another sum of Rs. 54,000 has been set aside towards general reserve. The Directors have recommended the payment of dividend at the rate of 10 per cent subject to deduction of tax which will absorb Rs. 2.25 lakhs. It is revealed that the 2,000 KW Turbo-Alternator Set, the acquisition of which was under negotiations with the Madhya Pradesh Electricity Board, would commence around August 1962.

Saugor Electricity Supply Company Limited shows a profit of Rs. 77,550 after making provision for taxation, depreciation, etc. A sum of Rs. 33,000 is set aside towards general reserve. The Directors have recommended the payment of a dividend at the rate of 6 per cent subject to deduction of tax, which will absorb Rs. 18,000.

Banaras Electric Light and Power Company Limited recorded a profit of Rs. 6.2 lakhs from which a sum of Rs. 1.93 lakhs was deducted against contingency and development reserve. A sum of Rs. 2.35 lakhs was taken out for general reserve. The Directors have recommended the payment of a dividend at the rate of 11 per cent subject to deduction of tax, which will absorb a sum of Rs. 1.87 lakhs. The company, after negotiations with the Uttar Pradesh State Electricity Board, has succeeded in getting a small amount of standby loan from Rihand supply which has to certain extent eased the situation. Efforts continue to be made to enhance the amount of load the company will take from the Rihand supply.

supply.

Bareilly Electricity Supply Company Limited shows a profit of Rs. 1.72 lakhs. After providing for reserve, the Directors have recommended the payment of a dividend at the rate of 11 per cent subject to deduction of tax which will absorb Rs. 88,000. The Directors reported that on account of foreign exchange problem there was no progress in regard to installation of additional plant. The Company's standby requirements are being met from the temporary bulk supply from the Sarda Hydel Grid. Negotiations are also in progress with the Uttar Pradesh State Electricity Board to enhance the amount of standby. The Company's power station is operating at full capacity naturally leaving little scope for development.

Upper Jumna Valley Electricity Supply Company Limited reveals a profit of Rs. 2.29 lakhs. A dividend at the rate of 13½ per cent was recommended by the Directors. The Directors in their report have expressed concern regarding the possible enhancement of company's operating costs because they have received a notice from the Uttar Pradesh State Electricity Board to the effect that the tariff to the licencee will be enhanced as from July 1, 1962. The situation arising out of this measure is still being examined by the Company.

United Provinces Electric Supply Company Limited registered a profit of Rs. 8.70 lakhs after providing a sum of Rs. 2.22 lakhs towards statutory contingency reserve. A sum of Rs. 2 lakhs was set aside towards reserve for redemption of depreciation and Rs. 50,000 to general reserve. The Directors have recommended the payment of a dividend at the rate of 11 per cent subject to deduction of tax. It is indicated that the first consignment of the new plant has arrived at site at Lucknow. The plant expansion scheme has, therefore, already commenced. Expanding and commissioning of the new plant, the State Electricity Board has agreed to increase the availability of power from the Sarda Grid upto 5,000 KVA.

Agra Electric Supply Company Limited shows a profit of Rs. 3.61 lakhs. After providing Rs. 1.36 lakhs towards general reserve the Directors have recommended the payment of a dividend at the rate of 11 per cent subject to deduction of tax which will absorb Rs. 2.20 lakhs. The Directors are discussing the installation of an additional plant but there seems to be a serious problem of foreign exchange which is holding these discussions; otherwise the company is progressing satisfactorily.

NEW ISSUES

Following are some of the companies that have been granted consent by the Controller of Capital Issues to raise capital.

Indian Refineries Limited, New Delhi, a wholly-owned Central Government undertaking, is to issue further capital of Rs. 9.10 crores (including Rs. 3.85 crores already issued) divided into 91,000 equity shares of Rs. 1,000 each to be issued to the Central Government for cash at par.

Bharat Forge Company Limited, Bombay, a new company, will issue capital of Rs. 230 lakhs in equity shares of Rs. 100 each. Out of this, shares of the value of Rs. 5 lakhs will be issued to Steel Improvement and Forge Company of Cleveland, Ohio, USA. The proceeds of the issue would be utilised for the manufacture of various types of steel forgings.

Indian Aluminium Company Limited will issue (i) 801,276 equity shares of Rs. 10 each for cash at a premium of Rs. 15.50 per share to be issued to the existing shareholders; (ii) 6½ per cent 1971-76 debenture stock for an amount of Rs. 100 lakhs to be issued at par at a premium not exceeding 2 per cent; (iii) sterling debenture Stock of the value of £500,000 to be issued to the Commonwealth Development Finance Company Limited, UK. The proceeds of the issue will be utilized for increasing the production capacity of the smelter at Alupuram from 5120 tons to 10,850 tons per annum and setting up an aluminium foil rolling and finishing mill of the capacity of 2,500 tons per annum at Kalwa near Bombay.

The Titaghur Paper Mills Company Limited, Calcutta, is raising further capital of Rs. 168,07,200 consisting of Rs. 56,02,400 in bonus shares on capitalisation of reserves and Rs. 112,04,800 in equity shares of Rs. 10 each for cash to be offered to the existing equity shareholders at a premium of Rs. 5 per share. The proceeds will be utilised for financing the scheme of expansion and renovation of the mills.

Fiber Glass Pilkington Limited, Bombay, a new company, is raising capital of Rs. 1,19,99,930 in equity shares of Rs. 10 each at par. Out of this, shares of the value of Rs. 61,20,000 would be issued to the foreign collaborators, Rs. 30.60 lakhs to Fibre Glass Limited, of St. Helens, Lancashire, England, and Rs. 30.60 lakhs to Owens Corining Fiberglass Corporation of USA. The proceeds of the issue would be utilised for the manufacture of glass fibred and glass fibre products.

Devidayal Cable Industries Limited, Bombay, will issue (1) bonus shares of Rs. 4.10 lakhs on capitalisation of 'general reserve fund' to a like extent and (2) further cash issue of Rs. 37.50 lakhs in 2,75,000 equity shares of Rs. 10 each and 1,00,000, 9½ per cent (subject to tax) preference shares of Rs. 10 each.

BOOK REVIEWS

PROBLEMS OF INDIAN ECONOMIC GROWTH

Some Aspects of Indian Economic Development, Vol. II: By S. K. Bose: Published by Ranjit Printers & Publishers, Delhi: Pp. 439: Price Rs. 12.50.

The first volume of Mr. Bose's analysis of Indian economic development was reviewed in "The Eastern Economist" dated March 16, 1962. The present volume takes the story further and scrutinises some important facets such as social welfare, community development, rural indebtedness, the co-operative movement, industrial labour and trade unionism, industrial finance; trade and transport; foreign trade and fiscal policy; money, currency and prices and the banking system. The last chapter sets out the achievements of the Indian economy during the past decade.

Mr. Bose has presented his study of the various aspects of the Indian economy in an objective manner without any political slant. He has drawn upon the research material available from several research agencies and has provided for the student in particular up-to-date information on all the foremost economic issues of the day. The approach has invariably been historical; in order to delineate the present position he has explained the developments since independence with particular emphasis in the operations of the first two Plans.

The impartial manner in which Mr. Bose has presented his analysis has not forbidden him to express his opinion strongly on certain issues in regard to which he felt that the truth needed to be told. In the case of the State Trading Corporation, he has come out openly saying that the STC has not always been successful in protecting the interests of the consumers. Quoting from the Third Annual Report of the STC, he has highlighted the fact that where the gap between supply and demand of a product was large, even the mechanism available with the STC was not enough to check blackmarketing.

THE PRICE OF SUGAR

Indian Sugar, Special Number (August 1962): Published by the Indian Sugar Mills Association, India Exchange, Calcutta-1: Editor J. S. Mehta: Pp. 130: Price Rs. 3.

The Indian Sugar Mills Association has brought out its 12th Annual Number containing very provocative articles dealing with the industry. Mr. M. N. Pittie has attempted to prove that Indian Sugar is cheaper than that of any other country, despite the common belief to the contrary. He has shown that the ex-factory price of sugar excluding taxes in India is lower than that of Java, Australia, Louisiana (USA), Hawaii, Commonwealth exporters, Brazil, Nicaragua and Cuba. All the same time, it is conceded that Indian sugar is slightly more costly than that of the Philippines, Mexico and Egypt. The analysis presented by him shows the abnormaly high price of sugarcane as one of the basic causes of the present relatively high domestic price. Again, he has stressed the need for allowing the expansion of the existing units rather than sanctioning the establishment of new ones for keeping the cost of production low. He has quoted chapter and verse to prove that the international trend is for expansion of the existing units; only the Indian Union continues to adopt a policy of increasing the number of units without regard to its implications in terms of the cost structure.

Mr. S. S. Kanoria, in his analysis of sugar industry in East U.P., has set out the deplorable condition of the factories there. Quoting from the Wage Board's report, he has shown that the average profit per year per factory in East U.P. was Rs. 94,000 only while factories in the South commanded profit levels at least ten times higher. The solution for the sugar industry lies, according to Mr. Kanoria, in lowering the excise duty and the cane cess in times of de-control on the analogy of higher prices granted to the industry during control in the past. Mr. Venugopal Naidu has also come to the same conclusion that the domestic price of sugar can be lowered either by reducing the cane price or the incidence of taxation or both. There are a few other stimulating articles as well; they all touch upon the price policy which seems to be the biggest head-ache for the industry today. The research pieces on the technique of manufacturing standard quality raw sugar in the Indian conditions and the problem of low recovery of sugar in the factories of North India are equally interesting. As usual the Annual Number contains up-to-date statistical information spread over 20 pages.

GUIDE FOR INVESTORS

Kothari's Economic Guide and Investors' Handbook of India, 1961 in Two Volumes: Published by Kothari & Sons, Oriental Buildings, Armenian Street, Madras—1: Price Rs. 50.

Kothari's Investors' Handbook has grown in volume over the years to such proportions that the publishers had to split it into two parts. While the first part deals with the balance sheet information of importance for the investors, the second volume deals with the economic surveys of the leading industries. The value of the second volume has been enhanced by the fact that the latest developments in all the major industries are provided by experts in the respective fields. Of great value is the information contained under the head "general information" which deals with the new issues and increases of capital and the licences issued to the new entrants in the industrial field.

The sheer volume of accurate information provided by Kothari's Guide and Investor's Handbook, will justify the price.

A Letter to the Editor

COTTON TEXTILE EXPORTS

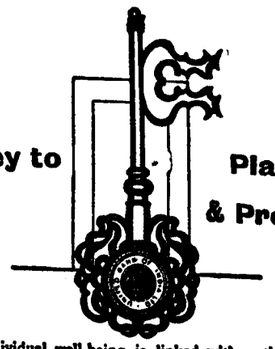
Sir,

My attention has been drawn to the Special Article "The Crisis in Cotton Textile Exports" appearing in your issue of September 21, 1962, wherein I am quoted from my speech at the Joint Meeting of the Import and Export Promotion Advisory Councils.

It is true that I pointed out the relatively very low prices at which Indian cotton was available to the Indian textile industry in 1950-51 and stated that it was one of the important factors which helped augment exports of Indian textiles. Since some of the mills raised a hue and cry against the prices they had to pay last year — which was one of scarcity of cotton — the point I made was that there was some kind of economic — or is it poetic? — justice in the rise of Indian cotton prices; The Indian cotton industry did not suggest raising ceiling prices of Indian cotton when the ceiling was far far below world prices!

The failure of Indian cotton to respond to the growing needs of the country is to some extent the result of Indian cotton having been controlled at artificially low rates for so many years. From your article it appears as if manufacturing efficiency, wages, rationalisation, taxation, reputation for quality of Indian textiles in the export markets etc. are almost secondary factors. You do not even mention the higher price of textiles in the closed internal market as a factor against exports and also as a factor which enables the mills to pay higher than the ceiling prices for Indian cotton and very much higher than import prices for foreign cotton. You seem to suggest that all that is needed to raise exports of textiles is to reduce the price of cotton.

This proposition has only to be stated to be disbelieved! It is overlooked that the lower the relative price of Indian cotton, the less of it will be produced. Cotton cannot be grown to order; it has to be attractive enough to the cultivator in comparison with competing cash crops like groundnuts, sugarcane, pulses, tobacco etc.



One does not see the rationale of controlling the price of cotton and at the same time leaving the prices of competing crops free. The constructive contribution to the export drive can be made by increasing the Indian cotton crop, which can be done only by an increase in the prevalent phenomenally low yield per acre. For this end, one has to get the goodwill and the enthusiasm of the cotton farmer by offering him an adequate price and providing him the tools, seeds, fertilisers, water etc., at the right time and at the right price.

As one who has been advocating the decontrol of cotton prices or at least their adjustment with the prices of competitive crops, I would like to mention that the present ceiling prices on cotton are adequate under the circumstances prevailing; and no attempt should be made by any quarters to circumvent the ceiling prices. At the same time, these prices will remain adequate only if the prices of other competitive crops as well as of articles which the cultivator needs to buy for his own consumption or for producing the cotton crop do not rise further.

Yours sincerely,
R. G. SARAIYA

Bombay,
October 6, 1962.

["The Eastern Economist" does not attach any less importance to the various factors pointed out by Mr. R. G. Saraiya as hindering our cotton textile exports, but holds the view that the price of cotton is the dominant factor. — Ed.]

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

THE EASTERN ECONOMIST

OCTOBER 19, 1962.

The Finance Minister Abroad

MR. Morarji Desai's stay abroad for nearly one month is obviously indicative of the scope of his mission which extended beyond attending the annual Fund-Bank meetings, which, undoubtedly, was its central purpose. His relatively long stay in America and visits to Canada and Japan were essentially intended for a continuation of his earlier chain of talks at the top level in the capital cities of Western Europe for a personal exchange of views on aid accompanied by trade.

But that was not the exclusive area of his diplomatic business in America at least, as the sketchy reports of his meetings with officials and non-official organizations tend to disclose. The impact of foreign economic policy can hardly be dissociated from foreign political policy in material issues and Mr. Desai found himself called upon to explain the Government's policy on certain points on which misapprehension or distrust cannot be presumed to have been removed completely in America. The MIG deal seems to have figured as an important subject in his long conversation with President Kennedy and it is difficult to judge how far the Finance Minister carried conviction with the Press representatives when he tried to assure them that, if it materialised on the scale intended, it would be in no way different from a commercial deal. The questions put to him on India's oil policy, particularly in relation to Russia, were significant pointers to the view taken of this policy by many who are interested in it. But on this question the Finance Minister had a cogent and convincing case to argue. In the final estimation, the preponderance of the conventional sources of supply has not been disturbed.

Mr. Desai's plea for aid with trade — and trade in this context signifies a positive emphasis on the exports of manufactured goods from the developing countries — found a powerful advocate at the Washington meetings in Mr. Eugene Black. Perhaps it was premature to correlate this plea with a switch away from the bilateral pattern of aid agreements which are now being moulded rapidly into project-wise deals. It was quite reasonable to suggest that in the case of tied credits the repayments should be linked with exports from the aid- receiving countries. But this precisely is a tough issue on which many of the capital-supplying countries are reluctant to relent. One serious consequence of this attitude is the compulsion for the aid-receiving countries to make a change in the order of priorities in development programmes from export industry to import-substituting industries, regardless of considerations of production costs or optimum size of plants, involving some misdirection of investment. But all this valid chain of reasoning has not proved effective — for the present at least.

The Fund-Bank meetings provide a very convenient and valuable opportunity for elaborate discussions between the Finance Ministers of the member-countries. Mr. Desai's dialogues with his opposite numbers from the member-nations of the Aid India Consortium undoubtedly gave a place of prominence to assistance to India during the remaining three years of the present Plan. And it was only to be expected that he should impress upon them the disturbance caused to the tenor of the Plan in the current year as a result of the suspense and uncertainty created by the delay in the Consortium's decisions on the contributions of individual countries. There is a reasonable case, which he seems to have stressed, for a broad, if not firm and positive, commitment by the member-nations on the quantum of credits for the remaining three years of the Plan. Such an offer, or assurance of offer, would facilitate a more cohesive formulation of development plans until March 1966. Actual sanctions or appropriations can, of course, be made in the yearly budgets. But since policy for economic aid to the developing countries is presumed to be bipartisan in its essential outline, an overall offer for three years should present no difficulty. How far Mr. Desai's efforts will succeed in evoking a favourable response, there are no means to judge at the moment. But in any event, it should be possible to convene the Consortium's next meeting in January. Such a timing would impart precision to our budget estimates during 1962-63.

Canada has been an unfailing collaborator from the inception of the Colombo Plan. Her assistance for the nuclear plant to be set up in Rajasthan will be quite sizeable. But her present state of external payments hardly admits of substantial aid burdens adding to her strains. It was in Japan that the Finance Minister could devote his energy directly to exploring the possibility of enlarging the area of economic co-operation between the two countries. His plea for liberalizing the terms of credits as regards the interest rates and periods of maturity may bear fruit after a time, but immediate response was not necessarily expected. Mr. Desai's forthright contacts with non-official business organisations were significant as indicative of the need to ease our foreign exchange tightness by the flow of private investment. It is rather curious that Mr. Raj Bahadur's assignment to seek collaboration in Japan for the admittedly low priority project of the shipyard at Cochin synchronized with Mr. Desai's visit. But participation in joint ventures could be directed to other pressing programmes in the private sector and it is to these that the Finance Minister primarily turned his attention. India's policy on foreign private investment rests on the principles of non-discrimination and concessions within a modest range. But this elucidation of policy is certainly not enough to attract foreign capital now under pressure of demand from an increasing number of importing countries. The Government will need to give serious thought to our competitive shortcomings in this sphere of relief in external resources.

Ceylon

MR. NEHRU's visit to Ceylon was essentially a goodwill visit. But even in the course of a goodwill visit it was not to be expected that the Prime Ministers of the two countries would exchange views on international problems alone and scrupulously eschew any question which exercised the minds of the governments and the people of both. Relations between India and Ceylon are running a smooth course except for the solitary issue of the stateless residents of Indian origin in

that country. The problem of these unfortunate victims of statelessness has defied solution for several years past; but defeat cannot be accepted in resolving the long-standing deadlock for the simple reason that the profound human aspect of the issue makes it inhuman to let it drift.

On the eve of his departure from Madras, Mr. Nehru made a frank admission that the Government of India felt deep concern for the misery of these people and he would talk about their future to the Prime Minister of Ceylon, should an opportunity be found for it. However heavily packed his schedule during the brief visit, some time could certainly be snatched to bring the subject within the compass of a general discussion. This was apparent from Mr. Nehru's observation that the issue had assumed great complexity, but, even so, a solution must be evolved. This is not to say that the question was included in the agenda for formal discussion, but an informal exchange was taken for granted.

Against this background, the earlier report of the exclusion of the future fate of the stateless from the talks between Mr. Nehru and Mrs. Bandaranaike served only to create confusion not unmixed with some disappointment. But the subsequent contradiction of this report revealed that an informal approach was made in an attempt to resume an attack on the deadlock. It was least to be anticipated that the two Prime Ministers would enter into the merits of this highly controversial subject without a prior discussion by the officials on both the sides to arrive at as precise a definition as possible of the points of agreement or disagreement. The machinery for a probe by the officials has been set in motion and Mr. Y. D. Gundevia, the Indian Commonwealth Secretary, has been asked to stay on in Colombo for this purpose. This is good news and a welcome result of Mr. Nehru's visit.

But the difficulties which the officials, or at a later stage the Ministers, will have to confront in the arduous task cannot be underrated. They arise from the internal nature of the problem as it has taken its present shape and the political mood in Ceylon which has been deeply coloured by diverse factors. Eight years ago, when an agreement was concluded at New Delhi in 1954 between Prime Ministers Nehru and Kotelawala, a solution to this vexed problem seemed assured within a couple of years. But political change and the powerful tide of complex events defeated all hope and made the question appear intractable. In pursuance of the pact, those among this class who would opt by a voluntary choice for Indian citizenship would be asked to emigrate, while those who would stick to their decision to adopt Ceylon as their homeland would be granted the citizenship status in the island. In between stood a small section of doubtful cases and the remedy for them was to accept repatriation. The Government of India made its position clear that option for Indian citizenship would be allowed on the application of the normal tests of eligibility. In the proceess of screening, the applications of a majority among the eight lakh residents who wanted to choose Ceylon citizenship were rejected on technical grounds — most of them petty or flimsy. The implication was that, if the hardships of statelessness were to be terminated soon for them, their repatriation to India was the inevitable course.

Meantime, more complications have been imported into this unhappy dealock. The new legislation on employment in plantations seeks to deprive them of opportunities for jobs and trade union activity on this grievance has widened the rift between the leftist parties and the Government. The liguistic and religious projections of the issue have added to the bitterness that has been created. Events would not have taken this swift turn but for the propitious climate generated by the prolonged economic crisis in the island. To that was added the element of political upsets, which brought in its wake a threat of instability. Instability now seems on the way to receding. But the overall situation would forbid any Government in Cylon to take a swift decision in resolving the issue at a single stroke. These ingredients in the situation need due appreciation in assessing the prospect of settlement.

The Distributive Trades

THE recent rise in prics brought forth the explanation from Mr T. T. Krishnamachari that the basic cause was the high profit margins charged by the middlemen. The statistical machinery both at the Centre and in the States has hardly any reliable information in regard to the distributive trades and it is, therefore, obvious that the pronouncement of the Minister without portfolio was based upon general impressions. It is, indeed, unfortunate that such a disturbing malday as inflation which has overtaken the Indian economy should be so lightly dealt with. There is certainly need for a detailed examination of the liability of the middle-man for the rise in prices, but it is hardly proper to hold him responsible for a situation in such a sweeping manner. A useful Seminar in this regard was held in Hyderabad between October 11 and 15 during the second meeting of the Central Technical Advisory Council on Statistics. At this Seminar, decisions were taken to encourage the collection of data so as to provide the administrators with reliable information on the profit margins in the various trades.

About two years ago at Jaipur, a recommendation was made at the Ninth Conference of Central and State Statisticians to set up a working group in the Central Statistical Organisation in order to complete the details of a regular survey of the distributive trade in the country. The Working Group accepted the suggestion put forward by the Central Statistical Organisation to conduct a sample survey for this purpose and also recommended that the frame of the study should be based upon the information available at the State level in regard to the administration of the Sales Tax and the Shops and Establishments Acts. At the request of the Working Group, a note was prepared by the Maharashtra State Bureau stressing the need for "the type-study research" as against the "sample survey approach" suggested by the CSO. In the type-study approach, the Maharashtra Bureau had recommended a sample (purposive sample) of 600 shops throughout the country. This small sample was proposed to be intensive in character for estimating efficiency in regard to some of the important characteristics in the domain of the distributive trade. The CSO, however, ruled out the type-study approach because it appeared "to be rather risky, particularly in view of its non-random character".

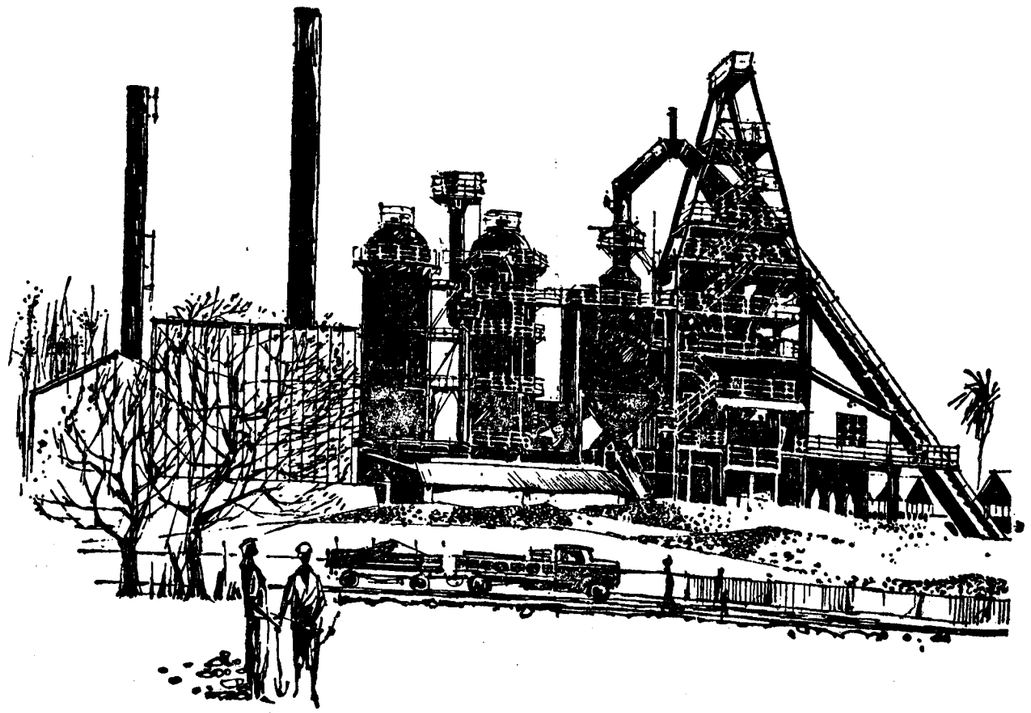
The elaborate market survey technique suggested by the CSO will no doubt take a long time to come to fruition. It is necessary that a beginning should be made in this regard and work should be started in this important field with whatever resources are available. The sales tax records and the registrations under the Shops and Establishments Acts provide a representative source for study. It is possible to make a purposive selection of 600 shops, as suggested by the Maharashtra Bureau, and to obtain the co-operation of these establishments for obtaining some basic information in regard to the burdens of the distributive trades on the price level. There are certain areas where the profit margins are significantly high. This particularly applies to those commodities which are in short supply in the country and also those whose imports have been restricted because of the foreign exchange shortage. A study of the distributive trade in these commodities will apparently be imperfect for lack of complete data. This handicap can be mitigated by comparing the domestic quotations with international prices.

The official agencies will be slow in taking up the challenge to evolve an elaborate framework for this study. They are likely to be meticulous about the degre of reliability which cannot be had without enormous expenditure. The paper submitted by the Gujarat Bureau of Economics and Statistics stressed this point thus: "It has to be recognised that collection of reliable statistics is a costly job. Furthermore, it is possible to control the sample size commensurate with the available resources. But even here, certain reliability at a given level—whether it is district, division, State, groups of States, or All-India level—and for each of the broad classifications by type of business and by type of broad commodity-groups must be ensured and one must be prepared to incur the necessary costs. If this cannot be done, it is better not to take any survey of distributive trade till funds can be found."

This field, however, is now open to the non-official agencies which may make a quick survey of the present profit margins in the various distributive trades without getting involved in elusive niceties. It is recognised that the size of the sample in such "purposive surveys" need not be elaborately large because the administrative errors in large samples are likely to be much in excess of the statistical errors. Keeping down the size of the sample is an asset and not a liability. The Seminar at Hyderabad will have served a useful purpose if it provokes some research institutions to conduct even the pilot surveys to fill the gap in a vital field.

Nutritional Standards

THE snail's pace of the progress recorded during the fifties by the South-East Asian countries, with the solitary exception of Japan, in regard to raising of the nutritional standards of their populations, which presumably prompted the holding of a Nutrition Seminar for the region at Hyderabad last week, evinces that the problem requires for its solution much more relentless efforts and bolder policies than has been the case hitherto. The Hyderabad Seminar laid great stress on proper nutrition education of the more vulnerable sections of the society as a means to achieving the objective of a balanced diet. In suggesting this measure, it appears to have been guided more than anything else by the example of Japan. Since food habits, in the shaping of which family traditions and religious beliefs of the people, apart from the climatic and other factors, have played an important role over the ages, are the hardest to modify, the launching of a nutrition education programme, especially to mould the psychological make-up of the younger generations and of mothers, is a step in the right direction. But in the present-day conditions of South-East Asia, it can have only limited success.



What the South-East Asian nations currently require is not so much of imparting to them a consciousness about the need to have a balanced diet, but the pre-requisite of it—availability of protective foods at reasonable prices. It is common knowledge that their nutritional levels, before concerted attempts were made to raise them, were being depressed for no other reason than that the production of protective foods was not keeping pace with the growth in population. A clear indication of this is available from the study made by the Indian Council of Medical Research a couple of years ago. It showed that between 1943 and 1957, the percentage deficit in the availability of milk and fruits in India, on the basis of the 1944 Nutrition Advisory Committee's recommended allowance of various components of a balanced diet for an average Indian, grew from 45 and 41 per cent to 55 per cent in both the cases. Though no data are available in respect of the consumption of vegetables, the 1943 picture does appear to have very much changed. In regard to vegetable oils and fats, fish, meat and eggs also the position has remained more or less static.

This is an unmistakable proof of the fact that even those sections of the Indian population, which do not lack consciousness about diversification of their diet, have been obliged to consume less of protective foods simply because of shortage of supplies. The imbalance has grown as a sequel to greater resort to consumption of cereals and pulses, the availability of which has improved significantly owing to their production having been stepped up during the era of planning and also through imports.

The phenomenal rise, nearly five-fold, in the prices of protective foods and particularly in the cost of living has further accentuated the imbalance in Indian diet. Add to this the failure of job opportunities to maintain the ratio of income-earners to the increasing population. How within the financial resources available to them, the masses can afford a higher intake of protective foods whose prices would obviously shoot up further if expansion in demand takes place through imparting of nutrition education, is something which is not comprehensible. The crux of the problem is not only a growth of consciousness on the part of the masses to understand the value of protective foods as a means to improving their health, but also provision of the wherewithal by which they can benefit from their newly acquired knowledge. A modification of the patterns of food preparation certainly can help in the attainment of better results from the point of view of nutritional standards, but this raises the question of changing tastes.

No marked progress towards raising the nutritional standards in the South-East Asian countries, or anywhere else, can obviously be achieved unless concerted attempts are made to produce more of protective foods and along with it money incomes of the masses are commensurably raised. That has been the experience of all the advanced countries. It can hardly be otherwise in the case of others. First things have to come first. A pyramid can stand only on its base.

KRUPP

Illustrated on this page is a low-shaft blast-furnace designed and built by Fried. Krupp Industriebau. Operating in Barbil (India), this unit is producing between 80 and 100 tons pig iron per day and is chiefly adapted for small-size, low-grade fuel unsuitable for use in the conventional blast-furnace process.

A World-wide Service to Industry

Exploration of mineral deposits, engineering of mining schemes.
Plants for the production of ferrous and non-ferrous metals.
Preparation and dressing plants for ore, coal and other minerals, chemical plants, cement plants, lime and gypsum plants.
Bridges and hydraulic structures.
Cranes for steelworks, ports and industrial purposes.
Castings, forgings, rolls, magnetic materials.
Cable making machinery.
Machinery for plastics, rubber and edible oil industry.
Can-making machinery.
Diesel and electric locomotives, special purpose wagons.
Giant excavators and bulk handling plants.

THE WEEK'S NOTES

Nepal

REPAIRING THE BREACH

THE OUTBURST of anti-Indian propaganda in the past few days in Nepal ought to be read in the context of the unusual tone of King Mahendra's speech on the occasion of Dussehra. In that speech the King went out of his way delivering a long-winding sermon to India how she should improve her behaviour towards his country if the traditional ties between the two countries were to be maintained. The extent to which attempts to spread hatred against India has gone can be gauged from the burning of the effigy of Prime Minister Nehru right in the vicinity of the border between Bihar and Nepal. This propaganda is accompanied by a bogey of an embargo on trade between India and Nepal imposed by the former. The allegation about the embargo was promptly contradicted by the Government of India. It serves the interests neither of Nepal nor of India to allow this kind of further pollution of their relations to continue.

The proximity between King Mahendra's unusual speech and Marshal Chen Yi's offer of help to Nepal against aggression may not be missed. China's Foreign Minister seized the opportunity of the anniversary of the Sino-Nepalese Border Agreement to make the unilateral offer of protection to Nepal against aggression. It does not require any intelligence to guess that none other than India is named, by implication, as the imminent aggressor against Nepal. It is significant that neither the King nor his Ministers have shown by any public expression their reaction to Chen Yi's insinuation. Perhaps the King and his Ministers meant their silence as an expression of a negative reaction, but what is really important in this attitude is that there is no polite rejection of the offer. This is no doubt evidence of the increasing influence of China in Nepal and the change in the ministerial set-up prepared the ground for it.

It has been stated on behalf of King Mahendra that his Government does not insist upon the handing back of the rebel Nepali leaders now taking asylum in this country. But their presence is at the root of much of the misunderstanding on the part of Nepal. It ought to be realized that it is the King, and the King alone, to whom the Government of India has to direct its efforts for the rehabilitation of cordial relations between the two countries. It would be naive to suppose that he is unaware of the danger implicit in drawing the dragon too close to his bosom. But in the present climate India must exercise effective control on the rebel Nepali leaders and stop them from indulging in using the freedom that is offered to them in this country in the way they choose, although it does not amount to a breach of the law in the formal sense. The traditional free crossing of the border between the two countries and the nature of the terrain make it difficult to give hundred per cent convincing proof that no supply of arms flows from the Indian side. But continued vigilance ought to be exercised on the border. Nepal's position as a buffer State needs to be appreciated properly when she attempts to maintain what she considers a proper balance in her relations with India and China.

The Vice-Chancellors

LOPSIDED DELIBERATIONS

THE CONFERENCE of the Vice-Chancellors was convened in the capital city certainly not for considering at great length only the much-discussed subject of the media of instruction at the university level. So great was the pre-occupation of the Vice-Chancellors as well as of those who spoke at the inauguration of the Conference that this one subject totally eclipsed the other important issues. There is a sad realisation in the country that the policy for education has not received the re-orientation that it urgently required after Independence. The spread of education at a rapid pace and the increasing outlay that is being made on it, and rightly so, would lose much of their meaning and force if proper direction is not given to education in general and its quality in particular. It would hardly serve the real purpose of the advancement of education to contend that education is a State subject and, therefore, the responsibility rests on the State Governments to give it the sorely-needed new direction. At the national level there must be a definite policy which by consent and persuasion can be made acceptable throughout the fourteen States. Beyond endorsing the necessity of extending the first degree University course to a total of fifteen years, hardly any questions of intrinsic importance to education other than the question of medium were seriously discussed at this Conference.

After scanning the view-points on the question of the media of instruction expressed at the Conference, one wonders whether this question admits of that degree of controversy as is usually made out. Many of the States have already proceeded in the direction of introducing the regional language as the medium of instruction in higher education and taking a long-range view it is impossible to resist the conclusion that the regional languages will inevitably occupy their place as the media of instruction. This is not to adopt an attitute of helplessness, but to recognise a force of development which is quite natural. But it is of the utmost importance to take precautions from time to time with continuous vigilance that the quality of education is not allowed to suffer. In this regard, the question is raised that the quality will be conditioned not only by the calibre of the teachers but by the quality of the text books written and prescribed for the students and good text books will not be forthcoming unless there is the assurance to the authors that they will be so prescribed. This is to argue in a vicious circle. No such guarantees are anywhere given and it is in a spirit of service of education as well as of competition that authors come out with their publications and they ought to in the various linguistic regions. It is of the utmost importance that to prevent intellectual isolation and parochial outlooks, Hindi and English must be deliberately fostered as the 'link languages' throughout the country. Their role as link languages can be ensured only if they are made compulsory subjects in the curricula at the secondary level itself and not merely at the higher level.

Civil Aviation

AFTER THIRTY YEARS

HISTORICAL SIGNIFICANCE certainly attaches to a commemorative performance in the original setting, even if that setting might look out-moded by current standards. Those, who are inclined to criticize Mr. J. R. D. Tata's solo flight in the Leopard Moth on October 15, 1962, from Karachi to Bombay to commemorate the first trip of the scheduled commercial air-mail service as futile and eccentric, totally miss the historical spirit behind it. A true assessment of the significance of this flight is to be found in the exchange of messages of greetings on this occasion between President Radhakrishnan and President Ayub Khan. In a real sense this performance gives a measure not only of the tremendous strides made by commercial aviation in India but also of the severe handicaps under which the pioneers and the earlier operators had to labour hard. When Mr. Tata took his pioneering flight thirty years ago with a bag of mail in the mono-engined Moth, there were no radio facilities and air flights were very much of a gamble in the air. Today the situation has radically changed.

During these three decades India has proved by the position which she has occupied on the air map of the world that she has fully justified her geographical and climatic suitability for aviation in a high degree. Air-India today runs a daily service to London and Washington and, besides, it links this country with 25 important cities in 21 countries of the world with different frequencies in the week. This is not its only achievement that can be placed at the top. It has set high standards in every single respect and, in particular, in respect of punctuality and service to the customer. It bears comparison with the scheduled operators of any of the advanced countries in civil aviation. Its capacity for transformation in keeping with the rapid progress of technology is amply demonstrated by its switch-over to an all-jet service of which not all the international operators can boast. The scheduled service which was started thirty years ago was demostic in its area of operation. But paradoxically enough, it is the international wing of India's civil aviation — Air-India — and not the Indian Airlines Corporation which is the real successor to the original domestic airline. It was on the advice of Mr. J. R. D. Tata that Air-India International and the Indian Airlines Corporation were retained as two distinct entities, when the nationalisaion Act was passed by Parliament. This bifurcation has enabled the former to maintain its high traditions. The pressure for the amalgamation of the two has been revived recently, but Government would do well to resist it as it did on prior occasions.

Southern Rhodesia

MAKING AMENDS

BRITAIN WHICH has earned high esteem for the political foresight and generosity with which she expedited the process of the liberation of her colonies in Africa can still rectify her policy of drift in Southern Rhodesia and make amends for the blunder which has been committed. It is pointless for her to cling to the contention that Southern Rhodesia is self-governing and, therefore, there is nothing that she can do to interfere with that country's discriminatory legislation against the African nationals. The theory of the self-governing status of Southern Rhodesia has not been accepted by the US Trusteeship Committee and it is clear that a system of government which is based on the rule of the minority with a subordinate position to the majority of the citizens cannot be regarded as a system of self-government.

The ban which has been imposed on the Zimbabwe African People's Union (ZAPU) and the restrictions which have been clamped on its leaders by means of detention without trial are untenable inasmuch as the alleged acts of violence attributed to it have not been proved and they have been emphatically denied by the leaders of the party. Legally, no new party can be formed by the leadership of the ZAPU professing the same creed and in the result Mr. Joshua Nkoma has taken the bold stand of defying the ban and running the organisation in spite of it. The new constitution is rejected by the majority of the African citizens in Southern Rhodesia for the obvious reason that it seeks to perpetuate the rule of the minority of whites and the promise of gradual conferment of full constitutional rights on the African majority is not acceptable to them for very obvious reasons. In this situation the emergence of the People's Independent Democratic Union (PIDU), as a party of African nationals willing to accept the constitution and prepared to participate in the projected elections, speaks for its real origin. It cannot be argued by any stretch of imagination that PIDU is genuinly representative of the African majority and the contention is hard to refute that it is propped up by the white minority.

The forthright course for Britain would be to appreciate the fact that a constitution of this variety cannot be sustained without creating an explosive situation which may let loose the forces of racial hatred and bloodshed at any moment. The proper course would be to face the opposition of the minority now in supreme command of the affairs of the State and to hold, as the UN Committee urges, a fresh conference to decide the question of a new constitution. The condition precedent to this is the release of the leaders of ZAPU and lifting of the ban on that party. Sir Hugh Foot's resignation from the British delegation to the United Nations ought to be taken as a courageous and sincere warning to Britain against the untenability of the stand which she has taken on Southern Rhodesia. There is still time to take the just and proper action and to prevent an avoidable internal strife in that country.

Scheduled Tribes

EFFECTIVE PROTECTION

THE CHIEF SECRETARIES of the State Governments who will meet in conference here in the second week of November will have on their agenda, among others, the specific question of providing more effective protection than hitherto to the scheduled tribes in respect of their property rights and general welfare. This appears to be in pursuance of the keen realization that the safeguards granted on paper are not fully translated in practice. It is somewhat surprising that the special measures which have been agreed to be taken about these tribes are virtually ignored in some of the States where there are large concentrations of their population —for instance, Orissa. The traditional rights which they hold to landed property and in respect of forest wealth have been recognised on the strength of custom, but in the land surveys hardly any attention is paid to leave them untouched. Complaints to this effect have been endorsed by the Commissioner for Scheduled Castes and Scheduled Tribes in his annual reports. Likewise the scheduled tribes are found to be the victims of the machinations of moneylenders indulging in usurious loans. This, too, is very surprising since in most of the States legislation has been passed to ban usury. If the victimisation still continues the plain inference to be drawn is that the law is not being enforced for lack of complaints being brought before the courts due to the ignorance or fear complex of the people.

It is suggested by the Home Minister who has convened the conference that legislation should be passed to take effect by 1964 to provide firm protection to these tribes against their present unfair treatment. As the case of usurious loans underlines, a greater significance ought to be attached to the enforcement of the law. The outlay on projects of welfare for the scheduled tribes (and castes) has increased nearly more than threefold between the First and the Third Plans. This is an indication of the earnest desire of the Government to direct resources for the promotion of the well-being of this backward class. But it is problematical how far the outlay has been effectively utilised for the purpose for which it is budgeted. In future stricter vigilance will need to be exercised on the use of the funds so allocated. A policy of making allotments of special additional funds for the two groups of backward classes is to be enunciated. But this too will require strict administration. To do greater justice to the scheduled tribes who are more backward than the scheduled castes, wherever there is a combined percentage of reservation of services for two, a separate percentage is to be fixed for the former. The same principle is to be applied to their representation in the local self-governing institutions. These measures will produce enduring results provided they are accompanied by intensive programmes of education for these tribes and their awakening to assert their rights.

Cast Iron Standard Socket and Spigot Specials

for Water, Sewage and Gas Mains

From 3" to 8" size to B.S. 78/1938
80 mm & 100 mm size to I.S. 1538/1960

Manufactured in our modern foundries at Kulti under strict quality control.
Attractive deliveries—from extensions recently completed at our Kulti Works, particularly for 80 and 100 mm. standard specials.

WHAT STARTS ECONOMIC GROWTH?

By ODYSSEUS

THE ATTAINMENT since World War II of independence by many low-income countries, which have expressed the vehement and natural desire to raise their incomes, taken together with the failure of some industrialised countries to keep pace with the dynamic growth of others, has turned the attention of economists to the problem of growth. How does growth start in an undeveloped economy? How is the pace quickened in a developed one?

Three exceptionally interesting new books deal with aspects of this problem and illustrate the enormous progress in clarifying the facts which has been made in the past fifteen years. They are "American and British Technology in the 19th Century" (Camb. Univ. Press. London. 32 sh. 6d.), by Professor H. J. Habakkuk of Oxford, "Factors in Economic Development" (Allen & Unwin. London. 35 sh.), by Professor A. K. Cairncross, formerly of Glasgow University and now Economic Adviser to the UK Government, and "On The Theory of Social Change" (Dorsey Press. Homewood, Illinois. USA. $7.50), by Professor E. E. Hagen of the Massachusetts Institute of Technology.

The first point that emerges from these three authorities is that growth does not spring primarily from capital investment. Technological change is responsible for a far greater increase in productivity. This was clear to the first great modern student of economic growth, J. A. Schumpeter, who said in his "Theory of Economic Development" that although the slow and continuous increase of national supply of productive means and savings is obviously important, development springs overwhelmingly from employing existing resources in a new way, irrespective of whether or not those resources increased.

CAPITAL INVESTMENT?

Professor Cairncross suggests that one reason for the widespread belief in the absolute need of capital for growth was that in those countries of Europe, which suffered extensive physical damage during the war, as well as arrears of repairs and maintenance, capital replacement in these particular countries was urgent, but where these special conditions do not apply, the need for capital must be seen in the perspective of technological advance. Adam Smith understood the importance of technological change, but Professor Hagen observes that his successors gradually turned their attention from it, in order that, by limiting the complexity of their analysis, they could reason more certainly about the remaining factors. Exposition after exposition assumes absence of technological change for the sake of simplifying the argument. As a result, in the formal body of theory, income per head rises only because of capital formation.

Professor Hagen points out that quantitative data support Schumpeter's theory. Of the increase in output per man hour in the USA from 1909 to 1949, it is estimated that not more than 13 per cent was due to increase in capital. About 87 per cent was due to technological advance. This means that if there had been no increase in the quantity of capital used per worker, and if changes in plant had been made only by replacing equipment as it wore out with new equipment, embodying new ideas, the USA would still have enjoyed 87 per cent of the increase in output per man hour that it did. Only 13 per cent is attributable to increase in the quantity of physical equipment used per worker. The point becomes even more dramatic if put the other way round. If the quantity of capital per worker in the USA had been increased as much as it actually was, but without the introduction of new methods, the increase in output per man hour would only have been 13 per cent of what it was!

It is interesting to note that the views of Professors Cairncross and Hagen on what does NOT make for economic growth in underdeveloped countries broadly coincide with those expressed by Colin Clark in "The Eastern Economist" of August 10, and with Our Special West European Correspondent's criticisms of Rostow's "Take-off" theory in the same issue. Professor Hagen shows that if we want to find out why growth starts, we must consult psychology and anthropology, rather than economics. The importance of his book is that, being himself an established economist, who spent two years in the field as economic advisor to the Burmese Government, he returned to the USA dissatisfied with the economic explanations of growth — none of which, he had found, explained why Burma's economy was growing at so discouraging a pace — and decided that he must look elsewhere for the true causes. The resulting combination of economics, psychology, and anthropoly, is erudite, stimulating, challenging, and packed with human interest.

The first economist who tackled the problems of undeveloped countries after the war assumed that any barriers to growth must be economic. They reasoned that almost all individuals in all societies seek higher incomes, and therefore, naturally, improved methods of production. Since knowledge of improved methods is now available to all, people in all countries should be improving production rapidly. But they are not. What prevents them? Since all people desire higher incomes, the barriers are not in themselves but are economic. Hence the economist's job was, they reasoned, to identify the barriers.

INABILITY TO SAVE?

One theory is that of the vicious circle of low income and inability to save. Because income is so low that almost no saving is possible, capital formation is impossible. Therefore, methods remain primitive and incomes low. The circle is: low production, no surpluses for investment, no tools, no equipment, lowstandard of production. Or as Professor Ragnar Nurkse said: "On the supply side, there is the small capacity to save, resulting from the low level of real income. The low real income is a reflection of low productivity which, in turn, is due largely to lack of capital. The lack of capital is a result of the small capacity to save, and so the circle is complete."

This hypothesis may seem axiomatic to a Westerner, for he may feel that at the level of income in an average Asian country, he himself could not live, much less save. At such low incomes, he assumes, all income must be devoted to keeping alive. This, however, is subjective reasoning. Observation of the income structure of low income countries shows that their distribution of incomes is more unequal than in high income countries, especially if the comparison is made after payment of direct individual taxes. It follows that if the mass of the people in low income countries have enough to live on, then the higher income groups are, a fortiori, able to save if they wish to. Observation also shows that even the lower income groups either save some fraction of their incomes or spend it on purposes unconnected with mere keeping alive, e.g. on village festivals, weddings, or on silver anklets, or other adornments, for their wives, or on contributions to temples.

Professor Hagen also reminds us that low income societies often maintain sizeable armies, and, he might have added, many keep up national air lines, circling the globe at vast cost to their tax payers, for the sake of prestige. A society which supports a sizable army (and|or a national air line) could, if it chose devote resources to investment. It is true that there is a subsistence level, below which life is impossible. This, in precise terms, is a level at which deaths equal births, so that total population remains unchanged. The masses in many low income countries must not be far above this. Yet at present income levels, observation shows much spending not at all related to the physical necessities of life. Given the incentives, therefore, the people could have enough to finance the investment needed for a rising income per head.

Another vicious circle argument is that demand is inadequate to justify investment in improved methods. More efficient plants have, it is said, a minimum efficient capacity. Because incomes are too low, the market is not big enough to provide a market for this capacity. So there is no inducement to invest. Without investment, productivity does not increase and incomes do not rise. Professor Hagen retorts, however, that while there is little demand for some products, there are many products already in use for which low income countries do provide markets adequate for factories using modern methods — sugar, rice or flour milling, sandals, umbrellas, textiles, cigarettes, sweets, and many agricultural manufactures. The first textile mill was set in India over a century ago. If more large scale factories are not set up in developing countries, this is probably not because of the size of the market, but because large factories involve radical social changes, and non-traditional entrepreneurial skills in management, selling, and labour relations, which are lacking or in inadequate supply.

Another favourite economic explanation of slow growth is the absence of social overhead capital or infrastructure — roads, railways, power stations etc. — which serve not one but many industries and which therefore provide a springboard for advance over a wide front. Growth is blocked, it is argued, because low income countries cannot afford the huge lump investment for the large projects, which are a necessary base for other projects. While, however, no one disputes that a big infrastructure helps further growth, historically in England where the Industrial Revolution originated the construction of roads, canals, and railways, did not precede, but follow, an increase in the demand for coal, timber, and so on in urban centres. The demand is evidence of growth already proceeding.

Having run through the foregoing (and several other) popular economic explanations of barriers to growth, Professor Hagen has cleared the path to his investigation of the factors that cause a traditional society to become one in which economic growth occurs. He asks why traditional societies are so changeless and stable, and he explains how psychological and social factors can emerge which make for change and growth. He illustrates his argument by reference to the economic histories of the UK, Russia, Japan, Burma, and Colombia.

I will outline his findings next week.

The European Scene

THE FRENCH POLITICAL CRISIS

From Our Special West European Correspondent

PARIS, October 14.

OF the three meetings that have been fixed in Brussels for the next round of the UK-Common Market negotiations, the first (Oct. 25-27) will take place on the eve of a referendum in France that will decide whether General de Gaulle stays at the helm; the second (Nov. 15-17) during a French election campaign that promises to be the most important and uncertain since 1956; and the third (Dec. 10-12) just as France has a new government, which could be of very different composition to the present one. It is of course unfortunate that one of the parties to the negotiations (in a sense, the most important party, in that it is Paris that is opposing most vehemently the British suggestions about trade in Commonwealth produce) should be going through a period of political indecision at this crucial time. It had been feared that the constitutional crisis in France would delay the progress of the talks, and indeed a weaker regime would have pleaded the uncertainty of its mandate as a reason for postponing taking far-reaching decisions before December. In fact, the calendar will be respected unless, against all probability, the first vote, the referendum, produces a majority against de Gaulle, in which case the talks will have to be suspended for a month at least.

A surprise is more likely in the second vote, the general elections, in which event the parties in Brussels would find themselves with a new French delegation for the December meeting. It is far from sure, even so, that any new French government would take a different line in these negotiations from that set down over the past 18 months. The French doctrine on the purely economic issues involved is largely a non-party one, despite all the gratuitous speculation about President de Gaulle's personal attitude to Britain's entry into the Common Market. A new ministry, one that was more responsive to popular pressures than to the general's wishes, would be less inclined to make concessions to Britain in such matters as trade in foodstuffs and sensitive products, for these are questions that affect the standard of living of influential sections of the electorate. The real opposition to granting British and Commonwealth food and other goods favoured access to European markets comes from the peasantry, from business men and the trade unions, rather than from the Elysee. Nor is there any evidence that the French electorate is more anglophile than the supposedly anti-British general. On the contrary a poll taken last month by the French Institute of Public Opinion revealed that 40 per cent of citizens favoured closer relations with West Germany and only 25 per cent preferred intimate collaboration with Britain; the 35 per cent who had no views on the question were, it will be noted, fewer than the cohorts of the Franco-German alliance.

So much for the tale that the Bonn-Paris "axis" and the insistence that Britain sign the Rome Treaty without major change are reflections of de Gaulle's personal policy which a more popular ministry would reverse. In fact, the coalition that is now massed against de Gaulle is composed mainly of European integrationists, who have a conception of European unity that is distasteful, indeed completely unacceptable, in London. Unable to lower the economic price of British membership, they would raise the political price. London would be placed in an embarrassing position, because this same integrationist coalition is also fervently loyal to NATO and to American leadership in Europe, and would thus enlist Washington's support for its plans even more easily than General de Gaulle has been able to do. Though the general, with his suspect designs, has long been the target of the British Press in the Common Market controversy, a Europe that was unifying in the way he opposes would be a much less comfortable place for the British, to precisely the extent that it would be a more convenient ally for the Americans. However, the issue of Europe's political unity is not among the questions at stake in the current French electoral battle, and the crisis could run its course without the evolution of that affair being affected.

Unable, then, to find a pro and an anti-British side in the contest, a section of the British Press has drawn the moral that the eruption of this crisis shows the dangerous instability of the partners Britain will have in Europe. In reality, the instability is on the other side of the Channel, and it is the Continentals that regard with apprehension the divisions of British opinion, as foreboding the entry of an unreliable partner into their association. At best, Mr. Macmillan can patch up an agreement in Brussels and then win elections against Labour's opposition, so that he would have to govern with a narrow majority; at worst, Labour could win the elections and then repudiate (or interpret restrictively) the Brussels accord. Either way, Britain will be a more unstable member of the European association than the France that is likely to emerge from the present electoral struggle.

Of course, the divisions in British opinion, however stark, refer only to the one question of co-operation with Europe, whereas the French, while in general agreement about the stand to take at Brussels, are divided about the very structure of their state. How grave is their constitutional crisis and what chance is there of it having repercussions on their own, and hence West Europe's, economic security? To appreciate that, one has to divest the dispute of all the vast exaggeration the French habitually bring to their political disagreements, and also to set the general's proposals in the peculiar context of the French multi-party system. Most people had expressed themselves satisfied with the working of the 1958 constitution and indeed the measure of France's economic recovery, the solution of the Algerian affair and the evident preservation of her liberties testify to its compatibility with a progressive and free society. De Gaulle's opponents pay him the generous compliment of saying that all this is due to his own liberal temper, and that matters might be much less favourable if his high post were occupied by a lesser man. The general replies modestly that anyone would do as well provided he enjoyed popular support, which he himself had because of his past and which another could secure by means of election by universal suffrage. So he suggests a single amendment to the constitution, that would replace the 80,000 local worthies that elected him, by the totality of the French people. Nothing else in the constitution will be changed, the balance of powers between the president and parliament will not be affected, the new mode of election will apply only to his successor, and in any event will not be introduced unless approved by the nation in a referendum. Nothing, he claims, could be more innocent or more democratic.

Unfortunately he chose to forward this scheme by means of a technical irregularity (or what might be one; the jurists cannot agree). Instead of having his amendment approved first by parliament and then by the people, he asked the people alone to endorse it. The people would have had to be consulted in any case; the deputies are objecting to being short-circuited. Not that they would have been able to prevent the amendment for long (fresh elections could have produced a majority favourable to the proposal) and they might not even

have tried to do so. So the violation of the constitution is purely technical, if it exists at all; de Gaulle replies that, being under sentence of death from the Secret Army fanatics, he had to choose the most expeditious course to guarantee a successor (who might be called on at any moment to take over) a moral authority equivalent to his own. Even the pettiest violation of the constitution, reply the old parties, is a bad precedent. This is an unexpected stand for deputies who have repeatedly violated every constitution that has ever been entrusted to them (and not pettily, but grossly), and who violated the present constitution with a clear conscience just lately in granting Algeria an independence denied her by the written law. And since the precedent that is being set concerns consulting the people on a matter that directly interests them, it might not seem so pernicious. However it is on this slender technical basis that the deputies are building their tower of juridical rhetoric.

Leaving the legal texts to whom it may concern, and looking at the realities of French political life, it is plain that the constant danger, the natural inclination one might say of the French, is to fall into the hands of assemblies divided into a dozen powerless parties, unable to agree on anything except the negative task of overthrowing governments. The supposed Bonapartist danger in this country exists only when such assemblies have been allowed to have their way and reduced the nation to confusion and disorder: Napoleon I came from the revolutionary imbroglio, Napoleon III from 1848, and de Gaulle (supposing there is any comparison) from the collapse of the Fourth Republic. Far from parliaments opposing adventurers, it is only parliaments operating in the sterile multi-party system that give them their chance. It is toward such a renewed parliamentary confusion that France would drift after de Gaulle, in the absence of a president armed with comparable moral authority. With a weak president, elected by a narrow college of notables, the letter of the constitution would make no difference, and the parliamentary factions would re-assert themselves, with results no doubt as degrading as in the Fourth Republic.

On paper, de Gaulle's successor will have powers that would make him unique in advanced democracies. He would have the prestige of popular election, the right to dissolve parliament once it was more than a year old, and the power to appeal to the people by referendum (provided he had a government enjoying the confidence of the elected assembly). Folk who imagine that dictators rely on texts, see in this accumulation of powers an invitation to adventure. Yet it is probably no more than the executive requires to maintain the State in a nation incapable of reducing the multiplicity of parties. (Incapable so far: the presidential elections might well offer the hope of polarising parties into two or three coalitions.) Underneath the eloquence about violation of the constitution and the dictatorial danger, there is the familiar struggle beween the French people's wish for a coherent executive and its affection for a patchwork of unorganised political parties.

DO I REALLY NEED A BANK ACCOUNT ?

Of course you do. If kept in a bank, your savings will earn interest. Besides, they'll be safe from theft and misplacement. And a bank account might induce you to save more.

But what happens when I need money for an emergency?

You can easily withdraw - quickly and without notice. Savings are intended for use on a rainy day.

But you know, we don't have much money?

No matter! You can open a savings bank account with the State Bank of India with as little as Rs. 5/-.

Really?

Yes, the State Bank of India. With over 1,000 offices throughout the country, the State Bank of India is serving the nation. And what is more by lodging your savings with the State Bank, you will not only benefit personally, but will also play your part in the development of the national economy.

The State Bank of India?

Yes, the State Bank of India.

STATE BANK OF INDIA
INDIA'S LEADING BANK

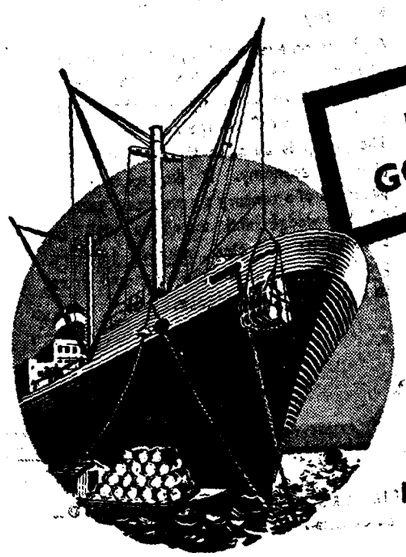
Economic Report from the U.S.

SKILLED LABOUR AND ECONOMIC DEVELOPMENT

By GUY SIMS FITCH

PUERTO RICO, October 15.

As nations in all parts of the world wrestle with problems of economic growth and development, one conclusion has come to the fore with dramatic impact. A trained work force is an essential element in development planning. Without it neither capital nor physical resources can be utilised adequately, and development progress cannot proceed with sufficient speed or effectiveness. Indeed, experience indicates that less than half of the development of the average industrialized country can be attributed to capital investment, important as is this development component. More than half, on the other hand, seems to be the result of increasing manpower skills to put advancing technology to fruitful use.



It is because a shortage of skilled workers has emerged as a major obstacle to the national aspirations of developing lands for economic and social progress, that the United States has called for a high-level International Conference on "Human Skills in the Decade of Development." The Conference, held in Puerto Rico between October 10-12 has drawn high-ranking delegates from more than 40 countries, both industrial and developing. This is a good indication of the importance attached to it.

The significance attached to the problem of worker's skills affects a country's entire socio-economic structure. It arises most obviously in relation to the manning of specific facilities and the use of productive resources, such as factories and mines, farms and public utilities. But it also involves the status and improvement of the educational system, and it extends equally to the social components, such as health and housing programmes, which are an integral part of total development progress. This problem is especially significant for countries that have, or look forward to having, rapidly changing economies. For them, the past is not necessarily a sure guide to the future. New technology and new industries are likely to require future work forces quite different in composition from those of the past or present. For effective use of manpower resources, then, developing country should have some idea of what skills it has available in its labour force and what skills it is likely to need at various stages of industrial and agricultural advancement. This suggests that programmes set up for the education and training of manpower can be most effective when they are geared to over-all national development planning.

This indicates a primary need for *self-help* programmes in the manpower field, no less than in other fields of economic and social development. But developing countries can be helped in this by the efforts of industrial nations to assist them in setting up these programmes and in offering initial guidance and instruction. The activities of the US Peace Corps is indicative of what can be done along these lines.

The developing countries also can be helped by learning from the occupational patterns of industrial countries, and even from those of other developing ones, and in which progress has been more rapid. Due allowance has to be made, of course, for the special factors indigenous to each nation — its own particular requirements, customs, resources and characteristics.

In examining the need for skilled workers in developing countries, the strategic importance of middle-level manpower is apparent. These skilled workers, be they mechanics or farmers, teachers or nurses, are to a large degree to ones who actually must develop a reality by translating plans into constructive action. It is the kind of action on which the highly educated, top-level professional and administrative leaders depend, and which the unskilled labourer is incapable of performing. Yet it is in this very sphere of middle-level manpower, where the need is greatest, that developing countries encounter their most pressing shortage. It is heartening, then, that the Conference here is focusing its attention on the training and utilization of manpower as an essential ingredient for an accelerated economic and social progress of developing nations.

RED LEAD GOES ABROAD

Red Lead, manufactured by D. Waldie & Co. (Lead Oxides) Ltd. in India, is now being exported to Cambodia and the Far Eastern countries. This makes yet another item for India's export drive to earn valuable foreign exchange.

A proved anticorrosive primer Red Lead has been extensively used by engineers for over 100 years all over the world for protection of metal structures, bridges, ships and buildings from rust and corrosion damage.

The Third Five Year Plan
Bird-Heilgers' part in it...

MADE IN INDIA

A SIMPLE PHRASE...
...VITALLY IMPORTANT!

"...special emphasis is being placed on... steel and machine-building and the manufacture of producer goods". The Third Plan very rightly stresses the need for rapid industrial development. Every new project for domestic production creates employment, saves foreign exchange, adds to the national striving for economic independence. The expansion of indigenous manufacture is critically important, and Bird-Heilgers is deeply committed to this decisive aspect of the Plan.

Steel for a solid industrial base

Steel is the very life-blood of an economy. Industries, utilities, homes, all depend on steel. Steady steel production depends, in turn, on the uninterrupted supply of minerals to the nation's blast furnaces. Bird-Heilgers supplies these minerals. Between 1957 and 1961, the group's output of minerals—coal, dolomite, iron and manganese ore and limestone—shot up almost 100% to well over 6,000,000 tons. The group will continue to help meet demand...to feed the blast furnaces with the minerals they must have

"Made in India"—by Bird-Heilgers

A vast range of products, hitherto imported, are now manufactured in India by Bird-Heilgers. The group produces jute goods, paper and board, water treatment equipment, air compressors and springs, castings and fabricated steel. The refractory manufacturing plant is the largest single unit in the East. A factory for the production of coal washeries was the first in India.

The group's engineering units are extremely flexible. They contribute, with equal facility, to projects as far removed as blast furnaces and ceramic plants. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. The agency department handles everything from heavy capital equipment to light consumer goods.

Towards a self-generating economy

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group is alive to the problems of a growing economy. It deploys the full potential of a century's resources, technical knowledge and executive skill to broaden its activities...increase domestic production...join in the national drive to economic independence.

Special Article

NATIONAL INCOME: A POOR START

THE quick estimates of national income for 1961-62, released by the Central Statistical Organisation last week, indicate not a happy start for the Third Plan. This overall indicator of the nation's progress pointed out that the rise in the total supply of goods and services in 1961-62 over 1960-61 was only a little more than 2 per cent. Table I below highlights the sectors in the economy which have not fared well. The major failure occurred in the case of agriculture which showed a decline of 0.3 per cent over the preceding year. The performance of the mining and factory establishments, though the second best amongst all the major contributors, was also not encouraging in relation to the dynamic impulses generated during the past decade; on the average, this particular sector exhibited a rate of growth of about 10 per cent per annum. During the year under review, its rate of rise fell to 6.7 per cent. Since the tertiary sector normally draws its inspiration in operations from the performance in the primary and secondary sectors, it was natural to expect a stagnant rate of rise in the tertiary activities as well. The last column in Table I indicates the contribution to the overall percentage rise sector-wise. It shows that, while mining and factory establishments made the second best contribution, agriculture produced a negative effect. It was primarily the "other sectors" — services and other tertiary activities — which accounted for nearly half of the increment in the national income because the growth of these sectors depended upon the "planned expenditure" and not upon the primary or the secondary sectors.

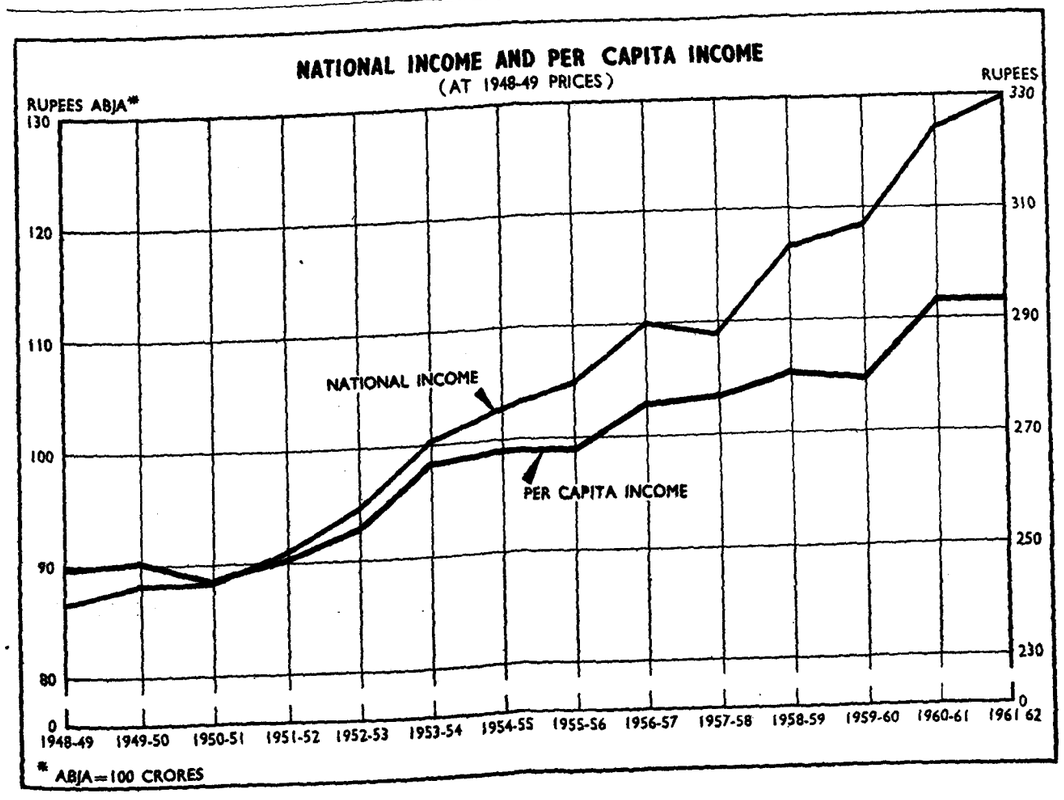

TABLE I.

CONTRIBUTION OF INDIVIDUAL SECTORS TO NATIONAL INCOME

(At 1948-49 Prices)

Sector	Percentage contribution to total national income 1960-61	Percentage change in 1961-62 over 1960-61	Contribution to the overall percentage rise in 1961-62 over 1960-61
1. Agriculture (proper	39.2	(—)0.3	(—)0.1
2. Mining and factory establishments	9.2	6.7	0.6
3. Communications	0.5	5.2	neg.
4. Railways	2.5	6.6	0.2
5. Organised banking and insurance	1.0	12.6	0.1
6. Other commerce and transport	15.3	3.7	0.5
7. Other sectors	32.3	2.9	0.9
All Sectors	100.0	2.2	2.2

This gloomy start of the Third Plan imposes additional burdens on the succeeding years in the sense that, if the broad objective of attaining more than 30 per cent rise in the national income during the Plan is to be achieved, in each year during the next four, the economy will have to exhibit the dramatic rate of rise of 7 per cent per annum. It is to be conceded that there have been certain years during the last decade when the national income in real terms did rise by more than 7 per cent and there is every possibility of the economy showing an improvement over its past performance in some years, particularly if the monsoons shower their

blessings. But as things stand today, the chances for the economy to make up the loss are slender. Already there are indications that the Plan will have to be pruned because of various shortfalls — particularly of foreign exchange — and, therefore, it is patent that the economy may not tread the path set forth in the Third Five-Year Plan.

Table II and the graph bring out in a dramatic manner the degree of stagnation registered in 1961-62. The provisional estimates of per capita income (at 1948-49 prices) in 1961-62 at Rs. 292.5 remained the same as for 1960-61. In other words, all the increase in national output was offset by the rise in population making the nation's standard of living static, on the average. This is indeed disturbing, though even during the Second Five-Year Plan, there were certain years when the static character of nation's level of living was witnessed. The major stumbling block continues to be the agricultural sector, as indicated above; unless something drastic is done, the picture may not take a sanguinary look.

Certain non-official estimates during the last week tried to impress the student of economics in this country by making out a case that the real rise in national income was only 1.9 per cent and not 2.2 per cent as indicated by the Central Statistical Organisation. The difference between these two estimates is not so large as to cause a stir, especially when both the official and the non-official estimates are based on meagre evidence in the tertiary sector in particular. The unofficial estimates, however, deepen the gloomy colour of the economy without making any positive contribution to our knowledge. Another fact which must be taken into consideration is the degree of margins of error to which the estimates for each one of the sectors is subject. Table III below, taken from the final report of the National Income Committee, shows that for many sectors the estimates prepared by the Central Statistical Organisation might be wide of the mark by 33 per cent. The unofficial estimates are not in any way better. When the margin of error in the particular sectors is so large, a small difference of 0.3 per cent between the official and the non-official computations ceases to have any real meaning.

TABLE II.

NATIONAL INCOME AND PER CAPITA INCOME

(At 1948-49 Prices)

Period	National Income		Per Capita Income*	
	Rs. Billion**	Index Numbers (Base: 1950-51 : 100)	Rupees	Index Numbers (Base: 1950-51 : 100)
1950-51 ..	88.5	100.0	247.5	100.0
1951-52 ..	91.0	102.8	250.3	101.1
1952-53 ..	94.6	106.9	255.7	103.3
1953-54 ..	100.3	113.3	266.2	107.6

** 1 Billion = 1,000,000,000.

TABLE III.

SECTOR MARGINS OF ERROR

(Conventional Series)

Sector	Per cent
1. Agriculture, animal husbandry and ancillary activities	20.0
2. Forestry	25.0
3. Fishery	25.0
4. Mining	10.0
5. Factory establishments	10.0
6. Small enterprises	33.3
7. Communications (post, telegraph, and telephone)	10.0
8. Railways	10.0
9. Organised banking and insurance	10.0
10. Other commerce and transport	33.3
11. Professions and liberal arts	33.3
12. Government services (administration) ..	10.0
13. Domestic service	33.3
14. House property	33.3

That the conventional estimates inflate the national income was disclosed by the National Income Unit of the Central Statistical Organisation in a publication released last year. "The Eastern Economist" carried a Special Article in its issue dated November 10, 1961, pointing out that the new series fell within the broad margin of 10 per cent stipulated in the final report. The fact to be noted was that the revised estimates were lower than the conventional series indicating that there had been a certain degree of overestimation in the computations.

A successful businessman knows that a bright office is the first step to winning the confidence of clients and customers

So, get down to brass tacks and keep the brass articles and fittings in your office bright as new with a regular Brasso polish. Brasso, available in large tins, is easy to use and economical too.

L.I.C. and the Madras Judgment

By CROESUS

AFTER the severe psychological impact on the insuring public of the recent Madras High Court judgement in connection with the settlement of a claim under a policy on the life of a deceased insured — N. Rajaratnam Nadar — the least that the Life Insurance Corporation could do was to pay the claim, although, technically, it was not required, as per the Court's orders, to do so, and to reassure the public at large and the policy-holders in particular that the L.I.C. regards it as its paramount duty to meet the just claims of every policy-holder. And, be it said to the credit of the Corporation, it has done both promptly enough. At a press conference, last week, the Chairman of the L.I.C., Mr. B. K. Kaul, disclosed that the Corporation had already settled the claim of Rs. 50,000 in respect of the late Nadar's policy. He also declared that "it is the firm policy and obligation of the Corporation to pay the just dues of policy-holders whose moneys are entrusted to its care."

In this connection, Mr. Kaul appealed to the public not to consider the Nadar business as a case to illustrate the intention and policy of the L.I.C. and explained at length the circumstances leading to the earlier repudiation of the claim. He pointed out that what had been repudiated was the claim in respect of only the 13th policy of the deceased, his other 12 claims having been duly settled on maturity. The repudiation in this case, it was pointed out, was "on the basis of available evidence in regard to suppression of material information and not on limitation — a plea which came up only at the Court stage." Unfortunately for the L.I.C. — but not altogether unjustifiably — the brunt of the criticism was that, after having itself slept over the matter for three years, it did not lie in the mouth of the Corporation to raise the limitation plea and on that ground to repudiate the claim. To many, it must have seemed, repudiation was bad enough, but raising the plea of limitation to repudiate (although the supression of material information was raised, it received relatively scant emphasis) was worse. It led many policy-holders (even existing, let alone the prospective) to apprehend that any pretext might be seized by the Corporation in future also similarly to repudiate a policy-holder's claim, and I have reasons to suspect this court case has distinctly slowed down the tempo of underwriting new business, especially in the Southern Zone.

Clearly, for any nationalised undertaking, this is a serious setback. Any false move may easily shatter public confidence, but to restore it is a really Herculean task. In a democracy, it is but natural that nationalised undertakings tend to be judged not so much by their achievements, where they exist, as by their lapses, if any. For example, people seldom speak of a train coming on or ahead of time, but lose no time in complaining of late arrival, even if it be only once in a way or a chance occurrence — not that this is the case yet in our country, though! All efforts must, therefore, be directed towards restoring public confidence in the L.I.C., which has a vital role in garnering savings, on the one hand, and aiding the country's economic development, both in the public and the private sectors, on the other. For this purpose, let me note down here the special points about the L.I.C. that Mr. Kaul stressed at his press conference, together with my comments on a few of them.

After spelling out the firm policy of the Corporation in regard to settlement of claims of policy-holders, the L.I.C. Chairman made it very clear that "on the plea of limitation, the Corporation is not ordinarily guided by considerations of the claim being barred by efflux of time in its decision to admit or repudiate liability" and that "many claims have been admitted and paid on the merits of the case "long after the period of limitations had expired!" According to him, thousands of families have received payments under life assurance policies, even though, in quite a few cases, claims were time-barred. One wished he had also given the number of such cases. However, he pointed out that, during the year 1961, the Corporation had paid out over 27,000 claims amounting to about Rs. 8 crores as death claims, whereas the number of claims repudiated during the year was only 334, being 1.24 per cent of the total number of claims.

Looked at purely from the human angle, the Nadar business has undoubtedly left a bad taste in the mouth. Although it is true the public did put up with similar cases of attempted repudiations before nationalisation of life insurance, it cannot be expected to do so now under a Socialistic Pattern of Society. Least of all, a public corporation is not expected to look at only profits, although the economists — spokesmen of the Socialistic Pattern of Society who once swore by it, do not seem to think so any longer — but also — indeed, more so —, the human aspect. Where a decision on mere technical grounds adversely affects a person, the argument goes, technical niceties should be ignored and the human element respected, even if this might entail a loss to the Corporation. This sort of latitude is understandable in cases — which, by the way, are a majority — where the policy is a small one and relates to a poor man whose only life's savings it may constitute, although, even here, one should be cautious in condoning deliberate acts of mala fide, if only in the interest of other similar policy-holders.

But I do not know how many have asked themselves the really relevant question whether the Nadar claim falls under the category of cases which ought to excite public pity on humanitarian grounds. Without batting an eye-lid, one can say, this does not constitute such a case, whatever may be the other principles involved. For, here is a policy-holder who could afford to take 13 policies, the last of which alone amounted to Rs. 50,000 and who had, at least prima facie (I say this, because the fact could not be conclusively established) stayed at a sanatorium, a fact he allegedly failed to disclose at the time of taking his last policy. Surely, when the investigating official came to know about it, it became his duty to apprise the Corporation and that of the Corporation, in its turn, to ask why the claim in question should not be resisted. But where the L.I.C. tripped up — and it did so very badly, I am afraid — was in taking its own time, so much so that limitation period for the policy-holder's nominees to put in the claim was over and in not having carefully cross — checked the records of all the previous 12 policies of the deceased. (Obviously the L.I.C. could not have done the latter, as it had still not come into being, but its predecessor

company should have done it.) The Corporation officers readily recognised this and Mr. Kaul, for his part, also did not hesitate to own up the lapse. Their assurances that there was no intention to victimise were good enough. What is more, besides what he stated at the outset, generally, that "since nationalisation of the industry and the setting up of the Corporation, a number of steps have been taken to review periodically outstanding claims and to ensure speedy settlement of claims which do not require time-consuming investigations", Mr. Kaul also gave a categorical undertaking that the Corporation would advise the policy-holder or his nominees in good time to enable the latter to contest the repudiation, if any, if it felt that such a step was called for.

A point that arises here is whether, even in case investigations are found to be necessary, so much time —as long as three years—is needed. From what the Corporation officials stated at the press conference, some claims require unduly time-consuming investigation. Delays, it was pointed out, occur mostly in early claims which are under investigation, on account of reasons beyond the control of the Corporation. Reluctance and even refusal of the part of various agencies — even hospitals, medical officers and others—to provide the necessary information to the Corporation and inadequate, and even absence of, co-operation from the claimants, it is stated, lead to inevitable delays in the settlement of those claims where it is essential for the Corporation to make thorough enquiries before it can part with its funds, which—and this is liable to be often overlooked —are after all a co-operative pooling of the hard—earned savings of lakhs of policy-holders. This charge of non-co-operation or inadequate co-operation on the part of certain quarters raises a new issue as to whether or not, whenever such investigations become necessary, all those whose evidence or services the LIC may deem fit to seek or requisition shall be statutorily required to extend their cooperation to the LIC.

Further, simply because, on account of some peculiar circumstances, the Nadar case put the LIC in a somewhat unfavourable light, the Corporation cannot afford to relax its vigilance. It is necessary, as Mr. Kaul himself observed, for the Corporation to exercise vigilance and see to the utmost extent possible, that claims, especially early claims which are considered to be fraudulent, or in respect of which material information has been suppressed, are not dealt with casually. In order to be fair to the larger body of its policy-holders, the Corporation ought to settle such claims only after convincing itself that the suppression of material information is of no consequence, or that the investigations do not provide proof of any such information having been suppressed.

It is surprising that all this should still be neces ary, after elaborate answers are given to the fairly searching questionnaire, which makes a proposer recall the history of not only his parents, brothers and sisters, alive or dead, but of all his ancestors before a policy is issued and a systematic medical examination also precedes it. But human nature being what it is, the answers are not honest and straightforward always, or, at any rate, in all cases. If one wants to withhold any vital information, no questionnaire or medical practitioner can elicit or get at it. It is also quite possible that, at the time of filling in the policy questionnaire or medical examination, a prospect may be perfectly normal case, or that he or she may be genuinely unaware of family illness. In either case, however, the consequences to the Corporation would be the same, in the event of something happening to the prospect after he or she has become a full-fledged policy-holder. In short, ever so many imponderables may supervene,even after every conceivable care has been exercised to see that nothing is allowed to go by default. It is not humanly possible to visualise every contingency in advance and so, perhaps, one must need go on improving and improvising all the time, but always keeping in view the essentially human aspect of the matter. After all, has not the LIC a lot to do with human lives?

Nagarjunasagar Project

THE projects assisted by the United States aid at once reveal the highly labour-intensive aspect of which the Nagarjunasagar Dam in Andhra Pradesh is a typical instance. As many as 30,000 people are working on it at present. This will be one of the tallest and the largest masonary dam in the world, but ironically enough one notices children carrying heavy loads which they under no circumstances should be allowed to carry. That labour laws should be flouted like that is really saddening. When work on the project reaches its peak, it is estimated that employment will reach 1,300 technical, 1,650 administrative, 10,500 skilled and 110,000 unskilled workers, a total of 123,450 persons. Apart from the employment of child labour, in the labour colonies no proper amenities exist in regard to public health and medical facilities.

So far as the construction aspect is concerned, the progress is rather slow. A project which was expected to be completed in 1968-69, it now seems, will be completed two years later. The work on this project started in 1955. So far, the construction of the dam has reached a height of about 150 ft. in the blocks in the flank portions and over 60 ft. in the spill-way blocks. The excavation of the main canals is in progress, but it is behind schedule. In terms of quantities, 45 per cent of the total work load for masonary dam, 36 per cent of the total workload for the exacavation of the right main canal and 30 per cent of the total workload for the excavation of the left main canal has so far been done.

Difficult terrain is said to be responsible for remaining behind the schedule. The cost of the project is now estimated at Rs. 91 crores in the first stage itself. And this has happened in spite of all the economies that have been brought into existence by way of replacement of concrete by cement mortar, procurement of surplus machinery from other projects and savings by departmental working and public participation. There is no denying that there has taken place a rise in wages and in the cost of materials, but not to the extent that it should warrant a drastic change in the estimate itself. Not long ago, the estimated cost of the first stage was put at Rs. 79 crores. The total cost of the project would be Rs. 140 crores. Obviously it seems that from the very beginning there has been no proper planning, but on the other hand incompetent execution. Formerly in matters of construction, a Control Board was in overall charge of the project including its technical, financial and administrative aspects, but with the taking over of the Administration by the State Government matters continue to be delayed. Then it is considered that mechanical devices from the very outset perhaps could have quickened the pace of the project, but versions differ on this matter. However, it is heartening to see that more of the mechanical devices are now being put into execution. As far as public participation is concerned, it is welcome. But there seems no justification for granting extra privileges to the Bharat Sevak Samaj. For instance, no security has been obtained from this body while granting the contracts which has been done in the case of contractors and the labour co-operatives.

The project in execution in the first phase consists

of the construction of masonary dam 364 ft. high and two canals, one on the right side for a length of 135 miles and another on the left side for a length of 108 miles, to irrigate in all an extent of 2.2 million acres, partly for paddy and sugarcane and other millets. Two flanking, earthfill dams, with a length of 6,500 feet will complete the main impoundings structures. The reservoir will have a capacity of 5,400,000 acre feet. The quantity of food production anticipated is 0.8 million tons per annum under the present phase of the scheme and 1.2 million tons in the ultimate scheme. The second stage involves the raising of the masonary dam by 40 feet taking it to 404 ft. The earth-fill dams in this stage will be raised by 45 ft. and the total storage capacity will be increased to some 9.2 million acre feet. Eight 50,000 kilowatt turbine generators will also be installed at the base of the dam as part of the Stage II development. Although a long way off, the hydro-electric development is expected to contribute 400,000 kw. of electric power to the State's severely limited supply when the second stage is completed to permit expansion of present and establishment of new industries. This then would help solve the unemployment problem to a considerable extent. The completion of the first stage would help in providing irrigation facilities to the waste and uncultivated land. The project no doubt has huge benefits in store for the people of this area, but the only complaint is that it is moving too slow. Cannot the State Government rise to the occasion and at least see to it that it is completed within a stipulated period? The project has received Public Law 480 assistance amounting to Rs. 29.5 crores. It now rests with the authorities concerned to give it the necessary tempo of execution.

Business Notes

Sugar

A WELCOME STEP

THE UNION Ministry of Food and Agriculture has shown commendable realism in withdrawing totally the 10 per cent cut on sugar production, imposed last year, in view of the huge carry-over stocks from the previous season, and only partially restored in U.P. and Bihar in May last to enable the industry to crush the surplus cane supplies. The withdrawal of the cut was warranted not only on account of the fears that the sugarcane crop this year—although the area under it has gone up further by about 92,000 acres—would be lower due to the adverse weather conditions that have visited the main cane-growing areas of North India, but also owing to the fact that a target of 5 lakh tons has been fixed for sugar exports during the next year. Domestic consumption too has shown more-than-expected increase and with nearly 3.6 lakh tons of sugar exports this year, the carry-over at the beginning of the next crushing season, starting in November, will not be much in excess of 7 lakh tons against a normal carry-over of 5 lakh tons.

The situation, especially in regard to exports, needs to be kept under close scrutiny for, if sugar output next year fails to reach about 27 lakh tons, it might have very adverse effects on the prices of the commodity in the internal market. The increase in the domestic demand for sugar next year may not be of the same order as this year because approximately two lakh tons out of the likely total increase in releases for internal consumption of the order of 4.5 lakh tons this year can be attributed to absorption by the trade pipeline after the removal of the price, distribution and movement controls on the commodity. Instead of the domestic consumption next year going up due to increase in population, it may even slightly show a decline. Even so it can be anticipated to be approximately 24 lakh tons. If exports next year have to be 5 lakh tons, production cannot be allowed to fall below 27 lakh tons. Only then the industry will be having a normal carry-over at the end of the next sugar season.

With near-normalcy having been restored now in the sugar industry, it is perhaps, time to abolish the one control that remains on it, i.e., the control on monthly releases. No doubt, releases during the past two months have been stepped up from 2.25 lakh tons to 2.5 lakh tons, but the recession in prices has not been of the warranted magnitude. The firmness which the sugar market experienced during the three months before the decision to step up monthly releases was taken, has not been wiped as yet.

E.C.M.

AN ANALYSIS OF U.K. MEMBERSHIP'S EFFECT ON INDIA

IN AN outspoken address to the Indian Council of World Affairs, Bombay branch, Mr. Woodrow Wyatt, the well-known Labour Member of the British Parliament, completely endorsed the nearly lone stand of 'The Eastern Economist' in this country that, apart from a transitional state of disturbance, India would, in the long run, reap the benefits of enhanced trade via the UK, if Britain should join the Common Market. India's trade with the UK, asserted Mr. Wyatt, would not be adversely hit by Britain joining the Common Market and proceeded to substantiate his statement by giving a break-up of the latest Indo-British trade figures. He claimed that, while 65 per cent of India's present exports to the UK would not suffer any adverse effect, some 16 per cent would actually benefit; for the rest, he felt, while the effect on 6 per cent of our exports was uncertain and 5 per cent might be adversely affected to some extent, only 4 per cent would really suffer.

This, obviously, is too pleasing a picture to be accepted readily. Moreover, from India's point of view, it is perhaps necessary not only to look at the problem as Mr. Wyatt has done (taking exports of individual commodities to the UK as percentages of her total exports to that country), but also to consider it from the point of view of what percentage of India's total exports the exports of a given commodity to the UK constitute. For example, while textiles might constitute less than nine per cent of India's exports to the UK, they constitute around 60 per cent of India's overall exports.

By and large, however, as Mr. Wyatt maintained, India would stand to benefit by Britain's entry into the Common Market, inasmuch as it would secure for India, as 'The Eastern Economist' has pointed out ere now, new markets which she never had before. The ECM with its 220 million rich people, to quote Mr. Wyatt, would indeed be a substantial market. The Labour MP also made the point that, after joining the ECM, Britain would become more prosperous, and, therefore, be able not only to buy more from India but also to give greater aid to her. He further seemed to convey, rather significantly, that, whether Britain joined the Common Market or not, India could not escape for long higher duties on her exports to the UK; on the much debated exports of textiles to the UK, already, he indicated, the same British interests who are opposing Britain's entry

into the Common Market, even as some sections in India, are now demanding imposition of tariffs on Indian textiles. In short, he opined, there was not much sense in India opposing the UK's entry into the Common Market. (In any case, it was too late, he added). On the other hand, he exhorted India to concentrate on capturing the expanded ECM market by a thorough re-orientation of her export promotion methods. And this, again, is what 'The Eastern Economist' urged as long ago as in July, 1961.

Bokaro Project

NEED FOR EARLY AID

BEFORE RENDERING any aid for the Bokaro Steel Plant, the Americans want to be satisfied that steel would be manufactured at a competitive price at this project and that uniform supply of raw materials would be assured. They also want to be assured that the mistakes made at Bhilai, Durgapur and Rourkela would not be repeated. This is the impression one forms after a tour of India's development projects receiving U.S. aid and the site earmarked for this project.

A good deal of spade work has been done by the Hindustan Steel Limited on this project which would cost totally Rs. 230 crores. The foreign exchange element for this would be Rs. 84 crores. Some of the details of this project have already been dealt with in the last week's issue of "The Eastern Economist" in the Capital's Corridors. Here it is to emphasise that the site located is an ideal one. The raw material position appears to be quite satisfactory. Iron ore, as explained by Mr. Dani, Officer on Special Duty, could be had from Kiri Buru, Megha Hatha Buru and Baldila mines. The site is on the bank of the Damodar River and so there can be no danger of any shortage of water supply. Coal is plentiful as the site is within only 40 KM of the richest coking coal belt of Jharia. The electrical power required for the operation of the steel works at Bokaro and for use in the township will be supplied by the Chandrapur Thermal Station, a U.S. financed project. About 60,000 KW have been reserved for use for the first stage works at the Bokaro steel works, from one of the generators being installed at Chandrapur and any additional power required for further expansion will be supplied by the Damodar Valley Corporation. The problem of the coal wagons returning empty from Bhilai and Rourkela factories is also likely to be obviated as with the setting up of this plant, the wagons returning from Bhilai and Rourkela will be in a position to carry iron ore from these areas.

The position hence in regard to the setting up of this plant seems to be satisfactory in every way. It would be no exaggeration to say that within 10 to 15 years the area around Bokaro will become the Ruhr of India since the overwhelming probabilities are that it will attract a number of industrial plants. All said and done, the need at the moment is for early aid because more steel would be required for various industries as the years pass by which the existing plants even when expanded would not be in a position to meet. It is, therefore, only to be hoped that the report of the American experts' team on which depends the decision about this project would be favourable. If American aid could be supplied by the end of the year, there is a possibility that the first of the three blast furnaces might go into production by the end of 1965. There is a very strong case why America should come forward to provide aid for this key project as she has done in the various sectors of India's economy.

Package Programme

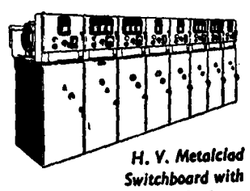
AN ASSESSMENT

WHILE THE objectives of the Intensive Agricultural District Programme, at present in existence in 15 districts, are laudable, it is wonderful if full use is made of the facilities offered and whether the programme is being implemented in a fully satisfactory way. It is partly because of the reason that there is lack of adequate personnel to administer the programme and partly because of the fact that limited publicity has been given it as yet. The primary objective of the programme is to show that agricultural production can be increased through improved farming practices, adequate drainage and irrigation, efficient use of chemical fertilisers and improved seeds and more adequate marketing facilities, etc.

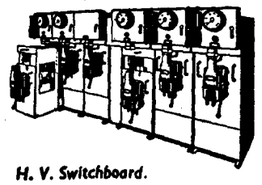
In the Saragaon village of the Raipur district in Madhya Pradesh, the cultivators explained to a party of journalists visiting this place that their financial needs were not adequately met. While a farmer needs about Rs. 1,500 as a medium-term loan to meet his requirements, he was being given only Rs. 250 as a short-term loan, repayable in a year's time. This was obviously insufficient to bring about the necessary improvements in their farming techniques. Then again only meagre facilities existed to ensure a uniform supply of water for irrigation purposes throughout the year. The breed of cattle was also very poor and hence the land could not be ploughed deep. There was also lack of godown facilities. The immediate need, therefore, appears to be to provide better quality cattle and adequate credit and irrigation facilities. Ford Foundation assistance is available for all this and needs to be utilised effectively. The U.S. assistance for FY-1963 totals $45,000. The total contemplated assistance for the Raipur district is estimated at $203,000. All said and done ultimately it would depend on the success of this programme how far we will be able to achieve the Third Plan target of 100 million tons of foodgrains. The

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)



Notice is hereby given that the Board of Directors of this Company have declared payment of an Interim Dividend on the Company's Preference Stock for the year ending 31st March, 1963 at the rate of £2-14-8.16/49d. per cent less income Tax at 7s. 9d. in the pound equal to £1-13-6d. per cent. Payment will be made on 30th November, 1962 to those stockholders whose names are registered in the Company's Stock Register on 13th November, 1962.



Applications for transfers received in this Office before 12 O'clock noon on Tuesday, the 13th November, 1962, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above dividend.

New DeLuxe Champion Tyres

GIVES MORE KILOMETRES PER RUPEE INVESTED

As an end product of over 20 years experience in the manufacture of tyres in India for Indian road conditions, and backed by Firestone world-wide technical research, the Firestone New DeLuxe Champion is a tyre exclusive in quality and construction. The specially compounded wear-resistant tread and strongly reinforced cord body ensure more trouble-free mileage—means more kilometres per rupee invested.

Your Mark of Quality

Raipur District land is amenable to double cropping. So every avenue should be tapped to raise in addition to paddy, groundnut and other suitable crops that can be effectively raised on this soil.

At the end it needs to be recorded that the district of Raipur with the coming in of this package programme has benefited to a certain extent. The cultivator perhaps would have been worse off but for this programme. It goes to the credit of this programme that cultivation of wheat has become known to many cultivators and there are plans to bring more area under it. Similarly, the growing of vegetables and fruits is also becoming quite common. Contour bunding as a water conservation measure, previously unknown in this district, is now appreciated, in more or less all the villages where this programme is being administered. The importance of veterinary service to improve animal husbandry is also being appreciated and many poultry units have been established in the area.

New Issues

BHARAT FERTILIZERS

THE BHARAT FERTILIZER INDUSTRIES, at present a private limited company, but envisaged to be converted into public limited concern very soon, is expected to enter the market early next year to raise from the public subscriptions for its share capital. The present authorised capital of the company is Rs. 25 lakhs. It is proposed to be doubled to Rs. 50 lakhs on conversion into a public limited enterprise. The paid-up capital is envisaged to be raised from Rs. 10 lakhs to Rs. 25 lakhs, all in equity shares of Rs. 100 each. Of the new capital to be issued, shares worth Rs. 2.5 lakhs would be subscribed by the directors, their friends and associates. The balance Rs. 12.5 lakhs worth capital is proposed to be offered to the public for subscription at par.

The proceeds of the issue are to be utilised for financing the setting up of the company's new granulated fertilizers manufacturing factory at Thana, near Bombay. The company at present manufactures fertilizers in powder form. Land for the Thana factory has already been secured.

The capacity of this plant will be to turn out annually 30,000 tons of mixed fertilizers. Production is expected to start towards the close of 1963.

The Industrial Credit and Investment Corporation of India has been approached for a Rs. 7 lakh rupee loan.

SANCTIONS BY CONTROLLER OF CAPITAL ISSUES

THE CONTROLLER OF CAPITAL ISSUES has given his consent this week to the following six companies for issuing fresh capital. The consent is valid for twelve months in all cases.

Tropex Batteries Ltd., Bombay, a new company, has been given consent to issue capital to the tune of Rs. 50 lakhs, at par, divided into one lakh equity shares of Rs. 50 each. Capital worth Rs. 7 lakhs will be issued for considerations other than cash and the remaining Rs. 43 lakhs for cash. The proceeds will be utilised for the manufacture of drycells, layer (or flat) type cells and batteries.

The Lake Palace Hotel and Motels Private Ltd., Udaipur, has been permitted to issue capital of Rs. 20 lakhs in equity shares of Rs. 1,000 at par privately. The proceeds will be utilised for running hotels and motels at Udaipur.

Galileo Instruments Ltd., Bombay, has been allowed to raise capital to the extent of Rs. 35 lakhs in equity shares of Rs. 100 each to be issued at par. Shares worth Rs. 8 lakhs will be issued to Officine Galileo S.P.A., Florence, Italy, against supply of machinery. The remaining shares will be issued to Indians. The proceeds will be utilised for manufacture of instruments, gas meters etc.

Kerala State Small Industries Corporation Ltd., Trivandrum, has secured permission to issue further equity capital of Rs. 8 lakhs in shares of Rs. 100 each, to be subscribed entirely by the State Government of Kerala. The proceeds will be utilised for providing working capital for the company.

Natraj Spinning And Weaving Mills Ltd., Hyderabad, has been allowed to issue capital of Rs. 25 lakhs, at par, in 2,00,000 equity and 50,000 9.5 per cent (subject to tax) preference shares of Rs. 10 each for establishing a spinning mill.

Suryalakshmi Cotton Mills Ltd., Hyderabad, has obtained consent for issuing capital of Rs. 25 lakhs, at par, in 2,00,000 equity and 50,000 9.5 per cent, preference shares of Rs. 10 each for establishing a spinning mill.

FROM THE CAPITAL'S CORRIDORS

CONCENTRATION OF WEALTH AND ECONOMIC POWER

THE Mahalanobis Committee, some extracts from whose Report are now available, has made it abundantly clear that the policy of total protection and existence of a vast and growing protected market in the country, coupled with the constitutional safeguard relating to compulsory payment of adequate compensation for acquisition of private property, will never materially change the present position of concentration of wealth and power in the hands of a few persons.

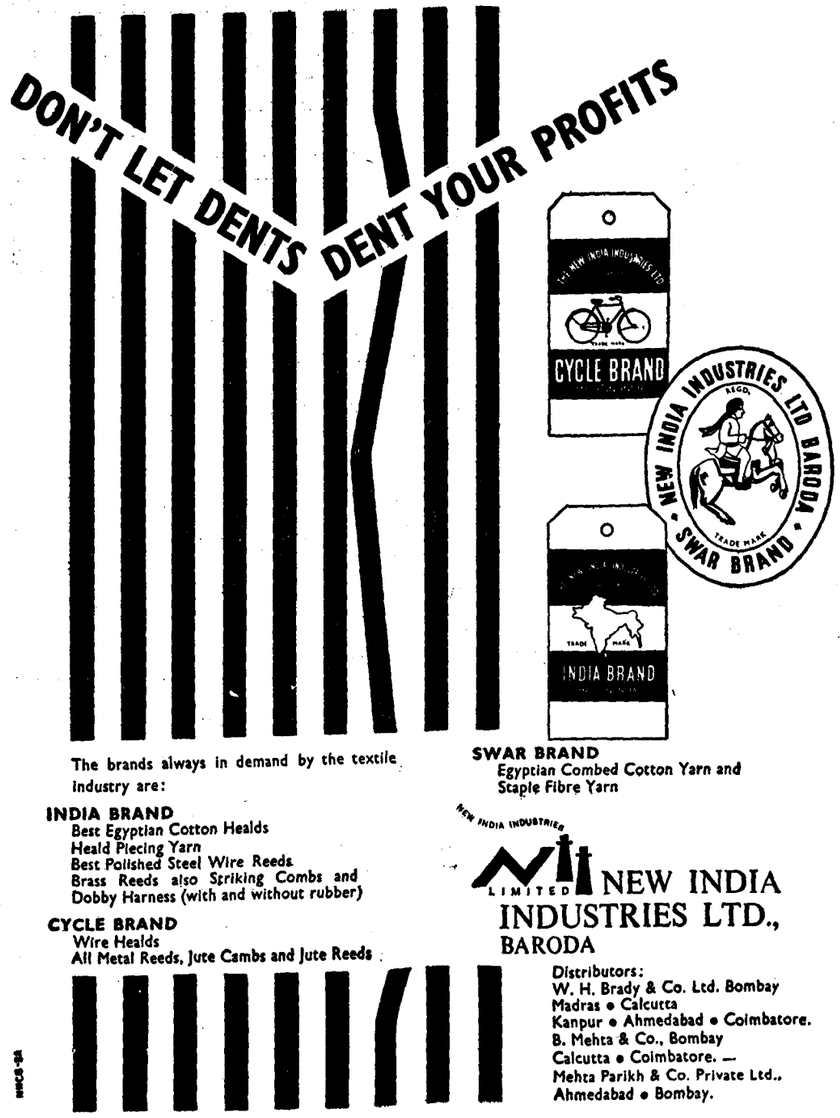
The Committee has studied, in considerable detail, the different forms of privately-owned wealth. It estimates that 75 per cent of the privately-owned wealth is under individual ownership. The remaining 25 per cent is owned jointly through the corporate sector.

The report also makes a comparative study of the concentration of distribution of stocks, securities and other property, on the basis of the distribution of assessed income from these sources. Concentration is stated to be the highest in the case of stocks, followed by securities and other property, in that order. It is estimated that in 1959-60, assessees with incomes above Rs. 1,00,000 per year shared as much as 26.48 per cent of the stocks, 15.52 per cent of the securities and 6.10 per cent of property assessed to income-tax. A comparison of the figures for 1955-56 and 1959-60 shows an unmistakeable evidence of a reduction of concentration, but to what extent this is the result of a deliberate attempt by assessees to avoid higher rates of taxation is a difficult question to answer.

Looking at it from another angle, the report estimates that the percentage which the number of households assessed to income-tax in 1959-60 bears to the total number of households may be taken as one per cent and that the percentage which the assessed income (of individuals and Hindu undivided families) bears to the total personal income may be taken as 6 per cent; the latter, however, includes about 75 per cent of the total dividend income—which indicates roughly that some one per cent of the households in the country own 75 per cent of the stocks. Even within this one per cent group, the distribution is very skew—in fact, the report estimates that more than half the privately-owned share-holdings in joint stock companies in the private sector are held by 14,000 households i.e. one hundredth of one per cent of the households in the country.

THE CONTRIBUTION OF RISE IN PRICES

Even without changes in the ownership or physical growth of wealth, mere changes in the price of different forms of wealth would mean accretion to the share of those persons whose assets have risen more steeply in value at the expense of other owners, the prices of whose assets have not increased to the same extent. Most forms of wealth have increased in terms of money value during the 10 years and the only people who have not gained in money terms are those who had no wealth of any kind or whose wealth was in forms of constant money value such as provident funds, bank deposits, Government securities etc. The report traces the change in prices of a number of different forms of wealth. It is noticed that the prices of variable dividend industrial securities have moved much faster than all other forms of wealth; next in order have been gold and silver, followed by machinery, equipment and construction; prices of Government securities, preference shares and debentures have registered practically no change.



With 1952-53 prices as 100, the report estimates that prices of variable dividend industrial securities appreciated to 171.7 in 1960-61. It is estimated that the value of these items constituted nearly 25 per cent of privately-owned capital and as such the concentration of distribution of this item has been incredibly high. The benefit of the price increase as also the preferential benefits conferred by our taxation laws on these gains have, therefore, been distributed among a microscopic section of the people at the very top of the income-brackets.

The form of wealth which rose next in value was house property which increased by nearly 50 per cent on the whole. The share of house property (31 per cent) in the total private tangible assets is more than that of shares, but although its distribution is certainly concentrated in relation to the total population, its concentration is nowhere near that of shares. According to estimates of the NCAER quoted in the report, as against 1.6 per cent urban savers who invest in shares and bonds of private companies, 17 per cent invest in 'own house'; also according to income-tax statistics of 1959-60, while one per cent of the top income-tax assessees appropriated 20 per cent of the dividend income, they appropriated only 8 per cent of the property income. Although, therefore, the accretion of wealth in respect of house property has been considerable and its distribution quite concentrated in relation to the total population, it was nowhere near as concentrated as that of shares. Incidentally, it is noticed from the NCAER estimates on savings cited above that the most popular form of urban savings is provident fund (including chit fund) and the next popular form life insurance. These attract 27.5 per cent and 15.7 per cent of savers respectively. Neither of these two forms have benefited by price changes.

The Report devotes a special chapter to a factual study of the problems connected with the existing concentration of control of industrial and economic activity. Referring to the arguments in favour of bigness, based on economies of scale in modern industry, the Report points out that engineers and entrepreneurs do not apply the same scale in judging bigness. The matter is really one of quantitative judgment and not merely qualitative logic. While it is indisputable that an individual unit should be large enough to employ the most efficient technology, the Report points out that big undertakings often consist merely of a large number of identical smaller units (or units spread among unconnected industries) whose association is sought to be justified on grounds of convenience and economies of management and not technique. Facilities for such 'management' may result in the emergence of monopoly and oligopoly. The existence of a single dominant unit is hardly necessary for this purpose; a small group of large units which sell a large share of the industry's output can lay down prices and other business policies within the industry, to subserve their own ends which may not necessarily be consistent with the interests of the consumers or the over-all objectives of the country. The Report suggests that "even where big units are technologically necessary, such situations should be counteracted by supervision of their operations and the setting up of a sufficiently large number of big firms, wherever possible, to avoid risk of dominance".

OWNERSHIP AND MANAGEMENT CONTROL

A distinction is drawn in the Report between ownership control and management control. It points out that statistics obtained by adding up the number of shareholders of different companies would lead to a gross over-estimation of the spread of ownership of industry because of inevitable multiple counting and benami holdings (including holdings by Banks on account of undisclosed persons). While the statistics analysed show that ownership control of industry is more concentrated than any other form of wealth, the Report proceeds to show that management control is incredibly more concentrated and it is difficult to measure the extent of such concentration. It is common knowledge and experience that persons or 'houses' with comparatively small shareholdings are able to secure charge of the policies and operations of companies. So long as they are able to

guarantee good dividends and capital gains to the shareholders—and that is rendered easier in an era of protection and rising prices—there is no risk to their positions and freedom tc manage their affairs to subserve whatever policies they think proper. The greater the dispersal of share-holdings, the smaller the size of the concentrated share-holding required to obtain and maintain control of the business.

The report also points out that the contribution of the share owners in the form of paid-up capital accounts for only a part of the resources required to finance industry; borrowings accounted for as much as 53.6 per cent of their total funds in 1957, nearly 30 per cent out of it being obtained from banks. In fact, according to the purpose-wise analysis of advances made by scheduled banks, the share of advances made to industries increased from 36 per cent of the total in 1951 to 47 per cent of the total in 1961. It is also observed that the bulk of the lending was to the bigger units and that comparatively little was advanced to small industries. The report also refers to the amounts advanced to private industry through the IFC and other financial institutions set up for the purpose. That the borrowings have not always been used for the purposes of the borrower is clear from the following quotation from the Third Annual Report of the Working of the Companies Act. "Cases have come to notice where companies with large reserves have invested heavy amounts in shares of other companies in the same group while borrowing heavily from the Government and quasi-Government institutions. In some cases, the investments in industrial holdings have been found to be of the order of half a crore of rupees, matched by an overdraft from the State Bank of India for a like amount".

The close working association between industry and banking may be inferred from the results of the analysis of common directorships of banks and large industrial units.

An analysis of the interlocking between directors of the leading banks and 296 large public companies with paid-up capital of more than Rs. 50 lakhs, for the year 1959-60 shows that, of the 248 Bank Directors concerned, 24 were also Directors of one large public company each, 37 were also Directors of 2 to 4 large public companies each, and 14 were directors of 5 or more large public companies each. The analysis also showed that of the Directors of the big-sized public companies under study, as many as 23 per cent held more than 10 Directorships each.

MANAGEMENT CONCENTRATION

The report gives the conclusion of certain special studies made regarding the mechanics of operation of some of the most important business houses (called Controlling Interests) in the country in exercising management control over large areas of the industrial sector called 'Groups'. The concept of "Group" is quite different from the companies "under the same management", as contemplated in section 370 of the Companies Act and there is no suggestion that the controlling interests are doing anything illegal in arriving at or implementind decisions which are solely intended to promote the interests of the companies, their shareholders, and the controlling interests themselves, often by enabling them to do indirectly what they are prohibited from doing directly, namely, purchasing their own shares, entering into transactions to transfer profits and losses, avoiding tax burdens, manipulating to create favourable market situations etc. The controlling interests do not find it necessary, for the purpose of acquiring and exercising control, to own the majority of shares in every company of the Group. By a process of inter-corporate investment—some of these investments have been laboriously traced in the studies concerned—it is possible to acquire control over a large industrial empire with comparatively little investment. The powers acquired by inter-corporate investment (subject to section 373 of the Companies Act), are supplemented by powers obtained under managing agency agreements and shares held on account of Investment Companies, Charitable Trusts, Banks, etc., belonging to the Group. This system constitutes a useful and flexible mechanism for the promotion of new enterprises and is capable of promoting the interests of the community. But it would be futile to expect the groups themselves voluntarily to set up and observe ethical standards in the exercise of their powers and opportunities. The Report shows how, through a chain of minimum investments,complying with the present legal requirements, controlling intersets are able to secure wide areas of industrial investment for their operations. The setting up and enforcement of ethical standards to be observed by them in the course of their operations is a formidable task for the Government and for the Company Law Administration.

Ten such groups considered in the Report—which are certainly among the largest of their kind in the country—controlled between them 542 companies in 1951 and 550 companies in 1958, with total share capital of Rs. 173.43 crores and Rs. 264.16 crores on the two dates; covering 29.35 per cent and 34.53 per cent respectively of the total share capital of non-Government companies. Excepting for two of these group—namely, Andrew Yule and Bird Heilger — the general picture presented by these groups is one of growth in their shares of the total private sector between the two dates. The groups selected include Tatas, Birlas, Dalmia, Sahu Jain and Martin Burn.

The study further divides the concerns of each group into "Inner Circle" concerns, namely, concerns in which they have direct majority control and "Outer Circle" concerns in which they do not control majority shares but in the day to day management of which they have nevertheless acquired sufficient control. The aggregate

share-holdings of 18 controlling interests in 737 companies of the Inner Circle and 168 companies of the Outer Circle amounted to only 45.6 per cent and 9.5 per cent respectively.

EXPORT CONTROL ON MOST ITEMS REMOVED

The Union Government has issued a new Exports (Control) Order, freeing a large number of items from all export control.

Under the new Order, which became effective on October 10, export restrictions will operate only on a small number of items in respect of which control is inescapable.

At the joint meeting of the Import and Export Advisory Councils held on September 8, 1962, it had been announced that a review of the licensing restrictions on export items had been undertaken with a view to removing such control on as many items as possible.

The items on which there will now be licensing restrictions have been set out in a schedule attached to the Order. List 'A' of the schedule consists of six categories of items, the export of which will not normally be allowed. These are specified kinds of metals; minerals; oilseeds; seeds; wild life and wheat and wheat flour.

List 'B' of the schedule contains 31 categories of items, the export of which will be allowed on merits or subject to ceilings or subject to some stipulations to be specified from time to time. Among these are specified animals; coal and coke; raw cotton and cotton waste; raw jute and mesta; wheat bran and rice bran; hides and skins; grains, pulses and flour, other than wheat and wheat flour; metal scraps; certain types of minerals; ores and concentrates; certain varieties of oil-cakes; raw wool; wood and timber; arms, ammunition and military stores; mineral oils; aircraft and parts; tapioca meal and wastes; rock salt and specified types of metals; cinematograph films (not exposed), mustard oil and rapeseed oil.

All the items which are not included in either of these two lists will be allowed for export without any licensing formalities whatsoever.

TRADE WITH RUSSIA

A substantial further increase in trade between India and the Soviet Union is envisaged under an agreement concluded in Moscow last week. In 1961, the total volume of trade between the two countries, both ways, was of the order of Rs. 50 crores. During the current year it is likely to go up to Rs. 80 crores. Next year attempts will be made to raise it to somewhere near Rs. 100 crores.

Among the items which will be available for import from the Soviet Union during 1963 are included raw materials like raw asbestos; newsprint; refractories; metal items like lead, zinc, alloy and special steel; chemicals, fertilizers; machinery and equipment; capital goods; oil and oil products, including mineral lubricating oil, and electric equipment.

The important items which India will be exporting to the Soviet Union, apart from the traditional goods, will be woollen and textile fabrics; leather footwear; leather cloth; safety razor blades; rolled steel products and other consumer goods like tanning materials, linoleum, coir products, handicrafts, etc.

INDO-MEXICAN TRADE

As a result of the visit to India last week of President Adolf Lapez Mateos of Mexico and his Minister of Industry and Commerce, a favourable atmosphere was created in which Indo-Mexican association in the field of economic activity was discussed. The joint communique issued by the visiting President and the Indian Prime Minister at the conclusion of the former's visit contained a specific mention in this regard. It stated: "It has been decided to send a (Mexican) Trade Delegation to India in the near future in order to study and recommend the commodities and goods which may be exchanged; an Indian Trade Delegation will also visit Mexico with the same purpose. The possibilities of exporting from India locomotives and engineering goods, not manufactured in Mexico, have been tentatively considered. On the other hand, Mexico would be in a position to export to India steel plates, lead and zinc concentrates and sulphur."

During his stay here, the Mexican Minister for Commerce and Industry, Dr. Raul Salinah Lozano accompanied by other senior Mexican officials had meetings with Mr. Manubhai Shah, Minister of International Trade and senior officials of the Union Ministries of Commerce and Industry and Finance. In the course of these meetings they discussed common problems of trade between the two countries and expressed their desire to increase the field of mutual commercial and economic co-operation. The Mexican delegation showed interest in buying from India railway equipments including locomotives, structurals, engineering products, pharmaceuticals and some other manufactures. On the Indian side, the possibilities of buying cotton, hides and leather, some categories of steel plates, non-ferrous metals including zinc concentrates, from Mexico were indicated.

THE COCHIN SHIPYARD

The Minister for Shipping, Mr. Raj Bahadur, who returned to New Delhi this Sunday after a ten-day visit to Japan, told newsmen on Monday that two Japanese ship-building concerns, the Mitsubishi Ship-building and Engineering Company, Nagasaki, and the Ishikiwajima-Harima, Tokyo, have shown considerable interest in collaborating with the Government of India for setting up the second shipyard at Cochin. Mitsubishi, one of the world's biggest ship-builders, is understood to have even made some definite proposals in this regard on the basis of participation in the equity capital of the project on a minority basis and will be sending a team of experts in November to examine the project in details with a view to draw up concrete proposals for their collaboration. Mr. Raj Bahadur, on his part, categorically pointed out to the Japanese ship-building interests that all the foreign exchange component for this project would have to be provided by the collaborators. Mitsubishi has promised to find the necessary foreign exchange funds if it finally decides to enter into this collaboration arrangement which it terms as a "prestige project for it." The imperativeness of the foreign exchange allocation for this project being outside the Yen credit already promised by Japan has been impressed upon Mitsubishi by Mr. Raj Bahadur. Some small contribution in this regard, however, may have to be made by the Government of India also, but that will have to be found from "free" foreign exchange resources. This would also necessitate the upgrading of this project by the Planning Commission from the low-priority category "C" to the medium priority category "B".

The Government of India's anxiety to have Japanese collaboration for this project emanates from various reasons, the primary one being that India at present is placed in similar conditions as Japan with its high cost of ship-building machinery and cheap labour. Secondly, Japan is the largest ship-building nation in the world today. The collaboration with Japanese interests would make the cost of production of ships at the proposed Cochin shipyard more competitive. The lukewarm response from Western ship-builders also is perhaps an additional reason. The British ship-builders have not shown any interest in the project apart from technical collaboration, although an experts' team from there had submitted a project report for it some years ago, which put the cost of implementation of this scheme at Rs. 20 crores with foreign exchange component estimated at Rs. 3.5 crores. Two West German and Dutch ship-building interests had made some overtures for participating

in this project last year, but their keenness appears to have died out since not much progress has been made in negotiations with them. In regard to the West German offer, Mr. Raj Bahadur remarked that he could not say whether this offer was closed or still alive. The Dutch proposals are stated to be still in the preliminary stages of negotiation.

If the negotiations with the Japanese shipbuilders fructify on the basis of their participation on minority financial basis and they agree to find foreign exchange resources required for it from outside the Yen credit already made available by the Japanese Government for the current Plan projects, the Government of India would be willing to allow them to have ful technical control of the project in the interest of its being executed properly and expeditiously.

IRON ORE EXPORTS TO JAPAN

Mr. Raj Bahadur also had discussions with the steel interests of Japan in respect of stepping up the share of Indian shipping in the iron ore trade between the two countries. India at present exports about 5 million tons of iron ore to Japan. Only 5.4 per cent of this is being carried in Indian bottoms. Japanese shipping interests carry from the Indian shores another 62.5 per cent of this iron ore, while the remaining quantity is shipped in third flag carriers. The Government of India is anxious to raise the share of Indian shipping in this iron ore trade with Japan to at least 25 per cent. This presumably will not be done at the expense of the Japanese shippers, but will be sought to be brought about as a sequel to diversion of traffic from the third flag carriers to Indian bottoms. The Japanese importers of iron ore have promised to consider the proposal favourably.

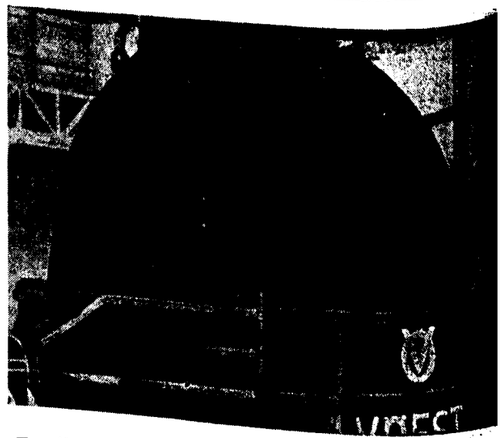
The Japanese Government and the tourist trade there has suggested to the Government of India through Mr. Raj Bahadur devising of ways and means for promoting foreign tourists traffic between the two countries. They have emphasised the desirability of creating some sort of Asian Common Market for tourism, which implies that foreign tourists visiting Japan or India should be encouraged to visit other Asian countries by offering them what are known as "package tour programmes."

HONG KONG INDIANS' GESTURE

On way back from Japan, Mr. Raj Bahadur had informal talks with the Indians in Hong Kong. An Indian hotel-owner there has come forward with a proposal to make available Rs. 1 crore in foreign exchange for setting up a hotel in this country. Some other Indian concerns doing business in Hong Kong have also indicated their desire to make some investment in Indian industries. These tentative proposals have been asked for by Mr. Raj Bahadur in concrete forms so that the Government of India could consider them.

U.S. LOAN FOR TROMBAY POWER

The U.S. Ambassador, Mr. John Kenneth Galbraith announced on October 12 a $17.9 million United States Government loan to finance the full foreign exchange cost of a major 125 megawatt expansion of the Trombay Thermal Power Station. The loan will be repayable by the Government of India over forty years with no payments due in the first ten years. It will carry no interest but will bear a service charge of three-fourths of one per cent. These terms are the most favourable of any assistance from any country, and substantially relieve the impact on India's present balance of payments position.



The loan agreement is with the Tata Power Companies which will be required to repay its loan to the Government of India over 20 years at an interest rate of three and one-half per cent. The expansion will involve the installation of a single generating unit of 125 megawatts, with associated boiler and other facilities.

Engineering consultants on the Trombay Project expansion are the American firm of Ebasco Inc. of New York City. This is the fifteenth loan granted by the U.S. Agency for International Development and its predecessor, the Development Loan Fund, for power development. The projects financed, have a total generating capacity of 2,412 megawatts and are the equivalent of forty per cent of the total Third Plan power requirement.

LOAN FOR CHANDRAPURA POWER PROJECT AND DUGDA COAL WASHERY

During a recent visit to the Chandrapura Thermal Power Station and the adjoining Dugda Coal Washery, the U.S. Ambassador Mr. John Kenneth Galbraith said the U.S. Government would announce in a few weeks its decision on financing major extensions of both projects. Applications for financing of the two project expansions were presented to the U.S. Agency for International Development about two months ago. The Ambassador said that detailed technical and economic consideration would proceed rapidly because of familiarity with the present projects. He said that previous involvement with the projects would no doubt help toward a favourable decision on the expansions.

The Chandrapura Power Project presently calls for two 125 MW generators with associated boilers and other equipment—the biggest power generatoring unit in Asia. It is being totally financed by the U.S. Government through a $30 million (Rs. 14.3 crores) foreign exchange loan, and a Rs. 20.5 crores loan from the sale proceeds under Public Law 480. Both the loans are being offered through the U.S. Agency for International Development. The expansion will involve the installation of a third 125 MW unit and will require an estimated $16 million foreign exchange loan. The Dugda Coal Washery, which will process metallurgical coal for Hindustan Steel and provide poorer grades for the Chandrapura Power Station, has been completed with foreign exchange financing of $4.8 million from the U.

Government provided through the Export-Import Bank. The expansion, which will double the capacity from 3 to 6 million tons of washed coal per year will require an additional estimated $5.0 million.

DEVELOPMENT OF PRADEEP PORT

A project for the export of iron ore from Pradeep Port in Orissa was considered by the Planning Commission last week. This port is being developed to export, in the first instance, two million tons of iron ore every year starting from 1965. The financial cost of the project is estimated at about Rs. 32 to 35 crores including some foreign exchange expenditure. These estimates include the construction of a 98-miles Express Highway already being built by the Orissa Government between Daitari and Paradeep Port to the extent of handling mechanically up to 3 to 5 million tons of ores per year with two main iron ore berths, mechanical handling equipment, dredging etc. These estimates will also cover expenses for development of the mines which consist of high, medium and low grade ores.

The Planning Commission took note of the development and progress made on this project. It is considered quite likely that with the concurrence of the Transport Ministry, the State Government will undertake the construction of the Pradeep Port as an Agency of the Central Government.

The ores are to be exported principally to Japan. In this connection an 18-member high level Japanese experts team is arriving in India at the invitation of the Goverment of India in November this year to survey and negotiate the terms of the project with the Indian Government. The Japanese Government and the Japanese Steel Industry, which have shown great interest in this project are also likely to assist the building of various aspects of this project, and some iron and coal based industries and power development.

The work on the development of the mines, the construction of the road and the construction of the Port are progressing satisfactorily and the Government hopes that the trucks required for transporting ore by road will be made available by the Heavy Truck Project being undertaken by the Ministry of Defence and other automobile manufacturers within the next two or three years. The Railway Ministry is also likely to conduct a survey of the railway line connecting the major iron ore mines at Nayagarh to Pradeep Port passing through the iron ore belt at Tomka and Daitari. It will also serve as a connecting link to Talcher, for export of ores through Pradeep Port. The Talcher coal deposits it may be added, are among the biggest coal deposits in the country which will help to development thermal power to the extent of 2 million killowatt per year to start with.

REAPPRAISAL OF FOREIGN EXCHANGE REQUIREMENTS OF PRIVATE SECTOR

At the instance of the Union Minister for Economic Co-ordination, Mr. T. T. Krishnamachari, a three-member Committee, consisting of Mr. Ranganathan, Mr. T. Swaminathan and Mr. Tarlok Singh, has been constituted to undertake an appraisal of the foreign exchange requirements of the 21 industries for which priority in licensing of imports of machinery and components is being accorded by the Union Ministry of Commerce and Industry. This review will take into consideration the 1965-66 targets fixed for these industries and the gaps that exist today in their installed capaciy vis-a-vis the targets laid down.

Tentatively, the foreign exchange requirements of these 21 priority industries are estimated at Rs. 250 crores.

CUT IN CALCIUM AMMONIUM NITRATE PRICES

The price differential between calcium ammonium nitrate and ammonium sulphate, two fertilisers of comparing values to the Indian agriculturist, has been increased from about Rs. 18 to at least Rs. 50 per metric [illegible] equal to the last week's cut in the prices of CAN, when sold for use by cultivators and plantations, will now be Rs. 310 per metric ton, except in U.P. where it will be Rs. 314 per metric ton. (This price includes the sales tax and other taxes). In Madras, with the sales tax added, the price will be Rs. 319.60 per metric ton. The minimum price of ammonium sulphate when sold for use by cultivators is Rs. 360 per metric ton, except in U.P. and Orissa where it is Rs. 366 and Rs. 370, respectively, inclusive of the sales tax and other local taxes. In Madras, the price, inclusive of the sales tax, is Rs. 370.20 per metric ton. The price for plantations is Rs. 284.60 per metric ton.

The price of calcium ammonium nitrate has been cut with a view to popularise it, this fertiliser being new so far as India is concerned.

Calcium ammonium nitrate is stated to contain as much nitrogen as ammonium sulphate i.e., 20.5 per cent. It can be used on a wide range of soils and crops. Like ammonium sulphate, it can be used for most of the crops both as a base fertiliser and for top-dressing. Compared to ammonium sulphate, calcium ammonium nitrate, however, has a distinct advantage because of the presence of calcium carbonate in it. It has neither an acidic nor an alkaline effect on the soil. Further, as it adds calcium to the soil, it is of particular benefit to acidic soils. It is claimed that CAN "does better" than ammonium sulphate on soils moderately to highly acidic and also on soils known to cause injury to crops.

Calcium ammonium nitrate has one drawback. It absorbs moisture on exposure to air and tends to "cake" on drying. This difficulty has been attempted to be obviated in the manufacture of fertiliser-grade CAN, which means its manufacture in granulated form. The granules are quoted with anti-caking materials. The finished product for delivery to the farmer is also packed in moisture-proof polythelene-lined hessian gunny bags.

POWER AND TRANSPORT DISCUSSIONS

At a meeting here last week between the Federation of Indian Chambers of Commerce and Industry and the Planning Commission, discussions mainly centred round the Third Plan power and transport targets and the major policy aspects as well as administrative details thereof. Expressing satisfaction over the improvement in rail transport of coal, the Commission ruled out any large-scale use of furnace oil as a substitute for coal in the Southern and Western parts of the country in view of the shortage of foreign exchange. During the discussion on transport, it was agreed that large industrial units should indicate one month earlier their transport requirements for each monthly period so as to enable the zonal railway authorities to plan for full train-loads as far as possible. A detailed scheme would be worked out for each industry and each railway system within the next two months. While reviewing the position about use of box wagons, the dicussion brought out two points for further study. The first was that consumers would be required, at the present stage, to resort to manual labour for unloading even though some of them were equipped with mechanical facilities suited to four-wheelers. The second point related to the installation of weighbridges. It was contended on behalf of the railways that the rebates allowed on installation of weighbridges should be deemed enough inducement for setting up the same. Whether adequate facilities for fabricating weighbridges were available, it had yet to be decided. No distinction, it was agreed, should be made between large consumers in the public and private sectors in regard to the order of priority for the use of box wagons.

Two suggestions were made about the use of surplus capacity available on coastal shipping services. The first related to carriage of steel by rail from Rourkela, Bhilai and Jamshedpur to Visakhapatnam for topping up vessels from Calcutta and Visakhapatnam, and the

Visakhapatnam. The FICCI expressed preference for the second suggestion.

As regards the implementation of the power programme of the Third Plan, the Planning Commission came out with categorical assurance that the power target of 12.5 million KW would be achieved. The Federation, however, derived little satisfaction from the Commission's this emphatic assurance. The indication by the Commission that the Union Ministry of Power and Irrigation was considering an increase of one per cent in the return to electricity undertakings to cover higher interest charges, also failed to satisfy FICCI, which had pleaded for a liberal return.

Through an integrated operation of power stations in the Bengal-Bihar-DVC area, additional power of 350 KW is envisaged to be available at the end of the Third Plan.

The Deputy Chairman of the Planning Commission, Mr. G. L. Nanda pointed out that the setting up of industries should necessarily be in tune with the availability of power. On the question of the lack of trained personnel, it was explained that apart from getting the services of foreign consultants, if necessary, special unit for construction and erection of plant was being set up in the Central Water and Power Commission.

The FICCI representatives urged special considera-ation for the provision of power in areas where there was large-scale unemployment. The FICCI, led by its President, Mr. Shriyans Prasad Jain, included Mr. G. D. Somani. On the Planning Commission's side, besides Mr. Nanda, Mr. T. N. Singh, Mr. C. M. Trivedi and Mr. Tarlok Singh were present.

AN INDO-U.K. COLLABORATION

An agreement was signed last week under which a new factory is to be built at Palghat, in Kerala State, to manufacture laboratory meters and component test equipment currently produced in Britain. A company with £90,000 capital, known as British Physical Laboratories (India) Private Limited, is to be set up to finance the scheme. The factory is scheduled to begin production in January 1964. The new industrial partnership will be owned 49 per cent by British Physical Laboratories Ltd., and 51 per cent by Universal Refrigeration Corporation, of Bombay.

The Board of the new company will consist of three Indian and two British directors. Dr. V. A. Sheridan and Mr. A. D. Sheridan will be the directors on behalf of the British company.

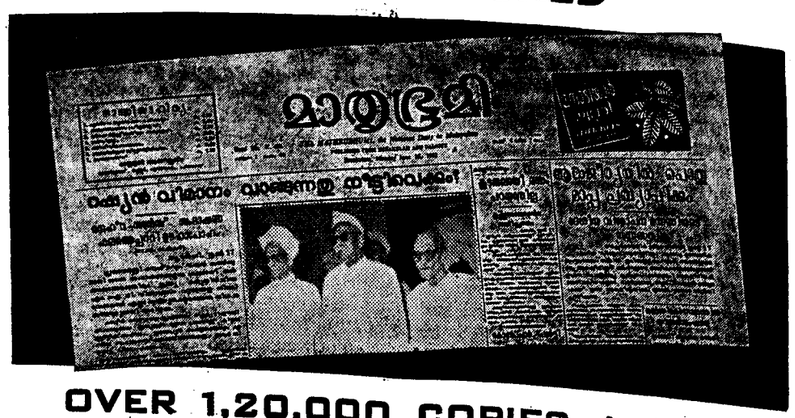
The agreement also includes the provision of long-term technical aid to the Indian firm. A number of Indians would be visiting Britain for training. The British company would begin producing equipment for the new factory immediately. All the equipment would be ready by September next.

IN BRIEF ....

Sir Donaki Kaberry, head of the British firm, BUXTERS, has been here during the week, finalising the arrangements for the manufacture of stone-crushers and other equipment in India, through Marshall and Sons Limited.

*

The financing of the Trombay Fertilizer Plant by the U.S. Aid included a substantial payment for know-how to France. This had been cleared by the U.S. Government in 1961, but due to its balance of payment difficulties the actual payment to France had been held up. Recently, the French party has agreed to accept payments in goods.



*

Talks with Rumania, now in offing will include request for aid for petro-Chemical Industries and Fertilizer Plant. Similar talks with Poles relate to the import programme of Coal Mining Machinery Plant, Coal Washeries, Fertilizer Plant, Machine-making Factory, Machine Tools.

*

Czechoslovakian project reports on High Pressure Boiler Plan project and Heavy Electrical Plant project at Ramachandrapuram have been received and are under examination by a Technical Committee, a Joint Ministerial Committee and Technical Committee of Heavy Electrical Corporation. Meanwhile, the Planning Commission has permitted the three Heavy Electrical Plants at Bhopal, Ranipur and Ramachandrapuram to go ahead with the schemes of power equipment.

The Government of Burma has issued an order limiting the grant of open general licences for imports to registered national firms only.

*

The International Cotton Advisory Committee has predicted a record world output of cotton for the year 1962-63, viz., two million bales more than in 1961-62.

COMPANY AFFAIRS

TRAVANCORE SUGARS

During the year to April 30, 1962, The Travancore Sugars and Chemicals Limited, recorded a profit of Rs. 3.42 lakhs which was a lower figure than that of the previous year's Rs. 5.78 lakhs. During the season 1961-62, which commenced on September 6, 1961 and concluded on April 30, 1962, the company crushed 1.25 lakh tonnes of cane and produced 10,769 tonnes of sugar showing a recovery of 8.62 per cent. Last season 1.18 lakh tonnes of cane was crushed and 10,502 tons of sugar was produced showing a recovery of 8.88 per cent. This slightly declined recovery this year is mainly due to climatic conditions. Sale of sugar was approximately at the same level as in the previous year. Sale of spirit continued to be satisfactory though the profit margin was lower due to the increased competition. As regards liquors, the Chairman in his annual report indicated that the growth of sales in North Indian markets were considerable though an increase in cost of production and distribution tended to keep down profit margins. The Chairman also added that the company has been compelled to close down the pharmaceutical works because the Government of Kerala discontinued to place orders with this company on the basis covered by the agreement until then in force.

Out of the profit of Rs. 3.43 lakhs, after making provision for taxation, there remains a surplus of Rs. 46,532 to which is added Rs. 1.50 lakhs transferred from general reserve and Rs. 68,170 brought forward from the previous year. The Directors have recommended the payment of a dividend on ordinary share capital at the rate of 5 per cent which will absorb Rs. 1.50 lakhs. Dividend on preference share capital is to be distributed at the rate of 6.5 per cent.

ROHTAS INDUSTRIES

The Chairman of the Rohtas Industries Limited in his statement appended to the annual report of the company for the year to March 31, 1962, indicated that due to continuing serious difficulties in respect of transport for movement of coal, raw materials and finished products, production during the year was considerably affected, as is clear from the table below:

PRODUCTION

(In Tonnes)

	1960-61	1961-62
Paper and Boards	50,936	46,565
Cement	3,14,945	2,67,885
Clinker	2,86,981	2,85,860
Asbestos Cement	15,510	17,770
Sugar (Season)	14,898	11,611
Vanaspati	10,655	9,795
Caustic Soda	5,484	5,575

In the face of continuing rise in costs due to higher prices of raw materials like bamboo, coal, additional railway freight, additional excise duties etc. without a corresponding increase in the prices of finished products particularly in respect of paper and boards, the working results suffered. Insufficient availability of bamboo due to transport and other factors necessitated slowing down of the pulp mill. Moreover the credit of the paper machines could again not be fully utilised for want of pulp. Efforts to obtaining licence for import of pulp did not materialise during the year. In the current year, however, some licence has been received for import of wood pulp and assurance of leases of bamboo areas for additional supply has also been received from Bihar Government. The company expects, therefore, that the production of paper and boards would show an upward trend during the current year.

Sugar production of the company was affected due to non-availability of cane on account of weather conditions and Government's restrictive policy towards production.

The profit after taxation was to the extent of Rs. 109.13 lakhs out of which a sum of Rs. 59.84 lakhs was provided for depreciation and another sum of Rs. 3.20 lakhs was separated towards Development Rebate Reserve. The Directors have recommended the payment of a dividend on ordinary shares at the rate of 8 per cent i.e. 80 nP. per share which will absorb a sum of Rs. 40 lakhs.

KERALA STATE INDUSTRIAL DEVELOPMENT CORPORATION

Kerala State Industrial Development Corporation in its report for the period ended March 31, 1962, reveals that during its first six months, the Corporation has drafted the rules and procedure for the conduct of the business of the Corporation. They have also finalised the terms and conditions for the grant of each of the four main types of financial assistance contemplated to be rendered by the Corporation. Moreover, it actually participated to the extent of a maximum of Rs. 1 lakh in the share capital of each of the 11 spinning mill units licensed recently to be set up in the State. This, it may be added, would not debar any of the units concerned from applying to the Corporation for additional financial assistance in the form of further share capital participation or loan or underwriting as the case may be. The finalisation of the scheme in which the Corporation participates, for the institution of the new zinc smelter unit in State is estimated to cost Rs. 5.08 crores. The scheme is to manufacture 20,000 tonnes of zinc per year as well as 120 tonnes of sulphuric acid per day. The Corporation is also likely to grant a long term loan of Rs. 1.6 lakhs to a water meter manufacturing company for the manufacture of 24,000 water meters per year. Because the Corporation's business activities have had no time to bear fruit during the first six months covered by their report, it registered a loss of Rs. 26,850. In the years to come the Corporation is bound to show some profit.

SATHE BISCUIT

The working results of the Sathe Biscuit and Chocolate Company Limited for the year to March 31, 1962, reveals a profit of Rs. 4.44 lakhs after providing for normal depreciation of nearly Rs. 1.5 lakhs. The Directors have also proposed a provision of nearly Rs. 30,000 for contingency reserve and Rs. 2.50 lakhs towards taxation. A dividend at the rate of 9 per cent on ordinary shares will absorb a sum of Rs. 88,650.

The report reveals that the sales during the year recorded an increase of Rs. 10.50 lakhs over that of the last year. The work of extention of the factory building was started during the year which is progressing and is likely to be completed towards the end of 1962. The company has obtained a licence for the automatic oil-fired wire mesh oven under the US Export-Import Bank programme. To meet the expenses of the building construction and the oven the company has applied to the Bombay State Financial Corporation for a loan of Rs. 8 lakhs which has been granted.

OCTOBER 26, 1962.

"Actuality" with a Vengeance

CHINA'S offer of cease-fire of October 24 is based on the fundamental acceptance of what she has chosen to call "actuality". The technique of "actuality" was conceived by her under similar circumstances as now prevailing, when she proposed the basis of talks for the settlement of the boundary in the western sector. "Acutality" is a euphemism for the recognition of the actual state of affairs, as created by blatant acts of military aggression and forcible occupation of the territory so seized. This time it is clear that the technique of "actuality" is being asserted with a vengeance, since it is being extended to the eastern sector where China had not laid any claims before to Indian territory. India's rejection of this offer was a foregone conclusion and China herself had no illusions about it.

While China has made aggressive intrusions in the eastern sector extending as far as 40 to 60 kilometres, her offer calling upon both the parties to withdraw 20 kilometres behind the 'line of actual control' is tantamount to a declaration of an uncompromising claim to the rest of the territory which she is now holding. To add a touch of a conciliatory mood, her statement explains that once withdrawal 20 kilometres behind the 'line of actual control' has been effected, China would agree to withdraw her frontier guards to the north of the line.

But more aggressive is her attitude in relation to the western and middle sectors, where she is not prepared to budge an inch from what she calls the traditional line—the boundary which she has illegally established by her advance and grabbing of 12,000 square miles of Indian territory in the Ladakh region. Here she has offered to throw a few crumbs of talks relating to some points scattered over the vast area in her forcible occupation. In sum, the cease-fire requires as a condition precedent India's recognition of the new boundary south of the McMahon Line as the actual and final boundary in the eastern sector and the virtual maintenance of the status quo in the middle and western sectors.

How far China is sincere in making even this offer should be clear from the sequence of events leading to it and certain specific statements in her note. It is not without significance that the note was handed over to Dr. P. K. Bannerjee, India's *Charge d'Affaires* in Peking, more than six hours after it was released to Press correspondents. This note was the outcome of the mediatory efforts performed by President Nasser, whose Ambassador in Peking handed his personal letter to Mr. Chou En-lie on very much the same lines as another letter delivered by the UAR Ambassador in New Delhi to Mr. Nehru. The substance of this letter was to make an earnest plea for settling the border dispute by peaceful negotiations. But the kind of offer that has been made by China as a result of it has thrown light on some painful and agonizing facts in this entire affair. The sting is in the tail. China's note concludes with an appeal to the Afro-Asian nations to make efforts for bringing about a peaceful settlement of the India-China border dispute. This is another subtle move to isolate India from the rest of this region by holding her out as intransigent.

Apart from the Afro-Asian countries the only mediator acceptable to China is apparently Russia. But Russia is conspicuous by the omission of her name. Her willingness to supply supersonic fighter jet aircraft to India and of collaboration in their manufacture in this country has been the subject of a strong protest by China. And the attitude of neutrality maintained by her in this dispute was hitherto another cause of anger and resentment on the part of China. But the latest publication of the Chinese version of the dispute in the eastern sector in *Izvestia* has come precisely at this juncture. Is it a straw in the wind? As these lines are about to be printed the doubts have been dispelled. An editorial in the *Pravda* endorses China's position in the eastern sector and calls upon 'brotherly' China and 'friendly' India to settle the matter by peaceful negotiation. Blood, after all, is thicker than water.

The nation's determination to clear out the aggressor and re-establish its territorial integrity poses a question of supreme and immediate importance. A high level of morale is not enough. It must be backed by an uninterrupted and massive flow of resources in sophisticated armaments, aircraft, in particular adequate fleets of transport planes and a range of defence aids of which we produce but a part. There is no time to lose. In this hour of crisis, the Government must show not the least hesitation to come to a quick decision on the sources of supply—sources which will stand by us loyally. They have already given an indication of readiness to rush to our help if they are approached.

Expansion of Trade

IT is not the twentieth session of GATT which commenced on Tuesday this week at Geneva that is in the forefront of public attention so much as quite a different and spectacular event. The GATT session is no doubt loaded with a heavy agenda which contains some items of direct interest to the developing countries. But even a brief examination of these items would reveal that only one out of the three of urgent interest to the under-developed countries will bring concrete results and some relief to them, hard pressed as they are by their chronic and almost insurmountable poblem of their payments deficit. The annual report of the EEC will be discussed at the session with parti-

cular reference to the policies of the Community. Nevertheless, from their angle the discussion is unlikely to prove more useful than providing an opportunity to them to express their aspirations, already reiterated on several occasions before, in regard to their trade relations with the EEC.

GATT's ministerial declaration of November 1961 calls upon the industrialised countries to find positive solutions to the expansion of the exports of the developing countries by a reduction of tariffs and removal of quota restrictions in respect of no less than thirty commodities. In the intervening period of two years little action appears to have been taken on this declaration and, in the result, the debate on this item will be utilised as yet another occasion to press for its implementation as a matter of urgency. But the one subject of vital importance to India, along with more textile exporting countries of the underdeveloped world, is the disclosure of the plans of the industrialized countries with respect to the dismantling of their restrictions on textile imports and the measures they propose to undertake to stimulate the exports of the less developed countries during the next five years in pursuance of the agreement which was recently concluded.

The spectacular event which constitutes a significant land-mark in the post-war expansion and liberalization of world trade is the US Trade Expansion Act, recently placed on the statute book. This Act is a most eloquent illustration of the fast moving new trend towards the demolition of tariff barriers as the major step in the expansion of world trade. It is a far cry from the Reciprocal Trade Act with its restricted powers of tariff reduction vested in the President and now replaced by the latest Act. The Trade Expansion Act abandons, by and large, the item-by-item basis of tariff reduction and substitutes it by a group-wise basis covering products of importance in the export trade. The President is vested with the authority to reduce tariffs by as much as 50 per cent on a five-yearly basis by direct negotiations. But a more revolutionary power has been conferred on him in regard to the total removal or substantial reduction of tariffs on such items in respect of which the US and the EEC together claim a joint share of 80 per cent in the global volume of trade. Tariff reduction through GATT's mechanism will place at the disposal of the Contracting Parties the most-favoured-nation principle.

There are important clauses for the liberalisation of trade in respect of agricultural commodities. An outstanding feature of the Trade Expansion Act is a substantial elimination of the escape clauses which detracted from the practical utility of the Reciprocal Trade Act. This does not, however, imply that the escape clauses have been expunged totally, but they are kept to the minimum for the strict purpose of redress in real cases of hardships, where American industry or labour stands to suffer a grievous injury from the President's exercise of powers under the Act.

It can hardly be disputed that the impressive dynamism disclosed by the EEC in its march towards rapid economic progress, with its emphasis on trade expansion, was instrumental for overwhelming support in the US being ranged behind the original proposal for the Trade Expansion Act. Few Acts with such far-reaching repercussions have escaped controversy. The onward march of the EEC and the impressive record it created in consistently raising the rate of economic growth brought a vivid realisation that the days of seeking prosperity behind the shelter of tariff walls were numbered and to cling to them would be nothing short of clinging to a state of economic stagnation. The overbearing competitive strength which began to unfold itself in the trade of the EEC was apprehended to create vital maladjustments and even some disruption in the economic relations between the Community and the rest of the Western world. This was, of course, the immediate and potent cause for a veering round of public opinion in the US to tariff demolition.

But it would be doing less than justice to the imaginative policies advocated from time to time by her for the economic rehabilitation and prosperity of Western Europe to attribute the outstanding shift in her tariff policy to the massive impact of the EEC. It is an interesting phenomenon that, while the emerging strength of the EEC throws up a challenge to the US, she has exerted calculated influence on Britain for moving towards entry into the Community. This seemingly paradoxical attitude springs from a basic faith in economic cooperation and integration between the countries of the Western world as the single potent force for the economic prosperity of the free world as a whole. It will be recalled that American efforts and exhortations were the basic sources of inspiration for the setting up of the European Coal and Steel Community. This initial move of integration is being followed up under her influence to its logical sequel.

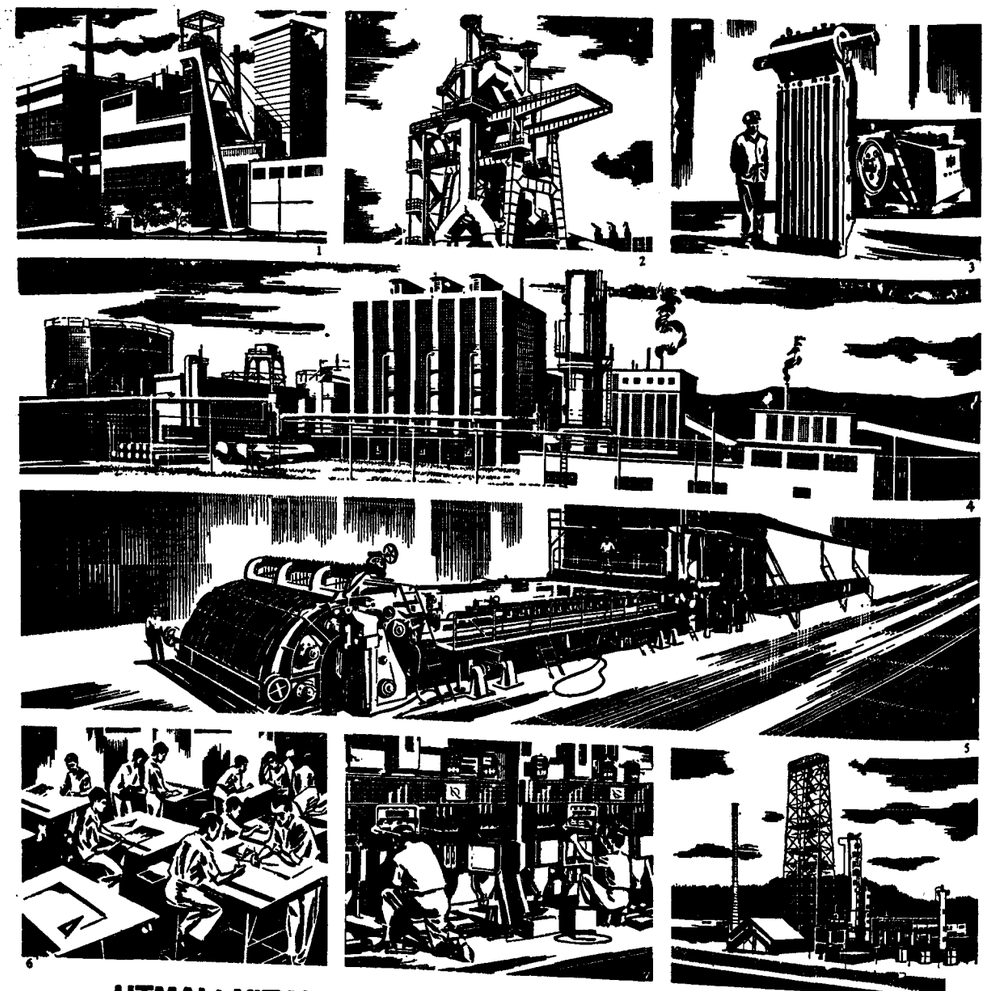
The larger purpose of adopting economic policies in general and trade policies in particular for achieving higher levels of prosperity is certainly not confined to the Western world. On the momentous occasion of the signing of the Trade Expansion Bill, President Kennedy made a solemn declaration that the liberalising powers incorporated in it would be used to stimulate and broaden the markets of the Western world for the intake of the primary products and manufactured goods of the developing countries. It is this assurance which is of immediate and direct relevance to the less developed countries sorely in need of the expansion of their existing outlets of exports and the establishment of new outlets—for their traditional as well as unconventional exports.

It is now some years that the export prices of primary commodities have sunk to very low levels without much prospect of a reversal of this depressing trend. Add to this the slow response from the industrialized countries to encourage the flow of exports of manufactures from the less developed countries. The net effect is to reduce the share of these countries in the increasing value of the exports of the free world. Last year they could obtain no more than one-third of the share in the increase in global exports. This stagnation urgently calls for a break-through. It now seems within the range of possibility without indefinite delay in view of President Kennedy's fresh accent on stimulating their export trade. If his proposal for a ministerial meeting of the Contracting Parties to the GATT some time in February or March next year meets with an enthusiastic response, it is reasonable to expect that positive courses of action will be devised for expanding the exports of the under-developed countries. This proposal, and not the move for a world trade conference under the auspices of the UN or otherwise, promises to yield concrete results.

The Failure on Housing

THE Seventh Annual Conference of State Housing Ministers in New Delhi last week brought into sharp focus the deteriorating housing situation in this country. The Union Housing Minister, Mr. Mehr Chand Khanna, pointed out that the gap in urban housing had doubled during the last decade from 2.5 million in 1951 to about 5 million in 1961. According to the current estimates, the Third Five-Year Plan is likely to throw up a further demand for 5 million houses, taking the total gap to 10 million houses by 1965-66. In financial terms, it may be translated into a capital cost of Rs. 5,000 crores. In the rural areas, the investment needed to bring the present sub-standard houses to the level where basic min mum requirements could be provided was Rs. 7,500 crores. Thus, the total demand in terms of funds for bringing the available housing capacity to reasonable minimum standards was Rs. 12,500 crores—a sum which cannot be provided by our Plans during the current decade. This prospect explains the Prime Minister's blunt warning to the Housing Ministers that they should not look to the Government for funds.

At the present juncture, in view of the border warfare with China, defence has acquired indisputable priority over every other project and there is no possibility of enhancing the allocation of funds for housing. There is no way out except to tackle the problem with the available resources. The Prime Minister urged upon all those who were associated with this problem to think in terms of "a scientific approach" whereby cheaper building materials could be utilised to the same effect by developing new techniques in processing and building. The country could not afford any more Chandigarhs which are nothing short of monuments of costly experiment in architecture and building. In keeping with the present living standards in the country, engineers have to evolve methods whereby the building cost could be kept to the minimum, so that the maximum number of houses could be built with the limited available resources.



While the paucity of funds with the public sector has kept down the growth of housing, the private sector has also, for various reasons, not been able to contribute its full mite. During the First Five-Year Plan, according to the official estimates, houses built in the private sector were in the region of 6 lakhs as compared to nearly 7½ lakhs in the public sector. Again, in the Second Five-Year Plan, houses constructed in the private sector were 8 lakhs as compared to nearly 9 lakhs in the public sector. The private sector's lower performance is not of its own making. It failed to receive the aids and incentives necessary for the construction of new houses. According to the estimates made by the Reserve Bank of India, the private sector investment during the Second Five-Year Plan in housing was about Rs. 600 crores. This could certainly be doubled if the essential facilities were provided by the Government. Even in the co-operative sector, progress in housing has been slow because of the red tape. In a well-informed, and lucidly argued article in the issue of this journal of October 12 Croesus has explained at length the difficulties that housing co-operatives have to face in Bombay. The growth of housing co-operatives was cribbed by the unimaginative behaviour of the bureaucrats. Whatever success has been recorded in the private sector is mostly due to the determined efforts of the people, without any help from the officials. Rather, the contribution of the officials has taken the form of raising technical hurdles.

A typical illustration of the bureaucratic failure is provided by Delhi. The public was promised no less than 60,000 plots, after development, at reasonable prices. As it turns out, the prices charged for these plots by the Government are much higher than the prices which were being charged by the private development companies before the freezing of lands. Even after the hurdle of acquiring the piece of land is over, many other obstacles raise their heads. Bricks are under control in Delhi and procuring first class bricks has become a big headache. There is an almost chronic shortage of cement which costs fifty per cent more in the black market—the premium could have been higher but for the Cement Marketing Company of India's efforts to maximise supplies at the controlled prices. As things stand today, the story of Delhi is being repeated in almost all the other towns throughout the country.

The slums in urban areas are like running sores which have provoked bitter outbursts from the Prime Minister times out of number. All steps taken so far have failed in arresting the growth of the slum areas. Not only that no solution has been found for the old slums, but a number of new spots of disgrace and human miseries continue to crop up all over the big cities. All attempts to rehabilitate the slum dwellers have been defeated because of their means of living being in the vicinity of their hutments. In the absence of the provision of subsidised houses and cheap and efficient transport in the urban areas, this problem will remain unresolved. There seems to have descended a degree of helplessness in the bureaucratic circles about this problem which has degenerated into a pathetic attitude of amazing inaction.

Another sphere where positive action could have been hastened is that of industrial housing. Incentives have been provided by the Government to the industries but even then, the industrial workers have not been able to get adequate shelter; in any case not more than 10 per cent of the industrial workers are in the happy position of being provided with healthy housing conditions by their employers. The provision of better houses will go a long way in increasing the productivity of our labour.

In the short period, it seems, the housing problem will drag on. It is linked with the larger problems of growth in population, the standard of living and the speed of urbanisation. The solution on western lines can be had only perhaps through efforts continued over four to five decades Unless a more imaginative approach is made, as suggested by the Prime Minister, to put some further "scientific work" on building material the problem will remain as acute as ever. On top of that, cheap plots of land, building materials at reasonable rates and cutting down of the red tape are absolutely essential to accelerate the flow of private funds into housing. Otherwise the current trend in deteriorating housing standards will not be arrested and the rot will bring in its train social, political and economic tensions of a grave magnitude.

UTMAL: VITAL MACHINERY FOR HEAVY INDUSTRIES

UTKAL Machinery Limited (Utmal), now getting ready to swing into full operation, is one of India's largest machinery-manufacturing enterprises. ■ UTMAL combines the resources and experience of three of the best-known German firms—GHH, Koppers and Voith—and a well-established Indian company: Larsen & Toubro Limited. Each is a leader in its own field, associated with pioneering ventures that have revolutionised many industrial techniques. ■ UTMAL will fully utilise indigenous technical skill, labour and raw materials. Through a special training programme, Indian engineers and administrative staff will play an increasingly important role in its development.

■ UTMAL has a multi-phased programme of manufacturing essential equipment for India's developing industries: Blast furnaces, steel works plant, pig casting machines; sintering plant, coke ovens and by-products recovery plant, plant and equipment for the cement, fertiliser, petro-chemical, paper and hydraulic industries, etc.

GHH One of the foremost manufacturers of heavy machinery in Germany. They are acknowledged pioneers in many fields—particularly in steel production. GHH export machinery to many parts of the world. Their products include plant and equipment for the iron and steel, mining, cement, sugar and chemical industries, floating docks, aerial ropeways, etc.

KOPPERS Experts in the field of fuel refining, Koppers design and construct coking plants and low temperature carbonisation plants with all by-product plants; plants for synthesis gas production from fuels of all kinds; mineral oil refineries, plants for water treatment and waste water purification, industrial furnaces of all types and plants for the chemical industry.

VOITH The largest manufacturers in Europe of pulp and paper machinery. Since their inception almost a century ago, Voith have made many important contributions to the development of this industry. With their extensive experience VOITH offer their services as project engineers for the design of complete plants

L & T Larsen & Toubro Limited are one of the leading engineering concerns in India. They have wide experience in the manufacture, supply and installation of different types of machinery and industrial plants.

They specialise in the manufacture of chemical plants in stainless steel, aluminium and copper, switchgear, petrol pumps, dairies and ancillary equipment, cooling towers, general fabrication etc. They have undertaken the complete installation of many major industrial projects in the country.

THE WEEK'S NOTES

The Congo

FLARE-UP AGAIN?

THERE ARE ominous indications that the Congo is almost on the way to a flare-up again, undoing all the work of conciliation that has been so strenuously undertaken by the U.N. This tragedy must be prevented at all costs. The agreements which were reached between the Central Government and the Government of Katanga have now been rejected by Mr. Cyrille Adoula, since it is his conviction, in the light of recent happenings, that no agreement can be implemented effectively unless Katanga is re-integrated with the Central Government first and that, too, without loss of time. This precisely is the crux of the whole matter. Mr. Tshombe is too shrewd a politician — and he expects indirect support from powerful quarters in a significant measure — to appear that he is adopting an intransigent attitude. His offer of launching an immediate fund of $2 million for the Central Government is an eye-wash, when it is recalled that last year itself he recovered not less than twenty-one times as much from the Union Miniere which should have gone to the Central Government. His agreement on the cease-fire in North Katanga between the Central Government's troops and the Katangese irregulars is in reality plausible. Recently, strong reports have been reaching — and they cannot be dismissed lightly — about substantial arrivals of mercenaries again in the Province of Katanga. Add to this Mr. Tshombe's acquisition of a large number of aircraft as a preparation to meet possible UN military action.

The federal constitution, which has been drafted at the instance of Mr. Adoula with the good offices of the UN, takes care to ensure that the key sectors of power remain in the hands of the Central Government. They are the control of the armed forces and the police throughout the provinces of the Congo, including Katanga. The division of Katanga into two provinces is another significant feature of this draft constitution. It is to a federal constitution of this type, that denies provincial autonomy practically bordering on independence (which is the real target of Mr. Tshombe's attack) that Mr. Tshombe offers resistance. It is unlikely that he will ever consent to a division of the revenue of Katanga between the province of Katanga and the Centre on the basis of 50 : 50 and, furthermore, the integration of the Katangese army with the Central forces may be made in practice an insurmountable task. Against this background, events seem to be heading towards a strong pressure from Mr. Adoula to move the UN to intervene, if necessary, in the military sense, to bring Katanga within the fold. This step is so delicate that no precipitate decision can be taken on it. For one thing, the UN itself is in a financial quandary and, for another, a military operation in the Congo will lead it to the brink of bankruptcy. Before the UN is moved, it is necessary that U Thant convenes a meeting of the Congo Advisory Committee, postponed until the end of the current month, to sound it before any positive recommendations are placed before the UN. All in all, the situation is fraught with grave possibilities.

Tripura Border

A WELCOME AGREEMENT

THE AGREEMENT reached between India and Pakistan for cease-fire across the small segment of the eastern border is to be welcomed for two reasons. Primarily it gives an opportunity to demarcate the border-line on the eastern part of the frontier and terminate a small matter which has kept on dragging for a long time. In the next place, an absolutely avoidable diversion of the Indian defence operations now demanding total concentration on the Sino-Indian border has been eliminated. It is pointless to probe into the motives of Authority in Pakistan in stirring up trouble along the Feni river now that an amicable agreement has been reached. It is of the utmost importance that the agreement should be carried out to the final conclusion in the same spirit in which it has been arrived at.

The armed forces which have been mustered on the border are to be withdrawn by October 27 which is a clear indication of the intention of the two parties to let the work of demarcating the boundary proceed peacefully and without interruption. India, however, is not directly involved in this withdrawal operation as she has not deployed any troops there. The fortifications which have been raised as a matter of temporary strategy are to be demolished for the same reason. No fresh settlements of occupants are to be made in the disputed area. This term of the agreement is important for the reason that the occupation of the border region which is in dispute and which awaits division between the two countries after demarcation gave cause for provocation recently. Then there is also an important point which has been agreed upon. The grievances of the peasantry in this area are to be given a careful hearing by the officials of the two governments and no action is to be taken on the settlement of the undemned border without disposing of these complaints.

For a considerable time past there have been infiltrations of Muslims into Tripura and there have also been intermittent cases of exodus of Hindus from East Pakistan. The infiltrators started their manoeuvres ostensibly under extraneous inspiration or else it is difficult to account for the large numbers in which they continued to conduct their movements across the border. India had to consider the problem of the repatriation of these illegal entrants in its full repercussions and no strong and prompt action could be taken by the Government, as demanded in several quarters in this country, for the likely consequences on the Hindu population in Pakistan. Highly coloured reports about the hardships of the repatriates and the twist that was being given about forcible expulsions of Muslims legally entitled to stay in India, would have resulted in retaliatory action against the minority in East Pakistan. It was for this reason that the pace of the repatriation of the infiltrators was moderated by the Government. All these unconnected, but inevitable, consequences of the unsettled state of the border and the movement of the armed forces there will be removed by the agreement.

Truck Transport

THE LESSON OF THE STRIKE

IT WAS by no voluntary choice that the truck transport operators in Madhya Pradesh went through the ordeal of a three-week strike. A strike throughout the State for such an unusually long period of time inflicts great injury on the economy of the State of which the operators are fully aware. What they are painfully aware of is the fact that it inflicts an equally great injury on their own financial and business interests. This perspective should be sufficient to bring home the genuineness of the grievances which impelled the operators to take the extreme decision which they did. Their central grievance was the unbearable incidence of taxation.

Ultimately the State Government realised its genuineness and agreed to arrive at a compromise. But the price of the ageerment must be recalled. Well over 11,000 trucks were immobilized in Madhya Pradesh for a period of three weeks and, furthermore, on October 17 there was a sympathetic one-day token strike of the lorry operators in Delhi, Rajasthan, Uttar Pradesh, Gujarat and Maharashtra, immobilizing, according to a rough estimate, something like 60,000 vehicles. The loss caused to trade and industry as well as to the operators as a result of the token strike is difficult to calculate, as also the great magnitude of the loss involved in the prolonged strike in Madhya Pradesh. The truck operators eventually succeeded in getting redress of their grievances. The State Government has agreed to amend the Motor Vehicles (Taxation of Goods) Act so as to reduce by 50 per cent each the fee levied on inter-regional permits from Rs. 534 per quarter to Rs. 267 per quarter and the composition fee from Rs. 678 per quarter to Rs. 339 per quarter of a year. It is not clear how far an understanding has been reached on the dispute over the abolition of the distinction between the regional and inter-regional permits.

It is not in Madhya Pradesh alone but throughout India that motor vehicles are considered as the milch cow from which ample milk of taxation can be squeezed. This taxation takes various forms from direct permit taxes to indirect levies of a considerable variety. In the aggregate, motor vehicles taxation in India has acquired the ill-fame of ranking among the top-heaviest in the world. The iniquity of such heavy taxation as well as its direct harmful effect on the development of transport, agriculture, industry and trade are now accepted facts. There has been a spate of reports on this particular subject beginning with the report of the Motor Vehicle Taxation Enquiry Committee. The Masani Committee is the latest to utter a warning to the Government against the ill-conceived and short-sighted policy of inflicting an unbearable tax burden on motor vehicles. Much the greater part of the aggregate tax collections from motor vehicles is appropriated by the State Governments and they have found in it a very fruitful source of revenue. Their stake in this source of taxation has become so deep-rooted and the limitations on the expansion of State taxation by policies like prohibition has strengthened that stake to such an extent that they can now confront the Centre with a blunt poser as to how they are to be compensated for the loss of motor taxation if they are to relax motor taxation.

There is no doubt some truth in the grievance of the State Governments that, in case they are asked to surrender a part of their revenue from motor taxation, they should be provided with compensatory or alternative revenues. But this argument has been exaggerated. Lower taxation of motor vehicles will encourage rapid expansion of truck transport and it will make a significant impression on the net revenue of the State Governments. As it is, something like 40 per cent of the road capacity is said to lie unexploited in most of the States. It can be pressed into service within the limits of the availability of foreign exchange to step up the supply of vehicles, domestic or imported. Road repairs and maintenance are in an awful condition not only on the provincial roads but on the national highways. If they are brought up to the normal standards, the volume of truck traffic will certainly go up. All these remedies will stimulate economic activity to an extent which will bring revenue to the State fisc in diverse ways. The loss on motor vehicle taxation will be more than compensated by the earnings of tax revenue and from other activities. The Madhya Pradesh ordeal of strike should serve as an appropriate occasion to take an agonizing stock of the whole situation.

C.P.I.

ESCAPE IN EQUIVOCATION

AT A time when all the parties and groups are spontaneously sinking their differences and issuing exhortations to the nation to stand solidly behind the Government and strengthen its hands in the defence against the Chines aggression, the Communist Party of India has the notorious distinction of deciding by a deliberate choice t remain in segregation. The resolution adopted by th Central Secretariat of the CPI on October 17 is an unabashed illustration of a purposeful resort to equivoca tion, the purpose being to evade calling an aggressor a aggressor and dealing with him as such. The relevan portion of the resolution adopted by the Secreta riat reads: "Reports of the Government of Indi 'show' that the Chinese forces have crossed t the south of the McMahon Line and, thus violated Indian territory, though the Chinese deny it." When Mr. E. M. S. Namboodiripad, the Party's General Secretary, was cornered and confronted with the question whether his Party equated the Government of India's statement with Chinese denial, he stated with a conviction that the Chinese denial was a fact and asked whether the Party should not state facts. But curiously enough, what the Government of India had stated was depicted as an inference of doubtful validity as the use of the word 'show' signifies. The CPI most reluctantly committed itself to the recognition of the McMahon Line as the border line between India and Tibet. Now that it is difficult for it to resile from this position, it is seeking refuge behind the reliability of the version about the aggression. When specifically asked whether the Communist Party of India supported the Government's firm policy that no proposal for talks could be entertained until the intrusion into NEFA was vacated, Mr. Namboodiripad once again gave the evasive reply that it had not gone into the details of the issue but discussed the NEFA situation in very broad terms. Mr. Dange's face-saving assertion that defence was better than condemnation was yet another telling example of the attitude of equivocation. To cap everything, the Secretariat's resolution describes the aggression in NEFA as the generation of 'new tensions' on the NEFA border.

The truth of the situation is that the CPI is now brought face to face with a positive situation in which it can no longer conceal the internal conflicts between its two factions—one, an out-and-out China lobby and, the other, inclined to take a realistic and nationalist view of the Indo-Chinese border problem. These exercises in tight-rope walking and finding an escape in equivocation cannot last long and the Party has to make its position clear beyond the shadow of any doubt. The extent to which the China lobby in the CPI is still rooted is easy to gauge. Mr. Jyoti Basu and Mr. B. T. Ranadive are reported to have denied in public statements the fact of aggression by China. The significant fact is that the party is led by leaders of such ideological-cum-anti-national loyalties. Many would quite reasonably hold that in issues like the present one the demarcation between the tight-rope and treason is thin.

A CORRECTION

In the leading article on **Nutritional Standards** in the last issue of 'The Eastern Economist,' "not" was inadvertently missed between the words "does" and "appear" in line 21 of paragraph 2. The sentence should read: "Though no data are available in respect of the consumption of vegetables, the 1943 picture does not appear to have very much changed."

The World Abroad

THE SECRET OF ECONOMIC ADVANCE

By ODYSSEUS

IN HIS ENDEAVOUR to ascertain what it is that starts economic growth in an undeveloped traditional society, Professor E. Hagen, a leading American economist, asserts in his new book "On The Theory of Social Change" (Dorsey Press. Illinois, $7.50.) that the generally accepted economic explanations—outlined here last week — mostly explain what happens once growth has started, not how it started.

Until recently, the weakness of most Western economists seeking to advise undeveloped countries on how to initiate growth was that they did not try to understand the structure of a traditional society, and the incentives and motives which governed its people. They dismissed these as "backward", and tried to instil in them the economic motives that govern wholly differently motivated industrialised societies.

CHANGE VERSUS SECURITY

Every society seeks, with varying success, to provide its people with security. In the West, security is promoted by the sanctity of contracts within a framework of written law. I am disposed to argue that, broadly speaking, Western societies, based on contracts, which enable the citizen to promote his own welfare, have been outstandingly successful in multiplying wealth, but only relatively successful in attaining individual security, and further, to assert that the substantial security achieved in a traditional society is incompatible with the multiplication of wealth. There is logic in this. Because it is the Western individual's *sense* of anxiety on behalf of himself, his family, his group, and his country, which drives him to work hard, to earn more money, to find new techniques, new solutions to old problems. He expects change. His history has accustomed him to see stage coaches displaced by railways, railways by motors, lorries, and aeroplanes—the steam engine by the internal combustion engine, internal combustion by jet propulsion. Although it is not true to say that the average Western individual sees no threat in change and offers no resistance to it—examples to the contrary will readily occur to everyone—nevertheless the structure of society is biased towards change, and it is this bias which gives scope and incentives to creative, innovating personalties.

The typical traditional society is very different. First, it is based on agriculture. Society consists, broadly on the one hand, of peasants and small traders and, on the other, of an elite of landed proprietors (who are by no means necessarily land owners). The peasant depends for help against the hazards of life not merely on his hierarchical overloads, but on a recognized system of mutual help amongst the members of his village or clan, who help each other in planting, harvesting, irrigation, house building, and at births, deaths, or marriages and, of course, at times when disaster strikes. The forms vary from society to society, but the result is the same: life depends on this mutual help. Many economic and religious functions cannot be carried on without it. In the West, the sanction against an individual for inadequate co-operation in the general aim of society (which is, broadly, the creation of wealth) is either failure to add to his present income or a decrease in it, or, finally, poverty and hardship. This is not to ignore the manifesting existence of important religious, cultural, artistic and other non-material values, but it remains true that the wealthier that a society is, the more it can afford the time and money to cultivate non-material values.

In a traditional society, the sanction against an individual to compel him to observe his customary obligations is the refusal of his group to co-operate with him. In extreme cases, he is ostracised. Because no one has labour or goods to spare, the obligations of mutual help are scrupulously observed. The enforcement of a rigid contract, which turned out to bear harshly on a villager, might endanger all social relationships in the village. Hence in the typical traditional society, there are no contracts and no legal code. In many traditional societies, each case of discontent is decided by the elders, not merely on grounds of equity, but with keen consciousness of the relative status, power, and social connexions of the parties, the resentments that might be aroused, and the implications for life in the village of alternative decisions. The headman's role is to ascertain and enforce the consensus of village opinion.

Because all this preserves the traditional social structure, the Westerner, accustomed to expect change and, indeed, anxious to promote it in order to speed economic advance, assumes that the villager leads a life of frustration and apathy. It is true that in many parts of Asia today he is sullen and apathetic, but the forces which make him so are those which are disrupting his traditional society, not the circumstances of that society. In an undisturbed traditional society, the villager takes the structure as the natural order, as unalterable as the sun, the moon, and the seasons. He feels the security of knowing his recognised place in it. He honours the elite without envy, as members of a world far outside his ken. He respects himself as a peasant. It is a Western mistake to picture the elite as holding the peasants down in grinding misery.

The citizen of an industrialised country seeks release from his anxieties in ceaseless activity that inevitably leads, sooner or later, to change. In the 19th century, he sought the change of political enfranchisement. Today, he seeks "fair shares" or equal opportunities to secure other changes that he thinks will better his condition. But in a traditional society, peasant and elite seek release from their anxieties in preserving the known and the familiar. The great stability of traditional social structures bears this out. A powerful elite might hold the people in hated peonage for a generation or two, but it is inconceivable that an elite could hold their position by force throughout the many centuries in which traditional societies have persisted. Peasants find satisfaction in depending for decisions on individuals above them in hierarchy which ensures them their respected place. Conversely, anything that interferes with, or erodes, the structure must arouse their anxiety; they recoil from having to make decisions or to cope with problems on their personal initiative outside the protecting structure of mutual self-help.

THE BASIC CAUSE OF CHANGE

The basic cause of the changes which disrupted the once traditional societies of Europe and elsewhere, was the perception by the members of some social group that their purpose and values in life were not respected by groups in the society whose esteem they valued. Thus, in Japan, a struggle for power among the elite led to the victory of the Tokugawa dynasty, who depressed the samurai and the class known as "wealthy peasants". In Russia, the Czar's religious reforms in the 1660's constituted a rejection of the Old Believers. Professor Hagen

outlines these and other erosions of the traditional structure in other countries in great detail, and he convincingly argues that a "withdrawal of status respect" causes cumulative discontent in the group affected, which, over a period of some generations, leads to the emergence within it of "innovational personalities", ready and anxious for change in the traditional structure. Instead of finding satisfaction in preserving the known, the innovator finds it in testing his capacities against the unknown. He is not necessarily a happy man who faces problems with pleasure. Rather, most creative individuals are driven to creative activity by incessant anxiety. Their feeling that the world is a threatening place leaves them only while they are active, then, after momentary satisfaction in the solution of a problem, it returns to drive them on again.

It is often said that social mobility is essential for economic progress, but it is not the mere possibility of social ascent that is necessary but specifically the social recognition accorded to economic prowess. If traditional channels of gaining status are open, then they will attract talent. For example, if social acceptance be gained by prowess in war, literary learning, the priesthood, and so on, then these careers will attract. However, if traditionally honoured roles are not open to an individual, and if armed rebellion or emigration is impossible, then he must seek other—non-traditional—channels for recognition. Whether or not he turns to technology depends on various factors, including the state of scientific and technical knowledge. Today, however, advanced technological information is readily available to innovating personalities in virtually all countries. Furthermore, the experience of colonial rule under industrialised nations in many traditional societies has given economic innovation widespread prestige, so that the chances are increased that dissatisfied groups will turn to economic activity.

It emerges, however, from Professor Hagen's study that the process of evolution from a traditional to an industrial society must be expected to be gradual and full of explosive social tensions, rather than quick or painless. To adopt non-traditional occupations is not only beyond the knowledge and skills of a traditionally educated adult: it is against all his instincts. He will direct his energies towards recovering the status that he has lost. If he fails, he becomes apathetic, sullen, or rebellious. The constructive effects of lost status will be on the young, especially on children in their formative years. The young are adaptable. The future lies with them. Professor Hagen concludes that since the impact of the West on traditional societies is world-wide, loss of status has started changes towards conditions making for economic growth everywhere, but their speed cannot be forecast. Nor does he offer any views as to how the leaders of traditional societies in transition may seek constructively to ease the social tensions that are inevitable.

I am conscious that this is an inadequate outline of an important and challenging book, but Professor Hagen's 500 closely documented pages, covering economics, psychology, and anthropology, defy summary.

...SEE your savings grow bigger and BIGGER...

...your savings can grow, from small monthly deposits to a large asset, by our **RECURRING DEPOSIT SCHEME** which brings you substantial returns.
You deposit, say, Rs. 10 every month in this account, and it becomes Rs. 383 in 36 months; Rs. 521 in 48 months; Rs. 665 in 60 months.
An attractive scheme, it makes regular saving a habit —a good, profitable habit. For, month by month, your account grows, earning compound interest. You can save larger amounts too, in multiples of 10, upto Rs. 1000 per month.

Monthly Deposit:	Total amount repayable at the end of 36 months	Total amount repayable at the end of 48 months	Total amount repayable at the end of 60 months
Rs. 10/-	Rs. 383/-	Rs. 521/-	Rs. 665/-
Rs. 30/-	Rs. 1,149/-	Rs. 1,563/-	Rs. 1,995/-
Rs. 50/-	Rs. 1,915/-	Rs. 2,605/-	Rs. 3,325/-
Rs. 100/-	Rs. 3,830/-	Rs. 5,210/-	Rs. 6,650/-
Rs 1000/-	Rs. 38,300/-	Rs. 52,100/-	Rs. 66,500/-

CHANGING CONSUMPTION PATTERNS

From Our Special West European Correspondent

PARIS, October 21.

THE evolution of consumer habits in response to a steady rise in real incomes (and also—this is a different matter—in response to recurrent falls in the rate of rise in real incomes) is a subject that naturally concerns planners and producers alike. Unfortunately, each nation seems to react differently to prosperity, and special studies are required in each case. For example, recently published enquiries reveal that the West Germans and the French have shown, on several points, diametrically opposite reactions to the long spell of prosperity of the 1950's; the Germans, especially young people and women, have spent much more on alcohol, and the French very much less. The Germans have gambled more (an increase of 300 per cent in sums left on gaming tables in five years), and the French less. The proportion of the family budget devoted to food has been stable in Germany and other Western countries, but it has declined in France quite sharply. Nevertheless, there are obvious common trends, such as the larger sums spent on automobiles, on tourism and on health.

Perhaps both the discordant and the concordant trends point to the same thing: to the gradual appearance of a common living pattern throughout West Europe, a pattern that may be called Americanisation. The French used to outlay more on food and drink than the others, and in reducing their relative expenditure on those things they are falling into line. In boosting their outlays on cars and holidays, West Europeans in general are following the American lead. However, this notion of a universal Western approach to the American way of life is based on a very hazardous extrapolation. Having visited each of the six Common Market countries this year, I was struck by some evident inroads of Americanism everywhere: the craze for "convenience foods" (deep-frozen and ready-prepared dishes), the mushrooming of motels and the spread of consumer-credit are too obvious to be missed. On the other hand, one has to look at the figures, rather than the shop-fronts, to see that certain attempts to introduce American ideas have failed or not even been tried: coin-operated laundries and dry-cleaning outfits have been resisted by Continentals, and the immense sums invested in bowling alleys have so far brought no return. Again, some consumer goods that have little or no place in the American budget have shown sharp rises, such as natural mineral waters. Finally, some of the most obvious new uniformities in European consumer habits are not American in origin at all, but Italian; this concerns food (ice-cream, espresso bars, ready-prepared dishes like pizza and antipasti) as well as clothing (shoe styles, seamless stockings, silk ties, etc.)

For that matter, the outlays on foreign travel, of which the increase marks an Americanisation of the traditionally stay-at-home French, reflect the Italian vogue too, for it is Italy that attracts most tourists from north Europe. As far as concerns the organisation of production and credit, there is a clear trend toward Americanisation, but in what relates to consumption as good a case could be made out for the Italianisation of West Europe. In any event, the common trends, if any, are less apparent than the different national reactions to increases in incomes, if only because consumption is influenced as much by national tax systems, by relative prices and by certain political options, as by imitation of foreign tastes. Belgians are not going to drink as much wine as their southern neighbours as long as the powerful brewery interests see to it that wine is severely taxed; nor Frenchmen eat as much veal as others when the price is maintained extravagantly high to subsidise peasants; nor Europeans spend as much on television when a government monopoly restricts the choice of programmes.

First one must recall the extent of the increase in real revenues in West Europe in recent years. Between 1950 and 1960, on average, consumer outlays per head at constant prices rose: by 6.1 per cent in West Germany; by 4 per cent in Italy; by 3.7 per cent in France; by 2.8 per cent in Holland; by 1.7 per cent in Belgium; as compared with 3.3 per cent in the United Kingdom and 2.1 per cent in the USA. How consumers react to these sizable increases in spending power depends on the level from which they began: Belgium used to have the highest living standards on the Continent, but has so no longer; France, in this period, overtook Belgium, approached British standards and improved her living standards from 40 per cent of American to 50 per cent; the Italian increase, of course, begins from a very low level. It depends, too, on how obvious the increase was to the consumer. The figures quoted are in constant prices and thus are known only to the statistician, after he has subtracted from the total volume of consumer outlays the part due to increase in prices and to expansion of the population. In some countries, prices were relatively stable and consumers at once noticed the rise in real spending power, but elsewhere, as in France, there was a considerable rise in prices, so that consumers got richer while complaining bitterly about "impoverishment" due to inflation. Naturally, they tended to spend their money differently in each case.

The German experience is set out in a study just published by the Economic Research Institute of Rhineland-Westphalia. It indicates that about one-quarter of the increment in real revenues was spent on motor-cars and holidays. Outlays that more than doubled were for radios, television, musical reproduction sets, strong liquor, gambling, collector items from stamps upwards, and some types of household amenities. Great detail is available for the revolution in French spending habits in the 1950-60 decade in a study of family budgets by Credoc, a consumer research organisation. The big change was from food to durable consumer goods. Apparently defying Engels' law, French families used to spend 49 per cent of their outlays on food as recently as 1950, but this has now dropped to 41 per cent. The main victims were brandy, liqueurs, aperitifs and similar products for pickling the liver; and bread, potatoes and starchy food in general. Consumption of milk, chocolate and ordinary wines stagnated or declined, apparently because saturation point had been reached, while purchases of mutton and veal could not increase in view of high prices. Products that flourished mightily were drinks containing little or no alcohol (fruit juices, mineral water and beer), sweets, cakes, biscuits and ice-

cream (and hence the champagne that goes with them), cheese and fine wines. Convenience foods prospered (tinned vegetables, package soups) and pork products, no doubt for similar reasons, for they come ready to eat. There were only modest rises for products of which saturation point had been reached (eggs, sugar, coffee, dried vegetables) or of which high prices and inefficient distribution hampered sales (beef, fish, fresh fruit and vegetables.)

Outlays on clothing declined from 15 to 12 per cent of the family budget, and less was spent on soap and cycles. The savings in these classes of goods went mainly to durable consumer goods, sales of which tripled: television, records, refrigerators, washing machines, musical reproduction sets, games, toys, camping equipment and motor cars. Less notable increases occurred in household amenities: furnishing fabrics, heating and cooking appliances, radios and furniture. Well behind that group came articles and services for personal use: toiletries, perfumes, hair-dressing, newspapers and magazines. Outlays on these items did not double in the decade. An exception here is expenditure on medical care and pharmaceuticals, which more than doubled. The picture that emerges is of a steadily richer citizen who is becoming more health-conscious and more of a family man. Responding to governmental campaigns as well as to his own desire to share his pleasures with the whole family, he has cut down items that are deleterious to health, consumed alone or out of the house; he has made his home more comfortable, favouring goods that are enjoyed jointly, such as motor car, TV and more varied meals, against personal items like clothing.

What happens to this choice if times get harder? The period in question was not free of economic accidents, for there were recessions in 1953 and 1958-59 as well as spells of accelerated inflation in 1951 and 1957-58. They show that when incomes cease rising or fall, total consumer spending, needless to say, stabilises but the various items are very differently treated. Some things are not sacrificed at all, such as outlays on medical care and drugs, whereas others slump at the least turn of the wind. Food outlays are relatively rigid; when circumstances are more difficult, the family seeks to keep up its newly acquired alimentary standards at any cost and the housewife refuses to go back to the old, cheaper foods. A second group of products or services is regarded as privileged and continues to increase, though at a slower rate: these are items whose intake is governed by previous decisions, such as heating and lighting power, schooling, housing and products required for upkeep, or whose consumption depends on contractual arrangements (rent, insurance).

This leaves the full burden of the belt-tightening to fall on a third group of goods, which are promptly sacrificed or put off for better times. These are clothing, motor cars, radios, household gadgets, photography and camping gear. It will be noticed that some of these are items that are especially favoured in affluent moments, and thus the industries concerned are highly cyclical: cars, camping equipment, electrical household gadgets. Others are products that get relatively less attention even in good times and yet are axed in bad times: clothing is the most notable case, and the fact is cheerless for the textiles industry. However, traders interested in the West European market for specific products need not rest content with the very general indications I have given. They can refer to the 800 statistical series covering 200 products or groups of products, giving for each the evolution over the last decade of sales in value and volume, which are published by the Centre for Research and Documentation on Consumption (Credoc), 30 rue d'Astorg, Paris, 8, and the similar studies by the Economic Research Institute of Rhineland-Westphalia.

American Express Banking Service is prompt and trouble-free. No tedious waiting...no irritating delays—everything's done for you with the utmost despatch and courtesy. Economic Report from the U.S.

HUMAN SIDE OF THE DEVELOPMENT PROCESS

By

GUY SIMS FITCH

WASHINGTON, Oct. 16.

IN reviewing the results of the 43-nation, US sponsored middle-level manpower conference in Puerto Rico last week, one element stands out with particular force. It is the evident determination of the delegates to come to grips with the subject at hand—not merely to talk about it in theory, but to discuss real problems in real terms, and to do something about them. It is not hard to see why this was so. In the first instance, the conference was dealing with a subject of tremendous appeal—the human side of the development process. Too often ignored in the past amid the concerted efforts directed at investment in physical resources, investment in human beings—in the development and utilization of their skills and their productive potential — now has drawn widespread attention as both a worthy end in itself and an indispensable ingredient of lasting economic and social progress.

More than one project in the history of economic development has had to be postponed or abandoned, not because capital was lacking, not because labour was in short supply, but because the skills needed to carry out the plans were unavailable. This matter of skills is important to all countries, whatever their stage of economic advancement. But it figures to be particularly pertinent to developing economies. Where education and training are scarcer, the contribution of a skilled individual to the economy promises to be greater. Awareness of the problem is only the starting point, of course. Much of the significance of last week's conference lies in the vast and fruitful exchange of information that took place, as participating countries detailed not only their manpower difficulties, but also the steps they were taking to cope with them, to upgrade the skills of their citizenry. These programmes range from carefully formulated public education efforts to tax and other incentives for private enterprise to train personnel for productive jobs. Among the heartening moves to come out of the conference were announcements by a number of industrialized countries that they have set up or will set up "peace corps" programmes of their own. These appear to be modelled largely on the example of the US Peace Crops, whose volunteer personnel are contributing to manpower training and skills development in nearly 40 countries around the globe.

This interest in volunteer training programmes is not confined to industrialized countries. Several developing nations also announced that they will be establishing domestic peace corps programmes of their own to help develop needed middle-level skills and to work with the volunteers from the United States and other industrialized nations. In keeping with the spirit of international co-operation that motivated the conference, US Peace Corps Director Sargent Shriver indicated that the United States stands ready to aid other nations in these endeavours. To help follow through with the efforts begun in Puerto Rico, the conference set up a small interim secretariat in Washington which will keep the entire subject under review and will help disseminate essential information about manpower needs and training to all interested nations. The work of the secretariat will be examined before a year has passed, with an eye to determining what else needs to be done.

Even this readiness to face up squarely to the issue of manpower resources is not the full measure of the significance of this international conference. It was no mere technical discussion of labour input, output and related questions. Virtually every delegation present indicated its agreement, open or implied, that what is at stake, in the final analysis, is the transformation and modernization of entire societies. To the extent that people become more literate, better educated and trained to take up productive roles in a changing and advancing society, they are in effect laying the foundation for the creation of new and dynamic social and political institutions. Through such institutions they can find growing opportunities for realizing their human aspirations for a better life with dignity and freedom. As Governor Munoz Marin of Puerto Rico noted in opening the conference, economic development should be the servant of civilization, not its master.

THE TEHRAN SYMPOSIUM ON OIL

(CONTRIBUTED)

THE preponderance of manual labour in agriculture and a low level of industrial development in the countries of Asia and the Far East have kept the demand for petroleum products in this region at a low ebb; in 1960, the ECAFE region's aggregate consumption of oil products formed only 5 per cent of the world total. But the increasing stress that is placed on industrialisation all over this area and the greater resort to mechanised farming in at least some of the more advanced countries among them is bound to push up this demand at a fairly rapid rate. During the next few years, the ECAFE region's requirements of petroleum products are estimated to go up by 100 per cent, if not more.

This has naturally given a tremendous fillip not only to the setting up of the oil processing industry in this vast region, but also to oil exploration and prospecting. During the four years to 1960, the overall production of oil in the ECAFE region increased by nearly 40 per cent and the refining capacity by as much as 34 per cent.

A major part of the increase in production has obviously taken place in Iran which has been for a long time one of the premier oil-producing countries in the world. But substantial additions have been made to the proved reserves of oil and gas in various other countries as well as a result of enhanced exploration activities. In Afghanistan, for instance, the total area under oil exploration has been increased to 1,13,000 square miles. Exploratory deep wells have been drilled in six structures. At one place oil has been found at a depth of about 2,200 feet. At two other places several commercially exploitable gas horizons have been encountered and plans are formulated to develop one of these by the end of 1963.

Pakistan has met with tremendous success in respect of natural gas availability, though not in the discovery of oil. So far eleven gas fields have been discovered in this country, the total recoverable reserves being estimated at 14 million million cubic feet. The discoveries have been in both the wings. Pakistan today is counted among the world's most prolific gas regions.

In India, substantial successes have crowned the ambitious programme of oil and natural gas exploration launched by the Government of India through the State-owned Oil and Natural Gas Commission and by the Burmah Oil Company. Fairly extensive oilfields have been discovered in Assam and Gujarat States and a gas region has been located in the Cambay area of the latter. Plans have been chalked out to intensify exploration in the Rudrasagar area in Assam and expedite it in the Indo-Gangetic plains in North India, the Cauvery Basin in the South and off-shore near Kutch on the Western Coast.

Though little success has been achieved so far in Australia, the Australian Government in spending large amounts on its quest for oil or natural gas in the Papua/New Guinea area as also on the mainland. The Japanese oil concern, the Arabian Oil Company, is stated to have intensified its production programme in its off-shore concessions in the Kuwait-Saudi Arabian neutral zone. In Iran, exploration is being continued in central and northern parts of the country. Similar extensive programmes are in operation in all other ECAFE region countries where there are hopes of finding oil or natural gas.

So far as stepping up of the oil refining capacity of this region is concerned, India has made quite a good deal of advance over the position obtaining in the mid-fifties, when four private sector refineries were in operation here, by setting up the 0.75 million tons Noonmati Refinery and planning for establishing three more refineries in the near future at Barauni (2 million tons), Koyali (2 million tons) and in South India. The total refining capacity in India by 1965-66 is estimated to go up to nearly 12 million tons. In Ceylon, consideration has been given to setting up a 1.4 million tons refinery. Pakistan is planning to add to its 8,000 b/d capacity refinery at Rawalpindi two more refineries, one at Karachi having a capacity of 1.5 million tons with a provision of expansion to 2 million tons and the second one at Chittagong having a capacity of 0.8 million tons. In Burma, which since recently has become a net importer of both crude oil and refined products, after remaining a surplus country for a long time, the Burmah Oil Cimpany (1954) expects to raise its total refining capacity to about 17,500 b/d.

With a view to providing a further fillip to the development of the oil industry in the ECAFE region, the Petroleum Symposium held last month at Tehran—the second one to be organised by the ECAFE—obviously was a significant event. As many as 27 countries, both from the ECAFE region and from the West, including the United States and the Soviet Union, participated in this Symposium where a larger number of papers on technical matters were discussed. The ECAFE region, though comparatively a new-comer in the oil industry, except for Iran and Brunei, has both to contribute to the knowledge on oil exploration and processing techniques as well as to receive guidance from the nations where this industry has made great strides since the turn of the present century. The various suggestions and recommendations made by the Tehran Symposium on the development of the petroleum resources of Asia and the Far East are obviously of considerable interest to all those countries which aspire for building up the oil industry within their bounds.

For facilitating and expediting oil exploration in the ECAFE region as a whole, the Symposium has laid great stress on photo-geology or aerial surveys and promotion of communications between palaeontologists and sedimentologists working within the region as also with those outside it. Joint exploration programmes in border areas in the neighbouring countries have also been suggested. This suggestion was given a concrete shape immediately when Pakistan and Iran proposed to set up a joint team to carry out geological exploration around their common frontier. Iran has also proposed a similar arrangement with Afghanistan. The extension of such arrangements of collaboration to other countries in the region which have similar topography can obviously be of great advantage and should yield wholesome results in obviating unnecessary duplication of work and expense.

While exchange of geological data between the neighbouring countries is thus helpful, it is but imperative that there should be some standardisation of the various definitions and nomenclatures used. It is encouraging to note that the ECAFE Secretariat, which has already prepared an oil and gas map of the area and is engaged in the preparation of regional mineral distribution, techtonic and metallogenic maps, has undertaken

this task. The other important jobs that the ECAFE Secretariat has been suggested to undertake are the compilation and printing, in a single volume, of the case histories of oil and natural gas fields and an inventory of the training facilities available in the region. The proceedings of the Tehran Symposium in regard to the training of oil technologists were heightened in significance by the offer made by Iran to accommodate a fairly large number of trainees at its NIOC production laboratory, the only laboratory of its kind in the whole of Asia and the Far East. The ECAFE Secretariat would shortly be preparing training schemes based on this offer. A number of countries, included in which are Afghanistan, Burma, India, Pakistan, the Philippines and even Japan, have welcomed this facility and indicated their desire to avail themselves of it. Part or whole of the travelling expenses of these trainees, if the number involved is large, will be required to be borne by the participating governments themselves for the simple reason that the financial resources available at the disposal of the ECAFE are only limited.

The training programme also envisages making available to the needy countries the services of experts, especially when the number of persons to be trained is very large. Arrangements will as well be made by the ECAFE Secretariat for sending some trainees to countries outside the ECAFE region as the demand arises.

While noting that drilling speeds in the ECAFE region have increased significantly in the recent past, the Symposium called for further relentless efforts in this regard through careful selection or modification of the drilling equipment, provision of special transport facilities and speedy rig moves, proper attention to mud technology, etc. The discussions at the Symposium in respect of injection experiments to raise recovery from an oilfield were also quite illuminating and instructive. Great interest was also shown in the new developments in the injection of hydrocarbons in blast furnaces, in the experiment on petroleum agricultural mulch, application of bitumen in civil engineering works and transport of high-wax Assam crude through pipelines.

In the field of natural gas uses, the contribution of the Tehran Symposium was of particular significance to countries like Iran, India and Pakistan, where sizable gas reserves have been discovered. The experts from the leading oil and natural gas producing and processing countries brought to the ECAFE nations a panoramic view of the contribution that the petro-chemical industries can make to a nation's well-being.

Iran's offer, during the deliberations on natural gas utilisation, to make available to the countries in the ECAFE region its vast gas reserves at reasonable prices and under favourable conditions, could be of particular interest to India. The long distance involved in transporting this gas may not make its utilisation as an industrial fuel a feasible proposition, but the availability of liquid ammonium produced from it, as suggested by Mr. Walter J. Levy, the renowned oil economist from the United States, may help this country, as also others, in stepping up their fertilizer and chemical production programmes.

How to Resist Rising Prices?

By CROESUS

FAR too much is being made these days, I am afraid, of the contribution made to the present rise in prices by the middlemen, without any concrete evidence to substantiate the charge. That the charge is more an impression than a conclusion based on facts is evident from the pertinent point made in a leading article in "The Eastern Economist", last week, that neither the Centre not the States have any reliable information in regard to the distributive trades. Generally, at times of acute shortages, superimposed on a deficit-finance-generated inflationary economy, there may be a tendency, on the part of some unsocial elements in the distributive trade, at some point or other in the supply pipe-line, to exploit the situation and extort a more than legitimate share of profit, but to make a sweeping generalisation on this basis is neither scientifically objective nor fair to the distributive trade as a whole. The margin of profit of middlemen is by no means an unearned income, and it is a moot point whether any agency that may take the place of middlemen will be able to render the same sort of — let alone better — service that the latter have been rendering. Moreover, very little attention, it seems, is being paid to the consequential unemployment that any hasty move to supplant the existing distributive agency would give rise to. Further, there is no guarantee of any worthwhile relief, at any rate so long as it takes the new agency that has to step in to familiarise itself with the distributive role — and that provided that this new agency will cost less for its service than the agency of middlemen. On both these points, though a firm believer in co-operation, I have my own doubts about the availability of the right type of personnel to man the proposed co-operatives — the problem becomes the more difficult, because the number needed is legion, which means that we must be prepared to accept any one that offers himself, good, bad or indifferent. Co-operation, however, presupposes the availability of good men with a missionary zeal who have not only the time but the will to work and, in more cases than not, on but an honorarium, not a handsome return.

These thoughts forced themselves on me, as I sat listening to the longwinded reply of Mrs. Tarakeshwari Sinha, Union Deputy-Minister for Finance, to the welcome speech of M. Lalchand Hirachand, President of the Maharashtra Chamber of Commerce, at the Thirty-fifth Anniversary Day of the Chamber, last week-end. Perhaps the blunt truth voiced by Mr. Lalchand when he told Mrs. Sinha: "there has been a tendency to put all the blame on the business community if prices soar" and "the rise in the price structure is mainly dependent upon Government's policy of deficit-financing, increasing controls, etc.", provoked her to give a whole homily on the price position today which was more impressive for its rhetoric than for its reasoning. I do not know whether Mrs. Sinha realised that, in her ardent attempt to defend the present policy — is it lack of policy? — with regard to prices, she was repeating a particularly vulnerable criticism of the present Government's policy often made by other political parties in the country, namely, that, "under a democratic system, it is not possible to control every sector of the economy". Is this not an open admission that the present price policy is ineffective? One only hopes this retarded realisation will not drive the powers-that-be to persuade themselves to drop the democratic system in sheer despair.

Be that as it may, after saying this, the Union Deputy Minister proceeded to disclose the Government's intention to "normalise the price of strategic commodities". Whatever that may mean, she seemed to set much store by distribution through co-operatives and stamping of retail prices, and, of course, called for sacrifices on all and sundry. For the rest, she said the Planning Commission was seized of the problem and it would make its recommendations to the Government. Meanwhile, she almost decreed a complete closure on all speculations in the press about either the reported proposals of the expert committee or the discussions by members of the Planning Commission on the subject. This is too tall an order to the press in any democracy and, in any case, does Mrs. Sinha want the Press to close its eyes and shut its ears even when some absurd proposals are bandied about, be they by Ministers of Government or members of the Planning Commission? Take, for instance, the suggestion to fix a quota for coarse cloth production. If, in their anxiety to bring down cloth prices (that cloth is a "strategic commodity" is admitted by all), the authorities were to stipulate that mills should produce more coarse cloth, what will happen? Have the likely consequences been foreseen by those that are credited with making the suggestion, even if one is charitable enough to concede that they may possibly not have cared to take note of the cloth consumption pattern in recent years, on the one hand, and the actually officially-inspired changing trend of cotton cultivation, on the other? How can any sensible newspaperman afford not to comment on such ineptitude? It is positively necessary to tell such people, if only in the larger interests of the country, that any such decision would be tantamount to turning the clock of progress — progress in cloth consumption (the shift in taste from coarse to fine counts) and progress in cotton cultivation (from short-staple to long staple) — apart from actively sabotaging the country's export drive. For, if it should become necessary for mills to consume more short-staple cotton, as any switch-over to more coarse cloth production (if it is at all feasible for all mills to do so) would entail, there would be a corresponding fall in the volume of one of our few relatively easily exportable commodities—short-staple cotton.

The problem of rising prices cannot be solved by resort to any such quixotic short-cuts. Rising prices can be effectively tackled only in two ways, first, by raising the output, especially of consumer goods — this is particularly so in the case of developing or underdeveloped economies which have to reckon with a greater measure of consumer-propensity for very understandable reasons — and, secondly, by reducing unproductive or highly slow-productive expenditure even if they hold out the presently irresistible prospect of being labour-intensive (they can only be so temporarily) to the irreducible minimum. There is also one negative approach that the authorities must take note of, namely not to talk incessantly or too much of shortages. For shortages produce different psychological effects on different nations, depending upon their respective degree of discipline. In a country that can boast of a highly

disciplined people such as the U.K., for example, the mere declaration of a state of scarcity, whether accompanied or not by an appeal to consume less, would lead to a spontaneous self-imposed restraint; on the other hand, in a country where people have still to develop that high measure of discipline such as ours, the very first whisper of shortages induces many people to rush to the marketplace and seize as much stocks as their resources permit. In the case of our people, persuasive appeals to consume less because the country needs it in this critical hour would perhaps produce far more encouraging response.

Business Notes

Power

PERSPECTIVE PLANNING AND PROBLEMS

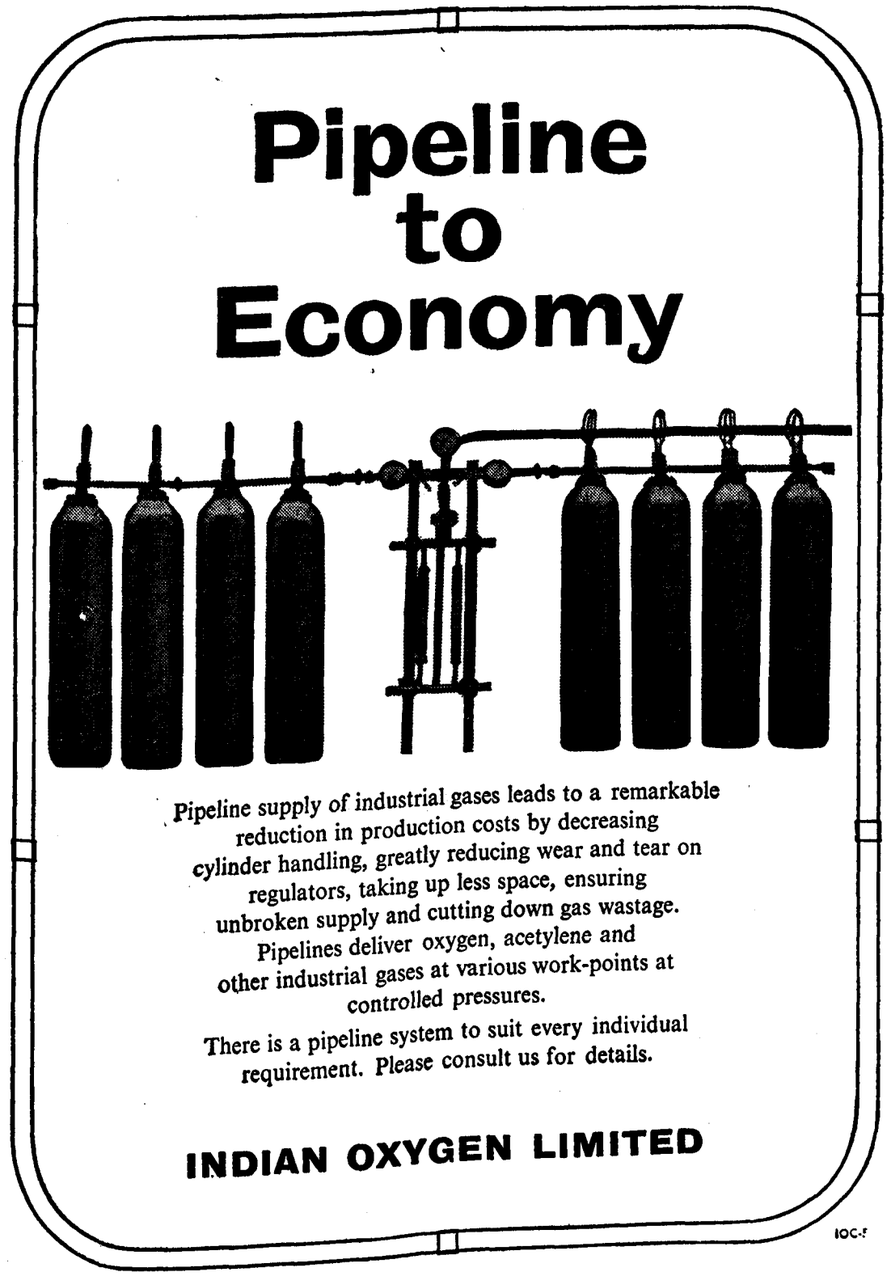
THE COUNTRY'S achievement in the development of electric power supply during the last decade has been fairly substantial, as is evident from the fact that the installed capacity of generating plants, which stood at only 2.30 million kW. at the beginning of the First Plan, rose to 5.70 million kW. at the end of the Second Plan. And, by the end of the current Plan, the aggregate capacity of the plants (in commission and under erection and testing) is expected to be of the order of 13.40 million kW., of which 12.70 million kW. would be in commercial operation. Notwithstanding this admittedly impressive achievement, as Mr. O. V. Alagesan, the Union Minister for State for Irrigation and Power, observed, "even this huge programme contemplated for the Third Plan may not keep pace with the growth in power demand". In these circumstances, the powers-that-be must adopt realistic and imaginative approach to solve this problem, by pressing into service other means—e.g. Thermal, Nuclear, etc.—to augment power supply.

Inaugurating the Licensees' Conference, organised by the Federation of Electricity Undertakings of India, in Bombay, the other day, Mr. Alagesan called for a long-term approach in the planning of power development and suggested a 15-year perspective planning, instead of only five-year ones as we have today. While no one may disagree with the anxiety of the Minister, thus, one would, at the same time, expect a measure of realism from the authorities in their approach to current problems being faced by the Electricity Undertakings in the country. It is known, for instance, that there have been repeated representations from electricity undertakings in the country urging a suitable amendment of the provisions of the Electricity (Supply) Act so as to enable them to raise new capital for their much-needed expansion schemes to augment power generation. Reiterating the plea of the undertakings—it must be for the umpteenth time now—Mr. S. M. Zubair, President of the FEUI, summed up the demand by saying that the industry should be allowed: (1) an increase in the "Standard Rate" of return on capital by at least one per cent per annum; (2) the elaboration of the permissible appropriation, namely "all taxes on income and profits", so as to cover all forms of taxation, including the tax at the prescribed rate deductible from dividends (the object being that all tax liability or tax relief redounds to the consumers' account); and (3) a provision in the amending Act to enable the undertakings which are obliged to raise loan finance at rates of interest above the level of the "Standard Rate" to charge up the actual rate of interest plus half per cent. It is gratifying to note that the authorities have reacted favourably to the question of raising the Standard Rate. What is now needed is a quick action to translate the assurance on the part of the Government in the interests of the undertakings, as also of the country. It is to be hoped that this will not lag far behind.

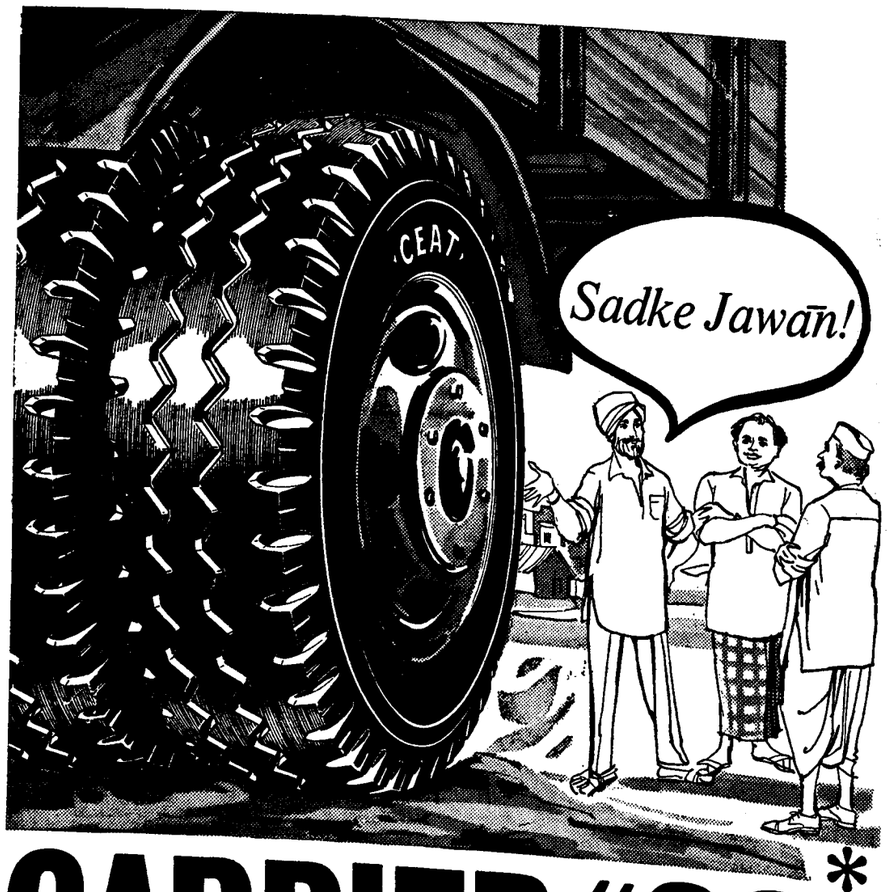
Import Substitution

MEHTA PANEL'S FIRST MEETING

THE PERSISTING foreign exchange problem and the halting growth of the country's exports have suddenly brought to the fore the question of import substitution. During the last twelve years, under a sustained industrialisation drive, this country has set up industrial capacity, much of which, for full utilisation, must needs depend on imports. And when imports cannot be had or have to be drastically curtailed, thanks to the severely limited availability of foreign exchange, this is but a natural development. As a matter of fact, the Government of India set up a Technical Panel on Import Substitution (TPIS) quite some time ago, but, owing to the sudden illness of Mr. G. L. Mehta, the Chairman of the Panel, no meeting could be held so far. The first meeting of the TPIS was held only last week in Bombay.



Addressing the Panel on the occasion, Mr. Mehta noted that no country could afford to do away with imports except at the price of high cost or uneconomic production which, in the process, would only help bring about the stifling of development. Viewed in this context—and it is the right context—he said, a policy of import substitution could only mean that imports are so regulated as to meet the changing needs of a dynamic economy. There has been a marked change in the composition of this country's imports since the last decade, and the pattern is likely to change continually and radically. Considering the recent developments in the export trade, as also the trends in external aid, Mr. Mehta stressed that the quantum of imports in the near future would have to be contained within a range more or less around what is obtaining at present, if not less. This makes it imperative for the existing users, whenever possible, to release their imports to make them available to newer claimants, he observed. But it could only be done by a process of import substitution, either by using indigenously available raw materials in place of the imported ones, or by importing semi-finished or intermediate products in place of finished products. Though the import of such substitution may not be immediately felt, as Mr. Mehta pointed out, it has an important function to perform in a developing economy faced with a foreign exchange crisis such as ours.



As Mr. Mehta clearly indicated further, the situation as is obtaining today demands a sense of urgency and a sense of responsibility from all users of foreign exchange, and the Government should have a comprehensive and co-ordinated view in this matter. Referring to the private sector, Mr. Mehta said that it should not be tempted to import more by exaggerating its import requirements. He regretted that incessant efforts had been made by some industrialists to get import licences for materials and components, even when corresponding indigenous materials and components could be had in the country, for the simple reason that the imported goods are cheaper and nearly always better in quality. Nobody wants to pay high price, but, as Mr. Mehta said, the remedy for high prices is encouragement of efficient production in a country poor enough for every anna's worth of efficiency to matter. Meanwhile, he added, it would be prudent for the public sector and the private industries alike to plan their projects in such a way as to keep their requirements of imports low enough to be able to insulate their production, as far as practicable, from the vagaries of our foreign exchange predicament.

Oil India

DEBENTURE ISSUE

OIL INDIA, a fifty-fifty partnership venture of the Government of India and the Burmah Oil Company, is floating a Rs. 30 crore debenture issue on October 30, 1962. The debentures carry the usual 6½ per cent interest per annum and are repayable in 1968-77. They

CARRIER "62"*

CARRIER "62" is everything the truck driver wants in a tyre. *CARRIER "62", the latest CEAT truck tyre-unique...with open shoulders for cooler running and higher mileage...with deep tread pattern for longer life...safer trucking.

CEAT
CARRIER "62"—the latest tyre

* Supplies are limited in certain areas.

CEAT TYRES OF INDIA LIMITED

CT-6.39

will be issued in units of Rs. 5,000 each. The Government of India has agreed to take up debentures worth Rs. 12.50 crores. Another Rs. 8.75 crores worth debentures have been agreed to be taken up by various financial institutions. The remaining Rs. 8.75 crores worth, which are fully underwritten by some banking concerns, are to be issued for public subscription. The list is to close at the discretion of the Directors, but not before November 1, 1962.

The proceeds of the issue are to be utilised for financing the construction of the oil-pipeline of the company, connecting the Nahorkatiya-Moran oilfields with the Noonmati and Barauni refineries. The first stage of this pipeline project, the 250 miles connection between Nahorkatiya and the Noonmati refinery, has already been commissioned into operation and the second stage of laying the pipeline from Noonmati to Barauni, over a distance of 470 miles, has been completed and is under test. The total cost of the pipeline is estimated at Rs. 49.50 crores, of which nearly Rs. 36 crores have already been expended, the rupee resources having been secured to the extent of Rs. 20 crores from an overdraft from the State Bank of India and to the tune of Rs. 6 crores from an advance by the Government and the foreign exchange component being provided by a sterling loan from the UK Government to the Indian Government to the tune of £3 million and overdraft facilities of £10 million made available by the Bank of Scotland in London on a guarantee given by the Burmah Oil Company. The proceeds of the debenture issue are to be utilised for repayment of the rupee overdraft of the State Bank and the Government of India's advance to the company, the surplus being meant for meeting the further expenditure on completing the pipeline project and for the development of the company's oilfields. Taken together, the pipeline project and the development of the Nahorkatiya-Moran oilfields are estimated to cost over Rs. 75 crores.

The proved and indicated oil and gas reserves of the company's oilfields as on July 1, 1962, amounted to 46 million tonnes and 7,56,000 million cubic feet, respectively, excluding 3.2 lakh tonnes of crude already supplied to the Noonmati and Digboi refineries. The development work in the oilfields is in full swing. The company has already completed drilling of 137 wells, of which 104 have proved to be successful commercial producers of oil or gas. Seventeen wells have yet to be tested fully to establish their status and only 16 wells have proved to be dry holes. By the time the 2 million tons Barauni refinery goes on stream, these oilfields will be in a position to supply nearly 3.5 million tonnes of crude to all the three refineries at Digboi, Noonmati and Barauni. The efficient working of the company should be evident from the fact that its annual report for 1961 showed a net surplus of Rs. 1,15,43,888, after providing for depreciation, taxation and statutory development rebate reserve.

Although Oil India's debenture issue is being floated at a time when Communist China has launched a full-scale invasion on our north-eastern frontier, the investing public should not be deterred from subscribing to this issue, firstly, because the company's fields of operation, no doubt situated in Assam, are no less than 350 to 400 miles away from the theatre of hostilities and secondly, owing to the fact that investment in the country's oil industry is all the more warranted at the present juncture when our economy is to be geared to war effort. Oil, obviously, has to play a great role in it.

Technical Training

MORE CENTRES WANTED

OF THE many centres where technical training is imparted, the one at Kotah and another at Nagarjunasagar in Andhra Pradesh need particular mention. These centres are being run under the Indo-American Co-operation Scheme. The training that is imparted here relates to theoretical and practical training on operation, maintenance, repairs and overhaul of heavy earthmoving and the allied equipment. The equipment provided is varied and covers almost all the types one is likely to encounter in any big construction work. Special stress is laid on the development of character and leadership in these centres so that the trainees after completion of their courses and with a little more experience can man responsible positions on construction work and can also, in turn, train others. The US Agency for International Development has contributed equipment worth Rs. 10 lakhs to the Kotah centre and has deputed a full-time technician to advise on training. The Government of India on its part has provided equipment worth Rs. 8 lakhs.

The present intake of the trainees at Kotah is only 40 while the demand for technical personnel is quite high. The number of trainees coming out of these training centres being meagre, it becomes important to realise that sooner more training centres are set up to meet the demand for trained personnel the better it would be. For then only would this solve the unemployment problem to some degree and provide the requisite technical manpower needed by the various multipurpose projects coming up within the country. It needs to be emphasised that the standardised equipment to impart training is limited at these centres and there is an urgent need to supply more of this equipment so that the trainees are not handicapped in any way. It is to be hoped that the authorities that are giving aid to these centres would realise the gravity of the situation and fulfil their requirements.

In the context of technical training it also needs to be emphasised that facilities be extended for training instructors at the various training institutes, the like of which exist in Calcutta, Bombay, Kanpur and Delhi. Realising the importance of the trained craftsmen, the Training Directorate of the Ministry of Labour and Employment increased the capacity of craftsmen trainees in the institutes from 10,000 to 47,000 in various industrial institutes in the Second Five-Year Plan. Now it is proposed to increase the seating capacity to 1 lakh in the Third Five-Year Plan. The object of these institutes is to improve the efficiency of the instructors employed in the institutions of Central and State Governments as also in private institutions and industrial establishments by giving them a course of theoretical and practical instructions in their respective States in the art of teaching; to train new instructors to meet the needs of the existing institutions and of new institutions to be started under-development plans, both Government and private, and to provide a refresher course for instructors with a view to ensuring that they are always up-to-date and conversant with the latest methods of production and teaching. Of the Central training institutes for instructors, Kurla (Bombay) is being assisted by the Agency for International Development of the USA. Equipment worth about $31,630 and books etc. worth $14,000 is likely to be supplied under the Agency. Ninety per cent of the equipment has already arrived and is being put to effective use. There are technical experts also from America guiding the various courses. Since the training imparted covers a number of courses in the technical field, better trained personnel are likely to be of great help in furthering the progress and the economy of the country.

AID FOR I.I.T.

FOR THE expansion of higher technical education the US assistance to the Indian Institute of "Technology, Kanpur, is likely to be of considerable help. The importance of

extending facilities in various parts of the country was realised as far back as 1945 and at a later stage it was decided that four technical institutes be set up in the East, West, South and North. Although the IIT at Kanpur was late in coming, it has made up for the deficiency to a considerable extent. Here it needs to be mentioned that the Institute at Kharaghpur was also established near Calcutta with US Government aid. The Institutes at Bombay and Madras were set up by Soviet aid and German aid. The US Government aid for the Indian Institute of Technology now coming up at the new site at Kalyanpur is provided under a contract with Educational Services Incorporated, which represents a Consortium of nine universities. The aid from the Consortium is considered to be useful on the score that it will bring to the Institute a broad spectrum of ideas and resources which perhaps would not have been available from a single institution. Besides it will help bring professors of experience to this Institute and thereby new methods of teaching in engineering education.

The project calls for the supply of the services of 23 technicians and 10 short-term consultants, training opportunities in the US for 30 members of the IIT staff; and commodities worth $1.1 million consisting of library books, laboratory and other equipment and training aids to contribute to the development of the best professional training by the institution.

The IIT is at present housed in Harcourt Butler Technological Institute. The Institute has 9 departments at present and will have more when it is fully established The Institute currently offers courses for branches like chemical engineering, civil engineering, electrical engineering and metallurgical engineering. The US assistance for the IIT upto the end of June 1962 was to the tune of $5.7 million. When the Institute is completed, which is expected to be in 1964, it will have 2,000 students and a faculty of about 250. At present there are nine American project technicians helping in the training programme. All of them are of a very high calibre and have been brought to this Institute from the notable universities in the United States. The training being in such capable hands, it would be no wonder if it soon grows into a flourishing technical centre. The job to be done is, no doubt, great, but it can be expected to be tackled with the help of these technicians in the best possible manner.

U.S. Aid

A REVIEW

EVER SINCE the signing of the Wheat Loan Agreement in 1951, the US assistance to India has been steadily mounting to new heights in an effort to promote the growth of the Indian economy. This aid has been widespread, but now it seems that it would mostly be concentrated on higher technical education, power development and food production. In other words, it means that the U.S. aid will not range over a variety of projects as in the past. This was revealed recently by Ambassador Galbraith to a party of journalists accompanying him on a tour of India's development projects receiving US aid. Amongst the power plants that have received assistance from the US, may be mentioned Bundel, the Chandrapur, Talcher and Cambay thermal projects and Pamba-Kakki Hydro-electric project in Kerala. Total American assistance to river valley and thermal power stations in India amounts to Rs. 382.3 crores. Rihand, Sharavati, Nagarjunasagar and Sabargiri, are some of the other projects which have benefited increasingly from US aid and are likely to play an effective role in developing India's economy.

So far as American aid to Indian railways is concerned, it has been mostly for their expansion and modernisation. In total, the US has contributed Rs. 96.6 crores for this purpose. Part of this aid has been utilised to finance the purchase of 300 diesel engines, electric locomotives and coaches, centralised traffic control equipment, steel for tracks and various other types of materials. This apart, American personnel have been helping the Indian railways in various ways.

In context with the aid, it is important to remember that US P.L. 480 Funds have been of considerable help. The total assistance so far has been Rs. 2,137 crores. So far as the effective utilisation of this aid is concerned there should not be any doubt. It was affirmed by the US Ambassador himself at a press conference recently that India was making efficient use of American aid and that the organisation for utilising the aid was in good shape. This should be enough to satisfy the authorities in Washington and they should readily agree to give further aid for the various other projects for which it has been asked for.

Premier Automobiles

STEADY PROGRESS

BY A visit to the Premier Automobiles Limited, one is straight away struck by the steady progress the company is making. So far as its expansion plans are concerned, it need not entertain any fears now as a loan of $10.2 million has been granted to the company by the United States Agency for International Development. This loan would be utilised for the establishment of a Sheet Metal Project at Kalyan. Thanks need to be given to the United States Government and the Agency for International Development for this help. It would be effective in bringing about an increase in indigenous content of the vehicles produced by PAL, which might even go up to 90 per cent. When the project is completed at Kalyan, 1,500 more people are likely to get employment. The rest of the two million dollar loan will be utilised for the establishment of a balancing plant to remove bottlenecks in production. The company at present produces Dodge and Fargo trucks of different load capacities and different types of bus chassis and Fiat passenger cars. Diesel and petrol engines for trucks, axles and other major components are also being manufactured. The current annual production of the PAL is about 6,000 to 7,000 trucks and passenger bus chassis and an equal number of cars. The 100,000th vehicle produced at PAL rolled out of the PAL plant on March 16, 1962.

It goes to the credit of the PAL that from a very humble beginning, it has risen to a position of strength. When PAL was founded its authorised capital was only Rs. 10 crores and the paid-up capital Rs. 2.25 crores. Today the figures stand at Rs. 25 crores of authorised capital and Rs. 7.56 crores of paid-up capital. There is no doubt that the protection granted to the automobile industry has helped in its consolidation, but it is also due to the effective and efficient management that it has grown to this position.

Planning

PURPOSE OF ECONOMIC DEVELOPMENT

IN AN illuminating address at Lucknow recently, Professor J. K. Galbraith, the US Ambassador in India, emphasized the need for proper guidelines in order to achieve favourable results from modern economic planning. While admitting the dangers of 'excessive introspection', he exhorted the necessity of taking stock, from time to time, of achievements in the light of the targets set, for all development implies movement towards some result.

Prof. Galbraith has discounted the view that developing countries should follow faithfully the developed ones. This is because, in his opinion, the economically advanced countries are less mindful of their development targets in that the distribution of income and efficiency of markets impart these economies a self-adjusting system. But this is not the case with the less developed countries, where privation, hunger and unemployment are rampant. Indiscriminate expansion of production is not a satisfactory guide in their case. Prof. Galbraith added that the question as to how much should be consumed now and how much should be invested for larger production and consumption later on takes on a vastly greater urgency; for in a poor country the necessary saving may have to come from people who are already insufficiently supplied.

Prof. Galbraith, aiming to be precise, generalized economic development into three broad categories. The first, the Symbolic Modernization, he considered, was a hoax—mainly a strategy of politicians meant to befool the poverty-stricken masses, leading them into believing that something is being done to ameliorate their lot. The second, the Maximized Economic Growth, reflects most strongly the influence of Western economic thought. This is aimed at maximizing economic growth by selecting plan outlays in accordance with their capital-output ratios. This method helps in establishing a large industrial base which in turn makes possible a larger subsequent rate of expansion in investment goods, consumer goods or both. But in the process, immediate needs of the large number of masses, upon whom falls the major burden of development pangs, could be overlooked. Also, vast disparities in incomes, which is another concomitant of such development, may well result in restlessness among the masses. Then there is the third type, the Selective Economic Growth, which has an edge over the second for it recognizes that benefits of planning must accrue as a matter of priority to the more needy sectors of population. This idea, however lofty, meets its equal in its most ardent protagonists—planners and politicians — who have divergent views about the selection of priorities.

Prof. Galbraith contended that whatever the selective choice—agriculture, primary education, or community development—to act as a palliative, a lasting solution will have to be provided only by industrial development. Therefore, rejecting practically all the three accepted norms of economic development, he suggested what he called the Popular Consumption Criterion. This, in his opinion, has been implicit in a good deal of past Indian thinking, and anchors economic development to the consumption requirements, present and prospective, of the typical citizen—of, statistically speaking, the model consumer—organizing development around the protection and increase of the living standards of the consumer. Obviously, it means a major emphasis on food, clothing, shelter, education and medicines since these are the dominant items in the economy of a low-income family.

Transport

NEED FOR CO-ORDINATION

IN THE wake of new and gigantic projects of development that have been launched with the avowed object of dispersing industries all over the country so as to bring about a more balanced development, the problem of transport has naturally assumed very great importance. That this should be solved boldly and with perspective policies needs no stressing. It is in this context that the deliberations which the All-India State Transport Undertakings Conference (A.I.S.T.U.C.) held recently, in Mahabaleshwar, are of considerable import.

Inaugurating the AISTU Conference, Mr. Y. B. Chavan, Chief Minister of Maharashtra, observed that it was the responsibility of the State Transport Under-

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

takings to cater to the needs of the people not only living in the newly-developed areas but also to those of the new industries established there. Only common national outlook, common thinking, and common approach could help us to cope with the new responsibilities and the varied problems arising in different States, he said. The Maharashtra Chief Minister also commended the proposal for the establishment of a Central Secretariat for State Transport Undertakings in the country as a step in the right direction. Such an agency should bring about the much-desired co-operation and co-ordination in the country's transport. As he observed, now that the idea of nationalised Road Transport has come to stay in the country, it is imperative that the different States should pool their experience to the benefit of all the undertakings, as also to the country. The necessity for pooling experience arises, because there are both States with long experience and others which have only just started the process, and there is need too to bring about a common pattern of development throughout the country. The proposed research and training institute may be expected to play a significant role in pooling experience. No State, howsoever advanced, could conduct research on its own problems of operational efficiency with all their varied facets requiring detailed attention.

Mr. G. Venketeshwara Iyyar, the Union Transport Secretary, who presided over the Conference also said that the various State Transport Organisations in the country should evolve a common practice and procedure to provide integrated Road Transport Services throughout the country without wasteful duplication of facilities available from other means of transport. It was gratifying to hear him hold out the assurance that the Central Government was keen that these were rendered as efficiently and as economically as possible so that the travelling public could have a fair deal.

Engineering

OKHLA TRAINING CENTRE

THE PROTOTYPE and Training Centre at Okhla celebrated what was called the "Open House Week" from October 15 to 21, 1962. This celebration marked the completion of the first phase of an active programme devoted to gearing up the Centre for production of machine tools combined with advanced and intensive training for workers and other technical personnel in the small-scale industries. In a period of a year and half, the Centre has evidently achieved significant success. The main activities of the Centre include the training of technicians from and for the small-scale industries, the designing and development of machine tools to be manufactured by the small-scale industry and planning a phased production programme for machine tools to support the training programme.

The Centre, it may be recalled, was established as a joint venture of the Government of India and the Government of Federal Republic of Germany for the development of tools for the small-scale sector. The West German Government contributed modern machines and equipment valued at about Rs. 50 crores and also the services of about 20 technical experts to guide the Centre in the initial stages. It is now anticipated that this Centre will involve an investment of approximately Rs. 100 lakhs after completion of its second stage of development and by early 1964 it will reach the peak of its capacity.

It is indeed a sound institution where training is imparted to technical personnel and the record of the first eighteen months is not discouraging. As many as 20 workmen in different trades received their training. The full target, however, is 600 trainees a year. This Centre is also producing various types of machine tools and sufficient amount of research work has been done on the types produced here. Lathes, tool and cutter grinders, horizontal milling machines, mechanical surface grinders and vertical milling machines are some of the items included in the production programme. This celebration also marks the successful commisioning of the first tool precision lathe manufactured at the Centre. This indeed is a happy occasion in the context of the present needs of industrialisation, when more similar institutions would be welcomed in the country.

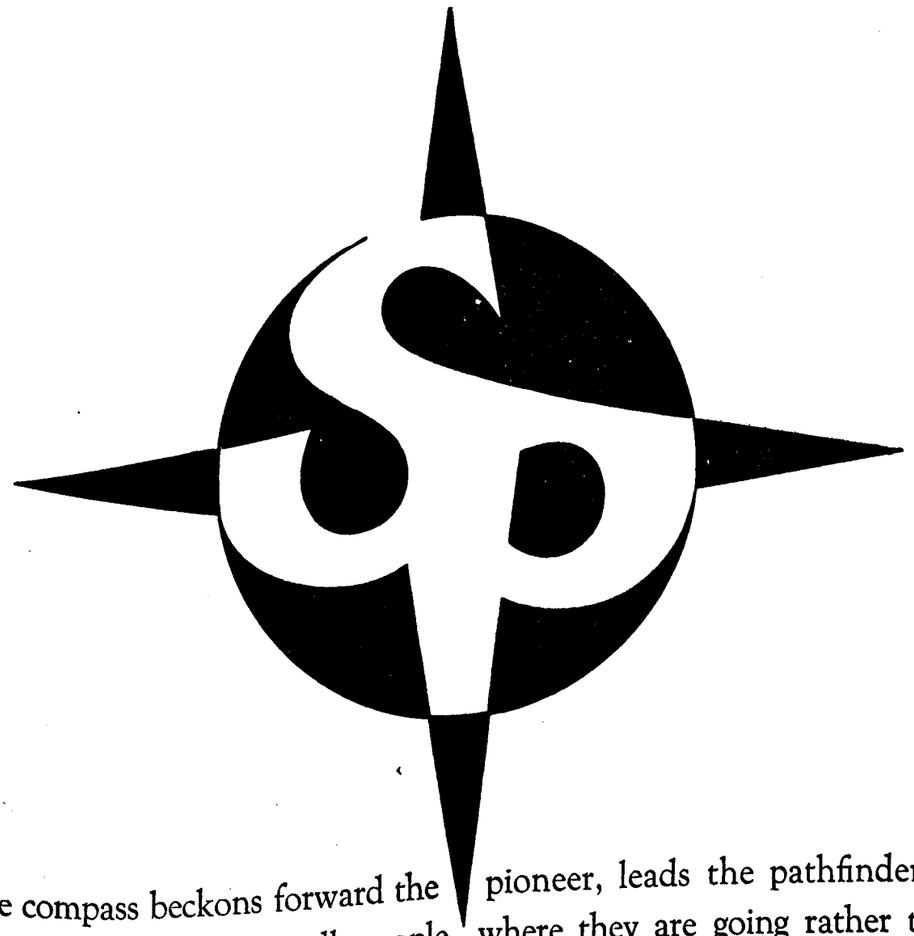
Kashmir

STATE'S FIRST TEXTILE MILL

A FURTHER evidence is now available of the ambitious programme of industrialisation on which the present Government of the Jammu and Kashmir State has embarked upon. A fortnight ago, the State Premier, Bakshi Ghulam Mohammed, laid the foundation stone of the first composite textile mill to be set up in the State at Kathua by one of the leading industrial houses of the country, namely, Birla Brothers.

The mill, employing 800 to 1,000 workers and costing nearly Rs. 1.35 crores, will have 12,500 spindles and 250 looms. Its annual output of yarn will amount to 40 lakh lbs. The yarn to be manufactured is envisaged to be used partly for feeding the weaving sections of the mill and the remainder for open sale. Plans are to double the capacity in two to three years' time when the number of spindles would be stepped up to 25,000 and that of looms to 500.

Mr. M. D. Dalmia, Executive President of the mill, has struck a note of confidence in the success of this new unit in the chain of industries set up by Birla Brothers as a measure of their participation in the national development.



The greater role that the country's industrialists have started playing in the development of the Jammu and Kashmir State is not only indicative of the political stability that has been brought about there by the present regime, but also brings its full-fledged integration with the Indian Union a step further.

The compass beckons forward the pioneer, leads the pathfinder by the hand. The compass tells people where they are going rather than where they have been. The compass is a symbol of planning and progress. Shalimar Paint adopts the compass as its corporate symbol, confident of its ability to chart a true onward course, excited by the prospects of the voyage into the future. To the people at Shalimar Paint the four points of the compass stand for the things they are proudest of—resources, research, know-how, quality-control—the four decisive elements which combine to make Shalimar Paint products unsurpassed in quality and performance.

CONGRATULATIONS

TO ALL CONCERNED

GOOD NEWS

The new well has struck oil. The collection tanks on the site are getting full, and the management have sent their congratulations to the drillers. Now the problems are to estimate the probable size of the field and determine the rate at which it will be practicable to extract the oil. The first well by itself will not give the answers, so a number of outstep wells must be drilled to find how far the oil bearing rocks extend to the North, South, East and West of the discovery. Then the thickness of the productive zone must be measured, and tests made to see whether there are deeper oil deposits besides those discovered in the initial test well.

Although every oil strike is good news, a great deal of drilling, testing and scientific evaluation is required before the real importance of the discovery can be assessed.

BOKARO STEEL PLANT

MR. N. N. Wanchoo, Secretary, Union Ministry for Steel, will be shortly leaving for Washington to hold discussions with the US Government in regard to financing and the management of the 2 million tons Bokaro Steel Plant. The Americans, it is understood, are in favour of having management of the Bokaro Steel Plant, if they finally decide to collaborate with the Government of India in setting up this fourth steel manufacturing unit in the public sector, on the pattern of the Bhilai Steel Plant. The operations of the Bhilai Plant are under the direct charge of the Russian team there and only the business side of this works is in Indian hands. The insistence of the Americans to have a similar control on the operations of the Bokaro Plant obviously emanates from the fact that they want to avoid the misfortunes that afflicted the Rourkela Steel Plant.

The US Technical Team which has been in India for nearly three months now, to study the feasibility of US collaboration in setting up this plant, is said to be giving final touches to its report. This Team is believed to have accepted India's estimates of demand for steel in 1966 and in 1972. Further, it is also understood to be in favour of locating this plant in Bokaro area, the exact site being still to be determined.

Two issues relating to the Bokaro Steel Plant are stated to be under discussion in the Ministry of Steel here. The first is whether this Plant, which would be producing by and large similar end-products as the Rourkela Plant does, should be taken up after the expansion of the Rourkela Plant or simultaneously with it. The second issue being studied is whether the US aid for this plant should be in two stages, initially for the development of coal and iron ore resources to feed it and subsequently for setting up of the actual plant, or in one stage covering both the activities.

EXPANSION OF BHADRAVATI STEEL WORKS

The project report received from the West German firm, Demag of Duisberg, for the expansion of the Bhadravati Steel Works, in Mysore, by 80,000 tons of finished steel, is stated to be under examination of the Government of India. Half of the additional capacity to be created under this expansion programme is envisaged to be earmarked for the manufacture of alloy steel required by the railways and the automobile industry. The categories of steel planned to be manufactured are: (1) spring steel, manganese and chromium steel required by the automobile and the precision engineering products manufacturing industries; and (2) steels for the manufacture of wheels, axels, hubs and coal-mining machinery.

The expansion programme is estimated to cost Rs. 7.5 crores, of which the foreign exchange component would amount to Rs. 3 to 4 crores.

IRON ORE EXPORTS FROM GOA

Three teams from the principal importing countries of Goa iron ore, namely, Japan, West Germany and Italy, are here at present to discuss with the Government of India the question of iron ore exports from Goa. All the three teams are understood to have asserted that their countries could get cheaper and better iron ore from elsewhere, in view of the world prices of the commodity having gone down. They have also alleged that loading facilities in Goa are not upto the modern standards and as such if the Government of India demanded a higher price for the Goa iron ore, they will have to divert their imports of this commodity to some other countries.

The Government of India has already stated that it does not want to interfere in the arrangements entered into by the private mine-owners in Goa with the importers abroad before this Portuguese enclave on the Indian soil was regained in December, 1961. On the question of the price of this ore, the Government of India's case is quite clear. The Portuguese rulers of Goa obviously were interested in selling iron ore at any price they could get. In formulation of this policy, important role was also played by the free import of consumer goods into Goa from where they could be smuggled into the Indian territory at a premium. With the take-over of Goa by the Indian Government, conditions have changed. India has to fit in Goa's trade in the pattern of the all India trade. India obviously cannot sell Goa iron ore at one price and ore of similar quality mined elsewhere in the country at a different rate. The threats held out by the foreign importers of Goa iron ore in regard to prices, knowledgeable circles here opine, are not the proper way to negotiate trade deals.

OIL EXPLORATION AND REFINING

On the eve of his departure on a tour of the Soviet Union, Rumania, Poland and Italy, the Union Minister for Oil, Mr. K. D. Malaviya, told newsmen here last week that his Ministry had drawn up an ambitious oil exploration and refining programme. The Government, he said, had every intention of sticking to the 3/3.5 million tons crude oil output Third Plan target for the public sector. The total crude ouput in the country, including the production from Oil-India's Nahorkatiya-Moran oilfields and the Digboi Oilfield of the Assam Oil Company, would, by the end of the current Plan period, amount to nearly 6.5 million tons per annum.

The Oil and Natural Gas Commission, Mr. Malaviya stated, would shortly undertake seismic work for offshore exploration near Cambay. Information drilling is also envisaged to be undertaken, in another couple of months, in the Caverey and the Indo-Gangetic Basins. In the Indo-Gangetic plain, the ONGC will drill several wells around the southern fringes of the Himalayas, with the assistance of ENI.

Talking about the Rudrasagar oilfield, Mr. Malaviya observed that two wells in this area had been completely "repaired" and had shown promise of commercial exploitation. The Third well—Well No. 1—is expected to be fully repaired in the near future. Three more deep rigs have been sent to this area for intensifying the exploration work. By the end of this year, there will be as many as 8 rigs in the Rudrasagar area engaged in oil prospecting.

In regard to the exploration work in the Punjab, Mr. Malaviya stated that although about a dozen wells drilled in this State had not yielded any fruitful results, the Government was of the view—on the advise of the Soviet experts—that oil prospecting in this area should not be given up as yet.

Talking about the stepping up of the oil refining capacity in the country, Mr. Malaviya disclosed that the Government was planning to set up a number of refineries during the Third and the Fourth Plan periods, apart from the expansion of the existing public sector units or even some of the proposed ones.

Apart from setting up a refinery in the South to meet the petroleum products requirements of Southern India, a proposal is being examined to set up a refinery at Calcutta sometime during the Fourth Plan period. The Noonmati refinery is envisaged to be expanded to a little over one million tons from its present capacity of 0.75 million tons per annum. The Barauni refinery may also be similarly expanded, but that will depend on the availability of additional crude from Assam. The Koyali refinery, at present planned for a capacity of 2 million tons per annum, may be expanded during the Fourth Plan period by another million tons. The construction of this refinery, Mr. Malaviya asserted, is progressing according to the schedule; the refinery is expected to be brought on stream by the third quarter of 1964.

Questioned about allowing further expansion of the private sector refineries in India, Mr. Malaviya stated that the Government had expressed its inability, for the present, to allow any expansion of the private sector refineries beyond the maximum through-put allowed to them since July last.

The Minister indicated that the gas reserves in the Cambay area were now estimated at a higher than that assessed a few months ago. Exploration in the Ankleshwar area also, he said, was showing more encouraging results.

GATT ON COMMON MARKET AND BRITAIN

The survey of International Trade in 1961, published by the Secretariat of GATT, provides certain interesting facts which go to substantiate the attitude adopted by the UK to seek admission into the EEC. It contains certain sections which throw fresh light on the state of the developing countries vis-a-vis the economically developed countries of the Common Market. These sections of the GATT report would be read with special interest in view of the fact that on Thursday, October 25, the Ministers of the Six were scheduled to meet to prepare for a meeting of the seven Ministers on the following two days.

It is gathered that the agenda for this meeting was supposed to cover domestic agriculture, nil tariffs, India, Pakistan and Ceylon and in restricted session, problems connected with association. It was doubtful if this meeting would be quite fruitful as far as these subjects were concerned. In fact, it was considered likely that the Ministers might give directives to deputies so that they could prepare for later meetings. Indications were available, however, that the 'Six' might rather negotiate trade agreement with India in the immediate future rather than to agree to nil tariffs being continued indefinitely.

Referring to the United Kingdom, the GATT report makes it clear that its trade has more and more been directed towards North America and the Western Europe. The report says: "The overseas sterling area, which was very important for British exports during the early post-war period, has shown a sharp relative drop in recent years and accounted in 1961 for an even smaller share than in 1928. It would appear, therefore, that there has been a relative re-orientation of British exports away from the overseas sterling area and other non-industrial areas towards North America, especially the United States, and Western Europe. The relative decline in sales to the overseas sterling area may have partly resulted from the reduction during recent years in the average margin of preference enjoyed by the United Kingdom under the Commonwealth preference system...The fact that during 1961, despite the tariff discrimination, the United Kingdom expanded its exports to EEC at a considerably higher rate than to any other area including EFTA shows clearly the importance British industry attaches to this fast growing market which already absorbs 17 per cent of its exports of manufactured goods."

The following are some other extracts from this report of special interest to India. "In 1961 the trade deficit of the "developing" countries combined, calculated on the basis of f.o.b. imports, was about $1,750 million as compared with $1,150 million in 1960 and only $200 million in 1959. However, if costs in respect of insurance and freight are added on to total imports, then the trade gap widened from $2,450 million in 1960 to $2,750 million in 1961".

Cotton Textiles: The serious shortfall of shipments of cotton textiles from India has been variously ascribed to unfavourable price differential on account of high prices of cotton, to an undue concentration of exports of greys, demand for which is falling in the less-developed areas where new weaving capacity is being developed, to the relative incompetitiveness of Indian finished cloth on the world market, and to competition from rayon. While production of cotton yarn rose substantially in 1961, exports were well below the previous year's level. Exports of cotton cloth, which amounted to $106 million as compared with $123 million in 1960, suffered particularly in the United Kingdom, Australian markets, and North America. There was some improvement in shipments to Asia and to certain African destinations (Sudan, East Africa). Exports of rayon and mixture piecegoods almost doubled in quantity between 1960-61, having successfully broken into the Moroccan market and having substantially expanded their markets in Ceylon and in Malaya and Singapore.

Jute: The value of jute manufactures exported from India rose from $251 million in 1960 to $266 million in 1961 when higher prices, occasioned by the shortage of raw jute during most of the year, more than made up for the lower quantities shipped.

Sugar: The volume of world trade in sugar rose from 16.8 million tons in 1960 to 19.5 million tons in 1961. While imports by Western Europe, where there was an abundant beet crop, and by the United States declined somewhat, shipments to the USSR and mainland China, mainly from Cuba, more than doubled, rising from 2.1 million tons in 1960 to 5 million tons in 1961. After imports of Cuban sugar into the United States were barred in 1961, the import quota was redistributed among domestic and off-shore producers and other suppliers, resulting in sharp increases in supplies both from the Western Hemisphere (especially Brazil, Peru and Mexico) and from certain other sources namely, Australia, India and Taiwan. In January 1961 the price of sugar in the free market was 2.93 cents per pound. In spite of a short-lived rally brought about by the reduction of export quotas in February to the minimum permissible level under the International Sugar Agreement, supplies looking for markets were abundant and the price fell again. In December 1961 it was no higher than 2.21 cents, the lowest post-war quotation. While the low prices ruling in 1961 stimulated world consumption, which rose at a much higher rate than in 1960, sugar stocks nonetheless showed no tendency to decline. According to FAO estimates, the rise in consumption may be smaller in 1962 but there will also probably be a lower harvest in Cuba, and in particular in Western Europe, which would have to import more. These circumstances may have prompted the recovery in sugar prices which took place in the first months of 1962.

The International Sugar Agreement was reviewed at the United Nations Sugar Conference in September-October 1961. As the Conference, when it reconvened in December, was unable to come to an agreement on the size of the basic export quotas to be applied in 1962 and 1963, the clauses regarding these quotas automatically lapsed on 31 December, 1961. The other provisions of the 1958 Sugar Agreement will, however, continue in force until the end of 1963. Provision was made for reconvening the Conference at any time during the life of the present Agreement. In addition, the Sugar Council was requested inter alia to undertake a detailed study of the problem of stocks and prices and to formulate a plan for promoting sugar consumption.

The United States import regime to be followed when the present Sugar Act expires on 30 June, 1962 will be a factor of importance in the sugar market.

GATT on Developing Countries: The report indicates that in Asia "not only would agricultural output have to increase at a very high rate compared to that of recent years, but particularly acute problems would also have to be solved in the field of foreign trade. It would appear that such a situation calls particularly for a liberal opening of the markets of the developed countries to manufactured goods produced in developing countries. It would therefore seem that an intensive flow of exports of manufactured goods—not only textiles and leather goods, but also 'newer' categories of exports especially in the field of the engineering industries—towards the developed countries, compensated by additional imports of highly-processed products—in particular machinery and transport equipment—would substantially help developing countries in their arduous industrialisation process."

COTTON GOODS EXPORTS TO BRITAIN

Britain is to continue to import cotton cloth and made-up cotton textiles from India, Pakistan and Hong Kong upto the present ceilings till the end of 1965. Her imports of yarn from these countries will, however, be limited to the rate of her imports in 1961. This is stated by the President of the British Board of Trade, Mr. Frederick Erroll, in a letter to the Chairman of the UK's Cotton Board, Lord Rochdale.

Mr. Erroll's letter, released on October 19, says: "In statements to Parliament on 6th and 28th June last, I described the proposed arrangements for imports of cotton textiles from India, Pakistan and Hong Kong and the Geneva long-term arrangement. Since then matters have developed further, and I am now able to add to these statements.

"As regards imports from the three Commonwealth countries, I announced in June the offer by Hong Kong to continue with the present ceilings on her exports of cloth and made-up goods up to the end of 1965 and, in addition, to limit her yarn exports to the 1961 level, provided that India and Pakistan did the same. I said that India had agreed to a similar limitation, and that Pakisan was still considering the matter, but that I hoped to secure her agreement shortly.

"Since then the matter has been very fully discussed with the Government of Pakistan which felt reluctant to agree to enforce limitations of exports on the basis accepted by India and Hong Kong. The British Government recognise and sympathise with Pakistan's urgent and real need to increase her export earnings, but they also feel that so far as cotton textiles are concerned, Britain is already taking her full share of those products.

"No difficulty arises at present because Pakistan exports of cloth and made-up goods to Britain will continue until the end of 1962 to be subject to voluntary control and her exports of yarn since July have been very small. I very much hope that Pakistan may yet find it possible to accept voluntary control on the same basis as Hong Kong and India. If, however, the need should arise, the Government will take whatever steps are necessary to ensure that the arrangement with all three countries is maintained. So far as Lancashire is concerned, therefore, the position is clear: imports from Hong Kong, India and Pakistan will continue until the end of 1965 to be subject to the same ceilings for cloth and made-ups as at present and imports of yarn will be limited to the rate of imports in 1961.

"As regards other countries, the long-term Geneva arrangement has now come into operation. The British Government have accepted it subject to a reservation exempting them from the obligation regarding a progressive increase in imports should restraints be applied under the arrangement. As I said in the House on 28th June, if there is a sudden upsurge of imports from any new supplier, I shall immediately consult the industry with a view to approaching the government concerned and invoking the arrangement if appropriate."

IMPORT POLICY FOR OCTOBER, 1962, TO MARCH, 1963

The adjustments envisaged to be made in the import policy for the second half of the current financial year, which have been delayed by at least one month, owing to stock-taking of the foreign exchange situation of the country, are expected to be announced early next month. Also the export performance during the six months to September last have been by no means encouraging and China has launched an all-out attack on our northern front, there is little doubt left that some further cuts on imports have to be resorted to. The Government of India, as indicated by the Union Commerce and Industry Minister, Mr. K. C. Reddy last month, will regulate further imports during the current financial year strictly according to a programme of priorities.

BUOYANCY IN CENTRAL REVENUES

Central revenue collections continue to show a buoyant trend. Receipts during the first five months of the current financial year at Rs. 391.15 crores showed an improvement of Rs. 52.26 crores over the figure for the corresponding period last year, indicating that the total yield from the new taxes, as also from the old ones, is likely to exceed the budget estimates by a substantial margin.

The following are the details of the revenue realised upto August under various heads :

(In lakhs of rupees)

Revenue Head	August		April to August	
	1962	1961	1962-63	1961-62
1. Customs	19,39	17,04	95,99	78,28
2. Union Excise Duties excluding cesses on Salt, Coal and Iron Ore	45,87	38,26	2,23,48	1,90,36

COLOMBO PLAN ANNUAL REPORT—1961-62

India was the largest donor of aid in the region and ranked fourth as the biggest donor of training places under the Colombo Plan during the 12 years of operation of this Programme, according to the 1961-62 Report of the Colombo Plan Council for Technical Co-operation in South and South-East Asia.

The report says that Colombo Plan technical co-operation activities, growing steadily since their inception, have reached the highest figures so far in 1961-62. The total value of technical assistance that has hitherto flowed into the region amounts to over £102 million (approximately Rs. 136 crores). Since 1950, 24,062 persons from the countries in South-East Asia have received training in other Colombo Plan countries. Besides, 4163 Colombo Plan experts in many agricultural, industrial, administrative and other fields have visited the area to perform a wide variety of highly technical tasks.

While India received training facilities for 4,870 people in other countries, it provided 1,914 training places during the twelve years of the Plan. Nepal turned out to be the largest recipient of aid from India under this Plan. Out of the training places provided by India, 1,244 were given to Nepal nationals. While the value of aid received by India during the 12-year period amounted to £15,588 million (approximately Rs. 20.78 crores) India's contribution came to Rs. 130 lakhs.

The report says that scientific, technical and training equipment to the value of over £32 million have been supplied to the area as an integral part of the technical co-operation under the Plan.

The proportion of spending on technical education, according to the report, has been of the order of over 25 per cent on some 24,062 trainees, nearly 40 per cent

on 4,163 experts and advisers and the balance on books, films and technical assistance equipment ranging from eye-pieces for microscopes to shipyard equipment and road construction and testing machinery.

The report records that during the year July 1, 1961, to June 30, 1962, the number of trainees rose from 4,417 in the previous year to 4,529 and that of experts —not counting those already in the field—from 786 to 1,008. The cost of equipment rose from £5.6 million to £17.5 million, which brought the total expenditure of Colombo Plan Technical Co-operation during the year to nearly £36 million, compared with £20.2 million in 1960-61.

The USA, which joined the Colombo Plan Council in 1958, is the largest donor of training places having provided 2,223 places last year—nearly 50 per cent of the total training awards—followed by Britain (656), Australia (541), India (369), Canada (246), New Zealand (218) and Japan (189).

India ranks first among the recipient countries of the Colombo Plan training awards (839), followed by Indonesia (737), Thailand (579), Pakistan (436), Nepal (340), Viet Nam (341), the Philippines (293), the Federation of Malaya (242) and Ceylon 200.

A SAMPLE CENSUS

A sample census is proposed to be held in the various part of India in December-January to estimate the rate of growth since the last census in 1961. The purpose is also to ascertain the death rate, infant death rate, in-migration and out-migration rates. Details of relation to head, age, sex, marital status residential status will also be recorded.

The sample census is expected to be a regular feature, covering the twelve months preceding the last sample count. The approximate period of twelve months is to be specified for various regions with reference to a local well-known festival so as to assist the informant in correctly giving the events occurring since that date.

INDO - RUMANIAN COLLABORATION

Letters were exchanged here between Mr. K. C. Reddy, the Union Minister for Commérce and Industry, and Mr. Corneliu Manescu, Rumanian Miister of Foreign Affairs, regarding technical and economic collaboration between India and Rumania.

The letters provide, among other things, for necessary technical assistance to India in the fields of oil industry, ore and mineral mining and chemical and petro-chemical industries.

The two Governments have arranged for discussions for the working out of the proposals arising out of this arrangement and also to arrange for further meetings and discussions at appopriate levels.

IN BRIEF...

The Government of India has accepted the offer of the British Government to train two nominees of the former in London in all matters relating to export trade. The names of these two nominees will be announced by the Indian Government very shortly. They will be attached to the British Board of Trade and shown the working of this organisation as also of the export trade department.

•

A trade mission from Zanzibar is here at present carrying on negotiations with the Government of India for increasing India's import of cloves in exchange for her non-traditional items of exports to Zanzibar. In 1961, India's imports from Zanzibar amounted to 1.87 crores, as against her exports to that country of the order of Rs. 34 lakhs.

•

CHEMTEX Chemical Engineers of the USA have been permitted to collaborate in a consultancy undertaking sponsored by Mr. Rasiklal Chinoy of the National Rayon Group. Fifty-one per cent of the share capital of this undertaking, it is indicated, has been allowed to be held by the US collabortors.

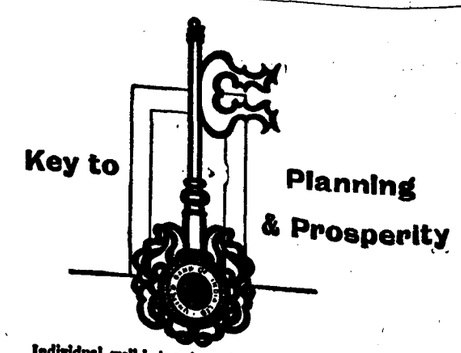
•

The Danish experts team, now in India to inspect suitable areas for setting up a dairy farm on the Danish model, is expected to complete its survey by the end of this month. It will later report to the Danish Committee for Technical Co-operation for grant of assistance to India for this project.

•

The Government of India has entered into a five-year trade and payments agreement with Yougoslavia, effective from January 1, 1963. The pact envisages possibilities of developing trade between the two countries at a higher level than the quantum of trade transacted between them in the past years.

•



The Government of India has decided to grant licences for import of dates from Iraq only to established importers, who had imported this item from Iraq by sailing vessels within the basic period 1959-60, 1960-61 and 1961-62. Import licences will be granted subject to the condition that the goods wil be imported from Iraq by sailing vessels only. The licences will be valid for six months. Applications are to be submitted before November 15.

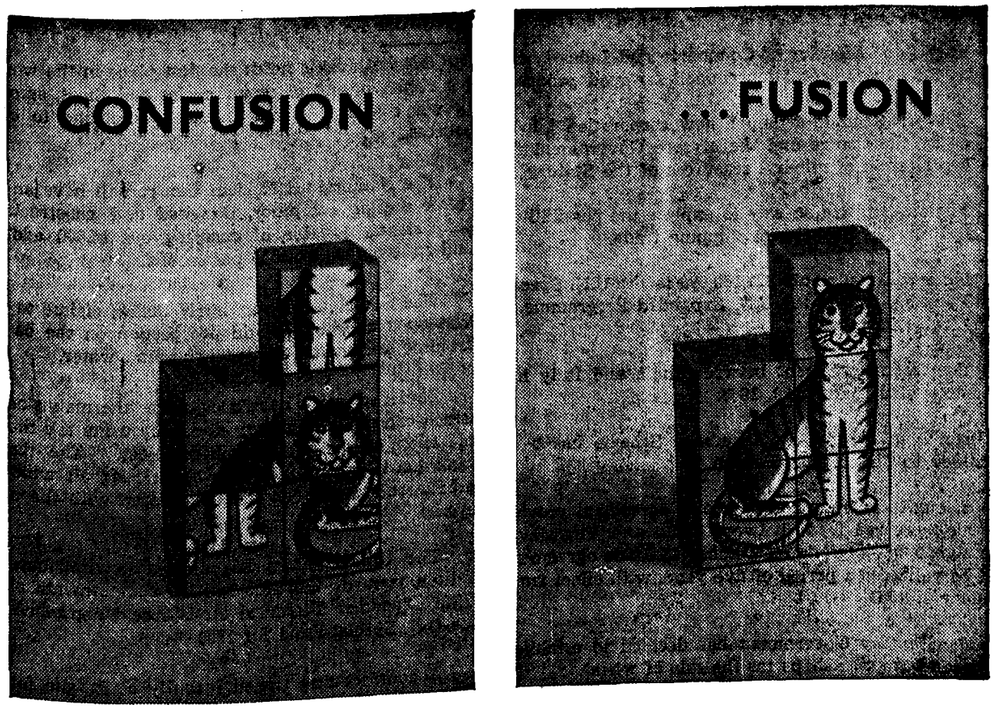
•

Consequent upon the enhancement of the rate of Central excise duty on woollen yarn and the new impost on jute manufactures, a revision has been effected by the Government in the ad hoc rates of rebate of excise levy in respect of the exciseable material used in the manufacture of woollen carpets that are exported. The revised rates have been fixed at 30 nP. per kilogram of woollen carpets exported, with effect from July 1, 1962.

•

The trade arrangement between India and Italy, which expired on June 30, 1961, has been extended for two years from that date. The main items of export from India to Italy are industrial raw materials; food items like coffee, tea, spices, meat preparations and dried fruits; cotton fabrics; jute, coir and leather footwear. The principal items of imports into India from Italy are agricultural and other types of machinery; scientific, engineering and optical instruments; syntheic fibres and dye-stuffs.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.



Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited

with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.

offers complete banking service

Just stacking up the pieces is'nt enough. To get a picture, you need to put them into a meaningful pattern.

The same is true of the records in your office: the lists and ledgers, the files and notes and charts and references.

They need to be maintained.

Many people think this is enough. We don't.

We have devised Systems of maintaining records so that not only are they maintained easily—they also give you an immediate, clear picture of your business —at all times.

Remington Rand Systems are the result of research with problems in all kinds of offices in many countries. They are simple to use and they can be arranged so that your records *work for you*. They can tell you when to act. Even how to act. You do not have to be a big businessman to use a Remington System. You just have to be a good businessman.

MAKE YOUR RECORDS WORK FOR YOU

NEWS IN BRIEF

INDIAN

The Union Ministry of Commerce and Industry has set up an export promotion council for food products.

•

It is proposed to set up a new corporation jointly owned by the Centre and the Mysore Government for the exploitation of mineral resources of the State.

•

Negotiations are on way to explore the possibilities of expansion of Indo-Soviet shipping trade.

•

India will contribute $21,150,000 to the U.N. Special Fund and $850,000 to the U.N. Expanded Programme of Technical Assistance.

•

The trade agreement between India and Italy has been extended to June 30, 1963.

•

The Employees' State Insurance Scheme has been extended to Chandigarh, Punjab.

•

A long-term trade and payments agreement providing for increased trade between India and Yugoslavia was signed in Belgrade on October 13. The agreement will be valid for a period of five years with effect from January 1, 1963.

•

The Bombay Government has decided to establish 650 more fair price shops for the sale of wheat.

•

A seven member delegation of the Spices Export Promotion Council will shortly undertake an overseas tour to explore possibilities of increased trade.

•

The Life Insurance Corporation of India has opened a "ladies" Unit in Bombay to train feminine personnel in Insurance Sales.

•

The Uttar Pradesh State Industrial Corporation has decided to set up two more industrial estates in the State.

•

A Danish team is at present in India to study the possibilities of setting up a model dairy farm with the assistance of the Danish Committee for Technical Co-operation.

•

The Hindustan Shipyards at Visakhapatnam, Andhra Pradesh, will build 3 cargo motor vessels—17 knotter 12,000 tonners — for the Scindia Steam Navigation Company.

•

The New Zealand Government has promised a grant of Rs. 13 lakhs to the Government of India to set up a dairy farm at Indore with a production capacity of 500 maunds of milk per day.

•

The Trombay Thermal Power Station, Bombay, has been promised a U.S. loan of $17.9 million to meet in full the foreign exchange requirement of its major expansion programme.

•

The Indian Sugar Industry will for the first time export raw sugar from the next month. The first consignment of 8,000 tons will be sent to the U.S.

•

Malaya's first industrial alcohol plant will go into production this November. The plant built at a cost of $2 million will use tapioca as raw material and will have a production capacity of 6,00,000 gallons of alcohol per year.

COMPANY AFFAIRS

SHIPPING CORPORATION

The Directors' Report and the Profit and Loss Accounts relating to the financial year 1961-62 of the Shipping Corporation of India Limited, reveal that a net profit of Rs. 1.07 crores were earned during the year. The Directors believe that the results are quite satisfactory when viewed in the context of depressing conditions which prevailed in the shipping industry all over the world. During the year the gross earnings, net profit, tonnage of cargo carried in their vessels and shipping tonnage in operation have all shown a substantial increase. The results are for the Shipping Corporation of India which was formed with effect from November 1961 by the transfer of the undertaking of the Western Shipping Corporation to the Eastern Shipping Corporation Limited which was renamed to the present title. The above-said amalgamation of the two public sector corporations was brought about by the Central Government for the purpose of securing co-ordination of policy.

The fleet now consists of 25 ships operating 1.85 lakh GRT. Between March 31, 1961, and the end of September, 1962, the number of ships has increased from 15 to 25 and tonnage from 1.09 lakhs GRT to the present 1.85 lakh GRT. During the last three years there has been tremendous increase in tonnage of cargo carried. In 1959-60 total carriage was 3.83 lakh tons of cargo. In 1960-61 it was 5.18 lakh tons and during 1961-62 it was 8.70 lakh tons. Similarly, the total earnings for 1961-62 were around Rs. 8.13 crores showing an increase of more than Rs. 2 crores over the corresponding figure for the preceding year i.e. 1960-61. In fact against 1959-60 the present gross earnings are nearly double: in 1959-60 gross earnings were Rs. 4.08 crores. The Corporation has made adequate provision for depreciation — Rs. 1.27 crores during the year under review against Rs. 1.07 crores a year before.

Operating expenditure as a percentage of operating earnings during 1959-60 came to 67.56 per cent. The figure in 1961-62 was 65.11 per cent. After making provision for taxation etc., the Directors have proposed to separate Rs. 90 lakhs towards Development Rebate Reserve, Rs. 35 lakhs towards fleet special repairs reserve and Rs. 40.4 lakhs towards General Reserve.

The Corporation continued its expansion activities during the year under review. It entered the India-U.K. Continent trade which is by far the most important sector in the country's overseas trade. Then the Corporation commenced the West Coast of India-Japan service and last of all the Corporation was called upon to enter the general trade of India specially for assistance in the transportation of coal, timber and Burma rice. The Corporation has recently negotiated a new agreement with the U.K. shipowners under which the share of the Indian lines in the trade has been substantially increased. At present the Corporation has two tankers operating on the coast of India for the transportation of refined products from the refineries in Bombay and Visakhapatanam. It has now been decided that a tanker of 32,000 d.w. tons should be constructed to be chartered to Messrs. Caltex India Limited. It has also been decided that the activities of the Corporation should be expanded by the commencement of a service from India to the USA. This service is expected to be regulated very soon. For the Third Plan too the Shipping Corporation has placed orders for six fast-dry cargo liners. The keels of the first and the second vessels of this series have already been laid. The Chairman, however, pointed out that the progress in the sectors like tramping and overseas tankers trade has not been very encouraging. It is estimated roughly that the Indian ships have carried only about 3 to 4 per cent of the total trade of the country in dry bulk cargoes. Similarly, there is only one overseas tanker under the Indian flag. The Shipping Corporation is trying its best to fill the gap.

KALINGA INDUSTRIES

The working results of Kalinga Industries Limited, Cuttack, for the year to March 31, 1962, show a profit of Rs. 16.45 lakhs. The Directors have made a provision of Rs. 4.35 lakhs for Depreciation. A sum of Rs. 2.3 lakhs is separated for adjusting dividend declared and paid on equity shares at 5 per cent for the year 1960-61 and on preference shares at 5 per cent for two years ending March 31, 1961. Dividend for the year under review was paid at the rate of 5 per cent on equity shares which absorbed Rs. 1.95 lakhs. A sum of Rs. 2.70 lakhs was provided for income-tax. It may be added that the net profit of Rs. 12.1 lakhs represents a return of 28.5 per cent on the share capital of Rs. 42.45 lakhs against a return of 22.5 per cent in 1960-61.

The plant of the Company worked satisfactorily and the output reached a figure of 29,584 tons during the year. About 12,700 tons pig iron out of the above production was exported and foreign exchange was earned to the extent of Rs. 34 lakhs. The expansion programme of the Company includes the putting up of two more furnaces so as to raise the annual capacity to 100,000 tons of pig iron, a power plant of 7,500 KW using the excess type-gases from these furnaces and a cast iron spun pipe plant with a capacity of 36,000 tons per annum. The Government of India has revalidated the sanction for capital issue until the end of December 1962 and as soon as the Company receives the letter about the allocation of the foreign exchange for the expansion programme, it intends to issue further capital worth Rs. 54 lakhs.

The factory produced 1,787 refrigerators of different sizes, a number slightly less than the last year. This decline was explained due to cut in the import licences for cooling units supplied by the collaborators Messrs. A. B. Electrolux, Sweden. The cooling unit factory of Electrolux India Limited at Choudwar is expected to go into production shortly. The construction of the second factory is also well in hand. Other sections like lighting fittings and the manufacture of tubular structures are also progressing well.

HINDUSTAN LEVER

Hindustan Lever Limited announces that it has applied to the Controller of Capital Issues, Government of India, for the consent to the issue of 8,42,725 new shares of Rs. 10 each to be offered to the shareholders of the Company for cash at Rs. 35 per share. Apart from the Milk Scheme at Etah, the Company has several new projects under active consideration. The Industrial Credit and Investment Corporation of India Limited has granted to the Company a loan of Rs. 25 lakhs to meet a part of the foreign exchange cost of the Milk Scheme. About Rs. 100 lakhs more in foreign exchange is needed for this scheme and other projects under consideration. Unilever Limited has agreed, subject to the necessary U.K. Government consent, to provide the additional foreign exchange required by participation in additional equity. Unilever Limited has also agreed to use this opportunity to increase the proportion of the public's investment from 10 to 15 per cent. A total of 5,57,000 shares will, therefore, be offered to the other shareholders of the Company in the proportion of 25 new shares for 37 shares held. The Company also has announced its decision to pay an interim dividend in respect of 1962 of 0.60 nP. per share, subject to deduction of tax. Such dividend is to be payable on November 12, 1962 to shareholders registered in the books of the Company, at the close of the business on November 7, 1962.

BOOK REVIEWS

ECONOMIC GROWTH

Economic Organisation and Development: By Satish C. Mehta. Sudha Publications, New Delhi-12: Price Rs. 11.25.

The problems of economic growth are now being discussed so widely that it has become nearly impossible for an ordinary reader to keep track of all the recent pronouncements on the subject. It needs off and on some author who puts together the latest ideas expounded by various economic thinkers. Moreover, economic growth needs so much of physical organisation that it has become a highly specialised subject. This is particularly so because economic theory is increasingly becoming the hand-maid of the policy makers in most of the countries. This is more true of the underdeveloped countries than anywhere else, where economic development has to be directed towards particular goals. Mr. Mehta in his Economic Organisation and Development has put in proper order the latest theories associated with the basic problems of economic organisation such as the problem of various objectives of planning, the choice regarding the size of the public and the private sector, the probable rates of growth under various conditions, the problems of occupational structure and the business organisations. The author has tried to use the minimum of technical terms. He has, in doing this, made the book more comprehensible for the students though for the same reason he has sacrificed certain controversial issues. The volume could have been improved by discussing particular instances from various developing economies.

AGRICULTURAL SURVEY

Economic Survey of Agriculture: By B. N. Pal: Kitab Mahal Publishers: Price Rs. 7.50.

It has been, by and large, the attitude of the economists to apply the principles evolved from industrial economy to agriculture. In doing that one major drawback was to overlook the real genesis of agro-economic principles. Mr. B. N. Pal who has spent several years on the subject has tried to evolve inferences especially on the basis of agricultural data. In fact through a comprehensive socio-economic approach he has tried to interpret various aspects of agricultural economy.

Starting with the role of nature in the process of agricultural production as well as the role of location and labour, he has attempted to define the twin problems of efficiency and productivity in relation to farm machinery and fertilizers. He has also reviewed the processes of distribution of the produce and the mechanism of prices and other allied phenomena. One aspect of the book that should be appreciated especially is that it has been written in a lucid and precise style and considerable effort has been made to interpret complicated problems in commonly understood language.

THE COMPANIES ACT

Guide for Filling Forms and Making Applications to the Government under the Companies Act: By M. V. Warerkar, A.C.A.

A person must be both very clever and uptodate before he can pick his way through the maze of rules, regulations and forms which are concomitants of the present Company Law. Since many may not come within this category, the need for a guide dealing with the practical aspect of filing returns and making applications to the Government under the Companies Act is very urgent, and this need has been fulfilled by the this book, which has been just brought out by the Department of Company Law Administration.

Part I of the publication deals with returns to be filed and part II with registration of companies and applications to the Government under various provisions of the Companies Act. The Guide tells us the fees to be paid on each document which has to be filed with the Registrar, the manner of paying it, etc. Illustrations are given, and filled-in forms in the light of those illustrations follow. This is visual aid with a capital V which no amount of theoretical explanation can replace. Part I bears the impress of the rich experience of its author, Mr. Warerker, who is, at present the Registrar of Companies, Madras. Indeed, he is the Nestor among Company Registrars, having entered the Department 18 years ago and, as such, he has the unique advantage of having administered the old as well as the new Companies Act at all the principal State capitals of India, such as Bombay and Calcutta, as well as at the Capital of India.

By reason of the great amount of labour which the author has put into the work, the judicious exercise of his judgment as to what should be included in and what should be excluded from it, and the practical touch which breathes through every page, this publication is bound to be not only useful but also popular. The practical administration, particularly regarding returns to be filled etc., of that lengthy and monumental piece of legislation, which the Companies Act undoubtedly is, is a gigantic task requiring a Senior Officer on special duty to deal with it. Such an officer should be in constant touch with the various Chambers of Commerce and put them in the way so far as the practical side of the administration of the Act, especially in regard to filing of returns, is concerned.

THE EASTERN ECONOMIST

NOVEMBER 2, 1962.

Facing the Emergency

THE declaration of the state of emergency by the President was not altogether unexpected since the entire nation was shocked as much by the impact of the suddenness of the Chinese aggression on a massive scale in the NEFA area as by our unpreparedness to meet it. A radical reassessment of the situation was imperative and the declaration gives a measure of that reassessment. Concrete content was given to the declaration by the promulgation of the Defence of India Ordinance in a matter of a few hours. The two measures have produced a lightning effect on public psychology by creating an acute consciousness of a grave threat to the very independence of the country. China's new posture has unmasked her ambition of waging a brutal war of aggrandisement to impose her ideology on India as a preliminary to drawing within her orbit the rest of the uncommitted nations in Asia. But the reaction created by her aggression has produced a remarkable sense of unity and solidarity among the people which is unique in the history of India since independence.

Public confidence in the capacity of the Defence Ministry to recover the lost ground and put up a stiff resistance could hardly be sustained in a full measure unless there was a change at the helm of its affairs. The demand for the removal of Mr. Krishna Menon from the Defence Ministry, which was persistently voiced by different sections of representative opinion for several months past, now gained a powerful momentum in view of the revelation of his amazing failure even to equip the armed forces adequately. The Congress Party itself became painfully aware that a great damage would be done to the cause of public morale and to the nation's capacity for resistance, if, in spite of its loss of faith in Mr. Krishna Menon, he was retained in this key post. His removal has come at long last under the pressure of public opinion.

The assumption of the Defence portfolio by the Prime Minister was the only immediate course that could be taken rightly. It will serve not only to conserve confidence but to stimulate a new enthusiasm and a stronger determination on the part of the people to rise to the occasion. Mr. Krishna Menon is relegated to the newly created portfolio of Defence Production, which, presumably, has no concern whatsoever with procurement and mobilization of defence supplies. This latter in itself is a job of mighty dimensions and it is necessary that procurement of supplies from abroad or at home and the co-ordination which it involves with the other Ministries should be a distinct charge. No time ought to be lost in creating this emergency portfolio.

Procurement of up-to-date as well as automatic weapons is an absolute preliminary before the tide of fighting on the NEFA front can be turned effectively to ultimate victory. The kind of arms and equipment which our armed forces sorely require have placed an imminent obligation on the Government to make a quick decision about the sources of supply. Curiously enough, the question of non-alignment in the matter of purchase of arms is being maintained. Simultaneously with an approach to America and Britain, an approach was also made to Russia for arms. No one has been surprised at Russia's reluctance to respond under the plea that hostilities should be terminated forthwith as a preliminary to negotiating a peaceful settlement.

America and Britain have been remarkably prompt in rushing supplies of arms by air to us and their effect is beginning to be quickly felt in the stiffer and more successful resistance from our armed forces. It is significant that negotiations for financial terms involved in the procurement deals have not been allowed to hamper in the least the flow of supplies. There are now definite indications that the problem of immediate payment will not arise and on this score considerable respite will be available to us. The financial terms of the procurement deal are likely to take one or more forms — deferred payments, an agreed type of lend and lease or even the setting up of an arms aid consortium. Canada and France have also expressed their readiness to meet our requirements as soon as an approach is made to them. The winter interregnum will thus be utilised for an arms build-up and training of the forces in their use. If the enemy is going to use the respite to fortify his striking power, we can also now make preparations to retaliate.

The switch-over in the economy to priority supply for the requirements of defence will make the first and most severe call on the transport system — and in the present context it means essentially the railway system—to keep the supply line running at full speed. Perforce, we will have to face a new problem of shortage of transport capacity perhaps for the key requirements in the coal and steel belt. The rest of the economy will have to put up with the prospect of recurring bottlenecks. In the NEFA area the network of communications which will need to be expanded quickly will make a heavy demand on truck transport. In the result, whatever relief can be expected to the civilian sector of the economy will have to be obtained from coastal shipping. But it has its own limitations in its area of operation. Along with transport, coal and power will find their potential geared first to the demands of defence production. All in all, the infra structure of the economy will be under the high pressure of defence mobilization.

Industrial production, whether in the heavy, medium or light segments, will have to cater to the demands of defence in varying degrees. The Defence of India Ordinance quite justifiably arms the Government with authority to commandeer whole factories and to requisition the output of plants at its discretion. The exercise of this discretion will be determined by the exigencies as they arise from time to time in the course of the fighting. It is safe to assume that total take-over of entire plants by the Government will be res-

tricted to a limited number for the obvious reason that the distinction between defence industries and civilian industries can never be sharply defined. A wide range of industries serve both the categories of defence and civilian demands. Priority will need to be assigned to the former by diverting not only the output but even the pattern of their production.

Flows of supplies in the quantities and at the times demanded by the Defence Ministry will leave an uncertain and relatively smaller residual capacity to cater to civilian requirements. The pressure of both, and in particular, of war requirements, makes it a matter of the utmost urgency to expand production by stretching the resources to the utmost. Expansion of output and even of capacity of selected industries will proceed ahead at a much faster rate than would otherwise have been the case. But expansion geared to defence purposes will be different from the expansion envisaged in the Third Plan. The projects and programmes prescribed in the Plan will perforce have to be reduced to the core until the hostilities are terminated. Meanwhile, it is inevitable to redraw the list of priorities on the basis of industries which are defence-oriented.

Outlay on defence creates inflationary forces of an extraordinary potential. Inflation in this situation needs to be curbed with the utmost vigilance for the basic reason that the supply-demand disequilibrium assumes a chronic rigidity. The pressures on the price line are bound to increase in intensity and they will call for an unremitting effort to curb them. Spokesmen of trade and industry have given an assurance to organise internal discipline to this end. Their promise ought to be taken in the spirit of sincerity and patriotic devotion in which it has been made. It was unwise on the part of Mr. Gulzari Lal Nanda to hold out threats of dire action against profiteers. The same deplorable lack of prudence has been shown by Mr. K. D. Malaviya in his statements on the coal and oil industries in the private sector. This is the time to sink ideological divergencies and harness the potential of the public and private sectors as a composite national sector.

Finally, a word about a loop-hole in the emergency measures. The Defence of India Ordinance comes in a somewhat anomalous situation. The war which has been imposed upon us is still an undeclared war. In the technical sense, a formal war has not been proclaimed between the two countries and in the circumstances China can hardly be described as an "enemy". Diplomatic relations between the two countries still continue to exist. The anomaly has given rise to a vital lacuna in the Defence of India Ordinance which is likely to defeat some of its provisions. Certain clauses in the Ordinance declare specified acts in relations to the "enemy" as offences and prescribe drastic punishments for them. In actual situation, the "enemy" in question is none other than China. But since China has not been formally declared as an "enemy" and the term "enemy" has not been defined in the Ordinance, a curious position may arise in which action taken in pursuance of the Ordinance by the special tribunals may be challenged in appeal and challenged probably successfully to the embarrassment of the appellate courts. Inadvertence in drafting is thus likely to oblige offenders acting as China's agents. To avoid the awkward prospect of making an amendment at a subsequent stage with retrospective effect, it would be advisable for Parliament, while passing the Ordinance into an Act, to bring within the ambit of the definition of the "enemy" a country with which we may not be engaged in a declared war, but which is actually at war with us despite the semblance of formal friendship.

Donations for Defence

THE Finance Minister's stirring appeal to the nation over the radio on Friday last week for prompt and profuse contributions from the public to raise resources for defence has evoked a reassuring response. This assessment made, among others, by Mr. Morarji Desai himself is significant when it is remembered that the actual arrangements for receiving contributions, and in particular the procedural precautions which need to be taken to record receipts of gold and gold ornaments, necessarily took a good part of the week since the appeal was broadcast and the flow of funds was received on a regular basis during the rest of the week. The scheme which has been prepared to attract contributions takes several forms. In the first place, there is the National Defence Fund to which contributions have been made acceptable either in cash or in gold or in gold ornaments. These contributions are to be outright donations to the cause of defence and they do not invite any liability of repayment. There are then two distinct types of schemes of borrowings announced as part of this plan. A new issue of the National Defence Bonds is to be put on tap and the small savings certificates are to be issued under the nomenclature of Defence Deposit Certificates and National Defence Certificates.

The Special Article in this issue is devoted to a statistical assessment of the likely magnitude of contributions on the basis of official data about personal incomes and company profits and the probable capacity to make the donations or to subscribe to the loans or small savings certificates. The conclusion reached is that the contributions of the public to the National Defence Fund would be of the order of Rs. 85 crores and the State Governments would raise about Rs. 55 crores by their own effort towards the National Defence Fund in terms of the commitments which they have publicly undertaken. The other estimates in the Article relate to the reasonable anticipations about subscriptions to small savings. One important fact about the character of the estimates made in the Article needs to be underlined. These estimates err on the side of conservative calculations and they are based on the officially available data about incomes and company balance sheets.

It is here pertinent to consider how far funds can be raised without imposing the liability of repayment on the exchequer. The Finance Minister has impressed upon the nation the valuable assistance which would come at the nick of time, if the contributions to the National Defence Fund are made in the form of gold and gold ornaments. This is for the obvious reason that contributions in gold will go to provide a partial relief in our tight foreign exchange position, while there is an urgent necessity to procure arms and equipment from the Western countries. At the time Mr. Desai broadcast his appeal, the prospect of payment in foreign currency looked rigid. But there are now encouraging and positive indications that America and Britain are prepared to free the exchequer from the ambarrassment by agreeing to financial terms on the basis of deferred payments or lend and lease. Not only that, but there is the bright prospect that as France and Canada also join this group, an arms aid consortium may be set up. Finance thus will not be allowed to stand in the way of equipping the armed forces.

A midway opportunity can be offered to the public to raise supplementary resources. As a member of the IMF the Government of India is under the obligation to buy or sell gold at the international price, while the price ruling in the domestic market fluctuates at a much higher premium. It would be worth while examining the proposition of inviting sales of gold from the public to the Government on deferred payment at the international price. The loss which they would suffer in terms of the domestic price will represent their sacrifice for defence. While the nation has responded in a splendid manner to the challenge of the Chinese aggression, it is of the utmost importance that the fervour of patriotism which has now been created should be raised to a higher pitch and a sustained effort should be made by the local voluntary organisations to induce the public to make outright donations for the defence effort.

Steeling Resistance

WHILE the Chinese invasion on our northern frontier has shocked us out of "living in an artificial atmosphere of our own creation", the exigencies of war have helped in shedding the lethargic bureaucratic methods of our administration. A concrete instance of this is available in the start made for gearing the economy, particularly the steel industry, to the war effort. The tempo of increase in steel output, which during the past few months had been raised under the dynamic stewardship of the new Union Minister for Steel, Mr. C. Subramaniam, is being stepped up further. All the steel plants, particularly those in the public sector, have been asked to achieve their rated capacity at the earliest. In the case of the Bhilai steel works, its performance is to be judged on a higher installed capacity basis — 1.2 million tons ingots.

All-out efforts are to be made to maximise on a priority basis and to the extent feasible, the production of various categories of steel required for the defence purposes. For the guidance of the steel industry in this respect a Joint Committee of the Defence and the Steel Ministries is being set up. To augment the supplies of pig iron, the demand for which is bound to go up appreciably as a sequel to the war effort, the Steel Ministry is actively considering proposals for setting up immediately an additional 2,000 tons capacity blast furnace at Durgapur and some low-shaft furnaces where local iron ore and low quality coal can be made use of. Possibilities are also being explored of licensing some small pig iron plants in the vicinity of the integrated steel works; they would use nut coke which cannot be utilised in the larger furnaces. The setting up of a pig iron unit in Goa and utilisation of the manganese industry's blast furnaces for producing pig iron are as well under consideration.

All these measures are heartily welcome in the present emergency situation. But a long-drawn war with Communist China, as envisaged by the Prime Minister, obviously calls for far more concerted efforts. The expansion programmes of the three public sector plants, which are envisaged to nearly double their present combined capacity, needs to be taken up on a war footing; so also the setting up of the Bokaro Plant, for the study of whose economies a U.S. team of experts visited this country recently. An early decision by the U.S. Government on collaboration in building this plant should be of immense utility in accelerating the tempo of preliminary work on it.

In the immediate future, supply of armaments from the friendly countries, notably from the United States and the United Kingdom, may not require India's steel industry matching the strength of the Chinese which during 1961 is estimated to have produced 21 million metric tons of crude steel. But since India can never now be complacent about the intentions of the miscalled "Golden" Dragon, it would indeed be a folly to spare efforts in producing more and more steel. An immediate stepping up of the Third Plan target of 10 million tons installed capacity may not be feasible due to difficulties of procuring additional equipment in a short time. But there is need for taking cognizance of our greatly increased requirements of this vital material while planning for the future.

To help the steel plants to achieve their rated capacity expeditiously, it is imperative that they should be assured of adequate supplies of the right quality raw materials, especially coal. This may not be possible unless the restrictions on raising metallurgical coal output beyond the current ceiling are relaxed. It is to be trusted that thought has already been given to this; the ash content in the coal supplied to the steel plants has shown persistent increase during the last few years. From the point of view of expediting the expansion programmes of the public sector steel plants, it is also prudent that the commissioning of the coal washeries should be hastened.

Along with the stepping up of the indigenous output and even imports of prime steel, if necessary, the scrap trade has also a vital role to play in the present emergency. The recent removal of the price and distribution controls on all categories of scrap, other than fresh unused defectives, specified re-rollable scrap and ingot moulds, — with a view to helping better collection — has been a step in the right direction. But it is not comprehensible why there should be any quibbling over allowing imports of mixed gauges and short lengths of second category prime steel as scrap when it is available in that form with the foreign suppliers. It is heartening that Mr. Subramaniam has assured a sympathetic consideration of this matter. An expeditious decision on it is urgently called for.

To mitigate the hardships of the civilian population, which will without any shadow of doubt grow with the reduction of supplies to it, the Steel Ministry will do well to streamline the Steel Controller's administration. It is a sad reflection on its current state of affairs that not a few of its shortcomings were brought under the spotlight at the last week's meeting of the Iron and Steel Advisory Council.

THE TWO BIGGEST BLAST FURNACES

in the European Economic Community (EEC) were supplied by

GHH

Gutehoffnungshuette—GHH—are one of the oldest of the heavy engineering enterprises that have set the pace for Germany's industrial growth. Established over 200 years ago, they have designed and built some of the largest and most important projects in the country.

GHH have pioneered techniques and equipment that have revolutionised many industrial processes. Notably in the field of steel production, GHH commissioned the first blast furnace in the Ruhr, then still fired with charcoal, pioneered in the application of pure oxygen for iron and steel production, supplied the world's first LD converter as a vital accessory to modern steel production.

Their vast research and manufacturing resources enable GHH to keep a front-rank position in many technical branches. GHH products are exported to all parts of the world—plant and machinery for the iron and steel, cement, sugar, chemical and mining industries, aerial ropeways, floating docks...

At Kansbahal, Orissa, three leading German firms—Gutehoffnungshuette Sterkrade AG., J.M. Voith G.m.b.H. and Heinrich Koppers G.m.b.H. —and a reputed Indian company, Larsen & Toubro Limited have pooled their vast resources and experience to set up UTMAL, a major undertaking for manufacturing heavy machinery UTMAL will play a significant role in the rapid industrialisation of our country, by supplying a wide range of industrial machinery.

THE WEEK'S NOTES

Cuba

THE UNEXPECTED RELIEF

THE UNEXPECTED has happened in Cuba and the world has been given a great relief from a dangerous position which was almost pushing it to the brink of a nuclear war. After America and Russia agreed to U Thant's proposal for a three-week freeze, an atmosphere of suspense but not of relief was created. Suspense was, however, better than the dangling ghost of the imminence of war. In the exchange of demands and counter-demands, when Russia came to the point of making a dogged claim for the dismantling of the American missile bases in Turkey as a quid pro quo for the Russian dismantling of the base in Cuba, an insoluble deadlock appeared to have been raised. The Russian demand of reciprocity was unexceptionable and for a time it appeared that the tables were turned against America. President Kennedy's silence on the Turkish bases was as good as an emphatic 'no'. And the problem before U Thant and other top mediators was how to get over the dilemma. For all practical purposes the indications were that the period of freeze would not offer any real respite and the same problem would raise its head with the same severity and magnitude after the freeze was unfrozen. But Mr. Khrushchev seems to have had a thorough and much objective as well as sensible searching of the Russian attitude. Was the Cuba base worth risking a war? And could a war, once it shot up, be prevented from culminating into a nuclear war? Good sense prevailed upon the Russian Premier and he retraced his step. His consent to removing the missile base from Cuba and further agreeing to the verification of the operation dismantling under the UN supervision has put an end to this terrible crisis. U Thant, accompanied by his military and political advisers, has reached Cuba and when he returns he will leave behind him, as he has informed Dr. Castro, his team of experts to assist the dismantling of the base.

America is still keeping her vigilance tight around Cuba. The quarantine will not be relaxed, much less dissolved, and reconnaissance operations by aeroplanes will continue until the assurance is gained that there is no vestige left of the base and no new threat created of any ballistic missile bases. The tough attitude adopted by her may be explained from her view-point as the price of her inadvertence in not detecting the installation of the base. But it may be questioned whether toughness of this sort is now conducive to the creation of a better atmosphere. Mr. Khrushchev has stressed the necessity of making a reappraisal of the international situation. When he makes such a proposal, though not in any concrete and definite form, it need not be presumed that he suffers from an awareness of the weakness of his position. Rather, his position at home seems to be firm without which he could not make an approach of this kind. There is no doubt that Mr. Khrushchev made a miscalculation in the Cuba adventure and he has had to face a defeat. In the hour of victory it is wise and farsighted to be generous. America does not stand to lose much by softening her vigilance and giving a full chance to Mr. Khrushchev for the reappraisal of which he has spoken.

Anti-Aggression Front

VOLUNTARY ORGANIZATIONS

THE PRIME MINISTER'S clarion call to the nation to mobilize all available resources to repel the Chinese aggression in the north has had a lightning effect in stirring up the sense of patriotism and of devotion to duty in every nook and corner of the country. The spontaneity with which response is pouring from the people gives an assurance not only of the solidarity of the nation in this critical situation but of their willingness to render service and sacrifice according to their mite. How grave is the crisis and how great the magnitude of the task of fighting back the aggression was vividly revealed by Mr. Nehru in his address to the students of the Delhi University on Friday last. China, he reminded the youth in particular, had the biggest standing army in the world and the force she had mobilized in Tibet alone out-numbered the strength of the Indian army. No quarter can be given to wishful thinking that the fighting which is taking place on the border will be a short-lived affair and Mr. Nehru has warned the nation to be ready for a prolonged warfare extending even to two years or more. It is because of the gravity of the threat to the country's independence that he has called upon youth, including even girls, to be ready to join the National Cadet Corps. A voluntary army would soon be raised in which it would be the duty of the youth to enlist themselves. This is no sentimental talk, for Mr. Nehru emphatically declared that compulsory military training in the educational institutions will have to be introduced. The armed forces will have to be expanded on a large scale.

There are many important spheres, short of regular enlistment in the army, that provide opportunities to perform essential defence functions. The fact that these functions have a civilian complexion does not make them any the less important planks in the anti-aggression programme. The seven-point programme which has been announced by the Bharat Sevak Samaj for national defence sets out an exemplary list of the tasks which the voluntary organizations can very well emulate. Over-powered by superior numbers and the superior fire-power of the Chinese, many of the jawans have lost their lives and many more will have to undergo untold sufferings. Their families must be the special care of these voluntary organisations. Maintenance of the morale of the people is as essential as joining the regular forces and to that end the voluntary organizations can take a number of day-to-day valuable activities. There is all the need to keep the public provided with the correct information about the fighting on the different fronts, to explain to them the changing implications of the military situation and above all to fight and counteract the spread of rumours or demoralising talk. This war is going to strain the nation's financial resources beyond the endurance point and it will be a basic duty of the voluntary organizations to keep up constant propaganda to mobilize savings.

There is, however, a great risk that the formation of too many voluntary organizations is likely to create wasteful duplication of effort and not a little confusion. All the political parties have sunk their differences and it is of the utmost importance that in the formation of the voluntary organizations also they should forget party considerations and place themselves under a unified command.

Malayan Premier

A FORTHRIGHT WARNING

TENGKU ABDUL RAHMAN, Malaya's Prime Minister, has never hesitated to be forthright and outspoken in his views on national as well as international problems. His speech at the civic reception held in his honour by the Municipal Corporation in the capital city was remarkable for the penetrating analysis he made of China's ulterior aims in her military aggression against India and its repercussions on entire Asia. Having known for full twelve years what the ruthless and unscrupulous tactics of international communism mean

and how his country was disrupted by them during this period, the Tengku uttered a grave warning to all the nations of Asia to take full note that the Chinese aggression is not an affair confined to India and China alone. What is now happening on the Himalayan border is but a repetition of the Chinese acts of infiltration or open aggression in Asian countries like Malaya, Vietnam and Korea.

Preparation for aggression on such a stupendous scale in a difficult terrain is certainly not meant to establish her right over some square miles of mountainous area. As events in NEFA have amply demonstrated, China's expansionist ambitions are unfolded in stages and no one can be sure that there will be an end to them until she feels that she has established her iron grip on the vast strategic north of this country. China has shown respect neither for international law nor even for consistency in her claims. She is constantly shifting her ground. The aim of China, in the final analysis, is to establish communism not only in India but in the other countries of Asia at convenient stages. India has been chosen for such a blatant act of aggression because she is an eye-sore to China and she is an eye-sore because she is holding before the Asian nations a convincing and effective example of the working of the democratic way of life. It is a warfare between ideologies and not a limited military action to establish a claim over a border area. The Tengku's warning deserves to be noted in Pakistan where the Press is gloating over India's current troubles. India's neighbours, as the Tengku has emphasized, need to look far beyond the future to scrutinize the real intentions of China.

By a remarkable coincidence this analysis of China's ulterior designs, coming from the leader of a country which has suffered badly at the hands of international communism, coincides with the warning uttered by that spiritual messenger of peace — Vinoba Bhave. In ringing tones Vinoba Bhave has warned his countrymen to realize that they were at war with a nation which wanted to impose its communist ideology by destroying their democratic way of life.

Kenya

PARTY MEMBERSHIP

THE KENYA African National Union, in announcing its decision to throw open its membership to non-Africans, has taken a long-delayed step in giving a comprehensive base to the party. It will be recalled that the Kenya African Democratic Union already took this measure about a year ago. There is, however, some difference in the forces and events which led the two parties to adopt a multi-racial basis for their membership.The KADU, the first in this field, represents a group of smaller tribes, which have their own apprehensions and grievances in regard to the majority Kikuyu tribe. It has rallied under its banner a number of African tribes which instinctively feel the urgent necessity of forming their own solid organization to preserve their own entity as minority groups and to seek redress against the likely policies and actions of the Kikuyu-dominated KANU. It is for this reason that the KADU has all along, in the course of the constitutional negotiations, laid the central stress on regionalism and a certain minimum amount of decentralization of political powers. It was only after a long lapse of time and delay that the KADU gave its consent to forming a coalition with the KANU. Because of this delay the Kenya Indian Congress found itself under the pressure of expediency to withdraw its support from the KADU. From that time the broad alignment has been that among the non-Africans it is the Europeans and not so much the Indians or Asians who are tending to throw their lot with the KADU. Many of the Asian (which in this context means, in the majority sense, the Indians) have shown a preference for alignment with the KANU.

Now that the membership of the KANU is formally open to all irrespective of race the forecast is that the Asians would stick to their former preference and swell the ranks of the KANU. It is not relevant in this context to assess the prospect of legitimate protection being extended to safeguard the interests of the Asians who have settled in that country and contributed to its economic development in an admittedly substantial measure. In the ultimate analysis, the reality is that after Kenya becomes a full-fledged sovereign State, Asians and Europeans who opt for African nationality will need to throw their lot with the majority. From this viewpoint their political merger with one of the two parties would be advisable. The fears and doubts which a minority anywhere entertains are bound to lurk in their minds and it is too much to expect of them to wipe them out in the short run. Harmonious racial relations in Africa will depend now on the attitude shown by the two parties. Mr. Tom Mboya has not helped the cause of better understanding and uninhibited mutual trust by making an outright demand that the non-Africans in the KANU will have to vote as the party indicates. The KANU can win the confidence and unreserved co-operation of the non-African citizens by relying less on this brand of unanimity and more on free discussion and accommodation.

French Presidency

THE VERDICT

SINCE PRESIDENT de Gaulle made it a personal issue to stay or not to stay in office, depending on the outcome of the referendum fixed for Sunday this week, it was reasonably taken for granted that the French public would not risk losing his stewardship. The issue for referendum was whether or not the President of the French Republic should be elected by a direct vote, based on universal adult suffrage, in substitution of election by an electoral college consisting of the members of the National Assembly, the Municipal Institutions and similar others, as under the constitution.

The verdict has been 61.75 per cent votes in favour and 28.25 against direct presidential election. President de Gaulle had declared that he would not rest satisfied with a mediocre vote. He would consider a vote of a minimum of 60 per cent as a success and a vote of 65 per cent or above as a triumph for his appeal to the nation. Anything short of the success vote would be taken by him as an indication to resign. The vote proves that the President achieved success, but not triumph. The total strength of voters on the register was 27.5 million, out of whom 12.81 million voted 'yes', 7.93 million voted 'no' and 6.76 million abstained from voting. The percentages given above for 'yes' and 'no' exclude the invalid votes. It is an interesting exercise for speculation how the balance in voting would have changed if the margin of abstention had not been as large as 24.6 per cent of the total number on the register. Would the percentage for 'yes' have jumped higher than it actually did, or would it have dipped below 60 per cent? But this speculation is an idle pastime and perhaps there would be little basis for it.

The substantial support which President de Gaulle got at the referendum throws serious doubts on the forecast floated in some quarters that the President may win the referendum but may lose the forthcoming general election. However, the result of the change in the election of the President has been to create the possibility of the President and the National Assembly being at variance with each other in political policies. Further, in view of the Presidential power to dissolve the Assembly, the chance of an individual President assuming absolute powers remains, depending, of course, on his personality and leanings.

HINDALCO

ALUMINIUM

TO MEET THE VARIED REQUIREMENTS OF INDIAN INDUSTRIES

The 20,000 tons (per annum) aluminium plant of Hindusthan Aluminium Corpn. Ltd. went into production in May 1962. "Hindalco" offers you ALUMINIUM INGOTS (commercial grade and electric conductor grade) of a very high quality. Supplies of aluminium ingots are now freely available to meet the growing demand for aluminium for various industries in India.

Why CIMMCO Sakamoto

BECAUSE

★ AUTOMATIC LOOM IS A MUST FOR QUALITY TEXTILES
★ 62% OF COUNTRY'S AUTOLOOMS ARE SAKAMOTO TYPE
★ 25% OF COUNTRY'S AUTOLOOMS ARE OTHER JAP. TYPE

ALSO

★ THESE ARE STURDY IN DESIGN
★ SIMPLE TO SET-UP AND OPERATE
★ TRIED IN COUNTRIES THE WORLD OVER

AND

TECHNICAL COLLABORATION COMBINES A LOOM BUILDING EXPERIENCE OF 18 YEARS AT CIMMCO WITH OVER 34 YEARS IN JAPAN.

Specially developed technique of boring frames on assembly ensures of perfect allignment. Improved temple cutter, end cutter and latest mechanised warp stop with efficient brake ensure faultless weaving continuously with minimum efforts.

The World Abroad

IS ADVERTISING WASTEFUL?

By
ODYSSEUS

I DO NOT apologise for the frequency with which I refer to the economic writings of Ambassador J. K. Galbraith. If he does not like being quoted, he should not have published the two most quotable books written since World War II: "American Capitalism" and "The Affluent Society" (Hamish Hamilton. London).

Over the years, I have periodically pointed out that because politicians, senior business executives, publicists, editorial writers, and others achieve positions in which they can influence public opinion usually when they are past fifty, and because in the interval since they left the university they have usually been far too busy earning their livings to keep up their reading in political science, history, economics, or whatever their subject is, and because the frontiers of knowledge have never ceased continuously to be pushed forward since their day, it follows that the theories on which the leading government, or other, policies of the day are based are normally thirty years behind the times. Mr. Galbraith makes the same point, but as, in addition to my intelligence, he has a gift for an epigrammatic phrase, everyone remembers what he says. To describe any theory, once itself on the frontiers of knowledge, but now hopelessly out of date, he coined the phrase "the conventional wisdom."

THE "CONVENTIONAL WISDOM"

Mr. Galbraith's astringent pages attack orthodox economic views, particularly the proposition that prices are kept down by competition between sellers. He stresses that modern industry in the West is characterised by oligopoly, or domination by a few powerful sellers, who are in a position to consider the advantage of any pricing policy from the viewpoint of the profits of the industry as a whole, an outlook close to that of a monopolist. The producer (in a Western economy), Mr. Galbraith argues, now has measureable control over his prices. Hence, contrary to the theory of the conventional wisdom, prices are no longer impersonal forces compelling efficiency and eliminating the inefficient; they have, instead, become an umbrella, which efficient and incompetent producer alike tacitly agree to hold at a safe level over their heads, and under which all live comfortably, profitably, and inefficiently.

The second prong of Mr. Galbraith's attack on the conventional wisdom is that as income has grown in the affluent USA, the consumer's need for each individual item of goods declines. This sets a limit on the volume needed to be produced of any individual good. Above that limit, it becomes unsaleable surplus. This, in turn, means, says Mr. Galbraith, that full employment is threatened unless ever increasing consumption is artifically induced by advertising. Needs have to be created in order to keep the economy going. He seems to imply that the assumption that the consumer's sovereign will still rules an industrialised economy is nonsense. Mr. Galbraith believes that the enormous sums spent by advertisers in persuading consumers to buy their wants are, from an economic viewpoint, wasteful, and are evidence of affluence. The USA, and a few other Western countries, are now so rich, he argues, that they can afford not to care about the waste of advertising.

There is no need further to elaborate Mr. Galbraith's theories, because his brilliant, aphoristic expositions have meant that hundreds of thousands of readers in many countries, who have never opened a book on economics before, have read him and gleaned the sum total of their economic knowledge from him. Mr. Galbraith's wisdom has, in fact, itself now become the new "conventional wisdom" of the day. As such, I propose, from my obscure sector of the battle for the advancement of knowledge, to aim a few shots at it.

I take most of my ammunition from "Advertising in Action", an academic study, written by Ralph Harris and Arthur Seldon, and published by the Institute of Economic Affairs (66A Eaton Sq. London, S.W.1.).

The seventy case histories in "Advertising in Action" establish that, in the UK, competition, despite distortions caused by government policies, remains a major regulating factor in the market, active in (a) influencing prices, (b) rewarding the efficient, and (c) eliminating the inefficient, to the extent that tariff protection or subsidies do no shelter the inefficient or that taxation hits the efficient.

Of those who observe that competition is imperfect and, like advertising, wasteful of resources, I ask: what are the alternatives? There are four broad types of economy: (1) competitive free enterprise, (2) complete state control as in the USSR, (3) a mixed economy, as in India, and (4) a static economy of the kind that, prior to the industrial revolution, prevailed throughout the world, in which innovation was rare and the masses lived round about subsistence level for centuries.

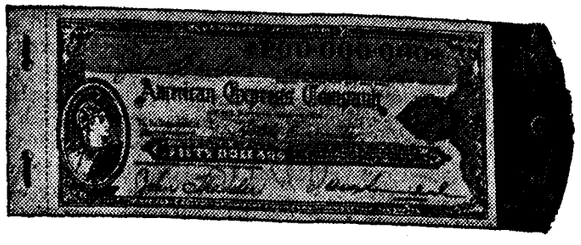
Now, I agree that it is not necessary to advertise food to hungry people living at subsistence level, and that the need and the opportunity to advertise arise only as people have the income to satisfy relatively unimportant wants, but when, from this, Mr. Galbraith concludes that the "social inefficiency of a wealthy community grows with the growth in wealth that goes far to make this inefficiency inconsequential," I begin to differ. What he calls "social inefficiency", I see as a margin of savings great enough to allow for experiment, for the trial and error that make a dynamic, as opposed to a static, economy.

Theoretically a planned economy eliminates the wastes of competition and advertising, but this assumes that planners never miscalculate, that crops never fail, and that the masses are content with the kind, and amount of, consumer goods allowed them. In a competitive economy, in which thousands of entrepreneurs are taking decisions, guided by their estimates of profit, the errors of different entrepreners may lead to some waste, but since they are uncorrelated they cancel out. In a planned economy, the inevitable errors are likely to be correlated throughout the series of individual official schemes, and so magnified. You cannot escape human error and waste in any system. A competitive economy minimises waste and, above all, promotes diversity and individual freedom of action and speech. A mixed economy is next best, because although it decreases efficiency in direct ratio to the degree of state direction, at least it preserves a modicum of freedom.

CAN ADVERTISING CREATE THE NON-EXISTENT?

Is it true that the free enterprise system must, to survive, create wants in order to sell the goods that it produces? Yes. in the sense that the alternatives are

either (1) a planned economy in which the state dictates permitted wants or (2) a statis economy catering to bare necessities. But if the implication is that a free economy can keep going by consistently persuading the masses, by means of advertising, to buy whatever goods producers decide to make or have in surplus quantities, the answer is "No". It is only over short periods that production can, in Mr. Galbraith's words, fill a void that it has itself created. Elsewhere he adds that advertising cannot be reconciled with the notion of independently determined desires, for its function is to bring into being wants that previously did not exist. This is true to the extent that no consumer can demand something that he has never heard of, or which does not yet exist. Watts had to invent the steam engine, and Alexander Graham Bell the telephone, before anyone could demand railways or long distance calls. Once the steam engine or the telephone has been invented, advertising can create a demand for it, and the prospect that adequate advertising will end in good profits for an inventor makes an economy dynamic.



But what emerges clearly from the case histories of "Advertising in Action" is that, however, technically efficient the advertising, its effectiveness is always limited by (1) the merits, (2) availability, and (3) price of the product or service compared with its competitors. In other words, if in the 19th century the new railways (to stick to my favourite example) had kept breaking down or been dirtier, slower, or more expensive than the old stage coaches, no amount of advertising would have persuaded consumers to quit stage coach travel.

On the other hand, many of "Advertising in Action's" cases illustrate the care taken by manufacturers, before they begin to advertise, to discover consumer needs, to assess changing social trends, to improve retail distribution, to meet competition, to provide after-sales service, and to improve packaging. The effort to ascertain consumer wants extended even to the animal kingdom, when Kattomeats researched into the eating habits of cats and established that (contrary to popular belief) they prefer meat to fish!

The longer term effect of advertising is complicated by the speed with which success provokes competition. Messrs. Harris and Seldon observe that the pioneer may have forecast accurately the prospects for increasing the sales of his product, but part of his advantage may be reaped by other firms attracted into the market. An outstanding example in the UK was that of Shell-Mex and BP, which began to develop the market for central heating, and was followed not only by other sellers of oil but also by sellers of gas, coal, and electricity.

In such markets, in which the supply of competing brands or products is relatively elastic, the most that the pioneer can hope is to keep at least one step ahead of competitors. Their combined promotion may extend sales faster, but once the scope for rapid growth comes to an end, perhaps temporarily, the rival advertisers may confront one another in a costly battle for larger shares of the available sales. It may appear that, in an oligopolistic market of three or four suppliers, common sense would enable all to reduce advertising without loss of sales. But the more go-ahead firms should not be expected to bolster those that want a quiet life. And the apparent waste of "combative" advertising is a price worth paying, in the short run, to maintain a dynamic competitive process that, in the longer run, leads to fresh pioneering, whether by the development of improved products or of cheaper methods of selling. I conclude that one of the reasons why static economies remain static is that they cannot afford the advertising which, by spurring competition, helps to promote change and growth.

CONSOLIDATING PEASANT HOLDINGS

From Our Special West European Correspondent

PARIS, October 28.

THE division of agricultural land into uneconomic plots, too small to be farmed rationally and yet too expensive to be bought by an indebted peasant who wishes to acquire a holding of reasonable size, is as familiar to the European peasantry as to the Indian. Admittedly, the problem is posed here on a different level. The disproportion between the size of farms and the cost of exploiting them scientifically, is due less to the reduction in area of holdings than to the rise in the cost of farming. Because of mechanisation, intensive use of fertilisers and selected livestock, and the rise in the cost of labour and all materials, the capital to be invested per acre is rising constantly, and plots that were economic a generation ago are so no longer. These aids to farming cannot be effectively deployed on holdings under a certain size, yet the farmer has to invest in them and thus has no capital to acquire extra land, when it comes up for sale, in order to round out his holding. The definition of an economic holding would differ greatly between India and France, yet it is true in both countries that most farms are uneconomically small. In most regions of France 20 hectares (about 50 acres) of land is regarded as below the threshold of profitability, and yet in 1955 it was found that 80 per cent of farmers were cultivating less than 20 hectares.

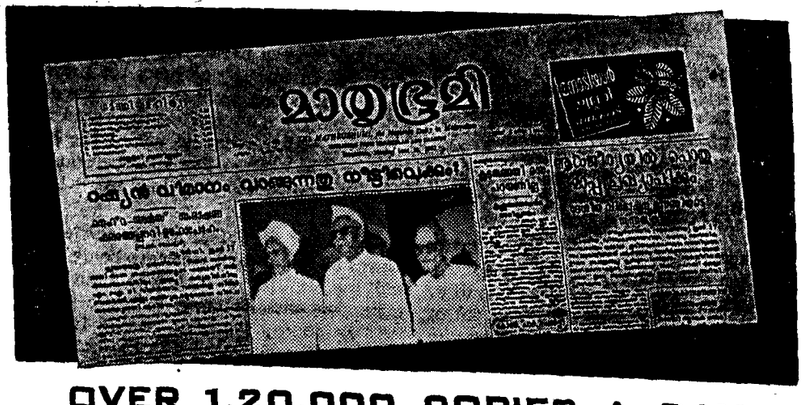
The problem being, in general terms, similar, the measures taken to tackle it in a law promulgated this week in France might have relevance elsewhere. The aim of the new measures, adopted by Agriculture Minister Pisani in response to seething discontent among the peasantry, is to increase the size of holdings to an economic level. The law entails certain modifications of the traditional rights of private property and this revolutionary step would not have been taken had not the problem assumed disturbing proportions. Not only has the capital-cost of farming increased (in contrast to almost every other occupation in modern societies, where the accumulation or inheritance of a large sum of capital is no longer necessary to enter a profession), but the price of land has been soaring: on average it increased by 130 per cent between 1950 and 1962. The small peasants blamed this on the competition of non-farmers and gentleman-farmers: industrialists, lawyers, butchers, canning industries practising vertical concentration, and rich city-dwellers, they claimed, have been buying land from poor peasants, thus unduly raising the price and worsening the conditions of the genuine farming community.

This led to some spectacular attacks on these "intruders", and film star Jean Gabin had his property damaged by rampaging peasants. Their diagnosis seems to be quite mistaken; there is no drift of land-holding out of the hands of the peasantry. Demographic pressure, the return of farmers from North Africa, successful expansion by a few big farmers who had the required capital, and the great increase in farm productivity explain most of the rise in the price of land, given that offers for sale are limited because many old peasants prefer to eke out a poor existence on uneconomic holdings. The fact stands that farming was being increasingly "capitalised": only a minority of big farmers were buying up land as it came up for sale, while the mass of peasants—though passionately attached to life on the land, and willing and able to apply modern cultivation techniques—were being squeezed between the impossibility of farming rationally on small plots and the financial impossibility of buying extra land.

To remedy this state of affairs, the new law permits the establishment of non-profit-making private societies called "Safers" (from the initials of their title in French: societies for land-holding reform and rural installation). They are not government organisations but are due to private initiative on the part of agricultural associations, yet they have to obtain government approval, where upon their geographical scope of action is fixed, their statutes harmonised and two official commissioners appointed to their board (from the Agriculture and Finance Ministries respectively). Though operating under private law, their purpose is to intervene in the free market in land, to prevent the unbalance that was being produced by laissez-faire. Their object is to "acquire lands and farms as they are put up freely for sale, and also to acquire uncultivated land, and then to hand them over to suitable farmers after they have been re-grouped". This re-grouping of land-holdings includes both increasing the size of a farm that is judged uneconomic, without any change in ownership of the original plot, and creating ready-made farms of economic size from uncultivated land. When a Safer buys land for these purposes it cannot hold it longer than five years (ten years in the case of forests exploited for their timber), but must by then hand it over to a farmer.

The capital of a Safer is subscribed by local agricultural associations and for those so far in existence the average capital is about Rs. 2.5 lakhs; the biggest, which covers six French departments, has a capital of Rs. 5 lakhs. Their working capital is drawn from long-term loans from State credit institutes, to be used for the purchase of land, and subsidies from the State that cover 50-80 per cent of the cost of improving the land they have bought. When they come to hand land back to farmers, these must approach the State agricultural credit organisms separately for the funds they need to buy; they receive 30 year loans at 3 per cent. Local authorities can participate along with agricultural associations in forming a Safer; the president and director are elected but have to be approved by the government, whose nominees on the board are instructed not only to watch over the use of the large public funds engaged but to see that the operations of the Safer do not disorganise the local land market.

Already 21 Safers are in existence, covering two-thirds of France and more are being formed. The Agriculture Minister is trying to limit their number, encouraging each to cover a larger area and dispose of greater funds; his ideal would be to have as many Safers as there are zones in the national plan. Besides, with a smaller number of organisations he would have a better chance of ensuring that their intervention in the traditional free market was not too disorderly; small local bodies dominated by people of particular political opinions might be tempted to act illiberally. For the fact is that the Safer represents a breach in the free-market system, because it was soon found that it could not work effectively without being given a right of pre-emption in land sales. In other words, it is empowered to stop the bidding in a land auction and take-over property at a reasonable price.



Needless to say this revolutionary power is hedged about with various safeguards. The Safer has no power to expropriate or to force owners to sell or to re-group holdings by authority. But at first it was imagined that it would be enough for the Safer to take part in free land sales and make bids on a footing of equality with other buyers; the scheme would thus work entirely within the private-property system. It soon appeared that the Safer was only raising prices and encouraging speculation, so it was given a priority over other bidders: landless labourers, the person culvating the plot up for sale (even if he already owns other land), near relations of ths seller, building societies and certain government agencies all have priority over the Safer; not that they have a right of pre-emption but the Safer cannot exercise its right of pre-emption as long as they are bidding. Moreover, the Safer has to apply to the government for this right, which is limited to specified areas and for a certain length of time. The faculty of pre-emption, then, is restricted, but it is still true that in many land sales the Safer can step in and buy at a reasonable price in favour of peasants with no farm or too small a farm.

Everyone with land to sell has to advise the local Safer two months in advance, stipulating the price and conditions of the sale. Even if it does not propose to buy the land in question and has no pre-emptive right, the Safer is represented at the sale, thus becoming a sort of watchdog and statistician of the whole free market in land. If sales take place in irregular conditions, notably in secrecy or with payments "under the table", the Safer can appeal to the courts to have the sale annulled and then acquires the land itself at a fixed price; this is the only case where its operations approach anything like expropriation, i.e. it is still paying for the land but is buying from someone who wished not to sell to it. In cases where prices asked for land put up for sale are excessively high, the Safer can again appeal to the courts to constrain the seller to moderate his pretensions, but the seller is then free to withdraw his offer to sell. Thus in a cautious and roundabout way there is introduced a sort of price control in land.

Having acquired land in any of these ways, the Safer can sell it at once to a neighbouring farmer anxious to enlarge his holding to a reasonable size; the farmer, as noted, gets a long-term loan to buy. Alternatively, the Safer can build up domains out of the parcels of land it buys, improve the land until it represents a whole farm of economic dimensions and then sell it to a farmer. This farmer must have proven his competence by cultivating for four years previously and should come from the region or from another regarded as over-populated. He must undertake to farm the holding sold to him on these special terms for 15 years at least and must meet throughout that time certain conditions about scientific exploitation of the property. Where there is competition for the holding, the Safer (remember that it is not a government body but is established by local farmers' groups) chooses the candidate most likely to succeed as an efficient cultivator. All this aspect of the Safer's operations resemble the organisations that distribute reclaimed land in Holland (the "polders").

If these powers of intervention seem extensive, it should be recalled that the Safer is not made obligatory by the new law: it is facultative and may be set up if local agricultural associations take the initiative. There is no question of the government consolidating land-holdings by authority; the government gives permission and assistance to local, democratic enterprise to do so if it wishes, and then in carefully controlled ways. That the scheme seems promising to the peasantry is evident from the fact that so many Safers have already been set up and it looks as though before long the whole territory will be covered by them. A project of agricultural reform which (for once!) is not forced on a reluctant peasantry by the State but which is taken up enthusiastically by farmers themselves might be capable of adaptation elsewhere.

RESOURCES FOR DEFENCE

THE hostilities on India's northern border have galvanised the nation into a determined unit which is straining every nerve to fight back the invaders with all its might. Of great significance is the spontaneous offer of the people to assist the Government in all its efforts to mobilise the national resources. The manner in which voluntary financial contributions have been forthcoming during the past few days to swell the National Defence Fund shows that there is not likely to be any serious shortfall in financial resources for the attainment of the objective in view. Again, the States have promised to contribute to the National Defence Fund. The Finance Minister is planning to float defence bonds, defence certificates and a new series of Prize Bonds. Further saving can be made by an all round austerity drive, especially in the non-planned expenditure. It is the objective of this special article to assess the total volume of finance which can be mobilised by all these methods.

The unprecedented response that has been witnessed since the commencement of hostilities makes one bold to estimate the probable impact in terms of total defence fund accumulations. The contributions have been received from all sectors of society, though the degree of consciousness is particularly acute amongst the salaried classes. There are numerous instances where all the employees of industrial and financial units have donated a month's salary to the Defence Fund. If all over the country households in income brackets above Rs. 3,000 per annum were to forego even a week's wages (or salaries) the accumulation would turn out to be near about Rs. 35 crores. It will be wrong to assume that the farm households will not respond to this national call. According to their capacity, the families in the lower income brackets, whether in the villages or the towns, are also contributing. It is a safe estimate to make that the Government may obtain not less than Rs. 50 crores from the masses for purposes of defence.

It will be necessary to explain how 'The Eastern Economist' has arrived at this figure of Rs. 50 crores for voluntary donations. In the September 1962 issue of the Reserve Bank of India monthly bulletin, a statistical table has been set out (see Table I below) which shows the total personal as well as disposable income of all the households in the Indian Union. It points out that 18.8 per cent of the disposable annual income is held by income groups above Rs. 3,000 per annum. Their total annual disposable income turns to be a little more than Rs. 1,900 crores. A week's earnings for these groups will be around Rs. 35 crores. This is in fact a conservative estimate because incomes of this class have risen by at least 30 per cent since the period under consideration. This is the contribution of the relatively privileged classes, but in this national struggle the less privileged are not lagging behind. It is estimated that another sum of Rs. 15 crores will be forthcoming from the households which constitute 95.3 per cent of the total households in the Indian Union and command 81.2 per cent of the purchasing power.

Contributions from many units in industry and trade have also been announced in the Press. Though it is not possible to add up all the help promised by them, yet it is possible to hazard a guess in this direction. According to the analysis of the balance sheets for 1,001 companies made by the Reserve Bank of India, the total

TABLE I.

DISTRIBUTION OF INCOME : 1953 - 54 — 1956 - 57 (AVERAGE)

(At current prices)

Group	Households ('000s)	Total income (Rs. crores)		Per Household income (Rs.)	
		Personal	Disposable	Personal	Disposable
Income Groups (Rs.)					
(i) 0— 3,000	77,074 (95.3)	8,294 (80.4)	8,230 (81.2)	1,076	1,068
(ii) 3,001—25,000	3,677 (4.5)	1,520 (14.7)	1,484 (14.6)	4,134	4,036
(iii) 25,000 and above	165 (0.2)	504 (4.9)	424 (4.2)	30,545	25,697
High Income Groups					
(i) Farm Households	1,634 (42.5)	567 (28.0)	553 (29.0)	3,470	3,384
(ii) Salary Earners	227 (5.9)	228 (11.3)	198 (10.4)	10,044	8,722
(iii) Non - salary Earners	1,981 (51.6)	1,229 (60.7)	1,157 (60.6)	6,204	5,840
TOTAL	3,842(100.0)	2,024(100.0)	1,908(100.0)	5,268	4,966

profits after tax in 1960 were placed at Rs. 116 crores. Because of the increase in the volume of business during the last two years, it is safe to assume that the profits of the organised sector have since risen to not less than Rs. 140 crores (exclusive of taxes). If these units were to part with at least 25 per cent of their profit, the addition to the Fund would be of the order of Rs. 35 crores, though in net terms it would amount to only Rs. 17½ crores because the other half would have in normal circumstances automatically gone to the Central Exchequer by way of taxes. In this way, both the household sector and the corporate sector will be in a position to make a net contribution of Rs. 85 crores in the current financial year. If that should happen, it would be a very happy turn in the financial affairs of this country and the Central Government's task to collect finances for defence purposes would be eased.

An encouraging trend has been witnessed as a result of the appeals of the Prime Minister and the Finance Minister to contribute liberally in gold and silver. The fair sex from many parts of the country has offered its jewellery to the Government of India so that the country may buy bullets against bullion. Any shortfall in the above estimates of Rs. 85 crores would be made up by contributions in the shape of gold and silver. The voluntary effort of enterprising women who are currently engaged in the work to provide essential clothing to the fighters on the front needs to be taken into account as well. By and large, it is certain that, in real terms, the figure of Rs. 85 crores will be attained. There should be no surprise if the overall figure should rise to Rs. 100 crores, after taking into account the donations made by Indians living abroad and other overseas sympathisers.

The State Governments have also reacted in the same manner and have come out with declarations to the effect that they would contribute to the National Defence Fund substantial sums for the purchase of arms for India's defence against the Chinese aggression. The Government of the Punjab has promised a sum of Rs. 2 crores, followed by West Bengal at Rs. 1.5 crores and Orissa at Rs. 1 crore. At a public meeting, Mr. Chavan fixed the target of Rs. 10 crores for the city of Bombay alone. An equivalent sum may be contributed by the Maharashtra Government as well. Even though West Bengal has so far promised Rs. 1.5 crores only, in view of the mounting enthusiasm throughout West Bengal—also because it is very near the theatre of hostilities—it will also have to raise its contributions to Rs. 10 crores. Table II below shows 'The Eastern Economist's' estimates of probable contributions by the States to the National Defence Fund. It will not be difficult for the State Governments to mobilise the resources out of their current revenues because they will, under the present circumstances, be willing to drop some of the relatively non-essential projects and diverting these resources for India's defence purposes. The total sum will be as much as Rs. 55 crores and during the current financial year will go a long way in increasing the war effort.

The Finance Minister has, in a realistic manner, informed the country that even these voluntary contributions may not be sufficient because the fight is likely to be a prolonged one and may not end soon. The country has got to be geared to a prolonged war and hence people's savings must be channelled into defence schemes. He is planning to initiate three schemes to siphon off the surpluses with the people. In the first place he is floating Defence Certificates and National Defence Certificates — with attractive terms. He is also planning to start a new scheme of Small Saving Certificates for defence purposes so that people with small means may also participate in this national effort. Again, he is working out details for a new series of prize bonds. All these three series of saving drives for defence may add up, during the current year, to something like Rs. 25 to Rs. 30 crores.

The voluntary contributions of the people and the corporate sector coupled with the savings certificates and bonds etc. may yield nearly Rs. 165 crores. The position is summarised in table III below. This estimate is a realistic one—something which can be attained with a determined drive. If for any reasons there should be a shortfall, the Government will be left no option but to bring in some taxation measures, but this eventuality need not be speculated upon.

THE BUSINESS WORLD

Bombay Bestirs to Rout the Chinese

By CROESUS

IT is seldom in the history of a nation that all the people rise like one man to register their protest against some happening in no unmistakable terms and to demand but one and only one course of action. Well, that has happened in India today. The people of India —that is every patriotic Indian with no extra-territorial loyalties—have strongly and spontaneously reacted to the naked Chinese aggression against an ever-trusting and unsuspecting neighbour and have solemnly resolved not to rest content until the last Chinese soldier is driven out of the sacred soil of Bharat. One had only to witness the mammoth mass rally of all political parties (except, of course, the Communists) on the Chowpatty sands in Bombay, last Monday, and the solemnity with which those present took the pledge read out by Mr. Y. B. Chavan, Chief Minister of Maharashtra, to resist the relentless invader on our Northern borders, to see a concrete evidence of this resolution.

No time was lost by Mr. Chavan in appointing a representative Citizens' Committee to devise ways and means of mobolising resources for the effective eviction of the treacherous enemy. The Citizens' Committee has undertaken, 'inter alia', to raise Rs. 10 crores as a first instalment contribution to the National Defence Fund; to collect workers' wages and employers' profits of one extra working day every month; to ensure that there are no strikes or lock-outs; to make sure of sufficient blood donations to our Jawans; and to hold the price-line by preventing hoarding and price rises. At the rate at which people have been coming forward to respond, all these goals are certain to be reached, even exceeded.

Perhaps the most difficult of all the tasks that faces the Citizens' Committee is the one to hold the priceline, because prices are governed not only by the laws of demand and supply but also by the forces that tend to affect either the demand or the supply or both, which are many and imponderable. So far as supply is concerned, the entire business community and the whole working class have expressed their determination to maximise production to the utmost extent feasible. So far as demand, at any rate public demand, goes the pledges being taken by both the merchant class and the consumers ought to be a sufficient guarantee against any undue rise in demand.

The chance of any unwarrantedly excessive demand manifesting itself may also be ruled out by the inevitable siphoning off of a considerable quantum of purchasing power consequent on the handsome subscriptions freely being made to the National Defence Fund. But, then, there is the irresistable and imperative defence demand which must be met in fully willy-nilly. The only way in which this unpredictable demand factor can be countered is for the civilian population correspondingly to curtail its demand by postponing all but the most essential or unavoidable purchases, or even by foregoing, if need be, as many purchases as possible.

This doubtless presupposes a high degree of discipline, but, without such discipline, all talk of building up civilian morale would be utterly useless. If, however, the business community addresses itself to this task without much ado and in a business-like way, even as was demonstrated by the only spokesman of the Indian business community that was called upon to address the Citizens Meeting in the Council Hall of the Maharashtra State Assembly, convened by Mr. Chavan on Saturday last—Mr. Pravina Chandra Gandhi, President of the Indian Merchants Chamber, Bombay, merely stated that the business community was wholly behind the Government and would not be found wanting in this hour of national crisis—it is sure to receive the whole-hearted co-operation of all sections of the people, thereby enabling it to render a creditable account of itself.

Business men need not pause at this stage even to take notice of the ill-advised and hardly warranted warnings of some official spokesmen who seem to think that the only section of the population in India that has to be "on probation" today is the business community. Let us not forget that we have quite a few exemplary patriots in the ranks of business men, far more perhaps than some people are prepared to concede, and these have not waited for anybody's call to do their bit by their motherland. They may be made to go further, to go all-out, in fact, provided they are approached properly. This is not the time even remotely to suspect their 'bona fides'. The time is to accept their 'bona fides' and to acknowledge their services and sacrifices unreservedly.

Mao, Markets and Moorat

ONE expected that Mao had caused enough mischief to mar the moorat in our markets, but the determined moorat mood of market-men in the city (Bombay) seemed to defy the might of Mao and his henchmen, even as the solemn resolve of the people of Maharashtra (why, of the whole country) who have decided to resist the Chinese to the last soldier. This is not to suggest that the moorat was either bright or that the volume of transactions at moorat trading was on a scale befitting a really good moorat, but, quite unexpectedly, there was not that degree of nervousness, as was feared, especially on the Stock Market. This may be attributed to the hopeful view market men have apparently taken of the long-term outlook. Save for any unpredictable turn that the Chinese aggression or the Cuban developments may take, this view is not altogether unjustified. Even in the event of a prolonged Chinese aggression—which may not be ruled out—it is reckoned, industrial production will not suffer quantitatively, though it may be affected qualitatively or pattern-wise. With the reasonably assured prospect of stable prices, on the one hand, and of industrial peace, on the other, this does not at all look like an unwarranted inference. A brief review of the moorat trading in the important markets will bear this out.

To take the Bombay stock market first. Transactions on this market were the thinnest for several years, so that even token transactions tended to occasion wide fluctuations. Fortunately, as there had already been a more or less steady decline for several months past, bears could not exploit the situation. Restrictions imposed by the Stock Exchange authorities to prevent undue falls in prices also proved a deterrent, at least to the traditional speculators. Further, the entry, although not on a sizeable scale, of the Life Insurance Corporation helped sustain prices, though, when purchases on account of the LIC were over, they tended to relapse. On balance, the 1962 moorat closing prices do not compare favourably with those of the 1961 moorat. Tata Steel, for example, quoted only Rs. 123 at the close of this year's moorat trading, as compared with the closing quotation of last year's moorat of Rs. 146.20. Prices of textile shares generally reflected—as is only to be expected—the volume of business in the Mulji Jetha Market and were lower than last year in every case. Miscellaneous shares too did not fare better, while the securities market remained as dull as ever. As a matter of fact, there was not a little surprise when a leading bank reportedly placed an order for a particular Government security at a price a little lower than its previous closing.

Moorat trading in the commodity markets also was a tame affair. The volume of transactions recorded a distinct decline and prices showed no improvement. The actual business transacted in the Mulji Jetha Market, for instance, was variously estimated at anywhere between 50,000 and one lakh bales, including the Dussehra deals, as against over a lakh of bales—in 1960, these sales were as much as 1.5 lakh bales!—of only Diwali sales last year. A feature of the trading was the reported reluctance of mills to offer coarse and grey cloth, presumably in the belief that these might be in demand for defence purposes.

The turnover in the forward section of the cotton market was put at between 6,000 and 7,000 bales. There was not much support, except from spot houses. Prices, therefore, moved within a very narrow range, Jarilla March closing at Rs. 744.

Perhaps the worst affected market was the bullion futures where trading fully reflected the anxiety of dealers in the matter of the future of forward trading, on the one hand, and about the possibility of compulsory acquisition of gold later (if the circumstances should warrant such a course), on the other. The relatively poor off-take, and that at lower rates, in the ready section also had a psychological effect on moorat trading in precious metals.

The position, however, was quite the opposite in the oilseeds market (ready) where there were brisk transactions particularly in groundnut and groundnut oil. The turnover was estimated at around 15,000 bags of groundnut and 500 tons of groundnut oil. However, even here, trading in the forward section turned out to be a pretty dull affair, with the volume of transactions hardly aggregating 20,000 candies.

To sum up, moorat transactions in all the markets were, by and large, of a token nature and hence severely restricted. Although the traditional gaiety associated with the moorat was conspicuous by its absence, thanks to the Chinese aggression, the inherent note was one of cautious optimism.

Business Notes

Prices

CONTAINING THE SPIRAL

WITH THE Sino-Indian border trouble flaring up into a shooting war over a fortnight ago, it is just in the fitness of things that next only to the questions relating to the building up of the defence potential of the country, the issue of containing the price spiral has been the uppermost in the mind of the Government. While industry and trade, by and large, have shown a commendable restraint in not pushing up prices and the nation as a whole has shown a heart-warming discipline in denying to itself the festivities associated with the country's most important festival — Deepavali — it will be nothing short of a folly to assume that the battle on the price front will be easily won.

The pinch of the rise in prices would perhaps not be felt for some time more, firstly, due to the fairly satisfactory position obtainable at present in regard to the supply of the essential items of consumption, secondly, because of the austerity imposed on themselves by the people and, finally, owing to the spilling over of some of the pressures on the priceline into the encouraging support that the National Defence Fund has received until now and the new borrowing programme of the Government can be anticipated to get. But the prolongation of the hostilities over a period of time, with its consequent repercussions on the supplies of consumption goods for the civilian population, is bound to exert an upward thrust on the price level in general. How far the Government with the support of the trade and the people will be able to contain this pressure by appealing to the patriotic instincts in them is something which cannot be visualised at the present juncture. But some unscrupulous profiteers and racketeers among traders would try to take advantage of the situation despite the exhortations of the national leaders and various industries and trade organisations, is a fact that has to be faced squarely. No doubt, with the promulgation of the Defence of India Ordinance, the Government has assumed wide powers to bring to book unscrupulous elements in the society; but there is no denying the fact that only a firm handling of the situation will enable the country to emerge unscathed in its honour and prestige from the present struggle.

The price policy of the Government has obviously to take into consideration long-term implications of the situation when drastic reduction in imports and severe curtailment of industrial output for civilian consumption will bring about a wide imbalance between demand and supply. The country has to be prepared for this steadily but resolutely. In view of the unhappy experience that we have had with both price and quantity controls in the past, the strategy to fight the battle on the price front has to be very carefully thought out. Physical controls, though not warranted at present, cannot be ruled out in the long run and the adequate machinery for their effective implementation has to be prepared well in advance. In respect of some of the essential materials required for strengthening the defence potential, such as steel, coal and petroleum products, a beginning may have to be made in the very near future. There is need for tremendous foresight on the part of the Government. It is hoped it will not be found wanting a second time in quick succession. All attempts need to be made to utilise fully the existing installed industrial capacity not only for meeting the defence requirements, which have the first priority, but also for producing the essential industrial goods for civilian consumption. Imports of deficit raw materials have to be given priority over all other imports howsoever important for a peacetime economic development but not needed at present to build the defence potential.

Wool

HOW TO STEP UP OUTPUT?

THE ADMITTEDLY slow growth of industrial production last year was due to acute paucity of raw materials caused mainly by our foreign exchange crisis. This also explains the high percentage of unutilised capacities in various industries, the woollen industry being no exception. The actual idle capacity (on three-shift basis) in the weaving and the spinning sectors of the woollen industry has been estimated at 75 per cent and 42 per cent, respectively, while production of woollen fabrics and yarn has been put at 18 million yards and 35 million lbs., respectively. The need for fuller utilisation of this industry's installed capacity has become all the more imperative now with the present perilous position on our Himalayan borders, where our jawans are engaged in repelling the relentless Chinese invaders.

Speaking at the second annual general meeting of the All-India Woollen Mills Association, Ltd., (AIWMA), held recently in Bombay, Mr. Jagdish L. Behel, the Chairman of the Association, pointed out that the reduction in the actual users' licences for the import of wool tops and raw materials for the period October, 1962, to September, 1963, by about Rs. 2 crores would not allow the industry to maintain even the 1½ shifts it was working last year, and he feared that, as a result, the production would be much less than last year. It is common knowledge that we do not have enough indigenous wool of the right quality for use by the worsted section of the industry. The consumption of Indian wool by the industry at present is estimated to be of the order of over 2 million lbs., but this quantity could be very much more if, as Mr. Behel observed, sufficient efforts were made to upgrade the quality of our wool by improved breeding and better shearing, sorting, etc.

Referring to the all-important question of rehabilitation and modernisation of the industry, the AIWMA Chief observed that, unless this problem was given priority and positive steps taken to modernise, no amount of supplies of raw materials alone would be much avail. Offering a solution to the problem, Mr. Behel reiterated the suggestion made by spokesmen of the industry in the past that the Government should allow the industry to utilise the export promotion licences for importing new machinery for replacement purposes. Even this might not altogether solve the problems of the industry but it is felt that the industry could at least make a start in rehabilitating itself so as to enable it to raise its production both quantitatively and qualitatively.

Talking of exports, there has been a considerable decline, during the last 2 to 3 years, in the exports of our woollen manufactures. Exports of woollen manufactures, including both woollen fabrics and yarn and shoddy manufactures, have been of the order of only Rs. 70 lakhs. It is to be hoped, now that the industry is stated to be happy with the revised Export Promotion Scheme for woollen goods (export incentives have been increased to 100 per cent of the F.O.B. export value), there will be distinct improvement in the industry's export performance. It is not clear to what extent this purpose would be served, if, as Mr. Behel desires, the Government should institute compulsory export targets for each of the different sections of the industry.

RESEARCH INSTITUTE FOR RAJASTHAN

THE PROBLEMS of sheep and wool have long been engaging the attention of the Government of India chiefly because wool is an important foreign exchange earner. This attention has been the greatest in the States where sheep rearing is the chief occupation of a large number of people. In Rajasthan a beginning to reorganise the industry was made in the First Plan when the Rajasthan Government set up with the help of the Central Government five sheep breeding farms and a small wool and fleece testing laboratory. It was felt that the industry needed to be properly organised instead of allowing it to survive on traditional lines. Introduction of modern techniques was also considered to be necessary. The services of foreign experts were sought in this matter, and it is now on their recommendations that a wool research institute will be set up in Rajasthan. The Institute will be located at Mapura near Ajmer where a 4,000 acre plot of land has been acquired.

The findings of the foreign experts had indicated that an intensive programme of research, training and demonstration was necessary to achieve good results. The project will be financed by the United Nations Special Fund, the Rajasthan Government and the Government of India. So far as total contribution from the United Nations Special Fund is concerned, it will be to the tune of Rs. 35.7 lakhs. The total share of the Rajasthan and Central Government would be Rs. 290 lakhs, in which the share of the Rajasthan Government would be Rs. 195 lakhs. The institute will serve as a demonstration centre for training instructors, supervisors, managers and research workers employed in the sheep and wool department. It has also been agreed that UNICEF will provide eight international specialists in various fields of wool production. Fine breeds of foreign sheep, equipment and machinery for research work would also be made available. Encouragement will also be given to the Indian personnel to go abroad for advanced training in modern methods of preparation of wool clip.

With the setting up of this institute the problem of wool industry in Rajasthan is likely to be solved to a considerable extent. There will not only be available the services of international experts to guide and train in research work, but better methods would also be evolved in rearing sheep. Time is not far off when Rajasthan would boast of a flourishing wool industry in the State.

FICCI

SOUTHERN REGION CONFERENCE

THE FEDERATION of Indian Chambers of Commerce and Industry organised a regional conference of the constituents of the Federation in the State of Andhra Pradesh, Kerala, Madras and Mysore in Madras recently. This was done as a measure to appreciate better the problems of industry and trade arising out of regional variations or specific policies pursued by the State Governments. It is true that the problems in crucial sectors relating to programme of production, export promotion, price levelling, power transport, coal, industrial raw materials etc., were more or less identical all over the country, but there always were problems which did need special attention in a specific region. This move on the part of the Federation has, therefore, to be welcomed.

As Mr. S. P. Jain, the President of the Federation indicated in his address on the occasion, some of the important industries of the South like tea, coffee, leather, tobacco, cashewnuts, spices and pepper, textiles, handlooms, coir products, mineral oils and mica, did require special attention. Some of these industries are agriculture based and some of them are run on small-scale business. Consequently they have their own special problems. Naturally, therefore, the discussion during the Conference was valuable for the producers as well as the traders.

One subject that was discussed at length was the plantation industry which deserved special attention because most of its products yield valuable foreign exchange, and because plantations is labour-intensive industry. Any increase in the cost of labour substantially would affect the cost of production. It was indicated that unless the yield of coffee and tea improved substantially, it might be difficult for the plantation industry to operate on competitive basis in the international market. This aspect should be borne in mind by the Wage Board for the plantation industry. It was also stressed that to make the tea industry more competitive in the international market, it was necessary to reduce excise duty on several articles like plywood, aluminium lining etc., used by the industry. Similarly, as far as tobacco industry was concerned, it was asserted that assistance from the Government should not be lacking. For instance, it was pointed out that the industry would be finding it difficult to obtain redrying machines which would augment the value of our tobacco exports.

Then the regional conference discussed the broader problems of the region in respect of coal and transport so that there was at the moment a great need to switch-over to alternative fuels such as furnace oil to supplement hydro-electric power. This could be understood in the light of what Mr. Muthiah called, "a variation in the approach in the content of the policies" in view of the special conditions of the region. The Federation has done well to draw the attention of the Centre towards these specific problems faced by the region. It is quite certain that these problems will not remain unnoticed.

Coal

MR. DRIVER'S PLEA

AT THE seventeenth annual general meeting of the Coal Consumers Association of India, Mr. Darab C. Driver made some useful suggestions to end the present crisis in coal. He, for instance, pointed out that while revenue considerations affect the proposal to reduce the excise on furnace oil to encourage its use as alternate fuel to coal, Government should consider how much less would be the loss to revenue by reduction in the excise, compared to the crores industry loses by not being able to work to capacity owing to inadequacy of coal received and its poor quality. As regards proposals for low-shaft furnaces for manufacture of pig iron using weakly coking and non-coking coal, Mr. Driver underlined, it would be helpful if estimates of capital cost for an economic size of plant and of the cost expected are also given. Referring to coal washeries, Mr. Driver said that more of these should be set up by the Government because that only would help in obtaining standard size coal required for our use. Incidentally, this would also help in making the dumps scheme a success.

On the rail-cum-sea movement of coal, Mr. Driver suggested that the Government might consider a similar formula for grant of the already declared subsidy for the costlier sea route compared to the direct rail route because the existing formula was too complicated to be complied with. Adjustments in box-wagons, of course, is a necessity. With a little more attention and proper planning, delays in turn-round of wagons could also be avoided. But for this authorities will have to be vigilant all along the line. Last but not the least, Mr. Driver pleaded that the Government may make a survey of the availability and sufficiency of foundry coke required by the public and private sectors for the rest of the Third Plan and the Plan following. The survey may also consider whether the growing demand of coke required by the public sector industries at Durgapur and Ranchi for machine building etc., would be supplied from the nearby Durgapur steelworks and therefrom the unsatisfied demand of the private sector be met. The issues raised and the ideas put forward are quite logical and need to be considered in

Organic Chemicals

GUJARAT LEADS AGAIN

WITH ITS quota of production of heavy chemicals estimated to constitute a third of the country's entire production of this commodity, Gujarat State is already first in this field. The State has again taken the lead in establishing organic chemicals industries in the country. Thus, the Formaldehyde and Hexamine Plants of Atul Drug House, established at Kandla are the first plants for the production of these organic chemicals not only in the Gujarat State but also in the whole of India.

The Formaldehyde and Hexmaine Plants, inaugurated by Dr. Jivraj Mehta, Chief Minister of Gujarat, recently, will be producing basic raw materials of many other industries like plastics, paints, resins, laminations, etc. When these two plants, along with the two others proposed, namely Pentaerythriotol and Acetaldehyde projects, come into full production — that is, by the end of 1963 — the entire project would have cost the Atul Drug House more than Rs. 1.5 crores. For the present, however, these two units have a capacity to produce only 14,000 tons of Formaldehyde and 300 tons of Hexamine per annum.

The two salient features of the new plants at Kandla are that the Atul Drug House has obtained the technical collaboration of Messrs. Karl Fischer of Germany, who are known the world over for their most economical process for the manufacture of Formaldehyde and who have also supplied more than fifty plants of different capacities to various countries. Having ensured this excellent technical collaboration, the Atul Drug House also successfully managed to secure the otherwise difficult foreign exchange component for meeting the cost of plant and machinery, as also of raw materials, through the co-operation of two well-known Indian business houses in Kenya.

The basic raw materials needed for the manufacture of Formaldehyde, namely Methanol, has still to be imported, as it is not manufactured in India. Atul Drugs, however, have plans to establish a plant to manufacture Methanol also and thus save over Rs. 50 lakhs annually in foreign exchange, but they have, for the time being, to rely on imports. Here, again, it is noteworthy, Atul Drugs have taken care to save as much foreign exchange as possible, by arranging to import Methanol in bulk by constructing storage tanks.

Dr. Jivraj Mehta, in his inaugural address, rightly commended the farsightedness of the Atul Drug House in establishing these plants, especially in Kandla which has been recommended to be made a Free Trade Zone. He also pointed out that the establishment of industries would further serve to give employment to the rehabilitated persons who inhabit the surrounding area of Kandla. At the same time, it is imperative that a rich and industrially developed hinterland is developed to justify the development of Kandla as a major port.

Fertilizers

TROMBAY FERTILIZER PLANT

WITH A view to attaining the fertilizer target in the Third Five-Year Plan, much thought and attention is being devoted to the setting up of fertilizer projects. Trombay fertilizer project is, for instance, one such project where planning is being executed in the most careful manner. The project is being designed entirely by Indian personnel and this is expected to save the foreign exchange element to a great extent. Nangal and Sindri had not only to pay for supplies of machinery and equipment but also for the services of consultants.

Saying on this score is likely to help the project to produce fertilizers at a much cheaper cost. It is estimated that the cost of fertilizers at this plant would be Rs. 800 per ton against Rs. 1,000 at the other plants. Although it would cost as much as Rs. 29 crores, the production at this plant is likely to be 110 per cent of that of Nangal. The raw material (naphtha and refinery gas) will be obtained from the nearby ESSO and Burmah-Shell refineries.

The entire project is being financed by the United States. The U.S. Agency for International Development is providing $30 million (Rs. 14.3 crores) in foreign exchange under DLF loan no. 162 and is, to-date, lending Rs. 13.3 crores ($28 million) in Indian currencies from the sale proceeds under Title I of the U.S. Public Law 480. The project is expected to go into production early in 1964 and when completed it will produce 1,100 tons of nitro-phosphate fertilizer and 300 tons of urea fertilizer per day or 90,000 tons in terms of nitrogenous plant nutrients per year. This production is likely to result in an annual foreign exchange savings estimated at about $25 million.

The Maharashtra Government is already importing fertilizers of the type that will be produced at Trombay with the idea that they may not have to face any difficulty when the project goes into completion after a lapse of about two years. So in a way the project is assured of a ready market in this part of the country.

So far as progress of the plant is concerned, 50 per cent of the equipment for the entire plant and as much as 80 per cent for ammonium plant has already arrived. The construction may not be according to schedule, but it is likely to be set right soon. The delay in schedule can be assigned to the rains that hampered the progress of work in the initial stages.

The Menthol plant is also likely to be set up at Trombay. By having a talk with the project officials one gets the impression that a clearance from the authorities concerned would soon be obtained. The greatest advantage of the Trombay fertilizer plant would be that fertilizer would be produced at a much cheaper cost.

Power

HAFIZ MOHD. IBRAHIM'S CALL

THERE IS little doubt that the appeal issued by the Union Minister for Irrigation and Power, Hafiz Mohd. Ibrahim, to all commercial organisations and individual consumers of electricity for non-productive purposes, to consume it as sparingly as possible will have wholesome response as has been the case in respect of the contributions to the National Defence Fund. A more judicious use of the present electricity output was even otherwise called for in view of the fairly general shortage of power in the country. In the present emergency situation when Communist China has launched an all-out attack on our northern frontier, its imperativeness can hardly be overemphasised.

As the Minister has said, every unit of electricity saved from non-productive uses will help in strengthening our defence. He has rightly called on the public concerns for pressing into service all the small units they own and which had been shut down on grounds of economy. An expeditious commissioning of the new units under construction is also urgently called for. Similarly, with a view to avoiding breakdowns of the plants through overworking, the stress the Minister has placed on their careful operation and maintenance is appropriate. But his plea that all essential raw materials and spare parts for this purpose should be procured in good time needs to be complemented with an immediate issue of foreign exchange necessary for their import from abroad. Along with the appeal the Minister for Power has issued, there is also a case for compulsorily reducing the supply of electricity for display and publicity purposes in at least the industrial belts of the country.

Labour

EMPLOYERS ON THE BONUS COMMISSION

COUNCIL OF Indian Employers, constituted by All-India Organisation of Industrial Employers and Employers' Federation of India, has submitted a memorandum to Bonus Commission last week. While tracing the historical background of the concept of bonus, the Council indicated that the concept has become increasingly clouded by the conflicting views and interpretations put forward by various parties to this controversy. It has sought a clarification on the principles whether bonus was an appropriate method of remuneration and if not what other system could replace it. In presenting their view the Council has indicated that the interests of the industrial community should be kept in mind while the claims of industrial workers are considered. At the same time, they assert that the right of the working class in the non-industrial and agricultural sectors should also be kept in mind. The long-term requirements of industry should be compared with immediate needs of labour and above all arrangements should be evolved to give optimum satisfaction so that the workers earned more with higher efficiency and productivity.

The Council has rightly reminded that there were industries which had to face the market forces abroad because their commodities (jute, tea, etc.) were sold at international prices. More than this, in view of the acute shortage of foreign exchange these industries were increasingly being asked to meet the challenges of the imbalance between our export earnings and import requirements. Under certain circumstances, industry had to bear losses on exports and naturally it was required to strengthen itself by efficiency and minimum costs to increase its competitiveness. Moreover in certain industries the final selling prices fixed by the Tariff Commission and the mode of regulation is such that the prices payable to the manufacturers were generally fixed at a level which did not always leave with the industry concerned sufficient surplus fund after meeting the expenses of operation and administration. Moreover, in several industries wage boards had been set up as in the case of cotton textiles, cement, sugar, jute, tea, coffee, rubber, iron and steel, coal mining industries, for evolving a wage structure based on the principles of fair wages and requirements of social justice.

Under these conditions, it was quite clear that the payment of bonus had to be arranged in each industry according to specific conditions. As the Council has indicated, if an industry having regard to its peculiar set up and for reasons of community wishes had made arrangements for a profit bonus by mutual agreement with the labour, it should not be compelled to fit in the rigid national formula. It added that bonus could best be conceived as a payment in addition to normal wages or salary to the employees for their contribution to the efficiency or prosperity of the undertaking. This concept seems quite reasonable and practical and the Bonus Commission should pay proper attention to the points raised by the Council. It has to be remembered that any fomula evolved for one industry or more should be applicable to all the units in the public as well as the private sectors. This step would eliminate any charge of bias against any party.

FROM THE CAPITAL'S CORRIDORS

STATE OF EMERGENCY PROCLAIMED

AS a sequel to the full-scale invasion launched by Communist China on India's northern frontier, the President, under Article 352 of the Constitution, issued a Proclamation on October 26, 1962, declaring a "State of Emergency" in the country. The President also promulgated on that day the Defence of India Ordinance, 1962. This Ordinance will be presented in the form of a Defence of India Bill soon after Parliament assembles for its emergency session called on November 8.

Under the State of Emergency the Central Government has been empowered to issue directives to State Governments on matters which lie within their executive field. Parliament can now make laws on subjects which lie within tne State field. The President can also issue an Ordinance on subjects which lie within the jurisdiction of the States.

Parliament and State Legislatures can also now pass laws which may abridge Fundamental Rights under Article 19.

The Defence of India Ordinance seeks to provide for special measures "to ensure the public safety and interest, the defence of India and civil defence and for the trial of certain offences."

The Ordinance is divided into six chapters. The "preliminary chapter" states that the Ordinance extends to the whole of India. It also applies to citizens of India outside India, persons in the services of the Government wherever they may be and for the regulation and discipline of the naval, military and air force or any other armed forces of the Union, to members of, and persons attached to, employed with, or following those forces. Persons on ships and aircraft registered in India wherever they may be are also covered by this Ordinance.

While the preliminary chapter dealing with applicability of the Ordinance came into force on October 26, the remaining provisions shall come into effect on dates to be notified. Different dates may be notified for different provisions and different areas.

Under the emergency powers vested by the Ordinance, the Central Government may, by notification in the official Gazette, make such rules as appear to it necessary or expedient "for securing the defence of India and civil defence, the public safety, the maintenance of public order or the efficient conduct of military operations, or for maintaining supplies and services essential to the life of the community."

The chapter on 'civil defence services' authorizes State Governments to constitute a body of persons to be called civil defence service and appoint a controller to command such a body.

As regards emergency powers, the Central Government may make rules or may empower any authority to make orders providing for all or any of the following matters:

1. Ensuring the safety and welfare of the armed forces of the Union, ships and aircraft, and preventing the prosecution of any work likely to prejudice the operations of the armed forces of the Union;

2. Prohibiting anything likely to prejudice the training, discipline or health of the armed forces of the Union;

3. Preventing any attempt to tamper with the loyalty of persons in, or to dissuade (otherwise than with advice given in good faith to the person dissuaded for his benefit or that of any member of his family or any of his dependents) persons from entering the service of the Government;

4. Preventing or prohibiting anything likely to assist the enemy or to prejudice the successful conduct of military operations or civil defence including: (a) communications with the enemy or agents of the enemy; (b) acquisition, possession without lawful authority or excuse and publication of information likely to assist the enemy; (c) contribution to, participation or assistance in, the floating of loans raised by or on behalf of the enemy; (d) advance of money to, or contracts or commercial dealings with the enemy, enemy subjects or persons residing, carrying on business, or being, in enemy territory; and (e) acts, publications or communications prejudicial to civil defence;

5. Preventing the spreading, without lawful authority or excuse, of false reports or the prosecution of any purpose likely to cause disaffection or alarm, or to prejudice India's relations with foreign powers or to prejudice maintenance of peaceful conditions in all areas including the tribal areas, or to promote feelings of ill-will, enmity or hatred between different classes of the people of India;

6. Requiring the publication of news and information;

7. Regulating the conduct of persons in respect of areas the control of which is considered necessary or expedient and the removal of persons from such areas;

8. Requiring any persons or class of persons to comply with any scheme of defence or civil defence;

9. Ensuring the safety of (a) ports, dockyards, lightships and aerodromes; (b) railways, tramways, roads, canals and all other means of transport by land or water; (c) telegraphs, post offices, signalling apparatus and all other means of communication; (d) sources and systems of water supply, works for the supply of water, gas or electricity, and all other works for public purposes; (e) vessels, aircraft, transport vehicles as defined in the Motor Vehicles Act, 1939, and rolling stocks of railways and tramways; (f) warehouses and all other places used or intended to be used for storage purposes; (g) mines, oilfields, factories or industrial or commercial undertakings in particular; (h) laboratories and institutions where scientific research is conducted; (i) all works and structures being part of, or connected with anything earlier mentioned in this clause; and (j) any other place or thing used or intended to be used for the purposes of Government or a local authority, the protection of which is considered necessary or expedient for securing the defence of India and civil defence, the public order, or the efficient conduct of military oprations, or for maintaining supplies and services essential to the life of the community;

10. The demolition, destruction or rendering useless in case of necessity of any building or other premises or any building or other premises or any other property;

11. Prohibiting or regulating traffic, and the use of vessels, buoys, lights and signals, in ports and territorial, tidal and inland waters;

12. The control of lights and sounds;

13. The control of persons entering, travelling in or departing from India;

14. Restricting and regulating the character of foreign vessels;

15. Regulating the structure and equipment of vessels for the purpose of ensuring the safety thereof and of persons therein;

16. Regulating work in dockyards and shipyards in respect of the construction and repairs of vessels;

17. Prohibiting or regulating the sailings of vessels from ports, traffic at aerodromes and the movement of aircraft, and traffic on railways, tramways and roads, and reserving and requiring to be adapted, for the use of the Central Government, all or any accommodation in vessels, aircraft, railways, tramways or road vehicles for the carriage of persons, animals or goods;

18. The impressment of vessels, aircraft, vehicles and animals for transport;

19. Prohibiting or regulating the use of postal, telegraphic or telephonic services, including the taking possession of such services and the delaying, seizing, intercepting interrupting of postal articles or telegraphic or telephonic messages;

20. Regulating the delivery otherwise than by postal or telegraphic service of postal articles and telegrams.

21. The control of trade or industry for the purpose of regulating or increasing the supply of and the obtaining of information with regard to articles or things of any description whatsoever which may be used in connection with the conduct of military operations or civil defence or for maintaining supplies and services essential to the life of the community;

22. The control of agriculture, including the cultivation of agricultural lands and crops to be raised therein, for the purpose of increasing the production and supply of food grains and other essential agricultural products;

23. The provision, storage and maintenance of commodities and things required for the conduct of military operations or for civil defence;

24. The securing of any building, premises or other structures from being readily recognizable in the event of an hostile attack by a foreign power;

25. Ensuring the ownership and control of mines and oilfields by the citizens;

26. Controlling the possession, use or disposal of or dealing in coin, bullion, bank notes, currency notes, securities or foreign exchange;

27. The control of any road or pathway, waterway, ferry or bridge, river, canal or other source of water supply;

28. The requisitioning and acquisition of any moveable property; and the principles on which and the manner in which compensation shall be determined and given in respect of such requisitioning or acquisition;

29. Prohibiting or regulating the possession, use or disposal of (a) explosives, inflammable substances, corrosive and other dangerous substances or articles, arms and ammunitions of war; (b) vessels; (c) wireless telegraphic apparatus; (d) aircraft; and (e) photographic and signalling apparatus and any means of recording information;

30. Prohibition or regulating the bringing into, or taking out of, India and the possession, use or transmission of ciphers and other secret means of communicating information;

31. Prohibiting or regulating the publication of results of research work having a bearing on efforts relating to defence of India or military operations;

32. Preventing the disclosure of official secrets;

33. Prohibiting or regulating meetings, assemblies, fairs and processions;

34. Preventing or controlling any use of uniforms, whether official or otherwise, flags, official decorations like medals, badges and other insignia and anything similar thereto, where such use is calculated to deceive or to prejudice the public safety, the maintenance of public order, the defence of India or civil defence;

35. Ensuring the accuracy of any report or declaration legally required of any person;

36. Preventing the unauthorised change of names;

37. Preventing anything likely to cause misapprehension in respect of the identity of any official person, official document or official property or in respect of the identity of any person, document or property purporting to be, or resembling, an official person, official document or official property;

38. The evacuation of areas and the removal of property or animals therefrom;

39. The billeting of evacuated person or persons authorized to exercise functions under this Ordinance;

40. The entry into, and search of, any place reasonably suspected of being used for any purpose prejudicial to the public safety or interest, to the defence of India or civil defence or to the efficient conduct of military operations, and for the seizure and disposal of anything found there and reasonably suspected of being used for such purpose.

The rules to be made may provide for the arrest and trial of persons contravening any of the regulations of the orders made under them. Any contravention or any attempt to contravene or abetment of contravention of the rules or orders shall be punishable with imprisonment for a term extending to seven years or with fine or with both. Any person contravening any provisions of the rules, with intent to wage war against India or to assist any country committing external aggression against India, shall be punishable with death or imprisonment for life or imprisonment for a term which may extend to ten years and shall also be liable to fine.

The compensation payable for the acquired property shall be (a) the price which the requisitioned property would have fetched in the open market if it had remained in the same condition as it was at the time of requisitioning and been sold on the date of acquisition, or (b) twice the price which requisitioned property would have fetched in the open market if it had been sold on the date, whichever is less. In empowering Government to requisition any immovable property excluding that used by the public for religious worship, the Ordinance provides for the payment of compensation to the concerned persons.

FUNDS FOR NATIONAL DEFENCE

For mobilising financial resources to meet the Chinese invasion, the Union Finance Minister, Mr. Morarji Desai, in a broadcast to the nation on the day "State of Emergency" was proclaimed by the President, announced some of the steps which the Government proposed to take. For pooling of voluntary contributions, he observed, a National Defence Fund had been established. The voluntary contributions to this Fund could both be in cash and in gold or gold ornaments. The Finance Minister laid great stress on contributions in the form of gold or jewellery so that the necessary foreign exchange for procurement of defence requirements and materials could be obtained.

Apart from voluntary contributions to the National Defence Fund, Mr. Desai called for increased savings on the part of the community. To channelise these for meeting the defence needs, the Government, Mr. Desai said, proposed, firstly, to place on tap a new series of National Defence Bonds, secondly, a new issue of small savings certificates to be designated as Defence Deposit Certificates and National Defence Certificates and, thirdly, issue of another series of Prize Bonds. The terms and conditions of all these forms of borrowings are being expeditiously finalised.

The Finance Minister also appealed to the nation to avoid all ostentatious and wasteful expenditure. He called for austerity in every sphere of life so that the inflationary pressures on the economy could be kept within bounds and savings augmented.

TURNING OF ECONOMY TO NATIONAL DEFENCE

In the meantime, under pressure of circumstances, the entire economy of the country has been geared for national defence purposes. Stress has been placed for fuller utilisation of the existing capacity, especially maximisation of the production of goods required for defence purposes.

In regard to production of iron and steel, the Union Minister for Steel, Mr. C. Subramaniam, observed at the meeting of the re-constituted Iron and Steel Advisory Council here last week that while the targets for production of various categories of steel had a meaning in so far as the implementation of the Third Plan was concerned, the present situation required complete reorientation of these targets. Mr. Subramaniam said, "We may be called upon to produce types and categories of steel which are urgently required by the ordnance factories and other factories engaged in producing military equipment. No delay can, therefore, be tolerated in meeting these requirements". The categories of steel required for the manufacture of strategic materials, he added, would become more and more scarce for civilian uses which have to be relegated to a secondary place. But this does not warrant any undue advantage to be taken by some unscrupulous amongst the trade.

To step up pig iron production in the country, which has lagged behind the schedule and targets laid down in the Third Plan due to delay that has occurred in the commissioning of the public sector steel plants, Mr. Subramanian stated that the Government was seriously considering setting up of a blast furnace at Durgapur with a capacity of 2,000 tons a day. This would subsequently be utilised for the expansion of this steelworks during the Fourth Plan period. Some more low-shaft furnaces using local ore and non-metallurgical coal are also thought to be licensed in the near future. Possibilities are also being explored for licensing small units near the integrated steelworks for the manufacture of pig iron using nut coke which cannot be used in the larger furnaces of the steelworks. The Government is also actively considering the setting up of a pig iron unit in Goa.

Earlier during the week, Mr. Subramanian told a Press Conference that attempts were being made to step up forthwith output of Rourkela and Durgapur plants to 90 per cent of their rated capacity. By next year, the production of these two plants is envisaged to be stepped up further to cent per cent of their rated capacity. The rated capacity of the Bhilai Steelworks has been stepped up by 0.2 million tons to 1.2 million tons. Measures are also contemplated to expedite the expansion programme of these three public sector steel plants.

So far as the Bokaro steel plant is concerned, Mr. Subramaniam disclosed that the Government planned to set up this unit with an initial capacity of 1.5 million tons with a provision to expand it to 4 million tons by the end of the Fourth Plan period. The U.S. Team, which is engaged in the study of the economics of this plant, has been asked to prepare its project report taking into consideration the above-mentioned facts.

STEPPING UP PRODUCTION OF OTHER ESSENTIAL MATERIALS

The Government of India has set up two committees to give thought to augmenting the production of some other essential materials and commodities also, required both for the defence and civilian uses. One of these committees has been set up under the chairmanship of Mr. S. Ranganathan, Secretary, Union Ministry of Commerce and Industry. The Committee will deal with the problems relating to supply of foodstuffs, steel, cloth, fuel (including petroleum products), cement and industrial production in general. Mr. S. K. Patil, the Union Food Minister, has assured the country that there are enough stocks of foodgrains with the Government to tide over any emergency. The Ranganathan Committee will, therefore, devote greater attention to suggesting measures to step up and maintain the supplies of the other essential commodities mentioned above. So far as petroleum products are concerned, particular attention is to be paid to augmenting the supplies of such deficit products as kerosene and lubricating oils. The private sector oil companies, whose refineries are based on imported crude, are stated to be confident of their being able to maintain their supplies.

The second committee is headed by the Transport Secretary. Its task will be to mobilise all forms of transport — road transport, railways, inland waterways, coastal and ocean shipping and aviation — for meeting the requirements of the emergency.

A Cabinet Sub-Committee has also been set up, with the Prime Minister at its helm of affairs, to take all steps regarded necessary to prepare the country for facing the Chinese invasion.

A POLICY FOR INDUSTRIAL DEVELOPMENT

Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, has, in a note to the A-ICC underlined the future role of the Industrial Policy, its implications and its working. The note indicates that the governing considerations will be: "(1) an annual rate of increase of the order of 7 per cent in aggregate national income appears to be necessary if the objective of providing a reasonable minimum standard of living to the people within the next 15 years is to be realised. This in turn requires that agriculture and related activities should expand at the rate of about 5 per cent per

annum and manufacturing at around 12 per cent a year. (2) The programme for industrial development should be such that the country will reach, within the next decade or so, a stage where a high rate of growth and of investment can be maintained with minimum reliance on external assistance. (3) This will call for a change in the structure of industries. In particular it will be necessary to seek a rapid expansion in the production of the basic and capital goods...The implementation of the plans so far has been such that the targets for several of these industries have not been achieved while the low priority and less essential industries have frequently fulfilled or exceeded their targets. Hence the importance of giving particular attention to the development of basic and capital goods manufacture in the future. (4) In the process of developing industries, the objective should be to take maximum advantage of the benefits of modern technology; and (5) the industrial expansion should be so regulated that it is not accompanied by excessive concentration of economic power in private hands.

"Given these considerations it follows that for several years to come, a substantial part of annual investment in the economy should be devoted to the building up of capital and intermediate goods industries; and in order that there may be rapid progress towards a socialist society, the major decisions in respect of such investment should rest with the public sector. These are taken as the operative elements in the formulation of policy. Against this background the questions of policy are examined under the following broad headings:

Relative Roles of the Public and Private Sectors: "The division of responsibility for industrial development between the public and private sectors is naturally influenced by the socialist objective of increasing the proportion of means of production under social control. However, in point of fact, the principal argument for the public sector assuming a dominant role in developing basic and heavy industries is that they involve large investments and take considerable time to reach full capacity production. As past experience has shown, the response of the private sector in respect of heavy and basic industries has been neither adequate nor general. Further, even where licences are granted, the implementation of the projects has been tardy, and the production targets for such industries have frequently not been realised.

"While it is certainly necessary to define the sectors which will be exclusively or largely in the public sector, there should be room for a measure of flexibility at the margin. The paramount consideration here should be that phased fulfilment of targets...To some extent Government has allowed the private sector to enter into fields reserved for the public sector with a view to achieving the Third Plan targets. What is equally necessary is that in the fields allotted to the private sector, Government should be ready to enter if the licensees do not take steps to implement their projects according to schedule.

Measures for Effective Implementation of Industrial Programmes in the Public Sector: "For economic and political reasons it is of the utmost importance that the planning and operation of enterprises in the public sector should be done efficiently. This is not just a matter of obtaining a specified rate of return on the capital investment by adjusting the prices at which the products of public enterprises are sold. Basically it is a question of organising the operation of such industries in a manner conducive to economy in the use of scarce resources, avoidance of delay in getting into production, exercise of proper judgment on the size and location of units and careful phasing of projects which are interlinked.

GOVERNMENT OF INDIA

4½ Per Cent Ten-Year Defence Deposit Certificates

(FREE OF INCOME-TAX)

Interest at the rate of 4½ per cent will be payable free of income-tax annually from the date of deposit and will not be taken into account in calculating the total income of the Depositor for the purpose of income-tax.

The maximum amount that may be held in these deposits including the amount invested in 3½ and 4 per cent Ten-Year Treasury Savings Deposits will be—

	Rs.
(a) For an individual	25,000
(b) For an individual jointly with another	50,000
(c) For an association or institution donations to which are exempt from payment of income-tax under Section 88 of the Income-tax Act, 1961 (43 of 1961), and a local authority	1,00,000
(d) For institutions and associations other than Provident Funds and those covered by item (c) above	50,000
(e) For Provident Funds	No limit

Deposits (in multiples of Rs. 50) in cash/cheque or in matured 3½ per cent Treasury Savings Deposit Certificates will be received from 10th November, 1962 until further notice. Such deposits will be refundable at any time after the expiry of one year from the date of deposit at a certain discount.

Applications will be received at the offices of the Reserve Bank of India, Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi, branches of the State Bank of India and its Subsidiary Banks conducting Government treasury business and treasuries and sub-treasuries in India at places where there is no such office or branch of the aforesaid banks.

Deposit Certificates will be accepted for safe custody by Public Debt Offices and interest remitted to holders, if so desired. The Certificates will be transferable by deed and will also be eligible for nomination.

For full particulars please apply to any of these offices, branches or treasuries.

BIRLANAGAR (M.P.)

"One of the main reasons for the delays and difficulties experienced in the public sector industries is that in respect of most of them, the technical details of the project are not worked out sufficiently in advance. This is partly due to the dependence on foreign consultants for preparation of projects reports, works programmes and so forth... It is, therefore, essential to set up specialized planning and design organisations for each of the industries falling within the purview of the public sector. These organisations should be able not only to provide expert opinion and advice on matters referred to them but also be made responsible for detailed planning of the industries... For major industries like steel, machine-making, transport equipment, electrical equipment, chemicals, etc. such organisations of technical experts should be constituted immediately. In respect of other public sector industries, if it is found to be impracticable or unnecessary to establish such organisations within the public sector to do the detailed planning project by project, the policy should be to encourage industrial consulting agencies approved or assisted by Government.

Instruments for Regulating Development in the Private Sector: (i) Licencing Policy: "At present, industrial development in the Private Sector is sought to be regulated through licences issued under the Industries Dvelopment and Regulation Act. Under the existing procedures, however, the issue of a licence does not ensure the execution of the project in time or with adequate technical efficiency. Much of the detailed work on the project is done after the licence is issued, and the licensee has to pass through several stages of further scrutiny and approval before he can start executing the project. This not only causes delays but also results in a piece-meal appraisal instead of a simultaneous and overall assessment of the project in all its aspects. The result has been a lack of correspondence between the licensing of projects and the attainment of production targets in the private industrial sector. While there is no doubt that the licensing system will have to continue, it has to be modified in several respects if it is to be really effective as a regulatory instrument. The need for modification of the licensing system has already been recognised and Government has, in respect of some industries, resorted to the issue of what amount to 'letters of intent' in the first instance. This practice of giving letters of intent, indicating Government's willingness to consider the issue of a regular licence after the details of the project have been scrutinised, should be extended. In respect of the larger and more important project, this information should be furnished in much greater detail than for other, relatively small or low-priority projects. Such details of the project should be submitted within a period to be specified in the letter of intent. The prescribed period will obviously vary with the nature of the project concerned.

"In arriving at a decision, the licencing authority should be assisted on technical matters by the technical organisations in the public sector concerned with the industry under question and/or the Development Wing. When the regular licence is issued, the successive steps to be taken by the licensee and the time-schedule for these should be defined. At the same time, the Government should, on its part assume responsibility for assisting the high-priority projects in obtaining supplies of controlled materials, transport facilities and so forth. Further, when, despite such assistance, there is undue delay in the execution of the ltcensed project, the Government should revoke the licence. The more important of the projects in regard to which such revocation becomes necessary should be taken over by the Government for implementation. It should be possible in most cases to define the steps to be taken within a reasonable period of time, say within six months, of the licence becoming effective.

(ii) **Use of the Price-Mechanism:** "The tightening of the licensing system in the manner indicated above will necessarily mean an increase in the administrative work connected with it... The strain on the licensing authority may be reduced to some extent if, as suggested earlier, the scrutiny of applications for low-priority projects is limited to an assessment of their consistency with the plan targets. In addition Government need not assume responsibility for supply of foreign exchange or scarce materials at regulated prices to these industries, as it would have to in the case of the high-priority industries. Such an arrangement would mean that in the allocation of scarce resources it would not be necessary to issue quota certificates or import licences to all users irrespective of their relative importance to the development programme... In fact even now, quotas which are allotted to the entrepreneurs are frequently sold to other users in more profitable but less important industries, through the black market. Allowing entrepreneurs and other users to buy residual supplies in something like a free market, would amount to nothing more than recognising transactions which now take place in a covert manner. The partial use of a free market as suggested above will however require the strengthening of direct allocations for priority uses with tax measures applicable to others in a manner which keeps under check the relative profitability of investment in the low priority industries.

"For instance, the profit margin of established importers, whose licences are of the order of over Rs. 50 crores in recent years, is known in several cases to exceed 100 per cent. There is no reason for allowing such profits to be made by private traders and it should be possible to divert the major part of these profits, if not all of them, to the public sector. This could be done either by the Government itself taking over the import of these commodities and auctioning the supplies to the actual users; or, if this is felt to be administratively difficult, by auctioning the licences themselves... As in the case of commodities covered by established importers' licences, the profits made in the black market on such commodities as steel and cement could also be diverted partially or wholly to the public sector through a combination of free market allocation of residual supplies and fiscal policy.

(4) **Concentration of Economic Power:** "It has often been argued that in the past the licencing system has to some extent encouraged concentration of economic power in the hands of a few large business houses, and that this should be remedied by enlarging the number of licences issued to the smaller entrepreneurs in the expanding industries. In this context, one needs to distinguish between technical concentration within an industry and concentration of economic power. In several industries the present size of the Indian market or the target set in the Plan permits of only a limited number of plants of economic size. In these cases it would be unwise to set up plants of a smaller size... The main thing here is that the need to confine licences to units of an economic size should not result in their being issued to large business houses, on the ground that entrepreneurial ability is scarce and concentrated in the established business houses. It should be possible to reconcile these conflicting interests since there are only a small number of business houses which may be considered as excessively large in the Indian context, and the problem is essentially one of preventing their further expansion.

"In actual practice, however, the identification of "excessively large" controlling groups will present difficult problems and a measure of arbitrariness in setting out the criteria for such differentiation will be inevitable."

MANUFACTURE OF HEAVY ELETRICAL GOODS

The Government of India, it is understood, holds the view that the planned capacity for manufacturing heavy electrical goods is adequate to meet the country's demand by the end of the current Plan period and that, therefore, there is no room for licensing further units in the private sector unless such units had export potential. The case of the latter units, it is further learnt, can be considered on merits. This decision presumably follows consideration of an application from Birla Brothers which envisaged setting up of a heavy electricals plant in collaboration with Westinghouse.

INDO - BELGIAN COLLABORATION

Increasing collaboration between India and Belgium in the industrial and economic fields was envisaged during the discussions which the Belgian Minister for Foreign Trade and Technical Assistance, Mr. Maurice Brasseur, had with Mr. K. C. Reddy, Union Minister of Commerce and Industry, Mr. Nityanand Kanungo, Minister of Industry, and Mr. Manubhai Shah, Minister of International Trade, soon after his arrival in New Delhi last week.

Mr. Reddy told the Belgian Minister that Government of India would welcome joint ventures between the two countries. Mr. Brasseur said that the Belgian Government would give all assistance to companies who came forward to enter into collaboration with Indian interests.

The Belgian Minister also called on Mr. C. Subramaniam, Minister of Steel and Heavy Industries in the Union Government.

MARITIME FREIGHT COMMISSION

The Government of India has set up a 3-man Maritime Freight Commission with Mr. U. N. Sukthankar as President, and Mr. D. S. Joshi, Special Secretary, Ministry of Commerce and Industry, and Dr. Nagendra Singh, Additional Secretary, Ministry of Transport and Communications and Director-General of Shipping, as members. The Commission will advise the Government on all matters of shipping freight whether international or coastal.

Foreign shipping concerns which are members of Conference still carry a large portion of Indian cargo. They work according to sheduled freight rates, but when these are increased, Indian interests, particularly exports, are affected adversely. A Freight Investigation Bureau was, therefore, constituted to enlighten the Government on what the freight structure ought to be and also to negotiate with foreign shipping companies for reduction in freight rates where these hamper our exports or are discriminatory. The recent agreement with the India-UK Conferences provides for discussion with Indian shippers and, then, with the Government in all cases where enhancement of rates is proposed by foreign shipping companies. A high-power Commission has, therefore, been set up to advise the Government about the justification of any proposed increase. The Freight Investigation Bureau at Bombay will form the Secretariat of the Commission. Mr. Sukthankar's appointment is honorary.

ZINC SMELTING

Poland has shown an interest in extending collaboration for zinc smelting in India. If the terms of collaboration are approved by the Indian Government, part of the Polish credit made available for the Third Plan period may be used for this purpose.

Subscription may however be closed earlier without notice if the total subscription is reached.

Copies of loan prospectus and application forms are available at all the Offices of the State Bank of India mentioned above and at the Office of the State Electricity Board, New Capital, Bhubaneswar.

NEWS IN BRIEF

INDIAN

The Rajasthan State will have five new industrial training institutes in addition to the six already functioning there. Free training, workshop clothing and medical aid will be provided to the candidates during the two-year training period.

•

A delegation of the Tea Association of India left the country on October 19 for a tour of the Pacific countries including Australia and New Zealand, to study the possibilities of increasing trade with them.

•

The Government of India has reconstituted the Advisory Committee for the Air-India International and the Indian Airlines Corporation.

•

The Central Warehousing Corporation has decided to establish a central warehouse at Ranibennur, Mysore State.

•

Mr. P. C. Bhattacharya, Governor of the Reserve Bank, declared open on October 19, the Madras branch of the Clarion Advertising Services Private Ltd.

•

The Government of India has decided to enhance the rates of dearness allowance in respect of Armed Forces personnel below officer rank with effect from November 1, 1961.

•

The Government of India has entered into agreement with M.A.N. Ausburg of West Germany for the manufacture of marine diesel engines in India during the current Plan period.

•

The United Nations Special Fund has agreed to contribute $744,000 for the establishment of a Central institute in Rajasthan for improvement of sheep and wool production.

•

Two French banks have granted a credit of £3,500,000 to the Industrial Finance Corporation of India to finance the import of French industrial equipment by India.

•

The Heavy Electricals, Bhopal, has received order for 120 sets of electrical equipment for 2,600 H.P. Diesel locomotives and 315 mw water turbine generator sets from the Punjab Government.

•

The Export Agency Division of the Indian Sugar Mills Association signed a contract with an international trade house for the export of 2 lakh tonnes of raw sugar during the first half of 1963.

•

Dr. Sushila Nayyar, Union Health Minister, has announced that the Government intends to establish 18 new medical colleges in the country during the current Plan period.

•

The Union Government has approved the Indian Oil Company's plans to set up two lubrication oil blending plants in Calcutta and Bombay with an annual capacity of 10,000 tons each, in collaboration with the Mobil Oil Company of America.

•

British gifts of laboratory equipment worth £5,000 being made available under the Colombo Plan to Central Building Research Institute, Roorkee, and Central Drug Research Laboratory, Lucknow.

•

A team of mining experts from Poland is at present in West Bengal to conduct a preliminary survey of coal deposits in the Raneegunje and Asansol areas.

FOREIGN

An Asian Seminar on Urban Community Development is scheduled to be held at Singapore this December under the aegis of the ECAFE and other United Nations agencies.

•

A spokesman of the UAR Government has announced a reduction in the press cable rates as a gesture of goodwill to the press.

•

The American Transworld Airlines recently flew the first transatlantic flight using a fully automated Doppler Radar system of navigation. The system requires no ground radio aids; radar signals from the plane are reflected from the earth's surface back to the plane's computer circuits connected by instruments on the radar panel.

•

Alitalia, the Italian Airlines inaugurated a daily flight from Rome to Genoa on the occasion of the opening of the new airport "Christopher Columbus" at Genoa on October 13.

•

Soviet engineers are designing a hydro-electric power station in Northern Sumatra (Indonesia) which when completed, will have an overall capacity of 280,000 Kilowatts, and will meet the needs of an industrial complex to be built in this area. The first section of the power station and the industrial complex are expected to be commissioned in 1967.

•

A Swiss watch manufacturer has produced the "BIVOUAC" which, in addition to the apparatus to indicate time, contains a barometer and an altimeter. The "BIVOUAC" would be specially useful for mountaineers and parachutists.

•

A candle factory with an annual production capacity of 1,000 tons has been set up in Lagos, Nigeria, through the initiative of the Indian Chellaram Company along with German, Swiss and African interests.

•

An agreement signed in Moscow on October 20 by the Soviet Union and the Sudan provides for a direct air link between Moscow and Khartoum.

•

The French Government has decided to raise the guaranteed minimum wage throughout the country and increase family allowances with effect from November 1.

•

The United States will play host to the World Food Congress of the FAO to be held in Washington in June, 1963.

•

The UAR and Hungary signed on October 19, at Budapest, a 3-year trade agreement providing for a 15 per cent increase in mutual trade.

•

Seventy-five postal administrations have agreed to issue "Freedom-from-Hunger" stamps on March 21, 1963, to support the FAO's efforts in this direction.

•

Eleven Congolese radio operators have graduated from the Leopoldville Civil Aviation School established by the United Nations Operations in Congo.

•

A group of leading French banks has opened a $37,600,000 credit for the Mexican State-owned oil company "Petroleos Mexicanos" to finance the latter's expansion projects.

COMPANY AFFAIRS

DELHI CLOTH MILLS

The audited accounts of the Delhi Cloth and General Mills Company Ltd. for the year to June 30, 1962 show an operational turnover at Rs. 38.52 crores which is more than last year's figure of Rs. 35.89 crores. It may however be noticed that profit earned is slightly lower at Rs. 4.28 crores against Rs. 4.35 crores a year before. The depreciation provided is higher than the previous year and the same is about tax provision. There is a net profit of Rs. 1.34 crores after all these provisions as also a provision for development rebate reserve. The directors have recommended the payment of dividend at the rate of 13 per cent on ordinary shares which is the same as last year's appropriation. A sum of Rs. 40 lakhs is separated towards development reserve and another Rs. 40 lakhs towards reserve for fall in prices.

The annual report indicates that in spite of difficulties in procurement of coal, cotton, etc., increase in cost of materials and higher wage bills, the textile units in India have shown encouraging results. The DCM has been able to maintain its position in the matter of exports notwithstanding adverse conditions in foreing market. The working of the silk, chemical division including vanaspati and sugar and distilled factories of the Company have continued satisfactorily. The Company has set up the nucleus to a chemical plant manufacturing section which is undertaking fabrication and supply of equipment against outside orders. Two sulphuric acid plants each of 50 ton capacity have been designed, fabricated and delivered against such orders. One of these units has started operations and the reports of its working have been quite satisfactory.

The Company is undertaking a concrete programme for renovation and modernisation in its textile units. The Company has been granted an industrial licence for putting up another spinning unit at Hissar with a capacity of 23,000 spindles. Machinery has already been ordered and the unit is likely to start early next year. The PVC project at Kota is progressing and the bulk of machinery on order has already arrived at site and the caustic soda plant is expected to go into production shortly.

The Company during the year also has finalised the orders for foreign machinery and equipment for rayon tyre cord project. The preliminary erection has already been taken in hand. The Company obtained a loan of $9.8 million from the United States Agency for International Development for meeting foreign exchange requirements of the rayon tyre cord project. The Company raised money by floating debentures of the value of Rs. 2.50 crores. The new ordinary shares have also been offered to the shareholders.

CALICO

The working results of the Ahmedabad Manufacturing and Calico Printing Company Ltd. revealed that during the year ended March 31, 1962, rapid modernisation and expansion and diversification of the Company's activities continued to be the most notable features. During the last five years the capital assets of over Rs. 6 crores were added to the block. The Company has been increasingly ploughing back its profits. During the year the directors' report indicates that the cost of production continued to rise, wages increased and the prices of stores, chemicals and dyes were higher. The Indian cotton crop was badly affected. With all this the prices of cloth were pegged to previous level. Against this comparatively darker side the Company made vigorous efforts to promote cloth exports. The Company was granted a licence to instal 25,000 additional spindles under the export promotion scheme.

The directors have reported that the polyvinyl chloride plant was put into commission in July 1961 and the quality of rasins and compounds has been proved to be of high levels. The caustic soda expansion scheme is also progressing satisfactorily. Against this expansion the issuing of debentures aggregating to Rs. 2 crores can be justified.

Out of the profit of Rs. 72.54 lakhs after providing for taxation depreciation etc. the directors have recommended the payment of dividend for the year at the rate of Rs. 9.50 per share subject to tax and Rs. 8.50 out of profits exempt from tax, making a total of final dividend of Rs. 18 per ordinary share in respect of 1.65 lakh ordinary shares. Interim dividend at Rs. 14 per ordinary share was declared by the Board and since paid.

NEW ISSUES

The Mysore Iron and Steel Limited and four other companies have been authorised by the Controller of Capital Issues to raise capital totalling Rs. 5.48 crores. Of these, Mysore Iron and Steel is issuing equity capital of Rs. 4 crores. Two companies are issuing equity plus preference shares. One issue is on rights basis. The consent for all these is valid for 12 months.

The Mysore Iron and Steel Limited, Bhadravati, is issuing equity capital of Rs. 4 crores in shares of Rs. 100 each for other than cash to the Mysore State Government in consideration of part payment for the transfer of the assets of the Mysore Iron and Steel Works Bhadravati, as a going concern to the company.

Gayday Iron and Steel Company Limited, Calcutta, will issue capital of Rs. 75 lakhs divided into 6 lakhs equity shares of Rs. 10 each and 15,000 cumulative redeemable preference shares of Rs. 100 each in supersession of an earlier consent for Rs. 53 lakhs.

The Davangere Cotton Mills Limited, Davangere, will raise capital of Rs. 33 lakhs divided into 15,000 equity shares of Rs. 100 each for cash at a premium of Rs. 25 per share and 18,000 9.5 per cent. (subject to tax) preference shares of Rs. 100 each for cash at par on rights basis. The proceeds will be utilised for the manufacture of cotton and staple fibre yarn and cloth.

Tan-India Wattle Extracts Company Limited, Madras, is to issue capital of Rs. 20 lakhs in the form of equity shares of Rs. 100 each for cash at par. The proceeds of the issue will be utilised for the manufacture of vegetable tanning extract known as wattle extract.

G. T. N. Textiles Limited, Kerala, is issuing equity capital of Rs. 20 lakhs for cash at par. The proceeds of the issue will be utilised for establishing a cotton textile mill in Kerala.

NOVEMBER 9, 1962.

For Positive Action

AS the nation's top policy-making organization, the National Development Council must have very likely devoted a good part of its deliberations at this week's meeting to evolving programmes of positive action to mobilise resources for defence. The declaration which it issued at the conclusion of the session gives precious little, but it is only reasonable to presume that the NDC covered a much wider ground. Its members had more than a week's time at their disposal, since the state of emergency was declared, to give constructive thought to the tasks that will now arise. If so, the wisdom of issuing a laconic communique must be questioned. The public quite justifiably expected the NDC to give it a lead, but the latter has done less than justice in not taking it more into its confidence.

If the communique was brief, it was not for that reason altogether vague. The demand for maximising the nation's defence potential did not by any stretch of reasoning signify a call for a halt to the major part of the activities of civilian life, much less did it indicate a freezing of the main projects of development in the Third Five-Year Plan. But there could be no doubt that every single phase of national life will have to be given a defensive orientation—whether it is production, distribution, mobilization of financial resources, formation of emergency organizations or training of youth.

All this underscores the fact that the tempo of the resurging sense of unity and solidarity ought to be consolidated and fortified. The communique took care to stress these objectives. They have a legitimate place in the initial declaration issued by the NDC after its first session since the emergency. But a repetitive resort to patriotic exhortations and appeals stands the risk of degenerating into high-sounding platitudes likely to cause erosion of the enthusiasm and determination of the public to offer resistance to the aggressor. The stage has been reached when the public must be given guidance in precise and concrete terms how its newly generated energies will be harnessed.

The NDC was undoubtedly right in repelling the thesis that the Third Plan will have to be axed ruthlessly to spare resources for the war effort. It is not a total war in which the nation has been engulfed. The redirection of resources would imply a positive and pronounced change in emphasis, but it need not be assumed that it will hamper the pursuit of the Plan in its basic components. The economy geared, in the first instance, to the war effort will generate a new tempo of development, but not all of it need encroach on the Plan programmes. The extent of the diversion of financial resources, as the NDC has measured it at the moment, should serve to temper any tendency towards entertaining alarmist estimates.

For the next financial year, 1963-64, Central assistance for the State plans will be reduced by Rs. 50 crores out of the projected Rs. 450 crores. Social services and welfare programmes generally attract priority postponement in any scheme of a downward revision of financial allocations. It is quite easy to appreciate why housing programmes will be severely hit. Besides economy in expenditure, conservation of construction materials for the requirements of the armed forces is a very powerful reason for their drastic curtailment. Medical and health services will be modified on a selective basis and outlay on education will be stabilised except for the training of technicians.

But these reverse modifications in the State plans will be counter-balanced in a considerable degree by the positive accent on specified programmes of expansion. Agricultural production will be stepped up by intensive techniques, schemes of small irrigation receiving a calculated boost. Power generation, road construction, road transport and small industries will be under pressure of a higher tempo of development. In the face of the national danger, State autonomy loses much of its justification and force. It was not a surprise, therefore, to find the Chief Ministers agreeing readily to the proposal that public loans will be floated by the Centre alone and the allocation of their shares will be subject to the criterion of defence needs. Inevitably, the State budgets will have to be fitted into a somewhat common pattern with the Central budget.

Inflation is a camp-follower of war. The diversion of the part of the production capacity of the economy to unproductive channels, technically so called, and the creation of employment as well as purchasing power are forces which combine to exert pressures on prices. The NDC has not so far done anything to demonstrate by what concrete measures it proposes to put a curb on price inflation. Its faith in the efficacy of co-operatives is least calculated to inspire confidence. Co-operation is a plant of slow growth and in India its qualitative growth has been stunted over more than five decades of official patronage. It is ill-suited as a weapon for the short period. Government ought to face boldly the obligation to set up a far-flung network of fair price shops to put off the eventuality of physical controls.

It will be some time before a clear and precise picture of the changes that will be needed in industry during the war can be obtained. The full nature of war requirements can be assessed after a time, but this will be a continuing process. Changes in output, adaptation of plant and equipment to the production of the types of goods required for defence, modifications in installed capacity and similar problems will demand careful investigation. Since bulk of this production is to proceed from private plants, joint consultations between the Government and managements of the plants involved will be imperative.

Gold Bonds

THERE could hardly be a more critical juncture or a nobler cause than the present one for calling for the mobilisation of the unproductive gold hoards with the public. To fight the unscrupulous Chinese aggression on our northern border we need arms. To the extent the friendly countries have come to our succour in this grave peril, the immediate requirements of foreign exchange for purchase of arms have been vastly reduced. But to gear the economy to the war effort also requires precious foreign exchange. There is, thus, the imperative need of disgorging the gold hoards.

The scheme of the Gold Bonds announced by the Finance Minister is indeed attractive and generous if its full implications are clearly grasped

Unfortunately, the debacle in the bullion markets has created the impression that it calls for heavy sacrifices from the possessors of gold. The recent sharp set-back in gold prices had its genesis elsewhere, probably in the fears that Mr. Morarji Desai had as yet fired only the first shot from his armoury; he might soon come out with stringent measures to regulate purchase and sale of gold in the open market. Whatever be the case, the spiralling of gold prices in the country out of all proportion to the international price had been quite legitimately a cause of serious concern to the Government, for it encouraged the nefarious smuggling activity which inflicted a heavy, if invisible, strain on our foreign exchange resources and weakened the rupee.

A rough estimate on the basis of the terms offered for subscriptions to the Gold Bonds reveals that the subscribers will not incur any loss over the long run. The Gold Bonds carry 6½ per cent interest, subject to tax, payable every six months for 15 years, on an issued price of Rs. 53.58 per 10 grammes of .995 fineness. The subscriptions are to be immune to wealth tax and the levy on capital gains which may accrue from the sale of these Bonds. Since this interest is 2 per cent higher than that on comparable Government loans, the Gold Bonds, negotiable and quotable on the stock exchanges as they are, should immediately command a premium of about 45 per cent over their face value; their market price should be between Rs. 75 and Rs. 80. This provides an incentive for those who have invested their ill-gotten money in gold hoards, to turn a good deal of their black holdings into white which can be openly utilised for productive investment. The promise that the Finance Minister has held out that no subscriber to Gold Bonds would be asked to disclose the source of acquisition should be enough to allay the fears of everyone that disgorging of gold hoards will invite the heavy hand of the income-tax authorities. This newly converted white money, no doubt, involves a loss of about 25 per cent at the present ruling price of gold. But this loss can very easily be made up by investing it into productive channels in a period not more than three to four years.

Those whose life savings have been invested in gold ornaments due to the age-old custom in this country also do not stand to lose much by subscribing to these Bonds. They may consider their initial loss as a voluntary contribution to the national defence effort. The sale price of the Bonds, if invested by them in National Defence Certificates, will yield on maturity after 12 years approximately Rs. 132, tax free. Even if this legitimate manoeuvre is not resorted to, the loss to the subscribers should not be beyond what they would have expected as appreciation in the value of gold during the next fifteen years. At the compound rate of half-yearly interest of 3¼ per cent, the face value of the Gold Bonds gives a yield of Rs. 70 (less tax which in the case of lower income groups should only be small) in 15 years. How much appreciation in the gold price from the present one of about Rs. 100 per 10 grammes can be is anybody's guess. *The Eastern Economist*, feels that with the Government endeavouring to bring down gold prices and with the changes that can be expected to come about in the habits of the people, if for no other reason than on account of the mounting pressure of the cost of living, unproductive hoarding of gold can be expected to decrease materially. Growth in literacy, especially among the fair sex, can also be expected to lead to a reduction in the demand for gold.

Whatever may be the subscriptions to the Gold Bonds inside the country—it is hazardous to make any estimate in this regard, firstly, because no authentic figures are available of the gold reserves in this country and, secondly, it would be presumptuous to assume that during the three-month period in which the Bonds will be on tap, people, particularly in the country-side, will shed their age-old habit, howsoever the patriotic impulse has inspired them at the moment—it may be worthwhile to explore the possibilities of inviting subscriptions from Indian nationals abroad, especially from the entrepot trade centres, like Hong Kong, Singapore and Aden, and some other countries which have expressed their sympathy and moral support for our present cause. There may be difficulties in the shipment of gold subscriptions from these countries to India, but they may possibly be obviated by arranging with the Governments concerned the sale of gold there itself and remittance of foreign exchange. This is, of course, within the limits of the elbow room permissible under the exchange controls in these countries. If any country, however, shows the generous gesture to relax them, it would certainly be most welcome and opportune. Feelers can be sent out fruitfully in this regard. In the advanced countries where purchase of gold for uses other than industrial is generally prohibited by law, the response from Indian nationals there cannot be substantial. But in some other countries where customs do not vary from ours, the Indian community should be in a position to invest in these Bonds. It is worthwhile considering how the cumbersome procedure prescribed for the repatriation of Indian capital abroad should be modified to suit the present emergency. To enhance the appeal and marketability of the Gold Bonds, the Finance Minister might as well consider a provision being inserted in their terms and conditions for the automatic revaluation of their face value in the event of any upward revision in the international price of gold.

Parliament Meets

THE Lok Sabha which started its session yesterday, a week ahead of the original schedule, is meeting under the cloud of the emergency created by the Chinese invasion. The current session of the Lower House is undoubtedly unique in character, but it need not be considered singularly crucial. In his forthright and vigorous speech moving the two resolutions on the proclamation of the state of emergency and the nation's resolve to fight aggression, the Prime Minister minced no words and with all the emphasis at his command he impressed upon the House to take the fullest note of the fact that China had now set on the path of imperialist expansion. As he repeatedly pointed out the Chinese frontier is mobile. It was in the fitness of things that Mr. Nehru reminded the House to be prepared for all eventualities. It is for this reason that the duration of hostilities is unpredictable and there might be many occasions for the future sessions of Parliament to deal with matters of more crucial importance than now.

The dramatic manner in which the controversy over the removal of Mr. Krishna Menon from the Cabinet, which was carried in its last stage inside the Congress Parliamentary Party, culminated on the eve of the Lok Sabha session and saved it from considerable dissipation of time

and energy. Even a most balanced and liberal evaluation of the Defence Ministry's alertness (or the lack of it) in the matter of making defensive preparations in the NEFA area would show that the neglect in this behalf cannot be condoned, when plain inferences could have been drawn from China's prolonged and mass-scale preparations for the construction of roads and deployment of as many as eleven divisions on the Tibetan side of the eastern sector were under way.

Even normally, a Prime Minister has to reckon with the fact that he has to be instrumental for the rolling of ministerial heads, if only to placate public opinion. In this particular case, the head that rolled on Wednesday evening was long overdue for this fate. Mr. Nehru's sense of loyalty to his colleagues was overdone in this case and certainly it was far from prudent to subordinate the national interest to personal preferences. Public opinion asserted itself eventually.

Now that Mr. Krishna Menon has completely gone out of the Cabinet the atmosphere has been cleared for the restoration of full and unqualified confidence in the ability of the Defence Ministry to take up the challenge of the invasion and this confidence is quite fundamental to the sustenance of public morale. The Defence Ministry will need extensive overhaul of its techniques to clear the mess. The assumption of the defence portfolio by the Prime Minister in person accords with the public will. But it cannot be overlooked that the burden which the Prime Minister now carries would be too heavy for him to bear long in the critical period ahead. Sooner rather than later, he should make the choice of a dynamic personality to shoulder this strategic charge. The creation of a separate Ministry of Supply is another imperative.

The new atmosphere of emergency ordains that there should be a transformation in the role of the Opposition. This is not to argue that the Opposition should impose upon itself a self-denying ordinance in the matter of criticism of the Government's policies and actions. But this function should be strictly confined to matters other than those of defence. It is of the greatest importance that delicate issues connected with defence should be handled with the utmost care and caution on the floor of the House. Restraint and moderation will be more effective than superlatives where criticism is essential. But normally, so long as the hostilities last, on all important matters of defence Parliament ought to act as an undivided House speaking with one voice. Vital differences, if any, had best be reserved for personal discussion with the Prime Minister and the Defence Minister.

Sliding Share Values

THERE was a sizable landslide in share values last Monday necessitating drastic action of a degree that recalled to memory the debacle following the presentation of the Central budget of the Interim Government by Mr. Liaquat Ali Khan in 1947 as also the earlier crisis consequent on the Japanese entry in World War II in 1942. On the Bombay Stock Exchange, for example, hardly had trading been in progress for forty minutes on that day, when the stampede to sell assumed such proportions that the Stock Exchange authorities were obliged to intervene, declare an emergency and suspend trading till today. More or less similar conditions prevailed in Ahmedabad and forced the stock exchange authorities there also to suspend trading till mid-week. On the other stock exchanges too, minimum prices have had to be fixed.

The immediate provocation for such panicky conditions on the stock markets was obviously the decision of the National Development Council, reinforced by the Union Finance Minister's subsequent broadcast talk, that the country should be prepared for still more taxes and sacrifices. Coming as these indications did on top of the recent measures to tighten bank credit, they were almost the last straw on the camel's back. But the last straw really was the selling on the Bombay Stock Exchange by operators from other centres where minimum prices had already been fixed.

The fall in share values did not begin on Monday, but started much earlier. Commencing with the Wall Street collapse in May last, the downward movement steadily gathered strength and received a momentum towards the end of October, when the Chinese incursion into Indian territory began in a big way. In this context, and with no constructive factors to boost the morale of the market, coupled with the known gradually worsening technical positian against bulls, a collapse of this kind in share values was perhaps inevitable. Evidently the ad hoc and restrictive measures adopted by the stock exchange authorities to meet the worsening situation have proved hardly effective. For some inscrutable reason, the Bombay Stock Exchange has been lagging behind in fixing minimum prices. Even now, it has only fixed the making-up prices for the clearing on November 17. There is a more or less general feeling, therefore, that the stock exchange authorities have not risen to the occasion and investors have been demanding a thorough disclosure of what effective measures they have taken in the matter. In the meanwhile, equity values have heavily eroded, the fall in the leading scrips ranging from around ten to fifteen per cent since the declaration of emergency. The fact that, even at these admittedly attractive levels, there is a conspicuous absence of buyers clearly reflects the crisis of confidence that has descended on the stock markets.

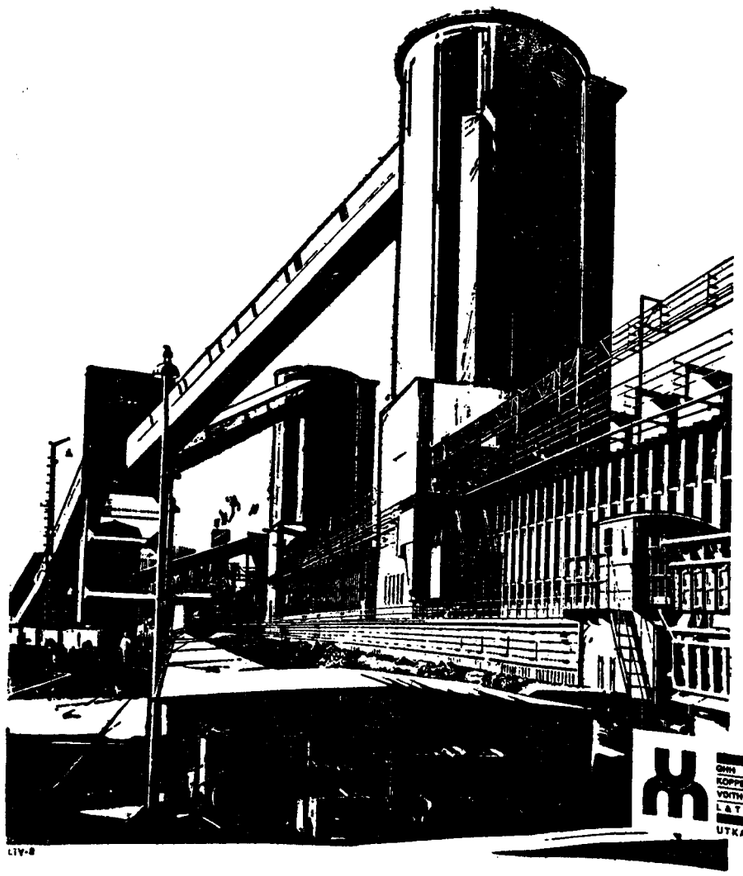
Perhaps, so long as the emergency lasts and so long as appropriate economic policies are not followed by the Government the present stalemate in the stock markets must perforce persist, in a manner, some times pronounced and some times not so pronounced. The authorities could certainly come to the assistance of the markets by a well-defined and co-ordinated investment policy through their main financial institutions such as the Life Insurance Corporation. The Life Insurance Corporation has no doubt been coming to the rescue of the stock markets, off and on, but, for some reason or other, its approach has not always evoked the unqualified approval of those competent to express an opinion on the subject. At least in this limited sphere, if not in the wider sphere on high level economic policy, where ideological considerations intervene, it is to be hoped, the authorities would take prompt action so as to revive the morale of the markets.

After all the fact remains that the stock markets reflect the investor's confidence which is essential for the health of the corporate sector. But confidence is a sensitive phenomenon, highly susceptible to external factors. The health of the economy, however, is basically sound and with some overdue technical correction of the boom in share values in the past several months the stock markets should be able to revert to stability.

KOPPERS FIRST IN FUEL TECHNOLOGY

In more than 60 years of successful work in the field of fuel refining Koppers have attained world renown.

Heinrich Koppers are recognized as top-ranking experts in the coking industry. They established the technical basis of modern coke ovens by introducing the system of single or cross regenerators.



Koppers originated many improvements in the recovery and processing of by-products. Outstanding among these is the semi-direct process of 1904 for recovering ammonium sulphate. It was according to this that 90 per cent of all German coking plants were operated at one time. For the economical recovery and processing of tar, benzole and sulphur, Koppers have opened up new roads of technology. Their new processes have been hailed as pioneering achievements.

With the continuously operated vertical chamber oven, Koppers introduced a versatile oven system particularly for the low temperature carbonisation of coal.

Koppers were the first to gasify coal dust with oxygen and steam to produce synthesis gas and to develop a universal gasification process for solid and liquid fuels of all kinds. Synthesis gas plants operating by this system have been constructed for nitrogen plants in Belgium, Finland, France, Greece, Japan, Portugal and Spain.

Other development work by Koppers promoted the design and construction of plants for the chemical industry, the planning of oil refineries, plants for water preparation and sewage purification, the construction of industrial furnaces and the automation of production procedures for mechanical operations and chemical processes of all types.

At Kansbahal, Orissa, three leading German firms—Gutehoffnungshuette Sterkrade AG., J.M. Voith G.m.b.H. and Heinrich Koppers G.m.b.H. — and a reputed Indian company, Larsen & Toubro Limited, have pooled their vast resources and experience to set up UTMAL, a major undertaking for manufacturing heavy machinery. UTMAL will play a significant role in the rapid industrialisation of our country, by supplying a wide range of industrial machinery.

THE WEEK'S NOTES

C.P.I.

CONVICTION OR EXPEDIENCY ?

THE NATIONAL COUNCIL of the Communist Party of India took several tortuous weeks to reconcile itself with recognizing the fact that China had committed an act of aggression against India by invading her territory south of the McMahon Line. It is significant to remember that it is silent on the Chinese aggression in Ladakh. The resolution adopted by the National Council at its meeting of October 31 is unequivocal in its expression. It brands China as an aggressor, recalls the fact that China broke her pledge which she had observed for the past three years not to violate the McMahon Line and it has called for full support to the Government in the national defence against this aggression. To this extent the resolution deserves to be welcomed. Superficially, this change in the policy of the CPI has a semblance of transformation in its basic attitude. But, in reality, is it so? One has only to analyse the trends in the voting on the resolution after a prolonged debate and a heated controversy over the draft of the resolution.

The precise voting is a closely-guarded secret, known only to the members of the National Council, but reliable reports which have leaked out confirm the fact that 23, if not more, of the 110 members voted against the resolution, while as many as 17 abstained from voting. The positive vote was thus about 70. Some reports place it at 60. Those who voted against represent the hard-boiled pro-Chinese core of the Party, drawn particularly from West Bengal and Andhra and to some extent from Punjab and a few other areas. It is significant, if the report is correct, that Mr. E. M. S. Namboodiripad, the Party's General Secretary, was among those who abstained from voting. This alignment in the voting not only proves lack of unanimity in the Party on a momentous issue of national importance but betrays the existence of a fanatic section which believes in Chinese aggressive tactics as no more than a tactical and innocent method of India's liberation or rather the liberation of the working class and the peasants. But the irony of fate for the CPI is that the workers and peasants whom it poses to represent consider this liberation as naked enslavement.

It would be absurd to slip into the belief that this change on the part of the CPI has come about as a result of conviction. All evidence tends to show that it is based on expediency. The earlier resolution adopted by the National Council and released after a good deal of hesitation and delay on October 17 is full of equivocation and a non-committal attitude. It even tended towards the acceptance of the Chinese version and threw doubts on the Government of India's version about aggression. What really has happened within the intervening brief period that the CPI should make a radical change in its attitude? This Party, which has all along looked for inspiration for a line either from Moscow or Peking, may make the discovery that in waging the defensive effort India is really falling into the trap of 'American imperialism'. It is vital to note that the rabid pro-Chinese leaders whose expulsion from the Party was demanded still stay inside the organisation. Has the CPI qualified itself for acceptance as a wholehearted collaborator — above suspicion — in the defensive war against China?

National Integration

EMERGENCY AS A SOLVENT

THE COMMITTEE on National Integration and Communalism, appointed under the Chairmanship of Mr. Asoka Mehta by the National Integration Council, decided at its fifth meeting held in the capital city on November 2 to adjourn all its further deliberations. In coming to this decision the Committee has recorded its considered view that "history will yet show that the evidence we collected is no longer needed to shape policies, but only to enrich the archives". It is common knowledge that during its extensive tours and the exhaustive labour it undertook, the Committee gathered a mass of evidence from leaders of thought and organizations at different levels. How is it that all this evidence would now go to adorn the archieves? The unexpected that has occurred is the result of the rude shock which the people received from the brutal Chinese invasion of India. Overnight, the emergency brought a sense of a grave danger which could be countered only by complete unity and unbreakable solidarity on the part of the people. All parochial differences or loyalties, based on communalism, casteism, linguism or regionalism, were banished and the Chinese challenge was taken up with a massive and spectacular demonstration that the Indian people are one and that they can be united in the hour of crisis, whatever the prophecies of critics at home and abroad. The integration that is now being witnessed throughout the length and breadth of the country is certainly as unique as it would have appeared incredible only a fortnight ago. The DMK with its unyielding goal of the creation of Dravidisthan, based on complete secession from the rest of India, has responded to the patriotic call of national unity for defence. The forces of integration have been fortified from yet altogether unexpected quarter. The hostile Nagas have proclaimed their opposition to the Chinese violation of the northern border.

It is not the Committee on National Integration and Communalism alone which feels convinced that the new psychology of national integration and unity created by the crisis of the war can be "a deeper solvent" to the grave problem posed by the centrifugal forces let loose since independence. However, if this integration is to be grounded on a solid foundation and made to grow as a perpetual force in the life of the nation, positive action must be taken to consolidate and direct in proper channels the new mood and psychology of oneness. The enthusiasm shown by people of all shades of opinion and the offers they have made of sacrifice and service in the national struggle against the enemy can be harnessed and conserved as an abiding force, if the people are given a positive sense of participation in the great defensive effort.

South Africa

APPLICATION OF SANCTIONS

SOUTH AFRICA once again came in for severe action at the hands of the United Nations, when the resolution on the application of sanctions against her was adopted in the world organisation. The requisite majority could be mustered primarily because of the united front presented by the Afro-Asian nations who hold very profound views on the subject as well as due to the support lent by the Soviet Bloc. The Western member-nations

abstained from voting certainly not for indicating their tacit approval of the racial policies in which South Africa persists but because they entertain serious doubts about the propriety of taking such an extreme step.

Perhaps it may be doubted how far sanctions can be made really effective and to what extent South Africa can be made to feel the physical isolation from the rest of the world. India's application of economic sanctions to that country, even in goods like jute manufactures where she holds a key position as a supplier, proved fruitless as it was circumvented by indirect channels of trade established with countries re-exporting the goods new or second-hand. Africa has gone on flouting world opinion on the question of her racial policies on the ground that that was a purely domestic issue in which the United Nations could not intervene. Numerous debates in the United Nations on her policy and the very sound and outspoken advice or criticism offered could produce little effect on her. In the still more flagrant case of the annexation of the mandated territory of South-West Africa, she paid no heed whatsoever to the United Nations. At the Commonwealth level she preferred severance of the tie to a change in her racial policy.

Some members of the United Nations are urging the extreme step of South Africa's expulsion from the United Nations if she refuses to mend her ways. This is not only a most ill-conceived way of thinking but a voice of despair. Expulsion or political ostracism will drive South Africa to a stiffer and more intransigent attitude under a persecution complex. While South Africa is inside the United Nations, there are chances to make repeated plain-speaking and trying to influence her with the force of world opinion to rectify her policies. With her expulsion from the United Nations, this valuable forum would be lost and she would get a blank charter to act as she would consider proper in her self-righteous attitude. Expulsion of South Africa, if ever it was attempted in real earnest, would defeat its purpose.

The Judiciary

A GRAVE LAPSE

THE ASSAM HIGH COURT adopted a most extraordinary and amazing course in exercising its powers to entertain appeals by the State Government against aquittals. In this case a railway official was tried on the charge of having accepted illegal gratification, but he was acquitted by the trial court. Against this order of acquittal an appeal was preferred by the State Government to the Assam High Court. The appeal was heard in May, 1959, and an order of dismissal was passed, upholding the acquittal. But for some mysterious reason the case was restored to the file and a secret rehearing of the appeal by the same Bench of Judges took place the next month. The order of acquittal was quashed and the railway official was sentenced to one year's imprisonment. The Assam High Court refused to grant him leave to appeal to the Supreme Court and in consequence he had to resort to the direct way open to him to move the Supreme Court.

The fact that the Supreme Court allowed the appeal and acquitted the aggrieved party, thereby restoring the decision of the trial court and of the Assam High Court in the hearing of the first appeal speaks for the merits of the judgment of the trial court. Justice in this case was done to the party. This is a matter of great reassurance. But what is distressing is the flagrant disregard shown by the High Court in going out of its way and reopening the case which was already decided. Strictly speaking, the moment the High Court dismissed the appeal of the State Government and upheld the acquittal, it ceased to exercise jurisdiction in the case. How the appeal was reopened and why the second hearing was held in secrecy contrary to the elementary canons of legal procedure is a mystery which the public at large should not expect to be unfolded. It casts serious reflections on the High Court at least which should have desisted from taking this astounding course. The judiciary in our country has inherited the noblest traditions of impartiality and uprightness. It is certainly a matter about which everybody, including critics of India after Independence, are proud that it has maintained its independence and uprightness. It is fulfilling its constitutional function of acting as a safeguard against the abuse of authority by the executive and dealing justice with an even hand and fair mind. It is to be trusted that what happened in the Assam High Court will be the last stray occurrence and this deplorable lapse will not be repeated. The Assam High Court merited the strictures which were passed on it by the Supreme Court.

Dr. Nkrumah

A SERMON ON SURRENDER

DR. NKRUMAH'S long-winding letter to Mr. Harold Macmillan gives a measure of how completely blind the Head of State is apt to be in his obsession with pet themes in total disregard of the bitter and stark realities of political life. The Ghanaian President says that he is gravely distressed and saddened to find that the British Government was ready and willing to support India's fight against China. Dr. Nkrumah has not left anybody in doubt as to what he in his obsession with peace and neutralism would have not only the Commonwealth countries but all other countries do in this ordeal of aggression facing India. In his letter he said: "Whatever the rights and wrongs of the present struggle between India and China, I am sure that we can all serve the cause of peace best by refraining from any action that may aggravate the unfortunate situation." Furtheron he expounds his theory of non-intervention and strict aloofness by arguing that armed support extended to India would not bring the termination of hostilities nearer for the obvious reason that assistance of arms and equipment provided to one country engaged in the conflict is likely to invite a counter-offer of like assistance to the other party to the conflict from its allies. This is splendid logic from the arm chair.

Does Dr. Nkrumah sincerely believe that the rights and wrongs of the dispute between India and China are a matter of not the least relevance at all? If so, on what basis is even a peaceful settlement of dispute to be negotiated? But apart from this primary consideration, does he mean that when a country like India has been the victim of aggression by an enemy, who has made full-scale and carefully planned preparations of invasion, it is to allow its territory to be overrun and finally grabbed by the aggressor? Is this the peace — the peace of the grave—which Dr. Nkrumah holds so dear to the heart? These posers may sound somewhat harsh, but it is most surprising that one who aspires to be the leader of Africa should be so self-righteous and also so naive as to assume that third countries should remain aloof when there are definite obligations, such as the Commonwealth ties or the supreme task to curb totalitarian aggression, cast upon them in the ultimate interest of world peace. Perhaps Dr. Nkrumah, who has taken ruthless measures in his own country to stamp out opposition and to put large numbers of the leaders of the opposition parties behind the bar, has his own notion of peace. But even in his own country he finds that the 'peace' he has gained by clapping opponents in jail has left him uneasy. It was only right that Mr. Macmillan should have treated his letter with a summary reply.

The World Abroad

THE (SOAP) BATTLE OF BRITAIN

By

ODYSSEUS

TWO OF THE MOST FREQUENTLY heard criticisms of the free enterprise system are that oligopoly has virtually eliminated the competition on which it claims to be based and that, in the "affluent" societies of the West, wants have to be artificially induced by wasteful advertising to keep the economy going—like a squirrel chasing its own tail in a cage.

A favourite example of those who insist on the social and economic waste of advertising is that of the constant battles for a limited total potential of sales between the sellers of detergent soaps in the UK. Let us, then, look at the chapter on detergents in "Advertising in Action," written by Ralph Harris and Arthur Seldon, and newly published by the Institute of Economic Affairs (66A Eaton Sq., London. S.W.1.)

The first point to notice is that synthetic detergents are an outstanding example of the built-in tendency towards change and growth of the free enterprise system, compared with the conservative tastes and conservative technological biases (at least in consumer goods if not in armaments!) of planned economies.

THE REVOLUTION IN WASHING

Over the past fifty years, technological advances in washing have revolutionised the Western housewife's once arduous burden. The invention of materials that dry quickly and need not be ironed have increased the frequency of washing. The housewife is no longer limited to the hand scrubbing board, zinc bath, kitchen sink, or copper, but has the choice of bagwash, laundry, laundrette, and a variety of home washing machines and driers. Not least has been the displacement of hard soap, soap powders, and soap flakes by synthetic detergents.

These synthetics are barely twelve years old. The first satisfactory synthetic product—Tide—was not widely distributed until 1950. But once some initial problems had been solved—Wisk, Fab, and others were unsuccessful because they caked—the sales of synthetic powders expanded from 0 in 1946 to 156,000 tons in 1955, and by 1961 formed 55 per cent of the volume of the powder detergent market.

Their swift success was due, first, to their superiority over soap and soap powders in hard water, and, secondly, to forceful advertising. But please note that no amount of advertising would have enabled the synthetics to succeed if the housewife had not, in fact, found them superior to soaps.

The basic ingredient in a washing agent must be able to remove dirt, emulsify it, and suspend it in solution until it is rinsed away. Soap does these jobs in soft water, but the magnesium and calcium salts in hard water react with the soap to form scum that gradually turns white materials grey. Synthetics do not react thus. On the other hand, the basic ingredient of synthetics is less efficient by itself than soap, so for washing fabrics "builders" are added to strengthen its cleansing and suspending powers. Synthetics also dissolve grease better than soap; they do not turn rancid; they leave no scum to spot clothes or ring a bath; and they give a better sparkle to glasses and dishes.

Synthetics thus reflect the real achievements of research chemists by offering housewives technical advances over exising products. Nobody disputes this. What they criticise is the extent and content of their sales promotion.

In 1960, total retail sales of synthetics were £22,500,000 and the cost of advertising was £400,000, or approximately 18 per cent. But synthetics cannot be sold at a price low enough to compete with soap unless sales are large, and to build up a vast market requires mass advertising, and advertising is likely to be cheaper than a price reduction as a market-builder. In practice, the alternative may be no more than a very small price cut, the effect of which also tends to wear off. The price of synthetics has remained fairly stable over the past ten years. Most are no more costly than when first introduced and the increasing frequency of "special offers" and short-term price reductions may have made some cheaper. Compared with a rise of 200 per cent in average UK prices since 1938, soap powders have risen by 60 per cent.

Nevertheless, it might seem that the loudest and cleverest advertiser wins the market. In 1948, when there were several hundred brands on the market, Unilever, Hedley, Colgate and the Co-operative Wholesale Society accounted for 28 per cent of synthetics. By 1956, they accounted for 97 per cent. Significantly, during this period total sales increased more than fourfold.

But advertising by itself does not explain why the largest firms became the dominant suppliers. They had the capital equipment to produce detergents that were technically efficient, did not cake, and had no unpleasant odour. They also had experience of the original soap industry. Not least they could, better than the powerful chemical and oil-refining companies that supplied the raw materials, ensure efficient distribution through their knowledge of soap marketing. Indeed marketing—and not advertising alone—emerges as the key to the structure of the industry.

COMPETITION BENEFITS HOUSEWIFE

But the housewife continues to benefit by the competition for her custom. A striking recent development has been the attempt to provide her with detergents suited for different tasks. Liquid detergents in plastic bottles are now widely used for washing up dishes. Stergene and Dreft may be used instead of soap flakes for fine washing, particularly for nylon and terylene; Flash and Handy Andy are designed for floor and paint washing. These refinements have led to more fragmentation of the market.

Because of the weight of their advertising, the layman might think that synthetics had taken over the whole market. But soap powders, of which Persil is one, accounted for about 45 per cent of the market by volume in 1961. Faced with severe competition from the synthetics, Unilever concentrated on improving the preformance of Persil in hard water areas, and their main improvements in 1950, 1958, and 1961, have included a scum disperser and other "builders", better stain removal, improved brightening and sudsing. The advent

of semi-automatic and automatic washing machines, and of spin dryers, have reasserted the advantages of soap powder. The excessive foaming of synthetics makes them less satisfactory for use in such machines.

We can readily concede that the use of detergents (synthetic and soapy) would not have spread so rapidly in the UK since 1950 if they had not been advertised, but the critics must also concede that the advertisers went to great trouble and expense to discover what the housewife's wants were and what could be useful to her. To allege, as does Mr. Galbraith in his "Affluent Society" that wants are in fact, the fruits of production and of advertising, and that production only fills the void that it has itself created, is, in the light of the case history of soaps and detergents in the UK, merely to split hairs. To fulfil Mr. Galbraith's thesis, the soap manufacturers should have been successful in compelling, by means of their advertising, the UK housewife to buy in ever increasing quantities the qualities and kinds of soaps that they were making in, say, 1909 when the original Persil was first launched. Such a world, in which you have only to spend enough on advertising the same old unchanging goods to maintain the ever increasing volume of production and full employment (the objects of the exercise in the "Affluent Society" thesis) would, in fact, be a business man's paradise. Ex-hypothesi, he could never go out of business because his advertising would keep the squirrel for ever chasing its tail.

The facts are, of course, that, thanks to competition, which induced soap-makers to study the housewife's needs, advertising has brought goods to her notice which have revolutionised her home life by increased efficiency, convenience, and labour-saving in washing of all kinds.

Ralph Harris and Arthur Seldon reasonably point out that a comprehensive study of the detergent market would show ways in which the leading firms might have achieved the same results with less expenditure on advertising, but this assumes an improbable, indeed inhuman, degree of foresight, or even hindsight. All human beings make miscalculations in any economic system, whether free or planned. Fuller research on marketing developments during a period of rapid change would, of course, permit a truer assessment of the role of advertising and might improve future judgments on marketing strategy and so reduce the avoidable waste on advertising, but perfection—the elimination of all waste —is unattainable.

"Advertising in Action" is the best corrective that I have yet encountered to the new "conventional wisdom", which proclaims that competition no longer prevails under free enterprise, and that oligopolies control prices so that they become umbrellas under which the efficient and the incompetent producer alike live comfortably, profitably, and inefficiently. On the contrary, "Advertising in Action" establishes that competition (in so far as it is not frustrated by tariffs or subsidies) remains the major regulating factor in a free market, (a) influencing prices, (b) rewarding the efficient, and (c) eliminating the inefficient.

The European Scene

NEW COMMON MARKET TARGETS

From Our Special West European Correspondent

PARIS, November 4.

THE long and important memorandum submitted this week by the ECM Commission to the six governments suggesting rapid progress with European integration probably goes further than the various national capitals would have wished. This is as it should be, for it is the function of the Commission to be a few jumps ahead of the governments. The Rome Treaty gives it the monopoly of initiative, and the Council of Ministers the monopoly of decision; the Commission cannot itself take important measures, but the Ministers can only decide to act on propositions put up by the Commission. So it is the job of the Brussels experts to be cutting out the work of the national governments, to suggest long-range tasks to which, left to themselves, they would have turned more slowly. The point is worth noting, in case it appears, in the next few weeks as the memorandum is discussed in the national capitals, that there is some discord between the Six and their Supranational commission: this dialectic is intentional and provides the motor of integration.

It was especially important for the Commission to take a spectacular initiative at this moment, because there is a tendency (notably in Paris) to play down its role. De Gaulle is suspicious of it, on the grounds that it is supranational, which means for him that it is devoid of political efficacy; the British, who are on the verge of joining the Six, would no doubt take a similar view. The Commission wants to demonstrate that it is no ineffectual international bureaucracy, but the real source of unifying ideas, and that it has political power in that its ideas can win popular support that will oblige the governments to adopt them. Quite apart from the content of its memorandum, this energetic display of the Commission's originating role comes at a suitable time, to remove the illusions of the Gaullists and more importantly of the British about toning down the supranational aspect of the European union. The men in the back rooms in Brussels are a force to be reckoned with.

The two main proposals they have made this week not only go beyond the present desires of governments but exceed the letter of the Rome Treaty. They have suggested an all-European plan, modelled on the French national plan, and this is nowhere mentioned in the founding charter of the Common Market; this programme would come into effect from 1964. And they have sketched a form of monetary union that would begin to take shape from 1966. Here again the Rome Treaty is silent. The Commission argues that it is not proposing a revision or extension of the Treaty, but filling in gaps that had to be filled in if the other objectives were to be attained. Without a supranational plan and a monetary union, the goal of economic integration, which is definitely inscribed in the Treaty, could not be reached. Its arguments are sound, but the fact stands that if these ideas make their way, the Common Market will have acquired a new dimension, which it will owe to the supranational organism in Brussels and not to the individual governments. The British could not be warned more plainly that, whatever General de Gaulle's hostility to a European federation, in joining the Common Market they will be letting themselves in for a far reaching experiment in supranationalism.

As it happens, the measures proposed from Brussels will seem acceptable to most governments, even if prematurely ambitious. This is the justification of the supranational organisation: it is not likely to put up revolutionary ideas or to try to browbeat national capitals into surrendering sovereignty to a superstate, but rather to indicate how policies that they already approve, or practise at home, can be given a more effective expression at the international level. This is plainest in regard to indicative planning, or what the memorandum calls long-range programming in order to spare German sensibilities. All the nations now members or candidates accept some form of democratic planning, save the West Germans and even they must be coming around to the idea of community programming for otherwise the Commission (which is of course international in composition) would not have ventured its suggestion. It is not necessary that Bonn adopt a national plan for the West German economy, for it to be able to co-operate with its partners in writing a European programme, so no doctrinal volte-face is being asked of Dr Erhard. If he can obtain by other means the information about the development of his economy that his compeers find in their national plans, he will be able to collaborate in the task.

Similarly with the project for a monetary union. The present members of the Common Market are willing to enter this path, and if the idea seems revolutionary to the British, it also offers them the advantage that the burdens now carried by the pound sterling would be shared by the Continentals. For what the Commission is proposing virtually is that central reserves be pooled. There would be no single European currency, but since member-governments would have guaranteed the fixity of exchange rates, it would be indifferent to Europeans whether they held pounds, marks, francs or liras: these would all be expressions, as it were, of one currency, supported by the same pool of reserves. The Commission has cut across all the dispute about monetary unification by pointing out that nothing else matters once exchange rates are fixed once for all within West Europe; that is as much monetary unity as will be required.

Instead of being a remote objective, this is a feasible project for the third phase of the Common Market which will open in 1966. To prepare it, the Commission specifies the measures that could be taken now, in the second phase. The first is creation of a council of governors of the issuing banks of the region, whose job would be to follow all monetary matters; eventually this council could become the central board of a federal reserve system. Meantime, the council would have to discuss all important changes in national monetary policy, such as variations in discount rates or statutory reserves of banks. This sounds simple but it is in fact a very tall order. When a variation in bank rate is contemplated in London or Paris, it is a closely guarded secret known to only a few men; the ECM Commission is suggesting that such a plan be revealed and debated in an international council. For all its delicacy, this problem will have to be faced sooner or later if economic policy is to be harmonised, for in a region with no tariff barriers, with uniform agricultural prices and free movements of money, one cannot imagine central banks being able to vary interest rates by surprise and at will.

At the same time, i.e. before the third phase begins, the Commission suggests that central banks and finance ministries agree on a common attitude inside the international financial institutions. This implies an extension of present monetary co-operation, for there already exists a Common Market bloc in the IMF and World Bank. Members would consult each other before having resort to these international agencies, they would harmonise their policies regarding reserve currencies (dollar and sterling) and would agree on the assistance they are supposed to give each other in terms of the Rome Treaty. Meanwhile the progressive liberalisation of capital movements would be pursued, notably by allowing the issue of securities in other member-countries' money markets. The Commission argues that there is nothing in all this to abridge the sovereignty of States nor of their banks of issue; after the required consultations they will still be free to take the steps they think concordant with their national interest. It is only later, in the third phase, that there would be a real centralisation of decisions.

Obviously, this plan means something very different depending on whether the pound sterling is, or is not, one of the currencies involved. This degree of harmonisation of monetary policy as between the present Six would already be an event of importance, but if the pound is implicated it becomes a development of basic significance to the whole monetary structure of the world. If the pound were in a healthier condition, one would assume that London would shrink from any such internationalisation of its affairs; but in that case, Britain would not be a candidate for admission to the Common Market. In her present circumstances, a co-ordinated West European monetary policy might offer the only hope of permanent cure of sterling's difficulties.

Nevertheless, the British would be entitled to complain that the association they resolved to join a year ago has begun changing shape and meaning even before they are inside. A Common Market that is working out an economic plan covering the whole region and which is heading toward a federal monetary structure is a rather different proposition from the mere customs union (counterbalanced by Gaullist insistance on national sovereignty) that was first offered to the British people. The Commission realises that it will be criticised on this point, and replies in advance that it is only bringing out the implications of the Rome Treaty and that it is simply fair to acquaint candidate-members with the shape of things to come. All the same, one cannot help feeling that this sudden insistance on accelerated unity is a reaction to the fear that Britain's entry will slow down the process of unification in Europe. The bus is being speeded up, not in order to make it harder for Britain to catch it, but to make sure it maintains its original direction after Britain boards.

Whatever qualms the British may feel about the new face that is being painted on the Common Market, the draft plan contained in the Commission's memorandum can only serve to fortify their resolution not to be excluded from Europe. For that plan foresees a 60 per cent increase in the Common Market's gross national product between 1960 and 1970. For the first five years, from 1960 to 1965, an expansion of 27 per cent is regarded as certain; in fact this is a minimum figure; for the second five years, the rate of growth is guessed to be slightly less robust: 25 per cent. Since the expansion of the British economy is only a fraction of these figures, the impossibility of stagnating just off the shores of a booming Continent remains the strongest argument in favour of British association.

ALUMINIUM

TO MEET THE VARIED REQUIREMENTS OF INDIAN INDUSTRIES

The 20,000 tons (per annum) aluminium plant of Hindusthan Aluminium Corpn. Ltd. went into production in May 1962. "Hindalco" offers you ALUMINIUM INGOTS (commercial grade and electric conductor grade) of a very high quality. Supplies of aluminium ingots are now freely available to meet the growing demand for aluminium for various industries in India.

The Truth about Rayon...1

Is the Rayon Industry really making HUGE profits?

CONTRARY to popular belief the Rayon industry is, in fact, making very moderate profits. The Reserve Bank's survey of 1001 leading companies shows the average of profits as percentage of net worth to be 10.8%. Against this, the rayon yarn spinners average less — a modest 9%.

The selling prices of Rayon have been arbitrarily pegged down since 1957, and have in effect been reduced by absorption of excise duty. In addition, rising production costs and a high rate of obsolescence...have made further inroads into profitability. The demand for more clothing will become increasingly pronounced over the next decade, and a serious crisis could result if the Rayon industry is not given incentives to produce more.

Our Prices Among World's Lowest

Although comparatively young, the Rayon industry has made rapid strides over the last decade. Qualitatively, it is equal to the world's best—in price Indian-made rayon yarn of all deniers is cheaper than most as the following table will show:

	Domestic prices of 150 denier yarn in Rs./kg
Switzerland	9.08
U.S.A.	8.79
Britain	8.27
Italy	7.80
Sweden	7.80
France	7.76
India	6.94
Japan	5.05

Controlled Price and Distribution

The Rayon yarn prices and distribution are controlled by the mutual authority of the Textile Commissioner and a committee of both spinners and weavers. This ensures supplies of yarn to the consumers at fixed prices which are some 40% below the market value of these yarns. 75% of yarn goes to organised textile units and the balance to handlooms, doublers, twisters, etc.

The truth is, moderate profits —not huge profits—is the reward of the manufacturers of Rayon...the fibre that serves you so well.

For our basic needs... Rayon!

Economic Report from the U.S.

FOREIGN TRADE CONVENTION

By

GUY SIMS FITCH

NEW YORK, October 31.

THE American business community is taking a hard look at the challenges and opportunities it faces in a world of wide and rapid economic change. This has been the main subject of discussion among more than 2,000 executives concerned with international trade attending the forty-ninth foreign trade convention that ended today. They included representatives from enterprises that account for most of the nation's annual $20,000 million in exports and its $35,000 million in direct foreign investment. This vital cross-section of American business opinion gathered here to examine what President John Akin of the National Foreign Trade Council termed "historic new initiatives" in the patterns of world business—chief of which is the US Trade Expansion Act giving the President authority to negotiate deep reciprocal tariff reductions. Businessmen here joined government officials in approval of the opportunities the legislation provides for expansion of world trade, and adjustment to the rise of the Common Market as well as to changing trade patterns resulting from the emergence of newly developing nations.

US Secretary of Commerce Luther Hodges struck a responsive note here with his promise that the US Government will be prepared to put the new authority of the Trade Expansion Act to effective use in what he termed "tough" bargaining for the reduction of tariffs and other barriers to the flow of international commerce. This has particular pertinence to negotiations with the growing Common Market. As Secretary Hodges pointed out, the Common Market in a few years probably will have no internal duties at all. It, therefore, will be important to use the instrumentality of the new Trade Act, to assure that the European Economic Community's common external tariff wall will be low and non-discriminatory before new international trading patterns are set irrevocably. This, of course, also will benefit all other US trading partners, notably those in the 44-nation General Agreement on Tariffs and Trade (GATT), through the most-favoured-nation principle whereby tariff concessions granted to one are as a general rule extended to all. These international requirements have their counterparts in the domestic American economy. A prosperous economy, one which can compete in world markets by producing quality goods at reasonable prices, is an important concomitant to the healthy expansion of foreign trade.

In recognition of this link between domestic and foreign programmes, Mr. Hodges has just undertaken a reorganization of commerce department offices which will bring main elements of these two functions into one operating unit. With expanded international trade tied to expanded demand at home and abroad, it was encouraging to hear the Secretary's activity for the immediate future, and may well experience a renewed upsurge as business investment increases under the impetus of special government tax, and depreciation incentives. Nor did Mr. Hodges overlook the longer-term beneficial effects of a general reduction in corporate and individual income tax rates, which the Kennedy administration had indicated it will be proposing early next year. The extent to which such a general tax cut can or will be applied may well depend on developments in the international political arena. It is of more than passing moment, in this connection, that the businessmen here have generally supported the US government's course in the Cuban situation, and have welcomed the recent hopeful easing of tensions to which this course appears to have contributed. This underscores a fact that should be but is not always appreciated. It is in a peaceful world, bent chiefly on peaceful pursuits, that private enterprise and investment best flourish. It is in this kind of an atmosphere that they can best contribute to economic growth and advancement of developing standards at home and abroad.

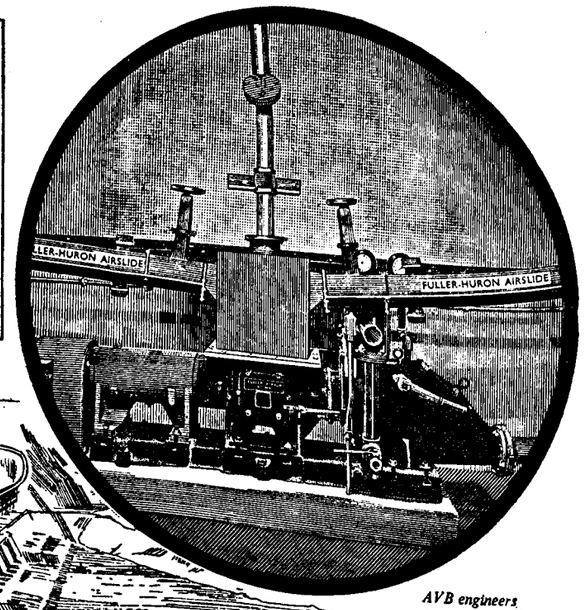
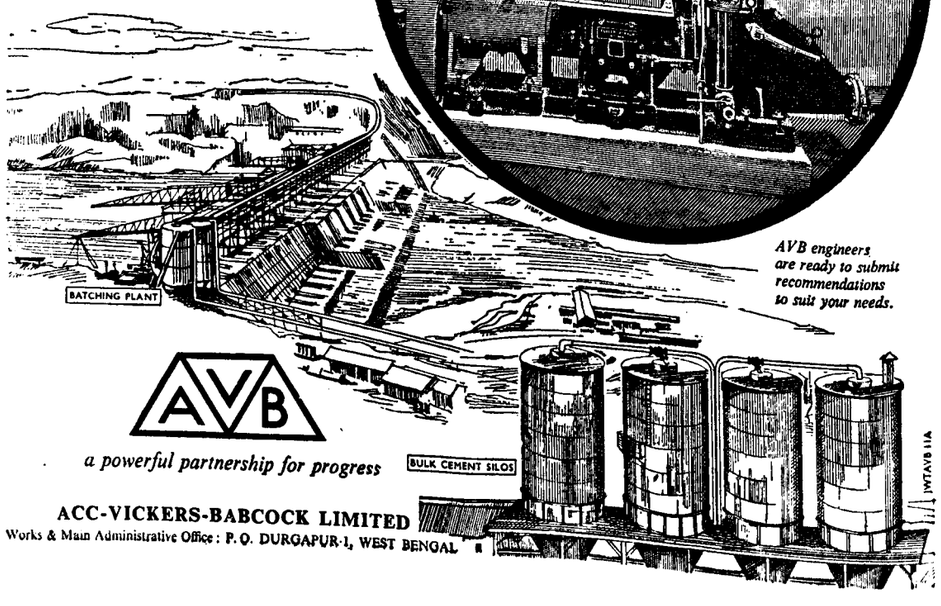
AVB has the answer to efficient and economic handling of pulverised material in bulk



FULLER BULK HANDLING EQUIPMENT
under licence arrangement with the Fuller Company, Catasauqua, Pa. U.S.A.



The Fuller system is a clean, safe and efficient means of transporting dry pulverised materials in bulk, especially well adapted to long distance conveying.
To the user of bulk material, the Fuller systems offer unique overall plant economy. Materials can be conveyed literally anywhere a pipe-line can run and to any number of delivery points.

The Fuller-Kinyon Pump and Fuller-Huron Airslide represent the result of many years of research and development work through practical operational experience in handling diversified pulverised materials, such as unpacked cement (for major construction jobs, concrete dams etc.), pulverised limestone and other minerals, pulverised coal, fly ash from pulverised fuel boilers, etc.

FULLER EQUIPMENT MANUFACTURED BY AVB

* Fuller Coolers and Clinkers Breakers
* Fuller-Kinyon Pumps and Accessories
* Fuller-Huron Airslides and Accessories
* Fuller Vane Feeders
* Dracco Dust Collectors and Filters
* Airmerge Blending Systems
* Fans for Coolers and Dust Collectors
* Diverting Valves and Rotary Valves

AVB engineers are ready to submit recommendations to suit your needs.

THE SINEWS OF WAR

FOR the successful execution of the war on our northern frontier it is necessary that the tempo of production in the country should be accelerated. The Prime Minister has given the lead in this direction by stating at the National Development Council meeting that "nothing is required more than production when you have such a problem to face." Pronouncements have been made by the representatives of the businessmen that the "battle of the nation" would be fought by feeding the supply line adequately. The labour unions have pledged not to go on strikes or do anything which, in any way, may hamper the war effort. This is all heartening and augurs well for intensified production. An attempt is made here to show how the industrial machinery can be geared to the needs of a wartime economy.

There is no parallel situation in the history of India when a challenge of the present magnitude has faced the country. Memories travel back to the most recent experience i.e. of the period from 1939 to 1945 during the Second World War when the productive effort of the country was geared to a war economy. Through better utilisation of the available resources, production was increased and the handicaps of the non-availability of imports was overcome. The present situation has also to be tackled by reducing imports to the minimum. There are many industries which have larger unutilised capacity. In the case of those which have failed to gather momentum, because of the paucity of raw materials, indigenous sources will have to be tapped. There are many engineering and chemical industries whose output can be increased by working double shifts or triple shifts. It is here that an effort should be primarily directed to leave no stone unturned for achieving the objective of increased output.

The mistake is likely to be made that during the war, attention is to be diverted only to those industries which bear in one way or the other on the war effort. It is true that the strategic industries have perforce to claim increased attention but in this process, the consumer industries cannot be neglected. The business community deserves to be complimented on its decision to keep up the production of the necessary consumer goods and for promising that their prices would not be allowed to rise. At a recent meeting of the Federation of Indian Chambers of Commerce and Industry, its President announced that the essentials of life such as sugar, cotton and woollen piecegoods, edible oils, footwear, paper, drugs, coal and coke and cement would not be allowed to rise in prices. Industry has taken a pledge to keep down their prices by raising their output. This will need to be supplemented by a voluntary check on prices.

The table alongside gives the percentage of production of some of the industries as compared to their installed capacity in 1961. It shows that in many industries, there is ample room for improving production. If the percentages for some of the industries are more than 100, it may mean that some of the units are either working at high speed or operating two shifts instead of one. If all the units had taken to double-shift operation, the percentage would have risen to 200, subject, of course, to the feasibility of working two shifts. For those industries which indicate the percentage at below 100, there is definite room for increased efficiency. In the case of the cement industry, for example, the total available installed capacity is not being utilised. Only last week, the Federation's President told the Union Finance Minister, Mr. Morarji Desai, that the output of cement could be increased immediately by as much as 0.75 million tons provided additional transport facilities and coal were made available. A further increase of a million tons could be made if the scheme for producing cement from blast furnace slag could be implemented. In the same way all the other important strategic industries could be boosted up.

UTILISATION OF INSTALLED CAPACITY IN 1961

	Industry	Production as percentage of installed capacity
1.	Power transformers	143
2.	Storage batteries	139
3.	Electric motors	137
4.	Lathe tools (tool bits)	125
5.	Road rollers	124
6.	P.V.C. sheetings	116
7.	Automobile of all sorts	99
8.	Cement	87
9.	Superphosphates	87
10.	Aluminium sheets & circles	86
11.	Aluminium (virgin metal)	83
12.	Finished steel	80
13.	Sulphuric acid	73
14.	Steel pipes and tubes	73
15.	Calico looms	72
16.	Threading tools	71
17.	Grinding wheels	70
18.	Complete ring spinning frames	68
19.	Matches	68
20.	Paints and varnishes	67
21.	Soap	57
22.	Carding engines	50
23.	Railway wagons	50
24.	Wire ropes	44
25.	Aluminium rods and sections	42
26.	Bleaching powder	31
27.	Trailors	27

Will the present crisis in the stock exchanges have any repercussions on the productive machinery of the country? It seems that the present drop in the stock exchanges is a technical correction which had been long overdue and has been precipitated because of the anxiety of the speculative operators to get out of the market. The productive machinery continues to be very sound and even though there might be some effect on the liquidity of the corporate sector, it is certain that the production of the industrial units will continue unhampered.

Many industries have suffered in the recent months because of the non-availability of raw materials. The debate has continued whether the meagre foreign exchange resources at the disposal of the country should be diverted for installing new capacity or for the maintenance of the present industries. As matters stand today, there is no doubt that preference will have to be made in favour of the maintenance imports after provision has been made for the import of armaments and other strategic materials.

The bottlenecks for industrial production have been, in the main, transport and power. They have been discussed a number of times in the columns of "The Eastern Economist". More heroic attempts need to be made for easing the transport bottleneck. In the first place, top priority has to be given for the movement of war materials to the northern frontier, and beyond certain points it is the road transport which has to be utilised. After the war needs have been fully met, the civilian needs of transport must not in any way be curtailed. It is a happy sign that the Union Railway Minister, Mr. Swaran Singh, assured the All-India Manufacturers' Association that all efforts would be made to expedite the movement of goods. Already a number of useful suggestions have been made. Particular mention needs to be made of the suggestion that coal should be moved in four wheelers rather than in box type wagons. Equally important is the acceptance of the suggestion by the Railway Minister to allow private parties to install their own cranes in railway sidings. Such measures will certainly go a long way in relieving the pressure on the railways.

In the case of power, the civilian needs may have to be curtailed; in particular, the schemes for the electrification of villages may be withheld so long as hostilities continue. More of ths power may be diverted to productive industries so that the available capacity in all the industries can be made use of even beyond the installed capacity by working on multiple shifts.

The fact that India's industrial capacity has had a hesitant rise is due to the unwise and restrictive policies imposed on the economy by the Planning Commission. This is no time to blame one organisation or the other. But it is a fact that the Planning Commission has to adopt positive policies whereby the entrepreneur who is willing to stake his everything for the motherland is not discouraged by ideological restraints. If the coal industry is willing to increase its output, the old dogma of allowing expansion only in the public sector should be done away with. Similar bold decisions will have to be taken in the case of other industries as well. When production is the crying need in this crisis, resources and facilities must be provided where there is the capacity to deliver the goods—be it the public sector or the private sector.

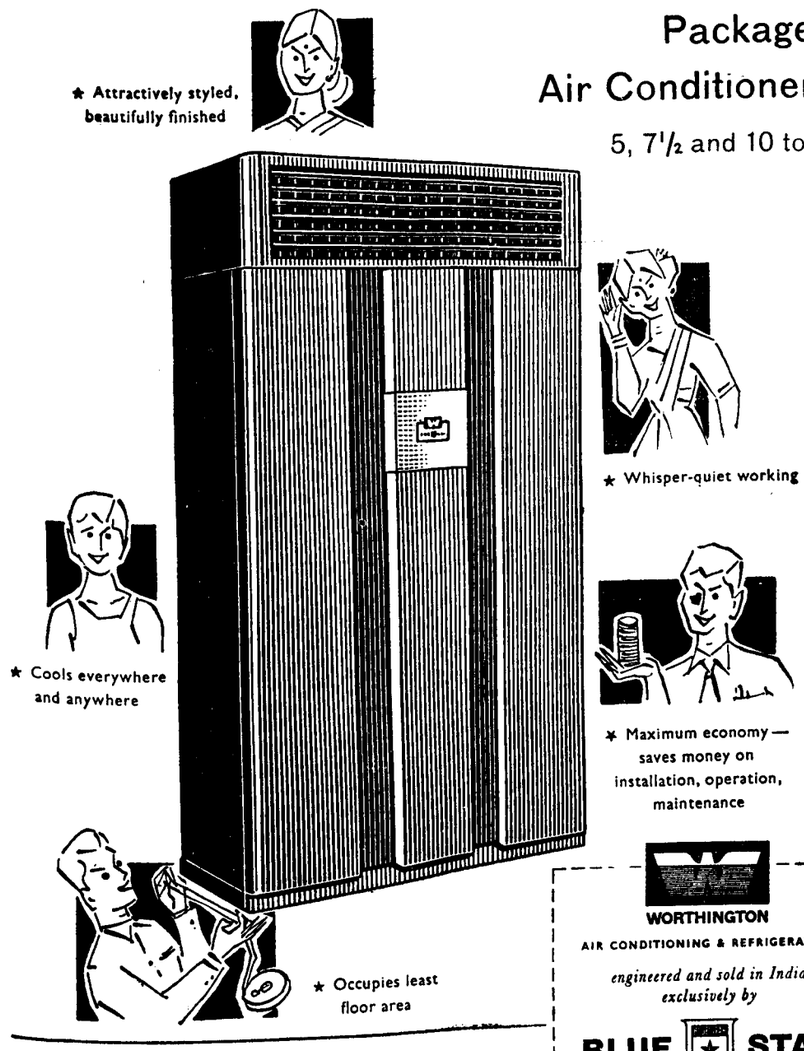
MINERALS FOR WAR MATERIALS

(CONTRIBUTED)

IN the face of Chinese aggression it has become incumbant on us to think in term of considerably stepping up or manufacturing indigenously war materials as a long-term policy to defend our border in the north, west and east. In this article it is proposed to describe the availability of various useful minerals in the country required mainly for the manufacture of war materials where high temperature structural materials are required. Though iron and steel are the basic ingredients for the manufacture of all war material and equipment for which the country has abundant resources, nevertheless there are certain other metals which can be grouped as nuclear fuel—uranium and thorium; nuclear component construction—zirconium, columbian and vanadium; moderately high temperature light weight structures — titanium, magnesium, aluminium and very high temperature structure-columbium, molybdenum rhenium and tungsten, and which form the foundation of modern war equipments manufacture. The country possesses proved mineral resources for most of the metals stated above which can be fruitfully exploited and utilised for war materials.

Uranium and thorium are the two important fissionable elements which are in plentiful supply and are used in atomic weapons. Uranium minerals are worked in Bihar and Rajasthan and processed at Jaduguda, Bihar. Copper belt of Bihar is also an important source of uranium. The beach sands containing monazite occuring in Kerala and Madras are chief source of supply of thorium and uranium. Monazite sands yield 0.2 to 0.4 per cent U_3O_8 (uranium oxide) and 5 to 11 per cent ThO_2 (thorium oxide). These are being processed at Rare Earth Factory, Kerala. Thorium is known as fertile element for the production of U-233 in a breeder cycle. But U-233 is less useful from the fissionable product stand point than U-235 and plutonium. Uranium is the source of the two desirable fissionable fuels U-235 and plutonium.

Zircon ($Zr SiO_4$) is the important ore of zirconium and is in abundant supply. Kerala beach sand contains 8 to 10 per cent of mineral zircon. It is a sister metal to titanium having the same allotropy, structure and general physical and chemical behavoiur. Zirconium alloyed with steel has been used to manufacture a number of equipments, during the last war. The further use of zirconium seems to be largely in nuclear energy and chemical corrosion fields. Its low neutron captive cross sections is entirely satisfactory and its corrosion resistence and strength are superior to other competitive metals. Zircon as such is very refractory and used as moulding sand in casting high temperature metals. It is also a prescribed mineral under Atomic Energy Act.



Ilmenite is the chief ore of titanium and in this mineral too the country has an abundant supply. We are exporting substantial quantity of ilmenite. The main source of supply of this mineral also is the beach sand of Kerala and Madras. The beach sand contains

The Third Five Year Plan
Bird-Heilgers' part in it....

FOURTEEN MILLION NEW JOBS

Employment. A word that translates into a meaningful future for millions of people without jobs. India's Five Year Plans are aimed at the concept of full employment. The intensified drives of the Third Plan are estimated to create 14,000,000 new job opportunities—more jobs for more people than ever before in the economy's history! To achieve the employment target calls for a single-minded national effort. It must be co-ordinated, dedicated, complete...

75,000 jobs—and more in the offing

Bird-Heilgers is convinced that the quickening tempo of industrial activity must be accelerated if unemployment is to be checked and full employment brought about. Wedded to this concept, the group provides well-paid employment for approximately 75,000 people. They are concerned with iron ore and insurance policies, bridges and writing paper, gunny sacks and laboratory tests—a complex of goods and services which involves the group heavily in the industrial resurgence of India.

Towards a self-generating economy...

A phrase on everyone's lips. A phrase that finds concrete expression in the urgent activity of an economy on the move. Bird-Heilgers reflects the nation's striving. The group delivers millions of tons of basic materials to the new blast furnaces. It produces jute goods, paper and board, air compressors and springs, and engineering and water treatment equipment. A project for the manufacture of coal washeries was the first in India. Planned diversification finds the group engaged in shipping, insurance, exporting and importing. Its agency department handles everything from heavy capital equipment to light consumer goods.

...and an exciting, promising future

The Five Year Plans are a challenge: existing industries must expand, new industries open up, per capita income increase. India needs more goods and services than ever before. Bird-Heilgers is alive to the problems of a growing economy. The group deploys the full potential of a century's resources, technical knowledge and executive skill to increase and broaden its activities...provide employment for many more thousands...join the national drive to economic independence.

THE BUSINESS WORLD

Golden Opportunity to Give Away Gold

By CROESUS

WHETHER as a result of the country's foreign exchange reserves having dropped very near to the statutory minimum level, or as a sequel to the Chinese aggression, or as a policy measure to hold all gold available in the country on Government account, or as a consequence of the Government's determination to pursue its non-alignment foreign policy by insisting on purchasing arms and armaments only against payment, a decision to issue gold bonds has been taken and the process of gold disgorging may be said to have begun. Could this have been postponed for long? The pressure of public opinion, both from within and abroad, especially at the hands of the economists, had become too strong to resist even for the Government of a country whose people use gold traditionally as gifts on marriages and other occasions, or as an investment that is not subject to the risk of capital depreciation. Indeed, for some time past, the Government of India was reported to have been considering ways and means of harnessing the people's gold, but it probably required a psychological moment such as the present to administer the shock.

True, the Union Finance Minister has endeavoured his utmost to cushion the shock as much as possible by offering attractive terms for the gold bond issue. But the question is whether the proposed gold bonds should be judged from the point of view of their attractiveness or from the more exacting, and also imperative, criterion of one's loyalty to the country in this hour of crisis. There is no gainsaying the fact that the whole question must be used mainly from the latter angle. Nevertheless, being of the earth earthy, most people who may have the gold would want at least the price that they have paid for it in the open market, if only because this gold may possibly represent all their life's savings. For this reason, it is perhaps worth considering whether some relief or concession could not be extended to such people. It occurs to me that, if, in addition to giving them gold bonds against surrender of gold and gold ornaments, calculated on the gold content at the international price, an irredeemable National Defence Bond for the difference between this price and the actual open market price paid by them (or, to save all the headache of verification of the rates, etc., at the time of purchase, the average price for, say, the past three or five years) is also issued to them and the same treated as a donation under Section 88 of the Indian Income-tax Act for providing income-tax relief, the response would be several times more than what it may turn out to be otherwise.

Gold in substantially large quantities can be expected not from the above category of persons, in any case, but from those who traditionally hoard gold, or from those who may have acquired the yellow metal through doubtful means. Here again, the response will depend entirely upon the extent to which the hoarders regard the terms as sufficiently attractive. Mr. Morarji Desai has no doubt offered an attractive rate of interest, besides exempting the income from the bonds from Wealth Tax and the sales proceeds of the bonds from Capital Gains Tax. It is also arguable that, at the end of fifteen years, any purchaser of these gold bonds would have recovered enough by way of interest to offset the immediate capital depreciation now; in fact, the subscriber may actually get more, if the interest to acrue from the interest earnings also is taken into account. To a hoarder who does not think in terms of selling or investing his gold, this consideration is of no consequence. But, even here, I suggest that the authorities might consider the further attraction of an irredeemable national defence loan for difference between the ruling market price and the international price, as suggested above, to ensure the maximum results.

There could certainly be no more propitious opportunity than the present for those who cannot give a proper explanation of the origin of their gold to disgorge as much of their gold holdings as possible. For there will be no limits for investment in gold bonds, nor will any questions be asked from those who might choose to invest in these bonds. But, even here, according to a section of market opinion, so long as there is a lurking fear that the purchasers of gold bonds might eventually attract the vigilance of the ubiquitous income-tax authorities, the response may tend to be halting and restrained. It is too much, however, to expect Mr. Morarji Desai to go beyond what he has already done. However, the other suggestion offered in market circles, namely to issue bearer bonds may be considered on its merits. In supporting this, what is uppermost in my mind is not to provide an umbrella to the unscrupulous to apply the unction to their soul, but to explore all avenues of extracting every gramme of the idle, hoarded gold in the country.

Apart from falling in line with industrialised countries in the matter of our attitude towards gold holding, acquisition of as much gold as possible by the Government is an imperative necessity for this country. For reasons best known to themselves, however, the authorities have not made this task easy by their insistence on paying for arms and armaments procured from foreign countries lest they should be charged with dropping their policy of non-alignment. Be that as it may, as Mr. Morarji Desai told an American correspondent, in New Delhi, recently, situated as we are, there are only three courses open to us: (1) payment in rupees; (2) deferred payments in kind, and (3) lend-lease, but, as he further indicated of these three, lend-lease is perhaps the only choice. To quote Mr. Desai "We could give the weapons back when we have finished with them, so that there is no problem of paying. On the other hand, deferred payment would build up problems for the future. The Indian economy is already stretched to the limit in the effort to raise living standards. Rupee payments could also eventually become a drag on the economy, if the rupees are spent on goods which might otherwise be exported to earn foreign exchange". Here is a clear indication of the serious straits to which we have been reduced on the foreign exchange front. The superimposition of defence needs will, if anything, weaken our ability to build up our foreign exchange reserves by limiting imports and maximising exports. It is in this context that the need for gold becomes all important. Those who wish to help the war effort — and there is no loyal Indian who will refuse to do this today — will, therefore, do well to think in terms of first contributing gold and only next in terms of contributing cash. If the choice before any one is whether to pay gold or cash, he should unhesitatingly contribute gold.

The Union Finance Minister's justifications for fixing the price of gold for the issue of gold bonds at the level fixed by the International Monetary Fund are two: one, that it is the level at which the IMF permits all its members to buy gold as a measure of mutual co-operation for maintaining the value of each other's currencies; and, two, that buying gold at a price higher than the international price would give an impetus to smuggling. These are both unexceptionable. But an even more deterrent effect on smuggling than the latter, in my opinion, is possible from a proper response to the clarion call of Mr. Morarji Desai to every citizen not to purchase any gold for the duration of the Chinese aggression. If this advice is heeded to by at least a majority of the Indian people, no smuggler would be tempted to bring gold into India, for the simple reason that the game would not be worth the chase.

To many students of Indian economics, the extent of response to the gold bonds issue will provide at least a remotely reliable index of the volume of hoarded gold in this country. There have been far too many fantastic estimates of our gold hoards in the past. Even in the last few days, I have come across at least three different estimates of such hoards, namely Rs. 1,800 crores, Rs. 3,000 crores, and Rs. 4,500 crores. Even if the total volume of gold that the Government might succeed in siphoning off as a result of the sale of gold bonds during the next three months approaches the first of these figures, I think, this country would have done very well, indeed.

Business Notes

Power

AIMO's MEMORANDUM

THE PRESENT parlous position of the country's energy resources has been attributed, among others, to the inadequate attention accorded to it by the Planning Commission. How serious the position is will be evident from the fact that not only is India's per capita energy consumption the lowest in the world, but as much as 61 per cent of the energy consumed is accounted for by non-commercial sources, such as cattle dung, wood, charcoal, farm waste, etc.! This only serves to bring out glaringly the fact that the energy requirements of the country have not been properly assessed, and, if assessed, not sufficiently stressed by the Planners. No wonder then that the targets envisaged by them in the Third Five-Year Plan have any relevance to the country's capacity to achieve these targets. The Working Committee of the All-India Manufacturers' Organisation (AIMO), went into this subject recently and, in a frank and forthright memorandum submitted by it to the Planning Commission on "Energy Resources for Industial Development", has tried to focus public attention on what may appear to be an unpalatable truth, namely, the non-availability of adequate energy resources in the country. Without mincing words, the AIMO Working Committee has laid the blame squarely on the Planning Commission for not according due importance to this aspect of industrialisation, as is clearly reflected in the existence today of an unusually large percentage of unutilised installed capacities in various industries.

Referring to the woeful situation in respect of the country's coal resources, the Committee has pointed out that, while the present gap between targets and achievements indicates a considerable shortfall in output, the unsatisfactory distribution arrangements, thanks to the transport bottlenecks, have made the position worse still. Presently, a number of industries are facing coal shortage of anywhere between 25 and 30 per cent of their requirements, while the percentage is as much as 50 in the case of some new industries! It may be mentioned here that we ended the Second Plan with a shortfall of as much as 4.86 million tons of coal. Though, during the first year of the Third Plan, coal production showed a marginal improvement of 0.18 million tons, the backlog to be carried forward at the end of the current year is expected to be no less than 12.62 million tons. It is against this background that the AIMO Committee has rightly questioned the wisdom of the authorities in persisting with a coal target of 97 million tons to be achieved by the end of the Third Plan.

Even in the case of the private sector, the Committee has deplored the fact that private sector collieries should have found it possible to apply for assistance amounting to only Rs. 7 crores, as against the Government of India's total loan of Rs. 17 crores from the World Bank for this purpose. The Committee should have added here that, more than the collieries, it was the Government itself that was responsible for this. Be that as it may, in view of the chronic coal shortage bedevilling the country's economic progress as a cumulative effect of all these bunglings, the AIMO has criticised the authorities for continuing to impose all manner of restrictions on the expansion of the existing private sector mines. So long as these prohibitory conditions last, it would be impossible for these mines to achieve the target of 17 million tons set for them.

In the field of electricity generation, undoubtedly considerable progress has been made; so also in the rate of consumption, which has moved up to 45 kwh per head (1961), and this is expected to go up to 95 kwh by the end of the currentPlan. But, even so, this per capita consumption compares very unfavourably with those of Japan and Italy in 1958 of 930 kwh and 928 kwh, respectively.

So much for the prevailing position. What is needed now, according to the AIMO memorandum, is to augment power generation by setting up coal-fired power stations and diesel power stations, as also atomic power stations, in spite of the fact that these entail a large foreign exchange outlay and also the fact that they are not in any way cheaper than hydel power generation. (The Chinese aggression makes this suggestion a little unrealistic).

As regards the priority to be given to rural electrification, opinions differ. Whereas one school believes in according the highest priority to industries, the others, like the AIMO, for example, have been reluctant to relegate to the background the claims of rural electrification. In fact, the AIMO Working Committee has made out a case for the upward revision of the present outlay of Rs. 105 crores on this account. The AIMO could not have thought of a more inappropriate time than the present to press this point of view.

In conclusion, the Committee has suggested that the Government should not only carry out intensive geographical surveys, but, at the same time, make fuller utilisation of all the known resources like lignite; undertake the tapping of the country's known hydraulic potential, mineral oils and natural gases, and make an intensive search for finding out the possibility of utilising wind power, solar, geo-thermal and tidal energy on a commercial basis. The Committee has also suggested the manufacture of petroleum-coke to relieve the present coal-coke shortage. Calling for the appointment of an Export Fuel Efficiency Committee to study the nature of the various industrial processes, the types of fuels required, the feasibility of shifting to alternative sources of energy, etc., the Committee has observed: All in all, it is a must that the Government should recognise the importance of energy if only for the successful implementation of our Five-Year Plans. If the present shortage were to continue, it has warned, it would not

only slow down the country's pace of industrialiastion but would also adversely affect its export earnings by starving industries with export potential of the required energy, as witness the not-too-distant experience of the jute industry.

CALCUTTA ELECTRIC SUPPLY CORPORATION'S EXPANSION

ONE FACTOR that is supposed to cause a major hurdle in the achievement of Plan projects in the industrial sphere is, beyond doubt, power. Several efforts have been made to raise the power production capacity but it seems even now that the shortages felt all round might not be relieved in the near future. The pressure of demand has been very persistent, and the electric supply industry is making efforts to expand its generating capacity. Sir William Lamond, Chairman of the Calcutta Electric Supply Corporation, speaking at the general meeting held in London last week, indicated that the Corporation was doing its best to alleviate the shortages in the Calcutta region. Through the instrumentality of the Electricity Supply Control Advisory Committee, he indicated, the Corporation was trying to spread its load as efficiently as possible. He was, however, of the opinion that the real gain lay in the increase in generating capacity which was desperately needed in the area. The company had been authorised by the Government to undertake an extension programme at New Cossipore to the tune of 50 MW. The plant installation programme was progressing and the Chairman was confident that new machine would be on commercial load by October next year. The real solution, however, would be visible when an increased import of power from Damodar Valley Corporation was possible.

The Chairman made a pointed reference to the power rates which had remained rather static. He believed that despite the continual rise in all other costs since the War, the existing rates for lights and fans and domestic power had remained unaltered for several years and other power rates had altered only to the extent necessary to reflect the greatly enhanced cost of coal. He was of the opinion that their rates for high voltage industrial power were, for energy supplied from coal-fired plant, almost the lowest in the world. The electricity suppliers had endeavoured to revise their rates on the general principle that each class of consumer should bear its proper share of the cost of production and distribution. It would be worthwhile if the comprehensive case of electricity suppliers was considered by the Government and the issues decided on the merits of the case.

Defence

RESOURCES

IN A Special Article in "The Eastern Economist" dated November 2, 1962, (pages 819—820) estimates of resources for Defence Fund which might be raised through voluntary contributions and through savings certificates and States contributions were presented. At that time, complete details in regard to National Defence Bonds were not available and hence it was not possible to include the estimated borrowings accruing to the Central Exchequer through these Bonds. According to the terms of the Defence Bonds, the interest payable will be at 4½ per cent per annum payable half-yearly and they will be issued at par in the multiples of Rs. 100. These Bonds will be redeemed at par after ten years from the date of sale and tax will not be deducted at source in the case of Bonds held by individuals. In the case of others, however, the interest will be liable to income tax. This is a medium-term national loan which is likely to have a very good response and according to the present indications the total subscriptions under this head alone might rise to Rs. 50 crores. It could have been higher if the Stock Exchanges and the bullion market had not passed through a revaluation during the past week which brought about substantial losses to many investors. If the yield from Defence Bonds alone should be around Rs. 50 crores, it is certain that the Defence Certificates and the Premium Prize Bonds will also yield Rs. 20 to 25 crores. In other words, under this head of Defence Certificates, Defence Bonds and Premium Prize Bonds, the estimated figure should change from Rs. 25 crores to Rs. 75 crores.

"The Eastern Economist" also estimated that the States would be in a position to contribute about Rs. 54.5 crores. The National Development Council has decided that the Central assistance to the States would be reduced by as much as Rs. 50 crores in 1963-64 so as to step up the Central Defence expenditure. This curtailment of Central assistance is not likely to have any impact on the contributions likely to be made by the States. They are planning to prune their expenditure for the current year and will definitely make an effort to control unnecessary expenditure.

The reappraisal of the Stock Exchanges and the all round downward turn in the share prices is likely to have an impact on the affairs of the corporate sector and it is now believed that the contributions from this particular sector might be reduced from Rs. 35 crores to Rs. 20 crores. The net position as it emerges is presented in the table below:

OVERALL ESTIMATES OF RESOURCES FOR DEFENCE FUND (Rs. Crores)

Source	Amount
A. **Voluntary Contributions**	
1. Contribution from the High-Income Group	35.0
2. Contribution from the Low-Income Group	15.0
3. Contribution from the Corporate Sector	20.0
B. **Savings and States' Contributions**	
4. From Defence Bonds, Defence Certificates and Prize Bonds	75.0
5. Contributions from States	54.5
TOTAL	199.5

Exports

NOT THE RIGHT APPROACH

COURTESY COSTS nothing, but it may earn one immense goodwill; lack of courtesy can cost dearly. This age-old golden principle appears to be at a discount in the Union Department of International Trade. A few instances have come to notice recently of some foreign dignatories vitally connected with India's export trade having not been humoured well which was their due.

A Foreign Minister of Trade passing through New Delhi, it is understood, paid a courtesy call on the Minister for International Trade in the Union Government by appointment. He was made to wait in his Secretary's office for as long a period as forty-five minutes only to be told that the Minister was too busy to spare any time for him. Another dignatory from a country which has recently joined the Aid India Consortium and for whom the Prime Minister and the Union Minister for Commerce and Industry, Mr. K. C. Reddy, could find time, even to attend a dinner party given in his honour, met not any better dealing at the hands of the Department of International Trade.

Last month two teams of Western German and Italian importers of Goa iron ore visited New Delhi to negotiate the price for the supply of this ore, but the treatment meted out to them left much to be desired. The Italian team boarded the plane back home the very next day. The German team followed soon after having been told that the Government of India's decision would be communicated to it by November 10.

Similar is stated to be the case with the offer made by the British Government in regard to training of Indians in export promotion. It took nearly six weeks

for the Department of International Trade to accept this offer, but the two nominees have yet to be selected and sent to Britain for receiving training in the British Board of Trade. A German export promotion expert is said to be in New Delhi at present waiting to be communicated whether his services are at all to be utilised by Mr. Manubhai Shah's Department.

All these instances are a significant pointer to a serious malady which afflicts the Union Department of International Trade. The concerted efforts which are supposed to be being made to step up Indian exports, obviously can be thwarted to a great extent by the lack of courtesy extended to the parties with whom we have to negotiate our export deals.

World Bank

THE NEW PRESIDENT

THE APPOINTMENT of Mr. George Woods as President of the World Bank in place of Mr. Eugene Black would be hailed in this country. Mr. Woods had been directly associated with India since 1952, when he first came over here as the head of the team sent by the World Bank to investigate the possibilities of setting up a steel plant in this country. Since then his interest in India has risen greatly. It was because of his influence that we got continued assistance from the World Bank for our various schemes of Development.

While formerly he was operating in an indirect way, now he will have the opportunity to look into the problems of developing countries directly. To him goes the credit of oraganising the Industrial Credit and Investment Corporation of India. Similarly, he has been responsible for organising development corporations in Pakistan and the Philippines. Then again the setting of the aluminium plant in this country with the collaboration of Kaisers has been largely due to his efforts. It was he who persuaded Mr. Edgar Kaiser to take an interest in the industrial development of this country. Industrialists of India had so much faith in this man that they always consulted the First Boston Corporation (with which he has been associated for such a long time as chairman) on matters of obtaining assistance from American banks and collaboration with American firms. In other words, he had been an unofficial link between Indian and American industry and finance. Mr. Woods has been a member of the governing body of the Indian Investment Centre since its very inception, and Chairman of the advisory committee of the Centre's New York office.

At the time of nationalisation of the Suez Canal, Mr. Woods played an important role in the settlement of the claims put forward by its shareholders. It is said that but for him the negotiations would not have come to a satisfactory end so soon and settled so amicably. Mr. Woods has a vast experience, a shrewed mind and a liberal outlook. The World Bank can well look forward to a period of healthy growth under his capable guidance. The job to be done at the World Bank is no doubt great, but under his stewardship, it can be expected that even the most complex of problems would be solved in the most effective manner. The dynamism that was imparted by Mr. Black to the World Bank's sister organisations like the IMF, IDA, IFC, is bound to get a further momentum for here is a man who understands each institution fully well. The underdeveloped countries on their part can hope that their problems would receive a sympathetic consideration for they know that the man heading the world institution is of a very liberal outlook.

Fertilizers

ENCOURAGING IMPROVEMENT AT SINDRI

IN THE present state of emergency in the country, the development of agriculture has been quite appropriately accorded a parallel priority to production for defence needs. Fertilisers have obviously to play a vital role in boosting our farm output. The encouraging improvement recorded by the Sindri factory in the recent past should augur well for acceleration of the development of our agrarian economy.

Production at Sindri's old Ammonium Sulphate group of plants is stated to have been restored to their full capacity. The Expansion Plants are also said to be now being operated at nearly the maximum possible capacity (90 per cent) consistent with the current limitations on the availability of coke-oven gas. The output of ammonia during the last month from the old group of plants was 8,890 metric tons, exceeding the monthly rated capacity by about 500 metric tons. Production in the Expansion Plants was of the order of 3,450 metric tons. The total production of ammonium sulphate during October was 30,463 metric tons, appreciably higher than the monthly rated capacity. Output of urea amounted to 1,849 tons. The production of double salt is also stated to have improved within the limitations imposed by restricted production of ammonia by the new plant.

Howsoever heart-warming this progress, achieved owing to an all-out effort organised during the last few months ,it is imperative that concerted efforts should be made to feed this very vital nitrogenous fertilizers manufacturing factory in the present exigencies with its full requirements of coking coal. In all, Sindri needs about 1,000 tons of coking coal per day — 60 per cent of these supplies from Dishergarh and 40 per cent from Jharia — in order to produce 600 tons of coke daily to feed the Gas Plant and at the same time to make available the requisite quantum of coke-oven gas to the Expansion Plants. A blend of 60 per cent Dishergarh coal is stated to be essential for yielding 10 million cubic feet of coke-oven gas for use in the Expansion Plants. If the requisite supplies are ensured, it could reasonably be expected that Sindri by boosting the production at the Expansion Plants to their rated capacity, will be able to turn out greater quantities of nitrogenous fertilizers the demand for which in the recent years has outstripped supplies by a wide margin. To the extent more food is produced in the country, the battle on the price front would be made easier to fight.

Industrial Estates

UNEVEN PROGRESS AND SHORTCOMINGS

ALTHOUGH ONE hears occasionally of the striking progress of an industrial estate here and an industrial estate there, one has still to know whether these estates have registered at least a more or less reasonably uniform progress throughout the country. Such an assessment would appear to be necessary, especially as new industrial estates have begun to crop up some times in the most unexpected places and certainly not always in the most suitable places.

Since the introduction of the scheme, the total number of approved estates has crossed the 200-mark (119 schemes at the end of the Second Plan and 94 under the Third Plan till June, 1962, to be precise), entailing an outlay of as much as Rs. 12 crores. According to a survey recently carried out by the "Financial Express" Bombay, the progress of these estates has been extremely tardy. Thus, although the number of industrial estates has gone up, only 69 estates are reported to have actually commenced functioning by the end of June last. Though 21 more estates had been completed, they had not started functioning for various reasons, while 16 more were still in various stages of construction.

Even the estates that have already started functioning, it is stated, have not fared well. Thus, out of 2,626 sheds constructed in all the estates by the end of March last, only 1,628 sheds (61.9 per cent) were actually in use. The percentage was still lower in the case of some individual states. In Uttar Pradesh, the Survey has mentioned, it was 34.5 per cent, in Jammu and Kashmir 37.5 per cent, in Mysore 39.8 per cent and in Maharashtra 49.4 per cent. The Survey has further observed that, in all these States, more anxiety was shown in inflating the number of estates than in the maximum utilisation of the facilities already brought into existence. Among others, it is stated, the non-utilisation of sheds in many cases has been due to lack of prior investigation and study in regard to location, while, in some other cases, it was more as a concession to popular pressure or clamour that estates were set up at places where some of the most important factors conducive to industrial development were woefully lacking. Moreover, some of the states are believed to have failed to provide even proper amenities, such as good roads, power, water, sewage, hospitals and residential areas. Some of the States are also reported to have ignored one of the main objectives of an industrial estate, namely, that of providing accommodation at an economic rent, by reason of the uneconomic use of land, heavy expenditure on construction, etc., by the authorities concerned. Although, in the earlier stages, the rent is to be subsidised, even the subsidised rent is alleged to be higher than the normal rent for similar accommodation in the neighbourhood. If this is the position with subsidised rents, what will be the position of tenants when the subsidy is withdrawn eventually, as it is bound to be?

The major handicap of these estates would appear to be the acute shortage of raw materials. Many entrepreneurs who were attracted to these estates on definite assurances in regard to supplies of raw materials, mainly iron, steel and non-ferrous metals, have found to their dismay that they can at best get only a fraction of their total requirements. For example, as the Survey points out, while the State Directors of Industries had assessed the requirements of these units for the August-September, 1962, period in respect of black sheets at 1.40 lakh tons, the actual allocation made by the Iron and Steel Controller was only 30,000 metric tons; as regards the supply of galvanised plain sheets and corrugated sheets the position was worse. For, whereas the assessed requirements were 88,210 metric tons and 11,499 metric tons, respectively, there was no allotment at all! The allocations with regard to non-ferrous metals, especially zinc and copper, according to the Survey, was only sufficient to meet 30 per cent of the actual requirements. This is, indeed, a sorry state of affairs in all conscience and requires to be looked into without delay if the country is not to be disillusioned about an otherwise potentially constructive move.

Lederle-India

NOW CYANAMID INDIA LIMITED

THE CHANGE in the name of Lederle Laboratories (India) Limited to Cyanamid India Limited, with effect from November 1, not only marks a significant event in the 15-year history of this Indo-American venture, but also is a signpost of wide import for the agrarian economy of this country. The change has been necessitated, according to Mr. William Parker, the Managing Director of Lederle-India, by the company's branching into the activities of the Agricultural Division of the parent Company—American Cyanamid. Hitherto Lederle—India had been carrying on the activities of only the Lederle Division of the American Cyanamid Company and thus was engaged in the manufacture and distribution of pharmaceutical products. The company had set up for this purpose two manufacturing units at Bulsar — the pharmaceutical unit, which commenced production in 1953, and the other one producing from local raw materials a large number of antibiotics, namely, the famed Tetracycline group antibiotics, Ledermycin, Achromycin and Aureomycin, that was commissioned early this year.

The new Agricultural Division of the company, which recently started producing and marketing animal health and veterinary products, is currently engaged in setting up a new plant for the basic manufacture of Malathion, a safe insecticide developed by Cyanamid Research. It hopes to market this product of local manufacture in the near future. Gradually, the company envisages to go into the manufacture and marketing of various other chemicals of the parent company's Agricultural Division as well. As the plans progress, the company proposes to raise its capital, in which the Indian participation at present is 24 per cent. An application to this effect has already been made to the Government of India.

In the initial stages, Malathion output is envisaged to be of the order of 160 tons per annum. Eventually, it is proposed to be stepped up to 1,000 tons. The significant role that Malathion can be expected to play in the attainment of the Third Plan target of 100 million tons of foodgrains should be evident from the fact that, according to authoritative estimates, the loss to our food crops due to insect pests is estimated around 9 million tons of grains valued at nearly Rs. 400 crores. In addition, approximately two million tons of grains, worth nearly Rs. 88 crores, are lost in storage owing to damage by insects and pests. Application of Malathion, which because of its low toxicity and high potency has been recognised and approved by the WHO as an insecticide of choice, should contribute materially towards avoidance of these losses, thus increasing the availability of foodgrains from indigenous sources.

The company has also plans to develop new insecticides suitable for Indian conditions. For this purpose, experiments are envisaged to be conducted on Indian farms. The resources of the parent company for this research work will be available to the Indian company.

Co-operation

SPECIAL EFFORT WEEK

THE NATIONAL Co-operative Union of India decided to celebrate Co-operative Week from November 3 to November 10 during which period "vigorous efforts in several directions on a continuing basis" were to be made. Mr. Braham Parkash, General Secretary of the Co-operative Union of India, stressed that all co-operatives must exert austerity and cut all avoidable expenditure. This indeed is true. During the coming period of emergency all institutions have to direct their energies to increase production of items which are vital for national defence. It is good that the co-operatives have decided to co-ordinate their activities on an all-India scale and have decided to strengthen all their agencies in the preparation and carrying out of their urban and rural plans.

Mr. Braham Parkash laid a special stress on the consumer co-operatives. This was all the more important because during the coming months there is every likelihood of shortages appearing in respect of certain commodities. It would be through association of consumers in the process of distribution that a smooth functioning of the consumer market can be assured. During the week, possible benefits of housing co-operatives and several schemes under which assistance from the State was available for housing co-operatives had to be explained to the people in details.

In the rural sector too, co-operatives have to play a very significant role. The role of service co-operatives in providing assistance to rural communities in different fields of economic activity has to be explained to the people in the villages. The co-operatives have to generate a sense of emergency so that the people in the rural areas exerted to their maximum to raise the output in the field of agriculture.

FROM THE CAPITAL'S CORRIDORS

NATIONAL DEVELOPMENT COUNCIL MEETING

THE National Development Council, the highest policy making body of the country, met in an emergency session here on November 4 and 5 to consider the situation arising out of the Chinese invasion of our northern frontier. In particular, the Council deliberated on questions relating to rephasing of the Third Plan, holding of the priceline and participation of the masses in the struggle to keep the flag of freedom flying. It declared at the end of this meeting: "We are fighting for our freedom and our honour, to save the democratic way of life adopted in our Constitution. With faith in the justness of our cause, we dedicate to protect our motherland."

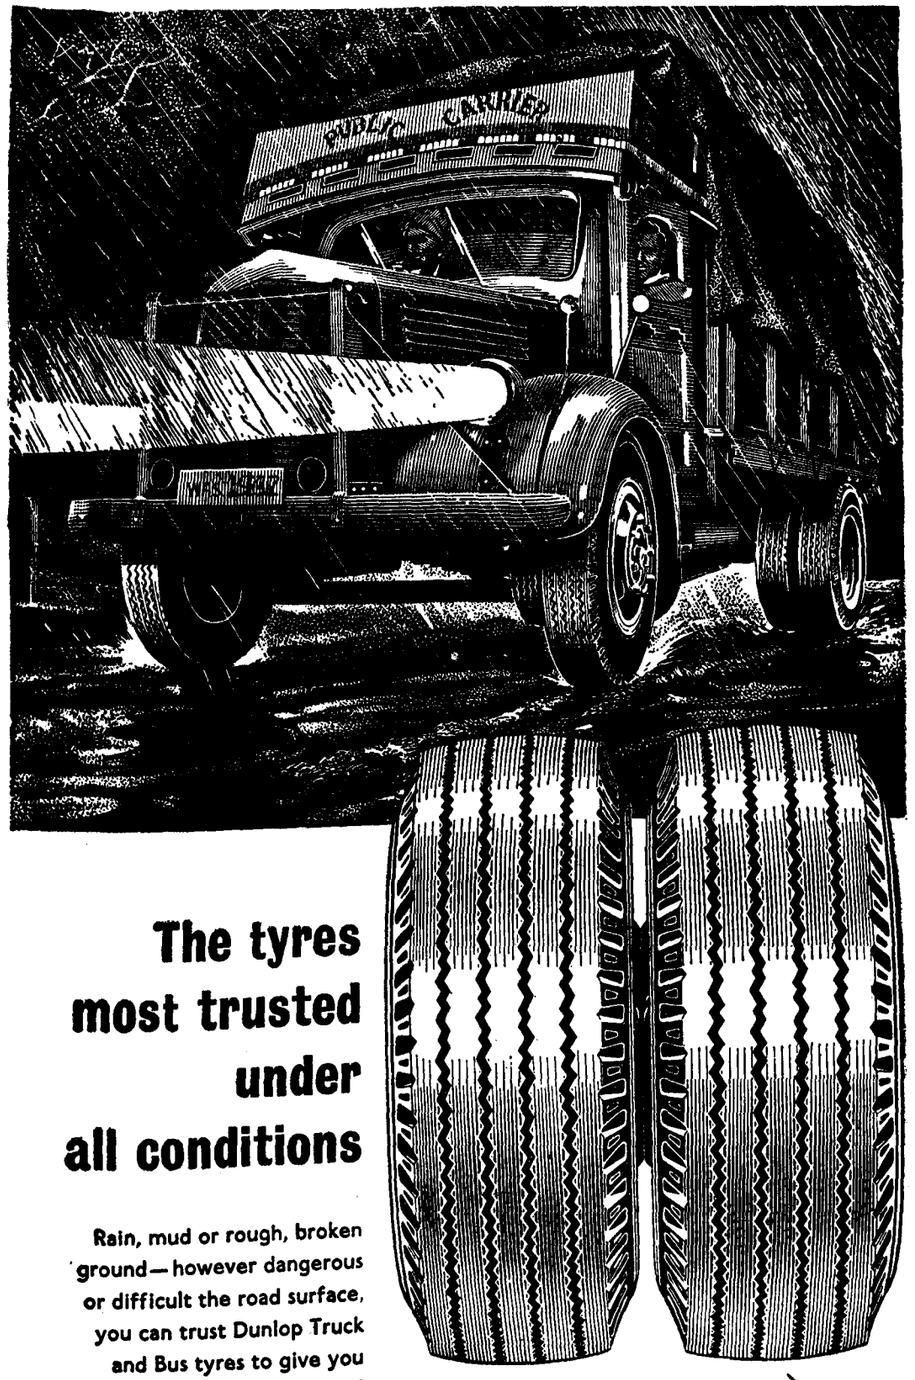
The Chief Ministers pledged "the entire resources, in men, money and material, of their respective States, to the making of a supreme effort to maintain inviolate the integrity of the country."

The Council considered the country's plans of development as integral part of the national defence; all these plans have to be geared to the defence effort.

So far as the rephasing of the Third Plan is concerned, a note prepared by the Planning Commission for this meeting throws ample light on the directions which the Planning Commission has given to the States for making the necessary adjustments in their Plans. The Planning Commission feels that during the current and the next year of the Plan, the Centre will be called upon to bear extraordinarily heavy burdens the magnitude of which cannot be precisely estimated at present. The States also will have to incur expenditure on several new activities arising from the emergency. Large amounts of purchasing power will be released and the supply of many goods for civilian consumption will have to be restricted. In the circumstances, both for economic reasons and for stepping up the tempo of development and production related to the defence effort, utmost economy will have to be observed. This, the Planning Commission feels, will have to be done first in relation to the State Plans. During 1963-64, it has been indicated to the States that the Central assistance for their Plans will have to be curtailed from Rs. 450 crores to Rs. 400 crores. The States' envisaged outlay of Rs. 275 to Rs. 300 crores, however, has been kept intact.

To make the maximum contribution towards defence effort in the immediate future, priorities in the State Plans have to be reviewed in the light of the following broad principles:

(a) re-examining the priority of activities which are not sufficiently closely related to present needs;
(b) rephasing large projects so as to reduce the claims on scarce resources (materials, foreign exchange, etc.) and to produce the largest possible results in the short run;
(c) intensifying action for increasing agricultural and industrial production;
(d) making the most effective use possible of trained manpower and multiplying facilities for training of personnel, including shortening of training periods;
(e) strengthening the administrative machinery at each level and mobilizing fully the leadership and machinery of Zila Parishads, Panchayat Samitis and Panchayats of municipal bodies in the urban areas and of voluntary organizations;
(f) reviewing existing loan policies of Government, substituting, as far as possible, assistance in kind for assistance in cash, and limiting assistance to essential purposes and for parties really in need; and
(g) ensuring maximum use of local resources.



The individual sectorial Plans of the States have to be reviewed according to the following programme:

(a) **General**
(i) Every project under construction should be reviewed with a view to speeding of its flow of benefits.
(ii) The priority of every project, now in progress or planned for implementation, should be tested in relation to present Defence needs and early addition to production potential.
(iii) Preference should be given to small and medium-sized projects which are capable of yielding results quickly, say, within one year or at the most two years.
(iv) Long-term projects already in progress should be suitably re-phased so as to reduce present claims on scarce resources.
(v) Utilization of existing capacities of projects already completed should be ensured and of those nearing completion should be speeded up.
(vi) Efficient maintenance is of the utmost importance; but foreign exchange expenditures required for maintenance should be cut down to the maximum extent possible.

(b) **Irrigation and Power**
(i) All measures needed for utilizing fully the irrigation potential of existing projects and those nearing completion should receive immediate attention.
(ii) Completion of medium irrigation scheme in progress should have first priority as against new medium schemes and all medium schemes should have absolute preference over large projects.
(iii) Subject to certain exceptions, large major projects, on which comparatively small expenditures have been incurred (say, 10 per cent of estimated cost) should be rephased and deferred as far as possible.
(iv) Existing flood control embankments should be strengthened adequately. The execution of flood control works should be speeded up. In respect of new flood control works, only short-term ones should be taken up.
(v) Power development has high priority for Defence production. Supplementary programmes for additional capacity, where feasible on a short-term basis, may be taken up.
(vi) In operating plants and power systems the maximum efficiency should be ensured through proper maintenance, avoidance of heat losses in thermal plants and reduced transmission and distribution losses.
(vii) All non-essential power loads should be restricted. Where necessary, additional charges should be levied for such loads.

(c) **Industrial Projects**
(i) Completion of projects which are well advanced should be expedited.
(ii) Projects on which there has not been much progress so far should be rephased and deferred unless they are related to production for Defence or for essential civil supplies.
(iii) Schemes relating to Industrial Development Areas may be deferred.
(iv) Loans and assistance from State Financial Corporations and State Industrial Development Corporations should be channelled for production and development related primarily to Defence efforts.

(d) **Intensification of Agricultural Production**
(i) The most important contribution which State Plans can make is to achieve a rapid increase in

agricultural production. The Third Plan itself embodies large-scale programmes for agriculture and provides substantial resources. By and large, agricultural programmes are not yet intensive enough and the organization of supplies and services has to become much more efficient. Local communities and their leaders must be fully involved in the production drive.

(ii) In August, 1962, States were asked to step up by 20 per cent the Third Plan targets for areas to be benefited by minor irrigation (12.8 million acres) and by soil conservation on agricultural lands (11 million acres), and additional resources for the purposes were provided. These targets should now be stepped further in every State, so that 50 per cent increase is realised.

(iii) Special stress has been laid on securing urgent increase in the production of cotton and oilseeds.

(e) **Reorientation of Community Development**

(i) In community development blocks village level workers should now be given one set of tasks, only to carry out, namely, organizing agricultural extension and supplies and helping the Village Panchayat and Co-operative to draw up and implement the village production plan.

(ii) For the time being, apart from maintenance of social services already established and extension of rural water supply, the funds allotted to Community Development Blocks should be diverted to the utmost extent possible for agricultural development.

(iii) The target for extension of dry farming, which has been placed in the Third Plan at 22 million acres, should be increased at 50 million acres. Responsibility for realising this should be placed squarely on the Community Development Organization. The target should be broken down through Zila Parishads and Panchayat Samitis by Districts, Blocks and Villages.

(f) **Production of Fruits, Vegetables, Fish, Eggs and Milk:** Production programmes relating to these subsidiary foods should be intensified, especially those which are capable of speedy execution. Special efforts should be made in the vicinity of cities and towns. Detailed proposals for intensifying present programmes have been formulated and will be sent to States.

(g) **Co-operation:** Execution of Plan programmes for co-operative credit, co-operative marketing and co-operative farming should be speeded up. Organization of labour co-operatives and consumer co-operatives should be undertaken as immediate priorities.

(h) **Rural works programme:** The rural works programme will be continued, but it will be concentrated on works relating to agricultural production and in areas which have been markedly backward in development.

(i) **Roads and Road Transport**

(i) Roads and bridges of strategic importance and trunk routes should be strengthened. The first priority should be to strengthen weak bridges on strategic roads and trunk routes. Special attention should be given to missing links. New roads programmes and programmes relating to construction of roads of lower priority should be deferred.

(ii) Programmes for expanding fleets of nationalised undertakings for passenger services should be held in abeyance or curtailed of the minimum and where possible, deferred.

(iii) Road transport services in the private sector, specially for goods traffic, should be reorganized, as far as possible, on the basis of pooling of vehicles. This would make it possible both to utilise available capacity to the maximum advantage and to release a proportion of vehicles for use in other areas.

(j) **Education**

(i) In primary schools, specially in classes I and II, double shifts may be introduced.

(ii) Facilities for teaching in science and in technical subjects at the secondary level should be expanded further and improved.

(iii) Programme for NCC and ACC should be expanded; also physical education.

(iv) Targets for technical education should be raised. By ensuring the utmost economy in respect of buildings, these higher targets should be realised without increasing financial provisions under the Plan.

(v) To the utmost extent, educational buildings should be put up with local materials, and existing buildings should be used intensively.

(vi) All economies possible in the expansion in education at the secondary stage should be achieved.

(vii) Programmes for conversion of high schools into higher secondary schools and for primary schools into basic schools should be staggered.

(viii) Proposals for opening new universities and new arts colleges should be postponed. This may be counterbalanced by increase in admission capacity in some of the smaller colleges.

(ix) Schemes for expanding cultural programmes may be held in abeyance as far as possible.

(k) **Health**

(i) The National Malaria Eradication Programme should be continued as at present.

(ii) Training programmes for medical and paramedical personnel should be expanded, and periods of training shortened wherever possible.

(iii) The urban water supply programmes should be staggered over a longer period.

(iv) Expansion programmes for hospitals and dispensaries should be rephased. Wherever construction is necessary, it should be of the cheaper kind.

(v) New schemes should not be sanctioned unless they are urgent and related to present requirements.

(l) **Welfare of backward classes:** The proposed expansion in the number of Tribal Development Blocks under the Third Plan should be deferred.

(m) **Housing**

(i) Generally, housing programmes will have to be slowed down, including industrial housing, low-income housing and slum clearance.

(ii) Land acquisition programmes should go forward but, as far as possible, payments should be made in Defence Bonds, Defence Certificates, etc.

In regard to the Central Plan projects, utmost priority is to be accorded to development in the vital sectors, namely, transport, steel, heavy engineering, power, coal and cement. The agricultural development in the State Plans is given the highest priority. The Union Ministry of Food and Agriculture is being geared to the new tasks of co-ordination and rendering of advice. Some of the Central projects on which work is in the preliminary stages at present and which can be postponed without affecting the defence effort, may be postponed so as to make available all the funds for fighting the Chinese menace.

Price Policy: To fight the battle on the price front, the State Governments have been advised to set up immediately the necessary organisations at State and district levels for regulating and ensuring supplies for civilian consumption at reasonable prices. In respect of

food, cotton textiles and drugs and medicines detailed instructions are expected to be issued by the Central Ministries concerned very shortly. The accent is to be on stepping up of production of essential commodities of civilian consumption along with the maximum production of materials required by the Defence Ministry. A large network of co-operative and other consumer stores is envisaged to be set up immediately in accordance with a scheme drawn up by the Union Ministry of Community Development and Co-operation. Vigilance committees to stand watch on the situation are also to be set up through the length and breadth of the country. Hoarding and profiteering are envisaged to be checked with a firm hand.

FEDERATION ON EMERGENCY

An emergency meeting of the Committee of the Federation of Indian Chambers of Commerce and Industry was convened here on Monday to consider the situation arising out of the blatent Chinese aggression and the measures to be taken by the business community to meet this grave peril. Mr. Shriyans Prasad Jain, President of the Federation, pointed out that the Regional Conference of the Federation's constituents in South India on October 23, had already called upon business men to exercise self-restraint and to do their utmost to ensure that the tensions in the economy that were likely to be generated in such a situation were checked effectively. The nation had reasons to congratulate itself, he added, at the manner in which all sections of the community, not the least, business men and industrialists, had spontaneously responded to the appeals made, and the remarkable enthusiasm that had been generated. He was of the opinion that this enthusiasm should be channelised in the most fruitful direction. He, therefore, pointed out that business men had a special role to play and they should follow certain precise rules.

They, he said, should (a) maintain and increase production of commodities essential to the life of the nation, (b) increase the potential of war supplies; (c) maintain the priceline; (d) subscribe to the various schemes of Defence Bonds, Loans and Funds and (e) should mount a massive propaganda for the success of all these.

He indicated that the following commodities were essential to the life of the nation: (1) Foodgrains and wheat flour, (2) Sugar and gur, (3) Cotton piecegoods, (4) Woollen piecegoods, (5) Vanaspati and other edible oils, (6) Footwear, (7) Paper, (8) Drugs and pharmaceuticals, (9) Coal and coke, and (10) Cement.

He was confident that the position in regard to the supplies and availability of foodgrains, sugar, cotton piecegoods, and vanaspati were fairly satisfactory. Even then, he said, the problem had to be seen not from a narrow and immediate point of view, but as it is likely to emerge over the next two or three years. He suggested that every effort should be made to increase the production of these essential items. In the case of cotton textiles, he opined, the industry could increase production, of course with the co-operation of labour, if supplies of raw cotton were augmented. Although a good crop was aniticipated, he added arrangements would still have to be made to import the requisite quantity of cotton from abroad.

Cement output, he pointed out, could be raised by about 7.5 lakh tons if coal supplies were adequate and further by a million tons or so if the requisite machinery for producing slag cement could be imported expeditiously. In the case of commodities like the woollen piecegoods and yarn, footwear and also cement, people, he said, have to be told to consume less.

As regards increasing the war potential, Mr. Jain pointed out that discussion were already going on in Government circles. By and large, the industry did not yet know as to what would be the equipment it would be expected to produce. A sense of urgency has, however, to permeate the consideration of all these vital issues so that right from now the industry could prepare for the trying times ahead. He urged that (a) the Government should decide, as early as possible, as to what were the strategic supplies that had to be developed and supplied from our existing industrial potential and in what manner the switch-over should take place; (2) to the extent possible, essential industries must be supplied with full requirements of indigenous as well as imported raw materials; (3) the recent improvement in the supplies of coal and rail transport must be maintained and further improved — (Special examination must be made of the transport problem because of the possible increased pressure); (4) since railway transport may not be able to meet the situation fully, all kinds of restrictions on road transport should be removed and at the same time fuller use should be made of inland waterways; (5) efforts must be made to stockpile strategic materials like steel, non-ferrous metals, petroleum products and the like by securing them from friendly countries; (6) in order to enable industries to take the best out of the existing equipment, amendment to the statute concerning labour should be effected to enable three-shift working wherever possible, and for working additional hours and on holidays.

Mr. Jain assured on behalf of the Federation that the central organisations of manufacturers of the various commodities would make arrangements to see that the products of their industries were distributed in such a manner that they reached the ultimate consumers at prices they were expected to pay. They would also ensure that such commodities which could be price-marked were stamped with retail prices. The retailers, particularly in large towns, would be asked to display prices in prominent places in their shops, so that the consumer knows, even before he buys, as to what he is being charged.

DEFENCE OF INDIA ORDINANCE: ALL PROVISIONS IN OPERATION

All the provisions of the Defence of India Ordinance, 1962, promulgated on October 26, have been put into effect from October 31, 1962. The Ordinance provides "for special measures to ensure the public safety and interest, the defence of India and civil defence and for the trial of certain offences." Earlier, only Section I of the Ordinance had been put into operation.

MOBILISING RESOURCES FOR DEFENCE

The Union Government has announced the details of its new borrowing programme to raise resources for meeting the emergency created by the Chinese invasion on our northern border. It consists of issue of five new series of bonds and certificates to suit all types of investors.

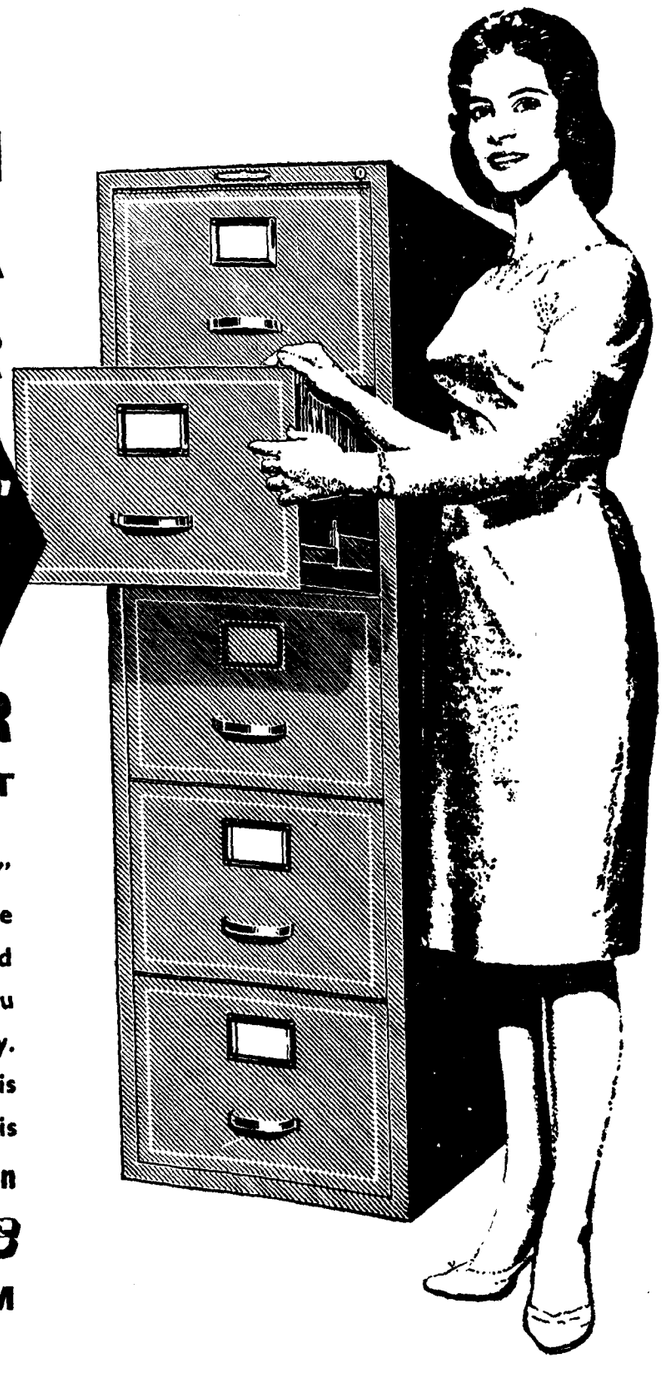
For institutional investors and also those in the higher income brackets, a new series of bonds, called the National Defence Bonds, repayable after 10 years from the date of sale, is being floated from November 10, 1962. The series will be kept on tap for a period of six months i.e. upto May 9, 1963, if not closed earlier at the discretion of the Government, and will be issued at par in multiples of Rs 100. The Bonds will carry interest, payable half-yearly, at 4¼ per cent per annum. Interest will be liable to tax, but in the case of small investors, tax will not be deducted at source at the time of payment of interest in the case of Bonds held by individuals.

To attract small savings in a larger measure, two types of certificates—10-year Defence Deposit Certificates and 12-year National Defence Certificates—are being issued. The Defence Deposits Certificates will be issued from November 10, 1962, and will carry an interest of 4½ per cent per annum, payable every year. Subscriptions will have to be in multiples of Rs. 50. The principal will be repaid after 10 years from the date of purchase. Interest will be free of income-tax. The

You can depend on BOAC

THE ROLLS ROYCE AIRLINE

Book BOAC Rolls-Royce Comet and Rolls-Royce 707 for Reliability and Clockwork Regularity.



All over the world Rolls-Royce is a by-word for sheer quality, for sumptuous comfort, for perfection in travel. This you'll find as soon as you step aboard a BOAC flight. Rolls-Royce means utterly dependable precision engineering. It is Rolls-Royce engines that supply the mighty power for BOAC Rolls-Royce Comets and Rolls-Royce 707s. That's how BOAC have won their big reputation for reliability and for on-schedule-flying. You can be sure you're in good hands when you fly BOAC!

maximum amount that can be invested in these certificates, including the investment in the Treasury Savings Deposit Certificates, will be Rs. 25,000 for individuals and Rs. 50,000 for joint holders. The existing 4 per cent 10-year Treasury Savings Deposit Certificates will cease to be issued with effect from the close of business on November 9, 1962. To enable the investors in Treasury Savings Deposit Certificates to have the benefit of higher rate of interest on the Defence Deposit Certificates choice has been offered for conversion of the former into the latter if they have been purchased on or after November 1, 1962.

The 12-year National Defence Certificates will be issued in the denominations of Rs. 5, Rs. 10, Rs. 100, Rs. 500, Rs. 1,000, Rs. 5,000 and Rs. 25,000 from November 15, 1962, and will replace the existing 12-year National Plan Savings Certificates. They will be repaid on maturity at a premium of 75 per cent of the issue price, yielding a return of 6.25 per cent per annum simple or 4.75 per cent per annum compound, as against the maturity yield of Rs. 165 on the National Plan Savings Certificates. The yield on the new series, as in the case of the old one, will be free of income-tax. The maximum amount of investment in these certificates, inclusive of the investment in the earlier Postal Savings Certificates, will be Rs. 25,000 for individuals and Rs. 50,000 for two persons jointly. The National Plan Savings Certificates purchased after November 1, 1962, can be converted into the National Defence Certificates so that the investors could have the benefit of higher return.

To encourage small savings further, a new series of prize bonds, called the Premium Prize Bonds, 1963, is proposed to be put on sale with effect from January 1. These Bonds will be issued in the denominations of Rs. 5 and Rs. 100 and will be repayable with a premium of 10 per cent five years after the date of their sale. The Bonds will be bearer bonds. In addition to the premium, the bond-holders will be eligible to participate in two draws for prizes to be held in 1964. For each Rs. 1 crore worth of bonds the prize money will be Rs. 5 lakhs in each draw for each of the two denominations and will be distributed in 243 prizes in the case of Rs. 100 denomination bonds and 568 prizes for Rs. 5 denomination bonds. The details about subsequent prize draws have not been made clear as yet. The number and amount of prize money will not be limited but will increase with every increase in the sale of Bonds. For sales of fractions of a crore of rupees, both the number and amount of prizes will be suitably adjusted. Unsold Bonds will be completely eliminated for winning prizes and all prizes will be awarded amongst the sold Bonds only. Both the premium and the prize money will be free of income-tax.

For mobilising for productive purposes the gold resources, which at present lie hoarded in private hands, 15-year Gold Bonds are envisaged to be issued from November 12, 1962. These Bonds will carry an interest of 6½ per cent subject to tax, but will be exempted from wealth tax and the tax on the capital gains which may accrue from their sale. Subscriptions to these Bonds will be in the form of gold, gold coins and/or gold ornaments. They will be treated as issued on the date the gold is tendered as subscription. The value of the gold will after assaying be calculated at the rate of Rs. 53.58 nP per 10 grammes of .995 fineness, equivalent to Rs. 62.50 nP per tola of the same fineness. In the case of individuals, the tax on interest will not be deducted at the time of payment of interest if the holder gives the declaration that the total nominal value of the Gold Bonds held by him or on his behalf does not exceed Rs. 10,000. Subscription lists for these Bonds will remain open for a period of three months from November 12, 1962, but they can be closed earlier at the discretion of the Government without notice.

COMPANY CONTRIBUTION TO NDF

With a view to enabling companies to make prompt and generous contributions to the National Defence Fund, the President has promulgated an Ordinance under which the Board of Directors of a company can, irrespective of the provisions of its Memorandum and Articles of Association, make contributions to the NDF and other Funds approved by the Government for the purpose of national defence, in excess of the limits of Rs. 25,000 or five per cent of its net profits without obtaining the approval of its shareholders as was required under the Companies Act. The Ordinance came into force immediately.

The Federation of Indian Chambers of Commerce and Industry, it is stated, will shortly finalise a scheme for corporate sector's contribution's to the National Defence Fund on a generous and regular basis during the current emergency.

WITHDRAWALS FROM IMF CREDIT

Thanks to the timely untied aid provided by the U.S.A., the U.K., Holland and West Germany to enable India to finance her maintenance imports, the Government does not intend withdrawing further 25 million dollars from the IMF credit for the present.

The aid mentioned above is untied to the projects, but is available for imports from the donar countries. It should release India's free foreign exchange for purchase of war materials.

A policy decision is also envisaged in the near future on India's purchase of military equipment and ammunition from the friendly countries who have come to her assistance in the present grave crisis. The three alternatives being studied are the commercial purchase of arms outright to the extent possible, procuring arms on deferred payment or on lend-lease basis. Deferred payment includes grant of long-term loans from the supplier countries, out of which payments can be made to the supplying concerns there.

TWO NEW U.S. LOANS

The United States Agency for International Development has made available to the Government of India two more loans, totalling $24.4 milllion (Rs. 11.6 crores), for the development of thermal power in this country. Both the loans are repayable over a period of forty years. They will carry no interest but only a service charge of three-fourths of one per cent per annum. No payment of any kind is to be made in the first 10 years.

One of the loans, amounting to $16 million, is meant for utilisation for augmenting the capacity of the Delhi 'C' thermal power station, currently under construction with an earlier grant of $4.2 million from the U.S. Government, from 36,000 KW to 2,16,000 KW. Apart from meeting the power requirements of the capital, power produced here will also be supplied to Punjab; the station will be interlinked with the Punjab State Electricity Board's Bhakra-Nangal Hydro-Electric Plant over the existing 200-mile double circuit 220 KV transmission lines.

This loan will meet the bulk of the foreign exchange cost of the expansion programme of this power station and is envisaged to be utilised for purchase in the U.S. three 60,000 KW turbine generator units, cooling towers, switchgears, transformers, coal handling equipment, engineering services and other mechanical equipment.

The second loan, amounting to $8.4 million, will help in stepping up the present 37.5 MW capacity of the thermal power station at Ramagundam by installing one 60 MW turbo-generator with associated boiler and other facilities. This plant, which is located in the heart of coal-mining area in Andhra Pradesh, will provide power for the neighbouring coal mines and for industrial development in Sipur and Mancherial. It will be interconnected with the Northern Andhra Pradesh Grid

and thus will also serve a large part of the demand in the metropolitan area of Hyderabad.

The U.S. Agency for International Development has also plans to provide loans from the sale proceeds under P.L. 480 to finance the local currency costs of these two projects which are presently estimated at Rs. 12 crores.

COMMERCIAL PURCHASES OF FOREIGN WHEAT TO BE CUT

The U.S. Administration has agreed to the Government of India's request for a reduction in India's commercial purchases of wheat. India will now be required to buy only 200,000 tons this year (July 1962 to June 1963) instead of 400,000 tons which was the agreed quantity under the original P.L. 480 deal. Commercial purchases are made generally from Australia and Canada. The 50 per cent cut means a saving of about Rs. 8 crores in foreign exchange.

The United States Government is also stated to have sounded the Union Food and Agriculture Ministry on stepping up of foodgrains supplies under PL 480 for building up adequate reserve stocks in this country to meet the exigencies of the present emergency. The proposal is being considered.

The Union Food Ministry is said to have issued directives to the States and Warehousing Corporation to step up the storage capacity to the maximum extent possible.

INDUSTRIAL TRUCE ARRANGED

An industrial truce for the period of the present state of emergency in the country was approved last week at a joint meeting of all the central employers' and workers' organizations convened by the Government of India.

The resolution passed at the meeting said: "Realizing that a grave emergency has overtaken the nation on account of the Chinese aggression and the need has arisen for taking urgent steps, in every direction, to prepare adequately for the defence of the country, and repelling the invasion of its territory, the Joint Meeting of all Central Employers' and Workers' organisations, held today, November 3, 1962, resolves that no effort shall be spared to achieve maximum production, and managements and workmen will strive in collaboration in all possible ways, to promote the defence effort of the country and reaffirms their pledge of unstinted loyalty and devotion to the country."

It was agreed that positive steps should be taken to promote constructive co-operation between managements and workers, in all possible ways.

INDUSTRIAL LICENSING COMMITTEE'S MEETING POSTPONED

The monthly meeting of the Industrial Licensing Committee scheduled for last week was postponed sine die. The Committee was set up under the industrial (Control and Regulation) Act to license industrial units according to development plan, taking into consideration the availability of raw materials, transport, fuel and power, and select their location with a view to secure even development of the country or, conversely, prevent concentration of industries in some States. The Committee is also an authority to approve foreign collaborations. Its adjournment sine die reflects the state of emergency and Government's decision to gear production to war effort.

MANUFACTURE OF ELECTRIC EQUIPMENT FOR LOCOMOTIVES

A collaboration agreement for indigenous manufacture of electrical equipment for 25 KV AC electric locomotives was signed here last week between the Union Ministry of Railways and the Group for the Study and Electrification of Railways at Single Phase, 50 cycles, Zurich. The Group is a combine of eight reputed electric equipment manufacturers of France, Belgium, Germany and Switzerland.

The electrical equipment, under the agreement, will be manufactured at the Heavy Elctricals, Bhopal, for assembly in the vehicular portions to be turned out at the Chittaranjan Locomotive Works. The Chittaranjan Locomotive Works has already commenced the manufacture of mechanical parts of such electric locomotives.

The Group has already supplied 100 AC electric locomotives to the Indian Railways. Another order has been placed on this consortium for the supply of a few more locomotives and equipment.

ADDITIONAL PAYMENTS TO CANE-GROWERS — CHANGES IN FORMULA

The Government of India had issued on August 22, 1962, a Resolution and a Press Note on the Tariff Commission's Report on the revision of the price-linking formula for sharing the price of sugar between sugar factories and cane-growers. It was stated therein that Government had decided to retain the formula notified in September, 1958, in the Sugarcane (Control) Order, after making suitable changes. Since the proposed changes had to be given retrospective effect, Parliament passed necessary legislation (on September 16, 1962) viz., the Sugarcane Control (Additional Powers) Act 1962, authorising the Central Government to amend the provisions in the Sugarcane (Control) Order relating to additional payments either prospectively or retrospectively. The Government has now finalised the changes which need to be made in these provisions and they have been notified in a Gazette Extraordinary dated November 1, 1962. The principal changes made are:

(1) The schedule of costs given by the Tariff Commission in its report of 1959 has been used for purposes of determining the ratio which the cost of sugarcane bears to the cost of sugar (including taxes). There is provision for the costs to be brought up-to-date.

(2) Three-fourths of the amount earned by factories by way of rebate in excise duty for their production during 1959-60 and 1960-61 has been ordered to be taken into account for determining the additional price to be paid to cane-growers. But this amount would be shareable in the same manner as other receipts.

(3) An allowance for the purposes of rehabilitation has been made admissible to such factories as may have actually spent certain amounts on rehabilitation or transferred such amounts as reserve to a special rehabilitation account during the year.

The Government will be shortly setting up the required machinery to determine the amount which may become due to sugarcane-growers from factories in various parts of the country. It is intended to complete this process as soon as possible, but it would involve scrutiny of accounts and other data relating to all the factories during a period of four years.

In accordance with the decision announced earlier that the minimum price of sugarcane would be linked with sugar recovery from the year 1962-63, the Government has fixed the minimum prices for sugarcane payable by individual sugar factories in the country with effect from November 1, 1962. The prices vary from Rs. 1.50 to Rs. 2.13 per maund of cane. They have been published in a Gazette of India extraordinary dated November 1, 1962, and communicated to State Governments and individual factories.

JAYANTI SHIPPING

The Union Government has given permission to the Jayanti Shipping Company to acquire five freighters of the Courtline Shipping Company of the United Kingdom for £1.2 million. Part of this payment will be made on signing the deal, and the remaining in instalments spread over a period of ten years.

NEWS IN BRIEF

INDIAN

A small-scale refrigerators factory in the private sector has been set up at Jagadhri, Punjab. It is expected that its present production of one refrigerator a day would be ultimately increased to 15 per day.

The Pakistan Government is considering the establishment of a shipping corporation with private sector participation to improve the operational efficiency of Pakistan ships on foreign routes.

*

The Government of Pakistan has invited foreign ship-builders to tender for orders worth £37 million for her merchant marine.

*

An official publication states that in 1961 the Japanese Civil Aviation Industry was ranked tenth among the 90 countries affiliated to the International Civil Aviation Organisation. This represents a remarkable advance over the 15th rank she held in the previous year.

*

An official press release from Czechoslovakia claims that the cost of living index in that country for the year ending 1961 has dropped by 5 per cent compared to 1958.

COMPANY AFFAIRS

TATA CHEMICALS

The working results of Tata Chemicals Limited for the year to June 30, 1962, reveal a profit of Rs. 16.94 lakhs which is nearly at the last year's level when the profit was Rs. 16.60 lakhs. A sum of Rs. 4 lakhs is transferred from development reserve. The Directors have recommended the payment of a dividend at the rate of 5.41 nP. per share on new ordinary shares representing proportionate dividend for one month. A dividend at the rate of 65 nP. per share was recommended on old ordinary shares of Rs. 10 each. The value of goods sold during the year, inclusive of excise duty recovered, amounted to Rs. 5.31 crores as compared to Rs. 4.16 crores during the previous year. In spite of this major advance in production and the sales to the extent of 27 per cent there was a minor decrease in profit. This, the Directors indicated, was almost entirely due to heavy rainfall during the last year's monsoon which resulted in the loss of the larger part of their company's salt harvest and necessitated the purchase of salt at an additional cost of Rs. 26.60 lakhs.

The Chairman of the company indicated in the annual report that the company is concentrating on achieving production of Soda Ash and its derivative chemicals at the full rated capacity of its plants and at the lowest possible cost. Along with this, the production of Dense Ash and Pure Salt is being pressed forward. A new series of Hooker Cells which will ultimately double the present volume of electroytic caustic production is expected to be commissioned by December. When these things have been done, the current programme of modernisation and expansion will have been completed. The company plans to increase further the production of Soda Ash by another hundred tons or so per day. If the technical studies now being made of this possibility prove it to be feasible, the company proposes to proceed with it in the assured expectation that it will strengthen the company and improve its profitability through higher production and lower costs.

The Controller of Capital Issues consented in January this year to the issue to the existing shareholders of 5,03,920 new ordinary shares of Rs. 10 each, at a premium of 50 nP. per share in the ratio of one new share for every five shares held. The Consent Order stated that any surplus unsubscribed shares should be distributed among subscribing shareholders who apply for additional shares, on an equitable basis with reference to the number of shares already held, provided that shareholders who had renounced their rights either in whole or in part, would not be entitled to apply for these additional shares. The issue was oversubscribed, and the new equity shares have qualified for dividend with effect from 1st June, 1962.

AIR - INDIA

Profit and loss accounts of Air-India reveal that during the year to March 31, 1962, the company registered a reduced operating profit at Rs. 67.99 lakhs against Rs. 117.41 lakhs a year before. Net surplus was also lower at Rs. 38.86 lakhs against Rs. 67.97 lakhs last year. It may, however, be observed that net worth of the company in terms of capital and reserves has increased to Rs. 27.93 crores against Rs. 21.38 crores at the financial year 1960-61. As is indicated, this year was essentially one of transitions for air transport industry. It was the period in which massive world-wide increase of capacity has brought about sharply decreased load factors resulting in serious financial losses for many of the major airline companies.

The Corporation commenced the year with a fleet of 13 aircraft comprising 3 Boeing 707 jets, nine Super Constellations and one Dakota used for non-commercial purposes. Two Boeings were added to the fleet in April 1961 and March 1962. A sixth Boeing was added to the fleet in April 1962.

The Chairman has indicated that the international airlines industry is growing acutely competitive one. During the previous year, the industry suffered from excess of capacity in relation to demand which is primarily responsible for its low load factor. This situation, the Chairman adds, is likely to continue for some time more. The constant expansion of the international air transport industry through the creation of new carriers of or expansion of small regional airlines in the long haul operations further aggravated the existing excess of capacity over demand and has led to widespread unhealthy practices. The Corporation, the Chairman points out, feels that such a situation should not be allowed to aggravate although the Corporation is confident that it would itself be amongst those able to survive the crippling competition. The question of excessive capacity is linked with that of levels of fares and rates. While by and large fares have over the years been steadily reduced in the tourist and economy classes, it is felt by many in the industry including the Corporation that the process of reducing fares should be continued and if possible accelerated in the future with a view to create a much larger market than is available at the present fair levels.

NEW ISSUES

The following companies were authorised to issue further capital. The consents are valid for 12 months.

The Central Bank of India Ltd., Bombay, will raise further capital of Rs. 3.15 crores (nominal) divided into 630,000 new ordinary shares of Rs. 50 each, to be issued for cash at a premium of Rs. 10 per share, Rs. 25 paid-up.

Bombay Suburban Electric Supply Ltd., Bombay, is issuing capital of Rs. 187.50 lakhs consisting of convertible debentures of Rs. 87.50 lakhs and mortgaged debentures of Rs. 1 crore.

Precision Bearings India Ltd., Bombay, a new company, is raising capital of Rs. 105 lakhs in equity shares of Rs. 100 each for cash at par. Out of this, shares of the value of Rs. 30 lakhs will be offered to Norma-Hoffman Bearings Corporation, USA, and Rs. 18 lakhs to IFC, Washington.

Trianthrene Dyes, Drugs and Organics Ltd., Bombay, a new company will issue capital of Rs. 50 lakhs in equity shares of Rs. 100 each for cash at par.

Nepa Chemicals Ltd., a public company, registered in the State of Madhya Pradesh and engaged in the manufacture of heavy chemicals, is issuing capital of Rs. 50 lakhs (including Rs. 3.35 lakhs already issued) divided into 40,000 equity and 100,000 9.5 per cent cumulative redeemable preference shares of Rs. 100 each, for cash at par.

Rajasthan Textile Manufacturing Company Ltd. is to issue capital of Rs. 40 lakhs divided into Rs. 32 lakhs in equity shares and Rs. 8 lakhs in preference shares.

The Yemmiganur Spinning Mills Ltd., Andhra Pradesh, is issuing capital of Rs. 25 lakhs for cash at par, divided into 20,000 equity shares and 5,000 9.3 per cent (subject to tax) preference shares of Rs. 100 each.

(Continued from page 866)

nearly 65 to 70 per cent ilmenite. The total reserves of about 245 million tonnes of ilmenite are estimated. Titanium is both light and most plentiful. It is known as the metal of tomorrow. Its significant properties are its low density (about 0.6 that of steel), magnificient corrosion resistence to marine and saline atmosphere, its good resistence to oxidation damage upto 649°C and its allotropy which permits the formulation of very strong (upto 200,000 psi) alloys. Titanium is finding increasing use in aircraft and missiles.

The chief source of the vanadium in the country is the vanadium bearing titaniferous magnesite ore found in a belt stretching from southern part of the Singhbhum district of Bihar to Mayurbhanj district of Orissa. The reserves are estimated at 224 million tonnes. The vanadium oxide (V_2O_3) content in this deposit has been found to vary from 0.5 to 0.48 per cent going upto 8 per cent in some cases. Vanadium has a relatively high melting point (1899°C) and a relatively low density about midway between the densities of Ti and steel. A number of simple vanadium alloys appear to beat the best titanium alloys and stainless steel in short-time strength and creep properties in the range 538°C-649°C. Vanadium alloys are dutile and can be welded. Its thermal conductivity is double that of Ti or stainless steel which are important for both aircraft and nuclear reactor applications. Vanadium steel when further alloyed with other elements like chromium, manganese, tungsten etc. its property is further increased and utilised for the production of high speed tools. Such high speed steels are used in the manufacture of axles, clutch, gear etc. where strength, hardness and fatigue are primary requisite. The country has adequate resources for chromium and manganese ores.

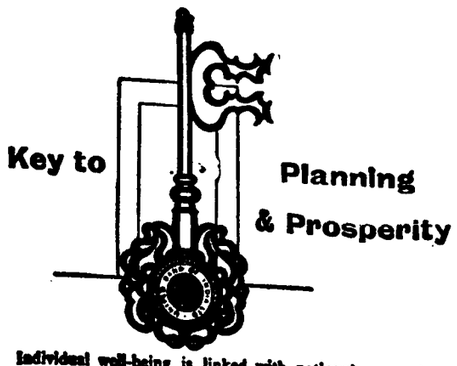
During the years 1945 to 1946 an attempt was made to produce ferro-vanadium by a newly formed company styled as the National Vanadium Trust Ltd. But the company stopped the work in April, 1946, the plant is located at Rairangpur in Orissa. It is utmost important to produce ferro-vanadium by reviving the old plant or making an ancillary unit to Rourkela. The entire requirements of ferro-vanadium and also considerable quantity of vanadium bearing steel ore imported.

It has highest melting point (3410°C). It is used mostly as cutting tools. Tungsten carbide is the well-known product for the drilling bits. Wolfram is the chief ore found in India though in limited quantity. The ore is known to occur only at two places, one at Chenadpather in Bankura district, West Bengal, and the other in Degana hill, Jodhpur district, Rajasthan.

Besides minerals and the metals discussed above which are required for armament purposes, the country possesses as well good resources of beryllium ore. Beryllium and its alloys are also reported to be used in many high speed aircraft and reactors. Other minerals like mica, manganese ore, aluminium ore etc. which are directly or indirectly used in the manufacture of various components are found in adequate quantity in the country and there could be no deficiency in meeting the expanded requirements. Small resources of nickel and cadmium metals have also been found. These metals would be recovered as by-product during the electrolytic production of copper and zinc metals shortly. To conclude, it may be stated as an objective proposition that India has good resources of most of the required minerals and it can conveniently depend and utilise its own resources for building up heavy equipment and war materials.

THE MYSORE KIRLOSKAR LIMITED
Yantrapur, P. O. Harihar

NOTICE



NOTICE is hereby given that the Twentyfirst Annual General Meeting of the Company will be held on Saturday the 8th December, 1962 at 11-00 A.M. (I.S.T.) at the Registered Office of the Company at Harihar to transact the usual business the details of which have been made known to the share holders separately by notice sent along with the Balance Sheet and Profit and Loss Account and Directors' Report.

The Share Transfer Books and Membership Register shall remain closed from the 24th November, 1962 to the 8th December, 1962 (both days inclusive).

By Order of the Board,
For THE MYSORE KIRLOSKAR LIMITED

V. K. BODAS
Asstt. Secretary.

Dated 18th October, 1962.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1

with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.

offers complete banking service

ANNOUNCEMENT REGARDING THE ISSUE OF 110,000 EQUITY SHARES OF RS. 10 EACH AT PAR IN TERMS OF THE PROSPECTUS.

A Copy of the Prospectus together with the documents required to be attached thereto has been duly filed with the Registrar of Companies, West Bengal.

WELLMAN INCANDESCENT INDIA LIMITED
Regd. Office: 8, Harington Street, Calcutta-16

EXISTING AND PROPOSED ACTIVITIES:

The object of the Company with reference to the proposed issue will be to undertake the design, production and sale of all types of oil fired, gas fired, coal fired and electrically heated furnaces, ovens mechanical handling and allied equipment.

With the approval of the Ministry of Steel and Heavy Industries Government of India a Technical Assistance Agreement has been entered into between the Company and the Wellman Smith Owen Engineering Corporation Ltd. of London with its subsidiaries including Incandescent Heat Groups of Companies, the largest designers and manufacturers of industrial furnaces and heat treatment equipment in the world. Under the agreement the company is given the right to manufacture in India the products designed by the Wellman Incandescent Group of Companies. The technical consultants will assist and advise the company in the preparation of design drawings specifications and other technical data, in tendering for contracts and for the construction, erection and commissioning of the products and the purchase of components and equipment required to be imported in India.

LOCATION OF THE INDUSTRY:

Part of the Fabrication and manufacture will be undertaken by the Company itself at the plant located at the Howrah Industrial Estate in West Bengal. A major part of the fabrication and manufacture will be subcontracted to various other manufacturers.

BOARD OF DIRECTORS

Name and Address of Directors and their Occupation	Description
1) Maharaja Sir P. C. Bhanjdeo of Mayurbhang (Chairman) 3, Rainy Park, Calcutta. Company Director.	Director of:- Burn & Co. Ltd., The Hooghly Docking and Engineering Co. Ltd., The Indian Iron & Steel Co. Ltd., Union Carbide India Ltd., India Steamship Co. Ltd., etc., etc.
2) Donald Allen Hume, 107, Leigham Court Road, London, England. Business Executive.	Director of: The Wellman Smith Owen Engineering Corpn. Ltd. Robinson and Kershaw Ltd., England.
3) George Dallimore Wright, 107, Leigham Court Road, London, England Business Executive.	Director of: Incandescent Limited.
Albert Edwin Crawley, 57/1, Ballygunje Circular Road, Calcutta. Consulting Engineer.	Alternate Director to Mr. G. D. Wright.
4) Barendra Prasad Ray, 2A, Dhanada Ghosh Street, Calcutta-5. Solicitor.	Director of: Baghmari Tea Co. Ltd., Rewa Coal Fields Ltd. Kumardhubi Fireclay and Silica Works Ltd. Eagle Rolling Mills Ltd., Ganges Printing Ink Factory Ltd., Partner of: Orr Dignam & Co., Calcutta, etc., etc.
5) Bryan Allan Harper, 8, Harington Street, Calcutta-16. Thermal Engineer.	Managing Director.
6) Santosh Kumar Basu, P-141, Lake Road, Calcutta-29. Chartered Secretary.	Secretary of the Company.

SHARE CAPITAL

Authorised:
500,000 Equity Shares of Rs. 10 each .. Rs. 5,000,000|-

Issued & Subscribed:
70 Equity Shares of Rs. 10 each .. Rs. 700|-

Present Issue:
249,930 Equity Shares of Rs. 10 each .. Rs. 2,499,300|-

OUT OF THE PRESENT ISSUE:

(a) The Wellman Smith Owen Engg. Corpn. Ltd. of London have agreed

to take up and will be allotted 125,000 Equity shares of Rs. 10 each at per .. Rs. 1,250,000

(b) The Directors, their associates and their friends have agreed to subscribe for and will be allotted 14,930 Equity Shares of Rs. 10 each at per .. Rs. 149,300

(c) NOW OFFERED AT PAR FOR PUBLIC SUBSCRIPTION 110,000 Equity Shares of Rs. 10 each .. Rs. 1,100,000

Rs. 2,499,300

DATES OF THE OPENING AND CLOSING OF THE SUBSCRIPTION LIST:

The Subscription list will open at the commencement of Banking hours on 19th November, 1962, and will remain open until the close of banking hours on 24th November, 1962 unless closed earlier at the discretion of the Directors but not before the close of banking hours on 21st November, 1962.

APPLICATION FOR SHARES AND ALLOTMENTS:

Application forms along with copies of the prospectus can be had from the registered office of the Company or from the Bankers and Brokers whose names and address are given below:

BANKER

1) Mercantile Bank Ltd., Calcutta, and its branches at Delhi, New Delhi, Bombay and Madras.

2) The Bank of India Ltd., Calcutta, its head office at Bombay, and its Branches at Delhi, Madras, Hyderabad, Ahmedabad and Indore.

BROKERS:

CALCUTTA : Place, Siddons & Gough (Private) Ltd., 6, Lyons Range, Calcutta-1.

BOMBAY : Lewis & Jones, Bank of Baroda Building, Apolo St., Bombay-1.
Batlivala & Karnani, Union Bank Building, 1st Floor, Dalal St. Bombay-1.

DELHI : Harbans Singh Mehta & Co., 22, Regal Buildings, Parliament Street, P.B. No. 300, New Delhi.

MADRAS : Paterson & Co., 22, Errabalu Chetty St., P.O. Box 48, Madras-1.

Company Meeting

THE CALCUTTA ELECTRIC SUPPLY CORPORATION

SIR WILLIAM LAMOND'S REVIEW

The 65th Annual General Meeting of The Calcutta Electric Supply Corporation, Ltd., was held on November 1, at Victoria House, Vernon Place, London. W.C., Sir William Lamond, chairman, presiding.

The following is his review, which had been circulated with the report and accounts:

It is with very deep regret that I have to record the death on 19th November, 1961, of Sir Harry Burn who had been a member of your Board since 1947 and was Chairman from 1954 until his death. Sir Harry worked tirelessly in the interests of the Company and his experience was of great value. He is missed by all his colleagues. The Board elected me to succeed him — an honour which I greatly appreciate. Mr. I. A. Macpherson has been appointed Deputy Chairman.

To fill vacancies on the Board Sir Owain Jenkins and Mr. A. R. Colley were appointed to be Directors. Both Sir Owain and Mr. Colley with their wide experience in their respective spheres will give valuable assistance to the Board. Those two appointments now come up for confirmation.

It is also with deep regret that I record the death on 1st July, 1962, of Dr. B. C. Roy, Chief Minister of West Bengal. Successive Chairmen and Agents of this Company have been honoured by his friendship and have been privileged to have the benefit of his advic and guidance.

In the Chairman's Review for the year ended 31st March, 1961, mention was made of the series of breakdowns of plant that occurred at our New Cossipore Generating Station towards the end of that year and at the beginning of the year 1961-62. These breakdowns had a twofold effect in the year under review; first to the extent to which the output of the machines which were out of action could not be covered by increased generation elsewhere or by increased import from the Damodar Valley Corporation, the demand on our system was unsatisfied and the consequent load shedding involved us in loss of Revenue; and secondly, to the extent to which these outages could be covered by increased generation with less efficient plant elsewhere in our system and by increased import (which in fact happened to a substantial degree) they involved us in enhanced Revenue Expenditure, quite apart from the actual cost of repairing the damaged machines. This abnormal Revenue Expenditure is, under the provisions of the Electricity (Supply) Act, 1948, being recovered from the Contingency Reserve Fund.

Serious as were the effects of these breakdowns on our Revenues they were equally serious for our consumers, particularly our industrial consumers, who had to bear the brunt of the drastic load shedding that was necessary and I welcome this opportunity of expressing once more the Board's great appreciation of their cooperation during this difficult period. The load shedding and the load spreading which were then necessary unfortunately still persist, as was predicted last year, though of course not to the extent that was the case when our New Cossipore machines were out of action.

EXPANDING ECONOMY

India is on the threshold of an industrial revolution which obviously generates pressures within an economy, the expansion of which has of necessity been planned against the background of an acute shortage of foreign exchange. One of these pressures is a shortage of power which has for some years now been manifest throughout the country. We can regard this as one of the growing pains of an expanding economy but whilst it persists, the electricity supply industry must make every effort to expand its generating capacity, and at the same time, to ensure maximum utilisation of existing capacity.

In Calcutta we are doing both: the latter through the instrumentality of the Electricity Supply Control Advisory Committee on which our industrial consumer interests are represented and which makes recommendations to Government with regard to load spreading and also to the amount of, and the conditions under which new load should be connected to our system. But, of course, the real remedy lies in the increase in generating capacity which is so desperately needed in the area.

NEW COSSIPORE EXTENSION

Last year you were informed that Government, reversing its previous decision, had at last authorised our 50 MW extension at New Cossipore. During the year under review great progress has been made on the foundation raft and the new pumphouse monolith, both of which were completed ahead of time; the plant manufacturing programme in this country is also well up to schedule and I have every confidence that this new machine will be on commercial load in October next year — about the same time as we have been promised the first tranche of the power we shall be importing in increasing quantity from the West Bengal Government State Electricity Board in the future. The present shortage will thus continue for at least another year and the position between now and then can only be alleviated by an increase in the import of power from the Damodar Valley Corporation hitherto pegged at the contractual figure of 105 MVA. Any surplus in the Damodar Valley Corporation system which can be transmitted to Calcutta, even if only during the evening peak hours when our own system is so hard pressed, brings great relief to industry in the area and particularly to the jute industry which is of such national importance from a foreign exchange earning point of view.

We realise that the Damodar Valley Corporation is at times itself hard pressed and often has the same difficulty that we have experienced in taking plant out for overhaul. It is, therefore, with pleasure that I record our appreciation of the fact that the Damodar Valley Corporation has recently been able to increase its export to us; we are grateful to them and to the officials in Government and the State Board whose good offices have made this possible.

YEAR OF EXPANSION

It will be noted from the Report of the Directors that during the year ended 31st March, 1962, there were increased sales of energy for Power Purposes, Lights and Fans, Public Lighting and Bulk Supplies. 80 per cent of the energy sold for Power Purposes is supplied to High Tension Industrial consumers and the effect of the load shedding, to which I have already referred, has been almost entirely confined to those consumers. Consumers using energy for Lights and Fans and those receiving Bulk Supplies suffered only slightly. Thus, if there had been no load shedding the energy sold for Power Purposes would have shown a much larger increase.

In addition to large industrial consumers energy sold for Power Purposes covers a large number of small industries supplied at Low Tension. It also includes energy sold for Domestic Power Purposes the demand for which again showed a substantial growth due to the popularity of small air-conditioning units in residences and offices. Although the jute industry holds its predominating position as our largest industrial cnnsumer, supplies to that industry were less than the previous year owing to the severe shortage of raw jute in the middle of 1961. But in recent months the demand from the jute mills has greatly increased, as supplies of raw jute became more plentiful. Other important industries on our supply are Rolling Mills and Engineering Workshops, Cotton Mills, Chemical Works and Paper Mills, and with the exception of the last mentioned, their consumption has increased.

Sales of energy for Lights and Fans again increased. Various housing estates, both in the Calcutta suburbs and in other parts of our area, are still being developed.

Almost all of the increased sales for Public Lighting were for the Calcutta Corporation. Our sole consumer for traction purposes is the Calcutta Tramways Company Ltd., whose demands are not likely to show any appreciable increase.

The West Bengal State Electricity Board, which distributes entirely outside the Company's licensed area, takes 95 per cent of our Bulk Supplies. The large increase was almost entirely for that Board whose demands will continue to expand. Most of the sales under Special Contracts were at our special tariff to owners of large office and residential buildings, public institutions, cinemas and hotels. Demand from such consumers was little changed and is not likely to show much increase in the near future.

REVENUE ACCOUNT

The Revenue Account shows that gross revenue from the sale of current at £10,494,687 was just short of £700,000 more than last year — an increase of 7 per cent. This compares with percentage increases of 11 per cent in 1960-61 and 8.9 per cent in 1959-60 and reflects the effect of load shedding on our power sales, already mentioned. On the other hand, Revenue Expenditure has increased by about £1,120,000 owing for the most part to an increase of some £870,000 in the cost of power imported from the Damodar Valley Corporation. It must be realised that the price paid for bulk supplies necessarily includes interest and depreciation charges whereas such charges are not included in our own operating expenditure, being shown separately in the Accounts. The large increase in the import from the Damodar Valley Corporation has thus resulted in a disproportionate increase in our total operating expenditure.

Cost of Generation, Transmission and Distribution is about £190,000 up on last year, despite a saving of about £75,000 in the cost of coal, brought about by the breakdowns at New Cossipore, as a result of which the output of our generating stations, at 1,666 million units generated, was some 177 million units less than in 1960-61. This net increase can be attributed, for the most part, to increased salaries and wages arising out of a general revision of scales of pay which came into effect from 1st September, 1961. In 1960-61 our purchases from the Damodar Valley Corporation totalled 390.4 million units at a cost of £1,070,194; in the year under review the figures were 664.9 million units and £1,940,775. Administration and General Establishment Charges increased by about £60,000, due again, for the most part, to higher salaries and wages.

I deal now with the Net Revenue Account. Despite the uninterrupted increase in sales, the Company's rates have in recent years produced insufficient revenue to meet the increasing costs and, in addition, to earn the full Reasonable Return to which we are entitled by statute; the shortfall has been made good by transfers from reserves accumulated in the past specifically for this purpose. As is explained in the Directors' Report, the shortfall in revenue this year was £515,618 which

has been reduced to £327,802 by the transfer of the balance remaining in the Tariff and Dividends Control Reserve, namely £187,816. These reserves being now exhausted, we have, in the future, to look to current revenues to earn our Reasonable Return. We are hopeful that our recently revised rates, which I refer to below, will have this result. The Indian tax charge at £945,310 for the year is some £220,000 less than last year, due of course to the fact that for the reasons referred to above, the balance on the Revenue Account at the end of the year was some £458,000 less than last year. This tax charge does not take into account certain demands we have received from the Indian taxation authorities, which we are contesting, and which are referred to more specifically in the notes on page 10 of the directors' report. After providing for Debenture Interest and making the other usual appropriations, including the transfer of £300,000 to Special Appropriations for Plant Expansion, Replacements and Contingencies and providing for dividends on the same scale as last year, the balance on Net Revenue Account, including £124,585 brought in, amounts to £100,524.

BALANCE SHEET

The Balance Sheet shows a decline in our holding of Treasury Bills of some £400,000 as compared with last year. This represents funds used in London for the purchase of plant exported to India and for the payment of Sterling Debenture Interest, Dividends, etc. Apart from the normal expansion of the transmission and distribution system which involves capital expenditure averaging £1¼ million per annum paid, for the most part, from depreciation monies and other sources of internal finance, the extension to our New Cossipore Generating Station is estimated to cost £3½ million. To the extent by which our liquid resources are insufficient to meet the cost of this plant, when this would normally be payable, it will be met by finance specially arranged with our Bankers in India and by deferred payments which have been negotiated with certain British manufacturers. Capital expenditure during the year amounted to approximately £1.4 million of which about £225,000 was on account of the extension at New Cossipore.

REVISION OF RATES

I have referred above to the recent revision of our rates which, because of the increasing cost of imported power and of rising taxation, could no longer be delayed. Despite the continual rise in all costs since the war, our existing rates for lights and fans and for domestic power have remained unaltered for over fifteen years and other rates have altered only to the extent necessary to reflect the greatly enhanced cost of coal. In fact, our rate for high voltage industrial power was, for energy supplied from coal-fired plant, almost the lowest in the world for which statistics are available. We have endeavoured to revise our rates on the general principle that each class of consumption should bear its proper share of the cost of production and distribution. For many years now our industrial high voltage consumers have not provided an adequate share of our overall cost and so our first call has fallen on this class of consumer whose rates have been increased by about 17½ per cent on average. For the present, our other very important rates, that for lights and fans, will remain unchanged, as will also the rate for the smaller low voltage power users. The rate for the larger low voltage power users has, however, been increased by about 17½ per cent on average and our rate B (high voltage energy for domestic and commercial supplies) by about 13½ per cent. In addition meter rents have been increased. It was also our intention to increase the rates for low voltage domestic power and for distributing licensees, but at the express request of the State Electricity Board we have agreed to forgo, for the time being, the increase contemplated in these two rates. We have, however, the right to review the position.

Although the impact of the charge for Indian taxation is not always predictable year by year, we hope that this revision of rates, which came into effect from the beginning of May, this year, will result, in a full year, in more nearly equating our Clear Profit with our Reasonable Return than has been the case in the recent past. Whether it does so or not will depend also largely on the cost of imported power. If the State Board from whom, as from a year hence, we shall be importing power on an increasing scale, is able to let us have this power at a basic price, comparable to that now charged by the Damodar Valley Corporation, then our present cost structure will not be radically disturbed — otherwise a further increase in rates in 1965 when the State Board supply is expected to be fully available, may be necessary.

VISITS TO CALCUTTA

During the year Mr. Macpherson and Sir Owain Jenkins visited Calcutta where they had the great benefit of discussions with the Chief Minister, the Chairmen of the State Electricity Board and the Damodar Valley Corporation, officers of the Government of West Bengal and leaders in commerce and industry in Calcutta. They inspected all sections of our organisation and were satisfied that all was being conducted with efficiency and economy. Despite the anxious period through which we have passed and are still passing, because the power shortage still persists, the prestige of the Company in the City remains high — a tribute to the efficiency and devotion with which the Company's affairs are conducted by our Staff in India who have the great responsibility entrusted to them of running this important public service.

Our thanks are again due to the Electricity Council, the Area Boards and the various manufacturing companies who have provided facilities in this country for the post-graduate training of young Indian Engineers under our Technical Training Scheme. This scheme was introduced shortly after the war and has been a great success. It gives me much satisfaction to record that some of our earlier trainees are now holding responsible positions with our undertaking in Calcutta.

TRIBUTE TO STAFF AND EMPLOYEES

In conclusion I would remind shareholders of the debt we owe to our Staff and Employees in Calcutta. It is difficult for anyone who was not in Calcutta at the time to appreciate the difficulties with which the breakdowns of our plant at New Cossipore confronted them — difficulties which, because of the continuing power shortage, still persist. It gives me the utmost satisfaction to report that, ably led by our Agent in Calcutta, Dr. Bowker, by our Chief Engineer, Mr. Kanga, and by our Commercial Manager, Mr. Pugh, the staff proved equal to the severe calls that were made on them. Mr. Pugh has since retired after nearly 26 years with the Company in India, the last 10 in the important position of Commercial Manager. We wish him many happy years of retirement. I also wish to record the Board's appreciation of the able manner in which Mr. Colley has discharged his responsible duties as Secretary.

The report and accounts were unanimously adopted and an alteration to the Articles of Association was approved.

Note: The above statement is not a report of the proceedings of the Annual General Meeting referred to.

THE EASTERN ECONOMIST

NOVEMBER 16, 1962.

With One Will

AT no point in the parliamentary debate on the nation's resolve to repel the Chinese aggression to vindicate the inviolability of our territorial integrity was the slightest doubt left that the entire people would rise like a man, full of determination to put up a united defence, whatever the cost in effort and sacrifice. India, torn by interminable dissensions of all sorts since independence, threatening to draw her to the downward path of disintegration, shed all the petty, parochial feuds and emerged with perfect unity overnight as China threw the challenge on the NEFA front. This metamorphosis verily sprang as a boon from the lightning onslaught. It was a stroke of luck that the enemy who invaded us to smash our strength inspired us to forge solidarity with a united will and determination to fight his aggression. There was a touch of irony, as of paradox, in the Prime Minister's remark in his reply in the Lower House how he wished he could append a paragraph to the resolution to extend a vote of thanks to China for awakening our national soul.

A grave issue of extraordinary moment was being debated by Parliament with a full sense of the gravity of the situation. The fact that the nation was treated to some humiliation by the reverses in the first stage of the fighting in the north-eastern sector had chastened the mood of the House. There was deep resentment that this should have been allowed to happen on such a scale and in such an uninterrupted succession. The invasion took us unawares But could greater defences not be built, if, as the Prime Minister later stated, the possibility of an attack in this sector of the front was not ruled out for a long time past? Mr. Nehru's explanation, repeated twice or thrice in the two Houses together, about the expansion of the output of small arms in the ordnance factories, their switch-over to automatic weapons and the necessary time-lag required in the whole process does not go far enough.

This is not the time for what may be dubbed an inquisition, but the point of unpreparedness on such a surprising scale had to be driven with force and repetition. Nothing must be done during the critical situation of the emergency that may produce its own repercussions on morale, particularly on the army's morale. But a proper probe is necessary. It has been promised at an appropriate time. But it need not be regarded as in the nature of the formality of an inquest. It will be a live investigation with considerable potential for guidance to close similar likely gaps in our defence in the future.

China's massive invasion of NEFA after extensive and calculated preparations over a long time has administered a shock to the people. The theory that this is a bargaining counter to coerce India into conceding all her claims in Ladakh will not be entertained by any one. The Prime Minister, therefore, did the very thing that ought to have been done in impressing upon the people that they must take note of the deadly fact that China had entered on the phase of imperialist expansion. But expansion for what? The attempt made in certain quarters to dissociate it from international communism is, perhaps, prompted by political expediency, but it hardly carries conviction. Some MP's were forthright in quoting Mao Tse-tung on the mission of the socialist camp to spread communism by armed force. Whatever the inner purpose of China's aggressive expansionism, she must be contained at any cost in this sector. It is not necessary to amplify that in the vicinity lie the oil wells of Assam and India's Ruhr as prizes to be coveted. These cannot be dismissed as scares. However, the House fully reflected public opinion and strengthened the hands of the Government in pronouncing the people's united determination not to rest until the nation's honour and territory were redeemed.

The determination to defend and not to relax until the lost ground is recovered is a time-consuming ordeal which may be prolonged to three or four years. More important than that, it demands arms and equipment on a scale and at a cost which can be met with the co-operation of friendly countries. America, Britain and Canada, which rushed arms to us or promised planes to us, the moment we approached them, did so to stand by us in our hour of danger. It is true that the ulterior purpose of the Chinese aggression transcending India's frontier and also its repercussions beyond Asia were factors which weighed with them. India's non-alignment and its continuance have not been allowed to confuse the major objective. Now that a candid confession has been made that we were living in an artificial atmosphere of our own creation, let us address ourselves to the task of defence as realists. Of what avail is it to go on harping that we will procure arms from any country, when we are inwardly convinced that it is only the Western countries that will heed our call?

Price Policy

THE price policy announced last week-end assumes that no elaborate enforcement machinery on the pattern of the prototype introduced during World War II will be necessary at the moment, since physical controls will be reserved as a weapon of the last resort. This aversion to controls is easy to appreciate in the light of past experience. Nevertheless, the continuing prospect of a tight supply position for the civilian population makes regulation of prices and of the system of distribution of commodities of essential consumption obligatory on the Government. The policy as announced represents the first phase and covers three groups of commodities — foodgrains, cotton textiles and drugs and pharmaceuticals. They hardly extend to one-sixth of the range of articles, which may be considered, on a conservative estimate, as the minimum for the average standard of living, whether in the urban or rural areas. Among the articles which have not qualified for priority in regulation at the current stage, there are many — kerosene, matches, oils and vanaspati, footwear, paper and patent foods, for instance — that do not admit of any substantial expansion in output or supply. Economy in their use will be an imperative necessity. In any event, austerity in consumption, to the extent it is practicable, will be the supplementary means to blunt the edge of shortages and to mitigate the impact of inflation.

Cotton textiles, among the three groups included in the first phase, are amenable to smooth and efficient regulation. There already exists a close liaison between the Textile Commissioner and the industry. Fixation of prices at the ex-factory, wholesale and retail points presents no serious difficulties. Likewise, direction of output to ensure adequate quantities of coarse and low as well as middle medium varieties of cloth in popular demand can be successfully implemented. Earmarking of output for supply to the consumer stores and fair price shops, too, is easy of enforcement. Confusion is likely to arise, despite price marking and exhibition of price lists, in the smaller towns and rural centres at the retail level because of the prevalence of illiteracy. Close vigilance is the main corrective here.

The principal problem with which price policy will have to grapple is ensuring a continuous and adequate flow of foodgrains and pulses. The absolute preliminary to the programme of regulation in this sphere is building up necessary stocks by the Government. As usual, rice will present intractable difficulties. The exhortation to change or modify dietary habits is quite justified in the situation, but it is unlikely to produce any marked impression on demand. The stockpiles are to be fortified by State purchases in surplus areas from growers and in all areas from the rice mills. These domestic purchases are to be supplemented by imports — mostly under P.L. 480 shipments. Here lies the snag since the surplus quantities offered under this agreement are small. Transport is almost sure to raise obstacles to timely movements. These factors underline the need for setting up storage facilities. The Third Plan schedule is to be advanced by one year to store 3 million tons of foodgrains. The backlog in construction and the dubious shortening of the time schedule emphasize the necessity of requisitioning suitable buildings particularly for small storages.

The policy statement on foodgrains highlights the role of co-operative stores and creates the impression that the co-operatives, coupled with fair price shops for the vulnerable sections of the population in the smaller towns and rural centres, will do the trick of keeping the supply line adequately fed. In all, 200 wholesale co-operative depots and 4,000 primary stores or branches are to be ramified over cities and towns with a population of one lakh or above. Some additions to these are envisaged in the short run. No target is mentioned for the fair price shops. Confidence in setting up the co-operatives is inspired by the fact that the initial capital and working capital will be supplied in a fair proportion by the Government and so also supplies will be ensured by it.

But it must be remembered that cities and towns with a minimum population of one lakh number 107 and their aggregate population was 3.51 crores last year. The co-operatives will touch only the fringe of this urban mass. The significance of the traditional private channels of trade cannot be underrated. Associations of grain dealers (as also representative apex organisations of the corporate sector like the Federation of Indian Chambers of Commerce and Industry) have come forward with voluntary assurances to keep the price line. In the present spectacular upsurge of patriotism, they ought to be taken on trust and encouraged to forge codes of disciplinary behaviour. The emergency powers can take care of anti-social miscreants. But an obsession with the universal prevalence of profiteering is most certain to lead to a witch-hunt and choke up the distributive channels for the majority of the consumers.

The nerve-centre of this system of price regulation is to be the official Price Stabilisation Committee. Production costs and profit margins of the wholesale and retail trade will be the two basic determinants it will have to assess in recommending fair prices. No representative sample surveys on any adequate scale have been undertaken in respect of the profit margins especially at the retail end. The Committee runs the serious risk of being led by assumptions of questionable validity in this as in some other basic matters. It is vitally important that this Committee should include non-officials possessing business expertise to impart objectivity and flexibility to the methods it adopts in the discharge of its intricate work.

Oil and Emergency

THE Union Minister for Oil, Mr. K. D. Malaviya, has ruled out for the present any rationing of petrol and has remained content with appealing to the public for an austere use of kerosene. In view of the surplus that we have in the former and presumably owing to the understanding which Mr. Malaviya might have received from the Soviet Union, during his recent visit to that country, in regard to the supplies of the latter, already committed, the Oil Minister may claim justification for his attitude. But any prolongation of hostilities, as envisaged by the Prime Minister, obviously calls for a drastic reappraisal of our oil policy.

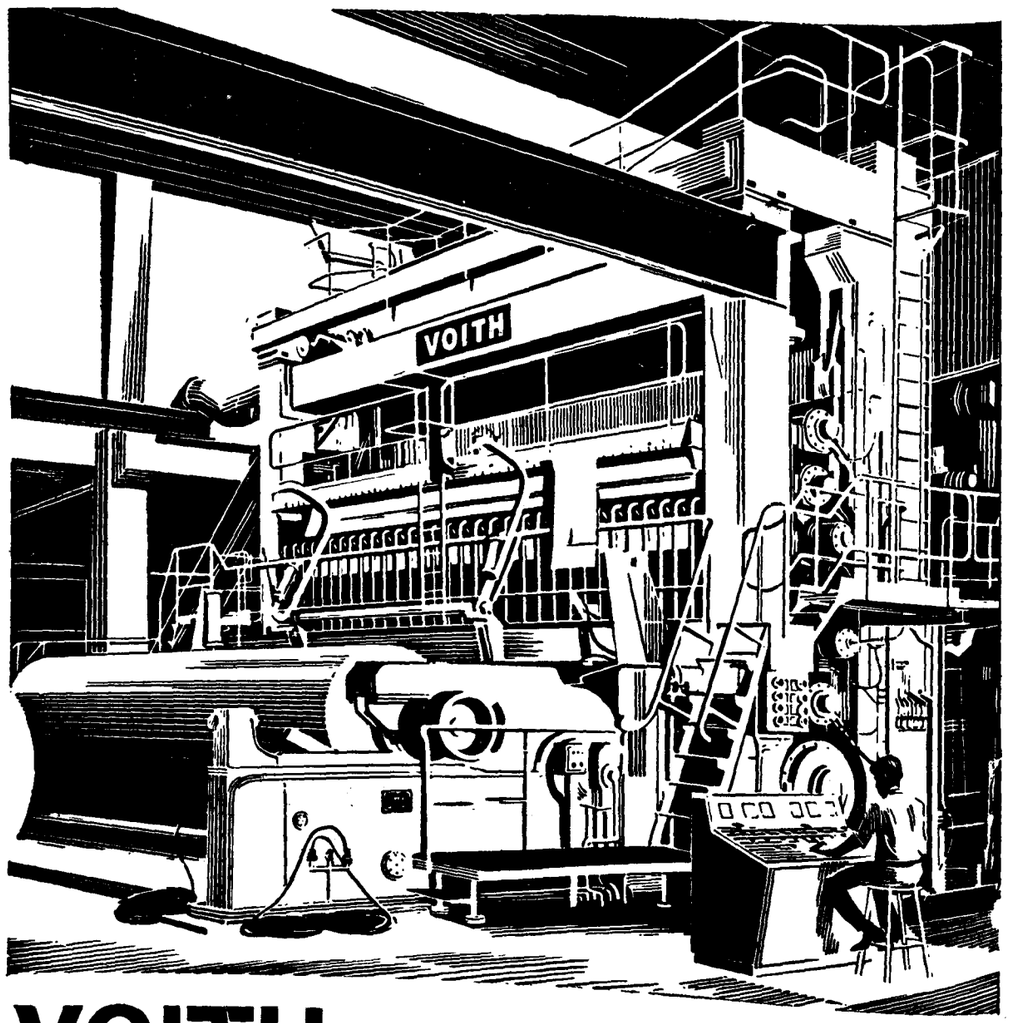
There can be little doubt that all the estimates of our requirements of petroleum products, including Mr. Malaviya's estimate of 14 million tons by the end of the current Plan and the Oil Steering Committee's estimate of 17.25 million tons, have now gone awry as a sequel to the Chinese aggression. To meet the immediate spurt in demand, hardly any emphasis needs to be placed not only on making the existing refineries, both in the public and the private sectors, work to their full capacity, but also on calling upon them to improve on their current performance to the extent possible. An estimate prepared by *The Eastern Economist* reveals that the existing refineries should be able to step up their throughput further by about 7 lakh tons per annum, through debottlenecking at two or three of these refineries at minor expense or by cutting into the time required for annual overhaul.

The question of permitting the private sector refineries to expand their capacity further has also assumed a new significance in the present circumstances. With the country's foreign exchange position coming under greater and greater stress, it may not be possible to step up foreign exchange allocations for import of petroleum products beyond a point. *The Eastern Economist* has no quarrel with the long-term objective of the Government of earmarking a dominant role for the public sector in the oil economy of the country. *But the question is how expeditiously this end should be achieved.* Setting up of new refineries is admittedly a time-consuming process and a costly affair. The present situation warrants that resort should be taken to expansion of the present refineries which should not take more than 18 to 20 months and that too with no additional finances required from the Central Exchequer, except in the case of the Noonmati Refinery. The hypothetical possibility of the course of hostilities on the eastern sector dislocating the flows of crude oil from Assam is also a factor which has an important bearing on this issue. The negotiations with the private sector refineries on the abrogation of their Refinery Agreements and replacement of these by licences under the Industries Act on an understanding being reached on some crucial issues, included in which is the question of their expansion, need to be expedited with a sense of urgency.

Even if this enhanced capacity of the private sector, along with the proposed refineries to be set up at Barauni, Koyali, in South India and at Calcutta, makes the country surplus in refining capacity at some time, the cutback in output obviously can be brought about in the refineries based on imported crude. There should be no objection by the private sector refineries to this since the use of indigenous resources to the maximum extent has a legitimate priority over imports. If the private refineries do not favour any cutback in their output at that stage, they can be allowed to function to their full capacity on the understanding that all their surplus products would have to be exported by them. The country needs to plan for plenty and not for marginal shortages, especially in an emergency.

Another important aspect of the problem that has to be given its due share of consideration is the production of lubricants in the country. The peace-time demand for lubricants at the end of the current Plan period is placed at nearly 4.5 lakh tons per annum. Even today it is around 3 lakh tons, of which only a small quantity is produced indigenously. The rest of the requirements are currently met through imports from places as far away as the United States. It is, indeed, heartening that an agreement has been reached on details regarding the ESSO Standard's proposal to set up a one-lakh-ton lubricating oils plant, in partnership with the Government; a formal pact is due to be signed shortly. For another two-lakh tons requirements, the proposal is to set up a plant in the public sector at Barauni. But in view of the increase in demand, which can be envisaged as a consequence of the present war with China, it would be judicious to plan for further capacity in this regard. Burmah-Shell is known to have put forth a proposal some three years ago for setting up a lubricating oils plant, but it was rejected outright at that time. The proposal may be revived now to tide over the difficult times ahead.

In the end, a word about the oil exploration policy of the Government should not be out of place. The Union Ministry of Oil at present has plans to spend over Rs. 200 crores on the search for oil, of which nearly Rs. 68 crores would be the expenditure in foreign exchange. In view of the necessity of diverting resources, both rupee and foreign exchange, to defence requirements, some saving needs to be effected in the exploration programme of the Oil and Natural Gas Commission. This does not imply that oil exploration should be hampered. The ONGC should be in a position to effect some economies in its working. Efforts also need be made, by imparting flexibility in approach, to interest experienced oil companies in the matter, not merely as contractors to the ONGC but on the basis of exploration on their own expense.



Steel: Production Before Price

THE marathon speech of Sir Biren Mookerjee, Chairman of the Indian Iron and Steel Company centres round the recent decision of the Government of India to reject, in part, the findings of the Tariff Commission and fix the retention prices of steel on the basis of (a) a reduced capital block due to allocation of special advance, (b) a diminished block by taking operational efficiency at 100 per cent, and (c) a curtailed working capital provision from six months' cost of production to four months only. Cogent reasoning has been advanced by him while refuting the stand taken by the Government on all the three counts. Citing the example of the United Kingdom, he has shown that the average operational efficiency there during the last eight years was 92.2 per cent and in 1959 it dropped as low as 78.9 per cent. Tracing the history of the advance of Rs. 10 crores to IISCO, he has demonstrated that the Government policy relating to the expansion of the steel industry in the private sector has undergone a revolutionary change since 1953. In a telling manner he has refuted the contention of the Government that "every indentor of steel has to pay in advance 25 per cent of the total value of his order in cash to the steel producer before it can be booked, and therefore, the companies invariably had a fairly large sum of money at their disposal"; for the last three years the audited accounts of the company show that the security deposit and advance payment in cash have not been even one per cent of the gross steel sales.

However convincing his arguments may be, the fact remains that the price of steel — whether in India, the U.K. or the United States of America — has always been influenced by extraneous factors without strict regard to the scientific principles of cost accounting and a fair return. *The Eastern Economist* reiterates its view that "the price of steel, entering, indeed, in a wide variety of industries, essential for a nation's life, might be regulated not with reference to the general principles of free enterprise or fairness of return, but by strategic elements not all of which can be fully explained." Since we expressed this view, the strategic aspect has become all too overriding in the light of the intensification of hostilities on our northern border. The nation will depend heavily on all the steel plants. In this hour of the gravest of crises since Independence no action of the community will place sectional interest before national interests, least of all entrepreneurs in the key steel industry. Sir Biren has come out with the avowed declaration that efforts will be intensified by the industry "to meet all the emergency requirements needed by the Ministry of Defence."

The need of the hour is to concentrate on increased output and eliminate all bottlenecks which have hitherto stood in the way of increased efficiency. Sir Biren has made pointed reference to some of the chief production difficulties such as the inferior quality of raw materials, the irregularity of transport and the wrong type of wagons provided to IISCO for transporting the raw materials. Coking coal among the raw materials has declined in quality considerably and the average ash content at 24 per cent — with wide fluctuations from consignment to consignment — has proved a great headache. Again, IISCO's efficiency has been affected by the unwise decision of the railway authorities to substitute the Box type wagons in place

VOITH the LARGEST manufacturers of pulp and paper machinery in Europe!

Voith are one of the leading manufacturers of paper plant in the world. With almost a century of experience in the field, Voith's outstanding contributions to the development of basic paper machinery and equipment are recognized the world over.

Voith build an almost complete range of machines for the production of groundwood and chemical pulp, the refining of paper stock and the manufacture of all grades of paper. Over 800 Voith paper making machines are in operation all over the world today.

One of their latest achievements is the successful installation and operation of **Europe's widest newsprint machine**—rated capacity 375 tons per day, wire width 8,300 mm, design speed 900 m/min.

Hydraulic turbines and transmissions represent another important field where Voith have done pioneering work. They made major improvements in the design of the Francis Turbine and the Pelton Wheel...built the first Kaplan Turbine...developed the Voith-Schneider propellers.

Voith have so far designed, constructed and supplied 17,500 hydraulic turbines with an aggregate output of 27.5 million HP, for projects in different parts of the world!

At Kansbahal, Orissa, three leading German firms—Gutehoffnungshuette Sterkrade AG., J.M. Voith G.m.b.H. and Heinrich Koppers G.m.b.H. —and a reputed Indian company, Larsen & Toubro Limited, have pooled their vast resources and experience to set up UTMAL, a major undertaking for manufacturing heavy machinery. UTMAL will play a significant role in the rapid industrialisation of our country, by supplying a wide range of industrial machinery.

THE WEEK'S NOTES

Planning

STATE PLANNING BOARDS

THE SENSE of grave emergency imparted to every branch of the nation's life and every sector of the economy could not but make its impact felt keenly on the technique of planning, particularly at the State level. The one salutary effect of this will be that the luxury of leisurely and loose planning in which the State Governments showed a tendency to indulge will vanish. Already the decision has been made that the market loans will be floated by the Central Government alone and shares would be allocated to the State Governments out of the central pool and the States immediately agreed to surrender their right to raise the loans. Much of the adaptation that would be required to be made in the State plans arises from the fact that agricultural production, road transport, a wide range of industrial output and other activities will need an intensive effort for mobilization by the State Governments as they come under their purview. During the emergency decision-making without loss of time is a supreme necessity and delays cannot be brooked. It is for this reason that the Planning Commission has impressed upon the State Governments that their responsibility for making quick decisions will increase tremendously, and, therefore, they must gear their planning methods to this new demand.

In substance it means that the time-consuming process of consultation between the State Ministers and the Planning Commission cannot be continued. Priorities in the projects will have to be rearranged and reshuffled over again according to the requirements of the exigencies arising from time to time. Likewise, allocation of expenditure will have to be shifted from what is included in the development programmes in the Third Plan to non-plan programmes, the basic criterion being the orientation of development activities to the war effort. Before the emergency, the process of consultation was abused by the State Governments to bring pressure upon the Planning Commission to allow enlargement of their plans and to demand allocations of Central assistance for them. This will now have to go. In view of the active delegation of responsibility in a pronounced manner to the State Governments, the time has become opportune for these Governments to set up their own Planning Boards. For a long time this issue of the desirability of the State Governments establishing their own Planning Boards was hanging fire and except for a few States no State Government had shown any earnest desire to take up real and fuller responsibility of planning for itself. In the abnormal situation now created, however, the Planning Commission's recently repeated suggestion to the State Governments to set up their Planning Boards will be readily accepted.

Preventive Detention

CORRECT ACTION

THE EMERGENCY powers assumed by the Government under the Ordinance recently promulgated were certainly not meant to remain mere dead letters. They were in all earnestness intended to be used and enforced with a sense of urgency over a wide field. The Fundamental Rights, incorporated in the Constitution, have provided very powerful safeguards to the citizen, which are thoroughly justified in the normal times, but whose justification in the abnormal situation created by an emergency such as that of war is completely knocked out. It was, therefore, right on the part of the Govt. ernment to hold the Fundamental Rights in abeyance and to take away from the citizen the normal right to obtain various writs from the High Courts and the Supreme Court for redress against the infringement of the Fundamental Rights. It is important to note that this has an immediate bearing on the Preventive Detention Act. Simultaneously with the action on Fundamental Rights, a number of rights, vested in a person put under preventive detention, have been kept in cold storage, in spite of their inclusion in the Preventive Detention Act. The reasons for the detainee's detention need not be disclosed to him and he has no right to move the court as under normal conditions and furthermore the detention can enure for a long period and not restricted as under the Act.

The Maharashtra Government took prompt action in putting under preventive detention a large number of individuals propagating the most questionable views and who constituted a potential threat to the security of the State. The fact that an overwhelming majority of the persons so put under custody happens to belong to the extreme pro-China Ranadive Group in the CPI's Maharashtra Wing does not affect the stand taken and explanation given by the Maharashtra Government that the action has been taken on the individual basis and not on the basis of party affiliation. It is important to remember that Mr. Limaye who was put under preventive detention by arrest in New Delhi is an Independent member of the Rajya Sabha. The State Government has been guided by the sole consideration of safeguarding security during the emergency.

In the light of this situation the protest raised by Prof. Hiren Mukherjee, Deputy Leader of the Communist Group in the Lok Sabha, against these arrests is absolutely untenable. His explanation is that the Party's National Executive has adopted a resolution branding China as an aggressor and pledged its full support to the Government in the defence against this aggression and, therefore, all elements in the Party are now governed by the dictates of this resolution. At best this is only a plausible defence which can mislead no one. Differences of opinion inside the same party are permissible features during normal times. But in an abnormal situation it is preposterous to suggest that a section of the CPI, which has not abjured its pro-China views, should be presumed to abide by the discipline of the Party. This attitude of the section amounts to treason and no Party which has a genuine sense of the honesty about its policy can tolerate the existence of such a section inside it. The straightforward course for the CPI's National Executive to adopt was to amputate this obnoxious limb. It showed neither the courage nor the inclination to do it. Perhaps it is entertaining a feeling of inward glee that what it dared not do is being done for it in one State. The debate in the Lok Sabha on the nation's resolve to repel aggression has brought to light the activities of the pro-China lobby which is disseminating dangerous views holding up aggression as emancipation. It is high time the screw of the Preventive Detention Act was turned tightly against these elements.

U.S. Elections

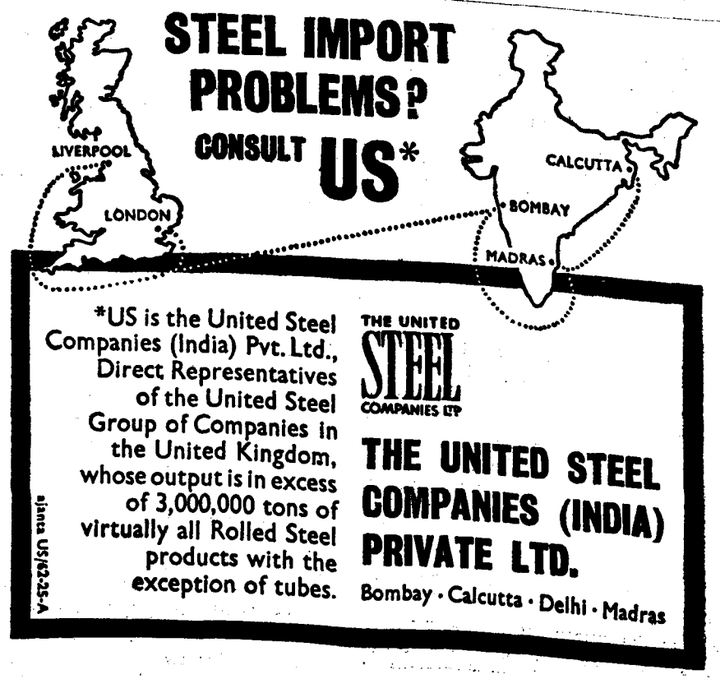
DEMOCRATIC VICTORY

CHANGES IN the mid-stream in the position of the parties in both the Houses of Congress are a normal occurrence. They take place usually to the great embarrassment of the President who is confronted with an Opposition returning after the mid-term elections with an accretion of strength. President Kennedy was spared this fate. His Democratic Party has emerged with an improved strength in the House of Representatives and with a clear two-thirds majority in the Senate.

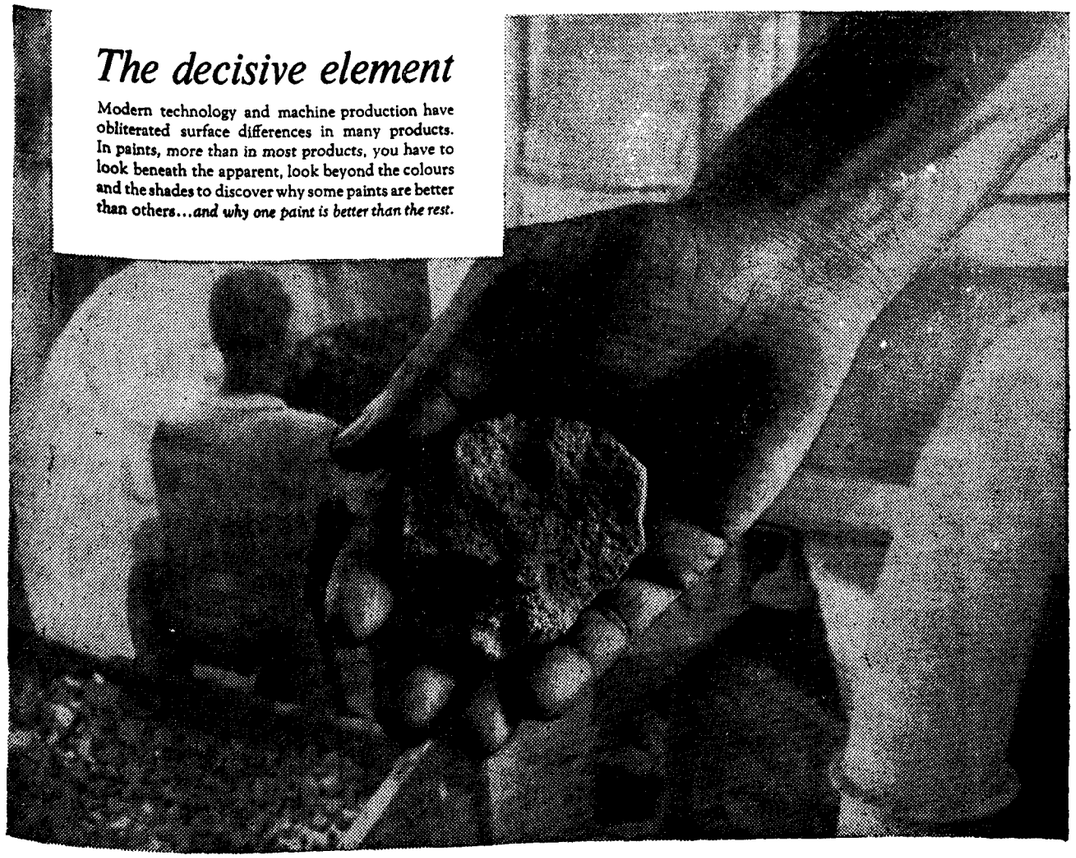
The Cuban crisis and President Kennedy's resolute handling of it were undoubtedly strong elements in the switch-over of that margin of floating votes to the Democrats. The outcome of the crisis in Cuba is not only a matter of national pride for America, but a great achievement in the cause of warding off the threat of communism in the two Americas. Usually the enthusiasm of the voter is at a low ebb at the mid-term elections.

But on this occasion the heavy polling can be ascribed to a genuine interest created in national and international issues.

From the view-point of India this victory for the Democratic Party is significant. The recent tide of opposition, or at least the cold attitude, to a vigorous programme of foreign aid had presented a somewhat anxious problem for the underdeveloped countries. In spite of her balance of payments difficulties, America stands out as the most liberal and the biggest supplier of economic aid to the developing countries. President Kennedy's hands will now be strengthened to pursue the bold policy of foreign aid which he launched with such earnestness. From the domestic angle, the change in the party position would bring undoubted gains in enabling the President to push up his programmes without much hindrance. But doubts are expressed, and perhaps with some force, in certain quarters how far the new majority would enable the President to go ahead with his liberal reform programme of the new frontier. The legislative schedule which he has chalked out ahead involves federal financial outlays on a number of social and welfare reforms. To push this legislation through with ease and smoothness, he required a return to Congress of liberal Democrats. But it would appear that this has not happened in a full measure. The possibility still remains that Republicans and Democrats from the South may make a common cause to put a brake on his policy of civil rights.



In the gubernatorial elections there was on the whole no change in the overall party position. But two results have attracted notice which they were bound to. Mr. Nixon's defeat in the election for the Governorship of California has a deep significance. The consensus is that after this defeat Mr. Nixon's political survival becomes an extremely rare possibility. In the New York State Mr. Nelson Rockefeller has been elected for the second term with a thumping majority. He now emerges as the Republican candidate for the Presidential election of 1964.

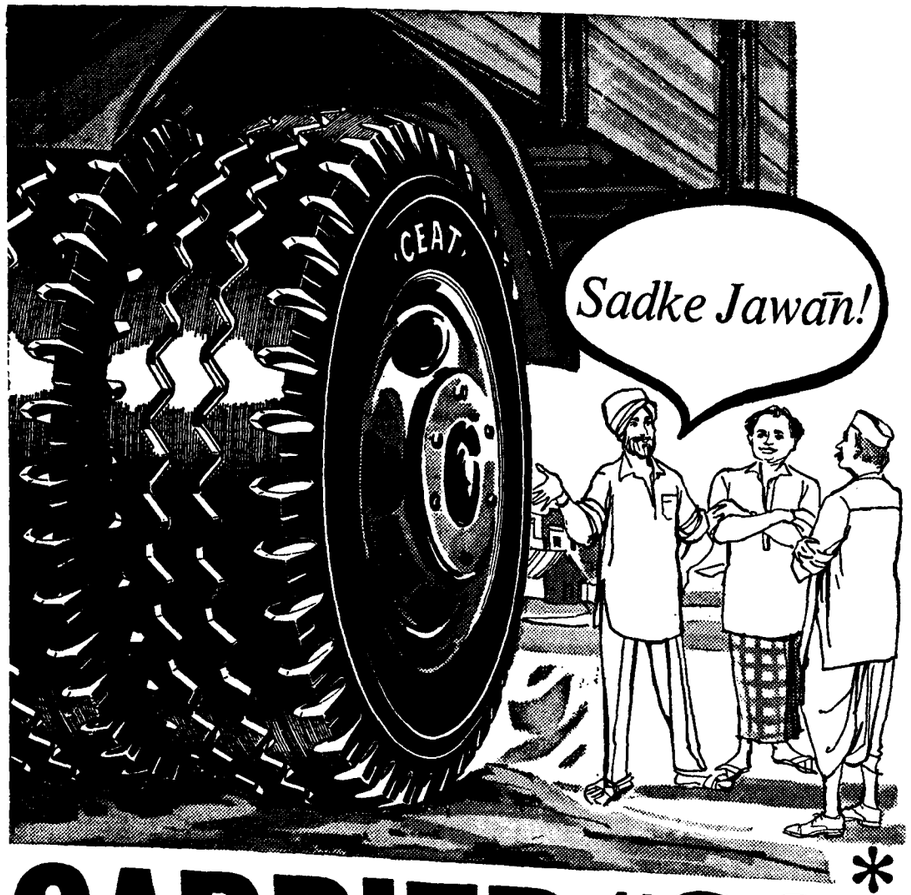


Nepal

A WELCOME APPEAL

IN ISSUING a passionate appeal to the followers of the Nepali Congress in that country to stop their agitation for the restoration of democratic rights, Mr. Subarna Shamshere, the Acting President of the Congress, has taken the most welcome move and also taken it at the most critical juncture. It is to be trusted that the followers of the Nepali Congress would respond to his appeal and desist from engaging in any activity which would create embarrassment and tensions for the Government of Nepal at this time.' It is a total mistake to suppose that the invasion of India by China is a matter with which Nepal is not concerned in any manner. At the present time the relations between China and Nepal are the closest to a point which history never witnessed before. But it is significant to recall that when the Communist dragon volunteered to extend the assurance of military help to Nepal against aggression from "any quarter" (unmistakably implying India), King Mahendra maintained a calculated silence and gave no response. Was it not because he is fully conscious of the danger that is posed to the security and sovereignty of Nepal once China's military assistance is accepted and the Chinese hordes are allowed to swamp Nepalese territory? This one vital development should convince Nepal of the real source of threat to her independent existence.

The Nepalese Government is harbouring a strong grievance against India ostensibly because India has given asylum to the leaders of the Nepali Congress who have chosen to go into exile. She believes that India is conniving at the surreptitious supply of arms from inside her borders by these leaders and their sympathisers to the followers of the Nepali Congress in their violent rebellious activities. The best way to arrive at the truth in this issue is joint investigations into specific allegations of such connivance and recording of joint reports along with notes of dissent. Nepal has not found its way to accepting this convincing course. And in the absence of any alternative solution to remove this suspicion and fear, King Mahendra's advisers, particularly the Foreign Minister, Dr. Tulsi Giri, are seizing the opportunity to poison the relations between India and Nepal in their eager desire to draw Nepal closer to China. The fact that China is not waging this war for some square kilometres of frontier soil, but she has definite, deep-laid and long-term designs of imposing international Communism by armed force, is now clear. This is the time when in their own interest Nepal and India should revive the traditional friendly relations. A rapprochement is now sorely needed.



Resources To provide top quality products and service to a nation-wide market year after year after year, an organisation must have command over men, machinery and materials on a massive scale. Shalimar Paint has the resources. It had them to begin with sixty years ago—and it has built them up progressively over six decades of successful leadership of India's paint industry. Quite apart from being the finest organisation of talents and facilities producing a comprehensive range of paints for the nation's homes and industries, Shalimar Paint's overseas associates help keep it continually abreast of international developments. In every Shalimar paint you are offered the sum of four decisive elements—resources, research, know-how, quality-control.

THE STATUS OF "PROFITEERS" IN INDIA

By ODYSSEUS

HOW DID IT COME ABOUT that the UK, first country to industrialise, did not keep her long lead but was increasingly overtaken in wealth by the USA in the 19th century, and still more in the 20th?

It was, of course, because the USA developed new techniques and technologies faster than the UK, for as I have often had occasion to insist here, economic advance springs less from capital formation than from employing existing resources in a different way, in doing new things with them, irrespective of whether those resources increase or not. But why did the UK not develop the new technologies, like electricity and the internal combustion engine, which were first exploited in the USA?

In his newly published "American and British Technology in the 19th Century (Camb. Univ. Press. London. 32 sh. 6d.), Professor H. J. Habukkuk, of Oxford, suggests several interesting answers.

The first is that of various factors of production in short supply, a shortage of labour is likely to provide a greater stimulus to change and growth than a scarcity of finance. It was the labour shortage in the UK that in the 18th century stimulated invention in the cotton textile industry. A shortage of labour reveals itself to an established industry by a rise in wages and a threatened decrease in the size of its labour force. If the industry does nothing to increase the productivity of its labour, it will have to contract. A shortage of capital, on the other hand, *does not* show itself in a decrease in capital already employed but in inability to expand, so that shortage of labour is a greater incentive to search for new methods than a shortage of capital. At the beginning of the 19th century the UK's labour shortage turned into labour abundance as population grew, the new poor relief stimulated births, the armies which had absorbed huge numbers in the Napoleonic wars were demobilised, thousands of Irish immigrants came in, and as technical changes in agriculture depressed rural wages and increased the supply of cheap labour to industry.

In the USA, on the other hand, industrial employers had, from the first, to pay high wages to attract workers from the land, which was abundant and cheap, while labour was scarce. Men of small means could set themselves up as independent farmers, whereas, in the UK, land was scarce in relation to labour and its supply restricted by the existence of large estates. To set up as a tenant farmer required considerable capital and a man could generally enter agriculture only as a labourer commanding low wages. A general shortage of labour is felt most in the unskilled grades, because workers in low paid activities are readier to seek better paid jobs when labour is scarce than when it is abundant.

All this forced US entrepreneurs to pay high wages to unskilled workers, and this stimulated them to adopt labour-saving, capital-intensive techniques. Scarce labour compelled the economical use of workers by "capital deepening", whereas, in the UK, abundant labour encouraged wasteful use of workers and "capital widening", i.e. the multiplication of machines of the existing type worked by additional hands, rather than the invention of new machines that would enable the same number of hands to produce a greater volume of goods.

ABUNDANT LABOUR

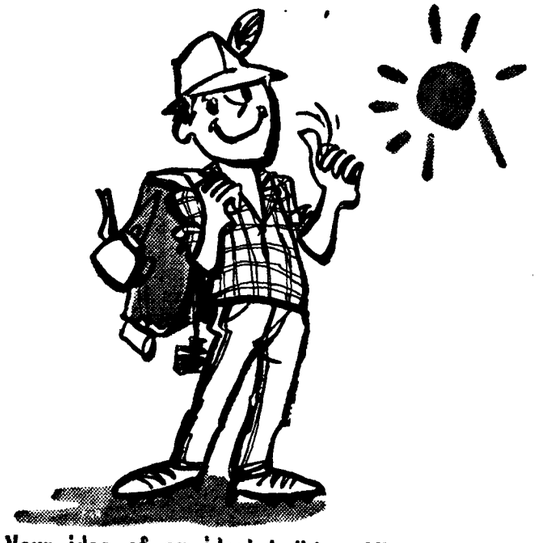
Abundant labour in the UK also slowed technological progress, because labour-saving was likely to replace by a machine, or by a better machine, labour that was already employed. In the USA, labour-saving devices made a *limited labour force more* effective without displacing workers. Consequently, there was far less opposition in the USA to new labour-saving practices, or machines, or administrative methods of *economising labour*. The fear of unemployment was less, and the chances greater of gaining in higher wages from increased productivity. It was no accident, that scientific systems of labour management originated in the USA. In turn, careful management of labour bred careful habits in the workers. In the UK, the manager's indifference to waste set the example for the workers.

With postwar overfull employment, British entrepreneurs have become infinitely more labour-saving and management-conscious but, with memories of labour surpluses in the 19th century and of massive unemployment between the wars, the unions resist innovations and waste of labour is widespread, particularly in the old established industries like the railways, which at present keep some 18,000 superfluous workers on the pay rolls of their workshops. The newer expanding industries are, however, for the most part as efficient as any in the world.

Another weakness, which slowed the UK's economic growth in the 19th century, was a phenomenon with which we are familiar in India: the persistence, along side factory industry, of handicraft workers producing the same goods. Between 1819 and 1829, the number of hand looms fell from 240,000 to 225,000, but the output per handloom rose between 25 and 30 percent and the prices of their products fell. This was not because of technical improvements in the hand looms but because of longer hours of work at each loom. The hand loom weavers struggled to compete with the power looms. This harmed both the factory and handicraft industries, because the increased handloom production caused *prices to fall and the profits of* the factories to be lower than they would have been, thus reducing the ability and the incentive of factory owners to instal more, or better, looms. If the handloom weavers had not been ready to produce more at lower prices, the entrepreneurs who bought their goods would have had incentives to withdraw their capital from handicraft and devote it to industrial enterprise. Thus the persistence of the handlooms slowed the mechanisation and advance of the whole economy. In the light of these facts, I suggest that India's declining cotton textile exports are connected with the strenuous and well-meaning, but as it seems to me, misguided efforts (from the viewpoint of India's economy as a whole) to keep the village weavers going.

THE STATUS SEEKERS

Another factor which set limits to the multiplication of wealth in 19th century England was the social ambition of the entrepreneur. Eighteenth century England was dominated by the landed aristocracy. Although there were many exceptions, broadly speaking this class were not the originators or leaders in the industrial revolution. Innovation came mostly from the commercial classes, particularly the Non-



conformists, Quakers, and Presbyterian Scots, whose ambition was to accumulate enough money to buy an estate, to send their sons to one of the great public schools and to Oxford, to lead the lives of country gentlemen, and to be accepted socially into the elite. A manufacturer, whose aim was to cease to be a manufacturer would, for that reason, plough back his profits all the more vigorously until he had made enough, but, when he had achieved that, not even a high return on further investment would induce him to continue. Where he sold out, the buyer would have invested his funds in existing equipment and would have less inducement to scrap it in favour of new technologies. More commonly the manufacturer did not sell out, but became a part-time industrialist, dividing his energies between country life and industry, to the obvious detriment of industry. Recruitment of talent to industry was also diminished by the social prestige of service in the army and the civil service, into which the sons of successful manufacturers were increasingly drawn.

In the USA, there was no established heirarchy to impede social mobility. As a source of social prestige, business had few competitors. Horace Alger, the hero of the American success story, wanted to be a business man, not a general, a civil servant, or a landowner. Americans of ambition and ability turned to business, not only because of the gains to be made, but because successful business men had the highest and most respected status in the country. There was no haemorrage of capital and ability from industry and trade into landownership and politics. In the UK, Robert Peel and Gladstone both came of industrial families, but their abilities were devoted to politics.

These facts fully bear out Professor Hagen's interesting analysis in his "Theory of Social Change", outlined here on October 26. Professor Hagen pointed out that changes began in a static, traditional society when some group felt that it had lost the respect of other groups whose esteem it valued. Since everyone seeks the social approval of his fellows, a group which feels socially deprived becomes more and more critical of the traditional structure and seeks to change it. Professor Hagen insisted that it is not the mere possibility of ascent to social recognition that is important in securing changes devoted to economic growth, but that what counts is specifically the social recognition that is accorded to economic prowess. If the socially frustrated and ambitious can gain recognition in the traditionally esteemed occupations of a society—such as landownership, the army, the priesthood, or the humane arts—then they will strive for these. Whether they strive for success in industry depends partly on the difficulty of gaining traditional recognition, partly on the availability of technological skills, but, above all, on the degree of prestige accorded to success in industry, trade, or commerce.

Would you not agree, as a broad generalisation, that in India, over wide areas of society, the traditional high castes continue to enjoy the greatest prestige, that, next to them, comes the prestige of government service, and that industrialists, business men and traders come a long way down the list? As long as this is so, the multiplication of wealth in India will be impeded. Many and great are the qualities of Brahmins and government servants, but they are not specialists in the art of making money. They are apt to despise business men as "profiteers." Capital imports and new schools are, however, bought out of excess profits, not out of mediocre profits, still less out of losses.

I commend "American and British Technology in the 19th Century" to your attention for the lessons that it suggests to contemporary India.

ACCOSET-50

makes linings and joints as strong as the firebricks themselves

Composed of finely ground plastic clays, high alumina burnt refractory materials and special chemicals, **ACCOSET-50** gives good bonding strength and high heat resistance. Once it is dried and burnt **ACCOSET-50** becomes *one with the bricks.*

YOU CAN USE ACCOSET-50

for jointing, repairing and patching
for bonding and laying firebricks of any shape
for protective wash for furnace walls and floors
for monolithic and rammed linings

ACCOSET-50 — your refractory monolithic cement that makes strong joints to improve furnace thermal efficiency.

ACCOSET-50 — saves your time, saves your money

The European Scene

O.E.C.D. MEETS THIS MONTH

From Our Special West European Correspondent

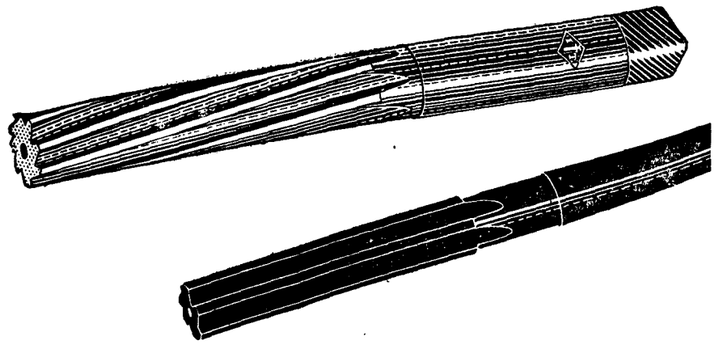
PARIS, November 11.

EXPERTS have been meeting in committee here this week to prepare the second annual conference of the Organisation for Economic Co-operation and Development in Paris on November 27 and 28. This second meeting of the 20 nations of the OECD (the 18 members of the old Organisation for European Economic Co-operation, plus the USA and Canada) promises to be just an important and considerably more practical than last November's initial gathering. Last year, it will be remembered, the 20 adopted a common programme requiring a 50 per cent increase in their total production in the decade 1960-1970. That impressive objective was proposed by the Americans, but nothing was said about how it was to be attained. Events since have shown that most Common Market countries (and perhaps the Six taken as a whole) were capable of keeping up the pace necessary to reach that target, but the North Americans and the British were very far from doing so. This month's meeting will get down to practical issues, by suggesting the sort of policy that all the 20 must follow if this rate of expansion is to be facilitated.

Moreover, it is learned at the last minute that another practical question, and one of direct interest to India and other developing countries, has unexpectedly been placed near the top of the agenda. This is the matter of international guarantees for foreign private investment. Whatever comes of the conference at the end of the month, it can be said that the OECD is at least trying to live up to its name: it is not limiting itself to co-operation between rich countries (which was the task of the old OEEC) but is seeking to promote development, both by ensuring rapid growth in the West and by stimulating development aid to the industrialising regions. The dynamism is supplied by the Kennedy administration in Washington, whose delegation here is pushing the others to adopt progressive positions. Some of the Europeans, and notably the West Germans, are less anxious to follow them, and one hears the opinion expressed in the wings of the preparatory meetings that Washington is not so much concerned to activate the OECD as to get the approval of the Europeans for the expansionary policy it wishes to pursue at home. That is to say, the Kennedy administration is meeting opposition in the USA, for its "reflationary" programme, from orthodox bankers and financiers who consider that inflation is still the main menace to the US economy; by getting the Europeans to endorse its expansionary stand, it can hope to disarm some of this domestic criticism.

The question of guarantees for foreign private investment has been brought up by certain Europeans, and has been included among the main subjects of this month's meeting by the OECD's secretary, Mr. Kristinsen. The idea is to work out a multilateral code for the treatment of private capital imports, so that when an investor places funds in a developing country he is not relying solely on the promises of the local regime but has the security of an agreed international procedure in case of dispute. The European Payments Union began working on such a code back in 1957, and a detailed project was later drawn up by Herman Abs, the leading West German banker, by Lord Shawcross and by Dr. Rheinhardt, an eminent Swiss banker. This year the Economic and Industrial Consultative Committee of the OECD (which groups private Western interests that advise and "lobby" the international organisation) modified this plan and put it up officially to the OECD. It suggests that a formal code of good behaviour in treatment of foreign private investments be written and submitted to ratification by all the members of the OECD as well as by all developing countries that import, or want to import, private capital. Secondly, that some sort of international organism, grouping both lending and borrowing countries, be set up to see that this code is implemented, so that there would be a multilateral, formal guarantee for all investments. The main practical provisions of the code would be those stipulating that all engagements freely contracted must be executed; that there can be no unilateral confiscation without just and effective compensation, fixed by due process of law; and that profits from private investments can be freely transferred.

One is entitled to be skeptical about the beneficial effects of such an international convention. The date at which it began to be discussed — 1957 — is to be noted, for it came as a reaction to the blow that Western investors' confidence suffered in the demagogic and arbitrary way that Colonel Nasser nationalised the Suez Canal. This does not mean that the suggested code is a sinister attempt to prevent developing countries from exercising their economic sovereignty. It would not come into force until they had consented to sign it, and presumably they would not bind themselves to a convention that limited their freedom. Even when they had signed it, a mere scrap of paper would not make impossible acts of confisation by dictators. But if the existence of an international convention encourages private investors, who now shrink from political risks, to place funds in ways helpful to developing countries, the idea has no harm in it. If the OECD backs the proposal later this month, the scheme will be submitted to Delhi and similar capitals for their consideration.

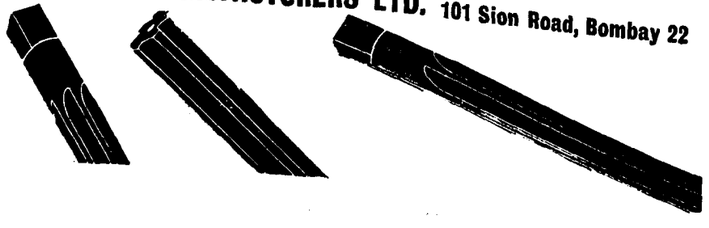


Of more immediate concern to OECD members is the resolution being discussed here this week by the experts, which will invite all Western Governments to abstain from practising restrictive monetary, fiscal or economic policies when seeking to rectify their balance of payments. Or, to put it positively: in the event of an international threat of recession, all the members bind themselves to practise a joint policy of systematic expansion. This proposal comes from the American and British delegations, but they are anxious to have it put before the OECD ministers at the end of this month as the proposal of the whole Economic Policy Committee. In other words, the Anglo-Saxons want the OECD to adopt an anti-recession programme, without seeming to have inspired it to do so. The point is that Washington and London believe that there exists, at this present moment, a world deflationary danger; in this they are supported by the IMF chief, Per Jacobsson. The Continentals, and singularly the West Germans, are not convinced of any such thing, and regard it as inopportune to publish a reflationary programme at a time when their economies are fully employed, prices rising and inflationary pressures evident.

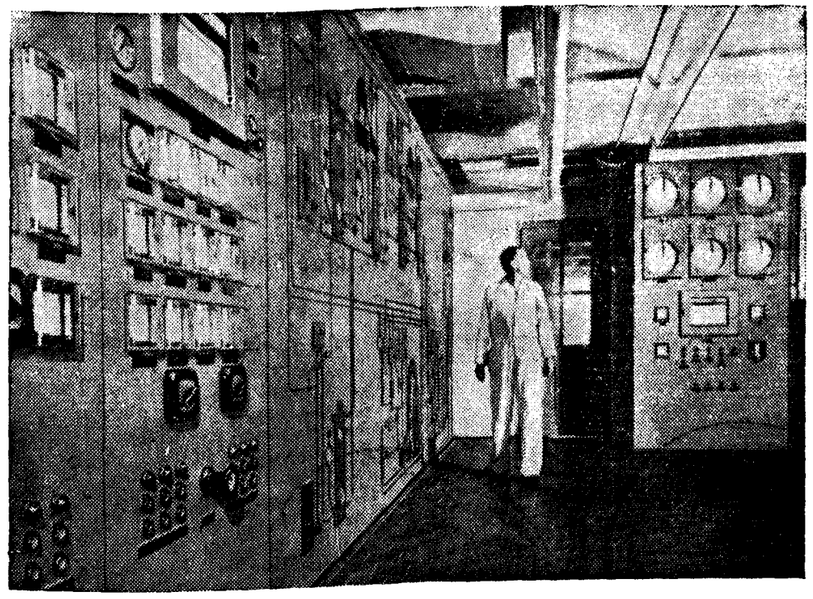
As I write, the phrasing of the resolution has not been agreed upon by the experts, though they have

heard a statement from Dr. Heller, the White House's chief economic counsellor, who argued the urgency of taking combined action against the supposed recessionary danger. It appears that West German opposition to any aggressively reflationary doctrine is so strong that the motion will have to be framed in very general terms, but it might well include unanimous European support for the Kennedy programme of tax reductions in the USA as a means to combat stagnation in that country. The American delegation might have to be content to return to Washington with this European backing for an expansionary domestic policy, but without having persuaded the Six that there is any menace of generalised recession.

The reasons for the different attitudes of the Anglo-Saxons and the Continentals are not hard to find. They are not simply in the fact that business is brisker on this side of the water than on the other, it is not all that brisk in West Germany, and the pace of expansion has slowed down somewhat in Italy and maybe in France, but in all these cases for the reason that physical capacity is fully employed. The main fact is that Washington and London have to worry about their threatened currencies. If they take the measures they would like to take in order to stimulate economic activity at home, while the Continentals take restrictive measures to contain the inflationary pressures implicit in full employment of their human resources, then the dollar and sterling will weaken further. The Anglo-Saxon capitals can defend their currencies and stimulate expansion only if the Common Market countries agree to participate in a world reflationary programme. As some Continental experts are saying here this week, the Americans are not worried about world-wide deflation really; they are concerned about discrepancies in rates of inflation between the Common Market and the USA. Washington wants to gamble on inflation, but cannot do so without damaging the dollar further unless the Six promise to inflate at least as fast, or, at the very minimum, give an undertaking not to use restrictive measures to contain current pressure on prices in West Europe.



Actually, there is no danger of the French and Italians resorting to restrictive measures in the foreseeable future. They are mildly disturbed by recent price rises but are confident that the gradual increase in their labour force (in Italy by drawing on the large pool of uninstructed unemployed; in France by drafting returned settlers and demobilised soldiers into industry) will enable them to maintain a very respectable pace of expansion without real inflationary danger. It is the West Germans that the Americans and British are anxious about. If Bonn were to apply sound-money remedies to its present situation (leaving aside the question whether that would be the wise course from the Germans' own point of view), the flight of capital away from the dollar and from sterling toward the Common Market would be embarrassingly accelerated. That is why the main subject at this month's OECD gathering will be to persuade the Germans that, local appearances to the contrary, there exists a generalised danger of recession which the 20 Western nations must meet by adopting right away an aggressively reflationary programme.



I/T DAGGER BRAND REAMERS FOR LASTING PRECISION PERFORMANCE

BACKED BY 25 YEARS OF TRADITION and rigid control at every stage of production
DAGGER BRAND REAMERS (available in metric and inch sizes)
assure precision performance. They are made of superior quality steel,
specially heat-treated to ensure long life and manufactured in
India's biggest and most modern factory for Small Tools.

Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

E.R.W. BOILER TUBES

For trouble-free steam raising in all applications calling for rigid specifications, Electric Resistance Weld tubes are in every respect equal to corresponding seamless tubes. High frequency current ensures efficient welding, and normalising is carried out in controlled atmosphere furnaces to produce a ductile tube with a smooth, blue finish.

LOCO

We supply E.R.W. loco boiler and superheater tubes from our Jamshedpur Works to meet the bulk of the Indian Railway's demand. These tubes meet all the technical requirements of Indian Railways.

MARINE

Our E.R.W. tubes meet all the tests specified by Lloyd's Register of Shipping. Indian Tube is on Lloyd's Register of Shipping's list of approved manufacturers.

LAND

Our E.R.W. tubes for land boilers are accepted by the D.G.S. & D. and comply with the Indian Boiler Regulations. We also carry ready stocks of this category at our Warehouses.

Economic Report from the U.S.

BETTER EMPLOYMENT SITUATION

By GUY SIMS FITCH

WASHINGTON, November 6.

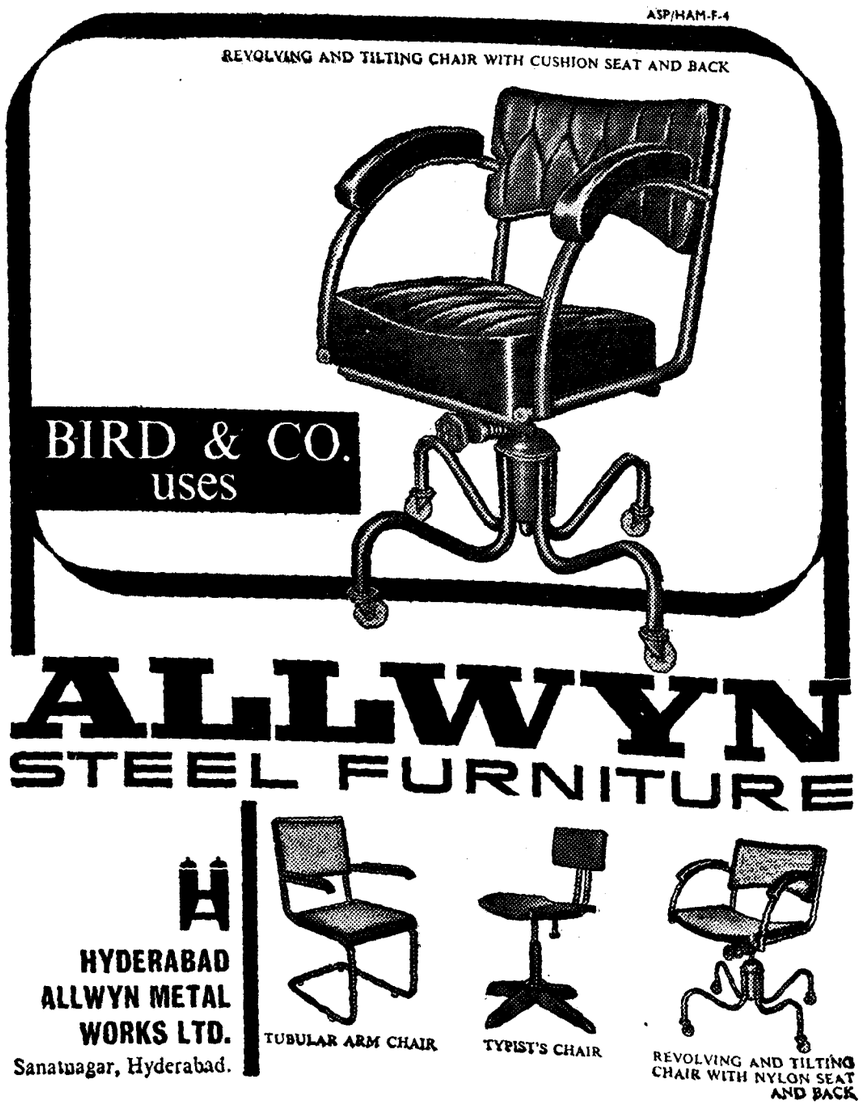
TWO significant developments give added substance to the sustained strength of U.S. economic activity. One is the notable improvement in the employment situation. The number of job holders last month rose seasonally by 225,000 to an October record of nearly 68.9 million. Non-farm employment, in fact, rose by 315,000 to more than offset the usual drop in agricultural employment at this time of the year. Unemployment during October declined by 218,000 to a three-year low of just under 3.3 million. A drop of only 50,000 normally is expected at this time of the year. This means that the jobless rate, after adjustment for seasonal variations, dropped from 5.8 per cent to 5.5 per cent of the labour force.

The other development is October's record rate of automobile sales and production. At an estimated total of 726,000 new car sales were the highest for any month in the industry's history, well above the previous record of 704,000 cars sold in April during the boom year of 1955. Automobile production, meanwhile, totalled some 744,000 units. One must go all the way back to 1950 to find the previous October high of 659,000. On the basis of present industry schedules, a new quarterly production record of about 2,196,000 cars appears in the making for the last three months of 1962, compared with the previous record of 1,949,000 in the final quarter of 1955. The highly encouraging results in these two important sectors do not in themselves indicate that the economy is now posed for another new upsurge, on the other hand, they do appear to contradict predictions of an imminent downturn.

The economy has been moving ahead at a rather slow pace, according to most broad measurements, since early summer. But the scattered forecasts of a general slump always have proved premature. If there is to be a recession, the belief now is that it will not begin until the first half of next year, and will prove to be both very brief and very moderate. There still are more than a few experts, however, who are not reconciled to the inevitability of even a short or shallow dip. In addition to the recent results in the key employment and automobile sectors, they find support for their views in two other significant barometers of business health. They point out that previous post-war business dips have come after corporate profits began to deteriorate and inventories reached higher levels in relation to sales. Neither of these elements is evident today. Corporate profits, while not rising with any great momentum, still seem to be following an upward trend. Inventories are now at the lowest level in relation to final purchase in seven years. None of the recent favourable developments, moreover, shows any abnormal influence from the current Cuban situation. There has been a noticeable absence of panic buying on the part of American consumers.

The October rise in car sales came on the heels of an automobile market that has been strong throughout the year. If any special influence was felt, it probably was the introduction of new 1963 models at the end of September and the beginning of October. As for employment, the totals for October were assembled on the basis of samplings taken at mid-month, before President Kennedy's historic address to the nation on October 22. On the basis of these and other trends, 'Fortune' Magazine — one of the most respected of American economic journals — sees the possibility of $10,000 million advance for the U.S. economy during the current, final quarter of 1962. This would then be the sharpest quarterly gain of the year. It would bring the total output of goods and services, or gross national product, to an annual rate of $565,000 million, up some five per cent from the fourth quarter of 1962 and some 13 per cent from the pre-recession low in the first quarter of 1961. Even if this projection is realised, the economy still would be operating at a level deemed far from satisfactory, in terms of its potential to both government and business economists, nor would it necessarily assure that the rise would continue in 1963. In many respects, the early months of next year could emerge as a new testing period for the U.S. economy. But those who are looking for a significant downturn should bear in mind that the economy has been demonstrating a far greater strength and resiliency than many an expert has thought likely only a few months ago.

OUR HUMBLE OFFERINGS TO THE DEFENDERS



OF THE MOTHERLAND

In view of the National Emergency The Punjab National Bank Limited offers the Armed Forces Personnel and their wives FREE OF ANY CHARGE the usual banking facilities such as remittances from one office of the Bank to another to the same or any other Account, collection of salary and other cheques, carrying out of standing instructions for recurring payments. No incidental charges will be levied on Current and Savings Fund Accounts. For particulars please contact our nearest office.

All contributions by the public to the National Defence Fund will be remitted by all offices of the Bank without any charge.

Special Article

THE STOCK EXCHANGES: AN ANATOMY OF THE CRISIS

THE week ended November 10, 1962, has rightly been described as the "crisis week" in the history of the stock exchanges in this country. The panic which gripped the trading centres emerged from a variety of reasons, the most dominant one being India's entry into what looks like a prolonged war with China on the question of the demarcation of the border. The avalanche in the Bombay Stock Exchange was hastened because, unlike the other Stock Exchanges, it had fixed no minimum prices and, hence, the operators from other centres attempted to unload their holdings in Bombay. It is amazing that at a time when the nation was rallying round the leaders in an effort to contribute liberally to the National Defence Fund, investors should lose confidence and bring about a state of affairs which necessitated the closure of the stock exchanges because no regular trading could continue when the investors had virtually lost their nerve.

It is now apprehended that the ambitious targets of voluntary effort for the National Defence Fund estimated earlier in these columns may not materialise. The business community has lost heavily not only in the stock exchanges, but also in the bullion and other commodity markets because of the landslide in prices. It has indirectly helped the country in pegging down the price line for which the Government had been planning some bold measures. The market reports from the major cities indicate that the pronouncements of the leaders asking for more sacrifices (which, later, may take the shape of increased taxation) indicated that the prospect for the return on investment was not alluring as it had seemed before. The debacle in the American Stock Exchanges in May this year produced some ripples in India's stock exchanges, but it was believed that no serious decline could be expected because of the boom through which the industry had been passing. The manner in which the investors greeted every new issue showed that the confidence in the soundness of the Indian economy and, in particular, the industrial structure, was of a very high order, and, therefore, there was little prospect of the markets easing in line with the international trend.

The institutional investors have attempted during the last week to provide a boost to the market. The Government of India in the Ministry of Finance has come out with a special statement saying that there was no real cause for the widespread loss of confidence. This has been interpreted to mean that the Government would give all possible support for the revival of the market. So far as the production pattern, sales, profits, and dividends of the industry were concerned, there was likely to be no change; on the other hand, there was every possibility of the industry working double and triple shifts so as to increase production. In view of all these considerations, the economic indicators show that the recovery of the stock exchange may not be far off. Even if the Government is forced to impose additional taxes, it will do so judiciously since the corporate sector of industry provides the sinews of war. The response to the borrowing programme now launched will be another vital factor. It is reasonable to presume that before the end of the current fiscal year, the Government of India may not have to come in for fresh doses of taxation. The State plans are being pruned: The Plan is also being rephased by the Planning Commission so as to reallocate the available resources to raise the tempo of industrial production. In the short period, therefore, there is no reason for the stock exchanges to behave in the manner in which they have done during the past few days.

A measure of the decline in the stock exchanges is provided by the index numbers of the variable dividend industrial securities. With 1952-53 = 100, the index had an all-time peak in the third week of May, 1962, at 195.6 (see Table I below). Since then, it has been gradually slipping and is estimated to be around 160,

TABLE I

INDEX NUMBERS OF VARIABLE DIVIDEND INDUSTRIAL SECURITIES

(Base: 1952-53 = 100)

Last Week of		General Index
1957-58	..	126.6
1958-59	..	146.8
1959-60	..	161.7
1960-61	..	182.6
1961-62	..	192.7
1962 April	..	192.9
May	..	194.8 (195.6*)
June	..	188.3

September	..	180.4
October	..	174.4
November 3	..	171.8
November 10	..	160.0**

* Week ended May 19, 1962.

** Estimated.

for the week ended November 10, 1962. In other words, the fall is of the order of 20 per cent all round, though certain specific shares have declined in value from 30 to 40 per cent. It is now obvious that without the support of the institutional investors and the measures proposed by the Ministry of Finance to give a boost to the stock exchanges, the markets will not revive. It by no means assumes, however, that the same upward curve will reappear. It only means that the market has already touched the rock bottom on the current yield basis and cannot but recover both to maintain the healthy growth of the economy and keep up the war effort.

Even before the onslaught of the current crisis, the market had shown a slow declining tendency. This fact is brought out in Table II below which compares the index for variable dividend industrial securities between the third week of May 1962, and November 3, 1962. The third week in May represents an all-time peak recorded in the recent history of the stock prices. November 3 prices represent the level before the present fall. It will be seen that transport equipment, iron and steel and the basic industrial chemicals were at the top of the list with maximum drops in share prices. In almost all the industries the drop was by more than 10 per cent, the exceptions being sugar at 7.1 per cent and jute textiles at 9.5 per cent. In the case of electricity undertakings, however, there was a marginal depreciation of 0.9 per cent, indicating that in this particular sector the market sentiment had virtually no effect at all.

TABLE II

VARIABLE DIVIDEND INDUSTRIAL SECURITIES

(Industry-wise)

(Base: 1952-53 = 100)

Industry	May 19 1962 (1)	Nov. 3 1962 (2)	Percentage change of (2) over (1)
1. Sugar	141.8	131.7	— 7.1
2. Cotton Textiles	196.0	172.8	—11.8
3. Jute Textiles	106.5	96.4	— 9.5
4. Cement	169.3	147.1	—13.1
5. Paper	233.2	206.9	—11.3
6. Basic Industrial Chemicals	206.1	177.3	—14.0
7. Iron and Steel	167.1	143.2	—14.3
8. Transport Equipment	404.2	338.6	—16.2
9. Electrical Machinery	183.6	161.0	—12.3
10. Electricity Generation and Supply	86.6	85.8	— 0.9

The fact that most of the blue chips were high priced is apparent from the low anticipated yield computed on the basis of the appreciated value of the shares in May, 1962. This may be illustrated with reference to certain specific stocks. In the case of TELCO, for example, which has depreciated in value by 31.0 per cent since the peak of May 1962, the market value at Rs. 370.50 fetched a yield of 3.9 per cent, implying that TELCO ranked higher than even the Government securities in terms of yield. This also applied to Tata Chemicals whose yield was still lower at 3.7 per cent. The extreme example is that of Indian Dyestuff: with the face value of the share at Rs. 100, quoting at Rs. 557.50 in May 1962 and with the dividend prospect of Rs. 7, it indicated a yield of 1.3 per cent only. Premier Automobiles at 5.2 per cent and Larsen and Toubro at 4.2 per cent also ranked very near the yields of Government of India securities. Table III below illustrates this fact clearly. Thus, at these prices the shares were very much inflated in value, and they were just waiting for a technical correction which came so abruptly during the last week.

TABLE III

Scrip	Market Quotation as on May 17, 1962 (Rs.)	Paid-up per share (Rs.)	Dividend Per cent	Yield Per cent
1. Telco	370.50	100	14.50	3.9
2. Tata Chemicals	17.36	10	6.50	3.7
3. Indian Dyestuff	557.50	100	7.00	1.3
4. Gwalior Rayon	58.80	10	25.00	4.3
5. Premier Automobiles	135.25	100	7.00	5.2
6. Larsen and Toubro	33.35	10	14.00	4.2

Table IV shows the experience of some of the major scrips, indicating the erosion which has occurred in the case of the leading counters. Here again, the impact of the crisis has been to take away nearly one-fourth to a half of the value of these shares. This depreciation in the share prices has caused two far-reaching effects. In the first place, the banks have been put in a very tight position. If they force the holders of these scrips to make payments for the losses already incurred — a situation which the holders are not in a position to honour — the logical conclusion will be to let these shares be unloaded on the stock exchanges, thus further accentuating the already weak position of the market. In the second place, there is currently a stringency in the money market because large liquid sums have been utilised in covering up the losses. Both these factors will act as deterrents against any further appreciation in the stock prices. Unless support is provided by the Government and other institutional investors, the stock exchanges may not come back to normal operations. The Reserve Bank can assist in resolving the crisis by advising the banks not to force the situation on the holders of the securities. Positive action would be to

THE INDIAN IRON & STEEL COMPANY LIMITED

STATEMENT OF THE CHAIRMAN, SIR BIREN MOOKERJEE, DEALING WITH THE YEAR ENDED 31ST MARCH, 1962.

The following statement by Sir Biren Mookerjee, Chairman of the Indian Iron and Steel Company Ltd., dealing with Company's working for the year ended 31st March, 1962, has been issued to shareholders. The Annual General Meeting of the Company will be held on Tuesday, the 11th December, 1962, at 3 p.m. at the Royal Exchange Hall of the Bengal Chamber of Commerce and Industry, 6, Netaji Subhas Road, Calcutta-1.

The production of iron for the year at 1,187,397 tonnes and of steel ingots at 934,498 tonnes shows a small increase over the previous year. Yet in fact the rate of production remained more or less the same in the two years.

This apparent anomaly is due to the fact that there was a railway strike last year during which period there was a stoppage of all raw material coming into the works. As stocks of coal had run down to only four days' requirements, it left no alternative other than to carefully damp down all the four blast furnaces one by one as well as to reduce the input of coal into the coke ovens just to maintain sufficient heat to prevent damage to those plants. This calculated shut down last year, carried out under careful scientific observations by Works' executive experts, resulted in a computed total loss in production of some 27,000 tonnes of ingot steel. It will be seen, therefore, that while this year's production shows an increase over last year of 20,339 tonnes, it is in fact on the basis of actual rate of production less by some 6,000 tonnes.

In this connection I would like to emphasise, that ever since the new blast furnace and melting shop expansions were completed some time round about the middle of 1959, every effort has been made to go all out to reach the rated capacity of iron and steel production. But we failed each year to achieve this owing to the poor quality of raw material and particularly in the case of coal, a quality almost unusable. Added to these difficulties there was the ever persistent irregularity of transport. How then in the face of these insurmountable difficulties can Government insist that 100 per cent production is to be maintained? They have merely to look at the production of their own steel plants, where in the case of one plant the quality of raw material can be termed excellent compared to ours, with little or no transport difficulties. In the case of the other two Government plants, raw material and transport problems do arise, but it is nothing compared to that of your Company. Steel qua steel may be made at the cost of quality. Is that then what the Government desire, a sacrifice in quality and a mass rolling of unrequired sections of steel for the sake of production records? I shall refer to this and many other points later on in my statement.

ACCOUNTS:

In my statement last year I made reference to the Tariff Commission's enquiry in connection with the fixation of the retention price of steel effective from 1st of April, 1960. After conducting the usual careful investigations, visits to the works and discussions with the representatives of the Steel Companies, the Tariff Commission submitted its report to the Government in April 1962, having made such deductions and adjustments in costs as it thought fit. It was not until the 7th September, 1962, that Government's decision on this important matter was announced in Parliament according to which steel retention prices were increased by Rs. 10.50 per tonne on an assumed product mix basis commencing from the 1st of April, 1960, as against the Tariff Commission's recommendations of an increase of Rs. 38 per tonne over the provisional increase announced by Government in February 1961, a reference to which was made in my statement to you last year.

Curiously enough Government apparently did not consider the retention prices of individual categories of steel as important, as these details were only made available on the 12th October, 1962. This delay in announcement on Government's part of the category-wise retention prices of steel prevented the Company from closing its annual accounts and presenting them to you along with the auditors' report within the prescribed period; hence two appeals had to be made to the Company Law authorities to extend the permissible date of the annual general meeting to the maximum limit of 3 months, namely, the 31st December, 1962.

The most surprising part of Government's decision was the drastic and unconventional manner in which the Tariff Commission's carefully considered recommendations and mature judgment were turned down flatly in respect of the normal retention prices for the past two years, ending on 31st March, 1962, as well as a special element that should have been allowed in the retention price in addition, for payment by the Tata Iron and Steel Company and your Company, of interest on and towards repayment of special advance of Rs. 10 Crores each made to these Companies by Government. I will deal with this in greater detail later on.

The salient points of the accounts for the year have been fully dealt with in the report of the Board of Directors, but there is one point, a very important point indeed, on which I would like to make some observations.

On the recommendations of the Tariff Commission in 1959, the Government of India in terms of their Resolution No. PS45(112)|57 dated the 25th November,

1959, decided that the Interest on the Special Advance should be charged to the Company as from 1st July, 1958 at 5 per cent per annum and the calculation of a special element in the normal retention price for steel for meeting this interest charge was postponed until after 31st March, 1960, when it was necessary to work out the fair retention price of steel produced by the main producers. As the interest accrued from the 1st of July, 1958, your Company had to, under the Indian Companies Act, make provision for this accrued liability in the past years' accounts and as in terms of an Agreement with the Government of India dated the 15th July, 1953, it was expected that in fixing the retention prices of steel for the two years ended 31st March, 1962, a special element should be included in such prices to fully cover interest upto the end of this period, a corresponding amount was included in Sales Retention Prices in those years as the anticipated earnings from such special element. This expectation has, however, been belied. Although a special element to cover Interest and Repayment of Special Advance was recommended by the Tariff Commission, the Government of India has, in reversal of their earlier decision, rejected this recommendation. This has put your Company in a very awkward situation. The Interest of Special Advance charged in the previous two years' Accounts has to remain as such but the anticipated compensatory element in steel retention prices amounting to Rs. 1,40,01,141 included in the Accounts of those two years had to be written back from the current year's "Sales"; besides, whether Interest is actually paid in cash or not, your Company has to go on charging such accrued Interest from year to year without a corresponding compensating element in "Sales". Repeated representations have been made to the Government, but it does not seem to realise this difficulty of your Company; it appears to be under the impression that so long as the Company has not to make actual cash payment to Government, it is immaterial whether any special element is included in the prices or not. Government just cannot realise that your Company does not keep its Accounts, as Government departments do, on a Cash basis but on the normal Commercial basis where any liability accrued, whether paid or not has to be duly provided in the Accounts.

TARIFF COMMISSION'S RECOMMENDATIONS AND GOVERNMENT'S DECISION:

At long last, that is, after two and a half years, Retention Prices of steel were announced by Government on the 7th of September, 1962 on an estimated product mix basis on which, as I have already stated, your Company's accounts could not be closed. Apart from the fact of Government's rejection of the Tariff Commission's deliberations and conclusions it has come to an ad hoc decision totally divorced from the conditions specially laid down in 1953 for the calculation of retention prices of steel, after taking into consideration repayment of loans to Government and the World Bank (International Bank for Reconstruction and Development), maintenance of regular dividend and putting into reserve statutorily or otherwise sufficient sums in order to enable the Company to remain healthy and to continue to increase production and achieve expansion out of its own resources as and when the country needed extra steel. It now appears from Government's latest announcement in the papers that the Tariff Commission's sins are that it arrived at its conclusions according to these formulae and conditions laid down by Government earlier and according to which your Board of Directors agreed to accept loans on your behalf for the expansion schemes. If now these conditions and formulae for calculating retention prices are changed for the worse, as has been announced recently, there is little or no hope of further expansions to your plant.

Government's decision regarding cutting down the retention prices recommended by the Tariff Commission has, as announced on 7th September, 1962, been arrived at by:

(a) Reducing the value of the block considered fair, after careful study by the Tariff Commission, from Rs. 1,300 to Rs. 1,176 per tonne.

(b) Reducing the working capital provision to 4 months' cost of production as against 8 months' claimed by us in our representation and 6 months allowed by the Tariff Commission.

(c) Disallowing the inclusion of Rs. 8 per tonne as recommended by the Tariff Commission towards interest on Special Advance and its repayment.

The reasons stated for making a reduction in block are:

(1) The operational efficiency of the plant should be taken at 100 per cent as against 90 per cent optimum considered by the Tariff Commission.

(2) The capital block of Rs. 10 crores received as Special Advance from the Government should be excluded.

Apart from reduction of Rs. 8 per tonne on account of the Special Element towards payment of interest and repayment of Special Advance, the total reduction effected by Government per tonne of steel from what was recommended by the Tariff Commission comes to Rs. 19.50 per tonne as shown below:

(1)	Reduction in capital block due to deduction of special advance	Rs. 10.30 per tonne
(2)	Reduction of block by taking operational efficiency at 100 per cent	Rs. 6.20 „
(3)	Reduction in working capital	Rs. 3.00 „
	TOTAL	Rs. 19.50 per tonne

As a result of this, your Company has been deprived of approximately Rs. 2:8 Crores on despatches of 1.4 million tonnes of saleable steel during the 2 years and will also suffer in future as, we fear, this will also apply to the provisional price to be fixed from 1st April, 1962 onwards.

But the story is actually different. The new prices fixed by Government for individual categories of steel will only enable the Company to earn an increase of Rs. 8.53 per tonne as against Rs. 10.50 per tonne announced by Government on the despatch of steel made during the last two years.

The target of operational efficiency as contemplated by Government recently should have been based on an approach inspired by lessons of realism and past experience rather than dogmas. Nowhere in the world have steel plants been rated to operate at 100 per cent of their rated capacities. It can only be expected over short spells. The Tariff Commission very rightly adopted 90 per cent efficiency as a factor of normal operation. I quote below some interesting figures of capacity utilisation as published by the U.K. Iron and Steel Board (vide para 65 — Annual Report — 1961):

Year	% capacity utilisation assumed by the Board	Actual Operation
1954	90	98.0
1955	90	98.0
1956	90	97.0
1957	90	96.4
1958	90	87.1
1959	90	78.9
1960	90	93.9
1961	90	88.5
	Average over 8 years	92.2

Although the average of actual operation works out to 92.2 per cent the Board for calculation purposes maintains 90 per cent as the target of capacity utilisation.

It may not be difficult to attain 100 per cent efficiency occasionally, but provision must be made for bad weather and unfavourable circumstances which do arise more often than not and over which no management control can be exercised; in our case the transport and raw material difficulties are well-known. The fixation of block value at 100 per cent utilisation of capacity in the steel industry is unrealistic and I am afraid, will be of no help to the industry. It is my sincere suggestion that the matter should be reconsidered and given a second thought by Government. It must also be remembered that when vital issues of this nature are referred by Government to an independent semi-judicial and expert body like the Tariff Commission, its recommendations should not be flouted in the manner in which it has been done in this case, as it is bound to undermine confidence in the private sector and definitely make foreign aid participation very doubtful.

As regards the disallowance of the Special Advance of Rs. 10 crores from the block a great deal has been said, both in Parliament and outside it, about this interest-free loan to your Company by the Government. I have so far refrained from answering queries from stock holders, financial journals and papers, as I thought it to be Government's duty to explain the reasons and motive behind such a loan first to Parliament. Since 1958 Government's ideas on the repayment of the interest-free loan have been undergoing many changes, some even contradictory. It is only fair to stock-holders that I should now take them into confidence and explain how this interest-free loan of Rs. 10 crores came into being.

At the request of the Government of India, Mr. Eugene R. Black, the World Bank President, paid a visit to India in February 1952 to acquaint himself of the broad aspects of the country's development programme in the light of the Five-Year Plan. On the 17th February he, accompanied by Mrs. Black, Messrs. Joseph Rucinski, Chief Economist of the Loan Department, Leonard B. Rist, Director of Economic Department and Harold N. Graves, Director of Public Relations, arrived at Burnpur on a two-day visit to have a first-hand study of your Company's expansion programme.

Being satisfied with the merit of your expansion scheme, he was kind enough to send to India in June 1952, a Fact Finding and Feasibility Probing Mission of four members headed by Mr. George D. Woods, one of India's best friends outside the World Bank and the President of the First Boston Corporation of New York. The Commission consisted of Mr. Woods, Mr. Maccurda, his personal adviser, Mr. Joseph Rucinski of the World Bank and Mr. Carl Fiesher, Technical Consultant to the Bank. They visited your Works and went into the details of the First Expansion Scheme with the Company's Consulting Engineers and the Works' senior executives. On being satisfied with our scheme generally in every respect, discussions with Government were started in Delhi directly afterwards. At these discussions, the then Finance and Commerce and Industries Ministers were present along with their respective secretaries and advisers. You were represented by my colleague, Mr. F. G. Liversedge and myself. At the conclusion of these discussions, the World Bank's representatives agreed to put the matter up to the World Bank Directors subject to a detailed scheme of the plant proposed, its costs broken up into foreign exchange and local currency, the legal aspects of mortgage of all lands and property of the Company etc., considered. The foreign exchange requirement to be met by the World Bank was approximately estimated to be Rs. 15 Crores or 31½ million dollars. Government's loan to the Company on the same terms and conditions, but ranking second to the World Bank and the then debenture holders, was set up approximately to be Rs. 7.9 Crores. The Company was to find an equal amount, namely, Rs. 7.9 crores from its own resources. It was then found, a further Rs. 10 crores was needed for financing the entire scheme, as well as to meet the working expenses. The question then arose how to bridge this gulf. The Woods Commission came to the conclusion that the then Tariff Board's function as directed by Government in the case of the steel industry, was not so much as to find ways and means of protecting the indigenous industry from foreign invasion, but to prevent it from claiming a higher world price for its commodities, obviously for Government's own benefit; Government, therefore, in all fairness could hardly refuse to find for the industry the needed amount, and they said, if I remember correctly, "Whose money are you giving away and to whom; in the case of jute, tea, sugar, copper and other such commodities, the industries are allowed to claim or sell at the highest prices the World market was willing to pay, but in the case of steel, the industry was beaten down by the Tariff Board on a framed up formula fixed by Government. All Government has to do is to remove it and the steel industry would no longer need financial aid from Government, other than a guarantee of the repayment of foreign exchange loan". After a couple of days' thinking Government agreed to find the money as a loan which the World Bank's representatives thought should be "rent free", meaning interest free. The Ministers agreed to the loan to be termed as a Special Advance and interest free, but thought in order to avoid questions being asked in Parliament, the whole or part of the corpus should be repaid sometime, i.e., when the Company was opulent enough to do so and no further expansions were contemplated. The World Bank representatives were of the opinion that so long as it was agreed that the amount would only be paid, both interest, if any, and the corpus out of a special element to be included over and above the normal retention price, they would have no objection. The Government agreed to it, but later thought they should also include the clause wherein they would reserve the right to ask the Company to raise additional share capital for the repayment of whole or part of the corpus as and when the Company was in a position to do so. The World Bank's representatives were of the opinion that this should only be done subject to mutual agreement between the Government and the Company.

The World Bank's representatives then went on to explain that the primary function of the I.B.R.D., whose

capital was subscribed by a number of nations, was to rehabilitate and/or expand industry in the private sector only and in doing so to enable such industry to remain in a healthy financial position in order that it could expand on its own, and further, the Tariff Board must be instructed by Government that it must not, as in the past, take away incentives from the Company in the way of any operational efficiency or savings in the cost of production or by increased production, and a normal depreciation and a reasonable return on capital etc., should be maintained. Both Government and your Company agreed to these principles and Government issued new directions to the Tariff Board which later on was converted into the Tariff Commission with statutory powers. It appears Government now wishes to resile from its previous commitments and undertakings it had then made.

The recommendation by the Tariff Commission of Rs. 8 per tonne relating to the repayment of Special Advance and interest thereon has not been accepted by Government. The reason, in their own words, being "Finally, in revision of their earlier decision taken in 1959, Government now consider that it is not necessary to provide an element in the retention price for the payment of interest on and repayment of special advance. The agreement with the Companies provided for an alternative method of repayment of a part of the Special Advance with interest, namely, issue of share capital by the Companies at such time or times as the Government of India may, in agreement with the Companies, decide."

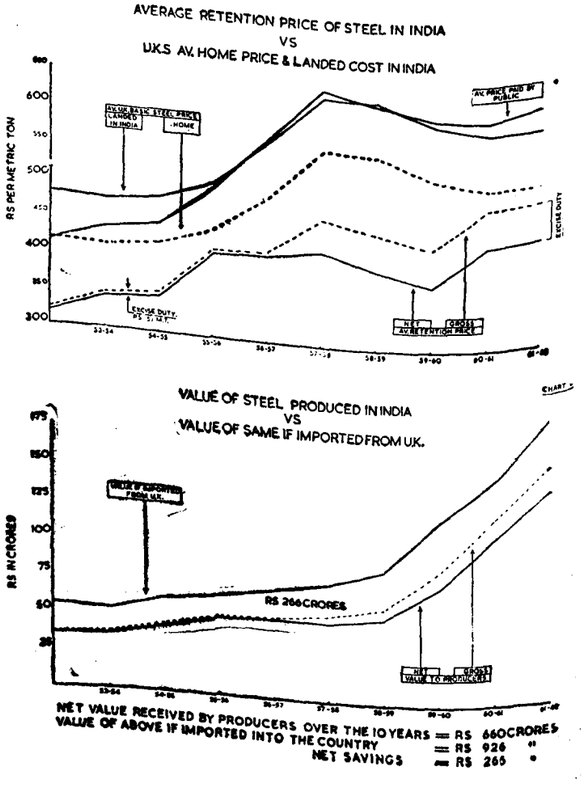
For the benefit of the stock-holders I give below the relevant extract from the agreement between the President of India and your Company dated the 15th of July, 1953:

Clause 1 (iv) (c):

"The Government of India shall decide, on the advice of the Tariff Commission, whether after the 30th June, 1958 (or such later date as aforesaid), the Company should be charged any interest on the said advance and at what rate the Company should repay the advance. PROVIDED that the interest and repayment of the advance shall to the extent to which the same is not paid out of the share capital to be raised by the Company in accordance with Clause 3(c) be payable by the Company out of its earnings arising from a special element in the prices of iron and/or steel over and above the normal retention prices, after deducting from earnings all taxes payable by the Company to the Government of India on such earnings at the rate or rates applicable to the Company's total income during the period ending the 31st March, 1969."

It is further amplified later in Clause 3(c) which reads as follows:

"Notwithstanding the provisions in paragraphs (c) and (d) of Sub-clause (iv) of Clause 1 laying down the manner of payment of special advance to make an issue of share capital at such time or times as the Government of India may call upon the Company to do and to repay out of the proceeds of such issue a portion of the special advance. The proposals for any such issue (including the timing, the amount of the share capital to be so raised and the portion of the special advance to be repaid out of the proceeds of the issue of shares and other particulars relating thereto) shall be as may be agreed between the Government and the Company."



It will be seen, therefore, the intention of Government in 1953 in regard to expansion of the steel industry in the Private Sector has undergone a very great change, for if your Company has to raise capital to repay the advance of Rs. 10 crores, and this contention is upheld by Government, it virtually means saying goodbye to any future expansion, even if it be for merely balancing of your plant and thereby effecting a fully economic unit.

Apart from all that I have said in this connection I utterly fail to see any logic or justification in the Government's action in deducting the corpus of the Special Advance of Rs. 10 crores to arrive at the standard block on which overheads are to be allowed. If Government has now changed its mind and treats this money as a free gift, i.e. neither interest nor repayment of the corpus being required, then there may be something in the Government's contention. But in its recent statement made on the 19th September, Government has reiterated its stand regarding the repayment of the advance and indicated that it could ask the Company to repay this Special advance out of an issue of fresh capital. Therefore, it is not a gift and if that be so, then on what ground can Government take this totally unreasonable and unrealistic stand?

It can be safely vouched and nobody will deny the special position and importance of the steel industry in our country, particularly in an era of expanding economy based on rapid industrialisation. Contribution made by this Industry in the past, specially in the field of saving foreign exchange is very considerable, and this is explained clearly in the appended two charts (A and B) showing:

A. The net price per tonne of steel given to the producers, the price paid by the public and what it would have cost the country if imported from overseas.

B. Saving of foreign exchange effected due to indigenous production over the past ten years, in other words, the cost of a new one million ton capacity integrated steel plant.

That then has virtually been the contribution of the two steel plants in the Private Sector. Does it therefore behove Government to accord to this industry the perfunctory and niggardly manner of treatment it has been subjected to? Is it not a matter of elementary economics that the benefit of maximum possible incentive should be extended to the industry to allow it not only to exist, but to function and produce on as high and efficient a level as is possible? Why then this ire as if the industry has done something terrible, and deny it a healthy climate all round to earn a reasonable return on the capital employed, which is largely being ploughed back from profits and maintain an increasing output, thereby enhancing the growth of national wealth?

When Government's decision on the retention price of steel was released there was widespread criticism and Government made a statement on the 19th of September, 1962 in an attempt to justify its official action for reducing substantially the prices recommended by the Tariff Commission. I will now deal with the arguments advanced by Government item by item and prove to you how futile these are.

It was stated that Government had accepted the Works costs as calculated by the Tariff Commission and this constituted 70 per cent of the total retention prices. This statement seems to imply that a great favour has been done to the steel industry by Government, by its acceptance of this major element of the retention price. This is no favour at all. Government could not help but accept as correct, calculations of Works costs by the Tariff Commission, as these were not estimates of future Works cost, but facts based on historical costs on the actual performances of the producers during the period of price fixation, namely from 1st of April, 1960 to 31st of March, 1962.

In regard to reduction by Government of the working capital of your Company to 4 months' cost of production as against 8 months' claimed by the Company in its representation and 6 months' allowed by the Tariff Commission, the reasons given by Government to justify its stand are based on two grounds:

(a) That every indentor of steel has to pay in advance 25 per cent of the total value of his order in cash to the steel producer before it can be booked, and therefore, the Companies invariably had a fairly large sum of money at their disposal.

(b) That at any given time the Companies had large sums of money belonging to the Government in their possession and these were not actually paid into Government account.

In regard to (a) the statement made by Government that every indentor had to pay 25 per cent security deposit against order is absolutely baseless. This could easily have been verified from any Government Accounts Officer and it would have been found that no Government department gives any security deposit whatsoever, whereas on the other hand Government takes months to pay your bills. It is a fact that producers dare not ask for any security deposit from Government, including the Railways, and large well-established customers which constitute more than 80 per cent of their sales. It is only in the case of small bazaar parties that the producers take a security deposit and this too with the Iron and Steel Controller's acquiescence, as no order can be booked without his approval. Some years ago it was found that some of these small bazaar parties having booked orders (for reasons best known to them) were found to be non-existent, or refused to accept bills when the railway wagons arrived at the destination. What then could your Sales Organisation do other than to run to the Iron and Steel Controller for his approval to divert the railway wagons to some other party — in the meantime demurrage accrued as well as the extra freight for diverting the wagons. Who then was responsible for the extra cost of freight and demurrage as your sales organisation was in no way responsible for the order? The then Iron and Steel Controller thereupon decided that for these unknown and unreliable parties the producers were entitled to demand 25 per cent with the order, in order to reimburse them in such cases of default. These advances are mostly in G. P. Notes and fixed deposits in banks. The interest accruing is payable to the customers and the Company has no access whatsoever to these funds. To make my point clear, I append below a statement for the 3 years, 1959-60, 1960-61 and 1961-62 showing the gross steel sales from Burnpur and the security deposits and advance payments in cash received by your Company:

	1959-60 Rs.	1960-61 Rs.	1961-62 Rs.
Gross Steel Sales	30 crores	46 crores	50 crores
Security deposit and advance payments in cash	26 lakhs	30 lakhs	29 lakhs
Percentage	0.67	0.65	0.58

In view of these actual figures from the Company's audited accounts the statement made by Government seems to be most irresponsible, as during the three years under reference the maximum amount lying with the Company was between 0.67% to 0.58% which is nowhere near 25% stated by Government.

In regard to (b) the statement that at any time the producers owe large sums of money to Government is again just a myth. Both Mr. Bhoothalingam and Mr. N. N. Wanchoo, Secretaries to the Ministry of Iron & Steel have written to me complaining about the large outstandings from the Company to Government and every time we have written back in reply to prove that Government's statements were incorrect. Moreover, Government seems conveniently to forget that it is your Company that do it a favour by collecting surcharge moneys on its behalf and further all collection expenses including cash discount allowed by us on the amount of the surcharge are being borne by the Company. Besides, whether the Company receives payment of a bill or not, it is required to pay the surcharge portion of the bill immediately to the Iron & Steel Controller. How can Government then quibble over a few lakhs of rupees worth of surcharge money that necessarily must remain outstanding at any time with the Company as claims cannot be finalised within the period.

On the other side of the picture, apart from outstanding bills for materials supplied by the Company, it has to wait years to get reimbursement from the Equalisation Fund in respect of any increases in the retention prices. These increases are due to the Company as costs and overheads have gone up in the meantime and which are beyond the control of the Com-

pany. Although it has already been out of pocket to these extents it cannot claim any reimbursement from Government unless Government so deigns, at its leisurely pace to decide on the revised retention price. As an example, in the case of the recent increase in steel prices which are really due from the 1st of April, 1960, the notification by Government of such increase in the retention prices is dated 7th of September 1962, and the category-wise retention prices were made available to the Company only on the 12th of October 1962, i.e., a time lag of about two and half years. This, in other words, means that crores of rupees due to your Company has been lying with the Equalisation Fund for this period, whilst your Company had to borrow money from banks and pay interest on it to meet its day to day obligations.

For the reduction in the return on capital it has been stated by Government that your Company, like Tata Iron & Steel Company, had no more than one-fourth of the total capital of the Company in the form of equity capital and that this ratio may have still fallen further. The Government's contention is that the rest of the capital has been borrowed and therefore should be treated differently as it was not the stock-holders' money. For your information I append below a statement showing that during the 10 years, i.e. from the date of the Expansion Scheme until 31st of March this year your Company has contributed out of its own resources—and which really is your money—to the extent of Rs. 34.69 crores, a sum which cannot be sneered at on any account:—

CAPITAL EXPENDITURE AND SOURCES OF FUNDS DURING THE TEN YEARS 1952-53 to 1961-62.

	Rs. Crores	Rs. Crores	Rs. Crores
Expenditure on Extensions:			
Burnpur—			
1950 Extensions	4.97		
1953 „	37.64		
1955 „	18.46		
General	5.97	67.04	
Kulti ..		3.76	70.80
Less: Outside Sources of Funds for Extensions:			
World Bank Loans		21.28	
Government of India Loans		7.35	
Special Advance		10.00	
New Shares Issued		7.00	45.63
Extensions financed out of own Resources			25.17
Capital Expenditure financed out of own Resources upto 31-3-62			
For Extension as above		Rs.	25.17 Crores
World Bank Loans Repayment ..		„	5.80 „
Govt. of India Loan Repayment ..		„	2.13 „
Sterling Debenture Repayment ..		„	1.59 „
		Rs.	34.69 Crores

This, in other words, means that in addition to a sum of Rs. 7 Crores contributed by you as a rights issue in July 1957 a sum of Rs. 34.69 Crores has already been ploughed back from your profits during these years, making a total contribution from you of Rs. 41.69 Crores, and this process will continue until all loans, past and future, are repaid.

In my previous statements to you as well as in the Annual General Meetings in the past, I have made it known that these large sums of money, which you are investing in the Company from year to year will one day be partly converted into equities. But your Board of Directors were precluded even from thinking about it owing to the penal tax of 30 per cent, now reduced to 12½ per cent levied by Government on bonus issue. From these figures it will be seen that your Company has made contributions towards the expansion scheme in no mean measure. No integrated modern steel plant, no matter what part of the free world it is situated in, can be expanded or modernised with stock-holders' money only. It has to take recourse to borrowing funds from banks and the most enterprising and sensible Governments come forward to give them such help as needed in order to reap the benefit of extra production of iron and steel, thereby creating extra expansion in the country's heavy industries etc., as well as finding an outlet for foreign exchange by exporting goods.

Government also seems to argue that if a part of the gross block is financed by loan capital the structure of the Company's finance should be different and the return on such capital should accordingly be calculated on different lines. To say the least, this is a strange way of thinking on the principles of economics, as it is both unorthodox and unheard of. If Government had these ideas in mind it should have, in all fairness and to all concerned, declared them in unequivocal terms when these very loans were being negotiated. It would then have been for the Board of Directors and the stockholders either to accept or reject the terms and conditions at the time and not to have a surprise suddenly sprung on them as at present.

As already stated, Government's latest contention has been that on account of the special capital structure of the Company and on account of not achieving 100 per cent production, the return on capital should be correspondingly reduced, and for this purpose Government has decided to cut a slice into the block which is standing up proudly at your Works. But as depreciation is calculated on block, this has also resulted in a reduction in the total quantum of depreciation allowed by the Tariff Commission. Are we not justified in enquiring, why this unwarrantable reduction in depreciation? I can only term this action as adding insult to injury.

It has also been openly said in Parliament the other day that your Company has earned huge profits during the year under review. I do not know, in the case of a Company like yours, what the yard-stick for this "hugeness" is. All I can say is that your Company has earned only a reasonable profit, commensurate with its requirements and obligations. Besides, uniform retention prices were fixed for all Producers, and if any one Company has earned a little extra due to efficient working, that I should have said, would have been a matter for congratulation and not resentment. I am sure it is not Government's desire to discard all cardinal principles of economic aid to penalise efficiency.

PRODUCTION DIFFICULTIES

The quality of raw material, if anything, has deteriorated from what it was last year, and added to this, irregularity of transport as well as wrong type of wagons for transporting the materials do not help to make the Works Executive's life a happy one.

I append a few charts (No. 1 to No. 6) which will show the difficulties that have to be surmounted in order to utilise the raw materials. The object is to bring out some of the obstacles which prevent the Company from achieving a production rating of 100% of its installed capacity. Apart from these obstacles, there is also the question of the quality of the raw materials, particularly Coking Coal. The average ash content of our Coke has now reached 24% but the average figure does not indicate the true picture, as the quality of the Coal fluctuates widely, and the manner in which the Railway authorities deliver the Coal prohibits blending which would neutralise to some extent the wide fluctuations.

It will be observed that against the normal daily requirements of 107 BOBS Wagons, the number fell very much below this figure on most days. The Railway authorities substituted BOX type wagons in place of BOBS wagons in spite of the fact that the Works are unable to off-load BOX wagons except by manual means.

Here it will be observed that apart from ore handling in our normal mechanical stock handling Ore Gantry, we had to handle in and out of stock as much as 5,775 tonnes in one day.

This Chart brings out clearly that whereas Durgapur Steel plant was never intended to be supplied with BOBS wagons but rather BOX wagons, it is, in fact, now being given BOBS wagons at the expense of your Works and that your Works are being forced to accept a greater and greater number of BOX wagons in consequence. It will also be observed from this Chart that Bhilai remains unaffected as far as BOBS wagons are concerned.

The Company has always objected to being forced to accept BOX wagons in lieu of BOBS wagons as with the full knowledge and approval of the Railway Board our mechanical off-loading equipment was de-

* The Company has always objected to being forced to accept B.O.X. wagons in lieu of B.O.Bs. wagons as with the full knowledge and approval of the Railway Board our mechanical off-loading equipment was designed and installed to handle only B.O.Bs. wagons.

CHART NO. 3 showing the Iron Ore Programme & Receipt Position against the production of Iron of various Steel Plants

signed and installed to handle only BOBS wagons.

Burnpur Works require an average of 40 BFRs per day but, as can be seen from the Chart, this figure is rarely supplied.

Charts Nos. 5 and 6 have been prepared to show that practically every day the Railway authorities impose restrictions on the despatch of finished materials on numerous routes and to numerous destinations. The practical result of this is that wagons already loaded with materials are not accepted by the Railway authorities at the last moment, thus causing detention and demurrage liabilities, and also in many cases, your Works are unable to load wagons because they have no material available for the destinations which are free of restrictions. Again, there is wagons detention and demurrage liability.

In effect, the Railway authorities supply wagons for despatch of finished material and at the same time dictate to us where these materials shall be sent and in many cases against the Iron & Steel Controller's orders. This is an absurd situation and would require a considerable tonnage of finished goods to be held in stock to cover such a wide field of variation of free destinations.

COLLIERY EXPANSION SCHEME:

The object of our Colliery Expansion Scheme is to provide the bulk, if not the entire needs of our Coking Coal, approximately 85% of which will be crushed, washed and blended to produce a consistent grade of Coking Coal of approximately 17.5% Ash.

The major development will take place at your Chasnalla Colliery where the Coal will be extracted:—

(1) from Open Cast Quarries, and

(2) Underground Mines.

The run-of-mine Coal will be crushed and washed in a Coal Preparation Plant and the resultant blend product transported to the Burnpur Works by two Aerial Ropeways costing approximately Rs. 4.5 Crores over a distance of approximately 32 miles. This

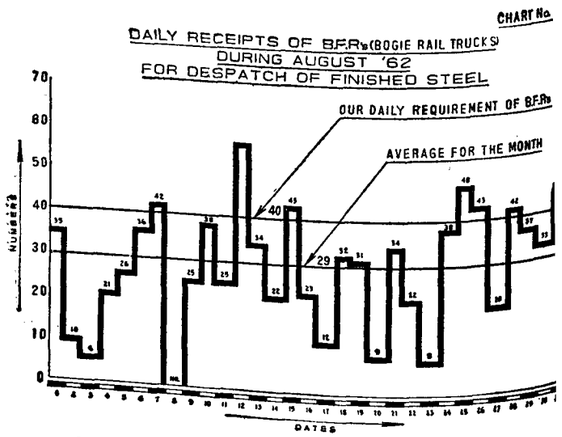

CHART NO. 4 showing Daily Receipts of BFRs (Bogie Flat Rail Trucks) during August 1962

development will take place over a period of approximately five years, the production progressively increasing to the target of 4,200 tonnes of washed Coal per working day.

The Coal reserves in your Jitpur Colliery at the present working levels are almost exhausted making

it necessary to sink the existing shafts to proven lower levels and also to make provision for Sand Stowing to permit maximum extraction. The production will thus be raised from the present 800 tonnes per day to 1,500 tonnes per working day over a period of five years. This Coal will be conveyed by Aerial Ropeway about six miles to the Chasnalla Coal Preparation Plant for blending and washing, yielding approximately 1,200 tonnes of washed Coal per working day.

The Company's Ramnagore Colliery is being modernised to increase the production of Coal from the present 400 tonnes per day to 1,000 tonnes per working day. The modernising includes the new Sand Gathering Plant and a Sand Transportation System. A new Ventilation Shaft and a ventilating fan have already been installed. Ramnagore Coal will be transported by Rail Car to Burnpur via the Company's own Kulti-Burnpur track. This Coal does not need to be washed as it will readily blend with the Chasnalla-Jitpur blend.

Experiments carried out at your Works over a period have shown that if we are to achieve greater productivity from our blast furnaces, our Iron Ore must be subjected to treatment to obtain a smaller and more uniform size and to remove the deleterious gangue. The smaller fractions of our Ores cannot be used without further processing. This problem is being closely studied and practical tests made in order to obtain sufficient basic information to enable us to select the most suitable process of agglomeration. In the meantime, it is proposed to instal the appropriate plant at your Gua Ore Mines to enable us to wash the Ore and screen to the desired size fractions.

INCREASE OF STEEL PRODUCTION UNDER THE FOURTH FIVE-YEAR PLAN:

The assessment of the future demand for steel in India is a futile exercise of mind and brain as the quantum is so large as to outstrip the ability to achieve it by any specified period of time.

The maximum achievement can only be accomplished by first concentrating on making available predetermined and realistic quantities of the necessary raw materials, its transport and the power required by predetermined dates and planning the simultaneous completion of matching Steel capacity.

To erect Iron & Steel Plants first, with the pious hope that the raw materials, power and transport will 'turn-up' is the mistake of the past and would be a criminal waste of money and energy if blindly followed in future.

Although the type of product required in the future has to be estimated, the estimate must be subjected to continual review as the pattern of product will inevitably change as time goes on. In adopting long-term planning for the development of new capacity, the development potential of the existing capacity must not be lost sight of as it is cheaper and quicker to achieve this than putting down a new plant of the same capacity. Development of capacity should be a continual process and to obtain maximum production with utmost efficiency from existing units, it is imperative that they be kept up-to-date technologically. In these days of advancement in new steel-making, long before the building of a new Steel Plant is complete, it is more often than not out of date, making it necessary to adopt newer techniques and equipment to maintain an efficient economic and technological balance.

The location of new Steel Plants is of vital importance, the principal influencing factors in the past have been the proximity of rew materials, power,

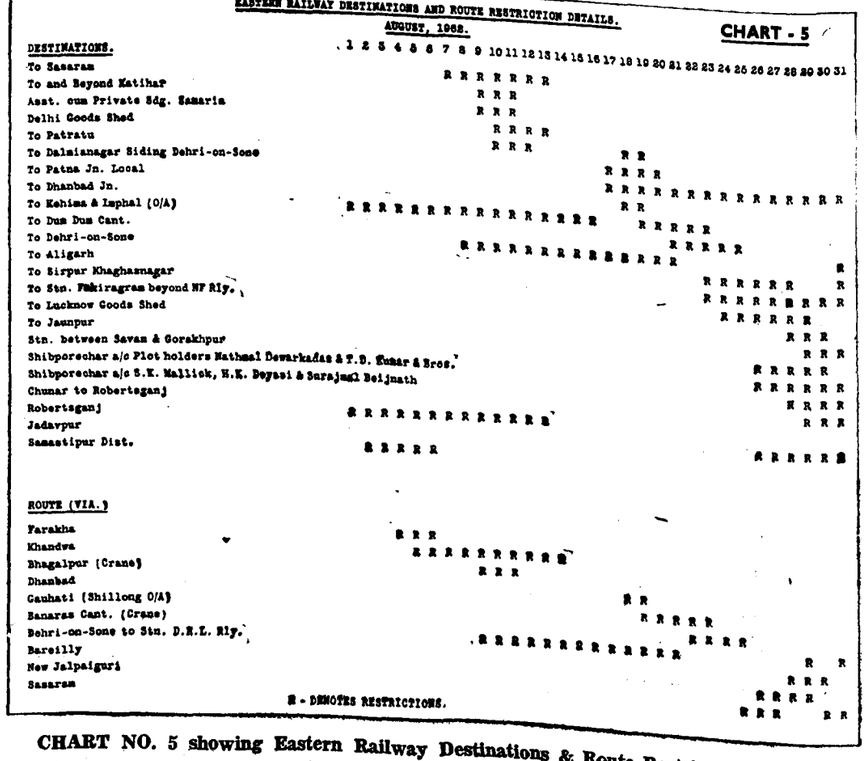

CHART NO. 5 showing Eastern Railway Destinations & Route Restriction Details

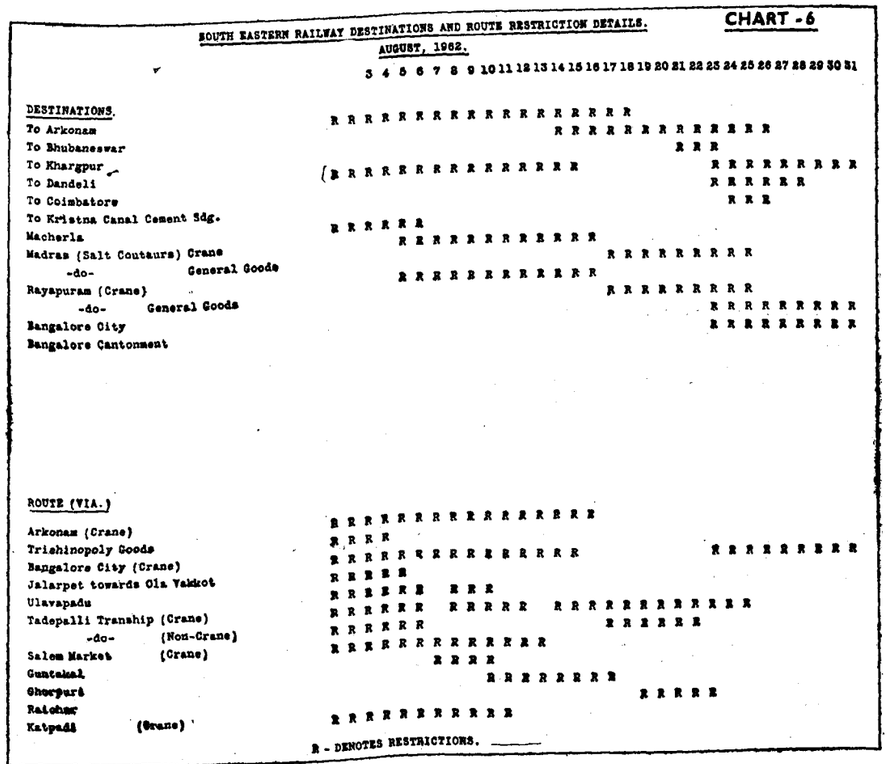

CHART NO. 6 showing South Eastern Railway Destinations & Route Restriction Details

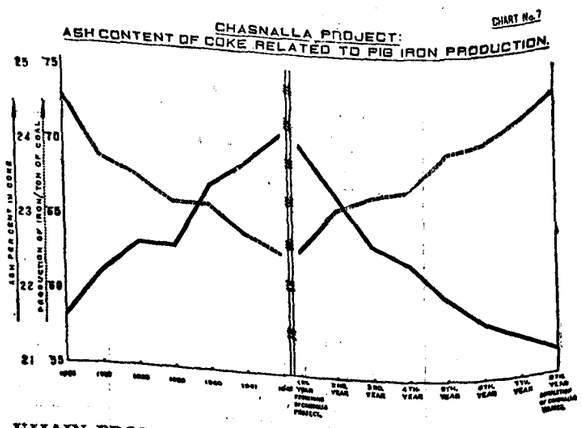
water and adequate rail transport. It is thus very tempting to proceed to locate new Steel Plants along the traditional Iron Ore|Coal rail route. Unfortunately, in our country this route is grossly overloaded now, and in the absence of large scale railroad development and modern techniques of handling it, the addition of one or more Steel Plants is bound to have a detrimental effect on the units already in existance. Throughout the world the trend is for bigger and bigger Steel Plant capacity until new plants of 3|5 million tonnes are not uncommon. Therefore, any designing of plants should take into account the probable ultimate size. If the intention is to develop larger plants for export purpose, then the ideal place for them is on a navigable river or sea-board.

The reserves of the basic Iron & Steelmaking raw materials in India have been variously quoted, some of the figures are such that if accepted, would discourage longterm planning of Steelmaking capacity. One such item is lime-stone, but it is difficult to believe that a country the size of India is relatively short of good quality limestone. To establish the truth of the matter large-scale prospecting must be carried out, uninhibited by thoughts of distance from the consumer. Transport facilities must be developed to match the sources of supply and this would be a much better proposition than spending large sums of money beneficiating local inferior limestones and run into the vexed transport problem.

It has to be accepted that the quality of Coking Coal in India has never been and never will be 'good' that it is worse today than ever before. Here again the calculated reserves are based on inadequate knowledge of the possible existence of coal lying below the normal working depth of Indian Coal Mines. It has not been conclusively proved that Coking Coal does not exist as valuable reserves below a depth of 2,000 ft. In the meantime, the existing Coking Coal quality must be improved by washing to produce a product of consistent ash level even if the ash is still not as low as desirable. Conservation of the existing reserves is imperative even to the extent of prohibiting the use of any Grade of Metallurgical Coal for purposes other than Metallurgical. Every effort has to be made to reduce the consumption of Coke per tonne of Pig Iron by resorting to modern Technology in regard to preparation of Blast Furnace Raw Materials and the use of fuel injection coupled with refractory materials to withstand the maximum blast heat attainable.



Of all the raw materials, Iron Ore is the most plentiful in India and is of high Fe content. Unfortunately, most, if not all, of the ores also contain a high Al2O3 content, a factor which contributes to a greater Coke consumption (an expensive item) than would otherwise be the case, particularly where Pig Iron is manufactured specifically for Steelmaking.

The beneficiation of ore in the form of uniform and smaller sizing together with washing should greatly improve Blast Furnace operation and the quality of Pig Iron obtained.

The measures taken to obtain a smaller and regular Ore size will result in a substantial quantity of under-size Ore at the Mines. Many processes have been developed to agglomerate under-size ore for use in Blast Furnaces, each of them having their own merit for a particular set of conditions. None of them has universal application which makes the selection of one or the other a matter of the greatest importance. It is suggested that in view of the vast Iron Ore reserves in this country compared with the reserves of the other raw materials there is plenty of time to study all methods of agglomeration in an effort to find the best possible solution to India's particular problem; which may or may not be the popular method of Sintering.

The washing of Coking Coal will simultaneously produce a discard fraction of middlings, the disposal of which will not be a problem if used for the generation of electrical power. Here is opportunity to alleviate the chronic shortage of electric power. Such Power Generating Stations should be erected in conjunction with or adjacent to several Coal Preparation Plants.

Due to the rapid industrial development of India there is a great dearth of experienced technicians. Training programmes have been organised to create an army of trained personnel required to man the new Steel Plants. This is a gigantic task in itself, unfortunately it cannot be said to have been wisely handled. Far too many trainees without previous Works experience have been sent abroad for a training of doubtful value when instead they should have been employed in the construction of the plant they would eventually have to operate. Thus a valuable opportunity was lost in which a large number of selected men destined to be Supervisors or Managers would have matured with the experience of working with their own hands. It is suggested that in future, training programmes should be designed in such a manner that all trainees, irrespective of their ultimate destiny, are required to 'work on the job' for an extended period of time before final selection. Training abroad should be limited to those who are already mature to some extent and who can profit most from specialised training. General overseas training is useless. Until such time, and in my humble opinion of some thirtytwo years' experience, the country has to bring out highly experienced overseas staff to train our men to man our plants—a matter of ten to twelve years.

UJJAIN PROJECT:

At the last Annual General Meeting I mentioned to members present that your Company in conjunction with our old friends, Stanton & Stavely Ltd. were contemplating on starting a new Works as a subsidiary of this Company at some suitable place in Madhya Pradesh which would be convenient from its transport point of view to cover Kashmir, Punjab, Rajasthan,

Delhi, Himachal Pradesh, parts of Uttar Pradesh, Gujrat and Maharashtra, etc., in other words areas where freight costs made sale of your Spun Iron Pipe products from your Kulti Works unremunerative. I am happy to report to you that an Agreement has been concluded with Stanton & Stavely Ltd. of U.K. whereby they will contribute towards all plant and spares which cannot be made in India, this being about 1|3rd of the actual cost of the project, the other 2|3rds of the cost to be met by your Company; this agreement has had Government's blessing and the necessary licences etc. have already been issued. The position of the new Works will be situated about 5 miles west of Ujjain, a city famous from the time of the epic of the Ramayana and of Meghaduta, where all necessary requirements such as land, power, water and transport, both broad and metre gauge railway, plus roads are available. All work in this connection is proceeding satisfactorily except that of the railway siding into the Works, which, although it is almost alongside the main track, is taking a little time — a matter that must be expedited without delay as otherwise nothing can be installed at the site. The range of products will be Spun Iron Pipes — the same as that produced at your Kulti Works No. 1 Pipe Foundry since 1942, viz. from 3" to 12" dia. and 18 ft. in length and for the necessary specials and bends, etc. for which there will be a Specials Foundry. The approximate total cost of the completed plant will be about Rs. 3 crores. In view of the tremendous demands for these pipes to complete some of the Second and all of the Third Five-Year Plans set up by Government and the Private Sector, one would have thought the Railways would have made a special attempt to put in hand and make available these sidings, a matter of a few hundred yards only.

The total production of pipes and specials will be in the neighbourhood of some 65,000 tonnes per annum and the plant is capable of being doubled without much trouble, should demand for its products remain. The quantities of special grade iron and coke will be met from your Burnpur Works. Stockholders would be invited to subscribe towards building of this plant in the way of a Rights Issue, and the nomenclature and time will be notified in due course after consulting the Capital Issue Department of the Government.

FUTURE EXPANSION:

Another matter, which I am sure, will be of great interest to you is the balancing of the Burnpur plant and its future expansion to make it an economic unit. This came up for discussion at Washington while my advisers and I were engaged in concluding our loan arrangement of $19.5 millions with the World Bank for the Colliery Expansion scheme. A day before we left for Washington, Mr. E. De'alba of the World Bank requested us to make a chart on the historical performances of the blast furnaces as from the time the quality of coal started deteriorating upto the present, and projecting the same to show the effective improvement in iron production as a result of the use of increased quantities of washed coal from the Colliery Expansion Scheme. When this chart arrived at Washington it was found from historical past records of your Blast Furnace practice that performance and production once we reverted back to the 1955 quality of coal, when free purchase of coal in regard to quality and price was permitted, your Blast Furnaces would produce more iron than they are doing at present, and what is more, the right quality of iron suitable for steel making. It will be seen from Chart No. 7 that as we proceed with the Colliery Expansion Schemes, the quality of coal after washing will improve yearly till work is completed, when it will be better than what we had in 1955. It was then confirmed by our Consulting Engineers that with the right quality of steel making iron being available, the present steel melting capacity could, with inclusion of a few ancillary plants of the latest technique, be almost doubled. This was indeed an intriguing situation! What then were the missing links? Your Consulting Engineers were of the opinion that with the help of oil injection in Blast Furnaces and oxygen injection in the Steel Furnaces coupled with continuous casting, electric furnaces, a rolling mill and an additional Blast Furnace to take care of the Foundry, requirements of your Kulti and Ujjain plants could be installed at a figure not exceeding 1|5th or 1|4th of the cost of a new integrated steel plant of a million ton capacity installed in a new place. All these figures were, of course, approximate and needed further careful looking into. The World Bank authorities were, however, appreciative of these findings and expressed a genuine desire to help the Company with the necessary foreign exchange requirements (for the fourth time) subject to Government's blessings and agreement to guarantee the repayment of the foreign exchange. On the 17th of January this year the matter was discussed with Government when it was explained to them that apart from the increased production, the beauty of the scheme was not only the low cost and the quickness with which the plant could be installed, but also that no further coal would be required other than what we shall mine ourselves and transport by our own ropeway system, thereby relieving the Railways of their responsibility of transporting some 6,400 tonnes of coal a day, a not too insignificant problem and headache, effecting at the same time a considerable financial saving to Government.

Government at first was not responsive, but later suggested that the scheme be phased out into two parts, the first phase merely to embrace the balancing of the existing plant due to improvement of coal and the second to cover the full scheme. The Company submitted to Government the two phases of the Scheme on 9th June this year and stated that Phase I would cost the Company Rs. 12.2 crores, increasing the ingot production by approximately 3,10,000 tonnes and finished steel by 2,48,000 tonnes, and further suggested that final details regarding Phase II would be submitted at a later date about the time when Phase I would be nearing completion, depending on the then market demand of the type and quality of steel to be made, as well as incorporating the latest improvement in plant design. In this connection your Board of Directors have invariably accepted your Managing Agents' advice on the principle of consolidation and experience gained thereby first before further expansions are undertaken, ever since 1950, 1953, 1955 and the present 1961 colliery expansions were taken on hand as well as this latest one now under consideration of Government.

Phase I would increase steel production in terms of ingots or its equivalent by about 3,10,000 tonnes and finished steel by about 2,48,000 tonnes.

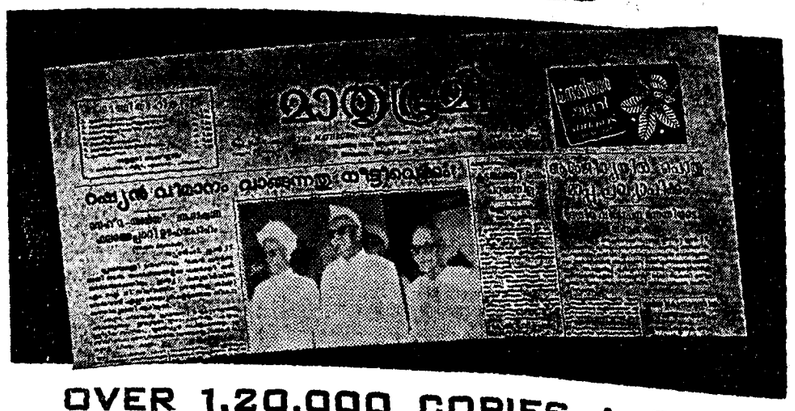
Phase II may bring the total production of your Company to anything up to a total of 2 million tonnes of ingot equivalent and 1.6 million tonnes of finished steel. My personal views are, however, that we must not rush where the angels fear to tread. By that I mean, whilst the transport and raw material situation is as it is, it would be foolhardy on our part to even think of a larger expansion at Burnpur than 2 million

or thereabout tonnes of equivalent ingot steel. I have been dealing with your Company's affairs in one way or another for 32 years as Managing Agents' representative, *Director and Chairman*. I can assure you that our conservative views have so far paid you well. Your new plants have been brought into commission well ahead of the scheduled time and as for results, you are the best judge.

APPEARANCE OF WAR CLOUDS:

The Steel Corporation of Bengal tapped its first cast of steel ingot on the 10th November, 1939 when the World War II had just started. I distinctly remember, that at the request of the then Munitions Board and the Roger Mission, which had come out to investigate the possibilities of manufacturing in India the latest types of ballistic missiles and other requirements, as well as augmenting the production of the existing Ordnance Factories, this infant was called upon from that early stage to produce special quality steel. As the War proceeded, more and more such steel was produced and at times almost at a moment's notice.

The Steel Corporation of Bengal was amalgamated with your Company by an Ordinance promulgated by the Government of India on the 29th October, 1952 to make it effective from the 1st January, 1953. Since then your Company has been making both, different qualities as well as categories of steel to suit the country's requirements, and I am sure, the country can rely on your Company to bring forth its best efforts to meet all emergency requirements needed by the Defence Ministry and thereby help to enable them to throw out this naked aggression committed on a peace-loving nation like ours by the barbarous communist-minded Chinese.



ACKNOWLEDGEMENTS:

I would again this year express on behalf of your Directors our appreciation of the services rendered by your General Manager, Mr. J. McCracken, and his able team of executives at the Burnpur and Kulti Works, as well as at the Ore Mines & Collieries. Production has been achieved in the face of constant operational difficulties and I would like to make special mention of the Blast Furnace and the Steel Melting Shop Supervisory staff who have so ably faced up to the ever changing problems with which they have been, and continue to be, confronted in the maintenance of production under existing conditions. I should also mention about the Supervisory staff at your Kulti Works, due to whose untiring efforts the Kulti Foundries have once again created a record by achieving a production of 2,30,423 tonnes.

In concluding my statement to you I would add that I have not had any difficulty in endeavouring to state facts and include figures and charts as they stand, as I have not indulged in the luxury of painting a picture by letting my imagination run riot, nor in one of the modern trends of impressionism, thereby obscuring matters. I have given a photostat of facts and figures as they exist so that you may view them in their true perspective with the vision God has given you. May He bless us all!

Note: The above statement is not a document purporting to be a report of the proceedings of the Annual General Meeting.

THE ROAD TO BURNPUR

A detour at 200 km. on the trunk route from Calcutta. Less than forty years ago it would have led to a cluster of sleepy hamlets, named severally—Hirapur, Santa, Narsinghband, Napuria and Dharampur. The same road today takes you instead to a purposeful steeltown—Burnpur.

There, at the million-ton integrated steelworks, production records are quietly being set and excelled and production efficiency is currently the highest among all steel units in India For us it is all in the day's work and we seldom talk about it. Where there is a challenge to be met, IISCO takes it naturally, in its stride.

IISCO FACES THE FUTURE WITH CONFIDENCE

DELHI CLOTH AND GENERAL MILLS COMPANY, LIMITED

LALA BHARAT RAM'S REVIEW

Speech delivered by Lala Bharat Ram, Chairman Delhi Cloth & General Mills Co., Ltd., Delhi, at the Annual General Meeting of Shareholders held on November 9, 1962, in the office of the Company at Bara Hindu Rao, Delhi.

Ladies & Gentlemen,

I welcome you to this 74th Meeting of the General Body of the Shareholders of the Delhi Cloth & General Mills Co., Ltd.

We are meeting today under the deep shadows of a national crisis. I do not think that in our living memory anyone of us can recall that the country has ever had to face such a grave peril inflicted upon us, without the slightest provocation, by a neighbouring country which professed friendship, but has paid goodness by evil. We now face a situation which has taken us almost by surprise, and to face which every fibre of the Nation will have to be flexed and no sacrifice will be too great to render at the altar of the freedom, integrity and honour of the country. It is necessary, therefore, that wherever we are and in whichever station of life, we reflect on the responsibilities and duties which have fallen upon all of us. It is gratifying to note that already a great deal of spontaneous enthusiasm has been generated in the people. In fact, there is an upsurge of purposive emotion and indignation, the like of which never took place in recent history. This enthusiasm and emotional outburst has to be channelled and harnessed to the best advantage of the country and not to be frittered away in petty directions. What is more, this has to be maintained because the war is bound to be a long drawn out affair, and it will be fatal if we allow ourselves to be lulled as a result of some gains here and there into a sense of complacency. The misfortune of the country has been that we had become complacent, and, may I say, even soft? The present crisis has shaken us off this complacency. It is now for the leaders of the country and Government to let the people know clearly and in concrete terms as to what is expected of them, in what manner austerity, if necessary, has to be observed, what the industry and workers have to produce, and how exactly the energy of the scores of voluntary organisations has to be channelised to meet the one objective that we have before us. It is also up to our leaders to inculcate a sense of pride in austere living, which can only be done by example and precept rather than by preaching.

DONATION TO DEFENCE FUND

Industrialists and business men have a great responsibility towards the country today. I am glad that responsible organisations of Industry and Trade from all the nooks and corners of the country are sending their messages of support to our Prime Minister and Government. However, much more has to be done, and on various fronts. Many leading Business Houses have donated large sums of money to the National Defence Fund. Your Company will also make, for the time being, a donation of rupees ten lakhs. It is a matter of great pride that the workers of the Delhi Cloth Mills and Swatantra Bharat Mills took a lead in working on a Diwali holiday on the 29th October voluntarily and donated the wages for that day. All the staff of D.C.M., S.B.M., H.O. and C.M.O. have also donated a day's salary. The Company also donated the profits of that day. The Managing Agents have also given their commission for that day. The total of these amounted to Rs. 1,18,789. In fact, the workers are keen to work on other holidays and donate the wages to the National Defence Fund, and it is expected that the Delhi Cloth Mills will work on the 11th of this month which was to be a holiday.

While it is good that business people and others are donating large amounts to the National Defence Fund, we must not lose sight of the increasing need for earning more foreign exchange by exports. This need is even greater today than before as the country would have to import large quantities of defence equipment and various types of raw materials in larger quantities to increase production in the country. I would, therefore, urge the industrial and business community that they make every effort to increase the exports even at a sacrifice and consider this sacrifice as their additional contribution to the defence effort.

In this hour of National crisis, the business community, as in fact the entire Nation, will be on trial, and it would be judged by the manner in which it meets the essential civilian and Defence requirements at reasonable prices. We have therefore to see that no hoarding or profiteering takes place. This can be done by the producers making arrangements to distribute the products in such a way that they reach the ultimate consumer at prices which they are expected to pay. The wholesalers have similarly to play their part. Such of the commodities which can be price-marked should be stamped with retail prices as is being done in the case of cloth. In respect of other items, large-scale advertisement of price should be resorted to. The retailers, especially in large towns, should display prices in prominent place in their shops so that the consumer knows, even before he buys, as to what he is expected to pay. All these measures will not only help in creating confidence in the minds of the people, but also to put a curb on those who may be tempted to make easy money in the difficult times that lie ahead.

FULL SUPPORT

On behalf of the Delhi Cloth & General Mills, I assure the Prime Minister and the Government that we are fully behind them and we will spare no effort to contribute our mite to the cause in every possible direction.

To the consumers also I would like to say a word. Although there is no shortage of cloth at the moment and I am sure that its production will be maintained at levels which will meet the full requirements of the people, even so it is necessary for them to exercise some self-restraint on consumption. In respect of some other items also, it is imperative to apply restraint; for example, all leather goods, particularly shoes and woollen materials. Apart from other Defence requirements these are the two commodities which by consuming less the consumer can directly contribute to the war effort. Even from the point of view of making our contribution to creating the proper psychological atmosphere in the country, some self-restraint on consumption of several commodities has to be imposed.

One more word, and I would have done as far as this subject is concerned. Our industries will have to produce more. They will also have to turn out equipment which is required by the army. In order that we do not place an undue strain on our foreign exchange resources, all of us should be prepared to use whatever substitutes are indigenously available and try to make good with these. Although quality should be our end, in times of emergency it behoves us that we make good with whatever we have, provided that it can be used without detriment to the overall effort.

Coming back now to the Company's affairs, the Balance Sheet, Profit & Loss Account and the Report of the Board of Directors for 1961-62 have been in your hands and with your permission I will take them as read.

YEAR'S PROFITS

The net profits of the Company have been marginally lower than last year. These have been due to higher provisions for depreciation and taxation.

We have been continuously renovating and modernising our textile mills. The old Waste Plant in the D.C.M. will be replaced by a modern Waste Plant during the next few months. The spinning capacity at Hissar is being expanded by the addition of another 23,000 spindles. It is expected that the installation of these additional spindles will start soon. Your Company has been a pioneer in the distribution of cloth directly to consumers. This policy has resulted in supplies to consumers at controlled prices by the Mills. This service has been appreciated in ample measure by the public at large at all times of shortages. Today the Company has over 300 retail shops scattered all over the country and the Company will continue to increase its retail shops as and when necessary.

Your Company has not only been maintaining its exports of textiles but expects to increase its exports in the current calendar year. This is in spite of the fact that until June this year the exports of textiles have been declining. In the face of this declining trend of textiles, the textile industry undertook to export 12½% of each Mill's production voluntarily and it is gratifying to note that in the past few months the exports of textiles from India have increased.

Our plan for the expansion of crushing capacity at Mawana is in progress, and we hope that in 1963-64 we will have increased our crushing capacity from 1,500 tons per day to 3,000 tons per day. During the last season, the quality of cane in our area was extremely poor and the recoveries consequently suffered. The new system of linking the cane prices to sugar content, for which the industry has been pressing for many years, was at long last finalized by the Government and will take effect this year. This will not only help the industry but it will gradually persuade the cultivator to concentrate on high sugar yielding varieties of cane.

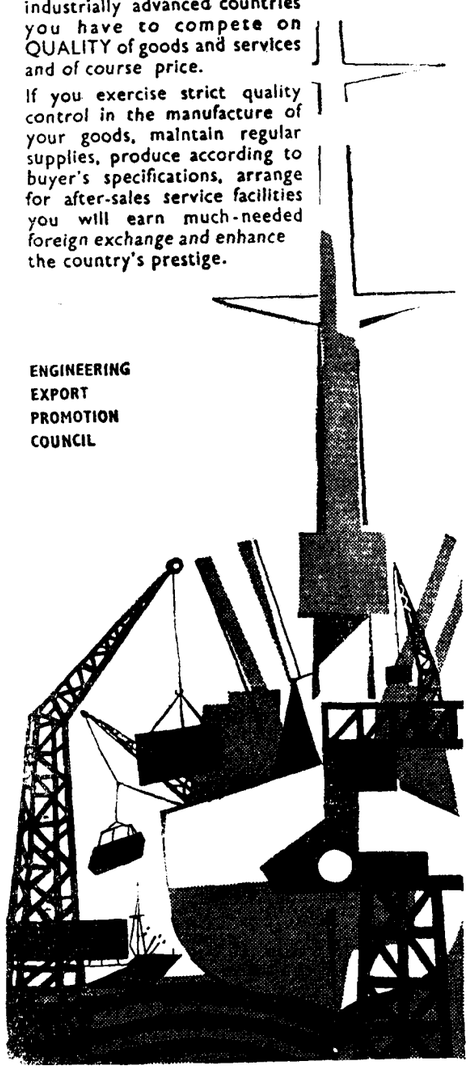
CHEMICAL PLANTS

A recent activity that your Company has undertaken is the designing, construction and erection of Chemical Plants. We have already designed, manufactured, supplied and erected two Sulphuric Acid Plants. Two more Sulphuric Acid Plants and two Superphosphate Plants ordered by various parties are nearing completion. Gradually, we hope to extend the activities of this Section to cover other types of Chemical Plants also.

In my speech last year, I had made a reference to two new Projects which we had taken in hand. You will be glad to learn that these Projects have made good progress. Most of the machinery for the P.V.C. project has been received at site and erection work is in progress. The Caustic Soda Plant, which is part of the project, will soon be in production. The final product, namely P.V.C., would be on the market some time in the latter part of 1963.

Our negotiations with the USA Agency for International Development for a dollar loan to meet the foreign exchange requirements of the Rayon Tyre-Cord Project have been successful. The agreements have been signed and orders will be placed soon. It is expected that this factory will be in production by the end of 1963 or early 1964.

Before concluding, I would like to place on record our sincere appreciation of the good work of all our workers and staff whose efforts have enabled us to achieve satisfactory results during the year.



Earlier, Lala Bharat Ram recalled gratefully the devoted services of Mr Ahmed Islam Khan, the Managing Agent's working member in Pakistan, who passed away in October.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Your market outside is discerning

As an exporter of engineering goods you must be aware that in the export markets, for the buyer to select your goods in preference to those of other industrially advanced countries you have to compete on QUALITY of goods and services and of course price.

If you exercise strict quality control in the manufacture of your goods, maintain regular supplies, produce according to buyer's specifications, arrange for after-sales service facilities you will earn much-needed foreign exchange and enhance the country's prestige.

THE BUSINESS WORLD

Mr. Maudling's Autumn Budget

By PAUL BAREAU, Editor, The Statist

THE fickle British climate has this year vouchsafed a magnificent autumn. Nowhere has its magnificence outmatched that of the autumn budget. This is almost a contradiction in terms. An autumn budget is, by all precedents, a horrible affair. In the past such a budget has only been introduced at times of crisis when the fiscal screw had to be turned because of a deterioration in the position since the major budget had been introduced in the previous April.

Nothing of the kind has happened this time. The new Chancellor of the Exchequer, Mr. Reginald Maudling, has just given us two major concessions. The first is a cut from 45 to 25 per cent in the purchase tax on motor cars. The second is a group of concessions in the tax treatment of depreciation and investment allowances. Together they will involve a loss of revenue by the Exchequer amounting in a full year to £165 million.

We have been assured on the highest authority that this is not to be regarded as a budget, supplementary or otherwise. This, however, would appear to be a technical evasion of terms. The two concessions could be brought into effect without the presentation of a supplementary Finance Bill and to that extent the "budget" terminology could be avoided. But the amounts involved are surely such as to make this a major fiscal initiative.

The need for a Finance Bill was avoided in the first place because the Government has the power, by executive action, to shift items from one of the existing ranges of purchase tax to another. This is what has been done in the case of motor cars. The means by which new legislation was avoided in the case of the investment and depreciation allowances were more stubtle. The Chancellor announced that the necessary changes in taxation would be included in the next Finance Bill in April 1963, but that they would be made retrospective.

This, incidentally, gives the Chancellor a much more flexible fiscal instrument than he or his predecessors have ever controlled in the past. If, by making fiscal legislation retrospective, changes in taxation can be made virtually in any week of the financial year, most of the criticism of the regidity of the budget as one of the instruments for control of the economy, will have been dismissed.

The initiative of the Chancellor of the Exchequer came not a week too early. The general economic position has unquestionably been deteriorating. Unemployment has recently topped the half million mark, which is the highest figure for this time of the year since the end of the war. There is every prospect of the total rising to over 600,000 during the winter months. There is also mounting evidence of a large margin of unused capacity in the British economy.

It has been argued by eminent economists that a margin of 5 per cent is needed in order to maintain the economy in balance, to avoid overful employment and the inflationary repercussions which this causes. On any sober calculation, however, it is probable that the margin of unused capacity at the moment lies between 10 and 15 per cent for industry as a whole. It is, of course, well above that figure for certain industries which are now particularly hardpressed. The iron and steel industry is working at less than 70 per cent of its capacity and the ship-building industry at rather less than one half of what it can produce.

The motor car trade was chosen for special favour for three main and adequate reasons. It occupies a key position in the whole engineering complex in Britain. What is good for motor cars will be good for steel and many other parts of the British economy. Secondly, the motor car industry had been particularly successful in its export drive and will no doubt continue its performance in this respect. Finally, it has been particularly co-operative in the readiness with which it set up some of its newer plants in areas where the Government for political and economic reasons wanted to see them rise, namely, where unemployment is heavy.

The concessions on capital allowances are highly complex as such matters usually are; but it can be said of them that they have put British industry in a more favourable position than exists in any other highly developed country in the world. In future there will be no justification for the British industrialist pleading the burden of taxation to explain why he has failed to re-equip and renovate his plant in a manner commensurate with the practice of his foreign competitors.

The question now arises whether these measures will succeed in boosting the British economy and causing it to regain the dynamism which it had so clearly lost. By themselves these concession are still too small to achieve that objective. And yet, to have done more, particularly in the stimulation of consumer demand, would have been to invite real danger of running into a balance of payments crisis.

The fact is that the industrial countries are all beginning to feel the effects of economic stagnation and over-production. What is needed is a collective attempt to restimulate demand. The Managing Director of the International Monetary Fund, Mr. Per Jacobsson, made that point very clearly in a speech delivered in New York a few days ago. His was the first voice which announced the end of the post-war inflation. This he did in 1958. Now he has warned the world of a vicious circle of deflation unless effective but collective counter measures are taken.

The forum within which such joint action can be discussed is the Organisation for Economic Co-operation and Development in Paris which is the successor of O.E.E.C. but supplemented by the full membership of the United States and Canada. The Ministers of O.E.C.D. countries will be meeting in Paris on the 27th November. There Mr. Maudling will be able to plead the need for re-expansionist action, including cheaper money, more expenditure on public works, and, it is to be hoped, more aid for under-developed countries. He will also be able to reinforce his argument with convincing proof that Britain has already done something to implement the logic of his proposals. It is true that at the Washington meeting of the I.M.F. Mr. Maudling had little luck with his first initiative, that designed to improve the international payments arrangements. Let us trust that he will fare better on this next occasion.

Safety for Share-Holders in the States

By CROESUS

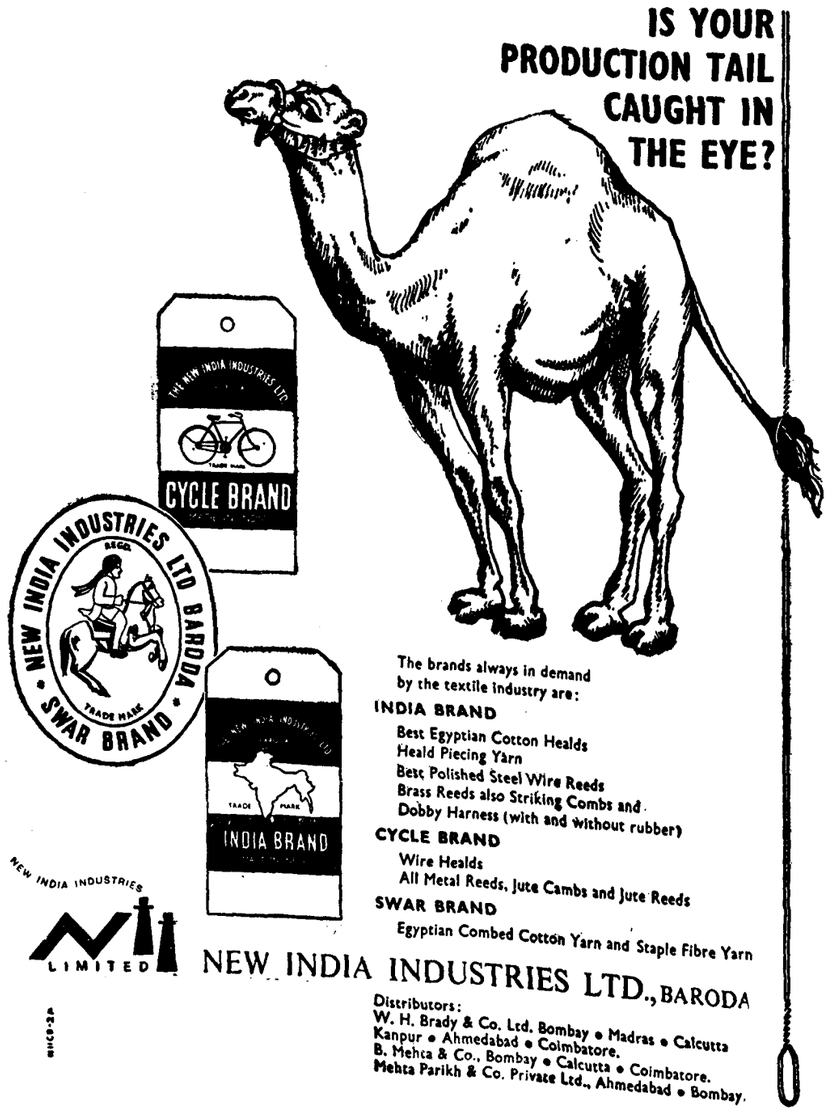
THERE was something to learn for share-holders, stock-brokers and company managements alike in what Mr. Louis Loss, Professor of Law at the Harvard Law School, had to say in the several brief talks that he gave to a number of institutions during his all-too-brief a stay in Bombay, last week. Among others, he addressed the Company Law Association of India, the Bombay Share-holders' Association, the Maharashtra Unit of the Indian Law Society, and the Institute of Chartered Accountants.

Taking it for granted,—which is, broadly speaking, also correct—that the Indian Company Law is based on the British Law, Mr. Loss compared the law as it affects share-holders, directors and stock exchanges in the U.K. and the U.S.A. The British approach was one of compulsory disclosure, he said, but, though not the same, the U.S. approach was more stringent, in that it provided for a detailed and minute examination of the prospectus by a team of experts before its acceptance by the Registrar. In other words, a lay investor in America need not bother to verify the correctness of all the statements and claims usually made by the promoters of a new company in the published prospectus. Once a prospectus is given a clearance by the Registrar, it can be taken as genuine and reliable.

"The aim of the U.S. legislation is to protect the genuine interests of investors", declared Mr. Loss, and, in support of this statement, he gave a number of illustrations. "A proxy notice," he said, for example, "has to disclose all relevant information and a share-holder may demand that his proposal should be included in it". Again, it would appear, share-holders, when they find themselves in a minority, do not have to muster over 10 per cent. of the total number of votes, as they have to do in our country, to take it to the company law authority; even one share-holder, if he feels genuinely aggrieved, can sue the management, and no share-holder, however meagre his resources, fights shy of doing so, it is stated, because he can always fix up with his lawyers to pay an agreed percentage of his gain, if the case is won, or not pay anything at all in the event of the case being lost. (This is not permitted in India). That this has not led to too much of litigation speaks for the discipline and restraint of both the company managements and the share-holders in the States.

In all his talks, Mr. Loss laid great stress on the moral responsibility of company managements consciously to do nothing that would harm the interests of share-holders. For instance, he said, a director of a company listed on a stock exchange having a 10 per cent interest in that company cannot deal in the company's shares. Similarly, a broker or a lawyer may not deal in the shares of a company of which he is a director, taking advantage of the inside information he may come to have. In this connection, the U.S. Law Professor narrated an interesting case of a stock-broker firm with two partners, one of whom was also a director in a company. This director-partner attended his company meeting in which it was decided to skip the dividend for that year. The practice in the U.S. is that, in respect of listed companies, all such news are immediately reported to the stock exchange authorities who have them creeded on the tape straightaway. Allowing for the time reasonably required for all this, the director-partner of the stock-broker firm went from the Directors' room to the telephone and asked his other partner as to how the market had reacted to the news of the dividend of the company having been skipped. As ill-luck would have it, there was some slip-up somewhere and the ticker had not carried the news on the tape, so that this partner was the first to have the news and also to act on that news by a sizeable unloading of the shares of that company. When the authorities came to know about this, an investigation was ordered and the director was found to have taken undue advantage of the inside knowledge he had come by in his capacity as a director!

After recounting this, Mr. Loss stated that there was nothing to prevent a broker or a lawyer from becoming a director in a company, so long as he undertook not to cash in on any inside information that he might come to possess, by virtue of his being a director, for his personal benefit. This is a great moral responsibility, but, with rare exceptions, we are told, this fiduciary position of a director has been abused in the States.



The control over stock exchanges in the U.S. is more of co-operation as between these exchanges and the Government. To quote Mr. Loss, "Dealing in shares takes place in the U.S. under a system of regulations based on co-operation between the Government and the Stock Exchanges." Only the shares of listed companies are subject to these regulations, and there are a number of companies whose shares are not listed, although more and more, depending upon the size of the company, are being listed these days. A close watch is kept on the trends of trading and if there should be any undue rise or fall in values for no ostensible reason, it is immediately notified to Washington and the Securities Commission starts looking into the business of buying and selling brokers. If no proper and satisfactory explanation is forthcoming from the concerned brokers, an investigation is ordered. As regards speculative transactions, the U.S. Professor's notion of "speculation" seemed to be quite different from what one understands by that term in this country. He disclosed that, although there was no ban on short sales, it was unlawful for a broker to sell a share in a foreign market. It would be interesting to know whether the recent sales of shares in Bombay by some operators of other markets where margins had been fixed would fall within the mischief of this American provision.

Business Notes

Development

NEGLECT OF RURAL ECONOMY NOT WARRANTED

DESPITE the strenuous efforts being made by the under-developed countries for the last fifteen years or so, the conditions in these countries hardly present an alluring picture. This is intriguing, because there has neither been an absence of natural resources in these countries, nor has aid from other countries been non-available to them. What then is the explanation for this obstinancy to develop, as it were? A plausible answer was provided to this intriguing question, the other day, by Mr. E. F. Schumacher, the well-known Britsh Economist, when he addressed the Madras branch of the Society for International Development. Mr. Schumacher attributed this obstinacy to develop to "a sort of dual economy, a phenomenon of mutual poison-

ing of the metropolitan and rural economies prevailing in these countries." And this has come about, he said, due to these countries adopting an unsuitable technology of development beyond the reaches of rural economies.

Mr. Schumacher also made the observation that the extremely disturbing picture obtaining today in most of the countries in South-East Asia, such as the Philippines, Burma, Iraq and Iran, as also India, was due to splitting the country into two parts economically and thereby inexorably driving the country into a metropolitan culture, wherein more and more amenities tended to be concentrated, while neglecting the rural economy and leaving it to rot in abject poverty. For this reason, it would seem, these countries have not been able materially to promote their general well-being. To this British Economist, the present situation in these countries is more or less the same as what was witnessed there some 20 to 30 years ago. What has changed since, according to him, is that the population has increased very much and the metropolitan areas have become slightly bigger and slightly more assimilated in the modern way whereas the rural areas have been left behind in the race. This type of dual economy (metropolitan and rural), Mr. Schumacher cautioned, should not be viewed as a passing phase and ignored. It has already destroyed the possibilities of better, understanding between the metropolitan and the rural areas in other countries, and the outcome of such a trend, to quote him, is that "activity congregates in the metropolitan areas and sucks in energy from the rest of the country, leaving large areas derelict". This process, he recalled, had been witnessed in France and England, as also Germany. The ultimate consequence of all this, in this view is that the metropolitan areas would submerge all non-industrial areas, a position which could possibly exist only in an affluent economy like America. If this trend were not stemmed, he went on, the rural areas, in their turn, would poison the metropolitan areas and send its unemployed population to the urban areas.

Mr. Schumacher wholly disapproved of the theory that, in a poor country, unemployment cannot be avoided and that the only way to deal with it is to tighten belts and consume less. If there was a tightening of belts, he made the provocative point, there would actually be more unemployment. Arguing to the contrary, he held that "because there are more people with larger needs and more hands will be needed to produce things in a country with poor resources, there will be greater employment in under-developed countries."

Theoretically, all this may sound fine, but how will it work out in practice? Long before Mr. Schumacher made his discovery, some great Indian leaders like Gandhiji had put forward a more or less similar thesis. Even today several programmes, such as community projects, package deals, agro-industries and industrial estates, have been conceived of with such or similar ends as Mr. Schumacher has in view. A key industry for each district was the untiring slogan of that late Dr. Visvesvaraya for the best part of his life. Unfortunately, these have not all been as effectively implemented as they should have been, evidently because the people in charge have lacked the emotional conviction. At best, what Mr. Schumacher has put forward is another version of the "back-to-the village" slogan. What is needed in reality is not merely a return to the village, but a return to the closely-knit mutually helpful village economy of old, leavened with a fair sprinkling of such essential modern amenities as electric light, flush-type latrine, medical aid, educational facilities, etc. These we find even today in quite a few places where agro-industries have been successfully established, such as, for example, in Walchandnagar in Maharashtra State. But one wonders whether, with the systematic dismantling of the large-scale entrepreneur economy in the rural areas which has contributed towards this consummation by such legislation as the land ceiling law, one can ever hope for the establishment of another Walchandnagar, and, therefore, for the ideal type of rural economy that Mr. Schumacher has in view.

Labour

MORE LEAVE FOR WORKER.

THE IMPERATIVE need to step up the country's production all round in order to bring down production costs so as to make available much more than now for export purposes, as also fully to meet the growing internal demand, has been emphasised by one and all. While it is true that lack of sufficient raw materials, power shortage, and transport bottlenecks have all been taking their toll, it is no less true that the comparatively greater number of holidays or annual vacation with pay also has made its own not immaterial contribution. As though this were not bad enough, some sections of labour have lately begun to demand a month's privilege leave with full pay and ten days' casual leave to boot. Whatever merit such a demand may have or response it may evoke in normal times, even to talk of putting forward such a demand today in the midst of a national crisis is, to say the least, unpatriotic.

Be that as it may, what is the position prevailing in the other countries in this behalf? A comprehensive study on 'Annual Vacation with Pay' appeared recently in the "International Labour Review", which it would amply repay our managements and labour leaders to read.

The article in question gives information in respect of 77 countries, out of which as many as 47 countries have the practice of granting annual vacation only up to two weeks, either by legislation or by collective agreements. Sixteen of these 47 countries have also specific provisions which require the length of annual vacation to be increased after years of service. For example, a vacation of four weeks may be earned, in eight countries, only after putting in 15 years of service. In the other countries, annual vacation of only less than two weeks is permitted. As the article points out, while the coverage of the annual vacation benefit varies from country to country, the general pattern seems to indicate a minimum basic annual vacation for workers who have worked for at least the prescribed minimum number of days during a reference period, usually one year.

As regards the conditions of workers' entitlement to annual vacation also, the practice varies widely not only from country to country, but even within the same country and from one industry to another as well. The article has grouped these under the following four main categories to indicate the broad differences in the conditions of entitlement:

(1) The minimum period of service which a worker has to put in;
(2) The provision or non-provision for proportionate leave for workers who do not qualify for the full period;
(3) Whether continuity of service refers to one employer or to more than one employer; and
(4) What types of absence from work due to causes beyond the control of the worker are recognised as not amounting to a break in continuity of service.

But, as stated already, this is not the time to go into all these controversial issues. They must wait at least until the present emergency is over.

Trade

CODE OF CONDUCT

THE REPORT of the Committee on Fair Trading Practices, appointed by the Board of Trade in June last under the chairmanship of Mr. Shriyans Prasad Jain,

has recommended that a code of conduct should form an integral part of the bye-laws or rules and regulations of all the commerce bodies, manufacturers' organisations and export promotion councils. The gist of it is that the business community must make an earnest effort to bring about a self-imposed discipline to serve the best interests of consumers in India and abroad. Although unethical business practices have been resorted to by only a minority of business men, yet it has always been felt that a code of conduct in business must be adopted so that the consumer may have a better confidence in trade practices and a congenial atmosphere is created in the interests of the economy. A recommendation of this nature could not have come at a more appropriate time than the present juncture when a state of national emergency has been created in the country by the unprovoked aggression by Communist China on our northern border.

The complaints are mostly against quality, delays in delivery, non-fulfilment of contractual obligations, short delivery in terms of weights and measures, non-payment of commission agreed to be paid, incorrect invoicing and delay in settlement of claims. The code of fair trading practices should aim at the elimination of all these. All trade contracts, particularly those relating to international trade, the Committee has suggested, should have a suitable arbitration clause. To the extent these complaints are obviated, our exports should look up.

For holding the priceline in the domestic market, the Committee has recommended that greater resort should be taken to price tagging, price stamping and display of price lists in respect of all the essential commodities that enter common man's consumption. In view of some practical difficulties, the scheme has been recommended for implementation in 107 cities with a population of more than one lakh each, and in regard to 25 necessities of life. Price display forms an essential feature of trading practices in all the advanced countries and it is just proper that we should have a scheme of this nature well enforced, so that the consumer knows before hand what price he is expected to pay for an item of his purchase. The constituent units of the Associated Chambers of Commerce and the Federation of Indian Chambers of Commerce and Industry have obviously to play an important role in making this programme a success.

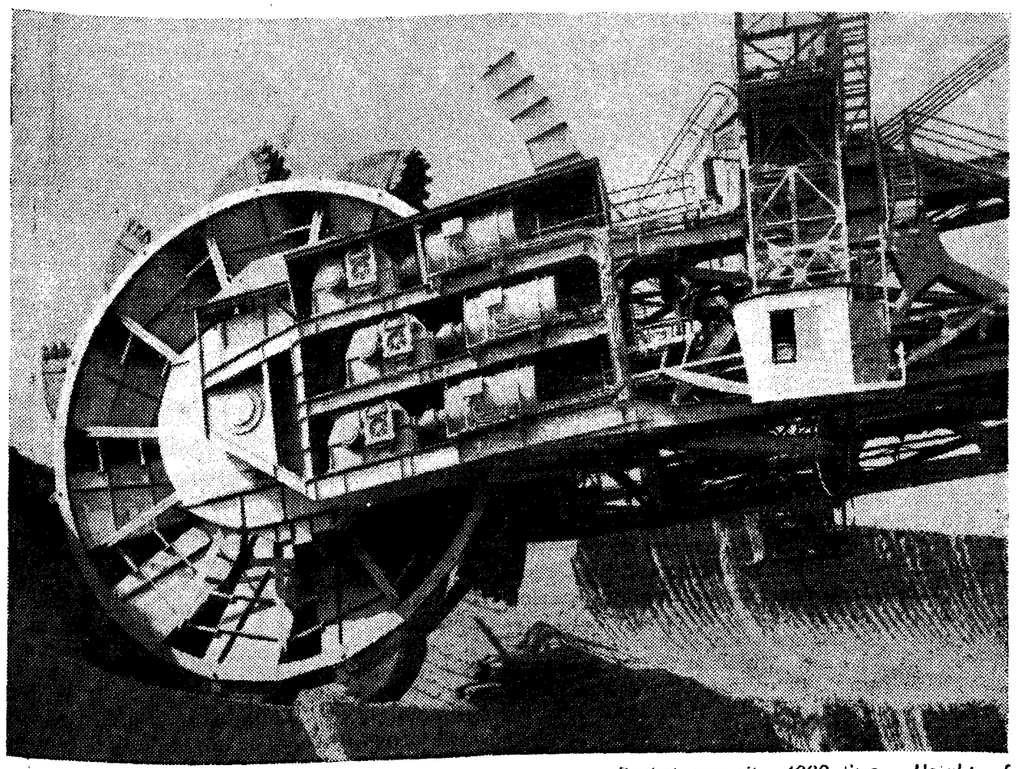
Textiles

EXPORTS LOOK UP

A NEW hope has emerged as a result of the concerted efforts of the cotton textile mills to raise their exports. Hitherto the picture had been very gloomy. But the voluntary scheme of exports initiated about four months ago has now brought forth rich dividends. During the quarter July-September, 1962, the exports of cotton textile goods increased by about 5 million yards as compared to the same quarter in 1961. The industry needs to be congratulated for its heroic attempts to turn the tide of decline in exports which looked like getting out of control. In 1960, the exports of cotton piecegoods were 694.83 million yards which dropped to 574.30 million yards in 1961. The downward trend got further accentuated in the first two quarters of the current year. The fact that the third quarter recorded an increase over the corresponding quarter of the preceding year shows that, after a long interval, the industry has successfully faced the challenge.

How has the declining trend been reversed? The international factors remain unchanged e.g., there is no diminution in the competition of the competing countries and the traditional markets of the Indian Union have not given up their plans to set up cotton textile mills. Mr. Manubhai Shah broke this happy news to the Informal Consultative Committee of Parliament for the Ministry of Commerce and Industry last week and gave credit to the industry for its achievement without providing any details of the specific steps taken by the industry. It seems, it is the sheer determination of the industry to sell its products abroad in the teeth of competitive opposition that has borne fruit. It will be necessary, however, to analyse carefully how the industry has been successful in achieving its goal during the third quarter and due publicity needs to be given to the facts which emerge so as to enlighten those exporters who have not been successful in their mission of increasing their exports so far.

In order to raise India's exports of cotton textiles — and this is as important during the present emergency as it was earlier because of the need of earning foreign exchange — the plan for accelerating the installation of automatic looms has assumed a great importance. Against the Third Plan target of 25,000 automatic looms, the Ministry of Commerce and Industry has already sanctioned the establishment of 7,500 looms. Three-fourths of the output of these looms will be exported and to that extent it will help in earning increased foreign exchange.



DCM PREPARES FOR EMERGENCY

MR. BHARAT RAM, Chairman of the Delhi Cloth and General Mills Ltd., devoted a major part of his speech at the annual general meeting of the company, held recently, to the responsibility that the industrialists have to bear on account of the emergency created as a result of the Chinese aggression. The company, it was revealed, apart from donating Rs. 10 lakhs to the National Defence Fund, associated the workers too, who decided to forgo their Diwali holiday voluntarily and donated the wages for that day along with the company's profits for the day for war effort. In this manner a sum of Rs. 1.19 lakhs was donated to the National Defence Fund. This indeed is an instance which should inspire other similar institutions; it has doubly good effect: firstly, the output is increased and, secondly, the returns of this increased output can go to the National Defence Fund. It may be observed that the DCM has already been serving the consumers directly through its over three hundred retail shops scattered all over the country. The Chairman indicated that the number of such retail shops would continue to increase. This aspect of the company's service has assumed special significance because in the coming period of emergency there may be a shortage of textiles and it will be such retail shops that will help in eliminating the danger of rising prices.

The DCM, revealed the Chairman, has been continuously renovating and modernising its textile mills. For instance, the old waste plant in Delhi will be replaced by a modern waste plant within a few months. The spinning capacity at Hissar is also being expanded by the addition of another 23,000 spindles. Till now the company was trying its best to increase its exports of textiles and during the current calendar year it expects to increase them further.

The company is going through expansion programmes in other fields too. It is planning expansion of the crushing capacity of its sugar factory at Mowana in the near future and it is hoped that in 1963-64 season they will have increased their crushing capacity from 1,500 tons per day to 3,000 tons per day. The Chairman added that during the last season the quality of cane in their area was extremely poor and the recoveries consequently suffered. The new system of linking the cane price to sugar content would definitely help the industry as well as would persuade the cultivators to concentrate on high sugar yielding varieties of cane. The company has also undertaken the designing and construction of chemicals plants. The company has already designed, manufactured, supplied and erected two sulphuric acid plants. Two more

KRUPP

Bucket-wheel excavator combined with travelling loader. Bucket capacity 4000 litres. Height of cut 50 m. Built by Fried. Krupp Maschinen-und Stahlbau Rheinhausen.

A World-wide Service to Industry

Exploration of mineral deposits, engineering of mining schemes.
Plants for the production of ferrous and non-ferrous metals.
Preparation and dressing plants for ore, coal and other minerals.
Chemical plants, cement plants, lime and gypsum plants.
Bridges and hydraulic structures.
Cranes for steelworks, ports, and industrial purposes.

Castings, forgings, rolls, magnetic materials.
Cable making machinery.
Machinery for plastics, rubber and edible oil industry.
Can-making machinery.
Diesel and electric locomotives, special purpose wagons.
Giant excavators and bulk handling plants.

sulphuric acid plants and two super-phosphate plants ordered by various parties are also nearing completion. The Company hopes to extend the activities of this section to cover other types of chemical plants too. Another important fact of their expansion programme, Mr. Bharat Ram stated, was that their negotiations with the Agency for International Development in the United States for a dollar loan to meet the foreign exchange requirements of the Rayon Tyre-Cord Project had been successful. The agreement would be signed soon. Expectations are that this factory would be in operation by the end of 1963 or early in 1964. The expansion programme of the company should indeed be a welcome step in the context of the present emergency.

Shellac

SURPLUS STOCKS POSE PROBLEM

THE SHELLAC TRADE has been caught in the grip of a depression caused by accumulation of surplus stocks in the market. The position may be further aggravated when this year's crop, which is reported to be good, begins to flow into the market.

The anxiety is greater in the export field because the shellac trade is mainly dependent on exports for its very existence. This being so, it is indeed alarming to note that exports of lac over the past few years have been steadily losing ground. In 1960-61 exports were 3.45 lakh packages, valued at Rs. 6.32 crores, while in 1961-62 they declined to 2.69 lakh packages, valued at Rs. 4.62 crores, against the target of Rs. 6.50 crores. The exports in 1962-63 are expected to be even lower at about 2.5 lakh packages, valued at about Rs. 4 crores.

In retrospect, the minimum export prices, introduced by the Government of India on October 5, 1961, for all varieties of seedlac and shellac appear to have failed to rejuvenate the trade. The trade, in fact, has moved down the hill a little faster than before. The already low prices of seedlac IB and IIB at Rs. 123 and Rs. 106 per package in October 1961 declined to the rock bottom level of Rs. 80 and Rs. 64, respectively, in October this year. International prices have slumped all around.

In order to arrest this fast downward trend, the State Trading Corporation started buffer stock operations in December, 1961, in Calcutta. Subsequently, purchases were made in the other growing centres as well. The operations got off to a good start, though not without lapses, and by the end of August, 1962, about 60,000 bags of shellac had been purchased.

It had the desired effect of checking the decline and indeed prices began to look up. But just when operations were beginning to yield results, the STC discontinued purchases with the result that prices again began to fall. Sporadic buying indulged in by the STC later did more harm than good to the traders, the manufacturers as well as the growers.

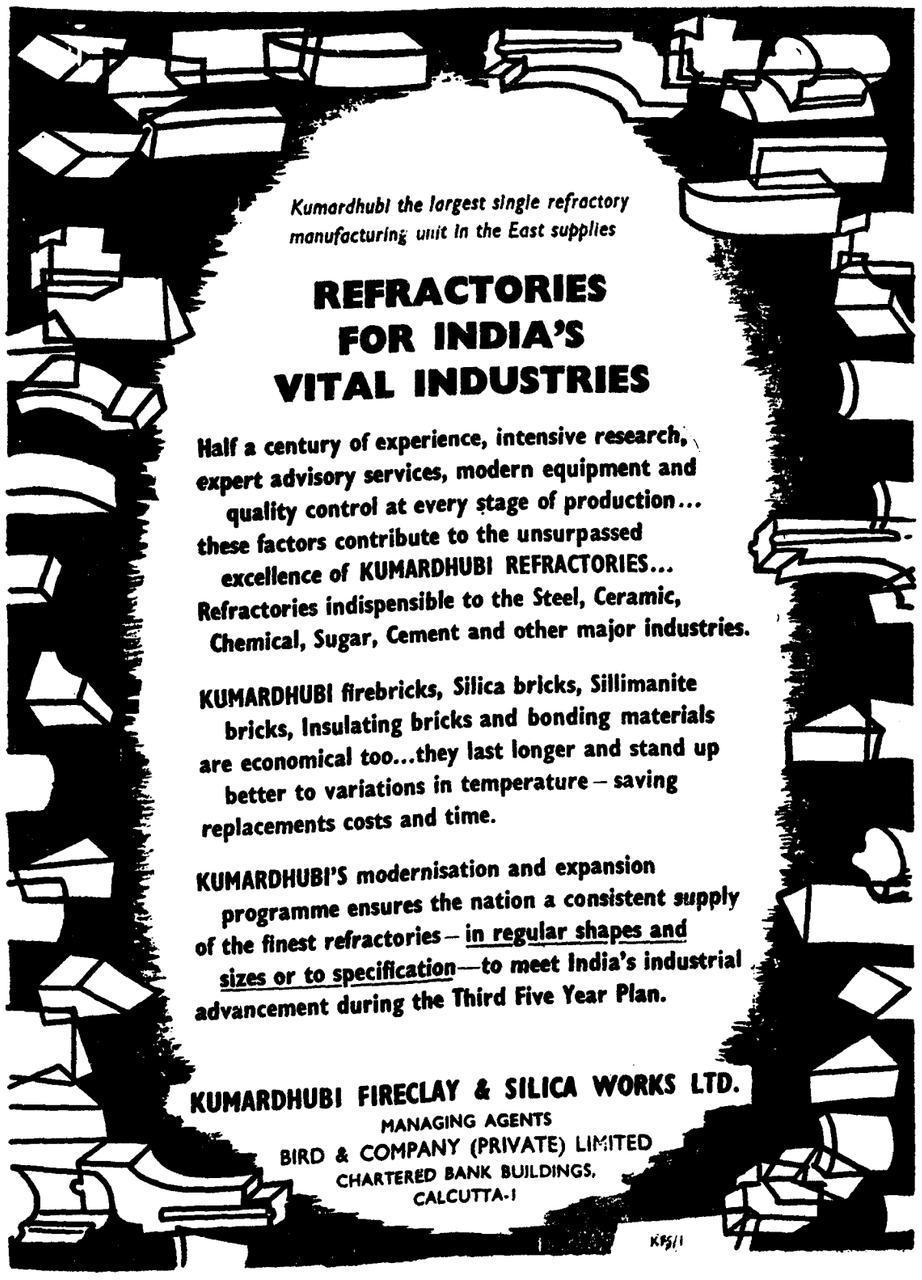
The factors responsible for the dwindling volume of overseas demand are the growing popularity of synthetic resins and the emergence of Siam as a serious competitor in the world market, particularly in the U.S. The current export price of Siamese seedlac is only 9 cents against 20.25 cents of Indian origin. A bumper crop is expected in Thailand this year. This would mean a far stiffer competition from that country. The extent thereof can be gauged from the fact that India, which was supplying 60 per cent of U.S.A.'s requirements some time ago, could supply only 40 per cent in the recent past. The loss is to some extent offset by increased Russian purchases. That minimum prices should either be reduced further or completely abolished to enable the industry to compete in the world market it is needless to suggest. Efforts should be made simultaneously to expand domestic consumption so as to provide a cushion against any occasional slumps in the overseas trade.

Economy

A REASSESSMENT

A REASSESSMENT of the economy has to take place in view of the present emergency before steps can be taken to maximise production. This reassessment of the basis of planning is very essential to gear the wheels of war effort. A note in this direction was struck realistically by Mr. S. T. Sadasivan in his Presidential address at the second quarterly general meeting of the Indian Chambers of Commerce. He not only appealed to the business community to maximise production in every possible way, with a view not only to maintain the defence supplies but also to meet the civilian requirements. At the same time he pointed out that effective control must be exercised on distribution so that there may not arise any need to impose physical controls.

To the Government his plea was that decisions be taken expeditiously and effective co-ordination be brought about between the different Ministeries. The Government has no doubt risen to the situation and is gearing up its administrative machinery in all possible fields. While all this is to the good, what is needed is that economic policy as a whole should become less ideological and more realistic. This in fact is the only way in which an effective co-operation can be brought about between the private sector and the public sector.



It is heartening that every one in this country has awakened at the time of emergency and the business community in particular is doing its best to contribute its mite in the best possible manner. Mr. Sadasivan emphatically appealed that we should generously contribute to defence funds and subscribe to the defence bonds and gold bonds that are being issued by the Government. Regarding exports, Mr. Sadasivan's suggestion was that even if we have to tighten our belts we must do so particularly when we need foreign exchange at this critical juncture to buy various types of goods.

While taking these steps attention will have to be paid to prevent any increase in prices which may result due to shortage of goods. The Government no doubt is taking specific measures to check the rise in prices, but these steps can only be successful if there is more production. Time now is to act as in increased production only lies the solution to our problems.

(Continued from page 905)

of BOBS wagons, despite the fact that the works at IISCO were not in a position to unload the Box wagons without employing arduous and lengthy manual means. In fact, the railways have been dictating the IISCO in regard to the despatch of their finished material to specific centres in the country which conflict with the allocations made by the Iron and Steel Controller. This is indeed an intolerable situation and involves considerable delay and loss in distribution.

Another interesting point which Sir Biren has made is that long-term planning of steel production in the country should not neglect the development potential which already exists in the present plants. While the temptation to set up new plants in the traditonal "iron-ore-and-coal belt" is very great, there are definite advantages in raising the size of the industry vertically instead of horizontally. The trend in the world also has been in favour of bigger plants of three to five million tons. This implies that the Government should not rule out possibilities of expanding the existing plants to make room for new ones.

FROM THE CAPITAL'S CORRIDORS

HOLDING THE PRICELINE

THE Union Minister for Planning, Labour and Employment, Mr. G. L. Nanda, outlined in the Lok Sabha last week the first phase of the measures which the Government proposed to take for maintaining the prices of essential commodities at reasonable levels. This phase relates to foodgrains, cotton textiles, drugs and medicines.

"In the present emergency," Mr. Nanda stated, "the problem of maintaining the prices of essential commodities at reasonable levels has assumed even greater urgency. The Government will maintain a close watch on the situation and will take whatever further measures may be called for".

The following are the highlights of the statement Mr. Nanda laid on the table of the House on the price policy of the Government.

(a) **Committee on Price Stabilisation:** With a view to keeping under close scrutiny the current price trends, especially retail prices, securing of regular and systematic flow of information concerning ex-factory costs and wholesale and retail margins, and arranging for special inquiries, the Government is constituting a high level committee on price stabilisation within the Department of Economic Affairs, Ministry of Finance. In the light of its studies, which will be undertaken on a continuing basis, the Committee will be required to recommend action by the Ministries concerned, and to formulate proposals for consideration by the Planning Commission and approval by the Cabinet. The Committee will function in close co-operation with the economic sections of the Ministries concerned and the Reserve Bank of India, and will serve as an important common agency on behalf of the Government as a whole in relation to the problems of price stabilisation.

(b) The existing agencies and the Central Statistical Organisation are being strengthened with a view to bring together all the available information on retail prices and for identifying the spreads between wholesale and retail prices at regular intervals.

(c) **Consumer Stores:** The Government has sanctioned a programme for building up a large network of co-operative and other consumer stores, specially for supply of essential commodities. It is proposed to set up about 200 wholesale and central stores with about 4,000 branch and primary stores. These will cover all metropolitan cities, State capitals, industrial centres, cities with a population of 1 lakh or more and a number of other towns. Departments and agencies of Government are also being asked to set up stores, specially for the benefit of their employees, which may be open to others in the locality. The Ministry of Home Affairs is establishing a Central Consumers' Co-operative Society in Delhi with 15 to 20 branches to begin with. Similar stores will be established by the Ministry of Home Affairs in Bombay, Calcutta and Madras. The Ministry of Labour and Employment is implementing a scheme for the organisation of consumers' co-operatives for industrial workers, under which employers will participate in providing fixed capital, working capital and managerial grants. In the established industrial centres, which have a large trade union membership, trade unions are being asked to take a leading part in the organisation of consumer stores and will be given such assistance as may be needed. Voluntary organisations will also be encouraged in promoting and organising consumer stores. The appropriate Government authorities, both Central and State, are being asked to ensure that the co-operative and other consumer stores which are set up receive the necessary supplies and that intermediary charges are eliminated to the greatest extent possible. The necessary funds for the programme of consumer stores are being allotted to the Department of Co-operation, in the Ministry of Community Development and Co-operation, which will implement the programme in collaboration with State Governments and the Ministries concerned. (In other words, socialisation of retail trade has been ushered in. How will this affect the employment in regular trade is not yet known).

(d) **Foodgrains:** The following are the principal decisions which have been taken for giving effect to the policy for foodgrains:

1. Substantial quantities of wheat are being made available for consumption at a concessional price in millet-consuming areas.

2. Releases of wheat from stocks are being made, in particular, in those States in which there had been a shortfall in the production of millets last year and in which food prices have been high this year.

3. Steps will be taken to popularise the consumption of wheat in rice-consuming areas and to discourage the consumption of rice in wheat-consuming areas.

4. In addition to large imports of rice, specially under PL 480, the Ministry of Food and Agriculture proposes to build up adequate stocks from the coming harvest.

5. For effecting purchases on behalf of the Central Government from wholesale traders and from rice mills, procurement prices for rice and paddy for the coming season are being fixed in consultation with State Governments. Based on these procurement prices, State Governments will also be asked to announce purchase prices at which they will be prepared to buy from farmers directly. These purchase prices will have the effect of assuring farmers of the necessary support and, at the same time, of enabling State Governments to obtain larger stocks. With a view to stimulating increased production, it is envisaged that these prices will continue beyond the current year. State Governments are being asked to take necessary measures to strengthen their machinery for making purchases on behalf of the Central Government. Financial accommodation will be made available to State Governments to the extent necessary for facilitating their purchase operations.

6. Arrangements will be made by the Ministry of Food and Agriculture to regulate inter-State movements of wheat by rail and road.

7. Wholesale traders and rice mills are already licensed and the system will be further strengthened and extended. State Governments are being asked to adopt broadly uniform conditions for licensing throughout the country. The conditions of licence will be enforced strictly and arrangements will be made for proper inspection of and supervision over the operations of the licensees, including checking of accounts and use of stocks.

8. Under the Essential Commodities Act, licensees are required to comply with such orders as may be

issued from time to time by the Government. One of the main conditions of the licence will be to enable the Government to impose a levy on wholesale traders and on rice mills, that is, to obtain such proportion of the quantity purchased by them as may be necessary in the public interest. Arrangements have been made with the Governments of Punjab and Uttar Pradesh to make a levy of 66-2|3 per cent and 50 per cent, respectively, and to make stipulated quantities of foodgrains available to the Central Government. Similar arrangements will be made in other surplus States. In deficit States, the method of procurement and other details will be worked out by the Ministry of Food and Agriculture in consultation with the State Governments concerned.

9. The working of the system of fair price shops will be improved and strengthened in a number of directions. Distribution through fair price shops will be directed towards meeting the needs of specified sections of the community, and adequate arrangements will be made for administrative vigilence, including inspection and supervision of stocks, returns and operations.

10. Through close liaison between the Reserve Bank of India and the Ministries of Finance and Food and Agriculture, advances against foodgrains by scheduled banks will be suitably regulated.

11. The programme for the construction of 3 million tons of additional food storage, which was to be completed by the end of the Third Plan, will be accelerated, so that the target can be reached as far as possible by the end of 1964-65. This will bring the total storage available to the Government to about 5 million tons. It is also proposed that in addition to the setting up of large godowns, a number of small storage units should be located at suitable places.

(e) **Cotton Textiles:** In respect of cotton textiles, the following are the main decisions which have been taken:

1. A scheme for supervised marketing of cotton has been introduced by the Textile Commissioner. Cotton can be purchased by mills only through approved supervisors who survey the cotton and determine appropriate prices. No mill will be permitted to maintain stocks in excess of requirements for a prescribed period.

2. The relative production of cloth in the lower ranges and of the more popular varieties will be increased. The medium category, now classified into lower medium and higher medium, is proposed to be divided into three parts—lower medium, middle medium and higher medium. It is hoped to raise production in the coarse and lower and middle medium range to the extent of about 250 to 300 million yards a year.

3. With the approval of the Textile Commissioner, the Indian Cotton Mills Federation, through its Regional Associations, will appoint 'nominees' for wholesale distribution. The 'nominees' will hold stocks of common varieties of cloth and arrange for distribution according to the Textile Commissioner's instructions. Mills whose cloth is in popular demand are being asked to open retail shops on a more extensive scale and also bring considerably larger numbers of retail dealers on their approved lists.

4. Prices to be stamped on cloth will be specifically approved by the Textile Commissioner, who would also indicate selling margins at the wholesale and retail levels.

5. To ensure supplies to consumer stores, fair price shops, etc., a prescribed proportion of the output of textile mills will be distributed under the specific instructions of the Textile Commissioner. This proportion may ordinarily be up to 10 per cent but, if necessary, it may be raised.

6. The Textile Commissioner will take steps to impose restrictions to the extent necessary on stocks held by mills and on movement of cloth, both by rail and road.

7. State Governments are being requested to take urgent steps to strengthen the co-operative sector in handloom industry and to bring as many handlooms as possible into co-operatives. They are being asked to establish the necessary arrangements for placing orders, providing specifications and technical guidance, supplying raw materials and other facilities, financing production and for organising marketing. To facilitate development along these lines, sales of yarn to handlooms will be regulated and free market sales will be progressively reduced. State Governments will, thus, be in a position to exercise greater direction and control over production and marketing in the handloom industry and to take whatever steps may be necessary for ensuring that prices of handloom products are maintained at reasonable levels.

(f) **Drugs and Medicines:** Arrangements are being made by the Ministry of Commerce and Industry to ensure that prices of many essential drugs and of the more common and important household remedies are fixed with Government's approval and widely publicised and displayed.

(g) **Subsidiary Foods:** Proposals for the intensification of production programmes for fruits, vegetables, fish, meat, eggs and milk are being drawn up and will be shortly communicated to State Governments.

(h) **Other Commodities:** Other commodities at present under examination include oilseeds and oils, sugar, woollen goods, kerosene oil, soap and paper.

Mr. Nanda called for active support and participation of trade, industry and labour, all consumer associations and voluntary organisations throughout the country and also the press for securing the objective of the price policy.

WOOLLENS FOR DEFENCE

The woollen industry in the country is to be switched over to defence production. Important decisions in this regard were taken at a meeting of the representatives of the woollen industry held here last week.

Control over the distribution and prices of woollen yarn and fabrics is to be tightened. All stocks of specified varieties of woollen cloth and fabrics in the possession of mills, producers or manufacturers are to be sold only against the indents of the Director-General of Supplies and Disposals. All yarn produced by the spinning mills will be distributed to hosiery and small-scale sectors through the Director-General of Supplies and Disposals.

To help the defence effort, knitting yarn will be made available at such places and quantities as may

THE WEATHER

OUTSIDE

is difficult to predict and impossible to control.

The weather indoors is a different matter.

If you are planning to construct or renovate a large building, *plan* the weather in it to your requirement with

TRANE

Central air-conditioning equipment.

You can control the weather with special advantages like separate air-conditioning for each room, positive circulation and complete filtering of all air.

TRANE systems are extremely flexible too. You can shut down parts of the system without power wastage.

And if you haven't quite decided just how big your building is going to be, a TRANE central plant is still your answer, since it can be shifted, adjusted or expanded without rebalancing.

How
ISI Helps
the
Manufacturer

BY PROVIDING THE SEAL OF INTEGRITY

The ISI Certification Mark may be given to any manufacturer whose products are made to the relevant Indian Standards. It is a recognition of his business integrity and trustworthiness.

Modern methods of quality control, an essential part of any scheme of certification, bring about many economies in production through elimination of defectives, increase in productivity, and securing of uniform quality of output. These benefits far outweigh any additional cost involved in instituting continuous inspection and testing.

Periodical check-up by ISI of manufacturers' own quality control systems constitutes an invaluable service to ensure top management of the high efficiency of production and maintenance of quality.

Consumer satisfaction and competitive marketing position are the obvious advantages enjoyed by all ISI Mark users.

Enquire for details NOW how you too can join the distinguished company of manufacturers who already hold the ISI Certification Mark Licence.

be required by the voluntary organisations engaged in knitting garments for the defence forces.

The Government of India has appointed a Woollen Controller to implement and supervise the various measures decided upon.

It has also been decided that early steps should be taken to modernise the existing woollen industry. The wool combing capacity is to be increased to make the country self-sufficient in combing.

All future imports of raw wool and wool tops, except to the extent already covered by irrevocable comitments, will be in those varieties a list of which will be drawn up by the Woollen Controller in consultation with the Textile Commissioner. To cope with the shortage of imported wool, the maximum utilisation of Indian wool for the production of fabrics and knitting yarn for which it is suitable is to be arranged by the Woollen Controller.

MACHINE TOOLS AND EMERGENCY

While addressing a group of Machine Tool Manufacturers last week, Mr. C. Subramaniam, the Union Minister for Steel and Heavy Industries, dwelt on the significance of the Third Five-Year Plan aims of evolving a base for self-sustaining growth. "For this purpose", he said, "there is no industry more important than the machine tool industry". The estimate of requirements of machine tools at the end of the Third Plan, he added, was valued at Rs. 60 crores per year. A minimum internal production of machine tools valued at Rs. 30 crores was given in the Plan. Progress, however, has not been satisfactory. Possibly, only some 20 to 25 crores of rupees worth of machine tools per year would be produced at the end of 1965-66.

In the context of the present emergency, the Minister stated that the demand for borers, drilling machines, milling machines, grinders, lathes, presses and special-purpose machines would greatly expand. He, therefore, suggested that (1) every machine tool factory should, wherever possible, work round the clock; (2) the machine tool manufacturers who had succeeded in achieving their maximum production should expand capacity and take on new urgent lines of manufacture; (3) a certain amount of co-operative effort, at least for the duration of the emergency, would be most welcome. (This could include the sharing of designs and drawings in regard to the more urgently needed machine tools and the sharing of know-how); (4) machine tool makers who had good foundries as adjuncts or as part of their productive units, should expand output by every possible means. They should also take on jobbing work for others who need quality castings. This would apply also to the machine shops.

The Minister also stressed the role of standardisation and indicated that for the duration of the emergency at least, an attempt should be made to reduce the number of types and specifications. This would help in regard to the sharing of designs and of know-how and using one another's capacity in many ways. This would as well assist in developing component and ancillary production outside the major production units, thus spreading the effort and freeing their capacity for major specialised operations. Further, he desired that each sizable manufacturer of machine tools should, within a very few days, give the Development Wing an estimate of requirements of raw materials like pig iron, coke, alloy steels etc., so that the planning of production and procurement of raw materials could be immediately taken in hand.

AID-INDIA CLUB

Indications are available here that the next meeting of the Aid-India Club may be convened much earlier than originally envisaged in view of the precarious situation that India faces today on the foreign exchange front with the outbreak of hostilities on her northern frontier. Opinion appears to be growing in the friendly countries that they should contribute maximum untied assistance to enable India to finance her maintenance imports.

Possibilities of Australia and New Zealand joining this Club are also hinted at in the knowledgeable circles.

ASSISTANCE FROM FRANCE

The French Ambassador in India, M. Jean Paul Garnier, announced here last week that his country had decided to speed up the supply of equipment for the Indian Army in response to an urgent indent by India. He said the French Ministry of Defence had decided to send some of the equipment from its own stocks. Orders had also been placed for a few helicopters, which, he added, were primarily intended for evacuating seriously wounded personnel. The French Red Cross had flown for the Jawans 150 bottles of blood.

On the economic side, too, the Ambassador said, France was committed to give economic aid (as a member of the Aid-India Club) to the extent of $50 million. The French Government had also authorised the Bank of France to give a loan of $ 10 million to the Industrial Finance Corporation of India.

The Ambassador also indicated that $8 million had been set apart for helping India in oil exploration. General survey and prospecting had already begun.

MINING ON THE FRENCH MODEL

An Indian team of mining engineers which recently visited France has submitted its recommendations to the Union Government regarding the suitability of the French mining methods to Indian conditions, it is learnt here.

The Chief Inspector of Mines and a senior mining engineer of the National Coal Development Corporation visited France recently to study the French mining methods, especially that of sub-level caving which had been recommended by French experts for adoption in India, This French method employs a system of false roofing which, after collapsing, eliminates the need for subsequent stowing.

The Indian team has favoured extraction of coal in slices, followed by pneumatic stowing as peculiarly suited to the Karanpura area. The suggestion is based primarily on considerations of safety. However, the French experts consider that this method would prove very expensive as compared to the sub-level caving method employing false roofing as adopted in France.

The report of the Indian team as also the views of the French experts are presently under the consideration of the Government of India.

IN BRIEF....

The Union Government is considering at present the feasibility of locating a machine tools factory in Kerala. The unit will be in the public sector.

*

After the completion of third stage expansion scheme, the FACT factory at Alwaye will have a capacity to produce 70,000 tons of nitrogen and 27,000 tons

of P2O5 per annum. The end-products will be ammonium sulphate, ammonium phosphate, ammonium chloride and single superphosphate.

*

The Government of Gujarat has been informed by the Central Government that the latter has no objection to the State Government undertaking specific schemes of prospecting by drilling coal and lignite in its area. Investigations relating to bauxite deposits in the Kutch area have already been started by the Geological Survey of India. Estimates of probable reserves of bauxite here are placed around 6 million tons, out of which nearly 4 million tons are envisaged to be of high grade.

*

Granulated slag for sale to the cement companies for the manufacture of slag cement is to be produced at all the three public sector steel plants. Measures have already been taken to set up a plant for granulation of slag at Bhilai. A project for installing a similar plant at Durgapur is under preparation.

*

The Union Minister for Steel and Heavy Industries is at present engaged in examining the list of industrial units which need to be geared for defence effort. The automobile industry has already been advised to slow down its production of passanger cars and to divert the capacity thus released for the manufacture of one-ton trucks.

*

Discussions are in progress in New Delhi for setting up an organisation for mobilising production and supplies to suit the current emergency in the country.

*

Orders have already been placed for the import of spares and equipment etc., of the value of about DM 20.7 million for the Rourkela Steel Plant out of about DM 41 million (Rs. 48.75 million) estimated by the Solveen Committee. Orders for the balance are likely to be placed shortly. Arrangements have also been made for the recruitment of additional foreign technical staff. The Rourkela Steel Works has in the recent past shown quite a good deal of improvement in its working.

*

The decision of the Government that Bhilai Steel Plant is liable to pay royalty on minerals worked out in the State Government lands but not in respect of minerals in the private lands acquired under the Land Acquisition Act, 1894, has recently been communicated to the Hindustan Steel Limited which will be informing the State Government accordingly.

*

The Textile Commissioner by an order dated November 11, 1962, has banned the movement of cotton from the godowns and jaithas situated in the city of Bombay belonging to the Bombay Port Trust at cotton deport area with effect from November 12, 1962, except in accordance with a special permission issued by the Textile Commissioner or any officer authorised by him on this behalf.

*

The Government of India has decided to ban forward trading in gold throughout the country. All outstanding contracts have been ordered to be closed at the rates prevailing at the close of business on November 13, 1962.

*

The Government has accepted the Tariff Commission's recommendation that protection to the stearic acid and oleic acid industry should not be continued beyond December 31, 1962.

GOVERNMENT OF INDIA
GOLD BONDS

SUBSCRIPTIONS for 6½ per cent Gold Bonds, 1977 are being received from the 12th of November 1962, in the form of gold, gold coins and/or gold ornaments.

The value of the gold will, after assaying, be calculated at the rate of Rs. 53.58 nP. per 10 grammes of .995 fineness equivalent to Rs. 62.50 nP. per tola of the same fineness.

Interest on the Bonds will accrue from the date of issue and will be payable half-yearly on the 12th of May and the 12th of November. Interest will be liable to tax but no tax will be deducted at the time of payment of interest on the Bonds held by individuals if the holder gives a declaration that the total nominal value of the Bonds held by him, or on his behalf, does not exceed Rs. 10,000.

The Bonds will be exempt from Wealth Tax and any capital gains from their sale will not be subject to Capital Gains Tax.

Subscription lists opened on 12th of November, 1962 and will close on the 11th of February, 1963 or earlier without notice.

Applications for the Bonds will be received at:—

(a) Offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi;

(b) Branches of the subsidiary banks of the State Bank of India conducting Government treasury business; and

(c) Branches of the State Bank of India at other places in India.

For full particulars apply to any of these receiving offices or branches.

EXPORT?

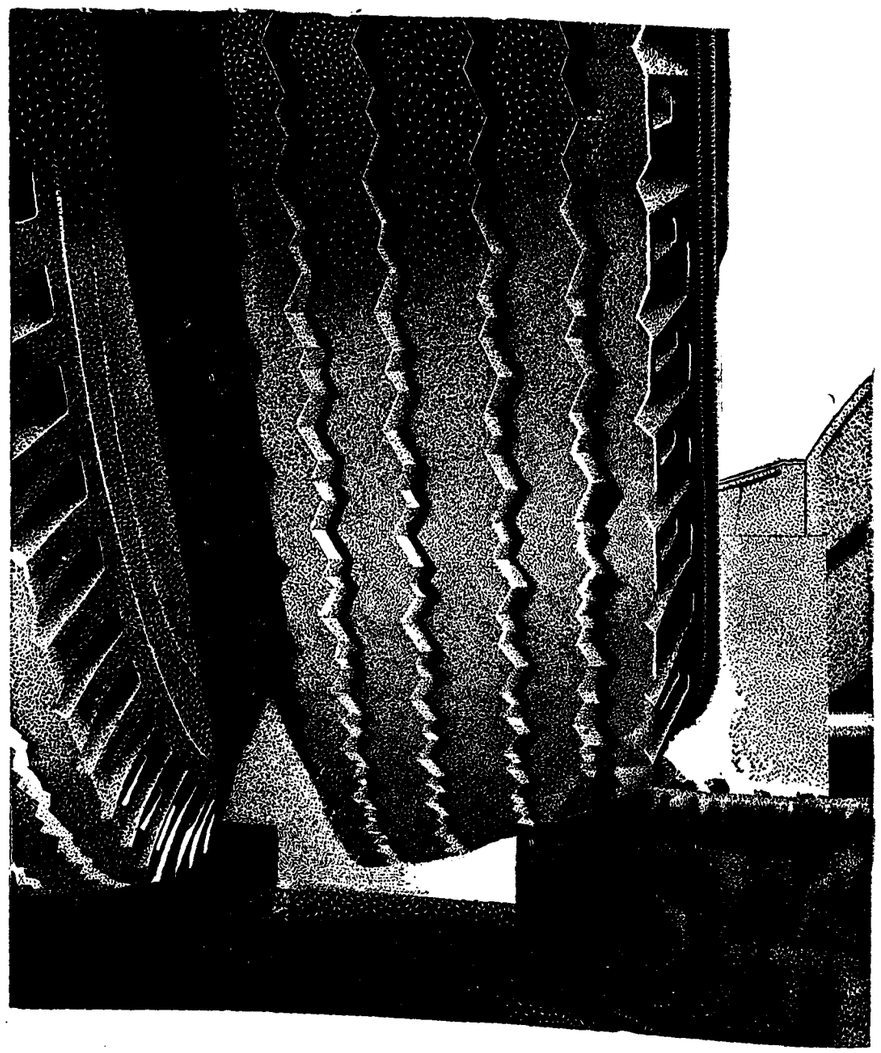
AIR-INDIA!

Export your goods the modern way—on Air-India's Boeings!
Here's how we can help you earn valuable foreign exchange:

SPEED We jet-speed your cargo at 600 m.p.h., reaching foreign markets in a matter of hours. This means less tied-up capital for you! Also you can safely export perishable goods—be sure they'll arrive fresh and unspoilt!

FREQUENCY We have a frequent network of flights direct to the business centres of the world.

CAREFUL HANDLING Whatever your product it is handled with care by specially trained staff, eliminating loss through damage and pilferage.



REDUCED COSTS Because of our special handling facilities, expensive crating becomes unnecessary. Only light packing is needed. And the time factor reduces insurance rates and eliminates warehousing charges.

DISCOUNTS The larger your consignment, the lower our freight charges. And we also offer special reduced rates on certain commodities!

Let us assist you in promoting your exports.
Please contact our local office for free service.

Sudan's first sugar factory has gone into production. Built with German financial and technical aid, it has a production capacity of 50,000 tons per annum.

COMPANY AFFAIRS

INDIAN TELEPHONE INDUSTRIES

During the year to March 31, 1962, Indian Telephone Industries Limited recorded a net profit of Rs. 64.43 lakhs after providing a sum of Rs. 12.11 lakhs towards interest and Rs. 35.87 lakhs for depreciation. The company separated Rs. 39.50 lakhs towards provision for taxes, Rs. 4.84 lakhs towards development rebate reserve, Rs. 6 lakhs towards general reserve and Rs. 14 lakhs for dividend. In view of anticipated increase in production, during 1962-63, the Government of India accorded permission to the company to increase the cash credit limit from Rs. 150 lakhs to Rs. 200 lakhs during 1961-62. The Government of India also sanctioned a loan of Rs. 60 lakhs towards part requirement of the funds necessary for the expansion proposed during the Third Five-Year Plan. As may be observed, from the following table, actual production the targets were not quite in line in the sense that actual achievements were not quite up to the mark.

	Target 1916-62	Achievements 1961-62
Telephones	1,26,800	1,16,701
Multiple Racks	728	614
Miscellaneous Racks	611	532
Small Exchanges	878	781

It may be added that the company manufactured nearly Rs. 45 lakhs worth of spares in an effort to clear the back-log of orders for such items. The MAX Division of the company had also taken up the production of special types of Relays for Indian Railways which were imported so far. The Transmission Division of the company also showed substantial progress. As against Rs. 60 lakhs worth of equipment manufactured during 1960-61, output this year was of the order of Rs. 115 lakhs notwithstanding the fact that the cost of the production had come down. Here the achievements were higher at least in the case of Stackable Channels:

	Target 1961-62	Achievements 1961-62
Stackable Channels	303	303
12-Channel Bay Sides	123	105

The Instruments Division of the Company manufactured 17 different types of higher frequency precision measuring instruments. It may be added that continued efforts in exporting exports for telephones and other equipment manufactured by the company were made in Burma, Ceylon, Indonesia, Viet Nam, Syria and Egypt. The Directors indicate that satisfactory progress was being made in the construction of a new factory building for transmission production and two factory units for the MAX division and planting type.

CALCUTTA TRAMWAYS

There was a minor increase in the receipts from traffic in the case of the Calcutta Tramways Company Limited during the year to December 31, 1961. Against the total receipts of £ 2.30 million during 1961, the receipts on this score during 1960 were of the order of £ 2.28 million. It may be observed that due to higher traffic expenses and power expenses, surplus balance was lower at £ 263,383 against £ 266,167, a year before. After providing for income-tax, out of a gross profit of £ 144,397, the Directors proposed the payment of a dividend on ordinary shares at the rate of 5 per cent free of income tax.

The Renewals and Replacements Account at the commencement of the year stood at £ 278,631. Deduction therefrom £ 70,880 written off for Renewals and Replacements during the year, and £ 25,000 written off in connection with Dalhousie Square, and adding £ 100,000 allocated out of the 1961 profit, there remains a balance of £ 282,751 to the credit of the Account.

NEW ISSUES

Six companies have been authorised to issue capital aggregating Rs. 6.32 crores. One is a new company and one is a State Government concern. One company is issuing bonus shares, four equities and one equity plus preference shares. The Controller's consent in all cases is valid for 12 months.

Kangan Private Limited, (Bombay), is issuing capital of Rs. 30,000 in the form of 1,200 bonus shares of Rs. 25 each by capitalisation of company's general reserve to a like extent. Shares will be issued to the existing shareholders at the rate of one share for every 5 shares held.

Uttar Pradesh Pulp & Paper Mills Limited, a public company incorporated on 24-10-1961, in the State of Uttar Pradesh, for undertaking manufacture of writing, printing and wrapping paper, is raising capital of Rs. 300 lakhs divided into 25,00,000 equity shares of Rs. 10 each and 50,000 cumulative redeemable preference shares of Rs. 100 each carrying dividend of 9 p.c. free of company's income tax but subject to deduction of tax at source at the prescribed rates. Out of this issue, equity shares of the value of Rs. 25 lakhs and preference shares of the value of Rs. 25 lakhs will be offered to a USA company against supply of plant and machinery to be imported and the balance will be issued for cash at par.

East Anglia Plastic (India) Limited, (Calcutta), will issue 21,25,000 equity shares of Rs. 10 each out of which 1,25,000 shares will be issued to the foreign collaborators, a French firm, against supply of plant and machineries. 20,00,000 shares will be issued to the existing shareholders at par in the ratio of two new shares for every share held. The capital is required for the establishment of a factory in Andhra Pradesh for the manufacture of cellulose acetabe flakes.

Devidayal Tube Industries Private Limited (Maharashtra) (Bombay), (now proposed to be converted into a public limited company), is issuing further capital of Rs. 61 lakhs out of which shares of the value of Rs. 19.19 lakhs will be allotted to Devidayal (Sales) Private Limited, in consideration of the balance assets transferred and the balance to the public for cash at par.

Facit Asia Limited (Madras), will issue 30,000 equity shares of Rs. 100 each for cash at par. Out of this, 15,000 shares will be issued to AB Atvidabergs Industrier, Atvidabergs, Sweden,. The proceeds will be utilised for the manufacture of calculating machines.

Gaskets & Oil Seals Private Limited (Baroda), is to issue Rs. 20 lakh in equity shares of Rs. 100 each for cash at par (inclusive of Rs. 10 lakhs issued by the company during July, 1962). The proceeds of the issue will be utilised in the manufacture of spare parts of automobiles.

help conserve nations fuel

FUEL is in short supply and expensive too. It forms a substantial part of the budget in every Industry. Efficient use of FUEL has therefore become imperative, whether you want to cut costs or plan to increase your production. Our FUEL experts have devised ways and means of getting 10 to 20% more out of the FUEL you use without costly capital investment.

THE EASTERN ECONOMIST

NOVEMBER 23, 1962

Peking's Peace Offensive

IF the first — and presumably also the final — reaction to Peking's peace offensive of November 21 has been one of intense scepticism, treating the offer as a trap, not only in India but abroad, it speaks for the reputation which the Chinese Government has earned for its behaviour in making overtures of peaceful settlement of the border dispute. It is sufficient to put even the gullible on their guard. All the sections of the Lok Sabha—barring, of course, the Communist Party—uttered a strong warning to the Government to be wary in reacting to this peace offensive. A government cannot hastily and unceremoniously reject out of hand a proposal made even by an enemy government. It has to give attention to it, apart from reasons of diplomatic decorum, to ascertain if there exists any substance in it. It is in this spirit that the Government of India is scrutinising the offer and analysing its implications. But the mandate to the Government is crystal clear. And Mr. Nehru has reiterated the Government's stand to adhere to its proposal of restoration of the position prior to September 8, 1962.

The substantial point of similarity between this proposal and the previous one of October 24, is that both are very nearly identical in content, which means that the new peace offensive seeks to reiterate the earlier one. The entire proposal announced in Peking on November 21 is a tissue of ambiguities woven round that perplexing term — "the line of actual control."

To outward appearances, in the middle and western sectors the position as it existed on November 7, 1959, is to be restored. But the historical preface to the official text of the note takes deliberate care to emphasize that what India maintains as the position subsisting on November 7, 1959, is an attempt to impose on China unilaterally a position which would require her to cede 13,000 to 15,000 square kilometres of area. The position of November 7, 1959, according to China's conception and assertion, thus varies radically from ours, claiming 15,000 square kilometres of territory south of this frontier as their own, not subject to negotiation.

In the eastern sector, China's "frontier guards" have been attacked by Indian troops in the area north of the traditional, customary line — meaning the area of China's aggression in NEFA. But there is a proposal in the new offensive that China would withdraw 20 kilometres beyond the north of the McMahon Line. Does it mean that she will voluntarily renounce all the fruits of her latest aggression here? The significant fact that must be grasped is that China's conception of the McMahon Line, too, is different in parts.

The third point in the new offer makes the confusion of ambiguity worse confounded. It does not draw any distinction between the middle and western sectors, on the one hand, and the eastern sector, on the other, as the first two points do. It specifically mentions that China would set up on her side of the "line of actual control" a number of new check-posts manned by "civil police" to enforce peace and order. This term is so vaguely worded as to conceal her determination to retain effective control of the areas on her side of the "line of actual control" after the withdrawal of the "frontier guards" and be it noted that the ambiguity is heightened by the absence of the specification of dates governing the position of the "line of actual control". Its implication in relation to the eastern sector seems to be that in the course of the proposed negotiations, China will adhere to her claim to the area now captured south of the McMahon Line on the ground that it lies on her side of the "traditional and customary line". This makes a spectacular shift in the position in the eastern sector.

China's unilateral cease-fire commenced on the mid-night of November 21-22. Why withdrawal should start nine days later on December 1 is far from clear and how long the operation of withdrawal will take is a matter of guess. The entire period including negotiations or exchange of letters represents the lull. Withdrawal is subject, as the offer sets out, to the control of the "civil police" over the areas vacated. But far more important than this is the stark reality that neither the cease-fire nor the withdrawal is a bar to stockpiling of arms, road construction and deployment of troops behind the line. The lull can be a period of intensive build-up.

India's duty is clear. If China's cease-fire continues to be effective, we need not waste our defensive resources. The entire cobweb of equivocation will have to be cleared first by obtaining from China clarification on every single point. The implications of the ambiguities have been thrashed out in the memoranda accompanying Mr. Nehru's reply to China's proposal of October 24. The straight course is to obtain a cartographic clarification from her setting out all the areas and places in precise detail with a clear demarcation of "line of actual control." Whether this peace offensive is a ruse to gain time or is intended as a sop to the Afro-Asian nations which are specifically cajoled in the text of the note or it is a strategic gesture on the eve of the session of the Central Committee of the Communist Party of the Soviet Union need not detract India. There must be no relaxation whatsoever in the Government's effort at mobilisation to safeguard the Assam front, as if the enemy continues to pour in numbers. America and Britain are rushing armaments and equipment to us in sizable quantities. There should be the fullest negotiations with the military missions which have arrived here from the two countries under Mr. Averrel Harriman and General Sir Richard Hull. We must be fully prepared for the eventuality of this peace offensive turning to be the precursor to yet another aggressive offensive with a far more forcible push, reinforced by more massive strength than heretofore.

Parliament in Emergency

IT WOULD have been the limit of loss of perspective if the first session of Parliament since the national emergency had not been cut short. Summoning of Parliament in this gravest of crises since independence was imperative to take counsel with this sovereign constitutional authority of the nation. But the present is not the time for what must certainly be regarded, in the prevailing context, as the luxury of leisurely debates on Bills and resolutions concerned with the problems of peace-time. There can be no regret that the agenda for the session, overloaded with a plethora of Bills and other business, was scrapped to the minimum. Such business as was transacted could not be postponed in any event. Its urgency lay mostly in the necessity of arming the Government with emergency powers.

If consultation with Parliament was the overriding object of this session, its performance, and more especially the quality of that performance, must be judged by the extent to which the session was conducted to that end. An assessment from this angle should prove useful. The abnormality of the situation demands that parlimentary sessions must be not only thoroughly business-like but war-like. The sense of emergency, of the peril to our survival as a free nation, must not only permeate but predominate the atmosphere in the two Houses. The invaluable contribution which Parliament can make depends on the manner in which it fortifies the Government in its task to carry on war operations with vigour and unflinching determination to the end.

The session got off to a good start—rather a most befitting start—fully reflecting the people's spontaneous reaction to China's challenge. The debate on the resolution of the nation's resolve to repel the aggression was as much essential to give a demonstration to the world of the cause for which India was determined to fight and to enlist its support for her as it was essential to give a further boost to the morale of the fighting forces and of the civilian population. The tone of the speeches was calculated to accomplish these objectives. But it was unwise on the part of Parliament to give such a lopsided vent to its wrath and resentment against the Government's unpreparedness to meet the situation resulting in the reverses. First reverses are no doubt a deterrent warning, but they do not determine the subsequent trend of fighting or the ultimate result. If remonstrance was the object of the criticism, it could have been fulfilled equally effectively with a sharp but brief attack.

In fact, the sense of brevity was so conspicuously lacking almost through the entire course of the debate. It was a sad spectacle to find some, although a few, speakers hurling accusations against their opponents of twisting the occasion for party ends. In this climate of crisis, when action and not words count, why should the Lok Sabha have devoted 6 days to the debate and what justification was there for as many as 165 speakers to participate? The rule of self-discipline for all the parties during the emergency must be that of brief, precise and non-repetitive speeches. But above all the supreme dictum must be—no fresh point, no speech.

The demands for supplementary grants were almost entirely intended for defence expenditure. Here was an opportunity to carry some critical probe into the complexities of the gigantic defence organisation for self-enlightenment as well as for the enlightenment of the public. But the Lower House signally failed on this occasion. Suggestions for the abolition of prohibition and reimposition of the salt tax looked so absolutely odd in the discussion on the supplementary defence expenditure here and now. Those who urged the Government to enlist the services of ex-INA men added to the oddity, when it was apparent that most of the revenue as well as capital expenditure asked for did not relate to personnel.

Issues connected with defence—and of defence thrust upon us so abruptly by the enemy's unexpected onslaughts and opening of new fronts of action—are as delicate as they are grave. It was deplorable that there was too insufficient an appreciation on the part of several members—the party in office not excluded—of the delicacy of the situation and the embarrassment that would be caused to the treasury benches by unwary questioning. The threat to Assam brought to the fore the loss of equilibrium. This is no reflection on the sense of profound anxiety felt by the members. But the impropriety of repeated emphasis on questions calling upon the Government what strategy or action it proposed for countering the enemy's thrusts ought to have been quite apparent to the questioners. Such questioning has its place in parliamentary procedure, provided it is feasible to hold the sittings in camera. In our Parliament it is not feasible with a particular presence. The wise course is to hold brief discussions with the Prime Minister in his chamber and to act on his assurance in this behalf—the assurance to meet groups of members on party basis. It is sad to reflect that shrewd sense and self-discipline on the part of the members had to be substituted by the Speaker's intervention.

The Axe on Imports

THE pressure on India's foreign exchange has repeatedly forced the Ministry of Commerce and Industry to curtail the list of imports after every half-year in the case of private sector imports, of course, along with the public sector on a much smaller scale. Every scrutiny that has been undertaken during the last five years has either eliminated certain items or has drastically curtailed the imports of some of the non-essential as well as essential goods. Recently, the axe has fallen on some of the relatively essential goods with the result that the fear has rightly been expressed that continuous curtailments of imports on private account will definitely reflect themselves in slowing down the production effort. The national emergency has once again necessitated a further examination of the import list and as the current indications show, the Ministry of Commerce and Industry is likely to announce at the end of this month a further cut of nearly 33 per cent — Rs. 50 crores in value terms — in the case of private sector imports.

What is the criterion for the exclusion of items from the import list? Broadly, the Ministry has followed a policy whereby those goods

which can be manufactured within the country (without regard to quality of manufacture in many cases) have come under the axe in the first instance. Sometimes this has affected the efficiency of certain units. The present cut is likely to affect those industries which, directly or indirectly, have no bearing on the war effort. In normal times, a further cut would have been resented and rightly so, because the industrial capacity in the country should not be allowed to remain idle. Under the present abnormal circumstances, all such considerations will, however, be brushed aside, though it will go against the repeated suggestions being made in all quarters that unutilised capacity in the country must be utilised in full and with vigour so that the production machinery may be accelerated to meet the grave challenge. To that extent a policy of compromise has to be evolved and if the production of the non-strategic goods only is affected, the units affected will have to put up with it in the larger interests of the country.

There are certain items which can come under the axe without creating much serious harm. In the case of imported glass, components of watches, etc. there may be a complete ban on imports or the quotas may be reduced to a nominal figure. In the short period, it may affect adversely the civilian population, but that is the price of the fight for Independence which the country cannot but pay. In the case of the Hindustan Machine Tools Unit at Bangalore, which has been very successfully assembling and selling watches for civilian use, there should be a ban on the production of such watches and any foreign exchange already sanctioned for this purpose should be surrendered to the Government by the producing unit. This should also apply to many other similar items such as photographic goods, spectacles, high quality paper, etc. The one sector where imports should not be cut is that of petroleum crude and some of the refined products, because the war machinery will not be able to face the challenge if the vital products are not made available to it in the requisite quantity at the right time. There might be necessity of even curtailing the imports of cotton for such varieties which are consumed domestically and will not affect Indian export effort.

The task indeed is a difficult one. Any suggestions put forward in this direction without careful examination may, in fact, go against the war effort because the battle has got to be fought not only with guns and mortar but has also to be sustained by continuous civilian effort which has to provide the essential sinews of war. A cut of 50 crores of rupees in foreign exchange may not go a very long way in solving the problem, but in times like this, every bit that can be done in this direction can be of direct use to the economy.

The Race for Rice

THANKS to the commendable restraint shown by the trade in not pushing up prices, the cool-headedness evinced by the public by not getting scared into stockpiling and the fairly satisfactory position of supplies, foodgrains prices, by and large, have not tended to go up, as was feared, except in Orissa and Assam. But this does not imply that the battle on this front has been won. The emergency has been with us for only a month and the growth of new demand for food supplies is yet to take place with the expansion in our armed forces and the inflow of wartime expenditure into the countryside. The 2.5 million (approximate) annual deficit in our food requirements can, thus, be expected to increase. To what extent, it is not essential to speculate.

So far as wheat is concerned, there is no cause for worry, barring, of course, the remote possibility of widespread failure of the recently-sown rabi crop. The country has an "extremely satisfactory" stock position in respect of this commodity and the U.S. Administration is prepared to help to the utmost by not only maintaining a regular supply in terms of the P.L. 480 agreement of 1960 but also by making available an additional 50,000 tons a month up to the middle of the next year. The same, however, cannot be said about rice which, indeed, is the Achilles' heel of our food economy. The vissisitudes that rice output shows from year to year are reflected in the prices to an extent much greater than in the case of any other foodstuff.
